7.4.4.1 A járató biztosítsa a légijármű-vezető repüléstechnikai felkészültségének és a vészhelyzeti eljárások megfelelő végrehajtásának ellenőrzését oly módon, amelyből egyértelműen kiderül a légijármű-vezető szakmai jártassága. Amennyiben az üzemeltetés műszerrepülési szabályok között is végrehajtható, a járató biztosítsa, hogy a forgószárnyas légijármű-vezető az ilyen (IFR) szabályok alapján történő megfelelő tevékenységét, szakmai jártasságát a járató ellenőrző légijármű-vezetője vagy a járató államának képviselője számára bizonyítsa. Az ilyen ellenőrzéseket egy éven belül két alkalommal végezzék el, azonban négy egymást követő hónapon belül kétszer végrehajtott hasonló jellegű ellenőrzés a fenti követelményt nem elégíti ki.

Megjegyzés: Az ellenőrzések olyan részleteinek végrehajtására felhasználhatók a járató állama által erre elfogadott mesterséges repülés gyakorló berendezés, amelyekre ezek külön jogosítással rendelkeznek.

7.4.4.2 Amikor egy járató a hajózó személyzetet azonos típusú forgószárnyas légijármű különböző változataira, vagy a légiüzemeltetési eljárások, a rendszerek és a kiszolgálás tekintetében hasonló jellemzőkkel bíró de eltérő típusú forgószárnyas légijárművekre osztja be, az állam döntse el, hogy a 7.4.4.1 bekezdés követelményeit milyen feltételekkel lehet összekapcsolni minden egyes változatra vagy minden egyes légijármű típusra vonatkozóan.

7.5. A hajózószemélyzet felszerelése

A hajózószemélyzet tagja rendelkezzen könnyen hozzáférhető, megfelelő tartalék szemüveggel abban az esetben, ha szakszolgálati tevékenységének végzésére csak megfelelő korrekciós szemüveg viselése mellett jogosult.

7.6 Repülési idő, repülési szolgálati idő és pihenőidő

A járató állama dolgozzon ki előírásokat a hajózószemélyzet tagjainak repülési idejének, valamint repülési szolgálati idejének korlátozására. Ezek az előírások biztosítsák a megfelelő pihenőidőt és olyanok legyenek, hogy a repülés vagy repülési sorozat végrehajtása során illetve bizonyos időszak alatt ezen feladatok és más események miatt felhalmozódott fáradtság ne veszélyeztesse a repülés biztonságát.

Megjegyzés: A korlátozások kidolgozására vonatkozó útmutató az A. Mellékletben található.

8. fejezet
Repülés-üzemi tiszt / szolgálatvezető

8.1 Amennyiben a járató állama megköveteli, hogy a légiüzemeltetés irányításának és felügyeletének jóváhagyott rendszerén belül alkalmazott repülés-üzemi tiszt/szolgálatvezető rendelkezzen szakszolgálati engedéllyel, akkor az érintett repülés-üzemi tisztet/szolgálatvezetőt az 1. Annex előírásainak megfelelő szakszolgálati engedéllyel lássák el.

8.2 Amennyiben a repülés-üzemi tiszt/szolgálatvezető szakszolgálati engedélytől eltérő más jogosítási módszert fogadnak el, akkor a légiüzemeltetés irányításának és felügyeletének jóváhagyott rendszerével összefüggésben, a járató állama követelje meg, hogy az ilyen személyek minimum feleljenek meg az 1. Annexben a repülés-üzemi tisztre/szolgálatvezetőre meghatározott követelményeknek.

8.3 A légiüzemeltetés irányításának és felügyeletének jóváhagyott rendszerével szolgálatra csak azt követően osztható be, hogy:

a) megfelelően elvégezte a járatóra meghatározott tanfolyamot, amely tartalmazza a 2.2.1.4 bekezdésben a járató légiüzemeltetés irányításának és felügyeletének jóváhagyott rendszerével összefüggő sajátságos összetevőket;

Megjegyzés: az ilyen tananyag összeállítására vonatkozó útmutató a Kiképzési Kézikönyv *(Doc 7192),* Repülés-üzemi tiszt/szolgálatvezető *című D-3 részében található.*

b) a megelőző 12 hónapon belül legalább egy alkalommal egy egy-irányú útvonal jogosító repülésen vett részt a forgószárnyas légijármű pilótakabinjában bármely olyan terület felett, amelyre repülésfelügyeleti jogosítással rendelkezik. A repülés gyakorlati szempontból a lehető legtöbb forgószárnyas légijármű leszállóhelyre való leszállást is foglaljon magába;

Megjegyzés: A jogosító repülés céljainak megfelelően a repülés-üzemi tiszt/szolgálatvezető legyen képes ellenőrizni a hajózó személyzet egymás közötti kommunikációját biztosító rendszert és a rádió kommunikációt, és legyen képes megfigyelni a hajózó személyzet tevékenységét.

c) a járatónak bizonyította, hogy kielégítő mértékben ismeri:

1) a H. mellékletben ismertetett üzemeltetési kézikönyv tartalmát;

2) az alkalmazott forgószárnyas légijárművek rádió berendezéseit; és

3) az alkalmazott forgószárnyas légijárművek navigációs berendezéseit;

d) bizonyította a járatónak, hogy ismeri azon feladatok következő részleteit, amelyekért felelős valamint azokat a területeket, amelyeken az érintett repülés-üzemi tiszt/szolgálatvezető repülés-felügyelet gyakorlására jogosult;

1) az évszaknak megfelelő időjárási körülmények és a meteorológiai tájékoztatások beszerzési forrásai;

2) az időjárási körülmények hatásai az alkalmazott forgószárnyas légijárművek rádió berendezéseinek vételi tulajdonságaira;

3) az üzemeltetés során használt egyes rádiónavigációs rendszerek jellegzetességei és üzemeltetési korlátozásai; és

4) a forgószárnyas légijármű terhelési utasítása;

e) bizonyította a járatónak, hogy rendelkezik az emberi teljesítőképességgel összefüggő olyan ismeretekkel és jártassággal, amelyek a szolgálatvezetői tevékenységgel állnak kapcsolatban; és

f) bizonyította a járatónak, hogy képes a 2.6 pontban kijelölt feladatainak ellátására.

8.4 ***Ajánlás*** *– A szolgálatra kijelölt repülés-üzemi tiszt/szolgálatvezető teljes mértékben ismerje a feladatkörét érintő üzemeltetés összes jellemzőit, beleértve az emberi teljesítőképességgel kapcsolatos elméleti és gyakorlati ismereteket.*

Megjegyzés: Az emberi teljesítmény és gyakorlati ismeretek fejlesztését célzó kiképzési programok tervezéséhez útmutató az Emberi Tényezők Kiképzési Kézikönyv*-ében (Doc 9683) található.*

8.5 ***Ajánlás*** *– A repülés-üzemi tisztet/szolgálatvezetőt ne jelöljék ki szolgálatra abban az esetben, ha egymást követő 12 hónapon keresztül ilyen szolgálatot nem látott el, kivéve, ha a 8.3 pont előírásainak eleget tesz.*

9. fejezet
Kézikönyvek, naplók és nyilvántartások

Megjegyzés: A következő kiegészítő kézikönyvek, nyilvántartások és jegyzőkönyvek a jelen Annex anyagához kapcsolódnak, azonban ezeket a fejezet nem tartalmazza:

tüzelőanyag és olaj jegyzőkönyvek	lásd 2.2.8
karbantartások nyilvántartása	lásd 6.8
repülési idő, repülési szolgálati idő és pihenőidő jegyzőkönyvek	lásd 2.2.9.3
repülés előkészítési formanyomtatványok	lásd 2.3
üzemeltetői repülési terv	lásd 2.3.3
légijármű parancsnok útvonal és repülőtér jogosításainak nyilvántartásai	lásd 7.4.3.4

9.1 Repülésvégrehajtási kézikönyv

Megjegyzés: A repülésvégrehajtási kézikönyv a 8. Annex-ben meghatározott tájékoztatásokat tartalmazza.

A repülésvégrehajtási kézikönyvet a lajstromozó állam előírásai alapján kötelező érvényű változások behelyezésével tartsák naprakészen.

9.2 Járató karbantartás irányítási kézikönyve

A járató 6.2 szakasz előírásai alapján biztosított karbantartás irányítási kézikönyve, amelyet több részben is kiadhat, a következő tájékoztatásokat tartalmazza:

a) a 6.1.1 pont alapján előírt eljárások ismertetése, szükség szerint:

1) a járató és az engedélyezett karbantartó szervezet közötti adminisztratív megállapodások;

2) a karbantartás végrehajtási eljárások valamint a karbantartási nyilatkozat elkészítési és aláírási eljárások, amikor a karbantartást olyan rendszerben hajtják végre, amely nem azonos az engedélyezett karbantartó szervezet eljárásaival;

b) a 6.1.4 pontban előírt személy vagy személyek neve és feladatai;

c) hivatkozás a 6.3.1 pontban előírt karbantartási programra;

d) a járató karbantartási jegyzőkönyveinek elkészítési és megőrzési módszerei a 6.4 szakasz előírásai alapján;

e) a 6.5.1 pontban előírt karbantartás és üzemeltetés felügyeleti, értékelési és jegyzőkönyvezési eljárások ismertetése;

f) a 8. Annex II. rész 4.2.3 f) és 4.2.4 pontjaiban előírt, a szolgálati tájékoztatások jelentésére vonatkozó követelmények teljesítésének eljárásai;

g) a 6.5.2 pontban előírt folyamatos légialkalmassági tájékoztatások értékelésének és az ennek alapján végrehajtott bármely tevékenység elvégzésének eljárásai;

h) a kötelező folyamatos légialkalmassági tájékoztatás alapján szükséges intézkedések végrehajtásának eljárásai;

i) az ellenőrzési és elemzési rendszer kialakításának és fenntartásának ismertetése valamint a karbantartási program teljesítményének és hatékonyságának folyamatos felügyelete, melynek célja a program bármely hiányosságának kiküszöbölése;

j) az légijármű típusok és típusváltozatok ismertetése, amelyekre a kézikönyv alkalmazható;

k) azon eljárások ismertetése, amelyek biztosítják a légialkalmasságot befolyásoló meghibásodások, valamint hiányosságok jegyzőkönyvezését és kijavítását; és

l) azon eljárások ismertetése, amelyekkel a lajstromozó államot értesítik a repülés végrehajtás során bekövetkezett jelentősebb rendellenességekről.

m) a légijármű és a hozzá tartozó szerkezeti elemek bérletének ellenőrzésére vonatkozó eljárások ismertetése; és

n) a karbantartás irányítási kézikönyv módosítási eljárásainak ismertetése.

9.3 Karbantartási program

9.3.1 Minden egyes forgószárnyas légijármű karbantartási programja a 6.3 szakasz előírásai alapján a következőket tartalmazza:

a) a karbantartási feladatok és ezek elvégzésének időszakai a forgószárnyas légijármű várható és tervezett igénybevételének figyelembevételével;

b) a forgószárnyas légijármű szerkezeti épségének folyamatos ellenőrzése – amikor ez a karbantartási feladat alkalmazható;

c) a fenti a) és b) alpontok előírásaitól való eltérés vagy azok megváltozatása céljából alkalmazott eljárások; és

d) a forgószárnyas légijármű rendszereinek, alkatrészeinek, meghajtás áttételeinek, forgószárnyainak valamint hajtóműveinek állapotát és megbízhatóságát felülvizsgáló programok szükség szerinti ismertetése.

9.3.2 A forgószárnyas légijármű típusra kötelezőnek kijelölt karbantartási feladatokat és ezek elvégzésének időszakait ennek megfelelően azonosítsák.

9.3.3 **Ajánlás** – *A karbantartási programot a tervezés állama vagy a típus tervezéséért felelős szervezet által rendelkezésre bocsátott tájékoztatások valamint bármely más megfelelő gyakorlati tapasztalatok alapján dolgozzák ki.*

9.4 Útinapló

9.4.1 **Ajánlás** – *A forgószárnyas légijármű útinaplója a következő tételeket és a vonatkozó római* *számokat tartalmazza:*

I - A forgószárnyas légijármű nemzeti hovatartozása és lajstromjele.
II - A repülés időpontja.
III - A személyzeti tagok névsora.
IV - A személyzet tagjainak kijelölt feladatai.
V - Az indulás helye.
VI - Az érkezés helye.
VII - Az indulás időpontja.
VIII - Az érkezés időpontja.
IX - A repülés időtartama.
X - A repülési feladat pontos meghatározása (magáncélú, menetrendszerű vagy nem-menetrendszerű repülés).
XI - Események és megfigyelések – ha van.
XII - A felelős személy aláírása.

9.4.2 **Ajánlás** – *A forgószárnyas légijármű útinaplót naprakészen vezessék, a bejegyzéseket tollal vagy kitörölhetetlen ceruzával írják be.*

9.4.3 **Ajánlás** – *A kitöltött útinaplót őrizzék meg, hogy a forgószárnyas légijármű üzemeltetésének utolsó hat hónapjáról folyamatos feljegyzés álljon rendelkezésre.*

9.5 A fedélzeten szállított vészhelyzeti és túlélési felszerelések jegyzéke

A járató mindig rendelkezzen a mentést koordináló központnak azonnal továbbítható jegyzékkel, amely tartalmazza a nemzetközi légiközlekedésben üzemeltetett bármely forgószárnyas légijárművének fedélzetén szállított vészhelyzeti és túlélési felszerelések felsorolását. A tájékoztató szükség szerint tartalmazza a mentőtutajok számát, színét és típusát, a rendelkezésre álló pirotechnikai eszközök ismertetését, a vészhelyzeti egészségügyi készletek részletezését, a vízkészletek meghatározását valamint a hordozható vészhelyzeti rádióberendezések típusát és frekvenciáit.

9.6 Repülési adatrögzítő felvételei

A járató a lehetőségek határain belül biztosítsa, hogy amennyiben egyik forgószárnyas légijárműve balesetet szenvedett vagy repeseményben érintett, az összes vonatkozó repülési adatrögzítő felvételt és ha szükséges, a repülési adatrögzítő berendezéseket is megőrizze és azokat a 13. Annex előírásaival összhangban biztonságos őrizet alatt tárolja.

10. fejezet
Utaskabin személyzet

10.1 Vészhelyzeti feladatok kijelölése

A járató a járató államának egyetértésével minden egyes forgószárnyas légijármű típusához az ülésszám vagy a szállított utasok száma alapján határozza meg az utaskabin személyzet legkisebb számát annak érdekében, hogy vészhelyzetben vagy olyan esetben, amikor a forgószárnyas légijármű vészkiürítése válik szükségessé, a fentiekre előírt feladatokat valamint a forgószárnyas légijármű biztonságos és gyors elhagyását végrehajtsák. Ezeket a feladatokat a járató minden egyes forgószárnyas légijármű típusára határozza meg.

10.2 Az utaskabin személyzet védelme a repülés alatt

A fel és leszállás végrehajtása alkalmával továbbá minden olyan esetben, amikor a légijármű parancsnoka erre utasítást ad, minden egyes utaskabin személyzeti tag foglaljon helyet és biztonsági övét vagy ha ilyet biztosítottak, vállhevederekkel ellátott biztonsági övét csatolja be.

Megjegyzés: Az előbbiek nem zárják ki, hogy a légijármű parancsnoka a fel és leszállás végrehajtásának kivételével bármely más alkalommal csak a biztonsági övek becsatolását rendelje el.

10.3 Kiképzés

A járató a járató államának jóváhagyásával dolgozzon ki és bonyolítson le kiképzési programot, amelyen utaskabin személyzeti tagnak történő kijelölése előtt minden érintett személynek részt kell vennie. Az utaskabin személyzet ezt követően évente vegyen részt ismétlődő képzési programon. Ezek a kiképzési programok biztosítsák, hogy minden érintett személy:

a) gyakorlottan végre tudja hajtani azokat a biztonsági feladatokat és kötelezettségeket, amelyek elvégzésére a repülés során bekövetkező vészhelyzet vagy vészkiürítést igénylő helyzet esetében az utaskabin személyzeti tagot kijelölték;

b) megfelelő gyakorlati tapasztalatokkal rendelkezzen a forgószárnyas légijármű fedélzetén történő szállításra előírt vészhelyzeti és életmentő felszerelések használatában és képes legyen ezen eszközök, mint például mentőmellények, mentőtutajok, vészcsúszdák, vészkijáratok, hordozható tűzoltó készülékek, oxigén berendezések és elsősegély-nyújtó készletek használatára;

c) amennyiben 3000 méter (10 000 láb) repülési magasság felett üzemeltetett forgószárnyas légijárművön teljesít szolgálatot, ismerje az oxigén hiány hatásait, valamint a túlnyomásos kabinnal rendelkező forgószárnyas légijármű esetében a hirtelen nyomásvesztést, azaz dehermetizációt kísérő fiziológiai tüneteket;

d) olyan mértékben ismerje a személyzet többi tagjának vészhelyzet esetére kijelölt feladatait, amennyire ez saját feladatainak ellátásához szükséges; és

e) ismerje a forgószárnyas légijármű utaskabinjában szállítható, illetve nem szállítható veszélyes árukat és végezze el a veszélyes áruk szállítására vonatkozó, a 18. Annex-ben előírt kiképzési programot; és

f) ismerje az utaskabinban végrehajtandó biztonsági feladatokat érintő emberi tevékenységet és teljesítményt, beleértve az utaskabin személyzet és a hajózószemélyzet közötti együttműködést is.

Megjegyzés: Az emberi teljesítmény ismeretének fejlesztését célzó kiképzési programok tervezésére vonatkozó útmutató az Emberi Tényezők Kiképzési Kézikönyv-*ében (Doc 9683) található.*

10.4 Repülési idő, repülési szolgálati idő és pihenőidő

A járató állama dolgozzon ki előírásokat az utaskabin személyzet repülési idejének és repülési szolgálati idejének korlátozására, valamint a megfelelő pihenőidő biztosítására.

Megjegyzés: A korlátozások kidolgozásával kapcsolatos útmutató az A. Mellékletben található.

11. fejezet
Védelem

Megjegyzés: A jelen fejezetben a "védelem" kifejezés a polgári légiközlekedéssel szemben végrehajtott jogellenes (törvénytelen) cselekedetek megakadályozását jelenti.

11.1 Forgószárnyas légijármű átkutatás ellenőrző jegyzéke

A járató biztosítsa, hogy a forgószárnyas légijármű fedélzetén helyezzenek el ellenőrző jegyzéket, amely tartalmazza azokat az eljárásokat, amelyek alapján a feltételezett szabotázs esetében a robbanószerkezet felkutatása érdekében végrehajtják a forgószárnyas légijármű átvizsgálását. Az ellenőrző jegyzék mellett biztosítsanak útmutatást azokról a feladatokról és tevékenységekről, amelyeket abban az esetben szükséges végrehajtani, ha robbanószerkezetet vagy gyanús tárgyat találnak.

11.2 Kiképzési programok

11.2.1 A járató dolgozzon ki és bonyolítson le kiképzési programot, amely biztosítja, hogy a személyzet minden tagja a helyzetnek leginkább megfelelő módon tevékenykedjen, a lehető legkisebbre csökkentve ezzel a jogellenes beavatkozás következményeit.

11.2.2 A járató dolgozzon ki és bonyolítson le további kiképzési programot, amelynek során az érintett alkalmazottai megismerik azokat a megelőző intézkedéseket és a szükséges módszereket, amelyek az utasok, poggyász, teheráru, postaküldemények, felszerelések és kellékek forgószárnyas légijárművön történő szállítására vonatkoznak, hozzájárulva ezzel a szabotázs vagy más jogellenes beavatkozás megelőzéséhez.

11.3 A jogellenes beavatkozás jelentése

A jogellenes beavatkozást követően a légijármű parancsnoka a kijelölt helyi hatóságnak késedelem nélkül tegyen jelentést erről az eseményről.

III. szakasz
Általános célú nemzetközi légiközlekedés

1. fejezet
Általános rész

1. Megjegyzés: Bár a Nemzetközi Polgári Légiközlekedési Egyezmény a lajstromozó államra bizonyos feladatokat ír elő, amelyek végrehajtására az állam jogosult vagy kötelezett, a Közgyűlés A23-13 számú határozatában elismerte azt a tényt, hogy a lajstromozó állam bizonyos körülmények között képtelen megfelelő módon eleget tenni a fenti kötelezettségének, amikor a légijárművet más állam járatója – elsősorban hajózószemélyzet nélkül – bérbe veszi, szerződés vagy csere megállapodás alapján üzemelteti valamint azt is, hogy amíg az Egyezmény 83/b. cikkelye életbe nem lép, az Egyezmény nem megfelelően határozza meg a járató államára ilyen esetekben vonatkozó jogokat és kötelezettségeket. Ezért a Tanács felhívja a figyelmet arra, hogy ha a fenti esetekben a lajstromozó állam megállapítja, hogy képtelen az Egyezményben előírt kötelezettségei teljesítésére, azokat a feladatokat, amelyeket a járató állama jobban el tud végezni és amennyiben ez a feladatok végrehajtását elvállalja, járató államára utalhatja át. Tudomásul vették, hogy a 83/b. cikkely hatályba lépéséig a fentiek csak gyakorlati szempontból lesznek célszerűek és nem érintik a Chicagó-i Egyezménynek a lajstromozó államra vagy egy harmadik államra háruló kötelezettségeit. Mindazonáltal, mivel a 83/b. cikkely 1997. június 20-án hatályba lépett, a vonatkozó kiegészítő jegyzőkönyvet (Doc 9318) aláíró államok kötelesek az ilyen átadási megállapodásokban foglaltak teljesítésére.

2. Megjegyzés: A nemzetközi légi üzemeltetés esetében, amelyet olyan forgószárnyas légijárművekkel bonyolítanak le, amelyek nem mindegyike van azonos szerződő államban lajstromozva, a jelen rész előírásai közül semmi sem akadályozza meg az érintett államokat abban, hogy szerződés alapján közösen végezzék el azokat a feladatokat, amelyek végrehajtására a vonatkozó Annex-ek a lajstromozó államot jelölik ki.

1.1 A jogszabályok, előírások és eljárások betartása

1.1.1 A légijármű parancsnoka tegyen eleget azon államok megfelelő törvényeinek, előírásainak és eljárásainak, amelyekben a forgószárnyas légijárművet üzemeltetik.

1. Megjegyzés: A lajstromozó állam az 1.1.1 pont előírásával nem ellentétes, fokozottan korlátozó intézkedéseket is előírhat.

2. Megjegyzés: A nyílt vizek feletti repülési feladatok végrehajtására vonatkozó előírásokat a 2. Annex tartalmazza.

3. Megjegyzés: A repülőgépvezetőknek szóló azon információkat, amelyek a repülési eljárások paramétereire és az üzemeltetési eljárásokra vonatkoznak, a PANS-OPS I. kötete (Doc 8168) tartalmazza. A látás utáni és a műszeres repülési eljárások felépítésére vonatkozó követelményeket a PANS-OPS II. kötete (Doc 8168) tartalmazza. Az akadály mentesség követelményeinek és eljárásainak használata egyes államokban eltérhetnek a PANS-OPS előírásaitól, és biztonsági okokból fontos ezen különbségek ismerete.

1.1.2 A légijármű parancsnoka felelős a forgószárnyas légijármű fedélzeten tartózkodó összes hajózószemélyzeti tag, utas és az elhelyezett teheráru biztonságáért. A parancsnok felelős továbbá a forgószárnyas légijármű üzemeltetéséért és biztonságáért attól a pillanattól kezdve, amikor a hajtóműve(ke)t beindítják addig, mikor a forgószárnyas légijármű a repülés után végleg megáll, a hajtóműve(ke)t leállítják és a forgószárny megáll.

1.1.3 Amennyiben a forgószárnyas légijármű vagy az utasok biztonságát fenyegető vészhelyzet esetében olyan tevékenységre van szükség, amellyel megsértik a helyi előírásokat vagy eljárásokat, erről a légijármű parancsnoka késedelem nélkül értesítse az illetékes helyi hatóságot. Ha az állam, amelynek felségterületén az esemény bekövetkezik így rendelkezik, a légijármű parancsnoka bármely ilyen előírás megsértéséről nyújtson be jelentést az állam illetékes hatósága számára; ebben az esetben a jelentés másolatát nyújtsa be továbbá a járató állama számára is. Az ilyen jelentéseket a lehető legrövidebb időn, általában tíz napon belül nyújtsák be.

1.1.4 A légijármű parancsnoka felelős a legközelebbi illetékes hatóság lehető leggyorsabb értesítéséért a forgószárnyas légijárművet érintő bármely olyan balesetről, amelynek következménye bármely személy súlyos vagy halálos sérülése illetve a forgószárnyas légijármű vagy más anyagi javak jelentős károsodása.

Megjegyzés: A "súlyos sérülés" kifejezés meghatározása a 13. Annex-ben található.

1.1.5 ***Ajánlás*** *– A forgószárnyas légijármű fedélzetén álljon a légijármű parancsnokának rendelkezésére az átrepült területen működő kutató és mentő szolgálatokra vonatkozó összes alapvető tájékoztatás.*

1.2 Veszélyes árúk

1. Megjegyzés: A veszélyes árukra vonatkozó előírások a 18. Annex-ben találhatók.

2. Megjegyzés: Az Egyezmény 35. cikkelye bizonyos teheráru korlátozási osztályokra vonatkozik.

1.3 Szellemi tevékenységet befolyásoló anyagok használata

Megjegyzés: A szellemi tevékenységet befolyásoló anyagok használatára vonatkozó előírások az 1. Annex 1.2.7 és a 2. Annex 2.5 pontjaiban találhatók.

2. fejezet
Repülésvégrehajtás

2.1 Az üzemeltetés létesítményeinek alkalmassága

A légijármű parancsnoka ne kezdje meg a repülés végrehajtását az előtt, hogy minden rendelkezésre álló lehetséges és ésszerű eszközzel meggyőződött arról, hogy azok a rendelkezésre álló földi és/vagy vízfelszíni létesítmények, amelyek a forgószárnyas légijármű biztonságos üzemeltetése valamint az utasok védelme érdekében közvetlenül szükségesek, megfelelnek annak az üzemeltetési típusnak, amelyben a repülést végre fogják hajtani és azokat a fenti célnak megfelelő módon üzemeltetik.

Megjegyzés: A jelen előírásban alkalmazott "lehetséges és ésszerű eszköz" kifejezés a parancsnok részére az indulási helyen rendelkezésre álló tájékoztatások felhasználását jelenti, amelyek a légiforgalmi tájékoztató szolgálatok által kiadott hivatalos közleményekből vagy más forrásokból származnak.

2.2 Helikopter repülőtér üzemeltetési minimum

A légijármű parancsnoka ne hajtson végre repülési feladatot olyan helikopter repülőtérre vagy repülőtérről, amelyen az üzemeltetési minimum értéke alacsonyabb, mint amit az az állam határozott meg, ahol az adott helikopter repülőtér elhelyezkedik, kivéve, ha erre az adott állam külön engedélyt ad.

Megjegyzés: Néhány állam gyakorlata szerint a repülés tervezési célokra magasabb minimumokat jelölnek meg arra az esetre, ha a helikopter repülőteret kitérőként választják szemben azzal, ha ez a helikopter repülőtér a tervezett leszállás helye.

2.3 Repülés előtti tájékoztatás

2.3.1 A légijármű parancsnoka biztosítsa, hogy a személyzet tagjai valamint az utasok szóbeli tájékoztatás útján vagy más módszerrel megismerjék a következő eszközök elhelyezkedését és használatát:

a) biztonsági övek vagy vállhevederek, és amennyiben helyénvaló;

b) vészkijáratok;

c) mentőmellények;

d) oxigén ellátó berendezések; és

e) más, egyéni használatra rendszeresített mentőfelszerelések, beleértve az utastájékoztató kiadványokat is.

2.3.2 A légijármű parancsnoka biztosítsa, hogy a fedélzeten tartózkodó összes személy ismerje a közös használatra rendszeresített alapvető mentőfelszerelések elhelyezkedését és általános használatát.

2.4 Forgószárnyas légijármű légialkalmassága és biztonsági intézkedések

A repülési feladat végrehajtását ne kezdjék meg mindaddig, amíg a légijármű parancsnoka meggyőződött arról, hogy:

a) a forgószárnyas légijármű repülésre alkalmas, azt előírásszerűen lajstromozták és az erre vonatkozó okmányok a forgószárnyas légijármű fedélzetén vannak;

b) a forgószárnyas légijárművön felszerelt műszerek és berendezések a várható repülési körülmények figyelembevételével az adott repülési feladat végrehajtására megfelelőek;

c) a 6. fejezet előírása szerint elvégezték az összes szükséges karbantartási munkát;

d) a forgószárnyas légijármű tömege valamint súlypont-helyzete a várható repülési körülmények figyelembevételével olyan, hogy a repülési feladat biztonságosan végrehajtható;

e) valamennyi szállítmányt megfelelő módon elhelyeztek és biztonságosan rögzítettek; és

f) a forgószárnyas légijármű üzemeltetési kézikönyvében vagy az ezzel egyenértékű dokumentumban meghatározott üzemeltetési korlátozásokat nem lépik túl.

2.5 Időjárás jelentések és előrejelzések

A repülés megkezdése előtt a légijármű parancsnoka ismerje meg a tervezett repüléshez rendelkezésre álló összes időjárási tájékoztatást. Az indulási hely közeléből eltávolodó és a műszerrepülési szabályok szerint végrehajtott összes repülés előkészítéséhez a következők tartozzanak:

1) a rendelkezésre álló érvényes időjárás-jelentések és előrejelzések tanulmányozása; valamint

2) kitérő tevékenység megtervezése, amely lehetővé teszi a repülés folytatását abban az esetben, ha az időjárási körülmények miatt azt nem lehet a tervek szerint végrehajtani.

Megjegyzés: A repülési tervekre vonatkozó követelményeket a 2. Annex (Repülési Szabályok) és a PANS-ATM Doc 4444 (Légiforgalmi Szolgálatok Szabályai) tartalmazza.

2.6 Időjárási körülmények miatt szükséges korlátozások

2.6.1 Látvarepülési szabályok szerint végrehajtott repülés

A kizárólag helyi, látás utáni időjárási körülmények között végrehajtott repülés kivételével a látvarepülési szabályok szerint tervezett repülés végrehajtását ne kezdjék meg csak akkor, ha az érvényes időjárás-jelentések vagy az érvényes időjárás-jelentések és előrejelzések azt jelzik, hogy a megfelelő időben, az útvonalon vagy annak látvarepülési szabályok szerint tervezett repülési szakaszán az uralkodó időjárási körülmények olyanok lesznek, hogy az ilyen (VFR) szabályok betartása lehetséges.

2.6.2 Műszerrepülési szabályok szerint végrehajtott repülés

2.6.2.1 *Ha kitérő helikopter repülőtér kijelölése szükséges*

A műszerrepülési szabályok szerint tervezett repülés végrehajtását ne kezdjék meg csak akkor, ha a rendelkezésre álló tájékoztatások szerint az érkezés várható időpontjában a tervezett leszállási és legalább egy kitérő helikopter repülőtéren az uralkodó (időjárási) körülmények helikopter repülőtér üzemeltetési minimumnak megfelelőek vagy annál jobbak lesznek.

Megjegyzés: Néhány állam gyakorlata szerint a repülés tervezési célokra magasabb minimumokat jelölnek meg arra az esetre, ha a helikopter repülőteret kitérőként választják szemben azzal, ha ugyanez a helikopter repülőtér a tervezett leszállás helye.

2.6.2.2 *Ha kitérő helikopter repülőtér kijelölése nem szükséges*

Amennyiben kitérő helikopter repülőtér nem szükséges, a műszerrepülési szabályok szerint tervezett repülés végrehajtását egy helikopter repülőtérre ne kezdjék meg csak akkor, ha a rendelkezésre álló érvényes időjárás tájékoztatások azt jelzik, hogy az érkezés számított időpontja előtt valamint ez után – két órával vagy az indulási időpontjától az érkezés számított időpontja után két óráig – amelyik a rövidebb időtartam – a következő időjárási körülmények állnak fenn:

a) a felhőalap a műszeres megközelítési eljáráshoz előírt minimum értéknél legalább 120 méterrel (400 láb) magasabb; és

b) a látástávolság legalább 1.5 km-el több mint az eljáráshoz előírt minimum érték.

Megjegyzés: A fentieket minimum értékként akkor fogadják el, ha megbízható és folyamatos (helyi) időjárás megfigyelést tartanak fenn. Ha csak úgynevezett területi előrejelzés van, a fenti értékeket ennek megfelelő mértékben növeljék meg.

2.6.3 Helikopter repülőtér üzemeltetési minimum

2.6.3.1 A repülést ne folytassák a tervezett leszállási helikopter repülőtér felé csak abban az esetben, ha a rendelkezésre álló legújabb tájékoztatások azt jelzik, hogy az érkezés várható időpontjában ezen a leszállási vagy legalább egy kitérő helikopter repülőtéren az időjárási körülmények a meghatározott helikopter repülőtér üzemeltetési minimum értéknek megfelelőek vagy ennél jobbak lesznek.

2.6.3.2 A precíziós megközelítés esetében a műszeres megközelítést ne folytassák a külső marker adó (OM) navigációs ponton túl vagy nem precíziós megközelítés esetében a helikopter repülőtér feletti 300 méter (1000 láb) magasság alatt, kivéve ha a jelentett látástávolság vagy a meghatározó futópályamenti látástávolság érték (RVR) a megállapított minimum felett van.

2.6.3.3 Amennyiben precíziós megközelítés esetében a külső marker adó (OM) navigációs pont átrepülése után vagy nem precíziós megközelítés esetében a repülőtér feletti 300 méter (1000 láb) magasság alá történő süllyedésnél a jelentett látástávolság vagy a meghatározó futópályamenti látástávolság érték a megállapított minimum alá csökken, a megközelítés az elhatározási (DA/H) vagy a legalacsonyabb süllyedési magasságig (MDA/H) folytatható. A forgószárnyas légijármű semmi esetre se folytassa a leszálláshoz történő megközelítését bármely helikopter repülőtérre azon a meghatározott ponton túl, amely után az arra megállapított helikopter repülőtér üzemeltetési minimum értéket megsértené.

2.6.4 Repülés jegesedés körülményei között

Ismert vagy várható jegesedés körülményei között a repülést ne kezdjék meg, csak akkor, ha a forgószárnyas légijármű ilyen körülmények közötti üzemelésre van jogosítva és felszerelve.

2.7 Kitérő helikopter repülőterek

2.7.1 A műszerrepülési szabályok szerint tervezett repülés esetében az üzemeltetési és a légiforgalmi szolgálati egységeknek benyújtott repülési tervekben határozzanak meg legalább egy alkalmas kitérő helikopter repülőteret vagy leszállási helyet, kivéve ha:

a) az uralkodó időjárási körülmények megfelelnek a 2.6.2.2 pontnak; vagy

b) 1) a tervezett leszállási helikopter repülőtér elszigetelt fekvésű és alkalmas kitérő nem áll rendelkezésre; és

2) az elszigetelt fekvésű tervezett leszállási repülőtéren műszeres megközelítési eljárást írnak elő; és

3) a vízfelszíni célállomás esetében olyan pontot határoznak meg, ahonnan a visszafordulás (PNR) már nem lehetséges.

2.7.2 Az alkalmas parttól, azaz szárazföldtől távoli vízfelszíni kitérő helikopter repülőtereket vagy leszállási helyeket a következők alapján határozhatják meg:

a) a vízfelszíni (parttól távoli) kitérőket csak azon pont átrepülése után használják, amely után a visszafordulás nem lehetséges (PNR). Ezen pont előtt a szárazföldi kitérőket vegyék igénybe;

b) a kitérő alkalmasságának meghatározásánál vizsgálják meg és vegyék figyelembe a kritikus repülésvezérlő rendszerek, valamint egyéb lényeges részegységek (mechanikai) műszaki megbízhatóságát;

c) a kitérőre történő érkezés előtt határozzák meg és vegyék figyelembe a forgószárnyas légijármű egy működésképtelen hajtóművel történő üzemi teljesítményét;

d) a leszállási hely biztosan rendelkezésre áll; és

e) az időjárási tájékoztatások minden körülmények között pontosak és megbízhatóak legyenek.

Megjegyzés: A repülés végrehajtási kézikönyvben a repülésvezérlő rendszerek meghibásodása esetére meghatározott leszállási módszerek kizárhatják egyes leszállási helyek kitérőként történő igénybevételét.

2.7.3 **Ajánlás** – *Amennyiben a szárazföldi kitérő helikopter repülőtér vagy leszállási hely eléréséhez szükséges tüzelőanyag mennyiség szállítása lehetséges, ne vegyenek igénybe parttól távoli (vízfelszíni) kitérőket. Ezek a körülmények kivételesek és a kedvezőtlen időjárási körülmények közötti terhelés növelés nem tartozik ezek közé.*

2.8 Tüzelőanyag (üzemanyag) és olajkészlet

2.8.1 *Minden forgószárnyas légijármű esetében* – A repülés végrehajtását ne kezdjék meg csak akkor, ha az időjárási körülmények valamint a repülés során várható bármely késés figyelembevételével a forgószárnyas légijármű elegendő tüzelőanyagot és olajat szállít ahhoz, hogy a repülést biztonságosan be tudja fejezni. Ezen kívül az előre nem látható eseményekre való tekintettel szállítsanak tartalékot is.

2.8.2 *Látvarepülési szabályok szerinti (VFR) üzemeltetés* – A 2.8.1 pont előírásának megfelelően szállított tüzelőanyag és olaj mennyisége a látvarepülési szabályok szerint történő üzemeltetés esetében legalább annyi legyen, ami lehetővé teszi, hogy a forgószárnyas légijármű:

a) elrepüljön arra a helikopter repülőtérre, amelyre a repülést tervezték:

b) ezt követően repüljön a legoptimálisabb utazósebességgel 20 percig; és

c) a forgószárnyas légijármű ezen felül rendelkezzen annyi tüzelőanyaggal, amely fedezi az általános célú légiközlekedést szabályzó előírásokban az állam által meghatározott, előre nem látható esetekben bekövetkező fogyasztás növekedés mennyiségét.

2.8.3 *Műszerrepülési szabályok szerinti (IFR) üzemeltetés* – A 2.8.1 pont előírásának megfelelően szállított tüzelőanyag és olaj mennyisége a műszerrepülési szabályok szerint történő üzemeltetés esetében legalább annyi legyen, ami lehetővé teszi, hogy a forgószárnyas légijármű:

2.8.3.1 Amennyiben a 2.6.2.2 előírása alapján kitérő kijelölése nem szükséges, elrepüljön arra a helikopter repülőtérre, amelyre a repülést tervezték és ezt követően;

a) a célállomás helikopter repülőtér felett 450 méter (1500 láb) magasságon, szabványos hőmérsékleti viszonyok között, a várakozásra előírt sebességgel 30 percet repüljön, valamint egy megközelítést és leszállást hajtson végre; és

b) a forgószárnyas légijármű ezen felül rendelkezzen annyi tüzelőanyaggal, amely fedezi az előre nem látható esetekben bekövetkező fogyasztás növekedés mennyiségét.

2.8.3.2 Amennyiben a 2.6.2.1 pont előírása alapján kitérő kijelölése szükséges, elrepüljön arra a helikopter repülőtérre, amelyre a repülést tervezték, ott egy megközelítést és egy megszakított megközelítést hajtson végre és ezt követően;

a) elrepüljön a repülési tervben meghatározott kitérőre; majd

b) a kitérő felett 450 méter (1500 láb) magasságon, szabványos hőmérsékleti viszonyok között, a várakozásra előírt sebességgel 30 percet repüljön, valamint megközelítést és leszállást hajtson végre; és

c) a forgószárnyas légijármű ezen felül rendelkezzen annyi tüzelőanyaggal, amely fedezi az előre nem látható esetekben bekövetkező fogyasztás növekedés mennyiségét.

2.8.3.3 Amennyiben alkalmas kitérő nem áll rendelkezésre (vagyis a tervezett leszállási helikopter repülőtér elszigetelt fekvésű és alkalmas kitérő nem áll rendelkezésre), elrepüljön a tervezett célállomás helikopter repülőtérre és ezt követően a játató állama által meghatározott további időtartamig repüljön.

2.8.4 A 2.8.1 pont előírása alapján szükséges tüzelőanyag és olaj készlet mennyiségének kiszámításánál a legalább következő tényezőket vegyék figyelembe:

a) előrejelzett időjárási körülmények;

b) várható légiforgalmi irányítói engedélyek és útvonalak valamint forgalmi késések;

c) a műszerrepülési szabályok szerint végrehajtott repülés esetében egy műszeres megközelítés végrehajtása a célállomás helikopter repülőterén, beleértve egy megszakított megközelítést is;

d) a repülés végrehajtása alatt bekövetkező egy hajtómű meghibásodás vagy – amennyiben alkalmazható – a túlnyomásos kabin dehermetizálódás esetére előírt eljárások; és

e) minden egyéb olyan körülmény, amely a forgószárnyas légijármű leszállását késleltetheti vagy a tüzelőanyag és/vagy olajfogyasztást növelheti.

Megjegyzés: A 2.8 szakaszban ismertetett tényezők nem korlátozzák a repülési terv repülés közben történő módosításának lehetőségét és a repülés áttervezését egy másik helikopter repülőtérre, feltéve hogy a 2.8 pont előírásai teljesíthetők attól a ponttól kezdődően is, ahol a repülés áttervezése megtörtént.

2.9 Oxigén készlet

Megjegyzés: A szövegben alkalmazott abszolút légnyomás értékeknek megfelelő, az Egyezményes Légkör alapján meghatározott megközelítő magasságok a következők:

Abszolút légnyomás	***magasság – méter***	***magasság – láb***
700 hPa	3000	10 000
620 hPa	4000	13 000

2.9.1 Olyan repülési magasságon végrehajtandó repülés esetében, amelyen a személyek részére rendszeresített kabin(ok)ban a légnyomás 700 hPa értéknél alacsonyabb lesz, a repülést ne kezdjék meg csak akkor, ha elegendő mennyiségű belélegzésre alkalmas oxigént biztosítottak, amely ellátja:

a) a személyzet minden tagját valamint az utasok 10 %-át 30 percet meghaladó bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 700 hPa és 620 hPa érték között van; és

b) a személyzet tagjait valamint az utasokat bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 620 hPa értéknél alacsonyabb.

2.9.2 A túlnyomásos kabinnal rendelkező forgószárnyas légijármű esetében a repülés végrehajtását ne kezdjék meg csak akkor, ha elegendő mennyiségű belélegzésre alkalmas oxigént biztosítottak, amely a túlnyomás megszűnése esetében, a repülés körülményeinek megfelelően ellátja a személyzet összes tagját, valamint az utasokat bármely olyan időtartamra, amely alatt az általuk elfoglalt kabinban a légnyomás 700 hPa értéknél alacsonyabb.

2.10 Oxigén használat

A forgószárnyas légijármű repülése alatt, annak biztonságos üzemeltetéséhez nélkülözhetetlen feladatokat ellátó összes hajózószemélyzeti tagja folyamatosan használja az oxigén légzőkészüléket, amikor ezt az uralkodó körülmények a 2.9.1 vagy 2.9.2 pontok előírásai szerint szükségessé teszik.

2.11 Vészhelyzeti utasítások a repülés alatt

A repülés közben bekövetkező vészhelyzetben a légijármű parancsnoka biztosítsa, hogy a fedélzeten tartózkodó valamennyi személy a körülményeknek megfelelő vészhelyzeti utasításokat és tájékoztatásokat kapjon.

2.12 Légijármű vezetők időjárás jelentése

Ajánlás – *Amennyiben olyan időjárási körülményeket észlelnek, amelyek valószínűleg más légijárművek biztonságát is befolyásolják, ezeket a lehető legrövidebb időn belül jelentsék.*

2.13 Repülésre veszélyes körülmények

Ajánlás – *A repülésre veszélyes, az időjárási viszonyokkal kapcsolatostól eltérő, a repülés végrehajtása során tapasztalt egyéb körülményeket a lehető legrövidebb időn belül jelentsék. Az ilyen leadott jelentések tartalmazzák a más légijárművek biztonságával összefüggő vagy kapcsolatba hozható részleteket is.*

2.14 A hajózószemélyzet tagjainak fizikai állapota

A légijármű parancsnoka felelős annak biztosításáért, hogy a repülést:

a) ne kezdjék meg, ha a hajózószemélyzet bármely tagja valamely okból képtelen előírt feladatainak teljesítésére; Ilyen okok közé tartozhat a testi sérülés, betegség, fáradtság, gyógyszeres vagy alkoholos befolyásoltság; és

b) ne folytassák a legközelebbi alkalmas helikopter repülőtéren túl, ha a hajózószemélyzet bármely tagjának teljesítőképessége valamely ok, mint például fáradtság, betegség vagy oxigén hiány miatt jelentős mértékben csökken.

2.15 A hajózószemélyzet tagjai szolgálati helyeiken

2.15.1 Fel és leszállás

A pilótakabinban szolgálatra kijelölt valamennyi hajózószemélyzeti tag tartózkodjon szolgálati helyén.

2.15.2 Útvonalon

A pilótakabinban szolgálatra kijelölt valamennyi hajózószemélyzeti tag tartózkodjon szolgálati helyén kivéve, ha távolléte a forgószárnyas légijármű üzemeltetésével kapcsolatos feladatok elvégzése vagy fiziológiai okok miatt szükséges.

2.15.3 Biztonsági övek

A hajózószemélyzet valamennyi tagja szolgálati helyén biztonsági övét tartsa becsatolva.

2.15.4 Vállhevederekkel ellátott biztonsági övek

Ajánlás – *Amennyiben ilyen biztonsági övet biztosítottak, a fel és leszállási szakaszokban a hajózószemélyzet bármely légijármű vezetői ülést elfoglaló tagja vállhevederrel ellátott biztonsági övét tartsa becsatolva; a hajózószemélyzet többi tagja a fel és leszállási szakaszokban vállhevederrel ellátott biztonsági övét tartsa becsatolva kivéve, ha a vállhevederek akadályozzák őket feladataik végrehajtásában, amely esetben a vállhevedereket kikapcsolhatják, azonban a biztonsági öveket bekapcsolva kell tartaniuk.*

Megjegyzés: A vállhevederekkel ellátott biztonsági öv egymástól függetlenül használható vállhevederekből és biztonsági övből áll.

2.16 Műszerrepülési eljárások

2.16.1 Az az állam, amelynek területén a helikopter repülőtér elhelyezkedik, vagy az az állam, amelyik felelős egy állam területén kívül levő helikopter repülőtérért hagyjon jóvá és tegyen közzé egy vagy több műszeres megközelítési eljárást a műszerrepülési szabályok szerint igénybe vett minden egyes helikopter repülőtérre vagy végső megközelítési és felszállási területre.

2.16.2 A műszerrepülési szabályok szerint üzemelő összes forgószárnyas légijármű tartsa be azokat a műszerrepülési eljárásokat, amelyeket az az állam hagyott jóvá, amelynek területén a helikopter repülőtér elhelyezkedik, vagy az az állam hagyott jóvá, amelyik felelős az állam területén kívül levő helikopter repülőtérért.

1. Megjegyzés: A műszerrepülési eljárásokban érintett személyek részére ajánlott üzemeltetési eljárások a PANS OPS (Doc 8168) I. kötetében találhatók.

2. Megjegyzés: A műszerrepülési eljárások követelményeire vonatkozó útmutatás az eljárások kidolgozásában résztvevő szakértők részére a PANS-OPS (Doc 8168) II. kötetében található.

2.17 Utasítások – Általános

A forgószárnyas légijármű forgószárnyát hajtómű segítségével csak akkor szabad megforgatni, ha a kormányoknál szakszolgálati engedéllyel rendelkező légijármű vezető foglal helyet.

2.18 Tüzelőanyag-feltöltés utasokkal a fedélzeten vagy a forgószárny(ak) mozgása közben

2.18.1 **Ajánlás** – *A forgószárnyas légijárművön ne végezzenek tüzelőanyag feltöltést akkor, amikor az utasok beszállnak, kiszállnak vagy a fedélzeten tartózkodnak illetve a forgószárny mozgása közben, kivéve ha a légijármű parancsnok vagy más kiképzett személyzet áll készenlétben a forgószárnyas légijármű leggyorsabb és legcélszerűbb módszerekkel történő kiürítésének megkezdésére és a kiürítés irányítására.*

2.18.2 **Ajánlás** – *Az utasok beszállása, kiszállása vagy a forgószárnyas légijármű fedélzetén történő tartózkodása alatt végzett tüzelőanyag feltöltés közben a belső távközlési berendezés vagy más alkalmas eszköz segítségével tartsanak fenn kétoldalú beszédüzemű összeköttetést a tüzelőanyag feltöltést ellenőrző földi személyzet és a légijármű parancsnoka vagy a 2.18.1 pontban előírt más kiképzett személyzet között.*

1. *Megjegyzés: A légijármű tüzelőanyag feltöltésére vonatkozó előírások a 14. Annex, I. Kötetében és a biztonságos tüzelőanyag feltöltési módszerekkel kapcsolatos útmutató a* Repülőtér Szolgálati Kézikönyv *(Doc 9137) 1. és 8. részeiben található.*

2. Megjegyzés: Amikor a forgószárnyas légijármű tüzelőanyaggal történő feltöltését nem kerozinnal végzik, a feltöltés alkalmával a kerozin más gázturbina hajtóanyagokkal keveredik, vagy nyílt töltővezetéket alkalmaznak, további elővigyázatossági rendszabályokra van szükség.

2.19 Vízfelszín feletti repülések

A 4.3.1 pont előírása alapján, a kedvezőtlen időjárási körülmények között, vízfelszín feletti repülést végrehajtó összes forgószárnyas légijármű jogosítva legyen a vízreszállásra. A vízreszállási tájékoztatások

Törölt: barátságtalan

tartalmazzák a vízfelszínre (tengerre) vonatkozó összes információt.

3. fejezet
Forgószárnyas légijármű teljesítmény üzemeltetési korlátozások

3.1 A forgószárnyas légijárművet a következők szerint üzemeltessék:

a) légialkalmassági bizonyítvánnyal vagy más egyenértékű okmánnyal összhangban;

b) a lajstromozó állam légialkalmasságot jogosító hatósága által kiadott teljesítmény korlátozások betartásával; és

c) a 16. Annex I. kötet zajszint minősítési előírásaiban meghatározott tömeg korlátozásoknak megfelelően kivéve, ha különleges körülmények között, bizonyos helikopter repülőtéren, ahol zajszint probléma nem jelentkezik, erre az érintett állam illetékes hatósága – amelyben a helikopter repülőtér elhelyezkedik – külön engedélyt ad.

3.2 A forgószárnyas légijárművön táblákkal, felsorolásokkal, jegyzékekkel, műszer jelölésekkel vagy ezek együttesével tüntessék fel azokat az üzemeltetési korlátozásokat, amelyeket a lajstromozó állam légialkalmasságot jogosító hatósága előírt.

Megjegyzés: A 8. Annex – Légijárművek légialkalmassága *(IV. rész) nemzetközi előírásai és ajánlott gyakorlati eljárásai vonatkoznak a nemzetközi légiközlekedésben utas, teheráru vagy postaküldemény szállítására felhasználni kívánt minden forgószárnyas légijárműre.*

3.3 Amikor a forgószárnyas légijárművel sűrűn lakott, kedvezőtlen időjárási körülmények közötti helikopter repülőtérről kell felszállni vagy arra leszállni, azon állam illetékes hatósága, amelyben a helikopter repülőtér elhelyezkedik, határozza meg azon követelményeket amelyek lehetővé teszik az ilyen üzemeltetésnél a hajtómű egység meghibásodásával járó kockázatra adott megfelelő megoldások alkalmazását.

Törölt: barátságtalan

Megjegyzés: Útmutató az A. Melléklet, 2.4 pontjában található..

4. fejezet
Forgószárnyas légijármű műszerek, felszerelések és repülési okmányok

Megjegyzés: A forgószárnyas légijármű távközlési és navigációs felszerelésére vonatkozó előírásokat a 5. fejezet tartalmazza.

4.1 Az összes forgószárnyas légijármű összes repülése

4.1.1 Általános rész

A légialkalmassági bizonyítvány kiadásához szükséges alapvető felszereléseken kívül a felhasznált forgószárnyas légijármű típustól valamint a repülés végrehajtásának körülményeitől függően a következő pontokban előírt műszereket, felszereléseket és repülési okmányokat helyezzék el vagy szállítsák a forgószárnyas légijárművön. Az előírt műszereket és berendezéseket, beleértve azok felszerelését is a lajstromozó állam hagyja jóvá vagy fogadja el.

4.1.2 Műszerek

A forgószárnyas légijárművet szereljék fel azokkal a műszerekkel, amelyek a hajózószemélyzet számára lehetővé teszik a forgószárnyas légijármű repülési pályájának irányítását és ellenőrzését, bármely előírt eljárás művelet végrehajtását valamint a forgószárnyas légijármű üzemeltetési korlátozásainak a várható üzemeltetési körülmények között történő megfigyelését.

4.1.3 Felszerelések

4.1.3.1 Minden forgószárnyas légijárművet minden repülésén szereljék fel:

a) egy hozzáférhető elsősegélynyújtó készlettel;

b) olyan típusú hordozható tűzoltó készülékkel, amelynek tűzoltó anyaga igénybevétel után nem szennyezi veszélyesen a forgószárnyas légijármű belső terének levegőjét. Legalább egy ilyen tűzoltó készüléket helyezzenek el;

1) a forgószárnyas légijármű pilótafülkéjében; és

2) minden egyes olyan utaskabinban, amely a pilótakabintól el van választva és amelyet a légijármű parancsnoka vagy másodpilótája nem tud azonnal megközelíteni.

c) 1) a lajstromozó állam által meghatározott életkor felett minden egyes személy részére egy megfelelő ülő vagy fekvőhellyel;

2) minden üléshez egy biztonsági övvel valamint minden fekvőhelyhez egy bekötő biztonsági hevederrel;

d) a következő kézikönyvekkel, térképekkel és tájékoztatásokkal:

1) az adott forgószárnyas légijármű repülésvégrehajtási kézikönyve vagy más olyan kiadvány illetve tájékoztató, amely tartalmazza a 3. fejezet alkalmazásához szükséges, a lajstromozó állam légialkalmasságot jogosító hatósága által a forgószárnyas légijárműre előírt bármely üzemeltetési korlátozást;

2) érvényes és alkalmas térképek, amelyek fedik a tervezett repülés útvonalát, valamint bármely olyan egyéb útvonalat, amelyről joggal feltételezhető, hogy arra a repülés átirányítható;

3) az elfogott légijármű parancsnok számára a 2. Annex-ben előírt eljárások; és

4) az elfogó és az elfogott légijárművek által használandó, a 2. Annex-ben előírt látjelek; és

e) megfelelő értékű elektromos biztosítékok tartalékként a repülés közben hozzáférhető biztosítékok cseréjéhez.

4.1.3.2 **Ajánlás** – *Minden forgószárnyas légijármű minden repülésén legyen felszerelve a kutatás és mentés céljait szolgáló föld-levegő látjelekkel.*

4.1.3.3 **Ajánlás** – *Minden forgószárnyas légijármű minden repülésén az összes hajózószemélyzeti tag ülése legyen felszerelve vállhevederekkel ellátott biztonsági övvel.*

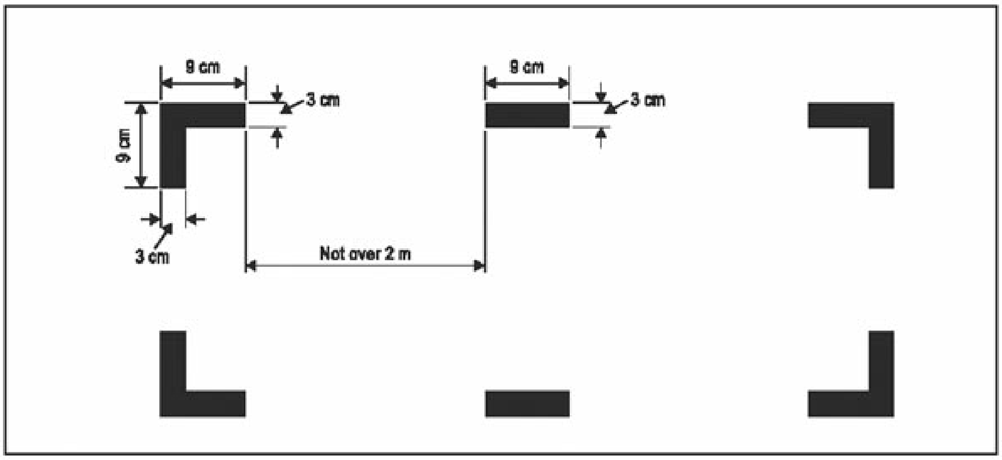
Megjegyzés: A vállhevederekkel ellátott biztonsági öv egymástól függetlenül használható vállhevederekből és biztonsági övből áll.

4.1.4 Az átvágható felületek jelzése

4.1.4.1 Amennyiben a forgószárnyas légijárművön a mentőszemélyzet részére jelzik a kényszerhelyzet esetében a törzsön átvágható felületeket, azokat az alábbi ábrának megfelelő módon jelöljék meg. A jelölések színe vörös vagy sárga legyen és ha erre a háttértől történő megkülönböztethetőség érdekében szükség van, azokat fehér színű alapozásra készítsék el.

4.1.4.2 Amennyiben a sarkok jelölése egymástól több mint 2 méter távolságra van, fessenek fel 9 x 3 cm-es vonalakat olyan módon, hogy az egymás mellett levő vonalak közötti távolság 2 méternél nagyobb ne legyen.

Megjegyzés: Ez az előírás nem teszi szükségessé azt, hogy bármely forgószárnyas légijármű sárkányszerkezetén átvágható felületek legyenek.



A légijármű törzsén levő átvágható felületek azaz behatolási pontok jelzése
a mentőszemélyzet számára
Jelölések közötti távolság nem több mint 2 méter

4.2 A látvarepülési (VFR) és műszerrepülési (IFR) szabályok szerint, nappal és éjszaka végrehajtott repülésekhez szükséges műszerek és berendezések

Megjegyzés: A 4.2.1 – 4.2.3 pontok repülőgépvezetési műszerekre vonatkozó követelményei műszer kombinációkkal, vagy elektronikus képernyőkkel teljesíthetők.

4.2.1 Az összes látvarepülési szabályok (VFR) szerint, nappal üzemeltetett forgószárnyas légijárművet szereljék fel a következőkkel:

a) egy mágneses iránytűvel;

b) egy pontos időmérő berendezéssel, amely az időt órában, percben és másodpercben jelzi;

c) érzékeny nyomás-magasság mérőműszerrel;

d) repülési sebesség mérőműszerrel; és

e) olyan további műszerekkel vagy berendezésekkel, amelyeket az illetékes hatóság előírt.

4.2.2 Az összes látvarepülési szabályok (VFR) szerint, éjjel üzemeltetett forgószárnyas légijárművet szereljék fel a következőkkel:

a) a 4.2.1 pontban felsorolt berendezésekkel;

b) helyzetjelző műszerrel (műhorizonttal), minden egyes légijárművezető számára;

c) csúszásjelzővel;

g) irányjelző műszerrel (géptengely irány-jelző pörgettyűs – giroszkópikus – műszer);

h) emelkedési és süllyedési sebesség mérőműszerrel;

i) olyan kiegészítő műszerekkel és berendezésekkel, melyeket a megfelelő hatóság ír elő;

és a következő világító eszközökkel:

g) a 2. Annex előírásainak megfelelő fényekkel, a helikopter repülőtér mozgási területein üzemelő légijárművek fényeire meghatározottak szerint;

Megjegyzés: A fények általános jellemzőit a 8. Annex határozza meg. A repülés közben levő valamint a helikopter repülőtér mozgási területein üzemelő légijárművek fényeire vonatkozó, 2. Annex előírásainak megfelelő fények jellemzőit a Légialkalmassági Kézikönyv *-ben (Doc 9760) részletezi.*

h) leszálló fényszóróval;

i) a forgószárnyas légijármű biztonságos üzemeltetése szempontjából alapvető fontosságú, a hajózószemélyzet által használt valamennyi műszer és berendezés (meg)világításával;

j) világítással valamennyi utastérben; és

k) elektromos kézilámpával minden egyes személyzet tag szolgálati helyen.

4.2.2.1 **Ajánlás** – *Az egyik leszálló fényszóró legalább függőleges síkban elfordítható legyen.*

4.2.3 A műszerrepülési szabályok szerint (IFR) üzemeltetett összes forgószárnyas légijárművet vagy azokat, amelyek üzemeltetésük során egy vagy több műszer segítsége nélkül nem tarthatók a kívánt repülési helyzetben, szereljék fel:

a) egy mágneses iránytűvel;

b) egy pontos időmérő berendezéssel, amely az időt órában, percben és másodpercben jelzi;

c) érzékeny, nyomás-magasság mérőműszerrel;

Megjegyzés: A már hosszabb ideje tapasztalható pontatlan mérések miatt a dob-mutatós magasságmérő használata nem javasolt.

d) repülési sebesség mérőműszerrel, amely olyan berendezéssel van ellátva, amely megakadályozza a párakicsapódás vagy jegesedés következtében lehetséges helytelen működést;

e) csúszás jelzőműszerrel;

f) repülési helyzetjelző műszerrel (műhorizont) az igényelt mennyiségű légijárművezetők számának megfelelően, és egy kiegészítő helyzetjelző műszerrel;

g) irányjelző műszerrel (géptengely irány-jelző pörgettyűs – giroszkópikus – műszer):

h) a pörgettyűs műszerek kielégítő elektromos táplálásának jelzésére szolgáló eszközzel;

i) a pilótakabinban felszerelt, a külső levegő hőmérsékletét jelző műszerrel;

j) emelkedési és süllyedési sebesség mérőműszerrel;

k) olyan további műszerekkel vagy berendezésekkel, amelyeket az illetékes hatóság előírt; és

l) éjszakai repülések esetére 4.2.2 g) – k) és 4.2.2.1 alpontokban meghatározott fényekkel.

4.3 Az összes, vízfelszín felett üzemeltetett forgószárnyas légijármű

4.3.1 Úszóeszközök

Minden olyan forgószárnyas légijárművet, amelyet vízfelszín felett kívánnak üzemeltetni, szereljenek fel állandó vagy gyorsan kibocsátható (üzembe helyezhető) úszóeszközzel, amely biztosítja a forgószárnyas légijármű biztonságos vízreszállását, ha:

a) a járató állama szerint meghatározott módon a forgószárnyas légijármű engedélyezve lett parttól távoli repülésekre, vagy egyéb vízfelszín feletti műveletekre; vagy

b) a szárazföldtől a megfelelő állami hatóság által meghatározott távolságra repül vízfelszín felett.

Megjegyzés: A 4.3.1 pontban ismertetett szárazföldtől számított távolság meghatározása alkalmával vegyék figyelembe a környezeti körülményeket, valamint a kutató és mentő szolgálat (SAR) igénybevételének lehetőségeit.

4.3.2 Vészhelyzeti felszerelések

4.3.2.1 A 4.3.1 pont előírása alapján üzemeltetett forgószárnyas légijárművet szereljék fel;

a) a fedélzeten tartózkodó minden személy részére azonnal hozzáférhető helyen tárolt mentőmellénnyel vagy egyéb megfelelő egyéni úszóeszközzel;

b) ha az alkalmazott forgószárnyas légijármű típusától függően nem rendelkeznek másként, elegendő számú mentő-tutajjal a fedélzeten tartózkodó összes személy elhelyezésére, amelyeket úgy tárolnak, hogy azok a vészhelyzet esetén gyorsan üzembe helyezhetők és a repülési útvonal sajátosságainak megfelelő életmentő eszközökkel vannak ellátva, beleértve a létfenntartási eszközöket is; és

c) a 2. Annex-ben ismertetett pirotechnikai vészjelzések előállítására szolgáló eszközökkel.

4.3.2.2 Ha a forgószárnyas légijármű olyan helikopter repülőtéren száll fel vagy le, ahol a járató államának véleménye szerint a felszállási vagy leszállási útvonal olyan hosszan vezet vízfelszín felett, hogy az esetleges rendellenes üzemelés vagy repesemény alkalmával vízreszállás valószínű, a forgószárnyas légijárművet szereljék fel legalább a 4.3.2.1 a) pont előírása alapján szükséges vészhelyzeti felszereléssel.

4.3.2.3 Minden egyes mentőmellényt és egyéb megfelelő egyéni úszóeszközt, amelyet a jelen 4.3 szakasz előírásai alapján szállítanak, a felhasználó személy feltalálásának megkönnyítése érdekében lássanak el elektromos világítással.

4.3.2.4 **Ajánlás** – *Bármely forgószárnyas légijárművön, amelynek egyedi légialkalmassági bizonyítványát először 1991 január 1-én vagy ezt követően adták ki, a 4.3.2 pont előírása alapján szállított mentőtutajok legalább 50 %-a távirányítással legyen kibocsátható.*

4.3.2.5 **Ajánlás** – *A távirányítással nem kibocsátható és 40 kg-nál nehezebb mentőtutajok a kibocsátás megkönnyítése érdekében valamilyen mechanikus kibocsátó szerkezettel legyenek felszerelve.*

4.3.2.6 **Ajánlás** – *Bármely forgószárnyas légijármű esetében, amelynek egyedi légialkalmassági bizonyítványát először 1991 január 1. előtt adták ki, 1992 december 31. előtt teljesítsék a 4.3.2.4 és 4.3.2.5 pontok előírásait.*

4.4 Az összes, kijelölt szárazföld felett üzemeltetett forgószárnyas légijármű

Amennyiben a forgószárnyas légijárművet olyan szárazföldi területek felett üzemeltetik, amelyeket az érintett államok olyan területként jelölnek meg, ahol a kutatás és mentés különös nehézségekbe ütközik, a forgószárnyas légijárművet szereljék fel olyan jeladó berendezéssel és életmentő felszereléssel, beleértve a létfenntartási eszközöket is, amelyek nagy valószínűséggel megfelelnek az átrepülendő terület sajátosságainak.

4.5 Az összes, nagy repülési magasságon üzemeltetett forgószárnyas légijármű

4.5.1 Túlnyomásos kabin nélküli forgószárnyas légijármű

Amennyiben a túlnyomásos kabinnal nem rendelkező forgószárnyas légijárművet nagy repülési magasságon kívánják üzemeltetni, azt szereljék fel a 2.9.1 pontban előírt oxigén tároló és adagoló berendezéssel.

4.5.2 Túlnyomásos kabinnal rendelkező forgószárnyas légijármű

Ajánlás – *Amennyiben a túlnyomásos kabinnal rendelkező forgószárnyas légijárművet nagy repülési magasságon kívánják üzemeltetni, azt szereljék fel a 2.9.2 pontban előírt belélegzésre alkalmas oxigén készlet tárolására megfelelő vészhelyzeti oxigén tároló és adagoló berendezéssel.*

4.6 Minden forgószárnyas légijármű, amelynek meg kell felelnie a 16. Annex I. kötet zajbizonyítvány előírásoknak

Minden forgószárnyas légijármű, amelynek meg kell felelnie a 16. Annex, I. kötet zajbizonyítvány előírásoknak, hordozza a zajbizonyítványt igazoló okmányt. Amikor ez az okmány vagy a lajstromozó állam részéről jóváhagyott más dokumentumban található zajbizonyítványt tartalmazó megfelelő nyilatkozat nem angol nyelvű, mellékeljék annak hiteles angol nyelvű fordítását is.

1. Megjegyzés: – A kötelezettségvállalást a fedélzeten tartott bármilyen dokumentum tartalmazhatja, amelyet a lajstromozó állam a 16. Annex, I. kötet rendelkezéseivel összhangban jóváhagyott.

2. Megjegyzés: – A 16. Annex, I. kötetben közölt, és a forgószárnyas légijárműveknél alkalmazható, különböző zajbizonyítvány előírásokat a típusalkalmassági megkérésének dátumával, vagy az igazolást kiadó hatóság által meghatározott egyenértékű eljárás szerint benyújtott kérelem elfogadási dátumával lehet meghatározni. Néhány forgószárnyas légijárműnél nem követelmény, hogy megfeleljen bármelyik zajbizonyítvány előírásnak. Részletesebben lásd a 16. Annex, I. kötet, II. rész, 8 és 11 fejezeteit.

4.7 Repülési adatrögzítők

1. Megjegyzés: A repülési adatrögzítők két rendszerből illetve berendezésből, a repülési adatrögzítőből (FDR) valamint a pilótakabin hangrögzítőből (CVR) állnak.

2. Megjegyzés: Az összetett repülési adat és pilótakabin hangrögzítő berendezések (FDR/CVR) csak a jelen Annex-ben külön ismertetett repülési adatrögzítő berendezés előírások teljesítésére használhatók.

3. Megjegyzés: A repülési adatrögzítőkkel kapcsolatos részletes útmutató a B. Mellékletben található.

4.7.1 Repülési adatrögzítők – típusok

4.7.1.1 *A IV. típusú repülési adatrögzítők*

4.7.1.1.1 A IV. típusú repülési adatrögzítő rögzítse azokat az adatokat, amelyek a forgószárnyas légijármű repülési pályájának, sebességének, helyzetének, hajtómű teljesítményének és működésének pontos meghatározásához szükségesek.

4.7.1.1.2 A IVA. típusú repülési adatrögzítő rögzítse azokat az adatokat, amelyek a forgószárnyas légijármű repülési pályájának, sebességének, helyzetének, hajtómű teljesítményének, működésének és repülésvezérlő szerkezetei helyzetének pontos meghatározásához szükségesek.

4.7.1.2 Az V. típusú repülési adatrögzítő rögzítse azokat az adatokat, amelyek a forgószárnyas légijármű repülési pályájának, sebességének, helyzetének és hajtómű teljesítményének pontos meghatározásához szükségesek.

4.7.1.3 A repülési adatrögzítő berendezésekben 1995 január 1. után ne használjanak fémszalagot.

4.7.1.4 ***Ajánlás*** *– 1998 november 5. után ne használják a frekvencia modulációt (FM) alkalmazó analóg adatrögzítőket.*

4.7.1.4.1 2003 január 1. után ne használják a fényképészeti filmmel működő repülési adatrögzítőket.

4.7.1.5 Az összes olyan digitális adathálózati összeköttetést alkalmazó valamint pilótakabin hangrögzítő berendezés (CVR) szállítására kötelezett forgószárnyas légijármű, amelynek egyedi légialkalmassági bizonyítványát először 2005 január 1. után adták ki, az összes adathálózati digitális közleményváltást a repülési adatrögzítő berendezésén rögzítse. A legkisebb felvételi időtartam azonos legyen a pilótakabin hangrögzítő berendezés felvételi időtartamával és a felvétel összevethető legyen a pilótakabinban rögzített hangfelvétellel.

4.7.1.5.1 2007 január 1-től az összes, digitális adathálózati összeköttetést alkalmazó valamint pilótakabin hangrögzítő berendezés szállítására kötelezett forgószárnyas légijármű rögzítse a légiforgalmi szolgálattal történt digitális közleményváltásait a pilótakabin hangrögzítő vagy repülési adatrögzítő berendezésén. A legkisebb felvételi időtartam azonos legyen a pilótakabin hangrögzítő berendezés felvételi időtartamával és a felvétel összevethető legyen a pilótakabinban rögzített hangfelvétellel.

4.7.1.5.2 Rögzítsék az adathálózati digitális közleményváltás tartalmának megismeréséhez szükség információkat és ahol ez lehetséges a közlemény megjelenítésének vagy a hajózószemélyzet által történt lehívásának időpontját is.

Megjegyzés: Az adathálózati összeköttetések közé tartoznak, azonban nem csak ezekre korlátozódnak a következők:

ADS- C – automatikus légtérfelderítési adat szolgáltatási megállapodás
CPDLC – légiforgalmi irányító és repülőgépvezető közötti adathálózati összeköttetések
D-FIS – adathálózati és repüléstájékoztató szolgálati összeköttetések
AOC – légiközlekedési üzemi irányítási közlemények.

4.7.1.6 **Ajánlás** – *Minden olyan 2730 kg. legnagyobb engedélyezett felszállósúlynál nagyobb tömegű forgószárnyas légijárművet, amely repülési adatrögzítő és pilótakabin hangrögzítő berendezések szállítására kötelezett, alternatív megoldásként egy összetett repülési adat és pilótakabin hangrögzítő berendezéssel is (FDR/CVR) felszerelhetnek.*

4.7.2 Repülési adatrögzítők – felvételi időtartam

A IV. és V. típusú repülési adatrögzítő legyen képes a működésének legalább utolsó tíz órájában rögzített adatok tárolására.

4.7.3 Repülési adatrögzítők – Forgószárnyas légijárművek, amelyek egyedi légialkalmassági bizonyítványát először 1989 január 1-én vagy ezt követően adták ki

4.7.3.1 Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 7000 kg, szereljenek fel IV. típusú repülési adatrögzítő berendezéssel.

4.7.3.2 ***Ajánlás*** *– Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett* *felszállósúlya (tömege) 2730 kg-tól 7000 kg-ig terjed, szereljenek fel V. típusú repülési adatrögzítő berendezéssel.*

4.7.4 Repülési adatrögzítők – Forgószárnyas légijárművek, amelyek egyedi légialkalmassági bizonyítványát először 2005. január 1. után adták ki

Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 3175 kg, szereljenek fel IV.A típusú repülési adatrögzítő berendezéssel, melynek felvételi időtartama legalább 10 óra.

Megjegyzés: Elfogadható az önálló (FDR) vagy az összetett (CVR/FDR) repülési adatrögzítő is.

4.7.5 Pilótakabin hangrögzítők – Forgószárnyas légijárművek, amelyek egyedi légialkalmassági bizonyítványát először 1987 január 1-én vagy ezt követően adták ki

Megjegyzés: A pilótakabin hangrögzítő berendezésre előírt műszaki követelmények megtalálhatók az EUROCAE Polgári Légiközlekedési Berendezések Európai Szervezete repülési adatrögzítő rendszerekre kidolgozott MOPS (minimális üzemi teljesítmény előírások) kiadványában vagy más egyenértékű dokumentumban.

4.7.5.1 Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) több mint 7000 kg, szereljenek fel pilótakabin hangrögzítő berendezéssel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt. A repülési adatrögzítővel nem rendelkező forgószárnyas légijárművön a pilótakabin hangrögzítő berendezés egyik felvételi sávján rögzítsék legalább a fő forgószárny fordulatszámát.

4.9.5.2 ***Ajánlás*** *– Minden olyan forgószárnyas légijárművet, amelynek legnagyobb engedélyezett felszállósúlya (tömege) 3175 kg-tól 7000 kg-ig terjed, szereljenek fel pilótakabin hangrögzítő berendezéssel, amelynek célja a pilótakabin belső hangkörnyezetének rögzítése a repülés időtartama alatt. A repülési adatrögzítővel nem rendelkező forgószárnyas légijárművön a pilótakabin hangrögzítő berendezés egyik felvételi sávján rögzítsék legalább a fő forgószárny fordulatszámát.*

4.7.6 Pilótakabin hangrögzítők – felvételi időtartam

4.7.6.1 A pilótakabin hangrögzítő berendezés képes legyen a működése legalább utolsó 30 percében rögzített adatok tárolására.

4.7.6.2 **Ajánlás** *— Az a pilótakabin hangrögzítő berendezés, amelyet olyan forgószárnyas légijárműbe szereltek be, amelynek egyedi légialkalmassági bizonyítványát először 1990 január 1-én vagy ezt követően adták ki, képes legyen a működése legalább utolsó két órájában rögzített adatok tárolására.*

4.7.6.3 Az a pilótakabin hangrögzítő berendezés, amelyet olyan forgószárnyas légijárműbe szereltek be, amelynek egyedi légialkalmassági bizonyítványát először 2003 január 1. után adták ki, képes legyen a működése legalább utolsó két órájában rögzített adatok tárolására.

4.7.7 Repülési adatrögzítők – szerkezet és beszerelés

A repülési adatrögzítőket úgy készítsék el és helyezzék el illetve szereljék be a légijárműbe, hogy biztosítsák a rögzített adatok gyakorlatilag lehetséges legnagyobb védelmét annak érdekében, hogy a rögzített adatok megőrizhetők, leolvashatók és feldolgozhatók legyenek.

4.7.8 Repülési adatrögzítők – működés

4.7.8.1 A repülési adatrögzítőt a repülés alatt ne kapcsolják ki.

4.7.8.2 A repülési adatrögzítővel rögzített adatok megőrzése érdekében a berendezést egy baleset vagy repesemény utáni repülés befejezését követően kapcsolják ki és azt a 13. Annex előírásaival összhangban az adatokat tartalmazó adathordozó eltávolítása előtt ne kapcsolják ismét be.

1. Megjegyzés: A repülési adatrögzítővel rögzített tájékoztatások légijárműből történő eltávolításának szükségességét a vizsgálatot végző állam vizsgáló hatósága határozza meg az esemény súlyossága és körülményei alapján, beleértve az eseménynek a repülési üzemre gyakorolt hatását is.

2. Megjegyzés: A járatónak a repülési adatrögzítővel rögzített adatok tárolására vonatkozó felelősségét a 9.6 pont tartalmazza.

4.7.9 Repülési adatrögzítők – folyamatos működőképesség

Végezzék el a repülési adat és pilótakabin hangrögzítő rendszerek felvételeinek üzemi ellenőrzését és értékelését annak érdekében, hogy a rögzítő berendezések folyamatos működőképességét biztosíthassák.

Megjegyzés: A repülési adat és pilótakabin hangrögzítő rendszerek ellenőrzésének eljárásait a B. Melléklet tartalmazza.

4.8 Vészhelyzeti helyjeladó berendezés (ELT)

2008. június 30-ig alkalmazható

4.8.1 Minden olyan, a 4.3.1 a) alpont alapján vízfelszín felett üzemeltetett 1. és 2. teljesítmény osztályú forgószárnyas légijárművet amelynek egyedi légialkalmassági bizonyítványát először 2002 január 1. után adták ki, és minden olyan a 4.3.1 b) alpont alapján üzemeltetett 3. teljesítmény osztályú forgószárnyas légijárművet amelynek egyedi légialkalmassági bizonyítványát először 2002 január 1. után adták ki, és mentőtutajonként legalább egy darab automatikus ELT berendezéssel és egy darab (ELT/S) berendezéssel szereljenek fel

4.8.2 A 4.3.1 a) alpont alapján a vízfelszín felett üzemeltetett összes 1. és 2. teljesítmény osztályú és a 4.3.1 b) alpont alapján üzemeltetett 3. teljesítmény osztályú forgószárnyas légijárművet 2005 január 1-től mentőtutajonként legalább egy darab automatikus ELT berendezéssel és legalább egy darab (ELT/S) berendezéssel szereljenek fel.

4.8.3 A 4.6 szakasz alapján kijelölt szárazföldi területek felett repülést végrehajtó minden forgószárnyas légijárművet, amelynek egyedi légialkalmassági bizonyítványát először 2002 január 1. után adták ki, legalább egy darab automatikus vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

4.8.4 2005 január 1-től a 4.4 szakasz alapján kijelölt szárazföldi területek felett repülést végrehajtó minden forgószárnyas légijárművet legalább egy darab automatikus vészhelyzeti helyjeladó (ELT) berendezéssel szereljenek fel.

4.8.5 **Ajánlás** – *Az összes forgószárnyas légijárművet szereljék fel automatikusan működésbe lépő vészhelyzeti helyjeladó (ELT) berendezéssel.*

4.8.6 A fenti 4.8.1 – 4.8.5 pontok alapján felszerelt vészhelyzeti helyjeladó (ELT) berendezés a 10. Annex III. kötet vonatkozó előírásai szerint üzemeljen.

2008. július 01-től alkalmazható

4.8.7 2008 július 01-től minden 1. és 2. teljesítmény osztályú forgószárnyas légijárművet szereljenek fel legalább egy darab automatikus ELT berendezéssel, és a 4.3.1 a) alpontban leírtak szerinti vízfelszín feletti üzemeltetés esetére pedig mentőtutajonként vagy mentőmellényenként szereljenek fel legalább egy darab automatikus ELT berendezéssel és legalább egy darab (ELT/S) berendezéssel.

4.8.8 2008 július 01-től minden 3. teljesítmény osztályú forgószárnyas légijárművet szereljenek fel legalább egy darab automatikus ELT berendezéssel, és a 4.3.1 b) alpontban leírtak szerinti vízfelszín feletti üzemeltetés esetére pedig mentőtutajonként vagy mentőmellényenként szereljenek fel legalább egy darab automatikus ELT berendezéssel és legalább egy darab (ELT/S) berendezéssel.

4.8.9 A fenti 4.8.7 és 4.8.8 pontok alapján felszerelt vészhelyzeti helyjeladó (ELT) berendezés a 10. Annex III. kötet vonatkozó előírásai szerint üzemeljen.

Megjegyzés: A vészhelyzeti helyjeladó (ELT) számának, típusának és a légijárművön való elhelyezésének valamint az uszóképességet támogató kiegészítő rendszerének megfelelő kiválasztása adja a legnagyobb esélyt a vészhelyzeti helyjeladó (ELT) működésbe hozására, amennyiben a kutatás és mentés szempontjából különösen nehéz területeket is beleértve, a víz vagy a szárazföld felett repülő légijárművet baleset érné. Az adóegység elhelyezése a legfontosabb tényező az optimális törés és tűz elleni védelem biztosításában. Az automatikus működésű beépített vészhelyzeti helyjeladó (ELT) vezérlő és kapcsoló eszközeinek (aktíváló kijelzők) elhelyezésénél és a kapcsolódó üzemeltetési eljárások kialakításánál tekintetbe kell venni a figyelmetlenségből adódó működésbe hozatal gyors felismerésének, valamint a manuális bekapcsolás esetén a személyzet általi könnyű kezelhetőség igényeit.

4.9 Forgószárnyas légijárművek, amelyeket nyomásmagasság-adó másodlagos radar válaszjeladóval kell felszerelni

4.9.1 2003 január 1-től az illetékes hatóság felmentésének kivételével minden forgószárnyas légijárművet szereljenek fel a 10. Annex IV. kötet vonatkozó előírásainak megfelelően üzemelő nyomásmagasság-adó másodlagos radar válaszjeladó berendezéssel.

4.9.2 **Ajánlás** – *Minden forgószárnyas légijárművet szereljenek fel a 10. Annex IV. kötet vonatkozó előírásainak megfelelően üzemelő nyomásmagasság-adó másodlagos radar válaszjeladó berendezéssel.*

Megjegyzés: A 4.9.1 és 4.9.2 pontok előírásainak célja a légiforgalmi szolgálatok valamint az összeütközést elkerülő fedélzeti rendszerek hatékony működésének fejlesztése. Az ACAS rendszer felszerelésére és szállítására vonatkozó hatálybalépési időpontokat a 6. Annex I. rész 6.18.1 és 6.18.2 pontjai tartalmazzák. Az előírás célja továbbá az is, hogy a nyomásmagasság-adó másodlagos radar válaszjeladó berendezéssel fel nem szerelt légijármű ne üzemeljen közös légtérben olyan légijárművel, amely összeütközést elkerülő fedélzeti rendszerrel (ACAS) van felszerelve. Ennek érdekében a nyomásmagasság-adó másodlagos radar válaszjel adó berendezés szállítása alól történő felmentéseket olyan légtér kijelölése mellett adják ki, amelyben az ilyen berendezés szállítása nem kötelező.

4.10 Mikrofonok

Ajánlás – *A pilótakabinban szolgálati feladatot ellátó összes hajózószemélyzeti tag közleményváltásaihoz az átváltási szint/magasság alatt gégemikrofont vagy fejhallgatóhoz erősített mikrofont használjon.*

5. fejezet
Forgószárnyas légijármű távközlési és navigációs berendezések

5.1 Távközlési berendezés

5.1.1 A műszerrepülési szabályok szerint vagy éjszaka üzemeltetett forgószárnyas légijárművet szereljék fel rádió távközlési berendezéssel. Az ilyen berendezés a meghatározott frekvenciákon alkalmas legyen kétoldalú rádióösszeköttetés fenntartására az illetékes hatóság által előírt légiforgalmi állomásokkal.

Megjegyzés: A 5.1.1 pont előírásai teljesítettnek tekinthetők, ha az útvonalon szokásos hullámterjedési viszonyok között a forgószárnyas légijármű képes az itt meghatározott távközlési összeköttetések fenntartására.

5.1.2 Amikor a 5.1.1 előírásának teljesítése érdekében egynél több berendezés felszerelése szükséges, azok egymástól függetlenül működjenek úgy, hogy az egyik berendezés meghibásodása ne okozza bármely másik berendezés meghibásodását.

5.1.3 A látvarepülési szabályok szerint, de ellenőrzött repülésként üzemeltetett forgószárnyas légijárművet az illetékes hatóság mentesítő engedélyének hiányában szereljenek fel rádió távközlési berendezéssel, amely a repülés végrehajtása alatt bármikor alkalmas az illetékes hatóság által meghatározott frekvenciákon és kijelölt légiforgalmi állomásokkal a kétoldalú rádió-összeköttetés fenntartására.

5.1.4 Azt a forgószárnyas légijárművet, amelyet olyan repülés végrehajtására használnak fel, amelyre a 4.3 vagy 4.4 szakaszok előírásai vonatkoznak, az illetékes hatóság mentesítő engedélyének hiányában szereljenek fel rádió távközlési berendezéssel, amely a repülés végrehajtása alatt bármikor alkalmas az illetékes hatóság által meghatározott frekvenciákon és kijelölt légiforgalmi állomásokkal a kétoldalú rádió-összeköttetés fenntartására.

5.1.5 **Ajánlás** – *Az 5.1.1 – 5.1.4 pontok alapján előírt rádió berendezés alkalmas legyen rádió összeköttetés fenntartására a légiközlekedési vészfrekvencián.*

5.1.6 A légtér meghatározott szakaszaiban vagy olyan útvonalakon történő repülések végrehajtásakor, ahol RCP típus lett előírva, az 5.1.1 – 5.1.5 pontokban meghatározott követelményeken túl a forgószárnyas légijármű:

a) legyen felszerelve olyan távközlési berendezésekkel, amelyek lehetővé teszik az előírt RCP típus(ok) szerinti üzemeltetést; és

b) a járató állama részéről rendelkezzen jogosítással az ilyen légtérben történő üzemeléshez.

Megjegyzés: az előírt távközlési teljesítményre (RCP), az ezzel összefüggő eljárásokra valamint a jogosítási folyamatra vonatkozó tájékoztatásokat az előkészítés alatt lévő Előírt Távközlési Teljesítmény

(RCP) *Kézikönyv (Doc 9869) tartalmazza. Ez a kiadvány felsorolja továbbá azokat a dokumentumokat is amelyeket az államok és a nemzetközi szervezetek a távközlési rendszerekre és az előírt távközlési teljesítményre (RCP) dolgoztak ki.*

5.2 Navigációs berendezés

5.2.1 A forgószárnyas légijárművet olyan navigációs berendezéssel szereljék fel, amelynek segítségével az képes:

a) az üzemeltetői repülési tervében meghatározott útvonal követésére; és

b) a légiforgalmi szolgálatok előírásainak megfelelő repülés végrehajtására;

kivéve, ha ezt az illetékes hatóság nem tiltja meg, a látvarepülési szabályok szerint végrehajtott repülés során a navigációt a földi tájékozódási pontok látás utáni azonosításával hajtja vége. Az általános célú nemzetközi légiközlekedés esetében a földi vonatkozási pontok (tereptárgyak illetve jellegzetes tájolási pontok) közötti legnagyobb távolság 110 km (60 NM) lehet.

5.2.2 A légtér meghatározott szakaszaiban vagy olyan útvonalakon történő repülés esetében, amelyekre vonatkozóan RNP típust írtak elő, a forgószárnyas légijármű az 5.2.1 pontban ismertetett előírások mellett:

a) legyen felszerelve olyan navigációs berendezésekkel, amelyek lehetővé teszik az előírt RNP típus(ok) szerinti üzemeltetést; és

b) a lajstromozó állam részéről rendelkezzen jogosítással az ilyen légtérben történő üzemeléshez.

Megjegyzés: Az előírt navigációs pontosságra (RNP), az ezzel összefüggő eljárásokra valamint a jogosítási folyamatra vonatkozó tájékoztatásokat az RNP Kézikönyv *(Doc 9613) tartalmazza. A kiadvány átfogóan felsorolja azokat a dokumentumokat és egyéb anyagokat, amelyeket az államok és a nemzetközi szervezetek a navigációs rendszerekre valamint az előírt navigációs teljesítményre vonatkozóan készítettek el.*

5.2.3 A forgószárnyas légijárművet olyan navigációs berendezéssel szereljék fel, amely biztosítja, hogy a repülés végrehajtásának bármely szakaszában bekövetkező, az egyik rendszert érintő meghibásodás esetében a forgószárnyas légijárművet a 5.2.1 pont valamint ahol ez alkalmazható, az 5.2.2 pont előírásainak megfelelően tovább lehessen irányítani (navigálni).

Megjegyzés: Az általános célú nemzetközi légiközlekedés vonatkozásában ezt az előírást a berendezések megkettőzésén kívül más módszerekkel is teljesíthetik.

5.2.4 A műszeres időjárási körülmények között végrehajtott leszállással tervezett repülések esetében a forgószárnyas légijárművet szereljék fel olyan rádió berendezéssel, amely alkalmas az irányvezetést biztosító rádiójelek vételére addig a pontig, ahonnan a leszállás látással végrehajtható. Ez a rádió berendezés alkalmas legyen az irányvezetés biztosítására minden olyan tervezett leszállási, valamint bármely kijelölt kitérő helikopter repülőtéren, ahol műszeres időjárási körülmények között történő leszállás végrehajtását tervezik.

6. fejezet
Forgószárnyas légijármű karbantartás

1. Megjegyzés: A jelen fejezetben történő alkalmazás során a forgószárnyas légijármű kifejezésbe tartoznak a hajtóművek, meghajtás áttételek, forgószárnyak, légcsavarok, alkatrészek, műszerek, szerkezeti egységek és felszerelések, beleértve a vészhelyzeti felszereléseket is.

2. Megjegyzés: A folyamatos légialkalmasság követelményeire vonatkozó útmutató a Légialkalmassági Kézikönyv-*ben (Doc 9760) található*
.

6.1 Karbantartási felelősség

6.1.1 A forgószárnyas légijármű tulajdonosa vagy bérlet esetében annak bérlője biztosítsa, hogy:

a) minden üzemeltetett forgószárnyas légijárműve repülésre alkalmas állapotban legyen;

b) a tervezett repüléshez szükséges üzemeltetési és vészhelyzeti berendezések működőképesek legyenek;

c) minden egyes üzemeltetett forgószárnyas légijárművének Légialkalmassági Bizonyítványa érvényes legyen;

d) a forgószárnyas légijármű karbantartását a lajstromozó állam részéről elfogadható program szerint elvégezték.

6.1.2 A forgószárnyas légijárművet csak akkor üzemeltessék, ha azt a lajstromozó állam részéről elfogadható rendszerben tartják karban és adják ki további üzemeltetésre.

6.1.3 Amikor a karbantartási nyilatkozatot nem a 6. Annex I. rész 8.7 szakasza alapján jóváhagyott szervezet adja ki, a karbantartási nyilatkozatot aláíró személy az 1. Annex előírásainak megfelelő szakszolgálati jogosítással rendelkezzen.

6.2 Karbantartások nyilvántartása

6.2.1 A tulajdonos biztosítsa a karbantartásokra vonatkozó következő nyilvántartások megőrzését a 6.2.2 pontban jelzett időtartamig:

a) a forgószárnyas légijármű és az összes korlátozott ideig üzemeltethető alkatrészének teljes üzemideje (szükség szerint órában, naptári időszakban és repülési ciklusokban meghatározva);

b) a forgószárnyas légijármű állapota az összes kötelező folyamatos légialkalmassági előírás és tájékoztatás teljesítése vonatkozásában;

c) a forgószárnyas légijármű és főbb szerkezeti elemeinek, alkatrészeinek módosítása és javítása valamint ennek részletezése;

d) a forgószárnyas légijármű vagy meghatározott kötelező karbantartási időszakkal vagy ciklussal rendelkező részeinek teljes üzemideje az utolsó (nagy)javítás óta (szükség szerint órában, naptári időszakban és/vagy repülési ciklusokban meghatározva);

e) a forgószárnyas légijármű karbantartási programhoz viszonyított jelenlegi felülvizsgálati – ellenőrzési – helyzete a feladatok végrehajtása alapján; és

f) részletes karbantartási jegyzőkönyvek, amelyekből megállapítható, hogy teljesítették a karbantartásból való kiadáshoz szükséges összes előírást.

6.2.2 A 6.2.1 a)–e) alpontokban ismertetett nyilvántartásokat azon egység üzemi élettartamának lejáratát és üzemeltetésből történő végleges kivonását követő legalább 90 napig őrizzék meg, amely egységre a nyilvántartás vonatkozik. A 6.2.1 f) alpontban ismertetett jegyzőkönyvet a karbantartási nyilatkozat aláírását követő egy évig őrizzék meg.

6.2.3 A forgószárnyas légijármű bérlője a bérleti időtartam alatt szükség szerint teljesítse a 6.2.1 és 6.2.2 pontok előírásait.

6.3 Folyamatos légialkalmassági tájékoztatás

A 3175 kg. legnagyobb engedélyezett felszállósúlynál (tömeg) nehezebb forgószárnyas légijármű tulajdonosa vagy bérlet esetében annak bérlője a lajstromozó állam előírásai szerint biztosítsa, hogy a folyamatos légialkalmasságra vonatkozó tájékoztatásokat és gyakorlati tapasztalatokat a 8. Annex II. rész 4.2.3 f) valamint 4.2.4 pontok előírásaiban meghatározott rendszer alapján továbbítsák.

6.4 Módosítások és javítások

Az összes módosítást és javítást a lajstromozó állam által elfogadható légialkalmassági előírásoknak megfelelően végezzék el. Dolgozzanak ki eljárásokat annak biztosítására, hogy a légialkalmasságra vonatkozó követelmények teljesítésének bizonyítására elegendő mennyiségű adatot őriznek meg.

6.5 Karbantartási nyilatkozat

6.5.1 A lajtromozó állam előírásai szerint a karbantartási munka kielégítő és sikeres elvégzésének igazolására készítsenek el és írjanak alá karbantartási nyilatkozatot.

6.5.2 A karbantartási nyilatkozat tartalmazzon igazolást az alábbiakról:

a) az elvégzett karbantartási munka alapvető részletei;

b) a karbantartás befejezésének időpontja;

c) az engedélyezett karbantartó szervezet azonosítója – amennyiben ez alkalmazható; és

d) a karbantartási nyilatkozatot aláíró személy vagy személyek neve.

7. fejezet
A forgószárnyas légijármű hajózószemélyzete

7.1 Jogosítások

A légijármű parancsnoka biztosítsa, hogy a hajózószemélyzet minden egyes tagja rendelkezzen a lajstromozó állam által kiadott vagy érvényesített szakszolgálati engedéllyel és jogosításuk megfelelő, továbbá bizonyosodjon meg arról, hogy a hajózószemélyzet tagjai rendelkeznek a szükséges szakmai jártassággal.

Megjegyzés: A repülőgépvezetőknek szóló azon információkat, amelyek a repülési eljárások paramétereire és az üzemeltetési eljárásokra vonatkoznak, a PANS-OPS I. kötete (Doc 8168) tartalmazza. A látás utáni és a műszeres repülési eljárások felépítésére vonatkozó követelményeket a PANS-OPS II. kötete (Doc 8168) tartalmazza. Az akadály mentesség követelményeinek és eljárásainak használata egyes államokban eltérhetnek a PANS-OPS előírásaitól, és biztonsági okokból fontos ezen különbségek ismerete.

.

7.2 A hajózószemélyzet összetétele

A hajózószemélyzet tagjainak száma és összetétele a repülésvégrehajtási kézikönyvben vagy a légijármű légialkalmassági bizonyítványával összefüggésben levő más egyéb dokumentumban meghatározott minimális létszámnál alacsonyabb ne legyen.

6. Annex – III. rész
Függelékek

1. FÜGGELÉK
A járatók biztonsági felülvizsgálata

(lásd: II. rész, 2. fejezet, 2.2.1.7)

1. Elsődleges légiközlekedési törvényhozás

1.1 A járató állama léptessen érvénybe és alkalmazzon olyan törvényt, amely képessé teszi az államot a polgári légiközlekedés szabályozására a Polgári Légiközlekedési Hatóság (CAA), vagy erre a célra létrehozott azonos szervezet bevonásával. A törvény jogosítsa fel a Hatóságot az állam felülvizsgálati tevékenységének végrehajtására. A törvény tegye lehetővé előírások kiadását, a járatók tanúsítását és folyamatos felügyeletét, és határozat meghozatalát a Hatóság által megállapított biztonsági ügyekben.

Megjegyzés: A jelen Függelékben használatos Hatóság kifejezés megfelel a Polgári Légiközlekedési Hatóságnak, valamint a felügyelőket és az állományt magába foglaló azonos szervezeteknek.

1.2 A járató állama biztosítsa, hogy az állam törvényei írják elő a járatók számára azt a követelményt, hogy a Hatóság hozzáférhessen a járatók személyi állományához, légijárműveihez, üzemeltetéséhez és létesítményeihez valamint a nyilvántartásokhoz a a tanúsítások és a folyamatos felülvizsgálatok céljából.

Megjegyzés: Azon rendszer kritikus elemeire vonatkozó útmutató, amely képessé teszi az államot az üzemeltetés ellenőzésében, tanúsításában és folyamatos felülvizsgálatában viselt felelősségének gyakorlására, a Biztonsági Felülvizsgálati Kézikönyvnek *(Doc 9734)* az Állami Biztonsági Felülvizsgálati Rendszer Létrehozása és Irányítása című A. részében, az Üzemeltetés Felügyeleti, Jogosítási és Folyamatos Ellenőrzési Eljárások Kézikönyvben *(Doc 8335)* és a Légialkalmassági Kézikönyvben *(Doc 9760) található.*

2. Különleges üzemeltetési előírások

2.1 A járató állama olyan előírásokat fogadjon el a légijárművek üzemeltetésének folyamatos felügyeletére és tanúsítására, valamint a légijárművek karbantartására, amelyek biztosítják a Nemzetközi Polgári Légiközlekedési Egyezmény Annexeivel való összhangot.

2.2 A járató állama biztosítsa, hogy a technológia és az üzemeltetési környezet változásainak tekintetében az állam előírásai eléggé átfogóak, részletezettek és naprakészek legyenek, amelyek garantálják, hogy az előírásokhoz való alkalmazkodás az adott üzemeltetés elfogadható biztonsági szintjét eredményezi.

3. A Polgári Légiközlekedési Hatóság felépítése és a biztonsági felülvizsgálati feladatok

3.1 Az állami felelősség hatékony vállalása érdekében a járató állama biztosítsa, hogy a Hatóság legyen felelős a légiüzemeltetés biztonsági felülvizsgálatáért, valamint a Hatóság rendelkezzen az állam fennhatósága alá tartozó polgári légiközlekedés összetettségének és méretének megfelelő erőforrásokkal.

3.2 A járató állama biztosítsa, hogy a hatósági ellenőrök rendelkezzenek megfelelő támogatással, felhatalmazással és szállítóeszközzel annak érdekében, hogy függetlenül láthassák el a tanúsítási és folyamatos felügyeleti tevékenységüket.

4. Műszaki útmutatók

4.1 A járató állama biztosítsa, hogy a hatósági ellenőrök a járatók tanúsításához és folyamatos felülvizsgálatához szükséges irányelveket, eljárásokat és szabványokat tartalmazó műszaki útmutató kézikönyvekkel rendelkezzenek.

4.2 A járató állama biztosítsa, hogy a hatósági ellenőrök a biztonsági kérdésekkel összefüggő és a hatályba léptetést is magukba foglaló döntésekhez szükséges irányelveket, eljárásokat és szabványokat tartalmazó műszaki útmutató kézikönyvekkel rendelkezzenek.

4.3 A járató állama biztosítsa, hogy a hatósági ellenőrök a hivatalos kötelezettségek teljesítésekor követendő erkölcsre, személyes viselkedésre valamint a valós vagy vélt érdek ütközések elkerülésére irányuló műszaki útmutató kézikönyvekkel rendelkezzenek.

5. Jogosított műszaki személyzet

5.1 A járató állama használjon módszertant az ellenőri állományára vonatkozó követelmények meghatározására, az adott állam polgári légiközlekedésének összetettségéhez és méretéhez igazodva.

5.2 **Ajánlás –** az 5.1 bekezdés módszertanát dokumentálják.

5.3 A járató állama határozzon meg jogosítási követelményeket annak biztosítása érdekében, hogy az ellenőrző személyzetük rendelkezzen a tanúsításhoz és ellenőrzéshez szükséges tevékenységükkel összhangban álló üzemeltetési és műszaki végrehajtási tapasztalattal és képzettséggel.

Megjegyzés: az ellenőrök gyakorlati jártasságára és képzésére vonatkozó útmutatót az Üzemeltetés Felügyeleti, Jogosítási és Folyamatos Ellenőrzési Eljárások Kézikönyvben *(Doc 8335) című anyag, Fejezet 9, 9.4 része tartalmazza.*

5.4 A járató állama követelje meg, hogy a tanúsítási és a folyamatos felügyeleti feladataik hatékony ellátásához, a hatósági ellenőrök részesüljenek alap- és ismétlő képzésben a vonatkozó műszaki témakörökből (beleértve a légijármű specifikus témaköröket) és gyakorlati ismeretekből.

5.5 **Ajánlás** – *a járató állama hozzon megfelelő intézkedéseket az alkalmazási feltételek és a javadalmazás terén, hogy biztosítani lehessen felkészült ellenőrök jelentkezését és megtartását.*

6. Igazolási és tanúsítási kötelezettségek

6.1 A járató állama alkalmazzon dokumentált eljárást a járatók tanúsításához, amely magába foglalja a II. Részben meghatározott eljárások, dokumentációk és üzemeltetések elfogadásához vagy jóváhagyásához vezető átfogó műszaki értékeléseket is.

6.2 A járató állama követelje meg, hogy új kereskedelmi légiszállítási tevékenység megkezdése előtt a járatók bizonyítsák be, hogy a beterjesztett üzemeltetést biztonságosan tudják elvégezni.

7. Folytatólagos felügyeleti kötelezettségek

7.1 A járató állama alkalmazzon dokumentált eljárást a járatók folyamatos felügyeletéhez, amellyel igazolni lehet a járatók részére a Hatóság által kiadott légijármű üzembentartási engedélyek folyamatos érvényességét.

7.2 A járató állama alkalmazzon egy használatban lévő felügyeleti tervet annak alátámasztására, hogy a járatók változatlanul megfelelnek az alaptanúsításra megállapított követelményeknek és, hogy az összes járató megfelelőképpen működik.

8. Biztonsági kérdésekről hozott döntések

8.1 A felismert biztonsági problémák megoldása érdekében, a járató állama alkalmazzon dokumentált eljárást a végrehajtást is magába foglaló megfelelő helyesbítő intézkedések meghozatalához.

8.2 A járató által a felismert biztonsági problémák megoldására hozott intézkedéseket is magába foglaló fejlődést nyomonkövető és nyilvántartó rendszer segítségével, a járató állama győződjön meg arról, hogy a felismert biztonsági problémák a megfelelő időben megoldásra kerültek.

2. Függelék

A 3. teljesítmény osztályú helikopterek üzemeltetésére vonatkozó kiegészítő követelmények műszeres időjárási körülmények (IMC) közötti repülések esetére

(Lásd II. Rész, 3. fejezet 3.4.1)

A II. Rész, 3. fejezet, 3.4.1 alpontjában előírt légialkalmassági és üzemeltetési követelmények betartása az alábbiakkal biztosítható:

1. Gázturbinás hajtómű megbizhatósága

1.1 A 3. teljesítmény osztályú helikopterek műszeres időjárási körülmények (IMC) közötti repüléseinél alkalmazott hajtóművek jóváhagyásának megszerzésénél és annak fenntartásánál:

1.1.1 Annak érdekében, hogy az üzemeltetésben meglévő hajtómű típus kezdeti jóváhagyását meg lehessen szerezni, kockázat kezelési eljárással mutassák be, hogy a hajtómű megbízhatósági mutatóját jellemző teljesítmény elvesztési mérték egynél kevesebb 100 000 hajtómű órára vetítve.

Megjegyzés: A teljesítmény elvesztését ebben az esetben a hajtómű vagy hajtómű komponens – beleértve a tüzelőanyag segédberendezéseket vagy a hajtómű vezérlő rendszereket is – hibás tervezésére vagy beépítésére visszavezethető ok miatt bekövetkező bármely teljesítményvesztéssel lehet értelmezni (lásd: I melléklet).

1.1.2 Egy új hajtómű típus kezdeti jóváhagyásának megszerzése érdekében a Tervező állama egyenként vizsgálja meg a hajtómű mintákat a műszeres időjárási körülmények (IMC) közötti 3. teljesítmény osztályú repüléseknél.

1.1.3 A jóváhagyás fenntartása érdekében a Tervező állama folyamatos légialkalmassági eljárás keretében mutassa be, hogy a hajtómű megbízhatósága összhangban marad az 1.1.1 pont előírásának céljával.

1.2 A járató felel a hajtómű üzemállapot változásának figyeléséért.

1.3 A repülésközbeni hajtómű meghibásodás valószínűségének csökkentése érdekében a hajtóművet fel kell szerelni:

a) Gázturbinás hajtómű esetében egy automatikusan működésbe lépő ismételt gyújtást biztosító rendszerrel, vagy kézzel kiválasztható folyamatos gyújtást biztosító rendszerrel, amíg a hajtómű tanúsításánál megállapításra nem kerül, hogy ilyen rendszerre nincs szükség. A tanúsításnál figyelembe kell venni azt a legvalószínűbb környezeti feltétel rendszert, amelyen belül a hajtómű felhasználásra kerül;

b) Egy mágneses részecske érzékelő vagy ahhoz hasonló rendszerrel, amely figyeli a hajtómű, a segédberendezéseket meghajtó ház és az áttétel ház állapotát, és amely magába foglalja a műszerfalra figyelmeztető jelzést kiadó rendszert is; és

c) Egy vész hajtómű teljesítmény szabályozó berendezéssel, amely biztosítja a hajtómű folyamatos üzemeltetését egy megfelelő teljesítmény tartományon keresztül, amellyel biztonságosan befejezhető a repülés a tüzelőanyag szabályozó egység ésszerű keretek között bekövetkező valószínű meghibásodása esetén.

2. Rendszerek és felszerelések

A műszeres időjárási körülmények (IMC) közötti 3. teljesítmény osztályú repülésekre alkalmazott forgószárnyas légijárművek legyenek felszerelve az összes megengedett üzemeltetési feltételek mellett, egy hajtómű meghibásodás bekövetkezését követően, a folyamatos biztonságos repülés fenntartását és a biztonságos kényszerleszállás végrehajtását támogató alábbi rendszerekkel és felszerelésekkel:

a) Vagy két, egymástól elválasztott, elektromos energiát előállító rendszerrel, melyek mindegyike alkalmas az IMC feltételek közötti folyamatos repülésekhez előírt műszerek, felszerelések és rendszerek elektromos terhelésének összes valószínűsíthető kombinációjában való táplálásához; vagy egy elsődleges áramforrással és egy tartalék akkumulátorral vagy egy egyéb tartalék áramforrással amely képes legalább egy órán keresztül a helikopter vész üzemmódban való repülésének biztonságos fenntartásához szükséges berendezések és műszerek elektromos terhelésének 150 százalékával megegyező táplálás biztosítására; és

b) A fő elektromos energia ellátó rendszer elvesztését követően működésbe lépő megfelelő kapacitású és terhelhetőségű vész elektromos energia ellátó rendszerrel, amely minimum legyen képes:

Megjegyzés: ha akkumulátor biztosítja a másodlagos áramforrással szemben támasztott követelmények teljesítését (lásd 2 a) fentebb) akkor kiegészítő áramforrás alkalmazása nem követelmény.

1) Az összes olyan repülőgépvezetési műszer, kommunikációs és navigációs rendszer működtetésére, amelyek a maximálisan engedélyezett magasságról, siklási konfigurációban a leszállás végrehajtásához szükségesek;

2) A stabilizálást biztosító rendszerek működtetésére, amennyiben szükségesek;

3) A futóművek kiengedésére, amennyiben szükségesek;

4) Egy olyan pitot cső fűtéséhez szükséges energia biztosítására, amely a légijárművezető számára világosan látható légsebességmérő műszer táplálását látja el;

5) A leszálló fény működtetésére;

6) Egy hajtómű újraindítására, amennyiben szükséges; és

7) A rádiómagasság mérő működtetésére.

c) Egy rádió magasságmérővel;

d) Egy robotpilótával, ha a másodpilóta helyett kerülne alkalmazásra. Ebben az esetben a járató állama gondoskodjon arról, hogy a járató jóváhagyása világosan tartalmazza a robotpilóta alkalmazásának feltételeit vagy korlátozásait;

e) Olyan eszközzel, amely legalább egy kísérletet lehetővé tesz a hajtómű újraindítására;

f) Műszer szerinti repülésekre tanúsított körzeti navigációs rendszerrel, amely alkalmas biztonságos leszálló helyek meghatározására vész üzemmód esetén;

g) A futóműtől független leszálló fényre, amely alkalmas a földetérés körzetének megfelelő megvilágítására, az éjszakai vészleszállás során; és

h) Egy hajtómű tűzjelző rendszerre.

3. Minimális felszerelések jegyzéke

A járató állama határozza meg a műszeres időjárási feltételek (IMC) közötti, 3. teljesítmény osztályú repülésekhez szükséges berendezésekre vonatkozó minimális üzemképességi követelményeket.

4. A repülésvégrehajtási kézikönyv információi

A repülésvégrehajtási kézikönyvnek tartalmaznia kell azokat a korlátozásokat, eljárásokat, jóváhagyási állapotokat és egyéb információkat, amelyek a 3. teljesítmény osztályú forgószárnyas légijárművek IMC feltételek közötti repüléseihez szükségesek.

5. Események jelentése

5.1 A 3. teljesítmény osztályú forgószárnyas légijárművek IMC feltételek közötti üzemeltetésére jóváhagyott járató jelentse az összes lényeges meghibásodást, rendellenességet vagy hibás működést a járató államának és az másfelől a tervező államának.

5.2 A járató állama kisérje figyelemmel a 3. teljesítmény osztályú forgószárnyas légijárművek IMC feltételek közötti üzemeltetését, hogy képes legyen a szükséges intézkedéseket megtenni a kívánt repülésbiztonsági szint elérése érdekében. A járató állama tájékoztatást ad a jelentős eseményekről vagy egyedi problémákról az érintett tipusalkalmassági bizonyítvány tulajdonosnak és a tervező államának.

6. A járató tervezése

A járató útvonal tervezése vegye figyelembe a tervezett útvonal vagy üzemeltetési körzet felülvizsgálata során az összes kapcsolódó információt, a következőket is beleértve:

a) A repült útvonal alatt található felszín tulajdonságait, beleértve a biztonságos kényszerleszállás végrehajtásához szükséges lehetőségeket egy hajtómű meghibásodás vagy jelentős rendellenesség esetére;

b) A repülésre hatást gyakorolható időjárási információkat, beleértve a szezonális és más kedvezőtlen meteorológiai hatásokat; és

c) Más jellemzőket és korlátozásokat a járató államának meghatározásai szerint.

7. A hajózószemélyzet jártassága, képzése és ellenőrzése

7.1 A járató állama írja elő a hajózó személyzet minimális jártasságát, ami a 3. teljesítmény osztályú forgószárnyas légijárművek IMC feltételek közötti üzemeltetéséhez szükségesek.

7.2 A járató rendelkezzen megfelelő képzéssel és ellenőrzéssel a 3. teljesítmény osztályú forgószárnyas légijárművek IMC feltételek közötti üzemeltetését végző hajózó személyzetek számára, amely lefedi a normál, rendellenes és vészhelyzetekre vonatkozó eljárásokat, és különösen a hajtómű meghibásodások esetét, beleértve a kényszerleszálláshoz való süllyedést éjszaka és/vagy IMC feltételei között. A képzés és ellenőrzés terjedjen ki az egyhajtóműves forgószárnyas légijárművek stabilizált autorotációs üzemmódba való átállására is.

8. A járató tanúsítása vagy megerősítése

A járató állama által meghatározott tanúsítási és jóváhagyási folyamattal a járatónak bizonyítania kell a képességét a 3. teljesítmény osztályú forgószárnyas légijárművek IMC feltételek közötti repüléseinek végrehajtására.

Megjegyzés – a légialkalmassági és üzemeltetési követelményekre vonatkozó útmutatót az I Melléklet tartalmazza.

Mellékletek

A. Melléklet
Forgószárnyas légijármű teljesítmény és üzemeltetési korlátozások

II. szakasz 3. fejezet és III. szakasz 3. fejezet kiegészítése

Cél és tárgykör

A következő példa célja azon teljesítmény szint bemutatása, amelyet a 6. Annex III. rész II. szakasz 3. fejezet és III. szakasz 3. fejezet előírásaival kívánunk biztosítani. A jelen anyagot az állam kiindulási alapként kezelheti a saját teljesítmény előírásainak létrehozásakor, bár más olyan lehetőséget vagy könnyítéseket is alkalmazhat, amelyek kielégítik a 6. Annex biztonsági célkitűzéseit.

Megjegyzés: Mennyiségi előírásokat az alább bemutatott példák tartalmazzák.

1. Meghatározások

A kategória **(Category A)** A forgószárnyas légijárművekkel kapcsolatosan jelenti azt a több-hajtóműves forgószárnyas légijárművet, melyet a IVB Részben meghatározott hajtómű és rendszer szétválasztási jellemzőkkel terveztek meg és képes üzemelni a kritikus hajtómű meghibásodás előfordulása esetére előre kiszámított felszállási és leszállási adatokkal, melyek megfelelő nagyságú talajfelszínt és kielégítő teljesítmény kapacitást biztosítanak a repülés biztonságos folytatására, vagy a felszállás biztonságos megszakítására.

B kategória **(Category B)** A forgószárnyas légijárművekkel kapcsolatosan jelenti azt az egyhajtóműves, vagy többhajtóműves forgószárnyas légijárművet, amely nem felel meg az A kategória szabványainak. A B kategóriájú forgószárnyas légijárműveknek nincs garantált képességük a repülés biztonságos folytatására egy hajtómű meghibásodás esetén, és egy kényszerleszállást feltételezve.

2. Általános rész

2.1 Az 1. és 2. teljesítmény osztályú forgószárnyas légijárművek A kategóriájú tanúsítással rendelkezzenek.

2.2 A 3. teljesítmény osztályú forgószárnyas légijárművek vagy A kategóriájú vagy B kategóriájú (vagy azokkal egyenértékű) tanúsítással rendelkezzenek.

2.3 Kivéve, ha a megfelelő hatóság másképp nem rendelkezik:

2.3.1 Egy kedvezőtlen körülményű sűrűn lakott területen található helikopter leszállóhelyen a fel és leszállást csak 1. teljesítmény osztályú forgószárnyas légijárművel hajtsák végre.

2.3.2 A 2. teljesítmény osztályú repüléseket csak akkor lehet végrehajtani, ha a fel- és leszállás során rendelkezésre állnak a biztonságos kényszerleszállás feltételei.

2.3.3 A 3. teljesítmény osztályú repüléseket csak kedvező környezeti feltételek mellett lehet végrehajtani.

Törölt: barátságos

2.4 A 2.3.1 – 2.3.3 pontokban leírt változatok szerinti repülések engedélyezéséhez a hatóság végezzen kockázat elemzést, amelyhez vegye figyelembe a következő tényezőket:

a) az üzemeltetés típusát és a repülési körülményeket;

b) a területet / felszínt, amely felett a repülést végrehajtják;

c) a kritikus hajtómű egység meghibásodásának valószínűségét és az ilyen esemény következményeit;

d) a hajtómű egység(ek) megbízhatóságának teljesítéséhez szükséges eljárásokat;

e) a kritikus hajtómű egység meghibásodásából adódó következmények csökkentéséhez szükséges üzemeltetési eljárásokat és képzéseket;

f) állapotfigyelő rendszerek beszerelését és felhasználását.

1. Megjegyzés: Elfogadott, hogy előfordulhatnak olyan esetek, amelyeknél biztonságos kényszerleszállást nem lehet végrehajtani a környezeti vagy egyéb feltételek miatt. Több állam alkalmazta már a kockázatkezelés módszerét és engedélyezett sajátos üzemeltetési változatokat, mint például úszó leszállóhelyekről végrehajtott repüléseket, melyeknél a hajtómű meghibásodás miatti veszélyhelyzet kényszerleszállás nélkül is fennállhat. A kockázat elemzésen alapuló változatok engedélyezése elfogadott részét képezik az államok teljesítmény előírások kidolgozásánál alkalmazott folyamatainak. Amikor a repülések végrehajtására úgy kerül sor, hogy a kényszerleszállásokhoz nem áll rendelkezésre megfelelő terület, akkor az összes vonatkozó tényezőt vegyék figyelembe. Ez magába foglalhatja az esemény bekövetkezésének valószínűségét, a lehetséges következményeket, az elkerülési módszereket továbbá az üzemeltetés potenciális eredményeit és a szükséges ráfordításokat. Az ilyen jellegű értékeléshez alkalmazandó sajátos eljárásokat az államnak kell meghatároznia. Mindenesetre a kényszerleszállás biztonságos végrehajtására vonatkozó megfontolások egyértelműen és világosan jelenjenek meg a teljesítmény előírások kialakításában. A balesetek áttekintésének és egyéb vonatkozó biztonsági adatok és értékelések alkalmazásának döntő szerepe van az üzemeltetési előírások kidolgozásánál az adott területen belül. Az eredményként megjelenő követelmények több féle formában jelenhetnek meg, mint például a jóváhagyott üzemeltetési területek, a repülési útvonalak és az akadálymentességi követelmények kijelölése.

