1 signifies air-initiated Comm-B reservation request (3.1.2.6.11.3.1)
2 signifies Comm-B closeout (3.1.2.6.11.3.2.3)
3 not assigned.

MES, the 3-bit (23-25) multisite ELM subfield shall contain reservation and closeout commands for ELM as follows:

0 signifies no ELM action
1 signifies uplink ELM reservation request (3.1.2.7.4.1)
2 signifies uplink ELM closeout (3.1.2.7.4.2.8)
3 signifies downlink ELM reservation request (3.1.2.7.7.1.1)
4 signifies downlink ELM closeout (3.1.2.7.7.3)
5 signifies uplink ELM reservation request and downlink ELM closeout
6 signifies uplink ELM closeout and downlink ELM reservation request
7 signifies uplink ELM and downlink ELM closeouts.

RSS, the 2-bit (27, 28) reservation status subfield shall request the transponder to report its reservation status in the UM field. The following codes have been assigned:

0 signifies no request
1 signifies report Comm-B reservation status in UM
2 signifies report uplink ELM reservation status in UM
3 signifies report downlink ELM reservation status in UM.

d) If DI = 1 or 7:

LOS, the 1-bit (26) lockout subfield, if set to 1, shall signify a multisite lockout command from the interrogator indicated in IIS. LOS set to 0, shall be used to signify that no change in lockout state is commanded.

TMS, the 4-bit (29-32) tactical message subfield shall contain communications control information used by the data link avionics.

e) If DI = 7:

RRS, the 4-bit (21-24) reply request subfield in SD shall give the BDS2 code of a requested Comm-B reply.

Bits 25, 27 and 28 are not assigned.

f) If DI = 2:

TCS, the 3-bit (21-23) type control subfield in SD shall control the position type used by the transponder. The following codes have been assigned:

0 signifies no position type command
1 signifies use surface position type for the next 15 seconds
2 signifies use surface position type for the next 60 seconds
3 signifies cancel surface type command
4-7 not assigned.

RCS, the 3-bit (24-26) rate control subfield in SD shall control the squitter rate of the transponder when it is reporting the surface format. This subfield shall have no effect on the transponder squitter rate when it is reporting the airborne position type. The following codes have been assigned:

0 signifies no surface position extended squitter rate command
1 signifies report high surface position extended squitter rate for 60 seconds
2 signifies report low surface position extended squitter rate for 60 seconds
3 signifies suppress all surface position extended squitters for 60 seconds
4 signifies suppress all surface position extended squitters for 120 seconds
5-7 not assigned.

Note 1.— The definition of high and low squitter rates is given in 3.1.2.8.6.4.3.

Note 2.— As stated in 3.1.2.8.5.2 d), acquisition squitters are transmitted when surface position extended squitters are suppressed by using RCS=3 or 4.

SAS, the 2-bit (27-28) surface antenna subfield in SD shall control the selection of the transponder diversity antenna that is used for (1) the extended squitter when the transponder is reporting the surface format, and (2) the acquisition squitter when the transponder is reporting the on-the-ground status. This subfield shall have no effect on the transponder diversity antenna selection when it is reporting the airborne status. The following codes have been assigned:

0 signifies no antenna command
1 signifies alternate top and bottom antennas for 120 seconds
2 signifies use bottom antenna for 120 seconds
3 signifies return to the default.

Note.— The top antenna is the default condition (3.1.2.8.6.5).

g) If DI = 3:

SIS, the 6-bit (17-22) surveillance identifier subfield in SD shall contain an assigned surveillance identifier code of the interrogator (3.1.2.5.2.1.2.4).

LSS, the 1-bit (23) lockout surveillance subfield, if set to 1, shall signify a multisite lockout command from the interrogator indicated in SIS. If set to 0, LSS shall signify that no change in lockout state is commanded.

RRS, the 4-bit (24-27) reply request subfield in SD shall contain the BDS2 code of a requested GICB register.

Bits 28 to 32 are not assigned.

3.1.2.6.1.5 *PC and SD field processing.* When DI = 1, PC field processing shall be completed before processing the SD field.

3.1.2.6.2 *COMM-A ALTITUDE REQUEST, UPLINK FORMAT 20*

1	6	9	14	17	33	89
UF	PC	RR	DI	SD	MA	AP
5	8	13	16	32	88	112

The format of this interrogation shall consist of these fields:

Field	*Reference*
UF uplink format	3.1.2.3.2.1.1
PC protocol	3.1.2.6.1.1
RR reply request	3.1.2.6.1.2
DI designator identification	3.1.2.6.1.3
SD special designator	3.1.2.6.1.4
MA message, Comm-A	3.1.2.6.2.1
AP address/parity	3.1.2.3.2.1.3

3.1.2.6.2.1 *MA: Message, Comm-A.* This 56-bit (33-88) field shall contain a data link message to the aircraft.

3.1.2.6.3 *SURVEILLANCE IDENTITY REQUEST, UPLINK FORMAT 5*

1	6	9	14	17	33
UF	PC	RR	DI	SD	AP
5	8	13	16	32	56

The format of this interrogation shall consist of these fields:

Field	*Reference*
UF uplink format	3.1.2.3.2.1.1
PC protocol	3.1.2.6.1.1
RR reply request	3.1.2.6.1.2
DI designator identification	3.1.2.6.1.3
SD special designator	3.1.2.6.1.4
AP address/parity	3.1.2.3.2.1.3

3.1.2.6.4 *COMM-A IDENTITY REQUEST, UPLINK FORMAT 21*

1	6	9	14	17	33	89
UF	PC	RR	DI	SD	MA	AP
5	8	13	16	32	88	112

The format of this interrogation shall consist of these fields:

Field	*Reference*
UF uplink format	3.1.2.3.2.1.1
PC protocol	3.1.2.6.1.1
RR reply request	3.1.2.6.1.2
DI designator identification	3.1.2.6.1.3
SD special designator	3.1.2.6.1.4
MA message, Comm-A	3.1.2.6.2.1
AP address/parity	3.1.2.3.2.1.3

3.1.2.6.5 *SURVEILLANCE ALTITUDE REPLY, DOWNLINK FORMAT 4*

1	6	9	14	20	33
DF	FS	DR	UM	AC	AP
5	8	13	19	32	56

This reply shall be generated in response to an interrogation UF 4 or 20 with an RR field value less than 16. The format of this reply shall consist of these fields:

Field	*Reference*
DF downlink format	3.1.2.3.2.1.2
FS flight status	3.1.2.6.5.1
DR downlink request	3.1.2.6.5.2
UM utility message	3.1.2.6.5.3
AC altitude code	3.1.2.6.5.4
AP address/parity	3.1.2.3.2.1.3

3.1.2.6.5.1 *FS: Flight status.* This 3-bit (6-8) downlink field shall contain the following information:

Coding

0	signifies no alert and no SPI, aircraft is airborne
1	signifies no alert and no SPI, aircraft is on the ground
2	signifies alert, no SPI, aircraft is airborne
3	signifies alert, no SPI, aircraft is on the ground
4	signifies alert and SPI, aircraft is airborne or on the ground
5	signifies no alert and SPI, aircraft is airborne or on the ground
6	reserved
7	not assigned

Note.— The conditions which cause an alert are given in 3.1.2.6.10.1.1.

3.1.2.6.5.2 *DR: Downlink request.* This 5-bit (9-13) downlink field shall contain requests to downlink information.

Coding

0	signifies no downlink request
1	signifies request to send Comm-B message
2	reserved for ACAS
3	reserved for ACAS
4	signifies Comm-B broadcast message 1 available
5	signifies Comm-B broadcast message 2 available
6	reserved for ACAS
7	reserved for ACAS
8-15	not assigned
16-31	see downlink ELM protocol (3.1.2.7.7.1)

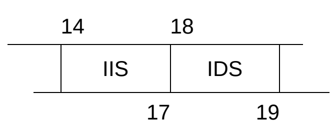
Codes 1-15 shall take precedence over codes 16-31.

Note.— Giving precedence to codes 1-15 permits the announcement of a Comm-B message to interrupt the announcement of a downlink ELM. This gives priority to the announcement of the shorter message.

3.1.2.6.5.3 *UM: Utility message.* This 6-bit (14-19) downlink field shall contain transponder communications status information as specified in 3.1.2.6.1.4.1 and 3.1.2.6.5.3.1.

3.1.2.6.5.3.1 Subfields in UM for multisite protocols

UM FIELD STRUCTURE



The following subfields shall be inserted by the transponder into the UM field of the reply if a surveillance or Comm-A interrogation (UF equals 4, 5, 20, 21) contains DI = 1 and RSS other than 0:

IIS: The 4-bit (14-17) interrogator identifier subfield reports the identifier of the interrogator that is reserved for multisite communications.

IDS: The 2-bit (18, 19) identifier designator subfield reports the type of reservation made by the interrogator identified in IIS.

Assigned coding is:

0 signifies no information
1 signifies IIS contains Comm-B II code
2 signifies IIS contains Comm-C II code
3 signifies IIS contains Comm-D II code.

3.1.2.6.5.3.2 *Multisite reservation status.* The interrogator identifier of the ground station currently reserved for multisite Comm-B delivery (3.1.2.6.11.3.1) shall be transmitted in the IIS subfield together with code 1 in the IDS subfield if the UM content is not specified by the interrogation (when DI = 0 or 7, or when DI = 1 and RSS = 0).

The interrogator identifier of the ground station currently reserved for downlink ELM delivery (3.1.2.7.6.1), if any, shall be transmitted in the IIS subfield together with code 3 in the IDS subfield if the UM content is not specified by the interrogation and there is no current Comm-B reservation.

3.1.2.6.5.4 *AC: Altitude code.* This 13-bit (20-32) field shall contain altitude coded as follows:

a) Bit 26 is designated as the M bit, and shall be 0 if the altitude is reported in feet. M equals 1 shall be reserved to indicate that the altitude reporting is in metric units.

b) If M equals 0, then bit 28 is designated as the Q bit. Q equals 0 shall be used to indicate that the altitude is reported in 100-foot increments. Q equals 1 shall be used to indicate that the altitude is reported in 25-foot increments.

c) If the M bit (bit 26) and the Q bit (bit 28) equal 0, the altitude shall be coded according to the pattern for Mode C replies of 3.1.1.7.12.2.3. Starting with bit 20 the sequence shall be C1, A1, C2, A2, C4, A4, ZERO, B1, ZERO, B2, D2, B4, D4.

d) If the M bit equals 0 and the Q bit equals 1, the 11-bit field represented by bits 20 to 25, 27 and 29 to 32 shall represent a binary coded field with a least significant bit (LSB) of 25 ft. The binary value of the positive decimal integer “N” shall be encoded to report pressure-altitude in the range [(25 N – 1 000) plus or minus 12.5 ft]. The coding of 3.1.2.6.5.4 c) shall be used to report pressure-altitude above 50 187.5 ft.

Note 1.— This coding method is only able to provide values between minus 1 000 ft and plus 50 175 ft.

Note 2.— The most significant bit (MSB) of this field is bit 20 as required by 3.1.2.3.1.3.

e) If the M bit equals 1, the 12-bit field represented by bits 20 to 25 and 27 to 31 shall be reserved for encoding altitude in metric units.

f) 0 shall be transmitted in each of the 13 bits of the AC field if altitude information is not available or if the altitude has been determined invalid.

3.1.2.6.6 *COMM-B ALTITUDE REPLY, DOWNLINK FORMAT 20*

1	6	9	14	20	33	89
DF	FS	DR	UM	AC	MB	AP
5	8	13	19	32	88	112

This reply shall be generated in response to an interrogation UF 4 or 20 with an RR field value greater than 15. The format of this reply shall consist of these fields:

Field	*Reference*
DF downlink format	3.1.2.3.2.1.2
FS flight status	3.1.2.6.5.1
DR downlink request	3.1.2.6.5.2
UM utility message	3.1.2.6.5.3
AC altitude code	3.1.2.6.5.4
MB message, Comm-B	3.1.2.6.6.1
AP address/parity	3.1.2.3.2.1.3

3.1.2.6.6.1 *MB: Message, Comm-B.* This 56-bit (33-88) downlink field shall be used to transmit data link messages to the ground.

3.1.2.6.7 *SURVEILLANCE IDENTITY REPLY, DOWNLINK FORMAT 5*

1	6	9	14	20	33
DF	FS	DR	UM	ID	AP
5	8	13	19	32	56

This reply shall be generated in response to an interrogation UF 5 or 21 with an RR field value less than 16. The format of this reply shall consist of these fields:

Field	*Reference*
DF downlink format	3.1.2.3.2.1.2
FS flight status	3.1.2.6.5.1
DR downlink request	3.1.2.6.5.2
UM utility message	3.1.2.6.5.3
ID identity	3.1.2.6.7.1
AP address/parity	3.1.2.3.2.1.3

3.1.2.6.7.1 *ID: Identity (Mode A code).* This 13-bit (20-32) field shall contain aircraft identity code, in accordance with the pattern for Mode A replies in 3.1.1.6. Starting with bit 20, the sequence shall be C1, A1, C2, A2, C4, A4, ZERO, B1, D1, B2, D2, B4, D4.

3.1.2.6.8 *COMM-B IDENTITY REPLY, DOWNLINK FORMAT 21*

1	6	9	14	20	33	89
DF	FS	DR	UM	ID	MB	AP
5	8	13	19	32	88	112

This reply shall be generated in response to an interrogation UF 5 or 21 with an RR field value greater than 15. The format of this reply shall consist of these fields:

Field	*Reference*
DF downlink format	3.1.2.3.2.1.2
FS flight status	3.1.2.6.5.1
DR downlink request	3.1.2.6.5.2
UM utility message	3.1.2.6.5.3
ID identity	3.1.2.6.7.1
MB message, Comm-B	3.1.2.6.6.1
AP address/parity	3.1.2.3.2.1.3

3.1.2.6.9 *LOCKOUT PROTOCOLS*

3.1.2.6.9.1 *Multisite all-call lockout*

Note.— The multisite lockout protocol prevents transponder acquisition from being denied one ground station by lockout commands from an adjacent ground station that has overlapping coverage.

3.1.2.6.9.1.1 The multisite lockout command shall be transmitted in the SD field (3.1.2.6.1.4.1). A lockout command for an II code shall be transmitted in an SD with DI = 1 or DI = 7. An II lockout command shall be indicated by LOS code equals 1 and the presence of a non-zero interrogator identifier in the IIS subfield of SD. A lockout command for an SI code shall be transmitted in an SD with DI = 3. SI lockout shall be indicated by LSS equals 1 and the presence of a non-zero interrogator identifier in the SIS subfield of SD. After a transponder has accepted an interrogation containing a multisite lockout command, that transponder shall commence to lock out (i.e. not accept) any Mode S-only all-call interrogation which includes the identifier of the interrogator that commanded the lockout. The lockout shall persist for an interval T_L (3.1.2.10.3.9) after the last acceptance of an interrogation containing the multisite lockout command. Multisite lockout shall not prevent acceptance of a Mode S-only all-call interrogation containing PR codes 8 to 12. If a lockout command (LOS = 1) is received together with IIS = 0, it shall be interpreted as a non-selective all-call lockout (3.1.2.6.9.2).

Note 1.— Fifteen interrogators can send independent multisite II lockout commands. In addition, 63 interrogators can send independent SI lockout commands. Each of these lockout commands must be timed separately.

Note 2.— Multisite lockout (which only uses non-zero II codes) does not affect the response of the transponder to Mode S-only all-call interrogations containing II equals 0 or to Mode A/C/S all-call interrogations.

3.1.2.6.9.2 *Non-selective all-call lockout*

Note 1.— In cases where the multisite lockout protocol for II codes is not required (e.g. there is no overlapping coverage or there is ground station coordination via ground-to-ground communications) the non-selective lockout protocol may be used.

On acceptance of an interrogation containing code 1 in the PC field, a transponder shall commence to lock out (i.e. not accept) two types of all-call interrogations:

a) the Mode S-only all-call (UF = 11), with II equals 0; and

b) the Mode A/C/S all-call of 3.1.2.1.5.1.1.

This lockout condition shall persist for an interval T_D (3.1.2.10.3.9) after the last receipt of the command. Non-selective lockout shall not prevent acceptance of a Mode S-only all-call interrogation containing PR codes 8 to 12.

Note 2.— Non-selective lockout does not affect the response of the transponder to Mode S-only all-call interrogations containing II not equal to 0.

3.1.2.6.10 BASIC DATA PROTOCOLS

3.1.2.6.10.1 *Flight status protocol.* Flight status shall be reported in the FS field (3.1.2.6.5.1).

3.1.2.6.10.1.1 *Alert.* An alert condition shall be reported in the FS field if the Mode A identity code transmitted in Mode A replies and in downlink formats DF equals 5 and DF equals 21 are changed by the pilot.

3.1.2.6.10.1.1.1 *Permanent alert condition.* The alert condition shall be maintained if the Mode A identity code is changed to 7500, 7600 or 7700.

3.1.2.6.10.1.1.2 *Temporary alert condition.* The alert condition shall be temporary and shall cancel itself after T_C seconds if the Mode A identity code is changed to a value other than those listed in 3.1.2.6.10.1.1.1.

Note.— The value of T_C *is given in 3.1.2.10.3.9.*

3.1.2.6.10.1.1.3 *Termination of the permanent alert condition.* The permanent alert condition shall be terminated and replaced by a temporary alert condition when the Mode A identity code is set to a value other than 7500, 7600 or 7700.

3.1.2.6.10.1.2 *Ground report.* The on-the-ground status of the aircraft shall be reported in the CA field (3.1.2.5.2.2.1), the FS field (3.1.2.6.5.1), and the VS field (3.1.2.8.2.1). If an automatic indication of the on-the-ground condition (e.g. from a weight on wheels or strut switch) is available at the transponder data interface, it shall be used as the basis for the reporting of on-the-ground status except as specified in 3.1.2.6.10.3.1. If such indication is not available at the transponder data interface (3.1.2.10.5.1.3), the FS and VS codes shall indicate that the aircraft is airborne and the CA field shall indicate that the aircraft is either airborne or on the ground (CA=6).

3.1.2.6.10.1.3 *Special position identification (SPI).* An equivalent of the SPI pulse shall be transmitted by Mode S transponders in the FS field and the surveillance status subfield (SSS) when manually activated. This pulse shall be transmitted for T_I seconds after initiation (3.1.1.6.3, 3.1.1.7.13 and 3.1.2.8.6.3.1.1).

Note.— The value of T_I *is given in 3.1.2.10.3.9.*

3.1.2.6.10.2 *Capability reporting protocol.* The data structure and content of the data link capability report registers shall be implemented in such a way that interoperability is ensured.

Note 1.— Aircraft capability is reported in special fields as defined in the following paragraphs.

Note 2.— The data format of the registers for reporting capability is specified in the Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871).*

3.1.2.6.10.2.1 *Capability report.* The 3-bit CA field, contained in the all-call reply, DF equals 11, shall report the basic capability of the Mode S transponder as described in 3.1.2.5.2.2.1.

3.1.2.6.10.2.2 *Data link capability report.* The data link capability report shall provide the interrogator with a description of the data link capability of the Mode S installation.

Note.— The data link capability report is contained in register 10_{16} with a possible extension in registers 11_{16} to 16_{16} when any continuation will be required.

3.1.2.6.10.2.2.1 *Extraction and subfields in MB for data link capability report.*

3.1.2.6.10.2.2.1.1 *Extraction of the data link capability report contained in register 10_{16}* .The report shall be obtained by a ground-initiated Comm-B reply in response to an interrogation containing RR equals 17 and DI is not equal to 7 or DI equals 7 and RRS equals 0 (3.1.2.6.11.2).

3.1.2.6.10.2.2.1.2 *Sources of data link capability*. Data link capability reports shall contain the capabilities provided by the transponder, the ADLP and the ACAS unit. If external inputs are lost, the transponder shall zero the corresponding bits in the data link report.

3.1.2.6.10.2.2.1.3 The data link capability report shall contain information on the following capabilities as specified in Table 3-٦.

3.1.2.6.10.2.2.1.4 The Mode S subnetwork version number shall contain information to ensure interoperability with older airborne equipment.

3.1.2.6.10.2.2.1.4.1 The Mode S subnetwork version number shall indicate that all implemented subnetwork functions are in compliance with the requirements of the indicated version number. The Mode S subnetwork version number shall be set to a non-zero value if at least one DTE or Mode S specific service is installed.

Note.— The version number does not indicate that all possible functions of that version are implemented.

3.1.2.6.10.2.2.2 *Updating of the data link capability report.* The transponder shall, at intervals not exceeding four seconds, compare the current data link capability status (bits 41-88 in the data link capability report) with that last reported and shall, if a difference is noted, initiate a revised data link capability report by Comm-B broadcast (3.1.2.6.11.4) for BDS1 = 1 (33-36) and BDS2 = 0 (37-40). The transponder shall initiate, generate and transmit the revised capability report even if the aircraft data link capability is degraded or lost. The transponder shall set the BDS code for the data link capability report.

Note.— The setting of the BDS code by the transponder ensures that a broadcast change of capability report will contain the BDS code for all cases of data link failure (e.g. the loss of the transponder data link interface).

3.1.2.6.10.2.2.3 *Zeroing of bits in the data link capability report*

If capability information to the transponder fails to provide an update at a rate of at least once every 4 seconds, the transponder shall insert ZERO in bits 41 to 56 of the data link capability report (transponder register 10_{16}).

Note.— Bits 1 to 8 contain the BDS1 and BDS2 codes. Bits 16 and 37 to 40 contain ACAS capability information. Bit 33 indicates the availability of aircraft identification data and is set by the transponder when the data comes from a separate interface and not from the ADLP. Bit 35 is the SI code indication. All of these bits are inserted by the transponder.

3.1.2.6.10.2.3 *Common usage GICB capability report.* Common usage GICB services which are being actively updated shall be indicated in transponder register 17_{16}.

3.1.2.6.10.2.4 *Mode S specific services GICB capability reports.* GICB services that are installed shall be reported in registers 18_{16} to $1C_{16.}$

3.1.2.6.10.2.5 *Mode S specific services MSP capability reports.* MSP services that are installed shall be reported in registers $1D_{16}$ to $1F_{16}$.

3.1.2.6.10.3 *Validation of on-the-ground status declared by an automatic means*

Note.— For aircraft with an automatic means of determining vertical status, the CA field reports whether the aircraft is airborne or on the ground. ACAS II acquires aircraft using the short or extended squitter, both of which contain the CA field. If an aircraft reports on-the-ground status, that aircraft will not be interrogated by ACAS II in order to reduce unnecessary interrogation activity. If the aircraft is equipped to report extended squitter messages, the function that formats these messages may have information available to validate that an aircraft reporting "on-the-ground" is actually airborne.

3.1.2.6.10.3.1 Aircraft with an automatic means for determining the on-the-ground condition that are equipped to format extended squitter messages shall perform the following validation check:

If the automatically determined air/ground status is not available or is "airborne", no validation shall be performed. If the automatically determined air/ground status is available and "on-the-ground" condition is being reported, the air/ground status shall be overridden and changed to "airborne" if the conditions given for the vehicle category in Table 3-٧ are satisfied.

Note.— While this test is only required for aircraft that are equipped to format extended squitter messages, this feature is desirable for all aircraft.

3.1.2.6.11 *STANDARD LENGTH COMMUNICATIONS PROTOCOLS*

Note 1.— The two types of standard length communications protocols are Comm-A and Comm-B; messages using these protocols are transferred under the control of the interrogator. Comm-A messages are sent directly to the transponder and are completed within one transaction. A Comm-B message is used to transfer information from air to ground and can be initiated either by the interrogator or the transponder. In the case of ground-initiated Comm-B transfers, the interrogator requests data to be read out from the transponder, which delivers the message in the same transaction. In the case of air-initiated Comm-B transfers, the transponder announces the intention to transmit a message; in a subsequent transaction an interrogator will extract the message.

Note 2.— In a non-selective air-initiated Comm-B protocol all transactions necessary can be controlled by any interrogator.

Note 3.— In some areas of overlapping interrogator coverage there may be no means for coordinating interrogator activities via ground communications. Air-initiated Comm-B communications protocols require more than one transaction for completion. Provision is made to ensure that a Comm-B message is closed out only by the interrogator that actually transferred the message. This can be accomplished through the use of the multisite Comm-B communications protocols or through the use of the enhanced Comm-B communications protocols.

Note 4.— The multisite and the non-selective communications protocols cannot be used simultaneously in a region of overlapping interrogator coverage unless the interrogators coordinate their communications activities via ground communications.

Note 5.— The multisite communications protocol is independent of the multisite lockout protocol. That is, the multisite communications protocol may be used with the non-selective lockout protocol and vice versa. The choice of lockout and communications protocols to be used depends upon the network management technique being used.

Note 6.— The broadcast Comm-B protocol can be used to make a message available to all active interrogators.

3.1.2.6.11.1 *Comm-A.* The interrogator shall deliver a Comm-A message in the MA field of an interrogation UF = 20 or 21.

3.1.2.6.11.1.1 *Comm-A technical acknowledgement.* Acceptance of a Comm-A interrogation shall be automatically technically acknowledged by the transponder, by the transmission of the requested reply (3.1.2.10.5.2.2.1).

Note.— The receipt of a reply from the transponder according to the rules of 3.1.2.4.1.2.3 d) and 3.1.2.4.1.3.2.2.2 is the acknowledgement to the interrogator that the interrogation has been accepted by the transponder. If either uplink or downlink fail, this reply will be missing and the interrogator will normally send the message again. In the case of downlink failure, the transponder may receive the message more than once.

3.1.2.6.11.1.2 *Comm-A broadcast.* If a Comm-A broadcast interrogation is accepted (3.1.2.4.1.2.3.1.3) information transfer shall be handled according to 3.1.2.10.5.2.1.1 but other transponder functions shall not be affected and a reply shall not be transmitted.

Note 1.— There is no technical acknowledgement to a Comm-A broadcast message.

Note 2.— Since the transponder does not process the control fields of a Comm-A broadcast interrogation, the 27 bits following the UF field are also available for user data.

3.1.2.6.11.2 *Ground-initiated Comm-B*

3.1.2.6.11.2.1 *Comm-B data selector, BDS.* The 8-bit BDS code shall determine the register whose contents shall be transferred in the MB field of the Comm-B reply. It shall be expressed in two groups of 4 bits each, BDS1 (most significant 4 bits) and BDS2 (least significant 4 bits).

Note.— The transponder register allocation is specified in Annex 10, Volume III, Part I, Chapter 5, Table 5-24.

3.1.2.6.11.2.2 *BDS1 code.* The BDS1 code shall be as defined in the RR field of a surveillance or Comm-A interrogation.

3.1.2.6.11.2.3 *BDS2 code.* The BDS2 code shall be as defined in the RRS subfield of the SD field (3.1.2.6.1.4.1) when DI = 7. If no BDS2 code is specified (i.e. DI is not equal to 7) it shall signify that BDS2 = 0.

3.1.2.6.11.2.4 *Protocol.* On receipt of such a request, the MB field of the reply shall contain the contents of the requested ground-initiated Comm-B register.

3.1.2.6.11.3 *Air-initiated Comm-B*

3.1.2.6.11.3.1 *General protocol.* The transponder shall announce the presence of an air-initiated Comm-B message with the insertion of code 1 in the DR field. To extract an air-initiated Comm-B message, the interrogator shall transmit a request for a Comm-B message reply in a subsequent interrogation with RR equal to 16 and, if DI equals 7, RRS must be equal to 0 (3.1.2.6.11.3.2.1 and 3.1.2.6.11.3.3.1). Receipt of this request code shall cause the transponder to transmit the air-initiated Comm-B message. If a command to transmit an air-initiated Comm-B message is received while no message is waiting to be transmitted, the reply shall contain all ZEROs in the MB field.

The reply that delivers the message shall continue to contain code 1 in the DR field. After a Comm-B closeout has been accomplished, the message shall be cancelled and the DR code belonging to this message immediately removed. If another air-initiated Comm-B message is waiting to be transmitted, the transponder shall set the DR code to 1, so that the reply contains the announcement of this next message.

Note.— The announcement and cancellation protocol ensures that an air-initiated message will not be lost due to uplink or downlink failures that occur during the delivery process.

3.1.2.6.11.3.2 *Additional protocol for multisite air-initiated Comm-B*

Note.— The announcement of an air-initiated Comm-B message waiting to be delivered may be accompanied by a multisite reservation status report in the UM field (3.1.2.6.5.3.2).

Recommendation.— *An interrogator should not attempt to extract a message if it has determined that it is not the reserved site.*

3.1.2.6.11.3.2.1 *Message transfer.* An interrogator shall request a Comm-B reservation and extract an air-initiated Comm-B message by transmitting a surveillance or Comm-A interrogation UF equals 4, 5, 20 or 21 containing:

RR = 16
DI = 1
IIS = assigned interrogator identifier
MBS = 1 (Comm-B reservation request)

Note.— A Comm-B multisite reservation request is normally accompanied by a Comm-B reservation status request (RSS = 1). This causes the interrogator identifier of the reserved site to be inserted in the UM field of the reply.

3.1.2.6.11.3.2.1.1 Protocol procedure in response to this interrogation shall depend upon the state of the B-timer which indicates if a Comm-B reservation is active. This timer shall run for T_R seconds.

Note 1.— The value of T_R *is given in 3.1.2.10.3.9.*

a) If the B-timer is not running, the transponder shall grant a reservation to the requesting interrogator by:

   1) storing the IIS of the interrogation as the Comm-B II; and

   2) starting the B-timer.

   A multisite Comm-B reservation shall not be granted by the transponder unless an air-initiated Comm-B message is waiting to be transmitted and the requesting interrogation contains RR equals 16, DI equals 1, MBS equals 1 and IIS is not 0.

b) If the B-timer is running and the IIS of the interrogation equals the Comm-B II, the transponder shall restart the B-timer.

c) If the B-timer is running and the IIS of the interrogation does not equal the Comm-B II, then there shall be no change to the Comm-B II or the B-timer.

Note 2.— In case c) the reservation request has been denied.

3.1.2.6.11.3.2.1.2 In each case the transponder shall reply with the Comm-B message in the MB field.

3.1.2.6.11.3.2.1.3 An interrogator shall determine if it is the reserved site for this message through coding in the UM field. If it is the reserved site it shall attempt to close out the message in a subsequent interrogation. If it is not the reserved site it shall not attempt to close out the message.

3.1.2.6.11.3.2.2 *Multisite-directed Comm-B transmissions.* To direct an air-initiated Comm-B message to a specific interrogator, the multisite Comm-B protocol shall be used. When the B-timer is not running, the interrogator identifier of the desired destination shall be stored as the Comm-B II. Simultaneously the B-timer shall be started and the DR code shall be set to 1. For a multisite-directed Comm-B message, the B-timer shall not automatically time out but shall continue to run until:

a) the message is read and closed out by the reserved site; or

b) the message is cancelled (3.1.2.10.5.4) by the data link avionics.

Note.— The protocols of 3.1.2.6.5.3 and 3.1.2.6.11.3.2.1 will then result in delivery of the message to the reserved site. The data link avionics may cancel the message if delivery to the reserved site cannot be accomplished.

3.1.2.6.11.3.2.3 *Multisite Comm-B closeout.* The interrogator shall close out a multisite air-initiated Comm-B by transmitting either a surveillance or a Comm-A interrogation containing:

either DI = 1
IIS = assigned interrogator identifier
MBS = 2 (Comm-B closeout)

or DI = 0, 1 or 7
IIS = assigned interrogator identifier
PC = 4 (Comm-B closeout)

The transponder shall compare the IIS of the interrogation to the Comm-B II and if the interrogator identifiers do not match, the message shall not be cleared and the status of the Comm-B II, B-timer, and DR code shall not be changed. If the interrogator identifiers match, the transponder shall set the Comm-B II to 0, reset the B-timer, clear the DR code for this message and clear the message itself. The transponder shall not close out a multisite air-initiated Comm-B message unless it has been read out at least once by the reserved site.

3.1.2.6.11.3.2.4 *Automatic expiration of Comm-B reservation.* If the B-timer period expires before a multisite closeout has been accomplished, the Comm-B II shall be set to 0 and the B-timer reset. The Comm-B message and the DR field shall not be cleared by the transponder.

Note.— This makes it possible for another site to read and clear this message.

3.1.2.6.11.3.3 *Additional protocol for non-selective air-initiated Comm-B*

Note.— In cases where the multisite protocols are not required (i.e. no overlapping coverage or sensor coordination via ground-to-ground communication), the non-selective air-initiated Comm-B protocol may be used.

3.1.2.6.11.3.3.1 *Message transfer.* The interrogator shall extract the message by transmitting either RR equals 16 and DI is not equal to 7, or RR equals 16, DI equals 7 and RRS equals 0 in a surveillance or Comm-A interrogation.

3.1.2.6.11.3.3.2 *Comm-B closeout.* The interrogator shall close out a non-selective air-initiated Comm-B message by transmitting PC equals 4 (Comm-B closeout). On receipt of this command, the transponder shall perform closeout, unless the B-timer is running. If the B-timer is running, indicating that a multisite reservation is in effect, closeout shall be accomplished as per 3.1.2.6.11.3.2.3. The transponder shall not close out a non-selective air-initiated Comm-B message unless it has been read out at least once by an interrogation using non-selective protocols.

3.1.2.6.11.3.4 *Enhanced air-initiated Comm-B protocol*

Note.— The enhanced air-initiated Comm-B protocol provides a higher data link capacity by permitting parallel delivery of air-initiated Comm-B messages by up to sixteen interrogators, one for each II code. Operation without the need for multisite Comm-B reservations is possible in regions of overlapping coverage for interrogators equipped for the enhanced air-initiated Comm-B protocol. The protocol is fully conformant to the standard multisite protocol and thus is compatible with interrogators that are not equipped for the enhanced protocol.

3.1.2.6.11.3.4.1 The transponder shall be capable of storing each of the sixteen II codes: (1) an air-initiated or multisite-directed Comm-B message and (2) the contents of GICB registers 2 through 4.

Note.— GICB registers 2 through 4 are used for the Comm-B linking protocol defined in the Mode S subnetwork SARPs (Annex 10, Volume III, Part I, Chapter 5).

3.1.2.6.11.3.4.2 *Enhanced multisite air-initiated Comm-B protocol*

3.1.2.6.11.3.4.2.1 *Initiation.* An air-initiated Comm-B message input into the transponder shall be stored in the registers assigned to II = 0.

3.1.2.6.11.3.4.2.2 *Announcement and extraction.* A waiting air-initiated Comm-B message shall be announced in the DR field of the replies to all interrogators for which a multisite directed Comm-B message is not waiting. The UM field of the announcement reply shall indicate that the message is not reserved for any II code, i.e. the IIS subfield shall be set to 0. When a command to read this message is received from a given interrogator, the reply containing the message shall contain an IIS subfield content indicating that the message is reserved for the II code contained in the interrogation from that interrogator. After readout and until closeout, the message shall continue to be assigned to that II code. Once a message is assigned to a specific II code, announcement of this message shall be no longer made in the replies to interrogators with other II codes. If the message is not closed out by the assigned interrogator for the period of the B-timer, the message shall revert back to multisite air-initiated status and the process shall repeat. Only one multisite air-initiated Comm-B message shall be in process at a time.

3.1.2.6.11.3.4.2.3 *Closeout.* A closeout for a multisite air-initiated message shall only be accepted from the interrogator that is currently assigned to transfer the message.

3.1.2.6.11.3.4.2.4 *Announcement of the next message waiting.* The DR field shall indicate a message waiting in the reply to an interrogation containing a Comm-B closeout if an unassigned air-initiated message is waiting and has not been assigned to a II code, or if a multisite-directed message is waiting for that II code (3.1.2.6.11.3.4.3).

3.1.2.6.11.3.4.3 *Enhanced multisite directed Comm-B protocol*

3.1.2.6.11.3.4.3.1 *Initiation.* When a multisite directed message is input into the transponder, it shall be placed in the Comm-B registers assigned to the II code specified for the message. If the registers for this II code are already occupied, (i.e. a multisite directed message is already in process to this II code) the new message shall be queued until the current transaction with that II code is closed out.

3.1.2.6.11.3.4.3.2 *Announcement.* Announcement of a Comm-B message waiting transfer shall be made using the DR field as specified in 3.1.2.6.5.2 with the destination interrogator II code contained in the IIS subfield as specified in 3.1.2.6.5.3.2. The DR field and IIS subfield contents shall be set specifically for the interrogator that is to receive the reply. A waiting multisite directed message shall only be announced in the replies to the intended interrogator. It shall not be announced in the replies to other interrogators.

Note 1.— If a multisite-directed message is waiting for II = 2, the surveillance replies to that interrogator will contain DR = 1 and IIS = 2. If this is the only message in process, replies to all other interrogators will indicate that no message is waiting.

Note 2.— In addition to permitting parallel operation, this form of announcement enables a greater degree of announcement of downlink ELMs. The announcements for the downlink ELM and the Comm-B share the DR field. Only one announcement can take place at a time due to coding limitations. In case both a Comm-B and a downlink ELM are waiting, announcement preference is given to the Comm-B. In the example above, if an air-directed Comm-B was waiting for II = 2 and a multisite-directed downlink ELM was waiting for II = 6, both interrogators would see their respective announcements on the first scan since there would be no Comm-B announcement to II = 6 to block the announcement of the waiting downlink ELM.

3.1.2.6.11.3.4.3.3 *Closeout.* Closeout shall be accomplished as specified in 3.1.2.6.11.3.2.3.

3.1.2.6.11.3.4.3.4 *Announcement of the next message waiting.* The DR field shall indicate a message waiting in the reply to an interrogation containing a Comm-B closeout if another multisite directed message is waiting for that II code, or if an air-initiated message is waiting and has not been assigned to a II code. (See 3.1.2.6.11.3.4.2.4.)

3.1.2.6.11.3.4.4 *Enhanced non-selective Comm-B protocol.* The availability of a non-selective Comm-B message shall be announced to all interrogators. Otherwise, the protocol shall be as specified in 3.1.2.6.11.3.3.

3.1.2.6.11.4 *Comm-B broadcast*

Note 1.— A Comm-B message may be broadcast to all active interrogators within range. Messages are alternately numbered 1 and 2 and are self-cancelling after 18 seconds. Interrogators have no means to cancel Comm-B broadcast messages.

Note 2.— Use of the Comm-B broadcast is restricted to transmission of information which does not require a subsequent ground-initiated uplink response.

Note 3.— The timer used for the Comm-B broadcast cycle is the same as that used for the Comm-B multisite protocol.

Note 4.— Data formats for Comm-B broadcast are specified in the Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871).*

3.1.2.6.11.4.1 *Initiation.* A Comm-B broadcast cycle shall not be initiated when an air-initiated Comm-B is waiting to be transmitted. A Comm-B broadcast cycle shall begin with:

a) the insertion of DR code 4 or 5, (3.1.2.6.5.2) into replies with DF 4, 5, 20 or 21; and

b) the starting of the B-timer.

3.1.2.6.11.4.2 *Extraction.* To extract the broadcast message, an interrogator shall transmit RR equals 16 and DI not equal to 7 or RR equals 16 and DI equals 7 with RRS equals 0 in a subsequent interrogation.

3.1.2.6.11.4.3 *Expiration.* When the B-timer period expires, the transponder shall clear the DR code for this message, discard the present broadcast message and change the broadcast message number (from 1 to 2 or 2 to 1) in preparation for a subsequent Comm-B broadcast.

3.1.2.6.11.4.4 *Interruption.* In order to prevent a Comm-B broadcast cycle from delaying the delivery of an air-initiated Comm-B message, provision shall be made for an air-initiated Comm-B to interrupt a Comm-B broadcast cycle. If a broadcast cycle is interrupted, the B-timer shall be reset, the interrupted broadcast message shall be retained and the message number shall not be changed. Delivery of the interrupted broadcast message shall recommence when no air-initiated Comm-B transaction is in effect. The message shall then be broadcast for the full duration of the B-timer.

3.1.2.6.11.4.5 *Enhanced broadcast Comm-B protocol.* A broadcast Comm-B message shall be announced to all interrogators using II codes. The message shall remain active for the period of the B-timer for each II code. The provision for interruption of a broadcast by non-broadcast Comm-B as specified in 3.1.2.6.11.4.4 shall apply separately to each II code. When the B-timer period has been achieved for all II codes, the broadcast message shall be automatically cleared as specified in 3.1.2.6.11.4.3. A new broadcast message shall not be initiated until the current broadcast has been cleared.

Note.— Due to the fact that broadcast message interruption occurs independently for each II code, it is possible that the broadcast message timeout will occur at different times for different II codes.

3.1.2.7 EXTENDED LENGTH COMMUNICATION TRANSACTIONS

Note 1.— Long messages, either on the uplink or the downlink, can be transferred by the extended length message (ELM) protocols through the use of Comm-C (UF = 24) and Comm-D (DF = 24) formats respectively. The ELM uplink protocol provides for the transmission on the uplink of up to sixteen 80-bit message segments before requiring a reply from the transponder. They also allow a corresponding procedure on the downlink.

Note 2.— In some areas of overlapping interrogator coverage there may be no means for coordinating interrogator activities via ground communications. However, the ELM communication protocols require more than one transaction for completion; coordination is thus necessary to ensure that segments from different messages are not interleaved and that transactions are not inadvertently closed out by the wrong interrogator. This can be accomplished through the use of the multisite communications protocols or through the use of the enhanced ELM protocols.

Note 3.— Downlink extended length messages are transmitted only after authorization by the interrogator. The segments to be transmitted are contained in Comm-D replies. As with air-initiated Comm-B messages, downlink ELMs are either announced to all interrogators or directed to a specific interrogator. In the former case an individual interrogator can use the multisite protocol to reserve for itself the ability to close out the downlink ELM transaction. A transponder can be instructed to identify the interrogator that has reserved the transponder for an ELM transaction. Only that interrogator can close out the ELM transaction and reservation.

Note 4.— The multisite protocol and the non-selective protocol cannot be used simultaneously in a region of overlapping interrogator coverage unless the interrogators coordinate their communications activities via ground communications.

3.1.2.7.1 *COMM-C, UPLINK FORMAT 24*

1	3	5	9	89
UF	RC	NC	MC	AP
2	4	8	88	112

The format of this interrogation shall consist of these fields:

Field	*Reference*
UF uplink format	3.1.2.3.2.1.1
RC reply control	3.1.2.7.1.1
NC number of C-segment	3.1.2.7.1.2
MC message, Comm-C	3.1.2.7.1.3
AP address/parity	3.1.2.3.2.1.3

3.1.2.7.1.1 *RC: Reply control.* This 2-bit (3-4) uplink field shall designate segment significance and reply decision.

Coding

RC = 0 signifies uplink ELM initial segment in MC
= 1 signifies uplink ELM intermediate segment in MC
= 2 signifies uplink ELM final segment in MC
= 3 signifies a request for downlink ELM delivery (3.1.2.7.7.2)

3.1.2.7.1.2 *NC: Number of C-segment.* This 4-bit (5-8) uplink field shall designate the number of the message segment contained in MC (3.1.2.7.4.2.1). NC shall be coded as a binary number.

3.1.2.7.1.3 *MC: Message, Comm-C.* This 80-bit (9-88) uplink field shall contain:

a) one of the segments of a sequence used to transmit an uplink ELM to the transponder containing the 4-bit (9-12) IIS subfield; or

b) control codes for a downlink ELM, the 16-bit (9-24) SRS subfield (3.1.2.7.7.2.1) and the 4-bit (25-28) IIS subfield.

Note.— Message content and codes are not included in this chapter except for 3.1.2.7.7.2.1.

3.1.2.7.2 *INTERROGATION-REPLY PROTOCOL FOR UF24*

Note.— Interrogation-reply coordination for the above format follows the protocol outlined in Table 3-5 (3.1.2.4.1.3.2.2).

3.1.2.7.3 *COMM-D, DOWNLINK FORMAT 24*

1		4	5	9	89
DF		KE	ND	MD	AP
	2		8	88	112

The format of this reply shall consist of these fields:

Field	*Reference*
DF downlink format	3.1.2.3.2.1.2
spare — 1 bit	
KE control, ELM	3.1.2.7.3.1
ND number of D-segment	3.1.2.7.3.2
MD message, Comm-D	3.1.2.7.3.3
AP address/parity	3.1.2.3.2.1.3

3.1.2.7.3.1 *KE: Control, ELM.* This 1-bit (4) downlink field shall define the content of the ND and MD fields.

Coding
KE = 0 signifies downlink ELM transmission
1 signifies uplink ELM acknowledgement

3.1.2.7.3.2 *ND: Number of D-segment.* This 4-bit (5-8) downlink field shall designate the number of the message segment contained in MD (3.1.2.7.7.2). ND shall be coded as a binary number.

3.1.2.7.3.3 *MD: Message, Comm-D.* This 80-bit (9-88) downlink field shall contain:

a) one of the segments of a sequence used to transmit a downlink ELM to the interrogator; or

b) control codes for an uplink ELM.

3.1.2.7.4 *MULTISITE UPLINK ELM PROTOCOL*

3.1.2.7.4.1 *Multisite uplink ELM reservation.* An interrogator shall request a reservation for an uplink ELM by transmitting a surveillance or Comm-A interrogation containing:

DI = 1
IIS = assigned interrogator identifier
MES = 1 or 5 (uplink ELM reservation request)

Note.— A multisite uplink ELM reservation request is normally accompanied by an uplink ELM reservation status request (RSS = 2). This causes the interrogator identifier of the reserved site to be inserted in the UM field of the reply.

3.1.2.7.4.1.1 Protocol procedure in response to this interrogation shall depend upon the state of the C-timer which indicates if an uplink ELM reservation is active. This timer shall run for T_R seconds.

Note 1.— The value of T_R *is given in 3.1.2.10.3.9.*

a) If the C-timer is not running, the transponder shall grant a reservation to the requesting interrogator by:

   1) storing the IIS of the interrogation as the Comm-C II and,

   2) starting the C-timer.

b) If the C-timer is running and the IIS of the interrogation equals the Comm-C II, the transponder shall restart the C-timer.

c) If the C-timer is running and the IIS of the interrogation does not equal the Comm-C II, there shall be no change to the Comm-C II or the C-timer.

Note 2.— In case c) the reservation request has been denied.

3.1.2.7.4.1.2 An interrogator shall not start ELM activity unless, during the same scan, having requested an uplink ELM status report, it has received its own interrogator identifier as the reserved interrogator for uplink ELM in the UM field.

Note.— If ELM activity is not started during the same scan as the reservation, a new reservation request may be made during the next scan.

3.1.2.7.4.1.3 If uplink ELM delivery is not completed on the current scan, the interrogator shall ensure that it still has a reservation before delivering additional segments on a subsequent scan.

3.1.2.7.4.2 *Multisite uplink ELM delivery.* The minimum length of an uplink ELM shall be 2 segments, the maximum length shall be 16 segments.

3.1.2.7.4.2.1 *Initial segment transfer.* The interrogator shall begin the ELM uplink delivery for an n-segment message (NC values from 0 to n-1) by a Comm-C transmission containing RC equals 0. The message segment transmitted in the MC field shall be the last segment of the message and shall carry NC equals *n*-1.

On receipt of an initializing segment (RC = 0) the transponder shall establish a “setup” defined as:

a) clearing the number and content of previous segment storage registers and the associated TAS field;

b) assigning storage space for the number of segments announced in NC of this interrogation; and

c) storing the MC field of the segment received.

The transponder shall not reply to this interrogation.

Receipt of another initializing segment shall result in a new setup within the transponder.

3.1.2.7.4.2.2 *Transmission acknowledgement.* The transponder shall use the TAS subfield to report the segments received so far in an uplink ELM sequence. The information contained in the TAS subfield shall be continually updated by the transponder as segments are received.

Note.— Segments lost in uplink transmission are noted by their absence in the TAS report and are retransmitted by the interrogator which will then send further final segments to assess the extent of message completion.

3.1.2.7.4.2.2.1 *TAS, transmission acknowledgement subfield in MD.* This 16-bit (17-32) downlink subfield in MD reports the segment numbers received so far in an uplink ELM sequence. Starting with bit 17, which denotes segment number 0, each of the following bits shall be set to ONE if the corresponding segment of the sequence has been received. TAS shall appear in MD if KE equals 1 in the same reply.

3.1.2.7.4.2.3 *Intermediate segment transfer.* The interrogator shall transfer intermediate segments by transmitting Comm-C interrogations with RC equals 1. The transponder shall store the segments and update TAS only if the setup of 3.1.2.7.4.2.1 is in effect and if the received NC is smaller than the value stored at receipt of the initial segment. No reply shall be generated on receipt of an intermediate segment.

Note.— Intermediate segments may be transmitted in any order.

3.1.2.7.4.2.4 *Final segment transfer.* The interrogator shall transfer a final segment by transmitting a Comm-C interrogation with RC equals 2. The transponder shall store the content of the MC field and update TAS if the setup of 3.1.2.7.4.2.1 is in effect and if the received NC is smaller than the value of the initial segment NC. The transponder shall reply under all circumstances as per 3.1.2.7.4.2.5.

Note 1.— This final segment transfer interrogation can contain any message segment.

Note 2.— RC equals 2 is transmitted any time that the interrogator wants to receive the TAS subfield in the reply. Therefore, more than one "final" segment may be transferred during the delivery of an uplink ELM.

3.1.2.7.4.2.5 *Acknowledgement reply.* On receipt of a final segment, the transponder shall transmit a Comm-D reply (DF = 24), with KE equals 1 and with the TAS subfield in the MD field. This reply shall be transmitted at 128 microseconds plus or minus 0.25 microsecond following the sync phase reversal of the interrogation delivering the final segment.

3.1.2.7.4.2.6 *Completed message.* The transponder shall deem the message complete if all segments announced by NC in the initializing segment have been received. If the message is complete, the message content shall be delivered to the outside via the ELM interface of 3.1.2.10.5.2.1.3 and cleared. No later-arriving segments shall be stored. The TAS content shall remain unchanged until either a new setup is called for (3.1.2.7.4.2.1) or until closeout (3.1.2.7.4.2.8).

3.1.2.7.4.2.7 *C-timer restart.* The C-timer shall be restarted each time that a received segment is stored and the Comm-C II is not 0.

Note.— The requirement for the Comm-C II to be non-zero prevents the C-timer from being restarted during a non-selective uplink ELM transaction.

3.1.2.7.4.2.8 *Multisite uplink ELM closeout.* The interrogator shall close out a multisite uplink ELM by transmitting either a surveillance or a Comm-A interrogation containing:

either DI = 1
IIS = assigned interrogator identifier
MES = 2, 6 or 7 (uplink ELM closeout)

or DI = 0, 1 or 7
IIS = assigned interrogator identifier
PC = 5 (uplink ELM closeout)

The transponder shall compare the IIS of the interrogation to the Comm-C II and if the interrogator identifiers do not match, the state of the ELM uplink process shall not be changed.

If the interrogator identifiers match, the transponder shall set the Comm-C II to 0, reset the C-timer, clear the stored TAS and discard any stored segments of an incomplete message.

3.1.2.7.4.2.9 *Automatic multisite uplink ELM closeout.* If the C-timer period expires before a multisite closeout has been accomplished the closeout actions described in 3.1.2.7.4.2.8 shall be initiated automatically by the transponder.

3.1.2.7.5 *NON-SELECTIVE UPLINK ELM*

Note.— In cases where the multisite protocols are not required (for example, no overlapping coverage or sensor coordination via ground-to-ground communication), the non-selective uplink ELM protocol may be used.

Non-selective uplink ELM delivery shall take place as for multisite uplink ELMs described in 3.1.2.7.4.2. The interrogator shall close out an uplink ELM by transmitting PC equals 5 (uplink ELM closeout) in a surveillance or Comm-A interrogation. On receipt of this command, the transponder shall perform closeout, unless the C-timer is running. If the C-timer is running, indicating that a multisite reservation is in effect, the closeout shall be accomplished as per 3.1.2.7.4.2.8. An uncompleted message, present when the closeout is accepted, shall be cancelled.

3.1.2.7.6 *ENHANCED UPLINK ELM PROTOCOL*

Note.— The enhanced uplink ELM protocol provides a higher data link capacity by permitting parallel delivery of uplink ELM messages by up to sixteen interrogators, one for each II code. Operation without the need for multisite uplink ELM reservations is possible in regions of overlapping coverage for interrogators equipped for the enhanced uplink ELM protocol. The protocol is fully conformant to the standard multisite protocol and thus is compatible with interrogators that are not equipped for the enhanced protocol.

3.1.2.7.6.1 *General*

3.1.2.7.6.1.1 The interrogator shall determine from the data link capability report whether the transponder supports the enhanced protocols. If the enhanced protocols are not supported by both the interrogator and the transponder, the multisite reservation protocols specified in 3.1.2.7.4.1 shall be used.

Note.— If the enhanced protocols are supported, uplink ELMs delivered using the multisite protocol may be delivered without a prior reservation.

3.1.2.7.6.1.2 **Recommendation.—** *If the transponder and the interrogator are equipped for the enhanced protocol, the interrogator should use the enhanced uplink protocol.*

3.1.2.7.6.1.3 The transponder shall be capable of storing a sixteen segment message for each of the sixteen II codes.

3.1.2.7.6.2 *Reservation processing.* The transponder shall support reservation processing for each II code as specified in 3.1.2.7.4.1

Note 1.— Reservation processing is required for interrogators that do not support the enhanced protocol.

Note 2.— Since the transponder can process simultaneous uplink ELMs for all sixteen II codes, a reservation will always be granted.

3.1.2.7.6.3 *Enhanced uplink ELM delivery and closeout.* The transponder shall process received segments separately by II code. For each value of II code, uplink ELM delivery and closeout shall be performed as specified in 3.1.2.7.4.2 except that the MD field used to transmit the technical acknowledgment shall also contain the 4-bit (33-36) IIS subfield.

Note.— The interrogator may use the II code contained in the technical acknowledgement in order to verify that it has received the correct technical acknowledgement.

3.1.2.7.7 *MULTISITE DOWNLINK ELM PROTOCOL*

3.1.2.7.7.1 *Initialization.* The transponder shall announce the presence of a downlink ELM of *n* segments by making the binary code corresponding to the decimal value 15 + *n* available for insertion in the DR field of a surveillance or Comm-B reply, DF equals 4, 5, 20, 21. This announcement shall remain active until the ELM is closed out (3.1.2.7.7.3, 3.1.2.7.8.1).

3.1.2.7.7.1.1 *Multisite downlink ELM reservation.* An interrogator shall request a reservation for extraction of a downlink ELM by transmitting a surveillance or Comm-A interrogation containing:

DI = 1
IIS = assigned interrogator identifier
MES = 3 or 6 (downlink ELM reservation request)

Note.— A multisite downlink ELM reservation request is normally accompanied by a downlink ELM reservation status request (RSS = 3). This causes the interrogator identifier of the reserved interrogator to be inserted in the UM field of the reply.

3.1.2.7.7.1.1.1 Protocol procedure in response to this interrogation shall depend upon the state of the D-timer which indicates if a downlink ELM reservation is active. This timer shall run for T_R seconds.

Note 1.— The value of $\mathrm{T_R}$ *is given in 3.1.2.10.3.9.*

a) if the D-timer is not running, the transponder shall grant a reservation to the requesting interrogator by:

 1) storing the IIS of the interrogation as the Comm-D II; and

 2) starting the D-timer.

 A multisite downlink ELM reservation shall not be granted by the transponder unless a downlink ELM is waiting to be transmitted.

b) if the D-timer is running and the IIS of the interrogation equals the Comm-D II, the transponder shall restart the D-timer; and

c) if the D-timer is running and the IIS of the interrogation does not equal the Comm-D II, there shall be no change to the Comm-D II or D-timer.

Note 2.— In case c) the reservation request has been denied.

3.1.2.7.7.1.1.2 An interrogator shall determine if it is the reserved site through coding in the UM field and, if so, it is authorized to request delivery of the downlink ELM. Otherwise, ELM activity shall not be started during this scan.

Note.— If the interrogator is not the reserved site, a new reservation request may be made during the next scan.

3.1.2.7.7.1.1.3 If downlink ELM activity is not completed on the current scan, the interrogator shall ensure that it still has a reservation before requesting additional segments on a subsequent scan.

3.1.2.7.7.1.2 *Multisite-directed downlink ELM transmissions.* To direct a downlink ELM message to a specific interrogator, the multisite downlink ELM protocol shall be used. When the D-timer is not running, the interrogator identifier of the desired destination shall be stored as the Comm-D II. Simultaneously, the D-timer shall be started and the DR code (3.1.2.7.7.1) shall be set. For a multisite-directed downlink ELM, the D-timer shall not automatically time out but shall continue to run until:

a) the message is read and closed out by the reserved site; or

b) the message is cancelled (3.1.2.10.5.4) by the data link avionics.

Note.— The protocols of 3.1.2.7.7.1 will then result in the delivery of the message to the reserved site. The data link avionics may cancel the message if delivery to the reserved site cannot be accomplished.

3.1.2.7.7.2 *Delivery of downlink ELMs.* The interrogator shall extract a downlink ELM by transmitting a Comm-C interrogation with RC equals 3. This interrogation shall carry the SRS subfield which specifies the segments to be transmitted. On receipt of this request, the transponder shall transfer the requested segments by means of Comm-D replies with KE equals 0 and ND corresponding to the number of the segment in MD. The first segment shall be transmitted 128 microseconds plus or minus 0.25 microsecond following the sync phase reversal of the interrogation requesting delivery and subsequent segments shall be transmitted at a rate of one every 136 microseconds plus or minus 1 microsecond. If a request is received to transmit downlink ELM segments and no message is waiting, each reply segment shall contain all ZEROs in the MD field.

Note 1.— The requested segments may be transmitted in any order.

Note 2.— Segments lost in downlink transmissions will be requested again by the interrogator on a subsequent interrogation carrying the SRS subfield. This process is repeated until all segments have been transferred.

3.1.2.7.7.2.1 *SRS, segment request subfield in MC.* This 16-bit (9-24) uplink subfield in MC shall request the transponder to transfer downlink ELM segments. Starting with bit 9, which denotes segment number 0, each of the following bits shall be set to ONE if the transmission of the corresponding segment is requested. SRS shall appear in MC if RC equals 3 in the same interrogation.

3.1.2.7.7.2.2 *D-timer restart.* The D-timer shall be restarted each time that a request for Comm-D segments is received if the Comm-D II is non-zero.

Note.— The requirement for the Comm-D II to be non-zero prevents the D-timer from being restarted during a non-selective downlink ELM transaction.

3.1.2.7.7.3 *Multisite downlink ELM closeout.* The interrogator shall close out a multisite downlink ELM by transmitting either a surveillance or a Comm-A interrogation containing:

either DI = 1
IIS = assigned interrogator identifier
MES = 4, 5 or 7 (downlink ELM closeout)

or DI = 0, 1 or 7
IIS = assigned interrogator identifier
PC = 6 (downlink ELM closeout).

The transponder shall compare the IIS of the interrogation to the Comm-D II and if the interrogator identifiers do not match, the state of the downlink process shall not be changed.

If the interrogator identifiers match, and if a request for transmission has been complied with at least once, the transponder shall set the Comm-D II to 0, reset the D-timer, clear the DR code for this message and clear the message itself.

If another downlink ELM is waiting to be transmitted, the transponder shall set the DR code (if no Comm-B message is waiting to be delivered) so that the reply contains the announcement of the next message.

3.1.2.7.7.4 *Automatic expiration of downlink ELM reservation.* If the D-timer period expires before a multisite closeout has been accomplished, the Comm-D II shall be set to 0, and the D-timer reset. The message and DR code shall not be cleared.

Note.— This makes it possible for another site to read and clear this message.

3.1.2.7.8 *NON-SELECTIVE DOWNLINK ELM*

Note.— In cases where the multisite protocols are not required (i.e. no overlapping coverage or sensor coordination via ground-to-ground communication), the non-selective downlink ELM protocol may be used.

Non-selective downlink ELM delivery shall take place as described in 3.1.2.7.7.2.

3.1.2.7.8.1 *Non-selective downlink ELM closeout.* The interrogator shall close out a non-selective downlink ELM by transmitting PC equals 6 (downlink ELM closeout) in a surveillance or Comm-A interrogation. On receipt of this command, and if a request for transmission has been complied with at least once, the transponder shall perform closeout unless the D-timer is running. If the D-timer is running, indicating that a multisite reservation is in effect, the closeout shall be accomplished as per 3.1.2.7.7.3.

3.1.2.7.9 *ENHANCED DOWNLINK ELM PROTOCOL*

Note.— The enhanced downlink ELM protocol provides a higher data link capacity by permitting parallel delivery of downlink ELM messages by up to sixteen interrogators, one for each II code. Operation without the need for multisite downlink ELM reservations is possible in regions of overlapping coverage for interrogators equipped for the enhanced downlink ELM protocol. The protocol is fully conformant to the standard multisite protocol and thus is compatible with interrogators that are not equipped for the enhanced protocol.

3.1.2.7.9.1 *General*

3.1.2.7.9.1.1 The interrogator shall determine from the data link capability report whether the transponder supports the enhanced protocols. If the enhanced protocols are not supported by both the interrogator and the transponder, the multisite reservation protocols specified in 3.1.2.6.11 shall be used for multisite and multisite-directed downlink ELMs.

Note.— If the enhanced protocols are supported, downlink ELMs delivered using the multisite-directed protocol can be delivered without a prior reservation.

3.1.2.7.9.1.2 **Recommendation.—** *If the transponder and the interrogator are equipped for the enhanced protocol, the interrogator should use the enhanced downlink protocol.*

3.1.2.7.9.2 *Enhanced multisite downlink ELM protocol*

3.1.2.7.9.2.1 The transponder shall be capable of storing a sixteen segment message for each of the sixteen II codes.

3.1.2.7.9.2.2 *Initialization.* A multisite message input into the transponder shall be stored in the registers assigned to II = 0.

3.1.2.7.9.2.3 *Announcement and extraction.* A waiting multisite downlink ELM message shall be announced in the DR field of the replies to all interrogators for which a multisite directed downlink ELM message is not waiting. The UM field of the announcement reply shall indicate that the message is not reserved for any II code, i.e. the IIS subfield shall be set to 0. When a command to reserve this message is received from a given interrogator, the message shall be reserved for the II code contained in the interrogation from that interrogator. After readout and until closeout, the message shall continue to be assigned to that II code. Once a message is assigned to a specific II code, announcement of this message shall no longer be made in the replies to interrogators with other II codes. If the message is not closed out by the associated interrogator for the period of the D-timer, the message shall revert back to multisite status and the process shall repeat. Only one multisite downlink ELM message shall be in process at a time.

3.1.2.7.9.2.4 *Closeout.* A closeout for a multisite message shall only be accepted from the interrogator that was assigned most recently to transfer the message.

3.1.2.7.9.2.5 *Announcement of the next message waiting.* The DR field shall indicate a message waiting in the reply to an interrogation containing a downlink ELM closeout if an unassigned multisite downlink ELM is waiting, or if a multisite directed message is waiting for that II code (3.1.2.7.9.2).

3.1.2.7.9.3 *Enhanced multisite directed downlink ELM protocol*

3.1.2.7.9.3.1 *Initialization.* When a multisite directed message is input into the transponder, it shall be placed in the downlink ELM registers assigned to the II code specified for the message. If the registers for this II code are already in use (i.e. a multisite directed downlink ELM message is already in process for this II code), the new message shall be queued until the current transaction with that II code is closed out.

3.1.2.7.9.3.2 *Announcement.* Announcement of a downlink ELM message waiting transfer shall be made using the DR field as specified in 3.1.2.7.7.1 with the destination interrogator II code contained in the IIS subfield as specified in 3.1.2.6.5.3.2. The DR field and IIS subfield contents shall be set specifically for the interrogator that is to receive the reply. A waiting multisite directed message shall only be announced in the replies to the intended interrogator. It shall not be announced in replies to other interrogators.

3.1.2.7.9.3.3 *Delivery.* An interrogator shall determine if it is the reserved site through coding in the UM field. The delivery shall only be requested if it is the reserved site and shall be as specified in 3.1.2.7.7.2. The transponder shall transmit the message contained in the buffer associated with the II code specified in the IIS subfield of the segment request interrogation.

3.1.2.7.9.3.4 *Closeout.* Closeout shall be accomplished as specified in 3.1.2.7.7.3 except that a message closeout shall only be accepted from the interrogator with a II code equal to the one that transferred the message.

3.1.2.7.9.3.5 *Announcement of the next message waiting.* The DR field shall indicate a message waiting in the reply to an interrogation containing a downlink ELM closeout if another multisite directed message is waiting for that II code, or if a downlink message is waiting that has not been assigned a II code (3.1.2.7.9.2).

3.1.2.7.9.4 *Enhanced non-selective downlink ELM protocol.* The availability of a non-selective downlink ELM message shall be announced to all interrogators. Otherwise, the protocol shall be as specified in 3.1.2.7.7.

3.1.2.8 AIR-AIR SERVICE AND SQUITTER TRANSACTIONS

Note.— Airborne collision avoidance system (ACAS) equipment uses the formats UF or DF equals 0 or 16 for air-air surveillance.

3.1.2.8.1 *SHORT AIR-AIR SURVEILLANCE, UPLINK FORMAT 0*

1		9		14	15		33
UF		RL		AQ	DS		AP
5					22		56

The format of this interrogation shall consist of these fields:

Field	*Reference*
UF uplink format	3.1.2.3.2.1.1
spare — 3 bits	
RL reply length	3.1.2.8.1.2
spare — 4 bits	
AQ acquisition	3.1.2.8.1.1
DS data selector	3.1.2.8.1.3
spare — 10 bits	
AP address/parity	3.1.2.3.2.1.3

3.1.2.8.1.1 *AQ: Acquisition.* This 1-bit (14) uplink field shall contain a code which controls the content of the RI field.

3.1.2.8.1.2 *RL: Reply length.* This 1-bit (9) uplink field shall command the format to be used for the reply.

Coding

0 signifies a reply with DF = 0

1 signifies a reply with DF = 16

Note.— A transponder that does not support DF = 16 (i.e. transponder which does not support the ACAS cross-link capability and is not associated with airborne collision avoidance equipment) would not reply to a UF=0 interrogation with RL=1

3.1.2.8.1.3 *DS: Data selector.* This 8-bit (15-22) uplink field shall contain the BDS code (3.1.2.6.11.2.1) of the GICB register whose contents shall be returned to the corresponding reply with DF = 16.

3.1.2.8.2 *SHORT AIR-AIR SURVEILLANCE, DOWNLINK FORMAT 0*

1	6	7		14		20	33
DF	VS	CC		RI		AC	AP
5				17		32	56

This reply shall be sent in response to an interrogation with UF equals 0 and RL equals 0. The format of this reply shall consist of these fields:

Field	*Reference*
DF downlink format	3.1.2.3.2.1.2
VS vertical status	3.1.2.8.2.1
CC cross-link capability	3.1.2.8.2.3
spare — 6 bits	
RI reply information	3.1.2.8.2.2

spare — 2 bits	
AC altitude code	3.1.2.6.5.4
AP address/parity	3.1.2.3.2.1.3

3.1.2.8.2.1 *VS: Vertical status:* This 1-bit (6) downlink field shall indicate the status of the aircraft (3.1.2.6.10.1.2).

Coding

0	signifies that the aircraft is airborne
1	signifies that the aircraft is on the ground

3.1.2.8.2.2 *RI: Reply information, air-air.* This 4-bit (14-17) downlink field shall report the aircraft's maximum cruising true airspeed capability and type of reply to interrogating aircraft. The coding shall be as follows:

0	signifies a reply to an air-air interrogation UF = 0 with AQ = 0, no operating ACAS
1-7	reserved for ACAS
8-15	signifies a reply to an air-air interrogation UF = 0 with AQ = 1 and that the maximum airspeed is as follows:
8	no maximum airspeed data available
9	maximum airspeed is .LE. 140 km/h (75 kt)
10	maximum airspeed is .GT. 140 and .LE. 280 km/h (75 and 150 kt)
11	maximum airspeed is .GT. 280 and .LE. 560 km/h (150 and 300 kt)
12	maximum airspeed is .GT. 560 and .LE. 1 110 km/h (300 and 600 kt)
13	maximum airspeed is .GT. 1 110 and .LE. 2 220 km/h (600 and 1 200 kt)
14	maximum airspeed is more than 2 220 km/h (1 200 kt)
15	not assigned.

Note.— ".LE." means "less than or equal to" and ".GT." means "greater than".

3.1.2.8.2.3 *CC: Cross-link capability.* This 1-bit (7) downlink field shall indicate the ability of the transponder to support the cross-link capability, i.e. decode the contents of the DS field in an interrogation with UF equals 0 and respond with the contents of the specified GICB register in the corresponding reply with DF equals 16.

Coding

0	signifies that the transponder cannot support the cross-link capability
1	signifies that the transponder supports the cross-link capability.

3.1.2.8.3 LONG AIR-AIR SURVEILLANCE, DOWNLINK FORMAT 16

1	6		14		20	33	89
DF	VS		RI		AC	MV	AP
5			17		32	88	112

This reply shall be sent in response to an interrogation with UF equals 0 and RL equals 1. The format of this reply shall consist of these fields:

Field	*Reference*
DF downlink format	3.1.2.3.2.1.2
VS vertical status	3.1.2.8.2.1
spare — 7 bits	
RI reply information	3.1.2.8.2.2

spare — 2 bits	
AC altitude code	3.1.2.6.5.4
MV message, ACAS	3.1.2.8.3.1
AP address/parity	3.1.2.3.2.1.3

3.1.2.8.3.1 *MV: Message, ACAS*. This 56-bit (33-88) downlink field shall contain GICB information as requested in the DS field of the UF 0 interrogation that elicited the reply.

Note.— The MV field is also used by ACAS for air-air coordination (4.3.8.4.2.4).

3.1.2.8.4 *AIR-AIR TRANSACTION PROTOCOL*

Note.— Interrogation-reply coordination for the air-air formats follows the protocol outlined in Table 3-5 (3.1.2.4.1.3.2.2).

The most significant bit (bit 14) of the RI field of an air-air reply shall replicate the value of the AQ field (bit 14) received in an interrogation with UF equals 0.

If AQ equals 0 in the interrogation, the RI field of the reply shall contain the value 0.

If AQ equals 1 in the interrogation, the RI field of the reply shall contain the maximum cruising true airspeed capability of the aircraft as defined in 3.1.2.8.2.2.

In response to a UF = 0 with RL = 1 and DS ≠ 0, the transponder shall reply with a DF = 16 reply in which the MV field shall contain the contents of the GICB register designated by the DS value. In response to a UF = 0 with RL = 1 and DS = 0, the transponder shall reply with a DF = 16 with an MV field of all zeros. Receipt of a UF = 0 with DS ≠ 0 but RL = 0 shall have no associated ACAS cross-link action, and the transponder shall reply as specified in 3.1.2.8.2.2.

3.1.2.8.5 *ACQUISITION SQUITTER*

Note.— SSR Mode S transponders transmit acquisition squitters (unsolicited downlink transmissions) to permit passive acquisition by interrogators with broad antenna beams, where active acquisition may be hindered by all-call synchronous garble. Examples of such interrogators are an airborne collision avoidance system and an airport surface surveillance system.

3.1.2.8.5.1 *Acquisition squitter format.* The format used for acquisition squitter transmissions shall be the all-call reply, (DF = 11) with II = 0.

3.1.2.8.5.2 *Acquisition squitter rate.* Acquisition squitter transmissions shall be emitted at random intervals that are uniformly distributed over the range from 0.8 to 1.2 seconds using a time quantization of no greater than 15 milliseconds relative to the previous acquisition squitter, with the following exceptions:

a) the scheduled acquisition squitter shall be delayed if the transponder is in a transaction cycle (3.1.2.4.1);

b) the acquisition squitter shall be delayed if an extended squitter is in process;

c) the scheduled acquisition squitter shall be delayed if a mutual suppression interface is active (see Note 1 below); or

d) acquisition squitters shall only be transmitted on the surface if the transponder is not reporting the surface position type of Mode S extended squitter.

An acquisition squitter shall not be interrupted by link transactions or mutual suppression activity after the squitter transmission has begun.

Note 1.— A mutual suppression system may be used to connect onboard equipment operating in the same frequency band in order to prevent mutual interference. Acquisition squitter action resumes as soon as practical after a mutual suppression interval.

Note 2.— The surface report type may be selected automatically by the aircraft or by commands from a squitter ground station (3.1.2.8.6.7).

3.1.2.8.5.3 *Acquisition squitter antenna selection.* Transponders operating with antenna diversity (3.1.2.10.4) shall transmit acquisition squitters as follows:

a) when airborne (3.1.2.8.6.7), the transponder shall transmit acquisition squitters alternately from the two antennas; and

b) when on the surface (3.1.2.8.6.7), the transponder shall transmit acquisition squitters under control of SAS (3.1.2.6.1.4.1 f)). In the absence of any SAS commands, use of the top antenna only shall be the default.

Note.— Acquisition squitters are not emitted on the surface if the transponder is reporting the surface type of extended squitter (3.1.2.8.6.4.3).

3.1.2.8.6 *EXTENDED SQUITTER, DOWNLINK FORMAT 17*

1	6	9	33	89
DF	CA	AA	ME	PI
5	8	32	88	112

Note.— SSR Mode S transponders transmit extended squitters to support the broadcast of aircraft-derived position for surveillance purposes. The broadcast of this type of information is a form of automatic dependent surveillance (ADS) known as ADS-broadcast (ADS-B).

3.1.2.8.6.1 *Extended squitter format.* The format used for the extended squitter shall be a 112-bit downlink format (DF = 17) containing the following fields:

Field	*Reference*
DF downlink format	3.1.2.3.2.1.2
CA capability	3.1.2.5.2.2.1
AA address, announced	3.1.2.5.2.2.2
ME message, extended squitter	3.1.2.8.6.2
PI parity/interrogator identifier	3.1.2.3.2.1.4

The PI field shall be encoded with II equal to 0.

3.1.2.8.6.2 *ME: Message, extended squitter.* This 56-bit (33-88) downlink field in DF = 17 shall be used to transmit broadcast messages. Extended squitter shall be supported by registers 05, 06, 07, 08, 09, 0A {HEX} and 61-6F {HEX} and shall conform to either version 0 or version 1 message formats as described below:

a) Version 0 ES message formats and related requirements are suitable for early implementation of extended squitter applications. Surveillance quality is reported by navigation uncertainty category (NUC), which can be an indication of either the accuracy or integrity of the navigation data used by ADS-B. However, there is no indication as to which of these, integrity or accuracy, the NUC value is providing an indication of.

b) Version 1 ES message formats and related requirements apply to more advanced ADS-B applications. Surveillance accuracy and integrity are reported separately as navigation accuracy category (NAC), navigation integrity category (NIC) and surveillance integrity level (SIL). Version 1 ES formats also include provisions for enhanced reporting of status information.

Note 1.— The formats and update rates of each register are specified in the Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871).*

Note 2.— The formats for the two versions are interoperable. An extended squitter receiver can recognize and decode both version 0 and version 1 message formats.

Note 3.— Guidance material on transponder register formats and data sources is included in the Manual on Mode S Specific Services *(Doc 9688).*

3.1.2.8.6.3 *Extended squitter types*

3.1.2.8.6.3.1 *Airborne position squitter.* The airborne position extended squitter type shall use format DF = 17 with the contents of GICB register 05 {HEX} inserted in the ME field.

Note.— A GICB request (3.1.2.6.11.2) containing RR equals 16 and DI equals 7 and RRS equals 5 will cause the resulting reply to contain the airborne position report in its MB field.

3.1.2.8.6.3.1.1 *SSS, surveillance status subfield in ME.* The transponder shall report the surveillance status of the transponder in this 2-bit (38, 39) subfield of ME when ME contains an airborne position squitter report.

Coding

0	signifies no status information
1	signifies transponder reporting permanent alert condition (3.1.2.6.10.1.1.1)
2	signifies transponder reporting a temporary alert condition (3.1.2.6.10.1.1.2)
3	signifies transponder reporting SPI condition (3.1.2.6.10.1.3)

Codes 1 and 2 shall take precedence over code 3.

3.1.2.8.6.3.1.2 *ACS, altitude code subfield in ME.* Under control of ATS (3.1.2.8.6.3.1.3), the transponder shall report either navigation-derived altitude, or the barometric altitude code in this 12-bit (41-52) subfield of ME when ME contains an airborne position report. When barometric altitude is reported, the contents of the ACS shall be as specified for the 13-bit AC field (3.1.2.6.5.4) except that the M-bit (bit 26) shall be omitted.

3.1.2.8.6.3.1.3 *Control of ACS reporting.* Transponder reporting of altitude data in ACS shall depend on the altitude type subfield (ATS) as specified in 3.1.2.8.6.8.2. Transponder insertion of barometric altitude data in the ACS subfield shall take place when the ATS subfield has the value of ZERO. Transponder insertion of barometric altitude data in ACS shall be inhibited when ATS has the value 1.

3.1.2.8.6.3.2 *Surface position squitter.* The surface position extended squitter type shall use format DF = 17 with the contents of GICB register 06 {HEX} inserted in the ME field.

Note.— A GICB request (3.1.2.6.11.2) containing RR equals 16 and DI equals 7 and RRS equals 6 will cause the resulting reply to contain the surface position report in its MB field.

3.1.2.8.6.3.3 *Aircraft identification squitter.* The aircraft identification extended squitter type shall use format DF = 17 with the contents of GICB register 08 {HEX} inserted in the ME field.

Note.— A GICB request (3.1.2.6.11.2) containing RR equals 16 and DI equals 7 and RRS equals 8 will cause the resulting reply to contain the aircraft identification report in its MB field.

3.1.2.8.6.3.4 *Airborne velocity squitter.* The airborne velocity extended squitter type shall use format DF = 17 with the contents of GICB register 09 {HEX} inserted in the ME field.

Note.— A GICB request (3.1.2.6.11.2) containing RR equals 16 and DI equals 7 and RRS equals 9 will cause the resulting reply to contain the airborne velocity report in its MB field.

3.1.2.8.6.3.5 *Event-driven squitter.* The event-driven extended squitter type shall use format DF = 17 with the contents of GICB register 0A {HEX} inserted in the ME field.

Note.— A GICB request (3.1.2.6.11.2) containing RR equals 16 and DI equals 7 and RRS equals 10 will cause the resulting reply to contain the event-driven report in its MB field.

3.1.2.8.6.4 *Extended squitter rate*

3.1.2.8.6.4.1 *Initialization.* At power up initialization, the transponder shall commence operation in a mode in which it broadcasts only acquisition squitters (3.1.2.8.5). The transponder shall initiate the broadcast of extended squitters for airborne position, surface position, airborne velocity and aircraft identification when data are inserted into transponder registers 05, 06, 09 and 08 {HEX}, respectively. This determination shall be made individually for each squitter type. When extended squitters are broadcast, transmission rates shall be as indicated in the following paragraphs. Acquisition squitters shall be reported in addition to extended squitters unless the acquisition squitter is inhibited (2.1.5.4). Acquisition squitters shall always be reported if position or velocity extended squitters are not reported.

Note 1.— This suppresses the transmission of extended squitters from aircraft that are unable to report position, velocity or identity. If input to the register for a squitter type stops for 60 seconds, broadcast of that extended squitter type will be discontinued until data insertion is resumed.

Note 2.— After timeout (3.1.2.8.6.6), this squitter type may contain an ME field of all zeroes.

3.1.2.8.6.4.2 *Airborne position squitter rate.* Airborne position squitter transmissions shall be emitted when the aircraft is airborne (3.1.2.8.6.7) at random intervals that are uniformly distributed over the range from 0.4 to 0.6 seconds using a time quantization of no greater than 15 milliseconds relative to the previous airborne position squitter, with the exceptions as specified in 3.1.2.8.6.4.7.

3.1.2.8.6.4.3 *Surface position squitter rate.* Surface position squitter transmissions shall be emitted when the aircraft is on the surface (3.1.2.8.6.7) using one of two rates depending upon whether the high or low squitter rate has been selected (3.1.2.8.6.9). When the high squitter rate has been selected, surface position squitters shall be emitted at random intervals that are uniformly distributed over the range from 0.4 to 0.6 seconds using a time quantization of no greater than 15 milliseconds relative to the previous surface position squitter (termed the high rate). When the low squitter rate has been selected, surface position squitters shall be emitted at random intervals that are uniformly distributed over the range of 4.8 to 5.2 seconds using a time quantization of no greater than 15 milliseconds relative to the previous surface position squitter (termed the low rate). Exceptions to these transmission rates are specified in 3.1.2.8.6.4.7.

3.1.2.8.6.4.4 *Aircraft identification squitter rate.* Aircraft identification squitter transmissions shall be emitted at random intervals that are uniformly distributed over the range of 4.8 to 5.2 seconds using a time quantization of no greater than 15 milliseconds relative to the previous identification squitter when the aircraft is reporting the airborne position squitter type, or when the aircraft is reporting the surface position squitter type and the high surface squitter rate has been selected. When the surface position squitter type is being reported at the low surface rate, the aircraft identification squitter shall be emitted at random intervals that are uniformly distributed over the range of 9.8 to 10.2 seconds using a time quantization of no greater than 15 milliseconds relative to the previous identification squitter. Exceptions to these transmission rates are specified in 3.1.2.8.6.4.7.

3.1.2.8.6.4.5 *Airborne velocity squitter rate.* Airborne velocity squitter transmissions shall be emitted when the aircraft is airborne (3.1.2.8.6.7) at random intervals that are uniformly distributed over the range from 0.4 to 0.6 seconds using a time quantization of no greater than 15 milliseconds relative to the previous airborne velocity squitter, with the exceptions as specified in 3.1.2.8.6.4.7.

3.1.2.8.6.4.6 *Event-driven squitter rate.* The event-driven squitter shall be transmitted once, each time that GICB register 0A {HEX} is loaded, while observing the delay conditions specified in 3.1.2.8.6.4.7. The maximum transmission rate for the event-driven squitter shall be limited by the transponder to twice per second. If a message is inserted in the event-driven register and cannot be transmitted due to rate limiting, it shall be held and transmitted when the rate limiting condition has cleared. If a new message is received before transmission is permitted, it shall overwrite the earlier message.

Note.— The squitter transmission rate and the duration of squitter transmissions is application-dependent. Choices made for each application must take into account interference considerations (Manual of the Secondary Surveillance Radar (SSR) Systems *(Doc 9684), Chapter 8 refers).*

3.1.2.8.6.4.7 *Delayed transmission.* Extended squitter transmission shall be delayed in the following circumstances:

a) if the transponder is in a transaction cycle (3.1.2.4.1);

b) if an acquisition or another type of extended squitter is in process; or

c) if a mutual suppression interface is active.

The delayed squitter shall be transmitted as soon as the transponder becomes available.

3.1.2.8.6.5 *Extended squitter antenna selection.* Transponders operating with antenna diversity (3.1.2.10.4) shall transmit extended squitters as follows:

a) when airborne (3.1.2.8.6.7), the transponder shall transmit each type of extended squitter alternately from the two antennas; and

b) when on the surface (3.1.2.8.6.7), the transponder shall transmit extended squitters under control of SAS (3.1.2.6.1.4.1 f)).

In the absence of any SAS commands, use of the top antenna only shall be the default condition.

3.1.2.8.6.6 *Register time-out*. The transponder shall clear all 56-bits of the airborne position, surface position, squitter status and airborne velocity information transponder registers 05, 06, 07 and 09 {HEX} if these registers are not updated within two seconds of the previous update. This time-out shall be determined separately for each of these registers.

Note 1.— Termination of extended squitter broadcast is specified in the Technical Provisions for Mode S Services and Extended Squitter (Doc 9871).

Note 2.— These registers are cleared to prevent the reporting of outdated position, velocity and squitter rate information.

3.1.2.8.6.7 *Airborne/surface state determination.* Aircraft with an automatic means of determining on-the-ground conditions shall use this input to select whether to report the airborne or surface message types. Aircraft without such means shall report the airborne type messages, except as specified in Table 3-^. Use of this table shall only be applicable to aircraft that are equipped to provide data for radio altitude AND, as a minimum, airspeed OR ground speed. Otherwise, aircraft in the specified categories that are only equipped to provide data for airspeed and ground speed shall broadcast the surface format if:

airspeed <50 knots AND ground speed <50 knots.

Aircraft with or without such automatic on-the-ground determination shall use position message types as commanded by control codes in TCS (3.1.2.6.1.4.1 f)). After time-out of the TCS commands, control of airborne/surface determination shall revert to the means described above.

Note ١.— Use of this technique may result in the surface position format being transmitted when the air-ground status in the CA fields indicates "airborne or on the ground".

Note ٢.— Extended squitter ground stations determine aircraft airborne or surface status by monitoring aircraft position, altitude and ground speed. Aircraft determined to be on the ground that are not reporting the surface position message type will be commanded to report the surface format via TCS (3.1.2.6.1.4.1 f)). The normal return to the airborne position message type is via a ground command to report the airborne message type. To guard against loss of communications after take-off, commands to report the surface position message type automatically time-out.

3.1.2.8.6.8 *Squitter status reporting.* A GICB request (3.1.2.6.11.2) containing RR equals 16 and DI equals 7 and RRS equals 7 shall cause the resulting reply to contain the squitter status report in its MB field.

3.1.2.8.6.8.1 *TRS, transmission rate subfield in MB.* The transponder shall report the capability of the aircraft to automatically determine its surface squitter rate and its current squitter rate in this 2-bit (33, 34) subfield of MB.

Coding

0	signifies no capability to automatically determine surface squitter rate
1	signifies that the high surface squitter rate has been selected
2	signifies that the low surface squitter rate has been selected
3	unassigned

Note 1.— High and low squitter rate is determined on board the aircraft.

Note 2.— The low rate is used when the aircraft is stationary and the high rate is used when the aircraft is moving. For details of how "moving" is determined, see the data format of register 07_{16} in the Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871).*

3.1.2.8.6.8.2 *ATS, altitude type subfield in MB.* The transponder shall report the type of altitude being provided in the airborne position extended squitter in this 1-bit (35) subfield of MB when the reply contains the contents of transponder register 07 {HEX}.

Coding

0	signifies that barometric altitude shall be reported in the ACS (3.1.2.8.6.3.1.2) of transponder register 05 {HEX}.
1	signifies that navigation-derived altitude shall be reported in the ACS (3.1.2.8.6.3.1.2) of transponder register 05 {HEX}.

Note.— Details of the contents of transponder registers 05 {HEX} and 07 {HEX} are shown in the Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871).*

3.1.2.8.6.9 *Surface squitter rate control.* Surface squitter rate shall be determined as follows:

a) once per second the contents of the TRS shall be read. If the value of TRS is 0 or 1, the transponder shall transmit surface squitters at the high rate. If the value of TRS is 2, the transponder shall transmit surface squitters at the low rate;

b) the squitter rate determined via TRS shall be subject to being overridden by commands received via RCS (3.1.2.6.1.4.1 f)). RCS code 1 shall cause the transponder to squitter at the high rate for 60 seconds. RCS code 2 shall cause the transponder to squitter at the low rate for 60 seconds. These commands shall be able to be refreshed for a new 60 second period before time-out of the prior period; and

c) after time-out and in the absence of RCS codes 1 and 2, control shall return to TRS.

3.1.2.8.6.10 *Latitude/longitude coding using compact position reporting (CPR).* Mode S extended squitter shall use compact position reporting (CPR) to encode latitude and longitude efficiently into messages.

Note.— The method used to encode/decode CPR is specified in the Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871).*

3.1.2.8.6.11 *Data insertion.* When the transponder determines that it is time to emit an airborne position squitter, it shall insert the current value of the barometric altitude (unless inhibited by the ATS subfield, 3.1.2.8.6.8.2) and surveillance status into the appropriate fields of register 05 {HEX}. The contents of this register shall then be inserted into the ME field of DF = 17 and transmitted.

Note.— Insertion in this manner ensures that (1) the squitter contains the latest altitude and surveillance status, and (2) ground read-out of register 05 {HEX} will yield exactly the same information as the AC field of a Mode S surveillance reply.

3.1.2.8.7 EXTENDED SQUITTER/SUPPLEMENTARY, DOWNLINK FORMAT *18*

10010	CF:3			PI:24

Note 1.— This format supports the broadcast of extended squitter ADS-B messages by non-transponder devices, i.e. they are not incorporated into a Mode S transponder. A separate format is used to clearly identify this non-transponder case to prevent ACAS II or extended squitter ground stations from attempting to interrogate these devices.

Note 2.— This format is also used for ground broadcast of ADS-B related services such as traffic information broadcast (TIS-B).

Note 3.— The format of the DF = 18 transmission is defined by the value of the CF field.

3.1.2.8.7.1 *ES supplementary format.* The format used for ES supplementary shall be a 112-bit downlink format (DF = 18) containing the following fields:

Field	*Reference*
DF downlink format	3.1.2.3.2.1.2
CF control field	3.1.2.8.7.2
PI parity/interrogator identifier	3.1.2.3.2.1.4

The PI field shall be encoded with II equal to zero.

3.1.2.8.7.2 *Control field*. This 3-bit (6-8) downlink field in DF = 18 shall be used to define the format of the 112-bit transmission as follows.

Code 0 = ADS-B ES/NT devices that report the ICAO 24-bit address in the AA field (3.1.2.8.7)

Code 1 = Reserved for ADS-B for ES/NT devices that use other addressing techniques in the AA field (3.1.2.8.7.3)

Code 2 = Fine format TIS-B message

Code 3 = Coarse format TIS-B message

Code 4 = Reserved for TIS-B management messages

Code 5 = TIS-B messages that relay ADS-B messages that use other addressing techniques in the AA field

Code 6 = ADS-B rebroadcast using the same type codes and message formats as defined for DF = 17 ADS-B messages

Code 7 = Reserved

Note 1.— Administrations may wish to make address assignments for ES/NT devices in addition to the 24-bit addresses allocated by ICAO (Annex 10, Volume III, Part I, Chapter 9) in order to increase the available number of 24-bit addresses.

Note 2.— These non-ICAO 24-bit addresses are not intended for international use.

3.1.2.8.7.3 *ADS-B for extended squitter/non-transponder (ES/NT) devices*

10010	CF=0	AA:24	ME:56	PI:24

3.1.2.8.7.3.1 *ES/NT format.* The format used for ES/NT shall be a 112-bit downlink format (DF = 18) containing the following fields:

Field	*Reference*
DF downlink format	3.1.2.3.2.1.2
CF control field = 0	3.1.2.8.7.2
AA address, announced	3.1.2.5.2.2.2
ME message, extended squitter	3.1.2.8.6.2
PI parity/interrogator identifier	3.1.2.3.2.1.4

The PI field shall be encoded with II equal to zero.

3.1.2.8.7.3.2 *ES/NT squitter types*

3.1.2.8.7.3.2.1 *Airborne position squitter.* The airborne position type ES/NT shall use format DF = 18 with the format for register 05 {HEX} as defined in 3.1.2.8.6.2 inserted in the ME field.

3.1.2.8.7.3.2.2 *Surface position squitter.* The surface position type ES/NT shall use format DF = 18 with the format for register 06 {HEX} as defined in 3.1.2.8.6.2 inserted in the ME field.

3.1.2.8.7.3.2.3 *Aircraft identification squitter*. The aircraft identification type ES/NT shall use format DF = 18 with the format for register 08 {HEX} as defined in 3.1.2.8.6.2 inserted in the ME field.

3.1.2.8.7.3.2.4 *Airborne velocity squitter*. The airborne velocity type ES/NT shall use format DF = 18 with the format for register 09 {HEX} as defined in 3.1.2.8.6.2 inserted in the ME field.

3.1.2.8.7.3.2.5 *Event-driven squitter.* The event-driven type ES/NT shall use format DF = 18 with the format for register 0A {HEX} as defined in 3.1.2.8.6.2 inserted in the ME field.

3.1.2.8.7.3.3 *ES/NT squitter rate*

3.1.2.8.7.3.3.1 *Initialization.* At power up initialization, the non-transponder device shall commence operation in a mode in which it does not broadcast any squitters. The non-transponder device shall initiate the broadcast of ES/NT squitters for airborne position, surface position, airborne velocity and aircraft identification when data are available for inclusion in the ME field of these squitter types. This determination shall be made individually for each squitter type. When ES/NT squitters are broadcast, transmission rates shall be as indicated in 3.1.2.8.6.4.2 to 3.1.2.8.6.4.6.

Note 1.— This suppresses the transmission of extended squitters from aircraft that are unable to report position, velocity or identity. If input to the register for squitter types stops for 60 seconds, broadcast for this extended squitter type will cease until data insertion resumes, except for an ES/NT device operating on the surface (as specified for extended squitter Version 1 formats in the Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871).*

Note 2.— After timeout (3.1.2.8.7.6) this squitter type may contain an ME field of all zeros.

3.1.2.8.7.3.3.2 *Delayed transmission.* ES/NT squitter transmission shall be delayed if the non-transponder device is busy broadcasting one of the other squitter types.

3.1.2.8.7.3.3.2.1 The delayed squitter shall be transmitted as soon as the non-transponder device becomes available.

3.1.2.8.7.3.3.3 *ES/NT antenna selection.* Non-transponder devices operating with antenna diversity (3.1.2.10.4) shall transmit ES/NT squitters as follows:

a) when airborne (3.1.2.8.6.7), the non-transponder device shall transmit each type of ES/NT squitter alternately from the two antennas; and

b) when on the surface (3.1.2.8.6.7), the non-transponder device shall transmit ES/NT squitters using the top antenna.

3.1.2.8.7.3.3.4 *Register timeout.* The non-transponder device shall clear all 56-bits of the airborne position, surface position and velocity registers used for these messages if these registers are not updated within two seconds of the previous update. This timeout shall be determined separately for each of these registers.

Note 1.— The termination of an extended squitter broadcast is specified in the Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871).*

Note 2.— These registers are cleared to prevent the reporting of outdated position and velocity information.

3.1.2.8.7.3.3.5 *Airborne/surface state determination.* Aircraft with an automatic means of determining on-the-ground condition shall use this input to select whether to report the airborne or surface message types except as specified in 3.1.2.6.10.3.1. Aircraft without such means shall report the airborne type message, except as specified in 3.1.2.8.6.7.

3.1.2.8.7.3.3.6 *Surface squitter rate control.* Aircraft motion shall be determined once per second. The surface squitter rate shall be set according to the results of this determination.

Note.— The algorithm to determine aircraft motion is specified in the definition of register 07_{16} *in the* Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871).*

3.1.2.8.8 *EXTENDED SQUITTER MILITARY APPLICATION, DOWNLINK FORMAT 19*

10011	AF:3	

Note.— This format supports the broadcast of extended squitter ADS-B messages in support of military applications. A separate format is used to distinguish these extended squitters from the standard ADS-B message set broadcast using DF = 17 or 18.

3.1.2.8.8.1 *Military format.* The format used for DF = 19 shall be a 112-bit downlink format containing the following fields:

Field	*Reference*
DF downlink format	3.1.2.3.2.1.2
AF control field	3.1.2.8.8.2

3.1.2.8.8.2 *Application field.* This 3-bit (6-8) downlink field in DF = 19 shall be used to define the format of the 112-bit transmission.

Code 0 to 7 = Reserved

3.1.2.8.9 EXTENDED SQUITTER MAXIMUM TRANSMISSION RATE

3.1.2.8.9.1 The maximum total number of extended squitters (DF = 17, 18 or 19) emitted by any extended squitter installation shall not exceed 6.2 per second.

3.1.2.9 AIRCRAFT IDENTIFICATION PROTOCOL

3.1.2.9.1 *Aircraft identification reporting.* A ground-initiated Comm-B request (3.1.2.6.11.2) containing RR equals 18 and either DI does not equal 7 or DI equals 7 and RRS equals 0 shall cause the resulting reply to contain the aircraft identification in its MB field.

3.1.2.9.1.1 *AIS, aircraft identification subfield in MB.* The transponder shall report the aircraft identification in the 48-bit (41-88) AIS subfield of MB. The aircraft identification transmitted shall be that employed in the flight plan. When no flight plan is available, the registration marking of the aircraft shall be inserted in this subfield.

Note.— When the registration marking of the aircraft is used, it is classified as "fixed direct data" (3.1.2.10.5.1.1). When another type of aircraft identification is used, it is classified as "variable direct data" (3.1.2.10.5.1.3).

3.1.2.9.1.2 *Coding of the AIS subfield.* The AIS subfield shall be coded as follows:

33	41	47	53	59	65	71	77	83
BDS	Char. 1	Char. 2	Char. 3	Char. 4	Char. 5	Char. 6	Char. 7	Char. 8
40	46	52	58	64	70	76	82	88

Note.— Aircraft identification coding provides up to eight characters.

The BDS code for the aircraft identification message shall be BDS1 equals 2 (33-36) and BDS2 equals 0 (37-40).

Each character shall be coded as a 6-bit subset of the International Alphabet Number 5 (IA-5) as illustrated in Table 3-9. The character code shall be transmitted with the high order unit (b_6) first and the reported aircraft identification shall be transmitted with its left-most character first. Characters shall be coded consecutively without intervening SPACE code. Any unused character spaces at the end of the subfield shall contain a SPACE character code.

3.1.2.9.1.3 *Aircraft identification capability report.* Transponders which respond to a ground-initiated request for aircraft identification shall report this capability in the data link capability report (3.1.2.6.10.2.2.2) by setting bit 33 of the MB subfield to 1.

3.1.2.9.1.4 *Change of aircraft identification.* If the aircraft identification reported in the AIS subfield is changed in flight, the transponder shall report the new identification to the ground by use of the Comm-B broadcast message protocol of 3.1.2.6.11.4.

3.1.2.10 ESSENTIAL SYSTEM CHARACTERISTICS OF THE SSR MODE S TRANSPONDER

3.1.2.10.1 *Transponder sensitivity and dynamic range.* Transponder sensitivity shall be defined in terms of a given interrogation signal input level and a given percentage of corresponding replies. Only correct replies containing the required bit pattern for the interrogation received shall be counted. Given an interrogation that requires a reply according to 3.1.2.4, the minimum triggering level, MTL, shall be defined as the minimum input power level for 90 per cent reply-to-interrogation ratio. The MTL shall be –74 dBm ±3 dB. The reply-to-interrogation ratio of a Mode S transponder shall be:

a) at least 99 per cent for signal input levels between 3 dB above MTL and –21 dBm; and

b) no more than 10 per cent at signal input levels below –81 dBm.

Note.— Transponder sensitivity and output power are described in this section in terms of signal level at the terminals of the antenna. This gives the designer freedom to arrange the installation, optimizing cable length and receiver-transmitter design, and does not exclude receiver and/or transmitter components from becoming an integral part of the antenna subassembly.

3.1.2.10.1.1 *Reply ratio in the presence of interference*

Note.— The following paragraphs present measures of the performance of the Mode S transponder in the presence of interfering Mode A/C interrogation pulses and low-level in-band CW interference.

3.1.2.10.1.1.1 *Reply ratio in the presence of an interfering pulse.* Given a Mode S interrogation which requires a reply (3.1.2.4), the reply ratio of a transponder shall be at least 95 per cent in the presence of an interfering Mode A/C interrogation pulse if the level of the interfering pulse is 6 dB or more below the signal level for Mode S input signal levels between –68 dBm and –21 dBm and the interfering pulse overlaps the P_6 pulse of the Mode S interrogation anywhere after the sync phase reversal.

Under the same conditions, the reply ratio shall be at least 50 per cent if the interference pulse level is 3 dB or more below the signal level.

3.1.2.10.1.1.2 *Reply ratio in the presence of pulse pair interference.* Given an interrogation which requires a reply (3.1.2.4), the reply ratio of a transponder shall be at least 90 per cent in the presence of an interfering $P_1 – P_2$ pulse pair if the level of the interfering pulse pair is 9 dB or more below signal level for input signal levels between –68 dBm and –21 dBm and the P_1 pulse of the interfering pair occurs no earlier than the P_1 pulse of the Mode S signal.

3.1.2.10.1.1.3 *Reply ratio in the presence of low level asynchronous interference.* For all received signals between –65 dBm and –21 dBm and given a Mode S interrogation that requires a reply according to 3.1.2.4 and if no lockout condition is in effect, the transponder shall reply correctly with at least 95 per cent reply ratio in the presence of asynchronous interference. Asynchronous interference shall be taken to be a single Mode A/C interrogation pulse occurring at all repetition rates up to 10 000 Hz at a level 12 dB or more below the level of the Mode S signal.

Note.— Such pulses may combine with the P_1 *and* P_2 *pulses of the Mode S interrogation to form a valid Mode A/C-only all-call interrogation. The Mode S transponder does not respond to Mode A/C-only all-call interrogations. A preceding pulse* *may also combine with the* P_2 *of the Mode S interrogation to form a valid Mode A or Mode C interrogation. However, the* P_1 *–* P_2 *pair of the Mode S preamble takes precedence (3.1.2.4.1.1.1). The Mode S decoding process is independent of the Mode A/Mode C decoding process and the Mode S interrogation is accepted.*

3.1.2.10.1.1.4 *Reply ratio in the presence of low-level in-band CW interference.* In the presence of non-coherent CW interference at a frequency of 1 030 ±0.2 MHz at signal levels of 20 dB or more below the desired Mode A/C or Mode S interrogation signal level, the transponder shall reply correctly to at least 90 per cent of the interrogations.

3.1.2.10.1.1.5 *Spurious response*

Recommendation.— *The response to signals not within the receiver pass band should be at least 60 dB below normal sensitivity.*

3.1.2.10.2 *Transponder peak pulse power.* The peak power of each pulse of a reply shall:

a) not be less than 18.5 dBW for aircraft not capable of operating at altitudes exceeding 4 570 m (15 000 ft);

b) not be less than 21.0 dBW for aircraft capable of operating above 4 570 m (15 000 ft);

c) not be less than 21.0 dBW for aircraft with maximum cruising speed exceeding 324 km/h (175 kt); and

d) not exceed 27.0 dBW.

3.1.2.10.2.1 *Inactive state transponder output power.* When the transponder is in the inactive state the peak pulse power at 1 090 MHz plus or minus 3 MHz shall not exceed –50 dBm. The inactive state is defined to include the entire period between transmissions less 10-microsecond transition periods preceding the first pulse and following the last pulse of the transmission.

Note.— Inactive state transponder power is constrained in this way to ensure that an aircraft, when located as near as 185 m (0.1 NM) to a Mode A/C or Mode S interrogator, does not cause interference to that installation. In certain applications of Mode S, airborne collision avoidance for example, where a 1 090 MHz transmitter and receiver are in the same aircraft, it may be necessary to further constrain the inactive state transponder power.

3.1.2.10.2.2 *Spurious emission radiation*

Recommendation.— *CW radiation should not exceed 70 dB below 1 watt.*

3.1.2.10.3 *SPECIAL CHARACTERISTICS*

3.1.2.10.3.1 *Mode S side-lobe suppression*

Note.— Side-lobe suppression for Mode S formats occurs when a P_5 *pulse overlays the location of the sync phase reversal of* P_6*, causing the transponder to fail to recognize the interrogation (3.1.2.4.1.1.3).*

Given a Mode S interrogation that requires a reply, the transponder shall:

a) at all signal levels between MTL +3 dB and –21 dBm, have a reply ratio of less than 10 per cent if the received amplitude of P_5 exceeds the received amplitude of P_6 by 3 dB or more;

b) at all signal levels between MTL +3 dB and –21 dBm, have a reply ratio of at least 99 per cent if the received amplitude of P_6 exceeds the received amplitude of P_5 by 12 dB or more.

3.1.2.10.3.2 *Mode S dead time.* Dead time shall be defined as the time interval beginning at the end of a reply transmission and ending when the transponder has regained sensitivity to within 3 dB of MTL. Mode S transponders shall not have more than 125 microseconds' dead time.

3.1.2.10.3.3 *Mode S receiver desensitization.* The transponder's receiver shall be desensitized according to 3.1.1.7.7.1 on receipt of any pulse of more than 0.7 microseconds duration.

3.1.2.10.3.3.1 *Recovery from desensitization.* Recovery from desensitization shall begin at the trailing edge of each pulse of a received signal and shall occur at the rate prescribed in 3.1.1.7.7.2, provided that no reply or data transfer is made in response to the received signal.

3.1.2.10.3.4 *Recovery after Mode S interrogations that do not elicit replies*

3.1.2.10.3.4.1 *Recovery after a single Mode S interrogation*

3.1.2.10.3.4.1.1 The transponder shall recover sensitivity to within 3 dB of MTL no later than 128 microseconds after receipt of the sync phase reversal following a Mode S interrogation that is not accepted (3.1.2.4.1.2) or that is accepted but requires no reply.

3.1.2.10.3.4.1.2 **Recommendation.—** *The transponder should recover sensitivity to within 3 dB of MTL no later than 45 microseconds after receipt of the sync phase reversal following a Mode S interrogation that is not accepted (3.1.2.4.1.2) or that is accepted but requires no reply.*

3.1.2.10.3.4.1.3 All Mode S transponders installed on or after 1 January 1999 shall recover sensitivity to within 3 dB of MTL no later than 45 microseconds after receipt of the sync phase reversal following a Mode S interrogation that is not accepted (3.1.2.4.1.2) or that is accepted but requires no reply.

3.1.2.10.3.4.2 *Recovery after a Mode S Comm-C interrogation.* A Mode S transponder with Comm-C capability shall recover sensitivity to within 3 dB of MTL no later than 45 microseconds after receipt of the sync phase reversal following acceptance of a Comm-C interrogation for which no reply is required.

3.1.2.10.3.5 *Unwanted Mode S replies.* Mode S transponders shall not generate unwanted Mode S replies more often than once in 10 seconds. Installation in the aircraft shall be made in such a manner that this standard shall be achieved when all possible interfering equipments installed in the same aircraft are operating at maximum interference levels.

3.1.2.10.3.5.1 *Unwanted Mode S replies in the presence of low-level in-band CW interference.* In the presence of non-coherent CW interference at a frequency of 1 030 ±0.2 MHz and at signal levels of -60 dBm or less, and in the absence of valid interrogation signals, Mode S transponders shall not generate unwanted Mode S replies more often than once per 10 seconds.

3.1.2.10.3.6 *Reply rate limiting*

Note.— Reply rate limiting is prescribed separately for Modes A and C and for Mode S.

3.1.2.10.3.6.1 *Mode S reply rate limiting.* Reply rate limiting is not required for the Mode S formats of a transponder. If such limiting is incorporated for circuit protection, it shall permit the minimum reply rates required in 3.1.2.10.3.7.2 and 3.1.2.10.3.7.3.

3.1.2.10.3.6.2 *Modes A and C reply rate limiting.* Reply rate limiting for Modes A and C shall be effected according to 3.1.1.7.9.1. The prescribed sensitivity reduction (3.1.1.7.9.2) shall not affect the Mode S performance of the transponder.

3.1.2.10.3.7 *Minimum reply rate capability, Modes A, C and S*

3.1.2.10.3.7.1 All reply rates specified in 3.1.2.10.3.7 shall be in addition to any squitter transmissions that the transponder is required to make.

3.1.2.10.3.7.2 *Minimum reply rate capability, Modes A and C.* The minimum reply rate capability for Modes A and C shall be in accordance with 3.1.1.7.9.

3.1.2.10.3.7.3 *Minimum reply rate capability, Mode S.* A transponder capable of transmitting only short Mode S replies shall be able to generate replies at the following rates:

50 Mode S replies in any 1-second interval
18 Mode S replies in a 100-millisecond interval
8 Mode S replies in a 25-millisecond interval
4 Mode S replies in a 1.6-millisecond interval

In addition to any downlink ELM transmissions, a level 2, 3 or 4 transponder shall be able to generate as long replies at least:

16 of 50 Mode S replies in any 1-second interval
6 of 18 Mode S replies in a 100-millisecond interval
4 of 8 Mode S replies in a 25-millisecond interval
2 of 4 Mode S replies in a 1.6-millisecond interval

In addition to downlink ELM transmissions, a level 5 transponder shall be able to generate as long replies at least:

24 of 50 Mode S replies in any 1-second interval
9 of 18 Mode S replies in a 100-millisecond interval
6 of 8 Mode S replies in a 25-millisecond interval
2 of 4 Mode S replies in a 1.6-millisecond interval

In addition, a transponder within an ACAS installation shall be able to generate as ACAS coordination replies at least 3 of 50 Mode S replies in any 1-second interval.

3.1.2.10.3.7.4 *Minimum Mode S ELM peak reply rate*

Note 1.— When a downlink ELM is initialized (3.1.2.7.7.1), the Mode S transponder announces the length (in segments) of the waiting message. The transponder must be able to transmit this number of segments, plus an additional margin to make up for missed replies, during the beam dwell of the ground interrogator.

At least once every second a Mode S transponder equipped for ELM downlink operation shall be capable of transmitting in a 25-millisecond interval, at least 25 per cent more segments than have been announced in the initialization (3.1.2.7.7.1). The minimum length downlink ELM capability for level 4 and 5 transponders shall be as specified in 3.1.2.10.5.2.2.2.

Note 2.— A transponder capable of processing the maximum length downlink ELM (16 segments) is therefore required to be able to transmit 20 long replies under the above conditions. Level 4 transponders may be built which process less than the maximum message length. These transponders cannot initialize a message length that exceeds their transmitter capability. For example, a transponder that can transmit at most 10 long replies under the above conditions can never announce a message of more than 8 segments.

3.1.2.10.3.8 *Reply delay and jitter*

Note.— After an interrogation has been accepted and if a reply is required, this reply transmission begins after a fixed delay needed to carry out the protocols. Different values for this delay are assigned for Modes A and C, for Mode S and for Modes A/C/S all-call replies.

3.1.2.10.3.8.1 *Reply delay and jitter for Modes A and C.* The reply delay and jitter for Modes A and C transactions shall be as prescribed in 3.1.1.7.10.

3.1.2.10.3.8.2 *Reply delay and jitter for Mode S.* For all input signal levels between MTL and –21 dBm, the leading edge of the first preamble pulse of the reply (3.1.2.2.5.1.1) shall occur 128 plus or minus 0.25 microsecond after the sync phase reversal (3.1.2.1.5.2.2) of the received P_6. The jitter of the reply delay shall not exceed 0.08 microsecond, peak (99.9 percentile).

3.1.2.10.3.8.3 *Reply delay and jitter for Modes A/C/S all call.* For all input signal levels between MTL +3 dB and –21 dBm the leading edge of the first preamble pulse of the reply (3.1.2.2.5.1.1) shall occur 128 plus or minus 0.5 microseconds after the leading edge of the P_4 pulse of the interrogation (3.1.2.1.5.1.1). Jitter shall not exceed 0.1 microsecond, peak (99.9 percentile).

Note.— A peak jitter of 0.1 microsecond is consistent with the jitter prescribed in 3.1.1.7.10.

3.1.2.10.3.9 *Timers.* Duration and features of timers shall be as shown in Table 3-10.

All timers shall be capable of being restarted. On receipt of any start command, they shall run for their specified times. This shall occur regardless of whether they are in the running or the non-running state at the time that the start command is received. A command to reset a timer shall cause the timer to stop running and to return to its initial state in preparation for a subsequent start command.

3.1.2.10.3.10 *Inhibition of replies.* Replies to Mode A/C/S all-call and Mode S-only all-call interrogations shall always be inhibited when the aircraft declares the on-the-ground state. It shall not be possible to inhibit replies to discretely addressed Mode S interrogations regardless of whether the aircraft is airborne or on the ground.

3.1.2.10.3.10.1 **Recommendation.—** *Aircraft should provide means to determine the on-the-ground state automatically and provide that information to the transponder.*

3.1.2.10.3.10.2 **Recommendation.—** *Mode A/C replies should be inhibited when the aircraft is on the ground to prevent interference when in close proximity to an interrogator or other aircraft.*

Note.— Mode S discretely addressed interrogations do not give rise to such interference and may be required for data link communications with aircraft on the airport surface. Acquisition squitter transmissions may be used for passive surveillance of aircraft on the airport surface.

3.1.2.10.3.10.3 *Inhibition of squitter transmissions.* It shall not be possible to inhibit extended squitter transmissions except as specified in 3.1.2.8.6 or acquisition squitter transmissions except as specified in 3.1.2.8.5 regardless of whether the aircraft is airborne or on the ground.

Note.— For additional information on squitter inhibition see the Manual of the Secondary Surveillance Radar (SSR) Systems *(Doc 9684).*

3.1.2.10.4 *Transponder antenna system and diversity operation.* Mode S transponders equipped for diversity operation shall have two RF ports for operation with two antennas, one antenna on the top and the other on the bottom of the aircraft's fuselage. The received signal from one of the antennas shall be selected for acceptance and the reply shall be transmitted from the selected antenna only.

3.1.2.10.4.1 *Radiation pattern.* The radiation pattern of Mode S antennas when installed on an aircraft shall be nominally equivalent to that of a quarter-wave monopole on a ground plane.

Note.— Transponder antennas designed to increase gain at the expense of vertical beamwidth are undesirable because of their poor performance during turns.

3.1.2.10.4.2 *Antenna location.* The top and bottom antennas shall be mounted as near as possible to the centre line of the fuselage. Antennas shall be located so as to minimize obstruction to their fields in the horizontal plane.

3.1.2.10.4.2.1 **Recommendation.—** *The horizontal distance between the top and bottom antennas should not be greater than 7.6 m (25 ft).*

Note.— This recommendation is intended to support the operation of any diversity transponder (including cables) with any diversity antenna installation and still satisfy the requirement of 3.1.2.10.4.5.

3.1.2.10.4.3 *Antenna selection.* Mode S transponders equipped for diversity operation shall have the capability to evaluate a pulse sequence simultaneously received on both antenna channels to determine individually for each channel if the P_1 pulse and the P_2 pulse of a Mode S interrogation preamble meet the requirements for a Mode S interrogation as defined in 3.1.2.1 and if the P_1 pulse and the P_3 pulse of a Mode A, Mode C or intermode interrogation meet the requirements for Mode A and Mode C interrogations as defined in 3.1.1.

Note.— Transponders equipped for diversity operation may optionally have the capability to evaluate additional characteristics of the received pulses of the interrogations in making a diversity channel selection. The transponder may as an option evaluate a complete Mode S interrogation simultaneously received on both channels to determine individually for each channel if the interrogation meets the requirements for Mode S interrogation acceptance as defined in 3.1.2.4.1.2.3.

3.1.2.10.4.3.1 If the two channels simultaneously receive at least a $P_1 – P_2$ pulse pair that meets the requirements for a Mode S interrogation, or a $P_1 – P_3$ pulse pair that meets the requirements for a Mode A or Mode C interrogation, or if the two channels simultaneously accept a complete interrogation, the antenna at which the signal strength is greater shall be selected for the reception of the remainder (if any) of the interrogation and for the transmission of the reply.

3.1.2.10.4.3.2 If only one channel receives a pulse pair that meets the requirements for an interrogation, or if only one channel accepts an interrogation, the antenna associated with that channel shall be selected regardless of received signal strength.

3.1.2.10.4.3.3 *Selection threshold.* If antenna selection is based on signal level, it shall be carried out at all signal levels between MTL and –21 dBm.

Note.— Either antenna may be selected if the difference in signal level is less than 3 dB.

3.1.2.10.4.3.4 *Received signal delay tolerance.* If an interrogation is received at one antenna 0.125 microsecond or less in advance of reception at the other antenna, the interrogations shall be considered to be simultaneous interrogations, and the above antenna selection criteria applied. If an accepted interrogation is received at either antenna 0.375 microsecond or more in advance of reception at the other antenna, the antenna selected for the reply shall be that which received the earlier interrogation. If the relative time of receipt is between 0.125 and 0.375 microsecond, the transponder shall select the antenna for reply either on the basis of the simultaneous interrogation criteria or on the basis of the earlier time of arrival.

3.1.2.10.4.4 *Diversity transmission channel isolation.* The peak RF power transmitted from the selected antenna shall exceed the power transmitted from the non-selected antenna by at least 20 dB.

3.1.2.10.4.5 *Reply delay of diversity transponders.* The total two-way transmission difference in mean reply delay between the two antenna channels (including the differential delay caused by transponder-to-antenna cables and the horizontal distance along the aircraft centre line between the two antennas) shall not exceed 0.13 microsecond for interrogations of equal amplitude. This requirement shall hold for interrogation signal strengths between MTL +3 dB and –21 dBm. The jitter requirements on each individual channel shall remain as specified for non-diversity transponders.

Note.— This requirement limits apparent jitter caused by antenna switching and by cable delay differences.

3.1.2.10.5 DATA PROCESSING AND INTERFACES

3.1.2.10.5.1 *Direct data.* Direct data shall be those which are required for the surveillance protocol of the Mode S system.

3.1.2.10.5.1.1 *Fixed direct data.* Fixed direct data are data from the aircraft which do not change in flight and shall be:

a) the aircraft address (3.1.2.4.1.2.3.1.1 and 3.1.2.5.2.2.2);

b) the maximum airspeed (3.1.2.8.2.2); and

c) the registration marking if used for flight identification (3.1.2.9.1.1).

3.1.2.10.5.1.2 *Interfaces for fixed direct data*

Recommendation.— *Interfaces from the transponder to the aircraft should be designed such that the values of the fixed direct data become a function of the aircraft installation rather than of the transponder configuration.*

Note.— The intent of this recommendation is to encourage an interface technique which permits transponder exchange without manipulation of the transponder itself for setting the fixed direct data.

3.1.2.10.5.1.3 *Variable direct data.* Variable direct data are data from the aircraft which can change in flight and shall be:

a) the Mode C altitude code (3.1.2.6.5.4);

b) the Mode A identity code (3.1.2.6.7.1);

c) the on-the-ground condition (3.1.2.5.2.2.1, 3.1.2.6.5.1 and 3.1.2.8.2.1);

d) the aircraft identification if different from the registration marking (3.1.2.9.1.1); and

e) the SPI condition (3.1.2.6.10.1.3).

3.1.2.10.5.1.4 *Interfaces for variable direct data.* A means shall be provided for the Mode A identity code, the SPI condition and, for transponders of Level 2 and above, the aircraft identification to be inserted by the pilot via a variable data interface.

Interfaces shall be included to accept the pressure-altitude and on-the-ground coding.

Note.— A specific interface design for the variable direct data is not prescribed.

3.1.2.10.5.2 *Indirect data*

Note.— Indirect data are those which pass through the transponder in either direction but which do not affect the surveillance function.

If origins and/or destinations of indirect data are not within the transponder's enclosure, interfaces shall be used for the necessary connections.

3.1.2.10.5.2.1 *The function of interfaces*

Note.— Indirect data interfaces for standard transactions serve interrogations which require a reply and the broadcast function. Indirect data interfaces for ELM serve that system and require buffering and protocol circuitry within the transponder. Interface ports can be separate for each direction and for each service or can be combined in any manner.

3.1.2.10.5.2.1.1 *Uplink standard length transaction interface.* The uplink standard length transaction interface shall transfer all bits of accepted interrogations, (with the possible exception of the AP field), except for UF = 0, 11 or 16.

Note.— AP can also be transferred to aid in integrity implementation.

3.1.2.10.5.2.1.2 *Downlink standard length transaction interface.* A transponder which transmits information originating in a peripheral device shall be able to receive bits or bit patterns for insertion at appropriate locations within the transmission. These locations shall not include those into which bit patterns generated internally by the transponder are inserted, nor the AP field of the reply.

A transponder which transmits information using the Comm-B format shall have immediate access to requested data in the sense that the transponder shall respond to an interrogation with data requested by that interrogation.

Note.— This requirement may be met in two ways:

a) the transponder may have provisions for internal data and protocol buffering;

b) the transponder may employ a "real time" interface which operates such that uplink data leave the transponder before the corresponding reply is generated and downlink data enter the transponder in time to be incorporated in the reply.

3.1.2.10.5.2.1.3 *Extended length message interface*

Note.— The ELM interface extracts from, and enters into, the transponder the data exchanged between air and ground by means of the ELM protocol (3.1.2.7).

3.1.2.10.5.2.2 *Indirect data transaction rates*

3.1.2.10.5.2.2.1 *Standard length transactions.* A transponder equipped for information transfer to and from external devices shall be capable of processing the data of at least as many replies as prescribed for minimum reply rates in 3.1.2.10.3.7.2 and uplink data from interrogations being delivered at a rate of at least:

50 long interrogations in any 1-second interval
18 long interrogations in a 100-millisecond interval
8 long interrogations in a 25-millisecond interval
4 long interrogations in a 1.6-millisecond interval.

Note 1.— A transponder capable of reply rates higher than the minimum of 3.1.2.10.3.7.2 need not accept long interrogations after reaching the uplink data processing limits above.

Note 2.— The Mode S reply is the sole means of acknowledging receipt of the data content of a Mode S interrogation. Thus, if the transponder is capable of replying to an interrogation, the Mode S installation must be capable of accepting the data contained in that interrogation regardless of the timing between it and other accepted interrogations. Overlapping Mode S beams from several interrogators could lead to the requirement for considerable data processing and buffering. The minimum described here reduces data processing to a realistic level and the non-acceptance provision provides for notification to the interrogator that data will temporarily not be accepted.

3.1.2.10.5.2.2.2 *Extended length transactions.* Level 3 (2.1.5.1.3) and level 4 (2.1.5.1.4) transponders shall be able to transfer data from at least four complete sixteen segment uplink ELMs (3.1.2.7.4) in any four second interval. A level 5 transponder (2.1.5.1.5) shall be able to transfer the data from at least four complete sixteen segment uplink ELMs in any one second interval and shall be capable of accepting at least two complete sixteen segment uplink ELMs with the same II code in a 250 millisecond interval. A level 4 transponder shall be able to transmit at least one four-segment downlink ELM (3.1.2.7.7 and 3.1.2.10.3.7.3) in any one second interval. A level 5 transponder shall be able to transmit at least one sixteen segment downlink ELM in any one second interval.

3.1.2.10.5.2.2.2.1 **Recommendation.—** *Level 3 and level 4 transponders should be able to accept at least two complete sixteen segment uplink ELMs in a 250 millisecond interval.*

3.1.2.10.5.2.3 *Data formats for standard length transactions and required downlink aircraft parameters (DAPs)*

3.1.2.10.5.2.3.1 All level 2 and above transponders shall support the following registers:

— the capability reports (3.1.2.6.10.2);

— the aircraft identification protocol register 20 {HEX} (3.1.2.9); and

— for ACAS-equipped aircraft, the active resolution advisory register 30 {HEX} (4.3.8.4.2.2).

3.1.2.10.5.2.3.2 Where required, DAPs shall be supported by the registers listed in Table 3-11. The formats and minimum update rates of transponder registers shall be implemented consistently to ensure interoperability.

3.1.2.10.5.2.3.3 The downlink standard length transaction interface shall deliver downlink aircraft parameters (DAPs) to the transponder which makes them available to the ground. Each DAP shall be packed into the Comm-B format ('MB' field) and can be extracted using either the ground-initiated Comm-B (GICB) protocol, or using MSP downlink channel 3 via the dataflash application.

Note.— The formats and update rates of each register and the dataflash application are specified in the Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871).*

3.1.2.10.5.3 *Integrity of data content transfer.* A transponder which employs data interfaces shall include sufficient protection to ensure error rates of less than one error in 10^3 messages and less than one undetected error in 10^7 112-bit transmissions in both directions between the antenna and each interface port.

3.1.2.10.5.4 *Message cancellation.* The downlink standard length transaction interface and the extended length message interface shall include the capability to cancel a message sent to the transponder for delivery to the ground, but whose delivery cycle has not been completed (i.e. a closeout has not been accomplished by a ground interrogator).

Note.— One example of the need for this capability is to cancel a message if delivery is attempted when the aircraft is not within coverage of a Mode S ground station. The message must then be cancelled to prevent it from being read and interpreted as a current message when the aircraft re-enters Mode S airspace.

3.1.2.10.5.5 *Air-directed messages.* The transfer of this type of message requires all of the actions indicated in 3.1.2.10.5.4 plus the transfer to the transponder of the interrogator identifier of the site that is to receive the message.

3.1.2.11 ESSENTIAL SYSTEM CHARACTERISTICS OF THE GROUND INTERROGATOR

Note.— To ensure that Mode S interrogator action is not detrimental to Mode A/C interrogators, performance limits exist for Mode S interrogators.

3.1.2.11.1 *Interrogation repetition rates.* Mode S interrogators shall use the lowest practicable interrogation repetition rates for all interrogation modes.

Note.— Accurate azimuth data at low interrogation rates can be obtained with monopulse techniques.

3.1.2.11.1.1 *All-call interrogation repetition rate.* The interrogation repetition rate for the Mode A/C/S all-call, used for acquisition, shall be less than 250 per second. This rate shall also apply to the paired Mode S-only and Mode A/C-only all-call interrogations used for acquisition in the multisite mode.

3.1.2.11.1.2 *Interrogation repetition rate to a single aircraft*

3.1.2.11.1.2.1 *Interrogations requiring a reply*. Mode S interrogations requiring a reply shall not be transmitted to a single aircraft at intervals shorter than 400 microseconds.

3.1.2.11.1.2.2 *Uplink ELM interrogations.* The minimum time between the beginning of successive Comm-C interrogations shall be 50 microseconds.

3.1.2.11.1.3 *Transmission rate for selective interrogations*

3.1.2.11.1.3.1 For all Mode S interrogators, the transmission rate for selective interrogations shall be:

a) less than 2 400 per second averaged over a 40-millisecond interval; and

b) less than 480 into any 3-degree sector averaged over a 1-second interval.

3.1.2.11.1.3.2 Additionally, for a Mode S interrogator that has overlapping coverage with the sidelobes of any other Mode S interrogator, the transmission rate for selective interrogations shall be:

a) less than 1 200 per second averaged over a 4-second interval; and

b) less than 1 800 per second averaged over a 1-second interval.

Note.— Typical minimum distance to ensure sidelobe separation between interrogators is 35 km.

3.1.2.11.2 *INTERROGATOR-EFFECTIVE RADIATED POWER*

Recommendation.— *The effective radiated power of all interrogation pulses should be minimized as described in 3.1.1.8.2.*

3.1.2.11.3 *Inactive-state interrogator output power.* When the interrogator transmitter is not transmitting an interrogation, its output shall not exceed –5 dBm effective radiated power at any frequency between 960 MHz and 1 215 MHz.

Note.— This constraint ensures that aircraft flying near the interrogator (as close as 1.85 km (1 NM)) will not receive interference that would prevent them from being tracked by another interrogator. In certain instances even smaller interrogator-to-aircraft distances are of significance, for example if Mode S surveillance on the airport surface is used. In such cases a further restraint on inactive state interrogator output power may be necessary.

3.1.2.11.3.1 *Spurious emission radiation*

Recommendation.— *CW radiation should not exceed 76 dB below 1 watt.*

3.1.2.11.4 *Tolerances on transmitted signals.* In order that the signal-in-space be received by the transponder as described in 3.1.2.1, the tolerances on the transmitted signal shall be as summarized in Table 3-12.

3.1.2.11.5 *SPURIOUS RESPONSE*

Recommendation.— *The response to signals not within the passband should be at least 60 dB below normal sensitivity.*

3.1.2.11.6 *Lockout coordination.* A Mode S interrogator shall not be operated using all-call lockout until coordination has been achieved with all other operating Mode S interrogators having any overlapping coverage volume in order to ensure that no interrogator can be denied the acquisition of Mode S-equipped aircraft.

Note.— This coordination may be via ground network or by the allocation of interrogator identifier (II) codes and will involve regional agreements where coverage overlaps international boundaries.

3.1.2.11.7 *MOBILE INTERROGATORS*

Recommendation.— *Mobile interrogators should acquire, whenever possible, Mode S aircraft through the reception of squitters.*

Note.— Passive squitter acquisition reduces channel loading and can be accomplished without the need for coordination.

TABLES FOR CHAPTER 3

Table 3-1. Pulse shapes — Mode S and intermode interrogations

Pulse	*Duration*	*Duration tolerance*	*(Rise time) Min.*	*(Rise time) Max.*	*(Decay time) Min.*	*(Decay time) Max.*
P_1, P_2, P_3, P_5	0.8	±0.1	0.05	0.1	0.05	0.2
P_4 (short)	0.8	±0.1	0.05	0.1	0.05	0.2

4	RR (3.1.2.6.1.2) less than 16	4
	RR (3.1.2.6.1.2) equal to or greater than 16	20
5	RR (3.1.2.6.1.2) less than 16	5
	RR (3.1.2.6.1.2) equal to or greater than 16	21
11	Transponder locked out to interrogator code, IC (3.1.2.5.2.1.2)	No reply
	Stochastic reply test fails (3.1.2.5.4)	No reply
	Otherwise	11
20	RR (3.1.2.6.1.2) less than 16	4
	RR (3.1.2.6.1.2) equal to or greater than 16	20
	AP contains broadcast address (3.1.2.4.1.2.3.1.3)	No reply
21	RR (3.1.2.6.1.2) less than 16	5
	RR (3.1.2.6.1.2) equal to or greater than 16	21
	AP contains broadcast address (3.1.2.4.1.2.3.1.3)	No reply
24	RC (3.1.2.7.1.1) equals 0 or 1	No reply
	RC (3.1.2.7.1.1) equals 2 or 3	24

Table 3-٦. Table for register 10_{16}

Subfields of register 10_{16}	*MB bits*	*Comm-B bits*
Continuation flag	9	41
ACAS capability	16 and 37-40	48 and 69-72
Mode S subnetwork version number	17-23	49-55
Transponder enhanced protocol indicator	24	56
Specific services capability	25	57
Uplink ELM capability	26-28	58-60
Downlink ELM capability	29-32	61-64
Aircraft identification capability	33	65
Squitter capability subfield (SCS)	34	66
Surveillance identifier code capability (SIC)	35	67
Common usage GICB capability report	36	68
Status of DTE sub-addresses 0 to 15	41-56	73-88

Table 3-7. Validation of on-the-ground status

Determination of airborne status					
A/V category	*Ground speed*		*Airspeed*		*Radio altitude*
No information	No change to on-the-ground status				
Weight < 15 500 lbs (7 031 kg)	No change to on-the-ground status				
Weight ≥15 500 lbs (7 031 kg)	>100 knots	or	>100 knots	or	>50 feet
High performance (>5 g acceleration and >400 knots)	>100 knots	or	>100 knots	or	>50 feet
Rotorcraft	No change to on-the-ground status				

Table 3-٨. Surface format broadcast without an automatic means of on-the-ground determination

ADS-B Emitter Category set "A"						
Coding	*Meaning*	*Ground Speed*		*Airspeed*		*Radio Altitude*
0	No ADS-B emitter category information	Always report airborne position message (3.1.2.8.6.3.1)				
1	Light (<15 500 lbs or 7 031 kg)	Always report airborne position message (3.1.2.8.6.3.1)				
2	Small (15 500 to 75 000 lbs or 7 031 to 34 019 kg)	< 100 knots	and	<100 knots	and	<50 feet
3	Large (75 000 lbs to 300 000 lbs or 34 019 to 136 078 kg)	<100 knots	and	<100 knots	and	<50 feet

4	High-vortex aircraft	<100 knots	and	<100 knots	and	<50 feet
5	Heavy (> 300 000 lbs or 136 078 kg)	<100 knots	and	<100 knots	and	<50 feet
6	High performance (>5g acceleration and >400 knots)	<100 knots	and	<100 knots	and	<50 feet
7	Rotorcraft	Always report airborne position message (3.1.2.8.6.3.1)				
ADS-B Emitter Category Set “B”						
Coding	*Meaning*	*Ground Speed*		*Airspeed*		*Radio Altitude*
0	No ADS-B emitter category information	Always report airborne position message (3.1.2.8.6.3.1)				
1	Glider/sailplane	Always report airborne position message (3.1.2.8.6.3.1)				
2	Lighter-than-air	Always report airborne position message (3.1.2.8.6.3.1)				
3	Parachutist/skydiver	Always report airborne position message (3.1.2.8.6.3.1)				
4	Ultra-light/hang-glider/paraglider	Always report airborne position message (3.1.2.8.6.3.1)				
5	Reserved	Reserved				
6	Unmanned aerial vehicle	Always report airborne position message (3.1.2.8.6.3.1)				
7	Space/trans-atmospheric vehicle	<100 knots	and	<100 knots	and	<50 feet
ADS-B Emitter Category Set “C”						
Coding	*Meaning*					
0	No ADS-B emitter category information	Always report airborne position message (3.1.2.8.6.3.1)				
1	Surface vehicle – emergency vehicle	Always report surface position message (3.1.2.8.6.3.2)				
2	Surface vehicle - service vehicle	Always report surface position message (3.1.2.8.6.3.2)				
3	Fixed ground or tethered obstruction	Always report airborne position message (3.1.2.8.6.3.1)				
4 – 7	Reserved	Reserved				
ADS-B Emitter Category Set “D”						
Coding	*Meaning*					
0	No ADS-B emitter category information	Always report airborne position message (3.1.2.8.6.3.1)				
1 – 7	Reserved	Reserved

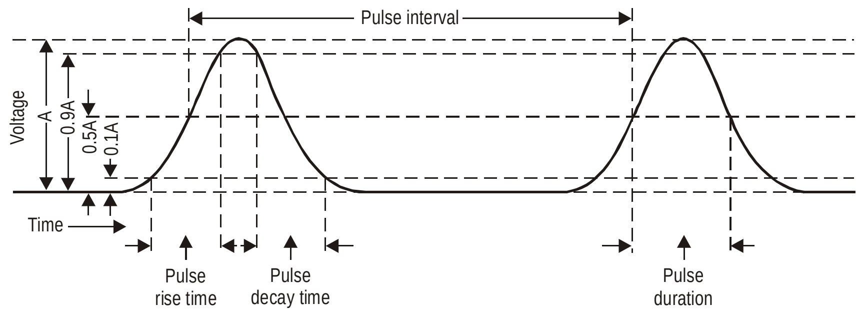
		True track angle	12-23
		Ground speed	24-34
		Track angle rate	35-45
		True airspeed	46-56
60 {HEX}	Heading and speed report	Magnetic heading	1-12
		Indicated airspeed	13-23
		Mach	24-34
		Barometric altitude rate	35-45
		Inertial vertical velocity	46-56

Table 3-12. Transmitted signal tolerances

Reference	*Function*	*Tolerance*
3.1.2.1.4.1	Pulse duration P_1, P_2, P_3, P_4, P_5 Pulse duration P_6	±0.09 microsecond ±0.20 microsecond
3.1.1.4	Pulse duration $P_1 – P_3$ Pulse duration $P_1 – P_2$	±0.18 microsecond ±0.10 microsecond
3.1.2.1.5.1.3	Pulse duration $P_3 – P_4$	±0.04 microsecond
3.1.2.1.5.2.4	Pulse duration $P_1 – P_2$ Pulse duration P_2 — sync phase reversal Pulse duration P_6 — sync phase reversal Pulse duration P_5 — sync phase reversal	±0.04 microsecond ±0.04 microsecond ±0.04 microsecond ±0.05 microsecond
3.1.1.5	Pulse amplitude P_3	P_1 ±0.5 dB
3.1.2.1.5.1.4	Pulse amplitude P_4	P_3 ±0.5 dB
3.1.2.1.5.2.5	Pulse amplitude P_6	Equal to or greater than P_2 – 0.25 dB
3.1.2.1.4.1	Pulse rise times	0.05 microsecond minimum, 0.1 microsecond maximum
3.1.2.1.4.1	Pulse decay times	0.05 microsecond minimum, 0.2 microsecond maximum

FIGURES FOR CHAPTER 3



Definitions

Phase reversal. A 180-degree change in the phase of the radio frequency carrier.

Phase reversal duration. The time between the 10-degree and 170-degree points of a phase reversal.

Pulse amplitude A. The peak voltage amplitude of the pulse envelope.

Pulse decay time. The time between 0.9A and 0.1A on the trailing edge of the pulse envelope.

Pulse duration. The time interval between 0.5A points on leading and trailing edges of the pulse envelope.

Pulse interval. The time interval between the 0.5A point on the leading edge of the first pulse and the 0.5A point on the leading edge of the second pulse.

Pulse rise time. The time between 0.1A and 0.9A on the leading edge of the pulse envelope.

Time intervals. The intervals are referenced to:

a) the 0.5A point on the leading edge of a pulse;

b) the 0.5A point on the trailing edge of a pulse; or

c) the 90-degree point of a phase reversal.

Transponder sensitivity and power reference point. The antenna end of the transmission line of the transponder.

Note.— The 90-degree point of a phase reversal can be approximated by the minimum amplitude point on the envelope amplitude transient associated with the phase reversal and the phase reversal duration can be approximated by the time between the 0.8A points of the envelope amplitude transient.

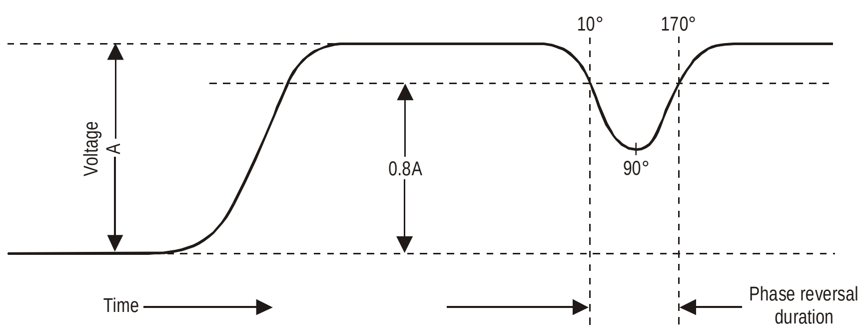


Figure 3-1. Definitions of secondary surveillance radar waveform shapes, intervals and the reference point for sensitivity and power

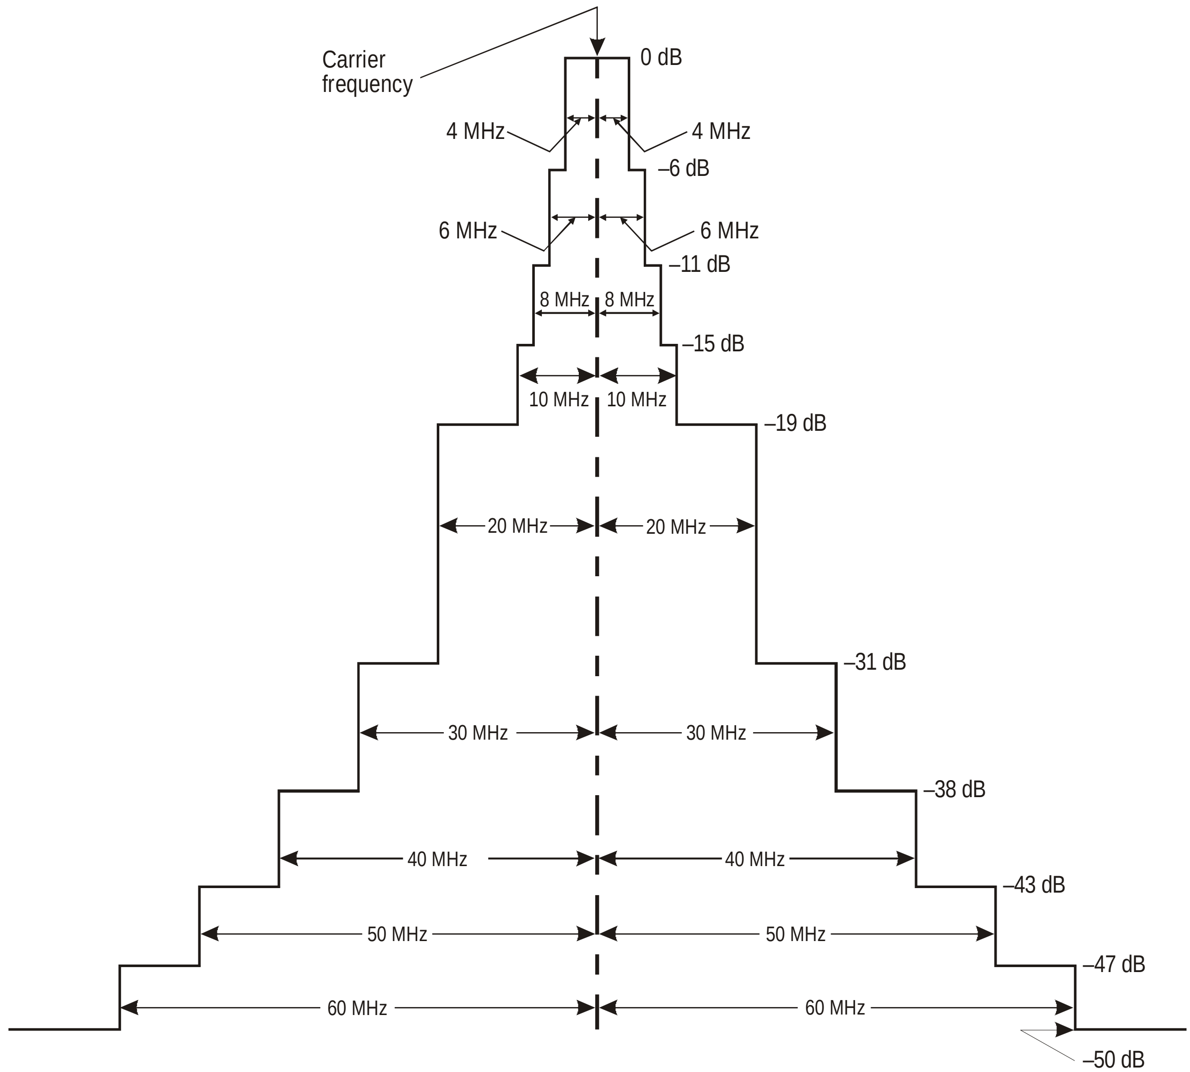

Figure 3-2. Required spectrum limits for interrogator transmitter

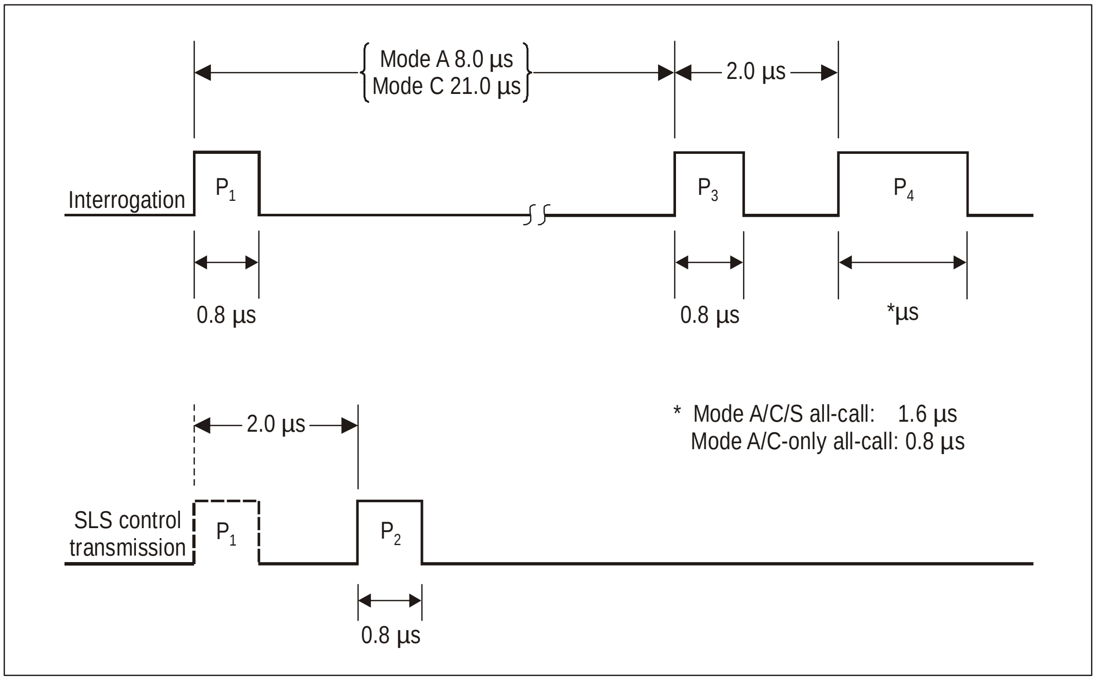

Figure 3-3. Intermode interrogation pulse sequence

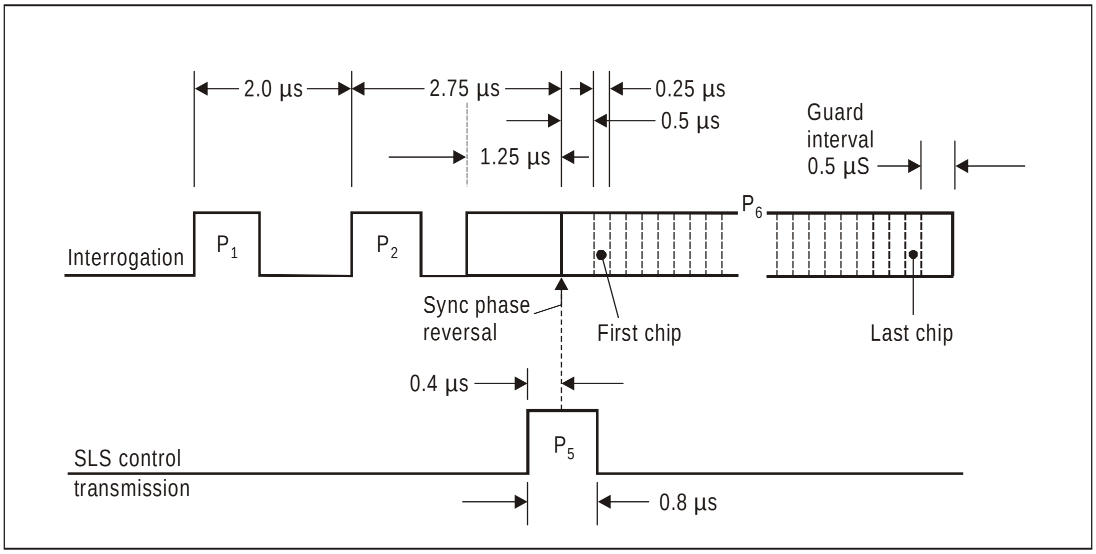

Figure 3-4. Mode S interrogation pulse sequence

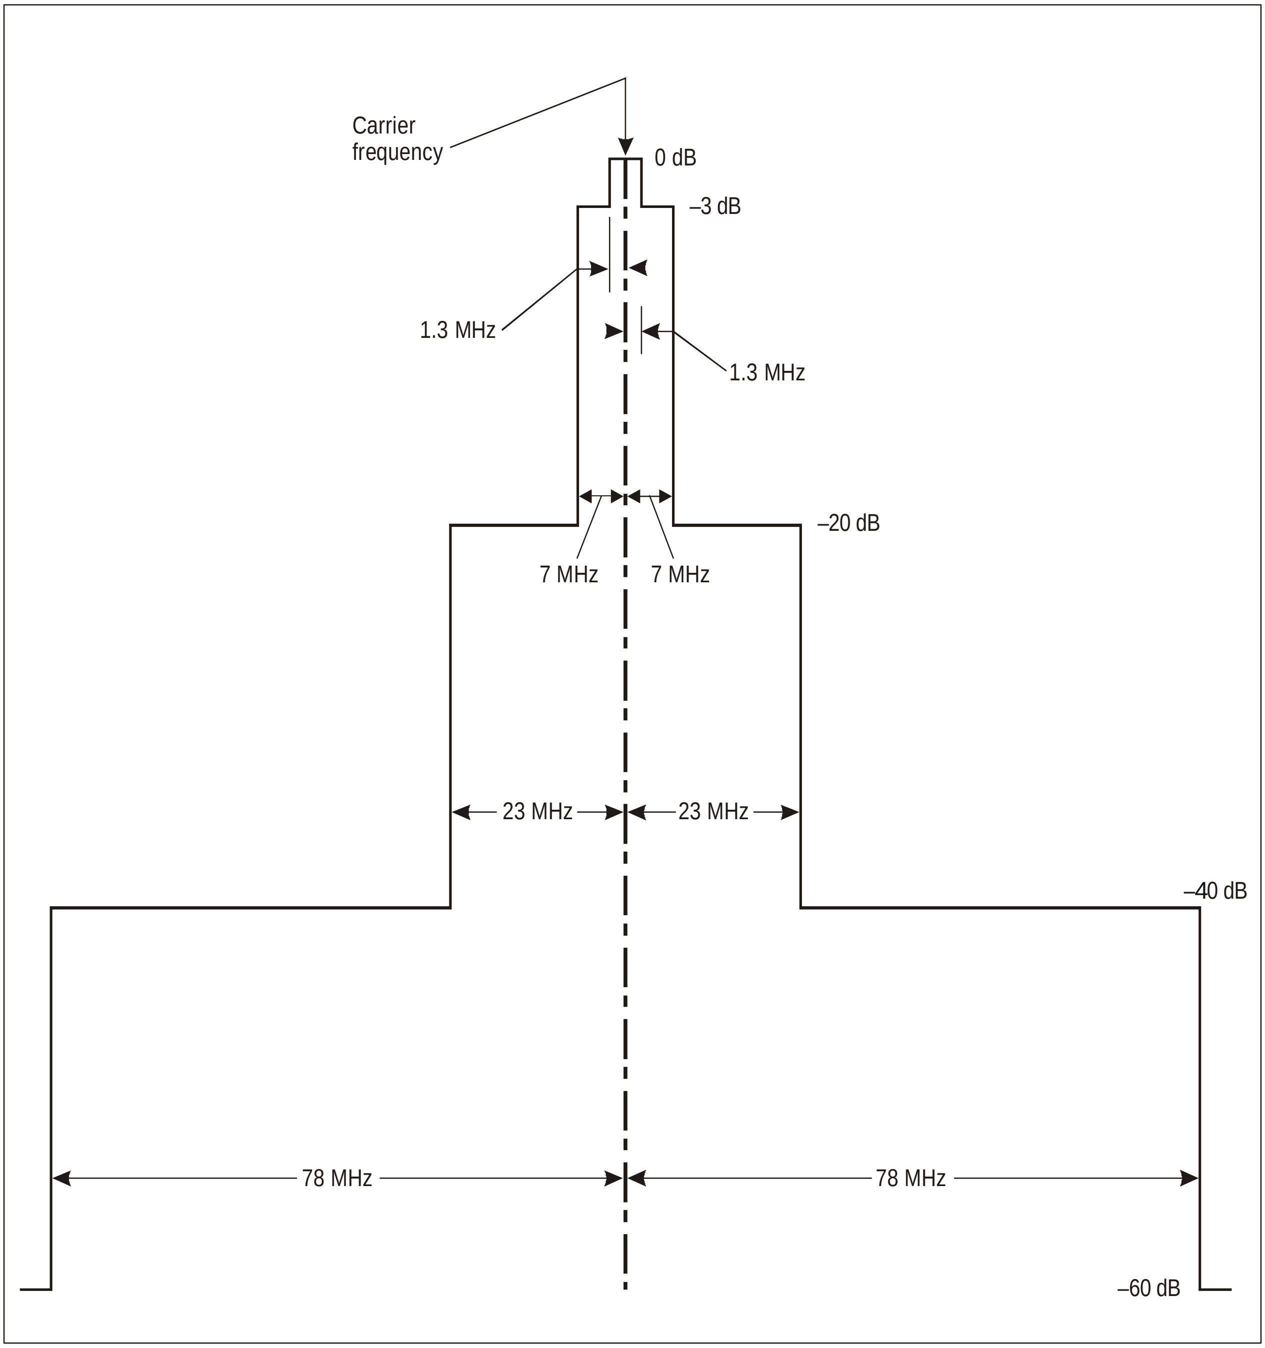

Figure 3-5. Required spectrum limits for transponder transmitter

Note.— This figure shows the spectrum centred on the carrier frequency and will therefore shift in its entirety plus or minus 1 MHz along with the carrier frequency.

NOTES:

1. XX:M denotes a field designated "XX" which is assigned M bits.
2. N denotes unassigned coding space with N available bits. These shall be coded as ZEROs for transmission.
3. For uplink formats (UF) 0 to 23 the format number corresponds to the binary code in the first five bits of the interrogation. Format number 24 is defined as the format beginning with "11" in the first two bit positions while the following three bits vary with the interrogation content.
4. All formats are shown for completeness, although a number of them are unused. Those formats for which no application is presently defined remain undefined in length. Depending on future assignment they may be short (56 bits) or long (112 bits) formats. Specific formats associated with Mode S capability levels are described in later paragraphs.
5. The PC, RR, DI and SD fields do not apply to a Comm-A broadcast interrogation.

CHAPTER 4. AIRBORNE COLLISION AVOIDANCE SYSTEM

Note 1.— Guidance material relating to the airborne collision avoidance system is contained in the Attachment.

Note 2.— Non-SI alternative units are used as permitted by Annex 5, Chapter 3, 3.2.2. In limited cases, to ensure consistency at the level of the logic calculations, units such as ft/s, NM/s and kt/s are used.

4.1 DEFINITIONS RELATING TO AIRBORNE COLLISION AVOIDANCE SYSTEM

ACAS I. An ACAS which provides information as an aid to "see and avoid" action but does not include the capability for generating resolution advisories (RAs).

Note.— ACAS I is not intended for international implementation and standardization by ICAO. Therefore, only ACAS I characteristics required to ensure compatible operation with other ACAS configurations and interference limiting are defined in 4.2.

ACAS II. An ACAS which provides vertical resolution advisories (RAs) in addition to traffic advisories (TAs).

ACAS III. An ACAS which provides vertical and horizontal resolution advisories (RAs) in addition to traffic advisories (TAs).

ACAS broadcast. A long Mode S air-air surveillance interrogation (UF = 16) with the broadcast address.

Active RAC. An RAC is active if it currently constrains the selection of the RA. RACs that have been received within the last six seconds and have not been explicitly cancelled are active.

Altitude crossing RA. A resolution advisory is altitude crossing if own ACAS aircraft is currently at least 30 m (100 ft) below or above the threat aircraft for upward or downward sense advisories, respectively.

Climb RA. A positive RA recommending a climb but not an increased climb.

Closest approach. The occurrence of minimum range between own ACAS aircraft and the intruder. Thus range at closest approach is the smallest range between the two aircraft and time of closest approach is the time at which this occurs.

Coordination. The process by which two ACAS-equipped aircraft select compatible resolution advisories (RAs) by the exchange of resolution advisory complements (RACs).

Coordination interrogation. A Mode S interrogation (uplink transmission) radiated by ACAS II or III and containing a resolution message.

Coordination reply. A Mode S reply (downlink transmission) acknowledging the receipt of a coordination interrogation by the Mode S transponder that is part of an ACAS II or III installation.

Corrective RA. A resolution advisory that advises the pilot to deviate from the current flight path.

Cycle. The term "cycle" used in this chapter refers to one complete pass through the sequence of functions executed by ACAS II or ACAS III, nominally once a second.

Descend RA. A positive RA recommending a descent but not an increased descent.

Established track. A track generated by ACAS air-air surveillance that is treated as the track of an actual aircraft.

Increased rate RA. A resolution advisory with a strength that recommends increasing the altitude rate to a value exceeding that recommended by a previous climb or descend RA.

Intruder. An SSR transponder-equipped aircraft within the surveillance range of ACAS for which ACAS has an established track.

Own aircraft. The aircraft fitted with the ACAS that is the subject of the discourse, which ACAS is to protect against possible collisions, and which may enter a manoeuvre in response to an ACAS indication.

Positive RA. A resolution advisory that advises the pilot either to climb or to descend (applies to ACAS II).

Potential threat. An intruder deserving special attention either because of its close proximity to own aircraft or because successive range and altitude measurements indicate that it could be on a collision or near-collision course with own aircraft. The warning time provided against a potential threat is sufficiently small that a traffic advisory (TA) is justified but not so small that a resolution advisory (RA) would be justified.

Preventive RA. A resolution advisory that advises the pilot to avoid certain deviations from the current flight path but does not require any change in the current flight path.

RA sense. The sense of an ACAS II RA is "upward" if it requires climb or limitation of descent rate and "downward" if it requires descent or limitation of climb rate. It can be both upward and downward simultaneously if it requires limitation of the vertical rate to a specified range.

Note.— The RA sense may be both upward and downward when, having several simultaneous threats, ACAS generates an RA aimed at ensuring adequate separation below some threat(s) and above some other threat(s).

Resolution advisory (RA). An indication given to the flight crew recommending:

a) a manoeuvre intended to provide separation from all threats; or

b) a manoeuvre restriction intended to maintain existing separation.

Resolution advisory complement (RAC). Information provided by one ACAS to another via a Mode S interrogation in order to ensure complementary manoeuvres by restricting the choice of manoeuvres available to the ACAS receiving the RAC.

Resolution advisory complements record (RAC record). A composite of all currently active vertical RACs (VRCs) and horizontal RACs (HRCs) that have been received by ACAS. This information is provided by one ACAS to another ACAS or to a Mode S ground station via a Mode S reply.

Resolution advisory strength. The magnitude of the manoeuvre indicated by the RA. An RA may take on several successive strengths before being cancelled. Once a new RA strength is issued, the previous one automatically becomes void.

Resolution message. The message containing the resolution advisory complement (RAC).

Reversed sense RA. A resolution advisory that has had its sense reversed.

Sensitivity level (S). An integer defining a set of parameters used by the traffic advisory (TA) and collision avoidance algorithms to control the warning time provided by the potential threat and threat detection logic, as well as the values of parameters relevant to the RA selection logic.

Threat. An intruder deserving special attention either because of its close proximity to own aircraft or because successive range and altitude measurements indicate that it could be on a collision or near-collision course with own aircraft. The warning time provided against a threat is sufficiently small that an RA is justified.

Track. A sequence of at least three measurements representing positions that could reasonably have been occupied by an aircraft.

Traffic advisory (TA). An indication given to the flight crew that a certain intruder is a potential threat.

Vertical speed limit (VSL) RA. A resolution advisory advising the pilot to avoid a given range of altitude rates. A VSL RA can be either corrective or preventive.

Warning time. The time interval between potential threat or threat detection and closest approach when neither aircraft accelerates.

4.2 ACAS I GENERAL PROVISIONS AND CHARACTERISTICS

4.2.1 *Functional requirements.* ACAS I shall perform the following functions:

a) surveillance of nearby SSR transponder-equipped aircraft; and

b) provide indications to the flight crew identifying the approximate position of nearby aircraft as an aid to visual acquisition.

Note.— ACAS I is intended to operate using Mode A/C interrogations only. Furthermore, it does not coordinate with other ACAS. Therefore, a Mode S transponder is not required as a part of an ACAS I installation.

4.2.2 *Signal format.* The RF characteristics of all ACAS I signals shall conform to the provisions of Chapter 3, 3.1.1.1 through 3.1.1.6 and 3.1.2.1 through 3.1.2.4.

4.2.3 Interference control

4.2.3.1 *Maximum radiated RF power.* The effective radiated power of an ACAS I transmission at 0 degree elevation relative to the longitudinal axis of the aircraft shall not exceed 24 dBW.

4.2.3.2 *Unwanted radiated power.* When ACAS I is not transmitting an interrogation, the effective radiated power in any direction shall not exceed –70 dBm.

Note.— This requirement is to ensure that, when not transmitting an interrogation, ACAS I does not radiate RF energy that could interfere with, or reduce the sensitivity of, the SSR transponder or radio equipment in other nearby aircraft or ground facilities.

4.2.3.3 *Interference limiting.* Each ACAS I interrogator shall control its interrogation rate or power or both in all SSR modes to minimize interference effects (4.2.3.3.3 and 4.2.3.3.4).

Note.— These limits are a means of ensuring that all interference effects resulting from these interrogations, together with the interrogations from all other ACAS I, ACAS II and ACAS III interrogators in the vicinity are kept to a low level.

4.2.3.3.1 *Determination of own transponder reply rate.* ACAS I shall monitor the rate that own transponder replies to interrogations to ensure that the provisions in 4.2.3.3.3 are met.

4.2.3.3.2 *Determination of the number of ACAS II and ACAS III interrogators.* ACAS I shall count the number of ACAS II and ACAS III interrogators in the vicinity to ensure that the provisions in 4.2.3.3.3 or 4.2.3.3.4 are met. This count shall be obtained by monitoring ACAS broadcasts (UF = 16), (4.3.7.1.2.4) and shall be updated as the number of distinct ACAS aircraft addresses received within the previous 20-s period at a nominal frequency of at least 1 Hz.

4.2.3.3.3 *Mode A/C ACAS I interference limits.* The interrogator power shall not exceed the following limits:

n_a	*Upper limit for* $\{\sum_{k=1}^{k_1} P_a(\mathrm{k})\}$	
	If $f_r \leq 240$	*If* $f_r > 240$
0	250	118
1	250	113
2	250	108
3	250	103
4	250	98
5	250	94
6	250	89
7	250	84
8	250	79
9	250	74
10	245	70
11	228	65
12	210	60
13	193	55
14	175	50
15	158	45
16	144	41
17	126	36
18	109	31
19	91	26
20	74	21
21	60	17
≥22	42	12

where:

n_a = number of operating ACAS II and ACAS III equipped aircraft near own (based on ACAS broadcasts received with a transponder receiver threshold of –74 dBm);

{ } = average value of the expression within the brackets over last 8 interrogation cycles;

P_a(k) = peak power radiated from the antenna in all directions of the pulse having the largest amplitude in the group of pulses comprising a single interrogation during the *k*th Mode A/C interrogation in a 1 s interrogation cycle, W;

k = index number for Mode A/C interrogations, $k = 1, 2,..., k_t$;

k_t = number of Mode A/C interrogations transmitted in a 1 s interrogation cycle;

f_r = Mode A/C reply rate of own transponder.

4.2.3.3.4 *Mode S ACAS I interference limits.* An ACAS I that uses Mode S interrogations shall not cause greater interference effects than an ACAS I using Mode A/C interrogations only.

4.3 GENERAL PROVISIONS RELATING TO ACAS II AND ACAS III

Note 1.— The acronym ACAS is used in this section to indicate either ACAS II or ACAS III.

Note 2.— Carriage requirements for ACAS equipment are addressed in Annex 6, Part I, Chapter 6.

Note 3.— The term "equipped threat" is used in this section to indicate a threat fitted with ACAS II or ACAS III.

4.3.1 Functional requirements

4.3.1.1 *ACAS functions.* ACAS shall perform the following functions:

a) surveillance;

b) generation of TAs;

c) threat detection;

d) generation of RAs;

e) coordination; and

f) communication with ground stations.

The equipment shall execute functions b) through e) on each cycle of operation.

Note.— Certain features of these functions must be standardized to ensure that ACAS units cooperate satisfactorily with other ACAS units, with Mode S ground stations and with the ATC system. Each of the features that are standardized is discussed below. Certain other features are given herein as recommendations.

4.3.1.1.1 The duration of a cycle shall not exceed 1.2 s.

4.3.2 Surveillance performance requirements

4.3.2.1 *General surveillance requirements.* ACAS shall interrogate SSR Mode A/C and Mode S transponders in other aircraft and detect the transponder replies. ACAS shall measure the range and relative bearing of responding aircraft. Using these measurements and information conveyed by transponder replies, ACAS shall estimate the relative positions of each responding aircraft. ACAS shall include provisions for achieving such position determination in the presence of ground reflections, interference and variations in signal strength.

4.3.2.1.1 *Track establishment probability.* ACAS shall generate an established track, with at least a 0.90 probability that the track is established 30 s before closest approach, on aircraft equipped with transponders when all of the following conditions are satisfied:

a) the elevation angles of these aircraft are within ±10 degrees relative to the ACAS aircraft pitch plane;

b) the magnitudes of these aircraft's rates of change of altitude are less than or equal to 51 m/s (10 000 ft/min);

c) the transponders and antennas of these aircraft meet the Standards of Chapter 3, 3.1.1 and 3.1.2;

d) the closing speeds and directions of these aircraft, the local density of SSR transponder-equipped aircraft and the number of other ACAS interrogators in the vicinity (as determined by monitoring ACAS broadcasts, 4.3.7.1.2.4) satisfy the conditions specified in Table 4-1; and

e) the minimum slant range is equal to or greater than 300 m (1 000 ft).

Table 4-1. ACAS design assumptions

Conditions									*Performance*
Quadrant						*Maximum traffic density*		*Maximum number of other ACAS within 56 km (30 NM)*	*Probability of success*
Forward		*Side*		*Back*					
Maximum closing speed									
m/s	*kt*	*m/s*	*kt*	*m/s*	*kt*	*aircraft/km^2*	*aircraft/NM^2*		
260	500	150	300	93	180	0.087	0.30	30	0.9
620	1 200	390	750	220	430	0.017	0.06	30	0.9

Note.— Table 4-1 shows the design assumption upon which the development of ACAS was based. Operational experience and simulation show that ACAS provides adequate surveillance for collision avoidance even when the maximum number of other ACAS within 56 km (30 NM) is somewhat higher than that shown in Table 4-1. Future ACAS designs will take account of current and expected ACAS densities.

4.3.2.1.1.1 ACAS shall continue to provide surveillance with no abrupt degradation in track establishment probability as any one of the condition bounds defined in 4.3.2.1.1 is exceeded.

4.3.2.1.1.2 ACAS shall not track Mode S aircraft that report that they are on the ground.

Note.— A Mode S aircraft may report that it is on the ground by coding in the capability (CA) field in a DF = 11 or DF = 17 transmission (Chapter 3, 3.1.2.5.2.2.1) or by coding in the vertical status (VS) field in a DF = 0 transmission (Chapte 3, 3.1.2.8.2.1). Alternatively, if the aircraft is under Mode S ground surveillance, ground status may be determined by monitoring the flight status (FS) field in downlink formats DF = 4, 5, 20 or 21 (Chapter 3, 3.1.2.6.5.1).

4.3.2.1.1.3 **Recommendation.—** *ACAS should achieve the required tracking performance when the average SSR Mode A/C asynchronous reply rate from transponders in the vicinity of the ACAS aircraft is 240 replies per second and when the peak interrogation rate received by the individual transponders under surveillance is 500 per second.*

Note.— The peak interrogation rate mentioned above includes interrogations from all sources.

4.3.2.1.2 *False track probability.* The probability that an established Mode A/C track does not correspond in range and altitude, if reported, to an actual aircraft shall be less than 10^{-2}. For an established Mode S track this probability shall be less than 10^{-6}. These limits shall not be exceeded in any traffic environment.

4.3.2.1.3 *RANGE AND BEARING ACCURACY*

4.3.2.1.3.1 Range shall be measured with a resolution of 14.5 m (1/128 NM) or better.

4.3.2.1.3.2 **Recommendation.—** *The errors in the relative bearings of the estimated positions of intruders should not exceed 10 degrees rms.*

Note.— This accuracy in the relative bearing of intruders is practicable and sufficient as an aid to the visual acquisition of potential threats. In addition, such relative bearing information has been found useful in threat detection, where it can indicate that an intruder is a threat. However, this accuracy is not sufficient as a basis for horizontal RAs, nor is it sufficient for reliable predictions of horizontal miss distance.

4.3.2.2 INTERFERENCE CONTROL

4.3.2.2.1 *Maximum radiated RF power.* The effective radiated power of an ACAS transmission at 0 degree elevation relative to the longitudinal axis of the aircraft shall not exceed 27 dBW.

4.3.2.2.1.1 *Unwanted radiated power.* When ACAS is not transmitting an interrogation, the effective radiated power in any direction shall not exceed –70 dBm.

4.3.2.2.2 *Interference limiting.* Each ACAS interrogator operating below a pressure-altitude of 5 490 m (18 000 ft) shall control its interrogation rate or power or both so as to conform with specific inequalities (4.3.2.2.2.2).

4.3.2.2.2.1 *Determination of the number of other ACAS.* ACAS shall count the number of other ACAS II and III interrogators in the vicinity to ensure that the interference limits are met. This count shall be obtained by monitoring ACAS broadcasts (UF = 16), (4.3.7.1.2.4). Each ACAS shall monitor such broadcast interrogations to determine the number of other ACAS within detection range.

4.3.2.2.2.2 *ACAS interference limiting inequalities.* ACAS shall adjust its interrogation rate and interrogation power such that the following three inequalities remain true, except as provided in 4.3.2.2.2.2.1.

$$\{\sum_{i=1}^{i_1}\left[\frac{p(i)}{250}\right]^{\alpha}\} < minimum\left[\frac{280}{1+n_a},\frac{11}{\alpha^2}\right] \qquad (1)$$

$$\{\sum_{i=1}^{i_1} m(i)\} < 0.01 \qquad (2)$$

$$\{\frac{1}{B}\sum_{k=1}^{k_1}\frac{P_a(k)}{250}\} < minimum\left[\frac{80}{1+n_a},3\right] \qquad (3)$$

The variables in these inequalities shall be defined as follows:

i_t = number of interrogations (Mode A/C and Mode S) transmitted in a 1 s interrogation cycle;

i = index number for Mode A/C and Mode S interrogations, $i = 1, 2,..., i_t$;

α = the minimum of α_1 calculated as 1/4 $[n_b/n_c]$ subject to the special conditions given below and α_2 calculated as Log_{10} $[n_a/n_b]$ / Log_{10} 25, where n_b and n_c are defined as the number of operating ACAS II and ACAS III equipped aircraft (airborne or on the ground) within 11.2 km (6 NM) and 5.6 km (3 NM) respectively, of own ACAS (based on ACAS surveillance). ACAS aircraft operating at or below a radio altitude of 610 m (2 000 ft) AGL shall include both airborne and on-ground ACAS II and ACAS III aircraft in the value for n_b and n_c. Otherwise, ACAS shall include only airborne ACAS II and ACAS III aircraft in the value for n_b and n_c. The value of a is further constrained to a minimum of 0.5 and a maximum of 1.0.

In addition;

IF $[(n_b \leq 1)$ OR $(n_b > 4n_c)$ OR $(n_b \leq 4$ AND $n_c \leq 2$ AND $n_a > 25)]$ THEN $\alpha_1 = 1.0$,

IF $[(n_c > 2)$ AND $(n_b > 2\ n_c)$ AND $(n_a < 40)]$ THEN $\alpha_1 = 0.5$;

$p(i)$ = peak power radiated from the antenna in all directions of the pulse having the largest amplitude in the group of pulses comprising a single interrogation during the *i*th interrogation in a 1 s interrogation cycle, W;

$m(i)$ = duration of the mutual suppression interval for own transponder associated with the *i*th interrogation in a 1 s interrogation cycle, s;

B = beam sharpening factor (ratio of 3 dB beam width to beamwidth resulting from interrogation side-lobe suppression). For ACAS interrogators that employ transmitter side-lobe suppression (SLS), the appropriate beamwidth shall be the extent in azimuth angle of the Mode A/C replies from one transponder as limited by SLS, averaged over the transponder population;

{ } see 4.2.3.3.3

$P_a(k)$ "
k "
k_t "
n_a "

Note.— RA and ACAS broadcasts (4.3.6.2.1 and 4.3.7.1.2.4) are interrogations.

4.3.2.2.2.2.1 *Transmissions during RAs.* All air-to-air coordination interrogations and RA and ACAS broadcasts shall be transmitted at full power and these interrogations shall be excluded from the summations of Mode S interrogations in the left-hand terms of inequalities (1) and (2) in 4.3.2.2.2.2 for the duration of the RA.

4.3.2.2.2.2.2 *Transmissions from ACAS units on the ground.* Whenever the ACAS aircraft indicates that it is on the ground, ACAS interrogations shall be limited by setting the number of other ACAS II and III aircraft (n_a) count in the interference limiting inequalities to a value that is three times the value obtained based on ACAS broadcasts received with a transponder receiver threshold of –74 dBm. Whenever Mode A/C interrogation power is reduced because of interference limiting, the Mode A/C interrogation power in the forward beam shall be reduced first until the forward sequence matches the right and left sequences. The forward, right and left interrogation powers shall then sequentially be reduced until they match the rear interrogation power. Further reduction of Mode A/C power shall be accomplished by sequentially reducing the forward, side and rear interrogation powers.

4.3.2.2.2.2.3 *Transmissions from ACAS units above 5 490 m (18 000 ft) altitude.* Each ACAS interrogator operating above a pressure-altitude of 5 490 m (18 000 ft) shall control its interrogation rate or power or both such that inequalities (1) and (3) in 4.3.2.2.2.2 remain true when n_a and a are equal to 1, except as provided in 4.3.2.2.2.2.1.

4.3.3 Traffic advisories (TAs)

4.3.3.1 *TA function.* ACAS shall provide TAs to alert the flight crew to potential threats. Such TAs shall be accompanied by an indication of the approximate relative position of potential threats.

4.3.3.2 PROXIMATE TRAFFIC DISPLAY

Recommendation.— *While any RA and/or TA are displayed, proximate traffic within 11 km (6 NM) range and, if altitude reporting, ±370 m (1 200 ft) altitude should be displayed. This proximate traffic should be distinguished (e.g. by colour or symbol type) from threats and potential threats, which should be more prominently displayed.*

4.3.3.3 *TAs as RA precursors.* The criteria for TAs shall be such that they are satisfied before those for an RA.

4.3.3.3.1 *TA warning time.* For intruders reporting altitude, the nominal TA warning time shall not be greater than (T+20 s) where T is the nominal warning time for the generation of the resolution advisory.

Note.— Ideally, RAs would always be preceded by a TA but this is not always possible, e.g. the RA criteria might be already satisfied when a track is first established, or a sudden and sharp manoeuvre by the intruder could cause the TA lead time to be less than a cycle.

4.3.4 Threat detection

4.3.4.1 *Declaration of threat.* ACAS shall evaluate appropriate characteristics of each intruder to determine whether or not it is a threat.

4.3.4.1.1 *Intruder characteristics.* As a minimum, the characteristics of an intruder that are used to identify a threat shall include:

a) tracked altitude;

b) tracked rate of change of altitude;

c) tracked slant range;

d) tracked rate of change of slant range; and

e) sensitivity level of intruder's ACAS, S_i.

For an intruder not equipped with ACAS II or ACAS III, S_i shall be set to 1.

4.3.4.1.2 *Own aircraft characteristics.* As a minimum, the characteristics of own aircraft that are used to identify a threat shall include:

a) altitude;

b) rate of change of altitude; and

c) sensitivity level of own ACAS (4.3.4.3).

4.3.4.2 *Sensitivity levels.* ACAS shall be capable of operating at any of a number of sensitivity levels. These shall include:

a) *S* = 1, a "standby" mode in which the interrogation of other aircraft and all advisories are inhibited;

b) *S* = 2, a "TA only" mode in which RAs are inhibited; and

c) *S* = 3-7, further levels that enable the issue of RAs that provide the warning times indicated in Table 4-2 as well as TAs.

4.3.4.3 *Selection of own sensitivity level (S_o).* The selection of own ACAS sensitivity level shall be determined by sensitivity level control (SLC) commands which shall be accepted from a number of sources as follows:

a) SLC command generated automatically by ACAS based on altitude band or other external factors;

b) SLC command from pilot input; and

c) SLC command from Mode S ground stations.

4.3.4.3.1 *Permitted SLC command codes.* As a minimum, the acceptable SLC command codes shall include:

	Coding
for SLC based on altitude band	2-7
for SLC from pilot input	0,1,2
for SLC from Mode S ground stations	0,2-6

4.3.4.3.2 *Altitude-band SLC command.* Where ACAS selects an SLC command based on altitude, hysteresis shall be applied to the nominal altitude thresholds at which SLC command value changes are required as follows: for a climbing ACAS aircraft the SLC command shall be increased at the appropriate altitude threshold plus the hysteresis value; for a descending ACAS aircraft the SLC command shall be decreased at the appropriate altitude threshold minus the hysteresis value.

4.3.4.3.3 *Pilot SLC command.* For the SLC command set by the pilot the value 0 shall indicate the selection of the "automatic" mode for which the sensitivity level selection shall be based on the other commands.

Table 4-2

Sensitivity level	*2*	*3*	*4*	*5*	*6*	*7*
Nominal warning time	no RAs	15s	20s	25s	30s	35s

4.3.4.3.4 *Mode S ground station SLC command.* For SLC commands transmitted via Mode S ground stations (4.3.8.4.2.1.1), the value 0 shall indicate that the station concerned is not issuing an SLC command and that sensitivity level selection shall be based on the other commands, including non-0 commands from other Mode S ground stations. ACAS shall not process an uplinked SLC value of 1.

4.3.4.3.4.1 *ATS selection of SLC command code.* ATS authorities shall ensure that procedures are in place to inform pilots of any ATS selected SLC command code other than 0 (4.3.4.3.1).

4.3.4.3.5 *Selection rule.* Own ACAS sensitivity level shall be set to the smallest non-0 SLC command received from any of the sources listed in 4.3.4.3.

4.3.4.4 *Selection of parameter values for RA generation.* When the sensitivity level of own ACAS is 3 or greater, the parameter values used for RA generation that depend on sensitivity level shall be based on the greater of the sensitivity level of own ACAS, S_o, and the sensitivity level of the intruder's ACAS, S_i.

4.3.4.5 *Selection of parameter values for TA generation.* The parameter values used for TA generation that depend on sensitivity level shall be selected on the same basis as those for RAs (4.3.4.4) except when an SLC command with a value of 2 ("TA only" mode) has been received from either the pilot or a Mode S ground station. In this case, the parameter values for TA generation shall retain the values they would have had in the absence of the SLC command from the pilot or Mode S ground station.

4.3.5 Resolution advisories (RAs)

4.3.5.1 *RA generation.* For all threats, ACAS shall generate an RA except where it is not possible to select an RA that can be predicted to provide adequate separation either because of uncertainty in the diagnosis of the intruder's flight path or because there is a high risk that a manoeuvre by the threat will negate the RA.

4.3.5.1.1 *RA cancellation.* Once an RA has been generated against a threat or threats it shall be maintained or modified until tests that are less stringent than those for threat detection indicate on two consecutive cycles that the RA may be cancelled, at which time it shall be cancelled.

4.3.5.2 *RA selection.* ACAS shall generate the RA that is predicted to provide adequate separation from all threats and that has the least effect on the current flight path of the ACAS aircraft consistent with the other provisions in this chapter.

4.3.5.3 *RA effectiveness.* The RA shall not recommend or continue to recommend a manoeuvre or manoeuvre restriction that, considering the range of probable threat trajectories, is more likely to reduce separation than increase it, subject to the provisions in 4.3.5.5.1.1 and 4.3.5.6.

Note.— See also 4.3.5.8.

4.3.5.4 *Aircraft capability.* The RA generated by ACAS shall be consistent with the performance capability of the aircraft.

4.3.5.4.1 *Proximity to the ground.* Descend RAs shall not be generated or maintained when own aircraft is below 300 m (1 000 ft) AGL.

4.3.5.4.2 ACAS shall not operate in sensitivity levels 3-7 when own aircraft is below 300 m (1 000 ft) AGL.

4.3.5.5 *Reversals of sense.* ACAS shall not reverse the sense of an RA from one cycle to the next, except as permitted in 4.3.5.5.1 to ensure coordination or when the predicted separation at closest approach for the existing sense is inadequate.

4.3.5.5.1 *Sense reversals against equipped threats.* If an RAC received from an equipped threat is incompatible with the current RA sense, ACAS shall modify the RA sense to conform with the received RAC if own aircraft address is higher in value than that of the threat.

Note.— 4.3.6.1.3 requires that the own ACAS RAC for the threat is also reversed.

4.3.5.5.1.1 ACAS shall not modify an RA sense in a way that makes it incompatible with an RAC received from an equipped threat if own aircraft address is higher in value than that of the threat.

4.3.5.6 *RA strength retention.* Subject to the requirement that a descend RA is not generated at low altitude (4.3.5.4.1), an RA shall not be modified if the time to closest approach is too short to achieve a significant response or if the threat is diverging in range.

4.3.5.7 *Weakening an RA.* An RA shall not be weakened if it is likely that it would subsequently need to be strengthened.

4.3.5.8 *ACAS-equipped threats.* The RA shall be compatible with all the RACs transmitted to threats (4.3.6.1.3). If an RAC is received from a threat before own ACAS generates an RAC for that threat, the RA generated shall be compatible with the RAC received unless such an RA is more likely to reduce separation than increase it and own aircraft address is lower in value than that of the threat.

Note.— In encounters with more than one threat where it is necessary to pass above some threats and below other threats, this standard can be interpreted as referring to the whole duration of the RA. Specifically, it is permissible to retain an RA to climb (descend) towards a threat that is above (below) own aircraft provided there is a calculated intention to provide adequate separation from all threats by subsequently levelling-off.

4.3.5.9 *Encoding of ARA subfield.* On each cycle of an RA, the RA sense, strength and attributes shall be encoded in the active RA (ARA) subfield (4.3.8.4.2.2.1.1). If the ARA subfield has not been refreshed for an interval of 6 s, it shall be set to 0, along with the MTE subfield in the same message (4.3.8.4.2.2.1.3).

4.3.5.10 *System response time.* The system delay from receipt of the relevant SSR reply to presentation of an RA sense and strength to the pilot shall be as short as possible and shall not exceed 1.5 s.

4.3.6 Coordination and communication

4.3.6.1 PROVISIONS FOR COORDINATION WITH ACAS-EQUIPPED THREATS

4.3.6.1.1 *Multi-aircraft coordination.* In a multi-aircraft situation, ACAS shall coordinate with each equipped threat individually.

4.3.6.1.2 *Data protection during coordination.* ACAS shall prevent simultaneous access to stored data by concurrent processes, in particular, during resolution message processing.

4.3.6.1.3 *Coordination interrogation.* Each cycle ACAS shall transmit a coordination interrogation to each equipped threat, unless generation of an RA is delayed because it is not possible to select an RA that can be predicted to provide adequate separation (4.3.5.1). The resolution message transmitted to a threat shall include an RAC selected for that threat. If an RAC has been received from the threat before ACAS selects an RAC for that threat, the selected RAC shall be compatible with the received RAC unless no more than three cycles have elapsed since the RAC was received, the RAC is altitude-crossing, and own aircraft address is lower in value than that of the threat in which case ACAS shall select its RA independently. If an RAC received from an equipped threat is incompatible with the RAC own ACAS has selected for that threat, ACAS shall modify the selected RAC to be compatible with the received RAC if own aircraft address is higher in value than that of the threat.

Note.— The RAC included in the resolution message is in the form of a vertical RAC (VRC) for ACAS II (4.3.8.4.2.3.2.2) and a vertical RAC (VRC) and/or horizontal RAC (HRC) for ACAS III.

4.3.6.1.3.1 *Coordination termination*. Within the cycle during which an intruder ceases to be a reason for maintaining the RA, ACAS shall send a resolution message to that intruder by means of a coordination interrogation. The resolution message shall include the cancellation code for the last RAC sent to that intruder while it was a reason for maintaining the RA.

Note.— During an encounter with a single threat, the threat ceases to be a reason for the RA when the conditions for cancelling the RA are met. During an encounter with multiple threats, a threat ceases to be a reason for the RA when the conditions for cancelling the RA are met in respect of that threat, even though the RA may have to be maintained because of other threats.

4.3.6.1.3.2 ACAS coordination interrogations shall be transmitted until a coordination reply is received from the threat, up to a maximum of not less than six and not more than twelve attempts. The successive interrogations shall be nominally equally spaced over a period of 100 ±5 ms. If the maximum number of attempts is made and no reply is received, ACAS shall continue its regular processing sequence.

4.3.6.1.3.3 ACAS shall provide parity protection (4.3.8.4.2.3.2.6 and 4.3.8.4.2.3.2.7) for all fields in the coordination interrogation that convey RAC information.

Note.— This includes the vertical RAC (VRC), the cancel vertical RAC (CVC), the horizontal RAC (HRC) and the cancel horizontal RAC (CHC).

4.3.6.1.3.4 Whenever own ACAS reverses its sense against an equipped threat, the resolution message that is sent on the current and subsequent cycles to that threat shall contain both the newly selected RAC and the cancellation code for the RAC sent before the reversal.

4.3.6.1.3.5 When a vertical RA is selected, the vertical RAC (VRC) (4.3.8.4.2.3.2.2) that own ACAS includes in a resolution message to the threat shall be as follows:

a) "do not pass above" when the RA is intended to provide separation above the threat;

b) "do not pass below" when the RA is intended to provide separation below the threat.

4.3.6.1.4 *Resolution message processing.* Resolution messages shall be processed in the order in which they are received and with delay limited to that required to prevent possible concurrent access to stored data and delays due to the processing of previously received resolution messages. Resolution messages that are being delayed shall be temporarily queued to prevent possible loss of messages. Processing a resolution message shall include decoding the message and updating the appropriate data structures with the information extracted from the message.

Note.— According to 4.3.6.1.2, resolution message processing must not access any data whose usage is not protected by the coordination lock state.

4.3.6.1.4.1 An RAC or an RAC cancellation received from another ACAS shall be rejected if the encoded sense bits indicate the existence of a parity error or if undefined value(s) are detected in the resolution message. An RAC or an RAC cancellation received without parity errors and without undefined resolution message values shall be considered valid.

4.3.6.1.4.2 *RAC storage.* A valid RAC received from another ACAS shall be stored or shall be used to update the previously stored RAC corresponding to that ACAS. A valid RAC cancellation shall cause the previously stored RAC to be deleted. A stored RAC that has not been updated for an interval of 6 s shall be deleted.

4.3.6.1.4.3 *RAC record update.* A valid RAC or RAC cancellation received from another ACAS shall be used to update the RAC record. If a bit in the RAC record has not been refreshed for an interval of 6 s by any threat, that bit shall be set to 0.

4.3.6.2 PROVISIONS FOR ACAS COMMUNICATION WITH GROUND STATIONS

4.3.6.2.1 *Air-initiated downlink of ACAS RAs.* When an ACAS RA exists, ACAS shall:

a) transfer to its Mode S transponder an RA report for transmission to the ground in a Comm-B reply (4.3.11.4.1); and

b) transmit periodic RA broadcasts (4.3.7.3.2).

4.3.6.2.2 *Sensitivity level control (SLC) command.* ACAS shall store SLC commands from Mode S ground stations. An SLC command received from a Mode S ground station shall remain effective until replaced by an SLC command from the same ground station as indicated by the site number contained in the IIS subfield of the interrogation. If an existing stored command from a Mode S ground station is not refreshed within 4 minutes, or if the SLC command received has the value 15 (4.3.8.4.2.1.1), the stored SLC command for that Mode S ground station shall be set to 0.

4.3.6.3 PROVISIONS FOR DATA TRANSFER BETWEEN ACAS AND ITS MODE S TRANSPONDER

4.3.6.3.1 *Data transfer from ACAS to its Mode S transponder:*

a) ACAS shall transfer RA information to its Mode S transponder for transmission in an RA report (4.3.8.4.2.2.1) and in a coordination reply (4.3.8.4.2.4.2);

b) ACAS shall transfer current sensitivity level to its Mode S transponder for transmission in a sensitivity level report (4.3.8.4.2.5); and

c) ACAS shall transfer capability information to its Mode S transponder for transmission in a data link capability report (4.3.8.4.2.2.2).

4.3.6.3.2 *Data transfer from Mode S transponder to its ACAS:*

a) ACAS shall receive from its Mode S transponder sensitivity level control commands (4.3.8.4.2.1.1) transmitted by Mode S ground stations;

b) ACAS shall receive from its Mode S transponder ACAS broadcast messages (4.3.8.4.2.3.3) transmitted by other ACAS; and

c) ACAS shall receive from its Mode S transponder resolution messages (4.3.8.4.2.3.2) transmitted by other ACAS for air-air coordination purposes.

4.3.7 ACAS protocols

4.3.7.1 SURVEILLANCE PROTOCOLS

4.3.7.1.1 *Surveillance of Mode A/C transponders.* ACAS shall use the Mode C-only all-call interrogation (Chapter 3, 3.1.2.1.5.1.2) for surveillance of aircraft equipped with Mode A/C transponders.

4.3.7.1.2 *SURVEILLANCE OF MODE S TRANSPONDERS*

4.3.7.1.2.1 *Detection.* ACAS shall monitor 1 090 MHz for Mode S acquisition squitters (DF = 11). ACAS shall detect the presence and determine the address of Mode S-equipped aircraft using their Mode S acquisition squitters (DF = 11) or extended squitters (DF = 17).

Note 1.— It is acceptable to acquire individual aircraft using either acquisition or extended squitters (DF = 11 or DF = 17), and to monitor for both squitters. However, ACAS must monitor for acquisition squitters because, at any time, not all aircraft will transmit the extended squitter.

Note 2.— If, in the future, it becomes permitted for aircraft not to transmit the acquisition squitter, relying instead on continual transmission of the extended squitter, it would become essential for all ACAS units to monitor for both the acquisition and the extended squitters.

4.3.7.1.2.2 *Surveillance interrogations.* On first receipt of a 24-bit aircraft address from an aircraft that is determined to be within the reliable surveillance range of ACAS based on reception reliability and that is within an altitude band 3 050 m (10 000 ft) above and below own aircraft, ACAS shall transmit a short air-air interrogation (UF = 0) for range acquisition. Surveillance interrogations shall be transmitted at least once every five cycles when this altitude condition is satisfied. Surveillance interrogations shall be transmitted each cycle if the range of the detected aircraft is less than 5.6 km (3 NM) or the calculated time to closest approach is less than 60 s, assuming that both the detected and own aircraft proceed from their current positions with unaccelerated motion and that the range at closest approach equals 5.6 km (3 NM). Surveillance interrogations shall be suspended for a period of five cycles if:

a) a reply was successfully received; and

b) own aircraft and intruder aircraft are operating below a pressure-altitude of 5 490 m (18 000 ft); and

c) the range of the detected aircraft is greater than 5.6 km (3 NM) and the calculated time to closest approach exceeds 60 seconds, assuming that both the detected and own aircraft proceed from their current positions with unaccelerated motion and that the range at closest approach equals 5.6 km (3 NM).

4.3.7.1.2.2.1 *Range acquisition interrogations.* ACAS shall use the short air-air surveillance format (UF = 0) for range acquisition. ACAS shall set AQ = 1 (Chapter 3, 3.1.2.8.1.1) and RL = 0 (Chapter 3, 3.1.2.8.1.2) in an acquisition interrogation.

Note 1.— Setting AQ = 1 results in a reply with bit 14 of the RI field equal to 1 and serves as an aid in distinguishing the reply to own interrogation from replies elicited from other ACAS units (4.3.7.1.2.2.2).

Note 2.— In the acquisition interrogation RL is set to 0 to command a short acquisition reply (DF = 0).

4.3.7.1.2.2.2 *Tracking interrogations.* ACAS shall use the short air-air surveillance format (UF = 0) with RL = 0 and AQ = 0 for tracking interrogations.

4.3.7.1.2.3 *Surveillance replies.* These protocols are described in 4.3.11.3.1.

4.3.7.1.2.4 *ACAS broadcast.* An ACAS broadcast shall be made nominally every 8 to 10 s at full power from the top antenna. Installations using directional antennas shall operate such that complete circular coverage is provided nominally every 8 to 10 s.

Note.— A broadcast causes other Mode S transponders to accept the interrogation without replying and to present the interrogation content containing the MU field at the transponder output data interface. The UDS1 = 3, UDS2 = 2 combination identifies the data as an ACAS broadcast containing the 24-bit address of the interrogating ACAS aircraft. This provides each ACAS with a means of determining the number of other ACAS within its detection range for limiting interference. The format of the MU field is described in 4.3.8.4.2.3.

4.3.7.2 AIR-AIR COORDINATION PROTOCOLS

4.3.7.2.1 *Coordination interrogations.* ACAS shall transmit UF = 16 interrogations (Chapter 3, 3.1.2.3.2, Figure 3-7) with AQ = 0 and RL = 1 when another aircraft reporting RI = 3 or 4 is declared a threat (4.3.4). The MU field shall contain the resolution message in the subfields specified in 4.3.8.4.2.3.2.

Note 1.— A UF = 16 interrogation with AQ = 0 and RL = 1 is intended to cause a DF = 16 reply from the other aircraft.

Note 2.— An aircraft reporting RI = 3 or RI = 4 is an aircraft equipped with an operating ACAS which has vertical only or vertical and horizontal resolution capability, respectively.

4.3.7.2.2 *Coordination reply.* These protocols are described in 4.3.11.3.2.

4.3.7.3 PROTOCOLS FOR ACAS COMMUNICATION WITH GROUND STATIONS

4.3.7.3.1 *RA reports to Mode S ground stations.* These protocols are described in 4.3.11.4.1.

4.3.7.3.2 *RA broadcasts.* RA broadcasts shall be transmitted at full power from the bottom antenna at jittered, nominally 8 s intervals for the period that the RA is indicated. The RA broadcast shall include the MU field as specified in 4.3.8.4.2.3.4. The RA broadcast shall describe the most recent RA that existed during the preceding 8 s period. Installations using directional antennas shall operate such that complete circular coverage is provided nominally every 8 s and the same RA sense and strength is broadcast in each direction.

4.3.7.3.3 *Data link capability report.* These protocols are described in 4.3.11.4.2.

4.3.7.3.4 *ACAS sensitivity level control.* ACAS shall act upon an SLC command if and only if TMS (Chapter 3, 3.1.2.6.1.4.1) has the value 0 and DI is either 1 or 7 in the same interrogation.

4.3.8 Signal formats

4.3.8.1 The RF characteristics of all ACAS signals shall conform to the Standards of Chapter 3, 3.1.1.1 through 3.1.1.6, 3.1.2.1 through 3.1.2.3, 3.1.2.5 and 3.1.2.8.

4.3.8.2 RELATIONSHIP BETWEEN ACAS AND MODE S SIGNAL FORMATS

Note.— ACAS uses Mode S transmissions for surveillance and communications. ACAS air-air communication functions permit RA decisions to be coordinated with ACAS-equipped threats. ACAS air-ground communication functions permit the reporting of RAs to ground stations and the uplinking of commands to ACAS-equipped aircraft to control parameters of the collision avoidance algorithms.

4.3.8.3 *Signal format conventions.* The data encoding of all ACAS signals shall conform to the Standards of Chapter 3, 3.1.2.3.

Note.— In air-air transmissions used by ACAS, interrogations transmitted at 1 030 MHz are designated as uplink transmissions and contain uplink format (UF) codes. Replies received at 1 090 MHz are designated as downlink transmissions and contain downlink format (DF) codes.

4.3.8.4 FIELD DESCRIPTION

Note 1.— The air-air surveillance and communication formats which are used by ACAS but not fully described in Chapter 3, 3.1.2 are given in Figure 4-1.

Uplink:										
UF = 0	00000	3	RL:1	4	AQ:1	18	AP:24

Figure 4-1. Surveillance and communication formats used by ACAS

Note 2.— This section defines the Mode S fields (and their subfields) that are processed by ACAS to accomplish ACAS functions. Some of the ACAS fields (those also used for other SSR Mode S functions) are described with unassigned ACAS codes in Chapter 3, 3.1.2.6. Such codes are assigned in 4.3.8.4.1. Fields and subfields used only by ACAS equipment are assigned in 4.3.8.4.2.

Note 3.— The bit numbering convention used in 4.3.8.4 reflects the bit numbering within the entire uplink or downlink format rather than the bits within individual fields or subfields.

4.3.8.4.1 *FIELDS AND SUBFIELDS INTRODUCED IN CHAPTER 3, 3.1.2*

Note.— Codes for mission fields and subfields that are designated "reserved for ACAS" in Chapter 3, 3.1.2, are specified in this section.

4.3.8.4.1.1 *DR (downlink request).* The significance of the coding of the downlink request field shall be as follows:

Coding	
0-1	See Chapter 3, 3.1.2.6.5.2
2	ACAS message available
3	Comm-B message available and ACAS message available
4-5	See Chapter 3, 3.1.2.6.5.2
6	Comm-B broadcast message 1 available and ACAS message available
7	Comm-B broadcast message 2 available and ACAS message available
8-31	See Chapter 3, 3.1.2.6.5.2

4.3.8.4.1.2 *RI (air-air reply information).* The significance of the coding in the RI field shall be as follows:

Coding	
0	No operating ACAS
1	Not assigned
2	ACAS with resolution capability inhibited
3	ACAS with vertical-only resolution capability
4	ACAS with vertical and horizontal resolution capability
5-7	Not assigned
8-15	See Chapter 3, 3.1.2.8.2.2

Bit 14 of the reply format containing this field shall replicate the AQ bit of the interrogation. The RI field shall report "no operating ACAS" (RI = 0) if the ACAS unit has failed or is in standby. The RI field shall report "ACAS with resolution capability inhibited" (RI = 2) if sensitivity level is 2 or TA only mode has been selected.

Note.— Codes 0-7 in the RI field indicate that the reply is a tracking reply and also give the ACAS capability of the interrogated aircraft. Codes 8-15 indicate that the reply is an acquisition reply and also give the maximum true airspeed capability of the interrogated aircraft.

4.3.8.4.1.3 *RR (reply request).* The significance of the coding in the reply request field shall be as follows:

Coding	
0-18	See Chapter 3, 3.1.2.6.1.2
19	Transmit a resolution advisory report
20-31	See Chapter 3, 3.1.2.6.1.2

4.3.8.4.2 *ACAS FIELDS AND SUBFIELDS*

Note.— The following paragraphs describe the location and coding of those fields and subfields that are not defined in Chapter 3, 3.1.2 but are used by aircraft equipped with ACAS.

4.3.8.4.2.1 *Subfield in MA*

4.3.8.4.2.1.1 *ADS (A-definition subfield).* This 8-bit (33-40) subfield shall define the remainder of MA.

Note.— For convenience of coding, ADS is expressed in two groups of four bits each, ADS1 and ADS2.

4.3.8.4.2.1.2 When ADS1 = 0 and ADS2 = 5, the following subfield shall be contained in MA:

4.3.8.4.2.1.3 *SLC (ACAS sensitivity level control (SLC) command).* This 4-bit (41-44) subfield shall denote a sensitivity level command for own ACAS.

Coding	
0	No command issued
1	Not assigned
2	Set ACAS sensitivity level to 2
3	Set ACAS sensitivity level to 3
4	Set ACAS sensitivity level to 4
5	Set ACAS sensitivity level to 5
6	Set ACAS sensitivity level to 6
7-14	Not assigned
15	Cancel previous SLC command from this ground station

Note.— Structure of MA for a sensitivity level control command:

33	37	41	45
ADS1 = 0	ADS2 = 5	SLC	- - - - - 44 - - - - -
36	40	44	88

4.3.8.4.2.2 *Subfields in MB*

4.3.8.4.2.2.1 *Subfields in MB for an RA report.* When BDS1=3 and BDS2=0, the subfields indicated below shall be contained in MB.

Note.— The requirements for communication of information relating to the current or recent RAs is described in 4.3.11.4.1.

4.3.8.4.2.2.1.1 *ARA (active RAs).* This 14-bit (41-54) subfield shall indicate the characteristics of the RA, if any, generated by the ACAS associated with the transponder transmitting the subfield (4.3.6.2.1 a)). The bits in ARA shall have meanings determined by the value of the MTE subfield (4.3.8.4.2.2.1.4) and, for vertical RAs, the value of bit 41 of ARA. The meaning of bit 41 of ARA shall be as follows:

Coding	
0	There is more than one threat and the RA is intended to provide separation below some threat(s) and above some other threat(s) or no RA has been generated (when MTE = 0)
1	Either there is only one threat or the RA is intended to provide separation in the same direction for all threats

When ARA bit 41 = 1 and MTE = 0 or 1, bits 42-47 shall have the following meanings:

Bit	*Coding*	
42	0	RA is preventive
	1	RA is corrective
43	0	Upward sense RA has been generated
	1	Downward sense RA has been generated
44	0	RA is not increased rate
	1	RA is increased rate
45	0	RA is not a sense reversal
	1	RA is a sense reversal
46	0	RA is not altitude crossing
	1	RA is altitude crossing
47	0	RA is vertical speed limit
	1	RA is positive
48-54		Reserved for ACAS III

When ARA bit 41 = 0 and MTE = 1, bits 42-47 shall have the following meanings:

Bit	*Coding*	
42	0	RA does not require a correction in the upward sense
	1	RA requires a correction in the upward sense
43	0	RA does not require a positive climb
	1	RA requires a positive climb
44	0	RA does not require a correction in the downward sense
	1	RA requires a correction in the downward sense
45	0	RA does not require a positive descend
	1	RA requires a positive descend
46	0	RA does not require a crossing
	1	RA requires a crossing
47	0	RA is not a sense reversal
	1	RA is a sense reversal
48-54		Reserved for ACAS III

Note.— When ARA bit 41 = 0 and MTE = 0, no vertical RA has been generated.

4.3.8.4.2.2.1.2 *RAC (RACs record).* This 4-bit (55-58) subfield shall indicate all the currently active RACs, if any, received from other ACAS aircraft. The bits in RAC shall have the following meanings:

Bit	*Resolution advisory complement*
55	Do not pass below
56	Do not pass above
57	Do not turn left
58	Do not turn right

A bit set to 1 shall indicate that the associated RAC is active. A bit set to 0 shall indicate that the associated RAC is inactive.

4.3.8.4.2.2.1.3 *RAT (RA terminated indicator).* This 1-bit (59) subfield shall indicate when an RA previously generated by ACAS has ceased being generated.

Coding

0	ACAS is currently generating the RA indicated in the ARA subfield
1	The RA indicated by the ARA subfield has been terminated (4.3.11.4.1)

Note 1.— After an RA has been terminated by ACAS, it is still required to be reported by the Mode S transponder for 18±1 s (4.3.11.4.1). The RA terminated indicator may be used, for example, to permit timely removal of an RA indication from an air traffic controller's display, or for assessments of RA duration within a particular airspace.

Note 2.— RAs may terminate for a number of reasons: normally, when the conflict has been resolved and the threat is diverging in range; or when the threat's Mode S transponder for some reason ceases to report altitude during the conflict. The RA terminated indicator is used to show that the RA has been removed in each of these cases.

4.3.8.4.2.2.1.4 *MTE (multiple threat encounter).* This 1-bit (60) subfield shall indicate whether two or more simultaneous threats are currently being processed by the ACAS threat resolution logic.

Coding

0	One threat is being processed by the resolution logic (when ARA bit 41 = 1); or no threat is being processed by the resolution logic (when ARA bit 41 = 0)
1	Two or more simultaneous threats are being processed by the resolution logic

4.3.8.4.2.2.1.5 *TTI (threat type indicator subfield).* This 2-bit subfield (61-62) shall define the type of identity data contained in the TID subfield.

Coding

0	No identity data in TID
1	TID contains a Mode S transponder address
2	TID contains altitude, range and bearing data
3	Not assigned

4.3.8.4.2.2.1.6 *TID (threat identity data subfield).* This 26-bit subfield (63-88) shall contain the Mode S address of the threat or the altitude, range, and bearing if the threat is not Mode S equipped. If two or more threats are simultaneously processed by the ACAS resolution logic, TID shall contain the identity or position data for the most recently declared threat. If TTI = 1, TID shall contain in bits 63-86 the aircraft address of the threat, and bits 87 and 88 shall be set to 0. If TTI = 2, TID shall contain the following three subfields.

4.3.8.4.2.2.1.6.1 *TIDA (threat identity data altitude subfield).* This 13-bit subfield (63-75) shall contain the most recently reported Mode C altitude code of the threat.

Coding

Bit	63	64	65	66	67	68	69	70	71	72	73	74	75
Mode C code bit	C_1	A_1	C_2	A_2	C_4	A_4	0	B_1	D_1	B_2	D_2	B_4	D_4

4.3.8.4.2.2.1.6.2 *TIDR (threat identity data range subfield).* This 7-bit subfield (76-82) shall contain the most recent threat range estimated by ACAS.

Coding (n)

n	*Estimated range (NM)*
0	No range estimate available
1	Less than 0.05
2-126	(*n*-1)/10 ±0.05
127	Greater than 12.55

4.3.8.4.2.2.1.6.3 *TIDB (threat identity data bearing subfield).* This 6-bit subfield (83-88) shall contain the most recent estimated bearing of the threat aircraft, relative to the ACAS aircraft heading.

Coding (n)

n	*Estimated bearing (degrees)*
0	No bearing estimate available
1-60	Between 6(*n*-1) and 6*n*
61-63	*Not assigned*

Note.— Structure of MB for an RA report:

33	37	41	55	59	60	61	63
BDS1 = 3	BDS2 = 0	ARA	RAC	RAT	MTE	TTI = 1	TID
36	40	54	58	59	60	62	88

33	37	41	55	59	60	61	63	76	83
BDS1 = 3	BDS2 = 0	ARA	RAC	RAT	MTE	TTI = 2	TIDA	TIDR	TIDB
36	40	54	58	59	60	62	75	82	88

4.3.8.4.2.2.2 *Subfields in MB for the data link capability report.* When BDS1 = 1 and BDS2 = 0, the following bit patterns shall be provided to the transponder for its data link capability report:

Bit	*Coding*
48	0 ACAS failed or on standby
	1ACAS operating
69	0 ACAS II
	1ACAS III
70	0 ACAS generating TAs only
	1 ACAS generating TAs and RAs
71	0 ACAS not fitted
	1 ACAS fitted
72	0 Hybrid surveillance not fitted
	1 Hybrid surveillance fitted

Note 1.— A summary of the MB subfields for the data link capability report structure is described in Chapter 3, 3.1.2.6.10.2.2.

Note 2.— The use of hybrid surveillance to limit ACAS active interrogations is described in 4.5.1. The ability only to support decoding of DF = 17 extended squitter messages is not sufficient to set bit 72.

4.3.8.4.2.3 *MU field.* This 56-bit (33-88) field of long air-air surveillance interrogations (Figure 4-1) shall be used to transmit resolution messages, ACAS broadcasts and RA broadcasts.

4.3.8.4.2.3.1 *UDS (U-definition subfield).* This 8-bit (33-40) subfield shall define the remainder of MU.

Note.— For convenience in coding, UDS is expressed in two groups of four bits each, UDS1 and UDS2.

4.3.8.4.2.3.2 *Subfields in MU for a resolution message.* When UDS1 = 3 and UDS2 = 0 the following subfields shall be contained in MU:

4.3.8.4.2.3.2.1 *MTB (multiple threat bit).* This 1-bit (42) subfield shall indicate the presence or absence of multiple threats.

Coding

0 Interrogating ACAS has one threat
1 Interrogating ACAS has more than one threat

4.3.8.4.2.3.2.2 *VRC (vertical RAC).* This 2-bit (45-46) subfield shall denote a vertical RAC relating to the addressed aircraft.

Coding

0 No vertical RAC sent
1 Do not pass below
2 Do not pass above
3 Not assigned

4.3.8.4.2.3.2.3 *CVC (cancel vertical RAC).* This 2-bit (43-44) subfield shall denote the cancellation of a vertical RAC previously sent to the addressed aircraft. This subfield shall be set to 0 for a new threat.

Coding

0 No cancellation
1 Cancel previously sent “Do not pass below”
2 Cancel previously sent “Do not pass above”
3 Not assigned

4.3.8.4.2.3.2.4 *HRC (horizontal RAC).* This 3-bit (50-52) subfield shall denote a horizontal RAC relating to the addressed aircraft.

Coding

0 No horizontal RAC or no horizontal resolution capability
1 Other ACAS sense is turn left; do not turn left
2 Other ACAS sense is turn left; do not turn right
3 Not assigned
4 Not assigned
5 Other ACAS sense is turn right; do not turn left
6 Other ACAS sense is turn right; do not turn right
7 Not assigned

4.3.8.4.2.3.2.5 *CHC (cancel horizontal RAC).* This 3-bit (47-49) subfield shall denote the cancellation of a horizontal RAC previously sent to the addressed aircraft. This subfield shall be set to 0 for a new threat.

Coding	
0	No cancellation or no horizontal resolution capability
1	Cancel previously sent "Do not turn left"
2	Cancel previously sent "Do not turn right"
3-7	Not assigned

4.3.8.4.2.3.2.6 *VSB (vertical sense bits subfield).* This 4-bit (61-64) subfield shall be used to protect the data in the CVC and VRC subfields. For each of the 16 possible combinations of bits 43-46 the following VSB code shall be transmitted:

	CVC		VRC		VSB			
Coding	43	44	45	46	61	62	63	64
0	0	0	0	0	0	0	0	0
1	0	0	0	1	1	1	1	0
2	0	0	1	0	0	1	1	1
3	0	0	1	1	1	0	0	1
4	0	1	0	0	1	0	1	1
5	0	1	0	1	0	1	0	1
6	0	1	1	0	1	1	0	0
7	0	1	1	1	0	0	1	0
8	1	0	0	0	1	1	0	1
9	1	0	0	1	0	0	1	1
10	1	0	1	0	1	0	1	0
11	1	0	1	1	0	1	0	0
12	1	1	0	0	0	1	1	0
13	1	1	0	1	1	0	0	0
14	1	1	1	0	0	0	0	1
15	1	1	1	1	1	1	1	1

Note.— The rule used to generate the VSB subfield bit setting is a distance 3 Hamming code augmented with a parity bit, producing the ability to detect up to three errors in the eight transmitted bits.

4.3.8.4.2.3.2.7 *HSB (horizontal sense bits subfield).* This 5-bit (56-60) subfield shall be used to protect the data in the CHC and HRC subfields. For each of the 64 possible combinations of bits 47-52 the following HSB code shall be transmitted:

	CHC			HRC			HSB				
Coding	47	48	49	50	51	52	56	57	58	59	60
0	0	0	0	0	0	0	0	0	0	0	0
1	0	0	0	0	0	1	0	1	0	1	1
2	0	0	0	0	1	0	1	0	0	1	1
3	0	0	0	0	1	1	1	1	0	0	0
4	0	0	0	1	0	0	1	1	1	0	0

62	1	1	1	1	1	0	0	1	1	1	0
63	1	1	1	1	1	1	0	0	1	0	1

Note.— The rule used to generate the HSB subfield bit setting is a distance 3 Hamming code augmented with a parity bit, producing the ability to detect up to three errors in the eleven transmitted bits.

4.3.8.4.2.3.2.8 *MID (Aircraft address).* This 24-bit (65-88) subfield shall contain the 24-bit aircraft address of the interrogating ACAS aircraft.

Note.— Structure of MU for a resolution message:

33	37	41	42	43	45	47	50	53	56	61	65
UDS1 = 3	UDS2 = 0	-1-	MTB	CVC	VRC	CHC	HRC	-3-	HSB	VSB	MID
36	40	41	42	44	46	49	52	55	60	64	88

4.3.8.4.2.3.3 *Subfield in MU for an ACAS broadcast.* When UDS1 = 3 and UDS2 = 2, the following subfield shall be contained in MU:

4.3.8.4.2.3.3.1 *MID (Aircraft address).* This 24-bit (65-88) subfield shall contain the 24-bit aircraft address of the interrogating ACAS aircraft.

Note.— Structure of MU for an ACAS broadcast:

33	37	41	65
UDS1 = 3	UDS2 = 2	- - - - - - 24 - - - - - -	MID
36	40	64	88

4.3.8.4.2.3.4 *Subfields in MU for an RA broadcast.* When UDS1 = 3 and UDS2 = 1, the following subfields shall be contained in MU:

4.3.8.4.2.3.4.1 *ARA (active RAs).* This 14-bit (41-54) subfield shall be coded as defined in 4.3.8.4.2.2.1.1.

4.3.8.4.2.3.4.2 *RAC (RACs record).* This 4-bit (55-58) subfield shall be coded as defined in 4.3.8.4.2.2.1.2.

4.3.8.4.2.3.4.3 *RAT (RA terminated indicator).* This 1-bit (59) subfield shall be coded as defined in 4.3.8.4.2.2.1.3.

4.3.8.4.2.3.4.4 *MTE (multiple threat encounter).* This 1-bit (60) subfield shall be coded as defined in 4.3.8.4.2.2.1.4.

4.3.8.4.2.3.4.5 *AID (Mode A identity code).* This 13-bit (63-75) subfield shall denote the Mode A identity code of the reporting aircraft.

Coding

Bit	63	64	65	66	67	68	69	70	71	72	73	74	75
Mode A code bit	C_1	A_1	C_2	A_2	C_4	A_4	0	B_1	D_1	B_2	D_2	B_4	D_4

4.3.8.4.2.3.4.6 *CAC (Mode C altitude code).* This 13-bit (76-88) subfield shall denote the Mode C altitude code of the reporting aircraft.

Coding

Bit	76	77	78	79	80	81	82	83	84	85	86	87	88
Mode C code bit	C_1	A_1	C_2	A_2	C_4	A_4	0	B_1	D_1	B_2	D_2	B_4	D_4

Note.— Structure of MU for an RA broadcast:

33	37	41	55	59	60	61	63	76
UDS1 = 3	UDS2 = 1	ARA	RAC	RAT	MTE	-2-	AID	CAC
36	40	54	58	59	60	62	75	88

4.3.8.4.2.4 *MV field.* This 56-bit (33-88) field of long air-air surveillance replies (Figure 4-1) shall be used to transmit air-air coordination reply messages.

4.3.8.4.2.4.1 *VDS (V-definition subfield).* This 8-bit (33-40) subfield shall define the remainder of MV.

Note.— For convenience in coding, VDS is expressed in two groups of four bits each, VDS1 and VDS2.

4.3.8.4.2.4.2 *Subfields in MV for a coordination reply.* When VDS1 = 3 and VDS2 = 0, the following subfields shall be contained in MV:

4.3.8.4.2.4.2.1 *ARA (active RAs).* This 14-bit (41-54) subfield shall be coded as defined in 4.3.8.4.2.2.1.1.

4.3.8.4.2.4.2.2 *RAC (RACs record).* This 4-bit (55-58) subfield shall be coded as defined in 4.3.8.4.2.2.1.2.

4.3.8.4.2.4.2.3 *RAT (RA terminated indicator).* This 1-bit (59) subfield shall be coded as defined in 4.3.8.4.2.2.1.3.

4.3.8.4.2.4.2.4 *MTE (multiple threat encounter).* This 1-bit (60) subfield shall be coded as defined in 4.3.8.4.2.2.1.4.

Note.— Structure of MV for a coordination reply:

33	37	41	55	59	60	61
VDS1 = 3	VDS2 = 0	ARA	RAC	RAT	MTE	-28-
36	40	54	58	59	60	88

4.3.8.4.2.5 *SL (sensitivity level report).* This 3-bit (9-11) downlink field shall be included in both short and long air-air reply formats (DF = 0 and 16). This field shall denote the sensitivity level at which ACAS is currently operating.

Coding

0	ACAS inoperative
1	ACAS is operating at sensitivity level 1
2	ACAS is operating at sensitivity level 2
3	ACAS is operating at sensitivity level 3
4	ACAS is operating at sensitivity level 4
5	ACAS is operating at sensitivity level 5
6	ACAS is operating at sensitivity level 6
7	ACAS is operating at sensitivity level 7

4.3.9 ACAS equipment characteristics

4.3.9.1 *Interfaces.* As a minimum, the following input data shall be provided to the ACAS:

a) aircraft address code;

b) air-air and ground-air Mode S transmissions received by the Mode S transponder for use by ACAS (4.3.6.3.2);

c) own aircraft's maximum cruising true airspeed capability (Chapter 3, 3.1.2.8.2.2);

d) pressure-altitude; and

e) radio altitude.

Note.— Specific requirements for additional inputs for ACAS II and III are listed in the appropriate sections below.

4.3.9.2 *Aircraft antenna system.* ACAS shall transmit interrogations and receive replies via two antennas, one mounted on the top of the aircraft and the other on the bottom of the aircraft. The top-mounted antenna shall be directional and capable of being used for direction finding.

4.3.9.2.1 *Polarization.* Polarization of ACAS transmissions shall be nominally vertical.

4.3.9.2.2 *Radiation pattern.* The radiation pattern in elevation of each antenna when installed on an aircraft shall be nominally equivalent to that of a quarter-wave monopole on a ground plane.

4.3.9.2.3 *ANTENNA SELECTION*

4.3.9.2.3.1 *Squitter reception*. ACAS shall be capable of receiving squitters via the top and bottom antennas.

4.3.9.2.3.2 *Interrogations.* ACAS interrogations shall not be transmitted simultaneously on both antennas.

4.3.9.3 *Pressure-altitude source*. The altitude data for own aircraft provided to ACAS shall be obtained from the source that provides the basis for own Mode C or Mode S reports and they shall be provided at the finest quantization available.

4.3.9.3.1 **Recommendation.—** *A source providing a resolution finer than 7.62 m (25 ft) should be used.*

4.3.9.3.2 Where a source providing a resolution finer than 7.62 m (25 ft) is not available, and the only altitude data available for own aircraft is Gilham encoded, at least two independent sources shall be used and compared continuously in order to detect encoding errors.

4.3.9.3.3 **Recommendation.—** *Two altitude data sources should be used and compared in order to detect errors before provision to ACAS.*

4.3.9.3.4 The provisions of 4.3.10.3 shall apply when the comparison of the two altitude data sources indicates that one of the sources is in error.

4.3.10 Monitoring

4.3.10.1 *Monitoring function.* ACAS shall continuously perform a monitoring function in order to provide a warning if any of the following conditions at least are satisfied:

a) there is no interrogation power limiting due to interference control (4.3.2.2.2) and the maximum radiated power is reduced to less than that necessary to satisfy the surveillance requirements specified in 4.3.2; or

b) any other failure in the equipment is detected which results in a reduced capability of providing TAs or RAs; or

c) data from external sources indispensable for ACAS operation are not provided, or the data provided are not credible.

4.3.10.2 *Effect on ACAS operation.* The ACAS monitoring function shall not adversely affect other ACAS functions.

4.3.10.3 *Monitoring response.* When the monitoring function detects a failure (4.3.10.1), ACAS shall:

a) indicate to the flight crew that an abnormal condition exists;

b) prevent any further ACAS interrogations; and

c) cause any Mode S transmission containing own aircraft's resolution capability to indicate that ACAS is not operating.

4.3.11 Requirements for a Mode S transponder used in conjunction with ACAS

4.3.11.1 *Transponder capabilities.* In addition to the minimum transponder capabilities defined in Chapter 3, 3.1, the Mode S transponder used in conjunction with ACAS shall have the following capabilities:

a) ability to handle the following formats:

Format No.	*Format name*
UF = 16	Long air-air surveillance interrogation
DF = 16	Long air-air surveillance reply

b) ability to receive long Mode S interrogations (UF = 16) and generate long Mode S replies (DF = 16) at a continuous rate of 16.6 ms (60 per second);

c) means for delivering the ACAS data content of all accepted interrogations addressed to the ACAS equipment;

d) antenna diversity (as specified in Chapter 3, 3.1.2.10.4);

e) mutual suppression capability; and

f) inactive state transponder output power restriction.

When the Mode S transponder transmitter is in the inactive state, the peak pulse power at 1 090 MHz ±3 MHz at the terminals of the Mode S transponder antenna shall not exceed –70 dBm.

4.3.11.2 DATA TRANSFER BETWEEN ACAS AND ITS MODE S TRANSPONDER

4.3.11.2.1 *Data transfer from ACAS to its Mode S transponder:*

a) The Mode S transponder shall receive from its ACAS RA information for transmission in an RA report (4.3.8.4.2.2.1) and in a coordination reply (4.3.8.4.2.4.2);

b) the Mode S transponder shall receive from its ACAS current sensitivity level for transmission in a sensitivity level report (4.3.8.4.2.5);

c) the Mode S transponder shall receive from its ACAS capability information for transmission in a data link capability report (4.3.8.4.2.2.2) and for transmission in the RI field of air-air downlink formats DF = 0 and DF = 16 (4.3.8.4.1.2); and

d) the Mode S transponder shall receive from its ACAS an indication that RAs are enabled or inhibited for transmission in the RI field of downlink formats 0 and 16.

4.3.11.2.2 Data transfer from Mode S transponder to its ACAS:

a) The Mode S transponder shall transfer to its ACAS received sensitivity level control commands (4.3.8.4.2.1.1) transmitted by Mode S stations;

b) the Mode S transponder shall transfer to its ACAS received ACAS broadcast messages (4.3.8.4.2.3.3) transmitted by other ACASs;

c) the Mode S transponder shall transfer to its ACAS received resolution messages (4.3.8.4.2.3.2) transmitted by other ACASs for air-air coordination purposes; and

d) the Mode S transponder shall transfer to its ACAS own aircraft's Mode A identity data for transmission in an RA broadcast (4.3.8.4.2.3.4.5).

4.3.11.3 COMMUNICATION OF ACAS INFORMATION TO OTHER ACAS

4.3.11.3.1 *Surveillance reply.* The ACAS Mode S transponder shall use the short (DF = 0) or long (DF = 16) surveillance formats for replies to ACAS surveillance interrogations. The surveillance reply shall include the VS field as specified in Chapter 3, 3.1.2.8.2, the RI field as specified in Chapter 3, 3.1.2.8.2 and in 4.3.8.4.1.2, and the SL field as specified in 4.3.8.4.2.5.

4.3.11.3.2 *Coordination reply.* The ACAS Mode S transponder shall transmit a coordination reply upon receipt of a coordination interrogation from an equipped threat subject to the conditions of 4.3.11.3.2.1. The coordination reply shall use the long air-air surveillance reply format, DF = 16, with the VS field as specified in Chapter 3, 3.1.2.8.2, the RI field as specified in Chapter 3, 3.1.2.8.2 and in 4.3.8.4.1.2, the SL field as specified in 4.3.8.4.2.5 and the MV field as specified in 4.3.8.4.2.4. Coordination replies shall be transmitted even if the minimum reply rate limits of the transponder (Chapter 3, 3.1.2.10.3.7.2) are exceeded.

4.3.11.3.2.1 The ACAS Mode S transponder shall reply with a coordination reply to a coordination interrogation received from another ACAS if and only if the transponder is able to deliver the ACAS data content of the interrogation to its associated ACAS.

4.3.11.4 COMMUNICATION OF ACAS INFORMATION TO GROUND STATIONS

4.3.11.4.1 *RA reports to Mode S ground stations.* During the period of an RA and for 18±1 s following the end of the RA, the ACAS Mode S transponder shall indicate that it has an RA report by setting the appropriate DR field code in replies to a Mode S sensor as specified in 4.3.8.4.1.1. The RA report shall include the MB field as specified in 4.3.8.4.2.2.1. The RA report shall describe the most recent RA that existed during the preceding 18±1 s period.

Note 1.— The last sentence of 4.3.11.4.1 means that for 18±1 s following the end of an RA, all MB subfields in the RA report with the exception of bit 59 (RA terminated indicator) will retain the information reported at the time the RA was last active.

Note 2.— Upon receipt of a reply with DR = 2, 3, 6 or 7, a Mode S ground station may request downlink of the RA report by setting RR = 19 and either DI = 7, or DI = 7 and RRS = 0 in a surveillance or Comm-A interrogation to the ACAS aircraft. When this interrogation is received, the transponder replies with a Comm-B reply whose MB field contains the RA report.

4.3.11.4.2 *Data link capability report.* The presence of an ACAS shall be indicated by its Mode S transponder to a ground station in the Mode S data link capability report.

Note.— This indication causes the transponder to set codes in a data link capability report as specified in 4.3.8.4.2.2.2.

4.3.12 Indications to the flight crew

4.3.12.1 CORRECTIVE AND PREVENTIVE RAS

Recommendation.— *Indications to the flight crew should distinguish between preventive and corrective RAs.*

4.3.12.2 ALTITUDE CROSSING RAS

Recommendation.— *If ACAS generates an altitude crossing RA, a specific indication should be given to the flight crew that it is crossing.*

4.4 PERFORMANCE OF THE ACAS II COLLISION AVOIDANCE LOGIC

Note.— Caution is to be observed when considering potential improvements to the reference ACAS II system described in Section 4 of the guidance material in the Attachment since changes may affect more than one aspect of the system performance. It is essential that alternative designs would not degrade the performances of other designs and that such compatibility is demonstrated with a high degree of confidence.

4.4.1 Definitions relating to the performance of the collision avoidance logic

Note.— The notation [t_1, t_2] is used to indicate the interval between t_1 and t_2.

Altitude layer. Each encounter is attributed to one of six altitude layers as follows:

Layer	*1*	*2*	*3*	*4*	*5*	*6*
from		2 300 ft	5 000 ft	10 000 ft	20 000 ft	41 000 ft
to	2 300 ft	5 000 ft	10 000 ft	20 000 ft	41 000 ft	

The altitude layer of an encounter is determined by the average altitude of the two aircraft at closest approach.

Note.— For the purposes of defining the performance of the collision avoidance logic, there is no need to specify the physical basis of the altitude measurement or the relationship between altitude and ground level.

Approach angle. The difference in the ground headings of the two aircraft at closest approach, with 180 degrees defined as head on and 0 degrees defined as parallel.

Crossing encounter. An encounter in which the altitude separation of the two aircraft exceeds 100 ft at the beginning and at the end of the encounter window, and the relative vertical position of two aircraft at the end of the encounter window is reversed from that at the beginning of the encounter window.

Encounter. For the purposes of defining the performance of the collision avoidance logic, an encounter consists of two simulated aircraft trajectories. The horizontal coordinates of the aircraft represent the actual position of the aircraft but the vertical coordinate represents an altimeter measurement of altitude.

Encounter class. Encounters are classified according to whether or not the aircraft are transitioning at the beginning and end of the encounter window, and whether or not the encounter is crossing.

Encounter window. The time interval [*tca* – 40 s, *tca* + 10 s].

Horizontal miss distance (hmd). The minimum horizontal separation observed in an encounter.

Level aircraft. An aircraft that is not transitioning.

Original trajectory. The original trajectory of an ACAS-equipped aircraft is that followed by the aircraft in the same encounter when it was not ACAS equipped.

Original rate. The original rate of an ACAS-equipped aircraft at any time is its altitude rate at the same time when it followed the original trajectory.

Required rate. For the standard pilot model, the required rate is that closest to the original rate consistent with the RA.

tca. Nominally, the time of closest approach. For encounters in the standard encounter model (4.4.2.6), a reference time for the construction of the encounter at which various parameters, including the vertical and horizontal separation (*vmd* and *hmd*), are specified.

Note.— Encounters in the standard encounter model (4.4.2.6) are constructed by building the trajectories of the two aircraft outwards starting at tca. *When the process is complete,* tca *may not be the precise time of closest approach and differences of a few seconds are acceptable.*

Transitioning aircraft. An aircraft having an average vertical rate with a magnitude exceeding 400 feet per minute (ft/min), measured over some period of interest.

Turn extent. A heading difference defined as an aircraft's ground heading at the end of a turn minus its ground heading at the beginning of the turn.

Vertical miss distance (*vmd*). Notionally, the vertical separation at closest approach. For encounters in the standard encounter model (4.4.2.6), by construction the vertical separation at the time *tca*.

4.4.2 Conditions under which the requirements apply

4.4.2.1 The following assumed conditions shall apply to the performance requirements specified in 4.4.3 and 4.4.4:

a) range and bearing measurements and an altitude report are available for the intruder each cycle as long as it is within 14 NM, but not when the range exceeds 14 NM;

b) the errors in the range and bearing measurements conform to standard range and bearing error models (4.4.2.2 and 4.4.2.3);

c) the intruder's altitude reports, which are its Mode C replies, are expressed in 100 ft quanta;

d) an altitude measurement that has not been quantized and is expressed with a precision of 1 ft or better is available for own aircraft;

e) errors in the altitude measurements for both aircraft are constant throughout any particular encounter;

f) the errors in the altitude measurements for both aircraft conform to a standard altimetry error model (4.4.2.4);

g) the pilot responses to RAs conform to a standard pilot model (4.4.2.5);

h) the aircraft operate in an airspace in which close encounters, including those in which ACAS generates an RA, conform to a standard encounter model (4.4.2.6);

i) ACAS-equipped aircraft are not limited in their ability to perform the manoeuvres required by their RAs; and

j) as specified in 4.4.2.7:

   1) the intruder involved in each encounter is not equipped (4.4.2.7 a)); or

   2) the intruder is ACAS-equipped but follows a trajectory identical to that in the unequipped encounter (4.4.2.7 b)); or

   3) the intruder is equipped with an ACAS having a collision avoidance logic identical to that of own ACAS (4.4.2.7 c)).

Note.— The phrase "altitude measurement" refers to a measurement by an altimeter prior to any quantization.

4.4.2.1.1 The performance of the collision avoidance logic shall not degrade abruptly as the statistical distribution of the altitude errors or the statistical distributions of the various parameters that characterize the standard encounter model or the response of pilots to the advisories are varied, when surveillance reports are not available on every cycle or when the quantization of the altitude measurements for the intruder is varied or the altitude measurements for own aircraft are quantized.

4.4.2.2 STANDARD RANGE ERROR MODEL

The errors in the simulated range measurements shall be taken from a Normal distribution with mean 0 ft and standard deviation 50 ft.

4.4.2.3 STANDARD BEARING ERROR MODEL

The errors in the simulated bearing measurements shall be taken from a Normal distribution with mean 0.0 degrees and standard deviation 10.0 degrees.