2. Megjegyzés: Ha a repülések végrehajtása olyan útvonalakon történik, ahol hozzá lehet férni megfelelő kényszerleszállási területekhez, akkor ezeket kell használni a sűrűn lakott területekre való be- és kirepüléseknél. Ha ilyen útvonalak nem állnak rendelkezésre, akkor az üzemeltetési feltételek értékelése során vegyék figyelembe a veszélyhelyzetet csökkentő tényezőket is, mint például a meghajtó rendszer megbízhatósága azokon a rövid szakaszokon, ahol nem biztosítottak a megfelelő kényszerleszálló hely feletti repülés végrehajtási feltételei.

Példa

Cél és hatókör

A következő példa mennyiségi megfontolásokat tartalmaz a II. szakasz, 3. fejezet előírásainak teljesítéséhez szükséges teljesítmény szintek bemutatására. Egy állam ezeket a példákat felhasználhatja alapként a saját teljesítmény előírásainak megalkotásánál, de alkalmazhat más változatokat is, amennyiben ezek a változatok kielégítik a II. szakasz, 3. fejezet és az A. melléklet biztonsági célkitűzéseit.

A forgószárnyas légijárművek üzemeltetésénél alkalmazott rövidítések

Rövidítések

D	A forgószárnyas légijármű maximális befoglaló mérete
DPBL	Leszállás előtt meghatározott pont
DPATO	Meghatározott pont felszállás után
DR	Forgószárnyas légijármű által megtett út
FATO	Végső megközelítési és felszállási terület
HFM	Forgószárnyas légijármű repülésvégrehajtási kézikönyve
LDP	Leszállási elhatározási pont
LDAH	Rendelkezésre álló leszállási távolság
LDRH	Szükséges leszállási távolság
R	Forgószárny sugár
RTODR	Szükséges megszakított felszállási távolság
TDP	Felszállási elhatározási pont
TLOF	Földetérési és elemelkedési terület
TODAH	Rendelkezésre álló felszállási távolság
TODRH	Szükséges felszállási távolság
V_{TOSS}	Felszállási biztonságos sebesség

1. Meghatározások

1.1 Csak 1. teljesítmény osztályú forgószárnyas légijárművekre alkalmazandó

Szükséges leszállási távolság (LDRH) – Landing distance required
A leszállási felület felett 15 méter (50 láb) magasságról történő leszálláshoz és teljes megálláshoz szükséges vízszintes távolság.

Szükséges megszakított felszállási távolság (RTODR) – Rejected take-off distance required
A felszállás megkezdésétől a forgószárnyas légijármű teljes megállásáig szükséges vízszintes távolság a hajtómű meghibásodás és a felszállási elhatározási ponton végrehajtott felszállás megszakítás után.

Szükséges felszállási távolság (TODRH) – Take-off distance required
A felszállás megkezdésétől addig a pontig szükséges vízszintes távolság, ahol a felszállási elhatározási ponton (TDP) bekövetkező kritikus hajtómű meghibásodás után elérik a V_{TOSS}, a kiválasztott magasság valamint pozitív emelkedés értékeket, miközben a többi hajtómű egység engedélyezett üzemi határértékein belül működik.

Megjegyzés: A fentiekben megjelölt kiválasztott magasság meghatározása történhet, vagy:

a) *a felszállási terephez viszonyítva; vagy*

b) *azon magassághoz viszonyítva, amelyet a felszálláshoz szükséges távolságon belül található legmagasabb akadályhoz képest állapítanak meg.*

1.2 Minden teljesítmény osztályú forgószárnyas légijárműre alkalmazandó

D – A forgószárnyas légijármű maximális befoglaló mérete.

DR Távolság – Distance DR
Az a vízszintes távolság, amelyet a forgószárnyas légijármű a rendelkezésre álló felszállási távolság végétől megtett.

Rendelkezésre álló leszállási távolság (LDAH) – Landing distance available
A rendelkezésre álló végső megközelítési és felszállási terület valamint bármely más terület együttes hossza, amelyet a forgószárnyas légijárművek egy meghatározott magasságból történő leszállásának végrehajtására alkalmasnak nyilvánítottak.

R - Forgószárny sugár.

Rendelkezésre álló felszállási távolság (TODAH) – Take-off distance available
A rendelkezésre álló végső megközelítési és felszállási terület, valamint ha ilyet meghatároztak, a helikopter biztonsági terület együttes hossza, amelyet a forgószárnyas légijárművek felszállásának végrehajtására alkalmasnak nyilvánítottak.

Felszállási repülési pálya – Take-off flight path
A felszállásnál meghatározott ponttól a felszín feletti 300 m (1000 láb) magasságig terjedő, üzemképtelen kritikus hajtómű egységgel megtett függőleges és vízszintes repülési pálya.

Földetérési és elemelkedési terület (TLOF) – Touchdown and lift-off area
Olyan teherviselő felület, amelyre a forgószárnyas légijármű leszállhat, vagy amelyről elemelkedhet.

V_{TOSS} - Felszállási biztonságos sebesség

V_{y} - Legjobb emelkedési sebesség.

2. Általános rész

2.1 Alkalmazhatóság

2.1.1 Azok a forgószárnyas légijárművek, melyek utasbefogadó képessége meghaladja a 19 főt, vagy sűrűn lakott kedvezőtlen körülményű területen üzemelnek, 1. teljesítmény osztálynak megfelelően kerüljenek alkalmazásra.

2.1.2 A 19 vagy attól kevesebb, de 9-nél több utas befogadására alkalmas forgószárnyas légijárművek 1. vagy 2. teljesítmény osztálynak megfelelően kerüljenek felhasználásra. Amennyiben az üzemeltetés sűrűn lakott kedvezőtlen körülményű területen történik, a forgószárnyas légijárműveket 1. teljesítmény osztálynak megfelelően alkalmazzák.

2.1.3 A 9 vagy attól kevesebb utas befogadására alkalmas forgószárnyas légijárművek 1. 2. vagy 3. teljesítmény osztálynak megfelelően kerüljenek felhasználásra. Amennyiben az üzemeltetés sűrűn lakott kedvezőtlen körülményű területen történik, a forgószárnyas légijárműveket 1. teljesítmény osztálynak megfelelően alkalmazzák.

2.2 Jelentős teljesítmény tényezők

A forgószárnyas légijármű teljesítményének meghatározásához legalább a következő tényezőket vegyük figyelembe:

a) a forgószárnyas légijármű tömege;

b) a tengerszint feletti magasság vagy nyomás-magasság valamint a hőmérséklet;

c) szél: fel és leszállásnál bármely jelentett állandó 5 csomós vagy nagyobb szembeszél esetében a szél nem több mint 50 %-át, amennyiben a repülésvégrehajtási kézikönyvben engedélyezik a hátszélben történő fel és leszállás végrehajtását, bármely jelentett hátszél érték nem kevesebb mint 150 %-át vegyük figyelembe. Ahol pontos szélsebesség mérő berendezés a felszállási és leszállási ponton lehetővé teszi a szél sebességének pontos mérését, ezek az értékek változhatnak.

2.3 Légijármű üzemeltetési módszerek

2.3.1 Ahol a repülés bármely szakaszában bekövetkező hajtómű meghibásodás a 2. és 3. teljesítmény osztályú forgószárnyas légijárművek kényszerleszállását okozhatja:

a) a járatónak a forgószárnyas légijármű jellemzőinek figyelembevételével legalacsonyabb látástávolság értéket kell meghatároznia, azonban ez soha nem lehet alacsonyabb, mint 3. teljesítmény osztályú forgószárnyas légijármű esetében 800 méter;

b) a járató köteles igazolni, hogy a tervezett repülési pálya alatti felület lehetővé teszi, hogy a légijármű vezető kényszerleszállást hajtson végre.

2.3.2 A 3. teljesítmény osztályú üzemeltetés nem végezhető:

a) felszínlátás nélkül; vagy

b) éjszaka; vagy

c) ha a felhőalap 180 méternél (600 láb) alacsonyabb.

Megjegyzés: A 2.3 fejezet szövege a biztonságos kényszerleszállás esetére tartalmazza a „megfelelő megoldás” magyarázatát (a II. Szakasz, 3. Fejezet, 3.1.2 pontban található). Azon államok esetében, amelyek előnyben részesítik a II. Szakasz, 3. Fejezet, 3.4 pont előírásait, vagy amelyek a kockázat értékelésen alapuló hatásvizsgálatot hajtanak végre és/vagy engedélyezik az éjszakai látásszerinti repüléseket, a 2.3 előírásait helyettesítsék megfelelően kidolgozott alternatív szöveggel.

2.4 Akadály felelősségi terület

2.4.1 Az alábbi 4. alpontban leírtakra vonatkozóan az akadálymentességi követelmények céljára a forgószárnyas légijármű útjában akadálynak tekintendő az a tárgy, amelynek távolsága a tervezett repülési pálya alatt a felszínen levő legközelebbi ponttól kevesebb mint:

a) látásszerinti (VFR) üzemeltetés esetén:

1) forgószárnyas légijármű repülésvégrehajtási kézikönyvében meghatározott végső megközelítési és felszállási terület (vagy a forgószárnyas légijármű repülésvégrehajtási kézikönyvében használatos fogalomnak megfelelő terület) legkisebb szélességének fele (vagy ha a szélesség nem került meghatározásra, akkor 0,75 D), ezen felül 0,25 x D (vagy 3 m, amelyik nagyobb), ezen felül:

- 0.10 DR, nappali VFR üzemeltetés esetén;
- 0.15 DR, éjszakai VFR üzemeltetés esetén.

b) műszerszerinti (IFR) üzemeltetés esetén:

1) 1.5 D (vagy 30 m, amelyik nagyobb), ezen felül:

- 0.10 DR, pontos irányvezetéssel rendelkező IFR üzemeltetés esetén;
- 0.15 DR, szabványos irányvezetéssel rendelkező IFR üzemeltetés esetén;
- 0.30 DR, elektronikus irányvezetéssel nem rendelkező IFR üzemeltetés esetén.

c) ha a felszállás kezdeti szakasza látás után történik, és az átváltási ponttól kezdve műszer szerinti (IFR) vagy műszeres meteorológiai körülmények (IMC) közötti repüléssel folytatják, akkor az átváltási pontig a 2.4.1 a) pont követelményeit, míg az átváltási pont után a 2.4.1 b) pont követelményeit alkalmazzák.

2.4.2 A hátrafelé repülésből (vagy oldalirányú átmenetből) végrehajtott felszállás esetén az alábbi 4. alpontban leírt akadálymentességi követelmények céljára vegyék figyelembe a forgószárnyas légijármű hátrafelé (vagy oldalirányban) történő elmozdulásának pályája alatt elhelyezkedő akadályt, amelynek oldalirányú távolsága a tervezett repülési pálya alatti felszínen levő legközelebbi ponttól kevesebb mint a forgószárnyas légijármű repülésvégrehajtási kézikönyvében meghatározott végső megközelítési és felszállási terület (vagy a forgószárnyas légijármű repülésvégrehajtási kézikönyvében használatos fogalomnak megfelelő terület) legkisebb szélességének fele (vagy ha a szélesség nem került meghatározásra, akkor 0,75 D és ezen felül 0,25 x D, vagy 3 m, amelyik nagyobb), ezen felül:

Törölt: váltásból

a) a végső megközelítési és felszállási terület hátsó szélétől megtett távolság 10 százaléka nappali VFR üzemeltetés esetén;

b) a végső megközelítési és felszállási terület hátsó szélétől megtett távolság 15 százaléka éjszakai VFR üzemeltetés esetén

2.4.3 Az akadályokat figyelmen kívül lehet hagyni, amennyiben a következő távolság értéken kívül helyezkednek el:

a) 7 R nappali üzemeltetés esetében, ha biztosítják, hogy az emelkedés során alkalmas látás utáni segédeszközökkel pontos navigáció végezhető;

b) 10 R éjszakai üzemeltetés esetében, ha biztosítják, hogy az emelkedés során alkalmas látás utáni segédeszközökkel pontos navigáció végezhető;

c) 300 méter, ha navigációs berendezésekkel pontos navigáció végezhető; és

d) 900 méter egyéb esetekben.

Megjegyzés: A szabványos irányvezetés az ADF (automatikus rádióiránytű) és a VOR (VHF körsugárzó rádió-irányadó) szerinti irányvezetést jelenti. A pontos irányvezetés az ILS, MLS vagy azokkal megegyező navigációs pontosságot biztosító irányvezetési módszerek alkalmazását jelenti.

2.4.4 Az átmeneti pont nem helyezkedhet el az 1. teljesítmény osztály szerint üzemelő forgószárnyas légijárművek esetében a szükséges felszállási távolság (TODRH) vége előtt, és a 2. teljesítmény osztály szerint üzemelő forgószárnyas légijárművek esetében pedig a felszállás utáni meghatározott pont (DPATO) előtt.

Törölt: átváltási

2.4.5 Ha a megközelítési repülési pálya eltévesztésével kell számolni, akkor az akadály felelősségi területtől való eltérést csak a rendelkezésre álló felszállási távolság vége után alkalmazzák.

2.5 Teljesítmény adatok forrása

A járató tegye lehetővé, hogy forgószárnyas légijármű repülésvégrehajtási kézikönyvében található jóváhagyott teljesítményadatokat alkalmazzák a jelen példával való megfelelőség meghatározása érdekében. Szükség szerint a repülésvégrehajtási kézikönyvet egészítsék ki a járató állama számára elfogadható egyéb adatokkal.

3. Üzemeltetési terület

3.1 Végső megközelítési és felszállási terület (FATO)

Az 1. teljesítmény osztályú üzemeltetés esetén a végső megközelítési és felszállási terület (FATO) mérete legalább a forgószárnyas légijármű repülésvégrehajtási kézikönyvében meghatározott értékű legyen.

Megjegyzés: Egy, a forgószárnyas légijármű repülésvégrehajtási kézikönyvében meghatározottnál kisebb méretű megközelítési és felszállási terület (FATO) elfogadható, amennyiben a forgószárnyas légijármű egy hajtómű meghibásodása esetén képes a párnahatás zónáján kívüli függésre (HOGE OEI), és az alábbi 4.1 alpontban leírt feltételek teljesíthetők.

4. Teljesítménytől függő korlátozások

4.1 Az 1. teljesítmény osztályú forgószárnyas légijármű üzemeltetése

4.1.1 *Felszállás*

4.1.1.1 A forgószárnyas légijármű felszállósúlya (tömege) olyan legyen, hogy ne lépje túl a repülésvégrehajtási kézikönyvben az alkalmazott eljárásra meghatározott maximális felszállósúlyt (tömeget), és a kritikus hajtómű meghibásodása esetén a működőképes hajtómű egységek megfelelő teljesítmény értékénél tegye lehetővé a 100 láb/perc emelkedési sebesség elérését a helikopter repülőtér felszínéhez viszonyított 60 m (200 láb) magasságon és a 150 láb/perc emelkedési sebesség elérését a helikopter repülőtér felszínéhez viszonyított 300 m (1000 láb) magasságon. Ennek során vegyék figyelembe a 2.2 pontban (A-1 ábra) meghatározott jellemzőket.

4.1.1.2 Megszakított felszállás

A forgószárnyas légijármű felszállósúlya (tömege) olyan legyen, amelynél a szükséges megszakított felszállási távolság nem több, mint a rendelkezésre álló megszakított felszállási távolság.

4.1.1.3 Felszállási távolság

A forgószárnyas légijármű felszállósúlya (tömege) olyan legyen, amelynél a szükséges felszállási távolság nem több, mint a rendelkezésre álló felszállási távolság.

1. Megjegyzés: Más megoldásként a fenti követelmény figyelmen kívül hagyható feltéve, hogy a felszállási elhatározási ponton bekövetkező kritikus hajtómű meghibásodás esetében a forgószárnyas légijármű felszállását folytatva a rendelkezésre álló felszállási távolság végétől a szükséges felszállási távolság végéig legkevesebb 10.7 m (35 láb) értékű biztonságos magasságon (A-2 ábra) átrepül az összes akadály felett.

2. Megjegyzés: Az emelt szinten létesített helikopter repülőtérre vonatkozóan a légialkalmassági előírások megfelelő biztonsági határértéket állapítanak meg (A-3. ábra).

4.1.1.4 Hátrafelé repülési eljárások (vagy oldalirányú átmenetet alkalmazó eljárások)

Törölt: átváltást

A járató gondoskodjon arról, hogy üzemképtelen kritikus hajtóművel hátrafelé (oldalirányban) végrehajtott repülés pályája az alatta elhelyezkedő összes akadály felett kellő magasságban legyen. Csak a 2.4.2 pontben meghatározott akadályokat kell tekintetbe venni.

4.1.2 *Felszállási repülési pálya*

A szükséges repülési pálya végétől üzemképtelen kritikus hajtóművel történő repülésnél:

4.1.2.1 A forgószárnyas légijármű felszállósúlya (tömege) olyan legyen, hogy a felszállási elhatározási ponton (TDP) bekövetkező kritikus hajtómű meghibásodás esetében az emelkedési pálya VFR üzemeltetés esetében legalább 10.7 méter (35 láb), IFR üzemeltetés esetében pedig 10.7 méter (35 láb) és ezen felül (+) 0.01 DR függőleges biztonsági távolságot biztosít az emelkedési pályán levő összes akadály felett. Csak a 2.4. pontban meghatározott akadályokat kell tekintetbe venni.

4.1.2.2 Ahol több mint 15°-os irányváltoztatást hajtanak végre, az akadályokra vonatkozó biztonsági távolság értékeket a forduló megkezdésének pontja előtt 5 méterrel (15 láb) növeljék meg. Ennek a fordulónak végrehajtását ne kezdjék meg a felszállási felület feletti 60 méter (200 láb) magasság elérése előtt, kivéve ha a repülésvégrehajtási kézikönyvben jóváhagyott eljárás részeként másként nem engedélyezik.

4.1.3 *Útvonal*

A forgószárnyas légijármű felszállósúlya (tömege) olyan legyen, hogy a teljes repülési pálya bármely pontján bekövetkező kritikus hajtómű meghibásodás esetében lehetséges legyen a repülés folytatása a megfelelő leszállási helyig és a forgószárnyas légijármű elérje a lerepülendő útvonalnak megfelelő legalacsonyabb repülési magasságot.

4.1.4 Megközelítés, leszállás és megszakított leszállás (A-4 és A-5 ábrák)

A forgószárnyas légijármű számított leszálló súlya (tömege) a célállomáson vagy a kitérőn olyan legyen, hogy:

a) a leszálló súly (tömeg) ne haladja meg a repülésvégrehajtási kézikönyvben az alkalmazott eljárásra meghatározott legnagyobb leszálló súly (tömeg) értéket és a kritikus hajtómű meghibásodása esetén a működőképes hajtómű egységek megfelelő teljesítmény értékénél tegye lehetővé a 100 láb/perc emelkedési sebesség elérését a helikopter repülőtér felszínéhez viszonyított 60 m (200 láb) magasságon és a 150 láb/perc emelkedési sebesség elérését a helikopter repülőtér felszínéhez viszonyított 300 m (1000 láb) magasságon. Ennek során vegyék figyelembe a 2.2 pontban meghatározott jellemzőket;

b) a szükséges leszállási távolság ne legyen több mint a rendelkezésre álló leszállási távolság, amennyiben a leszállási elhatározási pont (LDP) után bárhol bekövetkező kritikus hajtómű meghibásodás esetében elkerüli az akadályokat a végső megközelítés során;

c) a leszállási elhatározási pont után bárhol bekövetkező kritikus hajtómű meghibásodás esetében lehetséges legyen a leszállás és a megállás a végső megközelítési és felszállási területen (FATO) belül;

d) amennyiben a kritikus hajtómű meghibásodás a leszállási elhatározási pont (LDP) után következik be, lehetséges legyen a leszállás és megállás a végső megközelítési és felszállási területen belül vagy a megszakított leszállás (átstartolás) végrehajtása és a repülési pályán levő összes akadály felett, a 4.1.2.1 és 4.1.2.2 pontokban meghatározott feltételek megtartása mellett.

Megjegyzés: Az emelt szinten létesített helikopter repülőtérre vonatkozóan a légialkalmassági előírások megfelelő biztonsági határértéket állapítanak meg.

4.2 A 2. teljesítmény osztályú forgószárnyas légijármű üzemeltetése

4.2.1 *Felszállás* (A-6 és A-7 ábrák)

A forgószárnyas légijármű felszállósúlya (tömege) olyan legyen, hogy ne lépje túl a repülésvégrehajtási kézikönyvben az alkalmazott eljárásra meghatározott maximális felszállósúlyt (tömeget), és a kritikus hajtómű meghibásodása esetén a működőképes hajtómű egységek megfelelő teljesítmény értékénél tegye lehetővé a 150 láb/perc emelkedési sebesség elérését a helikopter repülőtér felszínéhez viszonyított 300 m (1000 láb) magasságon. Ennek során vegyék figyelembe a 2.2 pontban meghatározott jellemzőket.

4.2.2 *Felszállási repülési pálya*

A kritikus hajtómű meghibásodása esetén, a felszállás utáni meghatározott ponttól (DPATO), vagy másik lehetőségként, legkésőbb a felszálló terület felszínéhez viszonyított 60 m (200 láb) magasságtól tartsák be a 4.1.2.1 és 4.1.2.2 pontok előírásait.

4.2.3 *Útvonal*

Tartsák be a 4.1.3 pont előírásait

4.2.4 Megközelítés, leszállás és megszakított leszállás (A-8 és A-9 ábrák)

A forgószárnyas légijármű számított leszálló súlya (tömege) a célállomáson vagy a kitérőn olyan legyen, hogy:

a) a leszálló súly (tömeg) ne haladja meg a repülésvégrehajtási kézikönyvben az alkalmazott eljárásra meghatározott legnagyobb leszálló súly (tömeg) értéket és a kritikus hajtómű meghibásodása esetén a működőképes hajtómű egységek megfelelő teljesítmény értékénél tegye lehetővé a 150 láb/perc emelkedési sebesség elérését a helikopter repülőtér felszínéhez viszonyított 300 m (1000 láb) magasságon. Ennek során vegyék figyelembe a 2.2 pontban meghatározott jellemzőket;

b) előfordulhat, hogy amennyiben a kritikus hajtómű meghibásodása a leszállás előtt meghatározott pontnál (DPBL), vagy azt megelőzően következik be, biztonságos kényszerleszállást vagy átstartolást kell végrehajtani a 4.1.2.1 és 4.1.2.2 pontokban meghatározott feltételek megtartása mellett.

Csak a 2.4 pontban meghatározott akadályokat kell tekintetbe venni.

4.3 A 3. teljesítmény osztályú forgószárnyas légijármű üzemeltetése

4.3.1 *Felszállás*

A forgószárnyas légijármű felszállósúlya (tömege) a 2.2 pontban ismertetett jellemzők figyelembevételével ne haladja meg a repülésvégrehajtási kézikönyvben meghatározott legnagyobb felszállósúly értéket, amelyet a felszállás során minden hajtómű működése esetén kell alkalmazni a párnahatás magasságán belül végrehajtott függésnél. Ha a feltételek nem teszik lehetővé a párnahatás figyelembevételét, akkor a forgószárnyas légijármű felszállósúlya (tömege) a 2.2 pontban ismertetett jellemzők figyelembevételével ne haladja meg azt a legnagyobb felszállósúly értéket, amelyet a felszállás során minden hajtómű működése esetén kell alkalmazni a párnahatás magasságán kívüli függésnél.

4.3.2 *Kezdeti emelkedés*

A forgószárnyas légijármű felszállósúlya (tömege) olyan legyen, hogy az emelkedési pálya minden hajtómű működése mellett megfelelő függőleges biztonsági távolságot biztosítson az emelkedési pálya mentén levő összes akadály felett.

4.3.3 *Útvonal*

A forgószárnyas légijármű felszállósúlya (tömege) olyan legyen, hogy minden hajtómű működése mellett a forgószárnyas légijármű elérje a lerepülendő útvonalnak megfelelő legalacsonyabb repülési magasságot.

4.3.4 *Megközelítés és leszállás*

A forgószárnyas légijármű számított leszálló súlya (tömege) a célállomáson vagy a kitérőn olyan legyen, hogy:

a) a számított leszálló súly (tömeg) a 2.2 pontban ismertetett jellemzők figyelembevételével ne haladja meg a repülésvégrehajtási kézikönyvben meghatározott legnagyobb leszállósúly értéket, amelyet a felszállás során minden hajtómű működése esetén kell alkalmazni a párnahatás magasságán belül végrehajtott függésnél. Ha a feltételek nem teszik lehetővé a párnahatás figyelembevételét, akkor a forgószárnyas légijármű felszállósúlya (tömege) a 2.2 pontban ismertetett jellemzők figyelembevételével ne haladja meg azt a legnagyobb felszállósúly értéket, amelyet a felszállás során minden hajtómű működése esetén kell alkalmazni a párnahatás magasságán kívüli függésnél.

b) az összes hajtómű működése mellett a repülési pálya bármely pontján megszakított leszállás végrehajtása lehetséges és a forgószárnyas légijármű a repülési pályán levő összes akadály felett megfelelő függőleges biztonsági távolságot tart.

B. melléklet
Repülési adatrögzítők

Kiegészítés a II. szakasz 4. fejezet 4.3 és III. szakasz 4. fejezet 4.9 pontokhoz

Bevezető

A jelen mellékletben található anyag a nemzetközi légiközlekedésben üzemeltetett forgószárnyas légijárműveken felszerelni kívánt repülési adatrögzítő berendezésekkel foglalkozik. A repülési adatrögzítők két rendszerből, a forgószárnyas légijármű repülési adatrögzítőből valamint a pilótakabin hangrögzítőből állnak. A forgószárnyas légijármű repülési adatrögzítők a rögzítendő adatok mennyiségétől függően IV., IV.A típus és V. típus csoportba tartoznak.

1. Repülési adatrögzítő (FDR)

1.1 Általános követelmények

1.1.1 A repülési adatrögzítő a repülési idő alatt folyamatosan rögzítse az adatokat.

1.1.2 A repülési adatrögzítő burkolata:

a) feltűnő narancssárga vagy sárga színű legyen;

b) feltalálásának megkönnyítése érdekében helyezzenek el rajta tükröződést biztosító anyagot; és

c) rendelkezzen biztonságosan rögzített és automatikusan működésbe lépő víz alatti helyzetjelző berendezéssel.

1.1.3 A repülési adatrögzítőt úgy szereljék be, hogy:

a) a lehető legkisebbre csökkentsék a berendezés sérülésének lehetőségét;

b) a berendezés elektromos táplálását olyan áramkörről kapja, amely biztosítja az üzemeltetés legnagyobb fokú megbízhatóságát a nélkülözhetetlen, alapvető vagy vészhelyzeti fogyasztók ellátásának veszélyeztetése nélkül; és

c) hallás vagy látás utáni lehetőség legyen az adatrögzítő megfelelő működésének repülés előtt történő ellenőrzésére.

1.2 Rögzítendő adatok

1.2.1 *A IV.A típusú repülési adatrögzítő*

Ez a repülési adatrögzítő képes legyen a forgószárnyas légijárműnek megfelelő, legalább a B-1. táblázatban található negyvennyolc féle repülési adat rögzítésére. A (*) csillagjel nélküli adatok kötelező adatok, melyeket rögzíteni szükséges. Ezenkívül a (*) csillaggal megjelölt adatok rögzítése is kötelező, ha az adatot szolgáltató jelforrást a forgószárnyas légijármű rendszerei vagy hajószemélyzete is felhasználja a forgószárnyas légijármű üzemeltetéséhez. Mindazonáltal a forgószárnyas légijármű típusának és a rögzítő berendezés jellemzőinek figyelembevételével a felsoroltaktól eltérő más adatok is rögzíthetők.

1.2.2 *A IV. típusú repülési adatrögzítő*
Ez a repülési adatrögzítő képes legyen a forgószárnyas légijárműnek megfelelő, legalább a B-1. táblázatban található harminc féle repülési adat rögzítésére. Mindazonáltal a forgószárnyas légijármű típusának és a rögzítő berendezés jellemzőinek figyelembevételével a felsoroltaktól eltérő más adatok is rögzíthetők.

1.2.2 *Az V. típusú repülési adatrögzítő*
Ez a repülési adatrögzítő képes legyen a forgószárnyas légijárműnek megfelelő, legalább a B-1. táblázatban található első tizenöt repülési adat rögzítésére. Mindazonáltal a forgószárnyas légijármű típusának és a rögzítő berendezés jellemzőinek figyelembevételével a felsoroltaktól eltérő más adatok is rögzíthetők.

1.2.4 Ha további rögzítési kapacitás is rendelkezésre áll, akkor a következő kiegészítő adatokat is vegyék figyelembe:

a) az elektronikus képernyőkről, mint az elektronikus repülési műszerrendszerről (EFIS), a központi elektronikus légijármű képernyőről (ECAM), a hajtómű ellenőrző és hajózószemélyzet riasztó rendszerről (EICAS) kapott kiegészítő üzemeltetési adatok;

b) kiegészítő hajtómű paraméterek (EPR, N1, tüzelőanyag áramlás, stb.).

1.3 Kiegészítő tájékoztatások

1.3.1 A felszerelt berendezés mérési tartományát, rögzítési időközeit, a repülési adatok és jellemzők pontosságát általában a légialkalmassági bizonyítványt kiadó hatóság módszerei alapján jogosítják.

1.3.2 A repülési adatrögzítőre vonatkozóan a gyártó általában a következő tájékoztatásokat adja meg az országos engedélyező hatóságnak:

a) a gyártó üzemeltetési utasításai, a berendezés korlátozásai valamint a felszerelési eljárások;

b) a repülési adatok és jellemzők eredetét vagy forrását valamint a megfelelő mértékegységre történő átszámítás módozatait; és

c) a gyártó ellenőrző felülvizsgálatának eredményét.

1.3.3 A rögzített adatok jellemzőire, az átváltási számításokra, időszakos kalibrálásokra, valamint egyéb karbantartási és/vagy üzemeltetési tájékoztatásokra vonatkozó dokumentációt a járató tartsa naprakész állapotban. Ez a dokumentáció alkalmas legyen arra, hogy a baleset kivizsgáló hatóságok a rögzített adatok megfelelő létesítményekben történő feldolgozásához beszerezhessék a szükséges tájékoztatásokat.

2. Pilótakabin hangrögzítő berendezés (CVR)

2.1 Általános követelmények

2.1.1 A hangrögzítő berendezést úgy tervezzék meg, hogy az legalább a következőket rögzítse:

a) a forgószárnyas légijármű fedélzetén elhelyezett rádióberendezéssel vett és adott szóbeli közlemények;

b) a forgószárnyas légijármű pilótakabinjának belső hangkörnyezete;

c) a hajózószemélyzet tagjainak szóbeli közleményei, amelyhez a forgószárnyas légijármű belső távközlési rendszerét használják;

d) a navigációs vagy megközelítési berendezéseket azonosító szó vagy hangjelek, amelyek a fejhallgatóban vagy a külső hangszóróban hallhatók;

e) az utastájékoztató rendszer segítségével adott szóbeli tájékoztatások a hajózószemélyzet tagjaitól – amennyiben ilyet felszereltek és

f) a légiforgalmi szolgálatokkal folytatott digitális adatcsere kivéve, ha ezt a repülési adatrögzítő veszi fel.

2.1.2 A hangrögzítő burkolata:

a) feltűnő narancssárga vagy sárga színű legyen;

b) feltalálásának megkönnyítése érdekében helyezzenek el rajta tükröződést biztosító anyagot; és

c) rendelkezzen biztonságosan rögzített és automatikusan működésbe lépő víz alatti helyzetjelző berendezéssel.

2.1.3 A beszéd és a hangok megkülönbözetésének megkönnyítése érdekében a mikrofonokat a pilótakabinban a felvétel szempontjából legalkalmasabb helyekre helyezzék el, hogy azok a legjobb minőségben vegyék a légijármű vezetője és a másodpilóta munkahelyéről származó, valamint a pilótakabinban más hajózószemélyzeti tagoktól az előbbieknek szánt közleményeket és szóbeli tájékoztatásokat. Ez az igény legjobban mikrofonos fejhallgató bekötésével teljesíthető, a hangfelvételek folyamatos, külön felvételi csatornákon való rögzítésével.

2.1.4 A pilótakabin hangrögzítőt úgy szereljék be, hogy:

a) a lehető legkisebbre csökkentésék a hangfelvételek sérülésének lehetőségét;

b) a hangrögzítő berendezés elektromos táplálását olyan áramkörről kapja, amely biztosítja az üzemeltetés legnagyobb fokú megbízhatóságát a nélkülözhetetlen, alapvető vagy vészhelyzeti fogyasztók ellátásának veszélyeztetése nélkül; és

c) hallás vagy látás utáni lehetőség legyen a hangrögzítő berendezés megfelelő működésének repülés előtt történő ellenőrzésére; és

d) amennyiben a hangrögzítő berendezés gyorstörlő egységgel rendelkezik, a felszerelést úgy tervezzék meg, hogy megakadályozzák a gyorstörlőnek a repülés időtartama alatti vagy egy becsapódástól származó ütés következtében történő működésbe lépését.

2.2 Teljesítmény követelmények

2.2.1 A hangrögzítő berendezés képes legyen legalább négy felvételi sáv egyidejű rögzítésére. A sávok közötti pontos idő összefüggés biztosítása érdekében a hangrögzítő berendezés soros *(in-line)* rendszerben működjön. Amennyiben két felvételi irányt (oda-vissza játszó) alkalmaznak, a soros működést és a csatorna elosztást mindkét irányba biztosítsák.

2.2.2 A legkívánatosabb sáv elosztás a következő:

1. sáv – a másodpilóta fejhallgatója és élő hangot közvetítő szerelt mikrofonja

2. sáv – a légijármű vezető fejhallgatója és élő hangot közvetítő szerelt mikrofonja

3. sáv – pilótakabin belső mikrofonja

4. sáv – idő referencia jel valamint a hajózószemélyzet harmadik és negyedik tagjának (ha van) fejhallgatója és élő hangot közvetítő szerelt mikrofonja

1. Megjegyzés: Az 1. sáv a felvevőfej aljához legközelebb levő sáv legyen.

2. Megjegyzés: Az ajánlott felvételi sáv kijelölés a jelenleg általánosan alkalmazott mágnes-szalag továbbító mechanizmus használatát feltételezi. A kijelölés oka az, hogy a sérülés veszélye a mágnes-szalag szélein nagyobb, mint annak középső (belső) részén. Nem kívánjuk más hangrögzítő berendezés használatát kizárni, amelyek esetében a fenti korlátozások nem szükségesek.

2.2.3 Amikor a hangrögzítő berendezést az illetékes légialkalmasságot elbíráló hatóság elfogadott módszereivel ellenőrzik, mutassák be, hogy a berendezés képes olyan szélsőséges körülmények között működni, amelyek között történő üzemelésre azt tervezték.

2.2.4 Megfelelő módszert alkalmazzanak a repülési adatrögzítő, valamint a pilótakabin hangrögzítő berendezések közötti pontos-idő kapcsolat fenntartására.

Megjegyzés: Ennek egyik módszere a repülési adatrögzítő idő-jelének átvétele a pilótakabin hangrögzítő 4. sávjára.

2.3 További tájékoztatások

A pilótakabin hangrögzítőre vonatkozóan a gyártó általában a következő tájékoztatásokat adja meg az országos engedélyező hatóságnak:

a) a gyártó üzemeltetési utasításai, a berendezés korlátozásai valamint a felszerelési eljárások; és

b) a gyártó ellenőrző felülvizsgálatának eredményét.

3. A repülési adatrögzítő és a pilótakabin hangrögzítő rendszerek ellenőrzése

3.1 Az adott nap első repülési feladatának megkezdése előtt vizsgálják felül a repülési adatrögzítő (FDR), a pilótakabin hangrögzítő (CVR) rendszerek és a repülési adatgyűjtő egység (FDAU) – ha ilyeneket felszereltek – pilótakabinban levő beépített ellenőrző egységeit.

3.2 Az éves ellenőrző vizsgálatot a következők szerint hajtsák végre:

a) a repülési adatrögzítő és pilótakabin hangrögzítő (FDR és CVR) berendezések felvett adatainak visszajátszásával biztosítsák, hogy a rögzítő berendezések a névleges felvételi időtartamon belül megfelelően működnek;

b) a repülési adatrögzítő adatainak elemzésével értékeljék a rögzített adatok minőségét annak meghatározása érdekében, hogy a bit-hiba arány elfogadható értékek között van továbbá, hogy a hibák természete és eloszlása milyen képet mutat;

c) a repülési adatrögzítő rendszer működését ellenőrző műszaki szervezetnél az összes rögzített jellemző érvényességének vizsgálata érdekében elemezzék ki egy teljes repülés adatait. Különösen nagy figyelmet szenteljenek a repülési adatrögzítőnek közvetlen adatot biztosító érzékelőktől származó jellemzőknek. A légijármű elektromos hálózatától származó jellemzőket nem szükséges felülvizsgálni abban az esetben, ha annak működőképességét a légijármű más rendszerei segítségével ellenőrizni lehet;

d) a repülési adatrögzítő ellenőrző szervezet rendelkezzen a rögzített értékek pontos leolvasásához és átalakításához, valamint az egyes jelek pontos megkülönböztethetőségéhez szükséges software csomagokkal;

e) pilótakabin hangrögzítő berendezés felvett adatainak éves vizsgálatát a felvétel visszajátszásával végezzék el. Amikor a berendezést a légijármű fedélzetén felszerelik, a pilótakabin hangrögzítő berendezés (CVR) vegye fel az ellenőrző jeleket minden egyes belső fedélzeti és a megfelelő külső forrásokból annak biztosítása érdekében, hogy az összes felvétel megfelel-e az érthetőségre vonatkozó előírásoknak; és

f) ahol ez gyakorlatilag lehetséges, az éves ellenőrzés során vizsgálják meg a pilótakabin hangrögzítő repülés közbeni felvételeinek egy részét annak biztosítása érdekében, hogy a jelek érthetősége elfogadható-e.

3.3 A repülési adatrögzítő rendszerek működésképtelennek tekintendők, ha az adatok jelentősebb ideig rossz minőségűek, érthetetlenek vagy a kötelezően rögzítendő jellemzők közül egy vagy több pontatlanul illetve nem helyesen kerül rögzítésre.

3.4 Az éves ellenőrzésről készített jegyzőkönyvet kérésre bocsássák az állam felügyeleti hatósága rendelkezésére.

3.5 A repülési adatrögzítő rendszer kalibrálása:

a) a repülési adatrögzítő rendszert a kötelező jellemzők műszaki rögzítés átalakítási módszereinek helyességét érintő bármely hiányosságok megállapítása érdekében és annak biztosítása céljából, hogy a jellemzőket a kalibrálási tűrési határértéken belül rögzíti, legalább öt-évente kalibrálják újra; és

b) amikor a repülési magasság és sebesség jellemzők a repülési adatrögzítő rendszernek közvetlen adatat biztosító érzékelőktől származnak, ezeket az érzékelők gyártó szervezet ajánlásai alapján vagy legalább két-évente kalibrálják újra.

B-1. táblázat

Forgószárnyas légijármű - repülési adatrögzítővel rögzítendő jellemző adatok

Sor-szám	Jellemző adat	Mérési tartomány	Mintavétel és rögzítés max. időköze (mp)	Mérési pontosság (az érzékelő bemenő jele összehasonlítva az FDR kiértékelésével)	Adatrögzí-tés felbontása	Megjegyzés
1	idő (UTC vagy eltelt repülési idő)	24 óra (UTC) vagy 0-4095 (eltelt idő)	4	±0.125% óránként	1 mp	az eltelt idő 4 mp-ként növekszik a rendszer működése alatt
2	nyomás-magasság	-300 m (- 1000 láb) -tól a légijármű legnagyobb engedélyezett repülési magassága +1500 m (5000 láb) -ig	1	±30 méter – ±200 méter (±100 láb – ±700 láb)	5 láb	
3	műszer szerinti repülési sebesség	a mérőrendszer kijelzése szerint	1	±3%	1 csomó	
4	géptengely irányszög	360°	1	±2°	±0,5°	
5	függőleges gyorsulás	-3 g-től +6 g-ig	0.125	±0,09 g, kivéve a ±0,045 g adathibát		
6	bólintási helyzet	±75° vagy az alkalmazott értéktartomány 100%-a, amelyik nagyobb	0.5	±2°	0,5°	
7	dőlési helyzet	±180°	0.5	±2°	0,5°	
8	rádióadás kapcsolása	be/ki kapcsolva (egy parancsjel)	1	-	-	
9	az egyes hajtóművek teljesítménye	teljes tartomány	1 (hmű-ként)	±2%	a teljes tartomány 0,1%-a	elegendő jellemző adatot rögzítsenek a hmű teljesítmény meghatározhatósága érdekében.
10	fő forgószárny: fordulatszáma fék rendszere	 50 – 130% parancsjel	 0.51	 ±2% -	 a teljes tartomány 0,3%-a -	 ha a jelek azonnal rendelkezésre állnak
11	a forgószárnyas légijármű elsődleges repülésvezérlő szerkezeteinek működtetése a légijármű vezető által és/vagy a kormányfelületek helyzete (kollektív állásszög, hosszirányú ciklikus állásszög, oldalirányú ciklikus állásszög, farok légcsavar pedál)	teljes tartomány	0,5 (0,25 javasolt)	±2% kivéve, ha nagyobb pontosságot írnak elő	a műkö-dési tartomány 0,5%-a	hagyományos vezérlés rendszer esetén „vagy” , nem-mechanikus vezérlés rendszer esetén „és” alkalmazása szükséges.
12	hidraulika, minden rendszer (kis nyomás és kiválasztás)	parancsjel	-	-		

Sor-szám	Jellemző adat	Mérési tartomány	Mintavétel és rögzítés max. időköze (mp)	Mérési pontosság (az érzékelő bemenő jele összehasonlítva az FDR kiértékelésével)	Adatrögzí -tés felbontása	Megjegyzés
13	külső levegő hőmérséklete	a mérőműszer érzékelési tartománya	2	±2°C	0,3°C	
14*	robotpilóta/ tolóerő automata / automatikus repülésvezérlő (AFCS) rendszer üzemmód és működési helyzet	egyszeri parancsjelek megfelelő kombinációja	1	-	-	a parancsjelek mutassák a bekapcsolt rendszert
15*	stabilizáló rendszer igénybevétele	egyszeri parancsjel	1			a parancsjelek mutassák a bekapcsolt rendszert
Megjegyzés: az előző 15 jellemző adat az V. típusú repülési adatrögzítőnek felel meg						
16*	fő áttételház olajnyomás	felszerelés szerint	1	felszerelés szerint	6,895kN/m^2 (1 psi)	
17*	fő áttételház olajhőmérséklet	felszerelés szerint	2	felszerelés szerint		
18	legyező mozgás szögsebessége	±400°/mp	0.25	maximális tartomány ±1.5%-a, a ±5% adathiba kivételével	±2°/mp	a legyezőmozgás gyorsulása is elfogadható
19*	függési (emelőerő) terhelés	az engedélyezett terhelés 0 – 200%-a	0.5	maximális tartomány ±3%-a	maximális eng. terhelés 0,5%-a	ha a jelek azonnal rendelkezésre állnak
20	hosszirányú gyorsulás	±1g	0.25	±0,015g, a ±0,05g adathiba kivételével	0,004 g	
21	oldalirányú gyorsulás	±1g	0.25	±0,015g, a ±0,05g adathiba kivételével	0,004 g	
22*	rádió magasságmérő	-6 m és 750 m között (- 20 láb és 2500 láb között)	1	150 m (500 láb) alatt ±0.6 m (±2 láb) vagy 3% – amelyik a nagyobb, és 150 m (500 láb) felett ±5%	150 m (500 láb) alatt 0,3 m (1 láb) + a telj. tartomány 0,5%-a 150 m (500 láb) felett	
23*	eltérés a siklópályától	jeltartomány	1	±3%	teljes tartomány 0,3%-a	
24*	eltérés az iránysávtól	jeltartomány	1	±3%	teljes tartomány 0,3%-a	
25	marker adók átrepülése	egyszeri parancsjel	1	-	-	egy darab egyszeri parancsjel elegendő mindegyik marker adóra

Sor-szám	Jellemző adat	Mérési tartomány	Mintavétel és rögzítés max. időköze (mp)	Mérési pontosság (az érzékelő bemenő jele összehasonlítva az FDR kiértékelésével)	Adatrögzí-tés felbontása	Megjegyzés
26	központi riasztó jelzés	egyszeri parancsjel(ek)	1	-	-	egyszeri parancsjelet rögzítsenek központi riasztás, áttételház alacsony olajnyomás és SAS meghibásodás esetén. Másik „piros” riasztást rögzítsenek amikor a riasztás okát nem lehet megállapítani más jellemzőkből, vagy a fedélzeti beszédrögzítőről.
27	mindegyik navigációs vevő frekvencia beállítás	elégséges a kiválasztott frekvencia meghatározásához	4	felszerelés szerint	-	ha a jel digitális formában rendelkezésre áll.
28*	1. és 2. DME távolságok	0 – 280 NM	4	felszerelés szerint	1 NM	ha a jel digitális formában rendelkezésre áll. Az INS-től vagy más navigációs rendszertől való hosszúsági és szélességi érték rögzítése megfelelő változat.
29*	navigációs adatok {szélesség és hosszúság, föld feletti sebesség, szélsebesség, szélirány}	felszerelés szerint	2	felszerelés szerint	felszerelés szerint	
30*	futómű vagy futókibocsátó kar helyzete	egyszeri parancsjel	4	-	-	
Megjegyzés: A fenti 30 jellemző megfelel a IV. típusú repülési adatrögzítőre vonatkozó követelményeknek						
31*	hajtómű kiáramló gáz hőmérséklet (T_4)	felszerelés szerint	1	felszerelés szerint		
32*	turbina bemenő hőmérséklet (TIT/ITT)	felszerelés szerint	1	felszerelés szerint		
33*	tüzelőanyag térfogata	felszerelés szerint	4	felszerelés szerint		
34*	magasságváltozás sebessége	felszerelés szerint	1	felszerelés szerint		csak akkor szükséges, ha a fedélzeti műszerekről megszerezhető
35*	jegesedés érzékelés	felszerelés szerint	4	felszerelés szerint		egyszeri parancsjelek megfelelő összetétele az összes érzékelő állapotának meghatározására
36*	a forgószárnyas légijármű állapotát és felhasználását figyelő rendszer	felszerelés szerint	-	felszerelés szerint	-	
37	hajtómű vezérlési üzemmódok	egyszeri parancsjel	1	-	-	

Sor-szám	Jellemző adat	Mérési tartomány	Mintavétel és rögzítés max. időköze (mp)	Mérési pontosság (az érzékelő bemenő jele összehasonlítva az FDR kiértékelésével)	Adatrögzí-tés felbontása	Megjegyzés
38*	kiválasztott légnyomás beállítása (parancsnok és első tiszt)	felszerelés szerint	64 (4 javasolt)	felszerelés szerint	0,1 mb (0,01 Hgmm-ben)	csak az elektronikus képernyővel felszerelt forgószárnyas légijárműveken kell rögzíteni
39*	kiválasztott magasság (pilóták által kiválasztható összes üzemmód)	felszerelés szerint	1	felszerelés szerint	Elegendő a személy-zet általi kiválasz-tás meghatá-rozásához	
40*	kiválasztott sebesség (pilóták által kiválasztható összes üzemmód)	felszerelés szerint	1	felszerelés szerint		
41*	kiválasztott Mach szám (pilóták által kiválasztható összes üzemmód)	felszerelés szerint	1	felszerelés szerint		
42*	kiválasztott függőleges sebesség (pilóták által kiválasztható összes üzemmód)	felszerelés szerint	1	felszerelés szerint		
43*	kiválasztott útirányszög (pilóták által kiválasztható összes üzemmód)	felszerelés szerint	1	felszerelés szerint		
44*	kiválasztott repülési pálya (pilóták által kiválasztható összes üzemmód)	felszerelés szerint	1	felszerelés szerint		
45*	kiválasztott elhatározási magasság	felszerelés szerint	4	felszerelés szerint		
46*	EFIS képernyő formátum (parancsnok és első tiszt)	egyszeri parancsjel(ek)	4	-	-	az egyszeri parancsjelek fejezzék ki a képernyőn látható rendszerek állapotát, pl.: kikapcsolva, normál, meghibásodott, összetétel, szektor, sík, szélrózsa, navigációs eszközök, időjárási radar, értéktartomány, ismétlés.
47*	többfeladatú/hajtómű/ riasztó képernyő formátum	egyszeri parancsjel(ek)	4	-	-	az egyszeri parancsjelek fejezzék ki a képernyőn látható rendszerek állapotát, pl.: kikapcsolva, normál, meghibásodott és a képernyő oldalak azonosítását vészeljárások esetén. A felolvasó listák közleményeit és a szükséges eljárásokat ne rögzítsék.
48*	Esemény kijelölés	egyszeri parancsjel	1	-	-	

Megjegyzés: A fenti 48 jellemző megfelel a IV.A típusú repülési adatrögzítőre vonatkozó követelményeknek

C. Melléklet
Repülési idő és repülési szolgálati idő korlátozások

Kiegészítés a II. szakasz 2. fejezet 2.2.9.3 ponthoz

1. Cél és tárgykör

1.1 A repülési idő és a repülési szolgálati idő korlátozásának egyedüli célja, hogy csökkenjen annak valószínűsége, hogy a hajózószemélyzet tagjának fáradtsága a repülésbiztonságot hátrányosan befolyásolja.

1.2 A fenti lehetőség kiküszöbölése érdekében kétféle fáradtságot, nevezetesen az átmeneti és a hosszabb időn át felgyülemlett fáradtságot kell figyelembe venni. Az átmeneti fáradtság úgy irható le, mint ami az egészséges személynél munkával, feszültséggel vagy erőkifejtéssel járó időszakot követően alakul ki és amit általában egyszeri, megfelelő időtartamú alvással ki lehet pihenni. A felgyülemlett fáradtság ezzel szemben az átmeneti fáradtság nem időben vagy nem teljes mértékben történő kipihenése esetében vagy nagyobb mértékű munkavégzés, különösen nagyfokú izgalom vagy erőkifejtés utóhatásaként jöhet létre, amelyet az érintett személy nem tudott kipihenni.

1.3 A jelen rész előírásai alapján kidolgozott korlátozások védelmet biztosítanak mindkét típusú fáradtsággal szemben, mert figyelembe veszik a következőket:

1.3.1 A repülési idő korlátozása szükséges olyan módon, hogy ezzel védelmet biztosítsanak mindkét fajta fáradtsággal szemben.

1.3.2 A földön, a repülést közvetlenül megelőző vagy a közbenső pontokon a repülési sorozatok között eltöltött szolgálati idő korlátozása szükséges elsősorban az átmeneti fáradtsággal szembeni védelem érdekében.

1.3.3 Szükség van arra, hogy a hajózószemélyzet tagjai számára megfelelő lehetőséget biztosítsanak a fáradtság kipihenésére.

1.3.4 Elsősorban a felgyülemlett fáradtság hatásaival szemben történő védelem érdekében szükséges, hogy a hajózószemélyzet tagjának más előírt feladatait is figyelembe vegyék.

2. Általános rész

2.1 A légijármű vezető felelős azért, hogy szakszolgálati engedélyével és jogosításaival összefüggő jogait ne gyakorolja abban az esetben, ha tudatában van annak, hogy egészségi állapota, beleértve a fáradtsággal összefüggésben levő fizikai állapot szint csökkenést is, képtelenné teheti ezen jogok biztonságos gyakorlására.

2.2 A következő pontokban ismertetett korlátozások minimális követelményként tekintendők és a járató felelős azért, hogy azokat az alábbiakban jelzett tényezők figyelembevétel az egyes esetekre alkalmazza. A korlátozásoknál a következő egyedi tényezőket vegyék figyelembe:

a) a légijármű hajózószemélyzetének összetétele;

b) az üzemeltetés során előforduló késések valószínűsége;

c) a légijármű típusa és a lerepülendő útvonal nehézségi foka, amelyet a következő tényezők befolyásolnak: a forgalom sűrűsége, a navigációs berendezések, a szállított berendezések minősége és fajtái; a távközlési nehézségek, nagy magasságon történő repülés túlnyomás nélküli vagy magas értékű utaskabin nyomás-magasság mellett üzemelő túlnyomással ellátott légijárművel;

d) a repülési feladat során teljesített éjszakai repülések részaránya;

e) az útvonal megszakítás pihenő helyén a személyzetnek biztosított elhelyezés, amennyiben az megfelelő pihenést tesz lehetővé;

f) a fel és leszállások száma;

g) a rendszeres menetrendi tervezés rendszerének szükségessége, amely nagyfokú rendszerességet biztosít (ehhez lényeges tényező a megfelelő tartalék személyzet biztosítása);

h) az általános alvási és ébrenléti ciklusok megszakításából származó egyedi alváskárosodás, azaz pihenési nehézségek; és

i) a légijármű pilótakabin belső környezete.

2.3 A járató repülésbiztonsági okokból felelős annak biztosításáért, hogy ha a hajózószemélyzet tagjai a munkaadó részére végzendő, nem repülési szolgálati feladatokkal foglalkoznak, a repülési szolgálat felvétele előtt legalább a minimális előírt időt pihenéssel töltsék el.

3. Meghatározások

Kitelepült személyzet – Deadheading crew
A járató által légi vagy szárazföldi úton előre küldött személyzeti tag.

Szolgálati idő – Duty period
Az az időtartam, amely alatt a hajózószemélyzet tagja munkaadójának részére, annak utasítására adott feladatot elvégez.

Repülési szolgálati munkaidő – Flight duty period
Azon teljes időtartam, amely akkor kezdődik, amikor a hajózószemélyzeti tag pihenőidejét követően a repülés vagy repülési sorozat előtt szolgálatba lép és addig az időpontig tart, amikor a hajózószemélyzeti tag a repülés vagy repülési sorozat befejezése után mentesül összes szolgálati feladata alól.

Repülési szakasz – Flight sector
Egy repülés vagy repülések sorozatának egyike, amely a légijármű állóhelyén kezdődik és a légijármű megérkezése után annak állóhelyén végződik.

A repülési szakasz a következő részekből áll:

– repülés előkészítés

– repülési idő (tényleges)

– repülés utáni idő, a repülési szakasz vagy a repülési szakaszok sorozatának végrehajtása után.

Repülési idő – Forgószárnyas légijárművek – Flight time – Helicopters
Az a teljes időtartam, amely akkor kezdődik, amikor a légijármű forgószárnyai elindulnak és akkor fejeződik be, amikor a légijármű a repülés végén megáll és forgószárnyai leállnak.

Pihenőidő – Rest period
A földön eltöltött bármely időtartam, amely alatt a járató a hajózószemélyzet tagját mentesíti összes feladata alól.

Repülések sorozata – Series of flights
Két pihenő időszak között teljesített két vagy több repülési szakasz.

Tartalék – Standby
Olyan meghatározott időtartam, amely alatt a személyzet tagja azonnali szolgálattételre hívható be.

Fordulóidő – Turnaround time
Két repülési szakasz között a repülési szolgálati munkaidőn belül a földön töltött időtartam.

4. Megjegyzések a meghatározásokhoz

4.1 Repülési idő

A repülési idő meghatározás szükségszerűen nagyon általános, de a hajózószemélyzet tagjaira korlátozások vonatkozásában természetesen a "hajózószemélyzeti tag" meghatározás szerint alkalmazandó. Ennek megfelelően az utasként utazó, szakszolgálati engedéllyel rendelkező személyzeti tagok nem tekinthetők hajózószemélyzeti tagnak, bár az utazási idejüket a pihenőidő megállapításánál figyelembe vehetik.

4.2 Repülési szolgálati idő

4.2.1 A repülési szolgálati idő meghatározás célja egy olyan folyamatos szolgálati időtartam megnevezése, amely mindig egy repülésre vagy repülési sorozatra vonatkozik. Tartalmazza a hajózószemélyzet tagjának minden olyan feladatát, amelyeknek elvégzésére a repülés napján szolgálati helyen történő jelentkezéstől a repülés vagy repülési sorozat befejezését követően a szolgálatból történő felmentéséig utasítható. Álláspontunk szerint szükséges ezen időtartam korlátozása, mert a hajózószemélyzet tagjának ezen időtartamon belül történő tevékenysége átmeneti vagy felgyülemlett fáradtságot eredményez, amely a repülésbiztonságot veszélyezteti. Másrészt viszont (a repülésbiztonság szempontjából) egyéb olyan időszakokat illetően, amelyek során a hajózószemélyzet tagja a járató által számára kijelölt más feladatokat végez, nincs elegendő nyomós indok a korlátozás bevezetésére. Az ilyen feladatokat ezért csak a pihenőidővel kapcsolatos rendelkezéseknél és csak a fáradtság kialakulásához vezető számos tényező egyikeként vegyék figyelembe.

4.2.2 A repülési szolgálati idő meghatározásánál nem tekintjük szükségesnek egyéb olyan időtartamok beszámítását, mint például azt, amely alatt a hajózószemélyzet tagja otthonából a munkahelyére utazik.

4.2.3 Fontos elővigyázatossági intézkedés valósítható meg, amennyiben az államok és a járatók elismerik a személyzeti tag jogát a további repülési szolgálat elutasítására, ha az olyan természetű fáradtságot érez, amely hátrányosan befolyásolja a repülésbiztonságot.

4.3 Pihenőidő

A pihenőidő meghatározás szolgálattól való távollétet jelent, amelynek célja a fáradtság kipihenése; a pihenés módját az érintett személy önmaga határozza meg.

5. A korlátozások módjai

5.1 A korlátozások az időtartam tekintetében nagyon különbözőek; például az ICAO-nak erről tájékoztatást nyújtó államok többsége napi, havi és éves repülési idő korlátozásokat ír elő valamint igen sokan negyedévi korlátozást is alkalmaznak. Valószínűlege elegendő a napi repülési szolgálati időszakok korlátozása, mindazonáltal meg kell érteni, hogy ezek a korlátozások az egyedi helyzetek különbségei miatt jelentős mértékben eltérőek egymástól.

5.2 A repülési idő korlátozását szabályozó előírások vagy utasítások kidolgozásánál vegyék figyelembe a személyzet összetételét, valamint azt is, hogy a különböző feladatok milyen mértékben oszthatók fel a személyzet tagjai között. Abban az esetben, ha a légijárművön megfelelő pihenésre alkalmas helyet biztosítanak arra, hogy a személyzet tagja ott elkülönítetten és vízszintes (fekvő) testhelyzetben pihenjen, a repülési szolgálati idő meghosszabbítható. A földön, ahol a személyzet tagjai a pihenőidőt töltik, megfelelő pihenőhelyek kialakítása szükséges. Az államok vagy járatók továbbá a következő tényezőket is vegyék figyelembe: a forgalom sűrűsége, a rendelkezésre álló navigációs és távközlési létesítmények, a munka és alvásidő ciklusa illetve ritmusa, a fel és leszállások száma, a légijármű kezelés, kiszolgálás valamint teljesítmény jellemzők és az időjárási körülmények.

6. Repülési idő táblázat

A sok lehetséges változat közül az alábbiakban bemutatjuk azt a nyilvántartó táblázatot, amelyben a szolgálati idő a II. szakasz 2.2.9.3 pontjának megfelelően vezethető.

Hajózó személyzet	*Leghosszabb repülési szolgálati idő 24 óra alatt*	*Leghosszabb repülési időtartam (óra)*				*Pihenőidő*	
		napi 24 óra	*havi*	*negyedévi*	*évi*	*napi*	*heti*
Légijármű parancsnok							
Első tiszt							

D. Melléklet
Elsősegélynyújtó egészségügyi készletek

Kiegészítés a II. szakasz 4. fejezet 4.2.2 a) alponthoz

A következőkben ismertetjük a forgószárnyas légijármű fedélzetén szállítandó általános Elsősegélynyújtó készlet tartalmát:

∗ elsősegély-nyújtási kézikönyv
∗ ”Túlélők által használt föld – levegő látjelek” a 12. Annex alapján
∗ sérülések ellátására szolgáló egészségügyi anyagok
∗ szemcseppek
∗ orrváladék oldó permet(szóró)k
∗ rovarirtó illetve riasztó szerek
∗ lágyító/puhító szemkenőcs
∗ napsugárzásból származó égési sérülések kezelésére szolgáló kenőcs
∗ vízzel keverhető fertőtlenítő és bőrtisztító anyag
∗ kiterjedt égési sérülések kezelésére szolgáló anyagok
∗ szájon át bevehető tabletták a következők szerint:
érzéstelenítő, görcsoldó, a központi idegrendszert élénkítő, keringést serkentő, koszorú-ér tágító, hasmenés valamint egyensúlyi zavarok elleni orvosságok
∗ műanyagcső a mesterséges lélegeztetéshez
∗ műanyag csonttörés rögzítő.

E. Melléklet
Minimális felszerelési jegyzék (MEL)
Kiegészítés a II. szakasz 4. fejezet 4.1.3 ponthoz

1. Ha az állami előírásoktól való eltéréseket a légijármű jogosítása alkalmával nem engedélyezték, a légijármű csak akkor üzemeltethető a levegőben, ha minden rendszere és berendezése üzemképes. A tapasztalatok szerint rövidtávon bizonyos egységek üzemképtelensége elfogadható, ha a többi üzemeltetési rendszer és berendezés biztosítja az üzemeltetés biztonságos folytatását.

2. A minimális felszerelési jegyzék elfogadásával az állam jelezze azokat a rendszereket és felszerelési tárgyakat, amelyek bizonyos repülési körülmények között üzemképtelenek lehetnek – azzal a céllal, hogy a meghatározottakon felül más üzemképtelen rendszerrel vagy berendezéssel a repülés nem hajtható végre.

3. Ezért a légijármű típushoz a típus megtervezéséért felelős szervezet által, a tervezés államának jóváhagyásával kidolgozott gyártói minimális felszerelési jegyzéknek megfelelően meghatározott és a járató állama által elfogadott minimális felszerelési jegyzék minden légijármű részére szükséges.

4. A járató állama kérje fel a járatót a minimális felszerelési jegyzék elkészítésére annak érdekében, hogy lehetővé tegyék a légijármű üzemeltetését bizonyos rendszerek vagy berendezések üzemképtelensége mellett feltéve, hogy a biztonság elfogadható szintjét fenntartják.

5. A minimális felszerelési jegyzéknek nem célja, hogy a légijármű nem működő rendszerekkel vagy berendezésekkel történő üzemeltetését korlátlan ideig biztosítsa. A minimális felszerelési jegyzék alapvető célja a légijármű egyes nem működő rendszerekkel vagy berendezésekkel történő biztonságos üzemeltetésének meghatározott és ellenőrzött karbantartási valamint alkatrész csere program kereteken belül történő tartása.

6. A járató biztosítsa, hogy a repülés végrehajtását ne kezdjék meg a minimális felszerelési jegyzékbe tartozó több tétel működésképtelensége mellett annak megállapítása előtt, hogy az üzemképtelen rendszerek vagy alkatrészek közötti kapcsolat nem okozza a biztonság elfogadhatatlan szint alá csökkenését és/vagy a hajózószemélyzet munkaterhelésének szükségtelen mértékű növekedését.

7. Az elfogadható biztonsági szint meghatározása alkalmával figyelembe kell venni az üzemképtelen rendszerekkel vagy berendezésekkel történő üzemeltetés folytatása során bekövetkező további meghibásodások lehetőségét is. A minimális felszerelési jegyzék nem térhet el a repülésvégrehajtási kézikönyv korlátozásaitól, a vészhelyzeti eljárásoktól vagy más, a járató vagy a lajstromozó állam légialkalmassági előírásaitól kivéve, ha az illetékes légialkalmassági hatóság vagy a repülésvégrehajtási kézikönyv másként rendelkezik.

8. Egy repülés során üzemképtelennek elfogadott rendszereket vagy berendezéseket szükség szerint lássák el feliratokkal vagy jelzésekkel és az összes ilyen tételt vezessék be a repülőgép műszaki jegyzékébe (naplójába), hogy a hajózó és a karbantartó személyzetet tájékoztassák az üzemképtelen rendszerekről vagy berendezésekről.

9. Egy adott üzemképtelennek elfogadott rendszer vagy berendezés esetében a repülés megkezdése előtt szükség lehet egy karbantartási eljárás megállapítására annak érdekében, hogy az üzemképtelen rendszert vagy berendezést lekapcsolják vagy elkülönítsék. Ehhez hasonlóan szükség lehet a megfelelő hajózószemélyzeti üzemeltetési eljárás kidolgozására is.

10. A légijármű parancsnokának felelősségét a minimális felszerelési jegyzéknek megfelelő hiányosságokkal rendelkező forgószárnyas légijármű üzemeltetésre történő elfogadására a II. szakasz 2. fejezet 2.3.1 pont határozza meg.

F. Melléklet

A légi üzemeltető (járató) tanúsítása és megerősítése

Kiegészítés a II alrész. 2. fejezet, 2.2.1 ponthoz

1. Cél és tárgykör

1.1 Bevezetés

A jelen melléklet célja, hogy az államok által a járatók 2. fejezet, 2.2.1 pont szerinti tanúsítási követelményeivel kapcsolatban előírt tevékenységekkel, különös tekintettel ezen tevékenységek végrehajtásához és nyilvántartásához szükséges eszközökkel kapcsolatban útmutatót adjon.

1.2 A tanúsítást megelőző követelmények

A 2.2.1.4 alpontban előírtaknak megfelelően a légijármű üzembentartási engedély (AOC) kibocsátása a járató állama részéről annak függvénye, hogy a járató a meghatározott üzemeltetés természetétől és nagyságrendjétől függően valamint figyelembevételével bizonyságot tesz a repülési tevékenység megfelelő ellenőrzéséről és szervezéséről, kiképzési programjairól, földi kiszolgálásáról és karbantartási intézkedéseiről. A tanúsítási folyamat magába foglalja az összes járatónak az állam részéről történő értékelését, vagy későbbi engedélyek hozzáadását az AOC-hez, valamint annak a meghatározását, hogy az AOC első kibocsátását megelőzően a járató képes a biztonságos üzemeltetés lefolytatására.

1.3 Szabványos tanúsítási gyakorlatok

A 2.2.1.7 alpont előírja, hogy a járató állama hozzon létre egy tanúsítási rendszert az üzemeltetés hatályába tartozó típusra vonatkozó előírások betartásának igazolására,. Számos állam az iparág lehetőségeinek megfelelően alakította ki a saját politikáját és eljárásait, hogy ezen tanúsítási követelményeknek megfeleljen. Noha ezek az államok egymással való koordináció nélkül alakították ki saját gyakorlatukat, ezen gyakorlati megoldások szerfelett hasonlítanak egymásra és összhangban állnak saját követelményeik tekintetében. Ezen gyakorlati megoldások hatékonysága az évek során igazolást nyert, a járatók számára javuló biztonsági nyilvántartásokat eredményezve a világ minden részén. Ezen gyakorlati megoldások jelentős része hivatkozásként bépítésre került az ICAO ajánlásokba.

2. Előírt műszaki biztonsági értékelések

2.1 Jóváhagyási és elfogadási tevékenységek

2.1.1 A járatók tanúsítása és folyamatos ellenőrzése magába foglalja az államnak, az általa történő felülvizsgálatra benyújtott tárgykörben tett vizsgálatait. Az államnak, az általa történő felülvizsgálatra benyújtott tárgykörben tett válaszainak jellegétől függően a tevékenységeket jóváhagyási vagy elfogadási kategóriába lehet sorolni.

2.1.2 Egy jóváhagyás az állam által adott aktív válasz a felülvizsgálat céljából hozzá benyújtott tárgykörben. Egy jóváhagyás a megfelelő előírásnak való megfelelés meghatározását vagy tényét állapítja meg. Egy jóváhagyás bizonyosságát a jóváhagyó hivatalos személy aláírása, egy dokumentum vagy tanúsítvány kibocsátása, vagy az állam által hozott egyéb formális tevékenység igazolja.

2.1.3 Egy elfogadás nem feltétlenül igényli az állam aktív válaszát a felülvizsgálat céljából hozzá benyújtott tárgykörben. Egy állam a hozzá felülvizsgálat céljából benyújtott anyagot elfogadhatja, mint a megfelelő előírással megegyezőt, ha az állam kifejezetten nem utasítja el a felülvizsgálat alá tartozó anyag egészét vagy egy részét, általában a benyújtást követő meghatározott időtartam után.

2.1.4 Az „Állam által jóváhagyva" kifejezés, vagy a „jóváhagyva" szót alkalmazó hasonló kifejezések gyakran fordulnak elő a III. rész, II. alrészében. Az állam részéről jóváhagyást vagy legalább „elfogadást" igénylő felülvizsgálatot jelző intézkedések fordulnak még elő gyakran a III. rész, II. alrészében. Ezen sajátos kifejezéseken felül, a III. rész, II. alrésze számos hivatkozást tartalmaz olyan követelményekre, amelyek minimum legalább az állam által végrehajtandó műszaki felülvizsgálat igényét fogalmazzák meg. Az államok általi használat megkönnyítése céljából ez a melléklet csoportokba szedi és összefoglalja ezeket a sajátos előírásokat és ajánlott gyakorlati eljárásokat.

2.1.5 A jóváhagyás vagy az elfogadás kibocsátása előtt az állam hajtson végre vagy készítsen elő műszaki biztonsági értékelést. Az értékelést:

a) olyan személy hajtsa végre, aki különleges jogosítással rendelkezik az ilyen műszaki értékelések végrehajtására;

b) leírt, szabványos módszer szerint hajtsák végre; és

c) gyakorlati bemutató bevonásával hajtsák végre, amennyiben a biztonság érdekében szükséges a járató valós képességeinek vizsgálata az ilyen üzemeltetések végrehajtásához.

2.2 Szemléltetés néhány jóváhagyás kibocsátása előtt

2.2.1 A 2.2.1.4 alpontban leírtak kötelezik a járató államát arra, hogy a járató tanúsítását megelőzően követeljen meg a járatótól egy olyan szemléltetést, amely alapján az állam el tudja dönteni, hogy a járató szervezete, a repülési tevékenység, a földi kiszolgálás valamint a karbantartási programok irányítására és felügyeletére használt módszerei megfelelőek-e. Ezek a szemléltetések a kézikönyvek, nyilvántartások, létesítmények és eszközök értékelésén és ellenőrzésén felül kerülnek alkalmazásra. Ezen részben megkövetelt egyes jóváhagyások, mint például a III. kategória szerinti üzemeltetés jóváhagyása, érzékelhető biztonsági kihatással rendelkeznek, így szemléltetés alapján kerülnek elbírálásra mielőtt az állam jóváhagyná az ilyen üzemeltetést.

2.2.2 Habár az előírt szemléltetések és értekelések mértéke és sajátos módszerei eltérőek az államok között, mégis azon államok esetében, ahol a járatók jó biztonsági adatokkal rendelkeznek, a tanúsítási folyamatok általában összhangban vannak. Ezekben az államokban, az AOC kibocsátása vagy az AOC kiegészítéseinek jóváhagyása előtt, a műszakilag felkészített ellenőrök egy reprezentatív mintát vizsgálnak a tényleges képzés, karbantartás és üzemeltetés területéről.

2.3 A tanúsítási tevékenységek jegyzőkönyvezése

2.3.1 Nagyon fontos, hogy az államok tanúsítási, jóváhagyási és elfogadási tevékenysége megfelelően legyen dokumentálva. A tevékenységek hivatalos feljegyzéseként az állam adjon ki egy okiratot, mint például egy levelet vagy egy hivatalos dokumentumot. Ezt az okiratot mindaddig meg kell őrizni, amíg a járató gyakorolja a felhatalmazása szerinti tevékenységet, amelyre a jóváhagyási vagy elfogadási műveleteket lefolytatták. Ezen okirat a járató felhatalmazásának egyértelmű tanúbizonysága, és bizonyítékként szolgál abban az esetben, ha az állam és a járató eltérő véleménnyel van arról az üzemeltetésről, amelynek folytatására a járatót felhatalmazták.

2.3.2 Egyes államok egy okmánygyűjtőben összesítik a tanúsítással kapcsolatos adatokat, mint az ellenőrzés, a szemléltetés, a jóváhagyás és az elfogadás iratait, és mindaddig megőrzik, míg a járató aktív. Más államok ezeket az adatokat a végrehajtott tanúsítási tevékenységnek megfelelő gyűjtőben tárolják, és a gyűjtőt a jóváhagyási vagy az elfogadási okmány naprakészségének megfelelően módosítják. Az alkalmazott módszertől függetlenül, ezek a tanúsítási adatok meggyőző tanúbizonyságul szolgálnak, hogy az államok eleget tesznek a járató tanúsításával kapcsolatos ICAO kötelezettségeiknek.

2.4 Az üzemeltetés és a légialkalmasság értékelésének összehangolása

A III. rész, II. alrészének a jóváhagyásra vagy az elfogadásra vonatkozó egyes hivatkozásai megkövetelik a járatók értékelését és a légialkalmasság értékelését. Az alacsony minimumokra voantkozó jóváhagyás, amely a II kategóriájú és a III kategóriájú alacsony feltételek szerinti ILS megközelítések végrehajtásához szükségesek, például az üzemeltetési és a légialkalmassági szakemberek összehangolt előzetes értékelését igényli. A légiüzemeltetési szakemberek értékeljék az üzemeltetési eljárásokat, képzéseket és jogosításokat. A légialkalmassági szakemberek értékeljék a légijármű és a berendezések megbízhatóságát és a karbantartási eljárásokat. Ezen értékeléseket önállóan is el lehet végezni, de a biztonsághoz szükséges összes tényező figyelembevételének biztosítása érdekében, a jóváhagyás kibocsátása előtt az értékeléseket össze kell hangolni.

2.5 A járató államának és a lajstromozó államnak a felelőssége

2.5.1 A III. rész, II. alrésze a járató államának felelősségébe utalja az alaptanúsítást, az AOC kibocsátását és a járató működés alatti felügyeletét. A III. rész, II. alrésze megköveteli a járató államától azt is, hogy vegye figyelembe a lajstromozó állam által kiadott különböző jóváhagyásokat és elfogadásokat, vagy cselekedjen azok szerint. Ezen kérésekre tekintettel, a járató állama biztosítsa, hogy az intézkedései összhangban állnak a lajstromozó állam jóváhagyásaival és elfogadásaival, és azt is, hogy a járató megfelel a lajstromozó állam követelményeinek.

2.5.2 Jelentős fontosságú, hogy a járató állama kapja meg mindazon intézkedéseket, különösen a karbantartásra és a hajózó személyzetek képzésére vonatkozókat, melyek alapján a légi üzemeltetői használják egy másik állam lajstromába tartozó légijárművet. Az ilyen intézkedéseket a lajstromozó állammal összhangban tekintse át a járató állama. Ahol helyénvaló, a Nemzetközi Polgári Légiközlekedési Egyezmény 83 bis cikkelye értelmében egy olyan egyezményt kell előkészíteni, amelyik a lajstromozó állam felülvizsgálati felülvizsgálati felelősségét átruházza a járató államára, hogy ki lehessen zárni bármely arra vonatkozó félreértést, hogy melyik állam felelős a különös felülvizsgálati felelősségért.

Megjegyzés: a bérbevétel, a különjárati és a közös üzemeltetéssel összefüggésben a járató államának és a lajstromozó államnak a felelősségére vonatkozó útmutatót az Üzemeltetés Felügyeleti, Jogosítási és Folyamatos Ellenőrzési Eljárások Kézikönyv *(Doc 8335) tartalmazza. A lajstromozó állam felelősségének a járató államára való átruházására vonatkozó útmutató, amikor a felelősség átruházása a 83. bis cikkely értelmében valósul meg,* a Nemzetközi Polgári Légiközlekedési Egyezmény 83 bis cikkelyének alkalmazási útmutatójában *(Cir 295) található meg.*

3. Jóváhagyási intézkedések

3.1 Jóváhagyások

A „jóváhagyás” fogalom sokkal több hivatalos tevékenységre utal a tanusítás tárgyára vonatkozó állami szerepvállalásban, mint azt az „elfogadás” fogalom teszi. Egyes államok megkövetelik, hogy a Polgári Légiközlekedési Hatóság (CAA) igazgatója, vagy egy kijelölt alacsonyabb beosztású CAA hivatalnok bocsásson ki egy hivatalos okmányt minden egyes elvégzett „jóváhagyási” tevékenységre. Egyes államok megengedik különféle okiratok kibocsátását a jóváhagyás bizonyítékaként. A jóváhagyó okirat és az abban meghivatkozott tárgy a hivatalnokra ruházott hatáskörtől fog függeni. Az ilyen államokban a rutin jóváhagyások aláírásának jogát, mint például a járató minimális berendezéseinek jegyzéke egy meghatározott légijárműre, a műszaki ellenőrökre bízzák. Normál esetben az összetettebb vagy jelentős jóváhagyások kibocsátása magasabb szintű hivatalos személyek feladata.

3.2 Légijármű üzembentartási engedély (AOC)

3.2.1 A 6. Annex, III. rész, 2.2.1 alpontja által előírtak szerint az AOC egy hivatalos okmány, amely a 2.2.1.6 alpont követelményeinek megfelelően legalább a következőket tartalmazza:

a) a járató megnevezése (cégnév vagy azonosító, székhelye);

b) a kiadás időpontja és az érvényesség időtartama;

c) az engedélyezett üzemeltetés típusok ismertetése;

d) a használatra engedélyezett légijármű típus(ok); és

e) üzemeltetésre engedélyezett területek vagy repülési útvonalak.

3.2.2 Egyes államok az AOC-t és a kapcsolódó okiratokat, mint például az üzemeltetések részletezését a III. rész, II. alrésze által előírt egyéb engedélyek alátámasztására alkalmazzák.

3.3 Jóváhagyást igénylő intézkedések

Az alábbi intézkedések megkövetelik, vagy támogatják a meghatározott államok által történő jóváhagyást. A járató államának jóváhagyása szükséges az alább felsorolt minden olyan tanúsítás esetén, amelyet nem előz meg egy vagy több csillagjel. Az alább felsorolt tanúsítási esetek közül, amelyeket egy vagy több csillagjel előz meg, vagy a lajstromozó állam (egy csillag, vagy ”*”), vagy a tervező állam (kettős csillag, vagy ”**”) jóváhagyása szükséges. Ennek ellenére a járató állama tegyen meg minden szükséges lépést annak biztosítása érdekében, hogy a felelősségi körébe tartozó járatók, az ő követelményein felül, feleljenek meg minden szükséges, a lajstromozó állam és/vagy a tervező állam által kiadott jóváhagyásnak.

a) **Repülésvezérlő szerkezetek alaphelyzettől történő eltéréseinek jegyzéke (CDL) (Meghatározások);

b) **Gyártó minimális felszerelési jegyzéke (MMEL) (Meghatározások);

c) A legalacsonyabb repülési magasságok meghatározásának módszere (2.2.6.3);

d) A helikopter repülőtér üzemeltetési minimum meghatározásának módszere (2.2.7.1);
e) Repülési idő, repülési szolgálati időtartam és pihenőidő (2.2.9.2);

f) Helikopter-specifikus minimális felszerelési jegyzék (MEL) (4.1.3);

g) RNP üzemeltetések (5.2.2 b));

h) *Engedélyezett karbantartó szervezet (6.1.2);

i) *Helikopter-specifikus karbantartási program (6.3.1);

j) Hajózószemélyzeti tag kiképző programok (7.3.1);

k) Veszélyes áruk szállítására vonatkozó képzés (7.3.1, 5. Megjegyzés);

l) Szintetikus repülési gyakorló berendezés használata (7.3.2 a), 7.4.2. és 7.4.4, Megjegyzés);

m) A repülési üzem irányításának és felügyeletének módszere (2.2.1.4 és 8.1);

n) **Kötelező karbantartási feladatok és ezek elvégzésének időszakai (9.3.2); és

o) Utaskabin személyzeti tagok képzési programjai (10.3).

3.4 Műszaki értékelést igénylő intézkedések

A jelen részben található egyéb intézkedések igénylik, hogy az államok műszaki értékelést hajtsanak végre. Ezek az intézkedések olyan kifejezéseket tartalmaznak, mint „az állam számára elfogadható”, „az állam számára megfelelő”, „az állam által meghatározva”, „az állam által elfogadhatónak itélve” és az „állam által előírva”. Miközben nem feltételenül várják el az állam által történő jóváhagyást, ezek az előírások megkövetelik az államtól, hogy legalább fogadja el a szóbanforgó ügyet, miután hajtson végre egy sajátos felülvizsgálatot vagy értékelést. Ezek az intézkedéseka következők:

a) a helikopter-specifikus ellenőrző lista részletei (Meghatározás: légijármű üzemeltetési kézikönyv és 4.1.4);

b) a légijármű specifikus rendszerek részletei (Meghatározás: légijármű üzemeltetési kézikönyv és 4.1.4);

c) kötelező anyag az üzemeltetési kézikönyv számára (2.2.2.2 és H. Melléklet);

d) *a járató légijármű-specifikus karbantartási felelősségei (6.1.1);

e) *a karbantartás és a karbantartási nyilatkozat kiadásának módszere (6.1.2);

f) *karbantartás irányítási kézikönyv (6.2.1);

g) *kötelező anyag a karbantartás irányítási kézikönyv számára (6.2.4);

h) *a karbantartási gyakorlatra vonatkozó információk jelentése (6.5.1);

i) *a karbantartás szükséges helyesbítő intézkedéseinek bevezetése (6.5.2);

j) *módosítási és javítási követelmények (6.6);

k) oktatási létesítmények (7.3.1);

l) az oktatók jogosítása (7.3.1);

m) ismeretfelújító képzése szükségessége (7.3.1);

n) levelező tanfolyamok és írásbeli vizsgáztatás alkalmazása (7.3.1, 4. melléklet);

o) szintetikus repülési gyakorló berendezés alkalmazása (7.3.2);

p) a hajózó személyzetek jogosításainak nyilvántartása (7.4.3.4);

q) a járató államának kijelölt képviselője (7.4.4.1);

r) *a repülésvégrehajtási kézikönyv változásai (9.1); és

s) meghatározott légijárművekre kijelölt légiutaskisérők minimális száma (10.1).

4. Elfogadási tevékenységek

4.1 Elfogadás

4.1.1 A járató meghatározott légiüzemeltetés végrehajtásához való felkészültségének ellenőrzésénél, az állam által végrehajtott műszaki értékelés valós terjedelme legyen sokkal átfogóbb, mint az az előírás, amelyik megköveteli, vagy maga után vonja a jóváhagyást. A járató nemzetközi kereskedelmi légiszállítási feladatainak megkezdése előtt, az állam győződjön meg a tanúsítás során arról, hogy a járató megfelel a III. rész, II. alrész összes követelményének.

4.1.2 Egyes államok az „elfogadás" fogalmát hivatalos módszerként használják, amikor meg akarnak győződni arról, hogy az AOC hivatalos kibocsátását megelőzően, a járató tanúsításának összes kritikus elemét megvizsgálta az állam. Az előbbi fogalom használatával, ezek az államok érvényesítik azon előjogukat, hogy rendelkeznek a műszaki ellenőröknek a járatók üzemeltetési biztonságot befolyásoló politikájáról és eljárásairól szóló beszámolóival. Ezen elfogadást tükröző okmány tényleges kiadásával (feltételezve, hogy egy ilyen dokumentum kibocsátásra kerül) a tanúsítás végrehajtására kijelölt műszaki ellenőrt is meg lehet bízni.

4.1.3 Az „elfogadás"-i tevékenység egy meghatározott jóváhagyás kiadásához kapcsolódó kiegészítésnek tekinthető. Például, az üzemeltetési utasítás egy adott részét el lehet „fogadni" egy hivatalos okmány kiadásával, míg más részeit, mint például a légijármű-specifikus minimális felszerelési jegyzéket, egy önálló hivatalos okmány kiadásával „jóváhagyják".

4.2 Megfelelőségi jelentés

Egyes államok a megfelelőségi jelentést konkrét járatóra vonatkozó elfogadás okmányolására használják. Ez egy olyan, a járató által beterjesztett dokumentum, amelyben a járató az üzemeltetési vagy a karbantartási kézikönyv megfelelő részeire való hivatkozással azt részletezi, hogy miként fog megfelelni az állam összes alkalmazható követelményének. Ezt a fajta dokumentumot a Doc 8335, 3.3.2 e) része és a Légialkalmassági Kézikönyv (Doc 9760), I. kötet, 6.2.1 c) 4) része hivatkozza meg. A tanúsítás során az ilyen megfelelőségi jelentést aktívan kell alkalmazni és szükség szerint módosítani, a járató politikájában és eljárásaiban az állam igényei alapján végrehajtott változtatások bemutatása érdekében. Ezt követően a végleges megfelelőségi jelentést elhelyezik az állam tanúsítási nyilvántartásában, más egyéb tanúsítási jelentésekkel együtt. A megfelelőségi jelentés egy kiváló módszer annak bemutatására, hogy a járató tanúsítása az összes, alkalmazandó hatósági előírás szerint megfelelően lett végrehajtva.

4.3 Üzemeltetési és karbantartási kézikönyvek

4.3.1 Az üzemeltetési és a karbantartási kézikönyveket, valamint az összes további módosításukat terjesszék be az államnak (2.2.2.2, 6.1.1, 6.2.4, 6.3.2). Továbbá, az állam meghatározza ezen kézikönyvek minimális tartalmát (9.2, 9.3, 9.4 és H. Melléklet). Az állam műszaki kézikönyvében határozzák meg a járató kézikönyveinek (például, az üzemeltetési politika kézikönyve, üzemeltetési kézikönyv, utaskabin személyzet kézikönyve, útvonal ismertető és képzési kézikönyv) értékelésre szolgáló adagját. Egyes államok hivatalos okmányt adnak ki az összes kézikönyv és minden további módosítás elfogadásáról.

4.3.2 Az állam műszaki értékelése, az előírt tartalom meglétének ellenőrzésén kívül, téren ki arra is, hogy a sajátosan jellemző politika és eljárások az elvárt eredményt hozzák-e. Például az üzemeltetési repülési tervre (H. Melléklet, 2.1.15) vonatkozó részletes leírás, az említett tervek tartalmára és megőrzésére vonatkozó 2.3 alfejezet előírásainak teljesítése érdekében, határozzon meg egy lépésenkénti kitöltési útmutatót.

4.3.3 A kipróbált iparági alkalmazásokat hivatkozás céljából, mint például a hajózó személyzetek és a szolgálatvezetők által ténylegesen kitöltött üzemeltetési repülési tervet (habár nem egy szabványosat), a tanúsítás során az állam műszaki felülvizsgálója elkérheti. A műszaki értékelés ezen részét az üzemeltetés tanúsításában gyakorlott ellenőr végezze. A kipróbált iparági gyakorlat értékelésének alkalmazásával kapcsolatos legfőbb megfontolás tárgyát képezi, hogy ez a módszer légijármű-specifikus, berendezés-specifikus, vagy korlátozottan állnak rendelkezésre olyan értékelő személyek, akik naprakész jogosítással rendelkeznek az értékelendő alkalmazás vonatkozásában.

5. Egyéb jóváhagyási vagy elfogadási megfontolások

Jóváhagyás vagy elfogadás céljából egyes államok bekérnek bizonyos, a jelen részben meghatározott kritikus dokumentumokat, feljegyzéseket vagy eljárásokat, noha a 6. Annexben található vonatkozó előírás nem követeli meg a járató állama általi jóváhagyást vagy elfogadást. Néhány erre vonatkozó példa látható az alábbiakban:

a) biztonsági program (1.1.9);

b) légiközlekedési adatok beszerzésének módja (2.1.1);

c) a tüzelőanyag és olaj jegyzékek megfelelősége (2.2.8);

d) a repülési időre, a repülési szolgálati időtartamra és a pihenőidőre vonatkozó adatok megfelelősége (2.2.9.3, 7.6 és 10.4);

e) a légijármű karbantartási naplójának megfelelősége (2.3.1 a), b) és c));

f) a terhelési nyilatkozat megfelelősége (2.3.1 d), e) és f));

g) a repülési terv megfelelősége (2.3.1 g));

h) az időjárási adatok beszerzési módja (2.3.5.1 és 2.3.5.2);

i) a kézi poggyász megfelelő elhelyezésének módja (2.7);

j) forgószárnyas légijármű teljesítmény üzemeltetési korlátozások (3.2.4);

k) helikopter repülőtéri akadály adatok beszerzésének és felhasználásának módja (3.3);

l) az utastájékoztató kártyák megfelelősége (4.2.2 d));

m) a hosszútávú navigáció eljárásai (5.2.1 b));

n) az útinapló tartalma (9.4); és

o) a repülésvédelmi képzésre vonatkozó program tartalma (11.2).

6. Az üzemeltetési előírások megerősítése

A 2.2.1.5 alpont előírása meghatározza, hogy a légijármű üzembentartási engedély (AOC) folyamatos érvényessége attól függ, hogy a járató a járató államának ellenőrzése alatt rendszeresen eleget tesz az eredeti tanúsítási előírásnak (2.2.1.4). Ez az ellenőrzés megköveteli egy olyan folyamatos minőség ellenőrzési rendszer létrehozását, amellyel biztosítani lehet a 2.2.1.7 alpontban található, a légijármű üzemeltetés színvonalára vonatkozó előírások betartását. Megfelelő kiindulási pont egy ilyen rendszer létrehozásában, ha éves vagy féléves ellenőrzéseket, megfigyeléseket vagy vizsgálatokat követelnek meg, az igényelt tanusítás jóváhagyási és elfogadási tevékenységek érvényesítéséhez.

7. A légijármű üzembentartási engedély módosítása

A járató tanúsítása egy folyamatos tevékenység. Kevés járató fog egy idő elteltével megfelelni a légijármű üzembentartási engedélyével megszerzett kezdeti felhatalmazásának. A piaci lehetőségek kibontakozása arra készteti a járatót, hogy változtasson légijármű modellt és kérjen jóváhagyást egyéb járulékos feltételeket igénylő üzemeltetési területekre. Az eredeti légijármű üzembentartói engedély bármely változását és egyéb felhatalmazását jóváhagyó hivatalos okmány kiadása előtt az állam hajtson végre kiegészítő műszaki értékelést. Ahol lehetséges, minden kérést az eredeti felhatalmazásra támaszkodva vizsgáljanak meg, hogy a hivatalos okmány kiadása előtt meg lehessen határozni az állam előtt álló értékelési feladat mértékét.

G. Melléklet
Repülésbiztonsági dokumentációs rendszer

Kiegészítés a II. rész 1. fejezet 1.1.10 ponthoz

1. Bevezető

1.1 A következő anyag útmutatót biztosít a járató repülésbiztonsági dokumentum rendszerének kidolgozásához és megszervezéséhez. Vegyék figyelembe, hogy a dokumentációs rendszer kidolgozása összetett feladat és ezért a rendszer részét képező minden egyes dokumentum módosítása hatással lehet az egész rendszerre. Az üzemeltetési dokumentumok elkészítésére vonatkozó irányelveket az állami, kormány és ipari szervek dolgozták ki és ezek a járatók rendelkezésére állnak. Mindazonáltal a járatók számára nehézséget jelenthet ezek átfogó felhasználása, mivel az irányelvek csak több különböző kiadványból szerezhetők be.

1.2 Az üzemeltetési dokumentumok kidolgozásához alkalmazható útmutató elsősorban a kiadvány szerkesztésére vonatkozik, csak ritkán terjed ki az üzemeltetési dokumentum teljes körű elkészítésére. Nagyon fontos, hogy az egyes anyagok egymással összhangban, az előírásokkal, a gyártói rendelkezésekkel és az emberi tényezők alapelveivel egybehangzók legyenek. Fontos továbbá a szervezeti és alkalmazási egység biztosítása. Ezért a hangsúly az átfogó kidolgozáson van, az üzemeltetési dokumentumok közös rendszerként alkalmazandók.

1.3 A jelen melléklet anyaga a járató (üzemeltető) repülésbiztonsági dokumentum rendszerének kidolgozási eljárásával foglalkozik annak érdekében, hogy az a II. szakasz 1. fejezet 1.1.10 pontnak megfelelő legyen. Az útmutató nemcsak a tudományos kutatás, hanem a legutóbbi ipari gyakorlatok felhasználásával, különös hangsúllyal a magas szintű gyakorlati felhasználhatóságra készült.

2. Összeállítás és tartalom

2.1 A repülésbiztonsági dokumentum rendszert úgy dolgozzák ki és szerkesszék meg, hogy az biztosítsa a légi- és földi üzemeltetéshez szükséges tájékoztatások egyszerű megtalálását a biztonsági rendszert alkotó különböző dokumentumokban és megkönnyítse ezek szétosztását, illetve a módosítások után történő kiadását is.

2.2 A repülésbiztonsági dokumentum rendszerbe tartozó tájékoztatásokat azok fontossága és felhasználási módja szerint, a következők alapján csoportosítsák:

a) idő szempontjából alapvető fontosságú tájékoztatások, mint például azok a tájékoztatások, amelyek azonnal elérhetőség hiányában veszélyeztethetik az üzemeltetés biztonságát;

b) idő szempontjából lényeges tájékoztatások, amelyek gyors elérhetőség hiányában befolyásolhatják az üzemeltetés biztonságának szintjét vagy késleltethetik az üzemeltetést;

c) gyakran használt tájékoztatások;

d) hivatkozások, például olyan tájékoztatások, amelyek az üzemeltetéshez szükségesek, azonban nem tartoznak a fenti b) vagy c) alpontok hatálya alá;

e) olyan tájékoztatások, amelyek az üzemeltetés szakaszai szerint csoportosíthatók.

2.3 Az idő szempontjából alapvető tájékoztatásokat idejekorán és figyelemfelkeltő módon helyezzék el a repülésbiztonsági dokumentum rendszerben.

2.4 Az idő szempontjából alapvető és lényeges, továbbá a gyakran felhasznált tájékoztatásokat cserelapokra és gyorsan alkalmazható ellenőrző jegyzékekre készítsék el.

3. Megerősítés

A repülésbiztonsági dokumentum rendszert a bevezetés előtt, valós körülmények között vizsgálják felül és az alkalmazáshoz szükséges megerősítést csak ez után adják ki. A megerősítés illetve engedélyezési eljárás a hatékonyság igazolása érdekében terjedjen ki a felhasználás fontos tényezőire, továbbá vizsgálják meg a különböző szakmai csoportok közötti együttműködés kérdéseit is.

4. Tartalmi kialakítás

4.1 A repülésbiztonsági dokumentum rendszer szakkifejezései egymással összhangban legyenek, a közös témakörök, egységek és feladatok leírására szabványos meghatározásokat használjanak.

4.2 Az üzemeltetési dokumentumok tartalmazzák a meghatározások, kifejezések és rövidítések gyűjteményes magyarázatát, amelyet a műszaki fejlődés alapján rendszeresen és folyamatosan vizsgáljanak felül, illetve naprakészen módosítsanak. A repülésvégrehajtási dokumentumokban található összes fontos meghatározás, kifejezés és rövidítés ismertetését a kiadványban tegyék közzé.

4.3 A repülésbiztonsági dokumentum rendszer elkészítése során biztosítsák az egységes dokumentum típus alkalmazást, beleértve a szöveg stílust, a kifejezéseket, a táblázatokat és rajzokat valamint a nyomdai kialakítást is. Egyes meghatározott tájékoztatások mindig állandó helyen szerepeljenek, az alkalmazott mértékegységek és kódok mindig azonosak, egymásnak megfelelők legyenek.

4.4 A repülésbiztonsági dokumentum rendszer tartalmazzon az alkalmazási időpont szerint összeállított lényegi (fő) tartalomjegyzéket, amelynek célja az egynél több üzemeltetési dokumentumban található tájékoztatások egyszerű megtalálása.

Megjegyzés: Ezt a fő tartalomjegyzéket minden egyes dokumentum elején kell elhelyezni. A tartalomjegyzék háromnál több szintet nem tartalmazhat. A különleges és vészhelyzeti tájékoztatásokat a közvetlen kiválaszthatóság érdekében fülekkel kell ellátni.

4.5 A repülésbiztonsági dokumentum rendszer feleljen meg a járató minőségbiztosítási rendszere előírásainak, amennyiben ilyet meghatároztak.

5. Terjesztés

A járató kísérje figyelemmel a repülésbiztonsági dokumentum rendszer terjesztését, biztosítva ezzel a dokumentumok helyes és időszerű alkalmazását az üzemeltetési környezet jellemzői alapján valamint olyan módon, amely üzemeltetési szempontból megbízható és hasznos a felhasználók számára. Ide tartozik a járató részéről fenntartott információs rendszer, amelynek segítségével az üzemeltető személyzettől visszajelzéseket szerez be.

6. Módosítás

6.1 A járató dolgozzon ki tájékoztatás gyűjtési, felülvizsgálati, szétosztási és ellenőrzési rendszert az üzemeltett típusnak megfelelő összes forrásból beszerzendő tájékoztatások és adatok feldolgozására, beleértve, de nem csak ezekre korlátozva a járató, a lajstromozó és a tervezés államait, a gyártókat és a berendezések kereskedőit.

Megjegyzés: A gyártók egy adott légijármű üzemeltetéséhez olyan tájékoztatásokat nyújtanak, amelyek a légijármű rendszerekre és eljárásokra vonatkoznak olyan általános üzemeltetési körülmények között, amelyek nem mindig egyeznek meg teljes mértékben a járató igényeivel. A járatók biztosítsák, hogy a beszerzett tájékoztatások feleljenek meg egyedi igényeknek és a helyi hatóságok elvárásainak.

6.2 A járató dolgozzon ki tájékoztatás összegyűjtési, felülvizsgálati, szétosztási és ellenőrzési rendszert az üzemeltetésből származó vagy az üzemeltetés során bekövetkező változások feldolgozására, beleértve:

a) egy új berendezés felszereléséből származó változások;

b) az üzemeltetés gyakorlati tapasztalatai miatt bekövetkező változások;

c) a járató tevékenységének, céljainak, és eljárásainak változásai;

d) a járató jogosításainak változása;

e) a légiflotta állomány egységesítésének igénye érdekében bekövetkező változások.

Megjegyzés: A járató biztosítsa, hogy személyzeti politikája, szakmai egyeztetési tevékenysége és személyi erőforrás módszerei megfeleljenek az üzemeltetési típusának.

6.3 A repülésbiztonsági dokumentum rendszer vizsgálják felül;

a) rendszeresen (legalább évente egyszer);

b) jelentősebb eseményeket követően (egyesülés, bővítés, a vállalat gyors növekedése vagy csökkenése, stb.);

c) technológiai változások után (új berendezések és felszerelések felszerelése és használata); és

d) a biztonsági szabályok változásai után.

6.4 A járatók dolgozzanak ki módszereket az új tájékoztatások szétosztására, amely módszerek feleljenek meg a tájékoztatások közzététele sürgősségének és fontosságának.

Megjegyzés: Tekintettel arra, hogy a gyakori változások csökkentik az új vagy módosított eljárások fontosságát, kívánatos a repülésbiztonsági dokumentum rendszer változásainak legalacsonyabb szinten tartása.

6.5 Az új tájékoztatást a teljes repülésbiztonsági dokumentum rendszerre gyakorolt hatásai alapján vizsgálják felül és hitelesítsék.

6.6 Az új tájékoztatás közzétételét olyan módszerrel egészítsék ki, amelynek segítségével az üzemeltető személyzet nyomon követheti a tájékoztatás hitelességét, érvényességét valamint annak tényleges igazolását, hogy a közzétett tájékoztatások naprakészek. Az ellenőrző rendszer tartalmazzon eljárást annak igazolására, hogy az üzemeltető személyzet minden esetben megkapja a legutóbbi módosításokat.

H. Melléklet
Az üzemeltetési kézikönyv szerkezete és tartalma

Kiegészítés a II. szakasz 2. fejezet 2.2.2.1 ponthoz

1. Szerkezet

1.1 A II. szakasz 2. fejezet 2.2.2.1 pont előírásai alapján kiadott üzemeltetési kézikönyvet, amely a különböző üzemeltetési területek szerint esetleg külön részekből is állhat, a következő összeállítás szerint készítsék el:

a) általános rész;

b) légijármű üzemeltetési tájékoztatások;

c) útvonalak és repülőterek; és

d) kiképzés.

1.2 2006. január 1-től a 2. fejezet 2.2.2.1 pont előírásai alapján kiadott üzemeltetési kézikönyvet, amely a különböző üzemeltetési területek szerint esetleg külön részekből is állhat, a következő felépítésben alakítsák ki:

a) általános rész;

b) légijármű üzemeltetési tájékoztatások;

c) útvonalak és repülőterek; és

d) kiképzés.

2. Tartalom

Az 1.1 és az 1.2 bekezdések előírásainak megfelelő üzemeltetési kézikönyvek legalább az alábbiakat tatalmazzák:

2.1 Általános rész

2.1.1 A repülési üzemeltetés végrehajtásához szükséges üzemeltető személyzet felelősségi körének ismertetése.

2.1.2 A hajózószemélyzeti tagok és az utaskabin személyzeti tagok repülési idejének és repülési szolgálati idejének korlátozására továbbá megfelelő pihenőidejének biztosítására vonatkozó szabályok.

2.1.3 A szállítandó navigációs berendezések felsorolása.

2.1.4 Azon körülmények ismertetése, amelyek között rádiófigyelést kell tartani.

2.1.5 A legalacsonyabb repülési magasság meghatározásának módszere.

2.1.6 A repülőtér üzemeltetési minimum meghatározásának módszere.

2.1.7 Biztonsági elővigyázatossági intézkedések az olyan tüzelő-anyag feltöltés esetére, amikor az utasok a fedélzeten tartózkodnak.

2.1.8 A földi kiszolgálás rendszere és eljárásai.

2.1.9 A balesetet észlelő légijármű parancsnok számára a 12. Annex-ben előírt eljárások.

2.1.10 Minden egyes típusú üzemeltetéshez meghatározott hajózószemélyzet, beleértve a parancsnokság sorrendjének megállapítását is.

2.1.11 Egyedi utasítások az útvonalra szükséges tüzelőanyag és olaj mennyiségének kiszámításához az üzemeltetés valamennyi körülményének figyelembevételével, beleértve a túlnyomás elvesztésének és az útvonalon bekövetkező egy vagy több hajtómű meghibásodás lehetőségét is.

2.1.12 Azon körülmények, amelyek között oxigén használatra van szükség továbbá a II. szakasz, 2. fejezet 2.3.8.2 pont alapján meghatározott oxigén-készlet mennyisége.

2.1.13 Tömeg és súlypont (egyensúly) számítási utasítások.

2.1.14 A földi jégtelenítés illetve jégmentesítés végrehajtására és ellenőrzésére vonatkozó utasítások.

2.1.15 Az üzemeltetési repülési tervre vonatkozó előírások.

2.1.16 Előírt szabványos üzemeltetési eljárások (SOP) a repülés minden egyes szakaszára.

2.1.17 A rendes körülmények között használt ellenőrző jegyzékek használatára és a használat időpontjára vonatkozó előírások.

2.1.18 Az indulási korlátozásokra vonatkozó eljárások.

2.1.19 A repülési magasság folyamatos tartásának figyelésére vonatkozó utasítások.

2.1.20 A légiforgalmi irányítói engedélyek tisztázására és elfogadására vonatkozó utasítások különösen abban az esetben, ha azok földfelszín feletti biztonságos magassággal is kapcsolatosak.

2.1.21 Indulási és megközelítési tájékoztatások.

2.1.22 Útvonal és célállomás repülési körülmények ismertetése.

2.1.23 A műszeres megközelítés megkezdéséhez vagy folytatásához szükséges feltételek.

2.1.24 A precíziós és nem-precíziós műszeres megközelítési eljárások végrehajtására vonatkozó utasítások.

2.1.25 A hajózószemélyzet feladatainak kiosztása valamint a tagok munkaterhelése helyes elosztásának eljárásai az éjszakai repülés valamint a műszeres időjárási körülmények (IMC) között végrehajtott megközelítés és leszállás során.

2.1.26 A polgári légijármű elfogásával kapcsolatos tájékoztatások és utasítások, beleértve;

a) az elfogott légijármű parancsnoka számára a 2. Annex-ben előírt eljárások;

b) az elfogó és az elfogott légijárművek által használandó, a 2. Annex-ben előírt látjelek.

2.1.27 A II. szakasz, 1. fejezet 1.1.9 pont előírásai szerint biztosítandó baleset-megelőzési és repülésbiztonsági program részletezése, beleértve az alkalmazott biztonsági rendszert és személyi felelősséget.

2.1.28 Veszélyes áruk szállítására vonatkozó tájékoztatások és utasítások, beleértve a vészhelyzet esetén végrehajtandó intézkedéseket is.

Megjegyzés: Veszélyes árúk szállítása során a légijármű fedélzetén bekövetkező váratlan események kezelését érintő módszerek és eljárások kidolgozására valamint végrehajtására vonatkozó útmutató a Veszélyes áruk szállítása során a légijármű fedélzetén bekövetkező eseményekre hozott vészintézkedések *(Doc 9481) kiadványban található.*

2.1.29 Védelmi utasítások és útmutatók.

2.1.30 A II. szakasz, 11. fejezet 11.1 pont előírása szerint biztosítandó repülőgép átkutatási ellenőrző jegyzék.

2.2 Légijármű üzemeltetési tájékoztatások

2.2.1 Légialkalmasság jogosítási és üzemeltetési korlátozások.

2.2.2 A II. szakasz, 4. fejezet 4.1.4 pont alapján előírt általános, különleges és vészhelyzeti eljárások a hajózószemélyzet részére, az ezekre vonatkozó ellenőrző jegyzékek.

2.2.3 Repülés tervezési adatok a repülés előtti és repülés közbeni tervezéshez, különböző hajtómű teljesítmény beállítások és repülési sebességek mellett.

2.2.4 Tömeg és súlypont (egyensúly) számítási utasítások.

2.2.5 Légijármű rakodási és teher rögzítési utasítások.

2.2.6 Légijármű rendszerek, megfelelő vezérlő szervek és használati utasítások a II. szakasz, 4. fejezet 4.1.4 pont előírása szerint.

2.2.7 Az engedélyezett különleges üzemeltetésre és az üzemeltetett forgószárnyas légijármű típusra vonatkozó gyártó(i) minimális felszerelési jegyzék.

2.2.8 A vészhelyzeti és biztonsági berendezések ellenőrző jegyzéke valamint ezek használati utasítása.

2.2.9 A vészkiürítési eljárások, beleértve az adott légijármű típust érintő eljárásokat, a hajózószemélyzet közötti együttműködés szervezését, a hajózószemélyzet minden egyes tagjának vészhelyzeti helyét és kijelölt vészhelyzeti feladatait.

2.2.10 Az utaskabin személyzet részéről alkalmazott általános, különleges és vészhelyzeti eljárások, az ezekre vonatkozó ellenőrző jegyzékek valamint légijármű rendszer tájékoztatások, beleértve a szükséges együttműködési eljárásokat a hajózószemélyzet és az utaskabin személyzet között.

2.2.11 A különböző repülési útvonalakon szállított vészhelyzeti és túlélési felszerelések valamint azok helyes működésének felszállás előtt történő ellenőrzésének eljárásai, beleértve a szükséges oxigén mennyiség megállapításának és rendelkezésre álló mennyiségének meghatározását.

2.2.12 A túlélők részére a 12. Annex-ben meghatározott, alkalmazandó föld-levegő látjelek.

2.3 Útvonalak és repülőterek

2.3.1 Az útvonalra vonatkozó tájékoztatások, amelyek biztosítják, hogy a hajózószemélyzet minden egyes repülés vonatkozásában részletes tájékoztatást kapjon a távközlési létesítményekről, navigációs berendezésekről, repülőterekről, az üzemeltetéshez igénybe vehető műszeres megközelítésekről, érkezési és indulási eljárásokról valamint minden más olyan tényezőről, amelyet a járató a szabályszerű repülésvégrehajtás érdekében szükségesnek ítél.

2.3.2 Minden egyes lerepülendő útvonalszakasz legalacsonyabb repülési magassága.

2.3.3 Minden egyes olyan helikopter repülőtér üzemeltetési minimuma, amelyet tervezett leszállási vagy kitérő helikopter repülőtérként valószínűleg igénybe vehetnek.

2.3.4 A megközelítési vagy a helikopter repülőtéri létesítmény használhatóságának csökkenése esetére megnövelt helikopter repülőtér üzemeltetési minimum.

2.4 Kiképzés

2.4.1 A hajózószemélyzet kiképzési program a II. szakasz, 7. fejezet 7.3 pont előírásai alapján..

2.4.2 Az utaskabin személyzet kiképzési program a II. szakasz, 10. fejezet 10.3 pont előírásai alapján.

2.4.3 A repülésüzemi tiszt/szolgálatvezető kiképző program, ha azt a II. szakasz, 2. fejezet 2.2 pont alapján repülés felügyelettel összefüggésben alkalmazzák.

Megjegyzés: A repülésüzemi tiszt/szolgálatvezető kiképző program részletezését a II. szakasz, 8. fejezet 8.3 pontja tartalmazza.

I. Melléklet

Kiegészítő útmutató a 3. teljesítmény osztályú forgószárnyas légijárművek műszeres időjárási körülmények (IMC) közötti üzemeltetésére

Kiegészítés a II. szakasz 3. fejezet 3.4 ponthoz és a 2. Függelékhez

1. Cél és tárgykör

A jelen melléklet azt a célt szolgálja, hogy kiegészítő útmutatót adjon a II. szakasz, 3. fejezet 3.4 alfejezetében és a 2. Függelékben leírt légialkalmassági és üzemeltetési követelményekhez, melyeket a 3. teljesítmény osztályú forgószárnyas légijárművek IMC feltételek közötti jóváhagyott üzemeltetéséhez szükséges teljes körű biztonsági szint létrehozására fogalmaztak meg.

2. Hajtómű megbízhatósága

2.1 A 3. fejezet, 3.4.1 alfejezetében és a 2. Függelékben előírtaknak megfelelően a tolóerő megszűnésének arányát úgy kell meghatározni, hogy amennyiben lehetséges az feleljen meg a kereskedelmi üzemeltetésből nyert adatoknak, kiegészítve azokat a hasonló körülmények között lebonyolított egyéb forgalomból szerzett üzemeltetési adatokkal. Az értékelés megalapozásához az aktuális forgószárnyas légijármű/hajtómű kombinációra vonatkoztatva a tervező állama által elfogadható óraszámú gyakorlati tapasztalat szükséges, kivéve, ha a rendelkezésre álló hajtóművel kiegészítő vizsgálatot vagy kísérletet hajtottak végre teljesen azonos kialakítás mellett.

2.2 A gázturbinás hajtómű megbízhatóságának vizsgálata során a bizonyítékokat a világszerte használatos teljes flotta adatbázisából kell meríteni, hogy az üzemeltetést jellemző minél nagyobb számú minta álljon rendelkezésre, melyeket a típusalkalmassági bizonyítványok tulajdonosainak kell összesíteniük és a tervező államának kell felülvizsgálnia. Mivel a járatók által használatos típusok nem mindegyikére kötelező a repült órák jelentése, ezért megfelelő statisztikai becslésekre lehet támaszkodni a hajtómű megbízhatósági adatok kimunkálása során. Az ilyen üzemeltetésre jóváhagyott egyedi járatók által létrehozott adatokat, beleértve az állapotváltozás figyelését és az események jelentését, a járatók államainak kell figyelnie és felülvizsgálnia annak igazolása érdekében, hogy a járatók által betartott gyakorlat megfelel az elvárásoknak.

2.2.1 A hajtómű állapotváltozásának figyelése a következőket tartalmazza:

a) Egy, a gyártó javaslatain alapuló, olajfogyasztást ellenőrző programot; és

b) Egy, a hajtómű állapotát ellenőrző programot, meghatározva az ellenőrzésre kijelölt paramétereket, az adatok összegyűjtésének módját és a helyesbítő műveletekre vonatkozó eljárásokat. Mindezeknek a gyártók javaslatain kell alapulniuk. Az ellenőrzésnek az a célja, hogy minél korábbi szakaszban meg lehessen állapítani a hajtómű állapot romlását, és helyesbítő intézkedést lehessen tenni, mielőtt a biztonságos üzemeltetés feltételei megváltoznának.

2.2.2 A megbízhatósági program fedje le a hajtóművet és kapcsolódó rendszereit is. A hajtómű program tartalmazza a vizsgált időszakra vonatkozó repülésközbeni üzemórák számát és az okokra vetített repülésközbeni hajtómű leállások statisztikai értékét. Az események jelentési rendszere fedje le az IMC feltételek közötti repülések biztonságos végrehajthatóságát befolyásoló összes eseményt. Az adatok legyenek elérhetők a típusbizonyítvány tulajdonos és a tervező állama számára annak megállapítása érdekében, hogy a kitűzött megbízhatósági szint elérésre került-e. Bármely folyamatosan fennálló kedvezőtlen állapotváltozás esetén, a járató haladéktalanul végezzen értékelést, amelybe vonja be a tervező államát és a típusbizonyítvány tulajdonosát.

Megjegyzés: A kiválasztott aktuális időszaknak tükröznie kell a világméretű felhasználás és a figyelembe vett tapasztalati eredmény kapcsolatát (például egy korai adat alkalmatlan lehet, az adat felvételét követően végrehajtott kötelező módosítás miatt, amely befolyásolhatja a tolóerő csökkenésének arányát). Egy új hajtómű változat bevezetését követően, és amíg a világméretű felhasználás viszonylag alacsony, az összes rendelkezésre álló gyakorlati eredményt hasznosítani kell a statisztikailag értékelhető átlag elérése érdekében.

2.3 A tolóerő megszűnésének arányát egy meghatározott időszakot meghaladó gördülő átlaggal kell jellemezni. A tolóerő megszűnésének aránya kerül inkább alkalmazásra, mint a repülés közbeni hajtómű leállási arány, mivel ez sokkal kifejezőbb a 3. teljesítmény osztályú forgószárnyas légijárművek esetén. Ha egy 1. vagy 2. teljesítmény osztályú körümények között üzemelő forgószárnyas légijárművön olyan hiba keletkezik, amely jelentős, de nem teljes mértékű tolóerő csökkenést eredményez egy hajtóművön, akkor valószínüleg ez nem fog hajtómű leállításhoz vezetni, mivel ezen a hajtóművön még mindig marad elegendő tolóerőt eredményező teljesítmény. Azonban a 3. teljesítmény osztályú forgószárnyas légijárműveknél még további segítséget jelenthet a maradék tolóerő felhasználása a siklási távolság megnövelésére.

3. Üzemeltetési kézikönyv

Az üzemeltetési kézikönyvnek tartalmaznia kell mindazon tudnivalókat, melyek a 3. teljesítmény osztályú forgószárnyas légijárművek IMC feltételek közötti üzemeltetésével összefüggésben szükségesek. Ennek magába kell foglalnia az összes kiegészítő felszerelést, és az ilyen üzemeltetéshez szükséges eljárást és képzést, az üzemeltetés útvonalát és/vagy körzetét, valamint a repülőterekre vonatkozó ismereteket (beleértve a tervezési és üzemeltetési minimumokat is).

4. A járató tanúsítása, vagy megerősítése

A járató állama által meghatározott tanúsítási vagy megerősítési folyamatnak igazolnia kell a járató eljárásainak alkalmasságát a normál, rendellenes és vészhelyzetekre vonatkozóan, beleértve hajtómű, a rendszerek és felszerelések meghibásodását követő műveleteket is. A járató tanúsítására vagy megerősítésére vonatkozó általános követelményeken felül, a következő előírásokat is figyelembe kell venni a 3. teljesítmény osztályú forgószárnyas légijárművek IMC feltételek közötti üzemeltetésével kapcsolatban:

a) a hajtómű elért megbízhatóságának igazolását az adott hajtómű-forgószárnyas légijármű összeállításban (lásd: 2. Függelék, 1. bekezdés);

b) a sajátos és a megfelelő képzésre valamint az ellenőrzésre vonatkozó eljárásokat a 2. Függelék, 7. bekezdésében leírtak szerint;

c) a karbantartási programot, amely kiterjesztésre került a 2. függelék, 2. bekezdésében meghatározott felszerelésekre és rendszerekre;

d) a MEL-t, amely módosításra került az IMC feltételek közötti repülésekhez szükséges felszerelésekre és rendszerekre;

e) az IMC feltételek közötti üzemeltetéshez tartozó tervezési és üzemeltetési minimumokat;

f) az indulási és érkezési eljárásokat, valamint az útvonal korlátozásokat;

g) a légijárművezetők jogosítását és jártasságát; és

h) az üzemeltetési kézikönyvet, amely tartalmazza a korlátozásokat, a vész eljárásokat, az üzemeltetéshez jóváhagyott útvonalakat és körzeteket, a MEL-t és a 2. függelék, 2. bekezdésében meghatározott felszerelésekre vonatkozó normál eljárásokat.

5. Üzemeltetői és karbantartási program előírások

5.1 A 3. teljesítmény osztályú forgószárnyas légijárműveknek a légiüzemeltetői engedélyben vagy azzal megegyező dokumentumban leírt és az IMC feltételek közötti üzemeltetésére vonatkozó jóváhagyása, magába kell, hogy foglalja az adott sárkány/hajtómű összeállítást, beleértve az ilyen üzemeltetésre vonatkozó naprakész típustervezési előírásokat, a jóváhagyott különös forgószárnyas légijárművet és az ilyen üzemeltetésekhez tartozó útvonalakat vagy körzeteket.

5.2 A járató karbantartás irányítási kézikönyve magába kell, hogy foglalja a szükséges kiegészítő felszerelések tanúsítására vonatkozó nyilatkozatot, és a hajtóművet is beleértve az ilyen felszerelés karbantartási és megbízhatósági programját.

ANNEX 9.
Egyszerűsítések

12. kiadás – 2005. július

20. módosítás

TARTALOMJEGYZÉK

Oldal

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT GYAKORLATOK

1. FEJEZET - MEGHATÁROZÁSOK ÉS ÁLTALÁNOS IRÁNYELVEK

A. – Meghatározások

Ha a repüléssel kapcsolatos szabványokban és ajánlott gyakorlatokban az alább következő kifejezéseket használják, akkor azok jelentése a következő:

Azonosítatlan személypoggyász - Unidentified baggage

A repülőtéren lévő, címkével ellátott, vagy anélküli személypoggyász, amelyet senki sem visz el és azonosíthatatlan, hogy mely utashoz tartozhat.

Általános célú repülési tevékenység - General aviation operation

A kereskedelmi légi szállító tevékenységtől és a munkarepüléstől eltérő bármely repülőtevékenység.

Behozatali illetékek és adók - Import duties and taxes

Vám illetékek és minden egyéb illeték, adó, vagy díj, amelyet behozatalkor, vagy azzal összefüggésben szednek be. Ebbe nem tartozik bele a nemzet más hatósága nevében a vámhatóság által nyújtott, vagy beszedett szolgáltatások megközelítőleges költségére korlátozódó egyéb díj.

Belépés/bebocsátás – admission

Személyre szóló engedély, amely az ország törvényei alapján az országba való belépésre a közhivatal biztosít

Berakodás - Lading

A teheráru, posta küldemény, vagy ellátmány elhelyezése a légi-járművön abból a célból, hogy azokat a járat magával vigye.

Beszáll(ít)ás – Embarkation

A repülés megkezdése céljából az illető személy légi-jármű fedélzetre lépése, kivéve az ugyanazon továbbinduló járat egy megelőző szakaszán beszállt repülő személyzetet, vagy utasokat

Csökkent képességű személy - Person with disabilities

Fizikai (érzékszervi, vagy mozgásszervi) cselekvési korlát, szellemi fogyatékosság, öregség, betegség, vagy a cselekvőképességet korlátozó egyéb más oknál fogva a szállítás igénybevételekor magatehetetlen személy, akinek állapota külön figyelmet és azt igényli, hogy a többi utas számára rendelkezésre álló szolgáltatásokat az illető személy szükségletéhez igazítsák.

Egyjelű többszakaszos légi-járat - Through flight

A légi-jármű sajátos üzemeltetése, amelyet az üzemeltető ugyanazon jel használatával azonosít az indulási ponttól a közbeeső ponton át a rendeltetési pontig.

Ellátmány/készlet - Stores/Supplie

a) Ellátmány/készlet elfogyasztásra; és b) ellátmány/készlet elvitelre.

Ellátmány/készlet elvitelre - Stores/Supplies for taken away

A légi-jármű utasainak és személyzetének elvitel céljából eladásra szánt cikkek.

Ellátmány/készlet fogyasztásra - Stores/Supplies for consumption

A fedélzeten lévő utasok és a személyzet fogyasztására szánt javak - akár árusították azok, akár nem – és a légi-jármű üzemeléséhez és karbantartásához szükséges javak, ideértve az üzemanyagot és a kenőanyagokat is.

Eltávolítási rendelkezés - Removal order

Az állam által kiállított, a felségterületéről való elvitelre utasítást adó írásos rendelkezés azon üzemeltető felé, amelynek a járatán a nem bebocsátható személy utazott az adott államba.

Fertőzött körzet (humán egészségügyi célokra) - Infected area

A helyi-, vagy nemzeti közegészségügyi hatóság, vagy az Egészségügyi Világszervezet jelentése szerint földrajzi területként meghatározott térségek, amelyben aktívan terjednek az emberi és/vagy állati közvetítéssel hordozott betegségek.

Megjegyzés - Az egészségügyi hatóságok által bejelentett fertőzött körzetekről az Egészségügyi Világ Szervezet „Weekly Epidemiological Record" (Heti Epidemiológiai Jegyzék) című kiadványában tesznek közzé tájékoztatást

Féregtelenítés – Disinsection

A légi-járművön, illetve a konténerben lévő rovarokat ellenőrző illetve elpusztító tevékenység.

Földi berendezések (Ground equipment) - A légi-jármű földi karbantartásához, javításához és kiszolgálásához használt speciális eszközök, ideértve az ellenőrző berendezéseket, a teheráru- és az utas kezelő berendezéseket is.

Gazdátlan poggyász - Unclaimed baggage

A repülőtérre érkező olyan személypoggyász, amelyet senki sem visz el, illetve nem követel.

Hajózószemélyzeti tag - Crew member

Az üzemeltető által megbízott személy, aki a repülés ideje alatt a légi-járművön feladatot lát el.

Határ integritás - Border integrity

Az állam azon törvényeinek és rendelkezéseinek az alkalmazása, amelyek az áruk és/vagy személyek határokon át való mozgására vonatkoznak.

Határőrizeti ellenőrzés (Immigration control) – Az államok által alkalmazott intézkedés a levegőben utazók ellenőrzésére, amikor felségterületükre be kívánnak lépni, azon leszállva tovább utaznak, vagy onnan el kívánnak utazni.

Ideiglenes bebocsátás - Temporary admission

Vámeljárás, amely révén bizonyos cikkek a behozatali illetékek és adók alól feltételesen teljes egészében vagy részben mentesítve bevihetők egy adott vámterületre; az ilyen cikkeket egy meghatározott céllal kell importálni és azzal a szándékkal, hogy meghatározott időtartamon belüli ismét exportálni kell anélkül, hogy változást hajtanának végre rajtuk, kivéve a használatukból eredő állagromlást.

Javak engedélyezése - Clearance of goods

A javak hazai felhasználáshoz való belépéséhez, exportálásához, vagy egy másfajta vám eljárás alá helyezéséhez szükséges vám formaságok elvégzése.

Javak felszabadítása - Release of goods

A vizsgálaton áteső javaknak a kapcsolatos személyek rendelkezésére bocsátását engedélyező vámhatósági felszabadító ténykedés.

Járulékos készletek - Commissary supplies

Egyszer használatos, vagy ismételt használatra szánt cikkek, amelyeket az üzemeltető a repülés folyamán szolgáltatásnyújtáshoz, főként az utas ellátásához és az utas kényelemhez alkalmaz.

Kábítószer ellenőrzés - Narcotics control

A kábítószerek és a bódítószerek légi szállítását ellenőrző intézkedések.

Kirakodás – Unlading

Leszállást követően a teheráru, postaküldemény, vagy ellátmány kirakodása a légi-járműről.

Kíséret nélküli személypoggyász - Unaccompanied baggage

Teher áruként szállított személypoggyász, amely lehet ugyanazon, vagy másik légi-járművön is, mint amelyiken tulajdonosa utazik.

Kiszáll(ít)ás – Disembarkation

A repülő személyzet és az útjukat ugyanazon továbbinduló járat következő szakaszán is folytató utasok kivételével, a légi-jármű elhagyása leszállását követően.

Kiutasítási rendelkezés - Deportation order

Az illetékes állam hatósága által kiadott írásos rendelkezés, amely a kiutasítottat utasítja az ország elhagyására.

Kiutasított – Deportee

Személy, akit az adott állam hatósága törvényesen beléptetett, vagy aki törvénytelenül lépett be az országba, és az illetékes hatóságok egy későbbi időpontban hivatalosan az ország elhagyására utasít.

Kockázat kezelés - Risk management

A határőrizeti szervek számára a kockázatot jelentő küldemények és mozgások kézben tartásához szükséges információkat biztosító kezelési eljárások és gyakorlatok módszeres alkalmazása.

Kockázat megállapítás - Risk assessment

A kiutasító állam megállapítása, hogy a kiutasított személy kísérettel vagy kíséret nélkül alkalmas a kereskedelmi légi szolgáltatás igénybevételével történő elvitelre. A megállapításnak tekintettel kell lennie minden vonatkozó tényezőre, beleértve kereskedelmi járaton történő szállításra való egészségi, szellemi és fizikai alkalmasságot, az utazási hajlandóságot vagy ellenállást, a viselkedési jegyeket és bármely erőszakra utaló előéletet.

Közegészségügyi kockázat - Public health risk

A lakosság egészségét valószínűsíthetően hátrányosan érintő esemény, hangsúlyozottan olyan, amely nemzetközi méreteket ölthet, vagy súlyos és közvetlen veszélyt jelenthet.

Közszolgálati hatóságok - Public authorities

A szerződő állam, jelen szabványokkal és ajánlott eljárásokkal bármiféle szempontból kapcsolatban álló minden különleges törvénye és szabályzata kiadásáért és végrehajtásáért felelős szervei, vagy tisztviselői.

Közvetlen tranzit megállapodás - Direct tranzit agreement

Az érintett állami hatóságok által jóváhagyott különleges megállapodás, mely szerint a szerződő államon áthaladó és rövid ideig ott tartózkodó forgalom a hatóság közvetlen ellenőrzése alatt maradhat.

Közvetlen tranzit terület – Direct tranzit area

A nemzetközi repülőtéren, a szerződő államon való áthaladás közben rövid ideig az államban tartózkodó forgalom felvételére létesített, az érintett állami hatóságok által jóváhagyott és közvetlen ellenőrzés alatt tartott külön terület.

Lajstromozó állam - State of registry

Az állam, amelynek lajstromába a légi-járművet bevezették.

Látogató - Visitor

Bármely személy, aki a szokásos lakóhelyétől eltérő Szerződő Állam felségterületén száll ki és lép be; törvényesen ott marad, ahogy a meglátogatott Szerződő Állam előírja a hivatalos nem bevándorlási célokra, mint például túrizmus, üdülés, sportolás, gyógykezelés, családi kapcsolatok ápolása, vallási célú zarándoklat, vagy üzletkötés esetére; és a meglátogatott felségterületen eltöltött tartózkodás alatt semmilyen haszonszerző elfoglaltságot nem folytat.

Légi-jármű felszerelés - aircraft equipment

Repülés közben a légi-jármű fedélzetén használt felszerelések, ideértve az elsősegély és életmentő felszerelést és a járulékos készleteket, de nem a raktárkészletet, vagy a tartalék alkatrészt.

Légi-jármű üzemeltető - Aircraft operator

A légi-jármű üzemeltetést folytató vagy az ezt felajánló személy, szervezet vagy vállalkozás.

Légi-jármű üzemeltetői dokumentumok - Airline operator's document

A légiforgalmi vállalatok és üzemeltetők használatára rendszeresített légi-szállító levelek /fuvarlevelek, utas jegyek és beszállító kártyák, banki és ügynöki elszámolás terv dokumentumok, túlsúlyos csomag jegyek, bemutatóra szóló egyes számlák (M.C.O.), kár és rendellenesség jelentés, csomag és árucímkék, menetrendek és tömeg, illetve súlypont helyzeti dokumentumok.

Légitársaság – Airline

Az Egyezmény 96. cikkelyében meghatározottak szerint menetrendszerű nemzetközi légi szolgáltatást felajánló vagy folytató bármely légi szállító vállalkozás.

Megbízott ügynök - Authorized agent

A légi-jármű üzemeltetőt képviselő személy, akit az üzemeltető felhatalmazott vagy megbízott, hogy az üzemeltető légi-járműveit, személyzeteit, utasait, teheráruit, postaküldeményeit, poggyászait és készleteit érintő minden beléptetési és engedélyezési formaságot a nevében intézzen, és magában foglal - ahol azt a nemzeti jogszabályok lehetővé teszik - egy, a légi-jármű fedélzetén rakomány kezelésére felhatalmazott harmadik felet.

Nem bebocsátható személy - Inadmissable person

Az a személy, akinek bebocsátását az állami hatóságok visszautasítják, vagy vissza fogják utasítani.

Nem megfelelő dokumentumokkal rendelkező személy - Improperly documented person

Utazó vagy utazni szándékozó személy, aki: a) lejárt úti-okmánnyal vagy érvénytelen vízummal; b) utánzott, hamisított vagy megmásított úti-okmánnyal vagy vízummal; c) más személy úti-okmányával vagy vízumával; d) úti-okmány nélkül; vagy e) a kötelező vízum nélkül kísérel meg utazni.

Nemzetközi repülőtér - International airport

A szerződő állam saját felségterületén arra kijelölt minden repülőtér, hogy nemzetközi belépő és induló repülőtérként szolgáljon, amelyen elvégzik a vámolással, bevándorlással, közegészséggel, állati és növényi karanténozással és hasonlókkal kapcsolatos formaságokat.

Nemzetközi szintű közegészségügyi veszélyhelyzet - Public health emergency of international concern)

Rendkívüli esemény, amelyet az Egészségügyi Világszervezet Nemzetközi Egészségügyi Szabályai (2005) szerint határoznak meg, hogy: (1) megállapítsák a betegség nemzetközi terjedése által más Államokra irányuló közegészségügyi kockázatot és (2) a koordinált nemzetközi válaszlépéseket lehetőség szerint megköveteljék.

Nyilatkozó – Declarant

Áru nyilatkozatot kiállító, vagy bármely személy, akinek a nevében az ilyen nyilatkozatot kiállították.

Parancsnokpilóta - Pilot-in-command

A repülési idő alatt a légi-jármű üzemeltetéséért és biztonságáért felelős repülőgép-vezető.

Postaküldemény – Mail

Postai hatóság által a Általános Postaszövetség (UPU – Universal Postal Union) szabályaival egyezésben vállalt és egy másik postai hatósághoz szállítás céljából indított levelek és egyéb tárgyak szállítmányai.

Repülő személyzeti tag - Flight crew member

Szakszolgálati engedéllyel ellátott személyzeti tag, akit a légi-jármű üzemeltetéséhez alapvető feladatok ellátásával bíznak meg a repülési idő tartamára.

Segélynyújtó repülés - Relief flights

Humanitárius célból végzett repülések - segélynyújtó személyzet és segély ellátmány (mint például élelmiszer, ruházat, menedékhely, orvosi és egyéb cikkek) szállítására - vészhelyzet és/vagy katasztrófa során és/vagy azt követően. Olyan esetben is, amikor az ilyen vészhelyzet és/vagy katasztrófa miatt a személyeket - az életüket és/vagy egészségüket veszélyeztető helyről ugyanazon államon belüli, vagy az ilyen személyek befogadására hajlandó más állam területén lévő, biztonságos helyre - menekítenek.

Személy eltávolítása – Removal of a person

Az illetékes állam arra irányuló törvényes cselekedete, hogy egy személyt az állam elhagyására utasítson.

Személy poggyász - Baggage

Az utas, vagy a repülő személyzet személyi tulajdona, amelyet a légi-jármű az üzemeltetővel létrejött megegyezés alapján visz magával.

Tartalék alkatrészek - Spare parts

A légi-járműbe, ideértve a hajtóművet és a légcsavart is, beszerelendő javítási, vagy csere jellegű cikkek.

Teheráru / rakomány – Cargo

A posta küldemény, az ellátmány, illetve a kísérettel rendelkező, vagy tévesen kezelt személypoggyászon kívül a légi-járművön szállított minden tulajdon.

Tévesen kezelt (elveszett) poggyász - Mishandled baggage

Az utastól vagy a repülő személyzettől tévedésből, vagy elkerülhetetlen módon elidegenített személypoggyász.

Utazási dokmentum - Travel document

Az állam vagy szervezet által kiadott útlevél vagy egyéb – személyazonosság igazolását szolgáló – okmány, amelyet a jogos birtokos nemzetközi utazásra használ.

Utazás megkezdése - Commencement of journey

Az a pont, ahol a személy megkezdte az utazását anélkül, hogy tekintetbe vennénk bármely repülőteret, amelyen akár továbbmenő akár csatlakozó járat céljából a közvetlen tranzitban megállt feltéve, hogy a kérdéses repülőtér közvetlen tranzit területét nem hagyta el.

Vámmentes terület (Free zone) – A szerződő állam felségterületének egy része, amelyre a bejuttatott bármiféle javat általában – az import illetékek és adók értelmében - úgy tekintik, mint amely a vámterületen kívül van.

Védelmi felszerelés - Security equipment

A polgári repülés és létesítményei ellen irányuló jogellenes cselekmények megakadályozásában, vagy észlelésében speciális használatra szánt egyedi eszköz, vagy rendszer alkotórésze.

B. – Általános irányelvek

1.1 A jelen Annex-ben szereplő szabványok és ajánlott gyakorlatok előírásai a légi-jármű üzemeltetés minden kategóriájára alkalmazandók, kivéve azokat az eseteket, ahol a rendelkezés más üzemeltetési kategória említése nélkül nevez meg egyfajta üzemeltetési kategóriát.

1.2 A szerződő állam tegye meg a szükséges lépéseket az alábbiak biztosítására:

a) a személyek és a légi-jármű tekintetében a határ ellenőrzés végrehajtásához és a javak vizsgálatához/engedélyezéséhez szükséges időt a minimumon tartsák;

b) az adminisztratív és a vizsgálati követelmények alkalmazása a legkisebb kényelmetlenséget okozza;

c) a szerződő államok, üzemeltetők és repülőterek közötti vonatkozó információcserét a lehető legteljesebb mértékben bátorítsák és mozdítsák elő; és

d) optimális védelmi szint és a törvény betartása valósuljon meg.

1.3 A szerződő állam a javak határellenőrzést szolgáló ellenőrző/engedélyező eljárásaiban alkalmazza a kockázat kezelést.

1.4 Az eljárások hatékonyságának és hatásosságának fokozása érdekében, a szerződő állam hatékony információs módszert fejlesszen ki repülőterein.

1.5 A szerződő állam dolgozzon ki eljárást az adatok érkezést megelőző beszerzésére oly módon, hogy lehetővé váljon a gyorsított vizsgálat/engedélyezés.

1.6 Ezen Annex rendelkezései nem akadályozzák a nemzeti jogszabályok alkalmazását a repülés védelmi intézkedések, vagy egyéb szükséges ellenőrzések tekintetében.

2. FEJEZET – LÉGI-JÁRMŰVEK BELÉPÉSE ÉS KILÉPÉSE

A. – Általános rész

2.1 A szerződő állam megfelelő intézkedéseket léptessen érvénybe a más szerződő államba induló, vagy onnan érkező légi-jármű engedélyezéséhez, amely intézkedéseket olyan módon kell bevezetni, hogy a szükségtelen késlekedést megakadályozzák.

2.2 Az induló, vagy az érkező légi-járművek hatékony engedélyezését célzó eljárások kidolgozásakor a szerződő állam – ahol szükséges - vegye figyelembe a repülésvédelem és a kábítószer ellenőrzés céljára alkalmazott eljárásokat.

2.3 **Ajánlott gyakorlat**. - *A szerződő állam megfelelő ellenőrző hatóságai kössenek egyetértési szerződést az állam területére nemzetközi szolgáltatást biztosító légi-jármű üzemeltetőkkel és nemzetközi repülőtereik üzemeltetőivel, lefektetve benne a kábító és személyiség befolyásoló szerek nemzetközi forgalmazása által jelentett veszély leküzdése terén való együttműködésük irányelveit. Az ilyen egyetértési szerződést a vámügyi világszervezet által e célra kidolgozott mintái közül megfelelő szerint kell megformázni. Ezen felül, a szerződő államokat ösztönözzük, hogy egyetértési szerződést maguk között is létrehozzanak.*

2.4 **Ajánlott gyakorlat**. - *Az Egészségügyi Világszervezet Nemzetközi Egészségügyi Szabályzatával egyezésben, a szerződő állam egészségügyi okok miatt ne szakítsa meg a légi szállító tevékenységet. Olyan esetekben, amikor kivételes körülmények miatt e szolgáltatása felfüggesztését fontolgatja, mielőtt a szerződő állam a légi szállító tevékenység felfüggesztésére bármiféle lépést tenne, először konzultáljon az Egészségügyi Világszervezettel és a betegség előfordulási helye szerinti állam egészségügyi hatóságaival.*

B. – Dokumentumok - követelmény és alkalmazás

2.5 Légi-jármű belépéséhez, vagy indulásához a szerződő állam a jelen Fejezetben előírt okiratokon felül mást ne követeljen meg.

2.6 A szerződő állam ne követeljen vízumot, ne szedjen be vízum, vagy egyéb díjat a légi-jármű belépéséhez, vagy indulásához szükséges bármiféle okirat alkalmazásával összefüggésben

2.7 **Ajánlott gyakorlat.** - *Az arab, angol, francia, orosz vagy spanyol nyelven benyújtott légi-jármű belépéséhez, vagy indulásához szolgáló okiratot a szerződő állam fogadja el. A szerződő állam előírhatja, hogy ezeket, szóban, vagy írásban, a saját nemzeti nyelvére lefordítsák.*

2.8 A szerződő állam műszaki lehetőségeinek függvényében a légi-jármű induláshoz és belépéséhez az alábbiak szerint benyújtott dokumentumokat el kell fogadni:

a) a közszolgálati hatóságok információs rendszerére elektronikus formában továbbított dokumentum;

b) az elektronikus úton előállított, vagy továbbított papír alapú dokumentum; vagy

c) a jelen Annex-ben bemutatott formát követve kézzel kitöltött papír alapú dokumentum.

2.9 Ha adott dokumentumot továbbította az üzemeltető, vagy nevében továbbították azt, és a közszolgálati hatóságok azt elektronikus formában megkapta, akkor a szerződő állam ne követelje meg, hogy ugyanazt a dokumentumot papírformában is bemutassák.

2.10 Az Általános Nyilatkozatot (General Declaration) megkövetelő szerződő állam köteles az 1. Függelékben feltüntetett tételekre korlátozni tájékoztatására vonatkozó igényét. A tájékoztatást papír vagy elektronikus formában is el kell fogadnia.

2.11 Ha a szerződő állam az Általános Nyilatkozatot (General Declaration) már csak tanúsítás céljából követeli meg, olyan intézkedést alkalmazzon, amely révén a tanúsítási követelmény teljesíthető a Teheráru Bizonylat (Cargo Manifest) valamely oldalán a kívánt szövegezést tartalmazó kiegészítő nyilatkozat akár kézírással, akár gumi-bélyegzővel történő felvitelével. Az ilyen tanúsítást vagy a meghatalmazott ügynök, vagy a repülőgép parancsnok köteles aláírni.

2.12 A szerződő állam szokványos körülmények között ne írja elő az Utas Bizonylat (Passenger Manifest) benyújtását. Ha a szerződő állam az Utas Bizonylat benyújtását továbbra is megkívánja, követelményeit korlátozza a 2. Függelékben rögzített elemekre. A tájékoztatást - legyen papír vagy elektronikus formában - el kell fogadni.

2.13 Ha a szerződő állam az Utas Bizonylat papír alapú bemutatását írja elő, azt fogadja el, az alábbiak közül bármelyik változatban:

a) a 3. Függelékben bemutatott és az utasítás szerint kitöltött bizonylat; vagy
b) a 3. Függelékben bemutatott, részben kitöltött bizonylat a légi-járművön lévő rakomány mindegyike légi fuvarlevelének másolatával.

6.57 A nemzetközi repülőtereken helyszíni elsősegélynyújtó személyzetet és létesítményt kell fenntartani, és alkalmas szervezési megoldással kell rendelkezni, hogy az alkalmanként előforduló - gyors beavatkozást igénylő - súlyosabb esetek előre megszervezett szakorvosi ellátásban részesüljenek.

D. - Az engedélyező ellenőrzéshez és az ellenőrző szolgálatok működéséhez szükséges eszközök

6.58 **Ajánlott gyakorlat. -** *Az engedélyező ellenőrzés végzésével megbízott hatóságok számára szolgáló helyet és létesítményeket amennyire csak lehetséges közpénzen biztosítsák.*

6.59 Ha a 6.58 ajánlott gyakorlatban említett helyet és létesítményeket nem közpénzen biztosítja, a szerződő állam köteles gondoskodni arról, hogy e területeket és létesítményeket ne kedvezőtlenebb feltételekkel biztosítsák, mint amilyenek az állam területére belépő - és hasonló méretű területet és létesítményeket igénylő - egyéb szállítási mód üzemeltetőjére vonatkoznak.

6.60 A szerződő államok kötelesek az érintett hatóságok elégséges és illetékmentes szolgáltatás nyújtásáról gondoskodni az üzemeltetők részére, az e hatóságok által megállapított üzemidőn belül.

Megjegyzés - Ha a forgalom nagysága és a rendelkezésre álló terület és létesítmények szükségessé teszik, a szerződő állam kívánatosnak tarthatja, hogy az utasok és személypoggyászaik részére ne csak egyetlen helyen biztosítsanak engedélyező ellenőrzést.

6.60.1 A szerződő állam a közszolgálati hatóságok szolgáltatásait elegendő mértékben úgy köteles biztosítani, hogy a tényleges igényeket és ily módon a hatóságok által meghatározott munkaidőszak alatt a forgalom nagyságát kielégítve reagáljon.

1. Megjegyzés. - A 6.60 és a 6.60.1 szabványt a Nemzetközi Egészségügyi Szabályok (1969) harmadik, 1983. évi javított kiadásának 82. cikkelye szerint kell alkalmazni, amely értelmében az egészségügyi hatóság -a Nemzetközi Egészségügyi Szabályzatban (IHR) előírt orvosi vizsgálatok egyike esetében sem vagy egy érkező utas oltásáért illetve annak igazolásáért sem róhat fel illetéket. Az IHR előírja, hogy fizetség behajtása, vagy elfogadása nem engedhető meg sem a nappali, sem az éjszakai órákban végzett vizsgálat ellenében. A 24. Cikkely előírja, hogy az egészségügyi intézkedéseket azonnal meg kell kezdeni, és késedelem nélkül végre kell hajtani.
2. Megjegyzés. - A 15. Annex - Légiforgalmi Tájékoztató Szolgálatok - értelmében az állam köteles a nemzetközi repülőterein biztosított határátlépést engedélyező szerveinek (vám, bevándorlás, egészségügy) fajtáját és üzemidejét közzétenni.

6.61 A 6.60 és 6.60.1 pontban említett nemzetközi repülőtereken a lényeges munkateher lefedésére megállapított munkaidőszakon kívül, a légi-jármű üzemeltetők részére az ilyen hatóságok szolgáltatását a szerződő állam köteles nem kedvezőtlenebb feltételekkel biztosítani, mint amilyen feltételek az állam területére belépő egyéb szállítási mód üzemeltetőjére vonatkoznak.

6.62 **Ajánlott gyakorlat. -** *A szerződő állam intézkedjen, hogy felségterületén lehetővé váljon más állam vonatkozó közszolgálati hatóságai képviselőinek tartózkodása a légi-járművek, utasok, hajózószemélyzeti tagok, személypoggyász, teheráru megvizsgálása, illetve a vámkezelési, bevándorlási, közegészségügyi, állati- és növényi karanténozás dokumentálása céljából azt megelőzően, hogy ezek az illető másik állam felé elindulnának feltéve, hogy ez az eljárás a másik állam területére megérkezéskor szükséges engedélyezési eljárásokat segíti. Alternatív megoldásként a szerződő államok megegyezés szerint, a fentiekben felsorolt funkciók közül bármelyik esetében, a másik államba érkezéskori engedélyeztetés elősegítését célzó, elektronikus elő-engedélyeztetést alakíthatnak ki.*

E. – Pénzváltási eszközök

6.63 A szerződő állam köteles gondoskodni arról, hogy nemzetközi repülőterein láthatók legyenek más államok pénznemeinek saját nemzeti pénznemre való átváltását szabályozó rendelkezései.

6.64 Más állam pénznemeire továbbra is átváltás ellenőrzést fenntartó szerződő állam köteles intézkedni arról, hogy:

a) közzétegye az ilyen pénznemek hivatalos és érvényes átváltási árfolyamait;
b) nemzetközi repülőterein jelenítse meg, vagy egyéb módon tegye hozzáférhetővé az illető repülőtéren az érdeklődésre elsődlegesen számításba vehető átváltási árfolyamokat.

6.65 Ha más államok pénznemei közül némelyik vagy mindegyik átváltását a szerződő állam nem ellenőrzi, nemzetközi repülőterein köteles ilyen értelmű tájékoztatást megjeleníteni.

6.66 **Ajánlott gyakorlat. -** *Más államok olyan pénznemei esetében, amelyekre az illető szerződő állam ellenőrzött beváltási árfolyamot nem alakított ki, a szerződő állam tegyen kivitelezhető intézkedéseket arra, hogy nemzetközi repülőterein az éppen érvényes szabadpiaci átváltási árfolyamról tájékoztatás álljon rendelkezésre.*

6.67 A szerződő állam köteles biztosítani, hogy nemzetközi repülőterein kormányzati ügynökségek vagy arra felhatalmazott magánügynökségek révén, az utazóközönség igényeit kielégítő időben, megfelelő lehetőség álljon rendelkezésre más államok pénznemeinek törvényes átváltásához. E lehetőség az induló és az érkező utas számára egyaránt legyen igénybe vehető.

Megjegyzés - E rendelkezés megvalósítása során a szerződő állam lehetséges megoldásként, az induló utas számára külföldi valuta beszerzésre a nappal, vagy az éjszaka bármely időszakában lehetőséget nyújtó pénzváltó automaták alkalmazását vegye fontolóra, amelyek a nemzetközi repülőtereken igen hasznosnak bizonyultak.

8.8 A szerződő államok kötelesek elősegíteni az ENSZ részéről elismert nemzetközi szervezet által, vagy maguk az államok által, illetve megbízásukból végrehajtott segélynyújtó repülésben résztvevő légi-járművek területükre történő belépését, arról történő kilépését, vagy azon történő áthaladását, és minden lehetséges intézkedést meg kell hozniuk azok biztonságos üzemelésének garantálására. Ilyen repülések azok a segélyrepülések, amelyeket a természeti, vagy ember által előidézett katasztrófákra, valamint hasonló, az ENSZ segítségét igénylő és az emberi egészséget, vagy a környezetet súlyosan veszélyeztető vészhelyzeti körülményekre reagálva hajtanak végre. Az ilyen repüléseket a lehető leggyorsabban meg kell kezdeni azt követően, hogy a fogadó államtól a beleegyezés megérkezett.

1. Megjegyzés. - Az Alapfogalmak Nemzetközileg Elfogadott Gyűjteménye szerint, az Egyesült Nemzetek Humanitárius Ügyek Osztálya a vészhelyzetet "hirtelen és előre nem látható, a hátrányos következmények minimumra csökkentéséhez azonnali intézkedéseket igényelő" eseménynek, míg a katasztrófát olyan eseménynek tekinti, amely "a társadalom működésében nagymértékű emberi, anyagi vagy környezeti veszteséget okozó súlyos törés, amelynek csak saját erőből történő leküzdése meghaladja az illető társadalom erejét".
2. Megjegyzés - A segélynyújtó repülések biztonságos üzemének biztosítására szolgáló intézkedésekkel összefüggésben a következőkre hívjuk fel a figyelmet: 11. Annex – Légi-forgalmi szolgálatok; A polgári légi-jármű üzemelésre potenciálisan veszélyes katonai tevékenységekkel kapcsolatos biztonsági intézkedések kézikönyve (Doc 9554); és a Polgári légi-jármű elfogásának kézikönyve (Doc 9433).

8.9 A szerződő államoknak biztosítaniuk kell, hogy a 8.8 szabvány szerinti segélynyújtó repülésekkel érkező személyzet és cikkek belépésének engedélyezési eljárása szükségtelen késedelem nélkül végbemenjen.

D. Vészhelyzeti műveletek tenger szennyeződés és a tengeri biztonság terén

8.10 Vészhelyzet alkalmával a szerződő államok felségterülete tekintetében segítsék elő azoknak a légi-járműveknek belépését, átrepülését és kilépését, amelyek a tenger szennyezettségének leküzdésében vagy megakadályozásában, vagy a tenger biztonsága, az élővilág biztonsága, vagy a tengeri környezet megóvása érdekében szükséges egyéb tevékenységben vesznek részt.

8.11 Vészhelyzet esetén a szerződő államok a lehető legnagyobb mértékben segítsék elő a 8.10 szabványban leírt tengeri szennyezettség elleni és tengerbiztonsági tevékenységhez szükséges személyek, felszerelés, anyagok és berendezések belépését, átrepülését, kilépését.

E. A nemzetközi egészségügyi előírások és vonatkozó rendelkezések végrehajtása

8.12 A szerződő államok tegyenek eleget az Egészségügyi Világszervezet (WHO) *Nemzetközi Egészségügyi Szabályainak* (2005) érvényes kiadásában szereplő rendelkezéseknek.

8.13. Az említett szabályok 23. cikkelyével egyezésben, a szerződő államok legfeljebb azokat az intézkedéseket alkalmazhatják az utasok, személypoggyászaik, a rakomány és egyéb cikkek beléptetésénél, amelyek a szabályzatban megengedettek.

8.13 A szerződő államoknak minden lehetséges intézkedést meg kell tenniük, hogy rendelkezzenek oltókkal, akik alkalmazzák az Oltási vagy Kórmegelőzési Nemzetközi Tanúsítvány Modellt, összhangban a *Nemzetközi Egészségügyi Szabályok* (2005) 36. cikkelyével és 6. Annex-ével, biztosítandó az egységes jóváhagyást.

8.14 Minden egyes szerződő állam köteles megszervezni, hogy minden érdekelt légi-jármű üzembentartó és ügynökség számára biztosítsa, hogy utasainak lehetőség szerint utazásuk megkezdése előtt rendelkezésére álljon a cél-országok oltási követelményeiről szóló tájékoztató csakúgy, mint a *Nemzetközi Egészségügyi Szabályok* (2005) 36. cikkelyével és 6. Annex-szel összhangban álló Oltási vagy Kórmegelőzési Nemzetközi Tanúsítvány Modellről.

8.15 A légi-jármű parancsnoka köteles gondoskodni egy feltételezett fertőző betegség haladéktalan jelentéséről a légiforgalmi irányítás felé, hogy elősegítsék az érkezéskori közegészségügyi kockázatkezeléshez szükséges intézkedéstételt speciális egészségügyi szakszemélyzet és eszközök előállítására.

1. Megjegyzés – Fertőző betegség feltételezhető és további értékelést követel meg, amennyiben egy személy lázas (38°C illetve 100°F, vagy ennél magasabb a testhőmérséklete, amelyet bizonyos tünetek kísérnek, így például: nyilvánvalóan rosszul lévőnek látszik, állandóan köhög, gyengén lélegzik, állandó hasmenése van, bőrkiütései vannak, állandóan hány, horzsolásai vannak, illetve vérzik előzetes sérülés nélkül, zavart egy nem régi roham következtében

2. Megjegyzés – A légi-jármű fedélzetén feltételezett fertőző betegség felmerülése esetén a légi-jármű parancsnoka szükségszerűen követheti az üzembentartó rendtartását és irányelveit az indulási és érkezési ország egészségüggyel kapcsolatos jogszabályai kiegészítéseként. Utóbbiak a kialakított rend szerint megtalálhatók az érintett államok Légiforgalmi Tájékoztató Kiadványában (AIP.)

8.15.1 **Ajánlott gyakorlat. -** *Olyan esetekben, amikor beazonosítják a közegészségügyet fenyegető veszélyt, és az érintett államok közegészségügyi hatóságai igényt támasztanak az utasok és a személyzet utazási adatairól vagy kapcsolatairól tájékoztatásra annak érdekében, hogy a fertőző betegségnek esetlegesen kitett személyeket beazonosítsák, a szerződő állam fogadja el erre a célra egyedüli dokumentumként a 13. Függelékben bemutatott „Utas helymeghatározó kártya közegészségügyi célra" nyomtatványt.*

Megjegyzés – Javallott, hogy az államok az „Utas helymeghatározó kártya"-ból nemzetközi repülőtereiken és a légi-jármű üzembentartók felé történő elosztásra elegendő készlettel rendelkezzenek, hogy kitöltésre az utasok és a személyzet hozzáférjenek.

F. Nemzeti légi-közlekedési terv a fertőző betegségkitörés esetére

8.16 A szerződő állam köteles létrehozni egy nemzeti légi-közlekedési tervet, felkészülve a nemzetközi méretű közegészségügyi kockázatot vagy közegészségügyi kényszerhelyzetet felvető fertőző betegségkitörésre.

Megjegyzés – A nemzeti légi-közlekedési terv kialakítására vonatkozó útmutatás található az ICAO web lapján az „Aviation Medicine” oldalon.

G. Nemzeti alakiság egyszerűsítő programok létrehozása

8.17 Minden egyes szerződő államnak ki kell alakítania nemzeti alakiság egyszerűsítő programokat az Egyezmény és a 9. Annex követelményeinek megfelelően.

8.18 Minden egyes szerződő állam köteles biztosítani, hogy a nemzeti légi szállítási alakiság egyszerűsítő programjának célja az legyen, hogy elfogadjon minden hasznos intézkedést a légi-járművek, hajózószemélyzeti tagok, utasok, teheráru, posta küldemények és raktárkészletek mozgásának elősegítése érdekében, a szükségtelen akadályok és késlekedés megszüntetésével.

8.18.1 **Ajánlott gyakorlat**. - *Az államok a nemzeti polgári alakiság egyszerűsítési programjuk létrehozásakor használják a 12. Függelékben közölt útmutató anyagot.*

8.19 Minden egyes szerződő állam köteles létrehozni nemzeti légi-szállítási alakiság egyszerűsítő bizottságot és repülőtéri alakiság egyszerűsítő bizottságot vagy hasonló koordinációs testületet a kormányhivatalok, ügynökségek és más olyan érintett állami szervek közötti együttműködés elősegítése érdekében, amelyek illetékesek vagy felelősek a nemzetközi polgári repülés és hasonlóképpen a repülőterek és a légi-jármű üzemeltetők sokféle nézőpontja tekintetében.

8.20 **Ajánlott gyakorlat. -** *A szerződő állam törekedjen a polgári repülésvédelem és az alakiság egyszerűsítési programja közötti, körülményekhez igazított szoros koordináció megvalósítására. E célból, az Alakiság Egyszerűsítési Bizottság bizonyos tagjai egyben legyenek tagjai a Repülésvédelmi Bizottságnak is.*

8.21 **Ajánlott gyakorlat. -** *A nemzeti légi-szállítási alakiság egyszerűsítő bizottság és a repülőtéri alakiság egyszerűsítő bizottság létrehozásakor az állam használja fel a 11. és 12. Függelékben található útmutatást.*

H. - Különleges segítséget igénylő utasok szállításának elősegítése

I. Általános rész

8.22 **Ajánlott gyakorlat. -** *Csökkent képességű személyeknek – utazásukkor - megkülönböztetett segítségség nyújtása szükséges annak érdekében, hogy számukra is igénybe vehető legyen a nagyközönség számára általában nyújtott minden szolgáltatás. E segítség körébe tartozik a média útján közzétett - a felismerési vagy érzékszervi hiányossággal bíró utas számára - érthető tájékoztatás és útbaigazítás.*

8.23 **Ajánlott gyakorlat. -** *A szerződő államoknak arra való tekintettel is működjenek együtt, hogy minden szükséges lépést megtesznek, amellyel az utazás kezdetétől a végéig biztosítható, hogy a csökkent képességű személyek az utazásuk elejétől a végéig annak egymáshoz kapcsolódó összes láncszeméhez hozzáférnek.*

8.24 **Ajánlott gyakorlat. -** *A szerződő államok a légi-jármű üzemeltetőkkel, repülőterekkel és a földi kiszolgáló üzemeltetőkkel tegyék meg a szükséges lépéseket a csökkent képességű személyek szállítási szolgáltatásai tekintetében egységes hozzáférési minimum szabványok létrehozására, az indulási* *repülőtérre érkezéstől egészen a célrepülőtér elhagyásáig.*

8.25 **Ajánlott gyakorlat. -** *A szerződő államok a légi-jármű üzemeltetőkkel, a repülőterekkel, a földi kiszolgáló üzemeltetőkkel és az utazási ügynökségekkel együtt tegyék meg a szükséges lépéseket, hogy a csökkent képességű személyek a számukra fontos információkat megkapják. Gondoskodjon arról, hogy a légi-jármű üzemeltetők, a repülőterek, a földi kiszolgáló üzemeltetők és az utazási ügynökségek legyenek olyan helyzetben, hogy a csökkent képességű személyeknek utazásukhoz az igényüktől függő szükséges segítséget megadják.*

8.26 **Ajánlott gyakorlat. -** *A szerződő államok tegyenek meg minden szükséges lépést, amellyel kiképző programok létrehozása és összehangolása céljából biztosítható a légi-jármű üzemeltetők, a repülőterek és a földi kiszolgáló üzemeltetők együttműködése, amelynek révén elérhető, hogy kiképzett személyzet áll rendelkezésre a csökkent képességű személyek segítségére.*

II. A repülőtér megközelíthetősége

8.27 A szerződő államok kötelesek meghozni a szükséges intézkedéseket, amelyekkel biztosítható, hogy a repülőtéri létesítmények és szolgáltatások alkalmazkodjanak a csökkent képességű személyek igényeihez.

8.28 **Ajánlott gyakorlat. -** *A szerződő államok gondoskodjanak arról, hogy megfelelő emelő rendszer, vagy más alkalmas berendezés legyen biztosított érkezéskor és induláskor is ott, ahol utas-híd használatának hiányában ez szükséges az idősebb, vagy a csökkent képességű utasok légi-jármű és utas-terminál közötti közlekedésének segítésére.*

8.29 **Ajánlott gyakorlat. -** *Intézkedések megtételével biztosítsák, hogy a hallás- és látáskárosult személyek a repülési információkhoz hozzájuthassanak.*

8.30 **Ajánlott gyakorlat. -** *Az utas-terminál épületnél az odavitt vagy onnan elviendő idősebb és a csökkent képességű személyek részére a fenntartott helyeket a főbejárathoz lehető legközelebb kell kijelölni. A repülőtér különböző területei elérésének megkönnyítéséhez a megközelítési útvonalaknak akadálymenteseknek kell lenniük.*

8.31 **Ajánlott gyakorlat. -** *Ahol a közérdekű szolgáltatáshoz a hozzáférhetőség korlátozott, minden erőfeszítést tegyenek meg a mozgásukban segítségre szoruló személyek részére az elérhető és elfogadható áru földi szállítási szolgáltatás biztosítására, a meglévő és a tervezett nyilvános átszállító rendszer alkalmassá tételével vagy speciális szállító szolgáltatás biztosításával.*

8.32 **Ajánlott gyakorlat. -** *A mozgásukban segítségre szoruló személyek részére megfelelő parkolási létesítményt biztosítsanak, továbbá a parkoló épület és az utas-terminál közötti közlekedésük elősegítésére hozzanak megfelelő intézkedéseket.*

8.33 **Ajánlott gyakorlat. -** *Elsősorban az idősebb és a csökkent képességű személyek egyik légi-járműről egy másikra történő közvetlen átszállását, ahol szükséges és lehetséges, engedélyezni kell minden esetben, amikor ezt a csatlakozó járatok közötti időtartam vagy egyéb más körülmény megkívánja.*

III. A légi szolgáltatások hozzáférhetősége

8.34 A szerződő államok kötelesek a szükséges lépéseket megtenni, amelyekkel biztosítható, hogy a csökkent képességű személyek a légi szolgáltatásokhoz a kívánatos módon hozzáférhessenek.

8.35 **Ajánlott gyakorlat. -** *A szerződő államok léptessenek életbe rendelkezéseket, amelyek által az újonnan vagy nagyobb átalakítás után szolgálatba állított légi-járműveknek teljesíteniük kell a* *hozzáférésükre vonatkozó egységes minimum szabványt a légi-jármű fedélzeti berendezések tekintetében, amelyek körébe tartozik a felhajtható kartámasz, a fedélzeti tolószék, a mosdók, az alkalmas világítás és a jelzések.*

8.36 **Ajánlott gyakorlat. -** *A csökkent képességű személy számára szükséges kerekesszék, különleges készülék és felszerelés utas-kabinban történő szállítása legyen díjmentes, ha a légi-jármű üzemeltető nézete szerint az ilyen szállítást az elhelyezés és a biztonsági követelmények lehetővé teszik, vagy elsőbbséget élvező poggyásznak minősítik. A vonatkozó nemzeti, vagy légi-jármű üzemeltetői szabályzatok alkalmazásának függvényében ugyancsak díjmentesen szállítandó a csökkent képességű utas társaságában lévő szolgálatot ellátó állat.*

8.37 **Ajánlott gyakorlat. -** *Elviekben, a csökkent képességű személynek legyen megengedve a döntés, hogy igényt tart-e kísérőre és, hogy orvosi engedély iránti igény nélkül repül. Ha viszont segítség vagy emelés szükséges, akkor előzetes értesítés legyen kötelező. Csak olyan orvosi esetekben legyen megengedve a légi-jármű üzemeltetőnek orvosi engedélyt követelni a csökkent képességű utastól, amikor egyértelmű, hogy az illető állapota miatt saját vagy a többi utas biztonsága nem garantálható, vagy ha nem garantálható, hogy az illető jól fogja érezni magát. Továbbá, csak olyan esetekben legyen megengedve a légi-jármű üzemeltetőnek a csökkent képességű utashoz kísérőt követelni, amikor egyértelmű, hogy az illető magatehetetlen, és mint ilyen, nem garantálható a saját vagy a többi utas biztonsága, vagy ha nem garantálható, hogy az illető jól fogja érezni magát.*

8.38 **Ajánlott gyakorlat. -** *Arra az esetre, ha kísérő jelenléte szükséges, a szerződő államok a légi-jármű üzemeltetőt bátorítsák, hogy csökkentett díjtételű szállítást kínáljon az illető kísérő személy számára.*

I. Segítségnyújtás a légi-jármű baleset áldozatainak és családtagjaiknak

8.39 A légi-jármű baleset helyszínének állama és a szomszédos államok kötelesek úgy intézkedni, hogy elősegítsék a légi-jármű baleset áldozatai családtagjainak ideiglenes alapú belépését felségterületükre.

8.40 A légi-jármű balest helyszínének állama és a szomszédos államok kötelesek olyan intézkedéseket is tenni, amellyel elősegítik, hogy felségterületükre ideiglenes alapon beléphessenek a balesetet szenvedett légi-jármű üzemeltető vagy szövetséges partnere képviselői, hogy lehetővé tegyék számukra a segítségnyújtást a túlélőknek és családtagjaik, a baleset elhunyt áldozatai családtagjainak, és az állam illetékes hatóságainak.

Megjegyzés – A „code-sharing" és hasonló szövetségesi megállapodások néha szükségessé teszik, hogy a szövetséges partner, mint „első felelős" lépjen fel az érintett üzemeltető nevében, abban az esetben, amikor a szövetséges partner a baleset helyszínére előbb tud odaérni, mint az érintett üzemeltető.

8.41 **Ajánlott gyakorlat –** *A 8.39 pontban felsorolt személyek belépésének elintézésekor a baleset helyszínének állama és a szomszédos államok a kizárólagosan e személyek számára kiadott útlevélen vagy vészhelyzeti utazási dokumentumon kívül más utazási dokumentumot ne igényeljenek ahhoz, hogy ezen államokba beutazhassanak. Ha a 8.39 és 8.40 pontban felsorolt személyek számára a baleset helyszínének állama vagy egy szomszédos állam belépő vízumot igényel, gyorsítsa meg e vízumoknak a kiadását.*

8.42 A szerződő államok kötelesek szükség esetén a vészhelyzeti utazási dokumentumokat kiadni a balesetet túlélt állampolgárainak.

8.43. A szerződő államok kötelesek az összes szükséges segítségnyújtást kiterjeszteni, mint például az elszállítás és vámengedély elintézése tekintetében, az emberi maradványok hazatelepítésére a származási államba az áldozat családtagjainak vagy a balesetet szenvedett üzemeltetőnek a kérésére.

1. FÜGGELÉK - ÁLTALÁNOS NYILATKOZAT (GEN.DEC.)

ÁLTALÁNOS NYILATKOZAT
(indulási/érkezési)

Üzemeltető:……

11. FÜGGELÉK - A REPÜLŐTÉRI ALAKISÁG EGYSZERŰSÍTÉS

(FAL) MODELJE

1. A REPÜLŐTÉRI ALAKISÁG EGYSZERŰSÍTŐ PROGRAM CÉLJA

A repülőtéri alakiság egyszerűsítő program célja, hogy a 9. Annex célkitűzéseit kövesse üzemeltetési szinten, a légi-járművek, hajózószemélyzetek, utasok, és a teheráruk tekintetében a repülőtereken elősegítse a határ engedélyezési formalitások teljesítését.

2. A REPÜLŐTÉRI ALAKISÁG EGYSZERŰSÍTÉSI PROGRAM HATÓKÖRE

A repülőtéri alakiság egyszerűsítési program átöleli a 9. Annex valamennyi előírását, amely a repülőtéri határengedélyezési eljárásokra vonatkozik, de ezen eljárások megtervezését és irányítását is. Az alábbi táblázat reprezentatív felsorolást biztosít a teljesítendő feladatokról és az alkalmazandó szabványokról vagy ajánlott gyakorlatokról (SARP-ok).

Repülőtéri alakiság egyszerűsítő program feladata	*A 9. Annex (13. kiadás) szabványai vagy ajánlott gyakorlatai*
Alakítson ki, vizsgálja felül, és szükség szerint igazítsa ki adott repülőtéren a járatok belépésére és engedélyezésére vonatkozó eljárásokat	6.1.1, 8.16 szabvány
Rendszeresen vizsgálja felül valamennyi résztvevő teljesítését a tekintetben, hogy milyen mértékben tartják a belépő utasok kezelésére vonatkozó 45 perces és a kilépő utasok kezelésére vonatkozó 60 perces célkitűzést. A szükséges korrekció meghatározásához alkalmazzon időméréseket és sorbaállás elemzést.	3.36 és 3.39 ajánlott gyakorlat
Alakítson ki a határőrizeti és vámvizsgálat céljára korszerű rendszereket, felhasználva az alkalmazható technológiát. Az automatizált utas engedélyező rendszer felállításában működjön együtt.	3.40 , 3.51 és 6.26 szabvány
A növekvő forgalommal lépést tartva hajtsa végre a szükséges változtatásokat a repülőtéri forgalom áramoltatásban és az ellenőrző pontokon.	6.3 szabvány
Az utasok zavarának mérséklése érdekében a vizsgálati berendezéseknél javítsa a jelzések minőségét és mennyiségét.	6.9 és 6.12.1 ajánlott gyakorlat
A vizsgálati pontok munkaerő ügyeit – műszakbeosztások, túlmunkák stb. – vizsgálja felül és törekedjen a forgalom igényéhez igazodó korrekció megtételére.	6.3.1 ajánlott gyakorlat
Az ott székelő légi-jármű üzemeltetők és vizsgálati szervek nevében az új repülőterek tervezéséhez és új vizsgálati berendezésekhez adjon inputokat.	6.2 és 6.7 és 6.57 szabvány
Figyelje és javítsa a poggyász eljutását a vámvizsgálati területre.	6.28 szabvány
A pénzváltással összefüggő mindennemű szolgáltatási problémára hívja fel az illetékes hatóság figyelmét. Ajánlja az érkező területeken az ATM-ek telepítését.	6.63, 6.64 és 6.65 szabvány
Úgy koordinálja az alakiság egyszerűsítési, kábítószer ellenőrzési, légi-közlekedés védelmi	8.19 szabvány

és veszélyes áru kezelési eljárásokat, hogy mind a négy program célkitűzései teljesüljenek.	
Ne feledkezzen el a teheráruról! Koordinálja a különféle vizsgálati szervek tevékenységét és elvárásait úgy, hogy a légi teheráru szállítmányok azonnali engedélyezése és elszállítása biztosítva legyen. Gondoskodjon arról, hogy a vámengedélyre várakozás közben a teheráru ki- és berakodására és biztonságos tárolására alkalmas eszközök álljanak rendelkezésre.	4.25 szabvány és 4.28, 4.29, 6.38és 6.50 ajánlott gyakorlat
Állítson fel és működtessen elektronikus rendszereket a teheráru bizonylatolására, vámengedélyezésére és feladására.	4.15 és 4.4 szabvány

3. SZERVEZET ÉS VEZETÉS

3.1 Üzemelői szinten az alakiság egyszerűsítő program vezetésére szolgáló ajánlott eszköz a Repülőtéri Alakiság Egyszerűsítési Bizottság. Bár e bizottságok bátorítása, és a problémáikról, haladásukról való tájékoztatása szükséges a Nemzeti Alakiság Egyszerűsítési Bizottság részéről, de nem feltétlenül taroznak a nemzeti testület felügyelete alá. Legfőbb érdekük a napi problémák megoldása és a 9. Annex teljesítése.

3.2. Ajánlott, hogy a repülőtér igazgatója vezesse a bizottságot és tartson rendszeres megbeszéléseket. A tagok között kapjanak helyet a repülőtéri vizsgálati szervek – mint például a vámhatóság, a határőrség, a közegészségügy - felelős vezető tisztségviselői ugyanúgy, mint a nemzetközi forgalomban részt vevő légi-jármű üzemeltetők azon a repülőtéren tevékenykedő állomásvezetői. Mindegyik fél részvétele fontos ahhoz, hogy a repülőtéri alakiság egyszerűsítési program sikeres legyen.

A Chicago-i Egyezmény megbízása	*Alkalmazási feladatok*
10. Cikkely – *Leszállás vámköteles repülőtéren* …a szerződő állam felségterületére belépő mindegyik légi-jármű köteles - amennyiben az állam rendelkezései így kívánják meg – leszállni az állam által kijelölt repülőtéren vámellenőrzés és egyéb vizsgálatok céljából. A szerződő állam felségterületéről történő elinduláskor az ilyen légi-jármű köteles egy hasonlóan kijelölt vámköteles repülőtérről ezt megenni.	- Vámköteles repülőterek létesítése és ennek megfelelő újak nyitása - Olyan eljárások kidolgozása, amelyek révén a menetrendszerinti és nem menetrendszerinti üzemeltetők engedélyt kérhetnek a vámköteles repülőtereken való leszállásra és onnan való elindulásra. - A vámköteles repülőtéren a határ-ellenőrzési szolgálatok megszervezése.
13. Cikkely – *Belépési és engedélyeztetési rendelkezések* A szerződő állam azon törvényei és rendeletei, amelyek a légi-járművek utasainak, hajózószemélyzeteinek és teherárujának felségterületére történő be- és kiléptetésére vonatkoznak, mint például a belépési, engedélyezési, határőrizeti, útlevél, vám és karantén rendelkezések, az ilyen utasok, hajószemélyzetek által vagy a teheráruk tekintetében betartandók az államba történő belépéskor és abból való kilépéskor és felségterületén tartózkodás során.	- Az érdekelt határőrizeti ügynökségek támogatása, a repülőtereken hatékony vizsgálati rendszerek létrehozatalára és fenntartására, és a vonatkozó eljárásaik ésszerűsítésére tett erőfeszítéseik tekintetében. - Programok kidolgozása a védelmi problémák kezelésére, így például a dokumentumhamisításra, az illegális bevándorlásra és a csempészésre. - Különleges eseményekkor, mint például nemzetközi atlétikai verseny esetében, a nagy számú nemzetközi látogató engedélyezési előkészületeinek

	koordinálása.
14. Cikkely – *a fertőzés terjedésének megelőzése* Minden egyes szerződő állam egyetért azzal, hogy hatékony lépéseket tesz annak megelőzésére, hogy a légi-közlekedés útján ne terjedjen a kolera, a tífusz (járványos), a fekete himlő, pestis és ehhez hasonló más, fertőzés útján terjedő betegség, miután a szerződő államok időről időre kötelesek kijelölni…	- A légi úton terjedő fertőző betegségek megelőzésére vonatkozó nemzeti irányelvek kialakítása, felülvizsgálata és szükség szerinti módosítása, így például a légi-jármű rovarmentesítése és fertőtlenítése, a közegészségügyhöz tartozó karantén programok és egy egészségügyi vészhelyzetben alkalmazandó védelmi intézkedések.
22. Cikkely – *a formalitások egyszerűsítése* Minden egyes szerződő állam egyetért abban, hogy speciális rendeletek kiadása útján vagy más módon minden hasznos lépést megtesz, hogy elősegítse és meggyorsítsa a légi-járművek navigációját a szerződő államok felségterületei között és, hogy megelőzi a légi-járművek, hajózó személyzetek, utasok és teheráruk szükségtelen késleltetését, különösen a bevándorlásra, a karanténozásra, a vámolásra és az engedély megadásra vonatkozó törvények meghozatalakor.	- A légi úton történő nemzetközi mozgásokra vonatkozó állami vám-, határőrizeti- és karantén törvényeket alkalmazó nemzeti rendelkezéseknek a létrehozása, felülvizsgálata és szükség szerinti módosítása.
23. Cikkely – *vám- és határőrizeti eljárások* Minden egyes szerződő állam, amennyire hasznosnak tartja, megvalósítja a nemzetközi légi-fuvarozásra ható vám- és határőrizeti eljárások létesítését, azokkal a gyakorlatokkal összefüggésben, amelyek ezen egyezmény alapján időről időre létrehozhatók vagy ajánlottak.	- A 9. Annex-ben lefektetett szabványokkal és ajánlott gyakorlatokkal való harmonizáláshoz a repülőtereken teljesítendő vám- és határőrizeti eljárások létrehozása és megfelelő módosítása - A Doc 9303 – *„Gépi Feldolgozású Utazási Dokumentumok”-ban* levő ICAO specifikációnak megfelelően támogatja és pártolja az útlevelek és más utazási dokumentumok nemzeti kiadását.
37. Cikkely – *a nemzetközi szabványok és eljárások bevezetése* Minden egyes szerződő állam vállalja, hogy együttműködik mindazon rendelkezések, szabványok, eljárások és szervezetek lehető legnagyobb mértékű egységesítésének biztosításában, amelyek a légi-járművekre, a személyzetekre, a légi folyosókra és a kisegítő szolgáltatásokra vonatkoznak minden olyan esetben, amikor az ilyen egységesítések egyszerűsítik és javítják a légi-közlekedést. … (j) Vám- és határőrizeti eljárások…	- A 9. Annex ICAO általi fejlesztésében való részvétel - A nemzeti eljárások rendszeres időközönkénti felülvizsgálata annak érdekében, hogy a 9. Annex előírásaival való összhang biztosított legyen.
38. Cikkely – *kiindulás a nemzetközi szabványokból és eljárásokból* Bármely állam, amelyik nem találja célravezetőnek azt, hogy bármely ilyen nemzetközi szabványt vagy eljárást kövessen, vagy teljes összhangba hozza a saját rendeleteit és gyakorlatait a nemzetközi szabványokkal és eljárásokkal az utóbbi módosítását követően, vagy szükségesnek tartja olyan rendelkezések és gyakorlatok elfogadását, amelyek bármely sajátos tekintetben eltérnek egy nemzetközi szabvány által meghatározottaktól, köteles haladéktalanul értesíteni a Nemzetközi Polgári Légi-közlekedési Szervezetet a	- Rendszeres időközönként annak áttekintése, hogy valamennyi ide tartozó szerv tartja-e magát a 9. Annex előírásaihoz, és az ICAO értesítése a nemzeti gyakorlat és a vonatkozó szabványok közötti eltérésekről.

saját gyakorlata és a nemzetközi szabványban megállapítottak közötti eltérésről.

13. FÜGGELÉK – UTAS HELYMEGHATÁROZÓ KÁRTYA KÖZEGÉSZSÉGÜGYI CÉLRA

UTAS HELYMEGHATÁROZÓ KÁRTYA KÖZEGÉSZSÉGÜGYI CÉLRA

A Utas helymeghatározó kártya közegészségügyi célra kitöltendő, ha a közegészségügyi hatóság fertőző betegségre gyanakszik. Az Ön által nyújtott tájékoztatás segíti a közegészségügyi hatóságot abban, hogy a közegészségügyi eseményt ellenőrzés alatt tartsa azáltal, hogy a fertőző betegségnek esetlegesen kitett utasokat be tudja azonosítani. A tájékoztatást a közegészségügyi hatóság a vonatkozó törvények szerint kezeli, és kizárólag közegészségügyi célokra használja fel.

A repülés adatai

1. Légitársaság és járatszám *2. Érkezés ideje* *3. Az Ön tényleges ülőhelye a repülőgépen*

_ _

Légitársaság Járatszám nap hónap év

Személyi adatok

4. Név

_ _

Családnév Utónév

Jelenlegi lakhelye (ország név is)

_ _

Utcanév Város Megye/Tartomány

* Ezek a csatornák kizárólag nemzeti kiosztásra vannak fenntartva.

** Ezeket a csatornákat másodlagos alapon lehet nemzeti kiosztásra felhasználni. Ezen csatornák tartalékolásának elsődleges oka az, hogy védelmet biztosítsunk a másodlagos légtérellenőrző radar (SSR) rendszerek részére.

A 108,0 MHz-nek ILS szolgáltatási frekvenciaként való kijelölése nem tervezett. A hozzá kapcsolódó DME a 17X sz. üzemeltetési csatornát kényszerhelyzeti alkalmazásra lehet kijelölni. A 17X csatorna válaszfrekvenciáját (978 MHz) az UAT is használja. Az UAT szabványok és ajánlott eljárások az Annex 10, III. kötet, I. rész, 12 fejezetében találhatók.

2	FA Végső megköz.	85 m (279 láb) lineárisan csökkenően 12 m (40 láb)	12 m (40 láb)	
Lásd a Megj.-t	IA Kezdeti megköz.	100 m (328 láb)	68 m (223 láb)	
Az MLS megközelítési vonatkoztatási pontnál és a teljes fedésterületen	1	FA Végső megköz.	30 m (100 láb)	18 m (60 láb)
2	FA Végső megköz.	12 m (40 láb)	12 m (40 láb)	
A hátsó irányszektor teljes fedésterületi légterében	1 és 2	FA Végső megköz.	100 m (328 láb)	68 m (223 láb)
Lásd a Megj.-t	IA Kezdeti megköz.	100 m (328 láb)	68 m (223 láb)	

Megjegyzés. - A 9,3 km-es (5 tmf) távolságból az MLS megközelítési vonatkoztatási pontig és a hátsó irányszektor teljes fedésterületén a kezdeti megközelítési (IA) módot lehet használni akkor, amikor a végső megközelítési (FA) mód nem üzemel.

7. 1. 13. Az UAT-vel kapcsolatos tényezők
7. 1. 13. 1. A frekvencia tervezési kritériumok a DME és az UAT közötti kompatibilitás biztosítása végett az UAT kézikönyv II. Kötetében található (Doc. 9861: előkészítés alatt)

7. 2 a csak a DME / N berendezésre vonatkozó útmutató anyag

7. 2. 1 *a DME / N berendezések kisugárzott teljesítménye (ERP)*

7. 2. 1. 1 a 3. Fejezet 3. 5. 4. 1. 5. 1 pontjában előírt teljesítmény-sűrűség a következő alapfeltételeken alapszik:

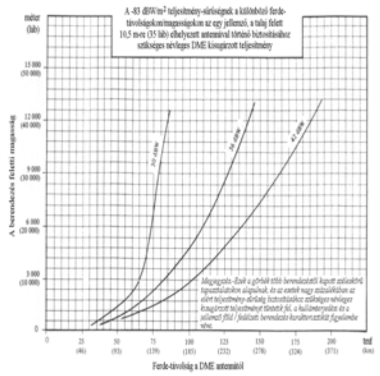
Légijármű fedélzeti vevő érzékenység	-112 dBW
Légijármű fedélzeti tápvonal veszteség	+3 dB
Légijármű fedélzeti sugárzási diagram veszteség egy izotróp antennához viszonyítva	+4 dB
Az antennánál szükséges teljesítmény	-105 dBW

Az antennánál a mínusz 105 dBW mínusz 83 dBW/m^2-nek felel meg a közepes átviteli frekvenciánál.
Megjegyzés. - Az egy izotróp antennára vonatkozó teljesítmény-sűrűséget a következő módon lehet kiszámítani:

$$P_d = P_a - 10 \log \frac{\lambda^2}{4\pi}$$

ahol: P_d *= a teljesítmény-sűrűség dBW/m*^{2}*-ben;*
P_a *= a teljesítmény a vételi pontnál dBW-ban;*

λ *= a hullámhossz méterben.*
7. 2. 1. 2 A mínusz 83 dBW/m^2 teljesítmény-sűrűség eléréséhez szükséges kisugárzott teljesítmény névleges értékei a C-20. számú ábrán kerültek megadásra. A nehéz terepviszonyok, és telepítési körülmények melletti fedésterületre szükséges lehet az, hogy a kisugárzott teljesítményt megfelelően növeljék. Ellenkező esetben kedvező telepítési körülmények esetén a megállapított teljesítmény-sűrűséget kisebb kisugárzott teljesítménnyel is el lehet érni.
7.2.1.3 A C-20. sz. ábra alkalmazását a következő példák mutatják be. Azért, hogy a szükséges névleges teljesítmény-sűrűség elérésre kerüljön a 342 km-es ferdetávolságnál (185 tmf) a 12 000 m (40 000 láb) magasságon és a 263 km-es (142 tmf) ferdetávolságnál a 12 000 m (40 000 láb) magasságon, illetve a 135 km-es (73 tmf) ferdetávolságnál a 6 000 m-es (20 000 láb) magasságon külön-külön plusz 42 dBW, plusz 36 dBW, illetve plusz 30 dBW kisugárzott teljesítményre lesz szükség.



C-20. ábra

7. 3 A csak a DME / P berendezésre vonatkozó útmutató anyag

7. 3. 1 *A DME / P berendezés rendszer leírása*

7. 3. 1. 1 A DME / P berendezés a 3. Fejezet 3. 11 pontjában leírt mikrohullámú leszállító rendszer szerves része. A DME / P jel formátum két üzemelési módot határoz meg, a kezdeti megközelítési (IA) és a végső megközelítési (FA) módot. A kezdeti megközelítési mód kompatibilis és együtt működtethető a DME / N-el és arra a célra tervezett, hogy javított pontosságot biztosítson a megközelítés és a leszállás kezdeti szakaszaiban. A végső megközelítési mód lényegesen nagyobb pontosságot biztosít a végső megközelítési területen. Mindkét üzemmód egy egyedüli DME / P földi berendezésben van egyesítve, és a rendszer jellemzője olyan, hogy a DME / N és a DME / P funkcióit össze lehet kapcsolni egy egyedüli kérdező adó-vevőben. A kezdeti megközelítési és a végső megközelítési módok a 3. Fejezet 3. 5. 4. 4 pontjában meghatározott impulzus kódokkal kerülnek azonosításra. Az MLS megközelítési szektorában a DME / P berendezés fedésterületének legalább 41 km-nek (22 tmf) kell lenni a földi válaszadótól mérve. Az a cél, hogy a kérdező adó-vevő ne működjön a válaszadó telepítési helyétől mért 13 km-nél (7 tmf) nagyobb távolságban végső megközelítési üzemmódban, jóllehet, a kezdeti megközelítési módról való átállás a válaszadótól mért 15 km-nél (8 tmf) kezdődhet meg. Ezek a számok azon az előfeltételen alapulóan kerültek kiválasztásra, hogy a válaszadó a futópálya megállási végén túl, a futópálya küszöbétől körülbelül 3 600 m (2 tmf) távolságra van telepítve.

7. 3. 1. 2 A megközelítési és leszállási műveletek végső szakaszaiban előforduló pontosság csökkenés nagyobb lehetséges okozója a többutas (jel-visszaverődéses) interferencia. A DME / P berendezés végső megközelítési módja minimálisra csökkenti ezeket a hatásokat úgy, hogy olyan szélessávú impulzus jelfeldolgozást alkalmaz, amelynél gyors az impulzus-felfutás felfutási ideje és a beérkezési időt a vett impulzusok egy olyan alacsony pontján méri, ahol még nincs a több-utas terjedés miatt jelentős jel-romlás. Ezzel szemben egy alacsonyabb impulzus felfutási időt és egy magasabb, az 50 százalékos jelszintnél bekövetkező küszöbértéket alkalmaznak a DME / N berendezésekben.

7. 3. 1. 3 Mivel a végső megközelítési mód a 13 km-nél (7 tmf) kisebb távolságban kerül alkalmazásra, az adó megfelelő jelszintet tud biztosítani ahhoz, hogy a szükséges pontosságot anélkül kielégítse, hogy a gyors impulzus felfutási idő rontaná a válaszadó impulzus spektrum követelményeit. Az 50 százalékos küszöbérték és a keskenyebb vevő sávszélesség alkalmazása a kezdeti megközelítési módnál lehetővé tesz egy kielégítő, de kisebb követelményű teljesítményt a fedésterületi határvonalakig. A válaszadó határozza meg a lekérdezési módot egy lekérdező kódnak az olyan felhasználásával, ami időzíti a válasz késését a megfelelő mérési referenciától. A kezdeti megközelítési mód együttműködő-képes a DME / N berendezéssel és lehetővé teszi azt, hogy egy DME / N kérdező adó-vevő kerüljön a DME / P válaszadóval együtt felhasználásra úgy, hogy legalább elérje a DME / N válaszadó pontosságát.

Hasonlóképpen a DME / P kérdező adó-vevőt fel lehet használni a DME / N válaszadóval együtt.

7. 3. 2 *A DME / P berendezés rendszer* pontossági követelményei

7. 3. 2. 1 *A DME / P berendezés pontossági követelményei*

7. 3. 2. 1. 1 Amikor a DME / P berendezés pontossági követelményeit mérlegelik, akkor azok az üzemeltetések, amelyeket a végső megközelítési mód szolgálati hatótávolságában végre lehet hajtani, két csoport valamelyikébe sorolhatók. Ez vezetett arra, hogy két pontossági szabvány került meghatározásra a végső megközelítési módra:

a) *1. pontossági szabvány:* ez a kisebb követelményű és a legtöbb hagyományos fel- és leszállású (CTOL) üzemeltetés kiszolgálására tervezett pontosság;

b) *2. pontossági szabvány:* ez megnövelt pontosságot ad, és ez lehet a függőleges fel- és leszállású (VTOL), valamint a rövid fel- és leszállású (STOL) üzemeltetésekhez, valamint az MLS kilebegtetési magassági vezérlést felhasználó hagyományos fel- és leszállású üzemeltetések kilebegtetési manővereihez és a hagyományos fel- és leszállású üzemeltetések nagysebességű futópálya elhagyási manővereihez szükséges.

7. 3. 2. 1. 2 A C-5. táblázat mutatja be a DME és a jellemző pontossági követelmények alkalmazását. Ez segítséget fog nyújtani a megfelelő pontossági szabvány kiválasztásához úgy, hogy azok megfeleljenek az üzemeltetési követelményeknek. A számítások a DME antenna és a futópálya küszöb közötti 1768 méteres (5 800 láb) távolságon alapulnak. A következő pontok a C-5. táblázatra vonatkoznak.

7. 3. 2. 1. 3 Az a cél, hogy a DME / P pontossága körülbelül feleljen meg az oldalszög funkció útvonal-követési hiba (PFE) értékének az MLS vonatkozási ponttól mért 37 km-es (20 tmf) távolságnál, mind a meghosszabbított középvonal mentén, mind a 40 fokos oldalszög értékeknél. Ugyanígy a DME / N berendezés hibája az MLS fedésterületének határvonalainál egyezzen meg a 3. Fejezet 3. 5. 3. 1. 3. 3 pontja rendszer pontossági 0, 37 km-es (0, 2 tmf) értékével. A kormányzási elmozdulási zaj (CMN) a plusz vagy mínusz 0, 1 fok kormányzási elmozdulási érték lineáris megfelelője legyen, ahogy az az oldalszög útirány-vezetési szög funkcióra meghatározásra került.

7. 3. 2. 1. 4 Az útvonal-követési hiba (PFE) az oldalszög szöghibának felel meg, a kormányzási elmozdulás zaj (CMN) körülbelül az oldalszög útirány-vezetési szög rendszerre meghatározott 0, 1 fok kormányzási elmozdulási zaj (CMN) lineáris megfelelője.

7. 3. 2. 1. 5 A plusz vagy mínusz 30 méteres útvonal-követési hiba (PFE) plusz vagy mínusz 1, 5 méteres függőleges hibának felel meg egy 3 fokos magassági szögnél.

7. 3. 2. 1. 6 A kilebegtetés megkezdése az MLS megközelítési vonatkozási pont közelében történik, az MLS magassági szöge és a DME / P biztosítja a függőleges útirány-vezetést az automatikus leszálláshoz akkor, amikor a futópálya küszöbe alatti terepfelszín egyenetlen.

7. 3.2. 1. 7 Az érzékenység módosulása vagy a robotpilóta erősítés szabályozására vonatkozó körülmények nem függnek közvetlenül a pontosságtól.

C-5. táblázat

Funkció	Jellemző távolság a küszöbtől	Útvonal-követési hiba (95 %-os valószínűség)	Kormányzási elmozdulási zaj
Megközelítés (7. 3.2. 1. 3)			
— a futópálya meghosszabbított középvonalán	37 km (20 tmf)	±250 m (820 láb)	±68 m (±223 láb)
— a 40°-os oldalszögnél	37 km (20 tmf)	±375 m (±1 230 láb)	±68 m (±223 láb)
Megközelítés (7. 3. 2. 1. 4)			
— a futópálya meghosszabbított középvonalán	9 km (5 tmf)	±85 m (±279 láb)	±34 m (±111 láb)
— a 40°-os oldalszögnél	9 km (5 tmf)	±127 m (±417 láb)	±34 m (±111 láb)
Helyjeladó helyettesítés			
— külső helyjeladó	9 km (5 tmf)	±800 m (±2 625 láb)	nem alkalmazható
— középső helyjeladó	1 060 m (0,57 tmf)	±400 m (±1 312 láb)	nem alkalmazható
A 30 méteres elhatározási magasság meghatározása (100 láb) (7. 3. 2. 1. 5)			
— 3°-os siklópálya (hagyományos fel- és leszállás)	556 m (0, 3 tmf)	±30 m (±100 láb)	nem alkalmazható
— 6°-os siklópálya (rövid fel- és leszállás)	556 m (0, 3 tmf)	±15 m (±50 láb)	nem alkalmazható
A kilebegtetés megkezdése egyenetlen terep felett (7. 3. 2. 1. 6)			
— 3°-os siklópálya (hagyományos fel- és leszállás)	0	±30 m (±100 láb)	±18 m (±60 láb)
— 6°-os siklópálya (rövid fel- és leszállás)	0	±12 m (±40 láb)	±12 m (±40 láb)
Érzékenység módosulás (7. 3. 2. 1. 7)			
(robotpilóta erősítés szabályozása)	37 km-től (20 tmf) 0-ig	±250 m (±820 láb)	nem alkalmazható
Kilebegtetési manőver MLS kilebegtetési magassággal (7. 3. 2. 1. 8)			
— Hagyományos fel- és leszállás	0	±30 m (±100 láb)	±12 m (±40 láb)

— Rövid fel- és leszállás	0	±12 m (±40 láb)	±12 m (±40 láb)
Hosszú kilebegtetési riasztás (7. 3. 2. 1. 9)	A futópálya körzete	±30 m (±100 láb)	nem alkalmazható
Hagyományos fel- és leszállás nagysebességű leszállás utáni kifutás / futópálya elhagyás (7. 3. 2. 1. 10)	A futópálya körzete	±12 m (±40 láb)	±30 m (±100 láb)
Felszállási emelkedés és megszakított megközelítés	0-tól 9 km-ig (5 tmf)	±100 m (±328 láb)	±68 m (±223 láb)
Függőleges fel- és leszállású megközelítések (7. 3. 2. 1. 11)	925 m-től (0, 5 tmf) 0-ig	±12 m (±40 láb)	±12 m (±40 láb)
Koordináta "áttétel" (7. 3. 2. 1. 12)	-	±12 m-től ±30 m-ig (±40 láb-tól ±100 láb-ig)	±12 m (**±40 láb)**

ÖSSZEKÖTTETÉSI ELJÁRÁSOK

II. KÖTET HATODIK KIADÁS - 2001. JÚLIUS

1. Az alábbi cserelapokat kell behelyezni az Annex 10 II. Kötetébe (Hatodik kiadás), amelyek a 82. módosításokat foglalják magukban, és amelyek 2007. november 22-én lépnek hatályba.

a) (iv) oldal	- tartalomjegyzék
b) (xii) oldal	- Előszó
c) a 4-3, 4-8, 4-11, 4-22 és 4-24 oldalak	- 4. Fejezet
d) az 5-5, 5-6, 5-7, 5-9, 5-10 és 5-15 oldalak	- 5. Fejezet
e) a 8-2, 8-3, 8-5, 8-6, 8-7 oldalak	- 8. Fejezet

2. A módosításokat a borító- és az előzéklapra 2001. júliusi dátummal, kézzel kell rávezetni

3. A módosítást a (ii) oldalra kell bejegyezni.

TARTALOMJEGYZÉK

Oldal

4.4 Légiforgalmi állandóhelyű távközlési hálózat (AFTN)

4.4.1 Általános rész

4.4.1.1 *Közlemények kategóriái.* A 3.3 pont előírásait is figyelembe véve, a légiforgalmi állandóhelyű távközlési hálózatnak az alábbi kategóriákba sorolható közleményeket kell kezelnie:

a) vészhelyzeti közlemények *(distress messages)*;

b) sürgősségi közlemények *(urgency messages)*;

c) repülésbiztonsággal kapcsolatos közlemények; *(flight safety messages)*

d) meteorológiai közlemények;

e) a repülések rendszerességét elősegítő közlemények;

f) a Légiforgalmi Tájékoztató Szolgálat (AIS) közleményei;

g) légiforgalmi adminisztrációs, igazgatási közlemények;

h) szolgálati közlemények.

4.4.1.1.1 *Vészhelyzeti közlemények (SS sürgősségi jelzéssel).* Ebbe a kategóriába azok a közlemények tartoznak, amelyeket a mozgó állomások adnak föl, és amelyben azt közlik, hogy súlyos és közvetlen veszély fenyegeti őket, valamint minden egyéb olyan közlemény, amely a vészhelyzetben lévő mozgó állomásnak történő azonnali segítségnyújtással kapcsolatos.

4.4.1.1.2 *Sürgősségi közlemények (DD elsőbbségi jelzéssel).* Ebbe a kategóriába azok a közlemények tartoznak, amelyek egy hajó, légijármű vagy egyéb jármű biztonságával, vagy a fedélzetén, illetve a látótávolságában lévő személy biztonságával kapcsolatosak.

4.4.1.1.3 Repülésbiztonsági közlemények (FF elsőbbségi jelzéssel). Ebbe a kategóriába tartoznak:

a) a légijárművek mozgásával és irányításával kapcsolatos közlemények, ahogy azokat a PANS-ATM (Doc 4444) 11. Fejezete meghatározza;

b) a légijárművet üzemeltető ügynökség (járató) által feladott közlemények, amelyek közvetlenül, haladék nélkül érintenek egy repülésben lévő, vagy indulni készülő légijárművet;

c) a meteorológiai közlemények a SIGMET tájékoztatásra, a különleges légijelentésekre, az AIRMET közleményekre, a vulkáni hamufelhők és trópusi ciklonok tanácsadói információira és az előrejelzések módosításaira korlátozottak.

4.4.1.1.4 Meteorológiai közlemények (GG elsőbbségi jelzéssel).

Ebbe a kategóriába tartoznak:

a) az előrejelzéseket, pl. közelkörzeti/repülőtéri előrejelzéseket (TAF-okat), területi és útvonali előrejelzéseket tartalmazó közlemények;

b) észleléseket és jelentéseket tartalmazó közlemények, mint pl. a METAR és a SPECI.

4.4.1.1.5 A repülések rendszerességét elősegítő közlemények (GG elsőbbségi jelzéssel).

Ebbe a kategóriába tartoznak:

a) légijárművek terhelésével kapcsolatos, a súly és súlypont számításához szükséges közlemények;

b) a légijárművek üzemeltetési menetrendjében beálló változásokkal kapcsolatos közlemények;

c) a légijárművek karbantartásával, szervizelésével kapcsolatos közlemények;

d) az utasokra, személyzetre és árura vonatkozó kollektív követelmények változásával kapcsolatos közlemények, melyek a szokásos üzemeltetési menetrendtől való eltérésre vonatkoznak;

e) a nem tervezett - szokásostól eltérő - leszállásokkal kapcsolatos közlemények;

f) a nem menetrendszerű repülések számára a repülés előtti léginavigációs szolgálatok biztosítását és operatív kiszolgálást kérő közlemények, pl. átrepülési engedély kérése;

g) a légijármű-üzemeltető ügynökségek (járatók) által feladott, a légijármű érkezését, vagy indulását jelentő közlemények;

h) alkatrészekkel vagy anyagokkal kapcsolatos közlemények, melyekre sürgősen szükség van a légijárművek üzemeltetéséhez.

4.4.1.1.6 Légiforgalmi tájékoztató szolgálat (AIS) közleményei (GG elsőbbségi jelzéssel).

Ebbe a kategóriába tartoznak:

a) A NOTAM-okkal kapcsolatos közlemények;

b) A SNOWTAM-okkal kapcsolatos közlemények.

4.4.1.1.7 Légiforgalmi adminisztratív közlemények (KK elsőbbségi jelzéssel).

Ebbe a kategóriába tartoznak:

a) a légijárművek üzemeltetésének biztonsága vagy rendszeressége érdekében biztosított létesítmények üzemeltetésével, vagy fenntartásával, karbantartásával kapcsolatos közlemények;

b) a légiforgalmi távközlési szolgálatok működésével kapcsolatos közlemények;

c) a Polgári Légügyi Hatóságok között váltott, a légiforgalmi szolgálatokkal kapcsolatos közlemények.

4.4.1.1.8 Az információ-kérő közleményeket ugyanolyan elsőbbségi jelzéssel kell ellátni, mint amilyennel azt a közleményt láttak el, amellyel kérnek, kivéve, ha a repülés biztonsága érdekében ennél magasabb prioritás indokolt.

4.4.1.1.9 *Szolgálati közlemények (megfelelő elsőbbségi jelzéssel).*

Ebbe a kategóriába tartoznak a légiforgalmi állandóhelyű állomásoktól származó közlemények, amelyekben tájékoztatást vagy megerősítést kérnek más, olyan közleményekkel kapcsolatban, amelyeket a légiforgalmi állandóhelyű hálózat látszólag helytelenül továbbított, vagy amelyekkel a csatorna-sorszámok megerősítését kérik, stb.

4.4.1.1.9.1 A szolgálati közleményeket a 4.4.2 vagy a 4.4.15 pontban előírt formában kell elkészíteni. Amikor a 4.4.3.1.2 vagy a 4.4.15.2.1.3 pont előírásait alkalmazzák egy olyan szolgálati közleményre, amelynek címzettje egy csak helységkóddal azonosított légiforgalmi állandóhelyű állomás, akkor közvetlenül ez után a helységkód után az ICAO három-betűs "YFY" azonosítóját kell beilleszteni, amelyet egy megfelelő nyolcadik betű kövessen.

4.4.1.9.2 A szolgálati közleményeket a megfelelő elsőbbségi jelzéssel kell ellátni.

4.4.1.1.9.2.1 **Ajánlás.** - *Ha a szolgálati közlemények korábban feladott közleményekre vonatkoznak, lehetőleg ugyanazzal az elsőbbségi jelzéssel lássák el, mint az (oka) t, amely (ek) re vonatkoznak.*

4.4.1.1.9.3 Az átviteli hibákat javító szolgálati közleményeket minden olyan címzettnek meg kell küldeni, aki a hibás adást meg fogja kapni.

4.4.1.1.9.4 A szolgálati közleményre adott választ annak az állomásnak kell megcímezni, amely az eredeti szolgálati közleményt feladta.

4.4.1.1.9.5 **Ajánlás.** - *A szolgálati közlemények szövege a lehető legtömörebb legyen.*

4.4.1.1.9.6 A szolgálati közleményeket, kivéve azokat, amelyek SS közlemény vételét nyugtázzák, az SVC rövidítéssel kell azonosítani, amely a szöveg első eleme legyen.

4.4.1.1.9.7 Amikor a szolgálati közlemény egy korábban kezelt közleményre hivatkozik, akkor a korábbi közleményre a megfelelő közlemény-azonosítóval (lásd a 4.4.2.1.1 b) és 4.4.15.1.1. b) pontokat), vagy a feladási időt és a feladót jelző azonosító karaktercsoportok megadásával (lásd a 4.4.4 és a 4.4.15.2.2 pontokat) kell hivatkozni, azokkal, amelyekkel a hivatkozott közleményt egyértelműen meghatározzák

4.4.1.2 *Elsőbbségi sorrend.*

4.4.1.2.1 A Légiforgalmi állandóhelyű távközlési hálózaton a közlemények továbbításának elsőbbségi sorrendje a következő:

A Közlemény továbbításának elsőbbségi sorrendje	*Elsőbbségi jelzés*
1	SS
2	DD FF
3	GG KK

4.4.1.2.2 **Ajánlás.** *Az azonos elsőbbségi jelzéssel rendelkező közleményeket lehetőleg abban a sorrendben továbbítsák, amilyen sorrendben azokat feladásra benyújtották.*

4.4.1.3 *A közlemények továbbítási útvonalának meghatározása*

4.4.1.3.1 Minden közleményt a rendelkezésre álló leggyorsabb továbbítási útvonalon kell a címzettnek leadni.

4.4.1.3.2 A közlemény-forgalom gyorsítására, ha szükséges, előzetes megállapodásokat kell kötni a kitérő útvonalakról. Minden távközlési központnak rendelkeznie kell a megfelelő kitérő útvonal listával, amelyet az érintett távközlési központokat üzemeltető Hatóság (ok) jóváhagyott (jóváhagytak), és szükség esetén ezeket kell használni.

4.4.1.3.2.1 **Ajánlás.-** *Kitérő továbbítási útvonalat kell választani:*

1) egy teljesen automatizált távközlési központban:

a) közvetlenül a vonal megszakadásának észlelése után, ha a forgalmazást egy teljesen automatizált távközlési központon keresztül irányítják át;

b) a vonal megszakadásának észlelésétől számított 10 percen belül, ha a forgalmazást egy nem teljese automatizált távközlési központon keresztül irányítják át;

2) egy nem teljesen automatizált távközlési központban a vonal megszakadásának észlelésétől számított 10 percen belül.

Ott, ahol nem kötöttek előzetes kétoldalú vagy többoldalú megállapodásokat, az átirányítás szükségességéről az érintetteket szolgálati közleményben kell értesíteni.

4.4.1.3.3 Mihelyt nyilvánvalóvá válik az, hogy a légiforgalmi állandóhelyű szolgálat segítségével nem lehet a közleményt elfogadható időintervallumon belül továbbítani, és amennyiben a közlemény annál az állomásnál van, ahol azt benyújtották, akkor meg kell kérdezni a feladót, hogy milyen intézkedéseket tegyenek, kivéve, ha:

a) erről másképp nem egyezik meg az érintett állomás és a közlemény feladója; vagy

b) léteznek olyan megállapodások, amelyek értelmében a késedelmet szenvedő közleményeket automatikusan átirányítják a kereskedelmi távközlési szolgálatokhoz, a feladó értesítése nélkül.

Megjegyzés.- Az "elfogadható időintervallum" azt jelenti, valószínűnek látszik az, hogy a közleményt nem tudják kézbesíteni a címzettnek az érintett közlemény kategóriájára vonatkozó rögzített átviteli idő-intervallumon belül, vagy, ha ilyen nincs, azon időtartamon belül, amelyben a feladó és az érintett távközlési állomás előzetesen megegyezett.

4.4.1.4 *A közlemények forgalmának felügyelete*

4.4.1.4.1 *A közlemények forgalmának folytonossága.* A vevő állomásnak ellenőriznie kell a bejövő közlemények közlemény-azonosítóját, hogy meggyőződjön róla, az adott csatornán érkező összes közlemény csatorna-sorszáma a helyes sorrendben érkezik-e.

4.4.1.7.2 Amennyiben az AFTN távközlési állomások között nyugtázás történik, akkor az átjátszó állomás úgy tekinthető, hogy a továbbiakban nem felelős azon közlemények újra feladásáért vagy ismétléséért, amelyekre pozitív nyugtázást kapott, és így azt a feljegyzéseiből törölheti.

Megjegyzés. - Az AFTN forgalmazási jegyzőkönyveknek az AFTN távközlő központokban történő hosszú távú megőrzéséről a 4.4.1.6 pont rendelkezik.

4.4.1.8 Az AFTN csatornákon történő ellenőrzések eljárásai

4.4.1.8.1 **Ajánlás**. - *Az AFTN csatornákon ellenőrzés és vonal-javítás céljából leadott ellenőrző közlemények lehetőleg az alábbiakat tartalmazzák:*

1) a közlemény eleje jel;

2) a QJH eljárás-jel;

3) a feladó azonosítója;

*4) az ITA-2 kód használata esetén az RY karakter, vagy az IA-5 kód használata esetén az U (5/5) *(2/10) karakterek sorozata három sorban egymás után; és*

5) a "közlemény vége" jel.

4.4.2 Közlemény-formátumok - 2-es számú Nemzetközi Távíró ABC (ITA-2)

A 4.4.1.8 és a 4.4.9.3 pontokban előírtak kivételével minden közleménynek a 4.4.2.1-től a 4.4.6.1-ig terjedő pontokban előírt elemeket kell tartalmaznia.

1.Megjegyzés: Az ITA-2 közlemény-formátumot a 4-1. ábra mutatja be.

2.Megjegyzés: A következőkben leírt, közlemény-formátumra vonatkozó szabványokban az alábbi szimbólumokat használtuk a 2-es sz. Nemzetközi Távíró ABC bizonyos karaktereihez rendelt funkciók megjelölésére (lásd a III. Kötet, 1 Rész, 8.2.1 pontját és a 8-1. táblázatát):

Szimbólum	*Jelentés*
<	KOCSI VISSZA (*27-es számú jel*)
≡	SOREMELÉS (*28-as számú jel*)
↓	BETŰVÁLTÓ (*29-es számú jel*)
↑	SZÁMVÁLTÓ (*30-as számú jel*)
→	SZÓKÖZ (*31-es számú jel*)

4.4.2.1 *Fejrész*

4.4.2.1.1 A fejrésznek az alábbi elemekből kell állnia:

a) "közlemény eleje" jelzés, a **ZCZC** karakterek;

b) a közlemény azonosítója, amelynek elemei:

1) a vonal /áramkör/ azonosítója;

2) a csatorna-sorszám.

c) további szolgálati információk (ha szükséges), amelynek elemei:

1) egy SZÓKÖZ;

2) legfeljebb tíz karakter.

d) jelköz.

4.4.2.1.1.1. A vonal azonosítója az adóállomás által kiválasztott és hozzárendelt három betűből kell, hogy álljon; az első betű a vonal adóállomás felöli végét, a második a vonal vevő-állomás felőli végét azonosítja, a harmadik pedig a csatornát. Ahol az adó- és a vevőállomás között csak egyetlen csatorna létezik, akkor erre a célra az "A" betűt kell használni. Ha az állomások között több csatorna is van, akkor a csatornákat az "A", "B", "C", stb. betűkkel kell azonosítani, a megfelelő sorrendben.

4.4.2.1.1.2 A távközlési állomásoknak 001 és 000 (az 1000 helyett) közötti háromjegyű, sorrendben növekvő csatorna-sorszámokat kell kijelölni valamennyi, közvetlenül egyik állomástól a másiknak küldött közleményhez. Minden csatornán külön sorszámozást kell alkalmazni, és minden nap 0000 órakor új sorozatot kell kezdeni.

4.4.2.1.1.2.1 **Ajánlás. -** *Hogy elkerüljék ugyanazon sorszámok ismétlődését 24 órán belül, megengedhető a négy-jegyű csatorna-sorszámok használata, amennyiben erről a vonal üzemeltetéséért felelős hatóságok megállapodást kötnek.*

4.4.2.1.1.3 A közlemény-azonosítót a vonalon a következő sorrendben kell leadni:

a) SZÓKÖZ [→];

b) az adó végberendezés betűjele;

c) a vevő végberendezés betűjele;

d) csatorna-azonosító betű;

e) SZÁMVÁLTÓ [↑];

f) csatorna-sorszám (3 számjegy).

4-1. ábra: Az ITA-2 közlemény-formátum

Közlemény rész	A közlemény rész összetevője		Távgépíró jele	
FEJLÉC (lásd 4.4.2.1)	Közlemény kezdete jel		—	**ZCZC**
Közlemény azonosítója		a) Egy SZÓKÖZ /SPACE/ b) Feladó végberendezés betűjele c) Vevő végberendezés betűjele d) Csatorna - azonosító betű e) Egy SZÁMVÁLTÓ /FIGURE SHIFT/ f) Csatorna - sorszám (3 számjegy) (*Példa:* **NRA062)**	→...↑...	
(ha szükséges) további szolgálati jelzések				
Elválasztó jelsorozat		Öt SZÓKÖZ /SPACES/ Egy BETŰVÁLTÓ /LETTER SHIFT/	→→→→→↓	

CÍMZÉS (lásd 4.4.3)	A K Ö Z L E M É N Y Á L L A N D Ó R É S Z E	Kijelölési funkció	Egy KOCSI VISSZA /CARRIAGE RETURN/, egy SOREMELÉS /LINE FEED/	<≡
Elsőbbségi jelzés	A megfelelő két-betűs csoport	..		
Címzettek megjelölése	Egy SZÓKÖZ /SPACE/ egy nyolc-betűs csoport (minden egyes címzettre) (*Példa:* **EGLLZRZX→EDLLYKYX→EGLLACAM**)			
Kijelölési funkció (k)	Egy KOCSI VISSZA, egy SOREMELÉS	<≡		

FELADÓ (lásd 4.4.4)	Feladási idő	Egy SZÁMVÁLTÓ /FIGURE SHIFT/ Az a hat-betűs dátum-idő csoport, ami meghatározza azt, hogy a közlemény mikor került továbbításra be- nyújtásra. Egy BETŰVÁLTÓ	**↑......↓**
Feladó azonosítója	Egy SZÓKÖZ A feladót azonosító nyolc-betűs csoport	**→........**	
Elsőbbségi Riasztó Jelzés (*csak távgépíró üzemben, a Vészhelyzeti Közlemények megjelölésére*)	Egy SZÁMVÁLTÓ A 2-es számú Távíró ABC 10. számú jele, ötször leadva Egy BETŰVÁLTÓ	**↑figyelmeztető jel (ek)↓**	
Kiegészítő Fejléc Információ	a) Egy Szóköz b) A Kiegészítő adatok nem haladhatják meg a sor maradványt, lásd 4.4.4.4 alatt		
Kijelölési Funkció	Egy KOCSI VISSZA, egy SOREMELÉS	<≡	

SZÖVEG (lásd 4.4.5)	A szöveg kezdete	A Címzett (ek) közelebbről meghatározott (speciális) megjelölése (*ha szükséges*), és mindegyiket követően egy KOCSI VISSZA, egy SOREMELÉS (*ha szükséges*). Az angol **FROM** szó (*ha szükséges*) (lásd 4.4.5.2.3) A feladó közelebbről meghatározott (speciális) megjelölése (*ha szükséges*) Az angol **STOP** szó, utána egy KOCSI VISSZA, egy SOREMELÉS (*ha szükséges*) (lásd 4.4.5.2.3); *és/vagy* A feladó hivatkozási jele /referenciája/ (*ha használatos*)	
Közlemény szövege	A közlemény szövege, egy KOCSI VISSZA és egy SOREMELÉS a szöveg minden egyes sora után az utolsó sor kivételével (lásd a 4.4.5.3 pontot)		
Megerősítés (*ha szükséges*)	a) Egy KOCSI VISSZA, egy SOREMELÉS b) A CFM megerősítés rövidítés, amelyet a szövegnek az a része követ, amelyik megerősítésre kerül.		
Helyesbítés (*ha szükséges*)	a) Egy KOCSI VISSZA, egy SOREMELÉS b) a COR rövidítés, és a megelőző szövegben ejtett hibák javítása		
A szöveg vége jel	a) Egy BETŰVÁLTÓ b) Egy KOCSI VISSZA, egy SOREMELÉS	↓<≡	

BEFEJEZÉS (lásd 4.4.6)	Lapemelés jelsorozat	Hét SOREMELÉS	≡≡≡≡≡≡≡
Közlemény vége jel	Négy nagy-betűs N (14 számú jel)	**NNNN**	
	Közlemény elválasztó jel *(csak a kézi /"tépett szalagos"/ közlemény forgalomtovábbító állomásoknál használatos)*	Tizenkettő darab BETŰVÁLTÓ	↓↓↓↓ ↓↓↓↓
		Szalagemelés (ld. 4.4.7)	További BETŰVÁLTÓK /LETTER SHIFTS/ jelennek meg azokban az esetekben, ahol egyezményeket kötöttek arra, hogy a szalag-továbbításos eljárású átvitel kerül alkalmazásra egy bejövő áramkörön. . (lásd 4.4.7)

(a fenti ábra a 4.4.2 - 4.4.9.1 pontokban leírt távgépíró közlemény formátumát mutatja be)

4.4.4.2.2 Amennyiben a közleményt levegőben repülő légijármű adta fel, és a közlemény útjának egy részét az AFTN hálózaton teszi meg, mielőtt kézbesítik, a feladó csoportban azt a légiforgalmi állomást kell megjelölni, amelyik a közleményt az AFTN-hez továbbította, ami után közvetlenül az ICAO három-betűs ZZZ jelölés és a helykitöltő X betű következik. A légijármű azonosító jelét (hívójelét) a közlemény szövegének első elemeként kell feltűntetni.

4.4.4.2.3 Az AFTN-en továbbított olyan közlemények számára, amelyeket egy másik hálózatban adtak föl, ki kell jelölni egy érvényes AFTN feladó megjelölést, amelyet - megegyezés alapján - az AFTN hálózatot a külső hálózattal összekötő közvetítő, vagy kapu- (gateway) berendezés használ.

Megjegyzés:- Az alábbi példa a 4.4.4.2.2 pontban leírt eljárás alkalmazását mutatja be, egy fiktív közleménnyel, amelyet a KLM153 hívójelű légijármű adott fel, a CZEG-ben található Körzeti Irányító Központnak (ACC-nek) címezve, és a közleményt a CYCB-ben lévő légiforgalmi állomáson keresztül küldik el. A példa a közleményt a távgépíró nyomtatott formájú példányán mutatja, a fejrész és a záró rész nélkül:

(Cím)	*FF*	*CZEGZRZX*
(Feladó)	*031821*	*CYCBZZZX*
(Szöveg)	*KLM153 [a szöveg hátralevő része, ahogy azt a légijárműtől vették]*	

4.4.4.3 Az elsőbbségi jelzést csak a vészhelyzeti közlemények esetén kell használni. Ha használják, akkor az alábbi elemekből álljon, az alábbi sorrendben:

a) SZÁMVÁLTÓ [↑];

b) ÖT darab 10-es számú jel egymás után (szám-készletben);

c) BETŰVÁLTÓ [↓].

1. Megjegyzés. - A 2. számú Nemzetközi Távíró ABC 10-es számú jelének szám-készletbeli alakja általában megegyezik a légiforgalmi állandóhelyű vonalakon használatos távgépírókon a "J" betű szám-készletbeli alakjával.

2. Megjegyzés. - Az elsőbbségi riasztó jelzés a vevő távgépíró-állomáson megszólaltatja a csengőt. A teljesen automatizált állomások hasonló figyelmeztető jelzést adhatnak az SS sürgősségi jelzés észlelésekor. Ezek a jelzések hívják fel az automata átjátszó központokban a felügyelő személyzet, az alárendelt állomásokon pedig kezelő személyzet figyelmét arra, hogy a közlemény azonnali figyelmet követel.

4.4.4.4 A feladó sorban további adatok közlését is meg kell engedni, feltéve hogy a feladó rész teljes hossza nem haladja meg a 69 karaktert, és hogy ez az érintett hatóságok megállapodásának tárgyát kell, hogy képezze. A további adatmezők jelenlétét egy szóközzel kell jelezni közvetlenül a kiegészítő az adatok előtt.

4.4.4.4.1 **Ajánlás.** *Ha egy közleményben a forrás és a cél címzések között további címzési információk cseréje szükséges, akkor azt lehetőleg a szabadon választható adatmezőben (ODF) tegyék, az alábbi meghatározott formátumban:*

a) a kiegészítő címzés funkció paraméter-kódját egy egyes számmal és egy ponttal (1.) kell jelezni;

b) ezután három módosító karakter és egy egyenlőségjel (=) következik, majd a kiadott 8-karakteres ICAO címzés; és

c) a kiegészítő címzés paraméter-mezőjét egy kötőjellel (-) zárják le.

4.4.4.4.1.1 **Ajánlás.** *Ha a szolgálati közleményekre, vagy kérdésekre a külön cím nem egyezik meg a feladó megjelölésével, akkor lehetőleg az SVC módosító jelzést kell használni.*

4.4.4.5 A feladó részt egy kijelölési funkcióval [<≡] kell lezárni.

4.4.5 Szöveg

4.4.5.1 A közlemények szövegét a 4.1.2 pont előírásainak megfelelően kell megfogalmazni.

4.4.5.2 Ha a feladóra utaló hivatkozást használnak, akkor az a szövegrész elején legyen, kivéve a 4.4.5.2.1 és a 4.4.5.2.2 pontban leírtak esetét.

4.4.5.2.1 Ha a címzett-megjelölés második elemét az YXY, YYY vagy ZZZ három-betűs ICAO jelölés alkotja (lásd a 4.4.3.1.2.1 és a 4.4.3.1.2.2 pontokat), és ezért szükség van a szövegben a közlemény címzettjének pontos meghatározására, akkor ezt az azonosító karakter-csoportot a feladóra való hivatkozás elé kell írni (ha van ilyen), és ezzel ez a szöveg első eleme lesz.

4.4.5.2.2 Ha a feladó-megjelölés második elemét az ICAO három-betűs YXY, YYY vagy ZZZ jelölés alkotja (lásd a 4.4.4.2.1 és a 4.4.4.2.2 pontokat), és ezért szükség van a szövegben azon szervezet (vagy katonai szolgálat), vagy légijármű nevének közlésére, amely a közleményt feladta, akkor ezt az azonosítót a szöveg első elemeként kell beilleszteni a közleménybe.

4.4.5.2.3 Amikor a 4.4.5.2.1 és a 4.4.5.2.2 pontok előírásait alkalmazzák olyan közleményekre, amelyekben az ICAO három-betűs YXY, YYY vagy ZZZ azonosítóját/azonosítóit két vagy több különböző szervezet (vagy katonai szolgálat) megjelölésére használják, akkor a szövegbe illesztett azonosítók sorrendje meg kell egyezzen a közlemény címzési és feladó részében használt teljes sorrenddel. Ilyen esetben minden címzett-megjelölés után közvetlenül egy kijelölési funkciót kell küldeni. Ilyenkor a közleményt feladó (YXY, YYY vagy ZZZ kóddal jelölt) szervezet neve elé a "FROM" ("...-TÓL") szót kell írni. Az ilyen azonosítók után a szövegrészbe, a szöveg többi részének kezdete elé a "STOP" szót és egy kijelölési funkciót kell írni.

4.4.5.3 A szöveg minden nyomtatott sora után egy kijelölési funkciót [<≡] kell küldeni, kivéve a szöveg utolsó sorát (lásd a 4.4.5.6 pontot).

4.4.5.4 Távgépíró üzemben, ha a szöveg egy részét meg kívánják erősíteni, akkor ezt a megerősítést az utolsó szövegcsoporttól egy kijelölési funkcióval [<≡] kell elválasztani, majd a CFM rövidítéssel kezdve a megerősített szövegrész következik.

4.4.5.5 Távgépíró hálózatban, ha észlelik, hogy a szövegben gépelési hiba történt, akkor a hibajavítást az utolsó szövegcsoporttól, vagy megerősítéstől (ha van ilyen) egy kijelölési funkcióval [<≡] kell elválasztani. Ezután a COR rövidítés és maga a helyesbítés következik.

4.4.5.5.1 A helyi kikézbesítés előtt, az állomás személyzetének el kell végeznie a nyomtatott példányon az összes jelzett helyesbítést.

4.4.5.6 A szöveg végén az alábbi szöveg vége jelet kell küldeni:
Egy BETŰVÁLTÓ [↓], kijelölési funkció [<≡].

4.4.5.7 Az AFTN feladó állomás által begépelt közlemény szövegének hossza nem haladhatja meg az 1800 karaktert.

1. Megjegyzés - Ha a légiforgalmi állandóhelyű távközlési hálózaton keresztül olyan közleményt kívánnak továbbítani, amelynek szövegrész hossza meghaladja az 1800 karaktert, akkor a 4.4.5.7 pont előírásainak értelmében az AFTN feladó állomásnak az ilyen közleményt több közleményre bontva kell feladnia, amely közlemények szövege egyenként sem haladhatja meg az 1800 karakter hosszúságot. A II. kötet "B" melléklete tartalmaz útmutatást arra vonatkozóan, hogyan kell egy hosszú közleményt több különálló közleményre bontani.

2. Megjegyzés - A karakterek számába bele kell számítani minden, a szövegben található nyomtatható és nem nyomtatható karaktert is, a szöveg elejét jelző kijelölő funkciót és a szöveg vége jelet kivéve.

4.4.6 A záró rész

4.4.6.1 A záró résznek az alábbi elemekből kell állnia:

a) lap-emelés jel, vagyis hét darab SOREMELÉS [≡ ≡ ≡ ≡ ≡ ≡ ≡];
Megjegyzés - Ez, valamint az ezt megelőző kijelölési funkcióban található egy SOREMELÉS, már elegendő elkülönítést biztosít a közlemények között, a nyomtatott példányokon.

b) a "közlemény vége" jel, vagyis négy darab "N" betű (a 14-es számú jel betű-készletbeli alakja), megszakítatlan karakter-sorozatként.

Megjegyzés. - Ez az összetevő - amelyet a közlemény első továbbításának pillanatától a végső *kézbesítésig mindig sértetlenül továbbítani kell, - azért szükséges, hogy a félautomata vagy teljesen automatikus átjátszó berendezéseken az állomások közötti továbbítás érdekében létrehozott összeköttetéseket fel lehessen szabadítani a további közlemények fogadásához.*

Ezt kiegészítendő, ha a közleményt csak kézi ("tépett szalagos") átjátszó állomásnak adják le:

c) közlemény-elválasztó jel, azaz BETŰVÁLTÓ [↓] tizenkétszer egymás után megszakítatlan karakter-sorozatként.

1. Megjegyzés. - Az egyik közlemény "közlemény vége" jele és a következő közlemény "közlemény eleje" jele között a közlemények továbbítása során csak betűváltó jeleket szabad továbbítani.

2. Megjegyzés. - Az alábbi példa a 4.4.2-től a 4.4.6.1-ig terjedő pontokban leírt eljárások alkalmazását mutatja be, a közlemény nyomtatott példányán:

(Fejrész)	**ZCZC*		*LPA183*
(Cím)	*GG*	*LGGGZRZX*	*LGATKLMW*
(Feladó)	*201838*		*EGLLKLMW*
(Szöveg)	*Szükség*		*szerint*
(Zárórész)	*(Lapemelés)*		
	*NNNN***		

**2.A Megjegyzés. - Ha ez a közlemény egy sorozat egyik tagja, és a vevő távgépíró kezelője nem alkalmazott kézi lapemelést az egyes közlemények között, akkor az előző közlemény NNNN jelzése itt jelenik meg.*

***2.B Megjegyzés. - A 2A megjegyzésben leírt körülmények között a következő vett üzenet fejrésze a nyomtatott lapon ezen a helyen íródik ki.*

2.C Megjegyzés. - A gyakorlatban az állomásokon a nyomtatott közleményeket úgy választják el, hogy a lapemelés sorozatnál tépik el a papírt. A "közlemény vége" jel ezért a következő közlemény részévé válik. Nem valószínű azonban, hogy ez a nyilvánvaló áthelyeződés bármilyen félreértést okozna a feladó és a vevő között, hiszen a gyakorlatban a "közlemény vége" jelnek nyomtatott formában nincs jelentősége.

4.4.6.2 Az AFTN feladó állomás által leírt AFTN közlemény hossza nem haladhatja meg a 2100 karaktert.

Megjegyzés.- A karakterek számába bele kell számolni a közleményben található összes nyomtatható és nem nyomtatható karaktert, a beleértve közlemény eleje jelet (ZCZC), és a "közlemény vége" (NNNN) jelet is.

4.4.7 Szalagtovábbítás

4.4.7.1 **Ajánlás.-** *A kézi ("tépett szalagos - torn tape") és a félautomata, folyamatos szalagot használó állomások esetében, ha a 4.4.6.1 pontban leírt jeleken kívül további vezérlő jelekre van szükség annak biztosítására, hogy a szalag a vevőállomás újralyukasztó gépéről megfelelően kerüljön tovább, amikor a "közlemény vége" jelet nem követi azonnal a következő közlemény kezdetét jelző jel, akkor lehetőleg a vevő állomáson helyben intézkedjenek annak elkerülése érdekében, hogy ezeket a vezérlőjeleket ne az adó állomásnak kelljen leadnia.*

Megjegyzés. - A kézi ("tépett szalagos") állomásokon általában szükség van olyan berendezésre, amelynek segítségével a szalagot előre lehet mozgatni az újralyukasztó berendezésből, legalább annyira, hogy a kezelő a megfelelő ponton tudja eltépni a szalagot, olyan esetekben, amikor a kezelő már készen áll a szalag eltépésére, de még nem jött következő közlemény, amely a szalagot a berendezésen előre mozgatta volna. A félautomata állomásokon, ahol folyamatos *szalaggal dolgoznak, hasonló körülmények között, hasonló eljárásra lehet szükség, hogy a szalagot annyira előre lehessen mozgatni, hogy a "közlemény vége" jel eljusson a leadó berendezésig.*

4.4.15 Közlemények formátuma - 5-ös számú Nemzetközi ABC (IA-5)

Ha az érintett Hatóságok az 5-ös számú Nemzetközi (IA-5) ABC használatában állapodtak meg, akkor a 4.4.15-től a 4.4.15.3-ig terjedő pontokban leírt közlemény-formátumot kell használniuk. Az IA-5-öt használó Hatóságok felelőssége annak biztosítása, hogy alkalmazkodjanak azokhoz a szomszédos AFTN állomásokhoz, amelyek a 4.4.2 pontban leírt formátumú ITA-2 kódot használják.

Minden közleményt - a 4.4.1.8 és a 4.4.9.3 pontban leírtak kivételével - a 4.4.15.1-től a 4.4.15.6-ig terjedő pontokban leírt elemekből kell összeállítani.

1. Megjegyzés. - A 4-4. ábra mutatja be az IA-5 közlemény-formátumot.
2. Megjegyzés. - Az alább részletezett, a közlemény-formátumra vonatkozó szabványokban a következő szimbólumokat használtuk az IA-5 bizonyos jeleihez rendelt funkciók megjelölésére. (Lásd a III. Kötet, I.Rész, 8.6.1 pontját, valamint a 8-2. és 8-3. Táblázatokat.)

Jel	*Jelentés*
<	KOCSI VISSZA (a 0/13 karakter pozíció)
≡	SOREMELÉS (a 0/10 karakter pozíció)
→	SZÓKÖZ (a 2/0 karakter pozíció)

4.4.15.1 *Fej-rész*

4.4.15.1.1. A fej-résznek az alábbi elemekből kell állnia:

a) fej-rész - kezdete jel (SOH), a 0/1 karakter;

b) közlemény-azonosító, amelynek az elemei:

1) az áramkör vagy vonal azonosítója;

2) csatorna-sorszám;

c) további szolgálati információk (ha szükséges), amelynek elemei:

1) egy SZÓKÖZ;

2) és legfeljebb 10 karakter.

4.4.15.1.1.1 A pont-pont közötti áramkörök vagy vonalak esetén az azonosító az adó-állomás által kiválasztott és hozzárendelt három betűből áll; az első betű a vonal adó felőli végét, a második a vevő felőli végét, a harmadik pedig a csatornát azonosítja. Ha csak egy csatorna létezik, akkor az " A" betűt kell használni. Ha az állomások között több csatorna is van, akkor a csatornákat sorrendben az “A”, “B”, “C”, stb. betűkkel kell azonosítani. Több-pontú csatornák esetében az azonosító a vonalat ellenőrző vagy vezérlő (“master”) állomás által kiválasztott és hozzárendelt három betűből áll.

4.4.15.1.1.2 A 4.4.15.1.1.3 pontban leírtak kivételével, a távközlési állomásoknak minden, közvetlenül az egyik állomástól a másikhoz küldött közleménynek háromjegyű csatorna-sorszámot kell kijelölniük, amely 001-től 000-ig (mely 1000-et jelent) terjed. Minden csatornán külön kell a közleményeket sorszámozni, és minden nap 0000 órakor új számsorozatot kell kezdeni.

4.4.15.1.1.3 **Ajánlás. -** *Annak érdekében, hogy elkerülhető legyen ugyanazon sorszámok ismételt előfordulása 24 órán belül, lehetőleg meg kell engedni a csatorna-sorszámok bővítését, ha erről a vonal üzemeltetéséért felelős Hatóságok megállapodást kötöttek.*

4.4.15.1.1.4 A közlemény-azonosítót a vonalon az alábbi sorrendben kell leadni:

a) az adó-terminál betűjele;

b) a vevő-terminál betűjele;

c) csatorna-azonosító betű;

d) a csatorna-sorszám.

4.4.15.1.1.5 Megengedhető további szolgálati tájékoztatás beszúrása a közlemény-azonosító után, ha erről a vonal üzemeltetéséért felelős Hatóságok megállapodást kötöttek. Az ilyen további szolgálati információ elé egy SZÓKÖZT [→] kell tenni, majd ezt legfeljebb tíz karakter követheti, melyeket a közlemény fej-részébe kell beilleszteni közvetlenül a csatorna-sorszám utolsó számjegye után, és nem tartalmazhatnak semmilyen kijelölési funkciót. Ha ilyen tájékoztatást nem szúrtak be, akkor a 4.15.1.1.4 pontban részletezett adatok után közvetlenül a 4.4.15.2 pontban leírt adatok következzenek.

4.4.15.2 *Címzés*

4.4.15.2.1 A címzés az alábbi elemekből kell, hogy álljon:

a) kijelölési funkció [<≡];

b) elsőbbségi jel;

c) címzett(ek) megjelölése;

d) kijelölési funkció [<≡].

4.4.15.2.1.1 Az elsőbbségi jelnek - a feladó által hozzárendelt - megfelelő két-betűs csoportból kell állnia a következőknek megfelelően:

Közlemény rész		A közlemény rész összetevője	Az összetevő eleme	Távgépíró jele
A FEJRÉSZ	FEJRÉSZ SOR (ld. 4.4.15.1.1)	A „FEJRÉSZ KEZDETE” karakter	Egy karakter (0/1)	SOH
		Közlemény azonosító	a) Egy szóköz b) Vevő terminál betűjele c) Csatorna - azonosító betű d) Csatorna sorszám (Példa: NRA062)	……………..
		(ha szükséges) további szolgálati jelölések, tájékoztatások	a) Egy szóköz b) Nem több mint legfeljebb a sor végéig (Példa: 270930)	→
	CÍMZÉS (ld. 4.4.15.2.1)	Szövegigazító funkció	Egy KOCSI-VISSZA, egy SOREMELÉS	<≡
		Elsőbbségi jelzés	A megfelelő kétbetűs csoport.	
		Címzett (ek) megjelölése	Egy szóköz sorban Egy nyolcbetűs minden csoport címzettnek (Példa: **EGLLZRZX →** **EGLLYKYX** **→ EGLLACAD**	
		Szövegigazító funkció(k)	Egy KOCSI-VISSZA, egy SOREMELÉS <≡	<≡
	FELADÓ RÉSZ (ld. 4.4.15.2.2.)	Feladási idő	6 számjegyből álló dátum-idő csoport, amikor a közleményt továbbításra benyújtották	**......**
		Feladó megjelölése	a) Egy szóköz b) Egy nyolcbetűs csoport a feladó azonosítására	→**......**

		Elsőbbségi Riasztó Jelzés (csak távgépíró üzemmódban használják Vészhelyzeti-közlemények esetén)	Öt karakter (0/7)(BEL)	
		Opcionális Fejrész információ	a) Egy szóköz b) További adatok, legfeljebb a sor végéig. Ld. 4.4.15.2.2.6	
		Szövegigazító funkció	Egy KOCSI-VISSZA, egy SOREMELÉS	<≡
		Szöveg eleje karakter	Egy karakter (0/2)	**STX**
SZÖVEG (Ld. 4.4.15.3)		Szöveg kezdete	(ha szükséges) a címzett (ek) közelebbi megjelölése (ha szükséges) valamint mindegyik után egy KOCSI VISSZA, egy SOREMELÉS. Az angol FROM szó (ha szükséges) (Ld.4.4.15.3.5) A feladó közelebbi megjelölése (ha szükséges) Az angol STOP szó, melyet egy KOCSI VISSZA, egy SOREMELÉS követ (ha szükséges) (Ld. 4.4.15.3.5) és/vagy a feladó hivatkozási adata (ha használnak ilyet)	
		A közlemény szövege	A közlemény szövege, mely szöveg minden nyomtatott sorát egy KOCSI-VISSZA, egy SOREMELÉS karakter zár, kivéve az utolsó sort (Ld. 4.4.15.3.6)	

	Megerősítés (ha szükséges)	a) Egy KOCSI-VISSZA, egy SOREMELÉS b) a CFM rövidítés, melyet a szöveg megerősítendő része követ	
	Javítás (ha szükséges)	a) Egy KOCSI-VISSZA, egy SOREMELÉS b) a COR rövidítés, melyet a megelőző szövegben elkövetett hibák javítása követ	
ZÁRÓRÉSZ (Ld. 4.4.15.3.12.1)	Szövegigazító funkció	Egy KOCSI-VISSZA, egy SOREMELÉS	<≡
	Lapemelés	Egy karakter (0/11)	VT
	“Szöveg vége” karakter	Egy karakter (0/3)	ETX

4-4. ábra Az 5-ös számú Nemzetközi ABC (IA-5)

(ez az ábra a 4.4.15 pont alatt részletezett közlemény-formátumot mutatja be)

Elsőbbségi jelzés	*Közlemény kategóriája*
SS	vészhelyzeti közlemények
DD	sürgősségi közlemények (*lásd* a 4.4.1.1.2 pontot)
FF	repülésbiztonsági közlemények (*lásd* a 4.4.1.1.3 pontot)
GG	meteorológiai közlemények (*lásd* a 4.4.1.1.4 pontot)
GG	a repülések rendszerességét elősegítő közlemények (*lásd* a 4.4.1.1.5 pontot)
GG	légiforgalmi tájékoztató szolgálatok közleményei (*lásd* a 4.4.1.1.6 pontot)
KK	légiforgalmi adminisztrációs közlemények (*lásd* a 4.4.1.1.7 pontot)
	ahogy megfelelő szolgálati közlemények (*lásd* a 4.4.1.1.9 pontot)

4.4.15.2.1.2 Az elsőbbségi sorrend megegyezik a 4.4.1.2 pontban leírtakkal.

4.4.15.2.1.3 Minden címzett megjelölés elé egy SZÓKÖZ-t kell tenni, kivéve, ha az a második vagy harmadik címzett sorban található első ilyen címzett megjelölés. A címzett megjelölés az alábbi elemekből kell, hogy álljon:

a) a célállomás négy-betűs helység jelölése;

b) a címzett szervezetet (légiforgalmi hatóságot, szolgálatot, vagy légijármű üzemeltető ügynökséget) azonosító három-betűs jelzés;

c) egy további betű, amely a címzett szervezeten belül egy osztályt, részleget, vagy eljáró egységet azonosít. Az X betűt kell használni helykitöltésre, ha ilyen további azonosításra nincs szükség.