4.4.2.4 STANDARD ALTIMETRY ERROR MODEL

4.4.2.4.1 The errors in the simulated altitude measurements shall be assumed to be distributed as a Laplacian distribution with zero mean having probability density

$$p(e) = \frac{1}{2\lambda} \exp\left(-\frac{|e|}{\lambda}\right)$$

4.4.2.4.2 The parameter λ required for the definition of the statistical distribution of altimeter error for each aircraft shall have one of two values, λ_1 and λ_2, which depend on the altitude layer of the encounter as follows:

Layer	*1*		*2*		*3*		*4*		*5*		*6*	
	m	*ft*	*m*	*ft*	*m*	*ft*	*m*	*ft*	*m*	*ft*	*m*	*ft*
λ_1	10	35	11	38	13	43	17	58	22	72	28	94
λ_2	18	60	18	60	21	69	26	87	30	101	30	101

4.4.2.4.3 For an aircraft equipped with ACAS the value of λ shall be λ_1.

4.4.2.4.4 For aircraft not equipped with ACAS, the value of λ shall be selected randomly using the following probabilities:

Layer	*1*	*2*	*3*	*4*	*5*	*6*
prob(λ_1)	0.391	0.320	0.345	0.610	0.610	0.610
prob(λ_2)	0.609	0.680	0.655	0.390	0.390	0.390

4.4.2.5 STANDARD PILOT MODEL

The standard pilot model used in the assessment of the performance of the collision avoidance logic shall be that:

a) any RA is complied with by accelerating to the required rate (if necessary) after an appropriate delay;

b) when the aircraft's current rate is the same as its original rate and the original rate complies with the RA, the aircraft continues at its original rate, which is not necessarily constant due to the possibility of acceleration in the original trajectory;

c) when the aircraft is complying with the RA, its current rate is the same as the original rate and the original rate changes and consequently becomes inconsistent with the RA, the aircraft continues to comply with the RA;

d) when an initial RA requires a change in altitude rate, the aircraft responds with an acceleration of 0.25 *g* after a delay of 5 s from the display of the RA;

e) when an RA is modified and the original rate complies with the modified RA, the aircraft returns to its original rate (if necessary) with the acceleration specified in g) after the delay specified in h);

f) when an RA is modified and the original rate does not comply with the modified RA, the aircraft responds to comply with the RA with the acceleration specified in g) after the delay specified in h);

g) the acceleration used when an RA is modified is 0.25 *g* unless the modified RA is a reversed sense RA or an increased rate RA in which case the acceleration is 0.35 *g*;

h) the delay used when an RA is modified is 2.5 s unless this results in the acceleration starting earlier than 5 s from the initial RA in which case the acceleration starts 5 s from the initial RA; and

i) when an RA is cancelled, the aircraft returns to its original rate (if necessary) with an acceleration of 0.25 *g* after a delay of 2.5 s.

4.4.2.6 STANDARD ENCOUNTER MODEL

4.4.2.6.1 *ELEMENTS OF THE STANDARD ENCOUNTER MODEL*

4.4.2.6.1.1 In order to calculate the effect of ACAS on the risk of collision (4.4.3) and the compatibility of ACAS with air traffic management (ATM) (4.4.4), sets of encounters shall be created for each of:

a) the two aircraft address orderings;

b) the six altitude layers;

c) nineteen encounter classes; and

d) nine or ten *vmd* bins as specified in 4.4.2.6.2.4.

The results for these sets shall be combined using the relative weightings given in 4.4.2.6.2.

4.4.2.6.1.1.1 Each set of encounters shall contain at least 500 independent, randomly generated encounters.

4.4.2.6.1.1.2 The two aircraft trajectories in each encounter shall be constructed with the following randomly selected characteristics:

a) in the vertical plane:

   1) a *vmd* from within the appropriate *vmd* bin;

   2) a vertical rate for each aircraft at the beginning of the encounter window, $\dot{z}_1$, and at the end of the encounter window, $\dot{z}_2$;

   3) a vertical acceleration; and

   4) a start time for the vertical acceleration; and

b) and in the horizontal plane:

   1) an *hmd*;

   2) an approach angle;

   3) a speed for each aircraft at closest approach;

   4) a decision for each aircraft whether or not it turns;

   5) the turn extent; the bank angle; and the turn end time;

   6) a decision for each aircraft whether or not its speed changes; and

   7) the magnitude of the speed change.

Note.— It is possible for the selections made for the various characteristics of an encounter to be irreconcilable. When this occurs, the problem can be resolved by discarding either the selection for a particular characteristic or the whole encounter, as most appropriate.

4.4.2.6.1.3 Two models shall be used for the statistical distribution of *hmd* (4.4.2.6.4.1). For calculations of the effect of ACAS on the risk of collision (4.4.3), *hmd* shall be constrained to be less than 500 ft. For calculations of the compatibility of ACAS with ATM (4.4.4), *hmd* shall be selected from a larger range of values (4.4.2.6.4.1.2).

Note.— 4.4.2.6.2 and 4.4.2.6.3 specify vertical characteristics for the aircraft trajectories in the standard encounter model that depend on whether the hmd *is constrained to be small ("for calculating risk ratio") or can take larger values ("for ATM compatibility"). Otherwise, the characteristics of the encounters in the vertical and horizontal planes are independent.*

4.4.2.6.2 ENCOUNTER CLASSES AND WEIGHTS

4.4.2.6.2.1 Aircraft address. Each aircraft shall be equally likely to have the higher aircraft address.

4.4.2.6.2.2 *Altitude layers.* The relative weights of the altitude layers shall be as follows:

Layer	*1*	*2*	*3*	*4*	*5*	*6*
prob(layer)	0.13	0.25	0.32	0.22	0.07	0.01

4.4.2.6.2.3 *Encounter classes*

4.4.2.6.2.3.1 The encounters shall be classified according to whether the aircraft are level (L) or transitioning (T) at the beginning *(before tca*) and end (after *tca*) of the encounter window and whether or not the encounter is crossing, as follows:

	Aircraft No. 1		*Aircraft No. 2*		
Class	*before* tca	*after* tca	*before* tca	*after* tca	*Crossing*
1	L	L	T	T	yes
2	L	L	L	T	yes
3	L	L	T	L	yes
4	T	T	T	T	yes
5	L	T	T	T	yes
6	T	T	T	L	yes
7	L	T	L	T	yes
8	L	T	T	L	yes
9	T	L	T	L	yes
10	L	L	L	L	no
11	L	L	T	T	no
12	L	L	L	T	no
13	L	L	T	L	no
14	T	T	T	T	no
15	L	T	T	T	no
16	T	T	T	L	no
17	L	T	L	T	no
18	L	T	T	L	no
19	T	L	T	L	no

4.4.2.6.2.3.2 The relative weights of the encounter classes shall depend on layer as follows:

	for calculating risk ratio		*for ATM compatibility*	
Class	*Layers 1-3*	*Layers 4-6*	*Layers 1-3*	*Layers 4-6*
1	0.00502	0.00319	0.06789	0.07802
2	0.00030	0.00018	0.00408	0.00440
3	0.00049	0.00009	0.00664	0.00220
4	0.00355	0.0027	0.04798	0.06593
5	0.00059	0.00022	0.00791	0.00549
6	0.00074	0.00018	0.00995	0.00440
7	0.00002	0.00003	0.00026	0.00082
8	0.00006	0.00003	0.00077	0.00082
9	0.00006	0.00003	0.00077	0.00082
10	0.36846	0.10693	0.31801	0.09011
11	0.26939	0.41990	0.23252	0.35386
12	0.06476	0.02217	0.05590	0.01868
13	0.07127	0.22038	0.06151	0.18571
14	0.13219	0.08476	0.11409	0.07143
15	0.02750	0.02869	0.02374	0.02418
16	0.03578	0.06781	0.03088	0.05714
17	0.00296	0.00098	0.00255	0.00082
18	0.00503	0.00522	0.00434	0.00440
19	0.01183	0.03651	0.01021	0.03077

4.4.2.6.2.4 vmd *bins*

4.4.2.6.2.4.1 The *vmd* of each encounter shall be taken from one of ten *vmd* bins for the non-crossing encounter classes, and from one of nine or ten *vmd* bins for the crossing encounter classes. Each *vmd* bin shall have an extent of 100 ft for calculating risk ratio, or an extent of 200 ft for calculating compatibility with ATM. The maximum *vmd* shall be 1 000 ft for calculating risk ratio, and 2 000 ft otherwise.

4.4.2.6.2.4.2 For non-crossing encounter classes, the relative weights of the *vmd* bins shall be as follows:

vmd *bin*	*for calculating risk ratio*	*for ATM compatibility*
1	0.013	0.128
2	0.026	0.135
3	0.035	0.209
4	0.065	0.171
5	0.100	0.160
6	0.161	0.092
7	0.113	0.043
8	0.091	0.025
9	0.104	0.014
10	0.091	0.009

Note.— The weights for the vmd *bins do not sum to 1.0. The weights specified are based on an analysis of encounters captured in ATC ground radar data. The missing proportion reflects the fact that the encounters captured included some with* vmd *exceeding the maximum* vmd *in the model.*

4.4.2.6.2.4.3 For the crossing classes, the relative weights of the *vmd* bins shall be as follows:

vmd *bin*	*for calculating risk ratio*	*for ATM compatibility*
1	0	0.064
2	0.026	0.144
3	0.036	0.224
4	0.066	0.183
5	0.102	0.171
6	0.164	0.098
7	0.115	0.046
8	0.093	0.027
9	0.106	0.015
10	0.093	0.010

Note.— For the crossing classes, vmd *must exceed 100 ft so that the encounter qualifies as a crossing encounter. Thus, for the calculation of risk ratio there is no* vmd *bin 1, and for calculations of the compatibility with ATM* vmd *bin 1 is limited to [100 ft, 200 ft].*

4.4.2.6.3 *CHARACTERISTICS OF THE AIRCRAFT TRAJECTORIES IN THE VERTICAL PLANE*

4.4.2.6.3.1 *vmd.* The *vmd* for each encounter shall be selected randomly from a distribution that is uniform in the interval covered by the appropriate *vmd* bin.

4.4.2.6.3.2 *Vertical rate*

4.4.2.6.3.2.1 For each aircraft in each encounter, either the vertical rate shall be constant ($\dot{z}$) or the vertical trajectory shall be constructed so that the vertical rate at tca – 35 s is $\dot{z}_1$ and the vertical rate at *tca* + 5 s is $\dot{z}_2$. Each vertical rate, $\dot{z}$, $\dot{z}_1$or $\dot{z}_2$, shall be determined by first selecting randomly an interval within which it lies and then selecting the precise value from a distribution that is uniform over the interval selected.

4.4.2.6.3.2.2 The intervals within which the vertical rates lie shall depend on whether the aircraft is level, i.e. marked “L” in 4.4.2.6.2.3.1, or transitioning, i.e. marked “T” in 4.4.2.6.2.3.1, and shall be as follows:

L	*T*
[240 ft/min, 400 ft/min]	[3200 ft/min, 6000 ft/min]
[80 ft/min, 240 ft/min]	[400 ft/min, 3200 ft/min]
[–80 ft/min, 80 ft/min]	[–400 ft/min, 400 ft/min]
[–240 ft/min, 80 ft/min]	[–3 200 ft/min, 400 ft/min]
[–400 ft/min, 240 ft/min]	[–6 000 ft/min, 3200 ft/min]

4.4.2.6.3.2.3 For aircraft that are level over the entire encounter window, the vertical rate $\dot{z}$ shall be constant. The probabilities for the intervals within which $\dot{z}$ lies shall be as follows:

$\dot{z}$ *(ft/min)*	*prob($\dot{z}$)*
[240 ft/min, 400 ft/min]	0.0382
[80 ft/min, 240 ft/min]	0.0989
[80 ft/min, 80 ft/min]	0.7040
[–240 ft/min, 80 ft/min]	0.1198
[–400 ft/min, 240 ft/min]	0.0391

4.4.2.6.3.2.4 For aircraft that are not level over the entire encounter window, the intervals for $\dot{z}_1$ and $\dot{z}_2$ shall be determined jointly by random selection using joint probabilities that depend on altitude layer and on whether the aircraft is transitioning at the beginning of the encounter window (Rate-to-Level), at the end of the encounter window (Level-to-Rate) or at both the beginning and the end (Rate-to-Rate). The joint probabilities for the vertical rate intervals shall be as follows:

for aircraft with Rate-to-Level trajectories in layers 1 to 3,

$\dot{z}_2$ interval	*joint probability of $\dot{z}_1$ and $\dot{z}_2$ interval*				
[240 ft/min, 400 ft/min]	0.0019	0.0169	0.0131	0.1554	0.0000

–6 000 ft/min –3 200 ft/min –400 ft/min 400 ft/min 3 200 ft/min 6 000 ft/min $\dot{z}_1$

4.4.2.6.3.2.5 For a Rate-to-Rate track, if line $|\dot{z}_2 - \dot{z}_1| < 566$ ft/min then the track shall be constructed with a constant rate equal to $\dot{z}_1$.

4.4.2.6.3.3 *Vertical acceleration*

4.4.2.6.3.3.1 Subject to 4.4.2.6.3.2.5, for aircraft that are not level over the entire encounter window, the rate shall be constant and equal to $\dot{z}_1$ over at least the interval [tca – 40 s, *tca* – 35 s] at the beginning of the encounter window, and shall be constant and equal to $\dot{z}_2$ over at least the interval [*tca* + 5 s, *tca* + 10 s] at the end of the encounter window. The vertical acceleration shall be constant in the intervening period.

4.4.2.6.3.3.2 The vertical acceleration ($\ddot{z}$) shall be modelled as follows:

$$\ddot{z} = (A\dot{z}_2 - \dot{z}_1) + \varepsilon$$

where the parameter *A* is case-dependent as follows:

	$A(s^{-1})$	
Case	*Layers 1-3*	*Layers 4-6*
Rate-to-Level	0.071	0.059
Level-to-Rate	0.089	0.075
Rate-to-Rate	0.083	0.072

and the error ε is selected randomly using the following probability density:

$$p(\varepsilon) = \frac{1}{2\mu}\exp\left(-\frac{|\varepsilon|}{\mu}\right)$$

where $\mu = 0.3$ ft s^{-2}.

Note.— The sign of the acceleration $\ddot{z}$ is determined by $\dot{z}_1$ and $\dot{z}_2$. An error ε that reverses this sign must be rejected and the error reselected.

4.4.2.6.3.4 *Acceleration start time*. The acceleration start time shall be distributed uniformly in the time interval [*tca* – 35 *s*, *tca* – 5 s] and shall be such that $\dot{z}_2$ is achieved no later than *tca* + 5 s.

4.4.2.6.4 *CHARACTERISTICS OF THE AIRCRAFT TRAJECTORIES IN THE HORIZONTAL PLANE*

4.4.2.6.4.1 *Horizontal miss distance*

4.4.2.6.4.1.1 For calculations of the effect of ACAS on the risk of collision (4.4.3), hmd shall be uniformly distributed in the range [0, 500 ft].

4.4.2.6.4.1.2 For calculations concerning the compatibility of ACAS with ATM (4.4.4), *hmd* shall be distributed so that the values of *hmd* have the following cumulative probabilities:

	cumulative probability			*cumulative probability*	
hmd *(ft)*	*Layers 1-3*	*Layers 4-6*	hmd *(ft)*	*Layers 1-3*	*Layers 4-6*
0	0.000	0.000	17013	0.999	0.868

80	0.28	0.19	180	1.00	1.00
90	0.32	0.22			

4.4.2.6.4.3 *Aircraft speed.* The cumulative distribution for each aircraft's horizontal ground speed at closest approach shall be as follows:

ground speed (kt)	*cumulative probability Layers 1-3*	*Layers 4-6*	*ground speed (kt)*	*cumulative probability Layers 1-3*	*Layers 4-6*
45	0.000		325	0.977	0.528
50	0.005		350	0.988	0.602
75	0.024	0.000	375	0.997	0.692
100	0.139	0.005	400	0.998	0.813
125	0.314	0.034	425	0.999	0.883
150	0.486	0.064	450	1.000	0.940
175	0.616	0.116	475		0.972
200	0.700	0.171	500		0.987
225	0.758	0.211	525		0.993
250	0.821	0.294	550		0.998
275	0.895	0.361	575		0.999
300	0.949	0.427	600		1.000

4.4.2.6.4.4 *Horizontal manoeuvre probabilities.* For each aircraft in each encounter, the probability of a turn, the probability of a speed change given a turn, and the probability of a speed change given no turn shall be as follows:

Layer	*Prob(turn)*	*Prob(speed change) given a turn*	*Prob(speed change) given no turn*
1	0.31	0.20	0.5
2	0.29	0.20	0.25
3	0.22	0.10	0.15
4, 5, 6	0.16	0.05	0.10

4.4.2.6.4.4.1 Given a speed change, the probability of a speed increase shall be 0.5 and the probability of a speed decrease shall be 0.5.

4.4.2.6.4.5 *Turn extent.* The cumulative distribution for the extent of any turn shall be as follows:

Turn extent (deg.)	*cumulative probability Layers 1-3*	*Layers 4-6*
15	0.00	0.00
30	0.43	0.58
60	0.75	0.90
90	0.88	0.97
120	0.95	0.99
150	0.98	1.00
180	0.99	
210	1.00	

4.4.2.6.4.5.1 The direction of the turn shall be random, with the probability of a left turn being 0.5 and the probability of a right turn being 0.5.

4.4.2.6.4.6 *Bank angle.* An aircraft's bank angle during a turn shall not be less than 15 degrees. The probability that it equals 15 degrees shall be 0.79 in layers 1-3 and 0.54 in layers 4-5. The cumulative distribution for larger bank angles shall be as follows:

	cumulative probability	
Bank angle (deg.)	*Layers 1-3*	*Layers 4-6*
15	0.79	0.54
25	0.96	0.82
35	0.99	0.98
50	1.00	1.00

4.4.2.6.4.7 *Turn end time.* The cumulative distribution for each aircraft's turn end time shall be as follows:

Turn end time	*cumulative probability*	
(seconds before tca*)*	*Layers 1-3*	*Layers 4-6*
0	0.42	0.28
5	0.64	0.65
10	0.77	0.76
15	0.86	0.85
20	0.92	0.94
25	0.98	0.99
30	1.00	1.00

4.4.2.6.4.8 *Speed change.* A constant acceleration or deceleration shall be randomly selected for each aircraft performing a speed change in a given encounter, and shall be applied for the duration of the encounter. Accelerations shall be uniformly distributed between 2 kt/s and 6 kt/s. Decelerations shall be uniformly distributed between 1 kt/s and 3 kt/s.

4.4.2.7 ACAS EQUIPAGE OF THE INTRUDER

The performance requirements specified in 4.4.3 and 4.4.4 each apply to three distinct situations in which the following conditions concerning the intruder's ACAS and trajectory shall apply:

a) where the intruder involved in each encounter is not equipped (4.4.2.1 j) 1)), it follows a trajectory identical to that which it follows when own aircraft is not equipped;

b) where the intruder is ACAS-equipped but follows a trajectory identical to that in the unequipped encounter (4.4.2.1 j) 2)):

   1) it follows the identical trajectory regardless of whether or not there is an RA;

   2) the intruder ACAS generates an RA and transmits an RAC that is received immediately after any RA is first announced to the pilot of own aircraft;

   3) the sense of the RAC generated by the intruder ACAS and transmitted to own aircraft is opposite to the sense of the first RAC selected and transmitted to the intruder by own aircraft (4.3.6.1.3);

   4) the RAC transmitted by the intruder is received by own aircraft; and

5) the requirements apply both when own aircraft has the lower aircraft address and when the intruder aircraft has the lower aircraft address; and

c) where the intruder is equipped with an ACAS having a collision avoidance logic identical to that of own ACAS (4.4.2.1 j) 3)):

1) the conditions relating to the performance of own aircraft, ACAS and pilot apply equally to the intruder aircraft, ACAS and pilot;

2) RACs transmitted by one aircraft are received by the other; and

3) the requirements apply both when own aircraft has the lower aircraft address and when the intruder aircraft has the lower aircraft address.

4.4.2.8 COMPATIBILITY BETWEEN DIFFERENT COLLISION AVOIDANCE LOGIC DESIGNS

Recommendation.— *When considering alternative collision avoidance logic designs, certification authorities should verify that:*

a) the performances of the alternative design are acceptable in encounters involving ACAS units that use existing designs; and

b) the performances of the existing designs are not degraded by the use of the alternative design.

Note.— To address the compatibility between different collision avoidance logic designs, the conditions described in 4.4.2.7 b) are the most severe that can be anticipated in this respect.

4.4.3 Reduction in the risk of collision

Under the conditions of 4.4.2, the collision avoidance logic shall be such that the expected number of collisions is reduced to the following proportions of the number expected in the absence of ACAS:

a)	when the intruder is not ACAS equipped	0.18;
b)	when the intruder is equipped but does not respond	0.32; and
c)	when the intruder is equipped and responds	0.04.

4.4.4 Compatibility with air traffic management (ATM)

4.4.4.1 NUISANCE ALERT RATE

4.4.4.1.1 Under the conditions of 4.4.2, the collision avoidance logic shall be such that the proportion of RAs which are a "nuisance" (4.4.4.1.2) shall not exceed:

.06 when own aircraft's vertical rate at the time the RA is first issued is less than 400 ft/min; or

.08 when own aircraft's vertical rate at the time the RA is first issued exceeds 400 ft/min.

Note.— This requirement is not qualified by the ACAS equipage of the intruder (4.4.2.7) since it has negligible effect on the occurrence and frequency of nuisance RAs.

4.4.4.1.2 An RA shall be considered a "nuisance" for the purposes of 4.4.4.1.1 unless, at some point in the encounter in the absence of ACAS, the horizontal separation and the vertical separation are simultaneously less than the following values:

	horizontal separation	*vertical separation*
above FL100	2.0 NM	750 ft
below FL100	1.2 NM	750 ft

4.4.4.2 COMPATIBLE SENSE SELECTION

Under the conditions of 4.4.2, the collision avoidance logic shall be such that the proportion of encounters in which following the RA results in an altitude separation at closest approach with the opposite sign to that occurring in the absence of ACAS shall not exceed the following values:

a) when the intruder is not ACAS equipped 0.08;
b) when the intruder is equipped but does not respond 0.08; and
c) when the intruder is equipped and responds 0.12.

4.4.4.3 DEVIATIONS CAUSED BY ACAS

4.4.4.3.1 Under the conditions of 4.4.2, the collision avoidance logic shall be such that the number of RAs resulting in "deviations" (4.4.4.3.2) greater than the values indicated shall not exceed the following proportions of the total number of RAs:

	when own aircraft's vertical rate at the time the RA is first issued	
	is less than 400ft/min	*exceeds 400ft/min*
when the intruder is not ACAS equipped,		
for deviations ≥300 ft	0.15	0.23
for deviations ≥600 ft	0.04	0.13
for deviations ≥1 000 ft	0.01	0.07
when the intruder is equipped but does not respond,		
for deviations ≥300 ft	0.23	0.35
for deviations ≥600 ft	0.06	0.16
for deviations ≥1 000 ft	0.02	0.07
when the intruder is equipped and responds,		
for deviations ≥300 ft	0.11	0.23
for deviations ≥600 ft	0.02	0.12
for deviations ≥1 000 ft	0.01	0.06

4.4.4.3.2 For the purposes of 4.4.4.3.1, the "deviation" of the equipped aircraft from the original trajectory shall be measured in the interval from the time at which the RA is first issued until the time at which, following cancellation of the RA, the equipped aircraft has recovered its original altitude rate. The deviation shall be calculated as the largest altitude difference at any time in this interval between the trajectory followed by the equipped aircraft when responding to its RA and its original trajectory.

4.4.5 Relative value of conflicting objectives

Recommendation.— *The collision avoidance logic should be such as to reduce as much as practicable the risk of collision (measured as defined in 4.4.3) and limit as much as practicable the disruption to ATM (measured as defined in 4.4.4).*

4.5 ACAS USE OF EXTENDED SQUITTER REPORTS

4.5.1 ACAS hybrid surveillance using extended squitter position data

Note.— Hybrid surveillance is the technique used by ACAS to take advantage of passive position information available via extended squitter. Using hybrid surveillance, ACAS validates the position provided by extended squitter through direct active range measurement. An initial validation is performed at track initiation. Revalidation is performed once per 10 seconds if the intruder becomes a near threat in altitude or range. Finally, regular active surveillance is performed once per second on intruders that become a near threat in both altitude and range. In this manner, passive surveillance (once validated) is used for non-threatening intruders thus lowering the ACAS interrogation rate. Active surveillance is used whenever an intruder becomes a near threat in order to preserve ACAS independence as an independent safety monitor.

4.5.1.1 DEFINITIONS

Active surveillance. The process of tracking an intruder by using the information gained from the replies to own aircraft's interrogations.

Active track. A track formed by measurements gained by active interrogation.

Hybrid surveillance. The process of using active surveillance to validate and monitor other aircraft being tracked principally using passive surveillance in order to preserve ACAS independence.

Initial acquisition. The process of starting the formation of a new track upon receipt of a squitter from a Mode S aircraft for which there is no track by making an active interrogation.

Initial validation. The process of verifying the relative position of a new track using passive information by comparing it to the relative position obtained by active interrogation.

Passive surveillance. The process of tracking another aircraft without interrogating it, by using the other aircraft's extended squitters. ACAS uses the information contained in passive tracks to monitor the need for active surveillance, but not for any other purpose.

Passive track. After initial acquisition, a track maintained without active interrogation, using information contained in extended squitters.

4.5.1.2 An ACAS equipped to receive extended squitter position reports for passive surveillance of non-threatening intruders shall utilize this passive position information in the following manner.

4.5.1.3 PASSIVE SURVEILLANCE

4.5.1.3.1 *Initial validation*. At initial acquisition of an aircraft reporting extended squitter information, ACAS shall determine the relative range and bearing as computed from the position of own aircraft and the intruder's position as reported in the extended squitter. This derived range and bearing and the altitude reported in the squitter shall be compared to the range, bearing and altitude determined by active ACAS interrogation of the aircraft. Differences between the derived and measured range and bearing and the squitter and squitter and reply altitude shall be computed and used in tests to determine whether the extended squitter data is valid. If these tests are satisfied the passive position shall be considered to be validated and the track shall be maintained on passive data. If any of the above tests fail, the track shall be declared an active track and no further use shall be made of the subsequent passive surveillance data received for this track.

4.5.1.3.2 **Recommendation.—** *The following tests should be used to validate the position reported in the extended squitter message:*

| slant range difference | ≤ 200 m; and

| bearing difference | ≤ 45 degrees; and

| altitude difference | ≤ 100 ft.

4.5.1.3.3 *Supplementary active interrogations*. In order to ensure that an intruder's track is updated at least as frequently as required in the absence of extended squitter data (4.3.7.1.2.2), each time a track is updated using squitter information the time at which an active interrogation would next be required shall be calculated. An active interrogation shall be made at that time if a further squitter has not been received before the interrogation is due.

4.5.1.4 *Revalidation and monitoring.* If the following condition is met for a track being updated using passive surveillance data:

a) $|a| \leq 10\,000$ ft and either;

b) $|a| \leq 3\,000$ ft or $|a - 3\,000 \text{ ft}| / |\dot{a}| \leq 60$ s; or

c) $r \leq 3$ NM or $(r - 3 \text{ NM}) / |\dot{r}| \leq 60$ s;

where:
a = intruder altitude separation in ft
$\dot{a}$ = altitude rate estimate in ft/s
r = intruder slant range in NM
$\dot{r}$ = range rate estimate in NM/s

an active interrogation shall be made every 10 seconds to continuously revalidate and monitor the extended squitter data for as long as the above condition is met. The tests required in 4.5.1.3.1 shall be performed for each active surveillance. If any of these tests fail, the track shall be declared an active track.

4.5.1.5 *Full active surveillance.* If the following condition is met for a track being updated via passive surveillance data:

a) $|a| \leq 10\,000$ ft and both;

b) $|a| \leq 3\,000$ ft or $|a - 3\,000 \text{ ft}| / |\dot{a}| \leq 60$ s; and

c) $r \leq 3$ NM or $(r - 3 \text{ NM}) / |\dot{r}| \leq 60$ s;

where:
a = intruder altitude separation in ft
$\dot{a}$ = altitude rate estimate in ft/s
r = intruder slant range in NM
$\dot{r}$ = range rate estimate in NM/s

the aircraft shall be declared an active track and shall be updated on active range measurements once per second for as long as the above condition is met.

4.5.2 ACAS operation with an improved receiver MTL

Note.— Applications of extended squitter that are independent of ACAS might be implemented (for convenience) using the ACAS receiver. The use of an improved receiver minimum triggering level (MTL) will make it possible to receive extended squitters from ranges of up to 60 NM and beyond in support of such applications.

4.5.2.1 An ACAS operating with a receiver having a MTL more sensitive than –74 dBm shall implement the capabilities specified in the following paragraphs.

4.5.2.2 *Dual minimum triggering levels*. The ACAS receiver shall be capable of setting an indication for each squitter reception as to whether the reply would have been detected by an ACAS operating with a conventional MTL (–74 dBm). Squitter receptions received at the conventional MTL shall be passed to the ACAS surveillance function for further processing. Squitter receptions that do not meet this condition shall not be passed to the ACAS surveillance function.

Note 1.— Extended squitters containing position report information will be disseminated for display in connection with an extended squitter application.

Note 2.— Use of the conventional MTL for the ACAS surveillance function preserves the current operation of ACAS surveillance when operating with a receiver with an improved MTL.

4.5.2.3 *Dual or re-triggerable reply processor.* The ACAS Mode S reply processing function shall:

a) use separate reply processors for Mode S reply formats received at or above the conventional MTL and a separate reply processor for Mode S reply formats received below the conventional MTL; or,

b) use a Mode S reply processor that will re-trigger if it detects a Mode S preamble that is 2 to 3 dB stronger than the reply that is currently being processed.

Note.— Care must be taken to ensure that low-level squitters (i.e. those below the conventional MTL) do not interfere with the processing of acquisition squitters for ACAS. This could happen if the low-level squitter is allowed to capture the reply processor. This can be prevented by using a separate reply processor for each function, or by requiring the reply processor to be re-triggered by a higher level squitter.

CHAPTER 5. MODE S EXTENDED SQUITTER

Note 1.— A functional model of Mode S extended squitter systems supporting ADS-B and/or TIS-B is depicted in Figure 5-1.

Note 2.— Airborne systems transmit ADS-B messages (ADS-B OUT) and may also receive ADS-B and TIS-B messages (ADS-B IN and TIS-B IN). Ground systems (i.e. ground stations) transmit TIS-B (as an option) and receive ADS-B messages.

Note 3.— Although not explicitly depicted in the functional model presented in Figure 5-1, extended squitter systems installed on aerodrome surface vehicles or fixed obstacles may transmit ADS-B messages (ADS-B OUT).

5.1 MODE S EXTENDED SQUITTER TRANSMITTING SYSTEM CHARACTERISTICS

Note.— Many of the requirements associated with the transmission of Mode S extended squitter are included in Chapter 2 and Chapter 3 for Mode S transponder and non-transponder devices using the message formats defined in the Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871). The provisions presented within the following subsections are focused on requirements applicable to specific classes of airborne and ground transmitting systems that are supporting the applications of ADS-B and TIS-B.*

5.1.1 ADS-B out requirements

5.1.1.1 Aircraft, surface vehicles and fixed obstacles supporting an ADS-B capability shall incorporate the ADS-B message generation function and the ADS-B message exchange function (transmit) as depicted in Figure 5-1.

5.1.1.1.1 ADS-B transmissions from aircraft shall include position, aircraft identification and type, airborne velocity, and event driven messages including emergency/priority information.

Note.— The data formats and protocols for messages transferred via extended squitter are specified in the Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871).*

5.1.1.2 *Extended squitter ADS-B transmission requirements.* Mode S extended squitter transmitting equipment shall be classified according to the unit's range capability and the set of parameters that it is capable of transmitting consistent with the following definition of general equipment classes and the specific equipment classes defined in Tables 5-1 and 5-2:

a) Class A extended squitter airborne systems support an interactive capability incorporating both an extended squitter transmission capability (i.e. ADS-B OUT) with a complementary extended squitter reception capability (i.e. ADS-B IN) in support of onboard ADS-B applications;

b) Class B extended squitter systems provide a transmission only (i.e. ADS-B OUT without an extended squitter reception capability) for use on aircraft, surface vehicles, or fixed obstructions; and

c) Class C extended squitter systems have only a reception capability and thus have no transmission requirements.

5.1.1.3 *Class A extended squitter system requirements.* Class A extended squitter airborne systems shall have transmitting and receiving subsystem characteristics of the same class (i.e. A0, A1, A2, or A3) as specified in 5.1.1.1 and 5.2.1.2.

Note.— Class A transmitting and receiving subsystems of the same specific class (e.g. Class A2) are designed to complement each other with their functional and performance capabilities. The minimum air-to-air range that extended squitter transmitting and receiving systems of the same class are designed to support are:

a) A0-to-A0 nominal air-to-air range is 10 NM;

b) A1-to-A1 nominal air-to-air range is 20 NM;

c) A2-to-A2 nominal air-to-air range is 40 NM; and

d) A3-to-A3 nominal air-to-air range is 90 NM.

The above ranges are design objectives and the actual effective air-to-air range of the Class A extended squitter systems may be larger in some cases (e.g. in environments with low levels of 1 090 MHz fruit) and shorter in other cases (e.g. in environments with very high levels of 1 090 MHz fruit).

5.1.2 TIS-B out requirements

5.1.2.1 Ground stations supporting a TIS-B capability shall incorporate the TIS-B message generation function and the TIS-B message exchange function (transmit).

5.1.2.2 The extended squitter messages for TIS-B shall be transmitted by an extended squitter ground station when connected to an appropriate source of surveillance data.

Note 1.— Extended squitter messages for TIS-B are specified in the Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871).*

Note 2.— Ground stations supporting TIS-B use an extended squitter transmission capability. The characteristics of such ground stations, in terms of transmitter power, antenna gain, transmission rates, etc., are to be tailored to the desired TIS-B service volume of the specific ground station assuming airborne users are equipped with (at least) Class A1 receiving systems.

5.1.2.3 **Recommendation.—** *The maximum transmission rates and effective radiated power of the transmissions should be controlled to avoid unacceptable levels of RF interference to other 1 090 MHz systems (i.e. SSR and ACAS).*

5.2 MODE S EXTENDED SQUITTER RECEIVING SYSTEM CHARACTERISTICS (ADS-B IN AND TIS-B IN)

Note 1.— The paragraphs herein describe the required capabilities for 1 090 MHz receivers used for the reception of Mode S extended squitter transmissions that convey ADS-B and/or TIS-B messages. Airborne receiving systems support ADS-B and TIS-B reception while ground receiving systems support only ADS-B reception.

Note 2.— Detailed technical provisions for Mode S extended squitter receivers can be found within RTCA DO-260A, "Minimum Operational Performance Standards for 1 090 MHz Extended Squitter Automatic Dependent Surveillance – Broadcast (ADS-B) and Traffic Information Services – Broadcast (TIS-B)."

5.2.1 Mode S extended squitter receiving system functional requirements

5.2.1.1 Mode S extended squitter receiving systems shall perform the message exchange function (receive) and the report assembler function.

Note.— The extended squitter receiving system receives ADS-B Mode S extended squitter messages and outputs ADS-B reports to client applications. Airborne receiving systems also receive TIS-B extended squitter messages and output TIS-B reports to client applications. This functional model (shown in Figure 5-1) depicts both airborne and ground 1 090 MHz ADS-B receiving systems.

5.2.1.2 *Mode S extended squitter receiver classes*. The required functionality and performance characteristics for the Mode S extended squitter receiving system will vary depending on the ADS-B and TIS-B client applications to be supported and the operational use of the system. Airborne Mode S extended squitter receivers shall be consistent with the definition of receiving system classes shown in Table 5-3.

Note.— Different equipment classes of Mode S extended squitter installations are possible. The characteristics of the receiver associated with a given equipment class are intended to be appropriate to support the required level of operational capability. Equipment classes A0 through A3 are applicable to those Mode S extended airborne installations that include a Mode S extended squitter transmission (ADS-OUT) and reception (ADS-B IN) capability. Equipment classes B0 through B3 are applicable to Mode S extended installations with only a transmission (ADS-B OUT) capability and includes equipment classes applicable to airborne, surface vehicles and fixed obstructions. Equipment classes C1 through C3 are applicable to Mode S extended squitter ground receiving systems. Guidance on the Mode S extended squitter equipment classes is provided in the Manual on the Secondary Surveillance Radar (SSR) Systems *(Doc 9684).*

5.2.2 Message exchange function

5.2.2.1 The message exchange function shall include the 1 090 MHz receiving antenna and the radio equipment (receiver/demodulator/decoder/data buffer) sub-functions.

5.2.2.2 *Message exchange functional characteristics*. The airborne Mode S extended squitter receiving system shall support the reception and decoding of all extended squitter messages as listed in Table 5-3. The ground ADS-B extended squitter receiving system shall, as a minimum, support the reception and decoding of all of the extended squitter message types that convey information needed to support the generation of the ADS-B reports of the types required by the client ATM ground applications.

5.2.2.3 *Required message reception performance*. The airborne Mode S extended squitter receiver/demodulation/ decoder shall employ the reception techniques and have a receiver minimum trigger threshold level (MTL) as listed in Table 5-3 as a function of the airborne receiver class. The reception technique and MTL for extended squitter ground receiver shall be selected to provide the reception performance (i.e. range and update rates) as required by the client ATM ground applications.

5.2.2.4 *Enhanced reception techniques.* Class A1, A2 and A3 airborne receiving systems shall include the following features to provide improved probability of Mode S extended squitter reception in the presence of multiple overlapping Mode A/C fruit and/or in the presence of an overlapping stronger Mode S fruit, as compared to the performance of the standard reception technique required for Class A0 airborne receiving systems:

a) Improved Mode S extended squitter preamble detection.

b) Enhanced error detection and correction.

c) Enhanced bit and confidence declaration techniques applied to the airborne receiver classes as shown below:

1) Class A1 – Performance equivalent to or better than the use of the "Centre Amplitude" technique.

2) Class A2 – Performance equivalent to or better than the use of the "Multiple Amplitude Samples" baseline technique, where at least 8 samples are taken for each Mode S bit position and are used in the decision process.

3) Class A3 – Performance equivalent to or better than the use of the "Multiple Amplitude Samples" baseline technique, where at least 10 samples are taken for each Mode S bit position and are used in the decision process.

Note 1.— The above enhanced reception techniques are as defined in RTCA DO-260A, Appendix I.

Note 2.— The performance provided for each of the above enhanced reception techniques when used in a high fruit environment (i.e. with multiple overlapping Mode A/C fruit) is expected to be at least equivalent to that provided by the use of the techniques described in RTCA DO-260A, Appendix I.

Note 3.— It is considered appropriate for ground extended squitter receiving systems to employ the enhanced reception techniques equivalent to those specified for airborne Class A2 or A3 receiving systems.

5.2.3 Report assembler function

5.2.3.1 The report assembler function shall include the message decoding, report assembly, and output interface sub-functions.

5.2.3.2 When an extended squitter message is received, the message shall be decoded and the applicable ADS-B report(s) of the types defined in 5.2.3.3 shall be generated within 0.5 seconds.

Note 1.— Two configurations of extended squitter airborne receiving systems, which include the reception portion of the ADS-B message exchange function and the ADS-B/TIS-B report assembly function, are allowed:

a) Type I extended squitter receiving systems receive ADS-B and TIS-B messages and produce application-specific subsets of ADS-B and TIS-B reports. Type I extended squitter receiving systems are customized to the particular client applications using ADS-B and TIS-B reports. Type I extended squitter receiving systems may additionally be controlled by an external entity to produce installation-defined subsets of the reports that those systems are capable of producing.

b) Type II extended squitter receiving systems receive ADS-B and TIS-B messages and are capable of producing complete ADS-B and TIS-B reports in accordance with the equipment class. Type II extended squitter receiving systems may be controlled by an external entity to produce installation-defined subsets of the reports that those systems are capable of producing.

Note 2.— Extended squitter ground receiving systems receive ADS-B messages and produce either application-specific subsets or complete ADS-B reports based on the needs of the ground service provider, including the client applications to be supported.

Note 3.— The extended squitter message reception function may be physically partitioned into hardware separate from those that implement the report assembly function.

5.2.3.3 ADS-B REPORT TYPES

Note 1.— The ADS-B report refers to the restructuring of ADS-B message data received from Mode S extended squitter broadcasts into various reports that can be used directly by a set of client applications. Five ADS-B report types are defined by the following subparagraphs for output to client applications. Additional information on the ADS-B report contents and the *applicable mapping from extended squitter messages to ADS-B reports can be found in the* Manual on the Secondary Surveillance Radar (SSR) Systems *(Doc 9684) and RTCA DO-260A.*

Note 2.— The use of precision (e.g. GNSS UTC measured time) versus non-precision (e.g. internal receiving system clock) time sources as the basis for the reported time of applicability is described in 5.2.3.5.

5.2.3.3.1 *State vector report.* The state vector report shall contain time of applicability, information about an airborne or vehicle's current kinematic state (e.g. position, velocity), as well as a measure of the integrity of the navigation data, based on information received in airborne or ground position, airborne velocity, and identification and type extended squitter messages. Since separate messages are used for position and velocity, the time of applicability shall be reported individually for the position related report parameters and the velocity related report parameters. Also, the state vector report shall include a time of applicability for the estimated position and/or estimated velocity information (i.e. not based on a message with updated position or velocity information) when such estimated position and/or velocity information is included in the state vector report.

Note.— Specific requirements for the customization of this type of report may vary according to the needs of the client applications of each participant (ground or airborne). The state vector data is the most dynamic of the four ADS-B reports; hence, the applications require frequent updates of the state vector to meet the required accuracy for the operational dynamics of the typical airborne or ground operations of airborne and surface vehicles.

5.2.3.3.2 *Mode status report.* The mode status report shall contain time of applicability and current operational information about the transmitting participant, including airborne/vehicle address, call sign, ADS-B version number, airborne/vehicle length and width information, state vector quality information, and other information based on information received in operational status, airborne identification and type, airborne velocity and airborne status extended squitter messages. Each time that a mode status report is generated, the report assembler function shall update the report time of applicability. Parameters for which valid data is not available shall either be indicated as invalid or omitted from the mode status report.

Note 1.— Specific requirements for the customization of this type of report may vary according to the needs of the client applications of each participant (ground or airborne).

Note 2.— Once the target state and status message (as shown in the Manual on Mode S Specific Services *(Doc 9688)) becomes available, certain parameters conveyed in that message type are also to be included in the mode status reports.*

Note 3.— The age of the information being reported within the various data elements of a mode status report may vary as a result of the information having been received within different extended squitter messages at different times. Data being reported beyond the useful life of that parameter type may be either indicated as invalid or omitted from the mode status report as described in the Manual on the Secondary Surveillance Radar (SSR) Systems *(Doc 9684).*

5.2.3.3.3 *Air referenced velocity report.* Air referenced velocity reports shall be generated when air referenced velocity information is received in airborne velocity extended squitter messages. The air referenced velocity report shall contain time of applicability, airspeed and heading information. Only certain classes of extended squitter receiving systems, as defined in 5.2.3.5, are required to generate air referenced velocity reports. Each time that an individual mode status report is generated, the report assembly function shall update the report time of applicability.

Note 1.— The air referenced velocity report contains velocity information that is received in airborne velocity messages along with additional information received in airborne identification and type extended squitter messages. Air referenced velocity reports are not generated when ground referenced velocity information is being received in the airborne velocity extended squitter messages. Guidance on the air referenced velocity report contents is provided in the Manual on the Secondary Surveillance Radar (SSR) Systems *(Doc 9684).*

Note 2.— Specific requirements for the customization of this type of report may vary according to the needs of the client applications of each participant (ground or airborne).

5.2.3.3.4 *Resolution advisory (RA) report.* The RA report shall contain time of applicability and the contents of an active ACAS resolution advisory (RA) as received in a Type=28 and Subtype=2 extended squitter message.

Note.— The RA report is only intended to be generated by ground receiving subsystems when supporting a ground ADS-B client application(s) requiring active RA information. An RA report will nominally be generated each time a Type=28, Subtype=2 extended squitter message is received.

5.2.3.3.5 *TARGET STATE REPORT*

Note.— The requirements for reporting of target state information is not at the same level of maturity as for the other ADS-B report types. The reporting of target state information is currently not required, but may in the future be required for Class A2 and A3 airborne receiving systems. Once supported, the target state report will be generated when information is received in target state and status messages, along with additional information received in airborne identification and type extended squitter messages. The target state and status message is defined in the Manual on Mode S Specific Services *(Doc 9688). Specific requirements for the customization of this type of report may vary according to the needs of the client applications of each participant (ground or airborne). Guidance on the target state report contents is provided in the* Manual on Mode S Specific Services *(Doc 9688).*

5.2.3.4 TIS-B REPORT TYPES

5.2.3.4.1 As TIS-B messages are received by airborne receiving systems, the information shall be reported to client applications. Each time that an individual TIS-B report is generated, the report assembly function shall update the report time of applicability to the current time.

Note 1.— The TIS-B message formats are defined in the Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871).*

Note 2.— The TIS-B report refers to the restructuring of TIS-B message data received from ground Mode S extended squitter broadcasts into reports that can be used by a set of client applications. Two ADS-B report types are defined by the following subparagraphs for output to client applications. Additional information on the TIS-B report contents and the applicable mapping from extended squitter messages to ADS-B reports can be found in the Manual on the Secondary Surveillance Radar (SSR) Systems *(Doc 9684).*

Note 3.— The use of precision (e.g. GNSS UTC measured time) versus non-precision (e.g. internal receiving system clock) time sources as the basis for the reported time of applicability is described in 5.2.3.5.

5.2.3.4.2 *TIS-B target report.* All received information elements, other than position, shall be reported directly, including all reserved fields for the TIS-B fine format messages and the entire message content of any received TIS-B management message. The reporting format is not specified in detail, except that the information content reported shall be the same as the information content received.

5.2.3.4.3 When a TIS-B position message is received, it is compared with tracks to determine whether it can be decoded into target position (i.e. correlated to an existing track). If the message is decoded into target position, a report shall be generated within 0.5 seconds. The report shall contain the received position information with a time of applicability, the most recently received velocity measurement with a time of applicability, the estimated position and velocity applicable to a common time of applicability, airborne/vehicle address, and all other information in the received message. The estimated values shall be based on the received position information and the track history of the target.

5.2.3.4.4 When a TIS-B velocity message is received, if it is correlated to a complete track, a report shall be generated, within 0.5 seconds of the message reception. The report shall contain the received velocity information with a time of applicability, the estimated position and velocity applicable to a common time of applicability, airborne/vehicle address, and all other information in the received message. The estimated values shall be based on the received ground reference velocity information and the track history of the target.

5.2.3.4.5 *TIS-B management report.* The entire message content of any received TIS-B management message shall be reported directly to the client applications. The information content reported shall be the same as the information content received.

5.2.3.4.5.1 The contents of any received TIS-B management message shall be reported bit-for-bit to the client applications.

Note.— The processing of TIS-B management messages is defined in the Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871)*.

5.2.3.5 REPORT TIME OF APPLICABILITY

The receiving system shall use a local source of reference time as the basis for reporting the time of applicability, as defined for each specific ADS-B and TIS-B report type (see 5.2.3.3 and 5.2.3.4).

5.2.3.5.1 *Precision time reference.* Receiving systems intended to generate ADS-B and/or TIS-B reports based on the reception of surface position messages, airborne position messages, and/or TIS-B messages shall use GNSS UTC measured time for the purpose of generating the report time applicability for the following cases of received messages:

a) version zero (0) ADS-B messages, as defined in 3.1.2.8.6.2, when the navigation uncertainty category (NUC) is 8 or 9; or

b) version one (1) ADS-B or TIS-B messages, as defined in 3.1.2.8.6.2 and 3.1.2.8.7 respectively, when the navigation integrity category (NIC) is 10 or 11;

UTC measured time data shall have a minimum range of 300 seconds and a resolution of 0.0078125 (1/128) seconds.

5.2.3.5.2 *NON-PRECISION LOCAL TIME REFERENCE*

5.2.3.5.2.1 For receiving systems not intended to generate ADS-B and/or TIS-B reports based on reception of ADS-B or TIS-B messages meeting the NUC or NIC criteria as indicated in 5.2.3.5.1, a non-precision time source shall be allowed. In such cases, where there is no appropriate precision time source available, the receiving system shall establish an appropriate internal clock or counter having a maximum clock cycle or count time of 20 milliseconds. The established cycle or clock count shall have a minimum range of 300 seconds and a resolution of 0.0078125 (1/128) seconds.

Note.— The use of a non-precision time reference as described above is intended to allow the report time of applicability to accurately reflect the time intervals applicable to reports within a sequence. For example the applicable time interval between state vector reports could be accurately determined by a client application, even though the absolute time (e.g. UTC measured time) would not be indicated by the report.

5.2.3.6 REPORTING REQUIREMENTS

5.2.3.6.1 *Reporting requirements for Type I Mode S extended squitter airborne receiving systems.* As a minimum, the report assembler function associated with Type I Mode S extended squitter receiving systems, as defined in 5.2.3, shall support that subset of ADS-B and TIS-B reports and report parameters, that are required by the specific client applications being served by that receiving system.

5.2.3.6.2 *Reporting requirements for Type II Mode S extended squitter airborne receiving systems.* The report assembler function associated with Type II receiving systems, as defined in 5.2.3, shall generate ADS-B and TIS-B reports according to the class of the receiving system as shown in Table 5-4 when the prerequisite ADS-B and/or TIS-B messages are being received.

5.2.3.6.3 *Reporting requirements for Mode S extended squitter ground receiving systems.* As a minimum, the report assembler function associated with Mode S extended squitter ground receiving systems, as defined in 5.2.3, shall support that subset of ADS-B reports and report parameters, that are required by the specific client applications being served by that receiving system.

5.2.4 Interoperability

The Mode S extended squitter receiving system shall provide interoperability with both version 0 and version 1 extended squitter ADS-B message formats.

Note 1.— Version 0 and version 1 messages are defined in the Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871).*

Note 2.— Techniques for providing interoperability of version 0 and version 1 ADS-B message formats are described in the Manual on the Secondary Surveillance Radar (SSR) Systems *(Doc 9684) and further information is provided in RTCA DO-260A, Appendix N.*

5.2.4.1 INITIAL MESSAGE DECODING

The Mode S extended squitter receiving system shall, upon acquiring a new ADS-B target, initially apply the decoding provisions applicable to version 0 (zero) ADS-B messages until or unless an operational status message is received indicating version 1 (one) message format is in use.

5.2.4.2 APPLYING VERSION NUMBER

The Mode S extended squitter receiving system shall decode the version number information conveyed in the operational status message and shall apply the corresponding decoding rules, version 0 (zero) or version 1 (one), for the decoding of the subsequent extended squitter ADS-B messages from that specific airborne or vehicle.

5.2.4.3 HANDLING OF RESERVED MESSAGE SUBFIELDS

The Mode S extended squitter receiving system shall ignore the contents of any message subfield defined as reserved.

Note.— This provision supports interoperability between message versions by allowing the definition of additional parameters that will be ignored by earlier receiver versions and correctly decoded by newer receiver versions.

TABLES FOR CHAPTER 5

Table 5-1. ADS-B Class A equipment characteristics

<table>
<tr><th>Equipment class</th><th>Minimum transmit power (at antenna terminal)</th><th>Maximum transmit power (at antenna terminal)</th><th>Airborne or surface</th><th>Minimum extended squitter message capability required (see Note 2)</th></tr>

Note 1.— Specific MTL is referenced to the signal level at the output terminal of the antenna, assuming a passive antenna. If electronic amplification is integrated into the antenna assembly, then the MTL is referenced at the input to the amplifier. For Class A3 receivers, a second performance level is defined at a received signal level of –87 dBm where 15 per cent of the messages are to be successfully received. MTL values refer to reception under non-interference conditions.

Note 2.— The extended squitter receiver reception techniques are defined in 5.2.2.4. "Standard" reception techniques refer to the baseline techniques, as required for ACAS 1 090 MHz receivers, that are intended to handle single overlapping Mode A/C fruit. "Enhanced" reception techniques refer to techniques intended to provide improved reception performance in the presence of multiple overlapping Mode A/C fruit and improved decoder re-triggering in the presence of overlapping stronger Mode S fruit. The requirements for the enhanced reception techniques that are applicable to the specific airborne receiver classes are defined in 5.2.2.4.

Note 3.— The extended squitter messages are defined in the Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871). However, the target state and status message, as defined in the* Manual on Mode S Specific Services *(Doc 9688), is not yet at the same level of maturity as the other ADS-B messages.*

Note 4.— The TIS-B messages are defined in the Technical Provisions for Mode S Services and Extended Squitter *(Doc 9871).*

ATTACHMENT TO VOLUME IV

Guidance material related to airborne collision avoidance system (ACAS)

Note 1.— The following material is intended to provide guidance concerning the technical characteristics of the airborne collision avoidance system (ACAS) having vertical resolution capability (ACAS II, unless stated otherwise). ACAS SARPs are contained in Chapter 4.

Note 2.— Non-SI alternative units are used as permitted by Annex 5, Chapter 3, Section 3.2.2. In limited cases, to ensure consistency at the level of the logic calculations, units such as ft/s, NM/s and kt/s are used.

1. EQUIPMENT, FUNCTIONS AND CAPABILITIES

1.1 ACAS equipment characteristics

1.1.1 ACAS equipment includes an ACAS processing unit, Mode S transponder, control unit, appropriate antennas and means of providing advisories.

1.1.2 ACAS equipment in the aircraft interrogates SSR transponders on other aircraft in its vicinity and listens for the transponder replies. By computer analysis of these replies, the ACAS equipment determines which aircraft represent potential collision threats and provides appropriate indications (advisories) to the flight crew to avoid collisions.

1.1.3 ACAS equipment is capable of providing two classes of advisories. Traffic advisories (TAs) indicate the approximate positions of intruding aircraft that may later cause resolution advisories. Resolution advisories (RAs) propose vertical manoeuvres that are predicted to increase or maintain separation from threatening aircraft.

1.2 Advisories provided

1.2.1 TRAFFIC ADVISORIES

TAs may indicate the range, range rate, altitude, altitude rate, and bearing of the intruding aircraft relative to own aircraft. TAs without altitude information may also be provided on Mode C or Mode S-equipped aircraft that do not have an automatic altitude reporting capability. The information conveyed in ACAS TAs is intended to assist the flight crew in sighting nearby traffic.

1.2.2 RESOLUTION ADVISORIES

1.2.2.1 If the threat detection logic in the ACAS computer determines that an encounter with a nearby aircraft could lead to a near-collision or collision, the computer threat resolution logic determines an appropriate vertical manoeuvre that will ensure the safe vertical separation of the ACAS aircraft. The selected manoeuvre ensures adequate vertical separation within constraints imposed by the climb rate capability and proximity to the ground of the ACAS aircraft.

1.2.2.2 The RAs provided to the pilot can be divided into two categories: corrective advisories, which instruct the pilot to deviate from the current flight path (e.g. “CLIMB” when the aircraft is in level flight); and preventive advisories, which advise the pilot to maintain or avoid certain vertical speeds (e.g. “DON’T CLIMB” when the aircraft is in level flight).

1.2.2.3 Under normal circumstances, ACAS issues only one RA during an encounter with one or multiple intruders. The RA is issued when, or shortly after, the (first) intruder becomes a threat, is maintained as long as the (any) intruder remains a threat, and is cancelled when the (last) intruder ceases to be a threat. However, the indication given to the flight crew as part of that RA may be modified. It may be strengthened or even reversed when a threat modifies its altitude profile or when the detection of a second or third threat changes the initial assessment of the encounter. It may also be weakened when adequate separation has been achieved but the (any) intruder temporarily remains a threat.

1.2.3 WARNING TIMES

If a threat is detected, the ACAS equipment generates an RA some time before the closest approach of the aircraft. The amount of warning time depends on the protected volume selected for ACAS system use. The nominal resolution advisory time before closest approach used by ACAS varies from 15 to 35 seconds. A TA will nominally be issued between 5 and 20 seconds in advance of an RA. Warning times depend on sensitivity level as described in 3.5.12.

1.2.4 AIR-AIR COORDINATION OF RESOLUTION ADVISORIES

1.2.4.1 If the aircraft detected by the ACAS equipment has only a Mode A/C transponder and automatic pressure-altitude reporting equipment, its pilot will not be aware that it is being tracked by the ACAS-equipped aircraft. When the pilot of the ACAS aircraft receives an RA in an encounter with such an aircraft and manoeuvres as advised, the ACAS aircraft will be able to avoid the intruding aircraft provided the intruder does not accelerate so as to defeat the manoeuvre of the ACAS aircraft.

1.2.4.2 If the intruding aircraft is equipped with ACAS, a coordination procedure is performed via the air-to-air Mode S data link in order to ensure that the ACAS RAs are compatible.

1.2.5 AIR-GROUND COMMUNICATION

1.2.5.1 ACAS may communicate with ground stations using the Mode S air-ground data link. The transmission of sensitivity level control commands to ACAS equipment by Mode S ground stations is one aspect of communication. This feature permits a Mode S ground station to adapt the RA warning time to the local traffic environment as an ACAS aircraft moves through the region of coverage of the station. An effective trade-off between collision warning time and alert rate is thereby ensured.

1.2.5.2 The Mode S air-ground data link may also be used to transmit ACAS RAs to Mode S ground stations. This information can then be used by air traffic services to monitor ACAS RAs within an airspace of interest.

1.2.6 FUNCTIONS PERFORMED BY ACAS

1.2.6.1 The functions executed by ACAS are illustrated in Figure A-1. To keep the illustration simple, the functions “own aircraft tracking” and “intruder aircraft tracking” have been represented once in Figure A-1, under “surveillance”. However, the trackers that are intended to support the collision avoidance function may not be suitable to support the surveillance function. Separate tracking functions may be required to adequately support both the collision avoidance and the surveillance functions.

1.2.6.2 Surveillance is normally executed once per cycle; however, it may be executed more frequently or less frequently for some intruders. For example, surveillance may be executed less frequently for some non-threatening intruders to respect interference limiting inequalities or it may be executed more frequently for some intruders to improve the azimuth estimate.

1.2.6.3 Parameters used in the implementation of the ACAS functions are adjusted automatically or manually to maintain collision avoidance protection with minimal interference to normal air traffic control (ATC) operations.

1.3 Intruder characteristics

1.3.1 TRANSPONDER EQUIPAGE OF INTRUDER

ACAS provides RAs on aircraft equipped with altitude reporting Mode A/C or Mode S transponders. Some aircraft are equipped with SSR transponders but do not have altitude encoders. ACAS cannot generate RAs in conflicts with such aircraft because, without altitude information, a collision threat assessment cannot be made. ACAS equipment can generate only TAs on such aircraft, describing their ranges, range rates and bearings. Aircraft equipped with Mode A only transponders and those not equipped with or not operating Mode A/C or Mode S transponders cannot be tracked by ACAS.

1.3.2 INTRUDER CLOSING SPEEDS AND TRAFFIC DENSITIES

1.3.2.1 ACAS equipment designed for operation in high density airspace is capable of providing overall surveillance performance on intruders as defined in Chapter 4, 4.3.2 and Table 4-1.

1.3.2.2 The conditions enumerated in Table 4-1, which define two distinct density regions in the multi-dimensional condition space that affects ACAS performance, were extrapolated from airborne measurements of the performance of a typical ACAS. The airborne measurement data indicated that the track establishment probability will not drop abruptly when any of the condition bounds is exceeded.

1.3.2.3 The performance is stated in terms of probability of tracking a target of interest at a maximum closing speed in a given traffic density at least 30 seconds before the point of closest approach. The maximum traffic density associated with each of the two density regions is defined as:

$$\rho = n(r)/\pi r^2$$

where n(r) is the maximum 30-second time average of the count of SSR transponder-equipped aircraft (not counting own aircraft) above a circular area of radius r about the ACAS aircraft ground position. In the airborne measurements, the radii were different for the two density regions. In the high-density measurements the radius was 9.3 km (5 NM). In the low-density measurements the radius was 19 km (10 NM). Traffic density outside the limits of the circular area of constant density may be assumed to decrease inversely proportional to range so that the number of aircraft is given by:

$$n(r) = n(r_o)r/r_o$$

where r_o is the radius of the constant density region.

1.3.2.4 When the density is greater than 0.017 aircraft/km^2 (0.06 aircraft/NM^2), the nominal radius of uniform density r_o is taken to be 9.3 km (5 NM). When the density is equal to or less than indicated above, r_o is nominally 18.5 km (10 NM).

1.3.2.5 The table is based on an additional assumption that at least 25 per cent of the total transponder-equipped aircraft in the highest density 0.087 aircraft/km^2 (0.3 aircraft/NM^2) airspace are Mode S equipped. If fewer than 25 per cent are Mode S equipped, the track probability for Mode A/C aircraft may be less than 0.90 because of increased synchronous garble. If the traffic density within r_o exceeds the limits given in the table or if the traffic count outside of r_o continues increasing faster than r, the actual track establishment probability for Mode A/C aircraft may also be less than 0.90 because of increased synchronous garble. If the closing speed exceeds the given limits, the tracks for Mode A/C and Mode S aircraft may be established late. If the number of other ACAS in the area exceeds the limits given in the table, the interference limiting requirements of Chapter 4, 4.3.2.2 require that the ACAS transmitter power and receiver sensitivity be further reduced, thereby resulting in a later establishment time. However, the track probability is expected to degrade gradually as any of these limits is exceeded.

1.3.2.6 The table reflects the fact that the ACAS tracking performance involves a compromise between closing speed and traffic density. Although it may not be possible to maintain a high probability of track when the traffic density and the intruder closing speed are both simultaneously large, the ACAS design is capable of reliable track establishment on high-speed intruders when operating in relatively low-density en-route airspace (typically characterized by densities of less than 0.017 aircraft/km^2, i.e. 0.06 aircraft/NM^2) or when operating in higher density, low-altitude terminal airspace where the closing speeds are typically below 260 m/s (500 kt) for operational reasons.

1.3.2.7 The table also accounts for the fact that higher closing speeds are associated with the forward direction than with the side or back directions so that the ACAS surveillance design is not required to provide reliable detection for the highest closing speeds in the side or back directions.

1.3.3 SYSTEM RANGE LIMITATIONS

The required nominal tracking range of the ACAS is 26 km (14 NM). However, when operating in high density, the interference limiting feature may reduce system range to approximately 9.3 km (5 NM). A 9.3 km (5 NM) range is adequate to provide protection for a 260 m/s (500 kt) encounter.

1.4 Control of interference to the electromagnetic environment

1.4.1 The ACAS equipment is capable of operating in all traffic densities without degrading the electromagnetic environment. Each ACAS equipment knows the number of other ACAS units operating in the local airspace. This knowledge is used to ensure that no transponder is suppressed by ACAS activity for more than 2 per cent of the time and to ensure that ACAS does not contribute to an unacceptably high fruit rate that would degrade ground SSR surveillance performance. Multiple ACAS units in the vicinity cooperatively limit their own transmissions. As the number of such ACAS units increases, the interrogation allocation for each of them decreases. Thus, every ACAS unit monitors the number of other ACAS units within detection range. This information is then used to limit its own interrogation rate and power as necessary. When this limiting is in full effect, the effective range of the ACAS units may not be adequate to provide acceptable warning times in encounters in excess of 260 m/s (500 kt). This condition is normally encountered at low altitude where this closing speed capability is sufficient. Whenever the ACAS aircraft is on the ground, ACAS automatically limits the power of its interrogations. This limiting is done by setting the ACAS count (n_a) in the interference limiting inequalities to a value three times the measured value. This value is selected to ensure that an ACAS unit on the ground does not contribute any more interference to the electromagnetic environment than is unavoidable. This value will provide an approximate surveillance range of 5.6 km (3 NM) in the highest density terminal areas to support reliable ground ACAS surveillance of local airborne traffic and a 26 km (14 NM) range in very low density airspace to provide wide area surveillance in the absence of an SSR.

1.4.2 The presence of an ACAS unit is announced to other ACAS units by the periodic transmission of an ACAS interrogation containing a message that gives the address of the ACAS aircraft. This transmission is sent nominally every 8 to 10 seconds using a Mode S broadcast address. Mode S transponders are designed to accept message data from a broadcast interrogation without replying. The announcement messages received by the ACAS aircraft's Mode S transponder are monitored by the interference limiting algorithms to develop an estimate of the number of ACAS units in the vicinity.

2. FACTORS AFFECTING SYSTEM PERFORMANCE

2.1 Synchronous garble

When a Mode C interrogation is transmitted, all the transponders that detect it reply. Since the reply duration is 21 microseconds, aircraft whose ranges from ACAS are within about 2.8 km (1.5 NM) of each other generate replies that persistently and synchronously overlap each other at the interrogating aircraft. The number of overlapping replies is proportional to the density of aircraft and their range from ACAS. Ten or more overlapping replies might be received in moderate density terminal areas. It is possible to decode reliably only about three overlapping replies. Hence, there is a need to reduce the number of transponders that reply to each interrogation. Whisper-shout and directional transmit techniques are available for controlling such synchronous garble (see 3.2 and 3.3). They are both needed in ACAS equipment operating in the highest traffic densities.

2.2 Multipath from terrain reflections

2.2.1 SSR transponders use quarter-wave monopole antennas mounted on the bottom of the aircraft. A stub antenna of this sort has a peak elevation gain at an angle of 20 to 30 degrees below the horizontal plane. This is suitable for ground-air surveillance, but the direct air-air surveillance path may operate at a disadvantage relative to the ground reflection path, particularly over water.

2.2.2 If the ACAS unit uses a bottom-mounted antenna, there are geometries for which the reflected signal is consistently stronger than the direct signal. However, when a top-mounted antenna is used for interrogation, its peak gain occurs at a positive elevation angle and the signal-to-multipath ratio is improved. Thus, when ACAS transmits from the top-mounted antenna, the effects of multipath are reduced significantly. Even when a top-mounted antenna is used, the multipath will still occasionally exceed the receiver threshold. Thus, there is need to reject low-level multipath. ACAS can achieve this rejection through the use of variable receiver thresholds (see 3.4).

2.3 Altimetry data quality

2.3.1 MEASUREMENT ERRORS

2.3.1.1 The vertical separation between two conflicting aircraft is measured as the difference between own altitude and the intruder's altitude as reported in its Mode C or Mode S reply. If the ACAS aircraft is an air carrier, it will normally have accurate altimetry; an intruding aircraft might have less accurate altimetry.

2.3.1.2 Errors in altimetry can cause two types of effects: first, if the aircraft are on a near collision course, errors could indicate safe passage, and the impending near mid-air collision might not be resolved by ACAS; second, if the aircraft are on a near collision course, but are separated in altitude, errors could lead to an ACAS manoeuvre in the wrong direction which could induce an even closer encounter.

2.3.1.3 ACAS attempts to achieve a difference of at least 90 m (300 ft) between aircraft at closest approach based on reported altitude. Thus, if the combination of intruder and ACAS altimetry errors approached 90 m (300 ft), there would be finite risk of inadequate vertical separation despite the presence of ACAS. Studies of the expected altimetry errors of both ACAS and non-ACAS aircraft at altitudes from sea level to FL 400 have concluded that the risk is essentially negligible if both aircraft are equipped with high accuracy altimetry systems that can achieve root-sum-square (RSS) errors of approximately 15 m (50 ft). It was further concluded that if an ACAS with high accuracy altimetry operates in a traffic environment consisting of typical general aviation aircraft (with RSS errors of approximately 30 m (100 ft), normally distributed), then altimetry errors will occasionally lead to inadequate ACAS RAs. However, this will not occur often enough to seriously interfere with the effectiveness of the system. Performance was considered to be inadequate if both aircraft in an encounter had a low accuracy altimetry system. This led to the requirement that ACAS possess a high accuracy system.

2.3.2 ALTITUDE BIT FAILURE

If the Mode C or Mode S altitude reports from the intruding aircraft or the altitude data for own aircraft contain bit errors, ACAS may develop erroneous estimates of the corresponding vertical position or rate. These errors can have effects similar to the effects of measurement errors. Such errors are most likely to occur when the altitude data source is a Gilham encoder, and the use of Gilham encoded data for own aircraft altitude can have serious adverse consequences. When there is no alternative source than Gilham encoded data, two encoders must be used and a comparison function in the Mode S transponder used to detect errors in the altitude data before they are provided to ACAS.

2.3.3 CREDIBILITY OF OWN AIRCRAFT ALTITUDE

All sources of own altitude data are required to be checked for credibility, including fine altitude data (which can come from various sources: gyro, air data computer, etc.) and radar altitude data.

2.4 Potential for ground-based SSR site monitors (PARROTs) to cause spurious traffic and resolution advisories

An ACAS interrogates all SSR transponders within range, including ground-based transponder installations used to monitor the operation of ground radar systems, or test transponders. If these ground-based transponders reply with false altitude data, the potential exists for an ACAS to generate spurious TAs and RAs. To prevent this problem, information on the operation of position adjustable range reference orientation transponders (PARROTs) and transponder test facilities is provided in the *Manual of Secondary Surveillance Radar (SSR) Systems* (Doc 9684).

2.5 Allocation and assignment of SSR Mode S addresses

To ensure safe operation, the system requires that all Mode S-equipped aircraft have unique addresses. Multiple aircraft with the same address or aircraft with addresses not compliant with Annex 10, Volume III, Part I, Chapter 9, can adversely affect the surveillance and coordination functions.

2.6 Potential for TCAS I systems to affect ACAS II performance

Note.— For the purpose of this material, TCAS I is defined as a system that uses SSR interrogations to provide aircrew with traffic alert warning information as an aid to the "see and avoid" principle.

Some TCAS I systems employ ACAS II interference limiting techniques with resolution advisories suppressed. These systems do not comply with ACAS I SARPs. Because ACAS II interference limiting relies on direct interaction with other ACAS II aircraft (using the ACAS broadcast and Mode S transponder replies), the presence of such TCAS I aircraft can directly influence the surveillance performance of nearby ACAS II aircraft. If such TCAS I systems are fitted to aircraft that are known to operate in close proximity to each other (e.g. rotorcraft or gliders) then the effect may reduce the surveillance range of other ACAS II aircraft and delay the provision of collision avoidance warnings. In light of these concerns, TCAS I systems (which employ ACAS II interference limiting techniques) must not be used for aircraft which are known to operate in close proximity to each other for sustained periods of time. Care must be taken to ensure that the effect on the SSR electromagnetic environment is acceptable, since these TCAS I units may be fitted in very large numbers.

3. CONSIDERATIONS ON TECHNICAL IMPLEMENTATION

3.1 System operation

3.1.1 SURVEILLANCE OF INTRUDERS

3.1.1.1 The main purposes of the surveillance processes described below are to obtain position reports and to correlate these to form tracks. This involves the use of trackers and requires the estimation of rates.

3.1.1.2 The ACAS unit transmits an interrogation sequence nominally once per second. The interrogations are transmitted at a nominal effective radiated power level of +54 ±2 dBm as measured at zero degree elevation relative to the longitudinal axis of the aircraft. When these interrogations are received by Mode A/C and Mode S altitude reporting transponders, the transponders transmit replies that report their altitude. The ACAS unit computes the range of each intruding aircraft by using the round-trip time between the transmission of the interrogation and the receipt of the reply. Altitude rate and range rate are determined by tracking the reply information.

3.1.1.3 In the absence of interference, overload, interference-limiting conditions, or other degrading effects, the equipment will nominally be capable of providing surveillance for Mode A/C and Mode S targets out to a range of 26 km (14 NM). However, because the surveillance reliability degrades as the range increases, the equipment should assess as possible collision threats only those targets within a maximum range of 22 km (12 NM). No target outside of this range should be eligible to generate an RA. However, ACAS is able to detect ACAS broadcast interrogations from ACAS-equipped aircraft out to a nominal range of 56 km (30 NM).

3.1.1.4 The equipment should have the capacity for surveillance of any mix of Mode A/C or Mode S targets up to a total peak target capacity of 30 aircraft. ACAS equipment is nominally capable of reliable surveillance of high-closing-speed targets in a peak traffic density of up to 0.017 aircraft per square km (0.06 aircraft per square NM) or approximately 27 aircraft in a 26 km (14 NM) radius.

3.1.1.5 When the average traffic density exceeds the above value, the reliable surveillance range decreases. ACAS equipment is capable of providing reliable surveillance of targets closing only up to 260 m/s (500 kt) in an average traffic density of 0.087 aircraft per square km (0.3 aircraft per square NM). The surveillance range required for 260 m/s (500 kt) targets is about 9.3 km (5 NM). It is possible to provide 9.3 km (5 NM) surveillance in a short-term peak traffic density of 0.087 aircraft/km^2 (0.3 aircraft/NM^2) or more without exceeding a total target capacity of 30. If the overall target count ever exceeds 30 at any range up to 26 km (14 NM), the long-range targets may always be dropped without compromising the ability to provide reliable surveillance of lower-speed targets. Thus a peak capability of 30 targets (any mix of Mode A/C or Mode S) is adequate for ACAS and if the number of Mode A/C plus Mode S targets under surveillance exceeds 30, excess targets are to be deleted in order of decreasing range without regard to target type.

3.1.2 SURVEILLANCE OF INTRUDERS WITH MODE A/C TRANSPONDERS

3.1.2.1 Surveillance of Mode A/C transponders is accomplished by the periodic transmission of a Mode C-only all-call (intermode) interrogation (Chapter 3, 3.1.2.1.5.1.2). This elicits replies from Mode A/C transponders, but not from Mode S transponders, thus preventing the replies of Mode S transponders from synchronously garbling the replies of Mode A/C transponders. Other techniques for reducing synchronous garble are (1) the use of directional antennas to interrogate only those aircraft in an azimuth wedge, and (2) the use of a sequence of variable power suppressions and interrogations (known as "whisper-shout") that interrogates only aircraft that have similar link margins (see 3.2.2). The use of both of these techniques together provides a powerful tool for overcoming the effects of synchronous garble.

3.1.2.2 Whisper-shout employs a sequence of interrogations at different power levels transmitted during each surveillance update period. Each of the interrogations in the sequence, other than the one at lowest power, is preceded by a suppression transmission, where the first pulse of the interrogation serves as the second pulse of the suppression transmission. The suppression transmission pulse begins at a time 2 microseconds before the first pulse of the interrogation. The suppression pulse is transmitted at a power level lower than the accompanying interrogation so that the transponders that reply are only those that detect the interrogation and do not detect the suppression. To guard against the possibility that some transponders do not reply to any interrogation in the sequence, the suppression pulse is transmitted at a power level somewhat lower than that of the next lower interrogation. The time interval between successive interrogations should be at least 1 millisecond. This ensures that replies from transponders at long range are not mistaken for replies to the subsequent interrogation. All interrogations in the sequence are transmitted within a single surveillance update interval.

3.1.2.3 Responses to each Mode C-only all-call interrogation are processed to determine the range and altitude code of each reply. It is possible to determine the altitude codes for up to three overlapping replies if care is taken to identify the location of each of the received pulses.

3.1.2.4 After all of the replies are received in response to the whisper/shout sequence, duplicate replies should be merged so that only one "report" is produced for each detected aircraft. Reports may be correlated in range and altitude with the predicted positions of known intruders (i.e. with existing tracks). Since intruding aircraft are interrogated at a high rate (nominally once per second), good correlation performance is achieved using range and altitude. Mode A code is not needed for correlation. Reports that correlate are used to extend the associated tracks. Reports that do not correlate with existing tracks may be compared to previously uncorrelated reports to start new tracks. Before a new track is started, the replies that lead to its initiation may be tested to ensure that they agree in all of the most significant altitude code bits. A geometric calculation may be performed to identify and suppress specular false targets caused by multipath reflections from the terrain.

3.1.2.5 Tracks being initiated may be tested against track validity criteria prior to being passed to the collision avoidance algorithms. The purpose of these tests is to reject spurious tracks caused by garble and multipath. Spurious tracks are generally characterized by short track life.

3.1.2.6 Aircraft not reporting altitude in Mode C replies are detected using the Mode C reply framing pulses. These aircraft are tracked using range as the correlation criterion. The additional use of bearing for correlation will help to reduce the number of false non-Mode C tracks.

3.1.2.7 *Reply merging.* Multiple replies may be generated by a Mode A/C target that responds to more than one whisper-shout interrogation during each whisper-shout sequence or by a target that responds to interrogations from both the top and bottom antennas. The equipment is expected to generate no more than one position report for any target even though that target may respond to more than one interrogation during each surveillance update interval.

3.1.2.8 *Mode A/C surveillance initiation.* The equipment will pass the initial position reports to the collision avoidance algorithms only if the conditions in a) and b) below are satisfied:

a) initially, a Mode C reply is received from the target in each of three consecutive surveillance update periods, and:

   1) the replies do not correlate with surveillance replies associated with other tracks;

   2) the range rate indicated by the two most recent replies is less than 620 m/s (1 200 kt);

   3) the oldest reply is consistent with the above range rate in the sense that its range lies within 95.3 m (312.5 ft) of a straight line passing through the two most recent replies;

4) the replies correlate with each other in their altitude code bits;

b) a fourth correlating reply is received within five surveillance update intervals following the third reply of the three consecutive replies in a) above and is within ±60 m (±200 ft) of the predicted altitude code estimate determined in a) 4) above.

3.1.2.8.1 The following is an example of an acceptable set of rules for assessing correlation of reply code bits and determining the initial altitude track code estimate for a target. Three replies correlate only if:

a) all eight of their D, A and B code pulses agree; or

b) seven of their D, A, and B code pulses agree and at least one of their C code pulses agrees.

3.1.2.8.2 The test for code agreement among the three replies is made individually for each of the reply pulse positions. This test is based on the presence of code pulses alone; agreement occurs for a given reply pulse position if all three replies are detected with ONE in the position or all three replies are detected with a ZERO in that position. The confidence associated with those pulse detections does not affect agreement.

3.1.2.8.3 The confidence flag for a reply pulse position is set “low” whenever there exists another received reply (either real or phantom) that could have had a pulse within ±0.121 microsecond of the same position. Otherwise, the confidence flag is set “high”.

3.1.2.8.4 When agreement among the three replies does not occur for a given reply pulse position, the initial track pulse code estimate for that position is based on the values of the individual pulse codes and the confidence flags associated with those pulse codes in three replies.

3.1.2.8.5 When agreement fails for a given pulse position, the rules for estimating the initial track code for that position are based on the principle that “low” confidence ONEs are suspect. The rules are as follows:

a) If in the most recent (third) reply the detected code for a given pulse position is “high” confidence or a ZERO, the initial track pulse code estimate for that position is the same as the code detected in that position in the most recent reply.

b) If in the most recent reply the detected code for a given pulse position is a “low” confidence ONE, the initial track pulse code estimate for the position is the same as the code detected in that position in the second reply provided that was not also a “low” confidence ONE. If the second was also a “low” confidence ONE, the initial track pulse code estimate is the same as the code detected in that position in the first reply.

3.1.2.9 *MODE A/C SURVEILLANCE EXTENSION*

3.1.2.9.1 *General.* The equipment should continue to pass position reports for a target to the collision avoidance algorithms only if:

a) the track has not been identified as an image (see 3.1.2.9.6); and

b) the reply altitudes occur within an altitude window of ±60 m (200 ft) centred on the altitude predicted from previous reply history; and

c) all replies used for threat assessment after the initiation procedure occur within a range window centred on the range predicted from previous reply history.

3.1.2.9.2 *Range correlation.* The following is an example of an acceptable set of rules for determining the size of the range window:

a) The tracks are processed individually in increasing range order with input range precision of at least 15 m (50 ft) and retained computational accuracy of at least 1.8 m (6 ft). Range is estimated and predicted by a recursive (alpha-beta) tracker with alpha of 0.67 and beta of 0.25.

b) After each surveillance update a new range measurement is available for each target. Since the measurement includes errors, it must be smoothed based on previous measurements to obtain improved estimates of the current target position and velocity. The range and range rate estimation equations are as follows:

$$r(t) \text{ estimate} = r(t) \text{ prediction} + [\text{alpha} \times (r(t) \text{ measurement} - r(t) \text{ prediction})]$$

$$\dot{r}\ (\text{t}) \text{ estimate} = \dot{r}\ (t - T_p) \text{ estimate} + [(\text{beta}/T_p) \times (r(t) \text{ measurement} - r(t) \text{ prediction})],$$

where T_p is the time difference between the current and previous measurements.

c) The gains, alpha and beta determine the relative degree of reliance on current and previous measurements; gains of unity would place complete reliance on the current measurement and result in no smoothing.

d) The estimates obtained from the above equations are subsequently used to predict the range at the time of the next measurement as follows:

$$r(t + T_n) \text{ prediction} = r(t) \text{ estimate} + [\dot{r}\ (t) \text{ estimate} \times T_n]$$

where T_n is the time difference between the next measurement and the current measurement.

e) The range correlation window is centred at the predicted range and has a half-window width as follows:

$$\begin{bmatrix} \text{760 ft if coasted} \\ \text{last interval} \\ \\ \text{570 ft if updated} \\ \text{last interval} \end{bmatrix} + \begin{bmatrix} \text{if track is not established:} \\ 0 \\ \\ \text{if track is established:} \\ \\ \text{2 000 ft, if 0.00 NM} \le r < \text{0.17 NM} \\ \text{1 000 ft, if 0.17 NM} \le r < \text{0.33 NM} \\ \text{600 ft, if 0.33 NM} \le r < \text{1.00 NM} \\ \text{240 ft, if 1.00 NM} \le r < \text{1.50 NM} \\ \text{0 ft, if 1.50 NM} \le r \end{bmatrix}$$

f) If the track is above 3 050 m (10 000 ft), the term contained within the second pair of brackets is multiplied by four.

3.1.2.9.3 *Altitude correlation.* For the purposes of altitude correlation, altitude is estimated and predicted by an alpha-beta tracker with alpha of 0.28 and beta of 0.06. The tracker has retained computational accuracy of (30 m) (100 ft) divided by 16. The altitude prediction is rounded to the nearest 30 m (100 ft) increment and converted to grey code. The grey codes of the predicted altitude ±30 m (100 ft) are also computed. The longer-term altitude predictions performed by the threat detection logic require a more accurate altitude tracking procedure (see 3.5.3). The reply(ies) that lies in the range correlation window is tested for altitude correlation in increasing range order. The track is updated with the first reply that has exact agreement (in all bits) with any of the three grey codes computed above. If no reply matches, two additional grey codes are computed and the process tried again. The two codes are the predicted altitude ±60 m (200 ft).

3.1.2.9.4 *Track updating — establishment.* The updating reply (if any) is eliminated from further consideration in updating other tracks, or in the track initiation process. If there is no updating reply, the range and altitude estimates are set equal to the corresponding predicted values. If this is the sixth consecutive interval having no updating reply, the track is dropped. If there is an updating reply, and if the track is not identified as an image (see 3.1.2.9.6), the track is flagged as established, that is, it is now available for use by the threat detection logic. Once established, a track remains established until it is dropped, even if it subsequently satisfies the conditions for an image track.

3.1.2.9.5 *Test for track splits.* When all tracks have been processed, they are combined with the tracks that are newly initiated during the current scan, and then all the tracks are examined pairwise to determine if a given pair of tracks is likely to represent the same intruder. If:

a) the ranges differ by at most 150 m (500 ft)

b) the range rates differ by at most 4.6 m/s (8.9 kt)

c) either

   1) the altitudes differ by at most 30 m (100 ft), or

   2) the altitude rates differ by at most 3 m/s (10 ft/s) and both tracks were initiated during the same scan,

only one of the tracks is retained, preference being given to the track showing the larger number of replies since initiation.

3.1.2.9.6 *Image track processing.* Those tracks that could have been formed by replies specularly reflected from the ground are referred to as image tracks. A track is identified as an image if there exists a track at shorter range (referred to as the real track) such that:

a) the difference between the real altitude and the image altitude is less than or equal to 60 m (200 ft) for altitude-reporting targets, or both the image track and the real track are non-altitude-reporting; and

b) the difference between the measured image range rate and the calculated image range rate $\dot{r}_i$ is less than or equal to 21 m/s (40 kt), where the calculated image range rate is either (for the single-reflection case):

$$\dot{r}_i = \left(\frac{1}{2}\right)[\dot{r} + \left(\frac{1}{2r_i - r}\right)[((2r_i - r)^2 - r^2 + (Z_0 - Z)^2)^{\frac{1}{2}}(\dot{Z}_0 + \dot{Z}) + r\dot{r} - (Z_0 - Z)(\dot{Z}_0 + \dot{Z})]]$$

or (for the double-reflection case):

$$\dot{r}_i = \left(\frac{1}{r_i}\right)\left[\left(r_i^2 - r^2 + (Z_0 - Z)^2\right)^{\frac{1}{2}}(\dot{Z}_0 + \dot{Z}) + r\dot{r} - (Z_0 - Z)(\dot{Z}_0 - \dot{Z})\right]$$

where:

r_i is the image range,

r is the real range,

Z is the real altitude, for altitude reporting targets or Z is set to own altitude for non-altitude reporting targets, and

Z_0 is own altitude

If a track is identified as an image, it may be retained, but it cannot be flagged as established for use by the threat detection logic.

3.1.2.10 *Missing Mode A/C reports.* The equipment continues to pass to the collision avoidance algorithms predicted position reports for Mode A/C targets for six surveillance update intervals following the receipt of the last valid correlating reply. The equipment does not pass position reports for more than six surveillance update intervals following the receipt of the last valid correlating reply unless the target again satisfies the surveillance initiation criteria of 3.1.2.8.

3.1.3 SURVEILLANCE OF INTRUDERS WITH MODE S TRANSPONDERS

3.1.3.1 Efficient air-air surveillance techniques have been developed for intruders equipped with Mode S transponders. Because of Mode S selective address, there is no synchronous garble associated with surveillance of Mode S transponders. However, multipath must be dealt with and the surveillance of Mode S transponders should be accomplished with as few interrogations as possible to minimize interference.

3.1.3.2 The Mode S modulation formats are inherently more resistant to multipath than are the Mode A/C modulation formats. However, the greater length of the Mode S transmission makes it more likely to be overlapped by multipath. The use of top-mounted antennas and variable receiver thresholds (to protect the Mode S reply preamble) increases the multipath resistance to an acceptable level for reliable air-air surveillance. The use of antenna diversity transponders on ACAS aircraft provides an additional reliability margin for coordination between pairs of conflicting ACAS aircraft.

3.1.3.3 Mode S interrogation rates are kept low by passive detection of transponder transmissions and by interrogating once per second only those intruders that could become immediate threats. Intruders that are not likely to become immediate threats should be interrogated less frequently (i.e. once every 5 seconds). Passive address acquisition prevents unnecessary interference with other elements of the SSR and ACAS system. ACAS listens to Mode S all-call replies (DF = 11, acquisition squitter transmissions, Chapter 3, 3.1.2.8.5.1 or DF = 17, extended squitter transmissions, Chapter 3, 3.1.2.8.6.1). These may occur in response to Mode S ground station all-call interrogations or as spontaneous transmission (called squitters) at intervals ranging from 0.8 to 1.2 seconds for the acquisition squitter, and at shorter intervals for the extended squitter. Reception of squitters may be alternated between the top and bottom antennas. If reception is switched, it will be necessary to control the switching times to avoid undesirable synchronism with the squitters transmitted by Mode S antenna diversity transponders.

3.1.3.4 The 24-bit aircraft address in the squitter is protected by error coding to ensure a high probability of obtaining a correct address. Since the squitter transmission does not contain altitude information, ACAS attempts to obtain altitude passively from Mode S replies generated in response to ground interrogations or interrogations from other ACAS aircraft. If altitude is not received shortly after address detection, the Mode S aircraft is actively interrogated to obtain altitude.

3.1.3.5 After ACAS has determined the altitude of a detected Mode S aircraft, it compares the altitude of this aircraft to its own altitude to determine whether or not the target can be ignored or should be interrogated to determine its range and range rate. If the measured range and the estimated range rate indicate that it is (or could soon be) a collision threat, the intruder should be interrogated once per second and the resulting track data fed to the collision avoidance algorithms. An aircraft at longer range should be interrogated only as often as necessary to maintain track and ensure that it will be interrogated once per second before it becomes a collision threat.

3.1.3.6 The use of passive detection in combination with altitude comparison and a less frequent interrogation of non-threat intruders reduce the Mode S interrogation rate automatically when the local densities of other ACAS aircraft are very high. Therefore, a higher interrogation power level is available to improve surveillance performance.

3.1.3.7 *MODE S SURVEILLANCE INITIATION*

3.1.3.7.1 The equipment is intended to provide Mode S surveillance with a minimum of Mode S interrogations. The identity of Mode S targets is determined by passively monitoring transmissions received with DF = 11 or DF = 17. Error detection and correction is applied to the received squitters to reduce the number of addresses to be processed. The altitude of the Mode S targets from which a squitter has been received is determined by passive monitoring transmissions received with DF = 0 (short air-air surveillance replies, Chapter 3, 3.1.2.8.2) or DF = 4 (surveillance altitude replies, Chapter 3, 3.1.2.6.5) or active selective interrogations (air-air surveillance interrogation, Chapter 4, 4.3.8.4) and monitoring the corresponding air-air surveillance replies. The equipment monitors squitter and altitude replies whenever it is not transmitting, or receiving replies to, Mode S or Mode C interrogations. Each received reply is examined to determine what further action should be taken.

3.1.3.7.2 To reduce the number of unnecessary interrogations, a squitter target is not interrogated if so few squitters and altitude replies are received from it that no threat is indicated. Targets that might be a threat are called valid targets. The equipment is not intended to interrogate a target unless the altitude information indicates that it is within 3 050 m (10 000 ft) of own altitude. The ACAS aircraft interrogates targets from which it does not receive altitude information but does continue to receive error-free squitters. In order to establish timely acquisition of targets that transition the 3 050 m (10 000 ft) relative altitude boundary, the altitude of targets that are beyond 3 050 m (10 000 ft) of own altitude are monitored using unsolicited DF = 0 or DF = 4 replies, or in the absence of such replies, by periodically interrogating to elicit a DF = 0 reply.

3.1.3.7.3 The following is an example of one acceptable means of processing squitters and altitude replies to reduce unneeded interrogations:

a) When a valid squitter is first received, a running sum initialized at 0 is associated with it. During each succeeding surveillance update interval the sum is decremented by 1 if no squitters or altitude replies with a particular address are received, and the sum is incremented by 16 for each reception of either a squitter or an altitude reply. The process continues until the sum equals or exceeds 20. When the sum becomes less than or equal to –20, the address is removed from the system. When it equals or exceeds +20, the target is declared to be valid.

b) When a target has been declared to be valid, it is interrogated unless its altitude differed from the ACAS altitude by more than 3 050 m (10 000 ft). Otherwise, its altitude is monitored using DF = 0 or DF = 4 replies, or in the absence of such replies, by interrogating once every 10 seconds to elicit a DF = 0 reply.

c) When any of these conditions are satisfied, the running sum continues to be incremented and decremented even though its value may exceed 20.

3.1.3.8 *MODE S RANGE ACQUISITION*

3.1.3.8.1 The equipment should transmit an acquisition interrogation (UF = 0, 16, AQ = 1, Chapter 3, 3.1.2.8.1.1) to determine the range of each valid target with relative altitude as defined above, or from which inadequate altitude information has been received.

3.1.3.8.2 If an acquisition interrogation fails to elicit a valid reply, additional interrogations should be transmitted. The total number of acquisition interrogations addressed to a single target must not exceed three within a single surveillance update period. The first acquisition interrogation is to be transmitted using the top antenna. If two acquisition interrogations to a target fail to elicit valid replies, the next two acquisition interrogations to that target are to be transmitted using the bottom antenna. If in the acquisition attempt in the first surveillance update period, valid replies are not received, ACAS transmits a total of nine acquisition interrogations distributed over the first six successive surveillance update periods. If acquisition interrogations fail to elicit replies within six surveillance update intervals, the acquisition process is to cease until enough additional squitters/fruit are received indicating that a successful acquisition is likely. One means of accomplishing this is to process subsequent squitters/fruit as described in 3.1.3.7, but with the increment 16 replaced by 8. If a second failure to acquire occurs, the process is repeated with an increment of 4. After any subsequent failure, an increment of 2 is used.

3.1.3.8.3 If additional attempts are made to acquire the target, they conform to the pattern described above except that:

a) On the second and third attempt, only one interrogation is to be made during a single surveillance update interval; and in the absence of valid replies, six interrogations are to be transmitted during the first six surveillance update intervals.

b) Any further attempts consist of a single interrogation during the entire six update intervals.

3.1.3.8.4 When a valid acquisition reply is received, the VS field in the reply is examined to determine the vertical status of a target. If a target is determined to be on the ground, its vertical status is periodically monitored by interrogating as often as necessary to ensure timely acquisition when airborne. When a valid acquisition reply is received from an airborne target, one or more interrogations are to be transmitted to the target within two surveillance update intervals in order to confirm the reliability of the altitude data and the altitude quantization bit. When two replies have been received from an airborne target that have altitude values within 150 m (500 ft) of each other and within 3 050 m (10 000 ft) of own altitude and have identical quantization bit values, periodic surveillance interrogations (designated as "tracking" interrogations) are to be initiated for that target.

3.1.3.8.5 The range of the target is used with its estimated range rate to determine its potential threat to ACAS. If the target is not an immediate potential threat, it can be interrogated less frequently than if it were a potential threat for which an advisory would soon most likely be issued. Each 1-second surveillance update interval, the potential threat level *(TAU)* of the target is calculated as follows:

$$TAU = -(\mathrm{r} - \mathrm{SMOD}^2/r)/\dot{r},$$

where r is the tracked range, $\dot{r}$ is the estimated relative range rate and *SMOD* is a surveillance distance modifier which is equivalent to 5.6 km (3 NM). If the estimated relative range rate is either a negative value of less than –6 kt or positive (either a slow convergence or the aircraft are diverging), the $\dot{r}$ value used to calculate *TAU* is –6 kt. An *SMOD* value of 5.6 km ensures that ACAS will always use the nominal 1-second interrogation cycle in situations where the value of *TAU* can change rapidly, such as in a parallel approach. A target with a *TAU* value of equal to or less than 60 seconds is interrogated at the nominal rate of once every second. A target with a *TAU* value greater than 60 seconds is interrogated at a rate of once every five seconds if the altitude of the target and own aircraft are both less than 5 490 m (18 000 ft) and at a rate of at least once every five seconds if the altitude of the target or own aircraft is greater than 5 490 m (18 000 ft).

3.1.3.9 *MODE S SURVEILLANCE EXTENSION*

3.1.3.9.1 The equipment passes position reports for a Mode S target to the collision avoidance algorithms only if all replies used for threat assessment after the initial range acquisition occur within range and altitude windows centred on range and altitude predicted from previous reply history, the altitude quantization bit matches the previous value, and the VS field in the short special surveillance reply indicates the target to be airborne at least once during the previous three surveillance update cycles. The range and altitude windows are the same as those used for Mode A/C tracking in 3.1.2.9.2 and 3.1.2.9.3 respectively.

3.1.3.9.2 If a tracking interrogation fails to elicit a valid reply, additional interrogations are transmitted. The total number of tracking interrogations addressed to a single target is not expected to exceed five during a single surveillance update period or sixteen distributed over six successive surveillance update periods. The first tracking interrogation is transmitted using the antenna that was used in the last successful interrogation of that target. If two successive tracking interrogations fail to elicit valid replies from a target, the next two interrogations to that target are transmitted using the other antenna.

3.1.3.10 *Missing Mode S replies.* The equipment continues to pass to the collision avoidance algorithms predicted position reports for Mode S targets for six surveillance update intervals following the receipt of the last valid reply to a tracking interrogation if the target is interrogated once every second or for eleven 1-second surveillance update intervals following receipt of the last valid reply to a tracking interrogation if the target is interrogated once every five seconds. The equipment does not pass position reports for Mode S targets for more than six surveillance update intervals following the receipt of the last reply to a tracking interrogation whose rate is once every second or for more than eleven 1-second surveillance update intervals following receipt of the last reply to a tracking interrogation whose rate is once every five seconds unless the target again satisfies the range acquisition criteria of 3.1.3.7. The Mode S address of a dropped track is retained for four additional seconds to shorten the reacquisition process if squitters are received.

3.1.3.11 *Mode S overload.* The equipment passes position reports for all Mode S targets regardless of the distribution of targets in range, provided the total peak target count does not exceed 30.

3.1.3.12 *Mode S power programming.* The transmit power level of Mode S tracking interrogations to targets (but not air-to-air coordination interrogations) is to be automatically reduced as a function of range for targets within 18.5 km (10 NM) as follows:

$$P_T = P_{\max} + 20 \log \frac{r}{10},$$

where P_T is the adjusted power level, P_{max} is the nominal power level (typically 250 W), which is transmitted to targets at ranges of 18.5 km (10 NM) or more, and r is the predicted range of the target. The actual transmitted power is the lesser of P_T and the limit imposed by the interference limiting inequalities of Chapter 4, 4.3.2.2.2.2.

3.1.3.13 *Mode S track capacity.* When the aircraft density is nominally 0.087 Mode S aircraft per km^2 (0.3 aircraft per NM^2) in the vicinity of the ACAS aircraft, there will be about 24 aircraft within 9.3 km (5 NM) and about 142 aircraft within 56 km (30 NM) of the ACAS aircraft. Thus, the ACAS equipment is expected to have capacity for at least 150 aircraft addresses.

3.1.3.14 *USE OF BEARING ESTIMATES FOR MODE S SURVEILLANCE*

3.1.3.14.1 Bearing estimation capability is not required for high-density Mode S surveillance. However, if bearing estimates are available, it is seen that the use of directional Mode S interrogations significantly reduces the transmitter power requirement of the equipment. Directional Mode S interrogations may also be used in the absence of bearing information, provided the interference limits are not exceeded.

3.1.3.14.2 Bearing estimates may also be used in conjunction with knowledge of own airspeed to reduce the overall Mode S interrogation rate. The following is one possible way of achieving such a reduction.

3.1.3.14.3 Instead of calculating time-to-endanger based on the conservative assumption that the two aircraft are on a head-on collision course, the time-to-endanger can be increased by taking into account the threat bearing and the limited turn-rate of own aircraft and allowing for the time that would be required for own aircraft to turn in the direction of the threat. Such computation would continue to assume that the target aircraft is travelling at its reported maximum capable speed directly toward the collision point.

3.2 Transmitter

3.2.1 POWER LEVELS

3.2.1.1 In the absence of interference and when using an antenna whose pattern is identical to that of a quarter-wave monopole above a ground plane, it is possible to provide reliable air-to-air surveillance of transponders at ranges of 26 km (14 NM) by using a nominal effective radiated power of 54 dBm (250 W).

3.2.1.2 The transmitter output power is to be carefully limited between transmissions because any leakage may severely affect the performance of the Mode S transponder on board the ACAS aircraft. The leakage power into the transponder at 1 030 MHz is generally to be kept at a level below –90 dBm. If the physical separation between the transponder antenna and the ACAS antenna is no less than 50 cm, the coupling loss between the two antennas will exceed 20 dB. Thus, if the RF power at 1 030 MHz at the ACAS antenna terminal does not exceed –70 dBm in the inactive state, and if a minimum antenna spacing of

50 cm is adhered to, the direct interference from the ACAS antenna to the transponder antenna will not exceed –90 dBm. This requirement is to ensure that, when not transmitting an interrogation, ACAS does not radiate RF energy that could interfere with, or reduce the sensitivity of, the SSR transponder or other radio equipment in nearby aircraft or ground facilities.

3.2.1.3 Measures must also be taken to ensure that direct 1 030 MHz leakage from the ACAS enclosure to the transponder enclosure is below –110 dBm when the two units are mounted side-by-side in a typical aircraft installation.

3.2.1.4 It is expected that the ACAS equipment be tested side-by-side with Mode S transponders of equivalent classification to ensure that each unit meets its sensitivity requirements in the presence of transmitter leakage from the other.

3.2.2 CONTROL OF SYNCHRONOUS INTERFERENCE BY WHISPER-SHOUT

3.2.2.1 To control Mode A/C synchronous interference and facilitate ACAS operation in airspace with higher traffic densities, a sequence of interrogations at different power levels may be transmitted during each surveillance update period. Each of the interrogations in the sequence, other than the one at lowest power, is preceded by a suppression pulse (designated S_1) 2 microseconds preceding the P_1 pulse. The combination of S_1 and P_1 serves as a suppression transmission. S_1 is transmitted at a power level lower than that of P_1. The minimum time between successive interrogations is to be 1 millisecond. All interrogations in the sequence should be transmitted within a single surveillance update interval.

3.2.2.2 Because the suppression transmission in each step is always at a lower power level than the following interrogation, this technique is referred to as whisper-shout. The intended mechanism is that each aircraft replies to only one or two of the interrogations in a sequence. A typical population of Mode A/C transponders at any given range may have a large spread in effective sensitivity due to variation in receivers, cable losses, and antenna shielding. Ideally, each transponder in the population will respond to two interrogations in the sequence, and will be turned off by the higher power suppression transmissions accompanying higher-power interrogations in the sequence. Given a situation in which several aircraft are near enough to each other in range for their replies to synchronously interfere, it is unlikely they would all reply to the same interrogation and, as a result, the severity of synchronous interference is reduced. Use of whisper-shout also reduces the severity of the effects of multipath on the interrogation link.

3.2.2.3 Figure A-2a defines a whisper-shout sequence that is matched to the requirements for high-density Mode A/C surveillance and Figure A-2b defines a whisper-shout sequence that is matched to the requirements for low-density Mode A/C surveillance. Five distinct subsequences are defined; one for each of the four beams of the top-mounted antenna and one for the bottom-mounted omnidirectional antenna. The interrogations may be transmitted in any order. When the high density sequence of Figure A-2a is truncated to limit interference, the steps are dropped in the order shown in the column Interference limiting priority. When the low-density sequence of Figure A-2b is reduced in power to limit interference, each interrogation and its related MTL value, as indicated in the last column, is reduced by 1 dB in the order shown in the column Interference limiting priority. The lowest numbered steps in the sequence are dropped or reduced first. The timing of individual pulses or steps in either sequence is defined in Figure A-3 which illustrates the three lowest-power steps in the top-forward antenna sequence. The first pulse of the interrogation serves as the second pulse of the suppression.

3.2.2.4 The minimum triggering level (MTL) values tabulated in Figure A-2a and Figure A-2b are based on the assumption that replies to all interrogations are received omnidirectionally. If a directional-receive antenna is used, the MTL values must be adjusted to account for the antenna gain. For example, for a net antenna gain of 3 dB, all MTL values in the table would be raised by 3 dB; and the MTL for step number 1 would be –71 dBm rather than –74 dBm.

3.2.2.5 The power is defined as the effective radiated power for the interrogation. All power levels are to be within ±2 dB of nominal. The tolerance of the step increments is to be ±1/2 dB and the increments are to be monotonic throughout the entire power range of the sequence.

3.2.2.6 Most of the interrogations are transmitted from the top antenna because it is less susceptible to multipath interference from the ground.

3.2.2.7 Selection of the appropriate whisper-shout subsequence for a particular antenna beam is performed each interrogation cycle based on the current or anticipated level of Mode A/C synchronous garble in that beam as determined by ACAS surveillance. The high density whisper-shout subsequence is selected for an antenna beam whenever synchronous garble is present in that beam as evident from the existence of at least one low confidence altitude code bit in two consecutive Mode C replies. The 6-level whisper-shout sequence is selected for an antenna beam if either:

a) a single Mode A/C aircraft exists within the surveillance range of that beam and synchronous garble is not present; or

b) synchronous garble is not present, Mode A/C targets are not within garble range of each other, and the Mode A/C aircraft density within the reliable surveillance range is equal to or less than 0.23 aircraft/km (0.43 aircraft/NM). Whenever a TA is generated on a threat within a particular antenna beam, the high level sequence is used for that beam for the duration of the advisory. Whenever an RA is generated, the high level sequence is used for all antenna beams for the duration of the advisory.

3.2.2.8 If no established Mode A/C surveillance track nor any candidate track, consisting of three correlating Mode C acquisition replies, exists within the surveillance range of an antenna beam, degarbling is unnecessary and ACAS transmits a single Mode C interrogation in that beam. The power level of the single interrogation and its associated MTL in each beam is equivalent to the highest allowable power level of the corresponding low level whisper-shout subsequence as determined by interference limiting. Single Mode C interrogations are susceptible to uplink mode conversion due to multipath and may result in a mixture of Mode A and Mode C replies from an intruder that are separated by 13 microseconds. ACAS, therefore, selects the low level whisper-shout subsequence for a beam for reliable surveillance acquisition and tracking whenever:

a) a single interrogation in that beam results in a Mode A/C reply that occurs within a 1 525 m (5 000 ft) range window centred either at the measured range of a Mode A/C reply received in the previous surveillance update interval or at a range offset from the previous reply range by ±13 microseconds; or

b) an established Mode C track or a Mode C track in the process of being acquired traverses into that beam from another beam. ACAS switches back to the single interrogation after ten surveillance update intervals in which two correlating acquisition replies were not received.

3.2.3 INTERFERENCE LIMITING

3.2.3.1 ACAS equipment conforms to a set of three specific inequalities (Chapter 4, 4.3.2.2.2.2) for controlling interference effects. The three inequalities, applicable to ACAS operating below a pressure-altitude of 5 490 m (18 000 ft), are associated with the following physical mechanisms: (1) reduction in “on” time of other transponders caused by ACAS interrogations, (2) reduction in “on” time of own transponder caused by mutual suppression during transmission of interrogations, and (3) Mode A/C fruit caused by ACAS Mode A/C interrogations. Setting n_a to 1 in inequalities (1) and (3) for ACAS operating above pressure-altitude of 5 490 m (18 000 ft), prevents a single ACAS from transmitting unlimited power by providing an upper limit on the ACAS one-second interrogation power/rate product.

3.2.3.2 Inequality (1) ensures that a “victim” transponder will never detect more than 280 ACAS interrogations in a one-second period from all the ACAS interrogators within 56 km (30 NM) for any ACAS distribution, surrounding the “victim” transponder, within the limits of uniform-in-range to uniform-in-area. The left-hand side of the inequality allows an ACAS unit to increase its interrogation rate if it transmits at less than 250 W since low power transmissions are detected by fewer transponders. Each normalized power value within the summation in the left-hand side of this inequality contains an exponent α which serves to match the inequality to the localized ACAS distribution. The value of α defines the local ACAS aircraft distribution curve and is derived from own ACAS measurement of the distribution and number of other ACAS within 56 km (30 NM) range. As the ACAS distribution varies from uniform-in-area ($\alpha = 1$) to uniform-in-range ($\alpha = 0.5$), the density, and therefore the electromagnetic impact, of ACAS aircraft in the vicinity of a “victim” transponder becomes greater. This increased potential for ACAS interference is offset by the greater degree of interference limiting that results from using an exponent of less than one in the normalized power values of the inequality. The denominator of the first term on the right-hand side of this inequality accounts for other ACAS interrogators in the vicinity and the fact that all ACAS units must limit their interrogation rate and power in a similar manner so that, as the number of ACAS units in a region increases, the interrogation rate and power from each of them decreases and the total ACAS interrogation rate for any transponder remains less than 280 per second.

3.2.3.3 Within an airspace in which ACAS aircraft are distributed between the limits of uniform-in-range to uniform-in-area, and provided that the "victim" is taken off the air for 35 microseconds by suppression or reply dead time whenever it receives an ACAS interrogation, the total "off" time caused by ACAS interrogations will then never exceed 1 per cent. Measurements and simulations indicate that the total "off" time can be higher than 1 per cent in high-density terminal areas because of ACAS aircraft distributions that are beyond the region defined by uniform-in-area to uniform-in-range and because of a Mode S transponder recovery time to certain interrogations that is expected to be greater than 35 microseconds. The second term on the right-hand side of this inequality limits the maximum value of the interrogation power-rate product for ACAS II, regardless of n_a, in order to allow a portion of the total interference limiting allocation to be used by ACAS I. The term, which is matched to the ACAS distribution by the value of α in the denominator, ensures that an individual ACAS II unit never transmits more average power than it would if there were approximately 26 other ACAS II nearby distributed uniformly-in-area or approximately 6 other ACAS II nearby distributed nearly uniformly-in-range.

3.2.3.3.1 High-density terminal areas will suffer from higher loads due to violation of the 1 per cent estimate at approximately 14.8 – 18.5 km (8 – 10 NM) from touch down. To ensure sufficient surveillance performance for both ACAS and ground surveillance systems in such areas, ACAS flying below 610 m (2 000 ft) AGL include also ACAS II and ACAS III operating on ground in the calculation of n_b and n_c. This value was chosen for practical reasons:

a) the use of a radio altimeter allows sufficient measurement accuracy at and below 610 m (2 000 ft); and

b) it assumes aircraft are approaching on an ILS glide path. In that case, 610 m (2 000 ft) AGL corresponds to a distance of approximately 11.2 km (6 NM) from an airport.

New approach procedures (e.g. based on MLS or GNSS) may require additional considerations to limit interference. And even with ILS approach, it is recommended to establish procedures switching ACAS II and ACAS III to "stand-by" while the aircraft is not on an active runway.

3.2.3.4 Inequality (2) ensures that the transponder on board the ACAS aircraft will not be turned off by mutual suppression signals from the ACAS unit on the same aircraft more than 1 per cent of the time.

3.2.3.5 Inequality (3) ensures that a "victim" Mode A/C transponder will not generate more than 40 Mode A/C replies in a one-second period in response to interrogations from all the ACAS interrogators within its detection range. Like inequality (1) it includes terms to account for reduced transmit power, to account for the other ACAS interrogators in the vicinity, and to limit the power of a single ACAS unit. Forty Mode A/C replies per second is approximately 20 per cent of the reply rate for a transponder operating without ACAS in a busy area of multiple Mode A/C ground sensor coverage.

3.2.3.6 *EXAMPLE OF INTERFERENCE LIMITING*

3.2.3.6.1 As an example, when interrogation limiting is not invoked, the overall Mode A/C and Mode S interrogation rates of a directional ACAS unit would typically be as follows: the Mode A/C interrogation rate k_t is typically constant at 83 whisper-shout interrogations per second. Assume that the sum of the normalized whisper-shout powers, i.e. the Mode A/C contribution to the left-hand side of inequality (1), is approximately 3. The Mode S interrogation rate depends on the number of Mode S aircraft in the vicinity. In en-route airspace it is typically an average of about 0.08 interrogations per second for each Mode S aircraft within 56 km (30 NM). In a uniform aircraft density of 0.006 aircraft per square km (0.02 aircraft per square NM), the number of aircraft within 56 km (30 NM) is 57. If 20 per cent of these are ACAS equipped, n_a = 12 and the variable term on the right-hand side of inequality (1) is 21.5. If the number of ACAS aircraft in the area does not exceed 26, the fixed term continues to govern and no limiting occurs until there are approximately 100 Mode S aircraft within 56 km (30 NM).

3.2.3.6.2 Similar considerations hold for inequalities (2) and (3). In inequality (2) the mutual suppression interval associated with each top antenna interrogation is 70 microseconds. The bottom antenna mutual suppression interval is 90 microseconds. Thus the Mode A/C contribution to the left-hand side of inequality (2) is 0.0059 and the Mode S interrogation rate can be as high as 59 top antenna interrogations per second before violating the limit. With a typical whisper-shout sequence, the left-hand side of inequality (3) is approximately 3. The number of ACAS aircraft within 56 km (30 NM) can be as high as 26 without violating inequality (3).

3.2.3.6.3 When the interrogation rate or density increases to the point at which one of the limits is violated, either the Mode A/C or Mode S normalized interrogation rate or both must be reduced to satisfy the inequality. If the density were to reach 0.029 aircraft per km^2 (0.1 aircraft per NM^2) uniformly out to 56 km (30 NM), there would be 283 aircraft within a 56 km (30 NM) radius. If 10 per cent of these were equipped with ACAS, $n_a = 28$. The right-hand limits in inequalities (1) and (3) would then be 9.66 and 2.76 respectively. To satisfy these lower limits, the Mode A/C and Mode S contributions to the left-hand side of inequality (1) would both have to be reduced. As a result, the surveillance range of both Mode A/C and Mode S targets would be less.

3.2.3.6.4 Inequality (1) contains an exponent α which serves to match the inequalities to the specific local ACAS aircraft density such that a "victim" transponder operating in the vicinity of ACAS that are distributed within the limits of uniform-in-area to uniform-in-range will never detect more than 280 ACAS interrogations in a one-second period.

The value of α defines the local ACAS distribution characteristic within the vicinity of own ACAS.

It is based on the relative numbers of ACAS within 56 km (30 NM), within 11.2 km (6 NM) and within 5.6 km (3 NM) as derived from ACAS broadcast interrogations and from ACAS surveillance. The value of α is the minimum of:

a) the logarithm of the ratio of the number of ACAS aircraft, n_a , within 56 km (30 NM) to the number of ACAS aircraft, n_b, within 11.2 km (6 NM) divided by the logarithm of 25; and

b) one fourth of the ratio of the number of ACAS aircraft, n_b, within 11.2 km (6 NM) to the number of ACAS aircraft, n_c, within 5.6 km (3 NM).

A uniform-in-area distribution of ACAS aircraft within 56 km results in an α value of 1.0 and a uniform-in-range distribution results in a value of 0.5. Since decreasing values of α result in greater power reduction and therefore shorter surveillance ranges, the minimum value of α is constrained to 0.5 in order to preserve adequate surveillance range for collision avoidance in the highest density terminal areas. Additional constraints are imposed on the value of α_1 to account for special situations in which the measured local ACAS distribution is:

1) based on numbers so small as to be inconclusive ($n_b = 1$), in which case α_1 is constrained to 1;

2) is inconsistent with a relatively high overall ACAS count ($n_b \leq 4$, $n_c \leq 2$, $n_a > 25$), in which case α_1 is constrained to 1; or

3) is inconsistent with a relatively low overall ACAS count, ($n_c > 2$, $n_b > 2n_c$, $n_a < 40$), in which case α_1 is constrained to 0.5.

3.2.3.7 *INTERFERENCE LIMITING PROCEDURES*

3.2.3.7.1 At the beginning of each surveillance update interval, n_a, n_b and n_c are to be determined as indicated above. n_a is then used to evaluate the current right-hand limits in inequalities (1) and (3). Smoothed values of the Mode S variables in the inequalities are also to be calculated.

n_b and n_c are used to compute the value of α_1 according to the following expression:

$$\alpha_1 = 1/4\ [n_b/n_c]$$

n_a and n_b are used to compute the value of a α_2 according to the following expression:

$$\alpha_2 = \frac{Log_{10}[n_a/n_b]}{Log_{10}25}$$

In addition:

IF [($n_b \leq 1$) OR ($n_b > 4n_c$) OR ($n_b \leq 4$ AND $n_c \leq 2$ AND $n_a > 25$)] THEN $\alpha_1 = 1.0$;
IF [($n_b < 2n_c$) OR (($n_c > 2$) AND ($n_b > 2n_c$) AND ($n_a < 40$))] THEN $\alpha_1 = 0.5$;
IF ($n_a > 25n_b$) THEN $\alpha_2 = 1.0$;
IF ($n_a < 5n_b$) THEN $\alpha_2 = 0.5$;
the value of α is the minimum of α_1 and α_2.

3.2.3.7.2 All air-to-air coordination interrogations and RA and ACAS broadcast interrogations are transmitted at full power. Air-to-air coordination interrogations and RA and ACAS broadcast interrogations are not included in the summations of Mode S interrogations in the left-hand terms of these inequalities. Whenever an RA is posted, surveillance interrogations to that intruder may be transmitted at full power to allow for maximum link reliability. Because the frequency of RAs is very low, these transmissions do not result in a measurable increase in interference.

3.2.3.7.3 If the smoothed value of the left-hand side of either inequality (1) or (2) equals or exceeds the current limit and own ACAS aircraft are operating below a pressure-altitude of 5 490 m (18 000 ft), both the Mode S and Mode A/C surveillance parameters are to be modified to satisfy the inequalities. If the left-hand side of inequality (3) exceeds the current limit and own ACAS aircraft are operating below a pressure-altitude of 5 490 m (18 000 ft), Mode A/C surveillance parameters are modified to satisfy the inequalities.

3.2.3.7.4 Mode A/C surveillance can be modified by sequentially eliminating steps from the whisper-shout sequence described in 3.2.2. Each whisper-shout step is uniquely associated with a receiver MTL setting. Thus, the receiver sensitivity in Mode A/C surveillance periods will be automatically tailored to match these power reductions.

3.2.3.7.5 The overall surveillance sensitivity for Mode S targets can be reduced by reducing the interrogation power and by increasing the receiver MTL during all Mode S squitter listening periods. This will indirectly reduce the Mode S interrogation rate by reducing the target count. Many Mode S interrogations are acquisition interrogations transmitted to targets of unknown range. It is thus not effective to directly control the Mode S interrogation rate simply by dropping long-range targets from the track file.

3.2.3.7.6 For airborne ACAS, the Mode A/C and Mode S surveillance power and sensitivity reductions are to be accomplished such that equality between the surveillance ranges for Mode S and Mode A/C targets exists in the forward beam. In order to provide a reliable 11.2 km (6 NM) surveillance range in all directions for n_b, the maximum allowed interference limiting power reduction in any beam for an airborne ACAS unit is 10 dB for Mode S and 7 dB for Mode A/C. Mode A/C surveillance power and sensitivity reductions for ACAS on the ground are to be accomplished such as to achieve equal whisper-shout capability in each beam. This requires that Mode A/C power and sensitivity reduction be accomplished in the forward beam until it is equivalent to the side beams and then in the forward and side beams until they are equivalent to the rear beam. In order to provide a reliable 5.6 km (3 NM) surveillance range in all directions for surveillance prior to departure, the maximum allowed interference limiting power reduction for an ACAS unit on the ground is as follows:

a) forward beam: 13 dB for Mode S and 10 dB for Mode A/C;

b) side beam: 13 dB for Mode S and 6 dB for Mode A/C; and

c) rear beam: 13 dB for Mode S and 1 dB for Mode A/C.

In addition, the Mode A/C and Mode S surveillance power and sensitivity reductions for ACASs that are airborne or on the ground are to be accomplished such that the ACAS equipment is not prematurely limited and has the capability of using at least 75 per cent of the allowance specified in the three limiting equations for all mixes of target types and for all densities up to the maximum density capability of the system. When the value of any of the smoothed limits is exceeded, the appropriate action is required to limit interference within one surveillance update interval. Means are to be provided for gradually restoring the surveillance sensitivity when the environment subsequently improves enough to allow the interference limits to be relaxed.

3.2.3.7.7 ACAS cross-link interrogations are included in the summation of Mode S interrogations in the left-hand terms of the interference limiting inequalities.

3.2.3.8 *IMPLEMENTATION OF A TYPICAL INTERFERENCE LIMITING PROCEDURE*

3.2.3.8.1 The following describes one possible implementation of an interference limiting procedure. It varies the system parameters appearing in inequalities (1), (2) and (3) to maximize and maintain approximate equality between the estimated surveillance ranges for Mode S and Mode A/C targets. In evaluating these inequalities, 8-second averages of the Mode S parameters are used, and current or anticipated values of the Mode A/C parameters are used. The procedure is illustrated in the flow chart of Figure A-4.

3.2.3.8.2 *Step 1.* The first step in the control process is to reduce the number of whisper-shout steps tentatively scheduled for use during the present scan if either:

a) inequality (3) is violated; or

b) inequality (1) or (2) is violated and the Mode S surveillance range of the last scan does not exceed the Mode A/C surveillance range that would result from use of the scheduled whisper-shout sequence.

Whisper-shout steps are eliminated in the order dictated by the design of the Mode A/C processor and the number of steps eliminated is just large enough to ensure that neither of the above conditions is satisfied. The value of the number of whisper-shout steps tentatively scheduled for use is initialized at the number used on the last scan.

The relative magnitudes of the Mode S and Mode A/C surveillance ranges are determined from the estimated effective radiated power (ERP) seen by targets with Mode S and Mode A/C transponders located directly ahead of the ACAS aircraft. The ERP in a given direction is determined by the product of the power input to the antenna, and the antenna pattern gain in that direction. If the transponder sensitivities were identical, the Mode S range would be more or less than the Mode A/C range according to whether the Mode S transmitted power was more or less than the Mode A/C transmitted power. Since Mode A/C transponders may have somewhat lower sensitivities than Mode S transponders, the Mode A/C range is assumed to be greater than the Mode S range if, and only if, the Mode A/C power exceeds the Mode S power by 3 dB.

3.2.3.8.3 *Step 2.* The second step in the controlling process is to reduce the Mode S interrogation power for acquisition by 1 dB, and to increase the MTL for Mode S squitter listening by 1 dB from the values last used, if inequality (1) or (2) is violated and the Mode S surveillance range of the last scan exceeds the Mode A/C surveillance range that would result from use of the scheduled whisper-shout sequence.

Once such a change has been made, the only change allowed during the ensuing 8 seconds is a reduction in the number of whisper-shout steps if needed to satisfy inequality (3). This 8-second freeze allows the effect of the Mode S changes to become apparent since the 8-second averages used in inequalities (1) and (2) then will be determined by the behaviour of the system since the change.

3.2.3.8.4 *Step 3.* The third step is to add a whisper-shout step to those tentatively scheduled, when it is not prevented by an 8-second freeze, and the following conditions are satisfied:

a) inequalities (1), (2) and (3) are satisfied and will continue to be satisfied after the step is added; and

b) the Mode S surveillance range of the last scan exceeds the Mode A/C surveillance range that would result from use of the scheduled sequence; and

As many steps are added as possible without violating a) or b) above.

3.2.3.8.5 *Step 4.* Finally, if condition a) of 3.2.3.8.4 above is satisfied, but condition b) is not, an estimate is made of the effects of increasing the Mode S interrogation power for acquisition by 1 dB and reducing the MTL for Mode S squitters/fruit by 1 dB. If the estimate indicates that inequalities (1) and (2) will not continue to be satisfied, the 1 dB change is not made. If the estimate indicates that they will continue to be satisfied, the 1 dB change is made and no further changes in either the Mode A/C or Mode S parameters are made for the ensuing 8 seconds, except as described in 3.2.3.8.3 above.

3.2.4 INTERROGATION JITTER

Mode A/C interrogations from ACAS equipment are intentionally jittered to avoid chance synchronous interference with other ground-based and airborne interrogators. It is not necessary to jitter the Mode S surveillance interrogations because of the inherently random nature of the Mode S interrogation scheduling process for ACAS.

3.3 Antennas

3.3.1 USE OF DIRECTIONAL INTERROGATIONS

3.3.1.1 A directional antenna is recommended for reliable surveillance of Mode A/C targets in aircraft densities up to 0.087 aircraft per square km (0.3 aircraft per square NM). The recommended antenna system consists of a four-beam antenna mounted on top of the aircraft and an omnidirectional antenna on the bottom. A directional antenna may also be used instead of the omnidirectional antenna on the bottom of the aircraft. The directional antenna sequentially generates beams that point in the forward, aft, left, and right directions. Together these provide surveillance coverage for targets at all azimuth angles without the need for intermediate pointing angles.

3.3.1.2 The directional antenna typically has a 3-dB beam width (BW) in azimuth of 90 ±10 degrees for all elevation angles between +20 and –15 degrees. The interrogation beamwidth is to be limited by transmission of a P_2 side-lobe suppression pulse following each P_1 interrogation pulse by 2 microseconds. The P_2 pulse is transmitted on a separate control pattern (which may be omnidirectional).

3.3.1.3 There is need for timely detection of aircraft approaching with low closing speeds from above and below. Detection of such aircraft suggests a need for sufficient antenna gain within a ±10 degree elevation angle relative to the ACAS aircraft pitch plane. An ACAS directional antenna typically has a nominal 3 dB vertical beamwidth of 30 degrees.

3.3.1.4 The shape of the directional antenna patterns and the relative amplitude of the P_2 transmissions is controlled such that a) a maximum suppression transponder located at any azimuth angle between 0 and 360 degrees and at any elevation angle between +20 and –15 degrees would reply to interrogations from at least one of the four directional beams and b) a minimum suppression transponder would reply to interrogations from no more than two adjacent directional beams. A maximum suppression transponder is defined as one that replies only when the received ratio of P_1 to P_2 exceeds 3 dB. A minimum suppression transponder is defined as one that replies when the received ratio of P_1 to P_2 exceeds 0 dB.

3.3.1.5 The effective radiated power (ERP) from each antenna beam (forward, left, right, aft, omni) is expected to be within ±2 dB of its respective nominal value as given in Figure A-2a.

3.3.1.6 A forward directional transmission, for which TRP = 49 dBm and BW = 90^{o} has a power gain product at beam centre of approximately,

$$PG = \frac{TRP}{BW/360^{\circ}} = 55 \text{ dBm}$$

This is 1 dB greater than the nominal and allows for adequate coverage at the cross-over points of the directional beams. The TRP of the side and aft beams is reduced relative to the front beam to account for the lower closing speeds that occur when aircraft approach from these directions. Mode A/C surveillance performance will generally improve as the directivity (and hence the number of beams) is increased for the top-mounted antenna. However, the use of a directional antenna on the bottom would provide only marginal improvement in detectability and would, if used at full power, degrade the overall performance of the equipment by increasing the false track rate due to ground-bounce multipath.

3.3.2 DIRECTION FINDING

The angle-of-arrival of the transmissions from the replying transponders can be determined with better than 10-degree RMS accuracy by means of several simple and practical direction-finding techniques. These techniques typically employ a set of four or five monopole radiating elements mounted on the aircraft surface in a square array with quarter-wave spacing. The signals from these elements may be combined so as to generate from two to four distinct beams which may be compared in phase or amplitude to provide an estimate of the direction of arrival of the received signal. This level of direction-finding accuracy is adequate to provide the pilot with TAs to effectively aid the visual acquisition of intruding aircraft.

3.3.3 DIRECTIONAL TRANSMISSION FOR CONTROL OF SYNCHRONOUS GARBLE

3.3.3.1 The use of directional interrogation is one technique for reducing synchronous garble. The directional interrogation can reduce the size of the interrogation region. Coverage must be provided in all directions. Hence, multiple beams are used to elicit replies from all aircraft in the vicinity of the ACAS-equipped aircraft. Care must be taken to overlap the beams so that gaps in coverage do not exist between beams.

3.3.3.2 The antenna may be a relatively simple array capable of switching among typically four or eight discrete beam positions. For four beam positions, the antenna beamwidth is expected to be on the order of 100°. The effective antenna beamwidth for interrogating Mode A/C transponders can be made more narrow than the 3-dB beamwidth by means of transmitter side-lobe suppression.

3.3.4 ANTENNA LOCATION

The top-mounted directional antenna is to be located on the aircraft centre line and as far forward as possible. The ACAS antennas and the Mode S transponder antennas are to be mounted as far apart as possible on the airframe to minimize coupling of leakage energy from unit to unit. The spacing must never be less than 0.5 m (1.5 ft), as this spacing results in a coupling loss of at least 20 dB.

3.4 Receiver and processor

3.4.1 SENSITIVITY

A sensitivity equivalent to that of a Mode S transponder (minimum triggering level of –74 dBm) will provide adequate link margin to provide reliable detection of near co-altitude aircraft in level flight at a range of 26 km (14 NM) provided those aircraft are themselves equipped with transponders of nominal transmit power.

3.4.2 CONTROL OF RECEIVER THRESHOLD

3.4.2.1 ACAS receivers use a variable (dynamic) threshold to control the effects of multipath. When the first pulse of a reply is received, the variable receiver threshold technique raises the receiver threshold from the minimum triggering level (MTL) to a level at a fixed amount (e.g. 9 dB) below the peak level of the received pulse. The receiver threshold is maintained at this level for the duration of a Mode A/C reply, at which time it returns to the MTL. When multipath returns are weak compared to the direct-path reply, the first pulse of the direct-path reply raises the receiver threshold sufficiently so that the multipath returns are not detected.

3.4.2.2 Variable receiver thresholds have historically been avoided in Mode A/C reply processors because such thresholding tends to discriminate against weak replies. However, when used in conjunction with whisper-shout interrogations, this disadvantage is largely overcome. On any given step of the interrogation sequence it is possible for a strong reply to raise the threshold and cause the rejection of a weaker overlapping reply. However, with whisper-shout interrogations, the overlapping replies received in response to each interrogation are of approximately equal amplitudes since the whisper-shout process sorts the targets into groups by signal strength.

3.4.2.3 The ACAS receiver MTL used in the reply listening period following each whisper-shout interrogation relates to the interrogation power in a prescribed manner. In particular, less sensitive MTLs are used with the lower interrogation powers in order to control the Mode A/C fruit rate in the ACAS receiver while still maintaining a balance between the interrogation link and the reply link so that all elicited replies are detected.

3.4.3 PULSE PROCESSING

3.4.3.1 A relatively wide dynamic range receiver faithfully reproduces the received pulses. Provisions may be included for locating the edges of received pulses with accuracy, and logic may be provided for eliminating false framing pulses that are synthesized by code pulses from real replies. The processor is capable of resolving pulses in situations where overlapped pulse edges are clearly distinguishable. It is also capable of reconstructing the positions of hidden pulses when overlapping pulses of nearly the same amplitude cause the following pulses to be obscured. The reply processor has the capacity for handling and correctly decoding at least three overlapping replies. Means are also provided for rejecting out-of-band signals and for rejecting pulses with rise times exceeding 0.5 microsecond (typically, DME pulses).

3.4.3.2 If a Mode S reply is received during a Mode C listening period, a string of false Mode C fruit replies may be generated. The ACAS equipment is expected to reject these false replies.

3.4.4 ERROR DETECTION AND CORRECTION

3.4.4.1 ACAS avionics intended for use in airspace characterized by closing speeds greater than 260 m/s (500 kt) and densities greater than 0.009 aircraft per km^2 (0.03 aircraft per NM^2) or closing speeds less than 260 m/s (500 kt) and densities greater than 0.04 aircraft per km^2 (0.14 aircraft per NM^2) requires a capability for Mode S reply error correction. In these high densities, error correction is necessary to overcome the effects of Mode A/C fruit. Mode S error correction permits successful reception of a Mode S reply in the presence of one overlapping Mode A/C reply.

3.4.4.2 Error correction decoding is to be used for the following replies: DF = 11 all-call replies, DF = 0 short air-air surveillance replies, and DF = 16 long air-air surveillance replies (both acquisition and non-acquisition). In addition, passive monitoring of DF = 4 short surveillance altitude replies requires error correction decoding.

3.4.4.3 If two or more acquisition replies requiring error correction are received within the Mode S range acquisition window, it may be impractical to apply error correction to more than the first received reply. Acquisition replies other than the first do not need to be corrected when this occurs.

3.4.5 RECEIVER SIDE-LOBE SUPPRESSION

ACAS equipment that interrogates directionally may use receiver side-lobe suppression techniques to eliminate replies (fruit) generated by nearby aircraft that are outside the interrogated sector. This reduces the number of replies processed during the surveillance update period.

3.4.6 DUAL MINIMUM TRIGGERING LEVELS

If the MTL of the receiver used by ACAS is lowered to obtain longer range operation with extended squitter, provision must be made to label squitter receptions that were received at the MTL that would have been used by an unmodified ACAS receiver. Squitter receptions that are received at the conventional MTL or higher are fed to the ACAS surveillance function. Squitter receptions that are received below the conventional MTL are not used for ACAS surveillance but are routed directly to the extended squitter application. This filtering by MTL is necessary to prevent ACAS from attempting to interrogate aircraft that are beyond the range of its active surveillance capability. This would increase the ACAS interrogation rate without providing any improved surveillance performance. Use of the conventional MTL for the ACAS surveillance function preserves the current operation of ACAS surveillance when operating with a receiver with an improved MTL.

3.5 Collision avoidance algorithms

Note.— The guidance material on the collision avoidance logic of ACAS II is organized in two sections. This section addresses the Standards in the ACAS SARPs and elaborates on important concepts using the design features of a specific implementation of the ACAS logic as examples. Section 4 provides further details on the algorithms and parameters used by this particular ACAS implementation. As a consequence of this arrangement, paragraphs in this section often refer to paragraphs in the next one.

3.5.1 GENERAL

3.5.1.1 The ACAS algorithms operate in a cycle repeated nominally once per second. At the beginning of the cycle, surveillance reports are used to update the tracks of all intruders and to initiate new tracks as required. Each intruder is then represented by a current estimate of its range, range rate, altitude, altitude rate, and perhaps, its bearing. Own aircraft altitude and altitude rate estimates are also updated.

3.5.1.2 After the tracks have been updated, the threat detection algorithms are used to determine which intruders are potential collision threats. Two threat levels are defined: potential threat and threat. Potential threats warrant TAs while threats warrant RAs.

3.5.1.3 The resolution algorithms generate an RA intended to provide vertical separation from all threats identified by the threat-detection algorithms. Coordination with each equipped threat occurs as part of the process of selecting the RA. Pairwise coordination with each equipped threat is necessary to establish which aircraft is to pass above the other and thus guarantee avoidance manoeuvres that are compatible.

3.5.2 THREAT DETECTION

3.5.2.1 Collision threat detection is based on simultaneous proximity in range and altitude. ACAS uses range rate and altitude rate data to extrapolate the positions of the intruder and own aircraft. If within a short time interval (e.g. 25 seconds hence) the range of the intruder is expected to be “small” and the altitude separation is expected to be “small”, the intruder is declared a threat. Alternatively, the threat declaration may be based on current range and altitude separations which are “small”.

The algorithm parameters which establish how far into the future positions are extrapolated, and which establish thresholds for determining when separations are "small", are selected in accordance with the sensitivity level at which the threat detection algorithms are operating.

3.5.2.2 Each sensitivity level defines a specific set of values for the detection parameters used by the algorithms. These include threshold values for the predicted time to closest approach, the minimum slant range, and the vertical separation. Through the process of sensitivity level control, these parameters are assigned different values to account for the smaller aircraft separations that occur in dense terminal airspace. Sensitivity level may be selected automatically using the altitude of own aircraft, or may be selected by command from a Mode S ground station, or by a manual pilot switch (see 3.5.12).

3.5.2.3 The values used for threat detection parameters cannot be optimum for all situations because ACAS is handicapped by its lack of knowledge of intruder intent. The result is that a balance has to be struck between the need to give adequate warning of an impending collision and the possible generation of unnecessary alerts. The latter may result from encounters that are resolved at the last moment by intruder manoeuvres. A feature of ACAS that helps in this respect is the variability of the protected volume of airspace. This volume is automatically coupled in size to the relative speed between the two aircraft, and is automatically aligned in a direction parallel to the relative velocity vector. Bearing plays no part in this process. Each encounter gives rise to a protected volume tailored to that encounter. In a multi-aircraft situation there is an individual protected volume for the ACAS aircraft paired with each threat.

3.5.3 PROTECTED VOLUME

An intruder becomes a threat when it penetrates a protected volume enclosing own aircraft. The protected volume is defined by means of a range test (using range data only) and an altitude test (using altitude and range data). Application of these tests delivers a positive or a negative result (implying that the threat is inside or outside the appropriate part of the protected volume). An intruder is declared a threat when both tests give a positive result.

3.5.3.1 *PROTECTED VOLUME TERMS' DESCRIPTION*

Collision plane. The plane containing the range vector and the instantaneous relative velocity vector originating at the intruder.

Critical cross-sectional area. The maximum cross-sectional area of the protected volume in a plane orthogonal to the major axis.

Instantaneous relative velocity(ies). The modulus of the current value of relative velocity.

Linear miss distance (m_a). The minimum value that range will take on the assumption that both the intruder and own aircraft proceed from their current positions with unaccelerated motions.

Linear time to closest approach (t_a). The time it would take to reach closest approach if both the intruder and own aircraft proceed from their current positions with unaccelerated motions.

Given that the only information available to ACAS to make range predictions are range and range rate estimates, both the linear miss distance and the linear time to closest approach are unobservable quantities.

The unobservable quantities, linear miss distance and linear time to closest approach, are related to the observable quantities range r and range rate $\dot{r}$ by the following equality:

$$t_a = \frac{(r^2 - {m_a}^2)}{(-r\dot{r})}$$

Major axis. In the context of the protected volume, the line through the ACAS II aircraft which is parallel to the instantaneous relative velocity vector.

Range convergence. The aircraft is deemed to be converging in range if the range rate is less than or equal to zero.

3.5.4 RANGE TEST

3.5.4.1 The protected volume resulting from the range test used in the ACAS implementation described in Section 4 can be defined in terms of the maximum dimensions of a realizable implementation of the test which is illustrated by Figure A-5. This shows a section through the protected volume generated by a range test in the plane containing both aircraft and the instantaneous relative velocity vector. The protected volume is that which would be produced by rotating the solid curve about the x axis. Note that the length of the major axis is a function of the relative speed, s. For the realizable range test, the radius of the maximum cross section through the protected volume in a plane normal to the instantaneous relative velocity vector is m_c. This represents the maximum miss distance for which an alert can be generated if the relative velocity at the time of entry to the protected volume is maintained to closest approach. The length of the major axis is the principal feature determining warning time while m_c controls the projected miss distance which is likely to generate an alert. Ideally, the warning time would be T seconds and m_c would be such that only intruders projected to have miss distances less than D_m (the radius of the broken-line circle in Figure A-5) would qualify for an alert. The significance of D_m, when specified as in the ACAS implementation described in Section 4, is that, to a good approximation, it represents the lateral displacement experienced by an aircraft over the time T when turning with a constant acceleration of $g/3$ (bank angle = 18°). Thus an encounter with a projected miss distance of D_m when the time to closest approach is T can result in a collision if either aircraft is manoeuvring with an acceleration of $g/3$. In the absence of adequate bearing rate or range acceleration data, ACAS cannot achieve the ideal. Figure A-6 shows the maximum value for m_c (i.e. $\hat{m}_c$ as a function of relative speed and sensitivity level). When the relative speed is very low, as can occur in a tail-chase, the protected volume produced by the range test becomes a sphere of radius D_m centred on the ACAS aircraft.

3.5.4.2 Essentially, the range test gives a positive result if, when approximately T seconds remain before closest approach, the relative velocity vector can be projected to pass through a circle of radius m_c centred on the ACAS aircraft and placed in the plane normal to the relative velocity vector. Since the value of m_c is very large compared to the value for adequate vertical separation, the use of the range test alone would generate a large number of unnecessary alerts. It is therefore necessary to tailor the range test protected volume to more modest proportions using altitude data. Inevitably, this reduces the immunity to manoeuvres in the vertical plane.

3.5.4.3 The constraints on the range test are designed to give a nominal warning time of T seconds allowing for a manoeuvre producing a displacement of D_m normal to the relative velocity vector. It may be demonstrated that, for an encounter having a reasonably large relative velocity, the relative acceleration produced by a turning aircraft is nearly normal to the relative velocity vector. For low relative speed there can be a substantial component of acceleration in the direction of a relative velocity. Erosion of the warning time due to this component is compensated by having a minimum length for the major axis of the protected volume which is greater than sT.

3.5.5 ALTITUDE TEST

3.5.5.1 The objective of the altitude test is to filter out intruders that give a positive result for the range test but are nevertheless adequately separated in the vertical dimension. The altitude test is used to reduce alert rate in the knowledge that the standard vertical separation distances for aircraft are normally much less than the standard horizontal separation distances. An inevitable result is that the acceleration protection, nominally provided by the range test in all planes, is largely restricted to the horizontal plane. Also, even in the absence of relative acceleration, the altitude test can delay warnings if some vertical separation at closest approach is predicted to exist. A view in elevation of the relative motion of two aircraft is shown in Figure A-7. AOB represents a plane normal to the relative velocity vector and containing the ACAS aircraft. The intruder may be horizontally displaced from the ACAS so it is not necessarily in the plane of the diagram. The essential feature of the altitude test is that it aims to give a positive result if the projected vertical miss distance is less than Z_m. In the ACAS implementation described in Section 4, Z_m varies with altitude in steps from 180 m (600 ft) to 240 m (800 ft).

3.5.5.2 Since the main interest is in intruders with projected miss distances less than D_m, an ideal altitude test (in combination with an ideal range test) would give a positive result if, *inter alia*, the relative velocity vector were projected to pass through the critical area shown by the solid outline in Figure A-7. In practice, the altitude test and the range test outlined in 3.5.1.2 tend to be satisfied if the vector passes through the larger area defined by the broken outline. Those intruders passing through the shaded areas are likely to give rise to unnecessary alerts.

3.5.5.3 The altitude test is no better placed to predict the time to closest approach than is the range test. This means that, if no other conditions are applied, the range test determines the time of the alert. However, an additional feature of the altitude test of the ACAS implementation described in Section 4 attempts to guard against the eventuality that one of the aircraft levels off above or below the other, thus avoiding a close encounter. Two types of encounter are recognized: the first in which the current altitude separation is less than Z_t (see 4.3.4.2); and a second, in which the current altitude separation is greater than Z_t and the aircraft are converging in altitude. For the first type, the altitude test requires only that the critical area is projected to be penetrated. For the second an additional condition is that the time to reach co-altitude is to be less than or equal to a time threshold that is sometimes less than T, the nominal warning time. The effect is that warning time is controlled by the range test for intruders that are projected to cross in altitude before closest approach while later warnings are given for altitude crossings beyond closest approach.

3.5.6 ESTABLISHED THREATS

3.5.6.1 An established threat is an intruder that has been declared a threat and still merits a resolution advisory.

3.5.6.2 The need to give a positive result for both the range test and the altitude test on the same cycle of operation before declaring an intruder to be a threat (3.5.2.1) applies only for new threats. Subsequently, only the range test is applied and a positive result has the effect of maintaining threat status. The reason for omitting the altitude test is that a rapid pilot response, or the fact that the intruder initially only just satisfied the altitude criteria, may result in cancellation of threat status before reaching closest approach.

3.5.7 ALERT RATE

3.5.7.1 The principal variables controlling alert rate are relative velocity, miss distance and the ambient aircraft density. The principal parameters affecting alert rate are T, D_m and Z_m. Alert rates can be calculated for constant velocity random traffic but the influences of see-and-avoid and ATC make such calculations for real traffic very difficult. Figure A-6 gives some guidance on some features of an encounter that might give rise to an alert although it gives no assistance concerning the result of the altitude test. For example, it can be seen that, for sensitivity level 5 (altitudes between FL 50 and FL 100) there can be no alert if the horizontal separation is greater than 5.5 km (3 NM) and the relative speed is less than about 440 m/s (850 kt).

3.5.7.2 Simulations using ground-based radar surveillance data and initial experience with ACAS equipments have indicated that the overall alert rate ranges from about 1 in 30 flight hours to 1 in 50 flight hours in typical busy airspaces.

3.5.8 THREAT RESOLUTION

3.5.8.1 *COORDINATION*

If the threat aircraft is equipped with ACAS II or ACAS III, own ACAS is required to coordinate with the threat aircraft's ACAS via the Mode S data link to ensure that compatible RAs are selected. The nature of the advisory selected can also be influenced by the fact that the threat is ACAS-equipped.

3.5.8.2 *CLASSIFICATION OF RESOLUTION ADVISORIES*

3.5.8.2.1 ACAS escape manoeuvres are confined to the vertical plane and can be characterized by a sense (up or down) and a strength. The objective of an RA with an upward sense is to ensure that own aircraft will safely pass above the threat. The objective of an RA with a downward sense is to ensure that own aircraft will safely pass below the threat. Examples of RA strengths with the upward sense are "limit vertical speed" (to a specified target descent speed), "do not descend", or "climb". Examples of equivalent RA strengths with the downward sense are "limit vertical speed" (to a specified target climb speed), "do not climb", or "descend". RAs are of two types: "positive", meaning a requirement to climb or descend at a particular rate; and "vertical speed limit", meaning that a prescribed range of vertical speed must be avoided. Any advisory may be "corrective" or "preventive". A corrective advisory requires a change in own aircraft's current vertical rate whereas a preventive advisory does not.

3.5.8.2.2 It is expected that the RA generated be consistent with flight path limitations in some regimes of flight, due to flight envelope restrictions and aircraft configurations that reduce climb capability. It is expected that the aircraft's manoeuvre limitation indications available to ACAS will offer a conservative assessment of the actual aircraft performance capabilities. This is particularly true of climb inhibit. In the rare and urgent case of a high altitude downward sense RA being reversed to a climb, it is expected that, very often, the aircraft performance capabilities needed to comply with the RA will be available despite the climb inhibit. When such capabilities are not available, it is expected that the pilot will always be able to comply with the reversal at least partially by promptly levelling-off.

3.5.8.3 *ALTITUDE SEPARATION GOAL*

3.5.8.3.1 To be certain of avoiding a collision, ACAS must provide a true altitude separation at closest approach which is commensurate with aircraft dimensions and worst-case orientation of the aircraft. Since only measured altitude data are available, due allowance must be made for altimetry errors in both aircraft. Furthermore, the avoiding action must be commenced before closest approach so it is possible that this action will be based on predicted altitude separation at closest approach, which introduces a further source of error. These factors lead to a requirement that the RA provided to the pilot should be such that the desired altitude separation at closest approach can be achieved in the time available. This altitude separation goal, A_l, must vary as a function of altitude in order to adequately compensate for altimetry errors. In the ACAS implementation described in Section 4, A_l varies from 90 m (300 ft) to 210 m (700 ft).

3.5.8.3.2 The time to closest approach cannot be estimated accurately because the miss distance is not known, the threat could manoeuvre and the range observations are imperfect. However, limits that have been found useful and acceptable are the times to closest approach assuming the miss distance to take the largest value of concern (D_m) and the value zero, and that all other sources of error have been neglected. This interval is critical for encounters in which the range rate takes on very small values. By maintaining the altitude separation over the entire interval, the selection of the RA is made immune to potentially large errors in estimating the time of minimum range. Such errors can result from small absolute errors in estimating range rate. For preventive RAs, the assumption of an immediate change of rate to the limit recommended by the RA will cause the calculation to deliver a bound (upper for downward RAs, lower for upward RAs) on the altitude of own aircraft at closest approach.

3.5.8.4 *MINIMUM DISRUPTION*

3.5.8.4.1 In principle, the larger altitude separations goals could be achieved by a more vigorous escape manoeuvre but constraints are passenger comfort, aircraft capability and deviation from ATC clearance. The ACAS parameters described in Section 4 below are based on an anticipation that the typical altitude rate needed to avoid a collision is 1 500 ft/min.

3.5.8.4.2 The initial choice of the sense and strength of the RA is intended, subject to the exceptions described below, to require the smallest possible change in the vertical trajectory of the ACAS aircraft. And the advisory is expected to be appropriately weakened, if possible, at later stages of the encounter, and removed altogether when the desired separation has been achieved at closest approach. A prime consideration is the minimization of any departure from an ATC clearance.

3.5.8.5 *PILOT RESPONSE*

Since the pilot exercises such a major influence on the effectiveness of the system, it is necessary for any ACAS design to make certain assumptions concerning the response of the pilot. The ACAS implementation described in Section 4 uses a response delay of 5 seconds for a new advisory and a vertical acceleration of *g*/4 to establish the escape velocity. The response time reduces to 2.5 seconds for subsequent advisory changes. ACAS may not provide adequate vertical separation if the pilot response delay exceeds the expected pilot response delay assumed by the design.

3.5.8.6 *INTRUDERS IN LEVEL FLIGHT*

3.5.8.6.1 Intruders that are flying level at the time of the alert and continue thereafter in level flight present few problems for ACAS. If own aircraft is also in level flight, the altitude prediction problem does not exist. All the ACAS aircraft has to do is to move in the direction which increases the current altitude separation to the target value. Possible obstacles to this simple logic are that the ACAS aircraft may be unable to climb, or may be too close to the ground to descend safely.

3.5.8.6.2 The manoeuvre limitation problems largely disappear when the ACAS aircraft is in climb or descent since separation can then often be obtained simply by levelling-off. And the prediction problem is likely to be a minor one if ACAS is fed with high resolution data for own altitude.

3.5.8.7 *INTRUDERS IN CLIMB/DESCENT*

Intruders in climb or descent provide more difficulty than intruders in level flight. It is often a problem to determine their altitude rates. There is also evidence that a climbing or descending threat that is projected to pass close to own aircraft is more likely to level-off than to maintain its observed altitude rate thus avoiding the close encounter. Therefore the selection of RAs by ACAS should be biased by an expectation that threats might level-off, e.g. in response to ATC. A low confidence in the threat's tracked altitude rate may cause RA generation to be delayed pending a better estimate of this rate.

3.5.8.8 *ALTITUDE CROSSING RAs*

3.5.8.8.1 Intruders that are projected to cross the altitude of an ACAS aircraft make the design of a totally effective ACAS extremely difficult because such intruders might level-off. Some of the altitude crossing RAs occasionally generated have been found counter-intuitive by pilots. Indeed, such RAs require the pilot to initially manoeuvre toward the intruder, temporarily losing vertical separation. Nevertheless, encounters for which altitude crossing RAs are clearly appropriate have been observed, and it is not yet demonstrated that it is desirable or possible to avoid them entirely. The frequency of altitude crossing RAs is likely to depend on the management and behaviour of aircraft. It is known that aircraft climbing and descending at high rates more frequently give rise to RAs, including crossing RAs, than other aircraft. The potential effect of approaching a cleared flight level at high speed and then levelling-off in close horizontal and vertical proximity to another aircraft is described below. Measures to mitigate these effects are described in 3.5.8.9.

3.5.8.8.2 For the scenario illustrated in Figure A-8, suppose that the alert occurs while the intruder is climbing towards the level ACAS aircraft. Given that the climb continues, the best escape strategy would be for own aircraft to descend towards the threat, in so doing crossing through the threat's altitude. A climb away could possibly provide enough vertical clearance but, for the same escape velocity, a descent will give greater clearance. If own aircraft does descend it can be seen that a hazardous situation arises if the threat levels off at the cardinal flight level below own aircraft. Such manoeuvres are common-place in some controlled airspaces since they are used by controllers to cross aircraft safely with the required altitude separation in situations where the horizontal separation is small. An ACAS design based on the choice of sense likely to give the greatest altitude separation could induce a close encounter where one would not otherwise occur. An ACAS design must include provisions to make it as immune as possible to such an eventuality.

3.5.8.9 *Provisions for avoiding induced close encounters.* In the absence of any knowledge concerning the intent of the threat, it appears reasonable to assume that the threat will continue with its current altitude rate but chooses the RA in an attempt to mitigate the effect of a likely threat manoeuvre. Other features must provide for the contingency that a subsequent threat manoeuvre is detected. For example, the implementation described in Section 4 uses the logic described below.

3.5.8.9.1 *Biasing the choice of sense.* If a positive non-altitude crossing advisory is predicted to give at least adequate altitude separation at closest approach (A_l), then preference is given to the sense that prevents the aircraft from crossing in altitude before closest approach if the threat does not level-off. There is evidence that, in some circumstances, altitude crossing RAs are more disruptive than non-altitude-crossing RAs.

3.5.8.9.2 *Increased rate resolution advisory.* If the sense chosen as a result of the process described in 3.5.8.9.1 results in own aircraft moving away from the threat the encounter may still not be resolved if the threat increases its altitude rate. In such a case the pilot of the ACAS aircraft can be invited to increase own altitude rate in an attempt to outrun the threat.

3.5.8.9.3 *Altitude separation test.* Sense choice biasing will not always result in an RA to move away from the threat and the altitude separation test is provided further to decrease the chance of an induced close encounter due to a threat levelling off or reducing its altitude rate. The test involves delaying the issue of the RA until the intent of the threat can be deduced with greater confidence. It is therefore not without risk of causing ACAS to be unable to resolve the encounter. The ACAS implementation described in Section 4 balances these conflicting risks with the logic described below.

3.5.8.9.3.1 For a scenario of the type shown in Figure A-8 illustrating a threat with a significant altitude rate, the alert, without this delay, would be given when the aircraft were still well separated in altitude. For example, when the warning time is 25 seconds and the altitude rate is 900 m/min (3 000 ft/min), the initial separation is 380 m (1 250 ft). If the situation is such that an altitude crossing RA would be required, i.e. biased sense choice is ineffective, ACAS delays the issue of an advisory until the current altitude separation falls below a threshold (A_c) that is smaller than the standard IFR separation. If the threat actually levels off at any altitude before crossing that threshold, as is most likely, the alert state will either be cancelled (for level-offs outside Z_m), or a non-altitude crossing advisory will be generated. Otherwise, apart from the possibility that the threat has just overshot its cleared altitude, there is every indication that it is carrying on to, or through, own aircraft's level and the altitude crossing advisory can be issued with more confidence. If the situation is such that non-altitude crossing advisory would be required, a reduced time threshold (T_v) is used for the altitude test. This vertical threshold test (VTT) is designed to hold off the RA just long enough so that a level-off manoeuvre initiated by the intruder might be detected.

3.5.8.9.3.2 The altitude separation test was intended principally to alleviate problems experienced in an IFR traffic-only environment. It may appear to be desirable to select the value for A_c such that altitude overshoots or even non-IFR separations are covered. However, the risk of ACAS to be unable to resolve the encounters is to be taken into careful consideration.

3.5.8.9.3.3 The test takes advantage of the cooperation between two equipped aircraft by causing the ACAS in the level aircraft to delay the choice of an RA until it has received a resolution message from the equipped intruder. The ACAS in the latter must almost certainly choose a reduction in its own altitude rate and the coordination process would then result in the level aircraft being able to maintain its level status. In practice the delay in starting to resolve the encounter will be small, but the risk of failure to resolve is less sensitive to delay because both aircraft are taking avoiding action. The delay is limited to 3.0 s, which is normally sufficient for the threat to have initiated coordination.

3.5.8.9.4 *Sense reversal.* In spite of the precautions taken to avoid induced close encounters described above, there are still situations which are not covered. For example, in airspace containing VFR traffic, threat levelling-off can occur with a nominal separation of 150 m (500 ft). The altitude separation test could be less effective in such circumstances. When ACAS determines that a threat manoeuvre has defeated its initial choice of RA, the advisory sense can be reversed. The requirement to achieve the target altitude separation at closest approach may be relaxed when this course of action is taken.

3.5.8.10 *OTHER CAUSES OF INDUCED CLOSE ENCOUNTERS*

3.5.8.10.1 *Altimetry errors.* The altitude separation parameter representing the separation goal (A_l) must include an allowance for altimetry error that is sufficient to give a high probability of not causing an ACAS-equipped aircraft to provoke a close encounter where none really existed. For gross altimetry errors, however, there remains a low probability that a close encounter will be induced when the original separation is adequate. Similarly, there is a low probability that ACAS will be unable to resolve a close encounter due to altimetry error.

3.5.8.10.1.1 The use of Gilham encoded data for either aircraft is a particular cause of altitude report errors, and induced close encounters have resulted. In the case of own aircraft, such errors can be prevented by using an altitude source that has not been Gilham encoded.

3.5.8.10.2 *Mode C errors*

3.5.8.10.2.1 Errors in encoding the threat's altitude to provide Mode C data can, when sufficiently large, induce close encounters in much the same way as gross altimetry error. The incidence of such encounters will be very low in airspaces where ATC takes steps to advise the pilot that an aircraft's reported altitude is incorrect.

3.5.8.10.2.2 A more severe form of Mode C error occurs when the error is confined to the C-bits. These are unchecked by ATC, which is normally content to find that an aircraft is within the specified tolerance value of its reported altitude. A stuck or missing C-bit can produce an error of only 30 m (100 ft). However, such a fault can have a more serious effect on the intruder's altitude rate as perceived by ACAS and in this way can cause an induced close encounter or result in failure to resolve a close encounter.

3.5.8.10.3 *Contrary pilot response.* Manoeuvres opposite to the sense of an RA may result in a reduction in vertical separation with the threat aircraft and therefore must be avoided. This is particularly true in the case of an ACAS-ACAS coordinated encounter.

3.5.8.11 *MULTI-AIRCRAFT ENCOUNTERS*

3.5.8.11.1 ACAS takes account of the possibility of three or more aircraft being in close proximity and it is required to produce an overall RA that is consistent with each of the advisories that it would give against each threat treated on an individual basis. In such circumstances it cannot always be expected that the ACAS aircraft will achieve an altitude separation of A_l with respect to all threats.

3.5.8.11.2 Simulations based on recorded ground-based radar surveillance data and initial experience with ACAS equipment have indicated that multi-aircraft conflicts are rare. Also, there is no evidence of a "domino" effect whereby the ACAS aircraft's manoeuvre to avoid a threat brings it into an encounter with a third aircraft which is equipped and so on. Such an event might be expected to take place in a holding pattern, but the available evidence does not confirm this.

3.5.9 VERTICAL RATE ESTIMATION

3.5.9.1 The vertical tracking algorithm must be capable of using altitude information quantized in either 25 or 100 ft increments to produce estimates of aircraft vertical rates. This tracker must avoid overestimating vertical rate when a jump in reported altitude occurs because an aircraft with a small vertical rate moves from one quantized altitude level to another. But response limitation cannot be achieved by merely increasing tracker smoothing, since the tracker would then be slow to respond to actual rate changes. For altitude reports quantized to 100 ft, the altitude tracker (in Section 4) uses special track update procedures that suppress the response to an isolated altitude transition (altitude report that differs from the preceding altitude report) without sacrificing response to acceleration. The tracker also includes several features that contribute to reliability.

3.5.9.2 Some key features of the vertical tracking algorithm are as follows:

a) Before any altitude report is accepted for use by the update routines, tests are made to determine if the report appears reasonable, given the sequence of reports previously received. If the report appears unreasonable, it is discarded, although it may subsequently be used in checking the credibility of later reports.

b) The algorithm recursively averages the time between altitude transitions rather than altitude reports.

c) The tracker strictly limits the response to isolated altitude transitions (i.e. transitions that are not part of any trend in altitude). An isolated altitude transition results in initialization of the rate estimate to a specified modest rate in the direction of the transition. The rate estimate will be decayed toward zero on each successive scan without a transition.

d) When a transition is observed that is consistent in direction with the preceding transition, a trend is declared. The altitude rate is initialized to a value consistent with the time between the two transitions.

e) Rate oscillations due to quantization effects are suppressed when a trend or level track has been declared. During a trend period, altitude reports that indicate no altitude transition are tested to determine if the lack of a transition is consistent with the previously estimated rate. If not consistent, the rate is reset to a lower value. If consistent, the rate remains unchanged.

f) When a trend has been declared and a transition is observed, then a test is made to see if the transition is consistent in both direction and timing with the previously estimated rate. If not consistent, the rate is reset. If consistent, the rate is updated by smoothing. The transition may be due to jitter and in reality the trend may be continuing.

g) During each scan the tracker provides a track confidence index that indicates the degree of confidence that can be placed in the altitude rate estimate. “High” confidence is declared when recent altitude reports are consistent with both altitude and altitude rate estimates of the tracker. “Low” confidence is declared when altitude reports are not consistent, implying a possible vertical acceleration or when altitude reports are missing for two or more successive cycles. “Low” confidence might justify a delay in the generation of an RA.

h) The tracker provides upper and lower bounds within which the true altitude rate is expected to lie. The altitude rate bounds are used to determine if RA generation is to be delayed and in assessing the need for a sense reversal when the altitude rate confidence is “low”.

3.5.10 AIR-AIR COORDINATION

3.5.10.1 *Coordination interrogations.* When ACAS declares a similarly equipped intruder to be a threat, interrogations are transmitted to the latter for RA coordination via the Mode S data link. These interrogations, which contain resolution messages, are made once per processing cycle as long as the intruder remains a threat. The equipped threat always acknowledges receipt of a resolution message by transmitting a coordination reply.

3.5.10.2 *COORDINATION INTERROGATION PROCESSING*

3.5.10.2.1 ACAS processes a resolution message received from another ACAS-equipped intruder by storing the RAC for that intruder and by updating the RAC record.

3.5.10.2.2 RAC is a general term that is used to mean a vertical RAC (VRC) and/or a horizontal RAC (HRC) as appropriate. Specifically, the information provided in the Mode S interrogation is the VRC for ACAS II and the VRC and/or HRC for ACAS III.

3.5.10.2.3 The RAC record is a composite of all currently active RACs (VRCs and/or HRCs) that have been received by ACAS. The four bits in the RAC record correspond to the two VRC values (“do not pass below” and “do not pass above”) followed by the two HRC values ("do not turn left" and "do not turn right"). If a bit in the RAC record is set, it means that the corresponding RAC has been received from one or more ACAS. Each time an RAC is received from another ACAS, the corresponding bit(s) in the RAC record is (are) set. Each time an RAC cancellation is received from another ACAS, the corresponding bit(s) is (are) cleared so long as no other ACAS is also currently causing the bit(s) to be set.

3.5.10.3 *COORDINATION SEQUENCE*

The sequence of coordination messages and associated processing is illustrated in Figure A-9. Failure to complete the coordination may result in the choice by the threat of an incompatible RA sense.

3.5.10.4 *COORDINATION PROTOCOL*

3.5.10.4.1 After declaring an equipped intruder to be a threat, ACAS first checks to see if it has received a resolution message from that threat. If so, ACAS selects an RA that is compatible with the threat's vertical sense. If not, ACAS selects an RA based on the geometry of the encounter (3.5.2). In either case, ACAS begins to transmit vertical sense information to the threat once per scan in the form of an RA complement in a resolution message. The RA complement is "don't pass above" when ACAS has elected to pass above the threat and "don't pass below" when ACAS has elected to pass below the threat.

3.5.10.4.2 Upon detecting ACAS as a threat, the threat goes through a comparable process. If for any reason the two aircraft select the same (incompatible) separation sense, the aircraft with the higher 24-bit aircraft address reverses its sense. This could happen if the two aircraft detect each other as threats simultaneously or if there were a temporary link failure preventing successful communication.

3.5.10.5 *COORDINATION DATA PROTECTION*

ACAS stores the current RA and the active RAC(s) received from other ACAS-equipped aircraft that perceive own aircraft to be a threat. In order to ensure that the stored information is not modified in response to one or more ACAS while it is being used for RA selection by own ACAS, the data must be protected so that it is available to, or capable of being modified in response to, only one ACAS at a time. For example, this may be accomplished by entering the coordination lock state whenever the data store is accessed by own ACAS or offered new data from a threat ACAS. If a resolution message is received while the coordination lock state is active, the data is held until the current coordination lock state is ended. The potential for simultaneous data access by different processes within ACAS exists because incoming threat resolution messages are received asynchronously to the ACAS processing, effectively interrupting this processing.

3.5.11 GROUND COMMUNICATION

3.5.11.1 *Report of ACAS resolution advisories to the ground.* Whenever an RA exists, ACAS indicates to the aircraft's Mode S transponder that it has an RA report available for a Mode S ground station. This causes the transponder to set a flag indicating that a message is waiting to be transmitted to the ground. Upon receipt of this flag a Mode S sensor may request transmission of the RA report. When this request is received, own Mode S transponder provides the message in a Comm-B reply format. In addition, ACAS generates periodic broadcasts at 8-second intervals for the time during which an RA is indicated to the pilot. The broadcast reports the last values taken by the parameters of the RA during the previous 8-second period even if the advisory has been terminated. This allows ACAS RA activity to be monitored in areas where Mode S ground station surveillance coverage does not exist by using special RA broadcast signal receivers on the ground. RA broadcasts are normally destined for ground equipment but are defined as uplink transmissions.

3.5.11.2 *Ground station control of threat detection parameters.* Threat detection parameters can be controlled by one or more Mode S ground stations by transmitting interrogations containing sensitivity level control (SLC) command messages addressed to the ACAS aircraft. Upon receipt of an SLC command message from a given Mode S ground station, ACAS stores the SLC command value indexed by ground station number. ACAS uses the lowest of the values received if more than one ground station has sent such a message. ACAS times out each site's SLC command separately and cancels it if it is not refreshed by another message from that site within 4 minutes. ACAS can also immediately cancel an SLC command from a ground station if a specified cancellation code is received from that station. SLC commands cannot be used within linked Comm-A interrogations.

3.5.12 SENSITIVITY LEVEL CONTROL

Control of the ACAS threat detection parameters can be effected by means of SLC commands provided as follows:

a) an internally generated value based on altitude band;

b) from a Mode S ground station (see 3.5.11.2); and

c) from a pilot-operated switch.

The sensitivity level used by ACAS is set by the smallest non-zero SLC command provided by these three sources. When a Mode S ground station or the pilot has no particular interest in the sensitivity level setting, the value zero is delivered to ACAS from that source and it is not considered in the selection process. The sensitivity level will normally be set by the internally generated value based on altitude band. Hysteresis is used around the altitude thresholds to prevent fluctuations in the SLC command value when the ACAS aircraft remains in the region of an altitude threshold.

3.6 Compatibility with on-board Mode S transponders

3.6.1 Compatible operation of ACAS and the Mode S transponder is achieved by coordinating their activities via the avionics suppression bus. The Mode S transponder is suppressed during and shortly after an ACAS transmission. Typical suppression periods are a) 70 microseconds from the top antenna and b) 90 microseconds from the bottom antenna. These suppression periods prevent multipath caused by the ACAS interrogation from eliciting an SSR reply from the Mode S transponder.

3.6.2 Unwanted power restriction on a Mode S transponder associated with ACAS is more stringent than in Chapter 3, 3.1.2.10.2.1 in order to ensure that the Mode S transponder does not prevent ACAS from meeting its requirements. Assuming a transponder undesired radiation power level of –70 dBm (Chapter 4, 4.3.11.1) and a transponder to ACAS antenna isolation of –20 dBm, the resultant interference level at the ACAS RF port will then be below –90 dBm.

3.6.3 An additional compatibility requirement is to keep the leakage power of the ACAS transmitter at a low level (see 3.2.1).

3.7 Indications to the flight crew

3.7.1 DISPLAYS

3.7.1.1 ACAS implementations will typically display resolution advisory information on one or two displays. The TA display presents the crew with a plan view of nearby traffic. The RA display presents the crew with manoeuvres to be executed or avoided in the vertical plane. The TA display and the RA display may utilize separate indicators or instruments to convey information to the pilot, or the two functions may be combined on a single display. The displayed RA information can either be integrated with existing displays available on the flight deck or presented on a dedicated display.

3.7.1.2 *TRAFFIC ADVISORIES*

3.7.1.2.1 The TA display presents the flight crew with a plan view of nearby traffic. The information thus conveyed is intended to assist the flight crew in sighting nearby traffic. Simulation has demonstrated that tabular alphanumeric displays of traffic are difficult for the flight crew to read and assimilate, and the use of this type of display as the primary means of displaying traffic information is not recommended. The TA display provides the capability to display the following information for intruders:

a) position (range and bearing);

b) altitude (relative or absolute if the intruder is reporting altitude); and

c) altitude rate indication for an altitude reporting intruder (climbing or descending).

3.7.1.2.2 The TA display may use shapes and colours to indicate the threat level of each displayed intruder, i.e. RAs, TAs, and proximate traffic. The essential differences between the tests for TA generation and the tests for threat detection are the uses of larger values for warning time.

3.7.1.2.3 The continuous display of proximate traffic is not a required component of ACAS. However, pilots need guidance concerning proximate traffic as well as potential threats to ensure that they identify the correct aircraft as the potential threat. The word "display" is not intended to imply that a visual display is the only acceptable means of indicating the position of intruders.

3.7.1.2.4 Ideally, an RA would always be preceded by a TA, but this is not always possible; e.g. the RA criteria might be already satisfied when a track is first established, or a sudden and sharp manoeuvre by the intruder could cause the TA lead time to be less than a cycle.

3.7.1.3 *RESOLUTION ADVISORIES*

The RA display presents the flight crew with an indication of vertical speed to be attained or avoided. The RA display may be incorporated into the instantaneous vertical speed indicator (IVSI) or into the primary flight display (PFD). The RA display may provide a means to differentiate between preventive and corrective RAs.

3.7.2 AURAL AND VOICE ALERTS

Aural alerts are used to alert the flight crew that a TA or RA has been issued. When the vocabulary used to announce RAs is selected, care must be taken to select phrases that minimize the probability of a misunderstood command. An aural annunciation is also provided to the flight crew to indicate that the ACAS aircraft is clear of conflict with all threatening aircraft.

3.8 Crew control functions

As a minimum, it is expected that a means be provided manually through flight crew action for either selecting an "AUTOMATIC" mode in which sensitivity levels are based on other inputs, selecting a mode in which only TAs are able to be issued, or selecting specific sensitivity levels including at least sensitivity level 1. When sensitivity level 1 is selected, the ACAS equipment is essentially in a "stand-by" condition. The term STAND-BY may be used to designate this selection. The current ACAS sensitivity level may be different from that selected by the flight crew. Provisions are to be made for indicating to the flight crew when ACAS is in STAND-BY or when only TAs will be issued. The control for ACAS may be integrated with the controls for the Mode S transponder, or the two systems may have separate controls. If the ACAS and Mode S controls are integrated, a means must be provided to allow the flight crew to select a transponder-only mode of operation.

3.9 Performance monitoring

ACAS equipment is expected to include an automatic performance monitoring function for determining on a continuing basis the technical status of all critical ACAS functions without interfering with or otherwise interrupting the normal operation of the equipment. Provisions are to be made for indicating to the flight crew the existence of abnormal conditions as determined by this monitoring function.

4. TYPICAL ALGORITHMS AND PARAMETERS FOR THREAT DETECTION AND GENERATION OF ADVISORIES

Note 1.— The characteristics given below describe a reference design for the ACAS II collision avoidance logic. This description, however, does not preclude the use of alternative designs of equal or better performance.

.

Note 2.— Lower case mathematical symbols are used to represent variables throughout this section. Upper case symbols are used for parameters. The dot notation used for some parameters does not indicate that they are derived quantities but rather that they have the dimensions suggested by the notation, e.g. distance/time for a speed parameter.

4.1 Tracking performance characteristics

4.1.1 RANGE TRACKING

Range, range rate, and range acceleration ($r, \dot{r}, \ddot{r}$) are estimated by means of an adaptive α-ß-γ tracker using for its coefficients α, ß, and γ values that are decreasing with each successive range measurement until they reach their minimum values equal to 0.40, 0.10 and 0.01, respectively. The range acceleration estimate is used to estimate the expected miss distance in range at closest approach, *m*, using the following formula:

$$m^2 = r^2 - \frac{r^2}{1 + r\ddot{r}/\dot{r}^2}$$

This estimate is not calculated when further calculations indicate that it may not be reliable either because of the magnitude of the estimation errors or because of a possible manoeuvre by one of the aircraft in the horizontal plane. The latter calculations rely on the age of the track, the observed accuracy of the successive range predictions, the observed consistency of the range acceleration estimates, the observed consistency of a second range track based on a linearized trajectory agreeing with the previously estimated miss distance, and the observed consistency of a rough bearing track.

4.1.2 ALTITUDE TRACKING

4.1.2.1 *Sources of altitude data.* Intruder aircraft's altitude is obtained from intruder Mode C or Mode S reports. Own aircraft's altitude is obtained from the source that provides the basis for own Mode C or Mode S reports and is required to be at the finest quantization available.

4.1.2.1.1 *Altitude report credibility.* Before any altitude report is accepted, a test is made to determine whether the report is credible. A credibility window is calculated on the basis of the previous estimated altitude and altitude rate. The altitude report is discarded and the altitude track updated as though the report was missing (4.1.2.3.7) if the report is outside the credibility window.

4.1.2.2 *Own altitude rate.* Own ACAS aircraft's altitude rate is obtained from a source having errors that are as small as possible and in any event no greater than those of the rate output of the tracker described in 4.1.2.3.6.

4.1.2.3 *INTRUDER ALTITUDE TRACKING*

4.1.2.3.1 *Altitude tracking terms' description*

Established rate track. An altitude track for which the pattern of the last few altitude reports received from the intruder allows the inference that that intruder is climbing or descending with a constant, non-zero altitude rate.

Level track. An altitude track for which the pattern of the last few altitude reports received from the intruder allows the inference that that intruder is level.

New track. An altitude track newly initialized.

Oscillating track. An altitude track for which the pattern of the last few altitude reports received from the intruder oscillates between two or more values in a way that allows the inference that that intruder is level.

Transition. An altitude report for a track that is different from the last credible altitude report for that track.

Trend. A trend exists for the altitude rate if the two most recent altitude level transitions were in the same direction.

Unconfirmed rate track. An altitude track for which the pattern of the last few altitude reports received from the intruder does not allow the track to be classified in any other way.

4.1.2.3.1.1 On any cycle of tracking, each track is attributed one and only one track classification.

4.1.2.3.1.2 Any track classification is maintained until conditions for another track classification are satisfied.

4.1.2.3.2 The ACAS II tracks the altitudes of intruders. Tracking is based on automatic pressure-altitude reports from their transponders, using altitude reports quantized as received. For every intruder on every cycle the tracker provides altitude and altitude rate estimates.

Note.— The function that associates Mode C altitude data with tracks is specified in Chapter 4, 4.3.2.1. The altitude tracker specified below assumes that this function has been performed prior to application of the tracker.

4.1.2.3.2.1 The reference altitude tracking design assumes that, for each track, altitude reports are received at the nominal rate of one altitude report per second. However, it allows for missing reports, in other words, cases in which no altitude report has been received for a given track prior to a tracking cycle.

4.1.2.3.2.2 Intruder altitude tracks of one of two types are created and maintained. So-called 100-ft tracks are obtained when altitude reports are supplied in units of 100 ft. Such tracks are updated by a dedicated tracker referred to as the 100-ft altitude tracker. So-called 25-ft tracks are obtained when altitude reports are supplied in units of 25 ft. Such tracks are updated by a dedicated tracker referred to as the 25-ft altitude tracker.

4.1.2.3.2.3 Special logic automatically switches intruder altitude tracks between the 100-ft altitude tracker and the 25-ft altitude tracker following a confirmed change in the units in which altitude reports are supplied. Such a change is considered confirmed when three successive valid altitude reports expressed in the same units have been received.

4.1.2.3.2.4 When an altitude reporting unit change has been observed but not yet been confirmed, the existing track is coasted and the altitude report is temporarily stored. Once the unit change is confirmed, the track is re-initialized using the last altitude rate estimate computed before the change as well as all temporarily stored altitude reports.

4.1.2.3.2.5 The 25-ft tracker is an adaptive alpha-beta tracker. It is briefly described in 4.1.2.3.5.

4.1.2.3.2.6 The design of the 100-ft altitude tracker is motivated by the need for a stable altitude rate estimate when the true altitude rate of the intruder is less than 100 ft/s, in other words, less than one quantization interval per tracking cycle. This tracker estimates the altitude rate indirectly by estimating the time taken to cross one quantization level. Further details on this design are provided in 4.1.2.3.6.

4.1.2.3.3 *Altitude rate confidence.* For every intruder on every cycle, the tracker provides an indication of either "high" or "low" confidence in the altitude rate estimate (4.1.2.3.6.9 and 4.1.2.3.6.10).

4.1.2.3.4 *Altitude rate reasonableness.* The tracker provides a "best estimate" altitude rate and upper and lower bounds for this altitude rate consistent with the received sequence of reports.

4.1.2.3.5 *25-ft quantization reports*

4.1.2.3.5.1 For altitude reports quantized to 25-ft increments, an adaptive α-ß tracker is used. This tracker is adaptive in the sense that it selects among three sets of α and ß values depending on the magnitude of the prediction error, i.e. the difference between the predicted altitude and the reported altitude, as well as on the magnitude of the rate estimate. These α and ß values are:

- α = 0.4 and ß = 0.100 when the current altitude rate estimate is less than 7.0 ft/s; otherwise,
- α = 0.5 and ß = 0.167 when the prediction error is less than 22.5 ft; and otherwise,
- α = 0.6 and ß = 0.257.

4.1.2.3.5.2 The tracker maintains two distinctive sets of altitude and altitude rate estimates. The first one is derived directly from the standard α-ß smoothing equations. This set is purely internal to the tracker. The second set contains the estimates passed to the collision avoidance logic. It differs from the first set as follows. The altitude estimate passed to the logic is constrained to be within one-half quantization interval of the reported altitude (±12.5 ft). The altitude rate estimate passed to the logic is set equal to zero when the internal estimate decreases below 2.5 ft/s in absolute value and is kept equal to zero until the internal estimate increases beyond 5.0 ft/s in absolute value.

4.1.2.3.5.3 The tracker uses only two of the previously defined track classifications: level track and established rate track (4.1.2.3.1). It declares a track to be a level track when at least seven tracking cycles have elapsed since the last altitude transition (4.1.2.3.1). The internal rate estimate is then reset to zero. It declares the track to be an established rate track when, following two sufficiently closely spaced altitude transitions, the internal rate estimate (and thus also the rate estimate passed to the logic) increases beyond 5.0 ft/s.

4.1.2.3.5.4 Confidence in the estimates is declared "high" when the track has existed for at least four tracking cycles and the prediction error has been no greater than 22.5 ft on at least two successive tracking cycles. It is set to "low" when the prediction error is larger than 22.5 ft. It is also set to "low" when altitude reports have been missing on two successive cycles.

4.1.2.3.6 *100-ft quantization reports.* For altitude reports quantized to 100-ft increments, the performance of the altitude tracker is, in all respects, equal to or better than that of a reference tracker setting the altitude rate estimate to have an appropriate sign and the magnitude as described in this paragraph.

4.1.2.3.6.1 *Tracker variables.* The reference tracker uses the following variables:

$\dot{z}$ altitude rate estimate, m/s (ft/s);

$\dot{Z}_{gu}$ see 4.1.2.3.6.5.1;

Δz altitude difference between the current report and the most recent credible report;

T_n 1 s;

Q 30.5 m (100 ft);

t_r time since the most recent credible report, *s*;

t_p time between the two most recent altitude level transitions or, for multiple transitions within one cycle, the average time between these transitions, *s*;

t_b estimated level occupancy time after the most recent transition, *s*;

t_{bm} calculated lower bound on level occupancy time, *s*;

ß computed smoothing coefficient for t_b;

$\beta_\int$ limit for ß based on t_b;

b_t number of altitude levels crossed between the two most recent altitude level transitions;

$b_{\dot{z}}$ number of altitude levels crossed at the most recent rate;

ε smoothed error estimate of t_b, s;

d_t sign of the most recent altitude transition (= +1 for an increase in altitude; = –1 for a decrease); and

x^* value of any variable x before being updated following an altitude level transition.

4.1.2.3.6.2 *Report credibility.* The altitude report is regarded as being credible if either of the following conditions is satisfied:

a) $\Delta z = 0$

b) $|\Delta z - \dot{z}t_r| - Q\, t_r / T_n - \dot{Z}_{gu}\, t_r \leq 0$

4.1.2.3.6.3 *Track classification scheme*

Established rate track. An altitude track is classified as established rate if two or more successive transitions are observed in the same direction and the time interval between the two transitions is sufficiently short that the track classification would not be changed to level track during that interval (see the definition of level track), or if an observed transition is opposite in direction to an existing trend and the time since the previous transition is “unexpectedly small” (4.1.2.3.6.8.1).

Level track. An altitude track is classified as level if reports are received at the same level for longer than T_1 after the time at which the next transition was expected, if one was expected, or for more than T_2 whether or not a transition was expected (4.1.2.3.6.3.1).

New track. An altitude track is classified as new during the period between the time of the first altitude report and the first transition or until T_2 has elapsed (4.1.2.3.6.3.1).

Oscillating track. An altitude track is classified as oscillating if a transition occurs in the opposite direction to that of the immediately preceding transition, only one level has been crossed, the time interval between the two transitions is sufficiently short that the track classification would not be changed to level track during that interval (see the definition of level track) and, if the track was classified as established rate, the time since that transition is not “unexpectedly small” (4.1.2.3.6.8.1).

Unconfirmed rate track. An altitude track is classified as unconfirmed rate if a transition occurs for a new or for a level track or if a transition in the opposite direction to the previous transition occurs and more than one level has been crossed for an established, oscillating or unconfirmed rate track.

4.1.2.3.6.3.1 The following values are used:

$T_1 = 4.0$ s

$T_2 = 20$ s

4.1.2.3.6.3.2 If a track is already classified as unconfirmed rate and a transition occurs in the opposite direction to the previous one and more than one level has been crossed, the altitude rate is determined as if the track had just become classified as unconfirmed rate (4.1.2.3.6.5).

4.1.2.3.6.3.3 The tracks are classified (4.1.2.3.6.3), and the transitions between track classifications are shown in Figure A-10. Tracks are classified in order to determine how new measurements should be used to update the altitude rate estimate.

4.1.2.3.6.4 The magnitude of the rate is set to zero if the track is new, level or oscillating.

4.1.2.3.6.4.1 The quantities ε and $b_{\dot{z}}$ are set to zero and t_b to 100 s.

4.1.2.3.6.4.2 When a track is classified as level, all earlier transitions and any current trend are disregarded.

4.1.2.3.6.5 The magnitude of the rate is set to $\dot{Z}_{gu}$ when a track first becomes unconfirmed rate and then decayed each cycle from the value determined the previous cycle until another transition is observed.

4.1.2.3.6.5.1 The value of $\dot{Z}_{gu}$ is 2.4 m/s (480 ft/min) and the decay constant is 0.9.

4.1.2.3.6.5.2 The quantities ε and $b_{\dot{z}}$ are set to zero and t_b to $Q/|\dot{z}|$

4.1.2.3.6.6 For established rate tracks the magnitude of the rate is set to the quantization interval divided by the estimated level occupancy time. The level occupancy time is estimated on receipt of transitions in the direction of the trend and held constant until the next transition either occurs or becomes overdue (4.1.2.3.6.7).

4.1.2.3.6.6.1 When a track is first established, the quantities ε, $b_{\dot{z}}$ and t_b are set as follows:

$$\varepsilon = 0,\ b_{\dot{z}} = 1,\ t_b = \text{maximum}\ (t_p,\ 1.4\ \text{s})$$

4.1.2.3.6.6.2 Unless the transition is early or late (4.1.2.3.6.6.3), the quantities ε, $b_{\dot{z}}$ and t_b are calculated by recursive averaging following the third and subsequent transitions as follows:

$$\varepsilon' = 0.8\varepsilon^* + (t_p - t_b^*)$$

$$\beta_{\int} = \frac{(t_b^* - T_n)^2}{[(t_b^*)^2 + 64T_n^2]}$$

$b_{\dot{z}} = b_{\dot{z}}* + b_t$ and

β = maximum $(\frac{b_t}{b_{\dot{z}}}, \beta_f)$ and

$\varepsilon = \varepsilon'$

for $|\varepsilon'| \leq 1.35$ (or 2.85 if the most recent transition was observed following one or more missing reports);

$b_{\dot{z}} = 3$ and

$ß = 0.5$ and

$\varepsilon = 0.3\varepsilon'$ otherwise;

and in both cases: $t_b = t_b^* + ß(t_p - t_b^*)$.

4.1.2.3.6.6.3 *Early or late transitions*

If $|t_p - t_b^*| > 1.5$ s (or 3.0 s if the most recent transition was observed following one or more missing reports) or b_t lies outside the range $(t_r/t_b^* + 1.1) \geq b_t \geq (t_r/t_b^* - 1.1)$, then the quantities ε, $b_{\dot{z}}$ and t_b are set as follows:

$b_{\dot{z}} = 1$
$\varepsilon = 0$
t_{bm} = minimum $((0.7t_p + 0.3t_b^*), 1.4 \text{ s})$
t_b = maximum (t_p, t_{bm}).

The rate is calculated as: $\dot{z} = d_tQ/t_b$.

4.1.2.3.6.7 *Overdue transition.* The magnitude of the rate is decayed on each cycle from the value obtained on the previous cycle if reports are received at the same level for at least T_3 after the time of the next expected transition (or T_4 if the most recent transition was observed following one or more missing reports). The value of t_b is not changed in these circumstances.

4.1.2.3.6.7.1 The following values are used:

$T_3 = 1.5$ s

$T_4 = 3.0$ s

The following formula for rate decay is used:

$$\dot{z} = d_tQ/[t_b + (0.3t_b + 0.5T_n)(0.7 + (t_l - t_b)/T_n)^2]$$

where t_l = time since the most recent transition, s.

4.1.2.3.6.7.2 The quantity $b_{\dot{z}}$ is set to maximum $(2, b_{\dot{z}}^* - 1)$.

4.1.2.3.6.8 *Transitions due to jitter.* The magnitude of the rate is set to the value obtained on the previous cycle if a transition is observed opposite in direction to that of the trend, the immediately preceding transition followed the trend, only one level has been crossed and the time since the immediately preceding transition is “unexpectedly small”. Such a transition is subsequently treated as missing except for the requirements of 4.1.2.3.4 and 4.1.2.3.6.10 e).

4.1.2.3.6.8.1 The time since the immediately preceding transition is declared "unexpectedly small" when $t_p \leq 0.24\ t_b^*$.
4.1.2.3.6.8.2 The quantities ε, $b_{\dot{z}}$ and t_b are not changed.

4.1.2.3.6.9 *Track high confidence declaration.* "High" confidence in the tracked rate is declared when the current altitude report is credible and one or more of the following conditions are met:

a) a new track has been observed for longer than T_5 (4.1.2.3.6.9.1) without an altitude transition; or

b) an unconfirmed rate track has been observed for longer than T_6 (4.1.2.3.6.9.1) without an altitude transition; or

c) a track is classified as level; or

d) a track is first classified as established rate; or

e) for an established rate track when a transition has occurred the ratio of the observed transition time to the expected transition time (before being updated) falls between $\Re_1$ and $\Re_2$ (4.1.2.3.6.9.1); or the absolute value of the difference between these times is less than T_8; or the time between the most recently observed and the previous transition is longer than T_8 (4.1.2.3.6.9.1); or

f) for an established rate track when a transition has occurred, the previous report was missing, $|t_p - t_b^*| \geq T_7$, $t_p/t_b^* \geq 1$ and $-t_p - T_9 \leq (t_b - t_p)\ b_t \leq T_9$; or

g) a track is classified as oscillating; or

h) confidence was previously set to "high" upon processing of the last credible altitude report and conditions a) to e) of 4.1.2.3.6.10 for "low" confidence declaration are not satisfied.

4.1.2.3.6.9.1 The following values are used:

T_5 = 9 s
T_6 = 9 s
T_7 = 1.1 s
T_8 = 8.5 s
T_9 = 1.25 s
$\Re_1$ = 2/3
$\Re_2$ = 3/2

4.1.2.3.6.10 *Track low confidence declaration.* "Low" confidence in the tracked rate is declared when one or more of the following conditions are satisfied:

a) for a new track until condition a) in 4.1.2.3.6.9 is satisfied; or

b) for an unconfirmed rate track until condition b) in 4.1.2.3.6.9 is satisfied; or

c) when an observed transition time for an established rate track does not satisfy condition e) or condition f) in 4.1.2.3.6.9; or

d) when an expected transition is more than T_{10} (4.1.2.3.6.10.1) late; or

e) for an established rate track when the condition in 4.1.2.3.6.8 is satisfied; or

f) confidence was previously "low" and the conditions for "high" confidence declaration are not satisfied (4.1.2.3.6.9).

4.1.2.3.6.10.1 The value T_{10} = 0.25 s is used.

4.1.2.3.7 *Missing altitude reports.* When altitude reports are missing:

a) the previous value of the altitude rate estimate is maintained; and

b) confidence in the tracked rate is declared "low" when altitude reports are missing for two or more successive cycles.

4.2 Traffic advisories (TAs)

4.2.1 TA GENERATION

4.2.1.1 A TA is generated for an intruder reporting Mode C altitude when the application of both a range test (4.2.3) and an altitude test (4.2.4) gives a positive result for each in the same cycle of operation.

4.2.1.2 A TA is generated for an intruder equipped with a non-altitude-reporting transponder when the result of applying a range test (4.2.3) is positive.

4.2.2 TA WARNING TIME

For intruders reporting altitude, the range test for TAs gives a nominal warning time as follows:

S	*2*	*3*	*4*	*5*	*6*	*7*
TA warning time	T+10	T+10	T+10	T+15	T+15	T+13

where S = sensitivity level

4.2.2.1 The values for T for sensitivity levels 3 to 7 are those given in 4.3.3.3.1. The value for T for sensitivity level 2 is 10 s.

4.2.3 TA RANGE TEST

The range test for TAs has the same form as that used for threat detection (4.3.3). The values used for D_m for sensitivity levels 3 to 7 are those given in 4.3.3.1.1 incremented by $g(T_w - T)^2/6$ where T_w is the desired TA warning time. The base value for D_m for sensitivity level 2 is 0.19 km (0.10 NM).

4.2.4 TA ALTITUDE TEST

The altitude test gives a positive result if one of the following sets of conditions is satisfied:

a) current altitude separation is "small"; or

b) the aircraft are converging in altitude and the time to co-altitude is "small".

These terms and conditions are defined in 4.3.4.1, 4.3.4.2, 4.3.4.3 and 4.3.4.5. The time threshold for time to co-altitude is the TA warning time (4.2.2) and the values used for Z_t are as follows:

z_o FL	below 300	above 300
Z_t m	260	370
(Z_t ft	850	1 200)

4.3 Threat definition

4.3.1 THREAT DETECTION CHARACTERISTICS

4.3.1.1 *Intruder characteristics.* The characteristics of an intruder that are used to define a threat are:

a) tracked altitude: z_i

b) tracked rate of change of altitude: $\dot{z}_i$

c) tracked slant range: r

d) tracked rate of change of slant range: $\dot{r}$

e) sensitivity level of intruder's ACAS: S_i

For an intruder not equipped with ACAS II or ACAS III, S_i is set to 1.

4.3.1.2 *Own aircraft characteristics.* The following characteristics of own aircraft are used in threat definition:

a) altitude: z_o

b) rate of change of altitude: $\dot{z}_o$

c) sensitivity level of own ACAS (Chapter 4, 4.3.4.3): S_o.

4.3.1.3 *Altitude-band SLC command.* The reference logic selects the SLC command based altitude band as indicated in Table A-1.

4.3.2 *Criteria for threat declaration.* An intruder becomes a threat if and only if both the following apply on the same cycle:

a) the range test gives a positive result; and

b) either:

1) the altitude test gives a positive result; or

2) an altitude-crossing RAC has been received from the threat.

4.3.2.1 *Established threat.* The threat status of an established threat is maintained on successive cycles if, as a minimum, the range test gives a positive result.

4.3.3 RANGE TEST

4.3.3.1 *Range convergence.* Aircraft are considered converging in range if the estimated range rate is less than $\dot{R}_t$. In this case the range rate estimate used in the range test is the minimum of the estimated range rate and $-\dot{R}_t$.

4.3.3.1.1 The value 3 m/s (6 kt) is used for $\dot{R}_t$.

4.3.3.2 *Range divergence.* Aircraft that are not considered converging in range are considered diverging in range. Range divergence is considered "slow" if the product of the estimated range multiplied by the estimated range rate is less than $\dot{P}_m$.

4.3.3.2.1 The following values are used for $\dot{P}_m$:

S	*3*	*4 to 6*	*7*
$\dot{P}_m$ km^2/s	0.0069	0.0096	0.0137
($\dot{P}_m$ NM^2/s	0.0020	0.0028	0.0040)

4.3.3.3 *Range test criteria.* The range test gives a positive result when one of the following conditions is satisfied:

a) both

1) the aircraft are converging in range; and

2) the following inequality is satisfied:

$$(r - D_m^2 / r) / |\dot{r}'| < T;$$

where $\dot{r}'$ = minimum $(\dot{r}, -\dot{R}_t)$; *or*

b) the aircraft are diverging in range but the range is less than D_m and the range divergence is "slow"; or

c) either a miss distance estimate could not be calculated on the current cycle or the calculated miss distance is less than H_m;

and for all other conditions the result of the range test is negative.

Note.— The formula in item a) 2) above provides a practical text for the following condition: the range and range rate estimates indicate that the encounter could be such that the linear miss distance is less than or equal to D_m and the linear time to closest approach is less than T.

4.3.3.3.1 The values of the parameters *T*, D_m and H_m are as follows:

S	*3*	*4*	*5*	*6*	*7*
T s	15	20	25	30	35
D_m (km)	0.37	0.65	1.0	1.5	2.0
(D_m (NM)	0.20	0.35	0.55	0.80	1.1)
H_m (m)	382	648	1 019	1 483	2 083
(H_m (ft)	1 251	2 126	3 342	4 861	6 683)

4.3.4 ALTITUDE TEST

4.3.4.1 *ALTITUDE TEST TERMS' DESCRIPTION*

Altitude divergence rate $(\dot{a})$. The rate of change of a.

Current altitude separation (a). The modulus of the current tracked altitude separation between own aircraft and the intruder.

Times to closest approach (τ_u, τ_m). The estimated time which will be taken to reach minimum range. τ_u is the maximum value (assuming rectilinear relative motion and zero miss distance) and τ_m is the minimum value (assuming rectilinear relative motion and the maximum miss distance of interest, D_m).

Time to co-altitude (τ_v). The estimated time which will be taken to reach co-altitude.

Vertical miss distance (v_m). An estimated lower bound for the projected altitude separation at the estimated time of closest approach.

4.3.4.2 *Current altitude separation.* Current altitude separation is declared "small" if $a < Z_t$ where Z_t is set equal to Z_m (4.3.4.4.2) in the reference logic.

4.3.4.3 *ALTITUDE CONVERGENCE*

4.3.4.3.1 $\dot{a}$ is calculated as follows:

$\dot{a} = \dot{z}_o - \dot{z}_i$ for $z_o - z_i \geq 0$

$\dot{a} = \dot{z}_i - \dot{z}_o$ for $z_o - z_i < 0$

4.3.4.3.2 The aircraft are declared converging in altitude if $\dot{a} < -\dot{Z}_c$.

4.3.4.3.3 The value of $-\dot{Z}_c$ is positive and not greater than 0.3 m/s (60 ft/min).

4.3.4.4 *VERTICAL MISS DISTANCE*

4.3.4.4.1 When the aircraft are converging in range ($\dot{r} \leq 0$), time to closest approach and vertical miss distance are calculated as follows:

$\dot{r}' = \text{minimum}(\dot{r}, -\dot{R}_t)$

$\tau_u = \text{minimum}(|r / \dot{r}'|, T)$

$\tau_u = |r - D_m^2/r) / \dot{r}'|$

for $r \geq D_m$

$= 0$ for $r < D_m$

v_{m1} $= (z_o - z_i) + (\dot{z}_o - \dot{z}_i)\ \tau_u$

v_{m2} $= (z_o - z_i) + (\dot{z}_o - \dot{z}_i)\ \tau_m$

v_m $= 0$ for $v_{m1}v_{m2} \le 0$, otherwise
v_m $=$ minimum (v_{m1}, v_{m2}) for $v_{m1} > 0$
$=$ maximum (v_{m1}, v_{m2}) for $v_{m1} < 0$

4.3.4.4.2 Vertical miss distance is declared "small" if $|v_m| < Z_m$. The maximum values for Z_m are given by:

z_o *FL*	*below 200*	*200 to 420*	*above 420*
Z_m (m)	183	213	244
(Z_m (ft)	600	700	800)

4.3.4.5 *TIME TO CO-ALTITUDE*

4.3.4.5.1 The time to co-altitude for $\dot{a}$ less than $-\dot{Z}_c$ is calculated as follows:

$$\tau_v = -a/\dot{a}$$

Note.— τ_v is not used if the aircraft are not converging in altitude and range.

4.3.4.5.2 τ_v is declared "small" if $\tau_v < T_v$ for encounters in which the magnitude of own aircraft's vertical rate is not more than 600 ft/min or own aircraft's vertical rate has the same sign as but smaller magnitude than that of the intruder. For all other encounters τ_v is declared "small" if $\tau_v < T$. The values of the parameters T_v are as follows:

S	*3*	*4*	*5*	*6*	*7*
T_v s	15	18	20	22	25

4.3.4.6 *Altitude test criteria.* The altitude test of the reference logic gives a positive result when any of the three following conditions are satisfied:

a) the aircraft are converging in range, the current altitude separation is "small" and the vertical miss distance is "small"; or

b) the aircraft are converging in range and altitude, the time to co-altitude is "small" and either the vertical miss distance is "small", or co-altitude is predicted to occur before closest approach ($\tau_v < \tau_u$); or

c) the aircraft are diverging in range and the current altitude separation is "small";

and for all other conditions the results of the altitude test are negative.

4.4 Generation of RAs

4.4.1 RA types are defined in Chapter 4, 4.1.

4.4.2 DELAY IN RA GENERATION

Note.— An RA will be generated for all threats except in the circumstances described here or for coordination purposes.

The reference logic does not generate a new RA or modify an existing RA for a new threat when any of the following conditions are satisfied:

a) an altitude-crossing RAC has not been received from the threat; and

b) either:

1) the altitude separation test (4.4.2.1) gives a negative result; or

2) confidence in the tracked altitude rate of the intruder is "low" and no resolution manoeuvre would provide a predicted separation of at least A_t (4.4.2.2), whether the threat had an altitude rate equal to the upper altitude rate bound, to the lower altitude rate bound, or to any altitude rate between these bounds (4.1.3.3.4); or

3) there is "low" confidence in the threat's tracked altitude rate, the current altitude separation is greater than 46 m (150 ft), and the RA that would be selected against the threat when considered separately from other possible threats would be altitude crossing.

4.4.2.1 *ALTITUDE SEPARATION TEST*

4.4.2.1.1 The altitude rate of own aircraft is declared "small" if $|\dot{z}_o| \le \dot{Z}_\ell$.

4.4.2.1.2 The value 3.0 m/s (600 ft/min) is used for $\dot{Z}_\ell$.

4.4.2.1.3 The delay in threat declaration is declared "acceptable" if it is less than 3.0 s.

4.4.2.1.4 The maximum altitude separation threshold, A_c, is given a value of 260 m (850 ft), when the vertical rates of own and of the threat are in the opposite directions and neither of them is "small", and a value of 183 m (600 ft) otherwise.

4.4.2.1.5 Altitude separation is declared "minimum" if it is equal to 100 ft.

4.4.2.1.6 An encounter is declared "slow closing" if the range rate is greater than D_m/T.

4.4.2.1.7 *Test conditions.* The altitude separation test gives a negative result if the threat is a new threat and the RA that would be selected against the new threat when considered separately from other possible simultaneous threats would be either:

a) altitude crossing and either:

1) the current altitude separation exceeds A_c; or

2) the threat is equipped, a valid RAC has not been received from it, the altitude rate of own aircraft is "small", the altitude rate of the threat is not "small", and the delay in issuing an RA or modifying the existing RA is "acceptable"; or

b) unable to generate at least "minimum" separation over the critical interval if the encounter is not "slow closing"; or

c) unable to generate at least "minimum" separation at closest approach (τ_u) if the encounter is "slow closing" and either range is less than D_m or time to a range of D_m, τ_m, is less than 5 s.

Otherwise, the result of the altitude separation test is positive.

4.4.2.2 The following values are used for A_t:

z_o	A_t m	(A_t ft)
less than FL 100	61	(200)
FL 100 to FL 200	73	(240)
FL 201 to FL 420	122	(400)
greater than FL 420	146	(480)

4.4.2.2.1 Hysteresis of ±500 ft is applied to the boundaries between adjacent altitude layers.

4.4.3 *Altitude separation goal.* The initial strength of the RA is selected to meet the goal of an altitude separation of at least A_l at closest approach except in the circumstances described in 4.4.3.2.

4.4.3.1 The following values are used for the parameter A_l:

z_o	A_t m	(A_t ft)
less than FL 50	91	(300)
FL 50 to FL 100	107	(350)
FL 100 to FL 200	122	(400)
FL 201 to FL 420	183	(600)
greater than FL 420	213	(700)

4.4.3.1.1 Hysteresis of ±500 ft is applied to the boundaries between adjacent altitude layers.

4.4.3.2 *Inadequate vertical separation.* If the restrictions on RAs (Chapter 4, 4.3.5 and 4.4.4 below) preclude the generation of an RA predicted to provide an altitude separation at closest approach of at least A_l, the RA is that predicted to provide the largest altitude separation at closest approach consistent with the other provisions in this chapter.

4.4.3.3 *Critical interval.* Predictions for closest approach are for the period of time during which a collision could occur.

4.4.3.3.1 The critical interval is that time between $\tau_{m\ell}$ and $\tau_{u\ell}$ where:

$$\dot{r}' = \text{minimum } (\dot{r}, -\dot{R}_t)$$

$$\tau_{u\ell} = \text{minimum } (\tau^*_{u\ell}, |r/\dot{r}'|, T_e)$$

$$\tau_{m\ell} = \text{minimum } (\tau^*_{m\ell}, |(r - D_m^2/r)/\dot{r}'|)$$

for $r \geq D_m$

$T_{ml} = 0$ for $r < D_m$

where $\tau^*_{u\ell}$ and $\tau^*_{m\ell}$ are both equal to T_e for a threat that has newly passed the range test (4.3.3) and are the values of $\tau_{u\ell}$ and $\tau_{m\ell}$, respectively, on the previous cycle otherwise.

4.4.3.3.1.1 The following parameter values are used:

S	*3*	*4*	*5*	*6*	*7*
T_e, s	25	30	30	35	40

4.4.3.4 *The threat trajectory.* The RA is designed to provide altitude separations sufficient to avoid collisions with threats that:

a) continue with their current altitude rates; or

b) are climbing or descending when they first become threats and reduce their altitude rates or manoeuvre to level flight.

4.4.3.4.1 Predicted altitude separation is based on the assumption that the threat will maintain its current altitude rate except as described in 4.4.4.4 for ACAS equipped threats.

4.4.3.5 *Own aircraft trajectory.* Predicted altitude separation at closest approach is based on the following assumptions concerning the response of the ACAS II aircraft to the RA:

a) for preventive RAs, the altitude rate of own aircraft will remain within the limits specified by the RA;

b) for corrective RAs, the trajectory of own aircraft will consist of unaccelerated flight at the current rate for $T_p + T_s$, followed by a constant acceleration $(\ddot{Z}_g)$ in the vertical plane to achieve the selected altitude rate ($\dot{Z}_g$) and thereafter unaccelerated motion at this rate.

Note.— The predicted time to closest approach might be so short that the selected altitude rate, $\dot{Z}_g$, cannot be achieved.

4.4.3.5.1 The parameter T_p, which represents pilot reaction time, takes the value 5 s for the initial RA strength or 2.5 s for any subsequent RA strength.

4.4.3.5.2 The value of the parameter T_s is chosen so that it models the system delay from receipt of the relevant SSR reply to the presentation of the RA to the pilot (Chapter 4, 4.3.5.10).

4.4.3.5.3 The parameter $\ddot{Z}_g$ takes the value 0.35g for a reversed sense RA or an increased rate RA or 0.25g otherwise.

4.4.3.5.4 If the selected altitude rate, $\dot{Z}_g$, exceeds the performance capabilities of the aircraft, a value suitable for the aircraft is substituted.

4.4.4 RESTRICTIONS ON RAs

4.4.4.1 *Range of available RA strengths.* The reference logic has a capability to provide the vertical RA strength options of Table A-2 in resolving encounters.

4.4.4.1.1 *Increased rate RAs.* The reference logic does not consider the increase climb and increase descend strength when selecting the initial strength of the RA. These RA strengths are only used when the predicted separation for the existing RA is inadequate and reversing the sense of the RA is not an acceptable option. These RA strengths are intended to convey an increased sense of urgency to the pilot. They correspond to increases in the selected altitude rate $\dot{Z}_g$ beyond $\dot{Z}_{clm}$ or $\dot{Z}_{des}$, as appropriate.

4.4.4.1.1.1 Increases in the selected altitude rate to 13 m/s (2 500 ft/min) are generated when all the following conditions are satisfied:

a) a positive RA with the same sense is currently displayed and has been displayed for more than one cycle; and either

1) if the threat is equipped or the current RA is not altitude crossing, confidence in the threat's tracked altitude rate is "high" (4.1.2.3.6.9), and the current RA strength is predicted to provide an altitude separation at closest approach of less than 61 m (200 ft); or

2) the threat is not equipped and the current RA is altitude crossing, and 10 s or less remain until closest approach and the threat's altitude at closest approach is currently predicted to be less than 61 m (200 ft) above or below the current altitude of own aircraft in the case of a descend or a climb RA respectively;

b) the time remaining to closest approach is less than T_{ir} and greater than 4 s;

c) own aircraft is either descending and above 1 450 ft AGL or climbing and above 1 650 ft AGL, and increase climb RAs are not inhibited by aircraft performance limits, and

d) either τ_u (4.3.4.4.1) is not increasing or, if it is, the range to the threat is less than 3.2 km (1.7 NM).

The following values are used for T_{ir}.

S	*3*	*4*	*5*	*6*	*7*
T_{ir}, *s*	13	18	20	24	26

Note 1.— Condition 2) of a) above allows the use of an increased rate RA against a levelling-off, unequipped threat in an altitude-crossing encounter which does not qualify for a sense reversal (4.4.4.3.1). This situation can arise because the threat is levelling off with a low deceleration such that its predicted altitude at the point of closest approach follows the ACAS II aircraft's current altitude on each succeeding cycle. An increased rate RA could generate additional altitude separation.

Note 2.— Condition c) prevents undesirable interactions between the collision avoidance logic and the ground proximity warning system (GPWS).

4.4.4.1.2 The default values for $\dot{Z}_{clm}$ and $\dot{Z}_{des}$ are 7.6 m/s (1 500 ft/min) and –7.6 m/s (–1 500 ft/min), respectively. If 7.6 m/s (1 500 ft/min) exceeds the aircraft's climb capability, a suitable value may be substituted to enable the generation of climb RAs. If the actual rate of climb or descent exceeds the default rate, the actual rate is substituted, if it is less than a maximum rate of 4 400 ft/min; otherwise the maximum rate of 4 400 ft/min is used.

Note.— Climbs may be inhibited in response to discrete indications e.g. that the aircraft is at its ceiling. However, it is possible that certain aircraft will have such limited climb capability that RAs to climb at 7.6 m/s (1 500 ft/min) have to be permanently inhibited to comply with Chapter 4, 4.3.5.4.

4.4.4.1.3 *RA retention.* Subject to the requirement that a descend RA is neither generated nor maintained below a specified altitude (Chapter 4, 4.3.5.4.1), the RA is not modified (Chapter 4, 4.3.5.6) if any of the following apply:

a) the range test has given a negative result but the intruder remains a threat (4.3.5.1.1); or

b) less than 2.5 s remain until closest approach; or

c) the intruder is diverging in range but the RA has not yet been cancelled (4.3.5.1.1).

4.4.4.1.4 *Weakening RAs.* Subject to the requirement that a descend RA is not generated at low altitude (Chapter 4, 4.3.5.4.1), an RA is not weakened (Chapter 4, 4.3.5.7) if any of the following conditions apply:

a) it is positive and current altitude separation is less than A_l; or

b) it (any strength) has been displayed for less than 10 s or, for a reversed sense RA, 5 s; or

c) there is "low" confidence in the threat's tracked altitude rate; or

d) the RA is a vertical speed limit RA.

Furthermore, positive RAs are not weakened beyond an RA strength allowing a return to level flight ("do not climb" for a downward RA; "do not descend" for an upward RA).

Note.— This limitation on weakening RAs does not apply to the declaration of an aircraft to be not a threat (Chapter 4, 4.3.5.1.1).

4.4.4.2 *Initial bias against altitude crossing.* A newly generated RA is non-crossing provided:

a) a non-crossing RA is predicted to provide an altitude separation of at least A_l at closest approach; and

b) responding to a non-crossing RA with a standard response (4.4.3.5) is predicted to preserve at least "minimum" vertical separation (4.4.2.1) throughout the entire time interval until closest approach.

4.4.4.3 *Sense reversal for an established threat.* Sense reversals are generated when the following conditions apply:

a) the threat is not equipped or the threat is equipped, has a higher aircraft address, and at least 9 s have elapsed since it became a threat and own ACAS has not previously reversed its RA; and

b) more than 4 s remain before closest approach; and

c) the value of τ_u (4.3.4.4.1) was not already rising by the time the range to the threat was 3.2 km (1.7 NM); and

d) either:

1) i) the current RA is altitude crossing; and

ii) current altitude separation is at least 61 m (200 ft), or 30 m (100 ft) if more than 10 s remain before closest approach; and

iii) either

— at the time the RA was generated the threat was predicted to cross the initial altitude of own aircraft, but currently the threat's altitude at closest approach is predicted to be above or below the current altitude of own aircraft in the case of a climb or descend RA, respectively; or

— at the time the RA was generated the threat was not predicted to cross the initial altitude of own aircraft, but current estimates of the separations predicted to be achievable for climb and descend RAs at closest approach show that greater separation will be obtained for a reversed sense RA; and

iv) by the time of reaching closest approach, own aircraft will, with reversed sense, be able to exceed the maximum bound on the threat's altitude at closest approach (projected using the maximum altitude rate bound (4.1.2.3.4)); or

2) i) the current RA is not altitude crossing; and

ii) at least one of the following:

— the threat has crossed own aircraft's altitude by at least 30 m (100 ft) in the direction of the RA sense; or

— the threat is not equipped and own aircraft has not yet crossed the altitude of the threat, but its vertical rate is opposite to the RA and an immediate manoeuvre to comply with the RA would not prevent an altitude crossing before closest approach; or

— the threat is not equipped and current separation does not exceed A_c (4.4.2.1.4), the vertical rates of own and the threat exceed 1 000 ft/min in the same direction, the RA has been positive for at least 9 s, confidence in the tracked rate of the threat is high, and either an altitude crossing is predicted to occur before closest approach or vertical separation at closest approach is predicted to be less than 30 m (100 ft).

Note.— The sense of an RA for an established threat cannot be reversed except for coordination purposes or because the predicted separation at closest approach for the existing sense is inadequate (Chapter 4, 4.3.5.5).

4.4.4.3.1 Climb RAs occurring as a result of reversals of downward-sense RAs are issued regardless of manoeuvre limitation indications.

4.4.4.4 *Strength selection for non-crossing RAs against ACAS-equipped threats.* In a conflict with an ACAS-equipped threat, in which the reference logic would normally generate a non-crossing climb or descend RA that is opposite in direction to own aircraft's existing vertical rate, an RA to limit the vertical rate to 0 ft/min will be generated instead, if the following conditions are met:

a) own aircraft and the threat are converging vertically;

b) own aircraft's vertical rate exceeds $\dot{Z}_{lo}$;

c) the threat aircraft's vertical rate is less than $\dot{Z}_{lo}$; and

d) the vertical separation that would be achieved at closest approach if both aircraft were to level off exceeds Z_{losep}.

4.4.4.4.1 The vertical speed limit 0 ft/min RA generated in accordance with 4.4.4.4 is retained if neither aircraft accelerates vertically toward the other with a change in rate in excess of $\dot{Z}_l$. Otherwise, the reference logic will immediately generate a climb or descend RA as appropriate for the RA sense.

4.4.4.4.2 The value 6 m/s (1 000 ft/min) is used for $\dot{Z}_{lo}$. The value 244 m (800 ft) is used for Z_{losep}.

5. ACAS II USE OF HYBRID SURVEILLANCE TECHNIQUES

5.1 Overview

5.1.1 Hybrid surveillance is the technique used by ACAS to take advantage of passive position information available via extended squitter. Using hybrid surveillance, ACAS validates the position provided by extended squitter through direct active range measurement. Initial validation is performed at track initiation. Revalidation is performed once per 10 seconds if the intruder becomes a near threat in altitude or range. Finally, regular once-per-second active surveillance is performed on intruders that become a near threat in both altitude and range. In this manner, passive surveillance (once validated) is used for non-threatening intruders thus lowering the ACAS interrogation rate. Active surveillance is used whenever an intruder becomes a near threat in order to preserve ACAS independence as an independent safety monitor. A block diagram of the hybrid surveillance algorithm is presented in Figure A-11.

5.1.2 The reported altitude in the extended squitter position report is loaded within the Mode S transponder from the same source used to provide the altitude reported in the reply to an ACAS addressed interrogation. The altitude reported in an extended squitter position report may therefore be used to update the altitude of a track undergoing active surveillance, in the event that the transponder fails to reply to active interrogations.

5.2 Hybrid surveillance equipment characteristics

5.2.1 INITIAL VALIDATION

5.2.1.1 A passive track is initiated by the receipt of an extended squitter with a 24-bit address that is not in the track file, nor is associated with a track undergoing active surveillance. This latter case can occur if the short squitter established an active track before an extended squitter containing position reports is received.

5.2.1.2 ACAS will handle an extended squitter acquisition the same way that it handles a short squitter acquisition. After receiving the required number of squitters at the ACAS MTL (the same number as specified for short squitters in Chapter 3, 3.1.2.8.5), an attempt is made at active surveillance for a prescribed number of times. A successful reply will lead to track acquisition. An unsuccessful attempt will lead to discarding acquisition for this aircraft address, since the ADS data could not be validated. Continued receipt of extended squitters will lead to a subsequent acquisition attempt.

5.2.1.3 In the case of an aircraft providing extended squitter information, a successful acquisition reply will provide the opportunity to validate the information. But in either case (short or long squitter), the same criteria for track acquisition are followed, in terms of the number of correlating squitters that are required and the number of interrogation attempts that are made.

5.2.1.4 Initial ADS information validation is performed at passive track initiation to determine if the track can be maintained on passive data. An active surveillance measurement is made using a short addressed interrogation which carries an ACAS cross-link command to provide the contents of register 05[HEX] (extended squitter airborne position) in the reply. The reply to this interrogation also provides the aircraft speed capability and the reported barometric altitude in addition to the ADS-B airborne position report. The relative range and bearing computed from own and intruder reported positions is compared to the active range and bearing measurements and the altitude provided in the position report is compared to the altitude obtained from the active interrogation. If the reported information does not agree with the range, bearing or altitude obtained via the active interrogation within limits recommended in Chapter 4, 4.5.1.3.2, the track is declared to be an active track and future extended squitters from this aircraft are ignored by ACAS.

5.2.2 REVALIDATION AND MONITORING

If the following condition is met for an aircraft with a relative altitude ≤ 10 000 ft:

(Intruder altitude difference ≤ 3 000 ft OR vertical *TAU* to 3 000 ft ≤ 60 seconds) OR
(Range difference ≤ 3 NM OR range *TAU* to 3 NM ≤ 60 seconds)

an active interrogation is made every 10 seconds to continuously revalidate and monitor the position reports. Any detected difference will result in the aircraft being declared an active track.

5.2.3 ACTIVE SURVEILLANCE

If the following condition is met for an aircraft with a relative altitude ≤ 10 000 ft:

(Intruder altitude difference ≤ 3 000 ft OR vertical *TAU* to 3 000 ft ≤ 60 seconds) AND

(Range difference ≤ 3 NM OR range *TAU* to 3 NM ≤ 60 seconds)

the aircraft is declared an active track and is updated on active range measurements once per second.

5.2.4 THREAT EVALUATION DECLARATION

If the intruder aircraft is declared to be a threat or potential threat, active range measurement continues.

6. PERFORMANCE OF THE COLLISION AVOIDANCE LOGIC

6.1 Purpose of the performance requirements

6.1.1 The ACAS collision avoidance logic is the part of ACAS that receives information relating to identified intruders (i.e. any aircraft for which ACAS has established a track) and generates collision avoidance advisories on the basis of that information. In any ACAS equipment it is likely to take the form of software residing in a microprocessor and this software will implement a collection of mathematical algorithms. These algorithms might vary from one ACAS to another and the purpose of the performance requirements for the collision avoidance logic is to ensure that the performance of the mathematical algorithms is acceptable.

6.1.2 The development of the collision avoidance algorithms and their implementation as software are thought of as separate processes and these standards relate to the algorithms, even though, in practice, the software used to demonstrate that the algorithms are satisfactory might be closely related to that installed with ACAS. The performance requirements for the collision avoidance logic are not intended to guarantee that the collision avoidance software is satisfactory as software, though they are an essential ingredient of such a guarantee. Satisfactory performance of the software is to be achieved by using sound software engineering practices to ensure that the algorithms are implemented reliably.

6.1.3 The interoperability of the collision avoidance logics in any two equipments is achieved by ensuring that their RAs are consistent and that either RA alone is sufficient for the purpose of the system as a whole. Consistency is ensured by the requirements relating to coordination (Chapter 4, 4.3.5.5.1, 4.3.5.8 and 4.3.6.1.3). That either RA is sufficient is guaranteed by the collision avoidance logic performance requirements and, in particular, the requirement of satisfactory performance when the other aircraft is ACAS equipped but does not cooperate (Chapter 4, 4.4.2.1 j) 2)).

6.1.4 The performance requirements are intended to provide a global guarantee that the ACAS logic in question has an overall performance that is comparable with or superior to that of other ACAS logics. They do not describe the performance of the logic in any particular airspace. For many purposes, the best method of determining or studying the performance of an ACAS logic in a particular airspace is by means of simulations based on ATC ground radar data. This possibility is discussed further in 6.4.4.

6.2 Conditions under which the requirements apply

6.2.1 COMMENT

The conditions given in Chapter 4, 4.4.2 are specified in order to define the subsequent requirements, but satisfactory performance is required in all normal operating conditions. This is to be demonstrated by varying the conditions in which the performance measures are calculated in a way that reflects the normal variations that might be expected and ensuring that the calculated performance measures are robust, i.e. that they do not degrade sharply as the conditions assumed deteriorate.

6.2.2 SURVEILLANCE ERRORS

6.2.2.1 Surveillance errors can take a number of forms:

a) a track is not formed for the intruder;

b) a track is formed late;

c) a track is dropped prematurely;

d) a track is formed but reports are not available each cycle; and

e) the reports, e.g. of range, will be subject to measurement errors.

6.2.2.2 While any assessment of the effectiveness of ACAS as a whole must take failure to form tracks, item a), into account, there is no need to prove that the logic is effective when it has no data.

6.2.2.3 Late track formation, item b), could delay the generation of RAs (perhaps because the various trackers in the logic have not converged and the RA is delayed by low confidence) or result in an inappropriate initial RA (perhaps because the output of the trackers is used before it has converged). Best practice would be to determine the frequency of late track formation for the actual surveillance system to be used with the logic being tested.

6.2.2.4 Once a track is formed, missing reports can degrade the accuracy of the track or cause low confidence in the track, both of which could delay the initial RA, result in an inappropriate RA or delay changes in an RA after it has been generated. Best practice would be to determine the frequency of missing reports for the actual surveillance system to be used with the logic being tested. The probability that a report is missing on any given cycle will be a function of the range of the intruder, altitude and whether or not a report was missing on the previous cycle.

6.2.2.5 Actual bearing measurement errors are highly dependant on the airframe and the siting of the ACAS antenna and other antennas and obstacles fitted to the same airframe. The bearing measurements are characteristically so poor that early ACAS designs made no use of them in the collision avoidance logic. A later design, which includes a filter that inhibits RAs when the sequence of range measurements indicates a significant horizontal miss distance, used the bearing and bearing rate measurements to verify that neither aircraft is accelerating; the filter is disabled if the bearing measurements are not consistent with the diagnosed miss distance. The conditions specified in Chapter 4, 4.4.2 are intended to cover this sort of feature in the logic.

6.2.2.6 It is most unlikely that any ACAS installation will provide bearing measurements of sufficient accuracy to provide the primary basis of a miss distance filter or any other aspect of the collision avoidance logic.

6.2.2.7 Range and bearing measurements are also used to determine the relative position of the intruder for use in the traffic display. The requirements for this use are much less stringent than those of the collision avoidance logic, and the models specified in Chapter 4, 4.4.2.2 and 4.4.2.3 have no bearing on this use.

6.2.3 ALTITUDE QUANTIZATION

6.2.3.1 The intruder's altitude could be available as either Mode C or Mode S reports and is thus expressed in 100 ft or 25 ft quanta. Chapter 4, 4.4.2.1 c) specifies that 100 ft quanta be assumed for the purposes of confirming that the performance requirements are met. The performance of the collision avoidance logic is expected to be improved when the intruder's altitude is available as 25 ft quanta and it is desirable to confirm that this is the case.

6.2.3.2 In most cases, the altitude of own aircraft will be available to ACAS as a measurement prior to the formation of a Mode C or Mode S report and Chapter 4, 4.4.2.1 d) specifies that this is assumed. For installations where it is not possible to provide the original altitude measurement to ACAS, the collision avoidance logic will have to use the Mode C or Mode S reports made by own aircraft. This is expected to degrade the performance of the logic but Chapter 4, 4.4.2.1.1 requires that this degradation be acceptable. The logic is not expected to meet the performance requirement when altitude reports (as opposed to measurements) are used for own aircraft. The test is whether the resulting measures are judged acceptable given that they result from an installation where it has been necessary to compromise performance by using input that does not match the normal standards, and whether they indicate that the logic is unduly sensitive to quantization of the altitude data for own aircraft.

6.2.4 STANDARD ALTIMETRY ERROR MODEL

6.2.4.1 The standard altimetry error model is needed for the calculation of the effect of ACAS on the risk of collision (6.3.2). Although it is based on the observed performance of operational altimeters, there is no intention that the model be used as a reference recording that performance. Still less is there an implied requirement for altimeters to match the performance described in the model whether or not they are used in conjunction with ACAS. The model is standardized solely for the purpose of defining the conditions under which the requirements relating to the performance of the collision avoidance logic apply.

6.2.4.2 The model describes the distribution that is to be assumed for the errors in altimeter measurements. It excludes the effect of the quantization that is needed to create Mode C or Mode S altitude reports. Nevertheless, the calculation of the effect of ACAS on the risk of collision must take full account of this quantization and this is to be achieved by quantizing the simulated altitude measurements and thus forming simulated reports that are provided to the simulated ACAS logic.

6.2.4.3 The simulations of the effect of ACAS will include precise knowledge of the aircrafts' measured altitudes. Their actual altitudes are not known either to ATC or to the aircraft; they are the sum of the simulated measurement and the random altimeter error. In every encounter where the horizontal miss distance is very small, there is some risk of collision and it equals the probability that the difference in the actual altitudes of the two aircraft is small enough for them to collide. Thus the calculation of the effect of ACAS on the risk of collision (6.3.2) involves forming the statistical distribution of the error in the measured difference in the altitudes of the two aircraft: the convolution of two statistical distributions, one for each aircraft.

6.2.4.4 For the standard altimetry error model specified in Chapter 4, 4.4.2.4, the probability that the actual vertical separation *d* is less than a threshold value *h* (which is taken to be 100 ft in 6.3.2) is as follows:

for $\lambda_1 = \lambda_2$ and $a \geq h$

$$Prob(|d| \leq h) = \frac{1}{4\lambda}\exp\left(\frac{-(a+h)}{\lambda}\right)\left[\exp\left(\frac{2h}{\lambda}\right)(2\lambda + a - h) - (2\lambda + a + h)\right]$$

for $\lambda_1 = \lambda_2$ and $a < h$

$$Prob(|d| \leq h) = 1 - \frac{1}{4\lambda}\exp\left(\frac{-(a+h)}{\lambda}\right)\left[\exp\left(\frac{2h}{\lambda}\right)(2\lambda - a + h) + (2\lambda + a + h)\right]$$

for $\lambda_1 \neq \lambda_2$ and $a \geq h$

$$\frac{Prob(|d| \leq h) = \lambda_1^2 \exp\left(\frac{-a}{\lambda_1}\right)\sinh\left(\frac{h}{\lambda_1}\right) - \lambda_2^2 \exp\left(\frac{-a}{\lambda_2}\right)\sinh\left(\frac{h}{\lambda_2}\right)}{\lambda_1^2 - \lambda_2^2}$$

and for $\lambda_1 \neq \lambda_2$ and $a < h$

$$\frac{Prob(|d| \leq h) = \lambda_1^2\left[1-\exp\left(\frac{-h}{\lambda_1}\right)\cosh\left(\frac{a}{\lambda_1}\right)\right]-\lambda_2^2\left[1-\exp\left(\frac{-h}{\lambda_2}\right)\cosh\left(\frac{a}{\lambda_2}\right)\right]}{\lambda_1^2-\lambda_2^2}$$

where λ_1 and λ_2 are the values of λ for the two aircraft, and a is the apparent vertical separation as in 6.3.2, i.e. the altitude separation as measured by the altimeters in the two aircraft.

6.2.5 STANDARD PILOT MODEL

6.2.5.1 The standard pilot model represents a reasonable expectation of pilots' normal reaction to RAs. However, it does not capture the full range of potential responses, for example, slow responses that undermine collision avoidance and excessively violent reactions that cause large deviations from clearance. For some responses, for example, failure to respond or a decision to move to the next flight level in response to a climb RA, it is not appropriate to examine the performance of the logic, but the following modifications to the standard model will provide an indication whether the logic is unduly dependent on an accurate pilot response.

6.2.5.2 In the context of Chapter 4, 4.4.3, the reduction in the risk of collision, a suggested deficient pilot response is:

a) the pilot responds slowly, *viz.* in 8 s to an initial RA and in 5 s to a changed RA; and

b) the pilot aims for an inadequate rate, *viz.* 200 ft/min less than the rate required.

6.2.5.3 In the context of Chapter 4, 4.4.4, the effect of ACAS on air traffic management (ATM), a suggested excessive response is:

a) the pilot responds quickly, *viz.* in 3 s to an initial RA and in 1 s to a changed RA;

b) the pilot aims for an excessive rate, *viz.* 500 ft/min more than the rate required; and

c) the pilot fails to respond to weakening RAs.

6.2.5.4 The logic is not expected to meet the performance requirements when the pilot responds as described above, but calculation of the performance measures using these non-standard pilot responses will provide some insight into the sensitivity of the logic to the accuracy of the pilot's response. The test is whether the changes in the measures are judged acceptable given that they result from an inaccurate response, and whether they indicate that the logic is unduly sensitive to the response assumed from the pilot.

6.2.6 STANDARD ENCOUNTER MODEL

6.2.6.1 Effectively, there are two encounter models, one for use in risk ratio calculations (where the horizontal miss distance is small) and the other for use when assessing the compatibility of the logic design with ATM (where the horizontal miss distance can be comparable with the ATC horizontal separation minimum). This overcomes what would otherwise be an unacceptable simplification: both models treat the horizontal and vertical characteristics of the encounters independently.

6.2.6.2 The standard model is the result of an analysis of a large amount of ground radar data collected in two States. This means that one can expect the performance measures calculated using this standard model to be related to operational reality even though that is not the purpose of the calculations. The data analysed revealed very considerable variation in the airspace characteristics expressed in the encounter model depending on the location of the radar providing the data. The characteristics of the data from the two States were radically different. This implies that a standard encounter model cannot provide predictions of performance that will be valid for any specific location. However, given that a standard model is essential to the definition of standard performance, the model standardized is considered sufficiently complex and representative.

6.2.6.3 To determine the parameters of the standard encounter model (Chapter 4, 4.4.2.6), for example the relative weights of the encounter classes, encounters were reconstructed from ground radar data. This required a reinterpretation of aspects of the encounters, examples of which are given below.

6.2.6.3.1 The definition of "Altitude layer" given for the standard encounter model (Chapter 4, 4.4.1) is simple because it is made solely for the purpose of standardizing the collision avoidance logic. When, in the real encounters observed in the ground radar data, ground level did not correspond to a pressure-altitude of 0 ft, it was necessary to distinguish between height above the ground and pressure-altitude with respect to mean sea level (MSL). The method used to determine the altitude layer appropriate for an encounter observed in real radar data was to place it in Layer 1 if it occurred less than 2 300 ft above ground level (AGL), and to use the pressure-altitude with respect to MSL otherwise. At locations of high altitude, one or more layers were sometimes missing.

6.2.6.3.2 The vertical rates of an aircraft at the beginning and the end of an encounter, $\dot{z}_1$ and $\dot{z}_2$ are, in the standard encounter model, values at precise times, *viz.* $tca - 35$ s and $tca + 5$ s. When processing the data for real encounters observed in the ground radar data, the values used for $\dot{z}_1$ and $\dot{z}_2$ were the average vertical rates over the first 10 s, i.e. [$tca - 40$ s, $tca - 30$ s], and the last 10 s, i.e. [tca, $tca + 10$ s], of the encounter.

6.2.6.3.3 In similar vein, in the real encounters *tca* was the actual time of closest approach, and *hmd* was the actual horizontal separation at closest approach. The vertical miss distance, *vmd*, was either the vertical separation at closest approach, for encounters in which $hmd \geq 500$ ft, or it was the minimum vertical separation during the period of time in which the horizontal separation of the two aircraft was less than 500 ft.

6.2.6.3.4 Some aspects of the standard encounter model, e.g. the magnitude of speed changes during an encounter, could not be determined from examination of the ground radar data (because of the nature of the data) and had to be specified using a general understanding of aircraft dynamics.

6.2.6.3.5 To put the lack of precise correspondence between the model encounters and those observed in radar data into context, it is necessary to bear in mind that the purpose of the standard encounter model is to provide a basis for standardizing the performance of the collision avoidance logic. While, naturally, every realistic effort was made to ensure that the model is as faithful as possible to operational reality, precise fidelity is not required and will not have been achieved. This is not a reason for using an alternative model; the only model that is valid for assessing the performance of the collision avoidance logic against the requirements stated here is the model specified here for that purpose.

6.2.6.4 Any construction of the standard encounter model that can be proved equivalent to that specified in Chapter 4, 4.4.2.6 is acceptable. Two examples of such equivalent alternatives are given below.