4.4.15.2.1.3.1 Ha egy közleményt olyan szervezetnek kell címezni, amelynek nem osztottak ki a 4.4.15.2.1.3 pontban leírt típusú ICAO három-betűs jelzést, akkor a célállomás négy-betűs helység jelölése után az ICAO három-betűs YYY (vagy, katonai szervezet, vagy szolgálat esetében az ICAO három-betűs YXY) jelzést kell írni. A címzett szervezet nevét ilyenkor a közlemény szövegének első elemeként kell feltüntetni. Az ICAO három-betűs YYY vagy YXY jelzés után a következő nyolcadik) betűnek a helykitöltő X betűnek kell lennie.

4.4.15.2.1.3.2 Amikor egy közleményt egy repülésben lévő légijárműnek kell megcímezni, és a közlemény - mielőtt a Légiforgalmi Mozgó Szolgálat továbbítaná - útjának egy részét az AFTN hálózaton keresztül teszi meg, akkor annak a légiforgalmi állomásnak a helység jelölése után, amelynek továbbítania kell a közleményt a légijármű részére, az ICAO három-betűs ZZZ jelzést kell írni. Ezután a légijármű azonosítóját a közlemény szövegrészének első elemeként kell feltüntetni. Az ICAO három-betűs ZZZ jelzés után a következő (nyolcadik) betűnek a helykitöltő X betűnek kell lennie.

4.4.15.2.1.4 A teljes címzés a nyomtatott példányon legfeljebb három sort foglalhat el, és a 4.4.16 pontban leírtak kivételével, külön címzett megjelölést kell használni minden egyes címzettre, akár egy helyen találhatók azok, akár nem.

4.4.15.2.1.5 A címzett megjelölés csoport(ok) befejezése után közvetlenül egy kijelölési funkciót kell beilleszteni.

4.4.15.2.1.6 Ha a közleményt továbbításra nyomtatott formában veszik át, és a közlemény több címzett megjelölést tartalmaz, mint amennyi a nyomtatott lapon három sorban elfér, akkor az ilyen közleményeket, tovább küldés előtt két vagy több közleményre kell bontani, amelyek már megfelelnek a 4.4.15.2.1.5 pont előírásainak. Az ilyen átalakítás során - amennyire az gyakorlatilag lehetséges – a címzett megjelöléseket olyan sorrendbe kell rendezni, hogy a soron következő távközlési központokban a lehető legkevesebb számú újra-feladásra legyen szükség.

4.4.15.2.2 *Feladó rész*

A feladó résznek az alábbi elemekből kell állnia:

a) feladási idő;

b) feladó megjelölése;

c) elsőbbségi jelzés (ha szükséges);

d) választható fej-rész információ;

e) kijelölési funkció [<≡];

f) szöveg-kezdete karakter, a 0/2 karakter (STX).

4.4.15.2.2.1 A feladási idő egy hat-számjegyű dátum-idő csoportból kell, hogy felépüljön, mely azt jelzi, hogy a közleményt feladásra mikor nyújtották be (*lásd* a 3.4.2 pontot).

4.4.15.2.2.2 A feladó megjelölése, amely elé közvetlenül egy SZÓKÖZ-t kell tenni, a következő elemekből kell, hogy álljon:

a) a feladás helyének négy-betűs helység jelölése;

b) a közleményt feladó szervezetet/hatáskört (légiforgalmi hatóságot, légiforgalmi szolgálatot vagy légijármű-üzemeltető ügynökséget) azonosító három-betűs jelzés;

c) egy további betű, amely a feladó szervezeten belül egy osztályt, részleget vagy eljáró egységet azonosít. Az X betűt kell használni helykitöltésre, ha ilyen további azonosításra nincs szükség.

4.4.15.2.2.3 Ahol a közlemény feladója olyan szervezet, amelynek nem osztottak ki a 4.4.15.2.2.2 pontban leírt típusú ICAO három-betűs jelzést, a feladás helyének négy-betűs helység jelölése után azonnal az ICAO három-betűs YYY jelzést és a helykitöltő X betűt kell írni (vagy, katonai szervezet vagy szolgálat esetében az ICAO három-betűs YXY jelzést és a helykitöltő X betűt kell írni). A szervezet (vagy katonai szolgálat) nevét ezután a közlemény szövegének első elemeként kell feltűntetni.

4.4.15.2.2.3.1 Az AFTN-en továbbított olyan közlemények számára, amelyeket egy másik hálózatban adtak fel, ki kell jelölni egy érvényes AFTN feladót, amelyet - megegyezés alapján – az AFTN-t a külső hálózattal összekötő relé- (relay), vagy kapu- (gateway) berendezés használ.

4.4.15.2.2.4 Ha a közlemény feladója egy repülésben lévő légijármű, és a közleményt útvonalának egy részén az AFTN hálózaton keresztül kell továbbküldeni, mielőtt kézbesíteni lehetne, akkor a feladó megjelölése annak a légiforgalmi állomásnak a négy-betűs helység jelölése, amely a közleményt az AFTN-nek továbbította, majd az ICAO három-betűs ZZZ jelzés és a helykitöltő X betű következik. A légijármű azonosítóját (hívójelét) ezután a közlemény szövegének első elemeként kell megadni.

4.4.15.2.2.5 Az elsőbbségi jelzést csak vészhelyzeti közlemények esetében kell használni. Amikor használják, akkor öt egymás után következő BEL (0/7, csengő) karakterből kell, hogy álljon.

Megjegyzés.- Az elsőbbségi jelzés a vevő távgépíró-készülékben lévő csengőt (figyelemfelkeltő jelzést) szólaltatja meg, eltérően a teljesen automatikus távközlési állomások esetén, melyek hasonló figyelmeztető jelzést adhatnak az SS sürgősségi jelzés észlelésekor, ezáltal riasztják az átjátszó központokban a felügyelő személyzet, az alárendelt állomásokon pedig a kezelő személyzet figyelmét, és így a közleményre azonnali figyelmet fordíthatnak.

4.4.15.2.2.6 A feladó sorban további szabadon választható adatok közlését is meg kell engedni, feltéve, hogy teljes hossza nem haladja meg a 69 karaktert, és hogy ez az érintett Hatóságok megállapodásának tárgyát képezi. A szabadon választható adatmező kezdetét egy SZÓKÖZ-el kell jelezni.

4.4.15.2.2.6.1 **Ajánlás. -** *Ha egy közleményben a 'forrás' és a 'cél' címzések között további címzési információk cseréje szükséges, akkor azt lehetőleg a szabadon választható adatmezőben (ODF) tegyék,*
A feladó megjelölése, amely elé közvetlenül egy SZÓKÖZ -t kell tenni, a következő elemekből kell, hogy álljon:

a) (1.) a feladás helyének a további címzési információk paramétereinek jelzésére;

b) három módosító karakter, amelyet egyenlőség jel követ (=) és a 8 karakterből álló ICAO jelzés, és;

c) egy (-) kötőjel karakter a további címjegyzék mező befejezésére;

4.4.15.2.2.6.1.1 **Ajánlás. –** *Ha a szolgálati közleményekre, vagy kérdésekre a külön cím nem egyezik meg a feladó megjelölésével, akkor lehetőleg az SVC módosító jelzést kell használni.*

.

4.4.15.2.2.7 A feladó részt egy kijelölési funkcióval [<≡] és a “szöveg-kezdete” (STX) (0/2) karakterrel kell lezárni.

4.4.15.3 *Szöveg*

4.4.15.3.1 A közlemények szövegét a 4.1.2 pont előírásainak megfelelően kell megfogalmazni, és az STX és az ETX között lévő valamennyi adatból kell állnia.

Megjegyzés.- Ha a közlemény szövegét nem kell ITA-2 kódba és formátumba átalakítani, és nem ütközik azokkal az ICA0 közlemény típusokkal vagy formátumokkal, amelyek a PANS - ATM-ben (Doc 4444) vannak leírva, a Hatóságok teljes mértékben kihasználhatják az 5-ös számú Nemzetközi ABC-ben (IA-5) rendelkezésre álló karaktereket.

4.4.15.3.2 Ha feladóra vonatkozó hivatkozási adatot használnak, akkor azt a szöveg elejére kell tenni,
kivéve a 4.4.15.3.3 és a 4.4.15.3.4 pontban megadottakat.

4.4.15.3.3 Ha a címzett megjelölés második elemét, az YXY, az YYY vagy a ZZZ három-betűs ICAO
jelölés alkotja (*lásd* a 4.4.15.2.1.3.1 és a 4.4.15.2.1.3.2 pontokat), és ezért szükségessé válik a szövegben a közlemény címzettjének közlése, akkor ezt az azonosító karakter-csoportot a feladóra való hivatkozás elé kell írni (ha van ilyen), és ezzel ez a szöveg első elemévé válik.

4.4.15.3.4 Ha a feladó megjelölés második elemét az YXY, az YYY vagy a ZZZ három-betűs ICAO jelzés alkotja (*lásd* a 4.4.15.2.2.3 és 4.4.15.2.2.4 pontokat), és ezért szükségessé válik a szövegben a közleményt feladó szervezet (vagy katonai szolgálat), vagy a légijármű nevének közlése, akkor ezt az azonosítót a szöveg első elemeként kell megadni.

4.4.15.3.5 Amikor a 4.4.15.3.3 és a 4.4.15.3.4 pontok előírásait alkalmazzák olyan közlemények esetében, amelyekben az ICAO három-betűs YXY, YYY vagy ZZZ jelzéseket két vagy több különböző szervezet (vagy katonai szolgálat) megjelölésére is használták, akkor a szövegben a további azonosítók sorrendjének meg kell egyeznie a közlemény címzés- és címzett-megjelölésében használt teljes sorrendjével. Ilyen esetben minden címzett megjelölés után egy kijelölési funkciót kell tenni. A közleményt feladó (YXY, YYY vagy ZZZ jelzéssel megjelölt) szervezet neve elé ilyenkor a "FROM" szót kell írni.
Az azonosítók után, a szöveg többi része elé, a "STOP" szót kell írni, amelyet egy kijelölési funkció kell, hogy kövessen.

4.4.15.3.6 A szöveg minden nyomtatott sora után egy kijelölési funkciót kell küldeni. A távgépíró üzemben - ha a szöveg egy részét meg kívánják erősíteni, akkor - a megerősítést az utolsó szövegcsoporttól egy kijelölési funkcióval kell elválasztani [<≡] , és ezt a CFM rövidítéssel kell jelezni, amely után a megerősített szöveg-rész következik

tengerszint feletti magasság (altitude)	*továbbításuk*
800	**eight hundred**
3 400	**three thousand four hundred**
12 000	**one two thousand**
felhőalap (cloud height)	*továbbításuk*
2 200	**two thousand two hundred**
4 300	**four thousand three hundred**
látástávolság (visibility)	*továbbításuk*
1 000	visibility **one thousand**
700	visibility **seven hundred**
futópálya menti látástávolság (runway visual range)	*továbbításuk*
600	RVR **six hundred**
1 700	RVR **one thousand seven hundred**

5.2.1.4.1.3 A tizedespontot tartalmazó számokat az 5.2.1.4.1.1 pontban található szabályok szerint kell továbbítani, úgy, hogy a tizedespontot a megfelelő sorrendet betartva a "DECIMAL" (TIZEDES) szóval kell jelölni.

1. Megjegyzés. - Az alábbi példák ennek az eljárásnak az alkalmazását mutatják be:

Szám	*Továbbítás módja*
100.3	ONE ZERO ZERO DECIMAL THREE
38 143.9	THREE EIGHT ONE FOUR THREE DECIMAL NINE

2. Megjegyzés. - A VHF frekvenciák azonosítására a tizedespont után használt számjegyek számát a csatorna-osztás határozza meg (a 25 kHz-es osztással elválasztott frekvenciákra az 5.2.1.7.3.4.3 pont, illetve a 8,33 kHz-es osztással elválasztott frekvenciákra pedig az 5.2.1.7.3.4.4 pont előírásai vonatkoznak).

3. Megjegyzés. - A 8.33 kHz-es és a 25 kHz-es osztáshoz tartozó csatorna-osztási / frekvencia párosítási kapcsolatokat az V. kötet 4.1 (bis) táblázata foglalja össze.

5.2.1.4.1.4 **PANS. -** *Időadat továbbításakor általában csak az óra perceit szükséges megadni. Minden egyes számjegyet külön kell kimondani. Az órát is közölni kell azonban, ha annak elhagyása bármilyen zavart okozhatna.*

Megjegyzés. - Az alábbi példák ennek az eljárásnak az alkalmazását mutatják be, amennyiben az 5.2.1.2.2 pont előírásait alkalmazzák:

Idő	*Továbbítása*	
0920	*(de. 9:20)*	TOO ZE-RO, vagy ZE-RO NIN-er TOO ZE-RO
1643	*(du.. 4:43)*	FOW-er TREE, vagy WUN SIX FOW-er TREE

5.2.1.4.2 *Számok ellenőrzése, megerősítése*

5.2.1.4.2.1 Ha szükséges a számok pontos vételének ellenőrzése, megerősítése, akkor a közleményt továbbító személy felkéri a közleményt vevő személyt a számok visszaolvasására.

5.2.1.4.3 *Számok kiejtése*

5.2.1.4.3.1 Az 5.2.1.2.2 pont előírásainak alkalmazása során a számokat az alábbi kiejtéssel kell továbbítani:

Szám, vagy közlemény	*Kiejtés (angol kiejtési számrésze megfeleltetéssel)*
0	ZE-RO
1	WUN
2	TOO
3	TREE
4	FOW-er
5	FIFE
6	SIX
7	SEV-en

8	AIT
9	NIN-er
Decimal	DAY-SEE-MAL
Hundred	HUN-dred
Thousand	TOU-SAND

Megjegyzés. - A fenti táblázatban a nagybetűvel írt szótagok a hangsúlyosak. Például, a ZE-RO szóban mindkét szótag egyformán hangsúlyos, míg a FOW-er szóban a hangsúly az első szótagra esik.

5.2.1.5 *Adás-technika*

5.2.1.5.1 **PANS**. - *Minden írott közleményt az adás megkezdése előtt lehetőség szerint egyszer végig kell olvasni, hogy elkerülhető legyen a fölösleges késedelem a továbbítás során.*

5.2.1.5.2 A közleményt adó fogalmazzon tömören, normál társalgási hanghordozást használva.

Megjegyzés. – Lásd a nyelvismereti követelményeket az Annex 1-hez tartozó Függelékben.

5.2.1.5.3 **PANS. -** *A beszéd adás-technikája lehetőség szerint olyan legyen, hogy biztosítsa minden adás során az elérhető legtisztább érthetőségét. Ennek a célnak az elérése érdekében szükséges, hogy a hajózó és a földi személyzet lehetőleg:*

a) minden szót tisztán és világosan ejtsen ki;

b) egyenletes tempóban beszéljen, a beszéd sebessége ne haladja meg a 100 szót percenként. Ha a közlemény légijárműnek szól és a tartalmát le kell írni, akkor beszéljen lassabban, hogy legyen elég idő a közlemény leírására. A számok előtti és utáni kis szünet elősegítheti azok megértését;

c) tartsa a beszéd hangerejét állandó szinten;

d) ismerje a mikrofon-kezelési technikát, különösen azt, hogy a mikrofont állandó távolságban tartsa a szájától, ha nem alkalmaznak állandó hangerőt beállító áramkört;

e) ha szükséges elfordítania a fejét a mikrofontól, átmenetileg függessze fel a beszédet.

5.2.1.5.4 **Ajánlás**.- *A beszéd- és adás-technikát lehetőleg az adás idején uralkodó körülményekhez kell igazítani.*

5.2.1.5.5 **PANS. -** *A továbbításra elfogadott közleményeket lehetőség szerint vagy jól érthető szövegként, vagy jóváhagyott szakkifejezések használatával kell továbbítani anélkül, hogy a közlemény értelmét bármilyen módon megváltoztatnák. A közlemény szövegében előforduló, elfogadott ICAO rövidítéseket általában azokkal a nem-rövidített szavakkal vagy kifejezésekkel ajánlott helyettesíteni, melyeket ezek a rövidítések a továbbításra használt nyelven jelentenek, kivéve azokat a rövidítéseket, amelyeket a gyakori és általános használat következtében a légiközlekedés szakszemélyzete rendszerint megért.*

Megjegyzés. - A PANS-ABC (Doc 8400) kiadvány rövidítéseket kódoló része külön is jelzi azokat a rövidítéseket, amelyek a fenti 5.2.1.5.5 pontban említett kivételek közé tartoznak.

5.2.1.5.6 **PANS. -** *Az összeköttetés meggyorsítása céljából a fonetikus betűzést el lehet hagyni, ha ez nem veszélyezteti a közlemény pontos vételét és érthetőségét.*

5.2.1.5.7 **PANS. -** *Hosszú közlemények továbbításakor, az adást lehetőleg időről időre meg kell szakítani néhány pillanatra, hogy a közleményt adó személy meggyőződhessen arról, hogy a használt frekvencián nincs zavarás, és ezzel lehetőséget adjon a vevő személynek arra, hogyha szükséges, a közlemény nem vett részeinek ismétlését kérhesse.*

5.2.1.5.8 Szükség szerint az alábbi szavakat és kifejezéseket kell használni a rádió-távbeszélő összeköttetések során, a táblázatban megadott jelentés szerint:

Kifejezés	*Jelentés*
ACKNOWLEDGE	"Tudassa velem, hogy vette és megértette ezt a közleményt!"
AFFIRM	"Igen."
APPROVED	"A tervezett tevékenységre az engedély megadva."
BREAK	"Jelzem a közlemény egyes részei közötti elválasztást." *(Akkor kell használni, ha nem különülnek el világosan a szöveg és a közlemény egyéb részei.)*
BREAK BREAK	"Jelzem, hogy itt van a különböző légijárműveknek szóló közlemények közötti elválasztás a frekvencia nagy terhelése miatt."
CANCEL	"Vegye semmisnek a korábban kiadott engedélyt!"
CHECK	"Ellenőrizzen egy rendszert vagy eljárást!"
	(Más jelentésben ne használja. Általában nem várnak rá választ.)
CLEARED	"Felhatalmazom, hogy a megadott feltételek szerint járjon el."
CONFIRM	"Kérem a következők megerősítését: *(engedély, utasítás, rendelkezés, információ).*"
CONTACT	"Létesítsen összeköttetést ... -val."
CORRECT	"Helyes", vagy "Pontos".
CORRECTION	"Hiba történt ebben az adásban *(vagy* a jelzett közleményben). A helyes változat a következő: ...."
DISREGARD	"Ne vegye figyelembe!"
HOW DO YOU READ	"Milyen az adásom érthetősége?"*(lásd az* 5.2.1.8.4 *pontot).*
I SAY AGAIN	"Ismétlem az érthetőség, vagy a nyomatékosítás érdekében"
MAINTAIN	"Folytassa a meghatározott körülmény(ek)nek megfelelő módon", vagy szó szerinti értelmében, pl. "Maintain VFR" ("Folytassa VFR szabályok szerint").
MONITOR	"Figyeljen a ... (frekvencián)."
NEGATIVE	"Nem" *vagy* "Nincs engedélyezve." *vagy* "Ez nem helyes." *vagy* "Nem alkalmas."
OVER	"A közleményemnek vége, választ várok Öntől." *(Megjegyzés.- VHF csatornákon általában nem használatos.)*

OUT	"Ezt a közleményváltást befejeztem, választ nem várok." *(Megjegyzés: VHF csatornákon általában nem használatos.)*
READ BACK	"Ismételje meg a teljes közleményt, vagy annak meghatározott részét, pontosan úgy, ahogyan azt vette!"
RECLEARED	"Az utoljára kiadott engedélyében változás történt, és ez az új engedély hatálytalanítja a korábbi engedélyt vagy annak egy részét."
REPORT	"Jelentse nekem a következő információkat ..."
REQUEST	"Szeretném tudni..." *vagy* "Szeretném megszerezni (megkapni) az ..."
ROGER	"Teljes egészében vettem az utolsó közleményét." *Megjegyzés. - Semmilyen körülmények között sem szabad válaszul olyan közleményekre használni, amelyek visszaolvasást (READ BACK) igényelnek, vagy közvetlen megerősítő (AFFIRM), vagy elutasító (NEGATIVE) választ.*
SAY AGAIN	"Ismételje meg a teljes utolsó adását, vagy az alábbi részét!"
SPEAK SLOWER	"Csökkentse a beszéd sebességét." *(Megjegyzés: A normál beszédsebességet lásd az 5.2.1.5.3 b) pontban.)*
STANDBY	"Várjon, hívni fogom." *Megjegyzés.- A hívó fél rendszerint ismét megpróbálja a kapcsolat felvételét, ha a késedelem hosszúra nyúlik. A STANDBY nem egy jóváhagyás, vagy visszautasítás.*
UNABLE	"Nem tudom teljesíteni a kérését, utasítását, vagy engedélyét." *Megjegyzés. - Az UNABLE kifejezés után általában közölni szokták az okot is.*
WILCO	*(A "will comply" kifejezés rövidítése.)* "Megértettem a közleményét, és az abban foglaltaknak megfelelően fogok eljárni."
WORDS TWICE	a) *Kérésként:* "A kommunikáció (vétel) nehézségekbe ütközik. Kérem, minden szót, vagy szócsoportot adjon kétszer!" b) *Információként:* "Mivel az adás nehézségekbe ütközik, ezért ebben a közleményben minden szót vagy szócsoportot kétszer adok."

5.2.1.6 *Közlemények összeállítása*

5.2.1.6.1 Azoknak a közleményeknek, amelyeket kizárólag a légiforgalmi mozgó szolgálat kezel, az alábbi részekből kell állnia, az itt leírt sorrendben:

a) hívás, amely tartalmazza a címzettet és a feladót (*lásd* az 5.2.1.7.3 pontot);

b) szöveg (*lásd* az 5.2.1.6.2.1.1 pontot).

Megjegyzés.- Az alábbi példák ennek az eljárásnak az alkalmazását mutatják be:

(hívás) NEW YORK RADIO SWISSAIR ONE ONE ZERO

(szöveg) REQUEST SELCAL CHECK ("SELCAL ellenőrzést kérek!"),

vagy

(hívás) SWISSAIR ONE ONE ZERO NEW YORK RADIO

(szöveg) CONTACT SAN JUAN ON FIVE SIX ("Lépjen összeköttetésbe ..... ").

5.2.1.6.2 Azokat a közleményeket, melyeket a továbbítás során részben AFTN-en keresztül is kell kezelni, valamint hasonlóképpen azokat a közleményeket, melyeket nem az előre meghatározott szétosztási rendnek megfelelő módon kezelnek (*lásd* a 3.3.7.1 pontot), az alábbiak szerint kell összeállítani:

5.2.1.6.2.1 *Ha egy légijármű a közlemény feladója:*

1) hívás (lásd az 5.2.1.7.3 pontban);

2) a "FOR" szó;

3) a címzett szervezet neve;

4) a célállomás neve;

5) a szöveg.

5.2.1.6.2.1.1 A szöveg a lehető legrövidebb formában tartalmazza a szükséges információkat; teljes mértékben ki kell használni az ICAO kifejezéseket.

Megjegyzés. - Az alábbi példa ennek az eljárásnak az alkalmazását mutatja be:

(hívás) BOSTON RADIO SWISSAIR ONE TWO EIGHT

(címzés) FOR SWISSAIR BOSTON

(szöveg) NUMBER ONE ENGINE CHANGE REQUIRED (Az egyes számú hajtómű cseréje szükséges)

5.2.1.6.2.2 *Ha a közleményt egy légijárműnek címezik:* Ha egy, a 4.4.2 pont előírásai szerint összeállított közleményt egy légiforgalmi állomás közvetít egy, a levegőben lévő légijármű számára, akkor a közleménynek a légiforgalmi mozgó szolgálat segítségével történő továbbítása során az AFTN közlemény-formátum fej-részét és címzését el kell hagyni.

5.2.1.6.2.2.1 Amikor az 5.2.1.6.2.2 pont előírásait alkalmazzák, a légiforgalmi mozgó szolgálat közleménye az alábbi részeket kell, hogy magában foglalja:

a) a szöveget [beleértve az AFTN közleményben található minden helyesbítést (COR) is];

b) a "FROM" szót;

c) a feladó szervezet nevét és a feladás helyét (az AFTN közlemény feladó-részéből átvéve).

5.2.1.6.2.2.2 **PANS.** .- *Ha a légiforgalmi állomás által egy repülésben lévő légijárműnek továbbítandó közleményben elfogadott ICAO rövidítések vannak, akkor a közlemény továbbítása során ezeket általában azokkal a nem-rövidített szavakkal vagy kifejezésekkel ajánlott helyettesíteni, melyeket ezek a rövidítések a továbbításra használt nyelven jelentenek, kivéve azokat a rövidítéseket, amelyeket a gyakori és általános használat következtében a légiközlekedés szakszemélyzete rendszerint megért.*

Megjegyzés. - Az 5.2.1.6.2.2.2 pontban említett kivételeket képező rövidítések a PANS-ABC (Doc 8400) rövidítések kódolási részében vannak külön meghatározva.

5.2.1.7 *Hívás*

5.2.1.7.1 R*ádió-távbeszélő hívójelek légiforgalmi állomások számára*

Megjegyzés. - A hívójelek összeállítási szabályait az ITU S19 Rádió Szabályzatának III. és VII. Része tartalmazza.

5.2.1.7.1.1 A légiforgalmi mozgó szolgálat keretein belül a légiforgalmi állomásokat az alábbiakkal kell azonosítani:

a) a hely nevével; és

b) a rendelkezésre álló egység vagy szolgálat megjelölésével.

5.2.1.7.1.2 Az egységet vagy szolgálatot az alábbi táblázat alapján kell azonosítani, azzal a kivétellel, hogy a hely, vagy az egység/szolgálat nevét el lehet hagyni, feltéve, hogy már kielégítő összeköttetést sikerült létesíteni.

Egység/szolgáltatás megjelölése	*Hívójel utótag*
Körzeti irányító központ	CONTROL
Bevezető irányítás	APPROACH
Bevezető radar-irányítás érkezőknek	ARRIVAL
Bevezető radar-irányítás indulóknak	DEPARTURE
Repülőtéri irányítás	TOWER
Gurító irányítás	GROUND
Radar-irányítás (általában)	RADAR
Precíziós bevezető- radar-irányítás	PRECISION
Iránymérő állomás	HOMER
Repülés-tájékoztató szolgálat	INFORMATION
Engedély-kiadás	DELIVERY
Előtéri irányítás	APRON
Társasági diszpécser	DISPATCH
Légiforgalmi állomás	RADIO

5.2.1.7.2 A légijárművek rádió-távbeszélő hívójelei

5.2.1.7.2.1 *Teljes hívójelek*

5.2.1.7.2.1.1 Egy légijármű rádió-távbeszélő hívójele az alábbi típusok valamelyike kell , hogy legyen:

a) típusú – a karakterek megegyeznek a légijármű lajstromjelével; vagy

b) típusú – a légijármű járatójának rádió-távbeszélő megjelölése, amelyet a légijármű lajstromjelének utolsó négy karaktere követ;

c) típusú – a légijármű járatójának rádió-távbeszélő megjelölése, amelyet a járatot azonosító jelzés követ.

1. Megjegyzés. - A fenti a) típusú hívójelben használható előtag lehet a légijármű gyártójának neve vagy modelljének neve (lásd az 5.1 táblázatot).

2. Megjegyzés. - A b) és c) típusú rádió-távbeszélő azonosítókat a Doc 8585, Légijármű Járatók, Légiforgalmi Szervezetek, Hatóságok és Szolgálatok Azonosítói /Designators for Aircraft Operating Agencies, Aeronautical Authorities and Services/ *tartalmazza*.

3. Megjegyzés. - Az előbbiekben felsorolt hívójelek közül bármelyik beírható az ICAO repülési terv 7. rovatába, mint a légijármű azonosítója. A repülési terv kitöltésére vonatkozó útbaigazításokat a PANS-ATM, Doc 4444 tartalmazza.

5.2.1.7.2.2 *Rövidített hívójelek*

5.2.1.7.2.2.1 A légijárművek fenti 5.2.1.7.2.1.1 pontban bemutatott rádió-távbeszélő hívójeleit - a c) típusú hívójel kivételével, - az 5.2.1.7.3.3.1 pontban leírt feltételekkel le lehet rövidíteni. A rövidített hívójeleknek az alábbi formátumúaknak kell lenniük:

a) típusú – a lajstromjel első karaktere és legalább a hívójel utolsó két karaktere; vagy

b) típusú – a légijármű járatójának rádió-távbeszélő megjelölése és legalább a hívójel utolsó két karaktere;

5-1. táblázat: Példák teljes és rövidített hívójelekre

(lásd az 5.2.1.7.2.1 és az 5.2.1.7.2.2 pontokat)

	a) típus			b) típus	c) típus
Teljes hívójel	N 57826	*CESSNA FABCD	*CITATION FABCD	VARIG PVMA	SCANDINAVIAN 937
Rövidített hívójel	N26	CESSNA CD	CITATION CD	VARIG MA	(nem rövidíthető)
	vagy	vagy	vagy	vagy	
	N826	CESSNA BCD	CITATION BCD	VARIG VMA	

* Ezek a példák az 5.2.1.7.2.1.1 pont 1. Megjegyzésében található előírások alkalmazását mutatják be.

c) típusú – nem rövidíthető formátum.

Megjegyzés.- A fenti a) típusú hívójelben az első karakter helyett akár a légijármű gyártójának, akár a légijármű modelljének neve használható.

5.2.1.7.3 *Rádió-távbeszélő eljárások*

5.2.1.7.3.1 A légijármű a rádió-távbeszélő hívójelének típusát repülés közben nem változtathatja meg, kivéve, ha erre - ideiglenes jelleggel - egy légiforgalmi irányító egység a repülés biztonsága érdekében utasítja.

5.2.1.7.3.1.1 Hacsak nem a repülés biztonsága érdekében szükséges, a légijárműhöz felszállás közben, a végső megközelítés utolsó fázisában és a leszállás utáni kifutás közben nem szabad közleményt intézni.

5.2.1.7.3.2 *Rádió-távbeszélő összeköttetés létesítése*

5.2.1.7.3.2.1 Az összeköttetés felvételekor mindig a teljes rádió-távbeszélő hívójelet kell használni. Az összeköttetést létesítő légijárműnek a hívást az 5-2. táblázatban foglaltak szerint kell végrehajtania.

5.2.1.7.3.2.2 **PANS**. - *Azoknak az állomásoknak, melyeknek egy közleményt valamennyi olyan állomás számára kell továbbítaniuk, amelyek azt valószínűleg hallani fogják, az ilyen adást lehetőleg az "ALL STATIONS" ("MINDEN ÁLLOMÁSNAK") általános hívással kell kezdeniük, amelyet a hívó állomás azonosítója kell, hogy kövessen.*

Megjegyzés. - Az ilyen általános hívásokra nem várnak választ, kivéve, ha ezt követően az egyes állomásokat fel nem kérik a nyugtázásra.

5.2.1.7.3.2.3 Az előbbi hívásokra az 5-3. táblázatnak megfelelően kell válaszolni. A légiforgalmi állomás hívásakor az állomás hívójelét, - amelyet légiforgalmi állomás hívójelével történő válaszadás követ - úgy tekinteni mint kérést az adás megkezdésére

5.2.1.7.3.2.4 **PANS. -** *Ha egy állomás hívást vett, de nem biztos a hívó állomás azonosítójában, akkor lehetőleg az alábbiak adásával válaszoljon.*

STATION CALLING (*a meghívott állomás neve*), SAY AGAIN YOUR CALL SIGN ("Ismételje a hívójelét!").

Megjegyzés. - Az alábbi példa ennek az eljárásnak az alkalmazását mutatja be:
(CAIRO állomás válasza)

STATION CALLING CAIRO *(szünet)* SAY AGAIN YOUR CALL SIGN
/"A Kairó-t hívó állomásnak. *(szünet)* Ismételje meg a hívójelét!"/

5.2.1.7.3.2.5 A közlemény-váltást egy hívással és egy válasz-adással kell kezdeni, amikor az összeköttetést szeretnék létrehozni, kivéve, ha bizonyosak abban, hogy a hívott állomás venni fogja a hívást; ebben az esetben a hívó állomás leadhatja a közleményét anélkül, hogy megvárná a hívott állomás jelentkezését.

5.2.1.7.3.2.6 A légijárművezetők közötti, levegő-levegő közlemény-váltást a 123,45 MHz-es csatornán kell kezdeményezni, akár egy meghatározott légijármű állomásnak szóló közvetlen hívással, vagy általános hívással, figyelembe véve e csatorna használatának feltételeit.

Megjegyzés. - A levegő-levegő csatornák használatának feltételeit lásd az Annex 10, V. Kötet, 4.1.3.2.1 pontban, valamint a II. Kötet, 5.2.2.1.1.4 pontban.

5.2.1.7.3.2.6.1 **PANS .-** *Mivel a légijármű egynél több frekvencián is figyelhet, a kezdeti hívás lehetőleg tartalmazza a csatorna megkülönböztető "INTERPILOT" megjelölését.*

Megjegyzés. - Az alábbi példák ezen hívási eljárások alkalmazását mutatják be:

CLIPPER123 – SABENA901 – INTERPILOT – DO YOU READ
("CLIPPER123 – A SABENA901 hívja az INTERPILOT csatornán – hallja az adásomat?")

vagy

ANY AIRCRAFT VICINITY OF 30 NORTH 160 EAST - JAPANAIR 401 - INTERPILOT – OVER
("Bármely légijármű az Északi szélesség 30 és a Keleti hosszúság 160 körzetében – a JAPANAIR 401 hívja az INTERPILOT csatornán – Vétel")

5-2. táblázat: Rádió-távbeszélő hívási eljárások*

(lásd az 5.2.1.7.3.2.1 p*ontot)*

	a) típus	*b) típus*	*c) típus*
A hívott állomás megnevezése	NEW YORK RADIO	NEW YORK RADIO	NEW YORK RADIO
A hívó állomás megnevezése	GABCD**	SPEEDBIRD ABCD**	AEROFLOT321**

** Bizonyos esetekben, amikor a hívást a légiforgalmi állomás kezdeményezi, a hívást kódolt impulzus-jelek leadásával is végre lehet hajtani.*

*** A rádió-távbeszélő hívójel és a légijármű típusa kivételével a hívójel minden karakterét külön ki kell mondani. Az egyes betűket az 5.2.1.3 pontban előírt rádió-távbeszélő ABC szerint kell kiejteni. A számokat az 5.2.1.4 pont előírásai szerint kell kimondani.*

5-3. táblázat: Rádió-távbeszélő eljárások válasz esetére

(lásd az 5.2.1.7.3.2.3 *pontot)*

	a) típus	*b) típus*	*c) típus*
A hívott állomás megnevezése	GABCD*	SPEEDBIRD ABCD*	AEROFLOT321*
A válaszoló állomás megnevezése	NEW YORK RADIO	NEW YORK RADIO	NEW YORK RADIO

** A rádió-távbeszélő megjelölés és a légijármű típusa kivételével a hívójel minden karakterét külön ki kell mondani. Az egyes betűket az 5.2.1.3 pontban előírt rádió-távbeszélő ABC szerint kell kiejteni. A számokat az 5.2.1.4 pont előírásai szerint kell kimondani.*

5.2.1.7.3.3 *A kapcsolat-felvétel utáni rádió-távbeszélő közlemény-váltások*

5.2.1.7.3.3.1 A fenti 5.2.1.7.2.2 pontban leírt rövidített rádió-távbeszélő hívójeleket csak akkor szabad használni, ha már sikeres összeköttetést sikerült létrehozni, és ha hívójel összetévesztés bekövetkezése nem valószínű. A légijármű állomásnak csak akkor szabad a rövidített hívójelét használnia, ha a légiforgalmi állomás már intézett hozzá hívást ilyen módon.

5.2.1.7.3.3.2 Az összeköttetés létrehozása után a folyamatos kétirányú kommunikáció engedélyezett minden további azonosítás, vagy hívás nélkül, a közlemény-váltás befejezéséig.

5.2.1.7.3.3.3 Az esetleges összetévesztés elkerülése érdekében, amikor ATC engedélyeket adnak ki, valamint az ilyen engedélyek visszaolvasásakor, a légiforgalmi irányítók és a légijárművezetők mindig kötelesek hozzátenni annak a légijárműnek a hívójelét, amelyre az adott engedély vonatkozik.

5.2.1.7.3.4 *Az adó frekvencia azonosítása, jelölése*

5.2.1.7.3.4.1 **PANS. -** *Mivel a légiforgalmi állomás kezelője általában több frekvencián figyel, a hívás után lehetőleg azonosítania kell a használt frekvenciát, hacsak nincs egyéb ismert, megfelelő módszer a frekvencia azonosítására.*

5.2.1.7.3.4.2 **PANS. -** *Ha nem valószínű, hogy összetéveszthetik, akkor a HF csatornák azonosításakor az első két számjegyet kell megadni (kHz-ben) az adó csatorna azonosítására.*

Megjegyzés. - Az alábbi példa ennek az eljárásnak az alkalmazását mutatja be:

(PAA 325 hívja Kingstont a 8871 kHz-es frekvencián)
KINGSTON CLIPPER THREE TWO FIVE - ON EIGHT EIGHT

5.2.1.7.3.4.3 **PANS. -** *Ha a VHF kommunikációs csatornákat 25 kHz-es osztással választják el egymástól, a rádió-távbeszélő közlemény-váltások során az adó vivőfrekvencia azonosítására csak az első 5 számjegy használata szükséges. A tizedespont után csak két fontos számjegyet kell használni. Ha itt két nulla áll, akkor egy nulla számít fontos számjegynek.*

Megjegyzés. - Az alábbi példa ennek az eljárásnak az alkalmazását mutatja be:

Csatorna	*Továbbítása*
118.000	*ONE ONE EIGHT DECIMAL ZERO*
118.025	*ONE ONE EIGHT DECIMAL ZERO TWO*

5.2.2.5.2 **PANS. -** *Egyik hálózatról a másikra történő áttérés esetén az átadásnak lehetőleg addig kell megtörténnie, amíg a légijármű egy olyan állomással áll összeköttetésben, amely mindkét hálózatban üzemel, hogy ezzel biztosítsák az összeköttetés folyamatosságát. Ha azonban a hálózatok közti váltást azzal egyidőben kell elvégezni, hogy az összeköttetést egy másik hálózati állomásnak átadják, akkor az átadást a két hálózati állomásnak lehetőség szerint koordinálnia kell, mielőtt a frekvenciaváltást tanácsolnák, vagy arra felhatalmazást adnának. A légijárművel közölni kell az átadás után használandó elsődleges és másodlagos frekvenciákat is.*

5.2.2.5.3 Amikor egy légijármű-állomás az egyik rádiófrekvencia figyeléséről egy másik frekvencia figyelésére tért át, ha az illetékes ATS Hatóság ezt megköveteli, tájékoztassa az érintett légiforgalmi állomást, hogy megkezdte az összeköttetés figyelését az új frekvencián.

5.2.2.5.4 **PANS. -** *Amikor a légijármű felszállása után a légijármű-állomás bejelentkezik egy hálózathoz, akkor meg kell adnia felszállásának idejét, vagy az utolsó ellenőrző pont átrepülésének idejét a megfelelő illetékes állomásnak.*

5.2.2.5.5 **PANS. -** *Amikor a légijármű-állomás új hálózatba lép át, akkor meg kell adnia az utolsó ellenőrző pont feletti átrepülésének idejét, vagy az utolsó jelentett pozíciója idejét a megfelelő illetékes állomásnak.*

5.2.2.5.6 **PANS. -** *Mielőtt a légijármű-állomás elhagyná a hálózatot, lehetőleg minden esetben értesítse a megfelelő illetékes állomást erről a szándékáról - az alábbiak közül - a megfelelő kifejezés továbbításával:*

a) amikor a légijármű-vezető - légiforgalmi irányító között használt csatornára tér át:

Légijármű: CHANGING TO ... (ÁTKAPCSOLOK A) ... – *(a megfelelő légiforgalmi szolgálati egység neve)*

b) leszállás után:

Légijármű: LANDED ... (LESZÁLLTAM) .... *(hely) ... (idő)*

5.2.2.6 *VHF összeköttetés átadása*

5.2.2.6.1 A légijárművet az illetékes légiforgalmi állomásnak kell felkérnie arra, hogy térjen át egyik frekvenciáról a másikra, a jóváhagyott eljárásoknak megfelelően. Ilyen felkérés hiányában a légijármű-állomásnak kell értesítenie az illetékes légiforgalmi állomást, mielőtt áttér egyik frekvenciáról a másikra.

5.2.2.6.2 Amikor az első kapcsolatot felveszi, illetve a VHF frekvencia elhagyásakor, a légijármű-állomásnak továbbítania kell minden olyan tájékoztatást, amit az illetékes Hatóság előírt számára.

5.2.2.7 *Hang összeköttetési hiba*

5.2.2.7.1 *Levegő-föld összeköttetés*

5.2.2.7.1.1 Ha egy légijármű-állomásnak nem sikerül összeköttetést létesítenie a légiforgalmi állomással a kijelölt frekvencián, akkor meg kell kísérelnie az összeköttetés felvételét a korábban használt frekvencián, ennek sikertelensége esetén pedig egy - az útvonalnak megfelelő - másik frekvencián. Amennyiben ez a kísérlet sem sikerül, a légijármű-állomásnak az útvonalnak megfelelő frekvencián meg kell próbálnia összeköttetést létesíteni más légijárművekkel, vagy más légiforgalmi állomásokkal. Ezen kívül, egy hálózatban működő légijárműnek a megfelelő VHF frekvenciát figyelnie kell, hogy képes legyen a közelében lévő légijáművektől érkező hívások vételére.

5.2.2.7.1.2 Ha az 5.2.2.7.1.1 pontban leírt kísérletek eredménytelenek maradnak, a légijármű-állomásnak a "TRANSMITTING BLIND" (vak-adás) kifejezés után közleményét kétszer le kell adnia a kijelölt csatorná(ko)n, és ha szükséges, hozzá kell tennie a címzette(ke)t is, aki(k)nek a közleményt szánja.

5.2.2.7.1.2.1 **PANS. -** *Hálózati üzemelés esetén a vak-adással leadandó közleményt kétszer kell leadni az elsődleges és a másodlagos frekvencián is. A frekvencia-váltás előtt a légijármű-állomásnak be kell jelentenie, hogy melyik frekvencia az, amire át fog váltani.*

5.2.2.7.1.3 A v*evőkészülék meghibásodása*

5.2.2.7.1.3.1 Ha egy légijármű-állomás a vevőkészülék hibája miatt nem képes összeköttetést létesíteni, akkor jelentéseit továbbítania kell a használatos frekvencián a kívánt időpontokban vagy földrajzi helyeken, a "TRANSMITTING BLIND DUE TO RECEIVER FAILURE" ("VAK-ADÁS A VEVŐKÉSZÜLÉK HIBÁJA MIATT") kifejezés után. A légijármű-állomás le kell, hogy adja a szükségesnek ítélt közleményét, majd meg kell ismételnie az egészet. Az eljárás során a légijárműnek közölnie kell a következő tervezett adásának időpontját is.

5.2.2.7.1.3.2 Ha a légijármű, légiforgalmi irányítói szolgáltatásban vagy tanácsadói szolgáltatásban részesül, az 5.2.2.7.1.3.1 pont előírásainak betartásán felül adjon tájékoztatást a légijármű parancsnok-pilótájának a repülés folytatásával kapcsolatos szándékáról is.

5.2.2.7.1.3.3 Ha a légijármű a fedélzeti berendezés hibája miatt nem képes összeköttetést létesíteni, akkor - ha rendelkezik az ehhez szükséges berendezéssel - állítsa be a megfelelő SSR kódot a rádióhiba jelzésére.

Megjegyzés. - A rádióhiba esetén használható általános szabályokat a Chicagói Egyezmény, ICAO Annex 2 (a Nemzetközi Polgári Repülési Szervezet Egyezményének 2. Függeléke) tartalmazza.

5.2.2.7.2 *Föld-levegő összeköttetés*

5.2.2.7.2.1 Amikor a légiforgalmi állomás nem képes összeköttetést létesíteni egy légijármű-állomással, miután hívta azokon a frekvenciákon, amelyeken a légijármű feltételezhetően figyel, akkor:

a) kérjen fel segítség-nyújtásra más légiforgalmi állomásokat, úgy, hogy a légijárművet meghívják és közvetítik a forgalmazást, ha az szükséges;

b) kérje fel az útvonalon repülő légijárműveket, hogy kíséreljék meg az összeköttetés felvételét az adott légijárművel, és közvetítsék a forgalmazást, ha szükséges.

5.2.2.7.2.2 Az 5.2.2.7.2.1 pont előírásait szintén alkalmazni kell:

a) az érintett légiforgalmi szolgálati egység kérésére;

b) ha a várt összeköttetés egy légijárművel a várható időszakon belül nem jön létre, és ezért rádióhiba előfordulására gyanakszanak.

Megjegyzés. - Az adott időtartamot az illetékes ATS Hatóság írhatja elő.

5.2.2.7.2.3 **Ajánlás. -** *Ha az 5.2.2.7.2.1 pontban leírt kísérletek sikertelenek maradnak, a légiforgalmi állomás a légijárműnek címzett közleményeket - a légiforgalmi irányítói engedélyeket tartalmazó közlemények kivételével - vak-adással kell, hogy leadja azo(ko)n a frekvenciá(ko)n, amelye(ke)n a légijármű feltételezhetően figyel.*

5.2.2.7.2.4 Vak-adással a légijárművek számára nem szabad légiforgalmi irányítói engedélyeket továbbítani, kivéve azt az esetet, ha a közlemény feladója ezt határozottan kéri.

5.2.2.7.3 *A rádióhiba bejelentése.* A levegő-föld irányítói rádióállomás a lehető leghamarabb értesítse a levegő-föld összeköttetés bármely hibájáról az érintett légiforgalmi szolgálati egységeket és a légijárművek járatóit.

5.2.3 A HF közlemények kezelése

5.2.3.1 *Általános előírások*

5.2.3.1.1 **PANS. -** *Hálózati üzemelés esetén a légijármű-állomásnak - ha az össszeköttetés körülményei megengedik - a közleményeit lehetőleg a hálózat azon állomásainak kell leadnia, amelyektől azokat a lehető legkönnyebben, leggyorsabban lehet továbbítani a végső rendeltetési helyeikre. A légijárműveknek különösen a légiforgalmi szolgálatok által megkívánt jelentéseket kell annak a hálózati állomásnak leadniuk, amely azt a repülés-tájékoztató központot, vagy körzeti irányító központot szolgálja ki, amelynek területén belül a légijármű éppen repül. Fordított esetben, a repülésben lévő légijárműveknek szánt közleményeket - amikor csak lehetséges - a légijárművekhez közvetlenül arról a hálózati állomásról kell továbbítani, amelyik a közlemény feladójának helyét szolgálja ki.*

Megjegyzés. - Egy légijárműnek kivételesen szüksége lehet arra, hogy olyan légiforgalmi állomással vegye fel az összeköttetést, amely a repülés adott útvonal-szakaszán belül illetékes hálózaton kívül esik. Amikor a figyelést az illetékes ATS Hatóság előírja, ez megengedhető a légijárművek számára, amennyiben ezt meg lehet tenni anélkül, hogy a légijármű megszakítaná a figyelést azon az összeköttetési hálózaton, amely a repülés adott útvonal-szakaszán illetékes, és feltéve, hogy ezzel nem okoznak zavaró kölcsönhatást más légiforgalmi állomások működésében.

5.2.3.1.2 **PANS. -** *Egy bizonyos légijárműtől valamely hálózati állomásnak szóló közleményeket - amennyiben lehetséges - a hálózat többi olyan állomásának is vennie és nyugtáznia kell, amelyek olyan helyeket szolgálnak ki, ahol az adott információra szintén szükség van.*

1. Megjegyzés. - A címzés nélküli levegő-föld közlemények szétosztására vonatkozó eljárások meghatározása több-oldalú vagy helyi megállapodások útján történik.

2. Megjegyzés. - Elvben az adásokat venni köteles állomások számát, az operatív követelményeknek megfelelően, a lehetséges minimumon kell tartani.

5.2.3.1.2.1 **PANS. -** *Az adás vételét lehetőleg közvetlenül azután kell nyugtázni, miután azon állomás, amelyiknek a közleményt továbbították nyugtázta azt.*

5.2.3.1.2.2 **PANS. -** *A vett adást úgy kell nyugtázni, hogy a közleményt vevő állomás leadja a saját rádió-hívójelét, amelyet a ROGER szó követ - ha szükségesnek ítélik -, valamint annak az állomásnak a hívójelét, amelyik a közleményt leadta.*

5.2.3.1.2.3 **PANS. -** *Ha az adás vételét egy percen belül nem nyugtázzák, akkor annak az állomásnak kell azt továbbítania, amelyik vette a légijárműtől a közleményt, általában a légiforgalmi állandóhelyű szolgálaton keresztül, annak/azoknak/ az állomás(ok)nak, amely(ek) nem nyugtázta/nyugtázták/ az adás vételét.*

5.2.3.1.2.3.1 **PANS. -** *Ha rendkívüli körülmények között szükség van rá, hogy az adást a levegő-föld csatornákon keresztül továbbítsák, akkor lehetőség szerint az 5.2.2.3.4 pont előírásait kell betartani.*

5.2.3.1.2.4 **PANS. -** *Ha a továbbítás a légiforgalmi állandóhelyű távközlési hálózaton keresztül történt, akkor a közleményeket az érintett hálózati állomás(ok)nak kell megcímezni.*

5.2.3.1.2.5 **PANS. -** *Az(ok)nak az állomás(ok)nak, amely(ek) részére a közleményeket továbbították, el kell, hogy végezze/végezzék/ a közlemények helyi szétosztását, ugyanolyan módon, mintha a közleményeket közvetlenül a légijárművektől kapta/kapták/ volna a levegő-föld csatornán.*

5.2.3.1.2.6 Az a légiforgalmi állomás, amelyik egy repülésben lévő légijárműről leadott légijelentést (AIREP), vagy meteorológiai tájékoztatást tartalmazó közleményt vesz, köteles késedelem nélkül továbbítani:

1) az állomással kapcsolatban álló légiforgalmi szolgálati egységnek és meteorológiai hivatalnak;

2) az érintett légijármű járatójának, vagy képviselőjének, ha az adott járató kifejezetten kérte, hogy az ilyen közleményeket megkapja.

5.2.3.1.3 **PANS. -** *Az 5.2.3.1.2 pont előírásait, ha ez megvalósítható, a nem-hálózati üzemelés esetén is alkalmazni kell.*

8. FEJEZET LÉGIFORGALMI MOZGÓ SZOLGÁLAT - ADATKAPCSOLATI ÖSSZEKÖTTETÉSEK

8.1 Általános előírások

1. Megjegyzés. - Jóllehet a 8. Fejezet előírásai elsődlegesen a Légiforgalmi Irányítás – légijárművezető közötti digitális adatkapcsolati összeköttetések alkamazására (CPDLC) vonatkoznak, a 8.1 pont előírásai más jellegű adatkapcsolati alkalmazásokra is érvényesek lehetnek, ahol alkalmazhatóak, beleértve az Adatkapcsolat – Légiforgalmi Tájékoztató Szolgálat felhasználást (pl. D-ATIS, D-VOLMET, stb.) is.

2. Megjegyzés. - Ezen rendelkezések értelmében a légiforgalmi mozgó szolgálatra alkalmazható összeköttetési eljárások, értelemszerűen, a légiforgalmi mozgó-műholdas szolgálatra is alkalmazhatók.

8.1.1 Az adatkapcsolati közlemények összeállítása

8.1.1.1 A közlemények szövegét a szabványos közlemény formátumban kell összeállítani (pl. szabványos CPDLC közlemények), nyílt szöveggel, vagy rövidítések és kódok felhasználásával, ahogy ez a 3.7 pontban leírásra került. A nyílt szöveges változat kerülendő, amennyiben a közlemény szövege nagymértékben rövidíthető megfelelő rövidítések és kódok használatával. Kerülni kell az olyan felesleges szavakat és szókapcsolatokat, mint amilyenek az udvariassági kifejezések.

8.1.1.2 Az alábbi karaktereket lehet felhasználni a közlemények összeállítására:

Betűk: ABCDEFGHIJKLMNOPQRSTUVWXYZ

(csak nagybetűk használatával)

Számok: 1 2 3 4 5 6 7 8 9 0

Egyéb jelek:

-	kötőjel)
?	(kérdőjel)
:	kettőspont)
(	nyitó zárójel)
)	záró zárójel)
.	pont, pont a mondat végén, vagy tizedes pont)

,	(vessző)
'	(aposztróf)
=	(kettős kötőjel, vagy egyenlőségjel)
/	törtvonal, vagy ferde zárójel)
+	összeadásjel)

és a szóköz karakter.

A felsorolt karaktereken kívül más karaktereket nem szabad használni a közleményekben.

8.1.1.3 Római számokat nem lehet használni. Ha a közlemény feladója azt szeretné, hogy a címzettet értesítsék arról, hogy római számokat akartak használni a közleményben, akkor arab számot, vagy számokat kell írni, melyek elé a ROMAN ("római") szót kell beszúrni.

8.1.2 Az adatkapcsolati közlemények kijelzése

8.1.2.1 A földi és fedélzeti berendezések lehetővé teszik a közlemények megfelelő megjelenítését, szükség szerinti nyomtatását, valamint tárolását olyan formában, hogy azok szükség esetén, megfelelő időben kényelmes módon visszakereshetők legyenek.

8.1.2.2 Amikor szöveges kijelzésre van szükség, az angol nyelvű megjelenítés a minimális követelmény.

8.2 CPDLC - A Légiforgalmi Irányítás és a légijárművezető közötti digitális adatkapcsolati összeköttetési eljárások

Megjegyzés. - A CPDLC közlemények ebben a fejezetben hivatkozott készlete a PANS-ATM (Légiforgalmi Szolgálatok Eljárásai - Légiforgalmi Irányítás Szervezés), 5. Függelékében található meg.

8.2.1 Valamennyi összeköttetés során mindig a legtökéletesebb fegyelmet kell tanúsítani, betartani.

8.2.1.1 **Ajánlás. -** *A közlemények összeállításánál lehetőleg figyelembe kell venni az emberi teljesítőképesség azon korlátait, amelyek hatással lehetnek a közlemények hibátlan vételére és megértésére.*

Megjegyzés. - Az emberi teljesítőképességgel foglalkozó tájékoztató anyagok az alábbi kiadványokban találhatóak: Az Emberi Tényezőkkel Kapcsolatos Oktatási Kézikönyv *(Doc 9683) és az* Emberi Tényezővel Kapcsolatos Irányelvek az ATM (Légiforgalmi Irányítás Szervezési) Rendszerekben *(Doc 9758).*

8.2.2 A földi és fedélzeti berendezéseknek biztosítaniuk kell, hogy a légiforgalmi irányítók és a légijárművezetők az általuk küldendő bármely üzemeltetéssel kapcsolatos közleményt átnézhessék és jóváhagyhassák.

8.2.3 A földi és fedélzeti rendszereknek biztosítaniuk kell, hogy a légiforgalmi irányítók és a légijárművezetők bármely általuk vett, üzemeltetéssel kapcsolatos közleményt átnézhessék, jóváhagyhassák, és ha ez alkalmazható, nyugtázhassák.

8.2.4 A légiforgalmi irányító számára biztosítani kell a lehetőségét arra, hogy válaszolhasson a közleményekre, beleértve a kényszerhelyzeti közleményeket is, engedélyeket, utasításokat és tanácsokat adhasson, valamint hogy információkat kérhessen és adhasson.

8.2.5 A légijárművezető számára biztosítani kell a lehetőséget, hogy válaszolhasson a közleményekre, engedélyeket és információkat kérhessen, tájékoztatásokat jelenthessen, valamint hogy egy kényszerhelyzetet bejelenthessen vagy törölhessen.

8.2.6 A légijárművezető és a légiforgalmi irányító számára biztosítani kell a lehetőséget, hogy egymással olyan közleményeket válthassanak, melyek nem felelnek meg az előre meghatározott közlemény formátumoknak (azaz szabad szöveges közlemények /free text messages/).

8.2.7 Hacsak az illetékes ATS hatóság másként nem rendelkezik, a CPDLC közlemények szóbeli visszaolvasását nem szabad megkövetelni.

8.2.8 A CPDLC létesítése

8.2.8.1 A légiforgalmi irányítót és a légijárművezetőt tájékoztatni kell akkor, amikor a CPDLC kapcsolat sikeresen létrejött.

8.2.8.2 **PANS. -** *A CPDLC-t elegendő időben kell létrehozni ahhoz, hogy biztosítható legyen a légijármű és a illetékes ATC egység közötti összeköttetés.*

8.2.8.3 A légiforgalmi irányítót és a légijárművezetőt tájékoztatni kell, amikor a CPDLC kapcsolat rendelkezésre áll üzemeltetési felhasználásra az első kapcsolat-felvételnél, valamint akkor is, ha meghibásodás után a CPDLC kapcsolat újra helyreáll.

8.2.8.4 A légijárművezetőnek bármikor tudnia kell azonosítani a légiforgalmi irányító szolgáltatást biztosító légiforgalmi irányító egységet a szolgáltatás igénybevétele során.

8.2.8.5 Amikor a fedélzeti rendszer úgy érzékeli, hogy rendelkezésre áll a CPDLC kapcsolat üzemeltetési felhasználásra, akkor el kell küldenie a FOLYAMATOS ADAT JOGOSULTSÁG /CURRENT DATA ATHORITY/ CPDLC fedélzetről leadott közlemény elemet.

8.2.8.6 *A fedélzetről kezdeményezett CPDLC*

8.2.8.6.1 **PANS. -** *Amikor a Légiforgalmi Irányítás /ATC/ valamely egysége egy váratlan, CPDLC-re irányuló kérést vesz egy légijárműről, akkor meg kell tudnia a légijárműtől a kérés okát, hogy meghatározhassa a további intézkedéseket.*

8.2.8.6.2 **PANS. -** *Amikor az ATC egység visszautasít egy CPDLC-re irányuló kérést, meg kell adnia a légijárművezető számára a visszautasítás okát, egy megfelelő CPDLC közlemény felhasználásával.*

8.2.8.7 *Az ATC egység által kezdeményezett CPDLC*

8.2.8.7.1 Egy ATC egység csak akkor létesíthet CPDLC kapcsolatot egy légijárművel, ha az adott légijármű még nem létesített CPDLC összeköttetést, vagy ha erre a légijárművel folyamatos CPDLC összeköttetésben lévő ATC egység feljogosítja.

8.2.8.7.2 Amikor egy CPDLC kapcsolat-felvételre irányuló kérést egy légijármű utasít vissza, akkor a visszautasítás okát vagy a NINCS FOLYAMATOS ADAT JOGOSULTSÁG /NOT CURRENT DATA AUTHORITY/, vagy a "NOT AUTHORIZED NEXT DATA AUTHORITY" NEM ENGEDÉLYEZETT A KÖVETKEZŐ ADAT JOGOSULTSÁG /NOT AUTHORIZED NEXT DATA AUTHORITY/ CPDLC fedélzetről küldött közlemény elem segítségével kell közölnie, amelyik értelemszerűen az ideillő. A helyi eljárásoknak kell szabályozniuk azt, hogy vajon a visszautasítás okát megjelenítik-e a légiforgalmi irányító számára. Az ATC egység által kezdeményezett CPDLC kapcsolat-felvétel fedélzeti visszautasításának más, az előbb felsoroltaktól eltérő oka nem megengedett.

8.2.9 Az üzemeltetési CPDLC közlemények cseréje

8.2.9.1 A légiforgalmi irányítók és a légijárművezetők CPDLC közleményeiket az előre meghatározott közlemények (közlemény elemek) készletéből, egy szabad szöveges közleményből, vagy ezen elemek kombinációjából kell összeállítaniuk.

8.2.9.1.1 **PANS. -** *Amikor CPDLC összeköttetést használnak, és a célnak megfelelő közleményt a PANS-ATM 5. Függelékében található CPDLC szabványos közlemények készlete tartalmazza, akkor a kapcsolódó szabványos közleményt kell használni.*

8.2.9.1.2 **PANS. -** *A 8.2.12.1 pontban előírtak kivételével, ha egy légiforgalmi irányító, vagy egy légijárművezető CPDLC-n keresztül küld közleményt, akkor lehetőség szerint a válasznak is CPDLC-n keresztül kell érkeznie. Amikor a légiforgalmiirányító vagy a légijárművezető beszéd-üzemű összeköttetésben áll, akkor a választ beszéd-üzemű adásban kell leadnia.*

8.2.9.1.3 **PANS. -** *Ha egy üzemeltetési választ igénylő CPDLC-n keresztül történt közlemény módosítása szükséges, vagy a közlemény tartalma szorul magyarázatra, a légiforgalomirányító, vagy a légijárművezető a rendelkezésére álló megfelelő eszközöket használja a pontos részletek közlésével vagy az engedély megadásával*

Megjegyzés: a légiforgalmi irányító vagy a légijárművezető az alábbi eljárásokat alkalmazhatja egy korábbi közleményben szereplő engedélyek, utasítások vagy információk módosítására:

8.2.9.1.3.1 PANS. – *Ha egy CPDLC közlemény beszéd-üzemű adásban kerül módosításra, amely közleményre még nem érkezett üzemeltetési válasz, a légiforgalmi irányító, vagy a légijárművezető adását az alábbi kifejezés adásának kell megelőznie: „DISREGARD CPDLC („Ne vegye figyelembe") (közlemény típus) MESSAGE, BREAK, (közlemény, szünet) majd ezt követi a pontos engedély, utasítás, információ, vagy kérés.*

Megjegyzés: - Előfordulhat, hogy a beszédüzemben folytatott engedélyezés adásakor a CPDLC közlemény nem érte még el a címzettet, vagy elérte, de intézkedésre sor nem került, vagy már elérte és az intézkedésre is sor került.

8.2.9.1.3.2 **PANS.** – *a CPDLC közleményre való hivatkozásnál, annak azonosításánál, vagy figyelmen kívül hagyásánál figyelmet kell fordítani arra, hogy az engedélyek, kérések, vagy információkban történő módosítások egyértelműek és összetéveszthetetlenek legyenek.*

Megjegyzés.- Például, ha a SAS 445 számú járata FL290 magasságot tartva CPDLC közleményben utasítást kap FL 350-re történő emelkedésre és a légiforgalmi irányító beszédüzemben módosítani akarja az utasítást, az alábbi szöveget használhatja:

SAS445 DISREGARD CPDLC CLIMB CLEARANCE MESSAGE, BREAK, CLIMB TO FL310

(SAS445 NE VEGYE FIGYELEMBE A CPDLC KÖZLEMÉNYT, EMELKEDJEN FL310-RE)

8.2.9.1.3.3 **PANS**. - *Ha egy CPDLC közleménnyel kapcsolatban üzemelési válaszadás megadására van* *szükség, amelyre beszéd-üzemben kerül sor, egy megfelelő CPDLC befejező válasz-közlemény kerül elküldésre a CPDLC párbeszéd megfelelő szinkronizációjának biztosítása végett. Ez megoldható olyan formában, hogy vagy a közlemény fogadóját beszéd-üzemben utasítjuk a párbeszéd befejezésére, vagy a párbeszéd lezárását a rendszer automatikusan elvégzi.*

8.2.9.2 Egy CPDLC közlemény összeállításánál nem szabad ötnél több közlemény elemet felhasználni, és az elemek közül csak kettő tartalmazhat útvonal-engedély változókat.

8.2.9.2.1 **PANS. -** *Ahol ez lehetséges, kerülni kell a hosszú közlemények használatát, vagy az olyan közleményekét, amelyek összetett engedély elemeket, vagy engedélyek és információk kombinációját tartalmazzák.*

*Megjegyzés. - A helyi üzemeltetési eljárások kidolgozásával és a CPDLC hatékony, megfelelő üzemeltetési módszereivel foglalkozó tájékoztató anyag az "*Emberi Tényezővel Kapcsolatos Irányelvek az ATM Rendszerekben" című dokumentumban található (Human Factors Guidelines for Air Traffic Management (ATM) Systems - *Doc 9758*).

8.2.9.3 A CPDLC földi rendszereknek és a fedélzeti rendszereknek alkalmasnak kell lenniük a CPDLC közlemények sürgősségi és riasztási jellemző tulajdonságainak alkalmazására úgy, hogy a megjelenítés megváltoztatásával felhívják a felhasználók figyelmét a nagyobb elsőbbségű közleményekre.

Megjegyzés. - Egy közlemény vételekor a közlemény jellemzői a CPDLC használójától bizonyos közlemény-kezelési követelmények betartását követelik meg. Valamennyi CPDLC közlemény három jellemzővel rendelkezik: sürgősségi, riasztási és válasz-adási jellemzővel. Amikor egy közlemény összetett közlemény elemeket tartalmaz, akkor a legmagasabb elsőbbséggel rendelkező közlemény elem adott típusa válik az egész közlemény jellemző típusává.

8.2.9.3.1 A sürgősségi jellemzőnek (urgency attribute) kell leírnia a végfelhasználó számára megjelenített, vett közlemények besorolási követelményeit. A sürgősségi típusok a 8-1 Táblázatban találhatók.

8.2.9.3.2 A riasztási jellemzőnek (alert attribute) kell meghatároznia a közlemény vétele után a szükséges riasztás típusát. A riasztás típusait a 8-2 Táblázat tartalmazza.

8.2.9.3.3 A válaszadási jellemzőnek (response attribute) kell meghatároznia az érvényes válaszokat az adott közlemény elem számára. A választípusok a 8-3 Táblázatban találhatók az "uplink" (légijárműnek szóló) közleményekre és a 8-4 Táblázatban a "downlink" (légijárműről származó) közleményekre.

8.2.9.3.3.1 **PANS. -** *Amikor egy több elemből álló közleményre kell válaszolni, és a válasz formája egy közlemény elem, akkor a választ az összes közlemény elemre kell vonatkoztatni.*

Megjegyzés. - Például egy több elemből álló közlemény tartalma a: CLIMB TO FL310 MAINTAIN MACH.84. *Az erre érkező* WILCO *válasz mind a két közlemény elemre vonatkozik, és mindkét utasítás elem teljesítését jelenti.*

8.2.9.3.3.2 **PANS.- Ha** *a légijármű egy egyetlen közlemény elemből álló engedélyt, vagy egy több elemből álló engedély közlemény bármely részét nem képes végrehajtani, akkor a légijármű vezetőjének egy* UNABLE *választ kell küldenie az egész közleményre.*

8.2.9.3.3.3 **PANS. -** *A légiforgalmi irányítónak egy* UNABLE *közleménnyel kell válaszolnia, amely a kérés összes elemére vonatkozik, amennyiben egy egyetlen elemből, vagy egy több elemből álló engedélykérésnek nincs olyan eleme, amely jóváhagyható lenne. A folyamatban, érvényben lévő engedélyeket nem szabad* *megismételni.*

8.2.9.3.3.4 PANS. - Amikor egy több elemből álló engedély-kérés csak részben hagyható jóvá , akkor a légiforgalmi irányító egy UNABLE közleménnyel válaszol, amely a kérés összes elemére vonatkozik és ha szükséges a válasz kitér az egyes okokra,és/vagy információt ad arra vonatkozóan, hogy mikorra várható az engedély megadása.

Megjegyzés.

Külön közlemény(ek) ezt követően továbbítható(k) válaszként azokra az elemekre vonatkozóan, amelyek jóváhagyhatók.

8.2.9.3.3.5 PANS. – Ha egy egy-, vagy több elemből álló engedélykérés valamennyi eleme jóváhagyható a légiforgalmi irányító ebben az esetben a kérés valamennyi elemére vonatkozóan adja meg az engedélyt.Ez a válasz egy fedélzetre irányuló „uplink” közlemény legyen.

Megjegyzés. – Például, amíg a több elemet tartalmazó engedélykérő közlemények kerülendők a több elemből álló fedélzetről származó ("downlink") közlemény az alábbi bemutatott közlemény elemeket tartalmazza:

REQUEST CLEARANCE YQM YYG YYT YQX TRACK
X EINN EDDF
REQUEST CLIMB TO FL 350
REQUEST MACH .0.84

Az alábbiakat tartalmazó közleménnyel válaszolható meg:

CLEARED YQM YYG YYT YQX TRACK X EINN EDDF
CLIMB TO FL350
REPORT MAINTAINING
CROSS YYG AT OR AFTER 1150
NO SPEED RESTRICTION

8.2.9.3.3.6 **PANS. -** *Amikor egy CPDLC közlemény több mint egy közleményelemet tartalmaz és a közleményre a válasz jellemző Y, ha felhasználják, akkor az egyetlen válasz közleménynek a megfelelő számú válaszokat kell tartalmaznia, ugyanabban a sorrendben.*

Megjegyzés.- Például egy több elemből álló "uplink" (légijárműnek szóló) közlemény tartalma:

CONFIRM SQUAWK
WHEN CAN YOU ACCEPT FL410

Az alábbi közleménnyel válaszolható meg:

SQUAWKING 5525
WE CAN ACCEPT FL410 AT 1636Z

8-1. táblázat: Sürgősségi jellemző típusok (fedélzetre irányuló és a légijárműről származó)

Típusa	Leírás	Elsőbbség
D	Distress *(Vészhelyzet)*	1
U	Urgent (*Sűrgősség)*	2
N	Normal *(Normál)*	3
L	Low *(Alacsony)*	4

8-2. táblázat: Riasztási jellemző típusok (fedélzetre irányuló és légijárműről származó)

Típusa	Leírás	Elsőbbség

H	High (*Magas)*	1
M	Medium (*Közepes)*	2
L	Low *(Alacsony)*	3
N	Nincs szükség riasztásra	4

8-3. táblázat: Válaszadási jellemzők (fedélzetre irányuló)

Típusa	Válasz szükséges	Érvényes válaszok	Elsőbbség
W/U	Igen	WILCO, UNABLE, STANDBY, NOT CURRENT DATA AUTHORITY, NOT AUTHORIZED NEXT DATA AUTHORITY, LOGICAL ACKNOWLEDGEMENT (csak ha szükséges), ERROR	1
A/N	Igen	AFFIRM, NEGATIVE, STANDBY, NOT CURRENT DATA AUTHORTI'Y, NOT AUTHORIZED NEXT DATA AUTHORITY, LOGICAL ACKNOWLEDGEMENT (csak ha szükséges), ERROR	2
R	Igen	ROGER, UNABLE, STANDBY, NOT CURRENT DATA AUTHORITY, NOT AUTHORIZED NEXT DATA AUTHORITY, LOGICAL ACKNOWLEDGEMENT (csak ha szükséges), ERROR	3
Y	Igen	Bármely fedélzetről származó CPDLC közlemény, LOGICAL ACKNOWLEDGEMENT (csak ha szükséges)	4
N	Nem, kivéve ha logikai nyugtázásra van szükség	LOGICAL ACKNOWLEDGEMENT (csak ha szükséges), NOT CURRENT DATA AUTHORTI'Y, NOT AUTHORIZED NEXT DATA AUTHORITY, ERROR	5

8-4. táblázat Válaszadási jellemzők (légijárműtől származó)

Típusa	Válasz szükséges	Érvényes válaszok	Elsőbbség
Y	Igen	Bármely fedélzetre irányuló CPDLC közlemény, LOGICAL ACKNOWLEDGEMENT (csak ha szükséges)	1
N	Nem, kivéve ha logikai nyugtázásra van szükség	LOGICAL ACKNOWLEDGEMENT (csak ha szükséges), SERVICE UNAVAILABLE, FLIGHT PLAN NOT HELD, ERROR	2

8.2.9.4 Amikor egy földi, vagy fedélzeti rendszer "ERROR" (Hiba) CPDLC közleményt hoz létre, akkor a hiba okát is mellékelni kell a közleményben.

8.2.9.5 Az illetékes ATS hatóságnak ki kell választania azokat a PANS-ATM 5. Függelékében található közleményelemeket, melyek a saját légterében az üzemeltetést támogatják Amennyiben egy ATS hatóság úgy dönt, hogy ezeknek a közlemény-elemeknek csak egy részhalmazát választja, és a vett közlemény nem tartozik ezek közé, akkor az ATC egységnek a "SERVICE UNAVAILABLE" közlemény elem fedélzetre irányuló továbbításával kell válaszolnia.

Megjegyzés. - A vett közlemény további feldolgozására nincs szükség.

8.2.9.5.1 **Ajánlás. -** *Egy légiforgalmi irányító számára lehetőleg csak az adott irányító szektor tevékenységének megfelelő "uplink" közleményeket kell biztosítani.*

Megjegyzés. - A PANS-ATM 5. Függelékében található CPDLC közlemény készletet úgy fejlesztették ki, hogy az különböző ATM (Légiforgalmi Irányítás Szervezési) körülményeknek is megfeleljen.

8.2.9.5.2 Amennyiben az illetékes hatóság szükségesnek ítéli, további előre összeállított szabad szöveges közleményeket kell a légiforgalmi irányító rendelkezésére bocsátani azokra az esetekre, amikor a PANS-ATM által rendelkezésre álló szabványos (CPDLC) közlemények készlete nem alkalmazható bizonyos követelmények esetén. Ilyen esetekben az illetékes hatóságnak - az üzemeltetőkkel és más, esetleg érintett ATS hatóságokkal konzultálva - össze kell állítania egy listát az előre elkészített szabad szöveges közleményekből.

8.2.9.5.3 A CPDLC közleményelemek felhasznált részhalmazaival, és amennyiben van ilyen, bármely kiegészítő, előre összeállított, szabad szöveges közleménnyel kapcsolatos információt közzé kell tenni a Légiforgalmi Tájékoztató Kiadványban (AIP).

8.2.9.6 *A CPDLC átadása*

*Megjegyzés. - A CPDLC átadásával kapcsolatos részletes tájékoztató a "*Manual of Air Traffic Services Data Link Applications"-ban *(DOC 9694) dokumentumban található.*

8.2.9.6.1 **PANS. -** *Amikor a CPDLC átadásra került, akkor a beszéd-üzemű rádió-összeköttetés és a CPDLC kapcsolat párhuzamosan jön létre.*

8.2.9.6.2 **PANS.-** *Amikor egy légijárművet egy olyan ATC egységtől küldtek át, ahol rendelkezésre áll a CPDLC, egy olyan ATC egységnek, ahol a CPDLC nem használható, a CPDLC összeköttetés bezárását egyidőben kell elkezdeni a beszéd-üzemű rádió-összeköttetés átadásával.*

8.2.9.6.3 Amikor egy CPDLC átadása következtében az adatkapcsolat felett rendelkező egység megváltozik, és még mindig vannak olyan közlemények, amelyekre még nem érkezett lezáró válasz (azaz még közlemények várhatóak), akkor erről a CPDLC átadást végző légiforgalmi irányítót értesíteni kell.

8.2.9.6.3.1 Amennyiben egy légiforgalmi irányító át kell küldje a légijárművet anélkül, hogy válaszolna bármely, még elintézetlen, a fedélzetről származó ("downlink") közlemény(ek)re, a rendszernek képesnek kell lennie arra, hogy automatikusan megküldje a megfelelő lezáró, válaszközlemény(eke)t. Ilyen esetekben, bármely automatikusan elküldendő lezáró válasz közlemény(ek) tartalmát közzé kell tenni a helyi utasításokban.

8.2.9.6.3.2 Amikor a légiforgalmi irányító úgy dönt, hogy átküldi a légijárművet anélkül, hogy megvárná valamely függőben lévő uplink közleményére (közleményeire) a légijárművezető válaszát, a földi rendszernek képesnek kell lennie arra, hogy minden egyes közlemény tekintetében automatikusan lezárja a párbeszédet, mielőtt az átküldés megtörténne.

8.2.9.6.3.2.1 **PANS.-** *A légiforgalmi irányítónak vissza kell térnie a beszédüzemű rádió-összeköttetésre, hogy bármely bizonytalanságot tisztázzon, amely(ek) a függőben lévő közleménnyel(közleményekkel) lehet(nek) kapcsolatban.*

8.2.9.6.4 Amennyiben a CPDLC átadása nem jelenti az adatkapcsolat felett rendelkező egység megváltoztatását, és még további befejezetlen közlemények vannak folyamatban, ezeket a közleményeket vagy az illetékes légiforgalmi irányító számára kell eljuttatni, vagy le kell zárni azokat, a helyi utasításoknak, és ha szükséges, az együttműködési egyezményeknek megfelelő módon.

8.2.10 A CPDLC közlemények kijelzése

Ajánlás. - *Azok az ATC egységek, melyek a PANS-ATM-ben található CPDLC szabványos közleményeket használják, a kapcsolódó szöveget, mely az adott közleményhez társítható, lehetőleg úgy kell megjelenítsék, ahogy azt a PANS-ATM, 5. Függelékében bemutatásra került.*

8.2.11 Szabad szöveges közlemények

PANS. - *A légiforgalmi irányítók vagy légijárművezetők részére a 8.2.9.5.2 pontban bemutatott, előre összeállított, szabad szöveges közleményeken kívül, más szabad szöveges közlemény használatát lehetőleg el kell kerülni.*

Megjegyzés. - Jóllehet elismert, hogy a nem szokásos és a kényszerhelyzet okozta körülmények szükségessé tehetik a szabad, szöveges közlemények használatát, különösen ha a beszéd-üzemű rádió-összeköttetésben hiba lép fel, a szabad szöveges közlemények használatának elkerülése a tévedés és félreérthetőség lehetőségének csökkentését szolgálja.

8.2.12 Kényszerhelyzetek, vészhelyzetek és a berendezés meghibásodása során követendő eljárások

8.2.12.1 **PANS. -** *Amikor egy CPDLC kényszerhelyzeti közleményt vettek, a légiforgalmi irányítónak a lehető leghatékonyabb módon kell nyugtáznia a közlemény vételét.*

8.2.12.2 **PANS. -** *Amikor CPDLC-n keresztül egy olyan jelentésre válaszolnak, amely jogellenes beavatkozásra utal, a "ROGER 7500" fedélzetre irányuló közleményt kell használni.*

8.2.12.3 **PANS. -** *Amikor CPDLC-n keresztül bármely más kényszerhelyzeti közleményre válaszolnak, a "ROGER" fedélzetre irányuló közleményt kell használni.*

8.2.12.4 Amikor egy CPDLC közleményre logikai nyugtázás szükséges, és/vagy egy üzemeltetői válasz, és ez nem érkezik meg, a légijárművezetőt, vagy a légiforgalmi irányítót erre, értelemszerűen, figyelmeztetni kell.

8.2.12.5 *A CPDLC meghibásodása*

8.2.12.5.1 **Ajánlás. -** *A CPDLC hibáját lehetőleg kellő időben kell észlelni.*

8.2.12.5.2 A légiforgalmi irányítót és a légijárművezetőt azonnal figyelmeztetni kell a CPDLC hibás működésére, amint a hibát észlelték.

8.2.12.5.3 **PANS. -** *Amikor a légiforgalmi irányítót, vagy a légijárművezetőt figyelmeztették arra, hogy a CPDLC meghibásodott, és a CPDLC helyreállítása előtt valamelyiküknek összeköttetésbe kell lépnie, akkor vissza kell térniük a beszéd-üzemű kapcsolattartásra, ha ez lehetséges, és az információkat:*

"CPDLC FAILURE" - kifejezéssel kell bevezetni.

8.2.12.5.4 **PANS. –** *Azok a légiforgalmi irányítók, akiktől megkívánják, hogy a teljes CPDLC földi rendszer hibájáról információkat közvetítsenek valamennyi olyan állomásnak, amely valószínűleg hallhatja a közleményt, az ilyen általános hívással kiadott közleményt az "ALL STATIONS CPDLC FAILURE" ("MINDEN ÁLLOMÁSNAK, A CPDLC MEGHIBÁSODOTT") kifejezéssel kell bevezetniük, melyet a hívó állomás azonosítója kell, hogy kövessen.*

Megjegyzés. - Az ilyen általános hívásra nem várnak választ, kivéve, ha ezt követően az egyes állomásokat felkérik a vétel nyugtázására.

8.2.12.5.5 **PANS. -** *Amikor a CPDLC meghibásodik, és az összeköttetésekben visszatérnek a beszéd-üzemű rádió-kapcsolatra, az összes lezáratlan CPDLC közleményt úgy kell tekinteni, hogy nem jutott el a címzetthez, és a függőben lévő közleményekkel kapcsolatos teljes közlemény-váltást lehetőleg újra kell kezdeni a beszéd-üzemű rádió-kapcsolat felhasználásával.*

8.2.12.5.6 **PANS. -** *Amikor a CPDLC meghibásodott, de helyreállítják, mielőtt beszéd-üzemű összeköttetésre kellene áttérni, az összes függőben lévő befejezetlen közleményt úgy kell tekinteni, hogy nem jutott el a címzetthez, és a befejezetlen közleményeket illető teljes közlemény-váltást újra kell kezdeni a CPDLC-n keresztül.*

8.2.12.6 *A CPDLC szándékos kikapcsolása*

8.2.12.6.1 Amennyiben a kommunikációs hálózat, vagy a CPDLC földi rendszerének időleges üzemszüneteltetése előre tervezett, egy NOTAM-ot kell kiadni, amellyel az összes érintett felet előzetesen értesíteni kell az üzemszünet tervezett időtartamáról, és ha szükséges, a felhasználandó beszéd-üzemű rádió-kapcsolat frekvenciáinak részleteiről.

8.2.12.6.2 Az ATC-vel pillanatnyilag kapcsolatban lévő légijárműveket szóban, vagy a CPDLC-n keresztül értesíteni kell a CPDLC szolgáltatás küszöbön álló kieséséről.

8.2.12.6.3 A légiforgalmi irányítónak és a légijárművezetőnek biztosítani kell a CPDLC szolgáltatás azonnali leállításának lehetőségét.

8.2.12.7. *Szóló CPDLC közlemény meghibásodása*

PANS.- *Ha a légiforgalmi irányító vagy a légijárművezető figyelmeztetést kap, hogy egy szóló CPDLC közlemény meghibásodott, akkor a légiforgalmi irányító vagy a légijárművezető az alábbiak szerint jár el:*

a) beszédüzemben visszaigazolja azokat a műveleteket, amelyeket a vonatkozó párbeszéddel kapcsolatban elvégez és az információt az alábbi szöveggel vezeti be:

CPDLC MESSAGE FAILURE; (CPDLC közlemény meghibásodás)

b) CPDLC közlemény útján, újra kiadja a meghibásodott közleményt

8.2.12.8 A légijárművezetői CPDLC közlemény- kérések használatának leállítása

8.2.12.8.1. **PANS.** *Amennyiben a légiforgalmi irányító felkér valamennyi állomást, vagy egy adott járatot arra, hogy ne küldjön egy korlátozott időszakon belül CPDLC közleményeket, az alábbi formátumot használja:*

((call sign) or ALL STATIONS) STOP SENDING CPDLC REQUESTS (UNTIL ADVISED) (reason)

((Hívójel), vagy MINDEN ÁLLOMÁS RÉSZÉRE) NE KÜLDJENEK (TOVÁBBI ÉRTESÍTÉSIG) CPDCL KÖZLEMÉNYEKET (fennálló ok megnevezése)

Megjegyzés. – Ebben a helyzetben a CPDLC közlemények a légijárművezető részére elérhetők, szükség esetén válaszol a közleményekre, jelenti az információt és elrendeli, illetve megszünteti a vészhelyzetet

8.2.12.8.2. **PANS.**- *A CPDLC közlemények normál használatának visszaállása után az alábbi formátumban jelenik meg a közlés:*

((call sign) or ALL STATIONS) RESUME NORMAL CPDLC OPERATIONS

((hívójel) vagy MINDEN ÁLLOMÁS RÉSZÉRE) NORMÁL CPDLC ÜZEMMÓD HELYREÁLLÍTVA

8.2.13 Amennyiben egy légijárművel a CPDLC tesztelése kihatással lehet a légijármű számára nyújtott légiforgalmi szolgáltatásokra, akkor egyeztetés szükséges az ilyen ellenőrzést megelőzően.

8.2.14 A soron következő irányító egységtől származó engedély-továbbítási szolgáltatás /DCDS/

8.2.14.1 Az illetékes ATS hatóság dönti el, hogy egy ATC egységnél alátámasztják-e az útvonal soron következő légiforgalmi irányító egységétől származó engedély továbbítási szolgáltatást.

8.2.14.2 *A soron következő irányító szolgálati egységtől származó engedély-továbbítási szolgáltatás /DCDS/ létrehozása*

8.2.14.2.1 A DCDS szolgáltatását csak a fedélzeti rendszernek kell kezdeményeznie. A kezdeményezésnek jeleznie kell, hogy ez az összeköttetés csak a DCDS-től származó engedély vételére szolgál.

8.2.14.2.2 Amikor egy ATC egység visszautasítja a DCDS-t, megadja a légijárművezetőnek a visszautasítás okát is, a "SERVICE UNAVAILABLE" a légiforgalmi irányító és a légijárművezetők közötti digitális adat-kapcsolati /CPDLC/ közlemény használatával.

8.2.14.3 *A soron következő irányító szolgálati egységtől származó engedély-továbbítási szolgáltatás /DCDS/ üzemeltetése*

8.2.14.3.1 A légiforgalmi irányítót és a légijárművezetőt értesíteni kell, amikor a DCDS rendelkezésre áll az üzemeltetésre.

8.2.14.3.2 A légiforgalmi irányítót és a légijárművezetőt értesíteni kell arról, ha a DCDS meghibásodik.

8.2.14.3.3 Azokat a Légiforgalmi Irányítás - légijárművezetők közötti digitális adat-kapcsolati /CPDLC/ közlemény elemeket, amelyek a soron következő irányító szolgálati egységtől származó engedély-továbbítási szolgáltatásban /DCDS/ megengedett közlemények, körzeti léginavigációs megállapodásokban /Regional Air Navigation Agreement/ kerülnek meghatározásra.

8.2.14.3.4 A soron következő szolgálati egységtől származó engedély-továbbítási szolgáltatáson leadott engedély-kérésnek, mint olyannak, a légiforgalmi irányító számára egyértelműen azonosíthatónak kell lennie.

8.2.14.3.5 A soron következő szolgálati egységtől származó engedély-továbbítási szolgáltatásban leadott engedélynek, mint olyannak, a légijárművezető számára egyértelműen azonosíthatónak kell lennie.

8.2.14.4 *A soron következő szolgálati egységtől származó engedély-továbbítási szolgáltatás /DCDS/ befejezése*

8.2.14.4.1 A DCDS befejezését csak a légijármű fedélzeti rendszer kezdeményezheti.

8.2.14.4.2 A DCDS engedély-továbbítási szolgálat akkor fejeződik be az ATC egységgel, amikor az engedély-továbbítási szolgáltatás folyamatos adat-jogosultságú szolgálattá válik.

ANNEX 10/III.
Légiforgalmi távközlés:
(I. Rész – Digitális adatközlő rendszerek
II. Rész – Hangtávközlő rendszerek

III.kötet 2. kiadás – 2007. július
70-82. módosításokkal

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT ELJÁRÁSOK
LÉGIFORGALMI TÁVKÖZLÉS
10. ANNEX
A NEMZETKÖZI POLGÁRI REPÜLÉSI EGYEZMÉNYHEZ

III. KÖTET - HÍRKÖZLÉSI RENDSZEREK

(I. RÉSZ – DIGITÁLIS ADAT-ÖSSZEKÖTTETÉSI RENDSZEREK;
II. RÉSZ – HANGTÁVKÖZLŐ RENDSZEREK)

Ebben a kiadásban valamennyi olyan módosítás szerepel, amelyet a Tanács 2007. február 27-ét megelőzően fogadott el, így az Annex 10, III. Kötetének valamennyi korábbi kiadásában foglaltak 2007. november 22-én hatályukat vesztik.

A szabványok és ajánlott eljárások alkalmazásával kapcsolatos információkat lásd az Előszó c. fejezetben.

A III. KÖTET MÁSODIK KIADÁSA – 2007. JÚLIUS

Értesítés: A NEMZETKÖZI POLGÁRI REPÜLÉSI EGYEZMÉNYHEZ KIADÁSRA KERÜLT ANNEX-EK ÚJABB KIADÁSÁVAL KAPCSOLATBAN

Tudomásunkra jutott, hogy egy újabb Annex megjelenésekor a felhasználók a korábbi kiadások függelékeit kiselejtezik. Ezúton hívjuk fel az érdekeltek figyelmét arra, hogy ezeket a jövőben szíveskedjenek megőrizni az új függelék megjelenésének időpontjáig.

TARTALOMJEGYZÉK

6. FEJEZET: VHF levegő-föld digitális adatkapcsolat (VDL)

6.1 Meghatározások és rendszer teljesítőképességek
6.2 A földi telepítésű rendszerelemek jellemzői
6.3 A légijármű fedélzetére telepített rendszerelemek jellemzői
6.4 Fizikai réteg protokolllok és szolgáltatások
6.5 Kapcsolat réteg protokollok és szolgáltatások
6.6 Alhálózati réteg protokollok és szolgáltatások
6.7 A VDL mozgó szolgálati alhálózat függő konvergencia funkció (SNDCF)
6.8 Hangfrekvenciás egység a 3-as üzemmódhoz
6.9 A VHF adatkapcsolat /VDL/ 4-es üzemmód
Táblázatok a 6. Fejezethez
Ábrák a 6. Fejezethez

Függelék a 6. FEJEZETHEZ

7. FEJEZET: Alhálózati rendszerek (kidolgozás alatt)

8. FEJEZET: AFTN Hálózat

8.1 Meghatározások

8.2. AZ AFTN-ben használatos távgépíró készülékekre és áramkörökre vonatkozó műszaki előírások
8.3 A 2,5-30 MHz-es sávban működő légiforgalmi rádió-távgépíró csatornákhoz kapcsolódó vég-berendezések
8.4 Az interregionális légiforgalmi állandó-helyű szolgálatok /AFS/ áramköreinek jellemzői
8.5 A légiforgalmi szolgálati /ATS/ közlemények átvitelére vonatkozó műszaki előírások
8.6 A közepes és magasabb jeladási sebességgel történő nemzetközi föld-föld közötti adatcserére vonatkozó műszaki előírások

10. FEJEZET: Pontból-Több-pontba történő kommunikáció

10.1 Repülési információk műholdon keresztüli terjesztését végző szolgáltatás

MELLÉKLETEK

Melléklet a II. részhez: Útmutató a kapcsolati rendszerekhez

ELŐSZÓ

Történelmi háttér

A Légiforgalmi Távközlés Szabványait és Ajánlott Gyakorlatait a Tanács először 1949. május 30-án fogadta el a Nemzetközi Polgári Repülésről szóló Egyezmény 37. cikkelyében lévő előírásoknak megfelelően (Chicago, 1944) és az Egyezmény 10. Annex-eként jelölte ki, amely 1950. március 1-jén lépett hatályba. A Szabványok és Ajánlott Gyakorlatok a Hírközlési Osztály 1949. januárjában tartott Harmadik Ülésszaka ajánlásain alapulnak.

Egészen a hetedik kiadásig (ez utóbbit is beleértve), az Annex 10 egy kötetben került kiadásra, ami négy részt foglalt magába, a hozzájuk csatolt mellékletekkel együtt: az I. rész – Berendezések és Rendszerek, a II. rész – Rádiófrekvenciák, a III. rész – Eljárások és a IV. rész – Kódok és rövidítések.

A 42. Módosítással a IV. részt törölték az Annex-ből; és az ebben a részben található kódokat és rövidítéseket egy új dokumentumba, a Doc 8400-ba helyezték át.

A 44. Módosítás 1965. évi május 31-i elfogadásának eredményeként az Annex 10 hetedik kiadása két kötetbe került felosztásra: az I. kötetbe (első kiadás) - ami az I. részt, a "Berendezések és Rendszerek"-et és a II. részt, a "Rádiófrekvenciák"-at foglalja magába, valamint a II. kötetbe (első kiadás), ami a "Hírközlési Eljárások"-at tartalmazza.

A 70. Módosítás 1995. évi március 20-i elfogadásának eredményeként az Annex 10 átszerkesztésre került úgy, hogy öt kötetből áll: I. kötet – Rádiónavigációs Berendezések; II. kötet – Hírközlési eljárások; III. kötet – Hírközlési rendszerek; IV. kötet – Légtér-ellenőrző radar és Összeütközést Elkerülő Rendszerek; és az V. kötet – A Légiforgalmi Rádiófrekvencia Spektrum Felhasználása. A 70. Módosítással a III. és a IV. kötet 1995-ben került kiadásra és az V. kötet kiadását a 71. Módosítással tervezték.

Az “A” táblázat mutatja be az Annex 10 III. kötetének a 70. sz. Módosítást követő eredetét, a bennük lévő legfontosabb témák összefoglalásával, és azokkal az időpontokkal együtt, amikor a Tanács az Annex-et és a módosításokat elfogadta, amikor azok hatályba léptek, és végül, amikor alkalmazhatókká váltak.

A Szerződő Államok tevékenysége

Az eltérések bejelentése. A Szerződő Államok figyelmét felhívják az Egyezmény 38. cikkelye értelméből eredő azon kötelezettségükre, amely szerint a Szerződő Államokat felkérik arra, hogy jelentsenek be a Szervezetnek minden olyan eltérést, mely a nemzeti rendszabályaik és eljárásaik, valamint az ebben az Annex-ben lévő és ezt követően módosított Nemzetközi Szabványok között fennáll. Kérik a Szerződő Államokat, hogy ezt a bejelentést terjesszék ki az ezen Annex-ben lévő Ajánlott Gyakorlatoktól való eltérésekre is, amennyiben az ilyen eltérés lényeges jelentőséggel bír a léginavigáció szempontjából. Továbbá felkérik a Szerződő Államokat, hogy folyamatosan tájékoztassák a Szervezetet minden olyan eltérésről, amely ezt követően felmerül, vagy amennyiben bármely korábban bejelentett eltérés megszűnik. Egy, az eltérések bejelentésére vonatkozó külön felkérés kerül azonnali megküldésre a Szerződő Államok részére az egyes módosítások elfogadását követően.

Felhívják ezenkívül az Államok figyelmét az Annex 15 azon előírásaira, amelyek szerint a nemzeti rendszabályaik és gyakorlataik, valamint az ICAO Szabványok és Ajánlott Gyakorlatok között felmerülő eltéréseket a Légiforgalmi Tájékoztató Szolgálaton keresztül tegyék közzé, az Egyezmény 38. cikkelyében lefektetett, az Államokra vonatkozó kötelezettségen felül.

A tájékoztatás közzététele. Az Annex 10-ben meghatározott Szabványoknak, Ajánlott Gyakorlatoknak és Eljárásoknak megfelelően biztosított, a légijármű üzemeltetéseket érintő berendezések, szolgálatok és eljárások változásait, azok életbeléptetését és megszűntetését be kell jelenteni, és az Annex 15 előírásainak megfelelően kell hatályba léptetni.

Az Annex szövegének használata a nemzeti rendszabályokban. A Tanács 1948. április 13-án elfogadott egy határozatot, amelyben felhívta a Szerződő Államok figyelmét annak kívánatosságára, hogy saját nemzeti rendszabályaikban – a lehetőségek figyelembevétele mellett - használják azoknak az ICAO Szabványoknak a pontos nyelvi kifejezésmódjait, amelyek szabályozó jellegűek, hasonlóképpen a Szabványoktól való eltérések jelölésére is, minden olyan kiegészítő nemzeti rendszabállyal együtt amelyek a léginavigáció biztonsága vagy előírás szerűségi szempontokból fontosak. Ennek az Annex-nek a szövege szándékosan olyan módon került megfogalmazásra, hogy lehetőség nyíljon annak szövegáltoztatás nélküli, a nemzeti törvényalkotásba történő befoglalására.

Az Annex alkotóelemeinek jogi helyzete

Az Annex-ek az alábbiakban felsorolt alkotó elemekből állnak, de ezen elemek mindegyike nem feltétlenül szerepel valamennyi Annex-ben. és az alábbi jogi helyzetre utalnak:

1. – Az Annex-et alkotó anyagok a tulajdonképpeni:

a) *Szabványok és Ajánlott Gyakorlatok,* amelyeket a Tanács fogadott el az Egyezmény előírásainak megfelelően. Meghatározásuk a következő:

Szabvány: A fizikai jellemzőkre, összetételre, anyagra, teljesítőképességre, személyzetre vagy eljárásra vonatkozó minden olyan meghatározás, amelynek egységes alkalmazását a nemzetközi léginavigáció biztonsága szempontjából szükségesnek tekintenek, és amelynek a Szerződő Államok az Egyezmény értelmében eleget kell tegyenek; nem-megfelelés esetén annak bejelentése a Tanács részére a 38. Cikkely alapján kötelező.

Ajánlott Gyakorlat: Fizikai jellemzőkre, összetételre, anyagra, teljesítőképességre, személyzetre vagy eljárásra vonatkozó minden olyan meghatározás, amelynek egységes alkalmazását kívánatosnak tekinti a nemzetközi léginavigáció biztonsága, szabályszerűsége vagy hatékonysága érdekében, és amelynek teljesítésére a Szerződő Államoknak az Egyezmény értelmében törekedniük kell.

b) *Függelékek,* a kényelmi szempontból külön csoportosított anyagok, de ezek részét képezik a Tanács által elfogadott Szabványoknak és Ajánlott Gyakorlatoknak.

c) *Meghatározások,* a Szabványokban és Ajánlott Gyakorlatokban használt azon szakkifejezések értelmezése, amelyek nem magától értetődőek, mivel nincs elfogadott szótári jelentésük. Egy bizonyos meghatározásnak nincs önálló státusza, de minden egyes Szabványnak és Ajánlott Gyakorlatnak lényeges részét képezi, aszerint, hogy milyen szövegkörnyezetben használják, mivel a szakkifejezés jelentésének értelmi változása befolyásolná az előírás értelmezését.

d) A*Táblázatok* és *ábrák* kiegészítik vagy illusztrálják azokat a Szabványokat és Ajánlott Gyakorlatokat, amelyekre azokban utalnak, ezek a vonatkozó Szabványoknak és Ajánlott Gyakorlatoknak részét képezik, és ugyanazzal a jogi helyzettel rendelkeznek.

2. – A Tanács által a Szabványokhoz és Ajánlott Gyakorlatokhoz kapcsolódóan közzétételre elfogadott anyag:

a) *Előszavak*, a Tanács tevékenységén alapuló történeti és magyarázó anyagokat tartalmazzák, és magukba foglalják az Államoknak az Egyezményből és az Elfogadási Határozatból következő - a Szabványok és Ajánlott Gyakorlatok alkalmazására vonatkozó - kötelezettségeinek magyarázatát is, ami a Chicagói Egyezményen és annak Végrehajtási Határozatán alapszik;

b) *Bevezetések,* azok a magyarázó anyagok, amelyekkel az Annex részei, fejezetei vagy szakaszai kezdődnek, azért, hogy a szöveg alkalmazásának megértését segítsék;

c) A *Megjegyzések* a szövegbe beépítve - ahol szükséges - tárgyi információt vagy hivatkozást adnak a Szabványokkal vagy Ajánlott Gyakorlatokkal kapcsolatos kérdésekben, de nem képezik a Szabványok és Ajánlott Gyakorlatok részét;

d) A *Mellékletek* a Szabványokkal és Ajánlott Gyakorlatokkal kapcsolatos kiegészítő anyagokat tartalmazzák, vagy azok alkalmazásához útmutatóként kerültek beépítésre.

A szabadalmi felelősség elutasítása

Felhívjuk a figyelmet annak lehetőségére, hogy az ebben az Annex-ben lévő Szabványok és Ajánlott Gyakorlatok bizonyos elemei szabadalom vagy egyéb szellemi tulajdoni jog tárgyát képezhetik. Az ICAO nem vállal felelősséget vagy kötelezettséget bármilyen ilyen jellegű jog azonosításának elmulasztása miatt. Az ICAO nem foglal állást semmilyen találmánynak vagy egyéb vélt szellemi tulajdoni jog létezésével, érvényességével illetve annak alkalmazhatóságával kapcsolatban és nem ismeri el sem felelősségét, sem egyéb kötelezettségét az ilyen ügyekkel kapcsolatban.

A nyelv kiválasztása

Ez az Annex négy nyelven – angol, francia, orosz és spanyol - került elfogadásra. Minden egyes Szerződő Államot felkérnek, hogy ezeknek a különböző nyelvű szövegeknek egyikét válasszák ki hazai felhasználásra, valamint az Egyezményben meghatározott egyéb célokra, akár a közvetlen felhasználás, akár a saját nemzeti nyelvre történő fordítás útján, és ennek megfelelően értesítsék a Szervezetet.

Szerkesztési gyakorlat

A következő gyakorlat kerül következetesen alkalmazásra abból a célból, hogy az egyes állítások jogállása egyetlen pillantással megállapítható legyen: a *Szabványok* vékony antikva betűtípussal vannak nyomtatva; az Ajánlott Gyakorlatok vékony dőlt betűvel vannak szedve, jogállásukat az **Ajánlás** szó jelzi; a *Megjegyzések* vékony dőlt betűvel vannak szedve, jogi helyzetüket a Megjegyzés jelzi.
A következő szerkesztési gyakorlatot követtük az előírások megfogalmazásánál: a Szabványok esetében a "kell", az Ajánlott Gyakorlatok esetében pedig a „kellene" segédigét használtuk.
Az ebben a dokumentumban alkalmazott mértékegységek megegyeznek a Nemzetközi Mértékegység Rendszerrel (SI) úgy, ahogy az a Nemzetközi Polgári Repülési Egyezmény 5. Annex-ében meghatározásra került. Ott, ahol az Annex 5 megengedi a nem-SI mértékegységek alternatív használatát, azok zárójelben feltűntetve követik az alap mértékegységet. Ahol a két rendszer szerinti mértékegységek szerepelnek, nem szabad feltételezni , hogy az értékek egyenlők, illetve csereszabatosak. Megállapítható viszont, hogy a biztonság azonos szintje elérhető a két mértékegység bármelyikének kizárólagos használatakor.
Ennek a dokumentumnak bármely részére történő hivatkozás, amely egy számmal és/vagy címmel került azonosításra, magába foglalja annak a résznek valamennyi al-részét is.

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT ELJÁRÁSOK

I. RÉSZ – DIGITÁLIS ADAT-ÖSSZEKÖTTETÉSI RENDSZEREK

1. FEJEZET. MEGHATÁROZÁSOK

1. Megjegyzés. – A "Radio Regulations"-ra történő minden hivatkozás a Nemzetközi Távközlési Egyesület (ITU) által közzétett Nemzetközi Rádió-Rendszabályzatra vonatkozik. A Nemzetközi Rádió-Rendszabályzat újra és újra módosításra kerül az általában két vagy háromévenként megrendezésre kerülő Rádió-távközlési Világ-konferenciák (World Radiocommunication Conferences) záróközleményeiben kifejezett döntéseknek megfelelően. A Nemzetközi Távközlési Egyesület /ITU/ eljárásainak azon részeit, melyek a légiforgalmi rádiórendszerek frekvenciáinak a felhasználására vonatkozó további információkat tartalmazzák, a Polgári Légiközlekedés Rádiófrekvencia Spektrum Követelmények Kézikönyve (Handbook on Radio Frequency Spectrum Requirements for civil Aviation) *(Doc 9718) foglalja össze, amely egyúttal a jóváhagyott ICAO elvek ismertetését is tartalmazza.*

2. Megjegyzés. – Az Annex 10-nek ez a része az összeköttetési rendszerek meghatározott berendezéseire vonatkozó Szabványokat és Ajánlott Gyakorlatokat tartalmazza. Jóllehet, a Szerződő Államok fogják meghatározni a meghatározott berendezések telepítési szükségességének felülvizsgálatát, összhangban a vonatkozó Szabványokban vagy Ajánlott Gyakorlatokban leírt feltételekkel összhangban, Az érintett Szerződő Államokra vonatkozó ICAO véleményeket és az ajánlásokat a Tanács hajtja végre a szokásos módon, rendszeres időközönként, a Körzeti Léginavigációs Értekezletek ajánlásai alapján (Doc 8144, Körzeti Léginavigációs Értekezletek Irányelvei és azok Végrehajtási Eljárásainak Rendszabályai).

3. Megjegyzés. – Ez a fejezet az összeköttetési rendszerekre vonatkozó általános meghatározásokat foglalja magába. Az ebben a kötetben lévő egyes rendszerekre vonatkozó speciális meghatározások a megfelelő fejezetekben találhatók.

4. Megjegyzés. – Az összeköttetési rendszerek másodlagos energiaellátásra és a megbízhatóságukra, valamint a rendelkezésre állásukra vonatkozó útmutató anyagot az Annex 10, I. Kötet 2.9 pontja és az "F" Melléklet foglalja magába.

Aeronautical telecommunication network (ATN). Légiforgalmi Távközlési Hálózat (ATN). Egy belső hálózati kiépítés, amely lehetővé teszi a földi, levegő-föld és repülési adat alhálózatok számára az együttműködést egymás között, a Nemzetközi Szabványügyi Szervezet (ISO) Nyílt Rendszer Összekapcsolás (OSI) referencia modellen alapuló közös interfész szolgáltatás és protokolllok elfogadásával.
Aircraft address. Légijármű címzés. Huszonnégy bit egyedi kombinációja, amely egy légijármű számára kijelölésére rendelkezésre áll a levegő-föld összeköttetés, a navigáció és légtér-ellenőrzés céljára.
Aircraft earth station (AES). Légijármű fedélzeti földi állomás (AES). Mozgó földi állomás a repülési mozgó műholdas szolgáltatásban, amely egy légijármű fedélzetén van elhelyezve (lásd még ("GES").
Bit error rate (BER). Bit hiba-arány (BER). Egy mintavételben található bit hibák száma, osztva a mintavételben lévő összes bitek számával, általában sok ilyen mintavétellel átlagolva.
Carrier-to-multipath ratio (C/M). Direkt több-utas vivőfrekvenciás teljesítmény viszonyszám. A vivőfrekvencia teljesítmény közvetlenül vett, azaz visszaverődés nélküli viszonyszáma, a több-utas teljesítményhez, azaz a visszavert vivőfrekvencia teljesítményhez képest.
Carrier-to-noise density ratio (C/N_0). Vivőfrekvencia zajsűrűség viszonyszám (C/N_0). A teljes vivőfrekvencia teljesítmény viszonyszáma az 1 Hz sávszélességhez tartozó átlagos zajteljesítményhez képest, amelyet rendszerint dBHz-ben fejeznek ki.
Channel rate. Csatorna átviteli sebesség. Az a sebesség, amellyel biteket visznek át az RF csatornán keresztül. Ezek a bitek tartalmazzák azokat a biteket, amelyeket keretezésre és hiba-korrekcióhoz használnak, valamint az információt hordozó biteket. Kötegelt adatátvitel esetében az átviteli sebesség a kötegelés időtartama alatti pillanatnyi kötegelési sebességre vonatkozik.

Channel rate accuracy. Csatorna átviteli sebesség pontossága. Ez annak az órajelnek a relatív pontossága, amelyhez az átvitt csatorna-biteket szinkronizálják. Például, az 1,2 kbit/s csatorna átviteli sebességnél a 10^6 egy részének maximális hibája, amely magában foglalja a maximálisan megengedett órajel-hibát, ±1,2 x 10^{-3} Hz.
Circuit mode. Áramköri módozat. Olyan kialakítású kommunikációs hálózat, amely az alkalmazások szempontjából dedikált átviteli vonalnak tekinthető.
Doppler shift. Doppler-eltolódás. A vevő egységnél megfigyelt frekvencia-eltolódás, amely az adó egység és a vevő egység közötti relatív elmozdulás következménye.
End-to-end. Végponttól-végpontig. Teljes kommunikációs úthoz tartozó, vagy arra vonatkozó, tipikusan (1) az információ-forrás és a kommunikációs rendszer közötti, az átviteli végen lévő interfésztől (2) a kommunikációs rendszer és az információ-használó, vagy feldolgozó, vagy alkalmazó közötti, a vételi végen lévő interfészig tartó összeköttetési útvonal.
End-user. Végfelhasználó. Az információ végső forrása és/vagy felhasználója.
Energy per symbol to noise density ratio. (E_S/N_0) Jel-zaj teljesítmény viszony (E_s/N_0). A csatorna-szimbólumonként kisugárzott átlagos energia és az átlagos zaj teljesítmény viszonyszáma az
1 Hz sávszélességben, rendszerint dB-en kifejezve. Az A-BPSK és A-QPSK esetében egy csatorna-szimbólum egy csatorna-bitnek felel meg.
Equivalent isotropically radiated power (e.i.r.p.) Izotropikusan kisugárzott egyenértékű teljesítmény (e.i.r.p.) Az antennába táplált teljesítmény és az antenna egy megadott irányban az izotróp sugárzóhoz viszonyított nyereségének összege. *(abszolút vagy izotróp nyereség).*
Forward error correction (FEC). Adat-továbbítási hiba védelem (FEC). A továbbított jel redundáns információval oly módon történő kiegészítésének folyamata, amely lehetővé teszi a továbbításban jelentkező hibák kijavítását a vevőnél.
Gain-to-noise temperature ratio. Nyereség-zaj hőmérsékleti viszonyszám. Az antenna alrendszer vevő-oldali kimenetén az antenna-nyereség és zaj viszonyszáma rendszerint dB/K-ban kifejezve. A zajt annak a hőmérsékletnek az értékeként fejezik ki, amellyel egy 1 Ohm-os ellenállás hőmérsékletének emelkedni kell az ugyanakkora zaj teljesítmény-sűrűség előállításához.
Ground earth station(GES). Földi telepítésű földi állomás (GES) A műholdas állandóhelyű szolgálat, vagy néhány esetben a műholdas légiforgalmi mozgó-szolgálat földi állomása, amelyet egy meghatározott állandó földi helyre telepítenek a műholdas légiforgalmi mozgó-szolgálat részére távkapcsolat nyújtása céljából.

Megjegyzés. – Ezt a meghatározást az ITU Nemzetközi Rádió-Rendszabályzata a "repülési földi állomás" meghatározásaként használja. A Szabványok és Ajánlott Gyakorlatok-(SARPs)-ban alkalmazott "GES" meghatározásának az a célja, hogy egyértelműen megkülönböztesse ezt egy légijármű fedélzetén elhelyezett földi állomástól (AES), amely egy légijármű fedélzetén lévő mozgó állomás.

Mode S subnetwork. Mód S alhálózat. A másodlagos légtér-ellenőrző radar (SSR) Mode S kérdező és válaszadó egységek felhasználásával - meghatározott protokollok szerint végzett digitális adatcsere céljára szolgáló eszköz.
Packet. Adatcsomag. Hálózati szintű összeköttetési eszközök közötti adatcsere alapegysége.
Packet layer protocol (PLP). Adatcsomag réteg protokolll (PLP). Egyenrangú **egységek** közötti hálózati szintű összeköttetés létesítésére és fenntartására, valamint adatcsomagok átvitelére szolgáló protokoll. Ezen szabvány vonatkozásában a hivatkozott kifejezés arra a protokolllra vonatkozik, melyet az ISO 8208 szabványban határoztak meg.
Point-to-point. Ponttól-pontig. Két, főképpen végfelhasználói berendezés, egymással való kölcsönös összeköttetéséhez tartozó, vagy arra vonatkozó, két különálló végfelhasználót összekötő szolgáltatás kommunikációs útvonala, megkülönböztetésként a közvetítő- és a több-pontú szolgáltatástól.
Slotted aloha. Időosztásos távközlési csatorna használat. Véletlenszerű hozzáférhetőség stratégiája, ahol több felhasználó egymástól függetlenül férhet hozzá ugyanahhoz az adatátviteli csatornához, de minden összeköttetést egy rögzített résidőre kell korlátozni. Az összes felhasználó ismeri ugyanazon résidő szerkezetet, de egyéb koordináció nincs a felhasználók között.
Switched virtual circuit (SVC). Kapcsolt virtuális áramkör (SVC). Az ISO 8208 protokolllon belül szolgáltatott elsődleges áramkör vezérlő eljárás. A hálózati forrásokat dinamikusan kiosztják szükség esetén, és felszabadítják, ha már nincs erre igény.
Time division multiplex access (TDMA). Időosztásos multiplex hozzáférés (TDMA). Egy RF csatorna időmegosztásos használatán alapuló, többszörös hozzáférési eljárás, amely a következőket alkalmazza: (1) diszkrét, egymást követő idő-réseket, mint alapvető megosztott forrást; és (2) működő protokolllok egy halmazát, amely

lehetővé teszi a használók számára, hogy együttműködjenek egy vezérlő irányító állomással a csatorna elérés elősegítésére.
Time division multiplex (TDM). Időosztásos multiplex (TDM). Egy csatorna-megosztási stratégia, amelyben az azonos forrásból származó, de különböző rendeltetési helyű információ-csomagokat időrendben sorba rendezik ugyanazon a csatornán.
Transit delay. Átviteli késés. Az összeállított adatcsomag továbbítására irányuló kérés, valamint a vevő-oldali megfelelő csomag vételére és felhasználására vagy továbbítására való készségre vonatkozó jelzés között eltelt idő, kötegelt adat rendszerekben.
VHF digital link (VDL). VHF (ultrarövidhullámú) digitális összeköttetés. A repülési távközlési hálózat (ATN) alkotó részét képező mozgó alhálózat, amely a repülési mozgó VHF frekvencia-sávban üzemel. Ezenkívül, a VDL nem-ATN funkciókat is szolgáltat, mint például digitalizált hangot.

2. FEJEZET.

(Kidolgozás alatt.)

3. FEJEZET. LÉGIFORGALMI TÁVKÖZLÉSI HÁLÓZAT

3.1 MEGHATÁROZÁSOK

1. Megjegyzés. – A következő meghatározásokat az ISO/IEC 7498-1, Information technology – Open Systems Interconnection – Basic Reference Modell (Információs technológia – Nyílt rendszerek belső kapcsolás – Alap referencia modell) (*Reference: ITU-T Rec. X. 200 (1194) és az ICAO Doc 9705 –* Manual of Technical Provisions for the Aeronautical Telecommunication Network (ATN) (Légiforgalmi Távközlési Hálózat Műszaki Előírásai Kézikönyv) *meghatározásaiból vettük.*

2. Megjegyzés. – Az ICAO Doc 9705 több kiadást ért meg. Ennek a dokumentumnak mindegyik alkötete jelezte az előírások alakulását az egymást követő kiadások között.

3. Megjegyzés. – Az ICAO Doc 9705 I. alkötete egy kereszt-hivatkozási grafikont szolgáltat a változatok (azaz beépített szoftver képessége) és a kiadványok (azaz műszaki előírások) között.

Accounting management. Forgalmi kezelés**.** Egy olyan rendszerkezelési berendezés, amely a felhasználók hálózati erőforrás felhasználásait kezeli, ellenőrzi és korlátozza az erőforrások felhasználását.
ADS application. ADS alkalmazás. Egy olyan Légiforgalmi Távközlési Hálózati /ATN/ alkalmazás, amely a légijárművektől származó automatikus berendezés-függő légtérellenőrző /ADS/ adatokkal látja el a Légiforgalmi Szolgálati /ATS/ Egysége(ke)t, légtérellenőrzési célokra.
Aeronautical administrative communication (AAC). Légiforgalmi igazgatási közleményváltás. Repülésüzemeltető ügynökségek által használt, a repülési és szállítási szolgáltatásaikra vonatkozó üzleti közleményváltás. Ezt a közleményváltási formát széleskörűen alkalmazzák, mint például repülési és földi szállításokra, könyvelésre, személyzet és légijármű üzembe állítására, vagy más logisztikai célokra a teljes repülésüzemeltetés hatékonyságának fenntartása vagy növelése érdekében.
Aeronautical operational control (AOC). Repülésüzemi járatói felügyelet (AOC). A repülések indítása, folytatása, átirányítása vagy befejezése céljából, azok biztonsága, rendszeressége és hatékonysága érdekében végzett felügyelet ellátásához megkövetelt járatói kapcsolattartás.
Aeronautical passanger communication) (APC). Légiutasok távközlése (APC). Nem biztonsági jellegű beszéd- és adatszolgáltatási kapcsolattartás utasok és a légi hajózó személyzeti tagok részére személyes közlemény-váltáshoz.
AIDC application. ATS Egységek közötti automatikus adatcsere (AIDC) alkalmazás. Egy olyan Légiforgalmi Távközlési Hálózati /ATN/ alkalmazás, melynek rendeltetése a Légiforgalmi Irányítás (ATC) Légiforgalmi Szolgálati Egységei (ATSUs) közötti információ-cserére szolgál, a repülési értesítések, a repülés koordináció, az összeköttetés átadása, a légtérellenőrzési adatok továbbítása, valamint általános adatok továbbítása céljára.
Air traffic service. Légiforgalmi szolgálat. (ATS) Gyűjtőfogalom, ami jelenthet repülés-tájékoztató szolgálatot, repülőtéri repülés-tájékoztató szolgálatot, riasztó szolgálatot, légiforgalmi tanácsadó szolgálatot, légiforgalmi irányító szolgálatot (körzeti, bevezető, vagy repülőtéri).