6.2.6.4.1 Chapter 4, 4.4.2.6.1 specifies that the performance measures be calculated by creating sets of encounters defined by broad characteristics (specifically: the ordering of the aircraft addresses; the altitude layer; the encounter class; and the approximate value for the vertical miss distance) and combining the results from these sets by using the weights specified in Chapter 4, 4.4.2.6.2. This will involve as many simulations of relatively rare types of encounters, e.g. crossing encounters, as of the more common types of encounters, e.g. non-crossing encounters. This approach ensures that the full range of possibilities within each set is properly investigated. However, the same end can be achieved by creating a number of encounters for each set that is proportional to the specified weight and combining all the encounters into one much larger pool. The only caveat on this alternative approach is that the total number of encounters must be large enough to ensure that the results from the smallest set, considered in isolation, are statistically reliable.

6.2.6.4.2 The statistical distributions for each of the vertical rates have been specified by requiring that first an interval is selected within which the final value is to lie, and then the final value is selected using a distribution that is uniform within the interval. This is merely a device adopted for the sake of clear presentation of the tables in Chapter 4, 4.4.2.6.3.2.4. It would be equivalent to select the value directly using a statistical distribution that is linear within each of the intervals and for which the cumulative probability increases across each interval by an amount equal to the specified probability for that interval.

6.2.6.5 The encounters in the standard encounter model are constructed from a notional closest approach outwards. The time of this notional closest approach is fixed and written "*tca*" in Chapter 4, 4.4.2.6. In the vertical plane, the vertical rates 35 s before *tca* and 5 s after *tca* are selected and joined by a period of acceleration if necessary, and then the altitudes in the trajectory are fixed by requiring that the vertical separation at *tca* equals the selected value for "*vmd*". In the horizontal plane, selected values for "*hmd*", the approach angle, and the aircraft speeds define the relative trajectories of the two aircraft at the time *tca*. The aircraft turns and speed changes are then imposed by modifying the trajectories before and after *tca*. At the conclusion of this process, the time of closest approach only approximates *tca*.

6.2.7 ACAS EQUIPAGE OF THE INTRUDER

6.2.7.1 The standards specify three sets of conditions concerning the equipage of the intruder and the way the intruder aircraft is to be assumed to behave:

a) the other aircraft involved in each encounter is not equipped;

b) the other aircraft is ACAS equipped but follows a trajectory identical to that in the unequipped encounter; and

c) the other aircraft is equipped with an ACAS having a collision avoidance logic identical to that of own ACAS.

6.2.7.2 The first circumstance a) ensures that the logic performs satisfactorily in encounters with an unequipped intruder. The other two circumstances both test the collision avoidance logic when the other aircraft is equipped but do so from different perspectives. Circumstance b) ensures that the logic performs satisfactorily under the constraints of the coordination process, while circumstance c) ensures that the benefits to be expected when both aircraft are equipped are realized.

6.2.7.3 The conditions applying in circumstance b) are intended to allow own ACAS to select its initial RA but to then apply the most pessimistic reasonable assumptions about the effect of the need for coordination on the performance of the own ACAS logic. When own aircraft has the lower aircraft address, the conditions of the test imply that the sense of the RA cannot be reversed. Furthermore, the intruder does not generate an RA and an RAC until the own ACAS RA is announced because an early design included an initial coordination delay (the purpose of which was to allow the coordination to complete and avoid the pilot seeing rapid changes in the RA); the intention of the requirement is to ensure that performance is satisfactory in spite of the deleterious effects of any such delay.

6.2.7.4 Circumstance c) requires that the behaviour of the two aircraft be fully cooperative, but the fact that both ACAS are using the subject logic ensures that the performance measure relates to the subject logic and that the subject logic is effective.

6.2.7.5 As discussed above, the performance specifications are intended to ensure satisfactory operation of the logic and not the system as a whole. To the extent that they are capable of wider interpretation in terms of the benefits of the system as a whole in an operational environment, circumstance c) might be thought to provide the more credible performance measure for ACAS-ACAS encounters. The specified performance of the logic in circumstance b) is worse than that where the intruder is not equipped, because circumstance b) invokes only the constraints imposed by coordination. However, the fact that the cooperation of an intruder cannot be guaranteed and that some pilots will fail to respond to RAs on occasion means that all three measures have operational relevance.

6.3 Reduction in the risk of collision

6.3.1 STATUS OF THE LOGIC RISK RATIO

6.3.1.1 The risk ratio calculated for the purposes of Chapter 4, 4.4.3 is a measure of the performance of the logic and not the ACAS as a whole. For example, ACAS can prevent a collision by prompting the pilot to carry out a successful visual search for the intruder and it can fail because a track is not established or the pilot ignores the RA; these are aspects of the total system that are not reflected in the calculations required for Chapter 4, 4.4.3.

6.3.1.2 When considering the relevance of the "logic risk ratio" figures calculated for Chapter 4, 4.4.3 to operations or policy decisions, it might be helpful to regard them as solely the reliability that can be attached to RAs. They express the effect that following an RA will have on the immediate risk of collision when, at the time it is issued, the pilot has no information other than the RA on which to base a decision whether to follow the RA or ignore it. As a rough guide, the collision risk created by ACAS arises from following the RA so the logic risk ratio overstates this "induced risk ratio"; on the other hand, it also overstates the capability of ACAS to prevent collisions because of the many other failure modes in the total system.

6.3.1.3 The figures calculated for the purposes of Chapter 4, 4.4.3 are unsuitable as guidance concerning the effect of ACAS on the overall risk of collision in an airspace or faced by an airline.

6.3.2 CALCULATION OF THE LOGIC RISK RATIO

6.3.2.1 The risk ratio *R* can be written:

$$R = \frac{\sum \textit{probability of a collision with ACAS}}{\sum \textit{probability of a collision without ACAS}}$$

where the summation is over all encounters, or, more practically, all encounters that contribute to the total risk of collision with or without ACAS. The need for the characteristics and statistics of the encounters to be representative of operational realities is standardized in Chapter 4, 4.4.2.6 and discussed in 6.2.6.

6.3.2.2 The estimated risk of collision depends on the interpretation of the word "collision". While this problem is largely avoided by expressing the requirement in terms of the ratio between the risks of collision with and without ACAS, it is important that realistic allowance is made for the size of the largest aircraft. It would be reasonable to treat a vertical separation of less than 100 ft between the centre points of the two aircraft as if it were small enough to allow a collision. It would not be advisable to use significantly larger miss distances as approximations to collisions because it has been found that the calculated risk ratio is sensitive to the definition of "collision" even though it is a ratio.

6.3.2.3 If the approximation is made that a collision occurs when

$|d| < 100$ ft, where d is the actual vertical separation

Then

$$R = \frac{\sum \text{prob}\,(|d| < 100 \textit{ ft with ACAS})}{\sum \text{prob}\,(|d| < 100 \textit{ ft without ACAS})}$$

where now the summation is over all encounters with zero or extremely small horizontal miss distance.

6.3.2.4 Now introduce e, the altimeter error and a, the apparent vertical separation and note that

$$a = d + e$$

a is conceptually the altitude separation as measured by altimeters. It should not be necessary to consider quantization errors because the modelled altimeter readings can be known with arbitrary precision in the computer simulations. They are quantized before they are provided to ACAS as modelled Mode C reports, which ACAS tracks. This is why the standard Chapter 4, 4.4.2 excludes quantization effects.

6.3.2.5 Define a_{with} to be the apparent vertical separation with ACAS and $a_{without}$ to be the apparent vertical separation without ACAS. Then

$|d| < 100\ ft$ with ACAS

if and only if $|a_{with} - e| < 100\ ft$

i.e. $a_{with} - 100\ ft < e < a_{with} + 100\ ft$

and similarly

$|d| < 100\ ft$ without ACAS

if and only if $|a_{without} - 100\ ft < e < a_{without} + 100\ ft$

6.3.2.6 Risk ratio is thus given by

$$R = \frac{\sum \text{prob}(a_{with} - 100\ \ ft < e < a_{with} + 100\ \ ft)}{\sum \text{prob}(a_{without} - 100\ \ ft < e < a_{without} + 100\ \ ft)}$$

In order to use this formula to calculate risk ratio, the values of a_{with} and $a_{without}$ must be determined for a collection of encounters that is fully representative of all the potential actual encounters in which there is both a risk of collision without ACAS and a risk that ACAS will induce a collision. When these values of hypothetically measured altitude separation are known, knowledge of the errors in altitude measurement completes the calculation.

6.3.3 INDUCED AND UNRESOLVED RISK

6.3.3.1 It is not sufficient to demonstrate that ACAS will prevent collisions that might occur in its absence. The risk that ACAS logic could cause collisions in otherwise safe circumstances must be fully considered, not least because in managed airspace the number of encounters potentially facing an induced risk greatly exceeds the number of near collisions.

6.3.3.2 The upper limit on the logic risk ratio standardized at Chapter 4, 4.4.3 effectively places an approximate upper limit on the ACAS induced risk of collision. Although some other failures could cause ACAS to induce a collision, e.g. pilots manoeuvring on a TA or an RA directing the aircraft into the trajectory of an unseen third party, the induced risk is largely attributable to following RAs. In operational conditions, failure to raise or follow an RA will reduce the risk of an induced collision (even though it increases the absolute risk).

6.3.3.3 The requirement is that the logic is designed to reduce the risk of collision and no distinction is drawn between risk induced by the logic and risk that it is unable to resolve. It is possible to draw such a distinction and even to subdivide the risk into that due to altimeter error and that due to inappropriate operation of the logic but it is considered that this exercise has little value for the design of the logic.

6.3.4 USE OF GROUND RADAR DATA TO CALCULATE RISK RATIO

It is possible to use encounters observed in ground radar data as the basis of the safety calculations described in 6.3.2. However, it is difficult to interpret the results because the calculation concerns extremely rare events and, even when many months of data are used, trajectories have to be modified to insert a risk of collision that was absent in the actual encounters. It is more practicable to use the radar data to inform the choice of the weights to be ascribed to the various encounter classes in the encounter model and thus produce a version of the idealized encounter model that is more representative of the airspace in question than the standard model presented here.

6.4 Compatibility with ATM

6.4.1 NUISANCE ALERT RATE

6.4.1.1 ACAS is required to diagnose a risk of imminent collision on the basis of incomplete information. Furthermore, this information has to be independent of that providing the primary basis for aircraft separation. It follows that there will be alerts in encounters where, from an operational perspective, there would seem to be no risk of collision. Standard Chapter 4, 4.4.4.1 requires that these nuisance alerts be as infrequent as possible.

6.4.1.2 The specification of a nuisance RA given in Chapter 4, 4.4.4.1.2 is made with the view that an RA is a nuisance if normal standard separation is not clearly lost. Additionally, it is intended that the horizontal separation threshold is sufficiently stringent to require the use of a horizontal miss distance filter. The horizontal separation threshold has been set at 40 per cent of normal separation, and the vertical separation threshold has been set at a figure based on an ATC tolerance of deviations of 200 ft from altitude clearance.

6.4.2 COMPATIBLE SENSE SELECTION

The requirement at Chapter 4, 4.4.4.2 is not intended to constrain the manner in which dangerous encounters are resolved, but rather is based on an appreciation that the majority of RAs are likely to be generated in encounters where there is no danger of collision. It places a statistical limit on the frequency with which ACAS disrupts ATC or the normal operation of the aircraft by inverting the vertical separation of two aircraft.

6.4.3 DEVIATIONS CAUSED BY ACAS

The restrictions on the deviations that may be caused by following RAs, Chapter 4, 4.4.4.3, limit the disruption to normal aircraft operation as well as to ATC. While deviations from altitude clearances are the most obviously disruptive to ATC, other deviations, such as that caused by an RA to climb when the aircraft is descending, could be viewed equally seriously by ATC.

6.4.4 USE OF GROUND RADAR DATA OR THE STANDARD ENCOUNTER MODEL

6.4.4.1 Conformance with the requirement for compatibility with ATM can be tested most convincingly using simulations based on reconstructions of actual operational encounters occurring within the coverage of ATC ground radars, provided that only a small proportion of the aircraft thus observed are equipped with ACAS. However, the results of such simulations based on actual data will reflect the particular properties of the airspace (or airspaces) in which the data were collected as much as those of the collision avoidance logic used. Thus, there are considerable practical difficulties in using real encounter data to validate collision avoidance logic, and the provisions of Chapter 4, 4.4.4 assume the use of artificial encounters based on the standard encounter model specified in Chapter 4, 4.4.2.6.

6.4.4.2 The use of the standard encounter model to obtain performance measures describing the operation of the collision avoidance logic will provide only indirect evidence concerning its operation in any particular airspace. Authorities that have access to ground radar data and wish to understand the interaction of ACAS with local ATC practices are advised to use simulations based on their ground radar data rather than the standard encounter model. In doing so, they need to note that the results can be subverted if the aircraft observed are already equipped with ACAS. They will also need to collect sufficient data to ensure that the simulated RAs derived from the data are statistically representative; for example, data collected over 100 days in one State contained very few examples of some types of RAs.

6.5 Relative value of conflicting objectives

The design of the collision avoidance logic for ACAS must strike an operationally acceptable balance between the reduction in the risk of collision and the disruption caused by ACAS alerts. The requirements relating to the risk of collision (Chapter 4, 4.4.3) and the disruption to ATC (Chapter 4, 4.4.4) are minimum standards that are known to be achievable from work with a prototype system. Other designs are only acceptable when it can be demonstrated that the risk of collision and the disruption to ATC have both been minimized as much as practicable in the context of a need to minimize the other.

TABLES

Table A-1

Nominal altitude band	*SLC command code*	*Altitude threshold at which sensitivity level value changes*	*Hysteresis values*
0 to 1 000 ft AGL	2	1 000 ft AGL	±100 ft
1 000 ft to 2 350 ft AGL	3	2 350 ft AGL	±200 ft
2 350 ft AGL to FL 50	4	FL 50	±500 ft
FL 50 to FL 100	5	FL 100	±500 ft
FL 100 to FL 200	6	FL 200	±500 ft
above FL 200	7		

Table A-2. RA strength options

Constraint	*Type*	$\dot{Z}_g$
Upward sense RA		
Increased climb	Positive	$>\dot{Z}_{clm}$
Climb	Positive	$\dot{Z}_{clm}$
Do not descend	VSL	0
Do not descend faster than 2.5 m/s	VSL	–2.5 m/s (–500 ft/min)
Do not descend faster than 5.1 m/s	VSL	–5.1 m/s (–1 000 ft/min)
Do not descend faster than 10 m/s	VSL	–10 m/s (–2 000 ft/min)
Downward sense RA		
Increased climb	Positive	$<\dot{Z}_{des}$
Descend	Positive	$\dot{Z}_{des}$
Do not climb	VSL	0
Do not climb faster than 2.5 m/s	VSL	+2.5 m/s (+500 ft/min)
Do not climb faster than 5.1 m/s	VSL	+5.1 m/s (+1 000 ft/min)
Do not climb faster than 10 m/s	VSL	+10 m/s (+2 000 ft/min)

ICAO TECHNICAL PUBLICATIONS

The following summary gives the status, and also describes in general terms the contents of the various series of technical publications issued by the International Civil Aviation Organization. It does not include specialized publications that do not fall specifically within one of the series, such as the Aeronautical Chart Catalogue *or the* Meteorological Tables for International Air Navigation.

International Standards and Recommended Practices are adopted by the Council in accordance with Articles 54, 37 and 90 of the Convention on International Civil Aviation and are designated, for convenience, as Annexes to the Convention. The uniform application by Contracting States of the specifications contained in the International Standards is recognized as necessary for the safety or regularity of international air navigation while the uniform application of the specifications in the Recommended Practices is regarded as desirable in the interest of safety, regularity or efficiency of international air navigation. Knowledge of any differences between the national regulations or practices of a State and those established by an International Standard is essential to the safety or regularity of international air navigation. In the event of non-compliance with an International Standard, a State has, in fact, an obligation, under Article 38 of the Convention, to notify the Council of any differences. Knowledge of differences from Recommended Practices may also be important for the safety of air navigation and, although the Convention does not impose any obligation with regard thereto, the Council has invited Contracting States to notify such differences in addition to those relating to International Standards.

Procedures for Air Navigation Services (PANS) are approved by the Council for worldwide application. They contain, for the most part, operating procedures regarded as not yet having attained a sufficient degree of maturity for adoption as International Standards and Recommended Practices, as well as material of a more permanent character which is considered too detailed for incorporation in an Annex, or is susceptible to frequent amendment, for which the processes of the Convention would be too cumbersome.

Regional Supplementary Procedures (SUPPS) have a status similar to that of PANS in that they are approved by the Council, but only for application in the respective regions. They are prepared in consolidated form, since certain of the procedures apply to overlapping regions or are common to two or more regions.

The following publications are prepared by authority of the Secretary General in accordance with the principles and policies approved by the Council.

Technical Manuals provide guidance and information in amplification of the International Standards, Recommended Practices and PANS, the implementation of which they are designed to facilitate.

Air Navigation Plans detail requirements for facilities and services for international air navigation in the respective ICAO Air Navigation Regions. They are prepared on the authority of the Secretary General on the basis of recommendations of regional air navigation meetings and of the Council action thereon. The plans are amended periodically to reflect changes in requirements and in the status of implementation of the recommended facilities and services.

ICAO Circulars make available specialized information of interest to Contracting States. This includes studies on technical subjects.

Recommended Practices

AIR TRAFFIC SERVICES

(Annex 11 to the Convention on International Civil Aviation)

1. Insert the following replacement pages in Annex 11 (Thirteenth Edition) to incorporate Amendment 45 which becomes applicable on 22 November 2007:

    a) Page (iii) — Table of Contents

    b) Page (xiii) — Foreword

    c) Pages 1-1 to l-7 — Chapter 1

    d) Pages 2-2 to 2-12 — Chapter 2

    e) Pages 3-4 and 3-6 — Chapter 3

    f) Pages 6-1 to 6-4 — Chapter 6

    g) Pages 7-1 to 7-3 — Chapter 7

    h) Page APP 1-1 — Appendix 1

    i) Pages APP 2-1 to APP 2-3 — Appendix 2

    j) Page APP 3-1 — Appendix 3

    k) Pages ATT A-1, ATT A-4 and ATT A-5 — Attachment A

    l) Page ATT B-1, ATT B-3 and ATT B-4 — Attachment B

2. Record the entry of this amendment on page (ii).

TABLE OF CONTENTS

Amendment(s)	*Source(s)*	*Subject(s)*	*Adopted/approved Effective Applicable*
41	Tenth meeting of the Review of the General Concept of Separation Panel (RGCSP/10); Seventeenth meeting of the Dangerous Goods Panel (DGP/17)	Spacing between parallel area navigation (RNAV) routes; and notification of dangerous goods information to rescue coordination centres (RCCs).	21 February 2002 15 July 2002 28 November 2002
42	Laser Emitters and Flight Safety Study Group; Secretariat; the Proficiency Requirements in Common English Study Group; Air Navigation Commission	Laser beam emissions; language proficiency requirements; and air traffic contingency measures.	7 March 2003 14 July 2003 27 November 2003
43	Secretariat; Aeronautical Information Services/ Aeronautical Charts (AIS/MAP) Divisional Meeting (1998)	Definitions; use of surface movement radar; ATS requirements for communications; meteorology information; height-keeping performance by aircraft; ATS safety management; electronic terrain and obstacle data; editorial amendments.	2 March 2005 11 July 2005 24 November 2005
44	35th Session of the ICAO Assembly; Eleventh Air Navigation Conference; Air Navigation Commission	ATS safety management; recording devices.	14 March 2006 17 July 2006 23 November 2006
45	Air Navigation Commission	Definitions and associated procedures for ADS-B, ADS-C and RCP; coordination procedures between ATS and other entities; name-code designators; introduction of wind shear alerts.	26 February 2007 16 July 2007 22 November 2007

INTERNATIONAL STANDARDS AND RECOMMENDED PRACTICES

CHAPTER 1. DEFINITIONS

Note 1.— Throughout the text of this document the term "service" is used as an abstract noun to designate functions, or service rendered; the term "unit" is used to designate a collective body performing a service.

Note 2.— The designation (RR) in these definitions indicates a definition which has been extracted from the Radio Regulations of the International Telecommunication Union (ITU) (see Handbook on Radio Frequency Spectrum Requirements for Civil Aviation including statement of approved ICAO policies (*Doc 9718)).*

When the following terms are used in the Standards and Recommended Practices for Air Traffic Services, they have the following meanings:

Accepting unit. Air traffic control unit next to take control of an aircraft.

Accident. An occurrence associated with the operation of an aircraft which takes place between the time any person boards the aircraft with the intention of flight until such time as all such persons have disembarked, in which:

a) a person is fatally or seriously injured as a result of:

— being in the aircraft, or

— direct contact with any part of the aircraft, including parts which have become detached from the aircraft, or

— direct exposure to jet blast,

except when the injuries are from natural causes, self-inflicted or inflicted by other persons, or when the injuries are to stowaways hiding outside the areas normally available to the passengers and crew; or

b) the aircraft sustains damage or structural failure which:

— adversely affects the structural strength, performance or flight characteristics of the aircraft, and

— would normally require major repair or replacement of the affected component,

except for engine failure or damage, when the damage is limited to the engine, its cowlings or accessories; or for damage limited to propellers, wing tips, antennas, tires, brakes, fairings, small dents or puncture holes in the aircraft skin; or

c) the aircraft is missing or is completely inaccessible.

Note 1.— For statistical uniformity only, an injury resulting in death within thirty days of the date of the accident is classified as a fatal injury by ICAO.

Note 2.— An aircraft is considered to be missing when the official search has been terminated and the wreckage has not been located.

Accuracy. A degree of conformance between the estimated or measured value and the true value.

Note.— For measured positional data the accuracy is normally expressed in terms of a distance from a stated position within which there is a defined confidence of the true position falling.

ADS-C agreement. A reporting plan which establishes the conditions of ADS-C data reporting (i.e. data required by the air traffic services unit and frequency of ADS-C reports which have to be agreed to prior to using ADS-C in the provision of air traffic services).

Note.— The terms of the agreement will be exchanged between the ground system and the aircraft by means of a contract, or a series of contracts.

Advisory airspace. An airspace of defined dimensions, or designated route, within which air traffic advisory service is available.

Advisory route. A designated route along which air traffic advisory service is available.

Aerodrome. A defined area on land or water (including any buildings, installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of aircraft.

Aerodrome control service. Air traffic control service for aerodrome traffic.

Aerodrome control tower. A unit established to provide air traffic control service to aerodrome traffic.

Aerodrome traffic. All traffic on the manoeuvring area of an aerodrome and all aircraft flying in the vicinity of an aerodrome.

Note.— An aircraft is in the vicinity of an aerodrome when it is in, entering or leaving an aerodrome traffic circuit.

Aeronautical fixed service (AFS). A telecommunication service between specified fixed points provided primarily for the safety of air navigation and for the regular, efficient and economical operation of air services.

Aeronautical Information Publication (AIP). A publication issued by or with the authority of a State and containing aeronautical information of a lasting character essential to air navigation.

Aeronautical mobile service (RR S1.32). A mobile service between aeronautical stations and aircraft stations, or between aircraft stations, in which survival craft stations may participate; emergency position-indicating radio beacon stations may also participate in this service on designated distress and emergency frequencies.

Aeronautical telecommunication station. A station in the aeronautical telecommunication service.

Airborne collision avoidance system (ACAS). An aircraft system based on secondary surveillance radar (SSR) transponder signals which operates independently of ground-based equipment to provide advice to the pilot on potential conflicting aircraft that are equipped with SSR transponders.

Aircraft. Any machine that can derive support in the atmosphere from the reactions of the air other than the reactions of the air against the earth's surface.

Air-ground communication. Two-way communication between aircraft and stations or locations on the surface of the earth.

AIRMET information. Information issued by a meteorological watch office concerning the occurrence or expected occurrence of specified en-route weather phenomena which may affect the safety of low-level aircraft operations and which was not already included in the forecast issued for low-level flights in the flight information region concerned or sub-area thereof.

Air-taxiing. Movement of a helicopter/VTOL above the surface of an aerodrome, normally in ground effect and at a ground speed normally less than 37 km/h (20 kt).

Note.— The actual height may vary, and some helicopters may require air-taxiing above 8 m (25 ft) AGL to reduce ground effect turbulence or provide clearance for cargo slingloads.

Air traffic. All aircraft in flight or operating on the manoeuvring area of an aerodrome.

Air traffic advisory service. A service provided within advisory airspace to ensure separation, in so far as practical, between aircraft which are operating on IFR flight plans.

Air traffic control clearance. Authorization for an aircraft to proceed under conditions specified by an air traffic control unit.

Note 1.— For convenience, the term "air traffic control clearance" is frequently abbreviated to "clearance" when used in appropriate contexts.

Note 2.— The abbreviated term "clearance" may be prefixed by the words "taxi", "take-off", "departure", "en route", "approach" or "landing" to indicate the particular portion of flight to which the air traffic control clearance relates.

Air traffic control service. A service provided for the purpose of:

a) preventing collisions:

   1) between aircraft, and

   2) on the manoeuvring area between aircraft and obstructions; and

b) expediting and maintaining an orderly flow of air traffic.

Air traffic control unit. A generic term meaning variously, area control centre, approach control unit or aerodrome control tower.

Air traffic flow management (ATFM). A service established with the objective of contributing to a safe, orderly and expeditious flow of air traffic by ensuring that ATC capacity is utilized to the maximum extent possible and that the traffic volume is compatible with the capacities declared by the appropriate ATS authority.

Air traffic service. A generic term meaning variously, flight information service, alerting service, air traffic advisory service, air traffic control service (area control service, approach control service or aerodrome control service).

Air traffic services airspaces. Airspaces of defined dimensions, alphabetically designated, within which specific types of flights may operate and for which air traffic services and rules of operation are specified.

Note.— ATS airspaces are classified as Class A to G as described in 2.6.

Air traffic services reporting office. A unit established for the purpose of receiving reports concerning air traffic services and flight plans submitted before departure.

Note.— An air traffic services reporting office may be established as a separate unit or combined with an existing unit, such as another air traffic services unit, or a unit of the aeronautical information service.

Air traffic services unit. A generic term meaning variously, air traffic control unit, flight information centre or air traffic services reporting office.

Airway. A control area or portion thereof established in the form of a corridor.

ALERFA. The code word used to designate an alert phase.

Alerting service. A service provided to notify appropriate organizations regarding aircraft in need of search and rescue aid, and assist such organizations as required.

Alert phase. A situation wherein apprehension exists as to the safety of an aircraft and its occupants.

Alternate aerodrome. An aerodrome to which an aircraft may proceed when it becomes either impossible or inadvisable to proceed to or to land at the aerodrome of intended landing. Alternate aerodromes include the following:

Take-off alternate. An alternate aerodrome at which an aircraft can land should this become necessary shortly after take-off and it is not possible to use the aerodrome of departure.

En-route alternate. An aerodrome at which an aircraft would be able to land after experiencing an abnormal or emergency condition while en route.

ETOPS en-route alternate. A suitable and appropriate alternate aerodrome at which an aeroplane would be able to land after experiencing an engine shutdown or other abnormal or emergency condition while en route in an ETOPS operation.

Destination alternate. An alternate aerodrome to which an aircraft may proceed should it become either impossible or inadvisable to land at the aerodrome of intended landing.

Note.— The aerodrome from which a flight departs may also be an en-route or a destination alternate aerodrome for that flight.

Altitude. The vertical distance of a level, a point or an object considered as a point, measured from mean sea level.

Approach control service. Air traffic control service for arriving or departing controlled flights.

Approach control unit. A unit established to provide air traffic control service to controlled flights arriving at, or departing from, one or more aerodromes.

Appropriate ATS authority. The relevant authority designated by the State responsible for providing air traffic services in the airspace concerned.

Apron. A defined area, on a land aerodrome, intended to accommodate aircraft for purposes of loading or unloading passengers, mail or cargo, fuelling, parking or maintenance.

Apron management service. A service provided to regulate the activities and the movement of aircraft and vehicles on an apron.

Area control centre. A unit established to provide air traffic control service to controlled flights in control areas under its jurisdiction.

Area control service. Air traffic control service for controlled flights in control areas.

Area navigation (RNAV). A method of navigation which permits aircraft operation on any desired flight path within the coverage of station-referenced navigation aids or within the limits of the capability of self-contained aids, or a combination of these.

Area navigation route. An ATS route established for the use of aircraft capable of employing area navigation.

ATS route. A specified route designed for channelling the flow of traffic as necessary for the provision of air traffic services.

Note 1.— The term "ATS route" is used to mean variously, airway, advisory route, controlled or uncontrolled route, arrival or departure route, etc.

Note 2.— An ATS route is defined by route specifications which include an ATS route designator, the track to or from significant points (waypoints), distance between significant points, reporting requirements and, as determined by the appropriate ATS authority, the lowest safe altitude.

Automatic dependent surveillance — broadcast (ADS-B). A means by which aircraft, aerodrome vehicles and other objects can automatically transmit and/or receive data such as identification, position and additional data, as appropriate, in a broadcast mode via a data link.

Automatic dependent surveillance — contract (ADS-C). A means by which the terms of an ADS-C agreement will be exchanged between the ground system and the aircraft, via a data link, specifying under what conditions ADS-C reports would be initiated, and what data would be contained in the reports.

Note.— The abbreviated term "ADS contract" is commonly used to refer to ADS event contract, ADS demand contract, ADS periodic contract or an emergency mode.

Automatic terminal information service (ATIS). The automatic provision of current, routine information to arriving and departing aircraft throughout 24 hours or a specified portion thereof:

Data link-automatic terminal information service (D-ATIS). The provision of ATIS via data link.

Voice-automatic terminal information service (Voice-ATIS). The provision of ATIS by means of continuous and repetitive voice broadcasts.

Base turn. A turn executed by the aircraft during the initial approach between the end of the outbound track and the beginning of the intermediate or final approach track. The tracks are not reciprocal.

Note.— Base turns may be designated as being made either in level flight or while descending, according to the circumstances of each individual procedure.

Calendar. Discrete temporal reference system that provides the basis for defining temporal position to a resolution of one day (ISO 19108*).

Change-over point. The point at which an aircraft navigating on an ATS route segment defined by reference to very high frequency omnidirectional radio ranges is expected to transfer its primary navigational reference from the facility behind the aircraft to the next facility ahead of the aircraft.

Note.— Change-over points are established to provide the optimum balance in respect of signal strength and quality between facilities at all levels to be used and to ensure a common source of azimuth guidance for all aircraft operating along the same portion of a route segment.

Clearance limit. The point to which an aircraft is granted an air traffic control clearance.

Conference communications. Communication facilities whereby direct speech conversation may be conducted between three or more locations simultaneously.

Control area. A controlled airspace extending upwards from a specified limit above the earth.

Controlled aerodrome. An aerodrome at which air traffic control service is provided to aerodrome traffic.

Note.— The term "controlled aerodrome" indicates that air traffic control service is provided to aerodrome traffic but does not necessarily imply that a control zone exists.

Controlled airspace. An airspace of defined dimensions within which air traffic control service is provided in accordance with the airspace classification.

Note.— Controlled airspace is a generic term which covers ATS airspace Classes A, B, C, D and E as described in 2.6.

Controlled flight. Any flight which is subject to an air traffic control clearance.

Controller-pilot data link communications (CPDLC). A means of communication between controller and pilot, using data link for ATC communications.

Control zone. A controlled airspace extending upwards from the surface of the earth to a specified upper limit.

Cruising level. A level maintained during a significant portion of a flight.

Cyclic redundancy check (CRC). A mathematical algorithm applied to the digital expression of data that provides a level of assurance against loss or alteration of data.

Data link communications. A form of communication intended for the exchange of messages via a data link.

Data quality. A degree or level of confidence that the data provided meets the requirements of the data user in terms of accuracy, resolution and integrity.

Datum. Any quantity or set of quantities that may serve as a reference or basis for the calculation of other quantities (ISO 19104*).

Declared capacity. A measure of the ability of the ATC system or any of its subsystems or operating positions to provide service to aircraft during normal activities. It is expressed as the number of aircraft entering a specified portion of airspace in a given period of time, taking due account of weather, ATC unit configuration, staff and equipment available, and any other factors that may affect the workload of the controller responsible for the airspace.

DETRESFA. The code word used to designate a distress phase.

Distress phase. A situation wherein there is reasonable certainty that an aircraft and its occupants are threatened by grave and imminent danger or require immediate assistance.

* All ISO Standards are listed at the end of this chapter.

Downstream clearance. A clearance issued to an aircraft by an air traffic control unit that is not the current controlling authority of that aircraft.

Emergency phase. A generic term meaning, as the case may be, uncertainty phase, alert phase or distress phase.

Final approach. That part of an instrument approach procedure which commences at the specified final approach fix or point, or where such a fix or point is not specified,

a) at the end of the last procedure turn, base turn or inbound turn of a racetrack procedure, if specified; or

b) at the point of interception of the last track specified in the approach procedure; and

ends at a point in the vicinity of an aerodrome from which:

1) a landing can be made; or

2) a missed approach procedure is initiated.

Flight crew member. A licensed crew member charged with duties essential to the operation of an aircraft during a flight duty period.

Flight information centre. A unit established to provide flight information service and alerting service.

Flight information region. An airspace of defined dimensions within which flight information service and alerting service are provided.

Flight information service. A service provided for the purpose of giving advice and information useful for the safe and efficient conduct of flights.

Flight level. A surface of constant atmospheric pressure which is related to a specific pressure datum, 1 013.2 hectopascals (hPa), and is separated from other such surfaces by specific pressure intervals.

Note 1.— A pressure type altimeter calibrated in accordance with the Standard Atmosphere:

a) when set to a QNH altimeter setting, will indicate altitude;

b) when set to a QFE altimeter setting, will indicate height above the QFE reference datum;

c) when set to a pressure of 1 013.2 hPa, may be used to indicate flight levels.

Note 2.— The terms "height" and "altitude", used in Note 1 above, indicate altimetric rather than geometric heights and altitudes.

Flight plan. Specified information provided to air traffic services units, relative to an intended flight or portion of a flight of an aircraft.

Note.— Specifications for flight plans are contained in Annex 2. When the expression "flight plan form" is used it denotes the model flight plan form at Appendix 2 to the PANS-ATM.

Forecast. A statement of expected meteorological conditions for a specified time or period, and for a specified area or portion of airspace.

Geodetic datum. A minimum set of parameters required to define location and orientation of the local reference system with respect to the global reference system/frame.

Gregorian calendar. Calendar in general use; first introduced in 1582 to define a year that more closely approximates the tropical year than the Julian calendar (ISO 19108*).

Note.— In the Gregorian calendar, common years have 365 days and leap years 366 days divided into twelve sequential months.

Height. The vertical distance of a level, a point or an object considered as a point, measured from a specified datum.

Human Factors principles. Principles which apply to aeronautical design, certification, training, operations and maintenance and which seek safe interface between the human and other system components by proper consideration to human performance.

Human performance. Human capabilities and limitations which have an impact on the safety and efficiency of aeronautical operations.

IFR. The symbol used to designate the instrument flight rules.

IFR flight. A flight conducted in accordance with the instrument flight rules.

IMC. The symbol used to designate instrument meteorological conditions.

INCERFA. The code word used to designate an uncertainty phase.

Incident. An occurrence, other than an accident, associated with the operation of an aircraft which affects or could affect the safety of operation.

Note.— The types of incidents which are of main interest to the International Civil Aviation Organization for accident prevention studies are listed in the Accident/Incident Reporting Manual (ADREP Manual) *(Doc 9156).*

Instrument meteorological conditions (IMC). Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling, less than the minima specified for visual meteorological conditions.

Note.— The specified minima for visual meteorological conditions are contained in Annex 2.

Integrity (aeronautical data). A degree of assurance that an aeronautical data and its value has not been lost nor altered since the data origination or authorized amendment.

International NOTAM office. An office designated by a State for the exchange of NOTAM internationally.

Level. A generic term relating to the vertical position of an aircraft in flight and meaning variously, height, altitude or flight level.

Manoeuvring area. That part of an aerodrome to be used for the take-off, landing and taxiing of aircraft, excluding aprons.

Meteorological office. An office designated to provide meteorological service for international air navigation.

Movement area. That part of an aerodrome to be used for the take-off, landing and taxiing of aircraft, consisting of the manoeuvring area and the apron(s).

NOTAM. A notice distributed by means of telecommunication containing information concerning the establishment, condition or change in any aeronautical facility, service, procedure or hazard, the timely knowledge of which is essential to personnel concerned with flight operations.

Obstacle. All fixed (whether temporary or permanent) and mobile objects, or parts thereof, that are located on an area intended for the surface movement of aircraft or that extend above a defined surface intended to protect aircraft in flight.

Operator. A person, organization or enterprise engaged in or offering to engage in an aircraft operation.

Pilot-in-command. The pilot designated by the operator, or in the case of general aviation, the owner, as being in command and charged with the safe conduct of a flight.

Printed communications. Communications which automatically provide a permanent printed record at each terminal of a circuit of all messages which pass over such circuit.

Radiotelephony. A form of radiocommunication primarily intended for the exchange of information in the form of speech.

RCP type. A label (e.g. RCP 240) that represents the values assigned to RCP parameters for communication transaction time, continuity, availability and integrity.

Reporting point. A specified geographical location in relation to which the position of an aircraft can be reported.

Required communication performance (RCP). A statement of the performance requirements for operational communication in support of specific ATM functions.

Required navigation performance (RNP). A statement of the navigation performance necessary for operation within a defined airspace.

Note.— Navigation performance and requirements are defined for a particular RNP type and/or application.

Rescue coordination centre. A unit responsible for promoting efficient organization of search and rescue services and for coordinating the conduct of search and rescue operations within a search and rescue region.

RNP type. A containment value expressed as a distance in nautical miles from the intended position within which flights would be for at least 95 per cent of the total flying time.

Example.— RNP 4 represents a navigation accuracy of plus or minus 7.4 km (4 NM) on a 95 per cent containment basis.

Runway. A defined rectangular area on a land aerodrome prepared for the landing and take-off of aircraft.

Runway visual range (RVR). The range over which the pilot of an aircraft on the centre line of a runway can see the runway surface markings or the lights delineating the runway or identifying its centre line.

Safety programme. An integrated set of regulations and activities aimed at improving safety.

Safety management system. A systematic approach to managing safety, including the necessary organizational structures, accountabilities, policies and procedures.

SIGMET information. Information issued by a meteorological watch office concerning the occurrence or expected occurrence of specified en-route weather phenomena which may affect the safety of aircraft operations.

Significant point. A specified geographical location used in defining an ATS route or the flight path of an aircraft and for other navigation and ATS purposes.

Special VFR flight. A VFR flight cleared by air traffic control to operate within a control zone in meteorological conditions below VMC.

Station declination. An alignment variation between the zero degree radial of a VOR and true north, determined at the time the VOR station is calibrated.

Taxiing. Movement of an aircraft on the surface of an aerodrome under its own power, excluding take-off and landing.

Terminal control area. A control area normally established at the confluence of ATS routes in the vicinity of one or more major aerodromes.

Track. The projection on the earth's surface of the path of an aircraft, the direction of which path at any point is usually expressed in degrees from North (true, magnetic or grid).

Traffic avoidance advice. Advice provided by an air traffic services unit specifying manoeuvres to assist a pilot to avoid a collision.

Traffic information. Information issued by an air traffic services unit to alert a pilot to other known or observed air traffic which may be in proximity to the position or intended route of flight and to help the pilot avoid a collision.

Transfer of control point. A defined point located along the flight path of an aircraft, at which the responsibility for providing air traffic control service to the aircraft is transferred from one control unit or control position to the next.

Transferring unit. Air traffic control unit in the process of transferring the responsibility for providing air traffic control service to an aircraft to the next air traffic control unit along the route of flight.

Uncertainty phase. A situation wherein uncertainty exists as to the safety of an aircraft and its occupants.

VFR. The symbol used to designate the visual flight rules.

VFR flight. A flight conducted in accordance with the visual flight rules.

Visual meteorological conditions (VMC). Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling, equal to or better than specified minima.

Note.— The specified minima are contained in Annex 2.

VMC. The symbol used to designate visual meteorological conditions.

Waypoint. A specified geographical location used to define an area navigation route or the flight path of an aircraft employing area navigation. Waypoints are identified as either:

Fly-by waypoint. A waypoint which requires turn anticipation to allow tangential interception of the next segment of a route or procedure, or

Flyover waypoint. A waypoint at which a turn is initiated in order to join the next segment of a route or procedure.

CHAPTER 2. GENERAL

2.1 Establishment of authority

2.1.1 Contracting States shall determine, in accordance with the provisions of this Annex and for the territories over which they have jurisdiction, those portions of the airspace and those aerodromes where air traffic services will be provided. They shall thereafter arrange for such services to be established and provided in accordance with the provisions of this Annex, except that, by mutual agreement, a State may delegate to another State the responsibility for establishing and providing air traffic services in flight information regions, control areas or control zones extending over the territories of the former.

Note.— If one State delegates to another State the responsibility for the provision of air traffic services over its territory, it does so without derogation of its national sovereignty. Similarly, the providing State's responsibility is limited to technical and operational considerations and does not extend beyond those pertaining to the safety and expedition of aircraft using the concerned airspace. Furthermore, the providing State in providing air traffic services within the territory of the delegating State will do so in accordance with the requirements of the latter which is expected to establish such facilities and services for the use of the providing State as are jointly agreed to be necessary. It is further expected that the delegating State would not withdraw or modify such facilities and services without prior consultation with the providing State. Both the delegating and providing States may terminate the agreement between them at any time.

2.1.2 Those portions of the airspace over the high seas or in airspace of undetermined sovereignty where air traffic services will be provided shall be determined on the basis of regional air navigation agreements. A Contracting State having accepted the responsibility to provide air traffic services in such portions of airspace shall thereafter arrange for the services to be established and provided in accordance with the provisions of this Annex.

Note 1.— The phrase "regional air navigation agreements" refers to the agreements approved by the Council of ICAO normally on the advice of Regional Air Navigation Meetings.

Note 2.— The Council, when approving the Foreword to this Annex, indicated that a Contracting State accepting the responsibility for providing air traffic services over the high seas or in airspace of undetermined sovereignty may apply the Standards and Recommended Practices in a manner consistent with that adopted for airspace under its jurisdiction.

2.1.3 When it has been determined that air traffic services will be provided, the States concerned shall designate the authority responsible for providing such services.

Note 1.— The authority responsible for establishing and providing the services may be a State or a suitable Agency.

Note 2.— Situations which arise in respect of the establishment and provision of air traffic services to either part or whole of an international flight are as follows:

Situation 1: *A route, or portion of a route, contained within airspace under the sovereignty of a State establishing and providing its own air traffic services.*

Situation 2: *A route, or portion of a route, contained within airspace under the sovereignty of a State which has, by mutual agreement, delegated to another State, responsibility for the establishment and provision of air traffic services.*

Situation 3: *A portion of a route contained within airspace over the high seas or in airspace of undetermined sovereignty for which a State has accepted the responsibility for the establishment and provision of air traffic services.*

For the purpose of this Annex, the State which designates the authority responsible for establishing and providing the air traffic services is:

in Situation 1: *the State having sovereignty over the relevant portion of the airspace;*

in Situation 2: *the State to whom responsibility for the establishment and provision of air traffic services has been delegated;*

in Situation 3: *the State which has accepted the responsibility for the establishment and provision of air traffic services.*

2.1.4 Where air traffic services are established, information shall be published as necessary to permit the utilization of such services.

2.2 Objectives of the air traffic services

The objectives of the air traffic services shall be to:

a) prevent collisions between aircraft;

b) prevent collisions between aircraft on the manoeuvring area and obstructions on that area;

c) expedite and maintain an orderly flow of air traffic;

d) provide advice and information useful for the safe and efficient conduct of flights;

e) notify appropriate organizations regarding aircraft in need of search and rescue aid, and assist such organizations as required.

2.3 Divisions of the air traffic services

The air traffic services shall comprise three services identified as follows.

2.3.1 The *air traffic control service*, to accomplish objectives a), b) and c) of 2.2, this service being divided in three parts as follows:

a) *Area control service:* the provision of air traffic control service for controlled flights, except for those parts of such flights described in 2.3.1 b) and c), in order to accomplish objectives a) and c) of 2.2;

b) *Approach control service:* the provision of air traffic control service for those parts of controlled flights associated with arrival or departure, in order to accomplish objectives a) and c) of 2.2;

c) *Aerodrome control service:* the provision of air traffic control service for aerodrome traffic, except for those parts of flights described in 2.3.1 b), in order to accomplish objectives a), b) and c) of 2.2.

2.3.2 The *flight information service*, to accomplish objective d) of 2.2.

2.3.3 The *alerting service*, to accomplish objective e) of 2.2.

2.4 Determination of the need for air traffic services

2.4.1 The need for the provision of air traffic services shall be determined by consideration of the following:

a) the types of air traffic involved;

b) the density of air traffic;

c) the meteorological conditions;

d) such other factors as may be relevant.

Note.— Due to the number of elements involved, it has not been possible to develop specific data to determine the need for air traffic services in a given area or at a given location. For example:

a) a mixture of different types of air traffic with aircraft of varying speeds (conventional jet, etc.) might necessitate the provision of air traffic services, whereas a relatively greater density of traffic where only one type of operation is involved would not;

b) meteorological conditions might have considerable effect in areas where there is a constant flow of air traffic (e.g. scheduled traffic), whereas similar or worse meteorological conditions might be relatively unimportant in an area where air traffic would be discontinued in such conditions (e.g. local VFR flights);

c) open stretches of water, mountainous, uninhabited or desert areas might necessitate the provision of air traffic services even though the frequency of operations is extremely low.

2.4.2 The carriage of airborne collision avoidance systems (ACAS) by aircraft in a given area shall not be a factor in determining the need for air traffic services in that area.

2.5 Designation of the portions of the airspace and controlled aerodromes where air traffic services will be provided

2.5.1 When it has been determined that air traffic services will be provided in particular portions of the airspace or at particular aerodromes, then those portions of the airspace or those aerodromes shall be designated in relation to the air traffic services that are to be provided.

2.5.2 The designation of the particular portions of the airspace or the particular aerodromes shall be as follows:

2.5.2.1 *Flight information regions.* Those portions of the airspace where it is determined that flight information service and alerting service will be provided shall be designated as flight information regions.

2.5.2.2 *Control areas and control zones*

2.5.2.2.1 Those portions of the airspace where it is determined that air traffic control service will be provided to IFR flights shall be designated as control areas or control zones.

Note.— The distinction between control areas and control zones is made in 2.10.

2.5.2.2.1.1 Those portions of controlled airspace wherein it is determined that air traffic control service will also be provided to VFR flights shall be designated as Classes B, C, or D airspace.

2.5.2.2.2 Where designated within a flight information region, control areas and control zones shall form part of that flight information region.

2.5.2.3 *Controlled aerodromes.* Those aerodromes where it is determined that air traffic control service will be provided to aerodrome traffic shall be designated as controlled aerodromes.

2.6 Classification of airspaces

2.6.1 ATS airspaces shall be classified and designated in accordance with the following:

Class A. IFR flights only are permitted, all flights are provided with air traffic control service and are separated from each other.

Class B. IFR and VFR flights are permitted, all flights are provided with air traffic control service and are separated from each other.

Class C. IFR and VFR flights are permitted, all flights are provided with air traffic control service and IFR flights are separated from other IFR flights and from VFR flights. VFR flights are separated from IFR flights and receive traffic information in respect of other VFR flights.

Class D. IFR and VFR flights are permitted and all flights are provided with air traffic control service, IFR flights are separated from other IFR flights and receive traffic information in respect of VFR flights, VFR flights receive traffic information in respect of all other flights.

Class E. IFR and VFR flights are permitted, IFR flights are provided with air traffic control service and are separated from other IFR flights. All flights receive traffic information as far as is practical. Class E shall not be used for control zones.

Class F. IFR and VFR flights are permitted, all participating IFR flights receive an air traffic advisory service and all flights receive flight information service if requested.

Note.— Where air traffic advisory service is implemented, this is considered normally as a temporary measure only until such time as it can be replaced by air traffic control. (See also PANS-ATM, Chapter 9.)

Class G. IFR and VFR flights are permitted and receive flight information service if requested.

2.6.2 States shall select those airspace classes appropriate to their needs.

2.6.3 The requirements for flights within each class of airspace shall be as shown in the table in Appendix 4.

Note.— Where the ATS airspaces adjoin vertically, i.e. one above the other, flights at a common level would comply with requirements of, and be given services applicable to, the less restrictive class of airspace. In applying these criteria, Class B airspace is therefore considered less restrictive than Class A airspace; Class C airspace less restrictive than Class B airspace, etc.

2.7 Required navigation performance (RNP) for en-route operations

2.7.1 RNP types shall be prescribed by States. When applicable, the RNP type(s) for designated areas, tracks or ATS routes shall be prescribed on the basis of regional air navigation agreements.

2.7.2 **Recommendation.—** *For the en-route phase of flight, RNP types RNP 1, RNP 4, RNP 10, RNP 12.6 and RNP 20 should be implemented as soon as practicable.*

2.7.3 The prescribed RNP type shall be appropriate to the level of communications, navigation and air traffic services provided in the airspace concerned.

Note.— Applicable RNP types and associated procedures are published in the Manual on Required Navigation Performance (RNP) *(Doc 9613).*

2.8 Required communication performance (RCP)

2.8.1 RCP types shall be prescribed by States. When applicable, the RCP type(s) shall be prescribed on the basis of regional air navigation agreements.

2.8.2 The prescribed RCP type shall be appropriate to the air traffic services provided in the airspace concerned.

Note.— Applicable RCP types and associated procedures will be published in the Manual on Required Communication Performance (RCP) *(Doc 9869) (in preparation).*

2.9 Establishment and designation of the units providing air traffic services

The air traffic services shall be provided by units established and designated as follows:

2.9.1 Flight information centres shall be established to provide flight information service and alerting service within flight information regions, unless the responsibility of providing such services within a flight information region is assigned to an air traffic control unit having adequate facilities for the discharge of such responsibility.

Note.— This does not preclude delegating to other units the function of providing certain elements of the flight information service.

2.9.2 Air traffic control units shall be established to provide air traffic control service, flight information service and alerting service within control areas, control zones and at controlled aerodromes.

Note.— The services to be provided by various air traffic control units are indicated in 3.2.

2.10 Specifications for flight information regions, control areas and control zones

2.10.1 **Recommendation.—** *The delineation of airspace, wherein air traffic services are to be provided, should be related to the nature of the route structure and the need for efficient service rather than to national boundaries.*

Note 1.— Agreements to permit the delineation of airspace lying across national boundaries are advisable when such action will facilitate the provision of air traffic services (see 2.1.1). Agreements which permit delineation of airspace boundaries by straight lines will, for example, be most convenient where data processing techniques are used by air traffic services units.

Note 2.— Where delineation of airspace is made by reference to national boundaries there is a need for suitably sited transfer points to be mutually agreed upon.

2.10.2 Flight information regions

2.10.2.1 Flight information regions shall be delineated to cover the whole of the air route structure to be served by such regions.

2.10.2.2 A flight information region shall include all airspace within its lateral limits, except as limited by an upper flight information region.

2.10.2.3 Where a flight information region is limited by an upper flight information region, the lower limit specified for the upper flight information region shall constitute the upper vertical limit of the flight information region and shall coincide with a VFR cruising level of the tables in Appendix 3 to Annex 2.

Note.— In cases where an upper flight information region is established the procedures applicable therein need not be identical with those applicable in the underlying flight information region.

2.10.3 Control areas

2.10.3.1 Control areas including, *inter alia*, airways and terminal control areas shall be delineated so as to encompass sufficient airspace to contain the flight paths of those IFR flights or portions thereof to which it is desired to provide the applicable parts of the air traffic control service, taking into account the capabilities of the navigation aids normally used in that area.

Note.— In a control area other than one formed by a system of airways, a system of routes may be established to facilitate the provision of air traffic control.

2.10.3.2 A lower limit of a control area shall be established at a height above the ground or water of not less than 200 m (700 ft).

Note.— This does not imply that the lower limit has to be established uniformly in a given control area (see Figure A-5 of the Air Traffic Services Planning Manual *(Doc 9426), Part I, Section 2, Chapter 3).*

2.10.3.2.1 **Recommendation.—** *The lower limit of a control area should, when practicable and desirable in order to allow freedom of action for VFR flights below the control area, be established at a greater height than the minimum specified in 2.10.3.2.*

2.10.3.2.2 **Recommendation.—** *When the lower limit of a control area is above 900 m (3 000 ft) MSL it should coincide with a VFR cruising level of the tables in Appendix 3 to Annex 2.*

Note.— This implies that the selected VFR cruising level be such that expected local atmospheric pressure variations do not result in a lowering of this limit to a height of less than 200 m (700 ft) above ground or water.

2.10.3.3 An upper limit of a control area shall be established when either:

a) air traffic control service will not be provided above such upper limit; or

b) the control area is situated below an upper control area, in which case the upper limit shall coincide with the lower limit of the upper control area.

When established, such upper limit shall coincide with a VFR cruising level of the tables in Appendix 3 to Annex 2.

2.10.4 Flight information regions or control areas in the upper airspace

Recommendation.— *Where it is desirable to limit the number of flight information regions or control areas through which high flying aircraft would otherwise have to operate, a* *flight information region or control area, as appropriate, should be delineated to include the upper airspace within the lateral limits of a number of lower flight information regions or control areas.*

2.10.5 Control zones

2.10.5.1 The lateral limits of control zones shall encompass at least those portions of the airspace, which are not within control areas, containing the paths of IFR flights arriving at and departing from aerodromes to be used under instrument meteorological conditions.

Note.— Aircraft holding in the vicinity of aerodromes are considered as arriving aircraft.

2.10.5.2 The lateral limits of a control zone shall extend to at least 9.3 km (5 NM) from the centre of the aerodrome or aerodromes concerned in the directions from which approaches may be made.

Note.— A control zone may include two or more aerodromes situated close together.

2.10.5.3 If a control zone is located within the lateral limits of a control area, it shall extend upwards from the surface of the earth to at least the lower limit of the control area.

Note.— An upper limit higher than the lower limit of the overlying control area may be established when desired.

2.10.5.4 **Recommendation.—** *If a control zone is located outside of the lateral limits of a control area, an upper limit should be established.*

2.10.5.5 **Recommendation.—** *If it is desired to establish the upper limit of a control zone at a level higher than the lower limit of the control area established above it, or if the control zone is located outside of the lateral limits of a control area, its upper limit should be established at a level which can easily be identified by pilots. When this limit is above 900 m (3 000 ft) MSL it should coincide with a VFR cruising level of the tables in Appendix 3 to Annex 2.*

Note.— This implies that, if used, the selected VFR cruising level be such that expected local atmospheric pressure variations do not result in a lowering of this limit to a height of less than 200 m (700 ft) above ground or water.

2.11 Identification of air traffic services units and airspaces

2.11.1 **Recommendation.—** *An area control centre or flight information centre should be identified by the name of a nearby town or city or geographic feature.*

2.11.2 **Recommendation.—** *An aerodrome control tower or approach control unit should be identified by the name of the aerodrome at which it is located.*

2.11.3 **Recommendation.—** *A control zone, control area or flight information region should be identified by the name of the unit having jurisdiction over such airspace.*

2.12 Establishment and identification of ATS routes

2.12.1 When ATS routes are established, a protected airspace along each ATS route and a safe spacing between adjacent ATS routes shall be provided.

2.12.2 **Recommendation**.— *When warranted by density, complexity or nature of the traffic, special routes should be established for use by low-level traffic, including helicopters operating to and from helidecks on the high seas. When determining the lateral spacing between such routes, account should be taken of the navigational means available and the navigation equipment carried on board helicopters*.

2.12.3 ATS routes shall be identified by designators.

2.12.4 Designators for ATS routes other than standard departure and arrival routes shall be selected in accordance with the principles set forth in Appendix 1.

2.12.5 Standard departure and arrival routes and associated procedures shall be identified in accordance with the principles set forth in Appendix 3.

Note 1.— Guidance material relating to the establishment of ATS routes is contained in the Air Traffic Services Planning Manual *(Doc 9426).*

Note 2.— Guidance material relating to the establishment of ATS routes defined by VOR is contained in Attachment A.

Note 3.— The spacing between parallel tracks or between parallel ATS route centre lines for which an RNP type is required will be dependent upon the relevant RNP type specified. Guidance material relating to the establishment of ATS routes for use by RNAV-equipped aircraft and to the spacing between routes based on RNP type is contained in Attachment B.

2.13 Establishment of change-over points

2.13.1 **Recommendation.—** *Change-over points should be established on ATS route segments defined by reference to* *very high frequency omnidirectional radio ranges where this will assist accurate navigation along the route segments. The establishment of change-over points should be limited to route segments of 110 km (60 NM) or more, except where the complexity of ATS routes, the density of navigation aids or other technical and operational reasons warrant the establishment of change-over points on shorter route segments.*

2.13.2 **Recommendation.—** *Unless otherwise established in relation to the performance of the navigation aids or frequency protection criteria, the change-over point on a route segment should be the mid-point between the facilities in the case of a straight route segment or the intersection of radials in the case of a route segment which changes direction between the facilities.*

Note.— Guidance on the establishment of change-over points is contained in Attachment A.

2.14 Establishment and identification of significant points

2.14.1 Significant points shall be established for the purpose of defining an ATS route and/or in relation to the requirements of air traffic services for information regarding the progress of aircraft in flight.

2.14.2 Significant points shall be identified by designators.

2.14.3 Significant points shall be established and identified in accordance with the principles set forth in Appendix 2.

2.15 Establishment and identification of standard routes for taxiing aircraft

2.15.1 **Recommendation.—** *Where necessary, standard routes for taxiing aircraft should be established on an aerodrome between runways, aprons and maintenance areas. Such routes should be direct, simple and where practicable, designed to avoid traffic conflicts.*

2.15.2 **Recommendation.—** *Standard routes for taxiing aircraft should be identified by designators distinctively different from those of the runways and ATS routes.*

2.16 Coordination between the operator and air traffic services

2.16.1 Air traffic services units, in carrying out their objectives, shall have due regard for the requirements of the operators consequent on their obligations as specified in Annex 6, and, if so required by the operators, shall make available to them or their designated representatives such information as may be available to enable them or their designated representatives to carry out their responsibilities.

2.16.2 When so requested by an operator, messages (including position reports) received by air traffic services units and relating to the operation of the aircraft for which operational control service is provided by that operator shall, so far as practicable, be made available immediately to the operator or a designated representative in accordance with locally agreed procedures.

Note.— For aircraft subjected to unlawful interference, see 2.23.3.

2.17 Coordination between military authorities and air traffic services

2.17.1 Air traffic services authorities shall establish and maintain close cooperation with military authorities responsible for activities that may affect flights of civil aircraft.

2.17.2 Coordination of activities potentially hazardous to civil aircraft shall be effected in accordance with 2.18.

2.17.3 Arrangements shall be made to permit information relevant to the safe and expeditious conduct of flights of civil aircraft to be promptly exchanged between air traffic services units and appropriate military units.

2.17.3.1 Air traffic services units shall, either routinely or on request, in accordance with locally agreed procedures, provide appropriate military units with pertinent flight plan and other data concerning flights of civil aircraft. In order to eliminate or reduce the need for interceptions, air traffic services authorities shall designate any areas or routes where the requirements of Annex 2 concerning flight plans, two-way communications and position reporting apply to all flights to ensure that all pertinent data is available in appropriate air traffic services units specifically for the purpose of facilitating identification of civil aircraft.

Note.— For aircraft subjected to unlawful interference, see 2.23.3 and 2.24.1.3.

2.17.3.2 Special procedures shall be established in order to ensure that:

a) air traffic services units are notified if a military unit observes that an aircraft which is, or might be, a civil aircraft is approaching, or has entered, any area in which interception might become necessary;

b) all possible efforts are made to confirm the identity of the aircraft and to provide it with the navigational guidance necessary to avoid the need for interception.

2.18 Coordination of activities potentially hazardous to civil aircraft

2.18.1 The arrangements for activities potentially hazardous to civil aircraft, whether over the territory of a State or over the high seas, shall be coordinated with the appropriate air traffic services authorities. The coordination shall be effected early enough to permit timely promulgation of information regarding the activities in accordance with the provisions of Annex 15.

2.18.1.1 **Recommendation.—** *If the appropriate ATS authority is not that of the State where the organization planning the activities is located, initial coordination should be effected through the ATS authority responsible for the airspace over the State where the organization is located.*

2.18.2 The objective of the coordination shall be to achieve the best arrangements which will avoid hazards to civil aircraft and minimize interference with the normal operations of such aircraft.

2.18.2.1 **Recommendation.—** *In determining these arrangements the following should be applied:*

a) the locations or areas, times and durations for the activities should be selected to avoid closure or realignment of established ATS routes, blocking of the most economic flight levels, or delays of scheduled aircraft operations, unless no other options exist;

b) the size of the airspace designated for the conduct of the activities should be kept as small as possible;

c) direct communication between the appropriate ATS authority or air traffic services unit and the organization or unit conducting the activities should be provided for use in the event that civil aircraft emergencies or other unforeseen circumstances require discontinuation of the activities.

2.18.3 The appropriate ATS authorities shall be responsible for initiating the promulgation of information regarding the activities.

2.18.4 **Recommendation.—** *If activities potentially hazardous to civil aircraft take place on a regular or continuing basis, special committees should be established as required to ensure that the requirements of all parties concerned are adequately coordinated.*

2.18.5 Adequate steps shall be taken to prevent emission of laser beams from adversely affecting flight operations.

Note 1.— Guidance material regarding the hazardous effects of laser emitters on flight operations is contained in the Manual on Laser Emitters and Flight Safety (*Doc 9815*).

Note 2.— See also Annex 14 — Aerodromes, *Volume I —* Aerodrome Design and Operations, *Chapter 5.*

2.18.6 **Recommendation.—** *In order to provide added airspace capacity and to improve efficiency and flexibility of aircraft operations, States should establish procedures providing for a flexible use of airspace reserved for military or other special activities. The procedures should permit all airspace users to have safe access to such reserved airspace.*

2.19 Aeronautical data

2.19.1 Determination and reporting of air traffic services-related aeronautical data shall be in accordance with the accuracy and integrity requirements set forth in Tables 1 to 5 contained in Appendix 5 while taking into account the established quality system procedures. Accuracy requirements for aeronautical data are based upon a 95 per cent confidence level, and in that respect three types of positional data shall be identified: surveyed points (e.g. navigation aids positions), calculated points (mathematical calculations from the known surveyed points of points in space/fixes) and declared points (e.g. flight information region boundary points).

Note.— Specifications governing the quality system are given in Annex 15, Chapter 3.

2.19.2 Contracting States shall ensure that integrity of aeronautical data is maintained throughout the data process from survey/origin to the next intended user. Aeronautical data integrity requirements shall be based upon the potential risk resulting from the corruption of data and upon the use to which the data item is put. Consequently, the following classifications and data integrity levels shall apply:

a) critical data, integrity level 1×10^{-8}: there is a high probability when using corrupted critical data that the continued safe flight and landing of an aircraft would be severely at risk with the potential for catastrophe;

b) essential data, integrity level 1×10^{-5}: there is a low probability when using corrupted essential data that the continued safe flight and landing of an aircraft would be severely at risk with the potential for catastrophe; and

c) routine data, integrity level 1×10^{-3}: there is a very low probability when using corrupted routine data that the continued safe flight and landing of an aircraft would be severely at risk with the potential for catastrophe.

2.19.3 Protection of electronic aeronautical data while stored or in transit shall be totally monitored by the cyclic redundancy check (CRC). To achieve protection of the integrity level of critical and essential aeronautical data as classified in 2.19.2, a 32- or 24-bit CRC algorithm shall apply respectively.

2.19.4 **Recommendation.—** *To achieve protection of the integrity level of routine aeronautical data as classified in 2.19.2, a 16-bit CRC algorithm should apply.*

Note.— Guidance material on the aeronautical data quality requirements (accuracy, resolution, integrity, protection and traceability) is contained in the World Geodetic System — 1984 (WGS-84) Manual *(Doc 9674). Supporting material in respect of the provisions of Appendix 5 related to accuracy and integrity of aeronautical data is contained in RTCA Document DO-201A and European Organization for Civil Aviation Equipment (EUROCAE) Document ED-77 —* Industry Requirements for Aeronautical Information.

2.19.5 Geographical coordinates indicating latitude and longitude shall be determined and reported to the aeronautical information services authority in terms of the World Geodetic System — 1984 (WGS-84) geodetic reference datum, identifying those geographical coordinates which have been transformed into WGS-84 coordinates by mathematical means and whose accuracy of original field work does not meet the requirements in Appendix 5, Table 1.

2.19.6 The order of accuracy of the field work and determinations and calculations derived therefrom shall be such that the resulting operational navigation data for the phases of flight will be within the maximum deviations, with respect to an appropriate reference frame, as indicated in the tables contained in Appendix 5.

Note 1.— An appropriate reference frame is that which enables WGS-84 to be realized on a given position and with respect to which all coordinate data are related.

Note 2.— Specifications governing the publication of aeronautical data are given in Annex 4, Chapter 2 and Annex 15, Chapter 3.

Note 3.— For those fixes and points that are serving a dual purpose, e.g. holding point and missed approach point, the higher accuracy applies.

2.20 Coordination between meteorological and air traffic services authorities

2.20.1 To ensure that aircraft receive the most up-to-date meteorological information for aircraft operations, arrangements shall be made, where necessary, between meteorological and air traffic services authorities for air traffic services personnel:

a) in addition to using indicating instruments, to report, if observed by air traffic services personnel or communicated by aircraft, such other meteorological elements as may be agreed upon;

b) to report as soon as possible to the associated meteorological office meteorological phenomena of operational significance, if observed by air traffic services personnel or communicated by aircraft, which have not been included in the aerodrome meteorological report;

c) to report as soon as possible to the associated meteorological office pertinent information concerning pre-eruption volcanic activity, volcanic eruptions and information concerning volcanic ash cloud. In addition, area control centres and flight information centres shall report the information to the associated meteorological watch office and volcanic ash advisory centres (VAACs).

Note 1.— VAACs are designated by regional air navigation agreements in accordance with Annex 3, Chapter 3, 3.5.1.

Note 2.— See 4.2.3 regarding transmission of special air-reports.

2.20.2 Close coordination shall be maintained between area control centres, flight information centres and associated meteorological watch offices to ensure that information on volcanic ash included in NOTAM and SIGMET messages is consistent.

2.21 Coordination between aeronautical information services and air traffic services authorities

2.21.1 To ensure that aeronautical information services units obtain information to enable them to provide up-to-date pre-flight information and to meet the need for in-flight information, arrangements shall be made between aeronautical information services and air traffic services authorities responsible for air traffic services to report to the responsible aeronautical information services unit, with a minimum of delay:

a) information on aerodrome conditions;

b) the operational status of associated facilities, services and navigation aids within their area of responsibility;

c) the occurrence of volcanic activity observed by air traffic services personnel or reported by aircraft; and

d) any other information considered to be of operational significance.

2.21.2 Before introducing changes to the air navigation system, due account shall be taken by the services responsible for such changes of the time needed by the aeronautical information service for the preparation, production and issuance of relevant material for promulgation. To ensure timely provision of the information to the aeronautical information service, close coordination between those services concerned is therefore required.

2.21.3 Of particular importance are changes to aeronautical information that affect charts and/or computer-based navigation systems which qualify to be notified by the Aeronautical Information Regulation and Control (AIRAC) system, as specified in Annex 15, Chapter 6 and Appendix 4. The predetermined, internationally agreed AIRAC effective dates in addition to 14 days postage time shall be observed by the responsible air traffic services when submitting the raw information/data to aeronautical information services.

2.21.4 The air traffic services responsible for the provision of raw aeronautical information/data to the aeronautical information services shall do so while taking into account accuracy and integrity requirements for aeronautical data as specified in Appendix 5 to this Annex.

Note 1.— Specifications for the issue of a NOTAM, SNOWTAM and ASHTAM are contained in Annex 15, Chapter 5.

Note 2.— Reports of volcanic activity comprise the information detailed in Annex 3, Chapter 4.

Note 3.— AIRAC information is distributed by the aeronautical information service at least 42 days in advance of the AIRAC effective dates with the objective of reaching recipients at least 28 days in advance of the effective date.

Note 4.— The schedule of the predetermined, internationally agreed AIRAC common effective dates at intervals of 28 days, including 6 November 1997, and guidance for the AIRAC use are contained in the Aeronautical Information Services Manual *(Doc 8126, Chapter 2, 2.6).*

2.22 Minimum flight altitudes

Minimum flight altitudes shall be determined and promulgated by each Contracting State for each ATS route and control area over its territory. The minimum flight altitudes determined shall provide a minimum clearance above the controlling obstacle located within the areas concerned.

Note.— The requirements for publication by States of minimum flight altitudes and of the criteria used to determine them are contained in Annex 15, Appendix 1. Detailed obstacle clearance criteria are contained in PANS-OPS (Doc 8168), Volume II.

2.23 Service to aircraft in the event of an emergency

2.23.1 An aircraft known or believed to be in a state of emergency, including being subjected to unlawful interference, shall be given maximum consideration, assistance and priority over other aircraft as may be necessitated by the circumstances.

Note.— To indicate that it is in a state of emergency, an aircraft equipped with an appropriate data link capability and/or an SSR transponder might operate the equipment as follows:

a) on Mode A, Code 7700; or

b) on Mode A, Code 7500, to indicate specifically that it is being subjected to unlawful interference; and/or

c) activate the appropriate emergency and/or urgency capability of ADS-B or ADS-C; and/or

d) transmit the appropriate emergency message via CPDLC.

2.23.1.1 **Recommendation.—** *In communications between ATS units and aircraft in the event of an emergency, Human Factors principles should be observed.*

Note.— Guidance material on Human Factors principles can be found in the Human Factors Training Manual *(Doc 9683).*

2.23.2 When an occurrence of unlawful interference with an aircraft takes place or is suspected, ATS units shall attend promptly to requests by the aircraft. Information pertinent to the safe conduct of the flight shall continue to be transmitted and necessary action shall be taken to expedite the conduct of all phases of the flight, especially the safe landing of the aircraft.

2.23.3 When an occurrence of unlawful interference with an aircraft takes place or is suspected, ATS units shall, in accordance with locally agreed procedures, immediately inform the appropriate authority designated by the State and exchange necessary information with the operator or its designated representative.

Note 1.— A strayed or unidentified aircraft may be suspected as being the subject of unlawful interference. See 2.24.1.3.

Note 2.— Procedures relating to the handling of strayed or unidentified aircraft are contained in 2.24.1.

Note 3.— PANS-ATM *(Doc 4444), Chapter 15, 15.1.3 contains more specific procedures related to unlawful interference.*

2.24 In-flight contingencies

2.24.1 Strayed or unidentified aircraft

Note 1.— The terms "strayed aircraft" and "unidentified aircraft" in this paragraph have the following meanings:

Strayed aircraft. *An aircraft which has deviated significantly from its intended track or which reports that it is lost.*

Unidentified aircraft. *An aircraft which has been observed or reported to be operating in a given area but whose identity has not been established.*

Note 2.— An aircraft may be considered, at the same time, as a "strayed aircraft" by one unit and as an "unidentified aircraft" by another unit.

Note 3.— A strayed or unidentified aircraft may be suspected as being the subject of unlawful interference.

2.24.1.1 As soon as an air traffic services unit becomes aware of a strayed aircraft it shall take all necessary steps as outlined in 2.24.1.1.1 and 2.24.1.1.2 to assist the aircraft and to safeguard its flight.

Note.— Navigational assistance by an air traffic services unit is particularly important if the unit becomes aware of an aircraft straying, or about to stray, into an area where there is a risk of interception or other hazard to its safety.

2.24.1.1.1 If the aircraft's position is not known, the air traffic services unit shall:

a) attempt to establish two-way communication with the aircraft, unless such communication already exists;

b) use all available means to determine its position;

c) inform other ATS units into whose area the aircraft may have strayed or may stray, taking into account all the factors which may have affected the navigation of the aircraft in the circumstances;

d) inform, in accordance with locally agreed procedures, appropriate military units and provide them with pertinent flight plan and other data concerning strayed aircraft;

e) request from the units referred to in c) and d) and from other aircraft in flight every assistance in establishing communication with the aircraft and determining its position.

Note.— The requirements in d) and e) apply also to ATS units informed in accordance with c).

2.24.1.1.2 When the aircraft's position is established, the air traffic services unit shall:

a) advise the aircraft of its position and corrective action to be taken; and

b) provide, as necessary, other ATS units and appropriate military units with relevant information concerning the strayed aircraft and any advice given to that aircraft.

2.24.1.2 As soon as an air traffic services unit becomes aware of an unidentified aircraft in its area, it shall endeavour to establish the identity of the aircraft whenever this is necessary for the provision of air traffic services or required by the appropriate military authorities in accordance with locally agreed procedures. To this end, the air traffic services unit shall take such of the following steps as are appropriate in the circumstances:

a) attempt to establish two-way communication with the aircraft;

b) inquire of other air traffic services units within the flight information region about the flight and request their assistance in establishing two-way communication with the aircraft;

c) inquire of air traffic services units serving the adjacent flight information regions about the flight and request their assistance in establishing two-way communication with the aircraft;

d) attempt to obtain information from other aircraft in the area.

2.24.1.2.1 The air traffic services unit shall, as necessary, inform the appropriate military unit as soon as the identity of the aircraft has been established.

2.24.1.3 Should the ATS unit consider that a strayed or unidentified aircraft may be the subject of unlawful interference, the appropriate authority designated by the State shall immediately be informed, in accordance with locally agreed procedures.

2.24.2 Interception of civil aircraft

2.24.2.1 As soon as an air traffic services unit learns that an aircraft is being intercepted in its area of responsibility, it shall take such of the following steps as are appropriate in the circumstances:

a) attempt to establish two-way communication with the intercepted aircraft via any means available, including the emergency radio frequency 121.5 MHz, unless such communication already exists;

b) inform the pilot of the intercepted aircraft of the interception;

c) establish contact with the intercept control unit maintaining two-way communication with the intercepting aircraft and provide it with available information concerning the aircraft;

d) relay messages between the intercepting aircraft or the intercept control unit and the intercepted aircraft, as necessary;

e) in close coordination with the intercept control unit take all necessary steps to ensure the safety of the intercepted aircraft;

f) inform ATS units serving adjacent flight information regions if it appears that the aircraft has strayed from such adjacent flight information regions.

2.24.2.2 As soon as an air traffic services unit learns that an aircraft is being intercepted outside its area of responsibility, it shall take such of the following steps as are appropriate in the circumstances:

a) inform the ATS unit serving the airspace in which the interception is taking place, providing this unit with available information that will assist in identifying the aircraft and requesting it to take action in accordance with 2.24.2.1;

b) relay messages between the intercepted aircraft and the appropriate ATS unit, the intercept control unit or the intercepting aircraft.

2.25 Time in air traffic services

2.25.1 Air traffic services units shall use Coordinated Universal Time (UTC) and shall express the time in hours and minutes and, when required, seconds of the 24-hour day beginning at midnight.

2.25.2 Air traffic services units shall be equipped with clocks indicating the time in hours, minutes and seconds, clearly visible from each operating position in the unit concerned.

2.25.3 Air traffic services unit clocks and other time-recording devices shall be checked as necessary to ensure correct time to within plus or minus 30 seconds of UTC. Wherever data link communications are utilized by an air traffic services unit, clocks and other time-recording devices shall be checked as necessary to ensure correct time to within 1 second of UTC.

2.25.4 The correct time shall be obtained from a standard time station or, if not possible, from another unit which has obtained the correct time from such station.

2.25.5 Aerodrome control towers shall, prior to an aircraft taxiing for take-off, provide the pilot with the correct time, unless arrangements have been made for the pilot to obtain it from other sources. Air traffic services units shall, in addition, provide aircraft with the correct time on request. Time checks shall be given to the nearest half minute.

2.26 Establishment of requirements for carriage and operation of pressure-altitude reporting transponders

States shall establish requirements for carriage and operation of pressure-altitude reporting transponders within defined portions of airspace.

Note.— This provision is intended to improve the effectiveness of air traffic services as well as airborne collision avoidance systems.

2.27 Safety management

2.27.1 States shall establish a safety programme, in order to achieve an acceptable level of safety in the provision of ATS.

2.27.2 The acceptable level of safety to be achieved shall be established by the State(s) concerned.

Note.— Guidance on safety programmes and on defining acceptable levels of safety is contained in Attachment E and the Safety Management Manual (SMM) *(Doc 9859).*

2.27.3 States shall require, as part of their safety programme, that an air traffic services provider implements a safety management system acceptable to the State that, as a minimum:

a) identifies safety hazards;

b) ensures that remedial action necessary to maintain an acceptable level of safety is implemented;

c) provides for continuous monitoring and regular assessment of the safety level achieved; and

d) aims to make continuous improvement to the overall level of safety.

2.27.4 A safety management system shall clearly define lines of safety accountability throughout the air traffic services provider, including a direct accountability for safety on the part of senior management.

Note.— Guidance on safety management systems is contained in the Safety Management Manual (SMM) *(Doc 9859), and associated procedures are contained in the* PANS-ATM *(Doc 4444).*

2.27.5 Any significant safety-related change to the ATS system, including the implementation of a reduced separation minimum or a new procedure, shall only be effected after a safety assessment has demonstrated that an acceptable level of safety will be met and users have been consulted. When appropriate, the responsible authority shall ensure that adequate provision is made for post-implementation monitoring to verify that the defined level of safety continues to be met.

Note.— When, due to the nature of the change, the acceptable level of safety cannot be expressed in quantitative terms, the safety assessment may rely on operational judgment.

2.28 Common reference systems

2.28.1 Horizontal reference system

World Geodetic System — 1984 (WGS-84) shall be used as the horizontal (geodetic) reference system for air navigation. Reported aeronautical geographical coordinates (indicating latitude and longitude) shall be expressed in terms of the WGS-84 geodetic reference datum.

Note.— Comprehensive guidance material concerning WGS-84 is contained in the World Geodetic System — 1984 (WGS-84) Manual *(Doc 9674).*

2.28.2 Vertical reference system

Mean sea level (MSL) datum, which gives the relationship of gravity-related height (elevation) to a surface known as the geoid, shall be used as the vertical reference system for air navigation.

Note.— The geoid globally most closely approximates MSL. It is defined as the equipotential surface in the gravity field of the Earth which coincides with the undisturbed MSL extended continuously through the continents.

2.28.3 Temporal reference system

2.28.3.1 The Gregorian calendar and Coordinated Universal Time (UTC) shall be used as the temporal reference system for air navigation.

2.28.3.2 When a different temporal reference system is used, this shall be indicated in GEN 2.1.2 of the Aeronautical Information Publication (AIP).

2.29 Language proficiency

2.29.1 An air traffic services provider shall ensure that air traffic controllers speak and understand the language(s) used for radiotelephony communications as specified in Annex 1.

2.29.2 Except when communications between air traffic control units are conducted in a mutually agreed language, the English language shall be used for such communications.

2.30 Contingency arrangements

Air traffic services authorities shall develop and promulgate contingency plans for implementation in the event of disruption, or potential disruption, of air traffic services and related supporting services in the airspace for which they are responsible for the provision of such services. Such contingency plans shall be developed with the assistance of ICAO as necessary, in close coordination with the air traffic services authorities responsible for the provision of services in adjacent portions of airspace and with airspace users concerned.

Note 1.— Guidance material relating to the development, promulgation and implementation of contingency plans is contained in Attachment D.

Note 2.— Contingency plans may constitute a temporary deviation from the approved regional air navigation plans; such deviations are approved, as necessary, by the President of the ICAO Council on behalf of the Council.

b) to pilots and operators through aeronautical information publications, where separation is based on the use by aircraft of specified navigation aids or specified navigation techniques.

3.5 Responsibility for control

3.5.1 Responsibility for control of individual flights

A controlled flight shall be under the control of only one air traffic control unit at any given time.

3.5.2 Responsibility for control within a given block of airspace

Responsibility for the control of all aircraft operating within a given block of airspace shall be vested in a single air traffic control unit. However, control of an aircraft or groups of aircraft may be delegated to other air traffic control units provided that coordination between all air traffic control units concerned is assured.

3.6 Transfer of responsibility for control

3.6.1 Place or time of transfer

The responsibility for the control of an aircraft shall be transferred from one air traffic control unit to another as follows:

3.6.1.1 *Between two units providing area control service.* The responsibility for the control of an aircraft shall be transferred from a unit providing area control service in a control area to the unit providing area control service in an adjacent control area at the time of crossing the common control area boundary as estimated by the area control centre having control of the aircraft or at such other point or time as has been agreed between the two units.

3.6.1.2 *Between a unit providing area control service and a unit providing approach control service.* The responsibility for the control of an aircraft shall be transferred from a unit providing area control service to a unit providing approach control service, and vice versa, at a point or time agreed between the two units.

3.6.1.3 *Between a unit providing approach control service and an aerodrome control tower*

3.6.1.3.1 *Arriving aircraft.* The responsibility for the control of an arriving aircraft shall be transferred from the unit providing approach control service to the aerodrome control tower, when the aircraft:

a) is in the vicinity of the aerodrome, and:

   1) it is considered that approach and landing will be completed in visual reference to the ground, or

   2) it has reached uninterrupted visual meteorological conditions, or

b) is at a prescribed point or level, as specified in letters of agreement or ATS unit instructions; or

c) has landed.

Note.— Even though there is an approach control unit, control of certain flights may be transferred directly from an area control centre to an aerodrome control tower and vice versa, by prior arrangement between the units concerned for the relevant part of approach control service to be provided by the area control centre or the aerodrome control tower, as applicable.

3.6.1.3.2 *Departing aircraft.* The responsibility for control of a departing aircraft shall be transferred from the aerodrome control tower to the unit providing approach control service:

a) *when visual meteorological conditions prevail in the vicinity of the aerodrome:*

   1) prior to the time the aircraft leaves the vicinity of the aerodrome, or

   2) prior to the aircraft entering instrument meteorological conditions, or

   3) at a prescribed point or level,

as specified in letters of agreement or ATS unit instructions;

b) *when instrument meteorological conditions prevail at the aerodrome:*

   1) immediately after the aircraft is airborne, or

   2) at a prescribed point or level,

as specified in letters of agreement or ATS unit instructions.

Note.— See Note following 3.6.1.3.1.

3.6.1.4 *Between control sectors/positions within the same air traffic control unit*

The responsibility for control of an aircraft shall be transferred from one control sector/position to another control sector/position within the same air traffic control unit at a point, level or time, as specified in ATS unit instructions.

3.6.2 Coordination of transfer

3.6.2.1 Responsibility for control of an aircraft shall not be transferred from one air traffic control unit to another without the consent of the accepting control unit, which shall be obtained in accordance with 3.6.2.2, 3.6.2.2.1, 3.6.2.2.2 and 3.6.2.3.

3.6.2.2 The transferring control unit shall communicate to the accepting control unit the appropriate parts of the current flight plan and any control information pertinent to the transfer requested.

3.6.2.2.1 Where transfer of control is to be effected using radar or ADS-B data, the control information pertinent to the transfer shall include information regarding the position and, if required, the track and speed of the aircraft, as observed by radar or ADS-B immediately prior to the transfer.

3.6.2.2.2 Where transfer of control is to be effected using ADS-C data, the control information pertinent to the transfer shall include the four-dimensional position and other information as necessary.

3.6.2.3 The accepting control unit shall:

a) indicate its ability to accept control of the aircraft on the terms specified by the transferring control unit, unless by prior agreement between the two units concerned, the absence of any such indication is understood to signify acceptance of the terms specified, or indicate any necessary changes thereto; and

b) specify any other information or clearance for a subsequent portion of the flight, which it requires the aircraft to have at the time of transfer.

3.6.2.4 The accepting control unit shall notify the transferring control unit when it has established two-way voice and/or data link communications with and assumed control of the aircraft concerned, unless otherwise specified by agreement between the two control units concerned.

3.6.2.5 Applicable coordination procedures, including transfer of control points, shall be specified in letters of agreement and ATS unit instructions as appropriate.

3.7 Air traffic control clearances

Air traffic control clearances shall be based solely on the requirements for providing air traffic control service.

3.7.1 Contents of clearances

3.7.1.1 An air traffic control clearance shall indicate:

a) aircraft identification as shown in the flight plan;

b) clearance limit;

c) route of flight;

d) level(s) of flight for the entire route or part thereof and changes of levels if required;

Note.— If the clearance for the levels covers only part of the route, it is important for the air traffic control unit to specify a point to which the part of the clearance regarding levels applies whenever necessary to ensure compliance with 3.6.5.2.2 a) of Annex 2.

e) any necessary instructions or information on other matters such as approach or departure manoeuvres, communications and the time of expiry of the clearance.

Note.— The time of expiry of the clearance indicates the time after which the clearance will be automatically cancelled if the flight has not been commenced.

3.7.1.2 **Recommendation.—** *Standard departure and arrival routes and associated procedures should be established when necessary to facilitate:*

a) the safe, orderly and expeditious flow of air traffic;

b) the description of the route and procedure in air traffic control clearances.

Note.— Material relating to the establishment of standard departure and arrival routes and associated procedures is contained in the Air Traffic Services Planning Manual *(Doc 9426). The design criteria are contained in PANS-OPS, Volume II (Doc 8168).*

3.7.2 Clearances for transonic flight

3.7.2.1 The air traffic control clearance relating to the transonic acceleration phase of a supersonic flight shall extend at least to the end of that phase.

3.7.2.2 **Recommendation.—** *The air traffic control clearance relating to the deceleration and descent of an aircraft from supersonic cruise to subsonic flight should provide for uninterrupted descent, at least during the transonic phase.*

3.7.3 Read-back of clearances and safety-related information

3.7.3.1 The flight crew shall read back to the air traffic controller safety-related parts of ATC clearances and instructions which are transmitted by voice. The following items shall always be read back:

a) ATC route clearances;

b) clearances and instructions to enter, land on, take off from, hold short of, cross and backtrack on any runway; and

c) runway-in-use, altimeter settings, SSR codes, level instructions, heading and speed instructions and, whether issued by the controller or contained in ATIS broadcasts, transition levels.

3.7.3.1.1 Other clearances or instructions, including conditional clearances, shall be read back or acknowledged in a manner to clearly indicate that they have been understood and will be complied with.

3.7.3.1.2 The controller shall listen to the read-back to ascertain that the clearance or instruction has been correctly acknowledged by the flight crew and shall take immediate action to correct any discrepancies revealed by the read-back.

3.7.3.2 Unless specified by the appropriate ATS authority, voice read-back of CPDLC messages shall not be required.

Note.— The procedures and provisions relating to the exchange and acknowledgement of CPDLC messages are contained in Annex 10, Volume II, and PANS-ATM, Chapter 14.

3.7.4 Coordination of clearances

An air traffic control clearance shall be coordinated between air traffic control units to cover the entire route of an aircraft or a specified portion thereof as follows.

3.7.4.1 An aircraft shall be cleared for the entire route to the aerodrome of first intended landing:

a) when it has been possible, prior to departure, to coordinate the clearance between all the units under whose control the aircraft will come; or

b) when there is reasonable assurance that prior coordination will be effected between those units under whose control the aircraft will subsequently come.

Note.— Where a clearance is issued covering the initial part of the flight solely as a means of expediting departing traffic, the succeeding en-route clearance will be as specified above even though the aerodrome of first intended landing is under the jurisdiction of an area control centre other than the one issuing the en-route clearance.

3.7.4.2 When coordination as in 3.7.4.1 has not been achieved or is not anticipated, the aircraft shall be cleared only to that point where coordination is reasonably assured; prior to reaching such point, or at such point, the aircraft shall receive further clearance, holding instructions being issued as appropriate.

3.7.4.2.1 When prescribed by the appropriate ATS authority, aircraft shall contact a downstream air traffic control unit, for the purpose of receiving a downstream clearance prior to the transfer of control point.

3.7.4.2.1.1 Aircraft shall maintain the necessary two-way communication with the current air traffic control unit whilst obtaining a downstream clearance.

3.7.4.2.1.2 A clearance issued as a downstream clearance shall be clearly identifiable as such to the pilot.

3.7.4.2.1.3 Unless coordinated, downstream clearances shall not affect the aircraft's original flight profile in any airspace, other than that of the air traffic control unit responsible for the delivery of the downstream clearance.

Note.— Requirements relating to the application of downstream clearance delivery service are specified in Annex 10, Volume II. Guidance material is contained in the Manual of Air Traffic Services Data Link Applications *(Doc 9694).*

3.7.4.2.1.4 **Recommendation.—** *Where practicable, and where data link communications are used to facilitate downstream clearance delivery, two-way voice communications between the pilot and the air traffic control unit providing the downstream clearance should be available.*

3.7.4.3 When an aircraft intends to depart from an aerodrome within a control area to enter another control area within a period of thirty minutes, or such other specific period of time as has been agreed between the area control centres concerned, coordination with the subsequent area control centre shall be effected prior to issuance of the departure clearance.

3.7.4.4 When an aircraft intends to leave a control area for flight outside controlled airspace, and will subsequently re-enter the same or another control area, a clearance from point of departure to the aerodrome of first intended landing may be issued. Such clearance or revisions thereto shall apply only to those portions of the flight conducted within controlled airspace.

3.7.5 Air traffic flow management

3.7.5.1 Air traffic flow management (ATFM) shall be implemented for airspace where air traffic demand at times exceeds, or is expected to exceed, the declared capacity of the air traffic control services concerned.

Note.— The capacity of the air traffic control services concerned will normally be declared by the appropriate ATS authority.

3.7.5.2 **Recommendation**.— *ATFM should be implemented on the basis of regional air navigation agreements or, if appropriate, through multilateral agreements. Such agreements should make provision for common procedures and common methods of capacity determination.*

3.7.5.3 When it becomes apparent to an ATC unit that traffic additional to that already accepted cannot be accommodated within a given period of time at a particular location or in a particular area, or can only be accommodated at a given rate, that unit shall so advise the ATFM unit, when such is established, as well as, when appropriate, ATS units concerned. Flight crews of aircraft destined to the location or area in question and operators concerned shall also be advised of the delays expected or the restrictions that will be applied.

Note.— Operators concerned will normally be advised, in advance where possible, of restrictions imposed by the air traffic flow management unit when such is established.

3.8 Control of persons and vehicles at aerodromes

3.8.1 The movement of persons or vehicles including towed aircraft on the manoeuvring area of an aerodrome shall be controlled by the aerodrome control tower as necessary to avoid hazard to them or to aircraft landing, taxiing or taking off.

3.8.2 In conditions where low visibility procedures are in operation:

a) persons and vehicles operating on the manoeuvring area of an aerodrome shall be restricted to the essential minimum, and particular regard shall be given to the requirements to protect the ILS/MLS sensitive area(s) when Category II or Category III precision instrument operations are in progress;

b) subject to the provisions in 3.8.3, the minimum separation between vehicles and taxiing aircraft shall be as prescribed by the appropriate ATS authority taking into account the aids available;

c) when mixed ILS and MLS Category II or Category III precision instrument operations are taking place to the same runway continuously, the more restrictive ILS or MLS critical and sensitive areas shall be protected.

Note.— The period of application of low visibility procedures is determined in accordance with ATS unit instructions. Guidance on low visibility operations on an aerodrome is contained in the Manual of Surface Movement Guidance and Control Systems (SMGCS) *(Doc 9476).*

3.8.3 Emergency vehicles proceeding to the assistance of an aircraft in distress shall be afforded priority over all other surface movement traffic.

3.8.4 Subject to the provisions in 3.8.3, vehicles on the manoeuvring area shall be required to comply with the following rules:

a) vehicles and vehicles towing aircraft shall give way to aircraft which are landing, taking off or taxiing;

b) vehicles shall give way to other vehicles towing aircraft;

c) vehicles shall give way to other vehicles in accordance with ATS unit instructions;

d) notwithstanding the provisions of a), b) and c), vehicles and vehicles towing aircraft shall comply with instructions issued by the aerodrome control tower.

3.9 Provision of radar and ADS-B

Recommendation.— *Radar and ADS-B ground systems should provide for the display of safety-related alerts and warnings, including conflict alert, conflict prediction, minimum safe altitude warning and unintentionally duplicated SSR codes.*

3.10 Use of surface movement radar (SMR)

Recommendation.— *In the absence of visual observation of all or part of the manoeuvring area or to supplement visual observation, surface movement radar (SMR) provided in accordance with the provisions of Annex 14, Volume I, or other suitable surveillance equipment, should be utilized to:*

a) monitor the movement of aircraft and vehicles on the manoeuvring area;

b) provide directional information to pilots and vehicle drivers as necessary; and

c) provide advice and assistance for the safe and efficient movement of aircraft and vehicles on the manoeuvring area.

Note.— See the Manual of Surface Movement Guidance and Control Systems (SMGCS) *(Doc 9476), the* Advanced-Surface Movement Guidance and Control Systems (A-SMGCS) Manual *(Doc 9830) and the* Air Traffic Services Planning Manual *(Doc 9426) for guidance on the use of SMR.*

CHAPTER 6. AIR TRAFFIC SERVICES REQUIREMENTS FOR COMMUNICATIONS

6.1 Aeronautical mobile service (air-ground communications)

6.1.1 General

6.1.1.1 Radiotelephony and/or data link shall be used in air-ground communications for air traffic services purposes.

Note.— Requirements for ATS units to be provided with and to maintain guard on the emergency channel 121.5 MHz are specified in Annex 10, Volumes II and V.

6.1.1.2 Where RCP types have been prescribed by States for ATM functions, ATS units shall, in addition to the requirements specified in 6.1.1.1, be provided with communication equipment which will enable them to provide ATS in accordance with the prescribed RCP type(s).

Note.— Information on RCP and associated procedures, and guidance concerning the approval process, will be contained in the Manual on Required Communication Performance (RCP) (*Doc 9869) (in preparation). This document also contains references to other documents produced by States and international bodies concerning communication systems and RCP.*

6.1.1.3 When direct pilot-controller two-way radiotelephony or data link communications are used for the provision of air traffic control service, recording facilities shall be provided on all such air-ground communication channels.

Note.— Requirements for retention of all automatic recordings of communications in ATC are specified in Annex 10, Volume II, 3.5.1.5.

6.1.1.4 Recordings of communications channels as required in paragraph 6.1.1.3 shall be retained for a period of at least thirty days.

6.1.2 For flight information service

6.1.2.1 Air-ground communication facilities shall enable two-way communications to take place between a unit providing flight information service and appropriately equipped aircraft flying anywhere within the flight information region.

6.1.2.2 **Recommendation.—** *Whenever practicable, air-ground communication facilities for flight information service should permit direct, rapid, continuous and static-free two-way communications.*

6.1.3 For area control service

6.1.3.1 Air-ground communication facilities shall enable two-way communications to take place between a unit providing area control service and appropriately equipped aircraft flying anywhere within the control area(s).

6.1.3.2 **Recommendation.—** *Whenever practicable, air-ground communication facilities for area control service should permit direct, rapid, continuous and static-free two-way communications.*

6.1.3.3 **Recommendation.—** *Where air-ground voice communication channels are used for area control service and are worked by air-ground communicators, suitable arrangements should be made to permit direct pilot-controller voice communications, as and when required.*

6.1.4 For approach control service

6.1.4.1 Air-ground communication facilities shall enable direct, rapid, continuous and static-free two-way communications to take place between the unit providing approach control service and appropriately equipped aircraft under its control.

6.1.4.2 Where the unit providing approach control service functions as a separate unit, air-ground communications shall be conducted over communication channels provided for its exclusive use.

6.1.5 For aerodrome control service

6.1.5.1 Air-ground communication facilities shall enable direct, rapid, continuous and static-free two-way communications to take place between an aerodrome control tower and appropriately equipped aircraft operating at any distance within 45 km (25 NM) of the aerodrome concerned.

6.1.5.2 **Recommendation.—** *Where conditions warrant, separate communication channels should be provided for the control of traffic operating on the manoeuvring area.*

6.2 Aeronautical fixed service (ground-ground communications)

6.2.1 General

6.2.1.1 Direct-speech and/or data link communications shall be used in ground-ground communications for air traffic services purposes.

Note 1.— Indication by time of the speed with which the communication should be established is provided as a guide to communication services, particularly to determine the types of communication channels required, e.g. that "instantaneous" is intended to refer to communications which effectively provide for immediate access between controllers; "fifteen seconds" to accept switchboard operation and "five minutes" to mean methods involving retransmission.

Note 2.— Requirements for retention of all automatic recordings of communications in ATC are specified in Annex 10, Volume II, 3.5.1.5.

6.2.1.2 Where RCP types have been prescribed by States for ATM functions, ATS units shall, in addition to the requirements specified in 6.2.1.1, be provided with communication equipment which will enable them to provide ATS in accordance with the prescribed RCP type(s).

Note.— Information on RCP and associated procedures, and guidance concerning the approval process, will be contained in the Manual on Required Communication Performance (RCP) *(Doc 9869) (in preparation). This document also contains references to other documents produced by States and international bodies concerning communication systems and RCP.*

6.2.2 Communications within a flight information region

6.2.2.1 *Communications between air traffic services units*

6.2.2.1.1 A flight information centre shall have facilities for communications with the following units providing a service within its area of responsibility:

a) the area control centre, unless collocated;

b) approach control units;

c) aerodrome control towers.

6.2.2.1.2 An area control centre, in addition to being connected to the flight information centre as prescribed in 6.2.2.1.1, shall have facilities for communications with the following units providing a service within its area of responsibility:

a) approach control units;

b) aerodrome control towers;

c) air traffic services reporting offices, when separately established.

6.2.2.1.3 An approach control unit, in addition to being connected to the flight information centre and the area control centre as prescribed in 6.2.2.1.1 and 6.2.2.1.2, shall have facilities for communications with the associated aerodrome control tower(s) and, when separately established, the associated air traffic services reporting office(s).

6.2.2.1.4 An aerodrome control tower, in addition to being connected to the flight information centre, the area control centre and the approach control unit as prescribed in 6.2.2.1.1, 6.2.2.1.2 and 6.2.2.1.3, shall have facilities for communications with the associated air traffic services reporting office, when separately established.

6.2.2.2 *Communications between air traffic services units and other units*

6.2.2.2.1 A flight information centre and an area control centre shall have facilities for communications with the following units providing a service within their respective area of responsibility:

a) appropriate military units;

b) the meteorological office serving the centre;

c) the aeronautical telecommunications station serving the centre;

d) appropriate operator's offices;

e) the rescue coordination centre or, in the absence of such centre, any other appropriate emergency service;

f) the international NOTAM office serving the centre.

6.2.2.2.2 An approach control unit and an aerodrome control tower shall have facilities for communications with the following units providing a service within their respective area of responsibility:

a) appropriate military units;

b) rescue and emergency services (including ambulance, fire, etc.);

c) the meteorological office serving the unit concerned;

d) the aeronautical telecommunications station serving the unit concerned;

e) the unit providing apron management service, when separately established.

6.2.2.2.3 The communication facilities required under 6.2.2.2.1 a) and 6.2.2.2.2 a) shall include provisions for rapid and reliable communications between the air traffic services unit concerned and the military unit(s) responsible for control of interception operations within the area of responsibility of the air traffic services unit.

6.2.2.3 *Description of communication facilities*

6.2.2.3.1 The communication facilities required under 6.2.2.1, 6.2.2.2.1 a) and 6.2.2.2.2 a), b) and c) shall include provisions for:

a) communications by direct speech alone, or in combination with data link communications, whereby for the purpose of transfer of control using radar or ADS-B, the communications can be established instantaneously and for other purposes the communications can normally be established within fifteen seconds; and

b) printed communications, when a written record is required; the message transit time for such communications being no longer than five minutes.

6.2.2.3.2 **Recommendation.—** *In all cases not covered by 6.2.2.3.1, the communication facilities should include provisions for:*

a) communications by direct speech alone, or in combination with data link communications, whereby the communications can normally be established within fifteen seconds; and

b) printed communications, when a written record is required; the message transit time for such communications being no longer than five minutes.

6.2.2.3.3 In all cases where automatic transfer of data to and/or from air traffic services computers is required, suitable facilities for automatic recording shall be provided.

6.2.2.3.4 **Recommendation.—** *The communication facilities required in accordance with 6.2.2.1 and 6.2.2.2 should be supplemented, as and where necessary, by facilities for other forms of visual or audio communications, for example, closed circuit television or separate information processing systems.*

6.2.2.3.5 The communication facilities required under 6.2.2.2.2 a), b) and c) shall include provisions for communications by direct speech arranged for conference communications.

6.2.2.3.6 **Recommendation.—** *The communication facilities required under 6.2.2.2.2 d) should include provisions for communications by direct speech arranged for conference communications, whereby the communications can normally be established within fifteen seconds.*

6.2.2.3.7 All facilities for direct-speech or data link communications between air traffic services units and between air traffic services units and other units described under 6.2.2.2.1 and 6.2.2.2.2 shall be provided with automatic recording.

6.2.2.3.8 Recordings of data and communications as required in 6.2.2.3.3 and 6.2.2.3.7 shall be retained for a period of at least thirty days.

6.2.3 Communications between flight information regions

6.2.3.1 Flight information centres and area control centres shall have facilities for communications with all adjacent flight information centres and area control centres.

6.2.3.1.1 These communication facilities shall in all cases include provisions for messages in a form suitable for retention as a permanent record, and delivery in accordance with transit times specified by regional air navigation agreements.

6.2.3.1.2 Unless otherwise prescribed on the basis of regional air navigation agreements, facilities for communications between area control centres serving contiguous control areas shall, in addition, include provisions for direct-speech and, where applicable, data link communications, with automatic recording, whereby for the purpose of transfer of control using radar, ADS-B or ADS-C data, the communications can be established instantaneously and for other purposes the communications can normally be established within fifteen seconds.

6.2.3.1.3 When so required by agreement between the States concerned in order to eliminate or reduce the need for interceptions in the event of deviations from assigned track, facilities for communications between adjacent flight information centres or area control centres other than those mentioned in 6.2.3.1.2 shall include provisions for direct speech alone, or in combination with data link communications. The communication facilities shall be provided with automatic recording.

6.2.3.1.4 **Recommendation.—** *The communication facilities in 6.2.3.1.3 should permit communications to be established normally within fifteen seconds.*

6.2.3.2 **Recommendation.—** *Adjacent ATS units should be connected in all cases where special circumstances exist.*

Note.— Special circumstances may be due to traffic density, types of aircraft operations and/or the manner in which the airspace is organized and may exist even if the control areas and/or control zones are not contiguous or have not (yet) been established.

6.2.3.3 **Recommendation.—** *Wherever local conditions are such that it is necessary to clear aircraft into an adjacent control area prior to departure, an approach control unit and/ or aerodrome control tower should be connected with the area control centre serving the adjacent area.*

6.2.3.4 **Recommendation.—** *The communication facilities in 6.2.3.2 and 6.2.3.3 should include provisions for communications by direct speech alone, or in combination with data link communications, with automatic recording, whereby for the purpose of transfer of control using radar, ADS-B or ADS-C data, the communications can be established instantaneously and for other purposes the communications can normally be established within fifteen seconds.*

6.2.3.5 In all cases where automatic exchange of data between air traffic services computers is required, suitable facilities for automatic recording shall be provided.

6.2.3.6 Recordings of data and communications as required in 6.2.3.5 shall be retained for a period of at least thirty days.

6.2.4 Procedures for direct-speech communications

Recommendation.— *Appropriate procedures for direct-speech communications should be developed to permit immediate connections to be made for very urgent calls concerning the safety of aircraft, and the interruption, if necessary, of less urgent calls in progress at the time.*

6.3 Surface movement control service

6.3.1 Communications for the control of vehicles other than aircraft on manoeuvring areas at controlled aerodromes

6.3.1.1 Two-way radiotelephony communication facilities shall be provided for aerodrome control service for the control of vehicles on the manoeuvring area, except where communication by a system of visual signals is deemed to be adequate.

6.3.1.2 Where conditions warrant, separate communication channels shall be provided for the control of vehicles on the manoeuvring area. Automatic recording facilities shall be provided on all such channels.

6.3.1.3 Recordings of communications as required in 6.3.1.2 shall be retained for a period of at least thirty days.

Note.— See also Annex 10, Volume II, 3.5.1.5.

6.4 Aeronautical radio navigation service

6.4.1 Automatic recording of surveillance data

6.4.1.1 Surveillance data from primary and secondary radar equipment or other systems (e.g. ADS-B, ADS-C), used as an aid to air traffic services, shall be automatically recorded for use in accident and incident investigations, search and rescue, air traffic control and surveillance systems evaluation and training.

6.4.1.2 Automatic recordings shall be retained for a period of at least thirty days. When the recordings are pertinent to accident and incident investigations, they shall be retained for longer periods until it is evident that they will no longer be required.

CHAPTER 7. AIR TRAFFIC SERVICES REQUIREMENTS FOR INFORMATION

7.1 Meteorological information

7.1.1 General

7.1.1.1 Air traffic services units shall be supplied with up-to-date information on existing and forecast meteorological conditions as necessary for the performance of their respective functions. The information shall be supplied in such a form as to require a minimum of interpretation on the part of air traffic services personnel and with a frequency which satisfies the requirements of the air traffic services units concerned.

7.1.1.2 **Recommendation.—** *Air traffic services units should be supplied with available detailed information on the location, vertical extent, direction and rate of movement of meteorological phenomena in the vicinity of the aerodrome, and particularly in the climb-out and approach areas, which could be hazardous to aircraft operations.*

Note.— The meteorological phenomena are listed in Annex 3, Chapter 4, 4.6.8.

7.1.1.3 **Recommendation.—** *When computer-processed upper air data are made available to air traffic services units in digital form for use by air traffic services computers, the contents, format and transmission arrangements should be as agreed between the Meteorological Authority and the appropriate ATS Authority.*

7.1.2 Flight information centres and area control centres

7.1.2.1 Flight information centres and area control centres shall be supplied with meteorological information as described in Annex 3, Appendix 9, 1.3, particular emphasis being given to the occurrence or expected occurrence of weather deterioration as soon as this can be determined. These reports and forecasts shall cover the flight information region or control area and such other areas as may be determined on the basis of regional air navigation agreements.

Note.— For the purpose of this provision, certain changes in meteorological conditions are construed as deterioration in a weather element, although they are not ordinarily considered as such. An increase in temperature may, for example, adversely affect the operation of certain types of aircraft.

7.1.2.2 Flight information centres and area control centres shall be provided, at suitable intervals, with current pressure data for setting altimeters, for locations specified by the flight information centre or area control centre concerned.

7.1.3 Units providing approach control service

7.1.3.1 Units providing approach control service shall be supplied with meteorological information as described in Annex 3, Appendix 9, 1.2 for the airspace and the aerodromes with which they are concerned. Special reports and amendments to forecasts shall be communicated to the units providing approach control service as soon as they are necessary in accordance with established criteria, without waiting for the next routine report or forecast. Where multiple anemometers are used, the indicators to which they are related shall be clearly marked to identify the runway and section of the runway monitored by each anemometer.

Note.— See Note following 7.1.2.1.

7.1.3.2 Units providing approach control service shall be provided with current pressure data for setting altimeters, for locations specified by the unit providing approach control service.

7.1.3.3 Units providing approach control service for final approach, landing and take-off shall be equipped with surface wind display(s). The display(s) shall be related to the same location(s) of observation and be fed from the same sensor(s) as the corresponding display(s) in the aerodrome control tower and in the meteorological station, where such a station exists.

7.1.3.4 Units providing approach control service for final approach, landing and take-off at aerodromes where runway visual range values are assessed by instrumental means shall be equipped with display(s) permitting read-out of the current runway visual range value(s). The display(s) shall be related to the same location(s) of observation and be fed from the same sensor(s) as the corresponding displays in the aerodrome control tower and in the meteorological station, where such a station exists.

7.1.3.5 **Recommendation**.— *Units providing approach control service for final approach, landing and take-off at aerodromes where the height of cloud base is assessed by instrumental means should be equipped with display(s) permitting read-out of the current value(s) of the height of cloud base. The displays should be related to the same location(s) of* *observations and be fed from the same sensor(s) as the corresponding display(s) in the aerodrome control tower and in the meteorological station, where such a station exists.*

7.1.3.6 Units providing approach control service for final approach, landing and take-off shall be supplied with information on wind shear which could adversely affect aircraft on the approach or take-off paths or during circling approach.

Note.— Provisions concerning the issuance of wind shear warnings and alerts and ATS requirements for meteorological information are given in Annex 3, Chapter 7 and Appendices 6 and 9.

7.1.4 Aerodrome control towers

7.1.4.1 Aerodrome control towers shall be supplied with meteorological information as described in Annex 3, Appendix 9, 1.1 for the aerodrome with which they are concerned. Special reports and amend-ments to forecasts shall be communicated to the aerodrome control towers as soon as they are necessary in accordance with established criteria, without waiting for the next routine report or forecast.

Note.— See Note following 7.1.2.1.

7.1.4.2 Aerodrome control towers shall be provided with current pressure data for setting altimeters for the aerodrome concerned.

7.1.4.3 Aerodrome control towers shall be equipped with surface wind display(s). The display(s) shall be related to the same location(s) of observation and be fed from the same sensor(s) as the corresponding display(s) in the meteorological station, where such a station exists. Where multiple sensor(s) are used, the displays to which they are related shall be clearly marked to identify the runway and section of the runway monitored by each sensor.

7.1.4.4 Aerodrome control towers at aerodromes where runway visual range values are measured by instrumental means shall be equipped with display(s) permitting read-out of the current runway visual range value(s). The display(s) shall be related to the same location(s) of observation and be fed from the same sensor(s) as the corresponding display(s) in the meteorological station, where such a station exists.

7.1.4.5 **Recommendation**.— *Aerodrome control towers at aerodromes where the height of cloud base is assessed by instrumental means should be equipped with display(s) permitting read-out of the current value(s) of the height of cloud base. The displays should be related to the same location(s) of observations and be fed from the same sensor(s) as the corresponding display(s) in the meteorological station, where such a station exists.*

7.1.4.6 Aerodrome control towers shall be supplied with information on wind shear which could adversely affect aircraft on the approach or take-off paths or during circling approach and aircraft on the runway during the landing roll or take-off run.

7.1.4.7 **Recommendation.—** *Aerodrome control towers and/or other appropriate units should be supplied with aerodrome warnings.*

Note.— The meteorological conditions for which aerodrome warnings are issued are listed in Annex 3, Appendix 6, 5.1.3.

7.1.5 Communication stations

Where necessary for flight information purposes, current meteorological reports and forecasts shall be supplied to communication stations. A copy of such information shall be forwarded to the flight information centre or the area control centre.

7.2 Information on aerodrome conditions and the operational status of associated facilities

Aerodrome control towers and units providing approach control service shall be kept currently informed of the operationally significant conditions of the movement area, including the existence of temporary hazards, and the operational status of any associated facilities at the aerodrome(s) with which they are concerned.

7.3 Information on the operational status of navigation aids

7.3.1 ATS units shall be kept currently informed of the operational status of non-visual navigation aids, and those visual aids essential for take-off, departure, approach and landing procedures within their area of responsibility and those visual and non-visual aids essential for surface movement.

7.3.2 **Recommendation.—** *Information on the operational status, and any changes thereto, of visual and non-visual aids as referred to in 7.3.1 should be received by the appropriate ATS unit(s) on a timely basis consistent with the use of the aid(s) involved.*

Note.— Guidance material regarding the provision of information to ATS units in respect to visual and non-visual navigation aids is contained in the Air Traffic Services Planning Manual *(Doc 9426). Specifications for monitoring visual aids are contained in Annex 14, Volume I, and related guidance material is in the* Aerodrome Design Manual *(Doc 9157), Part 5. Specifications for monitoring non-visual aids are contained in Annex 10, Volume I.*

7.4 Information on unmanned free balloons

Operators of unmanned free balloons shall keep the appropriate air traffic services units informed of details of flights of unmanned free balloons in accordance with the provisions contained in Annex 2.

7.5 Information concerning volcanic activity

7.5.1 ATS units shall be informed, in accordance with local agreement, of pre-eruption volcanic activity, volcanic eruptions and volcanic ash cloud which could affect airspace used by flights within their area of responsibility.

7.5.2 Area control centres and flight information centres shall be provided with volcanic ash advisory information issued by the associated VAAC.

Note.— VAACs are designated by regional air navigation agreements in accordance with Annex 3, 3.5.1.

7.6 Information concerning radioactive materials and toxic chemical "clouds"

ATS units shall be informed, in accordance with local agreement, of the release into the atmosphere of radioactive materials or toxic chemicals which could affect airspace used by flights within their area of responsibility.

APPENDIX 1. PRINCIPLES GOVERNING THE IDENTIFICATION OF RNP TYPES AND THE IDENTIFICATION OF ATS ROUTES OTHER THAN STANDARD DEPARTURE AND ARRIVAL ROUTES

(Chapter 2, Sections 2.7 and 2.12 refer)

Note.— See Appendix 3 concerning the identification of standard departure and arrival routes and associated procedures. Guidance material on the establishment of these routes and procedures is contained in the Air Traffic Services Planning Manual *(Doc 9426).*

1. Designators for ATS routes and RNP types

1.1 The purpose of a system of route designators and required navigation performance (RNP) type(s) applicable to specified ATS route segment(s), route(s) or area is to allow both pilots and ATS, taking into account automation requirements:

a) to make unambiguous reference to any ATS route without the need to resort to the use of geographical coordinates or other means in order to describe it;

b) to relate an ATS route to a specific vertical structure of the airspace, as applicable;

c) to indicate a required level of navigation performance accuracy, when operating along an ATS route or within a specified area; and

d) to indicate that a route is used primarily or exclusively by certain types of aircraft.

Note 1.— Prior to the global introduction of RNP, all references in this appendix to RNP also apply to area navigation (RNAV) routes, where navigation performance accuracy requirements have been specified.

Note 2.— Specifications governing the publication of RNP types are given in Annex 4, Chapter 7, and Annex 15, Appendix 1.

Note 3.— In relation to this appendix and for flight planning purposes, a prescribed RNP type is not considered an integral part of the ATS route designator.

1.2 In order to meet this purpose, the designation system shall:

a) permit the identification of any ATS route in a simple and unique manner;

b) avoid redundancy;

c) be usable by both ground and airborne automation systems;

d) permit utmost brevity in operational use; and

e) provide sufficient possibility of extension to cater for any future requirements without the need for fundamental changes.

1.3 Controlled, advisory and uncontrolled ATS routes, with the exception of standard arrival and departure routes, shall therefore be identified as specified hereafter.

2. Composition of designator

2.1 The ATS route designator shall consist of a basic designator supplemented, if necessary, by:

a) one prefix as prescribed in 2.3; and

b) one additional letter as prescribed in 2.4.

2.1.1 The number of characters required to compose the designator shall not exceed six characters.

2.1.2 The number of characters required to compose the designator should, whenever possible, be kept to a maximum of five characters.

2.2 The basic designator shall consist of one letter of the alphabet followed by a number from 1 to 999.

2.2.1 Selection of the letter shall be made from those listed hereunder:

a) A, B, G, R for routes which form part of the regional networks of ATS routes and are not area navigation routes;

b) L, M, N, P for area navigation routes which form part of the regional networks of ATS routes;

c) H, J, V, W for routes which do not form part of the regional networks of ATS routes and are not area navigation routes;

d) Q, T, Y, Z for area navigation routes which do not form part of the regional networks of ATS routes.

2.3 Where applicable, one supplementary letter shall be added as a prefix to the basic designator in accordance with the following:

a) K to indicate a low-level route established for use primarily by helicopters;

b) U to indicate that the route or portion thereof is established in the upper airspace;

c) S to indicate a route established exclusively for use by supersonic aircraft during acceleration, deceleration and while in supersonic flight.

2.4 When prescribed by the appropriate ATS authority or on the basis of regional air navigation agreements, a supplementary letter may be added after the basic designator of the ATS route in question in order to indicate the type of service provided or the turn performance required on the route in question in accordance with the following:

a) for RNP 1 routes at and above FL 200, the letter Y to indicate that all turns on the route between 30 and 90 degrees shall be made within the allowable RNP tolerance of a tangential arc between the straight leg segments defined with a radius of 22.5 NM (e.g. A123Y[1]);

b) for RNP 1 routes at and below FL 190, the letter Z to indicate that all turns on the route between 30 and 90 degrees shall be made within the allowable RNP tolerance of a tangential arc between the straight leg segments defined with a radius of 15 NM (e.g. G246Z[1]);

c) the letter F to indicate that on the route or portion thereof advisory service only is provided;

d) the letter G to indicate that on the route or portion thereof flight information service only is provided.

Note 1.— Due to limitations in the display equipment on board aircraft, the supplementary letters "F", "G", "Y" or "Z" may not be displayed to the pilot.

Note 2.— Implementation of a route or a portion thereof as controlled route, advisory route or flight information route is indicated in aeronautical charts and aeronautical information publications in accordance with the provisions in Annexes 4 and 15.

Note 3.— The conditions under which States may specify the controlled turn performance referred to in 2.4 a) and b) are discussed in the Manual on Required Navigation Performance (RNP) *(Doc 9613).*

3. Assignment of basic designators

3.1 Basic ATS route designators shall be assigned in accordance with the following principles.

3.1.1 The same basic designator shall be assigned to a main trunk route throughout its entire length, irrespective of terminal control areas, States or regions traversed.

Note.— This is of particular importance where automated ATS data processing and computerized airborne navigation equipment is used.

3.1.2 Where two or more trunk routes have a common segment, the segment in question shall be assigned each of the designators of the routes concerned, except where this would present difficulties in the provision of air traffic service, in which case, by common agreement, one designator only shall be assigned.

3.1.3 A basic designator assigned to one route shall not be assigned to any other route.

3.1.4 States' requirements for designators shall be notified to the Regional Offices of ICAO for coordination.

4. Use of designators in communications

4.1 In printed communications, the designator shall be expressed at all times by not less than two and not more than six characters.

4.2 In voice communications, the basic letter of a designator shall be spoken in accordance with the ICAO spelling alphabet.

4.3 Where the prefixes K, U or S specified in 2.3 are used, they shall, in voice communications, be spoken as follows:

K — KOPTER
U — UPPER
S — SUPERSONIC

The word "kopter" shall be pronounced as in the word "helicopter" and the words "upper" and "supersonic" as in the English language.

4.4 Where the letters "F", "G", "Y" or "Z" specified in 2.4 above are used, the flight crew should not be required to use them in voice communications.

APPENDIX 2. PRINCIPLES GOVERNING THE ESTABLISHMENT AND IDENTIFICATION OF SIGNIFICANT POINTS

(Chapter 2, Section 2.14 refers)

1. Establishment of significant points

1.1 Significant points should, whenever possible, be established with reference to ground-based radio navigation aids, preferably VHF or higher frequency aids.

1.2 Where such ground-based radio navigation aids do not exist, significant points shall be established at locations which can be determined by self-contained airborne navigation aids, or, where navigation by visual reference to the ground is to be effected, by visual observation. Specific points may be designated as ‘‘transfer of control’’ points by agreement between adjacent air traffic control units or control positions concerned.

2. Designators for significant points marked by the site of a radio navigation aid

2.1 Plain language name for significant points marked by the site of a radio navigation aid

2.1.1 Whenever practicable, significant points shall be named with reference to an identifiable and preferably prominent geographical location.

2.1.2 In selecting a name for the significant point, care shall be taken to ensure that the following conditions are met:

a) the name shall not create difficulties in pronunciation for pilots or ATS personnel when speaking in the language used in ATS communications. Where the name of a geographical location in the national language selected for designating a significant point gives rise to difficulties in pronunciation, an abbreviated or contracted version of this name, which retains as much of its geographical significance as possible, shall be selected;

   Example: FUERSTENFELDBRUCK = FURSTY

b) the name shall be easily recognizable in voice communications and shall be free of ambiguity with those of other significant points in the same general area. In addition, the name shall not create confusion with respect to other communications exchanged between air traffic services and pilots;

c) the name should, if possible, consist of at least six letters and form two syllables and preferably not more than three;

d) the selected name shall be the same for both the significant point and the radio navigation aid marking it.

2.2 Composition of coded designators for significant points marked by the site of a radio navigation aid

2.2.1 The coded designator shall be the same as the radio identification of the radio navigation aid. It shall be so composed, if possible, as to facilitate association with the name of the point in plain language.

2.2.2 Coded designators shall not be duplicated within 1 100 km (600 NM) of the location of the radio navigation aid concerned, except as noted hereunder.

Note.— When two radio navigation aids operating in different bands of the frequency spectrum are situated at the same location, their radio identifications are normally the same.

2.3 States’ requirements for coded designators shall be notified to the Regional Offices of ICAO for coordination.

3. Designators for significant points not marked by the site of a radio navigation aid

3.1 Where a significant point is required at a position not marked by the site of a radio navigation aid, the significant point shall be designated by a unique five-letter pronounceable “name-code”. This name-code designator then serves as the name as well as the coded designator of the significant point.

3.2 This name-code designator shall be selected so as to avoid any difficulties in pronunciation by pilots or ATS personnel when speaking in the language used in ATS communications.

Examples: ADOLA, KODAP

3.3 The name-code designator shall be easily recognizable in voice communications and shall be free of ambiguity with those used for other significant points in the same general area.

3.4 The name-code designator assigned to a significant point shall not be assigned to any other significant point. When there is a need to relocate a significant point, a new name-code designator shall be chosen. In cases when a State wishes to keep the allocation of specific name-codes for re-use at a different location, such name-codes shall not be used until after a period of at least six months.

3.5 States' requirements for name-code designators shall be notified to the Regional Offices of ICAO for coordination.

3.6 In areas where no system of fixed routes is established or where the routes followed by aircraft vary depending on operational considerations, significant points shall be determined and reported in terms of World Geodetic System — 1984 (WGS-84) geographical coordinates, except that permanently established significant points serving as exit and/or entry points into such areas shall be designated in accordance with the applicable provisions in 2 or 3.

4. Use of designators in communications

4.1 Normally the name selected in accordance with 2 or 3 shall be used to refer to the significant point in voice communications. If the plain language name for a significant point marked by the site of a radio navigation aid selected in accordance with 2.1 is not used, it shall be replaced by the coded designator which, in voice communications, shall be spoken in accordance with the ICAO spelling alphabet.

4.2 In printed and coded communications, only the coded designator or the selected name-code shall be used to refer to a significant point.

5. Significant points used for reporting purposes

5.1 In order to permit ATS to obtain information regarding the progress of aircraft in flight, selected significant points may need to be designated as reporting points.

5.2 In establishing such points, consideration shall be given to the following factors:

a) the type of air traffic services provided;

b) the amount of traffic normally encountered;

c) the accuracy with which aircraft are capable of adhering to the current flight plan;

d) the speed of the aircraft;

e) the separation minima applied;

f) the complexity of the airspace structure;

g) the control method(s) employed;

h) the start or end of significant phases of a flight (climb, descent, change of direction, etc.);

i) transfer of control procedures;

j) safety and search and rescue aspects;

k) the cockpit and air-ground communication workload.

5.3 Reporting points shall be established either as "compulsory" or as "on-request".

5.4 In establishing "compulsory" reporting points the following principles shall apply:

a) compulsory reporting points shall be limited to the minimum necessary for the routine provision of information to air traffic services units on the progress of aircraft in flight, bearing in mind the need to keep cockpit and controller workload and air-ground communications load to a minimum;

b) the availability of a radio navigation aid at a location should not necessarily determine its designation as a compulsory reporting point;

c) compulsory reporting points should not necessarily be established at flight information region or control area boundaries.

5.5 "On-request" reporting points may be established in relation to the requirements of air traffic services for additional position reports when traffic conditions so demand.

5.6 The designation of compulsory and on-request reporting points shall be reviewed regularly with a view to keeping the requirements for routine position reporting to the minimum necessary to ensure efficient air traffic services.

5.7 Routine reporting over compulsory reporting points should not systematically be made mandatory for all flights in all circumstances. In applying this principle, particular attention shall be given to the following:

a) high-speed, high-flying aircraft should not be required to make routine position reports over all reporting points established as compulsory for low-speed, low-flying aircraft;

b) aircraft transiting through a terminal control area should not be required to make routine position reports as frequently as arriving and departing aircraft.

5.8 In areas where the above principles regarding the establishment of reporting points would not be practicable, a reporting system with reference to meridians of longitude or parallels of latitude expressed in whole degrees may be established.

APPENDIX 3. PRINCIPLES GOVERNING THE IDENTIFICATION OF STANDARD DEPARTURE AND ARRIVAL ROUTES AND ASSOCIATED PROCEDURES

(See Chapter 2, 2.12.3)

Note.— Material relating to the establishment of standard departure and arrival routes and associated procedures is contained in the Air Traffic Services Planning Manual *(Doc 9426).*

1. Designators for standard departure and arrival routes and associated procedures

Note.— In the following text the term "route" is used in the meaning of "route and associated procedures".

1.1 The system of designators shall:

a) permit the identification of each route in a simple and unambiguous manner;

b) make a clear distinction between:

— departure routes and arrival routes;

— departure or arrival routes and other ATS routes;

— routes requiring navigation by reference to ground-based radio aids or self-contained airborne aids, and routes requiring navigation by visual reference to the ground;

c) be compatible with ATS and aircraft data processing and display requirements;

d) be of utmost brevity in its operational application;

e) avoid redundancy;

f) provide sufficient possibility for extension to cater for any future requirements without the need for fundamental changes.

1.2 Each route shall be identified by a plain language designator and a corresponding coded designator.

1.3 The designators shall, in voice communications, be easily recognizable as relating to a standard departure or arrival route and shall not create any difficulties in pronunciation for pilots and ATS personnel.

2. Composition of designators

2.1 Plain language designator

2.1.1 The plain language designator of a standard departure or arrival route shall consist of:

a) a basic indicator; followed by

b) a validity indicator; followed by

c) a route indicator, where required; followed by

d) the word "departure" or "arrival"; followed by

e) the word "visual", if the route has been established for use by aircraft operating in accordance with the visual flight rules (VFR).

2.1.2 The basic indicator shall be the name or name-code of the significant point where a standard departure route terminates or a standard arrival route begins.

2.1.3 The validity indicator shall be a number from 1 to 9.

2.1.4 The route indicator shall be one letter of the alphabet. The letters "I" and "O" shall not be used.

2.2 Coded designator

The coded designator of a standard departure or arrival route, instrument or visual, shall consist of:

a) the coded designator or name-code of the significant point described in 2.1.1 a); followed by

b) the validity indicator in 2.1.1 b); followed by

c) the route indicator in 2.1.1 c), where required.

Note.— Limitations in the display equipment on board aircraft may require shortening of the basic indicator, if that indicator is a five-letter name-code, e.g. KODAP. The manner in which such an indicator is shortened is left to the discretion of operators.

3. Assignment of designators

3.1 Each route shall be assigned a separate designator.

3.2 To distinguish between two or more routes which relate to the same significant point (and therefore are assigned the same basic indicator), a separate route indicator as described in 2.1.4 shall be assigned to each route.

4. Assignment of validity indicators

4.1 A validity indicator shall be assigned to each route to identify the route which is currently in effect.

4.2 The first validity indicator to be assigned shall be the number "1".

4.3 Whenever a route is amended, a new validity indicator, consisting of the next higher number, shall be assigned. The number "9" shall be followed by the number "1".

5. Examples of plain language and coded designators

5.1 *Example 1*: Standard departure route — instrument:

a) Plain language designator: BRECON ONE DEPARTURE

b) Coded designator: BCN 1

5.1.1 *Meaning*: The designator identifies a standard instrument departure route which terminates at the significant point BRECON (basic indicator). BRECON is a radio navigation facility with the identification BCN (basic indicator of the coded designator). The validity indicator ONE (1 in the coded designator) signifies either that the original version of the route is still in effect or that a change has been made from the previous version NINE (9) to the now effective version ONE (1) (see 4.3). The absence of a route indicator (see 2.1.4 and 3.2) signifies that only one route, in this case a departure route, has been established with reference to BRECON.

5.2 *Example 2*: Standard arrival route — instrument:

a) Plain language designator: KODAP TWO ALPHA ARRIVAL

b) Coded designator: KODAP 2 A

5.2.1 *Meaning*: This designator identifies a standard instrument arrival route which begins at the significant point KODAP (basic indicator). KODAP is a significant point not marked by the site of a radio navigation facility and therefore assigned a five-letter name-code in accordance with Appendix 2. The validity indicator TWO (2) signifies that a change has been made from the previous version ONE (1) to the now effective version TWO (2). The route indicator ALPHA (A) identifies one of several routes established with reference to KODAP and is a specific character assigned to this route.

5.3 *Example 3*: Standard departure route — visual:

a) Plain language designator ADOLA FIVE BRAVO DEPARTURE VISUAL

b) Coded designator: ADOLA 5 B

5.3.1 *Meaning*: This designator identifies a standard departure route for controlled VFR flights which terminates at ADOLA, a significant point not marked by the site of a radio navigation facility. The validity indicator FIVE (5) signifies that a change has been made from the previous version FOUR (4) to the now effective version FIVE (5). The route indicator BRAVO (B) identifies one of several routes established with reference to ADOLA.

6. Composition of designators for MLS/RNAV approach procedures

6.1 Plain language designator

6.1.1 The plain language designator of an MLS/RNAV approach procedure shall consist of:

a) "MLS"; followed by

b) a basic indicator; followed by

c) a validity indicator; followed by

d) a route indicator; followed by

e) the word "approach"; followed by

f) the designator of the runway for which the procedure is designed.

6.1.2 The basic indicator shall be the name or name-code of the significant point where the approach procedure begins.

6.1.3 The validity indicator shall be a number from 1 to 9.

6.1.4 The route indicator shall be one letter of the alphabet. The letters "I" and "O" shall not be used.

6.1.5 The designator of the runway shall be in accordance with Annex 14, Volume I, 5.2.2.

ATTACHMENT A. MATERIAL RELATING TO A METHOD OF ESTABLISHING ATS ROUTES DEFINED BY VOR

(Paragraph 2.7.1 and Section 2.12 refer)

1. Introduction

1.1 The guidance material in this Attachment results from comprehensive studies, carried out in Europe in 1972 and the United States in 1978, which were in general agreement.

Note.— Details of the European studies are contained in Circular 120 — Methodology for the Derivation of Separation Minima Applied to the Spacing between Parallel Tracks in ATS Route Structures.

1.2 In applying the guidance material in 3 and 4, it should be recognized that the data on which it is based are generally representative of navigation using VOR meeting the full requirements of Doc 8071 — *Manual on Testing of Radio Navigation Aids*, Volume I. Any additional factors, such as those due to particular operational requirements, frequency of aircraft passings or information available regarding the actual track-keeping performance of aircraft within a given portion of airspace should be taken into account.

1.3 Attention is also invited to the basic assumptions in 4.2 and to the fact that the values given in 4.1 represent a conservative approach. Before applying these values, account should therefore be taken of any practical experience gained in the airspace under consideration, as well as the possibility of achieving improvements in the overall navigation performance of aircraft.

1.4 States are encouraged to keep ICAO fully informed of the results of the application of this guidance material.

2. Determination of VOR system performance values

The large variability of the values which are likely to be associated with each of the factors that make up the total VOR system, and the limitation of presently available methods to measure all these effects individually with the required precision, have led to the conclusion that an assessment of the total system error provides a more realistic method for determining the VOR system performance. The material contained in 3 and 4 should be applied only after study of Circular 120 especially with respect to the environmental conditions.

Note.— Guidance material on overall VOR system accuracy is also contained in Annex 10, Volume I, Attachment C.

3. Determination of protected airspace along VOR-defined routes

Note 1.— The material of this section has not been derived by means of the collision-risk/target level of safety method.

Note 2.— The word "containment" as used in this section is intended to indicate that the protected airspace provided will contain the traffic for 95 per cent of the total flying time (i.e. accumulated over all aircraft) for which the traffic operates along the route in question. Where, for example 95 per cent containment is provided, it is implicit that for 5 per cent of the total flying time traffic will be outside *the protected airspace. It is not possible to quantify the maximum distance which such traffic is likely to deviate beyond the protected airspace.*

3.1 For VOR-defined routes where radar or ADS-B is not used to assist aircraft in remaining within the protected airspace, the following guidance is provided. However, when the lateral deviations of aircraft are being controlled with the aid of radar or ADS-B monitoring, the size of the protected airspace required may be reduced, as indicated by practical experience gained in the airspace under consideration.

3.2 As a minimum, protection against activity in airspace adjacent to the routes should provide 95 per cent containment.

3.3 The work described in Circular 120 indicates that a VOR system performance based on the probability of 95 per cent containment would require the following protected airspace around the centre line of the route to allow for possible deviations:

— VOR routes with 93 km (50 NM) or less between VORs: ±7.4 km (4 NM);

— VOR routes with up to 278 km (150 NM) between VORs: ±7.4 km (4 NM) up to 46 km (25 NM) from the VOR then expanding protected airspace up to ±11.1 km (6 NM) at 139 km (75 NM) from the VOR.

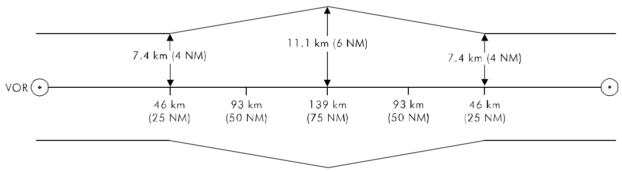

Figure A-1

3.4 If the appropriate ATS authority considers that a better protection is required, e.g. because of the proximity of prohibited, restricted or danger areas, climb or descent paths of military aircraft, etc., it may decide that a higher level of containment should be provided. For delineating the protected airspace the following values should then be used:

— for segments with 93 km (50 NM) or less between VORs, use the values in line A of the table below;

— for segments with more than 93 km (50 NM) and less than 278 km (150 NM) between the VORs use the values given in line A of the table up to 46 km (25 NM), then expand linearly to the value given in line B at 139 km (75 NM) from the VOR.

	Percentage containment					
	95	*96*	*97*	*98*	*99*	*99.5*
A (km)	±7.4	±7.4	±8.3	±9.3	±10.2	±11.1
(NM)	±4.0	±4.0	±4.5	±5.0	±5.5	±6.0
B (km)	±11.1	±11.1	±12.0	±12.0	±13.0	±15.7
(NM)	±6.0	±6.0	±6.5	±6.5	±7.0	±8.5

For example, the protected area for a route of 222 km (120 NM) between VORs and for which 99.5 per cent containment is required should have the following shape:

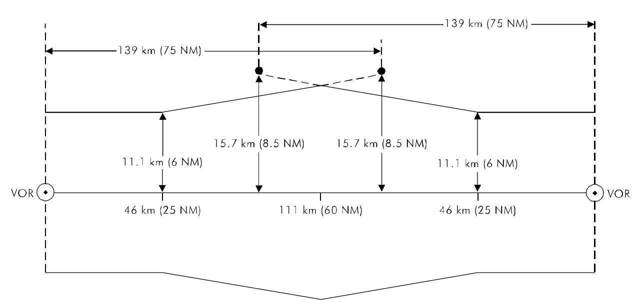

Figure A-2

3.5 If two segments of a VOR-defined ATS route intersect at an angle of more than 25 degrees, additional protected airspace should be provided on the outside of the turn and also on the inside of the turn as necessary. This additional space is to act as a buffer for increased lateral displacement of aircraft, observed in practice, during changes of direction exceeding 25 degrees. The amount of airspace added varies with the angle of intersection. The greater the angle, the greater the additional airspace to be used. Guidance is provided for protected airspace required at turns of no more than 90 degrees. For the exceptional circumstances which require an ATS route with a turn of more than 90 degrees, States should ensure that adequate protected airspace is provided on both the inside and outside of such turns.

3.6 The following examples have been synthesized from the practices of two States which use templates to facilitate the diagramming of airspace for planning purposes. Design of the turning area templates took into account factors such as aircraft speed, bank angle in turns, probable wind velocity, position errors, pilot delays and an intercept angle of at least 30 degrees to achieve the new track, and provides at least 95 per cent containment.

3.7 A template was used to establish the additional airspace required on the outside of turns to contain aircraft executing turns of 30, 45, 60, 75 and 90 degrees. The simplified figures below represent the outer limits of this airspace with the fairing curves removed to allow easy construction. In each case, the additional airspace is shown for aircraft flying in the direction of the large arrow. Where routes are used in both directions, the same additional airspace should be provided on the other outside boundary.

3.8 Figure A-3 illustrates the application of two segments intersecting at a VOR, at an angle of 60 degrees.

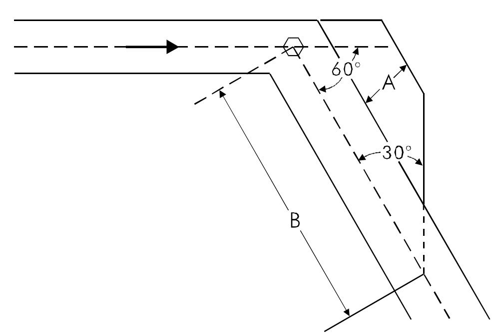

Figure A-3

3.9 Figure A-4 illustrates the application for two segments meeting at a VOR intersection at an angle of 60 degrees beyond the point where boundary splay is required in order to comply with 3.3 and Figure A-1.

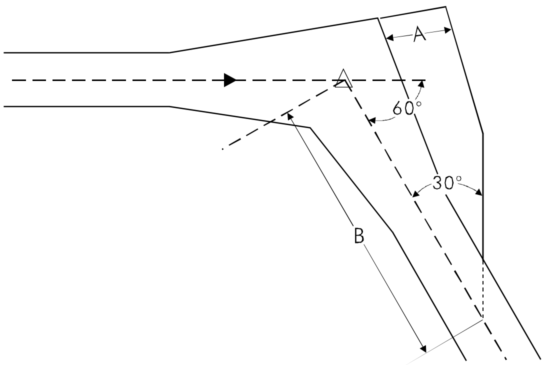

Figure A-4

3.10 The following table outlines the distances to be used in sample cases when providing additional protected airspace for route segments at and below FL 450, intersecting at a VOR or meeting at a VOR intersection not more than 139 km (75 NM) from each VOR.

Note.— Refer to Figures A-3 and A-4.

Angle of intersection		*30°*	*45°*	*60°*	*75°*	*90°*
VOR						
*Distance "A"	(km)	5	9	13	17	21
	(NM)	3	5	7	9	11
*Distance "B"	(km)	46	62	73	86	92
	(NM)	25	34	40	46	50
Intersection						
*Distance "A"	(km)	7	11	17	23	29
	(NM)	4	6	9	13	16
*Distance "B"	(km)	66	76	88	103	111
	(NM)	36	41	48	56	60

*Distances are rounded up to the next whole kilometre/nautical mile.

Note.— For behaviour of aircraft at turns, see Circular 120, 4.4.

3.11 Figure A-5 illustrates a method to construct the required additional protected airspace on the inside of turns for turns of 90 degrees or less:

Locate a point on the airway centre line, equal to the radius of turn plus the along-track tolerance prior to the nominal turning point.

From this point, drop a perpendicular line to intersect the edge of the airway on the inside of the turn.

From this point on the inner edge of the airway, construct a line to intersect the airway centre line beyond the turn at an angle of half of the angle of turn.

The resulting triangle on the inside of the turn depicts the additional airspace which should be protected for the change of direction. For any turn of 90 degrees or less, the extra space on the inside will serve for aircraft approaching the turn from either direction.

Note 1.— Criteria for the calculation of the along-track tolerance are contained in PANS-OPS (Doc 8168), Volume II, Part III, Appendix to Chapter 31.

Note 2.— Guidance on the calculation of radius of turn is provided in Section 7.

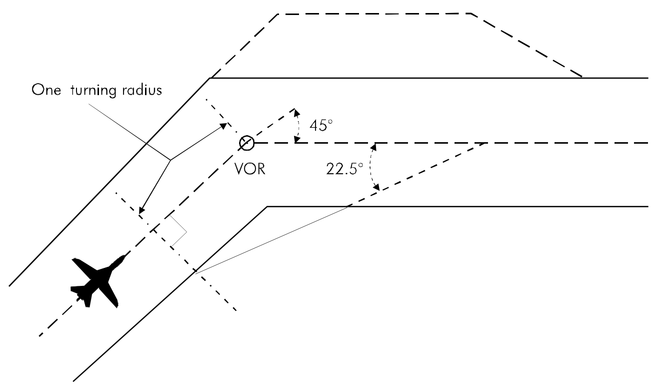

Figure A-5

3.12 For turns at VOR intersections, the principles of construction for extra airspace on the inside of a turn as described in 3.11 can be applied. Depending on the distance of the intersection from one or both VORs, one or both airways may have a splay at the intersection. Depending upon the situation, the extra airspace may be inside, partially inside, or outside of the 95 per cent containment. If the route is used in both directions, the construction should be completed separately for each direction.

3.13 Measured data for routes longer than 278 km (150 NM) between VORs are not yet available. To determine protected airspace beyond 139 km (75 NM) from the VOR, the use of an angular value of the order of 5 degrees as representing the probable system performance would appear satisfactory. The following figure illustrates this application.

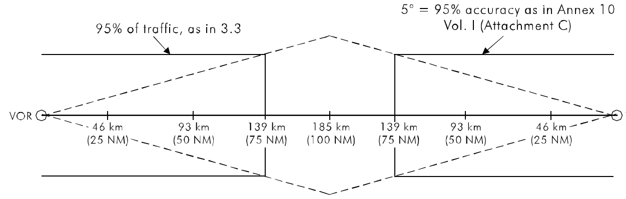

Figure A-6

4. Spacing of parallel routes defined by VORs

Note.— The material of this section has been derived from measured data using the collision-risk/target level of safety method.

4.1 The collision risk calculation, performed with the data of the European study mentioned in 1.1 indicates that, in the type of environment investigated, the distance between route centre lines (S in Figure A-7) for distances between VORs of 278 km (150 NM) or less should normally be a minimum of:

a) 33.3 km (18 NM) for parallel routes where the aircraft on the routes fly in opposite direction; and

b) 30.6 km (16.5 NM) for parallel routes where the aircraft on the two routes fly in the same direction.

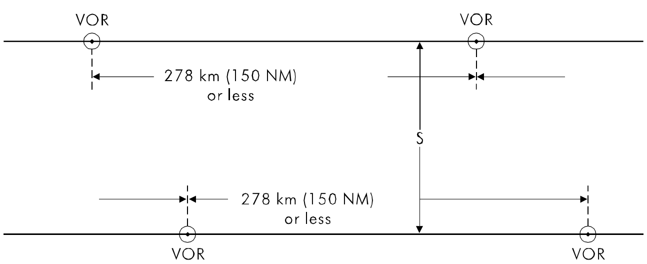

Figure A-7

Note.— Two route segments are considered parallel when:

— *they have about the same orientation, i.e. the angular difference does not exceed 10 degrees;*

— *they are not intersecting, i.e. another form of separation must exist at a defined distance from the intersection;*

— *traffic on each route is independent of traffic on the other route, i.e. it does not lead to restrictions on the other route.*

4.2 This spacing of parallel routes assumes:

a) aircraft may either during climb or descent or during level flight be at the same flight levels on the two routes;

b) traffic densities of 25 000 to 50 000 flights per busy two-month period;

c) VOR transmissions which are regularly flight checked in accordance with Doc 8071 — *Manual on Testing of Radio Navigation Aids*, Volume I, and have been found to be satisfactory in accordance with the procedures in that document for navigational purposes on the defined routes; and

d) no real-time radar or ADS-B monitoring or control of the lateral deviations is exercised.

4.3 Preliminary work indicates that, in the circumstances described in a) to c) below, it may be possible to reduce the minimum distance between routes. However, the figures given have not been precisely calculated and in each case a detailed study of the particular circumstances is essential:

a) if the aircraft on adjacent routes are not assigned the same flight levels, the distance between the routes may be reduced; the magnitude of the reduction will depend on the vertical separation between aircraft on the adjacent tracks and on the percentage of climbing and descending traffic, but is not likely to be more than 5.6 km (3 NM);

b) if the traffic characteristics differ significantly from those contained in Circular 120, the minima contained in 4.1 may require adjustment. For example, for traffic densities of about 10 000 flights per busy two-month period a reduction of 900 to 1 850 m (0.5 to 1.0 NM) may be possible;

c) the relative locations of the VORs defining the two tracks and the distance between the VORs will have an effect on the spacing, but this has not been quantified.

4.4 Application of radar or ADS-B monitoring and control of the lateral deviations of the aircraft may have a large effect on the minimum allowable distance between routes. Studies on the effect of radar monitoring indicate that:

— further work is necessary before a fully satisfactory mathematical model can be developed;

— any reduction of separation is closely related to:

  — traffic (volume, characteristics);
  — coverage and data processing, availability of an automatic alarm;
  — monitoring continuity;
  — sector workload; and
  — radiotelephony quality.

According to these studies and taking into account the experience some States have accumulated over many years with parallel route systems under continuous radar control, it can be expected that a reduction to the order of 15 to 18.5 km (8 to 10 NM), but most probably not less than 13 km (7 NM), may be possible as long as radar monitoring workload is not increased substantially by that reduction. Actual operations of such systems using reduced lateral spacing have shown that:

— it is very important to define and publish change-over points (see also 6);

— large turns should be avoided when possible; and

— where large turns cannot be avoided, required turn profiles should be defined for turns larger than 20 degrees.

Even where the probability of total radar or ADS-B failure is very small, procedures to cover that case should be considered.

5. Spacing of adjacent VOR-defined routes that are not parallel

Note 1.— The material of this section is intended to provide guidance for situations where non-intersecting VOR-defined routes are adjacent and have an angular difference exceeding 10 degrees.

Note 2.— The material of this section has not been derived by means of the collision-risk/target level of safety method.

5.1 For adjacent non-intersecting VOR-defined routes that are not parallel, the collision-risk/target level of safety method is not, at its present state of development, fully appropriate. For this reason use should be made of the material in 3.

5.2 The protected airspace between such routes should not be less than that which will provide, without overlap, the 99.5 per cent containment values given in the table in 3.4 (see example in Figure A-8).

5.3 Where there is an angular difference of more than 25 degrees between route segments, additional protected airspace, as indicated in 3.5 to 3.10, should be provided.

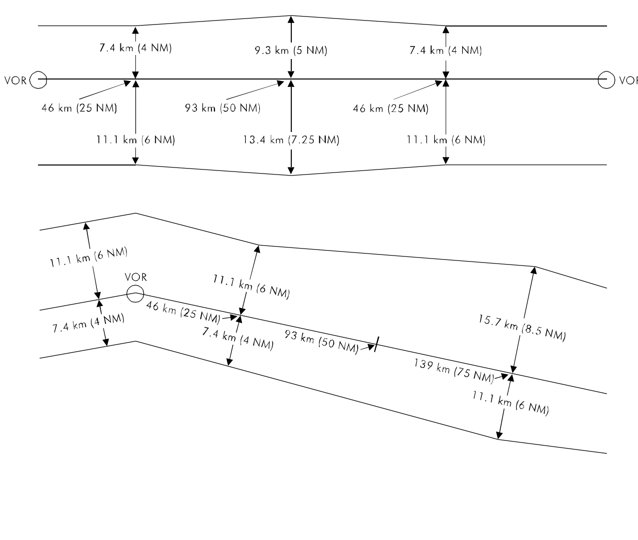

Figure A-8

6. Change-over points for VORs

6.1 When considering the establishment of points for changeover from one VOR to another for primary navigational guidance on VOR-defined ATS routes, States should bear in mind that:

a) the establishment of change-over points should be made on the basis of performance of the VOR stations concerned, including an evaluation of the interference protection criteria. The process should be verified by flight checking (see Doc 8071, Volume I, Part II);

b) where frequency protection is critical, flight inspection should be undertaken at the highest altitudes to which the facility is protected.

6.2 Nothing in 6.1 should be interpreted as placing a restriction on the service ranges of VOR installations meeting the specifications in Annex 10, Volume I, 3.3.

7. Calculation of radius of turn

7.1 The method used to calculate turn radii and the turn radii indicated below are applicable to aircraft performing a constant radius turn. The material has been derived from the turn performance criteria developed for RNP 1 ATS routes and can be used in the construction of the required additional protected airspace on the inside of turns also for ATS routes other than those defined by VOR.

7.2 Turn performance is dependent on two parameters — ground speed and bank angle. Due to the effect of the wind component changing with the change of heading, the ground speed and hence bank angle will change during a constant radius turn. However, for turns not greater than approximately 90 degrees and for the speed values considered below, the following formula can be used to calculate the achievable constant radius of turn, where the ground speed is the sum of the true airspeed and the wind speed:

$$\text{Radius of turn} = \frac{(\text{Ground speed})^2}{\text{Constant 'G'} * \text{TAN(bank angle)}}$$

7.3 The greater the ground speed, the greater will be the required bank angle. To ensure that the turn radius is representative for all foreseeable conditions, it is necessary to consider extreme parameters. A true airspeed of 1 020 km/h (550 kt) is considered probably the greatest to be encountered in the upper levels. Combined with maximum anticipated wind speeds in the medium and upper flight levels of 370 km/h (200 kt) [99.5 per cent values based on meteorological data], a maximum ground speed of 1 400 km/h (750 kt) should be considered. Maximum bank angle is very much a function of individual aircraft. Aircraft with high wing loadings flying at or near their maximum flight level are highly intolerant of extreme angles. Most transport aircraft are certified to fly no slower than 1.3 times their stall speed for any given configuration. Because the stall speed rises with TAN(bank angle), many operators try not to cruise below 1.4 times the stall speed to protect against gusts or turbulence. For the same reason, many transport aircraft fly at reduced maximum angles of bank in cruise conditions. Hence, it can be assumed that the highest bank angle which can be tolerated by all aircraft types is in the order of 20 degrees.

7.4 By calculation, the radius of turn of an aircraft flying at 1 400 km/h (750 kt) ground speed, with a bank angle of 20 degrees, is 22.51 NM (41.69 km). For purposes of expediency, this has been reduced to 22.5 NM (41.6 km). Following the same logic for the lower airspace, it is considered that up to FL 200 (6 100 m) the maximum figures to be encountered are a true airspeed of 740 km/h (400 kt), with a tailwind of 370 km/h (200 kt). Keeping the maximum bank angle of 20 degrees, and following the same formula, the turn would be defined along a radius of 14.45 NM (26.76 km). For expediency, this figure may be rounded up to 15 NM (27.8 km).

7.5 Given the above, the most logical break point between the two ground speed conditions is between FL 190 (5 800 m) and FL 200 (6 100 m). In order to encompass the range of turn anticipation algorithms used in current flight management systems (FMS) under all foreseeable conditions, the turn radius at FL 200 and above should be defined as 22.5 NM (41.6 km) and at FL 190 and below as 15 NM (27.8 km).

ATTACHMENT B. METHOD OF ESTABLISHING ATS ROUTES FOR USE BY RNAV-EQUIPPED AIRCRAFT

(Paragraph 2.7.1 and Section 2.12 refer)

1. Introduction

1.1 This guidance material is the result of studies carried out in several States. It also reflects the long existence of RNAV criteria in several States. It must be noted that some of the values contained herein have not been derived by means of the collision-risk/target level of safety method. This is indicated where applicable.

1.2 States are encouraged to keep ICAO fully informed of the results of their application of the provisions of this guidance material.

2. Operational applications of RNAV routes based on RNP 4

2.1 General

2.1.1 This guidance material is meant for use on RNAV routes that are established within the coverage area of electronic navigation aids that will provide necessary updates and guard against RNAV "blunder" errors.

2.1.2 Only those aircraft that have been granted airworthiness/operational approval in accordance with Sections 5.5 and 5.6, *Manual on Required Navigation Performance (RNP)* (Doc 9613) are to be afforded air traffic services on RNAV routes developed in accordance with this material.

2.1.3 The use of RNAV equipment should be permitted for navigation along ATS routes defined by VOR. Additionally, RNAV routes may be provided where practicable and when justified by the number of aircraft with RNAV capability. The routes may be:

a) fixed RNAV routes;

b) contingency RNAV routes; and

c) random RNAV routings.

2.1.4 The navigational performance required of such RNAV equipment envisages a level of navigational accuracy for en-route purposes having a navigation performance equal to or better than a track-keeping accuracy of ±11.1 km (6 NM) for 99.5 per cent of the flight time of all aircraft using RNAV equipment. Navigational performance of this type is expected to be consistent with a track-keeping accuracy of ±7.4 km (4 NM) for 95 per cent of flight time of all aircraft using RNAV equipment. This level is similar to that currently achieved by aircraft without RNAV capability operating on existing routes defined by VOR or VOR/DME, where the VORs are less than 93 km (50 NM) apart.

2.2 Protected airspace for RNAV ATS routes based on RNP 4

2.2.1 The minimum protected airspace provided for RNAV ATS routes should be 11.1 km (6 NM) either side of the intended track, within which RNAV-equipped aircraft can be expected to remain for 99.5 per cent of the flight time. Before applying the values stemming from this concept, account should be taken of any practical experience gained in the airspace under consideration as well as the possibility of achieving improvements in the overall navigation performance of aircraft. In this context, when lateral deviations are being controlled with the aid of radar monitoring, the size of the protected airspace required may be reduced in accordance with the following:

	Percentage containment					
	95	*96*	*97*	*98*	*99*	*99.5*
km	±7.4	±7.4	±8.3	±9.3	±10.2	±11.1
NM	±4.0	±4.0	±4.5	±5.0	±5.5	±6.0

2.2.2 Radar monitoring studies indicate that any potential reduction of the protected airspace is closely related to traffic characteristics, information available to the controller, and sector workload. Finally, it is worth considering that the analysis of RNAV accuracy performed in terms of containment measurements by some European States has shown that flights with RNAV capability were within 5 NM of the route centre line for 99.5 per cent of the time (EUR Doc 001, RNAV/4 refers). If the appropriate ATS authority considers that more protection is required, e.g. because of proximity of prohibited, restricted or danger areas, climb and descent paths of military aircraft, etc., additional buffers should be provided.

2.2.3 Where there is an angular difference of more than 25 degrees between route segments, additional protected airspace, as indicated in Attachment A, 3.5 to 3.12 and Section 7, should be provided.

Note.— Different levels of navigation accuracy may be required by States for operations of RNAV-equipped aircraft. These requirements are not covered by this guidance material and may necessitate changes to protected airspace criteria.

2.3 Spacing between parallel RNAV routes based on RNP 4

When utilizing protected airspace as described in 2.2, route centre lines may be spaced such that the protected airspaces encompassing the 99.5 per cent containment values do not overlap. When implementing a spacing encompassing less than the 99.5 per cent containment values, radar monitoring is required.

3. Spacing between parallel tracks or between parallel RNAV route centre lines based on RNP type

3.1 It should be noted that, where indicated, the spacings depicted below are based on safety assessments performed specifically for a particular network of tracks or routes. As such, the assessments evaluated traffic characteristics which might be unique to the network being assessed. For example, some of these characteristics are traffic density, the frequency of aircraft passing with minimum separation, communication and surveillance facilities, etc. Additional information on performing safety assessments is contained in the *Manual on Airspace Planning Methodology for the Determination of Separation Minima* (Doc 9689).

3.2 When determining the spacing between parallel tracks or ATS routes (hereinafter referred to as a "system"), the safety assessment, involving an examination of items such as those listed in 3.1 above, should be performed against a minimum acceptable safety level.

3.2.1 Where "fatal accidents per flight hour" is considered to be an appropriate metric, a target level of safety (TLS) of 5×10^{-9} fatal accidents per flight hour per dimension should be applied for determining the acceptability of future en-route systems that will be implemented after the year 2000. Until then, a TLS of 2×10^{-8} fatal accidents per flight hour per dimension may be applied for this purpose.

3.2.2 However, where "fatal accidents per flight hour" is not considered to be an appropriate metric, justifiable alternative metrics and methods of assessment providing an acceptable level of safety may be established by States and, as appropriate, be implemented by regional agreements.

3.3 If, at the time a system is established or upon a subsequent system safety assessment, it is determined that the system does not meet the appropriate level of safety for the method of assessment being used, a reassessment should be considered. This assessment should be undertaken in accordance with Doc 9689 to determine if a level of safety equivalent to or better than the minimum acceptable level can be met.

3.4 Examples of spacings for systems in specific areas or regions based on RNP type are provided below. Where these spacings are based on the characteristics of a specific area or region (reference system), other States or regions will need to evaluate their own systems for comparability with the reference system.

3.4.1 For procedural environments:

a) **RNP 20**

Spacing: 185 km (100 NM);

Basis: Existing usage, based on long-standing, operational experience; and

Minimum ATS requirements:

NAV — All aircraft need RNP type 20 approval appropriate for the routes/tracks to be flown

COM — Voice communications through a third party

SUR — Procedural-pilot position reports.

b) **RNP 12.6**

Spacing: 110 km (60 NM);

Basis: Collision risk model performed for NAT Organized Track Structure (*Report of the Limited/North Atlantic Regional Air Navigation Meeting (1976)* (Doc 9182)); and

Minimum ATS requirements:

NAV — All aircraft need RNP type 12.6 approval appropriate for the routes/tracks to be flown

COM — Voice communications through a third party

SUR — Procedural-pilot position reports

Other — System safety must be evaluated periodically.

Note.— Direct controller/pilot communications may be desirable in certain areas, such as areas of known convective weather.

c) **RNP 10**

Spacing: 93 km (50 NM);

Basis: Collision risk model performed by the United States Federal Aviation Administration for the Pacific Region based on North Pacific traffic characteristics; and

Minimum ATS requirements:

NAV — All aircraft need RNP type 10 approval appropriate for the routes/tracks to be flown

COM — Voice communications through a third party

SUR — Procedural-pilot position reports

Other — System safety must be evaluated periodically.

Note.— Direct controller/pilot communications may be desirable in certain areas, such as areas of known convective weather.

d) **RNP 5 (or RNP 4 or better)**

Spacing: 30.6 km (16.5 NM) in a unidirectional system
33.3 km (18 NM) in a bi-directional system;

Basis: Comparison to a high-density continental reference system (VOR spacing) as described in Attachment A; and

Minimum ATS requirements:

NAV — All aircraft need RNP type 5 approval appropriate for the routes/tracks to be flown, and the NAVAID infrastructure must be provided sufficient to support RNP 5 operations

COM — Direct VHF controller/pilot voice communications

SUR — Procedural-pilot position reports.

Note 1.— Guidance material relating to the use of RNP 5 is contained in the Manual on Required Navigation Performance (RNP) *(Doc 9613).*

Note 2.— This spacing was not developed for applicability in remote and/or oceanic airspace where an appropriate VOR infrastructure is not available.

e) **RNP 4**

Spacing: 55.5 km (30 NM);

Basis 1: Safety assessment performed by the United States Federal Aviation Administration based on analysis of acceptable rate of gross lateral errors in a parallel route system using 55.5 km (30 NM) track spacing while meeting a target level of safety of 5×10^{-9} fatal accidents per flight hour.

Basis 2: Minimum requirements for communications and surveillance listed below are operationally necessary to manage contingency and emergency events in a 55.5 km (30 NM) route system.

Note.— Further information on the safety assessment performed is contained in the Manual on Airspace Planning Methodology for the Determination of Separation Minima *(Doc 9689).*

Minimum ATS requirements:

NAV — RNP 4 shall be prescribed for the designated area, tracks or ATS routes

COM — Direct controller-pilot voice communications or controller-pilot data link communications (CPDLC)

SUR — An ADS-C system in which an event contract must be set that includes a lateral deviation event report whenever a deviation from track centre line greater than 9.3 km (5 NM) occurs.

Other — Prior to implementation, a system verification of sufficient duration and integrity shall be performed to demonstrate that the maximum acceptable rate of lateral deviations greater than or equal to 27.8 km (15 NM) will not exceed those listed in Table B-1 and that the system meets operational and technical requirements. The verification should be conducted after the minimum navigation, communications and surveillance requirements listed above have been met. Following implementation, a monitoring programme must be established to periodically verify that the system's actual rate of lateral deviations greater than or equal to 27.8 km (15 NM) does not exceed the maximum prescribed in Table B-1 (information pertaining to monitoring can be found in the *Manual on Airspace Planning Methodology for the Determination of Separation Minima* (Doc 9689), Chapter 8.

Note 1.— The airspace planner should first decide which of the four system descriptions applies in the airspace under consideration. If the system is not identical to one of the four cases described in Table B-1, the planner should conservatively interpolate between the cases by taking from the two cases that resemble the system, the one with the lower lateral deviation rate. Next, select from the first column, the value of system lateral occupancy that the system is not expected to exceed over the planning horizon. By reading the table at the row and column selected, the airspace planner obtains the value of the lateral deviation rate that should not be exceeded in the system to meet the TLS of 5×10^{-9} fatal accidents per flight hour.

Note 2.— Lateral deviations that should be considered for the purposes of assessing the system safety are any deviation from track of a magnitude greater than or equal to 27.8 km (15 NM) which are not associated with the execution of an approved contingency procedure.

Note 3.— Procedures pertaining to the use of ADS-C and CPDLC are contained in the PANS-ATM (Doc 4444), Chapters 13 and 14, respectively. Criteria for CPDLC and ADS-C should be established by an appropriate safety assessment. Information on safety assessments is contained in the Manual on Airspace Planning Methodology for the Determination of Separation Minima *(Doc 9689).*

Note 4.— This spacing was developed for applicability in remote and/or oceanic airspace where an appropriate VOR infrastructure is not available.

Note 5.— In this material, lateral occupancy means a number equal to twice the number of laterally proximate pairs of aircraft divided by the total number of aircraft. A detailed explanation of the terms used in collision risk modelling is contained in the Air Traffic Services Planning Manual *(Doc 9426), Part II, Chapter 4, Appendices A and C.*

3.4.2 For radar environments:

a) **RNP 4**

Spacing: 14.8-22.2 km (8-12 NM);

Basis: Comparison to a reference system — containment areas, determined in accordance with 2.2.1, do not overlap; and

Minimum ATS requirements:

NAV — All aircraft need at least RNP type 4 approval appropriate for the routes/tracks to be flown, and the NAVAID infrastructure must be provided sufficient to support RNP 4 operations

COM — Direct VHF controller/pilot voice communications

SUR — Radar which meets existing standards

Other — System safety, including controller workload, must be evaluated.

b) **RNP 5**

Spacing: 18.5-27.8 km (10-15 NM);

Basis: Comparison to a reference system — containment areas, adapted from the provisions of 2.2.1 above to reflect RNP 5, do not overlap; and

Minimum ATS requirements:

NAV — All aircraft need at least RNP type 5 appropriate for the routes/tracks to be flown, and the NAVAID infrastructure must be provided sufficient to support RNP 5 operations

COM — Direct VHF controller/pilot voice communications

SUR — Radar which meets existing standards

Other — System safety, including controller workload, must be evaluated.

COVER SHEET TO AMENDMENT 18

INTERNATIONAL STANDARDS
AND RECOMMENDED PRACTICES

SEARCH AND RESCUE

ANNEX 12
TO THE CONVENTION ON INTERNATIONAL CIVIL AVIATION

EIGHTH EDITION — JULY 2004

INTERNATIONAL CIVIL AVIATION ORGANIZATION

Checklist of Amendments to Annex 12

	Effective date	*Date of applicability*
Eighth Edition (incorporates Amendments 1 to 17)	12 July 2004	25 November 2004
Amendment 18 (adopted by the Council on 16 March 2007) Replacement pages (viii), 4-1 and 4-2	16 July 2007	22 November 2007

Transmittal note

Amendment 18

to the

International Standards and
Recommended Practices

SEARCH AND RESCUE

(Annex 12 to the Convention on International Civil Aviation)

1. Insert the following replacement pages in Annex 12 (Eighth Edition) to incorporate Amendment 18 which becomes applicable on 22 November 2007:

   a) Page (viii) — Foreword

   b) Pages 4-1 and 4-2 — Chapter 4

2. Record the entry of this amendment on page (ii).

CHAPTER 4. PREPARATORY MEASURES

4.1 Preparatory information

4.1.1 Each rescue coordination centre shall have readily available at all times up-to-date information concerning the following in respect of its search and rescue region:

a) search and rescue units, rescue subcentres and alerting posts;

b) air traffic services units;

c) means of communication that may be used in search and rescue operations;

d) addresses and telephone numbers of all operators, or their designated representatives, engaged in operations in the region; and

e) any other public and private resources including medical and transportation facilities that are likely to be useful in search and rescue.

4.1.2 **Recommendation.—** *Each rescue coordination centre should have readily available all other information of interest to search and rescue, including information regarding:*

a) the locations, call signs, hours of watch, and frequencies of all radio stations likely to be employed in support of search and rescue operations;

b) the locations and hours of watch of services keeping radio watch, and the frequencies guarded;

c) locations where supplies of droppable emergency and survival equipment are stored; and

d) objects which it is known might be mistaken for unlocated or unreported wreckage, particularly if viewed from the air.

4.1.3 **Recommendation.—** *Each rescue coordination centre whose search and rescue region includes maritime areas should have ready access to information regarding the position, course and speed of ships within such areas that may be able to provide assistance to aircraft in distress and information on how to contact them.*

Note.— This information may either be kept in the rescue coordination centres or be readily accessible

4.1.4 **Recommendation**.— *Contracting States should, individually or in cooperation with other States, either establish ship reporting systems in cooperation with maritime authorities or arrange communication links with Amver or regional ship reporting systems to facilitate search and rescue operations at sea.*

Note.— Amver is a cooperative international ship reporting system with worldwide coverage that is available for interrogation by all rescue coordination centres. A number of Contracting States also operate regional ship reporting systems.

4.2 Plans of operation

4.2.1 Each rescue coordination centre shall prepare detailed plans of operation for the conduct of search and rescue operations within its search and rescue region.

4.2.2 **Recommendation**.— *Search and rescue plans of operations should be developed jointly with representatives of the operators and other public or private services that may assist in providing search and rescue services or benefit from them, taking into account that the number of survivors could be large.*

4.2.3 The plans of operation shall specify arrangements for the servicing and refuelling, to the extent possible, of aircraft, vessels and vehicles employed in search and rescue operations, including those made available by other States.

4.2.4 The search and rescue plans of operation shall contain details regarding actions to be taken by those persons engaged in search and rescue, including:

a) the manner in which search and rescue operations are to be conducted in the search and rescue region;

b) the use of available communication systems and facilities;

c) the actions to be taken jointly with other rescue coordination centres;

d) the methods of alerting en-route aircraft and ships at sea;

e) the duties and prerogatives of persons assigned to search and rescue;

f) the possible redeployment of equipment that may be necessitated by meteorological or other conditions;

g) the methods for obtaining essential information relevant to search and rescue operations, such as weather reports and forecasts, appropriate NOTAM, etc.;

h) the methods for obtaining, from other rescue coordination centres, such assistance, including aircraft, vessels, persons or equipment, as may be needed;

i) the methods for assisting distressed aircraft being compelled to ditch to rendezvous with surface craft;

j) the methods for assisting search and rescue or other aircraft to proceed to aircraft in distress; and

k) cooperative actions to be taken in conjunction with air traffic services units and other authorities concerned to assist aircraft known or believed to be subject to unlawful interference.

4.2.5 **Recommendation.—** *Search and rescue plans of operation should be integrated with airport emergency plans to provide for rescue services in the vicinity of aerodromes including, for coastal aerodromes, areas of water.*

4.3 Search and rescue units

4.3.1 Each search and rescue unit shall:

a) be cognizant of all parts of the plans of operation prescribed in 4.2 that are necessary for the effective conduct of its duties; and

b) keep the rescue coordination centre informed of its preparedness.

4.3.2 Contracting States shall:

a) maintain in readiness the required number of search and rescue facilities; and

b) maintain adequate supplies of rations, medical stores, signalling devices and other survival and rescue equipment.

4.4 Training and exercises

To achieve and maintain maximum efficiency in search and rescue, Contracting States shall provide for regular training of their search and rescue personnel and arrange appropriate search and rescue exercises.

4.5 Wreckage

Recommendation.— *Each Contracting State should ensure that wreckage resulting from aircraft accidents within its territory or, in the case of accidents on the high seas or in areas of undetermined sovereignty, within the search and rescue regions for which it is responsible, is removed, obliterated or charted following completion of the accident investigation, if its presence might constitute a hazard or confuse subsequent search and rescue operations.*

AIRCRAFT ACCIDENT AND INCIDENT INVESTIGATION

ANNEX 13

TO THE CONVENTION ON INTERNATIONAL CIVIL AVIATION

NINTH EDITION — JULY 2001

CORRIGENDUM NO. 3

1. Please replace existing page 8-1 dated 23/11/06 by the attached new page bearing the notation "Corr. 3".

2. Record the entry of this corrigendum on page (ii).

CHAPTER 8. ACCIDENT PREVENTION MEASURES

Note.— The objective of these specifications is to promote accident prevention by analysis of accident and incident data and by a prompt exchange of information.

Incident reporting systems

8.1 A State shall establish a mandatory incident reporting system to facilitate collection of information on actual or potential safety deficiencies.

8.2 **Recommendation.—** *A State should establish a voluntary incident reporting system to facilitate the collection of information that may not be captured by a mandatory incident reporting system.*

8.3 A voluntary incident reporting system shall be non-punitive and afford protection to the sources of the information.

Note 1.— A non-punitive environment is fundamental to voluntary reporting.

Note 2.— States are encouraged to facilitate and promote the voluntary reporting of events that could affect aviation safety by adjusting their applicable laws, regulations and policies, as necessary.

Note 3.— Guidance related to both mandatory and voluntary incident reporting systems is contained in the Safety Management Manual (SMM) *(Doc 9859).*

Note 4.— Attachment E contains legal guidance for the protection of information from safety data collection and processing systems.

Database systems

8.4 **Recommendation.—** *A State should establish an accident and incident database to facilitate the effective analysis of information obtained, including that from its incident reporting systems.*

8.5 **Recommendation.—** *The database systems should use standardized formats to facilitate data exchange.*

Note 1.— Guidance material related to the specification for such databases will be provided by ICAO upon request from States.

Note 2.— States are encouraged to foster regional arrangements, as appropriate, when implementing 8.4.

Analysis of data — Preventive actions

8.6 A State having established an accident and incident database and an incident reporting system shall analyse the information contained in its accident/incident reports and the database to determine any preventive actions required.

Note.— Additional information on which to base preventive actions may be contained in the Final Reports on investigated accidents and incidents.

8.7 **Recommendation.—** *If a State, in the analysis of the information contained in its database, identifies safety matters considered to be of interest to other States, that State should forward such safety information to them as soon as possible.*

8.8 **Recommendation.—** *In addition to safety recommendations arising from accident and incident investigations, safety recommendations may result from diverse sources, including safety studies. If safety recommendations are addressed to an organization in another State, they should also be transmitted to that State's investigation authority.*

Exchange of safety information

8.9 **Recommendation.—** *States should promote the establishment of safety information sharing networks among all users of the aviation system and should facilitate the free exchange of information on actual and potential safety deficiencies.*

Note.— Standardized definitions, classifications and formats are needed to facilitate data exchange. Guidance material on the specifications for such information-sharing networks will be provided by ICAO upon request.

Updating of existing provisions related to the distribution of NOTAM on volcanic activity; use of the AIRAC system; information included in pre-flight briefings; and information to be included in the AIP.	2 March 2007 16 July 2007 22 November 2007

INTERNATIONAL STANDARDS AND RECOMMENDED PRACTICES

CHAPTER 1. INTRODUCTION

The object of the aeronautical information service is to ensure the flow of information/data necessary for the safety, regularity and efficiency of international air navigation. The role and importance of aeronautical information/data changed significantly with the implementation of area navigation (RNAV), required navigation performance (RNP), airborne computer-based navigation systems and data link systems. Corrupt or erroneous aeronautical information/data can potentially affect the safety of air navigation.

To satisfy the uniformity and consistency in the provision of aeronautical information/data that is required for the operational use by computer-based navigation systems, States shall, as far as practicable, avoid standards and procedures other than those established for international use.

These Standards and Recommended Practices are to be used in conjunction with the *Procedures for Air Navigation Services — ICAO Abbreviations and Codes* (PANS-ABC, Doc 8400).

It is recognized that Supplementary Procedures may be required in certain cases in order to meet particular requirements of the ICAO Regions.

Guidance material on the organization and operation of aeronautical information services is contained in the *Aeronautical Information Services Manual* (Doc 8126).

CHAPTER 2. DEFINITIONS

When the following terms are used in the Standards and Recommended Practices for aeronautical information services, they have the following meanings:

Accuracy. A degree of conformance between the estimated or measured value and the true value.

Note.— For measured positional data the accuracy is normally expressed in terms of a distance from a stated position within which there is a defined confidence of the true position falling.

Aeronautical data. A representation of aeronautical facts, concepts or instructions in a formalized manner suitable for communication, interpretation or processing.

Aeronautical information. Information resulting from the assembly, analysis and formatting of aeronautical data.

Aeronautical Information Circular (AIC). A notice containing information that does not qualify for the origination of a NOTAM or for inclusion in the AIP, but which relates to flight safety, air navigation, technical, administrative or legislative matters.

Aeronautical Information Publication (AIP). A publication issued by or with the authority of a State and containing aeronautical information of a lasting character essential to air navigation.

Aeronautical information service (AIS). A service established within the defined area of coverage responsible for the provision of aeronautical information/data necessary for the safety, regularity and efficiency of air navigation.

AIP Amendment. Permanent changes to the information contained in the AIP.

AIP Supplement. Temporary changes to the information contained in the AIP which are published by means of special pages.

AIRAC. An acronym (aeronautical information regulation and control) signifying a system aimed at advance notification based on common effective dates, of circumstances that necessitate significant changes in operating practices.

Air defence identification zone (ADIZ). Special designated airspace of defined dimensions within which aircraft are required to comply with special identification and/or reporting procedures additional to those related to the provision of air traffic services (ATS).

AIS product. Aeronautical information provided in the form of the elements of the Integrated Aeronautical Information Package (except NOTAM and PIB), including aeronautical charts, or in the form of suitable electronic media.

Application. Manipulation and processing of data in support of user requirements (ISO 19104*).

ASHTAM. A special series NOTAM notifying by means of a specific format change in activity of a volcano, a volcanic eruption and/or volcanic ash cloud that is of significance to aircraft operations.

Assemble. A process of merging data from multiple sources into a database and establishing a baseline for subsequent processing.

Note.— The assemble phase includes checking the data and ensuring that detected errors and omissions are rectified.

ATS surveillance service. Term used to indicate a service provided directly by means of an ATS surveillance system.

ATS surveillance system. A generic term meaning variously, ADS-B, PSR, SSR or any comparable ground-based system that enables the identification of aircraft.

Note.— A comparable ground-based system is one that has been demonstrated, by comparative assessment or other methodology, to have a level of safety and performance equal to or better than monopulse SSR.

Automatic dependent surveillance — broadcast (ADS-B). A means by which aircraft, aerodrome vehicles and other objects can automatically transmit and/or receive data such as identification, position and additional data, as appropriate, in a broadcast mode via a data link.

Automatic dependent surveillance — contract (ADS-C). A means by which the terms of an ADS-C agreement will be exchanged between the ground system and the aircraft, via a data link, specifying under what conditions ADS-C reports would be initiated, and what data would be contained in the reports.

---

* All ISO Standards are listed at the end of this chapter.

Note.— The abbreviated term "ADS contract" is commonly used to refer to ADS event contract, ADS demand contract, ADS periodic contract or an emergency mode.

Automatic terminal information service (ATIS). The automatic provision of current, routine information to arriving and departing aircraft throughout 24 hours or a specified portion thereof:

Data link-automatic terminal information service (D-ATIS). The provision of ATIS via data link.

Voice-automatic terminal information service (Voice-ATIS). The provision of ATIS by means of continuous and repetitive voice broadcasts.

Bare Earth. Surface of the Earth including bodies of water and permanent ice and snow, and excluding vegetation and man-made objects.

Calendar. Discrete temporal reference system that provides the basis for defining temporal position to a resolution of one day (ISO 19108*).

Canopy. Bare Earth supplemented by vegetation height.

Controller-pilot data link communications (CPDLC). A means of communication between controller and pilot, using data link for ATC communications.

Culture. All man-made features constructed on the surface of the Earth, such as cities, railways and canals.

Cyclic redundancy check (CRC). A mathematical algorithm applied to the digital expression of data that provides a level of assurance against loss or alteration of data.

Danger area. An airspace of defined dimensions within which activities dangerous to the flight of aircraft may exist at specified times.

Database. One or more files of data so structured that appropriate applications may draw from the files and update them.

Note.— This primarily refers to data stored electronically and accessed by computer rather than in files of physical records.

Data product. Data set or data set series that conforms to a data product specification (ISO 19131*).

Data product specification. Detailed description of a data set or data set series together with additional information that will enable it to be created, supplied to and used by another party (ISO 19131*).

Note.— A data product specification provides a description of the universe of discourse and a specification for mapping the universe of discourse to a data set. It may be used for production, sales, end-use or other purpose.

Data quality. A degree or level of confidence that the data provided meets the requirements of the data user in terms of accuracy, resolution and integrity.

Data set. Identifiable collection of data (ISO 19101*).

Data set series. Collection of data sets sharing the same product specification (ISO 19115*).

Datum. Any quantity or set of quantities that may serve as a reference or basis for the calculation of other quantities (ISO 19104*).

Digital Elevation Model (DEM). The representation of terrain surface by continuous elevation values at all intersections of a defined grid, referenced to common datum.

Note.— Digital Terrain Model (DTM) is sometimes referred to as DEM.

Direct transit arrangements. Special arrangements approved by the public authorities concerned by which traffic which is pausing briefly in its passage through the Contracting State may remain under their direct control.

Ellipsoid height (Geodetic height). The height related to the reference ellipsoid, measured along the ellipsoidal outer normal through the point in question.

Feature. Abstraction of real world phenomena (ISO 19101*).

Feature attribute. Characteristic of a feature (ISO 19101*).

Note.— A feature attribute has a name, a data type and a value domain associated with it.

Feature operation. Operation that every instance of a feature type may perform (ISO 19110*).

Note.— An operation upon the feature type dam is to raise the dam. The result of this operation is to raise the level of water in the reservoir.

Feature relationship. Relationship that links instances of one feature type with instances of the same or a different feature type (ISO 19101*).

Feature type. Class of real world phenomena with common properties (ISO 19110*).

Note.— In a feature catalogue, the basic level of classification is the feature type.

Geodesic distance. The shortest distance between any two points on a mathematically defined ellipsoidal surface.

Geodetic datum. A minimum set of parameters required to define location and orientation of the local reference system with respect to the global reference system/frame.

Geoid. The equipotential surface in the gravity field of the Earth which coincides with the undisturbed mean sea level (MSL) extended continuously through the continents.

Note.— The geoid is irregular in shape because of local gravitational disturbances (wind tides, salinity, current, etc.) and the direction of gravity is perpendicular to the geoid at every point.

Geoid undulation. The distance of the geoid above (positive) or below (negative) the mathematical reference ellipsoid.

Note.— In respect to the World Geodetic System — 1984 (WGS-84) defined ellipsoid, the difference between the WGS-84 ellipsoidal height and orthometric height represents WGS-84 geoid undulation.

Gregorian calendar. Calendar in general use; first introduced in 1582 to define a year that more closely approximates the tropical year than the Julian calendar (ISO 19108*).

Note.— In the Gregorian calendar, common years have 365 days and leap years 366 days divided into twelve sequential months.

Height. The vertical distance of a level, point or an object considered as a point, measured from a specific datum.

Heliport. An aerodrome or a defined area on a structure intended to be used wholly or in part for the arrival, departure and surface movement of helicopters.

Human Factors principles. Principles which apply to aeronautical design, certification, training, operations and maintenance and which seek safe interface between the human and other system components by proper consideration to human performance.

Integrated Aeronautical Information Package. A package which consists of the following elements:

— AIP, including amendment service;

— Supplements to the AIP;

— NOTAM and PIB;

— AIC; and

— checklists and lists of valid NOTAM.

Integrity (aeronautical data). A degree of assurance that an aeronautical data and its value has not been lost or altered since the data origination or authorized amendment.

International airport. Any airport designated by the Contracting State in whose territory it is situated as an airport of entry and departure for international air traffic, where the formalities incident to customs, immigration, public health, animal and plant quarantine and similar procedures are carried out.

International NOTAM office (NOF). An office designated by a State for the exchange of NOTAM internationally.

Logon address. A specified code used for data link logon to an ATS unit.

Manoeuvring area. That part of an aerodrome to be used for the take-off, landing and taxiing of aircraft, excluding aprons.

Metadata. Data about data (ISO 19115*).

Note.— Data that describes and documents data.

Minimum en-route altitude (MEA). The altitude for an en-route segment that provides adequate reception of relevant navigation facilities and ATS communications, complies with the airspace structure and provides the required obstacle clearance.

Minimum obstacle clearance altitude (MOCA). The minimum altitude for a defined segment of flight that provides the required obstacle clearance.

Movement area. That part of an aerodrome to be used for the take-off, landing and taxiing of aircraft, consisting of the manoeuvring area and the apron(s).

NOTAM. A notice distributed by means of telecommunication containing information concerning the establishment, condition or change in any aeronautical facility, service, procedure or hazard, the timely knowledge of which is essential to personnel concerned with flight operations.

Obstacle. All fixed (whether temporary or permanent) and mobile objects, or parts thereof, that are located on an area intended for the surface movement of aircraft or that extend above a defined surface intended to protect aircraft in flight.

Obstacle/terrain data collection surface. A defined surface intended for the purpose of collecting obstacle/terrain data.

Orthometric height. Height of a point related to the geoid, generally presented as an MSL elevation.

Portrayal. Presentation of information to humans (ISO 19117*).

Position (geographical). Set of coordinates (latitude and longitude) referenced to the mathematical reference ellipsoid which define the position of a point on the surface of the Earth.

Post spacing. Angular or linear distance between two adjacent elevation points.

Precision. The smallest difference that can be reliably distinguished by a measurement process.

Note.— In reference to geodetic surveys, precision is a degree of refinement in performance of an operation or a degree of perfection in the instruments and methods used when taking measurements.

Pre-flight information bulletin (PIB). A presentation of current NOTAM information of operational significance, prepared prior to flight.

Prohibited area. An airspace of defined dimensions, above the land areas or territorial waters of a State, within which the flight of aircraft is prohibited.

Quality. Degree to which a set of inherent characteristics fulfils requirements (ISO 9000*).

Note 1.— The term "quality" can be used with adjectives such as poor, good or excellent.

Note 2.— "Inherent", as opposed to "assigned", means existing in something, especially as a permanent characteristic.

Quality assurance. Part of quality management focused on providing confidence that quality requirements will be fulfilled (ISO 9000*).

Quality control. Part of quality management focused on fulfilling quality requirements (ISO 9000*).

Quality management. Coordinated activities to direct and control an organization with regard to quality (ISO 9000*).

Relief. The inequalities in elevation of the surface of the Earth represented on aeronautical charts by contours, hypsometric tints, shading or spot elevations.

Requirement. Need or expectation that is stated, generally implied or obligatory (ISO 9000*).

Note 1.— "Generally implied" means that it is custom or common practice for the organization, its customers and other interested parties, that the need or expectation under consideration is implied.

Note 2.— A qualifier can be used to denote a specific type of requirement, e.g. product requirement, quality management requirement, customer requirement.

Note 3.— A specified requirement is one which is stated, for example, in a document.

Note 4.— Requirements can be generated by different interested parties.

Resolution. A number of units or digits to which a measured or calculated value is expressed and used.

Restricted area. An airspace of defined dimensions, above the land areas or territorial waters of a State, within which the flight of aircraft is restricted in accordance with certain specified conditions.

Route stage. A route or portion of a route flown without an intermediate landing.

SNOWTAM. A special series NOTAM notifying the presence or removal of hazardous conditions due to snow, ice, slush or standing water associated with snow, slush and ice on the movement area, by means of a specific format.

Station declination. An alignment variation between the zero degree radial of a VOR and true north, determined at the time the VOR station is calibrated.

Terrain. The surface of the Earth containing naturally occurring features such as mountains, hills, ridges, valleys, bodies of water, permanent ice and snow, and excluding obstacles.

Note.— In practical terms, depending on the method of data collection used, terrain represents the continuous surface that exists at the bare Earth, the top of the canopy or something in-between, also known as "first reflective surface".

Traceability. Ability to trace the history, application or location of that which is under consideration (ISO 9000*).

Note.— When considering product, traceability can relate to:

— the origin of materials and parts;

— the processing history; and

— the distribution and location of the product after delivery.

Validation. Confirmation, through the provision of objective evidence, that the requirements for a specific intended use or application have been fulfilled (ISO 9000*).

Verification. Confirmation, through the provision of objective evidence, that specified requirements have been fulfilled (ISO 9000*).

Note 1.— The term "verified" is used to designate the corresponding status.

Note 2.— Confirmation can comprise activities such as:

— *performing alternative calculations;*

— *comparing a new design specification with a similar proven design specification;*

— *undertaking tests and demonstrations; and*

— *reviewing documents prior to issue.*

VOLMET. Meteorological information for aircraft in flight.

Data link-VOLMET (D-VOLMET). Provision of current aerodrome routine meteorological reports (METAR) and aerodrome special meteorological reports (SPECI), aerodrome forecasts (TAF), SIGMET, special air-reports not covered by a SIGMET and, where available, AIRMET via data link.

VOLMET broadcast. Provision, as appropriate, of current METAR, SPECI, TAF and SIGMET by means of continuous and repetitive voice broadcasts.

CHAPTER 4. AERONAUTICAL INFORMATION PUBLICATIONS (AIP)

Note 1.— AIP are intended primarily to satisfy international requirements for the exchange of aeronautical information of a lasting character essential to air navigation. When practicable, the form of presentation is designed to facilitate their use in flight.

Note 2.— AIP constitute the basic information source for permanent information and long duration temporary changes.

4.1 Contents

4.1.1 An Aeronautical Information Publication shall contain, in three parts, sections and subsections uniformly referenced to allow for standardized electronic data storage and retrieval, current information relating to, and arranged under, those subjects enumerated in Appendix 1 that appear in Roman type, except that when the AIP, or volume of the AIP, is designed basically to facilitate operational use in flight, the precise format and arrangement may be left to the discretion of the State provided that an adequate table of contents is included.

4.1.1.1 **Recommendation.—** *Aeronautical Information Publications should, in addition, contain current information relating to those subjects enumerated in Appendix 1 that appear in italic type.*

4.1.2 Aeronautical Information Publications shall include in Part 1 — General (GEN):

a) a statement of the competent authority responsible for the air navigation facilities, services or procedures covered by the AIP;

b) the general conditions under which the services or facilities are available for international use;

c) a list of significant differences between the national regulations and practices of the State and the related ICAO Standards, Recommended Practices and Procedures, given in a form that would enable a user to differentiate readily between the requirements of the State and the related ICAO provisions;

d) the choice made by a State in each significant case where an alternative course of action is provided for in ICAO Standards, Recommended Practices and Procedures.

4.1.3 The aeronautical charts listed alphabetically below shall, when available for designated international aerodromes/heliports, form part of the AIP, or be distributed separately to recipients of the AIP:

a) Aerodrome/Heliport Chart — ICAO;

b) Aerodrome Ground Movement Chart — ICAO;

c) Aerodrome Obstacle Chart — ICAO Type A;

d) Aerodrome Terrain and Obstacle Chart — ICAO (Electronic);

e) Aircraft Parking/Docking Chart — ICAO;

f) Area Chart — ICAO;

g) ATC Surveillance Minimum Altitude Chart — ICAO;

h) Instrument Approach Chart — ICAO;

i) Precision Approach Terrain Chart — ICAO;

j) Standard Arrival Chart — Instrument (STAR) — ICAO;

k) Standard Departure Chart — Instrument (SID) — ICAO;

l) Visual Approach Chart — ICAO.

Note.— A page pocket may be used in the AIP to include the Aerodrome Terrain and Obstacle Chart — ICAO (Electronic) on appropriate electronic media.

4.1.4 Charts, maps or diagrams shall be used, when appropriate, to complement or as a substitute for the tabulations or text of Aeronautical Information Publications.

Note.— Where appropriate, charts produced in conformity with Annex 4 — Aeronautical Charts, *may be used to fulfil this requirement. Guidance material as to the specifications of index maps and diagrams included in Aeronautical Information Publications is contained in the* Aeronautical Information Services Manual *(Doc 8126).*

4.2 General specifications

4.2.1 Each Aeronautical Information Publication shall be self-contained and shall include a table of contents.

Note.— If it is necessary by reason of bulk or for convenience, to publish an AIP in two or more parts or volumes, each of them will indicate that the remainder of the information is to be found in the other part(s) or volume(s).

4.2.1.1 Each AIP shall not duplicate information within itself or from other sources.

4.2.1.2 When two or more States combine to issue a joint AIP, this shall be made clear both on the cover and in the table of contents.

4.2.2 **Recommendation.—** *AIP should be published in loose-leaf form unless the complete publication is reissued at frequent intervals.*

4.2.3 Each Aeronautical Information Publication shall be dated. In the case of Aeronautical Information Publications issued in loose-leaf form, each page shall be dated. The date, consisting of the day, month (by name) and year, shall be the publication date or the effective date of the information.

4.2.4 A checklist giving the current date of each page in the Aeronautical Information Publication series shall be reissued frequently to assist the user in maintaining a current publication. The page number/chart title and date of the checklist shall appear on the checklist itself.

4.2.5 Each Aeronautical Information Publication issued as a bound volume and each page of an Aeronautical Information Publication issued in loose-leaf form shall be so annotated as to indicate clearly:

a) the identity of the Aeronautical Information Publication;

b) the territory covered and subdivisions when necessary;

c) the identification of the issuing State and producing organization (authority);

d) page numbers/chart titles;

e) the degree of reliability if the information is doubtful.

4.2.6 **Recommendation.—** *The sheet size should be no larger than 210 × 297 mm, except that larger sheets may be used provided they are folded to the same size.*

4.2.7 All changes to the AIP, or new information on a reprinted page, shall be identified by a distinctive symbol or annotation.

4.2.8 Operationally significant changes to the AIP shall be published in accordance with AIRAC procedures and shall be clearly identified by the acronym — AIRAC.

4.2.9 AIP shall be amended or reissued at such regular intervals as may be necessary to keep them up to date. Recourse to hand amendments or annotations shall be kept to the minimum. The normal method of amendment shall be by means of replacement sheets.

4.2.9.1 The regular interval referred to in 4.2.9 shall be specified in the AIP, Part 1 — General (GEN).

Note.— Guidance material on the establishment of intervals between publication dates of AIP Amendments is contained in the Aeronautical Information Services Manual *(Doc 8126).*

4.3 Specifications for AIP Amendments

4.3.1 Permanent changes to the AIP shall be published as AIP Amendments.

4.3.2 Each AIP Amendment shall be allocated a serial number, which shall be consecutive.

4.3.3 Each AIP Amendment page, including the cover sheet, shall display a publication date.

4.3.4 Each AIRAC AIP Amendment page, including the cover sheet, shall display an effective date.

4.3.5 When an AIP Amendment is issued, it shall include references to the serial number of those elements, if any, of the Integrated Aeronautical Information Package which have been incorporated into the amendment.

4.3.6 A brief indication of the subjects affected by the amendment shall be given on the AIP Amendment cover sheet.

4.3.7 When an AIP Amendment will not be published at the established interval or publication date, a NIL notification shall be originated and distributed by the monthly printed plain-language list of valid NOTAM required by 5.2.13.3.

4.4 Specifications for AIP Supplements

4.4.1 Temporary changes of long duration (three months or longer) and information of short duration which contains extensive text and/or graphics shall be published as AIP Supplements.

Note.— Guidance material on the use of AIP Supplements together with examples of such use is contained in the Aeronautical Information Services Manual *(Doc 8126).*

4.4.2 Each AIP Supplement shall be allocated a serial number which shall be consecutive and based on the calendar year.

4.4.3 AIP Supplement pages shall be kept in the AIP as long as all or some of their contents remain valid.

4.4.4 When an AIP Supplement is sent in replacement of a NOTAM, it shall include a reference to the serial number of the NOTAM.

4.4.5 A checklist of valid AIP Supplements shall be issued at intervals of not more than one month. This information shall be issued through the medium of the monthly printed plain-language list of valid NOTAM required by 5.2.13.3.

4.4.6 **Recommendation.—** *AIP Supplement pages should be coloured in order to be conspicuous, preferably in yellow.*

4.4.7 **Recommendation.—** *AIP Supplement pages should be kept as the first item in the AIP parts.*

4.5 Distribution

AIP, AIP Amendments and AIP Supplements shall be made available by the most expeditious means.

5.2.5 The NOTAM originator shall allocate to each NOTAM a series identified by a letter and a four-digit number followed by a stroke and a two-digit number for the year. The four-digit number shall be consecutive and based on the calendar year.

Note.— Letters A to Z, with the exception of S and T, may be used to identify a NOTAM series.

5.2.6 When errors occur in a NOTAM, a NOTAM with a new number to replace the erroneous NOTAM shall be issued.

5.2.7 When a NOTAM is issued which cancels or replaces a previous NOTAM, the series and number of the previous NOTAM shall be indicated. The series, location indicator and subject of both NOTAM shall be the same. Only one NOTAM shall be cancelled or replaced by a NOTAM.

5.2.8 Each NOTAM shall deal with only one subject and one condition of the subject.

Note.— Guidance concerning the combination of a subject and a condition of the subject in accordance with the NOTAM Selection Criteria is contained in the Aeronautical Information Services Manual *(Doc 8126).*

5.2.9 Each NOTAM shall be as brief as possible and so compiled that its meaning is clear without the need to refer to another document.

5.2.10 Each NOTAM shall be transmitted as a single telecommunication message.

5.2.11 A NOTAM containing permanent or temporary information of long duration shall carry appropriate AIP or AIP Supplement references.

5.2.12 Location indicators included in the text of a NOTAM shall be those contained in *Location Indicators* (Doc 7910).

5.2.12.1 In no case shall a curtailed form of such indicators be used.

5.2.12.2 Where no ICAO location indicator is assigned to the location, its place name spelt in accordance with 3.6.2 shall be entered in plain language.

5.2.13 A checklist of valid NOTAM shall be issued as a NOTAM over the Aeronautical Fixed Service (AFS) at intervals of not more than one month using the NOTAM Format specified in Appendix 6. One NOTAM shall be issued for each series.

5.2.13.1 A checklist of NOTAM shall refer to the latest AIP Amendments, AIP Supplements and at least the internationally distributed AIC.

5.2.13.2 A checklist of NOTAM shall have the same distribution as the actual message series to which they refer and shall be clearly identified as checklist.

5.2.13.3 A monthly printed plain-language list of valid NOTAM, including indications of the latest AIP Amendments, AIC issued and a checklist of AIP Supplements, shall be prepared with a minimum of delay and forwarded by the most expeditious means to recipients of the Integrated Aeronautical Information Package.

5.3 Distribution

5.3.1 NOTAM shall be distributed on the basis of a request.

5.3.2 NOTAM shall be prepared in conformity with the relevant provisions of the ICAO communication procedures.

5.3.2.1 The AFS shall, whenever practicable, be employed for NOTAM distribution.

5.3.2.2 When a NOTAM exchanged as specified in 5.3.4 is sent by means other than the AFS, a six-digit date-time group indicating the date and time of NOTAM origination, and the identification of the originator shall be used, preceding the text.

5.3.3 The originating State shall select the NOTAM that are to be given international distribution.

5.3.3.1 **Recommendation.—** *Selective distribution lists should be used when practicable.*

Note.— These lists are intended to obviate superfluous distribution of information. Guidance material relating to this is contained in the Aeronautical Information Services Manual *(Doc 8126).*

5.3.4 International exchange of NOTAM shall take place only as mutually agreed between the international NOTAM offices concerned. The international exchange of ASHTAM (see 5.2.4), and NOTAM where States continue to use NOTAM for distribution of information on volcanic activity, shall include volcanic ash advisory centres and the centres designated by regional air navigation agreement for the operation of AFS satellite distribution systems (satellite distribution system for information relating to air navigation (SADIS) and international satellite communications system (ISCS)), and shall take account of the requirements of long-range operations.

Note.— Arrangements may be made for direct exchange of SNOWTAM (see Appendix 2) between aerodromes/heliports.

5.3.4.1 These exchanges of NOTAM between international NOTAM offices shall, as far as practicable, be limited to the requirements of the receiving States concerned by means of separate series providing for at least international and domestic flights.

5.3.4.2 A predetermined distribution system for NOTAM transmitted on the AFS in accordance with Appendix 5 shall be used whenever possible, subject to the requirements of 5.3.4.

CHAPTER 6. AERONAUTICAL INFORMATION REGULATION AND CONTROL (AIRAC)

6.1 General specifications

6.1.1 Information concerning the circumstances listed in Appendix 4, Part 1, shall be distributed under the regulated system (AIRAC), i.e. basing establishment, withdrawal or significant changes upon a series of common effective dates at intervals of 28 days, including 29 January 1998. The information notified therein shall not be changed further for at least another 28 days after the effective date, unless the circumstance notified is of a temporary nature and would not persist for the full period.

Note.— Guidance material on the procedures applicable to the AIRAC system is contained in the Aeronautical Information Services Manual *(Doc 8126).*

6.1.2 **Recommendation.—** *The regulated system (AIRAC) should also be used for the provision of information relating to the establishment and withdrawal of, and premeditated significant changes in, the circumstances listed in Appendix 4, Part 2.*

6.1.3 When information has not been submitted by the AIRAC date, a NIL notification shall be originated and distributed by NOTAM or other suitable means, not later than one cycle before the AIRAC effective date concerned.

6.1.4 Implementation dates other than AIRAC effective dates shall not be used for pre-planned operationally significant changes requiring cartographic work and/or for updating of navigation databases.

6.1.5 **Recommendation.—** *The use of the date in the AIRAC cycle which occurs between 21 December and 17 January inclusive should be avoided as an effective date for the introduction of significant changes under the AIRAC system.*

6.2 Provision of information in paper copy form

6.2.1 In all instances, information provided under the AIRAC system shall be published in paper copy form and shall be distributed by the AIS unit at least 42 days in advance of the effective date with the objective of reaching recipients at least 28 days in advance of the effective date.

6.2.2 **Recommendation.—** *Whenever major changes are planned and where advance notice is desirable and practicable, information published in paper copy form should be distributed by the AIS unit at least 56 days in advance of the effective date.*

Note.— Guidance on what constitutes a major change is included in Doc 8126.

6.3 Provision of information in electronic form

6.3.1 States that have established an aeronautical database shall, when updating its contents concerning the circumstances listed in Appendix 4, Part 1, ensure that the effective dates of data coincide with the established AIRAC effective dates used for the provision of information in paper copy form.

6.3.2 Information provided in electronic form, concerning the circumstances listed in Appendix 4, Part 1, shall be distributed/made available by the AIS unit so as to reach recipients at least 28 days in advance of the AIRAC effective date.

6.3.3 **Recommendation.—** *Whenever major changes are planned and where advance notice is desirable and practicable, information provided in electronic form should be distributed/made available at least 56 days in advance of the effective date.*

Note.— Guidance on what constitutes a major change is included in Doc 8126.

CHAPTER 7. AERONAUTICAL INFORMATION CIRCULARS (AIC)

7.1 Origination

7.1.1 An AIC shall be originated whenever it is necessary to promulgate aeronautical information which does not qualify:

a) under the specifications in 4.1 for inclusion in an AIP; or

b) under the specifications in 5.1 for the origination of a NOTAM.

7.1.1.1 An AIC shall be originated whenever it is desirable to promulgate:

a) a long-term forecast of any major change in legislation, regulations, procedures or facilities;

b) information of a purely explanatory or advisory nature liable to affect flight safety;

c) information or notification of an explanatory or advisory nature concerning technical, legislative or purely administrative matters.

This shall include:

1) forecasts of important changes in the air navigation procedures, services and facilities provided;

2) forecasts of implementation of new navigational systems;

3) significant information arising from aircraft accident/incident investigation which has a bearing on flight safety;

4) information on regulations relating to the safeguarding of international civil aviation against acts of unlawful interference;

5) advice on medical matters of special interest to pilots;

6) warnings to pilots concerning the avoidance of physical hazards;

7) effect of certain weather phenomena on aircraft operations;

8) information on new hazards affecting aircraft handling techniques;

9) regulations relating to the carriage of restricted articles by air;

10) reference to the requirements of, and publication of changes in, national legislation;

11) aircrew licensing arrangements;

12) training of aviation personnel;

13) application of, or exemption from, requirements in national legislation;

14) advice on the use and maintenance of specific types of equipment;

15) actual or planned availability of new or revised editions of aeronautical charts;

16) carriage of communication equipment;

17) explanatory information relating to noise abatement;

18) selected airworthiness directives;

19) changes in NOTAM series or distribution, new editions of AIP or major changes in their contents, coverage or format;

20) advance information on the snow plan (see 7.1.1.2);

21) other information of a similar nature.

Note.— The publication of an AIC does not remove the obligations set forth in Chapters 4 and 5.

7.1.1.2 The snow plan published under AD 1.2.2 of Appendix 1 shall be supplemented by seasonal information, to be issued well in advance of the beginning of each winter — not less than one month before the normal onset of winter conditions — and shall contain information such as that listed below:

a) a list of aerodromes/heliports where snow clearance is expected to be performed during the coming winter:

   *1) in accordance with the runway and taxiway systems; or

   *2) planned snow clearing, deviating from the runway system (length, width and number of runways, affected taxiways and aprons or portions thereof);

* This information, or any part of it, may be included in the AIP, if so desired.

*b) information concerning any centre designated to coordinate information on the current state of progress of clearance and on the current state of runways, taxiways and aprons;

c) a division of the aerodromes/heliports into SNOWTAM distribution lists in order to avoid excessive NOTAM distribution;

*d) an indication, as necessary, of minor changes to the standing snow plan;

*e) a descriptive list of clearance equipment;

*f) a listing of what will be considered as the minimum critical snow bank to be reported at each aerodrome/heliport at which reporting will commence.

7.2 General specifications

7.2.1 AIC shall be issued in printed form.

Note.— Both text and diagrams may be included.

7.2.1.1 The originating State shall select the AIC that are to be given international distribution.

7.2.1.2 Each AIC shall be allocated a serial number which shall be consecutive and based on the calendar year.

7.2.1.3 When AIC are distributed in more than one series, each series shall be separately identified by a letter.

7.2.1.4 **Recommendation.—** *Differentiation and identification of AIC topics according to subjects using colour coding should be practised where the numbers of AIC in force are sufficient to make identification in this form necessary.*

Note.— Guidance on colour coding of AIC by subject can be found in the Aeronautical Information Services Manual *(Doc 8126)*.

7.2.2 A checklist of AIC currently in force shall be issued at least once a year, with distribution as for the AIC.

7.3 Distribution

States shall give AIC selected for international distribution the same distribution as for the AIP.

* This information, or any part of it, may be included in the AIP, if so desired.

CHAPTER 8. PRE-FLIGHT AND POST-FLIGHT INFORMATION/DATA

8.1 Pre-flight information

8.1.1 At any aerodrome/heliport normally used for international air operations, aeronautical information essential for the safety, regularity and efficiency of air navigation and relative to the route stages originating at the aerodrome/heliport shall be made available to flight operations personnel, including flight crews and services responsible for pre-flight information.

8.1.2 Aeronautical information provided for pre-flight planning purposes at the aerodromes/heliports referred to in 8.1.1 shall include relevant:

a) elements of the Integrated Aeronautical Information Package;

b) maps and charts.

Note.— The documentation listed in a) and b) may be limited to national publications and when practicable, those of immediately adjacent States, provided a complete library of aeronautical information is available at a central location and means of direct communications are available between the aerodrome AIS unit and that library.

8.1.2.1 Additional current information relating to the aerodrome of departure shall be provided concerning the following:

a) construction or maintenance work on or immediately adjacent to the manoeuvring area;

b) rough portions of any part of the manoeuvring area, whether marked or not, e.g. broken parts of the surface of runways and taxiways;

c) presence and depth of snow, ice or water on runways and taxiways, including their effect on surface friction;

d) snow drifted or piled on or adjacent to runways or taxiways;

e) parked aircraft or other objects on or immediately adjacent to taxiways;

f) presence of other temporary hazards;

g) presence of birds constituting a potential hazard to aircraft operations;

h) failure or irregular operation of part or all of the aerodrome lighting system including approach, threshold, runway, taxiway, obstruction and manoeuvring area unserviceability lights and aerodrome power supply;

i) failure, irregular operation and changes in the operational status of ILS (including markers), MLS, basic GNSS, SBAS, GBAS, SRE, PAR, DME, SSR, ADS-B, ADS-C, CPDLC, D-ATIS, D-VOLMET, VOR, NDB, VHF aeromobile channels, RVR observing system, and secondary power supply; and

j) presence and operation of humanitarian relief missions, such as those undertaken under the auspices of the United Nations, together with any associated procedures and/or limitations applied thereof.

8.1.3 A recapitulation of current NOTAM and other information of urgent character shall be made available to flight crews in the form of plain-language pre-flight information bulletins (PIB).

Note.— Guidance on the preparation of PIB is contained in the Aeronautical Information Services Manual *(Doc 8126).*

8.2 Automated aeronautical information systems

8.2.1 Where the civil aviation authority or the agency to which the authority to provide service has been delegated in accordance with 3.1.1 c) uses automated pre-flight information systems to make aeronautical information/data available to operations personnel including flight crew members for self-briefing, flight planning and flight information service purposes, the information/data made available shall comply with the provisions of 8.1.2 and 8.1.3.

8.2.2 **Recommendation.—** *Automated pre-flight information systems providing a harmonized, common point of access by operations personnel, including flight crew members and other aeronautical personnel concerned, to aeronautical information in accordance with 8.2.1 and meteorological information in accordance with 9.5.1 of Annex 3 —* Meteorological Service for International Air Navigation, *should be established by an agreement between the civil aviation authority or the agency to which the authority to provide service has been delegated in accordance with 3.1.1 c) and the relevant meteorological authority.*

8.2.3 Where automated pre-flight information systems are used to provide the harmonized, common point of access by operations personnel, including flight crew members and other aeronautical personnel concerned, to aeronautical information/data and meteorological information, the civil aviation authority or the agency to which the authority to provide service has been delegated in accordance with 3.1.1 c) shall remain responsible for the quality and timeliness of the aeronautical information/ data provided by means of such a system.

Note.— The meteorological authority concerned remains responsible for the quality of the meteorological information provided by means of such system in accordance with 9.5.1 of Annex 3.

8.2.4 Self-briefing facilities of an automated pre-flight information system shall provide for access by operations personnel, including flight crew members and other aeronautical personnel concerned, to consultation as necessary with the aeronautical information service by telephone or other suitable telecommunications means. The human/machine interface of such facilities shall ensure easy access in a guided manner to all relevant information/data.

8.2.5 **Recommendation.—** *Automated pre-flight information systems for the supply of aeronautical information/data for self-briefing, flight planning and flight information service should:*

a) provide for continuous and timely updating of the system database and monitoring of the validity and quality of the aeronautical information stored;

b) permit access to the system by operations personnel including flight crew members, aeronautical personnel concerned and other aeronautical users through suitable telecommunications means;

c) ensure provision, in paper copy form, of the aeronautical information/data accessed, as required;

d) use access and interrogation procedures based on abbreviated plain language and ICAO location indicators, as appropriate, or based on a menu-driven user interface or other appropriate mechanism as agreed between the civil aviation authority and operator concerned; and

e) provide for rapid response to a user request for information.

Note.— ICAO abbreviations and codes and location indicators are given respectively in the Procedures for Air Navigation Services — ICAO Abbreviations and Codes (*PANS-ABC, Doc 8400*) *and* Location Indicators (*Doc 7910*).

8.3 Post-flight information

8.3.1 States shall ensure that arrangements are made to receive at aerodromes/heliports information concerning the state and operation of air navigation facilities noted by aircrews and shall ensure that such information is made available to the aeronautical information service for such distribution as the circumstances necessitate.

8.3.2 States shall ensure that arrangements are made to receive at aerodromes/heliports information concerning the presence of birds observed by aircrews and shall ensure that such information is made available to the aeronautical information service for such distribution as the circumstances necessitate.

Note.— See Annex 14, Volume I, Chapter 9, Section 9.4.

APPENDIX 1. CONTENTS OF AERONAUTICAL INFORMATION PUBLICATION (AIP)

(see Chapter 4)

PART 1 — GENERAL (GEN)

If an AIP is produced and made available in more than one volume with each having a separate amendment and supplement service, a separate preface, record of AIP Amendments, record of AIP Supplements, checklist of AIP pages and list of current hand amendments must be included in each volume.

GEN 0.1 Preface

Brief description of the Aeronautical Information Publication (AIP), including:

1) name of the publishing authority;

2) applicable ICAO documents;

3) the AIP structure and established regular amendment interval; and

4) service to contact in case of detected AIP errors or omissions.

GEN 0.2 Record of AIP Amendments

A record of AIP Amendments and AIRAC AIP Amendments (published in accordance with the AIRAC system) containing:

1) amendment number;

2) publication date;

3) date inserted (for the AIRAC AIP Amendments, effective date); and

4) initials of officer who inserted the amendment.

GEN 0.3 Record of AIP Supplements

A record of issued AIP Supplements containing:

1) Supplement number;

2) Supplement subject;

3) AIP section(s) affected;

4) period of validity; and

5) cancellation record.

GEN 0.4 Checklist of AIP pages

A checklist of AIP pages containing:

1) page number/chart title; and

2) publication or effective date (day, month by name and year) of the aeronautical information.

GEN 0.5 List of hand amendments to the AIP

A list of current hand amendments to the AIP containing:

1) AIP page(s) affected;

2) amendment text; and

3) AIP Amendment number by which a hand amendment was introduced.

GEN 0.6 Table of contents to Part 1

A list of sections and subsections contained in Part 1 — General (GEN).

Note.— Subsections may be listed alphabetically.

GEN 1. NATIONAL REGULATIONS AND REQUIREMENTS

GEN 1.1 Designated authorities

The addresses of designated authorities concerned with the facilitation of international air navigation (civil aviation, meteorology, customs, immigration, health, en-route and aerodrome/heliport charges, agricultural quarantine and aircraft accident investigation) containing, for each authority:

1) designated authority;

2) name of the authority;

3) postal address;

4) telephone number;

5) telefax number;

6) telex number; and

7) aeronautical fixed service (AFS) address.

GEN 1.2 Entry, transit and departure of aircraft

Regulations and requirements for advance notification and applications for permission concerning entry, transit and departure of aircraft on international flights.

GEN 1.3 Entry, transit and departure of passengers and crew

Regulations (including customs, immigration and quarantine, and requirements for advance notification and applications for permission) concerning entry, transit and departure of non-immigrant passengers and crew.

GEN 1.4 Entry, transit and departure of cargo

Regulations (including customs, and requirements for advance notification and applications for permission) concerning entry, transit and departure of cargo.

Note.— Provisions for facilitating entry and departure for search, rescue, salvage, investigation, repair or salvage in connection with lost or damaged aircraft are detailed in section GEN 3.6, Search and rescue.

GEN 1.5 Aircraft instruments, equipment and flight documents

Brief description of aircraft instruments, equipment and flight documents, including:

1) instruments, equipment (including aircraft communication, navigation and surveillance equipment) and flight documents to be carried on aircraft, including any special requirement in addition to the provisions specified in Annex 6, Part I, Chapters 6 and 7; and

2) emergency locator transmitter (ELT), signalling devices and life-saving equipment as presented in Annex 6, Part I, 6.6 and Part II, 6.4 where so determined by regional air navigation meetings, for flights over designated land areas.

GEN 1.6 Summary of national regulations and international agreements/conventions

A list of titles and references and, where applicable, summaries of national regulations affecting air navigation, together with a list of international agreements/conventions ratified by State.

GEN 1.7 Differences from ICAO Standards, Recommended Practices and Procedures

A list of significant differences between national regulations and practices of the State and related ICAO provisions, including:

1) provision affected (Annex and edition number, paragraph); and

2) difference in full text.

All significant differences must be listed under this subsection. All Annexes must be listed in numerical order even if there is no difference to an Annex, in which case a NIL notification must be provided. National differences or the degree of non-application of the regional supplementary procedures (SUPPS) must be notified immediately following the Annex to which the supplementary procedure relates.

GEN 2. TABLES AND CODES

GEN 2.1 Measuring system, aircraft markings, holidays

GEN 2.1.1 Units of measurement

Description of units of measurement used including table of units of measurement.

GEN 2.1.2 Temporal reference system

Description of the temporal reference system (calendar and time system) employed, together with an indication of whether or not daylight saving hours are employed and how the temporal reference system is presented throughout the AIP.

GEN 2.1.3 Horizontal reference system

Brief description of the horizontal (geodetic) reference system used, including:

1) name/designation of the reference system;

2) identification of the projection;

3) identification of the ellipsoid used;

4) identification of the datum used;

5) area(s) of application; and

6) an explanation, if applicable, of the asterisk used to identify those coordinates that do not meet Annex 11 and 14 accuracy requirements.

GEN 2.1.4 Vertical reference system

Brief description of the vertical reference system used, including:

1) name/designation of the reference system;

2) description of the geoid model used including the parameters required for height transformation between the model used and EGM-96; and

3) an explanation, if applicable, of the asterisk used to identify those elevations/geoid undulations that do not meet Annex 14 accuracy requirements.

GEN 2.1.5 Aircraft nationality and registration marks

Indication of aircraft nationality and registration marks adopted by the State.

GEN 2.1.6 Public holidays

A list of public holidays with indication of services being affected.

GEN 2.2 Abbreviations used in AIS publications

A list of alphabetically arranged abbreviations and their respective significations used by the State in its AIP and in the distribution of aeronautical information/data with appropriate annotation for those national abbreviations that are different from those contained in the *Procedures for Air Navigation Services — ICAO Abbreviations and Codes* (PANS-ABC, Doc 8400).

Note.— A list of alphabetically arranged definitions/glossary of terms may also be added.

GEN 2.3 Chart symbols

A list of chart symbols arranged according to the chart series where symbols are applied.

GEN 2.4 Location indicators

A list of alphabetically arranged location indicators assigned to the locations of aeronautical fixed stations to be used for encoding and decoding purposes. An annotation to locations not connected to the Aeronautical Fixed Service (AFS) must be provided.

GEN 2.5 List of radio navigation aids

A list of radio navigation aids arranged alphabetically, containing:

1) identifier;

2) name of the station;

3) type of facility/aid; and

4) indication whether aid serves en-route (E), aerodrome (A) or dual (AE) purposes.

GEN 2.6 Conversion tables

Tables for conversion between:

1) nautical miles and kilometres and vice versa;

2) feet and metres and vice versa;

3) decimal minutes of arc and seconds of arc and vice versa; and

4) other conversion tables, as appropriate.

GEN 2.7 Sunrise/sunset tables

Brief description of criteria used for determination of the times given in the sunrise/sunset tables, together with an alphabetical list of locations for which the times are given with a reference to the related page in the table and the sunrise/sunset tables for the selected stations/locations, including:

1) station name;

2) ICAO location indicator;

3) geographical coordinates in degrees and minutes;

4) date(s) for which times are given;

5) time for the beginning of morning civil twilight;

6) time for sunrise;

7) time for sunset; and

8) time for the end of evening civil twilight.

GEN 3. SERVICES

GEN 3.1 Aeronautical information services

GEN 3.1.1 Responsible service

Description of the Aeronautical Information Service (AIS) provided and its major components, including:

1) service/unit name;

2) postal address;

3) telephone number;

4) telefax number;

5) telex number;

6) AFS address;

7) a statement concerning the ICAO documents on which the service is based and a reference to the AIP location where differences, if any, are listed; and

8) an indication if service is not H24.

GEN 3.1.2 Area of responsibility

The area of responsibility for the aeronautical information service.

GEN 3.1.3 Aeronautical publications

Description of the elements of the Integrated Aeronautical Information Package, including:

1) AIP and related amendment service;

2) AIP Supplements;

3) AIC;

4) NOTAM and pre-flight information bulletins (PIB);

5) checklists and lists of valid NOTAM; and

6) how they may be obtained.

When an AIC is used to promulgate publication prices, that must be indicated in this section of the AIP.

GEN 3.1.4 AIRAC system

Brief description of the AIRAC system provided including a table of present and near future AIRAC dates.

GEN 3.1.5 Pre-flight information service at aerodromes/heliports

A list of aerodromes/heliports at which pre-flight information is routinely available, including an indication of relevant:

1) elements of the Integrated Aeronautical Information Packages held;

2) maps and charts held; and

3) general area of coverage of such data.

GEN 3.1.6 Electronic terrain and obstacle data

Details of how electronic terrain and obstacle data may be obtained, containing:

1) name of the individual, service or organization responsible;

2) street address and e-mail address of the individual, service or organization responsible;

3) telefax number of the individual, service or organization responsible;

4) contact telephone number of the individual, service or organization responsible;

5) hours of service (time period including time zone when contact can be made);

6) online information that can be used to contact the individual, service or organization; and

7) supplemental information, if necessary, on how and when to contact the individual, service or organization.

GEN 3.2 Aeronautical charts

GEN 3.2.1 Responsible service(s)

Description of service(s) responsible for the production of aeronautical charts, including:

1) service name;

2) postal address;

3) telephone number;

4) telefax number;

5) telex number;

6) AFS address;

7) a statement concerning the ICAO documents on which the service is based and a reference to the AIP location where differences, if any, are listed; and

8) an indication if service is not H24.

GEN 3.2.2 Maintenance of charts

Brief description of how aeronautical charts are revised and amended.

GEN 3.2.3 Purchase arrangements

Details of how charts may be obtained, containing:

1) service/sales agency(ies);

2) postal address;

3) telephone number;

4) telefax number;

5) telex number; and

6) AFS address.

GEN 3.2.4 Aeronautical chart series available

A list of aeronautical chart series available followed by a general description of each series and an indication of the intended use.

GEN 3.2.5 List of aeronautical charts available

A list of aeronautical charts available, including:

1) title of series;

2) scale of series;

3) name and/or number of each chart or each sheet in a series;

4) price per sheet; and

5) date of latest revision.

GEN 3.2.6 Index to the World Aeronautical Chart (WAC) — ICAO 1:1 000 000

An index chart showing coverage and sheet layout for the WAC 1:1 000 000 produced by a State. If Aeronautical Chart — ICAO 1:500 000 is produced instead of WAC 1:1 000 000, index charts must be used to indicate coverage and sheet layout for the Aeronautical Chart — ICAO 1:500 000.

GEN 3.2.7 Topographical charts

Details of how topographical charts may be obtained, containing:

1) name of service/agency(ies);

2) postal address;

3) telephone number;

4) telefax number;

5) telex number; and

6) AFS address.

GEN 3.2.8 Corrections to charts not contained in the AIP

A list of corrections to aeronautical charts not contained in the AIP, or an indication where such information can be obtained.

GEN 3.3 Air traffic services

GEN 3.3.1 Responsible service

Description of the air traffic service and its major components, including:

1) service name;

2) postal address;

3) telephone number;

4) telefax number;

5) telex number;

6) AFS address;

7) a statement concerning the ICAO documents on which the service is based and a reference to the AIP location where differences, if any, are listed; and

8) an indication if service is not H24.

GEN 3.3.2 Area of responsibility

Brief description of area of responsibility for which air traffic services are provided.

GEN 3.3.3 Types of services

Brief description of main types of air traffic services provided.

GEN 3.3.4 Coordination between the operator and ATS

General conditions under which coordination between the operator and air traffic services is effected.

GEN 3.3.5 Minimum flight altitude

The criteria used to determine minimum flight altitudes.

GEN 3.3.6 ATS units address list

A list of ATS units and their addresses arranged alphabetically, containing:

1) unit name;

2) postal address;

3) telephone number;

4) telefax number;

5) telex number; and

6) AFS address.

GEN 3.4 Communication services

GEN 3.4.1 Responsible service

Description of the service responsible for the provision of telecommunication and navigation facilities, including:

1) service name;

2) postal address;

3) telephone number;

4) telefax number;

5) telex number;

6) AFS address;

7) a statement concerning the ICAO documents on which the service is based and a reference to the AIP location where differences, if any, are listed; and

8) an indication if service is not H24.

GEN 3.4.2 Area of responsibility

Brief description of area of responsibility for which telecommunication service is provided.

GEN 3.4.3 Types of service

Brief description of the main types of service and facilities provided, including:

1) radio navigation services;

2) voice and/or data link services;

3) broadcasting service;

4) language(s) used; and

5) an indication of where detailed information can be obtained.

GEN 3.4.4 Requirements and conditions

Brief description concerning the requirements and conditions under which the communication service is available.

GEN 3.5 Meteorological services

GEN 3.5.1 Responsible service

Brief description of the meteorological service responsible for the provision of meteorological information, including:

1) service name;

2) postal address;

3) telephone number;

4) telefax number;

5) telex number;

6) AFS address;

7) a statement concerning the ICAO documents on which the service is based and a reference to the AIP location where differences, if any, are listed; and

8) an indication if service is not H24.

GEN 3.5.2 Area of responsibility

Brief description of area and/or air routes for which meteorological service is provided.

GEN 3.5.3 Meteorological observations and reports

Detailed description of the meteorological observations and reports provided for international air navigation, including:

1) name of the station and the ICAO location indicator;

2) type and frequency of observation including an indication of automatic observing equipment;

3) types of meteorological reports (e.g. METAR) and availability of a trend forecast;

4) specific type of observation system and number of observation sites used to observe and report surface wind, visibility, runway visual range, cloud base, temperature and, where applicable, wind shear (e.g. anemometer at intersection of runways, transmissometer next to touchdown zone, etc.);

5) hours of operation; and

6) indication of aeronautical climatological information available.

GEN 3.5.4 Types of services

Brief description of the main types of service provided, including details of briefing, consultation, display of meteorological information, flight documentation available for operators and flight crew members, and of the methods and means used for supplying the meteorological information.

GEN 3.5.5 Notification required from operators

Minimum amount of advance notice required by the meteorological authority from operators in respect of briefing, consultation and flight documentation and other meteorological information they require or change.

GEN 3.5.6 Aircraft reports

As necessary, requirements of the meteorological authority for the making and transmission of aircraft reports.

GEN 3.5.7 VOLMET service

Description of VOLMET and/or D-VOLMET service, including:

1) name of transmitting station;

2) call sign or identification and abbreviation for the radio communication emission;

3) frequency or frequencies used for broadcast;

4) broadcasting period;

5) hours of service;

6) list of aerodromes/heliports for which reports and/or forecasts are included; and

7) reports, forecasts and SIGMET information included and remarks.

GEN 3.5.8 SIGMET and AIRMET service

Description of the meteorological watch provided within flight information regions or control areas for which air traffic services are provided, including a list of the meteorological watch offices with:

1) name of the meteorological watch office, ICAO location indicator;

2) hours of service;

3) flight information region(s) or control area(s) served;

4) SIGMET validity periods;

5) specific procedures applied to SIGMET information (e.g. for volcanic ash and tropical cyclones);

6) procedures applied to AIRMET information (in accordance with relevant regional air navigation agreements);

7) the air traffic services unit(s) provided with SIGMET and AIRMET information; and

8) additional information (e.g. concerning any limitation of service, etc.).

GEN 3.5.9 Other automated meteorological services

Description of available automated services for the provision of meteorological information (e.g. automated pre-flight information service accessible by telephone and/or computer modem) including:

1) service name;

2) information available;

3) areas, routes and aerodromes covered; and

4) telephone, telex and telefax number(s).

GEN 3.6 Search and rescue

GEN 3.6.1 Responsible service(s)

Brief description of service(s) responsible for the provision of search and rescue (SAR), including:

1) service/unit name;

2) postal address;

3) telephone number;

4) telefax number;

5) telex number;

6) AFS address; and

7) a statement concerning the ICAO documents on which the service is based and a reference to the AIP location where differences, if any, are listed.

GEN 3.6.2 Area of responsibility

Brief description of area of responsibility within which search and rescue services are provided.

GEN 3.6.3 Types of service

Brief description and geographical portrayal, where appropriate, of the type of service and facilities provided including indications where SAR aerial coverage is dependent upon significant deployment of aircraft.

GEN 3.6.4 SAR agreements

Brief description of SAR agreements in force, including provisions for facilitating entry and departure of other States' aircraft for search, rescue, salvage, repair or salvage in connection with lost or damaged aircraft, either with airborne notification only or after flight plan notification.

GEN 3.6.5 Conditions of availability

Brief description of provisions for search and rescue, including the general conditions under which the service and facilities are available for international use, including an indication of whether a facility available for search and rescue is specialized in SAR techniques and functions, or is specially used for other purposes but adapted for SAR purposes by training and equipment, or is only occasionally available and has no particular training or preparation for SAR work.

GEN 3.6.6 Procedures and signals used

Brief description of the procedures and signals employed by rescue aircraft and a table showing the signals to be used by survivors.

GEN 4. CHARGES FOR AERODROMES/HELIPORTS AND AIR NAVIGATION SERVICES

Reference may be made to where details of actual charges may be found, if not itemized in this chapter.

GEN 4.1 Aerodrome/heliport charges

Brief description of type of charges which may be applicable at aerodromes/heliports available for international use, including:

1) landing of aircraft;

2) parking, hangarage and long-term storage of aircraft;

3) passenger service;

4) security;

5) noise-related items;

6) other (customs, health, immigration, etc.);

7) exemptions/reductions; and

8) methods of payment.

GEN 4.2 Air navigation services charges

Brief description of charges which may be applicable to air navigation services provided for international use, including:

1) *approach control;*

2) *route air navigation services;*

3) *cost basis for air navigation services and exemptions/reductions; and*

4) *methods of payment.*

PART 2 — EN-ROUTE (ENR)

If an AIP is produced and made available in more than one volume with each having a separate amendment and supplement service, a separate preface, record of AIP Amendments, record of AIP Supplements, checklist of AIP pages and list of current hand amendments must be included in each volume. In the case of an AIP being published as one volume, the annotation "not applicable" must be entered against each of the above subsections.

Reference must be made in the appropriate subsection to indicate that differences between national regulations and ICAO SARPs and procedures exist and that they are detailed in GEN 1.7.

ENR 0.6 Table of contents to Part 2

A list of sections and subsections contained in Part 2 — En-route.

Note.— Subsections may be listed alphabetically.

ENR 1. GENERAL RULES AND PROCEDURES

ENR 1.1 General rules

The requirement is for publication of the general rules as applied within the State.

ENR 1.2 Visual flight rules

The requirement is for publication of the visual flight rules as applied within the State.

ENR 1.3 Instrument flight rules

The requirement is for publication of the instrument flight rules as applied within the State.

ENR 1.4 ATS airspace classification

The description of ATS airspace classes in the form of the ATS airspace classification table in Annex 11, Appendix 4, appropriately annotated to indicate those airspace classes not used by the State.

ENR 1.5 Holding, approach and departure procedures

ENR 1.5.1 General

The requirement is for a statement concerning the criteria on which holding, approach and departure procedures are established. If different from ICAO provisions, the requirement is for presentation of criteria used in a tabular form.

ENR 1.5.2 Arriving flights

The requirement is to present procedures (conventional or area navigation or both) for arriving flights which are common to flights into or within the same type of airspace. If different procedures apply within a terminal airspace, a note to this effect must be given together with a reference to where the specific procedures can be found.

ENR 1.5.3 Departing flights

The requirement is to present procedures (conventional or area navigation or both) for departing flights which are common to flights departing from any aerodrome/heliport.

ENR 1.6 ATS surveillance services and procedures

ENR 1.6.1 Primary radar

Description of primary radar services and procedures, including:

1) supplementary services;

2) the application of radar control service;

3) radar and air-ground communication failure procedures;

4) voice and CPDLC position reporting requirements; and

5) graphic portrayal of area of radar coverage.

ENR 1.6.2 Secondary surveillance radar (SSR)

Description of secondary surveillance radar (SSR) operating procedures, including:

1) emergency procedures;

2) air-ground communication failure and unlawful interference procedures;

3) the system of SSR code assignment;

4) voice and CPDLC position reporting requirements; and

5) graphic portrayal of area of SSR coverage.

Note.— The SSR description is of particular importance in areas or routes where the possibility of interception exists.

ENR 1.6.3 Automatic dependent surveillance — broadcast (ADS-B)

Description of automatic dependent surveillance — broadcast (ADS-B) operating procedures, including:

1) emergency procedures;

2) air-ground communication failure and unlawful interference procedures;

3) aircraft identification requirements;

4) voice and CPDLC position reporting requirements; and

5) graphic portrayal of area of ADS-B coverage.

Note.— The ADS-B description is of particular importance in areas or routes where the possibility of interception exists.

ENR 1.7 Altimeter setting procedures

The requirement is for a statement of altimeter setting procedures in use, containing:

1) brief introduction with a statement concerning the ICAO documents on which the procedures are based together with differences to ICAO provisions, if any;

2) basic altimeter setting procedures;

3) description of altimeter setting region(s);

4) procedures applicable to operators (including pilots); and

5) table of cruising levels.

ENR 1.8 Regional supplementary procedures

The requirement is for presentation of regional supplementary procedures (SUPPS) affecting the entire area of responsibility, with properly annotated national differences, if any.

ENR 1.9 Air traffic flow management

Brief description of air traffic flow management (ATFM) system, including:

1) ATFM structure, service area, service provided, location of unit(s) and hours of operation;

2) types of flow messages and descriptions of the formats; and

3) procedures applicable for departing flights, containing:

   a) service responsible for provision of information on applied ATFM measures;

   b) flight plan requirements; and

   c) slot allocations.

ENR 1.10 Flight planning

The requirement is to indicate any restriction, limitation or advisory information related to the flight planning stage which may assist the user in the presentation of the intended flight operation, including:

1) procedures for the submission of a flight plan;

2) repetitive flight plan system; and

3) changes to the submitted flight plan.

ENR 1.11 Addressing of flight plan messages

The requirement is for an indication, in tabular form, of the addresses allocated to flight plans, showing:

1) category of flight (IFR, VFR or both);

2) route (into or via FIR and/or TMA); and

3) message address.

ENR 1.12 Interception of civil aircraft

The requirement is for a complete statement of interception procedures and visual signals to be used with a clear indication of whether ICAO provisions are applied and if not, a complete presentation of differences.

ENR 1.13 Unlawful interference

The requirement is for presentation of appropriate procedures to be applied in case of unlawful interference.

ENR 1.14 Air traffic incidents

Description of air traffic incidents reporting system, including:

1) definition of air traffic incidents;

2) use of the "Air Traffic Incident Reporting Form";

3) reporting procedures (including in-flight procedures); and

4) purpose of reporting and handling of the form.

ENR 2. AIR TRAFFIC SERVICES AIRSPACE

ENR 2.1 FIR, UIR, TMA

Detailed description of flight information regions (FIR), upper flight information regions (UIR), and terminal control areas (TMA), including:

1) name, geographical coordinates in degrees and minutes of the FIR/UIR lateral limits and in degrees, minutes and seconds of the TMA lateral limits, vertical limits and class of airspace;

2) identification of unit providing the service;

3) call sign of aeronautical station serving the unit and language(s) used, specifying the area and conditions, when and where to be used, if applicable;

4) frequencies supplemented by indications for specific purposes; and

5) remarks.

Control zones around military air bases not otherwise described in the AIP must be included in this subsection. Where the requirements of Annex 2 concerning flight plans, two-way communications and position reporting apply to all flights in order to eliminate or reduce the need for interceptions and/or where the possibility of interception exists and the maintenance of guard on the VHF emergency channel 121.5 MHz is required, a statement to this effect must be included for the relevant area(s) or portion(s) thereof.

A description of designated areas over which the carriage of an emergency locator transmitter (ELT) is required and where aircraft shall continuously guard the VHF emergency frequency 121.5 MHz, except for those periods when aircraft are carrying out communications on other VHF channels or when airborne equipment limitations or cockpit duties do not permit simultaneous guarding of two channels.

Note.— Other types of airspace around civil aerodromes/ heliports such as control zones and aerodrome traffic zones are described in the relevant aerodrome or heliport section.

ENR 2.2 Other regulated airspace

Where established, a detailed description of other types of regulated airspace and airspace classification.

ENR 3. ATS ROUTES

Note 1.— Bearings, tracks and radials are normally magnetic. In areas of high latitude, where it is determined by the appropriate authority that reference to Magnetic North is impractical, another suitable reference, i.e. True North or Grid North, may be used.

Note 2.— Changeover points established at the midpoint between two radio navigation aids, or at the intersection of the two radials in the case of a route which changes direction between the navigation aids, need not be shown for each route segment if a general statement regarding their existence is made.

ENR 3.1 Lower ATS routes

Detailed description of lower ATS routes, including:

1) route designator, required navigation performance (RNP) type(s) applicable to a specified segment(s), names, coded designators or name-codes and the geographical coordinates in degrees, minutes and seconds of all significant points defining the route including "compulsory" or "on-request" reporting points;

2) tracks or VOR radials to the nearest degree, geodesic distance to the nearest tenth of a kilometre or tenth of a nautical mile between each successive designated significant point and, in the case of VOR radials, changeover points;

3) upper and lower limits or minimum en-route altitudes, to the nearest higher 50 m or 100 ft, and airspace classification;

4) lateral limits and minimum obstacle clearance altitudes;

5) direction of cruising levels; and

6) remarks, including an indication of the controlling unit, its operating channel and, if applicable, its logon address.

Note.— In relation to Annex 11, Appendix 1, and for flight planning purposes, the specified RNP type is not considered to be an integral part of the route designator.

ENR 3.2 Upper ATS routes

Detailed description of upper ATS routes, including:

1) route designator, required navigation performance (RNP) type(s) applicable to a specified segment(s), names, coded

designators or name-codes and the geographical coordinates in degrees, minutes and seconds of all significant points defining the route including "compulsory" or "on-request" reporting points;

2) tracks or VOR radials to the nearest degree, geodesic distance to the nearest tenth of a kilometre or tenth of a nautical mile between each successive designated significant point and, in the case of VOR radials, changeover points;

3) upper and lower limits and airspace classification;

4) lateral limits;

5) direction of cruising levels; and

6) remarks, including an indication of the controlling unit, its operating channel and, if applicable, its logon address.

Note.— In relation to Annex 11, Appendix 1, and for flight planning purposes, the specified RNP type is not considered to be an integral part of the route designator.

ENR 3.3 Area navigation routes

Detailed description of area navigation (RNAV) routes, including:

1) route designator, required navigation performance (RNP) type(s) applicable to a specified segment(s), names, coded designators or name-codes and the geographical coordinates in degrees, minutes and seconds of all significant points defining the route including "compulsory" or "on-request" reporting points;

2) in respect of waypoints defining a VOR/DME area navigation route, additionally:

   a) station identification of the reference VOR/DME;

   b) bearing to the nearest degree and the distance to the nearest tenth of a kilometre or tenth of a nautical mile from the reference VOR/DME, if the waypoint is not collocated with it; and

   c) elevation of the transmitting antenna of DME to the nearest 30 m (100 ft);

3) geodesic distance to the nearest tenth of a kilometre or tenth of a nautical mile between defined end-points and distance between each successive designated significant point;

4) upper and lower limits and airspace classification;

5) direction of cruising levels; and

6) remarks, including an indication of the controlling unit, its operating channel and, if applicable, its logon address.

Note.— In relation to Annex 11, Appendix 1, and for flight planning purposes, the specified RNP type is not considered to be an integral part of the route designator.

ENR 3.4 Helicopter routes

Detailed description of helicopter routes, including:

1) route designator, required navigation performance (RNP) type(s) applicable to a specified segment(s), names, coded designators or name-codes and the geographical coordinates in degrees, minutes and seconds of all significant points defining the route including "compulsory" or "on-request" reporting points;

2) tracks or VOR radials to the nearest degree, geodesic distance to the nearest tenth of a kilometre or tenth of a nautical mile between each successive designated significant point and, in the case of VOR radials, changeover points;

3) upper and lower limits and airspace classification;

4) minimum flight altitudes to the nearest higher 50 m or 100 ft; and

5) remarks, including an indication of the controlling unit and its operating frequency.

Note.— In relation to Annex 11, Appendix 1, and for flight planning purposes, the specified RNP type is not considered to be an integral part of the route designator.

ENR 3.5 Other routes

The requirement is to describe other specifically designated routes which are compulsory within specified area(s).

Note.— Arrival, transit and departure routes which are specified in connection with procedures for traffic to and from aerodromes/heliports need not be described since they are described in the relevant section of Part 3 — Aerodromes.

ENR 3.6 En-route holding

The requirement is for a detailed description of en-route holding procedures, containing:

1) holding identification (if any) and holding fix (navigation aid) or waypoint with geographical coordinates in degrees, minutes and seconds;

2) inbound track;

3) direction of the procedure turn;

4) maximum indicated airspeed;

5) minimum and maximum holding level;

6) time/distance outbound; and

7) indication of the controlling unit and its operating frequency.

Note.— Obstacle clearance criteria related to holding procedures are contained in Procedures for Air Navigation Services, Aircraft Operations *(PANS-OPS, Doc 8168), Volumes I and II.*

ENR 4. RADIO NAVIGATION AIDS/SYSTEMS

ENR 4.1 Radio navigation aids — en-route

A list of stations providing radio navigation services established for en-route purposes and arranged alphabetically by name of the station, including:

1) name of the station and magnetic variation to the nearest degree and for VOR, station declination to the nearest degree used for technical line-up of the aid;

2) identification;

3) frequency/channel for each element;

4) hours of operation;

5) geographical coordinates in degrees, minutes and seconds of the position of the transmitting antenna;

6) elevation of the transmitting antenna of DME to the nearest 30 m (100 ft); and

7) remarks.

If the operating authority of the facility is other than the designated governmental agency, the name of the operating authority must be indicated in the remarks column. Facility coverage must be indicated in the remarks column.

ENR 4.2 Special navigation systems

Description of stations associated with special navigation systems (DECCA, LORAN, etc.), including:

1) name of station or chain;

2) type of service available (master signal, slave signal, colour);

3) frequency (channel number, basic pulse rate, recurrence rate, as applicable);

4) hours of operation;

5) geographical coordinates in degrees, minutes and seconds of the position of the transmitting station; and

6) remarks.

If the operating authority of the facility is other than the designated governmental agency, the name of the operating authority must be indicated in the remarks column. Facility coverage must be indicated in the remarks column.

ENR 4.3 Global navigation satellite system (GNSS)

A list and description of elements of the global navigation satellite system (GNSS) providing the navigation service established for en-route purposes and arranged alphabetically by name of the element, including:

1) the name of the GNSS element (GPS, GLONASS, EGNOS, MSAS, WAAS, etc.);

2) frequency(ies), as appropriate;

3) geographical coordinates in degrees, minutes and seconds of the nominal service area and coverage area; and

4) remarks.

If the operating authority of the facility is other than the designated governmental agency, the name of the operating authority must be indicated in the remarks column.

ENR 4.4 Name-code designators for significant points

An alphabetically arranged list of name-code designators (five-letter pronounceable “name-code”) established for significant points at positions not marked by the site of radio navigation aids, including:

1) name-code designator;

2) geographical coordinates in degrees, minutes and seconds of the position; and

3) reference to ATS or other routes where the point is located.

ENR 4.5 Aeronautical ground lights — en-route

A list of aeronautical ground lights and other light beacons designating geographical positions which are selected by the State as being significant, including:

1) name of the city or town or other identification of the beacon;

2) type of beacon and intensity of the light in thousands of candelas;

3) characteristics of the signal;

4) operational hours; and

5) remarks.

ENR 5. NAVIGATION WARNINGS

ENR 5.1 Prohibited, restricted and danger areas

Description, supplemented by graphic portrayal where appropriate, of prohibited, restricted and danger areas together with information regarding their establishment and activation, including:

1) identification, name and geographical coordinates of the lateral limits in degrees, minutes and seconds if inside and in degrees and minutes if outside control area/control zone boundaries;

2) upper and lower limits; and

3) remarks, including time of activity.

Type of restriction or nature of hazard and risk of interception in the event of penetration must be indicated in the remarks column.

ENR 5.2 Military exercise and training areas and air defence identification zone (ADIZ)

Description, supplemented by graphic portrayal where appropriate, of established military training areas and military exercises taking place at regular intervals, and established air defence identification zone (ADIZ), including:

1) geographical coordinates of the lateral limits in degrees, minutes and seconds if inside and in degrees and minutes if outside control area/control zone boundaries;

2) upper and lower limits and system and means of activation announcements together with information pertinent to civil flights and applicable ADIZ procedures; and

3) remarks, including time of activity and risk of interception in the event of penetration of ADIZ.

ENR 5.3 Other activities of a dangerous nature and other potential hazards

ENR 5.3.1 Other activities of a dangerous nature

Description, supplemented by charts where appropriate, of activities that could affect flights including:

1) geographical coordinates in degrees and minutes of centre of area and range of influence;

2) vertical limits;

3) advisory measures;

4) authority responsible for the provision of information; and

5) remarks, including time of activity.

ENR 5.3.2 Other potential hazards

Description, supplemented by charts where appropriate, of other potential hazards that could affect flights (e.g. active volcanoes, nuclear power stations, etc.) including:

1) geographical coordinates in degrees and minutes of location of potential hazard;

2) vertical limits;

3) advisory measures;

4) authority responsible for the provision of information; and

5) remarks.

ENR 5.4 Air navigation obstacles

The list of obstacles affecting air navigation in Area 1 (the entire State territory), including:

1) obstacle identification or designation;

2) type of obstacle;

3) obstacle position, represented by geographical coordinates in degrees, minutes and seconds;

4) obstacle elevation and height to the nearest metre or foot;

5) type and colour of obstacle lighting (if any); and

6) if appropriate, an indication that the list of obstacles is available in electronic form, and a reference to GEN 3.1.6.

Note 1.— An obstacle whose height above the ground is 100 m and higher is considered an obstacle for Area 1.

Note 2.— Specifications governing the determination and reporting (accuracy of field work and data integrity) of positions (latitude and longitude) and elevations/heights for obstacles in Area 1 are given in Annex 11, Appendix 5, Tables 1 and 2, respectively.

ENR 5.5 Aerial sporting and recreational activities

Brief description, supplemented by graphic portrayal where appropriate, of intensive aerial sporting and recreational activities together with conditions under which they are carried out, including:

1) designation and geographical coordinates of the lateral limits in degrees, minutes and seconds if inside and in degrees and minutes if outside control area/control zone boundaries;

2) vertical limits;

3) operator/user telephone number; and

4) remarks, including time of activity.

Note.— This paragraph may be subdivided into different sections for each different category of activity, giving the indicated details in each case.

ENR 5.6 Bird migration and areas with sensitive fauna

Description, supplemented by charts where practicable, of movements of birds associated with migration, including migration routes and permanent resting areas and areas with sensitive fauna.

ENR 6. EN-ROUTE CHARTS

The requirement is for the En-route Chart — ICAO and index charts to be included in this section.

PART 3 — AERODROMES (AD)

If an AIP is produced and made available in more than one volume with each having a separate amendment and supplement service, a separate preface, record of AIP Amendments, record of AIP Supplements, checklist of AIP pages and list of current hand amendments must be included in each volume. In the case of an AIP being published as one volume, the annotation "not applicable" must be entered against each of the above subsections.

AD 0.6 Table of contents to Part 3

A list of sections and subsections contained in Part 3 — Aerodromes (AD).

Note.— Subsections may be listed alphabetically.

AD 1. AERODROMES/HELIPORTS — INTRODUCTION

AD 1.1 Aerodrome/heliport availability

Brief description of the State's designated authority responsible for aerodromes and heliports, including:

1) the general conditions under which aerodromes/heliports and associated facilities are available for use;

2) a statement concerning the ICAO documents on which the services are based and a reference to the AIP location where differences, if any, are listed;

3) regulations, if any, concerning civil use of military air bases;

4) the general conditions under which the low visibility procedures applicable to Cat II/III operations at aerodromes, if any, are applied;

5) friction measuring device used and the runway friction level below which the State will declare the runway to be slippery when wet; and

6) other information of a similar nature.

AD 1.2 Rescue and firefighting services and snow plan

AD 1.2.1 Rescue and firefighting services

Brief description of rules governing the establishment of rescue and firefighting services at aerodromes and heliports available for public use together with an indication of rescue and firefighting categories established by a State.

AD 1.2.2 Snow plan

Brief description of general snow plan considerations for aerodromes/heliports available for public use at which snow conditions are normally liable to occur, including:

1) organization of the winter service;

2) surveillance of movement areas;

3) measuring methods and measurements taken;

4) actions taken to maintain the usability of movement areas;

5) system and means of reporting;

6) the cases of runway closure; and

7) distribution of information about snow conditions.

Note.— Where different snow plan considerations apply at aerodromes/heliports, this subparagraph may be subdivided accordingly.

AD 1.3 Index to aerodromes and heliports

A list, supplemented by graphic portrayal, of aerodromes and heliports within a State, including:

1) aerodrome/heliport name and ICAO location indicator;

2) type of traffic permitted to use the aerodrome/heliport (international/national, IFR/VFR, scheduled/non-scheduled, private); and

3) reference to AIP, Part 3 subsection in which aerodrome/heliport details are presented.

AD 1.4 Grouping of aerodromes/heliports

Brief description of the criteria applied by the State in grouping aerodromes/heliports for the production/distribution/provision of information purposes (e.g. international/national; primary/secondary; major/other; civil/military; etc.).

AD 2. AERODROMES

Note.— **** is to be replaced by the relevant ICAO location indicator.

**** AD 2.1 Aerodrome location indicator and name

The requirement is for the ICAO location indicator allocated to the aerodrome and the name of aerodrome. An ICAO location indicator must be an integral part of the referencing system applicable to all subsections in section AD 2.

**** AD 2.2 Aerodrome geographical and administrative data

The requirement is for aerodrome geographical and administrative data including:

1) aerodrome reference point (geographical coordinates in degrees, minutes and seconds) and its site;

2) direction and distance of aerodrome reference point from centre of the city or town which the aerodrome serves;

3) aerodrome elevation to the nearest metre or foot, and reference temperature;

4) geoid undulation at the aerodrome elevation position to the nearest metre or foot;

5) magnetic variation to the nearest degree, date of information and annual change;

6) name of aerodrome administration, address, telephone, telefax and telex numbers and AFS address;

7) types of traffic permitted to use the aerodrome (IFR/VFR); and

8) remarks.

**** AD 2.3 Operational hours

Detailed description of the hours of operation of services at the aerodrome, including:

1) aerodrome administration;

2) customs and immigration;

3) health and sanitation;

4) AIS briefing office;

5) ATS reporting office (ARO);

6) MET briefing office;

7) air traffic service;

8) fuelling;

9) handling;

10) security;

11) de-icing; and

12) remarks.

**** AD 2.4 Handling services and facilities

Detailed description of the handling services and facilities available at the aerodrome, including:

1) cargo-handling facilities;

2) fuel and oil types;

3) fuelling facilities and capacity;

4) de-icing facilities;

5) hangar space for visiting aircraft;

6) repair facilities for visiting aircraft; and

7) remarks.

**** AD 2.5 Passenger facilities

Brief description of passenger facilities available at the aerodrome, including:

1) *hotel(s) at or in the vicinity of aerodrome;*

2) *restaurant(s) at or in the vicinity of aerodrome;*

3) *transportation possibilities;*

4) medical facilities;

5) *bank and post office at or in the vicinity of aerodrome;*

6) *tourist office;* and

7) remarks.

**** AD 2.6 Rescue and firefighting services

Detailed description of the rescue and firefighting services and equipment available at the aerodrome, including:

1) aerodrome category for firefighting;

2) rescue equipment;

3) *capability for removal of disabled aircraft;* and

4) remarks.

**** AD 2.7 Seasonal availability — clearing

Detailed description of the equipment and operational priorities established for the clearance of aerodrome movement areas, including:

1) type(s) of clearing equipment;

2) clearance priorities; and

3) remarks.

**** AD 2.8 Aprons, taxiways and check locations/positions data

Details related to the physical characteristics of aprons, taxiways and locations/positions of designated checkpoints, including:

1) surface and strength of aprons;

2) width, surface and strength of taxiways;

3) location and elevation to the nearest metre or foot of altimeter checkpoints;

4) location of VOR checkpoints;

5) position of INS checkpoints in degrees, minutes, seconds and hundredths of seconds; and

6) remarks.

If check locations/positions are presented on an aerodrome chart, a note to that effect must be provided under this subsection.

**** AD 2.9 Surface movement guidance and control system and markings

Brief description of the surface movement guidance and control system and runway and taxiway markings, including:

1) use of aircraft stand identification signs, taxiway guide lines and visual docking/parking guidance system at aircraft stands;

2) runway and taxiway markings and lights;

3) stop bars (if any); and

4) remarks.

**** AD 2.10 Aerodrome obstacles

Detailed description of obstacles, including:

1) obstacles in Area 2:

   a) obstacle identification or designation;

   b) type of obstacle;

c) obstacle position, represented by geographical coordinates in degrees, minutes, seconds and tenths of seconds;

d) obstacle elevation and height to the nearest metre or foot;

e) obstacle marking, and type and colour of obstacle lighting (if any);

f) if appropriate, an indication that the list of obstacles is available in electronic form, and a reference to GEN 3.1.6; and

g) NIL indication, if appropriate.

Note 1.— Chapter 10, 10.2.2, provides a description of Area 2 while Appendix 8, Figure A8-2, contains graphical illustrations of obstacle data collection surfaces and criteria used to identify obstacles in Area 2.

Note 2.— Specifications governing the determination and reporting (accuracy of field work and data integrity) of positions (latitude and longitude) and elevations for obstacles in Area 2 are given in Annex 11, Appendix 5, Tables 1 and 2, and in Annex 14, Volume I, Appendix 5, Tables A5-1 and A5-2, respectively.

2) obstacles in Area 3:

a) obstacle identification or designation;

b) type of obstacle;

c) obstacle position, represented by geographical coordinates in degrees, minutes, seconds and tenths of seconds;

d) obstacle elevation and height to the nearest metre or foot;

e) obstacle marking, and type and colour of obstacle lighting (if any);

f) if appropriate, an indication that the list of obstacles is available in electronic form, and a reference to GEN 3.1.6; and

g) NIL indication, if appropriate.

Note 1.— Chapter 10, 10.2.3, provides a description of Area 3 while Appendix 8, Figure A8-3, contains graphical illustrations of obstacle data collection surfaces and criteria used to identify obstacles in Area 3.

Note 2.— Specifications governing the determination and reporting (accuracy of field work and data integrity) of positions (latitude and longitude) and elevations for obstacles in Area 3 are given in Annex 14, Volume I, Appendix 5, Tables A5-1 and A5-2, respectively.

****** AD 2.11 Meteorological information provided**

Detailed description of meteorological information provided at the aerodrome and an indication of which meteorological office is responsible for the service enumerated, including:

1) name of the associated meteorological office;

2) hours of service and, where applicable, the designation of the responsible meteorological office outside these hours;

3) office responsible for preparation of TAFs and periods of validity and interval of issuance of the forecasts;

4) availability of the trend forecasts for the aerodrome, and interval of issuance;

5) information on how briefing and/or consultation is provided;

6) types of flight documentation supplied and language(s) used in flight documentation;

7) charts and other information displayed or available for briefing or consultation;

8) supplementary equipment available for providing information on meteorological conditions, e.g. weather radar and receiver for satellite images;

9) the air traffic services unit(s) provided with meteorological information; and

10) additional information (e.g. concerning any limitation of service, etc.).

****** AD 2.12 Runway physical characteristics**

Detailed description of runway physical characteristics, for each runway, including:

1) designations;

2) true bearings to one-hundredth of a degree;

3) dimensions of runways to the nearest metre or foot;

4) strength of pavement (PCN and associated data) and surface of each runway and associated stopways;

5) geographical coordinates in degrees, minutes, seconds and hundredths of seconds for each threshold and runway end, and geoid undulation to the nearest one-half metre or foot for each threshold;

6) elevations of:

— thresholds of a non-precision approach runway to the nearest metre or foot; and

— thresholds and the highest elevation of the touchdown zone of a precision approach runway to the nearest one-half metre or foot;

7) slope of each runway and associated stopways;

8) dimensions of stopway (if any) to the nearest metre or foot;

9) dimensions of clearway (if any) to the nearest metre or foot;

10) dimensions of strips;

11) the existence of an obstacle-free zone; and

12) remarks.

****** AD 2.13 Declared distances**

Detailed description of declared distances to the nearest metre or foot for each direction of each runway, including:

1) runway designator;

2) take-off run available;

3) take-off distance available;

4) accelerate-stop distance available;

5) landing distance available; and

6) remarks.

If a runway direction cannot be used for take-off or landing, or both, because it is operationally forbidden, then this must be declared and the words “not usable” or the abbreviation “NU” entered (Annex 14, Volume I, Attachment A, Section 3).

****** AD 2.14 Approach and runway lighting**

Detailed description of approach and runway lighting, including:

1) runway designator;

2) type, length and intensity of approach lighting system;

3) runway threshold lights, colour and wing bars;

4) type of visual approach slope indicator system;

5) length of runway touchdown zone lights;

6) length, spacing, colour and intensity of runway centre line lights;

7) length, spacing, colour and intensity of runway edge lights;

8) colour of runway end lights and wing bars;

9) length and colour of stopway lights; and

10) remarks.

****** AD 2.15 Other lighting, secondary power supply**

Description of other lighting and secondary power supply, including:

1) location, characteristics and hours of operation of aerodrome beacon/identification beacon (if any);

2) location and lighting (if any) of anemometer/landing direction indicator;

3) taxiway edge and taxiway centre line lights;

4) secondary power supply including switch-over time; and

5) remarks.

****** AD 2.16 Helicopter landing area**

Detailed description of helicopter landing area provided at the aerodrome, including:

1) geographical coordinates in degrees, minutes, seconds and hundredths of seconds and geoid undulation to the nearest one-half metre or foot of the geometric centre of touch-down and lift-off (TLOF) or of each threshold of final approach and take-off (FATO) area (where appropriate);

2) TLOF and/or FATO area elevation:

— for non-precision approaches, to the nearest metre or foot; and

— for precision approaches, to the nearest one-half metre or foot;

3) TLOF and FATO area dimensions to the nearest metre or foot, surface type, bearing strength and marking;

4) true bearings to one-hundredth of a degree of FATO;

5) declared distances available, to the nearest metre or foot;

6) approach and FATO lighting; and

7) remarks.

****** AD 2.17 Air traffic services airspace**

Detailed description of air traffic services (ATS) airspace organized at the aerodrome, including:

1) airspace designation and geographical coordinates in degrees, minutes and seconds of the lateral limits;

2) vertical limits;

3) airspace classification;

4) call sign and language(s) of the ATS unit providing service;

5) transition altitude; and

6) remarks.

****** AD 2.18 Air traffic services communication facilities**

Detailed description of air traffic services communication facilities established at the aerodrome, including:

1) service designation;

2) call sign;

3) channel(s);

4) logon address, as appropriate;

5) hours of operation; and

6) remarks.

****** AD 2.19 Radio navigation and landing aids**

Detailed description of radio navigation and landing aids associated with the instrument approach and the terminal area procedures at the aerodrome, including:

1) type of aids, magnetic variation to the nearest degree, as appropriate, and type of supported operation for ILS/MLS, basic GNSS, SBAS, and GBAS and for VOR/ILS/MLS also station declination to the nearest degree used for technical line-up of the aid;

2) identification, if required;

3) frequency(ies), as appropriate;

4) hours of operation, as appropriate;

5) geographical coordinates in degrees, minutes, seconds and tenths of seconds of the position of the transmitting antenna, as appropriate;

6) elevation of the transmitting antenna of DME to the nearest 30 m (100 ft) and of DME/P to the nearest 3 m (10 ft); and

7) remarks.

When the same aid is used for both en-route and aerodrome purposes, a description must also be given in section ENR 4. If the ground-based augmentation system (GBAS) serves more than one aerodrome, description of the aid must be provided under each aerodrome. If the operating authority of the facility is other than the designated governmental agency, the name of the operating authority must be indicated in the remarks column. Facility coverage must be indicated in the remarks column.

****** AD 2.20 Local traffic regulations**

Detailed description of regulations applicable to the traffic at the aerodrome including standard routes for taxiing aircraft, parking regulations, school and training flights and similar but excluding flight procedures.

****** AD 2.21 Noise abatement procedures**

Detailed description of noise abatement procedures established at the aerodrome.

****** AD 2.22 Flight procedures**

Detailed description of the conditions and flight procedures, including radar and/or ADS-B procedures, established on the basis of airspace organization at the aerodrome. When established, detailed description of the low visibility procedures at the aerodrome, including:

1) runway(s) and associated equipment authorized for use under low visibility procedures;

2) defined meteorological conditions under which initiation, use and termination of low visibility procedures would be made; and

3) description of ground marking/lighting for use under low visibility procedures.

****** AD 2.23 Additional information**

Additional information at the aerodrome, such as an indication of bird concentrations at the aerodrome, together with an indication of significant daily movement between resting and feeding areas, to the extent practicable.

**** AD 2.24 Charts related to an aerodrome

The requirement is for charts related to an aerodrome to be included in the following order:

1) Aerodrome/Heliport Chart — ICAO;

2) Aircraft Parking/Docking Chart — ICAO;

3) Aerodrome Ground Movement Chart — ICAO;

4) Aerodrome Obstacle Chart — ICAO Type A (for each runway);

5) Aerodrome Terrain and Obstacle Chart — ICAO (Electronic);

6) Precision Approach Terrain Chart — ICAO (precision approach Cat II and III runways);

7) Area Chart — ICAO (departure and transit routes);

8) Standard Departure Chart — Instrument — ICAO;

9) Area Chart — ICAO (arrival and transit routes);

10) Standard Arrival Chart — Instrument — ICAO;

11) ATC Surveillance Minimum Altitude Chart — ICAO;

12) Instrument Approach Chart — ICAO (for each runway and procedure type);

13) Visual Approach Chart — ICAO; and

14) bird concentrations in the vicinity of the aerodrome.

If some of the charts are not produced, a statement to this effect must be given in section GEN 3.2, Aeronautical charts.

Note.— A page pocket may be used in the AIP to include the Aerodrome Terrain and Obstacle Chart — ICAO (Electronic) on appropriate electronic media.

AD 3. HELIPORTS

When a helicopter landing area is provided at the aerodrome, associated data must be listed only under **** AD 2.16.

Note.— **** is to be replaced by the relevant ICAO location indicator.

**** AD 3.1 Heliport location indicator and name

The requirement is for the ICAO location indicator assigned to the heliport and the name of heliport. An ICAO location indicator must be an integral part of the referencing system applicable to all subsections in section AD 3.

**** AD 3.2 Heliport geographical and administrative data

The requirement is for heliport geographical and administrative data, including:

1) heliport reference point (geographical coordinates in degrees, minutes and seconds) and its site;

2) direction and distance of heliport reference point from centre of the city or town which the heliport serves;

3) heliport elevation to the nearest metre or foot, and reference temperature;

4) geoid undulation at the heliport elevation position to the nearest metre or foot;

5) magnetic variation to the nearest degree, date of information and annual change;

6) name of heliport administration, address, telephone, telefax and telex numbers and AFS address;

7) types of traffic permitted to use the heliport (IFR/VFR); and

8) remarks.

**** AD 3.3 Operational hours

Detailed description of the hours of operation of services at the heliport, including:

1) heliport administration;

2) customs and immigration;

3) health and sanitation;

4) AIS briefing office;

5) ATS reporting office (ARO);

6) MET briefing office;

7) air traffic service;

8) fuelling;

9) handling;

10) security;

11) de-icing; and

12) remarks.

****** AD 3.4 Handling services and facilities**

Detailed description of the handling services and facilities available at the heliport, including:

1) cargo-handling facilities;

2) fuel and oil types;

3) fuelling facilities and capacity;

4) de-icing facilities;

5) hangar space for visiting helicopter;

6) repair facilities for visiting helicopter; and

7) remarks.

****** AD 3.5 Passenger facilities**

Brief description of passenger facilities available at the heliport, including:

1) *hotel(s) at or in the vicinity of the heliport;*

2) *restaurant(s) at or in the vicinity of the heliport;*

3) *transportation possibilities;*

4) medical facilities;

5) *bank and post office at or in the vicinity of the heliport;*

6) *tourist office;* and

7) remarks.

****** AD 3.6 Rescue and firefighting services**

Detailed description of the rescue and firefighting services and equipment available at the heliport, including:

1) heliport category for firefighting;

2) rescue equipment;

3) *capability for removal of disabled helicopter;* and

4) remarks.

****** AD 3.7 Seasonal availability — clearing**

Detailed description of the equipment and operational priorities established for the clearance of heliport movement areas, including:

1) type(s) of clearing equipment;

2) clearance priorities; and

3) remarks.

****** AD 3.8 Aprons, taxiways and check locations/positions data**

Details related to the physical characteristics of aprons, taxiways and locations/positions of designated checkpoints, including:

1) surface and strength of aprons, helicopter stands;

2) width, surface type and designation of helicopter ground taxiways;

3) width and designation of helicopter air taxiway and air transit route;

4) location and elevation to the nearest metre or foot of altimeter checkpoints;

5) location of VOR checkpoints;

6) position of INS checkpoints in degrees, minutes, seconds and hundredths of seconds; and

7) remarks.

If check locations/positions are presented on a heliport chart, a note to that effect must be provided under this subsection.

****** AD 3.9 Markings and markers**

Brief description of final approach and take-off area and taxiway markings and markers, including:

1) final approach and take-off markings;

2) taxiway markings, air taxiway markers and air transit route markers; and

3) remarks.

****** AD 3.10 Heliport obstacles**

Detailed description of obstacles, including:

1) obstacles in Area 2:

   a) obstacle identification or designation;

   b) type of obstacle;

   c) obstacle position, represented by geographical coordinates in degrees, minutes, seconds and tenths of seconds;

   d) obstacle elevation and height to the nearest metre or foot;

   e) obstacle marking, and type and colour of obstacle lighting (if any);

   f) if appropriate, an indication that the list of obstacles is available in electronic form, and a reference to GEN 3.1.6; and

   g) NIL indication, if appropriate.

Note 1.— Chapter 10, 10.2.2, provides a description of Area 2 while Appendix 8, Figure A8-2, contains graphical illustrations of obstacle data collection surfaces and criteria used to identify obstacles in Area 2.

Note 2.— Specifications governing the determination and reporting (accuracy of field work and data integrity) of positions (latitude and longitude) and elevations for obstacles in Area 2 are given in Annex 11, Appendix 5, Tables 1 and 2, and in Annex 14, Volume II, Appendix 1, Tables 1 and 2, respectively.

2) obstacles in Area 3:

   a) obstacle identification or designation;

   b) type of obstacle;

   c) obstacle position, represented by geographical coordinates in degrees, minutes, seconds and tenths of seconds;

   d) obstacle elevation and height to the nearest metre or foot;

   e) obstacle marking, and type and colour of obstacle lighting (if any);

   f) if appropriate, an indication that the list of obstacles is available in electronic form, and a reference to GEN 3.1.6; and

   g) NIL indication, if appropriate.

Note 1.— Chapter 10, 10.2.3, provides a description of Area 3 while Appendix 8, Figure A8-3, contains graphical illustrations of obstacle data collection surfaces and criteria used to identify obstacles in Area 3.

Note 2.— Specifications governing the determination and reporting (accuracy of field work and data integrity) of positions (latitude and longitude) and elevations for obstacles in Area 3 are given in Annex 14, Volume II, Appendix 1, Tables 1 and 2, respectively.

**** AD 3.11 Meteorological information provided

Detailed description of meteorological information provided at the heliport and an indication of which meteorological office is responsible for the service enumerated, including:

1) name of the associated meteorological office;

2) hours of service and, where applicable, the designation of the responsible meteorological office outside these hours;

3) office responsible for preparation of TAFs, and periods of validity of the forecasts;

4) availability of the trend forecasts for the heliport, and interval of issuance;

5) information on how briefing and/or consultation is provided;

6) type of flight documentation supplied and language(s) used in flight documentation;

7) charts and other information displayed or available for briefing or consultation;

8) supplementary equipment available for providing information on meteorological conditions, e.g. weather radar and receiver for satellite images;

9) the air traffic services unit(s) provided with meteorological information; and

10) additional information (e.g. concerning any limitation of service, etc.).

**** AD 3.12 Heliport data

Detailed description of heliport dimensions and related information, including:

1) heliport type — surface-level, elevated or helideck;

2) touchdown and lift-off (TLOF) area dimensions to the nearest metre or foot;

3) true bearings to one-hundredth of a degree of final approach and take-off (FATO) area;

4) dimensions to the nearest metre or foot of FATO, and surface type;

5) surface and bearing strength in tonnes (1 000 kg) of TLOF;

6) geographical coordinates in degrees, minutes, seconds and hundredths of seconds and geoid undulation to the nearest one-half metre or foot of the geometric centre of TLOF or of each threshold of FATO (where appropriate);

7) TLOF and/or FATO slope and elevation:

   — for non-precision approaches to the nearest metre or foot; and

   — for precision approaches to the nearest one-half metre or foot;

8) dimensions of safety area;

9) dimensions, to the nearest metre or foot, of helicopter clearway;

10) the existence of an obstacle-free sector; and

11) remarks.

****** AD 3.13 Declared distances**

Detailed description of declared distances to the nearest metre or foot, where relevant for a heliport, including:

1) take-off distance available;

2) rejected take-off distance available;

3) landing distance available; and

4) remarks.

****** AD 3.14 Approach and FATO lighting**

Detailed description of approach and FATO lighting, including:

1) type, length and intensity of approach lighting system;

2) type of visual approach slope indicator system;

3) characteristics and location of FATO area lights;

4) characteristics and location of aiming point lights;

5) characteristics and location of TLOF lighting system; and

6) remarks.

****** AD 3.15 Other lighting, secondary power supply**

Description of other lighting and secondary power supply, including:

1) location, characteristics and hours of operation of heliport beacon;

2) location and lighting of wind direction indicator (WDI);

3) taxiway edge and taxiway centre line lights;

4) secondary power supply including switch-over time; and

5) remarks.

****** AD 3.16 Air traffic services airspace**

Detailed description of air traffic services (ATS) airspace organized at the heliport, including:

1) airspace designation and geographical coordinates in degrees, minutes and seconds of the lateral limits;

2) vertical limits;

3) airspace classification;

4) call sign and language(s) of ATS unit providing service;

5) transition altitude; and

6) remarks.

****** AD 3.17 Air traffic services communication facilities**

Detailed description of air traffic services communication facilities established at the heliport, including:

1) service designation;

2) call sign;

3) frequency(ies);

4) hours of operation; and

5) remarks.

****** AD 3.18 Radio navigation and landing aids**

Detailed description of radio navigation and landing aids associated with the instrument approach and the terminal area procedures at the heliport, including:

1) type of aids, magnetic variation (for VOR, station declination used for technical line-up of the aid) to the nearest degree, and type of operation for ILS, MLS, basic GNSS, SBAS, and GBAS;

2) identification, if required;

3) frequency(ies), as appropriate;

4) hours of operation, as appropriate;

5) geographical coordinates in degrees, minutes, seconds and tenths of seconds of the position of the transmitting antenna, as appropriate;

6) elevation of the transmitting antenna of DME to the nearest 30 m (100 ft) and of DME/P to the nearest 3 m (10 ft); and

7) remarks.

When the same aid is used for both en-route and heliport purposes, a description must also be given in section ENR 4. If the ground-based augmentation system (GBAS) serves more than one heliport, description of the aid must be provided under each heliport. If the operating authority of the facility is other than the designated governmental agency, the name of the operating authority must be indicated in the remarks column. Facility coverage must be indicated in the remarks column.

**** AD 3.19 Local traffic regulations

Detailed description of regulations applicable to traffic at the heliport, including standard routes for taxiing helicopters, parking regulations, school and training flights and similar but excluding flight procedures.

**** AD 3.20 Noise abatement procedures

Detailed description of noise abatement procedures established at the heliport.

**** AD 3.21 Flight procedures

Detailed description of the conditions and flight procedures, including radar and/or ADS-B procedures, established on the basis of airspace organization established at the heliport. When established, detailed description of the low visibility procedures at the heliport, including:

1) touchdown and lift-off (TLOF) area(s) and associated equipment authorized for use under low visibility procedures;

2) defined meteorological conditions under which initiation, use and termination of low visibility procedures would be made; and

3) description of ground marking/lighting for use under low visibility procedures.

**** AD 3.22 Additional information

Additional information about the heliport, such as an indication of bird concentrations at the heliport together with an indication of significant daily movement between resting and feeding areas, to the extent practicable.

**** AD 3.23 Charts related to a heliport

The requirement is for charts related to a heliport to be included in the following order:

1) Aerodrome/Heliport Chart — ICAO;

2) Area Chart — ICAO (departure and transit routes);

3) Standard Departure Chart — Instrument — ICAO;

4) Area Chart — ICAO (arrival and transit routes);

5) Standard Arrival Chart — Instrument — ICAO;

6) ATC Surveillance Minimum Altitude Chart — ICAO;

7) Instrument Approach Chart — ICAO (for each procedure type);

8) Visual Approach Chart — ICAO; and

9) bird concentrations in the vicinity of heliport.

If some of the charts are not produced, a statement to this effect must be given in section GEN 3.2, Aeronautical charts.

Level of alert colour code	Status of activity of volcano
GREEN ALERT	Volcano is in normal, non-eruptive state. *or, after a change from a higher alert level:* Volcanic activity considered to have ceased, and volcano reverted to its normal, non-eruptive state.
YELLOW ALERT	Volcano is experiencing signs of elevated unrest above known background levels. *or, after a change from higher alert level:* Volcanic activity has decreased significantly but continues to be closely monitored for possible renewed increase.
ORANGE ALERT	Volcano is exhibiting heightened unrest with increased likelihood of eruption. *or,* Volcanic eruption is underway with no or minor ash emission *[specify ash-plume height if possible]*.
RED ALERT	Eruption is forecasted to be imminent with significant emission of ash into the atmosphere likely. *or,* Eruption is underway with significant emission of ash into the atmosphere *[specify ash-plume height if possible]*.

Note.— The colour code for the level of alert indicating the status of activity of the volcano and any change from a previous status of activity should be provided to the area control centre by the responsible vulcanological agency in the State concerned, e.g. "RED ALERT FOLLOWING YELLOW" OR "GREEN ALERT FOLLOWING ORANGE".

3.6 *Item F* — If volcanic ash cloud of operational significance is reported, indicate the horizontal extent and base/top of the ash cloud using latitude/longitude (in whole degrees) and altitudes in thousands of metres (feet) and/or radial and distance from source volcano. Information initially may be based only on special air-report, but subsequent information may be more detailed based on advice from the responsible meteorological watch office and/or volcanic ash advisory centre.

3.7 *Item G* — Indicate forecast direction of movement of the ash cloud at selected levels based on advice from the responsible meteorological watch office and/or volcanic ash advisory centre.

3.8 *Item H* — Indicate air routes and portions of air routes and flight levels affected, or expected to become affected.

3.9 *Item I* — Indicate closure of airspace, air routes or portions of air routes, and availability of alternative routes.

3.10 *Item J* — Source of the information, e.g. "special air-report" or "vulcanological agency", etc. The source of information should always be indicated, whether an eruption has actually occurred or ash cloud reported, or not.

3.11 *Item K* — Include in plain language any operationally significant information additional to the foregoing.

5) SCOPE

A = Aerodrome
E = En-route
W = Nav Warning
K = NOTAM is a checklist

Note.— Depending on the NOTAM subject and content, the qualifier field SCOPE may contain combined qualifiers. For possible combinations refer to the NOTAM Selection Criteria in the Aeronautical Information Services Manual *(Doc 8126). If the subject is qualified AE, the aerodrome location indicator must be reported in Item A).*

6) and 7) LOWER/UPPER

LOWER and UPPER limits shall always be filled and shall only be expressed in flight levels (FL). In the case of navigation warnings and airspace restrictions, values entered shall be consistent with those provided under Items F) and G).

If the subject does not contain specific height information, insert "000" for LOWER and "999" for UPPER as default values.

8) COORDINATES, RADIUS

The latitude and longitude accurate to one minute, as well as a three-digit distance figure giving the radius of influence in NM (e.g. 4700N01140E043). Coordinates present approximate centre of circle whose radius encompasses the whole area of influence, and if the NOTAM affects the entire FIR/UIR or more than one FIR/UIR, enter the default value "999" for radius.

4. Item A)

Insert the location indicator as contained in ICAO Doc 7910 of the aerodrome or FIR in which the facility, airspace, or condition being reported on is located. More than one FIR/UIR may be indicated when appropriate. If there is no available ICAO location indicator, use the ICAO nationality letter as given in ICAO Doc 7910, Part 2, plus "XX" and followed up in Item E) by the name, in plain language.

If information concerns GNSS, insert the appropriate ICAO location indicator allocated for a GNSS element or the common location indicator allocated for all elements of GNSS (except GBAS).

Note.— In the case of GNSS, the location indicator may be used when identifying a GNSS element outage (e.g. KNMH for a GPS satellite outage).

5. Item B)

For date-time group use a ten-figure group, giving year, month, day, hours and minutes in UTC. This entry is the date-time at which the NOTAMN, NOTAMR OR NOTAMC comes into force.

6. Item C)

With the exception of NOTAMC, a date-time group (a ten-figure group giving year, month, day, hours and minutes in UTC) indicating duration of information shall be used unless the information is of a permanent nature in which case the abbreviation "PERM" is inserted instead. If the information on timing is uncertain, the approximate duration shall be indicated using a date-time group followed by the abbreviation "EST". Any NOTAM which includes an "EST" shall be cancelled or replaced before the date-time specified in Item C).

7. Item D)

If the hazard, status of operation or condition of facilities being reported on will be active in accordance with a specific time and date schedule between the dates-times indicated in Items B) and C), insert such information under Item D). If Item D) exceeds 200 characters, consideration shall be given to providing such information in a separate, consecutive NOTAM.

Note.— Guidance concerning a harmonized definition of Item D) content is provided in Doc 8126.

8. Item E)

Use decoded NOTAM Code, complemented where necessary by ICAO abbreviations, indicators, identifiers, designators, call signs, frequencies, figures and plain language. When NOTAM is selected for international distribution, English text shall be included for those parts expressed in plain language. This entry shall be clear and concise in order to provide a suitable PIB entry. In the case of NOTAMC, a subject reference and status message shall be included to enable accurate plausibility checks.

9. Items F) and G)

These items are normally applicable to navigation warnings or airspace restrictions and are usually part of the PIB entry. Insert both lower and upper height limits of activities or restrictions, clearly indicating reference datum and units of measurement.

Note.— For NOTAM examples see Doc 8126 and the PANS-ABC (Doc 8400).

COVER SHEET TO AMENDMENT 9

INTERNATIONAL STANDARDS
AND RECOMMENDED PRACTICES

THE SAFE TRANSPORT OF DANGEROUS GOODS BY AIR

ANNEX 18
TO THE CONVENTION ON INTERNATIONAL CIVIL AVIATION

THIRD EDITION — JULY 2001

INTERNATIONAL CIVIL AVIATION ORGANIZATION

Checklist of Amendments to Annex 18

	Effective date	*Date of applicability*
Third Edition (incorporates Amendments 1 to 6)	16 July 2001	1 November 2001
Amendment 7 (adopted by the Council on 24 February 2003)	14 July 2003	27 November 2003
Amendment 8 (adopted by the Council on 16 February 2005)	11 July 2005	24 November 2005
Amendment 9 (adopted by the Council on 19 February 2007) Replacement pages (viii) and 12-1	16 July 2007	20 November 2008

Transmittal note

Amendment 9

to the

International Standards and
Recommended Practices

THE SAFE TRANSPORT OF DANGEROUS GOODS BY AIR

(Annex 18 to the Convention on International Civil Aviation)

1. Insert the following replacement pages in Annex 18 (Third Edition) to incorporate Amendment 9 which becomes applicable on 20 November 2008:

   a) Page (viii) — Foreword

   b) Page 12-1 — Chapter 12

2. Record the entry of this amendment on page (ii).

16/7/07

Table A. Amendments to Annex 18

Amendment	*Source(s)*	*Subject(s)*	*Adopted/approved* *Effective* *Applicable*
1st Edition	Air Navigation Commission Study		26 June 1981 1 January 1983 1 January 1984
1	Sixth Meeting of the Dangerous Goods Panel	Miscellaneous amendments for alignment with Recommendations of the UN Committee of Experts and IAEA.	26 November 1982 26 March 1983 1 January 1984
2	Fifth, Sixth and Seventh Meetings of the Dangerous Goods Panel	Improved definitions for overpack and unit load device. Definitions of package and packaging aligned with Recommendations of the UN Committee of Experts. Addition of a paragraph covering surface transport to or from aerodromes. The requirement to provide information to the pilot-in-command revised to indicate when this information should be given.	1 June 1983 1 October 1983 1 January 1984
3	Eighth Meeting of the Dangerous Goods Panel	Clarification of the circumstances when exemptions may be granted. Clarification of the segregation requirements of poisons or infectious substances from animals or foodstuffs.	25 March 1985 29 July 1985 1 January 1986
4 (2nd Edition)	Eleventh Meeting of the Dangerous Goods Panel	General simplification of the provisions of Annex 18 through the removal of technical detail. Miscellaneous amendments to various provisions.	24 February 1989 23 July 1989 16 November 1989
5	Fourteenth and Sixteenth Meetings of the Dangerous Goods Panel	Clarification of the responsibility of States to achieve compliance with any amendment to the *Technical Instructions for the Safe Transport of Dangerous Goods by Air* (Doc 9284). Clarification of the exceptions to dangerous goods carried by passengers and crew members.	10 March 1999 19 July 1999 4 November 1999
6 (3rd Edition)	Seventeenth Meeting of the Dangerous Goods Panel and Amendment 25 to Annex 6, Part I	a) revised definitions of dangerous goods, crew member, flight crew member and pilot-in-command; b) revision of the provisions to grant exemptions in special circumstances by the States of Overflight to facilitate the movement of dangerous goods in an aircraft overflying its territory; c) alignment of provisions regarding packaging with the Technical Instructions; d) introduction of provisions to cover the requirement to load and stow dangerous goods in accordance with the Technical Instructions; e) revision of the provisions to place the overall responsibility with States to provide information to passengers; f) revision of the provisions to ensure that emergency response personnel are informed without delay, after an accident or incident, about the dangerous goods carried as cargo on board the aircraft; g) revision of the provisions to enhance cooperation between States in taking action against shippers who wilfully violate the dangerous goods transport regulations; and h) revision of the provisions of the pilot to provide information on dangerous goods on board in the event of an emergency.	7 March 2001 16 July 2001 1 November 2001

Amendment	*Source(s)*	*Subject(s)*	*Adopted/approved Effective Applicable*
7	Eighteenth Meeting of the Dangerous Goods Panel	a) notification to ICAO of appropriate national authorities responsible for dangerous goods; and b) provision of emergency response information regarding dangerous goods.	24 February 2003 14 July 2003 27 November 2003
8	Nineteenth Meeting of the Dangerous Goods Panel	a) a refinement of paragraph 9.6.1 to make it clear that the presence of dangerous goods needs to be reported only in the case of a serious incident in which the dangerous goods were likely to have been involved; and b) introduction of a new Chapter 13 requiring States to establish dangerous goods security measures.	16 February 2005 11 July 2005 24 November 2005
9	Twentieth Meeting of the Dangerous Goods Panel	The extension of the provisions in Chapter 12 relating to the investigation of dangerous goods accidents and incidents to include cases of misdeclared and undeclared dangerous goods.	19 February 2007 16 July 2007 20 November 2008

CHAPTER 12. DANGEROUS GOODS ACCIDENT AND INCIDENT REPORTING

12.1 With the aim of preventing the recurrence of dangerous goods accidents and incidents, each Contracting State shall establish procedures for investigating and compiling information concerning such accidents and incidents which occur in its territory and which involve the transport of dangerous goods originating in or destined for another State. Reports on such accidents and incidents shall be made in accordance with the detailed provisions of the Technical Instructions.

12.2 **Recommendation.—** *With the aim of preventing the recurrence of dangerous goods accidents and incidents, each Contracting State should establish procedures for investigating and compiling information concerning such accidents and incidents which occur in its territory other than those described in 12.1. Reports on such accidents and incidents should be made in accordance with the detailed provisions of the Technical Instructions.*

12.3 With the aim of preventing the recurrence of instances of undeclared or misdeclared dangerous goods in cargo, each Contracting State shall establish procedures for investigating and compiling information concerning such occurrences which occur in its territory and which involve the transport of dangerous goods originating in or destined for another State. Reports on such instances shall be made in accordance with the detailed provisions of the Technical Instructions.

12.4 **Recommendation.—** *With the aim of preventing the recurrence of instances of undeclared or misdeclared dangerous goods in cargo, each Contracting State should establish procedures for investigating and compiling information concerning such occurrences which occur in its territory other than those described in 12.3. Reports on such instances should be made in accordance with the detailed provisions of the Technical Instructions.*

167 (10.kiadás)	Léginavigáció Bizottság tanulmányok; A repülési személyzet szakszolgálati és oktatási bizottságának második ülése	Átdolgozott és új egészségügyi rendelkezések a repülési személyzet felső korhatárával kapcsolatban; új szakszolgálati követelmények léghajókra és helyből felszálló repülőgépekre; az MCP pilóta szakszolgálati engedély bevezetése; módosítások a jelenlegi repülési személyzet szakszolgálati engedély szabvány részleteiben; módosítások a szimulátor tréning-berendezések szerepével kapcsolatos rendelkezésekben, a szaktudás megszerzéséhez és megőrzéséhez, amelyre szükség van a különféle szintű szakszolgálati engedélyek és jogosítások megszerzéséhez.	2006.03.10. 2006.07.17. 2006.11.23
168	Léginavigáció Bizottság Tanulmány;	A módosítás az alábbiakra vonatkozik: a) a bevezető radarirányítási jogosítás felváltása körzeti irányítás ellenőrzési jogosításra, rávilágítva arra a tényre, hogy a felügyeleti rendszerek nem korlátozódhatnak a radarra; b) az emberi tényezők ismereti követelményeinek harmonizálása a légiforgalmi irányítók számára az 1 Annex 167 számú módosításában a közelmúltban került elfogadásra a repülési személyzetek számára; c) a meglévő szabványok alkalmazhatósága a repülési személyzet részére jóváhagyott kiképzés keretein belül (Annex 1, 1.2.8 és a 2.sz. Függelék) a légiforgalmi irányítók számára, amely előírás a szakszolgálati engedély és jogosítás megszerzéséhez; valamint d) új rendelkezések növendék légiforgalmi irányítók munkahelyi környezetben történő képzésével kapcsolatban.	2007.02.23. 2007.07.16 2007.11.22

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT ELJÁRÁSOK

1. FEJEZET – MEGHATÁROZÁSOK ÉS AZ ENGEDÉLYEKRE VONATKOZÓ ÁLTALÁNOS SZABÁLYOK

1. 1. Meghatározások

Ahol a szakszolgálati engedélyezésre vonatkozó Szabványokban és Ajánlott Eljárásokban az alábbi kifejezéseket használtuk, ezek jelentése a következő:

Hiteles orvosi minősítés - (Accredited medical conclusion) Az engedélyt kiadó Hatóság által elfogadott egy vagy több orvos szakértő által, - a végeredmény elérése céljából, szükség szerint repülési, vagy egyéb szakértők bevonásával - az adott eset tárgyában levont végeredmény.

Repülőgép - (Aeroplane) A levegőnél nehezebb, erőgép meghajtású légijármű, amely repülés közben a felhajtóerőt elsősorban a repülés adott szakaszaiban rögzített helyzetben maradó felületeire ható aerodinamikai reakciók révén nyeri.

Légijármű - (Aircraft) Bármely szerkezet, mely a légkörben a levegő reakciójából nyeri a felhajtóerőt, mely nem azonos a talajfelszínre ható levegő reakciójával.

Légijármű repülési elektronika - (Aircraft avionics) Bármilyen elektronikus szerkezet meghatározására vonatkozó fogalom - annak elektromos részeit is beleértve - amelyet egy légijárműben alkalmaznak, ide értve a rádiót, az automatikus repülésvezérlést, és a műszer rendszereket.

Légijármű - osztály - (Aircraft - category) A légijárművek osztályba sorolása meghatározott alapjellemzők szerint, pl. repülőgép, helikopter, vitorlázó repülőgép, szabadon repülő ballon.

Egy pilótás üzemelésre hitelesített légijármű - (Aircraft certificated for single-pilot operation) A légijárművek azon típusa, amelyről a lajstromozó állam a légi alkalmassági vizsgálatok alapján megállapította, hogy egy pilótás minimum létszámú személyzettel biztonságosan üzemeltethető.

Másodpilótás üzemelésre hitelesített légijármű (Aircraft required to be operated with a co-pilot) A légijárművek azon típusa, amelyet másodpilóta vezethet a repülési kézikönyvben foglaltak szerint

A légijármű típusa - (Aircraft – type of) Azonos alapkonstrukciójú légijárművek összessége, beleértve azok minden változatát, kivéve, ha olyan módosításokat hajtottak végre, amelynek következtében a légijármű vezetési vagy repülési jellemzői megváltoztak.

Légijármű-vezetői tevékenység (Airmanship) A légijármű-vezető a légijármű irányítására vonatkozó repülési feladatot a megfelelő döntéshozatali képesség és a megtanult elméleti ismeretek következetes használatával, megfelelő jártassággal és felelősségtudattal hajtja végre.

Léghajó – (Airship) A levegőnél könnyebb, erőgép-meghajtású légijármű

Jogosított karbantartó szervezet - (Approved maintenance organization) A Szerződő Állam által a 6. Annex I. Részének 8. Fejezete (Repülőgép Karbantartás) előírásai alapján jogosított, és az illető állam jóváhagyott felügyelete alatt működő szervezet, melynek feladata a légijármű, vagy részeinek karbantartása.

Megjegyzés. Jelen meghatározásban semmi sem zárja ki azt, hogy a szervezetet és annak felügyeletét egynél több Állam hagyja jóvá.

Jóváhagyott kiképzés - (Approved training) A Szerződő Állam által jóváhagyott speciális tanterv és felügyelet szerint végzett képzés az Annex 1. 1. 2. 8. 2 és a 2. sz. Függelékben foglaltak szerint, amelynek értelmében a repülési személyzet képzése az Állam felügyelete alá tartozik

Bevezetés irányító szolgálat (ATS surveillance service). Ez a kifejezés használatos a bevezetés irányító szolgálat által közvetlenül nyújtott szolgáltatást
.
Bevezetés irányító rendszer (ATS surveillance system). Általánosító meghatározás, amely különböző ADS-B, PSR, SSR, vagy hasonló földi telepítésű rendszer, amely lehetővé teszi légijárművek azonosítását.

Megjegyzés. Hasonló földi telepítésű rendszer, összehasonlító értékelés és más módszerek együttes alkalmazásával, bizonyította, hogy biztonsági szintje és teljesítménye egyenlő, vagy jobb, mint az egyimpulzusos SSR.

Ballon – (Balloon) A levegőnél könnyebb, erőgép meghajtással nem rendelkező légijármű.

Megjegyzés: Jelen Annex céljára ez a meghatározás a szabadon repülő ballonra vonatkozik.

Légi-alkalmassá nyilvánítás - (Certify as airworthy (to) Annak igazolása, hogy a légijármű, vagy annak részei a rajtuk elvégzett karbantartást követően az érvényes légi alkalmassági előírásoknak megfelel.

Kereskedelmi légiszállítás (Commercial Air Transport)
Utas-, légiáru vagy postai küldemények szállítása díjazás, vagy bérleti díj ellenében.

Szaktudás (Competency)
Szakértelem, tudás és magatartásformák együttese, amelyek szükségesek az egyes feladatok elvégzéséhez az előírt szabványok szerint.

Az alkalmasság alapeleme (Competency element)
Cselekvés, amely olyan feladatot képez, amely meghatározott kezdő-és befejező eseményhez kapcsolódik, világosan meghatározza korlátait és eredménye megfigyelhető.

Az alkalmasság egysége (Competency Unit)
Számos alkalmassági alapelemből álló diszkrét funkció

Másodpilóta - (Co-pilot) Szakszolgálati engedéllyel rendelkező, a légijármű fedélzetén a repülőgép parancsnok feladatain kívül bármely más pilóta-feladatot ellátó pilóta, kivéve azt a személyt, aki a légijármű fedélzetén kizárólag repülésoktatás céljából tartózkodik.

Jóváírás (Credit) Korábban megszerzett képesítés, képzettség vagy más, az adott személy által elért eredmény beszámítása.

Útvonalrepülés, távrepülés (Cross-Country) egy indulási és egy érkezési pont közötti repülés, egy előre eltervezett útvonalon, szabvány navigációs eljárások alkalmazásával.

Kétkormányos képzési idő - (Dual instruction time) Az a repülési időtartam, amely alatt a légijármű fedélzetén egy adott személyt megfelelő jogosítással rendelkező pilóta oktatott.

Hiba (Error). A repülési személyzet részéről végrehajtott tevékenység vagy annak hiánya, amelynek következménye eltér a szervezet, vagy a repülési személyzet szándékától vagy elvárásaitól

*Megjegyzés (Note**)** lásd az Annex 13 E mellékletét –„Légijármű balesetek és események kivizsgálása." Leírás üzemeltető személyzetek részére.*

Hiba kezelése (Error management) az a folyamat, amelynek során a hibák felderítése és az ellenintézkedések segítségével rájuk adott válasz olyan, hogy csökkenti, vagy kiküszöböli a hibák következményeit, és csökkenti a további hibák, vagy a nemkívánatos légijármű helyzetek valószínűségét

Megjegyzés (Note): lásd a C. Melléklet 3. Fejezetét (PANS- Doc. 9868TRG), valamint a 314 értesítőt TEM (Threat and Error Management) (Fenyegetés és Hibakezelés) az ATC-ben a nemkívánatos államok leírásban.

Hajózó személyzeti tag - (Flight crew member) Szakszolgálati engedéllyel rendelkező olyan repülőszemélyzeti tag, akit a repülés időtartama alatt a légijármű üzemeltetéséhez nélkülözhetetlen kötelmek elvégzésével bíztak meg.

Repülési terv - (Flight plan) A légiforgalmi szolgálatok egységei számára biztosított meghatározott tartalmú tájékoztatás, mely egy tervezett repülésre, vagy annak egy részére vonatkozik.

Replülési eljárást gyakorló berendezés (Flight procedures trainer) – lásd **a *Repülési és navigációs eljárás-gyakorló berendezés (Flight procedures training device)*** címszó alatt

Repülési és navigációs eljárás-gyakorló berendezés (Flight procedures training device)
Az alábbi három készülék típus bármelyike, ha a repülési feltételeket a földön szimulálják:

Repülési szimulátor - (Flight simulator) *(FFS),* amely egy adott típusú légijármű pilótafülkéjének olyannyira pontos megfelelője, hogy a mechanikus, elektromos, elektronikus, stb. légijármű rendszerek szervei, a pilóták munkakörnyezete, a teljesítmény és az adott típus repülési jellemzői valósághűen előállíthatók.

Repülési eljárást gyakorló berendezés - (Flight procedure trainer) amely egy adott típusú légijármű pilótafülkéjének pontos megfelelője, a mechanikus, elektromos, elektronikus, stb. légijármű rendszerek szervei, a pilóták munkakörnyezete, a teljesítmény és az adott típus repülési jellemzői valósághűen előállíthatók.

Alapszintű műszerrepülés gyakorló berendezés (A basic instrument flight trainer
(BITD), amelyet felszereltek a megfelelő műszerekkel, és amely megjeleníti valamely légijármű pilótafülke környezetét műszerek szerinti repülési körülményekre.

Repülési szimulátor (Flight simulator)- lásd a ***Repülési és navigációs eljárás-gyakorló berendezés (Flight simulation training device)*** címszó alatt.

Repülési idő – repülőgépek - (Flight Time – aeroplanes) Az a teljes időtartam, mely a repülőgép felszállás céljából történő megmozdulásának első pillanatával kezdődik és azzal a pillanattal végződik, amikor a repülőgép a repülés befejeződésével végső nyugalomba jut.

Megjegyzés: A fentiekben meghatározott repülési idő általánosan használt értelemben megegyezik a „fékoldástól – befékezésig”, vagy a „féktuskó elvételétől a visszahelyezéséig” kifejezésekkel, és időtartamát attól a pillanattól mérik, amikor a repülőgép felszállás céljából először mozdul meg és tart addig a pillanatig, amikor a repülés befejeződésével a repülőgép véglegesen leáll
.

Repülési idő – helikopterek (Flight time – Helicopters) Az a teljes időtartam, mely akkor kezdődik, amikor a helikopter rotor-lapátjai forogni kezdenek és tart addig a pillanatig, amikor a repülés befejeződésével a helikopter véglegesen megáll, rotor-lapátjainak forgása teljesen megszűnik.

Vitorlázó repülőgép - (Glider) Erőgép meghajtással nem rendelkező, a levegőnél nehezebb légijármű, mely repülés közben a felhajtóerőt elsősorban a repülés adott szakaszaiban rögzített helyzetben maradó felületeire ható aerodinamikai reakciók révén nyeri.

Vitorlázó repülési idő - (Glider Flight Time) Attól függetlenül, hogy a vitorlázó repülőgép vontatással, vagy szabadon tartózkodik a levegőben, a repüléssel eltöltött teljes időtartam kezdete az a pillanat, amikor a vitorlázógép felszállás céljából először megmozdul és addig a pillanatig tart, amikor a repülés befejeztével a repülőgép nyugalmi helyzetbe kerül.

Helikopter - (Helicopter) Olyan a levegőnél nehezebb légijármű, melynek levegőben maradását egy általában függőleges tengelyre szerelt egy vagy több motormeghajtású rotor-lapáton képződő légreakció biztosítja.

Emberi tényezők -(Human performance) Az emberi képességeknek és korlátainak összessége, mely befolyást gyakorol a légiforgalmi tevékenységek biztonságára és hatékonyságára.

Műszeres repülési idő - (Instrument flight time) Az az időtartam, mely alatt a pilóta valamely légijárművet kizárólag a műszerek alapján vezet, külső vizuális támpontok felhasználása nélkül.

Műszeres földi idő - (Instrument ground time) Az az időtartam, amely alatt a pilóta szimulált műszeres repülést gyakorol a földön egy olyan mesterséges repülésoktató berendezésben, melyet az Engedélyező Hatóság jóváhagyott.

Műszeres idő - (Instrument time) Műszeres repülési idő, vagy műszeres földi idő.

Engedélyező Hatóság - (Licensing Authority) A Szerződő Állam által kijelölt hatóság, amely felelős a szakszemélyzet engedéllyel történő ellátásáért.

Megjegyzés- Jelen *Annex rendelkezései feltételezik, hogy a Szerződő Állam az engedélyező hatóságot az alábbi jogkörökkel ruházta fel:*

a) *engedély vagy jogosítás megszerzéséhez a folyamodó alkalmasságának felmérése,*

b) *engedélyek és jogosítások kiadása és korlátozó bejegyzésekkel való ellátása,*

c) *jóváhagyott személyek kijelölése és felhatalmazása,*

d) *kiképző tanfolyamok jóváhagyása,*

e) *mesterséges repülést gyakorló berendezés jóváhagyása, illetve a berendezés használatának* *engedélyezése a szükséges tapasztalat megszerzése céljából, vagy az engedély vagy jogosítás kiadásához a megkívánt jártasság bizonyítására, és*

f) *más Szerződő Állam által kiadott szakszolgálati engedélyek érvényesítése.*

Valószínű - (Likely) a 6. Fejezetben, az egészségügyi előírásokkal kapcsolatban a 'valószínű' kifejezés azt jelenti, hogy az előfordulás valószínűsége nem elfogadható az orvos szakértő számára.

Karbantartás - (Maintenance) A légijármű folyamatos légialkalmasságának fenntartásához szükséges feladatok ellátása, beleértve a külön-külön, vagy bármely kombinációban végzett nagyjavítást, az átvizsgálást, a cserét, hiánypótlást és a módosítást vagy a javítást.

Egészségügyi minősítés - (Medical Assessment) A Szerződő Állam által kiadott olyan bizonyítvány, amely szerint a szakszolgálati engedély birtokosa az egészségügyi alkalmasság meghatározott követelményeinek megfelel. Azt követően adják ki, hogy az Engedélyező Hatóság értékelte az engedélyért folyamodó személy vizsgálatát végző kijelölt vizsgálóorvos által benyújtott jelentést.

Egészségügyi minősítő (Medical assessor) – olyan szakorvos, akinek szakterülete a repülési orvosi praxis, aki kiértékeli az egészségügyi jelentéseket, amelyet az Engedélyező Hatóság orvos szakértője részére továbbított.

Orvos szakértő (Medical examiner) széleskörű tapasztalatokkal és nagy jártassággal rendelkezik a repülési orvostan területein, akit az Engedélyező hatóság nevez ki szakorvosi vizsgálatok elvégzésére a szakszolgálati engedélyért folyamodók alkalmasságának elbírálására.

Éjszaka - (Night) Az esti szürkület vége és a hajnali szürkület kezdete között eltelt idő, vagy olyan egyéb időtartam a napnyugta és a napkelte között, melyet az illetékes Hatóság állapított meg.

Megjegyzés- Az esti szürkület *akkor fejeződik be, amikor a napkorong középpontja 6°-kal a horizont alá süllyedt, a hajnali szürkület pedig reggel akkor kezdődik, amikor a napkorong középpontja 6°-kal a horizont alatt van.*

Teljesítmény kritériumok (Performance criteria) Az alkalmassági elemek előírt végeredményének egyszerű, értékelhető megállapításai, és azon kritériumok ismertetése, amelyeket annak megítéléséhez alkalmaztak, hogy a teljesítmény előírt szintje teljesült-e.

A légijármű vezetése - (Pilot (to) Valamely légijármű repülési kormányszerveinek működtetése a repülési idő alatt.
Parancsnokpilóta - (Pilot-in-command) Az üzemeltető, vagy kisgépes (általános célú) repülésben a tulajdonos által parancsnokpilótának kijelölt pilóta, akit megbíznak a repülés biztonságos végrehajtásával.

Felügyelet alatt álló parancsnokpilóta (Pilot-in-command under supervision)- PICUS, az a másodpilóta, aki parancsnokpilóta felügyelete alatt parancsnokpilótai beosztást és feladatot lát el. A beosztás akkor látható el, ha a felügyelet ellátására vonatkozó módszert, eljárást a légiközlekedési hatóság jóváhagyta.

Helyből felszálló repülőgép (Powered-lift)- a levegőnél nehezebb olyan légijármű, amely képes a függőleges felszállásra, a függőleges leszállásra és a kis sebességgel történő repülésre, és amely elsődlegesen a motormeghajtású emelőszerkezettől, vagy az emeléshez szerepet nem játszó nem-forgó légijármű felület (ek)-től a vízszintes repülés alatt

Káros szerek problémát okozó használata - (Problematic use of substances)
A repülési szakszemélyzet által fogyasztott olyan egy vagy több pszichoaktív szer, mely:

a) használójára nézve közvetlen veszélyt jelent, vagy mások életét, egészségét, illetve jólétét veszélyezteti, és/vagy
b) foglalkozási, szociális, mentális, fizikai problémát, vagy rendellenességet okoz, illetve azt súlyosbítja.

Pszichoaktív szerek - (Psichoactive substances) Az alkohol, az ópium-rokon-, a cannabis-rokon-anyagok, a nyugtató és hipnotikus anyagok, a kokain, a tudatállapotot befolyásoló egyéb szerek, a hallucinogén anyagok és az illó oldószerek a kávé és a dohány kivételével.

Minőségbiztosítási rendszer (Quality system) – a szervezet dokumentált eljárásai és irányelvei, és ezen irányelvek és eljárások belső auditjai, a minőség tökéletesítése érdekében hozott ajánlások és felülvizsgálatok kezelése.

Jogosított légiforgalmi irányító - (Rated air traffic controller) Olyan légiforgalmi irányító, aki szakszolgálati engedéllyel és az általa gyakorolt tevékenységre érvényes jogosítással rendelkezik.

Jogosítás - (Rating) A szakszolgálati engedélybe bejegyzett, vagy a szakszolgálati engedélyhez tartozó, annak részét képező felhatalmazás, amely a szakszolgálati engedélyt érintő külön feltételeket, jogosításokat vagy a korlátozásokat rögzíti.

Érvényesség elismerése (szakszolgálati engedély) - (Rendering (a licence) valid) Valamely Szerződő Állam saját szakszolgálati engedély kiadását helyettesítő olyan tevékenység, amellyel a más Szerződő Állam által kiadott szakszolgálati engedélyt saját kiadású szakszolgálati engedélyével egyenértékűnek ismer el.

Karbantartási nyilatkozat aláírása - (Sign a maintenance release (to) A 6. Annexben szereplő karbantartási nyilatkozat kiadásával annak igazolása, hogy a karbantartási munkát a vonatkozó légialkalmassági szabványokkal megegyezően kielégítő módon elvégezték.

Szignifikáns (Significant) – a 6. fejezetben szereplő egészségügyi előírások szövegvonatkozásaiban a „szignifikáns" kifejezés olyan természetű dologra utal, amely valószínűsíthetően veszélyeztetheti a repülés biztonságát.

Egyedül- repülési idő - (Solo flight time) Az az időtartam, amely alatt a növendék pilóta egyedül tartózkodik a légijárműben.

Fenyegetés (Threat) – olyan események, vagy hibák, amelyek függetlenek a repülési személyzet cselekedeteitől, megnövelik az üzemeltetés bonyolultságát, és amelyeket kezelni kell a biztonság megfelelő szintjének fenntartása érdekében.

Megjegyzés: lásd az Annex 13 E mellékletét –„Légijármű balesetek és események kivizsgálása." leírás üzemeltető személyzetek részére.

Fenyegetés kezelése (Threat management) –a fenyegetések felderítése, és a válaszul tett ellenintézkedések annak érdekében, hogy a fenyegetések következményei csökkenjenek vagy kiküszöbölhetőek legyenek, valamint a hibák vagy a nemkívánatos légijármű helyzetek előfordulási valószínűsége csökkenjen.

Megjegyzés (Note): lásd a C. Melléklet 3. Fejezetét (PANS- Doc. 9868TRG), valamint a 314 értesítőt TEM (Threat and Error Management) (Fenyegetés és Hibakezelés) az ATC-ben a nemkívánatos államok leírásban.

1. 2. Az engedélyekre vonatkozó általános szabályok

1. Megjegyzés: Annak ellenére, hogy a Nemzetközi Polgári Repülés Egyezménye a Lajstromozó Államot olyan feladatokkal ruházza fel, amelyeket ez az állam – a helyzetnek megfelelően – jogosult, vagy köteles gyakorolni, a Közgyűlés az A23-13 Határozatában elismerte, hogy a lajstromozó állam esetenként képtelen megfelelően eleget tenni kötelezettségének akkor, amikor más állam által üzemeltetett légijárművet - elsősorban hajózó személyzet nélkül- vesz bérbe, szerződésbe vagy cserébe, és elismerte továbbá azt, hogy az Egyezmény esetleg nem megfelelően írja elő az üzemeltető államának ilyen esetekre vonatkozó jogait és kötelezettségeit mindaddig, amíg az Egyezmény függőben lévő 83. Cikkelye érvénybe nem lép. Ezért a Tanács arra ösztönöz,- ha a fenti körülmények között a Lajstromozó Állam képtelennek vagy nem teljes értékűnek ítéli meg a rá vonatkozó előírt feladatok ellátását,- hogy utalja át az üzemeltető államának hatáskörébe (ha ezt az utóbbi elfogadja) a Lajstromozó Állam azon feladatait, amelyeket az üzemeltető állama sokkal megfelelőbben képes gyakorolni. Habár az Egyezmény függőben lévő 83. Cikkelye 1997. június 20.-án életbe lépett mindazon államokra vonatkozólag, amelyek a kapcsolódó Protokollt (DOC 9318) aláírták, a fentiekben említett lépések elsősorban azokra a Szerződő Államokra vonatkoznak, amelyek a függőben lévő 83. Cikkely hatálya alá eső szerződéses kapcsolattal nem rendelkeznek. Nyilvánvaló, hogy a függőben lévő 83. Cikkely érvénybe lépése után az előzőekben említett tevékenységek a gyakorlati célszerűséget segítik elő, és nem érintik sem a Chicago-i Egyezménynek a Lajstromozó Állam, sem bármely harmadik állam kötelezettségeket előíró rendelkezéseit. Az Egyezmény 83. Cikkelye ugyan érvénybe lépett 1997. június 20.-án, az ilyen átruházási egyezmények csak azokat a Szerződő Államokat fogják érinteni, amelyek ratifikálták a Protokollt (DOC 9318) a 83. Cikkelyben foglalt feltételek teljesítését követően.

2. Megjegyzés: A nemzetközi szabványokat és ajánlott gyakorlatokat az alábbi szakszolgálati engedélyekre alakították ki:
a) Hajózó személyzet

- *magánpilóta – repülőgép,*
- *kereskedelmi pilóta – repülőgép,*
- *közforgalmi pilóta – repülőgép,*
- *magánpilóta – helikopter,*
- *kereskedelmi pilóta – helikopter,*
- *közforgalmi pilóta – helikopter,*
- *vitorlázó repülőgép pilóta,*
- *szabadon repülő ballon pilótája,*
- *hajózó navigátor,*
- *hajózó mérnök*

b) egyéb személyzet
- *légijármű szerelő (technikus /mérnök /mechanikus),*
- *légiforgalmi irányító,*
- *repülésüzemi tiszt,*
- *légiforgalmi állomásüzemeltető.*

1. 2. 1. Hajózó személyzeti tagként való ténykedés joga

Valamely személy légijárművön csak abban az esetben tevékenykedhet hajózó személyzet tagjaként, ha rendelkezik a feladatkörének megfelelő és ezen Annex előírásait kielégítő érvényes szakszolgálati engedéllyel. A szakszolgálati engedélyt az adott légijárművet Lajstromozó Államnak kell kiállítania, vagy érvényesítenie kell a más Szerződő Állam által kiadott szakszolgálati engedélyt.

Megjegyzés: A Nemzetközi Polgári Repülési Egyezmény 29. Cikkelye előírja, hogy a hajózó személyzeti tagoknak a megfelelő engedélyeket magukkal kell vinniük a fedélzetre minden olyan légijármű esetében, amely részt vesz a nemzetközi légi navigációban

1. 2. 2. Az engedély érvényességének elismerése

1. 2. 2. 1. Ha egy Szerződő Állam egy másik Állam által kibocsátott szakszolgálati engedélyt érvényesnek ismer el a saját kibocsátású szakszolgálati engedélye alternatívájaként, az érvényességet az előbbi engedéllyel együtt viselendő megfelelő kiterjesztéssel határozza meg, melyben a másik állam szakszolgálati engedélyét a sajátjával egyenértékűnek elismeri. A kiterjesztés érvényessége nem haladhatja meg a szakszolgálati engedély lejárati idejét.

Megjegyzés: Ez a kitétel nem szándékozik megakadályozni a szakszolgálati engedélyt kibocsátó államot abban, hogy megfelelő bejelentéssel meghosszabbítsa az engedély érvényességi időtartamát anélkül, hogy megkövetelné akár a szakszolgálati engedély fizikai visszaküldését, akár a szakszolgálati engedély tulajdonosának megjelenését az adott állam hatóságai előtt.

1. 2. 2. 2. A Szerződő Állam által az 1. 2. 2. 1 pontban szereplő kibocsátott pilóta szakszolgálati engedélyt a többi Szerződő Állam részéről érvényesnek kell elismerni magánrepülések esetére.

1. 2. 2. 3. **Ajánlás –** Valamely Szerződő Állam által kibocsátott pilóta szakszolgálati engedély érvényesnek tekintendő bármely más Szerződő Államban magán célú repülésre.

Megjegyzés: A más Szerződő Állam által kiadott szakszolgálati engedélyt magánrepülések céljára hivatalos formaságok nélkül elismerő Szerződő Államot arra ösztönözzük, hogy ezt a lehetőséget saját Légiforgalmi Tájékoztató Kiadványában (AIP) tegye közzé

1. 2. 3. A szakszolgálati engedély birtokosának jogai

A Szerződő Állam ne engedélyezze, hogy az engedély birtokosa a szakszolgálati engedélyében biztosított jogain kívül egyéb jogokat is gyakorolhasson.

1. 2. 4. Egészségügyi alkalmasság

1. Megjegyzés: Tájékoztató anyagot a Polgári Repülés Egészségügyi Kézikönyve (DOC 8984) tartalmaz.

2. Megjegyzés: A folyamodónak az „Egészségügyi Minősítés"-ben foglalt és három külön osztályba sorolt követelmény közül a megfelelőt kell teljesítenie a különböző típusú szakszolgálati engedélyek egészségügyi feltételeinek kielégítéséhez. Az erre vonatkozó részleteket a 6. 2, 6. 3, 6. 4, és a 6. 5 pontok tartalmazzák.

Az 1. 2. 4. 1 pontban leírt követelmények teljesítésének bizonyítékául az Engedélyező Hatóság megadja a folyamodónak a megfelelő (1., 2., illetve 3. osztályú) Egészségügyi Minősítést. Ez többféle módon történhet, mint például: megfelelő megnevezésű külön bizonyítvány kiadásával, a szakszolgálati engedélybe történő bejegyzéssel, állami szabályba foglalással, miszerint az egészségügyi minősítés a szakszolgálati engedély szerves része, stb.
1. 2. 4. 1. Az engedélyért folyamodónak, ahol ez alkalmazható, a 6. Fejezetben részletezett követelményeknek megfelelően kiállított egészségügyi minősítéssel kell rendelkeznie.

1. 2. 4. 2. Az adott egészségügyi minősítés folyamatos érvényességi időtartamának meg kell felelnie az 1. 2. 5. 2 pont előírásainak. Az érvényesség időtartama az egészségügyi minősítés kiállításának napjával kezdődik.

1. 2. 4. 2. 1. Az egészségügyi minősítés érvényességi ideje meghosszabbítható 45 nappal az Engedélyező Hatóság jóváhagyása alapján.

Megjegyzés: ajánlatos meghagyni azt a naptári napot fix időpontnak, amikor az egészségügyi minősítés lejár.

1. 2. 4. 3. A hajózó személyzet tagjai, vagy a légiforgalmi irányítók csak akkor gyakorolhatják a szakszolgálati engedélyükkel együtt járó jogaikat, ha a szakszolgálati engedélyüknek megfelelő, érvényes egészségügyi minősítéssel rendelkeznek, az 1. 2. 5. 2. 3. pontban foglaltak kivételével.

1. 2. 4. 4. A Szerződő Állam jelöljön ki megfelelő képesítéssel és orvosi gyakorlattal rendelkező orvosokat, akik a folyamodó egészségi állapotának orvosi vizsgálatait elvégzik a 2. és a 3. Fejezetben ismertetett szakszolgálati engedélyek vagy jogosítások kiadásához, megújításához, és a 4. Fejezetben szereplő megfelelő engedélyek kiadásához és megújításához.

1. 2. 4. 4. 1. A vizsgáló orvosoknak repülő-orvosi képzettséggel kell rendelkezniük, vagy részt kell venniük ilyen képzésben, illetve időszakonként ismereteiket frissíteniük kell szaktanfolyamok elvégzése által.

1. 2. 4. 4. 2. - A vizsgáló orvosok szerezzenek gyakorlati ismereteket és tapasztalatokat azokról a körülményekről, amelyek között a szakszolgálati engedélyek és jogosítások birtokosai a feladatkörüket ellátják.

Megjegyzés: a gyakorlati tudás, valamint a repülési, szimulációs és egyéb gyakorlati példák, megfigyelések összhangban az Engedélyező Hatóság követelményeivel.

1. 2. 4. 5. Bármilyen szakszolgálati engedélyért vagy jogosításért (mely kiadásának alapfeltétele az orvosi alkalmasság) folyamodó személy köteles aláírásával ellátott nyilatkozatot eljuttatni vizsgáló orvosának, amelyben közli, hogy korábban hasonló vizsgálaton vett-e részt, és ha igen, milyen eredménnyel. Fel kell tüntetni, hogy a folyamodónak korábban volt-e elutasított, visszavont, vagy felfüggesztett egészségügyi minősítése, és ha igen ezek okai.

1. 2. 4. 5. 1. Ha a szakszolgálati engedélyért vagy jogosításért folyamodó a vizsgáló orvosnak valótlan nyilatkozatot tesz, az orvos ezt jelenteni köteles az állam Engedélyező Hatóságának, hogy az megtehesse a szükségesnek ítélt lépéseket.

1. 2. 4. 6. Amikor a folyamodó 6. Fejezet szerinti orvosi vizsgálata befejeződött, a vizsgáló orvos az Engedélyező Hatóság részére, ezen hatóság előírásaival egyező vizsgálat eredményéről megfelelő részletességű és aláírt jelentést köteles küldeni.

1. 2. 4. 6. 1. Ha az orvosi jelentést az Engedélyező Hatóság részére elektronikus úton továbbítják, szükséges a vizsgálatot végző orvos megfelelő azonosítását elvégezni.

1. 2. 4. 6. 2. Abban az esetben, ha az orvosi vizsgálatot két, vagy több vizsgáló orvos végzi, a Szerződő Államok a vizsgálatok eredményeinek koordinálására az egyik vizsgáló orvost jelöli ki az orvosi alkalmasság megállapítására és a jelentés aláírására.

1. 2. 4. 7. A Szerződő Államoknak repülő-orvosi gyakorlatban jártas orvosok szolgálatait kell igénybe venniük, ha szükségesnek látszik a vizsgáló orvosok által az Engedélyező Hatóságnak küldött jelentések értékelése.

1. 2. 4. 7. 1 A vizsgáló orvos köteles az egészségügyi információt az Engedélyező Hatóságnak megküldeni, hogy a Hatóság az egészségügyi minősítés auditálását elvégezhesse.

Megjegyzés: az ilyen jellegű auditálás elvégzése annak igazolására szolgál, hogy az orvos szakértők megfelelnek-e az orvosi gyakorlat általános követelményeinek.

1. 2. 4. 8. Ha a 6. Fejezetben foglalt, az adott szakszolgálati engedély kiadásához előírt egészségügyi követelmények valamelyike nem teljesül, akkor a Szerződő Állam egészségügyi minősítést addig nem adja meg, vagy nem újítja meg, amíg a következő feltételek nem teljesülnek:

a) csatolt orvosi vélemény jelzi, hogy a folyamodó azon hibája, miszerint speciális esetekben valamely követelménynek – akár számszerűségben, akár más módon – nem tesz eleget , ez olyan hiba, mely a kért szakszolgálati engedélyben szereplő jogosítványok gyakorlása során a repülés biztonságára valószínűleg nem jelent veszélyt,

b) a kérelmező adott képességeit, ismereteit és gyakorlottságát, illetve az üzemi körülményeket alaposan mérlegelték,

c) ha a kérelmező feladatainak biztonságos teljesítése korlátozás, vagy korlátozások betartásától függ, a szakszolgálati engedélyt külön korlátozással kell ellátni.

1. 2. 4. 9. Az orvosi titoktartást mindenkor be kell tartani.

1. 2. 4. 9. 1. Minden egyes orvosi jelentést és nyilvántartást biztonságos helyen kell tartani és azokhoz kizárólag csak meghatalmazással rendelkező személyek férhetnek hozzá.

1. 2. 4. 9. 2. Ha üzemeltetési megfontolások igazolják, az egészségügyi minősítő dönti el, hogy milyen szinten továbbítja az egészségügyi információt az Engedélyező Hatóság illetékes tisztségviselőjének.

1. 2. 5. A szakszolgálati engedélyek érvényessége

1. 2. 5. 1. Ha a Szerződő Állam szakszolgálati engedélyt adott ki, akkor köteles megbizonyosodni arról, hogy a tulajdonos a szakszolgálati engedélyben, vagy a vele kapcsolatban biztosított jogait csak akkor gyakorolja, ha alkalmasságát fenntartotta és rendelkezik az Állam által előírt előzetes tapasztalatokkal.

1. 2. 5. 1. 1. **Ajánlás**. *A Szerződő Állam határozza meg a pilóta szakszolgálati engedélyhez és jogosításához szükséges szakértelemmel és gyakorlattal összefüggő követelményeket.*

1. 2. 5. 1. 2 A szolgálati engedélyt kiadó Szerződő Államnak biztosítania kell, hogy a többi Szerződő

Államnak módjában álljon a szakszolgálati engedély érvényességéről meggyőződni.

1. Megjegyzés: A kereskedelmi légi-szállításban részt vevő hajózó személyzeti tagok szakképzettségének meglétéről kielégítő módon lehet meggyőződni az Annex 6 szerint végrehajtott gyakorló repüléseken.

2. Megjegyzés: A szakképzettség megléte kielégítően dokumentálható az üzemeltető nyilvántartásában, vagy a hajózó személyzet tagjainak személyi repülési naplójában, vagy a szakszolgálati engedélyben.

3. Megjegyzés: A hajózó személyzet tagjai – a Lajstromozó Állam által kívánatosnak tartott mértékig – bizonyíthatják szakképzettségük folyamatos meglétét a Lajstromozó Állam által jóváhagyott szintetikus repülés-gyakorló berendezésben is.

4. Megjegyzés: Lásd A Repülési Szimulátor Minősítési Kritériumai Kézikönyvet (DOC 9625)

5. Megjegyzés: Lásd (Doc 9379) kézikönyvet.

1. 2. 5. 2. Az 1. 2. 4. 5 és az 1. 2. 4. 6. pontokkal összhangban meghatározott egészségügyi alkalmasságról szóló jelentést az alábbiaknál nem hosszabb időközönként kell benyújtani (kivéve az 1. 2. 5. 2. 1, az 1. 2. 5. 2. 2. és 1. 2. 5. 2. 3 pontokban foglaltakat):

60 hónap a magánpilóta – repülőgép, léghajó, helikopter és helyből felszálló repülőgépre vonatkozó szakszolgálati engedély esetében;

12 hónap a kereskedelmi pilóta – repülőgép, léghajó, helikopter és helyből felszálló repülőgépre vonatkozó szakszolgálati engedély esetében;

12 hónap a közforgalmi pilóta – repülőgép szakszolgálati engedély esetében;

24 hónap a magánpilóta – helikopter szakszolgálati engedély esetében;

12 hónap a kereskedelmi pilóta – repülőgép szakszolgálati engedély esetében;

12 hónap a közforgalmi pilóta – repülő, helikopter és helyből felszálló repülőgép szakszolgálati engedély esetében;

60 hónap a vitorlázó repülőgép pilóta szakszolgálati engedély esetében;

60 hónap a szabadon repülő ballon pilóta szakszolgálati engedély esetében;

12 hónap a hajózó navigátor szakszolgálati engedély esetében;

12 hónap a hajózó fedélzeti mérnök szakszolgálati engedély esetében;

48 hónap a légiforgalmi irányító szakszolgálati engedély esetében;

Megjegyzés: 1. a fent felsorolt érvényességi idők 45 nappal meghosszabbíthatók az 1. 2. 4. 1. pontban foglaltak szerint.

Megjegyzés 2. Ha a számítást az 1. 2. 5. 2. pont és annak pontjai szerint végzik el, az érvényesség ideje-

beszámítva az utolsó hónapot- magában foglalja azt a napot, amely egybe esik az orvosi vizsgálat keltével, illetve ha a tárgyhóban olyan nap nem nincsen, akkor a hónap utolsónapjával.

1. 2. 5. 2 1. Az egészségügyi minősítés érvényesség ideje csökkenthető amennyiben orvosilag indokolt.

1. 2. 5. 2. 2. – Ha a repülőgép, helikopter, helyből felszálló repülőgépre érvényes szakszolgálati engedéllyel rendelkező pilóták, valamint a repülőgép, léghajó, helikopter és helyből felszálló repülőgép szakszolgálati engedéllyel rendelkező kereskedelmi pilóták, akik kereskedelmi üzemelésben lévő járatokon utasokat szállítanak és betöltötték 40. életévüket, szakszolgálati engedélyük érvényessége az 1. 2. 5. 2 pontban foglaltak szerint 6 hónapra csökken.

1. 2. 5. 2. 3. Ha a repülőgép, helikopter, helyből felszálló repülőgépre érvényes szakszolgálati engedéllyel rendelkező pilóták, valamint a repülőgép, léghajó, helikopter és helyből felszálló repülőgép szakszolgálati engedéllyel rendelkező kereskedelmi pilóták, akik kereskedelmi üzemelésben lévő járatokon utasokat szállítanak és betöltötték 60. életévüket, szakszolgálati engedélyük érvényessége az 1. 2. 5. 2 pontban foglaltak szerint 6 hónapra csökken.

1. 2. 5. 2. 4. Magánpilóták, akik repülőgép, léghajó, helikopter és helyből felszálló repülőgép, ballon, vitorlázórepülő és légiforgalmi irányító szakszolgálati engedéllyel rendelkeznek és betöltötték 40. életévüket szakszolgálati engedélyük érvényessége az 1. 2. 5. 2 pontban foglaltak szerint 6 hónapra csökken.

1. 2. 5. 2. 5. **Ajánlás** -. Magánpilóták, akik repülőgép, léghajó, helikopter és helyből felszálló repülőgép, ballon, vitorlázórepülő és légiforgalmi irányító szakszolgálati engedéllyel rendelkeznek és betöltötték 50. életévüket szakszolgálati engedélyük érvényessége az 1. 2. 5. 2 pontban foglaltak szerint további 12 hónapra csökken.

Megjegyzés: A fenti érvényességi idők attól számítanak, amikor a jelentkezőn az orvosi vizsgálatokat elvégzik

1. 2. 5. 2. 6. *Az orvosi vizsgálat halaszthatóságának feltételei.* Ha a szakszolgálati engedély birtokosa a kijelölt orvosi vizsgálat helyszínétől távol tevékenykedik, az Engedélyező Hatóság döntése szerint az előírt újra-vizsgálat halasztható feltéve, hogy ezt csak kivételesen alkalmazzák, és nem haladja meg az alábbi időtartamot:

a) kereskedelmi légiszállítási tevékenységet nem végző hajózó személyzeti tag esetében egyszeri hat hónapos időtartam,

b) kereskedelmi légi-szállítási tevékenységben részt vevő hajózó személyzeti tag esetében két egymást követő három hónapos időtartam, feltéve, hogy mindkét esetben kedvező orvosi jelentést kapott a szóban forgó terület kijelölt vizsgáló orvosánál végrehajtott vizsgálatot követően, vagy olyan esetekben, amikor ilyen személy nem áll rendelkezésre, akkor egy olyan orvos által elvégzett vizsgálat után, aki törvényes minősítéssel rendelkezik orvosi gyakorlat folytatására ezen a területen. Az orvosi vizsgálatról szóló jelentést a szakszolgálati engedélyt kiállító Engedélyező Hatóság számára kell megküldeni.

c) magánpilóta esetében egyetlen, de 24 hónapot meg nem haladó időtartam olyan esetben, amikor az orvosi vizsgálatot az azon a területen tevékenykedő, a Szerződő Állam által az 1. 2. 4. 4. pontban meghatározottak szerint kijelölt vizsgáló orvos végezte el, ahol a kérelmező ideiglenesen tartózkodik. Az orvosi vizsgálat zárójelentését az Engedélyező Hatósághoz kell eljuttatni.

1. 2. 6. Az egészségi állapot romlása

1. 2. 6. 1. Jelen Annex-ben szereplő szakszolgálati engedélyek birtokosai nem gyakorolhatják szakszolgálati engedélyeik és a hozzá kapcsolódó jogosításokból eredő jogaikat, ha tudomásukra jut, hogy egészségi állapotuk bármilyen mértékben romlott, és ennek következtében az engedélyezett feladatkörök biztonságos és megfelelő végzésére esetleg képtelenné válhatnak.

1. 2. 6. 1. 1. ***Ajánlás –*** *A szakszolgálati engedélyek birtokosainak tájékoztatniuk kell az Engedélyező Hatóságot akár igazolt terhességükről, vagy minden egyéb, 20 napot meghaladó egészségi állapotukban történő változásról, szükségük van-e folyamatos kezelésekre és gyógyszereke, illetve szükségük van-e kórházi ápolásra.*

1. 2. 6. 1. 2. ***Ajánlás –*** *Minden egyes Szerződő Államnak gondoskodnia kell arról, hogy a szakszolgálati engedélyek birtokosai ne gyakorolhassák szakszolgálati engedélyeik és jogosítványaik biztosította jogokat olyan időszakban, amikor egészségi állapotuk romlása egészségügyi minősítésük kiadását, vagy megújítását nem tehette volna lehetővé.*

1. 2. 7. Pszichoaktív anyagok használata

1. 2. 7. 1. Ezen Annex-ben szereplő szakszolgálati engedélyek birtokosai nem gyakorolhatják szakszolgálati engedélyeik és a hozzá kapcsolódó jogosítványaik biztosította jogokat, ha olyan pszichoaktív szer hatása alatt állnak, mely esetleg képtelenné tehetik őket jogosításaik biztonságos és megfelelő gyakorlására.

1. 2. 7. 2. Jelen Annex-ben felsorolt szakszolgálati engedélyek birtokosai problémát okozó káros szereket nem használhatnak.

1. 2. 7. 3**. Ajánlás -** *A Szerződő Államnak a legmesszebbmenőkig gondoskodnia kell arról, hogy minden egyes szakszolgálati engedély birtokosa, aki bármilyen problémás káros szert használ, felderítésre és eltávolításra kerüljön a biztonságot veszélyeztető, kritikus feladatkörökből. A biztonság szempontjából a kritikus feladatkörbe való visszatérés sikeres kezelés esetén fontolóra vehető, vagy kezelést nem igénylő esetekben, ha a problematikus szerek használatát abbahagyta és megállapítást nyert, hogy feladatköre ellátása során nem valószínű, hogy veszélyezteti a biztonságot.*

Megjegyzés.-   A Repülési Munkahelyeken Káros Szerek Problémát Okozó Használatának Megelőzési Kézikönyvében (DOC 9654) útmutató található a felderítés megfelelő módszereiről (amely biokémiai ellenőrzést is magában foglalhat, mint például az alkalmazást megelőzően, vagy alapos gyanú esetén, balesetet/eseményt követően, időszakosan és véletlenszerűen), továbbá más, megelőzési témákról.

1. 2. 8. Jóváhagyott kiképzés

Megjegyzés- A szakszolgálati engedély megszerzéséhez szükséges képzettség sokkal gyorsabban és könnyebben szerezhető meg, ha a kérelmező egy szigorúan ellenőrzött, szisztematikus és folyamatos kiképzési tanfolyamon vesz részt, mely egy tervezett tantervre és tematikára épült fel. A tapasztalatra vonatkozó követelmények bizonyos fokú csökkentésére már történt előkészület jelen Szabványokban és Ajánlott Eljárásokban ismertetett bizonyos szakszolgálati engedélyek és jogosítások kiadásához, olyan folyamodó esetében, aki már egy jóváhagyott kiképzést sikeresen befejezett.

1. 2. 8. 1. A jóváhagyott kiképzésnek legalább olyan képzettségi szintet kell biztosítania, mint a

jóváhagyott képzésben nem részesült személyekre vonatkozó minimális képzettségi követelmény.

1. 2. 8. 2. A kiképzési szervezet Állam által történő jóváhagyása attól függ, hogy a kérelmező megfelel-e a 2. sz. Függelékben foglalt követelményeknek.

Megjegyzés: a repülési személyzet kiképző szervezet engedélyezésével kapcsolatos útmutatás a repülési személyzet kiképző szervezeteinek engedélyezési kézikönyvben található.

1. 2. 9 Nyelvtudás

1. 2. 9. 1. A repülőgépen és helikopteren tevékenykedő pilótáknak, valamint azon hajózó navigátoroknak, akiknek használniuk kell a fedélzeti rádiótelefont, bizonyítaniuk kell azt, hogy képesek beszélni és megérteni a rádió-távbeszélő összeköttetésben használatos nyelvet.

Megjegyzés.- A Nemzetközi Polgári Repülési Egyezmény 42. Cikkelye értelmében az 1. 2. 9. 1 pont nem alkalmazható azon személyre, akinek szakszolgálati engedélyét eredetileg 2004. március 5. előtt adták ki, de minden esetben vonatkozik azokra a személyzeti tagokra, akiknek szakszolgálati engedélye 2008. március 5. után is érvényben marad.

1. 2. 9. 2. A légiforgalmi irányítóknak és a légiforgalmi állomásüzemeltetőknek bizonyítaniuk kell, hogy képesek beszélni és megérteni a rádió-távbeszélő összeköttetésben használatos nyelvet.

1. 2. 9. 3. **Ajánlás.-** *A hajózó mérnököknek és a vitorlázó vagy szabadon repülő ballonok pilótáinak beszélniük és érteniük kell a rádió-távbeszélő összeköttetésben használatos nyelvet.*

1. 2. 9. 4. 2008. március 5.-től a repülőgép és helikopter pilótáknak, a légiforgalmi irányítóknak és a légiforgalmi állomásüzemeltetőknek bizonyítaniuk kell, hogy beszélik és értik a rádió-távbeszélő összeköttetésben használatos nyelvet a Mellékletben meghatározott nyelvtudás szinten.

1. 2. 9. 5. **Ajánlás.-** *Mindazon repülőgép-vezetőknek és helikopter pilótáknak, helyből felszálló repülőgép pilótáknak, hajózó navigátoroknak, akiknek használniuk kell a légijármű fedélzeti rádiótelefonját, a légiforgalmi irányítóknak és a légiforgalmi állomásüzemeltetőknek bizonyítaniuk kell, hogy olyan szinten értik és beszélik a rádió-távbeszélő összeköttetésben használatos nyelvet, melyet az 1. Melléklet nyelvtudás követelményként meghatároz.*

1. 2. 9. 6. 2008. március 5.-vel kezdődően mindazon repülőgép-vezetők és helikopter pilóták, légiforgalmi irányítók és légiforgalmi állomásüzemeltetők nyelvismeretét, akiknek nyelvtudása nem éri el a Jártasság Szintjét (6 Szint), időszakonként az előírásoknak megfelelően értékelni kell a jártassági szint egyénileg történő bizonyításával.

1. 2. 9. 7. **Ajánlás.-** *Azon repülőgép-vezetőknek és helikopter pilótáknak, hajózó navigátoroknak nyelvtudását, akiknek használniuk kell a légijármű fedélzeti rádiótelefonját, valamint a légiforgalmi irányítók és a légiforgalmi állomásüzemeltetők nyelvismeretét, akik nem érik el a Jártasság Szintjét (6 Szint), időszakonként az előírásoknak megfelelően értékelni kell a jártassági szint egyénileg történő bizonyításával a következők szerint:*

a) mindazokat, akiknek bizonyított nyelvtudása eléri az Operatív Szintet (4 Szint), háromévenként legalább egyszer értékelni kell, és *b) mindazokat, akiknek bizonyított nyelvtudása eléri a Bővített Szintet (5 Szint), hatévenként legalább egyszer értékelni kell.*

1. Megjegyzés Előírásszerű értékelés nem szükséges olyan folyamodók esetében, akik bizonyítják magas szintű nyelvtudásukat, például anyanyelvük, és akik magas szinten beszélik, de nem anyanyelvük, tájszólással vagy olyan hangsúlyozással, amelyet a nemzetközi légiforgalom közössége meg tud érteni.

2. Megjegyzés Az 1. 2. 9 pont előírásai, ahol hivatkoznak az Annex 10 II. Kötet 5. Fejezetre, a rádió-távbeszélő összeköttetésben használt nyelv lehet az a nyelv, amelyet rendszerint a földi állomások használnak, vagy az angol nyelv. Ezért a gyakorlatban lesznek olyan helyzetek, ahol a hajózó személyzet tagjainak csak azt a nyelvet szükséges beszélniük, amelyet a földi állomások rendszerint használnak.

4. FEJEZET NEM HAJÓZÓ SZEMÉLYZET TAGJAINAK SZAKSZOLGÁLATI ENGEDÉLYEI ÉS JOGOSÍTÁSAI

4. 1. A nem hajózó személyzet tagjainak szakszolgálati engedélyére és jogosításaira vonatkozó általános szabályok

4. 1. 1. Bármely nem hajózó személyzeti tagra vonatkozó szakszolgálati engedély vagy jogosítás kiadása előtt a folyamodónak ki kell elégítenie az életkorra, szakismeretre, tapasztalatra és – ahol alkalmazható, - az egészségügyi alkalmasságra, jártasságra vonatkozó követelményeket, úgy, ahogy azokat az adott szakszolgálati engedélyhez vagy jogosításhoz előírták.

4. 1. 2. Ha egy nem hajózó személyzeti tag bármilyen szakszolgálati engedélyért vagy jogosításért folyamodik, demonstrálnia kell az Engedélyező Hatóság által meghatározott módon az ilyen szakszolgálati engedélyre vagy jogosításra előírt szakismeretet és jártasságot.

4. 2. Légijármű karbantartó (technikus /mérnök /szerelő)

Megjegyzés: - A zárójelben lévő meghatározásokat a szakszolgálati engedély címéhez elfogadható kiegészítésként adtuk meg. Minden egyes Szerződő Állam az általa elfogadhatónak talált kifejezést használja fel saját előírásaiban.

4. 2. 1. A szakszolgálati engedély kiadásának feltételei

4. 2. 1. 1. *Életkor*

A folyamodó nem lehet 18 évesnél fiatalabb.

4. 2. 1. 2. *Szakismeret*

A folyamodónak bizonyítania kell, hogy tudásszintje megfelel az adandó jogosítványoknak és a légijármű karbantartó szakszolgálati engedély birtokosa felelősségi körének legalább az alábbi témakörökben:

Légi jog és légi alkalmassági követelmények

a) a légijármű karbantartó szakszolgálati engedély birtokosára vonatkozó szabályok és előírások, beleértve a légi-alkalmassá nyilvánítást és a folyamatos légi alkalmasság körét szabályozó előírásokat, illetve a jóváhagyott légijármű karbantartó szervezetet és eljárásokat,

Természettudományi ismeretek és általános légijármű-ismeret

b) alapfokú matematika, mértékegységek, a fizika és a kémia elmélete és alapelvei, melyek a légijármű karbantartóra vonatkozhatnak,

Légijármű mérnökszolgálat (engineering)

c) a légijármű építéséhez használt anyagok jellemzői és alkalmazásuk, beleértve az építés alapelveit és a légijármű szerkezetének működését, a rögzítési módszereket, a hajtóműveket és a hozzájuk tartozó rendszereket, mechanikus, folyadékos, elektromos és elektronikus erőforrásokat, légijármű műszereket és kijelző rendszereket, légijármű vezérlési rendszereket, fedélzeti navigációs és kommunikációs rendszereket,

Légijármű karbantartás

d) egy légijármű folyamatos légi alkalmasságának fenntartásához előírt tevékenységek, beleértve a légijármű szerkezetének, elemeinek és rendszereinek nagyjavítására, javítására, felülvizsgálatára, cserélésére, módosítására és a hibaelhárításra vonatkozó eljárásokat és módszereket a vonatkozó Karbantartási Kézikönyvben, valamint az alkalmazandó légi alkalmassági Szabványokban előírt módszereknek megfelelően, és

Emberi tényezők

e) a légijármű karbantartó szakszolgálati engedély birtokosára vonatkozó emberi tényezők

Megjegyzés: Az emberi tényezőkre vonatkozó kiképzési program megtervezéséhez tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (9683) található.

.
4. 2. 1. 3. *Tapasztalat*

A folyamodónak mind a légijármű, mind pedig alkatrészeinek karbantartásában, szervizelésében, felülvizsgálatában az alábbi tapasztalattal kell rendelkeznie:

a) szakszolgálati engedély kiadásához a légijármű teljes egészére vonatkozó jogosítványokkal legalább:

1) négy év, vagy

2) két év, ha a folyamodó kielégítően elvégzett egy jóváhagyott kiképzési tanfolyamot, és

b) a 4. 2. 2. 2. a) 2) vagy 3) pontoknak megfelelő korlátozott jogosítványokkal kiadott szakszolgálati engedélyhez olyan időtartam, mely lehetővé teszi az a) alpontban előírt szakértelem szint elérését feltéve, hogy ez nem rövidebb, mint: 1) két év, vagy

2) egy olyan időtartam, melyet az Állam szükségesnek tart ahhoz, hogy a folyamodó egy jóváhagyott kiképzési tanfolyamot elvégzett személlyel azonos szintű gyakorlati tapasztalatot szerezzen.

4. 2. 1. 4. *Kiképzés*

Ajánlás - *A folyamodónak a kért jogosítványoknak megfelelő kiképzési tanfolyamot kell elvégeznie. Megjegyzés: - Légijármű karbantartó szakszolgálati engedélyért folyamodók számára a kiképzési tanfolyamra vonatkozó tájékoztató anyagot a Kiképzési Kézikönyv (DOC 7192) D-1 Része tartalmazza.*

4. 2. 1. 5. *Jártasság*

A folyamodónak bizonyítania kell, hogy képes ellátni a megadandó jogosítványoknak megfelelő funkciókat.

4. 2. 2. A szakszolgálati engedély birtokosának jogosítványai és ezek gyakorlásakor figyelembe veendő feltételek

4. 2. 2. 1. Ha a 4. 2. 2. 2 és a 4. 2. 2. 3 pontokban előírt követelményeknek megfelel, a légijármű karbantartó szakszolgálati engedély birtokosának joga van a légijármű vagy részeinek légi alkalmasságát igazolni jóváhagyott javítás, módosítás után, vagy egy hajtómű, tartozékok, műszer és/vagy berendezés tétel beépítését követően és aláírni a karbantartási okmányt felülvizsgálat, karbantartási munkák elvégzése és/vagy rutin szervizmunkák elvégzése után.

4. 2. 2. 2. A 4. 2. 2. 1. pontban meghatározott légijármű karbantartó szakszolgálati engedély birtokosának jogosítványai csak akkor gyakorolhatók, ha:

a) ezekre nézve:

1) a szakszolgálati engedélybe teljes egészében be van jegyezve a légijármű akár specifikusan, akár egy átfogó kategóriába sorolva; vagy

2) a szakszolgálati engedélybe akár specifikusan, akár egy átfogó kategóriába sorolva bejegyezték a sárkány és hajtóműveket, a légijármű rendszereket vagy részegységeket; és/vagy

3) a szakszolgálati engedélybe akár specifikusan, akár egy átfogó kategóriába sorolva bejegyezték a légijármű elektronikai rendszereket vagy részegységeket;

b) biztosított, hogy a szakszolgálati engedély birtokosa ismeri az adott légijármű karbantartására és légi-alkalmasságára vonatkozó összes olyan információt, amelyek alapján a szakszolgálati engedély birtokosa aláírja a Karbantartási Okmányt, vagy a sárkányra, hajtóműre, légijármű rendszerre vagy részegységre, valamint a légijármű elektronikai rendszerére, vagy annak részegységére vonatkozó minden olyan információt, amelyeknek légi alkalmasságát a szakszolgálati engedély birtokosa igazolja; és

c) feltéve, hogy a megelőző 24 hónapon belül a szakszolgálati engedély birtokosa tapasztalatot szerzett egy légijármű vagy alkotóelemei felülvizsgálata, szervizelése vagy karbantartása terén, és a kiadott szakszolgálati engedélye jogosítványait nem kevesebb, mint 6 hónapja gyakorolja, vagy eleget tett a szakszolgálati engedély megfelelő jogosítványokkal történő kiadása feltételeinek az Engedélyező Hatóság megelégedésére.

4. 2. 2. 3. A Szerződő Államnak a szakszolgálati engedély birtokosa jogosítványainak körét le kell írnia a feladatok komplexitásának azon fogalmaiban, amelyekre a szakszolgálati engedély kiadása vonatkozik.

4. 2. 2. 3. 1. **Ajánlás -** *A szakszolgálati engedély jogosítványainak részleteit vagy be kell vezetni a szakszolgálati engedélybe, vagy ahhoz kell csatolni akár közvetlenül, akár a Szerződő Állam által kiadott másik dokumentumra történő hivatkozással.*

4. 2. 2. 4. Ha a Szerződő Állam felhatalmaz egy jóváhagyott karbantartó szervezetet szakszolgálati engedéllyel nem rendelkező személyzet kijelölésére a 4. 2. 2 pont jogosítványainak gyakorlására, a kijelölt személynek ki kell elégítenie a 4. 2. 1 pont előírásait.

4. 3. Növendék légiforgalmi irányító

4. 3. 1.A Szerződő Államoknak megfelelő intézkedéseket kell foganatosítania, hogy a növendék légiforgalmi irányítók ne okozzanak veszélyt a légiközlekedésben.

4. 3. 2. Egészségügyi alkalmasság

A Szerződő Állam nem engedi meg a növendék légiforgalmi irányítónak, hogy utasításokat fogadjon üzemelési környezetben, ha a növendék légiforgalmi irányító nem rendelkezik érvényes 3. osztályú egészségügyi minősítéssel.

4. 4. A légiforgalmi irányító szakszolgálati engedély

4. 4. 1 Követelmények az engedély kiadására

A légiforgalmi irányító jogosításainak a következő kategóriákat kell magába foglalnia:
A légiforgalmi irányító szakszolgálati engedélyének kiállítása előtt a Szerződő Állam előírja, hogy a folyamodónak meg kell felelnie a 4. 4. 1 pontban szereplő követelményeknek és a 4. 5. pontban foglalt legalább egy jogosításnak. Engedéllyel nem rendelkező állami alkalmazottak is dolgozhatnak légiforgalmi irányítóként abban az esetben, ha ugyanazoknak a követelményeknek megfelelnek.

4. 4. 1. 1. *Életkor*

A folyamodó nem lehet 21 évesnél fiatalabb.

4. 4. 1. 2. Szakismeret

A folyamodónak bizonyítania kell, hogy tudásszintje megfelel a légiforgalmi irányító szakszolgálati engedélyéhez kötött ismereteknek legalább az alábbi témakörökben**:**
Légi jog

a) a légiforgalmi irányítóra vonatkozó szabályok és rendeletek*:*

Légiforgalmi irányítás berendezései

b) a légiforgalmi irányításban használt berendezések alapelvei és korlátozásai

Általános ismeretek

c) a repülés alapelvei, a légijármű, a hajtóművek és rendszerek működésének és üzemeltetésének alapelvei, a légijárműnek a légiforgalmi irányításra vonatkozó teljesítmény jellemzői,

Az emberi tényezők

d) az emberi tényezők a fenyegetés és hibák kezelésénél;

Megjegyzés: útmutató anyag az emberi tényezők képzés megtervezéséről a fenyegetés és hibák kezelésével kapcsolatban megtalálható az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683)

Meteorológia

e) repülési meteorológia; meteorológiai dokumentációk és információk elemzése és használata, a repülés végrehajtását és biztonságát befolyásoló időjárási jelenségek keletkezési helye és jellemzői, magasságmérés,

Navigáció

f) a repülési navigáció alapelvei, a navigációs rendszerek és a látás utáni navigáció segédeszközeinek alapelve, pontossága és korlátai, és

Üzemeltetési eljárások

g) a légiforgalmi irányítás, a rádióösszeköttetés, a rádió-távbeszélés és kifejezések eljárásai (szokványos, nem szokványos, vészhelyzeti), a vonatkozó légiforgalmi dokumentációk használata, a repüléssel kapcsolatos biztonsági gyakorlati eljárások

4. 4. 1. 3. Tapasztalat

A folyamodónak egy jóváhagyott kiképzési tanfolyamot kell elvégeznie és legalább három hónapig kielégítően kell tevékenykednie a tényleges légiforgalmi irányításban egy megfelelő jogosítással rendelkező légiforgalmi irányító felügyelete alatt. A légiforgalmi irányító jogosításaira a 4. 5. pontban meghatározott tapasztalat követelményeket a jelen pontban előírt tapasztalat részének lehet tekinteni.

4. 4. 1. 4. Egészségügyi alkalmasság

A folyamodónak érvényes 3. osztályú egészségügyi minősítéssel kell rendelkeznie.

4. 5. A légiforgalmi irányító jogosításai

4. 5. 1. A légiforgalmi irányító jogosításának kategóriái

A légiforgalmi irányító jogosításainak a következő kategóriákat kell magába foglalnia:

a) repülőtéri irányító jogosítás;

b) bevezetés irányító jogosítás;
c) radarbevezetés irányító jogosítás;

d) precíziós radarbevezetés irányító jogosítás;

e) távolkörzeti irányító jogosítás; és

f) távolkörzeti radarirányító jogosítás.

Megjegyzés: A Meteorológiai Világszervezet (WMO) a meteorológiai észleléseket végző személyzetre követelményeket írt elő, amelyek vonatkoznak az ugyanilyen feladatot ellátó légiforgalmi irányítókra is.

4. 5. 2. A légiforgalmi irányító jogosítások feltételei

4. 5. 2. 1 Szaktudás
A folyamodónak bizonyítania kell, hogy tudásszintje megfelel a megadandó jogosítványoknak az alábbi témakörökben és olyan mértékig, amennyire ezek érintik a felelősségi körét:

a) *repülőtéri irányító jogosultsághoz*:

1) a repülőtér kialakítása, fizikai jellemzői és a látás utáni navigáció segédeszközei;

2) a légtér szerkezete;

3) alkalmazandó szabályok, eljárások, és információforrások;

4) léginavigációs berendezések;

5) a légiforgalmi irányítás berendezései és azok használata;

6) domborzati és jellegzetes tereppontok;

7) a légiforgalom jellemzői;

8) időjárási jelenségek; és

9) vészhelyzeti, valamint kutatási és mentési tervek;

b) bevezetés irányító és távolkörzet irányító jogosításokhoz:

1) a légtér szerkezete;

2) alkalmazandó szabályok, eljárások és információforrás;

3) léginavigációs berendezések;

4) a légiforgalmi irányítás berendezései és használata;
5) domborzati és jellegzetes tereppontok;

6) a légiforgalom és a forgalomáramlás jellemzői;

7) időjárási jelenségek; és

8) vészhelyzeti, valamint kutatási és mentési tervek; és

c) radarberendezés irányító, precíziós radarbevezetés irányító és távolkörzeti radarirányító jogosításhoz:
A folyamodónak ki kell elégítenie a b) pontban előírt követelményeket a felelősségi körét érintő mértékben és bizonyítania kell az adandó jogosítványoknak megfelelő tudásszintet az alább felsorolt további témakörökben:

1) a radar, egyéb légtérellenőrző rendszerek, és a hozzájuk tartozó berendezések alapelve, használata és korlátai; és

2) a bevezetés, a precíziós bevezetés vagy a távolkörzeti radarirányítás szolgálatok biztosításának eljárásai, - amennyiben alkalmazhatók – beleértve a domborzattól való megfelelő elkülönítés megvalósításának eljárásait.

4. 5. 2. 2. *Szakismeret*

4. 5. 2. 2. 1. A folyamodónak:

a) sikeresen el kell végeznie egy jóváhagyott kiképzési tanfolyamot;

b) megfelelően jogosított légiforgalmi irányító felügyelete alatt irányítói szolgálatot kell kielégítően ellátnia:

1) *repülőtéri irányítói jogosítás esetében:* 90 óránál vagy egy hónapnál nem rövidebb ideig, attól függően, hogy melyik a hosszabb időtartam, egy repülőtéri irányító szolgálat azon egységénél, amelyre a jogosítását kéri;

2) *bevezetés irányító, radarbevezetés irányító, távolkörzeti vagy távolkörzeti radarirányító jogosítás esetében:* legalább 180 óra, vagy három hónap – attól függően, hogy melyik a hosszabb időtartam – azon irányítási egységnél, amelyre a jogosítását kéri;

3*) precíziós radarbevezetés irányító jogosítás esetében*: legalább 200 precíziós bevezetést, amelyből maximum 100 bevezetést lehet az Engedélyező Hatóság által erre a célra jóváhagyott szimulátoron teljesíteni. A fennmaradó precíziós bevezetésekből legalább ötvenet annál a szolgálati egységnél és azon az irányítóberendezésen kell teljesítenie, amelyre a jogosítását kéri; és

c) ha a radarbevezetés irányító jogosítás magába foglalja a légtérellenőrző radarbevezetés jogosítványát is, akkor a folyamodónak megfelelően jogosított bevezető irányító felügyelete alatt legalább 25 PPI (síkhelyzet kiértékelő) bevezetést kell végrehajtania olyan légtérellenőrző berendezés típuson, amelyet annál az egységnél használnak, amelyre a jogosítását kéri.

4. 5. 2. 2. 2. A 4. 5. 2. 2. 1 b) pontban meghatározott tapasztalatot az alkalmazását közvetlenül megelőző hat hónapon belül kell megszereznie.

4. 5. 2. 2. 3. Ha a folyamodó már rendelkezik légiforgalmi irányítói jogosítással egy másik kategóriában, vagy ugyanazzal a jogosítással egy másik irányító szolgálati egységnél, az Engedélyező Hatóságnak kell meghatároznia, hogy a 4. 5. 2. 2. pontban előírt gyakorlat csökkenthető-e, és ha igen, akkor milyen mértékben.

4. 5. 2. 3. *Jártasság*
A folyamodónak bizonyítania kell – a megadandó jogosítványoknak megfelelő szinten – az irányítói feladatok biztonságos, rendszeres és gyors ellátásához szükséges jártasságát, ítélőképességét és teljesítőképességét.

4. 5. 2. 4. *Két légiforgalmi irányító jogosítás egyidejű kiadása*

Ha a folyamodó egyidejűleg két légiforgalmi irányítói jogosítást kér, az Engedélyező Hatóságnak kell kialakítania az alkalmazható követelményeket az egyes jogosítások megszerzésének feltételei alapján. Az így meghatározott követelmények szintje nem lehet alacsonyabb, mint a magasabb követelményszintű jogosításé.

4. 5. 3. **A légiforgalmi irányító jogosítás (ok) birtokosainak jogai és ezek gyakorlásakor betartandó feltételek**

4. 5. 3. 1. Ha a szakszolgálati engedély birtokosa az 1. 2. 5, az 1. 2. 6. 1. 2. 7. 1. és 1. 2. 9. pontokban meghatározott követelményeknek eleget tett, és az alábbi jogosításokból egyet vagy többet bejegyeztek a légiforgalmi irányító szakszolgálati engedélyébe, akkor joga van:

a) repülőtéri irányító jogosítás esetében: repülőtéri irányító szolgálatot ellátni, vagy felügyeletet azon a repülőtéren, amelyre a jogosítása szól;

b) bevezetés irányító jogosítás esetében: bevezetés irányító szolgálatot, vagy felügyeletet ellátni a bevezetés irányító szolgálat illetékességi területébe vagy annak egy szektorába tartozó repülőtéren, vagy repülőtereken, amelyekre a szakszolgálati engedély birtokosa a jogosítást megszerezte;

c) radarbevezetés irányító jogosítás esetében: a bevezetés irányító szolgálat illetékessége alá tartozó, vagy annak meghatározott szektorában lévő repülőtéren, vagy repülőtéren radarral, vagy egyéb légtérellenőrző berendezéssel biztosított bevezetés irányító szolgálatot ellátni és/vagy felügyeletet, amelyekre a szakszolgálati engedély birtokosa a jogosítást megszerezte;

1) ha a 4. 5. 2. 2. 1. c) pont előírásainak megfelelt, a jogosítványoknak magukba kell foglalni a légtérellenőrző radarral (SRA) történő bevezetéseket is;

d) precíziós radarbevezetés irányító jogosítás esetében: precíziós radarbevezetés szolgálatot ellátni és/vagy felügyeletet azon a repülőtéren, amelyre a szakszolgálati engedély birtokosa jogosítást szerzett, és/vagy felügyeletet azon a repülőtéren, amelyre a szakszolgálati engedély birtokosa jogosítást szerzett;

e) távolkörzeti irányító jogosítás esetében: távolkörzeti irányító szolgálatot ellátni és/vagy felügyeletet gyakorolni azon irányítási körzetben vagy annak egy adott részében, amelyre a szakszolgálati engedély birtokosa jogosítást kapott; és *f) távolkörzeti radarirányítás jogosítás esetében*: az irányítási körzetben, vagy annak egy részében radar használatával irányító szolgálatot ellátni és/vagy felügyeletet gyakorolni, amelyre a szakszolgálati engedély birtokosa jogosítást szerzett.

4. 5. 3. 2. Mielőtt a 4. 5. 3. 1. pontban jelzett jogosítványait gyakorolná, a szakszolgálati engedély birtokosának meg kell ismernie az összes vonatkozó és érvényben lévő információt.

4. 5. 3. 3. A Szerződő Állam, ha már kiadott egy légiforgalmi irányító szakszolgálati engedélyt, ne engedje meg, hogy a szolgálati engedély birtokosa oktatást végezzen üzemi körülmények között feltéve, ha megfelelő felhatalmazást kapott erre a Szerződő Államtól.

4. 5. 3. 4. *A jogosítások érvényessége*
Egy jogosítás akkor válik érvénytelenné, ha egy légiforgalmi irányító az Engedélyező Hatóság által meghatározott időtartam alatt nem gyakorolja jogosítványait. Ez az időtartam nem haladhatja meg a hat hónapot. A jogosítás érvénytelensége fennáll addig, amíg az irányítóról újra meg nem állapítják, hogy képes a jogosítványok gyakorlására.

4. 6. Repülésüzemi tiszt/diszpécser szakszolgálati engedély

4. 6. 1. A szakszolgálati engedély kiadásának feltételei

4. 6. 1. 1. *Életkor*

A folyamodó nem lehet 21 évesnél fiatalabb.

4. 6. 1. 2. *Szakismeret*

A folyamodónak bizonyítania kell, hogy rendelkezik a repülésüzemi tiszt szakszolgálati engedély birtokosának megadott jogosítványoknak megfelelő tudásszinttel, legalább az alábbi témakörökben:

Légi jog

a) a repülésüzemi tiszt szakszolgálati engedély birtokosára vonatkozó szabályok és előírások, megfelelő légiforgalmi szolgálatok gyakorlatai és eljárásai;

Általános légijármű ismeret

b) a repülőgép hajtóműveinek, rendszereinek és műszereinek üzemeltetési alapelvei;

c) a repülőgépek és a hajtóművek üzemi korlátozásai;

d) minimálisan elégséges berendezések jegyzéke;

Repülési jellemzők kiszámítása és a repüléstervezés eljárásai

e) a terhelés és a tömegelosztás hatásai a légijármű teljesítményére és repülési jellemzőire, tömeg és tömegközéppont számítások;

f) a repülés részletes megtervezése, tüzelőanyag fogyasztás és tüzelőanyag időtartam számítások, kitérő repülőtér kiválasztási eljárásai, utazórepülés szabályozása az útvonalon, kiterjesztett hatótávolságú üzemelés;

g) repülési terv összeállítása és kitöltése a légiforgalmi szolgálatok részére;

h) a számítógépes repüléstervezési rendszerek alapelvei;

Emberi tényezők

i) a diszpécser kötelmekre vonatkozó emberi tényezők;

Megjegyzés: Az emberi tényezők kiképzési program megtervezéséhez tájékoztató anyag az Emberi Tényezők Kiképzési Kézikönyvben (DOC 9683) található.

Meteorológia

j) repülési meteorológia, a nyomásrendszerek mozgása, a frontok szerkezete, szignifikáns időjárási jelenségek keletkezési helye és jellemzői, amelyek befolyásolják a felszállás, az útvonalrepülés és a leszállás körülményeit;

k) a légiforgalmi meteorológiai jelentések, térképek és előrejelzések, a kódok és rövidítések értelmezése és alkalmazása, a meteorológiai információ használata és beszerzésének eljárásai;

Navigáció

l) a léginavigáció alapelvei, különös tekintettel a műszeres repülésre;

Üzemeltetési eljárások

m) a légiforgalmi dokumentáció használata;

n) áru és veszélyes anyagok szállításának üzemi eljárásai;

o) légijármű balesetekre és eseményekre vonatkozó eljárások, veszélyhelyzeti repülési eljárások;

p) a légijárműben elkövetett jogellenes cselekményekre és szabotázsakcióra vonatkozó eljárások;

Repüléselmélet

q) a megfelelő kategóriájú légijárműre vonatkozó repüléselmélet; és

Rádióösszeköttetés

r) a légijárművel és a vonatkozó földi állomásokkal történő rádióösszeköttetés eljárásai.

4. 6. 1. 3. *Tapasztalat*

4. 6. 1. 3. 1. A folyamodónak az alábbi tapasztalattal kell rendelkeznie:

a) két teljes év szolgálati idő az 1) - 3) alpontokban (mindkettőt beleértve) meghatározott munkakörök

bármelyikében, vagy ezek kombinációjában feltéve, hogy bármilyen kombináció esetében a szolgálati időnek bármelyik munkakörben legalább egy évnek kell lenni:
1) közforgalmi hajózó személyzet tagja; vagy

2) közforgalmi légijárművek diszpécser teendőit ellátó szervezetnél meteorológus; vagy

3) légiforgalmi irányító, vagy a repülésüzemi tisztek vagy közforgalmi repülésüzemi rendszerek műszaki ellenőre; vagy

b) legalább 1 évet eltöltött gyakornokként közforgalmi légijárművek diszpécser feladatainak ellátásában; vagy

c) sikeresen elvégzett egy jóváhagyott kiképzési tanfolyamot.

4. 6. 1. 3. 2. A folyamodónak az alkalmazását közvetlenül megelőzően 6 (hat) hónapon belül legalább 90 munkanapot kell teljesítenie egy repülésüzemi tiszt felügyelete alatt.

4. 6. 1. 4. *Jártasság*
A folyamodónak bizonyítania kell, hogy képes:

a) a napi időjárási térképekből és jelentésekből pontos és az üzemeltetés szempontjából elfogadható időjárás- analízist készíteni, egy adott útvonal általános környezetében uralkodó időjárási körülményekről üzemeltetési szempontból érvényes tájékoztatást adni, a repülést érintő időjárás tendenciát előre jelezni, különös tekintettel a cél- és kitérő repülőterekre;

b) egy adott járatszakasz optimális repülési útvonalát meghatározni, és kézzel és/vagy számítógéppel pontos repülési útvonaltervet készíteni; és

c) operatív felügyeletet gyakorolni, és minden egyéb segítséget megadni a tényleges vagy szimulált hátrányos időjárási körülmények között lévő járatnak, oly módon, ahogy a repülésüzemi tiszt szakszolgálati engedély birtokosának kötelmei ezt megkívánják.

4. 6. 2. A szakszolgálati engedély birtokosának jogosítványai és ezek gyakorlásakor betartandó követelmények
Ha az 1. 2. 5 pontban előírt követelményeknek megfelelt, a repülésüzemi tiszt szakszolgálati engedély birtokosának joga van ebbeli minőségében szolgálatot ellátni bármely olyan körzetre kiterjedő felelősséggel, amelyre nézve a folyamodó eleget tett az Annex 6-ban meghatározott feltételeknek.

4. 7. Légiforgalmi állomásüzemeltető szakszolgálati engedély

Megjegyzés: - Ez a szakszolgálati engedély nem a repülőtéri repüléstájékoztató szolgálat (AFIS) személyzete számára szolgál. Az ilyen személyzetek képesítésére vonatkozó tájékoztató anyag az ICAO 211 számú Körlevelében Repülőtéri Repüléstájékoztató Szolgálat (AFIS) címmel található meg.

4. 7. 1. A szakszolgálati engedély kiadásának feltételei

4. 7. 1. 1. Mielőtt a Szerződő Állam egy légiforgalmi állomásüzemeltető szakszolgálati engedélyt kiadna, meg kell követelnie a folyamodótól, hogy az eleget tegyen a 4. 6. 1 pont követelményeinek. Szakszolgálati engedély nélküli személyek azzal a feltétellel tevékenykedhetnek légiforgalmi állomásüzemeltetőként, hogy az az állam, amelynek területéről üzemelnek biztosítja, hogy ezen személyek megfelelnek

ugyanezen követelményeknek.

4. 7. 1. 2. *Életkor*
A folyamodó nem lehet 18 évesnél fiatalabb.

4. 7. 1. 3. *Szaktudás*

A folyamodónak demonstrálnia kell a légiforgalmi állomásüzemeltető szakszolgálati engedély birtokosára előírt tudásszintet legalább az alábbi témakörökben:

Általános ismeretek

a) az Állam területén belül biztosított légiforgalmi szolgálatok;

Üzemeltetési eljárások

b) rádió-távbeszélő eljárások, kifejezések, távközlési hálózat;

Szabályok és előírások

c) a légiforgalmi állomásüzemeltetőre vonatkozó szabályok és előírások; és

Távközlési berendezések

d) a légiforgalmi állomáson lévő távközlési berendezések alapelvei, használata és korlátozásai.

4. 7. 1. 4. *Tapasztalat*

4. 7. 1. 4. 1. A folyamodónak:

a) sikeresen el kell végeznie egy jóváhagyott kiképzési tanfolyamot az alkalmazását közvetlenül megelőző 12 hónapos időszak alatt, és kielégítően kell tevékenykednie egy minősített légforgalmi állomásüzemeltető mellett legalább két hónapig; vagy

b) egy minősített légiforgalmi állomásüzemeltető mellett kielégítően kell tevékenykednie legalább hat hónap időtartamig az alkalmazását közvetlenül megelőző 12 hónapon belül.

4. 7. 1. 5. *Jártasság*

A kérelmezőnek demonstrálnia kell, vagy már előzőleg demonstrálta jártasságát:

a) a használatos távközlési berendezések üzemeltetésében; és

b) a rádiótelefon üzenetek hatékony és pontos adásában és vételében.

4. 7. 2. A légiforgalmi állomásüzemeltető szakszolgálati engedély birtokosának jogosítványai és ezen jogosítványok gyakorlásakor figyelembe veendő feltételek

4. 7. 2. 1.Ha az 1. 2. 5 és 1. 2. 9. pontokban előírt követelményeket teljesítette, a légiforgalmi állomásüzemeltető szakszolgálati engedély birtokosának joga van egy légiforgalmi állomáson

ANNEX 2.
Repülési szabályok

10. kiadás – 2005 július
40. módosítás

Jelen kiadvány magában foglalja a Tanács által 2005. február 24-ét megelőzően elfogadott módosításokat, és 2005. november 24-től hatálytalanítja a 2. Annex összes megelőző kiadását.
A nemzetközi szabványok alkalmazhatóságával kapcsolatosan lásd az Előszót.

Nemzetközi Polgári Légi-közlekedési Szervezet

ICAO

Tartalomjegyzék

22) – Légi-navigációs Bizottság
Személyzet nélküli szabad léggömbök; várható érkezési idő.
1981. március 2. 1981. július 2. 1981. november 26.

23) – Hetedik kiadás – Légi-navigációs Bizottság
Polgári légi-jármű elfogása.
1981. április 1. 1981. augusztus 1. 1981. november 26.

24) – Légi-navigációs Bizottság
Légi-jármű külső fények.
1982. március 19. 1982. július 19. 1982. november 25.

25) – AGA bizottsági ülés (1981) – Légi-navigációs bizottság
Földfelszín feletti magasság; műszeres megközelítési eljárások; mozgási és munkaterület; gurulás és guruló út meghatározások; a „HIJACK" kifejezés használata a polgári légi-jármű elfogásánál; a légi-jármű bérletére; cseréjére és különjárati üzemeltetésére vonatkozó megjegyzés; előírások a légi-jármű földi mozgására és gurulására; 2. sorozatú jelzések; amelyeket a forgószárnyas légi-jármű elfogás esetén használ; mértékegységek.
1983. március 21. 1983. július 29. 1983. november 24.

26) – Adatfeldolgozási Munkacsoport 1981 évi harmadik ülése – Légi-navigációs Bizottság
Meghatározások; a légiforgalmi szolgálati egységeknek benyújtott repülési terv tartalma; az ismétlődő repülési tervek; ATS adatcsere; az elfogó légi-jármű által használt kifejezések kiejtése; rádiótelefon sürgősségi jelzés egyeztetése a 10. Annex II. kötetével; UTC – Egyeztetett Egységes Idő.
1984. június 22. 1984. október 22. 1985. november 21.

27) – Nyolcadik kiadás – Tanács – Légi-navigációs Bizottság
Polgári légi-jármű azonosítása és elfogása.
1986. március 10. 1986. július 27. 1986. november 20.

28) – Légi-navigációs Bizottság

A forgalmi előtér meghatározása; különleges eljárások a jogtalan beavatkozás esetére
1987. március 16. 1987. július 27. 1987. november 19.

29) – Kilencedik kiadás – Látva repülési szabályok szerinti üzemeltetés munkacsoport 1986 évi harmadik ülése – Titkárság – Látás utáni segédeszközök munkacsoport 1987 évi 11. ülése – Légi-navigációs Bizottság – A 6. Annex elfogadása miatt szükséges módosítások
Légi-jármű üzemeltetés VFR/IFR vegyes körülmények között; a légi-jármű földi mozgása, irányítása és ellenőrzése; a jogtalan beavatkozási eseményei; forgószárnyas légi-jármű elfogóként történő igénybevétele.
1990. március 12. 1990. július 30. 1991. november 14.

30) – SSR Fejlesztési és Összeütközés Megelőzési Rendszerek Munkacsoport 1989 évi negyedik ülése
Meghatározások; összeütközés elkerülését biztosító fedélzeti rendszer (ACAS).
1993. február 26. 1993. július 26. 1993. november 11.

31) – Az Elkülönítés Általános Elmélete munkacsoport 1990 évi hetedik ülése – Légi-navigációs Bizottság – Automatikus légtérfelderítés munkacsoport 1992 évi második ülése
Meghatározások; légi gurulás; elkülönítés a légi-járművek között; polgári légi-járművek kötelék repülése ellenőrzött légtérben; automatikus légtérfelderítés.
1994. március 18. 1994. július 25. 1994. november 10.

32) – Légi-navigációs Bizottság
Megjegyzés az összeütközés elkerülését biztosító fedélzeti rendszer (ACAS) elhelyezésére és alkalmazására vonatkozó előírásokhoz.
1996. február 19. 1996. február 19. --------------------

33) – Légi-navigációs Bizottság
Összeköttetés megszakadása esetén alkalmazott eljárások.
1997. február 26. 1997. július 21. 1997. november 6.

34) – Automatikus **L**égtérfelderítés Munkacsoport negyedik ülése (1996), Az elkülönítés általános elméletével foglalkozó munkacsoport kilencedik ülése (1996), az 1. Annex 162. kiegészítésének megfelelő módosítások.
Meghatározások; automatikus légtér-felderítési rendszerek és eljárások; adatcsere az automatizált légiforgalmi szolgálati rendszerek között; a levegő–föld adat-összeköttetés alkalmazása az ATS területén; a szellemi tevékenységet befolyásoló anyagok használatával kapcsolatos kérdések.
1998. március 19. 1998. július 20. 1998. november 5.

35) – Légi-navigációs Bizottság – Látás utáni segédeszközök munkacsoport 1997 évi 13. ülése
Légiforgalmi szolgálati légterek osztályozása; VMC időjárási körülmények között kiadott légiforgalmi irányítói engedély; futópálya várakozási hely.
1999. március 10. 1999. július 19. 1999. november 4.

36) – A legutóbbi módosításoknak megfelelő változások: 11. Annex 40.sz. módosítása., – 6. Annex I. rész 23–25. sz. módosítása, – 6. Annex II. rész 20. és III. rész 7. sz. módosítása., – 3. Annex 72. sz. módosítása.
Módosított meghatározások: légiforgalmi irányító egység, bevezető irányító egység, kitérő repülőtér, hajózószemélyzeti tag, légi-jármű parancsnok, látástávolság; továbbá szerkesztői módosítások.
2001. március 12. 2001. július 16. 2001. november 1.

37) – Elkülönítési és Légtérbiztonsági Munkacsoport (SASP) Repülőgép-vezető eljárásai a jogtalan beavatkozás esetén; szerkesztői módosítások.
2003 február 28. ------------------- --------------------

38) – Titkársági meghatározások; beállítói jelzések; rádióösszeköttetés megszakadási eljárások;

elfogási manőverek; szerkesztői módosítások
2005. február. 23. 2005. július 11. 2005. november 24.

39) – Titkársági átszövegezés annak érdekében, hogy nagyobb hangsúlyt kapjon a légi-jármű parancsnok felelőssége az összeütközések elkerülésében.
2006. február 20. 2006. július 17. 2006. november 23.

40) – Légi-navigációs Bizottság; Az ADS-B, ADS-C-re és az ADS-C egyezményre vonatozó meghatározások és hozzátartozó eljárások.
2007. február 26. 2007. július 16. 2007. november 22.

1. fejezet

Meghatározások

1. Megjegyzés - A jelen dokumentum szövegében a "szolgálat" kifejezés mindvégig a feladatkörök vagy biztosított szolgáltatások megjelölésre vonatkozó elvont fogalom, míg az "egység" kifejezés egy szolgálatot ellátó kollektív testület megjelölésére szolgál.
2. Megjegyzés - Ezen meghatározásokban az (RR) jelölés a Nemzetközi Távközlési Egyesülés (ITU) Rádió-berendezésre vonatkozó Rendelkezésére utal (lásd a jóváhagyott ICAO irányelveket (DOC 9718) magában foglaló „Rádiófrekvencia Spektrum Követelmények a Polgári Légi-közlekedés számára" című Kézikönyvet).

Amikor a Repülési Szabályokra vonatkozó nemzetközi szabványok szövegében a következő kifejezéseket használjuk, azok jelentése a következő:

Adat összeköttetési távközlés — Data link communications
Olyan távközlési összeköttetés, amelynek célja az adathálózaton keresztül történő közleményváltás.

ADS-C (*Automatikus légtér felderítési) megállapodás – *ADS-C agreement
Jelentési terv, amely megteremti az ADS-C adatjelentés (azaz a légiforgalmi szolgáltató egység által igényelt adatok és az ADS-C jelentések gyakorisága, amelyben a légiforgalmi szolgálatok által biztosított ADS-C használatot megelőzően kell megállapodni) feltételeit

Megjegyzés – A megállapodás tartalmának üzenetváltása a földi rendszer és a légi-jármű között szerződés, vagy szerződéssorozat segítségével megy végbe

Anyagok (szellemi tevékenységet befolyásoló) használatából származó veszélyek — Problematic use of substances
Egy vagy több, a szellemi tevékenységet befolyásoló anyag olyan jellegű felhasználása a légi-közlekedés szakszemélyzete részéről, amely:
a) közvetlen veszélyt jelent az anyagot felhasználó számára vagy veszélyezteti mások életét, egészségét illetve vagyontárgyait; és/vagy
b) foglalkozásbeli, társadalmi, szellemi vagy fizikai nehézséget illetve rendellenességet okoz.

Átállási pont — Change over point
Az a pont, ahol az ultrarövid hullámú (VHF) körsugárzó VOR berendezéssel kijelölt ATS útvonalszakaszon üzemelő légi-járműtől elvárják, hogy a már átrepült berendezés — mint elsődleges navigációs vonatkozási hely — követéséről átáll az előtt levő berendezés követésére.

Megjegyzés - Az átállási pontokat azért jelölik ki, hogy a jelek erőssége és minősége a legmegfelelőbb egyensúlyban legyen a navigációs berendezések között minden használatos szinten, továbbá hogy azonos berendezéstől származó irányszög vezetést biztosítsanak az azonos útvonalszakaszon üzemelő összes légi-jármű számára.

Átváltási magasság — Transition altitude
Az a magasság, amelyen vagy amely alatt a légi-jármű függőleges helyzetét a közepes tengerszint feletti magassághoz viszonyítva ellenőrzik.

Automatikus légtérfelderítés – rádióforgalmazás (ADS-B) — Automatic dependent surveillance – broadcast (ADS-B)
Egy eszköz, amelynek révén a légi-jármű, repülőtéri járművek és egyéb objektumok adattovábbítási összeköttetés rádióforgalmazási üzemmódjában olyan adatok automatikus adására és vételre képesek, mint az azonosítási, helyzet-meghatározási és egyéb megfelelő adatok.

Automatikus légtérfelderítés - adatszolgáltatási szerződés (ADS-C) — Automatic dependent surveillance – contract (ADS-C)
Egy eszköz, amelynek révén adat-összeköttetés útján egy ADS-C megállapodási üzenetváltás jön létre a földi rendszer és a légi-jármű között, meghatározva, hogy milyen feltételek mellett lehet kezdeményezni az ADS-C jelentést, és a jelentések milyen adattartalmúak lehetnek.

Megjegyzés - Az "ADS szerződés" rövidített gyűjtőfogalom, amelynek jelentése: ADS eseti szerződés, ADS igény szerinti szerződés, ADS időszakos szerződés vagy egy vészhelyzeti üzemmód.

Benyújtott repülési terv — Filed flight plan
A repülőgép-vezető vagy kijelölt képviselője által a légiforgalmi szolgálati egységnek (ATS) benyújtott repülési terv bármely egyéb, későbbi módosítás nélkül.

Bevezető irányító egység — Approach control unit
Egy vagy több repülőtér érkező vagy induló ellenőrzött repülés számára légiforgalmi irányító szolgálat biztosítása céljából létesített egység.

Bevezető irányító szolgálat — Approach control service
Az érkező vagy induló ellenőrzött forgalom irányítására létesített légiforgalmi irányító szolgálat.

Biztonsági szempontból fontos személyek — Safety-sensitive personnel
A légi-közlekedés biztonságát veszélyeztethető személyek, amennyiben feladataikat és kötelességeiket nem megfelelő módon látják el. E személyek közé tartoznak - de nem kizárólagosan - a hajózószemélyzetek tagjai, a légi-jármű karbantartó személyzet és a légiforgalmi irányítók.

Ellenőrzött légtér — Controlled airspace
Meghatározott kiterjedésű légtér, amelyen belül - a légtérosztályozásnak megfelelően - az IFR és VFR repülések számára légiforgalmi irányító szolgálatot biztosítanak.

Megjegyzés - Az ellenőrzött légtér olyan gyűjtőfogalom, amelybe a 11. Annex 2.6 pontjában ismertetett A, B, C, D és E osztályú (ATS) légiforgalmi szolgálati légterek tartoznak.

Ellenőrzött repülés — Controlled flight
Bármely repülés, amely légiforgalmi irányítói engedély függvénye.

Ellenőrzött repülőtér — Controlled aerodrome
Olyan repülőtér, amelyen a repülőtéri forgalom számára légiforgalmi irányító szolgálatot biztosítanak.

Megjegyzés - Az "ellenőrzött repülőtér" kifejezés azt jelzi, hogy a repülőtéri forgalom számára légiforgalmi irányító szolgálatot biztosítanak, azonban ez nem jelenti szükségszerűen azt, hogy ott repülőtéri irányítói körzet is van.

Engedélyhatár — Clearance limit
Az a pont, ameddig egy légi-jármű részére légiforgalmi irányítói engedélyt adtak ki.

Érvényes repülési terv — Current flight plan
A későbbi engedélyekből (ha van ilyen) adódó módosításokat is magába foglaló repülési terv.
Felhőalap — Ceiling
6 000 méter (20 000 ft) alatt, az égbolt több mint felét beborító föld- vagy vízfelszín feletti legalacsonyabb felhőréteg alapjának magassága.

Forgalmi előtér — Apron
A szárazföldi repülőtéren kijelölt terület, amely az utasok, posta vagy teheráru küldemények be- és kirakodására valamint a légi-jármű üzemanyaggal történő feltöltésére, parkírozására vagy karbantartására szolgál.

Forgalmi tájékoztatás — Traffic information
A légiforgalmi szolgálati egységtől származó, az adott légi-jármű közelében vagy annak tervezett útvonalán előforduló ismert vagy észlelt légi forgalomról szóló tájékoztatás annak érdekében, hogy a repülőgép-vezetőt figyelmeztessék, és ezzel segítséget nyújtsanak számára az összeütközés elkerüléséhez.

Forgalomkerülési tanács — Traffic avoidance advice
Repülési műveletek végrehajtására vonatkozó tanács a légiforgalmi szolgálati egységtől annak érdekében, hogy ezzel segítséget nyújtsanak a repülőgép-vezető számára az összeütközés elkerüléséhez.

Földi látástávolság — Ground visibility
A repülőtérre akkreditált észlelő vagy automata rendszerek által jelentett látástávolság.

Futópálya — Runway
Egy szárazföldi repülőtéren meghatározott derékszögű terület, amelyet a légi-jármű le és felszállására alakítottak ki.

Futópálya várakozási hely — Runway-holding position
A futópálya, egy akadálykorlátozási felület vagy az ILS/MLS kritikus/érzékeny terület védelmére kijelölt hely, amelynél a guruló légi-járműveknek és egyéb járműveknek a repülőtéri irányító torony ettől eltérő engedélyének hiányában meg kell állniuk és várakozniuk kell.

Megjegyzés – A rádiótelefonos szóhasználatban a „várakozási pont" kifejezést a futópálya várópont megjelölésére alkalmazzák.

Gurulás — Taxiing
A légi-jármű mozgása a repülőtér területén saját hajtóművei segítségével, a fel és leszállás eseteit kivéve.

Guruló út — Taxiway
Egy szárazföldi repülőtéren a légi-járművek gurulására kialakított út, amelynek feladata a repülőtér egyes részei közötti összeköttetés biztosítása, beleértve:
a) Légi-jármű állóhely gurulási nyomvonal — A forgalmi előtér guruló útként kijelölt része, amelynek kizárólagos feladata a légi-jármű állóhelyek megközelítésének biztosítása.
b) Forgalmi előtér guruló út — A guruló út rendszer forgalmi előtéren átvezető része, amelynek

feladata a forgalmi előtéren történő átgurulás biztosítása.

c) Gyors leguruló út — Egy futópályához hegyes szögben csatlakozó guruló út, amely lehetővé teszi, hogy a leszállt repülőgépek más legurulásra használható guruló utakkal szemben nagyobb sebességgel hagyják el a futópályát, ily módon csökkentve annak foglaltsági idejét.

Hajózószemélyzeti tag — Flight crew member
Szakszolgálati engedéllyel rendelkező személyzeti tag, aki a repülés időtartama alatt a légi-jármű üzemeltetéséhez nélkülözhetetlen feladatokkal van megbízva.

IFR — Instrument Flight Rules
A műszerrepülési szabályok jelzésére alkalmazott rövidítés.

IFR repülés — IFR flight
A műszerrepülési szabályok szerint végrehajtott repülés.

Illetékes hatóság — Appropriate authority

a) *A nyílt tenger feletti repülés esetén*: a lajstromozó állam megfelelő hatósága.

b) A nem nyílt tenger feletti repülés esetén: Az átrepült terület felett fennhatósággal rendelkező állam megfelelő hatósága.

Illetékes légiforgalmi szolgálati hatóság — Appropriate ATS authority
Az adott légtérben a légiforgalmi szolgálatok biztosításáért felelős, az állam által kijelölt megfelelő hatóság.

IMC — Instrument Meteorological Conditions
A műszeres időjárási körülmények jelzésére alkalmazott rövidítés.

Irányítói terület — Control area
A földfelszín felett meghatározott határtól felfelé terjedő ellenőrzött légtér.

Irányítói körzet — Control zone
A földfelszíntől egy meghatározott felső magasság határig terjedő ellenőrzött légtér.

Irányszög — Heading
Az általában északtól (földrajzi, mágneses, iránytű vagy hálózati) fokokban kifejezett irány, amelyre a légi-jármű hossztengelye mutat.

Ismétlődő repülési terv — Repetitive flight plan (RPL)
Azonos alapjellemzőkkel rendelkező, rendszeresen üzemeltetett egyedi repülések sorozatára vonatkozó repülési terv, amelyet a járató elfogadásra és ismétlődő felhasználásra nyújt be a légiforgalmi szolgálati egységek számára.

Jel terület — Signal area
A repülőtéren a földi látási jelek kihelyezésére használt terület.

Jelentő-pont — Reporting point
Meghatározott földrajzi hely, amelyhez viszonyítva egy légi-jármű helyzete jelenthető.

Kitérő repülőtér — Alternate aerodrome
Olyan repülőtér, amelyre a légi-jármű abban az esetben folytathatja az útját, ha a tervezett célállomás repülőtere felé történő repülés folytatása vagy az oda történő leszállás végrehajtása lehetetlenné válik vagy nem tanácsos. A kitérő repülőterek köze tartoznak az alábbiak:

Felszállási kitérő — Take-off alternate
Olyan kitérő repülőtér, amelyen a légi-jármű leszállhat, ha ez röviddel a felszállás után szükségessé válik és erre az indulási repülőtér nem használható.

Útvonal kitérő — En-route alternate
Olyan kitérő repülőtér, amelyen egy légi-jármű leszállhat, ha az útvonal-repülés közben a hajózószemélyzet szokásostól eltérő vagy vészhelyzetet tapasztal.

ETOPS útvonal kitérő — ETOPS en-route alternate
Olyan alkalmas és megfelelő kitérő repülőtér, amelyen egy légi-jármű szükség esetén leszállhat, ha az ETOPS üzemeltetés közben egy hajtómű leáll vagy a hajózószemélyzet egyéb, a szokásostól eltérő vagy vészhelyzetet tapasztal.

Célállomás kitérő (célkitérő) — Destination alternate
Olyan kitérő repülőtér, amely felé a légi-jármű folytathatja az útját, ha a tervezett célállomás repülőterén a leszállás végrehajtása lehetetlenné válik vagy nem tanácsos.

Megjegyzés - Az a repülőtér, amelyről a repülés elindult, az adott repülés számára útvonal vagy célállomás kitérőként is megjelölhető.

Korlátozott terület — Restricted area
Egy állam föld területe vagy felségvizei felett elhelyezkedő meghatározott kiterjedésű légtér, amelyen belül a légi-jármű repülését bizonyos meghatározott körülmények alapján korlátozzák.

Körzeti irányító központ — Area control centre
Az illetékessége alá tartozó irányítói területeken üzemelő ellenőrzött repülések számára légiforgalmi irányító szolgálat biztosítása céljából létesített egység.

Körzeti irányító szolgálat — Area control service
Az irányítói körzetekben üzemelő ellenőrzött repülések számára létesített légiforgalmi irányító szolgálat.

Közel-körzet — Terminal control area
Egy vagy több nagy repülőtér közelében, általában az ATS útvonalak egyesülésénél létesített irányítói körzet.

Különleges VFR repülés — Special VFR flight
A repülőtéri irányítói körzeten belül, a látás utáni időjárási körülményeknél rosszabb időjárási helyzetben a légiforgalmi irányító szolgálat által engedélyezett VFR repülés.

Látás szerinti időjárási körülmények — Visual meteorological conditions (VMC)
Látástávolsággal, felhőzettől mért távolsággal és felhőalappal kifejezett időjárási körülmények, ha azok a látás szerinti időjárási körülményekre meghatározott minimum értékeknél jobbak.

Megjegyzés - A látás szerinti időjárási körülményekre meghatározott minimum értékeket a 4. fejezet tartalmazza.

Látástávolság — Visibility
Légi-navigációs célokra szolgáló látástávolság, az alábbiak közül a nagyobb:

a) az a legnagyobb távolság, amelyen egy megfelelő méretű, a földfelszínhez közel elhelyezkedő fekete tárgy a fényes háttérből látható és felismerhető;
b) az a legnagyobb távolság, amelyen a kb. 1000 gyertyafényerejű fények kivilágítatlan háttérből láthatók és azonosíthatók.

1. Megjegyzés - A két távolság a levegőben egy adott kioltási együttható mellett különböző értékű. A b) pont értéke a háttérvilágítás függvényében változó. Az a) pont értéke jelenti a meteorológiai optikai távolságot (MOR).

2. Megjegyzés – A meghatározás a látástávolság helyi rutinon és megfigyelésen alapuló jelentésre, a METAR-ban és SPECI-ben jelentett érvényes és minimális látástávolságokra és a földfelület menti látástávolságra vonatkozik

Leszállási terület — Landing area
A mozgási terület azon része, amelyet a légi-jármű le és felszállására kívánnak igénybe venni.

Légi gurulás — Air-taxiing
A forgószárnyas vagy VTOL légi-jármű mozgása a repülőtér felszíne felett, általában földpárna-hatás mellett és 37 km/h (20 csomó) értéknél kisebb földfelszín feletti sebességgel.

Megjegyzés - A tényleges magasság változhat és bizonyos forgószárnyas légi-járművek a földpárna-hatás turbulencia csökkentése, valamint a függő mozgó teheráru rakományok védelme érdekében 8 méter (25 lábnál) AGL nagyobb magasságot igényelhetnek.

Légifolyosó — Airway
Folyosó formájában kijelölt irányítói terület vagy ennek egy része.

Légiforgalmi irányító és repülőgép-vezető közötti adatcsere — Controller - pilot data link communications (CPDLC)
A légiforgalmi irányító és a repülőgép-vezető közötti távközlési módszer, amelyben a légiforgalmi irányítói szolgálati közleményeket adatátviteli összeköttetéssel továbbítják.

Légiforgalmi szolgálat — Air traffic service
Különböző; repüléstájékoztató, riasztó, tanácsadó és légiforgalmi irányító szolgálatokat (körzeti irányító, közel-körzeti irányító vagy repülőtéri irányító szolgálatokat) magába foglaló gyűjtőfogalom.

Légiforgalmi szolgálati (ATS) útvonal — ATS route
A légiforgalmi szolgáltatás biztosítására, a forgalom irányításához szükséges meghatározott repülési útvonal.

1. Megjegyzés - A "légiforgalmi szolgálati (ATS) útvonal" kifejezés általános megnevezés, amely többek között légifolyosót, tanácsadói, ellenőrzött vagy nem ellenőrzött, érkezési vagy indulási útvonalat is jelenthet.

2. Megjegyzés - A légiforgalmi szolgálati (ATS) útvonalat útvonal leírással határozzák meg, amely tartalmazza az ATS útvonal jelölést, a jelentős pontok (útvonal pontok) közötti rárepülési vagy kirepülési irányszöget, a helyzetjelentési előírásokat valamint, az illetékes légiforgalmi szolgálati hatóság által megállapított legalacsonyabb biztonságos tengerszint feletti repülési magasságot.

Légiforgalmi állomás (RR S1.81) — Aeronautical station (RR S1.81)
A légiforgalmi mozgó szolgálat földi állomása. Bizonyos esetekben a légiforgalmi állomás hajó fedélzetén vagy vízfelszínen létesített építményen is elhelyezhető.

Légiforgalmi irányító szolgálat — Air traffic control service
A következő célokra létesített szolgálat:
a) összeütközés megelőzése:
1) a légi-járművek között; és
2) a munkaterületen üzemelő légi-járművek és az akadályok között;

b) a légi forgalom rendszeres és folyamatos áramlásának elősegítése.

Légiforgalmi irányító szolgálati egység — Air traffic control unit
Különböző, körzeti irányító, közel körzeti irányító vagy repülőtéri irányító egységeket magába foglaló gyűjtőfogalom.

Légiforgalmi irányítói engedély — Air traffic control clearance
Felhatalmazás (engedély) a légi-jármű részére ahhoz, hogy valamely légiforgalmi irányító szolgálati egység által meghatározott feltételek szerint üzemeljen.

1. Megjegyzés - A „légiforgalmi irányítói engedély" kifejezést, megfelelő szövegkörnyezetben gyakran „engedély"-re rövidítik.
2. Megjegyzés - A rövidített „engedély" kifejezést gyakran megelőzhetik a "gurulási", "felszállási", "indulási", "útvonal", "megközelítési" vagy "leszállási" szavak, amelyek a repülés engedélyezett szakaszát jelzik.

Légiforgalmi szolgálati egység — Air traffic services unit
Különböző, légiforgalmi irányító egységet, repüléstájékoztató központot vagy légiforgalmi szolgálatok bejelentő irodáját magába foglaló gyűjtőfogalom.

Légiforgalmi szolgálati légterek — Air traffic services airspace
Meghatározott kiterjedésű, az ABC betűivel azonosított légterek, amelyeken belül adott típusú repülések hajthatók végre, és amelyek számára légiforgalmi szolgálatokat jelöltek ki valamint üzemeltetési előírásokat határoztak meg.

Megjegyzés - A légiforgalmi szolgálati légterek az A — G osztályokba tartoznak.

Légiforgalmi szolgálatok bejelentő irodája — Air traffic services reporting office
A légiforgalmi szolgálatokat érintő jelentések valamint az indulás előtt a légiforgalmi szolgálati egységeknek benyújtott repülési tervek átvételére létesített egység.

Megjegyzés - A légiforgalmi szolgálatok bejelentő irodája különálló vagy egy már meglevővel — mint például egy másik légiforgalmi szolgálati egység vagy a légiforgalmi tájékoztató szolgálat irodája — együtt kialakított egység is lehet.

Légiforgalmi tájékoztató Kiadvány — Aeronautical Information Publication (AIP)
a légi-navigáció szempontjából fontos és tartós jellegű légiforgalmi tájékoztatásokat tartalmazó kiadvány, amelyet az érintett állam vagy annak megbízott szervezete tesz közzé.

Légiforgalmi tanácsadó szolgálat — Air traffic advisory service
A tanácsadói légtéren belül nyújtott szolgálat, amely az IFR repülési tervek alapján üzemelő légi-járművek között a lehetséges mértékben elkülönítést biztosít.

Légi forgalom — Air traffic
A levegőben levő valamint a repülőtér munkaterületén üzemelő légi-járművek összessége.

Légi-jármű — Aircraft
Bármely szerkezet, amelynek levegőben maradása a levegővel kialakuló olyan kölcsönhatásokból származik, amelyek különböznek a föld felszínére ható légköri hatásoktól.

Légi-jármű parancsnoka — Pilot-in-command
A repülés biztonságos végrehajtásáért felelős, a járató vagy az általános célú légi-közlekedés esetében a légi-jármű tulajdonosa részéről parancsnoknak kijelölt repülőgép-vezető.

Légi összeütközés elkerülését biztosító fedélzeti rendszer — Airborne collision avoidance system (ACAS)
A másodlagos légtérfelderítő radarberendezés válaszjel-adó egysége jeleinek segítségével működő fedélzeti rendszer, amely a földi berendezésektől függetlenül tájékoztatja a légi-jármű vezetőjét az SSR válaszjel-adóval felszerelt, összeütközési veszélyt jelentő egyéb légi-járművekről.

Levegő - föld irányítási rádióállomás — Air-ground control radio station
Légiforgalmi távközlési állomás, amely elsősorban az adott területen belül üzemelő légi-járművek üzemeltetéséhez és irányításához szükséges távközlés lebonyolításáért felelős.

Magasság – Height
Egy pontként vett szint, tárgy vagy pont valamint egy meghatározott vonatkozási alap (alapadat) közötti függőleges távolság.

Mozgási terület — Movement area
Egy repülőtérnek a légi-járművek fel és leszállására valamint gurulására használandó része, amely a munkaterületet és a forgalmi előtere(ke)t foglalja magába.

Munkaterület — Manoeuvring area
Egy repülőtérnek a légi-járművek fel és leszállására valamint gurulására használandó része a forgalmi előterek kivételével.

Műrepülés — Acrobatic flight
A légi-járművel szándékosan végrehajtott olyan repülési műveletek sorozata, amely hirtelen repülési helyzetváltoztatással, a szokásostól eltérő repülési helyzetekkel vagy rendkívüli sebesség változtatással jár.

Műszeres időjárási körülmények — Instrument meteorological conditions (IMC)
Látástávolsággal, felhőzettől mért távolsággal és felhőalappal kifejezett időjárási körülmények, amelyek a látás szerinti időjárási körülményekre meghatározott minimum értékeknél alacsonyabbak.

Megjegyzés - A látás szerinti időjárási körülményekre meghatározott minimum értékeket a 4. fejezet tartalmazza.

Műszeres megközelítési eljárás — Instrument approach procedure
A repülési műszerek segítségével, az akadályoktól megfelelő biztonsági távolságban végrehajtott, előre meghatározott repülési műveletek sorozata, amely a kezdeti megközelítés navigációs pontjától vagy — ahol ez alkalmazható — egy meghatározott érkezési útvonal kezdetétől addig a pontig tart, amelytől a leszállás végrehajtható, illetve amennyiben a leszállást nem hajtják végre, addig, ahonnan a várakozási vagy útvonal akadálymentességi előírásokat alkalmazzák.

A műszeres megközelítési eljárások besorolása:
Nem precíziós megközelítési (NPA) eljárás. Műszeres megközelítési eljárás, amely vízszintes útmutatást alkalmaz, ugyanakkor függőleges útmutatást nem.

Függőleges útmutatásos megközelítési (APV) eljárás. Műszeres megközelítési eljárás, amely mind vízszintes mind függőleges útmutatást alkalmaz, azonban nem felel meg a precíziós megközelítés és leszállás végrehajtásához megállapított követelményeknek.

Precíziós megközelítési (PA) eljárás. Az üzemelési kategória által meghatározott minimummal precíziós vízszintes és függőleges útmutatást alkalmazó műszeres megközelítési eljárás.

Megjegyzés – A vízszintes és függőleges útmutatás az alábbiak bármelyikének az útmutatására vonatkozik:

a) földi navigációs berendezés, vagy
b) számítógép által előállított navigációs adat

Nyomás-magasság — Pressure-altitude
A Nemzetközi Műlégkör[8. Annex alapján*] szerinti nyomás értéknek megfelelő magasság értékben kifejezett légköri nyomás.

Rádió-távbeszélés — Radiotelephony
Olyan rádió-távközlési módszer, amelynek során a tájékoztatás csere elsősorban szóbeli közleményváltással történik.

Repülési látástávolság — Flight visibility
A repülés közben egy légi-jármű pilótafülkéjéből előre irányba észlelt látástávolság.

Repülési szint — Flight level
Meghatározott 1013.2 hektopaszkál (hPa) alap-nyomás értékhez viszonyított állandó atmoszférikus légnyomású felület, amely más ilyen felületektől meghatározott légnyomáskülönbséggel van elválasztva.

1. Megjegyzés - Az egyezményes nemzetközi műlégkörnek megfelelően kalibrált nyomásmagasság-mérő:
a) QNH beállításra állítva tengerszint feletti magasság;
b) QFE beállításra állítva a QFE földfelszín feletti magasság;
c) 1013.2 hektopaszkál (hPa) beállításra állítva a repülési szint (FL) kijelzésére használható.
2. Megjegyzés - A fenti 1. megjegyzésben használt tengerszint és földfelszín feletti magasság kifejezések inkább barometrikus, azaz nyomásmagasságot, mint geometrikus, azaz földméréssel számított terepmagasságot jelentenek.

Repülési terv — Flight plan
A légiforgalmi szolgálati egységek rendelkezésére bocsátott, a légi-jármű tervezett repülésére vagy a repülés egy szakaszára vonatkozó meghatározott tájékoztatás.

Repüléstájékoztató körzet — Flight information region
Meghatározott kiterjedésű légtér, amelyen belül repüléstájékoztató és riasztó szolgálatot biztosítanak.

Repüléstájékoztató központ — Flight information centre
Repüléstájékoztató és riasztó szolgálat biztosítására létrehozott egység.

Repüléstájékoztató szolgálat — Flight information service
A repülések biztonságos és eredményes végrehajtásához hasznos tanácsok és tájékoztatások nyújtása céljából biztosított szolgálat.

Repülőgép — Aeroplane
Levegőnél nehezebb, hajtóművel működő légi-jármű, amely felhajtóerejét repülés közben főként az olyan felületekre ható aerodinamikai reakciókból nyeri, amelyek a repülés adott körülményei között rögzített helyzetben maradnak.

Repülőtér — Aerodrome
Szárazföldön vagy vízfelszínen kijelölt terület (beleértve bármely épületet, létesítményt és berendezést) amely egészében vagy részben a légi-járművek érkezésére, indulására és felszíni mozgására kívánnak felhasználni.

Repülőtéri forgalom — Aerodrome traffic

A repülőtér munkaterületén működő összes légi-jármű és egyéb járművek valamint a repülőtér körzetében repülő összes légi-jármű forgalma.

Megjegyzés - A repülőtér körzetében repülő légi-járművön a repülőtér forgalmi körén működő, az oda besoroló és az onnan kilépő légi-jármű értendő.

Repülőtéri forgalmi körzet — Aerodrome traffic zone
A repülőtér körül a repülőtéri forgalom védelmére kialakított meghatározott kiterjedésű légtér.

Repülőtéri irányító szolgálat — Aerodrome control service
A repülőtéri forgalom számára létesített légiforgalmi irányító szolgálat.

Repülőtéri irányító torony — Aerodrome control tower
A repülőtéri forgalom számára légiforgalmi irányító szolgálat biztosítása céljából létesített egység.

Riasztó szolgálat — Alerting service
A kutatásra és mentésre szoruló légi-járművek vonatkozásában a megfelelő szervek értesítésére és szükség esetén az ezekkel történő együttműködésre létesített szolgálat.

Számított érkezési idő — Estimated time of arrival
A műszerrepülési szabályok szerint végrehajtott repülések esetében az az időpont, amikor a légi-jármű a számítások szerint azon navigációs berendezéssel meghatározott kijelölt pont fölé érkezik, ahonnan a műszeres megközelítési eljárás megkezdődik; vagy amennyiben nincs ilyen a repülőteret kiszolgáló navigációs berendezés, azon időpont, amikor a légi-jármű a repülőtér fölé érkezik. A látás utáni szabályok szerint végzett repülések esetében azon időpont, amikor a légi-jármű a repülőtér fölé érkezik.

Számított fékoldási idő — Estimated off-block time
Az a számított időpont, amikor a légi-jármű megkezdi az indulással összefüggő mozgását.

Szellemi tevékenységet befolyásoló anyagok — Psychoactive substances
Alkohol, ópiumból vagy kenderből készített kábítószer, kokain, nyugtatók és altatók, egyéb izgató, serkentő, élénkítő-szerek, képzeteket keltő erős izgatószerek és illékony oldószerek a kávé és a dohányféleségek kivételével.

Személyzet nélküli szabad léggömb — Unmanned free balloon
Hajtómű és személyzet nélkül szabadon repülő, levegőnél könnyebb légi-jármű.

Megjegyzés - A személyzet nélküli szabad léggömbök a 4. Függelék előírásai alapján nehéz, közepes és könnyű osztályba tartoznak.

Szint — Level
A levegőben levő légi-jármű függőleges helyzetére vonatkozó általános kifejezés, amely jelenthet földfelszín feletti vagy tengerszinthez viszonyított magasságot, illetve repülési szintet.

Tanácsadói légtér — Advisory airspace
Meghatározott kiterjedésű légtér vagy kijelölt útvonal, amelyen belül légiforgalmi tanácsadói szolgálat áll rendelkezésre.

Tanácsadói útvonal — Advisory route
Kijelölt légi útvonal, amelyen légiforgalmi tanácsadói szolgálat áll rendelkezésre.

Teljes számított repülési idő — Total estimated elapsed time
IFR repülések esetében az a számított időtartam, amely a felszállástól addig szükséges, amíg a légi-

jármű azon navigációs berendezéssel meghatározott kijelölt pont fölé érkezik, ahonnan a műszeres megközelítési eljárás megkezdődik; vagy amennyiben nincs ilyen a rendeltetési repülőteret kiszolgáló navigációs berendezés, azon időtartam, amely alatt a légi-jármű a rendeltetési repülőtér fölé érkezik. A VFR repülések esetében a felszállástól a rendeltetési repülőtér fölé érkezésig számított időtartam.

Tengerszint feletti magasság — Altitude
Egy szint, egy pont vagy egy tárgy a közepes tengerszinthez viszonyított függőleges magassága.

Tiltott terület — Prohibited area
Egy állam földfelszíni területe vagy felségvizei felett elhelyezkedő meghatározott kiterjedésű légtér, amelyen belül a légi-jármű repülése tilos.

Utazó emelkedés — Cruise climb
Olyan repülőgép utazó repülés-végrehajtási módszer, amelynek során az útvonalon a tengerszint feletti repülési magasság a repülőgép tömegének csökkenésével növekszik.

Utazószint — Cruising level
Az a repülési szint, amelyet a légi-jármű a repülés jelentős szakasza során tart.

Útirány — Track
A légi-jármű repülési útvonalának vetülete a föld felületén, amelynek irányát bármely adott pontban általában északhoz (földrajzi, mágneses vagy földrajzi hálózati) viszonyított fok értékben fejezik ki.

VFR
A látva repülési szabályok szerint történő üzemeltetés jelzésére használt rövidítés.

VFR repülés — VFR flight
A látva repülési szabályok szerint végrehajtott repülés.

VMC — Visual Meteorological Conditions
A látás szerinti időjárási körülmények jelzésére alkalmazott rövidítés.

Várható megközelítési idő — Expected approach time
Azon időpont, amikor légiforgalmi irányító szolgálat számítása szerint egy késve érkező légi-jármű a leszálláshoz történő megközelítés végrehajtásához elhagyja a várakozási pontot.

Megjegyzés - A várakozási pont elhagyásának tényleges időpontja a bevezetési engedélytől függ.

Veszélyes légtér — Danger area
Meghatározott méretű légtér, amelyen belül bizonyos kijelölt időpontokban a légi-jármű repülésére veszélyes tevékenység folyhat.

3.6.1.4 Az ellenőrzött repülőtéren üzemelő légi-jármű a munkaterületen nem hajthat végre gurulást a repülőtéri irányító torony engedélye nélkül, és be kell tartania az ezen egység által adott bármely utasítást.

3.6.2 A repülési terv betartása

3.6.2.1 A 3.6.2.2 és 3.6.2.4 pontokban ismertetett előírások kivételével, a légi-jármű tartsa magát az ellenőrzött repülésre benyújtott érvényes repülési tervéhez vagy annak megfelelő részéhez, hacsak valamilyen módosítást nem kértek, és erre az illetékes légiforgalmi szolgálati egységtől engedélyt nem kaptak; vagy a légi-járműtől azonnali cselekvést megkövetelő vészhelyzet nem alakul ki, mely esetben - mihelyst az ilyen vészhelyzeti felhatalmazás gyakorlását követően a körülmények lehetővé teszik,- haladéktalanul értesíteni kell az illetékes légiforgalmi szolgálati egységet a megtett intézkedésről és, hogy azt vészhelyzeti felhatalmazás alatt végezték.

3.6.2.1.1 Hacsak az illetékes ATS hatóságtól más felhatalmazást, vagy az illetékes légiforgalmi irányító egységtől más utasítást nem kaptak, az ellenőrzött repüléseket, amennyire gyakorlatilag lehetséges

a) a kijelölt ATS útvonalon történő repülés alkalmával az adott útvonal meghatározott középvonalán; vagy
b) bármely más útvonalon történő repülés alkalmával, közvetlenül az útvonalat kijelölő navigációs berendezések és/vagy pontok között kell végrehajtani.

3.6.2.1.2 A 3.6.2.1.1 pontban ismertetett elsődleges fontosságú előírás figyelembevétele mellett VOR berendezésekre hivatkozással kijelölt ATS útvonal szakaszon repülő légi-járműnek a légi-jármű mögöttiről az előtte lévőre elsődleges navigációs irányítóeszközre kell átváltania az átváltási ponton (ahol ilyet kialakítottak) vagy olyan közel hozzá, amennyire üzemeltetési szempontból megvalósítható.

3.6.2.1.3 A 3.6.2.1.1 pontban előírtaktól való eltérésről értesíteni kell az illetékes légiforgalmi szolgálati egységet.

3.6.2.2 *Nem szándékos eltérések* – Amennyiben az ellenőrzött repülés nem szándékosan tér el az érvényes repülési tervétől, a következő intézkedéseket kell megtenni:

a)Letérés az útvonalról: ha a légi-jármű letér az útvonalról, haladéktalanul helyesbítse géptengely irányszögét úgy, hogy a lehető legrövidebb időn belül visszatérjen az útirányra;
b) Tényleges repülési sebesség eltérése esetén: ha a jelentőpontok között az utazószinten az átlagos tényleges repülési sebesség a repülési tervben meghatározott repülési sebességhez viszonyítva ± 5 %-kal ténylegesen vagy előreláthatóan eltér, tájékoztatni kell az illetékes légiforgalmi szolgálati egységet;
c) Számított idők eltérése esetén: ha a következő használandó jelentőpontra, repüléstájékoztató körzet határra vagy célrepülőtérre – amelyik előbb következik – számított idő három percnél többel, vagy az illetékes ATS hatóság által meghatározott illetve a körzeti légi-közlekedési egyezményben kijelölt más időtartammal eltér a légiforgalmi szolgálatok számára megadott időtől, a módosított számított időt a lehető legrövidebb időn belül közölni kell az illetékes légiforgalmi szolgálati egységgel.

3.6.2.2.1 Ezen túlmenően, amikor ADS egyezmény van érvényben, az adathálózaton keresztül automatikusan tájékoztatni kell az illetékes légiforgalmi szolgálati egységet (ATSU) a változásról abban az esetben, ha a változás meghaladja az ADS eseti adatszolgáltatási megállapodásban meghatározott határértéket.

3.6.2.3 *Szándékos eltérések* – A repülési terv megváltoztatására irányuló kéréseknek az alább ismertetett tájékoztatást kell tartalmazniuk:
a) Az utazómagasság megváltoztatása esetén: a légi-jármű azonosító jele; a kért új utazószint és utazósebesség ezen a szinten; a módosított számított idők (amikor alkalmazható) a következő repüléstájékoztató körzet határokra.
b) Az útvonal megváltoztatása esetén:

1) *A* célrepülőtér *változatlan:* a légi-jármű azonosító jele; repülési szabályok; a repülés új útvonalának leírása, beleértve a repülési terv vonatkozó adatait attól a helytől kezdődően, ahonnan a kért útvonal változtatás kezdődik; módosított számított idők; bármely más ide tartozó tájékoztatás.

2) *A* célrepülőtér meg*változott:* a légi-jármű azonosító jele; repülési szabályok; a repülés új útvonalának leírása a módosított célrepülőtérre, beleértve a repülési terv vonatkozó adatait attól a helytől kezdődően, ahonnan a kért útvonal változtatás kezdődik; módosított számított idők; kitérő repülőtér (repülőterek); bármely más ide tartozó tájékoztatás.

3.6.2.4 *Időjárásromlás a VMC értékek alá* – Amikor nyilvánvalóvá válik, hogy a repülést az érvényes repülési tervet követve látás szerinti időjárási körülmények (VMC) között végrehajtani nem lehet, a látva repülési szabályok szerint ellenőrzött repülést végző légi-jármű
a) kérjen módosított engedélyt, amely lehetővé teszi, hogy a légi-jármű repülését VMC körülmények között folytathassa a cél- vagy kitérő repülőtérig, vagy elhagyja azt a légteret, amelyben a repülést légiforgalmi irányítói engedély alapján végezheti; vagy
b) amennyiben a fenti *a)* alpontban meghatározott engedély nem szerezhető be, folytassa üzemelését VMC körülmények között, és értesítse az illetékes légiforgalmi irányító egységet az érintett légtér elhagyása vagy a legközelebbi alkalmas repülőtéren történő leszállás végrehajtása céljából foganatosított intézkedésről; vagy
c) a repülőtéri irányító körzeten belül történő üzemelés esetén, kérjen engedélyt különleges VFR repülésre; vagy
d) kérjen engedélyt a műszerrepülési szabályok szerint történő üzemelésre.

3.6.3 Helyzetjelentések

3.6.3.1 Hacsak az illetékes ATS hatóság, vagy az általa meghatározott feltételek alapján az illetékes légiforgalmi szolgálati egység e kötelezettség alól felmentést nem ad, az ellenőrzött repülésről a lehető legrövidebb időn belül jelentést kell adni az illetékes légiforgalmi szolgálati egység felé minden egyes kijelölt kötelező jelentőpont átrepülésének időpontjáról és repülési szintjéről, egyéb előírt tájékoztatással egyetemben. Az illetékes légiforgalmi szolgálati egység felkérésére hasonló helyzetjelentéseket kell adni kiegészítő pontokhoz kapcsolódóan is. Kijelölt jelentőpontok hiányában az ellenőrzött repülés helyzetjelentéseit az illetékes ATS hatóság által előírt vagy az illetékes légiforgalmi szolgálati egység által meghatározott időközökben köteles megtenni.

3.6.3.1.1 Az adathálózati összeköttetésen keresztül az illetékes légiforgalmi szolgálati egység felé helyzetéről tájékoztatást adó légi-járműnek szóbeli helyzetjelentést csak kérésre kell adnia.

Megjegyzés: Azok a feltételek és körülmények, amelyek között a nyomás-magasság ADS-B vagy SSR C módban történő adása megfelel a helyzetjelentés magassági tájékoztatásra vonatkozó követelményének, a PANS-ATM (Doc 4444) kiadványban találhatók.

3.6.4 Az irányítás megszűnése

Az ellenőrzött repülés – az ellenőrzött repülőtéren történő leszállás kivételével – a lehető legrövidebb időn belül köteles értesíteni az illetékes légiforgalmi irányító egységet, mihelyst megszűnik számára a légiforgalmi irányító szolgáltatás.

3.6.5 Összeköttetések

3.6.5.1 Az ellenőrzött repülést végrehajtó légi-jármű tartson fenn folyamatos figyelést a megfelelő rádió frekvencián, és szükség szerint létesítsen két-oldalú szóbeli rádióösszeköttetést az illetékes légiforgalmi irányító egységgel kivéve, ha az illetékes ATS hatóság az ellenőrzött repülőtér repülőtéri forgalmában résztvevő légi-járművek számára mást ír elő.

1. Megjegyzés: A SELCAL vagy más hasonló automatikus jelzőeszközök eleget tesznek a folyamatos levegő-föld beszédkommunikációs figyelés tartására vonatkozó előírásnak.
2. Megjegyzés: A levegő-föld beszédkommunikációs figyelés tartására vonatkozó előírás érvényben marad azt követően is, hogy a CPDLC összeköttetést létrejön.
3.6.5.2 *Az összeköttetés megszakadása* – Amennyiben az összeköttetés megszakadása miatt lehetetlen a 3.6.5.1 pont előírásának teljesítése, a légi-jármű hajtsa végre a 10. Annex II. kötetében található rádióösszeköttetés megszakadására vonatkozó, valamint - szükség szerint - a következőkben ismertetett eljárásokat, ezeken túlmenően az ellenőrzött repülőtér repülőtéri forgalmában résztvevő légi-jármű köteles figyelni a látási jelek útján kiadható utasításokra is.

3.6.5.2.1 Látási időjárási körülmények (VMC) között a légi-jármű:

a) folytassa repülését látási időjárási körülmények között; szálljon le a legközelebbi alkalmas repülőtéren; és érkezését a lehető leggyorsabb módon jelentse az illetékes légiforgalmi irányító egységnek;

b) ha tanácsosnak gondolják, teljesítsen IFR repülést a 3.6.5.2.2 szerint.

.

3.6.5.2.2 Műszeres időjárási körülmények (IMC) között vagy olyan esetben, ha a repülés befejezése a 3.6.5.2.1 a) pont alapján nem látszik lehetségesnek, a légi-jármű:

a) hacsak a helyi körzeti légi-közlekedési egyezmény másként nem rendelkezik, olyan légtérben, ahol a légiforgalmi irányítás használatába radar nem tartozik, tartsa az utoljára kijelölt sebességét és repülési szintjét vagy legalacsonyabb tengerszint feletti repülési magasságát — amelyik a nagyobb érték — húsz percen át azt követően, hogy nem tudta jelenteni helyzetét egy kötelező jelentőpont felett, majd ezután repülési szintjét és sebességét a légiforgalmi szolgálati egységeknek benyújtott repülési tervnek megfelelően állítsa be;

b) olyan légtérben, ahol a légiforgalmi irányítás használatába radar tartozik, tartsa az utoljára kijelölt sebességet és repülési szintet, vagy ha nagyabb, a minimális tengerszint feletti magasságot 7 percen át azt követően, hogy

1) elérte az utoljára kijelölt repülési szintet vagy tengerszint feletti magasságot; vagy

2) a válaszjel-adón beállította a 7600-os kódot; vagy

3) egy kötelező jelentőpont felett nem adott helyzetjelentést

attól függően, hogy melyik történt később, majd ezután a szintet és sebességet a benyújtott repülési tervnek megfelelően állítsa be.

c) radar vektoráláskor, vagy amikor az ATC meghatározott korlát nélkül az RNAV felhasználásával kitérésre ad utasítást, legkésőbb a következő kiemelt pontnál vissza kell térni az érvényes repülési terv szerinti útvonalra, tekintetbe véve az alkalmazható minimális repülési magasságot;

d) a célrepülőteret szolgáló alkalmas navigációs berendezésig vagy pontig kövesse az érvényes repülési terv szerinti útvonalat, és amikor tartania kell magát az alábbi e) pontban foglaltakhoz, e berendezés vagy pont felett várakozzon a süllyedés megkezdéséig;

e) a d) pontban meghatározott navigációs berendezéstől vagy ponttól kezdjen süllyedni, amennyire lehetséges az utoljára kapott és nyugtázott számított megközelítési vagy ahhoz legközelebbi időpontban; vagy, ha nem kapott és nyugtázott számított megközelítési időt, akkor az érvényes repülési tervből következően számított érkezési időhöz igazodva;

f) hajtson végre egy normál műszeres megközelítési eljárást, követve a kijelölt navigációs berendezésre vagy pontra meghatározottakat;

g) lehetőség szerint, az e) pontban meghatározott számított érkezési időhöz vagy - attól függően, hogy melyik esik későbbre,- az utoljára nyugtázott várható megközelítési időhöz viszonyított 30 percen belül szálljon le.

1. Megjegyzés - A légiforgalmi irányító szolgáltatás nyújtása az érintett légtérben működő többi légi-járműre vonatkozóan azon a feltételezésen alapul, hogy az összeköttetés megszakadását elszenvedett légi-jármű eleget tesz a 3.6.5.2.2 pontban foglalt szabályoknak.
2. Megjegyzés - Lásd még az 5.1.2 pontot is.

3.7 Jogtalan beavatkozás

A jogtalan beavatkozás alatt álló légi-jármű kísérelje meg értesíteni az illetékes légiforgalmi szolgálati egységet erről a tényről, valamint az ezzel kapcsolatos bármely lényeges körülményről, és az érvényes repülési tervétől így szükségessé váló bármely eltérésről annak érdekében, hogy az ATS egység biztosítani tudja számára az elsőbbséget, és a többi légi-járművel való konfliktus lehetőségét a lehető legcsekélyebbre csökkentse.

1. Megjegyzés – A légiforgalmi szolgálati egységek jogtalan beavatkozáskor fennálló felelősségét a 11. Annex tartalmazza.
2. Megjegyzés - A jogtalan beavatkozás alatt álló, azonban az ATS egységet erről értesíteni nem tudó légi-járművel kapcsolatos intézkedésekre vonatkozó tájékoztató a jelen Annex B. Mellékletében található.
3. Megjegyzés - A másodlagos válasz-jeladóval (SSR), ADS-B-vel vagy ADS-C-vel felszerelt - jogtalan beavatkozás alatt álló - légi-jármű által követendő eljárás a 11. Annex-ben, a PANS-ATM (Doc 4444) és PANS-OPS (Doc 8168) kiadványokban található.
4. Megjegyzés – A jogtalan beavatkozás alatt álló - CPDLC_vel felszerelt - légi-jármű által követendő cselekvések a 11. Annex-ben, a PANS-ATM (Doc 4444)-ben, és e tárgyban útmutatások a „Légiforgalmi szolgálatok adat-összeköttetési alkalmazások" Kézikönyve (Doc 9694) kiadványokban találhatók.

3.7.2. Amennyiben egy légi-jármű jogtalan beavatkozásnak van kitéve, a parancsnok-pilóta köteles a lehető leghamarabb megkísérelni a leszállást a legközelebbi alkalmas repülőtéren vagy egy meghatározott repülőtéren, amelyet az illetékes hatóság jelölt ki, hacsak a légi-jármű fedélzetén a helyzetértékelés más cselekvésre nem készteti.

1. Megjegyzés – Az állami hatóságokra – a jogtalan beavatkozásnak kitett földön tartózkodó légi-jármű tekintetében - vonatkozó követelményeket az Annex 17, 5. Fejezetének 5.2.4. tartalmazza.
2. Megjegyzés – Lásd a 2.4. pontot a légi-jármű parancsnokának hatásköre tekintetében.

3.8 Elfogás

Megjegyzés: Az „elfogás" kifejezés ebben az értelemben nem foglalja magában azt az esetet, amikor a veszélyben levő légi-jármű számára és kérésére a Nemzetközi Légi-közlekedési és Tengerhajózási Kutatási és Mentési Kézikönyv (IAMSAR – Doc 9731) II. és III. kötete alapján biztosítanak légi megközelítést és kíséretet.

3.8.1 A polgári légi-jármű elfogását a szerződő államok által kiadott megfelelő előírások és adminisztratív iránymutatások szerint hajtsák végre, amelyek megfelelnek a Nemzetközi Polgári Légi-közlekedési Egyezmény és különösen annak 3 (d) cikkelye rendelkezéseinek, miszerint a szerződő államok kötelezettséget vállalnak arra, hogy állami légi-járműveikre vonatkozó előírásaik kiadásakor kellő figyelmet fordítanak a polgári légi-közlekedésben működő légi-járművek biztonságára. Ennek megfelelően a vonatkozó előírások és adminisztratív iránymutatások kidolgozása alkalmával, kellő figyelmet kell fordítani az 1. Függelék 2. részében és a 2. Függelék 1. részében található előírásokra.
Megjegyzés: Elismerve, hogy a repülésbiztonság érdekében alapvető fontosságú, hogy a csak végső eszközként alkalmazott elfogás esetében használt bármilyen vizuális jelzéseket a polgári és katonai légi-járművek az egész világon helyesen értelmezik és viszonozzák, a Nemzetközi Polgári Légi-közlekedési Szervezet Tanácsa a jelen Annex 1. Függelékéhez tartozó látási jelek elfogadása alkalmával sürgette a szerződő államokat annak biztosítására, hogy állami légi-járműveik szigorúan tartsák magukat azokhoz. Arra tekintettel, hogy a polgári légi-járművek elfogása minden esetben gyakorlati veszélyt jelent, a Tanács különleges ajánlásokat dolgozott ki és nyomatékosan kéri, hogy azokat a szerződő államok egységesen alkalmazzák. E különleges ajánlásokat az A. Melléklet tartalmazza.

3.8.2 A polgári légi-jármű parancsnoka az elfogás alkalmával tegyen eleget a 2. Függelék 2. és 3. részében található nemzetközi előírásoknak, és a látási jeleket az 1. Függelék 2. részében meghatározottak szerint értelmezze és viszonozza.

Megjegyzés: Lásd még 2.1.1 és 3.4 pontokat.

3.9 VMC látástávolság és felhőzettől való távolság minimum

A látás szerinti időjárási körülményekre vonatkozó látástávolság és felhőzettől való távolság minimum értékeket a 3-1. táblázat tartalmazza.

3-1. táblázat *

(lásd 4.1 pont)

Magassági sáv	Légtér osztály	Repülési látástávolság	Távolság a felhőtől
3050m (10000ft) AMSL-en vagy afelett	A***BCDEFG	8 km	Vízszintesen 1500m Függőlegesen 300m (1000ft)
3050m (10000ft) AMSL alatt és 900m(3000ft) felett, vagy a terep feletti 300m (1000ft) felett – amelyik magasabb	A***BCDEFG	5 km	Vízszintesen 1500m Függőlegesen 300m (1000ft)
900m (3000ft) AMSL-en vagy felette, vagy a terep feletti 300m (1000ft) felett – amelyik magasabb	A***BCDE	5 km	Vízszintesen 1500m Függőlegesen 300m (1000ft)
	FG	5 km**	Felhőn kívül és talajlátással

* Amikor az átváltási magasság 3050 méter (10000 láb) AMSL értéknél alacsonyabb, a 10000 láb magasság helyett FL 100 használandó.
** Amikor az illetékes légiforgalmi szolgálati hatóság így írja elő:
a) 1500 méterig terjedő alacsonyabb repülési látástávolság engedélyezhető a repülések számára,

1) amelyeket olyan sebességgel hajtanak végre, amely az uralkodó látástávolság mellett lehetővé teszi az egyéb forgalom és bármely akadály időben történő észlelését és az összeütközés elkerülését; vagy

2) ha a körülmények olyanok, hogy az egyéb forgalommal történő találkozás valószínűsége csekély, például olyan területeken, ahol a forgalom kicsi vagy egészen alacsony magasságon végrehajtott munkarepülés esetén.

b) A forgószárnyas légi-jármű üzemeltetése engedélyezhető *1500 méter repülési látástávolság alatt*, ha olyan sebességgel repül, amely lehetővé teszi az egyéb forgalom és bármely akadály időben történő észlelését és az összeütközés elkerülését.
*** Az A osztályú légtér VMC minimuma útmutatást biztosít a repülőgép-vezetők részére, és nem teszi kötelezővé a látva repülési szabályok szerinti repülés elfogadását az „A” légtér osztályban.

4. fejezet
Látás szerinti repülés szabályai

4.1 A különleges VFR repülésként történő üzemelés kivételével a látás szerinti repülés szabályai közt történő (VFR) repüléseket úgy hajtsák végre, hogy a légi-jármű a 3-1. táblázatban meghatározott látástávolság és felhőzettől való távolsági értékek vagy azoknál nagyobb értékek mellett repüljön.

4.2 Kivéve, ha egy légiforgalmi irányító egység erre engedélyt adott, a látva repülési szabályok szerint üzemelő (VFR) repülés nem szállhat fel vagy le repülőtéri irányító körzetben levő repülőtéren vagy nem léphet be a repülőtér forgalmi körzetébe vagy körébe, amikor:

a) a felhőalap 450 méternél (1500 láb) alacsonyabb; vagy
b) a földi látástávolság kevesebb, mint 5 km.

4.3 Napkelte és napnyugta között vagy az illetékes légiforgalmi szolgálati hatóság által előírt eltérő időszakban a látva repülési szabályok szerint üzemelő (VFR) repüléseket az ilyen hatóság által előírt feltételekkel kell végrehajtani.

4.4 Kivéve, ha az illetékes légiforgalmi szolgálati hatóság erre engedélyt ad, a látva repülési szabályok szerinti (VFR) repülések nem végezhetők

a) FL 200 repülési szint felett;
b) transzszonikus és szuperszonikus repülési sebességgel.

4.5 Látva repülési szabályok szerinti (VFR) repülések végrehajtása nem engedélyezhető FL 290 felett azokon a területeken, amelyeken FL 290 repülési szint felett 300 méter (1000 láb) csökkentett függőleges elkülönítési minimumot alkalmaznak.

4.6 Kivéve, ha az a fel és leszállás végrehajtásához szükséges vagy az illetékes hatóság erre engedélyt ad, VFR repülés nem hajtható végre:

a) városok, falvak vagy települések sűrűn lakott területei vagy szabadban levő ember-csoportok felett, a légi-járműtől - mint középponttól - számított 600 méter sugarú körben található legmagasabb akadály felett 300 méternél (1000 láb) alacsonyabban;
b) a 4.6 *a)* pontban meghatározottaktól eltérő bármely más föld- vagy vízfelszín felett 150 méternél (500 láb) alacsonyabban.

Megjegyzés: Lásd még 3.1.2 pont.

4.7 Kivéve, ha a légiforgalmi irányítói engedély másként nem jelzi, vagy az illetékes légiforgalmi szolgálati hatóság másként nem rendelkezik, a föld- vagy vízfelszín felett 900 méternél (3000 láb) vagy az illetékes légiforgalmi szolgálati hatóság által meghatározott ennél magasabb alapmagasságnál végrehajtott szinttartó utazó VFR repüléseket a 3. Függelék utazómagasság táblázatában meghatározott, az útiránynak megfelelő utazási szinteken kell végezni.

4.8 A látva repülési szabályok szerint végrehajtott repülés tegyen eleget a 3.6 pont előírásainak, amennyiben azt

a) B, C, és D osztályú légtérben végzik;
b) az ellenőrzött repülőterek repülőtéri forgalmának részeként végzik; vagy
c) különleges VFR repülésként végzik.

4.9 Az illetékes légiforgalmi szolgálati hatóság által a 3.3.1.2 *c)* vagy *d)* pont alapján kijelölt területeken belül vagy útvonalakon üzemelő illetve azokra belépő VFR légi-jármű tartson fenn folyamatos figyelést a megfelelő rádió frekvencián, és szükség szerint jelentse helyzetét a repülés-tájékoztató szolgálatot ellátó légiforgalmi szolgálati egységnek.

Megjegyzés: Lásd a 3.6.5.1 pontot követő megjegyzéseket.

4.10 Amikor a látva repülési szabályok szerint üzemeltetett légi-jármű műszerrepülési szabályok (IFR) szerinti üzemelésre kíván áttérni:

a) amennyiben repülés tervet nyújtott be, közölje az érvényes repülési tervét érintő szükséges módosításokat; vagy
b) ha ez a 3.3.1.2 pont alapján szükséges, nyújtson be repülési tervet az illetékes légiforgalmi szolgálati egységeknek, és az ellenőrzött légtérben történő IFR repülés megkezdése előtt szerezzen be engedélyt.

2. FÜGGELÉK – POLGÁRI LÉGI-JÁRMŰVEK ELFOGÁSA

(Lásd az Annex 3. Fejezet 3.8 pontját)

1. Betartandó irányelvek az Államok számára

1.1 A polgári légi-járművek biztonságos navigációjához szükséges szabályozási egységesség eléréséhez a Szerződő Államoknak kellő figyelmet kell fordítaniuk az alábbi irányelvekre, amikor előírásokat és adminisztratív intézkedéseket dolgoznak ki:

a) polgári légi-járművek elfogását csak végső eszközként alkalmazzák;
b) amennyiben elfogást hajtanak végre, az elfogást csak a légi-jármű azonosításra korlátozzák, hacsak nem szükséges a légi-jármű visszavezetése annak tervezett útvonalára, a légi-járműnek az ország légteréből történő kivezetése, tiltott, korlátozott vagy veszélyes légterekből történő elvezetése, vagy nem szükséges a légi-járművek kijelölt repülőtérre történő leszállíttatása.
c) polgári légi-jármű elfogást gyakorlás céljából ne hajtsanak végre;
d) ha rádióösszeköttetés létesíthető, az elfogott légi-jármű részére a navigációs segítséget és az ezzel kapcsolatos tájékoztatást rádió-távbeszélőn keresztül biztosítsák;
e) abban az esetben, ha egy elfogott légi-járműtől megkívánják, hogy leszálljon az átrepült területen, a leszállás céljára kijelölt repülőtér alkalmas legyen az érintett légi-jármű típus biztonságos leszállására.

Megjegyzés. – Az ICAO tagállamok közgyűlésének 1984. május 10-én tartott 25. (rendkívüli) ülésén egyöntetűen elfogadott Nemzetközi Polgári Repülési Egyezmény 3 (b) cikkelye értelmében a Szerződő Államok elfogadták, hogy "minden államnak tartózkodnia kell a fegyverhasználattól, repülést folytató polgári légi-járművekkel szemben".

1.2 A Szerződő Államoknak közzé kell tenniük a polgári légi-járművet elfogó légi-jármű részére kialakított szabványos manőverezési módszert. Az ilyen módszert úgy kell kidolgozni, hogy az elfogott légi-jármű számára ne jelentsen semmiféle veszélyt.

Megjegyzés. – A manőverezési módszerre vonatkozó különleges ajánlásokat az „A" melléklet 3. pontja tartalmazza.

1.3 A Szerződő Államoknak biztosítaniuk kell, hogy ahol másodlagos radar vagy ADS-B rendelkezésre áll, ott azt használják fel a polgári légi-jármű azonosításához azokon a területeken, ahol elfogásnak lehetnek alávetve.

2. Az elfogott légi-jármű ténykedése

2.1 Egy másik légi-jármű által elfogott légi-járműnek azonnal

a) követnie kell az elfogó légi-jármű utasításait, a látási jeleket az „1" függelékben megadott előírások szerint értelmezve és viszonozva.
b) ha lehetséges, értesítse az illetékes légiforgalmi szolgálati egységet;
c) kísérelje meg a rádióösszeköttetés felvételét az elfogó légi-járművel, vagy az illetékes, elfogást irányító egységgel, általános hívással a 121,5 MHz vészhelyzeti frekvencián, megadva az elfogott légi-jármű azonosító jelét és a repülés fajtáját; és ha nem jött létre az összeköttetés és gyakorlatilag lehetséges, ismételje meg ezt a hívást a 243 MHz vészfrekvencián is;
d) ha fel van szerelve SSR válaszjel-adóval, állítsa be az „A" mód 7700 kódot, hacsak más utasítást nem kapott az illetékes légiforgalmi szolgálati egységtől.
e) ha fel van szerelve ADS-B-vel vagy ADS-C-vel, válassza ki a megfelelő vészhelyzeti funkciót, amennyiben rendelkezésre áll, hacsak más utasítást nem kap az illetékes légiforgalmi szolgálati egységtől.

2.2 Ha bármely rádión kapott utasítás ellentétes az elfogó légi-jármű által látási jelek útján adott utasítással, az elfogott légi-jármű kérjen azonnali tisztázást, mialatt továbbra is követi az elfogó légi-jármű látási jelekkel adott utasításait.

2.3 Ha bármely rádión vett utasítás ellentétes az elfogó légi-jármű által rádión adott utasítással, az elfogott légi-jármű kérjen azonnali tisztázást, mialatt továbbra is követi az elfogó légi-jármű rádión adott utasításait.

3. Rádióösszeköttetés az elfogás során

Ha létrejön a rádiókapcsolat, de nincs lehetőség közös nyelven a kommunikációra, az A 2.1 Táblázatban lévő kifejezéseket és kiejtések használatával és minden egyes kifejezést kétszer ismételve kell megkísérelni az utasításokat, az utasítások és alapvető információk tudomásulvételét továbbítani.

A2.1 táblázat

Az ELFOGÓ légi-jármű kifejezései

Kifejezés	Kiejtés	Jelentés
CALL SIGN	KOL SZAIN	Mi a hívójele?
FOLLOW	FOL-LO	Kövessen
DESCEND	DI-SZEND	Süllyedjen leszálláshoz
YOU LAND	JU LEEND	Szálljon le ezen a repülőtéren
PROCEED	PRO-SZID	Tovább haladhat

Az ELFOGOTT légi-jármű kifejezései

Kifejezés	Kiejtés	Jelentés
CALL SIGN	KOL SZAIN	Hívójelem…
WILCO	VILL-KO	Megértettem, végrehajtom
CAN NOT	KANN NOT	Nem tudom teljesíteni
REPEAT	RI-PIIT	Ismételje meg utasítását
AM LOST	EM LOSZT	Eltévedtem
MAYDAY	MÉJDÉJ	Vészhelyzetben vagyok
HIJACK	HÁJDZSEK	Eltérítettek
LAND (…)	LEEND (…)	Kérek leszállást (… helyen)
DESCEND	DI-SZEND	Süllyedést kérek

1. Megjegyzés. – A második oszlopban a hangsúlyozandó szótag alá van húzva.
2. Megjegyzés. – A megadandó hívójel az legyen, amelyet a légiforgalmi szolgálati egységekkel tartott rádió-távbeszélő összeköttetés során használnak, és amely megfelel a légi-jármű repülési tervében szereplő azonosító jelnek.
3. Megjegyzés. – A „HIJACK” kifejezés használatát a körülmények nem mindig teszik lehetővé, illetve kívánatossá.

a) a polietilén nyomásnélküli ballonoknál legalább két módszert, rendszert, berendezést vagy ezek kombinációját alkalmaznak, amelyek egymástól függetlenül működnek a ballon burkolatok repülésének megszüntetésére.

Megjegyzés. – E berendezések használata a túlnyomásos ballonoknál nem szükséges, mivel azok a teher elengedése után gyorsan felemelkednek és a ballon burkolata így, a kilyukasztásra szolgáló berendezés vagy rendszer nélkül is széthasad. A túlnyomásos ballon itt olyan nem táguló burkolatú ballont jelent, amely ellenáll a belső túlnyomásnak. A ballont úgy töltik fel, hogy az éjszakai kisebb nyomású gáz teljesen kitöltse a ballon belsejét. Az ilyen túlnyomásos ballon gyakorlatilag egészen addig állandó szinten marad, amíg túl sok gáz nem távozik el belőle.

c) a ballon burkolata olyan radarjel visszaverő berendezéssel vagy radarjel visszaverő anyaggal van felszerelve, amely a 200 MHz és 2700 MHz frekvencia tartományok között működő földi radarberendezéseknek visszavert jelet ad, és/vagy a ballon olyan egyéb berendezéssel van felszerelve, amely a földi radarberendezés hatótávolságán túl a radar kezelőjének folyamatos célkövetésre ad lehetőséget.

3.4 A "nehéz" személyzet nélküli szabad ballont tilos olyan területen üzemeltetni, ahol

a) földi telepítésű, másodlagos radarberendezést használnak, hacsak a ballon olyan másodlagos radar válaszjel-adóval nincs felszerelve, amely képes a kijelölt másodlagos radar kódon a folyamatos nyomás-magasság sugárzására, vagy a megfigyelő állomásról - szükség szerint – bekapcsolható; vagy
b) földi telepítésű ADS-B berendezést használnak, hacsak a ballon olyan ADS-B adóval nincs felszerelve, amely képes a nyomás-magasság folyamatos sugárzására, vagy a megfigyelő állomásról - szükség szerint - bekapcsolható.

3.5 Azt a nehéz besorolású, személyzet nélküli szabad ballon, amely olyan függő antennával van felszerelve, amelynek bármely pontján történő letöréséhez 230 N-nál nagyobb erőre van szükség, csak abban az esetben üzemeltethető, ha az antennán legalább 15 méterenként színes jelzőzászló vagy jelzőcsík található.

3.6 A nehéz besorolású személyzet nélküli szabad ballon nem üzemeltethető 18000 méter (60000 láb) nyomásmagasság alatt napnyugta és napkelte között kivéve, ha a ballont, annak tartozékait és a terhet - függetlenül attól, hogy ezek a repülés során a ballonról leválnak-e vagy sem,- jelzőfénnyel látják el.

3.7 A nehéz besorolású, személyzet nélküli szabad ballon, amely 15 méternél hosszabb felfüggesztő szerkezettel (a nagyon feltűnő, színes, nyitott ejtőernyő kivételével) van ellátva, nem üzemeltethető napkelte és napnyugta között 18000 méter (60000 láb) nyomásmagasság alatt, kivéve, ha a függő szerkezetet nagyon feltűnő színes csíkokkal befestik, vagy azt színes jelzőzászlókkal látják el.

4. A repülés megszüntetése

4.1 A nehéz besorolású, személyzet nélküli szabad ballon üzemeltetője köteles működésbe hozni a fenti 3.3 *a)* és *b)* pontban előírt - továbbrepülést megakadályozó - berendezést, ha

a) ismeretessé válik, hogy az időjárási feltételek az üzemeltetésre előírt minimumoknál rosszabbak;
b) meghibásodás, vagy bármely egyéb ok miatt a további üzemeltetés veszélyes lehet a légiforgalomra, a földön lévő személyekre vagy vagyontárgyakra; vagy
c) mielőtt a ballon engedély nélkül berepül egy másik állam légterébe.

5. A repülésre vonatkozó tájékoztatás

5.1 Repülés előtti tájékoztatás

5.1.1 A közepes és a nehéz besorolású, személyzet nélküli szabad ballon tervezett repüléséről - a repülés megkezdése előtt legalább hét nappal - előzetes tájékoztatást kell küldeni az illetékes légiforgalmi szolgálati egységnek.

5.1.2 A tervezett repüléssel kapcsolatos tájékoztatásnak – az illetékes légiforgalmi szolgálati egység kívánságának megfelelően – az alábbi adatokat, vagy ezek bármelyikét kell tartalmaznia:

a) a ballonrepülés azonosító jele vagy projekt kódneve;
b) a ballon osztályba sorolása és leírása;
c) SSR kód vagy NDB frekvencia (amelyik alkalmazható);
d) az üzemeltető neve és telefonszáma;
e) a felbocsátás helye;
f) a felbocsátás tervezett ideje (vagy több felbocsátás esetén a felbocsátások kezdete és befejezése);
g) több ballon felbocsátása esetén a ballonok száma, valamint a felbocsátások közötti időtartam;
h) a felemelkedés várható iránya;
i) utazószint(ek) (nyomásmagasság);
j) az a várható időtartam, amely a 18000 méter (60000 láb) nyomásmagasság keresztezéséig, vagy ha az utazószint 18000 méter (60000 láb) vagy kevesebb, az utazószint eléréséig eltelik, valamint a keresztezés vagy az utazószint elérés számított helye;

Megjegyzés. – Ha az üzemeltetés folyamatosan történő ballon felbocsátásokból áll, a feltüntetendő idők azon várható időpontok, amikor az első és az utolsó ballon eléri a megfelelő repülési szintet (például 122136–130330 UTC).

k) a repülés befejezésének várható ideje (nap/óra/perc), valamint a tervezett földet-érési (megtalálási) terület. Azon ballonok esetében, melyek repülése hosszú ideig tart és ezért a repülés befejezésének idejét, valamint a tervezett földet-érési/megtalálási területet pontosan nem lehet előre meghatározni, a „hosszú időtartam” (long duration) kifejezést kell használni.

Megjegyzés. – Amennyiben egynél több földet-érési/megtalálási területet állapítanak meg, minden egyes helyszínt, a megfelelő várható földet-érési idővel együtt fel kell tüntetni. Amennyiben sorozatos földet érés várható, a feltüntetendő idők azon várható időpontok legyenek, amikor a sorozat első és utolsó ballonja földet ér (például 070330–072300 UTC).

5.1.3 Az 5.1.2 pont előírásaiban megadott, felbocsátás előtti tájékoztatások bármely változását legalább 6 órával, kritikus időpontú naprendszeri vagy kozmikus zavarok vizsgálata esetén legalább 30 perccel a tervezett felbocsátás előtt be kell jelenteni az érintett légiforgalmi szolgálati egységnek.

5.2 A felbocsátásról szóló tájékoztatás

5.2.1 A közepes vagy nehéz besorolású, személyzet nélküli szabad ballon felbocsátása után az üzemeltetőnek azonnal értesítenie kell az illetékes légiforgalmi szolgálati egységet a következőkről:

a) a ballonrepülés azonosító jele;
b) a felbocsátás helye;
c) a felbocsátás tényleges ideje;
d) a 18000 méter (60000 láb) nyomásmagasság keresztezésének, vagy ha az utazószint 18000 méter (60000 láb) vagy kevesebb, az utazószint elérésének várható ideje és helye; és
e) az 5.1.2 *g)* és *h)* pontban előírtak szerint az előzetes tájékoztatásban közöltektől való bármely eltérés.

5.3 Tájékoztatás a repülési feladat törléséről

5.3.1 Az üzemeltetőnek azonnal értesítenie kell az illetékes légiforgalmi szolgálati egységet, amint ismertté válik az 5.1 pontban előírtak alapján előzetesen bejelentett közepes vagy nehéz besorolású, személyzet nélküli szabad ballon repülésének törlése.

6. A repülési útvonal követése és helyzetjelentés

6.1 A 18000 méter (60000 láb) nyomásmagasságon, vagy ez alatt működő nehéz besorolású, személyzet nélküli szabad ballon üzemeltetőjének figyelemmel kell kísérnie a ballon repülési útját és a légiforgalmi szolgálatok kívánságának megfelelően, jelentenie kell a ballon helyzetét. Hacsak a légiforgalmi szolgálatok gyakoribb helyzetjelentést nem kérnek, az üzemeltetőnek minden két órában jelentenie kell a ballon helyzetét.

6.2 A 18000 méter (60000 láb) nyomásmagasság felett működő nehéz besorolású, személyzet nélküli szabad ballon üzemeltetőjének figyelemmel kell kísérnie a ballon repülési útját, és a légiforgalmi szolgálatok kívánságának megfelelően jelentenie kell a ballon helyzetét. Hacsak a légiforgalmi szolgálatok gyakoribb helyzetjelentéseket nem kérnek, az üzemeltetőnek 24 óránként kell jelenteni a ballon helyzetét.

6.3 Amennyiben a ballon helyzetét a 6.1 és a 6.2 pontokban előírtak szerint nem lehet megállapítani, az üzemeltetőnek erről azonnal értesítenie kell az illetékes légiforgalmi szolgálati egységet. Ennek az értesítésnek tartalmaznia kell a ballon utolsó megállapított helyzetét. Amikor a ballonrepülési útvonalának követését ismét végre tudják hajtani, az illetékes légiforgalmi szolgálati egységet azonnal értesíteni kell.

6.4 A nehéz besorolású, személyzet nélküli szabad ballon tervezett süllyedésének megkezdése előtt egy órával az üzemeltetőnek értesíteni kell az illetékes légiforgalmi szolgálati egységet a ballonnal kapcsolatos következő adatokról:

a) jelenlegei földrajzi helyzet;
b) jelenlegi szint (nyomás-magasság);
c) amennyiben lehetséges, a 18000 méter (60000 láb) nyomás-magasság keresztezésének előre-jelzéses időpontja;
d) a földet érés előre-jelzéses ideje és helye.

6.5 A nehéz vagy közepes besorolású, személyzet nélküli irányítatlan ballon üzemeltetőjének értesítenie kell az illetékes légiforgalmi szolgálati egységet arról, hogy az üzemelést befejezték.

„A" MELLÉKLET

POLGÁRI LÉGI-JÁRMŰ ELFOGÁSA

(Megjegyzés. – Lásd az Annex 3. fejezet 3.8 pontját és a hozzá tartozó megjegyzést.)

Megjegyzés: A teljesség érdekében az Annex 2. Függelékének előírásait a jelen Mellékletben összefoglaljuk.

1. Bevezető

A Nemzetközi Polgári Légi-közlekedési Egyezmény 3 (d) cikkelyének rendelkezése szerint az ICAO szerződő államok „állami légi-járműveikre vonatkozó előírásaik kiadásakor kellő figyelmet fordítanak a polgári légi-közlekedésben működő légi-járművek biztonságára". Mivel a polgári légi-járművek elfogása minden esetben gyakorlati veszélyt jelent, az ICAO Tanács kidolgozta az alábbi különleges ajánlásokat, és nyomatékosan kéri, hogy azokat a szerződő államok egységesen alkalmazzák, mert az összes érintett részéről történő egységes alkalmazás alapvető fontosságú a polgári légi-járművek és bennük tartózkodó személyek biztonsága érdekében. Ezért az ICAO Tanácsa felhívja a szerződő államok figyelmét, hogy a szerződő állam értesítse a Szervezetet bármely eltérésről, amely saját országos előírásai és gyakorlata, illetve az alábbiakban ismertetett különleges ajánlások között van.

2. Általános rész

2.1 A polgári légi-jármű elfogása elkerülendő, csak végső eszközként alkalmazható. Amennyiben az elfogást alkalmazzák, az a légi-jármű azonosságának megállapítására korlátozódjon, hacsak szükség nem támad a tervezett repülési útvonalra vagy az ország légtér határain belülre történő visszavezetésére, a tiltott, korlátozott vagy veszélyes légterekből történő kivezetésre, illetve a kijelölt repülőtérre történő leszállás végrehajtására. A polgári légi-jármű gyakorlás céljából történő elfogása tilos.

2.2 A polgári légi-jármű elfogásának elkerülése vagy az elfogás szükségességének csökkentése érdekében

a) az elfogást irányító egységek tegyenek meg minden lehetséges intézkedést a légi-jármű - amely polgári légi-jármű lehet-, azonosítására, és az illetékes légiforgalmi szolgálati egységek segítségével adják meg a szükséges utasításokat vagy tanácsokat az ilyen légi-jármű számára. Ennek érdekében alapvető fontosságú, hogy gyors és megbízható összeköttetést hozzanak létre az elfogást irányító és a légiforgalmi szolgálati egységek között, továbbá a 11. Annex előírásai szerint megfelelő egyezményeket dolgozzanak ki az egységek között a polgári légi-jármű mozgására vonatkozó tájékoztatás biztosítására;
b) az összes polgári repülés számára tiltott, valamint olyan területeket, amelyeken a polgári repülést külön állami engedély nélkül nem engedélyezik, a légiforgalmi tájékoztató kiadványban - a 15. Annex előírásai szerint - pontosan tegyék közzé, a szükséges módon jelezve az elfogás lehetőségét az ilyen területre történő belépés esetén. Amikor az ilyen területek a közzétett légiforgalmi szolgálati útvonalak vagy más, gyakran használt útirányok közelében helyezkednek el, az államok vegyék figyelembe a polgári légi-járművek által használt navigációs rendszerek jellemzőit és általános pontosságát, valamint a légi-járművek azon képességét, amellyel a kijelölt területet elkerülik;
c) tekintsék át további kiegészítő navigációs berendezések létesítésének lehetőségét, illetve szükségességét, hogy a polgári légi-jármű biztonságosan elkerülhesse a tiltott vagy - ha megkövetelt,- a korlátozott területeket.

2.3 A végső eszközként alkalmazott elfogásokból származó veszélyek kiküszöbölése vagy csökkentése érdekében minden lehetséges intézkedést tegyenek meg a repülőgép-vezető és az érintett földi egységek személyzete összehangolt tevékenységének elősegítésére. Ennek érdekében alapvető, hogy a szerződő államok biztosítsák az alábbiakat:

a) az összes polgári légi-jármű repülőgép-vezetője pontosan ismerje a végrehajtandó feladatait és az alkalmazott látási jeleket, amelyek a jelen Annex 3. fejezetében és az 1. Függelékben kerültek meghatározásra;
b) a polgári légi-jármű üzemeltetője vagy parancsnoka tegyen eleget a 6. Annex I, II. és III. rész előírásainak, amelyek a légi-jármű rádió összeköttetés tartási képességére vonatkoznak a 121.5 MHz vészhelyzeti frekvencián, valamint a légi-jármű fedélzetén helyezzék el az elfogás esetén alkalmazandó eljárások és látási jelek jegyzékét;
c) a légiforgalmi szolgálatok teljes személyzete pontosan ismerje a 11. Annex 2. fejezet és a PANS-ATM (Doc 4444) előírásai szerint végrehajtandó feladatait;
d) az elfogó légi-járművek összes parancsnoka ismerje a polgári légi-jármű általános teljesítmény korlátozásait, és számoljon azzal a lehetőséggel, hogy az elfogott légi-jármű műszaki nehézségek vagy jogtalan beavatkozás miatt vészhelyzetben lehet;
e) az elfogást irányító egységek valamint a lehetséges elfogó légi-járművek parancsnokai számára pontos és egyértelmű utasításokat adjanak az elfogási műveletekről, az elfogott légi-jármű vezetéséről, az elfogott légi-jármű által várható tevékenységekről és repülési műveletekről, a levegőben alkalmazott látási jelekről, az elfogott légi-járművel történő rádióleveleézésről, és a fegyverhasználattól történő tartózkodás szükségességéről

Megjegyzés: Lásd a 3 – 8. pontokat;

f) az elfogott légi-járművel való kapcsolatteremtés érdekében az elfogást irányító egységek és az elfogó légi-járművek legyenek ellátva az Annex 10 I. kötetében meghatározott műszaki követelményű rádió-távbeszélő berendezéssel, az elfogott légi-járművel a 121,5 MHz vészhelyzeti frekvencián történő közleményváltás céljából;
g) biztosítsanak másodlagos radar és/vagy ADS-B eszközöket olyan mértékben, hogy lehetővé tegyék az elfogást irányító egységeknek a polgári légi-járművek azonosítását azokon a területeken, ahol azok elfogására egyébiránt sor kerülhet. Az ilyen eszközök tegyék lehetővé a légi-jármű azonosító felismerését, továbbá a vészhelyzeti és sürgősségi feltételek azonnali felismerését.

3. Elfogási manőverek

3.1 Az elfogott légi-járművet érintő veszélyek elkerülése érdekében a polgári légi-járművet elfogó légi-jármű repülési tevékenységére szabványos manőverezési eljárást kell kidolgozni. Az eljárás kidolgozásakor kellő mértékben vegyék figyelembe a polgári légi-járművek teljesítmény korlátait, azon követelményt, hogy az elfogó légi-jármű ne kerüljön az elfogott légi-járművel összeütközés veszélyét előidéző közelségbe, valamint, hogy az elfogó légi-jármű ne keresztezze az elfogott légi-jármű útját, vagy, hogy bármilyen más manővert ne úgy hajtsanak végre, hogy a légi-jármű által keltett turbulencia veszélyt idézzen elő, különösen akkor, ha az elfogott légi-jármű "könnyű" kategóriájú.

1.2. Az összeütközést elkerülő rendszerrel (ACAS) felszerelt és elfogás alatt lévő légi-jármű összeütközési fenyegetésnek érzékelheti az elfogót, és ennek következtében az ACAS megoldási tanácsára válaszul kikerülési manőverbe kezd. Ez a manőver az elfogó számára félrevezethető lehet, barátságtalan szándék jelzéseként értékelheti. Ebből következően fontos, hogy a másodlagos felderítő radar (SSR) válaszjel-adóval felszerelt elfogó légi-jármű repülőgép-vezetői elnyomják a nyomás-magasság információ adását (C válaszmódban vagy az S válaszmód AC mezőjében) az elfogás alatt álló légi-járműtől legalább 37 km (20 tengeri mérföld) távolságon belül. Ez az elfogott légi-járműben lévő ACAS-t meggátolja abban, hogy az elfogó vonatkozásában jelentkező megoldási tanácsokat felhasználja, mialatt az ACAS forgalom- tanácsadási tájékoztatása továbbra is rendelkezésre áll.

3.3 Látással történő azonosítási manőverek

3.3.1 Az alábbi eljárást javasoljuk az elfogó légi-jármű számára a polgári légi-jármű látással történő azonosításának végrehajtására:

I. szakasz:

Az elfogó légi-jármű az elfogott légi-járművet a légi-jármű hátulja felől közelítse meg. Az elfogó kötelék, vagy ha csak egy elfogó légi-jármű tevékenykedik, az elfogó légi-jármű vezetője az elfogott légi-jármű baloldalára, kissé az elfogott légi-jármű felett és előtt helyezkedjen el úgy, hogy az elfogott légi-járműtől kezdetben legalább 300 m távolságra, az elfogott légi-jármű vezetőjének látóterén belül legyen. Bármely más - az elfogásban résztvevő - légi-jármű maradjon biztonságos távolságban, lehetőleg az elfogott légi-jármű felett és mögött. Amikor az elfogott légi-járműhöz viszonyított megfelelő sebességet és repülési helyzetet felvette, az elfogó légi-jármű szükségszerűen hajtsa végre a mások szakaszban előírtakat.

II. szakasz:

Az elfogó kötelék, vagy az elfogó légi-jármű vezetője azonos szinten repülve kezdje meg az elfogott légi-jármű óvatos megközelítését. Az elfogó légi-jármű ne repüljön az elfogott légi-járműhöz közelebb, mint ahogy az a szükséges adatok beszerzése céljából feltétlenül szükséges. Az elfogó kötelék, vagy az elfogó légi-jármű vezetője legyen óvatos, nehogy megijessze az elfogott légi-jármű személyzetét, vagy utasait. Az elfogó légi-jármű vezetője mindig vegye figyelembe azt a tényt, hogy azok a manőverek, melyek az elfogó légi-járművek számára természetesek, veszélyesek lehetnek a polgári légi-jármű személyzetei, vagy utasai számára. Az elfogásban résztvevő bármely más légi-jármű maradjon az elfogott légi-járműtől biztonságos távolságra. Az azonosítás befejezése után az elfogó légi-jármű a harmadik szakaszban körvonalazottak szerint távolodjon el az elfogott légi-jármű közeléből.

III. szakasz:

Az elfogó kötelék, vagy az elfogó légi-jármű vezetője óvatosan, enyhe ereszkedő fordulóval repüljön el az elfogott légi-járműtől. Az elfogásban résztvevő bármely más légi-jármű maradjon az elfogott légi-járműtől biztonságos távolságra, és csatlakozzon a kötelék vezetőjéhez.

3.4 Navigációs vezetési manőverek

3.4.1 Amennyiben a fenti I. és II. szakaszban leírt azonosítási műveletek végrehajtása után úgy ítélik meg, hogy az elfogott légi-jármű repülési útvonalának megváltoztatása szükséges, a kötelék vezetőjének, vagy az egyedül elfogó légi-járműnek rendszerint az elfogott légi-jármű bal oldalán, kissé felette és előtte kell elhelyezkednie, hogy annak parancsnoka láthassa a leadott látási jeleket.

3.4.2 Nélkülözhetetlenül szükséges, hogy az elfogó légi-jármű parancsnoka meggyőződjön arról, hogy az elfogott légi-jármű parancsnoka az elfogást észlelte és nyugtázza a jelzéseket. Ha az 1. függelék II. részében szereplő 1. sorozatú jelzések ismétlésével sem sikerül az elfogott légi-jármű parancsnokának figyelmét felhívni, más jelzési módszerek is használhatók e célra, beleértve utolsó eszközként az után-égető keltette fényhatást, feltéve, ha ennek használata az elfogott légi-járműre nem jelent veszélyt.

3.5 Ismeretes, hogy adódnak olyan esetek, amikor az időjárási körülmények, vagy a domborzati viszonyok szükségessé tehetik, hogy a kötelékvezető vagy az egyedüli elfogó légi-jármű az elfogott légi-jármű jobb oldalán, kissé felette és előtte helyezkedjen el. Ilyen esetben, az elfogó légi-jármű parancsnokának megkülönböztetett figyelmet kell fordítania arra, hogy légi-járművét az elfogott légi-jármű parancsnoka folyamatosan, tisztán láthassa.

4. Az elfogott légi-jármű útbaigazítása

4.1 Amikor az elfogott légi-járművel rádióösszeköttetés létesíthető, a navigációs útbaigazítást és a kapcsolódó információkat rádió-távbeszélőn kell biztosítani az elfogott légi-jármű számára.

4.2 Amikor navigációs útbaigazítást adnak egy elfogott légi-jármű számára, gondoskodni kell arról, hogy az elfogott légi-járművet ne vezessék olyan körülmények közé, ahol a látástávolság a repülés látás szerinti időjárási körülmények közötti tartásához szükséges minimum alá csökkenhet. Vigyázni kell arra is, hogy az elfogott légi-járművektől megkövetelt manőverek ne növeljék az elfogott légi-járműre háruló, már meglévő veszélyeket abban az esetben, ha a légi-jármű üzemeltetési hatékonysága korlátozott.

4.3 Abban a kivételes esetben, ha az elfogott légi-járművet az átrepült területen le kell szállítani, ügyelni kell arra is, hogy

a) a kijelölt repülőtér alkalmas legyen az érintett légi-jármű típus biztonságos leszállására, különösen akkor, ha a repülőteret rendes körülmények között polgári légi-forgalom céljaira nem használják;
b) a repülőteret körülvevő terep alkalmas legyen a körözés, megközelítés, valamint a megszakított megközelítés végrehajtására;
c) az elfogott légi-járműnek elegendő üzemanyaga legyen a repülőtér elérésére;
d) ha az elfogott légi-jármű polgári szállító légi-jármű, a kijelölt repülőtér olyan futópályával rendelkezzen, amely megfelel egy közepes tengerszinten lévő, legalább 2500 m hosszúságú futópályának, és teherbírása elegendő legyen a légi-jármű elbírására; és
e) amikor csak lehetséges, a kijelölt repülőtér olyan legyen, melynek részletes leírása a vonatkozó légiforgalmi tájékoztató kiadványban szerepel.

4.4 Amennyiben polgári légi-járművet ismeretlen repülőtéren való leszállásra utasítanak, elegendő időt kell adni arra, hogy a polgári légi-jármű vezetője előkészülhessen a leszállás végrehajtására, figyelembe véve azt a tényt, hogy egyedül a polgári légi-jármű parancsnoka tudja megítélni azt, hogy adott időben a futópálya hosszát és a légi-jármű tömegét figyelembe véve a leszállási manőver biztonságosan végrehajtható-e.

4.5 Különösen fontos, hogy rádió-távbeszélő segítségével adják meg az elfogott légi-járműnek a biztonságos megközelítés és leszállás végrehajtásához szükséges összes tájékoztatást.

5. Az elfogott légi-jármű ténykedése

A 2. Függelék II. részében szereplő szabványok az alábbiakat írják elő:

„2.1 Egy másik légi-jármű által elfogott légi-járműnek azonnal

a) követnie kell az elfogó légi-jármű utasításait, a látási jeleket az „1” függelékben megadott előírások szerint értelmezve és viszonozva.
b) ha lehetséges, értesítse az illetékes légiforgalmi szolgálati egységet;
c) kísérelje meg a rádióösszeköttetés felvételét az elfogó légi-járművel, vagy az illetékes, elfogást irányító egységgel, általános hívással a 121,5 MHz vészhelyzeti frekvencián, megadva az elfogott légi-jármű azonosító jelét és a repülés fajtáját; és ha nem jött létre az összeköttetés és gyakorlatilag lehetséges, ismételje meg ezt a hívást a 243 MHz vészfrekvencián is;
d) ha fel van szerelve SSR válaszjel-adóval, állítsa be az „A” mód 7700 kódot, hacsak más utasítást nem kapott az illetékes légiforgalmi szolgálati egységtől.
e) ha fel van szerelve ADS-B-vel vagy ADS-C-vel, válassza ki a megfelelő vészhelyzeti funkciót, amennyiben rendelkezésre áll, hacsak más utasítást nem kap az illetékes légiforgalmi szolgálati

egységtől.

2.2 Ha bármely rádión kapott utasítás ellentétes az elfogó légi-jármű által látási jelek útján adott utasítással, az elfogott légi-jármű kérjen azonnali tisztázást, mialatt továbbra is követi az elfogó légi-jármű látási jelekkel adott utasításait.

2.3 Ha bármely rádión vett utasítás ellentétes az elfogó légi-jármű által rádión adott utasítással, az elfogott légi-jármű kérjen azonnali tisztázást, mialatt továbbra is követi az elfogó légi-jármű rádión adott utasításait."

6. Levegőben alkalmazott látási jelek

6.1 Az elfogó és az elfogott légi-járművek által alkalmazandó látási jeleket jelen Annex 1. Függeléke tartalmazza. Elengedhetetlenül fontos, hogy az elfogó légi-jármű pontosan alkalmazza e látási jeleket, és helyesen értelmezze a másik légi-jármű által adott jelzéseket. Különösen fontos, hogy az elfogó légi-jármű nagyon figyeljen minden - az elfogott légi-jármű által adott olyan - jelzésre, amely azt jelzi, hogy az elfogott légi-jármű veszélyben van, vagy segítségre szorul.