Application. Alkalmazás. Egy információs rendszer végső felhasználása; magától a rendszertől való megkülönböztetésként.
Application entity (AE). Alkalmazási entitás (AE). Az alkalmazási folyamat azon része, amely a Nyílt Rendszerek Összekapcsolásának (OSI) környezetén belül az összeköttetéseket érinti. Egy alkalmazási folyamat szempontjait, amelyeket az OSI céljainál figyelembe kell venni, egy vagy több Alkalmazási Entitás (AE) képviseli.
Application information. Alkalmazási információ. Az alkalmazási nevekre utal (például: az AE /Alkalmazási entitás/ minősítők, mint az ADS /Automatikus berendezés-függő légtér-ellenőrző rendszer/ és a CPC), a típus száma és a címzése (a hosszú vagy rövid TSAP, szükség szerint), minden egyes alkalmazásnál.
ATIS application. ATIS alkalmazás. Egy olyan FIS /Repüléstájékoztató Szolgálati Alkalmazás/, amely támogatja a D-ATIS- /Digitális Automatikus Közelkörzeti Tájékoztató Szolgálat/-ot.
ATN directory services (DIR). ATN katalógus szolgáltatás (DIR) Szolgáltatás, amely biztosítja egy alkalmazási entitás vagy felhasználó részére, hogy az ATN közösségben egy elosztott katalógus adatbázisról lekérdezhessen és visszakereshessen címzési, biztonsági és műszaki képességi információkat az ATN közösségen belüli más felhasználókról és entitásokról.
ATN security services. ATN biztonsági szolgáltatás. A biztonság előírások információs készlete, amely lehetővé teszi a vevő 'végső' állomás vagy közbenső rendszer állomás részére a vett információk forrásának egyértelmű azonosítását (hitelesen), és ezen információk sértetlenségének ellenőrzését.
ATN systems management (SM). ATN rendszerkezelés (SM). Berendezések készlete azon források vezérlésére, koordinálására és ellenőrzésére, amely lehetővé teszi, hogy az összeköttetések az ATN rendszerben létrejöjjenek. Ezek a berendezések magukba foglalják a hibák, az elszámolás, a felépítés, valamint, a teljesítmény és a biztonsági kezelést.
ATSC class. ATSC osztály. Az ATSC osztály-paraméter lehetővé teszi az ATSC használója számára a felkínált adatoknál várható szolgáltatási minőség meghatározását. Az ATSC osztály értéke az ATN végtől-végig való átvitel 95 százalékos valószínűségű késése fogalmával van meghatározva.
ATS communications (ATSC). ATS összeköttetés (ATSC)**.** A légiforgalmi szolgáltatásokkal kapcsolatos összeköttetés, amely a légiforgalmi szolgáltatások, a légiforgalmi irányítás, a repülési és meteorológiai információk, a helyzet-jelentések és a repülés biztonságával, valamint rendszerességével kapcsolatos szolgáltatásokat tartalmazza. Ez az összeköttetés egy vagy több légiforgalmi szolgálati adminisztrációt foglal magában. Ezt a fogalmat címzésekkel kapcsolatos adminisztratív célokra használják.
ATS interfacility data communication (AICD). ATS egységek közötti automatikus adatcsere (AIDC). Automatizált adatcsere légiforgalmi szolgálati egységek között, különösen a repülések koordinációja és átadása vonatkozásában.
ATS message handling services (ATSMHS). ATS közlemény-továbbítási eljárások (ATSMHS). Az ATS közlemények ATN-en keresztüli cseréjéhez használt eljárások oly módon, hogy egy ATS közlemény továbbítása általában nem korrelál a szolgálatot nyújtó másik ATS közlemény továbbításával. Két ATS közlemény kezelési szolgálat van, az ATS közlemény-küldő szolgálat és az ATN átmenő szolgálat.
ATS message handling system (AMHS) ATS közlemény kezelési rendszere (AMHS). Az ATS küldemény szolgálat által biztosított küldemények továbbítási rendszere.
ATS unit (ATSU). ATS egység (ATSU). Gyűjtőfogalom, amely jelenthet légiforgalmi irányító egységet, repülés-tájékoztató egységet vagy légiforgalmi szolgálatok bejelentő irodáját.
Authentication. Hitelesítés. Egy személy/felhasználó/hálózati entitás azonosságának ellenőrzésére bevezetett eljárás.
Authorized path. Engedélyezett összeköttetési útvonal. Összeköttetési útvonal, amelyet az adott terület vezetője(i) egy adott forgalom típushoz és kategóriához előre meghatározott (meghatároztak) és alkalmasnak nyilvánított (nyilvánítottak).
Automatic dependent surveillance (ADS). Berendezés-függő automatikus légtérellenőrző rendszer (ADS). Légtérellenőrzési mód alatt az értendő, amikor egy légijármű adatátviteli csatornán keresztül automatikusan továbbítja a fedélzeti navigációs- és helyzet-jelentő rendszerektől származó adatokat, beleértve a légijármű hívójelét, a négy-dimenziós helyzet-tájékoztatást és szükség szerint, egyéb adatokat is.
Automatic terminal information service (ATIS). Automatikus közel-körzeti tájékoztató szolgálat (ATIS). Egész nap, vagy a nap meghatározott részében aktuális, rutin jellegű tájékoztatások biztosítása az érkező és az induló légijárművek részére.
Adatkapcsolat - Automatikus közel-körzeti tájékoztató szolgálat (D-ATIS). Adatkapcsolat útján történő ATIS biztosítása.
Beszéd-üzemű - Automatikus közel-körzeti tájékoztató szolgálat. (Beszéd-üzemű ATIS). Folyamatos és ismétlődő, általános adások útján történő ATIS biztosítása.
Configuration management. Konfigurációs kezelési eljárás. ATN rendszer kezelési berendezés a kezelők részére a távirányítású elemek konfigurációinak megváltoztatásához.

Context management (CM) application. Bejelentkezési eljárás. Olyan ATN alkalmazás, amely bejelentkezési szolgáltatást nyújtva, kezdeti légijármű beiktatást, továbbá a légijárműre vonatkozó összes többi adatkapcsolat alkalmazás jegyzéke beiktatását teszi lehetővé az ATN-be. Magában foglalja továbbá az ATS egységek közötti címzésküldő funkciót.
Megjegyzés. – A bejelentkezési eljárás egy elismert OSI bemutató réteg fogalom. Az OSI használatnak és az ATN használatnak egyébként nincs közös területe.
Context management (CM) server. Bejelentkezési eljárás szerver. Egy olyan Légiforgalmi Szolgálati /ATS/ berendezés, amely képes arra, hogy alkalmazási információt biztosítson más ATSU-kra vonatkozóan légijárműtől, vagy ATSU-tól kérve.
Controller-pilot data link communication (CPDLC). Légiforgalmi irányító és légijárművezető közötti digitális adatcsere. A légiforgalmi irányító és a légijárművezető közötti távközlési módszer, ahol az ATC közleményeket adatátviteli összeköttetés segítségével továbbítják.
CPDLC application. CPDLC alkalmazás. Olyan Légiforalmi Távközlési Hálózati /ATN/ alkalmazás, amely eszközt biztosít a légiforgalmi irányítói adatösszeköttetésben az irányító, a vevő vagy a soron következő Légiforgalmi Szolgálati /ATS/ egységek és a légijármű között, a levegő-föld és föld-föld alhálózatokat felhasználva, és ami összeegyeztethető az ICAO szakkifejezésekkel, a Légiforgalmi Irányítás jelenlegi élőszavas összeköttetéseivel.
Data integrity. Adat sértetlenség. Annak a valószínűsége, hogy egy adat nem változik, illetve nem sérül meg.
D-METAR. D-METAR. A Digitális Adatkapcsolaton keresztül biztosított repülési időjárás-jelentő szolgálat jelölésére használatos rövidítés.
End system (ES). Vég-rendszer (ES). Rendszer, amely tartalmazza az OSI hét rétegét és egy vagy több végső felhasználó alkalmazási folyamatot.
End to end. Végponttól-végpontig. Teljes kommunikációs úthoz tartozó vagy arra vonatkozó, tipikusan (1) az információforrás és a kommunikációs rendszer közötti, az átviteli végen lévő interfésztől (2) a kommunikációs rendszer és az információt használó vagy azt feldolgozó, illetve alkalmazó közötti, a vételi végen lévő interfészig tartó összeköttetési útvonal.
Entity. Entitás. Aktív elem bármely rétegben, amely lehet vagy egy szoftver entitás (mint például egy folyamat) vagy egy hardver entitás (mint például egy intelligens input-output chip).
Fault management. Meghibásodás kezelése. Egy olyan Légiforgalmi Távközlési Hálózati /ATN/ rendszerkezelő berendezés, amely érzékeli, elkülöníti és kijavítja a problémákat.
FIS application. Repüléstájékoztató Szolgálati /FIS/ alkalmazás. Egy olyan Légiforgalmi Távközlési Hálózati /ATN/ alkalmazás, amely a légijárművek részére tájékoztatást ad és hasznos tanácsokat nyújt a repülések biztonságos és eredményes lefolytatásához.
Flight information service. **(FIS)** Repüléstájékoztató Szolgálat (FIS). Olyan szolgálat, amelyet a repülések biztonságos és hatékony végrehajtásához hasznos tanácsok és tájékoz tatások adása céljából nyújtanak.
Inter-centre communications (ICC) Központok közötti digitális közleményváltás (ICC). Az ICC az ATS egységek közötti adatkapcsolati összeköttetést jelent az ATS támogatása érdekében olyan területeken, mint például repülésekről szóló előzetes tájékoztatás, koordinálás, irányítás-átadás, repüléstervezés, légtér-gazdálkodás és légiforgalmi áramlás-szervezés.
Intermediate system (IS). Közbenső rendszer. Rendszer, amely átviteli és útvonalazási funkciót lát el és az OSI referencia modell legalsó három rétegére szorítkozik.
Internet communications service. Hálózatok közötti távközlési szolgáltatás. A hálózatok közötti távközlési szolgáltatás egy hálózatközi felépítmény, amely lehetővé teszi földi, levegő-föld és repüléselektronikai alhálózatok együttműködését közös interfész szolgálatok és protokollok elfogadásával az ISO/OSI referencia modell alapján.
METAR application. METAR alkalmazás. Egy olyan Repüléstájékoztatási Szolgálati /FIS/ alkalmazás, amely támogatja a. D-METAR közlemények továbbítását.
Open systems interconnection (OSI) reference modell. Nyílt rendszerek (OSI) referencia modell. Modell, amely szabvány megközelítést nyújt a hálózat tervezéséhez, modularitást vezet be a funkciók komplex együttesének hét jobban kezelhető, önálló funkcionális rétegre történő osztásával. Ezeket egyezményesen általában függőlegesen rakott halmazként írják le.

Megjegyzés – Az OSI referencia modellt az ISO/IEC 7498-1 határozza meg. .

Performance management. Teljesítmény felügyelet. Egy Légiforgalmi Távközlési Hálózati /ATN/ rendszer felügyelő berendezés, amely ellenőrzi és kiértékeli a rendszer teljesítményét.
Subnetwork. Alhálózat. Az adathálózat tényleges megvalósítása, amely homogén protokolllt és címzés-tervet

alkalmaz és egyetlen hatóság irányítása alatt áll.
System level requirement. Rendszerszint követelmény. A rendszerszint követelmény magas szintű műszaki követelmény, amely üzemelési követelményekből, technológiai korlátozásokból és rendszabályozási korlátozásokból (adminisztratív és intézményi) kerül levezetésre. A rendszerszint követelmények szolgálnak alapul a funkcionális - és az alacsonyabb szintű követelményekhez.
Transit delay. Átviteli késés. Köteg adatrendszerekben egy összeállított adatköteg továbbítására irányuló kérés és a vevő oldal arra vonatkozó jelzése között eltelt idő, amely idő alatt a hozzá tartozó köteget vette és felhasználásra vagy továbbításra készen áll.
Upper layers (UL) communications service. Felső rétegű (UL) kommunikációs szolgáltatás. Az OSI referencia modell gyűjtő, bemutató és alkalmazó rétegeihez tartozó fogalom.

3.2 BEVEZETÉS

3.2.1 A Légiforgalmi Távközlési Hálózat (ATN) olyan alkalmazási entitásokat és összeköttetési szolgáltatásokat foglal magába, amelyek lehetővé teszik a földi, levegő-föld és repülési adat alhálózatok részére a Nemzetközi Szabványügyi Szervezet (ISO) Nyílt Rendszerek (OSI) összeköttetési referencia modelljén alapuló közös interfész szolgáltatásainak és protokollljainak együttműködését. Az ATN koncepcionális modelljét a 3-1.* ábra mutatja be.
* Az összes ábra ennek a fejezetnek a végén található.

3.2.2 A Légiforgalmi Távközlési Hálózat /ATN/ és a hozzá kapcsolódó alkalmazási folyamatokat úgy tervezték, hogy elősegítsék az összeköttetést, a navigációt, a légtérellenőrzést és légiforgalmi szolgáltatásszervezési (CNS/ATM) rendszereket. A Légiforgalmi Távközlési Hálózat /ATN/:

a) kifejezetten és kizárólagosan arra a célra szolgál, hogy összeköttetési szolgáltatást biztosítson a légiforgalmi szolgáltatásokat biztosító szervezeteknek és a légijármű üzemeltető cégeknek, az összeköttetési forgalom következő típusain keresztül:

1) a Légiforgalmi Szolgálatok összeköttetései (ATSC);
2) a Repülésüzemi járatói felügyelet (AOC);
3) a Légiforgalmi igazgatási közlemény-váltás (AAC); és
4) a légiutasok távközlése (APC);

b) a felhasználó számára átlátható módon biztosítja azt a megbízható végpontból-végpontig összeköttetési szolgáltatást, amely a légiforgalmi szolgálatok között a biztonságos és hatékony ellátás támogatásához szükséges, az alábbiak között:

1) a légijármű fedélzeti rendszerek és a földi rendszerek; valamint
2) az összetett földi rendszerek között;

c) olyan adat összeköttetési szolgáltatást nyújt, amely alkalmas a felhasználók biztonsági és biztonságossági követelményeinek teljesítésére;

d) nemzetközileg elismert adat-összeköttetési szabványokon alapul, amely megkönnyíti a jól alkalmazható rendszerek fejlesztését, és támogatja a versenyképes hálózati szolgáltatás biztosítását;

e) eltérő szolgáltatási típusokat/kategóriákat/osztályokat foglal magába (beleértve az előnyben részesített/kiválasztott levegő-föld alhálózatokat), olyanokat, amelyeket a különböző alkalmazások megkívánnak;

f) meghatároz egy olyan felépítést, ami lehetővé teszi a nyilvános és a magán alhálózatok integritását, mind a levegő-föld, mind a föld-föld összeköttetésekhez. Ez lehetővé teszi a meglévő/tervezett infrastruktúra és hálózati technológia felhasználását, valamint megadja a kivitelezőknek a hálózat méretének megvalósításához úgy, hogy a növekvő felhasználói igények kielégíthetőek; és

g) hatékonyan használja fel a sávszélesség által korlátozott levegő-föld alhálózatot és annak megfelelően csökkenti a költségeket.

3.2.3 A jelenleg meghatározott Légiforgalmi Távközlési Hálózati /ATN/ alkalmazások úgy kerültek kidolgozásra, hogy biztosítják a légiforgalmi összeköttetéseket, a légtérellenőrzést és a tájékoztató szolgálatokat. Ezek az alkalmazások a következő légiforgalmi szolgáltatás-szervezési feladatok alátámasztására szolgálnak:

a) Légiforgalmi szolgálatok (ATS);

1) Légiforgalmi irányító szolgálat (ATC);
2) Repüléstájékoztató szolgálat (FIS); és
3) Riasztó szolgálat;

b) Légiforgalmi áramlás-szervezés (ATFM); és

c) Légtér-szervezés.

3.2.4 Ez a fejezet a Légiforgalmi Távközlési Hálózat /ATN/ átfogó és általános előírásait tartalmazza. A részletes műszaki előírások a Doc 9705-ben találhatók. Ennek a fejezetnek a fennmaradó része a következő követelmények és funkciók ismertetéséhez került kialakításra:

a) általános;

b) rendszerszint követelmények;

c) ATN alkalmazási követelmények;

d) ATN összeköttetési szolgáltatási követelmények;

e) ATN elnevezés és címzés;

f) ATN rendszerkezelési követelmények; és

g) ATN biztonsági követelmények.

3.3 ÁLTALÁNOS RÉSZ

3.3.1 A Légiforgalmi Távközlési Hálózat (ATN) adat összeköttetési szolgáltatást és alkalmazási entitásokat biztosítja az alábbiak alátámasztására:

a) a Légiforgalmi szolgálatok (ATS) közvetítése a légijárművek részére;
b) ATS információk cseréje az ATS egységek között; és

c) egyéb alkalmazások, mint például repülésüzemi járatói felügyelet (AOC) és légiforgalmi igazgatási közleményváltás (AAC).

1. Megjegyzés. –Intézkedések történtek az információ-csere befogadásáról, mint például az időjárás, a repülési tervek, a NOTAM-ok és a tényleges valós-idejű légiforgalmi áramlás-szervezés a légijárműveket üzemeltető ügynökségek /járatók/ földi-bázisú rendszerei és az ATS egységek között.

2. Megjegyzés. – Intézkedések történtek a légiutasok összeköttetési (APC) rendszerének befogadásáról is.

3.3.2 Amikor az ATN-t a légiforgalmi szolgálatok munkájának segítésére használják, akkor az feleljen meg az ebben a fejezetben lévő előírásoknak.
3.3.3 A Légiforgalmi Távközlési Hálózat /ATN/ használatára vonatkozó követelményeket a körzeti léginavigációs egyezmények alapján kerül előírásra.

3.3.4 **Ajánlás.** – *A polgári repülési hatóságoknak együtt kell működnie a nemzeti hatóságokkal és a légiforgalmi* *berendezéseket gyártó iparággal különös tekintettel azokra a Légiforgalmi Távközlési Hálózati /ATN/ kivitelezési szempontokat, amelyek lehetővé teszik az ATN világméretű biztonságát, együttműködő-képességét és hatékony, megfelelő felhasználását.*

3.4 RENDSZERSZINT KÖVETELMÉNYEK

Megjegyzés. – A rendszerszint követelmények magas szintű műszaki követelmények, amelyek az üzemeltetési követelményekből, a technológiai korlátozásokból és rendszabályozási korlátozásokból (adminisztratív és intézményi) erednek. Ezek a rendszerszint követelmények képezik az alapját a funkcionális követelményeknek és az alacsonyabb szintű követelményeknek.

3.4.1 Az ATN-nél a Nemzetközi Szabványügyi Szervezetnek (ISO) a Nyílt rendszerek összekapcsolására (OSI) vonatkozó szabványait kell alkalmazni.
3.4.2 Az ATN-nek egy eszközt kell biztosítani az átmenet megkönnyítéséhez az alkalmazás entitások és/vagy az összeköttetési szolgáltatások jövőbeli változataihoz.

Megjegyzés. – Az a cél, hogy a jövőbeli változatok felé történő fejlődés a visszafelé való kompatibilitást az előző változatokkal biztosítsa.

.
3.4.3 Az ATN-nek lehetővé kell tennie a jelenlegi AFTN/CIDIN felhasználók és rendszerek átmenetét az ATN felépítésbe.

.
Megjegyzés. – Az AFTN-ről vagy a CIDIN-ből az átmenet a Légiforgalmi Távközlési Hálózatba /ATN/ azok az AFTN/AMHS és a CIDIN/AMHS kapuk kezelik /AMHS= Légiforgalmi Szolgálatok Közlemény-kezelő Szolgáltatás/ külön-külön, amelyek a Doc 9705, III. Al-kötetében vannak meghatározva.

3.4.4 Az ATN-nél olyan intézkedéseket kell hozni, amelyek által csak az irányító Légiforgalmi Szolgálati /ATS/ egység adhat Légiforgalmi irányítási /ATC/ utasításokat a légtérben üzemelő légijárművek részére.

Megjegyzés. – Ez a légiforgalmi irányító és a légijárművezető közötti digitális adatcsere (CPDLC) összeköttetés alkalmazási adatkapcsolat entitás folyamatos adat-jogosultságon és a soron következő egység adat-jogosultságon keresztül elérhető.

3.4.5 A Légiforgalmi Távközlési Hálózatnak /ATN/ előre meghatározott továbbítási útvonal listán alapuló továbbítási útvonalakat kell biztosítani.
3.4.6 Az ATN-nek eszközt kell biztosítania annak meghatározását,, hogy az adat összekötetést csak a felhasználó által meghatározott forgalom fajtához és kategóriához jogosított útvonalon keresztül lehessen végrehajtani.
3.4.7 Az ATN-nek ATSC osztályzatot kell felkínálnia a 3-1.* táblázatban lévő követelményekkel összhangban.
* Az összes táblázat a fejezet végén került elhelyezésre.

1. Megjegyzés. – Amikor egy Légiforgalmi Távközlési Hálózati /ATN/ alkalmazás meghatároz egy ATSC osztályzatot, akkor az adatcsomagot az ATN internet összeköttetési szolgálatba "a legjobb erőfeszítési alapon" kell elküldeni. A "legjobb erőfeszítési alap" azt jelenti, hogy amikor egy útvonal az ATSC osztály részére rendelkezésre áll, akkor az adatcsomagot azon az útvonalon kell továbbítani. Amikor az ilyen továbbítási útvonal nem áll rendelkezésre, akkor az adatcsomagot az első olyan ismert útvonalon kell továbbítani, amelynek az ATSC osztályzata magasabb a kért útvonalnál, vagy ha nincs ilyen útvonal, akkor az ATSC osztályzatnál a kértnél alacsonyabb első ismert útvonalon kell továbbítani.

2. Megjegyzés. – Az ATN összeköttetési szolgálat nem tájékoztatja az alkalmazási entitásokat akkor, ha a kért ATSC osztály nem volt elérhető. Az alkalmazási entitás felelőssége, hogy meghatározza azt a tényleges átviteli késedelmet, amelyet helyi eszközökkel, például idő-bélyegzéssel lehet megállapítani.

3.4.8 Az ATN-nek a 3-2. és 3-3. táblázatban meghatározott közlemény prioritásnak megfelelően kell működnie.
3.4.9 Az ATN-nek eleget kell tennie az alkalmazási információk cseréjének, amikor egy vagy több jogosult vonala

rendelkezésre áll.
3.4.10 Az ATN-nek értesítenie kell a megfelelő alkalmazási folyamatot, amikor nem áll rendelkezésre jogosult vonala.
3.4.11 Az ATN-nek eszközt kell biztosítania ahhoz, hogy egyértelműen megcímezze az összes ATN végponti és közbenső rendszert.
3.4.12 A Légiforgalmi Távközlési Hálózatnak lehetővé kell tennie a közlemény vevője részére azt, hogy azonosítsa a közlemény feladóját.
3.4.13 Az ATN címzési és elnevezési tervének lehetővé kell tennie az Államok vagy a szervezetek számára, hogy a saját közigazgatási területeiken belül címeket és elnevezéseket jelöljenek ki.
3.4.14 Az ATN-nek fenn kell tartania az adat összeköttetést az állandó helyű és a mozgó szolgálati rendszerekkel.
3.4.15 Az ATN-nek biztosítania kell az ATN mozgó szolgálati hálózatával a kapcsolatot úgy, ahogy az ebben az Annex-ben meghatározásra került.
3.4.16 Az ATN-nek gondoskodnia kell arról, hogy hatékonyan felhasználja a korlátozott sávszélességű alhálózatokat.
3.4.17 Az ATN-nek lehetővé kell tennie azt, hogy egy légijármű fedélzeti közbenső rendszer összekapcsolásra kerüljön egy földi közbenső rendszerrel az együtt-futó mozgó szolgálati alhálózatokon keresztül.
3.4.18 Az ATN-nek lehetővé kell tennie azt, hogy egy légijármű fedélzeti közbenső rendszer összekapcsolásra kerüljön az összetett földi közbenső rendszerekkel.
3.4.19 Az ATN-nek lehetővé kell tennie az alkalmazási entitások közötti címzés információk cseréjét.
3.4.20 A Légiforgalmi Távközlési Hálózatnak támogatnia kell a Bejelentkezési Eljárás (CM) kezelési alkalmazást akkor, ha más levegő-föld alkalmazásokat is segít.
3.4.21 Az ATN-nek képesnek kell lenni a társ-társ alkalmazás összekapcsolására, fenntartására, felszabadítására és megszüntetésére a bejelentkezési eljárás (CM) alkalmazásnál.
3.4.22 Az ATN-nek képesnek kell lenni pártól-párig alkalmazás együttesek létrehozására, fenntartására, felszabadítására és megszüntetésére az automatikus függő légtérellenőrzés (ADS) alkalmazásnál.
3.4.23 Az ATN-nek képesnek kell lenni a társ-társ alkalmazás összekapcsolására, fenntartására, felszabadítására és megszüntetésére az légiforgalmi irányító-légijárművezető közötti digitális adatcsere (CPDLC) alkalmazásnál.
3.4.24 Az ATN-nek képesnek kell lenni a társ-társ alkalmazás összekapcsolására, fenntartására, és megszüntetésére az automatikus közel-körzeti tájékoztató szolgálat (ATIS) alkalmazásnál.
3.4.25 Az ATN-nek képesnek kell lenni a társ-társ alkalmazás összekapcsolására, fenntartására, felszabadítására és megszüntetésére az légiforgalmi szolgálatok közleményeit kezelő szolgáltatás (ATSMHS) alkalmazással.
3.4.26 Az ATN-nek képesnek kell lenni a társ-társ alkalmazás összekapcsolására, fenntartására, felszabadítására és megszüntetésére az ATS egységek közötti adat-csere (AIDC) alkalmazásnál.
3.4.27 Ahol az ATN-en belül a napra a pontos időt használják, ott annak az Egyeztetett Világidőhöz (UTC) 1 másodpercen belüli pontosságúnak kell lenni.

Megjegyzés. – Az idő pontossági érték a meghatározott pontossági értéknek legfeljebb a kétszeresével egyenlő szinkronizációs hibát eredményezhet.

3.4.28 A végrendszernek gondoskodnia kell annak biztosításáról, hogy annak valószínűsége, hogy nem észlel egy 255 oktettes közleményt, amelyet a hálózatok közötti távközlési szolgáltatásban (internet) rossz helyre továbbított, nem továbbított, vagy elrontott, kisebb vagy egyenlő legyen 10^{-8}-al közleményenként.

Megjegyzés. – Elfogadott az, hogy a Légiforgalmi Távközlési Hálózat alhálózatai biztosítják az adatok azon sérthetetlenségét, amely a rendszerszint követelménnyel összeegyeztethető.

3.4.29 Az ATN védelmi szolgálata ATN vég-rendszerének képesnek kell lennie arra, hogy a társ-végrendszer azonosságot hitelesítse, az alkalmazási közlemények forrását azonosítsa, és az alkalmazási közlemények adat-sértetlenségét biztosítsa.

Megjegyzés. – Az alkalmazás közlemények ebben az összefüggésben a Légiforgalmi Szolgálatokra /ATS/, rendszerkezelésre és az igazgatási szolgálatokra vonatkozik.

3.4.30 ATN földi és levegő-föld határvonal közbenső rendszer ATN védelmi szolgálatának képesnek kell lennie a társ-közbenső rendszer azonosságának hitelesítésére, a továbbítási útvonal információs forrásának hitelesítésére, és a továbbítási útvonal információk adat integritásának biztosítására.
3.4.31 Az ATN-nek képesnek kell lennie a társ-társ alkalmazás összekapcsolására, fenntartására, felszabadítására az

igazgatási tájékoztatások közlemény-cseréjéhez kapcsolódóan.
3.4.32 Egy Légiforgalmi Távközlési Hálózat rendszerkezelést támogató ATN rendszernek elő kell segítenie az ATN üzemeltetés fokozott folyamatosságát, beleértve az összeköttetési szolgáltatás ellenőrzését és minőségének fenntartását.
3.4.33 Az ATN-nek képesnek kell lennie a Rendszerkezelés (SM) alkalmazás össze- kapcsolására, fenntartására, felszabadítására és megszűntetésére a társ-társ alkalmazásokhoz kapcsolódóan.
3.4.34 Az ATN-nek képesnek kell lennie a repülési rutin időjárás-jelentő szolgálat (METAR) alkalmazás összekapcsolására, fenntartására, felszabadítására és megszűntetésére a társ-társ alkalmazásokhoz kapcsolódóan.

3.5 A LÉGIFORGALMI TÁVKÖZLÉSI HÁLÓZAT /ATN/ ALKALMAZÁSI KÖVETELMÉNYEI

1. Megjegyzés. – ATN alkalmazás (ok) megvalósítása egy Államon vagy egy körzeten belül nem vonja maga után az összes, az alábbiakban meghatározott ATN alkalmazás megvalósítását.

2. Megjegyzés. – Az ATN alkalmazásnak egy előre-meghatározott részegysége műszaki előírásainak megvalósítása úgy megengedett, ahogyan az a Doc 9705-ben részletesen meghatározott.

3.5.1 Rendszeralkalmazások

Megjegyzés. – Rendszeralkalmazások olyan szolgáltatásokat biztosítanak, amelyek a Légiforgalmi Távközlési Hálózat /ATN/ levegő-föld alkalmazásainak, föld-föld alkalmazásainak és/vagy az ATN összeköttetési szolgálatok működéséhez szükségesek.

3.5.1.1 A BEJELENTKEZÉSI ELJÁRÁS (CM) ALKALMAZÁS
Megjegyzés. – A bejelentkezési eljárás /CM/ alkalmazás biztosítja egy légijármű részére azt a lehetőséget, hogy egy Légiforgalmi Szolgálati /ATS/ földi rendszerhez bejelentkezzen; bizonyos esetekben a földi rendszer fogja kérni a légijárműtől, hogy vegye fel az összeköttetést egy meghatározott földi rendszerrel. Miután a megfelelő kapcsolat létrejött, a bejelentkezési eljárás /CM/ biztosítja az információ-cserét minden egyes alátámasztott ATN alkalmazás részére, beleértve az egyes hálózati címzéseket is, ahogy megfelelő. A védelmi szolgálatot alátámasztó ATN rendszerekre a CM biztosítja az adatcsere kulcsot és a kulcs kezelési információt is. A CM biztosítja még a bejelentkezési információ felfrissítésének lehetőségét is, és egy ATS földi rendszer részére azt a képességet, hogy továbbítsa a bejelentkezési információt egy másik ATS földi rendszerhez. A CM bejegyeztetési funkciója teszi lehetővé az információknak a földön vagy a légijárművön lévő további alkalmazásaival való megosztási lehetőséget.

3.5.1.1.1 A Légifogalmi Távközlési Hálózatnak képesnek kell lennie a következő bejelentkezési eljárás /CM/ alkalmazási feladatok ellátására:
a) bejelentkezés;
b) kapcsolat felvétel;
c) adat-felfrissítés;
d) CM szerver lekérdezés;
e) CM szerver felfrissítés;
f) földi továbbítás; és
g) bejegyeztetés.

Megjegyzés. – A CM alkalmazásra vonatkozó műszaki előírások a Doc 9705, II. Al-kötetében vannak meghatározva
.
3.5.1.2 LÉGIFORGALMI TÁVKÖZLÉSI HÁLÓZAT /ATN/ KATALÓGUS SZOLGÁLTATÁS (DIR)

3.5.1.2.1 Az ATN-nek képesnek kell lennie a következő DIR alkalmazás funkciók támogatására:
a) katalógus összeállítás;
b) a katalógus információ visszakeresése; és
c) a katalógus információ cseréje.

1. Megjegyzés. – Az ATN Katalógus Szolgáltatás lehetőséget biztosít egy alkalmazás vagy egy felhasználó részére, *hogy lekérdezze az elosztott katalógus adatbázist és, hogy visszakeresse a címzési, védelmi és műszaki lehetőségi tájékoztatásokat. A Katalógus Szolgáltatás (DIR) lehetőséget biztosít a meghatározott és jogosított felhasználók részére, hogy kiegészítsék, töröljék és módosítsák a katalógus adatbázis részeit, azokat, amelyekért felelősek. A Katalógus Szolgáltatás az ATN-en keresztül az összes olyan alkalmazás és felhasználó részére "felajánlott", aki eleget tesz a Doc 9705, VII. Al-kötet műszaki előírásainak.*

2. Megjegyzés. – A katalógus hozzárendelés feladata az, hogy társítást hozzon létre két olyan katalógus összetevő között, amelyek a további katalógus funkciókat támasztják alá. A katalógus hozzárendelés állítja fel az alkalmazási összefüggést és az egyéb katalógus funkciók használatának összeköttetési kapcsolata alapjául szolgál.

3.5.1.3 EGYÉB RENDSZERALKALMAZÁSOK
(Kidolgozás alatt)

3.5.2 Levegő-föld alkalmazások

Megjegyzés. – A levegő-föld alkalmazások földi összetevői foglalják magukba azokat a rendszereket, amelyek a levegő-föld közlemények tartalmát továbbítják a föld-föld összeköttetési vonalakon.

3.5.2.1 AZ AUTOMATIKUS BERENDEZÉS-FÜGGŐ LÉGTÉRELLENŐRZŐ RENDSZER (ADS) ALKALMAZÁSA
Megjegyzés. – Az ADS alkalmazást egy légijármű fedélzeti és egy földi rendszer alkotja. A légijármű fedélzeti ADS alkalmazási képes arra, hogy a Légiforgalmi Távközlési Hálózat /ATN/ összeköttetési szolgálatán keresztül automatikusan továbbítsa a földi rendszer részére az adatokat a fedélzeti navigációs rendszerekből. (pl. légijármű azonosítót, a négy-dimenziós helyzetet, a szándékot és kiegészítő adatokat, ahogy szükséges). Az ADS alkalmazás a szolgáltatást azokon a kapcsolatokon keresztül biztosítja, amelyek a rendszer levegőben lévő és földi egységei között létrejönnek (azaz igény kapcsolat, szakaszosan ismétlődő kapcsolat, esemény kapcsolat és kényszerhelyzeti kapcsolat) és a két ADS földi rendszer között (azaz a soron következő egységgel való kapcsolat).

3.5.2.1.1 A Légiforgalmi Távközlési Hálózat-/ATN/-nek képesnek kell lenni a következő ADS alkalmazások alátámasztására:
a) igény kapcsolatok;
b) szakaszosan ismétlődő kapcsolatok;
c) esemény kapcsolatok;
d) kényszerhelyzeti kapcsolatok; és
e) a soron következő egységgel való kapcsolatok

Megjegyzés. – A Berendezés-függő Automatikus Légtér-ellenőrző Rendszer /ADS/ alkalmazásra vonatkozó műszaki előírások a Doc 9705, II. Al-kötetében vannak meghatározva.

3.5.2.2 A LÉGIFORGALMI IRÁNYÍTÓ ÉS A LÉGIJÁRMŰVEZETŐ KÖZÖTTTI DIGITÁLIS ADATKAPCSOLAT (CPDLC) ALKALMAZÁSA

Megjegyzés. – A CPDLC alkalmazást egy légijármű fedélzeti és egy földi rendszer alkotja, és ezek lehetőséget biztosítanak az adatkapcsolati összeköttetésekre a Légiforgalmi Szolgálati /ATS/ egységek és az irányításuk alatt álló légijárművek között és/vagy azon légijárművekkel, amelyek az irányításuk alá kerülnek. A CPDLC alkalmazás rendelkezik azzal a képességgel, hogy létrehozza, kezelje és befejezze a CPDLC dialógusokat a légiforgalmi irányító - légijárművezető közlemény-váltásokban és a földi közlemények továbbításában.

3.5.2.2.1 A Légiforgalmi Távközlési Hálózat-/ATN/-nek képesnek kell lennie az alábbi CPDLC alkalmazási funkciók alátámasztására:
a) légiforgalmi irányító - légijárművezető közötti közlemény-váltás;
b) az adat jogosultság átadása;
c) a soron következő irányítási engedély kérése; és
d) adat-továbbítás a föld felé.

Megjegyzés. – A CPDLC alkalmazásra vonatkozó műszaki előírások a DOC 9880, az ATN részletes műszaki specifikációk kézikönyvben vannak meghatározva (kidolgozás alatt)

.

3.5.2.3 REPÜLÉS-TÁJÉKOZTATÓ SZOLGÁLATI (FIS) ALKALMAZÁS

Megjegyzés. – A FIS alkalmazások repülés-tájékoztató szolgálatot biztosít a légtér felhasználók részére a földi FIS rendszerektől.

3.5.2.3.1 AUTOMATIKUS KÖZEL-KÖRZETI TÁJÉKOZTATÓ SZOLGÁLAT (ATIS) ALKALMAZÁS

3.5.2.3.1.1 A Légiforgalmi Távközlési Hálózat-/ATN/-nek képesnek kell lenni a következő ATIS alkalmazás funkciók alátámasztására:

a) légijármű által kezdeményezett FIS igény kapcsolatok;

b) légijármű által kezdeményezett FIS adat-felfrissítési kapcsolatok; és

c) mindkét irányú, mind a légijármű, mind a föld által kezdeményezett FIS kapcsolatok törlése.

Megjegyzés. – Az ATIS alkalmazásokra vonatkozó műszaki előírások a Doc 9705, II. al-kötetében vannak meghatározva.

3.5.2.3.2 REPÜLÉSI RUTIN IDŐJÁRÁS-JELENTÉSI SZOLGÁLAT (METAR) ALKALMAZÁS

3.5.2.3.2.1 A Légiforgalmi Távközlési Hálózat-/ATN/-nek képesnek kell lennie a légijármű által kezdeményezett FIS igény kapcsolat esetén a METAR alkalmazási funkció alátámasztására.

Megjegyzés. – A METAR alkalmazásra vonatkozó műszaki előírások a Doc 9705, II. al-kötetében vannak meghatározva.

3.5.2.3.3 EGYÉB FIS ALKALMAZÁSOK

(Kidolgozás alatt.)

3.5.2.4 EGYÉB LEVEGŐ-FÖLD ALKALMAZÁSOK

(Kidolgozás alatt.)

3.5.3 Föld-föld közötti alkalmazások

Megjegyzés. – A föld-föld közötti alkalmazások úgy vannak meghatározva, mint Légiforgalmi Távközlési Hálózati /ATN/ alkalmazások, az azokban a földi bázisú rendszerekben lévő azon alkalmazások, amelyek kizárólag csak azokkal a társ-alkalmazásokkal cserélnek információt, amelyek szintén a földi rendszerekben vannak

.

3.5.3.1 KÖZPONTOK KÖZÖTTI DIGITÁLIS KÖZLEMÉNY-VÁLTÁS (IIC)

Megjegyzés. – A központok közötti digitális közlemény-váltás alkalmazások teszik lehetővé a légiforgalmi szolgálati egységek közötti információ-cserét.

3.5.3.1.1 LÉGIFORGALMI SZOLGÁLATI /ATS/ EGYSÉGEK KÖZÖTTI AUTOMATIKUS ADAT-CSERE (AIDC)

Megjegyzés. – Az AIDC egy olyan ATN alkalmazás, amely két légiforgalmi szolgálati egység között használatos a Légiforgalmi Szolgálati /ATS/ információk cseréjére: az aktív repülésre vonatkozó repülési jelentésekre, a repülés koordinációra, az irányítás átadására, a légtér-ellenőrzési adatokra és a szabad (szerkesztetlen) szöveg adatokra vonatkozóan.

3.5.3.1.1.1 A Légiforgalmi Távközlési Hálózat-/ATN/-nek képesnek kell lennie az alábbi AIDC alkalmazás funkciók alátámasztására:

a) repülési jelentések;

b) repülés koordináció;

c) az irányítás átadása;

d) az összeköttetés átadása;
e) a légtér-ellenőrzési adatok átadása; és
f) általános adatok átadása.

Megjegyzés. – Az AIDC alkalmazásra vonatkozó műszaki követelmények a Doc 9705. III. Al-kötetében vannak meghatározva.

3.5.3.2 A LÉGIFORGALMI SZOLGÁLATOK /ATS/ KÖZLEMÉNY TOVÁBBÍTÁSI ELJÁRÁSAI (ATSMHS) ALKALMAZÁSOK

Megjegyzés. – Az ATS közlemény továbbítási eljárások (ATSMHS) alkalmazások egy fő funkciót foglalnak magukba, név szerint az ATS közlemény szolgáltatás funkciót. Az ATS közlemény szolgáltatási funkció lehetővé teszi azt, hogy a közlemények cseréje a szolgáltatás felhasználók között megtörténjen az általános közlemény szolgáltatások által. Az ATSMHS alkalmazás magába foglalja az AFTN/ATN és CIDIN/ATN kapuk meghatározását.

3.5.3.2.1 Az ATN-nek képesnek kell lenni az ATS közlemény továbbítási eljárásainak (ATSMHS) alkalmazásában az ATS közlemény szolgáltatások támogatására.

Megjegyzés. – Az ATSMHS alkalmazásra vonatkozó műszaki követelmények a Doc 9705, III. Al-kötetében vannak meghatározva.

3.5.3.3 EGYÉB FÖLD-FÖLD ALKALMAZÁSOK
(Kidolgozás alatt.)

3.6 AZ ATN TÁVKÖZLÉSI SZOLGÁLTATÁS KÖVETELMÉNYEI

Megjegyzés. – Az ATN Távközlési Szolgáltatás követelményei meghatározzák a Nyílt Rendszerek /OSI/ referencia modell 3-tól 6-ig terjedő rétegei, valamint a 7. réteg egy része iránti követelményeket. Ezek a szolgálatok veszik át az egyes ATN alkalmazások által létrehozott információkat és hajtják végre a végponttól-végpontig összeköttetési szolgálat feladatát a szabvány protokolllok felhasználásával. Ezek az összeköttetési szolgáltatási követelmények két részre vannak osztva. A felső réteg összeköttetési szolgálatok határozzák meg a Szabványokat az 5-7 rétegre. Az 1. és 2. rétegekre vonatkozó követelmények az ATN Szabványok és Ajánlott Gyakorlatok /ATN SARPs/ tárgykörén kívül esnek.

3.6.1 Felső rétegű összeköttetési szolgáltatás

3.6.1.1 A felső réteg összeköttetési szolgáltatás magába foglalja:
a) a gyűjtő réteget;
b) a bemutató réteget;
c) az alkalmazási entitás szerkezetet;
d) az összekapcsolás irányító szolgálati elemet (ACSE);
e) a védelmi alkalmazás szolgáltatási célt (ASO) az ATN rendszert alátámasztó védelmi szolgáltatáshoz; és
f) vezérlő műveletet (CF).

1. Megjegyzés. – Az ATSMHS alkalmazás - az ATS közlemény szolgáltatási funkció kivételével - az összes ATN alkalmazás felső réteg összeköttetési szolgáltatásra vonatkozó műszaki előírások a Doc 9705, IV. al-kötetében vannak meghatározva
.
2. Megjegyzés. – Az ATSMHS alkalmazás ATS közlemény szolgáltatási funkcióra vonatkozó felső réteg összeköttetési szolgáltatás műszaki előírása a Doc 9705, III. Al- kötetében vannak meghatározva.

3.6.2 Légiforgalmi Távközlési Hálózat /ATN/ Hálózatok közötti távközlési szolgáltatás /Internet/

Megjegyzés. – Az ATN Internet szolgáltatási követelmények azokra a végponti rendszerekre és a közbenső rendszer funkcionális entitásaira alkalmazhatók, amelyek együtt az ATN Internet összeköttetési szolgáltatást biztosítják. Az ATN Inernet összeköttetési szolgáltatás a felhasználók részére (azaz a felső rétegekhez) a szállítási rétegszolgáltatás interfészen keresztül van biztosítva

.

3.6.2.1 Az ATN vég-rendszernek (ES) képesnek kell lennie az ATN Internet alátámasztására, beleértve a:
a) szállítási réteget; és
b) a hálózati réteget is.

3.6.2.2 Egy ATN közbenső rendszernek (IS) eleget kell tennie az ATN hálózati réteg előírásoknak úgy, ahogy az érintett ATN közbenső rendszer megfelelő osztályzatának megfelel.

Megjegyzés. – Az ATN közbenső rendszer különböző osztályzatainak száma, amelyre a hálózat réteg profilok meg vannak határozva, a Doc 9705, V. al-kötetében találhatók.

3.7 A LÉGIFORGALMI TÁVKÖZLÉSI HÁLÓZAT /ATN/ ELNEVEZÉSI ÉS CÍMZÉSI KÖVETELMÉNYEI

Megjegyzés. – Az ATN elnevezési és címzési vázlat-tervezése támasztja alá az információs célok félreérthetetlen azonosításának alapelvét és a teljes címzési szabványosítást.

3.7.1 Az ATN-nek előírásokat biztosít az alkalmazási réteg elnevezéséhez.
3.7.2 Az ATN-nek előírásokat biztosít a hálózati és szállítási réteg címzéséhez.

Megjegyzés. – Az ATN alkalmazási réteg elnevezésére vonatkozó előírások a Doc 9705, IV. Al-kötetében vannak meghatározva; a hálózati és szállítási címzésekre vonatkozó előírások az V. Al-kötetben vannak meghatározva és a jegyzékbe vételi szolgáltatás a IX. Al-kötetben került meghatározásra ugyanabban a dokumentumban.

3.8 A LÉGIFORGALMI TÁVKÖZLÉSI HÁLÓZAT /ATN/ RENDSZERKEZELÉSI KÖVETELMÉNYEK

1. Megjegyzés. – Az ATN rendszerkezelési (SM) alkalmazás biztosítja egy Rendszerkezelő /SM/ részére azt a lehetőséget, hogy információt cseréljen egy Rendszer kezelői /SM/ ügynökséggel és/vagy más rendszerkezelővel.

2. Megjegyzés. – Egy Légiforgalmi Távközlési Hálózat /ATN/ rendszerkezelési /SE/ szolgáltatások műszaki előírásainak alátámasztása egy Állami vagy körzeti alapon lehetséges.

3.8.1 Az ATN-nek képesnek kell lennie a következő rendszer kezelési alkalmazási funkciók támogatására:
a) Hibakezelés;
b) Konfiguráció kezelés;
c) Forgalmi kezelés;
d) Teljesítmény kezelés; és
e) Védelmi kezelés.

Megjegyzés. – Az ATN Rendszer kezelésre vonatkozó műszaki előírások a Doc 9705, VI. Al-kötetében kerültek meghatározásra.

3.8.1.1 Azoknak az ATN végponti rendszereknek és közbenső rendszereknek, amelyek az ATN rendszerkezelő alkalmazásokat támogatják és a rendszer kezelőknek /SM/ biztosítaniuk kell a kezelt adatokhoz való hozzáférést.

Megjegyzés. – A rendszerkezelési /SM/ alkalmazások kezelt céljainak meghatározását és a hozzáférési előírásokat a Doc 9705, VI. Al-kötete határozza meg.

3.9 A LÉGIFORGALMI TÁVKÖZLÉSI HÁLÓZAT /ATN/ BIZTONSÁGI KÖVETELMÉNYEI

3.9.1 Az ATN védelmét a műszaki előírások, a helyi fizikai biztonsági intézkedések és az eljárási biztonsági rendszabályok konfigurációjával kell elérni.

1. Megjegyzés. – Az ATN védelmére vonatkozó műszaki előírások a Doc 9705-ben, a fizikai, valamint az eljárási védelmi intézkedések az Annex 17-ben, illetve a Védelmi Kézikönyvben kerültek meghatározásra.

2. Megjegyzés. – Az ATN biztonsági szolgálatok műszaki előírásainak támogatására Állami vagy regionális alapon lehet szükség.

3.9.1.1 **Ajánlás.** – *Az alábbi fizikai és eljárási technikákat lehet felhasználni az ATN végponti rendszerek, a közbenső rendszerek, alhálózati kezelők, katalógus központi kiszolgáló egységek és az alhálózatok védelmének biztosításához:*
a) Korlátozott fizikai hozzáférés az ATN végponti rendszerekhez, közbenső rendszerekhez, SM munka- állomásokhoz,

a katalógus központi kiszolgáló egységekhez és az alhálózati kapcsolókhoz, hálózati kezelőkhöz és a további alapvető hálózati alrendszerekhez;
b) Korlátozott felhasználói hozzáférés - csak feljogosított személyek részére - az ATN végponti rendszerekhez, a közbenső rendszerekhez, a katalógus központi kiszolgáló egységekhez, valamint az /SM/ munkaállomásokhoz; és
c) az ATN földi végponti berendezések, a közbenső rendszerek és az SM munkaállomások táv-hozzáférésének megtiltása, vagy korlátozott hozzáférés biztosítása.

3.9.2 ATN biztonsági irányelvek

Megjegyzés. – Az összeköttetések ellenőrzése és a harmadik fél forgalmi elemzése nem jelent biztonsági veszélyt, és az ATS osztályzatra nem tekinthető biztonsági fenyegetésnek. Azonban néhány Légiforgalmi Szolgálati és/vagy nem-légiforgalmi szolgálati felhasználónak és alkalmazásnak lehetnek olyan helyi vagy szervezési irányelvei, amelyekben az összeköttetések ellenőrzését, valamint a harmadik fél forgalmazásának elemzését biztonsági fenyegetésnek tekinthetik egyéb vonatkozásokban, például gazdasági megfontolásokból.

3.9.2.1 A Légiforgalmi Szolgálatok /ATS/ közleményeit védeni kell a hibás megjelenítés, a módosítás és a visszajátszás ellen.

1. Megjegyzés. – Ez azt jelenti, hogy a Légiforgalmi Távközlési Hálózati /ATN/ entitások közötti adat-, közlemény-cseréknél magas szintű lesz annak a szavatossága, hogy a közlemény onnan jön, ahonnan azt igénylik, nem kerül meghamisításra és nem egy már elavult közlemény megismétlése.

2. Megjegyzés. – A védelem szintje a biztonság fenyegetésének típusa függvényében és a felhasználó vagy a felhasználói feldolgozás által kiválasztott ATN biztonsági szolgáltatási szint függvényében változó lehet.

3.9.2.2 Az ATS közlemények biztonságára vonatkozó kérést tiszteletben kell tartani.

Megjegyzés. – A biztonság mellőzése iránti kérés figyelembe vehető. Ez azt jelenti, hogyha a biztonság alkalmazása elmulasztásra kerül és a tárgyalás a mellőzésről a helyi irányelven alapszik.

3.9.2.3 Azokat az ATN szolgáltatásokat, amelyek légijárművekhez küldött és azoktól érkező közleményeket támasztanak alá, védeni kell a szolgáltatás visszautasítási támadásoktól olyan valószínűségi szintnek megfelelően, amely megegyezik a megkívánt alkalmazási szolgáltatás rendelkezésre állásának, ahogyan azt a helyi irányelvek meghatározzák.

1. Megjegyzés. – A "szolgáltatás visszautasítás" kifejezés azt a körülményt írja le, amikor az információkhoz és más ATN forrásokhoz való törvényes hozzáférés szándékosan akadályozva van.

2. Megjegyzés. – Ez azt is jelentheti, hogy egy alternatív összeköttetési útvonal rendelkezésre áll abban az esetben, ha az egyik útvonal szolgáltatási tilalomnak van alávetve.

TÁBLÁZATOK A 3. FEJEZETHEZ

3-1. táblázat. A Légiforgalmi Szolgálatokkal kapcsolatos összeköttetési osztályok átviteli késései

Maximális egy-utas ATN végberendezés-végberendezés átviteli késés 95 %-os valószínűséggel (másodperc)	*ATSC osztály*
Fenntartott	A
4,5	B
7,2	C
13,5	D
18	E
27	F
50	G
100	H
Nincs érték meghatározva	Nincs preferencia

1. Megjegyzés. - Az ATN végberendezéstől - végberendezésig átviteli késés körülbelül 90 %-át jelenti a rendszer végfelhasználói közötti végberendezéstől - végberendezésig tartó teljes késés értékének.

2. Megjegyzés. - A 95 %-os valószínűség a kért ATSC osztálynak megfelelő útvonal rendelkezésre állásán alapszik.

3-2. táblázat. A Légiforgalmi Távközlési Hálózat /ATN/ összeköttetési prioritási jegyzéke

Közlemény kategóriák	*ATN alkalmazás*	*A megfelelő protokoll prioritás*	
Szállítási réteg prioritás	*Hálózati réteg prioritás*		
Hálózat/rendszer kezelés	SM	0	14
Vészhelyzeti összeköttetések		1	13
Sürgősségi összeköttetések		2	12
Magas prioritású repülés-biztonsági közlemények	CPDLC, ADS	3	11
Szabvány prioritású repülés-biztonsági közlemények	AIDC, ATIS	4	10
Meteorológiai összeköttetések	METAR	5	9
Repülés menetrendszerűségi összeköttetések	CM, ATSMHS	6	8

Alacsony sürgős-ségű igazgatási közlemények és a légiutasok közleményei	0	0	Nem engedélyezett	Nem engedélyezett	Nem engedélyezett	Nem engedélyezett	Nem engedélyezett

1. Megjegyzés. – Az URH digitális adatkapcsolat /VDL/ 2. Módnak nincs speciális alhálózati prioritási mechanizmusa.

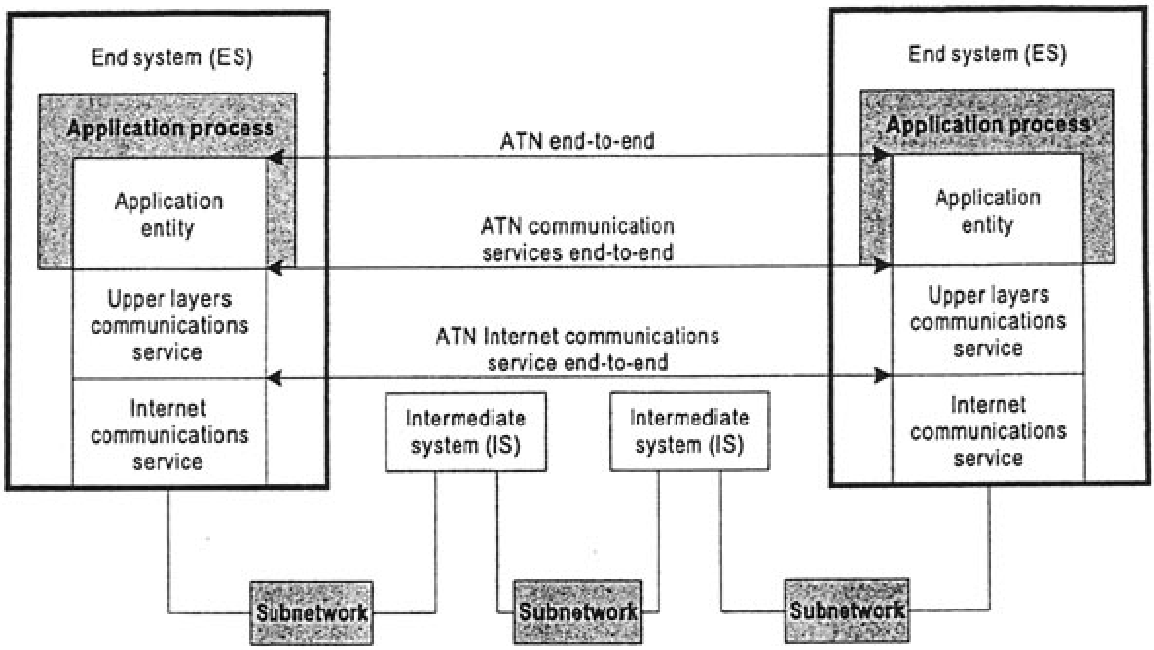
2. Megjegyzés. – A Légiforgalmi mozgó műholdas szolgálat /AMSS/ Szabványok és Ajánlott Gyakorlatok /SARPs/ anélkül határozzák meg az alhálózat- prioritásra a közlemény kategóriák jegyzékét, hogy határozottan utalnának az ATN hálózat réteg- prioritása.

3. Megjegyzés. – A „Nem engedélyezett” kifejezés azt jelenti, hogy csak a repülés biztonságára és rendszerességére vonatkozó közleményeknek a továbbítása engedélyezett ezen az alhálózaton, ahogy azt az alhálózat SARP-ja meghatározza.

4. Megjegyzés. – Csak azok a mozgó alhálózatok kerültek jegyzékbe vételre, amelyekre alhálózati SARP-ok vannak, és amelyekre határozott támogatást nyújtanak az ATN határvonal közbenső rendszer (BIS) műszaki előírásai.

5. Megjegyzés. - Az URH digitális adatkapcsolat /VDL/ 4. Módú alhálózat támogatást biztosít a légtér-ellenőrző alkalmazásokhoz (például Berendezés-függő Automatikus Légtér-ellenőrzés /ADS/).

ÁBRÁK A 3. FEJEZETHEZ



3-1. ábra:. A Légiforgalmi Távközlési Hálózat /ATN/ koncepcionális modellje

<u>Ábraszöveg a 3-1.sz. ábrához:</u>
End system (ES) = Vég-rendszer (ES)
Application process = Alkalmazási folyamat
ATN end-to-end = ATN vég-rendszertől - vég-rendszerig
Application entity = Alkalmazási entitás
ATN communication services end-to-end = ATN összeköttetési szolgáltatás vég-rendszertől - vég-rendszerig
Upper layers communications service = Felső réteg összeköttetési szolgáltatás
ATN Internet communications service end-to-end = ATN Internet összeköttetési szolgáltatás vég-rendszertől - vég-rendszerig
Internet communications service = Internet összeköttetési szolgáltatás
Internediate system (IS) = Közbenső rendszer (IS)
Subnetwork = Alhálózat

1. Megjegyzés. – Árnyékolás jelzi azokat az elemeket, amelyek ezeknek a Szabványoknak és Ajánlott Gyakorlatoknak /SARPs/ a tárgykörén kívül esnek. A felhasználói követelmény meghatározza az alkalmazás entitás és a felhasználó közötti kapcsolódást és biztosítja az ATN funkcionalitását és együttműködését.

2. Megjegyzés. – Az ábra az ATN-nek egy egyszerűsített modelljét mutatja be, de nem szemlélteti az összes képességét (pl. a tárolási és továbbítási képességet, amely az ATS közlemény kezelési szolgálata részére van biztosítva).

3. Megjegyzés. – Az ATN-en belül különböző vég-berendezéstől - vég-berendezésig pontok vannak meghatározva bizonyos vég-rendszertől - vég-rendszerig terjedő teljesítmény-követelmények meghatározására. Szükség lehet azonban ezektől eltérő vég- berendezéstől - vég-berendezésig terjedő pontok meghatározására ahhoz, hogy megkönnyítsék ezeknek a teljesítmény-követelményeknek megfelelési minősítését. Ezekben az esetekben a vég-berendezéstől - vég-berendezésig terjedő pontokat világosan meg kell határozni és összefüggésbe kell hozni az ábrán bemutatott vég-rendszertől - vég-rendszerig pontokkal.

4. Megjegyzés. – Egy IS a funkcionalitás fogalom megjelenítése amely nem tartozik pontosan egy továbbítási útvonalhoz. Egy olyan továbbítási útvonal rendszerkezelő alkalmazást valósít meg, ami igényli a vég-rendszer protokollljait, és a rendszerkezelő alkalmazást használva végrendszerként is működik.

4. FEJEZET: LÉGIFORGALMI MOZGÓ-MŰHOLDAS SZOLGÁLAT (AMS (R) S)

1.Megjegyzés – Ez a fejezet tartalmazza a légiforgalmi mozgó műholdas szolgálat használatával kapcsolatos szabványokat és ajánlott eljárásokat. Ezek a szabványok és ajánlott eljárások szolgáltatás- és teljesítmény orientáltak, és nem kapcsolhatók különleges technológiai vagy műszaki előírásokhoz.

2. Megjegyzés – Az AMS (R) S rendszerekre vonatkozó részletes műszaki leírások az AMS (R) S kézikönyvben találhatók. Ez a dokumentum részletes leírást tartalmaz az AMS (R) S rendszerrel kapcsolatban a szabványok és ajánlott eljárásokkal kapcsolatban is.

4.1. MEGHATÁROZÁSOK

Connection establishment delay. Kapcsolati késés létrehozása, az ISO 8348 meghatározása szerint egy olyan elem, amely a hívott alhálózati felhasználónak (SN)-nek tulajdonítható, az az idő amely az SN-CONNECT jelzés és az SN-CONNECT válaszadás között eltelik. Ez a felhasználói elem a műholdas alhálózatának határain kívül eső műveleteknek tudható, éppen ezért az AMS (R) S műszaki leírásban nem szerepel.

Data transit delay.(95th percentile). 95%-os adatátviteli késés. A késedelmes adatátvitel statisztikai megoszlásának 95%-os nagyságrendje, amely átlagosnak tekinthető.

Data transit delay. Adatátviteli késés. Az ISO 8348 szerint az adatátviteli késés statisztikai megoszlásának átlaga. Ez a késés az alhálózati késedelmet jelenti, és nem tartalmazza a kapcsolat létrehozási késedelmet.

Network (N) Hálózat (N) A „hálózat” szó és N rövidítése az ISO 8348 értelmezése szerint az „alhálózat” szóval helyettesítendő, és ennek megfelelően rövidítése „SN”alhálózati réteg adatcsomag teljesítmény szókörnyezetben.

Residual error rate Maradó hiba arány. A helytelen, elveszett és duplikát alhálózati szolgálati adategységek (SNSDU) aránya az összes elküldött SNSDU számához viszonyítva.

Spot beam. Spot-nyaláb, műholdas antenna irányíthatóság, amikor a fő spot-nyaláb lényegesen kevesebbet fog be a föld felszínénél a műhold látószögéhez képest. A rendszer forrásának hatékonyságának javítása céljából a tervezésénél figyelembe lehet venni a földi állomások földrajzi megosztását.

Subnetwork(SN) - lásd Network (N) címszó alatt.

Subnetwork service data unit (SNSDU) alhálózati adatszolgálati egység mennyisége, amely azonosítása az egyik alhálózat végétől a másik alhálózat kapcsolatig védett

Total voice transfer delay. Teljes hangátviteli késés. Az az idő, amely a beszéd AES, vagy GES-hez történő beérkezésétől a kapcsolati partner GES vagy AES-hez történő beérkezése között eltelik. Ez a késés magában foglalja a hangfelvételi eljárás idejét, a fizikai réteg késedelmét, az RF adás és egyéb más AMS (R) S-en belüli alhálózati késedelmet.

Megjegyzés – Az ebben a fejezetben használt szakkifejezések az Annex 10-ben az alábbiak szerint kerültek meghatározásra:

- Légiforgalmi távközlési hálózat (ATN): III. Kötet, I. Fejezet
- Légiforgalmi mozgó-műholdas szolgálat (AMS (R) S): II. Kötet, 1.1. Fejezet
- Légijármű fedélzeti földi állomás (AES): III. Kötet, I. Fejezet
- Alhálózati réteg: III. Kötet, 6.1. Fejezet

4.2. ÁLTALÁNOS RÉSZ

4. 2. 1 Bármely mozgó-műholdas rendszernek, amely AMS (R) S szolgáltatást nyújt, meg kell feleljen az e fejezetben foglalt követelményeknek.

4. 2. 1. 1 Az AMS (R) S rendszer támogatja az adatcsomag-szolgáltatást vagy a hang-szolgáltatást, vagy mindkettőt.

4. 2. 2 Az AMS (R) S rendszer berendezései számára kötelezően előírt vivőfrekvenciát, a rendszer képesség szintjéhez hasonlóan regionális léginavigációs szerződések alapján kell megállapítani, amely szerződések kijelölik a légtérben történő üzemeltetés és a berendezés vevőfrekvenciájának telepítési időbeosztását. A rendszer képességi szintje magában foglalja az AES, a műholdas és a GES teljesítményt.

4. 2. 3 A 4. 2. 2 pontban jelzett szerződéseknek legalább két éves kötelező jogosultságot kell, biztosítaniuk a rendszerek üzemeltetésére.

4. 2. 4 Ajánlás – A polgári repülési hatóságoknak egyeztetnie kell a nemzeti hatóságokkal és a szolgáltatásokat nyújtó szervezetekkel az AMS (R) S rendszerek telepítési szempontjairól, amely rendszerek lehetővé teszik azoknak a világ valamennyi országában történő optimális használhatóságát.

4.3 RF CSATORNA MŰSZAKI JELLEMZŐK

4.3.1 Frekvencia sávok

Megjegyzés az ITU Nemzetközi Rádió Rendszabályzata lehetővé teszi, hogy azok a rendszerek, amelyek mozgó-műholdas szolgáltatást nyújtanak, ugyanazt a spektrumot használhassák, mint az AMS (R) S, anélkül, hogy ezek a rendszerek biztonsági szolgáltatásokat nyújtanának. Ez a helyzet azért fontos, mivel csökkenti az AMS (R) S részére rendelkezésre álló spektrumot. Kritikus, hogy az Államok ezt a témát a frekvenciatervezésnél és a hazai, illetve a regionális spektrum követelmények megalkotásánál fontolóra veszik.

.

4.3.1.1 AMS (R) S kapcsolat nyújtása esetén az AMS (R) S rendszernek csak azon a frekvencia tartományban szabad üzemelnie, amelyet az AMS (R) S számára megfelelő módon kijelöltek, és amelyeket az ITU Rendszabályzata védi.

4.3.2 Kisugárzott teljesítmény

4.3.2.1 A Légijármű fedélzetén elhelyezett földi állomás /AES/ által sugárzott teljesítmény tartományt ellenőrizni kell, hogy az egyéb, vagy ugyanazon légijárművön lévő rendszerekkel történő interferencia elkerülhető, és a léginavigáció biztonsága megfelelő módon biztosítva legyen.

1. Megjegyzés- Veszélyes interferencia származhat a sugárzó és/vagy vezetékes kisugárzásnál, amelyek lehetnek harmonikus frekvenciák, nem összefüggő, téves intermodulációs termék és zajkibocsátás, és ezek nem szükségszerűen korlátozódnak az „adó bekapcsolva" állapotra.

2. Megjegyzés – A GNSS számára szükséges védelmi követelmények az Annex 10. I. kötetében találhatók.

4.3.2.2 INTEREFERENCIA MÁS AMS (R) S BERENDEZÉSSEL

4.3.2.2.1 Egy légijármű fedélzeti földi állomásról (AES) származó AMS (R) S kisugárzás nem okozhat veszélyes interferenciát egy más légijármű fedélzeti állomásán AES szolgáltatást nyújtó berendezésben.

Megjegyzés – A 4.3.2.2.1 pontban foglaltak szerinti megfelelés egy másik módszere a kisugárzás korlátozása a másik AMS (R) S berendezés működési sávjában egy olyan egyenletes szintre a rendszerközti interferencia követelményekhez képest, amelyek megtalálhatók az RTCA DO-215 dokumentumban. Az RTCA és az EUROCAE megállapíthat új teljesítmény szabványokat a későbbi AMS (R) S rendszerekre, amelyek leírják azokat a módszereket, amelyek megfelelnek e követelményeknek.

4.3 3 Érzékenység

4.3.3.1 A légijármű fedélzeti földi állomási berendezései megfelelően működnek egy interferencia környezetben, amely halmozottan 25%-os relatív változást okoz ($\Delta T/T$) a vevő zaj hőmérsékletében

4.4 PRIORITÁS ÉS KEZDEMÉNYEZŐ HOZZÁFÉRÉS

4.4.1 Minden légijármű fedélzeti földi állomását, és a földi telepítésű földi állomást úgy kell kialakítani, hogy az Annex 10 II. Kötetének 5.1.8. pontjában foglalt közlemények továbbítása megfelelő prioritási sorrend alapján történjen, és e közlemények adása és/vagy vétele késedelmet ne szenvedjen. Szükség esetén, a követelmények betartása végett az olyan közlemény-típusok adását és vételét, amelyek nem szerepelnek az Annex 10, II. kötetének 5.1.8. pontjában, le kell állítani minden előzetes figyelmeztetés nélkül, és az olyan közlemények adását illetve vételét kell végezni, amelyek az Annex 10, II. Kötet 5.1.8. pontjában foglaltaknak megfelelnek.

4.4.2 Valamennyi AMS (R) S adatcsomagot és hanghívást megfelelő prioritás szerint kell azonosítani.

4.4.3 Ugyanazon közlemény-kategórián belül a rendszer biztosítja a hangkommunikációs prioritást az adatközlési kommunikációval szemben.

4.5. JELGYŰJTÉS ÉS JELKÖVETÉS

4.5.1 Az AES, a GES és a műholdak megfelelően gyűjtik és követik a kapcsolati jeleket, amíg a légijármű az 1500 km/óra (800 csomó) földhöz viszonyított sebességgel halad bármilyen irányszögben.

4.5.1.1 **Ajánlás** – *Az AES, GES és a műholdak megfelelő módon gyűjtik és követik a kapcsolati jeleket, amíg a légijármű el nem éri a 2800 km/óra (1500 csomó) földhöz viszonyított sebességet bármilyen irányszögben.*

4.5.2 Az AES, GES és a műholdak megfelelő módon gyűjtik és követik a kapcsolati jeleket, amíg a légijármű gyorsulási vektora a műhold pályájához viszonyítva legalább 0.6 g.

4.5.2.1 **Ajánlás -** *Az AES, GES és a műholdak megfelelő módon gyűjtik és követik a kapcsolati jeleket, amíg a légijármű gyorsulási vektora a műhold pályájához viszonyítva legalább 1.2 g.*

4.6 TELJESÍTMÉNY KÖVETELMÉNYEK

4.6.1 Kijelölt működési fedésterület

4.6.1.1 Az AMS (R) S rendszer kijelölt működési fedésterületén keresztül biztosítja a légiforgalmi mozgó-műholdas szolgálatot. (DOC)

4.6.2. Hibajelentés

4.6.2.1 Szolgáltatási hiba esetén az AMS (R) S kellő időben jelzi az üzemleállás idejét, helyét és közli a normál szolgáltatás visszaállásának várható idejét.

Megjegyzés – A szolgáltatás leállását okozhatja például a műhold meghibásodása, a spot nyaláb, vagy a GES. Az ilyen leállások előfordulhatnak adott földrajzi területeken, okozhatja továbbá – időszakonként változóan -, a műhold *pályája és rendszere.*

4.6.2.2. A rendszer az észleléstől számított 30 másodpercen belül kijelzi a veszteséget az összeköttetési képességben.

4.6.3 AES követelmények

4.6.3.1 Az AES kielégíti a 4.6.4 és 4.6.5 pontokban foglalt lényeges teljesítmény követelményeket a légijármű számára egyenes irányú és vízszintes repülésben a műholdas rendszer kijelölt működési fedésterületén keresztül.

4.6.3.1.1 **Ajánlás** – *A légijármű fedélzeti földi állomásának (AES) ki kell elégítenie a 4.6.4 és 4.6.5 pontokban foglalt lényeges teljesítmény követelményeket +20/-5 emelkedési fokos légijármű térbeli helyzetben és +/-25 dőlésszögben a műholdas rendszer kijelölt működési fedésterületén keresztül (DOC).*

4.6.4 Adatcsomag szolgálat teljesítmény

4.6.4.1 Ha a rendszer biztosít AMS (R) S adatcsomag szolgáltatást, annak meg kell felelnie a következő alfejezetekben szereplő szabványoknak

Megjegyzés – Az adatcsomag szolgáltatásra vonatkozó rendszer teljesítményi szabványok megtalálhatók a RTCA Document DO-270-ben.

4.6.4.1.1 Az adatcsomag szolgáltatás nyújtó AMS (R) S rendszer képes az ATN mozgó alhálózatkénti üzemelésre.

Megjegyzés – Ezen kívül az AMS (R) S szolgáltathat nem-ATN adatfunkciókat.

4.6.4.1.2. KÉSÉSI PARAMÉTEREK

Megjegyzés – A „legmagasabb prioritású szolgáltatás" olyan prioritást jelent, amely vészhelyzetre, sürgősségi és bizonyos nem gyakori, a hálózati rendszerirányítás részére szóló közleményekre van fenntartva. A „legalacsonyabb prioritású szolgáltatást" kifejezés normál járatközlemények fokozati jelzését jelenti. Valamennyi késési paraméter csúcsidős légiforgalmi viszonyok mellett használandó.

4.6.4.1.2.1 -*Kapcsolatlétesítési késés.* A kapcsolatlétesítési késés nem haladhatja meg a 70 másodpercet.

4.6.4.1.2.1.1 **Ajánlás.** – *A kapcsolatlétesítési késés ne legyen 50 másodpercnél több.*

4.6.4.1.2.2 Az ISO 8348 szabvány szerint az adatátviteli késés állandó egy 128 oktett hosszúságú alhálózati szolgáltatási adategységen alapul (SNSDU). Az adatátviteli késéseket átlagértéken kell meghatározni.

4.6.4.1.2.3 *Adatátviteli késés légijárműtől, legmagasabb prioritás*. A légijárműtől történő adatátviteli késés nem lehet több 40 másodpercnél a legmagasabb prioritású adatszolgáltatásnál.

4.6.4.1.2.3.1 **Ajánlás -** *Adatátviteli késés légijárműtől, legmagasabb prioritás*. A légijárműtől történő adatátviteli késés ne legyen több 23 másodpercnél a legmagasabb prioritású adatszolgáltatásnál.

4.6.4.1.2.3.2 **Ajánlás. -** *Adatátviteli késés légijárműtől, legalacsonyabb prioritás*. A légijárműtől történő adatátviteli késés ne legyen több 28 másodpercnél a legalacsonyabb prioritású adatszolgáltatásnál.

4.6.4.1.2.4 *Adatátviteli késés légijárműhöz, legmagasabb prioritás*. A légijárműhöz történő adatátviteli késés ne legyen több 12 másodpercnél a legmagasabb prioritású adatszolgáltatásnál.

4.6.4.1.2.4.1 **Ajánlás**. *Adatátviteli késés légijárműhöz, legalacsonyabb prioritás*. *A légijárműhöz történő adatátviteli* *késés ne legyen több 28 másodpercnél a legmagasabb prioritású adatszolgáltatásnál.*

4.6.4.1.2.5 *Adatátviteli késés (95. százalékos), légijárműtől, legmagasabb prioritás*. A légijárműtől történő adatátviteli késés ne legyen több 80 másodpercnél a legmagasabb prioritású adatszolgáltatásnál.

4.6.4.1.2.5.1 **Ajánlás.-** *Adatátviteli késés (95. százalékos), légijárműtől, legmagasabb prioritás. A légijárműtől történő adatátviteli késés (95 százalékos) ne legyen több 40 másodpercnél a legmagasabb prioritású adatszolgáltatásnál.*

4.6.4.1.2.5.2 **Ajánlás. -** *Adatátviteli késés (95. százalékos), légijárműtől, legalacsonyabb prioritás. A légijárműtől történő adatátviteli késés (95. százalékos) ne legyen több 60 másodpercnél a legalacsonyabb prioritású adatszolgáltatásnál.*

4.6.4.1.2.6 *Adatátviteli késés (95. százalékos), légijárműhöz, legmagasabb prioritás*. A légijárműhöz történő adatátviteli késés (95 százalékos) ne legyen több 15 másodpercnél a legmagasabb prioritású adatszolgáltatásnál.

4.6.4.1.2.6.1 **Ajánlás**.- *Adatátviteli késés (95. százalékos), légijárműhöz, legalacsonyabb prioritás. A légijárműhöz történő adatátviteli késés (95 százalékos) ne legyen több 30 másodpercnél a legalacsonyabb prioritású adatszolgáltatásnál.*

4.6.4.1.2.7 *Csatlakozás kioldó késés (95.százalékos).* A csatlakozás kioldó késés (95. százalékos) nem lehet több 25 másodpercnél mindkét irányban.

4.6.4.1.2.7.1 **Ajánlás**.- *A csatlakozás kioldó késés (95. százalékos) ne legyen több 25 másodpercnél mindkét irányban.*

4.6.4.1.3 INTEGRITÁS

4.6.4.1.3.1 *A légijárműről származó maradó hiba arány.* A légijármű irányából származó maradó hiba arány nem lehet nagyobb 10^{-2} értéknél SNSDU-ként.

4.6.4.1.3.1.1 **Ajánlás.-** *A légijármű irányából származó maradó hiba arány nem lehet nagyobb 10^{-2} értéknél SNSDU-ként.*

4.6.4.1.3.2 *Maradó hiba arány a légijármű irányára. A maradó hiba arány a légijármű irányához nem lehet nagyobb 10^{-2} értéknél SNSDU-ként.*

4.6.4.1.3.3. *Csatlakozás rugalmasság*. Az alhálózati kapcsolat (SNC) lehívott SNC kioldás nem lehet nagyobb *10^{-2}-nél bármilyen egy óra intervallumon túl.*

Megjegyzés.- a GES-GES közötti átadás miatti csatlakozás kioldás, AES kijelentkezés vagy virtuális áramköri kezdeményezés ebben a specifikációban nem szerepel.
4.6.4.1.3.4 Az SNC alaphelyzetbe állításának lehetősége nem lehet nagyobb 10^{-1}-nél bármilyen egy óra intervallumon túl.

4.6.5. Hangszolgáltatási teljesítmény

4.6.5.1 Ha a rendszer biztosít AMS (R) S hangszolgáltatást, e szolgáltatásnak meg kell felelnie a következő albekezdésekben foglalt követelményeknek.

Megjegyzés.- Az ICAO jelenleg új technológiai eljárások bevezetése miatt tanulmányozza ezeket a rendelkezéseket.

4.6.5.1.1 HÍVÁS FELDOLGOZÁSI KÉSÉS

4.6.5.1.1.1 AES feladás. A késések 95 százaléka a GES számára a hívás eredet eseményének megállapítására a földi hálózati interfészhez, annak az AES interfészhez való megérkezéséhez számítva nem lehet több 20 másodpercnél.

4.6.5.1.1.2 GES feladás A késések 95 százaléka az AES-hez a híváseredet eseményének megállapítására a légijármű interfészhez és annak a földi hálózati interfészhez való megérkezéséhez nem lehet több 20 másodpercnél.

4.6.5.1.2 HANGMINŐSÉG

4.6.5.1.2.1 A hangátvitel teljes érthetőségi teljesítményt kell nyújtson, amely alkalmas a megkívánt működési és környezeti zajkörnyezetnek.

4.6.5.1.2.2 A teljes megengedhető átviteli késés az AMS (R) S alhálózaton belül nem lehet több 0.485 másodpercnél.

4.6.5.1.2.3 **Ajánlás**.- *Figyelembe kell venni a kettős vokóder hatásokat és/vagy más analóg/digitális konverziót*.

4.6.5.1.3 HANGKAPACITÁS

4.6.5.1.3.1 A rendszer rendelkezik megfelelő hangforgalmi csatorna forrásokkal, mint például AES- vagy GES eredetű AMS (RE) S hanghívással a rendszer irányában, a blokkolás lehetősége nem lehet több 10^{-2}-nél.

Megjegyzés. – A rendelkezésre álló forgalmi-csatorna források magukban foglalják a kezdeményező forrásokat és a nem AMS (R) S kommunikációs forrásokat is.

4.6.6. Védelem

4.6.6.1 A rendszer biztosítja a közlemények védelmét az átvitel fázisában illetéktelen hozzáféréssel szemben

4.6.6.2 A rendszer védelmet nyújt a szolgáltatás megtagadása, alacsony teljesítményjellemzők, vagy a rendszer kapacitás csökkenése ellen intézett külső beavatkozás esetén.

Megjegyzés.- Ilyen jellegű beavatkozások lehetnek a szándékosan elkövetett értelmetlen hamis közlemény-áradat küldése, a rendszer szoftver vagy adatbázisának szándékos rongálása, illetve a támogató infrastruktúra fizikai tönkretétele.

4.6.6.3 A rendszer védelmet nyújt a nem engedélyezett belépéssel szemben.

Megjegyzés.- A rendszer védelmet nyújt csalási kísérlet és „ fantomvezérlés”-el szemben is.

4.7 RENDSZER INTERFÉSZ

4.7.1. Az AMS (R) S rendszer lehetővé teszi alhálózati felhasználók részére AMS (R) S közlemények légijárműhöz történő küldését ICAO 24-bit légijármű címre.

Megjegyzés.- Az ICAO 24-bit címjegyzékkel kapcsolatos rendelkezések a 10 Függelék 9. Fejezetében találhatók.

4.7.2 Adatcsomag szolgáltatási interfész

4.7.2.1 Ha a rendszer biztosít AMS (R) S adatcsomag szolgáltatást akkor biztosít interfészt az ATN-hez

Megjegyzés.- Az ATN alhálózati szolgáltatással kapcsolatos rendelkezésekről szóló részletes műszaki specifikációk a DOC 9880 - A Légiforgalmi Távközlési Hálózat (ATN) Részletes Műszaki Specifikációs Kézikönyv *(kidolgozás alatt)* 5.2.5 és 5.7.2. fejezeteiben találhatók.

4.7.2.2 Ha a rendszer AMS (R) S adatcsomag szolgáltatást nyújt, biztosítja a kapcsolati értesítési (CN) funkciót.

5. FEJEZET: S-MÓDÚ SSR LEVEGŐ-FÖLD ADATKAPCSOLAT

Megjegyzés. - Az S-módú SSR levegő-föld adatkapcsolatra, a Légiforgalmi Távközlési Hálózattal (ATN) összefüggésben, mint S-módú alhálózatra is hivatkoznak.

5.1 AZ S-MÓDÚ ALHÁLÓZATRA VONATKOZÓ MEGHATÁROZÁSOK

Légijármű *(Aircraft).* A légijármű kifejezést használhatják hivatkozásként az S-módú sugárzó adóberendezésre, készülékre (azaz légijármű/szállítóeszköz), ahol alkalmazható.
Légijármű Cím *(Aircraft address).* 24 bit egyedi kombinációja, amelyet egy légijárműhöz rendelhetnek, a levegő-föld kommunikáció, a navigáció és a radarfelderítés céljára.
Légijármű Hálózati Végponti Berendezés *(ADCE) (Aircraft data circuit-terminating equipment).* Egy, a légijármű fedélzetén található adott hálózati végponti berendezés, amely egy, a fedélzeten található adatkapcsolat vezérlő egységhez (ADLP) kapcsolódik. Ez egy, az S-módú adatkapcsolathoz tartozó egyedi protokollt működtet a légijármű és a föld közötti adattovábbítás számára.
Fedélzeti Adatkapcsolat Vezérlő Egység *(ADLP) (Airborne data link processor).* Egy, a légijárművön található vezérlő egység, amely egyedi az adott levegő-föld adatkapcsolatban (pl. az S-módú kapcsolatban), és amely a csatorna kezelését biztosítja, valamint a közleményeket továbbítás végett részekre bontja és/vagy ismét összeállítja azokat. Ez az egyik oldalán a légijármű olyan egységeihez kapcsolódik, amelyek valamennyi adatkapcsolati rendszerben közösek, a másik oldalán pedig magához a levegő-föld kapcsolathoz.
Légijármű/Közlekedési Eszköz *(Aircraft/vehicle).* Használhatják egy gép, vagy egy eszköz meghatározására, amely képes a légkörben repülni, vagy egy közlekedési eszköz a repülőtér mozgási területén található (azaz a futópályák és a gurulóutak).
Légi-kezdeményezésű Protokoll *(Air-initiated protocol).* Egy légijármű S-módú fedélzeti berendezése által kezdeményezett eljárás, egy szabvány hosszúságú vagy kiterjesztett hosszúságú, fedélzetről származó közlemény továbbítására a földi berendezés részére.
BDS B-adatátvitel Adat Kiválasztó *(BDS Comm-B Data Selector)* A 8-bites BDS kód meghatározza azt a regisztert, amelynek a tartalmát továbbítani kell a B-adatátvitel válasz MB mezőjében. Ezt két, egyenként 4-bites bitcsoportban ábrázolják, BDS1 (a legmagasabb helyi értékű 4 bit) és BDS2 (a legkisebb helyi értékű 4 bit).
Általános Adás *(Broadcast).* Az S-módú rendszeren belüli protokoll, amely lehetővé teszi, hogy a fedésterületen belül lévő összes légijármű számára a fedélzetre irányuló közleményt (uplink message) küldjenek, valamint hogy a fedélzetről leadott közlemény (downlink message) álljon rendelkezésre valamennyi lekérdező állomás (interrogator) számára, amelynek fedésterületén belül található az a légijármű, amely ilyen közleményt kíván küldeni.
Teljesítőképesség Jelentés *(Capability report).* Információ, amely jelzi, hogy a válasz-jeladónak van-e olyan adatkapcsolati teljesítőképessége, ahogy azt a minden állomást hívó adásra, vagy a lekérdezés nélküli válaszjeladásra adott teljesítőképesség mezőjében (CA) jelenti (lásd az "Adatkapcsolati Képesség Jelentés"-t).
Kizárás *(Close-out).* Az S-módú lekérdező állomásról származó utasítás, amely lezárja az S-módú adatkapcsolati réteg kommunikáció végrehajtását /tranzakciót/.
A Lekérdező Állomások Csoportja *(Cluster of interrogators).* Két vagy több lekérdező állomás (interrogator), ugyanazzal a lekérdező azonosító kóddal (II), melyek együttműködnek, hogy biztosítható legyen a felderítés interferencia-mentessége és valamennyi lekérdező állomás adatkapcsolati teljesítménye a közös fedésterületen belül.
A-Adatátviteli Csomag *(Comm-A).* Egy 112 bites lekérdezés, ami tartalmazza az 56 bit hosszúságú A-Közlemény mezőt /MA/. Ezt a mezőt a fedélzetre irányuló szabvány hosszúságú közlemények (SLM) és az általános adás protokollok használják.
B-Adatátviteli Csomag *(Comm-B).* Egy 112 bites válasz, ami tartalmazza az 56 bit hosszúságú B-Közlemény mezőt /MB/. Ezt a mezőt a fedélzetről származó szabvány hosszúságú közlemények (SLM) és a földről kezdeményezett, valamint az általános adás protokollok használják.
C-Adatátviteli Csomag *(Comm-C).* Egy 112 bit hosszúságú lekérdezés, amely tartalmazza a 80 bit hosszú C-Közlemény mezőt /MC/. Ezt a mezőt a fedélzetre irányuló kiterjesztett hosszúságú közlemény (ELM) protokoll használja.
D-Adatátviteli Csomag *(Comm-D).* Egy 112 bit hosszúságú válasz, amely tartalmazza a 80 bit hosszú D-Közlemény mezőt /MD/. Ezt a mezőt a fedélzetről származó kiterjesztett hosszúságú közlemény (ELM) protokoll használja.
Összeköttetés *(Connection).* Logikai kapcsolat egy kommunikációs rendszerben, az egyszintű entitások között.
Adatkapcsolat Teljesítőképesség Jelentés *(Data link capability report).* Egy B-Adatávitel válaszban megadott

információ, amely azonosítja a légijármű fedélzetén lévő berendezés teljes S-módú kommunikációs teljesítő-képességét.
A Fedélzetről Leadott Adattovábbítás *(Downlink).* A fogalom a légijármű fedélzetéről a föld felé továbbított adatokra vonatkozik. Az S-módú levegő-föld jeleket az 1090 MHz-es válasz frekvencia csatornán továbbítják.
Kiterjesztett Hosszúságú Közlemény (ELM) *(Extended length message (ELM)).* Egy sorozat C-adatátviteli /Comm-C/ lekérdezés (a fedélzetre irányuló /uplink/ ELM), melyet a közben érkező válaszok igénye nélkül továbbítanak, vagy egy sorozat D-adatátviteli /Comm-D/ válasz (fedélzetről leadott /downlink/ ELM), melyet a közben beérkező kérdezések igénye nélkül továbbítanak.
A Fedélzetre Irányuló ELM *(UELM) (Uplink ELM).* Ez a fogalom a 112 bit hosszúságú S-módú C-adatátviteli /Comm-C/ lekérdezésekkel megvalósított kiterjesztett hosszúságú, fedélzetre irányuló össze-köttetésre vonatkozik. Valamennyi lekérdezés tartalmazza a 80 bit hosszúságú C-adatátviteli /Comm-C/ közlemény mezőt (MC).
A Fedélzetről Leadott ELM *(DELM) (Downlink ELM).* Ez a fogalom a 112 bit hosszúságú S-módú D-adatátviteli /Comm-D/ válaszokkal megvalósított kiterjesztett hosszúságú, fedélzetről leadott összeköttetésre vonatkozik. Valamennyi válaszközlemény tartalmazza a 80 bit hosszúságú D-adatátviteli /Comm-D/ közlemény mezőt (MD).
Keret *(Frame).* Az adatkapcsolati szinten az adatátvitel alapegysége. Az S-módú alhálózat vonatkozásában egy-egy keret 1-től 4-ig terjedően tartalmazhat A-adatátviteli, illetve B-adatátviteli szegmenst, és 2-től 16-ig terjedően C-adatátviteli szegmenst, vagy 1-től 16-ig terjedően D-adatátviteli szegmenst.
Általános Formázó/Kezelő *(GFM) (General formatter/manager (GFM)).* A légijármű azon funkciója, amely a válaszjeladó regisztereibe kerülő közlemények összeállításáért felelős. Feladata még az olyan hibajelenségek felderítése és kezelése is, mint a bemenő adatok hiánya.
Földi Hálózati Végponti Berendezés *(GDCE) (Ground data circuit -terminating equipment (GDCE)).* Egy olyan sajátosan földi hálózati végponti berendezés, amely egy földi telepítési rendszerű adatkapcsolat vezérlő egységéhez (GDLP) kapcsolódik. Ez egy az S-módú adatkapcsolathoz tartozó egyedi protokollt működtet a légijármű és a föld közötti adat-továbbítás számára.
Földi Telepítési Rendszerű Adatkapcsolat Vezérlő Egység *(GDLP) (Ground data link processor (GDLP)).* Egy olyan földi telepítési rendszerű vezérlő egység, amely egyedi az adott levegő-föld adatkapcsolatban (pl. az S-módú kapcsolatban), és amely biztosítja a csatorna kezelését, valamint a közleményeket a továbbítás céljából részekre bontja, és/vagy ismét összeállítja. Ez az egyik oldalán (a hálózati végponti berendezés /DCE/ segítségével) a földi berendezés olyan egységeihez kapcsolódik, amelyek valamennyi adatkapcsolati rendszerben általánosak, a másik oldalon pedig magához a levegő-föld kapcsolathoz.
Földről Kezdeményezett B-adatátvitel *(GICB) (Ground-initiated Comm-B (GICB)).* A földről kezdeményezett B-adatátvitel protokoll lehetővé teszi a lekérdező állomás részére, hogy a meghatározott forrásból eredő B-közlemény /MB/ mezőben lévő válasz adatokat kiemelje.
Földről Kezdeményezett Protokoll *(Ground-initiated protocol).* Egy S-módú, a lekérdező állomás által kezdeményezett eljárás a szabvány hosszúságú, vagy kiterjesztett hosszúságú közleményeknek a légijármű S-módú berendezései részére történő továbbítására.
Légijármű Fedélzetéről Kezdeményezett S-módú B-adatátviteli (AICB) protokoll *(Mode S air-initiated Comm-B (AICB) protocol).* Egy S-módú válaszjeladó (transponder) által kezdeményezett eljárás egy egyszeri B-adatátviteli szegmensnek a légijármű fedélzetén található berendezéstől történő továbbítása céljára.
S-módú Általános Adás Protokollok *(Mode S broadcast protocols).* Olyan eljárások, melyek lehetővé teszik szabvány hosszúságú, fedélzetre irányuló, vagy a fedélzetről leadott közlemények vételét egynél több válaszjeladóval, illetve földi telepítésű lekérdező állomással külön-külön.
S-módú Földről Kezdeményezett B-adatátviteli (GICB) protokoll *(Mode S ground-initiated Comm-B (GICB) protocol).* Egy, a lekérdező állomás által kezdeményezett S-módú eljárás a fedélzeten elhelyezett S-módú berendezéstől származó egyetlen olyan B-adatátviteli szegmens kiemelésére, amely magába foglalja az S-módú válaszjeladón belüli 255 B-adatátviteli regiszter valamelyikének tartalmát.
S-módú Több Helyre Irányított Protokoll *(Mode S multisite-directed protocol).* Olyan eljárás, amely biztosítja, hogy egy fedélzetről leadott szabvány hosszúságú, vagy kiterjesztett hosszúságú közlemény feldolgozását és lezárását (extraction, close-out) csak a légijármű által kiválasztott egyedi S-módú lekérdező állomás befolyásolhassa.
S-módú Csomag *(Mode S packet).* Az S-módú alhálózati szabványnak megfelelő csomag, amely arra szolgál, hogy minimalizálja a levegő-föld kapcsolat által igényelt sávszélességet. Az ISO-8208 csomagokat (packets) S-módú csomagokba lehet transzformálni és viszont.
S-módú Specifikus Protokoll *(MSP) (Mode S specific protocol (MSP)).* Olyan protokoll, amely korlátozott adatcsomag (datagram) szolgáltatást biztosít az S-módú alhálózaton belül.
S-módú specifikus szolgáltatások *(Mode S specific services).* Az S-módú rendszer által biztosított kommunikációs

szolgáltatások olyan készlete, amelyek más levegő-föld alhálózatokból nem elérhetők, ezért együttműködésre nem képesek.
S-módú specifikus szolgáltatási entitás *(SSE) (Mode S specific services entity (SSE)).* Egy, a Fedélzeti/Földi Adatkapcsolat Vezérlő Egységen /XDLP/ belül, a rendszerben található entitás, amely lehetővé teszi az S-módú specifikus szolgáltatások elérését.
Csomag *(Packet).* A hálózati rétegen belüli összeköttetési berendezések közötti adattovábbítás alapegysége (például egy ISO 8208 csomag vagy egy S-módú csomag).
Szegmens *(Segment).* Egy közleménynek az a része, amelyet be lehet illesztetni egy egyedüli A-Közlemény/B-Közlemény /MA/MB/ mezőbe egy szabvány hosszúságú közlemény, vagy egy C-Közlemény/D-Közlemény /MC/MD/ mezőbe egy kiterjesztett hosszúságú közlemény esetében. Ez a kifejezés az ezeket a mezőket magába foglaló S-módú továbbításokra is alkalmazott.
Szabvány Hosszúságú Közlemény *(SLM) (Standard length message (SLM)).* Egy kiválasztottan címzett A-adatátviteli /Comm-A/ lekérdezéseket és/vagy B-adatátviteli /Comm-B/ válaszokat felhasználó digitális adatcsere közlemény (lásd a "Comm-A"-t és "Comm-B"-t).
Alhálózat *(Subnetwork).* Egy olyan ténylegesen megvalósított adathálózat, amely azonos protokollt és címzési tervet alkalmaz, és egy egyedüli hatóság ellenőrzése alatt áll.
Alhálózat Kezelési Entitás *(SNME) (Subnetwork management entity (SNME)).* Egy Földi telepítési rendszerű adatkapcsolat vezérlőegységen /GDLP-n/ belüli entitás, amely az alhálózat kezelését végzi, és összeköttetést tart a közbenső vagy végponti rendszerek egyenrangú entitásaival.
Idő-túllépés *(Timeout).* Egy tranzakció törlése az után, hogy a résztvevő entitások egyike egy előre meghatározott időtartamon belül nem biztosította az igényelt választ.
A Fedélzetre Irányuló Közlemény *(Uplink).* Az a fogalom, mely a földről egy légijármű fedélzetére irányuló adatok továbbítására vonatkozik. Az S-módú föld-levegő jeleket az 1 030 MHz-es lekérdező frekvencia-csatornán továbbítják.
XDCE *(XDCE).* Általános fogalom, amely egyaránt vonatkozik a légijármű hálózati végponti berendezésre /ADCE-re/ és a Földi hálózati végponti berendezésre /GDCE-re/.
XDLP *(XDLP).* Általános fogalom, amely egyaránt vonatkozik a Fedélzeti adatkapcsolat vezérlő egységére /ADLP-re/ és a Földi Telepítési rendszerű adatkapcsolat vezérlő egységére /GDLP-re/.

5.2 AZ S-MÓDÚ ALHÁLÓZAT JELLEMZŐI

5.2.1 Általános előírások

1. Megjegyzés. - ISO Referencia dokumentum. Amikor ebben a szabványban az "ISO 8208" dokumentumra hivatkoznak, akkor ez az alábbi ISO szabványt jelenti: "Information technology - Data communications - X.25 Packet Layer Protocol for Data Terminal Equipment, Reference Number ISO/IEC 8208: 1990 (E)" - Információtechnológia - Adatösszeköttetések - X.25 csomag réteg a Hálózati Végponti Berendezések számára, Referencia száma: ISO/IEC 8208: 1990 (E).

2. Megjegyzés. - Az S-módú alhálózat teljes felépítését a következő oldalon található ábrán mutatjuk be.

3. Megjegyzés. - A feldolgozás három különböző úton folyik. Az első a virtuális kapcsolt adathálózatok feldolgozását (SVC-k), a második az S-módú specifikus szolgáltatások feldolgozását, és a harmadik az alhálózat vezérlési információinak feldolgozását tartalmazza. Az SVC-k az újraformázási folyamatot és a légijármű hálózati végponti berendezések /ADCE/, vagy a földi hálózati végponti berendezések /GDCE/ funkcióit használják. Az S-módú specifikus szolgáltatások az S-módú specifikus szolgáltatási entitás (SSE) funkcióit használják fel.

5.2.1.1 *A közlemény kategóriák.* Az S-módú alhálózat csak olyan légiforgalmi távközlést szolgálhat, melyeket a repülésbiztonság és a repülés rendszerességének biztosítása kategóriába soroltak, ahogy azt az Annex 10, II. Kötet, 5. Fejezet, 5.1.8.4. és 5.1.8.6 pontjában meghatározták.
5.2.1.2 *Jelek a térben.* Az S-módú alhálózat térbeli-jel jellemzőinek meg kell felelniük az Annex 10, IV. Kötet, 3. Fejezet, 3.1.2 pontjában található előírásoknak.
5.2.1.3 *Kód és bájt függetlenség.* Az S-módú alhálózat képes a digitális adatok kód- és bájt-független továbbítására.
5.2.1.4 *Adatátvitel.* Az S-módú adatkapcsolaton keresztül az adatokat szegmentálva kell továbbítani, akár a szabvány hosszúságú közlemény (SLM) protokollok, akár a kiterjesztett hosszúságú közlemény (ELM) protokollok felhasználásával, ahogy azt az Annex 10, IV. kötetének, 3.1.2.6.11 és 3.1.2.7 pontjában meghatározták.

1. Megjegyzés. - Egy szabvány hosszúságú közlemény /SLM/ szegmensnek egy 56-bites A-Közlemény /MA/, vagy B-Közlemény /MB/ mező a tartalma. Egy kiterjesztett hosszúságú közlemény /ELM/ szegmensnek egy 80-bites C-Közlemény /MC/, vagy D-Közlemény /MD/ mező a tartalma.

2. Megjegyzés. - Egy szabvány hosszúságú közlemény /SLM/ keretnek maximálisan négy kapcsolt MA, vagy MB mező a tartalma. Egy ELM keretnek 2-től 16-ig terjedő MC, vagy 1-től 16-ig terjedő MD mező a tartalma.

5.2.1.5 *Bitek számozása.* Az adatátviteli mezők leírásában a biteket a továbbításuk sorrendjében kell számozni, az 1-es számú bittel kezdve. A bitek sorszámozását a többszegmensű keretek második és további szegmensein keresztül is folytatni kell. Hacsak nincs másképpen előírva, a bit-csoportokkal (mezőkkel) kódolt numerikus értékeket pozitív bináris számábrázolást használva kell kódolni, és az első továbbított bitnek a legmagasabb helyi értékű bitnek (MSB) kell lennie (az Annex 10, IV. kötet, 3.1.2.3.1.3 pont).
5.2.1.6 *Hozzárendelés nélküli bitek*. Amikor az adatok hossza nem elegendő ahhoz, hogy az a közlemény mezőn, vagy részmezőn belül az összes bitpozíciót elfoglalja, a hozzárendelés nélküli bit pozíciókat 0-ra kell állítani.

5.2.2 Keretek

5.2.2.1 A FEDÉLZETRE IRÁNYULÓ KERETEK

5.2.2.1.1 *Szabvány hosszúságú közlemény (SLM) keretek.* Egy SLM keretet maximálisan négy szelektív módon címzett A-adatátvitel /Comm-A/ szegmensből kell összeállítani.

Megjegyzés. - A Fedélzeti adatkapcsolat vezérlő egység /ADLP/ által vett valamennyi A-adatátvitel /Comm-A/ szegmenst (A-Közlemény /MA/ mező), a szegmenst biztosító lekérdezés első 32 bitje kíséri (Annex 10, IV. kötet 3.1.2.10.5.2.1.1 pont). Ezen a 32 biten belül található a 16-bites Speciális Jelölő (SD) mező (Annex 10, IV. kötet 3.1.2.6.1.4 pont).

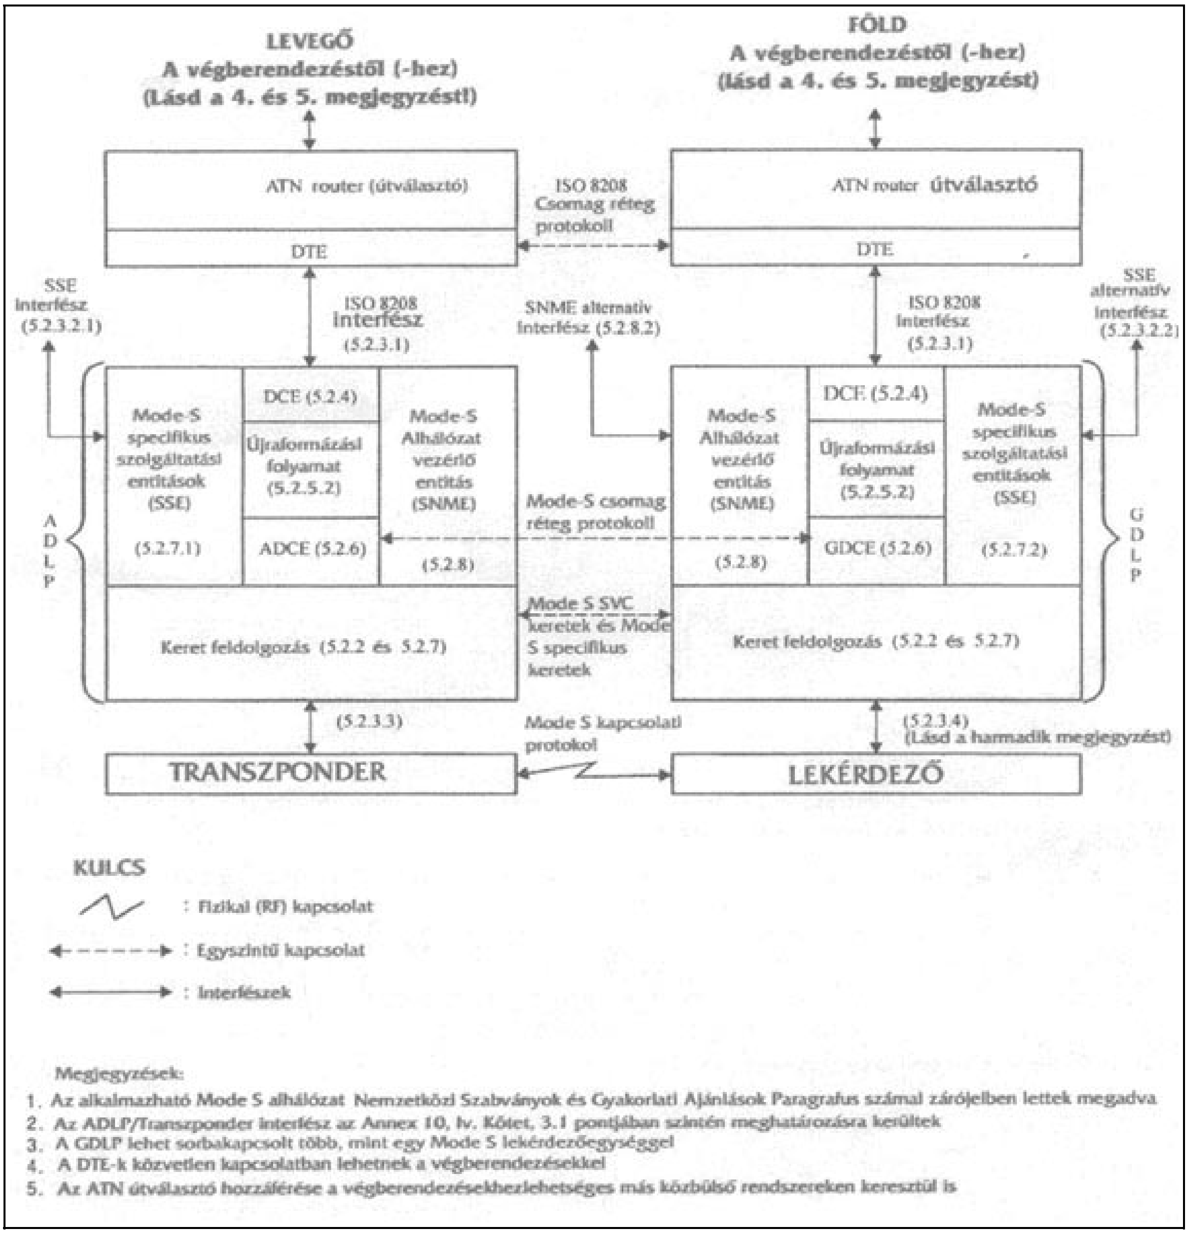
5.2.2.1.1.1 *Speciális jelölő /SD/ mező.* Amikor a Jelölő azonosító mező (DI) (14-16. bit) tartalma az 1-es, vagy a 7-es kód-érték, akkor az összes A-adatátvitel /Comm-A/ lekérdezés SD (Speciális jelölő) mezőjét (17-32. bit) kell felhasználni arra, hogy a Lekérdező azonosító részmezőt /Interrogator identifier subfield/ (IIS, 17-20. bit), valamint a Kapcsolt A-adatátvitel /Comm-A/ részmezőt /Linked Comm-A subfield/ (LAS, 30-32. bit) beszerezzék. A végrehajtandó művelet a kapott LAS értékétől függ. A LAS és az IIS tartalmát meg kell őrizni, és össze kell kapcsolni az A-adatátvitel /Comm-A/ közlemény szegmenssel, hogy a keret összeállításánál használják, az alábbiak szerint. A LAS mezőn kívül az összes többi mezőnek meg kell felelnie az Annex 10, IV. Kötet 3.1.2 pont előírásainak.

Megjegyzés. - A Speciális jelölő /SD/ mező felépítése az 5.1 ábrán látható.*

* Az összes táblázat és ábra ennek a fejezetnek a végén van elhelyezve.

5.2.2.1.1.2 *A Kapcsolt A-adatátvitel részmező /LAS/ kódolása.*
A 3-bites LAS részmezőt az alábbiak szerint kell kódolni:
LAS JELENTÉSE
0 egyetlen szegmens
1 kapcsolt, első szegmens
2 kapcsolt, második, de nem utolsó szegmens
3 kapcsolt, harmadik, de nem utolsó szegmens
4 kapcsolt, negyedik és utolsó szegmens
5 kapcsolt, ötödik és utolsó szegmens
6 kapcsolt, hatodik és utolsó szegmens
7 hozzárendelés nélküli

Az S-módú alhálózat funkcionális elemei



Kiegészítő ábraszöveg magyarázat:
DTE = Lekérdező adat végponti berendezés
DCE = Hálózati végponti berendezés
ADCE = Légijármű hálózati végponti berendezés
GDCE = Földi hálózati végponti berendezés
TRANSPONDER = Válaszjeladó
ADLP = Fedélzeti adatkapcsolat vezérlő egység
GDLP = Földi telepítési rendszerű adatkapcsolat vezérlő egység
ATN = Légiforgalmi távközlési hálózat

5.2.2.1.1.3 *Egyetlen Szabvány hosszúságú közlemény /SLM/ keret szegmens.* Ha a LAS = 0, akkor az A-közlemény /MA/ mezőben található adatot egy teljes keretnek kell tekinteni, és lehetővé kell tenni a további feldolgozását.
5.2.2.1.1.4 *Többszörös Szegmensű Szabvány hosszúságú közlemény /SLM/ keret.* A Fedélzeti adatkapcsolat vezérlő egységnek /ADLP/ vennie és össze kell állítania a kapcsolt 56-bites A-adatátvitel /Comm-A/ szegmenseket, amelyek kapcsolatban vannak mind a tizenhat lehetséges Lekérdező azonosító (II) kóddal. Az A-adatátvitel /Comm-A/ szegmensek helyes összekapcsolását annak megkövetelésével lehet biztosítani, hogy az összes A-adatátvitel /Comm-A/ szegmens egyforma Lekérdező azonosító részmező) /IIS/ értékkel rendelkezzen. Ha a Kapcsolt A-adatátvitel részmező /LAS/ értéke 1-től 6-ig terjed, a keretnek kettő - négy A-adatátvitel /Comm-A/ szegmensből

kell állnia a következő bekezdésekben leírtak szerint.
5.2.2.1.1.4.1 *Kezdeti szegmens.* Ha a Kapcsolt A-adatátvitel részmező /LAS/ = 1, akkor az A-közlemény /MA/ mezőt a Szabvány hosszúságú /SLM/ keret kezdeti szegmenseként kell összeállítani. A kezdeti szegmenset addig kell tárolni, amíg a keret összes szegmensét nem vették, vagy a keretet nem törölték.
5.2.2.1.1.4.2 *Átmeneti, közbenső szegmens.* Ha a LAS = 2 vagy 3, akkor az A-közlemény /MA/ mezőt szám szerinti sorrendben kell összeállítani, mint az SLM keret egy átmeneti, közbenső szegmensét. Össze kell kapcsolni az ugyanolyan értékű Lekérdező azonosító részmezőt /IIS/ tartalmazó előző szegmensekkel.
5.2.2.1.1.4.3 *Végső szegmens.* Ha a LAS = 4, 5 vagy 6, akkor az A-közlemény /MA/ mezőt az SLM keret végső szegmenseként kell összeállítani. Össze kell kapcsolni az ugyanolyan értékű Lekérdező azonosító részmezőt /IIS/ tartalmazó előző szegmensekkel.
5.2.2.1.1.4.4 *A Keret befejezése.* A keretet teljesnek kell tekinteni, és lehetővé kell tenni további feldolgozását, amint a keret összes szegmensét vették.
5.2.2.1.1.4.5 *A Keret törlése.* Egy nem teljes Szabvány hosszúságú közlemény /SLM/ keretet törölni, érvényteleníteni kell, ha az alábbi körülmények közül egy, vagy több fennáll:
a) Ugyanolyan Lekérdező azonosító részmező /IIS/ értékkel egy új kezdeti szegmenset (LAS = 1) vesznek. Ebben az esetben az új kezdeti szegmenset egy új Szabvány hosszúságú közlemény /SLM/ keret kezdeti szegmenseként kell megtartani;
b) A vett Kapcsolt A-adatátviteli /Comm-A/ /LAS/ részmező kódok sorrendje, (miután a több példányban előforduló kódokat törölték) nem egyezik meg az alábbi listában felsoroltakkal:
1) LAS = 0
2) LAS = 1,5
3) LAS = 1,2,6
4) LAS = 1,6,2
5) LAS = 1,2,3,4
6) LAS = 1,3,2,4
7) LAS = 1,2,4,3
8) LAS = 1,3,4,2
9) LAS = 1,4,2,3
10) LAS = 1,4,3,2

c) *Tc* másodperc eltelt azóta, hogy az utolsó A-adatátvitel /Comm-A/ szegmenset ugyanazzal a Lekérdező azonosító részmező /IIS/ értékkel vették (5-1. Táblázat).
5.2.2.1.1.4.6 *Szegmens törlése.* Egy Szabvány hosszúságú közlemény /SLM/ keret számára vett szegmenset érvénytelennek kell tekinteni, ha az egy közbenső vagy végső szegmens, és még nem vettek ugyanolyan IIS értékű kezdeti szegmenset.
5.2.2.1.1.4.7 *Szegmens ismétlése.* Ha a vett szegmens egy röviddel korábban vett azonos Lekérdező azonosító részmező /IIS/ értékű szegmens megismétlése, akkor az új szegmens le kell, hogy cserélje a korábban vett szegmenset.

Megjegyzés. - Az S-módú hálózati protokollok eljárása az A-adatátvitel /Comm-A/ szegmensek megismételt továbbítását eredményezheti.

5.2.2.1.2 *Kiterjesztett hosszúságú közlemény /ELM/ keret.* Egy uplink fedélzetre irányuló /uplink/ /ELM/ kiterjesztett hosszúságú közlemény /ELM/ keret 20-tól 160-ig terjedő bájtból kell felépülnie, és az Annex 10, IV. Kötet, 3.1.2.7 pontjában meghatározott protokoll felhasználásával kell továbbítani a lekérdező állomástól (interrogator) a válaszjeladó (transponder) felé. Valamennyi fedélzetre irányuló ELM szegmens első négy bitjének a C-közlemény /MC mező/ tartalmaznia kell az ELM-et továbbító S-módú lekérdező állomás lekérdező azonosító (II) kódját. A Fedélzeti adatkapcsolat vezérlő egységnek /ADLP/ ellenőriznie kell egy befejezett fedélzetre irányuló ELM összes szegmense lekérdező azonosító /II/ kódját. Ha az összes szegmens ugyanazt az II kódot tartalmazza, akkor az II kódot minden szegmensben törölni kell, és a további közlemény biteket meg kell őrizni, mint felhasználói adatokat, további feldolgozás céljára. Ha az összes szegmens nem ugyanazt az II kódot tartalmazza, akkor a teljes fedélzetre irányuló ELM-t érvénytelennek kell tekinteni.

Megjegyzés.- Egy fedélzetre irányuló ELM keret 2-től 16-ig terjedő kapcsolt C-adatátvitel /Comm-C/ szegmensből áll, valamennyi 4 bites II kódot tartalmaz. Ily módon a csomag továbbítás kapacitása a fedélzetre irányuló kiterjesztett hosszúságú /ELM/ keretenként 19 - 152 bájt.

5.2.2.2 A FEDÉLZETRŐL LEADOTT (DOWNLINK) KERETEK

5.2.2.2.1 *Szabvány hosszúságú /SLM/ keret.* Egy fedélzetről leadott SLM keret maximálisan 4 B-adatátviteli /Comm-B/ szegmensből állhat. A keret első B-adatátviteli szegmensének B-közlemény /MB/ mezője egy 2-bites kapcsolt B-adatátvitel részmezőt (az LBS, a B-közlemény /MB/ mező 1 és 2 bitje) tartalmaz. Ezt az részmezőt kell felhasználni a maximálisan négy B-adatátviteli /Comm-B/ szegmens összekapcsolásának vezérlésére.

Megjegyzés. - A kapcsolt B-adatátvitel részmező /LBS/ használja az első két-bit pozíciót egy többszörös vagy egyedüli fedélzetről leadott /downlink/ Szabvány hosszúságú /SLM/ keret első szegmensében. Ebből kifolyólag 54 bit áll rendelkezésre az S-módú adatcsomag részére a fedélzetről leadott SLM keret első szegmensében. A fedélzetről leadott SLM keret megmaradó szegmenseinek, ha léteznek, 56 bit áll rendelkezésükre.

5.2.2.2.1.1 *Kapcsolt B-adatátviteli részmező /LBS/ kódolás.* Az összekötést a Szabvány hosszúságú közlemény /SLM/ keret kezdő B-adatátvitel /Comm-B/ szegmensének B-közlemény /MB/ mezője LBS részmezőjének kódolásával jelzik.
A kapcsolt B-adatátvitel részmező /LBS/ kódolása a következő:
LBS JELENTÉSE
0 egyetlen szegmens
1 egy két-szegmenses SLM keret kezdő szegmense
2 egy három-szegmenses SLM keret kezdő szegmense
3 egy négy-szegmenses SLM keret kezdő szegmense

5.2.2.2.1.2 *Az összekapcsolási protokoll*
5.2.2.2.1.2.1 A B-adatátvitel /Comm-B/ protokollban a kezdő szegmenset a levegőből kezdeményezett, vagy több helyre irányított protokollok felhasználásával kell továbbítani. A kezdő szegmens LBS mezőjének jelezni kell a földnek a továbbításra kerülő további szegmensek számát (ha van ilyen). A kezdeti szegmensnek a válaszjeladóhoz (transponder) való továbbítását megelőzően az SLM keret megmaradó szegmenseit (ha vannak ilyenek) a válaszjeladóhoz kell továbbítani, a lekérdezőhöz (interrogator) való továbbítás céljából, a földi kezdeményezésű B-adatátviteli protokoll felhasználásával. Ezeket a szegmenseket vezérlő kódok kísérik, amelyek ezeknek a szegmenseknek a földi kezdeményezésű B-adatátvitel /Comm-B/ 2., 3., 4. regiszterébe való beillesztését végzik, ennek a számozásnak megfelelően a keret második, harmadik, vagy negyedik szegmenséhez kapcsolódóan.
5.2.2.2.1.2.2 Az olyan, levegőből kezdeményezett szegmens kizárása, amelyet a protokoll kezdeményezett, nem mehet végbe addig, amíg az összes szegmens nem került eredményesen továbbításra.

Megjegyzés. - A földi kezdeményezésű B-adatátvitel /Comm-B/ protokoll felhasználását magában foglaló összekapcsolási eljárást a Fedélzeti adatkapcsolat vezérlő egység /ADLP/ hajtja végre.

5.2.2.2.1.3 *A Szabvány hosszúságú közlemény /SLM/ keretek irányítása.* Ha az SLM keretnek több helyre irányítottnak kell lennie, akkor az ADLP-nek meg kell határoznia azon S-módú lekérdező, vagy lekérdező csoport lekérdező azonosító (II) kódját (5.2.8.1.3), amelyeknek az SLM keretet vennie kell.

5.2.2.2.2 *KITERJESZTETT HOSSZÚSÁGÚ KÖZLEMÉNY /ELM/ KERET*

Megjegyzés. - Egy fedélzetről leadott ELM egytől tizenhatig terjedő összekapcsolt szegmensből áll.