7. Rádióösszeköttetés az elfogást irányító egység vagy az elfogó légi-jármű, és az elfogott légi-jármű között

7.1 Az elfogás végrehajtása során, az elfogást irányító egység és az elfogó légi-jármű

a) először kíséreljen meg közös nyelven kétoldalú rádióösszeköttetést létesíteni a 121,5 MHz vészhelyzeti frekvencián;

A rádióösszeköttetés során a következő hívónevek használandók:
„INTERCEPT CONTROL" (elfogást irányító egység),
„INTERCEPTOR (hívójel)" [elfogó légi-jármű (hívójel)],
„INTERCEPTED AIRCRAFT" (elfogott légi-jármű); és

b) ennek sikertelensége esetén kíséreljenek meg kétoldalú rádióösszeköttetést létesíteni az elfogott légi-járművel olyan más frekvencián vagy frekvenciákon, amelyeket az illetékes ATS hatóságok írhattak elő, vagy létesítsenek összeköttetést a megfelelő ATS egységeken keresztül.

7.2 Ha az elfogás során létrejön a rádióösszeköttetés, de az üzenetváltás közös nyelven nem lehetséges, meg kell kísérelni az utasítások adását, az utasítások nyugtázását és a leglényegesebb tájékoztatások továbbítását az A-1 táblázatban szereplő kifejezések és kiejtési útmutató használatával, az egyes kifejezéseket kétszer ismételve.

A-1 táblázat

Az ELFOGÓ légi-jármű által használandó kifejezések:			*Az ELFOGOTT légi-jármű által használandó kifejezések:*		
Kifejezés	*Kiejtés*[1]	*Jelentése*	*Kifejezés*	*Kiejtés*[1]	*Jelentése*
CALL SIGN	<u>KOL-</u>SZAIN	Mi a hívójele?	CALL SIGN[2] (hívójel)	<u>KOL-</u>SZAIN (hívójel)	Hívójelem…
FOLLOW	<u>FOL</u>-LO	Kövessen	WILCO	<u>VILL</u>-KO	Megértettem, végrehajtom
DESCEND	DI-<u>SZEND</u>	Süllyedjen leszálláshoz	CAN NOT	<u>KAN-</u>NOT	Nem tudom teljesíteni

YOU LAND	JU-LEEND	Szálljon le ezen a repülőtéren	REPEAT	RI-PIT	Ismételje meg utasítását
PROCEED	PRO-SZID	Tovább haladhat	AM LOST	AM-LOSZT	Eltévedtem
			MAYDAY	MÉJDÉJ	Vészhelyzetben vagyok
			HIJACK[3]	HÁJDZSEK	Eltérítettek
			LAND (…)	LEND (…)	Leszállást kérek … helyen
			DESCEND	DI-SZEND	Süllyedést kérek

1. Megjegyzés. – A második oszlopban a hangsúlyozandó szótag alá van húzva.
2. Megjegyzés. – A megadandó hívójel az legyen, melyet a légiforgalmi szolgálati egységekkel tartott rádió-távbeszélő összeköttetés során használnak, és amely megfelel a légi-jármű repülési tervében szereplő azonosító jelnek.
3. Megjegyzés. – A "HIJACK" kifejezés használatát a körülmények nem mindig teszik lehetővé, illetve kívánatossá.

8. Tartózkodás a fegyverhasználattól

Megjegyzés. – Az ICAO tagállamok közgyűlésének 1984. május 10-én tartott 25. (rendkívüli) ülésén egyöntetűen elfogadott Nemzetközi Polgári Repülési Egyezmény 3 (b) cikkelye értelmében a Szerződő Államok elfogadták, hogy „minden államnak tartózkodnia kell a fegyverhasználattól repülést folytató polgári légi-járművekkel szemben"
.
Nyomjelzős lövedékek használata a figyelem felkeltése céljából veszélyes, és elvárt, hogy intézkedéseket foganatosítsanak ezek használatának elkerülésére annak érdekében, hogy a légi-jármű biztonságát és a fedélzeten lévő utasok életét ne veszélyeztessék.

9. Együttműködés az elfogást irányító egységek és a légiforgalmi szolgálati egységek között

9.1 Alapvető, hogy egy tudottan vagy feltételezhetően polgári légi-jármű elfogásának minden szakaszában szoros együttműködést tartsanak fenn az elfogást irányító egység és az illetékes légiforgalmi szolgálati egység között abból a célból, hogy a légiforgalmi szolgálati egység folyamatosan tájékoztatva legyen a fejleményekről, valamint az elfogott légi-járműtől megkövetelt tevékenységről.

„B" MELLÉKLET

JOGTALAN BEAVATKOZÁS

1. Általános rész

A következő eljárások útmutatóként szolgálnak arra az esetre, amikor a légi-jármű jogtalan beavatkozás alatt áll, és erről a légiforgalmi szolgálati egységet nem tudja értesíteni.

2. Eljárások

2.1 Amennyiben a légi-jármű parancsnoka a 3. Fejezet 3.7.2. pontban foglalt szabályok szerint nem képes egy repülőtér felé haladni, kísérelje meg folytatni útját a kijelölt útirányon és utazószinten legalább addig, amíg értesíteni tud egy légiforgalmi szolgálati egységet, vagy amíg radar vagy ADS-B fedésterületen van.

2.2 Amikor a jogtalan beavatkozás alatt álló légi-jármű el kell térjen kijelölt útirányától vagy utazószintjétől, és nem képes rádióösszeköttetést létesíteni az ATS-sel, a légi-jármű parancsnoka, amennyiben lehetséges

a) kísérelje meg figyelmeztetést adni a használatos VHF csatornán vagy a VHF vészhelyzeti frekvencián, és más megfelelő csatornákon, hacsak a légi-jármű fedélzetén a körülmények mást nem követelnek. Ha előnyös így cselekedni és a körülmények lehetővé teszik, használjon más berendezéseket is, mint például a fedélzeti válaszjel-adót vagy az adatátviteli eszközöket;
b) amennyiben ilyen eljárásokat kidolgoztak és a Helyi Körzeti Egyezmények (Doc 7030) eljárásaiban közzétettek, repüljön tovább a repülés közben kialakult váratlan helyzetekre előírt különleges eljárások szerint; vagy
c) ha alkalmazható körzeti eljárásokat nem dolgoztak ki, repüljön olyan szinten, amely a IFR repüléshez használt normál utazószintektől a következőkben különbözik:

> *1)* 150 méter (500 ft) olyan területen, ahol az alkalmazott függőleges elkülönítési minimum 300 méter (1000 láb); vagy
> *2)* 300 méter (1000 ft) olyan területen, ahol az alkalmazott függőleges elkülönítési minimum 600 méter (2000 láb).

Megjegyzés: A jogtalan beavatkozás alatt álló elfogott légi-jármű tennivalóit a jelen Annex 3.8 szakasza írja elő.

- Vége -

üzemeltetőként tevékenykedni. Mielőtt a szakszolgálati engedélye jogosítványait gyakorolná, a szakszolgálati engedély birtokosának meg kell ismernie a légiforgalmi állomáson használatos berendezéstípusokra és üzemeltetési eljárásokra vonatkozó és érvényes összes információt.

4. 8. Repülés-meteorológiai személyzet

Megjegyzés.- A repülés-meteorológiai személyzet kiképzésére és minősítésére vonatkozó követelmények a Meteorológiai Világszervezet (WMO) felelőssége és alapja az a munka megállapodás, mely a Nemzetközi Polgári Repülési Szervezet (ICAO) és a Meteorológiai Világszervezet (WMO) között jött létre (DOC 7475). A követelményeket a WMO 258. okiratában - Irányelvek a meteorológiai és az üzemi hidrológiai személyzet oktatására és kiképzésére – lásd Meteorológia I. Kötet:

ANNEX 3.
Meteorológiai Szolgálat Nemzetközi Léginavigációhoz

Lektorálta: Füredi Tamás Alkalmazás esetén mindenkor az eredeti ICAO anyagban foglaltak a mérvadók!

16. kiadás – 2007. július

I. rész
Szabványok és Ajánlott Eljárások törzsanyaga

II. rész
Függelékek és Mellékletek

Ez a kiadás magában foglalja a Tanács által 2007. február 22. előtt elfogadott összes módosítást, és 2007. november 7-ével hatálytalanítja a 3. Annex minden ezt megelőző kiadását.
A Szabványok és Ajánlott Eljárások alkalmazhatóságára vonatkozó információkat illetően lásd az Előszót.
Nemzetközi Polgári Repülési Szervezet

KÍSÉRŐ MEGJEGYZÉS
A NEMZETKÖZI POLGÁRI REPÜLÉSI EGYEZMÉNY FÜGGELÉKÉNEK ÚJ KIADÁSAI
Tudomásunkra jutott, hogy egy Annex új kiadásának megjelenésekor az Annex előző kiadásával együtt az ahhoz tartozó **Kiegészítés** is kidobásra kerültek. Kérjük megjegyezni, hogy az előző kiadáshoz tartozó Kiegészítést meg kell tartani, amíg egy új Kiegészítés kiadásra nem kerül.

A 74. MÓDOSÍTÁSRA VONATKOZÓ FONTOS MEGJEGYZÉS.
Ez az új kiadás az összes, 1-től 74-ig terjedő összes módosítást magában foglalja, és **2007. november 7.-**i alkalmazhatósági dátummal rendelkezik. Azonban a WAFS előrejelzések használatára vonatkozó bizonyos utasítások, az repülőtéri előrejelzés érvényességi időtartamának kiterjesztése, és a repülésmeteorológiai kódokra vonatkozó más módosítások csak **2008. november 5.-én** válnak alkalmazhatóvá, és ezeket az új kiadás **nem** tartalmazza. A 2008-ban alkalmazható utasítások helyettesítési oldalainak megküldésére 2007 szeptemberében kerül sor.

MÓDOSÍTÁSOK

A módosítások kiadását rendszeresen közlik az *ICAO Journal*-ban és a havonta megjelenő *Supplement to the Catalogue of ICAO Publications and Audio-visual Training Aids*-ben (Kiegészítés az ICAO kiadványok és audio-vizuális képzési segédletek katalógusához), amelyeket jelen kiadvány birtokosainak célszerű áttanulmányozni. Az alábbi hely ezeknek a módosításoknak a bejegyzésére szolgál.

MÓDOSÍTÁSOK ÉS JAVÍTÁSOK BEJEGYZÉSE

TARTALOMJEGYZÉK

II. RÉSZ. FÜGGELÉKEK ÉS MELLÉKLETEK

FÜGGELÉKEK

ELŐSZÓ

Történeti háttér

A meteorológiára vonatkozó Szabványokat és Ajánlott Eljárásokat a Tanács először 1948. Április 16-án fogadta el a Nemzetközi Polgári Repülési Egyezmény (Chicago, 1944) 37. Cikkelyében foglalt előírásoknak megfelelően, és 3. Annex-ként jelölte ki az Egyezményhez, *Szabványok és Ajánlott Eljárások - Meteorológiai Kódok* címen. A Szabványok és Ajánlott Eljárások a Meteorológiai Részleg 1947. szeptemberében tartott különleges ülésszakának ajánlásain alapultak.

Az *A* Táblázat mutatja az egymást követő módosítások eredetét, valamint egy jegyzéket az érintett lényegi kérdésekről és azokról a dátumokról, amelyeken az Annexet és a módosításokat a Tanács elfogadta, vagy jóváhagyta, amikor hatályba léptek, és amikor alkalmazhatóvá váltak.

A Szerződő Államok tevékenysége

Eltérések bejelentése. A Szerződő Államok figyelmét felhívjuk az Egyezmény 38. Cikkelyében szereplő kötelezettségükre, amely szerint a Szerződő Államok kötelesek tájékoztatni a Szervezetet bármely eltérésről, amely nemzeti szabályozásaik és eljárásaik, és a jelen Annexben és annak bármely módosításában tartalmazott Nemzetközi Szabvány között fennáll. Felhívjuk a Szerződő Államokat, hogy ezt a tájékoztatást terjesszék ki a jelen Annex és annak bármely módosítása által tartalmazott Ajánlott Eljárásoktól való eltérésekre, amennyiben ezek az eltérések a légiközlekedés biztonsága szempontjából fontosak. Továbbá felhívjuk a Szerződő Államokat, hogy folyamatosan tájékoztassák a Szervezetet a későbbiekben előforduló eltérésekről, illetve bármely, korábban bejelentett eltérés visszavonásáról. Az eltérések bejelentésére vonatkozó specifikus kérést a Szervezet minden, ezzel az Annexszel kapcsolatos módosítás elfogadása után azonnal elküldi a Szerződő Államoknak.

Felhívjuk a szerződő Államok figyelmét a 15. Annex azon előírásaira is, amelyek a nemzeti szabályozások és eljárások és a vonatkozó ICAO Szabványok és Ajánlott Eljárások között fennálló eltéréseknek a Repülési Információs Szolgálaton (AIS) keresztül való közzétételére vonatkoznak, amelyet az Államoknak az Egyezmény 38. Cikkelye szerinti kötelezettségén felül meg kell tenniük.

Információ közlés. A jelen Annexben részletezett Szabványoknak és Ajánlott Eljárásoknak megfelelően biztosított, a légijárművek üzemeltetését befolyásoló berendezések, szolgálatok és eljárások létrehozásáról, megszüntetéséről és változásáról tájékoztatást kell adni, és ezeket a 15. Annex rendelkezései szerint kell életbe léptetni.

Az Annex szövegének felhasználása a nemzeti szabályozásokban. A Tanács 1948. április 13-án elfogadott egy határozatot, amely felhívja a Szerződő Államok figyelmét arra, hogy kívánatos saját nemzeti szabályozásaikban, amennyiben lehetséges, azoknak az ICAO Szabványoknak pontos nyelvezetét használni, amelyek szabályozó jellegűek; továbbá, hogy kívánatos a Szabványoktól való eltérések közlése, beleértve bármely pótlólagos nemzeti szabályozásról adott tájékoztatást, amely fontos a légiközlekedés biztonsága és rendszeressége szempontjából. Ahol csak lehetséges volt, jelen Annex rendelkezései olyan módon íródtak, hogy megkönnyítsék a nemzeti rendelkezésekbe nagyobb szövegváltoztatás nélküli beillesztését.

Az Annex részeinek státusza

Egy Annex a következő alkotórészekből épül fel, amelyek közül azonban nem mindegyik található meg szükségszerűen minden egyes Annexben; ezeknek a következőkben meghatározott státuszuk van:

1. – *Az Annex sajátosságát tartalmazó anyag:*

a) *Szabványok és Ajánlott Eljárások,* amelyeket a Tanács elfogadott az Egyezmény előírásainak megfelelően. Ezek meghatározása a következő:

Szabvány: Fizikai jellemzőkre, elrendezésekre, anyagra, teljesítményre, személyekre vagy eljárásokra vonatkozó bármely előírás, amelynek egységes alkalmazását szükségesnek tartják a nemzetközi repülés biztonsága vagy rendszeressége szempontjából, és amelyhez a Szerződő Államok az Egyezményeknek megfelelően igazodnak; teljesítésének lehetetlensége esetén a 38. Cikkely értelmében a Tanácsot kötelező értesíteni.

Ajánlott Eljárás: Fizikai jellemzőkre, elrendezésekre, anyagra, teljesítményre, személyekre vagy eljárásokra vonatkozó bármely előírás, amelynek egységes alkalmazását kívánatosnak tartják a nemzetközi repülés biztonsága, rendszeressége vagy hatékonysága érdekében, és amelyhez a Szerződő Államok az Egyezménynek megfelelően igyekeznek alkalmazkodni.

b) *Függelékek* a kényelem kedvéért külön csoportosított anyag, de a Tanács által elfogadott Szabványok és Ajánlott Eljárások részét képezik.

c) *Meghatározások* a Szabványok és Ajánlott Eljárásokban használt azon kifejezések definíciói, amelyek nem maguktól értetődőek, mivel nincs elfogadott szótári jelentésük. A definíciónak nincs független státusza, de lényeges része minden Szabványnak és Ajánlott Eljárásnak, amelyben a kifejezés előfordul, mivel a kifejezés jelentésének megváltoztatása befolyásolná az előírást.

d) *Táblázatok és Ábrák,* amelyek kiegészítik, vagy illusztrálják a Szabványokat és Ajánlott Eljárásokat, amelyekben hivatkoznak azokra, részei a velük kapcsolatos Szabványoknak, illetve Ajánlott Eljárásoknak és ugyanazon státuszuk van.

2. – A Tanács által kiadásra jóváhagyott Szabványokkal és Ajánlott Eljárásokkal kapcsolatos anyag:

a) *Előszó:* Tartalmazza a történeti és magyarázó anyagot a Tanács tevékenységéről, és tartalmazza az Államoknak a Szabványok és Ajánlott Eljárások alkalmazására vonatkozó kötelezettségeinek kifejtését, amelyek az Egyezményből és az Elfogadási Határozatból következnek.

b) *Bevezetés* az Annex részeinek, fejezeteinek vagy alfejezeteinek az elején magyarázó anyagot tartalmaz, amely segít a szöveg alkalmazásának megértésében.

c) *Megjegyzések,* ahol szükségesek, a szövegben szerepelnek, tényszerű információkat és felvilágosításokat adnak az adott Szabványra és Ajánlott Eljárásra vonatkozóan, de nem alkotják a Szabványok és Ajánlott Eljárások részét.

d) *Mellékletek* olyan anyagokat tartalmaznak, amelyek kiegészítik a Szabványokat és Ajánlott Eljárásokat, vagy útmutatást adnak azok alkalmazásához.

Nyelv kiválasztása

Ezt az Annexet öt nyelven fogadták el - angolul, arabul, franciául, oroszul és spanyolul. Minden Szerződő Államot felkérnek, hogy válasszon ezek közül egyet a nemzeti alkalmazás céljaira és az Egyezményben előírt egyéb célokra, akár közvetlen felhasználással, akár saját nemzeti nyelvére lefordítva, és erről a Szervezetet megfelelően értesítse.

Szerkesztési eljárások

A következő szerkesztési gyakorlatot alkalmazták az előírások szövegezésében, hogy az egyes állítások státusza az első pillantásra jelezze: *Szabványok* antikva betűtípussal vannak nyomtatva, míg az *Ajánlott Eljárások* dőlt betűkkel, a státuszt az **Ajánlás** előtag jelzi; *Megjegyzés* antikva *betűtípussal* nyomtatva*,* a státuszt a *Megjegyzés* előtag jelzi.

Bármely hivatkozás ennek a dokumentumnak egy számmal azonosított részére, a rész valamennyi alrészét tartalmazza.

Alkalmazhatóság

Jelen dokumentumban szereplő Szabványok és Ajánlott Eljárások szabályozzák a *Regionális Kiegészítő Eljárások* (Doc. 7030) alkalmazását, amelyben a regionális választású megállapítások szerepelnek, amennyiben ilyen választást jelen Annex megenged.

Felelősség

A 6. Annex II. Rész Előszavának egy hasonló előírásában foglaltaknak megfelelően, a felelősség, amely az üzemeltetőre hárul, a 3. Annex előírásai szerint, a nemzetközi általános célú repülés esetén a légijármű parancsnokot terheli.

A megfelelő WMO kiadványokkal való kapcsolat

A 3. Annexben lévő szabályozó anyag, néhány kisebb szerkesztési eltéréstől eltekintve, azonos a Meteorológiai Világszervezet (WMO) Műszaki Szabályozások (C.3.1 Fejezet) anyagával.

A 3. Annexben hivatkozott repülésmeteorológiai kód formátumokat a Meteorológiai Világszervezet alakította ki az ebben az Annexben található repülési követelmények alapján, illetve a Tanács időről-időre megállapított követelményei alapján. A repülésmeteorológiai kód formátumokat a Meteorológiai Világszervezet No.306 kiadványban - *Kódkézikönyv,* I. kötet tette közzé.

43	Harmadik Léginavigációs Konferencia	A „SIGMET tájé-koztatás” kifejezés bevezetése a „ta-nácsadói közle-mény” és a „figyel-meztető közlemény” helyett; a POMAR-kódban a „tenger állapota” (State of Sea) táblázat módo-sítása.	1957.06.13. 1957.10.01. 1957.12.01.

44	Repülési Szabályok és Légiforgalmi Szolgálatok/Kutatás és Mentés Részlegek	A légijelentések AIREP formájában az 1.rész (helyzetjelentés) alapelemeinek változása - a „Repülési Körülmények” elem törlése és az utolsó elem módosítása ebben a részben a következőkre: „Következő helyzet és eltelt idő”	1960.02.18. 1960.05.01. 1960.08.01.
45	Repülési Szabályok és Légiforgalmi Szolgálatok/Kutatás és Mentés Részlegek	Az AIREP és POMAR típusú légijelentés formanyomtatvány mintájának módosítása, a 44. Módosítás következményeként.	
46	Meteorológiai Világszervezet	Felfrissítés a WMO által 1960. Január 1-jén bevezetett repülés-meteorológiai számkódokkal.	1960.06.08 – 1960.06.08

47 (5. kiadás)	A Meteorológiai Részleg 5. Ülésszaka	Légijárművek időjárás észlelési és jelentési eljárásainak módosítása, megváltoztatva azokat a különleges észlelések tekintetében, és bevezetve az egyéb észlelésekre vonatkozó követelményeket; a légijelentés POMAR formátumának törlése; a repülésmeteorológiai figyelés törlése és az útvonal előrejelző szolgálat bevezetése a területi meteorológiai figyelés kiegészítésére; a kitérő repülőtérhez vezető útvonalon lévő meteorológiai körülményekre vonatkozó előírások módosítása	1960.12.02. 1961.04.01. 1961.07.01..
48	A Meteorológiai Részleg 5. Ülésszaka	A légijelentés AIREP formanyomtatvány mintájának módosítása, hogy tükrözze a légijármű általi meteorológiai észlelésekre és jelentésekre a PANS-RAC módosítása miatt bekövetkező változásokat.	1960.12.02. – 1961.07.01.
49	A Meteorológiai Részleg 5. Ülésszaka	A „D-érték” definíciójának bevezetése	1963.04.08. 1963.08.01. 1963.11.01
50.	Meteorológiai Világszervezet	Felfrissítés az 1964. Január 1-jén a Meteorológiai Világszervezet által bevezetett repülésmeteorológiai számkódokkal.	1964.03.18 – 1964.03.18.

51 (6. kiadás)	Meteorológiai és Üzemelési Részleg ülése	Megfigyelés végzése követelményének bevezetése olyan helyekre, ahol ezek arra a területre lesznek jellemzőek, amelyre elsősorban megköveteltek. Különleges légijelentések kritériumainak kiterjesztése olyan jelenségekre, amelyek befolyásolhatják a hatékonyságot és a biztonságot, és az „egyéb légijármű általi észlelések” követelményének törlése a regionálisan egyeztetett kritériumok szerint; a légijelentések AIREP formátumából a D-érték, az időjárás és felhőzet, mint állandó tételek törlése; az AIREP formátum módosított mintájának bevezetése; a meteorológiai közlemények formájára vonatkozó és az információk képi formában való cseréjére biztosított eljárások változása; „köznyelv” definíciójának bevezetése.	1965.05.31. 1965.10.01. 1965.03.10.
52	Meteorológiai Világszervezet	Felfrissítés a Meteorológiai Világszervezet által 1966. Március 10-én bevezetett repülésmeteorológiai számkódokkal	1966.12.12 –

53	Meteorológiai és Üzemeltetési Részleg ülése.	A regionális léginavigációs egyezmény jóváhagyása a közlemények képi formában való továbbításáról az előrejelzések szétosztásában; a „szimbolikus közleményforma” kifejezés helyettesítése a közlemény formájának specifikusabb leírásával, amelyre ez a kifejezés volt hivatva utalni.	1966.12.12. 1967.04.12. 1967.08.24.
54	Meteorológiai Világszervezet	Felfrissítés a Meteorológiai Világszervezet által 1968. Január 1-jén bevezetett repülésmeteorológiai számkódokkal.	1967.06.13. 1968.01.01.
55.	Franciaország	A légijelentések változtatásának engedélyezése a föld-föld terjesztésük előtt	1968.12.16. 1969.04. 16. 1969.09.18.

56 (7. kiadás)	Hatodik Léginavigációs Konferencia	A következők bevezetése: területi előrejelző központok részletes leírása; meteorológiai szolgálatok egyszerűsített előírásai, amelyek a növekvő centralizációt tükrözik; a légijelentések tartalmának kiterjesztése rossz időjárási körülményekre, amelyekbe a légijármű a kezdeti emelkedés és a végső megközelítés során kerül; a légijármű általi jelentés inkább egy „adott ponton” uralkodó szélről, mint az „átlag” szélről; a turbulencia erősségéről repülés közben adandó jelentés kritériumainak pontosítása; a „légiforgalmi szolgálatok jelentő irodája” új definíciója és változtatás a „légiforgalmi szolgálati egység” meghatározásában; felfrissítés a Meteorológiai Világszervezet által 1969. Szeptember 18-án bevezetett repülésmeteorológiai kódokkal.	1970.05.15. 1970.09.15. 1971.02.04.

57	A Szuperszónikus Légiközlekedés Repülés Üzemelési Munkacsoport Második Ülése	A „SIGMET információ” meghatározásának módosítása, hogy az SST légijárművek üzemeltetési követelményeit figyelembe vegye; különleges megfigyelések végzésére és rögzítésére vonatkozó előírások bevezetése olyan esetekre, amikor transzonikus vagy szuperszonikus sebességű repülés során mérsékelt turbulencia, jégeső vagy cumulonimbus felhő tapasztalható.	1971.03.19. 1971.09.06. 1972.01.01
58.	Meteorológiai Világszervezet	Felfrissítés a Meteorológiai Világszervezet által 1972. Január 1-jén bevezetett repülésmeteorológiai kódokkal.	1971.03.19. 1972.01.06.
59	Hatodik Léginavigációs Konferencia	A meteorológiai szolgálatok között váltott légijelentések 1. Részéről a „következő helyzet és az odaérkezés ideje” elhagyásának engedélyezése: a légijelentés formátum mintájában és a megszokott adatokban bekövetkező változások bevezetése annak érdekében, hogy azt alkalmassá tegyék a számítógépbe való közvetlen bevitelre.	1972.03.24. 1972.07.24. 1972.12.07.

60. (8.kiadás)	Hatodik Léginavigációs Konferecia. Nyolcadik Léginavigációs Konferencia. Meteorológiai Részleg Ülése (1974)	A 3. Annex teljes átdolgozása, a PANS-MET beépítése, amelynek előírásait alkalmasnak találták a 3. Annexbe Szabványként és Ajánlott Eljárásként való beillesztésre; az átdolgozás figyelembe vette az elfogadott üzemeltetési követelményeket és azok kielégítésének korszerű módszereit; az üzemeltetők és a hajózószemélyzet tagjai részére adott szolgáltatások, a légiforgalmi szolgálatoknak és a kutató-mentő szolgálatoknak adott meteorológiai információkra vonatkozó új Szabványok és Ajánlott Eljárások bevezetése, beleértve a kommunikációra és azok felhasználására vonatkozó követelményeket is; a 3. Annex címe ennek megfelelően *Meteorológiai Szolgálat a Nemzetközi Repülés számára.*	1975.11.26. 1976.03.26. 1976.08.12.

61.	Kilencedik Léginavigációs Konferencia. Meteorológiai Részleg Ülés (1974))	Új előírások és fennálló rendelkezések módosításai a meteorológiai hivatalok/állomások és a légiforgalmi szolgálati egységek között meglévő koordináció és az utóbbi számára adott meteorológiai információkkal való ellátottság javítása érdekében; a 14. Annexnek a berendezések és épületek üzemelési területén való olyan elhelyezésére és építésére vonatkozó előírásaira utaló megjegyzés bevezetése, amelynél a légijárművek veszélyeztetettsége minimumra csökken; a „szuperszonikus szállító légijármű” kifejezés helyettesítése a „szuperszónikus légijármű” kifejezéssel; a 2. Függelék 2. Részének pontosítása; a „nefanalizis” definíciójának módosítása és a „(29.92 inch)” törlése a „repülési magasságszint” definíciójából; a D Melléklet - Repülésmeteorológiai Kódok rész törlése.	1977.12.14. 1978.04.14. 1978.08.10

62	Nyolcadik Léginavigációs Konferencia és az ICAO Tanács	Az 1. Függelékbe a Meteorológiai Világszervezet által a 3. Annexben szereplő üzemeltetési követelmények alapján kifejlesztett minta térképek és formanyomtatványok beiktatása; az adatjelölések és földrajzi jelzések átvitele a 3. Annex 2. Függelékéből a *Repülésmeteorológiai Eljárások Kézikönyvébe* (Doc 8896).	1978.06.26. 1978.10.26. 1979.11.29
63.	MET Részleg Ülés (1974). ICAO Titkárság Üzemi Repüléstájékoztató Szolgálati Panel. Kilencedik Léginavigációs Konferencia (Doc 9328)	Definíció a „meteorológiai bulletin"-re; a légijelentések föld-föld terjesztése hiányosságainak kijavítása; az „aktív zivatar területtel" foglalkozás csökkentése SIGMET közleményekben; a „jelentő vonalakra" való hivatkozás törlése; utalás új RVR Megfigyelési és Jelentési Eljárásaink Kézikönyvére.	1981.03.23. 1981.07.23. 1981.11.26
64	ICAO Titkárság	Új előírások és a meglévő módosítása, hogy megfeleljenek az alacsony szinti szélnyírás megfigyelésére és jelentésére vonatkozó üzemeltetési követelményeknek, beleértve a szélnyírásra való figyelmeztetést is, a repülés kezdeti emelkedési és a megközelítés fázisaiban.	1982.12.06. 1983.04.06. 1983.11.24.

65. (9. kiadás)	Távközlési/Meteorológiai Részleg Együttes Ülése (1982). ADAPT panel harmadik ülése	Új előírások és a régiek módosítása, amelyek az új világméretű területi előrejelző rendszer bevezetésére vonatkoznak; az üzemelési meteorológiai adatok cseréjének módszerei; az RVR becslési pontosságának javítása és az RVR jelentése	1983.06.10. 1984.10.10. 1984.11.22
66. (10. kiadás)	Távközlési/Meteorológiai Részlet Együttes Ülés (1982). Második Asia/Pacific Regionális léginavágiációsÜlés. Ez Európai Léginavigációs Tervezési Csoport Huszonkettedik és huszonharmadik ülése. Meteorológiai Világszervezet. Az ANC referencia dátum/idő módszere és a mértékegységekre vonatkozó javaslatai ICAO Titkárság	A következők módosítása: a szélnyírás információ repülőtéren kívülre való továbbítására vonatkozó előírás; a kiválasztott különleges jelentések kiadásának kritériumai, a felhő információ belefoglalása a repülőtéri előrejelzésekbe, rövidtávú-repülésekhez biztosítandó repülési dokumentáció a SIGMET közlemény és a meteorológiai bulletin fejrészének formátuma: a „SIGMET információ” definíciójának bevezetése; a 3. Annex és az 5. Annex egyeztetése a mértékegység és a referencia idő tekintetében.	1986.03.24. 1986.07.27. 1986.11.f20.

67	Távközlési/Meteorológiai Részleg Együttes Ülése (1982). Az Európai Léginavigációs Tervező Csoport 22. És 23. Ülése. ICAO Titkárság. Meteorológiai Világszervezet	A következőkre vonatkozó előírások módosítása: RVR mérésnél használt fényintenzitás beállítás; a kiválasztott repülőterek azonosítása és a WAFS térképeken a hőmérsékleti körök követelmény törlése; előrejelzések továbbítási ideje a regionális körzeti előrejelző központokból a felhasználókhoz; a vulkáni hamu figyelmeztetés eredetére és terjesztésére vonatkozó előírások bevezetése; a szélsebesség mértékegységeinek a repülésmeteorológiai számkódok példáiba való beillesztése, a 3. Annex és a PANS-RAC egyeztetése a légijelentések elemeinek tekintetében; a SIGMET közlemény példák szerkesztői módosítása	1987.03.27. 1987.07.27. 1987.11.19.

68.	Távközlési/Meteorológiai Részlet Együttes Ülése (1982). ICAO Titkárság Meteorológiai Világszervezet	Az RVR jelentés helyének azonosítására vonatkozó előírások módosítása; az RVR változásának kiválasztott különleges jelentésekben való közzétételének kritériumai; a repülőtéren túl szétosztandó jelentésekbe foglalandó földetérési zóna RVR értékek, amikor valamennyi futópálya használható leszállásra; repülőtéri dokumentációhoz minta térképek és formátumok; a vulkáni hamuval kapcsolatos SIGMET közlemény kiadása és módosítása, pontos előírások, hogy mikor szükséges a légiforgalmi tájékoztató szolgálati egységeket MET tájékoztatással ellátni; a légiforgalmi állandóhelyű távközlési hálózat és a légiforgalmi mozgószolgálat definíciók 10. Annex szerinti egységesítése, a terminológiai PANS-OPS II. kötet III. rész 6.3.1. pont szerinti egységesítése; a 3.3.7 pont szerkesztői módosítása az egyenértékű nyomásszint törlése; példa a SPECI jelentésre; a 8. Melléklet 3. Rész 1.4.b/ pontjának Hivatkozása; és a „C” melléklet lábjegyzete az RVR és a látástávolság vonatkozásában.	1989.03.21. 1989.07.23. 1989.11.16.

69. (11. kiadás)	Távközlési/Meteorológia/Üzemelések (COM/MET/OPS) Részleg Együttes Ülés (1990). ICAO Titkárság	A WAFS végső fázisára történő átmenettel kapcsolatos előírások módosítása; légiforgalmi meteorológiai kódok, útmutató anyag repülőtéri külön jelentések kritériumairól; légiforgalmi klimatológiai tájékoztatás; SIGMET információk és útmutató anyag SIGMET-ek kiadásához; automatikus időjárás észlelő állomások; meteorológiai információk helikopterek számára; valamint a 6. Annex I. és II. kötetének megfelelően, a kitérő repülőtér definíciója	1992.03.23. 1992.07.27. 1992.11.12. 1993.07.01.

70. (12. kiadás)	Kommunikációs/Meteorológiai/Üzemeltetési Részlet Együttes Ülése (1990). Korlátozott Észak-Atlanti (COM/MET/RAC) Regionális Léginavigációs Ülés (1992). Annex légiforgalmi szolgálatoknak (ATS) szóló meteorológiai információkkal foglalkozó előírásainak kijelölése; kritériumok módosítása, hogy a VOLMET és a D-VOLMET SIGMET-et és TAF-ot tartalmazzon ; a megfigyelés és mérés elérhető pontosságának törlése az A Mellékletből; a megkívánt pontosság frissítése a B Mellékletben; és szerkesztési módosítások.	

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT ELJÁRÁSOK

I. RÉSZ
SZABVÁNYOK ÉS AJÁNLOTT ELJÁRÁSOK TÖRZSANYAGA

1. FEJEZET. DEFINÍCIÓK

Megjegyzés. – Az (RR) jelölés ezekben a definíciókban olyan definíciót jelez, amelyet a Nemzetközi Távközlési Egyesület (ITU) Rádió Szabályzatokból vettünk (lásd Rádiófrekvencia Spektrum Előírások Kézikönyve Polgári Repülés részére, amely jóváhagyott ICAO álláspontokat tartalmaz *(Doc 9718)).*

1.1 Definíciók

Amikor a következő fogalmakat használják a Meteorológiai Szolgálat Nemzetközi Léginavigációhoz Szabványaiban és Ajánlott Eljárásaiban, ezek az alábbi jelentéssel bírnak:

Repülőtér (Aerodrome). Egy meghatározott terület földön vagy vízen (beleértve bármely épületet, építményt és berendezést), amely teljes egészében vagy részben a légijárművek érkezésére, indulására és földi mozgására szolgál.

Repülőtéri éghajlati összefoglaló (Aerodrome climatological summary). Meghatározott meteorológiai elemek tömör összefoglalása egy repülőtérre, statisztikai adatok alapján.

Repülőtéri éghajlati táblázat (Aerodrome climatological table). Olyan táblázat, amely statisztikai adatokat szolgáltat egy vagy több meteorológiai elem megfigyelt előfordulásáról egy adott repülőtéren.

Repülőtéri irányító torony (Aerodrome control tower). A repülőtéri forgalom számára légiforgalmi irányító szolgálat biztosítására létrehozott egység.

Repülőtér tengerszint feletti magassága (Aerodrome elevation). A leszálló terület legmagasabb pontjának tengerszint feletti magassága.

Repülőtéri meteorológiai iroda (Aerodrome meteorological office). A repülőtéren telepített, a nemzetközi repülés számára meteorológiai szolgálat nyújtására kijelölt hivatal.

Repülőtéri referencia pont (Aerodrome reference point). A repülőtér kijelölt földrajzi pontja.

Repülési állandóhelyű szolgálat (Aeronautical fixed service (AFS)). Meghatározott rögzített pontok közötti távközlési szolgálat, amely elsősorban a repülés biztonságát, valamint a légiszolgálatok rendszeres, hatékony és gazdaságos működését szolgálja.

Repülési állandóhelyű távközlési hálózat (Aeronautical fixed telecommunication network (AFTN)). A légiforgalmi állandóhelyű körök világméretű rendszere, amely a repülési állandóhelyű szolgálat részeként az ugyanolyan, vagy kompatíbilis távközlési jellemzőkkel rendelkező repülési állandóhelyű állomások közötti közlemények és/vagy digitális adatok cseréjére szolgál.

Repülésmeteorológiai állomás (Aeronautical meteorological station). A nemzetközi léginavigációban való felhasználásra szolgáló megfigyelések és meteorológiai jelentések készítésére kijelölt állomás.

Repülési mobil szolgáltatás (RR S1.32) (Aeronautical mobile service). Mobil szolgálat repülési állomások és légijármű állomások között, vagy légijármű állomások között, amelyben életmentő állomások is szerepelhetnek; vészhelyzeti helyzetjelző rádió jeladók is részt vehetnek ebben a szolgáltatásban, kijelölt katasztrófa- és vészhelyzeti frekvenciákon.

Repülési távközlési állomás (Aeronautical telecommunication station). A légiforgalmi távközlési szolgálat állomása.

Légijármű (Aircraft). Bármely gép, amely az atmoszférában képes támaszt leszármaztatni a levegő olyan reakcióiból, amelyeket a levegőből nem a földfelszín vált ki.

Légijárműves megfigyelés (Aircraft observation). Repülést végző légijárműtől származó, egy vagy több meteorológiai elem értékelése.

AIRMET információ (AIRMET information). Meteorológiai figyelő iroda által kiadott tájékoztatás, amely meghatározott útvonali időjárás jelenségek előfordulásával vagy várható előfordulásával foglalko-

zik, amely jelenségek befolyásolhatják a kismagasságú légijármű üzemelések biztonságát, és amely tájékoztatás már nem szerepelt a kismagasságú repülések részére kiadott előrejelzésben az illetékes repülési információs körzetben vagy ennek alkörzetében.
Légijelentés (Air-report). Légijárműről repülés közben adott jelentés, amelyet a helyzet, üzemeltetési és/vagy meteorológiai jelentésre vonatkozó előírásoknak megfelelően készítettek.
Megjegyzés. — Az AIREP formanyomtatványra vonatkozó részleteket a PANS-ATM (Doc 4444) tartalmaz.
Légiforgalmi szolgáltató egység (Air traffic service unit). Gyűjtőnévi kifejezés, amely váltakozva jelenthet légiforgalmi irányító egységet, repülésinformációs központot vagy légiforgalmi szolgálathoz tartozó jelentő irodát.
Kitérő repülőtér (Alternate aerodorome). Az a repülőtér, ahová a légijármű repülhet, ha a rendeltetési repülőtérre történő repülés, vagy az ott történő leszállás nem lehetséges, vagy nem tanácsos. A kitérő repülőterek fajtái az alábbiak:
Felszállási kitérő repülőtér (Departure alternate). Az a kitérő repülőtér, ahol egy légijármű leszállhat, ha ez a felszállást követő rövid időn belül szükségessé válik és az indulási repülőtér erre nem használható.
*Útvonali kitérő repülőtér (En-route alternate)***.** Az a kitérő repülőtér, ahol egy útvonalrepülés során rendellenes, vagy vészhelyzeti állapot észlelése után a légijármű leszállni képes.
ETOPS útvonali kitérő repülőtér (ETOPS en-route alternate). Alkalmas és megfelelő kitérő repülőtér, ahol ETOPS útvonal repülés során hajtóműleállás vagy egyéb rendellenes vagy vészhelyzeti állapot észlelése után a repülőgép leszállni képes.
Rendeltetési kitérő repülőtér (Destination alternate). Az a kitérő repülőtér, ahová egy légijármű repülhet, ha a szándékolt repülőtéren a leszállás lehetetlenné, vagy nem tanácsolttá válik.
Megjegyzés. — Az a repülőtér, amelyről a repülés elindult, e repülés számára útvonali vagy rendeltetési kitérő repülőtér is lehet.
Közepes tengerszint feletti magasság (Altitude). Egy szint, egy pont vagy egy pontnak tekintett tárgy közepes tengerszinttől (MSL) mért függőleges távolsága.
Bevezető irányítási egység (Approach control unit). Egy vagy több repülőtérre érkező vagy azokról induló irányított repülések részére légiforgalmi irányítás szolgáltatására létesített egység.
Illetékes ATS hatóság (Appropriate ATS authority). Egy állam által kijelölt illetékes hatóság, amely felelős az érintett légtérben a légiforgalmi szolgálatok ellátásáért.
Körzeti irányító központ (Area control centre). Az irányított repülések számára, az illetékessége alá tartozó irányítás körzetekben légiforgalmi irányító szolgálat ellátására létesített egység.
Automatikus függő légtérellenőrzés (ADS) (Automatic dependent surveillance(ADS))
Légtérellenőrzési eljárás, amelynél a légijárművek automatikusan, egy adatkapcsolaton keresztül fedélzeti navigációs és helyzetrögzítő rendszerekből származtatott adatokat, közöttük légijármű azonosítási, négydimenziós helyzet és szükség szerinti kiegészítő adatokat szolgáltatnak.
Eligazítás (Briefing). Szóbeli ismertetés fennálló és/vagy várható meteorológiai viszonyokról.
Üzemelési jelentőségű felhő (Cloud of operational significance). Felhő 1500 m (5000 láb) vagy a legmagasabb minimális szektormagasság, amelyik a nagyobb, alatti felhőalap magassággal, vagy comolonimbus felhő, vagy tornyosuló gomolyfelhő bármely magaságon.
Konzultáció (Consultation). A meteorológussal vagy más képesített személlyel a légi üzemeltetésre vonatkozó fennálló és/vagy várható meteorológiai viszonyokról folytatott megbeszélés; a kérdésekre adott válaszokat is magában foglalja.
Irányítási terület (Control area). A földfelszín felett meghatározott határtól felfelé terjedő ellenőrzött légtér.
Utazómagasság (Crusing level). A repülés jelentős szakaszán tartott repülési magasság.
Tengerszint feletti magasság (Elevation). Egy földfelszínen lévő, vagy ahhoz rögzített pontnak vagy szintnek a közepes tengerszinttől mért függőleges távolsága.
Kiterjesztett hatótávolságú üzemelés (Extended range operation). Két-gázturbinás-hajtóműves repülőgép olyan repülése, ahol a repülési idő az egyik hajtómű működőképtelensége esetéhez tartozó utazási repülési sebességnél (Nemzetközi Normál Atmoszféra és szélcsend körülményei között) az útvonal egy

pontjától egy alkalmas kitérő repülőtérig nagyobb, mint az Üzemeltető Állam által jóváhagyott küszöbidő.
Hajózószemélyzet tagja (Flight crew member). Szakszolgálati engedéllyel rendelkező személyzeti tag, aki olyan szolgálati feladatokkal van megbízva, amelyek a repülés ideje alatt fontosak a légijármű üzemeltetése szempontjából.
Repülési dokumentáció (Flight documentation). Kézírásos vagy nyomtatott okmányok, közöttük a repüléshez meteorológiai információkat tartalmazó térképek és nyomtatványok.
Repülési információs központ (Flight information centre). Repülési információs és riasztó szolgálat ellátására létesített egység.
Repülési információs régió (Flight information region). Meghatározott méretű légtér, amelyen belül repülési információs szolgálatot és riasztó szolgálatot biztosítanak.
Repülési magasságszint (Flight level). Egy állandó légköri nyomású felület, amely egy speciális 1013.2 hektopascal (hPa) nyomásértékhez tartozik, és amelyet más ilyen felületektől meghatározott nyomásintervallumok választanak el.
1. Megjegyzés Egy nyomás típusú , a Nemzetközi Normál Atmoszférával összhangban kalibrált magasságmérő:
a) amikor QNH magasságmérő beállításhoz állítják be, tengerszint feletti magasságot mutat;
b) amikor QFE magasságmérő beállításhoz állítják be, a QFE referencia érték feletti magasságot mutat; és
c) amikor 1013,2 hektopascal (hPa) nyomásra állítják be, akkor repülési magasságszintek jelzésére lehet használni.
2. Megjegyzés — A „height" (magasság) és „altitude" (tengerszint feletti magasság), amelyeket a fenti 1. Megjegyzésben használtunk, inkább altimetrikus, mint geometriai magasságokat és tengerszint feletti magasságokat jelölnek.
Előrejelzés (Forecast). Egy meghatározott időpontban vagy időszakban és a légtér egy meghatározott területén vagy részén várható meteorológiai viszonyokra vonatkozó közlés.
GAMET körzeti előrejelzés (GAMET area forecast) Körzeti előrejelzés rövidített köznyelven kismagasságú repüléseknél egy repülési információs körzet vagy alterület számára, amelyet az illetékes meteorológiai hatóság által kijelölt meteorológiai iroda készít, és amelyet a szomszédos repülési információs körzetekben működő meteorológiai irodával kicserélnek. az illetékes meteorológiai hatóságok közötti megállapodás szerint.
Rácspont adatok digitális formában (Grid point data in digital form). Egy térképen szabályos távolságokban elhelyezkedő pontok halmazára vonatkozó, számítógéppel feldolgozott meteorológiai adatok egy meteorológiai számítógépből másik számítógépbe való továbbítására, automatikus felhasználásra alkalmas kód formában.
Megjegyzés — Legtöbb esetben az ilyen adatokat közepes vagy nagysebességű távközlési csatornákon továbbítják.
Magasság - (Height) Egy szintnek, egy pontnak vagy egy pontnak tekintett tárgynak meghatározott vonatkozási alaptól mért függőleges távolsága.
Emberi Tényező alapelvek (Human Factors principles). Olyan alapelvek, amelyeket repülési tervezéshez, alkalmasság tanúsításhoz, képzéshez, üzemeltetéshez és karbantartáshoz alkalmaznak, és amelyek biztonságos kapcsolódást keresnek az emberi és más rendszer komponensek között az emberi teljesítőképesség helyes értékelésével.
Nemzetközi légiútvonali vulkán figyelés (International airways volcano watch) (IAVW) Nemzetközi egyezmények az atmoszférában lévő vulkánikus hamu figyeléséről és a légijárművek erre való figyelmeztetéséről.
Megjegyzés. – A IAVW repülési és nem-repülési operatív egységek együttműködésén alapszik, felhasználva az Államok által biztosított megfigyelő forrásokból és hálózatokból származtatott információkat. A figyelést az ICAO, más érdekelt nemzetközi szervezetekkel együttműködve, koordinálja.
Szint (Level) Repülést végző légijármű függőleges helyzetére vonatkozó gyűjtőnévi fogalom, amely váltakozva jelent magasságot, közepes tengerszint feletti magasságot vagy repülési magasságszintet.

Meteorológiai hatóság (Meteorological authority). A Szerződő Állam nevében a nemzetközi repülés részére meteorológiai szolgáltatást nyújtó vagy e szolgáltatás nyújtását elrendelő hatóság.
Meteorológiai bulletin (Meteorological bulletin). Meteorológiai információkat tartalmazó szöveg, amelyet egy megfelelő fejrész előz meg.
Meteorológiai információ (Meteorological information). Meteorológiai jelentés, analízis, előrejelzés és bármilyen egyéb, a fennálló vagy várható meteorológiai viszonyokra vonatkozó közlemény.
Meteorológiai iroda (Meteorological office). A nemzetközi léginavigáció számára meteorológiai szolgáltatásra kijelölt iroda.
Meteorológiai jelentés (Meteorological report). Egy meghatározott időre és helyre vonatkozó, megfigyelt meteorológiai viszonyok közlése.
Meteorológiai mesterséges hold (Meteorological satellite). Föld körül keringő mesterséges hold, amely meteorológiai megfigyeléseket végez és ezeket a földre továbbítja.
Minimális szektor tengerszint feletti magasság (Minimum sector altitude). Az alkalmazható legkisebb tengerszint feletti magasság, amely minimum 3OO m (1000 láb) akadálymentes magasságot szolgáltat egy navigációs rádióberendezés középpontú, 46 km (25 tengeri mérföld) sugarú kör szektoron belüli területen elhelyezkedő összes akadály felett.
Megfigyelés (meteorológiai) (Observation (meteorological)). Egy vagy több meteorológiai elem értékelése.
Üzemelés ellenőrzés (Operational control). Felügyelet gyakorlása egy repülés indítása, folytatása, elterelése vagy befejezése felett a légijármű biztonsága és a repülés rendszeressége és hatékonysága érdekében.
Üzemeltetési repülési terv (Operational flight plan). Az üzemeltető a repülés biztonságos végrehajtására vonatkozó terve a repülőgép teljesítménye, más üzemeltetési korlátok, valamint a lerepülendő légiútvonalon és a repülőtereken várható viszonyokra vonatkozó megfontolások alapján.
Üzemeltetési tervezés (Operational planning). A repülés üzemeltetés üzemeltető általi tervezése.
Üzemeltető (Operator). Személy, szervezet, vagy vállalat, amely légijárműveket üzemeltet, vagy arra ajánlatot tesz.
Légijármű parancsnok (Pilot-in-command). Az üzemeltető, vagy általános célú repülés esetén a tulajdonos, által parancsnokként a légijármű üzemeltetéséért és a repülés biztonságos végrehajtásáért felelősként kijelölt légijárművezető.
Dominens látás (Prevailing visibility). A körhorizontnak legalább a felén belül, vagy a repülőtéri felületnek legalább a felén belül a „látás" definíciójának megfelelően észlelt legnagyobb látási érték. Ezek a területek szomszédos és nem szomszédos szektorokat tartalmazhatnak.
Megjegyzés. – Ezt az értéket emberi megfigyeléssel és/vagy műszerezett rendszerekkel lehet meghatározni. Amikor műszereket szerelnek fel, azokat a dominens látás legjobb meghatározásának nyerésére használják.
Előrejelzési térkép ((Prognostic chart). Meghatározott meteorológiai elem(ek) előrejelzése egy meghatározott időpontra vagy időszakra, és egy meghatározott felületre vagy légtér részre, grafikusan ábrázolva egy térképen.
Minőségbiztosítás (Quality assurance**).** A minőségi rendszeren belül megvalósított, és szükség esetén demonstrált összes tervezett és rendszeres tevékenység, amely arra irányul, hogy bizonyosságot szolgáltasson arról, hogy egy entitás teljesíti a minőségi követelményeket (ISO 9000:2000[1]*)
Minőségellenőrzés (Quality control) Üzemelési eljárások és tevékenységek, amelyeket a minőségi követelmények kielégítésére használnak (ISO9000:2000[2]*)
Minőség menedzsment (Quality management**)** Az átfogó menedzsment funkcióhoz tartozó összes tevékenység, amely meghatározza a minőségpolitikát, a célokat és felelősségi köröket és azok megvalósítását olyan eszközökkel, mint például a minőség rendszeren belüli minőségtervezés, minőségellenőrzés, minőségbiztosítás és minőségjavítás (ISO9000:2000[3]*).
Minőség rendszer (Quality system**)** A minőség menedzsment megvalósításához szükséges szervezeti struktúra, eljárások, folyamatok és források (ISO 9000:2000[4]*)
Regionális léginavigációs egyezmény (Regional air navigation agreement). Az ICAO Tanács által jó-

váhagyott megegyezés, általában egy regionális léginavigációs értekezlet tanácsára.
körzetén belül lévő repülőterekről induló légijárművek számára és rácspont adatokat szolgáltasson digitális formában a világméretű fedéshez.
Jelentőpont (Reporting point). Egy meghatározott földrajzi hely, amelyhez viszonyítva egy légijármű helyzetét jelenteni lehet.
Mentés koordináló központ (Rescue coordinating centre). Egy kutató és mentő körzeten belül a kutatási és mentési szolgáltatás hatékony megszervezésének elősegítéséért és a kutatási és mentési műveletek végrehajtásának koordinálásáért felelős egység.
Futópálya (Runway). Szárazföldi repülőtéren a légijárművek le- és felszállására készített téglalap alakú terület.
Futópálya látástávolság (Runway visual range (RVR)). Az a távolság, amelyről a futópálya középvonalán lévő légijármű vezetője a futópálya felületi jelzéseit, vagy a futópálya szegélyfényeit, illetve a középvonalat jelző fényeket felismeri.
Kutató és mentő szolgálati egység (Search and rescue service unit). Gyűjtőnévi kifejezés, amely jelenthet mentést koordináló központot, mentő alközpontot, vagy riasztó őrhelyet.
Szolgálati terület (világterületi előrejelző rendszer). (Service area (world area forecast system)). Egy földrajzi terület, amelyen belül egy regionális területi előrejelző központ felelősséggel tartozik területi előrejelzések biztosításáért a meteorológiai hatóságok és más felhasználók részére.
SIGMET információ (SIGMET information). Meteorológiai figyelőiroda által kiadott, az útvonalon a légijárművek üzemeltetésének biztonságát befolyásolható, meghatározott időjárási jelenségek előfordulásáról, vagy várható előfordulásáról szóló információk.
Szabvány izobár felület (Standard isobaric surface). Izobár felület, amelyet világméretű alapon a légköri viszonyok reprezentálására és elemzésére használnak.
Küszöb (Threshold). A futópálya leszállásra használható részének kezdete.
Földetérési zóna (Touchdown zone). A futópálya küszöbén túli rész, ahol a leszállni szándékozó légijárművek először érintik a futópályát.
Trópusi ciklon (Tropical cyclone). Trópusi vagy szubtrópusi vizek felett keletkező, szervezett konvekcióval és határozott ciklonikus felületi szél cirkulációval rendelkező gyűjtőnévi fogalom.
Trópusi ciklon tájékoztató központ (Tropical cyclone advisory centre (TCAC)) Regionális léginavigációs egyezmény által meteorológiai figyelő irodák, világterületi előrejelző központok és nemzetközi OPMET adatbankok részére a trópusi ciklonok helyzetére, előrejelzett mozgásirányára és sebességére, központi nyomására és maximális talajszelére vonatkozó tanácsadó információk szolgáltatására kijelölt meteorológia központ.
Magaslégköri térkép (Upper-air-chart). Az atmoszféra meghatározott felső légköri szintjére vagy rétegére vonatkozó meteorológiai térkép.
Látás (Visibility) A repülési célokra szolgáló látás az alábbiak közül a nagyobbik:
a) az a legnagyobb távolság, amelynél megfelelő méretű, a föld közelében elhelyezett fekete tárgy látható és felismerhető, amikor fényes háttérrel szemben figyelik;
b) az a legnagyobb távolság, amelynél körülbelül 1000 gyertyás fények láthatóak és felismerhetőek kivilágítatlan háttérrel szemben.
Megjegyzés. – A két távolságnak, adott kioltási tényezőjű levegőben, különböző értékei vannak, és az utóbbi b) a háttér megvilágítással változik. Az előbbi a)-t a meteorológiai optikai távolság reprezentálja (MOR).
Vulkanikus hamu tájékoztató központ (Volcanic ash advisori centre (VAAC)). Regionális léginavigációs egyezmény által meteorológiai megfigyelő irodák, körzeti irányító központok, repülési információs központok, világterületi előrejelző központok és nemzetközi OPMET adatbankok részére a vulkánkitőrést követően a vulkanikus hamunak az atmoszférában való lateriális és függőleges kiterjedésére, előrejelzett mozgására tanácsadó információkat szolgáltató meteorológiai központ.
VOLMET. (VOLMET) Meteorológiai információ repülést végző légijármű részére.
Adatkapcsolati VOLMET (D-VOLMET) (Data link VOLMET (D-VOLMET)) Aktuális rendszeres repülőtéri időjárás jelentések, (METAR) és repülőtéri különleges meteorológiai jelentések (SPECI) repülőtéri

előrejelzések (TAF), SIGMET, SIGMET által nem lefedett különleges légijelentések és, ahol rendelkezésre áll, AIRMET közlemények szolgáltatása adatkapcsolaton keresztül.
VOLMET adás (VOLMET broadcast). Folytonos és ismétlődő rádióadások útján, ahogyan megfelelő, aktuális METAR, SPECI, TAF és SIGMET előrejelzések és SIGMET közlemények szolgáltatása.
Világterületi előrejelző központ (World area forecast centre(WAFC)). Egy meteorológiai központ, amelyet arra jelöltek ki, hogy szignifikáns időjárás előrejelzéseket és magaslégköri előrejelzéseket készítsen és biztosítson digitális és/vagy képi formában, az egész világra kiterjedően, a regionális területi előrejelző központok és közvetlenül az Államok részére, megfelelő eszközökkel, mint a repülési helyhez kötött szolgálat része.
Világterületi előrejelző rendszer) (World area forecast system (WAFS)). Egy világméretű rendszer, amelynek segítségével a világ- és regionális körzeti előrejelző központok légiforgalmi meteorológiai útvonal előrejelzéseket biztosítanak egységesített formában.

1.2 Korlátozott jelentéssel használt fogalmak

Ezen Annex céljára a következő kifejezések korlátozott jelentéssel rendelkeznek, az alábbiak szerint:

a) a „szolgálat" (service) szó körüli félreértések elkerülése érdekében a meteorológiai szolgálat, mint adminisztratív egység és az általa nyújtott szolgáltatás megkülönböztetésére „meteorológiai hatóságnak" nevezzük az előbbit és „szolgáltatásnak" az utóbbit;

b) „szolgáltatni" kizárólag szolgáltatással kapcsolatosan használatos;

c) „kiadni" kizárólag azokkal az esetekkel kapcsolatosan használatos, amikor a kötelezettség kifejezetten információknak egy felhasználóhoz való megküldésére terjed ki;

d) „hozzáférhetővé tesz" csak akkor használatos, ha a kötelezettség akkor fejeződik be, amikor az információt egy felhasználó számára hozzáférhetővé tették;

e) „rendelkezésre bocsát" kifejezés csak a c) vagy d) esetekkel kapcsolatban használatos.

2. FEJEZET – ÁLTALÁNOS ELŐÍRÁSOK

1. Bevezető Megjegyzés – Ismeretes, hogy ennek az Annex-nek a meteorológiai információkra vonatkozó rendelkezései annak megértésén alapulnak, hogy a Szerződő Állam kötelessége, az Egyezmény 28. Cikkelye alapján, meteorológiai információk szolgáltatása, és hogy az ilyen információk alkalmazásáért a felhasználó felelős.

2. Bevezető Megjegyzés.– Bár a Nemzetközi Polgári Repülési Egyezmény a lajstromozó államra bizonyos teendőket jelöl ki, amelyeket az állam jogosult vagy köteles végrehajtani, a közgyűlés elismerte az A23-13 sz. Határozatban, hogy a Lajstromozó Állam esetleg képtelen megfelelően teljesíteni kötelezettségeit olyan esetekben, ha a légijárművet egy másik Állam üzemeltetője haszonbérbe veszi, kibérli vagy elcseréli – különösen , ha személyzet nélküli – és, hogy az Egyezmény nem határozhatja meg pontosan az üzemeltető államának jogait és kötelezettségeit ilyen esetekben, amíg az Egyezmény 83. bis Cikkelye életbe nem lép. Ennek megfelelően a Tanács sürgette, hogy ha a fent említett esetben a Lajstromozó Állam képtelennek érezné magát az Egyezmény által ráosztott tevékenység megfelelő végrehajtására, akkor ruházza át azokat a feladatokat az üzemeltető államra, annak hozzájárulásával, amelyeket az jobban el tud látni. Nyilvánvaló, hogy amíg az Egyezmény 83. bis cikkelye életbe lép, az előbb említett intézkedés csupán gyakorlati megegyezés kérdése, és nem befolyásolja a Chicagói Egyezmény rendelkezéseit, amelyek a lajstromozó állam, illetve bármely harmadik állam kötelezettségeit előírja. Azonban, mivel az Egyezmény 83 bis cikkelye 1997. június 20-án életbelépett, ilyen átruházási egyezmények azokra a Szerződő Államokra bírnak érvénnyel, amelyek a vonatkozó Jegyzőkönyvet (Doc 9318) a 83 bis Cikkelyben megállapított feltételek kielégítéséről ratifikálták.

3. Bevezető Megjegyzés. – Nemzetközi üzemelés esetén, amelyet közösen olyan repülőgépekkel végeznek, amelyek nem mindegyike ugyanazon Szerződő Államban van lajstromozva, semmi nincs ebben az Annexben, ami megakadályozná az illető Államokat abban, hogy egyezményt kössenek azon funkciók közös gyakorlására, amelyeket ennek az Annexnek az előírásai a Lajstromozó Államra vonatkozóan lefektetnek.

2.1 A meteorológiai szolgálat célja, meghatározása és a rá vonatkozó előírás

2.1.1 A nemzetközi léginavigáció részére nyújtott meteorológiai szolgáltatás célja hozzájárulni a nemzetközi léginavigáció biztonságához, rendszerességéhez és hatékonyságához.
2.1.2 Ezt a célt úgy kell elérni, hogy az üzemeltetőnek, a hajózószemélyzet tagjainak, a légiforgalmi szolgálati egységeknek, kutató és mentőszolgálati egységeknek, repülőtéri igazgatóságoknak és más olyan szervezeteknek, amelyek a nemzetközi légiközlekedés fejlesztésében érdekeltek, biztosítják a saját feladataik ellátásához szükséges meteorológiai információkat.
2.1.3 Minden Szerződő Államnak meg kell határoznia azt a meteorológiai szolgáltatást, amelyet nyújtani fog a nemzetközi léginavigáció igényeinek kielégítésére. Ezt a jelen Annex rendelkezéseinek megfelelően kell végrehajtani, tekintettel a regionális léginavigációs egyezményekre is; ennek tartalmazni kell a nemzetközi vizek és az illető állam területén kívül fekvő területek fölötti léginavigáció számára nyújtott meteorológiai szolgáltatás meghatározását is.
2.1.4 Minden Szerződő Állam jelölje ki a hatóságát, a továbbiakban: meteorológiai hatóság, amely a Szerződő Állam képviseletében ellátja vagy megszervezi a nemzetközi légiközlekedés részére a meteorológiai szolgáltatást. Az így kijelölt meteorológiai hatóságra vonatkozó részleteket az Állam repülési információs kiadványnak kell tartalmaznia a 15. Annex, 1. Függelék, GEN 1.1.
2.1.5 Minden Szerződő Államnak biztosítania kell, hogy a kijelölt meteorológiai hatóság kielégítse a Meteorológiai Világszervezetnek a nemzetközi léginavigáció kiszolgálását végző meteorológiai személyzet képesítésére és szakképzésére vonatkozó követelményeit.
Megjegyzés. – A repülésmeteorológiában alkalmazott meteorológiai személyzet képesítésére és szakképzésére vonatkozó követelmények a WMO 49 sz. kiadványában, Technical Regulations, *Volume I –* General Meteorological Standards and Recommended Practises, *Chapter B.4 (*Műszaki Szabályozások, *I. Kötet –* Általános Meteorológiai Szabványok és Ajánlott Eljárások, *B.4 fejezet – Oktatás és képzés) találhatók*

2.2 Meteorológiai információk szolgáltatása, minőségbiztosítása és felhasználása

2.2.1 Szoros kapcsolatot kell tartani a nemzetközi léginavigáció meteorológiai szolgáltatásait érintő kérdésekre vonatkozó meteorológiai információk szolgáltatásában érdekeltek és a felhasználásában érdekeltek között.
2.2.2 **Ajánlás.** – *Hogy megvalósítsák a nemzetközi léginavigáció meteorológiai szolgálatának célját, a Szerződő Államoknak biztosítaniuk kell, hogy a 2.1.4 pontban hivatkozott kijelölt meteorológiai hatóság létrehozzon és megvalósítson egy jól szervezett minőségi rendszert, amely magában foglalja a 2.1.2 pontban felsorolt felhasználóknak szolgáltatott meteorológiai információk minőség menedzseléséhez szükséges eljárásokat, folyamatokat és forrásokat.*
2.2.3 **Ajánlás.** – *A 2.2.2 pontnak megfelelően létrehozott minőségi rendszer legyen konform a minőségbiztosítási szabványok Nemzetközi Szabványügyi Szervezet (ISO) 9000-es sorozatával, és erről egy megfelelő szervezet által kiadott igazolással rendelkezzen.*
Megjegyzés. – A minőségbiztosítási szabványok Nemzetközi Szabványügyi Szervezet (ISO) 9000-es sorozata alapkeretet szolgáltat egy minőségbiztosítási program kidolgozásához. Egy sikeres program részleteit minden Államnak meg kell fogalmaznia, és a legtöbb esetben ezek az Állam szervezeti sajátjai.
2.2.4 **Ajánlás.** – *A minőségi rendszernek biztosítékot kell nyújtania a felhasználóknak arra vonatkozóan, hogy a szolgáltatott információk kielégítik a megállapított követelményeket a földrajzi és térbeli lefedés, a forma és tartalom, a kiadás időpontja és gyakorisága és az érvényességi időszak, valamint a mérések, megfigyelések és előrejelzések pontossága tekintetében. Amennyiben a minőségi rendszer jelzi, hogy a felhasználók részére szolgáltatott információk nem felelnek meg a megállapított követelményeknek, és az automatikus hibakorrigáló eljárások nem alkalmazhatók, ezeket az információkat nem szabad a felhasználókhoz eljuttatni, hacsak az információ létrehozója ezeket nem érvényesíti.*
Megjegyzés. – A repülési felhasználók részére szolgáltatott meteorológiai információk földrajzi és térbeli lefedésre, tartalmára és formájára, a kiadás időpontjára és gyakoriságára és érvényességi időtartamára vonatkozó követelmények ennek az Annexnek a 3. 4., 6., 7., 8.,9. és 10. Fejezetében és a 2.,3.,5.,.6,.7.,8. és 9. Függelékeiben, és a megfelelő regionális léginavigációs tervekben vannak megadva. A mérési és megfigyelési pontossággal, és az előrejelzések pontosságával foglalkozó útmutató jelen Annex A és B Mellék-

letében található.

2.2.5 **Ajánlás.** *– Üzemelési célú meteorológiai információk cseréjére vonatkozóan a minőségi rendszer tartalmazzon igazolási és érvényesítési eljárásokat és forrásokat az egyedi üzenetek, és/vagy bulletinek, melyeknek cseréjét megkövetelik, előírt továbbítási üteme és a továbbítás időpontjai betartásának figyelésére. A minőségi rendszernek képesnek kell lenni a közlemények és bulletinek túlságosan hosszú továbbítási idejének észlelésére.*

Megjegyzés. – Üzemelési meteorológiai információk cseréjére vonatkozó előírások jelen Annex 11. Fejezetében és 10. Függelékében találhatók

2.2.6 **Ajánlás.** *– Az alkalmazott minőségi rendszer megfelelősségének demonstrálását ellenőrző vizsgálattal lehet végezni. Ha a rendszer konformitásának hiányát észlelik, az okot meg kell határozni, és meg kell szüntetni. Minden ellenőrző vizsgálatot tanúsítani és megfelelően dokumentálni kell.*

2.2.7 A 2.1.2 pontban felsorolt felhasználóknak szolgáltatott meteorológiai információknak konzisztenseknek kell lenniük az Emberi Tényező alapelvekkel, és olyan formájúaknak kell lenniük, hogy ezektől a felhasználóktól csak minimális értelmezési munkát igényeljenek, ahogyan az a következő fejezetekben le van írva.

Megjegyzés. – Útmutató anyag az Emberi Tényező alapelveiről az Emberi Tényező Oktatási Kézikönyvben (Human Factors Trainig Manual) *(Doc 9683) található.*

2.3 Az üzemeltetőktől megkövetelt értesítések

2.3.1 Az az üzemeltető, amely a meteorológiai szolgáltatást vagy a fennálló meteorológiai szolgáltatás megváltoztatását kívánja, elegendő idővel előre értesítse a meteorológiai hatóságot, vagy az illetékes meteorológiai irodát (irodákat). Az előzetes értesítés minimális terjedelme és minimális előretartási ideje a meteorológiai hatóság, vagy a meteorológiai iroda (irodák) és az üzemeltető közötti megállapodásnak megfelelő legyen.

2.3.2 A szolgáltatást kérő üzemeltetőnek értesítenie kell a meteorológiai hatóságot, ha:

a) új útvonalakat vagy új típusú üzemeltetést tervez;

b) tartós jellegű változtatásokat kíván végrehajtani a menetrendszerű járatokban;

c) egyéb olyan változtatásokat tervez, amelyek befolyásolják a meteorológiai szolgáltatás nyújtását.

Az ilyen információnak tartalmaznia kell az összes részletet, amelyek a meteorológiai hatóság részére szükségesek a megfelelő intézkedések tervezéséhez.

2.3.3 Az üzemeltető vagy a hajózószemélyzet tagja értesítse a repülőtéri vagy az illetékes meteorológiai irodát:

a) a repülési menetrendről;

b) amikor nem-menetrendszerű járatokat kívánnak üzemeltetni

c) ha a járatok késnek, korábban indulnak, vagy törölték őket.

2.3.4 **Ajánlás.** *– A repülőtéri, vagy az illetékes meteorológiai iroda számára az egyes járatokról adandó értesítésnek az alábbi információkat kell tartalmaznia, kivéve, ha a menetrendszerű járatok esetében ezeket az információkat, vagy azok egy részét a meteorológiai iroda és az üzemeltető közötti megállapodás alapján nem szükségesek:*

a) indulási repülőtér és a tervezett indulási idő;

b) rendeltetési hely és az érkezés tervezett időpontja;

c) repülendő útvonal és a közbenső repülőtérre (repülőterekre) való érkezés, illetve onnan való indulás becsült időpontja;

d) a repülés végrehajtási terv elkészítéséhez szükséges és a regionális léginavigációs tervezet megfelelő jegyzékében szereplők közül kiválasztott kitérő repülőterek;

e) utazómagasság;

f) a repülés típusa, hogy azt látás szerinti repülési-, vagy műszer szerinti repülési szabályok szerint hajtják végre;

g) a hajózószemélyzeti tag részére kért meteorológiai információ típusa: időjárási repülési dokumentáció és/vagy eligazítás vagy konzultáció; és *h) időpont(ok), amelyekre az eligazítás, konzultáció és/vagy repülési dokumentáció szükséges.*

3. FEJEZET – VILÁG TERÜLETI ELŐREJELZŐ RENDSZER ÉS METEOROLÓGIAI IRODÁK

Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat a 2. Függelék tartalmazza.

3.1 A világ területi előrejelző rendszer feladata

A világ területi előrejelző rendszer feladata ellátni a meteorológiai hatóságokat és más felhasználókat digitális formában globális magassági szél, magaslégköri hőmérséklet és nedvesség; maximális szélirány, sebesség és magasság, tropopauza magasság és hőmérséklet előrejelzésekkel; valamint a szignifikáns időjárás jelenségek előrejelzéseivel. Ezt a feladatot átfogó, integrált, világméretű és, amennyire megvalósítható, egységes rendszerrel és költséghatékony módon, a fejlődő technológia összes előnyének kihasználásával kell megvalósítani.

3.2 Világ területi előrejelző központok

3.2.1 Egy Szerződő Állam, amely magára vállalta egy világ területi előrejelző központ (WAFC) felállításának felelősségét a világ területi előrejelző rendszer keretében, a következőket rendelje el az adott központ számára:

a) globális előrejelzések készítése rácspont adatokhoz az összes előírt, alább felsorolt globális előrejelzés szintre:

1) magassági szél;
2) magaslégköri hőmérséklet és nedvesség;
3) a repülési magasságszintek geopotenciális tengerszint feletti magassága;
4) a tropopauza repülési magasságszintje és hőmérséklete; és
5) a maximális szél iránya, sebessége és repülési magasságszintje;

b) szignifikáns időjárási (SIGWX) jelenségek globális előrejelzéseinek készítése;

c) az a) és b) alpontok szerinti előrejelzések kiadása digitális formában a meteorológiai hatóságok és más felhasználók részére, ahogyan a Szerződő Állam a meteorológiai hatóság tanácsára jóváhagyta;

d) radioaktív anyagok véletlen atmoszférába jutásáról szóló információk fogadása a hozzátartozó WMO regionális, a radiológiai környezeti vészhelyzeti reagáláshoz szolgáló közlekedés modell eredmények szolgáltatására specializált meteorológiai központtól (RSMC) annak érdekében, hogy ezeket az információkat beillesszék a szignifikáns időjárás előrejelzésekbe; és

f) kapcsolatot létesíteni és fenntartani a VAAC-al a vulkánikus tevékenységről szóló információk cseréjéhez, hogy koordinálják a vulkánkitörésekről szóló információk beillesztését a szignifikáns időjárás (SIGWX) előrejelzésekbe.

3.2.2 Egy WAFC működésének megszakadása esetén feladatait vegye át egy másik WAFC.

Megjegyzés. – Egy WAFC működésének megszakadása esetén alkalmazandó támogató eljárásokat a Világ Területi Előrejelző Rendszer Operációs Csoport szükség szerint állandóan frissíti; az utolsó revízió a WAFSOPSG weboldalán: www.icao.int/anb/wafsopsg található.

3.3 Meteorológiai irodák

3.3.1 Minden Szerződő Államnak egy vagy több repülőtéri és/vagy egyéb meteorológiai irodát kell létesítenie, amelyek alkalmasak a nemzetközi repülési navigáció igényeinek kielégítéséhez szükséges meteorológiai szolgáltatások biztosítására.

3.3.2 Egy repülőtéri meteorológiai irodának el kell látnia az alábbiakban felsorolt feladatok mindegyikét vagy egy részét, amelyek szükségesek a repülőtéri repülés-üzemelés szükségleteinek kielégítéséhez:

a) előrejelzések és egyéb fontos információk készítése és/vagy beszerzése azokhoz a járatokhoz, amelyekkel ezek kapcsolatosak; az előrejelzések készítésére vonatkozó kötelezettségeinek ki kell terjednie a más irodáktól kapott útvonal és repülőtéri előrejelzések anyagának helyi hozzáférhetőségére és felhasználására;

b) előrejelzések készítése és/vagy beszerzése a helyi meteorológiai viszonyokról;
c) a meteorológiai viszonyok folyamatos ellenőrzése azokon a repülőtereken, amelyekre előrejelzéseket kell készítenie;
d) eligazítást, konzultációt és repülési dokumentációt kell biztosítania hajózószemélyzeti tagok és/vagy egyéb légi üzemeltetést végző személyek számára;
e) egyéb meteorológiai információk adása repülési felhasználóknak;
f) a rendelkezésre álló meteorológiai információk bemutatása;
g) meteorológiai információk cseréje más meteorológiai irodákkal;és
h) kitörés előtti vulkánikus aktivitással, vulkánkitöréssel vagy vulkánikus hamu felhővel kapcsolatban kapott információk szolgáltatása a légiforgalmi szolgálati egységnek, légiforgalmi tájékoztató szolgálati egységnek és meteorológiai figyelő irodának, ahogy ebben az érintett meteorológiai, légiforgalmi tájékoztató szolgálat és ATS hatóságok megegyeztek.
3.3.3 Azokat a repülőtéri meteorológiai irodákat, amelyektől repülési dokumentációt igényelnek, valamint a lefedendő területeket regionális léginavigációs egyezményben, kell meghatározni.
3.3.4 Azokat a repülőtereket, amelyekre leszállási előrejelzés szükséges, a regionális léginavigációs egyezményben kell meghatározni.
3.3.5 A meteorológiai irodával nem rendelkező repülőterek számára:
a) az illetékes meteorológiai hatóság jelöljön ki egy vagy több meteorológiai irodát a kívánt meteorológiai információk biztosítására; és
b) az illetékes hatóságok hozzák létre azokat az eszközöket, amelyek segítségével ezek az információk az érintett repülőterek számára eljuttathatók.

3.4 Meteorológiai megfigyelő irodák

3.4.1 Az a Szerződő Állam, amely elfogadta azt a kötelezettséget, hogy egy repüléstájékoztató körzeten vagy irányítási területen belül légiforgalmi szolgálatokat biztosít, egy vagy több megfigyelő irodát tartozik létesíteni, vagy el kell intéznie, hogy ezt egy másik Szerződő Állam megtegye.
3.4.2 A meteorológiai megfigyelő iroda tartozik:
a) figyelemmel kísérni azokat a meteorológiai viszonyokat, amelyek a felelősségi területének határain belül lévő légijárművek üzemeltetését befolyásolhatják;
b) SIGMET és egyéb információkat készíteni a felelősségi területére vonatkozóan;
c) SIGMET információkat és szükség esetén egyéb meteorológiai információkat szolgáltatni a kapcsolódó légiforgalmi szolgálati egységeknek;
d) szétosztani a SIGMET tájékoztatást;
e) amikor a regionális léginavigációs egyezmény megköveteli, a 7.2.1-el összhangban;
1) AIRMET információt készíteni a felelősségi területére vonatkozóan;
2) AIRMET információval ellátni a kapcsolódó légiforgalmi szolgálati egységeket; és
3) szétosztani az AIRMET információt;
f) kitörés előtti vulkanikus aktivitással, vulkánkitöréssel vagy vulkanikus hamu felhővel kapcsolatban kapott információkat továbbítani, amelyre vonatkozóan SIGMET-et még nem adtak ki, a hozzá kapcsolódó ACC/FIC számára, ahogy abban az érintett meteorológiai és ATS hatóságok megegyeztek, és a hozzá kapcsolódó VAAC számára, hogyan azt a regionális léginavigációs egyezmény meghatározta; és
g) a radioaktív anyagoknak azon a területen, amelyen figyelést végez, és a szomszédos területeken, véletlen atmoszférába jutásáról szóló, vett információk továbbítása a hozzá tartozó ACC/FIC-hez, az illetékes meteorológiai és ATS hatóságok közötti megállapodás szerint, és a repülési információs szolgálati egységeknek, az illetékes meteorológiai és megfelelő polgári repülési hatóságok közötti megállapodásnak megfelelően. Az információnak tartalmaznia kell a baleset helyét, dátumát és időpontját, és a radioaktív anyagok előrejelzett trajektóriáit.
Megjegyzés. – Az információt a radiológiai környezeti vészhelyzeti reagáláshoz szolgáló transzport modell eredmények szolgáltatására specializált WMO regionális meteorológiai központok (RSMC) által egy Államba delegált hatóság kérésére szolgáltatják. Az információkat az RSMC mindegyik Államban az országos meteorológiai szolgálatának egyetlen kapcsolódási pontjára küldi el. Ennek a kapcsolódási pont-

nak a felelőssége az RSMC produktumok újraelosztása az érintett Államon belül.
3.4.3 **Ajánlás** – *Azon terület határainak, amelyre a meteorológiai irodának figyelést kell fenntartania, lehetőség szerint egybe kell esnie egy repülésinformációs körzet, vagy repülésinformációs körzetek és/vagy összevont irányítási területek egy kombinációjának határaival.*
3.4.4 **Ajánlás** – *A meteorológiai figyelést folyamatosan fenn kell tartani, olyan területeken azonban, ahol a forgalom sűrűsége kicsi, a figyelést korlátozni lehet a várható repülésüzemelési időszakra.*

3.5 Vulkanikus hamu tájékoztató központok

3.5.1 Egy Szerződő Államnak, miután egy regionális léginavigációs egyezmény által elfogadta egy VAAC ellátásának kötelezettségét a nemzetközi légiútvonali vulkánikus figyelés keretében, meg kell szerveznie, hogy ez a központ válaszoljon egy vulkánkitöréséről vagy várható kitöréséről szóló értesítésre, vagy ha vulkanikus hamut jelentenek a felelősségébe tartozó területén, elrendezve, hogy ez a központ
a) figyelje a releváns geostacionárius és poláris keringési pályájú műhold adatokat, hogy észlelje vulkanikus hamu meglétét és kiterjedését az atmoszférában a szóbanforgó területen;
b) aktivizálja a vulkanikus hamu numerikus trajektória/szétoszlás modellt annak érdekében, hogy bármely észlelt vagy jelentett hamu „felhő" mozgását előrejelezzék.
Megjegyzés. – A numerikus modell lehet saját, vagy megegyezésalapján, egy másik VAAC modellje.
c) adjon ki vulkanikus hamu „felhő" kiterjedésére és előrejelzett mozgására vonatkozó tájékoztatási információkat a következő szervezetek részére:
1) meteorológiai megfigyelő irodák, körzeti irányító központok és repülési információs központok, amelyek azokat a felelősségi területén lévő repülési információs körzeteket szolgálják ki, amelyek érintettek lehetnek;
2) más VAAC-ok, amelyek felelősségi területei érintettek lehetnek;
3) világ területi előrejelző központok, releváns regionális területi előrejelző központok, nemzetközi OPMET adatbankok, nemzetközi NOTAM irodák, és a regionális léginavigációs egyezmény által repülési helyhezkötött szolgálati műholdas elosztó rendszerek működtetésére kijelölt központok; és
4) légitársaságok, amelyek a speciálisan erre a célra biztosított AFTN címen keresztül igénylik a tájékoztató információkat;
Megjegyzés. – A VAAC-ok által használt AFTN cím a Kézikönyv a Nemzetközi Légiútvonali Vulkán Figyelésről (IAVW) – *(Doc 9766) kiadványban, és a http:// www.icao.int/icao/ en/anb/met/index.htmlweb oldalon található.*
d) adjon ki felfrissített információkat a meteorológiai figyelő irodáknak, körzeti irányító központoknak és VAAC-oknak, amelyek a c)-ben vannak felsorolva, szükség szerint, de legalább minden hat órában, amíg a vulkánikus hamu „felhő" már nem azonosítható a műholdas adatokból, már nem érkezik több vulkánikus hamu jelentés a területről, és nem jelentenek már vulkánkitörést.
3.5.2 A vulkanikus hamu tájékoztató központoknak 24-órás figyelést kell fenntartaniuk.

3.6 Állami vulkánmegfigyelő állomások

Azoknak a Szerződő Államoknak, amelyek aktív vulkánok monitorozását végző vulkán megfigyelő állomásokat működtetnek, el kell rendezniük, hogy kiválasztott Állam vulkán megfigyelő állomásai, amelyek regionális léginavigációs szerződésnek megfelelően, megfigyelve

a) szignifikáns kitörés előtti vulkanikus tevékenységet, vagy annak megszűnését;
b) vulkánkitörést vagy annak megszűnését; és/vagy
c) az atmoszférában vulkanikus hamut,

ezeket az információkat amilyen gyorsan csak lehet, küldjék meg a hozzájuk tartozó AAC, MWO és VAAC intézményeknek.
Megjegyzés. – Kitörés előtti vulkanikus tevékenység ebben a vonatkozásban szokatlan és/vagy növekvő vulkanikus tevékenységet jelent, amely vulkánkitörés előjele lehet.

3.7 Trópusi ciklon tájékoztató központok

Egy Szerződő Államnak, miután egy regionális léginavigációs egyezmény által elfogadta egy TCAC ellátásának kötelezettségét, meg kell szerveznie, hogy ez a központ:
a) geostacionárius és poláris keringési pályán lévő műholdak adatainak, radar adatok és egyéb meteorológiai információk felhasználásával figyelje trópusi ciklonok kialakulását a felelősségi területén;
b) adjon ki rövidített köznyelven a ciklon központ helyzetére, mozgásának irányára és sebességére, a középpont nyomására és a középpont közelében a talajszélre vonatkozó tájékoztató információkat a következő szervezetek részére:
1) a felelősségi területén lévő meteorológiai figyelő irodák;
2) más TCAC-ok, amelyek felelősségi területei érintettek lehetnek;és
3) világ területi előrejelző központok, releváns regionális területi előrejelző központok, nemzetközi OPMET adatbankok és regionális léginavigációs egyezmény által repülési helyhezkötött szolgálati műholdas elosztó rendszerek működtetésére kijelölt központok;
c) adjon ki felfrissített tájékoztató információkat a meteorológiai figyelő irodák részére minden trópusi ciklonra, szükség szerint, de legalább minden hat órában.

4. FEJEZET – METEOROLÓGIAI MEGFIGYELÉSEK ÉS JELENTÉSEK

Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat a 3. Függelék tartalmazza.

4.1 Repülésmeteorológiai állomások és megfigyelések

4.1.1 Minden Szerződő Állam tartozik a területén elhelyezkedő repülőtereken olyan repülésmeteorológiai állomásokat létesíteni, amelyeket szükségesnek ítél. Egy repülésmeteorológiai állomás lehet különálló, vagy egy szinoptikus állomással kombinált.

Megjegyzés. – Repülésmeteorológiai állomások tartalmazhatnak a repülőtéren kívül felszerelt érzékelőket, ahol a meteorológiai hatóság által igazolt szükségessége a nemzetközi léginavigáció részére jelen Annexben előírt meteorológiai szolgáltatások biztosításához.

4.1.2 **Ajánlás** – *Minden Szerződő Állam létesítsen meteorológiai állomásokat, vagy gondoskodjon repülésmeteorológiai állomások létesítéséről tengeri építményeken vagy egyéb, a tengeri építményekre irányuló helikopter üzemelések szempontjából fontos helyeken, ha regionális léginavigációs egyezmény ezt megköveteli.*

4.1.3 A repülésmeteorológiai állomásoknak meghatározott időközönként rendszeres megfigyeléseket kell végezniük. Repülőtereken a rendszeres megfigyeléseket ki kell egészíteni különleges megfigyelésekkel, amikor meghatározott változások fordulnak elő a talajszél, a látás, futópálya látástávolság, aktuális időjárás, felhőzet és/vagy levegő hőmérséklet vonatkozásában.

4.1.4 **Ajánlás** – *Minden Szerződő Állam kellő gyakorisággal ellenőrizze a repülésmeteorológiai állomásait annak biztosítására, hogy a megfigyelések magas színvonalát fenntartsa, a műszerek és az összes jelzőberendezések kifogástalanul működjenek, és ellenőrizze, hogy a műszerek elhelyezése nem változott-e meg jelentősen.*

4.1.5 II. és III. kategóriájú műszeres megközelítési és leszállási műveletek végrehajtására szolgáló futópályákkal rendelkező repülőtereken a talajszél, a futópálya látástávolság és felhőalap magasság, levegő- és harmatpont hőmérséklet és atmoszférikus nyomás mérésére vagy megbecslésére, amelyik megfelelő, és figyelésére és távkijelzésére szolgáló automatizált berendezéseket kell felszerelni. Ezeknek a berendezéseknek integrált automatikus rendszereknek kell lenniük, amelyek a fel- és leszállási műveleteket befolyásoló meteorológiai paraméterek begyűjtését, feldolgozását, szétosztását és valósidejű kijelzését végzik. Az integrált automatikus rendszerek tervezésénél figyelembe kell venni az Emberi Tényezők alapelveket, és támasztó eljárásokat kell tartalmazniuk.

1. Megjegyzés. – A precíziós megközelítési és leszállási műveletek kategóriái a 6. Annex I. Részben vannak definiálva.

2. Megjegyzés. – Az Emberi Tényező alapelvek alkalmazására vonatkozó útmutató anyag az Emberi Tényező Oktatási Kézikönyvben *(Doc. 9683) található.*

4.1.6 **Ajánlás.** – *I. kategóriájú műszeres megközelítési és leszállási műveletek végrehajtására szolgáló* *futópályákkal rendelkező repülőtereken a talajszél, a látás, a futópálya látástávolság, a felhőalap magasság, levegő és harmatpont hőmérséklet és atmoszférikus nyomás mérésére vagy megbecslésére, amelyik megfelelő, és figyelésére és távkijelzésére szolgáló automatizált berendezéseket kell felszerelni a megközelítési és leszállási és felszállási műveletek támogatására. Ezeknek a berendezéseknek integrált automatikus rendszereknek kell lenniük, amelyek a fel- és leszállási műveleteket befolyásoló meteorológiai paraméterek begyűjtését, feldolgozását, szétosztását és valósidejű kijelzését végzik. Az integrált automatikus rendszerek tervezésénél figyelembe kell venni az Emberi Tényezők alapelveket, és támasztó eljárásokat kell tartalmazniuk.*

4.1.7 **Ajánlás.** – *Ahol integrált fél-automatikus rendszert használnak a meteorológiai információk szétküldésére/kijelzésére, ez legyen alkalmas azon meteorológiai elemek adatai manuális bevitelének fogadására, amelyek automatikus eszközökkel nem figyelhetők meg.*

4.1.8 A megfigyelések egyaránt alapját képezik azon jelentések elkészítésének, amelyeket a megfigyelést végző repülőtéren terjesztenek, valamint azoknak, amelyeket e repülőtéren kívül terjesztenek.

4.1.9 A meteorológiai elemek térbeli és időbeli változékonysága, az észlelési technika és bizonyos elemek definíciója által okozott bizonytalanságok miatt, egy jelentésben bármely elemre megadott jellemző értéket a fogadónak úgy kell értelmeznie, hogy az a tényleges viszonyok legjobb megközelítése a megfigyelés idején.

Megjegyzés – A mérések, illetve megfigyelések üzemeltetési szempontból kívánatos és jelenleg elérhető pontosságára vonatkozó tájékoztató anyagot az A Melléklet tartalmaz.

4.2 Légiforgalmi szolgáltató hatóságok és meteorológiai hatóságok közötti egyezmény

Ajánlás. – *A meteorológiai hatóság és az illetékes ATS hatóság között megállapodást kell létrehozni többek között a következőkre kiterjedően:*

a) a légiforgalmi szolgálati egységek ellátása integrált automatikus rendszerekre vonatkozó kijelzőkkel;

b) ezen kijelzők/műszerek hitelesítése és karbantartása;

c) ezeknek a kijelzőknek/műszereknek a légiforgalmi szolgálatok személyzete általi használata;

d) amennyiben és ahol szükséges, pótlólagos vizuális megfigyelések (pl. az emelkedési és megközelítési területeken üzemeltetési jelentőséggel bíró meteorológiai jelenségekről), amennyiben és amikor azt légiforgalmi szolgálatok személyzete végezte, annak érdekében, hogy a meteorológiai állomás által szolgáltatott információkat aktuálissá tegyék, vagy kiegészítsék;

e) a fel- és leszálló légijárművektől kapott meteorológiai információk (pl. a szélnyírásról);

f) ha rendelkezésre áll, földi időjárás radartól származó meteorológiai információk.

Megjegyzés. — Útmutatót az ATS és repülésmeteorológiai szolgálat közötti koordináció tárgyában a Manual on Coordination between Air Traffic Services, Aeronautical Information Services and Aeronautical Meteorology Services (Kézikönyv Légiforgalmi Szolgálat, Repülés Információs Szolgálat és Repülésmeteorológiai Szolgálat közötti koordinációról) *(Doc 9377).*

4.3 Rendszeres megfigyelések és jelentések

4.3.1 A repülőtereken minden nap 24 órán keresztül kell rendszeres megfigyeléseket végezni, kivéve, ha a meteorológiai hatóság, az illetékes légiforgalmi szolgálati hatóság és az érintett üzemeltető között másfajta megállapodás született. Az ilyen megfigyeléseket óránként, vagy ha regionális léginavigációs egyezményben úgy határozzák meg, félóránként kell végezni. Más repülésmeteorológiai állomásokon az ilyen megfigyeléseket a meteorológiai hatóság által a légiforgalmi szolgálati egységek és a légijárművek üzemeltetési követelményeinek figyelembevételével meghatározottak szerint kell végezni.

4.3.2 Rendszeres megfigyelések jelentéseit a következők szerint kell kiadni:

a) helyi rendszeres jelentésekként, csak azon a repülőtéren terjesztve, ahol ezeket kiadták (érkező és induló légijárművek számára); és

b) METAR formában, a származási helyhez tartozó repülőtéren kívül, a többi repülőtereken való terjesztésre (főleg repülés tervezésre, VOLMET rádióadásra és D-VOLMET-re szánva).

Megjegyzés. – ATIS-ban (beszéd-ATIS-ban és D-ATIS-ban) használt meteorológiai információkat a helyi rendszeres jelentésből kell kivenni, a 11. Annex 4.3.6.1 g) pontjával összhangban.

4.3.3 Azoknál a repülőtereknél, amelyek nem 24 órán keresztül üzemelnek, a 4.3.1 ponttal összhangban METAR-t kell kiadni a repülőtér újraüzemelései előtt, a regionális léginavigációs egyezménynek megfelelően.

4.4 Különleges megfigyelések és jelentések

4.4.1 A különleges megfigyelések kritériumainak listáját a meteorológiai hatóságnak a megfelelő ATS hatósággal, az üzemeltetőkkel és más érdekeltekkel konzultálva kell elkészítenie.
4.4.2 Különleges megfigyelések jelentéseit a következők szerint kell kiadni:
a) helyi különleges jelentések, csak azon a repülőtéren terjesztve, ahol ezeket kiadták (érkező és induló légijárművek számára); és
b) SPECI, a származási helyhez tartozó repülőtéren kívüli repülőtereken való terjesztésre (főleg repüléstervezésre, VOLMET rádióadásra és D-VOLMET-re szánva).
Megjegyzés. – ATIS-ban (beszéd-ATIS-ban és D-ATIS-ban) használt meteorológiai információkat a helyi különleges jelentésből kell kivenni, a 11. Annex 4.3.6.1 g) pontjával összhangban.
4.4.3 Azoknál a repülőtereknél, amelyek nem 24 órán keresztül üzemelnek, a 4.3.1 ponttal összhangban, METAR ismételt kiadása előtt, ha szükséges, SPECI-t kell kiadni.

4.5 A jelentések tartalma

4.5.1 A helyi rendszeres és különleges és a METAR/SPEC kódformájú rendszeres és különleges jelentéseknek az alábbi információkat kell tartalmazniuk, a megadott sorrendben:
a) a jelentés fajtájának azonosítása;
b) elhelyezkedési jelző;
c) a megfigyelés ideje;
d) automatizált vagy hiányzó jelentés azonosítása, ha alkalmazható;
e) talajszél iránya és sebessége;
f) látás;
g) futópálya látástávolság, ahol alkalmazható;
h) aktuális időjárás;
i) felhő mennyisége, fajtája (csak cumulonimbus és tornyosuló cumulus felhő esetén) és a felhőalap magassága, vagy, ahol mérik, függőleges látás;
j) levegőhőmérséklet és harmatpont hőmérséklet; és
k) QNH és ahol alkalmazható, QFE értéke (a QFE-t csak a helyi rendszeres és különleges, jelentések tartalmazzák).
Megjegyzés. – A fenti b) pontban említett helységjelzők és jelentésük az ICAO Doc 7910 –Location – Indicators (Hely jelölések) *kiadványban találhatók.*
4.5.2 **Ajánlás. –** *A 4.5.1 a) – k) pontok alatt felsorolt elemeken kívül a helyi rendszeres és különleges jelentések és a METAR és SPECI tartalmazhatnak kiegészítő információkat is, amelyeket a k pont után lehet elhelyezni.*
4.5.3 Kiegészítő információk alatt tartalmazott választható elemeket a METAR-nak és SPECI-nek a regionális léginavigációs egyezménynek megfelelően kell tartalmazni

4.6 Meteorológiai elemek megfigyelése és jelentése

4.6.1 Talajszél

4.6.1.1 A talajszél közepes irányát és közepes sebességét mérni kell, ugyanígy a szél irányában és sebességében beálló változásokat, és földrajzi fokokban és kilométer per órában (vagy csomóban) kell jelenteni.
4.6.1.2 **Ajánlás.–** *Amikor helyi rendszeres és különleges jelentéseket induló légijárművekhez használják, az ezekhez a jelentésekhez végzett talajszél megfigyeléseknek a futópálya mentére kell kiterjedniük; amikor helyi rendszeres és különleges jelentéseket érkező légijárművekhez használják, az ezekhez a jelentésekhez végzett talajszél megfigyeléseknek a földetérési zónára kell kiterjedniük.*

4.6.1.3 **Ajánlás.** – *METAR és SPECI esetén a talajszél megfigyeléseknek az egész futópályára kell kiterjednie, ha csak egy futópálya van, és a teljes futópálya komplexumra, ahol egynél több futópálya van.*

4.6.2 Látás

4.6.2.1 Az 1. Fejezetben definiált látást méterben vagy kilométerben kell mérni vagy megfigyelni és jelenteni.
Megjegyzés. – A műszeren leolvasott értékek látásra való átszámítására vonatkozó útmutató anyag a D Mellékletben található.
4.6.2.2 **Ajánlás.**– *Amikor helyi rendszeres és különleges jelentéseket induló légijárművekhez használják, az ezekhez a jelentésekhez végzett látás megfigyeléseknek a futópálya menti állapotokat kell tükrözniük; amikor helyi rendszeres és különleges jelentéseket érkező légijárművekhez használják, az ezekhez a jelentésekhez végzett látás megfigyeléseknek a földetérési zónára kell kiterjedniük.*
4.6.2.3 **Ajánlás.** – *METAR és SPECI esetén a talajszél megfigyeléseknek a repülőtérre kell kiterjedniük.*

4.6.3 Futópálya látástávolság

Megjegyzés. – A futópálya látástávolság témakörére vonatkozó útmutató anyag a Futópálya látástávolság észlelési és jelentési gyakorlatának kézikönyvében (Manual of Runway Visual Range Observing and Reporting Practices) *található (Doc.9328).*
4.6.3.1 Az 1. Fejezetben szereplő definíció szerinti futópálya látástávolságot az összes II. és III kategóriájú műszeres megközelítési és leszállási műveletekre szánt futópályára meg kell határozni.
4.6.3.2 **Ajánlás** – *Az 1. Fejezetben szereplő definíció szerinti futópálya látástávolságot az összes olyan futópályára meg kell határozni, amelyet csökkent látási időszakokban is használni kívánnak, közöttük a:*
a) az I. kategóriájú műszeres megközelítési és leszállási üzemelésre szolgáló precíziós megközelítési futópályákra; és
b) felszállásra használt és nagyintenzitású szegélyfényekkel és/vagy középvonalfényekkel rendelkező futópályákra.
Megjegyzés. – A precíziós megközelítési futópályák meghatározása a 14. Annex 1. Kötet, 1. Fejezetében, a „Műszeres futópályák" cím alatt található.
4.6.3.3 A futópálya látástávolságot, a 4.6.3.1 és 4.6.3.2 pontoknak megfelelően megállapítva, méterekben kell jelenteni azokban az időszakokban, amikor vagy a látás, vagy a futópálya látástávolság kisebb, mint 1500 m.
4.6.3.4 A futópálya látástávolság megállapításokat a futópálya alábbi részére kiterjedően kell végezni:
a) nem-precíziós vagy I. kategóriájú műszeres megközelítési és leszállási műveletekre szánt futópálya földetérési zónája;
b) II. kategóriájú műszeres megközelítési és leszállási műveletekre szánt futópálya földetérési zónája és felezőpontja;
c) III. kategóriájú műszeres megközelítési és leszállási műveletekre szánt futópálya földetérési zónája; felezőpontja és megállási végszakasza.
4.6.3.5 Egy repülőtér részére légiforgalmi szolgáltatást és repülési információszolgáltatást nyújtó egységeknek késedelem nélkül tudomást kell szerezniük a futópálya látástávolság megállapítására használt automatizált berendezések működőképességi állapotában beállt változásokról.

4.6.4 Aktuális időjárás

4.6.4.1 A repülőtéren és/vagy annak környékén uralkodó aktuális időjárást figyelni és szükség esetén jelenteni kell. Minimálisan a következő aktuális időjárás jelenségeket kell azonosítani: csapadék és fagyott csapadék (azok intenzitását is közölve), köd, fagyott köd és zivatarok (a szomszédos környezetben előforduló zivatarokkal együtt).
4.6.4.2 **Ajánlás**. – *Helyi rendszeres és különleges jelentéseknél az aktuális időjárás információknak a repülőtéri időjárási viszonyokra kell vonatkozniuk.*

4.6.4.3 **Ajánlás.** – *METAR és SPECI esetén az aktuális időjárás információknak a repülőtéri időjárási viszonyokra, és bizonyos meghatározott aktuális időjárási jelenségek esetében, a repülőtér környékére kell kiterjedniük.*

4.6.5 Felhők

4.6.5.1 A felhőmennyiséget, felhőtípust és felhőalap magasságát figyelni és jelenteni kell, szükség esetén ismertetve az üzemeltetés szempontjából jelentőséggel bíró felhőket. Ha az égbolt borult, a felhő mennyiség; felhő típus és felhőalap magasság helyett, ahol mérik, a függőleges látást kell figyelni és jelenteni. A felhőalap magasságát és a függőleges látást méterben (vagy lábban) kell jelenteni.
4.6.5.2 **Ajánlás**. – *Helyi rendszeres és különleges jelentésekhez végzett felhő megfigyeléseknek a megközelítési területre kell kiterjedniük.*
4.6.5.3 **Ajánlás.** – *METAR és SPECI részére végzett felhő megfigyeléseknek a repülőtérre és környékére kell kiterjedniük.*

4.6.6 Levegő hőmérséklet és harmatpont hőmérséklet

4.6.6.1 A levegő hőmérsékleteket és a harmatpont hőmérsékletet Celsius fokban kell mérni és jelenteni.
4.6.6.2 **Ajánlás**. – *Helyi rendszeres és különleges jelentések és METAR és SPECI részére végzett levegő hőmérséklet és harmatpont hőmérséklet megfigyeléseknek a teljes futópálya komplexumra kell kiterjedniük.*

4.6.7 Atmoszférikus nyomás

Az atmoszférikus nyomást mérni kell, és a QNH és QFE értékeket hektopascalban kell számolni és jelenteni.

4.6.8 Kiegészítő információk

Ajánlás. – *A repülőtereken végzett megfigyeléseknek magukban kell foglalniuk a szignifikáns meteorológiai viszonyokra vonatkozó kiegészítő információkat, különös tekintettel azokra, amelyek a megközelítési és emelkedési területekre vonatkoznak. Ahol megvalósítható, az információnak azonosítani kell a meteorológiai körülmények helyét.*

4.7 Automatikus megfigyelő rendszertől érkező meteorológiai információk jelentése

4.7.1 **Ajánlás.** – *Automatikus megfigyelő rendszerektől származó METAR és SPECI csak azok az Államok használhatják, amelyek abban a helyzetben vannak, hogy ezt megtehetik a repülőtér üzemidején kívüli órákban és a repülőtér üzemelési ideje alatt, a meteorológiai hatóság meghatározása szerint, a felhasználókkal konzultálva, a személyzet rendelkezésre állása és hatékony alkalmazása alapján.*
Megjegyzés. – Automatikus meteorológiai megfigyelő rendszerek használatára vonatkozó útmutató anyag A repülőtereken lévő automatikus meteorológiai megfigyelő rendszerek kézikönyve (Doc 9837) (Manual on Automatic Meteorological Observing Systems at Aerodromes)
4.7.2 Automatikus megfigyelő rendszerektől származó METAR és SPECI az „AUTO" szóval azonosítandó.

4.8 Vulkanikus tevékenység megfigyelése és jelentése

Ajánlás. – *A kitörés előtti vulkáni tevékenység, vulkánkitörés és vulkanikus hamu felhő előfordulását késedelem nélkül jelenteni kell a légiforgalmi szolgálati egységnek és a meteorológiai megfigyelő irodának. A jelentést vulkánikus tevékenység jelentés formájában kell elkészíteni, amely az alább felsorolt információkat tartalmazza a megadott sorrendben:*
a) közlemény típusa, VULKANIKUS TEVÉKENYSÉG JELENTÉS (VOLCANIC ACTIVITY REPORT);
b) állomás azonosítója, az állomás elhelyezkedés jelzője vagy neve;

c) a közlemény dátuma/időpontja;
d) a vulkán helye és neve, ha ismert;
e) az esemény tömör leírása, ideértve, rendelkezésre állás szerint, a vulkánikus tevékenység intenzitásának szintjét, kitörése előfordulását és annak dátumát és időpontját, valamint vulkánikus hamu felhő előfordulását az adott térségben, a hamu felhő mozgásának irányát és magasságát.
Megjegyzés: -- A kitörés előtti vulkanikus tevékenység ebben a szöveg-összefüggésben szokatlan és/vagy erősödő vulkanikus tevékenységet jelent, amely előre jelezheti egy vulkán kitörését.

5. FEJEZET – LÉGIJÁRMŰVES MEGFIGYELÉSEK ÉS JELENTÉSEK

Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat a 4. Függelék tartalmazza.

5.1 Az államok kötelezettségei

Minden Szerződő Állam köteles ennek a fejezetnek az előírásaival megegyezően intézkedni a felségjelével lajstromozott, nemzetközi légiútvonalakon üzemeltetett légijárművek által végzendő megfigyelésekről és a megfigyelések rögzítéséről, illetve azok jelentéséről.

5.2 Légijárműves megfigyelések fajtái

A következő légijárműves megfigyeléseket kell végrehajtani:

a) rendszeres légijárműves megfigyelések útvonalrepülés és emelkedés repülési fázisok során; és

b) speciális és más nem rendszeres légijárműves megfigyelések a repülés bármely fázisában.

5.3 Rendszeres légijárműves megfigyelések – kijelölés

5.3.1 **Ajánlás**. -- *Amikor levegő-föld adatösszeköttetést használnak, és automatikus függő ellenőrzést (ADS), vagy másodlagos ellenőrző radart (SSR) S-üzemmódban alkalmaznak, az útvonalrepülés fázisában minden 15 percben, míg az emelkedés fázisának első 10 perce során 30 másodpercenként automatizált rendszeres megfigyeléseket kell végezni.*
5.3.2 Amikor beszédkommunikációt használnak, rendszeres megfigyeléseket kell végezni az útvonalrepülés fázisban a következő légiforgalmi szolgálati jelentő pontokra vagy intervallumokra vonatkozóan:
a) amelyeken az alkalmazandó légiforgalmi szolgálati eljárások rendszeres helyzetjelentést követelnek meg; és
b) amelyek olyan távolságokkal vannak elválasztva, amelyek az egyórás repülési időnek megfelelő intervallumokhoz a legközelebb esnek.
5.3.3 **Ajánlás**. -- *Tengeren épült szerkezeteken lévő repülőterekre és repülőterekről történő helikopter üzemeléseknél a helikopterekről az érintett meteorológiai hatóságok és az illetékes helikopter üzemeltetők közötti megegyezés szerinti pontokon és időpontokban kell rendszeres észleléseket végezni.*
5.3.4 Nagysűrűségű légiforgalommal rendelkező légiútvonalak (pl. szervezett útvonalak) esetében egyes repülési magasságokon repülő légijárművek közül egyet ki kell jelölni, közelítőleg órás intervallumokban, rendszeres megfigyelések végzésére az 5.3.1 vagy 5.3.2 pontnak megfelelően, amelyik alkalmazható. A kijelölési eljárások regionális léginavigációs egyezmény tárgyai.
5.3.5 Emelkedési fázisban jelentés leadás iránti követelmény esetén egy légijárművet kell kijelölni, közelítőleg órás intervallumokban, egyes repülőtereknél rendszeres megfigyelés végzésére az 5.3.1 pontnak megfelelően.

5.4 Rendszeres légijárműves megfigyelések – mentesítések

5.4.1 Amikor beszédkommunikációt használnak, egy légijármű akkor mentesül az 5.4.2 pontban leírt rendszeres megfigyelések végzése alól, ha:
a) a légijármű nincs felszerelve RNAV berendezéssel, vagy
b) a repülés időtartama 2 óra vagy kevesebb; vagy
c) a légijármű egy repülési órának megfelelő távolságnál közelebb van a következő tervezett leszállási ponthoz; vagy

d) a repülési magassága 1500 m (5000 láb) alatt van.
5.4.2 **Ajánlás**. -- *Amikor beszédkommunikációt használnak, további felmentéseket írhat elő a regionális léginavigációs egyezmény a nagy légiforgalmú és/vagy megfelelő szinoptikus hálózattal rendelkező területeken és útvonalakon repülő járatok részére. Az ilyen eljárásoknak mentesítési vagy kijelölési eljárás formáját kell ölteni, és*

a) tegyék lehetővé valamennyi érdekelt meteorológiai hivatal minimális követelményeinek kielégítését a légijárművek által végzett észlelésekkel kapcsolatban;

b) végrehajtásuk a lehető legegyszerűbb legyen, és lehetőleg ne tartalmazzanak egyedi esetekre vonatkozó megfontolásokat.

5.5 Különleges légijárműves megfigyelések

Különleges megfigyeléseket kell végezni minden légijárműnek, ha az alábbi körülményekkel találkozik, vagy ilyent észlel:
a) erős turbulencia; vagy
b) erős jegesedés; vagy
c) erős hegyi hullám; vagy
d) zivatar jégeső nélkül, amely takart, beágyazott, széles kiterjedésű vagy széllökés vonalban lévő; vagy
e) zivatar jégesővel, amely takart, beágyazott, széles kiterjedésű vagy széllökés vonalban lévő;
f) heves porvihar vagy heves homokvihar; vagy
g) vulkanikus hamu felhő; vagy
h) kitörés előtti vulkanikus tevékenység vagy vulkánkitörés.
Megjegyzés. -- A kitörés előtti vulkanikus tevékenység ebben a szöveg-összefüggésben szokatlan és/vagy erősödő vulkánikus tevékenységet jelent, amely előre jelezhet egy vulkánkitörést.

5.6 Egyéb nem-rendszeres légijárműves megfigyelések

Amikor az 5.5 alatt nem-felsorolt meteorológiai viszonyok, pl. szélnyírás, lépnek fel, és olyanok, amelyek a légijármű parancsnok véleménye szerint más légijárművek biztonságára kihatnak, vagy üzemelési hatékonyságukat jelentősen befolyásolják, a légijármű parancsnok a lehető legrövidebb időn belül tájékoztassa erről a megfelelő légiforgalmi szolgálati egységet.
Megjegyzés. – A jegesedés, turbulencia és főleg a szélnyírás olyan elemek, amelyeket ma még nem lehet kielégítően észlelni a földről, és amelyek jelenlétére vonatkozóan a legtöbb esetben a légijárműves megfigyelések képezik az egyetlen bizonyítékot.

5.7 Légijárműves megfigyelések jelentése repülés során

5.7.1 A légijárműves megfigyeléseket a levegő-föld adatkapcsolaton keresztül kell jelenteni. Ahol levegő-föld adatösszeköttetés nincs, vagy nem megfelelő, a légijárműves megfigyeléseket beszédkommunikáció útján kell jelenteni.
5.7.2 A légijárműves megfigyeléseket a repülés során a megfigyelés végzésével egyidőben, vagy azután, a lehető legrövidebb időn belül, kell jelenteni.
5.7.3 Légijárműves megfigyeléseket légijelentésként kell jelenteni.

5.8 Légijelentések ATS egységek általi továbbítása

Az illetékes meteorológiai hatóságnak meg kell állapodnia a megfelelő légiforgalmi szolgálati hatósággal, hogy miután a légiforgalmi szolgálati egységek vették az alábbiakat, biztosítsák:

a) rendszeres és különleges légijelentések beszédkommunikációval, az ATS egységek ezeket késedelem nélkül továbbítsák a hozzájuk tartozó meteorológiai megfigyelő irodáknak;

b) rendszeres légijelentések adatkapcsolati kommunikációval, az ATS egységek ezeket késedelem nélkül továbbítsák a WAFC-oknak és;

c) különleges légijelentések adatkapcsolati kommunikációval, az ATS egységek ezeket késedelem nélkül továbbítsák a hozzájuk tartozó meteorológiai megfigyelő irodának, és a WAFC-oknak.

5.9 Vulkanikus tevékenység légijárműves megfigyeléseinek rögzítése és repülés utáni jelentése

A kitörés előtti vulkanikus tevékenység, vulkanikus kitörés vagy vulkanikus hamu felhő speciális légijármű megfigyeléseket a vulkanikus tevékenység különleges légijelentés formátumra kell rögzíteni. A formátum egy példányát tartalmaznia kell a repülési dokumentumnak, amelyet olyan útvonalakon üzemelő járatok részére adnak át, amely útvonalakat az illetékes meteorológiai hatóság véleménye szerint vulkanikus hamu felhők befolyásolhatnak.

6. FEJEZET – ELŐREJELZÉSEK

Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat az 5. Függelék tartalmazza.

6.1 Az előrejelzések értelmezése és felhasználása

6.1.1 A meteorológiai elemek térbeli és időbeli változása, az előrejelzési módszerek korlátjai, és néhány elem meghatározásában előforduló korlátozások miatt, egy előrejelzésben megadott bármely elemre vonatkozó értéket a fogadó félnek úgy kell értelmeznie, mint azt a legvalószínűbb értéket, amelyet az előrejelzési periódus folyamán az elem felvehet. Hasonlóképpen, ha valamely elem előfordulásának vagy megváltozásának idejét adják meg egy előrejelzésben, ezt az időt a legvalószínűbb időpontnak kell felfogni.

Megjegyzés. – Az előrejelzések üzemeltetés szempontjából kívánatos pontosságára vonatkozó útmutatást a B Melléklet tartalmaz.

6.1.2 Egy meteorológiai iroda által kiadott új előrejelzést, mint például egy rendszeres repülőtéri előrejelzést, úgy kell értelmezni, hogy az automatikusan törli bármely ugyanarra az érvényességi időszakra, vagy annak egy részére, ugyanarra a helyre vonatkozó, ugyanolyan típusú, korábban kiadott előrejelzést.

6.2 Repülőtéri előrejelzések

6.2.1 Repülőtéri előrejelzést az illetékes meteorológiai hatóság által kijelölt meteorológiai irodának kell készítenie.

6.2.2 A repülőtéri előrejelzést meghatározott időpontban kell kiadni, és a repülőtéren egy meghatározott időszak alatt várható meteorológiai viszonyokra vonatkozó tömör megállapításból kell állnia.

6.2.3 Repülőtéri előrejelzéseket és ezek módosításait TAF-ként kell kiadni, és a következő információkat kell, a jelzett sorrendben, tartalmazniuk:

a) az előrejelzés fajtájának azonosítása;
b) hely jelző;
c) előrejelzés kiadásának időpontja;
d) hiányzó előrejelzés azonosítása, amikor alkalmazható;
e) az előrejelzés érvényességi dátuma és időszaka;
f) törölt előrejelzés azonosítása, amikor alkalmazható;
g) talajszél;
h) látás;
i) időjárás;
j) felhő; és
k) ezen elemek közül egynek vagy többnek az érvényességi időszak alatt várható lényeges változásai.

A TAF-nak választható elemeket a regionális léginavigációs egyezménnyel összhangban kell tartalmazni

Megjegyzés. – A TAF-ban szereplő látás az előrejelzési domináns látásra vonatkozik.

6.2.4 A repülőtéri előrejelzéseket készítő meteorológiai irodáknak az előrejelzéseket folyamatosan ellenőrizniük kell, és ha szükséges, azonnal módosításokat kell kiadni. Az előrejelzési közlemények hosszát és az előrejelzésekben megjelölt változások számát minimálisra kell korlátozni.

Megjegyzés. – A TAF folyamatos ellenőrzés alatt tartásának módszerére vonatkozó útmutatás a Repülésmeteorológiai eljárások kézikönyve (DOC 8896) (Manual of Aeronautical Meteorological Practice)

6.2.5 Azt a TAF-t, amely nem tartható folytonos ellenőrzés alatt, törölni kell.

6.2.6 **Ajánlás.–** *Egy rendszeres TAF érvényességi időszaka nem lehet kevesebb, mint 6 óra, és nem lehet* *több mint 30 óra; az érvényességi időszakot a regionális léginavigációs egyezményben kell meghatározni. 12 óránál rövidebb időszakra érvényes rendszeres TAF-ot minden 3 órában ki kell adni, és azokat, amelyek 12-30 óráig érvényesek, minden 6 órában kell kiadni.*

6.2.7 TAF kiadása esetén a meteorológiai irodáknak biztosítaniuk kell, hogy egy repülőtéren egyidőben csak egy TAF legyen érvényben.

6.3 Leszállási előrejelzések

6.3.1 Leszállási előrejelzést a regionális léginavigációs egyezmény szerint illetékes meteorológiai hatóság által kijelölt meteorológiai irodának kell készítenie; az ilyen előrejelzéseknek ki kell elégíteniük a helyi felhasználók és a repülőtértől körülbelül egy órás repülési időre lévő légijárművek igényeit.

6.3.2 A leszállási előrejelzéseket trend típusú előrejelzés formájában kell elkészíteni.

6.3.3 Egy trend előrejelzés a repülőtéri időjárási viszonyokban várható jelentős változások tömör ismertetéséből áll, amelyet egy helyi rendszeres, vagy helyi különleges jelentéshez, vagy egy METAR-hoz, vagy SPECI-hez csatolnak. A trend előrejelzés érvényessége 2 óra annak a jelentésnek az időpontjától számítva, amely a leszállási előrejelzés részét képezi.

6.4 Előrejelzések felszálláshoz

6.4.1 Felszállási előrejelzést az illetékes meteorológiai hatóság által kijelölt meteorológiai irodának kell készítenie.

6.4.2 **Ajánlás**. – *A felszállási előrejelzésnek egy meghatározott időszakra kell vonatkoznia, és információkat kell tartalmaznia a futópálya rendszer felett várható viszonyokról, a talajszél irányáról és sebességéről, valamint annak bármilyen megváltozásáról, hőmérsékletről, a nyomásról (QNH), valamint helyi megállapodás szerinti, bármely más elemről.*

6.4.3 **Ajánlás**. – *A felszállási előrejelzést az üzemeltetők és a hajózószemélyzet tagjainak kérésére, 3 órával az indulás várható időpontja előtt rendelkezésükre kell bocsátani.*

6.4.4 **Ajánlás**. – *A felszálláshoz előrejelzéseket készítő meteorológiai irodáknak az előrejelzéseket állandóan felül kell vizsgálniuk, és ha szükséges, azonnal módosításokat kell kiadni.*

6.5 Körzeti előrejelzések kismagasságú repülések részére

6.5.1 Ha a 100-as repülési magasságszint alatt (maximálisan 150-es repülési magasságszintig hegyes területen, vagy ennél nagyobb magasságig, ha szükséges) üzemelő forgalom sűrűsége szükségessé teszi az ilyen repülések számára területi előrejelzések rendszeres kiadását és elosztását, akkor az ilyen előrejelzések kiadásának gyakoriságát, formáját és érvényességének rögzített időtartamát vagy időszakát, és ezek módosítási kritériumait a meteorológiai hatóságnak a felhasználókkal folytatott konzultáció alapján kell meghatároznia.

6.5.2 Amikor a 100-as repülési magasságszint alatt üzemelő járatok sűrűsége megkívánja AIRMET információk kiadását a 7.2.1 ponttal összhangban, az ilyen repüléseknek szóló területi előrejelzéseket az illetékes meteorológiai hatóságok közötti megállapodás szerinti formátumban kell elkészíteni. Ha rövidített köznyelvet használnak, az előrejelzést GAMET területi előrejelzésként kell elkészíteni, jóváhagyott ICAO rövidítéseket és számszerű értékeket alkalmazva; amikor térkép formátumot használnak, az előrejelzést a magassági szélre és magaslégköri hőmérsékletre és a SIGWX jelenségekre vonatkozó előrejelzések kombinációjaként kell elkészíteni. A területi előrejelzéseket úgy kell kiadni, hogy lefedjék a talajszint és a 100-as repülési magasságszint (vagy hegyes területen 150-es repülési magasságszint, vagy ha szükséges, magasabb szint) közötti réteget, és tartalmaznia kell a kismagasságú repülésekre veszélyes útvonali időjárás-jelenségekről szóló információkat az AIRMET információ kiadásának alátámasztására, és a kismagasságú repülések számára szükséges további információkat.

6.5.3 Kismagasságú repülések részére szóló területi előrejelzéseket, amelyeket az AIRMET információk kiadásának elősegítésére a meteorológiai irodák egymás között cserélnek, minden 6 órában ki kell adni egy 6 órás érvényességi időtartamra, és az illetékes meteorológiai irodák részére nem később, mint érvényességi időszakának kezdete előtt egy órával, továbbítani kell.

7. FEJEZET – SIGMET ÉS AIRMET TÁJÉKOZTATÁSOK, REPÜLŐTÉRI FIGYELMEZTETÉSEK ÉS SZÉLNYÍRÁS FIGYELMEZTETÉSEK ÉS RIASZTÁSOK

Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat a 6. Függelék tartalmazza.

7.1 SIGMET tájékoztatás

7.1.1 A SIGMET tájékoztatást meteorológiai figyelő irodának kell kiadnia, amelynek rövidített köznyelven, azoknak a meghatározott útvonali időjárási jelenségeknek tényleges vagy várható előfordulását kell tömören megadnia, melyek befolyásolhatják a légi üzemelés biztonságát, valamint meg kell adnia ezeknek a jelenségeknek időbeli és térbeli alakulását.
7.1.2 A SIGMET tájékoztatást törölni kell, ha a jelenség már nem fordul elő, vagy előfordulása az adott területen a továbbiakban nem várható.
7.1.3 A SIGMET közlemény érvényességi időtartama nem lehet több 4 óránál. A vulkanikus hamu felhőre és trópikus ciklonokra vonatkozó SIGMET közlemények speciális esetében az érvényességi időtartamot maximum 6 órára ki kell terjeszteni.
7.1.4 **Ajánlás**. – *Vulkanikus hamu felhőre illetve trópusi ciklonokra vonatkozó SIGMET közleményeknek a regionális léginavigációs egyezményben kijelölt VAAC-ok illetve TCAC-ok által kiadott tájékoztató infomációkon kell alapulni.*
7.1.5 Szoros együttműködést kell fenntartani a meteorológiai figyelő iroda és a hozzátartozó körzeti irányító központ/repülési információs központ között annak biztosítása érdekében, hogy a SIGMET és a NOTAM közleményekben lévő információk a vulkanikus hamuról, konzisztensek legyenek.
7.1.6 SIGMET üzeneteket az érvényességi időtartam kezdete előtt nem több, mint 4 órával kell kiadni. A vulkanikus hamu felhőre és trópusi ciklonokra vonatkozó SIGMET közlemények speciális esetében ezeket a közleményeket amint lehetséges, de az érvényességi időszak kezdete előtt nem több, mint 12 órával kell kiadni. A vulkanikus hamu felhőre és trópusi ciklonokra vonatkozó SIGMET közleményeket legalább minden 6 órában frissíteni kell.

7.2 AIRMET tájékoztatás

7.2.1 AIRMET tájékoztatást a meteorológiai megfigyelő iroda ad ki a regionális légi-navigációs egyezménynek megfelelően, figyelembe véve a 100-as repülési magasságszint alatti légiforgalmi sűrűséget. AIRMET tájékoztatásnak rövidített köznyelven rövid leírást kell adni meghatározott útvonali időjárás jelenségek előfordulásáról és/vagy várható előfordulásáról, amelyeket nem tartalmaz a kismagasságú repülések részére a 6. Fejezet 6.5 szakaszban leírtakkal összhangban kiadott területi előrejelzés I. szakasza, és amelyek kihatással lehetnek a kismagasságú repülések biztonságára, valamint a szóbanforgó jelenségek időbeli és térbeli alakulásáról.
7.2.2 AIRMET tájékoztatást törölni lehet, ha a jelenségek már nem állnak fenn, vagy megjelenésük már nem várható a területen.
7.2.3 Az AIRMET közlemény érvényességi időszaka nem lehet több 4 óránál.

7.3 Repülőtéri figyelmeztetések

7.3.1 A repülőtéri figyelmeztetéseket az illetékes meteorológiai hatóság által kijelölt meteorológiai irodának kell kiadnia, és ezeknek tömör információt kell adniuk olyan meteorológiai körülményekről, amelyek károsan befolyásolhatják a földön lévő légijárműveket, beleértve a parkoló légijárműveket is, valamint a repülőtéri létesítményeket és szolgálatokat.
7.3.2 **Ajánlás**- – *Repülőtéri figyelmeztetéseket törölni kell, amikor a repülőtéren a körülmények már nem állnak fenn és/vagy bekövetkezésük már nem várható.*

7.4 Szélnyírás figyelmeztetések és riasztások

Megjegyzés. – Útmutatást a szélnyírás tárgyában a Szélnyírás kézikönyv (Doc 9817). (Manual on Wind Shear) *tartalmaz. Szélnyírás riasztások elvárhatóan kiegészítik a szélnyírás figyelmeztetéseket, és együtt a* *szélnyírási szituáció tudatának erősítését szolgálják.*

7.4.1 A szélnyírás figyelmeztetéseket a meteorológiai hatóság, mely azoknál a repülőtereknél illetékes, amelyeknél a szélnyírás tényezőként szerepel, által kijelölt meteorológiai hivatalnak kell elkészítenie, a megfelelő ATS egységgel és az illetékes üzemeltetőkkel kötött megállapodásnak megfelelően. A szélnyírás figyelmeztetéseknek tömör információt kell adnia a megfigyelt vagy várhatóan megjelenő szélnyírásról, amely hátrányosan befolyásolhatja a légijárművet a megközelítési pályán, vagy a felszálló pályán, vagy körös megközelítés alatt a futópálya szint és e szint feletti 500 m-es (1600 láb) szint között, és a futópályán leszállási kigurulás vagy felszállási nekifutás végzése közben. Ahol a helyi terepviszonyok jelentős szélnyírás létesítését mutatják 500 m-t (1600 láb) a futópálya szint felett meghaladó magasságokon, ott az 500 m (1600 láb) nem tekinthető korlátozó értéknek.

7.4.2 **Ajánlás**. – *Az érkező és/vagy induló légijárművek számára szóló szélnyírási figyelmeztetést törölni kell, ha légijármű jelentések jelzik, hogy szélnyírás a továbbiakban nem áll fenn, vagy alternatívaként, egy megállapodás szerinti idő eltelte után. A szélnyírásról szóló figyelmeztetés megszüntetésének kritériumait minden repülőtérre helyileg kell megállapitani a meteorológiai hatóság, az illetékes ATS hatóság és az érintett üzemeltetők megállapodásának megfelelően.*

7.4.3 Azokon a repülőtereken, ahol a szélnyírást automatikus, földi telepítésű, szélnyírás távérzékelő vagy észlelő berendezéssel észlelik, ezekkel a rendszerekkel generált szélnyírás riasztásokat kell kiadni. A szélnyírás riasztásoknak tömör, frissített információt kell adni a szélnyírás megfigyelt létezéséről, amely 30 km/óra (15 csomó) vagy ennél nagyobb szembeszél/hátszél változásokat produkál, ami károsan befolyásolhatja a végső megközelítési pályán, vagy kezdeti felszálló pályán lévő légijárműveket, és a futópályán a leszállási kigurulást vagy felszállási nekifutást végző légijárműveket.

7.4.4 **Ajánlás. –** *A szélnyírás riasztást legalább minden percben frissíteni kell. A szélnyírás riasztást törölni kell, mihelyt a szembeszél/hátszél változás 30 km/óra (15 csomó) alá esik.*

8. FEJEZET. – REPÜLÉSKLIMATOLÓGIAI INFORMÁCIÓK

Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat a 7. Függelék tartalmazza.

8.1 Általános előírások

Megjegyzés. – Olyan esetekben, amikor a repülésklimatológiai információs követelményeket nemzeti alapon nem lehetséges kielégíteni, a megfigyelési adatok gyűjtését, feldolgozását és tárolását nemzetközi használatra rendelkezésre álló számítógépes eszközökkel is végre lehet hajtani, valamint a megkívánt repülésklimatológiai információ készítésének felelősségét az érintett meteorológiai hatóságok közötti megegyezés alapján át lehet ruházni.

8.1.1 A légi üzemeltetés tervezéséhez igényelt repülésklimatológiai információkat repülőtéri klimatológiai táblázatok és repülőtéri klimatológiai összefoglalók formájában kell elkészíteni. Az ilyen információkat repülési felhasználók részére a meteorológiai hatóság és az érintett felhasználók közötti megállapodás szerint kell szolgáltatni.

Megjegyzés. – Repülőtér-tervezési célokra szükséges klimatológiai adatok a 14. Annex I. Kötet, 3.1.4. pontjában és az A Mellékletben találhatók.

8.1.2 **Ajánlás**. – *A repülésklimatológiai információknak általában legalább 5 éven keresztül végzett megfigyeléseken kell alapulniuk, és ezt az időszakot meg kell jelölni a szolgáltatott információban.*

8.1.3 **Ajánlás**. – *Új repülőterek létesítésének helyére, valamint meglévő repülőtereken kialakítandó további futópályákra vonatkozó klimatológiai adatok gyűjtését a repülőterek, illetve futópályák üzembe helyezését megelőzően, a lehető legkorábban kell elkezdeni.*

8.2 Repülőtéri klimatológiai táblázatok

Ajánlás – *Minden Szerződő Állam intézkedjen a szükséges megfigyelési adatok gyűjtéséről és megőrzéséről, továbbá legyen képes:*

a) repülőtéri klimatológiai táblázatok készítésére a területén belül lévő valamennyi, a nemzetközi légiforgalom által rendszeresen és kitérőként használt repülőtérre; és *b) ezeknek a klimatológiai táblázatoknak elérhetővé tételére valamely légiforgalmi felhasználó számára egy olyan időszakon belül, amelyet a meteorológiai hatóság és a felhasználó közötti megállapodás tartalmaz.*

8.3 Repülőtéri klimatológiai összefoglalók

Ajánlás. – *A repülőtéri klimatológiai összefoglalókat a Meteorológiai Világszervezet által előírt eljárásoknak megfelelően kell készíteni. Amennyiben az információk tárolására, feldolgozására és visszakeresésére számítógépes eszközök állnak rendelkezésre, az összefoglalókat publikálni kell, vagy kérésükre egyéb módon a repülési felhasználók rendelkezésére kell bocsátani. Ahol ilyen számítógépes eszközök nincsenek, az összefoglalókat a Meteorológiai Világszervezet által meghatározott minták felhasználásával kell elkészíteni, ezeket ki kell adni és szükség szerint naprakészen kell tartani.*

8.4 A meteorológiai megfigyelési adatok példányai

Minden meteorológiai hatóság, kívánságra és a lehetőségekhez mérten, tegye hozzáférhetővé bármely más meteorológiai hatóság, üzemeltető és egyéb, a meteorológiának a nemzetközi légiközlekedésben való alkalmazásában érdekelt fél részére az eredeti meteorológiai észlelési adatok másolatait, amelyek kutatáshoz, kivizsgáláshoz vagy üzemeltetési analízishez szükségesek.

9. FEJEZET – ÜZEMELTETŐK ÉS REPÜLŐSZEMÉLYZETI TAGOK RÉSZÉRE NYÚJTOTT SZOLGÁLTATÁSOK

Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat a 8. Függelék tartalmaz.

9.1 Általános előírások

9.1.1 Meteorológiai információkat kell szolgáltatni az üzemeltetők és a hajózószemélyzet részére a következőkhöz:

a) az üzemeltetők által végzett repülés-előtti tervezéshez

b) üzemeltetők által, repülésüzemeltetés központosított üzemelés-irányításának felhasználásával végrehajtott, repülés közbeni áttervezéshez;

c) a hajózószemélyzet tagjai általi felhasználásra indulás előtt; és

d) repülést végző légijárművek számára.

9.1.2 Az üzemeltető és a hajózószemélyzeti tagok részére szolgáltatott információknak le kell fedniük a repülést idő, magasság és földrajzi kiterjedés szempontjából. Ennek megfelelően, az információnak a megfelelő rögzített időpontokra vagy időszakokra kell vonatkoznia, és a célrepülőtérig kell terjednie, és tartalmaznia kell a célrepülőtér és az üzemeltető által kijelölt kitérő repülőtér között várható meteorológiai viszonyait.

9.1 3 Az üzemeltetők és a hajózószemélyzeti tagok részére szolgáltatott meteorológiai információknak frissítettnek kell lenniük, és a következő információkat kell tartalmazniuk, ahogyan azt a meteorológiai hatóság az érintett üzemeltetőkkel megbeszélve megállapította:

a) az alábbiakra vonatkozó előrejelzések:

1) magassági szél és magaslégköri hőmérséklet;
2) magaslégköri nedvesség;
3) repülési magasságszintek geopotenciális magassága;
4) a tropopauza repülési magasságszintje és hőmérséklete;
5) maximális szél iránya, sebessége és repülési magasságszintje; és
6) SIGWX jelenségek.

Megjegyzés. – A magaslégköri nedvességre és a repülési magasságszintekre vonatkozó előrejelzéseket csak automatikus repüléstervezésben használják, és nem kell kijelezni.

b) METAR vagy SPECI (magában foglalva a trend előrejelzéseket, ahogyan a regionális léginavigációs egyezménynek megfelelően kiadták) az indulási- és célrepülőtérre, és felszállási, útvonali és rendeltetési kitérő repülőtérre;

c) TAF vagy módosított TAF az indulási- és célrepülőtérre, és felszállási, útvonali és rendeltetési kitérő repülőtérre;
d) felszállási előrejelzés;
e) SIGMET tájékoztatás és a teljes útvonalra érvényes megfelelő különleges légijelentések

Megjegyzés. – Megfelelő különleges légijelentések azok lesznek, amelyek nem kerültek már felhasználásra a SIGMET elkészítésénél.

f) regionális léginavigációs egyezmény szerint, GAMET területi előrejelzés és/vagy területi előrejelzések kismagasságú repülések számára térkép formában, amelyek AIRMET tájékoztatás kiadásának támogatására készülnek, és a teljes útvonalra érvényes AIRMET tájékoztatás kismagasságú repülések részére;
g) repülőtéri figyelmeztetések a helyi repülőtér számára;
h) meteorológiai műhold felvételek; és
i) földi telepítésű időjárás radar információk.

9.1.4 A 9.1.3a) pont alatt felsorolt előrejelzéseket a WAFC-ok által szolgáltatott digitális előrejelzésekből kell generálni, amikor ezek az előrejelzések időben, tengerszint feletti magasságban és földrajzi kiterjedésben lefedik a tervezett repülési pályát, hacsak a meteorológiai hatóság és az érintett üzemeltető között nem született más megállapodás.

9.1.5 Amikor előrejelzéseket a WAFC-októl származóként azonosítanak, ezek meteorológiai tartalmát nem lehet módosítani.

9.1.6 A WAFC-ok által szolgáltatott digitális előrejelzésekből generált térképeket az üzemeltetők kívánságára rendelkezésre kell bocsátani rögzített lefedési területekre, ahogyan azt a 8. Függelék A8-1, A8-2 és A8-3 ábrái mutatják.

9.1.7 Amikor a 9.1.3a) pont alatt felsorolt magassági szélre és magaslégköri hőmérsékletre vonatkozó előrejelzéseket térkép formájában szolgáltatják, ezeknek a repülési magasságszintekre vonatkozó, rögzített idejű prognosztikai térképeknek kell lenniük, ahogyan az a 2. Függelék 1.2.2a) pontjában elő van írva. Amikor a 9.1.3a) 6 pont alatt felsorolt SIGWX jelenségekre vonatkozó előrejelzéseket térkép formájában szolgáltatják, ezeknek rögzített idejű prognosztikai térképeknek kell lenniük az atmoszféra repülési magasságszintek által korlátozott részére, a 2. Függelék 1.3.2 pontjában és az 5. Függelék 4.3.2 pontjában előírtaknak megfelelően.

9.1.8 Az üzemeltető által a repülés előtti tervezéshez és a repülés alatti áttervezéshez kért, a 100-as repülési magasságszint feletti magassági szélre és a magaslégköri hőmérsékletre vonatkozó előrejelzéseket mihelyt rendelkezésre állnak, de az indulás előtt 3 óránál nem később, szolgáltatni kell. A repülés előtti tervezéshez és a repülés alatti áttervezéshez az üzemeltető által kért egyéb meteorológiai információkat a lehető leghamarabb szolgáltatni kell.

9.1.9 Amikor szükséges, az üzemeltetők és a hajózószemélyzeti tagok számára szolgáltatást nyújtó Állam meteorológiai hatósága koordinációt köteles kezdeményezni más Államok meteorológiai hatóságaival, annak érdekében, hogy beszerezze tőlük a szükséges jelentéseket és/vagy előrejelzéseket.

9.1.10 A meteorológiai információkat az üzemeltető és a hajózószemélyzet tagjai számára a meteorológiai hatóság által az üzemeltetőkkel folytatott konzultációk után, meghatározott helyen, a meteorológiai iroda és az érintett üzemeltető közötti megállapodásnak megfelelő időben kell szolgáltatni. A szolgáltatásnak rendes körülmények között az érintett Állam területéről induló járatokra kell korlátozódnia, hacsak nem születik más megállapodás a meteorológiai hatóság és az érintett üzemeltető között. Meteorológiai irodával nem rendelkező repülőtéren a meteorológiai információk nyújtására vonatkozó intézkedések a meteorológiai hatóság és az érdekelt üzemeltető között létrejött megállapodás szerintiek.

9.2 Eligazítás, konzultáció és kijelzés

Megjegyzés – Automatizált repülés előtti információs rendszerek eligazítás, konzultáció és kijelzés szolgáltatására való felhasználására vonatkozó követelmények a 9.4 szakaszban találhatók.

9.2.1 Kívánságra eligazítást és/vagy konzultációt kell biztosítani a hajózószemélyzet tagjainak és/vagy egyéb légiüzemeltetési személyzetnek. Ennek célja az, hogy megadja a legutóbbi rendelkezésre álló információkat a repülendő légiútvonalon fennálló és várható meteorológiai viszonyokról, valamint a tervezett rendeltetési repülőtérre, kitérő repülőtérre és egyéb érintett repülőterekre vonatkozóan, akár az, hogy

magyarázatot és megerősítést adjon a repülési dokumentációban található információkra, akár a meteorológiai hatóság és az üzemeltető megállapodása alapján repülési dokumentáció helyett szerepeljen.
9.2.2 Az eligazításhoz, konzultációhoz és kijelzésre szolgáló meteorológiai információknak magukban kell foglalniuk a 9.1.3 pontban felsoroltak közül az egyiket vagy mindegyiket.
9.2.3 Ha a meteorológiai iroda olyan véleményt nyilvánít, hogy valamely repülőtéren a meteorológiai viszonyok alakulása jelentősen eltér a repülési dokumentációban lévő repülőtéri előrejelzéstől, akkor a hajózószemélyzet tagjainak figyelmét fel kell hívni erre az eltérésre. Az eligazításnak az eltéréssel foglalkozó részét az eligazítás idején rögzíteni kell, és hozzáférhetővé kell tenni az üzemeltető számára.
9.2.4 Az igényelt eligazítást, konzultációt, kijelzést és/vagy repülési dokumentációt általában az indulási repülőteret kiszolgáló meteorológiai irodának kell biztosítania. Olyan repülőtéren, ahol ezek a szolgáltatások nem biztosíthatók, a hajózószemélyzet kívánságainak teljesítésére irányuló intézkedéseknek a meteorológiai hatóság és az érdekelt üzemeltető közötti megállapodásnak megfelelőknek kell lenniük. Kivételes körülmények között, mint pl. nagyobb késés, a repülőtérhez tartozó meteorológiai irodának új eligazítást, konzultációt és/vagy repülési dokumentációt kell, szolgáltatni, vagy ha ez nem megvalósítható, akkor intézkednie kell új eligazításról, konzultációról és/vagy repülési dokumentációról, ahogyan szükséges.
9.2.5 **Ajánlás** – *A hajózószemélyzet tagjának vagy más légiüzemeltetési személynek, akinek a részére az eligazítást, konzultációt és/vagy repülési dokumentációt igényelték, fel kell keresnie a meteorológiai irodát, a meteorológiai iroda és az érintett üzemeltető közötti megállapodásban előírt időben. Ha egy repülőtéren a helyi körülmények a személyes eligazítást vagy konzultációt nem teszik lehetővé, a meteorológiai irodának ezeket a szolgáltatásokat telefonon vagy egyéb megfelelő távközlési eszközök segítségével kell biztosítania.*

9.3 Repülési dokumentáció

Megjegyzés. – Automatikus repülés előtti információs rendszerek repülési dokumentációban való felhasználására vonatkozó előírások a 9.4 szakaszban találhatók.
9.3.1 Repülésdokumentációnak a 9.1.3 a) 1) és 6), b), c), e) és, amennyiben alkalmas, f) alatt felsorolt információkat kell tartalmaznia. Azonban, ha a meteorológiai hatóság és az érdekelt üzemeltető megegyezett, két óra vagy ennél kisebb időtartamú repülések repülési dokumentációját rövid megállás vagy fordulás után az üzemeléshez szükséges információkra kell korlátozni, de a dokumentációnak minden esetben tartalmaznia kell legalább a 9.1.3 b), c), e) és ha megfelelő, f) pontot.
9.4.3 Amikor nyilvánvalóvá válik, hogy a meteorológiai információk, amelyek a repülési dokumentációba kerülnek, lényegesen különbözni fognak, amelyet a repülés előtti tervezéshez és a repülés közbeni újratervezéshez rendelkezésre bocsátottak, az üzemeltetőt haladéktalanul értesíteni kell, és ha megvalósítható, revidiált információval el kell látni, ahogyan az üzemeltető és az illetékes meteorológiai iroda megállapodott.
9.3.2 Amikor nyilvánvalóvá válik, hogy a repülési dokumentáció által tartalmazott meteorológiai információ el fog térni a repülés előtti tervezéshez és a repülés alatti áttervezéshez rendelkezésre bocsátott re4pülési dokumentációtól, az üzemeltetőt haladéktalanul értesíteni kell, és ha megvalósítható, el kell látni a javított információval, az illetékes meteorológiai hatóság és üzemeltető közötti megállapodás szerint.
9.3.3 **Ajánlás** – *Abban az esetben, amikor a módosítás szükségessége a repülési dokumentáció kiadása után és a légijármű felszállása előtt merül fel, a meteorológiai irodának, a helyi megállapodásnak megfelelően, ki kell adni a szükséges módosítást vagy a felfrissített információt az üzemeltető számára, vagy a helyi légiforgalmi szolgálati egység részére, a légijárműhöz való továbbítás céljából.*
9.3 4 A meteorológiai hatóság őrizze meg a hajózószemélyzet tagjainak szolgáltatott információkat vagy nyomtatott példány, vagy számítógépes fájlok formájában, a kiadás keltétől legalább 30 napig. Az információkat kérésre hozzáférhetővé kell tenni érdeklődés vagy kivizsgálás céljára és ezek befejezéséig azokat meg kell őrizni.

9.4 Automatizált repülés előtti információs rendszerek eligazításhoz, konzultációhoz, repülésterve-

zéshez és repülési dokumentációhoz

9.4.1 Ahol a meteorológiai hatóság automatizált repülés előtti információs rendszereket használ az üzemeltetők és a repülő személyzeti tagok meteorológiai információkkal való ellátására és ezek kijelzésére eligazítás, repülés tervezés és repülés dokumentáció céljaira, a szolgáltatott és kijelzett információknak eleget kell tenniük a 9.1 - 9.3 szakaszok releváns előírásainak.

9.4.2 **Ajánlás.** *–Az üzemeltetők, repülőszemélyzeti tagok és más repülésben érdekelt személyek részére meteorológiai információkhoz és repülési információs szolgáltatási információkhoz összehangolt, közös pontú hozzáférést biztosító automatikus repülés előtti információs rendszereket kell létrehozni a meteorológiai hatóság és az illetékes polgári repülési hatóság, vagy azon hivatal közötti szerződés segítségével, amelybe a szolgáltatást végző hatóság delegálva van, a 15. Annex 3.1.1 c) pontjával összhangban.*

Megjegyzés – A szóbanforgó meteorológiai illetve a repülési információs szolgáltatási információkat a 9.1 – 9.3 szakaszok és a 8. Függelék és a 15.Annex 8.1 és 8.2 szakaszai ismertetik.

9.4 3 Ahol üzemeltetők, repülőszemélyzeti tagok és más repülésben érdekelt személyek részére meteorológiai információkhoz és repülési információs szolgáltatási információkhoz összehangolt, közös pontú hozzáférést biztosító automatikus repülés előtti információs rendszert használnak, az ilyen rendszerek által szolgáltatott meteorológiai információk minőségi ellenőrzésének és minőségmenedzselésének az érintett meteorológiai hatóság kötelezettségében kell maradnia, a 2. Fejezet 2.2.2 ponttal összhangban.

Megjegyzés. – A repülési információs szolgálati információkra és az információk minőségbiztosítására vonatkozó kötelezettségeket a 15. Annex 3. Fejezet tartalmazza.

9.5 Információk repülést végző légijárművek részére

9.5.1 A repülést végző légijárművek részére felhasználás céljára adott meteorológiai információkat a meteorológiai irodának a vele kapcsolatban álló légiforgalmi szolgálati egységnek kell továbbítania és D-VOLMET vagy VOLMET adásban sugároznia, ahogyan azt regionális léginavigációs egyezmény meghatározza. A repülést végző légijármű számára az üzemeltető által végzett tervezéshez szolgáló meteorológiai információkat kívánságra meg kell adni, a meteorológiai hatóság vagy hatóságok és az érintett üzemeltető közötti megállapodásnak megfelelően.

9.5.2 A repülést végző légijármű általi felhasználásra szolgáló meteorológiai információkat a 10. Fejezet előírásainak megfelelően kell eljuttatni a légiforgalmi szolgálati egységhez.

9.5.3 A meteorológiai információkat D-VOLMET vagy VOLMET adás segítségével kell szolgáltatni, a regionális léginavigációs egyezmény rendelkezéseinek és a 11. Fejezet előírásainak megfelelően.

10. FEJEZET – INFORMÁCIÓK A LÉGIFORGALMI SZOLGÁLATOK, A KUTATÓ ÉS MENTŐ SZOLGÁLATOK ÉS REPÜLÉSI TÁJÉKOZTATÓ SZOLGÁLATOK RÉSZÉRE

Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat a 9. Függelék tartalmazza.

10.1 Információk légiforgalmi szolgálati egységek részére

10.1.1 A meteorológiai hatóság jelöljön ki egy meteorológiai irodát, amely az egyes légiforgalmi szolgálati egységekkel kapcsolódik. A kapcsolódó meteorológiai irodának a légiforgalmi szolgálati egységgel való koordináció után, szolgáltatnia kell a legfrissebb meteorológiai információkat az egység részére, vagy intézkednie kell a friss információk biztosításáról, ahogyan az feladatainak ellátásához szükséges.

10.1.2 **Ajánlás** *– Repülőtéri irányító toronyhoz, vagy körzeti irányító egységhez kapcsolódó meteorológiai iroda repülőtéri meteorológiai iroda legyen.*

10.1.3 Repülési központhoz, vagy területi irányító központhoz rendelt meteorológiai iroda meteorológiai megfigyelő iroda legyen.

10.1.4 **Ajánlás** *– Ahol helyi körülmények miatt, célszerű valamely hozzárendelt meteorológiai iroda feladatait két vagy több meteorológiai iroda között megosztani, a felelősség megosztását a meteorológiai hatóságnak kell meghatároznia, az érintett ATS hatósággal folytatott konzultáció alapján.*

10.1.5 Bármely, a légiforgalmi szolgálati egység által kért meteorológiai információt, amely a légijárművek vészhelyzetével kapcsolatos, olyan gyorsan kell megadni, amennyire az lehetséges.

10.2 Információk a kutató és mentő szolgálati egységek részére

A regionális léginavigációs megállapodásnak megfelelően, a meteorológiai hatóság által kijelölt meteorológiai irodáknak a kutató-mentő szolgálati egységeket el kell látniuk az általuk kért információkkal, a kölcsönös megegyezés alapján létrehozott formában. E célból a kijelölt meteorológiai állomásnak kapcsolatot kell tartani a kutató-mentő szolgálati egységgel a kutató-mentő művelet során.

10.3 Információk a repülési információs szolgálati egységek részére

A meteorológiai hatóságnak, az illetékes polgári repülési hatósággal koordinálva, biztosítania kell a releváns repülési információs szolgálati egységek ellátását aktuális meteorológiai információkkal, feladataik ellátása érdekében.

11. FEJEZET – A KOMMUNIKÁCIÓVAL ÉS HASZNÁLATÁVAL SZEMBEN TÁMASZTOTT KÖVETELMÉNYEK

1. Megjegyzés. – Erre a fejezetre vonatkozó műszaki specifikációkat és részletes kritériumokat a 10. Függelék tartalmazza.

2. Megjegyzés – Elismert, hogy minden szerződő állam maga dönt a jelen fejezetben szereplő kommunikációs eszközök megvalósítását illető saját belső szervezeti és kötelezettségi kérdésekben.

11.1 Kommunikációval szembeni követelmények

11.1.1 Megfelelő távközlési eszközöket kell biztosítani annak érdekében, hogy a repülőtéri meteorológiai irodák és szükség szerint a repülésmeteorológiai állomások továbbíthassák a megkívánt meteorológiai információkat az azokon a repülőtereken lévő légiforgalmi szolgálati egységeknek, melyekért ezek a hivatalok, illetve állomások felelősek, különös tekintettel az ezeket a repülőtereket kiszolgáló repülőtéri irányító tornyokra, bevezető irányító egységekre és repülési távközlési állomásokra.

Megjegyzés. – Repülési helyhezkötött szolgálat áramköreit üzemelési meteorológiai információk gyűjtésére és regionális és interregionális cseréjére, valamint a nemzetközi üzemelési meteorológiai adatbankokhoz való hozzáféréshez használják. Három, globális lefedést szolgáltató repülési helyhezkötött szolgálati műholdas elosztó rendszert használnak az üzemelési meteorológiai információk regionális és interregionális cseréjének támogatására. A műholdas elosztó rendszerekre vonatkozó előírásokat a 10. Annex, III. Kötet, I. Rész 10.1 és 10.2 pontja tartalmaz.

11.1.2 Megfelelő távközlési eszközöket kell rendelkezésre bocsátani annak érdekében, hogy a meteorológiai figyelő irodák továbbíthassák a megkívánt meteorológiai információkat a légiforgalmi és mentő szolgálati egységek számára azon repülési információs régiókra, irányítói területekre, valamint kutatási és mentési régiókra vonatkozóan, melyekért ezek az irodák felelősek, különös tekintettel a repülési információs központokra, valamint a mentést koordináló központokra, és az ezekhez tartozó repülési távközlési állomásokra.

11.1.3 Megfelelő távközlési eszközöket kell rendelkezésre bocsátani annak érdekében, hogy a világ és a regionális területi előrejelző központok továbbíthassák a kívánt világterületi előrejelző rendszer anyagait a meteorológiai irodák, meteorológiai hatóságok és egyéb felhasználók számára.

11.1.4 A meteorológiai irodák, illetve szükség esetén a repülésmeteorológiai állomások és a repülőtéri irányítótornyok, vagy bevezető irányító egységek közötti távközlési eszközöknek lehetővé kell tenniük a közvetlen beszéd kommunikációt, a sebesség, amellyel a kommunikáció létrehozható, olyan legyen, hogy a kívánt pontok között a kapcsolat, rendes körülmények között, közelítőleg 15 másodpercen belül létrehozható legyen.

11.1.5 **Ajánlás** – *A meteorológiai irodák és a repülési információs központok, területi irányító központok, mentést koordináló központok és repülési távközlési állomások közötti távközlési eszközök tegyék lehetővé a következőket:*

a) a közvetlen beszéd kommunikációt, a sebesség, amellyel a kommunikációt létrehozzák, olyan legyen, hogy a kívánt ponttal való kapcsolat rendes körülmények között, közelítőleg 15 másodpercen belül megte-

remthető legyen; és
b) nyomtatott formájú kommunikációt, ha a fogadó felek a rögzítést megkívánják; a közlemény továbbítási ideje ne haladja meg az 5 percet.
Megjegyzés – A 11.1.4 és a 11.1.5 pontokban szereplő „közelítőleg 15 másodperc" a távbeszélő központon keresztüli telefon kommunikációra, az „5 perc" pedig a továbbküldést is magában foglaló, nyomtatott kommunikáció küldésre vonatkozik.
11.1.6 **Ajánlás** – *A 11.1.4 és a 11.1.5 pontoknak megfelelő távközlési eszközöket, ahol és amikor szükséges, ki kell egészíteni vizuális vagy audio kommunikáció egyéb formáival, például zártláncú televízióval vagy külön információ feldolgozó rendszerekkel.*
11.1.7 **Ajánlás** – *A meteorológiai hatóság és az üzemeltetők közötti megállapodás szerint rendelkezni kell arról, hogy lehetővé tegyék az üzemeltetők számára megfelelő távközlési eszközök létesítését, a repülőtéri meteorológiai irodáktól, illetve más megfelelő forrásoktól történő meteorológiai információk beszerzéséhez.*
11.1.8 Megfelelő távközlési eszközöknek kell rendelkezésre állni ahhoz, hogy a meteorológiai irodák kicserélhessék az üzemeltetési meteorológiai információkat más meteorológiai irodákkal.
11.1.9 **Ajánlás** – *Üzemeltetési meteorológiai információk cseréjére használt távközlési eszköz a repülési állandóhelyű szolgálat legyen.*

11.2 Repülési állandó helyű szolgálati kommunikáció felhasználása – alfanumerikus formátumú meteorológiai bulletinek

A légiforgalmi állandó helyű szolgálaton keresztül továbbított üzemeltetési meteorológiai információkat tartalmazó bulletineket a megfelelő meteorológiai irodának vagy meteorológiai állomásnak kell eredeztetnie.
Megjegyzés. – A légiforgalmi állandó helyű szolgálaton keresztüli továbbításra engedélyezett, üzemeltetési meteorológiai infomációkat tartalmazó meteorológiai bulletinek felsorolása a 10. Annex , II. Kötet 4. Fejezetében található, a megfelelő prioritással és prioritás jelölővel együtt.

11.3 A repülési helyhezkötött szolgálati kommunikáció felhasználása – a világ területi előrejelző rendszer anyagai

Ajánlás – *A világterületi előrejelző rendszer adatait digitális formában bináris adatkommunikációs technika alkalmazásával kell továbbítani. Az anyagok szétosztásának módszere és az erre használt kommunikációs csatornák feleljenek meg a regionális léginavigációs egyezményben meghatározottaknak.*

11.4 A repülési mozgószolgálati kommunikáció felhasználása

A légijárműveknek és a légijárművek által továbbított meteorológiai információk tartalma és formája legyen konzisztens a jelen Annex előírásaival.

11.5 Repülési adatkapcsolat szolgáltatás felhasználása – D-VOLMET tartalma

A D-VOLMET tartalmazzon aktuális METAR-t és SPECI-t trend előrejelzésekkel együtt, ahol rendelkezésre áll, TAF és SIGMET közleményeket, különleges légi-jelentéseket, amelyeket SIGMET nem fed le, és ahol rendelkezésre áll, AIRMET közleményeket.
Megjegyzés – METAR és SPECI kód formájú jelentések szolgáltatásának követelményei kielégíthetők az adatkapcsolati repülési információ szolgáltatás (D-FIS) alkalmazásával, amely az „Adatkapcsolat-repülési rendszeres időjárás jelentés (D-METAR) szolgáltatás" címet viseli; a TAF szolgáltatásának követelménye kielégíthető a D-FIS alkalmazásával, amely az „Adatkapcsolati-repülőtéri előrejelzés (D-TAF) szolgáltatás" címet viseli, és a SIGMET és AIRMET közlemények szolgáltatásának követelménye kielégíthető a D-FIS alkalmazásával, amely az „Adatkapcsolati SIGMET (D-SIGMET)szolgáltatás" címet viseli. Ezekről az adatkapcsolatokról részletes leírás a Manual of Air Traffic Services Data Link Applications (Légiforgalmi szolgálat adatkapcsolat alkalmazási kézikönyv) *(Doc. 9694) kiadványban található.*

11.6 A repülési rádióadási szolgáltatás felhasználása – VOLMET rádióadások tartalma

11.6.1 Az általában nagyon nagy frekvenciás (VHF), folyamatos VOLMET rádióadásoknak aktuális METAR-t és SPECI-t kell tartalmazniuk, trend előrejelzésekkel együtt, ahol rendelkezésre áll.
11.6.2 Az általában nagyfrekvenciás (HF) sugárzott rendszeres VOLMET adásoknak aktuális METAR-t és SPECI-t kell tartalmazniuk, trend előrejelzésekkel együtt, ahol rendelkezésre áll, valamint ha a regionális léginavigációs egyezmény előírja, TAF-t és SIGMET-et.

1. Szignifikáns időjárás szimbólumok

A táblázat szövegei
1 Trópusi ciklon
2 Erős széllökés vonal*
3 Mérsékelt turbulencia

4 Erős turbulencia
5 Hegyi hullám
6 Mérsékelt légijármű jegesedés
7 Erős légijármű jegesedés
8 Nagykiterjedésű köd
9 Radioaktív anyagok az atmoszférában**
10 Vulkánkitörés***
11 Hegyi takarás
12 Szitálás
13 Eső
14 Hó
15 Zápor
16 Jégeső
17 Nagykiterjedésű hófúvás
18 Erős homok vagy por miatti homály
19 Nagykiterjedésű homokvihar vagy porvihar
20 Nagykiterjedésű homály
21 Nagykiterjedésű párásság
22 Nagykiterjedésű füst
23 Ónos csapadék*****

24 *A 100-as repülési magasságszintig a repülés közbeni dokumentációban. Ez a szimbólum "széllökés vonal"-ra utal.
25 **A következő információkat a térkép oldalán kell elhelyezni: radioaktív anyagok szimbóluma; a baleset helyszínének földrajzi szélessége/hosszúsága; a baleset dátuma és időpontja; ellenőrzési NOTAM a következő információnál.
26 ***A következő információk azokra a szimbólumokra vonatkoznak, amelyek a térkép oldalán vannak feltüntetve: vulkánkitörés; a vulkán neve (ha ismert); földrajzi hosszúság/szélesség; az első kitörés dátuma és időpontja (ha ismert); vulkánikus hamura vonatkozó SIGMET-ek és NOTAM vagy ASHTAM ellenőrzése
27 ****Ez a szimbólum nem vonatkozik nagyon alacsony hőmérsékleten repülő légijárművel érintkezésbe kerülő csapadék miatti jegesedésre..
28 MEGJEGYZÉS: - Magasságjelzések, amely magasságok között a jelenségek várhatók, tető az alap felett, a térkép jelmagyarázata szerint.

2. Frontok és konvergencia zónák és más használt szimbólumok

A táblázat szövegei
1 Hideg front a felszínnél
2 Meleg front a felszínnél
3 Okkludált front a felszínnél
4 Kvázi-stacionárius front a felszínnél
5 Tropopauza magas
6 Tropopauza alacsony
7 Tropopauza szint
8 Maximális szél helye, sebessége és szintje
9 Konvergencia vonal
10 Fagyás szint
11 Intertrópusi konvergencia zóna
12 Tenger állapota
13 Tengerfelszín hőmérséklet

14 Kiterjedt erős talajszél*
15 A szélnyilak a maximális szelet jelzik a jetben és a repülési magasságszintet, ahol előfordulhat. Ha a maximális szél sebesség 240 km/h (120 csómó), a repülési magasságszintek, amelyek között a szelek nagyobbak, mint 160 km/h (80 csomó), a maximális szél szint alatt helyezkednek el. A példában a szelek nagyobbak, mint 160 km/h (80 csomó) 220-as repülési magasságszint és 400-as repülési magasságszint között.
16 A vastag vonal a jet tengely elejét/végét jelöli annál a pontnál, ahol szélsebesség az előrejelzés szerint 160 km/h (80 csomó).
17 *Ez a szimbólum a 60 km/h-t (30 csomó) meghaladó széles kiterjedésű talajszél sebességet jelöl.

3. Felhők jellemzésére használt rövidítések

3.1 Felhőfajta
CI = Cirrus
CC = Cirrocumulus
CS = Cirrostratus
AC = Altocumulus
AS = Altostratus
NS = Nimbostratus
SC = Stratocumulus
ST = Stratus
CU = Cumulus
CB = Cumulonimbus

3.2 Mennyiség
Felhők a CB kivételével
FEW = kevés (1/8-2/8)
SCT = elszórt (3/8-4/8)
BKN = (szakadozott (5/8-7/8)
OVC = borult (8/8)

Csak CB esetén
ISOL = egyedi CB-k (izolált)
OCNL = jól elkülönült CB-k (esetenkénti)
FRQ = CB-k kis elkülönüléssel vagy elkülönülés nélkül
EMBD = más felhőrétegekbe beágyazódott vagy homály által takart
CB-k (beágyazódott)

3.3 Magasságok
Az SWH és SWM térképeken a magasságokat repülési magasságszintekkel jelölik, (FL) tető az alap felett. Amikor a XXX-et használnak, a tetők vagy alapok kívül esnek azon az atmoszféra rétegen, amelyre a térképet alkalmazzák.
SWL térképeken:
i) a magasságokat közepes tengerszint feletti magasságként jelölik,
ii) az SFC rövidítést a talajszint jelölésére használják.

4. Vonalak és rendszerek ábrázolása specifikus térképeken

4.1 SWH és SWM modellek – Szignifikáns időjárás térképek (nagy és közepes magasság)
Cakkozott vonal = Szignifikáns időjárási területek elválasztása

Vastag szaggatott vonal	=	CAT terület körvonala
Vastag folytonos vonal szél-nyíllal és repülési magasságszinttel megszakítva	=	Jet-stream tengely helye, a szélirány, szélsebesség csomóban, vagy km/h-ban és magasság repülési magasságszintben megjelölésével
Számok a nyilakon	=	Frontrendszer mozgási sebessége csomóban vagy km/h-ban
Repülési magasságszintek kis négyszögeken belül	=	A tropopauza magassága repülés magasságszint-ben kifejezve adott helyeken, pl. 340. A tropopauza topográfia Alacsony és Magas pont-jait L és H betűkkel jelölik egy ötszögbe írt, re-pülési magasságszintben kifejezett magassággal együtt. Explicit repülési magasságszint kijelzés a JET mélységekre és a tropopauza magasságra még ha az előrejelzési határokon kívül is esik.

4.2 SWL modell – Szignifikáns időjárás térkép (kismagasság)

X	=	Nyomás középpontok helye hektopascalban meg-adva
L	=	Kisnyomás középpontja
H	=	Nagynyomás középpontja
Cakkozott vonal	=	Szignifikáns időjárási terület elválasztó körvonala
Szaggatott vonal	=	0°C izoterma magassága lábban (hektolábban) vagy méterben MEGJEGYZÉS: a 0°C szintet 0°:060 módon is le-het jelölni, azaz 0°C szint 6000 láb magasságban van
Számok nyilakon	=	Front rendszerek, depressziók vagy anticiklonok mozgási sebessége csomóban vagy km/h-ban
Szám a tenger állapota szimbólumon belül	=	Teljes hullám magasság lábban vagy méterben
Szám a tenger felszín hőmérséklet szimbólumon belül	=	Tenger felszín hőmérséklete C°-ban
Szám az erős talajszél szimbólumon belül	=	szél csomóban vagy km/h-ban

4.3 Nyilak, tollak és zászlócskák

A nyilak az irányt jelzik. A zászlócskák és/vagy tollak száma a sebességnek felel meg.
Példa:
270°/115 csomó (ekvivalens 213 km/h-val)
A zászlócskák 50 csomó vagyis 92 km/h sebességnek felelnek meg.
Tollak 10 csomónak vagy 18 km/h-nak felelnek meg.
Féltollak 5 csomónak vagy 9 km/h-nak felelnek meg.
*A használt átszámítási tényező 1 a 2-höz

Csomó átszámítása kilométer per órára

2. FÜGGELÉK A VILÁG TERÜLETI ELŐREJELZŐ RENDSZERRE ÉS METEOROLÓGIAI IRODÁKRA VONATKOZÓ MŰSZAKI ELŐÍRÁSOK

(Lásd jelen Annex 3. Fejezet)

1. VILÁG TERÜLETI ELŐREJELZŐ RENDSZER

1.1 Formátumok és kódok

A WAFC-oknak egységes formátumokat és kódokat kell alkalmazniuk előrejelzések és módosítások szolgáltatásánál.

1.2 Magaslégköri előrejelzések

1.2.1 A magassági szél, magaslégköri hőmérséklet és nedvesség, a maximális szélirány, sebesség és magasság és a tropopauza repülési magasságszint és hőmérséklet és a repülési magasságszintek előrejelzések, amelyeket a WAFC naponta négyszer készít, 6, 12, 18, 24, 30 36 óra hosszáig érvényesek az előrejelzések alapját képező szinoptikus adatok időpontja (0000, 0600, 1200 és1800 UTC) után. Az egyes előrejelzések kiosztását a fenti sorrendben kell végezni, és amint ez technikailag lehetséges, de nem később, mint a megfigyelési standard idő után 6 órával be kell fejezni.

1.2.2 A WAFC által készített rácspont előrejelzéseknek a következőkből kell állniuk:

a) szél és hőmérséklet adatok a következő repülési magasságszintekre: 50 (850 hPa), 100 (700 hPa), 140 (600 hPa), 180 (500 hPa), 240 (400 hPa), 300 (300 hPa), 340 (250 hPa), 390 (200 hPa), 450 (150 hPa)és 530(100 hPa);

b) tropopauza repülési magasságszintje és hőmérséklete;

c) a maximális szél iránya, sebessége és repülési magasságszintje;

d) nedvesség adatok a következő repülési magasságszinteken: 50 (850 hPa), 100 (700 hPa), 140 (600 hPa) és 180 (500 hPa);

e) geopotenciális magassági adatok az 50 (850 hPa), 100 (700 hPa), (700 hPa), 140 (600 hPa), 180 (500 hPa), 240 (400 hPa), 300 (300 hPa), 340 (250 hPa), 390 (200 hPa) és 450 (150 hPa) repülési magasságszintekre.

1.2.3 Az előző rácspont előrejelzéseket a WAFC-oknak bináris kód formában kell kiadniuk, a WMO által előírt GRIB kódformát használva.

Megjegyzés. – A GRIB kódformát a WMO 306 számú kiadványa, Kód kézikönyv (Manual on Codes) *1.2 kötet, B Rész – Bináris kódok tartalmazza.*

1.2.4 Az előző rácspont előrejelzéseket a WAFC-nak 140 km-es vízszintes felbontású rögzített rácsban kell készítenie.

Megjegyzés. – 140 km egy körülbelül 1,25°-os távolságot jelent hosszúsági körben.

1.3 Szignifikáns időjárás (SIGWX) előrejelzések

1.3.1 Általános előírások

1.3.1.1 A WAFC-oknak naponta négyszer SIGWX előrejelzést kell készíteniük, és ezek érvényesek rögzített érvényességi időn keresztül 24 óráig az előrejelzések alapját képező szinoptikus adatok ideje (0000, 0600, 1200 és 1800 UTC) után Az egyes előrejelzések kiosztását amint ez technikailag lehetséges, de nem később, mint a megfigyelési standard idő után 6 órával be kell fejezni.

1.3.1.2 A SIGWX előrejelzéseket bináris kód formában, a WMO által előírt BUFR kódforma használatával kell kiadni.

Megjegyzés – A BUFR kódformát a WMO 306 sz. kiadványa, Kód kézikönyv (Manual on Codes) *1.2 kötet, B rész – Bináris kódok tartalmazza.*

1.3.2 SIGWX előrejelzések fajtái

SIGWX előrejelzéseket a következők szerint kell kiadni:
a) magas szint SIGWX előrejelzések 250 és 630 közötti repülési magasságszintekre; és
b) közepes szint SIGWX előrejelzések 100 és 250 közötti repülési magasságszintekre korlátozott földrajzi területekre, regionális léginavigációs egyezményben meghatározottak szerint.

1.3.3 SIGWX előrejelzések által tartalmazott tételek

Magasszint és középszint SIGWX előrejelzéseknek a következő tételeket kell tartalmazniuk:

a) trópusi ciklon, feltéve, hogy a 10 perces közepes talajszél sebesség maximuma várhatóan eléri vagy meghaladja a 63 km/h-t (34 csomó);
b) erős széllökés vonal;
c) mérsékelt vagy erős turbulencia (felhőben vagy tiszta levegőben);
d) mérsékelt vagy erős jegesedés;
e) kiterjedt homokvihar/porvihar;
f) cumulonimbus felhők zivatarokkal és a)-tól e)-ig jelenségekkel összekötve;
Megjegyzés – Felhőbeni mérsékelt vagy erős turbulenciával és/vagy mérsékelt vagy erős jegesedéssel kapcsolódó nem konvektív felhő területeket a SIGWX előrejelzéseknek tartalmazniuk kell.
g) a tropopauza repülési magasságszintje;
h) jet streamek;
i) információ a légijármű üzemeltetésre jelentős hatást gyakorló hamu felhőket létrehozó vulkánkitörések helyéről, amely a következőkből áll: vulkánkitörés szimbóluma a vulkán helyén, és a térkép oldalán a vulkánkitörés szimbóluma, a vulkán neve, földrajzi szélesség/hosszúság, az első kitörés dátuma, időpontja, ha ismert, és hivatkozás az érintett területre kiadott SIGMET-re és NOTAM-ra vagy ASHTAM-ra; és
j) információ radioaktív anyagok véletlen kijutásáról az atmoszférába, amely jelentős hatást gyakorol a légijármű üzemeltetésre, amely a következőkből áll: radioaktivitás szimbóluma a baleset helyén, és a térkép oldalán radioaktivitás szimbóluma, a baleset helyének földrajzi szélessége/hosszúsága, a baleset dátuma és időpontja és emlékeztető a felhasználók részére az érintett területre vonatkozó NOTAM ellenőrzésére.
Megjegyzés – Az alacsony szintű (azaz a 100-as repülési magasságszint alatti) SIGWX előrejelzések által tartalmazott tételeket az 5. Függelék tartalmazza.

1.3.4 SIGWX előrejelzések által tartalmazott tételek kritériumai

A magas szint és közepes szint SIGWX előrejelzéseknél a következő kritériumokat kell alkalmazni:

a) az a) – f) tételeket csak akkor kell tartalmazniuk, ha a SIGWX előrejelzés alsó és felső szintje között előfordulásuk várható;

b) a „CB” rövidítést csak akkor tartalmazhatja, ha cumulonimbus felhők előfordulására vagy várható előfordulására hivatkozás történik, ahol ezek:

1) az érintett terület 50 százalékát vagy ennél nagyobb maximális térbeli lefedésű területre vannak kihatással;

2) egy vonal mentén helyezkednek el, ahol az egyes felhők között kis térköz van, vagy ilyen egyáltalán nincs; és

3) felhő rétegekbe vannak beágyazva, vagy pára rejti őket.

c) a „CB”-be tartozás alatt azt kell érteni, hogy ez tartalmaz minden olyan időjárás jelenséget, amely normál körülmények között cumulonimbus felhőkhöz kapcsolódnak, azaz zivatar, mérsékelt vagy erős turbulencia és jégeső;

d) ahol vulkánkitörés, vagy radioaktív anyagok véletlen atmoszférába jutása indokolja a vulkanikus tevékenység vagy a radioaktivitás szimbólumának megjelenését a SIGWX előrejelzésekben, a szimbólumoknak benne kell lenniük a magas szint vagy közepes szint SIGWX előrejelzésekben, tekintet nélkül a magasságra, amelyre a hamu oszlopot vagy radioaktív anyagot jelentették, vagy amelynek elérése várhatóan bekövetkezik.

e) az 1.3.3 a), i) és j) együttes fellépésének, vagy részleges átfedésének esetében, a legmagasabb prioritást az i) tételnek kell adni, ezt követi a j) és az a) tétel. A legmagasabb prioritású tételt az esemény helyénél kell elhelyezni, és nyilat kell alkalmazni a többi tétel helyének összekötéséhez a hozzátartozó szimbólummal, vagy keretezett szövegével.

2. METEOROLÓGIAI IRODÁK

2.1 WAFS produktumok használata

2.1.1 A repülőtéri meteorológiai irodáknak a repülési dokumentum elkészítésénél a WAFC-ok által kiadott előrejelzéseket kell felhasználniuk, amennyiben ezek az előrejelzések a szándékolt repülési pályát idő, tengerszint feletti magasság és földrajzi kiterjedés vonatkozásában lefedik, hacsak a meteorológiai hatóság és az érintett üzemeltető nem állapodott meg másképpen.
2.1.2 A repülési dokumentáció egységességének és szabványosításának érdekében a kapott WAFS GRIB és BUFR adatokat dekódolni kell szabványos WAFS térképekbe ebben az Annexben szereplő előírásokkal összhangban, és a WAFS előrejelzések eredetijének tartalmát és azonosítását nem szabad módosítani.

2.2 WAFC értesítése szignifikáns diszkrepenciákról

WAFS GRIB és/vagy BUFR adatokat használó meteorológiai irodáknak azonnal értesíteniük kell az illetékes WAFC-t, ha a következő kritériumoknak megfelelően, a WAFS SIGWX előrejelzésekre vonatkozóan szignifikáns diszkrepenciákat észleltek vagy jelentettek:
a) jegesedés, turbulencia, zivatarok, amelyek rejtettek, gyakoriak, beágyazottak vagy széllökés vonalon fordulnak elő, és homokviharok/porviharok:
– újra várható előfordulás vagy nem-előfordulás; vagy
b) vulkánkitörések vagy radioaktív anyagok véletlen atmoszférába jutása, amelyek a légijármű üzemeltetés szempontjából jelentőséggel bírnak:
– vulkanikus tevékenység szimbólum, vagy sugárzás szimbólum bevitele vagy eltávolítása.
Az üzenetet átvevő WAFC-nak tudatni kell az üzenet átvételét a létrehozóval egy a jelentésről és bármilyen intézkedésről szóló rövid kommentárral együtt, ugyanazokat a kommunikációs eszközöket használva, mint amelyeket a létrehozó alkalmazott.
Megjegyzés. – Szignifikáns diszkrepenciák jelentésére vonatkozó útmutatást a Repülésmeteorológiai gyakorlati kézikönyv (Manual of Aeronautical Meteorological Practice) *(Doc 8896) tartalmaz.*

3. VULKANIKUS HAMU TÁJÉKOZTATÓ KÖZPONTOK (VAAC)

3.1 Vulkanikus hamu tájékoztató információk

3.1.1 **Ajánlás.** – *A jóváhagyott ICAO rövidítéseket és magától értetődő jellegű numerikus értékeket használva, rövidített köznyelven kiadott vulkanikus hamu tájékoztató információknak összhangban kell lenniük az A2-1 táblázatban bemutatott mintával. Ahol jóváhagyott ICAO rövidítések nem állnak rendelkezésre, angol köznyelvű szöveget kell használni, minimumra törekedve.*
4.1.2 **Ajánlás.** – *Az A2-1 táblázatban felsorolt vulkanikus hamu információknak, amennyiben grafikus formátumban adták ki őket, az 1. Függelékben megadottakkal egyezőnek kell lenniük. Ha bináris formátumban adták ki őket, BUFR kódformát kell használni.*
Megjegyzés. – A BUFR kódformát a WMO 306 számú kiadványa, Kód kézikönyv (Manual on Codes) *1.2 kötet, B Rész – Bináris kódok tartalmazza.*

4. ÁLLAMI VULKÁN MEGFIGYELŐ ÁLLOMÁSOK

4.1 Információk az állami vulkán megfigyelő állomásoktól

Ajánlás. – *Az információknak, amelyeket az állami vulkán megfigyelő állomásoknak a hozzájuk tartozó ACC-k, MWO és VAAC részére meg kell küldeniük, a következőkből kell állniuk:*
a) szignifikáns, kitörés előtti vulkanikus tevékenységre vonatkozóan: a jelentés dátuma/időpontja (UTC); a vulkán neve és, ha ismert, száma; földrajzi hely (szélesség/hosszúság); és a vulkanikus tevékenység leírása; és
b) vulkánkitörésre vonatkozóan: a jelentés dátuma/időpontja (UTC) és a kitörés időpontja (UTC), ha a jelentés időpontjától különbözik; a vulkán neve és, ha ismert, száma; földrajzi hely (szélesség/hosszúság); és a vulkánkitörés leírása, benne, hogy hamuoszlop kilövellés történt-e, és ha igen, a hamuoszlop becsült magassága, és bármely látható vulkanikus hamufelhő kiterjedése a kitörés alatt, és azt követően.
Megjegyzés. – Kitörés előtti vulkanikus tevékenység ebben a vonatkozásban szokatlan és/vagy növekvő vulkanikus tevékenységet jelent, amely vulkánkitörés előjele lehet.

5. TRÓPUSI CIKLON TÁJÉKOZTATÓ KÖZPONTOK (TCAC)

5.1 Trópusi ciklon tájékoztató információk

5.1.1 Trópusi ciklonokra vonatkozó tájékoztató információkat akkor kell trópusi ciklonokra kiadni, amikor a talajszél 10 perces közepes sebesség maximum várhatóan eléri vagy meghaladja a 63 km/h (34 csomó) értéket a tájékoztatás által lefedett időszak során.
5.1.2 A trópusi ciklonra vonatkozó tájékoztató információknak összhangban kell lenniük az A2-2 táblázatban bemutatott mintával.
5.1.3 **Ajánlás. –** *Ha trópusi ciklon tanácsadást bináris formátumban adnak ki, BUFR kódformát kell használni.*
Megjegyzés. – A BUFR kódformát a WMO 306 számú kiadványa, Kód kézikönyv (Manual on Codes) *1.2 kötet, B Rész – Bináris kódok tartalmazza.*

A2-1 táblázat. Minta vulkanikus hamu tájékoztató közleményhez
Kulcs: M = kötelező bevitel, minden közlemény kötelező része
O = fakultatív bevitel
= = kettős párhuzamos vonal azt jelzi, hogy az ezt követő szöveget a következő sorban kell elhelyezni
1. Megjegyzés. – A vulkanikus hamu tájékoztató közleményekben szereplő numerikus elemek nagyságrendje és felbontása a 6. Függelék A6-4 táblázatban látható
2. Megjegyzés. – A rövidítések magyarázata a Procedures for Air Navigation Services – ICAO Abbreviations and Codes (Léginavigációs szolgálati eljárások – ICAO rövidítések és kódok) *(PANS-ABC, Doc 8400) kiadványban található*
3. Megjegyzés. – „Kettőspont" beírása minden elem címe után kötelező.
4. Megjegyzés. – Az 1-től 18-ig számok csak az anyag világossá tétele céljából szerepelnek, ezek nem részei a tájékoztató közleménynek, ahogyan az a példában látszik.

A2-2. táblázat. Minta trópusi ciklon tanácsadó közleményhez

Key = = kettős párhuzamos vonal azt jelzi, hogy az ezt követő szöveget a következő sorban kell elhelyezni

1. Megjegyzés. – A trópusi ciklon tájékoztató közleményekben szereplő numerikus elemek nagyságrendje és felbontása a 6. Függelék A6-4 táblázatban látható.

2. Megjegyzés. – A rövidítések magyarázata a Procedures for Air Navigation Services – ICAO Abbreviations and Codes (Léginavigációs szolgálati eljárások – ICAO rövidítések és kódok) *(PANS-ABC, Doc 8400).*

3. Megjegyzés. – Az összes elem kötelező.

4. Megjegyzés. – „Kettőspont" beírása minden elem címe után kötelező.

5. Megjegyzés. – Az 1-től 16-ig számok csak az anyag világossá tétele céljából szerepelnek, ezek nem részei a tanácsadó közleménynek, ahogyan az a példában látszik.

3. FÜGGELÉK. METEOROLÓGIAI MEGFIGYELÉSEKRE ÉS JELENTÉSEKRE VONATKOZÓ MŰSZAKI ELŐÍRÁSOK

(Lásd jelen Annex 4. Fejezete)

1. METEOROLÓGIAI MEGFIGYELÉSEKRE VONATKOZÓ ÁLTALÁNOS ELŐÍRÁSOK

1.1 **Ajánlás** – *A repülőtéren használt meteorológiai műszereket úgy kell elhelyezni, hogy arra a területre jellemző adatokat szolgáltassanak, amelyekre a méréseket igénylik.*

Megjegyzés. – Az üzemelési területeken telepített berendezések és felszerelések elhelyezésére és konstrukciójára vonatkozó előírások, amelyek a légijárművek veszélyeztetésének a minimumra csökkentését célozzák, a 14. Annex 1. Kötet 8. Fejezetében találhatók.

1.2 **Ajánlás. –** *A repülésmeteorológiai állomásokon lévő meteorológiai műszereket a Meteorológiai Világszervezet által közzétett eljárások és előírások szerint kell telepíteni, üzemeltetni és karbantartani.*

1.3 **Ajánlás.** – *A repülőtéren a megfigyelő eszközöket, amennyire lehetséges, úgy kell elhelyezni, hogy az általuk szolgáltatott adatok arra a területre vonatkozzanak, amelyre a megfigyeléseket igénylik*

1.4 **Ajánlás.** –*Ahol az automatikus berendezés részét képezi egy integrált fél-automatikus megfigyelő rendszernek, a helyi légiforgalmi szolgálati egységek számára rendelkezésre álló adatkijelzők a helyi meteorológiai szolgálati egység berendezéseinek kiegészítő egységei legyenek, és azokkal párhuzamosan működjenek. Ezeken a kijelzőkön az egyes időjárási elemeknél, ahogyan megfelelő, jelezni kell, hogy az elem melyik észlelési helyre vonatkozik.*

2. METEOROLÓGIAI JELENTÉSEKRE VONATKOZÓ ÁLTALÁNOS KRITÉRIUMOK

2.1 Meteorológiai jelentések formátuma

2.1.1 Helyi rendszeres és különleges jelentéseket rövidített köznyelven kell kiadni, az A3-1 táblázatban bemutatott mintának megfelelően.
2.1.2 METAR-t és SPECI-t az A3-2 táblázatban bemutatott mintával összhangban kell kiadni, és a Világ Meteorológiai Szervezet által előírt METAR és SPECI kód formában kell terjeszteni.
Megjegyzés. – A METAR és SPECI kódformákat a WMO 306 számú kiadványában, Kód kézikönyv (Manual on Codes), *1.1 kötet, A Rész – Alfanumerikus kódok.*
2.1.3 **Ajánlás. –** *A METAR-t és SPECI-t az Államok közötti kétoldalú megállapodások szerint, ha ezekben így szerepel, WMO BUFR kódformában kell terjeszteni, a METAR és SPECI 2.1.2 pontban előírtak mellett.*
Megjegyzés. – A BUFR kódformát a WMO 306 számú kiadványa, Kód kézikönyv (Manual on Codes) *1.2 kötet, B Rész – Bináris kódok tartalmazza.*

2.2 CAVOK használata

Amikor a megfigyelés idején a következő feltételek szimultán fordulnak elő:
a) látás, 10 km vagy nagyobb;
Megjegyzés. –.Helyi rendszeres és különleges jelentésekben a látás azokra az érték(ek)re vonatkozik, amelyeket 4.2.4.2 és 4.2.4.3 pontoknak megfelelően kell jelenteni; METAR-ban és SPECI-ben azokra az értékekre vonatkozik, amelyeket a 4.2.4.4 pontnak megfelelően kell jelenteni.
b) nincs a repülésüzemeltetés szempontjából jelentőséggel bíró felhő;
c) nincs olyan időjárás, amely a repülés számára, a 4.4.2.3 és 4.4.2.4 pontoknak megfelelően jelentőséggel bír;
akkor a látásra, a futópálya látástávolságra, az aktuális időjárásra és felhőmennyiségre, felhő fajtára és felhőalap magasságra vonatkozó információkat minden meteorológiai jelentésben a „CAVOK” terminussal kell helyettesíteni.

2.3 Helyi különleges jelentések és SPECI kiadásának kritériumai

2.3.1 A helyi különleges jelentések kritériumainak listájában a következőknek kell szerepelniük:
a) azok az értékek, amelyek a legszorosabban kapcsolódnak a repülőteret használó üzemeltetők minimumaihoz;
b) azok az értékek, amelyek kielégítik a légiforgalmi szolgálati egységek és az üzemeltetők más helyi követelményeit;
c) 2 C°-os vagy ennél nagyobb levegő hőmérséklet növekedés a legutolsó jelentésben megadotthoz képest, vagy egy alternatív küszöbérték, a meteorológiai hatóság, a megfelelő légiforgalmi szolgáltatási hatóság és az érintett üzemeltetők közötti megállapodásnak megfelelően;
d) a megközelítési és emelkedési területeken szignifikáns meteorológiai körülmények előfordulásával foglalkozó, rendelkezésre álló kiegészítő információk, az A3-1 táblázatban megadottaknak megfelelően; és
e) azok az értékek, amelyek a SPECI kritériumait alkotják.
2.3.2 **Ajánlás** – *SPECI- kell kiadni, valahányszor a következő kritériumoknak megfelelő változások lép-*

nek fel:
a) ha a talajszél közepes iránya 60 fokkal, vagy többel megváltozott a legutóbbi jelentésben közölthöz képest, amennyiben az átlagos sebessége a változás előtt és/vagy után 20 km/h (10 csomó), vagy több volt;
b) ha a talajszél közepes sebessége 20 km/h-val (10 csomóval), vagy többel megváltozott a legutóbbi jelentésben közölthöz képest;
c) ha a talajszél közepes sebességtől való eltérés (széllökések) 20 km/h-val (10 csomó), vagy többel nagyobb a legutóbbi jelentésben közölt értéknél, amennyiben a közepes szélsebesség a megváltozás előtt és/vagy után 30 km/h (15 csomó), vagy több volt
d) ha a szélváltozások üzemelési szempontból lényeges értékeket lépnek át. A küszöbértékeket a meteorológiai hatóságnak kell megállapítania az illetékes légiforgalmi szolgálatihatósággal és az érintett üzemeltetőkkel konzultálva, figyelembe véve azokat a szélváltozásokat, melyek:
1) használatos futópálya (futópályák) változtatást tesznek szükségessé;
2) jelzik, hogy a futópálya hátszél és oldalszél összetevői a repülőtéren üzemelő tipikus légijárművek számára a főbb üzemelési határértékeket meghaladják.
e) ha a látás javul, és a változások során az alábbi értékek közül egyet vagy többet elér, vagy túllép, vagy amikor a látás romlik, és az alábbi értékek közül egyet vagy többet átlép:
1) 800, 1500, 3000 méter; és
2) 5000 métert, ahol jelentős számú járatot üzemeltetnek látás szerinti repülési szabályok szerint.
Megjegyzés. – Helyi különleges jelentésekben a látás arra (azokra) az érték(ek)re vonatkozik, amelye(ke)t a 4.2.4.2 és 4.2.4.3 pontoknak megfelelően kell jelenteni, SPECI-ben a látás arra (azokra) az érték(ek)re vonatkozik, amelye(ke)t a 4.24.4 pontnak megfelelően kell jelenteni.
f) ha a futópálya látástávolság javul, és az alábbi értékek közül egyet vagy többet a változás során elér, vagy átlép, vagy ha a futópálya látástávolság romlik, és az alábbi értékek közül egyet vagy többet átlép: 150, 350, 600 vagy 800 m;
g) ha a következő meteorológiai jelenségek valamelyike, vagy ezek valamilyen kombinációja létrejön, megszűnik, vagy intenzitása megváltozik:
– ónos csapadék
– mérsékelt vagy heves csapadék (beleértve a záporokat is)
– zivatar (csapadékkal)
– porvihar
–homokvihar;
h) ha a következő meteorológiai jelenségek valamelyike, vagy ezek valamilyen kombinációja létrejön vagy megszűnik:
– jégkristályok
– fagyott köd
– talajközeli por-, homok- vagy hófúvás
– por, homok vagy hófúvás (beleértve a hóvihart)
– zivatar (csapadék nélkül))
– szélroham
– tölcsérfelhő (tornádó vagy víztölcsér);
i) amikor a BKN vagy OVC felhőtakarás legalacsonyabb felhőrétege alapjának magassága növekszik, és az alábbi értékek közül egyet vagy többet a változás során elér, vagy túllép, vagy amikor a BKN vagy OVC felhőtakarás legalacsonyabb felhőrétege alapjának magasságcsökkenése az alábbi értékek közül egyet vagy többet elér vagy átlép, vagy amikor a BKN vagy OVC felhőtakarás legalacsonyabb felhőrétege alapjának magasságcsökkenése az alábbi értékek közül egyet vagy többet elér vagy átlép:
1) 30, 60, 150, vagy 300 méter (100, 200, 500 vagy 1000 láb); és
2) 450 méter (1500 láb), olyan esetekben, amikor jelentős számú járatot üzemeltetnek látás szerinti repülési szabályok szerint;
j) amikor a 450 méter (1500 láb) alatti felhőréteg mennyisége az alábbiak szerint megváltozik:
1) SKC-ről, FEW-ről vagy SCT-ről BKN-re vagy OVC-re; vagy

2) BKN-ről vagy OVC-ről SKC-re, FEW-re vagy SCT-re vagy kisebbre;
k) amikor az égbolt borult és a függőleges látás javul, és az alábbi értékek közül egyet vagy többet elér vagy túlhalad, vagy amikor a függőleges látás romlik és az alábbi értékek közül egyen vagy többen áthalad: 30, 60, 150 vagy 300 m (100, 200, 500 vagy1000 láb); és
l)minden egyéb helyi üzemelési minimumokon alapuló kritérium, a meteorológiai hatóság és az üzemeltetők közötti megállapodás szerint.
Megjegyzés – A helyi repülőtér üzemelési minimumain alapuló egyéb kritériumokat a hasonló kritériumokkal párhuzamosan kell megfontolni a változás csoportokba való belefoglaláshoz és a TAF módosításhoz, mely minimumokat az 5. Függelék1.3.1 k) pontjának eleget téve alakítottak ki.
2.3.3 Ha egy időjárási elem romlását egy másik javulása kíséri, akkor egyetlen SPECI-t kell kiadni; ezt romlási jelentésként kell kezelni.

3. METEOROLÓGIAI JELENTÉSEK SZÉTKÜLDÉSE

3.1 METAR és SPECI

3.1.1 A METAR-t és SPECI-t el kell juttatni a nemzetközi OPMET adatbázisokhoz és a regionális léginavigációs egyezmények által repülési állandó helyű műholdas elosztó rendszer működtetésére kijelölt központokhoz, a regionális léginavigációs egyezménynek megfelelően.
3.1.2 METAR-t és SPECI-t a regionális léginavigációs egyezményeknek megfelelően más repülőterekhez is el kell juttatni.
3.1.3 **Ajánlás**. – *A körülmények leromlásáról szóló SPECI-t közvetlenül az észlelés után kell szétküldeni. A körülmények javulásáról szóló SPECI-t a javulás után 10 perc visszatartás után kell szétküldeni, szükség esetén a SPECI-t szétküldés előtt módosítani kell, és jelezni kell az ennek a 10 perces periódusnak a végén uralkodó körülményeket. Egy SPECI-t, amely az egyik időjárás elem leromlását és egy másik elem javulását tartalmazza, az észlelés után azonnal szét kell küldeni.*

3.2 Helyi rendszeres és különleges jelentések

3.2.1 A helyi rendszeres jelentéseket továbbítani kell a helyi légiforgalmi szolgálati egységeknek, és az üzemeltetők, és a repülőtéren más felhasználók részére rendelkezésre kell bocsátani.
3.2.2 A helyi különleges jelentéseket továbbítani kell a helyi légiforgalmi szolgálati egységeknek, mihelyt a specifikált körülmények megjelennek. Azonban a meteorológiai hatóság és a megfelelő légiforgalmi szolgáltatási hatóság közötti egyezmény szerint ezeket nem kell kiadni a következőkre vonatkozóan:
a) bármely elem, amelyre vonatkozóan a helyi légiforgalmi szolgáltató egységnél egy kijelző van, amely megegyezik a meteorológiai állomáson lévővel, és intézkedések vannak érvényben ennek a kijelzőnek a használatát illetően a helyi rendszeres és különleges jelentések által tartalmazott információk felfrissítésére; és
b) futópálya látástávolság, amikor a használt jelentési mérték szerinti egy vagy több lépcsőnyi összes változást a helyi légiforgalmi szolgálati egységnek egy repülőtéren lévő megfigyelő jelent.
Helyi különleges jelentéseket az üzemeltetők, és a repülőtéren lévő más felhasználók részére ugyancsak rendelkezésre kell bocsátani.

4. METEOROLÓGIAI ELEMEK MEGFIGYELÉSE ÉS JELENTÉSE
Bevezető Megjegyzés. – A 4.1-től – 4.8-ig szakaszokban hivatkozott meteorológiai információkhoz repülőtéri jelentésekbe bekerülő alkalmazható kiválasztott kritériumokat a C Melléklet táblázatos formában tartalmazza.

4.1 Talajszél

4.1.1 Elhelyezés
4.1.1.1 **Ajánlás**. – *A talajszelet közelítőleg a futópálya(k) felett 10 m (30 láb) magasságban kell megfi-*

gyelni.

4.1.1.2 **Ajánlás**. – *Reprezentatív talajszél megfigyeléseket alkalmasan elhelyezett érzékelők felhasználásával kell nyerni. A helyi rendszeres és különleges jelentésekhez végzett talajszél megfigyeléseket kiszolgáló érzékelőket úgy kell elhelyezni, hogy a futópálya menti és a földetérési zónákban uralkodó viszonyoknak a lehető legjobb jelzését adja. Azokon a repülőtereken, ahol a terepviszonyok vagy az uralkodó időjárási viszonyok a talajszélben jelentős különbségeket okoznak a futópálya különböző szakaszain, további érzékelőket kell alkalmazni.*

Megjegyzés. – Mivel a gyakorlatban a talajszelet nem lehet közvetlenül a futópályán mérni, a felszálláshoz és leszálláshoz végzett talajszél megfigyelések várhatóan a legjobb nyerhető mutatója a szeleknek, amellyel egy légijármű felszállás és leszállás közben találkozik.

4.1.2 Kijelzők

4.1.2.1 Az egyes érzékelőkhöz kapcsolódó kijelzőket a megfelelő légiforgalmi szolgálati egységnél lévő kijelzőkkel kapcsolódó meteorológiai állomáson kell elhelyezni. A meteorológiai állomáson és a légiforgalmi szolgálati egységeknél lévő kijelzőknek ugyanahhoz az érzékelőhöz kell tartozniuk, és ahol külön érzékelők szükségesek, ahogyan a 4.1.1.2 pontban van leírva, a kijelzőket világosan meg kell jelölni az egyes érzékelők által figyelt futópálya és futópálya szakasz azonosításához.

4.1.2.2 **Ajánlás**. – *A talajszél irány és sebesség közepes értékeit és jelentős változásait automatizált berendezésekkel kell leszármaztatni és kijelezni.*

4.1.3 Átlagolás

4.1.3.1 A talajszél megfigyelések átlagolási időszakainak a következőknek kell lenniük:

a) 2 perc helyi rendszeres és különleges jelentéseknél és szél kijelzőknél légiforgalmi szolgáltató egységeknél; és

b) 10 perc METAR és SPECI esetén, kivéve, ha a 10-perces időszak markáns diszkontinuitást tartalmaz a szélirányban és/vagy sebességben, amikor csak a diszkontinuitás utáni adatokat használják fel a középértékek nyeréséhez, ennek következtében az időintervallumokat ilyen körülmények között megfelelően csökkenteni kell.

Megjegyzés – Markáns diszkontinuitás akkor fordul elő, amikor egy szakadáslép fel, és a szélirányban 30 fokos vagy ennél nagyobb változás tartósan fennmarad, a változás előtt vagy után 20 km/h (10 csomó) szélsebesség mellett, vagy 20 km/h (10 csomó) vagy nagyobb szélsebesség változás esetén, amely legalább 2 percig tart.

4.1.3.2 **Ajánlás. –** *Az átlagolási időszak a közepes szélsebességtől való eltérések (széllökések), amelyeket a 4.1.4.2 c) pontnak megfelelően jelentettek, mérésénél 3 másodperc legyen helyi rendszeres és különleges jelentéseknél és METAR és SPECI esetén és a közepes szélsebességtől való eltérések (széllökések) leképezéséhez használt kijelzőknél, a légiforgalmi szolgálati egységeknél.*

4.1.4 A mérés pontossága

Ajánlás. – *A jelentett közepes talajszéliránynak és sebességnek, valamint a közepes talajszéltől való eltéréseknek ki kell elégíteniük az üzemelés szempontjából kívánatos mérési pontosságot, ahogyan az A Mellékletben meg van adva.*

4.1.5 Jelentés

4.1.5.1 Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben a talajszél irányt, illetve sebességet 10 földrajzi fokos, illetve 1 km per óra (vagy 1 csomó) lépcsőkben kell jelenteni. Az olyan észlelt értéket, amelyik nem illeszkedik a használt jelentés skálához, a skála legközelebbi lépcsőjének értékére kell kerekíteni.

4.1.5.2 Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben:

a) a szélsebesség mérésére használt mértékegységeket jelölni kell;

b) a közepes széliránytól az utolsó 10 perc során való eltéréseket a következők szerint kell jelenteni, ha a teljes változás 60^{o} vagy több:

1) ha a teljes változás 60^{o} vagy több és kisebb mint 180^{o}, és a szélsebesség 6 km/h (3 csomó) vagy ennél nagyobb; az ilyen irányváltozásokat a két szélső irány, amelyek között a talajszél változott, megadásával kell jelenteni;

2) ha a teljes változás 60° és kisebb mint 180°, és a szélsebesség kisebb, mint 6 km/h (3 csomó), a szélirányt, mint nem a közepes szélirránnyal változót kell jelenteni; vagy

3) ha a teljes változás 180° vagy nagyobb, a szélirányt, mint nem közepes szélirránnyal változót kell jelenteni;

c) az utolsó 10 perc során a közepes szélsebességtől való eltéréseket (széllökések) jelenteni kell, ha a maximális szélsebesség a közepes szélsebességet a következő értékekkel haladja meg:

1) 10 km/h (5csomó) vagy nagyobb értékkel helyi rendszeres és különleges jelentésekben, amikor zajcsökkentő eljárásokat alkalmaznak a PANS-ATM (Doc 4444) 7.2.3 pontjának megfelelően; vagy

2) 20km/h (10 csomó) vagy nagyobb más esetben;

d) ha 2 km/h-nál (1 csomó) kisebb szélsebességet jelentenek, ezt nyugalomként kell jelezni;

e) ha 200 km(h (100 csomó) vagy ennél nagyobb szélsebességet jelentenek, ezt több, mint 199 km/h-ként (99 csomó) kell jelölni; és

f) ha a 10 perces időperiódus a szélirány és/vagy szélsebesség markáns diszkontinuitását tartalmazza, csak ezen diszkontinuitás után fellépő, a közepes széliránytól és közepes szélsebességtől való eltéréseket kell jelenteni.

Megjegyzés. – Lásd a 4.1.3.1 pont alatti megjegyzést

4.1.5.3 A helyi rendszeres és különleges jelentésekben:

a) ha a talajszelet a futópálya mentén több helyen észlelik, azokat a helyeket, amelyeket ezek az értékek reprezentálnak, meg kell jelölni;

b) amikor több futópálya van használatban, és a talajszelet ezekre a futópályákra vonatkozóan figyelik, a rendelkezésre álló értékeket az egyes futópályákra kell megadni, és a futópályákat, amelyekre az érték vonatkozik, jelenteni kell;

c) ha a közepes széliránytól való eltéréseket a 4.1.5.2 b) 2) pontnak megfelelően jelentik, a két szélső értéket, amelyek között a talajszél változott, kell jelenteni; és

d) ha a közepes szélsebességtől való eltéréseket (széllökések) a 4.1.5.2c) pontnak megfelelően jelentik, a szélsebesség által elért maximális és minimális értéket kell jelenteni;

4.1.5.4 METAR-ban és SPECI-ben, amikor a közepes szélsebességtől való eltéréseket (széllökések) a 4.1.5.2 c) pontnak megfelelően jelentik, az elért maximális szélsebesség értéket kell jelenteni.

4.2 Látás

4.2.1 Elhelyezés

4.2.1.1 **Ajánlás –** *Ha a látás mérésére műszerezett rendszereket használnak, a látást a futópálya felett megközelítően 2,5 m (7,5 láb) magasságban kell mérni.*

4.2.1.2 **Ajánlás** – *Ha a látás mérésére műszerezett rendszereket használnak, reprezentatív észleléseket megfelelő helyeken elhelyezett érzékelők használatával kell nyerni. A helyi rendszeres és különleges jelentésekhez szükséges látás megfigyelésekre szolgáló érzékelőket úgy kell elhelyezni, hogy a futópálya menti és a földetérési zóna menti látás lehető legjobb jelzését adja.*

4.2.2 Kijelzők

Ajánlás – *Ha látás mérésére műszerezett rendszereket használnak, az egyes érzékelőkhöz tartozó látás kijelzőket a megfelelő légiforgalmi egységeknél lévő kijelzőkkel kapcsolódó meteorológiai állomáson kell elhelyezni. A meteorológiai állomáson és a légiforgalmi szolgálati egységeknél lévő kijelzőknek ugyanazon érzékelőkhöz kell tartozniuk, és ahol külön érzékelők szükségesek, ahogyan a 4.2.1 szakaszban le van írva, a kijelzőket világosan meg kell jelölni az egyes érzékelők által figyelt terület, például futópálya és futópálya szakasz azonosítása érdekében.*

4.2.3 Átlagolás

Ajánlás – *Ha látás mérésére műszerezett rendszereket használnak, ezek inputjait legalább minden 60 másodpercben fel kell frissíteni, hogy lehetővé tegyék az aktuális reprezentatív értékek szolgáltatását. Az átlagolási időszaknak a következők szerintinek kell lenni:*

a) 1 perc helyi rendszeres és különleges jelentéseknél és légiforgalmi szolgáltató egységeknél lévő látáskijelzőknél; és

b) 10 perc METAR és SPECI esetén, kivéve, ha a megfigyelést közvetlen megelőző 10-perces időszak markáns diszkontinuitást tartalmaz a látásban, amikor csak a diszkontinuitás utáni adatokat használják fel a középértékek nyeréséhez.
Megjegyzés – Markáns diszkontinuitás akkor fordul elő, amikor a látásban egy megszakítás és egy legalább 2 percig tartó változás fennmarad, amely eléri vagy meghaladja a 2.3 pontban megadott, SPECI jelentések kiadására vonatkozó kritériumokat.
4.2.4 Jelentés
4.2.4.1 Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben, ha a látás 800 m alatt van, azt 50 m-es lépcsőkben kell jelenteni, ha a látás 800 m, vagy több, de kevesebb, mint 5 km, akkor 100 m-es lépcsőket kell használni¸ 5 km felett, de 10 km alatt pedig kilométeres lépcsőkben; és ha 10 km, vagy több, akkor 10 km-ekben kell megadni, kivéve, ha fennállnak a CAVOK használatára vonatkozó feltételek. Ha valamely észlelt érték nem illeszkedik a használt jelentő skálához, akkor a skálán lévő legközelebbi kisebb lépcsőre kell lekerekíteni.
Megjegyzés. – A CAVOK használatára vonatkozó előírásokat a 2.2 szakasz tartalmazza.
4.2.4.2 Helyi rendszeres és különleges jelentésekben a futópálya (futópályák) menti látást a mérésnél használt mértékegységekkel együtt kell jelenteni.
4.2.4.3 **Ajánlás.** – *Helyi rendszeres és különleges jelentésekben, amikor műszerezett rendszert használnak a látás mérésére:*
a) ha a látást a futópálya mentén több helyen figyelik, ahogyan a 4. Fejezet 4.6.2.2 pontjában le van írva, a földetérési zónát reprezentáló értékeket kell először jelenteni, amelyet, ha szükséges, a futópálya középponthoz és megállás véghez tartozó értékek követnek, és az ezeket az értékeket reprezentáló helyeket jelezni kell; és
b) ha egynél több futópálya van használatban, és a látást ezekre a futópályákra vonatkozóan figyelik, az egyes futópályákat reprezentáló látás értékeket jelenteni kell, és a futópályákat, amelyekre ezek az értékek vonatkoznak, jelezni kell
4.2.4.4 **Ajánlás.** – *METAR-ban és SPECI-ben a látást domináns látásként kell jelenteni, ahogyan az 1. Fejezetben definiálva van. Ha a látás nem ugyanaz minden irányban és*
a) ha a legkisebb látás különbözik a domináns látástól és1) kisebb, mint 1500 m vagy 2) kisebb, mint a domináns látás 50 százaléka és kisebb, mint 5000m; a megfigyelt legkisebb látást is jelenteni kell és ennek a repülőtérhez viszonyított általános irányát az iránytű nyolc pontjának egyikéhez viszonyítva kell jelezni. Ha a legkisebb látást egynél több irányban észlelik, akkor az üzemeltetés szempontjából legszignifikánsabb irányt kell jelenteni; és
b) ha a látás gyakran és gyorsan ingadozik, és a domináns látás nem határozható meg, csak a legkisebb látást kell jelenteni az irány megjelölése nélkül.
4.2.4.5 **Ajánlás.** – *Automatizált METAR-ban és SPECI-ben, amikor a látásérzékelők olyan módon vannak elhelyezve, hogy iránybeli változtatásokat nem lehet megadni, a jelentett látás értéket az „NDV" rövidítésnek kell követni.*

4.3 Futópálya látástávolság

4.3.1 Elhelyezés
4.3.1.1 **Ajánlás. –** *Futópálya látástávolságot a futópálya felett közelítőleg 2,5 m (7,5 láb) magasságban kell meghatározni.*
4.3.1.2 **Ajánlás. –***A futópálya látástávolság megállapítását a futópálya középvonalától nem több, mint 120 m oldalirányú távolságban kell végezni. A földetérési zónát reprezentáló megfigyelések helyének kb. 300 m-re kell lennie a futópálya mentén a küszöbtől számítva. A futópálya középső pontját és megállási végpontját reprezentáló megfigyelések helyét a futópálya mentén a küszöbtől számítva 1000 és 1500 méter közötti távolságra kell telepíteni, illetve kb. 300 m-re a futópálya ellentétes végétől. E helyek, és ha szükséges, további helyek, pontos pozíciójának pontos meghatározásához olyan repülési, meteorológiai és klimatológiai tényezőket kell figyelembe venni, mint pl. hosszú futópályák, ingoványok és más ködösödésre hajlamos területek.*

4.3.2 Műszerezett rendszerek

Megjegyzés. – Mivel a pontosság egyik műszerkivitelezésről a másikra változhat, a teljesítményjellemzőket a futópálya látástávolság megállapítására szolgáló műszereknél kiválasztás előtt ellenőrizni kell. Az előre-szórás mérő kalibrálásának követhetőnek, és a transzmisszométer szabványhoz verifikálhatónak kell lenni, amelynek pontosságát az előirányzott üzemelési tartomány felett verifikálták. Műszerezett futópálya látástávolság rendszerekben lévő transzmisszométerek és előreszórás mérők használatára vonatkozó útmutató anyag a Futópálya látástávolság megfigyelési és jelentési eljárások kézikönyve (Manual of Runway Visual Range Observing and Reporting Practices) *(Doc 9328) kiadványban található.*

4.3.2.1 II. és III. kategóriájú műszeres megközelítési és leszállási műveletekre szánt futópályákon való futópálya látástávolság meghatározására transzmisszométereken vagy előre-szórás mérőkön alapuló műszerezett rendszereket kell használni.

4.3.2.2 **Ajánlás.** –*I. kategóriájú műszeres megközelítési és leszállási műveletekre szánt futópályákon való futópálya látástávolság meghatározására Transzmisszométereken vagy előre-szórás mérőkön alapuló műszerezett rendszereketkell használni.*

4.3.3 Kijelző

4.3.3.1 Ha a futópálya látástávolság megállapítására műszerezett rendszereket használnak, egy, vagy igény esetén több kijelzőt, a megfelelő légiforgalmi egységeknél lévő kijelzőkkel kapcsolódó meteorológiai állomáson kell elhelyezni. A meteorológiai állomáson és a légiforgalmi szolgálati egységeknél lévő kijelzőknek ugyanazon érzékelőkhöz kell tartozniuk, és ahol külön érzékelők szükségesek, ahogyan a 4.3.1.2 pontban le van írva, a kijelzőket világosan meg kell jelölni az egyes érzékelők által figyelt futópálya és futópálya szakasz azonosítása érdekében.

4.3.3.2 **Ajánlás.** – *Ahol a futópálya látástávolságot emberi megfigyelők állapítják meg, a futópálya látástávolságot jelenteni kell a megfelelő helyi légiforgalmi szolgáltató egységeknek, ha a jelentő skálának megfelelően jelentett értékben változás áll be (kivéve, ha a 3.2.2 a) vagy b) pont előírásai érvényesek). Az ilyen jelentések továbbítását normál esetben a megfigyelés befejezése után 15 másodpercen belül be kell fejezni.*

4.3.4 Átlagolás

Ahol a futópálya látástávolság meghatározására műszerezett rendszereket használnak, ezek inputjait legalább minden 60 másodpercben fel kell frissíteni, hogy lehetővé tegyék aktuális reprezentatív értékek szolgáltatását. A futópálya látástávolság értékeknél az átlagolási időszaknak a következőknek kell lenni:

a) 1 perc helyi rendszeres és különleges jelentéseknél és légiforgalmi szolgáltató egységeknél elhelyezett futópálya látástávolság kijelzőknél; és

b) 10 perc METAR és SPECI esetén, kivéve, ha a megfigyelést közvetlen megelőző 10-perces időszak markáns diszkontinuitást tartalmaz a futópálya látástávolság értékekben, amikor csak a diszkontinuitás utáni adatokat használják fel a középértékek nyeréséhez.

Megjegyzés – Markáns diszkontinuitás akkor fordul elő, amikor a látásban egy megszakítás, és egy legalább 2 percig tartó változás fennmarad, amely eléri vagy meghaladja a 2.3.2 f) pontban megadott, SPECI jelentések kiadására vonatkozó kritériumokat.

4.3.5 Futópálya megvilágítás intenzitása

Ajánlás – *Ha műszerezett rendszereket használnak a futópálya látástávolság megállapítására, számításokat kell végezni külön mindegyik rendelkezésre álló futópályára. A futópálya látástávolságot nem lehet a futópályán rendelkezésre álló maximális fényintenzitás 3%-ára vagy ennél kevesebbre számítani. Helyi rendszeres és különleges jelentések részére a számításhoz használt fényintenzitásnak a következőnek kell lenni:*

a) bekapcsolt fényekkel rendelkező futópályáknál a fényintenzitás aktuálisan az ezen a futópályán használt lesz; és

b) a kikapcsolt (vagy az újraüzemelés során a legkisebbre állított) világítású futópályánál az optimális fényintenzitás, amely megfelelne az uralkodó körülményekben üzemelési célra használtnak.

METAR-ban és SPECI-ben a futópálya látástávolságnak a futópályán rendelkezésre álló maximális fényintenzitáson kell alapulnia.

Megjegyzés. – A műszeren leolvasott értékek futópálya látástávolság értékekre való átszámítására vonat-

kozó útmutató anyag az E Mellékletben található.
4.3.6 Jelentés
4.3.6.1 Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben, ha a futópálya látástávolság 400 m alatt van, azt 25 m-es lépcsőkben kell jelenteni, 400 m és 800 m között 50 m-es lépcsőket kell használni, és 100 m-es lépcsőket, ha a futópálya látástávolság nagyobb, mint 800 m. Ha valamely észlelt érték nem illeszkedik a használt jelentő skálához, akkor a skálán lévő legközelebbi kisebb lépcsőre kell lekerekíteni.
4.3.6.2 **Ajánlás** – *A futópálya látástávolság alsó határának 50 métert, a felső határának 2000 métert kell tekinteni. Ezeken a határértékeken kívül eső értékeknél a helyi rendszeres és különleges jelentéseknek és a METAR-nak és SPECI-nek csupán azt kell jelezni, hogy a futópálya látástávolság kisebb, mint 50 méter, vagy nagyobb, mint 2000 méter.*
4.3.6.3 Helyi rendszeres és speciális jelentésekben és METAR-ban és SPECI-ben:
a) Ha a futópálya látástávolság a használt rendszerrel meghatározható maximális érték fölött van, ezt a „ABV" rövidítés használatával kell jelenteni a helyi rendszeres és különleges jelentésekben, és a „P" rövidítés használatával METAR-ban és SPECI-ben, amelyet a rendszerrel megállapítható maximális érték követ; és
b) ha a futópálya látástávolság a használt rendszerrel meghatározható minimális érték alatt van, azt „BLW" rövidítés használatával kell jelenteni a helyi rendszeres és különleges jelentésekben, és „M" rövidítés használatával METAR-ban és SPECI-ben, amelyet a rendszerrel meghatározó minimális érték követ.
4.3.6.4 Helyi rendszeres és különleges jelentésekben:
a) a használt mértékegységeknek szerepelniük kell;
b) ha futópálya látástávolságot a futópálya mentén csak egy helyen figyelik, azaz a földetérési zónában, annak a hely jelzése nélkül kell szerepelni;
c) ha a futópálya látástávolságot a futópálya mentén egynél több helyen figyelik, a földetérési zónát képviselő értéket kell először jelenteni, amelyet a középpontot és a megállási véget képviselő értékek követnek, és jelölni kell azokat a helyeket, amelyeket ezek az értékek reprezentálnak; és
d) ha egynél több futópálya van használatban, a rendelkezésre álló futópálya látástávolság értékeket mindegyik futópályára jelenteni kell, és a futópályákat, amelyekre az értékek vonatkoznak, jelölni kell.
4.3.6.5 **Ajánlás** – *METAR-ban és SPECI-ben:*
a) csak a földetérési zónát reprezentáló értéket kell jelenteni, és nem kell a futópályán lévő hely jelzését megadni; és
b) ahol egynél több futópálya áll leszálláshoz rendelkezésre, a földetérési zóna futópálya látástávolság értékeket minden ilyen futópályára, maximálisan négyre, meg kell adni és a futópályákat, amelyekre az értékek vonatkoznak, jelölni kell.
4.3.6.6 **Ajánlás**. – *Ha a futópálya látástávolság megállapításához műszeres rendszereket használnak, a megfigyelést megelőző 10 perc futópálya látástávolság értékek változásait a METAR-nak és a SPECI-nek tartalmazniuk kell a következők szerint:*
a) ha a futópálya látástávolság értékek a 10 perces időszak alatt eltérő tendenciát mutatnak, pl. az első 5 perc átlaga 100 m-el, vagy többel eltér a második 5 perc átlagától, ezt jelezni kell. Ha a látástávolság értékek változása növekvő, illetve csökkenő tendenciát mutatnak, ezt az „U", illetve a „D" rövidítésekkel kell jelezni. Olyan esetekben, amikor a 10 perces időszak alatti ingadozások eltérő tendenciát nem mutatnak, ezt a „N" rövidítéssel kell jelezni. Ha tendencia jelzések nem állnak rendelkezésre, a fenti rövidítések nem szerepelnek; és
b) ha a 10 perces időszak egy perces futópálya látástávolság értékei az átlagértéktől több mint 50 m-el, vagy több mint 20 százalékkal, attól függően, melyik a nagyobb, eltérnek, az 1 perces átlag minimumot és az 1 perces átlag maximumot kell megadni a 10 perces átlagérték helyett. Ha megfigyelést közvetlenül megelőző 10 perces időszak alatt jelentős diszkontinuitás mutatkozik a futópálya látástávolság értékekben, csak a diszkontinuitás utáni értékeket kell használni a változások meghatározásához.
Megjegyzés. – Markáns diszkontinuitásnak a futópálya látástávolság olyan hirtelen bekövetkező és folyamatos – legalább 2 percig tartó – változása minősül, amely eléri vagy meghaladja a SPECI kiadásá-

nak 2.3.2 f) pontban megadott kritériumait.

4.4. Aktuális időjárás

4.4.1 Elhelyezés

Ajánlás – *Ha a 4.4.2.3 és 4.4.2.4 pontok alatt felsorolt aktuális időjárás jelenségek megfigyelésére műszerezett rendszereket használnak, reprezentatív információkat megfelelően elhelyezett érzékelők használatával kell nyerni*

4.4.2 Jelentés

4.4.2.1 A helyi rendszeres és különleges jelentésekben az észlelt aktuális időjárási jelenségeket fajta és jelleg és minősített intenzitás fogalmakban kell megadni, amelyik a megfelelő.

4.4.2.2 METAR-ban és SPECI-ben az észlelt aktuális időjárási jelenségeket fajta és jelleg, , valamint minősített intenzitás vagy a repülőtérhez való közelség fogalmakban kell megadni, amelyik a megfelelő.

4.4.2.3 **Ajánlás. –** *Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben az aktuális időjárás jelenségek következő fajtáit kell jelenteni, a megfelelő rövidítéseket és releváns kritériumokat, amelyik a megfelelő, használva:*

a) Csapadék

Szitálás	*DZ*
Eső	*RA*
Hó	*SN*
Hódara	*SG*
Jéglabdacsok	*PL*
Jégkristályok (nagyon apró jégkristályok lebegésben, gyémántporként is ismert)	*IC*
– Csak akkor kell jelenteni, ha a hozzá kapcsolódó látás 5000 m vagy kevesebb.	
Jégeső	*GR*
– Akkor jelentendő, ha a legnagyobb jégszemek átmérője 5 mm, vagy ennél nagyobb.	
Kisméretű jég és/vagy hódara	*GS*
– Akkor jelentendő, ha a legnagyobb szemek átmérője 5 mm-nél kisebb.	

b) Homályosságok (hidrometeorok)

Köd	*FG*
– Akkor jelentendő, ha a látástávolság 1000 m alatt van, kivéve azokat az eseteket, amikor „MI”, „BC”, „PR”, vagy „VC”-nek van minősítve (lásd 4.4.2.5 és 44.2.6. pontokat).	
Párásság	*BR*
– Akkor jelölendő, ha a látástávolság legalább 1000 m, de nem több, mint 5000 m.	

c) Homályosság (litometeorok)

A következők csak akkor használandók, ha a homályosság túlnyomórészt litometeorokból áll és a látástávolság 5000 m, vagy annál kisebb, kivéve az „SA”-t, ha azt „DR”(lásd 4.4.2.5)és vulkanikus hamu kvalifikálja

Homok	*SA*
Por (nagy kiterjedésű)	*DU*
Homály	*HZ*
Füst	*FU*
Vulkanikus hamu	*VA*

d) Egyéb jelenségek

Por/homok forgatag (dust devils)	*PO*
Szélroham	*SQ*
Tölcsérfelhő (tornádó vagy víztölcsér)	*FC*
Porvihar	*DS*
Homokvihar	*SS*

4.4.2.4 **Ajánlás** – *Automatizált METAR-ban és SPECI-ben,a 4.4.2.3 a) pont alatt felsorolt csapadék fajták mellett z UP rövidítést kell használni nem-azonosított csapadéknál, amikor a csapadék fajtája automatikus megfigyelő rendszerrel nem lehet azonosítani.*
4.4.2.5 **Ajánlás.** – *Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben az aktuális időjárás jelenségek következő jellemzőit, ahogyan szükséges, kell jelenteni, a megfelelő rövidítéseiket és releváns kritériumaikat, amelyik alkalmas, használva:*

Zivatar	*TS*
–Csapadékkal kísért zivatar jelentésére használják, az A3-1 és A3-2 táblázatokban bemutatott mintáknak megfelelően. Ha mennydörgést hallani, vagy villámlást látnia repülőtéren a megfigyelést megelőző 10 perces időszakon belül, a „TS” rövidítést kell használni, minősítés nélkül.	
Zápor	*SH*
– Használatos záporesők jelentésére az A3-1 és az A3-2 táblázatokban bemutatott mintáknak megfelelően. A repülőtér környezetében észlelt záport (lásd 4.4.2.6. pont) „VCSH”-ként kell jelenteni, a csapadék típusának vagy intenzitásának minősítése nélkül;	
Ónos eső	*FZ*
Túlhűlt vízcseppek, vagy csapadék, az aktuális időjárás jelenségek fajtájánál használják az A3-1 és az A3-2 táblázatokban bemutatott mintáknak megfelelően	
Fúvás	*BL*
–Használatos az A3-1 és az A3-2 táblázatokban bemutatott mintáknak megfelelően a föld felett 2 m-ren, (6 láb) vagy annál magasabban fúvó szél által előidézett aktuális időjárás jelenség fajtáinál.	
Talajközeli fúvás	*DR*
--Használatos az A3-1 és az A3-2 táblázatokban bemutatott mintáknak megfelelően szél által a föld feletti 2 m-t (6 láb) el nem érő magasságban fúvó szél által előidézett aktuális időjárás jelenség fajtáinál	
Sekély	*MI*
--A földfelszínhez képest 2 m-nél (6 láb) alacsonyabb	
Foltok	*BC*
–Ködfoltok, amelyek a repülőteret véletlenszerűen elszórva borítják.	
Részleges	*PR*
–A repülőtér számottevő részét köd borítja, míg a többi rész tiszta.	

4.4.2.6 **Ajánlás.** – *Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben jelentett aktuális időjárási jelenség intenzitásának, illetve a repülőtérhez való közelségének, ahogy alkalmas, jelölésére az alábbiak szolgálnak:*

	(helyi rendszeres és különleges jelentések)	*(METAR és SPECI)*
Gyenge	*FBL*	*–*
Közepes	*MOD*	*(nincs jelölés)*
Erős	*HVY*	*+*

az aktuális időjárás jelenségekkel használatos az A3-1és az A3-2 táblázatokban bemutatott mintáknak megfelelően. A gyenge intenzitást csak csapadékként kell jelölni.

Környék *VC*

– Közelitőleg a repülőtér referencia pontjának 8 és 16 km-e közötl, és csak METAR-ban és SPECI-benaktuális időjárásnál az A3-2 táblázatban bemutatótt mintának megfelelően használatos, amikor 4.4.2.5. pont alatt nem jelentették.

4.4.2.7 **Ajánlás**. – *Helyi rendszeres és különleges jelentésekbenés METAR-ban vagy SPECI-ben:*

a) egy vagy több, maximum három, a 4.4.2.3 és 4.4.2.4 pontban megadott rövidítést kell szükség szerint használni, ahol alkalmas, a jelenség jellegének és intenzitásának vagy repülőtéri közelségének jelzésével együtt, úgy, hogy a repülési műveletek számára jelentőséggel bíró aktuális időjárásról komplett leírást adjon;
b) az intenzitás vagy a repülőtéri közelség jelölése kerüljön az első helyre, ahogy megfelelő, ezt kövesse az időjárási jelenség jellege és fajtája; és
c) ha két különböző fajtájú időjárást észlelnek, ezt két különálló csoportban kell jelenteni, ahol az intenzitás vagy repülőtér közelség jelölés arra az időjárási jelenségre utal, amelyik a jelölést követi. Az észlelés időpontjában előforduló többféle csapadék fajtát viszont egyetlen csoportban kell jelenteni, a domináns csapadékfajta jelentésével az első helyen, ezt csak egy intenzitásjelző előzi meg, amely a teljes csapadék-intenzitást jelöli.

4.5 Felhők

4.5.1 Elhelyezés
Ajánlás – *Ha a felhő mennyiség és felhőalap magasság mérésére műszerezett rendszert használnak, reprezentatív észleléseket kell nyerni megfelelően elhelyezett érzékelők használatával. Helyi rendszeres és különleges jelentéseknél precíziós megközelítéses futópályákkal rendelkező repülőterek esetén, a felhő mennyiség és felhőalap magasság érzékelőket úgy kell elhelyezni, hogy a felhőalap magasság és felhő mennyiség lehető legjobb jelzését adja a műszeres leszállító rendszer középső rádió jeladójánál, vagy olyan repülőtereknél, ahol középső rádió jeladót nem használnak, 900-1200 m (3000-4000 láb) távolságra a leszállási küszöbtől a futópálya megközelítési végénél.*
Megjegyzés. – Műszeres leszállító rendszer középső jeladó helyének specifikációi a 10. Annex 1. Kötet 3. fejezetben és a C Melléklet C-5 táblázatában vannak meg adva.
4.5.2 Kijelző
Ajánlás. – *Ha a felhőalap mérésére automatizált berendezést használnak, a felhőalap magasság kijelző(ke)t a megfelelő légiforgalmi szolgálati egységeknél lévő kijelző(k)höz kapcsolódó meteorológiai állomáson kell elhelyezni. A meteorológiai állomáson és a légiforgalmi szolgálati egységeknél lévő kijelzőknek ugyanahhoz az érzékelőhöz kell tartozniuk, és ahol különálló érzékelők szükségesek, ahogyan a 4.5.1 pontban le van írva, a kijelzőknek világosan azonosítani kell az egyes érzékelők által figyelt területet.*
4.5.3 Referencia szint
Ajánlás – *A felhőalap magasságot általában a repülőtér közepes tengerszint feletti magassága felettiként kell jelenteni. Ha olyan precíziós megközelítéses futópálya van használatban, amelynek 15 m-el (50 láb) vagy többel a repülőtér közepes tengerszint feletti magassága alatti küszöbmagassága van, helyi megállapodást kell kötni arról, hogy az érkező légijárműveknek jelentett felhőalap a küszöbmagasságra vonatkozzon. Tengeren lévő partközeli szerkezetekről kiadott jelentések esetében a felhőalap magasságot a közepes tengerszint felettiként kell megadni.*
4.5.4 Jelentés
4.5.4.1 Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben a felhőalap magasságát 30 m-es lépcsőkben kell megadni 3000 m-ig (10000 láb). Bármely észlelt értéket, amelyik nem illeszkedik a használt jelentési skálához, a skála legközelebbi alacsonyabb lépcsőjére kell lekerekíteni.
4.5.4.2 **Ajánlás** – *Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben:*
a) felhőmennyiséget a „FEW" (1-től 2 oktáig), „SCT" (3-tól 4 oktáig), „BKN" (5-től 7 oktáig) vagy „OVC" (8 okta) rövidítéseket használva kell jelenteni;
b) cumulonimbus felhőket és tornyosuló cumulus felhőket „CB" és „TCU" rövidítésekkel kell jelenteni;
c) a függőleges látást 30 m-es (100 láb) lépcsőkben kell jelenteni 600 m-ig (2000 láb);
d) ha nincs az üzemeltetés szempontjából jelentőséggel bíró felhő, és nincs korlát a függőleges látásban, és a „CAVOK" rövidítés nem megfelelő, az „NSC" rövidítést kell használni;

e) ha több, üzemeltetés szempontjából szignifikáns felhőréteget vagy felhőtömeget észleltek, mennyiségüket és felhőalap magasságukat a felhőalap magasság növekvő sorrendjében, és a következő kritériumoknak megfelelően kell jelenteni:
1) mennyiségre való tekintet nélkül, a legalacsonyabb réteg vagy tömeg, melyet megfelelően FEW, SCT, BKN, vagy OVC-ként kell jelenteni, amelyik megfelelő;
2) a következő réteg vagy tömeg, amely az égboltnak több mint 2/8 részét borítja, melyet megfelelően SCT, BKN, vagy OVC-ként kell jelenteni;
3) a következő magasabb réteg vagy tömeg, amely az égboltnak több, mint 4/8 részét borítja, melyet megfelelően BKN, vagy OVC-ként kell jelteni; és
4) cumulonimbus és/vagy tornyos cumulus felhők, ha észleltek ilyet és nem jelentették azokat a fenti 1)-3) pontokban.
f) ha a felhőalap kusza vagy egyenetlen, vagy gyorsan ingadozik, a felhőalap minimális magasságát, vagy felhőfoszlányokat kell jelenteni; és
g) ha egy egyedi felhőréteg (felhőtömeg) cumulonimbusszal és tornyosuló cumulus felhőkkel együtt van, a felhőfajtát csak mint cumulonimbust kell jelenteni.
Megjegyzés. – Tornyosuló cumulus nagy függőleges kiterjedésű cumulus congestust jelöl.
4.5.4.3 Helyi rendszeres és különleges jelentésekben:
a) a felhőalap magasság és a függőleges látás vonatkozó mértékegységeit jelölni kell; és
b) ha egynél több futópálya van használatban, és a felhőalap magasságokat ezekre a futópályákra műszerekkel figyelik, a rendelkezésre álló felhőalap magasságokat az egyes futópályákra vonatkozóan kell jelenteni, és a futópályát, amelyre az értékek vonatkoznak, meg kell jelölni.
4.5.4.4 **Ajánlás. –** *A automatizált METAR-ban és SPECI-ben:*
a) amikor a felhőfajtát nem lehet automatikus megfigyelő rendszerrel figyelni, a felhőtípust minden felhőcsoportban „///” jellel kell helyettesíteni;
b) ha nincs automatikus megfigyelő rendszerrel észlelt fefelhő, ezt az „NCD” rövidítés felhasználásával kell jelezni; és
c) ha cumulonimbus felhőket, vagytornyos cumulus felhőket automatikus megfigyelő rendszerrel észlelnek, és a felhő mennyiséget ésa felhőalap magasságot nem lehet észlelni, a felhő mennyiséget és a felhőalap magasságot „//////” jellel kell helyettesíteni.