5.2.2.2.2.1 *Eljárás.* A fedélzetről leadott ELM kereteknek a közlemények továbbításához 28 bájttal egyenlő, vagy annál több bájtot kell felhasználni, és azokat az Annex 10, IV. kötet, 3.1.2.7 pontjában meghatározott protokoll felhasználásával kell megformázni.
5.2.2.2.2.2 *ELM keretek irányítása.* Ha az ELM keretnek több helyre irányítottnak kell lennie, akkor az ADLP-nek meg kell határoznia azon S-módú lekérdező vagy lekérdező csoport lekérdező azonosító /II/ kódját (5.2.8.1.3), amelynek az ELM keretet vennie kell.
5.2.2.3 *Fedélzeti/Földi adatkapcsolat vezérlő egység /XDLP/ keret feldolgozás.* Keret-feldolgozást minden S-módú csomagon el kell végezni (kivéve az MSP csomagot) az 5.2.2.3-tól az 5.2.2.5-ig terjedő pontokban meghatározottak szerint. Keret-feldolgozását S-módú specifikus szolgáltatásoknál az 5.2.7 pontban meghatározottak szerint kell

végezni.
5.2.2.3.1 *Csomag hosszúság.* Minden csomagot (beleértve az egy egyedüli keretbe multiplikált csomag csoportot is) egy olyan keretbe kell áthelyezni, amelyet a csomag befogadásához szükséges legkisebb számú szegmens képez. A felhasználói adat mezőnek hosszban a bájtok egy integrál többszörösének kell lenni. Egy 4-bites hossz paramétert (LV) kell biztosítani az S-módú ADAT, HÍVÁSKÉRÉS, HÍVÁS ELFOGADÁS, BONTÁS KÉRÉS és MEGSZAKÍTÁS csomag fej-részekben úgy, hogy a kicsomagolás alatt további bájtokat nem adnak a felhasználói adat mezőhöz. A felhasználói adat hosszúság /LV/ mezőnek kell meghatároznia a keret utolsó szegmensében használt teljes bitek számát. A felhasználói adat hosszúság /LV/ számítások során a 4-bites lekérdező azonosító /II/ kódot a fedélzetre irányuló kiterjesztett hosszúságú közlemény /ELM/ utolsó szegmensében (1) el kell hanyagolni azoknál a fedélzetre irányuló ELM kereteknél, amelyek páratlan számú C-adatátviteli /Comm-C/ szegmenssel rendelkeznek, és (2) számba kell venni a páros számú C-adatátviteli szegmenssel rendelkező fedélzetre irányuló ELM kereteknél. Az LV mezőben lévő értéket figyelmen kívül kell hagyni, ha a csomag multiplikált.

Megjegyzés. - Specifikus hossz mezőt használnak a multiplikált csomag egyes elemei hosszának meghatározására. Ezért a felhasználói adat hosszúság /LV/ mező értéket nem használják. Az LV mező hiba kezelése az 5-16. és 5-19. táblázatban került leírásra.

5.2.2.3.2 *Multiplikálás.* Amikor a multiplikált S-módú csomagokat egy egyedüli Szabvány hosszúságú közleménybe /SLM/ multiplikálják, akkor a Kiterjesztett hosszúságú közlemény /ELM/ keretben a következő eljárásokat kell alkalmazni. A csomagok multiplikálása a Fedélzeti adatkapcsolat vezérlő egységen /ADLP/ belül nem alkalmazható különböző prioritású kapcsolt virtuális áramkörökhöz /SVC-k/ kapcsolódó csomagokra.

Megjegyzés. - A multiplikálás nem hajtható végre S-módú specifikus protokollú csomagokon.
5.2.2.3.2.1 *A multiplikálás optimalizálása*

Ajánlás. - *Amikor a multiplikált csomagok ugyanahhoz a Fedélzeti/Földi adatkapcsolat vezérlő egységhez /XDLP/ való átvitelre várnak, akkor ezeket egy egyedüli keretbe kell multiplikálni azért, hogy optimalizálják az átmenő teljesítményt, feltéve, hogy a különböző prioritású kapcsolt virtuális áramkörökhöz kapcsolódó csomagok nincsenek egymással multiplikálva.*
5.2.2.3.2.2 *Szerkezet.* A multiplikált csomagok szerkezetének a következőnek kell lenni:

FEJ-RÉSZ: 6 vagy 8	HOSSZ: 8	1.CSOMAG: v	HOSSZ: 8	2.CSOMAG: v

Megjegyzés. - A mezőben a szám a mezőhosszt jelöli bitekben; a "v" azt jelöli, hogy a mező változó hosszúságú.

5.2.2.3.2.2.1 *Multiplikált fej-rész.* A multiplikált csomagok fej-része a következő:

DP: 1	MP: 1	SP: 2	ST: 2	FILL2: 0 vagy 2

Adat csomag S-módú specifikusprotokoll csomag Felügyelő csomag Felügyelő típus 2. Töltő
Ahol:
Adat csomag típus (DP) = 0
S-módú specifikus protokoll /MSP/ csomag típus (MP) = 1
Felügyelő csomag (SP) = 3
Felügyelő típus (ST) = 2

Megjegyzés. - A multiplikáló fej-részben használt mező szerkezet meghatározását lásd az 5-23. ábrán.

5.2.2.3.2.2.2 *Hossz*. Ez a mező foglalja magába a következő csomag hosszúságát bájtokban. Egy multiplikált ADAT csomagban lévő bármilyen hibajelzés, mint például a HOSSZ mezőben jelzett hossz és az ezt a csomagot befogadó keret hossza közötti ellentmondás a csomag kizárását eredményezi, hacsak a hibát nem lehet a HOSSZ mezőre korlátozni, amely esetben a várható Csomag sorrend /PS/ értékű VISSZAUTASÍTÁS csomag küldhető.

5.2.2.3.2.2.2.1 **Ajánlás. -** *A multiplikált csomagokra az az ajánlott, hogy ha a teljes csomagot nem lehet de-multiplikálni /lebontás/, akkor az első összetevő csomagot egy alaki hibaként kell kezelni, és a továbbiakat érvényteleníteni.*

5.2.2.3.2.3 *Lezárás.* A multiplikált csomagok egy sorozatát magába foglaló keret végét a következő események egyikével kell meghatározni:
a) a mező hosszúsága mindenhol nulla; vagy
b) kevesebb, mint nyolc bit maradt a keretben.

5.2.2.3.3 *S-MÓDÚ CSATORNA SORREND MEGŐRZÉSE*

5.2.2.3.3.1 *Alkalmazás.* Abban az esetben, amikor a multiplikált S-módú keretek ugyanabból a Kapcsolt virtuális áramkörből /SVC/ arra várakoznak, hogy ugyanahhoz a Fedélzeti/Földi adatkapcsolat vezérlő egységhez /XDLP/ továbbítsák őket, a következő eljárást kell alkalmazni.

5.2.2.3.3.2 *Eljárás*

1. Megjegyzés. - A Szabvány hosszúságú közlemény /SLM/ és a Kiterjesztett hosszúságú közlemény /ELM/ tranzakciók függetlenül történhetnek.

2. Megjegyzés. - A fedélzetre irányuló és a fedélzetről leadott tranzakciók függetlenül történhetnek.

5.2.2.3.3.2.1 *Szabvány hosszúságú közlemény /SLM/ keretek*. Az átvitelre váró SLM kereteket a vétel sorrendjében kell továbbítani.
5.2.2.3.3.2.2 *Kiterjesztett hosszúságú közlemény /ELM/ keretek.* Az átvitelre váró ELM kereteket a vétel sorrendjében kell továbbítani.

5.2.2.4 FÖLDI TELEPÍTÉSI RENDSZERŰ ADATKAPCSOLAT VEZÉRLŐ EGYSÉG /GDLP/ KERET FELDOLGOZÁS

5.2.2.4.1 *ÁLTALÁNOS RENDELKEZÉSEK*

5.2.2.4.1.1 A GDLP-nek meg kell állapítania a felszerelt Fedélzeti adatkapcsolat vezérlő egység /ADLP//válaszjeladó adatkapcsolat képességét az adatkapcsolat teljesítőképesség jelentésből (5.2.9), mielőtt azzal z ADLP-vel bármilyen adatkapcsolati tevékenységbe kezdene.
5.2.2.4.1.2 A GDLP keret feldolgozásnak a lekérdező számára biztosítania kell az összes olyan adatot a fedélzetre irányuló adat-továbbításhoz, amelyhez a lekérdező nem tud közvetlenül hozzájutni.
5.2.2.4.2 *Kézbesítési állapot.* A Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ keret feldolgozásának egy jelzést kell kapnia a lekérdező funkciótól arról, hogy egy meghatározott fedélzetre irányuló keret, amelyet előzőleg a lekérdezőhöz továbbítottak, eredményesen befejezésre került a föld-levegő kapcsolaton keresztül.
5.2.2.4.3 *Légijármű címzés.* A Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ keret feldolgozásnak a lekérdezőtől vennie kell az egyes fedélzetről leadott adat-továbbítású Szabvány hosszúságú közlemény /SLM/ vagy Kiterjesztett hosszúságú közlemény /ELM/ keretekben lévő adatokkal együtt annak a légijárműnek a 24-bites címét, amely a keretet továbbította. A GDLP keret feldolgozásnak képesnek kell lenni a 24-bites légijármű címzésnek a lekérdezőhöz való továbbítására, amelynek vennie kell egy fedélzetre irányuló SLM vagy ELM keretet.
5.2.2.4.4 *S-módú protokoll típusazonosítás.* A Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ keret feldolgozásnak kell jeleznie a lekérdezőnek azt a protokollt, amelyet a keret átviteléhez használni kell: Szabvány hosszúságú közlemény protokoll, Kiterjesztett hosszúságú közlemény protokoll, vagy Általános adás protokoll.
5.2.2.4.5 *Keret meghatározás.* Egy S-módú csomagot (beleértve a multiplikált csomagokat, de kizárva az S-módú specifikus protokoll /MSP/ csomagokat), amelyet fedélzetre irányuló csomagként szánnak, és amely kisebb vagy egyenlő 28 bájttal, Szabvány hosszúságú közlemény /SLM/ keretként kell elküldeni. Egy S-módú csomagot, amely nagyobb, mint 28 bájt, fedélzetre irányuló Kiterjesztett hosszúságú közlemény /ELM/ keretként kell elküldeni az ELM képességű válaszjeladónak, M-bites feldolgozást használva, szükség szerint (5.2.5.1.4.1). Ha a transzponder nem rendelkezik ELM képességgel, akkor a 28 bájtnál nagyobb csomagokat M-bites vagy S-bites (5.2.5.1.4.2) összeállítási eljárást alkalmazva, valamint multiplikált SLM kereteket felhasználva kell elküldeni, ahogy szükséges.

Megjegyzés. - Csak az S-módú ADAT, HÍVÁSKÉRÉS, HÍVÁS FOGADÁS, BONTÁS KÉRÉS és MEGSZAKÍTÁS csomagok tartoznak azon S-módú csomagok közé, amelyek M-bites vagy S-bites sorrendet használnak.

5.2.2.5 FEDÉLZETI ADATKAPCSOLAT VEZÉRLŐ EGYSÉG /ADLP/ KERET FELDOLGOZÁS

5.2.2.5.1 *Általános rendelkezések.* Az utolsó 24 bit (címzés/paritás) lehetséges kivételével, az ADLP keret feldolgozásnak a válaszjeladótól mind az 56-bites, mind a 112-bites vett, fedélzetre irányuló továbbítások teljes tartalmát fogadnia kell - az általános hívás és Összeütközési veszélyt jelző fedélzeti rendszer /ACAS/ lekérdezések kivételével. Az ADLP keret feldolgozásnak biztosítania kell az összes olyan adatot is a válaszjeladónak a fedélzetről leadott adat-továbbításhoz, amelyet a válaszjeladó közvetlenül nem szolgáltat (5.2.3.3).
5.2.2.5.2 *Kézbesítési állapot.* A Fedélzeti adatkapcsolat vezérlő egység /ADLP/ keret feldolgozásának egy jelzést kell kapnia a válaszjeladótól arról, hogy egy meghatározott fedélzetről leadott keretnek, amelyet előzőleg a válaszjeladónak továbbítottak, befejezésre került.
5.2.2.5.3 *Lekérdező azonosító /II/.* Az ADLP keret feldolgozásnak a válaszjeladótól vennie kell az egyes fedélzetre irányuló adat-továbbítású Szabvány hosszúságú közleményben /SLM/ és Kiterjesztett hosszúságú közleményben /ELM/ lévő adatokkal együtt a keretet leadó lekérdezőnek a lekérdező azonosító (II) kódját. Az ADLP keret feldolgozásnak továbbítania kell a válaszjeladónak azon lekérdező, vagy lekérdező csoport II kódját, amelynek a több helyre irányított keretet vennie kell.
5.2.2.5.4 *S-módú protokoll típusazonosítás.* Az ADLP keret feldolgozásnak jeleznie kell a válaszjeladónak a keret továbbításához használandó protokollt: földi-kezdeményezésű, légi-kezdeményezésű, általános adás, több helyre irányított, szabvány hosszúságú vagy kiterjesztett hosszúságú közlemény.
5.2.2.5.5 *Keret törlés.* A Fedélzeti adatkapcsolat vezérlő egység /ADLP/ keret feldolgozásnak képesnek kell lennie arra, hogy törölje az olyan, fedélzetről leadott kereteket, amelyeket előzőleg a válaszjeladónak továbbításra átadott, de amelyekre befejezést nem jeleztek. Ha több mint egy keretet tárolnak a válaszjeladón belül, akkor a törlési eljárásnak szelektíven törölnie kell a tárolt kereteket.
5.2.2.5.6 *Keret meghatározás.* Az olyan S-módú csomagokat (beleértve a multiplikált csomagokat, de kizárva az MSP csomagokat), amelyek fedélzetről leadott adat-továbbításra szolgálnak, és 222 bitnél kisebbek, vagy azzal egyenlők, SLM keretként kell elküldeni. A 222 bitnél nagyobb S-módú csomagokat fedélzetről leadott kiterjesztett hosszúságú közlemény /ELM/ keretként kell elküldeni az ELM képességgel rendelkező transzpondereknek, M-bites feldolgozást használva, ahogyan szükséges (5.2.5.1.4). Amikor az M-bites feldolgozás használatos, akkor az összes M = 1-t magába foglaló kiterjesztett hosszúságú közlemény /ELM/ keretnek tartalmaznia kell az ELM szegmensek számát azért, hogy a válaszjeladó képes legyen a válaszában egy kérő lekérdezésre továbbítani azokat (UF = 24) (5.2.9.1). Ha a válaszjeladó nem rendelkezik ELM képességgel, akkor a 222 bitnél nagyobb csomagokat az M-bites vagy S-bites (5.2.5.1.4.2) összeállítási eljárások felhasználásával a multiplikált SLM keretek alkalmazásával kell elküldeni.

Megjegyzés. - A fedélzetről leadott SLM keret maximális hossza 222 bit. Ez egyenlő 28 bájttal (7 bájt a Comm-B szegmensnek), mínusz a 2-bites kapcsolt Comm-B részmező (5.2.2.2.1.1).

5.2.2.6 PRIORITÁS KEZELÉS

5.2.2.6.1 *Fedélzeti adatkapcsolat vezérlő egység /ADLP/ prioritás- kezelés.* A kereteket az ADLP-től a válaszjeladóhoz kell továbbítani a következő prioritási sorrendben (első a legmagasabb prioritású):
a) S-módú specifikus szolgáltatások;
b) Keresési kérések (5.2.8.1);
c) Csak magas prioritású kapcsolt virtuális áramkör /SVC/ csomagokat tartalmazó keretek; és
d) Csak alacsony prioritású SVC csomagokat tartalmazó keretek.

5.2.2.6.2 FÖLDI TELEPÍTÉSI RENDSZERŰ ADATKAPCSOLAT VEZÉRLŐ EGYSÉG /GDLP/ PRIORITÁS KEZELÉSE

Ajánlás. - *A fedélzetre irányuló kereteket a következő prioritási sorrendben ajánlatos továbbítani (legmagasabb prioritású az első):*
a) S-módú specifikus szolgáltatások;
b) Legalább egy S-módú ÚTVONAL csomagot tartalmazó keretek;
c) Legalább egy magas prioritású kapcsolt virtuális áramkör /SVC/ csomagot tartalmazó keretek; és
d) Csak alacsony prioritású SVC csomagokat tartalmazó keretek.

5.2.3 Adat-csere interfészek

5.2.3.1 A LEKÉRDEZŐ ADAT VÉGPONTI BERENDEZÉS /DTE/ISO 8208 INTERFÉSZ

5.2.3.1.1 *Általános követelmények.* A Fedélzeti/Földi adatkapcsolat vezérlő egység /XDLP/ és a Lekérdező adat végponti berendezések /DTE-k/ közötti csatoló egységnek meg kell felelnie az ISO 8208 csomag réteg protokollnak (PLP). Az XDLP-nek támogatnia kell a DTE eljárásokat úgy, ahogy az az ISO 8208-ban meg van határozva. Mint ilyen, az XDLP-nek tartalmaznia kell egy Hálózati végponti berendezést /DCE/. (5.2.4).

5.2.3.1.2 *A lekérdező adat végponti berendezés/Hálózati végponti berendezés /DTE/DCE/ csatoló egységgel szembeni fizikai és kapcsolati réteg követelmények.* A követelmények a következők:

a) A csatoló egységnek kód- és bájt-függetlennek kell lenni, és nem állapíthat meg korlátozásokat az egy csomagon belül továbbított bitek sorrendjére, utasításaira vagy alakzatára; és

b) A csatoló egységnek támogatnia kell a változó hosszúságú hálózati réteg csomagok átvitelét.

5.2.3.1.3 *A LEKÉRDEZŐ ADAT VÉGPONTI BERENDEZÉS /DTE/ CÍMZÉSE*

5.2.3.1.3.1 *Földi DTE címzés.* A földi DTE címzés 3, binárisan kódolt decimális (BCD) számjegy hosszúságú a következők szerint:

$X_0X_1X_2$

X_0 a legnagyobb értékű számjegy. Földi DTE címzéseknek decimális számoknak kell lenniük a 0-tól a 255-ig terjedő tartományból BCD-ben kódolva. A DTE címzés kijelölése helyi ügy. A Földi telepítési rendszerű adatkapcsolat vezérlő egységhez kapcsolt összes DTE, amely átfedő lefedéssel rendelkezik, egyedi címzéssel kell rendelkezzen. Azokat a GDLP-ket, amelyeknek a fedésterületeik közötti repülési idő kisebb, mint T_r (5-1. táblázat), átfedő lefedéssel rendelkezőnek kell tekinteni.

5.2.3.1.3.2 *Mozgó DTE címzés.* A mozgó DTE címzésnek 10 BCD számjegyű teljes hosszal kell rendelkeznie, a következők szerint:

$\mathrm{X_0X_1X_2X_3X_4X_5X_6X_7X_8X_9}$

X_0 a legnagyobb értékű számjegy. Az X_0 - X_7 számjegyek tartalmazzák a BCD-ben kódolt légijármű címzés nyolcjegyű felírását. Az X_8X_9 számjegyeknek egy alcímzést kell azonosítani, a légijármű fedélzetén lévő specifikus DTE-ket. Ennek az alcímzésnek egy decimális számnak kell lenni a 0-tól a 15-ig terjedő tartományban, BCD-ben kódolva. Az alábbi alcímzés kijelöléseket kell használni:

00 Légiforgalmi Távközlési Hálózat /ATN/ irányító

01 - 15 Kijelöletlen

5.2.3.1.3.3 Szabálytalan *DTE címzések*. A meghatározott tartományon kívül eső, vagy az 5.2.3.1.3.1 és 5.2.3.1.3.2 pontokban meghatározott földi és mozgó DTE címzések formátumainak nem megfelelő DTE címzéseket szabálytalan DTE címzésekként kell meghatározni. DTE címzés észlelése Egy HIVÁS KÉRÉS csomagban egy szabálytalan DTE címzés észlelése a hívás visszautasításához vezet, ahogyan ez az 5.2.5.1.5 pontban meghatározásra került.

5.2.3.1.4 *A LEKÉRDEZŐ ADAT VÉGPONTI BERENDEZÉS / HÁLÓZATI VÉGPONTI BERENDEZÉS /DTE/DCE/ CSATOLÓ EGYSÉG CSOMAG RÉTEG PROTOKOLL KÖVETELMÉNYEI*

5.2.3.1.4.1 *Teljesítőképességek*. A DTE és a DCE közötti illesztéseknek meg kell felelnie az ISO 8208-nak az alábbi teljesítőképességben:

a) gyorsított adat kézbesítés, azaz a maximálisan 32 bájtos felhasználói adatmezővel rendelkező MEGSZAKITÁS csomagok használata;

b) prioritás képesség (két szinttel, 5.2.5.2.1.1.6);

c) gyors kiválasztás (5.2.5.2.1.1.13, 5.2.5.2.1.1.16); és

d) hívott/hívás címzés bővítési lehetőség, ha a helyi körülmények szükségessé teszik (azaz a Fedélzeti/Földi adatkapcsolat vezérlő egység /XDLP/ a Lekérdező adat végponti berendezéshez /DTE/ van kapcsolva egy olyan hálózati protokollon keresztül, ami nem képes arra, hogy tartalmazza az S-módú címet, ahogy az meg van határozva). Egyéb ISO 8208 képességek és a D-bit és a Q-bit nem kerül az átvitel céljából lehívásra az S-módú csomag réteg protokollon át.

5.2.3.1.4.2 *Jellemző értékek.* Az időzítő és számoló jellemzőknek a DTE/DCE illesztéseknek összhangban kell lenniük az alapértelmezési ISO 8208 értékekkel.

5.2.3.2 S-MÓDÚ SPECIFIKUS SZOLGÁLTATÁSI ILLESZTÉS

Megjegyzés. - Az S-módú specifikus szolgáltatások a kisugárzott A-adatátvitel /Comm-A/ és B-adatátvitel /Comm-B/ adatcsomagokból és a Földről kezdeményezett B-adatátvitelből /GICB/, valamint az S-módú specifikus protokollokból

/MSP/ állnak.

5.2.3.2.1 *ADLP /Fedélzeti adatkapcsolat vezérlő egység/*
5.2.3.2.1.1 *Általános rendelkezések.* Az ADLP támogatja az S-módú specifikus szolgáltatásokhoz való hozzáférést az erre a célra szolgáló egy vagy több különálló ADLP interfész biztosításával.
5.2.3.2.1.2 *Működési teljesítőképesség.* Az ezen az illesztésen keresztüli közlemény és vezérlés kódolásnak az 5.2.7.1 pontban meghatározott összes teljesítőképességet támogatja.
5.2.3.2.2 *GDLP /Földi telepítési rendszerű adatkapcsolat vezérlő egység/*
5.2.3.2.2.1 *Általános követelmények.* A GDLP-nek támogatnia kell az S-módú specifikus szolgáltatások elérését erre a célra egy külön GDLP illesztés biztosításával, és/vagy ezekhez a szolgáltatásokhoz történő hozzáférés biztosításával a Lekérdező adat végponti berendezés/Hálózati végponti berendezés /DTE/DCE/ illesztő egységen keresztül.
5.2.3.2.2.2 *Működési teljesítőképesség.* Az ezen az illesztésen keresztüli közlemény és vezérlés kódolásnak az 5.2.7.2 pontban meghatározott összes teljesítőképességet támogatja.

5.2.3.3 FEDÉLZETI ADATKAPCSOLAT VEZÉRLŐ EGYSÉG /ADLP/ / VÁLASZJELADÓ ILLESZTÉS

5.2.3.3.1 *VÁLASZJELADÓ AZ ADLP-NEK*
5.2.3.3.1.1 Az ADLP-nek a válaszjeladótól egy, a protokoll típusát jelző jelzést kell venni, a válaszjeladótól az ADLP-hez továbbított adatokkal kapcsolatban. Ez a következő típusú protokollokat tartalmazza:
a) Légtérellenőrzési lekérdezés;
b) A-adatátvitel /Comm-A/ lekérdezés;
c) A-adatátvitel /Comm-A/ általános adású lekérdezés; és
d) Fedélzetre irányuló Kiterjesztett hosszúságú közlemény /ELM/.
Az ADLP-nek fogadnia kell a Lekérdező azonosító /II/ kódját is, amelyet a légtérellenőrzési A-adatátvitelnél /Comm-A/ vagy a fedélzetre irányuló ELM továbbításánál használ.

Megjegyzés. - A válaszjeladók nem adnak általános hívás és Összeütközési veszély jelző fedélzeti rendszer /ACAS/ információkat ezen az illesztésen.

5.2.3.3.1.2 Az ADLP-nek a válaszjeladótól olyan vezérlő információkat kell fogadnia, amelyek jelzik a fedélzetről leadott adat- továbbítások állapotát, ez magában foglalja:
a) B-adatátvitel /Comm-B/ befejezést;
b) B-adatátvitel /Comm-B/ sugárzási időhatárát; és
c) A fedélzetről leadott ELM befejezést.
5.2.3.3.1.3 Az ADLP hozzáféréssel rendelkezik azokhoz az aktuális információkhoz, amelyek meghatározzák az S-módú válaszjeladó kommunikáció teljesítőképességét, amellyel az működik. Ezt az információt az adatkapcsolat teljesítőképesség jelentés létrehozásához használják (5.2.9).
5.2.3.3.2 *FEDÉLZETI ADATKAPCSOLAT VEZÉRLŐ EGYSÉG /ADLP/ A VÁLASZJELADÓNAK*

5.2.3.3.2.1 Az ADLP egy, a protokoll típusa jelző jelzést ad a válaszjeladónak az ADLP-től a transzpondernek továbbított adatokhoz kapcsolódóan. Ez a következő protokoll típusokat foglalja magában:
a) földről kezdeményezett B-adatátvitel;
b) levegőből kezdeményezett B-adatátvitel;
c) több helyre irányított B-adatátvitel;
d) általános adású B-adatátvitel;
e) fedélzetről leadott kiterjesztett hosszúságú közlemény /ELM/; és
f) több helyre irányított fedélzetről leadott ELM.
Az ADLP biztosítja a Lekérdező azonosító /II/ kódot egy több helyre irányított B-adatátvitel, vagy fedélzetre irányuló ELM és a B-adatátvitel adat kiválasztó (BDS) kód továbbításához (Annex 10, IV. kötet, 3.1.2.6.11.2) a földi kezdeményezésű B-adatátvitelhez.
5.2.3.3.2.2 Az ADLP képes az 5.2.2.5.5 pontban meghatározottak szerinti keret-törlés végrehajtására.

5.2.3.4 FÖLDI TELEPÍTÉSI RENDSZERŰ ADATKAPCSOLAT VEZÉRLŐ EGYSÉG /GDLP/ S-MÓDÚ LEKÉRDEZŐ ILLESZTÉS

5.2.3.4.1 *LEKÉRDEZŐ A GDPL-NEK*
5.2.3.4.1.1 A GDLP-nek a lekérdezőtől egy protokoll típusú jelzést fogad, a lekérdezőtől a GDLP-hez továbbított adatokhoz kapcsolódóan. Ez a következő protokoll típusokat tartalmazza:
a) földi kezdeményezésű B-adaátvitel;
b) levegő kezdeményezésű B-adatátvitel;
c) levegő kezdeményezésű B-adatátvitel általános adás; és
d) fedélzetről leadott kiterjesztett hosszúságú közlemény /ELM/.
A GDLP-nek a B-adatátvitel adat kiválasztás /BDS/ kódot is fogadja, amelyet a földi kezdeményezésű B-adatátviteli szegmens azonosítására használ fel.
5.2.3.4.1.2 A GDLP-nek a lekérdezőtől vezérlő információkat fogadja, amelyek jelzik a fedélzetre irányuló adat átvitelének állapotát és a címzett légijármű S-módú állapotát.
5.2.3.4.2 *GDLP a lekérdezőnek*. A GDLP-nek egy protokoll típus jelzést biztosít a lekérdező részére a GDLP-től a lekérdezőhöz továbbított adatokkal kapcsolatban. Ez a következő protokoll típusokat tartalmazza:
a) A-adatátvitelű lekérdezés;
b) A-adatátvitelű általános adású lekérdezés;
c) Fedélzetre irányuló kiterjesztett hosszúságú közlemény /ELM/; és
d) Földi kezdeményezésű B-adatátviteli kérés.
A GDLP-nek a B-adatátvitel adat kiválasztó kódokat is biztosítania kell a földi kezdeményezésű B-adatátvitel protokollhoz.

5.2.4 A Hálózati végponti berendezés /DCE/ működése

Megjegyzés. - A DCE feldolgozási folyamata a Fedélzeti/Földi adatkapcsolat vezérlő egységen /XDLP/ belül mint társ-folyamat működik a lekérdező adat végponti berendezés /DTE/ adatainak feldolgozásában. A DCE támogatja a DTE működést azzal a teljesítőképességgel, amely az 5.2.3.1.4 pontban került meghatározásra. A következő követelmények nem határoznak meg formátum előírásokat és forgalom vezérlést a DTE/DCE illesztésen. Ezekre az esetekre az ISO 8208 előírásai és meghatározásai érvényesek.

5.2.4.1 *Állapot átvitelek.* A DCE állapotgépként működik. Egy állapotba kerülve, a DCE végrehajtja az 5-2. táblázatban ismertetett műveleteket. Az állapot átvitelek és kiegészítő művelet(ek) az 5-3.-tól az 5-12.-ig terjedő táblázatokban vannak leírva.
Megjegyzés. - A következő állapot átvitel (ha van ilyen) akkor következik be, amikor a Hálózati végponti berendezés /DCE/ egy csomagot fogad a Lekérdező adat végponti berendezéstől /DTE/, amely az 5-3.-tól az 5-8.-ig terjedő táblázatokban van meghatározva. Ezek a táblázatok az 5-2. ábrán bemutatott hierarchiának megfelelően vannak szervezve. Ugyanezek az átvitelek vannak meghatározva az 5-9.-től az 5-12.-ig terjedő táblázatokban, amikor a DCE egy csomagot fogad a Fedélzeti/Földi hálózati végponti berendezéstől /XDCE/ (az újraformátumozó folyamaton keresztül).

5.2.4.2 A CSOMAGOK KIOSZTÁSA

5.2.4.2.1 Egy csomagnak a Lekérdező adat végponti berendezéstől /DTE/ történő fogadása után a csomagot vagy kell, vagy nem kell továbbítani a Légijármű/Földi hálózati végponti berendezéshez /XDCE/ (az újra-formátumozó eljáráson keresztül) az 5-3.-tól az 5-8.-ig terjedő táblázatokban megadott zárójeles utasításoknak megfelelően. Ha a zárójeles utasítás nincs feltűntetve, vagy ha a zárójeles utasítás "ne továbbíts" utasítást mutat, akkor a csomagot érvényteleníteni kell.
5.2.4.2.2 Egy csomag fogadása után az XDCE-től az újra-formátumozó folyamaton keresztül a csomagot vagy kell, vagy nem kell továbbítani a Lekérdező adat végponti berendezéshez /DTE/ az 5-9.-től az 5-12.-ig terjedő táblázatokba foglalt zárójeles utasításoknak megfelelően. Ha zárójeles utasítás nincs feltűntetve, vagy a zárójeles utasítás "ne továbbíts" utasítást mutat, a csomagot érvényteleníteni kell.

5.2.5 S-módú csomag réteg feldolgozás

5.2.5.1 ÁLTALÁNOS KÖVETELMÉNYEK
5.2.5.1.1 *TÁROLÓ /PUFFER/ KÖVETELMÉNYEK*
5.2.5.1.1.1 *A Fedélzeti adatkapcsolat vezérlő egység /ADLP/ tároló követelményei*

5.2.5.1.1.1.1 A következő követelményeket kell alkalmazni a teljes ADLP-re, és úgy kell értelmezni ezeket, ahogyan az a fő feldolgozási folyamatok mindegyikénél. (Hálózat végponti berendezés /DCE/, újraformátumozás, Légijármű hálózati végponti berendezés /ADCE/, keret feldolgozás és S-módú szolgáltatás entitás /SSE/) szükséges.
5.2.5.1.1.1.2 Az ADLP képes elegendő tároló teret fenntartani tizenhat Kapcsolt virtuális áramkör /SVC/ részére:
a) Fenn kell tartania elegendő tároló teret tizenöt S-módú alhálózati, egyenként 152 bájtot tartalmazó csomag részére, mindegyik fedélzetre irányuló SVC-nként egy fedélzetre irányuló Kiterjesztett hosszúságú közlemény /ELM/ teljesítőképességű válaszjeladónál, vagy 28 bájtot más esetben;
b) Fenn kell tartania elegendő tároló teret tizenöt S-módú alhálózati, egyenként 160 bájtot tartalmazó csomag tartására, mindegyik fedélzetről leadott irányú közleményre SVC-nként, egy fedélzetről leadott ELM teljesítőképességű válaszjeladónál, vagy 28 bájtot más esetben;
c) Fenn kell tartania elegendő tároló teret két S-módú alhálózati, egyenként 35 bájtot tartalmazó MEGSZAKITÁS csomag számára (felhasználói adat mező plusz vezérlő információ) egyet mindkét irányban, minden egyes SVC-nél;
d) Fenn kell tartania elegendő, újra sorba-rendező tároló teret harmincegy, egyenként 152 bájtot tartalmazó S-módú alhálózati csomag tárolására a fedélzetre irányuló közleményekre SVC-ként egy fedélzetre irányuló ELM teljesítőképességgel rendelkező válaszjeladónál, vagy 28 bájtot ettől eltérő esetben; és
e) Fenn kell tartania elegendő tároló teret legalább egy olyan 160 bájtot tartalmazó S-módú csomag átmeneti tárolására, amely M-bit vagy S-bit feldolgozásra kerül, mindkét irányban SVC-ként.
5.2.5.1.1.1.3 A Fedélzeti adatkapcsolat vezérlőegység /ADLP/ képes egy 1600 bájtot tartalmazó tároló fenntartására az egyes irányokban megosztva az összes S-módú specifikus protokoll /MSP/ között.
5.2.5.1.1.2 A *Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ tároló követelményei*

5.2.5.1.1.2.1 **Ajánlás. -** *A GDLP-nek képesnek kell lenni elegendő tároló tér fenntartására átlagosan 4 Kapcsolt virtuális áramkör /SVC/ részére mindegyik olyan S-módú légijárműre, amely a lekérdezők lefedési területén belül összeköttetésben ez utóbbival, feltéve, hogy valamennyi légijármű Kiterjesztett hosszúságú közlemény /ELM/ teljesítőképességgel rendelkezik.*

Megjegyzés. - További tároló tér követelhető meg abban az esetben, ha végrendszerekkel kapcsolódó Lekérdező adat végponti berendezéseket /DTE-k/ biztosítanak.

5.2.5.1.2 *CSATORNA- SZÁM ÖSSZESÍTÉSEK*

5.2.5.1.2.1 A Fedélzeti/Földi adatkapcsolat vezérlő egység /XDLP/ fenntart több SVC csatorna-szám összesítést; a DTE/DCE (ISO 8208) illesztés egy készletet használ fel. Ennek szervezésének, szerkezetének és felhasználásának az ISO 8208 szabványban meghatározottaknak kell megfelelnie. A többi csatorna összesítést a Légijármű hálózati végponti berendezés/Földi hálózati végponti berendezés /ADCE/GDCE/ illesztésnél kell felhasználni.
5.2.5.1.2.2 A Földi telepítési rendszerű adatkapcsolat vezérlőegység /GDLP/ átmeneti csatorna-szám összesítést kezel ott, ahol a számok az 1, 2 és 3 közül kerülnek ki, minden egyes földi Lekérdező adat végponti berendezés/Fedélzeti adatkapcsolat vezérlő egység-párnál. /DTE/ADLP/ A GDLP által generált S-módú HIVÁS KÉRÉS csomagok tartalmazzák a földi DTE címzést és egy olyan átmeneti csatorna-számot, amely ennek a földi DTE-nek az összesítéséből került kiosztásra. A GDLP nem használhat újra egy olyan átmeneti csatorna-számot, amelyet egy Kapcsolt virtuális áramkörnek /SVC/ kiosztottak, és amely még HÍVÁSKÉRÉS állapotban van.

1. Megjegyzés. - Az átmeneti csatorna-számok használata lehetővé teszi a GDLP számára azt, hogy maximálisan három feldolgozásban lévő híváskéréssel rendelkezzen egy időben, egyedi földi DTE és ADLP kombinációnál. Ez azt is lehetővé teszi a GDLP vagy az ADLP számára, hogy egy csatornát felszabadítson, mielőtt a folyamatos csatorna-szám kijelölésre kerülne.

2. Megjegyzés. - Az ADLP érintkezésben lehet multiplikált földi DTE-kkel bármely időszakban. Az összes földi DTE átmeneti csatorna-számot használ, amelyek az 1, 2, 3 számok közül kerülnek ki.

5.2.5.1.2.3 A Fedélzeti adatkapcsolat vezérlő egység /ADLP/ a földi Lekérdező adat végponti berendezés /DTE/ címzését használja megkülönböztetésül az átmeneti csatorna-számoktól, amelyeket a különböző földi DTE-k használnak. Az ADPL-nek végleges csatorna-számot kell kijelölni (a 0-tól a 15-ig terjedő tartományból) minden SVC számára és tájékoztatni kell a GDLP-t a kijelölt számról, belefoglalva azt az ADLP által adott S-módú HIVÁS KÉRÉS-be, vagy az ADLP csomagokban adott S-módú HIVÁS FOGADÁS-ba. Az átmeneti csatorna-számot az

ADLP által adott S-módú HIVÁS FOGADÁS foglalja magába végleges csatorna-számmal együtt, abból a célból, hogy meghatározásra kerüljön az ezen csatorna-számok között meglévő kapcsolat. Az ADLP folytatja az átmeneti csatorna-szám társítását egy Kapcsolt virtuális áramkör /SVC/ végleges csatorna-számával addig, amíg az SVC visszatér a KÉSZ (p1) állapotába, vagy másként, amíg az ADATÁTVITEL (p4) állapotban egy olyan, a GDLP csomag által adott S-módú HIVÁSKÉRÉS kerül vételre, amely ugyanazt az átmeneti csatorna-számot viseli. Egy, az ADLP által adott nem-nulla átmeneti csatorna-szám az S-módú BONTÁS KÉRÉS-ben, a GDLP által adott BONTÁS KÉRÉS-ben, az ADLP csomagban lévő BONTÁS MEGERŐSITÉS-ben jelzi, hogy a végleges csatorna-számot kell használni, és az átmeneti csatorna-számot nem kell figyelembe venni. Abban az esetben, ha egy XDLP-t felkérnek ezen csomagok valamelyikének elküldésére végleges csatorna-szám hiányában, a végleges csatorna-számot nullára kell állítani, amely azt jelzi a társfolyamatú XDLP-nek, hogy az átmeneti csatorna-számot kell használni.

Megjegyzés. –A nulla végleges csatorna-szám használata lehetővé teszi az ADLP-nek egy SVC törlését akkor, amikor végleges csatorna-szám nem áll rendelkezésre, és lehetővé teszi a GDLP-nek, hogy ugyanúgy járjon el, mielőtt a végleges csatorna-számról tájékoztatást kap.

5.2.5.1.2.4 A Lekérdező adat végponti berendezés/Hálózati végponti berendezés /DTE/DCE/ illesztés által használt csatorna-számokat és azokat, amelyek a Légijármű hálózati végponti berendezés/Földi hálózati végponti berendezés /ADCE/GDCE/ illesztésnél használatosak, függetlenül kell kijelölni. Az újra formázási folyamatnak egy, a DTE/DCE és az ADCE/GDCE csatorna-számok közötti összekapcsolási táblázatot kell fenntartani.
5.2.5.1.3 *Fogadásra kész és fogadásra nem kész állapotok.* Az ISO 8208 interfész és az ADCE/GDCE interfész kezelési eljárásoknak független üzemelésűeknek kell lenni, mivel az egyes rendszereknek képesnek kell lenniük válaszolni elkülönítetten a fogadásra kész és a fogadásra nem kész jelzésekre.

5.2.5.1.4 *M-BITES ÉS S-BITES SOROZATOK FELDOLGOZÁSA*

Megjegyzés. - M-bit feldolgozás az ADAT csomag sorba-rendezéséhez alkalmazott. S-bit feldolgozást S-módú HÍVÁSKÉRÉS, HÍVÁS FOGADÁS, BONTÁS KÉRÉS és MEGSZAKÍTÁS csomagok sorba-rendezéséhez alkalmazott.

5.2.5.1.4.1 Az M-bites feldolgozás

Megjegyzés. - A Lekérdező adat végponti berendezés/Hálózati végponti berendezés /DTE/DCE/ illesztésnél használt csomag méret eltérő lehet attól, ami a Légijármű hálózati végponti berendezés/Földi hálózati végponti berendezés /ADCE/GDCE/ illesztésnél használatos.

5.2.5.1.4.1.1 M-bit feldolgozást akkor kell használni, amikor az ADAT csomagokat újraformátumozzák (5.2.5.2). Az M-bit feldolgozásnak az ISO 8208 szabványban lévő előírásokat kell felhasználni. Az M-bit sorozat feldolgozásnak a csatornánkénti alapot kell alkalmazni. Az M-bitnek az 1-re történő beállítása azt jelzi, hogy felhasználói adat mező folytatódik a soron következő ADAT csomagban. Az ezt követő csomagoknak egy M-bit sorozatban ugyanazt a fej-rész formátumot kell felhasználni (azaz a csomag formátum kizárja a felhasználói adat mezőt).
5.2.5.1.4.1.2 Ha a csomag mérete a Légijármű hálózati végponti berendezés/Földi hálózati végponti berendezés /XDCE/ (5.2.6.4.2) illesztésnél nagyobb, mint a Lekérdező adat végponti berendezés/Hálózati végponti berendezés /DTE/DCE/ használatos illesztése, akkor a csomagokat össze kell tömöríteni az M-bit által megszabott lehetséges mértékig, egy S-módú ADAT csomag továbbításánál. Ha a csomag méret kisebb az XDCE illesztésen, mint ami a DTE/DCE illesztésnél meghatározott, akkor a csomagokat 'tördelni kell' azért, hogy beilleszkedjenek az M-bites összeállítást felhasználó kisebb S-módú csomagba.
5.2.5.1.4.1.3 A csomagot a rákövetkező kötegekkel össze kell tömöríteni, ha a csomag tele van és az M-bit sorozatban több csomag van (M-bit = 1). Az erre a Kapcsolt virtuális áramkörre /SVC/ meghatározott maximális csomag méretnél kisebb csomag (részleges csomag) csak akkor megengedhető, amikor az M-bit egy M-bit sorozat végét jelzi. Egy olyan vett csomagnak, ami a maximális csomag méretnél kisebb, és az M-bit egyenlő 1-el, egy visszaállítást kell létrehozni, az ISO 8208-ban meghatározottak szerint, és a sorozat további részét érvényteleníteni kell.

5.2.5.1.4.1.4 **Ajánlás. -** *A kézbesítési késés csökkentése érdekében egy M-bit sorozat részleges vételekor az újra-formátumozást kell elvégezni, nem pedig az újra-formátumozást addig késleltetni, amíg a teljes M-bit sorozat vételre nem kerül.*

5.2.5.1.4.2 *S-bit feldolgozás.* S-bit feldolgozást csak S-módú HÍVÁSKÉRÉS, HÍVÁSFOGADÁS, BONTÁSKÉRÉS és MEGSZAKÍTÁS csomagokhoz alkalmazandó. A feldolgozást az az M-bit feldolgozás eseténél meghatározott módon kell elvégezni (5.2.5.1.4.1), kivéve azokat az S-bit sorozathoz társított csomagokat, amelyeknek az újra-összeállítása nem fejeződik be Tq másodperc alatt (5-1. és 5-13. táblázat), ezeket érvényteleníteni kell (5.2.6.3.6, 5.2.6.4.5.2 és 5.2.6.9), és egy rövidebb csomag vételét kell létrehozni mint a maximális csomag méret az S = 1-el olyan módon hogy a teljes S-bit sorozat formátum hibaként legyen kezelve az 5-16. táblázatban foglaltaknak megfelelően.

5.2.5.1.5 *S-MÓDÚ ALHÁLÓZATI HIBA FELDOLGOZÁS AZ ISO 8208 CSOMAGOKNÁL*

5.2.5.1.5.1 *D-bit.* Ha a Fedélzeti/Földi adatkapcsolat vezérlő egység /XDLP/ ADAT csomagot vesz úgy, hogy a D-bit 1-re van állítva, akkor az XDLP-nek egy olyan VISSZAÁLLÍTÁS KÉRELEM csomagot kell elküldeni a csomagot létrehozó Lekérdező adat végponti berendezésnek /DTE/, amely egy okozó kódot (CC) = 133 és egy diagnosztikai kódot (DC) = 166 tartalmaz. Ha a D-bit egy HÍVÁSKÉRÉS csomagban 1-re van állítva, akkor ezt az XDLP-nek figyelmen kívül kell hagyni. A megfelelő HÍVÁS ELFOGADÁS csomag D-bitjét mindig 0-ra kell állítani. A 'CC' használata választható.
5.2.5.1.5.2 *Q-bit.* Ha az XDLP egy olyan ADAT csomagot vesz, amelynél a Q-bit 1-re van állítva, akkor az XDLP-nek egy olyan VISSZAÁLLÍTÁS KÉRÉS-t kell küldenie a csomagot létrehozó DTE-nek, amely magába foglalja a CC = 133-t és DC = 83-t. A 'CC' használata választható.
5.2.5.1.5.3 *Érvénytelen prioritás.* Ha az XDLP egy olyan híváskérést vesz, amelynek egy, a 2-től a 254-ig terjedő értéktartományban van az összekapcsolás prioritásértéke, akkor az XDLP-nek törölnie kell a virtuális áramkört a DC = 66 és CC = 131 felhasználásával. A 'CC' használata választható.
5.2.5.1.5.4 *Támogatás nélküli szolgáltatás.* Ha az XDLP egy híváskérést vesz egy olyan szolgáltatás iránti kéréssel, amelyet nem tud támogatni, akkor az XDLP-nek törölnie kell a virtuális áramkört a DC = 65 és CC = 131 felhasználásával. A 'CC' használata választható.
5.2.5.1.5.5 *Érvénytelen hívó DTE címzés.* Ha az XDLP érvénytelen hívó DTE címzésű híváskérést vesz (5.2.3.1.3.3), akkor az XDLP-nek törölnie kell a virtuális áramkört a DC = 68 és CC = 141 használatával. A 'CC' felhasználása választható.
5.2.5.1.5.6 *Érvénytelen hívott DTE címzés.* Ha a XDLP érvénytelen hívott DTE címzésű híváskérést vesz (5.2.3.1.3.3), akkor az XDLP-nek törölnie kell a virtuális áramkört DC = 67 és CC = 141 használatával. A 'CC' felhasználása választható.

5.2.5.2 ÚJRA-FORMÁTUMOZÓ FELDOLGOZÁS

Megjegyzés. - Az újra-formátumozó feldolgozás két részfolyamatra van osztva: a fedélzetre irányuló formátumozásra és a fedélzetről leadott formátumozásra. A Fedélzeti adatkapcsolat vezérlő egységnél /ADLP/ a fedélzetre irányuló kapcsolt feldolgozás az S-módú csomagokat ISO 8208 csomagokba formátumozza újra, és a fedélzetről leadott kapcsolati feldolgozás az ISO 8208 csomagokat S-módú csomagokba formátumozza újra. A Földi telepítési rendszerű adatkapcsolat vezérlő egységnél /GDLP/ a fedélzetre irányuló kapcsolati feldolgozás az ISO 8208 csomagokat S-módú csomagokba formátumozza újra, és a fedélzetről leadott kapcsolati feldolgozás az S-módú csomagokat ISO 8208 csomagokba formátumozza újra.

5.2.5.2.1 *A FEDÉLZETI ADATKAPCSOLAT VEZÉRLŐEGYSÉG /ADLP/ ÁLTAL ADOTT HÍVÁSKÉRÉS*

5.25.2.5.2.1.1 *Átfordítás S-módú csomagokba*
5.2.5.2.1.1.1 *Az átfordított csomag formátuma.* Az egy helyi Hálózati végponti berendezés /DCE/ által vett ISO 8208 HÍVÁSKÉRÉS csomag újra-formátumozási feldolgozása a megfelelő S-módú HÍVÁSKÉRÉS-nek a Fedélzeti adatkapcsolat vezérlő egység /ADLP/ csomag(ok) ban végzett létrehozását eredményezi (ahogyan az az S-bit feldolgozás által meghatározása került (5.2.5.1.4.2)) a következőképpen:

DP: 1	MP: 1	SP: 2	ST: 2	FILL2: 0 v. 2	P: 1	FILL: 1	SN: 6

Adat-csomag S-módú spec. protokoll Felügyelő csomag Felügyelőtípus Kitöltés Prioritás kitöltés
Sorozat- szám

CH: 4	AM: 4	AG: 8	S: 1	FS: 2	F: 1	LV: 4	UD: v

Csatorna-szám Mobil cím Földi cím Több csomagjelzés Gyors kiválasztás Első csomag jelzés Felhasználói adathossz

Felhasználói adatmező

5.2.5.2.1.1.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.
5.2.5.2.1.1.3 *S-módú specifikus protokoll sorozatszám /MSP/ csomag típus (MP).* Ezt a mezőt 1-re kell állítani.
5.2.5.2.1.1.4 *Felügyelő csomag (SP).* Ezt a mezőt 1-re kell állítani.
5.2.5.2.1.1.5 *Felügyelő típus (ST).* Ezt a mezőt 0-ra kell állítani.
5.2.5.2.1.1.6 *Prioritás (P).* Ezt a mezőt 0-ra kell állítani alacsony prioritású Kapcsolt virtuális áramkör /SVC/ esetén és 1-re magas prioritású SVC-nél. Ennek a mezőnek az értékét az ISO 8208 csomag prioritási szolgáltatás adatátviteli mezőjéből kell 'megszerezni', és 0-ra kell állítani akkor, ha az ISO 8208 csomag nem foglal magába prioritási szolgáltatást, vagy ha egy 255-ös prioritást határoznak meg. A többi prioritási szolgáltatás mezőt figyelmen kívül hagyandó.
5.2.5.2.1.1.7 *Sorozat-szám (SN).* Egy adott SVC-re minden egyes csomagot be kell számozni (5.2.6.9.4).
5.2.5.2.1.1.8 *Csatorna-szám (CH).* A csatorna-számot a Fedélzeti adatkapcsolat vezérlő egység /ADLP/ rendelkezésére álló Kapcsolt virtuális áramkör /SVC/ csatorna-szám készletből kell kiválasztani. A készlet 1-től 15-ig terjedő 15 értékből áll. A legnagyobb rendelkezésre álló csatorna-számot kell a készletből kiválasztani. Egy rendelkezésre álló csatornát úgy kell meghatározni, mint egy p1 állapotban lévő csatornát. Az S-módú alhálózat által használt csatorna-szám és a Lekérdező adat végponti berendezés/Hálózati végponti berendezés /DTE/DCE/ illesztés által használt szám közötti megegyezést mindaddig fenn kell tartani, amíg a csatorna aktív.

Megjegyzés. - A csatorna-készlet kezeléssel kapcsolatban lásd még az 5.2.5.1.2 pontot.

5.2.5.2.1.1.9 *Címzés, mozgó (AM).* Ennek a címzésnek a mozgó Hálózati végponti berendezés /DTE/ alcímzésnek kell lenni (5.2.3.1.3.2) a 0-tól 15-ig terjedő tartományban. A címzést a hívó DTE címzés azon két legkisebb értékű számjegyéből kell kiválasztani, amelyet az ISO 8208 csomag tartalmaz és binárissá kell átalakítani.

Megjegyzés. - A 24-bites légijármű címzés az S-módú adatkapcsolat rétegen kerül továbbításra.

5.2.5.2.1.1.10 *Címzés, földi (AG).* Ez a címzés a földi DTE címzésnek kell lenni (5.2.3.1.3.1) a 0-tól 255-ig terjedő tartományban. A címzést abból a hívott DTE címzésből kell kivonni, amelyet az ISO 8208 csomag tartalmaz és binárissá kell átalakítani.
5.2.5.2.1.1.11 *Kitöltő mező.* A kitöltő mezőt arra használják, hogy sorba- állítsák az egymást követő adatmezőket a bájt határokon. Amikor "KITÖLTÉS: „n"-ként jelzik, akkor a kitöltő mezőt "n" bit hosszúságúra kell állítani. Amikor a "KITÖLTÉS 1: 0 vagy 6"-ként van jelezve, akkor a kitöltés mezőt 6 bit hosszúságúra kell állítani a nem-multiplikált csomagban a Fedélzetről leadott szabvány hosszúságú közlemény /SLM/ keretnél és 0 bitre minden más egyéb esetben. Amikor a "KITÖLTÉS 2: 0 vagy 2"-ként van jelezve, a kitöltő mezőt 0 bit hosszúságúra kell állítani egy nem-multiplikált Fedélzetről leadott SLM keretnél vagy multiplikált fejrésszel és 2 bitre az összes többi esetben.
5.2.5.2.1.1.12 *S mező (S).* Az 1 érték azt mutatja, hogy a csomag része egy többcsomagos S-bit sorozatnak a következő sorozatban. A 0 értéknek azt kell jelezni, hogy a sorozat ezzel a csomaggal végződik. Ezt a mezőt úgy kell beállítani, ahogy az az 5.2.5.1.4.2 pontban meghatározásra került.
5.2.5.2.1.1.13 *FS mező (FS).* A 0 értéknek kell jeleznie, hogy a csomag nem foglal magába gyors kiválasztású adatokat. A 2 vagy 3 értéknek jelzi, hogy a csomag gyors kiválasztású adatokat tartalmaz. A 2 érték szabvány gyors kiválasztási műveletet jelez. A 3 értéknek a korlátozott válasszal rendelkező gyors kiválasztást jelzi Az 1 értékű FS nincs határozva.
5.2.5.2.1.1.14 *Első csomag jelző (F).* Ezt a mezőt 0-ra kell állítani egy S-bit sorozat első csomagjában és egy olyan csomagban, amely nem képezi egy S-bit sorozat részét. Más esetekben 1-re kell beállítani.
5.2.5.2.1.1.15 *Felhasználói adat hosszúság (LV).* Ennek a mezőnek azon teljes bájtok számát kell jeleznie, amelyeket az utolsó Szabvány hosszúságú közlemény /SLM/ vagy Kiterjesztett hosszúságú közlemény /ELM/ szegmensben alkalmazottak, ahogyan az az 5.2.2.3.1 pontban meg van határozva.
5.2.5.2.1.1.16 *Felhasználói adatmező (UD).* Ennek a mezőnek csak akkor van jelen, ha a választható HÍVÁSKÉRÉS felhasználói adatot (maximálisan 16 bájt) vagy a gyors kiválasztású felhasználói adatot (maximálisan 128 bájt) az ISO 8208 csomag tartalmazza. A felhasználói adat- mezőt az ISO 8208 csomagból változtatás nélkül kell átfordítani S-bit feldolgozás felhasználásával, ahogyan az 5.2.5.1.4.2 pontban meghatározásra került.

5.2.5.2.1.2 *Átfordítás az ISO 8208 csomagokba*

5.2.5.2.1.2.1 *Átfordítás.* A Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ által vett, az S-módú HÍVÁSKÉRÉS-nek a Fedélzeti adatkapcsolat vezérlő egység /ADLP/ csomag (vagy egy, a csomagok S-bit sorrendje) általi újra-formátumozási folyamata a Földi hálózati végponti berendezéstől /GDCE/ egy, az annak megfelelő ISO 8208 HÍVÁSKÉRÉS csomag létrehozását eredményezi a helyi Hálózati végponti berendezéshez /DCE/. Az átfordítás az S-módú csomagból az ISO 8208 csomagba inverze az 5.2.5.2.1.1 pontban meghatározott folyamatnak, amely – bizonyos kivételekkel - a következő pontokban kerülnek leírásra.
5.2.5.2.1.2.2 *Hívott Lekérdező adat végponti berendezés /DTE/, hívó DTE címzés és hosszúság mezők.* A hívó DTE címzését a légijármű címzése és az S-módú köteg Mobil cím /AM/ mezőjében tartalmazott érték kell, hogy képezze, BCD-be alakítva (5.2.3.1.3.2). A hívott DTE címzésnek annak a földi DTE címzésnek kell lenni, amelyet az S-módú csomag Földi cím /AG/ mezője tartalmaz, BCD-be átalakítva. A hossz mezőnek az ISO 8208-ban meghatározottaknak megfelelőnek kell lennie.
5.2.5.2.2 *A FÖLDI TELEPÍTÉSI RENDSZERŰ ADATKAPCSOLAT VEZÉRLŐ EGYSÉG /GDLP/ ÁLTALI HÍVÁSKÉRÉS*
5.2.5.2.2.1 *Átfordítás S-módú csomagokba*
5.2.5.2.2.1.1 *Általános.* A helyi Hálózati végponti berendezéstől /DCE/ jövő ISO 8208 HÍVÁSKÉRÉS csomag GDLP általi újra-formátumozási folyamata a megfelelő S-módú HÍVÁSKÉRÉS csomag(ok) GDLP általi létrehozását eredményezi (ahogyan az S-bit feldolgozás (5.2.5.1.4.2) meghatározza) a következők szerint:

DP: 1	MP: 1	SP: 2	ST: 2	FILL: 2	P: 1	FILL: 1	SN: 6

Adat-csomag S-módú spec. protokoll Felügyelő csomag Felügyelőtípus Kitöltés Prioritás Kitöltés Sorozat szám

FILL: 2	TC: 2	AM: 4	AG: 8	S: 1	FS: 2	F: 1	LV: 4	UD: v

Kitöltés Ideiglenes csartornaszám Mobil cím Földi cím Több csomag jelzés Gyors kiválasztás Első csomag jelzés Felhasználói adathossz Felhasználói adatmező

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket úgy kell beállítani, ahogyan az az 5.2.5.2.1 pontban meghatározásra került.
5.2.5.2.2.1.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.
5.2.5.2.2.1.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.
5.2.5.2.2.1.4 *Felügyelő csomag (SP).* Ezt a mezőt 1-re kell állítani.
5.2.5.2.2.1.5 *Felügyelő típus (ST).* Ezt a mezőt 0-ra kell állítani.
5.2.5.2.2.1.6 *Ideiglenes csatorna-szám mező (TC).* Ezt a mezőt arra használják fel, hogy a rendszer megkülönböztesse a Földi telepítési rendszerű adatkapcsolat vezérlőegységtől /GDLP/ jövő multiplikált híváskéréseket. A Fedélzeti adatkapcsolat vezérlő egység /ADLP/ újra-formátumozási folyamata, miután egy ideiglenes csatorna-számot kap, kijelöl egy csatorna-számot azokból, amelyek éppen a KÉSZ állapotban, p1, vannak.
5.2.5.2.2.1.7 *Címzés, földi (AG).* Ez a címzés a földi Lekérdező adat végponti berendezés /DTE/ címzés (5.2.3.1.3.1) a 0-tól 255-ig terjedő tartományban. A címzést az ISO 8208 csomag által tartalmazott hívó DTE címzésből kell venni és binárissá átalakítani.
5.2.5.2.2.1.8 *Címzés, mozgó (AM).* Ez a címzés a mozgó DTE alcímzése (5.2.3.1.3.2) a 0-tól 15-ig terjedő tartományban. A címzést a DTE azon két legkisebb értékű számjegyéből kell kiválasztani, amelyet az ISO 8208 csomag tartalmaz, és binárissá kell átalakítani.

5.2.5.2.2.2 *Átfordítás ISO 8208 csomagokba*

5.2.5.2.2.2.1 *Átfordítás.* A Fedélzeti adatkapcsolat vezérlő egység /ADLP/ által vett, az S-módú HÍVÁSKÉRÉS-eknek a Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ csomag (vagy egy, a csomagok S-bit sorrendje) általi újra-formátumozási folyamata a Légijármű hálózati végponti berendezéstől /ADCE/ egy, az annak megfelelő ISO 8208 HÍVÁSKÉRÉS csomag létrehozást eredményez a helyi Hálózati végponti berendezéshez /DCE/. Az átfordítás az S-módú csomagból az ISO 8208 csomagba inverze az 5.2.5.2.2.1 pontban meghatározott folyamatnak, azokkal a kivételekkel, amelyek a következő pontokban kerülnek leírásra
5.2.5.2.2.2.2 *Hívott Lekérdező adat végponti berendezés /DTE/, hívó DTE címzés és hosszúság mezők.* A hívott DTE címzésnek a légijármű címzésből és az S-módú csomag Mobil cím /AM/ mezőjébe foglalt értékből kell összeállni BCD-be konvertálva (5.2.3.1.3.2). A hívó DTE címzés annak a földi DTE címzésnek felel meg, amelyet az S-módú csomag Földi cím /AG/ mezőjében szerepel BCD-re konvertálva. A hosszúság mező az ISO 8208-ban

meghatározottak szerint.

5.2.5.2.3 *A FEDÉLZETI ADATKAPCSOLAT VEZÉRLŐ EGYSÉG /ADLP/ ÁLTALI HÍVÁS FOGADÁS*

5.2.5.2.3.1 *Átfordítás S-módú csomagokba*
5.2.5.2.3.1.1 *Átfordított csomag formátum.* A helyi Hálózati végponti berendezéstől /DCE/ jövő ISO 8208 HÍVÁS FOGADÁS csomag újra-formátumozási folyamat Fedélzeti adatkapcsolat vezérlő egység /ADLP/ általi vétele a megfelelő S-módú HÍVÁS FOGADÁS csomagnak ADLP csomagok általi létrehozását eredményezi, (ahogyan az S-bit feldolgozás ezt meghatározza (5.2.5.1.4.2)) a következők szerint:

DP: 1	MP: 1	SP: 2	ST: 2	FILL2: 0 v. 2	TC: 2	SN: 6

Adat-csomag S-módú spec. protokoll Felügyelő csomag Felügyelőtípus Kitöltés Ideiglenes csatorna-szám Sorozat-szám

CH: 4	AM: 4	AG: 8	S: 1	FILL: 2	F: 1	LV: 4	UD: v

Csatorna-szám Mobil cím Földi cím Több csomagjelzés Kitöltés Első csomagjelzés Felhasználói adathossz Felhasználói adatmező

A csomag formátumban bemutatott, de a következő pontokban nem meghatározott mezőket úgy kell beállítani, ahogyan az az 5.2.5.2.1 pontban leírásra került.
5.2.5.2.3.1.2 *Adat csomag típus (DP)*. Ezt a mezőt 0-ra kell állítani.
5.2.5.2.3.1.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.
5.2.5.2.3.1.4 *Felügyelő csomag (SP)*. Ezt a mezőt 1-re kell állítani.
5.2.5.2.3.1.5 *Felügyelő típus (ST)*. Ezt a mezőt 1-re kell állítani.
5.2.5.2.3.1.6 *Ideiglenes csatorna-szám (TC).* A TC érték a létrehozó S-módú HÍVÁSKÉRÉS-ben a Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ csomaggal visszatér a GDLP-hez a Fedélzeti adatkapcsolat vezérlő egység /ADLP/ által kijelölt csatorna-számmal (CH) együtt.
5.2.5.2.3.1.7 *Csatorna-szám (CH)*. Ezt a mezőt az ADLP által kijelölt csatorna-számmal azonos értékre kell állítani, ahogy a HÍVÁSKÉRÉS eljárások során az S-módú kapcsolatnál meghatározásra kerültek.
5.2.5.2.3.1.8 *Címzés, mozgó és címzés, földi.* A Mobil cím /AM/ és Földi cím /AG/ értékek a létrehozó S-módú HÍVÁSKÉRÉS-ben GDLP csomaggal vissza kell térjenek ezekbe a mezőkbe. Ha jelen vannak, a Lekérdező adat végponti berendezés /DTE/ címzéseket az ISO 8208 HÍVÁS FOGADÁS csomagban figyelmen kívül kell hagyni.

5.2.5.2.3.2 *Átfordítás ISO 8208 csomagokba*

5.2.5.2.3.2.1 *Átfordítás.* A Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ által vett, az S-módú HÍVÁS ELFOGADÁS-nak a Fedélzeti adatkapcsolat vezérlő egység /ADLP/ csomag általi (vagy egy, a csomagok S-bit sorrendje általi) újra-formátumozási folyamata a Földi hálózati végponti berendezéstől /GDCE/ egy, az annak megfelelő ISO 8208 HÍVÁS ELFOGADÁS csomag létrehozását eredményezi a helyi Hálózati végponti berendezéshez /DCE/. Az átfordítás az S-módú csomagból az ISO 8208 csomagba az inverze annak a folyamatnak, amely az 5.2.5.2.3.1 pontban került meghatározásra, azokkal a kivételekkel, amelyek a következő pontokban kerülnek leírásra.
5.2.5.2.3.2.2 *Hívott Lekérdező adat végponti berendezés /DTE/, hívó DTE címzés és hosszúság mezők.* Ahol ilyen van, ott a hívott DTE címzésnek a légijármű címzésből és az S-módú csomag Mobil cím /AM/ mezőjében lévő értékekből kerül összeállításra, BCD-be konvertálva (5.2.3.1.3.2). Ahol ilyen van, ott a hívó DTE címzés annak a földi DTE címzésnek felel meg, amelyet az S-módú csomag Földi cím /AG/ mezője foglal magába BCD-re konvertálva. A hosszúság mező megfelel az ISO 8208-ban meghatározottaknak.

Megjegyzés. - A hívott és hívó DTE címzések szabadon választhatók a hozzátartozó ISO 8208 csomagban és nem követelik meg az S-módú alhálózat pontos működését.

5.2.5.2.4 *A FÖLDI TELEPÍTÉSI RENDSZERŰ ADATKAPCSOLAT VEZÉRLŐ EGYSÉG /GDLP/ ÁLTALI HÍVÁS FOGADÁS*
5.2.5.2.4.1 *Átfordítás S-módú csomagokba*
5.2.5.2.4.1.1 *Az átfordított csomag formátuma.* A helyi Hálózati végponti berendezéstől /DCE/ jövő ISO 8208 HÍVÁS FOGADÁS csomag újra-formátumozási folyamat Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/

általi vétele az annak megfelelő S-módú HÍVÁSFOGADÁS csomagok GDLP csomagok általi létrehozását eredményezi (ahogy azt az S-bit feldolgozás meghatározza (5.2.5.1.4.2)) a következőképpen:

DP: 1	MP: 1	SP: 2	ST: 2	FILL: 2	FILL: 2	SN: 6	CH: 4

Adat-csomag S-módú spec. protokoll Felügyelő csomag Felügyelőtípus Kitöltés Kitöltés Sorozat-szám Csatorna-szám

AM: 4	AG: 8	S: 1	FILL: 2	F: 1	LV: 4	UD: v

Mobil cím Földi cím Több csomag jelzés Kitöltés Első csomag jelzés Felhasználói adathossz Felhasználói adatmező

A csomag formátumban bemutatott, de a következő pontokban nem meghatározott mezőket úgy kell beállítani, ahogyan az az 5.2.5.2.1 pontban meghatározásra került.

5.2.5.2.4.1.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.

5.2.5.2.4.1.3 MSP csomag típus (MP). Ezt a mezőt 1-re kell állítani.

5.2.5.2.4.1.4 *Felügyelő csomag (SP).* Ezt a mezőt 1-re kell állítani.

5.2.5.2.4.1.5 *Felügyelő típus (ST).* Ezt a mezőt 1-re kell állítani.

5.2.5.2.4.1.6 *Címzés, mozgó és címzés, földi.* A Mobil cím /AM/ és Földi cím /AG/ értékek a Fedélzeti adatkapcsolat vezérlő egység /ADLP/ csomag által létrehozott S-módú HÍVÁSKÉRÉS-ben visszatérnek ezekbe a mezőkbe. Ha jelen vannak, a Lekérdező adat végponti berendezés /DTE/ címzéseket az ISO 8208 HÍVÁS FOGADÁS csomagban figyelmen kívül hagyandók.

5.2.5.2.4.2 *Átfordítás ISO 8208 csomagokba*

5.2.5.2.4.2.1 *Átfordítás*. A Légijármű hálózati végponti berendezés /ADLP/ által vett, az S-módú HÍVÁS ELFOGADÁS-nak a Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ csomag (vagy egy, a csomagok S-bit sorrendje) általi újra-formátumozási folyamata a Légijármű hálózati végponti berendezéstől /ADCE/ egy, az ennek megfelelő ISO 8208 HÍVÁS ELFOGADÁS csomag létrehozását eredményezi a helyi Hálózati végponti berendezéshez /DCE/. Az S-módú csomagból az ISO 8208 csomagba való átfordításnak az 5.2.5.2.4.1 pontban meghatározott folyamat inverze azokkal a kivételekkel, amelyek a következő pontokban kerültek meghatározásra.

5.2.5.2.4.2.2 *Hívott Lekérdező adat végponti berendezés /DTE/, hívó DTE címzés és hosszúság mezők.* Ahol ilyen van, ott a hívó DTE címzés légijármű címzésből és az S-módú csomag Mobil cím /AM/ mezőjében lévő értékekből kerül összeállításra, BCD-be konvertálva (5.2.3.1.3.2). Ebben az esetben a hívott DTE címzés megfelel annak a földi DTE címzésnek, amelyet az S-módú csomag Földi cím /AG/ mezőjében szerepel BCD-re konvertálva. A hosszúság mező az ISO 8208-ban szereplő meghatározás szerint.

Megjegyzés. - A hívott és hívó DTE címzések választhatók a megfelelő ISO 8208 csomagban és nem követelik meg az S-módú alhálózat helyes működését.

5.2.5.2.5 *A FEDÉLZETI ADATKAPCSOLAT VEZÉRLŐ EGYSÉG /ADLP/ ÁLTALI TÖRLÉSKÉRÉS*

5.2.5.2.5.1 *Átfordítás S-módú csomagokba*

5.2.5.2.5.1.1 *Átfordított csomag formátum.* A helyi Hálózati végponti berendezéstől /DCE/ jövő ISO 8208 TÖRLÉS KÉRÉS csomag újra-formátumozási folyamat Fedélzeti adatkapcsolat vezérlő egység /ADLP/ általi vétele az annak megfelelő S-módú TÖRLÉS KÉRÉS csomagok ADLP csomag(ok) általi létrehozását eredményezi (ahogy azt az S-bit feldolgozás meghatározza (5.2.5.1.4.2)) a következőképpen:

DP: 1	MP: 1	SP: 2	ST: 2	FILL2: 0 vagy 2	TC: 2	SN: 6	CH: 4 AM: 4

Adatcsomag S-módú spec. protokoll Felügyelő csomag Felügyelőtípus Kitöltés Ideiglenes csatorna-szám Sorozat-szám Csatorna-szám Mobil cím

AG: 8	CC: 8	DC: 8	S: 1	FILL: 2	F: 1	LV: 4	UD: v

Földi cím Törlést létrehozó Diagnosztika kód Több csomagjelzés Kitöltés Első csomagjelzés Felhasználói adathossz Felhasználói adatmező

A csomag formátumban bemutatott, de a következő pontokban nem meghatározott mezőket úgy kell beállítani, ahogyan az az 5.2.5.2.1 és 5.2.5.2.2 pontban leírásra került.

5.2.5.2.5.1.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.

5.2.5.2.5.1.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.
5.2.5.2.5.1.4 *Felügyelő csomag (SP).* Ezt a mezőt 1-re kell állítani.
5.2.5.2.5.1.5 *Csatorna-szám (CH).* Ha a hívás elfogadási időszak során egy csatorna-szám kerül kijelölésre, akkor a csatorna-számot /CH/ arra az értékre kell beállítani, eltérő esetekben ezt nullára kell állítani.
5.2.5.2.5.1.6 *Ideiglenes csatorna (TC).* Ha a hívás elfogadási időszak során egy csatorna-szám kerül kijelölésre, akkor az Ideiglenes csatorna-számot /TC/ nullára kell beállítani, más esetben a Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ által használt HÍVÁSKÉRÉS értékre kell beállítani.
5.2.5.2.5.1.7 *Felügyelő típus (ST).* Ezt a mezőt 2-re kell állítani.
5.2.5.2.5.1.8 *Címzés, földi és címzés, mozgó.* Az AM és AG értékek az ADLP által létrehozott S-módú HÍVÁSKÉRÉS, vagy a Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ által létrehozott HÍVÁSKÉRÉS csomagoknál visszatérnek ezekbe a mezőkbe. Ha jelen vannak, akkor a DTE címzéseket az ISO 8208 TÖRLÉSKÉRÉS csomagban figyelmen kívül kell hagyni.
5.2.5.2.5.1.9 *Törlést létrehozó (CC) és diagnosztikai kód (DC) mezők.* Ezeket a mezőket módosítás nélkül kell átfordítani az ISO 8208 csomagból az S-módú csomagba, amikor a Lekérdező adat végponti berendezés /DTE/ kezdeményezte a törlési eljárást. Ha a Fedélzeti/Földi adatkapcsolat vezérlő egység /XDLP/ kezdeményezte a törlési eljárást, akkor a törlést létrehozó mezőnek és a diagnosztikai mezőnek a Hálózati végponti berendezés /DCE/ és a Fedélzeti/Földi hálózati végponti berendezés /XDCE/ állapot táblázatokban meghatározottak (lásd még az 5.2.6.3.3 pontot). Ezeknek a mezőknek a kódolása és meghatározása az ISO 8208-ban előírtaknak felelnek meg.
5.2.5.2.5.2 *Átfordítás ISO 8208 csomagokba*
5.2.5.2.5.2.1 *Átfordítás.* A Földi telepítési rendszerű adatkapcsolat vezérlő egységtől /GDLP/ vett, az S-módú TÖRLÉS KÉRÉS-nek a Fedélzeti adatkapcsolat vezérlő egység /ADLP/ csomag általi újra-formátumozási folyamata a helyi Földi hálózati végponti berendezéstől /GDCE/ az annak megfelelő ISO 8208 TÖRLÉS KÉRÉS csomag létrehozását eredményezi a helyi Hálózati végponti berendezéshez /DCE/. Az S-módú csomagnak az ISO 8208 csomagba történő átfordításának az 5.2.5.2.5.1 pontban meghatározott folyamat inverze, azokkal a kivételekkel, amelyek a következő pontokban kerülnek meghatározásra.
5.2.5.2.5.2.2 *Hívott Lekérdező adat végponti berendezés /DTE/, hívó DTE és hosszúság mezők*. Ezeket a mezőket az ISO 8208 TÖRLÉS KÉRÉS csomagban el kell hagyni.
5.2.5.2.5.2.3 *Törlést létrehozó mező*. Ezt a mezőt az 5.2.6.3.3. pont figyelembevételével kell felállítani.

5.2.5.2.6 *A FÖLDI TELEPÍTÉSI RENDSZERŰ ADATKAPCSOLAT VEZÉRLŐ EGYSÉG /GDLP/ ÁLTALI TÖRLÉSKÉRÉS*

5.2.5.2.6.1 *Átfordítás S-módú csomagokba*
5.2.5.2.6.1.1 Átfordított csomag formátum. A helyi Hálózati végponti berendezéstől /DCE/ jövő ISO 8208 TÖRLÉSKÉRÉS csomag GDLP újra-formátumozási folyamat megfelelő S-módú TÖRLÉSKÉRÉS csomag (ok) GDLP csomagok általi létrehozását eredményezi (ahogy azt az S-bit feldolgozás meghatározza (5.2.5.2.4.2)) a következők szerint:

DP: 1	MP: 1	SP: 2	ST: 2	FILL: 2	TC: 2	SN: 6	CH: 4AM: 4

Adatcsomag S-módú spec. protokoll Felügyelő csomag Felügyelőtípus Kitöltés Ideiglenes csatorna-szám Sorozat-szám Csatorna-szám Mobil cím

AG: 8	CC: 8	DC: 8	S: 1	FILL: 2	F: 1	LV: 4	UD: v

Földi cím Törlést létrehozó Diagnosz-tika kód Több csomagjelzés Kitöltés Első csomag jelzés Felhasználói adathossz Felhasználói adatmező

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket úgy kell beállítani, ahogyan az az 5.2.5.2.1, 5.2.5.2.2 és 5.2.5.2.5 pontokban azok leírásra kerültek.
5.2.5.2.6.1.2 *Ada csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.
5.2.5.2.6.1.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.
5.2.5.2.6.1.4 *Felügyelő csomag (SP).* Ezt a mezőt 1-re kell állítani.
5.2.5.2.6.1.5 *Csatorna-szám (CH).* Ha a hívás elfogadási időszak során egy csatorna-szám kerül kijelölésre, akkor a csatorna-számot /CH/ arra az értékre kell beállítani, más esetekben ezt nullára kell állítani.
5.2.5.2.6.1.6 *Ideiglenes csatorna (TC).* Ha a hívás elfogadási időszak során egy csatorna-szám kerül kijelölésre, akkor az Ideiglenes csatorna-számot /TC/ nullára kell beállítani, más esetben a Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ által használt HÍVÁSKÉRÉS értékre kell beállítani.

5.2.5.2.6.1.7 *Felügyelő típus (ST).* Ezt a mezőt 2-re kell állítani.
5.2.5.2.6.2 *Átfordítás ISO 8208 csomagokba*
5.2.5.2.6.2.1 *Átfordítás.* A Fedélzeti adatkapcsolat vezérlő egységtől /ADLP/ vett, az S-módú TÖRLÉS KÉRÉS-nek a Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ csomag általi (vagy egy, a csomagok S-bit sorrendje általi) újra-formátumozási folyamata a helyi Fedélzeti hálózati végponti berendezéstől /ADCE/ az annak megfelelő ISO 8208 TÖRLÉS KÉRÉS csomag létrehozását eredményezi a helyi Hálózati végponti berendezéshez /DCE/. Az S-módú csomagnak az ISO 8208 csomagba történő átfordításának az 5.2.5.2.6.1 pontban meghatározott folyamat inverze, azokkal a kivételekkel, amelyek a következő pontokban kerülnek meghatározásra.
5.2.5.2.6.2.2 *Hívott Lekérdező adat végponti berendezés /DTE/, hívó DTE és hosszúság mezők.* Ezeket a mezőket az ISO 8208 TÖRLÉS KÉRÉS csomagban el kell hagyni.
5.2.5.2.7 *ADAT*
5.2.5.2.7.1 *Átfordítás S-módú csomagokba*
5.2.5.2.7.1.1 *Átfordított csomag formátum.* A helyi Hálózati végponti berendezéstől /DCE/ vett ISO 8208 ADAT csomag(ok) újra-formátumozási folyamat Fedélzeti/Földi adatkapcsolat vezérlő egység /XDLP/ általi vétele a megfelelő S-módú ADAT csomag(ok) létrehozását eredményezi, ahogy azt az M-bit feldolgozás meghatározza (5.2.5.1.4.1 pont), a következők szerint:

DP: 1	M: 1	SN: 6	FILL1: 0 vagy 6	PS: 4

Adat-csomag M-bit sorozat része Sorozat- szám Kitöltés Csomag küldési sorrend

PR: 4	CH: 4	LV: 4	UD: v

Csomag vételi sorrend Csatorna-szám Felhasználói adathossz Felhasználói adatmező

5.2.5.2.7.1.2 *Adat csomag típus (DP).* Ezt a mezőt 1-re kell állítani.
5.2.5.2.7.1.3 *M Mező (M).* Az 1 értéknek kell jeleznie, hogy a csomag egy M-bit sorozat része, több csomaggal a sorozatban következőkben. A 0 érték azt mutatja, hogy a sorozat ezzel a csomaggal végződik. A megfelelő értéket az S-módú csomag M-bit mezőjében kell elhelyezni.

Megjegyzés. - A teljes magyarázatot lásd az 5.2.5.1.4 pontban és az ISO 8208-ban.

5.2.5.2.7.1.4 *Sorozatszám (SN).* A sorozatszám mezőt az 5.2.5.2.1.1.7 pontban foglaltak szerint került meghatározásra.
5.2.5.2.7.1.5 *Csomag küldési sorrend (PS).* A csomag küldési sorrend mezőt az 5.2.6.4.4 pontban foglaltak szerint kell beállítani
5.2.5.2.7.1.6 *Csomag vételi sorrend (PR).* A csomag vételi sorrend mezőt az 5.2.6.4.4 pont szerint kell beállítani.
5.2.5.2.7.1.7 *Csatorna-szám (CH).* A csatorna-szám mező tartalmazza azt az S-módú csatorna-számot, amely megfelel a bejövő ISO 8208 ADAT csomag csatorna-számának.
5.2.5.2.7.1.8 *Felhasználói adat hossz (LV).* Ennek a mező jelzi az utolsó Szabvány hosszúságú közlemény /SLM/ vagy Kiterjesztett hosszúságú közlemény /ELM/ szegmensben lévő összes bájtok számát, ahogyan az az 5.2.2.3.1 pontban foglaltak szerint.
5.2.5.2.7.1.9 *Kitöltés (FILL1).* Ezt a mezőt az 5.2.5.2.1.1.11 pontban meghatározottak szerint kell beállítani.
5.2.5.2.7.1.10 *Felhasználói adat (UD).* A felhasználói adatokat az ISO 8208 csomagból az S-módú csomagba kell átvinni, az M-bit csomag összeállítási folyamatot felhasználva az előírásoknak megfelelően.
5.2.5.2.7.2 *Átfordítás ISO 8208 csomagokba.* A helyi Fedélzeti/Földi hálózati végponti berendezéstől /XDCE/ a Fedélzeti/Földi adatkapcsolat vezérlő egység /XDLP/ által vett S-módú ADAT csomag (ok) újra-formátumozási folyamata a megfelelő ISO 8208 ADAT csomag(ok) létrehozását eredményezi a helyi Hálózati végponti berendezés /DCE/ részére. Az S-módú csomag(ok) nak az ISO 8208 csomag (ok)ba történő átfordítása az 5.2.5.2.7.1 pontban meghatározott feldolgozás inverze.

5.2.5.2.8 *MEGSZAKÍTÁS*

5.2.5.2.8.1 *Átfordítás az S-módú csomagokba*
5.2.5.2.8.1.1 *Átfordított csomag formátum.* A helyi DCE-től jövő ISO 8208 MEGSZAKÍTÁS átfordítási folyamatnak az XDLP általi vétele a megfelelő S-módú MEGSZAKÍTÁS csomag(ok) létrehozását eredményezi (ahogy azt az S-bit feldolgozás meghatározza (5.2.5.1.4.2 pont)) a következők szerint:

DP: 1	MP: 1	SP: 2	FILL2: 0 vagy 2	S: 1

Adatcsomag S-módú spec. protokoll Felügyelő csomag Kitöltés Több csomag jelzés

F: 1	SN: 6	CH: 4	LV: 4	UD: v

Első csomag jelzés Sorozat- szám Csatorna-szám Felhasználói adathossz Felhasználói adatmező

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket az 5.2.5.2.1 pontban szereplő meghatározások szerint kell beállítani.

5.2.5.2.8.1.2 *Adatcsomag típus (DP).* Ezt a mezőt 0-ra kell állítani.
5.2.5.2.8.1.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.
5.2.5.2.8.1.4 *Felügyelő csomag (SP).* Ezt a mezőt 1-re kell állítani.
5.2.5.2.8.1.5 *Felügyelő típus (ST).* Ezt a mezőt 1-re kell állítani.
5.2.5.2.8.1.6 *Felhasználói adat hossz (LV).* Ezt a mezőt az 5.2.2.3.1 pontban foglaltak szerint kell beállítani.
5.2.5.2.8.1.7 *Felhasználói adat (UD).* A felhasználói adatokat az ISO 8208 csomagból az S-módú csomagba az S-bit csomag újra-összeállítási eljárását alkalmazva kell előírás szerint átvinni. A felhasználói adatmező maximális mérete egy MEGSZAKÍTÁS csomagra 32 bájt legyen.
5.2.5.2.8.2 *Átfordítás ISO 8208 csomagokba.* A helyi Fedélzeti/Földi hálózati végponti berendezéstől /XDCE/ a Fedélzeti/Földi adatkapcsolat vezérlő egység /XDLP/ által vett S-módú MEGSZAKÍTÁS csomag(ok) újra-formátumozási folyamata a megfelelő ISO 8208 MEGSZAKÍTÁS csomag létrehozását eredményezi a helyi Hálózati végponti berendezés /DCE/ részére. Az S-módú csomag(ok)nak az ISO 8208 csomag(ok)ba történő átfordítása az 5.2.5.2.8.1 pontban meghatározott feldolgozás inverze legyen.

5.2.5.2.9 *MEGSZAKÍTÁS MEGERŐSÍTÉS*

5.2.5.2.9.1 *Átfordítás S-módú csomagokba*
5.2.5.2.9.1.1 *Átfordított csomag formátum.* A helyi DCE-től jövő ISO 8208 MEGSZAKÍTÁS MEGERŐSÍTÉS átfordítási folyamatnak az XDLP általi vétele a megfelelő S-módú MEGSZAKÍTÁS MEGERŐSÍTÉS csomag létrehozását eredményezi a következők szerint:

DP: 1	MP: 1	SP: 2	ST: 1	SS: 2

Adatcsomag S-módú spec. protokoll Felügyelő csomag Felügyelő típus Felügyelő részhalmaz

FILL2 : 0 vagy 2	SN: 6	CH: 4	FILL: 4

Kitöltés Sorozat- szám Csatorna-szám Felhasználói adatmező

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket az 5.2.5.2.1 pontban meghatározottak szerint kell beállítani.
5.2.5.2.9.1.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.
5.2.5.2.9.1.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.
5.2.5.2.9.1.4 *Felügyelő csomag (SP).* Ezt a mezőt 3-ra kell állítani.
5.2.5.2.9.1.5 *Felügyelő típus (ST).* Ezt a mezőt 3-ra kell állítani.
5.2.5.2.9.1.6 *Felügyelő részhalmaz (SS).* Ezt a mezőt 0-ra kell állítani.
5.2.5.2.9.2 *Átfordítás ISO 8208 csomagokba.* A helyi Fedélzeti/Földi hálózati végponti berendezéstől /XDCE/ a Fedélzeti/Földi adatkapcsolat vezérlő egység /XDLP/ által vett S-módú MEGSZAKÍTÁS MEGERŐSÍTÉS csomag újra-formátumozási folyamata a megfelelő ISO 8208 MEGSZAKÍTÁS MEGERŐSÍTÉS csomag létrehozását eredményezi a helyi Hálózati végponti berendezés /DCE/ részére. Az S-módú csomagnak az ISO 8208 csomagba történő átfordítása az 5.2.5.2.9.1 pontban meghatározott feldolgozás inverze legyen.

5.2.5.2.10 *VISSZAÁLLÍTÁS KÉRÉS*

5.2.5.2.10.1 *Átfordítás S-módú csomagokba*
5.2.5.2.10.1.1 *Átfordított csomag formátum.* A helyi Hálózati végponti berendezéstől /DCE/ jövő ISO 8208 VISSZAÁLLÍTÁS KÉRÉS csomag újra-formátumozási folyamat Fedélzeti/Földi adatkapcsolat vezérlő egység /XDLP/ általi vétele a megfelelő S-módú VISSZAÁLLÍTÁS KÉRÉS csomag létrehozását eredményezi a következők szerint:

DP: 1	MP: 1	SP: 2	ST: 2	FILL2: 0 vagy 2

Adat-csomag S-módú spec. protokoll Felügyelő csomag Felügyelő típus Kitöltés Kitöltés

SN: 6	CH: 4	FILL: 4	RC: 8	DC: 8

Sorozat- szám Csatorna-szám Kitöltés Visszaállítást előidéző kód Diagnosztikai kód

A csomag-formátumban bemutatott és a következő pontokban nem meghatározott mezőket az 5.2.5.2.1 pontban szereplő meghatározás szerint kell beállítani:

5.2.5.2.10.1.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.
5.2.5.2.10.1.3 *MSP csomag típus (MP)*. Ezt a mezőt 1-re kell állítani.
5.2.5.2.10.1.4 *Felügyelő csomag (SP).* Ezt a mezőt 2-re kell állítani.
5.2.5.2.10.1.5 *Felügyelő típus (ST).* Ezt a mezőt 2-re kell állítani.
5.2.5.2.10.1.6 *A visszaállítást előidéző kód (RC) és a diagnosztikai kód (DC).* A visszaállítást előidéző és diagnosztikai kódok, amelyek az S-módú VISSZAÁLLÍTÁS KÉRÉS csomagban alkalmazásra kerülnek, az ISO 8208 csomagban előírt megfelelő kódoknak kell lenni akkor, amikor a visszaállítási eljárást a Lekérdező adat végponti berendezés /DTE/ kezdeményezi. Ha a visszaállítási eljárás a Hálózati végponti berendezéstől /DCE/ indul, akkor a DCE állapot táblázatoknak határozzák meg a diagnosztikai mezők kódolását. Ebben az esetben a visszaállítást előidéző mező 8-as bitjét 0-ra kell állítani.
5.2.5.2.10.2 *Átfordítás ISO 8208 csomagokba.* A helyi Fedélzeti/Földi hálózati végponti berendezéstől /XDCE/ a Fedélzeti/Földi adatkapcsolat vezérlő egység /XDLP/ által vett S-módú VISSZAÁLLÍTÁS csomag újra-formátumozási folyamata a megfelelő ISO 8208 VISSZAÁLLÍTÁS csomag létrehozását eredményezi a helyi Hálózati végponti berendezés /DCE/ részére. Az S-módú csomagnak ISO 8208 csomagba történő átfordítása az 5.2.5.2.10.1 pontban meghatározott feldolgozás inverze legyen.
5.2.5.2.11 *ISO 8208 ÚJRAINDÍTÁS KÉRÉS az S-módú TÖRLÉS KÉRÉS-hez.* A helyi DCE-ből jövő ISO 8208 ÚJRAINDÍTÁS KÉRÉS vételének az újra-formátumozási folyamatban eredményeznie kell a Fedélzeti adatkapcsolat vezérlő egység /ADLP/ által létrehozott S-módú TÖRLÉS KÉRÉS-t, vagy a Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ által létrehozott S-módú BONTÁS KÉRÉS-t a kérő Lekérdező adat végponti berendezéssel /DTE/ kapcsolódó összes Kapcsolt virtuális áramkörnél /SVC/. Az S-módú TÖRLÉSKÉRÉS csomagokat az 5.2.5.2.5 és 5.2.5.2.6 pontok szerint kell beállítani.

Megjegyzés. - Az S-módú csomag réteg protokollban nincsenek újraindítási állapotok.

5.2.5.3 CSOMAGOK, HELYI AZ S-MÓDÚ ALHÁLÓZATHOZ

Megjegyzés. - Az ebben a szakaszban meghatározott csomagok nem eredményeznek ISO 8208 csomag létrehozást.

5.2.5.3.1 *S-MÓDÚ FOGADÁSRA KÉSZ*
5.2.5.3.1.1 *Csomag formátum.* Egy Fedélzeti/Földi adatkapcsolat vezérlő egységtől /XDLP/ érkező S-módú FOGADÁSRA KÉSZ csomag nincs kapcsolatban a Lekérdező adat végponti berendezés/Hálózati végponti berendezés /DTE/DCE/ illesztés vezérléssel és nem eredményezi egy ISO 8208 csomag létrehozását. A csomag formátuma a következő:

DP: 1	MP: 1	SP: 2	ST: 2	FILL2: 0 vagy 2

Adatcsomag S-módú spec. protokoll
Felügyelő csomag Felügyelő típus Kitöltés

FILL: 2	SN: 6	CH: 4	PR: 4

Kitöltés Sorozat- szám Csatorna-szám Csomag vételi sorrend

A csomag formátumban bemutatott és a következő pontokban nem szereplő mezőket az 5.2.5.2.1 pontban meghatározottak szerint kell beállítani. A csomagot az 5.2.6.5 pontban meghatározottak szerint kell feldolgozni.
5.2.5.3.1.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.
5.2.5.3.1.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.
5.2.5.3.1.4 *Felügyelő csomag (SP).* Ezt a mezőt 2-re kell állítani.
5.2.5.3.1.5 *Felügyelő típus (ST).* Ezt a mezőt 0-ra kell állítani.
5.2.5.3.1.6 *Csomag vételi sorrend (PR).* Ezt a mezőt az 5.2.6.4.4 pontban meghatározottak szerint kell beállítani.
5.2.5.3.2 S-*MÓDÚ FOGADÁSRA NEM KÉSZ*
5.2.5.3.2.1 *Csomag formátum.* Egy Fedélzeti/Földi adatkapcsolat vezérlő egységtől /XDLP/ érkező S-módú FOGADÁSRA NEM KÉSZ csomag nincs kapcsolatban a Lekérdező adat végponti berendezés/Hálózati végponti berendezés /DTE/DCE/ illesztés vezérléssel és nem eredményezi ISO 8208 csomag létrehozását. A csomag formátuma a következő:

DP: 1	MP: 1	SP: 2	ST: 2	FILL2: 0 vagy 2

Adat-csomag S-módú spec. protokoll Felügyelő csomag Felügyelő típus Kitöltés

FILL: 2	SN: 6	CH: 4	PR: 4

Kitöltés Sorozat- szám Csatorna-szám Csomag vételi sorrend

A csomag formátumban bemutatott és a következő pontokban nem szereplő mezőket az 5.2.5.2.1 pontban meghatározottak szerint kell beállítani. A csomagot az 5.2.6.5 pontban meghatározottak szerint kell feldolgozni.
5.2.5.3.2.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.
5.2.5.3.2.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.
5.2.5.3.2.4 *Felügyelő csomag (SP).* Ezt a mezőt 2-re kell állítani.
5.2.5.3.2.5 *Felügyelő típus (ST).* Ezt a mezőt 1-re kell állítani.
5.2.5.3.2.6 *Csomag vételi sorrend (PR)*. Ezt a mezőt az 5.2.6.4.4 pontban meghatározottak szerint kell beállítani.
5.2.5.3.3 *S-MÓDÚ IRÁNYÍTÁS*
5.2.5.3.3.1 *Csomag formátum.* A csomag formátuma a következő:

DP: 1	MP: 1	SP: 2	ST: 2	OF: 1IN: 1

Adatcsomag S-módú spec. protokoll Felügyelő csomag Felügyelő típus Választható jelzés Indulási állapot beállítás

RTL: 8	RT: v	ODL: 0 vagy 8	OD: v

Irányítás táblázat hossz Irányítás táblázat Választható adat hossz Választható adat

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket az 5.2.5.2.1 pontban előírtak szerint kell beállítani. A csomag csak a Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ által kerül létrehozásra. A csomagot a Fedélzeti adatkapcsolat vezérlő egység /ADLP/ dolgozza fel az 5.2.8.1.2 pontban meghatározottak szerint, és a csomag maximális méretének az 5.2.6.4.2.1 pontban foglaltaknak kell megfelelni.
5.2.5.3.3.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.
5.2.5.3.3.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.
5.2.5.3.3.4 *Felügyelő csomag (SP).* Ezt a mezőt 3-ra kell állítani.
5.2.5.3.3.5 *Felügyelő típus (ST).* Ezt a mezőt 0-ra kell állítani.
5.2.5.3.3.6 *Választható jelzés (OF).* Ez a mező jelezi a választható adat hossz (ODL) és a választható adat (OD) jelenlétét. A választható jelzést (OF) 1-re kell beállítani akkor, amikor a Választható adat hossz (ODL) és a Választható adat (OD) mezők vannak. Egyéb esetekben 0-ra kell állítani.
5.2.5.3.3.7 *Indulási állapot beállító bit (IN).* Ennek a mező jelzi az alhálózat indulási állapot beállítása iránti igényt. Ezt a GDLP-nek az 5.2.8.1.2 d) pontban meghatározottaknak megfelelően kell beállítani.
Megjegyzés. - Az indulási állapotbeállítás az IRÁNYÍTÁS csomagban lévő Lekérdező adat végponti berendezés /DTE/

címzésekhez kapcsolódó bármely nyitott Kapcsolt virtuális áramkör /SVC/ törlését hozza létre. Ez annak biztosításához szükséges, hogy valamennyi csatorna zárva legyen az adatgyűjtésnél és egy GDLP meghibásodást követő helyreállítás indulási állapot beállításához.
5.2.5.3.3.8 *Irányítás táblázat hossz (RTL).* Ez a mező jelzi az irányítás táblázat méretét bájtokban kifejezve.
5.2.5.3.3.9 *Irányítás táblázat (RT)*
5.2.5.3.3.9.1 *Tartalom.* Ez a táblázat a változtatható számú belépési címekből áll, azokból, amelyek mindegyike olyan információt tartalmaz, amely meghatározza a belépési címek hozzáadását vagy törlését a Lekérdező azonosító /II/ kód Lekérdező adat végponti berendezés /DTE/ kereszt-hivatkozás táblázatban (5.2.8.1.1).
5.2.5.3.3.9.2 *Belépési címek.* Az irányítás táblázatban minden belépési cím az II kódból áll, maximálisan 8 földi DTE címzés felsorolásból és egy jelzésből, amely azt mutatja meg, hogy a származó II kód - DTE párokat hozzá kell-e adni vagy törölni kell-e az II kód - DTE kereszt-hivatkozási táblázatból. Az irányító táblázat bevitelét a következőképpen kell kódolni:

II: 4	AD: 1	ND: 3	DAL: v
Lekérdező azonosító	Hozzáadás/ /törlés jelzés	DTE címzések száma	DTE címzés jegyzék

5.2.5.3.3.9.3 *Lekérdező azonosító (II).* Ez a mező tartalmazza a 4-bites II kódot.
5.2.5.3.3.9.4 *Hozzáadás/törlés jelző (AD).* Ez a mező azt mutatja, hogy a II kód - DTE párokat hozzá kell adni (AD = 1) vagy törölni kell-e (AD = 0) az II kód - DTE kereszt-hivatkozás táblázatból.
5.2.5.3.3.9.5 *Lekérdező adat végponti berendezés /DTE/ címzések száma (ND).* Ezt a mezőt a 0-tól 7-ig terjedő tartományban binárisan kell kifejezni, és a DTE címzés jegyzékben /DAL/ jelenlévő DTE címzések számát mindig 1 levonással kell jelezni (azért, hogy lehetővé tegye az 1-től 8-ig terjedő DTE címzéseket).
5.2.5.3.3.9.6 *DTE címzés jegyzék (DAL).* Ennek a jegyzéknek maximálisan 8 DTE címzésből kell állnia 8-bites bináris adat feltűntetéssel.
5.2.5.3.3.10 *Választható adat hossz (ODL).* Ez a mező magába foglalja a következő Választható adat /OD/ mező bájtokban kifejezett hosszúságát.
5.2.5.3.3.11 *Választható adat (OD).* Ennek a változtatható hosszúságú mezőnek a választható adatokat tartalmazza.
5.2.5.3.4 *A FEDÉLZETI ADATKAPCSOLAT VEZÉRLŐ EGYSÉG /ADLP/ ÁLTALI S-MÓDÚ TÖRLÉS MEGERŐSÍTÉS*
5.2.5.3.4.1 *Csomag formátum.* A formátumnak ennél a csomagnál a következő:

DP: 1	MP: 1	SP: 2	ST: 2	FILL2: 0 vagy 2

Adat-csomag S-módú spec. protokoll Felügyelő csomag Felügyelő típus Kitöltés

TC: 2	SN: 6	CH: 4	AM: 4	AG: 8

Ideiglenes csatorna-szám Sorozat- szám Csatorna-szám Mobil cím Földi cím

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket az 5.2.5.2.1 és 5.2.5.2.5 pontokban foglaltak szerint. Ezt a csomagot az 5.2.6.3 pontban előírtaknak megfelelően kell feldolgozni.
5.2.5.3.4.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.
5.2.5.3.4.3 *MSP csomag típus (MP).* Ezt a mezőt 1-re kell állítani.
5.2.5.3.4.4 *Felügyelő csomag (SP).* Ezt a mezőt 3-ra kell állítani.
5.2.5.3.4.5 *Csatorna-szám (CH).* Ha a hívás elfogadási időszak során egy csatorna-szám kerül kijelölésre, akkor a csatorna-számot /CH/ arra az értékre kell beállítani, más esetekben ezt nullára kell állítani.
5.2.5.3.4.6 *Ideiglenes csatorna (TC).* Ha a hívás elfogadási időszak során egy csatorna-szám kerül kijelölésre, akkor az Ideiglenes csatorna-számot /TC/ nullára kell beállítani, más esetben a Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ által használt HÍVÁSKÉRÉS értékre kell beállítani.
5.2.5.3.4.7 *Felügyelő típus (ST).* Ezt a mezőt 3-ra kell állítani.
5.2.5.3.5 *A FÖLDI TELEPÍTÉSI RENDSZERŰ ADATKAPCSOLAT VEZÉRLŐ EGYSÉG /GDLP/ ÁLTALI S-MÓDÚ TÖRLÉS MEGERŐSÍTÉS*
5.2.5.3.5.1 *Csomag formátum.* Ennek a csomagnak a formátuma a következő:

DP: 1	MP: 1	SP: 2	ST: 2	FILL: 2

Adat-csomag S-módú spec. protokoll Felügyelő csomag Felügyelő típus Kitöltés

TC: 2	SN: 6	CH: 4	AM: 4	AG: 8

Ideiglenes csatorna-szám Sorozat- szám Csatorna-szám Mobil cím Földi cím

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket az 5.2.5.2.1 és 5.2.5.2.6 pontokban foglaltak szerint kell beállítani. Ezt a csomagot az 5.2.6.3 pontban előírtaknak megfelelően kell feldolgozni.
5.2.5.3.5.2 *Adat csomag típus (DP)*. Ezt a mezőt 0-ra kell állítani.
5.2.5.3.5.3 *MSP csomag típus (MP)*. Ezt a mezőt 1-re kell állítani.
5.2.5.3.5.4 *Felügyelő csomag (SP)*. Ezt a mezőt 1-re kell állítani.
5.2.5.3.5.5 *Csatorna-szám (CH).* Ha a hívás elfogadási időszak során egy csatorna-szám kerül kijelölésre, akkor a csatorna-számot /CH/ arra az értékre kell beállítani, más esetekben ezt nullára kell állítani.
5.2.5.3.5.6 *Ideiglenes csatorna (TC)*. Ha a hívás elfogadási időszak során egy csatorna-szám kerül kijelölésre, akkor az Ideiglenes csatorna-számot /TC/ nullára kell beállítani, más esetben a Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ által használt HÍVÁSKÉRÉS értékre kell beállítani.
5.2.5.3.4.7 *Felügyelő típus (ST)*. Ezt a mezőt 3-ra kell állítani.
5.2.5.3.6 *S-MÓDÚ VISSZAÁLLÍTÁS MEGERŐSÍTÉS*
5.2.5.3.6.1 *Csomag formátum.* Ennek a csomagnak a formátuma a következő:

DP: 1	MP: 1	SP: 2	ST: 2	FILL2: 0 v. 2

Adat-csomag S-módú spec. protokoll Felügyelő csomag Felügyelő típus Kitöltés

FILL: 2	SN: 6	CH: 4	FILL: 4

Kitöltés Sorozat- szám Csatorna-szám Kitöltés

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket az 5.2.5.2.1 pontban előírtak szerint kell beállítani. Ezt a csomagot az 5-14. táblázatban meghatározottak szerint kell feldolgozni.
5.2.5.3.6.2 *Adat csomag típus (DP)*. Ezt a mezőt 0-ra kell állítani.
5.2.5.3.6.3 *MSP csomag típus (MP)*. Ezt a mezőt 1-re kell állítani.
5.2.5.3.6.4 *Felügyelő csomag (SP)*. Ezt a mezőt 2-re kell állítani.
5.2.5.3.6.5 *Felügyelő típus (ST).* Ezt a mezőt 3-ra kell állítani.
5.2.5.3.7 *S-MÓDÚ VISSZAÁLLÍTÁS*
5.2.5.3.7.1 *Csomag formátum.* Ennek a csomagnak a formátuma a következő:

DP: 1	MP: 1	SP: 2	ST: 2	SS: 2

Adat-csomag S-módú spec. protokoll Felügyelő csomag Felügyelő típus Felügyelő részhalmaz

FILL2: 0 vagy 2	SN: 6	CH: 4	PR: 4

Kitöltés Sorozat- szám Csatorna-szám Csomag vételi sorrend

A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket az 5.2.5.2.1 pontban foglaltak szerint kell beállítani. Ezt a csomagot az 5.2.6.8 pontban előírtaknak megfelelően kell feldolgozni.
5.2.5.3.7.2 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.
5.2.5.3.7.3 *MSP csomag típus (MP)*. Ezt a mezőt 1-re kell állítani.
5.2.5.3.7.4 *Felügyelő csomag (SP).* Ezt a mezőt 3-ra kell állítani.
5.2.5.3.7.5 *Felügyelő típus (ST).* Ezt a mezőt 3-ra kell állítani.
5.2.5.3.7.6 *Felügyelő részhalmaz (SS).* Ezt a mezőt 1-re kell állítani.
5.2.5.3.7.7 *Csomag vételi sorrend (PR)*. Ezt a mezőt az 5.2.6.4.4 pontban meghatározottak szerint kell beállítani.

5.2.6 Légijármű/Földi hálózati végponti berendezés /XDCE/ működése

Megjegyzés. - A Légijármű hálózati végponti berendezés /ADCE/ feldolgozás a Fedélzeti adatkapcsolat vezérlő egységen /ADLP/ belül úgy működik, mint a Földi hálózati végponti berendezés /GDCE/ feldolgozás a Földi telepítési rendszerű adatkapcsolat vezérlő egységen /GDLP/ belüli társ-folyamata.

5.2.6.1 *Állapot átvitelek.* Az XDCE állapotgépként működik. Egy állapotba kerülve, az XDCE végrehajtja az 5-14. táblázatban ismertetett műveleteket. Az állapot átvitelek és kiegészítő művelet(ek) az 5-15.-től az 5-22.-ig terjedő táblázatokban szerepelnek.

1. Megjegyzés. - A következő állapot átvitel (ha van ilyen) akkor következik be, amikor a Légijármű/Földi hálózati végponti berendezés /XDCE/ egy csomagot fogad a társ XDCE-től, ami az 5-15.-től az 5-19.-ig terjedő táblázatokban van meghatározva. Ugyanezek az átvitelek kerültek meghatározásra az 5-20.-tól az 5-22.-ig terjedő táblázatokban, amikor a XDCE vesz egy csomagot a Hálózati végponti berendezéstől /DCE/ (az újra-formátumozó folyamaton keresztül).

2. Megjegyzés. - Az XDCE állapot hierarchiája ugyanolyan, mint a DCE-jé, ahogyan azt az 5-2 ábra bemutatja, azzal a kivétellel, hogy az 'r2', ' r3' és 'p5' állapotokat el kell hagyni.

5.2.6.2 A CSOMAGOK KIOSZTÁSA

5.2.6.2.1 Egy csomagnak a társ Légijármű/Földi hálózati végponti berendezéstől /XDCE/ történő fogadása után a csomagot vagy kell, vagy nem kell továbbítani a Hálózati végponti berendezéshez /DCE/ (az újra formátumozó eljáráson keresztül) az 5-15.-től az 5-19.-ig terjedő táblázatokban megadott zárójeles utasításoknak megfelelően. Ha a zárójeles utasítás nincs feltűntetve, vagy ha a zárójeles utasítás "ne továbbíts" utasítást mutat, akkor a csomagot érvényteleníteni kell.
5.2.6.2.2 Egy csomag fogadása után a DCE-től (az újra-formátumozó folyamaton keresztül) a csomagot vagy kell, vagy nem kell továbbítani a társ XDCE-hez az 5-20.-tól az 5-22.-ig terjedő táblázatokba foglalt zárójeles utasításoknak megfelelően. Ha zárójeles utasítás nincs feltűntetve, vagy a zárójeles utasítás "ne továbbíts" utasítást mutat, a csomagot érvényteleníteni kell.

5.2.6.3 KAPCSOLT VIRTUÁLIS ÁRAMKÖR /SVC/ HÍVÁS BEÁLLÍTÁSI ÉS TÖRLÉSI ELJÁRÁS
5.2.6.3.1 *Beállítási eljárások.* A Hálózati végponti berendezéstől /DCE/ vagy a társ XDCE-től jövő HÍVÁSKÉRÉS fogadása után a Fedélzeti/Földi adatkapcsolat vezérlő egységnek /XDLP/ meg kell állapítania, hogy van-e elegendő erőforrás az SVC működtetéséhez. Ennek a következőket kell tartalmazni: elegendő tároló tér (a tárolási követelményeket illetően nézzék meg az 5.2.5.1.1 pontot) és egy rendelkezésre álló p1 állapotú SVC. A DCE-től (az újra-formátumozási folyamaton keresztül) érkező HÍVÁSKÉRÉS fogadása után az S-módú HÍVÁSKÉRÉS csomagot továbbítani kell keret feldolgozásra. A társ XDCE-től (a keret feldolgozáson keresztül) érkezett S-módú HÍVÁSKÉRÉS fogadása után az S-módú HÍVÁSKÉRÉS-t el kell küldeni az újra-formátumozó feldolgozáshoz.
5.2.6.3.2 *Egy híváskérés leállítása*. Ha a Lekérdező adat végponti berendezés /DTE/ és/vagy a társ Légijármű/Földi hálózati végponti berendezés /XDCE/ leállít egy hívást, mielőtt azok egy HÍVÁS ELFOGADÁS csomagot vettek, jelezniük kell ezt a feltételt egy TÖRLÉS KÉRÉS csomag kibocsátásával. Az ezeknek az eseteknek a kezelésére szolgáló eljárások az 5-16. és 5-20. táblázatokban találhatók.

5.2.6.3.3 *VIRTUÁLIS HÍVÁS TÖRLÉS*

5.2.6.3.3.1 Ha az XDCE egy olyan S-módú HÍVÁSKÉRÉS-t vesz az újra-formátumozó feldolgozástól, amelyet nem tud támogatni, akkor egy S-módú TÖRLÉS KÉRÉS csomagot indít, amelyet a DCE-hez továbbít (az újra-formátumozó feldolgozáson keresztül) a DTE-hez való továbbítás céljából (a DCE ilyen módon belép a DCE TÖRLÉS KÉRÉS-be a DTE állapotába, a p7-be).
5.2.6.3.3.2 Ha az XDCE egy olyan S-módú HÍVÁSKÉRÉS csomagot vesz a társ XDCE-től (keret feldolgozáson keresztül), amelyet ez nem támogat, akkor belép a p7 állapotba.
5.2.6.3.3.3 Módot kell biztosítani ahhoz, hogy a DTE értesítést kapjon arról, hogy egy SVC a társ DTE tevékenysége miatt, vagy magán az alhálózaton belüli probléma miatt került törlésre.

5.2.6.3.3.4 **Ajánlás. -** *Az 5.2.6.3.3.3 pont követelményét a törlést létrehozó mező 8-as bitjének 1-re állításával kell kielégíteni annak jelzésére, hogy a probléma az S-módú alhálózatból ered és nem a DTE-ben keletkezett. A diagnosztikai /DC/ és törlést létrehozó /CC/ kódokat a következőképpen kell beállítani:*

a) csatorna-szám nem áll rendelkezésre, DC = 1, CC = 133;
b) tároló tér nem áll rendelkezésre, DC = 71, CC = 133;
c) DTE nem működőképes, DC = 162, CC = 141; és
d) kapcsolat meghibásodás, DC = 225, CC = 137.

5.2.6.3.3.5 Ha a Fedélzeti adatkapcsolat vezérlő egység /ADLP/ egy olyan S-módú IRÁNYÍTÁS csomagot vesz, ahol az Indulási állapot /IN/ bit EGY-re van állítva, az ADLP-nek egy helyi indulási állapot beállítást kell végrehajtania az IRÁNYÍTÁS csomagban lévő DTE címzésekhez kapcsolódó S-módú SVC-k törlésével. Ha a Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ egy keresés kérést (5-23 táblázat) vesz egy ADLP-től, akkor a GDLP-nek végre kell hajtania helyi indulási állapot beállítást az ahhoz az ADLP-hez kapcsolódó S-módú SVC-k törlésével. A helyi indulási állapot beállítást a következőkkel kell végrehajtani:
a) az összes, az ezekhez a Kapcsolt virtuális áramkörökhöz /SVC-k/ kapcsolódó lefoglalt hozzárendelt erőforrások leválasztásával (beleértve az újra sorba rendező tárolókat is);
b) ezeknek a SVC-knek a visszatérése a Légijármű hálózati végponti berendezés /ADCE/ kész állapotba (p1); és
c) S-módú TÖRLÉS KÉRÉS csomagok küldése ezekhez az SVC-khez a Hálózati végponti berendezésnél /DCE/ (az újra-formátumozási folyamaton keresztül) a Lekérdező adat végponti berendezéshez /DTE/ való továbbítás céljából.

Megjegyzés. - Ez a művelet lehetővé fogja tenni azt, hogy az S-módú SVC-khez tartozó összes ISO 8208 SVC-k törlésre kerüljenek, és visszatérjenek a kész állapotba (p1).

5.2.6.3.4 *A törlés megerősítése.* Amikor a Légijármű/Földi hálózati végponti berendezés /XDCE/ egy S-módú TÖRLÉS MEGERŐSÍTÉS csomagot vesz, az SVC kezelésére szolgáló, megmaradó hozzárendelt erőforrásokat le kell választania (beleértve az újra-sorba rendező tárolókat is) és az SVC-nek vissza kell térnie a p1 állapotba. S-módú TÖRLÉS MEGERŐSÍTÉS csomagot nem kell továbbítani az újra-formátumozó feldolgozáshoz.
5.2.6.3.5 *Törlés ütközés.* A törlés ütközés akkor fordul elő az XDCE-nél, amikor az egy S-módú TÖRLÉS KÉRÉS csomagot vesz a DCE-től (az újra-formátumozási feldolgozáson keresztül), és azután egy S-módú TÖRLÉS KÉRÉS csomagot vesz a társ XDCE-től (vagy fordítva). Ebben az eseményben az XDCE nem számít egy S-módú TÖRLÉS MEGERŐSÍTÉS csomag vételére, erre az SVC-re és a törlést teljesnek kell tekintenie.
5.2.6.3.6 *Csomag feldolgozás.* Az XDCE-nek az S-módú HÍVÁSKÉRÉS, HÍVÁS ELFOGADÁS és TÖRLÉS KÉRÉS csomagok S-bit sorozatát egyedi entitásként kell kezelnie.
5.2.6.4 ADATÁTVITELI ÉS MEGSZAKÍTÁSI ELJÁRÁSOK

5.2.6.4.1 *ÁLTALÁNOS ELŐÍRÁSOK*

5.2.6.4.1.1 Adatátviteli és megszakítási eljárásokat minden egyes SVC-hez függetlenül kell alkalmazni. A felhasználói adatmező tartalmát áttekinthető módon kell átadni a DCE-nek vagy a társ XDCE-nek. Az adatokat olyan sorrendben kell átvinni, amelyet az adat csomagok részére kijelölt sorozatszámok diktálnak.
5.2.6.4.1.2 Ahhoz, hogy csomagokat vigyen át, az SVC-nek FORGALOM VEZÉRLÉSRE KÉSZ állapotban (d1) kell lennie.

5.2.6.4.2 *S-MÓDÚ CSOMAG MÉRET*

5.2.6.4.2.1 Az S-módú csomagok maximális méretének 152 bájt-nak kell lenni a fedélzetre irányuló adattovábbítási irányban és 160 bájtnak a fedélzetről leadott adattovábbítási berendezéseknél, amelyek teljes fedélzetre irányuló vagy fedélzetről leadott adattovábbítási Kiterjesztett hosszúságú közlemény /ELM/ teljesítőképességgel rendelkeznek. A fedélzetről leadott maximális csomag méret négy válaszjeladós szintre kevesebb, mint 16 szegmens fedélzetről leadott ELM teljesítőképességgel, egyenlő lesz 10 bájt szorozva a fedélzetről leadott ELM szegmensek maximális számával, ahogy a válaszjeladó meghatározza az adatkapcsolati teljesítőképesség jelentésében. Ha nincs ELM teljesítőképesség, a maximális S-módú csomag méret 28 bájt.
5.2.6.4.2.2 Az S-módú alhálózat kisebb csomagokat tesz lehetővé, mint a továbbítandó maximális méret.
5.2.6.4.3 *FORGALOM VEZÉRLÉS ABLAK MÉRET*

5.2.6.4.3.1 Az S-módú alhálózat forgalom vezérlő ablak mérete független a DTE/DCE illesztésnél használt. Vezérlőablak méretétől. Az S-módú alhálózat ablak mérete 15 csomag a fedélzetre irányuló és a fedélzetről leadott adattovábbítás irányban.
5.2.6.4.4. *SVC FORGALOMVEZÉRLÉS*
5.2.6.4.4.1 A forgalomvezérlést egy, a vett csomagokra (PR) alkalmazott sorozatszám segítségével lehet irányítani, és egy másik sorozatszám (PS) segítségével olyan csomagoknál, amelyeket elküldenek. Minden egyes S-módú ADAT csomaghoz, amelyet a Fedélzeti/Földi adatkapcsolat vezérlő egység /XDLP/ hoz létre az egyes Kapcsolt virtuális áramkörre /SVC/, ki kell jelölni egy sorozatszámot (PS). Az első S-módú ADAT-csomag, amelyet a Légijármű/Földi hálózati végponti berendezés /XDCE/ a keret feldolgozáshoz továbbít, amikor az SVC éppen belépett a forgalom vezérlésre kész állapotba, a nulla számot kell kapja. Az első S-módú csomag, amelyet a társ XDCE-től vettek, miután egy SVC éppen belépett a forgalom vezérlésre kész állapotba, a nulla számot kell kapja. A következő csomagokat folyamatosan egymás után következő számokkal kell beszámozni.
5.2.6.4.4.2 Az S-módú ADAT-csomagok jelforrása (a Légijármű hálózati végponti berendezés /ADCE/ vagy a Földi hálózati végponti berendezés /GDCE/) nem fog küldeni (a vevőtől kapott engedély nélkül) több S-módú ADAT csomagot annál, mint ami megtöltené a forgalomvezérlési ablakot. A vevőnek kifejezett engedélyt kell adni a többi csomag küldéséhez.
5.2.6.4.4.3 Az engedély információnak a következő várt csomag sorozatszám formájában legyen és PR-nek kell jelölni. Ha a vevő fel kívánja frissíteni az ablakot, és van adata a küldőhöz történő továbbításra, S-módú ADAT-csomagot kell használnia az információ átadáshoz. Ha az ablakot fel kell frissíteni és nincs elküldendő adat, akkor az S-módú FOGADÁSRA KÉSZ (RR) vagy az S-módú FOGADÁSRA NEM KÉSZ (RNR) csomagot kell küldeni. Ennél a pontnál a "csúszó ablakot" el kell mozgatni ahhoz, hogy az új Csomag sorozatszám /PR/ értéknél kezdjen. Az XDCE most jogosult arra, hogy nyugtázás nélkül, az ablak korlátig további csomagokat továbbítson.
5.2.6.4.4.4 Amikor a továbbítandó következő S-módú ADAT csomag sorozatszáma (PS) a PR? PS ? RR + 14 (modulo 16) tartományban van, akkor a sorozatszámot "ablakban lévő"-ként kell meghatározni, és az XDCE-t fel kell jogosítani a csomag továbbítására. Az ettől eltérő esetekben a csomag sorozatszámát (PS) "ablakon kívüli"-ként kell meghatározni, és az XDCE nem továbbíthatja a csomagot a társ XDCE-nek.
5.2.6.4.4.5 Amikor a vett csomag sorozatszáma (PS) a sorban következő és ablakon belül van, akkor az XDCE-nek el kell fogadnia ezt a csomagot. Egy csomag fogadását olyan PS-el, amely:
a) az ablakon kívül van; vagy
b) a sorozatszámon kívül van; vagy
c) nem egyenlő 0-val a FORGALOM VEZÉRLÉSRE KÉSZ állapotba (d1) való belépés utáni első adat csomag esetén; hibának kell tekinteni.
5.2.6.4.4.6 Egy olyan S-módú ADAT-csomag fogadásának - amely érvényes PS számmal rendelkezik (azaz a sorrendben következő PS-el) - létre kell hoznia, hogy az ablak alacsonyabb csomag sorozatszám /PR/ értéke megváltoztatásra kerüljön, az adott PS érték plusz 1-re. A csomag vételi sorozatszámát (PR) továbbítani kell a létrehozó Fedélzeti/Földi adatkapcsolat vezérlőegységnek /XDLP/ az S-módú ADAT, FOGADÁSRA KÉSZ, FOGADÁSRA NEM KÉSZ vagy VISSZAUTASÍTÁS csomaggal. Egy érvényes PR értéket kell továbbítania az XDCE-nek a társ XDCE-hez 8 csomag fogadása után, feltéve, hogy 15 csomag tárolására elegendő tároló tér áll rendelkezésre. A PR és PS mezők növelését a modulo 16 aritmetika alkalmazásával kell végezni.