4.6 Levegő hőmérséklet és harmatpont hőmérséklet

4.6.1 Kijelző
Ajánlás. – *Ha a levegő hőmérséklet és harmatpont hőmérséklet mérésére automatizált berendezést használnak, a levegő hőmérséklet és harmatpont hőmérséklet kijelzőket a megfelelő légiforgalmi szolgálati egységeknél lévő kijelző(k)höz kapcsolódó meteorológiai állomáson kell elhelyezni. A meteorológiai állomáson és a légiforgalmi szolgálati egységeknél lévő kijelzőknek ugyanahhoz az érzékelőkhöz kell tartozniuk.*
4.6.2 Jelentés
4.6.2.1 Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben a levegő hőmérsékletet és a harmatpont hőmérsékletet egész Celsius fok lépcsőkben kell jelenteni. Azokat az észlelt értékeket, amelyek nem illeszkednek a használt jelentő skálához, a legközelebbi egész Celsius fokra kell kerekíteni, ha az észlelt érték 0,5° végződésű, akkor a legközelebbi nagyobb egész Celsius fokra kell kerekíteni.
4.6.2.2 Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben 0°C alatti hőmérsékletet azonosítani kell.

4.7 Atmoszférikus nyomás

4.7.1 Kijelző
Amikor nyomásmérésre automatizált berendezéseket használnak, a barométerrel kapcsolódó QNH és a 4.7.3.2 b) ponttal összhangban szükséges QFE kijelzőket a meteorológiai állomáson kell elhelyezni, összekötve a megfelelő légiforgalmi szolgáltató egységekben lévő kijelzőkkel. Ha a QFE értékek kijelzése

egynél több futópályára vonatkozóan történik, ahogyan az a 4.7.3.2 d) pontban le van írva, a kijelzőket világosan meg kell jelölni, hogy a futópálya, amelyre a kijelzett QFE érték vonatkozik, azonosítható legyen.

4.7.2 Referencia szint

Ajánlás. – *A QFE kiszámításához a vonatkozási szint a repülőtér tengerszint feletti magassága legyen. Nem-precíziós megközelítésű futópályáknál, amelyek küszöbje 2 méterrel (7 lábbal) vagy többel a repülőtér tengerszint feletti magassága alatt van, és a precíziós megközelítésű futópályáknál, a QFE-t, ha szükséges, a megfelelő küszöb tengerszint feletti magasságra vonatkoztatva kell megadni.*

4.7.3 Jelentés

4.7.3.1 Helyi rendszeres és különleges jelentéseknél és METAR-ban és SPECI-ben QNH-t és QFE-t tized hektopascalban kell számolni, és egész hektopascalos lépcsőkben kell jelenteni, négy számjegyet használva. Azokat az észlelt értékeket, amelyek nem illeszkednek a használt jelentő skálához, a legközelebbi kisebb egész hektopascalra kell kerekíteni.

4.7.3.2 Helyi rendszeres és különleges jelentésekben:

a) QNH-nak szerepelni kell;

b) QFE-nek szerepelni kell, ha az üzemeltetők igénylik, vagy ha a légiforgalmi szolgáltatási hatóságok és az érdekelt üzemeltetők között helyileg ilyen megállapodás van, reguláris alapon;

c) a QNH és QFE értékek mérésénél használt mértékegységeknek szerepelni kell; és

d) ha a QFE értékeket egynél több futópályára igénylik, az igényelt QFE értékeket az egyes futópályákra jelenteni kell, és a futópályákat, amelyekre az értékek vonatkoznak, meg kell jelölni.

4.7.3.3 METAR-ban és SPECI-ben csak a QNH értékeket kell szerepeltetni.

4.8 Kiegészítő információk

4.8.1 Jelentés

4.8.1.1 **Ajánlás**. – *Helyi rendszeres és különleges jelentésekben és METAR-ban és SPECI-ben az alább felsorolt legutóbbi időjárás jelenségeket, azaz azokat, amelyeket a repülőtéren az utolsó kiadott rendszeres jelentés óta eltelt időszak során, vagy az utolsó egy órában, amelyik a rövidebb, de nem a megfigyelés időpontjában észleltek, maximálisan három csoportot, az A3-1 és A3-2 táblázaban közölt mintának megfelelően a kiegészítő információban jelenteni kell:*

– ónos csapadék

– mérsékelt vagy heves csapadék (beleértve a záporokat)

– hófúvás

– porvihar, homokvihar

– zivatar

– tölcsér felhő (tornádó vagy víztölcsér)

– vulkanikus hamu

4.8.1.2 **Ajánlás. –** *Helyi rendszeres és különleges jelentésekben a következő szignifikáns meteorológiai viszonyokat, vagy ezek kombinációit kell kiegészítő információként jelenteni:*

– cumulonimbus felhők	*CB*
– zivatar	*TS*
– mérsékelt vagy heves turbulencia	*MOD TURB, SEV TURB*
– szélnyírás	*WS*
– jégeső	*GR*
– heves szélvihar vonal	*SEV SQL*
– mérsékelt vagy erős jegesedés	*MOD ICE, SEV ICE*
– ónos csapadék	*FZDZ, FZRA*
– erős hegyi hullám	*SEV MTW*
– porvihar, homokvihar	*DS, SS*

– hófúvás *BLSN*
– tölcsérfelhő (tornádó vagy víztölcsér) *FC.*
A meteorológiai körülmény helyét jelölni kell. Ahol szükséges, kiegészítő információkat kell bevinni, rövidített köznyelvet használva.
4.8.1.3 **Ajánlás. –** *Automatizált METAR-ban és SPECI-ben a 4.8.1.1 pontban felsorolt legutolsó időjárás jelenségek mellett, a legutolsó ismeretlen csapadékot jelenteni kell, az A3-2 táblázatban bemutatott mintának megfelelően, amikor a csapadék fajtát az automatikus megfigyelő rendszer nem tudja azonosítani.*
4.8.1.4 **Ajánlás. –** *METAR-ban és SPECI-ben, ahol a helyi körülmények így indokolják, szélnyírás információkat kell adni.*

Megjegyzés. – A 4.8.1.4 pontban hivatkozott helyi körülmények, bár nem korlátozódnak szükségszerűen egy nem átmeneti jellegű szélnyírásra, például kapcsolódhatnak alacsonyszinti hőmérséklet inverzióhoz vagy helyi terepviszonyokhoz.
4.8.1.5 **Ajánlás. –** *METAR-ban és SPECI-ben a következő információknak kell szerepelni a kiegészítő információk között, a regionális léginavigációs egyezménynek megfelelően:*
a) tengeren partközelben emelt építményeken létesített, repülésmeteorológiai állomásoktól származó, a tengerszinti hőmérsékletre és a tenger állapotára vonatkozó információk a helikopteres üzemelések támogatására; és
b) a megfelelő repülőtéri hatóság által szolgáltatott, a futópálya állapotára vonatkozó információk.
1. Megjegyzés. – A tenger állapota a WMO 306 számú kiadványában, Kód kézikönyv (Manual on Codes), *1.1 kötet, A Rész – Alfanumerikus kódok, 3700-es kód táblázat van specifikálva.*
2. Megjegyzés. –A tenger állapota a WMO 306 számú kiadványában, Kód kézikönyv (Manual on Codes), *1.1 kötet, A Rész – Alfanumerikus kódok, 0366, 0519, 0919 és 1079 kód táblázatok van specifikálva.*

A3-1 táblázat. Minta helyi rendszeres (MET REPORT) és helyi különleges (SPECIAL) jelentésekhez

Kulcs: M = kötelező bevitel, minden közlemény része
C = feltételes bevitel, meteorológiai körülményektől függ
O = fakultatív bevitel
1. Megjegyzés. –A helyi rendszeres és különleges jelentésekben szereplő számszerű elemek nagyságrendje és felbontása jelen Függelék A3-4 táblázatban látható
2. Megjegyzés. – A rövidítések magyarázata a Procedures for Air Navigation Services – ICAO Abbreviations and Codes (Léginavigációs szolgálati eljárások – ICAO rövidítések és kódok) *(PANS-ABC, Doc 8400) kiadványban található.*

Megjegyzések.–

1. Fiktív hely.
2. Fakultatív értékek egy vagy több futópályára.C)
3. Fakultatív értékek a futópálya egy vagy két szektorára.
4. Tartalmazni kell a 4.1.5.2 c) pontnak megfelelően.
5. Tartalmazni kell a 4.1.5.2 b) 1) pontnak megfelelően.
6. Tartalmazni kell, ha a látás vagy futópálya látástávolság < 1500 m.
7. Tartalmazni kell a 4.3.6.4 d) pontnak megfelelően
8. Tartalmazni kell a 4.3.6.4 c) pontnak megfelelően.
9. Tartalmazni kell, ha odavonatkozik.
10. Egy vagy több, maximum három csoport 4.4.2.7 a), 4.8.1.1és az 5. Függelék 2.2.4.3 pontjának megfelelően
11. A 4.4.2.3 a) pont alatt felsorolt csapadék fajták kombinálhatók a 4.4.2.7 és az 5. Függelék 2.2.4.2 pontjának megfelelően. Csak mérsékelt vagy heves csapadékot kell jelezni trend előrejelzésekben az 5. Függelék 2.2 4.2 pontjának megfelelően.
12. Maximálisan négy felhőréteg a 4.5.4.2e) pontnak megfelelően.

13. Rövidített köznyelv használható a 4.8.1.2 pontnak megfelelően
14. Tartalmazni kell a 6. Fejezet 6.3.2 pontnak megfelelően
15. A változás jelzők számát minimumon kell tartani az 5. Függelék 2.2.1 szakaszának megfelelően, általában három csoportot nem halad meg.

A két jelentés értelmi jelentése:

Különleges jelentés Donlon Nemzetközi Repülőtérről*, amelyet a hónap 15-én 1115 UTC-kor adtak ki; talajszél iránya 050 fok; szélsebesség 25 csomó, széllökések 10 és 37 csomó között (a minimális szélsebességet a SPECI-nek nem kell tartalmaznia); a látás 1200 méter (a futópálya (futópályák) mentén a helyi különleges jelentésben); domináns látás 3000 méter (SPECI-ben) 1200 méteres minimális látással észak-kelet felé (az irányváltozásokat csak a SPECI tartalmazza); zivatar heves esővel; szakadozott cumulonimbus felhő 500 lábon; lvegő hőmérséklet 25 fok Celsius; harmatpont hőmérséklet 22 fok Celsius; QNH 1008 hektopascal; a trend a következő két órában: látás (a futópálya (futópályák) mentén a helyi különleges jelentésben; domináns látás SPECI-ben) átmenetileg 600 méter 1115-től 1200-ig, 1200 UTC-kor, látás (a futópálya (futópályák) mentén a helyi különleges jelentésben; domináns látás SPECI-ben) 8 km lesz, a zivatar megszűnik és nincs szignifikáns időjárás és nincs szignifikáns felhő.

*Fiktív hely

Megjegyzés. – Ebben a példában a "csomó" és "láb"nem-SI alternatív mértékegységeket használtuk a sebességre és a felhőalap magasságra. Azonban az 5. Annex előírásainak megfelelően, helyettük a vonatkozó elsődleges mértékegységek, a „kilométer per óra” illetve a „méter” használható..

A3-3. példa – Vulkánikus tevékenység jelentés

VOLCANIC ACTIVITY REPORT YUSB* 231500 MT TROJEEN* VOLCANO N5605 W12652 ERUPTED 231445 LARGE ASH CLOUD EXTENDING TO APPROX 30000 FEET MOVING SW

Jelentése:

Vulkánikus tevékenység jelentés, amelyet a Siby/Bistock meteorológiai állomás adott ki 1500 UTC-kor a hónap 23-án. Az Mt Trojeen vulkán, amelynek helye 56 fok 5 perc északi szélesség és 126 fok 52 perc nyugati hosszúság a hónap 23. napján 1445 UTC-kor kitört; egy nagy hamufelhőt észleltek, amely közelítőleg 30000 lábig terjed, és délnyugati irányban mozog.

*Fiktív hely

4. FÜGGELÉK. LÉGIJÁRMŰVES MEGFIGYELÉSEKRE ÉS JELENTÉSEKRE VONATKOZÓ MŰSZAKI ELŐÍRÁSOK

(Lásd jelen Annex 5. Fejezet)

1. LÉGIJELENTÉSEK TARTALMA

1.1 Rendszeres légijelentések levegő-föld adatkapcsolattal

1.1.1 Amikor levegő-föld adatkapcsolatot használnak, és automatikus függő légtérellenőrzést (ADS) alkalmaznak, a rendszeres légijelentések által tartalmazott elemeknek a következőknek kell lenni:
Közlemény típus jelölő
Légijármű azonosítás

1. adatblokk
Földrajzi szélesség
Földrajzi hosszúság
Magasságszint
Idő

2. adatblokk
Szélirány
Szélsebesség
Szélminőség zászló
Hőmérséklet
Turbulencia (ha rendelkezésre áll)
Nedvesség (ha rendelkezésre áll)
Megjegyzés. – Amikor ADS vagy SSRS üzemmódban kerül alkalmazásra, a rendszeres légijelentés köve-

telményei kielégíthetők az alap ADS/SSR S üzemmód adatblokk (1. adatblokk) és a meteorológiai információs adatblokk (2. adatblokk) kombinációjával, amely az ADS vagy SSR S üzemmód jelentésekből áll rendelkezésre. Az ADS közlemény formátum ismertetése a PANS-ATM (Doc 4444) 4.11.4 pontban és a 13. fejezetben, és az SSR S üzemmód közlemény formátum a 10. Annex, III. Kötet I. Rész 5. fejezetben – Digitális adatkommunikációs rendszerek (Digital Data Communication Systems) *– került ismertetésre.*

1.1.2 Ha levegő-föld adatkapcsolatot használnak, amikor ADS nincs használatban, a rendszeres jelentések által tartalmazott elemeknek az 1.3 szakasszal kell összhangban lenniük.

Megjegyzés. – Amikor levegő-föld adatkapcsolatot használnak, miközben ADS és SSR S üzemmód nincs alkalmazásban, a rendszeres légi-jelentések követelményei kielégíthetők az irányító - légijárművezető adatkapcsolati kommunikáció (CPDLC) alkalmazásával, a „Helyzet jelentés" címzéssel. Ezen adatkapcsolat alkalmazásáról részletes leírás a Légiforgalmi szolgálatok adatkapcsolat alkalmazások kézikönyvben (Manual of Air Trafic Services Data Link Applications) *(Doc4444) és a 10. Annex, III. Kötet, I. Részben található.*

1.2 Különleges légi-jelentések levegő-föld adatkapcsolattal

Amikor levegő-föld adatkapcsolatot használnak, a rendszeres légi-jelentések által tartalmazott elemeknek a következőknek kell lenni:

Közlemény típus jelölő
Légijármű azonosító
1. adatblokk
Földrajzi szélesség
Földrajzi hosszúság
Magasságszint
Idő
2. adatblokk
Szélirány
Szélsebesség
Szélminőség zászló
Hőmérséklet
Turbulencia (ha rendelkezésre áll)
Nedvesség (ha rendelkezésre áll)
3. adatblokk
Különleges légijelentés kiadását indokolttá tevő körülmény (egy körülményt az A4-2 táblázatban közölt listáról kell kiválasztani).

1. Megjegyzés. – A különleges légijelentések követelményei kielégíthetők az adatkapcsolati repülés információ szolgáltatás (D-FIS) alkalmazásával, amely „Különleges légijelentés szolgáltatás" címet viseli. Ennek az adatkapcsolatnak az alkalmazásáról részletes specifikáció a Doc 9694 kiadványban található.

2. Megjegyzés. – Kitörés előtti vulkanikus tevékenység, vulkánkitörés vagy vulkanikus hamufelhő különleges légijelentése továbbításának esetében további követelmények a 4.2 szakaszban vannak feltüntetve.

1.3 Rendszeres légijelentések beszédkommunikációval

Amikor beszédkommunikációt használnak, a rendszeres és különleges légi jelentések által tartalmazott elemeknek a következőknek kell lenniük:

Közlemény típus jelölő
1. szekció (Helyzet információ)
Légijármű azonosítás
Helyzet vagy földrajzi szélesség és hosszúság
Időpont
Repülési magasságszint vagy tengerszint feletti magasság
Következő helyzet és az eltelt idő

Következő szignifikáns pont
2. szekció (Üzemelési információk)
Megérkezés becsült időpontja
Repülési időtartam
3. szekció (Meteorológiai információk)
Levegő hőmérséklet
Szélirány
Szélsebesség
Turbulencia
Légijármű jegesedés
Nedvesség (ha rendelkezésre áll)

1.4 Különleges légi jelentések beszédkommunikációval

Amikor beszédkommunikációt használnak, a különleges légi jelentéseknek a következő elemeket kell tartalmazniuk:
Közlemény típus jelölő
1. szekció (Helyzet információ)
Légijármű azonosítás
Helyzet vagy földrajzi szélesség és hosszúság
Időpont
Repülési magasságszint vagy tengerszint feletti magasság
3. szekció (Meteorológiai információk)
Különleges légi jelentés kiadását indokolttá tevő körülményeket az A4-2 táblázatban közölt listából kell kiválasztani.
1. Megjegyzés. – A légi-jelentés alapértelmezés szerint rendszeres jelentés. A közlemény típus jelző különleges légi jelentés esetére a PANS-ATM (Doc. 4444), I. Függelékben van leírva.
2 Megjegyzés. – Kitörés előtti vulkanikus tevékenység, vulkánkitörés vagy vulkanikus hamufelhő különleges légi jelentése esetében a további követelmények az 4.2 szakaszban vannak feltüntetve.

2. JELENTÉSI KRITÉRIUMOK

2.1 Általánosságok

Amikor levegő-föld adatkapcsolatot használnak, a légi-jelentésekben tartalmazott szélirányt, szélsebességet, szélminőség zászlót, hőmérsékletet, turbulenciát és nedvességet kell jelenteni a következő kritériumokkal összhangban.

2.2 Szélirány

A szélirányt földrajzi fokokban kell jelenteni, a legközelebbi egész fokra kerekítve.

2.3 Szélsebesség

A szélsebességet kilométer per órában vagy csomóban kell jelenteni, a legközelebbi 2 km/h-ra (1csomó) kerekítve. A használt mértékegységeket jelölni kell.

2.4 Szélminőség zászló

A szélminőség zászlót 0-nak kell jelenteni, ha a görgés szög kisebb, mint 5 fok, és 1-nek, ha a görgés szög 5 fok vagy ennél nagyobb.

2.5 Hőmérséklet

A hőmérsékletet tized Celsius fokokban kell jelenteni.

2.6 Turbulencia

A turbulenciát örvény disszipáció ráta (EDR) köbgyöke kifejezésben kell jelenteni..
2.6.1 Rendszeres légi-jelentések
A turbulenciát a repülés útvonal fázisa alatt kell jelenteni, és a megfigyelést közvetlenül megelőző 15 perces időszakra kell vonatkoznia. A turbulenciának mind az átlagos, mind a csúcsértékét, a csúcsérték megjelenési idejével együtt, a legközelebbi perc pontossággal, figyelni kell. Az átlagos és a csúcsértékeket az EDR köbgyökében kifejezve kell jelenteni. A csúcsérték megjelenési idejét az A4-1 táblázatban feltüntetett módon kell jelenteni. A turbulenciát az elemelkedés fázisban a repülés első 10 percére kell jelenteni, és a megfigyelést közvetlenül megelőző 30 másodpercre kell vonatkoznia. A turbulencia csúcsértékét figyelni kell.
2.6.2 A turbulencia jelentés értelmezése
A turbulencia erősségének értelmezése a következők szerinti:
a) heves, amikor az EDR köbgyökének csúcsértéke meghaladja a 0,7-et;
b) mérsékelt, ha az EDR köbgyökének csúcsértéke 0,4 felett van és kisebb vagy egyenlő 0,7-el;
c) enyhe, ha az EDR köbgyökének csúcsértéke 0,1 felett van és kisebb vagy egyenlő 0,4;
d) nincs, ha az EDR köbgyökének csúcsértéke kisebb vagy egyenlő 0,1-el.
Megjegyzés. – Az EDR a turbulencia légijárműtől független mértéke. Azonban az EDR értéke és a turbulencia csapadéka függvénye a légijármű típusának és tömegének, a közepes tengerszint feletti magasságának, konfigurációjának a légijármű levegőhöz viszonyított sebességének. Az EDR fent megadott értékei az erösségi szintet egy közepes méretű szállító repülőgépre, tipikus útvonali körülményekre (azaz tengerszint feletti magasságra,levegőhöz képesti sebességre és súlyra) vannak megadva.

2.6.3 Különleges légijelentések
Különleges légi-jelentéseket kell készíteni turbulenciáról a repülés bármely fázisában, amikor az EDR köbgyökének csúcsértéke meghaladja a 0,7 értéket. A különleges jelentést a megfigyelést közvetlen megelőző 1 perces időszakra vonatkozóan kell készíteni. A turbulenciának mind az átlagos, mind a csúcs értékét figyelni kell. A turbulencia átlagos és csúcs értékét az EDR köbgyökének terminusaiban kell jelenteni, ahogyan az. Különleges légijelentést minden percben ki kell adni addig az időpontig, amíg az EDR köbgyökének csúcsértékei 0,7 érték alá nem esnek.

2.7 Nedvesség

A nedvességet relatív nedvességként kell jelenteni, a legközelebbi egész százalékértékre kerekítve.
Megjegyzés. – A légijelentésekben szereplő meteorológiai elemek intervallumai és felbontásai az A4-3 táblázatban láthatók.

3. LÉGIJELENTÉSEK CSERÉJE

3.1 Meteorológiai figyelő irodák kötelezettségei

3.1.1 A meteorológiai figyelő irodáknak össze kell gyűjteniük a rendszeres légi jelentéseket, amelyek beszédkommunikáció útján érkeztek, és a regionális léginavigációs egyezménnyel összhangban továbbítaniuk kell azokat a WAFC-oknak és más meteorológiai irodáknak.
Megjegyzés. – Egyórás bázisú gyűjtemények cseréje lehet kívánatos, ha nagyon sok a jelentés.
3.1.2 A meteorológiai figyelő irodának késedelem nélkül továbbítania kell a beszédkommunikáció útján a vett különleges légijelentéseket a WAFC-okhoz
3.1.3 A meteorológiai figyelő irodának késedelem nélkül továbbítania kell a kitörés előtti vulkánikus tevékenységről, vulkánkitörésről, vagy vulkánikus hamufelhőről szóló, általa vett különleges légi jelentéseket a hozzátartozó VAAC-okhoz.

3.1.4 Ha különleges légijelentés érkezik a meteorológiai figyelő irodához, de az előrejelző úgy gondolja, hogy a jelenség, amely miatt a jelentés íródott, várhatóan nem marad fenn, és így SIGMET kiadására nincs ok, a különleges légijelentést kell ugyanolyan módon, mint egy SIGMET közleményt szétküldeni a 6. Függelék 1.2.1 pontjának megfelelően, azaz a meteorológiai figyelő irodáknak és más meteorológiai irodáknak, a regionális léginavigációs egyezménynek megfelelően.

3.2 Világ előrejelző központok kötelezettségei

A WAFC-oknál és RAFC-oknál vett légijelentéseket meteorológiai alapadatként kell tovább terjeszteni.
Megjegyzés. – A meteorológiai alapadatok terjesztését általában a WMO globális távközlési rendszerén végzik.

3.3 Légijelentések kiegészítő terjesztése

Ajánlás. – *Ahol a légijelentések kiegészítő szétosztására van szükség speciális repülési vagy meteorológiai igények kielégítésére, az ilyen terjesztést az illetékes meteorológiai hatóságok között kell lerendezni.*

3.4 Légijelentések formátuma

Légijelentéseket olyan formátumban kell cserélni, amilyenben azok érkeztek, kivéve azt, amikor beszéd kommunikációt használnak, ha helyzetet egy légiforgalmi szolgálat jelentő pontjára hivatkozva adnak meg, azt a meteorológiai megfigyelő irodának a megfelelő földrajzi szélességre és hosszúságra kell átalakítania.

4. SZÉLNYÍRÁS ÉS VULKANIKUS HAMU JELENTÉSÉRE VONATKOZÓ SPECIFIKUS ELŐÍRÁSOK

4.1 Szélnyírás jelentése

4.1.1 **Ajánlás**. -- *Elemelkedési és megközelítési repülési fázis során előfordult szélnyírás légijárműves megfigyeléseiről szóló jelentéseknek tartalmazniuk kell a légijármű típusát.*
4.1.2 **Ajánlás**. -- *Ha az elemelkedés vagy megközelítés fázisaiban szélnyírást jelentettek vagy előrejeleztek, de nem tapasztaltak, a légijármű parancsnokának ezt, mihelyt lehetséges, jelentenie kell az illetékes légiforgalmi szolgálati egységnek, kivéve, ha tudomása van arról, hogy a megfelelő légiforgalmi szolgálati egységet már tájékoztatta egy korábbi légijármű.*

4.2 Vulkanikus tevékenység repülés utáni jelentése

Megjegyzés. – A vulkánikus tevékenység megfigyelések rögzítésére és jelentésére vonatkozón részletes instrukciók a PANS-ATM (Doc.4444) 1. Függelékben találhatók.
4.2.1 Egy járat megérkezésekor egy repülőtérre, a vulkánikus tevékenységről szóló elkészített jelentést az üzemeltetőnek vagy a repülő személyzet egy tagjának késedelem nélkül el kell juttatnia a repülőtéri meteorológiai irodához, vagy ha ilyen iroda az érkező járat személyzete számára nem könnyen elérhető, a kész formátumot a meteorológiai hatóság és az üzemeltető közötti helyi megállapodásokkal összhangban kell kezelni.
4.2.2 A meteorológiai iroda által megkapott, vulkánikus tevékenységről szóló kész jelentést késedelem nélkül továbbítani kell azon meteorológiai figyelő iroda részére, amelynek kötelessége meteorológia megfigyelést biztosítani a repülési információhoz abban a régióban, ahol a vulkánikus tevékenységet megfigyelték.

A4-1 Táblázat A jelentendő csúcsérték megjelenésének időpontja

A megfigyelést …....perccel megelőző egy-perces időszak alatt előforduló turbulencia csúcsérték	*A jelentendő érték*
0–1	0

1–2	1
2–3	2
…	…
13–14	13

Megjegyzés

1. A megjelenés időpontját jelenteni kell az A4-1 táblázatnak megfelelően.
2. A turbulenciát a 2.6.3 pontnak megfelelően jelenteni kell.
3. Borult, beágyazott vagy kiterjedt zivatarok vagy zivatarok széllökésvonalakban.
4. Porvihar vagy homokvihar.

5 Kitörés előtti vulkanikus tevékenység vagy vulkánkitörés.

5. FÜGGELÉK ELŐREJELZÉSEKRE VONATKOZÓ MŰSZAKI ELŐÍRÁSOK

(Lásd jelen Annex 6. Fejezet)

1. TAF-RA VONATKOZÓ KRITÉRIUMOK

1.1 TAF formátum

A TAF-t az A5-1 táblázatban bemutatott mintának megfelelően kell kiadni, és a Meteorológiai Világ Szervezet által előírt TAF kódformában kell terjeszteni.
Megjegyzés. – A TAF kódforma ismertetését a WMO 306 számú kiadványa Kód kézikönyv (Manual on Codes) *1.1 Kötet, A Rész – Alfanumerikus kódok (Alphanumeric Codes) tartalmazza.*
1.1.2 **Ajánlás.** – *A TAF-t az ehhez megfelelő pozícióban lévő Államok közötti kétoldalú egyezmények szerint, WMO BUFR kódformában kell szétosztani, a TAF 1.1.1 pontnak megfelelő terjesztése mellett.*
Megjegyzés. – A BUFR kódforma ismertetését a WMO 306 számú kiadványa Kód kézikönyv (Manual on Codes) *1.2 Kötet, B Rész – Bináris kódok (Binary Codes) tartalmazza.*

1.2 Meteorológiai elemek bevitele TAF-ba

Megjegyzés. – Előrejelzések üzemelés szempontjából megkívánt pontosságáról útmutatást a B Melléklet tartalmaz.
1.2.1 Talajszél
Ajánlás. – *Szél előrejelzésben a várható domináns irányt kell megadni. Ha a domináns talajszél irányt a várható változása miatt nem lehet előrejelezni, például enyhe szél (kevesebb, mint 6 km/h (1csomó)), vagy zivatarok alatt, a szélirányt „VRB" alkalmazásával változóként kell jelölni. Ha a szelet 2 km/h-nál (1 csomó) kisebbre előrejelzik, a szélsebességet nyugalomként kell jelezni.. Ha az előrejelzett maximális sebesség (széllökés) 20 km/h-val (10 csomó) vagy többel meghaladja az előrejelzett közepes szélsebességet, az előrejelzett maximális szélsebességet kell jelezni. Ha az előrejelzés szerint 200 km/h (100 csomó) vagy ennél nagyobb szélsebesség várható, ezt nagyobb, mint 199 km/h (99 csomó)sebességként kell jelezni.*
1.2.2 Látás
Ajánlás. – *Ha a látást 800 m-nél kisebbre előrejelzik, ezt 50 m-es lépcsőkben kell kifejezni; ha az előrejelzett látás 800 m vagy nagyobb, de kisebb, mint 5 km, 100 m-es lépcsőkben; ha 5 km vagy nagyobb, de kisebb, mint 10 km, akkor kilométeres lépcsőkben; ha 10 km vagy ennél nagyobb, akkor 10 km-ként kell előrejelezni, kivéve ha CAVOK körülmények előrejelzése történt. Ha az előrejelzett látás különböző irányokban változó, és a domináns látás nem előrejelezhető, a legkisebb előrejelzett látást kell meg-*

adni.

1.2.3 Időjárás jelenségek

Ajánlás. – *Az alábbi időjárási jelenségek vagy azok kombinációi közül egynek vagy többnek, de maximum háromnak, jellemzőivel és, ahol lehet, intenzitásával együtt előrejelzését kell megadni, ha azok várhatóan a repülőtéren megjelennek:*

- ónos csapadék
- ónos köd
- mérsékelt vagy heves csapadék (beleértve a záport)
- talajközeli por, homok- vagy hófúvás
- por-, homok- vagy hófúvás
- porvihar
- homokvihar
- zivatar (csapadékkal vagy anélkül)
- szélroham
- tölcsérfelhő (tornádó vagy víztölcsér).
- egyéb, a 3. Függelék 4.4.2.3 pontjában megadott időjárás jelenségek csak akkor, ha azok várhatóan a látás lényeges megváltozását okozzák.

A fenti jelenségek várható megszűnését a „NSW" rövidítéssel kell jelezni.

1.2.4 Felhő

Ajánlás. – *A felhőzet mennyiségét szükség szerint a „FEW, „SCT", „BKN" vagy az „OVC" rövidítések használatával kell előrejelezni, ahogyan szükséges. Ha az ég várhatóan borult marad vagy borussá válik,és felhőzet előfordulás nem előrejelezhető, és a függőleges látásra vonatkozó információ a repülőtéren rendelkezésre áll, a függőleges látást kell előre jelezni "VV"formában, melyet a függőleges látás előrejelzett értéke követ. Ha több felhőréteg vagy felhőtömeg várható, mennyiségüket és alapjuk magasságát az alábbi sorrendben kell előrejelezni:*

a) mennyiségtől függetlenül, a legalacsonyabb réteget vagy tömeget FEW, SCT, BKN, illetőleg OVC , ahogy megfelelő, jelzésekkel kell előrejelezni;

b) a következő réteget vagy tömeget, amely az égboltnak több mint 2/8 részét borítja, SCT, BKN, illetőleg OVC jelzésekkel kell előrejelezni, ahogy megfelelő;

c) a következő magasabb réteget vagy tömeget, amely az égboltnak több mint 4/8 részét borítja, BKN illetőleg OVC jelzésekkel kell előrejelezni, ahogyan megfelelő; és

d) cumulonimbus felhők, ha várhatók, és a fenti a)-c) pontokban még nem szerepeltek.

A felhő információkat az üzemeltetés szempontjából jelentőséggel bíró felhőzetre kell korlátozni;ha üzemeltetés szempontjából jelentőséggel bíró felhőzet nincs előrejelezve, és „CAVOK" nem megfelelő,az „NSC" rövidítést kell használni.

1.2.5 Hőmérséklet

Ajánlás. – *Amikor regionális léginavigációs egyezménnyel összhangban, előrejelzett hőmérsékleteket visznek be, a TAF érvényességi időszaka alatt várhatóan fellépő maximális és minimális hőmérsékleteket, a megjelenésük időpontjával együtt, meg kell adni.*

1.3 Változás csoportok használata

Megjegyzés. – Változás és idő jelzők TAF-ban való használatára útmutatás az A5-2 Táblázatban található

1.3.1 **Ajánlás.** – *A változás csoportok TAF-ba bevitele vagy a TAF módosítása kritériumainak a következőkön kell alapulnia:*

a) ha a közepes talajszél változása az előrejelzés szerint 60° vagy nagyobb,a közepes sebesség a változás előtt és/vagy után 20 km/h (10csomó) vagy nagyobb;

b) ha a talajszél sebesség változásának előrejelzésében 20 km/h (10 csomó) szerepel;

c) ha a közepes talajszél sebességtől től való eltérések (széllökések) előrejelzése 20 km/h vagy ennél na-

gyobb értékre való növekedést tartalmaz, a közepes sebesség a változás előtt és/vagy után 30 km/h (15 csomó) vagy nagyobb;
d) Ha a talajszél az előrejelzés szerint az üzemeltetés szempontjából jelentőséggel bíró értékeket lép át. A küszöbértékeket a meteorológiai hatóság a megfelelő légiforgalmi szolgálati hatósággal és az érintett üzemeltetőkkel konzultálva állapítja meg, figyelembe véve az olyan szélváltozásokat, amelyek:
1) a használt futópálya (futópályák) cseréjét teszik szükségessé; és
2) jelzik, hogy a futópálya hátszél és oldalszél komponensei a repülőteret használó tipikus légijárművek főbb üzemelési kokorlátjait jelentő értékeket átlépve fognak változni.
e) ha a látás az előrejelzés szerint javul és az alábbi értékek közül egyet vagy többet elér vagy meghalad, vagy amikor az előrejelzés szerint a látás romlik és az alábbi értékek közül egyet vagy többet átlép:
1) 150, 350, 600, 800, 1500, vagy 3000 m; vagy
2) 5000 m azokban az esetekben, ha jelentős számú repülést végeznek látvarepülési szabályok szerint;
f) ha az alábbiakban felsorolt időjárási jelenségek közül bármelyik, vagy ezek valamilyen kombinációjának beindulása vagy megszűnése,vagy intenzitásának változása előrejelzés szerint bekövetkezik:
– ónos csapadék
– mérsékelt vagy heves csapadék (beleértve a záporokat is)
– zivatar (csapadékkal)
– porvihar
– homokvihar;
g) ha az alábbiakban felsorolt időjárási jelenségek közül bármelyik, vagy ezek valamilyen kombinációja előrejelzés szerint elkezdődik, vagy befejeződik,:
– jégkristályok
– zúzmarás köd
– talajközeli por-, homok- vagy hófúvás;
– por-, homok- vagy hófúvás
– zivatar (csapadék nélkül);
– szélroham;
– tölcsérfelhő (tornádó vagy víztölcsér);
h) ha a legalacsonyabb BKN vagy OVC felhőréteg, vagy felhőtömeg alapjának magassága az előrejelzés szerint emelkedik, és az alábbi értékek közül egyet vagy többet elér, vagy meghalad, vagy amikor a legalacsonyabb BKN vagy OVC felhőréteg vagy felhőtömeg alapjának magassága az előrejelzés szerint csökken és az alábbi értékek közül egyet vagy többet átlép:
1) 30, 60, 150, vagy 300 m (100, 200, 500 vagy 1000 láb), vagy
2) 450 m (1500 láb) azokban az esetekben, ha jelentős számú repülést végeznek látás szerinti repülési szabályok szerint;
i)) ha 450 m (1500 láb) alatti felhőréteg vagy felhőtömeg mennyisége előrejelzés szerint az alábbiaknak megfelelően változik;
1) NSC-ról, FEW-ról vagy SCT-ról BKN-re vagy OVC-re; vagy
2) BKN-ről vagy OVC-ről NSC-re, FEW-re vagy SCT-re;
j) ha a függőleges látás az előrejelzés szerint javul, és az alábbi értékek közül egyet, vagy többet elér, vagy meghalad, vagy amikor a függőleges látás az előrejelzés szerint romlik, és az alábbi értékek közül egyet vagy többet átlép: 30, 60, 150 vagy 300 m (100, 200, 500 vagy 1000 láb); és
k) bármely egyéb, a meteorológiai hatóság és az üzemeltetők által közösen megállapított, helyi repülőtéri üzemelési minimumokon alapuló kritérium.
Megjegyzés.– Más helyi repülőtéri üzemelési minimumokon alapuló kritériumokat a SPECI kiadásához a 3. Függelék 2.3.2.l) pontja szerint kialakított hasonló kritériumokhoz hasonlóan kell számításba venni.
1.3.2 **Ajánlás**. *– Ha a 6. Fejezet 6.2.3 pontjában megadott elemek valamelyikében beálló változást az 1.3.1 pontban szereplő kritériumoknak megfelelően jelezni kell, a „BECMG" vagy „TEMPO" változás jelzőket kell használni, és ezt követően meg kell adni azt az időszakot, amely alatt a változás várhatóan végbemegy. Az időszakot, annak kerek UTC órában kifejezett kezdeti és befejezési időpontjával kell jelölni. A változásjelzést követően csak azokat az elemeket kell megadni, melyek várhatóan szignifikánsan*

megváltoznak. Felhőzetre vonatkozó szignifikáns változások esetében azonban valamennyi felhőcsoportot, beleértve azokat a felhőrétegeket és tömegeket, amelyeknek változása nem várható, jelezni kell.

1.3.3 **Ajánlás. –** *A „BECMG” változás jelzőt és a hozzátartozó időcsoportot olyan változások leírására kell használni, ahol a meteorológiai körülmények egy megadott küszöbértéket szabályos vagy szabálytalan mértékben, és az időperiódus alatt egy nem meghatározott időpontban, várhatóan elérnek vagy meghaladnak. Az időperiodus normál körülmények között nem haladhatja meg a két órát, de semmi esetre sem haladhatja meg a 4 órát.*

1.3.4 **Ajánlás** *– A „TEMPO” változásjelzőt és az ehhez kapcsolódó időcsoportot olyan, várhatóan gyakori vagy nem gyakori átmeneti meteorológiai körülmény-ingadozások leírására kell használni, melyek meghatározott küszöbértékeket elérnek, vagy meghaladnak, és minden esetben egy óránál rövidebb időszakon keresztül tartanak, és az ingadozások együttesen előreláthatólag az előrejelzési időszak felénél rövidebb időtartam alatt fognak fennállni. Ha az átmeneti ingadozás várhatóan egy órán keresztül, vagy hosszabb ideig marad fenn, az 1.3.3 pont szerinti „BECMG” változás jelző csoportot kell használni, vagy az érvényességi időszakot az 1.3.5 pontnak megfelelően fel kell osztani.*

1.3.5 **Ajánlás. –** *Ahol az uralkodó időjárási feltételek egy együttesének jelentős változása, többé-kevésbé teljes mértékben egy eltérő feltétel együttesbe való átmenete várható, az érvényességi időszakot különálló időszakokra kell osztani az „FM” rövidítést használva, amelyet közvetlenül követ egy négyszámjegyű időcsoport UTC szerinti egész órákban és percekben, amelya azt a várható időpontot jelzi, amikor a változás várhatóan fellép. Az „FM” rövidítést követő felosztott időszaknak különállónak kell lennie, és a rövidítést követő előrejelzett körülmények a rövidítés előtt adott minden előrejelzett körülményt hatálytalanítanak.*

1.4 Valószínűségi csoportok használata

Ajánlás. – *Valamely előrejelzett időjárási elem, vagy elemek alternatív értékének előfordulási valószínűségét szükség szerint a „PROB” rövidítés használatával kell jelezni, melyet a 10 százalékos egységekben kifejezett valószinűségi érték, és annak az időperiódusnak a jelölése követ, amely alatt az alternatív érték(ek) várhatóan érvényesek. A valószínűség információt az előrejelzett elemet vagy elemeket követően kell elhelyezni, és ezt követően kell megadni az elem, vagy elemek alternatív értékét. A meteorológiai viszonyok várható időnkénti változásainak valószínűségét szükség szerint, a „PROB” rövidítés használatával kell jelezni, melyet a valószínűség 10 százalékos egységekben kifejezett értékének jelölése követ, amelyet a „TEMPO” változásjelző és a hozzá kapcsolódó időcsoport elé kell elhelyezni. Valamely alternatív érték vagy változás 30 százaléknál kisebb valószínűsége nem tekintendő elegendő jelentőségűnek ahhoz, hogy fel kelljen tüntetni. Valamely alternatív érték vagy változás 50 százalékos, vagy azt meghaladó valószínűségét repülési célokra nem valószínűségnek kell tekinteni, hanem szükség szerint a „BECMG” vagy „TEMPO” változásjelzők használatával, vagy az érvényességi időszak felosztásával, FM” rövidítés használatával kell jelezni. A valószínűségi csoportot nem használják sem a „BECMG” változásjelző, sem az „FM” időjelző minősítésére.*

1.5 Változási és valószínűségi csoportok száma

Ajánlás. – *A változási és valószínűségi csoportok számát minimumon kell tartani, és ez általában nem haladhatja meg az öt csoportot.*

1.6 TAF terjesztése

A TAF-t és módosításait el kell juttatni a nemzetközi OPMET adatbázisokhoz, és a regionális léginavigációs egyezmény által, a repülési állandó helyű szolgálati műhold elosztó rendszerek működtetéséhez kijelölt központokhoz, a regionális léginavigációs egyezménnyel összhangban.

2. TREND ELŐREJELZÉSEKRE VONATKOZÓ KRITÉRIUMOK

2.1 Trend előrejelzések formátuma

Trend előrejelzéseket a 3. Függelék A3-1 és A3-2 táblázatban bemutatott mintának megfelelően kell kiadni. A trend előrejelzésben használt egységeknek és méretarányoknak ugyanazoknak kell lenni, mint amiket a jelentés használ, amelyhez az előrejelzés tartozik.
Megjegyzés. – Trend előrejelzésekre példákat a 3. Függelék tartalmaz.

2.2 Meteorológiai elemek bevitele trend előrejelzésekbe

2.2.1 Általános előírások
A trend előrejelzéseknek jelezniük kell egy vagy több elem: talajszél, látás, időjárás és felhők vonatkozásában végbemenő jelentős változásokat. Csak azokat az elemeket kell tartalmazniuk, amelyeknek jelentős változása várható. Azonban felhőre vonatkozó jelentős változás esetén, minden felhőcsoportra, beleértve azokat a felhőrétegeket és tömegeket is, amelyeknél változás nem várható, meg kell jelölni. A látás jelentős változása esetén a látás csökkenését okozó jelenséget is meg kell jelölni. Ha változás bekövetkezése nem várható, ezt a „NOSIG" terminussal kell jelölni.
2.2.2 Talajszél
A trend előrejelzésnek jeleznie kell a talajszélben bekövetkező alábbi változásokat:
a) a közepes szélirány 60 fokos vagy nagyobb változása, amikor a közepes szélsebesség a változás előtt és/vagy után 2O km/h (10 csomó) vagy
b) a közepes szélsebesség 20 km/h (10 csomó) értékű vagy ennél nagyobb változása;
c) üzemelési szempontból lényeges értékeket meghaladó szélváltozások. A küszöbértékeket a meteorológiai hatóságnak kell megállapítania, az illetékes ATS hatósággal és az érintett üzemeltetőkkel konzultálva, figyelembe véve azokat a szélváltozásokat, melyek:
1) használatos futópálya (futópályák) megváltoztatását teszik szükségessé; és
2) jelzik, hogy a futópálya hátszél és oldalszél összetevői a repülőtéren üzemelő tipikus légijármű számára megállapított főbb üzemelési határértéket meghaladják.
2.2.3 Látás
Ha a látás várhatóan javul és a 150, 350, 600, 800, 1500 vagy 3000 m értékek közül egyet vagy többet elér, vagy túllép, vagy ha a látás várhatóan romlik és ezen értékek közül egyet vagy többet átlép, a trend előrejelzésekben jelezni kell a változást. Ha jelentős számú járat a látás szerinti repülési szabályok szerint repül, akkor az előrejelzésnek ezen felül jelezni kell az 5000 m-es értékre való változást vagy ennek átlépését.
Megjegyzés. – Helyi rendszeres és különleges jelentésekhez tartozó trend előrejelzésekben a látás a futópálya (futópályák) menti látás előrejelzésre vonatkozik; METAR-hoz és SPECI-hez tartozó trend előrejelzésekben az előrejelzett domináns látásra vonatkozik.
2.2.4 Időjárás jelenségek
2.2.4.1 A trend előrejelzésnek az alábbi időjárási jelenségek vagy azok kombinációi közül egynek vagy többnek, a várható kialakulását, megszűnését vagy intenzitásváltozását kell jeleznie:
– ónos csapadék
– mérsékelt vagy heves csapadék (beleértve a záporokat is)
– zivatar (csapadékkal)
– porvihar
– homokvihar
– a 3. Függelék 4.4.2.3 pontjában felsorolt egyéb időjárási jelenségek, csak akkor, ha várhatóan jelentős változást okoznak a látásban.
2.2.4.2 A trend előrejelzésnek az alábbi időjárási jelenségek vagy azok kombinációi közül egynek vagy többnek a várható kialakulását, vagy megszűnését kell jeleznie:
– jégkristályok
– ónos köd
–talajközeli por-, homok- vagy hófúvás

– por-, homok- vagy hófúvás
– zivatar (csapadék nélkül)
– széllökés
– tölcsérfelhő (tornádó vagy víztölcsér)
2.2.4.3 a 2.2.4.1 és 2.2.4.2 pontokban jelentett jelenségek teljes száma nem haladhatja meg a hármat.
2.2.4.4 A fenti jelenségek várható végét az „NSW" rövidítéssel kell jelezni
2.2.5 Felhők
Ha egy BKN vagy OVC felhőréteg alapjának magassága várhatóan növekszik, és az alábbi értékek közül egyet vagy többet elér, vagy túllép, vagy egy BKN vagy OVC felhőréteg alapjának magassága várhatóan csökken, és a következő értékek közül: 30, 60, 150, 300 és 450 m (100, 200, 500, 1000 és 1500 láb).egyet vagy többet átlép, a trend típusú leszállási előrejelzés trend részében a változást jelezni kell: Ha egy felhőréteg alapjának magassága 450 m (1500 láb) alatt van,vagy várhatóan az alá süllyed, vagy a fölé emelkedik, akkor a trend előrejelzésnek jelezni kell a felhőzet mennyiségének változásait, FEW-ról vagy SCT-ről BKN-re, vagy OVC-re növekedését, illetve BKN vagy OVC-ről SKC, FEW-ra vagy SCT-re csökkenését. Ha nincsenek üzemelés szempontjából jelentőséggel bíró felhők előrejelezve és a „CAVOK" nem megfelelelő, az „NSC" rövidítést kell alkalmazni.
2.2.6 Függőleges látás
Ha várható, hogy az égbolt takart marad, vagy azzá változik, és a repülőtéren a függőleges látás megfigyelések rendelkezésre állnak, és előrejelezték a függőleges látás javulását, és a változás eléri vagy meghaladja a 0, 60, 150 vagy 300 m (100, 200, 500 vagy 1000 láb) értékek egyikét, vagy közülük többet, vagy ha a függőleges látás romlása van előrejelezve, és ez a fenti értékek közül egyet vagy többet átlép, a trend előrejelzésnek jeleznie kell a változást
2.2.7 Kiegészítő kritériumok
A 2.2.2 - 2.2.6 pontokban megadottakon kívül, helyi repülőtéri üzemelési minimumokon alapuló változás jelzési kritériumokat a meteorológiai hatóság és az érintett üzemeltető(k) megállapodásának megfelelően kell alkalmazni.

2.3 Változás jelzők használata

Megjegyzés. – Változás jelzők trend előrejelzésekben való használatára útmutatás az A3-3 Táblázatban található.
2.3.1 Ha változás bekövetkezése várható, a trend előrejelzésnek a „BECMG" vagy „TEMPO" jelzések egyikével kell kezdődnie.
2.3.2 A „BECMG" változásjelzőt kell használni olyan változások előrejelzésének leírásához, ahol az időjárási körülmények szabályos vagy szabálytalan ütemben várhatóan elérnek, vagy átlépnek meghatározott értékeket. Azt az időszakot, vagy azt az időpontot, ami alatt, vagy amikor a változás bekövetkezését előrejelzik, az „FM", „TL" vagy AT" rövidítések, amelyik megfelelő, használatával, valamint ezeket követően egy órákból és percekből álló időcsoporttal jelezni kell. Ha a változás az előrejelzés szerint a trend előrejelzés kezdete és vége közötti időszakban teljes mértékben végbemegy, a változás kezdetét illetve végét az „FM", illetőleg „TL" rövidítésekkel és a hozzájuk tartozó időcsoportokkal kell jelezni. Ha a változás az előrejelzés szerint a trend előrejelzés kezdeti időpontjában kezdődik el, de még annak vége előtt befejeződik, az „FM" rövidítést és a hozzá kapcsolódó időcsoportot ki kell hagyni és csak a „TL"-t és a hozzá kapcsolódó időcsoportot kell használni. Ha a változás az előrejelzés szerint a trend előrejelzés érvényességi időszakában kezdődik meg és ezen időszak végének időpontjában fejeződik be, a „TL" rövidítést és a hozzá kapcsolódó időcsoportot ki kell hagyni és csak az „FM"-t és a hozzá kapcsolódó időcsoportot kell használni. Ha a változás az előrejelzés szerint a trend előrejelzés érvényességi időszaka alatti valamely időpontban történik, az „AT" rövidítést és ezt követően a hozzá kapcsolódó időcsoportot kell használni, Ha a változás az előrejelzés szerint a trend előrejelzés időszakának kezdetekor kezdődik és az időszak végéig befejeződik, vagy ha a változás az előrejelzés szerint a trend előrejelzés időtartama alatt megtörténik, de az időpont bizonytalan, az „FM", „TL" vagy „AT" rövidítéseket és az ezekhez kapcsolódó időcsoportokat el kell hagyni, és egyedül a „BECMG" változásjelzőt kell használni.

2.3.3 A „TEMPO” változásjelzőt kell használni olyan átmeneti időjárás ingadozások előrejelzésének leírásához, melyeknél az egyes változások meghatározott értékeket egy óránál rövidebb időtartamon keresztül érnek el, vagy lépnek át és az ingadozások összességükben az előrejelzés szerint az előrejelzési időszak felénél rövidebb időszakot fednek le. Azt az időszakot, amely alatt az átmeneti ingadozások az előrejelzés szerint fennállnak, az „FM” és/vagy „TL” rövidítések megfelelő használatával, valamint ezeket követően egy órákból és percekből álló időcsoporttal kell jelezni. Ha az átmeneti időjárás változások az előrejelzés szerint a trend előrejelzés kezdete és vége közötti időpontok között teljes mértékben végbemegy, az átmeneti ingadozások kezdetét illetve végét az „FM”, illetőleg a „TL” rövidítésekkel és a hozzájuk tartozó időcsoportokkal kell jelezni. Ha az átmeneti ingadozások időszaka az előrejelzés szerint a trend előrejelzés kezdeti időpontjában kezdődik el, de még annak vége előtt befejeződik, az „FM” rövidítést és a hozzá kapcsolódó időcsoportot ki kell hagyni és csak a „TL”-t és a hozzá kapcsolódó időcsoportot kell használni. Ha az átmeneti ingadozások időszaka az előrejelzés szerint a trend előrejelzés érvényességi időszakában kezdődik és ezen időszak végének időpontjában befejeződik, a „TL” rövidítést és a hozzá kapcsolódó időcsoportot ki kell hagyni és csak az FM-t és a hozzá kapcsolódó időcsoportot kell használni. Ha az átmeneti ingadozások időszaka az előrejelzés szerint a trend előrejelzés időszakának kezdetekor kezdődik és az időszak végéig befejeződik, az „FM” és „TL” rövidítéseket és a hozzájuk kapcsolódó időcsoportokat ki kell hagyni és egyedül a „TEMPO” változásjelzőt kell használni.

2.4 Valószínűségi jelző használata

A „PROB” jelző nem alkalmazható trend előrejelzésekben.

3. FELSZÁLLÁSI ELŐREJELZÉSEKRE VONATKOZÓ KRITÉRIUMOK

3.1 Felszállási előrejelzések formátuma

Ajánlás. – *Az előrejelzés formátumának a meteorológiai hatóság és az érintett üzemeltető közötti megállapodás szerintinek kell lennie. A felszállási előrejelzésekben használt időjárási elemek sorrendje, a terminológia, a mértékegységek és a skálák legyenek azonosak az ugyanazon repülőtérről készült jelentésekben használtakkal.*

3.2 Felszállási előrejelzések módosításai

Ajánlás. –. *A felszálláshoz a talajszél irányról és sebességről, a hőmérsékletről és nyomásról és más helyileg megállapított elemekről szóló előrejelzések módosításának kiadási kritériumairól a meteorológiai hatóság és az érintett üzemeltetők között kell megállapodni. A kritériumoknak konzisztensnek kell lenniük a hozzájuk tartozó repülőtéri különleges jelentésekre megállapított kritériumokkal, a 3. Függelék 2.3.1 pontjával összhangban.*

4. KISMAGASSÁGÚ REPÜLÉSEK RÉSZÉRE KIADOTT KÖRZETI ELŐREJELZÉSEKRE VONATKOZÓ KRITÉRIUMOK

4.1 GAMET körzeti előrejelzések formátuma és tartalma

Ha GAMET formátumban készülnek, a körzeti előrejelzéseknek két szakaszt kell tartalmazniuk: az I. Szakasz a kismagasságú repülésekre veszélyes útvonali időjárás jelenségekről szóló információkra vonatkozik, amelyek AIRMET információk kiadásának alátámasztására készülnek, és a II. Szakasz, amely a kismagasságú repülések által igényelt kiegészítő információkra vonatkozik. A GAMET területi előrelzés által tartalmazott elemeknek és sorrendjüknek, amikor készülnek, meg kell felelniük az A5-4 Táblázatban bemutatott mintának. A II. Szakasz által tartalmazott kiegészítő elemeknek a regionális léginavigációs egyezménnyel összhangban kell lenniük. Azokat az elemeket, amelyeket egy SIGMET előrejelzés már érintett, a GAMET körzeti előrejelzésekből ki kell hagyni.

4.2 GAMET körzeti előrejelzések módosításai

Ha a kismagasságú repülésekre veszélyes jelenség szerepelt a GAMET területi előrejelzésben, és az előre jelzett jelenség nem fordul elő, vagy már nincs előrejelezve, egy GAMET AMD-t kell kiadni, amely csak a szóbanforgó időjárás elemet módosítja.
Megjegyzés. – A kismagasságú repülésekre veszélyes időjárás jelenségekre vonatkozó körzeti előrejelzést módosító AIRMET információ kiadását érintő előírások a 6. Függelékben találhatók.

4.3 Kismagasságú repülésekre vonatkozó, térkép formájú körzeti előrejelzések tartalma

4.3.1 Amikor kismagasságú repüléseket érintő körzeti előrejelzésekhez térkép formát használnak, a magassági szél és magaslégköri hőmérséklet előrejelzéseket egymástól nem több, mint 500 km (300 tengeri mérföld) távolságra lévő pontokra és legalább a következő tengerszint feletti magasságokra: 600, 1500 és 3000 m (2000, 5000 és 10000 láb, és 4500 m(15000 láb) hegyes területeken.
4.3.2 Amikor kismagasságú repüléseket érintő körzeti előrejelzésekhez térkép formát használnak, a SIGWX jelenségekre vonatkozó előrejelzést alacsonyszintű SIGWX előrejelzésként kell kiadni a 100-as repülési magasságszint (vagy 150-es magasságszint hegyes területeken, vagy ahol szükséges, ennél magasabb) alatti repülési szintekre. Alacsonyszintű SIGWX előrejelzéseknek a következő tételeket kell tartalmazniuk:
a) SIGMET kiadását indokoló jelenségek, a 6. Függelékben megadottak szerint, és amelyek várhatóan hatással vannak a kismagaságú repülésekre; és
b) a kismagasságú repülésekre vonatkozó körzeti előrejelzésekben szereplő elemek az A5-4 Táblázat szerint, kivéve azalábbi elemekre vonatkozókat:
1) magassági szelek és magaslégköri hőmérséklet; és
2) QNH előrejelzés.
Megjegyzés. – Az „ISOL", „OCNL" és „FRQ"cumulonimbus és tornyosuló cumulus felhőkre vonatkozó terminusokra a 6. Függelék tartalmaz útmutatást.

4.4 Kismagasságú repülések részére készített körzeti előrejelzések cseréje

Kismagasságú repülések részére szóló körzeti előrejelzéseket, amelyeket az AIRMET információk kiadásának alátámasztására készítenek, az illetékes repülési információs körzetekben végzett kismagasságú repülések részére történő kiadásáért felelős meteorológiai irodáknak egymás között cserélniük kell.

A5-1 táblázat Minta TAF-ra
Kulcs: M = kötelező bevitel, minden közlemény része;
C = feltételes bevitel, meteorológiai körülményektől függ;
O = fakultatív bevitel.
1. Megjegyzés. – A TAF-ban szereplő numerikus elemek tartományait és felbontásait ennek a függeléknek az A5-3 táblázata mutatja be.
2. Megjegyzés. – A rövidítések magyarázata a Procedures for Air Navigation Services – ICAO Abbreviations and Codes (Léginavigációs szolgálati eljárások – ICAO rövidítések és kódok) *(PANS-ABC, Doc 8400)kiadványban található.*

Megjegyzések:

1. Fiktív hely.
2. Az 1.2.1 pontnak megfelelően kell használni.
3. Az 1.2.1 pontnak megfelelően kell tartalmazni.
4. Akkor kell tartalmazni, ha alkalmazható.
5. Egy vagy több, maximum három csoport, 1.2.3 pontnak megfelelően.

6. Akkor kell tartalmazni, ha odavonatkozik, az 1.2.3 pontnak megfelelően. Nincs minősítő *mérsékelt* intenzitásnál.
7. 1.2.3 pontnak megfelelő időjárás jelenségeket kell szerepeltetni.
8 Maximálisan négy felhőréteg, az 1.2.4 pontnak megfelelően.
9. Az 1.2.5 pontnak megfelelően kell tartalmazni.
10. Az 1.3, 1.4 és 1.5 pontoknak megfelelően kell tartalmazni.

A5-2 táblázat Változás- és idő jelzők használata TAF-ban

Változás vagy idő jelző		*Időszak*	*Jelentés*	
FM		$n_dn_dn_hn_hn_mn_m$	több időjárás elemben, n_hn_h óra n_mn_m perckor (UTC) fellépő jelentős változás jelölésére használják; az összes „FM” előtt megadott elemet tartalmaznia kell az „FM” után következőknek (azaz ezeket a rövidítést követők hatálytalanítják	
BECMG			a változás kezdetének előrejelzése nap és óra(UTC), és befejeződésének előrejelzése nap és óra (UTC); csak azokat az elemeket kell a „BECMG” után megadni, amelyek változását előrejelzik; az időszakasznak általában kisebbnek kell lenni, mint 2 óra és semmi esetre sem haladhatja meg a 4 órát	
TEMPO			átmeneti ingadozások elkezdődésének előrejelzése napra és órára (UTC), megszűnésének előrejelzése órára (UTC); csak azokat az elemeket kell a „TEMPO” után megadni, amelyek ingadozását előrejelzik; az átmeneti ingadozások nem tarthatnak tovább egy óránál az egyes esetekben, és összességében az időszakasznak kevesebb, mint a felét fedhetik le.	
PROBnn	–		az előrejelzett elem vagy elemek egy alternatív értékének előfordulási valószínűsége (%-ban); csak nn=30 vagy nn=40; a megfelelő elem(ek) után elhelyezve	–
	TEMPO			átmeneti ingadozások fellépésének valószínűsége

A5-3 Táblázat. Tartományok és felbontások TAF által tartalmazott numerikus elemekhez

A 6. Fejezetben meghatározottak szerinti elem		*Tartomány*	*Felbontás*
Szélirány	földrajzi fok	000–360	10
Szélsebesség	KMH KT	00–399* 00–199*	1 1
Látás	M M M M	0000–0800 0800–5000 5000–9000 9000–9999	50 100 1000 999
Függőleges látás	30's M (100's FT)	000–020	1
Felhőalap magassága	30's M (100's FT)	000–100	1
Levegő hőmérséklet (maximum és minimum)	°C	-80–+60	1
*Nincs repülési követelmény arra, hogy 200km/h (100 csomó) vagy nagyobb sebességű talajszelet jelentsenek, azonban rendeletet hoztak nem-repülési célokra szolgáló jelentések készítésére 399 km/h (199 csomó) szélsebességig, szükség szerint.			

A5-4 Táblázat. Minta GAMET-hez

Kulcs: M = kötelező bevitel, minden közlemény része;
C = feltételes bevitel, meteorológiai körülményektől függ;
O = fakultatív bevitel;
= = kettős vonal azt jelöli, hogy az ezt követő szöveget a következő sorba kell elhelyezni.

Jelentése: körzeti előrejelzés kismagasságú repülések részére (GAMET), a Donlon/International* meteorológiai iroda (YUDO) adott ki az Amswell* repülési információs régió 2. sz. alterülete (YUCC Amswell területi irányító központ által azonosított) számára a 100-as repülési magasságszit alatti légtérre;a közlemény érvényes a hó 22.-én 0600 UTC-től 1200 UTC-ig.

I. Szakasz:
talajszél sebesség: 1000 UTC és 200 UTC között 65 kilométer per óra;
talajmenti látás: 0600 UTC és 0800 UTC között 3000 méter az 51-es északi szélességi körtől északra; (párásság miatt);
szignifikáns időjárás jelenségek:: 1100 UTC és 1200 UTC között izolált zivatarok jégeső nélkül;
szignifikáns felhők: 0600 UTC és 0900 UTC között összefüggő felhő alap 800, tető 1100 láb föld feletti magasságon az 51-es északi szélességi körtől északra; 1000 UTC és 1200 között izolált tornyosuló cumulus felhőalap 1200, felhőtető 8000 láb föld feletti magasság szinten;
jegesedés: mérsékelt 050 és 080 repülési magasságszint között;
turbulencia: mérsékelt a 090-es repülési magasságszint felett (legalább a 100-as repülési magaságszintig);
SIGMET közlemények: 3 és 5 alkalmazható az érvényességi időszakra és az érintett al-területre;

II. Szakasz:
nyomás rendszerek: 0600 UTC-kor 1004 hektopascal alacsony nyomás északi 51,5 foknál, keleti 10,0 foknál, várható mozgás észak-kelet felé 25 csomó sebességgel és gyengül;
szelek és hőmérsékletek: 2000 láb föld feletti magasság szinten a szélirány 270 fok; szélsebesség 70 kilométer per óra, hőmérséklet plusz 3 fok Celsius; 5000 láb föld feletti magasság szinten a szélirány 250 fok; szélsebesség 80 kilométer per óra, hőmérséklet mínusz 2 fok Celsius; 10000 láb föld feletti magasságon a szélirány 240 fok; szélsebesség 85 kilométer per óra, hőmérséklet mínusz 11 fok Celsius;
felhők: szakadozott stratocumulus, felhőalap 2500 láb, felhőtető 800 láb föld feletti magasságon ;
fagyás szint: 3000 láb föld feletti magasság szinten;
minimum QNH: 1004 hektopascal;

tenger: felület hőmérséklete:	15 fok Celsius; és tenger állapot 5 méter;
vulkanikus hamu:	nincs.
*Fiktív helyek	

6. FÜGGELÉK. SIGMET ÉS AIRMET TÁJÉKOZTATÁSRA, REPÜLŐTÉRI FIGYELMEZTETÉSEKRE ÉS SZÉLNYÍRÁSRA VONATKOZÓ MŰSZAKI ELŐÍRÁSOK

(Lásd jelen Annex 7. Fejezet)

Megjegyzés. – A SIGMET, AIRMET, trópusi ciklon és vulkánikus hamu tájékoztató közlemények rövidített címeiben használt adattípus jelölések a WMO 386 számú kiadványában, Globális távközlési rendszer kézikönyv (Manual on Global Telecommunication System) *vannak megadva.*

1. SIGMET TÁJÉKOZTATÁSRA VONATKOZÓ ELŐÍRÁSOK

1.1 SIGMET közlemények formátuma

1.1.1 A SIGMET közlemény tartalmának és elemei sorrendjének az A6-1. táblázatban bemutatott mintával kell összhangban lennie.
1.1.2 A szubszonikus légijárművek számára adott SIGMET információkat tartalmazó közleményeket „SIGMET” jelöléssel kell azonosítani.
1.1.3 Az A6-1 táblázatban lévő mintában hivatkozott sorszámnak meg kell egyeznie azoknak a SIGMET közleményeknek a számával, amelyet az adott napon 0001 UTC óta a repülési információs régió számára kiadtak. A „SIGMET" és „SIGMET SST” közleményeket külön kell sorszámozni. A meteorológiai megfigyelő irodáknak, amelyeknek felelősségi területébe egynél több FIR és/vagy CTA tartozik, a felelősségi területébe tartozó mindegyik FIR és/vagy CTA részére külön SIGMET közleményt kell kiadni.
1.1.4 Az A6-1 táblázatban lévő mintának megfelelően, a SIGMET közleménynek a következő jelenségeknek csak egyikét kell tartalmaznia, az alább bemutatott rövidítéseket használva:
a) szubszonikus utazó magasságokon:

zivatar	
– takart	OBSC TS
– beágyazott	EMBD TS
– gyakori	FRQ TS
– széllökés vonali	SQL TS
– takart, jégesővel	OBSC TSGR
– beágyazott, jégesővel	EMBD TSGR
– gyakori, jégesővel	FRQ TSGR
– széllökésvonali, jégesővel	SQL TSGR
trópusi ciklon	
– trópusi ciklon	TC (+ciklon neve)
– 10 perces 63 km/h	
– (34 csomó) vagy nagyobb közepes talajszél-sebességű	
turbulencia	
– erős turbulencia	SEV TURB
jegesedés	
– erős jegesedés	SEV ICE

– erős jegesedés ónos eső miatt	SEV ICE (FZRA)
hegyi hullám	
– erős hegyi hullám	SEV MTW
porvihar	
– erős porvihar	HVY DS
homokvihar	
– erős homokvihar	HVY SS
vulkanikus hamu	
– vulkanikus hamu	VA (+ vulkán neve, ha ismert)
radioaktív felhő	RDOACT CLD

1.1.5 A SIGMET tájékoztatás nem tartalmazhat szükségtelen leíró részeket. A SIGMET kiadását előidéző időjárási jelenség leírása a 1.1.4 pontban megadottakon túlmenő leíró anyagot nem tartalmazhat. Zivatarokra és trópusi ciklonokra vonatkozó SIGMET tájékoztatások nem tartalmazhatnak hivatkozást velük társult turbulenciára és jegesedésre.
1.1.6 **Ajánlás.** – *Az erre alkalmas pozícióban lévő meteorológiai megfigyelő irodáknak SIGMET tájékoztatást kell kiadniuk vulkánikus hamu felhőről és trópusi ciklonokról grafikus formában, a WMO BUFR kódformát használva, még ugyanezen SIGMET tájékoztatásnak a 1.1.1 pontnak megfelelő rövidített köznyelven való kiadásán felül.*
Megjegyzés. – A BUFR kód formát a WMO 306 sz. kiadványa, Kód kézikönyv (Manual on Codes) *1.2. Kötet B Rész – Bináris kódok, tartalmazza.*
1.1.7 **Ajánlás. –** *A SIGMET-nek, ha grafikus formátumban adják ki, az 1. Függelékben előírtaknak megfelelőnek kell lennie.*

1.2 SIGMET közlemények terjesztése

1.2.1 A SIGMET közleményeket a meteorológiai figyelő irodák, WAFC-k és más meteorológiai irodák részére a regionális léginavigációs egyezményeknek megfelelően kell szétküldeni. A vulkanikus hamura vonatkozó SIGMET közleményeket a VAAC-oknak is el kell küldeni.
1.2.2 A SIGMET közleményeket továbbítani kell a nemzetközi OPMET adatbankokba, és a regionális léginavigációs egyezmény által repülési helyhezkötött szolgálati műholdas elosztó rendszerek működtetésére kijelölt központokhoz, a regionális léginavigációs egyezményekkel összhangban.

2. AIRMET INFORMÁCIÓKRA VONATKOZÓ ELŐÍRÁSOK

2.1 AIRMET közlemények formátuma

2.1.1 Az AIRMET közlemény tartalmának és elemei sorrendjének az A6-1 táblázatban bemutatott mintával kell összhangban lennie.
2.1.2 Az A6-1 táblázatban lévő mintában hivatkozott sorszámnak meg kell egyeznie azoknak az AIRMET közleményeknek a számával, amelyet az adott napon 0001 UTC óta a repülési információs régió számára kiadtak. A meteorológiai megfigyelő irodáknak, amelyeknek felelősségi területébe egynél több FIR és/vagy CTA tartozik, a felelősségi területébe tartozó mindegyik FIR és/vagy CTA részére külön AIRMET közleményt kell kiadni.
2.1.3 A repülési információs régiót, ha szükséges, alterületekre lehet osztani.
2.1.4 Az A6-1 táblázatban lévő mintának megfelelően, az AIRMET közleménynek a következő jelenségeknek csak egyikét kell tartalmaznia, az alább bemutatott rövidítéseket használva:

A 100-as repülési magasságszint alatti (vagy hegyes területen a 150-es repülési magasságszint alatti vagy ha szükséges, ennél is magasabb szint alatti) utazó magasságokon:

talajszél sebesség	
– nagykiterjedésű közepes talajszél sebesség 60 km/h (30 csomó) felett	SFC WSPD (+szélsebesség és egységei)
felszíni látás	
– a látásnak 5000 m-nél kisebbre csökkenése által befolyásolt nagykiterjedésű területek, amelyek magukbafoglalják a látás csökkenését okozó időjárás jelenséget	SFC VIS (+látás) (+a következő időjárási jelenségek illetve ezek kombinációinak valamelyike BR, DS, DU, DZ, FC FG, FU, GR, GS, HZ IC, PL PQ, RA, SA, SG SN, SQ SS, vagy VA)
zivatarok	
– izolált zivatarok jégeső nélkül	ISOL TS
– esetenkénti zivatarok jégeső nélkül	OCNL TS
– izolált zivatarok jégesővel	ISOL TSGR
– esetenkénti zivatarok jégesővel	OCNL TSGR
– hegytakarás	
–eltakart hegyek	MT OBSC
felhő	
–kisebb, mint 300 m (1000 láb) föld feletti felhőalap magassággal rendelkező szakadozott vagy összefüggő felhőzet kiterjedt területei	
–szakadozott és	BKN CLD (+felhőalap és tetőmagasság egységek)
–összefüggő felhőtakaró	OVC CLD (+felhőalapés tetőmagasság és egységek)
– cumulonimbus felhők, amelyek:	
– izolált	ISOL CB
– esetenkénti	OCNL CB
– gyakori	FRQ CB
– tornyos cumulus felhők, amelyek:	
– izolált	ISOL TCU
– esetenként	OCNL TCU
– gyakori	FRQ TCU
– jegesedés	
– mérsékelt jegesedés (kivéve a jegesedést konvektív felhőkben)	MOD ICE
– turbulencia	
– mérsékelt turbulencia (kivéve a turbulenciát konvektív felhőkben)	MOD TURB
– hegyi hullám	
– mérsékelt hegyi hullám	MOD MTW

2.1.5 AIRMET információ szükségtelen leíró anyagot nem tartalmazhat. Az időjárás jelenségek, amelyre az AIRMET-et kiadják, leírása nem tartalmazhat a 2.1.4-ben megadottakhoz képest további leíró anyagot. Zivatarokkal, vagy cumulonimbus felhőkkel foglalkozó AIRMET információ nem tartalmazhat kísérő turbulenciára és jegesedésre vonatkozó utalást.

Megjegyzés. –Kismagasságú repülésekhez is használható SIGMET tájékoztatásokra vonatkozó előírásokat az 1.1.4 pont tartalmaz.

2.2 SIGMET közlemények terjesztése

2.2.1 **Ajánlás** – *Az AIRMET közleményeket a szomszédos repülési információs régiókban lévő meteorológiai irodák és más meteorológiai irodák részére kell szétosztani, ahogyan az illetékes meteorológiai hatóságok megállapodtak.*
2.2.2 **Ajánlás. –** *Az AIRMET közleményeket továbbítani kell a nemzetközi üzemelési meteorológiai adatbankokba, és a regionális léginavigációs egyezmény által a repülési helyhezkötött szolgálati műholdas elosztó rendszerek működtetésére kijelölt központokhoz, a regionális léginavigációs egyezményekkel összhangban.*

3. KÜLÖNLEGES LÉGIJELENTÉSEKRE VONATKOZÓ ELŐÍRÁSOK

Megjegyzés. – Ez a függelék különleges légijelentések felfelé kapcsolatával foglalkozik. A különleges légijelentésekre vonatkozó általános leírások a 4. Függelékben találhatók.
3.1 **Ajánlás. –** *Különleges légijelentéseket kiadásuk utáni 60 perc során kell felküldeni.*
3.2 **Ajánlás. –** *Az automatizált különleges légijelentésekben lévő szél és hőmérséklet információkat nem kell felküldeni más, repülést végző légijárműveknek.*

4. SIGMET ÉS AIRMET KÖZLEMÉNYEKRE ÉS KÜLÖNLEGES LÉGIJELENTÉSEKRE (FELFELÉ KAPCSOLAT) VONATKOZÓ RÉSZLETES KRITÉRIUMOK

4.1 Repülési információs régió azonosítása

Ajánlás. – *Azokban az esetekben, amikor a légtér repülési információs régióra (FIR) és magassági repülési információs régióra (UIR) van felosztva, a SIGMET-et a FIR-t kiszolgáló légiforgalmi irányítási szolgálati egység hely jelzőjével kell azonosítani.*
Megjegyzés. – A SIGMET közlemény a FIR laterális határain belül a teljes légtérre érvényes, azaz a FIR-re és az UIR-re. A SIGMET kiadását szükségessé tevő időjárási jelenségek által befolyásolt részterületek és/vagy repülési magasságszintek a közlemény szövegében meg vannak adva.

4.2 A SIGMET és AIRMET közleményekben és különleges légijelentésekben tartalmazott jelenségekre vonatkozó kritériumok

4.2.1 **Ajánlás –** *Zivatarok és cumulonimbus felhők területei lehetnek:*
a) takart (OBSC), ha homály vagy füst borítja, vagy sötétség miatt nem látszik felismerhetően;
b) beágyazott (EMBD), ha felhőrétegek közé van beágyazódva és nem ismerhető fel;
c) izolált (ISOL), ha egyedekből áll, amelyek ténylegesen hatással vannak, vagy előrejelzés szerint hatással lesznek egy területre, amelynek térbeli beborítottsága kisebb, mint az érintett terület 50 százaléka (egy rögzített időpontban vagy egy érvényességi időszak alatt); és
d) eseti (OCNL), ha jól elkülönült egyedekből áll, amelyek ténylegesen hatással vannak, vagy előrejelzés szerint hatással lesznek egy területre, amelynek maximális térbeli beborítottsága az érintett terület 50 és 75 százaléka között van (egy rögzített időpontban vagy egy érvényességi időszak alatt).
4.2.2 **Ajánlás. –** *Zivatarok egy területét gyakorinak (FRQ) tekintik, ha ezen a területen belül a szomszédos zivatartól kis elválasztódások vannak, vagy ilyenek egyáltalán nincsenek, amelynek maximális térbeli beborítottsága az érintett, vagy az előrejelzés szerint érintetté váló terület 75 százalékánál nagyobb (egy rögzített időpontban vagy egy érvényességi időszak alatt).*
4.2.3 **Ajánlás. –** *Szélroham vonal (SQL) zivatart jelöl, amely egy vonal mentén egyedi felhők között kis közökkel rendelkezik, vagy ilyenközök egyáltalán nincsenek.*
4.2.4 **Ajánlás. –** *Jégesőt (GR) a zivatar további leírásaként kell használni, ha szükséges.*
4.2.5 **Ajánlás. –** *Heves és mérsékelt turbulencia (TURB) csak a következőkre vonatkozhat: alacsonyszinti turbulencia, amely erős talajszéllel kapcsolódik; rotor áramlás; turbulencia akár felhővel, akár felhő nélkül (CAT). Konvektív felhőkkel kapcsolatosan turbulenciát nem használnak.*
4.2.6 Turbulencia lehet:
a) erős, amikor az EDR köbgyökének csúcsértéke meghaladja a 0,7-et; és

b) mérsékelt, amikor EDR köbgyökének csúcsértéke 0,4 felett van és kisebb vagy egyenlő 0,7-el.
4.2.7 **Ajánlás.** – *Erős és mérsékelt jegesedés (ICE) nem-konvektív felhőben való jegesedésre vonatkozhat. Ónos eső (FZRA) ónos eső által okozott erős jegesedési körülményekre vonatkozhat.*
4.2.8 **Ajánlás.** – *Hegyi hullám (MTW) lehet:*
a) erős, amikor 3,0 m/s (600 láb/perc) vagy ennél nagyobb kísérő leáramlást és/vagy erős turbulencát észlelnek vagy előrejeleznek; és
b) mérsékelt, , amikor 1,75 – 3,0 m/s (350-600 láb/perc) kísérő leáramlást és/vagy mérsékelt turbulenciát észlelnek, vagy előrejeleznek.

5. REPÜLŐTÉRI FIGYELMEZTETÉSEKRE VONATKOZÓ ELŐÍRÁSOK

5.1 Repülőtéri figyelmeztetések formátuma és terjesztése

5.1.1 A repülőtéri figyelmeztetéseket az A6-2 táblázatban közölt mintának megfelelően kell kiadni, ahol az üzemeltetők vagy repülőtéri szolgáltatók igénylik, és az azokra vonatkozó helyi megállapodásnak megfelelően kell szétosztani.
5.1.2 Az A6-2 táblázatban lévő mintában a vonatkozó sorszámnak meg kell felelnie a repülőtérre a szóbanforgó napon 0001 UTC-től kiadott repülőtéri figyelmeztetések számának
5.1.3 **Ajánlás** – *Az A6-2 táblázatban közölt mintának megfelelően, repülőtéri figyelmeztetéseket az alábbi jelenségek közül valamelyiknek vagy többnek a megjelenésével, vagy várható megjelenésével kapcsolatban kell kiadni.*
– trópusi ciklon (akkor, ha a repülőtéren a 10 perces közepes talajszél sebesség 63 km/h-ra vagy ennél nagyobbra várható)
– zivatar
– jégeső
– hó (beleértve a várható vagy észlelt hó felgyülemlést)
– ónos csapadék
– dér vagy zúzmara
– homokvihar
– porvihar
– felkavart homok vagy por
– erős talajszél és széllökések
– szélroham
– fagy
– vulkanikus hamu
– cunami
– egyéb jelenségek helyi megállapodás szerint.

5.1.4 **Ajánlás.** – *Az A6-2 táblázatban lévő mintában felsorolt rövidítéseket kiegészítő szöveg használatát minimálisra kell korlátozni. A kiegészítő szöveget rövidített köznyelven kell kiadni, ICAO által jóváhagyott rövidítéseket, valamint numerikus értékeket használva. Ha ICAO által jóváhagyott rövidítések nem állnak rendelkezésre, angol köznyelvű szöveget kell használni.*

5.2 Mennyiségi kritériumok repülőtéri figyelmeztetésekhez

Ajánlás – *Ha mennyiségi kritériumok szükségesek repülőtéri figyelmeztetések kibocsátásához, például a várható maximális szélsebesség vagy a várható lehulló teljes hómennyiség, a kritériumokat a meteorológiai iroda és a figyelmeztetések felhasználói közötti megállapodásban kell rögzíteni.*

6. SZÉLNYÍRÁS FIGYELMEZTETÉSEKRE VONATKOZÓ ELŐÍRÁSOK

6.1 Szélnyírás észlelése

Ajánlás. – *Szélnyírás létezésének bizonyítékát a következőkből kell származtatni:*
a) földi szélnyírás távérzékelő berendezés, például Doppler radar;
b) földi szélnyírás észlelő berendezések, például talajszél és/vagy nyomásérzékelők, amelyek úgy vannak elhelyezve, hogy adott futópályát vagy futópályákat és a hozzájuk tartozó megközelítési és indulási pályákat figyelnek;
c) légijármű megfigyelések elemelkedési vagy megközelítési repülési fázisban, amelyeket az 5. Fejezetnek megfelelően kell végezni; vagy
d) más meteorológiai információk, például a repülőtér szomszédságában vagy magasföldek közelében lévő póznákon vagy tornyokon elhelyezett megfelelő érzékelőktől származó információk.
Megjegyzés. – A szélnyírási körülmények rendszerint a következő jelenségekkel járnak együtt:
– zivatarok, mikroburstök, tölcsérfelhő (tornádó vagy víztölcsér), és széllökés frontok;
– front felületek;
– helyi terepviszonyokkal kapcsolatos erős talajszél;
– tengeri szélfrontok;
– hegyi hullámok; (beleértve az alacsonyszinti rotorokat a terminál területen)
– alacsonyszinti hőmérséklet inverziók.

6.2 Szélnyírás figyelmeztetések formátuma és terjesztése

Megjegyzés. – A helyi rendszeres és különleges jelentéseknek és METAR-nak és SPECI-nek kiegészítő információként a szélnyírás információkat is tartalmazniuk kell az A3-1 és A3-2 táblázatokban lévő mintáknak megfelelően.
6.2.1 A szélnyírás figyelmeztetéseket az A6-3 Táblázatban lévő mintának megfelelően kell kiadni, és az idevonatkozó helyi elrendezésnek megfelelően kell terjeszteni.
6.2.2 Az A6-3 táblázatban lévő mintában a vonatkozó sorszámnak meg kell felelnie a repülőtérre a szóbanforgó napon 0001 UTC-től kiadott repülőtéri figyelmeztetések számának.
6.2.3 **Ajánlás.** – *Az A6-3 táblázatban lévő mintában felsorolt rövidítéseket kiegészítő szöveg használatát minimálisra kell korlátozni. A kiegészítő szöveget rövidített köznyelven kell kiadni, ICAO által jóváhagyott rövidítéseket, valamint numerikus értékeket használva. Ha ICAO által jóváhagyott rövidítések nem állnak rendelkezésre, angol köznyelvű szöveget kell használni.*
6.2.4 **Ajánlás**. – *Ha egy légijármű jelentést használnak fel készítenek szélnyírásról szóló figyelmeztetés készítéséhez, vagy megerősítik az előzőleg kiadott figyelmeztetést, akkor a légijármű jelentését, a légijármű típusával együtt, változatlan formában kell szétosztan, avonatkozó helyi elrendezéseknek megfelelően.*
1. *Megjegyzés. – Ha egy érkező és egy induló légijármű is jelentett szélnyírást, akkor két szélnyírásról szóló figyelmeztetés is létezhet, egy az induló, egy az érkező légijárművek számára.*
2. Megjegyzés. – A szélnyírás intenzitásának jelentésére vonatkozó részletek kidolgozása folyamatban van. Elfogadott azonban, hogy a pilóták a szélnyírás jelentésekor használhatják a „mérsékelt” (moderate), „erős” (strong) és „heves” (severe) minőségjelző kifejezéseket, az észlelt szélnyírás intenzitásának megítélését nagymértékben a pilóták szubjektív becslésére alapozva.
6.2.5 A szélnyírás figyelmeztetéseket automatizált, földi telepítésű szélnyírás távérzékelőtől vagy észlelő berendezésektől kell szétküldeni a vonatkozó helyi elrendezéseknek megfelelően.
6.2.6 **Ajánlás.** – *Ahol mikroburstöt észlenek, vagy pilóták jelentenek, vagy földi telepítésű szélnyírás észlelő vagy távérzékelő berendezéssel észlelnek, a szélnyírás figyelmeztetésnek, vagy szélnyírás riasztásnak a mikroburstre való különleges hivatkozást kell tartalmaznia.*
6.2.7 Ahol földi szélnyírás észlelő vagy távérzékelő berendezésektől nyerik a szélnyírás figyelmeztetés készítéséhez használt információkat, a szélnyírás figyelmeztetés vagy riasztás, amennyiben megvalósítható, a futópálya egy bizonyos szakaszára, és a megközelítési pálya vagy felszállási pálya mentén bizonyos távolságra vonatkozzon, a meteorológiai hatóság, a megfelelő ATS hatóság és az érdekelt üzemeltetők közötti megállapodásnak megfelelően.

6.1 Táblázat. Minta SIGMET és AIRMET közleményekre és különleges légi-jelentésekre

Kulcs: M = kötelező beszúrás, minden közlemény része
C = feltételes beszúrás meteorológiai körülményektől függ
= = kettős vonal azt jelzi, hogy az ezt követő szöveget a következő sorban kell elhelyezni.

Megjegyzés. – A SIGMET/AIRMET közleményekben és különleges légijelentésekben szereplő numerikus elemek tartományait és felbontásait ennek a függeléknek az A6-4 táblázata mutatja be.

Az 5. Fejezetben és a 6. Függelékben meghatározottak szerinti elem	*Részletes tartalom*	*Minta (Minták)*			*Példák*

7. FÜGGELÉK. REPÜLÉSI KLIMATOLÓGIAI INFORMÁCIÓKRA VONATKOZÓ MŰSZAKI ELŐÍRÁSOK

*(Lásd jelen Annex 8. Fejezezet***)**

1. REPÜLÉS-KLIMATOLÓGIAI INFORMÁCIÓK FELDOLGOZÁSA

Ajánlás. – *A reguláris és kitérő repülőtéri megfigyeléseket a repülőtéri klimatológiai információk készítéséhez illeszkedő formában kell összegyűjteni, feldolgozni és tárolni.*

2. REPÜLÉS-KLIMATOLÓGIAI INFORMÁCIÓK CSERÉJE

Ajánlás. – *Repülés-klimatológiai információkat kérésre a meteorológiai hatóságok között cserélni kell. Üzemeltetőknek és más repülési felhasználóknak, akik ilyen információkat igényelnek, általában ezek készítéséért felelős meteorológiai hatóságokhoz kell folyamodniuk.*

3. REPÜLÉS-KLIMATOLÓGIAI INFORMÁCIÓK TARTALMA

3.1 Repülőtéri klimatológiai táblázatok

3.1 1 **Ajánlás. –** *A repülőtéri klimatológia táblázatnak alkalmazhatóként az alábbiakat kell megadni:*
a) meteorológiai elemek középértékeit és az attól való eltéréseket, tartalmazva a maximum és minimum értékeket (például levegőhőmérséklet); és/vagy
b) a repülőtéren a repülésüzemeltetésre ható aktuális időjárás jelenségek (például homokvihar) előfordulási gyakoriságát; és/vagy
c) egy, vagy két, vagy több elem kombinációja (például alacsony látás és alacsony felhő kombinációja) megadott értékének megjelenési gyakoriságát.
3.1.2 **Ajánlás –** *A repülőtéri klimatológiai táblázatoknak tartalmazniuk kell azokat az információkat, amelyek repülőtéri klimatológiai összegezések 3.2 pontnak megfelelő elkészítéséhez szükségesek.*

3.2 Repülőtéri klimatológiai összegezések

Ajánlás – *Repülőtéri klimatológiai összegezéseknek le kell fedniük az alábbiakat:*
a) futópálya látástávolság/látás és/vagy meghatározott időpontokban meghatározott értékek alá nyúló BKN vagy OVC legalsó felhő réteg felhőalap magasság előfordulási gyakorisága;
b) meghatározott időpontokban meghatározott értékek alatti látás gyakorisága;
c) meghatározott időpontokban meghatározott értékek alá nyúló BKN vagy OVC legalsó felhőréteg felhőalap magasságának gyakorisága;
d) egyazon szél irány és sebesség előfordulás gyakorisága meghatározott intervallumokon belül;
e) talajmenti hőmérséklet gyakorisága az 5°C meghatározott intervallumaiban, meghatározott időpontokban;
f) üzemelés tervezési célokból, beleértve a felszállási teljesítményszámításokat is, szükséges meteorológiai elemek középértékei, és az ettől való eltérések, a maximális és minimális értékek.

Megjegyzés. – Az a)-tól e)-ig pontokra vonatkozó klimatológiai összegezési modelleket a WMO Publication No.49, Technical Regulations (Műszaki szabályozások), *II. kötet C.3.2 fejezet tartalmazza.*

8. FÜGGELÉK. ÜZEMELTETŐK ÉS REPÜLŐ SZEMÉLYZET KISZOLGÁLÁSÁRA VONATKOZÓ MŰSZAKI ELŐÍRÁSOK

(Lásd jelen Annex 9. Fejezet)

Megjegyzés. – A repülés dokumentációra (beleértve a minta térképeket és formátumokat) vonatkozó előírásokat az 1. Függelék tartalmazza.

1. METEOROLÓGIAI INFORMÁCIÓK SZOLGÁLTATÁSI ESZKÖZEI ÉS FORMÁTUMA

1.1 Üzemeltetőket és repülőszemélyzeti tagokat az alábbiak közül az egyik vagy többféle módon kell meteorológiai információkkal ellátni, a meteorológiai hatóság és az illetékes üzemeltető közötti megállapodás szerint, és az alábbiak szerinti sorrendben, amely nem alkalmaz prioritásokat:

a) írt vagy nyomtatott anyag, közötte specifikált térképek, és formanyomtatványok;

b) adatok digitális formában;

c) eligazítás;

d) konzultáció;

e) kijelzés; vagy

f) a)-tól e)-ig pontok helyett öneligazítást szolgáltató automatizált repülés előtti információs rendszer és repülésdokumentációs eszközök, fenntartva az üzemeltetők és repülőszemélyzet konzultálási lehetőségét, szükség esetén, a meteorológia irodával, az 5.1 pontnak megfelelően.

1.2 A meteorológiai hatóságnak az üzemeltetővel való konzultációjánál az alábbiakat kell meghatároznia:

a) a szolgáltatásra kerülő meteorológiai információk fajtáját és formátumát; és

b) ezen információk szolgáltatásának módszereit és eszközeit.

1.3 **Ajánlás**. – *Az üzemeltető kérésére a repülési tervhez szolgáltatott információknak adatokat kell tartalmazniuk a legalsó használható repülési magasságszint meghatározásához.*

2. REPÜLÉS ELŐTTI TERVEZÉSHEZ ÉS REPÜLÉS KÖZBENI ÁTTERVEZÉSHEZ SZOLGÁLÓ INFORMÁCIÓKRA VONATKOZÓ ELŐÍRÁSOK

2.1 Magaslégköri információ formátuma

A WAPC-ok által repülés előtti tervezéshez és repülés közbeni áttervezéshez szolgáltatott magaslégköri információknak GRIB kód formájúaknak kell lenniük.

Megjegyzés. – A GRIB kód formát a WMO 306 számú kiadványa (Kód kézikönyv (Manual on Codes) *1.2 Kötet B Rész – Bináris kódok (Binary Codes), tartalmazza.*

2.2 Szignifikáns időjárási információk formátuma

A WAFC-ok által repülés előtti tervezéshez és repülés közbeni áttervezéshez szolgáltatott információknak BUFR kódformát kell ölteniük.

Megjegyzés. – A BUFR kódformát a WMD 306 számú kiadványa (Kód kézikönyv (Manual on Codes), *1.2 Kötet B Rész – Bináris kódok (Binary Codes) tartalmazza.*

2.3 Helikopter üzemeltetés speciális igényei

Ajánlás – T*engeri partközeli szerkezetekre repülő helikoptereket üzemeltetők által végzett, repülés előtti tervezéshez és repülés közbeni áttervezéshez szolgáló meteorológiai információknak a tengerszinttől a 100-as repülési magassági szintig terjedő magasságokra vonatkozó adatokat kell tartalmazniuk. Különös figyelmet kell fordítani a várható felszíni látásra, a 100-as repülési magasságszint alatti felhő mennyiségére, fajtájára (ahol rendelkezésre áll), alapjára és tetejére, a tenger állapotára és tenger felszín hőmér-*

sékletére, a közepes tengerszinti nyomásra, és turbulencia és jegesedés előfordulására és várható megjelenésére, ahogyan a regionális léginavigációs egyezmény meghatározza.

3. ELIGAZÍTÁSRA ÉS KONZULTÁCIÓRA VONATKOZÓ ELŐÍRÁSOK

Ajánlás – *A kijelzett anyagnak olvashatóan hozzáférhetőnek kell lennie a repülőszemélyzet tagjai és más érdekelt repülésüzemeltető személyzet számára.*

4. REPÜLÉSI DOKUMENTÁCIÓRA VONATKOZÓ ELŐÍRÁSOK

4.1 Az infomáció prezentálása

4.1.1 A magassági szél és magaslégköri hőmérséklet és SIGWX jelenségek előrejelzésére vonatkozó repülési dokumentációkat térképek formájában kell prezentálni. Kismagassságú repülésekhez, alternatívaként GAMET körzeti előrejelzéseket kell használni.
Megjegyzés. – Repülési dokumentáció készítésében használt térképek és formátumok modelljei az 1. Függelékben vannak megadva. Ezeket a modelleket és módszereketa Világ Meteorológiai Szervezet a Nemzetközi Polgári Repülési Szervezet által felállított idevonatkozó üzemeltetési követelmények alapján fejlesztette ki.
4.1.2 METAR és SPECI (beleértve a regionális léginavigációs egyezménnyel összhangban kiadott trend előrejelzéseket), TAF, GAMET, SIGMET és AIRMET információkat a 3., 5. és 6. Függelékben található mintákkal összhangban kell prezentálni. Más meteorológiai irodáktól kapott METAR, SPECI, TAF, GAMET, SIGMET és AIRMET közleményeket a repülési dokumentációba változtatás nélkül kell beletenni.
Megjegyzés. METAR/SPECI és TAF prezentációjának formulájára példát az 1. Függelék tartalmaz.
4.1.3 **Ajánlás.** – *A használt hely jelzőket és rövidítéseket a repülési dokumentációban el kell magyarázni.*
4.1.4 **Ajánlás.** – *A repülési dokumentáció által tartalmazott térképek formuláit és jelmagyarázatát angolul, franciául, oroszul és spanyolul ki kell nyomtatni. Ahol lehetséges, jóváhagyott rövidítéseket kell használni. Az egyes elemekhez alkalmazott mértékegységeket jelölni kell; ezeknek összhangban kell lenniük az 5. Annexszel.*

4.2 Térképek repülési dokumentációban

4.2.1 Térképek jellemzői
4.2.1.1 **Ajánlás.** *A repülési dokumentáció által tartalmazott térképeknek világosnak és jól olvashatónak kell lenniük és a következő fizikai jellemzőkkel kell rendelkezniük:*
a) a kényelem kedvéért a térképek legnagyobb méretének körülbelül 42 x 30 cm-nek (szabványos A3 méret), és a legkisebb méretnek 21 x 30 cm-nek (szabványos A4 méret) kell lennie. E méretek közötti választás az útvonal hossztól függ, a térképeken megadni szükséges részletek mennyisége a meteorológiai hatóságok és a felhasználók közötti megállapodás tárgya.;
b) nagyobb földrajzi egységeket, mint például tengerpartokat, nagyobb folyókat és tavakat olyan módon kell ábrázolni, hogy azok könnyen felismerhetők legyenek;
c) számítógéppel készített térképeknél a meteorológiai adatok preferenciát élveznek az alap térkép információkkal szemben, az előbbi törli az utóbbit, ahol ezek fedik egymást;
d) nagyobb repülőtereket pontként kell ábrázolni, és annak a városnak az első betűjével azonosítani, amelyet a repülőtér kiszolgál, ahogyan arereleváns regionális léginavigációs terv AOP táblázatában meg van adva;
e) a földrajzi hálózatot minden 10º szélességnél és hosszúságnál pontozott vonalakkal húzott meridiánok és párhuzamosak képviselik; a pontokat egymástól egy fok távolságra kell elhelyezni;
f) a szélességi és hosszúsági értékeket a térképeken több különböző ponton kell jelölni (azaz nemcsak a széleken);
g) a címkéknek a repülési dokumentációs térképeken világosnak és egyszerűnek kell lenniük, és egyértelmű módon fel kell tüntetni rajtuk a világ területi előrejelző központ nevét, vagy nem-WAFS előállítások esetén az eredeti központ nevét, a térkép fajtáját, a dátumot és az érvényesség idejét, és szükség esetén a

használt egységek fajtáit egyértelmű módon..
4.2.1.2 A repülési dokumentációban szereplő meteorológiai információkat a következők reprezentálják:
a) a szeleket a térképeken tollakkal és árnyékolt zászlócskákkal ellátott nyilakkal kell ábrázolni, elegendően sűrű rácson;
b) a hőmérsékleteket számokkal kell ábrázolni, elegendően sűrű rácson;
c) egy világ területi előrejelző központtól kapott adatkészletből kiválasztott szél és hőmérséklet adatokat elegendően sűrű szélesség/hosszúság rácsban kell ábrázolni; és
d) szélnyilaknak előtérbe kell kerülniük a hőmérsékletekkel szemben és mindkettőnek előtérbe kell kerülniük a térkép háttérrel szemben.
4.2.1.3 **Ajánlás** – *Rövid hatótávolságú repülésekhez korlátozott területeket lefedő térképeket kell készíteni, 1:15x10*^{6} *méretarányban, ahogy megkövetelik.*

4.2.2 A szolgáltatandó térkép készlet
4.2.2.1 A 250-es repülési magasságszint és a 630-as repülési magasságszint közötti repülésekhez szolgáltatandó minimális számú térképek között kell lenni egy nagymagassági SIGWX térképnek (250-es repülési magasságszinttől 630-as repülési magasságszintig) és egy előrejelzési 250 hPa-os szél és hőmérséklet térképnek. A repülés előtti és repülés közbeni tervezéshez és a repülési dokumentációhoz szolgáló aktuális térképek együttesének összetételét a meteorológiai hatóságok és a szolgálati területen belüli más felhasználók közötti megállapodás határozza meg.
4.2.2.2 A szolgáltatandó térképeket a WAFC-ok által szolgáltatott digitális előrejelzésekből kell generálni, amikor ezek az előrejelzések idő, tengerszint feletti magasság és földrajzi kiterjedés szempontjából lefedik a szándékolt repülési pályát, hacsak a meteorológiai és az érintett üzemeltető közötti megállapodás másképp nem rendelkezik.
4.2.3 Magasság jelölések
Repülési dokumentációban a magasság jelöléseket a következőképpen kell megadni:
a) az útvonali meteorológiai viszonyokra való minden hivatkozást, mint például magassági szelek, turbulencia, vagy felhőalap és felhőtető magasságjelölések, lehetőség szerint repülési magasságszintekben kell kifejezni; ezek kifejezhetők még nyomásban, közepes tengerszint feletti magasságban, vagy, kismagasságú repüléseknél, föld feletti magassággal; és
b) a repülőtéri meteorológiai viszonyokra való minden hivatkozást, mint például a felhőalap magasság jelölések, a repülőtér közepes tengerszint feletti magassága feletti magassággal kell kifejezni.

4.3 Kismagasságú repülésekre vonatkozó előírások

4.3.1 Térkép formában
Ajánlás – *Ahol az előrejelzéseket térkép formájában szolgáltatják, a repülési dokumentációnak kismagasságú repülésekhez, beleértve azokat is, amelyek a látás szerinti repülés szabályai szerint folynak, amely repüléseket maximum a 100-as szinten hajtják végre (vagy hegyes területen maximum a 150-es repülési magasságszinten, vagy nagyobb magasságokban, ahol szükséges) a következőket kell tartalmazniuk, ahogyan a repülésnek megfelel:*
a) információk a releváns SIGMET és AIRMET közleményekből;
b magassági szél és magaslégköri hőmérséklet térképek, ahogyan a 5.4.3.1 pontban meg van adva; és
c) szignifikáns időjárás térképek, ahogy az 5. Függelék 4 3.2 pontban meg van adva.
4.3.2 Rövidített köznyelven
Ajánlás – *Ahol az előrejelzéseket nem térkép formájában szolgáltatják, a repülési dokumentációnak kismagasságú repülésekhez, beleértve azokat is, amelyek a látás szerinti repülés szabályai szerint folynak, amely repüléseket maximum a 100-as szinten hajtják végre (vagy hegyes területen maximum a 150-es repülési magasságszinten, vagy nagyobb magasságokban, ahol szükséges) a következőket kell tartalmazniuk, ahogyan a repülésnek megfelel:*
a) SIGMET és AIRMET tájékoztatások; és

b) GAMET körzeti előrejelzések.
Megjegyzés – a GAMET körzrti előrejelzésre példát az 5. Függelék tartalmaz.

5. ELIGAZÍTÁSHOZ, KONZULTÁCIÓHOZ, REPÜLÉSTERVEZÉSHEZ ÉS REPÜLÉSI DOKUMENTÁCIÓHOZ SZOLGÁLÓ, AUTOMATIZÁLT REPÜLÉS ELŐTTI INFORMÁCIÓS RENDSZEREKRE VONATKOZÓ ELŐÍRÁSOK

5.1 Hozzáférés a rendszerekhez

Öneligazítási eszközöket szolgáltató automatizált repülés előtti információs rendszereknek hozzáférést kell biztosítani az üzemeltetőknek és a repülőszemélyzet tagjainak, szükség esetén a meteorológiai irodával telefonon vagy más megfelelő kommunikációs eszközzel történő konzultációhoz.

5.2 A rendszerekre vonatkozó részletes előírások

Ajánlás. – *Öneligazításhoz, repülés előtti tervezéshez és repülési dokumentációhoz szolgáló meteorológiai információk szolgáltatását végző automatizált repülés előtti információs rendszereknek a következő feladatokat kell ellátni:*
a) gondoskodni a rendszer adatbázisának folyamatos és időben történő frissítéséről és tárolt meteorológiai információk érvényességének és integritásának figyeléséről;
b) lehetővé tenni az üzemeltetők és a repülőszemélyzet tagjai, valamint más illetékes használók részére is a hozzáférést a rendszerhez alkalmas távkölési eszközök segítségével;
c) rövidített köznyelven és, amennyiben megfelelő, ICAO hely jelölőkön és a WMO által előírt repülésmeteorológiai kód adat-típusú jelölőkön alapuló, vagy menü rendszerű felhasználói interfészen, vagy más alkalmas mechanizmusokon alapuló hozzáférési és lekérdezési eljárásokat használni a meteorológiai hatóság és az érintett üzemeltető közötti megegyezés szerint; és
d) gyors választ adni a felhasználó információ iránti kérésére.
Megjegyzés. –AZ ICAO rövidítések és kódok és hely jelölők a Léginavigációs szolgáltatási eljárások – ICAO rövidítések és kódok (Procedeures for Air Navigation Services – ICAO Abbreviations and Codes)*(PANS-ABC, Doc 8400)és* Hely jelölők (Location Indicators) *(DOC 7910) kiadványokban találhatók. Repülésmeteorológiai kód adat-típusú jelölők a WMO 386 számú kiadványában* Globális távközlési rendszer kézikönyv (Manual on Telecommunication System) *kiadványban vannak megadva*.

6. REPÜLÉST VÉGZŐ LÉGIJÁRMŰVEKNEK SZÓLÓ INFORMÁCIÓKRA VONATKOZÓ ELŐÍRÁSOK

6.1 Repülést végző légijármű által igényelt információk szolgáltatása

Ajánlás. *Ha repülést végző légijármű meteorológiai információt kér, a kérést vevő meteorológiai irodának intézkedni kell, ha szükséges másik meteorológiai iroda segítségével, az információ szolgáltatásának biztosítására.*

6.2 Információk az üzemeltető repülés közbeni tervezéséhez

Ajánlás. *Meteorológiai információt repülést végző légijármű üzemeltető általi repülési tervezéséhez a repülési periódus alatt kell szolgáltatni, és ezeknek a a következők valamelyikéből, vagy mindegyikéből kell állni:*
a) METAR és SPECI (beleértve trend előrejelzéseket is, mint regionális léginavigációs egyezmény szerint kiadottakat);
b) TAF és módosított TAF;
c) SIGMET és AIRMET tájékoztatás és erre a repülésre vonatkozó különleges légijelentések, hacsak az utóbbi nem volt egy SIGMET közlemény tárgya; és
d) magassági szél és magaslégköri levegő hőmérséklet információk.

9. FÜGGELÉK. LÉGIFORGALMI SZOLGÁLATOK, KUTATÓ ÉS MENTŐ SZOLGÁLATOK ÉS REPÜLÉSI INFORMÁCIÓS SZOLGÁLATOK RÉSZÉRE NYÚJTOTT INFORMÁCIÓKRA VONATKOZÓ MŰSZAKI ELŐÍRÁSOK

(Lásd jelen Annex 10. Fejezete)

1 LÉGIFORGALMI SZOLGÁLATI EGYSÉGEK SZÁMÁRA SZOGÁLTATANDÓ INFORMÁCIÓK

1.1 Repülőtéri irányító tornyoknak szóló információk jegyzéke

A következő meteorológiai információkat kell szükség esetén a repülőtéri irányító torony részére a hozzárendelt repülőtéri meteorológiai irodának biztosítani:
a) rendszeres és különleges jelentések, METAR és SPECI, TAF és trend előrejelzések és ezek módosításai az érintett repülőtérre vonatkozóan;
b) SIGMET és AIRMET tájékoztatások, szélnyírás figyelmeztetések és repülőtéri figyelmeztetések;
c) helyileg egyeztetett, bármely pótlólagos meteorológiai információ, mint például talajszélre vonatkozó előrejelzések a lehetséges futópálya változtatás meghatározásához;
d) vulkanikus hamu felhőről kapott tájékoztatás, amelyre vonatkozóan még nem adtak ki SIGMET-et, ahogy abban az érintett meteorológiai és ATS hatóságok megegyeztek; és
e) kitörés előtti vulkanikus tevékenységről és/vagy vulkánkitörésről kapott információ, ahogy abban az érintett meteorológiai és ATS hatóságok megegyeztek.

1.2 Bevezetés irányító egységnek szóló információk jegyzéke

A bevezető irányító egység részére a hozzárendelt repülőtéri meteorológiai irodának szükség esetén a következő meteorológiai információkat kell biztosítania:
a) helyi rendszeres és különleges jelentések, rendszeres jelentések METAR, és SPECI és trend előrejelzések és ezek módosításai arra (azokra) a repülőtérre (repülőterekre) vonatkozóan, amelye(ke)n a bevezető irányító egység illetékes.
b) arra a légtérre vonatkozó SIGMET és AIRMET tájékoztatások, szélnyírás figyelmeztetések és riasztások és megfelelő különleges légijelentések, amelyben a bevezető irányító egység illetékes, és repülőtéri figyelmeztetések;
c) bármely további meteorológiai információ, amelyben helyileg megegyeztek;
d) vulkanikus hamu felhőről kapott információ, amelyre vonatkozóan még nem adtak ki SIGMET-et, az érintett meteorológiai és ATS hatóságok megegyezésének megfelelően; és
e) kitörés előtti vulkanikus tevékenységről és/vagy vulkánkitörésről kapott információ, ahogy abban az érintett meteorológiai és ATS hatóságok megegyeztek.

1.3 Repülés információs központnak szóló információk jegyzéke

A repülési információs központ vagy a körzeti irányító központ részére, szükség szerint, a hozzárendelt meteorológiai megfigyelő irodának a következő meteorológiai információkat kell biztosítania :
a) METAR és SPECI, amelyek tartalmazzák a repülőterek és egyéb helyek aktuális légnyomás adatait, TAF és trend előrejelzéseket, és ezek módosításait, amelyek a repülési információs régiót vagy az irányító körzetet érintik, és ha a repülési információs központ vagy a körzeti irányító központ kívánja, a szomszédos repülési információs régióban lévő repülőterekre vonatkozókat is, a regionális léginavigációs egyezményben meghatározottaknak megfelelően;
b) a magassági szelekre és magaslégköri levegő hőmérsékletre, szignifikáns útvonal időjárási jelenségekre vonatkozó előrejelzések és ezek módosításai, különös tekintettel azokra, melyek lehetetlenné teszik a látás szerinti repülési szabályok szerinti üzemelést, SIGMET és AIRMET tájékoztatások és megfelelő különleges légijelentések, amelyek a repülési információs régióra, vagy irányítói körzetre vonatkoznak, valamint, ha a regionális léginavigációs egyezmény úgy határozza meg, és a körzeti irányító központ úgy kívánja, a szomszédos repülési információs régiókra vonatkozókat is;
c) bármely egyéb, a repülési információs központ, illetve a körzeti irányító központ által a repülést végző légijárművek kéréseinek kielégítéséhez igényelt meteorológiai információk; ha az igényelt információ nem áll rendelkezésre a hozzárendelt meteorológiai figyelő irodánál, akkor ennek más meteorológiai iroda segítségét kell kérnie ezen információk biztosításához;
d) vulkanikus hamu felhőről kapott információ, amelyre vonatkozóan még nem adtak ki SIGMET közleményt, ahogy abban az érintett meteorológiai és ATS hatóságok megegyeztek; és
e) radioaktív anyagok véletlen atmoszférába jutásáról szóló vett információ, az érintett meteorológiai és ATS hatóság közötti megállapodás szerint;
f) a területért felelős TCAC által kiadott trópikus ciklon tájékoztató információ;
g) a területért felelős VAAC által kiadott vulkanikus hamu tájékoztató információ; és
h) kitörés előtti vulkanikus tevékenységről és/vagy vulkánkitörésről kapott információ, ahogy abban az érintett meteorológiai és ATS hatóságok megegyeztek.

1.4 Repülési távközlési központok információ ellátása

Ahol repülési információs célokra szükséges, az aktuális meteorológiai jelentéseket és előrejelzéseket biztosítani kell kijelölt repülési távközlési állomások részére. Ha szükséges, az információk egy példányát továbbítani kell a repülési információs központnak vagy a körzeti irányító központnak.

1.5 Információ formátum

1.5.1 **Ajánlás** – *A légiforgalmi szolgálati egységeket helyi rendszeres és különleges jelentésekkel, METAR-ral, SPECI-vel, repülőtéri és leszállási előrejelzéssel, SIGMET és AIRMET tájékoztatással, magassági szél és magaslégköri hőmérséklet előrejelzésekkel és ezek módosításaival kell ellátni, abban a formában, amelyben ezek készültek, a többi meteorológiai irodákrészére szétosztásra kerültek, vagy más meteorológiai irodáktól érkeztek, hacsak helyileg nem állapodtak meg másképpen.*
1.5.2 **Ajánlás** – *Ha rácspontokra vonatkozó, számítógép által feldolgozott magaslégköri adatokat digitális formában továbbítják a légiforgalmi szolgálati egységnek a légiforgalmi szolgálatok számítógépein történő felhasználásra, a formátum és a továbbítás módja a meteorológiai hatóság és az illetékes ATS hatóság közötti megállapodás szerinti legyen. Az adatokat normál körülmények között, az előrejelzések feldolgozásának befejezése után, a lehető leggyorsabban szolgáltatni kell.*

2. KUTATÁS ÉS MENTÉS SZOLGÁLATI EGYSÉGEK RÉSZÉRE SZOLGÁLTATANDÓ INFORMÁCIÓK

2.1 Információk jegyzéke

A mentési koordinációs központoknak juttatott információknak tartalmazniuk kell a meteorológiai körülményeket, amelyek a keresett repülőgép utolsó ismert helyzeténél és ennek a légijárműnek a szándékolt útvonala mentén fennálltak, különös tekintettel a következőkre:
a) szignifikáns útvonali időjárás jelenségek;
b) felhő mennyiség és fajta, különösen a cumulonimbus, a felhőalap- és tető magasság jelzések;
c) látás és a látást csökkentő jelenségek;
d) talajszél és magassági szél;
e) a talaj állapota, különösen hótakaró vagy vízelöntés;
f) tengerfelület hőmérséklet, a tenger állapota, jégborítás, ha van, és óceáni áramlatok, ha relevánsak a kutatás területén;
g) tengerszinti nyomás adatok.

2.2 Kérésre szolgáltatandó információk

2.2.1 **Ajánlás** – *A mentést koordináló központ kérésére a kijelölt meteorológiai irodának intézkednie kell azon repülési dokumentáció részleteinek beszerzéséről, amelyet az eltűnt légijárműnek adtak, bármely előrejelzésre vonatkozó módosítással együtt, melyet a repülést végző légijárműnek továbbítottak.*
2.2.2 **Ajánlás** – *A kutatási és mentési munkálatok elősegítése érdekében a kijelölt meteorológiai iroda kérésre biztosítson:*
a) teljes és részletes információkat a jelenlegi és várható meteorológiai viszonyokról a kutatási területre vonatkozóan; és
b) az aktuális és előrejelzett körülményeket azokon az útvonalakon, amelyeken a kutató légijárművek a kutatás végrehajtási repülőterétől és az oda való visszatérésük alatt repülnek.
2.2.3 **Ajánlás** – *A mentést koordináló központ kérésére a kijelölt meteorológiai iroda szolgáltassa a kutató és mentő tevékenységet végző hajók által igényelt meteorológiai információkat vagy intézkedjen annak biztosítására.*

3. REPÜLÉSI INFORMÁCIÓS SZOLGÁLTATÓ EGYSÉGEK RÉSZÉRE BIZTOSÍTANDÓ INFORMÁCIÓK

3.1 Információk jegyzéke

Egy légiforgalmi információs szolgálati egység részére szükség szerint az alábbi információkat kell biztosítani:
a) információ a nemzetközi léginavigáció meteorológiai szolgálatáról, amelyet repülési információs kiad-

vány(ok)ban szándékoznak közzétenni.
Megjegyzés: – Ezeknek az információknak a részleteit lásd a 15. Annex, 1. Függelék 1. Rész GEN 3.5 és a 3. Rész AD 2.2, 2.11, 3.2 és 3.11 pontjai alatt.
b) NOTAM vagy ASHTAM elkészítéséhez szükséges információk, amelyek különösen az alábbiakra vonatkozó információkat tartalmazzák:
1) repülésmeteorológiai szolgálatok létesítése, megszüntetése és működésükben beálló jelentős változások. Ezt a tájékoztatást a repülési információs szolgálati egység részére a hatályba lépés időpontja előtt megfelelő idővel biztosítani kell, hogy lehetőség legyen NOTAM kiadására a 15. Annex 5.1.1 és 5.1.1.1 pontjának megfelelően.
2) vulkanikus tevékenység előfordulása; és
Megjegyzés – A kívánt speciális információkat 3. Fejezet 3.3.2 és a 4. Fejezet 4.8 pontjai tartalmazzák.
3) radioaktív anyagok véletlen atmoszférába kerülése, ahogyan az érintett meteorológiai és a megfelelő polgári repülési hatóság megállapodott; és
Megjegyzés. – A megkövetelt különleges információk a 3. Fejezet 3.4.2 g) pontban vannak megadva.
c) a repülési információs körlevelek elkészítéséhez szükséges információk, különösen az alábbi információk:
1) a repülésmeteorológiai eljárások, szolgálatok és eszközök várható jelentős változása; és
2) bizonyos időjárási jelenségek hatása a légijárművek üzemelésére.

10. FÜGGELÉK. KOMMUNIKÁCIÓVAL ÉS HASZNÁLATÁVAL SZEMBENI KÖVETELMÉNYEKRE VONATKOZÓ MŰSZAKI ELŐÍRÁSOK

(Lásd jelen Annex 11. Fejezet)

1. KOMMUNIKÁCIÓVAL SZEMBENI SPECIÁLIS KÖVETELMÉNYEK

1.1 Meteorológiai információk megkövetelt átviteli idői

Ajánlás – *Hacsak a regionális léginavigációs egyezményben máshogy nem rendelkeztek, az üzemeltetési meteorológiai információkat tartalmazó AFTN közlemények és bulletinek továbbítási idejének a következőkben megadottaknál rövidebbnek kell lenni:*

SIGMET és AIRMET közlemények, vulkánikus hamu és trópusi ciklon tájékoztató információk és különleges légijelentések		*5 perc*
Szignifikáns időjárásra és magaslégköri előrejelzésekre vonatkozó rövidített köznyelvű módosítások		*5 perc*
Módosított TAF és TAF korrekciók		*5 perc*
METAR Trend előrejelzések TAF SPECI	*0-900 km (500 NM)*	*5 perc*
	több mint 900 km (500NM)	*10 perc*

1.2 Rácspont adatok ATS és üzemeltetők részére

1.2.1 **Ajánlás. –***Amikor a légiforgalmi szolgálatok számítógépein való felhasználásra a rácspontokra vonatkozó magaslégköri adatokat digitális formában bocsátják rendelkezésre, a továbbításra vonatkozó elrendezések feleljenek meg a meteorológiai hatóság és az illetékes ATS hatóság közötti megállapodásnak.*

1.2.2 **Ajánlás. –** *Amikor számítógépes repüléstervezés céljából az üzemeltetők részére a rácspontokra vonatkozó magaslégköri adatokat digitális formában bocsátják rendelkezésre, a továbbításra vonatkozó rendelkezések feleljenek meg az érintett világterületi vagy regionális területi előrejelző központ, a meteorológiai hatóság és az üzemeltetők közötti megállapodásnak.*

2. REPÜLÉSI ÁLLANDÓHELYŰ SZOLGÁLATI KOMMUNIKÁCIÓ HASZNÁLATA

2.1 Meteorológiai bulletinek alfanumerikus formátumban

2.1.1 Bulletinek összeállítása

Ajánlás – *Mindenütt ahol lehetséges, az üzemeltetési meteorológiai információk cseréjét a meteorológiai tájékoztatások ugyanazon típusainak összevonásával, bulletinek formájában kell végezni*

2.1.2 Bulletinek létrehozási időpontjai

Ajánlás – *Ütemezetten továbbítandó meteorológiai bulletineket rendszeresen, előírt időpontban kell összeállítani. A METAR kód formájában készült jelentéseket továbbítás céljából nem később, mint 5 perccel a megfigyelés tényleges ideje után össze kell állítani. A repülőtéri előrejelzéseket továbbítás céljából legalább 1 órával az érvényességi időtartamuk kezdete előtt össze kell állítani, hacsak a regionális léginavigációs egyezmény másképp nem határozza meg.*

2.1.3 Bulletinek fejrészei

A repülési állandóhelyű szolgálatok eszközein keresztül való továbbításra szánt üzemeltetési meteorológiai információkat tartalmazó meteorológiai bulletinek az alábbiakból álló fejrésszel rendelkeznek:

a) négy betűből és két számjegyből álló azonosító;

b) a meteorológiai bulletint kibocsátó vagy összeállító meteorológiai iroda földrajzi helyére vonatkozó négybetűs ICAO hely-jelölés;

c) dátum-idő csoport; és

d) szükség esetén egy hárombetűs jelölés.

1. *Megjegyzés – A fejrész formájára és tartalmára vonatkozó részletes előírások a WMO* Globális Távközlési Rendszer Kézikönyv (Manual on the Telecommunication System*) I. kötetében találhatók és a* Repülésmeteorológiai Eljárások Kézikönyvben (Manual of Aeronautical Meteorological Practice) *(Doc. 8896) reprodukálva vannak.*

2. *Megjegyzés – Az ICAO hely-jelölések* Hely-jelölések (Location Indicators) *(Doc 7910) című kiadványban vannak felsorolva.*

2.1.4 Bulletinek szerkezete

Az AFTN-en keresztül továbbítandó üzemeltetési meteorológiai információkat tartalmazó meteorológiai bulletineket az AFTN közlemény formátum szöveg részébe kell belefoglalni.

2.2. Világ területi előrejelző rendszer produktumai

2.2.1 Távközlés WAFS produktumok szolgáltatásának részére

Ajánlás. – *A világ területi előrejelzési rendszer produktumainak szolgáltatására szolgáló eszközként a repülési állandó helyű szolgálatot kell használni*

2.2.2 Térképek minőségi követelményei

Ajánlás – *Ahol a világterületi előrejelző rendszer produktumait térkép formátumban osztják szét, a kapott térképek minősége olyan legyen, amely megfelelően olvasható másolatok készítését teszi lehetővé repüléstervezési és dokumentációs célokra. A kapott térképek az ábrázolt területnek több mint 95 százalékában legyenek olvashatók.*

2.2.3 Átvitelek minőségi követelményei
Ajánlás – *Az átvitelek olyanok legyenek, melyek biztosítják, hogy bármely 6 órás időtartam alatt a megszakadásuk nem haladja meg a 10 percet.*
2.2.4 WAFS produktumokat tartalmazó bulletinek fejrésze
A repülési állandó helyű szolgálat eszközein digitális formában továbbítandó, WAFS produktumokat tartalmazó meteorológiai bulletineket a 2.1.3 pontban megadott fejrésszel kell ellátni.

3. REPÜLÉSI MOZGÓ SZOLGÁLATI KOMMUNIKÁCIÓ HASZNÁLATA

3.1 Meteorológiai közlemények tartalma és formátuma

3.1.1 A légijárműveknek továbbított jelentések, előrejelzések és SIGMET tájékoztatások tartalma és formája legyen összhangban a jelen Annex 4., 6. és 7. Fejezeteiben előírtakkal.
3.1.2 A légijárművek által továbbított légijelentések tartalma és formája egyezzen meg a jelen Annex 5. Fejezetének, és a *Léginavigációs szolgáltatási eljárások – égiforgalmi menedzsment (Procedures for Air Navigation Services – Air Traffic Management)* (PANS-ATM, Doc. 4444) 1. Függelékének *előírásaival.*

3.2 Meteorológiai bulletinek tartalma és formátuma

A légiforgalmi mobil szolgálaton keresztül továbbított meteorológiai bulletin lényege maradjon változatlan ahhoz képest, amelyet a bulletin a kibocsátásakor tartalmazott.

4. REPÜLÉSI ADATKAPCSOLATI SZOLGÁLAT HASZNÁLATA – D-VOLMET

4.1 D-VOLMET részére rendelkezésre álló meteorológiai információk részletes tartalma

4.1.1 Azokat a repülőtereket, amelyekre jelentéseknek, előrejelzéseknek kell rendelkezésre állni felfelé kapcsolat részére a repülést végző légijárműhöz, regionális léginavigációs egyezménnyel kell meghatározni.
4.1.2 Azokat a repülési információs régiókat, amelyekre SIGMET és AIRMET közleményeknek kell rendelkezésre állni felfelé kapcsolat részére a repülést végző légijárműhöz, regionális léginavigációs egyezménnyel kell meghatározni.

4.2 A D-VOLMET részére rendelkezésre álló meteorológiai információkra vonatkozó kritériumok

4.2.1 **Ajánlás –** *A legfrissebb rendelkezésre álló METAR és SPECI és TAF, és érvényes SIGMET és AIRMET közleményeket kell a repülést végző légijárműhöz való felfelé kapcsolathoz használni.*
4.2.2 **Ajánlás** – *A D-VOLMET által tartalmazott TAF-t szükség esetén módosítani kell, annak érdekében, hogy egy előrejelzés, amikor a repülést végző légijárműhöz való felfelé kapcsolathoz rendelkezésre bocsátják, az illetékes meteorológiai iroda legfrissebb véleményét tükrözze.*
4.2.3 **Ajánlás** – *Ha nincs érvényes SIGMET közlemény egy repülési információs régióra, a D-VOLMET-ben „NIL SIGMET" jelzésnek kell benne lenni.*

4.3 A D-VOLMET részére rendelkezésre álló meteorológiai információk formátuma

A D-VOLMET-ben lévő jelentések, előrejelzések és SIGMET és AIRMET tájékoztatások tartalma és formája feleljen meg jelen Annex 4., 6. és 7. Fejezeteiben szereplő előírásoknak.

5. REPÜLÉSI RÁDIÓADÁS SZOLGÁLAT HASZNÁLATA — VOLMET RÁDIÓADÁSOK

5.1 VOLMET rádióadásokban tartalmazott meteorológiai információk részletes tartalma

5.1.1 Azokat a repülőtereket, amelyekre vonatkozó METAR-t, SPECI-t és TAF-t a VOLMET adásoknak tartalmazniuk kell, ezek továbbítási sorrendjét és az adás idejét regionális léginavigációs egyezménynek

kell meghatároznia.
5.1.2 Azokat a repülési információs régiókat, amelyek részére az időütemezett VOLMET rádióadásoknak SIGMET közleményeket kell tartalmazniuk, regionális léginavigációs egyezménnyel kell meghatározni. Ahol ez történik, a SIGMET közleményt, az adás elején, vagy egy ötperces idő-blokk elején kell továbbítani.

5.2 VOLMET rádióadásokban tartalmazott információkra vonatkozó kritériumok

5.2.1 **Ajánlás** – *Ha egy jelentés valamely repülőtérről nem érkezett meg időben az adáshoz, a legutóbbi rendelkezésre álló jelentést kell felvenni az adásba, az észlelés idejének megjelölésével.*
5.2.2 **Ajánlás** – *Rendszeres időközökben sugárzott VOLMET adásokban szereplő TAF-t szükség esetén módosítani kell annak érdekében, hogy az előrejelzés a továbbítás idején az érintett meteorológiai iroda legutolsó véleményét tükrözze.*
5.2.3 **Ajánlás.** – *Ahol időütemezett VOLMET rádióadások SIGMET közleményeket tartalmaznak, „NIL SIGMET"jelzést kell továbbítan, ha az érintett repülés információs régiókra nincs érvényes SIGMET közlemény.*

5.3 VOLMET rádióadásokban tartalmazott meteorológiai információk formátuma

5.3.1 A VOLMET adásokban szereplő jelentések, előrejelzések és SIGMET tájékoztatás tartalma és formátuma feleljen meg jelen Annex 4., 6. és 7. Fejezeteiben szereplő előírásoknak.
5.3.2 **Ajánlás.** – *VOLMET rádióadásoknak szabványos rádiótelefon frazeológiákat kell használni.*
Megjegyzés. – VOLMET rádióadásokban használt szabványos rádiótelefon frazeológiákról útmutatást a Kézikönyv a Légiforgalmi Szolgálatok, a Repülési Információs Szolgálatok és a Repülésmeteorológiai Szolgálatok közötti koordinációról (Manual on Coordination between Air Traffic Services, Aeronautical Meteorological Services) *(Doc 9377), 1. Függelék ad.*

A MELLÉKLET. MÉRÉSEK VAGY MEGFIGYELÉSEK ÜZEMELÉSI SZEMPONTBÓL KÍVÁNATOS PONTOSSÁGA

Megjegyzés – A jelen táblázatba foglalt útmutatás a 4. Fejezetre – Meteorológiai megfigyelések és jelentések – különösen a 4.1.9 pontra vonatkozik.

Észlelendő elem	*A mérések vagy megfigyelések üzemelés szempontjából kívánatos pontossága**
Átlagos talaj-szél	Irány: ±10 fok Sebesség: ±2 km/h (1 csomó) 19 km/h-ig (10 csomó) ±10% 19 km/h (10 csomó) felett
Eltérések az átlagos talajszéltől	±4km/h (2 csomó), hosszanti ésoldalirányú komponensekben kifejezve
Látás	±50 m 600 m-ig ±10% 600 és 1500 m között ±20% 1500 m felett
Futópálya látás-távolság	±10 m 400 m-ig ±25 m 400 és 800 m között ±10% 800m felett
Felhőmennyiség	±1 okta

Felhőmagasság	±10 m -től (33 láb) 100 m-ig (330 láb) ±10% 100 m (330 láb) felett
Levegő hőmérséklet és harmatpont hőmérséklet	±1ºC
Nyomásérték (QNH, QFE)	±0,5 hPa

* Az üzemelés szempontjából kívánatos pontosságot nem üzemelési előírásnak szánják; ezt az üzemeltetők által kifejezett célként kell tekinteni.

Megjegyzés. – A mérési vagy megfigyelési bizonytalanságra vonatkozó útmutatás a WMO 8. számú kiadványában – Útmutató meteorológiai műszerekhez és megfigyelési módszerekhez (Guide to Meteorological Instruments and Methods of Observation) *található.*

B MELLÉKLET. ELŐREJELZÉSEK ÜZEMELÉSI SZEMPONTBÓL KÍVÁNATOS PONTOSSÁGA

1. Megjegyzés. – Az ebben a táblázatban lévő útmutató a 6. Fejezet – Előrejelzések-re, különösen a 6.1.1 pontra vonatkozik

2. Megjegyzés. – Ha az előrejelzések pontossága a második oszlopban bemutatott, üzemelési szempontból kívánatos tartományon belül marad az eseteknek a harmadik oszlopban jelölt százalékánál, akkor az előrejelzés hibáinak hatása nem tekinthető lényegesnek a navigációs hibák és más üzemelési bizonytalanságok hatásaihoz képest.

Előrejelzendő elemek	*Előrejelzések üzemeltetési szempontból kívánatos pontossága*	*A tartományon belüli esetek minimális százaléka*
	TAF	
Szélirány	±20	az esetek 80%-a

Megjegyzések:

1. Az elmúlt 10 percet figyelembe véve (kivéve: ha a 10 perces időtartam alatt jelentős változás áll be (pl. az RVR eléri vagy meghaladja a 150, 350, 600 vagy 800 métert, és ez ≥2 perc, időn keresztül fennáll), ez esetben a változás utáni adatokat kell használni). Egyszerű diagram mutatja az RVR kritériumokra vonatkozó megfigyelés előtti 10 perces időtartamot, pl. AB, BC és AC.
2. CB és TCU-ból álló azonos felhőalapú réteg esetén, a felhőt „CB"-vel kell jelölni.
3. Az elmúlt 10 percet figyelembe véve (kivéve ha a 10 perces időtartam alatt jelentős diszkontinuitás áll be (pl. az irány ≥30 fokkal és a szélsebesség ≥20 km/h; vagy a szélsebesség változásai ≥20 km/h mértékben megváltozik és ez ≥2 percig tart), ez esetben a változás utáni adatokat kell használni.
4. Különböző irányok esetén az üzemeltetési szempontból legfontosabb irány használandó.
5. $\bar{R}_1$ = az AC időtartam alatt bármely 1 perc átlag RVR értéke;
$\bar{R}_{10}$ = az AC időtartam alatti átlag RVR érték;
$\bar{R}_{5(AB)}$= az AB időtartam alatti RVR érték 5 perces átlaga; és
$\bar{R}_{5(BC)}$ = a BC időtartam alatti RVR érték 5 perces átlaga
6. CB (cumulonimbus) és TCU (tornyosuló cumulus = nagy függőleges kiterjedésű cumulus congestus), ha a többi rétegben még nem szerepel.
7. Időátlagolás, ha alkalmazható, a bal felső sarokban jelezve.
8. N/A = nem alkalmazható.
9. Külön kérésre a QFE-t bele kell foglalni. A QFE referencia magassága a repülőtér közepes tengerszint feletti magassága, kivéve a precíziós megközelítéses futópályákat, és azokat a nem-precíziós megközelítéses futópályákat, melyeknek küszöbe ≥2 m-el (7 láb) a repülőtér tengerszint feletti magassága alatt vagy felett van, amikor a referencia szint a releváns küszöb közepes tengerszint feletti magassága.
10. Ahogyan a 3. Függelék 4.8 pontban fel van sorolva.
11. A WMO Kódok Kézikönyve (WMO – No.306) 15.4.5 pontja szerint „ajánlatos, hogy a szélmérő rendszerek olyanok legyenek, hogy a csúcs széllökések 3 másodperces átlag értékeket jelezzenek".
12. Beleértve a tenger felszíni hőmérsékletet és tengerállapotot, tengeren emelt építményen történő megfigyelés esetén. a regionális léginavigációs egyezménynek megfelelően.
13. Akkor jelezze, ha az RVR és/vagy a VIS ≤1500 méter, értékhatárok 50 és 2000 méter.
14. Azokon a repülőtereken, ahol a küszöbmagasság ≥15 m-el, a repülőtér tengerszint feletti magassága alatt van, és a leszállópálya precíziós megközelítésű, a *küszöb magasságot* kell referenciaként használni.
15. 0,1 hPa pontossággal mérve.

D MELLÉKLET – A MŰSZER LEOLVASÁSI ÉRTÉKEINEK ÁTALAKÍTÁSA FUTÓPÁLYA LÁTÁSTÁVOLSÁG ÉRTÉKEKRE

(Lásd jelen Annex 3. Függelék 4.3.5 pontját)

1. A műszer leolvasási értékeinek futópálya látástávolság értékekre történő átalakítása a Koschmieder-törvényen vagy az Allard-törvényen alapul, attól függően, hogy a pilóta a vizuális irányítás túlnyomó részét a futópályától és annak jelöléseitől, vagy pedig a futópálya-fényektől várhatja. A futópálya látástávolság becslésének szabványosítása érdekében ez a melléklet útmutatást ad a fő átszámítási tényezők használatára és alkalmazására vonatkozóan.
2. A Koschmieder-törvényben az egyik számításba veendő tényező a pilóta szemének kontrasztérzékenységi küszöbe. Megállapodás szerint ehhez a 0,05 állandót használják (dimenzió nélküli).
3. Az Allard-törvényben a megfelelő tényező a megvilágítási küszöb. Ez nem egy állandó, hanem a

háttérmegvilágítás folytonos függvénye. A megállapított összefüggést, amelyet olyan műszerezett rendszerben kell használni, melyben a megvilágítási küszöböt a háttér megvilágítás érzékelője folyamatosan állítja, a D1. ábra görbéje mutatja. Egy folytonos függvény használata, amely a lépcsős függvényt közelíti, ahogyan a D-1 ábra mutatja, a 4. paragrafusban leírt lépcsős összefüggéshez képesti nagyobb pontossága miatt előnyben részesül.

4. Olyan műszerezett rendszerekben, amelyek nem rendelkeznek folyamatos megvilágítási küszöb be állítással, négy egyenlő térközű megvilágítási küszöbérték használata megállapított megfelelő háttér megvilágítási tartományokkal, kényelmes, de a pontosságot csökkenti. A négy értéket a D-1 ábra lépcsőzetesen ábrázolja, valamint a D-1 táblázat is tartalmazza, a könnyebb érthetőség kedvéért.

1. Megjegyzés. – A futópálya látástávolság pályafényeken alapuló becsléséhez információ és útmutató anyag a Futópálya látástávolság észlelési és jelentési eljárásainak kézikönyve (Manual of Runway Visual Range Observing and Reporting Practices) *(Doc 9328) kiadványban található.*

2. Megjegyzés. – A látás repülési célokra alkotott definíciójával összhangban, a látás becsléséhez használt megvilágítás intenzitás 1000 cd környékén van.

D-1 táblázat. Megvilágítási küszöb lépcsők

Feltétel	*Megvilágítási küszöb (lx)*	*Háttér megvilágítás (cd/m2)*
Éjszaka	$8x10^{-7}$	≤50
Közbenső	10^{-5}	51-999
Normál nappal	10^{-4}	1000-12000
Fényes nappal (napfényes köd)	10^{-3}	>12000

D-1 ábra. Összefüggés az E_T(lx) megvilágítás küszöb és a B (cd/m^2) háttér fényerősség között

Ábra szövegek
1 Napsütéses nappal
2 Normál nappal
3 Közepes
4 Éjszaka
5 Megvilágítási küszöb – lux
6 Háttér megvilágítás – Candela per négyzetméter

ANNEX 4.
Légiforgalmi térképek

10. kiadás – 2001. július
54. módosítással
Ez a kiadás magában foglal a Tanács által 2001. március 8. előtt elfogadott minden módosítást és 2001. november 9-től a 4. Annex minden korábbi kiadásának helyébe lép.
A szabványok és az ajánlott gyakorlatok alkalmazási eljárásaira vonatkozó tájékoztatás az 1. Fejezetben és az Előszóban olvasható.
Nemzetközi Polgári Repülési Szervezet

MÓDOSÍTÁSOK

A módosítások kiadását az *ICAO Journal* és *az ICAO Kiadványok és Audio-vizuális Kiképzési segédletek Katalógusá*nak havi kiegészítései rendszeresen közlik, a jelen Kiadvány tulajdonosai kísérjék ezeket figyelemmel. Az alábbi táblázat a módosítások nyilvántartására szolgál.

ELŐSZÓ

Történeti háttér

A légiforgalmi térképekre vonatkozó szabványokat és ajánlott gyakorlatokat legelőször 1948. április 16-án fogadott el az ICAO Tanácsa a Nemzetközi Polgári Repülésről szóló Egyezmény (Chicago 1944) 37. cikkelye rendelkezésének folyományaként, és ezeket az Egyezmény 4. Annexének nevezték el. Ezek 1949. március 1-től váltak alkalmazandóvá.

Az "A" táblázatban található a soron következő módosítások felsorolása, a módosítások eredete az érintett főbb témakörökkel, és azokkal a dátumokkal együtt, amikor az Annex-et és módosításait a Tanács elfogadta, amikor azok hatályba léptek, és amikor alkalmazandóvá váltak.

A Szerződő Államok Ténykedése

Az eltérések bejelentése. Felhívjuk a Szerződő Államok figyelmét az Egyezmény 38. cikkelyéből fakadó kötelezettségükre, mely értelmében a Szerződő Államtól megkövetelt, hogy a szervezet számára bejelentsenek minden olyan eltérést, amelyek nemzeti előírásai és gyakorlatai, valamint a jelen Annex-ben és annak bármely módosításában található nemzetközi szabványok között fennáll. Felkérjük a Szerződő Államot, hogy ezt a bejelentést a jelen Annex-ben és annak bármely módosításában található ajánlott gyakorlatoktól történő eltérésekre is terjessze ki, ha az ilyen eltérések bejelentése a repülés biztonságra nézve fontos. Felkérjük továbbá a Szerződő Államot, hogy folyamatosan tájékoztassa a szervezetet az esetleg később keletkező eltérésekről, illetve a korábban bejelentett eltérés visszavonásáról is. A jelen Annex minden egyes módosításának elfogadása után azonnal külön felkérést küldünk a Szerződő Államnak az eltérések bejelentése céljából.
Felhívjuk az államok figyelmét a 15. Annex rendelkezéseire is, amely az államoknak az Egyezmény 38.

cikkelyéből fakadó kötelezettségén kívül előírja, hogy a nemzeti előírások és gyakorlatok, valamint a vonatkozó ICAO szabványok és ajánlott gyakorlatok közötti eltéréseket a légiforgalmi tájékoztató szolgálat útján közzé kell tenni.

A tájékoztatás közzététele. A légi-jármű üzemeltetést érintő és az ebben az Annexben előírt szabványoknak és ajánlott gyakorlatoknak, továbbá eljárásoknak megfelelően biztosított légi-forgalmi térképek rendelkezésre állásáról és módosításáról szóló tájékoztatást a 15. Annex előírásainak megfelelően kell közzétenni és érvénybe léptetni.

Az Annex alkotóelemeinek jogállása

Egy Annex az alábbi alkotóelemekből áll, habár nem minden elem található meg szükségképpen minden Annex-ben. Az egyes alkotóelemek az alábbiakban feltüntetett jogállással rendelkeznek:

1. - A szoros értelemben vett Annex-et alkotó anyag:

a) Szabványok és ajánlott gyakorlatok, amelyeket a Tanács az Egyezmény rendelkezései értelmében elfogadott. Ezek meghatározása a következő:

Szabvány: fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre, vagy eljárásra vonatkozó minden olyan kikötés, amelynek egységes alkalmazását a nemzetközi repülés biztonsága és rendszeressége szempontjából szükségesnek ismerték el és, amelyhez a Szerződő Államok az Egyezmény szerint alkalmazkodni fognak, illetőleg amelyek teljesítésének lehetetlensége esetén a Tanács értesítése a 38. cikkely értelmében kötelező

Ajánlott gyakorlat: fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre, vagy eljárásra vonatkozó minden olyan kikötés, amelynek egységes alkalmazását a nemzetközi repülés biztonsága, rendszeressége és hatékony lebonyolítása szempontjából kívánatosnak ismerték el és, amelyhez alkalmazkodni a Szerződő Államok az Egyezmény értelmében törekedni fognak.

b) *Függelékek:* ezek kényelmi szempontból külön csoportosított anyagot tartalmaznak, de a Tanács által elfogadott szabványok és ajánlott gyakorlatok részét képezik.

c) *Meghatározások:* A szabványokban és ajánlott gyakorlatokban használt olyan kifejezések meghatározásai, amelyek nem maguktól értetődők abban az értelemben, hogy elfogadott szótári jelentéssel nem rendelkeznek. A meghatározás független jogállással nem rendelkezik, de minden olyan szabványnak és ajánlott gyakorlatnak, amelyben a kifejezést használják, lényeges részei, mivel a kifejezés értelmének megváltoztatása hatással volna az előírásra is.

d) *Táblázatok* és *ábrák:* amelyek kiegészítik, vagy szemléltetik az adott szabványt, vagy ajánlott gyakorlatot és amelyekre a szabványban, vagy ajánlott gyakorlatban hivatkozás történik, azok a kapcsolatos szabvány, vagy ajánlott gyakorlat részét képezik és ugyanolyan jogállással rendelkeznek.

2. - A Tanács által a szabványokkal és ajánlott gyakorlatokkal együttes közzétételre jóváhagyott anyag:

a) *Előszó:* a Tanács tevékenységén alapuló történeti áttekintést és magyarázó jellegű anyagot tartalmaz, valamint a szabványok és ajánlott gyakorlatok alkalmazására vonatkozóan az államok részére magyarázattal szolgál az Egyezményből és az elfogadási határozatból eredő kötelezettségeikhez.

b) *Bevezető rész:* magyarázó jellegű anyagot tartalmaz, amely azért szerepel az Annex részeinek, fejezeteinek, vagy szakaszainak elején, hogy elősegítse a szöveg alkalmazásának megértését.

c) *Megjegyzések:* ahol szükséges, a szövegbe beépített anyag, amely az érintett szabvánnyal és ajánlott gyakorlattal kapcsolatban tárgyi felvilágosítással, vagy hivatkozással szolgál, de a szabvány és az ajánlott gyakorlat részét nem képezi.

d) *Mellékletek:* a szabványokat és az ajánlott gyakorlatokat kiegészítő anyag, vagy ezek alkalmazásához útmutatóul szolgáló anyag.

A nyelv kiválasztása

Ezt az Annex-et hat nyelven, angolul, arabul, kínaiul, franciául, spanyolul és oroszul fogadták el. Minden Szerződő Államra vonatkozó felkérés, hogy a hazai bevezetés céljára, illetve az Egyezményben meghatározott egyéb célokra az említett hat szöveg közül egyet válasszon ki és közvetlenül, vagy saját nyelvre lefordítva használja azt, és az ICAO-t erről tájékoztassa.

Szerkesztési gyakorlat

Annak érdekében, hogy minden alkotórész jogállása első pillantásra szembetűnjön, az alábbi gyakorlatot alkalmaztuk: a szabványokat vékony álló betűkkel nyomtattuk, az ajánlott gyakorlatokat vékony dőlt betűkkel nyomtattuk. Az ajánlás esetében a jogállást vastag álló betűvel szedett **Ajánlás** szó jelzi. A megjegyzéseket vékony dőlt betűvel szedtük, jogállásukat a dőlt betűvel szedett Megjegyzés címszó jelzi.

Az angol nyelvű rendelkezések szövegében az alábbi szerkesztési gyakorlatot követték: a szabványok szövegében a "kell", "köteles" szó (az angol nyelvű eredetiben "shall"), az ajánlott gyakorlatok szövegében a szükséges (az angol nyelvű eredeti szövegben "should") kifejezést alkalmazták.

E dokumentumban a mértékegységek metrikus rendszerben szerepelnek, amelyeket a láb-font rendszerben közölt mértékegységek zárójelben követnek.

A jelen dokumentum bármely számmal és/vagy címmel azonosított részére történő utalás magában foglalja az adott rész alpontjait is.

"A" Táblázat - a 4. Annex módosításai

Módosítás	*Forrás(ok)*	*Tárgy*	*Elfogadva Hatályba lépés Alkalmazandó*
1. kiadás	Légiforgalmi térképek szekció 1. ülés (1945 nov), 2. ülés (1946 ápr.), 3. ülés (1947jan.)	ICAO (WAC) 1:1000000 Légiforgalmi világtérkép; műszeres megközelítési és leszálló térképek; 1:500000 Légiforgalmi térképek; 1: 250000 Légiforgalmi térképek; Légiforgalmi tartózkodási hely követő térképek; Légiforgalmi útvonal térképek; Légiforgalmi tervező térképek	1948. ápr. 16 1948. nov. 1. 1949. márc.1
Az 1. Kiadásba beépített 1. módosítás	Légiforgalmi térképek szekció, 4.ülés (1948.március)	Az ICAO WAC 1:1000000 vetülete	1948. dec. 6 1949. márc. 15 1949. márc. 15
A 2. - 22. Módosításokat magába foglaló 2. kiadás	Légiforgalmi térképek szekció, 4. ülés (1948.március)	Meghatározások; ICAO WAC 1:1000000; ICAO 1:500000 Légiforgalmi térképek; 1: 250000 Légiforgalmi térképek; ICAO műszeres megközelítési térképek; ICAO Műszeres leszálló térképek; Rádió-navigációs berendezések térképei.	1949. nov. 15. 1950. jún. 1 1950. szept. 1
23. -28.	A Tanács egyéb tevékenysége	Rövidítések; Térképjelek; Meghatározások.	1951. jún. 25 1951. nov. 1 1952. jan. 1

47	Tanulmány a pilótakabinban használt térképekről. Az akadálymentességi szakcsoport hetedik ülésének 3/1 számú ajánlása és az AGA szekció ülés (1981) 8/2 számú ajánlása	Meghatározások; Általános előírások; ICAO A és B típusú Repülőtéri Akadály Térkép; ICAO Tartózkodási hely követő Térkép; ICAO Útvonal Térkép; ICAO Körzeti Térkép; ICAO Műszeres megközelítési térkép; ICAO 1:1000000 Légiforgalmi Világ Térkép; ICAO 1:500000 Légiforgalmi Térkép; ICAO Látás szerinti Megközelítési Térkép; ICAO Repülőtér Térkép; ICAO kis méretarányú Légiforgalmi Navigációs Térkép; ICAO Precíziós Megközelítés domborzati Térkép; ICAO térképjelölések; Színezési útmutató; A következő térképek bevezetése: ICAO Repülőtéri Földi Mozgások Térképe; ICAO Légi-jármű állóhely/beállító Térkép; ICAO Műszeres Szabvány Kirepülési Eljárás Térkép (SID); ICAO Műszeres Szabvány Érkezési Eljárás Térkép (STAR); ICAO C Típusú Repülőtéri Akadály Térkép.	1985. márc. 18 1985. júl. 29 1985. nov. 21

48	A 6. Annex 18. módosítása; a 14. Annex 33. módosítása; a Látási Segédeszközök Testület (11 értekezletének) 2/2 számú ajánlása és Titkársági észrevételek	ICAO A, B és C típusú Repülőtéri Akadály Térkép; ICAO Precíziós Megközelítés domborzati Térkép; ICAO Műszeres Szabvány Indulási Eljárás Térkép (SID); ICAO Műszeres Szabvány Érkezési Eljárás Térkép (STAR); ICAO Műszeres Megközelítési Térkép; ICAO Látás szerinti Megközelítési Térkép; ICAO Repülőtér Térkép; ICAO Repülőtéri Földi Mozgások Térképe; ICAO Légi-jármű állóhely/beállító Térkép; ICAO 1:1000000 Légiforgalmi Világtérkép; ICAO 1:500000 Légi-forgalmi Térkép; ICAO kis méretarányú Légiforgalmi Navigációs Térkép; ICAO Tartózkodási hely követő térkép; ICAO térképjelek;	1989. febr. 24 1989. júl. 31 1989. nov. 16
49	A 11. Annex 33. módosítása; A 14. Annex 39. módosítása; A 14. Annex II. Kötetének bevezetése; A Doc 8168 PANS-OPS I. és II. Kötetének 5., illetve 6. Módosítása	Meghatározások; Általános előírások; ICAO Útvonal Térkép; ICAO Körzeti Térkép; ICAO Műszeres Megközelítési Térkép; ICAO Látás szerinti Megközelítési Térkép; ICAO Repülőtéri Térkép; ICAO 1:1000000 Légiforgalmi Világ Térkép; ICAO 1 : 500 000 Légiforgalmi Térkép; ICAO térképjelek;	1992. febr. 28 1992. júl. 27 1992. nov. 12

50	A WGS-84 Tanács általi elfogadása, mint a nemzetközi légi-közlekedés szabvány geodéziai vonatkoztatási rendszere; WAFS tervezés és bevezetés; PANS-OPS bevezetési problémák; az All Weather Operation kézikönyv felülvizsgálata; a helikopter forgalom és a hagyományos repülőgép forgalom integrálása; az RGCSP/8 és a Titkárság javaslata	Meghatározások; új rendelkezések bevezetése a WGS84 koordináták 1998. január 1-el történő közzétételével kapcsolatban; a vízszintes gyorsítási magasság közzétételére vonatkozó rendelkezés megszüntetése; az RNP típus bevezetése; a közeli akadályokról szóló megjegyzések SID térképeken történő feltüntetése; új térkép szimbólum bevezetése az aktív tűzhányó jelzésére.	1995. márc. 1 1995. július 24. 1995. nov. 9 1998. január 1.
51	Az Akadály mentességi panel és a Légi-navigációs Bizottság 10. és 11. Találkozója	Meghatározások; repülési adatbázisok; a geodéziai világrendszer (WGS-84) függőleges eleme; emberi tényező; az RNAV eljárások azonosítása; a befejező megközelítés gradiensének biztosítása; meredek siklópályájú megközelítések; és térképjelek az átrepülési útvonal pont és a rátartásos útvonal pont céljára.	1998. márc. 20 1998. július 20. 1998. nov. 5

52	Az optikai berendezések panel (VAP); az akadály mentességi panel (OCP); a kormányzott földnek ütközés (CFIT) közös ICAO - iparági munkacsoport; a légiforgalmi tájékoztató szolgálatok/légiforgalmi térképek (AIS/MAP) divízió találkozójának (1998), és a titkárság ajánlásai	Meghatározások; futópálya várópontok; légvédelmi azonosító körzet (ADIZ); a domborzat és a legkisebb repülési magasságok ábrázolása; futópálya menti látástávolság (RVR) mérő helyek; légtér osztályozás; területi navigációs (RNAV) berendezésekre alapuló repülési eljárások és akadály mentességi kritériumok; térkép jelek a futópálya váró-pont, az ADIZ, az elektronikus légiforgalmi térképek, a légtér kategória, az atomerőmű és útvonalpont céljára, valamint 2002 november 28-tól új rendelkezések bevezetése az ICAO Elektronikus Légiforgalmi Térkép Megjelenítő - céljára.	2001. márc. 7 2001. júl. 16 2001. nov. 1 2002. nov. 28
53	Az Akadály Mentességi Panel tizenkettedik és tizenharmadik találkozója; a Légi-Navigációs Bizottság; és a Titkárság	A meghatározásokkal kapcsolatos új rendelkezések; függőleges és időpont vonatkoztatási rendszerek; közel-forgalmi érkezési magasság; ICAO Legkisebb Radar Magasság Térkép; és térképjelek a magasságok/repülési szintek és a befejező megközelítés kezdőpontja céljára. A geodéziai világrendszer - 1984 (WGS-84) érvényben lévő rendelkezéseinek naprakésszé tétele; akadályok; az ICAO Műszeres Megközelítési Térkép azonosítása, a rajta lévő repülőtér üzemeltetési minimum és kiegészítő információk; valamint légi-forgalmi adat minőségi követelmények.	2004. febr. 23 2004. júl. 12 2004. nov. 25

54	Különféle források, benne az AIS/MAP Divizió Találkozó (1998) 2.3/2 ajánlása és az OCP/14 és OPLINKP/1 találkozók, a Futópálya Biztonsági Oktató és Tudatosító Program, valamint a Titkárság ajánlásai	Meghatározások és új rendelkezések 2010 november 18-i bevezetése az ICAO (Elektronikus) Repülőtéri terep és akadály térképpel kapcsolatban; Legkisebb útvonal menti magasság, legkisebb akadály mentességi magasság, bejelentkezési cím, ATS felderítő rendszer kifejezések, légiforgalmi adatbázis követelmények, megközelítési fix-ek és pontok, gradiensekre és szögekre vonatkozó légiforgalmi adat minőségi követelmények, meredek megközelítési szög figyelmeztető megjegyzés, forró pont és közbenső várópont új térképjelekkel egyetemben.	2007. márc. 02 2007. júl. 16 2007. nov. 22

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT ELJÁRÁSOK

1. FEJEZET MEGHATÁROZÁSOK, ALKALMAZÁSI ELŐÍRÁSOK ÉS HOZZÁFÉRHETŐSÉG

1.1 Meghatározások

Ha a légiforgalmi térképekre vonatkozó Szabványokban és Ajánlott Eljárásokban a következő fogalmakat alkalmazzák, akkor azok a következő jelentéssel rendelkeznek:

Repülőtér (Aerodrome) – Szárazföldön, vagy vízen kijelölt terület (beleértve minden épületét, felszerelését és berendezését is), mely egészében, vagy részben a légi-járművek érkezésére, indulására és földfelszíni mozgására szolgál.

Repülőtér Tengerszint feletti magassága (Aerodrome elevation) - A leszállási terület legmagasabb pontjának tengerszinthez viszonyított magassága.

Repülőtér üzemeltetési minimum (Aerodrome operating minima) - Egy repülőtér használhatóságának határértéke a következőkre:

a) felszállásra, látástávolság és/vagy futópálya látástávolság és, ha szükséges, felhőviszonyok fogalmával kifejezve;

b) leszálláshoz precíziós megközelítéssel és leszállási üzemre, látástávolság és/vagy futópálya látástávolság és elhatározási QNH/QFE magasság (DA/H) fogalmakkal kifejezve, az üzemelési kategóriának megfelelően;

c) leszálláshoz megközelítési és leszállási üzemhez függőleges menti vezetés biztosítása mellett, látástávolság és/vagy futópálya látástávolság és elhatározási QNH/QFE magasság (DA/H) fogalmakkal kifejezve; és

d) leszálláshoz nem-precíziós megközelítési és leszállási üzemhez, látástávolság és/vagy futópálya látástávolság, minimum süllyedési magasság (MDA/H) és, ha szükséges, felhőviszonyok fogalmával kifejezve;

Repülőtér vonatkoztatási pont (Aerodrome reference point) - A repülőtér kijelölt földrajzi helyzete (helyzetpontja)

Légiforgalmi térkép (Aeronautical chart) - A földfelszín egy részének ábrázolása az adott kultúr környezetet és domborzatot kifejezetten a légi-navigációs követelményeknek megfelelően feltüntetve.

Légi-jármű állóhely (Aircraft stand) - Az előtér légi-jármű parkolásra szánt kijelölt része.

Légvédelmi azonosító körzet (Air defense identification zone) - Meghatározott kiterjedésű különleges céllal kijelölt légtér rész, amelyen belül a légi-járműtől elvárt, hogy a légiforgalmi szolgálatok (ATS) biztosításához kapcsolódó eljárások mellett eleget tegyen a különleges azonosítási és/vagy jelentési eljárásoknak

Légi gurulóút (Air taxiway) - Helikopterek lebegésben végzett gurulása céljából a talaj felszínen kijelölt pálya.

Légiforgalmi szolgálat (Air traffic service) - Gyűjtőfogalom, mely jelenthet repüléstájékoztató szolgálatot, riasztó szolgálatot, légiforgalmi tanácsadó szolgálatot, légiforgalmi irányító szolgálatot, (körzeti irányító szolgálatot, bevezető irányító szolgálatot, vagy repülőtéri irányító szolgálatot).

Légi tranzitút (Air transit route) - Helikopterek légi áthaladásához a talajfelszínen kijelölt pálya.

Légifolyosó (Airway) - folyosó formájában kialakított irányítói körzet, vagy annak egy része.

Tengerszint feletti magasság (Altitude) - Adott szintnek, pontnak, vagy pontként értelmezett tárgynak a közepes tengerszinthez (MSL) viszonyított függőleges távolsága.

Alkalmazás (Application) – Adatok felhasználói követelmények szerinti alakítása és feldolgozása (ISO 19104*)

Előtér (Apron) - Szárazföldi repülőtéren a légi-járművek kiszolgálására, utasok ki- és beszállítására, posta, vagy áru ki- és berakására, üzemanyag felvételre, parkolásra, vagy karbantartásra kijelölt terület.

Legkisebb területi magasság (Area minimum altitude AMA) - Műszeres meteorológiai körülmények (IMC) között alkalmazandó legkisebb magasság, amely - rendszerint földrajzi szélességgel és hosszúsággal - kijelölt területen belül biztosít minimum akadály mentességet.

Érkezési útvonal (Arrival routes) - A műszeres megközelítési eljárásban az a kijelölt útvonal, amelyet követve a légi-jármű a repülés utazószakaszáról a kezdeti megközelítés pontjára érkezik.

ATS útvonal (ATS route) - A légiforgalmi szolgálatok biztosításához szükség szerint, a légi-forgalom irányított áramlására kijelölt útvonal.

1. Megjegyzés: Az ATS útvonal kifejezés légifolyosó, tanácsadói útvonal, ellenőrzött, vagy nem-ellenőrzött útvonal, érkezési, vagy indulási útvonal, stb., jelentéssel használatos.

2. Megjegyzés: az ATS útvonalat útvonal jellemzőkkel azonosítják, e jellemzők közé tartozik egy ATS útvonal elnevezés, a jellemző pontokhoz (útvonal pontokhoz), vagy azoktól elvezető irány, a jellemző pontok közötti távolság, a jelentési előírások és, a megfelelő ATS hatóság által kijelölt legalacsonyabb biztonságos magasság.

ATS légtérellenőrző rendszer (ATS surveillance system) – Gyűjtő fogalom, jelenthet ADS-B, PSR, SSR, vagy légi-jármű azonosítást lehetővé tévő egyenértékű egyéb földi telepítésű rendszert.

Megjegyzés: Egyenértékű földi telepítésű rendszer az, amely biztonsága és teljesítménye összehasonlító elemzéssel, vagy egyéb módszerrel a monopulse SSR-ével egyezőnek, vagy jobbnak bizonyult.

Puszta Föld (Bare Earth) - A Föld felszíne, beleértve a vízfelületeket, az állandó jég és hó mezőket, de kizárva minden vegetációt és ember alkotta tárgyat.

Naptár (Calendar) - Egyértelmű időpont vonatkoztatási rendszer, amely az időpont egy napnyi nagyságrendű meghatározásához szolgáltat alapot (ISO 19108[1]*).

Burok (Canopy) - A puszta Föld felszín kiegészítve a vegetáció magasságával.

Átkapcsolási pont (Change-over point) - VHF körsugárzó rádió irányszög-adó (VOR) berendezésektől vett rádió-navigációs jelekkel kijelölt ATS útvonalon az a pont, amelynél a légi-jármű navigációs helymeghatározásának elsődleges viszonyítási alapjaként a mögötte lévő navigációs berendezésről az előtte lévő következő berendezésre várhatóan átkapcsol.

Megjegyzés: Átkapcsolási pontokat azért jelölnek ki, hogy a navigációs berendezések között kiegyenlített jel erősséget és minőséget biztosítsanak az összes használt repülési szinten, továbbá, hogy az azonos útvonal szakaszon repülő légi-járművek mindegyike számára ugyanattól a berendezéstől származó irányszög vezetést biztosítsanak.

Akadálymentes sáv (Clearway) **-** Az illetékes hatóság ellenőrzése alatt álló, alkalmasként kijelölt, vagy alkalmassá tett téglalap alakú szárazföldi, vagy vízi terület, amely felett a légi-jármű kezdeti emelkedésének egy részét az előírt magasság elérése érdekében végrehajthatja.

Szintvonal (Contour line) - térképen lévő, az azonos magasságokat összekötő vonal.

Kultúr környezet (Culture) - A föld felszínén található, ember által létrehozott minden olyan terepjellegzetesség, mint például a városok, vasútvonalak, csatornák, stb.

Ciklikus redundancia ellenőrzés (Cyclic Redundancy Check) - az adat vesztéssel, vagy módosulással szemben egy adott szinten biztosítékot nyújtó, az adat digitális kifejezéséhez alkalmazott matematikai algoritmus.

Veszélyes légtér (Danger area) - Meghatározott méretű légtér, amelyben meghatározott időben a légi-járművek repülésére veszélyes tevékenység folyhat.

Adat termék-előírás (Data product specification) **–** Adat készlet, vagy adat készlet csoportok részletes leírása a létrehozást, más felekhez juttatást és használatot lehetővé tévő egyéb információval együtt (ISO 19131*).

Megjegyzés.-Az adat termék-előírás biztosít leírást az adat készlet számszerűsített entitás tartományáról és előírást a számszerűsített entitás tartomány adat készlet szerinti leképezéséhez. Ez használható gyártási-, eladási-, vég-használói és egyéb célokra.

Adat készlet (Data set) **-** Adatok beazonosítható gyűjteménye (ISO 19101*).

Adat készlet sorozat (Data set series) **-** Azonos gyártási előírásokat követő adatkészlet gyűjtemények (ISO 19115*).

Digitális magasság model (Digital Elevation Model - DEM) **–**,

A domborzat felszín -közös vonatkoztatási alapadathoz viszonyított- magasság értékeinek folytonos ábrázolása adott rács minden metszéspontjában.

Megjegyzés.- A Digitális domborzati modellre (Digital Terrain Model - DTM) néha DEM-ként utalnak.

Adat minőség (Data Quality) - Megbízhatósági szint, vagy fok (mérték), miszerint a szolgáltatott adat teljesíti az adat-felhasználó pontosság, felbontás és egységesség tekintetében kifejezett követelményeit.

Alapadat (Datum) - Bármely mennyiség, vagy mennyiségek együttese, amely (amelyek) kiindulási, vagy viszonyítási alapul szolgálhatnak más mennyiségek kiszámításához (ISO 19104[2]*).

Beljebb helyezett küszöb (Displaced threshold) - Nem a futópálya végénél kijelölt küszöb.

Elektronikus légiforgalmi térkép megjelenítő (Electronic aeronautical chart display) - Elektronikus készülék, amely a repülő személyzetnek az előírt információ megjelenítésével kényelmes és időbeni útvonaltervezés, útvonal ellenőrzés és navigálás elvégzését teszi lehetővé.

Tengerszint feletti magasság (Elevation) - A föld felszínén lévő, vagy ahhoz rögzített pontnak, vagy szintnek a közepes tengerszinttől mért függőleges távolsága.

Elliptikus magasság (Geodéziai magasság) (Ellipsoid height) (Geodetic height) **-** Az ellipszoid kérdéses ponton keresztül haladó külső merőlegese mentén mért és a viszonyítási alapul vett ellipszishez vonatkoztatott magasság.

Jellegzetesség (Feature) **-** A valós világ absztrakt jellemzői (ISO 19101[3]*).

Jellegzetesség jegy (Feature attribute) **–** A jellegzetesség jellemzője (ISO 19101*).

Megjegyzés.- A jellegzetesség jegy névvel, adattípussal és magával kapcsolatos érték tartománnyal bír.

Befejező megközelítés (Final Approach) - A műszeres megközelítési eljárásnak egy meghatározott befejező megközelítési navigációs berendezésnél, vagy pontnál kezdődő része, vagy ahol ilyen berendezés, vagy pont nincs kijelölve,

a) az utolsó eljárási forduló, alapforduló, vagy lóversenypálya alakú eljárás rárepülési fordulója, ha azt kijelölték; vagy

b) a megközelítési eljárásban meghatározott utolsó útirányra való ráállás pontjánál: és a repülőtér közelében lévő azon pontig tartó szakasz, ahonnan:

1) a leszállás végrehajtható; vagy

2) megszakított megközelítési eljárást kell kezdeni.

Befejező megközelítési és felszállási légtér (Final approach and take-off area) (FATO). Meghatározott légtér, amely felett a megközelítési manőver befejező szakasza a függeszkedéshez, vagy leszálláshoz befejeződik és, amelyről a felszállás manőverét megkezdik. Abban az esetben, ha a FATO-t az 1. teljesítmény osztályba tartozó helikopterek használják, ez a légtér magába foglalja a megszakított felszálláshoz rendelkezésre álló légteret is.

A befejező megközelítés navigációs berendezése, vagy pontja (Final approach fix or point) - A műszeres megközelítési eljárásban az a navigációs berendezés vagy pont, amelynél a befejező megközelítési szakasz kezdődik.

Befejező megközelítési szakasz (Final approach segment) - A műszeres megközelítési eljárásnak az a szakasza, amelyen a befejező egyenesre való ráállást és a leszálláshoz való süllyedést végrehajtják.

Repüléstájékoztató körzet (Flight information region) - Meghatározott kiterjedésű légtér, amelyben repüléstájékoztató és riasztó szolgálat biztosított.

Repülési szint (Flight level) - Meghatározott alaphoz, az 1013 hektopaszkálhoz (hPa) viszonyított, állandó légnyomású felület, amelyet a többi ugyanilyen felületektől meghatározott nagyságú légnyomáskülönbség értékek választanak el.

1. Megjegyzés. - A Nemzetközi Műlégkörnek megfelelően kalibrált barometrikus magasságmérő az, amelyik:

a) ha QNH nyomásértékre van beállítva, a tengerszint feletti magasságot mutatja;

b) ha QFE nyomásértékre van beállítva, a QFE vonatkoztatási alap feletti magasságot mutatja;

c) ha az 1013,2 hPa nyomásértékre van beállítva, a repülési szintek jelzésére használható.

2. Megjegyzés. - A fenti 1. Megjegyzésben használt magasság és tengerszint feletti magasság kifejezések barometrikus magasságot, nem pedig geometrikus magasságot és geometrikus tengerszint feletti magasságot jelentenek.

Geodéziai távolság (Geodetic distance) - Matematikailag meghatározott ellipsziod felületen bármely két pont közötti legrövidebb távolság.

Geodéziai alapadat (Geodetic datum) - a viszonyítási világrendszerhez képest a helyi viszonyítási rendszer helyének és tájolásának meghatározásához szükséges minimum mennyiségű adat együttes.

Geoid (Geoid) – egyenlő gravitációs potenciájú felület a Föld gravitációs mezőjében, amely egybe esik a kontinenseken át folyamatosan kiterjesztett és zavarmentes közepes tengerszinttel (MSL).

Megjegyzés.- A helyi gravitációs zavarok eredményeképp (szél által keltett ár, sótartalom, áramlat stb.) a Geoid szabálytalan alakú és a gravitáció iránya minden ponton a geoidra merőleges.

Geoid egyenetlenség (Geoid undulation) - A geoid távolsága a matematikai viszonyítási ellipszoid alatt (negatív), vagy felett (pozitív).

Megjegyzés. - A Geodéziai Világrendszer - 1984 (WGS-84) által meghatározott ellipszoid tekintetében a WGS-84 ellipszoid magasság és az orthometrikus magasság közötti különbség adja a WGS-84 geoid egyenetlenségét.

Siklópálya (Glide path) - A befejező megközelítés közbeni függőleges menti vezetéshez kijelölt süllyedési pálya.

Gergely naptár (Gregorian calendar) - Általánosan használt naptár; először 1582-ben vezették be az év meghatározásához, amely a György (Julian) naptárnál sokkal pontosabban követi a tropikus évet (ISO 19108[4]*).

Megjegyzés. - A Gergely naptárban az egymást követő tizenkét hónapra osztott szokványos évek 365 *napból állnak, míg a szökőév 366 napból áll.*

Magasság (Height) - Egy szintnek, egy pontnak, vagy egy pontként értelmezett tárgynak meghatározott vonatkozási alaptól mért függőleges távolsága.

Helikopter állóhely (Helicopter stand) - Helikopter parkolását biztosító légi-jármű állóhely és, ahol légi gurulás végezhető ott lehetőséget biztosít a helikopter földet éréséhez, illetve elemelkedéséhez.

Helikopter repülőtér (Heliport) - Helikopterek érkezésére, indulására és felszíni mozgására részben, vagy teljes egészében használatos repülőtér vagy építményen kijelölt terület.

Várakozási eljárás (Holding Procedure) - Előre kijelölt manőver, amely a további engedélyre várakozó légi-járművet a kijelölt légtéren belül tartja.

Forró pont (Hot spot) – A repülőtér mozgási területének tapasztaltan, vagy lehetséges ütközés-, illetve futópályára tévedés veszélyes és fokozott pilóta/járművezető figyelmet igénylő része.

Emberi tényező alapelvek (Human Factors principles) - A repülés terén a tervezésben/kialakításban, jogosításban, kiképzésben, üzemeltetésben és karbantartásban alkalmazandó elvek, melyek az emberi teljesítőképességet figyelembe véve keresnek biztonságos összekapcsolódási megoldásokat az ember és a rendszer más alkotó elemei között.

Magassági szín árnyékolás (Hypsometric tints) - Tengerszinthez viszonyított magassági szintközök ábrázolására használt árnyékolási vagy színárnyalási fokozatok.

Kezdeti megközelítési szakasz (Initial approach segment) - A műszeres megközelítési eljárásnak a kezdeti megközelítési navigációs berendezés/pont és a közbenső megközelítési navigációs berendezés/pont, vagy ahol alkalmazható, a befejező megközelítési berendezés, vagy pont közötti szakasza.

Műszeres megközelítési eljárás (Instrument approach procedure) - Repülés műszerek alapján végrehajtott, előre meghatározott manőverek sorozata, az akadályoktól való meghatározott védettséggel, a kezdeti megközelítés navigációs berendezésétől/pontjától, vagy ahol alkalmazható, a meghatározott érkezési útvonal kezdetétől egy olyan pontig, ahonnan a leszállás végrehajtható és azt követően, ha a leszállás nem történt meg, egy olyan helyzetig, ahol a várakozásra, vagy az útvonal szakaszra előírt akadálymentességi követelményeket alkalmazzák.

Közbenső megközelítési szakasz (Intermediate approach segment) - A műszeres megközelítési eljárásnak az a szakasza, amely, vagy a közbeeső megközelítési navigációs berendezéstől/ponttól a befejező megközelítés navigációs berendezéséig/pontjáig tart, vagy az irányváltásos, a lóversenypálya alakú, vagy a számított helyzet navigációs eljárás vége és a befejező megközelítés navigációs berendezése, vagy pontja között helyezkedik el, amelyik alkalmazható.

Közbenső várópont (Intermediate holding position) – Forgalomirányítási célból kijelölt pont, amelynél a repülőtéri irányító torony utasítására a guruló légi-jármű és jármű köteles megállni és várni a továbbhaladás engedélyezéséig.

Izogon (Isogonal) - Térképen, vagy egy térképlapon feltüntetett vonal, melynek minden pontjában azonos értékű a mágneses elhajlás egy meghatározott időszakon belül.

Izogriv (Isogriv) - Egy térképen, vagy térképlapon feltüntetett azon vonal, amely a navigációs hálózati észak és a mágneses észak közötti azonos fokeltérésű pontokat köti össze.

Leszállási terület (Landing area) - A mozgási terület légi-járművek leszállására, vagy felszállására használatos része.

Leszállási irányjelző (Landing direction indicator) - A le- és felszállásra kijelölt aktuális irány lát jelzésére szolgáló eszköz.

Szint (Level) - A levegőben lévő légi-jármű függőleges helyzetére vonatkozó általános kifejezés, mely jelenthet magasságot, tengerszint feletti magasságot, vagy repülési szintet.

Bejelentkezési cím (Logon address) – ATS egységhez adatlánc bejelentkezésre használt kijelölt kód.

Mágneses eltérés (Magnetic variation) - A földrajzi Észak és a mágneses Észak közötti különbség, fokokban kifejezve.

Megjegyzés: A megadott érték megjelöli azt is, hogy a fokbeli eltérés keleti, vagy nyugati a földrajzi

Északhoz viszonyítva.

Munkaterület (Manoeuvring area) - Az előtér kivételével, a repülőtérnek légi-járművek fel- és leszállására valamint gurulására használatos része.

Jelölés (Marking) - A mozgásterület felületén, légiforgalmi tájékoztatás közlése céljából elhelyezett jel, vagy jelek csoportja.

Meta adat (Metadata) - Adat az adatról (ISO 19115[5]*).

Megjegyzés. - Az adatot leíró és dokumentáló adat.

Útvonal menti legkisebb magasság (Minimum en-route altitude - MEA) – Az utazó szakasz légtérszerkezetének megfelelő, a vonatkozó navigációs berendezések és az ATS adás kellő vételét és az előírt akadálymentességet biztosító magassága.

Legkisebb akadálymentes magasság (Minimum obstacle clearance altitude - MOCA) – A repülés adott szakaszának az előírt akadálymentességet még biztosító legkisebb magassága.

Legkisebb szektor magasság (Minimum sector altitude) - Az a használható legalacsonyabb tengerszint feletti magasság, amely a rádió-navigációs berendezés körüli 46 km (25 NM) sugarú kör egy adott szektora által határolt területen belül található összes akadály felett legkevesebb 300 m (1000 láb) akadálymentességet biztosít.

A megszakított megközelítés pontja (Missed approach point) (MAPt) - A műszeres megközelítési eljárás azon pontja, amelynél vagy, amely előtt az előírt megszakított megközelítési eljárást annak biztosítása érdekében meg kell kezdeni, hogy a légi-jármű az akadálymentességi minimumot ne sértse meg.

Megszakított megközelítési eljárás (Missed approach procedure) - Abban az esetben követendő eljárás, ha a megközelítés nem folytatható tovább.

Mozgási terület (Movement area) - A repülőtérnek az a része, amely a légi-járművek le- és felszállására, valamint gurulására használatos és, amely magába foglalja a munkaterületet és az előter(ek)et.

Akadály (Obstacle) - A repülésben lévő légi-jármű védelmét szolgáló meghatározott felület fölé nyúló, vagy a légi-jármű földi mozgására szánt területen belül található minden rögzített (akár időleges, akár állandó), vagy mozgó tárgy, vagy annak része.

Megjegyzés. - Jelen Annexben az "akadály" kifejezés kizárólag a térképre viendő olyan tárgyakra vonatkozik, amely tárgyak valós veszélyt jelentenek azon üzemelési fajta szerint működő légi-jármű biztonságos áthaladására, amely üzemeltetési fajtára az illető térképlapot kialakították.

Akadálymentes QNH magasság, vagy Akadálymentes QFE magasság - Obstacle clearance altitude (OCA) or Obstacle clearance height (OCH) - A vonatkozó futópálya küszöb szintje, vagy alternatívaképp a repülőtér szintje feletti - amelyik alkalmazandó- az a legkisebb tengerszinthez viszonyított QNH magasság (OCA), vagy QFE magaság (OCH), amelyet a vonatkozó akadálymentességi követelmények teljesítésének megállapításához használnak.

1. Megjegyzés. - Az akadálymentes magasságot (altitude) a közepes tengerszinthez viszonyítják, míg az akadálymentes magasságot (height) a küszöb magasságához, illetve nem-precíziós megközelítések esetében a repülőtér szintmagasságához, avagy a küszöb magasságához, ha ez több mint 2 m-el (7 ft) alacsonyabb a repülőtér szintmagasságánál. A körözésből végzett megközelítés akadálymentes magasságát a repülőtér szintmagasságához viszonyítják.

2. Megjegyzés. - Kényelmi okok miatt, amikor mindkét kifejezést alkalmazzák, ezt a következő formában is írhatják: akadálymentes magasság/tengerszint feletti magasság (altitude/height), rövidítése OCA/H.

3. Megjegyzés. - E meghatározás jellemző alkalmazásáról lásd a Légi-navigációs Szolgálatok Eljárásai – Légi-jármű üzemeltetés (Procedures for Air Navigation Services - Aircraft Operations) (Doc 8168) I. Kötet, I. Rész, 4. Szakasz, 1. Fejezet 1.5 és és II. Kötet, I. Rész, 4. Szakasz, 5. Fejezet 5.4 pontját.

Akadálymentes terület (Obstacle free zone) (OFZ) - A belső megközelítési, a belső átmeneti és az elvétett leszállási felületek feletti, valamint az ezen felületek által határolt földsáv azon része feletti légtér, amelybe kizárólag a légi-navigáció számára szükséges kistömegű és törhetően épített rögzített akadály nyúlik bele.

Ortometrikus magasság (Orthometric Height) - Egy adott pont általában MSL magasságban kifejezett geoidhoz vonatkoztatott magassága.

Pontfény (Point light) - Érzékelhető hosszúság nélkülinek látszó világító jel.

Ábrázolás (Portrayal) – Az információ megjelenítése az ember számára (ISO 19117*).

Helyzet (földrajzi) (Position - Geographical) - A matematikai ellipszoidhoz viszonyított és a föld felszínén lévő adott pont helyzetét meghatározó koordináta együttes (szélesség, hosszúság).

Preciziós megközelítési eljárás (Precision approach procedure) - ILS, vagy PAR berendezés révén biztosított iránysáv és siklópálya információkat alkalmazó műszeres megközelítési eljárás.

Eljárási QNH/QFE magasság (Procedure altitude/height) - A minimum QNH/QFE magasságon, vagy felette kijelölt és üzemszerűen alkalmazott QNH/QFE magasság, amely célja a közbeeső/befejező megközelítési szakaszon előírt süllyedési mértékű/szögű stabilizált süllyedések számára teret biztosítani.

Eljárási forduló (Procedure turn) - Manőver, amely során először a kijelölt repülési útirány elhagyására kell fordulót végezni, ezt egy ellentétes irányú forduló követi, amely a légi-járműnek lehetővé teszi a kijelölt repülési útiránnyal ellentétes irány felvételét és az azon való továbbrepülést.

1. Megjegyzés. - Az eljárási fordulót "bal", vagy "jobb" fordulós néven nevezik meg, az első forduló irányának megfelelően.

2. Megjegyzés. - Az eljárási forduló kijelölhető akár szinttartással, akár süllyedésben történő végrehajtásra, az egyes műszeres megközelítési eljárások által támasztott követelmények függvényében.

Tiltott légtér (Prohibited area) - Az állam területe, vagy felségvize felett kijelölt meghatározott kiterjedésű légtér, amelyen belül légi-járművek repülése tiltott.

Domborzat (Relief) - A föld felszínének a tengerszinthez viszonyított magasságaiban lévő egyenetlenségek, melyeket a légiforgalmi térképeken szintvonalakkal, színárnyalással, árnyékolással, vagy a pontok tengerszinthez viszonyított magasságainak megadásával jelölnek.

Jelentőpont (Reporting point) - Meghatározott földrajzi hely, amelyhez viszonyítva a légi-jármű helyzetét jelenteni lehet.

Teljesítendő Navigációs Pontosság (Required Navigation Performance - RNP) - Kijelölt légtérben történő üzemeléshez a navigációs képesség pontosságára vonatkozó közlemény.

Megjegyzés. - A navigációs teljesítőképességet és követelményeket adott RNP típusra és/vagy alkalmazásra határoznak meg.

Felbontás (Resolution) - Mérési egységek, vagy számjegyek szám értéke, amelyben adott mért, vagy számított értéket kifejeznek, illetve használnak.

Korlátozott légtér (Restricted area) - Az állam területe, vagy felségvize felett kijelölt, meghatározott kiterjedésű légtér, amelyen belül a légi-járművek repülése bizonyos előírt feltételeknek megfelelően korlátozott.

Irányváltásos eljárás (Reversal procedure) - A műszeres megközelítési eljárás kezdeti megközelítési szakasza folyamán a légi-járművek számára az ellentétes irányba fordulás lehetővé tételéhez kijelölt eljárás. A szakasz magába foglalhat eljárási fordulókat, vagy alapfordulókat.

RNP típus (RNP type) - Tengeri mérföld hosszmértékben kifejezett és a szándék szerinti tartózkodási helytől számított "belül tartózkodás" értéke, amelyen a repülőgép a teljes repülési idő legalább 95 %-ában belül marad.

Például. - Az RNP 4, plusz, vagy mínusz 7,4 km (4 tengeri mérföld) navigációs pontosságot jelent 95 százalékos "belül tartózkodási" alapon.

Futópálya (Runway) - A szárazföldi repülőtéren kijelölt derékszögű, a légi-járművek leszállására és felszállására előkészített terület.

Futópálya várópont (Runway-HoldingPosition) - A futópálya, az akadály korlátozó felület, vagy az ILS/MLS kritikus/érzékeny területek védelmére kijelölt földi helyzetpont, amelynél a földi mozgást végző légi-járműnek, vagy járműveknek meg kell állni és várakozni kell, amíg a repülőtéri torony irányító eltérő engedélyt nem ad.

Megjegyzés.- A rádiótelefon szóhasználatban a „várópont” kifejezés a futópálya várópont megjelölésére szolgál.

Futópálya sáv (Runway strip) - A futópályát, és ha ilyet létesítettek-a végbiztonsági sávot is magába foglaló, az alábbiak céljára szolgáló kijelölt terület:

a) a futópályáról lefutó légi-járművek sérülési kockázatának csökkentése; és

b) a felszállás, vagy leszállás művelete közben a felette átrepülő légi-járművek védelme.

Futópálya látástávolság (Runway visual range) (RVR) - Az a távolság, amely távolságig a futópálya középvonalán lévő légi-jármű vezetője látja a futópálya felületének jelzéseit, illetve a futópályát szegélyező, vagy annak középvonalát azonosító fényeket.

Padka (Shoulder) - Egy, a szilárd burkolatú felület széléhez csatlakozó és olymódon kiképzett terület, hogy az átmenetet biztosítson a szilárd burkolat és a szomszédos talajfelület között.

Fontos/mérvadó pont (Significant point) - Meghatározott földrajzi hely, melyet valamely ATS útvonal, vagy egy légi-jármű repülési útvonalának meghatározásához, valamint egyéb navigációs és ATS célokra használnak.

Végbiztonsági sáv (Stopway) - A rendelkezésre álló nekifutási úthossz végénél kezdődő kijelölt derékszögű terület, amelyet megfelelően előkészítettek arra a célra, hogy rajta, megszakított felszállás esetén, a légi-jármű megállítható legyen.

Gurulás (Taxiing) - A fel- és leszállások kivételével a légi-jármű saját erőből történő mozgása a repülőtér talaján.

Gurulóút (Taxiway) - A szárazföldi repülőtéren a légi-járművek gurulásra kijelölt és kialakított út, amelyet arra a célra terveztek, hogy a repülőtér egy meghatározott részét egy másik részével összekösse, beleértve az alábbiakat:

a) *Légi-jármű állóhely guruló útvonal (Aircraft stand taxilane)* - Az előtérnek gurulósávként kijelölt azon része, amely kizárólagos célja a légi-jármű állóhely elérésének lehetővé tétele.

b) *Előtéri gurulóút (Apron taxiway)* - A gurulóút rendszer előtéren elhelyezkedő része, amelynek rendeltetése, hogy az előtéren keresztül történő átguruláshoz útvonalat biztosítson.

c) *Gyors leguruló út (Rapid exit taxiway)* - A futópályához hegyesszögben csatlakozó gurulóút, amelynek célja a leszálló légi-járműnek biztosítani, hogy a futópályát attól nagyobb sebességgel lefordulva hagyhassa el, mint amekkora sebességet más gurulóút típusok tesznek lehetővé, ezáltal csökkentve a futópálya foglaltsági idejét.

Közel-forgalmi érkezési magasság (Terminal arrival altitude - TAA) - Az a használható legalacsonyabb tengerszint feletti magasság, amely a megközelítés kezdőpontja (IAF), vagy ha nincs IAF kijelölve, akkor a közbenső megközelítés pontja (IF) körüli 46 km (25 NM) sugarú kör egy adott íve által határolt területen belül található összes akadály felett legkevesebb 300 m (1000 láb) akadálymentességet biztosít, amely ív széleit az IF-el összekötő egyenesek határolják. Egy adott megközelítési eljáráshoz tartozó TAA-k együttese az IF körül 360 fok-os fedettséget biztosítsanak.

Domborzat (Terrain) - A Föld felszíne, amely az akadályok kivételével magában foglal minden olyan természetes jellegzetességet, mint például a hegyek, dombok, szakadékok, völgyek, vízfelületek, állandó jég- és hómezők.

Megjegyzés. - Gyakorlatilag - az adatgyűjtés módjától függően - a domborzat felöleli a puszta föld folytonos felületét, a (vegetációs) burok tetejét, vagy ami közöttük esetleg van - ez "első visszaverő felület" néven is ismert.

Küszöb (Threshold) - A futópálya leszállásra használható részének kezdete.

Földet érési és elemelkedési terület (Touchdown and lift-off area) (TLOF) - Teherviselésre képes terület, amelyről, illetve amelyre a helikopter elemelkedhet, illetve földet érhet.

Földet érési zóna (Touchdown zone) - A futópályának a küszöbön belül lévő azon része, amelyben a leszállni szándékozó légi-jármű a futópályát először érinti.

Útirány (Track) - A légi-jármű útvonalának földfelszíni vetülete, amelynek irányát annak minden pontjában általában (földrajzi, mágneses, vagy hálózati) Északtól mért fokokban fejezik ki.

Átváltási magasság (Transition altitude) - Az a tengerszint feletti magasság, amelyen, vagy amely alatt a légi-jármű függőleges helyzetét a közepes tengerszint feletti magassághoz viszonyítva vezérlik.

Irányvezetés (Vectoring) – ATS ellenőrző rendszer használatára alapozott, navigációs irányvezetés biztosítása légi-járművek számára meghatározott irányok formájában.

Látás szerinti megközelítési eljárás (Visual approach procedure) - Látási támpontokra alapozott előre meghatározott manőverek sorozata a megközelítés kezdőpontjától, vagy ahol alkalmazható, a meghatározott érkezési útvonal kezdetétől egy olyan pontig, ahonnan a leszállás végrehajtható, és azt követően, ha a leszállás nem történt meg, egy olyan helyzetig, ahonnan az ismételt megközelítés kezdőpontjához vezető eljárás végrehajtható.

Útvonal pont (Waypoint) - Adott területi navigációs út vonalvezetésének, vagy egy területi navigációt alkalmazó légi-jármű repülési útvonalának kijelöléséhez használt meghatározott földrajzi hely. Az útvonal pont elnevezése lehet:

Rátartásos útvonal pont (Fly-by way-point) - Útvonal pont, mely esetében a fordulót a forduló ívének beszámításával a pont elérése előtt kell kezdeményezni, hogy az adott útvonal következő szakaszára fel-, vagy egy eljárásba becsatlakozás a forduló ív érintője mentén történjen meg.

Átrepülendő útvonal pont (Flyover way-point) - Útvonal pont, melynél fordulót annak érdekében kezdeményeznek, hogy valamely útvonal következő szakaszára fel-, vagy egy eljárásba becsatlakozzanak.

1.2 Alkalmazási előírások

1.2.1 Ezen Annex előírásait 2001. november 1-ével kezdődően kell alkalmazni.

Megjegyzés: a 20. Fejezet - ICAO Elektronikus Légiforgalmi térkép megjelenítő, 2002. November 28-án és azután alkalmazandó.

1.2.2 Az ezen Annex hatáskörébe tartozó és 2001. november 1-i, vagy azt követő légiforgalmi információ érvényességi dátumú összes térképnek teljesítenie kell az adott térképre vonatkozó Szabványokat.

1.2.2.1 **Ajánlás**. - *Továbbá, minden ilyen térképnek teljesítenie kell a rá vonatkozó Ajánlott Gyakorlatokat is.*

1.3. Hozzáférhetőség

1.3.1 *Tájékoztatás*. A másik szerződő állam kérésére és részére a szerződő állam bocsássa rendelkezésre a saját területére vonatkozó és a jelen Annex szabványainak teljesítését lehetővé tévő minden tájékoztatást.

1.3.2 *Térképek*. Ha az előírt, a térkép, vagy térképsorozat egyedi térképlapjára vonatkozó megfelelő alábbi módok valamelyike révén a szerződő állam köteles biztosítani a térképeihez való hozzáférést.

Megjegyzés.- A térképhez férés vonatkozik meghatározott elektronikus térképekre is.

1.3.2.1 A szerződő állam a teljes egészében azon területén belülre vonatkozó bármely térkép, vagy térképsorozat egyedi lapja esetében, amely terület fölött a szerződő állam hatáskörrel rendelkezik, köteles:

1) vagy maga elkészíteni a térképet, illetve térkép lapot; vagy

2) intézkedni azoknak egy másik szerződő állam, illetve ügynökség általi elkészítéséről; vagy

3) a térkép elkészítéséhez szükséges adatokat egy olyan szerződő állam rendelkezésére bocsátani, amely hajlandó kötelezettséget vállalni a térkép, vagy térképlap elkészítésére.

1.3.2.2. Két, vagy több szerződő állam területét magába foglaló térképekre, vagy térképsorozat egyedi térképlapjára vonatkozóan, azon államoknak kell meghatározniuk a módot, amelynek megfelelően a térkép, vagy térképlap hozzáférhetőségét biztosítják, amelyek fennhatósági területét a térkép magába foglalja. A döntést úgy kell meghozni, hogy az megfelelően figyelembe vegye a körzeti légi-navigációs egyezményeket és az ICAO Tanács által kialakított minden térkép-szelvényezési programot.

Megjegyzés. - A "körzeti légi-navigációs egyezmények" kifejezés az ICAO Tanácsa által, általában a körzeti légi-navigációs értekezletek javaslatai alapján, jóváhagyott egyezményeket jelenti.

1.3.3 A szerződő állam köteles minden ésszerű intézkedést megtenni annak érdekében, hogy az általa szolgáltatott tájékoztatások és az általa biztosított térképek a szükséges kívánalmaknak megfelelőek és pontosak legyenek és, hogy azokat megfelelő helyesbítő szolgálattal naprakész állapotban tartsa.

1.3.4 **Ajánlás.** - *Hogy az új térképészeti technikáról és az előállítási eljárásokról a tájékoztatások világméretű terjesztése javuljon, a szerződő államok által készített megfelelő térképeket, kérésre és* *kölcsönösségi alapon, a többi szerződő államnak ingyenesen kell rendelkezésre bocsátani.*

Megjegyzés. - A légiforgalmi térképek elkészítéséről, beleértve azok mintáit is, a Légiforgalmi Térképek Kézikönyve (Doc 8697) tartalmaz útmutató segédanyagot.

3. FEJEZET - ICAO A TÍPUSÚ REPÜLŐTÉRI AKADÁLY TÉRKÉP - (ÜZEMELTETÉSI KORLÁTOZÁSOK)

3.1 Rendeltetése

3.1.1 Ez a térkép az AIP-ben közzétett információval együtt biztosítsa az üzemeltető számára a 6. Annex, I. Rész, 5. Fejezetében és a III. Rész, II. Szakaszának 3. Fejezetében leírt üzemeltetési korlátozások teljesítéséhez szükséges adatokat.

3.2 Alkalmazási előírások

Az ICAO A típusú Repülőtéri Akadály Térképet (Üzemeltetési Korlátozások) a nemzetközi polgári repülés által rendszeresen használt minden repülőtérről az 1.3.2 pontban előírt módon rendelkezésre kell bocsátani, kivéve azokat a repülőtereket, ahol a felszállás pályája mentén nincsenek akadályok, vagy ahol az ICAO (Elektronikus) Repülőtéri terep és akadály térkép biztosított az 5. Fejezetben előírtak szerint.

3.2.2 Ha ez a térkép nem szükséges, mert a felszállás pályája mentén nincsenek akadályok, akkor az AIP-ben ilyen értelmű tájékoztatást kell közzétenni.

3.3 Mértékegységek

3.3.1 A tengerszinthez viszonyított magasságokat a legközelebbi fél méter, vagy legközelebbi egész láb értéknek megfelelő pontossággal kell feltüntetni.

3.3.2 A hossz-méreteket a legközelebbi fél méter értéknek megfelelő pontossággal kell feltüntetni.

3.4 Fedésterület és méretarány

3.4.1 Mindegyik felülnézeti térképrajz méretének elegendő nagyságúnak kell lennie ahhoz, hogy az összes lényeges akadályt magába foglalja.

Megjegyzés. - Az olyan egyedül álló távoli mérvadó akadályokat, amelyek a térkép méretét szükségtelenül növelnék, jelezhetők mindössze a megfelelő térképjellel és egy nyíllal is, azzal a feltétellel, hogy az akadálynak legtávolabbi futópálya végétől mért távolságát és irányát eltávolítják, az akadály tengerszinthez viszonyított magasságát közlik.

3.4.2 A vízszintes méretarány 1:10 000-től 1:15 000-ig terjedő tartományba essen.

3.4.3 **Ajánlás**. - A vízszintes méretarány 1:10 000 legyen.

Megjegyzés. - Ha a térkép előállítása ezzel megkönnyíthető az 1:20 000 méretarány is alkalmazható.

3.4.4 A függőleges méretarány a vízszintes méretarány tízszerese legyen.

3.4.5 Hossz-mértékvonalak. A térképeken fel kell tüntetni a méter és láb beosztású vízszintes- és függőleges mértékvonalat.

3.5 Formátum

3.5.1 A térképeken felülnézeti és metszetrajzban ábrázolni kell minden futópályát és a hozzájuk tartozó minden végbiztonsági és akadálymentes sávot, a felszállás pályájának területét és az akadályokat.

3.5.2 A metszetrajzon - a megegyező felülnézeti rajz felett - fel kell tüntetni az egyes futópályákat, végbiztonsági és akadálymentes sávokat, valamint a felszállás pályájának területén lévő akadályokat. Az alternatív felszállási pálya terület oldalnézeti metszete foglalja magába a teljes felszálló pályát és olymódon kell a megfelelő felülnézeti rajza fölé helyezni, amely a tájékoztatás azonnali megértését a legmegfelelőbben szolgálja.

3.5.3 A futópálya kivételével a teljes metszetre, metszet méret hálót kell fektetni. A függőleges vonalháló kiindulási pontja a közepes tengerszint legyen. A vízszintes vonalháló kiindulási pontja a vonatkozó felszállás pályája alatti terület kezdetétől távolabb lévő futópályavég legyen. A beosztási térközöket jelző osztóvonalakat a méretarány alap vonalán és a függőleges határvonalakon végig (azok teljes hosszában) fel kell tüntetni.

3.5.3.1 **Ajánlás**.- *A függőleges méret hálót 30 m-es (100 láb), a vízszintes méret hálót 300 m-es (1000 láb) térközökkel kell ábrázolni.*

3.5.4 A térkép tartalmazzon:

a) A 3.8.3 pontban megadott üzemi adatok rögzítésére szolgáló ablakot;

b) A módosítások és azok dátumainak bejegyzésére szolgáló ablakot.

3.6 Azonosítás

A térképet a következő nevekkel kell azonosítani: az ország neve, amelyben a repülőtér elhelyezkedik, annak a városnak, vagy körzetnek a neve, amelyet a repülőtér kiszolgál, továbbá a repülőtér neve és a futópálya(ák) azonosítói.

3.7 Mágneses eltérés

A térképen a legközelebbi fokra kerekített mágneses eltérést, valamint az adatok felmérési dátumát fel kell tüntetni.

3.8 Légiforgalmi adatok

3.8.1 Akadályok

3.8.1.1 Akadálynak kell tekinteni és fel kell tüntetni a felszállás pályája alatti területen lévő, a felszállás pályájának kezdőpontjától induló, 1,2%-os lejtésű síkon túlnyúló akadályokat, kivéve azokat az akadályokat, amelyek a 3.8.1.2 pontban meghatározottak szerint teljes egészében más akadályok árnyékában fekszenek. Az olyan mozgó akadályokat, mint például hajók, vonatok, teherautók, stb., amelyek az 1,2%-os síkon túlnyúlnak, akadályoknak kell tekinteni, de ezeket nem lehet úgy venni, hogy azok képesek az árnyékhatás létrehozására.

3.8.1.2 Egy akadály árnyékát olyan sík felületként kell kezelni, amely az akadály tetején keresztül és a felszállási pálya területére merőlegesen húzott vízszintes vonalnál kezdődik. Ez a sík a felszállás nyomvonalának teljes szélességét fedi és vagy a 3.8.1.1 pontban meghatározott síkig, vagy a legközelebbi magasabb akadályig tart, amelyik előbb helyezkedik el. A felszállás nyomvonalának első 300 m-én (1000 láb) az árnyék síkok vízszintesek, ezen a ponton túl a síkok felfelé 1,2%-os meredekséggel emelkednek.

3.8.1.3 Ha az árnyékhatást létrehozó akadályt várhatóan eltávolítják, akkor a térképen fel kell tüntetni azokat a tárgyakat, amelyek az előző akadály eltávolítása után akadályokká válnak.

3.8.2 A felszállási pálya nyomvonal területe

3.8.2.1 A felszállás pályája alatti terület a föld felszínén közvetlenül a felszállás pályája alatt kijelölt, annak két oldalán szimmetrikusan elhelyezkedő, négy oldallal rendelkező terület. Ez a terület a következő jellemzőkel rendelkezik:

a) a felszállásra alkalmasként közzétett terület végénél kezdődik (azaz, a futópálya, vagy az akadálymentes sáv végénél - amelyik alkalmazandó);

b) szélessége a kiinduló pontnál 180 m (600 láb) és ez 0,25D értékkel növekszik 1800 m (6000 láb) legnagyobb szélességig, ahol is "D" egyenlő a kiindulási ponttól mért távolsággal;

c) addig a pontig terjed, amelyen túl nincsenek akadályok, vagy 10 km (5,4 tengeri mérföld) távolságig, amelyik a kisebb.

3.8.2.2 Az olyan légi-járműveket kiszolgáló futópályák esetében, amely légi-járművek üzemelési korlátjai miatt 1,2 %-nál kisebb meredekségű emelkedési gradiens alkalmazása nincs kizárva, a felszállás pályája alatti terület 3.8.2.1 c) pontban meghatározott hosszát legalább 12 km-re (6,5 tengeri mérföld) meg kell növelni és a síknak a 3.8.1.1 pontban, illetve a 3.8.1.2 pontban meghatározott emelkedését 1 %-ra, vagy ennél kisebbre kell csökkenteni.

Megjegyzés. - Ha az 1,0 százalékos felmérő sík akadályt nem érint, akkor hajlásszöge addig csökkenthető, amíg a sík valamely akadállyal érintkezik.

3.8.3 Közzétett úthosszak

3.8.3.1 Minden futópálya mindkét irányára a következő tájékoztatást kell feltüntetni az e célra biztosított helyen:

a) rendelkezésre álló nekifutási úthossz;

b) rendelkezésre álló gyorsítás-fékezési úthossz

c) rendelkezésre álló felszálló úthossz;

d) rendelkezésre álló leszálló úthossz;

Megjegyzés. - - A 14. Annex I. Kötet, A Mellékletének 3. szakaszában útmutatás található a közzétett úthosszakról.

3.8.3.2 **Ajánlás. -** *Ha valamelyik úthosszat nem teszik közzé, mert a futópálya csak egy irányból használható, akkor a futópályát "felszállásra, leszállásra, vagy egyikre sem használható"-ként kell azonosítani.*

3.8.4 Felülnézeti és oldalnézeti ábrázolások

3.8.4.1 A felülnézeti ábrán:

a) a futópályák körvonalát folyamatos vonallal kell ábrázolni, beleértve hosszukat és szélességüket, a legközelebbi fokra kerekített mágneses irányukat és a futópálya számát; b) az akadálymentes területet

b) szaggatott vonallal kell jelölni, beleértve a hosszát és ilyen területként való azonosítását;

c) a felszállást követő repülés nyomvonalának területeit szaggatott vonallal és középvonalát hosszú/rövid vonalakból álló vékony szaggatott vonallal kell jelölni;

d) a felszállást követő repülés alternatív nyomvonal területeket. Ha a futópálya meghosszabbított középvonalára nem központos felszállást követő repülési alternatív nyomvonal területeket ábrázolnak, akkor egy, az ilyen területek jelentőségét magyarázó megjegyzést kell biztosítani.

e) az akadályokat, beleértve:

1) az egyes akadályok pontos helyét, az akadály fajtáját mutató jel feltüntetésével együtt;

2) az egyes akadályok tengerszinthez viszonyított magasságát és azonosítását;

3) a nagy kiterjedésű akadályok túlnyúlásának határértékeit megkülönböztető módon kell feltüntetni és a jelmagyarázatban azonosítani.

Megjegyzés. - Ez nem zárja ki a felszállást követő repülési nyomvonal területén belül lévő kritikus magassági pontok jelzésének szükségességét.

3.8.4.1.1 **Ajánlás.** - *A futópálya és végbiztonsági sáv felületek fajtáját fel kell tüntetni.*

3.8.4.1.2 **Ajánlás.** - *A végbiztonsági területeket, mint olyanokat azonosítani kell és szaggatott vonallal kell jelezni.*

3.8.4.1.3 Ha a végbiztonsági területeket ábrázolják, akkor az egyes végbiztonsági területek hosszát meg kell adni.

3.8.4.2 Az oldalnézeti rajzokon fel kell tüntetni:

a) a futópálya középvonalának metszetrajzát folyamatos vonallal és az egyes kapcsolódó végbiztonsági sávok és akadálymentes területek középvonalának metszetrajzát szaggatott vonallal;

b) a futópálya középvonalának tengerszinthez viszonyított magasságát, a futópálya mindkét végénél, a végbiztonsági sávoknál, az egyes felszállási repülési nyomvonal területek kezdeténél valamint a futópálya és a végbiztonsági sáv lejtésének minden jelentős változásánál;

c) az akadályokat, beleértve:

1) az egyes akadályokat olyan folyamatos vonallal, amely egy tetszés szerinti megfelelő hálózati vonaltól legalább még egy hálózati vonalon keresztül az akadály tetejének tengerszinthez viszonyított magasságáig terjed;

2) az egyes akadályok azonosítását;

3) a nagy kiterjedésű akadályok túlnyúlási határait megkülönböztető módon és a jelmagyarázatban azonosítva.

Megjegyzés. - Az akadály profil is feltüntethető, amely az egyes mérvadó akadályok tetejét összekötő vonal és, amely az egymás után következő mérvadó akadályok általi árnyékhatást képviseli.

3.9 Pontosság

3.9.1 Az elért pontosság mértékét a térképen fel kell tüntetni.

3.9.2 **Ajánlás.** - *A futópálya, a végbiztonsági sáv és az akadálymentes terület térképén feltüntetendő vízszintes kiterjedését és tengerszinthez viszonyított magasságát a legközelebbi 0,5 m-re (1 láb) kell meghatározni.*

3.9.3 **Ajánlás.** - *A terepen végzett felmérő munka és a térkép elkészítésének pontossági fokának olyannak kell lennie, hogy a térképen végezhető mérések pontossága a felszállást követő repülési nyomvonal területén a következő legnagyobb eltérésen belül legyen.*

1) *vízszintes távolságokra: 5 m (15 láb) a kezdőpontnál és azt követően 1/500-as nagyságrenddel növekvő eltéréssel;*

2) *függőleges méretekre: 0,5 m (1,5 láb) az első 300 méteren (1000 láb) és azt követően 1/1000-es nagyságrenddel növekvő eltéréssel;*

3.9.4 Magasság viszonyítási alap. Ha nincs pontos magasság viszonyítási alap, akkor az alkalmazott magasság viszonyítási alap pontjának tengerszinthez viszonyított magasságát kell megállapítani és, 'feltételezett érték' megjelöléssel kell ellátni.

4. FEJEZET
ICAO B TÍPUSÚ REPÜLŐTÉRI AKADÁLY TÉRKÉP

4.1 Rendeltetése

A térképnek az alábbi feladatok teljesítéséhez kell információt biztosítania:

a) a minimális biztonságos tengerszinthez viszonyított magasságok megállapításához, beleértve a körözési eljárásokra vonatkozókat is.

b) a felszállás, vagy a leszállás során bekövetkező kényszerhelyzet esetén alkalmazandó eljárások megállapításához;

c) az akadály elkerülési és jelölési követelmények alkalmazásához;

d) forrás adatanyag biztosítására légiforgalmi térképekhez.

4.2 Alkalmazási rendelkezések

4.2.1 **Ajánlás.** - Az ICAO B Típusú Repülőtéri Akadály Térképet a nemzetközi polgári repülés által rendszeresen használt minden repülőtérről az 1.3.2 pontban előírt módon rendelkezésre kell bocsátani, kivéve azokat a repülőtereket, ahol az ICAO (Elektronikus) Repülőtéri terep és akadály térkép biztosított az 5. Fejezetben előírtak szerint.

4.2.2 Ha a 3. és a 4. Fejezet előírásait egyesítő térképet tesznek közzé, akkor azt "ICAO (összevont) Repülőtéri Akadály Térkép" névvel kell ellátni.

4.3 Mértékegységek

4.3.1 A tengerszinthez viszonyított magasságokat a legközelebbi fél méter, vagy legközelebbi egész láb értéknek megfelelő pontossággal kell feltüntetni.

4.3.2 A hossz-méreteket a legközelebbi fél méter értéknek megfelelő pontossággal kell feltüntetni.

4.4 Fedésterület és méretarány

4.4.1 Minden egyes felülnézeti térképrajz méretének elegendő nagyságúnak kell lennie ahhoz, hogy az összes akadályt magába foglalja.

Megjegyzés. - Az olyan egyedül álló távoli akadályok, amelyek a térkép méretét szükségtelenül növelnék, jelezhetők mindössze a megfelelő térképjellel és egy nyíllal is, azzal a feltétellel, hogy az akadálynak a repülőtér vonatkoztatási pontjától mért távolságát és irányát, továbbá az akadály tengerszinthez viszonyított magasságát is közlik.

4.4.2 A vízszintes méretarány 1:10 000-től 1:20 000-ig terjedő tartományba essen.

4.4.3 A térképeken fel kell tüntetni egy vízszintes mérővonal skálát, amely a méter és láb értékeket egyaránt tartalmazza. Ha szükséges, a hossz értékeket kilométerben is és tengeri mérföldben is mutató mérővonalat is fel kell tüntetni.

4.5 Formátum

A térképeken ábrázolni kell:

a) az alkalmazott vetület minden szükséges magyarázatát;

b) az alkalmazott hálózat minden szükséges magyarázatát;

c) annak jelölését, hogy a feltüntetett akadályok azok az akadályok, amelyek a 14. Annex, I. Kötet, 4. Fejezetében meghatározott felületeken túlnyúlnak;

d) egy, a módosítások és azok időpontjainak bejegyzésére alkalmas rovatot;

e) a térkép határoló vonalán kívül, a földrajzi szélesség és hosszúság minden egyes fokának és fokpercének jelölését.

Megjegyzés. - A szélességi és hosszúsági körök vonalait a térképen végighúzva is fel lehet tüntetni.

4.6 Azonosítás

A térképet a következő nevekkel kell azonosítani: az ország neve, amelyben a repülőtér elhelyezkedik, annak a városnak, vagy körzetnek a neve, amelyet a repülőtér kiszolgál, továbbá a repülőtér neve.

4.7 Kultúr környezet és tereprajz

4.7.1 A vízelvezetési és vízrajzi részleteket a minimumra kell szorítani.

4.7.2 A repülőtérhez kapcsolódó épületeket és egyéb jellemző jellegzetességeket fel kell tüntetni. Ahol lehetséges, ezeket mérethelyesen kell ábrázolni.

4.7.3 A térképen fel kell tüntetni minden olyan mesterséges és természetes akadályt, amely a 4.9 pontban meghatározott felszállási és megközelítési felületeken, vagy a 14. Annex, I. Kötet, 4. Fejezetében meghatározott akadály elkülönítési és akadály jelölő felületeken túlnyúlik.

4.7.4 A térképen ábrázolni kell azokat az utakat és vasutakat, amelyek a felszállási és a megközelítési területen belül, a futópályától vagy a futópálya meghosszabbítástól kevesebb, mint 600 méter (2000 láb) távolságban fekszenek.

Megjegyzés. - A terepjellegzetességek neve, ha ezek jelentőséggel bírnak, feltüntethetők.

4.8 Mágneses eltérés

A térképen el kell helyezni egy, a földrajzi Északra tájolt iránytűrózsát, vagy egy Észak pontot és fel kell tüntetni a legközelebbi fokra kerekített mágneses eltérést az adat felmérési dátumával és az évenkénti változással egyetemben.

4.9 Légiforgalmi adatok

4.9.1 A térképen fel kell tüntetni:

a) a repülőtér vonatkoztatási pontját és annak földrajzi koordinátáit fokban, fokpercben és fokmásodpercben;

b) a futópályák körvonalát folyamatos vonallal;

c) a futópályák hosszát és szélességét;

d) a futópályák legközelebbi fokra kerekített mágneses irányát és a futópálya számát;

e) a futópálya középvonalának tengerszinthez viszonyított magasságát a futópálya mindkét végénél, a végbiztonsági sávoknál, az egyes felszállást követő repülési nyomvonal és megközelítési repülés nyomvonal területek kezdeténél, valamint a futópálya és a végbiztonsági sáv lejtésének minden jelentős változásánál;

f) a guruló utakat, az előtereket és az állóhely területeket ilyenként azonosítva, körvonalaikat folyamatos vonallal ábrázolva;

g) a végbiztonsági területet szaggatott vonallal és ilyen területként való azonosítását;

h) az egyes végbiztonsági sávok hosszát;

i) az akadálymentes területeket szaggatott vonallal és ilyen területként való azonosításukat;

j) az egyes akadálymentes területek hosszát;

k) a felszállási és megközelítési felületeket ilyenekként azonosítva és szaggatott vonallal ábrázolva;

l) a felszállási és megközelítési területeket;

Megjegyzés. - A felszállási terület leírását a 3.8.2.1 pont tartalmazza. A megközelítési terület a 14. Annex, I. Kötet, 4. Fejezetében meghatározottak szerinti közvetlenül a megközelítési felület alatt fekvő földfelszíni terület.

m) az akadályokat pontos helyükön, beleértve:

1) az akadály fajtájára utaló jelölést;

2) a tengerszinthez viszonyított magasságot

3) azonosítását;

4) a nagymérvű túlnyúlások határértékeit a jelmagyarázatban azonosított megkülönböztető módon és;

Megjegyzés. - Ez nem zárja ki a felszállást követő repülési nyomvonal területén belül lévő kritikus magassági pontok jelzésének szükségességét.

n) minden olyan további, a 3.8.1.1 pont szerint meghatározott akadályt, beleértve az akadályok árnyékában lévő akadályokat is, amelyeket egyébként nem kellene feltüntetni.

Megjegyzés. - A 14. Annex, I. Kötet, 4. Fejezetében meghatározott követelmények minimum követelmények. Ha az illetékes hatóság alacsonyabb felületeket alakított ki, ott ezek alkalmazhatók az akadályok kijelölésére.

4.9.1.1 **Ajánlás.** - *A futópálya és végbiztonsági sáv felületek fajtáját meg kell nevezni.*

4.9.1.2 **Ajánlás.** - *Ha megvalósítható, a térképen szembeötlően kell feltüntetni a repülőtér vonatkoztatási pontjától mért 5000 m-es (15 000 láb) sugarú körön belül lévő, a szomszédos megközelítési területek közötti legmagasabb tárgyat, vagy akadályt.*

4.9.1.3 **Ajánlás**. - *A részben akadályt képező fás területek és domborzati jellemzők kiterjedését ábrázolni kell.*

4.10 Pontosság

4.10.1 Az elért pontosság mértékét a térképen fel kell tüntetni.

4.10.2 Ajánlás. - A térképen feltüntetett mozgási területek, végbiztonsági sávok és akadálymentes területek vízszintes kiterjedtségét és a tengerszinthez viszonyított magasságát a legközelebbi 0,5 m-re (1 láb) kerekítve kell ábrázolni.

4.10.3 **Ajánlás.** - *A terepen végzett felmérő munka pontossági fokának és a térkép elkészítési pontosságának olyannak kell lennie, hogy a térképen végezhető mérések pontossága a következő legnagyobb eltérésen belül legyen:*

a) felszállási és megközelítési területek:

1) vízszintes távolságokra: 5 m (15 láb) a kezdőpontnál és azt követően 1/500-as nagyságrenddel növekvő eltéréssel;

2) függőleges méretekre: 0,5 m (1,5 láb) az első 300 méteren (1000 láb) és azt követően 1/1000-es nagyságrenddel növekvő eltéréssel;

b) egyéb területek:

1) vízszintes távolságokra: 5 m (15 láb) a repülőtér vonatkoztatási pontjától mért 5000 m-en (15 000 láb)

belül és 12 m (40 láb) e területen kívül;

2) függőleges méretekre: 1 m (3 láb) a repülőtér vonatkoztatási pontjától mért 1500 m-en (5 000 láb) távolságon belül és azt követően 1/1000-es nagyságrenddel növekvő eltéréssel;

4.10.4 Magasság viszonyítási alap. Ha nincs pontos magasság viszonyítási alap, akkor az alkalmazott magasság viszonyítási alap pontjának tengerszinthez viszonyított magasságáról kell nyilatkozni és, mint feltételezett értéket kell jelölni.

5. FEJEZET ICAO (ELEKTRONIKUS) REPÜLŐTÉRI TEREP ÉS AKADÁLY TÉRKÉP

5.1 Rendeltetése

Ez az elektronikus térkép a domborzati- és az akadály adatokat a légiforgalmi adatokkal együtt (a közülük megfelelőt) az alább felsorolt igényeket teljesítő módon ábrázolja:

a) az üzemeltetőnek tegye lehetővé a 6. Annex, I. Része 5. Fejezetében és a III. Rész, II. Szakaszának 3. Fejezetében leírt üzemeltetési korlátozások teljesítését megszakított leszállás, vagy felszállás közbeni vészhelyzet során alkalmazandó szükség eljárás kidolgozása révén és légi-jármű üzemeltetési korlát elemzések elvégzésével; és

b) támogassa az alábbi célú légi-navigációs alkalmazásokat:

  1) műszeres eljárások tervezése (beleértve a körözési eljárást);
  2) repülőtéri akadályok korlátozása és eltávolítása; és
  3) forrás adat biztosítása egyéb légiforgalmi térképek előállításához.

Megjegyzés. - E térkép szándék szerinti céljáról és használatáról a Légiforgalmi Térkép Kézikönyv (Doc 8697) tartalmaz magyarázatot.

5.2 Alkalmazási rendelkezések

5.2.1 Az ICAO (Elektronikus) Repülőtéri terep és akadály térképet 2010 november 18-tól az 1.3.2-ben előírt módon kell biztosítani a nemzetközi polgári repülésben használt minden repülőtérre.

1. Megjegyzés.- Ha az ICAO (Elektronikus) Repülőtéri terep és akadály térkép biztosított, akkor az ICAO A Típusú Repülőtéri Akadálytérkép – (Üzemeltetési Korlátozások) és az ICAO B Típusú Repülőtéri Akadálytérkép nem szükséges (lásd 3.2.1 és 4.2.1).

2. Megjegyzés.- Az ICAO Precíziós Domborzati Térképre előírt információ biztosítható az ICAO (Elektronikus) Repülőtéri terep és akadály térképen. Ahol ez történik, ott nincs szükség az ICAO Precíziós Domborzati Térképre (lásd 6.2.1).

5.2.2 **Ajánlás.—** Az ICAO (Elektronikus) Repülőtéri terep és akadály térképet az 1.3.2-ben előírt módon szükséges biztosítani a nemzetközi polgári repülésben használt minden repülőtérre.

5.2.3 Az ICAO (Elektronikus) Repülőtéri terep és akadály térképet –kérésre- nyomtatott formában is biztosítani kell.

Megjegyzés.- A nyomtatott másolatra vonatkozó előírásokat lásd az 5.7.7 alatt.

5.2.4 Általános adatmodellezési keretként az ISO földrajzi információra vonatkozó 19100 sorozatú szabványait kell alkalmazni

Megjegyzés.- Az ISO földrajzi információra vonatkozó 19100 sorozatú szabványok használata elősegíti az ICAO (Elektronikus) Repülőtéri terep és akadály térkép különféle felhasználók közötti cseréjét és használatát.

5.3 Azonosítás

Az elektronikus térképeket a következőkkel kell azonosítani: az ország neve, amelyben a repülőtér elhelyezkedik, a repülőtér által kiszolgált város, vagy helység, továbbá repülőtér neve.

5.4 Térkép fedésterület

A térkép mérete legyen elegendő a 15. Annex 10.2 pontjában leírt „Area 2" lefedéséhez

5.5 Térkép tartalom

5.5.1 Általános rész

5.5.1.1 A térkép jellemzők ábrázolásához alkalmazandó számítógép grafikai alkalmazás tervezésekor alkalmazási sablonnal meg kell határozni a jellegzetesség, a jellegzetesség jegyek összefüggéseit és a háttéri térgeometria és a kapcsolódó topológiai összefüggéseket. Az ábrázolt információt a kötött ábrázolási szabályoknak megfelelően alkalmazott ábrázolási előírások szerint kell biztosítani. Az ábrázolási szabályok és az ábrázolási előírások nem lehetnek az adatkészlet részei. Az ábrázolási szabályokat ábrázolási katalógusban kell tárolni, amelyeknek a külön tárolt ábrázolási előírásokra kell hivatkozniuk.

Megjegyzés.— A 19117-es ISO szabvány tartalmazza a jellegzetesség-alapú földrajzi információ ábrázoló mechanizmust leíró sablon meghatározását, míg a 19109-es ISO szabvány az alkalmazási sablonra vonatkozó szabályokat tartalmaz. A térgeometria és a kapcsolódó topológiai összefüggéseket a 19107-es ISO szabvány határozza meg.

5.5.1.2 A jellegzetesség ábrázolására használt jel legyen összhangban a 2.4-el és a 2. Függelék – ICAO térkép jelek-el.

5.5.2 Domborzati jellegzetesség

5.5.2.1 Az ábrázolandó terep jellegzetességnek és a kapcsolódó jegyeknek, illetve a térképhez kapcsolt adatbázisnak a 15. Annex, 10. Fejezetének és 8. Függelékének követelményeit teljesítő elektronikus terep adat készletre kell alapozódnia.

5.5.2.2 A terep jellegzetességet a terep hatásos összbenyomását keltő módon kell ábrázolni. Ez legyen a terep felületi leképzése, folyamatosan feltüntetve a Digitális Magasság Modellként (DEM) is ismert meghatározott rácsháló összes metszéspontjánál a magasság értékeket.

Megjegyzés.- A 15. Annex, 10. Fejezetével és 8. Függelékével összhangban, az „Area 2" DEM pozíció térköz (rács) 1 ívmásodpercben (megközelítőleg 30 m) lett megállapítva.

5.5.2.3 **Ajánlás.-** A terep felületi leképzését -a DEM mellett- választható szintvonal rétegekként szükséges biztosítani.

5.5.2.4 **Ajánlás.-** A DEM javításához a DEM-en lévő jellegzetességekkel passzoló, az átlapoló látványon jellegzetességekkel bíró geometriailag korrigált látványt kell használni. A látványt külön választható rétegként szükséges biztosítani.

5.5.2.5 Az ábrázolt területi jellegzetesség az adatbázis(ok)ban tárolt következő társított jellegzetesség jegyekkel legyen összekapcsolva:

a) a rácspontok vízszintes pozíciója földrajzi koordinátákkal és a pontok magassága;

b) felület típus;

c) szintvonal értékek, ha adottak; és

d) város-, helységnevek és egyéb kiemelkedő tereprajzi jellegzetességek.

5.5.2.6 **Ajánlás.-** A 15. Annex 8. Függelékének A8-3 Táblázatában előírt és adatbázis(ok)ban tárolt egyéb terep jegyek az ábrázolt terep-jellegzetességekhez legyenek csatolva.

5.5.3 Akadály jellegzetességek

5.5.3.1 Az ábrázolt, vagy adatbázis szinten a térképhez csatolt akadály jellegzetességeknek és a társított jegyeknek a 15. Annex 10. Fejezetének és 8. Függelékének követelményeit teljesítő elektronikus akadály adatkészletre kell alapulniuk.

5.5.3.2 Minden akadályt megfelelő jellel és akadály azonosítóval kell ábrázolni.

5.5.3.3 Az ábrázolt akadály jellegzetessége az adatbázis(ok)ban lévő alábbi társított jegyekkel legyen

összekapcsolva:
a) vízszintes pozíció földrajzi koordinátákkal és a társított magasság;
b) akadály típus; és
c) akadály terjedelem, ha alkalmazható.

5.5.3.4 **Ajánlás.-** A 15. Annex 8. Függelékének A8-4-es Táblázatában előírt és adatbázis(ok)ban tárolt egyéb akadály jegyek legyenek az ábrázolt akadály jellegzetességéhez csatolva.

5.5.4 Repülőtér jellegzetességek

5.5.4.1 Az ábrázolt, vagy adatbázis szinten a térképhez csatolt repülőtér jellegzetességeknek és a társított jegyeknek a 14. Annex 10. I. Kötet, 5. Függelékének és a 15. Annex 7. Függelékének követelményeit teljesítő repülőtér adatokra kell alapulniuk.

5.5.4.2 Az alábbi repülőtér jellegzetességeket a megfelelő jellel kell ábrázolni:
a) repülőtér vonatkoztatási pont;
b) futópálya(k) és azonosító száma(uk), és, ha van, végbiztonsági sáv(ok) és akadály mentes sáv(ok); valamint
c) gurulóut(ak), előter(ek), nagy épület(ek) és egyéb kiemelkedő repülőtéri jellegzetességek.

5.5.4.3 Az ábrázolt repülőtér jellegzetessége az adatbázis(ok)ban lévő alábbi társított jegyekkel legyen összekapcsolva:
a) a repülőtér vonatkoztatási pontjának földrajzi koordinátája;
b) mágneses elhajlás a repülőtéren, az adatfelmérés éve és az éves változás;
Megjegyzés.- A mágneses elhajlás adatbázis szinten lehet a repülőtéri vonatkoztatási ponthoz csatolt.
c) futópálya(k), végbiztonsági sáv(ok) és akadálymentességi sáv(ok) hossz(a) és szélesség(e);
d) futópálya(k) és végbiztonsági sáv(ok) felület típus(ai);
e) a futópálya(k) legközelebbi fokra kerekített mágneses iránya(i);
f) szintmagasság minden futópálya, végbiztonsági sáv, akadálymentes sáv végénél, és a futópálya(k), végbiztonsági sáv(ok) minden jelentős lejtési szög változásá(i)nál;
g) Közzétett úthosszak minden futópálya irányra, vagy „NU” rövidítés, ha valamely futópálya irány nem használható fel-, vagy leszállásra, vagy egyikre sem.
Megjegyzés.- A közzétett úthosszakról útmutató a 14. Annex 14, I. Kötet, A Mellékletében található.

5.5.5 Rádiónavigációs berendezés jellemzők

A térkép fedésterületén belül lévő minden rádiónavigációs berendezés jellegzetességét a megfelelő jellel kell ábrázolni.

Megjegyzés.- A navigációs berendezés jellegzetesség jegyek az adatbázis(ok)ban lévő ábrázolt navigációs berendezés jellegzetességekhez csatolhatók.

5.6 Pontosság és felbontás

5.6.1 A légiforgalmi adat pontossági nagyságrendje a következőkben előírtaknak feleljen meg: 11. Annex 5. Függelék és 14. Annex I. Kötet 5. Függelék, illetve II. Kötet, 1. Függelék. A domborzati és akadály adat pontossági nagyságrendje a 15. Annex 8. Függelékében előírtak szerinti legyen.

5.6.2 A légiforgalmi adat felbontása a 15. Annex 7. Függelékében előírtak szerinti, míg a domborzat és az akadály adat felbontása a 15. Annex 8. Függelékében előírtak szerinti legyen.

5.7 Elektronikus funkciók

5.7.1 A térkép változtatható méretarányú megtekintése legyen biztosított. Az áttekinthetőség javításához a jel és a betűméret a térkép mérete szerint változzon.

5.7.2 A térkép információ föld-tájolású legyen és a kurzor pozíció legalább a legközelebbi fokmásodpercnél legyen meghatározható.

5.7.3 A térkép férjen össze a széles körben kapható asztali számítógép eszközökkel, programokkal és médiákkal.

5.7.4 **Ajánlás.-** A térkép tartalmazza saját „olvasó" programját.

5.7.5 Az engedélyezett frissítés kivételével, ne legyen lehetőség a térképről információt eltávolítani.

5.7.6 Az információ felhasználói testre szabását lehetővé tévő információ-réteg választékot kell biztosítani, ha információ zsúfoltság miatt a térkép szerepének ellátásához szükséges részletek megfelelő láthatósággal nem mutathatók egyetlen összesítő térkép nézeten.

Megjegyzés.- A repülőtér jellemzők többségének ajánlott megjelenítési módja a felhasználó által választható információ-réteggel bíró elektronikus térkép változat.

5.7.7 Legyen lehetőség a térkép felhasználó által választott tartalmi és méretarány igény szerinti másolatát kinyomtatni.

1. Megjegyzés.- Felhasználói igény szerint, a nyomtatott termék ábrázolhat szelvény-sorozatokat, vagy egy választott területet.

2. Megjegyzés.- A kapcsolt adatbázis révén rendelkezésre álló jellegzetesség-jegy információ biztosítható egy megfelelő hivatkozással ellátott különálló lapon.

5.8 Térkép-adat termék-előírás

5.8.1 A térképet képező adat készletről átfogó nyilatkozatot kell biztosítani adat termék előírások formájában, amely alapján a légi-navigációs felhasználó képes a térkép-adat terméket elemezni és meghatározni, hogy az teljesíti-e a felhasználási céljára (alkalmazására) vonatkozó követelményeket

5.8.2 A térkép-adat termék-előírás tartalmazza a következőket: egy áttekintőt, egy előírás tárgykört, egy adat termék-azonosítót, adat tartalmi információt, az alkalmazott vonatkoztatási rendszert, az adat minőségi követelményeket, és tájékoztatót az adat nyerésről, adat karbantartásról, adat ábrázolásról, valamint bármely rendelkezésre álló további információt, és a meta adatot.

Megjegyzés.- A földrajzi információra vonatkozó követelményeket és az adat termék-előírás vázlatát az ISO 19131 szabványa írja le.

5.8.3 A térkép-adat termék-előírás áttekintője biztosítson egy kötetlen leírást a termékről és tartalmazzon általános tájékoztatást az adat termékről.

A térkép-adat termék-előírás előírás tárgyköre tartalmazza a térkép fedés térbeli (vízszintes) terjedelmét. A térkép-adat termék-azonosító tartalmazza a termék megnevezését, egy rövid összefoglaló leírást a térkép tartalmáról és rendeltetéséről, valamint egy leírást a térkép által fedett földrajzi területről.

5.8.4 A térkép-adat termék-előírás adat tartalma egyértelműen azonosítsa a fedés és/vagy a látvány típusát, valamint adjon róluk rövid leírást.

Megjegyzés.- A fedés geometria és funkciók sablonját az ISO 19123 szabványa tartalmazza.

5.8.5 A térkép-adat termék-előírás tartalmazzon az alkalmazott vonatkoztatási rendszert meghatározó információt. Ez tartalmazza a térbeli (vízszintes és függőleges) vonatkoztatási rendszert, és, ha alkalmazható, az időviszonyítási rendszert. A térkép-adat termék-előírás nevesítse az adat minőségi követelményeit. Ez foglaljon magába egy nyilatkozatot az egyezés elfogadható minőségi szintjeiről és a megfelelő adat minőségi intézkedésekről. E nyilatkozat öleljen fel minden adat minőségi elemet és adat minőségi rész-elemet, még akkor is, ha csak annyi a megállapítás, hogy az illető adat minőségi elem, vagy adat minőségi rész-elem nem alkalmazható.

Megjegyzés.- Az ISO 19113 szabvány földrajzi információra vonatkozó minőségi elveket fogalmaz meg, míg az ISO 19114 szabvány minőség értékelő eljárásokat tárgyal.

5.8.6 A térkép-adat termék-előírás tartalmazzon nyilatkozatot az adat nyerésről, amely legyen egy általános leírás a térkép adat forrásairól és a térkép adat kinyeréshez alkalmazott folyamatokról. A térkép-adat termék-előírásban rendelkezni kell a térkép karbantartáshoz alkalmazott elvekről és kritériumokról is, ide értve a térkép termék frissítésének ütemezését. Kiemelt fontosságú legyen a térképre vitt akadály adat készlet karbantartásáról szóló információ és az akadály adat karbantartásban alkalmazott elvek, módszerek és kritériumok jelzése.

5.8.7 A térkép-adat termék-előírás tartalmazzon tájékoztatást az adat térképi ábrázolásának mikéntjéről, az 5.5.1.1. részletezésének megfelelően. A térkép-adat termék-előírás tartalmazzon információt az adat termék továbbításról is, szólva a továbbítási formátumról és az adat hordozójáról.