Megjegyzés. - A PR értéket magába foglaló csomag elvesztése az ADLP/GDLP üzemelés megszűnését okozhatja ennél az SVC-nél.

5.2.6.4.4.7 A csomagok másolatát meg kell őrizni addig, amíg a felhasználói adat eredményesen átvételre nem kerül. Az eredményes átvitelt követően a PS értéket fel kell frissíteni.
5.2.6.4.4.8 A felhasználói adat PR értékét azonnal fel kell frissíteni, amint az ablak részére szükséges tároló tér (a forgalom vezérlés kezelése által meghatározva) a DCE-n belül rendelkezésre áll.
5.2.6.4.4.9 A Hálózati végponti berendezés /DCE/ és a Légijármű/Földi hálózati végponti berendezés /XDCE/ között forgalom vezérlés kezelést kell biztosítani.

5.2.6.4.5 *MEGSZAKÍTÁS ELJÁRÁSOK A KAPCSOLT VIRTUÁLIS ÁRAMKÖRÖKNÉL*

5.2.6.4.5.1 Ha felhasználói adatot küldenek az S-módú alhálózaton keresztül az azt követő forgalom vezérlési eljárások nélkül, akkor a megszakító eljárásokat kell használni. A megszakítási eljárásnak nem lehet hatása a normál adatcsomag és a forgalom vezérlési eljárásokra. Egy megszakítás csomagot kell átadni a DTE-nek (vagy a válaszjeladó vagy lekérdező interfésznek) az adatáramlás azon pontjánál vagy pontja előtt, amelynél a megszakítás létrehozásra került. Az S-módú MEGSZAKÍTÁS csomag feldolgozásnak meg kell történnie azonnal, amint azt az XDCE vette.

Megjegyzés. - A törlés, visszaállítás és újraindítás eljárások a megszakítás adatok elvesztését hozhatják létre.

5.2.6.4.5.2 Az XDCE-nek az S-módú MEGSZAKÍTÁS csomagok S-bit sorozatát egyetlen entitásként kezeli.
5.2.6.4.5.3 A megszakítás feldolgozása prioritást élvez minden más feldolgozással szemben az SVC-nél a megszakítás folyamata idején.
5.2.6.4.5.4 Egy S-módú MEGSZAKÍTÁS csomag fogadását az előtt, hogy az SVC előző megszakítása megerősítést nyert volna (egy S-módú MEGSZAKÍTÁS MEGERŐSÍTÉS csomag fogadása által), hibaként kell meghatározni. A hiba egy visszaállítást eredményez (lásd az 5-18. táblázatot).

5.2.6.5 A FOGADÁSRA KÉSZ ELJÁRÁS

5.2.6.5.1 Az S-módú FOGADÁSRA KÉSZ csomagot kell elküldeni akkor, ha nem állnak S-módú ADAT csomagok (amelyek szabályszerűen a felfrissített PR értéket tartalmazzák) rendelkezésre állnak a továbbításra. Fontos, hogy a legutóbbi PR értéke kerüljön továbbításra. Ugyancsak ezt kell elküldeni egy vevő fogadásra nem kész állapot lezárásához is.
5.2.6.5.2 Egy S-módú FOGADÁSRA KÉSZ csomagnak az XDCE általi vétele az XDCE-nél létre kell, hogy hozza a PR érték felfrissítését a kimenő SVC részére. Ezt nem kell olyan csomagok újra átvitele iránti követelménynek venni, amelyek már átvitelre kerültek és még az ablakban vannak.
5.2.6.5.3 Az S-módú FOGADÁSRA KÉSZ csomag vétele után az XDCE-nek át kell lépni az ADLP (GDLP) FOGADÁSRA KÉSZ állapotba (g1).

5.2.6.6 A FOGADÁSRA NEM KÉSZ ELJÁRÁS

5.2.6.6.1 Az S-módú FOGADÁSRA NEM KÉSZ /RNR/ csomagot annak a jelzésére kell felhasználni, hogy a rendszer ideiglenesen nem képes további ADAT csomagokat fogadni egy adott SVC részére. Az S-módú RNR feltételt S-módú FOGADÁSRA KÉSZ /RR/ csomag vagy S-módú VISSZA-UTASÍTÁS csomag vételével kell törölni.
5.2.6.6.2 Amikor az XDCE S-módú FOGADÁSRA NEM KÉSZ csomagot vesz a társ XDCE-től, akkor fel kell frissítenie a csomag sorozatszám /PR/ értéket az SVC-re, és le kell állítania az S-módú ADAT csomagok továbbítását az SVC-n az XDLP-hez. Az XDCE-nek a Fedélzeti adatkapcsolat vezérlő egység /ADLP/ (Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/) FOGADÁSRA NEM KÉSZ állapotba kell átlépni (g2).
5.2.6.6.3 Az XDCE-nek egy S-módú FOGADÁSRA NEM KÉSZ csomagot kell leadni a társ XDCE-nek akkor, ha az képtelen már több S-módú ADAT csomagot venni a társ XDCE-től a jelzett SVC-n. Ilyen körülmények között az XDCE-nek a Légijármű hálózati végponti berendezés /ADCE/ (Földi hálózati végponti berendezés /GDCE/) FOGADÁSRA NEM KÉSZ állapotba (f2) kell átlépni.

5.2.6.7 ÚJRAÁLLÍTÁS ELJÁRÁS

5.2.6.7.1 Amikor az XDCE S-módú VISSZAÁLLÍTÁS KÉRÉS-t vesz, akár a társ XDCE-től, akár a DCE-től (az újra-formátumozási folyamaton keresztül), vagy egy hiba állapot miatt, akkor elvégzi a saját visszaállítását, a következő műveleteket kell végrehajtani:
a) azokat az S-módú ADAT- csomagokat, amelyeket továbbításra kerültek a társ XDCE-hez, el kell távolítani az ablakból;
b) azokat az S-módú ADAT- csomagokat, amelyek nem kerültek továbbításra a társ XDCE-hez, de amelyeket egy olyan M-bit sorozat foglal magába, amelynek részére néhány csomagot már továbbítottak, törölni kell az átvitelre várakozó ADAT- csomagok sorából;
c) azokat a társ XDCE-től vett S-módú ADAT- csomagokat, amelyek egy nem teljes M-bit sorozat részei, érvényteleníteni kell;
d) az ablak alsó szélét 0-ra kell állítani, és a következő elküldött csomagnak 0 sorozatszámot (PS) kell adni;
e) bármely visszatartott S-módú MEGSZAKÍTÁS csomagot, amely az XDCE-től jön vagy oda megy, megerősítetlenül kell hagyni; és
f) minden S-módú MEGSZAKÍTÁS csomagot, amely továbbításra vár, érvényteleníteni kell;
g) a továbbításra váró adat csomagokat nem kell érvényteleníteni (kivéve, ha azok egy részben továbbított M-bit

sorozat részét képezik); és
h) a $d1$-nek történő továbbításnak magába kell még foglalnia az $i1, j1, f1$ és $g1$-hez való továbbítást is.
5.2.6.7.2 A visszaállítás eljárást az ADAT ÁTVITEL állapotra (p4) kell alkalmazni. A hiba eljárásnál az 5-16. táblázatban megadottakat kell követni. Bármely más állapotban a visszaállítás eljárást el kell hagyni.
5.2.6.8 A VISSZAUTASÍTÁSI ELJÁRÁS
5.2.6.8.1 Amikor az XDCE egy nem pontos formátumú S-módú ADAT csomagot vesz a társ XDCE-től, vagy olyant, amelynek csomag sorozatszáma (PS) nincs a meghatározott ablakon belül (5-19. táblázat) vagy sorrenden kívüli, akkor a vett csomagot érvényteleníteni kell és S-módú VISSZA-UTASÍTÁS csomagot kell elküldeni a társ XDCE-nek a keret feldolgozáson keresztül. Az S-módú VISSZAUTASÍTÁS csomagnak egy csomag sorozatszám /PR/ értéket kell jeleznie, azt, amelynél az S-módú ADAT csomagok újratovábbítását el kell kezdeni. Az XDCE-nek érvényteleníti azokat a következő sorozaton kívüli S-módú ADAT- csomagokat, amelyek fogadása az alatt történik, amíg az S-módú VISSZAUTASÍTÁS csomag válasz még elintézetlen.
5.2.6.8.2 Amikor az XDCE S-módú VISSZAUTASÍTÁS csomagot vesz a társ XDCE-től, akkor felfrissíti az alsó ablak értékét az új csomag sorozatszám /PR/ értékkel, és elkezdi a PR sorozatszámmal rendelkező csomagok újra-továbbítását.
5.2.6.8.3 A visszautasítás jelzést nem kell a DCE-nek továbbítani. Ha az ISO 8208 illesztés alátámasztja a visszautasítás eljárást, akkor azok a visszautasítás jelzések, amelyek az ISO 8208 interfészen jelennek meg, nem kerülnek átvitelre a DCE és XDCE között.

5.2.6.9 A CSOMAG ÚJ LEFUTÁS-TERVEZÉSE /ÚJRA-SORBARENDEZÉSE/ ÉS A KÉTSZEREZÉS LETILTÁSA

1. Megjegyzés. - Ha egy Kapcsolt virtuális áramkörnél /SVC/ a keretek mindkét típust (Szabvány hosszúságú közlemény /SLM/ és Kiterjesztett hosszúságú közlemény /ELM/) magukba foglalják, az eltérő kézbesítési idők miatt a csomagok sorozata elveszhet. A sorrendiség akkor is elveszhet, ha multiplikált lekérdezőket használnak a keretek kézbesítésére ugyanazon SVC-re egy adott Fedélzeti/Földi adatkapcsolat vezérlő egységhez /XDLP/. A következő eljárás korlátozottan javítani fogja az új lefutás-tervezés /újra-sorbarendezés/ beállítását.

2. Megjegyzés. - Ez a feldolgozás illesztésként szolgál a keretfeldolgozás és a Légijármű/Földi hálózati végponti berendezés /XDCE/ funkció között.

5.2.6.9.1 *Új lefutás-tervezés /újra-sorbarendezés/.* Az új lefutás-tervezést függetlenül kell végrehajtani az S-módú, a fedélzetre irányuló és a fedélzetről leadott adattovábbításra minden egyes Kapcsolt virtuális áramkörre /SVC/. A következő változókat és paramétereket kell használni:
SNR /Vett adat-csomag sorozatszám/Egy 6-bites változó, amely egy meghatározott SVC vett csomag sorozatszámát mutatja. Ezt a csomag sorozatszám /SN/ mezője tartalmazza (5.2.5.2.1.1.7)
NESN /Következő várt sorozatszám/A következő sorozatszám az egymás után következő sorozatszámokat követő szám.
HSNR /A vett adatcsomag sorozatszám legmagasabb értéke/Az SNR legnagyobb értéke az új lefutás-tervező /újra-sorbarendező/ ablakban.
Tq /Új lefutás-tervező időzítők/Azok az új lefutás-tervező /újra-sorbarendező/ időzítők (lásd az 5-1. és 5-13. táblázatot), amelyek a meghatározott SVC-hez kapcsolódnak.
A sorozatszámot (SN) magába foglaló összes műveletet a modulo 64 szerint kell végrehajtani.
5.2.6.9.2 *Kétszerező ablak.* A Vett csomag sorozatszám /SNR/ tartomány értékeket a Következő várt sorozatszám, az NESN-32 és az NESN-1 között inkluzív diszjunkcióval vagy ki kell jelölni a kétszerező ablakban.
5.2.6.9.3 *Az új lefutás-tervező /újra-sorbarendező/ ablak.* A Vett csomag sorozatszám /SNR/ tartomány értékeket az NESN+1 és NESN+31 között inkluzív diszjunkcióval kell kijelölni az új lefutás-tervező ablakban. Az ebben a tartományban lévő sorozatszámmal rendelkező vett csomagokat az új lefutás-tervező ablakban kell tárolni a sorozatszámok sorrendjében.

5.2.6.9.4 *ADATÁTVITELI FUNKCIÓK*

5.2.6.9.4.1 Minden egyes SVC-nél az első csomagnak, amelyet a kapcsolat létrehozásához küldenek el (az első S-módú HÍVÁSKÉRÉS vagy az első S-módú HÍVÁS ELFOGADÁS csomag), a Sorozatszám /SN/ mező értékének nullával történő kezdését kell létrehoznia. Az SN mező értékét minden egyes csomag átvitel (vagy újra-átvitel) után

meg kell emelni.
5.2.6.9.4.2 A nyugtázatlan sorozatszámok maximális száma 32 egymást követő SN szám lehet. Amennyiben ez az állapot bekövetkezik, akkor azt egy hibaként kell kezelni, és a csatornát törölni kell.

Megjegyzés. - A nyugtázatlan csomagok számának korlátozása azért szükséges, mivel az SN mező hat bit hosszúságú, és ezért maximálisan 64 különböző értéke van, mielőtt az értékek ismétlődnek.

5.2.6.9.5 *VÉTEL FUNKCIÓK*

5.2.6.9.5.1 *Új lefutás-tervezés /újra-sorbarendezés/.* Az új lefutás-tervező algoritmus meg tartja a vett adat-csomag sorozatszám legmagasabb értéke /HSNR/ és a Következő várt sorozatszám /NESN/ változókat minden egyes SVC-re. Az NESN-t 0 kezdeti értékre kell állítani az összes SVC-nél és újra 0-ra kell állítani akkor, amikor az SVC újra belép a csatorna-szám poolba (5.2.5.1.2).
5.2.6.9.5.2 *A csomagok feldolgozása a kétszerező ablakon belül.* Ha egy csomagot a kétszerező ablakon belüli sorozatszám értékkel vesznek, akkor a csomagot érvényteleníteni kell.
5.2.6.9.5.3 *A csomagok feldolgozása az új lefutás-tervező /újra-sorbarendező/ ablakon belül.* Ha egy csomagot az új lefutás-tervező ablakon belüli sorozatszám értékkel vesznek, akkor ezt érvényteleníteni kell, mint duplikátot, ha egy ugyanolyan sorozatszámú csomagot már vettek és az újra-sorbarendezési ablakban már tárolták. Egyéb esetben a csomagot az új lefutás-tervezési /újra-sorbarendezési/ ablakban kell tárolni. Azután, ha nincs *Tq* futó óra-regiszter, akkor a *HSNR* értéket az *SNR* értékére kell állítani ennél a csomagnál, és egy *Tq* időzítőt kell indítani ezzel a kezdeti értékével (5-1. és 5-13. táblázat). Ha legalább egy *Tq* óra-regiszter fut, és az *SNR* nincs az *NESN* és *HSNR*+1 inkluzív diszjunkció között, akkor egy új *Tq* időzítőt kell indítani és a *HSNR* értékét fel kell frissíteni. Ha legalább egy *Tq* óra-regiszter működik, és az *SNR* ennél a csomagnál egyenlő *HSNR*+1-el, akkor a *HSNR* értékét kell frissíteni.
5.2.6.9.5.4 *A csomagok leválasztása az XDCE részére*. Ha egy csomagot az NESN-el egyenlő sorozatszámmal vesznek, akkor a következő eljárást kell alkalmazni:
a) a csomagot és minden, az újra-sorbarendezési ablakban már tárolt csomagokat egészen a következő hiányzó sorozatszámig, továbbítani kell az XDCE-nek;
b) az *NESN*-t 1+ értékre az XDCE-hez továbbított utolsó csomag sorozatszámának értékére kell állítani; és
c) a felszabadított csomagok mindegyikéhez tartozó *Tq* időzítőt le kell állítani.
5.2.6.9.6 *A Tq időzítő lejárati ideje.* Ha egy *Tq* időzítő lejár, akkor a következő eljárást kell alkalmazni:
a) a Következő várt sorozatszámot /*NESN*/ addig kell emelni, amíg a következő hiányzó sorozatszám nem észlelhető azután, hogy a *Tq* időzítőhöz kapcsolt csomag sorozatszáma lejárt;
b) minden olyan tárolt csomagot, amelynek a sorozatszáma már nincs az újra-sorbarendezési ablakban, továbbítani kell az XDCE-hez, kivéve azt, hogy a nem teljes S-bit sorozatot érvényteleníteni kell; és
c) a leválasztott csomaghoz tartozó *Tq* időzítőt le kell állítani.

5.2.7 S-módú specifikus szolgáltatás feldolgozás

Az S-módú specifikus szolgáltatásokon keresztül továbbított adat formátumoknak és protokolloknak azoknak kell lenniük, amelyek az ehhez a fejezethez kapcsolódó Függelékben meghatározásra kerültek. S-módú specifikus szolgáltatásokat az XDLP-ben lévő entitásnak kell feldolgoznia, amit S-módú specifikus szolgáltatási entitásnak (SSE) neveznek.

1. Megjegyzés. - Ez a szakasz az S-módú specifikus szolgáltatási illesztőtől vett vezérlés és közlemény adatfeldolgozásokat írja le.

2. Megjegyzés. - A vezérlő adatok olyan információkból állnak, amelyek lehetővé teszik például a közlemény hosszúság, az egy meghatározott tároló adat formátumához való hozzáféréshez használatos BDS kódot és a légijármű címzés meghatározását.

3.Megjegyzés.-Ez a szakasz leírja az S-módú specifikus szolgáltatási interfésztől kapott közlemény adatok feldolgozását.

4. Megjegyzés.- A kontroll adatok lehetővé teszik például a egy közlemény hosszúságának meghatározását, a felhasznált BDS kód pedig egy külön regiszterhez való hozzáférést nyújt, egy légijármű címéhez.

5.2.7.1 FEDÉLZETI ADATKAKPCSOLAT VEZÉRLŐ EGYSÉG /ADLP/ FELDOLGOZÁSA

5.2.7.1.1 *A FEDÉLZETRŐL LEADOTT ADAT FELDOLGOZÁSA*
5.2.7.1.1.1 *Specifikus szolgáltatási teljesítőképesség.* Az ADPL-nek képes vezérlő és közlemény adatok vételére az S-módú specifikus szolgáltatás illesztés(ek)től, és kézbesítési közlemények küldésére ezen interfész részére. A vezérlő adatokat fel kell dolgozni azért, hogy meghatározzák a protokoll típust és a közlemény adat hosszát. Amikor ennél az interfésznél a szolgáltatott közlemény vagy vezérlő adatok hibásak (azaz nem teljesek, érvénytelenek vagy ellentmondásosak), akkor az ADLP érvényteleníti a közleményt és hibajelzést kézbesít az interfésznél.

Megjegyzés. - A diagnosztika tartalom és hibajelzési mechanizmus helyi kérdés.

5.2.7.1.1.2 *Az általános adásfeldolgozás.* A vezérlő és közlemény adatokat kell felhasználni a B-közleményű /Comm-B/ általános adású közlemények formátumozására, ahogy az az 5.2.7.5 pontban meghatározásra került, és azt kell továbbítani a válaszjeladóhoz.
5.2.7.1.1.3 *A földről kezdeményezett B-adatátvitel /GICB/ feldolgozása.* A 8-bites B-adatátvitel kiválasztás /BDS/ kódot a vezérlő adatokból kell megállapítani. A 7-bites tároló tartalom a vett közlemény adatokból kerül kiválasztásra. A tárolótartalmat a válaszjeladónak kell továbbítani, ami a meghatározott tároló számának jelzésére szolgál. A légi-kezdeményezésű Comm-B tárolók egyikének, vagy az Összeütközési veszélyt jelző fedélzeti rendszer (ACAS) aktív megoldási tanácsadás tároló címzésére vonatkozó kérést érvényteleníteni kell. A tárolók kijelölése az 5-24. táblázatban meghatározottak szerint történjen.

Megjegyzés.- A válasz jeladó impulzustárolókban 40, 50 és 60 (HEX) hozzáférhető adatokkal kapcsolatban intézkedéseket írtak elő néhány ICAO régióban az ATM alkalmazások támogatására.

5.2.7.1.1.4 *Az S-módú specifikus protokoll / MSP/ feldolgozása*
5.2.7.1.1.4.1 Az MSP közlemény hosszát, a csatorna-számot (M/CH) (5.2.7.3.1.3) és választhatóan a lekérdező azonosító (II) kódot a vezérlő adatokból kell meghatározni. Az MSP közlemény tartalmat a vett közlemény adatokból kell kivonatolni. Ha a közlemény hossz 26 bájt vagy kevesebb, az S-módú szolgáltatás entitás /SSE/ egy légi kezdeményezésű B-adatátvitel /Comm-B/ közleményt formál (5.2.7.1.1.4.2) a válaszjeladóhoz történő továbbításra a rövid formájú S-módú specifikus protokoll /MSP/ csomag felhasználásával (5.2.7.3.1). Ha a közlemény hossza 27 - 159 bájt és a válasz-jeladó rendelkezik az elegendő fedélzetről továbbított Kiterjesztett hosszúságú közlemény /ELM/ adási teljesítőképességgel, akkor az SSE-nek egy ELM közleményt formál a válaszjeladóhoz történő továbbításra, a rövid formájú MSP csomagot használva. Ha a közlemény hossza 27 - 159 bájt és a válaszjeladónak korlátozott a fedélzetről leadott Kiterjesztett hosszúságú közlemény /ELM/ adási teljesítőképessége, akkor az SSE-nek multiplikált hossz formátumú MSP csomagokat formál (5.2.7.3.2) az ELM közlemények felhasználásával, ahogy szükséges, az L-bit és az M/SN mezőknek a csomagok társításához való felhasználásával. Ha a közlemény hossza 27 - 159 bájt és a válaszjeladó nem rendelkezik fedélzetről leadott Kiterjesztett hosszúságú közlemény /ELM/ adási teljesítőképességgel, akkor az SSE-nek multiplikált hossz formátumú MSP csomagokat formál (5.2.7.3.2), a légi kezdeményezésű B-adatátvitel közlemények /Comm-B/ felhasználásával, ahogy szükséges, az L-bit és az M/SN mezőknek a csomagok társításához való felhasználásával. Egymástól különböző keret típusokat sohasem lehet felhasználni az MSP közlemények kézbesítéséhez. A 159 bájtnál hosszabb közleményeket érvényteleníteni kell. A fedélzetről leadott MSP csatorna-számokat az 5-25. táblázatban meghatározottak szerint kell kijelölni.
5.2.7.1.1.4.2 Az S-módú specifikus protokollnál /MSP/ az egy csomag küldésére vonatkozó kérésnek létre kell hoznia a lekérdezőhöz való olyan több helyre irányított csomagját, amelynél a Lekérdező azonosító /II/ kód a vezérlés adatban van meghatározva. Ha nincs II kód meghatározva, akkor a csomagot fedélzetről leadott közleményként kell továbbítani a légi kezdeményezésű protokoll felhasználásával. Ehhez a csomaghoz egy közlemény kézbesítési figyelmeztetést kell biztosítani az S-módú specifikus interfész részére akkor, amikor a megfelelő lezárás (oka)t a válaszjeladótól vették. {} Ha a lezárást a válaszjeladótól nem vettek Tz másodpercen belül, ahogyan az az 5-1. táblázatban meg van határozva, akkor az MSP csomagot érvényteleníteni kell. Ez magába foglalja az ehhez a csomaghoz kapcsolódó bármely keret törlését a válaszjeladóban. Ehhez a közleményhez egy kézbesítési meghibásodás figyelmeztetést kell biztosítani az S-módú specifikus szolgáltatás illesztés részére.

5.2.7.1.2 *A FEDÉLZETRE IRÁNYULÓ ADAT FELDOLGOZÁSA*

Megjegyzés. - Ez a szakasz a válaszjeladótól vett S-módú specifikus szolgáltatási közlemények feldolgozását ismerteti.

5.2.7.1.2.1 *Specifikus szolgáltatási teljesítőképesség.* A Fedélzeti adatkapcsolat vezérlő egységnek /ADLP/ képesnek kell lenni a válaszjeladótól a keret feldolgozáson keresztül érkező S-módú specifikus szolgáltatási közlemények vételére. Az ADLP-nek képesnek kell lenni a közlemények és a hozzájuk tartozó vezérlési adatok kézbesítésére a specifikus szolgáltatás illesztésnél. Amikor az ennél az illesztésnél kiosztott erőforrás hozzárendelések elégtelenek a kimenő adatok befogadására, akkor az ADLP-nek a közleményt érvényteleníteni kell, és hibajelentést kézbesít ennél az illesztésnél.

Megjegyzés. - A diagnosztikai tartalom és a hiba jelentési mechanizmus helyi kérdés.

5.2.7.1.2.2 *Az általános adás feldolgozása.* Ha a vett közlemény egy általános adású A-adatátviteli /Comm-A/, ahogy azt a válaszjeladó/ADLP illesztésen keresztül érkezett vezérlési adatok jelzik, az általános adás azonosítóját /ID/ és a felhasználói adatokat (5.2.7.5) kell továbbítani az S-módú specifikus szolgáltatás illesztésnek (5.2.3.2.1) a vezérlési adatokkal együtt, amely azonosítja azt, hogy ez egy általános adású közlemény. A fedélzetre irányuló általános adás azonosító számai kijelölésének az 5-23. táblázatban meghatározottaknak megfelelőnek kell lenni.
5.2.7.1.2.3 *Az S-módú specifikus protokoll /MSP/ feldolgozása*. Ha a vett közlemény egy MSP, ahogy azt a csomag formátum fejrész jelezte (5.2.7.3), a vett MSP csomag felhasználói adat mezőjét továbbítani kell az S-módú specifikus szolgáltatás illesztéshez (5.2.3.2.1) az MSP csatorna-számmal (M/CH) együtt, valamint a Lekérdező azonosító részmezőt /IIS/ (5.2.2.1.1.1) a vezérlés adatokkal együtt, amelyek azt egy MSP közleménynek azonosítják. Az L-bit feldolgozást az 5.2.7.4 pontban foglaltak szerint kelll elvégezni, ahogy az. A fedélzetre irányuló MSP csatorna-számok kijelölése az 5-25. táblázatban megadottak szerint történjen.

5.2.7.2 A FÖLDI TELEPÍTÉSI RENDSZERŰ ADATKAPCSOLAT VEZÉRLŐ EGYSÉG /GDLP/ FELDOLGOZÁS

5.2.7.2.1 *A FEDÉLZETRE IRÁNYULÓ ADAT FELDOLGOZÁSA*
5.2.7.2.1.1 *Specifikus szolgáltatási teljesítőképesség.* A GDLP képes a vezérlési és a közlemény adatok vételére az S-módú specifikus szolgáltatás illesztés(ek)től (5.2.3.2.2) és kézbesítési értesítések küldésére az illesztés(ek) részére. A vezérlési adatokat fel kell dolgozni a protokoll típus és a közlemény adat hossz meghatározásához.
5.2.7.2.1.2 *Az általános adás feldolgozása.* A GDLP meghatározza a lekérdező(ke)t, az általános adás oldalszögeket és a letapogatási időket a vezérlési adatokból és az általános adás közlemény formátumából a lekérdezőhöz történő továbbítás céljából, az 5.2.7.5 pontban foglaltak szerint.
5.2.7.2.1.3 *A földről kezdeményezett B-adatátvitel /GICB/ feldolgozása.* A GDLP meg határozza a tároló számot és a légijármű címzést a vezérlési adatokból. A légijármű címzést és a B-adatátvitel adat-kiválasztás /BDS/ továbbítja a lekérdezőnek egy földi kezdeményezésű B-adatátvitel /Comm-B/ kéréseként.
5.2.7.2.1.4 *S-módú specifikus protokoll /MSP/ feldolgozás.* A Földi telepítési rendszerű adatkapcsolat vezérlőegységnek /GDLP/ a vezérlési adatokból kivonatolja a közlemény hosszt, az MSP csatorna-számot (M/CH) és a légijármű címzést, és a közlemény tartalmat a közlemény adatokból kapja meg. Ha a közlemény hossz 27 bájt vagy kevesebb, akkor az S-módú szolgáltatás entitásnak /SSE/ egy A-adatátvitel /Comm-A/ közleményt formál a lekérdezőhöz való továbbításra a rövid formájú MSP csomag felhasználásával (5.2.7.3.1). Ha a közlemény hosszúság 28 és 151 bájt közötti, és a válaszjeladó rendelkezik fedélzetre irányuló Kiterjesztett hosszúságú közlemény /ELM/ teljesítőképességgel, az SSE egy ELM közleményt formál a lekérdezőhöz való továbbítás céljából a rövid formájú MSP csomag felhasználásával. Ha a közlemény hosszúság 28 és 151 bájt közötti és a válaszjeladó nem rendelkezik fedélzetre irányuló ELM teljesítőképességgel, akkor az SSE multiplikált hosszú formájú MSP csomagokat formál (5.2.7.3.2), kihasználva az L-bit és az M/SN mezőket a csomagok összekapcsolásához. A 151 bájtnál hosszabb közleményeket érvényteleníteni kell. A lekérdező egy kézbesítési értesítést biztosít az S-módú specifikus szolgáltatási illesztés részére, ezzel jelezve az eredményes vagy eredménytelen kézbesítést minden egyes fedélzetre irányuló adatátviteli csomagnál.

5.2.7.2.2 *A FEDÉLZETRŐL LEADOTT ADAT-FELDOLGOZÁS*

5.2.7.2.2.1 *Specifikus szolgáltatás teljesítőképesség.* A Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ képes az S-módú specifikus szolgáltatási közlemények vételére a lekérdezőtől a keret feldolgozáson keresztül.
5.2.7.2.2.2 *Az általános adás feldolgozása.* Ha a vett közlemény egy általános adású B-adatátvitel /Comm-B/, a

lekérdező/GDLP illesztése által jelezve, akkor a GDLP:
a) vezérlési adatokat hoz létre, amelyekkel jelzi az általános adású közlemény, valamint annak a légijárműnek a 24-bites légijármű címzése jelenlétét, amelytől a közlemény vételre került;
b) hozzáteszi a B-adatátvitelű általános adás 7-bájtos B-adatátvitelű közlemény /MB/ mezőjét; és
c) továbbítja ezeket az adatokat az S-módú specifikus szolgáltatás illesztés(ek)nek (5.2.3.2.2).
5.2.7.2.2.3 *A földről kezdeményezett B-adatátvitel /GICB/ feldolgozása*. Ha a vett közlemény egy GICB, ahogyan a lekérdező/GDLP illesztése azt jelzi, a GDLP-nek
a) vezérlési adatokat hoz létre, amellyel jelzi az általános adású közlemény jelenlétét, a tároló számát és annak a légijárműnek a 24-bites légijármű címzését, amelytől a közlemény vételre került;
b) hozzá teszi a GIBC 7-bájtos B-adat-átviteli közlemény /MB/ mezőjét; és
c) továbbítja ezeket az adatokat az S-módú specifikus szolgáltatás illesztés(ek)nek (5.2.3.2.2).
5.2.7.2.2.4 *Az S-módú specifikus protokoll /MSP/ feldolgozása*. Ha a vett közlemény egy MSP, ahogyan ezt a csomag formátum fejléce jelzi (5.2.7.3), akkor a GDLP
a) vezérlési adatokat hoz létre, amelyekkel jelzi az MSP adattovábbítást, a közlemény hosszát és az MSP csatorna-számot (M/CH), valamint annak a légijárműnek a 24-bites címét; amelyből a közlemény vételre került;
b) hozzá kell tennie a vett MSP köteg felhasználói adat mezőjét; és
c) továbbítja ezeket az adatokat az S-módú specifikus szolgáltatás illesztés(ek)nek (5.2.3.2.2).
Az L-bit feldolgozását az 5.2.7.4 pontban meghatározottak szerint kell végrehajtani.

5.2.7.3 S-MÓDÚ SPECIFIKUS PROTOKOLL /MSP/CSOMAG FORMÁTUMOK

5.2.7.3.1 *Rövid formátumú MSP csomag.* A formátumnak ennél a csomagnál a következőnek kell lennie:

DP: 1	MP: 1	M/CH: 6	FILL1: 0 v. 6	UD: v

Adat-csomag S-módú spec. protokoll MSP csatorna-szám Kitöltés Felhasználói adatmező

5.2.7.3.1.1 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.
5.2.7.3.1.2 *MSP csomag típus (MP).* Ezt a mezőt 0-ra kell állítani.
5.2.7.3.1.3 *MSP csatorna-szám (M/CH):* Ezt a mezőt az SSE vezérlési adatokból nyert csatorna-számra kell állítani.
5.2.7.3.1.4 *Kitöltés mező (FILL1: 0 vagy 6):* A töltés hossz 6 bit egy fedélzetről leadott Szabvány hosszúságú közlemény /SLM/ keret esetén. Más esetben a töltés hossz 0.
5.2.7.3.1.5 *Felhasználói adatmező (UD)*. A felhasználói adatmező az S-módú specifikus szolgáltatás illesztéstől vett közleményt foglalja magába (5.2.3.2.2).
5.2.7.3.2 *Hosszú formátumú MSP csomag*. A formátumnak ennél a csomagnál a következő:

DP: 1 MP: 1 SP: 2 L: 1 M/SN: 3 FILL2: 0 v.2 M/CH: 6 UD: v
Adat-csomag S-módú spec. protokoll Felügyelő csomag L-bitsorozat MSPsorozatszám Kitöltés MSP csatorna-szám Felhasználói adatmező
A csomag formátumban bemutatott és a következő pontokban nem meghatározott mezőket az 5.2.5.2.1 pontban előírtak szerint kerül beállításra.
5.2.7.3.3 *Adat csomag típus (DP).* Ezt a mezőt 0-ra kell állítani.
5.2.7.3.3.1 *S-módú specifikus protokoll sorozatszám (MP).* Ezt a mezőt 1-re kell állítani.
5.2.7.3.3.2 *Felügyelő csomag (SP)*. Ezt a mezőt 0-ra kell állítani.
5.2.7.3.3.3 *L mező (L).* Az 1 érték azt jelzi, hogy a csomag részét képezi egy olyan L-bit sorozatnak, amelynek több csomagja az ezután következő sorozatban van. A 0 érték azt jelzi, hogy a sorozat ezzel a csomaggal végződik.
5.2.7.3.3.4 *MSP sorozatszám mező (M/SN)*. Ez a mező az L-bit sorozatok kézbesítésében lévő megkettőződések észlelésére használatos. Az első csomag részére egy L-bit sorozatban a 0 sorozatszámot kell kiosztani. A reá következő csomagok számozása a megfelelő sorrendben történik. Egy olyan csomagot, melyet ugyanazon sorozatszámmal vesznek, mint az előzőleg vett csomagé, érvényteleníteni kell.
5.2.7.4 *L-bit feldolgozás.* L-bit feldolgozást csak a hosszú formátumú MSP csomagon kell elvégezni és az M-bit feldolgozásnál meghatározott módon végrehajtani (5.2.5.1.4.1), kivéve a következő pontokban meghatározott eseteket.
5.2.7.4.1 Egy hosszú formátumú MSP csomag fogadásakor a Fedélzeti/Földi adatkapcsolat vezérlő egység /XDLP/ létrehozza a felhasználói adatmezőt a következők szerint:

a) Igazolja, hogy a csomag sorrend helyes az M/SN mező felhasználásával (5.2.7.3.2);
b) Feltételezi, hogy a felhasználói adatmező az MSP csomagban az integráló bájtok közül a legnagyobb számú a keretben;
c) Összekapcsol minden egyes felhasználói adatmezőt egy MSP csomagban, amelyet egy előző felhasználói adatmezővel egy MSP olyan csomagban vettek, amelynek 1-es az L-bit értéke; és

Megjegyzés. - A felhasználói adatmező megcsonkítása nem megengedett, mivel azt egy hiba- állapotként kezelendő.

d) Ha egy MSP csomag feldolgozásnál hibát észlelnek, akkor a csomagot érvényteleníteni kell.

5.2.7.4.2 Egy L-bit sorozat feldolgozásánál az XDLP minden olyan MSP csomagot érvénytelenít, amelynek kétszerezett M/SN értéke van. Az XDLP a teljes L-bit sorozatot érvényteleníteni fogja, ha egy hosszú formátumú MSP csomag úgy kerül meghatározásra, hogy hiányzik az M/SN mező felhasználása.
5.2.7.4.3 Bármely L-bit sorozathoz kapcsolódó olyan csomagot, amelynek újra-összeállítása nem fejeződik be Tm másodpercen belül, (5-1. és 5-13. táblázat) érvényteleníteni kell.

5.2.7.5 *AZ ÁLTALÁNOS ADÁS FORMÁTUMA*

5.2.7.5.1 *A fedélzetre irányuló általános adás.* Az A-adat-átvitelű /Comm-A/ általános adás formátumának a következő: A 83-bites fedélzetre irányuló általános adást be kell iktatni egy fedélzetre irányuló A-adatátvitel keretbe. Az A-adatátvitel keret MA mezője magába foglalja az első 8 bitjében azt az általános adás azonosítót, ami az 5-23. táblázatban került meghatározásra, majd ezt követi az általános adású közlemény első 48 felhasználói adat bitje. Az általános adású közlemény utolsó 27 felhasználói adat bitjét közvetlenül az A-adatátvitel keret UF mezőjét követő 27 bitben kell elhelyezni.
5.2.7.5.2 *Fedélzetről leadott általános adás.* A B-adatátvitelű /Comm-B/ általános adás formátuma a következő: Az 56-bites fedélzetről leadott általános adás beiktatandó a B-adatátvitel MB mezőjébe. Az MB mező magába foglalja az első 8 bitjében azt az általános adás azonosítót, ami az 5-23. táblázatban került meghatározásra, majd ezt követi az első 48 felhasználói adat bit.

5.2.8. Az S-módú alhálózat irányítása

5.2.8.1 LEKÉRDEZŐ ADATKAPCSOLAT MEGHATÁROZÁSI FUNKCIÓ

Megjegyzés. - A Fedélzeti adatkapcsolat vezérlő egység /ADLP/ lekérdező adatkapcsolat meghatározási funkció kiválasztja az S-módú lekérdező lekérdező azonosító /II/ kódját, amelyen keresztül egy S-módú alhálózati csomagot a kívánt földi rendeltetési Lekérdező adat végponti berendezéshez /DTE/ lehet juttatni.

5.2.8.1.1 *Lekérdező azonosító /II/ kód - Lekérdező azonosító végponti berendezés /DTE/ címzés viszonosság.* A Fedélzeti adatkapcsolat vezérlő egységnek /ADLP/ kell összeállítani és kezelni egy S-módú Lekérdező adat végponti berendezés (DTE) kereszt-referencia táblázatot, amelynek bejegyzései: S-módú lekérdező azonosító (II) kódok és azok a földi DTE címzések, amelyek a földi Légiforgalmi távközlési hálózat /ATN/ útválasztó vagy más földi DTE-kkel kapcsolódnak. A II kód - DTE kereszt-referencia táblázatnak a 4-bites S-módú II kódból és a földi DTE 8-bites bináris beírásából kell állnia.

1. Megjegyzés. - A félreérthetetlen címzés követelménye miatt egy DTE címzés egy Földi telepítési rendszerű adatkapcsolat vezérlő egységet /GDLP/ is egyértelműen azonosít

.

2. Megjegyzés. - Egy ATN útválasztónak több földi DTE címzése is lehet.

5.2.8.1.2 *Protokoll.* A következő eljárásokat kell használni:
a) Amikor a Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ légijármű jelenlétét először észleli, vagy kapcsolatot észlel egy éppen befogott légijárművel egy lekérdezőn keresztül egy új Lekérdező azonosító /II/ kóddal, akkor az ADATKAPCSOLAT TELJESÍTŐKÉPESSÉG jelentés megfelelő mezőitől kerül meghatározásra, hogy vajon a légijármű rendelkezik-e azzal a teljesítőképességgel, ami az adat-cserében való részvételéhez szükséges. Az adatkapcsolat teljesítőképesség pozitív meghatározása után GDLP-nek felküldi a fedélzetre egy vagy több S-módú

ÚTVÁLASZTÓ csomagot az 5.2.5.3.3 pontban foglaltak szerint. Ez az információ az S-módú Lekérdező azonosító /II/ kódra vonatkozik azokkal a földi DTE címzésekkel együtt, amelyek ezen a lekérdezőn keresztül érhetők el. A Fedélzeti adatkapcsolat vezérlő egységnek /ADLP/ frissíti az II kód - DTE kereszt-referencia táblázatot és azután érvényteleníteni az S-módú ÚTVÁLASZTÓ csomag(oka)t;
b) A Lekérdező azonosító /II/ kód - DTE kereszt-referencia táblázat bejegyzése törlendő akkor, amikor egy S-módú ÚTVÁLASZTÓ csomag erre parancsot ad, vagy amikor az ADLP felismeri, hogy a transzponder még nem került szelektív lekérdezésre egy S-módú lekérdező által egy adott II kóddal Ts másodperc alatt a Lekérdező azonosító almező /IIS/ általi ellenőrzéssel az S-módú légtér-ellenőrzésben, vagy az A-adatátviteli /Comm-A/ lekérdezésekben (5-1 táblázat);
c) Amikor a Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ meghatározza, hogy módosítás szükséges az S-módú lekérdező kijelölésben, akkor egy vagy több S-módú ÚTVÁLASZTÓ csomagot továbbít a Fedélzeti adatkapcsolat vezérlő egységnek /ADLP/. Az S-módú ÚTVÁLASZTÓ csomagba foglalt felfrissített információt az ADLP a kereszt-referencia táblázat módosítására használja fel. A kiegészítéseket a törlések előtt fel kell dolgozni;
d) Amikor a GDLP az első ÚTVÁLASZTÓ csomagot küldi egy S-módú adatkapcsolattal ellátott légijármű lekérdezése után, az Induló állapot /IN/ bitet EGY-re kell állítani. Ez az érték az ADLP-nél végrehajtja az eljárásokat az 5.2.6.3.3.3 pontban foglaltak szerint. Más esetben az IN bitet NULLA-ra kell állítani;
e) Amikor az ADLP-nél egy alaphelyzet beállítás történik (pl. áramellátási eljárás után), akkor az ADLP egy keresés-kérést ad le egy B-adatátvitelű általános adás közlemény küldésével az általános adás azonosító 'egyenlő 255' segítségével, (FF16, az 5-23. táblázatban foglaltak szerint), és a megmaradó 6 bájt felhasználatlan. A keresés kérést fogadva, a GDLP egy vagy több S-módú ÚTVÁLASZTÓ csomaggal válaszol és törli az ADLP-hez kapcsolódó összes Kapcsolt virtuális áramkört /SVC/ az 5.2.6.3.3 pont értelmében és érvényteleníti a keresés kérést. Ily módon az ADLP alaphelyzetbe állítja az II kód - DTE kereszt-referencia táblázatot.
f) Egy frissítési kérés fogadásában (5-23. táblázat) egy GDLP egy vagy több S-módú ÚTVÁLASZTÓ csomaggal válaszol, és érvényteleníteni a frissítés kérést. Ez az ADLP-t az II kód - DTE kereszt-referencia táblázat felfrissítésére készteti.

Megjegyzés. - A felfrissítés kérést az ADLP kivételes körülmények között (pl. áttérés tartalék egységre) használhatja a Lekérdező azonosító /II/ kód - DTE kereszt-referencia táblázata tartalmának ellenőrzésére.

5.2.8.1.3 *A FEDÉLZETRŐL LEADOTT ELJÁRÁSOK S-MÓDÚ CSOMAGOK ELJÁRÁSAI*

5.2.8.1.3.1 Amikor a Fedélzeti adatkapcsolat vezérlő egységnek /ADLP/ egy, a fedélzetről leadandó csomagja van, akkor a következő eljárásokat kell alkalmazni:
a) *HÍVÁSKÉRÉS csomag.* Ha a továbbítandó csomag egy S-módú HÍVÁSKÉRÉS, akkor a földi Lekérdező adat végponti berendezés /DTE/ címzés mezőjét meg kell vizsgálni, és össze kell kapcsolni a kapcsolt S-módú lekérdezővel, a Lekérdező azonosító /II/ kód - DTE kereszt-referencia táblázatot felhasználva. A csomagot a fedélzetről továbbítandó a több helyre irányított protokoll felhasználásával. Egy kérés a csomagnak egy olyan DTE címzéshez történő továbbítására, amely nincs a kereszt-referencia táblázatban, az 5.2.6.3.3.1 pontban meghatározott tevékenységet végzi
b) *Egyéb Kapcsolt virtuális áramkör /SVC/ csomagok.Ahhoz, hogy e*gy SVC csomagot tudjon küldeni egy földi DTE számára, a csomagnak több helyre irányíthatónak kell lennie az utolsó S módú lekérdezőhöz, amelyet sikeresen továbbít akár fedélzetre irányuló, vagy fedélzetről leadott csomag esetében a DTE-hez, ha az S-módú lekérdező éppen a Lekérdező azonosító II kód-DTE kereszt-rederencia táblázatban van.. Egyéb esetekben az SVC csomagot le kell adni a fedélzetről a több helyre irányított protokoll felhasználásával bármely olyan más S-módú lekérdező részére, amely kapcsolódik a meghatározott földi DTE címzéshez.
Az 5. szintű válaszjeladók részére megengedett a további lekérdezők használata fedélzetről leadott közlemény átvitelre az II kód - DTE kereszt-referencia táblázatban jelzettek szerint.
5.2.8.1.3.2 Egy fedélzetről leadott keret továbbítás eredményesnek határozható meg akkor, ha a B-adatátvitele vagy ELM lezárása a válaszjeladótól Tz másodpercen vételre kerül, az5-1 táblázatban foglaltak szerint. Ha a kísérlet nem eredményes és egy SVC csomagot kell elküldeni, akkor az II kód - DTE kereszt-referencia táblázatot meg kell vizsgálni egy másik bejegyzésnél ugyanazzal a hívott földi DTE címzéssel és egy eltérő S-módú II kóddal. Az eljárást újra meg kell kísérelni több helyre irányított protokoll felhasználásával az új S-módú lekérdezővel. Ha nincsenek bejegyzések a kívánt hívott DTL-nél, vagy az összes bejegyzés sikertelen kísérletet eredményez, akkor kapcsolat hibát kell bejelenteni (5.2.8.3.1).

5.2.8.2 A LEKÉRDEZŐ ADAT VÉGPONTI BERENDEZÉS(EK) /DTE-k/ TÁMOGATÁSA

5.2.8.2.1 *A Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ összekapcsolhatósági jelentése.* A GDLP-be jelenti a földi DTE-(k) részére az egy S-módú adatkapcsolattal ellátott légijármű elérhetőségét ("összekapcsolási eset"). A GDLP- továbbá arról is tájékoztatja a földi DTE-ket, amikor ilyen légijárművel már nem áll fenn a kapcsolat azon a GDLP-n keresztül ("elhagyás eset"). A GDLP-nek értesítést kell küldenie (kérésre) arról az összes S-módú adatkapcsolattal ellátott légijárműről, amelyik azzal a GDLP-vel kapcsolatban áll. Az értesítésekben meg kell adni a földi Légiforgalmi távközlési hálózat /ATN/ útválasztót a mozgó ATN útválasztó alhálózati csatlakozás pont (SNPA) címzést, a légijármű helyzetével együtt, és a szolgáltatás minőségét, mint választható paramétereket. A mozgó ATN útválasztó SNPA-jának a DTE címzésnek kell lenni, amelyet a légijármű címzés és a 0 alcím alkot (5.2.3.1.3.2).
5.2.8.2.2 *A Fedélzeti adatkapcsolat vezérlő egység /ADLP/ összekapcsolhatósági jelentése.* Az ADLP-bejelenti az összes légijármű DTE-t, amikor egy földi DTE utolsó megmaradó bemenete törlésre kerül a Lekérdező azonosító /II/ kód - DTE kereszt-referencia táblázatból (5.2.8.1.1). Ennek az értesítésnek magába kell foglalnia ennek a DTE-nek a címzését.
5.2.8.2.3 *Összeköttetési követelmények.* Az alrendszer össze-kapcsolhatósági változás összeköttetési mechanizmusának egy megerősített szolgáltatásnak kell lenni, például az összekapcsolási elhagyási eseteknél, amelyek engedélyezik az összekapcsolhatósági állapot bejelentését.
5.2.8.3 HIBA ELJÁRÁSOK

5.2.8.3.1 *Kapcsolat meghibásodás*. Egy csomagnak a vonatkozott XDLP-hez való kézbesítésében bekövetkezett hibát azután, hogy valamennyi rendelkezésre álló lekérdezőn keresztül kísérletet tettek ennek a csomagnak a kézbesítésére, kapcsolat szint hibaként kell bejelenteni. Egy Kapcsolt virtuális áramkörnél /SVC/ a Légijármű/Földi hálózati berendezésnek /XDCE/ a p1 állapotba kell belépni, és le kell választania az ehhez a csatornához kapcsolódó összes adatforrást. Ennek magába kell foglalnia az ehhez az SVC-hez kapcsolódó bármelyik válaszjeladójában lévő keret törlését. Egy S-módú TÖRLÉSKÉRÉS csomagot kell elküldeni a Hálózati végponti berendezésnek /DCE/ az újra-formátumozási folyamaton keresztül, és a DCE-nek úgy kell továbbítani azt, mint egy ISO 8208 csomagot a helyi Lekérdező adat végponti berendezés /DTE/ részére, ahogy az az 5.2.6.3.3 pontban leírásra került. A légijármű oldaláról a csatorna nem térhet vissza a Légijármű hálózati végponti berendezés /ADCE/ csatorna pool-ba, azaz nem térhet vissza a p1-be addig, amíg a kapcsolat hiba bejelentése utáni Tr másodperc el nem telik (5-1. táblázat).

5.2.8.3.2 *A FUTÓ CSATORNA MEGHATÁROZÁSA*

5.2.8.3.2.1 *Eljárás a d1 állapothoz*. Az XDLP figyeli az összes olyan SVC működését, amely nincs a KÉSZ állapotban (p1). Ha egy SVC több mint Tx másodpercig az (XDCE) FORGALOM VEZÉRLÉSRE KÉSZ (d1) állapotban van (a futó csatorna időzítő, 5-1. és 5-13. táblázat) anélkül, hogy S-módú FOGADÁSRA KÉSZ /RR/, FOGADÁSRA NEM KÉSZ /RNR/, ADAT vagy VISSZAUTASÍTÁS csomagot küldene, akkor:
a) ha az utolsó elküldött csomag S-módú VISSZAUTASÍTÁS csomag, amelyre válasz nem került vételre, az XDLP-nek ezt a csomagot vissza kell küldeni;
b) más esetben az XDLP-nek egy S-módú RR vagy RNR csomagot kell küldenie a társ XDLP-nek, amelyik a megfelelő.
5.2.8.3.2.2 *Eljárás egyéb állapotok esetén*. Ha egy XDCE SVC a p2, p3, p6, p7, d2 vagy d3 állapotban van több mint Tx másodpercen keresztül, akkor az 5.2.8.3.1 pont szerinti kapcsolat meghibásodási eljárást kell végrehajtania.
5.2.8.3.2.3 Kapcsolat hibát kell bejelenteni akkor, ha a 'maradjon készenlétben' csomagoknál egy késleltetési hiba vagy egy vételi hiba fordul elő. Az ilyen esetekben a csatornát törölni kell.

5.2.9 Az adatkapcsolat teljesítőképesség jelentés formátuma
Ezt a jelentést az Annex 10, IV. kötet, 3.1.2.6.10.2 pontjában meghatározottaknak megfelelően kell továbbítani.

5.2.10 Rendszer óra-regiszterek /időzítők/

5.2.10.1 Az óra-regiszterek /időzítők/ értékei meg kell, hogy feleljenek az 5-1. és 5-13. táblázatokban megadott értékeknek.
5.2.10.2 A tűrésnek minden időzítőnél plusz vagy mínusz egy százaléknak kell lenni.
5.2.10.3 A felbontóképességnek minden időzítőnél egy másod-percnek kell lenni.

5.2.11 R*e*ndszer követelmények

5.2.11.1 *Adat integritás.* A maximális bit hiba-arány az adatoknál, a Fedélzeti adatkapcsolat vezérlő egység /ADLP//válaszjeladó illesztésnél vagy a Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP//lekérdező illesztésnél megjelenő adatokra, a helyi Lekérdező adat végponti berendezés /DTE//Fedélzeti/Földi adatkapcsolat vezérlő egység /XDLP/ illesztésnél mérve (és fordítva is), nem haladhatja meg a 10-9-t a felderítetlen hibáknál és 10-7-t az észlelt hibáknál.

Megjegyzés. – A maximális hiba-arány az összes olyan hibát tartalmazza, amelyek az illesztéseken keresztüli adatátvitelekből és az XDLP belső működéséből származnak.

5.2.11.2 IDŐZÍTÉS

5.2.11.2.1 *A Fedélzeti adatkapcsolat vezérlő egység /ADLP/ időzítése.* ADLP műveletek nem tartanak tovább 0,25 másodpercnél az egyenletes forgalomra és 0,125 másodpercnél a megszakított forgalomra. Ezt az intervallumot a következők szerint kell meghatározni:
a) *Válaszjeladók Fedélzetről leadott Kiterjesztett hosszúságú közlemény /ELM/ képességgel*. Az az idő, ami eltelik attól, amikor egy 128 bájtos adat csomag utolsó bitje a Hálózati végponti berendezés /DCE/ részére fedélzetről leadandóként megjelenik, és addig az időpontig tart, amíg az első keretbe zárt végső bit a válasz-jeladóhoz történő továbbításra rendelkezésre áll.

b) Válaszjeladók B-adatátviteli /Comm-B/ képességgel. Az az idő, ami eltelik attól, amikor egy 24 bájtos felhasználói adatmező utolsó bitjét átadják a DCE-nek fedélzetről leadandó továbbításra, és addig az időpontig tart, amíg a felhasználói adatokat magába foglaló keretnek a négy B-adatátviteli utolsó szegmensének utolsó bitje a válaszjeladóhoz történő kézbesítésre rendelkezésre áll.
c) Válaszjeladók Fedélzetre irányuló Kiterjesztett hosszúságú közlemény /ELM/ képességgel. Az az idő, ami eltelik attól, amikor egy felhasználói adatmezőt magába foglaló 128 bájtos, 14 C-közlemény szegmensű ELM utolsó szegmense befejező bitjének a Fedélzeti adatkapcsolat vezérlő egység /ADLP/ általi vételétől addig az ideig tart, amikor a megfelelő csomag végső bitje a Lekérdező adat végponti berendezéshez /DTE/ történő kézbesítésre rendelkezésre áll.
d) Válaszjeladók A-adatátviteli képességgel. Az az idő, ami eltelik attól, amikor a felhasználói adatmezőt magába foglaló 25 bájtos, négy kapcsolt A-adatátviteli szegmens utolsó szegmensének befejező bitjét a Fedélzeti adatkapcsolat vezérlő egység /ADLP/

5.2.11.2.2 *Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ IDŐZÍTÉS*

Ajánlás. - *A teljes késési idő a GDLP-n keresztül, az átviteli késést kizárva, nem lehet nagyobb, mint 0,125 másodperc.*

5.2.11.3 *Illesztő egység átviteli teljesítmény.* A Fedélzeti adatkapcsolat vezérlő egység /ADLP/ és a válaszjeladó közötti illesztő egységnek minimálisan másodpercenkénti 100 kilobit átviteli teljesítménnyel kell rendelkezni.

5.3 HÁLÓZATI VÉGPONTI BERENDEZÉS /DCE/ ÉS LÉGIJÁRMŰ/FÖLDI HÁLÓZATI BERENDEZÉS /XDCE/ ÁLLAPOT TÁBLÁZATOK

5.3.1 *Állapot táblázat követelmények.* A DCE és az XDCE funkciók az 5-3.-tól az 5-22.-ig terjedő állapot táblázatokban foglaltak szerint működnek.. Az 5-15.-től az 5-22.-ig terjedő állapot táblázatokat a következőkre kell alkalmazni:
a) Fedélzeti adatkapcsolat vezérlő egység /ADLP/ állapot átmenetek azok, amikor az XDCE vagy Fedélzeti/Földi adatkapcsolat vezérlő egység /XDLP/ zárójelekben lévő tagok elhagyásra kerülnek; és
b) Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ állapot átmenetek azok, amikor a zárójelekben lévő tagokat használják fel, és az ezeket megelőző XDCE vagy XDLP tagok elhagyásra kerülnek.

5.3.2 *Diagnosztikai és létrehozó kódok.* A táblázat bejegyzések bizonyos körülményeknél egy diagnosztikai kódot jeleznek, amelyeket a létrehozott csomag tartalmaz, amikor belép a jelzett állapotba. A "D =" kifejezés a diagnosztikai kódot határozza meg. Amikor az "A = DIAG" jelenik meg, akkor a végrehajtandó műveletnek egy ISO 8208 DIAGNOSZTIKA csomagot hoz létre, és ezt kell továbbítania a DTE-hez; a jelzett diagnosztikai kód határozza meg a csomag diagnosztikai mezőjének beírását. A létrehozó mezőt az 5.2.6.3.3 pontban foglaltak szerint kell beállítani. A visszaállítást létrehozó kódot ISO 8208-ban foglaltak szerint kell beállítani.

1. Megjegyzés. - Az alábbiakban megadott táblázatok az állapot követelményeket határozzák meg a következő sorrendben
:
5-3 Hálózati végponti berendezés /DCE/ speciális esetek
5-4 A Lekérdező adat végponti berendezés /DTE/ hatása a DCE újraindítási állapotokra
5-5 DTE hatása a DCE hívás beállítási és törlési állapotokra
5-6 DTE hatása a DCE visszaállítási állapotokra
5-7 DTE hatása a DCE megszakítás átviteli állapotokra
5-8 DTE hatása a DCE forgalomvezérlés átvitel állapotokra
5-9 Légijármű/Földi hálózati végponti berendezés /XDCE/ hatása a DCE újraindítási állapotokra
5-10 XDCE hatása a DCE hívás beállítási és törlési állapotokra
5-11 XDCE hatása a DCE visszaállítási állapotokra
5-12 XDCE hatása a DCE megszakítás átviteli állapotokra
5-15 A Földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ (Fedélzeti adatkapcsolat vezérlő egység /ADLP/) hatása a Légijármű hálózati végponti berendezés /ADCE/ (Földi hálózati végponti berendezés /GDCE/) csomag réteg 'kész' állapotokra
5-16 GDLP (ADLP) hatása az ADCE (GDCE) hívás beállítási és törlési állapotokra
5-17 GDLP (ADLP) hatása az ADCE (GDCE) visszaállítási állapotokra
5-18 GDLP (ADLP) hatása az ADCE (GDCE) megszakítás átviteli állapotokra
5-19 GDLP (ADLP) hatása az ADCE (GDCE) forgalom vezérlés átviteli állapotokra
5-20 A Hálózati végponti berendezés /DCE/ hatása az ADCE (GDCE) hívás beállítási és törlési állapotokra
5.21 DCE hatása az ADCE (GDCE) visszaállítási állapotokra

5-22 DCE hatása az ADCE (GDCE) megszakítás átviteli állapotokra
2. Megjegyzés. - Mindegyik táblázatban mind az ADLP, mind a GDLP műveletek meghatározásra kerültek.
3. Megjegyzés. - Az S-módú alhálózaton belül a p6 és d2 állapotok átmeneti állapotok.
4. Megjegyzés. - A "megjegyzések"-re történő hivatkozások az állapot táblázatokban azokra a táblázat-specifikus megjegyzésekre vonatkoznak, amelyek az egyes állapot táblázatokat követik.

5. Megjegyzés. - Az összes diagnosztikai és létrehozó kód decimális számként van értelmezve.

6. Megjegyzés. - Egy ADCE és egy GDCE közötti SVC-t egy ideiglenes és/vagy állandó csatorna-számmal lehet azonosítani, ahogyan az az 5.2.5.1.2 pontban meghatározásra került.

5.4 S-MÓDÚ CSOMAG FORMÁTUMOK

5.4.1 *Formátumok*. Az S-módú csomag formátumok az 5-3.-tól az 5-22.-ig terjedő ábrák szerint kerültek meghatározásra.
5.4.2 *A vezérlő mezők jelentősége.* Az S-módú csomagokban használt formátum vezérlő mezők szerkezete az 5-23. ábrában meghatározottaknak kell megfelelnie. Az ezekben a csomag formátumokban használt vezérlő mezők jelentése a következő:
Mező
szimbólum *Meghatározás*
AG Címzés, Földi; a földi Lekérdező adat végponti berendezés /DTE/ címzés 8-bites bináris adat-feltűntetése (5.2.3.1.3.1)
AM Címzés, Mozgó; a mobil DTE címzés utolsó két binárisan kódolt decimális /BDC/ számjegyének 4-bites adat-feltűntetése (5.2.3.1.3.2)
CC Törlés létrehozás az ISO 8208-ban meghatározottak szerint
CH Csatorna-szám (0 - 15)
DC Diagnosztikai kód az ISO 8208-ban meghatározottak szerint
DP Adat csomag típus (5-23. ábra)
F S-bit sorozat, első csomag jelző
FILL Kitöltő mező
FILL1 6 bit hosszúságú egy nem-multiplikált csomagra a fedélzetről leadott Szabvány hosszúságú közlemény /SLM/ keretekben;
egyébként 0 bit
FILL2 0 bit hosszúságú egy nem-multiplikált csomagra a fedélzetről leadott Szabvány hosszúságú közlemény /SLM/ keretekben és
a multiplikáló fej-részekre; egyébként 2 bit
ELSŐ CSOMAG A multiplikált csomagok közül az első csomag tartalma
FS Gyors kiválasztás jelenléte
IN Az alaphelyzet beállító bit
L "Több bit" a hosszú formátumú MSP csomagokra az 5.2.7.4 pontban meghatározottak szerint
LAST PACKET A multiplikált csomagokból az utolsó csomag tartalma
LENGTH Egy multiplikált csomag hossza bájtokban egy előjel nélküli bináris számként kifejezve
LV A felhasználói adatmező hossza, a felhasznált bitek száma, ahogy az az 5.2.2.3.1 pontban meghatározásra került
M "Több bit" az SVC ADAT csomagokra, ahogy az az 5.2.5.1.4.1 pontban meghatározásra került
M/CH S-módú specifikus protokoll /MSP/ csatorna-szám
MP MSP csomag típus (5-23. ábra)
M/SN Sorozatszám; a hosszú formátumú MSP csomag sorozatszáma
OD Választható adat
ODL A választható adat hossza
OF A választhatóság jelzése
P Prioritás mező
PR Csomag vételi sorozatszám
PS Csomag küldési sorozatszám
RC Visszaállítást létrehozó kód az ISO 8208-ban meghatározottak szerint

RT Irányítási út táblázat az 5.2.5.3.3.8 pontban meghatározottak szerint
RTL Irányítási út táblázat hosszúság bájtokban kifejezve
S "Több bit" HÍVÁSKÉRÉS, HÍVÁS ELFOGADÁS, TÖRLÉS KÉRÉS és MEGSZAKÍTÁS csomagokhoz, az 5.2.5.1.4.2
pontban meghatározottak szerint
SN Sorozatszám; a sorozatszám ehhez a csomag típushoz
SP Felügyelő csomag (5-23. ábra)
SS Felügyelő részhalmaz szám (5-23. ábra)
ST Felügyelő típus (5-23. ábra)
TC Ideiglenes csatorna-szám
UD Felhasználói adatmező

TÁBLÁZATOK AZ 5. FEJEZETHEZ

5-1. táblázat: Fedélzeti adatkapcsolat vezérlő egység /ADLP/ S-módú alhálózati időzítők

Az időzítő neve	*Az időzítő ideje*	*Névleges érték*	*Referencia*
Csatorna visszavonás	*Tr*	*600 s*	*5.2.8.3.1*
Futó csatorna – ADLP	*Tx*	*420 s*	*5.2.8.3.2*
Lekérdező lekérdezés	*Ts*	*60 s*	*5.2.8.1.2*
Lekérdező kapcsolat	*Tz*	*30 s*	*5.2.7.1.1.4.2, 5.2.8.1.3.2*
Kapcsolat keret törlés	*Tc*	*60 s*	*5.2.2.1.1.4.5*
L-bit kézbesítés – ADLP	*Tm*	*120 s*	*5.2.7.4.3*
Csomag újra-sorbarendezés és 8-bit kézbesítés	*Tq*	*60 s*	*5.2.6.9*

5-2. táblázat: Hálózati végponti berendezés /DCE/ tevékenység állapot átmenetnél

DCE állapot	*Állapot meghatározás*	*Tevékenység, amelyet az állapotba való belépésnél el kell végezni*
*r*1	CSOMAG SZINT KÉSZ	Az összes Kapcsolt virtuális áramkör /SVCs/ visszatér a *p*1 állapotba (lásd a *p*1 állapot magyarázatot).
*r*2	LEKÉRDEZŐ ADAT VÉGPONTI BERENDEZÉS /DTE/ ÚJRAINDÍTÁS KÉRÉS	Mindegyik SVC visszatér a *p*1 állapotba (lásd a *p*1 állapot magyarázatot). ÚJRAINDÍTÁS MEGERŐSÍTÉS-t kiadni DTE-nek.
*r*3	HÁLÓZATI VÉGPPONTI BERENDEZÉS /DCE/ ÚJRAINDÍTÁS KÉRÉS	ÚJRAINDÍTÁS KÉRÉS-t kiadni a DTE-nek. Hacsak nem az *r*2 állapoton keresztül lépett be, egy ÚJRAINDÍTÁS KÉRÉS-t küldeni az újra-formátumozó feldolgozásnak.
*p*1	KÉSZ	Feloldani az SVC számára kijelölt összes adatforrást. Megszakítani a kapcsolatot a DTE/DCE SVC és a Légijármű hálózati végponti berendezés /ADCE/ / Földi hálózati végponti berendezés /GDCE/ SVC között. (Az ADCE/GDCE SVC még nem lehet *p*1 állapotban.)

*p*2	DTE HÍVÁSKÉRÉS	Meghatározni azt, hogy elegendő „erőforrás” áll-e rendelkezésre a kérés támogatására; ha igen, akkor kijelölni az erőforrást és HÍVÁSKÉRÉS csomagot küldeni az újra-formátumozó feldolgozásnak; ha nem, akkor DCE TÖRLÉS KÉRÉS a DTE-hez a (*p*7) állapotba történő lépéshez. Az erőforrások meghatározása és elosztása az ISO 8208-ban meghatározottak szerint történik.
*p*3	DCE HÍVÁSKÉRÉS	Meghatározni azt, hogy elegendő erőforrás áll-e rendelkezésre a kérés támogatására ; ha igen, akkor kijelölni az erőforrásokat és HÍVÁSKÉRÉS csomagot küldeni a DTE-nek; ha nem, akkor TÖRLÉS KÉRÉS csomagot küldeni az újra-formátumozó feldolgozásnak. Az erőforrások meghatározása és elosztása az ISO 8208-ban meghatározottak szerint történik.
*p*4	ADAT-TOVÁBBÍTÁS	Nincs művelet.
*p*5	HÍVÁS ÜTKÖZÉS	Újra kijelölni a kimenő hívást egy másik SVC-hez (a DTE a hívás ütközés állapotában nem veszi figyelembe a bejövő hívást) és belépni a DCE HÍVÁSKÉRÉS állapotba (*p*3) ennél az új SVC-nél. Belépni a *p*2 állapotba a DTE-től jövő HÍVÁSKÉRÉS feldolgozáshoz.
*p*6	DTE TÖRLÉS KÉRÉS	Feloldani az SVC számára kijelölt összes adatforrást, TÖRLÉS MEGERŐSÍTÉS csomagot küldeni a DTE-nek, és belépni a *p*1 állapotba.
*p*7	DCE TÖRLÉS KÉRÉS A DTE-HEZ	TÖRLÉS KÉRÉS csomagot küldeni a DTE-hez.
*d*1	FORGALOM VEZÉRLÉS KÉSZ	Nincs tevékenység.
*d*2	DTE VISSZAÁLLÍTÁS KÉRÉS	Eltávolítani az ablakból a DTE-hez továbbított ADAT-csomagokat; érvényteleníteni azokat az ADAT- csomagokat, amelyek a részben átvitt M-bit sorozatokat képviselik, és érvényteleníteni azokat a MEGSZAKÍTÁS csomagokat, amelyek a DTE-hez való továbbításra várnak; az összes ablak számlálót visszaállítani 0-ra; az ADAT és MEGSZAKÍTÁS átvitelre vonatkozó időzítési és újra-továbbítási paramétert az alaphelyzeti értékükre állítani. VISSZAÁLLÍTÁS MEGERŐSÍTÉS csomagot küldeni a DTE-nek. SVC-t visszaállítani a *d*1 állapotba.

*d*3	DCE VISSZAÁLLÍTÁS KÉRÉS A DTE-HEZ	Eltávolítani az ablakból a DTE-hez továbbított ADAT-csomagokat; érvényteleníteni minden olyan ADAT csomagot, amelyek a részben átvitt M-bit sorozatokat képviselik és érvényteleníteni azokat a MEGSZAKÍTÁS csomagokat, amelyek a DTE-hez való továbbításra várnak; az összes ablak számlálót visszaállítani 0-ra; az ADAT és MEGSZAKÍTÁS átvitelre vonatkozó időzítési és újra-továbbítási paramétereket az alaphelyzeti értékükre állítani. VISSZAÁLLÍTÁS KÉRÉS csomagot továbbítani a DTE-nek.
*i*1	DTE MEGSZAKÍTÁS KÉSZ	Nincs tevékenység.
*i*2	DTE MEGSZAKÍTÁS KÜLDÉS	A DTE-től vett MEGSZAKÍTÁS csomagot továbbítani az újra-formátumozási feldolgozáshoz.
*j*1	DCE MEGSZAKÍTÁS KÉSZ	Nincs tevékenység.
*j*2	DCE MEGSZAKÍTÁS KÜLDÉS	Az újra-formátumozási folyamatból vett MEGSZAKÍTÁS csomagot továbbítani a DTE-hez.
*f*1	DCE VÉTELRE KÉSZ	Nincs tevékenység.
*f*2	DCE VÉTELRE NEM KÉSZ	Nincs tevékenység.
*g*1	DTE VÉTELRE KÉSZ	Nincs tevékenység.
*g*2	DTE VÉTELRE NEM KÉSZ	Nincs tevékenység.

5-3. táblázat: Hálózati végponti berendezés /DCE/ speciális esetek

A Lekérdező adat végponti berendezéstől vett	*DCE speciális esetek* *Bármely állapot*
Bármely olyan csomagnál, amely kisebb, mint 2 bájt hosszúságban (beleértve az érvényes adat kapcsolat szint keretet, amely nem tartalmaz csomagot)	A = DIAG D = 38
Bármely olyan csomagnál, amely egy érvénytelen általános formátum azonosítóval érkezett	A = DIAG D = 40
Bármely olyan csomagnál, amely egy érvényes általános formátum azonosítóval és egy kijelölt logikai csatorna azonosítóval (beleértve egy ’0’ logikai csatorna azonosítót) érkezett	Lásd az 5-4. táblázatot.

5-4. táblázat: A lekérdező adat végponti berendezés /DTE/ hatása a hálózati végponti berendezés /DCE/

újra-indítási állapotokra

DTE-től vett csomag	DCE újra-indítási állapot (lásd az 5.Megj.-t)		
	CSOMAG SZINT KÉSZ (lásd 1.Megj.-t) $r1$	DTE ÚJRA-INDÍTÁS KÉRÉS $r2$	DCE ÚJRA-INDÍTÁS KÉRÉS $r3$
Csomagok, amelyek 1 bájtnál rövidebb csomag típus azonosítóval rendelkeznek, és a logikai csatorna azonosítójuk nem egyenlő 0-val	Lásd az 5-5. táblázatot	A = *HIBA* $S = r3$ $D = 38$ (lásd a 4. Megjegyzést)	A = *ÉRVÉNYTELENÍTÉS*
Bármely olyan csomag, kivéve az ÚJRA-INDÍTÁS-t és a JELTÁROLÁS-t, amely 0 logikai csatorna azonosítóval érkezett	A = *DIAG* $D = 36$	A = *DIAG* $D = 36$	A = *DIAG* $D = 36$
Csomag, olyan csomag típus azonosítóval, amely nincs meghatározva, vagy a DCE nem támasztja alá	Lásd az 5-5. táblázatot	A = *HIBA* $S = r3$ $D = 33$ (lásd a 4. Megjegyzést)	A = *ÉRVÉNYTELENÍTÉS*
ÚJRA-INDÍTÁS KÉRÉS, ÚJRA-INDÍTÁS MEGERŐSÍTÉS vagy JELTÁROLÁS (ha ilyen van) csomag olyan logikai csatorna azonosítóval, amely nem egyenlő 0-val	Lásd az 5-5. táblázatot	A = *HIBA* $S = r3$ $D = 41$ (lásd a 4. Megjegyzést)	A = *ÉRVÉNYTELENÍTÉS*
<u>ÚJRA-INDÍTÁS KÉRÉS</u>	A = *SZABÁLYOS* (továbbítás) $S = r2$	A = *ÉRVÉNYTELENÍTÉS*	A = *SZABÁLYOS* $S = p1$ v. $d1$ (lásd a 2. Megjegyzést)
ÚJRA-INDÍTÁS MEGERŐSÍTÉS	A = *HIBA* $S = r3$ $D = 17$ (lásd a 6. Megjegyzést)	A = *HIBA* $S = r3$ $D = 18$ (lásd a 4. Megjegyzést)	A = *SZABÁLYOS* $S = p1$ v. $d1$ (lásd a 2. Megjegyzést)

ÚJRA-INDÍTÁS KÉRÉS vagy ÚJRA-INDÍTÁS MEGERŐSÍTÉS csomag formátum hibával	*A = DIAG* *D* = 38, 39, 81 vagy 82	*A = ÉRVÉNY-TELENÍTÉS*	*A = HIBA* *D* = 38, 39, 81 vagy 82
JELTÁROLÁS KÉRÉS vagy JEL-TÁROLÁS MEGERŐSÍTÉS csomagok (lásd a 3.Megjegyzést)	*A = SZABÁ-LYOS*	*A = SZABÁ-LYOS*	*A = SZABÁ-LYOS*
JELTÁROLÁS KÉRÉS vagy JEL-TÁROLÁS MEGERŐSÍTÉS csomagok formátum hibával (lásd a 3.Megjegyzést)	*A = DIAG* *D* = 38, 39, 81 vagy 82	*A = HIBA* *S* = *r*3 *D* = 38, 39, 81 vagy 82 (lásd a 4. Meg-jegyzést)	*A = HIBA* *D* = 38, 39, 81 vagy 82
Hívás beállítás, hívás törlés, ADAT, megszakítás, forgalom vezérlés, vagy visszaállítás csomag	Lásd az 5-5. táblázatot	*A = HIBA* *S* = *r*3 *D* = 18	*A = ÉRVÉNY-TELENÍTÉS*

MEGJEGYZÉSEK:
1. Az S-módú alhálózatnak nincsenek újra-indítási állapotai. Egy ÚJRA-INDÍTÁS KÉRÉS vétele a DCE-nél azt idézi elő, hogy egy ÚJRA-INDÍTÁS MEGERŐSÍTÉS-sel válaszoljon. Az ÚJRA-INDÍTÁS KÉRÉS csomag az újra-formátumozó feldolgozáshoz kerül továbbításra, amely törlés kéréseket továbbít a DTE-hez kapcsolódó összes SVC-nek. A DCE csak akkor lép be az *r*3 állapotba, ha hibát észlel a DTE/DCE illesztésen.
2. Az SVC csatornák visszatérnek a *p*1 állapotba, az Állandó virtuális áramkör (PVC) csatornák pedig visszalépnek a *d*1 állapotba.
3. A jeltárolási berendezés felhasználása választható a DTE/DCE illesztésen.
4. Nem hajtanak végre tevékenységet az S-módú alhálózaton belül.
5. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.
6. A hiba eljárás az *r*3 állapotba lépésből és az ÚJRA-INDÍTÁS KÉRÉS-nek az újra-formátumozó feldolgozáshoz történő küldéséből áll.

5-5. táblázat: A lekérdező adat végponti berendezés /DTE/ hatása a hálózati végponti berendezés /DCE/ hívás beállítás és törlés állapotokra

DTE-től vett csomag	DCE hívás beállítás és törlés állapotok (lásd az 5.Megj.-t)					
KÉSZ *p*1	DTE HÍVÁSKÉRÉS *p*2	DCE HÍVÁSKÉRÉS *p*3	ADAT ÁT-VITEL *p*4	HÍVÁS ÜTKÖZÉS *p*5 (Lásd az 1. és 4.Megjegyzést)	DTE TÖRLÉS KÉRÉS *p*6	DCE TÖRLÉS KÉRÉS A DTE-hez *p*7

MEGJEGYZÉSEK:

1. A $p5$ állapotba belépve a DCE újrajelöli a kimenő hívást a DTE-hez egy másik csatornához (TÖRLÉS KÉRÉS nincs kiadva) és válaszol a bejövő DTE hívásra, ahogy megfelelő TÖRLÉS KÉRÉS vagy TÖRLÉS ELFOGADÁS csomaggal.
2. A hiba eljárást meghatározott tevékenységek végrehajtása képezi a $p7$ állapotba való belépésnél (beleértve egy TÖRLÉS KÉRÉS csomag küldését a DTE-nek) és kiegészítőleg egy TÖRLÉS KÉRÉS csomag elküldését az XDCE-nek (az újra-formátumozó folyamaton keresztül).
3. A gyors kiválasztás eszköz alkalmazása egy válasz korlátozással együtt megtiltja a DTE-nek azt, hogy HÍVÁS ELFOGADÁS csomagot küldjön.
4. A DTE-nek egy hívás ütközés esetén érvényteleníteni kell azt a HÍVÁSKÉRÉS csomagot, amelyet a DCE-től vett.
5. A táblázat bejegyzései a következőképpen kerültek meghatározásra: A = végrehajtandó tevékenység, S = az az állapot, amelybe be kell lépni, D = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.

*g*2	GDLP(ADLP) VÉTELRE NEM KÉSZ	Nincs tevékenység.

5-15. táblázat: A földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ (fedélzeti adatkapcsolat vezérlő egység /ADLP/) hatása a légijármű hálózati végponti berendezés /ADCE/ (földi hálózati végponti berendezés /GDCE/) csomag réteg kész állapotokra

GDLP(ADLP)-től vett csomag (lásd a 2. Megjegyzést)	ADCE(GDCE) állapotok (lásd az 1. és 3. Megjegyzést)
CSOMAG SZINT KÉSZ *r*1	
Csatorna-szám /CH/ = 0, nincs ideiglenes csatorna-szám /TC/ (lásd a 4. Megjegyzést) vagy CH = 0, egy HÍVÁS ELFOGADÁS az ADLP csomag által	*A = ÉRVÉNYTELENÍTÉS*

Kijelöletlen csomag fejrész	*A = ÉRVÉNYTELENÍTÉS*
Hívás beállítás, hívás törlés, ADAT, megszakítás, forgalom vezérlés vagy visszaállítás	Lásd az 5-16. táblázatot

MEGJEGYZÉSEK:

1. Az XDCE állapot nem szükségszerűen ugyanaz az állapot, mint a DTE/DCE illesztés.
2. A társ XDLP-től jövő összes csomag ellenőrzésre kerül a megkettőződés szempontjából, mielőtt az ebben a táblázatban bemutatottaknak megfelelően kiértékelésre kerülne.
3. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.
4. Ahol a Csatorna-szám /CH/ = 0 és egy érvényes ideiglenes csatorna-szám /TC/ van az ADLP vagy a GDLP csomag által adott TÖRLÉS KÉRÉS-ben, illetve az ADLP vagy a GDLP csomag által adott TÖRLÉS MGERŐSÍTÉS-ben, ott azt úgy kell kezelni, ahogy az az 5.2.5.1.2.3 pontban és az 5-16. táblázatban leírásra került.

5-16. táblázat: A földi telepítési rendszerű adatkapcsolat vezérlő egység /GDLP/ (fedélzeti adatkapcsolat vezérlő egység /ADLP/) hatása a légijármű hálózati végponti berendezés /ADCE/ (földi hálózati végponti berendezés /GDCE/) hívás beállítási és törlési állapotaira

MEGJEGYZÉSEK:

1. Az XDCE állapot nem szükségszerűen ugyanaz az állapot, mint a DTE/DCE illesztés.
2. A társ XDLP-től jövő összes csomag ellenőrzésre kerül a megkettőződés szempontjából, mielőtt az ebben a táblázatban bemutatottaknak megfelelően kiértékelésre kerülne.
3. Formátum hiba egy olyan S-bit sorozatból keletkezhet, amelynek rövidebb az első vagy közbenső csomagja a maximális hossznál, továbbá egy érvénytelen LV mezőből egy HÍVÁSKÉRÉS, HÍVÁS ELFOGADÁS, TÖRLÉS KÉRÉS vagy MEGSZAKÍTÁS csomagban. Más észlelhető S-módú formátum hiba nincs.
4. Az ADCE minden – az ADLP és GDLP között használatos – csatorna-számot kijelöl, ennek következtében hívás ütközés nem lehetséges. Amikor egy GDLP csomag általi olyan HÍVÁSKÉRÉS kerül vételre, amely egy, a *p*4 állapotban lévő SVC-vel kapcsolatos ideiglenes csatorna-számot visel, akkor az ideiglenes és állandó csatorna-szám közötti kapcsolat megszakad (5.2.5.1.2.3).
5. GDLP-hez nem alkalmazható.
6. A hiba eljárást meghatározott tevékenységek végrehajtása képezi a *p*7 állapotba való belépésnél (amely magába foglalja egy TÖRLÉS KÉRÉS csomag továbbítását a társ XDLP-nek) és egy további TÖRLÉS KÉRÉS csomag küldését a DCE-nek (az újra-formátumozó feldolgozáson keresztül).
7. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.
8. A zárójelekben lévő – az *„A = SZABÁLYOS”* táblázati bejegyzés alatti – szám az ebben a dokumentumban lévő

pontszámát jelenti, azt, amely azt a műveletet határozza meg, amelyet el kell végezni a vett csomagon a normál feldolgozás végrehajtásához. Ha nincs hivatkozott pontszám, akkor a szabályos eljárás a táblázat szövegében van megadva.

9. Hiba állapot bejelentése és a *p*7 állapotba történő átugrás csak akkor lehetséges, ha a földi DTE címzés egyértelműen ismert. Más esetben a műveletnek a csomagot érvényteleníteni kell.

10. A hiba eljárást meghatározott tevékenységek végrehajtása képezi a *p*7 állapotba való belépésnél (amely magába foglalja egy TÖRLÉS KÉRÉS csomag továbbítását az XDLP-nek), de egy TÖRLÉS KÉRÉS csomagnak a helyi DCE-hez történő elküldése nélkül.

5-17. táblázat: GDLP (ADLP) hatása az ADCE (GDCE) visszaállítási állapotokra

MEGJEGYZÉSEK:

1. Az XDCE állapot nem szükségszerűen ugyanaz az állapot, mint a DTE/DCE illesztés.

2. A társ XDLP-től jövő összes csomag ellenőrzésre kerül a megkettőződés szempontjából, mielőtt az ebben a táblázatban bemutatottaknak megfelelően kiértékelésre kerülne.

3. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.

4. A zárójelekben lévő – az *„A = SZABÁLYOS”* táblázati bejegyzés alatti – szám az ebben a dokumentumban lévő pontszámát jelenti, azt, amely azt a műveletet határozza meg, amelyet el kell végezni a vett csomagon a normál feldolgozás végrehajtásához. Ha nincs hivatkozott pontszám, akkor a szabályos eljárás a táblázat szövegében van megadva.

5. A hiba eljárást meghatározott tevékenységek végrehajtása képezi a *d*3 állapotba való belépésnél (amely magába foglalja egy VISSZAÁLLÍTÁS KÉRÉS csomag továbbítását a társ XDLP-nek) és egy VISSZAÁLLÍTÁS KÉRÉS csomag küldése a DCE-hez (az újra-formátumozó feldolgozáson keresztül).

6. A felhasználási adat hossznak a 32 bájtnál nagyobb MEGSZAKÍTÁS csomagokat, vagy egy, a sorrenden kívüli MEGSZAKÍTÁS csomagot hibának kell tekinteni.

RNR érvényes PR értékkel (lásd a 9. Megjegyzést)	*A = SZABÁLYOS* (5.2.6.5) *S* = *g*2	*A = SZABÁLYOS* (5.2.6.6)
VISSZAUTASÍTÁS érvényes PR értékkel (lásd a 9. Megjegyzést)	*A = SZABÁLYOS* (5.2.6.5)	*A = SZABÁLYOS* (5.2.6.6) *S* = *g*1

MEGJEGYZÉSEK:

1. Az XDCE állapot nem szükségszerűen ugyanaz az állapot, mint a DTE/DCE illesztés.
2. A társ XDLP-től jövő összes csomag ellenőrzésre kerül a megkettőződés szempontjából, mielőtt az ebben a táblázatban bemutatottaknak megfelelően kiértékelésre kerülne.
3. Egy érvénytelen PR érték az, amely kisebb, mint a társ XDLP által küldött utolsó csomag PR értéke (modulo 16), vagy nagyobb, mint az XDLP által továbbításra kerülő következő adat csomag PS értéke.
4. Egy érvénytelen PS érték az, amelyik a PS-re várható következő értéktől eltérő.
5. Egy érvénytelen LV almező az, amely olyan értéket tűntet fel, ami túl nagy a vett szegmens méretéhez. Egy olyan LV mező hiba esetében, amely a csomagban lévő többi mező helyességében való bizalom elvesztéséig növekedhet, a csomagot minden további nélkül érvényteleníteni kell.
6. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.
7. A zárójelekben lévő – az *„A = SZABÁLYOS”* táblázati bejegyzés alatti – szám az ebben a dokumentumban lévő pontszámát jelenti, azt, amely azt a műveletet határozza meg, amelyet el kell végezni a vett csomagon a normál feldolgozás végrehajtásához. Ha nincs hivatkozott pontszám, akkor a szabályos eljárás a táblázat szövegében van megadva.
8. A hiba eljárást meghatározott tevékenységek végrehajtása képezi a *d*3 állapotba való belépésnél (amely magába foglalja egy VISSZAÁLLÍTÁS KÉRÉS csomag továbbítását a társ XDLP-nek) és egy VISSZAÁLLÍTÁS KÉRÉS csomag küldése a DCE-hez (az újra-formátumozó feldolgozáson keresztül).
9. Az RR, RNR és VISSZAUTASÍTÁS csomagok nem rendelkeznek végtől-végig jelentőséggel, és nem kerülnek továbbításra a DCE-hez.
10. Egy olyan csomag vételének, amelynél az M-bit = 1-nél kisebb, mint a maximális csomag méret, elő kell idéznie azt, hogy egy visszaállítás kerüljön létrehozásra, és a sorozat fennmaradó részét érvényteleníteni kell.

5-20. táblázat: A hálózati végponti berendezés /DCE/ hatása a légijármű hálózati végponti berendezés /ADCE/ (földi hálózati végponti berendezés /GDCE/) hívás beállítás és törlési állapotokra

MEGJEGYZÉSEK:

1. Az XDCE állapot nem szükségszerűen ugyanaz az állapot, mint a DTE/DCE illesztés.

2. Ez az a DTE csomag, amelyet a DCE-n keresztül vesznek, azután, hogy az összes DTE/DCE feldolgozás megtörtént. Eljárások a DTE/DCE illesztésen belül (mint például a Vételre kész /RR/, Vételre nem kész /RNR/ és VISSZAUTASÍTÁS, ha érvényben van) nem hatnak közvetlenül az XDCE-re. Az összes hiba eljárás, ahogyan az az ISO 8208-ban dokumentálva van, végrehajtásra került. Ebből eredően bizonyos csomagokat az illesztés elutasít, és ezek nincsenek ebben a táblázatban feltűntetve.

3. A DCE a protokoll műveletében a DTE-vel észleli ezt a hiba körülményt és ennek megfelelően a hibás csomagra azt lehet mondani, hogy sohasem éri el az XDCE-t; lásd még a 2. megjegyzést.

4. A DTE/DCE csatorna-számának nem kell szükségszerűen ugyanazon csatorna-számnak lennie, mint amely az ADCE/GDCE-nél kerül felhasználásra; egy csomag a DTE-től, amely egy csatorna-számot foglal magába, összekapcsolódik egy levegő/föld csatornával a korábban létrehozott kereszt-referencia táblázat által. Ha egyik sincs, akkor a DTE/DCE csatorna meghatározás hivatkozása egy levegő/föld csatornára vonatkozik a *p*1 állapotban.

5. Az ADCE az ADLP és GDLP között használt összes csatorna-számot kijelöli; ennek folytán hívás ütközés (*p*5 ISO 8208 jelölés) nem lehetséges; lásd a 4. megjegyzést is.
6. A DTE-től jövő HÍVÁSKÉRÉS sohasem lehet összekapcsolva egy olyan XDCE csatorna-számmal, amely nincs *p*1 állapotban.
7. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.
8. A zárójelekben lévő – az *„A = SZABÁLYOS”* táblázati bejegyzés alatti – szám az ebben a dokumentumban lévő pontszámát jelenti, azt, amely azt a műveletet határozza meg, amelyet el kell végezni a vett csomagon a normál feldolgozás végrehajtásához. Ha nincs hivatkozott pontszám, akkor a szabályos eljárás a táblázat szövegében van megadva.

5-21. táblázat: A DCE hatása az ADCE (GDCE) visszaállítás állapotokra

DCE-től vett csomag	ADCE (GDCE) visszaállítási állapotok (lásd az 1., 4. és 5. Megjegyzést)		
FORGALOM VEZÉRLÉSRE KÉSZ *d*1	GDLP (ADLP) VISSZAÁLLÍTÁS KÉRÉS *d*2	ADCE (GDCE) VISSZAÁLLÍTÁS KÉRÉS a GDLP(ADLP)-hez *d*3

MEGSZAKÍTÁS MEGERŐSÍTÉS	Lásd az 5-22. táblázatot	*A = ÉRVÉNY-TELENÍTÉS*	ÉRVÉNYTELEN (lásd a 3. Megjegyzést)

ADAT (lásd a 2. Megjegyzést)	*A = SZABÁLYOS* (5.2.6.4) (Továbbítás)	*A = ÉRVÉNY-TELENÍTÉS*	Az adat visszatartása addig, amíg az S-módú visszaállítás befejezõdik

MEGJEGYZÉSEK:

1. Az XDCE állapot nem szükségszerűen ugyanaz az állapot, mint a DTE/DCE illesztés.

2. Ez az a DTE csomag, amelyet a DCE-n keresztül vesznek, azután, hogy az összes DTE/DCE feldolgozás megtörtént. Eljárások a DTE/DCE illesztésen belül (mint például a Vételre kész /RR/, Vételre nem kész /RNR/ és VISSZAUTASÍTÁS, ha érvényben van) nem hatnak közvetlenül az XDCE-re. Az összes hiba eljárás, ahogyan az az ISO 8208-ban dokumentálva van, végrehajtásra került. Ebből eredően bizonyos csomagokat az illesztés elutasít, és ezek nincsenek ebben a táblázatban feltűntetve.

3. A DCE a protokoll mûveletében a DTE-vel észleli ezt a hiba körülményt és ennek megfelelõen a hibás csomagra azt lehet mondani, hogy sohasem „éri el” az XDCE-t; lásd még a 2. megjegyzést.

4. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.

5. A zárójelekben lévő – az *„A = SZABÁLYOS”* táblázati bejegyzés alatti – szám az ebben a dokumentumban lévő pontszámát jelenti, azt, amely azt a műveletet határozza meg, amelyet el kell végezni a vett csomagon a normál feldolgozás végrehajtásához. Ha nincs hivatkozott pontszám, akkor a szabályos eljárás a táblázat szövegében van megadva.

5-22. táblázat: DCE hatása az ADCE (GDCE) megszakítás átvitel állapotokra

DCE-től vett csomag (lásd a 2. Megjegyzést)	ADCE (GDCE) megszakítás átvitel állapot (lásd az 1., 4. és 5. Megjegyzést)	
	GDLP (ADLP) MEGSZAKÍTÁSRA KÉSZ *i*1	GDLP (ADLP) MEGSZAKÍTÁS KÜLDÉS *i*2
MEGSZAKÍTÁS (lásd a 6. Megjegyzést)	ÉRVÉNYTELEN (Lásd a 3. Megjegyzést)	*A = SZABÁLYOS* (5.2.6.4.5) *S* = *i*1 (továbbítás)

DCE-től vett csomag (lásd a 2. Megjegyzést)	ADCE (GDCE) megszakítás átvitel állapot (lásd az 1., 4. és 5. Megjegyzést)	
	ADCE (GDCE) MEGSZAKÍTÁSRA KÉSZ *j*1	ADCE (GDCE) MEGSZAKÍTÁS KÜLDÉS *j*2
MEGSZAKÍTÁS	*A = SZABÁLYOS* (5.2.6.4.5) *S* = *j*2 (továbbítás)	ÉRVÉNYTELEN (Lásd a 3. Megjegyzést)

MEGJEGYZÉSEK:

1. Az XDCE állapot nem szükségszerűen ugyanaz az állapot, mint a DTE/DCE illesztés.

2. Ez az a DTE csomag, amelyet a DCE-n keresztül vesznek, azután, hogy az összes DTE/DCE feldolgozás megtörtént. Eljárások a DTE/DCE illesztésen belül (mint például a Vételre kész /RR/, Vételre nem kész /RNR/ és VISSZAUTASÍTÁS, ha érvényben van) nem hatnak közvetlenül az XDCE-re. Az összes hiba eljárás, ahogyan az az

ISO 8208-ban dokumentálva van, végrehajtásra került. Ebből eredően bizonyos csomagokat az illesztés elutasít, és ezek nincsenek ebben a táblázatban feltűntetve.

3. A DCE a protokoll mûveletében a DTE-vel észleli ezt a hiba körülményt és ennek megfelelõen a hibás csomagra azt lehet mondani, hogy sohasem „éri el” az XDCE-t; lásd még a 2. megjegyzést.

4. A táblázat bejegyzései a következőképpen kerültek meghatározásra: *A* = végrehajtandó tevékenység, *S* = az az állapot, amelybe be kell lépni, *D* = a diagnosztikai kód, amelyet az ennek a tevékenységnek a következtében létrehozott csomagokon alkalmazni kell, az *ÉRVÉNYTELENÍTÉS* azt jelzi, hogy a vett csomagot törölni kell az XDLP tárolókból és az ÉRVÉNYTELEN azt jelzi, hogy a csomag/állapot kombináció nem fordulhat elő.

5. A zárójelekben lévő – az *„A = SZABÁLYOS”* táblázati bejegyzés alatti – szám az ebben a dokumentumban lévő pontszámát jelenti, azt, amely azt a műveletet határozza meg, amelyet el kell végezni a vett csomagon a normál feldolgozás végrehajtásához. Ha nincs hivatkozott pontszám, akkor a szabályos eljárás a táblázat szövegében van megadva.

6. FEJEZET: VHF LEVEGŐ-FÖLD DIGITÁLIS ADATKAPCSOLAT (VDL)

6.1 MEGHATÁROZÁSOK ÉS RENDSZER MŰSZAKI JELLEMZŐK

1. Megjegyzés. – Az ultrarövidhullámú (VHF) digitális adatkapcsolat (VDL) 2. üzemmódja adatszolgáltatási képesség jelet biztosít. A VDL 3. üzemmód két – mind az előszavas, mind az adatszolgáltatási – képességgel rendelkezik. Az adatátviteli képesség a Légiforgalmi Távközlési Hálózatnak (ATN) egy alhálózati mozgó alkotó-része. Ezenkívül a VHF adatkapcsolat egy nem-ATN funkciót is képes biztosítani. A VHF digitális adatkapcsolat /VDL/ Szabványok és Ajánlott Gyakorlatok (SARPs) meghatározásai és hivatkozásai az alábbiakban találhatók.

2. Megjegyzés. – A VHF digitális adatkapcsolatra /VDL/ vonatkozó kiegészítő információkat foglal magába a VDL 2. üzemmód, a VDL 3. üzemmód és a VDL 4. üzemmód Műszaki Előírásainak kiadványa.

3. Megjegyzés. – A 6.1.2-től a 6.8.2-ig terjedő szakaszok foglalják magukba a VHF adatkapcsolat 2. és 3. üzemmódjaira vonatkozó Szabványokat és Ajánlott Gyakorlatokat. A 6.9 szakasz tartalmazza a VHF adatkapcsolat 4. üzemmód Szabványait és Ajánlott Gyakorlatait.

6.1.1 Meghatározások

Automatikus berendezés-függő légtér-ellenőrző általános adás (ADS-B) *(Automatic dependent surveillance-broadcast (ADS-B)).* Egy olyan légtér-ellenőrző technika, amelyben a légijármű automatikusan biztosítja – az általános adás módú adatkapcsolaton keresztül – a fedélzeti navigációs helymeghatározási *rendszeréből* származtatott adatokat, a légijármű azonosítóját, a négy-dimenziós helyzetet, és – ahogy szükséges – a kiegészítő adatokat is biztosítja.
Általános adás *(Broadcast).* A léginavigációra vonatkozó információk olyan továbbítása, amely nem egy meghatározott állomásnak vagy állomásoknak címzett adás.
Impulzus köteg *(Burst).* Egy vagy több idő által meghatározott, egymással összefüggésben álló elemi jel csatlakozó sorozata, amely felhasználói információt, jelzés-átvitelt és bármilyen szükséges bekezdő jelszakaszt tud továbbítani.
Adatáramlási rés *(Current slot).* Az a rés, amelyben a vett adás megkezdődik.
Hálózati végponti berendezés (DCE) *(Data circuit-terminating equipment (DCE).* A DCE egy hálózat biztosító berendezés, amely a felhasználói végberendezések /DTE-k/ közötti összeköttetés lehetővé tételére használatos.
Adatkapcsolat entitás (DLE) *(Data link entity (DLE)).* Protokoll állapotú berendezés, amely képes egyedül álló adatkapcsolat létesítésére és kezelésére.
Adatkapcsolat szolgáltatás (DLS) al-réteg *(Data link service (DLS) sublayer).* Az az alréteg, amely az adathordozó hozzáférés vezérlő /MAC/ alréteg felett helyezkedik el. A VHF adatkapcsolat /VDL/ 4. üzemmódnak a DLS alréteg az UHF specifikus szolgáltatás /VSS/ alréteg felett helyezkedik el. Az adatkapcsolat szolgáltatás /DLS/ al-réteg kezeli az adatátvitel sorba-állítást, létrehozza és megsemmisíti az adatkapcsolat entitásokat /DLE-k/ a kapcsolat-orientált

összeköttetéseknél, és lehetővé teszi a kapcsolat-kezelő entitás /LME/ részére az adatkapcsolat szolgáltatás /DLS/ kezelését, és lehetőséget biztosít a kapcsolat nélküli adatátvitelre.
Felhasználói végberendezés (DTE) *(Data terminal equipment (DTE)).* A DTE egy alhálózati összeköttetés végpontja.
Kiterjesztett Golay kód *(Extended Golay Code).* Többszörös bit-hiba javítására képes hibajavító kód.
Keret *(Frame).* A címek egy sorozatából, a vezérlésből, az állomány-kezelő rendszerből /FCS/ és az információs mezőkből tevődik össze. A VHF adatkapcsolat /VDL/ 2. üzemmódjánál ezek a mezők vannak összekapcsolva a nyitó és záró jelzés sorrenddel, és a keret magába foglalhat, vagy nem foglalhat magába egy változó hosszúságú információs mezőt.
Gauss szűrésű frekvencia-billentyűzés (GFSK) *(Gaussian filtered frequency shift keying (GFSK)).* Egy folyamatos fázisú, frekvencia-billentyűzési technika, amely két hangot és egy Gauss impulzus-formáló szűrőt használ fel.
Globális jel csatorna (GSC) *(Global signalling channel (GSC)).* Egy világméretű alapon rendelkezésre álló csatorna, amely adatátvitel vezérlést biztosít.
Kapcsolat *(Link).* Egy kapcsolat, amely összeköti a légijármű fedélzeti adatkapcsolat entitást /DLE/ valamint a földi DLE-t, és amelyet egyértelműen meghatároz a légijármű fedélzeti adatkapcsolat szolgáltatás /DLS/ címének és a földi DLS címének kombinációja. Különböző alhálózati entitások vannak jelen az egyes kapcsolat végpontok felett.
Kapcsolat réteg *(Link layer).* Az a réteg, ami közvetlenül a fizikai réteg felett található a Nyílt Rendszerek Összekapcsolása protokoll modellben. A kapcsolat réteg biztosítja az információk megbízható átvitelét a fizikai adathordozók között. Ez két részre van osztva: az adatkapcsolat al-rétegre és az adathordozó hozzáférés-vezérlő al-rétegre.
Kapcsolat kezelő entitás (LME) *(Link management entity (LME)).* Egy protokoll állapot gépi kód, amely képes egy egyedülálló egyenrangú rendszerrel a kapcsolatot ’megszerezni’, létrehozni és fenntartani. Egy LME létrehozza az adatkapcsolatot, és az alhálózati összeköttetéseket, „kézbesíti” ezeket a kapcsolatokat, és kezeli az adathordozó hozzáférés vezérlő al-réteget és a fizikai réteget. Egy légijármű kapcsolat kezelő entitás /LME/ nyomon követi azt, hogy milyen jól tud kommunikálni az egyedi földi rendszer földi állomásaival. Egy légijármű VHF adatkapcsolat kezelő entitás /VME/ ’bemutat’ egy LME-t minden egye olyan földi állomásnak, amelyet ellenőriz. Hasonlóképpen, a földi VME ’bemutat’ egy LME-t minden egyes légijárműnek, amit ellenőriz. Egy LME akkor kerül törlésre, amikor az összeköttetés a társ rendszerre a későbbiekben nem megvalósítható.
M impulzus-köteg *(M burst).* A VHF adatkapcsolat 3. üzemmódjában használatos bitekből álló kezelő csatorna adat-blokk. Ez az impulzus-köteg magába foglalja azokat a jelzési információkat, amelyek az adathordozóhoz való hozzáféréshez és a kapcsolat állapot ellenőrzéshez szükségesek.
Adathordozó hozzáférés vezérlés (MAC) *(Media access control (MAC)).* Az az al-réteg, amely befogja az adat-utat és vezérli a bitek mozgását az adat-úton keresztül.
2-es üzemmód – *(Mode 2).* Csak-adat VDL üzemmód, amely D8PSK modulációt és vivőfrekvencia érzékelő többszörös hozzáférés (CSMA) vezérlési sémát használ.
3-as üzemmód – *(Mode 3).* Hang és adat VDL üzemmód, amely D8PSK modulációt és TDMA közeg hozzáférés vezérlési sémát használ.
4-es üzemmód – *(Mode 4).* Csak adat VDL üzemmód, amely GFSK modulációs sémát és önszervező időosztásos többszörös hozzáférést használ.
Fizikai réteg – *(Physical layer).* A legalsó szintű réteg a Nyílt Rendszerek Összekapcsolása protokoll modellben. A fizikai réteg információ fizikai közegen való továbbítását végzi (pl.: VHF rádió).
Szolgáltatás minősége – *(Quality of service).* Az adat átviteli jellemzőkre vonatkozó információ, amelyet különböző kommunikáció protokollok használnak különböző teljesítményszintek elérésére a hálózat használói részére.
Reed-Solomon kód – *(Reed-Solomon code).* Szimbólum hibák javítására alkalmas hibajavító kód. Mivel a szimbólum-hibák bitek gyűjteményei, ezek a kódok jó impulzusköteg hiba javító képességet szolgáltatnak.
Önszervező idő-osztásos többszörös hozzáférés (STDMA) – *(Self-organizing time division multiple access).* Rádiófrekvenciás (RF) csatorna időosztásos használatán alapuló többszörös hozzáférés séma, amely a következőket alkalmazza: (1) diszkrét szomszédos idősések, mint alapvető felosztás-forrás; és (2) működő protokollok egy készlete, amely lehetővé teszi a felhasználók számára a közvetett hozzáférést ezekhez az időrésekhez vezér-állomás igénybevétele nélkül.
Rés – *(Slot).* Egyenlő időtartamú egymást követő időintervallumok sorozatának egyik tagja. Minden impulzusköteg átvitel egy rés kezdeténél indul.
Alhálózat összeköttetés – *(Subnetwork connection).* Hosszútávú összeköttetés egy légijármű DTE és egy földi DTE között egymást követő virtuális hívások felhasználásával az összeköttetés fenntartására kapcsolat levételen keresztül.
Alhálózat függő konvergencia funkció (SNDCF) – *(Subnetwork dependent convergence facility (SNDCF)).* Egy olyan adottság, amely egy adott alhálózat jellemzőit és szolgáltatásait hozzáilleszti a belső hálózati adottság által

megkövetelt jellemzőkhöz és szolgáltatásokhoz.
Alhálózat entitás – *(Subnetwork entity).* Ebben a dokumentumban a „földi DCE" fogalmát egy légijárművel kommunikáló, földi állomáson lévő alhálózat entitásnál fogjuk használni; a „földi DTE" fogalmát egy légijármű fedélzeti állomással kommunikáló földi útvonalazóban lévő alhálózat entitásnál használjuk, és a „légijármű DTE" fogalmát a földdel kommunikáló, egy légijárművön elhelyezett alhálózat entitásnál használjuk. Egy alhálózat entitás egy köteg réteg entitás, ahogyan az az ISO 8208-ban definiálva van.
Alhálózat réteg – *(Subnetwork layer).* Az a réteg, amely létrehoz, menedzsel és befejez összekapcsolásokat egy alhálózaton keresztül.
Rendszer – *(System).* Egy VDL-képességű entitás. Egy rendszer egy vagy több állomásból és a hozzátartozó VDL management entitásból áll. Egy rendszer lehet egy légijármú rendszer vagy egy földi rendszer.
Idő-osztásos többszörös hozzáférés (TDMA) – *(Time division multiple access (TDMA)).* RF csatorna idő-osztásos használatán alapuló többszörös hozzáérés séma, amely a következőket alkalmazza: (1) diszkrét szomszédos időrések, mint alapvető felosztás-forrás; és (2) működő protokollok egy készlete, amely lehetővé teszi a felhasználók számára az interaktív együttműködést a vezér-állomással a csatorna közvetett eléréséhez.
Felhasználói csoport – *(User group).* Földi és/vagy légijármű fedélzeti telepítésű állomások egy csoportja, amely csoportok hang és/vagy adat összeköttetést osztanak meg. Beszéd-kommunikációnál a felhasználói csoport minden tagja minden kommunikációhoz hozzáférhet. Adatok esetében a kommunikáció pont-pont összeköttetést foglal magában levegő-föld közleményeknél, és pont-pont és rádió összeköttetést föld-levegő közleményeknél.
VDL management entitás – *(VDL management entity).* VDL-specifikus entitás, amely az ATN-meghatározású SN-SME által megkívánt szolgáltatás minőségét biztosítja. A VME az LME-ket használja (amelyeket ez létrehoz és szétrombol) a pár rendszerektől rendelkezésre álló szolgáltatás minőség megvizsgálására.
VDL 4-es üzemmódú impulzusköteg – *(VDL Mode 4 burst).* Egy VHF digitális kapcsolat (VDL) 4-es üzemmódú impulzusköteg forráscímek sorozatából, impulzusköteg ID-ből, információkból, rés rezerválásból és keretellenőrzési sorozat (FCS) mezőkből áll össze, amelyet nyitó és záró jelzés sorozat fog össze.
Megjegyzés. – Egy impulzusköteg indítása csak kvantált időintervallumoknál jelenhet meg, és ez a korlátozás lehetővé teszi, hogy a továbbítás és a vétel közötti terjedés eltolódást le lehessen vezetni.
VDL 4-es üzemmód DLS rendszer – *(VDL Mode 4 DLS system).* VLL rendszer, amely megvalósítja a VDL 4-es üzemmód DLS és az alhálózati protokollok ATN kötegek és más kötegek hordozását.
VDL 4-es üzemmód specifikus szolgáltatási (VSS) al-réteg – *(VDL Mode 4 specific services (VSS) sublayer).* Az az al-réteg, amely a MAC al-réteg felett helyezkedik el, és VDL 4-es üzemmód specifikus hozzáférés protokollokat szolgáltat, amelyek fenntartott, véletlen és rögzített protokollokat foglalnak magukban.
VDL állomás – *(VDL station).* Légijármű-alapú vagy földi-alapú fizikai entitás, VDL 2-es, 3-as vagy 4-es képességgel.
Megjegyzés. – Ennek a fejezetnek a szövegében a VDL állomás „állomás"-ként is szerepel.
Vokóder – *(Vocoder).* Kis bit-sebességű hang-kódoló/dekódoló.
Hang egység – *(Voice unit).* Berendezés, amely szimplex hang- és jelzés összekapcsolást szolgáltat a felhasználó és a VDL között.
VSS felhasználó – *(VSS user).* A VDL 4-es üzemmód speciális szolgáltatásának felhasználója. A VSS felhasználó lehet magasabb réteg a VDL 4-es üzemmód SARP-okban, vagy VDL 4-es módot használó külső alkalmazás.

6.1.2 Rádió csatornák és funkcionális csatornák

6.1.2.1 *Légijármű fedélzeti állomás rádió frekvencia intervallum.* A légijármű állomás képes a 6.1.4.1 pontban meghatározott tartományon belüli bármelyik csatorna lehangolására egy önműködő lehangolási utasítás vétele utáni 100 milliszekundumon belül. Ezenkívül egy VDL 3. üzemmódú légijármű fedélzeti állomás képes a 6.1.4.1 pontban meghatározott tartományon belüli bármely frekvencia lehangolására egy hangolási parancs vétele utáni 100 milliszekundumon belül.
6.1.2.2 *Földi állomás rádiófrekvencia tartomány.* A földi állomás képes a kijelölt csatornáján való üzemelésre a 6.1.2.1 pontban részletezett rádiófrekvencia tartományán belül.
6.1.2.3 *Közös jelzés csatorna*. A 136,975 MHz-es csatornát fenn kell tartani egy világméretű közös jelzés csatornaként (CSC) VDL 2-es üzemmód részére.

6.1.3 Rendszer képességek

6.1.3.1 *Adat átláthatóság.* A VDL rendszer kódtól független, bájttól független adatátvitelt biztosít.
6.1.3.2 *Rádióadás.* A VDL rendszer kapcsolat réteg adat rádióadás szolgáltatást (2-es üzemmód) és/vagy hang és adat rádióadás szolgáltatást (3-as üzemmód) nyújt. VDL 3-as üzemmódnál az adat rádióadás szolgáltatásnak a földtől

származó hálózat többszörözés képességet támogat.
6.1.3.3 *Kapcsolat kezelés.* A VDL rendszer megbízható kommunikációs útvonalat létesít és fenntart a légijármű fedélzeti és földi rendszer között, megengedve, de nem megkövetelve kézi beavatkozást.

Megjegyzés. – Ebben a szöveg-összefüggésben a „megbízható" fogalmát a 6.3.5.1 pontban specifikált BER követelmény határozza meg.

6.1.3.4 *Földi hálózat átvitel.* Egy VDL-el felszerelt légijárműnek - ha a körülmények így kívánják - egy földi állomástól egy másik földi állomáshoz továbbítást kell végeznie.
6.1.3.5 *Beszéd-üzem képesség.* A VDL 3-as üzemmód rendszer egy „Hallgass be, mielőtt a beszédhez indítasz" csatorna hozzáférésen alapuló, átlátható szimplex beszéd-üzemű üzemelést tart fenn.

6.1.4 Levegő-föld VHF digitális adatkapcsolati összeköttetési rendszerjellemzők

6.1.4.1 A felhasznált rádiófrekvenciákat a 117,975-137 MHz sávban lévő frekvenciák közül kell kiválasztani. A legalacsonyabb kijelölhető frekvencia 118,000 MHz és a legmagasabb kijelölhető frekvencia 136,975 MHz. A kijelölt frekvenciák közötti szétválasztás (csatorna elkülönítés) 25 kHz.

Megjegyzés. – Az V. kötet határozza meg azt, hogy a 136,9-136,975 MHz-es frekvencia-blokk - ahol a határoló értékek a blokkhoz tartoznak - a VHF levegő-föld digitális kommunikáció részére van fenntartva.

6.1.4.2 A sugárzás tervezési polarizációjának függőlegesnek kell lennie.

6.2 A FÖLDI TELEPÍTÉS RENDSZER JELLEMZŐI

6.2.1 Földi állomás átviteli funkciója

6.2.1.1 *Frekvencia stabilitás.* A VDL földi állomás berendezés működési rádiófrekvenciája a kijelölt frekvenciától nem térhet el a plusz vagy mínusz 0,0002 százaléknál (2 rész per millió) nagyobb mértékben.

Megjegyzés. – A DSB-AM modulációt használó VDL földi állomások frekvencia stabilitása a III. kötet, II. rész, 2. Fejezetben van meghatározva 25 kHz-es csatorna elosztásra.

6.2.2 Teljesítmény

Ajánlás. – *A kisugárzott teljesítménynek olyannak kell lenni, hogy egy legalább 75 mikrovolt per méter (mínusz 109 dBW/m^2) térerősséget szolgáltasson az üzemeltetési fedésterületen belül a szabadtéri terjedés alapján.*

6.2.3 A zavaró sugárzások

6.2.3.1 A zavaró sugárzásokat a technika jelenlegi állapota és a szolgáltatás jellege által lehetővé tett legkisebb értéken kell tartani.

Megjegyzés. – A Rádió-Rendszabályzat S3. Függeléke tartalmazza azokat a zavaró sugárzási szinteket, amelyeknek az adóberendezéseknek meg kell felelniük.

6.2.4 Szomszéd csatorna sugárzások

6.2.4.1 A VDL földi adótól jövő teljesítmény nagysága minden üzemeltetési körülmény esetén - amikor az első szomszéd csatorna 25 kHz-es csatorna sávszélessége felett mérik - nem haladhatja meg a 0 dBm-t.
6.2.4.1.1. A 2002. január 1. után újonnan felszerelt VDL földi adótól jövő teljesítmény minden üzemeltetési körülmény esetén - az első szomszéd csatorna 25 kHz-es csatorna sávszélessége fölött mérve - nem haladhatja meg a 2 dBm-et.
6.2.4.2 A VDL földi adóberendezéstől jövő teljesítmény nagyságának minden üzemeltetési körülmény esetén, amikor a második szomszéd csatorna 25 kHz-es csatorna sávszélessége felett mérik, kevesebbnek kell lennie mínusz 25 dBm-nél, és innen 5 dB per oktáv minimális mértékkel monotonan csökkenni kell a mínusz 52 dBm maximális értékig.
6.2.4.2.1 2002. január 1. után újonnan felszerelt VDL földi adótól jövő teljesítménynek bármilyen üzemeltetési

körülmény esetén - a második szomszéd csatorna 25 kHz-es csatorna sávszélessége fölött mérve - kevesebbnek kell lennie mínusz 28 dBm.-nél
6.2.4.2.2 2002. január 1. után újonnan felszerelt VDL földi adótól jövő teljesítménynek bármilyen üzemeltetési körülmény esetén - a negyedik szomszéd csatorna 25 kHz-es csatorna sávszélessége fölött mérve - kevesebbnek kell lenni, mint mínusz 38 dBm, és innen monoton csökkennie kell 5 dB per oktáv minimális ütemben egy mínusz 53 dBm-es maximális értékre.
6.2.4.3 A VDL földi adótól jövő teljesítmény nagysága bármilyen üzemeltetési körülmény esetén - amikor az első szomszéd csatornán központosuló 16 kHz-es csatorna sávszélesség felett mérik - nem haladhatja meg a mínusz 20 dBm-et.
6.2.4.3.1 2002. január 1. után újonnan felszerelt VDL földi adótól jövő teljesítmény bármilyen üzemeltetési körülmény esetén - az első szomszédos csatornán központosuló 16 kHz-es csatorna sávszélesség fölött mérve - nem haladhatja meg a mínusz 18 dBm-et.
6.2.4.4 2005. január 1. után az összes VDL földi adónak ki kell elégítenie a 6.2.4.1.1, 6.2.4.2.1, 6.2.4.2.2 és 6.2.4.3.1 pont előírásait, a 6.2.4.5 pont feltételei szerint.
6.2.4.5 A 6.2.4.4 pont előírásai kötelező kielégítésének követelményeit olyan körzeti léginavigációs egyezmények alapján kell meghatározni, amelyek előírják az üzemelés légterét és a megvalósítás ütemtervezését. Az egyezményeknek tartalmazniuk kell a földi rendszereknek való kötelező megfelelés legalább két évre szóló előzetes értesítését is.