5.8.8 A térkép-adat termék-előírásba fel kell venni az alap térkép meta adat elemeit. A termék-előírásban nyilatkozni kell bármely egyéb biztosítandó meta adat tételről és azok formátumáról és kódolásáról.

1. Megjegyzés.- Az ISO 19115 szabvány a földrajzi információ meta adatára vonatkozó követelményeket határozza meg.

2. Megjegyzés.- A térkép-adat termék-előírás dokumentálja a térkép adat terméket, amelyet adat készletként telepítenek. Ezen adat készleteket meta adat írja le.

6. FEJEZET - ICAO PRECIZIÓS MEGKÖZELÍTÉSI TEREP TÉRKÉP

6.1 Rendeltetése

A térkép rendeltetése, hogy a befejező megközelítés egy meghatározott részéről részletes terepmetszeti tájékoztatást nyújtson a légi-jármű üzemeltetők részére a rádió-magasságmérő használat céljaira megállapítandó elhatározási magasságra a terepviszonyok által gyakorolt hatás felméréséhez.

6.2 Alkalmazási rendelkezések

6.2.1 Az "ICAO Precíziós Megközelítési terep térkép"-et a nemzetközi polgári légi-közlekedés által használt minden repülőtér minden II. és III. kategóriájú precíziós megközelítéssel rendelkező futópályájára el kell készíteni, kivéve, ha az előírt adatokat az ICAO (Elektronikus) Repülőtéri terep és akadály térképen biztosítják az 5. Fejezetnek megfelelően..

6.2.2 Az "ICAO Precíziós Megközelítési terep térkép"-et bármiféle jelentősebb változás bekövetkezésekor módosítani kell.

6.3 Méretarányok

6.3.1 **Ajánlás.** - *A vízszintes méretarány 1:2 500, a függőleges 1:500 méretarány legyen.*

6.3.2 **Ajánlás.** - *Ha a térkép a futópálya küszöbtől 900 m-nél (3000 láb) távolabb lévő terület terep metszetrajzát tartalmazza, akkor a vízszintes méretarány 1:5 000 legyen.*

6.4 Azonosítás

A térképet a következő nevekkel kell azonosítani: az ország neve, amelyben a repülőtér elhelyezkedik, annak a körzetnek, vagy városnak a neve, amelyet a repülőtér kiszolgál, a repülőtér neve és a futópálya azonosítója.

6.5 Felülnézeti és metszet információk

6.5.1 A térképnek tartalmaznia kell:

1) felülnézeti ábrázolást a metszetrajzon szereplőkkel egyező távolságig, a szintvonalakat a futópálya meghosszabbított középvonala mentén és annak mindkét oldalán 60-60 méteren (200 láb) belüli területen 1 m (3 láb) térközönként tüntetve fel, a szintvonalakat a küszöbhöz kell viszonyítani;

2) annak jelzését, hogy a terep vagy a terepen lévő bármilyen akadály a fenti 1) pontban meghatározott felülnézeti rajzon (3 méterrel (10 láb) eltér a középvonal metszésvonalának magasságától és valószínű, hogy a rádió-magasságmérőt befolyásolja;

3) a terep metszetrajzát a futópálya meghosszabbított középvonala mentén a futópálya küszöbtől 900 m (3000 láb) távolságig.

6.5.2 **Ajánlás**. - *Ha a futópálya küszöbétől mért 900 m (3000 láb) távolságon túl lévő terep hegyekkel tűzdelt, vagy a térkép használója számára egyéb szempontból lényeges, akkor a terepmetszetet a futópálya* *küszöbtől mért 2000 métert (6500 láb) meg nem haladó távolságig szükséges ábrázolni.*

6.5.3 **Ajánlás.** - *Az ILS vonatkoztatási pont magasságát a térképen a legközelebbi fél méter, vagy láb pontossággal tüntessék fel.*

7. FEJEZET - ICAO ÚTVONAL TÉRKÉP

7.1 Rendeltetése

E térképen kell közölni a légi-jármű személyzet részére az ATS útvonalakon a légiforgalmi szolgálati eljárások betartásához megfelelő navigációs tevékenységet megkönnyítő információkat.

Megjegyzés. - E térképek egyszerűsített változatai alkalmasak arra, hogy a rádióösszeköttetési és rádió-navigációs táblázatok kiegészítéseként a Légiforgalmi Tájékoztató Kiadványba bekerüljenek.

7.2 Alkalmazási eljárások

7.2.1 Az ICAO Útvonal Térkép-et az 1.3.2 pontban előírt módon el kell készíteni minden olyan területről, ahol repüléstájékoztató körzetet létrehoztak.

Megjegyzés. - Bizonyos körülmények között szükségessé válhat az ICAO Körzeti Térkép elkészítése (lásd a 8. Fejezetet).

7.2.2 Különálló térképet kell biztosítani, ha a légiforgalmi szolgálati útvonalak, a helyzetjelentési követelmények, a repüléstájékoztató körzetek, vagy irányítói körzet területi határvonalak kijelölése a légtérben különféle magassági rétegződés szerint történt és kielégítő átláthatósággal ezek egyetlen térképen nem ábrázolhatók.

7.3 Fedésterület és méretarány

1. Megjegyzés. - Az ilyen típusú térképekre egységes méretarány, a különféle területek változó mértékű adatsűrűsége miatt nem határozható meg.

2. Megjegyzés. - A térkép átlagos méretarányán alapuló vízszintes mérővonal feltüntethető

7.3.1 **Ajánlás.** - *A térképlapok fedésterületének határvonalait az ATS útvonal szerkezet sűrűsége és szerkezeti felépítése alapján szükséges meghatározni.*

7.3.2 A folyamatos útvonal rendszert ábrázoló egymással szomszédos térképek között kerülni kell a nagy méretaránybeli különbségeket.

7.3.3 A navigáció folyamatosságának biztosítása érdekében a térképlapokon megfelelő nagyságú átfedést kell kialakítani.

7.4 Vetület

7.4.1 **Ajánlás.** - *Szögtartó vetületet kell alkalmazni, amelyen az egyenes vonal hozzávetőleg a nagykörrel azonos.*

7.4.2 A szélességi és hosszúsági köröket megfelelő térközönként kell feltüntetni.

7.4.3 A fokbeosztás jelzéseit azonos térközönként kell kiválasztott szélességi és hosszúsági körök vonala mentén elhelyezni.

7.5 Azonosítás

Az egyes térképlapokat a térképsorozat megnevezésével és számmal kell azonosítani.

7.6 Kultúr környezet és terepszint

7.6.1 Az összes nyílt vízfelületet, a nagy tavak és folyók elnagyolt partvonalát fel kell tüntetni kivéve akkor, ha az a térkép rendeltetésével szorosabban összefüggő adatokkal ütközne.

7.6.2 A 7.6.3 pontban előírtak kivételével, az egyes szélességi és hosszúsági körök által alkotott négyzetekben fel kell tüntetni a Terület legkisebb magasságát.

7.6.3 **Ajánlás.** - *A magasabb földrajzi szélességeken fekvő olyan területek esetében, amelyekről az* *illetékes hatóság úgy határozott, hogy a térkép földrajzi északhoz tájolása nem használható, ott a terület tengerszinthez viszonyított legkisebb biztonságos magasságát a használatos hálózati vonalak által alkotott négyzetekbe kell beírni.*

7.6.4 Ha a térkép nem a földrajzi északhoz tájolt, akkor ezt a tényt és az alkalmazott tájolást egyértelműen kötelező jelezni.

7.7 Mágneses eltérés

Ajánlás. - *Az azonos mértékű mágneses eltérések pontjait összekötő vonalakat (isogon) valamint az információ beszerzésének időpontját fel kell tüntetni.*

7.8 Irányok, útirányok és radiálok

7.8.1 A 7.8.2 pontban előírtak kivételével, az irányoknak, útirányoknak és radiáloknak mágneses irányoknak kell lenniük.

7.8.2 **Ajánlás.** - *Ha a magasabb földrajzi szélességű területek esetében az illetékes hatóság úgy határoz, hogy a mágneses Északra való iránymeghatározás nem megfelelő, akkor más alkalmas vonatkozatási alapot, például földrajzi Északot, vagy hálózati Északot kell alkalmazni.*

7.8.3 Ha az irányokat, útirányokat és radiálokat földrajzi Északhoz vagy hálózati Északhoz viszonyítják, ott ezt világosan jelezni kell. Ahol hálózati Északot alkalmaznak, ott ennek a hálózati vonatkoztatási hosszúsági körét azonosítani kell.

7.9 Légiforgalmi adatok

7.9.1 Repülőterek

A nemzetközi polgári repülés által használt minden olyan repülőteret fel kell tüntetni, amelyre műszeres megközelítés végrehajtható.

Megjegyzés. - Az egyéb repülőterek is ábrázolhatók.

7.9.2 Tiltott, korlátozott és veszélyes légterek

Az adott légtérréteget érintő tiltott, korlátozott és veszélyes légtereket, azonosító jelükkel és függőleges határértékeikkel együtt fel kell tüntetni.

7.9.3 Légiforgalmi szolgálatok rendszere

7.9.3.1 Ahol alkalmazható, ott fel kell tüntetni az adott területen kialakított légiforgalmi szolgálati rendszer összetevő elemeit.

7.9.3.1.1 Az alkotóelemek a következőket foglalják magukba:

1) a légiforgalmi szolgálati rendszerhez kapcsolódó rádió-navigációs berendezéseket, neveikkel, azonosítójukkal, frekvenciájukkal és fokokban, fokpercekben, fokmásodpercekben megadott földrajzi koordinátáikkal együtt;

2) DME berendezések vonatkozásában, kiegészítőleg, a DME adó antenna legközelebbi 30 méterre (100 láb) kerekített tengerszinthez viszonyított magasságát;

3) az összes kijelölt légtér feltüntetése, beleértve oldal és magassági határait és a megfelelő légtér-osztály azonosítókat;

4) útvonal repülés céljára biztosított minden ATS útvonalat és útvonal elnevezést, az előírt navigációs teljesítőképesség fajtáját (RNP), az útvonal minden egyes szakaszán mindkét irányban a legközelebbi fokra kerekített útirányt és, ahol alkalmazható, a forgalom áramlási irányát;

5) az ATS útvonalat meghatározó, rádió berendezés nélkül kijelölt minden mérvadó pontot és névkódjaikat, fokokban, fokpercekben, fokmásodpercekben megadott földrajzi koordinátáikkal együtt;

6) a VOR/DME berendezésekkel meghatározott területi navigációs útvonalakat kijelölő útvonal pontok esetében kiegészítésképp:

a) az útvonalat kijelölő VOR/DME berendezés azonosító jelét és rádió frekvenciáját;

b) a legközelebbi tized fokra kerekített irányt és a legközelebbi kéttized kilométerre (egytized tengeri mérföldre) kerekített távolságot az útvonalat kijelölő VOR/DME berendezéstől, ha az útvonal pont nem esik egybe a berendezés telepítési helyével;

7) az összes kötelező és nem-kötelező jelentőpont és az ATS-MET jelentőpont jelölését;

8) a fordulópontként, vagy jelentőpontként szolgáló mérvadó pontok közötti távolságot a legközelebbi tized kilométerre, vagy tengeri mérföldre kerekítve;

Megjegyzés. - A rádió berendezések közötti össz távolság is feltüntethető.

9) VOR berendezésekkel kijelölt útvonalszakaszokon az átkapcsolási pontokat, a navigációs berendezéstől mért és a legközelebbi kilométerre, vagy tengeri mérföldre kerekített távolságot is feltüntetve;

Megjegyzés. - Két rádió-navigációs berendezés között félúton, vagy két radiál metszésénél kialakított minden átkapcsolási pontot minden olyan útvonal szakasz esetében felesleges feltüntetni, amely útvonal iránya a két berendezés között változik, abban az esetben, ha ezen átkapcsolási pontok létezéséről általános nyilatkozatot tesznek közzé.

10) az ATS útvonalak igénybe vehető legalacsonyabb repülési magasságait és a legkisebb akadálymentes magasságait a legközelebbi magasabb 50 méterre, vagy 100 lábra felkerekítve (Lásd 11. Annex 2.22);

11) a kommunikációs létesítmények felsorolását a csatornáikkal és, ha alkalmazható, bejelentkezési címeikkel együtt;

12) a légvédelmi azonosító körzeteket (ADIZ) megfelelően azonosítva.

Megjegyzés: Az ADIZ eljárás a térkép jelmagyarázatában leírható.

7.9.4 Kiegészítő tájékoztatások

7.9.4.1 A közel körzeten belüli érkezési és kirepülési eljárások útvonalát és a kapcsolódó várakozási eljárásokat fel kell tüntetni kivéve, ha ezeket az ICAO Körzeti Térképen, az ICAO Műszeres Szabvány Kirepülési Eljárás Térképen (SID), vagy az ICAO Műszeres Szabvány Érkezési Eljárás Térképen (STAR) megadják.

1. Megjegyzés. - Lásd a 8., 9. és 10. Fejezetet az ezen térképekre vonatkozó előírásokat illetően.

2. Megjegyzés. - A kirepülési útvonalak rendszerint a futópálya végénél kezdődnek, míg az érkezési útvonalak rendszerint annál a pontnál végződnek, ahol a műszeres megközelítési eljárás kezdődik.

7.9.4.2 A magasságmérő beállítási körzeteket –ha van- fel kell tüntetni és azokat azonosítani kell.

8. FEJEZET - ICAO KÖRZETI TÉRKÉP

8.1 Rendeltetése

E térképen kell közölni a légjármű személyzetek részére a műszeres repülés következő szakaszainak végrehajtását megkönnyítő információkat:

a) az utazó repülési szakasz és a repülőtér megközelítési szakasz közötti átmenet;

b) a felszállás/megszakított megközelítés és az utazó repülési szakasz közötti átmenet; és

c) a bonyolult ATS útvonalakkal, vagy légtérszerkezettel rendelkező területeken áthaladó repülési szakasz.

Megjegyzés. - A 8.1 c) pontban leírt rendeltetési cél kielégíthető különálló térképpel, vagy egy, az ICAO Útvonal Térképen beszúrt betét térképpel is.

8.2 Alkalmazási előírások

8.2.1 Az ICAO Körzeti Térkép-et az 1.3.2 pontban előírt módon kell elkészíteni ott, ahol a légiforgalmi szolgálati útvonalak, vagy a helyzetjelentési követelmények bonyolultak és ez az ICAO Útvonal Térkép-en kielégítő módon nem ábrázolható.

8.2.2 Ha a légiforgalmi szolgálati útvonalak, vagy a helyzetjelentési követelmények az érkezésekre és a kirepülésekre eltérőek és az kielégítő láthatósággal egyetlen térképen nem ábrázolható, ott különálló térképet kell biztosítani.

Megjegyzés. - Bizonyos körülmények között szükségessé válhat ICAO Műszeres Szabvány Indulási Eljárási Térképet (SID) és ICAO Műszeres Szabvány Érkezési Térképet (STAR) biztosítani (lásd 9. és 10. Fejezetet).

8.3 Fedésterület és méretarány

8.3.1 Az egyes térképek fedésterülete legyen olyan, hogy a térkép ténylegesen ábrázolja az érkezési és indulási útvonalakat.

8.3.2 A térképet méretarányosan kell rajzolni, feltüntetve a mérő vonalat is.

8.4 Vetület

8.4.1 **Ajánlás.** - *Szögtartó vetületet kell alkalmazni, amelyen az egyenes vonal hozzávetőleg a nagykörrel azonos.*

8.4.2 A szélességi és hosszúsági köröket megfelelő térközönként fel kell tüntetni.

8.4.3 A fokbeosztás jelzéseit azonos térközönként kell a térkép határvonalán elhelyezni.

8.5 Azonosítás

Minden egyes térképlapot az ábrázolt légtérhez kapcsolódó értelmező névvel kell azonosítani.

Megjegyzés. - Ez a név lehet a légiforgalmi szolgálati központ neve, egy, a térkép fedésterületén belül elhelyezkedő város, vagy nagyváros neve, vagy annak a városnak a neve, amelyet a repülőtér kiszolgál. Ha a várost több repülőtér szolgálja ki, akkor annak a repülőtérnek a nevét is hozzá kell tenni, amelyre az eljárások felépülnek.

8.6 Kultúr környezet és terepszint

8.6.1 Az összes nyílt vízfelületet, a nagy tavak és folyók elnagyolt partvonalát fel kell tüntetni kivéve akkor, ha az a térkép rendeltetésével szorosabban összefüggő adatokkal ütközne.

8.6.2 **Ajánlás. -** *A jelentős terep sajátossággal rendelkező területeken a tartózkodási hely tudat fokozása céljából az elsődleges repülőtér szintjétől 300 m-el (1000 láb) magasabb domborzatot halvány szintvonallal, szintvonal értékekkel és a szintkülönbségeket barna színárnyalattal kell feltüntetni. A megfelelő magassági pontokat, beleértve az egyes szintvonal csoportokon belüli legmagasabb pont magasságát fekete színnel nyomtatva kell feltüntetni. A mérvadó akadályokat ugyancsak fel kell tüntetni.*

1. Megjegyzés - A színárnyalás kezdődhet az alap topográfiai térképen az elsődleges repülőtér szintjétől számított 300 m-t (1000 láb) meghaladó következő magasabb alkalmas szintvonal színárnyalásával.

2. Megjegyzés - A szintvonalak és domborzati jellemzők céljára 3. Függelék - Szín Útmutató-ban szerepel az előírt barna szín, amelyet a féltónusú szint árnyaláshoz alapul kell venni.

3. Megjegyzés - A megfelelő magasság pontok és mérvadó akadályok azok, amelyeket az eljárás specialisták biztosítanak.

8.7 Mágneses eltérés

A térkép fedésterületére vonatkozó átlagos mágneses eltéréseket a legközelebbi fokra kerekítve meg kell adni.

8.8 Irányok, útirányok és radiálok

8.8.1 A 8.8.2 pontban előírtakat kivételével, az irányoknak, útirányoknak és radiáloknak mágneses irányoknak kell lenniük.

8.8.2 **Ajánlás. -** *Ha a magasabb földrajzi szélességű területek esetében az illetékes hatóság úgy határoz, hogy a mágneses Északra való iránymeghatározás nem megfelelő, akkor más alkalmas vonatkozatási alapot, például földrajzi Északot, vagy hálózati Északot kell alkalmazni.*

8.8.3 Ha az irányokat, útirányokat és radiálokat földrajzi Északhoz vagy hálózati Északhoz viszonyítják, ott ezt világosan jelezni kell. Ahol hálózati Északot alkalmaznak, ott ennek a hálózati vonatkoztatási hosszúsági körét azonosítani kell.

8.9 Légiforgalmi adatok

8.9.1 Repülőterek

A közel körzeti útvonal vezetést befolyásoló összes repülőteret fel kell tüntetni. Ha szükséges, akkor fel kell tüntetni a futópályák elhelyezkedési rajzát is.

8.9.2 Tiltott, korlátozott és veszélyes légterek

A tiltott, korlátozott és veszélyes légtereket fel kell tüntetni, azonosító jelükkel és függőleges kiterjedtségi határaikkal együtt.

8.9.3 Területi legkisebb repülési magasságok

A szélességi és hosszúsági körök által alkotott négyzetekben fel kell tüntetni a terület tengerszinthez viszonyított legalacsonyabb repülési magasságát.

Megjegyzés. - A térkép választott méretarányának függvényében, a szélességi és hosszúsági körök által alkotott négyzetek rendszerint egész hosszúsági, illetve szélességi fokoknak feleljenek meg.

8.9.4 Légiforgalmi szolgálatok rendszere

8.9.4.1 Az adott területet érintő kialakított légiforgalmi szolgálati rendszer összetevő elemeit fel kell tüntetni.

8.9.4.1.1 Az alkotóelemek a következőket foglalják magukba

1) a légiforgalmi szolgálati rendszerhez kapcsolódó rádió-navigációs berendezéseket, neveikkel, azonosítójukkal, frekvenciájukkal és fokokban, fokpercekben és fok másodpercekben kifejezett földrajzi koordinátáikkal együtt;

2) DME berendezések vonatkozásában, kiegészítésképp, a DME adó antenna tengerszint feletti magasságát a legközelebbi 30 méterre (100 láb) kerekítve;

3) azokat a közel körzeti rádió-navigációs berendezéseket, amelyek az induló és az érkező forgalom számára és a várakozási eljárásokhoz szükségesek;

4) az összes kijelölt légtér oldal és magassági határait és a megfelelő légtér-osztály azonosítókat;

5) a várakozási eljárásokat és a közel körzeti útvonal rendszert az útvonal elnevezésekkel együtt, valamint az előírt légifolyosók és közel körzeti útvonalak egyes szakaszainak legközelebbi fokra kerekített útirányát;

6) a közel körzeti útvonalakat kijelölő rádió-navigációs berendezéssel nem jelölt összes mérvadó pontot névkódjukkal és fokokban, fokpercekben és fokmásodpercekben kifejezett földrajzi koordinátáikkal együtt;

7) a VOR/DME berendezésekkel meghatározott területi navigációs útvonalakat kijelölő útvonal pontok esetében kiegészítésképp:

a) a viszonyítás alapját adó VOR/DME berendezés azonosító jelét és rádió frekvenciáját;

b) a legközelebbi tized fokra kerekített irányt és a legközelebbi kéttized kilométerre (egytized tengeri mérföldre) kerekített távolságot a viszonyítási alapul szolgáló VOR/DME berendezéstől, ha az útvonal pont nem esik egybe a berendezés telepítési helyével;

8) az összes kötelező és nem-kötelező jelentőpontot;

9) a fordulópontként, vagy jelentőpontként szolgáló mérvadó pontok közötti, legközelebbi kilométerre, vagy tengeri mérföldre kerekített távolságot;

Megjegyzés. - A rádió berendezések közötti össz távolság is feltüntethető

10) VOR berendezésekkel kijelölt útvonalszakaszokon az átkapcsolási pontokat, a navigációs berendezésektől mért legközelebbi kilométerre, vagy tengeri mérföldre kerekített távolsággal együtt;

Megjegyzés. - Két rádió-navigációs berendezés között félúton, vagy két radiál metszésénél kialakított minden átkapcsolási pontot minden olyan útvonal szakasz esetében felesleges feltüntetni, amely útvonal *iránya a két berendezés között változik, abban az esetben, ha ezen átkapcsolási pontok létezéséről általános nyilatkozatot tesznek közzé.*

11) az ATS útvonalak legalacsonyabb repülési magasságait és a legkisebb akadálymentes magasságait a legközelebbi magasabb 50 méterre, vagy 100 lábra kerekítve (lásd a 11. Annex 2.22 pontját).

12) a megállapított legkisebb vektorálási magasságokat a legközelebbi magasabb 50 méterre, vagy 100 lábra kerekítve és egyértelműen azonosítva;

1. Megjegyzés. - Ha a közzétett szabvány érkezési, vagy indulási útvonalakon a légi-járművek mérvadó pontokra/ról való rá-, illetve elvezetésére, avagy megközelítés folyamán a legkisebb szektormagasság alá süllyedéshez az engedély kiadásra ATS ellenőrző rendszert alkalmaznak, akkor a vonatkozó eljárás az ICAO Körzeti Térkép-re rajzolhatók feltéve, hogy ez túlzott zsúfoltságot nem okoz.

2. Megjegyzés. - Ha túlzott zsúfoltság keletkezne, akkor ICAO- ATC Ellenőrző Legkisebb Magasság Térkép adható ki (lásd a 21. Fejezetben), amely esetben a 8.9.4.1.1, 12) pontban említett elemeket nem kell az ICAO Körzeti Térkép-en megismételni.

13) a területen alkalmazandó sebesség és repülési szint/tengerszint feletti magasság korlátozásokat, ahol ilyent meghatároztak;

14) a kommunikációs létesítményeket csatornáik és, ha alkalmazható, bejelentkezési címeik felsorolásával együtt.

9. FEJEZET - ICAO MŰSZERES SZABVÁNY INDULÁSI ELJÁRÁS TÉRKÉP (SID)

9.1 Rendeltetése

E térképen kell közölni a légjármű személyzet részére azokat az információkat, amelyek alapján követni tudják a szabvány műszeres indulási útvonalakat a felszállás szakaszától az utazó repülési szakaszig.

1. Megjegyzés. - A szabvány indulási útvonalak azonosítására vonatkozó előírásokat a 11. Annex 3. Függeléke; az ilyen útvonalak kialakítására vonatkozó útmutató anyagot a Légiforgalmi Szolgálatok Tervezési Kézikönyve (Doc 9426) tartalmazza.

2. Megjegyzés. - Az akadálymentességi követelményeket és a közzéteendő legszükségesebb információkkal kapcsolatos részleteket meghatározó előírásokat a PANS-OPS II. Kötet II. Rész (Doc 8168) tartalmazza.

9.2 Alkalmazás

Az ICAO Műszeres Szabvány Indulási Eljárás Térképet (SID) ki kell adni, ha van kialakított szabvány műszeres indulási eljárás és az kielégítő láthatósággal az ICAO Körzeti Térkép-en nem ábrázolható.

9.3 Fedésterület és méretarány

9.3.1 Az egyes térképek fedésterülete legyen olyan, hogy a térkép ténylegesen ábrázolja azt a pontot, ahol az indulási útvonal kezdődik és azt a kijelölt pontot is, ahol egy kijelölt légiforgalmi szolgálati útvonalon az utazó repülés szakasza megkezdhető.

Megjegyzés. - Az indulási útvonal rendszerint a futópálya végénél kezdődik.

9.3.2 **Ajánlás. -** *A térkép legyen méretarányos.*

9.3.3 Ha a térkép méretarányosan készül, akkor a lépték vonalat is fel kell tüntetni.

9.3.4 Ha a térkép nem méretarányosan készül, rajta "NEM MÉRETARÁNYOS" feliratot kell elhelyezni és a méretarány váltási jelzést kell alkalmazni az útvonalakon és a térkép egyéb olyan részletein, amelyek túl nagyok ahhoz, hogy méretarányosan legyenek ábrázolhatók.

9.4 Vetület

9.4.1 **Ajánlás. -** Szögtartó vetületet kell alkalmazni, amelyen az egyenes vonal hozzávetőleg a nagykörrel azonos.

9.4.2 **Ajánlás.**- *Ha a térkép méretarányosan készül, akkor a szélességi és hosszúsági köröket megfelelő* *térközönként fel kell tüntetni.*

9.4.3 A fokbeosztás jelzéseit azonos térközönként kell a térkép szélvonalai mentén elhelyezni.

9.5 Azonosítás

A térkép azonosítása a következőkből álljon: a repülőtér által kiszolgált városnak, vagy körzetnek a neve, a repülőtér nevével egyetemben és a Légi-navigációs Szolgálatok Eljárásai - Légi-jármű Üzemelés (PANS-OPS, Doc 8168) II. Kötet I. Rész, 3. Szakasz 5. Fejezetével egyezésben kialakított műszeres szabvány indulási útvonal(ak) megnevezése.

Megjegyzés. - A műszeres szabvány indulási útvonal(ak) nevét az eljárás specialisták adják.

9.6 Kultúr környezet és domborzat

9.6.1 A méretarányosan rajzolt térkép esetében az összes nyílt vízfelületet, a nagy tavak és folyók elnagyolt partvonalát fel kell tüntetni kivéve akkor, ha az a térkép rendeltetésével szorosabban összefüggő adattal ütközne.

9.6.2 **Ajánlás.** - *A jelentős domborzati sajátossággal rendelkező területeken a tartózkodási hely tudat fokozása céljából a térképet méretarányosan kell készíteni és a repülőtér szintjétől 300 m-el (1000 láb) magasabb domborzatot halvány szintvonallal, szintvonal értékekkel és a szintkülönbségeket barna színárnyalattal kell feltüntetni. A megfelelő magassági pontokat, beleértve az egyes szintvonal csoportokon belüli legmagasabb pont magasságát fekete színnel nyomtatva kell feltüntetni. Az akadályokat ugyancsak fel kell tüntetni.*

1. Megjegyzés - Az alap topográfiai térképen a színárnyalás kezdhető a repülőtér szintjétől számított 300 m-t (1000 láb) meghaladó következő magasabb alkalmas szintvonal színárnyalásával.

2. Megjegyzés - A szintvonalak és domborzati jellemzők céljára 3. Függelék - Szín Útmutató-ban szerepel az az előírt barna szín, amelyet a féltónusú szint árnyaláshoz alapul kell venni.

3. Melléklet - A megfelelő magasság pontok és mérvadó akadályok azok, amelyeket az eljárás specialisták biztosítanak.

9.7 Mágneses eltérés

A mágneses irányok, útirányok és radiálok meghatározásához alkalmazandó legközelebbi fokra kerekített mágneses eltérést fel kell tüntetni.

9.8 Irányok, útirányok és radiálok

9.8.1 Az irányoknak, útirányoknak és radiáloknak mágneses irányoknak kell lenniük, kivéve a 9.8.2 pontban előírtakat.

Megjegyzés. - A térképen feltüntethető egy erre utaló megjegyzés.

9.8.2 **Ajánlás.** - *Ha a magasabb földrajzi szélességű területek esetében az illetékes hatóság döntése szerint a mágneses Északhoz viszonyított iránymeghatározás nem megfelelő, más alkalmas vonatkozatási alapot, például földrajzi Északot, vagy hálózati Északot kell alkalmazni.*

9.8.3 Ha az irányokat, útirányokat és radiálokat földrajzi Északhoz, vagy hálózati Északhoz viszonyítva teszik közzé, ott ezt világosan jelezni kell. Ahol hálózati Északot alkalmaznak, ott ennek a hálózati vonatkoztatási hosszúsági körét azonosítani kell.

9.9 Légiforgalmi adatok

9.9.1 Repülőterek

9.9.1.1 Az indulási repülőteret futópályáinak elhelyezkedését szemléltető jelzésekkel kell ábrázolni.

9.9.1.2 Minden egyes olyan repülőteret fel kell tüntetni és azonosítani kell, amelyek a kijelölt szabvány műszeres indulási eljárások útvonalait befolyásolják. Ahol alkalmazható, ott a futópályák elhelyezkedését szemléltető jelzéseket kell alkalmazni.

9.9.2 Tiltott, korlátozott és veszélyes légterek

Az összes olyan tiltott, korlátozott és veszélyes légteret, amely befolyásolhatja az eljárások végrehajtását, fel kell tüntetni, azonosítójukkal és magassági határaikkal együtt.

9.9.3 Legkisebb szektor magasság

9.9.3.1 Fel kell tüntetni az eljárással kapcsolatos navigációs berendezésre alapozott, legalacsonyabb megállapított szektor magasságot, világosan jelezve, hogy az melyik szektorra vonatkozik.

9.9.3.2 Ha a legkisebb szektor magasságot nem határozták meg, akkor a térképet méretarányosan kell megrajzolni és a hosszúsági és szélességi körök által határolt négyzetekben fel kell tüntetni a területi legkisebb magasságokat. A területi legkisebb magasságokat a térkép azon részein ugyancsak fel kell tüntetni, amely területeket a legkisebb szektor magasságok nem fednek le.

Megjegyzés. - A térkép választott méretarányának függvényében, a szélességi és hosszúsági körök által alkotott négyzetek rendszerint fél hosszúsági, illetve szélességi fokoknak feleljenek meg.

9.9.4 Légiforgalmi szolgálatok rendszere

9.9.4.1 A vonatkozó légiforgalmi szolgálati rendszer összetevő elemeit fel kell tüntetni.

9.9.4.1.1 Ezek az összetevő elemek foglalják magukba a következőket:

1) minden szabvány műszeres indulási útvonal grafikus ábrázolása, beleértve a:

a) az útvonal elnevezését;

b) az útvonalat kijelölő fontos pontokat;

c) az útvonalak egyes szakaszain a legközelebbi fokra kerekített útirányokat, vagy radiálokat;

d) a fontos pontok közötti legközelebbi egész kilométer, vagy tengeri mérföld értékre kerekített távolságokat;

e) az útvonalak, vagy az útvonal szakaszok a legközelebbi magasabb 50 méterre, vagy 100 lábra kerekített tengerszint feletti legkisebb repülési magasságait, az eljárás által előírt magasságokat, illetve a repülési szint korlátozásokat, ahol ilyen létezik;

f) ha a térkép méretarányos és az indulás során irányvezetés biztosított, a legközelebbi magasabb 50 méterre, vagy 100 lábra kerekített, egyértelműen azonosított, közzétett legkisebb vektorálási magasságot;

1. Megjegyzés. - Ha a közzétett szabvány indulási útvonalon a légi-járművek mérvadó pontokra/ról való rá-, illetve elvezetésére ATS ellenőrző rendszert alkalmaznak, akkor a vonatkozó eljárás az ICAO Szabvány Műszeres Indulási Eljárás Térkép (SID)-re rajzolható, feltéve, hogy ez túlzott zsúfoltságot nem okoz.

2. Megjegyzés. - Ha túlzott zsúfoltság keletkezne, akkor ICAO – ATC Ellenőrző Legkisebb Magasság Térkép adható ki (lásd a 21. Fejezetben), amely esetben a 9.9.4.1.1, 1) f) pontban említett elemeket nem kell az ICAO Szabvány Műszeres Indulási Eljárás Térkép (SID)-en megismételni.

2) az útvonalakhoz kapcsolódó rádió-navigációs berendezéseket, beleértve:

a) nyílt nyelvű nevüket;

b) azonosító jeleiket;

c) frekvenciájukat;

d) fokokban, fokpercekben és fokmásodpercekben kifejezett földrajzi koordinátáikat;

e) DME berendezésnél a csatorna számot és a DME berendezés adó antennájának tengerszinthez viszonyított magasságát a legközelebbi 30 méterre (100 láb) kerekítve;

3) rádió berendezés telepítési helyével ki-nem-jelölt minden mérvadó pontot névkódjával és fokokban, fokpercekben és fok másodpercekben kifejezett földrajzi koordinátáival egyetemben, továbbá a legközelebbi tized fokra kerekített irányát és a legközelebbi kéttized kilométerre (egytized tengeri mérföldre) kerekített távolságát a viszonyítási alapul szolgáló rádió berendezéstől;

4) az alkalmazható várakozási eljárásokat;

5) a legközelebbi magasabb 300 méterre, vagy 1000 lábra kerekített átváltási magasságot/tengerszint feletti magasságot;

6) az akadály felmérő síkon (OIS) túlnyúló közeli akadályok helyzetét és magasságát. Minden esetben egy kiegészítő megjegyzést kell közzétenni, ha a közeli akadályok túlnyúlnak az akadály felmérő síkon (OIS), amelyeket azonban a közzétett eljárás tervezési gradiensénél nem vettek figyelembe;

Megjegyzés. A PANS-OPS II. Kötetével egyezésben, a közeli akadályokra vonatkozó adatokat az eljárás specialisták adják meg.

7) a területi sebesség korlátozásokat, ahol ilyent meghatároztak;

8) az összes kötelező és kérésre alkalmazandó jelentőpontot;

9) a rádióösszeköttetési eljárásokat, beleértve:

a) az ATS egységek hívójeleit;

b) frekvenciáját;

c) a válasz jeladó kód beállítást, ahol szükséges.

9.9.4.2 **Ajánlás.** - *A műszeres szabvány indulási útvonal (SID) szöveges leírását és a vonatkozó rádióösszeköttetés megszakadása esetén alkalmazandó eljárások leírását meg kell adni és amikor csak lehetséges, ezeket a térképen, vagy a térképet magába foglaló oldalon kell feltüntetni.*

9.9.4.3 Légiforgalmi adatbázis követelmények

A navigációs adatbázis kódolást támogató megfelelő adatokat a Légi-navigációs Szolgálatok Eljárásai – Légi-jármű Üzemeltetés (PANS-OPS, DOC 8168), II. Kötet, III. Rész, 5. Szakasz, 2. Fejezet, 2.1 pontja szerint kell közzétenni, vagy a térkép hátoldalán, vagy egy megfelelő hivatkozásokkal ellátott különálló lapon.

Megjegyzés.- A megfelelő adatok azok, amelyeket az eljárás specialisták biztosítanak.

10. FEJEZET - ICAO MŰSZERES SZABVÁNY ÉRKEZÉSI ELJÁRÁS TÉRKÉP (STAR)

10.1 Rendeltetése

E térképen kell közölni a légjármű személyzet részére azokat az információkat, amelyek alapján követni tudja a szabvány műszeres érkezési útvonalakat az útvonal repülési szakasztól a megközelítési szakaszig.

1. Megjegyzés. - A "szabvány műszeres érkezési útvonal" fogalom értelme magában foglalja a "süllyedés profil" és a "folyamatos süllyedéssel végzett megközelítés" valamint egyéb, nem szabványos eljárás leírásokat is. Szabvány süllyedési profil esetében az oldalnézeti ábrázolás nem szükséges.

2. Megjegyzés. - A szabvány érkezési útvonalak azonosítására vonatkozó előírásokat a 11. Annex 3. Függeléke; míg az ilyen útvonalak kialakítására vonatkozó útmutató anyagot a Légiforgalmi Szolgálatok Tervezési Kézikönyve (Doc 9426) tartalmazza

10.2 Alkalmazási rendelkezések

Az ICAO Műszeres Szabvány Érkezési Eljárás Térkép-et (STAR) mindig ki kell adni, ha van kialakított szabvány műszeres megközelítési eljárás és az kielégítő láthatósággal az ICAO Körzeti Térkép-en nem ábrázolható.

10.3 Fedésterület és méretarány

10.3.1 Az egyes térképek fedésterülete legyen olyan, hogy a térkép tartalmazza azokat a pontokat, amelyeknél az utazó szakasz végződik és azokat, amelyeknél a megközelítés szakasza kezdődik.

10.3.2 **Ajánlás**. - *A térkép legyen méretarányos.*

10.3.3 Ha a térkép méretarányosan készül, akkor a lépték vonalat is fel kell tüntetni.

10.3.4 Ha a térkép nem méretarányosan készül, rajta "NEM MÉRETARÁNYOS" feliratot kell elhelyezni és a méretarány váltási jelzést kell alkalmazni az útvonalakon és a térkép egyéb olyan részletein, amelyek túl nagyok ahhoz, hogy méretarányosan legyenek ábrázolhatók.

10.4 Vetület

10.4.1 **Ajánlás. -** Szögtartó vetületet kell alkalmazni, amelyen az egyenes vonal hozzávetőleg a nagykörrel azonos.

10.4.2 **Ajánlás. -** Ha a térkép méretarányosan készül, akkor a szélességi és hosszúsági köröket megfelelő térközönként fel kell tüntetni.

10.4.3 A fokbeosztás jelzéseit azonos térközönként kell a térkép oldalvonalán elhelyezni.

10.5 Azonosítás

A térkép azonosítása a következőkből álljon: a repülőtér által kiszolgált városnak, vagy körzetnek a neve, a repülőtér nevével egyetemben és a Légi-navigációs Szolgálatok Eljárásai - Légi-jármű Üzemelés (PANS-OPS, Doc 8168) II. Kötet I. Rész, 4. Szakasz, 2. Fejezetével egyezésben kialakított műszeres szabvány érkezési útvonal(ak) megnevezése.

Megjegyzés. - A műszeres szabvány érkezési útvonal(ak) nevét az eljárás specialisták adják.

10.6 Kultúr környezet és tereprajz

10.6.1 Ha a térképet méretarányosan rajzolták, akkor az összes nyílt vízfelületet, a nagy tavak és folyók elnagyolt partvonalát fel kell tüntetni kivéve akkor, ha az a térkép rendeltetésével szorosabban összefüggő adattal ütközne.

10.6.2 **Ajánlás**. - *A jelentős szin különbséggel bíró területeken a tartózkodási hely tudat fokozása céljából a térképet méretarányosan kell készíteni és a repülőtér szintjétől 300 m-el (1000 láb) magasabb domborzatot halvány szintvonallal, szintvonal értékekkel és a szintkülönbségeket barna színárnyalattal kell feltüntetni. A megfelelő magassági pontokat, beleértve az egyes szintvonal csoportokon belüli legmagasabb pont magasságát fekete színnel nyomtatva kell feltüntetni. Az akadályokat ugyancsak fel kell tüntetni.*

1. Megjegyzés - - Az alap topográfiai térképen a színárnyalás kezdődhet a repülőtér szintjétől számított 300 m-t (1000 láb) meghaladó következő magasabb alkalmas szintvonal színárnyalásával.

2. Megjegyzés - A szintvonalak és domborzati jellemzők céljára 3. Függelék - Szín Útmutató-ban szerepel az az előírt barna szín, amelyet a féltónusú szint árnyaláshoz alapul kell venni.

3. Melléklet - A megfelelő magasság pontok és mérvadó akadályok azok, amelyeket az eljárás specialisták biztosítanak

10.7 Mágneses eltérés

A mágneses irányok, útirányok és radiálok meghatározásához alkalmazandó legközelebbi fokra kerekített mágneses eltérést fel kell tüntetni.

10.8 Irányok, útirányok és radiálok

10.8.1 Az irányoknak, útirányoknak és radiáloknak mágneses irányoknak kell lenniük, kivéve a 10.8.2 pontban előírtakat.

Megjegyzés. - A térképen feltüntethető egy erre utaló megjegyzés.

10.8.2 **Ajánlás. -** *Ha a magasabb földrajzi szélességű területek esetében az illetékes hatóság döntése szerint a mágneses Északhoz viszonyított iránymeghatározás nem megfelelő, más alkalmas vonatkozatási alapot, például földrajzi Északot, vagy hálózati Északot kell alkalmazni.*

10.8.3 Ha az irányokat, útirányokat és radiálokat földrajzi Északhoz, vagy hálózati Északhoz viszonyítva teszik közzé, ott ezt világosan jelezni kell. Ahol hálózati Északot alkalmaznak, ott ennek a hálózati vonatkoztatási hosszúsági körét azonosítani kell.

10.9 Légiforgalmi adatok

10.9.1 Repülőterek

10.9.1.1 A leszállás repülőterét futópályáinak elhelyezkedését szemléltető jelzésekkel kell ábrázolni.

10.9.1.2 A kijelölt szabvány műszeres érkezési eljárások útvonalait befolyásoló minden egyes repülőteret fel kell tüntetni és azonosítani kell. Ahol alkalmazható, ott a futópályák elhelyezkedését szemléltető jelzéseket kell alkalmazni.

10.9.2 Tiltott, korlátozott és veszélyes légterek

Az eljárások végrehajtását esetleg befolyásoló minden tiltott, korlátozott és veszélyes légteret fel kell tüntetni, azonosítójukkal és magassági határaikkal együtt.

10.9.3 Legkisebb szektor magasság

10.9.3.1 A szektor megállapított legkisebb magasságot -ha meghatározták-, fel kell tüntetni, világosan jelezve, hogy melyik szektorra vonatkozik.

10.9.3.2 Ha a legkisebb szektor magasságot nem határozták meg, akkor a térképet méretarányosan kell megrajzolni és a hosszúsági és szélességi körök által határolt négyzetekben fel kell tüntetni a területi legkisebb magasságokat. A területi legkisebb repülési magasságokat a térkép azon részein ugyancsak fel kell tüntetni, amelyeket a legkisebb szektorok magasságok nem fednek le.

Megjegyzés. - A térkép választott méretarányának függvényében, a szélességi és hosszúsági körök által alkotott négyzetek rendszerint fél hosszúsági, illetve szélességi fokoknak feleljenek meg.

10.9.4 Légiforgalmi szolgálatok rendszere

10.9.4.1 A vonatkozó légiforgalmi szolgálati rendszer összetevő elemeit fel kell tüntetni.

10.9.4.1.1 Ezek az összetevő elemek foglalják magukba a következőket:

1) minden szabvány műszeres érkezési útvonal grafikus ábrázolása, beleértve:

a) az útvonal elnevezését;

b) az útvonalat kijelölő fontos pontokat;

c) az útvonal szakaszainak legközelebbi egész fokértékre kerekített útirányait, vagy radiáljait;

d) a fontos pontok közötti legközelebbi egész kilométer érékre, vagy tengeri mérföldre kerekített távolságokat;

e) az útvonalak, vagy az útvonal szakaszok legközelebbi magasabb 50 méterre, vagy 100 lábra kerekített legkisebb akadálymentes magasságait és az eljárás által előírt magasságokat, illetve a repülési szintkorlátozásokat, ahol ilyen létezik;

f) ha a térkép méretarányos és az érkezés során irányvezetés biztosított, a legközelebbi magasabb 50 méterre, vagy 100 lábra kerekített, egyértelműen azonosított, közzétett legkisebb vektorálási magasságot;

1. Megjegyzés. - Ha a közzétett szabvány érkezési útvonalon a légi-járművek mérvadó pontokra/ról való rá-, illetve elvezetésére, vagy az érkezés során a legkisebb szektor magasság alá süllyedés engedélyének kiadásához ATS ellenőrző rendszert alkalmaznak, akkor a vonatkozó eljárás az ICAO Szabvány Műszeres Érkezési Eljárás Térkép (STAR)-ra rajzolható, feltéve, hogy ez túlzott zsúfoltságot nem okoz.

2. Megjegyzés. - Ha túlzott zsúfoltság keletkezne, akkor ICAO – ATS Ellenőrző Legkisebb Magasság Térkép adható ki (lásd a 21. Fejezetben), amely esetben a 10.9.4.1.1, 1) f) pontban említett elemeket nem kell az ICAO Szabvány Műszeres Érkezési Eljárás Térkép (STAR)-on megismételni.

2) az útvonalakhoz kapcsolódó rádió-navigációs berendezéseket, beleértve:

a) nyílt nyelvű elnevezéseiket;

b) azonosító jeleiket;

c) frekvenciájukat;

d) földrajzi fokokban, fokpercekben és fokmásodpercben kifejezett koordinátáikat;

e) DME berendezésnél a csatorna számot és a DME berendezés adó antennájának tengerszinthez viszonyított magasságát a legközelebbi 30 méterre (100 láb) kerekítve;

3) rádió berendezés telepítési helyével ki-nem-jelölt minden mérvadó pontot névkódjával és fokokban, fokpercekben és fok másodpercekben kifejezett földrajzi koordinátáival egyetemben, továbbá a legközelebbi tized fokra kerekített irányát és a legközelebbi kéttized kilométerre (egytized tengeri mérföldre) kerekített távolságát a viszonyítási alapul szolgáló rádió berendezéstől;

4) az alkalmazható várakozási eljárásokat;
5) a legközelebbi magasabb 300 méterre, vagy 1000 lábra kerekített átváltási magasságot/tengerszint feletti magasságot;
6) a területi sebesség korlátozásokat, ahol ilyent meghatároztak;
7) az összes kötelező és a kérésre alkalmazandó jelentőpontot;
8) a rádióösszeköttetési eljárásokat, beleértve:
a) az ATS egységek hívójeleit;
b) frekvenciáját;
c) a válasz jeladó kód beállítást, ahol szükséges.
10.9.4.2 **Ajánlás.** - *A műszeres szabvány érkezési útvonal (STAR) szöveges leírását és a vonatkozó rádióösszeköttetés megszakadása esetén alkalmazandó eljárások leírását meg kell adni, és amikor csak lehetséges, ezeket a térképen, vagy a térképet magába foglaló oldalon kell feltüntetni.*
10.9.4.3 Légiforgalmi adatbázis követelmények
A navigációs adatbázis kódolást támogató megfelelő adatokat a Légi-navigációs Szolgálatok Eljárásai – Légi-jármű Üzemeltetés (PANS-OPS, DOC 8168), II. Kötet, III. Rész, 5. Szakasz, 2. Fejezet, 2.2 pontja szerint kell közzétenni, vagy a térkép hátoldalán, vagy egy megfelelő hivatkozásokkal ellátott különálló lapon.
Megjegyzés.- A megfelelő adatok azok, amelyeket az eljárás specialisták biztosítanak.

11. FEJEZET - ICAO MŰSZERES MEGKÖZELÍTÉSI TÉRKÉP

11.1 Rendeltetése
E térképen kell közölni a légjármű személyzet részére azt az információt, amely lehetővé teszi számukra a jóváhagyott műszeres megközelítési eljárás végrehajtását arra a futópályára, amelyre a leszállást végre kívánják hajtani, beleértve a megszakított megközelítési eljárás végrehajtását és, ahol alkalmazható, a kapcsolódó várakozási eljárásokat is.
Megjegyzés. - A műszeres megközelítési eljárások kialakítására és a kapcsolódó tengerszint/terep szint feletti magasságok felbontási nagyságrendjére vonatkozó részletes előírásokat a Légi-navigációs Szolgálatok Eljárásai - Légi-jármű üzemeltetés (PANS-OPS, Doc 8168) tartalmazza.

11.2 Alkalmazási rendelkezések
11.2.1 Az ICAO Műszeres Megközelítési Térképet, a nemzetközi polgári repülés által használt minden olyan repülőtérről ki kell adni, amelyre az illető állam műszeres megközelítési eljárásokat alakított ki.
11.2.2 Az állam által kialakított minden precíziós műszeres megközelítési eljárásra általában különálló műszeres megközelítési térképet kell biztosítani.
11.2.3 Általában külön műszeres megközelítési térképet kell biztosítani az állam által kialakított minden nem-precíziós műszeres megközelítési eljárásra.
Megjegyzés. - Egyetlen lapra nyomtatott precíziós, vagy nem-precíziós megközelítési térkép is kiadható, amikor több olyan megközelítési eljárást tüntetnek fel, amelyek közbeeső megközelítési, befejező megközelítési és a megszakított megközelítési eljárási szakaszaik azonosak.
11.2.4 Több térképlapot kell készíteni akkor, ha a műszeres megközelítési eljárás befejező szakaszán kívül, a különféle légi-jármű kategóriákra vonatkozó útirányok, az idő, vagy a tengerszint feletti magasság értékek eltérőek és ezek egyetlen térképlapon való felsorolása zavart, vagy tévesztést idézhet elő.
Megjegyzés. - A légi-jármű kategóriákat illetően lásd a Légi-navigációs Szolgálatok Eljárásai – Légi-jármű üzemeltetés (PANS-OPS, Doc 8168), II. Kötet, I. Rész, 4. Szakasz, 9. Fejezetét.
11.2.5 Az "ICAO Műszeres Megközelítési Térkép"-et kötelező helyesbíteni, amikor a biztonságos üzemeltetéshez szükséges nélkülözhetetlen adatok elavulttá válnak.

11.3 Fedésterület és méretarány

11.3.1 Az egyes térképek fedésterülete kellően nagy legyen, hogy a műszeres megközelítési eljárás minden szakasza és az olyan kiegészítő területek ábrázolhatók legyenek, amelyek a tervezett megközelítési fajta esetében szükségesek lehetnek.

11.3.2 A választott méretarány optimális olvashatóságot biztosítson:

1) a térképen ábrázolt eljárás; és

2) a lapméret

figyelembevételével.

11.3.3 Méretarány jelzést biztosítani kell.

11.3.3.1 Ha megvalósítható, a térképen egy 20 km (10 tengeri mérföld) sugarú kört kell ábrázolni, amelynek középpontja vagy a repülőtéren, vagy annak szomszédságában telepített DME berendezés, vagy -ha alkalmas DME berendezés nincs- a repülőtér vonatkoztatási pontja; a sugár méretét a köríven ki kell írni.

11.3.3.2 **Ajánlás. -** *Közvetlenül a metszeti ábrázolás alatt, távolság mérővonal feltüntetése szükséges.*

11.4 Formátum

Ajánlás. *- A lapméret 210 × 148 mm (8,27 × 5,82 hüvelyk) legyen.*

11.5 Vetület

11.5.1 Szögtartó vetületet kell alkalmazni, amelyen az egyenes vonal hozzávetőleg a nagykörrel azonos.

11.5.2 **Ajánlás. -** *A fokbeosztás jelzéseit azonos térközönként kell a térkép oldalvonalán elhelyezni.*

11.6 Azonosítás

11.6.1 A térkép azonosítása a következőkből álljon: a repülőtér által kiszolgált városnak, vagy körzetnek a neve, a repülőtér neve és a Légi-navigációs Szolgálatok Eljárásai – Légi-jármű Üzemelés (PANS-OPS, Doc 8168) II. Kötet I. Rész, 4. Szakasz, 1. Fejezetével egyezésben kialakított műszeres megközelítési eljárás megnevezése.

Megjegyzés. – A műszeres megközelítési eljárás nevét az eljárás specialisták adják.

11.7 Kultúr környezet és domborzat

11.7.1 A szabvány műszeres megközelítési eljárás biztonságos végrehajtásához tartozó nélkülözhetetlen összes topográfiai információt fel kell tüntetni, ideértve a megszakított megközelítési eljárásokat, a kapcsolódó várakozási eljárásokat és a látással végzett manőverezést (körözést) is, ahol ilyent kialakítottak. Az ilyen terepjellegzetességeket csak akkor kell elnevezésükkel megjelölni, ha az eljárások érthetőségének növeléséhez ez szükséges. Legalább a nagyobb földterületeket valamint lényegesebb folyók és tavak körvonalát kell jelezni.

11.7.2 A domborzatot a terület sajátos magassági jellegzetességeinek legjobban megfelelő módon kell ábrázolni. Olyan térségekben, ahol a térkép fedésterületén belül a repülőtér szintjétől számított domborzat magassága 1200 m-nél (4000 láb) magasabb, vagy a repülőtér vonatkozási pontjától mért 11 km-en (6 tengeri mérföld) belül 600 m-nél (2000 láb) magasabb, avagy ha a befejező megközelítés, vagy a megszakított megközelítés gradiense az optimumnál meredekebb a domborzatnak betudhatóan, akkor a repülőtér szintjétől 150 m-el (500 láb) magasabb minden domborzatot halvány szintvonallal, szintvonal értékekkel és a szintkülönbségeket barna színárnyalattal kell feltüntetni. A megfelelő magassági pontokat, beleértve az egyes szintvonal csoportokon belüli legmagasabb pont magasságát fekete színnel nyomtatva kell feltüntetni.

1. Megjegyzés - A színárnyalás kezdődhet az alap topográfiai térképen feltüntetett és a repülőtér szintjétől számított 150 m-t (500 láb) meghaladó következő magasabb alkalmas szintvonal színárnyalásával.

2. Megjegyzés - A szintvonalak és domborzati jellemzők céljára a 3. Függelék - Szín Útmutató-ban szerepel az az előírt barna szín, amelyet a féltónusú szint árnyaláshoz alapul kell venni.

3. Megjegyzés - A megfelelő magasság pontok és mérvadó akadályok azok, amelyeket az eljárás specialisták biztosítanak.
11.7.3 **Ajánlás. -** *Az olyan területeken, ahol a domborzat alacsonyabb a 11.7.2-ben meghatározottaktól, ott a repülőtér szintjétől 150 m-el (500 láb) magasabb minden domborzatot halvány szintvonallal, szintvonal értékekkel és a szintkülönbségeket barna színárnyalattal kell feltüntetni. A megfelelő magassági pontokat, beleértve az egyes szintvonal csoportokon belüli legmagasabb pont magasságát fekete színnel nyomtatva kell feltüntetni.*
1. Megjegyzés - A színárnyalás kezdődhet az alap topográfiai térképen feltüntetett és a repülőtér szintjétől számított 150 m-t (500 láb) meghaladó következő magasabb alkalmas szintvonal színárnyalásával.
2. Megjegyzés - A szintvonalak és domborzati jellemzők céljára 3. Függelék - Szín Útmutató-ban szerepel az az előírt barna szín, amelyet a féltónusú szint árnyaláshoz alapul kell venni.
3. Megjegyzés - A megfelelő magasság pontok és mérvadó akadályok azok, amelyeket az eljárás specialisták biztosítanak.

11.8 Mágneses eltérés

11.8.1 **Ajánlás. -** *A mágneses eltérést fel kell tüntetni.*
11.8.2 Ha a legközelebbi egész fokra kerekített mágneses eltérést feltüntetik, akkor annak értéke egyezzen meg a mágneses irányok, útirányok és radiálok meghatározásához alkalmazott értékével.

11.9 Irányok, útirányok és radiálok

11.9.1 Az irányoknak, útirányoknak és radiáloknak mágneses irányoknak kell lenniük, kivéve a 11.9.2 pontban előírtakat.
Megjegyzés. - A térképen feltüntethető egy erre utaló megjegyzés.
11.9.2 **Ajánlás.** - *Ha a magasabb földrajzi szélességű területek esetében az illetékes hatóság döntése szerint a mágneses Északhoz viszonyított iránymeghatározás nem megfelelő más alkalmas vonatkozatási alapot, például földrajzi Északot, vagy hálózati Északot kell alkalmazni.*
11.9.3 Ha az irányokat, útirányokat és radiálokat földrajzi Északhoz, vagy hálózati Északhoz viszonyítva teszik közzé, ott ezt világosan jelezni kell. Ahol hálózati Északot alkalmaznak, ott ennek a hálózati vonatkoztatási hosszúsági körét azonosítani kell.

11.10 Légiforgalmi adatok

11.10.1 Repülőterek

11.10.1.1 A levegőből jellegzetes rajzolatot mutató minden repülőteret megfelelő jelöléssel kell feltüntetni a térképen. Az üzemen kívül helyezett repülőtereket "üzemen kívül"- ként kell megjelölni.
11.10.1.2 A futópályák elhelyezkedését a repülőtér egyértelmű szemléltetéséhez elégséges nagyságú méretben kell feltüntetni:
1) arra a repülőtérre, amelyre az eljárás alapszik;
2) az olyan repülőterekre, amelyek érintik a forgalmi kört, vagy úgy helyezkednek el, hogy kedvezőtlen időjárási körülmények esetén összetéveszthetők a tervezett leszállás repülőterével.
11.10.1.3 A repülőtér legközelebbi méterre, vagy lábra kerekített tengerszint feletti magasságát a térképen szembeötlő helyen kell feltüntetni.
11.10.1.4 A térképen fel kell tüntetni a küszöb tengerszinthez viszonyított legközelebbi méterre, vagy lábra kerekített magasságát, vagy ahol alkalmazható, a földet érési zóna legmagasabb pontjának legközelebbi méterre, vagy lábra kerekített tengerszint feletti magasságát.

11.10.2 Akadályok

11.10.2.1 Az akadályokat a repülőtér felülnézeti ábrázolásán fel kell tüntetni.
Megjegyzés. - A megfelelő akadályok azok, amelyeket az eljárás specialisták adnak meg.
11.10.2.2 **Ajánlás.** - *Ha valamely akadálymentességi/tengerszint feletti magasság meghatározó tényezője egy, vagy több akadály, akkor ezeket az akadályokat azonosítani kell.*

11.10.2.3 Az akadályok tetejének tengerszinthez viszonyított magasságát a legközelebbi (magasabb) méterre, vagy lábra kerekítve kell közzétenni.
11.10.2.4 **Ajánlás.** - *Az akadályok magasságát a közepes tengerszinttől eltérő alapszinttől mérten is fel kell tüntetni (lásd 11.10.2.3). Ha ilyen magasságokat is feltüntetnek, akkor ezeket zárójelbe téve kell a térképen ábrázolni.*
11.10.2.5 Ha az akadályok magasságát a közepes tengerszinttől eltérő egyéb vonatkoztatási alaphoz viszonyítva tüntetik fel, akkor e vonatkoztatás alapja a repülőtér tengerszinthez viszonyított magassága legyen, kivéve az olyan repülőterek esetében, amelyek műszeres futópályája (vagy pályái) küszöbének tengerszinthez viszonyított magassága több, mint 2 méterrel (7 láb) alacsonyabb, mint a repülőtér tengerszinthez viszonyított magassága, mert ilyen esetben a térkép vonatkoztatási alapja annak a küszöbnek a tengerszinthez viszonyított magassága legyen, amelyre a műszeres megközelítés vonatkozik.
11.10.2.6 Ha nem a közepes tengerszintet használják vonatkoztatási alapul, akkor ezt a térképen szembetűnő helyen közzé kell tenni.
11.10.2.7 Ha az I. kategóriás precíziós megközelítési futópályára akadály mentes zónát nem hoztak létre, ott ezt jelezni kell.

11.10.3 Tiltott, korlátozott és veszélyes légterek

Az eljárások végrehajtását befolyásoló tiltott, korlátozott és veszélyes légtereket azonosítójukkal és magassági határaikkal együtt fel kell tüntetni.

11.10.4 Rádióösszeköttetési berendezések és navigációs eszközök

11.10.4.1 Az eljárásokhoz szükséges rádió-navigációs eszközöket frekvenciával, azonosító jellel és útirány meghatározó jellemzőikkel - ha vannak - kell feltüntetni. A befejező megközelítés pályáján egynél több berendezést tartalmazó eljárás esetében a befejező megközelítésben iránykövetéshez alkalmazott berendezést egyértelműen kell azonosítani. Továbbá, fontolóra kell venni, hogy a megközelítési térképen lehetőleg ne tüntessék fel az eljárás folyamán nem alkalmazott berendezéseket.
11.10.4.2 A kezdeti megközelítési fixét (IAF), a közbenső megközelítési fixet (IF), a befejező megközelítési fixet (FAF) (vagy ILS eljárás esetén a befejező megközelítési pontot (FAP)), a megszakított megközelítési pontot (MAPt), ha létrehozták, és az eljárásban foglalt és ahhoz nélkülözhetetlen minden egyéb fixet és pontot fel kell tüntetni és azonosítani kell azokat.
11.10.4.3 **Ajánlás.** - *A befejező megközelítés fixét (vagy ILS eljárás esetén a befejező megközelítési pontot) fokokban, fokpercekben és fokmásodpercekben megadott földrajzi koordinátáival kell azonosítani.*
11.10.4.4 Az alternatív eljárásoknál használható rádió-navigációs berendezéseket, azok útirány meghatározó jellemzőikkel, ha van ilyen, fel kell tüntetni, vagy jelezni kell a térképen.
11.10.4.5 Az eljárás végrehajtásához szükségesek rádióösszeköttetési frekvenciákat, beleértve a hívójeleket is, fel kell tüntetni.
11.10.4.6 A befejező megközelítési szakasz által érintett minden rádió-navigációs berendezés repülőtértől mért, legközelebbi egész kilométerre, vagy tengeri mérföldre kerekített távolságát kötelező feltüntetni, ha az az eljáráshoz szükséges. Ha nincs berendezés a repülőtérre vezető útirány meghatározásához, akkor az irányt a legközelebbi egész fokra kerekítve kell feltüntetni.

11.10.5 Legkisebb szektor magasság, vagy közel-forgalmi érkezési magasság

Az illetékes hatóság által megállapított legalacsonyabb szektormagasságot, vagy közel-forgalmi érkezési magasságot a vonatkozó szektor egyértelmű jelölésével együtt kell feltüntetni.

11.10.6 Az eljárások útirányainak ábrázolása

11.10.6.1 A felülnézeti rajz -az alább megadott módon- a következő információt ábrázolja,:
a) a megközelítési eljárás útirányát nyilazott folyamatos vonallal, ahol a nyilak a repülés irányát jelzik;
b) a megszakított megközelítés útirányát nyilazott szaggatott vonallal;
c) nyilazott pontozott vonallal minden egyéb, az a), vagy a b) pontban megadottaktól eltérő kiegészítő

eljárás útirányát;
d) az eljáráshoz szükséges legközelebbi egész fokra kerekített irányokat, útirányokat, radiálokat és a legközelebbi kéttized kilométerre, vagy tized tengeri mérföldre kerekített távolságokat, vagy az eljáráshoz előírt időtartamokat;
e) ha az útirány meghatározására nincs navigációs berendezés, a befejező megközelítési szakasz által érintett navigációs berendezéstől a repülőtérre vezető, legközelebbi egész fokra kerekített mágneses irányt;
f) minden olyan szektor határvonalát, amelyben a látásos manőverezés (körözés) tiltott;
g) ahol kijelölték, ott a megközelítéshez és a megszakított megközelítéshez kapcsolódó várakozási eljárást és a várakozás legalacsonyabb tengerszint feletti magasságát/magasságait;
h) ahol szükséges, a térkép előlapján szembetűnő helyen feltüntetett figyelmeztető megjegyzéseket.
11.10.6.2 **Ajánlás.** - *A felülnézeti rajzon fel kell tüntetni a befejező megközelítési szakasz által érintett minden navigációs berendezésnek a repülőtértől mért távolságát.*
11.10.6.3 Rendszerint a felülnézeti rajz alatt, a következő adatokat feltüntető metszetrajzot kell biztosítani:
a) a repülőteret tömör négyszöggel ábrázolva, a repülőtér tengerszinthez viszonyított magasságánál;
b) a megközelítési eljárás oldalnézeti nyomvonalát nyilazott folyamatos vonallal, ahol a nyíl a repülés irányát jelzi.
c) a megszakított megközelítés oldalnézeti nyomvonalát nyilazott szaggatott vonallal és az eljárás leírásával;
d) nyilazott pontozott vonallal minden egyéb kiegészítő, a b) és c) pontban leírtaktól eltérő eljárás oldalnézeti nyomvonalát;
e) az eljáráshoz szükséges legközelebbi egész fokra kerekített irányokat, útirányokat, radiálokat és a legközelebbi kéttized kilométerre, vagy tized tengeri mérföldre kerekített távolságokat, vagy az eljáráshoz előírt időtartamokat;
f) az eljáráshoz szükséges tengerszint/terepszint feletti magasságokat, beleértve az átváltási magasságot is és az eljárásban előírt magasságokat, ahol ilyet kijelöltek;
g) az eljárási forduló legközelebbi egész kilométerre, vagy tengeri mérföldre kerekített határoló távolságát, ha ilyet meghatároztak;
h) a közbenső megközelítés fixét, vagy pontját az olyan eljárásokban, ahol irányváltás nincs engedélyezve;
i) a térkép széléig kiterjesztett, a repülőtér magasságát, vagy a küszöb magasságát - amelyik megfelelő- jelképező vonalat a futópálya küszöbnél kezdődő távolság léptékkel együtt.
11.10.6.4 **Ajánlás.** - *Az eljáráshoz szükséges magasságokat (height) zárójelben kell feltüntetni, a 11.10.2.5 pontban előírt magassági viszonyítási alapot használva.*
11.10.6.5. **Ajánlás.** – *Az oldalnézet tartalmazza a talaj metszetvonalát, vagy a minimum QNH/QFE magasság ábrázolását a következők szerint:*
a) a talaj metszetvonalát folyamatos vonallal tüntetve fel, amely ábrázolja a befejező megközelítés elsődleges területén belül előforduló legmagasabb domborzat legmagasabb pontjainak tengerszint feletti magasságát. A befejező megközelítés másodlagos területén belül előforduló legmagasabb terep alakulatok legmagasabb pontjainak tengerszint feletti magasságait a metszet rajzon szaggatott vonallal tüntetve fel; vagy
b) a közbenső és a befejező megközelítési szakaszra vonatkozó minimum QNH/QFE magasságokat körülhatárolt árnyékolt keretekben.
1. Megjegyzés. - A talaj oldalnézeti ábrázolásához a befejező megközelítési szakasz elsődleges és másodlagos területeinek aktuális mintáit a kartográfusok részére az eljárás specialisták biztosítják
2. Megjegyzés. - A minimum QNH/QFE magasság ábrázolás célja, hogy azt a nem-precíziós megközelítéseket befejező megközelítési fix-el ábrázoló térképeken használják.

11.10.7 Repülőtér üzemeltetési minimumok

11.10.7.1 Ha az állam repülőtér üzemeltetési minimumokat meghatározott, akkor azokat fel kell tüntetni.
11.10.7.2 Az akadálymentességi tengerszint feletti magasságot/terep feletti magasságot azon légi-jármű kategóriákra fel kell tüntetni, amely kategóriákra az eljárást kialakították; precíziós megközelítési

eljárásokhoz, a Cat D_L légi-járművek (szárny fesztávolság 65 m és 80 méter között és/vagy a kerekek, illetve a siklópálya vevő antenna repülési pályája közötti függőleges távolság 7 m és 8 m között van) számára kiegészítő OCA/H-t kell közzétenni, ha az szükséges.

11.10.8 Kiegészítő tájékoztatások

11.10.8.1 Ha a megszakított megközelítési pont az alábbiak révén kijelölt:
- a befejező megközelítési ponttól mért távolsággal, vagy
- navigációs berendezéssel, vagy ponttal és a befejező megközelítés pontjától mért vonatkozó távolsággal,

akkor meg kell adni a befejező megközelítés pontjától a megszakított megközelítés pontjáig adott és a legközelebbi kéttized kilométerre, vagy tized tengeri mérföldre kerekített távolságot, illetve a vonatkozó földfeletti sebességet és időtartamokat tartalmazó táblázatot.

11.10.8.2 Ha a befejező megközelítési szakaszon DME berendezés használata szükséges, akkor fel kell tüntetni egy olyan táblázatot, amely a tengerszint feletti magasságokat/terep feletti magasságokat, vagy 2 km-enként, vagy tengeri mérföldenként tartalmazza - amelyik a megfelelő. A táblázatban nem szerepelhetnek az OCA/H alatti magasságokhoz/tengerszint feletti magasságokhoz tartozó távolság adatok.

11.10.8.3 **Ajánlás.** - *A befejező megközelítési szakaszban DME berendezés használatát nem igénylő eljárás esetében, ha tájékoztató süllyedési profil információ biztosításához egy megfelelően telepített DME berendezés rendelkezésre áll, akkor a térképen legyen feltüntetve a tengerszint feletti magasság/terep feletti magasság táblázat.*

11.10.8.4 **Ajánlás.** - *A süllyedés mértékét megadó táblázat feltüntetése szükséges.*

11.10.8.5 A befejező megközelítési fixel rendelkező nem precíziós megközelítési eljárások esetében a befejező megközelítés süllyedési gradiensét a legközelebbi tized százalékra, és zárójelbe téve, a süllyedési szöget a legközelebbi tizedfokra kerekítve kötelező feltüntetni.

11.10.8.6 A függőleges irányvezetést biztosító precíziós megközelítési eljárások és megközelítési eljárások esetében a viszonyítási alap magasságát a legközelebbi fél méterre, vagy lábra kerekítve, és a siklópálya/magasság/függőleges pálya szöget a legközelebbi tized fokra kerekítve kötelező feltüntetni.

11.10.8.7 Ha egy ILS-re a befejező megközelítési fixet a befejező megközelítési pontnál jelölik ki, egyértelműen jelezni kell, hogy az vajon az ILS-re, a kapcsolatos csak ILS iránysáv eljárásra, vagy mindkettőre alkalmazandó. MLS esetében egyértelműen jelezni kell, ha a FAF-ot a befejező megközelítés pontjánál jelölték ki.

11.10.8.8 Figyelmeztető megjegyzést kötelező feltüntetni, ha bármiféle műszeres megközelítési eljárás befejező megközelítési süllyedési gardiense/szöge meghaladja a Légi-Navigációs Szolgálatok Eljárása – Légi-jármű Üzemeltetés (PANS-OPS, Doc 8168) II. Kötet, I. Rész, 4. Szakasz, 5. Fejezetében meghatározott maximum értéket.

11.10.9 Légiforgalmi adatbázis követelmények

A navigációs adatbázis kódolást támogató megfelelő adatokat a Légi-navigációs Szolgálatok Eljárásai – Légi-jármű Üzemeltetés (PANS-OPS, DOC 8168), II. Kötet, III. Rész, 5. Szakasz, 2. Fejezet, 2.3 pontja szerint kell közzétenni, vagy a térkép hátoldalán, vagy egy megfelelő hivatkozásokkal ellátott különálló lapon.

Megjegyzés.- A megfelelő adatok azok, amelyeket az eljárás specialisták biztosítanak.

13. FEJEZET - ICAO REPÜLŐTÉR/HELIKOPTER REPÜLŐTÉR TÉRKÉP

13.1 Rendeltetése

E térképnek kell a légi-jármű személyzet számára biztosítania a légi-járművek földi mozgását

megkönnyítő információt:
a) a légi-jármű állóhelyéről a futópályáig; és
b) a futópályától a légi-jármű állóhelyig;
valamint a helikopterek mozgását megkönnyítő információt:
a) a helikopter állóhelyéről a földet érési és elemelkedési területig és a befejező megközelítési és felszállási területig;
b) a befejező megközelítési és felszállási területről a földet érési és elemelkedési területig és a helikopter állóhelyig;
c) a helikopter földi és légi guruló utak mentén; és
d) a légi tranzit utak mentén;
továbbá, alapvető repülőtéri/helikopter repülőtéri üzemeltetési tájékoztatásokat is biztosítania kell.

13.2 Alkalmazási előírások

13.2.1 Az ICAO Repülőtér/helikopter repülőtér térkép-et a nemzetközi polgári repülés által rendszeresen használt összes repülőtérre/helikopter repülőtérre az 1.3.2 pontban leírt módon el kell készíteni.
13.2.2 **Ajánlás.** - *Az ICAO Repülőtér/helikopter repülőtér Térkép-et az 1.3.2. pontban előírt módon el kell készíteni a nemzetközi polgári repülés használatára rendelkezésre álló összes egyéb repülőtérről/helikopter repülőtérről is.*
Megjegyzés. - Bizonyos körülmények esetén szükségessé válhat az ICAO Repülőtéri Földi Mozgások Térkép és az ICAO Légi-jármű Állóhely/Beállító Térkép elkészítése (lásd a 14. és a 15. Fejezetben), amely esetben az ezeken a kiegészítő térképeken feltüntetett részleteket nem kell az ICAO Repülőtér/Helikopter repülőtér Térkép-en megismételni.

13.3 Fedésterület és méretarány

13.3.1 A fedésterület és a méretarány legyen elegendően nagy ahhoz, hogy a térkép a 13.6.1 pontban felsorolt valamennyi alkotóelemet világosan ábrázolja.
13.3.2 A térképen lineáris mérővonalat kell feltüntetni.

13.4 Azonosítás

A térképet a repülőtér/helikopter repülőtér által kiszolgált nagyváros, város, vagy körzet nevével, valamint a repülőtér/helikopter repülőtér nevével kell azonosítani.

13.5 Mágneses eltérés

A földrajzi és a mágneses Észak irányjelző nyilakat, a legközelebbi fokra kerekített mágneses eltérést és a mágneses eltérés éves változtatását fel kell tüntetni.

13.6 Repülőtéri/helikopter repülőtéri adatok

13.6.1 E térkép ábrázolja:
a) a repülőtér/helikopter repülőtér vonatkoztatási pontjának földrajzi koordinátáit fokokban, fokpercekben és fokmásodpercekben;
b) a legközelebbi egész méterre, vagy lábra kerekítve, a repülőtér/helikopter repülőtér, a nem precíziós megközelítési futópálya küszöbök és az előtér pontjainak (repülés előtti magasságmérő ellenőrzési helyek), ha alkalmazható, tengerszinthez viszonyított magasságát; és a nem-precíziós megközelítésekhez a futópálya küszöbök, valamint a földet érési és elemelkedési terület geometriai középpontjának tengerszinthez viszonyított magasságát és geoid egyenetlenségét;
c) a legközelebbi fél méterre, vagy lábra kerekítve, a futópálya küszöbök, a földet érési és elemelkedési terület geometriai középpontjának, valamint a precíziós megközelítési futópálya földet érési zónája legmagasabb pontjának tengerszinthez viszonyított magasságát és geoid egyenetlenségét;
d) az összes futópályát -beleértve az építés alatt állókat is-, a futópályák azonosítóját, a legközelebbi méterre kerekített hosszukat, szélességüket, teherbírásukat, a beljebb helyezett küszöböket a végbiztonsági

és az akadálymentes sávokat, a futópályák irányát a legközelebbi mágneses fokra kerekítve, a burkolat fajtáját és a futópálya burkolatának jeleit;
Megjegyzés. - A teherbírás megadható táblázatos formában a térkép előlapján, vagy a hátoldalán.
e) az összes előteret a légi-jármű/helikopter állóhelyekkel, a világítási rendszert, a jelöléseket és egyéb vizuális útmutató és irányító eszközöket, ahol alkalmazható, beleértve a vizuális beállító útmutató rendszerek típusát és elhelyezkedését, a helikopter repülőtér felületének típusát és teherbírását, vagy a légjármű korlátozás fajtáját ott, ahol a teherbírás kisebb, mint a kapcsolódó futópályák teherbírása;
Megjegyzés. - A teherbíró képesség, vagy a légi-jármű típus szerinti korlátozás táblázatos formában is megadható, a térkép előlapján, vagy a hátoldalán.
f) a küszöbök, a földet érési és elemelkedési terület geometriai középpontjának és/vagy a befejező megközelítés és felszállási terület küszöbjeinek földrajzi koordinátáit fokokban, fokpercekben és fokmásodpercekben (ahol alkalmazható);
g) az összes guruló utat, helikopter légi- és földi guruló utat a felület típusával együtt, a helikopter légi tranzit utakat, elnevezésükkel, szélességükkel, fénytechnikai rendszereikkel, burkolati jelzéseikkel (beleértve a gurulási várópontokat, és ahol biztosított, közbenső várópontokat) és a megállító kereszt fénysorokat, az egyéb vizuális útmutató és irányító eszközöket, a teherbíró képességet, vagy a légi-jármű típus szerinti korlátozásokat ott, ahol a teherbíró képesség kisebb, mint a kapcsolódó futópálya teherbíró képessége;
Megjegyzés. - A teherbíró képesség, vagy a légi-jármű típus szerinti korlátozás feltüntethető táblázatos formában a térkép előlapján, vagy hátoldalán.
h) ha meghatározták, a forró pontok helyét megfelelően feltüntetett további információval;
Megjegyzés.- A forró pontokra vonatkozó további információ a térkép elő-, vagy hátoldalán táblázatos formában közölhető.
i) megfelelő gurulóút középvonal pontok és légi-jármű állóhelyek földrajzi koordinátáit fokokban, fokpercekben és fokmásodpercekben;
j) ahol ilyet a guruló légi-járművek része kialakítottak, a szabvány útvonalakat, elnevezésükkel együtt;
k) a légiforgalmi irányító szolgálat területi határát;
l) a futópálya látástávolság (RVR) mérőberendezések helyét;
m) a bevezető és a futópálya fényeket;
n) az optikai siklópálya rendszer helyét és típusát, a névleges megközelítési siklószöget, valamint a névleges "siklópályán" jelhez tartozó küszöb feletti minimum szemmagasságot fel kell tüntetni. Továbbá ott, ahol a rendszer tengelye nem párhuzamos a futópálya középvonalával, fel kell tüntetni az irányeltérés szögét és irányát, úgy, mint jobbra, vagy balra.
o) kommunikációs létesítmények, csatornáikkal és, ha alkalmazható, bejelentkezési címeikkel együtt felsorolva;
p) a gurulási akadályokat;
q) a légi-jármű kiszolgáló területeket és az üzemeltetés szempontjából fontos épületeket;
r) a VOR ellenőrzési pontot és az adott berendezés frekvenciáját;
s) az ábrázolt mozgási terület légi-jármű részére tartósan alkalmatlan minden részét, ilyenként egyértelműen azonosítva azokat.
13.6.2 A 13.6.1-ben a helikopter repülőterekre vonatkozó tételek kiegészítéseképp a térképen fel kell tüntetni:
a) a helikopter repülőtér típusát;
Megjegyzés. - A helikopter repülőtér típusokat a 14. Annex II. Kötete, talajszinti, építményen kialakított, vagy hajófedélzeti helikopter repülőtérként azonosítja.
b) a földet érési és elemelkedési területet, beleértve a legközelebbi méterre kerekített méreteit, lejtését, a felület fajtáját és teherbírását tonnában kifejezve;
c) a befejező megközelítési és felszállás területet, beleértve típusát, földrajzi irányát a legközelebbi egész fokra kerekítve, (ahol megfelelő) azonosító számát, hosszát és szélességét a legközelebbi méterre kerekítve, lejtését és a felület fajtáját;

d) a biztonsági területet, beleértve hosszát, szélességét és a felület fajtáját;

e) a helikopter akadálymentes sávot, beleértve hosszát és talajának profilját;

f) az akadályokat, beleértve fajtájukat, tetejüknek a következő magasabb méter, vagy láb értékre kerekített szintmagasságát;

g) a megközelítési eljáráshoz tartozó látási segédeszközöket, a befejező megközelítési és felszállási terület valamint a földet érési és elemelkedési terület jelöléseit és fénytechnikai berendezéseit;

h) a helikopter repülőtér rendelkezésre állóként közzétett, legközelebbi méterre kerekített úthossz értékeit, ahol alkalmazható, beleértve:

1) a rendelkezésre álló felszálló úthosszat;

2) a rendelkezésre álló megszakított felszálló úthosszat;

3) a rendelkezésre álló leszálló úthosszat.

14. FEJEZET - ICAO REPÜLŐTÉRI FÖLDI MOZGÁSOK TÉRKÉPE

14.1 Rendeltetése

E kiegészítő térképnek kell a légi-jármű személyzet számára biztosítani a légi-járműnek a légi-jármű állóhelyekre/ről való földi mozgását és a légi-jármű parkolását/beállását megkönnyítő részletes tájékoztatást.

14.2 Alkalmazási előírások

Ajánlás. - *Az ICAO Repülőtéri Földi Mozgások Térképe-t az 1.3.2 pontban leírt módon biztosítani kötelező olyan esetekben, ha az információk zsúfoltsága miatt a légi-járműveknek a guruló utakon az állóhelyekre/ről való földi mozgásához szükséges részletes tájékoztatás nem tüntethető fel kielégítő láthatósággal az ICAO Repülőtér/Helikopter repülőtér Térkép-en.*

14.3 Fedésterület és méretarány

14.3.1 A térkép fedésterülete és méretaránya legyen elegendő nagyságú ahhoz, hogy a 14.6 pontban felsorolt összes alkotóelemet tisztán ábrázolja.

14.3.2 **Ajánlás**. - *A térképen lineáris mérővonalat kötelező feltüntetni.*

14.4 Azonosítás

A térképet a repülőtér által kiszolgált város, vagy nagyváros nevével valamint a repülőtér nevével kell azonosítani.

14.5 Mágneses eltérés

14.5.1 A térképen a földrajzi Északot jelző nyilat kötelező feltüntetni.

14.5.2 **Ajánlás. -** *A legközelebbi egész fokra kerekített mágneses eltérést és az évenkénti változását fel kell tüntetni.*

Megjegyzés. - E térképet nem szükséges a földrajzi Északra tájolni.

14.6 Repülőtéri adatok

E térképen a Repülőtér/Helikopter repülőtér Térképen megadott és azokkal megegyező módon kell feltüntetni az ábrázolt területre vonatkozó minden információt, beleértve:

a) az előtér legközelebbi méterre, vagy lábra kerekített tengerszinthez viszonyított magasságát;

b) az előtereket a légi-jármű állóhelyekkel, a teherbíró képességet, vagy a légi-jármű típus szerinti korlátozást, térvilágítást, a burkolati jeleket és egyéb vizuális útmutató és irányító eszközöket, ahol alkalmazható, beleértve a vizuális beállási útmutató rendszerek helyét és típusát is;

c) a légi-jármű állóhelyek földrajzi koordinátáit fokokban, fokpercekben és század fokmásodpercekben;

d) a guruló utakat elnevezésükkel, legközelebbi méterre kerekített szélességüket, teherbírásukat, vagy a légi-jármű típus szerinti korlátozásokat, ahol alkalmazható, a fényeket, a burkolati jeleket (beleértve a gurulási várópontokat és -ahol kialakították- közbenső várópontokat) a megállító kereszt fénysorokat, valamint az egyéb vizuális útmutató és irányító eszközöket;

e) ha meghatározták, a forró pontok helyét megfelelően feltüntetett további információval;

Megjegyzés.-A forró pontokra vonatkozó további információ a térképelő-, vagy hátoldalán táblázatos formában közölhető.

f) a guruló légi-járművek részére szolgáló szabvány útvonalakat, elnevezésükkel, ahol ilyet kialakítottak;

g) megfelelő guruló út középvonal pontok földrajzi koordinátáit fokokban, fokpercekben, fokmásodpercekben és század fokmásodpercekben;

h) a légiforgalmi irányító szolgálat területi határát;

i) a megfelelő kommunikációs létesítményeket csatornáik és –ha alkalmazható- belépési címeik felsorolásával együtt;

j) a gurulási akadályokat;

k) a légi-jármű kiszolgáló területeket és az üzemeltetés szempontjából fontos épületeket;

l) a VOR ellenőrzési pontot és az adott berendezés rádió frekvenciáját;

m) az ábrázolt mozgási terület légi-jármű részére tartósan alkalmatlan bármely részét, és azt ilyenként világosan azonosítva.

15. FEJEZET - ICAO LÉGI-JÁRMŰ ÁLLÓHELY/BEÁLLÍTÓ TÉRKÉP

15.1 Rendeltetése

A légi-jármű személyzetnek e kiegészítő térkép adjon tájékoztatást a légi-járműnek a guruló utak és a légi-jármű állóhelyek közötti mozgását, illetve a légi-jármű parkolását/beállását segítő részletekről.

15.2 Alkalmazási előírások

Ajánlás. - *Az ICAO Légi-jármű Állóhely/Beállító Térkép-et, az 1.3.2 pontban leírt módon el kell készíteni ott, ahol a forgalmi létesítmények rendszerének bonyolultsága miatt a tájékoztatás kielégítő áttekinthetőséggel nem adható meg az ICAO Repülőtér/Helikopter repülőtér Térkép-en, vagy az ICAO Repülőtér Földi Mozgások Térképe-n.*

15.3 Fedésterület és méretarány

15.3.1 A fedésterület és méretarány a 15.6 pontban felsorolt összes alkotóelem világos feltüntethetőségéhez elegendően nagy legyen.

15.3.2 **Ajánlás.** - *A térképen lineáris mérővonalat kötelező feltüntetni.*

15.4 Azonosítás

A térképet a repülőtér által kiszolgált város, vagy nagyváros, vagy térség nevével, valamint a repülőtér nevével kell azonosítani.

15.5 Mágneses eltérés

15.5.1 A térképen a földrajzi Északot jelző nyilat kötelező feltüntetni.

15.5.2 **Ajánlás.** - *A legközelebbi egész fokra kerekített mágneses eltérést és az évenkénti változását fel kell tüntetni.*

Megjegyzés. - E térképet nem szükséges a földrajzi Északra tájolni.

15.6 Repülőtéri adatok

E térképen, az ICAO Repülőtér/Helikopter repülőtér Térképen és az ICAO Földi Mozgások Térképen megadott és azokkal megegyező módon kell szerepelnie az ábrázolt területre vonatkozó minden információnak, beleértve:

a) az előtér legközelebbi méterre, vagy lábra kerekített tengerszinthez viszonyított magasságát;

b) az előtereket a légi-jármű állóhelyekkel, a teherbíró képességet, vagy a légi-jármű típus szerinti korlátozást, fényjelzéseket, a burkolati jeleket és egyéb vizuális útmutató és irányító eszközöket, ahol alkalmazható, beleértve a vizuális dokkolás irányító rendszerek helyét és típusát is;

c) a légi-jármű állóhelyek földrajzi koordinátáit fokokban, fokpercekben, fokmásodpercekben és század fokmásodpercekben;

d) a guruló út belépőpontokat elnevezéseikkel, beleértve a gurulási várópontokat és –ha van- a közbenső várópontokat és a megállító kereszt fénysorokat;

e) ha meghatározták, a forró pontok helyét megfelelően feltüntetett további információval;

Megjegyzés.-A forró pontokra vonatkozó további információ a térkép elő-, vagy hátoldalán táblázatos formában közölhető.

f) a megfelelő guruló út középvonal pontok földrajzi koordinátáit fokokban, fokpercekben, fokmásodpercekben és század fokmásodpercekben;

g) a légiforgalmi irányító szolgálat területi határát;

h) a megfelelő kommunikációs létesítményeket csatornáik és –ha alkalmazható- belépési címeik felsorolásával együtt;

i) a gurulási akadályokat;

j) a légi-jármű kiszolgáló területeket és az üzemeltetés szempontjából fontos épületeket;

k) a VOR ellenőrzési pontot és az adott berendezés rádió frekvenciáját;

l) az ábrázolt mozgási terület bármely olyan részét, amely tartósan alkalmatlan a légi-járművek részére és azokat ilyenként világosan azonosítva.

21. FEJEZET – ICAO - ATC ELLENŐRZŐ LEGKISEBB MAGASSÁG TÉRKÉP

21.1 Rendeltetése

21.1.1 E kiegészítő térképen kell közölni a légi-jármű személyzet részére az ATS ellenőrző rendszert használó irányító által kijelölt magasság betartását és kereszt ellenőrzését lehetővé tévő információt.
Megjegyzés. - A 11. Annex meghatározása szerint a légiforgalmi irányító szolgálat feladatai közé nem tartozik a földnek ütközés megelőzése. A Légi-Navigációs Szolgálatok Eljárásai – Légi-forgalom Kezelés (PANSATM, Doc 4444)-ben előírt eljárások nem mentesítik a repülőgép vezetőt azon felelőssége alól, hogy meggyőződjön róla, hogy a légiforgalmi irányító egység által kiadott bármely engedély e tekintetben biztonságos. Ha az IFR szerint repülő gépet vektorok adásával irányítják, vagy a repülőgépet az ATS útvonalon kívülre vivő direkt útvonalat engedélyeznek a Légi-navigációs Szolgálatok Eljárásai – Légi-forgalom Kezelés, *8. Fejezet 8.6.5.2.előírásai alkalmazandók.*
21.1.2 A térkép előlapján szembetűnő módon kell feltüntetni, miszerint a térkép csakis a már azonosított légi-jármű számára kijelölt magasság keresztellenőrzésére használható.

21.2 Alkalmazási rendelkezések

Ajánlás. - *Az ICAO – ATC Ellenőrző Legkisebb Magasság Térkép-et az 1.3.2 pontban leírt módon biztosítani kötelező olyan esetekben, amikor irányvezetési eljárást alakítottak ki és a legkisebb vektorálási magasságok megfelelő módon nem tüntethetők fel az ICAO Körzeti Térkép-en, az ICAO Szabvány Műszeres Indulási Eljárás Térképen (SID), vagy az ICAO Szabvány Műszeres Érkezési Eljárás Térképen (STAR).*

21.3 Fedésterület és méretarány

21.3.1 A térkép fedésterülete kellő mértékű legyen a vektorálási eljárással kapcsolatos minden információ feltüntetéséhez.
21.3.2 A térkép legyen méretarányos.
21.3.3 **Ajánlás.** - *A térkép ugyan olyan méretaránnyal készüljön, mint a kapcsolatos ICAO Körzeti Térkép.*

21.4 Vetület

21.4.1 **Ajánlás.** - *Szögtartó vetületet kell alkalmazni, amelyen az egyenes vonal hozzávetőleg a nagykörrel azonos.*
21.4.2 **Ajánlás.** - *A fokbeosztás jelzéseit azonos térközönként kell a térkép oldalvonalán elhelyezni.*

21.5 Azonosítás

21.5.1 A térkép azonosítása a következőkből álljon: a repülőtér neve, amelyre a vektorálási eljárást felépítették, vagy, ha az eljárás több repülőtérre vonatkozik, akkor az ábrázolt légtérhez kapcsolódó név.
Megjegyzés. – Ez a név lehet a repülőtér által kiszolgált városnak a neve, vagy ha a várost több repülőtér szolgálja ki, akkor a légiforgalmi szolgálati központ neve, avagy, a térkép fedésterületén belül elhelyezkedő legnagyobb város, vagy nagyváros neve.

21.6 Kultúr környezet és domborzat

21.6.1 Az összes nyílt vízfelületet, a nagy tavak és folyók elnagyolt partvonalát fel kell tüntetni kivéve akkor, ha az a térkép rendeltetésével szorosabban összefüggő adatokkal ütközne.
21.6.2 A megfelelő magasság pontokat és az akadályokat fel kell tüntetni.
Megjegyzés. - A megfelelő magasság pontok és akadályok azok, amelyeket az eljárás specialisták biztosítanak.

21.7 Mágneses eltérés

A térkép által fedett térség átlagos mágneses eltérését a legközelebbi egész fokra kerekítve fel kell tüntetni.

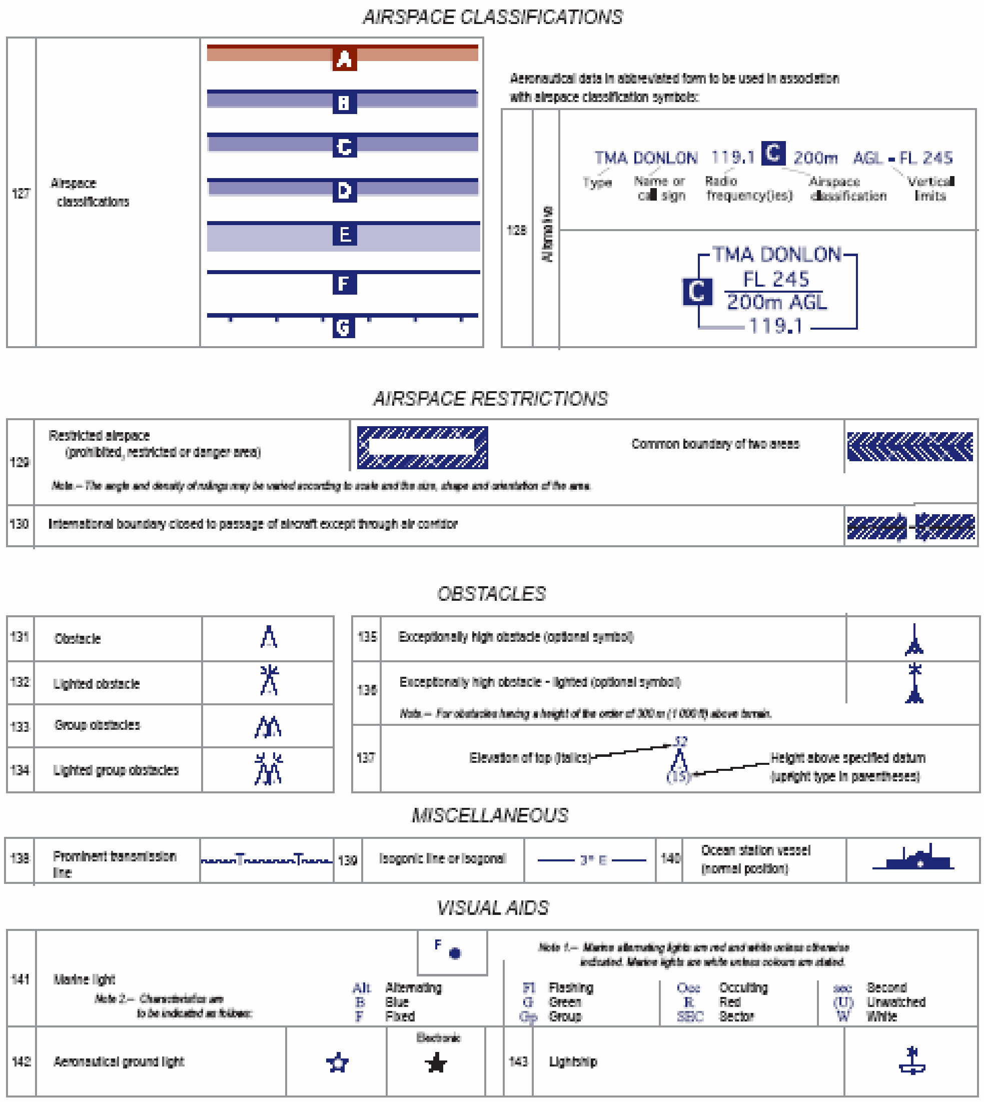
21.8 Irányok, útirányok és radiálok

21.8.1 Az irányoknak, útirányoknak és radiáloknak mágneses irányoknak kell lenniük, kivéve a 21.8.2 pontban előírtakat.
21.8.2 **Ajánlás.** - *Ha a magasabb földrajzi szélességű területek esetében az illetékes hatóság döntése szerint a mágneses Északhoz viszonyított iránymeghatározás nem megfelelő más alkalmas vonatkozatási alapot, például földrajzi Északot, vagy hálózati Északot kell alkalmazni.*
21.8.3 Ha az irányokat, útirányokat és radiálokat földrajzi Északhoz, vagy hálózati Északhoz viszonyítva teszik közzé, ott ezt világosan jelezni kell. Ahol hálózati Északot alkalmaznak, ott ennek a hálózati vonatkoztatási hosszúsági körét azonosítani kell.

21.9 Légiforgalmi adatok

21.9.1 Repülőterek
21.9.1.1 A közel-körzeti útvonalvezetést befolyásoló minden repülőteret fel kell feltüntetni a térképen. Ahol kivitelezhető, ott a futópályák elhelyezkedését mutató jelölést kell alkalmazni.
21.9.1.2 Fel kell tüntetni az elsődleges repülőtér tengerszinthez viszonyított és a legközelebbi méterre, vagy láb értékre felkerekített magasságát.
21.9.2 Tiltott, korlátozott és veszélyes légterek
A tiltott, korlátozott és veszélyes légtereket azonosítójukkal együtt kell feltüntetni.
21.9.3 Légiforgalmi Szolgálati Rendszer
21.9.3.1 A térképen fel kell tüntetni a kialakított légiforgalmi szolgálati rendszer alábbi összetevőit:
1) a vonatkozó rádió navigációs berendezéseket azonosítóikkal egyetemben;

2) a vonatkozó, kijelölt légterek oldal határait;
3) a szabvány műszeres indulási és érkezési eljárásokhoz kapcsolódó vonatkozó mérvadó pontokat;
Megjegyzés. – A légi-járművek vektor irányítása során használatos, a mérvadó pontokhoz, illetve azoktól elvezető útvonalak feltüntethetők.
4) átváltási magasságot, ha kijelölték;
5) a vektor irányítással összefüggő információkat, beleértve:
a) egyértelműen azonosított módon, a legközelebbi magasabb 50 m-re, vagy 100 láb-ra kerekített legkisebb vektorálási magasságot;
b) a legkisebb vektorálási magasság-szektorok oldalhatárait rendszerint rádió navigációs berendezéshez viszonyított iránnyal és távolsággal, vagy, ha ez nem oldható meg, akkor fokokban, fokpercekben és másodpercekben kifejezett földrajzi koordinátákkal és vastag vonalakkal rajzolva oly módon, hogy a kialakított különféle radar szektorok egyértelműen megkülönböztethetők legyenek;
Megjegyzés. – Az áttekinthetőség érdekében, a zsúfolt térségekben a földrajzi koordináták elhagyhatók.
c) a megnevezett repülőtér fő VOR rádió navigációs berendezését, vagy ha ilyen nincs, akkor a repülőtér/helikopter repülőtér vonatkoztatási pontját véve központul, vastag szaggatott vonalakkal rajzolt távolság jelző koncentrikus köröket 20 km, vagy 10 tengeri mérföld térközökkel, vagy, ha lehetséges 10 km, vagy 5 tangeri mérföld térközökkel, a körívek mentén feltüntetve a kör sugarának méretét;
d) az alacsony hőmérséklet hatásainak helyesbítéseivel összefüggő megjegyzések, ha alkalmazandók;
6) rádió összeköttetési eljárásokat, beleértve a vonatkozó ATC egység(ek) hívójelé(ei)t és csatornáját (csatornáit).
21.9.3.2 **Ajánlás.** - *A rádió összeköttetés megszakadása estére vonatkozó eljárás szöveges leírását biztosítani kell, és- amikor csak lehetséges- a térképen kell feltüntetni, avagy a térképet tartalmazó oldalon.*



144 Szilárd burkolatú futópálya
145 Lyuggatott acéllap, vagy acélháló futópálya
146 Burkolat nélküli futópálya

3. Táblázat – Gradiensek és szögek

Gradiensek és szögekGradiens/szög fajta	Térkép felbontás	Integritási osztály
Nem precíziós befejező megközelítés süllyedési gradiens	0,1 százalék	1 x 10 –8 kritikus
Befejező megközelítés süllyedési szög (Nem precíziós megközelítés, vagy megközelítés függőleges irányvezetéssel	0,1 fok	10-8 kritikus
Precíziós megközelítés süllyedési pálya/magasság szög	0,1 fok	10-8 kritikus

4 Táblázat - Mágneses eltérés

Mágneses eltérés	Térkép felbontás	Integritási osztály
Repülőtér/helikopter repülőtér mágneses eltérése	1 fok	1 x 10-5 fontos

5 Táblázat - Irányok

Irányok	Térkép felbontás	Integritási osztály
Útvonal szakasz	1 fok	1 x 10-3 szokványos
Útvonal és közel körzeti fix kialakítás	1/10 fok	1 x 10-3 szokványos
Közel körzeti érkezési/indulási útvonal szakasz	1 fok	1 x 10-3 szokványos
Műszeres megközelítési eljárás fix Kialakítás	1/10 fok	1 x 10-5 fontos
ILS iránysáv fekvés	1 fok	1 x 10-5 fontos
MLS zéró azimut fekvés	1 fok	1 x 10-5 fontos
Futópálya és FATO irány	1 fok	1 x 10-3 szokványos

6 Táblázat - Hosszúság/távolság/kiterjedés

Hosszúság / távolság / kiterjedés	Térkép felbontás	Integritási osztály
Útvonal szakasz hossza	1 km, vagy 1 NM	1 x 10-3 szokványos
Útvonal fix kialakítás távolsága	2/10 km (1/10 NM)	1 x 10-3 szokványos
Közel körzeti érkezési/indulási útvonal szakasz hossza	1 km, vagy 1 NM	1 x 10-5 fontos
Közel körzeti és műszeres megközelítési eljárás fix kialakítás távolsága	2/10 km (1/10 NM)	1 x 10-5 fontos
Futópálya és FATO hossza, TLOF kiterjedés	1 m	1 x 10-8 kritikus
Futópálya szélesség	1 m	1 x 10-5 fontos
Végbiztonsági sáv hossza és szélessége	1 m	1 x 10-8 kritikus
Rendelkezésre álló leszálló úthossz	1 m	1 x 10-8 kritikus
Rendelkezésre álló nekifutási úthossz	1 m	1 x 10-8 kritikus
Rendelkezésre álló felszálló úthossz	1 m	1 x 10-8 kritikus
Rendelkezésre álló gyorsítás-fékezési úthossz	1 m	1 x 10-8 kritikus
ILS iránysáv antenna-futópálya vég, távolság	berajzolás szerint	1 x 10-3 szokványos
ILS siklópálya antenna-küszöb, a középvonalon mért távolság	berajzolás szerint	1 x 10-3 szokványos
ILS marker-küszöb távolság	2/10 km (1/10 NM)	1 x 10-5 fontos
ILS DME antenna-küszöb, a középvonalon mért távolság	berajzolás szerint	1 x 10-5 fontos
MLS azimut antenna-futópálya vég távolsága	berajzolás szerint	1 x 10-3 szokványos
MLS magasság adó antenna-küszöb, a középvonalon mért távolság	berajzolás szerint	1 x 10-3 szokványos
MLS DME/P antenna-küszöb, a középvonalon mért távolság	berajzolás szerint	1 x 10-5 fontos

ANNEX 6/I.
A légijármű üzemeltetése: Nemzetközi kereskedelmi légiszállítás – Repülőgépek

I. kötet 8. kiadás – 2001. július
31. módosítással

A jelen kiadvány magába foglalja a 6. Annex I. részének 2001. március 10-e előtt elfogadott összes módosításait és 2001. november 1-től hatálytalanítja 6. Annex I. kötetének összes korábbi kiadásait.

A nemzetközi előírások és ajánlott gyakorlati eljárások alkalmazhatóságával kapcsolatosan lásd az Előszót.
.

Módosítások

A módosítások kiadásáról az ICAO Journal és az egyéb ICAO kiadványok valamint Audio-vizuális kiképzési segédanyagok havi katalógusa rendszeres tájékoztatást biztosítanak. Kísérjék figyelemmel a fenti kiadványokat és a módosításokat az alábbi rovatokba vezessék be:

1. Általános rész
2. Felszállás
3. Leszállás

3. példa
Cél és tárgykör
1. Általános rész
2. Repülőgép felszálló teljesítmény korlátozások
3. Felszállási akadálymentességi korlátozások
4. Korlátozások az útvonalon
5. Leszállási korlátozások

D. Melléklet - Repülési adatrögzítők

Bevezető
1. Repülési adatrögzítő (FDR)
2. Pilótakabin hangrögzítő (CVR)
3. A repülési adatrögzítő és a pilótakabin hangrögzítő rendszerek ellenőrzése

E. Melléklet - Két gázsugár hajtóművel felszerelt repülőgépek megnövelt hatótávolságú üzemeltetése

1. Cél és tárgykör
2. Meghatározások
3. Légialkalmassági követelmények a megnövelt hatótávolságú üzemeltetéshez
4. A meghajtó rendszer fejlettsége és megbízhatósága
5. Légialkalmassági módosítások és karbantartási program előírások
6. Repülés előkészítési követelmények
7. Az üzemeltetés alapelvei
8. Az üzemeltetés engedélyezése

F. Melléklet - Légijármű üzembentartási engedély és érvényesítés

1. Cél és tárgykör
2. Előírt műszaki biztonsági értékelések
3. Jóváhagyási intézkedések
4. Elfogadási tevékenységek
5. Egyéb jóváhagyási vagy elfogadási megfontolások
6. Az üzemeltetési előírások érvényesítése
7. A légijármű üzembentartási engedély módosítása

G. Melléklet - Minimális felszerelési jegyzék (MEL)

H. Melléklet - Repülésbiztonsági dokumentációs rendszer

1. Bevezető
2. Összeállítás és tartalom
3. Érvényesség
4. Tartalmi kialakítás
5. Terjesztés
6. Módosítás

I. Melléklet - Kiegészítő útmutató az egy gázsugár hajtóműves repülőgépek éjszaka és/vagy műszeres időjárási körülmények (IMC) közötti jóváhagyott üzemeltetésére

1. Cél és tárgykör
2. Gázturbinás hajtómű megbizhatósága
3. Üzemeltetési kézikönyv
4. A járató tanúsítása vagy megerősítése
5. Üzemeltetői és karbantartási program előírásai
6. A víz feletti repülés útvonalak korlátozásai

A 6. Annex I. részében alkalmazott rövidítések és jelzések

Rövidítések és jelzés

AC	váltóáram
ACAS	Összeütközés elkerülését biztosító fedélzeti rendszer
ADS	Automatikus légtérfelderítés
ADS-C	Automatikus légtérfelderítés - szerződés
AFCS	Automatikus repülésvezérlő rendszer
AGA	Repülőterek, légútvonalak és földi berendezések
AIG	Légijármű baleset kivizsgálás és megelőzés
AOC	Légiforgalmi üzemeltetési irányítás
AOC	Légijármű üzembentartási engedély
APU	Segédhajtómű
ASDA	Rendelkezésre álló gyorsításból történő megállási távolság
ASE	Magasságmérő rendszer hiba
ASIA/PACIFIC	Ázsia és Csendes Óceáni területek
ATC	Légiforgalmi irányító szolgálat
ATM	Légiforgalom szervezés
ATS	Légiforgalmi szolgálatok
CAS	Műszer szerint szabályozott helyesbített sebesség
CAT I	I. kategória
CAT II	II. kategória
CAT III	III. kategória
CAT IIIA	IIIA. kategória
CAT IIIB	IIIB. kategória
CAT IIIC	IIIC. kategória
Cm	centiméter
CDL	Repülésvezérlő szerkezetek alaphelyzettől történő eltéréseinek jegyzéke
CFIT	Földnek ütközés vezetett repülés során (szabályszerűen üzemelő légijárművel)
CPDLC	Légiforgalmi irányító és repülőgépvezető közötti adatátviteli összeköttetés
CVR	Pilótakabin hangrögzítő berendezés
DA	Tengerszint feletti elhatározási magasság
DA/H	Elhatározási magasság
DC	Berendezés vezérlés
D-FIS	Adatátvitelt alkalmazó repüléstájékoztatás
DH	Talajszint feletti elhatározási magasság

DME	Távolságmérő berendezés
DSTRK	Kívánatos repülési irány
ECAM	Központi elektronikus légijármű képernyő
EFIS	Elektronikus repülési műszerrendszer
EGT	Kilépő gázhőmérséklet
EICAS	Hajtómű ellenőrző és hajózószemélyzet riasztó rendszer
ELT	Vészhelyzeti helyjeladó berendezés
ELT(AD)	Automatikusan kibocsátható vészhelyzeti helyjeladó berendezés
ELT(AF)	Automatikus állandó vészhelyzeti helyjeladó berendezés
ELT(AP)	Automatikus hordozható vészhelyzeti helyjeladó berendezés
ELT(S)	Túlélési vészhelyzeti helyjeladó berendezés
EPR	Hajtómű nyomásviszony
ETOPS	Gázsugár hajtóműves repülőgép megnövelt hatótávolságú üzemeltetése
EUROCAE	Európai Polgári Légiközlekedési Elektronikai Szervezet
FDAU	Repülési adatgyűjtő egység
FDR	Légijármű repülési adatrögzítő
FL	Repülési szint
FM	Frekvencia moduláció
ft	láb
ft/min	láb/perc
g	Általános gyorsulás
GCAS	Földnek ütközés elkerülését biztosító fedélzeti rendszer
GNSS	Műholdas navigációs világ rendszer
GPWS	Földközelség jelző és riasztó rendszer
hPa	Hektopascal
IFR	Műszerrepülési szabályok
ILS	Műszeres leszállító rendszer
IMC	Műszeres időjárási körülmények
INS	Inerciális navigációs rendszer
ISA	Nemzetközi műlégkör
kg	kilogramm
kg/m^2	kilogramm/négyzetméter
km	kilométer
km/h	kilométer/óra
kt	csomó
kt/s	csomó/másodperc
lb	font (súlymérték)
LDA	Rendelkezésre álló leszállási távolság

m	méter
MDA	Legalacsonyabb tengerszint feletti süllyedési magasság
MDA/H	Legalacsonyabb süllyedési magasság tengerszint/földfelszín felett
MDH	Legalacsonyabb földfelszín feletti süllyedési magasság
MEL	Minimális berendezések jegyzéke
MHz	Megahertz
MLS	Mikrohullámú leszállító rendszer
MMEL	Gyártó minimális felszerelési jegyzéke
MNPS	Minimális navigációs teljesítmény előírás
MOPS	Minimális üzemi teljesítmény előírás
m/s	méter/másodperc
m/s^2	méter/másodperc négyzet
N	Newton (erő)
N_1	Kisnyomású kompresszor fordulatszáma (kétfokozatú kompresszor); ventillátor fokozat fordulatszáma (háromfokozatú kompresszor)
N_2	Nagynyomású kompresszor fordulatszáma (kétfokozatú kompresszor); közepes nyomású kompresszor fokozat fordulatszáma (háromfokozatú kompresszor)
N_3	Nagynyomású kompresszor fordulatszáma (háromfokozatú kompresszor)
NAV	Navigáció
NM	Tengeri mérföld
OCA	Akadálymentes tengerszint feletti magasság
OCA/H	Akadálymentes tengerszint/földfelszín feletti magasság
OCH	Akadálymentes földfelszín feletti magasság
PANS	Légiforgalmi szolgálatok eljárásai
RCP	Előírt kommunikációs teljesítmény
RNP	Előírt navigációs teljesítmény
RVR	Futópályamenti látástávolság érték
SICASP	Másodlagos légtérfelderítő radar fejlesztési és összeütközés elkerülési rendszereket kidolgozó munkacsoport
SOP	Szabványos üzemeltetési eljárások
SST	Hangsebesség feletti szállítás
STOL	Rövid fel és leszállás
TAS	Tényleges repülési sebesség
TAWS	Földfelszín közelség figyelmeztető rendszer
TCAS	Forgalmi riasztást és összeütközés elkerülést biztosító rendszer
TLA	Tolóerő szabályzó kar állásszöge
TLS	Megcélzott biztonsági szint
TODA	Rendelkezésre álló felszállási távolság

TORA	Rendelkezésre álló felszállási nekifutási távolság
TVE	Összegzett függőleges hiba
UTC	Egyeztetett világidő

Operator – Járató

Valamely személy, szervezet vagy vállalat, amely légijárműveket üzemeltet vagy ilyen tevékenység végzésére ajánlkozik.

Operator's maintenance control manual – Járató karbantartás irányítási kézikönyve
A járató azon eljárásait ismertető dokumentum, amely biztosítja az összes tervezett és igény szerint végrehajtandó karbantartási feladat megfelelő időben, és szabályozott valamint kielégítő módon történő végrehajtását a járató légijárművén.

Pilot-in-command – Légijármű parancsnoka
A repülés biztonságos végrehajtásáért felelős, a járató vagy az általános célú légiközlekedés esetében a légijármű tulajdonosa részéről parancsnoknak kijelölt repülőgépvezető.

Pressure-altitude – Nyomásmagasság
Magasság fogalmakban kifejezett légköri nyomás érték, mely megfelel a nemzetközi Egyezményes Légkör adott nyomásértékének (a 8. Annex alapján).

Psychoactive substances – Szellemi tevékenységet befolyásoló anyagok
Alkohol, ópiumból vagy kenderből készített kábítószer, kokain, nyugtatók és altatók, egyéb izgató, serkentő, élénkítőszerek, képzeteket keltő erős izgatószerek és illékony oldószerek a kávé és a dohányféleségek kivételével.

Repair – Javítás
A légijármű bármely üzemi alkatrészének sérülést vagy üzemszerű kopást követő repülésre alkalmas állapotba történő helyreállítása annak biztosítása érdekében, hogy az továbbra is megfeleljen a vonatkozó légialkalmassági előírásoknak, amelyeket az adott légijármű típus bizonyítványának kiadásakor figyelembe vettek.

Required communication performance (RCP) – Előírt távközlési teljesítmény
A repülés közbeni távközlési teljesítmény követelményeire vonatkozó, meghatározott ATM feladatok támogatásával összefüggő közlemény.

Required communication performance type (RCP) – Előírt távközlési teljesítmény típus
A távközlés lebonyolítási idejét, folyamatosságát, rendelkezésre állását és integrítását meghatározó RCP paraméterekhez rendelt értékeket jellemző címkék (például: RCP 240).

Required navigation performance (RNP) – Előírt navigációs pontosság
Egy meghatározott légtérben történő repülés-végrehajtáshoz szükséges navigációs teljesítmény, azaz pontosság.

Megjegyzés: A navigációs teljesítményt és előírásokat az adott RNP típusra és/vagy alkalmazásra határozzák meg.

Rest period – Pihenőidő
A földön eltöltött bármely időtartam, amely alatt a járató a hajózószemélyzet tagját mentesíti összes feladata alól.

RNP type – Előírt navigációs pontosság típus
A repülőgép tervezett repülési helyzetéhez viszonyított, tengeri mérföldben kifejezett távolsággal meghatározott pontossági érték. A repülés végrehajtása során a repülési idő legalább 95 %-ában ezen a határértéken belül kell a repülőgépnek tartózkodnia.

Például: – Az RNP 4 olyan navigációs pontosság határértéket jelent, amelynek alapján az adott repülőgép repülési idejének legalább 95 százalékában mindenkori tervezett repülési helyzetéhez viszonyítva plusz/minusz 4 tengeri mérföld (7.4 km) távolságon belül repül.

Runway visual range (RVR*)* – Futópályamenti látástávolság érték
Az a távolság, ameddig a futópálya középvonalán álló légijármű vezetője látja a futópálya felületi jelzéseket vagy a futópálya szélét kijelölő, illetve a középvonalát azonosító fényeket.

Safe forced landing – Biztonságos kényszerleszállás
Elkerülhetetlen kényszerleszállás talajra vagy vízfelszínre, melynek során nagy valószínűséggel várható, hogy a légijármű fedélzetén valamint a földön tartózkodó személyek nem sérülnek meg.

Safety management system – Biztonság irányítási rendszer
A biztonság irányításának rendszerezett megközelítése, amely magában foglalja a szükséges szervezeti felépítést, felelősségi köröket, irányelveket és eljárásokat.

Safety programme – Biztonsági program
Előírások és tevékenységek egységes rendszere, amely a biztonság növelésére irányul.

Small aeroplane – Kis repülőgép
Olyan repülőgép, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg vagy kevesebb.

State of Registry – Lajstromozó állam
Azon állam, amelynek lajstromába a légijárművet bevezették.

Megjegyzés: A nem nemzeti alapon működő nemzetközi üzemeltető vállalkozás vagy szervezet légijárművének lajstromozása esetében az abban érintett államokra együttesen és külön-külön is vonatkozik az a kötelezettség, amely a Chicagó-i Egyezmény értelmében a lajstromozó államot illeti. Erre vonatkozóan lásd a Tanács 1967. december 14-i Határozatát a Nemzetközi Üzemeltető Szervezetek Által Üzemeltetett Légijárművek Nemzeti Hovatartozása és Lajstromozása címmel, amely megtalálható a Nemzetközi Légiszállítás Gazdasági Szabályzására vonatkozó Útmutatóban (Doc 9587).

State of the Operator – Járató állama
Az az állam, amelynek területén a járató legfőbb üzleti telephelye található. Ennek hiányában az az állam, amelyben a járató állandó tartózkodási helye (címe) van.

Target level of safety (TLS) – Megcélzott biztonsági szint (TLS)
Adott körülmények között elfogadhatónak ítélt kockázati szintet kifejező általános fogalom.

Total vertical error (TVE) – Összegzett magassági hiba (TVE)
A légijármű aktuális repülési nyomás magassága és a részére meghatározott nyomás magasság (repülési szint) közötti függőleges geometriai különbség.

Visual meteorological conditions (VMC) – Látás utáni időjárási körülmények
Látástávolsággal, felhőzettől mért távolsággal és felhőalappal kifejezett időjárási körülmények (a 2. Annex alapján), ha azok a látás utáni időjárási körülményekre meghatározott minimum értékeknél jobbak.

Megjegyzés: A látás utáni időjárási körülményekre meghatározott minimum értékeket a 2. Annex 4. fejezete tartalmazza.

Megjegyzés: Ez az előírás nem teszi szükségessé azt, hogy bármely repülőgép sárkányszerkezetén átvágható felületek legyenek.

6.3 Repülési adatrögzítők

1. Megjegyzés: A repülési adatrögzítők két rendszerből illetve berendezésből, a repülési adatrögzítőből (FDR) valamint a pilótakabin hangrögzítőből (CVR) állnak.

2. Megjegyzés: Az összetett repülési adat és pilótakabin hangrögzítő berendezések csak a jelen Annex-ben külön ismertetett repülési adatrögzítő berendezés előírások teljesítésére használhatók.

3. Megjegyzés: A repülési adatrögzítőkre vonatkozó részletes útmutató a D. Mellékletben található.

6.3.1 Repülési adatrögzítők – típusok

6.3.1.1 Az I. típusú repülési adatrögzítő rögzítse azokat az adatokat, amelyek a repülőgép repülési pályájának, sebességének, helyzetének, hajtómű teljesítményének és működésének valamint a repülésvezérlő szerkezetek beállításának és működésének pontos meghatározásához szükségesek.

6.3.1.2 A II. és IIA. típusú repülési adatrögzítő rögzítse azokat az adatokat, amelyek a repülőgép repülési pályájának, sebességének, helyzetének, hajtómű teljesítményének valamint a magassági és áramlásrontó (fékező) szerkezetei beállításának pontos meghatározásához szükségesek.

6.3.1.3 1995 január 1. után ne használjanak fémszalaggal üzemelő repülési adatrögzítő berendezést.

6.3.1.4 **Ajánlás** – *1998 november 5. után ne használják a frekvencia modulációt (FM) alkalmazó analóg adatrögzítőket.*

6.3.1.4.1 2003 január 1. után ne használják a fényképészeti filmmel működő repülési adatrögzítőket.

6.3.1.5 Az összes olyan digitális adathálózati összeköttetést alkalmazó repülőgép, amelynek egyedi légialkalmassági bizonyítványát először 2005 január 1. után adják ki, valamint pilótakabin hangrögzítő berendezés (CVR) szállítására kötelezett, az összes adathálózati digitális közleményváltást a repülési adatrögzítő berendezésén rögzítse. A legkisebb felvételi időtartam azonos legyen a pilótakabin hangrögzítő berendezés felvételi időtartamával és a felvétel összevethető legyen a pilótakabinban rögzített hangfelvétellel.

6.3.1.5.1 2007 január 1. után az összes digitális adathálózati összeköttetést alkalmazó repülőgép, amely pilótakabin hangrögzítő berendezés (CVR) szállítására kötelezett, az összes adathálózati digitális közleményváltást a repülési adatrögzítő berendezésén rögzítse. A legkisebb felvételi időtartam azonos legyen a pilótakabin hangrögzítő berendezés felvételi időtartamával és összevethető legyen a pilótakabinban rögzített hangfelvétellel.

6.3.1.5.2 Az adathálózati digitális közleményváltás tartalmának megismeréséhez szükség tájékoztatást és ahol ez lehetséges a közlemény megjelenítésének vagy a hajózószemélyzet által történt lehívásának időpontját rögzítsék.

Megjegyzés: Az adathálózati összeköttetések közé tartoznak, azonban nem csak ezekre korlátozódnak a következők:

ADS – C – automatikus légtérfelderítési adat szolgáltatási megállapodás
CPDLC – légiforgalmi irányító és repülőgépvezető közötti adathálózati összeköttetések
D-FIS – adathálózati és repüléstájékoztató szolgálati összeköttetések
AOC – légiközlekedési üzemi irányítási közlemények.

6.3.1.6 **Ajánlás** – *Minden olyan 5700 kg. legnagyobb engedélyezett felszálló-súlynál nagyobb tömegű repülőgépet, amely repülési adatrögzítő és pilótakabin hangrögzítő berendezések szállítására kötelezett, alternatív megoldásként kettő összetett repülési adat és pilótakabin hangrögzítő berendezéssel is (FDR/CVR) felszerelhetnek.*

6.3.1.7 ***Ajánlás*** – *Minden olyan több gázturbinás sugárhajtóművel felszerelt repülőgépet, amelynek legnagyobb engedélyezett felszálló-súlya 5700 kg. vagy kevesebb és amely repülési adatrögzítő és/vagy pilótakabin hangrögzítő berendezések szállítására kötelezett, alternatív megoldásként egy összetett repülési adat és pilótakabin hangrögzítő berendezéssel is (FDR/CVR) felszerelhetnek.*

6.3.1.8 Az I.A típusú repülési adatrögzítő rögzítse azokat a jellemző adatokat, amelyek a repülőgép repülési pályájának, sebességének, helyzetének, hajtómű teljesítményének és működésének valamint a repülésvezérlő szerkezetek beállításának és működésének pontos meghatározásához szükségesek. A következő pontokban ismertetjük azokat a jellemzőket, amelyek kielégítik az I.A típusú repülési adatrögzítőre vonatkozó előírásokat. A jelölés (*) nélküli jellemzők rögzítése kötelező. A jelöléssel ellátott (*) jellemzők akkor rögzítendők, ha a repülőgép rendszerei vagy a hajózószemélyzet a jellemzőt illetve adatot a repülőgép üzemeltetéshez használja fel.

6.3.1.8.1 A repülőgép repülési pályájára és sebességére vonatkozó előírásokat kielégítő jellemzők:

– nyomás-magasság
– műszer szerinti vagy kalibrált repülési sebesség
– levegő – föld viszonyítási helyzet és minden egyes futómű levegő – föld érzékelő; szükség szerint
– külső levegő hőmérséklete vagy össz-hőmérséklet
– géptengely irányszög (a hajózószemélyzet elsődleges műszerei alapján)
– függőleges gyorsulás
– oldalirányú gyorsulás
– hosszirányú gyorsulás (törzs tengely)
– idő vagy relatív idő számítás
– navigációs adatok*: széleltérítés sodródási szög, szélsebesség, szélirány, szélességi és hosszúsági fok adatok
– földi feletti sebesség*
– rádió magasságmérő által jelzett magasság*

6.3.1.8.2 A repülési helyzetre vonatkozó előírásokat kielégítő jellemzők:

– bólintási helyzet
– bedöntési helyzet
– legyezőmozgás vagy csúszás szög*
– állásszög*

6.3.1.8.3 A hajtóműre vonatkozó előírásokat kielégítő jellemzők:

– hajtómű tolóerő illetve teljesítmény: minden egyes hajtómű tolóereje, pilótakabin tolóerő szabályzó kar(ok) helyzete
– sugárfordító helyzete*

– hajtómű tolóerő utasítás*
– szükséges hajtómű tolóerő*
– hajtómű levegőelvételi-szelep helyzete*
– további hajtómű jellemzők*: hajtómű nyomásviszony, kijelzett hajtómű rezgési szint értékek, tüzelőanyag áramlási értékek, tüzelőanyag elvételi kar helyzete, N_1, N_2, EGT, TLA, N_3

6.3.1.8.4 A repülésvezérlő szerkezetek helyzetére vonatkozó előírásokat kielégítő jellemzők:

– bólintás trimm lap(ok) helyzete
– fékszárnyak*: belépőél helyzete, pilótakabin fékszárny vezérlőkar beállítás
– orrsegédszárnyak*: orrsegédszárny belépőél helyzete, pilótakabin orrsegédszárny vezérlőkar helyzete
– futómű*: futómű, futó vezérlőkar helyzete
– oldalkormány trimm lap helyzete*
– csűrő trimm lap helyzete*
– pilótakabin trimm vezérlő szervek helyzete *: bólintás
– pilótakabin trimm vezérlő szervek helyzete *: bedöntés
– pilótakabin trimm vezérlő szervek helyzete *: legyezőmozgás
– földi áramlásrontó és aerodinamikai fék*: földi áramlásrontó helyzet, földi áramlásrontó vezérlőkar helyzet, aerodinamikai fék helyzet, aerodinamikai fék vezérlőkar helyzet
– jégmentesítő és/vagy jégtelenítő berendezések kiválasztása*
– hidraulika nyomás (minden egyes rendszer)*
– tüzelőanyag-mennyiség*
– AC (váltóáramú) elektromos táplálások helyzete*
– DC (egyenáramú) elektromos táplálások helyzete*
– segédhajtómű levegőelvételi-szelep helyzete*
– számított súlyponthelyzet*

6.3.1.8.5 Az üzemeltetésre vonatkozó előírásokat kielégítő jellemzők:

– riasztások

– elsődleges repülés vezérlő szerkezetek helyzete és a kezelő egységek beállítása: bólintási, bedöntési és legyezőmozgás szerinti tengelyek
– marker adó átrepülése
– minden egyes navigációs vevőberendezés frekvencia kiválasztása
– kézi rádió adógomb helyzete és CVR/FDR szinkron jel
– robotpilóta, tolóerő automata, automatikus repülésvezérlés üzemmód és bekapcsolt állapot helyzete*
– választott barometrikus nyomás beállítás*: légijármű parancsok és első tiszt
– választott nyomásmagasság (repülőgépvezető részéről állítható összes üzemmód)*
– választott repülési sebesség (repülőgépvezető részéről állítható összes üzemmód)*
– választott MACH szám (repülőgépvezető részéről állítható összes üzemmód)*
– választott emelkedési és süllyedési sebesség (repülőgépvezető részéről állítható összes üzemmód)*
– választott géptengely irányszög (repülőgépvezető részéről állítható összes üzemmód)*
– választott repülési pálya (repülőgépvezető részéről állítható összes üzemmód)*; repülési irányszög, korrigált repülési pálya, megközelítési siklópálya szög
– választott elhatározási magasság*
– az elektronikus repülési műszerrendszer (EFIS) választott megjelenítési beállítása*: légijármű parancsok és első tiszt
– több funkciós hajtómű teljesítmény és állapot riasztás megjelenítési beállítása*
– GWPS/TAWS/GCAS helyzet*: földfelszín megjelenítési mód választás, beleértve a következőket: figyelmeztető jelzések és riasztások, riasztási állapot, tanácsadó rendszer állapot, üzemi kapcsolók helyzete
– alacsony nyomás riasztások*: hidraulika és pneumatika rendszerek
– számítógép meghibásodás*
– veszélyes kabinnyomás csökkenés riasztás*
– TCAS/ACAS (forgalmi riasztó és összeütközés elkerülését biztosító rendszer / összeütközés elkerülését biztosító fedélzeti rendszer*
– jegesedés jelzőrendszer*
– veszélyes hajtómű rezgés riasztás minden egyes hajtóműnél*
– veszélyes hajtómű túlmelegedés riasztás minden egyes hajtóműnél*
– veszélyes alacsony olajnyomás riasztás minden egyes hajtóműnél*
– veszélyes hajtómű fordulatszám (sebesség) túllépés riasztás minden egyes hajtóműnél*
– szélnyírás riasztás*
– repülés közben működő átesés elleni védelem, vezérlőkar rázás és elmozdítás működtetése*
– a pilótakabinban található összes repülésvezérlő egység erőhatásai*: kormányszarv, kormányoszlop, pedálok kabinból való működtetésének erőhatásai
– függőleges eltérések*: ILS siklópálya, MLS magasság irányvezetés, GNSS megközelítési pálya
– vízszintes eltérések*: ILS iránysáv, MLS oldalszög irányvezetés, GNSS megközelítési pálya
– távolságmérő jelzőműszerek által jelzett távolság értékek (1 és 2 DME készletek)*
– elsődleges navigációs rendszerek*: GNSS, INS, VOR/DME, MLS, ILS, Loran C
– fékberendezések*: bal és jobb oldali féknyomások, bal és jobb oldali fékpedál helyzete
– időpont*
– események jelzése*
– pilótakabin üvegre vetített megjelenítő rendszer bekapcsolása*

– paravizuális megjelenítő egységek bekapcsolása*

1. Megjegyzés: Az előírt jellemzők, közöttük a tartományok, a mintavételi pontosság és felbontás megtalálhatók az EUROCAE Polgári Légiközlekedési Berendezések Európai Szervezetének repülési adatrögzítő rendszerekre kidolgozott MOPS (minimális üzemi teljesítmény előírások) kiadványában vagy más egyenértékű dokumentumban.

2. Megjegyzés: A rögzítendő jellemzők száma a repülőgép típustól, annak összetettségétől függ, azonban a csillag (*) jelölés nélküli jellemzőket ettől függetlenül rögzíteni kell. A (*) jelöléssel ellátott jellemzők akkor rögzítendők, ha a repülőgép rendszerei vagy a hajózószemélyzet a jellemzőt illetve adatot a repülőgép üzemeltetéshez használja fel.

6.3.2 Repülési adatrögzítők – felvételi időtartam

Minden repülési adatrögzítő képes legyen a működése legalább utolsó 25 órájában rögzített tájékoztatások tárolására, kivéve a IIA. típusú repülési adatrögzítőt, amely képes legyen a működése legalább utolsó 30 percében rögzített tájékoztatások tárolására.

6.3.3 Repülési adatrögzítők – Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 1989 január 1-én, vagy ezt követően adták ki

6.3.3.1 Minden olyan repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 27 000 kg. I. típusú repülési adatrögzítő berendezéssel szereljenek fel.

6 – 9 oldal

6.12 Az összes, 15 000 méter (49 000 láb) repülési magasság felett üzemeltetett repülőgép – sugárzásérzékelő és jelző berendezés

Minden olyan repülőgépet, amelyet 15 000 méter (49 000 láb) repülési magasság felett kívánnak üzemeltetni, szereljenek fel sugárzásmérő és jelző rendszerrel, amely folyamatosan méri és jelzi a teljes kozmikus sugárzás (azaz a galaktikus és szoláris eredetű ion és neutron sugárzás) kapott és a repülés során összegzett mennyiségét. A berendezés kijelző egysége egy hajózószemélyzeti tag számára közvetlenül látható legyen.

Megjegyzés: A berendezést az illetékes országos hatóság által elfogadhatónak tartott értékek alapján szabályozzák be (kalibrálják).

6.13 Az összes olyan repülőgép, amely megfelel a 16. Annex I. kötet zajbizonyítvány előírásoknak

A repülőgép szállítson olyan dokumentumot, amely megfelel a repülőgép zajbizonyítványának. Amikor ez az okmány vagy a lajstromozó állam részéről jóváhagyott más, egyéb dokumentumban található zajszint minősítést tartalmazó megfelelő nyilatkozat nem angol nyelvű, mellékeljék annak hiteles angol nyelvű fordítását is.

Megjegyzés: A zajszint minősítést bármely olyan dokumentum tartalmazhatja, amelyet a lajstromozó állam elfogad és a fedélzeten szállítanak.

6.14 MACH-szám jelzőműszer

Minden olyan repülőgépet, amelynek üzemeltetési sebesség korlátozásait Mach-szám érték(ek)ben fejezik ki, Mach-szám jelzőműszerrel szereljenek fel.

Megjegyzés: Ez az előírás nem zárja ki a repülési sebesség mérőműszer igénybevételét a légiforgalmi szolgálatok céljaira megadott Mach-szám érték kiszámításához.

6.15 Repülőgépek, amelyeket földközelség jelző és riasztó rendszerrel (GPWS) kell felszerelni

6.15.1 Minden olyan gázsugár hajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg-nál nagyobb, vagy amely több mint 9 utas szállítására jogosított, földközelség jelző és riasztó rendszerrel szereljenek fel.

6.15.2 Minden olyan gázsugár hajtóműves repülőgépet, amelynek egyedi légialkalmassági bizonyítványát először 2001 január 1-én vagy ezt követően adják ki, engedélyezett legnagyobb felszállósúlya (tömege) 15000 kg-nál nagyobb, vagy amely több mint 30 utas szállítására jogosított, szereljenek fel olyan földközelség jelző és riasztó rendszerrel, ami előre irányuló veszélyes földfelszín közelség megelőző riasztási feladatra is képes.

6.15.3 Minden olyan gázsugár hajtóműves repülőgépet, amelynek egyedi légialkalmassági bizonyítványát először 2004 január 1-én vagy ezt követően adják ki, és engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg-nál nagyobb, vagy amely több mint 9 utas szállítására jogosított, szereljenek fel olyan földközelség jelző és riasztó rendszerrel, ami előre irányuló veszélyes földfelszín közelség megelőző riasztási feladatra is képes.

6.15.4 2007 január 1-től minden olyan gázsugár hajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg-nál nagyobb, vagy amely több mint 9 utas szállítására jogosított, szereljenek fel olyan földközelség jelző és riasztó rendszerrel, ami előre irányuló veszélyes földfelszín közelség megelőző riasztási feladatra is képes.

6.15.5 ***Ajánlás –*** *Minden olyan gázsugár hajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg vagy kevesebb és ötnél több, de kilencnél kevesebb utas szállítására jogosított, szereljenek fel olyan földközelség jelző és riasztó rendszerrel, amely biztosítja a 6.15.8 a) valamint c) alpontokban előírt riasztást, a nem biztonságos földfelszín feletti magasság figyelmeztetést és* *előre irányuló veszélyes földfelszín közelség megelőző riasztási feladatra is képes.*

6.15.6 2007. január 1-től minden olyan dugattyús motorral felszerelt repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg-nál nagyobb vagy amely több mint 9 utas szállítására jogosított, szereljenek fel olyan földközelség jelző és riasztó rendszerrel, amely biztosítja a 6.15.8 a) valamint c) alpontokban előírt riasztást, a nem biztonságos földfelszín feletti magasság figyelmeztetést és előre irányuló veszélyes földfelszín közelség megelőző riasztási feladatra is képes.

6.15.7 A földközelség jelző és riasztó rendszer képes legyen a hajózószemélyzet részére önműködően, időben és jól megkülönböztethető módon figyelmeztető jelzést adni abban az esetben, ha a repülőgép a föld felszínét gyakorlati szempontból veszélyes mértékben megközelíti.

6.15.8 A földközelség jelző és riasztó rendszer legalább a következő körülmények között adjon figyelmeztető jelzést:

a) túlzott mértékű süllyedés;

b) túlzott mértékű közeledés a föld felszínéhez;

c) felszállást, vagy átstartolást követő túlzott mértékű magasságvesztés;

d) a földfelszín nem biztonságos megközelítése abban az esetben, amikor a repülőgép repülésvezérlő berendezései nem leszállási elrendezésben vannak;

> a) a futómű nincs kiengedett és rögzített helyzetben;
>
> b) fékszárnyak nincsenek leszállási helyzetben;

e) túlzott mértékű süllyedés a műszeres siklópálya alá.

6.16 Utasszállító repülőgépek – utaskabin személyzet ülései

6.16.1 Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 1981 január 1-én, vagy ezt követően adták ki

Minden repülőgépet szereljenek fel a repülőgép hossztengelyéhez viszonyított 15° tartományon belül előre vagy hátrafelé néző, vállhevederekkel ellátott biztonsági övvel rendelkező üléssel minden utaskabin személyzeti tag részére, akikre a repülőgép vészkiürítésénél a 12.1 pont előírása céljából szükség van.

6.16.2 Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 1981 január 1. előtt adták ki

Ajánlás – *Minden repülőgépet szereljenek fel a repülőgép hossztengelyéhez viszonyított 15° tartományon belül előre vagy hátrafelé néző, vállhevederekkel ellátott biztonsági övvel rendelkező üléssel minden utaskabin személyzeti tag részére, akikre a repülőgép vészkiürítésénél a 12.1 pont előírása céljából* *szükség van.*

Megjegyzés: A vállhevederekkel ellátott biztonsági öv egymástól függetlenül használható vállhevederekből és biztonsági övből áll.

6.16.3 A 6.16.1 és 6.16.2 pontok előírásai szerint biztosított utaskabin személyzeti tag üléseket úgy helyezzék el, hogy azok a padlószinten és egyéb helyeken található vészkijáratok közelében legyenek, ahogy azt a lajstromozó állam a vészhelyzeti kiürítésre vonatkozó előírásaiban meghatározta.

6.17 Vészhelyzeti helyjeladó berendezés (ELT)

2008. június 30-ig alkalmazható

6.17.1 Minden olyan, a 6.5.3 pont szerint vízfelszín felett hosszú távú repülést végrehajtó repülőgépet, amelynek egyedi légialkalmassági bizonyítványát először 2002 január 1. után adták ki, legalább kettő darab vészhelyzeti helyjeladó (ELT/S) berendezéssel szereljenek fel, amelyek közül az egyik automatikus működésű legyen.

6.17.2 2005 január 1-től minden, a 6.5.3 pont szerint vízfelszín felett hosszú távú repülést végrehajtó repülőgépet legalább kettő darab vészhelyzeti helyjeladó (ELT/S) berendezéssel szereljenek fel, amelyek közül az egyik automatikus működésű legyen.

6.17.3 Minden olyan, a 6.6 pont szerint kijelölt szárazföldi terület felett repülést végrehajtó repülőgépet, amelynek egyedi légialkalmassági bizonyítványát először 2002 január 1. után adták ki, legalább egy darab automatikus vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

6.17.4 A 6.6 pont szerint kijelölt szárazföldi terület felett repülést végrehajtó repülőgépet 2005 január 1-től legalább egy darab automatikus vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

6.17.5 **Ajánlás** – *Minden repülőgép szállítson egy automatikus működésű vészhelyzeti helyjeladó (ELT) berendezést.*

6.17.6 A fenti 6.17.1 – 6.17.5 pontok alapján felszerelt és szállított vészhelyzeti helyjeladó (ELT) berendezés a 10. Annex III. kötet vonatkozó előírásainak megfelelően üzemeljen.

2008. július 01-től alkalmazható

6.17.7 **Ajánlás** – *Minden repülőgép szállítson egy automatikus működésű vészhelyzeti helyjeladó (ELT) berendezést.*

6.17.8 A 6.17.9. pontban megadott esetet kivéve, 2008 július 01-től minden olyan repülőgépet, amely több mint 19 utas szállítására jogosított, szereljenek fel legalább egy darab automatikus vészhelyzeti helyjeladó (ELT) berendezéssel vagy két darab tetszőleges típusú vészhelyzeti helyjeladó (ELT) berendezéssel.

6.17.9 Minden olyan, több mint 19 utas szállítására jogosított repülőgépet, amelynek egyedi légialkalmassági bizonyítványát először 2008 július 1. után adták ki, legalább kettő darab vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel, amelyek közül az egyik automatikus működésű legyen.

6.17.10 A 6.17.11. pontban megadott esetet kivéve, 2008 július 01-től minden olyan repülőgépet, amely 19 vagy attól kevesebb utas szállítására jogosított, szereljenek fel legalább egy darab tetszőleges típusú vészhelyzeti helyjeladó (ELT) berendezéssel.

6.17.11 Minden olyan, 19 vagy attól kevesebb utas szállítására jogosított repülőgépet, amelynek egyedi légialkalmassági bizonyítványát először 2008 július 1. után adták ki, szereljenek fel legalább egy darab automatikus működésű vészhelyzeti helyjeladó (ELT) berendezéssel.

6.17.12 A fenti 6.17.7 – 6.17.11 pontok alapján felszerelt és szállított vészhelyzeti helyjeladó (ELT) berendezés a 10. Annex III. kötet vonatkozó előírásainak megfelelően üzemeljen.

Megjegyzés: A vészhelyzeti helyjeladó (ELT) számának, típusának és a légijárművön való elhelyezésének valamint az uszóképességet támogató kiegészítő rendszerének megfelelő kiválasztása adja a legnagyobb esélyt a vészhelyzeti helyjeladó (ELT) működésbe hozására, amennyiben a kutatás és mentés szempontjából különösen nehéz területeket is beleértve, a víz vagy a szárazföld felett repülő légijárművet baleset érné. Az adóegység elhelyezése a legfontosabb tényező az optimális törés és tűz elleni védelem biztosításában. Az automatikus működésű beépített vészhelyzeti helyjeladó (ELT) vezérlő és kapcsoló eszközeinek (aktíváló kijelzők) elhelyezésénél és a kapcsolódó üzemeltetési eljárások kialakításánál tekintetbe kell venni a figyelmetlenségből adódó működésbe hozatal gyors felismerésének, valamint a manuális bekapcsolás esetén a személyzet általi könnyű kezelhetőség igényeit.

6 – 11 oldal

6.18 Repülőgépek, amelyeket összeütközést elkerülő fedélzeti rendszerrel (ACAS II) kell felszerelni

6.18.1 2003 január 1-től minden olyan gázturbinás sugárhajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 15000 kg-nál nagyobb, vagy amely több mint 30 utas szállítására jogosított, szereljenek fel összeütközést elkerülő fedélzeti rendszerrel (ACAS II).

6.18.2 2005 január 1-től minden olyan gázturbinás sugárhajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg-nál nagyobb, vagy amely több mint 19 utas szállítására jogosított, szereljenek fel összeütközést elkerülő fedélzeti rendszerrel (ACAS II).

6.18.3 **Ajánlás** – *Minden repülőgépet szereljenek fel összeütközést elkerülő fedélzeti rendszerrel (ACAS II).*

6.18.4 Az összeütközést elkerülő fedélzeti rendszer a 10. Annex IV. kötet vonatkozó előírásainak megfelelően üzemeljen.

6.19 Repülőgépek, amelyeket nyomásmagasság-adó másodlagos radar válaszjeladóval kell felszerelni

6.19.1 A 10. Annex IV. kötet vonatkozó előírásainak megfelelően üzemelő minden repülőgépet szereljenek fel nyomásmagasság-adó másodlagos radar válaszjeladó berendezéssel.

6.19.2 Minden olyan repülőgépet, amelynek egyedi légialkalmassági bizonyítványát először 2009 január

1. után adják ki, szereljenek fel olyan adatforrással, amely biztosítja a 7,62 m (25 ft) vagy attól jobb felbontású nyomásmagasság jelet.

6.19.3 2012 január 1-ét követően minden repülőgépet szereljenek fel olyan adatforrással, amely biztosítja a 7,62 m (25 ft) vagy attól jobb felbontású nyomásmagasság jelet.

6.19.4 **Ajánlás** – *Az S módú válaszjeladónak biztosítsák a repülőgép levegőben/földön való tartózkodásának állapotáról szóló információt, amennyiben a repülőgép fel lett szerelve az ilyen állapot érzékelésére alkalmas automatikus eszközzel.*

Megjegyzés 1: Ennek az előírásnak célja az S módú radart alkalmazó légiforgalmi szolgálatok valamint az összeütközést elkerülő fedélzeti rendszerek hatékony működésének továbbfejlesztése. Különösen a követési folyamatok javulnak meg érzékelhetően a 7,62 m (25 ft) vagy attól jobb felbontás esetén.

Megjegyzés 2: A C módú választ adó válaszjeladók a nyomásmagasságot minden esetben 30.50 m (100) növekedésnél jelentik, függetlenül az adatforrás felbontási értékétől.

6.20 Mikrofonok

A pilótakabinban szolgálati feladatot ellátó összes hajózószemélyzeti tag az átváltási szint/magasság alatt közleményváltásaihoz kézi vagy fejhallgatóhoz erősített mikrofont használjon.

6.21 Sugárhajtóműves légijárművek – a repülés irányába előre irányuló (vizsgáló) fedélzeti szélnyírás jelző rendszer

6.21.1 **Ajánlás** – *Minden olyan sugárhajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg-nál nagyobb, vagy amely több mint 19 utas szállítására jogosított, a repülés irányába előre vizsgáló fedélzeti szélnyírás jelző rendszerrel szereljenek fel.*

6.21.2 **Ajánlás** – *A repülés irányába előre vizsgáló fedélzeti szélnyírás jelző rendszer képes legyen időben hang és látjelzés útján figyelmeztetést adni a repülőgépvezető számára a légijármű előtt levő szélnyírásról, megfelelő tájékoztatást nyújtani annak elősegítésére, hogy szükség esetén biztonságosan megszakított megközelítést, átstartolást vagy egyéb elkerülő repülési műveletet kezdjen és hajtson végre. A rendszer továbbá az önműködő leszállító berendezés alkalmazása esetében jelezze a repülőgépvezető számára, ha a szélnyírás a berendezésre engedélyezett határértékeket megközelíti.*

6.22 Minden repülőgép, amelyet a műszerrepülési szabályok szerint (IFR), vagy éjszaka egy pilóta üzemeltet

A 4.9.1 fejezettel összhangban történő jóváhagyás megszerzése céljából, minden olyan repülőgépet, amelyet a műszerrepülési szabályok szerint (IFR), vagy éjszaka egy pilóta üzemeltet, fel kell szerelni az alábbiakkal:

a) működőképessé tehető (javítható) robotpilótával, amelyik legalább magasságtartási, valamint repülési irány kiválasztási üzemmóddal rendelkezik;

b) fejhallgatós mikrofonnal, vagy azzal megegyezővel; és

c) térképet megjelenítő eszközzel, amelyik biztosítja a térkép olvashatóságát minden környezeti megvilágítási feltétel között.

7 – 1 oldal

7. fejezet
Repülőgép távközlési és navigációs berendezések

7.1 Távközlési berendezés

7.1.1 A repülőgépet szereljék fel olyan rádió távközlésre alkalmas berendezéssel, amely képes:

a) a repülőtéri irányítás céljainak megfelelő kétoldalú összeköttetés fenntartására;

b) a repülés végrehajtása során bármikor alkalmas az időjárási tájékoztatások vételére; és

c) a repülés végrehajtása során bármikor alkalmas a kétoldalú rádióösszeköttetés fenntartására legalább egy légiforgalmi állomással valamint más olyan légiforgalmi állomásokkal és olyan hullámhosszokon, amelyeket az illetékes hatóság előírt.

Megjegyzés: A 7.1.1 pont előírásai teljesítettnek tekinthetők, ha az útvonalon szokásos hullámterjedési viszonyok között a repülőgép képes az itt meghatározott távközlési összeköttetések fenntartására.

7.1.2 A 7.1.1 pont alapján előírt rádió berendezés képes legyen rádió összeköttetés fenntartására a 121.5 MHz-es légiközlekedési vészfrekvencián.

7.1.3 A légtér meghatározott szakaszaiban vagy olyan útvonalakon történő repülések végrehajtásakor, ahol RCP típus lett előírva, a 7.1.1 pontban meghatározott követelményeken túl a repülőgép:

a) legyen felszerelve olyan távközlési berendezésekkel, amelyek lehetővé teszik az előírt RCP típus(ok) szerinti üzemeltetést; és

b) a járató állama részéről rendelkezzen jogosítással az ilyen légtérben történő üzemeléshez.

Megjegyzés: az előírt távközlési teljesítményre (RCP), az ezzel összefüggő eljárásokra valamint a jogosítási folyamatra vonatkozó tájékoztatásokat az előkészítés alatt lévő Előírt Távközlési Teljesítmény (RCP) *Kézikönyv (Doc 9869) tartalmazza. Ez a kiadvány felsorolja továbbá azokat a dokumentumokat is amelyeket az államok és a nemzetközi szervezetek a távközlési rendszerekre és az előírt távközlési teljesítményre (RCP) dolgoztak ki.*

7.2 Navigációs berendezés

7.2.1 A repülőgépet szereljék fel olyan navigációs berendezéssel, amelynek segítségével az képes:

a) az üzemeltetői repülési tervében meghatározott útvonal követésére; és

b) a légiforgalmi szolgálatok előírásainak megfelelő repülés végrehajtására;

kivéve, – amennyiben az illetékes hatóság ezt nem tiltja meg – amikor a látvarepülési szabályok szerint végrehajtott repülés során a navigációt a földi tájékozódási pontok látás utáni azonosításával hajtja vége.

7.2.2 A légtér meghatározott szakaszaiban, vagy olyan útvonalakon történő repülés esetében, amelyekre vonatkozóan RNP típust írtak elő, a repülőgép a 7.2.1 pontban ismertetett előírások mellett:

a) legyen felszerelve olyan navigációs berendezésekkel, amelyek lehetővé teszik az előírt RNP típus(ok) szerinti üzemeltetést;

b) a járató állama részéről rendelkezzen jogosítással az ilyen légtérben történő üzemeléshez.

Megjegyzés: Az előírt navigációs teljesítményre (RNP), az ezzel összefüggő eljárásokra valamint a jogosítási folyamatra vonatkozó tájékoztatásokat az RNP Kézikönyv *(Doc 9613) tartalmazza. A kiadvány átfogóan felsorolja azokat a dokumentumokat és egyéb anyagokat, amelyeket az államok és a nemzetközi szervezetek a navigációs rendszerekre valamint az előírt navigációs teljesítményre vonatkozóan készítettek el.*

7.2.3 A Körzeti Léginavigációs Egyezmény alapján kijelölt olyan légterekben végrehajtott repülések esetében, amelyekre vonatkozóan minimális navigációs teljesítmény előírást (MNPS) határoztak meg, a repülőgépet szereljék fel olyan navigációs berendezéssel:

a) amely a kijelölt repülési útvonal bármely pontján a hajózószemélyzet részére az előírt pontossággal és folyamatosan jelzi az útvonal-tartást vagy az ettől való eltérést; és

b) amelyet a járató állama az érintett MNPS üzemeltetésre engedélyezett.

Megjegyzés: Az előírt minimális navigációs teljesítményre vonatkozó értékek és alkalmazási eljárások a Körzeti Kiegészítő Eljárások *című kiadványban (Doc 7030) találhatók.*

7.2.4 A légtér azon meghatározott szakaszaiban történő repüléseknél, ahol a helyi Körzeti Léginavigációs Egyezmény értelmében FL 290 felett 300 méter (1000 láb) függőleges elkülönítési minimumot (RVSM) alkalmaznak:

a) a repülőgépet szereljék fel olyan berendezéssel, amely képes:

1) a tartott repülési szintet (FL) a hajózószemélyzet részére jelezni;

2) a kiválasztott repülési szintet automatikusan tartani;

3) a hajózószemélyzet részére riasztó jelzést adni, ha a kiválasztott repülési szinttől eltérnek – az eltérés riasztó jelzés határértéke ne haladja meg a ±90 métert (300 láb); és

4) a nyomás-magasságot automatikusan jelezni; és

b) a repülőgépet a járató állama az ilyen légtérben történő üzemeltetésre engedélyezze.

7.2.5 A 7.2.4 b) szerinti RVSM jóváhagyás kiadása előtt, az állam győződjön meg arról, hogy:

a) a légijármű függőleges navigációt biztosító felszereléseinek képességei kielégítik a 4. Függelék követelményeit;

b) a járató megfelelő eljárásokat vezet be a folyamatos légialkalmassághoz (karbantatás és javítás) kapcsolódó gyakorlati tevékenységek és programok vonatkozásában; és

c) a járató megfelelő hajózó személyzeti eljárásokat vezet be az RVSM szerinti légtérben való üzemeltetéshez.

Megjegyzés: Az RVSM szerinti jóváhagyás globálisan érvényes annak figyelembe vételével, hogy egy adott régióra érvényes bármely üzemeltetési eljárást tartalmazni fogja az üzemeltetési kézikönyv vagy a megfelelő személyzeti útmutató.

7.2.6 A járató állama, amennyiben szükséges a lajstromozó állammal konzultálva, a 7.2.4 fejezetben említett légijárművek vonatkozásában biztosítja, hogy megfelelő lépések történjenek:

a) amikor a 11. Függelék, 3.3.4.1 alfejezetével összhangban létrehozott ellenőrző szervezettől jelentés érkezik a magasság tartás körülményeiről;

b) helyesbítő intézkedések bevezetésére az előbbiek szerinti jelentésben szereplő egyedi repülőgép, vagy repülőgép típusba tartozó csoportra vonatkozóan, amennyiben eltérést tapasztalnak az RVSM szerinti légtérben való üzemeltetésre vonatkozó követelmények betartásában, ha az alkalmazásra került.

7.2.7 Mindegyik állam, amelyik felelős azon légterekért, ahol az RVSM alkalmazásra került, vagy a járatóknak RVSM jóváhagyást adott ki a saját államán belül, olyan intézkedéseket és eljárásokat vezet be, amelyek biztosítják a megfelelő lépések megtételét az RVSM légteret, RVSM jóváhagyás nélkül használó repülőgépek vagy járatók ellen.

Megjegyzés: ezeket az intézkedéseket és eljárásokat mindkét olyan esetben alkalmazni szükséges, amikor a kérdéses repülőgép üzemeltetése jóváhagyás nélkül történik az állam légterében, vagy amikor az állam rendszeres felügyeleti felelősségébe tartozó járató a szükséges jóváhagyás nélkül üzemeltet egy másik állam légterében.

7.2.8 A repülőgépet szereljék fel olyan navigációs berendezéssel, amely biztosítja, hogy a repülés végrehajtásának bármely szakaszában bekövetkező, az egyik rendszert érintő meghibásodás esetében a repülőgépet a 7.2.1, valamint ahol ez alkalmazható, a 7.2.2, 7.2.3 és 7.2.4 pontok előírásainak megfelelően tovább lehessen irányítani (navigálni).

Megjegyzés: A FL 290 felett 300 méter (1000 láb) függőleges elkülönítési minimum alkalmazására kijelölt légtérben szükséges légijármű berendezésekre vonatkozó útmutató a 300 méter (1000 láb) Függőleges Elkülönítési Minimum Bevezetése FL 290 és FL 410 Repülési Szintek Között *(Doc 9574*) kézikönyvben *található.*

7.2.9 A műszeres időjárási körülmények között végrehajtott leszállással tervezett repülések esetében a repülőgépet szereljék fel olyan rádió berendezéssel, amely alkalmas az irányvezetést biztosító rádiójelek vételére egy olyan pontig, ahonnan a leszállás látással végrehajtható. Ez a rádió berendezés képes legyen az irányvezetés biztosítására minden olyan tervezett leszállási, valamint bármely kijelölt kitérő repülőtéren, ahol műszeres időjárási körülmények között történő leszállás végrehajtását tervezik.

7.3 Felszerelés

A berendezéseket úgy szereljék fel, hogy bármely egyedi egység meghibásodása – amely akár rádió távközlési összeköttetési, akár navigációs illetve mindkét célra szükséges – ne okozza a távközlési összeköttetési vagy navigációs célokból szükséges másik egység meghibásodását.

7.4 Elektronikus navigációs adat kezelés

7.4.1 Egy járató nem vehet használatba elektronikus navigációs adat terméket, amelyet levegőben és földön történő alkalmazásra hoztak létre, amíg a járató állama jóvá nem hagyta a járató azon eljárásait, melyekkel bizonyítani lehet, hogy az alkalmazott módszer és a leszállított termékek kielégítik az elfogadható teljességi előírásokat és azt, hogy a termékek összeegyeztethetőek annak a berendezésnek a tervezett feladataival amelyek használni fogják azokat. A járató állama legyen meggyőződve arról, hogy a járató folyamatosan figyeli úgy az eljárásokat, mint a termékeket.

Megjegyzés: az adatokat szolgáltatók által követendő eljárásokra vonatkozó útmutatót az RTCA DO-200A/EUROCAE ED-76 *és az* RTCA DO-201A/EUROCAE ED-77 *tartalmazza.*

7.4.2 A járató alkalmazzon olyan eljárásokat, amelyek biztosítják a naprakész és változatlan elektronikus navigációs adatok időben való elosztását és beillesztését az azokat igénylő légijárművek felé.

8-3 oldal

8. fejezet
Repülőgép karbantartás

i) a járató további karbantartási eljárásai és az ezekkel kapcsolatos előírások teljesítésére vonatkozó eljárások szükség szerinti ismertetése;

j) a 8. Annex II. rész 4.2.3 f) és 4.2.4 pontjaiban előírt, a szolgálati tájékoztatások jelentésére vonatkozó követelmények teljesítésének eljárásai; és

k) a légialkalmasságot befolyásoló összes szükséges adatnak a típus-bizonyítvány tulajdonosától vagy a típust tervező szervezettől történő beszerzésének, értékelésének, módosításának és szétosztásának eljárásai a karbantartó szervezeten belül.

8.7.2.2 A karbantartó szervezet biztosítsa, hogy az eljárási kézikönyvet szükség szerint módosítsák és egészítsék ki abból a célból, hogy az abban található tájékoztatások mindig naprakészek legyenek.

8.7.2.3 Az eljárási kézikönyv összes módosításának megfelelő példányait haladéktalanul juttassák el minden olyan szervezetnek vagy személynek, amelynek a kézikönyv eredeti példányát átadták.

8.7.3 A biztonság irányítása

8.7.3.1 Az államok dolgozzanak ki biztonsági programot annak érdekében, hogy a légijárművek karbantartásánál elfogadható biztonsági szintet érjenek el.

8.7.3.2 A célul kitűzött elfogadható biztonsági szintet az érintett állam(ok) határozza(ák) meg.

Megjegyzés – a biztonsági programra és az elfogadható biztonsági szint meghatározására vonatkozó útmutatót a 11. Annex E. melléklete és a Biztonság Irányítási Kézikönyv (SMM) *(Doc 9859) tartalmazza.*

8.7.3.3 **Ajánlás** – *az államok követeljék meg, hogy a biztonsági programjuk részeként egy karbantartó szervezet vezessen be az államnak elfogadható biztonság irányítási rendszert, amely minimum:*

a) megnevezi a biztonsági veszélyeket;

b) biztosítja, hogy egy elfogadható biztonsági szint kialakításához szükséges megelőző intézkedések alkalmazásra kerülnek;

c) gondoskodik a folyamatos figyelésről és az elért biztonsági szint rendszeres felülvizsgálatáról; és

d) törekedik a teljeskörű biztonsági szint folyamatos tökéletesítésére.

8.7.3.4 2009 január 01-től az államok a biztonsági programjuk részeként követeljék meg, hogy egy karbantató szervezet vezessen be az állam számára elfogadható biztonság irányítási rendszert, amely minimum:

a) megnevezi a biztonsági veszélyeket;

b) biztosítja, hogy egy elfogadható biztonsági szint kialakításához szükséges megelőző intézkedések alkalmazásra kerülnek;

c) gondoskodik a folyamatos figyelésről és az elért biztonsági szint rendszeres felülvizsgálatáról; és

d) törekedik a teljeskörű biztonsági szint folyamatos tökéletesítésére.

8.7.3.5 A biztonság irányítási rendszer világosan határozza meg a biztonságért viselt felelősség függelmi viszonyait egy karbantartó szervezeten belül, beleértve a felső vezetés biztonságért viselt közvetlen felelősségét.

Megjegyzés: A biztonság irányítási rendszerre vonatkozó útmutató a Biztonság Irányítási Kézikönyv-*ben* (SMM) *(Doc 9859) található.*

8.7.4 Karbantartási eljárások és minőség biztosítási rendszer

8.7.4.1 A karbantartó szervezet dolgozzon ki és vezessen be az engedélyt kiadó állam részéről elfogadható eljárásokat, amelyek biztosítják a karbantartás megfelelő és szakszerű elvégzését továbbá összhangban vannak a jelen fejezet összes vonatkozó előírásával.

8.7.4.2 A karbantartó szervezet biztosítsa a 8.7.4.1 pont előírásának teljesítését egy független minőség biztosítási rendszer létrehozásával, amely figyelemmel kíséri és felülvizsgálja az alkalmazott eljárások helyességét vagy olyan ellenőrzési rendszer kialakításával, amely biztosítja az összes karbantartási feladat megfelelő előírás-szerű elvégzését.

8.7.5 Létesítmények

8.7.5.1 A létesítmények és a munkakörülmények az elvégzendő feladatra alkalmasak legyenek.

8.7.5.2 A karbantartó szervezet rendelkezzen azon munka elvégzéséhez szükséges műszaki adatokkal, berendezésekkel, felszerelésekkel, szerszámokkal és anyagokkal, amelyre engedéllyel illetve jóváhagyással rendelkezik.

8.7.5.3 Alakítsanak ki megfelelő raktár területet az alkatrészek, berendezések, szerszámok és anyagok tárolására. Hozzanak létre biztonságos raktározási körülményeket, valamint akadályozzák meg a raktározott egységek károsodását és sérülését.

8.7.6 Személyzet

8.7.6.1 A karbantartó szervezet jelöljön ki egy személyt vagy munkacsoportot, akik felelősek annak biztosításáért, hogy a szervezet megfelel az engedélyezett karbantartó szervezetre vonatkozó, a 8.7 szakaszban található előírásoknak.

8.7.6.2 A karbantartó szervezet alkalmazza a szükséges személyeket, akik az elvégzendő munkát megtervezik, végrehajtják, felügyelik, ellenőrzik és igazolják.

8.7.6.3 A karbantartó személyzet szakmai jártassága a feladattal (eljárással) legyen összhangban és az engedélyező állam részére elfogadható szintű legyen. A karbantartási munka megfelelő elvégzésének igazolására készített karbantartási nyilatkozatot az erre az 1. Annex alapján jogosított személy írja alá.

8.7.6.4 A karbantartó szervezet biztosítsa, hogy a karbantartásban résztvevő összes személy feladatának és felelősségének megfelelő alapkiképzésben és folyamatos továbbképzésben részesüljön. A karbantartó szervezet által kidolgozott és alkalmazott kiképzési program tartalmazzon emberi tevékenységet és teljesítményt fejlesztő elméleti és gyakorlati képzést, beleértve a többi karbantartó személlyel és a hajózószemélyzettel történő együttműködést is.

Megjegyzés: Az emberi teljesítmény fejlesztését célzó kiképzési programok tervezéséhez útmutató az Emberi Tényezők Kiképzési Kézikönyv-*ében (Doc 9683) található.*

8.7.7 Jegyzőkönyvek

8.7.7.1 A karbantartó szervezet készítsen részletes karbantartási jegyzőkönyvet annak bizonyítására, hogy a karbantartási nyilatkozat aláírásához szükséges összes előírásnak és feltételnek eleget tettek.

8.7.7.2 A 8.7.7.1 pontban előírt karbantartási jegyzőkönyveket a karbantartási nyilatkozat aláírását követően legalább egy évig őrizzék meg.

8.8 Karbantartási nyilatkozat

8.8.1 A karbantartási munka megfelelő, a karbantartó szervezet eljárási kézikönyvében ismertetett eljárásoknak és a jóváhagyott feltételeknek megfelelően történő sikeres elvégzésének igazolására készítsenek el és írjanak alá karbantartási nyilatkozatot.

8.8.2 A karbantartási nyilatkozat tartalmazzon igazolást az alábbiakról:

a) az elvégzett karbantartási munka alapvető részletei, beleértve a felhasznált engedélyezési illetve jóváhagyási feltételek részletezését;

b) a karbantartás befejezésének időpontja;

c) az engedélyezett karbantartó szervezet azonosítója; és

d) a karbantartási nyilatkozatot aláíró személy vagy személyek neve.

11. fejezet
Kézikönyvek, naplók és nyilvántartások

Megjegyzés: A következő kiegészítő kézikönyvek, nyilvántartások és jegyzőkönyvek a jelen Annex anyagával kapcsolatban vannak, azonban ezeket a fejezet nem tartalmazza:

tüzelőanyag és olaj jegyzőkönyvek	lásd 4.2.9
karbantartási nyilvántartás	lásd 8.4
repülési idő jegyzőkönyvek	lásd 4.2.10.3
repülés előkészítési formanyomtatványok	lásd 4.3
üzemeltetői repülési terv	lásd 4.3.3.1
légijármű parancsnok útvonal és repülőtér jogosítások nyilvántartásai	lásd 9.4.3.4

11.1 Repülésvégrehajtási kézikönyv

Megjegyzés: A repülésvégrehajtási kézikönyv a 8. Annex-ben meghatározott tájékoztatásokat tartalmazza
.
A repülésvégrehajtási kézikönyvet a lajstromozó állam előírásai alapján kötelező érvényű változások behelyezésével tartsák naprakészen.

11.2 Járató karbantartás irányítási kézikönyve

A járató 8.2 szakasz előírásai alapján biztosított karbantartás irányítási kézikönyve, amelyet több részben is kiadhat, a következő tájékoztatásokat tartalmazza:

a) a 8.1.1 pont alapján előírt eljárások ismertetése, szükség szerint:

1) a járató és az engedélyezett karbantartó szervezet közötti adminisztratív megállapodások;

2) a karbantartás végrehajtási eljárások valamint a karbantartási nyilatkozat elkészítési és aláírási eljárások, amikor a karbantartást olyan rendszerben hajtják végre, amely nem azonos az engedélyezett karbantartó szervezet eljárásaival;

b) a 8.1.4 pontban előírt személy vagy személyek neve és feladatai;

c) hivatkozás a 8.3.1 pontban előírt karbantartási programra;

d) a járató karbantartási jegyzőkönyveinek elkészítési és megőrzési módszerei a 8.4 szakasz előírásai alapján;

e) a 8.5.1 pontban előírt karbantartás és üzemeltetés felügyeleti, értékelési és jegyzőkönyvezési eljárások ismertetése;

f) a 8. Annex II. rész 4.2.3 f) és 4.2.4 pontjaiban előírt, a szolgálati tájékoztatások jelentésére vonatkozó követelmények teljesítésének eljárásai;

g) a 8.5.2 pontban előírt folyamatos légialkalmassági tájékoztatások értékelésének és ezek alapján végrehajtott bármely tevékenység elvégzésének eljárásai;

h) a kötelező folyamatos légialkalmassági tájékoztatás alapján szükséges intézkedések végrehajtásának eljárásai;

i) az ellenőrzési és elemzési rendszer kialakításának és fenntartásának ismertetése valamint a karbantartási program teljesítményének és hatékonyságának folyamatos felügyelete, melynek célja a program bármely hiányosságának kiküszöbölése;

j) az légijármű típusok és típusváltozatok ismertetése, amelyekre a kézikönyv alkalmazható;

k) azon eljárások ismertetése, amelyek biztosítják a légialkalmasságot befolyásoló meghibásodások, valamint hiányosságok jegyzőkönyvezését és kijavítását; és

l) azon eljárások ismertetése, amelyekkel a lajstromozó államot értesítik a repülés végrehajtás során bekövetkezett jelentősebb rendellenességekről.

11.3 Karbantartási program

11.3.1 Minden egyes repülőgép karbantartási programja a 8.3 szakasz előírásai alapján a következőket tartalmazza:

a) a karbantartási feladatok és ezek elvégzésének időszakai a repülőgép várható és tervezett igénybevételének figyelembevételével;

b) a repülőgép szerkezeti épségének folyamatos ellenőrzése – amikor ez a karbantartási feladat alkalmazható;

c) a fenti *a)* és *b)* alpontok előírásaitól való eltérés vagy azok megváltozatása céljából alkalmazott eljárások; és

d) a légijármű rendszereinek, alkatrészeinek és hajtóműveinek állapotát és megbízhatóságát felülvizsgáló programok szükség szerinti ismertetése.

11.3.2 A légijármű típusra kötelezőnek kijelölt karbantartási feladatokat és ezek elvégzésének időszakait ennek megfelelően azonosítsák.

11.3.3 **Ajánlás** – *A karbantartási programot a tervezés állama vagy a típus tervezéséért felelős szervezet által rendelkezésre bocsátott tájékoztatások valamint bármely más megfelelő gyakorlati tapasztalatok alapján dolgozzák ki.*

11.4 Útinapló

11.4.1 **Ajánlás** – *A repülőgép útinaplója a következő tételeket és a megfelelő római számokat tartalmazza:*

I _ A repülőgép nemzeti hovatartozása és lajstromjele.

II _ A repülés időpontja.

III _ A személyzeti tagok névsora.

IV _ A személyzet tagjainak kijelölt feladatai.

V _ Az indulási helye.

VI _ Az érkezés helye.

VII _ Az indulás időpontja.

VIII _ Az érkezés időpontja.

IX _ A repülés időtartama.

X _ A repülési feladat pontos meghatározása (magáncélú, munkarepülés, menetrendszerű vagy nem-menetrendszerű repülés).

XI _ Események és megfigyelések – ha van.

XII _ A felelős személy aláírása.

11.4.2 **Ajánlás** – *A repülőgép útinaplót naprakészen vezessék, a bejegyzéseket tollal vagy kitörölhetetlen ceruzával írják be.*

11.4.3 **Ajánlás** – *A kitöltött útinaplót őrizzék meg, hogy a repülőgép üzemeltetésének utolsó hat hónapjáról folyamatos feljegyzés álljon rendelkezésre*

.

11.5 A fedélzeten szállított vészhelyzeti és túlélési felszerelések jegyzéke

A járató mindig rendelkezzen a mentést koordináló központnak azonnal továbbítható jegyzékkel, amely tartalmazza a nemzetközi légiforgalomban üzemeltetett bármely repülőgépén szállított vészhelyzeti és túlélési felszerelések felsorolását. A tájékoztató szükség szerint tartalmazza a mentőtutajok számát, színét és típusát, a rendelkezésre álló pirotechnikai eszközök ismertetését, a vészhelyzeti egészségügyi készletek részletezését, a vízkészletek meghatározását valamint a hordozható vészhelyzeti rádióberendezések típusát és frekvenciáit.

11.6 Repülési adatrögzítő felvételei

A járató a lehetőségek határain belül biztosítsa, hogy amennyiben egyik légijárműve balesetet szenvedett vagy repeseményben érintett, az összes vonatkozó repülési adatrögzítő felvételt és ha szükséges, a repülési adatrögzítő berendezéseket is megőrizze és azokat a 13. Annex előírásaival összhangban biztonságos őrizet alatt tárolja.

2. Függelék
Az üzemeltetési kézikönyv szerkezete és tartalma

(Lásd 4. fejezet 4.2.2.1 pont)

1. Szerkezet

1.1 **Ajánlás –** *A 4. fejezet 4.2.2.1 pont előírásai alapján kiadott üzemeltetési kézikönyvet, amely a különböző üzemeltetési területek szerint esetleg külön részekből is állhat, a következő összeállítás szerint készítsék el:*

a) általános rész;

b) légijármű üzemeltetési tájékoztatások;

c) útvonalak és repülőterek; és

d) kiképzés.

1.2 2006.január 1-től a 4. fejezet 4.2.2.1 pont előírásai alapján kiadott üzemeltetési kézikönyvet, amely a különböző üzemeltetési területek szerint esetleg külön részekből is állhat, a következő összeállítás szerint készítsék el:

a) általános rész;

b) légijármű üzemeltetési tájékoztatások;

c) útvonalak és repülőterek; és

d) kiképzés.

2. Tartalom

Az 1.1 és az 1.2 bekezdések előírásainak megfelelő üzemeltetési kézikönyvek legalább az alábbiakat tatalmazzák:

2.1 Általános rész

2.1.1 A repülési üzemeltetés végrehajtásához szükséges üzemeltető személyzet felelősségi körének ismertetése.

2.1.2 A hajózószemélyzeti tagok és az utaskabin személyzeti tagok repülési idejének és repülési szolgálati idejének korlátozására továbbá megfelelő pihenőidejének biztosítására vonatkozó, a 4. fejezet 4.2.10.2 pontja előírásának megfelelő szabályok.

2.1.3 A szállítandó navigációs berendezések felsorolása, beleértve az RNP légtérben történő üzemeltetésre vonatkozó bármely előírást.

2.1.4 Ahol ez az üzemeltetés szempontjából szükséges, a hosszú távú navigációs eljárások, a két gázsugár hajtóműves repülőgépek megnövelt hatótávolságú üzemeltetésére (ETOPS) vonatkozó hajtómű meghibásodási valamint a kitérő repülőterek kijelölésére és használatára vonatkozó eljárások.

2.1.5 Azon körülmények ismertetése, amelyek között rádiófigyelést kell tartani.

2.1.6 A legalacsonyabb repülési magasság meghatározásának módszere.

2.1.7 A repülőtér üzemeltetési minimum meghatározásának módszere.

2.1.8 Biztonsági elővigyázatossági intézkedések az olyan tüzelő-anyag feltöltés esetére, amikor az utasok a fedélzeten tartózkodnak.

2.1.9 A földi kiszolgálás rendszere és eljárásai.

2.1.10 A balesetet észlelő légijármű parancsnok számára a 12. Annex-ben előírt eljárások.

2.1.11 Minden egyes típusú üzemeltetéshez meghatározott hajózószemélyzet, beleértve a parancsnokság sorrendjének megállapítását is.

2.1.12 Egyedi utasítások az útvonalra szükséges tüzelőanyag és olaj mennyiségének kiszámításához az üzemeltetés valamennyi körülményének figyelembevételével, beleértve a túlnyomás elvesztésének és az útvonalon bekövetkező egy vagy több hajtómű meghibásodás lehetőségét is.

2.1.13 Azon körülmények, amelyek között oxigén használatra van szükség továbbá a 4. fejezet 4.3.8.2 pont alapján meghatározott oxigén-készlet mennyisége.

2.1.14 Tömeg és súlypont (egyensúly) számítási utasítások.

2.1.15 A földi jégtelenítés illetve jégmentesítés végrehajtására és ellenőrzésére vonatkozó utasítások.

2.1.16 Az üzemeltetési repülési tervre vonatkozó előírások.

2.1.17 Előírt szabványos üzemeltetési eljárások (SOP) a repülés minden egyes szakaszára.

2.1.18 A rendes körülmények között használt ellenőrző jegyzékek használatára és a használat időpontjára vonatkozó előírások.

2.1.19 Az indulási korlátozásokra vonatkozó eljárások.

2.1.20 A repülési magasság folyamatos tartásának figyelésére és az automatikus vagy hajózószemélyzet által előidézett magasság változásra figyelmeztető jelző rendszer használatára vonatkozó utasítások.

2.1.21 A robotpilóta és az önműködő hajtómű teljesítmény szabályzás használatára vonatkozó utasítások műszeres időjárási körülmények (IMC) között.

2.1.22 A légiforgalmi irányítói engedélyek tisztázására és elfogadására vonatkozó utasítások különösen abban az esetben, ha azok földfelszín feletti biztonságos magassággal is kapcsolatosak.

2.1.23 Indulási és megközelítési tájékoztatások.

2.1.24 Útvonal és célállomás repülési körülmények ismertetése.

2.1.25 Stabilizált megközelítési eljárás.

2.1.26 Nagy mértékű süllyedésre vonatkozó korlátozások a földfelszín közelében.

2.1.27 A műszeres megközelítés megkezdéséhez vagy folytatásához szükséges feltételek.

2.1.28 A precíziós és nem-precíziós műszeres megközelítési eljárások végrehajtására vonatkozó utasítások.

2.1.29 A hajózószemélyzet feladatainak kiosztása valamint a tagok munkaterhelése helyes elosztásának eljárásai az éjszakai repülés valamint a műszeres időjárási körülmények között végrehajtott megközelítés és leszállás során.

2.1.30 A kormányzott földnek ütközés (CFIT) megakadályozására illetve megelőzésére vonatkozó utasítások és kiképzési követelmények továbbá a földközelség jelző és riasztó (GPWS) rendszer használatának módszerei.

2.1.31 Az összeütközés elkerülésére valamint az összeütközés elkerülését biztosító fedélzeti riasztó rendszer (ACAS) használatára vonatkozó utasítások, eljárások, üzemeltetői stratégia és kiképzési eljárások.

Megjegyzés: Az összeütközés elkerülését biztosító fedélzeti (ACAS) rendszer üzemeltetésére vonatkozó eljárásokat a PANS-OPS (Doc 8168) I. kötet, VIII. rész 3. fejezete és a PANS-ATM (Doc 4444) 12. és 15. fejezete tartalmazza.

2.1.32 A polgári légijármű elfogásával kapcsolatos tájékoztatások és utasítások, beleértve;

a) az elfogott légijármű parancsnoka számára a 2. Annex-ben előírt eljárások;

b) az elfogó és az elfogott légijárművek által használandó, a 2. Annex-ben előírt látjelek.

2.1.33 A 15 000 méter (49 000 láb) repülési magasság felett üzemeltetni szándékozott repülőgépek esetében;

a) tájékoztatás, amely a repülőgépvezető számára lehetővé teszi a legmegfelelőbb intézkedések végrehajtását abban az esetben, ha a repülőgépet kozmikus sugárzás éri; és

b) eljárások arra az esetre, amikor süllyedés végrehajtását határozták el és ekkor;

i) szükséges az illetékes légiforgalmi szolgálati egység értesítése illetve riasztása, tájékoztatást adva a helyzetről és előzetesen engedélyt kérve a süllyedésre;

ii) intézkedések arra az esetre, ha az illetékes légiforgalmi szolgálati egységgel nem tudnak összeköttetést teremteni vagy az összeköttetés megszakadt.

Megjegyzés: A biztosítandó tájékoztatásokra vonatkozó útmutató a 126 számú Körlevélben – SST Légijármű Üzemeltetési Tájékoztató – *található.*

2.1.34 A 3. fejezet 3.2 szakasz előírásai szerint biztosítandó baleset-megelőzési és repülésbiztonsági program részletezése, beleértve az alkalmazott biztonsági rendszert és személyi felelősséget.

2.1.35 Veszélyes árúk szállítására vonatkozó tájékoztatások és utasítások, beleértve a vészhelyzet esetén végrehajtandó intézkedéseket is.

Megjegyzés: Veszélyes árúk szállítása során a légijármű fedélzetén bekövetkező váratlan események kezelését érintő módszerek és eljárások kidolgozására valamint végrehajtására vonatkozó útmutató a Veszélyes áruk szállítása során a légijármű fedélzetén bekövetkező eseményekre hozott vészintézkedések *(Doc 9481) kiadványban található.*

2.1.36 Védelmi utasítások és útmutatók.

2.1.37 A 13. fejezet 13.3 pont előírása szerint biztosítandó repülőgép átkutatási ellenőrző jegyzék.

2.2 Légijármű üzemeltetési tájékoztatások

2.2.1 Légialkalmasság jogosítási és üzemeltetési korlátozások.

2.2.2 A 6. fejezet 6.1.4 pont alapján előírt általános, különleges és vészhelyzeti eljárások a hajózószemélyzet részére, az ezekre vonatkozó ellenőrző jegyzékek.

2.2.3 Az emelkedési teljesítményre vonatkozó üzemeltetési utasítások és tájékoztatások minden hajtómű működése mellett – amennyiben ezt a 4. fejezet 4.2.3.3 pont alapján biztosították.

2.2.4 Repülés tervezési adatok a repülés előtti és repülés közbeni tervezéshez, különböző hajtómű teljesítmény beállítások és repülési sebességek mellett.

2.2.5 A maximális oldalszél és hátszél összetevők minden egyes üzemeltetett repülőgép típusra és ezen értékekre alkalmazott korlátozások a széllökések, alacsony látástávolság, futópálya állapot, személyzet gyakorlottság, a robotpilóta használat, rendellenes vagy vészhelyzeti körülmények valamint egyéb más helytálló üzemeltetési tényező figyelembevételével.

2.2.6 Tömeg és súlypont (egyensúly) számítási utasítások.

2.2.7 Légijármű rakodási és teher rögzítési utasítások.

2.2.8 Légijármű rendszerek, megfelelő vezérlő szervek és használati utasítások a 6. fejezet 6.1.4 pont előírása szerint.

2.2.9 Az engedélyezett különleges üzemeltetésre és az üzemeltetett repülőgép típusra vonatkozó gyártó(i) minimális felszerelési jegyzék valamint konfigurációs eltérési jegyzék, beleértve az előírt navigációs teljesítmény (RNP) alapján kijelölt légtérben történő üzemeltetésre vonatkozó bármely előírást.

2.2.10 A vészhelyzeti és biztonsági berendezések ellenőrző jegyzéke valamint ezek használati utasítása.

2.2.11 A vészkiürítési eljárások, beleértve az adott légijármű típust érintő eljárásokat, a hajózószemélyzet közötti együttműködés szervezését, a hajózószemélyzet minden egyes tagjának vészhelyzeti helyét és kijelölt vészhelyzeti feladatait.

2.2.12 Az utaskabin személyzet részéről alkalmazott általános, különleges és vészhelyzeti eljárások, az ezekre vonatkozó ellenőrző jegyzékek valamint légijármű rendszer tájékoztatások, beleértve a szükséges együttműködési eljárásokat a hajózószemélyzet és az utaskabin személyzet között.

2.2.13 A különböző repülési útvonalakon szállított vészhelyzeti és túlélési felszerelések valamint azok helyes működésének felszállás előtt történő ellenőrzésének eljárásai, beleértve a szükséges oxigén mennyiség megállapításának és rendelkezésre álló mennyiségének meghatározását.

2.2.14 A túlélők részére a 12. Annex-ben meghatározott, alkalmazandó föld-levegő látjelek.

2.3 Útvonalak és repülőterek

2.3.1 Az útvonalra vonatkozó tájékoztatások, amelyek biztosítják, hogy a hajózószemélyzet minden egyes repülés vonatkozásában részletes tájékoztatást kapjon a távközlési létesítményekről, navigációs berendezésekről, repülőterekről, az üzemeltetéshez igénybe vehető műszeres megközelítésekről, érkezési és indulási eljárásokról valamint minden más olyan tényezőről, amelyet a járató a szabályszerű repülésvégrehajtás érdekében szükségesnek ítél.

2.3.2 Minden egyes lerepülendő útvonalszakasz legalacsonyabb repülési magassága.

2.3.3 Minden egyes olyan repülőtér üzemeltetési minimuma, amelyet tervezett leszállási vagy kitérő repülőtérként valószínűleg igénybe vehetnek.

2.3.4 A megközelítési vagy a repülőtéri létesítmény használhatóságának csökkenése esetére megnövelt repülőtér üzemeltetési minimum.

2.3.5 Az előírásokban szereplő összes repülési művelet teljesítéséhez szükséges tájékoztatások, beleértve, de nem csak ezekre korlátozva az alábbiakat:

a) futópálya felszállási távolságok száraz, nedves és szennyezett körülmények között, beleértve azon rendszer meghibásodások eseteit, amelyek a szükséges távolságot befolyásolhatják;

b) felszállási emelkedési korlátozások;

c) útvonal emelkedési korlátozások;

d) megközelítési és leszállási emelkedési korlátozások;

e) futópálya leszállási távolságok száraz, nedves és szennyezett körülmények között, beleértve azon rendszer meghibásodások eseteit, amelyek a szükséges távolságot befolyásolhatják;

f) egyéb kiegészítő tájékoztatások, mint például gumiabroncs sebesség korlátozások.

2.4 Kiképzés

2.4.1 A hajózószemélyzet kiképzési program a 9. fejezet 9.3 szakasz előírásai alapján..

2.4.2 Az utaskabin személyzet kiképzési program a 12. fejezet 12.4 szakasz előírásai alapján.

2.4.3 A repülésüzemi tiszt/szolgálatvezető kiképző program, ha azt a 4. fejezet 4.2.1 pont alapján repülés felügyelettel összefüggésben alkalmazzák.

Megjegyzés: A repülésüzemi tiszt/szolgálatvezető kiképző program részletezését a 10. fejezet 10.2 szakasza tartalmazza.

ANNEX 6/II.
A légijármű üzemeltetése: Általános célú nemzetközi repülés – Repülőgépek

II. rész hatodik kiadása – 1998 július
26. módosítással

A jelen kiadvány magába foglalja a 6. Annex II. részének 2000 március 15-e előtt elfogadott összes módosításait és 1998 november 5-től hatálytalanítja a 6. Annex II. kötetének összes korábbi kiadásait.

A nemzetközi előírások és ajánlott gyakorlati eljárások alkalmazhatóságával kapcsolatosan lásd az Előszót.

Módosítások

A módosítások kiadásáról az ICAO Journal és az egyéb ICAO kiadványok valamint Audio-vizuális kiképzési segédanyagok havi katalógusa rendszeres tájékoztatást biztosítanak. Kísérjék figyelemmel a fenti kiadványokat és a módosításokat az alábbi rovatokba vezessék be:

Kiegészítés			
száma	kiadás időpontja	alkalmazhatóság időpontja	bevezette

A 6. Annex II. részében alkalmazott rövidítések és jelzések

Rövidítések és jelzés

ACAS	Összeütközés elkerülését biztosító fedélzeti rendszer
ADREP	Légijármű baleset vagy esemény jelentés
ADS-C	Automatikus légtérfelderítési adat szolgáltatási megállapodás
AFCS	Automatikus repülésvezérlő rendszer
AGA	Repülőterek, légútvonalak és földi berendezések
AIG	Légijármű baleset kivizsgálás és megelőzés
ASIA/PAC	Ázsia és Csendes Óceáni területek
ASE	Magasságmérő rendszer hiba
ATC	Légiforgalmi irányító szolgálat
ATS	Légiforgalmi szolgálatok
CAT I	I. kategória
CAT II	II. kategória
CAT III	III. kategória
CAT IIIA	IIIA. kategória
CAT IIIB	IIIB. kategória
CAT IIIC	IIIC. kategória
CFIT	Földnek ütközés vezetett repülés során (szabályszerűen üzemelő légijárművel)
cm	centiméter
CVR	Pilótakabin hangrögzítő berendezés
DA	Tengerszint feletti elhatározási magasság
DA/H	Elhatározási magasság
DH	Talajszint feletti elhatározási magasság
DME	Távolságmérő berendezés
ECAM	Központi elektronikus légijármű képernyő
EFIS	Elektronikus repülési műszerrendszer
EGT	Kilépő gázhőmérséklet
EICAS	Hajtómű ellenőrző és hajózószemélyzet riasztó rendszer
ELT	Vészhelyzeti helyjeladó berendezés
ELT(AD)	Automatikusan kibocsátható vészhelyzeti helyjeladó berendezés
ELT(AF)	Automatikus állandó vészhelyzeti helyjeladó berendezés
ELT(AP)	Automatikus hordozható vészhelyzeti helyjeladó berendezés
ELT(S)	Túlélési vészhelyzeti helyjeladó berendezés
EPR	Hajtómű nyomásviszony

EUROCAE	Európai Polgári Légiközlekedési Elektronikai Szervezet
FDAU	Repülési adatgyűjtő egység
FDR	Légijármű repülési adatrögzítő
FL	Repülési szint
FM	Frekvencia moduláció
ft	láb
g	Általános gyorsulás
GPWS	Földközelség jelző és riasztó rendszer
hPa	Hektopascal
IFR	Műszerrepülési szabályok
IMC	Műszeres időjárási körülmények
INS	Inerciális navigációs rendszer
kg	kilogramm
km	Kilométer
km/h	Kilométer/óra
kt	csomó
m	méter
MDA	Legalacsonyabb tengerszint feletti süllyedési magasság
MDA/H	Legalacsonyabb süllyedési magasság tengerszint/földfelszín felett
MDH	Legalacsonyabb földfelszín feletti süllyedési magasság
MHz	Megahertz
MNPS	Minimális navigációs teljesítmény előírás
NAV	Navigáció
NM	Tengeri mérföld
N1	Nagynyomású turbina fordulatszáma
OCA	Akadálymentes tengerszint feletti magasság
OCA/H	Akadálymentes tengerszint/földfelszín feletti magasság
OCH	Akadálymentes magasság
RCP	Előírt távközlési teljesítmény
RNP	Előírt navigációs teljesítmény
RVR	Futópályamenti látástávolság érték
RVSM	Csökkentett függőleges elkülönítési minimum
SI	Nemzetközi mértékegység
SICASP	Másodlagos légtérfelderítő radar fejlesztési és összeütközés elkerülési rendszereket kidolgozó munkacsoport
TLS	Megcélzott biztonsági szint
TVE	Összegzett függőleges hiba
UTC	Egyeztetett világidő

VFR	Látvarepülési szabályok
V_D	Tervezési süllyedési sebesség
VFR	Látvarepülési szabályok
VMC	Látás utáni időjárási körülmények
V_{SO}	Átesési sebesség, azaz a legalacsonyabb állandó sebesség a repülésvezérlő szerkezetek leszálláshoz történő beállítása mellett
WXR	Időjárás
Szimbólumok	
°C	Celsius fok
%	Százalék

A. táblázat — A 6. Annex II. részének módosításai

(módosítás — forrás — tárgy — elfogadva / hatályos / alkalmazható)

…

18) – Hatodik kiadás – Repülési adatrögzítés munkacsoport első ülése – Léginavigációs Bizottság tanulmányai – Az ipari és ICAO CFIT munkabizottságok vizsgálatai – 1. Annex 162. módosítása és a 11. Annex 38. módosítása – Szerkesztői módosítások

a) új és módosított meghatározások a szellemi tevékenységet befolyásoló anyagokra és az előírt navigációs teljesítményre vonatkozóan;

b) a kölcsönbérlet és csere vonatkozó megjegyzéseinek módosítása;

c) a szellemi tevékenységet befolyásoló (pszichoaktív) anyagok használatára vonatkozó új megjegyzés bevezetése;

d) új és módosított előírások a földközelség jelző és riasztó rendszer, a repülési adatrögzítők valamint a nyomásmagasság adó válaszjeladók szállítására.

1998. március 20. 1998. július 20. 1998. november 5.

19) – Repülési adatrögzítés munkacsoport második ülése – Léginavigációs Bizottság tanulmányai

a) meghatározások módosítása;

b) új előírások a 406 MHz és 121,5 MHz frekvencián üzemelő vészhelyzeti helyjeladó berendezések kötelező szállítására; földközelség jelző és riasztó rendszer (GPWS) kiegészítő veszélyes földfelszín közelség megelőző riasztási funkcióval történő ellátására vonatkozóan; a digitális összeköttetések rögzítésére vonatkozó határidő kijelölése.

1999. március 15. 1999. július 19. 1999. november 4.

20) – Léginavigációs Bizottság tanulmányai

a) meghatározások módosítása;

b) a műszeres megközelítések követelményeinek bevezetése; a légijármű parancsnok feladatainak módosítása.

2000. március 15. 2000. július 17. 2000. november 2.

21) – Repülési adatrögzítés munkacsoport második ülése – Az egész világot átfogó műholdas navigációs rendszerrel foglalkozó munkacsoport harmadik ülése – Folyamatos légialkalmassági munkacsoport ötödik ülése

a) a repülési adatrögzítőkre vonatkozó előírások módosítása, amelyek tartalmazzák a digitális távközlési adatok rögzítését; az új légijármű repülési adatrögzítőjére (FDR) vonatkozó előírások; rögzítendő

jellemzők új felsorolása; a pilótakabin hangrögzítők (CVR) két órás felvételi időtartamának előírása;
b) a műszeres megközelítés és leszállás osztályozásának módosítása;
c) új előírások a függőleges irányvezetéssel (APV) végrehajtott megközelítésre vonatkozóan; és
d) új meghatározások és a karbantartással kapcsolatos előírások módosítása.

2001. március 9. 2001. július 16. 2001. november 1.

22) –Léginavigációs Bizottság tanulmányai
A földközelség jelző és riasztó rendszerre (GPWS) és az előre irányuló veszélyes földfelszín közelség megelőző riasztó feladatra vonatkozó előírások módosítása;

2002. március 15. 2002. július 15. 2002. november 28.

23) – Elkülönítési és Légtérbiztonsági munkacsoport
A RNP légtérben történő repülésvégrehajtás engedélyezése a lajstromozó állam részéről.

2003. március 13. 2003. július 14. 2003. november 27.

24) – Elkülönítési és Légtérbiztonsági munkacsoport és Léginavigációs Bizottság tanulmányai
a) Új meghatározások és intézkedések a magasságtartási teljesítőképesség és magasság ellenőrzési követelményekre vonatkozóan a csökkentett függőleges elkülönítési minimum (RVSM) szerinti üzemeltetéssel összefüggésben; és
b) Új követelmények az összeütközést elkerülő fedélzeti rendszer (ACAS II) kisgépes légiközlekedéshez tartozó repülőgépekre való felépítésével kapcsolatban, és ezzel összefüggő képzési követelmények a repülőgépvezetők számára.

2005. február 28. 2005. július 11. 2005. november 24.

25) – Az Akadály védelmi Munkabizottság tizennegyedik ülése (OCP/14)
A repülőgépvezetők tudomása az eljárás felépítése alapján meghatározott üzemeltetési követelményekről.

2006. március 06. – –

(xiv) oldal

26) – Üzemeltetési Adatkapcsolat munkacsoport első ülése (OPLINKP/1) – Léginavigációs Bizottság tanulmánya:

a) előírások módosítása az automatikus légtérfelderítési adat szolgáltatási megállapodás (ADS-C) alkalmazásához rendelkezésre álló technológiák bevezetésének megkönnyítéséhez és a légiforgalmi szolgáltatások (ATS) biztosítása során az előírt távközlési teljesítmény RCP) bevezetéséhez; és
b) a vészhelyzeti helyjeladó berendezések (ELT-k) kötelező szállítási követelményei.

2007. március 14. 2007. július 16. 2007. november 22.
2008. július 1.

Flight time – Aeroplanes – Repülési idő – Repülőgép

Az a teljes időtartam, amely akkor kezdődik, amikor a repülőgép a felszállás céljából először megindul és akkor fejeződik be, amikor a repülőgép a repülés után megáll.

Megjegyzés: Az itt meghatározott repülési idő azonos az általánosan használt „blokk-idővel" vagy a „féktuskó elvételétől annak visszahelyezéséig" tartó időtartammal, amelyet attól az időponttól mérnek, amikor a repülőgép a felszállás céljából először megindul és akkor fejeződik be, mikor a repülőgép a repülés után megáll.

General aviation operation – Általános célú légiközlekedés

A kereskedelmi légiszállító tevékenységtől valamint a munkarepüléstől eltérő légijármű üzemeltetés.

Instrument meteorological conditions (IMC) – Műszeres időjárási körülmények

Látástávolsággal, felhőzettől mért távolsággal és felhőalappal* kifejezett időjárási körülmények, ha azok a látás utáni időjárási körülményekre meghatározott minimum értékeknél alacsonyabbak.

Megjegyzés: A látás utáni időjárási körülményekre meghatározott minimum értékeket a 2. Annex 4. fejezete tartalmazza.

Maintenance – Karbantartás

A légijármű folyamatos légialkalmasságának biztosításához előírt feladatok, beleértve a következők bármelyikét vagy ezek kombinációját; nagyjavítás, ellenőrzés, hibajavítás, csere, módosítás vagy a meghibásodás elhárítása.

Maintenance programme – Karbantartási program

Az előírt tervszerű karbantartási feladatok felsorolását tartalmazó kiadvány, amely jelzi a feladatok végrehajtásának időrendi tervét és rendjét. Ilyen kiadvány lehet a légijármű üzemi megbízhatósági programja, amely azon légijármű biztonságos üzemeltetéshez szükséges, amelyre az vonatkozik.

Maintenance release – Karbantartási igazolás

Olyan igazolást tartalmazó dokumentum, amely megerősíti, hogy a megfelelő karbantartási feladatokat a karbantartást végző szervezet eljárási kézikönyve vagy más egyenértékű rendszer alapján az elfogadott jellemzők figyelembevételével kielégítően elvégezték.

Meteorological information – Időjárás tájékoztatás

A jelenlegi vagy várható időjárási körülményekre vonatkozó időjárás jelentés, elemzés, előrejelzés vagy bármely más kiadott közlemény.

---

* A 2. Annex szerint.

Minimum descent altitude (MDA) / Minimum descent height (MDH) – Legalacsonyabb süllyedési magasság

A nem-precíziós megközelítési vagy a körözéssel végrehajtott megközelítési eljárásra előírt meghatározott tengerszint vagy földfelszín feletti magasság, amely alá az előírt látási feltételek létrejöttének hiányában süllyedni tilos.

1. Megjegyzés: A legalacsonyabb QNH süllyedési magasság a közepes tengerszinthez, a legalacsonyabb QFE süllyedési magasság a repülőtér magasságához vagy a futópálya küszöb magasságához viszonyított érték. Ez utóbbit akkor alkalmazzák, ha a futópálya küszöb magassága több mint 2 méterrel (7 láb) a repülőtér magassága alatt van. A megközelítéshez történő körözéshez meghatározott legalacsonyabb süllyedési magasság a repülőtér magasságához viszonyított érték.

2. Megjegyzés: A szükséges látási feltételek a fénytechnikai eszközök vagy a megközelítési terület azon elemeinek illetve részeinek látását jelentik, amelyeket a repülőgépvezetőnek elegendő ideig látnia kell ahhoz, hogy a légijármű helyzetét és a szükséges helyzetváltoztatás mértékét a kívánatos repülési pályához viszonyítva értékelhesse. A körözéssel végrehajtott megközelítés esetében a szükséges látási feltételek a futópálya környezetére vonatkoznak.

3. Megjegyzés: A gyakorlati alkalmazás megkönnyítése érdekében ott, ahol mindkét kifejezést használják, azok „QNH/OFE legalacsonyabb süllyedési magasság”-ként rövidítve pedig MDA/H-ként írhatók le.

Night – Éjszaka

Az esti polgári szürkület vége és a hajnali polgári szürkület kezdete között eltelt idő vagy olyan más, napnyugat és napkelte között eltelt időszak, amelyet az illetékes hatóság határoz meg.

Megjegyzés: Az esti polgári szürkület akkor fejeződik be, amikor a napkorong középpontja 6 fokkal a horizont alá süllyed és a hajnali polgári szürkület akkor kezdődik, amikor a napkorong középpontja 6 fokkal a horizont fölé emelkedik.

Obstacle clearance altitude (OCA) or Obstacle clearance height (OCH) – Akadálymentes tengerszint feletti magasság (OCA) vagy akadálymentes földfelszín feletti magasság (OCH)

A legalacsonyabb közepes tengerszinthez viszonyított magasság vagy a megfelelő futópálya küszöb illetve a repülőtér magassága feletti magasság – amelyik alkalmazható – amelyet az akadályoktól történő megfelelő függőleges elkülönítés biztosítása érdekében az akadálymentességi előírásokkal összhangban határoznak meg.

1. Megjegyzés: Az akadálymentes tengerszint feletti magasság a közepes tengerszinthez, az akadálymentes földfelszín feletti magasság a futópálya küszöb magasságához viszonyított érték. A nem-precíziós megközelítés esetében az akadálymentes földfelszín feletti magasság a repülőtér magasságához vagy a futópálya küszöb magasságához viszonyított érték. Ez utóbbit akkor alkalmazzák, ha a futópálya küszöb magassága több mint 2 méterrel (7 láb) a repülőtér magassága alatt van. A megközelítéshez történő körözéshez meghatározott akadálymentes földfelszín feletti magasság a repülőtér magasságához viszonyított érték.

2. Megjegyzés: A gyakorlati alkalmazás megkönnyítése érdekében ott, ahol mindkét kifejezést használják, azok „QNH/OFE akadálymentes magasság”-ként rövidítve pedig OCA/H-ként írhatók *le.*

Pilot-in-command – Légijármű parancsnoka

A repülés biztonságos végrehajtásáért felelős, a járató részéről parancsnoknak kijelölt repülőgépvezető vagy az általános célú légiközlekedés esetében a légijármű tulajdonosa.

Psychoactive substances – Szellemi tevékenységet befolyásoló anyagok

Alkohol, ópiumból vagy kenderből készített kábítószer, kokain, nyugtatók és altatók, egyéb izgató, serkentő, élénkítő-szerek, képzeteket keltő erős izgatószerek és illékony oldószerek a kávé és a dohányféleségek kivételével.

Required communication performance (RCP) – Előírt távközlési teljesítmény

A repülés közbeni távközlési teljesítmény követelményeire vonatkozó, meghatározott ATM feladatok támogatásával összefüggő közlemény

Required communication performance type (RCP) – Előírt távközlési teljesítmény típus

A távközlés lebonyolítási idejét, folyamatosságát, rendelkezésre állását és integrítását meghatározó RCP paraméterekhez rendelt értékeket jellemző címkék (például: RCP 240).

Repair – Javítás

A légijármű bármely üzemi alkatrészének sérülést vagy üzemszerű kopást követő repülésre alkalmas állapotba történő helyreállítása annak biztosítása érdekében, hogy az továbbra is megfelel a vonatkozó légialkalmassági előírásoknak, amelyeket az adott légijármű típus bizonyítványának kiadásakor figyelembe vettek.

3A oldal

Required navigation performance (RNP) – Előírt navigációs pontosság

Egy meghatározott légtérben történő repülés-végrehajtáshoz szükséges navigációs teljesítmény azaz pontosság.

Megjegyzés: A navigációs teljesítményt és előírásokat az adott RNP típusra és/vagy alkalmazásra határozzák meg.

Required navigation performance type (RNP type) – Előírt navigációs pontosság típus

Tengeri mérföldben kifejezett távolság érték, azaz pontossági határérték. A repülésvégrehajtás során a repülőgép tervezett repülési helyzetéhez viszonyítva a repülési idő legalább 95 %-ában ezen határértéken belül repüljön.

Például: – az RNP 4 olyan navigációs pontosság határértéket jelent, amelynek alapján az adott repülőgép repülési idejének legalább 95 százalékában mindenkori tervezett repülési helyzetéhez viszonyítva plusz/minusz 7.4 km (4 tmf) távolságon belül repül.

Runway visual range (RVR) – Futópályamenti látástávolság érték

Az a távolság, ameddig a futópálya középvonalán álló légijármű vezetője látja a futópálya felületi jelzéseket vagy a futópálya szélét kijelölő, illetve a középvonalát azonosító fényeket.

State of Registry – Lajstromozó állam

Azon állam, amelynek lajstromába a légijárművet bevezették.

Megjegyzés: A nem nemzeti alapon működő nemzetközi üzemeltető vállalkozás vagy szervezet légijárművének lajstromozása esetében az abban érintett államokra együttesen és külön-külön is vonatkozik az a kötelezettség, amely a Chicagó-i Egyezmény értelmében a lajstromozó államot illeti. Erre vonatkozóan lásd a Tanács 1967. december 14-i Határozatát a Nemzetközi Üzemeltető Szervezetek Által Üzemeltetett Légijárművek Nemzeti Hovatartozása és Lajstromozása címmel, amely megtalálható a Nemzetközi Légiszállítás Gazdasági Szabályzására vonatkozó Útmutatóban (Doc 9587).

Target level of safety (TLS) – Megcélzott biztonsági szint

Adott körülmények között elfogadhatónak ítélt kockázati szintet kifejező általános fogalom.

Total vertical error (TVE) – Összegzett magassági hiba

A légijármű aktuális repülési nyomás magassága és a részére meghatározott nyomás magasság (repülési szint) közötti függőleges geometriai különbség.

Visual meteorological conditions (VMC)- Látás utáni időjárási körülmények

Látástávolsággal, felhőzettől mért távolsággal és felhőalappal kifejezett időjárási körülmények, ha azok a látás utáni időjárási körülményekre meghatározott minimum értékeknél jobbak.

Megjegyzés: A látás utáni időjárási körülményekre meghatározott minimum értékeket a 2. Annex 4. fejezete tartalmazza.

6.10.1.4.1 2003 január 1. után ne használják a fényképészeti filmmel működő repülési adatrögzítőket.

6.10.1.5 Az összes olyan digitális adathálózati összeköttetést alkalmazó repülőgép, amelynek egyedi légialkalmassági bizonyítványát először 2005 január 1. után adták ki, valamint pilótakabin hangrögzítő berendezés (CVR) szállítására kötelezett, repülési adatrögzítő berendezésén rögzítse az összes, beérkező és kimenő digitális adathálózati közleményt. A legkisebb felvételi időtartam azonos legyen a pilótakabin hangrögzítő berendezés felvételi időtartamával és a felvétel összevethető legyen a rögzített hangfelvétellel.

6.10.1.5.1 2007 január 1.-től az összes digitális adathálózati összeköttetést alkalmazó repülőgép, amely pilótakabin hangrögzítő berendezés (CVR) szállítására kötelezett, repülési adatrögzítő berendezésén rögzítse az összes, beérkező és kimenő digitális adathálózati közleményt. A legkisebb felvételi időtartam azonos legyen a pilótakabin hangrögzítő berendezés felvételi időtartamával és a felvétel összevethető legyen a rögzített hangfelvétellel.

6.10.1.5.2 Az adathálózati digitális közleményváltás tartalmának megismeréséhez szükséges tájékoztatást és ahol ez lehetséges, a közlemény megjelenítésének vagy a hajózószemélyzet által történt lehívásának időpontját is rögzítsék.

Megjegyzés: Az adathálózati összeköttetések közé tartoznak, azonban nem csak ezekre korlátozódnak a következők:

ADS-C – automatikus légtérfelderítési adat szolgáltatási megállapodás

CPDLC – légiforgalmi irányító és repülőgépvezető közötti adathálózati összeköttetések

D-FIS – adathálózati és repüléstájékoztató szolgálati összeköttetések

AOC – légiközlekedési üzemi irányítási közlemények.

6.10.1.6 **Ajánlás** – *Minden olyan repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) több mint 5700 kg és repülési adatrögzítő és pilótakabin hangrögzítő berendezések szállítására kötelezett, alternatív megoldásként kettős (összetett) repülési adat és pilótakabin hangrögzítő berendezéssel is (FDR/CVR) felszerelhetnek.*

6.10.1.7 Az I.A típusú repülési adatrögzítő rögzítse azokat a jellemző adatokat, amelyek a repülőgép repülési pályájának, sebességének, helyzetének, hajtómű teljesítményének és működésének valamint a repülésvezérlő szerkezetek beállításának és működésének pontos meghatározásához szükségesek. A következő pontokban ismertetjük azokat a jellemzőket, amelyek kielégítik az I.A típusú repülési adatrögzítőre vonatkozó előírásokat. A (*) jelölés nélküli jellemzők rögzítése kötelező. A (*) jelöléssel ellátott jellemzők akkor rögzítendők, ha a repülőgép rendszerei vagy a hajózószemélyzet a jellemzőt illetve adatot a repülőgép üzemeltetéshez használja fel.

6.10.1.7.1 A repülőgép repülési pályájára és sebességére vonatkozó előírásokat kielégítő jellemzők:

– nyomás-magasság
– műszer szerinti vagy kalibrált repülési sebesség
– levegő – föld viszonyítási helyzet és minden egyes futómű levegő – föld érzékelő; szükség

szerint
- külső levegő hőmérséklete vagy össz-hőmérséklet
- géptengely irányszög (a hajózószemélyzet elsődleges műszerei alapján)
- függőleges gyorsulás
- oldalirányú gyorsulás
- hosszirányú gyorsulás (törzs tengely)
- idő vagy relatív idő számítás
- navigációs adatok*: széleltérítés sodródási szög, szélsebesség, szélirány, szélességi és hosszúsági fok adatok
- földi feletti sebesség*
- rádió magasságmérő által jelzett magasság*

6.10.1.7.2 A repülési helyzetre vonatkozó előírásokat kielégítő jellemzők:

- bólintási helyzet
- bedöntési helyzet
- legyezőmozgás vagy csúszás szög*
- állásszög*

6.10.1.7.3 A hajtóműre vonatkozó előírásokat kielégítő jellemzők:

- hajtómű tolóerő illetve teljesítmény: minden egyes hajtómű tolóereje, pilótakabin tolóerő szabályzó kar(ok) helyzete
- sugárfordító helyzete*
- hajtómű tolóerő utasítás*
- szükséges hajtómű tolóerő*
- hajtómű levegőelvételi-szelep helyzete*
- további hajtómű jellemzők*: hajtómű nyomásviszony, kijelzett hajtómű rezgési szint értékek, tüzelőanyag áramlási értékek, tüzelőanyag elvételi kar helyzete, N_1, N_2, EGT, TLA, N_3

6.10.1.7.4 A repülésvezérlő szerkezetek helyzetére vonatkozó előírásokat kielégítő jellemzők:

- bólintás trimm lap(ok) helyzete
- fékszárnyak*: belépőél helyzete, pilótakabin fékszárny vezérlőkar beállítás
- orrsegédszárnyak*: orrsegédszárny belépőél helyzete, pilótakabin orrsegédszárny vezérlőkar helyzete
- futómű*: futómű, futó vezérlőkar helyzete
- oldalkormány trimm lap helyzete*
- csűrő trimm lap helyzete*
- pilótakabin trimm vezérlő szervek helyzete *: bólintás
- pilótakabin trimm vezérlő szervek helyzete *: bedöntés
- pilótakabin trimm vezérlő szervek helyzete *: legyezőmozgás
- földi áramlásrontó és aerodinamikai fék*: földi áramlásrontó helyzet, földi áramlásrontó vezérlőkar helyzet, aerodinamikai fék helyzet, aerodinamikai fék vezérlőkar helyzet
- jégmentesítő és/vagy jégtelenítő berendezések kiválasztása*

– hidraulika nyomás (minden egyes rendszer)*
– tüzelőanyag-mennyiség*
– AC (váltóáramú) elektromos táplálások helyzete*
– DC (egyenáramú) elektromos táplálások helyzete*
– segédhajtómű levegőelvételi-szelep helyzete*
– számított súlyponthelyzet*

6.10.1.7.5 Az üzemeltetésre vonatkozó előírásokat kielégítő jellemzők:

– riasztások
– elsődleges repülés vezérlő szerkezetek helyzete és a kezelő egységek beállítása: bólintási, bedöntési és legyezőmozgás szerinti tengelyek
– marker adó átrepülése

16. oldal

– minden egyes navigációs vevőberendezés frekvencia kiválasztása
– kézi rádió adógomb helyzete és CVR/FDR szinkron jel
– robotpilóta, tolóerő automata, automatikus repülésvezérlés üzemmód és bekapcsolt állapot helyzete*
– választott barometrikus nyomás beállítás*: légijármű parancsok és első tiszt
– választott nyomásmagasság (repülőgépvezető részéről állítható összes üzemmód)*
– választott repülési sebesség (repülőgépvezető részéről állítható összes üzemmód)*
– választott MACH szám (repülőgépvezető részéről állítható összes üzemmód)*
– választott emelkedési és süllyedési sebesség (repülőgépvezető részéről állítható összes üzemmód)*
– választott géptengely irányszög (repülőgépvezető részéről állítható összes üzemmód)*
– választott repülési pálya (repülőgépvezető részéről állítható összes üzemmód)*; repülési irányszög, korrigált repülési pálya, megközelítési siklópálya szög
– választott elhatározási magasság*
– az elektronikus repülési műszerrendszer (EFIS) választott megjelenítési beállítása*: légijármű parancsok és első tiszt
– több funkciós hajtómű teljesítmény és állapot riasztás megjelenítési beállítása*
– GWPS/TAWS/GCAS helyzet*: földfelszín megjelenítési mód választás, beleértve a következőket: figyelmeztető jelzések és riasztások, riasztási állapot, tanácsadó rendszer állapot, üzemi kapcsolók helyzete
– alacsony nyomás riasztások*: hidraulika és pneumatika rendszerek
– számítógép meghibásodás*
– veszélyes kabinnyomás csökkenés riasztás*
– TCAS/ACAS (forgalmi riasztó és összeütközés elkerülését biztosító rendszer / összeütközés elkerülését biztosító fedélzeti rendszer*
– jegesedés jelzőrendszer*
– veszélyes hajtómű rezgés riasztás minden egyes hajtóműnél*
– veszélyes hajtómű túlmelegedés riasztás minden egyes hajtóműnél*
– veszélyes alacsony olajnyomás riasztás minden egyes hajtóműnél*

– veszélyes hajtómű fordulatszám (sebesség) túllépés riasztás minden egyes hajtóműnél*
– szélnyírás riasztás*
– repülés közben működő átesés elleni védelem, vezérlőkar rázás és elmozdítás működtetése*
– a pilótakabinban található összes repülésvezérlő egység erőhatásai*: kormányszarv, kormányoszlop, pedálok kabinból való működtetésének erőhatásai
– függőleges eltérések*: ILS siklópálya, MLS magasság irányvezetés, GNSS megközelítési pálya
– vízszintes eltérések*: ILS iránysáv, MLS oldalszög irányvezetés, GNSS megközelítési pálya
– távolságmérő jelzőműszerek által jelzett távolság értékek (1 és 2 DME készletek)*
– elsődleges navigációs rendszerek*: GNSS, INS, VOR/DME, MLS, ILS, Loran C
– fékberendezések*: bal és jobb oldali féknyomások, bal és jobb oldali fékpedál helyzete
– időpont*
– események jelzése*
– pilótakabin üvegre vetített megjelenítő rendszer bekapcsolása*
– paravizuális megjelenítő egységek bekapcsolása*

1. Megjegyzés: Az előírt jellemzők, közöttük a tartományok, a mintavételi pontosság és felbontás megtalálhatók az EUROCAE Polgári Légiközlekedési Berendezések Európai Szervezete repülési adatrögzítő rendszerekre kidolgozott MOPS (minimális üzemi teljesítmény előírások) kiadványában vagy más egyenértékű dokumentumban.
2. Megjegyzés: A rögzítendő jellemzők száma a repülőgép típustól, annak összetettségétől függ, azonban a csillag (*) jelölés nélküli jellemzőket ettől függetlenül rögzíteni kell. A (*) jelöléssel ellátott jellemzők akkor rögzítendők, ha a repülőgép rendszerei vagy a hajózószemélyzet a jellemzőt illetve adatot a repülőgép üzemeltetéshez használja fel.

6.10.2 Repülési adatrögzítők — felvételi időtartam

Az I. és II. típusú repülési adatrögzítő képes legyen a működése legalább utolsó 25 órájában rögzített adatok tárolására.

6.10.3 Repülési adatrögzítők — Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 1989 január 1-én vagy ezt követően adták ki

6.10.3.1 Minden olyan repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 27 000 kg. I. típusú repülési adatrögzítő berendezéssel szereljenek fel.

6.10.3.2 **Ajánlás** — *Minden olyan repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) 5700 kg-tól 27 000 kg-ig terjed, II. típusú repülési adatrögzítő berendezéssel szereljenek fel.*

6.10.4 Repülési adatrögzítők — Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 2005 január 1. után adták ki

Minden olyan repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 5700 kg. I.A típusú repülési adatrögzítő berendezéssel szereljenek fel.

6.10.5 Pilótakabin hangrögzítők — Repülőgépek, amelyek egyedi légialkalmassági bizonyítványát először 1987 január 1-én vagy ezt követően adták ki

Megjegyzés: A pilótakabin hangrögzítő berendezések teljesítmény előírásai megtalálhatók az EUROCAE

Polgári Légiközlekedési Berendezések Európai Szervezete repülési adatrögzítő rendszerekre kidolgozott MOPS (minimális üzemi teljesítmény előírások) kiadványában vagy más egyenértékű dokumentumban.

6.10.5.1 Minden olyan repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 27 000 kg. pilótakabin hangrögzítő berendezéssel szereljenek fel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt.

6.10.5.2 **Ajánlás** — *Minden olyan repülőgépet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) 5700 kg-tól 27 000 kg-ig terjed, pilótakabin hangrögzítő berendezéssel szereljenek fel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt.*

16A oldal

6.10.6 Pilótakabin hangrögzítők — felvételi időtartam

6.10.6.1 A pilótakabin hangrögzítő berendezés képes legyen a működése legalább utolsó 30 percében rögzített információk tárolására.

6.10.6.2 **Ajánlás** —*Az a pilótakabin hangrögzítő berendezés, amelyet olyan repülőgépbe szereltek fel, melynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 5700 kg. és egyedi légialkalmassági bizonyítványát először 1990 január 1-én vagy ezt követően adták ki, képes legyen a működése legalább utolsó két órájában rögzített információk tárolására.*

6.10.6.3 Az a pilótakabin hangrögzítő berendezés, amelyet olyan repülőgépbe szereltek fel, melynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 5700 kg. és egyedi légialkalmassági bizonyítványát először 2003 január 1. után adták ki, képes legyen a működése legalább utolsó két órájában rögzített információk tárolására.

6.10.7 Repülési adatrögzítők — szerkezet és beszerelés

A repülési adatrögzítőket úgy készítsék el és helyezzék el illetve szereljék be a repülőgépbe, hogy biztosítsák a rögzített adatok gyakorlatilag lehetséges legnagyobb védelmét annak érdekében, hogy a rögzített tájékoztatások megőrizhetők, leolvashatók és feldolgozhatók legyenek.

Megjegyzés: A baleseti törési ellenálló képesség és a tűz elleni védelem ipari előírásai megtalálhatók a Polgári Légiközlekedési Berendezések Európai Szervezete (EUROCAE) ED55 és ED56A jelű és hasonló kiadványokban.

6.10.8 Repülési adatrögzítők — működés

6.10.8.1 A repülési adatrögzítőt a repülés időtartama alatt ne kapcsolják ki.

6.10.8.2 A repülési adatrögzítővel rögzített adatok megőrzése érdekében a berendezést egy baleset vagy repesemény utáni repülés befejezését követően kapcsolják ki és azt a 13. Annex előírásaival összhangban, az információkat tartalmazó adathordozó eltávolítása előtt ne kapcsolják ismét be.

1. Megjegyzés: A repülési adatrögzítővel rögzített adatok légijárműből történő eltávolításának szükségességét a vizsgálatot végző állam vizsgáló hatósága határozza meg az esemény súlyossága és körülményei alapján, beleértve az eseménynek a repülési üzemre gyakorolt hatását is.

2. Megjegyzés: A légijármű parancsnoknak a repülési adatrögzítővel rögzített adatok tárolására vonatkozó felelősségét a 6.10.9 pont tartalmazza.

6.10.9 Repülési adatrögzítő felvételei

A légijármű parancsnoka a lehetőségek határain belül biztosítsa, hogy amennyiben a repülőgép balesetet szenvedett vagy repeseményben érintett, az összes vonatkozó repülési adatrögzítő felvételt és ha szükséges, az alkalmazott repülési adatrögzítő berendezéseket is megőrizze, továbbá azokat a 13. Annex előírásaival összhangban biztonságos őrizet alatt tárolja.

6.10.10 Repülési adatrögzítők — folyamatos működőképesség

Végezzék el a repülési adatrögzítő és pilótakabin hangrögzítő rendszerek felvételeinek üzemi ellenőrzését és értékelését annak érdekében, hogy a rögzítő berendezések folyamatos működőképességét biztosíthassák.

Megjegyzés: A repülési adatrögzítők és pilótakabin hangrögzítő rendszerek ellenőrzésének eljárásait az A. Melléklet tartalmazza.

6.11 MACH-szám jelzőműszer

Minden olyan repülőgépet, amelynek üzemeltetési sebesség korlátozásait Mach-szám érték(ek)ben fejezik ki, szereljenek fel Mach-szám jelzőműszerrel.

Megjegyzés: Ez az előírás nem zárja ki a repülési sebesség mérőműszer igénybevételét a légiforgalmi szolgálatok céljaira megadott Mach-szám érték kiszámításához.

6.12 Vészhelyzeti helyjeladó berendezés (ELT)

2008. június 30-ig alkalmazható

6.12.1 Minden olyan, a 6.3.3 b) pont szerint vízfelszín felett hosszú távú, és a 6.4 pont szerint kijelölt szárazföld felett repülést végrehajtó repülőgépet, amelynek egyedi légialkalmassági bizonyítványát először 2002 január 1. után adták ki, egy darab automatikus vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

6.12.2 2005 január 1-től minden, a 6.3.3 b) pont szerint vízfelszín felett hosszú távú, és a 6.4 pont szerint kijelölt szárazföld felett repülést végrehajtó repülőgépet egy darab automatikus vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

6.12.3 **Ajánlás** — *Minden repülőgépet szereljenek fel automatikusan működésbe lépő vészhelyzeti helyjeladó (ELT) berendezéssel.*

16B oldal

6.12.4 A fenti 6.12.1 — 6.12.3 pontok alapján felszerelt vészhelyzeti helyjeladó (ELT) berendezés a 10. Annex III. kötet vonatkozó előírásai szerint üzemeljen.

2008. július 01-től alkalmazandó

6.12.5 **Ajánlás –** *Minden repülőgép szállítson egy automatikus működésű vészhelyzeti helyjeladó (ELT)* *berendezést.*

6.12.6 A 6.12.7. pontban megadott esetet kivéve, 2008 július 01-től minden repülőgépet szereljenek fel legalább egy darab tetszőleges típusú automatikus vészhelyzeti helyjeladó (ELT) berendezéssel.

6.12.7 Minden olyan repülőgépet, amelynek egyedi légialkalmassági bizonyítványát először 2008 július 1. után adták ki, szereljenek fel legalább egy darab automatikus működésű vészhelyzeti helyjeladó (ELT) berendezéssel.

6.12.8 A fenti 6.12.5 — 6.12.7 pontok alapján felszerelt vészhelyzeti helyjeladó (ELT) berendezés a 10. Annex III. kötet vonatkozó előírásai szerint üzemeljen.

Megjegyzés: A vészhelyzeti helyjeladó (ELT) számának, típusának és a légijárművön való elhelyezésének valamint az uszóképességet támogató kiegészítő rendszerének megfelelő kiválasztása adja a legnagyobb esélyt a vészhelyzeti helyjeladó (ELT) működésbe hozására, amennyiben a kutatás és mentés szempontjából különösen nehéz területeket is beleértve, a víz vagy a szárazföld felett repülő légijárművet baleset érné. Az adóegység elhelyezése a legfontosabb tényező az optimális törés és tűz elleni védelem biztosításában. Az automatikus működésű beépített vészhelyzeti helyjeladó (ELT) vezérlő és kapcsoló eszközeinek (aktíváló kijelzők) elhelyezésénél és a kapcsolódó üzemeltetési eljárások kialakításánál tekintetbe kell venni a figyelmetlenségből adódó működésbe hozatal gyors felismerésének, valamint a manuális bekapcsolás esetén a személyzet általi könnyű kezelhetőség igényeit.

6.13 Repülőgépek, amelyeket nyomásmagasság-adó másodlagos radar válaszjeladóval kell felszerelni

6.13.1 2003 január 1. után az illetékes hatóság felmentésének kivételével minden repülőgépet szereljenek fel a 10. Annex IV. kötet vonatkozó előírásainak megfelelően üzemelő nyomásmagasság-adó másodlagos radar válaszjeladó berendezéssel.

6.13.2 **Ajánlás** — *Minden repülőgépet szereljenek fel a 10. Annex IV. kötet vonatkozó előírásainak megfelelően üzemelő nyomásmagasság-adó másodlagos radar válaszjeladó berendezéssel.*

Megjegyzés: A 6.13.1 és 6.13.2 pontok előírásainak célja a légiforgalmi szolgálatok valamint az összeütközést elkerülő fedélzeti rendszerek hatékony működésének fejlesztése. Az ACAS rendszer felszerelésére és szállítására vonatkozó hatálybalépési időpontokat a 6. Annex I. rész 6.18.1 és 6.18.2 pontjai tartalmazzák. Az előírás célja továbbá az is, hogy a nyomásmagasság-adó másodlagos radar válaszjeladó berendezéssel fel nem szerelt légijármű ne üzemeljen közös légtérben olyan légijárművel, amely összeütközést elkerülő fedélzeti rendszerrel van felszerelve. Ezért a nyomásmagasság-adó másodlagos radar válaszjeladó berendezés szállítása alól történő felmentéseket olyan légtér kijelölése mellett adják ki, amelyben az ilyen berendezés szállítása nem kötelező.

6.14 Repülőgépek, amelyeket összeütközést elkerülő fedélzeti rendszerrel (ACAS II) kell felszerelni

6.14.1 **Ajánlás** *–minden olyan gázturbinás sugárhajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 15000 kg-nál nagyobb, vagy amely több mint 30 utas szállítására jogosított, és amennyiben ezen repülőgép egyedi légialkalmassági bizonyítványát először 2005 november*

24 után adták ki, szereljenek fel összeütközést elkerülő fedélzeti rendszerrel (ACAS II).

6.14.2 Minden olyan gázturbinás sugárhajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 15000 kg-nál nagyobb, vagy amely több mint 30 utas szállítására jogosított, és amennyiben ezen repülőgép egyedi légialkalmassági bizonyítványát először 2007 január 1 után adták ki, szereljenek fel összeütközést elkerülő fedélzeti rendszerrel (ACAS II).

6.14.3 **Ajánlás** *–minden olyan gázturbinás sugárhajtóműves repülőgépet, amelynek engedélyezett legnagyobb felszállósúlya (tömege) 5700 kg-nál nagyobb de nem haladja meg a 15000 kg értéket, vagy amely több mint 19 utas szállítására jogosított, és amennyiben ezen repülőgép egyedi légialkalmassági bizonyítványát először 2008 január 1 után adták ki, szereljenek fel összeütközést elkerülő fedélzeti rendszerrel (ACAS II).*

6.15 Mikrofonok

Ajánlás — *A pilótakabinban szolgálati feladat ellátására kijelölt minden hajózószemélyzeti tag közleményváltásaihoz az átváltási szint/magasság alatt gégemikrofont vagy fejhallgatóhoz erősített mikrofont használjon.*

7. fejezet
Repülőgép távközlési és navigációs berendezések

7.1 Távközlési berendezés

7.1.1 A műszerrepülési szabályok szerint vagy éjszaka üzemeltetett repülőgépet szereljék fel rádió-berendezéssel. Ez a berendezés a meghatározott frekvenciákon alkalmas legyen kétoldalú rádió-összeköttetés fenntartására az illetékes hatóság által előírt légiforgalmi állomásokkal.

Megjegyzés: A 7.1.1 pont előírásai teljesítettnek tekinthetők, ha az útvonalon szokásos hullámterjedési viszonyok között a repülőgép képes az itt meghatározott távközlési összeköttetések fenntartására.

7.1.2 Amikor a 7.1.1 előírásának teljesítése érdekében egynél több berendezést szerelnek fel, azok egymástól függetlenül működjenek úgy, hogy az egyik berendezés meghibásodása ne okozza bármely másik berendezés meghibásodását.

7.1.3 A látvarepülési szabályok szerint, de ellenőrzött repülésként üzemeltetett repülőgépet az illetékes hatóság mentesítő engedélyének hiányában szereljenek fel rádió-berendezéssel, amely a repülés végrehajtása alatt a meghatározott frekvenciákon bármikor alkalmas kétoldalú rádió-összeköttetés fenntartására az illetékes hatóság által kijelölt légiforgalmi állomásokkal.

7.1.4 Azt a repülőgépet, amelyet olyan repülés végrehajtására vesznek igénybe, amelyre a 6.3.3 vagy 6.4 pontok előírásai vonatkoznak, hacsak az illetékes hatóság nem ad mentesítő engedélyt, szereljenek fel rádió-berendezéssel, amely a repülés végrehajtása alatt a meghatározott frekvenciákon bármikor alkalmas kétoldalú rádió-összeköttetés fenntartására az illetékes hatóság által kijelölt légiforgalmi állomásokkal.

7.1.5 A 7.1.1 — 7.1.4 pontok alapján előírt rádió berendezés képes legyen rádió-összeköttetés fenntartására a 121.5 Mhz-es légiközlekedési vészfrekvencián.

7.1.6 A légtér meghatározott szakaszaiban vagy olyan útvonalakon történő repülések végrehajtásakor, ahol RCP típus lett előírva, a 7.1.1 – 7.1.5 pontokban meghatározott követelményeken túl a repülőgép:

a) legyen felszerelve olyan távközlési berendezésekkel, amelyek lehetővé teszik az előírt RCP típus(ok) szerinti üzemeltetést; és

b) a járató állama részéről rendelkezzen jogosítással az ilyen légtérben történő üzemeléshez.

Megjegyzés: az előírt távközlési teljesítményre (RCP), az ezzel összefüggő eljárásokra valamint a jogosítási folyamatra vonatkozó tájékoztatásokat az előkészítés alatt álló Előírt Távközlési Teljesítmény (RCP) Kézikönyv *(Doc 9869) tartalmazza. Ez a kiadvány felsorolja továbbá azokat a dokumentumokat is amelyeket az államok és a nemzetközi szervezetek a távközlési rendszerekre és az előírt távközlési teljesítményre (RCP) dolgoztak ki.*

7.2 Navigációs berendezés

7.2.1 A repülőgépet szereljék fel olyan navigációs berendezéssel, amelynek segítségével az képes:

a) a repülési tervében meghatározott útvonal követésére; és

b) a légiforgalmi szolgálatok előírásai szerint történő repülésre;

kivéve, ha ezt az illetékes hatóság nem tiltja meg, a látvarepülési szabályok szerint végrehajtott repülés során a navigációt az útvonal mentén egymástól legfeljebb 110 km (60 NM) távolságra levő földi tájékozódási pontok látás utáni azonosításával hajtják vége.

7.2.2 A légtér meghatározott szakaszaiban vagy olyan útvonalakon történő repülés esetében, amelyekre vonatkozóan RNP típust írtak elő, a repülőgép a 7.2.1 pontban ismertetett előírások mellett:

a) legyen felszerelve olyan navigációs berendezésekkel, amelyek lehetővé teszik az előírt RNP típus(ok) szerinti üzemeltetést; és

b) rendelkezzen jogosítással a lajtromozó állam részéről az ilyen légtérben történő üzemeléshez.

Megjegyzés: Az előírt navigációs pontosságra (RNP), az ezzel összefüggő eljárásokra valamint a jogosítási folyamatra vonatkozó tájékoztatásokat az RNP Kézikönyv *(Doc 9613) tartalmazza. A kiadvány átfogóan felsorolja azokat a dokumentumokat és egyéb anyagokat, amelyeket az államok és a nemzetközi szervezetek a navigációs rendszerekre valamint az előírt navigációs teljesítményre vonatkozóan készítettek el.*

7.2.3 A Körzeti Léginavigációs Egyezmény alapján kijelölt olyan légterekben végrehajtott repülések esetében, amelyekre vonatkozóan minimális navigációs teljesítmény előírást (MNPS) határoztak meg, a repülőgépet szereljék fel olyan navigációs berendezéssel, amely:

a) a hajózószemélyzet részére az előírt pontossággal és folyamatosan jelzi az útvonal-tartást vagy az ettől való eltérést a kijelölt repülési útvonal bármely pontján;

b) amelyet a lajstromozó állam az érintett MNPS üzemeltetésre engedélyezett.

Megjegyzés: Az előírt minimális navigációs teljesítményre vonatkozó előírások és alkalmazási eljárások a Helyi Kiegészítő Eljárások *című kiadványban (Doc 7030) találhatók.*

7.2.4 Azon légtér meghatározott szakaszaiban történő repüléseknél, ahol a helyi Körzeti Léginavigációs Egyezmény értelmében FL 290 felett 300 méter (1000 láb) függőleges elkülönítési minimumot alkalmaznak, a repülőgépet szereljék fel:

a) olyan berendezéssel, amely képes:

1) a tartott repülési szintet (FL) a hajózószemélyzet részére jelezni;

2) a kiválasztott repülési szintet automatikusan tartani;

3) a hajózószemélyzet részére riasztó jelzést adni, ha a kiválasztott repülési szinttől eltérnek. A riasztó jelzés vonatkozó határértéke +/- 90 méter (300 láb) legyen; és

4) automatikusan jelezni a nyomás-magasságot.

b) A lajstromozó állam a repülőgépet engedélyezze az ilyen légtérben történő üzemeltetésre.

7.2.5 A 7.2.4 b) szerinti RVSM jóváhagyás kiadása előtt, az állam győződjön meg arról, hogy:

a) a légijármű függőleges navigációt biztosító felszereléseinek képességei kielégítik a 2. Függelék követelményeit;

b) a járató megfelelő eljárásokat vezet be a folyamatos légialkalmassághoz (karbantatás és javítás) kapcsolódó gyakorlati tevékenységek és programok vonatkozásában; és

c) a járató megfelelő hajózó személyzeti eljárásokat vezet be az RVSM szerinti légtérben való üzemeltetéshez.

Megjegyzés: Az RVSM szerinti jóváhagyás globálisan érvényes annak figyelembe vételével, hogy egy adott régióra érvényes bármely üzemeltetési eljárást tartalmazni fogja az üzemeltetési kézikönyv vagy a megfelelő személyzeti útmutató.

7.2.6 A járató állama, amennyiben szükséges a lajstromozó állammal konzultálva, a 7.2.4 fejezetben említett légijárművek vonatkozásában biztosítja, hogy megfelelő lépések történjenek:

a) amikor a 11. Függelék, 3.3.4.1 alfejezetével összhangban létrehozott ellenőrző szervezettől jelentés érkezik a magasság tartás körülményeiről;

b) helyesbítő intézkedések bevezetésére az előbbiek szerinti jelentésben szereplő egyedi repülőgép, vagy repülőgép típusba tartozó csoportra vonatkozóan, amennyiben eltérést tapasztalnak az RVSM szerinti légtérben való üzemeltetésre vonatkozó követelmények betartásában, ha az alkalmazásra került.

7.2.7 Mindegyik állam, amelyik felelős azon légterekért, ahol az RVSM alkalmazásra került, vagy a járatóknak RVSM jóváhagyást adott ki a saját államán belül, olyan intézkedéseket és eljárásokat vezet be, amelyek biztosítják a megfelelő lépések megtételét az RVSM légteret, RVSM jóváhagyás nélkül használó repülőgépek vagy járatók ellen.

1. Megjegyzés: ezeket az intézkedéseket és eljárásokat mindkét olyan esetben alkalmazni szükséges, amikor a kérdéses repülőgépet jóváhagyás nélkül üzemeltetik az állam légterében, vagy amikor az állam rendszeres felügyeleti felelősségébe tartozó járató a szükséges jóváhagyás nélkül üzemeltet egy másik állam légterében.

2. Megjegyzés: a FL 290 felett 300 méter (1000 láb) függőleges elkülönítési minimum alkalmazására kijelölt légtérben szükséges légijármű berendezések alkalmazásának engedélyezésére vonatkozó útmutatás a következő kézikönyvben található: 300 méter (1000 láb) függőleges elkülönítési minimum (VSM) bevezetése FL 290 és FL 410 repülési szintek között *(Doc 9574).*

7.2.8 A repülőgépet olyan navigációs berendezéssel szereljék fel, amely biztosítja, hogy a repülés végrehajtásának bármely szakaszában bekövetkező, az egyik rendszert érintő meghibásodás esetében a repülőgépet a 7.2.1 valamint ahol ez alkalmazható, a 7.2.2 — 7.2.4 pontok előírásainak megfelelően tovább lehessen irányítani (navigálni).

1. Megjegyzés: Ezt az előírást a berendezések megkettőzésén kívül más módszerekkel is teljesíthetik.

2. Megjegyzés: A FL 290 felett 300 méter (1000 láb) függőleges elkülönítési minimum alkalmazására kijelölt légtérben szükséges légijármű berendezésekre vonatkozó útmutatás a következő kézikönyvben található: 300 méter (1000 láb) függőleges elkülönítési minimum (VSM) bevezetése FL 290 és FL 410 repülési szintek között *(Doc 9574).*

7.2.9 A műszeres időjárási körülmények között végrehajtott leszállással tervezett repülések esetében a repülőgépet olyan rádió berendezéssel szereljék fel, amely alkalmas az irányvezetést biztosító rádiójelek vételére egy olyan pontig, ahonnan a leszállás látással végrehajtható. Ez a rádió berendezés képes legyen az irányvezetés biztosítására minden olyan tervezett leszállási, valamint bármely kijelölt kitérő repülőtéren, ahol műszeres időjárási körülmények között történő leszállás végrehajtását tervezik.

8. fejezet
Repülőgép karbantartás

1. Megjegyzés: A jelen fejezetben történő alkalmazás során a repülőgép kifejezésbe tartoznak a hajtóművek, légcsavarok, komponensek, műszerek, szerkezeti egységek és felszerelések, beleértve a vészhelyzeti felszereléseket is.

2. Megjegyzés: A folyamatos légialkalmasság előírásaira vonatkozó útmutatást a Légialkalmassági Kézikönyv *(Doc 9760) tartalmazza.*

8.1 Felelősség

8.1.1 A repülőgép tulajdonosa vagy bérlet esetén annak bérlője biztosítsa, hogy:

a) a repülőgép repülésre alkalmas állapotban legyen;

b) a tervezett repüléshez szükséges üzemeltetési és vészhelyzeti felszerelések üzemképesek;

c) a repülőgép légialkalmassági bizonyítványa érvényes; és

d) a repülőgép karbantartását a lajstromozó állam által elfogadott karbantartási program szerint elvégezték.

8.1.2 A repülőgépet csak abban az esetben üzemeltessék, ha annak karbantartását a lajstromozó állam által elfogadott karbantartási rendszer alapján elvégezték és karbantartási nyilatkozatát kiadták.

8.1.3 Ha a karbantartási nyilatkozatot nem a 6. Annex I. rész 8.7 pontjában meghatározott jogosított karbantartó szervezet adja ki, a jegyzőkönyvet aláíró személy rendelkezzen az 1. Annexben megállapított szakszolgálati jogosítással.

8.2 Karbantartások nyilvántartása

8.2.1 A repülőgép tulajdonosa biztosítsa a következő nyilvántartási adatok tárolását a 8.2.2 pontban jelzett időtartamig:

a) a repülőgép és az élettartam korláttal rendelkező összes komponens teljes üzemideje (óra, naptári időtartam, repülési ciklus meghatározásban szükség szerint);

b) a valós állapot az összes kötelező folyamatos légialkalmassági előírás és tájékoztatás teljesítése vonatkozásában;

c) a módosítások és javítások megfelelő részletezése;

d) a repülőgép vagy a kötelező nagyjavítási időkorlátokkal rendelkező komponenseinek az utolsó nagyjavítástól számított üzemideje (óra, naptári időtartam, repülési ciklus meghatározásban szükség szerint);

e) a repülőgép valós állapota a karbantartási programnak való megfelelés szempontjából; és

f) részletes karbantartási jegyzőkönyvek annak bizonyítására, hogy a karbantartási nyilatkozat aláírásához az összes feltételt teljesítették.

8.2.2 A 8.2.1 a) — e) pontokban ismertetett nyilvántartási adatokat legalább 90 napig őrizzék meg, miután azt az egységet amelyre a nyilvántartási adatok vonatkoznak az üzemeltetésből teljesen kivonták. A 8.2.1 f) pont esetében a nyilvántartási adatokat a karbantartási nyilatkozat aláírását követően, legalább egy évig őrizzék meg.

8.2.3 A repülőgép bérlője a bérleti időtartam alatt szükség szerint teljesítse a 8.2.1 és 8.2.2 pontok előírásait.

Megjegyzés: A nemzetközi repülések esetében a repülőgép fedélzetén csak az érvényes légialkalmassági bizonyítványt kell elhelyezni, a karbantartások nyilvántartásának és ezzel kapcsolatos egyéb okmányoknak a szállítására nincs szükség.

8.3 Folyamatos légialkalmassági tájékoztatás

Az 5700 kg. engedélyezett legnagyobb felszállósúlynál (tömegnél) nehezebb repülőgép tulajdonosa vagy bérlet esetén annak bérlője a lajtromozó állam előírásai szerint biztosítsa, hogy a folyamatos légialkalmasság szempontjából szükséges karbantartási és üzemeltetési tájékoztatásokat az Annex 8, II. rész 4.2.3 f) és 4.2.4 pontok előírásainak megfelelő továbbítsák.

8.4 Módosítások és javítások

Az összes módosítást és javítást a lajstromozó állam által elfogadható légialkalmassági előírásoknak megfelelően végezzék el. Dolgozzanak ki eljárásokat annak biztosítására, hogy elegendő mennyiségű adatot gyűjtsenek össze és tároljanak a légialkalmassági követelmények teljesítéséről.

8.5 Karbantartási nyilatkozat

8.5.1 A karbantartási munka kielégítő elvégzéséről és annak igazolására készítsenek és írjanak alá a lajstromozó állam előírásainak megfelelő karbantartási nyilatkozatot.

8.5.2 A karbantartási nyilatkozat tartalmazzon igazolást az alábbiakról:

a) az elvégzett karbantartási munka alapvető részletei;

b) a karbantartás befejezésének időpontja;

c) amennyiben alkalmazható, a jóváhagyott karbantartó szervezet azonosítója; és

d) a karbantartási nyilatkozatot aláíró személy vagy személyek neve.

ANNEX 6/III.
A légijármű üzemeltetése: Nemzetközi üzemeltetés – Helikopterek

III. kötet 6. kiadás – 2007 július
12. módosítással
A jelen kiadvány magába foglalja a 6. Annex III. részének 2007 március 15-e előtt elfogadott összes módosításait és 2007 november 22-től hatálytalanítja a 6. Annex III. kötetének összes korábbi kiadásait.

A nemzetközi előírások és ajánlott gyakorlati eljárások alkalmazhatóságára vonatkozóan lásd az Előszót.

Módosítások

A módosítások kiadásáról az ICAO Journal és az egyéb ICAO kiadványok valamint Audio-vizuális kiképzési segédanyagok havi katalógusa rendszeres tájékoztatást biztosítanak. Kísérjék figyelemmel a fenti kiadványokat és a módosításokat az alábbi rovatokba vezessék be:

Módosítás			
száma	kiadás időpontja	alkalmazhatóság időpontja	bevezette
Hatodik kiadás 1–12. módosításokkal	Beépítve a jelen kiadásba		

Kiegészítés			
száma	kiadás időpontja	alkalmazhatóság időpontja	bevezette

Tartalomjegyzék

11. fejezet - Védelem

11.1 Forgószárnyas légijármű átkutatás ellenőrző jegyzéke
11.2 Kiképzési programok
11.3 A jogtalan beavatkozás jelentése

III. szakasz - Általános célú nemzetközi légiközlekedés

1. fejezet - Általános rész

1.1 A jogszabályok, előírások és eljárások betartása
1.2 Veszélyes áruk
1.3 Szellemi tevékenységet befolyásoló anyagok használata

2. fejezet – Repülésvégrehajtás

2.1 Az üzemeltetés létesítményeinek alkalmassága
2.2 Helikopter repülőtér üzemeltetési minimum
2.3 Repülés előtti tájékoztatás
2.4 Forgószárnyas légijármű légialkalmassága és biztonsági intézkedések
2.5 Időjárás jelentések és előrejelzések
2.6 Időjárási körülmények miatt szükséges korlátozások
2.7 Kitérő helikopter repülőterek
2.8 Tüzelőanyag (üzemanyag) és olajkészlet
2.9 Oxigén készlet
2.10 Oxigén használat
2.11 Vészhelyzeti utasítások a repülés alatt
2.12 Légijármű vezetők időjárás jelentése
2.13 Repülésre veszélyes körülmények
2.14 A hajózószemélyzet tagjainak fizikai állapota
2.15 A hajózószemélyzet tagjai szolgálati helyeiken
2.16 Műszerrepülési eljárások
2.17 Utasítások – Általános
2.18 Tüzelőanyag-feltöltés utasokkal a fedélzeten vagy a forgószárny(ak) mozgása közben
2.19 Vízfelszín feletti repülések

3. fejezet - Forgószárnyas légijármű teljesítmény üzemeltetési korlátozások

4. fejezet - Forgószárnyas légijármű műszerek, felszerelések és repülési okmányok

4.1 Minden forgószárnyas légijármű minden repülése
4.2 A látvarepülési (VFR) és műszerrepülési (IFR) szabályok szerint, nappal és éjszaka végrehajtott repülésekhez szükséges műszerek és berendezések
4.3 Minden vízfelszín felett üzemeltetett forgószárnyas légijármű
4.4 Minden kijelölt szárazföld felett üzemeltetett forgószárnyas légijármű
4.5 Minden nagy repülési magasságon üzemeltetett forgószárnyas légijármű

5. Események jelentése
6. A járató tervezése
7. A hajózószemélyzet jártassága, képzése és ellenőrzése
8. A járató tanúsítása vagy megerősítése

Mellékletek

A. Melléklet - Forgószárnyas légijármű teljesítmény és üzemeltetési korlátozások

Cél és tárgykör
1. Meghatározások
2. Általános rész

B. Melléklet - Repülési adatrögzítők

Bevezető
1. Repülési adatrögzítő (FDR)
2. Pilótakabin hangrögzítő berendezés (CVR)
3. A repülési adatrögzítő és a pilótakabin hangrögzítő rendszerek ellenőrzése

C. Melléklet - Repülési idő és repülési szolgálati idő korlátozások

1. Cél és tárgykör
2. Általános rész
3. Meghatározások
4. Megjegyzések a meghatározásokhoz
5. A korlátozások módjai
6. Repülési idő táblázat

D. Melléklet - Elsősegélynyújtó egészségügyi készletek

E. Melléklet - Minimális felszerelési jegyzék (MEL)

F. Melléklet - Légijármű üzembentartási engedély és érvényesítés

1. Cél és tárgykör
2. Előírt műszaki biztonsági értékelések
3. Jóváhagyási intézkedések
4. Elfogadási tevékenységek
5. Egyéb jóváhagyási vagy elfogadási megfontolások
6. Az üzemeltetési előírások érvényesítése
7. A légijármű üzembentartási engedély módosítása

G. Melléklet - Repülésbiztonsági dokumentációs rendszer

1. Bevezető

2. Összeállítás és tartalom
3. Érvényesség
4. Tartalmi kialakítás
5. Terjesztés
6. Módosítás

H. melléklet - Az üzemeltetési kézikönyv szerkezete és tartalma

1. Szerkezet
2. Tartalom

I. melléklet - A 3. osztályba sorolt teljesítményű helikopterek üzemeltetésére vonatkozó kiegészítő útmutatók műszeres időjárási körülmények (IMC) közötti repülések esetére

1. Cél és tárgykör
2. A hajtómű megbízhatósága
3. Repülésvégrehajtási kézikönyv
4. A járató tanúsítása vagy megerősítése
5. Repülések jóváhagyása és karbantartási program követelmények

A 6. Annex III. részében alkalmazott rövidítések és jelzések

Rövidítések és jelzések	
ACAS	Összeütközés elkerülését biztosító fedélzeti rendszer
ADS-C	Automatikus légtérfelderítési adat szolgáltatási megállapodás
AFCS	Automatikus repülésvezérlő rendszer
AIG	Légijármű baleset kivizsgálás és megelőzés
AOC	Légijármű üzembentartási engedély
AOC	Légiforgalmi üzemeltetési irányítás
ATC	Légiforgalmi irányító szolgálat
ATM	Légiforgalom szervezés
ATS	Légiforgalmi szolgálatok
CAA	Polgári Légiközlekedési Hatóság
CAT I	I. kategória
CAT II	II. kategória
CAT III	III. kategória
CAT IIIA	IIIA. kategória
CAT IIIB	IIIB. kategória
CAT IIIC	IIIC. kategória
CDL	Repülésvezérlő szerkezetek alaphelyzettől történő eltéréseinek jegyzéke
CFIT	Földnek ütközés vezetett repülés során (szabályszerűen üzemelő légijárművel)
Cm	centiméter
CPDLC	Légiforgalmi irányító és légijárművezető közötti adat-átviteli összeköttetés
CVR	Pilótakabin hangrögzítő berendezés
DA	Tengerszint feletti elhatározási magasság

DA/H	Elhatározási magasság
D-FIS	Adatátvitelt alkalmazó repüléstájékoztatás
DH	Talajszint feletti elhatározási magasság
DME	Távolságmérő berendezés
Distance DR	Az a vízszintes távolság, amelyet a forgószárnyas légijármű a rendelkezésre álló felszállási távolság végétől megtett
ECAM	Központi elektronikus légijármű képernyő
EFIS	Elektronikus repülési műszerrendszer
EGT	Kilépő gázhőmérséklet
EICAS	Hajtómű ellenőrző és hajózószemélyzet riasztó rendszer
ELT	Vészhelyzeti helyjeladó berendezés
ELT(AD)	Automatikusan kibocsátható vészhelyzeti helyjeladó berendezés
ELT(AF)	Automatikus állandó vészhelyzeti helyjeladó berendezés
ELT(AP)	Automatikus hordozható vészhelyzeti helyjeladó berendezés
ELT(S)	Túlélési vészhelyzeti helyjeladó berendezés
EUROCAE	Európai Polgári Légiközlekedési Elektronikai Szervezet
EPR	Hajtómű nyomásviszony
FATO	Végső megközelítési és felszállási terület
FDAU	Repülési adatgyűjtő egység
FDR	Repülési adatrögzítő
FM	Frekvencia moduláció
Ft	láb
g	Függőleges gyorsulás
hPa	Hektopascal
HUMS	Egészség és alkalmazás figyelő rendszer
IFR	Műszerrepülési szabályok
ILS	Műszeres leszállító rendszer
IMC	Műszeres időjárási körülmények
in Hg	Higany hüvelyk
kg	kilogramm
km	kilométer
kN	Kilo-Newton
kt	csomó
LDAH	Rendelkezésre álló leszállási távolság
LDP	Leszállási elhatározási pont
LDRH	Szükséges leszállási távolság
m	méter
mb	millibar
MDA	Legalacsonyabb tengerszint feletti süllyedési magasság
MDA/H	Legalacsonyabb süllyedési magasság tengerszint/földfelszín felett
MDH	Legalacsonyabb földfelszín feletti süllyedési magasság
MEL	Minimális berendezések jegyzéke
MHz	Megahertz

MLS	Mikrohullámú leszállító rendszer
MMEL	Gyártó minimális felszerelési jegyzéke
MOPS	Minimális üzemi teljesítmény előírás
NAV	Navigáció
N_1	Kisnyomású kompresszor fordulatszáma (kétfokozatú kompresszor); ventilátor fokozat fordulatszáma (háromfokozatú kompresszor)
N_f	Gázturbina terhelés nélküli fordulatszáma
NM	Tengeri mérföld
NVIS	Éjjel-látó megjelenítő készülék
OCA	Akadálymentes tengerszint feletti magasság
OCA/H	Akadálymentes tengerszint/földfelszín feletti magasság
OCH	Akadálymentes földfelszín feletti magasság
PANS	Légiforgalmi szolgálatok eljárásai
PNR	Az a pont, amelyen túl a visszafordulás nem lehetséges
psi	Font per négyzethüvelyk
R	Forgószárny sugár
RCP	Előírt távközlési teljesítmény
RNP	Előírt navigációs teljesítmény
RTODR	Szükséges megszakított felszállási távolság
RVR	Futópályamenti látástávolság érték
SI	Nemzetközi mértékegység rendszer
SICASP	Másodlagos légtérfelderítő radar fejlesztési és összeütközés elkerülési rendszereket kidolgozó munkacsoport
SOP	Szabványos üzemeltetési eljárások
T_4	Hajtómű kiáramló gázhőmérséklet
TDP	Felszállási elhatározási pont
TIT	Gázturbina belépő hőmérséklet
TLOF	Földetérési és elemelkedési terület
TODAH	Rendelkezésre álló felszállási távolság
TODRH	Szükséges felszállási távolság
UTC	Egyeztetett világidő
VFR	Látvarepülési szabályok
VMC	Látás utáni időjárási körülmények
V_{TOSS}	Legalacsonyabb sebesség, amelyen üzemképtelen fő hajtómű továbbá a többi hajtómű üzemeltetési határértékeken belül történő működése mellett még emelkedés érhető el
V_y	Legjobb emelkedési sebesség
WXR	Időjárás
°C	Celsius fok
%	Százalék

A jelen Annex előírásaira vonatkozó kiadványok

Egyezmény a nemzetközi polgári légi közlekedésről (Doc 7300)

Európai Polgári Légiközlekedési Elektronikai Szervezet (EUROCAE) ED55A és ED56A jelzésű kiadványai

A Nemzetközi Légiszállítás Gazdasági Szabályzásának Előírásai és Útmutatója (Doc 9587)

Jegyzőkönyv a nemzetközi polgári légiközlekedésről szóló Egyezmény (83. b cikkely) módosításáról (Doc 9318)

A Nemzetközi Polgári Légiközlekedési Egyezmény Annex-ei

1. Annex	*Személyi jogosítás*
2. Annex	*Repülési szabályok*

Nemzetközi üzemeltetés — Forgószárnyas légijárművek

Előszó

Történeti háttér

A légijármű üzemeltetésre vonatkozó nemzetközi előírásokat és ajánlott gyakorlati eljárásokat a Tanács a Nemzetközi Polgári Légiközlekedési Egyezmény (Chicago 1944) 37. cikkelyének rendelkezései alapján először 1948 december 10-én a nemzetközi kereskedelmi légiszállításra, ezt követően 1968 december 2-án az általános célú légiközlekedésre vonatkozóan fogadta el és foglalta a 6. számú Annex-be. Ezek a nemzetközi előírások és ajánlott gyakorlati eljárások jelenleg a 6. Annex I. és II. részében találhatók; általánosságban ez a két rész a repülőgép üzemeltetéssel foglalkozik és egyértelműen egyik rész sem alkalmazható a helikopterekre, azaz a forgószárnyas légijárművekre.

Ezért a forgószárnyas légijárművek üzemeltetésére tekintettel kidolgozták a 6. Annex III. részét is. A forgószárnyas légijárművek részére kifejlesztett repülési adatrögzítőkkel és pilótakabin hangrögzítőkkel először a Balesetmegelőzési Munkacsoport 1979 évi 10/1 ajánlása alapján a Léginavigációs Bizottság foglalkozott. A kidolgozott előírásokat a Tanács 1986. március 14-én fogadta el, 1986. július 27-én léptek érvénybe és 1986. november 20-án váltak alkalmazhatóvá. Ezt követően a forgószárnyas légijárművek üzemeltetésének más területeire vonatkozó átfogó nemzetközi előírások és ajánlott gyakorlati eljárások kerületek kidolgozásra a Helikopter Üzemeltetési Munkacsoport segítségével; ezek az előírások az 1. Módosításba kerültek be, amelyet a Tanács 1990. március 21-én fogadott el. A módosítás 1990. július 30-án lépett érvénybe és 1990. november 15-én vált alkalmazhatóvá.

Az A. táblázat a vonatkozó fontosabb témakörök felsorolásával és az időpontok megjelölésével mutatja a módosításokat, amely időpontokban azokat a Tanács elfogadta, azok érvénybe léptek illetve alkalmazhatóvá váltak.

Alkalmazhatóság

A 6. Annex I. és II. részeiben található nemzetközi előírások és ajánlott gyakorlati eljárások — Légijármű üzemeltetés — az egyedileg meghatározottak kivételével a nemzetközi polgári légiközlekedésben üzemeltetett minden repülőgépre vonatkoznak. Ehhez hasonlóan a 6. Annex III. része azokat a nemzetközi előírásokat és ajánlott gyakorlati eljárásokat tartalmazza, amelyek a nemzetközi kereskedelmi légiszállításban valamint az általános célú nemzetközi légiközlekedésben üzemeltetett forgószárnyas légijárművekre vonatkoznak és alkalmazandók.

A szerződő államok tevékenysége

Az eltérések jelentése

Felhívjuk a szerződő államok figyelmét az Egyezmény 38. cikkelyéből adódó azon kötelezettségükre, hogy a szerződő állam értesítse a Szervezetet bármely eltérésről, amely saját országos előírásai és gyakorlata illetve a jelen Annex nemzetközi előírásai és ennek bármely módosítása között van. Felkérjük továbbá a szerződő államokat, hogy az ilyen értesítést terjesszék ki valamennyi olyan eltérésre is, amely a jelen Annex-ben található ajánlott gyakorlati eljárásokat és ezek bármely módosítását érinti, amennyiben ezen eltérések a légiközlekedés biztonsága szempontjából lényegesek. Ezen felül kérjük, hogy a szerződő államok folyamatosan tájékoztassák a Szervezetet bármilyen jövőbeni eltérésről valamint a korábbiakban jelzett eltérés megszűnéséről. A jelen Annex minden egyes módosításának elfogadása után külön az eltérésekről szóló értesítést kérő levelet küldünk majd minden szerződő államnak.

A szerződő államok figyelmét felhívjuk a 15. Annex rendelkezéseire, amelynek alapján saját országos szabályaik és gyakorlatuk valamint a vonatkozó ICAO előírások és ajánlott gyakorlati eljárások közötti eltérésekről szóló tájékoztatásaikat az Egyezmény 38. cikkelyében előírt kötelezettségük mellett a Légiforgalmi Tájékoztató Szolgálat útján is tegyék közzé.

A tájékoztatások továbbítása és közzététele

A jelen Annex-ben ismertetett nemzetközi előírások és ajánlott gyakorlati eljárások alapján biztosított, a légijárművek üzemeltetését érintő létesítmények, szolgálatok és eljárások létrehozását illetve megszüntetését a 15. Annex előírásainak megfelelően jelentsék be.

Az Annex részeinek jogállása

Az Annex a következő részekből áll, de nem feltétlenül szükséges, hogy minden rész megtalálható legyen minden egyes Annex-ben.
Az egyes részek jogállása a következő:

1.— Az Annex anyaga:

a) *Nemzetközi előírások és ajánlott gyakorlati eljárások*, amelyeket az Egyezmény rendelkezései szerint a Tanács fogad el. Ezek meghatározása a következő:
Előírás vagy Szabvány: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amelynek egységes alkalmazását szükségesnek tartják a nemzetközi légiközlekedés biztonsága és menetrendszerű fenntartása érdekében és amellyel kapcsolatban az Egyezmény alapján a Szerződő Államok megállapodnak. Amennyiben a teljes megállapodás nem lehetséges, az eltérést az Egyezmény 38. cikkelyében foglaltak alapján az érintett Államoknak a Tanács felé jelenteniük kell.

Ajánlott gyakorlati eljárás: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amely egységes alkalmazását a nemzetközi légiközlekedés biztonsága, menetrendszerű és hatékony lebonyolítása érdekében kívánatosnak minősítenek és amelyek alkalmazására a Szerződő Államok az Egyezmény értelmében törekszenek.

b) *Függelék:* A célszerűség érdekében külön csoportosított anyagok, amelyek azonban a Tanács által elfogadott nemzetközi előírások és ajánlott gyakorlati eljárások szerves részét képezik.

c) *Meghatározások:* A nemzetközi előírások és az ajánlott gyakorlati eljárások ismertetésénél alkalmazott azon fogalmak pontos magyarázata, amelyek elfogadott szótári jelentés hiányában nem maguktól értetődőek. A meghatározás külön jogállással nem rendelkezik, azonban szerves részét képezi azon nemzetközi előírásnak vagy ajánlott gyakorlati eljárásnak, amelyben előfordul, mert a meghatározás értelmének megváltoztatása az előírást befolyásolja.

d) *Táblázatok és ábrák:* Ezek egy nemzetközi előírást vagy ajánlott gyakorlati eljárást egészítenek ki vagy szemléltetnek, és amelyekre egy adott nemzetközi előírásban vagy ajánlott gyakorlati eljárásban utalnak. A táblázatok és az ábrák az adott nemzetközi előírás vagy ajánlott gyakorlati eljárás részét képezik és jogállásuk ezekkel megegyező.

Megjegyzendő, hogy a jelen Annex egyes előírásai olyan követelményeket is tartalmaznak, melyek jogállása ajánlott gyakorlati eljárás. Az ilyen esetekben ezek alkalmazására a Szerződő Államok az Egyezmény értelmében törekszenek.

2.— A nemzetközi előírásokkal és az ajánlott gyakorlati eljárásokkal együtt, a Tanács egyetértésével kiadott egyéb anyagok:

a) *Előszó:* Történeti áttekintés és magyarázat a Tanács tevékenysége alapján. Tartalmazza továbbá az államok kötelezettségeit, illetve az ezekre vonatkozó magyarázatokat a nemzetközi eljárások és gyakorlati eljárások alkalmazására az Egyezmény és a Bevezetési Határozat előírásainak megfelelően.

b) *Bevezető:* Az Annex egyes köteteinek, részeinek vagy fejezeteinek elején található magyarázó szöveg, amely segítséget nyújt a vonatkozó szöveg megértéséhez, illetve alkalmazásához.

c) *Megjegyzések:* Szükség szerint a szövegbe iktatott anyag, amely tényszerű tájékoztatást vagy utalást tartalmaz a szóban forgó nemzetközi előírásra vagy ajánlott gyakorlati eljárásra vonatkozóan, azonban nem képezi ezek szerves részét.

d) *Mellékletek:* A nemzetközi előírást és ajánlott gyakorlati eljárást kiegészítő anyagot tartalmaznak, vagy azok alkalmazásához szükséges tájékoztatással szolgálnak.

Az alkalmazandó nyelv kiválasztása

A jelen Annex-et az alábbi hat nyelven fogadták el - angol, arab, francia, kínai, orosz és spanyol. Minden egyes szerződő államot felkérünk, hogy ezek közül válasszon ki egy nyelvet az országos bevezetés céljára vagy bármely egyéb, az egyezményben előirt ténykedés megtételére akár az adott nyelv közvetlen felhasználásával, akár saját nemzeti nyelvére történő lefordításával. Erről kérjük, értesítsék a Szervezetet.

Szerkesztői gyakorlat

Annak érdekében, hogy minden egyes szerkezeti anyag jogállását az első pillantásra jelezhessük, az alábbi szerkesztői gyakorlatot követjük: A *nemzetközi előírásokat* vékony álló, az *ajánlott gyakorlati eljárásokat* vékony *dőlt* betűkkel nyomtatjuk. Ez utóbbiak jogállását **"Ajánlás"** felirattal is jelezzük. A vékony dőlt betűvel szedett megjegyzéseket a "*Megjegyzés:* " felirat egészíti ki.

Az írásmód / stílus szempontjából az angol szövegben az előírásokat "shall - kell" kifejezéssel és az ajánlott gyakorlati eljárásokat “should - szükséges" kifejezéssel jelezzük. Mindazonáltal a magyar fordítás alkalmával ezt a gyakorlatot nem minden esetben alkalmazzuk, mert a jelzett jogállás és a nyelvi sajátosságok ezt szükségtelenné teszik. Ha ez szükséges, a fordításban nyomatékos (kell) felszólító módot alkalmazunk.

A jelen kiadványban alkalmazott mértékegységek a nemzetközi polgári légiközlekedésről szóló Egyezmény 5. Annex előírásainak megfelelően összhangban állnak a nemzetközi mértékegység rendszerrel /SI/. Ahol az 5. Annex lehetővé teszi az alternatív (nem SI) mértékegységek alkalmazását, ott az alapegységet követően ezen mértékegységek zárójelben szerepelnek. Ahol az anyagban két mértékegység fajtát alkalmazunk, ott nem szabad azt feltételezni, hogy a mértékegységek értékei egyenlők és azok egymással korlátlanul felcserélhetők. Mindazonáltal lehetséges, hogy azonos biztonsági szint érhető el bármelyik mértékegység kizárólagos alkalmazásával.

A jelen kiadvány bármelyik részére történő hivatkozás akár számmal, akár címmel vagy pedig mindkettővel - vonatkozik az adott rész minden egyes alpontjára is.

A hímnem alkalmazása az Annex teljes szövegében egyaránt vonatkozik úgy a férfiakra, mint a nőkre.

A. táblázat — A 6. Annex III. részének módosításai

(módosítás — forrás — tárgy — elfogadva/ hatályos/ alkalmazható)

Első kiadás
Baleset-megelőzési és Kivizsgálási Munkacsoport 1979 évi körzeti ülésszaka
Repülési adatrögzítők elhelyezése a forgószárnyas légijárműben.

1986. március 14. 1986. július 27. 1986. november 20.

1) — Második kiadás — Helikopter Üzemeltetési Munkacsoport negyedik ülése a 6. Annex I. és II. részeinek 1990 évi módosítása alapján - Léginavigációs Bizottság tanulmányai

a) a forgószárnyas légijárművek üzemeltetésére vonatkozó, a 6. Annex I. és II. részeiben a repülőgépekkel kapcsolatos rendelkezésekhez hasonló előírások bevezetése; ezek a már korábban bevezetett repülési adatrögzítő berendezések felszerelésére vonatkozó előírásokkal (6. Annex III. rész első kiadás) együtt alkották a forgószárnyas légijárművek üzemeltetésre kidolgozott nemzetközi előírások és ajánlott gyakorlati eljárások első teljes anyagát;

b) meghatározások bevezetése a légijármű üzembentartási engedélyre, a minimális felszerelési jegyzékre, az üzemeltetési kézikönyvre valamint néhány új kifejezésre; ezekkel biztosították a 6. Annex három részének egybeesését illetve összhangját;
c) az elektronikus megjelenítő ernyőkel felszerelt forgószárnyas légijárművek üzemeltetési adatainak repülési adatrögzítő berendezéssel történő rögzítésével kapcsolatos útmutató bevezetése.

1990. március 21. 1990. július 30. 1990. november 15.

2) — Üzemeltetési munkacsoport ötödik ülése — az Elkülönítési munkacsoport általános elméletének módosítását célzó nyolcadik ülés — Baleset kivizsgálási munkacsoport 1992 évi ülése — Léginavigációs Bizottság tanulmányai

a) helikopter repülőtér üzemeltetési minimum, elhatározási magasság, legalacsonyabb süllyedési magasság kifejezések módosítása és akadálymentességi magasság kifejezés bevezetése;

b) vészhelyzeti helyjel adó (ELT) és előírt navigációs teljesítmény (RNP) illetve típus új meghatározások bevezetése;

c) a repülési adatrögzítőkben alkalmazott fém-szalagok használatára vonatkozó előírás módosítása;

d) a vészhelyzeti helyjel adó berendezés szállítására vonatkozó előírás bevezetése a vészrádió berendezés és helyjel adó helyett;

e) előírás, melynek alapján a légijárművön elhelyezett navigációs berendezés segítségével a légijármű előírt navigációs teljesítménye alapján repüljön tervezett útvonalán vagy területeken.

1994. március 21. 1994. július 25. 1994. november 10.

3) — Harmadik kiadás — Léginavigációs Bizottság tanulmányai — Veszélyes árúk munkacsoport tizennegyedik ülése — Szerkesztői módosítások — szöveg egyeztetése a 6. Annex II. és/vagy III. részével és a szükséges módosítások

a) új és módosított meghatározások bevezetése;

b) új előírások bevezetése a baleset megelőzéssel és a repülésbiztonsági programokkal kapcsolatosan;

c) az üzemeltetési létesítményekkel, a repülés közbeni történő vészhelyzeti gyakorlással, a legalacsonyabb repülési magasságokkal, a repülés előkészítéssel, a repülési idővel, a hajózószemélyzet repülési szolgálati és kötelező pihenőidejével, a hajózószemélyzet tagjai szolgálati helyeiken, az oxigén rendszerrel, a repülés-üzemi tiszt feladataival kapcsolatos előírások módosítása valamint új előírás a kézipoggyászra;

d) a tömeg korlátozással és az egészségügyi készletekkel kapcsolatos előírások módosítása;

e) új előírások az oxigén berendezéssel kapcsolatosan, a látvarepülési szabályok szerint és műszerrepülési szabályok szerint üzemeltetett forgószárnyas légijárműre vonatkozó előírások módosítása;

f) a hajózószemélyzet új kiképzési programjának előírásai különös tekintettel az emberi teljesítőképességre és ennek korlátaira;

g) a repülés-üzemi tiszt meghatározás egyeztetése az 1. Annex előírásaival;

h) üzemeltetési kézikönyv tartalmának felülvizsgálata és új előírások a helikopter repülőtér üzemeltetési minimum, oxigén tartalék rendszer, repülési szolgálati idő korlátozások, a hajózószemélyzet eljárásai és ellenőrző jegyzékei, az üzemeltetői repülési terv, a hajózószemélyzet kiképzési program, a légi-utaskísérők kiképzési programja, a biztonsági utasítások és útmutatók, a baleset megelőzési és repülésbiztonsági program, időzített indulási eljárások, tömeg és súlypont számítási eljárások vonatkozásában;

i) új előírások a repülési idő, légi-utaskísérők repülési szolgálati és kötelező pihenőideje vonatkozásában, a kiképzést érintő előírások felülvizsgálata és módosítása; és

j) módosított előírások az elsősegély készletekre vonatkozóan; és

k) új előírások a minimális felszerelési jegyzékre (MEL) vonatkozóan.
1995. március 10. 1995. július 24. 1995. november 9.

4) — A Másodlagos radarberendezések továbbfejlesztésével valamint az Összeütközés elkerülését biztosító rendszerekkel foglalkozó munkacsoportok negyedik ülése (SICASP/4)

A forgószárnyas légijárművek nyomásmagasság-adó másodlagos válaszjeladóval történő felszerelésére vonatkozó előírások felvétele (ACAS).

1996. február 19. 1996. július 15. 1996. november 7.

5) — Negyedik kiadás — Repülési adatrögzítés munkacsoport első ülése — Léginavigációs Bizottság tanulmányai — Az ICAO és ipari CFIT munkabizottságok vizsgálatai — 1. Annex 162. módosítása és a 11. Annex 38. módosítása — Szerkesztői módosítások

a) A légijármű üzemeltetési kézikönyv új és módosított meghatározásai, repülésvezérlő szerkezetek alaphelyzettől történő eltéréseinek felsorolása, emberi tényezők alapelvei, emberi teljesítőképesség és teljesítmény, gyártók minimális felszerelési jegyzéke, karbantartás, szellemi tevékenységet befolyásoló anyagok és előírt navigációs teljesítmény;

b) a kölcsönbérlet és csere vonatkozó megjegyzéseinek módosítása;

c) a pszichoaktív anyagok használatára vonatkozó új megjegyzés bevezetése;

d) a repülési adatrögzítőkkel kapcsolatos új és módosított előírások;

e) új és módosított előírások a függelékbe áthelyezett üzemeltetési kézikönyv tartalmára vonatkozóan;

f) az államok felelősségét érintő új előírások a légi szállítói engedély alapján végzett tevékenység felügyeletére, az üzemeltetési kézikönyv jóváhagyására valamint a járatói jogosítási és folyamatos ellenőrzési rendszer kialakítására;

g) új előírások a földi légijármű jégtelenítésre, a légijármű üzemeltetési teljesítmény korlátozásokra, tömeg korlátozásokra, érzékeny nyomásmagasság mérőműszerekre valamint az első tiszt meglévő gyakorlati tapasztalatára vonatkozóan;

h) módosított előírások a nyomásmagasság adó válaszjeladók szállítására; és

i) új előírások az emberi tényezők figyelembevétele alapján.

1998. március 20. 1998. július 20. 1998. november 5.

6) — Repülési adatrögzítés munkacsoport második ülése — A Közgyülés 32. ülése — Léginavigációs Bizottság tanulmányai

a) "légiutaskísérő" kifejezés módosítása "utaskabin személyzet" kifejezésre;

b) meghatározások módosítása;

c) új előírások a 406 MHz és 121,5 MHz frekvencián üzemelő vészhelyzeti helyjeladó berendezések kötelező szállítására; nyomásmagasság-adó másodlagos válaszjeladók; a digitális összeköttetések rögzítésére vonatkozó határidő kijelölése.

1999. március 15. 1999. július 19. 1999. november 4.

7) —Léginavigációs Bizottság tanulmányai

a) A műszeres megközelítés és leszállás osztályozásának bevezetése és a meghatározások módosítása;

b) új előírások a futópályamenti látástávolság érték biztosítására; a műszeres megközelítések követelményei; a parancsnok pilóta feladatainak módosítása.

2000. március 15. 2000. július 17. 2000. november 2.

8) — Ötödik kiadás — Repülési adatrögzítés munkacsoport második ülése — Az egész világot átfogó műholdas navigációs rendszerrel foglalkozó munkacsoport harmadik ülése — Folyamatos légialkalmassági munkacsoport ötödik ülése — Léginavigációs Bizottság tanulmányai

a) a repülési adatrögzítőkre vonatkozó előírások módosítása, amelyek tartalmazzák a digitális távközlési adatok rögzítését; az új légijármű repülési adatrögzítőjére vonatkozó előírások; rögzítendő jellemzők új felsorolása; a pilótakabin hangrögzítők két órás felvételi időtartamának előírása;

b) a műszeres megközelítés és leszállás osztályozásának módosítása;

c) új előírások a függőleges irányvezetéssel végrehajtott megközelítésre vonatkozóan;

d) új meghatározások és a karbantartással kapcsolatos előírások módosítása; és

e) a zajbizonyítvány angol nyelvre történő lefordítása.

2001. március 12. 2001. július 16. 2001. november 1.

9) — Elkülönítési és Légtérbiztonsági munkacsoport valamint a Léginavigációs Bizottság tanulmányai

a) (idegen) nyelvismeretre vonatkozó új előírások;

b) a járató repülésbiztonsági dokumentáció rendszerére vonatkozó új meghatározások és előírások;

c) a földi kiszolgálás biztonsági tényezőire vonatkozó új meghatározások és előírások;

d) a járató államának jogosítása a RNP légtérben történő üzemeltetésre;

e) légijármű összeütközés elkerülő fedélzeti rendszerek (ACAS) üzemeltetési kézikönyvének tartalmára vonatkozó új előírások.

2003. március 13. 2003. július 14. 2003. november 27.

10) – A légiközlekedési környezetvédelmi bizottság hatodik ülése

Új javaslatok a zajbizonyítványok hivatkozásaira vonatkozóan

2005. március 09. 2005. július 11. 2005. november 24.

11) – A hajózó személyzetek szakszolgálati engedélyeinek kiadásával és a képzéssel foglalkozó munkacsoport második ülése – Az akadálymentességi munkacsoport tizennegyedik ülése – Az Egyesült Államok javaslata – Tanácsi kérés – A Közgyülés 35. ülése – A Léginavigációs Konferencia tizenegyedik ülése

a) repülőgépvezetők folyamatos gyakorlatban tartási és szakmai jártassági ellenőrzésének követelményei, a személyzet kereszt jogosítása és a gyakorlati jártasság keresztirányú beszámítása, az alkalmasság értékelése, fenyegetés és hiba kezelés valamint a repülőgépvezetők félévenkénti szakmai jártasság ellenőrzése;

b) a repülőgépvezetők ismerete az eljárások tartalmi felépítése által meghatározott üzemeltetési követelményekről;

c) a repülés-üzemi tisztek / szolgálatvezetők jogosítása és az állami szabályozó rendszer kritikus elemei;

d) a légijármű üzembentartási engedély másolatának szállítása a légijármű fedélzetén;

e) biztonság irányítási intézkedések és hivatkozások az elfogadható biztonsági szint elképzeléseinek új útmutató anyagaira.

2006. március 14. 2006. július 17. 2006. november 23.

12) — Hatodik kiadás — Léginavigációs Bizottság tanulmánya — Üzemeltetési Adatkapcsolat munkacsoport első ülése (OPLINKP/1) – és a billenő rotor (Tiltrotor) hajtású helikopter Munkacsoport által támogatott Titkársági tanulmány

a) előírások módosítása az automatikus légtérfelderítési adatszolgáltatási megállapodás (ADS-C) alkalmazásához rendelkezésre álló technológiák bevezetésének megkönnyítéséhez és a légiforgalmi szolgáltatások (ATS) biztosítása során az előírt távközlési teljesítmény RCP) bevezetéséhez;

Törölt:

b) a 6. Annex III. részében foglalt ajánlások szorosabb egyeztetése az elfogadott gyakorlati eljárásokkal;

c) a teljesítmény osztályok meghatározásainak változása;

d) a biztonságos kényszerleszállás eléréséhez szükséges megfelelő szempontok engedélyezésének változásai a 2. és 3. teljesítmény osztályban végzett repülések során bekövetkező hajtómű meghibásodások esetére;

e) a műszeres meteorológiai feltételek alatt végrehajtott kereskedelmi repülésekhez kapcsolódó új rendelkezések kiegészítése;

f) az „üzemeltetés"kifejezés új meghatározása;

g) a „parttól távoli (vízfelszíni) üzemeltetés" elképzelés bemutatása; és

h) a vészhelyzeti helyjeladók (ELT) 2008. július 01-től érvényes kötelező szállításának követelményei

i) a válaszjeladóknál alkalmazott nyomás-magasság jel kialakítókra vonatkozó előírások változásai 2009. január 1-től és 2012 január 1-től.

2007. március 14. 2007. július 16. 2007. november 22.
2008. július 1.

I. szakasz
Általános rész
Nemzetközi előírások és ajánlott gyakorlati eljárások

1. fejezet
Meghatározások

Amennyiben a nemzetközi légiforgalomban üzemeltetett forgószárnyas légijárművekre vonatkozó nemzetközi előírások és ajánlott gyakorlati eljárások során a következő kifejezéseket alkalmazzák, azok az alábbi jelentéssel rendelkeznek:

Aerial Work – Munkarepülés
A légijármű olyan különleges szolgáltatások nyújtásához történő üzemeltetése, mint például mezőgazdasági, építési, légi-fényképezési, megfigyelési, felderítési, ellenőrzési, kutató és mentő feladatok

valamint hirdetési szolgáltatások.

Aircraft – Légijármű
Minden olyan szerkezet, amelynek levegőben maradását olyan aerodinamikai reakcióerők biztosítják, amelyek nem azonosak a földfelszínre ható aerodinamikai reakcióerőkkel.

Törölt: ¶

Aircraft operating manual – Légijármű üzemeltetési kézikönyv
A járató állama által elfogadható kézikönyv, amely tartalmazza az általános, különleges és vészhelyzeti eljárásokat, ellenőrző listákat, korlátozásokat, teljesítmény tájékoztatásokat, a légijármű rendszereinek részletezését valamint minden egyéb, a légijármű üzemeltetéséhez szükséges tájékoztató anyagot.

Megjegyzés: A légijármű üzemeltetési kézikönyv az üzemeltetési kézikönyvek közé tartozik.

Air operator certificate (AOC) —Légijármű üzembentartási engedély
A járatót meghatározott kereskedelmi légiszállítási tevékenység végrehajtására jogosító engedély.

Alternate heliport – Kitérő helikopter repülőtér
A repülési tervben meghatározott olyan helikopter repülőtér, amelyre a repülést folytatni lehet, ha a tervezett célállomás helikopter repülőtéren a leszállás végrehajtása nem tanácsos.

> *Take-off alternate - Felszállási kitérő helikopter repülőtér:* Egy kitérő helikopter repülőtér, ahova a forgószárnyas légijármű le tud szállni, amennyiben röviddel a felszállás után ez szükségessé válik és a kiindulási helikopter repülőtér használata nem lehetséges.
>
> *En-route alternate – Útvonal kitérő helikopter repülőtér*: Egy olyan helikopter repülőtér amelyre a forgószárnyas légijármű képes leszállni, amennyiben az útvonal repülés során az előírásostól eltérő állapot vagy vészhelyzet áll elő.
>
> *Destination alternate - Érkezési kitérő helikopter repülőtér:* Egy kitérő helikopter repülőtér amelyre a forgószárnyas légijármű folytathatja az útját, amennyiben lehetetlen vagy nem tanácsos azon a helikopter repülőtéren leszállni, amelyre a leszállást tervezeték.

Megjegyzés: Az útvonal- vagy kitérő helikopter repülőtér lehet az indulási helikopter repülőtér is.

Approach and landing operations using instrument approach procedures – Műszeres megközelítési eljárásokat alkalmazó megközelítés és leszállás
A műszeres megközelítési és leszállási eljárások osztályozása a következő:

Nem-precíziós megközelítés és leszállás (Non-precision approach and landing operations)
Olyan műszeres megközelítés és leszállás, amelynek végrehajtása során oldalirányú irányvezetést alkalmaznak, azonban függőleges irányvezetést nem vesznek igénybe.

Megközelítés és leszállás függőleges irányvezetéssel (Approach and landing operations with vertical guidance)
Olyan műszeres megközelítés és leszállás, amelynek végrehajtása során oldalirányú és függőleges irányvezetést alkalmaznak, azonban az a precíziós megközelítésre és leszállásra vonatkozó üzemeltetési előírásoknak nem tesz eleget.

Precíziós megközelítés és leszállás (Precision approach and landing operations)
Olyan műszeres megközelítés és leszállás, amelynek végrehajtása során precíziós oldalirányú és függőleges irányvezetést alkalmaznak az alábbiakban meghatározott üzemeltetési minimumok

figyelembevételével:

Megjegyzés: Az oldalirányú és függőleges irányvezetés a következő berendezések egyikének segítségével nyújtott iránysáv és siklópálya tájékoztatás:

a) földi telepítésű navigációs berendezés; vagy

b) számítógéppel biztosított navigációs adatok.

Precíziós megközelítés és leszállás kategóriái (Categories of precision approach and landing operations):

I. kategória (I. kat) (Category I (CAT I) operations)
Olyan műszeres megközelítés és leszállás, amelynek elhatározási magassága nem kevesebb, mint 60 méter (200 láb) valamint a látástávolság értéke nem kevesebb, mint 800 méter vagy a futópályamenti látástávolság értéke nem kevesebb, mint 550 méter.

II. kategória (II. kat) (Category II (CAT II) operations)
Olyan műszeres megközelítés és leszállás, amelynek elhatározási magassága kevesebb, mint 60 méter (200 láb) de nem kevesebb, mint 30 méter (100 láb) valamint a futópályamenti látástávolság értéke nem kevesebb, mint 350 méter.

III/A. kategória (III/A. kat) (Category IIIA (CAT IIIA) operations)
Olyan műszeres megközelítés és leszállás, amelynek:

a) elhatározási magassága kevesebb, mint 30 méter (100 láb) vagy ilyen elhatározási magasságot nem határoztak meg; és

b) a futópályamenti látástávolság értéke kevesebb, mint 200 méter, de nem kevesebb, mint 50 méter.

III/B. kategória (III/B. kat) (Category IIIB (CAT IIIB) operations)
Olyan műszeres megközelítés és leszállás, amelynek:

a) elhatározási magassága kevesebb, mint 15 méter (50 láb) vagy ilyen elhatározási magasságot nem határoztak meg; és

b) a futópályamenti látástávolság értéke kevesebb, mint 200 méter, de nem kevesebb, mint 50 méter.

III/C. kategória (III/C. kat) (Category IIIC (CAT IIIC) operations)
Olyan műszeres megközelítés és leszállás, amelyhez elhatározási magasság és futópályamenti látástávolság érték korlátozást nem határoztak meg.

Megjegyzés: Ahol az elhatározási magasság (DH) és futópályamenti látástávolság érték (RVR) különböző üzemeltetési kategóriákba esnek, a műszeres megközelítés és leszállás az igényesebb kategória alapján határozandó meg, azaz ott, ahol az elhatározási magasság érték a III/A. kategóriába, míg a futópályamenti látástávolság érték a III/B. kategóriába tartozik, a megközelítés és leszállás III/B. kategóriás lesz. Ugyanígy, amennyiben az elhatározási magasság érték II. kategóriás és a futópályamenti látástávolság érték az I. kategóriába tartozik, a megközelítés és leszállás II. kategóriásnak tekintendő.

Approach and landing phase – Helicopters – Megközelítési és leszállási szakasz – forgószárnyas légijárművek
A repülési feladatnak azon része, amely a végső megközelítési és felszállási terület1 tengerszint feletti

magassága feletti 300 méteren (1000 láb) kezdődik, ha a repülés tervezett magassága ennél nagyobb. Más esetekben a szakasz a süllyedés megkezdésével kezdődik és a leszállás végrehajtásáig vagy a megszakított leszállás pontjáig tart.

Cabin crew member – Utaskabin személyzeti tag
Személyzeti tag, aki a járató vagy a légijármű parancsnoka kijelölése alapján az utasok biztonsága érdekében szükséges feladatokat végzi, azonban nem a hajózószemélyzet tagja.

Commercial air transport operation – Kereskedelmi légiszállítási tevékenység
Utas, teheráru vagy postaküldemény szállítása érdekében, pénzbeli ellenszolgáltatásért vagy bérleti díjért végzett légijármű üzemeltetés.

Configuration deviation list (CDL) – Repülésvezérlő szerkezetek alaphelyzettől történő eltéréseinek jegyzéke
A típus tervezéséért felelős szervezet által kidolgozott és a tervezés állama által jóváhagyott lista, amely meghatározza a légijármű típus bármely olyan külső alkatrészét, amely a repülés megkezdésekor hiányozhat, továbbá szükség szerint tartalmazza az összes vonatkozó üzemeltetési korlátozást, valamint repülési teljesítmény korrekciós tájékoztatást.

Congested area – Sűrűn lakott terület
Város, falu vagy település közelében levő bármely olyan terület, amelyet elsősorban lakó, kereskedelmi vagy üdülési célokra vesznek igénybe.

Congested hostile environment – Kedvezőtlen körülményű sűrűn lakott terület
Kedvezőtlen körülmények egy sűrűn lakott területen belül.

Crew member – Személyzeti tag
A járató által a repülési időtartam alatt a légijárművön szolgálattételre kijelölt személy.

Dangerous goods – Veszélyes áruk
Olyan tárgyak vagy anyagok, amelyek az egészségre, a biztonságra vagy az anyagi javakra (tulajdonra) nagy kockázatot jelentenek és amelyek a Műszaki Utasításokban a veszélyes áruk felsorolásában találhatók vagy az Utasítások ilyennek minősítik.

Megjegyzés: A veszélyes árukat a 18. Annex 3. fejezete osztályozza.

Decision altitude (DA) / Decision height (DH) – Elhatározási magasság
A precíziós vagy a függőleges irányvezetéssel végrehajtott megközelítési eljárásra előírt meghatározott tengerszint vagy földfelszín feletti magasság, amelyen megszakított megközelítési eljárást kell kezdeményezni, ha a megközelítés folytatásához szükséges látás utáni tájékozódás feltételei nem jöttek létre.

1. Megjegyzés: A DA elhatározási magasság a közepes tengerszinthez, a DH elhatározási magasság pedig a futópálya küszöb magasságához viszonyított érték.

2. Megjegyzés: A szükséges látás utáni tájékozódás feltételei a fénytechnikai eszközök vagy a megközelítési terület azon elemeinek illetve részeinek látását jelentik, amelyeket a repülőgépvezetőnek elegendő ideig látnia kell ahhoz, hogy a légijármű helyzetét és a szükséges helyzetváltoztatás mértékét a kívánatos repülési pályához viszonyítva értékelhesse. III. kategóriás üzemelés során, amennyiben elhatározási magasságot jelölnek ki, a szükséges látási feltételek az adott eljárásra vagy üzemelésre vonatkoznak.

3. Megjegyzés: A gyakorlati alkalmazás megkönnyítése érdekében ott, ahol mindkét kifejezést használják, azok "QNH/QFE elhatározási magasság"-ként rövidítve pedig DA/H-ként írhatók le.

Defined point after take-off (DPATO) – Meghatározott pont a felszállás után
A felszállási és kezdeti emelkedési szakaszon belül az a pont, amely előtt a forgószárnyas légijármű repülésének biztonságos folytatása egy működésképtelen hajtóművel nincs biztosítva és kényszerleszállásra lehet szükség.

Megjegyzés: A meghatározott pont kifejezés csak a 2. teljesítmény osztályú forgószárnyas légijárművekre vonatkozik.

Defined point before landing – Meghatározott pont a leszállás előtt
A megközelítési és leszállási szakaszon belül az a pont, amely után a forgószárnyas légijármű repülésének biztonságos folytatása egy működésképtelen hajtóművel nincs biztosítva és kényszerleszállásra lehet szükség.

Megjegyzés: A meghatározott pont kifejezés csak a 2. teljesítmény osztályú forgószárnyas légijárművekre vonatkozik.

Elevated heliport – Emelt szinten létesített helikopter leszállóhely
Szárazföldön, talajszint felett levő emelt szerkezeten kialakított forgószárnyas légijármű leszállóhely.

Emergency locator transmitter (ELT) – Vészhelyzeti helyjeladó berendezés
Olyan berendezés leírására szolgáló általános kifejezés, amely megkülönböztetett (rádió)jeleket sugároz a kijelölt hullámhosszokon és alkalmazásától függően a baleset alkalmával automatikusan működésbe léphet vagy kézzel üzembe helyezhető. A vészhelyzeti helyjeladó berendezés az alábbi típusú lehet:

Automatikus rögzített (Automatic fixed ELT (ELT/AF))
Olyan vészhelyzeti helyjeladó berendezés, amely a légijárművön állandóan rögzítve helyezkedik el.

Automatikus hordozható (Automatic portable ELT (ELT/AP))
Olyan vészhelyzeti helyjeladó berendezés, amely a légijárművön rögzítve helyezkedik el, azonban a baleset után a légijármű fedélzetéről könnyen eltávolítható.

Automatikusan leváló (Automatically deployable ELT (ELT/AD))
Olyan vészhelyzeti helyjeladó berendezés, amely a légijárművön rögzítve helyezkedik el, azonban a baleset után, annak hatására automatikusan leválik a légijárműről. Szükség esetén lehetséges annak kézi eltávolítása is.

Túlélési (Survival ELT (ELT/S))
Olyan vészhelyzeti helyjeladó berendezés, amely eltávolítható légijárműről és a légijárművön úgy tárolják, hogy azt vészhelyzet esetén a túlélők egyszerűen üzembe helyezhetik és használhatják. A berendezés automatikus kapcsolószerkezettel is felszerelhető, azaz szükség esetén automatikusan is működésbe léphet.

En-route phase – Útvonal repülési szakasz
A repülésnek azon része, amely a felszállási és kezdeti emelkedési szakasz végétől a megközelítési és leszállási szakasz kezdetéig tart.

Megjegyzés: Amennyiben látás után végrehajtott repüléssel nem lehet megfelelő akadálymentességet *biztosítani, a repülést úgy tervezzék meg, hogy az akadályok elegendő távolsággal elkerülhetők legyenek. Kritikus hajtómű egység meghibásodás esetében szükségessé válhat, hogy az üzemeltetők egyéb, helyettesítő eljárásokat alkalmazzanak.*

Final approach and take-off area (FATO) – Végső megközelítési és felszállási terület
Meghatározott terület, amely felett végrehajtják a függés megkezdéséig vagy a teljes leszállásig tartó végső megközelítést és amelyen a felszállási műveletet megkezdik. Ahol a végső megközelítési és felszállási területet 1. teljesítmény osztályú forgószárnyas légijárművek veszik igénybe, a rendelkezésre álló megszakított felszállási terület is ehhez a meghatározott területhez tartozik.

Flight crew member – Hajózószemélyzeti tag
Szakszolgálati engedéllyel rendelkező személyzeti tag, akinek munkája a repülési szolgálati idő tartama alatt nélkülözhetetlen a légijármű üzemeltetéséhez.

Flight duty period – Repülési szolgálati munkaidő
Azon teljes időtartam, amely akkor kezdődik, amikor a hajózószemélyzeti tag pihenőidejét követően a repülés vagy repülési sorozat előtt szolgálatba lép és addig az időpontig tart, amikor a hajózószemélyzeti tag a repülés vagy repülési sorozat befejezése után összes szolgálati feladata alól mentesül.

Flight manual – Repülésvégrehajtási kézikönyv
A légialkalmassági bizonyítvánnyal összhangban kidolgozott és kiadott kézikönyv, amely tartalmazza azokat a korlátozásokat, amelyek mellett a légijármű repülésre alkalmasnak nyilvánítható, valamint azokat az utasításokat és tájékoztatásokat, amelyek a hajózószemélyzet tagjai számára a légijármű biztonságos üzemeltetéséhez szükségesek.

Flight operations officer/flight dispatcher – repülés-üzemi tiszt/szolgálatvezető
A járató által a légiüzemeltetés irányításába és felügyeletébe szakszolgálati engedéllyel vagy anélkül bevont, az 1. Annex előírásainak megfelelően jogosított személy, aki a légijármű parancsnokát támogatja, eligazítja és/vagy kiszolgálja a repülés biztonságos lefolytatása érdekében.

Flight plan – Repülési terv
A légiforgalmi szolgálati egységek rendelkezésére bocsátott, a légijármű tervezett repülésére vagy a repülés egy szakaszára vonatkozó meghatározott tájékoztatás.

Flight recorder – Repülési adatrögzítő
A légijárművön felszerelt bármely típusú adatrögzítő, amelynek célja a tájékoztatások biztosítása a légijármű baleset vagy repesemény kivizsgáláshoz.

Flight safety documents system – Repülésbiztonsági dokumentációs rendszer
A járató által kidolgozott és fenntartott, egymással összefüggő dokumentumok, amelyek rendezett formában tartalmazzák a légi- és földi üzemeltetéshez szükséges tájékoztatásokat. A rendszer legalább a repülés-végrehajtási kézikönyvből valamint a járató karbantartási ellenőrző kézikönyvéből álljon.

Flight simulation training device – Mesterséges repülés-gyakorló berendezés
Az alábbi három berendezés közül bármelyik, amely a repülési körülmények földi gyakorlati megjelenítésére, pontos utánzására alkalmas:

Repülési szimulátor – Flight simulator
Egy adott légijármű típus pilótakabinjának pontos utánzata olyan mértékben, hogy a mechanikus, elektromos továbbá elektronikus légijármű rendszerek működése és ezek hatása, a légijármű hajózószemélyzetének általános munkakörnyezete valamint az adott légijármű teljesítmény és repülési

jellemzői a valósághoz hűen utánozhatók;

Repülési eljárás gyakorló berendezés – Flight procedures trainer
Olyan berendezés, amely valóságos pilótafülke környezetet biztosít és mesterségesen ábrázolja a műszerek működését valamint reakcióit, megjeleníti a műszaki, mechanikus, elektromos és elektronikus rendszerek működését valamint az adott osztályba tartozó légijárművek teljesítmény és repülési jellemzőit;

Alap műszerrepülési gyakorló berendezés – Basic instrument flight trainer
Olyan megfelelő műszerekkel ellátott berendezés, amely mesterségesen biztosítja a légijármű műszerfal környezetét műszerrepülési körülmények között.

Flight time – Helicopters – Repülési idő – Forgószárnyas légijármű
Az a teljes időtartam, amely akkor kezdődik, amikor a légijármű forgó-szárnyai elindulnak és akkor fejeződik be, amikor a légijármű a repülés végén megáll és forgószárnyai leállnak.

1. Megjegyzés: Azokban az esetekben, amikor a repülési idő meghatározása nem írja le, vagy nem teszi lehetővé a normál gyakorlat alkalmazását az Állam útmutatót adhat ki. Például: a személyzet cseréje a forgószárnyak leállítása nélkül; és a forgószárnylapátok mosása járó hajtómű mellett a repülés befejezését követően. Mindenesetre, forgószárnyak repülési szakaszok közötti forgási idejét be kell számítani a repülési időbe.

2. Megjegyzés:A jelen meghatározást csak a repülési- és a szolgálati idő meghatározásához lehet felhasználni.

General aviation operation – Általános célú légiközlekedés
A kereskedelmi légiszállító tevékenységtől valamint a munkarepüléstől eltérő légijármű üzemeltetés.

Ground handling – Földi kiszolgálás
A légijármű érkezése után és indulása előtt a repülőtéren szükséges kiszolgálási feladatok, amelyeket nem a légiforgalmi szolgálatok végeznek el.

Helicopter – Forgószárnyas légijármű
Levegőnél nehezebb légijármű, amelynek levegőben maradását elsősorban a függőleges tengelyre felszerelt, egy vagy több hajtóművel meghajtott forgószárny levegővel szemben ható aerodinamikai reakció-erői biztosítják.

Megjegyzés: Némely államban a „helikopter" kifejezés alternatívájaként a „forgószárnyas légijármű" kifejezést használják.

Helideck – Helikopter leszállási hely
Úszó vagy parttól távol (nyílt vízen) rögzített szerkezeten a forgószárnyas légijárművek üzemeltetésére létesített leszállóhely.

Heliport – Helikopter repülőtér
Repülőtér vagy egy építmény meghatározott területén kialakított leszállóhely, amelyet teljes egészében vagy részben forgószárnyas légijárművek érkezésére, indulására és felszíni mozgására kívánnak felhasználni.

1. Megjegyzés: A jelen rész teljes egészében, amikor a „helikopter repülőtér" (heliport) alkalmazására kerül sor, akkor ez a kifejezés a repülőgépek által használt repülőterekre is vonatkozik.

2. Megjegyzés: a forgószárnyas légijárművek a helikopter repülőterektől eltérő helyekről (helyekre) is fel-, illetve leszállhatnak.

Törölt: s

Heliport operating minima – Helikopter repülőtér üzemeltetési minimum
Egy helikopter repülőtér igénybevételének a következő repülési feladatok végrehajtását érintő korlátozásai:

a) Felszállás – futópályamenti látástávolság (RVR) és/vagy látástávolság értékben és ha szükséges, felhőzet jellemzőkben kifejezve;

b) Precíziós megközelítés és leszállás – az üzemeltetés kategóriájának megfelelően látástávolság és/vagy futópályamenti látástávolság értékben (RVR) valamint elhatározási magasság értékben (DA/H) kifejezve;

c) Függőleges irányvezetéssel végrehajtott megközelítés és leszállás – látástávolság és/vagy futópályamenti látástávolság értékben (RVR) valamint elhatározási magasság értékben (DA/H) kifejezve;

d) Nem-precíziós megközelítés és leszállás – látástávolság és/vagy futópályamenti látástávolság értékben (RVR) valamint legalacsonyabb süllyedési magasság értékben (MDA/H) és ha szükséges, felhőzet jellemzőkben kifejezve.

***Hostile environment – K**edvezőtlen körülmények*
Olyan feltétel rendszer, amelyben:

a) A kényszerleszállást nem lehet végrehajtani, mivel a terep és annak környezete nem megfelelő; vagy

b) A helikopteren tartózkodókat nem lehet megfelelően megvédeni a körülményektől; vagy

c) A keresési és mentési intézkedések / lehetőségek nem állnak arányban a várható veszélyhelyzettel; vagy

d) A személyeket és a vagyoni eszközöket elfogadhatatlan kockázat érné a földön.

Human Factors principles – Emberi tényezők alapelvei
A légiközlekedési tervezés, jogosítás, kiképzés, üzemeltetés és karbantartás vonatkozó alapelvei, amelyek célja az emberi teljesítmény és teljesítő-képesség tényezőinek tökéletes figyelembevételével biztonságos kapcsolat kialakítása a személyek és a rendszer egyes (műszaki) elemei között.

Human performance – Emberi teljesítmény és teljesítőképesség
Az egyéni emberi képességek és korlátozó tényezők, amelyek hatással vannak a légiközlekedési üzemeltetés biztonságára és hatékonyságára.

Instrument meteorological conditions (IMC) – Műszeres időjárási körülmények
Látástávolsággal, felhőzettől mért távolsággal és felhőalappal (a 2. Annexben meghatározottak szerint) kifejezett időjárási körülmények, ha azok a látás utáni időjárási körülményekre meghatározott minimum értékeknél alacsonyabbak.

Megjegyzés: A látás utáni időjárási körülményekre meghatározott minimum értékeket a 2. Annex 4.

fejezete tartalmazza.

Integrated survival suit – egyesített túlélő öltözék
Olyan túlélő öltözék, amely kielégíti a mentő mellény és a túlélő öltözék egyesített követelményeit.

Landing decision point (LDP) – Leszállási elhatározási pont
A leszállási teljesítmény meghatározásánál alkalmazott pont, ahonnan hajtómű meghibásodás esetén a leszállási művelet biztonságosan folytatható vagy a leszállás megszakítása kezdeményezhető.

Megjegyzés: A leszállási elhatározási pont az I. teljesítmény osztályú forgószárnyas légijárműre vonatkozik.

Maintenance – Karbantartás
A légijármű folyamatos légialkalmasságának biztosításához előírt feladatok elvégzése, beleértve a következők bármelyikét vagy ezek kombinációját; nagyjavítás, ellenőrzés, átvizsgálás, javítás, csere, módosítás vagy a meghibásodás elhárítása.

Maintenance organization's procedures manual – Karbantartó szervezet eljárási kézikönyve
A karbantartó szervezet vezetője által jóváhagyott dokumentum, amely részletezi a karbantartó szervezet felépítését, a vezetői felelősségi rendszert, az elvégzendő munkafeladatokat, ismerteti a létesítményeket, a karbantartási eljárásokat valamint a minőségbiztosítási vagy felügyeleti illetve ellenőrzési rendszert.

Maintenance programme – Karbantartási program
Az előírt tervszerű karbantartási feladatok felsorolását tartalmazó kiadvány, amely a feladatok végrehajtásának időrendi tervét és rendjét jelzi. Ilyen kiadvány lehet a légijármű üzemi megbízhatósági programja, amely azon légijármű biztonságos üzemeltetéshez szükséges, amelyre az vonatkozik.

Maintenance release – Karbantartási nyilatkozat
Olyan igazolást tartalmazó dokumentum, amely megerősíti, hogy a megfelelő karbantartási feladatokat a karbantartást végző szervezet eljárási kézikönyve vagy más egyenértékű rendszer alapján az elfogadott jellemzők figyelembevételével kielégítően elvégezték.

Master minimum equipment list (MMEL) – Gyártó minimális felszerelési jegyzéke
Az adott légijármű típusra vonatkozóan a gyártó által kidolgozott és a gyártó állama által jóváhagyott felszerelési jegyzék, amely azokat a felszereléseket és egységeket tartalmazza, amelyek közül egy vagy több a repülés megkezdése előtt üzemképtelen lehet. A jegyzékhez (MMEL) különleges üzemeltetési feltételek, korlátozások vagy eljárások határozhatók meg.

Maximum mass – Legnagyobb tömeg
Legnagyobb engedélyezett felszállósúly.

Minimum descent altitude (MDA) / Minimum descent height (MDH) – Legalacsonyabb süllyedési magasság
A nem-precíziós megközelítési vagy a körözéssel végrehajtott megközelítési eljárásra előírt meghatározott tengerszint vagy földfelszín feletti magasság, amely alá az előírt látási feltételek létrejöttének hiányában süllyedni tilos.

1. Megjegyzés: A legalacsonyabb QNH süllyedési magasság a közepes tengerszinthez, a legalacsonyabb QFE süllyedési magasság a repülőtér magasságához vagy a futópálya küszöb magasságához viszonyított érték. Ez utóbbit akkor alkalmazzák, ha a futópálya küszöb magassága több mint 2 méterrel (7 láb) a *repülőtér magassága alatt van. A megközelítéshez történő körözéshez meghatározott legalacsonyabb süllyedési magasság a repülőtér magasságához viszonyított érték.*

2. Megjegyzés: A szükséges látási feltételek a fénytechnikai eszközök vagy a megközelítési terület azon elemeinek illetve részeinek látását jelentik, amelyeket a repülőgépvezetőnek elegendő ideig látnia kell ahhoz, hogy a légijármű helyzetét és a szükséges helyzetváltoztatás mértékét a kívánatos repülési pályához viszonyítva értékelhesse. A körözéssel végrehajtott megközelítés esetében a szükséges látási feltételek a futópálya környezetére vonatkoznak.

3. Megjegyzés: A gyakorlati alkalmazás megkönnyítése érdekében ott, ahol mindkét kifejezést használják, azok "QNH/QFE legalacsonyabb süllyedési magasság"-ként rövidítve pedig MDA/H-ként írhatók le.

Minimum equipment list (MEL) – Minimális felszerelési jegyzék
A légijármű üzemeletetéséhez rendelkezésre álló felszerelések jegyzéke, amely meghatározott feltételek alapján tartalmazza azokat a berendezéseket és egységeket, amelyek üzemképtelenek lehetnek. A jegyzéket a járató az adott légijármű vonatkozásában a MMEL alapján vagy ennél szigorúbb feltételek szerint dolgozza ki.

Night – Éjszaka
Az esti polgári szürkület vége és a hajnali polgári szürkület kezdete között eltelt idő vagy olyan más, napnyugat és napkelte között eltelt időszak, amelyet az illetékes hatóság határoz meg.

Megjegyzés: Az esti polgári szürkület akkor fejeződik be, amikor a napkorong középpontja 6 fokkal a horizont alá süllyed és a hajnali polgári szürkület akkor kezdődik, amikor a napkorong középpontja 6 fokkal a horizont fölé emelkedik.

Non-congested hostile environment – Ritkán lakott kedvezőtlen környezet
Sűrűn lakott területen kívüli, kedvezőtlen környezet.

Non-hostile environment – Kedvező környezet
Egy olyan környezet, amelyben:

Törölt: *Barátságos*

a) A kényszerleszállást végre lehet hajtani, mivel a terep és annak környezete megfelelő; vagy

b) A helikopteren tartózkodókat megfelelően meg lehet védeni a körülményektől; vagy

c) A keresési és mentési intézkedések / lehetőségek arányban állnak a várható veszélyhelyzettel; vagy

d) A személyeket és a vagyoni eszközök földön való veszélyeztetésének számított kockázatának mértéke elfogadható.

Megjegyzés: A sűrűn lakott területek fenti feltételeknek megfelelő részei kedvezőnek számítanak.

Obstacle clearance altitude (OCA) or Obstacle clearance height (OCH) – Akadálymentes tengerszint feletti magasság (OCA) vagy akadálymentes földfelszín feletti magasság (OCH)
A legalacsonyabb közepes tengerszinthez viszonyított magasság vagy a megfelelő futópálya küszöb illetve a repülőtér magassága feletti magasság – amelyik alkalmazható – amelyet az akadályoktól történő megfelelő függőleges elkülönítés biztosítása érdekében az akadálymentességi előírásokkal összhangban határoznak meg.

1. Megjegyzés: Az akadálymentes tengerszint feletti magasság a közepes tengerszinthez, az akadálymentes földfelszín feletti magasság a futópálya küszöb magasságához viszonyított érték. A nem-precíziós megközelítés esetében az akadálymentes földfelszín feletti magasság a repülőtér magasságához vagy a futópálya küszöb magasságához viszonyított érték. Ez utóbbit akkor alkalmazzák, ha a futópálya küszöb magassága több mint 2 méterrel (7 láb) a repülőtér magassága alatt van. A megközelítéshez történő körözéshez meghatározott akadálymentes földfelszín feletti magasság a repülőtér magasságához viszonyított érték.

2. Megjegyzés: A gyakorlati alkalmazás megkönnyítése érdekében ott, ahol mindkét kifejezést használják, azok "QNH/OFE akadálymentes magasság"-ként rövidítve pedig OCA/H-ként írhatók le.

Offshore operations – Parttól távoli (vízfelszíni) üzemeltetések
Olyan repülés, amelynek jelentős része tenger felett kerül végrehajtásra a nyílt tengeren lévő helyszínre való, vagy onnan történő visszarepülés során. Ezek a repülések magukba foglalják, de nem korlátozódnak csak a nyílt tengeri olaj-, gáz- és ásványi lelőhelyek kiszolgálására valamint hajó kormányosok szállítására.

Operation – üzemeltetés
Egy tevékenység, vagy tevékenységek csoportja, amelyek azonos vagy hasonló veszélyhelyzetnek vannak kitéve, és amelyek meghatározott berendezés készleteket, vagy meghatározott összetételű légijármű vezetői jártasság elérését és karbantartását igénylik, az ilyen jellegű veszélyhelyzetek elkerülése vagy legyőzése érdekében.

Megjegyzés:Az ilyen jelegű tevékenység magába foglalhatja, de nem korlátozódik csak a nyílt tengeri üzemeltetésre, a helikopterrel végzett teheremelésekre vagy vész-mentő szolgáltatásokra.

Operational control – Repülésüzemi irányítás
Felügyelet gyakorlása valamely repülési feladat megkezdésére, folytatására, befejezésére vagy kitérő repülőtérre történő irányítására a légijármű biztonsága valamint a repülés menetrendszerű és gazdaságos lebonyolítása érdekében.

Operational flight plan – Üzemeltetői repülési terv
A járató terve a repülési feladat biztonságos végrehajtására a forgószárnyas légijármű teljesítményének, üzemeltetési korlátozásainak valamint az útvonalon és az érintett repülőtereken várható repülésvégrehajtási körülmények figyelembevételével.

Operations in performance Class 1 – 1. teljesítmény osztályon belüli üzemeltetés
Azon teljesítménnyel történő üzemeltetés, amikor a kritikus hajtómű meghibásodás esetén a teljesítmény elegendő arra, hogy a helikopter biztonságosan folytassa a repülését a megfelelő leszálló helyig, hacsak a meghibásodás még azelőtt bekövetkezne, hogy a helikopter elérné a felszállási elhatározási pontot (TDP) vagy túlhaladna a leszállási elhatározási ponton (LDP), mely esetekben a helikopter legyen képes a leszállásra a megszakított felszállási vagy leszállási körzeten belül.

Operations in performance Class 2 – 2. teljesítmény osztályon belüli üzemeltetés
Azon teljesítménnyel történő üzemeltetés, amikor a kritikus hajtómű meghibásodás esetén a teljesítmény elegendő arra, hogy a helikopter biztonságosan folytassa a repülését a megfelelő leszálló helyig, kivéve, ha a meghibásodás a felszállás utáni meghatározott pont előtt vagy a leszállás előtti meghatározott pont után következik be, mert ebben az esetben kényszerleszállás végrehajtása válhat szükségessé.

Operations in performance Class 3 – 3. teljesítmény osztályon belüli üzemeltetés
Azon teljesítménnyel történő üzemeltetés, amikor a a repülés bármely szakaszán bekövetkező hajtómű

meghibásodás esetén kényszerleszállást kell végrehajtani.

Operations Manual – Üzemeltetési kézikönyv
Az üzemeltetéssel megbízott személyzet számára feladataik elvégzéséhez kiadott eljárásokat, utasításokat és tájékoztatásokat tartalmazó kézikönyv.

Operator – Járató
Valamely személy, szervezet vagy vállalat, amely légijárműveket üzemeltet vagy ilyen tevékenység végzésére ajánlkozik.

Operator's maintenance control manual – Járató karbantartás irányítási kézkönyve
A járató eljárásait ismertető dokumentum, amely segítségével a járató biztosítja, hogy légijárművén az összes tervezett és szükség szerint végrehajtandó karbantartási feladat az előírt időben valamint ellenőrzött és kielégítő módon elvégzésre kerül.

Pilot-in-command – Légijármű parancsnoka
A repülés biztonságos végrehajtásáért felelős, a járató vagy az általános célú légiközlekedés esetében a légijármű tulajdonosa részéről parancsnoknak kijelölt repülőgépvezető.

Psychoactive substances – Szellemi tevékenységet befolyásoló anyagok
Alkohol, ópiumból vagy kenderből készített kábítószer, kokain, nyugtatók és altatók, egyéb izgató, serkentő, élénkítő-szerek, képzeteket keltő erős izgatószerek és illékony oldószerek a kávé és a dohányféleségek kivételével.

Repair – Javítás
A légijármű bármely repülésüzemi alkatrészének sérülést vagy üzemszerű kopást követő repülésre alkalmas állapotba történő helyreállítása annak biztosítása érdekében, hogy az továbbra is megfelel a vonatkozó légialkalmassági előírásoknak, amelyeket az adott légijármű típus bizonyítványának kiadásakor figyelembe vettek.

Required communication performance (RCP) – Előírt távközlési teljesítmény
A repülés közbeni távközlési teljesítmény követelményeire vonatkozó, meghatározott ATM feladatok támogatásával összefüggő közlemény.

Required communication performance type (RCP type) – Előírt távközlési teljesítmény típus
A távközlés lebonyolítási idejét, folyamatosságát, rendelkezésre állását és integrítását meghatározó RCP paraméterekhez rendelt értékeket jellemző címkék (például: RCP 240).

Required navigation performance (RNP) – Előírt navigációs pontosság
Egy meghatározott légtérben történő repülés-végrehajtáshoz szükséges navigációs teljesítmény, azaz pontosság.

Megjegyzés: A navigációs teljesítményt és előírásokat egy adott RNP típusra és/vagy alkalmazásra határozzák meg.

Rest period – Pihenőidő
A földön eltöltött bármely időtartam, amely alatt a járató a hajózószemélyzet tagját összes feladata alól mentesíti.

RNP type (Required navigation performance type) – Előírt navigációs pontosság típus

Tengeri mérföldben kifejezett távolság, azaz pontossági határérték. A légijármű a repülésvégrehajtás során a repülési idő legalább 95 %-ában a tervezett repülési helyzetéhez viszonyítva ezen határértéken belül repüljön.

Például: – RNP 4 olyan navigációs pontosság határértéket jelent, amelynek alapján a légijármű repülési idejének legalább 95 százalékában mindenkori tervezett repülési helyzetéhez viszonyítva plusz/minusz 4 tengeri mérföld távolságon belül repül.

Runway visual range (RVR) – Futópályamenti látástávolság érték
Az a távolság, ameddig a futópálya középvonalán álló légijármű-vezetője látja a futópálya felületi jelzéseket vagy a futópálya szélét kijelölő, illetve a középvonalát azonosító fényeket.

Safe forced landing – Biztonságos kényszerleszállás
Elkerülhetetlen kényszerleszállás talajra vagy vízfelszínre, melynek során nagy valószínűséggel várható, hogy a légijármű fedélzetén valamint a földön tartózkodó személyek nem sérülnek meg.

Safety management system – Biztonsági irányítási rendszer
A biztonság irányításának rendszerezett megközelítése, amely magában foglalja a szükséges szervezeti felépítést, felelősségi köröket, irányelveket és eljárásokat.

Safety programme – Biztonsági program
Előírások és tevékenységek egységes rendszere, amely a biztonság növelésére irányul.

Series of flights – Repülési sorozat
A repülési sorozat olyan egymást követő repüléseket jelent, amelyek

a) egy 24 órás időszakon belül kezdődnek és fejeződnek be; és

b) és mindegyiket ugyanaz a légijármű parancsnok hajtja végre.

State of Registry – Lajstromozó állam
Azon állam, amelynek lajstromába a légijárművet bevezették.

Megjegyzés: A nem nemzeti alapon működő nemzetközi üzemeltető vállalkozás vagy szervezet légijárművének lajstromozás esetében az abban érintett államokra együttesen és külön-külön is vonatkozik az a kötelezettség, amely a Chicagó-i Egyezmény értelmében a lajstromozó államot illeti. Erre vonatkozóan lásd a Tanács 1967. december 17-i Határozatát a Nemzetközi Légiszállítás Gazdasági Szabályzásának Előírásai és Útmutatója (Doc 9587) címmel.

State of the Operator – Járató állama
Az az állam, amelynek területén a járató legfőbb üzleti telephelye található. Ennek hiányában az az állam, amelyben a járató állandó tartózkodási helye (címe) van.

Take-off and initial climb phase – Felszállási és kezdeti emelkedési szakasz
A repülésnek az a szakasza, amely a felszállástól a végső megközelítési és felszállási terület magassága felett 300 méter (1000 láb) magasságig tart abban az esetben, ha a repülés tervezett magassága ennél nagyobb. A szakasz más esetekben az emelkedés befejezéséig tart.

Take-off decision point (TDP) – Felszállási elhatározási pont
A felszállási teljesítmény meghatározásánál alkalmazott pont, ahonnan hajtómű meghibásodás esetén a felszállás megszakítható vagy a felszállási művelet biztonságosan folytatható.

Megjegyzés: A felszállási elhatározási pont az I. teljesítmény osztályú forgószárnyas légijárműre vonatkozik.

Visual meteorological conditions (VMC) – Látás utáni időjárási körülmények
Látástávolsággal, felhőzettől mért távolsággal és felhőalappal (A 2. Annex meghatározása szerint) kifejezett időjárási körülmények, ha azok a látás utáni időjárási körülményekre meghatározott minimum értékekkel azonosak vagy ezeknél jobbak.

Megjegyzés: A látás utáni időjárási körülményekre meghatározott minimum értékeket a 2. Annex 4. fejezete tartalmazza.

V_{TOSS}
Az a legalacsonyabb sebesség, amelynél üzemképtelen kritikus hajtóművel emelkedés érhető el úgy, hogy a többi hajtómű engedélyezett üzemeltetési határértékein belül működik.

Megjegyzés: A fent említett sebesség a légijármű műszerein vagy más, a repülés-végrehajtási kézikönyvben meghatározott eljárás segítségével mérhető.

2. fejezet
Alkalmazhatóság

A 6. Annex III. részében található nemzetközi előírások és ajánlott gyakorlati eljárások a nemzetközi kereskedelmi légiszállításban vagy az általános célú nemzetközi légiközlekedésben üzemeltetett forgószárnyas légijárművek működésére alkalmazandók, azonban ezek a nemzetközi előírások és ajánlott gyakorlati eljárások a munkarepülésben használt forgószárnyas légijárművekre nem vonatkoznak.

1. Megjegyzés: A nemzetközi kereskedelmi légiszállítási tevékenységre jogosított járatók repülőgépeinek üzemeltetésre vonatkozó nemzetközi előírások és ajánlott gyakorlati eljárások a 6. Annex I. részében találhatók.

2. Megjegyzés: Az általános célú nemzetközi légiközlekedésben üzemeltetett repülőgépekre vonatkozó nemzetközi előírások és ajánlott gyakorlati eljárások a 6. Annex II. részében találhatók.

II. szakasz
Nemzetközi kereskedelmi légiszállítás

1. fejezet
Általános rész

1. Megjegyzés: Bár a Nemzetközi Polgári Légiközlekedési Egyezmény a lajstromozó államra bizonyos feladatokat ír elő, amelyek végrehajtására az állam a helyzetnek megfelelően jogosult vagy kötelezett, a Közgyűlés A23-13 számú határozatában elismerte azt a tényt, hogy a lajstromozó állam bizonyos *körülmények között képtelen megfelelő módon eleget tenni a fenti kötelezettségének, amikor a légijárművet más állam járatója – elsősorban hajózószemélyzet nélkül – bérbe veszi, szerződés vagy csere megállapodás alapján üzemelteti valamint azt is, hogy amíg az Egyezmény 83/b. cikkelye hatályba nem lép, az Egyezmény nem határozza meg megfelelően a járató államára ilyen esetekben vonatkozó jogokat és kötelezettségeket. Ezért a Tanács felhívta a figyelmet arra, hogy ha a fenti esetekben a lajstromozó állam megállapítja, hogy az Egyezményben előírt kötelezettségei teljesítésére képtelen, azokat a feladatokat, amelyeket a járató állama jobban el tud végezni és ezen feladatok végrehajtását elvállalja, járató államára utalhatja át. Tudomásul vették, hogy a 83/b. cikkely hatályba lépéséig a fentiek csak gyakorlati szempontból lesznek célszerűek és nem érintik a Chicagó-i Egyezménynek a lajstromozó államra vagy bármely harmadik államra háruló kötelezettségeit. Mindazonáltal, mivel a 83/b. cikkely 1997. június 20-án hatályba lépett, a vonatkozó kiegészítést (Doc 9318) aláíró államok kötelesek az ilyen átadási megállapodásokban foglaltak teljesítésére.*

2. Megjegyzés: A nemzetközi légi üzemeltetés esetében, amelyet olyan forgószárnyas légijárművekkel bonyolítanak le, amelyek nem mindegyike van azonos szerződő államban lajstromozva, a jelen rész előírásai közül semmi sem akadályozza meg az érintett államokat abban, hogy szerződés alapján közösen végezzék el azokat a feladatokat, amelyek végrehajtására a jelen részben a lajstromozó államot jelöltük ki.

1.1 A jogszabályok, előírások és eljárások betartása

1.1.1 A járató biztosítsa, hogy minden külföldön tartózkodó alkalmazottja tudatában legyen annak, hogy eleget kell tenniük azon állam jogszabályainak, előírásainak és közzétett eljárásainak, amelyben forgószárnyas légijárműveiket üzemeltetik.

1.1.2 A járató biztosítsa, hogy összes forgószárnyas légijármű-vezetője ismerje a feladataik teljesítéséhez szükséges jogszabályokat, előírásokat és eljárásokat, amelyeket az átrepülendő területekre, az igénybe vett helikopter repülőterekre és léginavigációs létesítményekre előírtak. A járató biztosítsa, hogy a hajózószemélyzet többi tagja is ismerje a forgószárnyas légijármű üzemeltetésével kapcsolatos egyéni feladataik teljesítéséhez szükséges jogszabályokat, előírásokat és eljárásokat.

Megjegyzés: A repülőgépvezetőknek és a légiüzemeltetéssel foglalkozó személyeknek szóló azon információkat, amelyek a repülési eljárások paramétereire és az üzemeltetési eljárásokra vonatkoznak, a PANS-OPS I. kötete tartalmazza. A látás utáni és a műszeres repülési eljárások felépítésére vonatkozó követelményeket a PANS-OPS II. kötete tartalmazza. Az akadály mentesség követelményeinek és eljárásainak használata egyes államokban eltérhetnek a PANS-OPS előírásaitól, és biztonsági okokból fontos ezen különbségek ismerete.

1.1.3 A járató biztosítsa, hogy a hajózószemélyzet tagjai az 1. Annex előírásai szerint bizonyítsák képességüket a légiforgalmi rádiótávbeszélő összeköttetések során alkalmazott nyelv szóbeli használatára és megértésére.

1.1.4 A repülésüzemi irányításért a járató vagy kijelölt képviselője felelős.

Megjegyzés: Ez az előírás nem érinti az állam jogait és kötelezettségeit azon forgószárnyas légijárművek üzemeltetésére vonatkozóan, amelyeket abban az államban vettek lajstromba.

1.1.5 A repülésüzemi irányításért viselt felelősséggel csak a légijármű parancsnoka és a repülés-üzemi tiszt / szolgálatvezető hatalmazható fel, amennyiben a járató jóváhagyott módszere a légiüzemeltetés irányítására és felügyeletére megköveteli a repülés-üzemi tiszt / szolgálatvezető alkalmazását.

Megjegyzés: A repülésüzem irányításának megszervezésére vonatkozó útmutató és a repülés-üzemi tiszt /

szolgálatvezető szerepének leírása az Üzemeltetési Ellenőrzés, Jogosítás és Folyamatos Felülvizsgálat Kézikönyv-ben *(Doc 8335) található. A repülés-üzemi tiszt / szolgálatvezető felhatalmazására, kötelességeire, és felelősségi körére vonatkozó részletes útmutatót a* Repülésüzemi Kézikönyv Előkészítése (Doc 9376) *című anyagban található. A szakszolgálati engedéllyel rendelkező repülés-üzemi tiszt / szolgálatvezető korára, képzettségére, tudására és gyakorlati jártasságára vonatkozó követelmények az 1. Annexben találhatók.*

1.1.6 Amennyiben a forgószárnyas légijármű vagy az utasok biztonságát fenyegető vészhelyzetről először a repülés-üzemi tiszt / szolgálatvezető szerez tudomást, akkor annak a személynek a 2.6.1 bekezdés szerinti tevékenysége, ahol az lehetséges, tartalmazza a kialakult helyzet természetéről a megfelelő hatóságok késedelem nélküli értesítését, és a segítségre vonatkozó kérést, amennyiben szükséges.

1.1.7 Amennyiben a forgószárnyas légijármű vagy az utasok biztonságát fenyegető vészhelyzet esetében olyan tevékenységre van szükség, amellyel megsértik a helyi előírásokat vagy eljárásokat, a légijármű parancsnoka erről késedelem nélkül értesítse az illetékes helyi hatóságot. Ha az állam, amelynek felségterületén az esemény bekövetkezik így rendelkezik, a légijármű parancsnoka bármely ilyen előírás megsértéséről nyújtson be jelentést az állam illetékes hatósága számára; ebben az esetben a parancsnok a jelentés másolatát nyújtsa be a járató állama számára is. Az ilyen jelentéseket a lehető legrövidebb időn, általában tíz napon belül nyújtsák be.

1.1.8 A járató biztosítsa, hogy a forgószárnyas légijármű fedélzetén a légijármű parancsnokának rendelkezésére álljon az átrepült területen működő kutató és mentő szolgálatokra vonatkozó összes alapvető tájékoztatás.

Megjegyzés: Ezt a tájékoztatást a légijármű-vezető számára az üzemeltetési kézikönyv vagy más hasonló, alkalmasnak tekintető tájékoztató anyag is tartalmazhatja.

1.1.9 A járató dolgozzon ki és vezessen be baleset megelőzési és repülésbiztonsági programot.

Megjegyzés: A baleset megelőzéssel kapcsolatos útmutató a Baleset Megelőzési Kézikönyv-*ben (Doc 9422) valamint az* Üzemeltetési Kézikönyv Elkészítése *(Doc 9376) című kiadványokban található.*

1.1.10 **Ajánlás** *–A 7000 kg-nál nagyobb engedélyezett felszállósúllyal (tömeg), vagy kilencnél több utasüléssel rendelkező és repülési adatrögzítővel felszerelt forgószárnyas légijármű járatója biztonság irányítási rendszere részeként dolgozzon ki és vezessen be repülési adat elemző programot.*

Megjegyzés: A járató a repülési adat elemző program végrehajtásával megbízhat más szervezetet, azonban az ilyen programmal kapcsolatos általános felelősség a járatót terheli.

1.1.11 A repülési adat elemző program nem lehet szankcionáló jellegű és megfelelő intézkedéseket tartalmazzon az adatforrások védelmére.

1.2 A biztonság irányítása

1.2.1 Az államok dolgozzanak ki egy biztonsági programot, hogy a légijárművek üzemeltetése során el lehessen érni az elfogadható szintű biztonságot.

1.2.2 Az elérendő, elfogadható szintű biztonságot az érintett állam(ok) teremtse (teremtsék) meg.

Megjegyzés: A biztonsági programra vonatkozó útmutató a Biztonság Irányítási Kézikönyv-*ben* (SMM) *(Doc 9859), míg az elfogadható szintű biztonság meghatározása a 11. Annex E. mellékletében található.*

1.2.3 ***Ajánlás*** *– Az államok, mint a biztonsági programjuk részeként követeljék meg, hogy egy járató vezessen be a járató államának elfogadható biztonság irányítási rendszert, amely minimum:*

a) *megnevezi a biztonsági veszélyeket;*

b) *biztosítja, hogy egy elfogadható szintű biztonság kialakításához szükséges megelőző intézkedések alkalmazásra kerülnek;*

c) *gondoskodik a folyamatos figyelésről és az elért biztonsági szint rendszeres felülvizsgálatáról; és*

d) *törekedik a teljeskörű biztonsági szint folyamatos tökéletesítésére.*

1.2.4 2009 január 01-től az államok, mint a biztonsági programjuk részeként követeljék meg, hogy egy járató vezessen be a járató államának elfogadható biztonság irányítási rendszert, amely minimum:

a) megnevezi a biztonsági veszélyeket;

b) biztosítja, hogy egy elfogadható szintű biztonság kialakításához szükséges megelőző intézkedések alkalmazásra kerülnek;

c) gondoskodik a folyamatos figyelésről és az elért biztonsági szint rendszeres felülvizsgálatáról; és

d) törekedik a teljeskörű biztonsági szint folyamatos tökéletesítésére.

1.2.5 A biztonság irányítási rendszer világosan határozza meg a biztonságért viselt felelősség függelmi viszonyait a járató teljes szervezetén belül, beleértve a felső vezetés biztonságért viselt közvetlen felelősségét.

Megjegyzés: A biztonság irányítási rendszerre vonatkozó útmutató a Biztonság Irányítási Kézikönyv-*ben* (SMM) *(Doc 9859) található.*

1.2.6 A járató, biztonság irányítási rendszere részeként, az üzemeltető személyzet részére, felhasználás és útmutatás céljából dolgozzon ki egy repülésbiztonsági dokumentációs rendszert.

Megjegyzés: A repülésbiztonsági dokumentációs rendszer kidolgozására és elrendelésére vonatkozó útmutató a G. mellékletben található.

1.3 Veszélyes áruk

1. Megjegyzés: A veszélyes áruk szállítására vonatkozó előírások a 18. Annex-ben találhatók.

2. Megjegyzés: Az Egyezmény 35. cikkelye bizonyos teheráru korlátozási osztályokra vonatkozik.

1.4 Szellemi tevékenységet befolyásoló anyagok használata

Megjegyzés: A szellemi tevékenységet befolyásoló anyagok használatára vonatkozó előírások az 1. Annex 1.2.7 és a 2. Annex 2.5 pontjaiban találhatók.

1.2 Veszélyes áruk

1. Megjegyzés: A veszélyes áruk szállítására vonatkozó előírások a 18. Annex-ben találhatók.

2. Megjegyzés: Az Egyezmény 35. cikkelye bizonyos teheráru korlátozási osztályokra vonatkozik.

1.3 Szellemi tevékenységet befolyásoló anyagok használata

Megjegyzés: A szellemi tevékenységet befolyásoló anyagok 1 használatára vonatkozó előírások az 1. Annex 1.2.7 és a 2. Annex 2.5 pontjaiban találhatók.

2. fejezet
Repülésvégrehajtás

2.1 Az üzemeltetés létesítményeinek alkalmassága

2.1.1 A járató biztosítsa, hogy a repülés végrehajtása ne kezdődjön meg az előtt, hogy minden rendelkezésre álló lehetséges és ésszerű eszközzel meggyőződtek arról, hogy azok a rendelkezésre álló földi és/vagy vízfelszíni létesítmények, amelyek a forgószárnyas légijármű biztonságos üzemeltetése valamint az utasok védelme érdekében közvetlenül szükségesek, megfelelnek annak az üzemeltetési típusnak, amelyben a repülést végre fogják hajtani, továbbá azokat a fenti célnak megfelelő módon üzemeltetik.

Megjegyzés: A jelen előírásban alkalmazott „lehetséges és ésszerű eszköz" kifejezés a járató részére az indulási helyen rendelkezésre álló tájékoztatások felhasználását jelenti, amelyek a légiforgalmi tájékoztató szolgálatok által kiadott hivatalos közleményekből vagy más forrásokból származnak.

2.1.2 A járató biztosítsa, hogy az üzemeltetés során tapasztalt bármilyen működési rendellenességet indokolatlan késedelem nélkül jelentsék be a létesítmény üzemeltetéséért felelős hatóságnak.

2.2 Üzemeltetési engedélyek és ellenőrzés

2.2.1 Légijármű üzembentartási engedély

2.2.1.1 A járató kereskedelmi légiszállítási tevékenységet csak akkor végezhet, ha érvényes légijármű üzembentartási engedély van a birtokában, amelyet a járató állama bocsátott ki.

2.2.1.2 A légijármű üzembentartási engedély a meghatározott feltételek és korlátozások betartása mellett feljogosítja a járatót a kereskedelmi légiszállítási tevékenység végzésére.

Megjegyzés – a légijármű üzembentartási engedélyre vonatkozó útmutatót és a kapcsolódó felhatalmazásokat, feltételeket és korlátozásokat, melyeket az üzemeltetői specifikáció tartalmazhat, az Üzemeltetési Ellenőrzés, Jogosítás és Folyamatos Felülvizsgálat Kézikönyve (Doc 8335) tartalmazza.

2.2.1.3 A szerződő államok egy másik szerződő állam által kiadott légijármű üzembentartási engedélyt érvényesnek fogadhatnak el, feltételezve azt, hogy az engedély kiadásául szolgáló követelmények legalább azonosak a jelen Annexben meghatározott vonatkozó előírásokkal.

2.2.1.4 A légijármű üzembentartási engedély kibocsátása a járató állama részéről annak függvénye, hogy a járató a meghatározott üzemeltetés természetétől és nagyságrendjétől függően és figyelembevételével bizonyságot tesz a repülési tevékenység megfelelő szervezéséről, ellenőrzési módszereiről és átfogó irányításáról valamint a kiképzési és karbantartási programjairól.

Megjegyzés: A légijármű üzembentartási engedély kiadásával kapcsolatos tájékoztatás a 6. Annex I. rész F. Függelékben található.

2.2.1.5 A légijármű üzembentartási engedély vagy más ezzel egyenértékű dokumentum folyamatos érvényessége attól függ, hogy a járató a járató államának ellenőrzése alatt eleget tesz a 2.2.1.4 pont előírásának.

2.2.1.6 A légijármű üzembentartási engedély vagy más ezzel egyenértékű dokumentum legalább a következőket tartalmazza:

a) a járató megnevezése (cégnév vagy azonosító, székhelye);

b) a kiadás időpontja és az érvényesség időtartama;

c) az engedélyezett tevékenység típusok ismertetése;

d) a használatra engedélyezett légijármű típus(ok); és

e) üzemeltetésre engedélyezett területek vagy repülési útvonalak.

2.2.1.7 A járató állama az 1. Függelékkel öszhangban, dolgozzon ki és alkalmazzon járató üzemeltetés engedélyezési és folyamatos minőség ellenőrzési rendszert, mellyel biztosítja a 2.2 pontban található, a légijármű üzemeltetés színvonalára vonatkozó előírások betartását.

2.2.2 Üzemeltetési kézikönyv

2.2.2.1 A járató a H. Melléklet előírásaival összhangban, az érintett üzemeltető személyzet részére felhasználásra valamint tájékoztatásra biztosítson üzemeltetési kézikönyvet, amelyet szükség szerint módosítsanak és egészítsenek ki, hogy az mindig naprakész legyen. Minden ilyen kiegészítést és módosítást adjanak ki a kézikönyv használatára kötelezett összes személynek.

2.2.2.2 A járató állama írja elő, hogy az üzemeltetési kézikönyv egy példányát és az összes kiegészítést és/vagy módosítást ellenőrzésre, felülvizsgálatra, valamint amikor szükséges jóváhagyásra adja át a járató államának. A járató az üzemeltetési kézikönyvbe vegye fel azokat a további kötelező anyagokat, amelyeket a járató állama erre előírhat.

1. Megjegyzés: Az üzemeltetési kézikönyv tartalmára és szerkesztési elveire vonatkozó előírásokat az H. Melléklet tartalmazza.

2. Megjegyzés: Az üzemeltetési kézikönyvben szereplő egyes meghatározott tételekhez a 2.2.7, 4.1.3, 7.3.1 és 10.3 pontok előírásai alapján a járató államának jóváhagyása szükséges.

2.2.3 Üzemeltetési utasítások – Általános rész

2.2.3.1 A járató biztosítsa, hogy az üzemeltetésben résztvevő valamennyi dolgozója saját feladatairól, felelősségéről valamint a feladatainak a járató egész tevékenységében elfoglalt helyéről megfelelő oktatásban részesüljön.

2.2.3.2 A forgószárnyas légijármű forgószárnyát hajtómű segítségével csak akkor szabad megforgatni, ha a kormányoknál szakszolgálati engedéllyel rendelkező légijármű-vezető foglal helyet. A járató biztosítson megfelelő speciális képzést és folyamat leírást mindazon, a minősített légjármű vezető jogosítás nélküli személyek számára, akik repülési szándék nélkül végrehajthatják a forgószárnyak hajtómű segítségével való megforgatását.

2.2.3.3 ***Ajánlás*** *– A járató adjon ki üzemeltetési utasításokat és biztosítson tájékoztatásokat a forgószárnyas légijármű összes működő hajtóművel történő emelkedési képességéről, hogy ezzel a légijármű parancsnoka a meglevő felszállási körülmények és a tervezett felszállási módszer (repülés-technika) alapján meghatározhassa a felszállási és kezdeti emelkedési szakaszban elérhető emelkedés mértékét. Ez a tájékoztatás a forgószárnyas légijármű gyártója által kiadott vagy a járató állama által elfogadható egyéb adatokon alapuljanak és ezt a tájékoztatást vegyék fel az üzemeltetési kézikönyvbe.*

2.2.4 Vészhelyzet repülés közben történő gyakorlása

A járató biztosítsa, hogy amikor utasokat vagy teherárut szállítanak, a repülés közben vészhelyzeti vagy a rendes üzemeléstől eltérő gyakorlást illetve szimulációt ne végezzenek.

2.2.5 Ellenőrző jegyzékek

A hajózószemélyzet a forgószárnyas légijármű üzemeltetésének minden szakasza előtt, alatt és után továbbá vészhelyzetben alkalmazza a 4.1.4 pont előírása alapján elkészített és kiadott ellenőrző jegyzékeket annak biztosítására, hogy végrehajtották a légijármű üzemeltetési kézikönyvében, repülés-végrehajtási kézikönyvében vagy más, a légialkalmassági bizonyítvánnyal kapcsolatos egyéb dokumentumban valamint üzemeltetési tájékoztató kiadványokban található üzemeltetési eljárásokat. Az ellenőrző jegyzékek összeállítása és felhasználása alkalmával vegyék figyelembe az emberi tényezők alapelveit.

Megjegyzés: Az Emberi Tényezők alapelveinek alkalmazására vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv*-ében (Doc 9683) található.*

2.2.6 Legalacsonyabb repülési magasságok

2.2.6.1 A járató jogosult arra, hogy kijelölje a legalacsonyabb repülési magasságokat azokon a repülési útvonalakon, amelyekre az átrepült útvonal állama vagy az útvonalért felelős állam is kijelölt ilyen magasságokat, feltéve, hogy ezek nem alacsonyabbak, mint amelyeket az állam határozott meg. A fentieknél alacsonyabb magasság esetében külön eseti jóváhagyás szükséges.

2.2.6.2 A járató határozza meg és az üzemeltetési kézikönyvben tegye közzé azt a módszert, amely szerint meghatározni kívánja a legalacsonyabb repülési magasságokat azokra a repülési útvonalakra, amelyekre az átrepült útvonal állama vagy az útvonalért felelős állam nem jelölt ki ilyen magasságokat. A fenti módszer alapján megállapított legalacsonyabb repülési magasságok ne legyenek alacsonyabbak, mint a 2. Annex-ben meghatározott értékek.

2.2.6.3 ***Ajánlás*** *– A legalacsonyabb repülési magasságok meghatározásának módszerét a járató állama hagyja jóvá.*

2.2.6.4 ***Ajánlás*** *– A járató állama ezeket a legalacsonyabb repülési magasságokat kellő megfontolás után, a következő tényezők az üzemeltetés biztonságát valószínűleg befolyásoló hatásainak figyelembevételével hagyja jóvá:*

a) a pontosság és megbízhatóság, amellyel a forgószárnyas légijármű helyzete meghatározható;

b) a felhasznált magasságmérő berendezések jelzéseinek pontatlansága;

c) a földfelszín jellemzői (például a tengerszint feletti magasság hirtelen megváltozásai);

d) kedvezőtlen időjárási körülmények előfordulásainak valószínűsége (például erős turbulencia és leszálló légáramlatok);

e) a léginavigációs térképek lehetséges pontatlanságai; és

f) légtér korlátozások.

2.2.7 Helikopter repülőtér üzemeltetési minimum

2.2.7.1 A járató állama írja elő, hogy a járató határozzon meg helikopter repülőtér üzemeltetési minimumot minden olyan egyes helikopter repülőtérre, amelyet használni kíván, és a minimum meghatározásának módszerét a járató állama hagyja jóvá. Az ilyen minimum ne legyen alacsonyabb, mint amelyet a helikopter repülőtérre azon állam ír elő, amelyben a helikopter repülőtér elhelyezkedik, kivéve ha erre az érintett állam külön engedélyt ad.

Megjegyzés: Ez az előírás nem követeli meg attól az államtól, amelyben a helikopter repülőtér elhelyezkedik, hogy helikopter repülőtér üzemeltetési minimumot határozzon meg.

2.2.7.2 A járató állama írja elő, hogy a bármely üzemeltetési módra vonatkozó helikopter repülőtér üzemeltetési minimum meghatározásánál a következőket teljes mértékben vegyék figyelembe:

a) a forgószárnyas légijármű típusa, teljesítménye és kiszolgálási jellemzői;

b) a hajózószemélyzet összetétele, szakmai alkalmassága és tapasztalata;

c) a meghatározott és közzétett távolságok;

d) a rendelkezésre álló látás utáni és nem-látás utáni földi segédeszközök pontossága és jellemzői;

e) a forgószárnyas légijárművön a navigációhoz és/vagy a leszálláshoz történő megközelítés és a megszakított megközelítés repülési pályájának irányításához rendelkezésre álló berendezések;

f) a megközelítési és a megszakított megközelítési területeken elhelyezkedő akadályok, valamint a műszeres megközelítési eljárásokhoz meghatározott akadálymentes tengerszint és földfelszín feletti magasságok;

g) az időjárási körülmények felderítésére, meghatározására és jelentésére alkalmazott módszerek; és

h) a kezdeti emelkedési területeken levő akadályok és a szükséges biztonsági elkülönítés értékei.

2.2.7.3 II. és III. kategóriás műszeres megközelítést és leszállást csak akkor engedélyezzenek, ha futópályamenti látástávolság érték (RVR) tájékoztatás áll rendelkezésre.

2.2.7.4 **Ajánlás** – *A műszeres megközelítés és leszállás végrehajtására 800 méter látástávolság alatti helikopter repülőtéri üzemeltetési minimumot csak akkor engedélyezzenek, ha futópályamenti látástávolság érték (RVR) tájékoztatás, vagy pontosan mért illetve észlelt látástávolság érték áll rendelkezésre.*

Megjegyzés: a mérés és a megfigyelés repülés végrehajtása szempontjából kívánatos és jelenleg biztosítható pontosságára vonatkozó útmutató a 3. Annex, B. mellékletében található.

2.2.8 Tüzelőanyag és olaj nyilvántartás

2.2.8.1 A járató vezessen tüzelőanyag és olaj nyilvántartást annak érdekében, hogy a járató állama számára bizonyíthassa, hogy minden egyes repülés esetében eleget tettek a 2.3.6 pont előírásainak.

2.2.8.2 A tüzelőanyag és olaj nyilvántartást a járató három hónapig őrizze meg.

2.2.9 Személyzet

2.2.9.1 *Légijármű parancsnok* – A járató minden egyes járatra jelöljön ki egy légijármű-vezetőt, aki a parancsnoki feladatokat látja el.

2.2.9.2 *Repülési idő, repülési szolgálati időtartam és pihenőidő* – A járató dolgozzon ki szabályokat és előírásokat a repülési idő és a repülési szolgálati időtartam korlátozására, továbbá a megfelelő pihenőidő biztosítására a személyzet minden tagja számára. Ezeket a szabályokat a járató állama által meghatározott, vagy jóváhagyott előírásokkal összhangban dolgozzák ki és vegyék fel az üzemeltetési kézikönyvbe.

2.2.9.3 A járató rendszeresen tartsa nyilván a személyzet minden tagjának repülési idejét, repülési szolgálati, valamint pihenő idejét is.

Megjegyzés: A korlátozások kidolgozásával kapcsolatos útmutató a C. Mellékletben található.

2.2.10 Utasok

2.2.10.1 A járató biztosítsa, hogy az utasokkal megismertessék a következő eszközök elhelyezkedését és használatát:

a) biztonsági övek;

b) vészkijáratok;

c) mentőmellények, amennyiben ezek szállítását előírták;

d) oxigén légzőkészülék, amennyiben az utasok részére az oxigén szállítását előírták; és

e) más, egyéni használatra rendszeresített mentőfelszerelések, beleértve az utastájékoztató kiadványokat is.

2.2.10.2 A járató tájékoztassa az utasokat a közös használatra rendszeresített alapvető mentőfelszerelések elhelyezkedéséről és általános használatáról.

2.2.10.3 A repülés során bekövetkező vészhelyzetekben az utasokat a körülményeknek megfelelő vészhelyzeti tevékenységre utasítsák.

2.2.10.4 A járató biztosítsa, hogy a fel és leszállás során valamint bármikor, amikor a repülés alkalmával turbulencia, vagy bármely vészhelyzet következik be és ezt az óvintézkedést szükségesnek ítélik, a forgószárnyas légijármű fedélzetén tartózkodó valamennyi utas a rendelkezésre álló biztonsági övvel, vagy hevederrel az ülésbe legyen kötve.

2.2.11 Vízfelszín feletti repülések

A 4.5.1 pont előírásai alapján a vízfelület felett, kedvezőtlen időjárási körülmények között repülést végrehajtó összes forgószárnyas légijármű jogosítva legyen a vízfelszínre történő kényszerleszállásra, azaz vízreszállásra. A vonatkozó tájékoztatás szerves részét képezze a vízfelszín (tenger) jellemzőinek ismertetése.

2.3 Repülés előkészítés

2.3.1 A repülési feladat végrehajtását ne kezdjék meg mindaddig, amíg nem töltötték ki a repülés előkészítési nyomtatványokat annak bizonyítására, hogy a légijármű parancsnoka meggyőződött az alábbiakról:

a) a forgószárnyas légijármű repülésre alkalmas;

b) a 4. fejezetben az adott repülési feladat végrehajtására előírt műszerek és berendezések felszerelésre kerültek, megfelelőek és üzemképesek;

c) a forgószárnyas légijármű karbantartási nyilatkozatát a 6.7 pontban előírtak szerint kiállították;

d) a forgószárnyas légijármű tömege, valamint súlypont-helyzete a várható repülési körülmények figyelembevételével olyan, hogy a repülési feladat biztonságosan végrehajtható;

e) bármely szállítmányt megfelelő módon elhelyeztek és biztonságosan rögzítettek;

f) ellenőrízték, hogy a 3. fejezetben található üzemeltetési korlátozások az adott repülés vonatkozásában betarthatók; és

g) eleget tettek a 2.3.3 szakaszban található üzemeltetési repülés tervezési előírásoknak.

Megjegyzés: A repülési sorozat olyan egymást követő repüléseket jelent, amelyek

a) egy 24 órás időszakon belül kezdődnek és fejeződnek be; és

b) és mindegyiket ugyanaz a légijármű parancsnok hajtja végre.

2.3.2 A kitöltött repülés előkészítési nyomtatványokat a járató három hónapig őrízze meg.

2.3.3 Üzemeltetési repülés tervezés

2.3.3.1 Minden tervezett repüléshez, vagy repülési sorozathoz készítsenek üzemeltetési repülési tervet. Az üzemeltetési repülési tervet a légijármű parancsnoka, fogadja el és írja alá. Az üzemeltetési repülési tervet hagyják az illetékes hatóságnál. A járató határozza meg az üzemeltetési repülési terv elhelyezésének legalkalmasabb módját.

2.3.3.2 Az üzemeltetési kézikönyvben ismertetni kell az üzemeltetési repülési terv tartalmát és használatát.

2.3.4 Kitérő helikopter repülőterek

2.3.4.1 *Felszállási kitérő helikopter repülőtér*

2.3.4.1.1 Az üzemeltetési repülési tervekben határozzanak meg egy felszállási kitérő helikopter repülőteret, amennyiben az indulási helikopter repülőtéren az időjárási feltételek az adott repülőtérre elfogadott üzemeltetési minimumnak vagy a minimum alatti értékeknek felelnek meg.

2.3.4.1.2 A felszállás céljára kiválasztott kitérő helikopter repülőtérre vonatkozó tájékoztatás jelezze azt, hogy a tervezett felhasználási időpontban az időjárási feltételek az adott helikopter repülőtérre elfogadott üzemeltetési minimumnak vagy a minimum feletti értékeknek fognak megfelelni.

2.3.4.2 *Érkezési kitérő helikopter repülőtér*

2.3.4.2.1 A műszerrepülési szabályok szerint tervezett repülés esetében az üzemeltetési valamint a légiforgalmi szolgálatoknak benyújtott repülési tervekben határozzanak meg legalább egy alkalmas kitérő helikopter repülőteret vagy leszállási helyet, kivéve ha:

a) a repülés időtartama és az uralkodó időjárási körülmények olyanok, hogy nagy valószínűséggel feltételezhető, hogy a tervezett leszállási helikopter repülőtéren az érkezés számított időpontjában valamint ezt megelőzően és ezt követően ésszerű idő-határokon belül a megközelítés és a leszállás a járató állama előírása alapján látás utáni időjárási körülmények között végrehajtható lesz; vagy

b) a tervezett leszállási helikopter repülőtér elszigetelt fekvésű és alkalmas kitérő nem áll rendelkezésre. Határozzák meg azt a pontot (PNR), amelyen túl a visszafordulás már nem lehetséges.

2.3.4.2.2 Az érkezés céljára kiválasztott kitérő helikopter repülőtérre vonatkozó tájékoztatás jelezze azt, hogy a tervezett felhasználási időpontban az időjárási feltételek az adott helikopter repülőtérre elfogadott üzemeltetési minimumnak vagy a minimum feletti értékeknek fognak megfelelni.

2.3.4.2.3 **Ajánlás** – *Azon induló járatoknál, amelyek érkezési repülőterén az előrejelzések szerint a feltételek az üzemeltetési minimum alatt lesznek, két érkezési kitérő repülőteret válasszanak ki. Az első érkezési kitérő repülőtér minimuma legyen azonos vagy magasabb, mint a célrepülőtér üzemelési minimuma és a második érkezési kitérő repülőtér minimuma legyen azonos vagy magasabb mint a kitérő repülőtér üzemelési minimuma*

2.3.4.3 Az alkalmas, parttól távoli (vízfelszíni) kitérő helikopter repülőtereket vagy leszállási helyeket a következők alapján határozhatják meg:

a) a parttól távoli kitérőket csak azon pont átrepülése után használják, amely után a visszafordulás nem lehetséges (PNR). Ezen pont előtt a szárazföldi kitérőket vegyék igénybe;

b) a kitérő meghatározásánál vizsgálják meg és vegyék figyelembe a kritikus repülésvezérlő rendszerek, valamint egyéb lényeges részegységek (mechanikai) műszaki megbízhatóságát;

c) a kitérőre történő érkezés előtt határozzák meg és vegyék figyelembe a forgószárnyas légijármű egy működésképtelen hajtóművel történő üzemi teljesítményét;

d) a leszállási hely biztosan rendelkezésre áll;

e) az időjárási tájékoztatások minden körülmények között pontosak és megbízhatóak legyenek.

Megjegyzés: A repülésvégrehajtási kézikönyvben a repülésvezérlő rendszerek meghibásodása esetére meghatározott leszállási módszerek kizárhatják egyes leszállási helyek kitérőként történő igénybevételét.

2.3.4.4 ***Ajánlás*** – *Amennyiben a szárazföldi kitérő helikopter repülőtér vagy leszállási hely eléréséhez szükséges tüzelőanyag mennyiség szállítása lehetséges, parttól távoli (vízfelszíni) kitérőket ne vegyenek igénybe. A parttól távoli (vízfelszíni) kitérőket ne vegyék igénybe kedvezőtlen időjárási körülmények között.*

2.3.5 Időjárási körülmények

2.3.5.1 A látvarepülési szabályok szerint tervezett repülés végrehajtását ne kezdjék meg csak akkor, ha az érvényes időjárás-jelentések vagy az érvényes időjárás-jelentések és előrejelzések kombinációja azt jelzik, hogy az útvonalon vagy annak látvarepülési szabályok szerint tervezett repülési szakaszán a megfelelő időben az uralkodó időjárási körülmények olyanok lesznek, hogy a látás után történő repülésvégrehajtás szabályai (VFR) betarthatók lesznek.

Megjegyzés: Amikor a repülést a látvarepülési szabályok szerint hajtják végre, az éjjel-látó megjelenítő készülék (NVIS) vagy egyéb a látást javító rendszerek használata nem csökkenti a 2.3.5.1 pontban előírt követelmények teljesítésének szükségességét.

2.3.5.2 A műszerrepülési szabályok szerint tervezett repülés végrehajtását ne kezdjék meg csak akkor, ha a rendelkezésre álló tájékoztatások szerint az érkezés várható időpontjában a tervezett leszállási helikopter repülőtéren, vagy ahol kitérő meghatározása is szükséges, legalább egy ilyen helikopter repülőtéren az uralkodó (időjárási) körülmények helikopter repülőtér üzemeltetési minimumnak megfelelőek vagy annál jobbak lesznek.

Megjegyzés: Néhány állam gyakorlata szerint a repülés tervezési célokra magasabb minimumokat jelölnek meg arra az esetre, ha a helikopter repülőteret kitérőként választják szemben azzal, ha a helikopter repülőtér a tervezett leszállás helye.

2.3.5.3 Ismert vagy várható jegesedés körülményei között a repülést ne kezdjék meg, csak akkor, ha a forgószárnyas légijármű ilyen körülmények közötti üzemelésre van jogosítva és felszerelve.

2.3.5.4 Ismert vagy várható földi jegesedés körülményei között történő üzemelésre tervezett repülés ne szálljon fel mindaddig, amíg a forgószárnyas légijárművet jegesedés szempontjából nem vizsgálták felül és nem végezték el a megfelelő jégtelenítést vagy jégmentesítést. A jeget vagy más természetes szennyező anyagot úgy távolítsák el a forgószárnyas légijárműről, hogy az még közvetlenül a felszállás előtt is repülésre alkalmas állapotban legyen.

Megjegyzés: A fentiekre vonatkozó tájékoztatót a Légijármű földi jégtelenítés végrehajtása kézikönyv *(Doc 9640) tartalmazza.*

2.3.6 Tüzelőanyag (üzemanyag) és olajkészlet

2.3.6.1 *Minden forgószárnyas légijármű esetében* — A repülés végrehajtását ne kezdjék meg csak akkor, ha az időjárási körülmények valamint a repülés során várható bármely késés figyelembevételével a forgószárnyas légijármű elegendő tüzelőanyagot és olajt szállít ahhoz, hogy a repülést biztonságosan be tudja fejezni. Ezen kívül az előre nem látható eseményekre való tekintettel szállítsanak tüzelőanyag és olaj tartalékot is.

2.3.6.2 *Látvarepülési szabályok szerinti (VFR) üzemeltetés* — A 2.3.6.1 pont előírásának megfelelően szállított tüzelőanyag és olaj mennyisége a látvarepülési szabályok szerint történő üzemeltetés esetében legalább annyi legyen, ami lehetővé teszi, hogy a forgószárnyas légijármű:

a) elrepüljön arra a helikopter repülőtérre, amelyre a repülést tervezték;

b) ezt követően a legoptimálisabb utazósebességgel 20 percig valamint a tervezett repülési idő további 10 %-áig repüljön; és

c) a forgószárnyas légijármű ezen felül rendelkezzen annyi tüzelőanyaggal, amely fedezi a járató által meghatározott és a járató állama által jóváhagyott, előre nem látható esetekben bekövetkező fogyasztás növekedés mennyiségét.

2.3.6.3 *Műszerrepülési szabályok szerinti (IFR) üzemeltetés* — A 2.3.6.1 pont előírásának megfelelően szállított tüzelőanyag és olaj mennyisége a műszerrepülési szabályok szerint történő üzemeltetés esetében legalább annyi legyen, ami lehetővé teszi, hogy a forgószárnyas légijármű:

2.3.6.3.1 Ha a 2.3.4.2.1 a) előírása alapján kitérő kijelölése nem szükséges, elrepüljön arra a helikopter repülőtérre, amelyre a repülést tervezték és ezt követően;

a) a célállomás helikopter repülőtér felett 450 méter (1500 láb) magasságon, szabványos hőmérsékleti viszonyok között, a várakozásra előírt sebességgel 30 percet repüljön valamint megközelítést és leszállást hajtson végre; és

b) a forgószárnyas légijármű ezen felül rendelkezzen annyi tüzelőanyaggal, amely fedezi a járató által meghatározott és a járató állama által jóváhagyott, előre nem látható esetekben bekövetkező fogyasztás növekedés mennyiségét.

2.3.6.3.2 Ha kitérő kijelölése szükséges, elrepüljön arra a helikopter repülőtérre, amelyre a repülést tervezték, ott megközelítést és egy megszakított megközelítést hajtson végre majd ezt követően;

a) elrepüljön a repülési tervben meghatározott kitérő helikopter repülőtérre vagy leszállási helyre; és ott

b) a kitérő felett 450 méter (1500 láb) magasságon, szabványos hőmérsékleti viszonyok között, a várakozásra előírt sebességgel 30 percet repüljön valamint megközelítést és leszállást hajtson végre; és

c) a forgószárnyas légijármű ezen felül rendelkezzen annyi tüzelőanyaggal, amely fedezi a járató által meghatározott és a járató állama által jóváhagyott, előre nem látható esetekben bekövetkező fogyasztás növekedés mennyiségét.

2.3.6.3.3 Ha a 2.3.4.2.1 b) előírása alapján alkalmas kitérő nem áll rendelkezésre, (pl. a célállomás elszigetelt), akkor megfelelő mennyiségű tüzelőanyagot kell szállítani, amely lehetővé teszi a tervezett célállomásig történő elrepülést, és ezután még annyi időtartamra elegendő, amely a földrajzi és az időjárási feltételek figyelembevételével elégséges a biztonságos leszállás végrehajtásához.

2.3.6.4 A 2.3.6.1 pontban előírt szükséges tüzelőanyag és olaj készlet mennyiségének kiszámításánál legalább következő tényezőket vegyék figyelembe:

a) előrejelzett időjárási körülmények;

b) várható légiforgalmi irányítói engedélyek és útvonalak valamint forgalmi késések;

c) a műszerrepülési szabályok (IFR) szerint végrehajtott repülés esetében egy műszeres megközelítés végrehajtása a célállomás helikopter repülőtéren, beleértve egy megszakított megközelítést is;

d) az üzemeltetési kézikönyvben a repülés végrehajtása alatt bekövetkező egy hajtómű meghibásodása valamint — amennyiben alkalmazható — a túlnyomásos kabin dehermetizálódás esetére előírt eljárások; és

e) minden egyéb olyan körülmény, amely a forgószárnyas légijármű leszállását késleltetheti vagy a tüzelőanyag és/vagy olajfogyasztást növelheti.

Megjegyzés: A 2.3.6 pontban ismertetett tényezők nem korlátozzák a repülési terv repülés közben történő módosításának lehetőségét és a repülés áttervezését egy másik helikopter repülőtérre, feltéve hogy a 2.3.6 pont előírásai teljesíthetők attól a ponttól kezdődően is, ahol a repülés áttervezése megtörtént.

2.3.7 Tüzelőanyag-feltöltés utasokkal a fedélzeten, vagy a forgószárny forgása közben

***Ajánlás** — A forgószárnyas légijárművön ne végezzenek tüzelőanyag feltöltést akkor, amikor az utasok beszállnak, kiszállnak vagy a forgószárnyas légijármű fedélzetén tartózkodnak illetve ha a forgószárny mozgásban van, kivéve ha a járató a járató állama részéről megfelelő egyedi engedéllyel rendelkezik, amelyben meghatározzák azokat a feltételeket, amelyek betartásával a tüzelőanyag feltöltés ilyen esetekben is elvégezhető.*

1. Megjegyzés: A légijármű tüzelőanyag feltöltésére vonatkozó előírások a 14. Annex I. Kötetében, a biztonságos tüzelőanyag feltöltési módszerekkel kapcsolatos útmutató pedig a Repülőtér Kiszolgálási Kézikönyv *(Doc 9137) 1. illetve 8. Részeiben található.*

2. Megjegyzés: Amikor a forgószárnyas légijármű tüzelőanyaggal történő feltöltését nem kerozinnal végzik, a feltöltés alkalmával a kerozin más gázturbina hajtóanyagokkal keveredik, vagy nyílt töltővezetéket alkalmaznak, további elővigyázatossági rendszabályokra van szükség.

2.3.8 Oxigén készlet

Megjegyzés: A szövegben alkalmazott abszolút légnyomás értékeknek megfelelő, a nemzetközi műlégkör alapján meghatározott megközelítő magasságok a következők:

Abszolút légnyomás	magasság — méter	magasság — láb
700 hPa	3000	10 000
620 hPa	4000	13 000
376 hPa	7600	25 000

2.3.8.1 Olyan repülési magasságon végrehajtandó repülés esetén, amelyen a személyek részére rendszeresített kabin(ok)ban a légnyomás 700 hPa értéknél alacsonyabb lesz, a repülést ne kezdjék meg csak akkor, ha elegendő mennyiségű belélegzésre alkalmas oxigént biztosítottak, amely ellátja:

a) a személyzet minden tagját valamint az utasok 10 %-át 30 percet meghaladó bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 700 hPa és 620 hPa érték között van; és

b) a személyzet tagjait valamint az utasokat bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 620 hPa értéknél alacsonyabb.

2.3.8.2 A túlnyomásos kabinnal rendelkező forgószárnyas légijármű esetében a repülés végrehajtását ne kezdjék meg csak akkor, ha elegendő mennyiségű belélegzésre alkalmas oxigént biztosítottak, amely a túlnyomás megszűnése esetén, a repülés körülményeinek megfelelően ellátja a személyzet összes tagját valamint az utasokat bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 700 hPa értéknél alacsonyabb. Ezen kívül, ha a forgószárnyas légijárművet olyan repülési magasságon üzemeltetik, amelyen az atmoszférikus légnyomás értéke 376 hPa-nál alacsonyabb és a forgószárnyas légijárművel négy percen belül nem lehet biztonságosan olyan magasságra süllyedni, amelyen az atmoszférikus légnyomás értéke 620 hPa-nak felel meg, az utaskabinban tartózkodó személyek részére legalább tíz percre elegendő oxigén készletet biztosítsanak.

2.4 Repülés végrehajtási eljárások – repülés közben

2.4.1 Helikopter repülőtér üzemeltetési minimum

2.4.1.1 A repülést ne folytassák a tervezett leszállási helikopter repülőtér felé csak abban az esetben, ha a rendelkezésre álló legújabb tájékoztatások azt jelzik, hogy az érkezés várható időpontjában az adott vagy legalább egy kitérő helikopter repülőtéren a leszállás a 2.2.7.1 pont előírásai szerint meghatározott üzemeltetési minimum mellett végrehajtható.

2.4.1.2 A műszeres megközelítést precíziós megközelítés esetében ne folytassák a külső jeladó (OM) navigációs ponton túl vagy nem precíziós megközelítés esetében a helikopter repülőtér feletti 300 méter (1000 láb) magasság alatt kivéve, ha a jelentett látástávolság vagy a meghatározó futópályamenti látástávolság érték (RVR) a megállapított minimum felett van.

2.4.1.3 Amennyiben precíziós megközelítés esetében a külső jeladó (OM) navigációs pont átrepülése után vagy nem precíziós megközelítés esetében a repülőtér feletti 300 méter (1000 láb) magasság alá történő süllyedésnél a jelentett látástávolság vagy a meghatározó futópályamenti látástávolság érték a megállapított minimum alá csökken, a megközelítés az elhatározási vagy a legalacsonyabb süllyedési magasságig folytatható. A forgószárnyas légijármű semmi esetre se folytassa a leszálláshoz történő megközelítését bármely helikopter repülőtérre azon a meghatározott ponton túl, amely után az arra megállapított helikopter repülőtér üzemeltetési minimum értéket megsértené.

2.4.2 Időjárási megfigyelések

Megjegyzés: A repülés végrehajtása során a forgószárnyas légijármű fedélzetén történő időjárás megfigyelés, észlelés, feljegyzés valamint jelentés eljárásait a 3. Annex, a PANS-ATM (Doc 4444) és a megfelelő Körzeti Kiegészítő Eljárások *(Doc 7030) tartalmazzák.*

2.4.3 Repülésre veszélyes körülmények

A repülésre veszélyes, az időjárási viszonyokkal kapcsolatostól eltérő, a repülés végrehajtása során tapasztalt egyéb körülményeket a lehető legrövidebb időn belül jelentsék az illetékes légiforgalmi állomásnak. A jelentések tartalmazzák a más légijárművek biztonságával kapcsolatos vagy kapcsolatba hozható részleteket is.

2.4.4 A hajózószemélyzet tagjai szolgálati helyeiken

2.4.4.1 *Fel és leszállás* — A pilótakabinban szolgálatra kijelölt valamennyi hajózószemélyzeti tag tartózkodjon szolgálati helyén.

2.4.4.2 *Útvonalon* — A pilótakabinban szolgálatra kijelölt valamennyi hajózószemélyzeti tag tartózkodjon szolgálati helyén, kivéve, ha távolléte a forgószárnyas légijármű üzemeltetésével kapcsolatos feladatok elvégzése vagy fiziológiai okok miatt szükséges.

2.4.4.3 *Biztonsági övek* — A hajózószemélyzet valamennyi tagja szolgálati helyén tartsa biztonsági övét becsatolva.

2.4.4.4 *Vállhevederekkel ellátott biztonsági övek* — A fel és leszállási szakaszokban a hajózószemélyzet valamennyi légijármű-vezetői ülést elfoglaló tagja vállhevederrel ellátott biztonsági övét tartsa becsatolva; a hajózószemélyzet többi tagja a fel és leszállási szakaszokban vállhevederrel ellátott biztonsági övét tartsa becsatolva, kivéve, ha a vállhevederek akadályozzák őket feladataik végrehajtásában, amely esetben a vállhevedereket kikapcsolhatják, azonban a biztonsági öveket bekapcsolva kell tartaniuk.

Megjegyzés: A vállhevederekkel ellátott biztonsági öv egymástól függetlenül használható vállhevederekből és biztonsági övből áll.

2.4.5 Oxigén használat

A forgószárnyas légijármű repülése alatt, annak biztonságos üzemeltetéséhez nélkülözhetetlen feladatokat ellátó összes hajózószemélyzeti tagja folyamatosan használja az oxigén légzőkészüléket, amikor ezt az uralkodó körülmények a 2.3.8.1 vagy 2.3.8.2 pontok előírásai alapján szükségessé teszik.

2.4.6 A túlnyomásos kabinnal felszerelt forgószárnyas légijármű utaskabin személyzetének és utasainak védelme dehermetizáció – a túlnyomás megszűnése - esetén

***Ajánlás** — Az utaskabin személyzeti tagok biztonságát úgy védelmezzék, hogy azok az esetleges túlnyomás megszűnése esetében szükségessé váló vészsüllyedés alkalmával eszméletüket nagy valószínűséggel ne veszítsék el továbbá képesek maradjanak arra, hogy a vészhelyzetet követő stabilizált repülés folyamán az utasokat elsősegélyben részesítsék. Az utasok biztonságát olyan eszközökkel, berendezésekkel vagy* *üzemeltetési eljárásokkal védelmezzék, amelyek nagy valószínűséggel biztosítják, hogy a túlnyomás megszűnése miatt fellépő oxigénhiány hatásait túlélik.*

Megjegyzés: Nem lehet előre meghatározni vagy feltételezni, hogy az utaskabin személyzet a túlnyomás megszűnése esetén szükségessé váló vészsüllyedés alkalmával mindig képes lesz segítséget nyújtani az utasoknak.

2.4.7 Műszerrepülési eljárások

2.4.7.1 Az az állam, amelynek területén a helikopter repülőtér elhelyezkedik, vagy ha egy állam területén kívül levő helikopter repülőtérről van szó, az az állam, amely a létesítményért felelős, a műszerrepülési szabályok szerint igénybe vett minden egyes végső megközelítési és felszállási területre vagy helikopter repülőtérre hagyjon jóvá és tegyen közzé egy vagy több műszeres megközelítési eljárást.

2.4.7.2 A műszerrepülési szabályok szerint üzemelő összes forgószárnyas légijármű hajtsa végre azokat a műszeres megközelítési eljárásokat, amelyeket az az állam hagyott jóvá, amelynek területén a helikopter repülőtér elhelyezkedik, vagy ha egy állam területén kívül levő helikopter repülőtérről van szó az, amely a létesítményért felelős.

1. Megjegyzés: A műszerrepülési eljárásokban érintett személyek részére ajánlott üzemeltetési eljárások a PANS OPS (Doc 8168) I. kötetében találhatók.

2. Megjegyzés: A műszerrepülési eljárások követelményeire vonatkozó útmutatás az eljárások kidolgozásában résztvevő szakértők részére a PANS-OPS (Doc 8168) II. kötetében található.

2.4.8 Forgószárnyas légijármű zajcsökkentő eljárások

***Ajánlás** — A járató tegye lehetővé, hogy a fel és leszállások végrehajtása során a zajcsökkentés követelményei betartásra kerüljenek.*

2.5 A légijármű parancsnok kötelmei

2.5.1 A légijármű parancsnoka felelős a forgószárnyas légijármű fedélzeten tartózkodó összes személyzeti tag, utas és az elhelyezett teheráru biztonságáért. A parancsnok felelős továbbá a forgószárnyas légijármű üzemeltetéséért és biztonságáért attól a pillanattól kezdve, amikor a hajtóműve(ke)t beindítják addig, mikor a forgószárnyas légijármű a repülés után végleg megáll, a hajtómű egysége(ke)t leállítják és a forgószárny megáll.

2.5.2 A légijármű parancsnoka biztosítsa, hogy pontosan és részletesen betartsák a repülési ellenőrző jegyzékekre vonatkozó, a 2.2.5 pontban ismertetett előírást.

2.5.3 A légijármű parancsnoka felelős a legközelebbi illetékes hatóság lehető leggyorsabb értesítéséért a forgószárnyas légijárművet érintő bármely olyan balesetről, amelynek következménye bármely személy súlyos vagy halálos sérülése illetve a forgószárnyas légijármű vagy más anyagi javak jelentős károsodása.

Megjegyzés: A "súlyos sérülés" kifejezés meghatározása a 13. Annex-ben található

.

2.5.4 A légijármű parancsnoka felelős a forgószárnyas légijárművön tapasztalt vagy feltételezett meghibásodások jelentéséért a repülés befejezését követően a járató felé.

2.5.5 A légijármű parancsnoka felelős a 9.4.1 pontban ismertetett tájékoztatásokat tartalmazó útinaplóért vagy általános nyilatkozatért.

Megjegyzés: A Közgyűlés 1956. június-július hónapjaiban, Caracasban tartott tizedik ülésszakán elfogadott A10-36 számú határozata értelmében a 9. Annex-ben ismertetett "Általános Nyilatkozat" (General Declaration) – amennyiben tartalmazza az Egyezmény 34. cikkelyében előírt tájékoztatásokat – a szerződő államok részéről az "Útinapló" (Journey Log Book) megfelelő változataként fogadható el.

2.6 A repülés-üzemi tiszt, vagy szolgálatvezető kötelmei

2.6.1 A repülés-üzemi tiszt/szolgálatvezető – ha a 2.2.1.4 pont előírásainak megfelelően repülés-felügyeleti feladatok ellátásával van megbízva – hajtsa végre a következőket:

a) segítse a légijármű parancsnokát a repülés előkészítésében és adjon meg számára minden szükséges tájékoztatást;

b) segítse a légijármű parancsnokát az üzemeltetési és a légiforgalmi szolgálati egységeknek benyújtott repülési tervek elkészítésében, amennyiben erre szükség van, írja alá a dokumentumokat és nyújtsa be a megfelelő repülési tervet az illetékes légiforgalmi szolgálati egységnek; és

c) a rendelkezésre álló eszközök segítségével a repülés közben adja meg a légijármű parancsnokának azokat a tájékoztatásokat, amelyek szükségesek lehetnek a repülés biztonságos végrehajtásához.

2.6.2 Vészhelyzet esetén a repülés-üzemi tiszt/szolgálatvezető:

a) kezdeményezze az üzemeltetési kézikönyvben található eljárásokat, mialatt kerüljön el minden olyan ténykedést, amellyel ellentétbe kerülne a légiforgalmi irányítás eljárásaival; és

b) továbbítsa a légijármű parancsnoka felé a repülés biztonságos végrehajtásához szükséges biztonsággal kapcsolatos információkat, beleértve a repülési terv összes módosításával kapcsolatos információkat is, melyek a repülés végrehajtása során váltak szükségessé.

Megjegyzés – azonos módon fontos, hogy repülés végrehajtása során a légijármű parancsnoka szintén továbbítson hasonló információkat a repülés-üzemi tiszt/szolgálatvezető felé, különösen a veszélyhelyzettel összefüggőket.

2.7 Kézipoggyász

A járató biztosítsa, hogy a forgószárnyas légijárműre felvitt és az utas-kabinban elhelyezett összes poggyászt megfelelő módon és biztonságosan tárolják (szállítsák).

3. fejezet

Forgószárnyas légijármű teljesítmény üzemeltetési korlátozások

3.1 Általános rész

3.1.1 A forgószárnyas légijárműveket a lajstromozó állam által a jelen fejezet alkalmazható előírásaival összhangban kidolgozott és közzétett, részletes és átfogó teljesítmény előírás betartásával üzemeltessék.

1. Megjegyzés: A repülések végrehajtásához a teljesítmény előírások térjenek ki úgy a különböző repülési fázisokra, mint az üzemelés körülményeire.

2. Megjegyzés: A teljesítmény előírásoknak való megfelelést illetően a jelen rész 1. fejezete megköveteli, hogy járatók feleljenek meg azon állam törvényeinek, előírásainak és eljárásainak, amelyben a forgószárnyas légijárműveiket üzemeltetik. Az Egyezmény 11. szakasza ad alapot erre a követelményre.

3.1.2. Amikor a repülési feltételek nem biztosítják a kritikus hajtómű meghibásodása esetén a biztonságos repülés folytatását, a forgószárnyas légijármű repülésénél olyan megfelelő megoldásokat kell alkalmazni, amelyek lehetővé teszik a biztonságos kényszerleszállás végrehajtását.

Megjegyzés: a „megfelelő megoldásra" vonatkozó útmutatót az A. melléklet, 2.4 szakasza tartalmazza.

3.1.2.1 Ahol 3. teljesítmény osztálynál a járató állama megengedi a műszeres időjárási feltételek (IMC) melletti üzemeltetést, az ilyen üzemeltetést a 3.4 pont ajánlásai szerint hajtsák végre.

3.1.3 **Ajánlás** – *Olyan forgószárnyas légijárművek esetében, amelyekre a 8. Annex IV. része az Egyezmény 41. cikkelyének előírásában található kivétel miatt nem alkalmazható, a lajstromozó állam biztosítsa, hogy az 3.2 szakaszban meghatározott teljesítmény szintet a lehető legnagyobb mértékben betartsák.*

3.1.4 Amikor a forgószárnyas légijárművel sűrűn lakott, kedvezőtlen feltételek közötti helikopter repülőtérről kell felszállni vagy arra leszállni, azon állam illetékes hatósága, amelyben a helikopter repülőtér elhelyezkedik, határozza meg azon követelményeket amelyek lehetővé teszik az ilyen üzemeltetésnél a hajtómű egység meghibásodásával járó kockázatra adott megfelelő megoldások alkalmazását.

Megjegyzés: a „megfelelő megoldásra" vonatkozó útmutatót az A. melléklet, 2.4 szakasza tartalmazza.

3.2 A 8. Annex IV. rész előírásaival összhangban jogosított forgószárnyas légijárművek

3.2.1 A 3.2.2 – 3.2.7 pontokban ismertetett előírások azokra a forgószárnyas légijárművekre alkalmazandók, amelyekre 8. Annex IV. része vonatkozik.

Megjegyzés: A következő nemzetközi előírások nem tartalmaznak az országos légialkalmassági előírásokban található rendelkezésekkel összevethető érték (mennyiség) előírásokat. Ezeket a 3.1.1 pont alapján a szerződő államok saját előírásaikban határozzák meg.

3.2.2 A 3.1.1 pontban jelzett, a 3.2.1 pontban kijelölt forgószárnyas légijárművekre vonatkozó átfogó és részletes országos (nemzeti) előírásokban meghatározott teljesítmény szintek legalább lényegükben feleljenek meg a jelen fejezetben megfogalmazott általános színvonalnak.

Megjegyzés: Az A. Melléklet útmutató anyagot tartalmaz, amely példák segítségével mutatja be a jelen *fejezet nemzetközi előírásaiban és ajánlott gyakorlati eljárásaiban biztosítani kívánt teljesítmény szintet.*

3.2.3 A forgószárnyas légijárművet a légialkalmassági bizonyítványában található feltételek alapján, a repülésvégrehajtási kézikönyvben meghatározott, jóváhagyott teljesítmény korlátozások betartásával üzemeltessék.

3.2.4 A lajstromozó állam az ésszerűség határain belül foganatosítson olyan elővigyázatossági intézkedéseket, amelyek lehetővé teszik az elvárható általános biztonsági szint fenntartását minden várható – még a jelen fejezetben tételesen nem jelzett – üzemeltetési körülmények között.

3.2.5 A repülés végrehajtását csak akkor kezdjék meg, ha a repülésvégrehajtási kézikönyvben található teljesítmény tájékoztatások azt jelzik, hogy a tervezett repülés során a 3.2.6 és 3.2.7 pontok előírásait be tudják tartani.

3.2.6 A jelen fejezet előírásainak alkalmazásakor vegyék figyelembe a forgószárnyas légijármű teljesítményét jelentősen befolyásoló összes tényezőt (mint például a tömeg, magasság, az üzemeltetési hely magasságának megfelelő nyomás-magasság, hőmérséklet, szélviszonyok, a talaj felület állapota). Ezeket a tényezőket közvetlenül üzemeltetési jellemzőként vagy közvetetten tűrési illetve határértékként vegyék figyelembe, amelyek azon teljesítmény adatok részletes ismertetésével vagy átfogó teljesítmény előírással adhatók meg, amelyek alapján a forgószárnyas légijárművet üzemeltetik.

3.2.7 Tömeg (súly) korlátozások

a) A felszállás végrehajtásának megkezdésekor a forgószárnyas légijármű tömege ne haladja meg azt az étéket, amelynél a 3.1.1 pontban meghatározott teljesítmény előírások teljesíthetők, figyelembe véve a repülés előrehaladása folyamán vagy az üzemanyag-kibocsátás miatt bekövetkező súlycsökkenést.

b) A felszállás végrehajtásának megkezdésekor a forgószárnyas légijármű tömege semmi esetre se haladja meg a forgószárnyas légijármű repülésvégrehajtási kézikönyvében, a 3.2.6 pontban előírtak figyelembe vételével meghatározott értéket.

c) A tervezett leszállási vagy bármely kijelölt kitérő helikopter repülőtéren az érkezés várható időpontjában a forgószárnyas légijármű számított tömege semmi esetre se haladja meg a forgószárnyas légijármű repülésvégrehajtási kézikönyvében, a 3.2.6 pontban előírtak figyelembe vételével meghatározott értéket.

d) A felszállás végrehajtásának megkezdésekor vagy a leszállási illetve bármely kijelölt kitérő helikopter repülőtéren az érkezés várható időpontjában a forgószárnyas légijármű számított tömege semmi esetre se haladja meg a legnagyobb engedélyezett tömeget, amely megfelel a 16. Annex I. kötet zajszint minősítési előírásainak kivéve, ha különleges körülmények között, bizonyos üzemeltetési helyeken, ahol zajszint probléma nem jelentkezik, erre az érintett állam illetékes hatósága – amelyben az üzemeltetési hely elhelyezkedik – külön engedélyt ad.

3.2.7.1 A teljesítmény előírások alkalmazása során a járató állama az A. mellékletben leírt útmutó szerinti kockázat értékelés módszerét alkalmazza. Azon államok, amelyek nem alkalmazzák a kockázat értékelési módszert, járjanak el s 3.2.7.2 – 3.2.7.4 pontok előírásai szerint.

3.2.7.2 Felszállási és kezdeti emelkedési szakasz

3.2.7.2.1 Az *1. teljesítmény osztályú forgószárnyas légijármű* – A forgószárnyas légijármű a felszállási elhatározási ponton vagy ez előtt bekövetkező kritikus hajtómű meghibásodás esetén képes legyen a felszállás megszakítására, valamint a megállásra a rendelkezésre álló megszakított felszállási területen belül. Amennyiben a meghibásodás a felszállási elhatározási ponton vagy ez után következik be, a forgószárnyas légijármű képes legyen a felszállás folytatására és a repülési pályán levő összes akadály feletti biztonságos magasságra történő emelkedésre addig, amíg olyan helyzetbe kerül, hogy eleget tud tenni a 3.2.7.3.1 pont előírásának.

3.2.7.2.2 A *2. teljesítmény osztályú forgószárnyas légijármű* –Amennyiben a felszállás után meghatározott pont elérését követően bármely időpontban kritikus hajtómű meghibásodás következik be, a forgószárnyas légijármű képes legyen a felszállás folytatására és a repülési pályán levő összes akadály feletti biztonságos magasságra történő emelkedésre addig, amíg olyan helyzetbe kerül, hogy eleget tud tenni a 3.2.7.3.1 pont előírásának. A felszállás után meghatározott pont elérése előtt bekövetkező hajtómű meghibásodás esetén a forgószárnyas légijármű kényszerleszállás végrehajtására kényszerülhet és ezért erre az esetre a 3.1.2 pont előírása alkalmazandó.

3.2.7.1.3 A *3. teljesítmény osztályú forgószárnyas légijármű* – A repülési pálya bármely pontján bekövetkező hajtómű meghibásodás esetén a forgószárnyas légijármű kényszerleszállás végrehajtására kényszerülhet és ezért erre az esetre a 3.1.2 pont előírása alkalmazandó.

3.2.7.3 Útvonalon

3.2.7.2.1 Az *1. és 2. teljesítmény osztályú forgószárnyas légijármű* – A forgószárnyas légijármű az útvonalrepülés bármely pontján bekövetkező kritikus hajtómű meghibásodás esetén képes legyen a repülés folytatására a repülési útvonal legalacsonyabb tengerszint feletti repülési magassága alá történő süllyedés nélkül olyan üzemeltetési helyig, amelyen eleget tudnak tenni a 3.2.7.4.1 (1. teljesítmény osztály) vagy a 3.2.7.4.2 (2. teljesítmény osztály) pontok előírásának.

Megjegyzés: Amennyiben az útvonal szakasz teljesítése kedvezőtlen környezet felett történik és a kitérő repülőtér elérésének időtartama meghaladja a két órát, javasolt, hogy a járató állama vizsgálja meg a hajtómű meghibásodásával járó kockázatokat.

Törölt: *barátságtalan*

3.2.7.3.2 *A 3. teljesítmény osztályú forgószárnyas légijármű* – A forgószárnyas légijármű összes működő hajtóművével képes legyen a repülés folytatására tervezett útvonalán vagy meghatározott kitérő repülési útján az útvonal legalacsonyabb tengerszint feletti repülési magassága alá történő süllyedés nélkül. A repülési pálya bármely pontján bekövetkező hajtómű meghibásodás esetén a forgószárnyas légijármű kényszerleszállás végrehajtására kényszerülhet és ezért erre az esetre a 3.1.2 pont előírása alkalmazandó.

3.2.7.4 Megközelítési és leszállási szakasz

3.2.7.4.1 Az 1. teljesítmény osztályú forgószárnyas légijármű – A megközelítési és leszállási szakasz bármely pontján a leszállási elhatározási pont előtt bekövetkező kritikus hajtómű meghibásodás esetén a forgószárnyas légijármű a repülési útvonalon levő összes akadály biztonságos elkülönítési magasságon történő átrepülése után képes legyen a célállomáson és bármely kitérőn leszállni valamint a rendelkezésre álló leszállási távolságon belül megállni, vagy megszakított megközelítést végrehajtani és a 3.2.7.2.1 pont előírásának megfelelően a repülési útvonalon levő összes akadály felett biztonságos elkülönítés tartásával repülni. Amennyiben a hajtómű meghibásodás a leszállási elhatározási pont után következik be, a forgószárnyas légijármű képes legyen leszállni és a rendelkezésre álló leszállási távolságon belül megállni.

3.2.7.4.2 A *2. teljesítmény osztályú forgószárnyas légijármű* –Ha a kritikus hajtómű meghibásodás a leszállás előtt meghatározott pont elérése előtt következik be, a forgószárnyas légijármű képes legyen a célállomáson és bármely kitérőn leszállni valamint a rendelkezésre álló leszállási távolságon belül megállni, vagy megszakított megközelítést végrehajtani és a 3.2.7.2.2 pont előírásának megfelelően a repülési útvonalon levő összes akadály felett biztonságos elkülönítés tartásával repülni. A leszállási elhatározási pont után bekövetkező hajtómű meghibásodás a forgószárnyas légijármű kényszerleszállását idézheti elő; ezért erre az esetre a 3.1.2 pont előírása alkalmazandó.

3.2.7.4.3 A *3. teljesítmény osztályú forgószárnyas légijármű* –A repülési pálya bármely pontján bekövetkező hajtómű meghibásodás esetén a forgószárnyas légijármű kényszerleszállás végrehajtására kényszerülhet és ezért erre az esetre a 3.1.2 pont előírása alkalmazandó.

3.3 Akadály adatok

A járató vegye figyelembe a rendelkezésre álló akadály adatokat, amikor kidolgozza a felszállásra, a kezdeti emelkedésre, a megközelítésre és a leszállásra vonatkozó eljárásokat, ahogy azokat a járató állama által meghatározott teljesítmény követelmények meghatározzák.

3.4 A 3. teljesítmény osztályú forgószárnyas légijárművek, látvarepülési szabályok (VFR) szerinti különleges repüléseinek kivételével végrehajtott műszeres időjárási körülmények (IMC) közötti repüléseire vonatkozó kiegészítő követelmények

3.4.1 A 3. teljesítmény osztályú forgószárnyas légijárművek műszeres időjárási körülmények (IMC) közötti repüléseit azon állam illetékes hatósága által elfogadott szárazföldi terület felett hajtsák végre, amely állam illetékességébe tartozik az adott terület.

3.4.2 A 3. teljesítmény osztályú forgószárnyas légijárművek műszeres időjárási körülmények (IMC) közötti üzemeltetésének jóváhagyásakor a járató államának meg kell győződnie arról, hogy a forgószárnyas légijármű tanúsítva lett a műszeres szabályok (IFR) szerinti repülések végrehajtására, valamint a 6. és 8. Annex-ben előírt teljeskörű repülésbiztonsági szintek teljesítését az alábbiak biztosítják-e:

a) A hajtóművek megbízhatósága;

b) A járató karbantartási eljárásai, légiüzemeltetési gyakorlata, repülés előkészítési eljárásai és a hajózó személyzet képzési programjai; és

c) A felszerelések és a 2. Függelékkel összhangban előírt követelmények teljesítése.

Megjegyzés: A 3. teljesítmény osztályú forgószárnyas légijárművek műszeres időjárási körülmények (IMC) közötti üzemeltetésének kiegészítő követelményeire vonatkozó útmutatót a 2. Függelék tartalmazza.

3.4.3 A műszeres időjárási körülmények (IMC) között üzemeltetett 3. teljesítmény osztályú forgószárnyas légijárművek járatója vezessen be a a hajtómű üzemi állapot változásának figyelésére a forgószárnyas légijármű valamint a hajtómű gyártója által javasolt műszereket, rendszereket valamint üzemeltetési / karbantartási eljárásokat.

3.4.4 Ajánlás - A műszeres időjárási körülmények (IMC) között üzemeltetett 3. teljesítmény osztályú forgószárnyas légijárművek mechanikai jellegű meghibásodásai bekövetkezésének csökkentése érdekében a farok rotor meghajtó rendszerének rezgésekre bekövetkező állapotváltozását figyelő rendszert kell alkalmazni.

4. fejezet
Forgószárnyas légijármű műszerek, felszerelések és repülési okmányok

Megjegyzés: A forgószárnyas légijármű távközlési és navigációs felszerelésére vonatkozó előírásokat az 5. fejezet tartalmazza.

4.1 Általános rész

4.1.1 A légialkalmassági bizonyítvány kiadásához szükséges alapvető felszereléseken kívül a felhasznált forgószárnyas légijármű típustól valamint a repülés végrehajtásának körülményeitől függően a következő pontokban előírt műszereket, felszereléseket és repülési okmányokat helyezzék el vagy szállítsák a forgószárnyas légijárművön. Az előírt műszereket és berendezéseket, beleértve azok felszerelését is a lajstromozó állam hagyja jóvá vagy fogadja el.

4.1.2 A forgószárnyas légijármű szállítson egy tanúsított hiteles másolatot a 2.2.1 fejezetben meghatározott légijármű üzembentartási engedélyből, és egy másolatot a forgószárnyas légijármű típusra érvényes felhatalmazásokból, feltételekből és korlátozásokból, melyek a tanúsítással összefüggésben kerültek kiadásra. Amikor a tanúsítás és a hozzá kapcsolódó felhatalmazások, feltételek és korlátozások a járató állama részéről az angoltól eltérő nyelven kerül kiadásra, akkor mellékeljék az angol nyelvű forditásokat is.

Megjegyzés – a légijármű üzembentartási engedélyére és az ahhoz kapcsolódó azon, az üzemeltetési specifikációban esetleg megadott felhatalmazásokra, feltételekre és korlátozásokra vonatkozó útmutatót az Üzemeltetés Felügyeleti, Jogosítási és Folyamatos Ellenőrzési Eljárások Kézikönyve *(Doc 8335) tartalmazza.*

4.1.3 A járató az üzemeltetési kézikönyvben helyezze el a járató állama által jóváhagyott minimális felszerelési jegyzéket (MEL), amelynek segítségével a légijármű parancsnoka eldöntheti, hogy a repülés végrehajtása megkezdhető vagy egy közbenső állomástól folytatható abban az esetben, ha bármely műszer, felszerelés vagy rendszer üzemképtelenné válik. Ahol a járató állama nem azonos a lajstromozó állammal, a járató állama biztosítsa, hogy a minimális felszerelési jegyzék az adott forgószárnyas légijármű esetében ne befolyásolja a lajstromozó állam vonatkozó légialkalmassági előírásainak teljesítését.

Megjegyzés: A minimális felszerelési jegyzék (MEL) tájékoztatót az E. Melléklet tartalmazza.

4.1.4 A járató az üzemeltetési valamint a hajózószemélyzet részére, minden egyes üzemeltetett légijármű típushoz biztosítson légijármű üzemeltetési kézikönyvet, amely tartalmazza az adott légijármű típus üzemeltetéséhez szükséges általános, rendellenes és vészhelyzeti üzemeltetési eljárásokat. A kézikönyvben továbbá részletezzék a légijármű rendszereit és a felhasználandó ellenőrzési jegyzékeket is. A kézikönyvet az emberi tényezők alapelveinek figyelembevételével készítsék el. A kézikönyv legyen könnyen hozzáférhető a személyzet minden tagja számára, a repülés teljes időtartama alatt.

Megjegyzés: Az Emberi Tényezők alapelveinek alkalmazására vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv*-ében (Doc 9683) található.*

4.2 Az összes forgószárnyas légijármű összes repülése

4.2.1 A forgószárnyas légijárművet szereljék fel azokkal a műszerekkel, amelyek a hajózószemélyzet számára lehetővé teszik a forgószárnyas légijármű repülési pályájának irányítását és ellenőrzését, bármely előírt eljárás művelet végrehajtását valamint a forgószárnyas légijármű üzemeltetési korlátozásainak a várható üzemeltetési körülmények között történő megfigyelését.

4.2.2 A forgószárnyas légijárművet szereljék fel:

a) hozzáférhető és a forgószárnyas légijárművön szállításra engedélyezett utasok számának megfelelő egy vagy több elsősegély-nyújtó készlettel;

Megjegyzés: Az elsősegély-nyújtó készletek tartalmára vonatkozó útmutató a D. Mellékletben található.

b) olyan típusú hordozható tűzoltó készülék(ek)kel, amelynek tűzoltó anyaga igénybevétel után nem szennyezi veszélyesen a forgószárnyas légijármű belső terének levegőjét. Legalább egy ilyen tűzoltó készüléket helyezzenek el;

1) a forgószárnyas légijármű pilótafülkéjében; és

2) minden egyes olyan utaskabinban, amely a pilótakabintól el van választva és amelyet a hajózószemélyzet nem tud azonnal megközelíteni.

Megjegyzés: Előírásosnak minősül bármely olyan hordozható tűzoltó készülék, amely a forgószárnyas légijármű légialkalmassági bizonyítványában előírtak szerint került elhelyezésre.

c) 1) a járató állama által meghatározott életkor felett minden egyes személy részére egy megfelelő ülő vagy fekvőhellyel;
2) minden üléshez egy biztonsági övvel valamint minden fekvőhelyhez egy bekötő biztonsági hevederrel; és
3) minden egyes hajózószemélyzeti tag üléshez egy vállhevederekkel ellátott biztonsági övvel. A biztonsági vállhevederekhez tartozzon egy olyan szerkezet is, amely a hirtelen lassulás esetében automatikusan visszatartja az ülésben helyet foglaló személy testét.

Ajánlás – *Kétkormányos gépek esetében* a *forgószárnyas légijármű-vezetőüléseken felszerelt, vállhevederekkel ellátott biztonsági övhöz tartozzon egy olyan szerkezet is, amely megakadályozza, hogy a hirtelen cselekvőképtelenné vált légijármű-vezető gátolja a kormányszervek működését.*

1. Megjegyzés: A kialakítástól függően, a tehetetlenségi erő hatására reteszelő csévéző szerkezet is alkalmas lehet erre a célra.

2. Megjegyzés: A vállhevederekkel ellátott biztonsági öv egymástól függetlenül használható vállhevederekből és biztonsági övből áll.
d) az utasok felé a következő tájékoztatások és utasítások továbbítására szolgáló eszközökkel;

1) mikor kapcsolják be a biztonsági öveket;

2) amennyiben oxigén szállítása van előírva, mikor és hogyan kell használni az oxigén-ellátó

berendezést;

3) dohányzás korlátozása;

4) a mentőmellények vagy egyéb megfelelő egyéni úszóeszközök elhelyezkedése és használata, amennyiben ezek szállítása van előírva; és

5) a vészkijáratok elhelyezkedése és nyitása;

e) megfelelő értékű elektromos biztosítékok tartalékként a repülés közben hozzáférhető biztosítékok cseréjéhez.

4.2.3 A forgószárnyas légijármű szállítson;

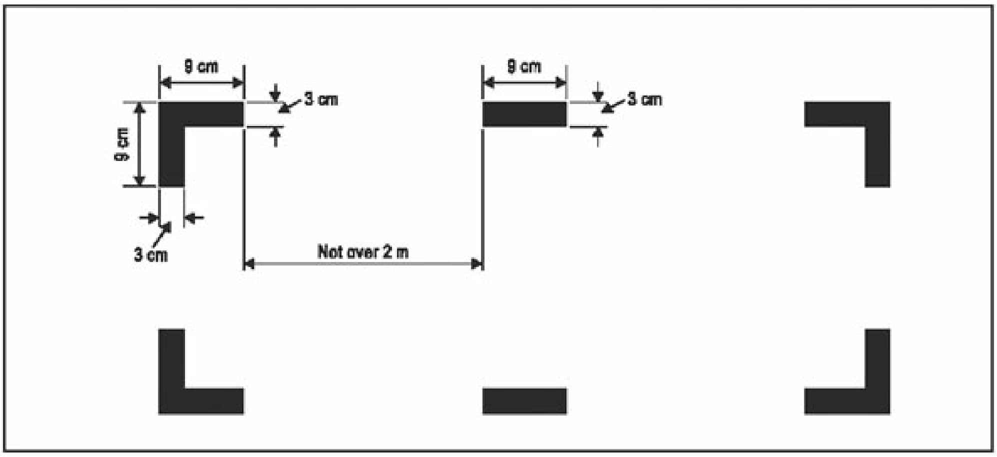
a) a 2.2.2 pont előírásának megfelelő üzemeltetési kézikönyvet vagy annak azon részeit, amelyek a repülés végrehajtására vonatkoznak;

b) az adott forgószárnyas légijármű repülésvégrehajtási kézikönyvét vagy más olyan dokumentumot, amely tartalmazza a 3. fejezet alkalmazásához szükséges teljesítmény adatokat valamint bármely más olyan tájékoztatást, amelyre a forgószárnyas légijármű üzemeltetéséhez – a légialkalmassági bizonyítványban meghatározott jellemzőkön belül – szükség van, kivéve, ha ezek az adatok az üzemeltetési kézikönyvben megtalálhatók; és

c) érvényes és alkalmas térképeket, amelyek fedik a tervezett repülés útvonalát, valamint bármely olyan egyéb útvonalat, amelyről joggal feltételezhető, hogy arra a repülés átirányítható.

4.2.4 Az átvágható felületek jelzése

4.2.4.1 Amennyiben a forgószárnyas légijárművön a mentőszemélyzet részére jelzik a kényszerhelyzet esetén a törzsön átvágható felületeket, azokat a következő ábrának megfelelő módon jelöljék meg. A jelölések színe vörös vagy sárga legyen és ha erre a háttértől történő megkülönböztethetőség érdekében szükség van, azokat fehér színű alapozásra készítsék el.



A légijármű törzsén levő átvágható felületek, azaz behatolási pontok

Jelölések közötti távolság nem több mint 2 méter

4.2.4.2 Amennyiben a sarkok jelölései egymástól több mint 2 méter távolságra vannak, fessenek fel 9 x 3 cm-es vonalakat olyan módon, hogy az egymás mellett levő vonalak közötti távolság 2 méternél nagyobb ne legyen.

Megjegyzés: Ez az előírás nem teszi szükségessé azt, hogy bármely forgószárnyas légijármű sárkányszerkezetén átvágható felületek legyenek.

4.3 Repülési adatrögzítők

1. *Megjegyzés: A repülési adatrögzítők két rendszerből illetve berendezésből, a repülési adatrögzítőből (FDR) valamint a pilótakabin hangrögzítőből (CVR) állnak.*

2. *Megjegyzés: Az összetett FDR/CVR berendezés csak a jelen Annex-ben külön ismertetett repülési adatrögzítő berendezés előírások teljesítésére használhatók.*

3. *Megjegyzés: A repülési adatrögzítőkkel kapcsolatos részletes útmutató a B. Mellékletben található.*

4.3.1 Repülési adatrögzítők – típusok

4.3.1.1 IV. típusú repülési adatrögzítő

4.3.1.1.1 A IV. típusú repülési adatrögzítő rögzítse azokat az adatokat, amelyek a forgószárnyas légijármű repülési pályájának, sebességének, helyzetének, hajtómű teljesítményének és működésének pontos meghatározásához szükségesek.

4.3.1.1.2 A IVA. típusú repülési adatrögzítő rögzítse azokat az adatokat, amelyek a forgószárnyas légijármű repülési pályájának, sebességének, helyzetének, hajtómű teljesítményének, működésének és repülésvezérlő szerkezetei helyzetének pontos meghatározásához szükségesek.

4.3.1.2 Az V. típusú repülési adatrögzítő rögzítse azokat az adatokat, amelyek a forgószárnyas légijármű repülési pályájának, sebességének, helyzetének és hajtómű teljesítményének pontos meghatározásához szükségesek.

4.3.1.3 A repülési adatrögzítő berendezésekben 1995 január 1. után ne használjanak fémszalagot.

4.3.1.4 ***Ajánlás*** *– 1998 november 5. után ne használják a frekvencia modulációt (FM) alkalmazó analóg adatrögzítőket.*

4.3.1.4.1 2003 január 1. után ne használják a fényképészeti filmmel működő repülési adatrögzítőket.

4.3.1.5 Az összes olyan digitális adathálózati összeköttetést alkalmazó valamint pilótakabin hangrögzítő berendezés (CVR) szállítására kötelezett forgószárnyas légijármű, amelynek egyedi légialkalmassági bizonyítványát először 2005 január 1. után adták ki, az összes adathálózati digitális közleményváltást a repülési adatrögzítő berendezésén rögzítse. A legkisebb felvételi időtartam azonos legyen a pilótakabin hangrögzítő berendezés felvételi időtartamával és a felvétel összevethető legyen a pilótakabinban rögzített hangfelvétellel.

4.3.1.5.1 2007 január 1-től az összes, digitális adathálózati összeköttetést alkalmazó valamint pilótakabin hangrögzítő berendezés szállítására kötelezett forgószárnyas légijármű rögzítse a légiforgalmi szolgálattal történt digitális közleményváltásait a pilótakabin hangrögzítő vagy repülési adatrögzítő berendezésén. A legkisebb felvételi időtartam azonos legyen a pilótakabin hangrögzítő berendezés felvételi időtartamával és a felvétel összevethető legyen a pilótakabinban rögzített hangfelvétellel.

4.3.1.5.2 Rögzítsék az adathálózati digitális közleményváltás tartalmának megismeréséhez szükség tájékoztatást és ahol ez lehetséges a közlemény megjelenítésének vagy a hajózószemélyzet által történt lehívásának időpontját is.

Megjegyzés: Az adathálózati összeköttetések közé tartoznak, azonban nem csak ezekre korlátozódnak a következők:

ADS- C – automatikus légtérfelderítési adat szolgáltatási megállapodás

CPDLC – légiforgalmi irányító és repülőgépvezető közötti adathálózati összeköttetések

D-FIS – adathálózati és repüléstájékoztató szolgálati összeköttetések

AOC – légiközlekedési üzemi irányítási közlemények.

4.3.1.6 **Ajánlás** – *Minden olyan 2700 kg. legnagyobb engedélyezett felszállósúlynál nagyobb tömegű forgószárnyas légijárművet, amely repülési adatrögzítő és pilótakabin hangrögzítő berendezések szállítására kötelezett, alternatív megoldásként egy összetett repülési adat és pilótakabin hangrögzítő berendezéssel is (FDR/CVR) felszerelhetnek.*

4.3.2 Repülési adatrögzítők – felvételi időtartam

A IV. és V. típusú repülési adatrögzítő képes legyen a működése legalább utolsó tíz órájában rögzített adatok tárolására.

4.3.3 Repülési adatrögzítők – Forgószárnyas légijárművek, amelyek egyedi légialkalmassági bizonyítványát először 1989 január 1. után adják ki

4.3.3.1 Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 7000 kg, szereljenek fel IV. típusú repülési adatrögzítő berendezéssel.

4.3.3.2 ***Ajánlás*** - *Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 2730 kg, egészen és beleértve 7000 kg-ig, szereljenek fel V. típusú repülési adatrögzítő berendezéssel.*

4.3.4 Repülési adatrögzítők – Forgószárnyas légijárművek, amelyek egyedi légialkalmassági bizonyítványát először 2005 január 1. után adták ki

Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 3175 kg, szereljenek fel IV.A típusú repülési adatrögzítő berendezéssel, melynek felvételi időtartama legalább 10 óra.

Megjegyzés: Elfogadható egy összetett (CVR/FDR) repülési adatrögzítő is.

4.3.5 Pilótakabin hangrögzítők – Forgószárnyas légijárművek, amelyek egyedi légialkalmassági bizonyítványát először 1987 január 1-én vagy ezt követően adták ki

4.3.5.1 Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 7000 kg, szereljenek fel pilótakabin hangrögzítő berendezéssel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt. A repülési adatrögzítővel nem rendelkező forgószárnyas légijárművön a pilótakabin hangrögzítő berendezés egyik felvételi sávján rögzítsék legalább a fő forgószárny sebességét.

4.3.5.2 Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) 3175 kg-tól 7000 kg-ig terjed, szereljenek fel pilótakabin hangrögzítő berendezéssel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt. A repülési adatrögzítővel nem rendelkező forgószárnyas légijárművön a pilótakabin hangrögzítő berendezés egyik felvételi sávján rögzítsék legalább a fő forgószárny sebességét.

4.3.6 Pilótakabin hangrögzítők – Forgószárnyas légijárművek, amelyek egyedi légialkalmassági bizonyítványát először 1987 január 1. előtt adták ki

Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 7000 kg, szereljenek fel pilótakabin hangrögzítő berendezéssel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt. A repülési adatrögzítővel nem rendelkező forgószárnyas légijárművön a pilótakabin hangrögzítő berendezés egyik felvételi sávján rögzítsék legalább a fő forgószárny sebességét.

Megjegyzés: A pilótakabin hangrögzítő berendezésre előírt műszaki követelmények megtalálhatók az EUROCAE Polgári Légiközlekedési Berendezések Európai Szervezete repülési adatrögzítő rendszerekre kidolgozott MOPS (minimális üzemi teljesítmény előírások) kiadványában vagy más egyenértékű dokumentumban.

4.3.7 Pilótakabin hangrögzítők – felvételi időtartam

4.3.7.1 A pilótakabin hangrögzítő berendezés képes legyen a működése legalább utolsó 30 percében rögzített információk tárolására.

4.3.7.2 **Ajánlás** *—Az a pilótakabin hangrögzítő berendezés, amelyet olyan forgószárnyas légijárműbe szereltek be, amelynek egyedi légialkalmassági bizonyítványát először 1990 január 1-én vagy ezt követően adták ki, képes legyen a működése legalább utolsó két órájában rögzített információk tárolására.*

4.3.7.3 Az a pilótakabin hangrögzítő berendezés, amelyet olyan forgószárnyas légijárműbe szerelnek be, amelynek egyedi légialkalmassági bizonyítványát először 2003 január 1. után adták ki, képes legyen a működése legalább utolsó két órájában rögzített információk tárolására.

4.3.8 Repülési adatrögzítők – szerkezet és beszerelés

A repülési adatrögzítőket úgy készítsék el és helyezzék el, illetve szereljék be a légijárműbe, hogy biztosítsák a rögzített adatok gyakorlatilag lehetséges legnagyobb védelmét annak érdekében, hogy a rögzített információk megőrizhetők, leolvashatók és feldolgozhatók legyenek. A repülési adatrögzítők tegyenek eleget a baleseti törési ellenálló-képesség és tűzvédelemi előírásoknak.

Megjegyzés: A baleseti törési ellenálló-képesség és tűzvédelem ipari előírásai megtalálhatók az Európai

Polgári Légiközlekedési Elektronikai Szervezet (EUROCAE) ED55 és ED56A jelű és hasonló kiadványokban.

4.3.9 Repülési adatrögzítők – üzemeltetés

4.3.9.1 A repülési adatrögzítőt a repülés alatt ne kapcsolják ki.

4.3.9.2 A repülési adatrögzítővel rögzített adatok megőrzése érdekében a berendezést egy baleset vagy repesemény utáni repülés befejezését követően kapcsolják ki és azt a 13. Annex előírásaiban meghatározottakkal összhangban a tájékoztatásokat tartalmazó adathordozó eltávolítása előtt ne kapcsolják ismét be.

1. Megjegyzés: A repülési adatrögzítővel rögzített adatok légijárműből történő eltávolításának szükségességét a vizsgálatot végző állam vizsgáló hatósága határozza meg az esemény súlyossága és körülményei alapján, beleértve az eseménynek a repülési üzemre gyakorolt hatását is.

2. Megjegyzés: A járatónak a repülési adatrögzítővel rögzített információk tárolására vonatkozó felelősségét a 9.6 pont tartalmazza.

4.3.10 Repülési adatrögzítők – folyamatos működőképesség

Végezzék el a repülési adat és pilótakabin hangrögzítő rendszerek felvételeinek üzemi ellenőrzését és értékelését annak érdekében, hogy a rögzítő berendezések folyamatos működőképességét biztosíthassák.

Megjegyzés: A repülési adat és pilótakabin hangrögzítő rendszerek ellenőrzésének eljárásait a B. Melléklet tartalmazza

.

4.4 A látvarepülési (VFR) és műszerrepülési (IFR) szabályok szerint, nappal és éjszaka végrehajtott repülésekhez szükséges műszerek és berendezések

Megjegyzés: A 4.4.1 – 4.4.3 pontok repülőgépvezetési műszerekre vonatkozó követelményei műszer kombinációkkal, vagy elektronikus képernyőkkel teljesíthetők.

4.4.1 Az összes látvarepülési szabályok (VFR) szerint, nappal üzemeltetett forgószárnyas légijárművet szereljék fel a következőkkel:

a) egy mágneses iránytűvel;

b) egy pontos időmérő berendezéssel, amely az időt órában, percben és másodpercben jelzi;

c) érzékeny nyomás-magasság mérőműszerrel;

d) repülési sebesség mérőműszerrel; és

e) olyan további műszerekkel vagy berendezésekkel, amelyeket az illetékes hatóság előírt.

4.4.2 Az összes látvarepülési szabályok (VFR) szerint, éjjel üzemeltetett forgószárnyas légijárművet szereljék fel a következőkkel:

a) a 4.4.1 pontban felsorolt berendezésekkel;

b) helyzetjelző műszerrel (műhorizonttal), minden egyes légijárművezető számára és egy kiegészítő helyzetjelző műszerrel;

c) csúszásjelzővel;

d) irányjelző műszerrel (géptengely irány-jelző pörgettyűs – giroszkópikus – műszer);

e) emelkedési és süllyedési sebesség mérőműszerrel;

f) olyan kiegészítő műszerekkel és berendezésekkel, melyeket a megfelelő hatóság ír elő;

és a következő világító eszközökkel:

g) a 2. Annex előírásainak megfelelő fényekkel, a helikopter repülőtér mozgási területein üzemelő légijárművek fényeire meghatározottak szerint;

Megjegyzés: A fények általános jellemzőit a 8. Annex határozza meg. A repülés közben levő valamint a helikopter repülőtér mozgási területein üzemelő légijárművek fényeire vonatkozó, 2. Annex előírásainak megfelelő fények jellemzőit a Légialkalmassági Kézikönyv *-ben (Doc 9760) részletezi.*

h) két leszálló fényszóróval;

d) a forgószárnyas légijármű biztonságos üzemeltetése szempontjából alapvető fontosságú, a hajózószemélyzet által használt valamennyi műszer és berendezés (meg)világításával;

e) világítással valamennyi utastérben; és

f) elektromos kézilámpával minden egyes személyzet tag szolgálati helyen.

4.4.2.1 **Ajánlás** – *Az egyik leszálló fényszóró legalább függőleges síkban elfordítható legyen.*

4.4.3 A műszerrepülési szabályok szerint (IFR) üzemeltetett összes forgószárnyas légijárművet vagy azokat, amelyek üzemeltetésük során egy vagy több műszer segítsége nélkül nem tarthatók a kívánt repülési helyzetben, szereljék fel:

a) egy mágneses iránytűvel;

b) egy pontos időmérő berendezéssel, amely az időt órában, percben és másodpercben jelzi;

c) kettő érzékeny, nyomás-magasság mérőműszerrel;

d) repülési sebesség mérőműszerrel, amely olyan berendezéssel van ellátva, amely megakadályozza a párakicsapódás vagy jegesedés következtében lehetséges helytelen működést;

e) csúszás jelzőműszerrel;

f) repülési helyzetjelző műszerrel (műhorizont) az igényelt mennyiségű légijárművezetők számának megfelelően, és egy kiegészítő helyzetjelző műszerrel;

g) irányjelző műszerrel (géptengely irány-jelző pörgettyűs – giroszkópikus – műszer):

h) a pörgettyűs műszerek kielégítő elektromos táplálásának jelzésére szolgáló eszközzel;

i) a pilótakabinban felszerelt, a külső levegő hőmérsékletét jelző műszerrel;

j) emelkedési és süllyedési sebesség mérőműszerrel;

k) stabilizációs rendszerrel kivéve, ha a légialkalmasságot elbíráló illetékes hatóság számára kielégítően bizonyították, hogy a forgószárnyas légijármű tervezési sajátosságainál fogva ilyen berendezés vagy rendszer nélkül is képes a megfelelő stabilizált repülési helyzet fenntartására;

l) olyan további műszerekkel vagy berendezésekkel, amelyeket az illetékes hatóság előírt; és

m) éjszakai repülések esetére 4.4.2 g) – k) és 4.4.2.1 alpontokban meghatározott fényekkel.

4.4.3.1 A műszerrepülési szabályok szerint (IFR) üzemeltetett összes forgószárnyas légijárművet szereljék fel egy vész áramforrással, amely független a fő elektromos energia ellátó rendszertől. A vész áramforrás legalább 30 perc időtartamon keresztül tegye lehetővé a légijármű parancsnok számára jól látható repülési helyzetjelző műszer (műhorizont) elektromos energiával való táplálását és megvilágítását. A vész energia ellátás lépjen automatikusan működésbe a fő elektromos energia ellátó rendszer teljes meghibásodását követően, és legyen egyértelmű kijelzés a műszerfalon, hogy a helyzetjelző műszer(ek) vész energia hálózatról működnek.

4.4.4 Ajánlás – *A műszerrepülési szabályok szerint (IFR) üzemeltetett azon forgószárnyas légijárművek, melyek engedélyezett maximális felszálló tömege több mint 3175 kg, vagy a maximális utasülés szám meghaladja a kilencet, legyen felszerelve a repülés irányába előre néző, tereppel való összeütközést megakadályozó földközelség jelző rendszerrel.*

4.5 Az összes, vízfelszín felett üzemeltetett forgószárnyas légijármű

4.5.1 Úszóeszközök

Minden olyan forgószárnyas légijárművet, amelyet vízfelszín felett kívánnak üzemeltetni, állandó vagy gyorsan kibocsátható (üzembe helyezhető) úszóeszközzel szereljenek fel, amely biztosítja a forgószárnyas légijármű biztonságos vízreszállását, amennyiben:

a) a járató állama szerint meghatározott módon a forgószárnyas légijármű engedélyezve lett parttól távoli repülésekre, vagy egyéb vízfelszín feletti műveletekre; vagy

b) az 1. vagy a 2. teljesítmény osztályú forgószárnyas légijármű kedvezőtlen körülmények között a szárazföldtől olyan távolságra repül vízfelszín felett, amely tíz percnél hosszabb időtartamú (normál) utazósebességgel végrehajtott repülésnek felel meg; vagy

Törölt: barátságtalan

Megjegyzés: Kedvezőtlen körülmények közötti repülés esetén a biztonságos vízreszállás érdekében a forgószárnyas légijármű kialakítása tegye lehetővé a vízre való leszállást, legyen tanúsítva a vízreszállást biztosító eszközöknek megfelelően.

Törölt: *Barátságtalan*

Törölt:

c) az 1. teljesítmény osztályú forgószárnyas légijármű megfelelő környezeti feltételek mellett a szárazföldtől olyan távolságra repül a vízfelszín felett, amelyet a felelős állam illetékes hatósága engedélyezett; vagy

Megjegyzés: Amikor várható, hogy a távolság meghaladja azt a mértéket, amelynél úszóeszköz alkalmazása szükséges, az állam vegye figyelembe a forgószárnyas légijármű tanúsítási előírásait.

d) a 3. teljesítmény osztályú forgószárnyas légijármű a szárazföldtől olyan távolságra repül vízfelszín felett, amely nagyobb, mint az autórotációs vagy biztonságos kényszerleszállási távolság.

4.5.2 Vészhelyzeti felszerelések

4.5.2.1 A 4.5.1 pont előírása alapján üzemeltetett 1. vagy 2. teljesítmény osztályú forgószárnyas légijárművet szereljék fel;

a) a fedélzeten tartózkodó minden személy részére ülőhelyéről vagy fekvőhelyéről azonnal hozzáférhető helyen tárolt mentőmellénnyel vagy egyéb megfelelő egyéni úszóeszközzel. Ezeket az eszközöket úgy helyezzék el, hogy a fedélzeten tartózkodó minden személy részére ülőhelyéről vagy fekvőhelyéről azonnal hozzáférhető legyen. A parttól távoli (vízfelszíni) üzemeltetésnél a mentőmellényt viseljék állandóan, hacsak a fedélzeten tartózkodó személy nem visel egyesített túlélő öltözéket, amely magába foglalja a mentőmellényt is;

b) elegendő számú mentő-tutajjal a fedélzeten tartózkodó összes személy elhelyezésére, amelyeket úgy tárolnak, hogy azok a vészhelyzet esetén gyorsan üzembe helyezhetők és a repülési útvonal sajátosságainak megfelelő életmentő eszközökkel vannak ellátva, beleértve a létfenntartási eszközöket is; és

Ajánlás – *Amikor két mentő tutajjal szerelik fel a forgószárnyas légijárművet, akkor mindegyik legyen képes egyenként is befogadni - túlterhelt állapotban - a fedélzeten tartózkodó összes személyt*.

Megjegyzés: a túlterhelt állapot a maximális befogadóképesség 1,5-szeres tervezési biztonsági szorzóval számított értéke.

c) a 2. Annex-ben ismertetett pirotechnikai vészjelzések előállítására szolgáló eszközökkel.

4.5.2.2 A szárazföldtől az autórotációs távolságon kívül, azonban a felelős állam illetékes hatósága által megállapított távolságon belül üzemelő 3. teljesítmény osztályú forgószárnyas légijárművet szereljék fel a fedélzeten tartózkodó minden személy részére ülőhelyéről vagy fekvőhelyéről azonnal hozzáférhető helyen tárolt mentőmellénnyel vagy egyéb megfelelő egyéni úszóeszközzel.

Megjegyzés: A 4.5.2.2 pontban ismertetett szárazföldtől számított távolság meghatározása alkalmával vegyék figyelembe a környezeti körülményeket, valamint a kutató és mentő szolgálat (SAR) igénybevételének lehetőségeit.

4.5.2.2.1 A szárazföldtől az autórotációs távolságon kívüli, nyílt vízfelület feletti repülések esetén a mentőmellényt viseljék állandóan, hacsak a fedélzeten tartózkodó személy nem visel egyesített túlélő öltözéket, amely magába foglalja a mentőmellényt is.

4.5.2.3 A 4.5.2.2 pontban meghatározott távolságon túl üzemelő 3. teljesítmény osztályú forgószárnyas légijárművet szereljék fel a 4.5.2.1 pont előírása alapján szükséges vészhelyzeti felszereléssel.

4.5.2.4 A 2. és 3. teljesítmény osztályú forgószárnyas légijármű esetében, amennyiben az olyan helikopter repülőtéren száll fel vagy le, ahol a járató államának véleménye szerint a felszállási vagy leszállási útvonal olyan hosszan vezet vízfelszín felett, hogy az esetleges rendellenes üzemelés vagy repesemény alkalmával vízreszállás valószínű, a forgószárnyas légijárművet szereljék fel legalább a 4.5.2.1 a) alpont előírása alapján szükséges felszereléssel.

4.5.2.5 Minden egyes mentőmellényt és egyéb megfelelő egyéni úszóeszközt, amelyet a jelen 4.5 szakasz előírásai alapján szállítanak, a felhasználó személy feltalálásának megkönnyítése érdekében lássanak el elektromos világítással.

4.5.2.6 **Ajánlás** – *Bármely olyan forgószárnyas légijárművön, amelynek egyedi légialkalmassági bizonyítványát először 1991 január 1-én vagy ezt követően adták ki, a 4.5.2 pont előírása alapján szállított mentőtutajok legalább 50 %-a távirányítással legyen kibocsátható.*

4.5.2.7 **Ajánlás** – *A távirányítással nem kibocsátható és 40 kg-nál nehezebb mentőtutajok a kibocsátás megkönnyítése érdekében valamilyen mechanikus kibocsátó szerkezettel legyenek felszerelve.*

4.5.2.8 **Ajánlás** – *Bármely olyan forgószárnyas légijármű esetében, amelynek egyedi légialkalmassági bizonyítványát először 1991 január 1. előtt adták ki, 1992 december 31. előtt teljesítendők a 4.5.2.6 és 4.5.2.7 pontok előírásai.*

4.5.3 A kijelölt vízterület felett üzemeltetett összes forgószárnyas légijármű

5.5.3.1 Amennyiben a forgószárnyas légijárművet olyan vízterületek felett üzemeltetik, amelyeket az érintett államok olyan területként jelölnek meg, ahol a kutatás és mentés különös nehézségekbe ütközik, a forgószárnyas légijárművet szereljék fel olyan életmentő felszereléssel, beleértve a létfenntartási eszközöket is, amelyek nagy valószínűséggel megfelelnek az átrepülendő terület sajátosságainak.

4.5.3.2 **Ajánlás** – *A parttól távoli (vízfelszíni) repüléseknél a fedélzeten tartózkodó összes személy viseljen túlélő öltözéket, amennyiben a tengervíz hőmérséklete alacsonyabb 10 Celsius foknál, vagy a kutatás időtartama meghaladja a számított túlélési időt. Amikor a nap látóhatár feletti elhelyezkedése vagy a napsugárzás ereje veszélyesen magas hőmérsékletet hozna létre a pilótafülkében, hajózó személyzetek részére lehetővé kell tenni az előző követelményekkel szembeni könnyítést.*

Megjegyzés: A kutatási idő megállapításánál vegyék figyelembe a tenger állapotát és a környező világítási feltételeket.

4.6 A kijelölt szárazföld felett üzemeltetett összes forgószárnyas légijármű

Amennyiben a forgószárnyas légijárművet olyan szárazföldi területek felett üzemeltetik, amelyeket az érintett államok olyan területként jelölnek meg, ahol a kutatás és mentés különös nehézségekbe ütközik, a forgószárnyas légijárművet szereljék fel olyan jeladó berendezéssel és életmentő felszereléssel, beleértve a létfenntartási eszközöket is, amelyek nagy valószínűséggel megfelelnek az átrepülendő terület sajátosságainak.

4.7 Vészhelyzeti helyjeladó berendezés (ELT)

2008. június 30-ig alkalmazható

4.7.1 Minden olyan, a 4.5.1 a) alpont alapján vízfelszín felett üzemeltetett 1. és 2. teljesítmény osztályú forgószárnyas légijárművet amelynek egyedi légialkalmassági bizonyítványát először 2002 január 1. után adták ki, és minden olyan a 4.5.1 b) alpont alapján üzemeltetett 3. teljesítmény osztályú forgószárnyas légijárművet amelynek egyedi légialkalmassági bizonyítványát először 2002 január 1. után adták ki, és mentőtutajonként legalább egy darab automatikus ELT berendezéssel és egy darab (ELT/S) berendezéssel szereljenek fel

4.7.2 A 4.5.1 a) alpont alapján a vízfelszín felett üzemeltetett összes 1. és 2. teljesítmény osztályú és a 4.5.1 b) alpont alapján üzemeltetett 3. teljesítmény osztályú forgószárnyas légijárművet 2005. január 1-től mentőtutajonként legalább egy darab automatikus ELT berendezéssel és legalább egy darab (ELT/S) berendezéssel szereljenek fel.

4.7.3 A 4.6 szakasz alapján kijelölt szárazföldi területek felett repülést végrehajtó minden forgószárnyas légijárművet, amelynek egyedi légialkalmassági bizonyítványát először 2002 január 1. után adták ki, legalább egy darab automatikus vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

4.7.4 2005 január 1-től a 4.6 szakasz alapján kijelölt szárazföldi területek felett repülést végrehajtó minden forgószárnyas légijárművet legalább egy darab automatikus vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

4.7.5 **Ajánlás** – *Az összes forgószárnyas légijárművet szereljék fel automatikusan működésbe lépő vészhelyzeti helyjeladó (ELT) berendezéssel.*

4.7.6 A fenti 4.7.1 – 4.7.5 pontok alapján felszerelt vészhelyzeti helyjeladó (ELT) berendezés a 10. Annex III. kötet vonatkozó előírásai szerint üzemeljen.

2008. július 01-től alkalmazható

4.7.7 2008 július 01-től minden 1. és 2. teljesítmény osztályú forgószárnyas légijárművet szereljenek fel legalább egy darab automatikus ELT berendezéssel, és a 4.5.1 a) alpontban leírtak szerinti vízfelszín feletti üzemeltetés esetére pedig mentőtutajonként vagy mentőmellényenként szereljenek fel legalább egy darab automatikus ELT berendezéssel és legalább egy darab (ELT/S) berendezéssel.

4.7.8 2008 július 01-től minden 3. teljesítmény osztályú forgószárnyas légijárművet szereljenek fel legalább egy darab automatikus ELT berendezéssel, és a 4.5.1 b) alpontban leírtak szerinti vízfelszín feletti üzemeltetés esetére pedig mentőtutajonként vagy mentőmellényenként szereljenek fel legalább egy darab automatikus ELT berendezéssel és legalább egy darab (ELT/S) berendezéssel.

4.7.9 A fenti 4.7.7 és 4.7.8 pontok alapján felszerelt vészhelyzeti helyjeladó (ELT) berendezés a 10. Annex III. kötet vonatkozó előírásai szerint üzemeljen.

Megjegyzés: A vészhelyzeti helyjeladó (ELT) számának, típusának és a légijárművön való elhelyezésének valamint az uszóképességet támogató kiegészítő rendszerének megfelelő kiválasztása adja a legnagyobb esélyt a vészhelyzeti helyjeladó (ELT) működésbe hozására, amennyiben a kutatás és mentés szempontjából különösen nehéz területeket is beleértve, a víz vagy a szárazföld felett repülő légijárművet baleset érné. Az adóegység elhelyezése a legfontosabb tényező az optimális törés és tűz elleni védelem *biztosításában. Az automatikus működésű beépített vészhelyzeti helyjeladó (ELT) vezérlő és kapcsoló eszközeinek (aktíváló kijelzők) elhelyezésénél és a kapcsolódó üzemeltetési eljárások kialakításánál tekintetbe kell venni a figyelmetlenségből adódó működésbe hozatal gyors felismerésének, valamint a manuális bekapcsolás esetén a személyzet általi könnyű kezelhetőség igényeit.*

4.8 A nagy repülési magasságon üzemeltetett összes forgószárnyas légijármű

Megjegyzés: A szövegben alkalmazott abszolút légnyomás értékeknek megfelelő, a nemzetközi műlégkör alapján meghatározott megközelítő magasságok a következők:

Abszolút légnyomás	*magasság – méter*	*magasság – láb*
700 hPa	3000	10 000
620 hPa	4000	13 000
376 hPa	7600	25 000

4.8.1 Azt a forgószárnyas légijárművet, amelyet olyan repülési magasságokon kívánnak üzemeltetni, amelyeken a személyek részére rendszeresített kabin(ok)ban a légnyomás 700 hPa értéknél alacsonyabb lesz, szereljenek fel oxigén tároló és adagoló berendezéssel, amely lehetővé teszi a 2.3.8.1 pontban előírt oxigén készlet tárolását és szükség szerinti adagolását.

4.8.2 Azt a forgószárnyas légijárművet, amelyet olyan repülési magasságokon kívánnak üzemeltetni, amelyeken az atmoszférikus légnyomás 700 hPa értéknél alacsonyabb lesz, azonban a forgószárnyas légijármű személyek részére rendszeresített kabinjá(i)ban megfelelő módszerekkel 700 hPa értéknél nagyobb nyomást biztosítanak, szereljenek fel oxigén tároló és adagoló berendezéssel, amely lehetővé teszi a 2.3.8.2 pontban előírt oxigén készlet tárolását és szükség szerinti adagolását.

4.8.3 Azt a forgószárnyas légijárművet, amelyet olyan repülési magasságokon kívánnak üzemeltetni, amelyeken az atmoszférikus légnyomás 376 hPa értéknél magasabb, azonban a forgószárnyas légijármű négy percen belül nem tud olyan biztonságosan olyan repülési magasságra süllyedni, amelyen az atmoszférikus légnyomás értéke 620 hPa és amelynek egyedi légialkalmassági bizonyítványát 1998 november 9-én vagy ezt követően adták ki, a 2.3.8.2 pont előírásának megfelelő automatikusan működésbe lépő oxigén berendezéssel szereljenek fel. Az oxigén adagoló eszközök teljes száma legalább 10 %-al több legyen, mint az utasok és utaskabin személyzet üléseinek száma.

4.8.4 **Ajánlás** – *Azt a forgószárnyas légijárművet, amelyet olyan repülési magasságokon kívánnak üzemeltetni, amelyeken az atmoszférikus légnyomás 376 hPa értéknél magasabb, azonban a forgószárnyas légijármű négy percen belül nem tud olyan biztonságosan olyan repülési magasságra süllyedni, amelyen az atmoszférikus légnyomás értéke 620 hPa és amelynek egyedi légialkalmassági bizonyítványát 1998 november 9. előtt adták ki a 2.3.8.2 pont előírásának megfelelő automatikusan működésbe lépő oxigén berendezéssel, szereljenek fel. Az oxigén adagoló eszközök teljes száma legalább 10 %-al több legyen, mint az utasok és utaskabin személyzet üléseinek száma.*

4.9 Jegesedési körülmények között üzemeltetett összes forgószárnyas légijármű

Az összes olyan forgószárnyas légijárművet, amely ténylegesen jelentett vagy várható jegesedési időjárási körülmények között üzemeltetnek, alkalmas jegesedést gátló és/vagy jégtelenítő rendszerrel szereljenek fel.

4.10 Forgószárnyas légijárművek amikor utasokat szállítanak – időjárás-felderítő radarberendezés

Ajánlás *– A forgószárnyas légijárműveket, amikor azok utasokat szállítanak és ezeket olyan területeken üzemeltetik, amelyeken éjszaka vagy műszeres időjárási körülmények között az időjárás-felderítő radarberendezéssel várhatóan idejében felderíthető zivatarok és más gyakorlatilag veszélyt jelentő időjárási jelenségek fordulhatnak elő, üzemképes időjárás-felderítő radarberendezéssel vagy más szignifikáns időjárási jelenség jelzőkészülékkel szereljék fel.*

4.11 Minden olyan forgószárnyas légijármű, amely megfelel a 16. Annex I. kötet zajbizonyítvány előírásoknak

Minden forgószárnyas légijármű, amelynek meg kell felelnie a 16. Annex, I. kötet zajbizonyítvány előírásoknak, hordozza a forgószárnyas légijármű zajbizonyítványát. Amikor ez az okmány vagy a lajstromozó állam részéről jóváhagyott más dokumentumban található zajbizonyítványt tartalmazó megfelelő nyilatkozat nem angol nyelvű, mellékeljék annak hiteles angol nyelvű fordítását is.

1. Megjegyzés: A kötelezettségvállalást a fedélzeten tartott bármilyen dokumentum tartalmazhatja, amelyet a lajstromozó állam a 16. Annex, I. kötet rendelkezéseivel összhangban jóváhagyott.

2. Megjegyzés: A 16. Annex, I. kötetben közölt, és a forgószárnyas légijárműveknél alkalmazható, különböző zajbizonyítvány előírásokat a típusalkalmassági megkérésének dátumával, vagy az igazolást kiadó hatóság által meghatározott egyenértékű eljárás szerint benyújtott kérelem elfogadási dátumával lehet meghatározni. Néhány forgószárnyas légijárműnél nem követelmény, hogy megfeleljen bármelyik zajbizonyítvány előírásnak. Részletesebben lásd a 16. Annex, I. kötet, II. rész, 8 és 11 fejezeteit.

4.12 Utasszállító forgószárnyas légijárművek – utaskabin személyzet ülései

4.12.1 Minden forgószárnyas légijárművet szereljenek fel a forgószárnyas légijármű hossztengelyéhez viszonyított 15° értéken belül előre vagy hátrafelé néző, vállhevederekkel ellátott biztonsági övvel rendelkező üléssel minden egyes utaskabin személyzeti tag részére, akikre a 10.1 szakasz előírása alapján a forgószárnyas légijármű vészkiürítésénél szükség van.

1. Megjegyzés: A 4.2.2 c) 1) alpont előírásai alapján minden egyes további utaskabin személyzeti tag számára biztosítsanak biztonsági övvel ellátott ülőhelyet.

2. Megjegyzés: A vállhevederekkel ellátott biztonsági öv egymástól függetlenül használható vállhevederekből és biztonsági övből áll.

4.12.2 Az utaskabin személyzet üléseit úgy helyezzék el, hogy azok a padlószinten és egyéb helyeken található vészkijáratok közelében legyenek, ahogy azt a lajstromozó állam a vészhelyzeti kiürítésre vonatkozó előírásaiban meghatározta.

4.13 Forgószárnyas légijárművek, amelyeket nyomásmagasság-adó másodlagos radar válaszjeladóval kell felszerelni

Minden forgószárnyas légijárművet szereljenek fel a 10. Annex IV. kötetének előírásai szerint üzemelő nyomásmagasság-adó másodlagos radar válaszjeladóval.

Megjegyzés: Ennek az előírásnak célja a légiforgalmi szolgálatok valamint az összeütközést elkerülő fedélzeti rendszerek hatásos működésének fejlesztése. További célkitűzés annak elősegítése, hogy az összeütközést elkerülő fedélzeti rendszerekkel felszerelt légijárművek által használt légtereket ne kelljen megosztani azon légijárművekkel melyen nincsenek felszerelve nyomásmagasság-adó másodlagos radar válaszjeladóval.

4.14 Mikrofonok

A pilótakabinban szolgálati feladatot ellátó összes hajózószemélyzeti tag közleményváltásaihoz az átváltási szint/magasság alatt kézi vagy fejhallgatóhoz erősített mikrofont használjon.

4.15 Rezgésekre bekövetkező állapotváltozást figyelő rendszert

Ajánlás – *Azokat a forgószárnyas légijárműveket, amelyek engedélyezett felszállló tömege meghaladja a 3175 kg-ot, vagy a maximális utasbefogadó képessége több mint kilenc fő, szereljék fel rezgésekre bekövetkező állapotváltozást figyelő rendszerrel.*

5. fejezet
Forgószárnyas légijármű távközlési és navigációs berendezések

5.1 Távközlési berendezés

5.1.1 A forgószárnyas légijárművet olyan rádió távközlésre alkalmas berendezéssel szereljék fel, amely képes:

a) a helikopter repülőtéri irányítás céljainak megfelelő kétoldalú összeköttetés fenntartására;

b) a repülés végrehajtása során bármikor az időjárási tájékoztatások vételére; és

c) a repülés végrehajtása során bármikor kétoldalú rádióösszeköttetés fenntartására legalább egy légiforgalmi állomással valamint más olyan légiforgalmi állomásokkal és olyan hullámhosszokon, amelyeket az illetékes hatóság előírt.

Megjegyzés: A 5.1.1 pont előírásai teljesítettnek tekinthetők, ha a forgószárnyas légijármű az útvonalon szokásos hullámterjedési viszonyok között képes az itt meghatározott távközlési összeköttetések fenntartására.

5.1.2 A 5.1.1 pont alapján előírt rádió berendezés alkalmas legyen rádió összeköttetés fenntartására a 121.5 Mhz-es légiközlekedési vészfrekvencián.

5.1.3 A légtér meghatározott szakaszaiban vagy olyan útvonalakon történő repülések végrehajtásakor, ahol RCP típus lett előírva, az 5.1.1 pontban meghatározott követelményeken túl a forgószárnyas légijármű:

a) legyen felszerelve olyan távközlési berendezésekkel, amelyek lehetővé teszik az előírt RCP típus(ok) szerinti üzemeltetést; és

b) a járató állama részéről rendelkezzen jogosítással az ilyen légtérben történő üzemeléshez.

Megjegyzés: az előírt távközlési teljesítményre (RCP), az ezzel összefüggő eljárásokra valamint a jogosítási folyamatra vonatkozó tájékoztatásokat az előkészítés alatt lévő Előírt Távközlési Teljesítmény (RCP) *Kézikönyv (Doc 9869) tartalmazza. Ez a kiadvány felsorolja továbbá azokat a dokumentumokat is amelyeket az államok és a nemzetközi szervezetek a távközlési rendszerekre és az előírt távközlési teljesítményre (RCP) dolgoztak ki.*

5.2 Navigációs berendezés

5.2.1 A forgószárnyas légijárművet szereljék fel olyan navigációs berendezéssel, amelynek segítségével az képes:

a) az üzemeltetői repülési tervében meghatározott útvonal követésére; és

b) a légiforgalmi szolgálatok előírásainak megfelelő repülés végrehajtására;

kivéve, – amennyiben ezt az illetékes hatóság nem tiltja meg – amikor a látvarepülési szabályok szerint végrehajtott repülés során a navigációt a földi tájékozódási pontok látás utáni azonosításával hajtják vége.

5.2.2 A légtér meghatározott szakaszaiban vagy olyan útvonalakon történő repülés esetében, amelyekre vonatkozóan RNP típust írtak elő, a forgószárnyas légijármű az 5.2.1 pontban ismertetett előírások mellett:

a) legyen felszerelve olyan navigációs berendezésekkel, amelyek lehetővé teszik az előírt RNP típus(ok) szerinti üzemeltetést; és

b) a járató állama részéről rendelkezzen jogosítással az ilyen légtérben történő üzemeléshez.

Megjegyzés: Az előírt navigációs pontosságra (RNP), az ezzel összefüggő eljárásokra valamint a jogosítási folyamatra vonatkozó tájékoztatásokat az RNP Kézikönyv *(Doc 9613) tartalmazza. A kiadvány átfogóan felsorolja azokat a dokumentumokat és egyéb anyagokat, amelyeket az államok és a nemzetközi szervezetek a navigációs rendszerekre valamint az előírt navigációs teljesítményre vonatkozóan készítettek el.*

5.2.3 A forgószárnyas légijárművet olyan navigációs berendezéssel szereljék fel, amely biztosítja, hogy a repülés végrehajtásának bármely szakaszában bekövetkező, az egyik rendszert érintő meghibásodás esetében a forgószárnyas légijárművet a másik rendszerrel az 5.2.1 pont valamint ahol ez alkalmazható, az 5.2.2 pont előírásainak megfelelően tovább lehessen irányítani (navigálni).

5.2.4 A műszeres időjárási körülmények között végrehajtott leszállással tervezett repülések esetében a forgószárnyas légijárművet szereljék fel olyan rádió berendezéssel, amely alkalmas az irányvezetést biztosító rádiójelek vételére addig a pontig, ahonnan a leszállás látással végrehajtható. Ez a rádió berendezés képes legyen az irányvezetés biztosítására minden olyan tervezett leszállási, valamint bármely kijelölt kitérő helikopter repülőtéren, ahol műszeres időjárási körülmények között történő leszállás végrehajtását tervezik.

5.3 Felszerelés

A berendezéseket úgy szereljék fel, hogy bármelyik egyedi egység meghibásodása, amely akár rádió távközlés összeköttetési, akár navigációs illetve mindkét célra szükséges – ne okozza a távközlési összeköttetés vagy navigációs célra szükséges másik egység meghibásodását.

6. fejezet
Forgószárnyas légijármű karbantartás

1. Megjegyzés: A jelen fejezetben történő alkalmazás során a forgószárnyas légijármű kifejezésbe tartoznak a hajtóművek, meghajtás áttételek, forgószárnyak, légcsavarok, alkatrészek, műszerek, szerkezeti egységek és felszerelések, beleértve a vészhelyzeti felszereléseket is.

2. Megjegyzés: A jelen fejezetben megadott előírások a lajstromozó állam előírásait jelentik. Amennyiben a járató állama nem azonos a lajstromozó állammal, szükséges lehet a járató állama bármely további előírásainak figyelembevétele is.

3. Megjegyzés: A folyamatos légialkalmasság követelményeire vonatkozó útmutató a Légialkalmassági Kézikönyv-*ben (Doc 9760) található.*

6.1 A járató karbantartási felelőssége

6.1.1 A járató biztosítsa, hogy a lajstromozó állam részéről elfogadható eljárásokkal összhangban:

a) minden üzemeltetett forgószárnyas légijárműve repülésre alkalmas állapotban legyen;

b) a tervezett repüléshez szükséges üzemeltetési és vészhelyzeti berendezések működőképesek legyenek;

c) minden egyes általa üzemeltetett forgószárnyas légijármű Légialkalmassági Bizonyítványa érvényes legyen.

6.1.2 A járató csak abban az esetben üzemeltesse a forgószárnyas légijárművet, ha annak karbantartását és a karbantartásról szóló nyilatkozat kiadását a lajstromozó állam részéről elfogadható, a 6. Annex I. rész 8.7 szakasza, vagy azzal egyenértékű rendszer alapján jóváhagyott szervezet hajtja végre.

6.1.3 Amikor a lajstromozó állam elfogadja a fenti megfelelő (műszaki) rendszert, a karbantartás végrehajtásáról szóló nyilatkozatot aláíró személy az 1. Annex előírásainak megfelelő szakszolgálati jogosítással rendelkezzen.

6.1.4 A járató alkalmazzon egy személyt vagy munkacsoportot annak biztosítására, hogy az összes karbantartási feladatot a karbantartás irányítási kézikönyvnek megfelelően végzik el.

6.1.5 A járató biztosítsa, hogy forgószárnyas légijárműveinek karbantartását a lajstromozó állam által jóváhagyott karbantartási programnak megfelelően végzik el.

6.2 A járató karbantartás irányítási kézikönyve

6.2.1 A járató a karbantartást végző szervezetek és személyek tájékoztatására és használatára a 9.2 szakasz előírásaival összhangban, a lajstromozó állam által elfogadható karbantartás irányítási kézikönyvet biztosítson. A kézikönyv tartalmi kialakítása vegye tekintetbe az emberi tényezők alapelveit.

Megjegyzés: Az Emberi Tényezők alapelveinek alkalmazására vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv-*ében (Doc 9683) található.*

6.2.2 A járató biztosítsa, hogy a karbantartás irányítási kézikönyvet szükség szerint módosítsák és egészítsék ki annak érdekében, hogy az abban található tájékoztatások mindig naprakészek legyenek.

6.2.3 A járató karbantartás irányítási kézikönyve összes módosításának megfelelő példányait haladéktalanul juttassák el minden olyan szervezetnek vagy személynek, amelynek a kézikönyv eredeti példányát átadták.

6.2.4 A járató adja át a járatói karbantartás irányítási kézikönyv egy-egy példányát a lajstromozó és a járató államainak az összes módosítással és/vagy kiegészítéssel továbbá az összes olyan anyaggal együtt, amelyeket ezek kötelezően előírnak.

6.3 Karbantartási program

6.3.1 A járató a karbantartást végző szervezetek és személyek tájékoztatására és használatára a 9.3 szakaszban meghatározott tájékoztatásokat tartalmazó, a lajstromozó állam részéről jóváhagyott karbantartási programot adjon ki. A járató karbantartási programjának kidolgozása és felhasználása alkalmával vegyék figyelembe az emberi tényezők alapelveit.

Megjegyzés: Az Emberi Tényezők alapelveinek alkalmazására vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv-*ében (Doc 9683) található.*

6.3.2 A karbantartási program összes módosításának megfelelő példányait haladéktalanul juttassák el minden olyan szervezetnek vagy személynek, amelynek a karbantartási programot átadták.

6.4 Karbantartások nyilvántartása

6.4.1 A járató biztosítsa a következő karbantartási adatok megőrzését a 6.4.2 pontban jelzett időtartamig:

a) a forgószárnyas légijármű és az összes korlátozott ideig üzemeltethető alkatrészének teljes üzemideje (szükség szerint órában, naptári időszakban és repülési ciklusokban meghatározva);

b) a forgószárnyas légijármű állapota az összes kötelező folyamatos légialkalmassági előírás és tájékoztatás teljesítése vonatkozásában;

c) a forgószárnyas légijármű és főbb szerkezeti elemeinek, alkatrészeinek módosítása és javítása valamint ennek részletezése;

d) a forgószárnyas légijármű vagy meghatározott kötelező karbantartási időszakkal vagy ciklussal rendelkező részeinek teljes üzemideje az utolsó (nagy)javítás óta (szükség szerint órában, naptári időszakban és/vagy repülési ciklusokban meghatározva);

e) a forgószárnyas légijármű karbantartási programhoz viszonyított jelenlegi felülvizsgálati – ellenőrzési – helyzete a feladatok végrehajtása alapján; és

f) részletes karbantartási jegyzőkönyvek, amelyekből megállapítható, hogy teljesítették a karbantartási kézikönyvben található, a karbantartási nyilatkozathoz szükséges összes előírást.

6.4.2 A 6.4.1 *a)–e)* alpontokban ismertetett nyilvántartásokat azon egység üzemi élettartamának lejáratát és üzemeltetésből történő végleges kivonását követő legalább 90 napig őrizzék meg, amely egységre a nyilvántartás vonatkozik. A 6.4.1 *f)* alpontban ismertetett jegyzőkönyvet a karbantartási nyilatkozat aláírását követő egy évig őrizzék meg.

6.4.3 Amennyiben a forgószárnyas légijármű járatója ideiglenesen megváltozik, a nyilvántartást bocsássák az új járató rendelkezésére. Ha a járató véglegesen megváltozik, a nyilvántartást adják át az új járatónak.

6.5 Folyamatos légialkalmassági tájékoztatás

6.5.1 A 3175 kg. legnagyobb engedélyezett felszállósúlynál (tömeg) nehezebb forgószárnyas légijármű járatója a folyamatos légialkalmasság szempontjából kövesse figyelemmel és értékelje a forgószárnyas légijármű üzemeltetését és karbantartását, biztosítsa a lajtromozó állam részéről előírt tájékoztatásokat és azokat a 8. Annex II. rész 4.2.3 f) valamint 4.2.4 pontok előírásaiban meghatározott rendszerben jelentse.

6.5.2 A 3175 kg. legnagyobb engedélyezett felszállósúlynál (tömeg) nehezebb forgószárnyas légijármű járatója a forgószárnyas légijármű típus tervezéséért felelős szervezettől szerezze be és értékelje ki a rendelkezésre álló folyamatos légialkalmassági tájékoztatásokat és ajánlásokat, továbbá ezek alapján a lajstromozó állam által elfogadható eljárásokkal összhangban szükség szerint vezessen be megfelelő intézkedéseket.

Megjegyzés: A forgószárnyas légijármű típus tervezéséért felelős szervezet kifejezés értelmezésére vonatkozó útmutatót a Légialkalmassági Kézikönyv *(Doc 9760) tartalmazza.*

6.6 Módosítások és javítások

Az összes módosítást és javítást a lajstromozó állam által elfogadható légialkalmassági előírásoknak megfelelően végezzék el. Dolgozzanak ki eljárásokat annak biztosítására, hogy elegendő mennyiségű adatot gyűjtsenek össze és őrizzenek meg annak bizonyítására, hogy a légialkalmasságra vonatkozó követelményeknek eleget tettek.

6.7 Karbantartási nyilatkozat

6.7.1 A karbantartási munka kielégítő, a karbantartó szervezet működési kézikönyvében ismertetett eljárásoknak és a jóváhagyott feltételeknek megfelelően történő sikeres elvégzésének igazolására készítsenek el és írjanak alá karbantartási nyilatkozatot.

6.7.2 A karbantartási nyilatkozat tartalmazzon igazolást az alábbiakról:

a) az elvégzett karbantartási munka alapvető részletei, beleértve a felhasznált engedélyezési illetve jóváhagyási feltételek részletezését;

b) a karbantartás befejezésének időpontja;

c) az engedélyezett karbantartó szervezet azonosítója – amennyiben ez alkalmazható; és

d) a karbantartási nyilatkozatot aláíró személy vagy személyek neve.

6.8 Nyilvántartások

6.8.1 A járató biztosítsa a következő nyilvántartások vezetését:

a) a forgószárnyas légijármű teljes egésze vonatkozásában – a teljes üzemidő;

b) a forgószárnyas légijármű összes fő alkatrésze vonatkozásában:

1) teljes üzemidő;

2) az utolsó nagyjavítás időpontja;

3) az utolsó felülvizsgálat időpontja;

c) az összes korlátozott ideig üzemeltethető műszer és berendezés vonatkozásában;

1) az üzemképesség meghatározásához vagy az üzemi élettartam kiszámításához szükséges üzemidő nyilvántartás;

2) az utolsó felülvizsgálat időpontja.

6.8.2 Ezeket a nyilvántartásokat azon egység üzemi élettartamának lejáratát követő 90 napig őrizzék meg, amely egységre a nyilvántartás vonatkozik.

7. fejezet
A forgószárnyas légijármű hajózószemélyzete

7.1 A hajózószemélyzet összetétele

7.1.1 A hajózószemélyzet tagjainak száma és összetétele az üzemeltetési kézikönyv előírásaiban megállapítottnál ne legyen alacsonyabb. A repülésvégrehajtási kézikönyvben vagy a légijármű légialkalmassági bizonyítványával összefüggésben levő más egyéb dokumentumban meghatározott minimális létszámon felül a hajózószemélyzetet egészítsék ki további hajózószemélyzeti tagokkal abban az esetben, ha ezt a forgószárnyas légijármű vagy az adott üzemeltetés típusa valamint a hajózószemélyzet váltási pontok közötti repülés időtartama szükségessé teszi.

7.1.2 A hajózószemélyzetben legalább egy olyan tag legyen, aki az alkalmazott rádiótávbeszélő berendezés üzemeltetésére jogosító, a lajstromozó állam által kiadott vagy elfogadott érvényes rádiótávbeszélő kezelői engedéllyel rendelkezik.

Megjegyzés: Egyes államok megkapták a rádiótávbeszélő engedély kiadási jogot.

7.2 A hajózószemélyzeti tag vészhelyzeti kötelességei

A járató minden egyes forgószárnyas légijármű típusra jelölje ki és határozza meg a hajózószemélyzet minden tagjának vészhelyzetben vagy a forgószárnyas légijármű vészkiürítése esetében elvégzendő egyéni feladatait. A járató kiképzési programja tartalmazza ezen vészhelyzeti feladatok éves gyakorlását, beleértve az összes vészhelyzeti és előírás szerint szállított életmentő berendezés használatát valamint a forgószárnyas légijármű kiürítésének gyakorlását is.

7.3 A hajózószemélyzeti tag kiképző programok

7.3.1 A járató dolgozzon ki és folyamatosan tartson fenn a járató állama által elfogadott és jóváhagyott földi és repülési kiképzési programot, amely biztosítja, hogy kijelölt feladatainak ellátására a hajózószemélyzet minden tagja megfelelő kiképzésben részesüljön.
A kiképzési program:

a) tartalmazzon a járató állama által meghatározott földi és repülési kiképző létesítményeket, továbbá jól képzett és jogosított oktatókat is;

b) álljon földi és repülési kiképzésből minden olyan forgószárnyas légijármű típuson, amelyen a hajózószemélyzeti tag szolgálatot teljesít;

c) terjedjen ki a hajózószemélyzet tagjai közötti együttműködésre, továbbá az összes olyan vészhelyzet vagy rendellenes üzemelés esetén szükséges eljárás gyakorlására, amely a hajtómű, áttételi rendszer, forgószárny, sárkányszerkezet, repülési rendszerek meghibásodása, tűz vagy más rendellenesség esetében következhet be;

d) tartalmazzon olyan elméleti és gyakorlati képzést, amely a betervezett üzemeltetési területekre érvényes látás szerinti és műszeres repülési eljárásokra, a fenyegetések és hibák kezelését is magába foglaló emberi teljesítőképesség fejlesztésére, valamint a veszélyes áruk szállítására tér ki;

e) biztosítsa, hogy a hajózószemélyzet minden egyes tagja ismerje azokat a feladatokat, amelyek végrehajtásáért személyesen felelős, továbbá ezen feladatok kapcsolatát a hajózószemélyzet többi tagjának feladataival, különös tekintettel a vészhelyzeti, vagy rendellenes üzemelés esetében szükséges eljárásokra; és

f) a járató államának előírásai alapján rendszeres időközönként kerüljön megismétlésre, melynek alkalmával az érintettek jártasságukról tegyenek vizsgát.

1. Megjegyzés: A 2.2.4 pont tiltja, hogy vészhelyzeti vagy a rendes üzemeléstől eltérő gyakorlást illetve szimulációt végezzenek a repülés közben abban az esetben, ha a fedélzeten utasok tartózkodnak vagy teherárut szállítanak.

2. Megjegyzés: A repülési kiképzést a járató állama által megfelelőnek tartott mértékben a járató állama által erre a célra engedélyezett szintetikus repülési gyakorló berendezésen is végre lehet hajtani.

3. Megjegyzés: A 7.2 és 7.3 szakaszokban előírt ismétlődő kiképzés terjedelme változtatható és annak nem *kell olyan alaposnak lennie, mint az adott forgószárnyas légijármű típus vonatkozásában lebonyolított első (alap) kiképzés.*

4. Megjegyzés: Az időszakos földi kiképzés követelményeinek biztosítására a járató állama által megfelelőnek tartott mértékben levelező tanfolyamokat, írásbeli vizsgáztatást vagy más, elfogadott módszereket is alkalmazhatnak.

5. Megjegyzés: A veszélyes áruk szállításával kapcsolatos kiképzésre vonatkozó előírásokat a 18. Annex tartalmazza.

6. Megjegyzés: Az emberi teljesítmény és gyakorlati ismeretek fejlesztését célzó kiképzési programok tervezésére vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv*-ében (Doc 9683) található.*

7. Megjegyzés: A repülőgépvezetőknek és a légiüzemeltetéssel foglalkozó személyeknek szóló azon információkat, amelyek a repülősi eljárások paramétereire és az üzemeltetési eljárásokra vonatkoznak, a PANS-OPS I. kötete (Doc 8168) tartalmazza. A látás utáni és a műszeres repülési eljárások felépítésére vonatkozó követelményeket a PANS-OPS II. kötete (Doc 8168) tartalmazza. Az akadály mentesség követelményeinek és eljárásainak használata egyes államokban eltérhetnek a PANS-OPS előírásaitól, és biztonsági okokból fontos ezen különbségek ismerete.

8. Megjegyzés: A hajózószemélyzetek kiképzési programjainak tartalmi összeállítására vonatkozó útmutató anyag a Repülésüzemi Kézikönyv Előkészítése *(Doc 9376) című anyagban található.*

9. Megjegyzés: az alkalmasság megállapítására használatos különböző eszközökre vonatkozó útmutató A Légiforgalmi Szolgálatok Eljárásai – Képzés *(PANS-TRG, Doc 9868) című anyag 2. fejezetének mellékletében található.*

7.3.2 Az időszakos ismétlődő repülési képzés követelményei az adott forgószárnyas légijármű típus vonatkozásában teljesítettnek tekinthetők, amennyiben:

a) a járató állama által elfogadott mértékben olyan forgószárnyas légijármű szintetikus repülési gyakorló berendezést használnak, amelyet az érintett állam erre a célra elfogadott; vagy

b) az adott forgószárnyas légijármű típusra a 7.4.4 pontban előírt repüléstechnikai ellenőrzést megfelelő időszakon belül elvégzik.

7.4 Jogosítások

Megjegyzés: A személyzet kereszt jogosításának az eltérő típusokon való repülésnek és a képzettség beszámításának általános tulajdonságaira vonatkozó útmutatót lásd az Egyéni szakszolgálati engedélyek kiadását biztosító állami rendszer létrehozására vonatkozó eljárások kézikönyvében *(Doc 9379).*

7.4.1 Folyamatos gyakorlatban tartás – légijármű parancsnok

7.4.1.1 A járató a forgószárnyas légijárművön légijármű parancsnoknak csak olyan légijármű-vezetőt jelöljön ki, aki megelőző kilencven nap folyamán az adott forgószárnyas légijármű típussal, vagy annak típus változatával legalább három fel és leszállást hajtott végre.

7.4.1.2 Amikor egy légijármű parancsnok azonos típusú forgószárnyas légijármű különböző változatait, vagy a légiüzemeltetési eljárások, a rendszerek és a kiszolgálás tekintetében hasonló jellemzőkkel bíró, de eltérő típusú forgószárnyas légijárműveket vezeti, az állam döntse el, hogy a 7.4.1.1 bekezdés követelményeit milyen feltételekkel lehet összekapcsolni minden egyes változatra, vagy minden egyes forgószárnyas légijármű típusra vonatkozóan.

7.4.2 Folyamatos gyakorlatban tartás – másodpilóta

7.4.2.1 A járató a repülési rendszerek fel és leszállás végrehajtása közben történő kezelésére csak olyan másodpilótát jelöljön ki, aki a megelőző kilencven nap folyamán az adott forgószárnyas légijármű típuson légijármű parancsnokként, vagy másodpilótaként szolgálatot teljesített és a légijárművet ilyen minőségében vezette, vagy az erre a célra elfogadott mesterséges repülés gyakorló berendezésen bizonyította alkalmasságát a másodpilóta feladatainak ellátására.

7.4.2.2 Amikor egy másodpilóta azonos típusú forgószárnyas légijármű különböző változatait, vagy a légiüzemeltetési eljárások, a rendszerek és a kiszolgálás tekintetében hasonló jellemzőkkel bíró, de eltérő típusú forgószárnyas légijárműveket vezeti, az állam döntse el, hogy a 7.4.2.1 bekezdés követelményeit milyen feltételekkel lehet összekapcsolni minden egyes változatra, vagy minden egyes forgószárnyas légijármű típusra vonatkozóan.

7.4.3 Légijármű parancsnok repülési jogosítása

7.4.3.1 A járató a légijármű-vezetőt forgószárnyas légijármű parancsnokként mindaddig ne jelölje ki olyan útvonalra, vagy útvonal szakaszra, amelyre az érintett légijármű-vezetőnek nincs érvényes jogosítása, amíg az érintett légijármű-vezető eleget nem tesz a 7.4.3.2 és 7.4.3.3 pontok előírásainak.

7.4.3.2 Valamennyi érintett légijármű-vezető a járató számára bizonyítsa, hogy megfelelő mértékben ismeri a következőket:

a) a lerepülendő feladatot a következő jellemzők vonatkozásában;

1) domborzati viszonyok és legalacsonyabb biztonságos repülési magasságok;

2) az évszaknak megfelelő időjárási körülmények;

3) a meteorológiai, távközlési és légiforgalmi irányítási létesítmények, szolgálatok valamint eljárások;

4) a kutató és mentő szolgálati eljárások; és

5) a tervezett repülési útvonal teljes hosszán található navigációs létesítmények és eljárások.

b) a sűrűn lakott területek felett valamint a nagy-forgalmú légtereken átvezető repülési útvonalak eljárásai, akadályai, fizikai jellemzői, megközelítési segédeszközei, érkezési, indulási, várakozási és műszeres megközelítési eljárásai továbbá az alkalmazható üzemeltetési minimumok.

Megjegyzés: Az érkezési, indulási, várakozási és műszeres megközelítési eljárások ismeretét az erre a célra alkalmas kiképzési segédeszköz igénybevételével is bizonyítani lehet.

7.4.3.3 A légijármű parancsnoka hajtson végre egy tényleges megközelítést az útvonalon elhelyezkedő összes leszállási helikopter repülőtérre olyan légijármű-vezető megfigyelése mellett, aki az adott helikopter repülőtérre rendelkezik jogosítással és hajózószemélyzeti tagként vagy megfigyelőként a fedélzeten tartózkodik.

7.4.3.4 A járató vezessen megfelelő nyilvántartást, amellyel a járató állama részére kielégítően bizonyítja a légijármű-vezető jogosítását, valamint a jogosítás megszerzésének módját.

7.4.3.5 A járató egy légijármű-vezetőt egy útvonalon légijármű parancsnokként csak akkor foglalkoztasson tovább, ha az érintett a megelőző 12 hónapon belül hajózószemélyzeti tagként, ellenőrző légijármű-vezetőként vagy a pilótakabinban megfigyelőként legalább egy utat megtett az útvonal két végpontja között. Amennyiben több mint 12 hónap telt el azóta, hogy a légijármű-vezető nem repült az útvonal közvetlen közelében és hasonló adottságú terep felett, az adott útvonalon légijármű parancsnokként történő foglalkoztatása előtt a 7.4.3.2 és 7.4.3.3 pontok előírásai alapján ismételt útvonal-jogosítást kell szereznie.

7.4.4 A légijármű-vezető szakmai jártasságának ellenőrzése