6.3 A LÉGIJÁRMŰ FEDÉLZETI TELEPÍTÉS RENDSZER JELLEMZŐI

6.3.1 *Frekvencia stabilitás.* A VDL légijármű fedélzeti berendezés rádiófrekvenciája a kijelölt frekvenciától nem térhet el plusz vagy mínusz 0,0005 százaléknál (5 rész per millió) nagyobb értékkel.
6.3.2 *Teljesítmény.* A kisugárzott teljesítménynek olyannak kell lenni, hogy egy legalább 20 mikro- volt per méter (mínusz 120 dBW/m^2) mínusz 87 dBm térerősséget biztosítson a szabadtéri terjedés alapján, olyan távolságokon és magasságokon, amelyek megfelelnek azoknak az üzemelési feltételeknek, amelyek azokhoz a területekhez tartoznak, amelyek felett a légijármű üzemel.

6.3.3 Zavaró sugárzások

6.3.3.1 A zavaró sugárzásokat a technika jelenlegi állapota és a szolgáltatás jellege által lehetővé tett legkisebb értéken kell tartani.

Megjegyzés. – A Rádió-Rendszabályzat S3 Függeléke határozza meg a zavaró sugárzások azon szintjeit, amelyeknek az adóknak meg kell felelniük.

6.3.4 Szomszédos csatorna kibocsátások

6.3.4.1 A VDL légijármű fedélzeti adóberendezéséből jövő teljesítmény nagysága bármilyen üzemeltetési körülmény esetén - amikor az első szomszéd csatorna 25 kHz-es csatorna sáv- szélessége felett mérik - nem haladhatja meg a 0 dBm-et.
6.3.4.1.1 2002. január 1. után minden új felszerelésű VDL fedélzeti adóberendezéstől jövő teljesítmény - minden üzemeltetési körülmény esetén - az első szomszédos csatorna 25 kHz-es csatorna sávszélessége felett mérve, nem haladhatja meg a 2 dBm-et.
6.3.4.2 A VDL légijármű fedélzeti adóberendezésétől jövő teljesítmény nagyságának - minden üzemeltetési körülmény esetén - amikor a második szomszédos csatorna 25 kHz-es csatorna sávszélessége felett mérik, kevesebbnek kell lennie mínusz 25 dBm-nél, és innen 5 dB per oktáv minimális mértékkel monoton csökkenie kell a mínusz 52 dBm maximális értékig.
6.3.4.2.1 2002. január 1. után újonnan felszerelt VDL légijármű fedélzeti adótól jövő teljesítménynek - minden üzemeltetési körülmény esetén - a második szomszédos csatorna 25 kHz-es csatorna sávszélessége fölött mérve, kevesebbnek kell lenni, mint mínusz 28 dBm.
6.3.4.2.2 2002. január 1. után újonnan felszerelt VDL légijármű fedélzeti adótól jövő teljesítménynek - minden üzemeltetési körülmény esetén - a negyedik szomszédos csatorna 25 kHz-es csatorna sávszélessége fölött mérve, kevesebbnek kell lenni, mint mínusz 38 dBm, és innen monoton csökkennie kell 5 dB per oktáv minimális ütemben egy mínusz 53 dBm-es maximális értékre.
6.3.4.3 A VDL légijármű fedélzeti adóberendezéstől jövő teljesítmény nagysága - minden üzemeltetési körülmény esetén - amikor az első szomszédos csatornán lévő központosuló 16 kHz-es csatorna felett mérik, nem haladhatja meg

a mínusz 20 dBm-t.
6.3.4.3.1 2002. január 1. után újonnan felszerelt VDL légijármű fedélzeti adótól jövő teljesítmény - minden üzemeltetési körülmény esetén - az első szomszédos csatornán központosuló 16 kHz-es csatorna sávszélesség fölött mérve, nem haladhatja meg a mínusz 18 dBm-et.
6.3.4.4 2005. január 1. után az összes VDL légijármű fedélzeti adónak ki kell elégíteni a 6.3.4.1.1, 6.3.4.2.1, 6.3.4.2.2 és 6.3.4.3.1 pont előírásait, a 6.3.4.5 pont feltételei szerint.
6.3.4.5 A 6.3.4.4 pont előírásai kötelező kielégítésének követelményeit olyan körzeti léginavigációs egyezmények alapján kell megalkotni, amelyek meghatározzák az üzemelés légterét és a megvalósítás ütemtervét. Az egyezményeknek tartalmazniuk kell a légijármű fedélzeti rendszereknek való kötelező megfelelés legalább két évre szóló előzetes értesítését is.
.

6.3.5 Vételi funkció

6.3.5.1 *A meghatározott hiba-arány*. A meghatározott hiba-aránynak 2-es üzemmódnál az 1 a 10^4-hez maximális helyesbített bit hiba-aránynak (BER) kell lennie. A meghatározott hiba-aránynak 3-as üzemmódnál az 1 a 10^3-hoz maximális helyesbítetlen BER-nek kell lennie. A meghatározott hiba-aránynak 4-es üzemmódnál az 1 a 10^4-hez maximális helyesbítetlen BER-nek kell lennie.
Megjegyzés. – A fenti fizikai réteg BER követelmények az ATN által az alhálózat interfésznél a BER-re meghatározott követelményekből erednek.
6.3.5.2 *Érzékenység.* – A vételi funkciónak ki kell elégítenie a meghatározott hiba-arányt egy nem nagyobb, mint 20 mikrovolt per méter (mínusz 120 dBW/m^2) megkívánt jel-erősséggel.

Megjegyzés. – A megkívánt jel-erősség a szolgáltatási terület határán figyelembe veszi a rendszeren belüli rendszer- és jel-veszteségek követelményeit és beszámítja a környezeti zajforrásokat is.

6.3.5.3 *Sávon kívüli érzéketlenségi teljesítmény*. A vételi funkció ki kell elégítse a meghatározott hiba-arányt egy nem nagyobb, mint 40 mikrovolt per méter (mínusz 114 dBW/m^2) megkívánt jel térerősséggel és egy nem-kívánt DSB-AM D8PSK vagy GFSK jellel a szomszédos vagy bármely más olyan kijelölhető csatornán, amely legalább 40 dB-el magasabb, mint a megkívánt jel.
6.3.5.3.1 2002. január 1-je után a vételi funkciónak ki kell elégítenie a meghatározott hiba-arányt is egy nem nagyobb, mint 40 mikrovolt per méter (-114 dBW/m^2) megkívánt jel térerősséggel és egy nem-kívánt VHF DSB-AM, D8PSK vagy GFSK jellel bármely más kijelölhető csatornán, amely legalább 60 dB-el erősebb, mint a megkívánt jel bármely kijelölhető csatornán, amely 100 kHz-re vagy távolabbra van a kívánt jel kijelölt csatornájától.

Megjegyzés. – Az interferencia érzéketlenségi teljesítménynek ez a szintje a VDL RF spektrum maszk hatásával konzisztens vevő teljesítményt biztosít, ahogyan a III. Kötet, I. Rész, 6.3.4 szakaszában egy 69 dB-es adó/vevő elkülönítés effektív elkülönítésével meg van határozva. A mérési eljárásra vonatkozó útmutató anyagot az Annex 10, V. Kötet, "A"- Melléklet, 7. szakasza tartalmazza.

6.3.5.3.2 2005. január 1. után az összes VDL telepítés vételi funkciójának ki kell elégíteni a 6.3.5.3.1 pont előírásait, a 6.3.5.3.3 pont feltételeinek megfelelően.
6.3.5.3.3 A 6.3.5.3.2 pont előírásai kötelező kielégítésének követelményeit olyan körzeti léginavigációs egyezmények alapján kell meghatározni, amelyek előírják az üzemelés légterét és a megvalósítás ütemtervezését. Az egyezményeknek tartalmazniuk kell a légijármű fedélzeti rendszereknek való kötelező megfelelés legalább két évre szóló előzetes értesítését is.

6.3.5.4 INTERFERENCIA ÉRZÉKETLENSÉGI TELJESÍTMÉNY

6.3.5.4.1 A vételi funkciónak ki kell elégítenie az előírt hiba-arányt egy nem nagyobb, mint 40 mikrovolt per méteres megkívánt térerősséggel és egy vagy több sávon kívüli jellel, kivéve az olyan VHF FM rádióadás jeleket, amelyek teljes szinttel rendelkeznek a vevő bemeneténél mínusz 33 dBm-el.
Megjegyzés. – Azokon a területeken, ahol szomszédos erősebb sáv jel interferencia meghaladja ezt a specifikációt, erősebb immunitási követelményt alkalmaznak.
6.3.5.4.2 A vételi funkciónak ki kell elégítenie a meghatározott hiba-arányt egy nem nagyobb, mint 40 mikrovolt per méteres megkívánt térerősséggel és egy vagy több VHF FM rádióadás jelekkel, amelyek teljes szinttel rendelkeznek a vevő bemeneténél mínusz 5 dBm-el.

6.4 FIZIKAI RÉTEG PROTOKOLLOK ÉS SZOLGÁLTATÁSOK

A légijármű fedélzeti és földi állomásoknak hozzá kell férniük a fizikai adathordozókhoz szimplex üzemmódban működve.

6.4.1 Funkciók

6.4.1.1 A fizikai rétegnek a következő funkciókat kell biztosítani:
a) adó és vevő frekvencia szabályozás;
b) digitális vétel a vevővel;
c) digitális továbbítás az adóval; és
d) értesítési szolgáltatás.
6.4.1.1.1 *Adó/vevő frekvencia szabályozás*. A VDL fizikai réteg az adó vagy vevő frekvenciát a kapcsolat kezelési entitás (LME) utasítása szerint állítja be.

Megjegyzés. – Az LME egy kapcsolat réteg entitás a VDL 2-es üzemmód, VDL 3-as üzemmód műszaki specifikáció kézikönyvben tartalmazottak szerint.

6.4.1.1.2 *Digitális vétel a vevővel*. A vevőnek dekódolni kell a bejövő jeleket, és feldolgozásra továbbítani kell azokat a magasabb rétegeknek.
6.4.1.1.3 *Digitális adat-átvitel*. A VDL fizikai rétegnek megfelelően kódolnia kell az adatkapcsolat rétegtől vett adatokat és továbbítania kell azokat a RF csatornán.

6.4.2 A 2-es és 3-as üzemmódú közös fizikai réteg

6.4.2.1 *Modulációs séma*. A 2-es és 3-as üzemmódoknak differenciálisan kódolt 8 fázis- billentyűzést (D8PSK) kell használnia, felhasználva egy $\alpha = 0,6$ (névleges értékű) emelt cosinus szűrőt. Az átviendő információt eltérően kell kódolni 3 bit per szimbólummal (baud), amelyet inkább fázis-változásként, mint abszolút fázisként visznek át. Az átviendő adat-folyamot 3, egymást követő adat-bitek csoportjára kell szétosztani, a legkisebb értékű bit az első. Nullákkal kell kitölteni az átvitel végét, amennyiben ez a befejező csatorna szimbólum számára szükséges.
6.4.2.1.1 *Adat kódolás*. Egy differenciál adat kódolóba belépő bináris adat folyamot X, Y és Z, három külön-választott bináris folyamba kell konvertálni úgy, hogy a 3n bitek képezik az X-et, a 3n+1 bitek képezik az Y-t és a 3n + 2 bitek képezik a Z-t. A tripletet $k(x_k Y_k Z_k)$ időpontnál egy fázis- változásra konvertálják, ahogyan azt a 6-1.* táblázat mutatja, és az abszolút fázis, a φ_k, a $\Delta\varphi_k$ összegzett sorozata, ami:

$$\phi_k = \phi_{k-1} + \Delta\phi_k$$

* Minden táblázat ennek a fejezetnek a végén van elhelyezve.

6.4.2.1.2 *Átvitt jelforma.* A fázismodulált alapsáv jelnek, ahogyan a 6.4.2.1.1 pontban az meg van határozva, az impulzus alak szűrőt kell gerjeszteni.

$$S(t) = \sum_{k=-\infty}^{+\infty} h\ (\Phi_k),\ t - kT_S)$$

Ahol:
h az impulzus alak szűrő komplex impulzus válasza;
k a 6.4.2.1.1 pontban van meghatározva;
ϕ a 6.4.2.1.1 pontban lévő egyenlet által definiált;
t az idő;
T_S az egyes szimbólumok időtartama.
Az impulzus alak szűrő kimenetének (az idő függvénye) és az impulzus-formáló szűrőnek (s(t)) kell a vivőfrekvenciát modulálnia. Az impulzus alak szűrőnek egy névleges $\alpha = 0,6$-es emelt-cosinus összegzett frekvencia jelleggörbéjének kell lennie.

6.4.2.2 *Moduláció sebesség*. A szimbólum sebesség 10500 szimbólum/másodperc, amely 31500 bit/s névleges bit-sebességet eredményez. A 2-es és 3-as üzemmódokra vonatkozó moduláció stabilitási előírások a 6-2. táblázatban vannak feltüntetve.

6.4.3 A 2-es üzemmódú specifikus fizikai réteg

Megjegyzés. – A 2-es üzemmódú specifikus réteg előírásai magukba foglalják a 2-es üzemmód szabályzó sorozatát, a vevő-oldali hibajavítást (FEC), a jelsorozat szétbontás-összeállítás műveletét, bit rejtjelezést, csatorna érzékelési és fizikai réteg rendszer-paraméterek ismertetését.

6.4.3.1 A keretek egy sorozatának a továbbításához egy állomásnak be kell illesztenie a bit számokat és jelzéseket (a 2-es üzemmód adatkapcsolat szolgáltatás leírása szerint, ahogyan azt a VDL 2-es Üzemmód Műszaki Előírásai Kézikönyv tartalmazza), ki kell számítania a FEC-t (6.4.3.1.2 pont szerint), össze kell rendeznie (6.4.3.1.3 pont szerint), elkészíteni az előkészítő jel-sorozatot (6.4.3.1.1 pont szerint), elvégezni a bit rejtjelezést (6.4.3.1.4 pont szerint), és végül kódolni és modulálni az RF jelet (6.4.2.1 pont szerint).
6.4.3.1.1 *Előkészítő jel-sorozat.* Az adat-továbbítás egy demodulátor előkészítő jelsorozattal kezdődik, amely öt szegmensből áll:
a) adó felfutás és teljesítmény stabilizáció;
b) szinkronizáció és hibás beolvasásos felbontás;
c) fenntartott szimbólum;
d) átviteli hossz; és
e) fej-rész FEC.

Megjegyzés. – Közvetlenül ezeket a szegmenseket követően egy, a VDL 2-es üzemmód műszaki előírások kézikönyvben lévő adatkapcsolat szolgáltatás leírásban meghatározott formátum szerinti AVLC keret követi.

6.4.3.1.1.1 *Adó felfutás és teljesítmény stabilizáció.* Az előkészítő jel-sorozat első szegmensének, amit a felfutásnak neveznek, az a célja, hogy egy adó teljesítmény stabilizációt és egy vevő automatikus erősítés-szabályozás /AGC/ befejezést biztosítson, és ennek közvetlenül meg kell előznie az egyedi szó első jelét. A felfutás idejének öt szimbólum időtartamúnk kell lenni. Az idő referencia pont (t) a következő előírásban az első egyedi szó szimbólumainak közepe, az a pont, ami egy fél-szimbólum időtartammal a felfutás vége után következik be. Kölcsönösen megállapítva. a felfutás kezdete t = -5,5 szimbólum időtartamnál kezdődik. A kisugárzott teljesítménynek -40 dBc-nél kevesebbnek kell lenni a t = -5,5 szimbólum időtartamot megelőzően. A felfutásnak biztosítania kell azt, hogy a t = -3,0 szimbólum időtartam időpontjában a kisugárzott teljesítmény a gyártó által meghatározott teljesítménynek 90 százaléka, vagy annál nagyobb legyen (lásd a 6-1.* ábrát). Az emelt-cosinus szűrő (vagy a levágás) alkalmazott módszerétől függetlenül az adó kimenetén a t = -3,0 és a t = -0,5 közötti időben ez úgy fog jelentkezni, mintha '000' szimbólum került volna kisugárzásra a felfutási idő időtartama alatt.

1. Megjegyzés. - A 3-as üzemmódnál az időzítési referencia pont megegyezik a teljesítmény referencia ponttal.

2. Megjegyzés. - Kívánatos az, hogy maximalizálják az automatikus erősítés-szabályozás /AGC/ beállítási idő megengedett időtartamát. "Erőfeszítéseket kell tenni" arra, hogy a teljesítmény a névleges kimeneti teljesítmény 90 százaléka felett legyen a t - 3,5 szimbólum időtartam időpontjában.

* Minden ábra ennek a fejezetnek a végén van elhelyezve

6.4.3.1.1.2 *Szinkronizáció és hibás beolvasás felbontás*. Az előkészítő jelsorozat második szegmense az egyedi szóból áll:
000 010 011 110 000 001 101 110 001 100 011 111 101 111 100 010
és balról jobbra haladva kell leadni.
6.4.3.1.1.3 *Fenntartott szimbólum*. Az előkészítő jelsorozat harmadik szegmense egyetlen szimbólumból áll, amelyet a 000 képvisel.

Megjegyzés. – Ez a mező jövőbeli meghatározás részére van fenntartva.

6.4.3.1.1.4 *Átviteli hossz*. Azért, hogy lehetővé váljon a vevő számára a végső Reed-Solomon blokk hosszának meghatározása, az adónak egy 17-bites szót kell elküldeni - a legkisebb értékű bittel (lsb) kezdve, a legmagasabb értékű bitig (msb) - jelezve az adat-bitek teljes számát, amelyek a fej-rész FEC-t követik.

Megjegyzés. – A hossz nem tartalmazza azokat a biteket, amelyeket a következők miatt kell továbbítani: a Reed-Solomon FEC-hez, beillesztett extra bitek annak biztosítására, hogy az összerendező 8-bites szavak integrál számát generálja, vagy extra hely-kitöltő bitek kerülnek beillesztésre, annak biztosítására, hogy az adat kódoló 3-bites szimbólumok integrál számát hozza létre.

6.4.3.1.1.5 *Fej-rész FEC*. A fej-részben lévő bit-hibák helyesbítéséhez egy (25, 20) blokk kódot kell számítani a fenntartott szimbólum és az átvitel hosszúság szegmensek felett. A blokk kódot ötödik szegmensként kell leadni. A kódolónak kell fogadnia a fej-részt a bit sorozatban, amely éppen átvitelre kerül. Az öt paritás bitet az átvitelhez a következő egyenlet felhasználásával kell generálni:

$[P_1,...,P_5] = [R_1,...,R_3, TL_1,...,TL_{17}]\ H^T$

ahol:
P a paritás szimbólum (P_l-et kell először leadni);
R a fenntartott szimbólum;
TL az átviteli hosszúság szimbólum;
T a mátrix transzponáló funkció; és
H az alább definiált paritás mátrix:

H =
00000000111111111111
00111111000011111111
11000111001100001111
11011011010100110011
01101001111001010101

6.4.3.1.1.6 *Bit átviteli sorrend*. Az eredő vektor termék öt paritás bitjét az első baloldali bitjével kezdve kell leadni.
6.4.3.1.2 *Vevő-oldali hibajavítás*. A tényleges csatorna áteresztőképesség javítása céljából a megkívánt újra-átvitelek számának csökkentéséhez FEC-t kell alkalmazni az előkészítő jelsorozat után, tekintet nélkül a keret határokra.
6.4.3.1.2.1 *A vevő-oldali hibajavítás (FEC) számítása*. A FEC kódolást egy szisztematikus rögzített hosszúságú Reed-Solomon (RS) (255,249)2^8-as kóddal kell végezni.

1. Megjegyzés. – Ez a kód maximálisan három oktett korrigálására képes 249 oktettes (1992 bit) adat blokknál. Hosszabb átviteleket 1992 bites átvitelekre kell felosztani, a rövidebb átviteleket virtuális, nullát képviselő kitöltőkkel kell kiterjeszteni. Hat RS-ellenőrzés oktettet kell használni egy 255 oktettes teljes blokkhoz.

A mező, amely a kód primitív polinomját meghatározza a következők szerint:
$p(x) = (x^8 + x^7 + x^2 + x + 1)$
A generáló polinom a következő:

$$\prod_{i=120}^{125} (x - \alpha^i)$$

ahol:
α a GF(256) primitív eleme;
GF(256) a 256-os méretű Galois mező (GF).

2. Megjegyzés. – A Reed-Solomon kódokat az Űr-technológiai Adat-átviteli Rendszer Szabványok: Távmérési Csatorna Kódolás tartalmazza, amelyet az Űr-technológiai Adat-átviteli Rendszerek Konzultatív Bizottsága adott ki (lásd Függelék)

.

6.4.3.1.2.2 *Blokk hosszúságok*. A hat RS-ellenőrzés oktettet 249 oktettes blokkra kell számolni. Hosszabb átvitelt 249 oktettes blokkokra kell felosztani a 6.4.3.1.3 pont szerint. A rövidebb blokkokat 249 oktettre kell kiegészíteni nullát

jelző virtuális kitöltésű előkészítő jelsorozattal. A virtuális kitöltést nem kell továbbítani. A blokkokat a 6.4.3.1.2.3 – 6.4.3.1.2.3.3 pontoknak megfelelően kell kódolni.
6.4.3.1.2.3 *Nincs hiba korrekció*. 2 vagy ennél kisebb nem-kitöltés oktettekkel rendelkező blokkoknál nem kell hibajavítást végezni.
6.4.3.1.2.3.1 *Egy-bájtos hiba korrekció*. 3-tól 30-ig terjedő nem-kitöltő oktettel rendelkező blokkoknál mind a hat RS-ellenőrzési oktettet generálni kell, de csak az első kettőt kell továbbítani. Az utolsó négy RS-ellenőrzés oktettet érvényteleníteni kell a dekódolónál.
6.4.3.1.2.3.2 *Két-bájtos hiba korrekció*. A 31-től a 67-ig terjedő nem-kitöltő oktettel rendelkező blokkoknál mind a hat RS-ellenőrzési oktettet generálni kell, de csak az első négyet kell továbbítani. Az utolsó két RS ellenőrzés oktettet érvényteleníteni kell a dekódolónál.
6.4.3.1.2.3.3 *Három-bájtos hiba korrekció*. A 68 vagy annál több nem-kitöltő oktettel rendelkező blokkoknál mind a hat RS-ellenőrzés oktettet generálni és továbbítani kell .
6.4.3.1.3 *Összerendezés*. A FEC teljesítmények javítása érdekében egy oktett alapú táblázat-indíttatású összerendezőt kell használni. Az összerendező egy olyan táblázatot hoz létre, amelynek soronként 255 oktettje és C-sorai vannak, ahol

c = átviteli
hosszúság (bit) /
1992 bit

ahol:

a) az átviteli hosszúság, ahogy az a 6.4.3.1.5 pontban meghatározásra került; és
b) c = a legkisebb egész szám, amely a tört értéknél nagyobb vagy azzal egyenlő.
Az adatoknak az 1992 bit páros-számú többszörösére való kiterjesztése után az összerendezőnek kell beírnia az átviteli folyamatot az egyes sorok első 249 oktettjébe, minden egymás utáni 8-bites csoportot véve, és tárolva őket az első oszloptól a 249-edikig. A 8-bites csoportok mindegyikében az első bitet a nyolcadik bit pozícióban kell tárolni; az első 1992-bites csoportot az első sorban kell tárolni, a második 1992-bites csoportot a második sorban, stb. Miután a FEC-et minden sorra kiszámították, a FEC adatok (vagy törlések) tárolásra kerülnek a 250-255. oszlopokban. Az összerendezőnek ezután továbbítania kell az adatokat a rejtjelzőhöz oszlopról-oszlopra történő kiolvasással, kihagyva minden olyan oktettet, amely érvénytelenítést tartalmaz, vagy az teljes egészében töltő biteket foglal magában. Az egy oktettben lévő összes bitet le kell adni a 8-as bittől az egyesig.
A vételnél a kibontó kiszámítja a sorok számát az utolsó (potenciálisan parciális) sor méretét a fej-részben lévő hosszúság mezőtől. Csak érvényes adat bájtokat továbbít a magasabb rétegnek.
6.4.3.1.4 *Bit rejtjelzés*. Az óra-jel helyreállítás segítésére és az átvitt spektrum alakjának stabilizálására bit rejtjelzést kell alkalmazni. A pseudo zaj (PN) jelsorozat egy 15-fokozatú generátor (lásd 6-2.ábra), a következő karakterisztikus polinommal:

$$X^{15} + X + 1$$

A PN jelsorozatnak a keret szinkronzációs jel után kell indulni a 1101 0010 1011 001 kezdeti értékkel a bal szélső bittel a regiszter első fokozatában, a 6-2. ábra szerint. Az egyes bitek feldolgozása után a regisztert egy bittel jobbra kell tolni. A lehetséges rejtjelzéshez a jövőben ezt a kezdeti értéket programozni fogják. A sorozatot hozzáadják (modulo 2) az adatokhoz az átviteli oldalon (rejtjelzés), és a rejtjelzett adatokhoz a vételi oldalon (rejtjel feloldás) a 6-3. táblázat szerint.

Megjegyzés. – A PN rejtjelző koncepció magyarázata az ITU-R Recommendation S. 446-4, I. Függelék 4.3.1 Szakasz I. Módszer alatt található (lásd ennek a Fejezetnek a Függelékét).

6.4.3.2 A 2-ES ÜZEMMÓDÚ CSATORNA ÉRZÉKELÉS

6.4.3.2.1 *Csatorna foglaltság-inaktív állapot érzékelése.* Amikor egy állomás legalább 5 milli- szekundumon keresztül legalább -87 dBm-es csatorna teljesítményt vesz, akkor:
a) 0,9 valószínűséggel a csatornát továbbra is foglaltnak kell tekinteni, ha a jelszint -92 dBm alá csillapodik 1 milliszekundumnál rövidebb idő alatt; és
b) 0,9 valószínűséggel a csatornát nem-foglaltnak kell tekinteni, ha a jelszint -92 dBm alá csillapodik legalább 1,5 milliszekundum alatt.

Megjegyzés. – A maximális kapcsolat áteresztőképesség, amely az összes felhasználó részére rendelkezésre áll, igen érzékeny az RF csatorna érzékelés-késésre (attól az időponttól, amikor a csatorna ténylegesen állapotot vált addig az időpontig, amíg egy állomás érzékeli és válaszol erre a változásra) és az RF csatorna foglaltság-késésre (attól az időponttól, amikor az állomás elhatározza a továbbítást addig az időpontig, amikor az adó elegendően felfut ahhoz, hogy kizárja a többi állomást). Ennek megfelelően nagyfontosságú az, hogy minden erőfeszítést megtegyenek ezeknek az időknek a csökkentésére, amennyire ezt a technika jelenlegi állása lehetővé teszi.

6.4.3.2.2 *Csatorna inaktív-foglaltság állapot érzékelése*. Legalább 0,9 valószínűséggel egy állomásnak a csatornát foglaltnak kell tekinteni 1 milliszekundumon belül azután, hogy a csatornán a teljesítmény legalább -90 dBm-re emelkedik.
6.4.3.2.3 **Ajánlás. –** *Egy foglalt csatorna észlelésének 0,5 milliszekundumon belül kell megjelenni.*

Megjegyzés. – Nagyobb valószínűségű hamis riasztás fogadható el a foglaltság-inaktív állapot érzékelése esetén, mint a csatorna inaktív-foglaltság állapot érzékelése esetén a két különböző hibahatás miatt.

6.4.3.3 A 2-ES ÜZEMMÓDÚ VEVŐ/ADÓ KÖLCSÖNHATÁS

6.4.3.3.1 *Vevő-adó átfutási idő*. Egy állomásnak az előkészítő jelsorozatot úgy kell leadni, hogy az egyedi szó első szimbólumának a közepét 1,25 milliszekundumon belül vigye át attól számítva, hogy a hozzáférési kísérlet sikerrel jár (Lásd 6-3 ábra). Az egyedi szó átvitele során a teljes frekvencia- változásnak 10 Hz-nél kisebbnek kell lenni. Az egyedi szó átvitele után a fázis- gyorsulásnak 500 Hz per másodpercnél kisebbnek kell lenni.
6.4.3.3.2 *Adótól-vevőig átfutási idő*. Az adó teljesítménynek -20 dBc-nek kell lennie az impulzus- köteg végső szimbóluma közepének 2,5 szimbólum periódusain belül. Az adó teljesítmény szivárgásnak, amikor az adó „ki" állapotban van, kevesebbnek kell lennie, mint -83 dBm. Az állomásnak képesnek kell lennie venni és demodulálni névleges teljesítménnyel egy bejövő jelet a végső információs szimbólum továbbítása után 1,5 milliszekundumon belül.

Megjegyzés. – Hivatkozás DO-160D 21. Szakasz, H kategória antenna sugárzású jelekre.

6.4.3.4 2-ES ÜZEMMÓDÚ FIZIKAI RÉTEG RENDSZER PARAMÉTEREK

6.4.3.4.1 A fizikai rétegnek a 6-4. táblázatban meghatározottak szerint kell megvalósítania a rendszer paramétereket.
6.4.3.4.1.1 *P1 paraméter (minimális átviteli hossz).* A P1 paraméter azt a minimális átviteli hosszt definiálja, melyet egy vevő demodulálni képes a BER leromlása nélkül.

6.4.4 A 3-as üzemmódú speciális fizikai réteg

Megjegyzés. – A 3-as módozatú speciális fizikai réteg műszaki leírása magába foglalja a 3-as üzemmód kezelés (M) impulzus-köteg és a levétel ellenőrzés közlemény (H) impulzus-köteg felfelé kapcsolatot, az M impulzus-köteg lefelé kapcsolatot, a hang/adat (V/D) impulzus- köteget és a bit rejtjelezést.

6.4.4.1 *Kezelés (M) impulzus-köteg és levétel ellenőrzés közlemény (H) impulzus-köteg felfelé kapcsolat*. Az M felfelé kapcsolat impulzus-kötegnek (ahogyan az a VDL 3-as Üzemmód Műszaki Előírások Kézikönyvben ismertetésre kerül) három szegmensből kell állnia, az előkészítő jelsorozatból, amelyet a rendszer adatok és az adó lefutás követ. A H felfelé kapcsolat impulzus-kötegnek (ahogyan azt a VDL 3-as Üzemmód Műszaki Előírások Kézikönyve ismerteti) három szegmensből kell állnia, az előkészítő jelsorozatból, amelyet a levétel ellenőrzés közlemény és az adó lefutás követ.
6.4.4.1.1 *Előkészítő jelsorozat*. A felfelé M impulzus-köteg és a H impulzus-köteg előkészítő jelsorozatoknak két összetevőből kell állniuk, a következők szerint:
a) adó felfutás és teljesítmény stabilizáció; és
b) szinkronizáció és félreérthetőség feloldás.
6.4.4.1.1.1 *Adó felfutás és teljesítmény stabilizáció*. Ennek a 6.4.3.1.1.1 szakaszban meghatározottal megegyezőnek kell lennie.
6.4.4.1.1.2 *Szinkronizáció és félreérthetőség feloldás.* Az előkészítő jelsorozat második össze- tevőjének az S_2*-ként ismert szinkronizációs sorozatból kell állnia, a következők szerint:

000 001 101 100 110 010 111 100 010 011 101 000 111 000 011 001
és balról jobbra haladva kell továbbítani.

Megjegyzés. – Az S_2 jelsorozat nagyon közeli kapcsolatban van az S_2 jelsorozattal (6.4.4.3.1.2 szakasz). Az S_2* 16 szimbóluma közötti 15 fázis-változás mindegyike pontosan 180°-on kívül van az S_2-höz kapcsolódó 15 fázis-változáshoz viszonyítva. Ez a kapcsolat felhasználható a két sorozat egyidejű keresési folyamatának egyszerűsítéséhez.*

6.4.4.1.2 *Rendszer adat és levétel ellenőrzés közlemény.* A nem-3T konfiguráció (ahogyan azt a VDL 3-as Üzemmód Műszaki Előírások Kézikönyv tartalmazza) rendszer adatának 32 továbbított szimbólumból kell állniuk. A 96 továbbított bitnek 4 Golay (24, 12) kód-szóként generált, 48 információ bitet és 48 paritás bitet kell tartalmaznia. A 3T konfigurációnak, ahogyan az a VDL 3-as Üzemmód Műszaki Előírások Kézikönyvben le van írva, 128 továbbított szimbólumból kell állnia. A 384 továbbított bitnek 16 Golay (24, 12) kód-szóként generált, 192 információ bitet és 192 paritás bitet kell tartalmaznia. A 3T konfiguráció levétel ellenőrzés közleménynek 40 átvitt szimbólumból kell állnia. A 120 továbbított bitnek 5 Golay (24, 12) kód-szóként generált, 60 információ bitet és 60 paritás bitet kell tartalmaznia.
A Golay kódoló speciális definíciójának a következők szerintinek kell lennie:
Ha a 12 bites input bit sorozatot **x** sor-vektorként írják fel, akkor a 24 bites output sorozat **y** sor- vektorként írható fel, ahol **y = x** és a **G** mátrixot a következőképpen kell megadni:

G =
110101110001100000000000
011111001001010000000000
111010010101001000000000
011000111011000100000000
111001101100000010000000
101100110110000001000000
100110011011000000100000
010110111100000000010000
001011011110000000001000
000101101111000000000100
110111000110000000000010
101011100011000000000001

Megjegyzés. – A kiterjesztett Golay kód lehetővé teszi bármilyen 3 vagy ennél kevesebb bit-hibából álló együttes korrekcióját, és bármely 4 bit-hibás együttes detektálását.

6.4.4.1.3 *Adó lefutás.* Az adó teljesítménynek -20 dBc-nek kell lennie az impulzus-köteg végső szimbóluma közepének 2,5 szimbólum periódusain belül. Az adó teljesítmény-szivárgásnak az adó „ki" állapotában -83dBm-nél kisebbnek kell lennie.

Megjegyzés. – Hivatkozás: RTCA/DO -160D 21 szakasz, H kategória antennasugárzású jeleknél.

6.4.4.2 *Kezelés (M) impulzus-köteg lefutás*. Az M lefutás impulzus-kötegnek (ahogyan azt a VDL 3-as Üzemmód Műszaki Előírások Kézikönyv tartalmazza) három szegmensből kell állnia, az előkészítő jelsorozatból, amelyet a rendszer adat és az adó lefutás követ.
6.4.4.2.1 *Az előkészítő jelsorozat*. A lefelé menő M impulzus-köteg bevezető sorozatoknak két összetevőből kell állniuk, a következők szerint:
a) adó felfutás és teljesítmény stabilizáció; és
b) szinkronizáció és félreérthetőség feloldás.
6.4.4.2.1.1 *Adó felfutás és teljesítmény stabilizáció*. Ennek meg kell felelni a 6.4.3.1.1.1 szakaszban meghatározottaknak.
6.4.4.2.1.2 *Szinkronizáció és félreérthetőség megoldás*. Ennél az impulzus-köteg típusnál három külön szinkronizáció sorozatot kell használni. Az S_1-ként ismert szabvány sorozatnak a következőnek kell lennie:
000 111 001 001 010 110 000 011 100 110 011 111 010 101 100 101
és balról jobbra haladva kell továbbítani. A speciális sorozatnak, amelyet a válaszok azonosítására használnak, a

6.4.4.1.1.2 szakaszban leírtaknak megfelelőnek kell lennie.
A hálózatba lépés kérések (S_1*) azonosítására használt speciális sorozatnak a következő sorozatot kell használni:
000 001 111 111 100 000 110 101 010 000 101 001 100 011 010 011
és balról jobbra haladva kell továbbítani.

Megjegyzés. – Az S_1 sorozat nagyon közeli kapcsolatban van az S_1 sorozattal (6.4.4.3.1.2 szakasz). Az S_1* 16 szimbóluma közötti 15 fázis-változás mindegyike pontosan 180° van kívül az S_1-hez kapcsolódó 15 fázis-változástól. Ez a kapcsolat felhasználható a két sorozat egyidejű keresési folyamatának egyszerűsítéséhez.*

6.4.4.2.2 *Rendszer adat*. Rendszer adat szegmensnek 16 átvitt szimbólumból kell állnia. A 48 átvitt bitet 24 rendszer adatként és 24 paritás bitként kell, kódolni amely két egymást követő (24, 12) Golay kód szóként van generálva. A (24, 12) Golay kód szavaknak a 6.4.4.1.2 szakaszban meghatározottak szerintinek kell lenniük.
6.4.4.2.3 *Adó lefutás*. Ennek a 6.4.4.1.3 pontban meghatározottaknak megfelelőnek kell lennie.
6.4.4.3 *Hang vagy adat (V/D) impulzus-köteg*. A V/D impulzus-kötegnek (ahogyan azt a VDL 3-as Üzemmód Műszaki Előírások Kézikönyv tartalmazza) négy szegmensből kell állnia: az előkészítő jelsorozatból, amelyet a fej-rész, a felhasználói információ szegmens és az adó lefutás követ. Ugyanazt a V/D impulzus-köteg formátumot kell használni mind a felfelé kapcsolatnál, mind a lefelé kapcsolatnál.
6.4.4.3.1 *Előkészítő jelsorozat.* A V/D impulzusköteg előkészítő jelsorozatoknak két összetevőből kell állniuk, a következők szerint:
a) adó felfutás és teljesítmény stabilizáció; és
b) szinkronizáció és félreérthetőség feloldás.
6.4.4.3.1.1 *Adó felfutás és teljesítmény stabilizáció*. Ennek a 6.4.4.1.1.1 szakaszban meghatározottaknak megfelelőnek kell lennie.
6.4.4.3.1.2 *Szinkronizáció és félreérthetőség feloldás*. Ennél az impulzus-köteg típusnál három külön szinkronizáció sorozatot kell használni. Az S_2-ként ismert szabvány sorozatnak a következőnek kell lennie:
000 111 011 010 000 100 001 010 100 101 011 110 001 110 101 111
és balról jobbra haladva kell továbbítani.
6.4.4.3.2 *Fej-rész*. A fej-rész szegmensnek 8 átvitt szimbólumból kell állnia. A 24 átvitt bitet 12 rendszer adatként és 12 paritás bitként kell kódolni, amely két egymást követő (24, 12) Golay kód szóként van generálva. A (24, 12) Golay kód szavaknak a 6.4.4.1.2 szakaszban meghatározottaknak megfelelőnek kell lenniük.
6.4.4.3.3 *Felhasználói információ*. A felhasználói információ szegmensnek 192 3-bites szimbólumból kell állnia. Hangátvitelnél a FEC-t kell alkalmazni a 6.8 szakaszban meghatározott vokódoló output analíziséhez. A vokódolónak kielégítően kell működnie 10^{-3}BER környezetben (10^{-2} tervezési célkitűzéssel). A *FEC-t tartalmazó* vokodoló teljes bit sebessége 4800 bit/s (kivéve a csonkolt módban, amikor a bit-sebesség 4000 bit/s).
6.4.4.3.3.1 Amikor felhasználói adatot visznek át, az 576 bitet egyetlen Reed-Solomon (72, 62) 2^8-rendű kód-szóként kell kódolni. A 496 bitnél kisebb hosszúságú Reed-Solomon kódoló felhasználói input adatánál ezt zérusokkal kell kitölteni a végénél, amíg el nem éri a 496 bit hosszúságot. A mezőnek, amelyet a kód primitív polinomja definiál, a 6.4.3.1.2.1 szakaszban leírtnak kell lennie. A generátor polinomnak a következőnek kell lenni:

$$\prod_{i=120}^{129} (x - \alpha^i)$$

Megjegyzés. – A Reed-Solomon (72, 62) kód képes maximum öt 2^8-rendű (kód-szó) szimbólum hiba javítására a vett szóban
.
6.4.4.3.4 *Adó lefutás.* Ennek a 6.4.4.1.3 szakaszban meghatározottnak megfelelőnek kell lennie.
6.4.4.4 *Összerendezés.* Nem lehet összerendezés a 3-as üzemmódú üzemelésben.
6.4.4.5 *Bit rejtjelezés*. A 3-as üzemmódú működés alatt a bit rejtjelezést - ahogyan az a 6.4.3.1.4 szakaszban az meg van határozva - az előkészítő jelsorozat után kezdve minden impulzus-kötegen el kell végezni. A rejtjelező sorozatot újra kell inicializálni minden impulzus-kötegen, hatékonyan állandó lefedést biztosítva a 3-as üzemmódú rögzített hosszúságú impulzus-kötegek mindegyikének.
6.4.4.6 *Adó/vevő kölcsönhatás*. A kapcsolási időt ebben az al-szakaszban, az egyik impulzus-köteg utolsó információ szimbólumának közepe és a következő impulzus-köteg szinkronizációs sorozata első szimbólumának közepe közötti időként határozták meg.

Megjegyzés. – Ezt a névleges időt lerövidítik olyan meggondolások alapján, mint például az egyes szimbólumok Nyquist szűrése miatti véges szélesség és a felfutás és teljesítmény stabilizáció. Az ilyen alternatív definíciók a kapcsolási időket maximálisan 8 szimbólum periódussal rövidíthetik le.

6.4.4.6.1 *Vevő-adó átkapcsolási idő*. Egy légijármű rádiónak képesnek kell lennie 17 szimbólum perióduson belül vételről adásra átkapcsolni. Ez az idő 33 szimbólum periódusra növekedhet az olyan légijármű adóknál, amelyek nem teljesítenek diszkrét címzést kívánó funkciókat.

1. Megjegyzés. – A legrövidebb vevő/adó átkapcsolási idő akkor fordul elő, amikor egy felfelé kapcsolati M-csatorna adás-vételét egy V/D átvitel követi ugyanabban az időrésben. Bizonyos esetekben, amikor a légijármű rádiók nem teljesítenek diszkrét címzést kívánó funkciókat, a vevő/adó átkapcsolási idő megnövelhető, mivel a felfelé kapcsolati M-csatorna adás utolsó két Golay szavát nem kell leolvasni
.
2. Megjegyzés. – A minimális átfutási idő feltételezi, hogy a 3V1D, 2V1D és 3T konfigurációjú (ahogyan azt a VDL 3-as Üzemmód Műszaki Előírásai Kézikönyv tartalmazza) légijárművek olyan szoftverrel vannak ellátva, amelyek megvédik őket egy lefelé kapcsolati M-csatorna közlés továbbításától egy olyan időrésben, amely egy másik légijárműtől hosszú időkéséssel érkező hangközlés vételét követi.

6.4.4.6.2 *Adó-vevő átkapcsolási idő*. Egy légijármű rádiónak képesnek kell lennie 32 szimbólum perióduson belül adásról vételre átkapcsolni.

Megjegyzés. – Az adó/vevő átkapcsolási idő legrosszabb esete egy légijármű rádió számára akkor jelenik meg, amikor egy lefelé kapcsolati M-csatorna közlést továbbít, és egy V/D közleményt vesz ugyanabban a időrésben.
6.4.4.7 *Fedésterület határ jelzés.*
6.4.4.7.1 **Ajánlás.** *– A VDL 3-as üzemmódú légijárművek részére ajánlott a fedésterületi határ közelség jelzés szolgáltatása.*

6.5 KAPCSOLAT RÉTEG PROTOKOLLOK ÉS SZOLGÁLTATÁSOK

6.5.1 Általános információk

6.5.1.1. *Funkcionalitás*. A VDL kapcsolat rétegnek a következő al-réteg funkciókat kell szolgáltatnia:
a) adathordozó elérési irányítás (MAC) al-réteg, amely megkívánja a vivőhullám érzékelő többszörös hozzáférés (CSMA) algoritmus használatát a 2-es üzemmódnál vagy a TDMA használatát a 3-as üzemmódnál;
b) adatkapcsolat szolgáltatás (DLS) al-réteg:
1) a 2-es üzemmódnál a DLS al-réteg összekapcsolás-orientált pont-pont kapcsolatokat szolgáltat az adatkapcsolat entitások (DLE) felhasználásával, és összekapcsolás-mentes rádiókapcsolatot a MAC al-réteg felett; és
2) a 3-as üzemmódnál a DLS al-réteg nyugtázott, összekapcsolás-mentes pont-pont és pont-több-pont kapcsolatokat szolgáltat egy MAC al-réteg felett, amely szekvenciálást garantál; és
c) a VDL kezelés entitás (VME), amely DLE-ket létesít és fenntartja a légijárművek és a földi telepítésű rendszerek közötti kapcsolat kezelési entitásokat (LME).

6.5.1.2 SZOLGÁLTATÁS

6.5.1.2.1 *Kapcsolat-orientált.* A VDL kapcsolat réteg megbízható ponttól-pontig szolgáltatást nyújt kapcsolat-orientált DLS al-réteg felhasználásával.
6.5.1.2.2 *Kapcsolat-nélküli.* A 2-es és a 3-as üzemmódú VDL kapcsolat réteg nem-nyugtázott rádió-adás szolgáltatást nyújt kapcsolat-nélküli DLS al-réteg felhasználásával.
6.5.1.2.3 *Nyugtázott kapcsolat-nélküli eljárás.* A 3-as üzemmódú kapcsolat rétegnek biztosítania kell egy pont-pont szolgáltatást egy olyan kapcsolat-nélküli DLS al-réteg felhasználásával, amely a sorrendiség garantálására a MAC al-rétegen alapszik.

6.5.2 MAC al-réteg

6.5.2.1 Az Adathordozó Hozzáférés Vezérlés /MAC/ al-rétegnek a megosztott kommunikációs útvonalon átlátható adatgyűjtést kell szolgáltatni. Ez láthatatlanná teszi azt a módot a DLS al-réteg számára, amelyben eléréséhez fenntartó kommunikációs forrásokat használnak ennek eléréséhez.

Megjegyzés. – A speciális MAC szolgáltatásokat és eljárásokat a VDL 2-es és 3-as üzemmódhoz a VDL 2-es üzemmód *és VDL 3-as üzemmód Műszaki Előírások Kézikönyv tartalmazza.*

6.5.3 Adatkapcsolat szolgáltatás al-réteg

6.5.3.1 A 2-es üzemmódnál az adatkapcsolat szolgáltatás al-rétegnek támogatnia kell a bit- orientált szimplex levegő-föld összeköttetéseket a légiforgalmi VHF kapcsolat vezérlési (AVLC) protokollt felhasználva.

Megjegyzés. - A VDL 2-es üzemmód speciális adatkapcsolati szolgáltatásait, paramétereit és protokoll meghatározásait a VDL 2-es Üzemmód Műszaki Előírások Kézikönyve foglalja magába.

6.5.3.2 A 3-as üzemmódnál a DLS támogatja a bit-oritentált prioritás alapú szimplex levegő-föld összeköttetéseket a nyugtázott kapcsolat-nélküli adatkapcsolat (A-CLDL) protokollt felhasználva.

Megjegyzés. - A VDL 3-as üzemmód speciális adatkapcsolati szolgáltatásait, paramétereit és protokoll meghatározásait a VDL -as Üzemmód Műszaki Előírások Kézikönyve foglalja magába.

6.5.4 VDL kezelési entitás (VME)

6.5.4.1 *Szolgáltatások.* A VDL kezelési entitásnak biztosítania kell a kapcsolat létrehozását, fenntartását és a szolgáltatás megszűntetését, valamint a paraméter módosítások alátámasztását. A speciális VME paraméter formátumok és eljárások a 2-es és 3-as üzemmódú szolgáltatások a VDL 2-es üzemmód és 3-as üzemmód Műszaki Előírásai Kézikönyvben találhatók.

6.6 ALHÁLÓZAT RÉTEG PROTOKOLLOK ÉS SZOLGÁLTATÁSOK

6.6.1 A 2-es üzemmód felépítése

6.6.1.1 Az alhálózat réteg protokollt, amelyet a VHF levegő-föld alhálózaton keresztül használnak a VDL 2-es üzemmódhoz, és amit formálisan alhálózat hozzáférés protokollnak (SNAcP) neveznek, meg kell, hogy feleljen az ISO 8208 szabványnak, kivéve azokat, ami A VDL 2-es Üzemmód Műszaki Előírások Kézikönyvben találhatók. Az SNAcP, ami A VDL 2-es Üzemmód Műszaki Előírások Kézikönyvben található, az alhálózati protokoll. Ha A VDL 2-es Üzemmód Műszaki Előírások Kézikönyve és az idézett előírások között különbségek vannak, akkor A VDL 2-es Üzemmód Műszaki Előírásoknak van prioritása. A levegő-föld interfészen a légijármű alrendszer entitás DTE-ként működik, a földi alhálózat entitásnak pedig DCE-ként kell működnie.

Megjegyzés. – A speciális al-réteg protokoll hozzáférési pontokat, szolgáltatásokat, paramétereket és eljárásokat a VDL 2-es üzemmódhoz A VDL 2-es Üzemmód Műszaki Előírások Kézikönyve foglalja magába.

6.6.2 A 3-as üzemmód felépítése

6.6.2.1 A VHF levegő-föld alhálózaton keresztül használt alhálózatnak a VDL 3-as üzemmód biztosítja a flexibilitást a többszörös alhálózati protokollok egyidejű fenntartásához. A jelenleg meghatározott opciók: az ISO 8473 kapcsolás-nélküli hálózat protokoll fenntartása és az ISO 8208 fenntartása, mindkettőnél úgy, ahogyan azok a VDL 3-as Üzemmód Műszaki Előírások Kézikönyvben találhatók. A VDL 3-as Üzemmód Műszaki Előírások Kézikönyvnek prioritást kell kapnia az idézett előírásoktól való bármely eltérés esetén. Az ISO 8208 interfésznél a légi és a földi alhálózat entitások egyaránt DCE-ként működnek.

Megjegyzés. – A speciális al-réteg protokoll hozzáférési pontokat, szolgáltatásokat. paramétereket és eljárásokat a VDL 3-as üzemmódhoz A VDL 3-as Üzemmód Műszaki Előírások Kézikönyve foglalja magába.

6.7. A VDL MOZGÓ SZOLGÁLATI ALHÁLÓZAT-FÜGGŐ KONVERGENCIA FUNKCIÓ (SNDCF)

6.7.1 A VDL 2-es üzemmódú SNDCF

6.7.1.1 *Bevezetés.* A szabvány mozgó szolgálati SNDCF szerepét a VDL 2-es üzemmódú mozgó szolgálati SNDCF-

nek kell betöltenie.
6.7.1.2 *Új funkció.* A VDL 2-es üzemmódú mozgó szolgálati SNDCF-nek kell alátámasztani az összefüggés fenntartását (pl. tömörítés táblázatok) az alhálózati hívásokon keresztül. Az SNDCF-nek ugyanazon szöveg-összefüggést (pl. tömörítés táblázatok) kell használnia az összes vele kapcsolatban lévő SVC-n keresztül a DTE szöveg-összefüggéssel, amikor ugyanazokkal a paraméterekkel tartják a kapcsolatot. Az SNDCF-nek legalább két, egy szöveg-összefüggést megosztó SVC-t kell alátámasztania.

1. Megjegyzés. – Mivel a vételek várhatóan átrendezik a kötegeket, bizonyos tömörítési algoritmusok nem alkalmasak a VDL 2-es üzemmódban való használatra. Továbbá az operandus-táblázat tömörítési algoritmusok szerkesztőinek kell kényesen vigyázniuk a vagy a régi, vagy az újonnan létesített híváson érkező felfrissítések problémájával szemben.

2. Megjegyzés. – A Hívás Felhasználói Adatmező kódolása a Doc 9705-ben van leírva, kivéve a VDL 2-es Üzemmód Műszaki Előírások Kézikönyvben található módosításokat.

6.7.2 A VHF adatkapcsolat /VDL/ 3-as üzemmód alhálózat berendezés-függő konvergencia szolgáltatása /SNDCF/

6.7.2.1 A VDL 3-as üzemmódnak alá kell támasztania a meghatározott SNDCF egyikét, vagy azokból többet. Az első a szabvány ISO 8208 SNCF, ahogy az a Doc 9705-ben meghatározásra került. Ez egy kapcsolat-irányított SNDCF. A VDL 3-as üzemmóddal alátámasztott SNDCF második típusa keret-alapú SNDCF-ként került megjelölésre. Ennek a kapcsolat-nélküli irányítottságú SNDCF-nek a részletezését a VHF adatkapcsolat 3-as Üzemmód Műszaki Előírása Kézikönyv foglalja magába, ami tartalmazza még a hálózati réteg interfészt, alátámasztja az általános adású és irányított adású hálózati csomagokat, és a Légiforgalmi Távközlési Hálózat /ATN/ közlemény továbbítás biztosítását.
Megjegyzés. – A keret-alapú SNDCF azért van így megnevezve, mivel a VDL 3. üzemmódú kereteket használja anélkül, hogy szüksége lenne egy kiegészítő protokollra (úgymint az ISO 208 SNDCF) a hálózati csomagok továbbításához. A keret-alapú SNDCF a hálózati protokolltól való függetlenséget azzal éri el, hogy azonosítja az egyes keretek 'hasznos terhelését'. Egy keret vételekor a hasznos terhelés kerül megvizsgálásra, és a vezérlés az azonosított protokollhoz kerül átadásra.

6.8 HANGFREKVENCIÁS EGYSÉG A 3-AS ÜZEMMÓDHOZ

6.8.1 Szolgáltatások

6.8.1.1 A hangfrekvenciás egység biztosít egy egyszerű „nyomó-gombos – beszéd-indítású" funkciót és jelzés átviteli interfészt a felhasználó és a VHF adatkapcsolat /VDL/ között. Két különálló, egymást kölcsönösen kizáró beszéd-üzemű csatorna áramkör típust támogat:
a) Célra rendelt áramköröket: Ennek egy speciális felhasználói csoport részére kell szolgáltatást biztosítani – kizárásos alapon – az áramkört a csoporton kívülálló más felhasználókkal nem megosztottan. A hozzáférést a „hallgasson be" figyelemmel biztosítva, mielőtt a nyomógombbal indítana.
b) Igény szerinti kijelölésű áramköröket: Ennek egy olyan beszéd-üzemű csatorna áramkör hozzáférést kell biztosítani, amelyet a földi állomás dönt el a légijármű fedélzeti állomástól vett hozzáférési kérésre válaszolva. Az üzemeltetés ilyen típusának meg kell engedni a csatorna forrás növekvő hatékonyságú dinamikus megosztását.
6.8.1.2 *Elsőbbég hozzáférés.* A hangfrekvenciás egység működésének biztosítania kell az elsőbbség megszakításos hozzáférést az arra feljogosított földi felhasználó részére.
6.8.1.3 *Közlemény forrás azonosítás.* A hangfrekvenciás egység működésének biztosítania kell azt, hogy egy vett közlemény forrásáról értesítse a felhasználót (azaz azt, hogy a közlemény a levegőből vagy egy földi állomástól ered-e).
6.8.1.4 *Kódolt zajzár.* A hangfrekvenciás egység működésének biztosítania kell egy kódolt zajzár működést, amely bizonyos értékű csillapítást ad a nem-kívánt közös csatornájú hangfrekvenciás közleményekre a beérkezési impulzus idejében.

6.8.2 Élőszavas kódolás, paraméterek és eljárások

6.8.2.1 A VHF adatkapcsolat 3-as üzemmódjának a korszerű több-soros aktiválású (AMBE) 4,8 kbit/s kódolási/dekódolási algoritmust kell használni, a változat száma: AMBE-ATC-10, amit a Digitális Beszéd Rendszerek Részvénytársaság (DVSI) fejlesztett ki a beszéd-üzemű átvitelhez.

1. Megjegyzés. – A 4,8 kbit/s AMBE algoritmusok műszaki jellemzőire vonatkozó tájékoztatásokat az AMBE-ATC-10

Alacsony Jelszintű Leírása foglalja magába, és a DVSI-től szerezhető be.

2. Megjegyzés. – A dokumentumban leírt 4,8 kbit/s AMBE kódolás/dekódolás technológia a DVSI szabadalmi joga és szerzői joga alatt áll. A gyártóknak egy licencmegállapodást kell kötniük a DVSI-vel azt megelőzően, hogy az algoritmusról egy részletes leírást kapjanak, mielőtt beépítenék azt a VDL 3-as üzemmódú szolgáltatást nyújtóan működő berendezéseikbe. Az ICAO-nak címzett 1999. október 29-i keltezésű levélben a DVSI megerősítette azon kötelezettség-vállalását, hogy engedélyezi a gyártóknak a technológia felhasználását, és a légiforgalmi berendezésekben való eladását diszkrimináció nélküli alapon megtárgyalt kikötések és feltételek mellett.

6.8.2.2 Az élőszavas kódolás meghatározását, a hangfrekvenciás egység paramétereinek és eljárásainak leírását a VDL 3-as üzemmódú beszéd-üzemű üzemeltetéséhez a VDL 3-as Üzemmódú Műszaki Előírások Kézikönyve foglalja magába.

6.9 A VHF ADATKAPCSOLAT /VDL/ 4-ES ÜZEMMÓD

6.9.1 Egy 4-es üzemmódú állomás meg kell, hogy feleljen a 6.1.2.3, 6.1.4.2, 6.2.1.1, 6.2.3.1, 6.2.4, 6.3.1, 6.3.3.1, 6.3.4, 6.3.5.1, 6.3.5.2, 6.3.5.3, 6.3.5.4.1 és 6.9 szakaszokban meghatározott követelményeknek.

6.9.2 A VHF adatkapcsolat 4-es üzemmódjának rádió csatornái

6.9.2.1 A VHF ADATKAPCSOLAT /VDL/ 4-es ÜZEMMÓDÚ ÁLLOMÁSAINAK FREKVENCIA TARTOMÁNYA

6.9.2.1.1 *Az adó/vevő hangolási tartomány.* Egy VHF adatkapcsolat 4. üzemmódú adó/vevőnek képesnek kell lennie arra, hogy a 117,975 MHz-től a 137 MHz-ig terjedő tartományban bármelyik 25 kHz-es csatornára lehangolható legyen. Az adónak a lehangolási tartományra rendelkeznie kell egy olyan eszközzel, ami korlátozza a szűkebb sávra történő hangolást.

Megjegyzés. – Az üzemeltetési körülmények vagy bizonyos alkalmazások szükségessé tehetik azt, hogy a berendezés szűkebb frekvencia tartományban kerüljön üzemeltetésre.

6.9.2.1.2 **Ajánlás. -** *Egy VHF adatkapcsolat 4-es üzemmódú adó/vevőnek képesnek kell lennie arra, hogy a108 MHz-től a 117,975 MHz-ig terjedő tartományban bármelyik 25 kHz-es csatornára lehangolható legyen.*

Megjegyzés. – A 108 – 117,975 MHz-es sávot a Nemzetközi Távközlési Unió /ITU/ Nemzetközi Rádió-Rendszabályzatának vonatkozó előírásaival összhangban lehet felhasználni.

6.9.2.1.3 *Szimultán vétel*. Egy 4-es üzemmódú állomásnak képesnek kell lennie két csatorna egyidejű vételére.
6.9.2.1.4 **Ajánlás.** – *Egy VDL 4-es üzemmódú állomás legyen képes további csatornák egyidejű vételére, amennyiben ezt az üzemeltetési szolgáltatás megkívánja.*

6.9.2.2 GLOBÁLIS JELZŐ CSATORNA

6.9.2.2.1 Egy 4-es üzemmódú állomásnak két kijelölt frekvenciát kell használni globális jelző csatornaként (GSC), a felhasználói kommunikáció és kapcsolat kezelés funkciók fenntartására.

Megjegyzés. – Kiegészítő csatornákat meg lehet határozni egy helyi tartományban és rádión értesíteni a mobil felhasználókat a földi állomásoktól a fent definiált GSC-kről.

6.9.3 Rendszer képességek

6.9.3.1 *ATN kompatibilitás.* A VDL 4-es üzemmódú rendszernek alá kell támasztania az ATN-kiszolgáló alhálózati szolgáltatást a légtér-ellenőrzési alkalmazásokhoz.
6.9.3.2 *Adat átláthatóság*. A VDL 4-es üzemmódú rendszernek kód-független és bájt-független adat-átvitelt kell biztosítania.
6.9.3.3 *Sugárzás*. A VDL 4-es üzemmódú rendszernek kapcsolat rétegsugárzási szolgáltatást kell nyújtania.
6.9.3.4 *Ponttól-pontig*. A VDL 4-es üzemmódú rendszernek ponttól-pontig szolgáltatást kell nyújtania.
6.9.3.5 *Levegő-levegő összeköttetések*. A VDL 4-es üzemmódú rendszernek levegő-levegő összeköttetést kell biztositania, földi támogatás nélkül, valamint biztosítania kell a levegő-föld kommunikációt is.
6.9.3.6 *Kapcsolatkezelés.* A levegő-föld üzemelés alátámasztásánál a VDL 4-es üzemmódú rendszernek megbízható összeköttetési útvonalat kell létesítenie és fenntartani a légijármű és a föld között, megengedve, de nem megkövetelve,

a kézi beavatkozást.
6.9.3.7 *Földi hálózati átvitel*. Egy mozgó VDL 4-es üzemmódú DLS állomásnak az egyik VDL 4-es módozatú DLS földi állomástól egy másikra szükség esetén át kell térnie.
6.9.3.8 *Származtatott idő-képesség.* VDL 4-es üzemmódnak a vett VDL 4-es üzemmódú átvitelek érkezési idejének méréséből való idő-leszármaztatás képességét kell biztosítani, amikor kívülről leszármaztatott időbecslések nem állnak rendelkezésre.
6.9.3.9 *Szimplex üzemeltetés*. A mozgó és földi VDL 4-es üzemmódú állomásoknak hozzá kell férniük a szimplex módban működő fizikai adathordozóhoz.

6.9.4 Csatorna használat koordinálása

6.9.4.1 Körzeti alapon az átviteleket UTC szerint kell ütemezni a megosztott csatornák hatékony felhasználása és nem-szándékos idősrés újra-felhasználás elkerülése érdekében.

6.9.5 Fizikai rétegprotokollok és szolgáltatások

Megjegyzés. – Ha nincs másképpen meghatározva, az ebben a szakaszban meghatározott előírások mind a mozgó, mind a földi állomásokon érvényesek.

6.9.5.1 FUNKCIÓK

6.9.5.1.1 ÁTVITT TELJESÍTMÉNY
6.9.5.1.1.1 *Légijármű fedélzeti telepítés*. A kisugárzott teljesítménynek olyannak kell lenni, hogy egy legalább 35 mikrovolt per méter (mínusz 114,5 dBW/m^2) térerősséget szolgáltasson a szabad-térbeli terjedés alapján, olyan távolságokban és magasságokon, amelyek megfelelnek az azon területekhez tartozó feltételeknek, amelyek felett a légijármű üzemelést végez.
6.9.5.1.1.2 *Földi telepítés*.
Ajánlás. – *A kisugárzott teljesítmény olyan legyen, hogy egy legalább 75 mikrovolt per méter (mínusz 109 dBW/m^2) térerősséget szolgáltasson a létesítmény meghatározott üzemelési fedésterületén belül a szabad-térbeli terjedés alapján.*
6.9.5.1.2 AZ ADÓ ÉS VEVŐ FREKVENCIA SZABÁLYOZÁSA
6.9.5.1.2.1 A VDL 4-es üzemmód fizikai rétegnek az adó vagy vevő frekvenciát a kapcsolat kezelő entitás (LME) utasításának megfelelően kell beállítania. A csatorna kiválasztási időnek kisebbnek kell lenni, mint 13 ms, egy VSS felhasználótól jövő utasítást követően.
6.9.5.1.3 A VEVŐ ÁLTALI ADAT-VÉTEL
6.9.5.1.3.1 A vevőnek a bemenő jelet dekódolnia és továbbítania kell a magasabb rétegekhez feldolgozás céljából.
6.9.5.1.4 AZ ADÓ ÁLTALI ADAT-TOVÁBBÍTÁS
6.9.5.1.4.1 *Adat kódolás és átvitel*. A fizikai rétegnek az adatkapcsolati rétegtől vett adatokat kódolnia és továbbítania kell az RF csatornán. Az RF-továbbítás csak akkor mehet végbe, ha az adathordozó hozzáférés vezérlés /MAC/ engedélyezte.
6.9.5.1.4.2 *Továbbítási sorrend*. A továbbításnak a következő fokozatokból, a következő sorrendben kell állnia:
a) adó teljesítmény stabilizálás;
b) bit szinkronizáció;
c) félreérthetőség feloldása és adat-továbbítás; és
d) adó csillapítás.

Megjegyzés. – A fokozatok meghatározásait a 6.9.5.2.3.1-től a 6.9.5.2.3.4-ig terjedő szakaszok tartalmazzák.

6.9.5.1.4.3 *Automatikus adó kikapcsolás*. A VDL 4-es üzemmódú állomásnak le kell kapcsolnia a végfokozat erősítőhöz menő teljesítményt abban az esetben, ha az ettől a végfokozat erősítőtől jövő kimenet több mint egy másodpercig meghaladja a -30 dBm-et. Az érintett erősítő üzemelési módba történő visszaállítását kézi művelettel kell végezni.

Megjegyzés. – Ennek az a célja, hogy megvédje az elosztott csatornaforrást az úgynevezett „beragadt adóktól”.

6.9.5.1.5 ÉRTESÍTÉS SZOLGÁLTATÁS

6.9.5.1.5.1 *Jelminőség*. A berendezések működési paramétereit a fizikai rétegnél kell ellenőrizni. A jelminőség elemzést a demodulációs folyamatban és a vételi folyamatban kell végezni.

Megjegyzés. – A demodulátorban értékelhető folyamatokat a bit hiba-arány (BER), a jel/zaj arány (SNR) és az időzítő vibrálás képezik. A vevőben értékelhető folyamatok vett jelszintet és a csoport késést tartalmazzák.

6.9.5.1.5.2 *Érkezési idő*. Minden vett átvitel érkezési idejét 5 mikroszekundumos két-szigma hibával kell mérni.

6.9.5.1.5.3 **Ajánlás.** *– A vevő legyen képes az érkezési idő 1 mikroszekundomos két-szigma hibán belüli mérésre*.

6.9.5.2 A GAUSS SZŰRÉSŰ FREKVENCIA-BILLENTYŰZÉS /GFSK/ PROTOKOLL MEGHATÁROZÁSA

6.9.5.2.1 *Modulációs séma*. A modulációs sémának a GFSK-nak kell lennie. Az első átvitt bitnek (az előkészítő jelsorozatban) magas hangnak kell lennie, és a továbbított hangot billentyűzni kell, mielőtt a 0 továbbításra kerülne (azaz nullára nem-visszatérő, invertált kódolás).

6.9.5.2.2 *Modulációs sebesség*. Bináris egyeseket és bináris nullákat kell generálni 0,25 ± 0,03 BT indexszel és 0,28 ± 0,03 BT termékkel, amely 19200 bit/s ± 50 ppm sebességű adatátvitelt biztosít.

6.9.5.2.3 AZ ÁTVITEL FOKOZATAI

6.9.5.2.3.1 *Adó teljesítmény stabilizáció*. Az előkészítő jelsorozat első szegmense az adó teljesítmény stabilizáció, amelynek 16 szimbólum időtartamának kell lennie. Az adó teljesítmény-szint az állandó állapotú teljesítmény-szint 90 százalékánál kisebb nem lehet az adó teljesítmény stabilizációs szakasz végénél.

6.9.5.2.3.2 *Bit szinkronizálás*. Az előkészítő jelsorozat második szegmensének a 24-bites 0101 0101 0101 0101 0101 0101 sorozatnak kell lennie, amelyet balról jobbra haladva, közvetlenül az adat-szegmens kezdete előtt kell továbbítani.

6.9.5.2.3.3 *Félreérthetőség feloldás és adat-átvitel*. Az adatok első bitjének továbbítását 40-bites intervallumokkal (közelítőleg 2083,3 mikroszekundum ±1 mikroszekundum) az átvitel névleges megkezdése után kell elkezdeni.

1. Megjegyzés. – Ez az antenna kimenetén lévő sugárzásra vonatkozik.

2. Megjegyzés. – A félreérthetőség feloldását a kapcsolat réteg hajtja végre.

6.9.5.2.3.4 *Adó csillapítás*. Az átvitt teljesítménynek legalább 20 dB-el kell csillapodni 300 mikroszekundumon belül az átvitel befejezése után. Az adó teljesítmény-szintnek az átvitel befejezése után 832 mikroszekundumon belül kisebbnek kell lennie, mint -90 dBm.

6.9.5.3 CSATORNA ÉRZÉKENYSÉG

6.9.5.3.1 *Zaj alapszint becslés*. Egy VDL 4-es üzemmódú állomásnak meg kell becsülnie a zaj alapszintet, a csatorna teljesítmény mérésének alapján, amikor érvényes bevezető sorozatot nem észlel.

6.9.5.3.2 A zaj alapszint kiszámításához használt algoritmusnak olyannak kell lenni, hogy a kiszámított zaj alapszint alacsonyabb legyen annál a maximum teljesítmény-szintnél, amelyet a csatornán az elmúlt azon percben mértek, amikor a csatornát inaktívként vették figyelembe.

Megjegyzés. – A VHF adatkapcsolat /VDL/ 4. üzemmódú vevő egy energia-érzékelő algoritmust használ fel a csatorna állapotának (inaktív vagy aktív) meghatározási eszközeként. Egy algoritmus, amit fel lehet használni a zaj alapszint kiszámításához, a VDL 4-es Üzemmód Műszaki Előírásai Kézikönyvben került leírásra.

6.9.5.3.3 *A csatorna inaktív – aktív állapotának meghatározása.* A VHF adatkapcsolat /VDL/ 4. üzemmódú állomásnak a következő eszközöket kell alkalmazni a csatornának a fizikai rétegnél történő inaktív – aktív átmenetének meghatározásához.

6.9.5.3.3.1 *Előkészítő jelsorozatok észlelése.* A csatornát akkor kell aktívnak nyilvánítani, amikor egy VDL 4. üzemmódú állomás egy érvényes előkészítő jelsorozatot és egy azt követő keretjelzést észlel.

6.9.5.3.3.2 *A csatorna teljesítmény mérése.* A demodulátor azon képességétől függetlenül, hogy képes egy érvényes

előkészítő jelsorozat észlelésére, a VDL 4-es üzemmódú állomásnak tekintetbe kell venni egy csatorna foglaltságot 95 százalékos valószínűséggel – 1 ms-on belül azután, hogy a csatornán belüli teljesítmény a számított zaj alapszintnek legalább a négyszeresére emelkedik – legalább 0,5 milliszekundumon keresztül.
6.9.5.3.4 *A csatorna aktív – inaktív átmenetének észlelése*
6.9.5.3.4.1 Egy VHF adatkapcsolat /VDL/ 4. üzemmódú állomásnak a következő eszközöket kell alkalmazni a csatorna aktív – inaktív átmenetének észleléséhez.
6.9.5.3.4.2 *Az adás hosszának mérése.* Amikor az előkészítő jelsorozat észlelésre kerül, a csatorna aktív állapotot fenn kell tartani azon időtartamon keresztül, ami legalább 5 milliszekundumig tart, és ezt követően engedélyezett a csatorna teljesítmény mérésen alapuló inaktív állapotba történő átmenet.
6.9.5.3.4.3 *A csatorna teljesítmény mérése.* Amikor a csatorna aktív állapot nem másképpen kerül fenntartásra, akkor a VDL -es. üzemmódú állomásnak a csatornát inaktívnak kell tekinteni legalább 95 százalékos valószínűséggel – ha a csatornán belüli teljesítmény a számított zaj alapszintnek a kétszeresével egyenlő, legalább 0,9 milliszekundumon keresztül.

6.9.5.4 VEVŐ/ADÓ KÖLCSÖNHATÁS

6.9.5.4.1 *Vevő – adó átfutási idő.* Egy VHF adatkapcsolat /VDL/ 4-es üzemmódú állomásnak képesnek kell lennie az adó teljesítmény stabilizáló jelsorozat adásának megkezdésére, a vevő funkció befejezése utáni 16 mikroszekundumon belül.
6.9.5.4.2 *Frekvencia-váltás az adás során.* A vivőhullám fázis felgyorsulási idejének a szinkronizáló jelsorozat kezdetétől az adat vége jelzésig másodpercenként 300 Hz-nél kevesebbnek kell lenni.
6.9.5.4.3 *Adó – vevő átfutási idő.* Egy VHF adatkapcsolat /VDL/ 4-es üzemmódú állomásnak képesnek kell lennie egy bejövő jel névleges teljesítménnyel való vételére és demodulására egy adás befejezése után 1 ms-on belül.

Megjegyzés. – A névleges teljesítmény egy 10^{-4} *értékű bit hiba-gyakoriságként (BER) van meghatározva.*

6.9.5.5 FIZIKAI RÉTEG RENDSZER PARAMÉTEREK

6.9.5.5.1 *P1 paraméter (minimális átviteli hossz)*
6.9.5.5.1.1 A vevőnek képesnek kell lenni a P1 minimális hosszúságú átvitelnek a bit hibagyakoriság /BER/ csökkenése nélküli demodulálására.
6.9.5.5.1.2 A P1 értékének 19 200 bit-nek kell lenni.
6.9.5.5.2 *P2 paraméter (névleges közös-csatornájú interferencia teljesítmény)*
6.9.5.5.2.1 A P2 paraméternek annak a névleges közös-csatornájú interferencia értéknek kell lenni, amelynél a vevő bit hiba-gyakoriság /BER/ csökkenése nélkül képes a demodulálásra.
6.9.5.5.2.2 A P2 értékének 12 dB-nek kell lennie.

6.9.5.6 A FREKVENCIA-MODULÁCIÓS /FM/ ÁLTALÁNOS-ADÁS INTERFERENCIA VÉDETTSÉGI TELJESÍTMÉNY A VHF ADATKAPCSOLAT /VDL/ 4-es ÜZEMMÓDÚ VEVŐ RENDSZEREKRE

6.9.5.6.1 Egy VDL 4-es üzemmódú állomásnak – amikor az a 117,975 – 137 MHz-es sávban üzemel – meg kell felelnie a 6.3.5.4 pontban meghatározott követelményeknek.
6.9.5.6.2 Egy VDL 4-es üzemmódú állomásnak – amikor az a 108 – 117,975 MHz-es sávban üzemel – meg kell felelnie az alábbiakban meghatározott követelményeknek.
6.9.5.6.2.1 Egy VDL 4-es üzemmódú vevő rendszernek meg kell felelni a 6.3.5.1 pontban meghatározott követelményeknek, amikor az olyan két-jel, harmadrendű kereszt-modulációs termékek jelenlétében üzemel, amelyeket azok az ultrarövidhullámú /VHF/ frekvencia-modulált /FM/ általános-adások jelei okoznak, melyeknek a jel szintjei a következőknek felelnek meg:

$$2N_1 + N_2 + 72 \leq 0$$

a VHF FM hangfrekvenciás általános-adású jelekre a 107,7 – 108,0 MHz-es tartományban, és

$$2N_1 + N_2 + 3\left\{24 - 20\log\frac{\Delta f}{0{,}4}\right\} \leq 0$$

a VHF FM hangfrekvenciás általános-adású jelekre a 107,7 MHz alatt, ahol a két VHF FM hangfrekveciás általános-adású jelek frekvenciája létrehozza a vevőn belül a két-jel, harmadrendű kereszt-modulációs terméket a

megkívánt VDL 4-es üzemmódú frekvencián.
Az N_1 és az N_2 a jel szintjei (dBm) a két VHF FM hangfrekvenciás általános-adású jelnek a VDL 4-es üzemmódú vevő bemenetén. Egyik szint sem haladhatja meg a 6.9.5.6.2.2 pontban lefektetett érzékenység-csökkentési követelményt.
$\Delta f = 108{,}1 - f1$, ahol az f1 az *N1* frekvenciája, a 108,1 MHz-hez közelebbi VHF FM hangfrekvenciás általános-adású jel.

Megjegyzés. – A frekvencia-moduláció /FM/ kereszt-modulációs védettségi követelmények nincsenek alkalmazva a 108,1 MHz alatt üzemelő VDL 4-es üzemmódú csatornára, és ennélfogva a 108,1 MHz alatti frekvenciák általános kijelölése nincs tervezve.

6.9.5.6.2.2 A VDL 4-es üzemmódú vevő rendszernél nem kell az érzékenység csökkentést alkalmazni a 6-5. és 6-6. táblázatoknak megfelelő szintű VHF FM általános-adású jelek jelenlétében.

6.9.6 Kapcsolati réteg

Megjegyzés. – A kapcsolati réteg funkciókról a VHF adatkapcsolat /VDL/ 4-es Üzemmód Műszaki Előírásai Kézikönyv foglal magába részletes leírást.

6.9.7 Alhálózati réteg és az Alhálózat Berendezés-függő Konvergencia Szolgáltatás /SNDCF/

Megjegyzés. – Az alhálózati réteg funkciókról és az SNDCF-ről részleteket a VHF adatkapcsolat /VDL/ 4. Üzemmód Műszaki Előírási Kézikönyv tartalmaz.

6.9.8 Automatikus Berendezés-függő Légtér-ellenőrző Általános-adás /ADS-B/ alkalmazások

Megjegyzés. – Az ADS-B alkalmazási funkciókról a VHF adatkapcsolat /VDL/ 4-es Üzemmód Műszaki Előírásai Kézikönyv tartalmaz részletes leírást.

A 6. FEJEZET TÁBLÁZATAI

6-1. táblázat: A 2-es és 3-as üzemmód adatok kódolása

X_k	Y_k	Z_k	$\Delta\phi_k$
0	0	0	$0\,\pi / 4$
0	0	1	$1\,\pi / 4$
0	1	1	$2\,\pi / 4$
0	1	0	$3\,\pi / 4$
1	1	0	$4\,\pi / 4$
1	1	1	$5\,\pi / 4$
1	0	1	$6\,\pi / 4$
1	0	0	$7\,\pi / 4$

6-2. táblázat: 2. és 3. üzemmód stabilitás

VDL üzemmód	Légijármű moduláció	Földi moduláció

	stabilitás	stabilitás
2-es üzemmód	± 0,0050 százalék	± 0,0050 százalék
3-as üzemmód	± 0,0005 százalék	± 0,0002 százalék

6-3. táblázat: Rejtjelező funkciók

Funkció	Bemenő adat	Kimenő adat
Rejtjelezés	"Tiszta adat"	Rejtjelezett adat
Rejtjel feloldás	Rejtjelezett adat	"Tiszta adat"

6-4. táblázat: Fizikai szolgáltatások rendszer paraméterei

Szimbólum	Paraméter neve	2-es üzemmód érték
P1	Minimális átvitel hossz	131 071 bit

6-5. táblázat: A 108,0 – 111,975 MHz közötti frekvencián üzemelő VHF adatkapcsolat /VDL/ 4-es üzemmódú rendszerek

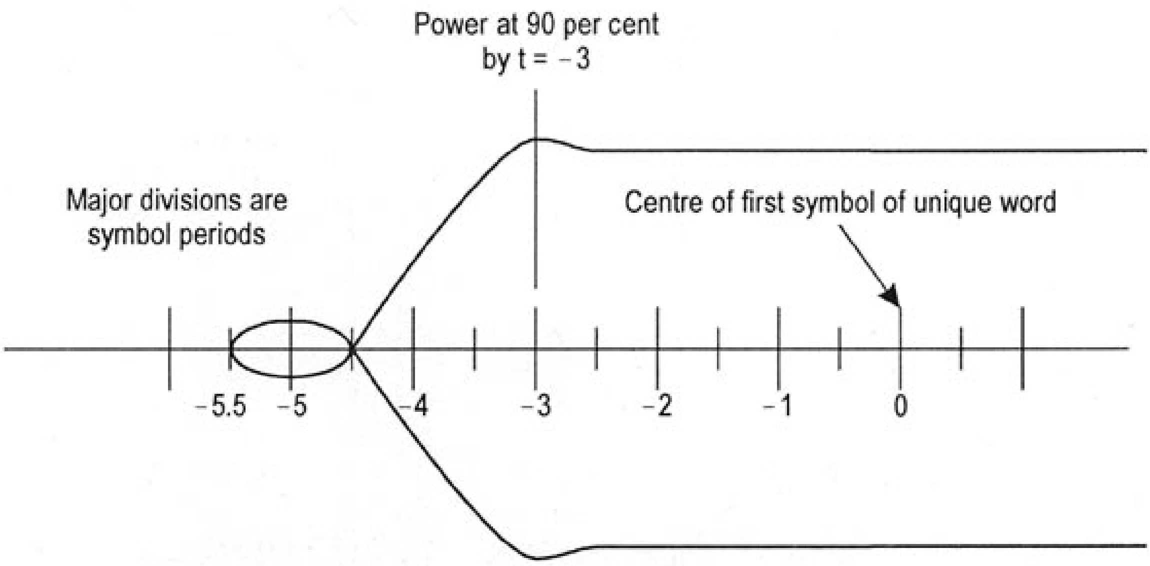
Frekvencia (MHz)	A nem-kívánt jel maximális szintje a vevő bemeneten (dBm)
88 – 102	+ 15
104	+ 10
106	+ 5
107,9	- 10

6-6. táblázat: A 112,0 – 117,975 MHz közötti frekvencián üzemelő VHF adatkapcsolat /VDL/ 4-es üzemmódú rendszerek

Frekvencia (MHz)	A nem-kívánt jel maximális szintje a vevő bemeneten (dBm)
88 – 104	+ 15
106	+ 10
107	+ 5
107,9	0

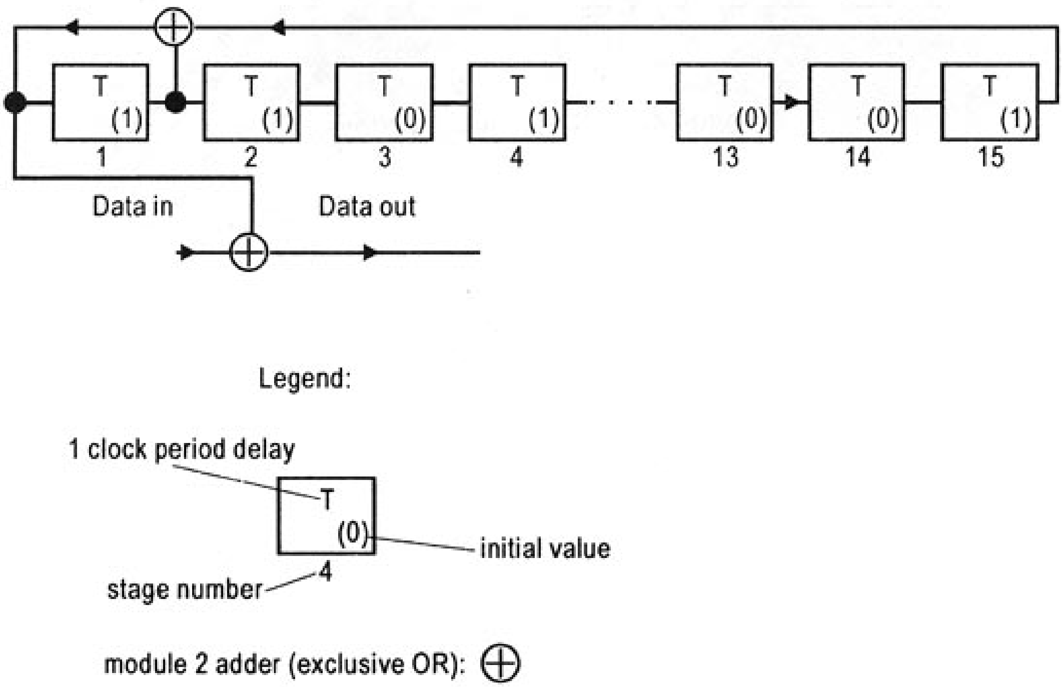
Megjegyzés. – A fenti frekvenciák által kijelölt szomszédos pontok között az összefüggés lineáris.

ÁBRÁK A 6. FEJEZETHEZ



6-1. ábra: Adó teljesítmény stabilizálás

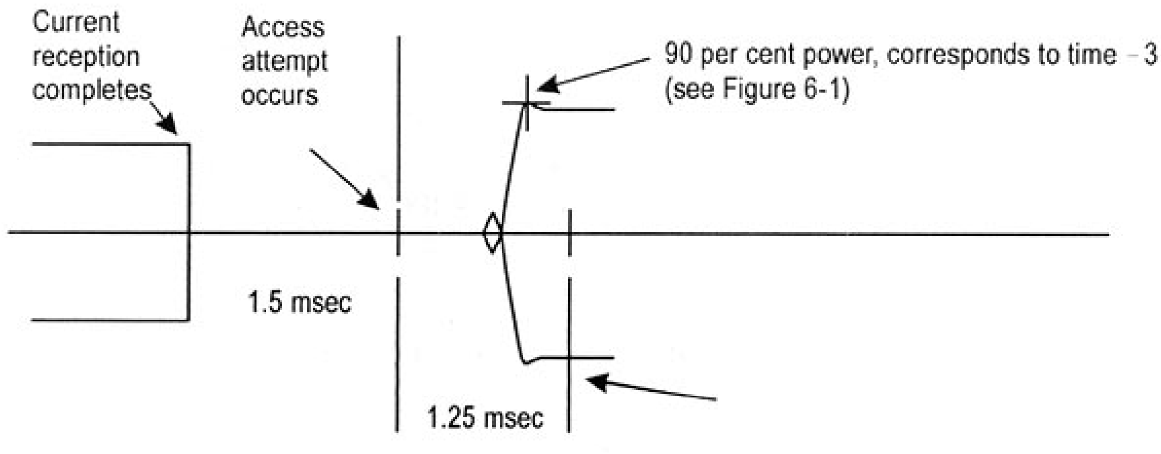
A 6-1.ábra szövegei:
1 - A teljesítmény 90 százaléknál t = -3-ig
2 - A fő felosztások a jel-periódusok
3 - Az egyedi szó jelének közepe



6-2. ábra: PN generátor a r bit rejtjelező jelsorozathoz

A 6-2. ábra szövegei:
1 - Adat be
2 - Adat ki
3 - Jelmagyarázat
4 - 1 órajel időszak késés
5 - Kezdeti érték

6 - Fokozat szám
7 - Modulo 2-es összeadás (kizáró VAGY) : ⊕



6-3. ábra: Vétel – Adás átfutási idő

A 6-3. ábra szövegei:
1 - Aktuális vétel befejeződik
2 - Hozzáférés kísérlet megjelenik
3 - 90 százalékos teljesítmény, megfelel a -3 időnek (lásd a 6-1. ábrát)

Függelék a 6. Fejezethez
HIVATKOZÁSOK

1. HIVATKOZÁSOK

A Nemzetközi Szabványügyi Szervezet (ISO) szabványaira való hivatkozások az alábbiakban felsorolt szabványok (a kiadás dátumát is magába foglalóan). Ezek az ISO szabványok a Szabványok és Ajánlott Gyakorlatokban /SARPs/ meghatározott mértékben alkalmazandók.

2. IRÁNYADÓ HIVATKOZÁSOK

Ezek a Szabványok és Ajánlott Gyakorlatok /SARPs/ a Nemzetközi Szabványügyi Szervezet /ISO/ következő dokumentumaira hivatkoznak:

7. FEJEZET. ALHÁLÓZATOK ÖSSZEKAPCSOLÁSA

(Kidolgozás alatt)

8. FEJEZET. AFTN HÁLÓZAT

8.1 MEGHATÁROZÁSOK

Data signalling rate. Adat jeladási sebesség. Az adat jeladási sebesség az idő- egység alatt átmenő információ egységekre vonatkozik és bit/másodperc-ben kerül kifejezésre. Az adat jeladási sebességet a következő képlet adja meg:

$$\sum_{i=1}^{i=m} \frac{1}{T_i} \log_2 n_i$$

ahol m a párhuzamos csatornák száma, T_i a minimális időtartam az i-edik csatornánál másodpercben kifejezve, az n_i a moduláció jellemző állapota, az i-edik csatornában.

1. Megjegyzés. –

a) Az egy csatornánál (soros átvitel) ez (1/T) log2n-re csökken; a két-állapotú modulációval (n=2) ez 1/T lesz.

b) A párhuzamos átvitelnél egyenlő minimális intervallumokkal és mindegyik csatornánál azonos jellemző állapottal ez m (1/T) log2n (m (1/T) két-állapotú moduláció esetén).

2. Megjegyzés. – A fenti meghatározásban a "párhuzamos csatorna" fogalmat a következő módon kell értelmezni: csatornák, amelyek mindegyike egy információs egység egy részét viszi át, például az egy karaktert képező bitek párhuzamos átvitele. Az olyan áramkör esetén, amelyek több olyan csatornából állnak, amelyek mindegyike "függetlenül" viszi az információt, egyedül a forgalom kezelési kapacitás növelésének céljával, ezek a csatornák nem

tekinthetők párhuzamos csatornáknak, ennek a meghatározásnak az értelmében.
Degree of standardized test distortion. Szabványosított torzítási ellenőrzési mérték. A torzítási helyreállítás mértéke, amelyet meghatározott időtartam alatt mérnek, akkor, amikor a moduláció tökéletes és megfelel egy speciális szövegnek.
Effective margin. Üzemi vétel határ. Egy egyedi berendezés teljesítőképesség határa, amelyet tényleges üzemelési körülmények között mérnek.
Low modulation rates. Alacsony modulációs sebességek. Modulációs sebességek maximálisan 300 baud értékig, azt is magába foglalóan.
Margin. Eltérési érték. Az áramkör maximális mértékű torzítása azon a végen, ahol az a berendezés elhelyezkedik, amely kompatíbilis az összes olyan jel átvitelével, amelynek vételére képes lehet.
Medium modulation rates. Közepes modulációs sebességek. Modulációs sebességek 300 baudnál nagyobb és maximálisan 3000 baud értékig, azt is magába foglalóan.
Modulation rate. Modulációs sebesség. Az elemi időköz másodpercekben mért reciproka. Ezt a sebességet baudokban fejezik ki.
Megjegyzés. – A távirati jeleket olyan időintervallumokkal jellemzik, amelyek hossza egyenlő vagy nagyobb, mint a legrövidebb elemi időköz. A modulációs sebességet (azelőtt telegrafikus sebesség) ezért ennek az egység időtartamnak az inverzeként fejezik ki. Ha például az elemi időköz 20 milliszekundum, akkor a modulációs sebesség 50 baud.
Synchronous operation. Szinkron működés. Olyan működés, amelyben a kód- egységek közötti időintervallum állandó.

8.2 AZ AFTN-BEN HASZNÁLATOS TÁVGÉPÍRÓ KÉSZÜLÉKEKRE ÉS ÁRAMKÖRÖKRE VONATKOZÓ MŰSZAKI ELŐÍRÁSOK

8.2.1. Az AFTN nemzetközi távgépíró áramkörökben használt 5-egységes kódot, a 2.számú Nemzetközi Távíró ABC-t (International Telegraph Alphabet No.2) (lásd a 8-1. táblázatot) csak a II. kötet, 4.1.2 pontjában leírt mértékig kell használni.
8.2.2 **Ajánlás.** – *A modulációs sebességet az illetékes szervek közötti kétoldalú vagy többoldalú egyezmény alapján kell meghatározni, elsődlegesen a forgalom nagyságának figyelembevételével.*
8.2.3 **Ajánlás.** – *Az átviteli ciklus névleges időtartamának legalább 7,4 egységnek kell lenni (ajánlatos érték 7,5), a stop elem legalább 1,4 egységen át tartson (ajánlott érték 1,5).*
8.2.3.1 **Ajánlás.** – *A vevőnek képesnek kell lenni üzem közben helyesen továbbítani az adótól jövő jeleket 7-egységes névleges átviteli ciklus mellett.*
8.2.4 **Ajánlás.** – *Üzemben lévő készüléket úgy kell karbantartani és beállítani, hogy a használatos üzemi vétel határa soha ne legyen 35 százaléknál kevesebb.*
8.2.5 **Ajánlás.** – *Az oldal-nyomtató készülék egy szövegsora által tartalmazható karakterek számát 69-ben kell rögzíteni.*
8.2.6. **Ajánlás.** – *Az automatikus idő-késleltető kapcsolóval felszerelt start-stop készülékekben a motor áramellátását csak az utolsó jel vétele után eltelt legalább 45 másodperces kihagyás után szabad megszakítani.*
8.2.7 **Ajánlás.** – *Lépéseket kell tenni annak érdekében, hogy elkerülésre kerüljön a jel-lyukvesztés a továbbított közlemények fej-részénél és a start-stop vételénél az újra-lyukasztó berendezéseknél.*
8.2.7.1 Ha az újra-lyukasztó készülék el van látva helyi eszközökkel a papír-tápláláshoz, akkor egynél több csonkolt üzenetet nem tolerálhat.
8.2.8 **Ajánlás.** – *A teljes áramköröket úgy kell műszakilag kezelni és karbantartani, hogy a szabványosított torzítási ellenőrzési mérték torzulása ne haladja meg a szabványosított szövegben a 28 százalékot:*
THE QUICK BROWN FOX JUMPS OVER THE LAZY DOG* /Magyar jelentése: A gyors barna róka átugorja a lusta kutyát./
vagy
VOYEZ LE BRICK GEANT QUE JEXAMINE PRES DU WHARF
8.2.9 **Ajánlás.** – *Az izochron torzulás mértéke egy teljes áramkör részei mindegyikének szabványosított szövegében a lehető legkisebb legyen és semmi esetre sem haladhatja meg a 10 százalékot.*
8.2.10 **Ajánlás.** – *A teljes torzítás a távgépíró csatornákban használt átviteli berendezésekben nem haladhatja meg az 5 százalékot.*
8.2.11 **Ajánlás.** – *Az AFTN áramköröket a csatorna állapotot folytonosan ellenőrző rendszerrel kell felszerelni. Ezenkívül ellenőrzött áramköri protokollokat kell alkalmazni.*

8.3 A 2,5 – 30 MHz-es SÁVBAN MŰKÖDŐ LÉGIFORGALMI RÁDIÓ-TÁVGÉPÍRÓ CSATORNÁKHOZ KAPCSOLÓDÓ VÉG-BERENDEZÉSEK

8.3.1 Moduláció és kód típus kiválasztása

8.3.1.1 **Ajánlás.** – *A frekvencia-eltolás modulációt (FIB) kell alkalmazni a légiforgalmi állandó-helyű szolgálatokban (AFS) használt rádió-távgépíró rendszerekben, kivéve ott, ahol a független oldalsáv (ISB) operációs módszer jellemzői előnyöket jelentenek.*

Megjegyzés. – A FIB típusú modulációt a rádiófrekvenciás vivőhullámnak a két frekvenciája közötti eltolásával valósítják meg, a start-stop 5-egységes távíró kóddal, az "A helyzet"-et jelentő (start jel) polaritással és a "Z helyzet"-et jelentő (stop jel) polaritással.

8.3.2 Rendszer jellemzők

8.3.2.1 **Ajánlás.** – *Az FIB modulációt használó rádió-távgépíró adótól jövő jelek jellemzői a következők:*

a Frekvencia-eltolás: *a legkisebb lehetséges érték*

b) Frekvencia-eltolás tűrés: *a frekvencia eltolás névleges értékének plusz vagy mínusz 3 százalékán belül.*

c) Polaritás: egy-csatornás áramkörök: *a magasabb frekvencia felel meg az "A helyzet"-nek (start jel polaritás).*

8.3.2.2 **Ajánlás.** – *Az "A helyzet"-et és "Z helyzet"-et reprezentáló rádió frekvenciák közötti középérték változása semmilyen két-órás periódus alatt sem haladhatja meg a 100 Hz-et.*

8.3.2.3 **Ajánlás.** – *A távgépíró jel teljes torzulása, ahogyan a rádió adó kimeneténél vagy közvetlen szomszédságában ellenőzik, nem haladhatja meg a 10 százalékot.*

Megjegyzés. – Az ilyen torzulás az elemek közötti átmenetek idejében a helyes pozíciójuktól való elmozdulásokat jelenti az egység elem-idő százalékában kifejezve.

8.3.2.4 **Ajánlás.** – *FIB modulációs rádió-távgépíró vevőknek képeseknek kell lenniük olyan jelekkel való kielégítő működésre, amelyek a korábbi 8.3.2.1 és 8.3.2.2 pontokban ismertetett jellemzőkkel rendelkeznek.*

8.3.2.5 **Ajánlás.** – *Távgépíró jelek rádió áramkörön keresztüli több-csatornás átviteli jellemzőit az érintett hivatalos szerveknek egyezmények alapján kell meghatározniuk.*

8.4 AZ INTERREGIONÁLIS LÉGIFORGALMI ÁLLANDÓ-HELYŰ SZOLGÁLATOK /AFS/ ÁRAMKÖREINEK JELLEMZŐI

8.4.1 Ajánlás. – *A megvalósításra vagy tökéletesítésre kerülő interregionális AFS áramköröknek kiváló minőségű távközlési szolgáltatást kell alkalmazniuk. A modulációs sebességnél figyelembe kell venni a szabályos és a kitérő útvonal feltételek között várható forgalom nagyságát.*

8.5 A LÉGIFORGALMI SZOLGÁLATI /ATS/ KÖZLEMÉNYEK ÁTVITELÉRE VONATKOZÓ MŰSZAKI ELŐÍRÁSOK

8.5.1. Közvetlen vagy gyűjtő csatornák – alacsony modulációs sebességek – 5-egységű kódok.

Megjegyzés. – Lásd az alábbi 8.6 pontban a közepes modulációs sebességeket.

8.5.1.1 **Ajánlás.** – *Az AFTN eljárásokat (lásd a fenti 8.2 pontot) kell használni.*

8.6 A KÖZEPES ÉS MAGASABB JELADÁSI SEBESSÉGGEL TÖRTÉNŐ NEMZETKÖZI FÖLD-FÖLD KÖZÖTTI ADATCSERÉRE VONATKOZÓ MŰSZAKI ELŐÍRÁSOK

Megjegyzés. – Ebben a szakaszban a kódolt karakter készletekre vonatkozó szövegekben az "egység" fogalom a szelektív információs egységet jelenti, és lényegében egyenlő a "bit" fogalmával.

8.6.1 Általános rész

8.6.1.1 **Ajánlás.** – *A karakterek nemzetközi adatcseréjénél a 128-karakteres repertoárt szolgáló 7-egységes kódolású karakter- készletet kell használni, amelyet Nemzetközi Távíró ABC 5. számú (IA-5) (International Telegraph Alphabet*

No.5) (IA-5) jelzéssel jelöltek. A Nemzetközi Távíró ABC 2. sz. (ITA-2) (International Telegraph Alphabet No.2 (ITA-2)) 5-egységes kódolású karakter- készletével való kompatibilitást - ahol megvalósítható - biztosítani kell.
8.6.1.2 Amikor a fenti 8.6.1.1 pont előírásait alkalmazzák, akkor a 8-2. táblázatban lévő *Nemzetközi Távíró ABC 5. számú* (International Alphabet No.5) (IA-5)-öt kell használni.
8.6.1.2.1 Az IA-5 egy egyedi karakterére szorítkozó egységek soros átvitelénél a jobb szélső egység (b_1) átvitelét kell elsőnek végrehajtani.
8.6.1.2.2 **Ajánlás.** – *Az IA-5 használata esetén mindegyik karakternek egy, a paritásra vonatkozó további egységet kell tartalmaznia a nyolcadik szint helyzetben.*
8.6.1.2.3 Amikor a fenti 8.6.1.2.2 pont előírásait alkalmazzák, akkor a karakter paritás bitnek páros paritást kell adnia azokban a kapcsolatokban, amelyek a start-stop alapelven működnek, és páratlan paritást azoknál a kapcsolatoknál, amelyek végponttól-végpontig szinkronüzemelést alkalmaznak.
8.6.1.2.4 A karakter-karakter átalakítás meg kell, hogy feleljen a 8-3. és a 8-4. táblázatban megadottaknak az összes karakterre, amely az AFTN formátumban az AFS átvitelre elő van írva az IA-5-ben és az ITA-2-ben egyaránt.
8.6.1.2.5 Azok a karakterek, amelyek csak egy kód-készletben jelennek meg, vagy amelyek nincsenek átvitelre engedélyezve az AFS-n, a kód átalakítási táblázatoknak megfelelően megrajzoltaknak kell lenniük.

8.6.2 Adat átviteli jellemzők

8.6.2.1 **Ajánlás. -** *Az adat jeladási sebességet az alábbiak közül kell kiválasztani:*
600 bit/s
1200 bit/s
2400 bit/s
4800 bit/s
9600 bit/s
8.6.2.2 **Ajánlás.** – *Az átvitel típusát az egyes adat jelzési sebességekhez a következők szerint kell kiválasztani:*

Adat jeladási sebesség	Az átvitel típusa
600 bit/s	*Szinkron vagy aszinkron soros átvitel*
1200 bit/s	*Szinkron vagy aszinkron soros átvitel*
2400 bit/s	*Szinkron soros átvitel*
4800 bit/s	*Szinkron soros átvitel*
9600 bit/s	*Szinkron soros átvitel*

8.6.2.3 **Ajánlás.** – *A moduláció típusát az egyes adatjeladási sebességekhez a következők szerint kell kiválasztani:*

Adat jeladási sebesség	A moduláció típusa
600 bit/s	*Frekvencia*
1200 bit/s	*Frekvencia*
2400 bit/s	*Fázis*
4800 bit/s	*Fázis*
9600 bit/s	*Fázis-amplitúdó*

Megjegyzés. – Ez az ajánlás nem feltétlen érvényes a kizárólag levegő-föld adatok átvitelére használt levegő-föld kapcsolatok föld-föld kierjesztésére, mivel az ilyen áramkörök a levegő-föld kapcsolat részének tekinthetők.

8.6.2.4 AZ ADATKAPCSOLATOK KARAKTER SZERKEZETE

8.6.2.4.1 Karakter paritást hibaellenőrzésre a CIDIN kapcsolatokon nem használnak. Az IA-5 kódolt karakterekbe illesztett paritást, a fentebbi 8.6.1.2.2 pont szerint a CIDIN-be való bevitel előtt figyelmen kívül kell hagyni. A CIDIN-ből kilépő közleményeknél a paritást a 8.6.1.2.3 pontnak megfelelően kell létrehozni.
8.6.2.4.2 A hosszúságban nyolc bitnél kisebb karaktereket nyolc bit hosszúságra kell kiegészíteni, mielőtt valamilyen oktett bázisú vagy bit-orientált kommunikációs hálózaton keresztül továbbítanák őket. A kitöltő bitek az oktett magasabb értékű végét foglalják el, azaz a 8-as bitet, 7-es bitet, ahogyan szükséges és 0 bináris értékkel rendelkeznek.
8.6.2.5 Amikor a CIDIN kapcsolatokon az adatok cseréjéhez bit-orientált eljárásokat használnak, a belépési központ címzés a kilépési központ címzések és a rendeltetési hely címzések a "Transport and CIDIN Packet Headers"-ben a 8-2. táblázatban lévő IA-5 karakter-készletben találhatóknak megfelelők kell, hogy legyenek.
8.6.2.6 **Ajánlás.** – *Amikor CIDIN kapcsolatokon keresztül AFTN formátumban bit-orientált eljárást használva továbbítanak közleményeket, akkor a közleményeknek a 8-2. táblázatban található IA-5 karakter-készletben lévő karaktereknek kell megfelelniük.*

8.6.3 Föld-föld karakter-orientált adatkapcsolat vezérlő eljárások

Megjegyzés. – Ennek a szakasznak az előírásai a föld-föld adat-csere alkalmazásokhoz tartoznak, amelyek a fentebbi 8.6.1 pont által leírt IA-5 konvertálást használják, és amely a tíz átviteli szabályozási karaktert (SOH, STX, ETX, EOT, ENQ, ACK, DLE, NAK, SYN és ETB) alkalmazza az adatkapcsolat szabályozásra, szinkron vagy aszinkron adatátviteli berendezés felett.

8.6.3.1 *Meghatározások.* A következő meghatározásokat kell használni az ebben a szakaszban szereplő adatkapcsolat alkalmazásokhoz:
a) Vezér-állomás az az állomás, amely adott pillanatban adatkapcsolati vezérléssel rendelkezik.
b) Mellék-állomás az, amely arra került kiválasztásra, hogy vegye a vezér-állomástól jövő továbbítást.
c) Vezérlő állomás az az egyedüli állomás egy többpontos kapcsolatban, amelynek megengedett a vezérlő állomás helyzet felvétele és a közlemények továbbítása egy vagy több egyedileg kiválasztott (nem-vezérlő) alárendelt állomásnak, vagy megengedett részére az, hogy vezér-állomás állapotot jelöljön ki azi alárendelt állomás bármelyikének.

8.6.3.2 KÖZLEMÉNY ÖSSZEÁLLÍTÁSA

a) Az adat-átvitelnek az IA-5 karakterekből kell állni, amelyeket a korábbi 8.6.1.2.2 pontnak megfelelően továbbítanak, és az vagy egy információs közlemény vagy egy ellenőrző jelsorozat.
b) Egy információs közlemény, amelyet adatcseréhez használnak, a következő formák egyikét veszi fel:

	S				E	B	(STX = a szöveg indulása)			
1)	T	- - -	SZÖVEG	- - -	T	C	(ETX = a szöveg vége)			
	X				X	C	(BCC = blokk ellenőrző karakter)			
							(ETB = az átviteli blokk vége)			
	S				E	B	(SOH = a fejrész kezdete)			
2)	T	- - -	SZÖVEG	- - -	T	C				
	X				B	C				
	S				S				E	B
3)	O	- - -	FEJ-RÉSZ	- - -	T	- - -	SZÖVEG	- - -	T	C
	H				X				X	C
	S				S				E	B
4)	O	- - -	FEJ-RÉSZ	- - -	T	- - -	SZÖVEG	- - -	T	C
	H				X				B	C
	S				E	B				
5)	O	- - -	FEJ-RÉSZ	- - -	T	C				
	H				B	C				

B
1. Megjegyzés. – A C egy blokk ellenőrző karakter (BCC).
C

2. Megjegyzés. – A fenti 2), 4) és 5) formátumokban, amelyek ETB-vel végződnek, bizonyos folytatás szükséges.

c) Az ellenőrző sorozatot vagy egyedi átviteli vezérlő karakterekből kell összeállítani (EOT, ENQ, ACK vagy NAK), vagy egy egyedül álló átvitel vezérlő képezi (ENQ), amelyet egy maximum 15 nem-vezérlő karakterből álló előtag előz meg, vagy a DLE karakter, amelyet más grafikus vagy vezérlő karakterrel együttesen használnak, és vezérlő karakterek, amelyek kiegészítő adatátvitel vezérlő funkciókat látnak el.

8.6.3.3 Három rendszer kategóriát határoztak meg a megoldandó feladataiknak megfelelően, áramköri jellemzőik, végberendezés konfigurációik és közlemény átviteli eljárásaik szerint, mégpedig a következőket:
"A" rendszer kategória: két-irányú több-pontos, amely lehetővé tesz akár centralizált, akár nem-centralizált üzemelést és egyedüli vagy többszörös, közlemény- orientált információ átviteleket válasz nélkül (de kézbesítési megerősítéssel).
"B" rendszer kategória: két-irányú egyidejű áramkörű, ponttól-pontig alkalmazású közlemény-összerendelésű blokkolással és modulo 8 blokk számozással és nyugtázással.
"C" rendszer kategória: két-irányú alternatív, több pont közötti, amely csak centralizált (számítógép-terminál)

üzemelést, egyedi vagy többszörös közlemény- továbbításokat válasszal tesz lehetővé.
8.6.3.3.1 Azokon a jellemzőkön kívül, amelyek mindkét, az "A" és "B" rendszer kategóriákat követő pontokban vannak előírva, más paraméterek is vannak, amelyeket figyelembe kell venni ahhoz, hogy biztosítsák a használható, megbízhatóan üzemelő összeköttetést, ezek a következők:
a) A szinkronizáció létrehozásához és fenntartásához szükséges SYN karakterek száma;

Megjegyzés. – Általában a továbbító állomás három egymást követő SYN karaktert küld és a vevő állomás legalább kettőt vesz, mielőtt bármilyen tevékenységet végrehajtana.

b) A rendszer szünetelések értékei olyan funkcióknál, mint a “szabad vonal” és a “nincs válasz”, valamint az automatikus újra-keresések száma, ahányszor ezt meg kell kísérelni a manuális beavatkozás jelzése előtt;
c) Az előtagok kompozíciója maximum 15 karakteren belül.

Megjegyzés. – Az illetékes hatóságok közötti megegyezés alapján megengedhető az ellenőrző jeleknél az, hogy állomásazonosító előtagot foglaljanak magukba az IA-5-nek a 4-7. oszlopaiból választott karakterek felhasználásával.

8.6.3.3.2 **Ajánlás.** – *A több-pont alkalmazásoknál, amelyeknél csak a centralizált (számítógép-terminál) üzemelés a megengedett, a 8.6.3.7 pont rendelkezéseit kell alkalmazni.*

8.6.3.4 BLOKK ELLENŐRZŐ KARAKTER

8.6.3.4.1 Mind az "A", mind a "B" rendszer kategóriának blokk ellenőrző karaktert kell használni egy átvitel érvényességének a meghatározásához.
8.6.3.4.2 A blokk ellenőrzésű karaktert 7 bit plusz egy paritás bit együttese alkotja.
8.6.3.4.3 A blokk ellenőrzésű karakter első 7 bitjének mindegyike modulo 2 bináris összege az átvitt blokk egymást követő karakterei ugyanazon 1-es bit-től 7-es bitig terjedő oszlopában lévő elemeknek.
8.6.3.4.4 A blokk egyes oszlopai hosszirányú paritás ellenőrzésének, beleértve a blokk ellenőrző karaktert is, párosnak kell lenni.
8.6.3.4.5 A blokk ellenőrzésű karakter paritás bitjének ugyanaz az értelme, mint ami az információs karaktereknél van (lásd a korábbi 8.6.1.2.3. pontot).
8.6.3.4.6 *ÖSSZEGEZÉS*
8.6.3.4.6.1 A blokk ellenőrzésű karakter megkapását célzó összegezés vagy a SOH (a fej-rész elkezdése) vagy a STX (a szöveg elkezdése) első megjelenésénél kezdődik.
8.6.3.4.6.2 Az indulási karaktert az összegezés nem tartalmazhatja.
8.6.3.4.6.3 Ha egy STX karakter azután jelenik meg, hogy az összegezést a SOH elindította, akkor az STX karaktert az összegezésnek úgy kell tartalmaznia, mintha szöveg-karakter lenne.
8.6.3.4.6.4 A SYN (szinkronizáló karakter) kivételével az összes karaktert, amelyet a blokk ellenőrzés összegezés után továbbítottak, az összegezésnek tartalmazna kell, beleértve az ETB (átvitel/blokk vége) vagy az ETX (szöveg vége) vezérlő karaktert is, amelyek jelzik, hogy a következő karakter a blokk ellenőrző karaktere lesz.
8.6.3.4.7 Semmilyen karaktert, SYN-t vagy mást, nem lehet az ETB vagy ETX karakter és a blokk ellenőrző karakter közé beilleszteni.

8.6.3.5 *Az "A" rendszer kategória leírása.*

Az "A” rendszer kategória olyan rendszer kategória, amelyben számos állomás egy több-pont kapcsolással van összekötve és egy állomás folyamatos vezérlő állomásnak van kijelölve, amely a kapcsolatot figyeli azért, hogy a rendszerüzemelést biztosítsa.

8.6.3.5.1 *KAPCSOLAT LÉTREHOZÁSI ELJÁRÁS*

8.6.3.5.1.1 Ahhoz, hogy a kapcsolatot az átvitelhez létrehozzák, a vezérlő állomás vagy
a) kiválasztja az alárendelt állomások egyikét ahhoz, hogy vezér-állomásként jelölje ki azt; vagy
b) felveszi a vezérlő állomás szerepét, és kiválaszt egy vagy több alárendelt állomást (mellék-állomás) az átvitel vételére.
8.6.3.5.1.2 A lekérdezést úgy kell elvégezni a vezérlő állomásnak, hogy egy lekérdező ellenőrző jelsorozatot küld, amely az egyedi mellékállomást azonosító előtagból áll és ENQ-ban végződik.

8.6.3.5.1.3 Az alárendelt állomásnak, amely észleli a lekérdező ellenőrző jelsorozatot, fel kell vennie a vezér-állomás állapotot, és a az alábbi két mód egyikével kell válaszolnia:
a) ha az állomásnak közleménye van továbbítás céljára, akkor kiválasztási ellenőrző jelsorozatot kezdeményez, ahogyan az a 8.6.3.5.1.5 pontban az alábbiakban leírásra kerül;
b) ha az állomásnak nincs közleménye továbbítás céljára, akkor egy EOT-t (adatátvitel vége) küld, és a vezér-állomás helyzet visszaáll a vezérlő állomásra.
8.6.3.5.1.4 Ha a vezérlő állomás érvénytelen választ észlel, vagy nem észlel választ a lekérdezésére, akkor egy EOT küldésével zár, mielőtt a lekérdezésre vagy a kiválasztásra visszatérne.
8.6.3.5.1.5 A kiválasztást a kijelölt vezér-állomásnak kell végrehajtania egy kiválasztási ellenőrző jelsorozat küldésével, amely egy egyedi állomás azonosítójából és az ENQ-ból áll.
8.6.3.5.1.6 Egy állomás, amely kijelölő kiválasztó ellenőrző jelsorozatát észlel, mellék-állomás állapotot vesz fel és az alábbi két válasz egyikét küldi:
a) ha az állomás vételre kész, egy előtagot küld, amelyet az ACK követ. E válasz észlelése utána a vezér állomásnak vagy egy másik állomás kell kiválasztania, vagy a közlemény továbbításával folytatnia.
b) ha az állomás vételre nem kész, egy előtagot küld, amelyet a NAK követ és ezáltal feladja a mellék-állomás kiszolgáló helyzetét. Ha a vezér-állomás veszi a NAK-ot, vagy ha nincs válasz, akkor vagy egy másik állomást vagy ugyanazt az "A" alárendelt állomást választja ki, vagy lezár.
c) N-újra-próbálkozás $(N \geq 0)$ engedélyezhető egy állomás részére, hogy egy olyan állomást válasszon, amelytől NAK /negatív nyugtázás/ érvénytelen válasz vétele történt, vagy semmilyen választ nem vettek.
8.6.3.5.1.7 Ha egy vagy több állomást választottak ki, és helyesen választottak az ACK-val, akkor a vezér-állomás a közlemény átvitellel folytatja.

8.6.3.5.2 *KÖZLEMÉNY ÁTVITELI ELJÁRÁS*
8.6.3.5.2.1 A vezér-állomás közleményt vagy közlemény-sorozatot küld fej-résszel vagy anélkül a kiválasztott mellék- állomás (ok) nak.
8.6.3.5.2.2 A közlemény átvitele:
a) kezdődik:
- SOH-el, ha a közlemény fej-résszel rendelkezik;
- STX-el, ha a közlemény nem rendelkezik fej-résszel;
b) folytatódik, és ETX-el végződik, amelyet közvetlenül egy blokk ellenőrző karakter (BCC) követ.
8.6.3.5.2.3 Egy vagy több közlemény továbbítása után a vezér-állomásnak ellenőriznie kell a sikeres kézbesítést mindegyik kiválasztott mellék-állomásnál.

8.6.3.5.3 *KÉZBESÍTÉSI ELLENŐRZÉSI ELJÁRÁS*

8.6.3.5.3.1 A vezér-állomásnak egy kézbesítési ellenőrzési jelsorozatot kell küldenie, amely az egyedi mellék-állomás azonosító jeléből és az ENQ-ból áll.
8.6.3.5.3.2 Egy mellék-állomás, amely észleli a kézbesítési ellenőrzési jelsorozatot, az alábbi két válasz közül az egyiket küldi:
a) ha a mellék-állomás helyesen vette az összes átvitelt, egy tetszőlegesen választott előtagot küld, amelyet az ACK követ;
b) ha a mellék-állomás nem vette helyesen az összes átvitelt, egy tetszőlegesen választott előtagot küld, amelyet a NAK követ.
8.6.3.5.3.3 Ha a vezér-állomás nem vesz választ, vagy érvénytelen választ vesz, ismétlést kell kérnie ugyanattól vagy egy másik mellék-állomástól addig, amíg az összes kiválasztott állomás helyesen "összeszámolásra nem kerül".
8.6.3.5.3.4 Ha a vezér-állomás negatív választ (NAK) vesz, vagy $(N \geq 0)$ ismételt kísérlet után nincs válasz, akkor ezt a lekérdezést a megfelelő mellék- állomásoktól egy későbbi alkalommal meg kell ismételnie.
8.6.3.5.3.5 Azután, hogy az összes közleményt elküldték, és a kézbesítést igazolták, a vezér-állomásnak le kell zárnia a kapcsolatot.

8.6.3.5.4 *KAPCSOLAT LEZÁRÁS ELJÁRÁS*

8.6.3.5.4.1 A lezárás funkciót, tagadva az összes állomás vezér- vagy mellék-állomás helyzetét, visszaadva a vezér helyzetet a vezérlő állomásnak, a vezér- állomás végzi el az EOT továbbításával.

8.6.3.6 *A "B" rendszer kategória leírása.* A "B" rendszer kategória olyan kategória, amelyben két állomás ponttól-pontig duplex kapcsolatban van, és mindegyik állomásnak megvan a képessége, hogy párhuzamosan fenntartson vezér- és mellék-állomás állapotot, azaz vezér helyzetet a továbbító oldalán és mellék állapotot a vevő oldalán, és mindkét állomás egy időben tud továbbítani.

8.6.3.6.1 *KAPCSOLAT LÉTREHOZÁSI ELJÁRÁS*

8.6.3.6.1.1 A kapcsolat létrehozása közlemény továbbításokhoz (a hívó állomástól a hívott állomáshoz), a hívó állomásnak kérni kell a hívott állomás azonosítását egy azonosító ellenőrző jelsorozat küldésével, amely egy DLE-ből, egy kettőspont karakterből, egy tetszőlegesen választható előtagból és az ENQ-ból áll.
8.6.3.6.1.2 A hívott állomásnak, miután az ENQ-t észlelt, az alábbi két válasz egyikét kell elküldenie:
a) ha vételre kész, akkor egy jelsorozatot küld, amely egy DLE-ből, egy azt követő kettőspontból, egy előtagból, amely az azonosítást végzi és az ACK0-ból áll (lásd az alábbi 8.6.3.6.2.5 pontot). Ez létrehozza a kapcsolatot a közleménynek a hívó állomástól a hívott állomáshoz történő átviteléhez;
b) ha vételre nem kész, a fenti sorozatot küldi az ACK0-t helyettesítő NAK-al.
8.6.3.6.1.3 A kapcsolat létrehozását a közlemény átvitelekhez az ellenkező irányban, az áramköri kapcsolást követő bármely időpontban, hasonló módon kell kezdeményezni, mint ahogy az a fentiekben le van írva.

8.6.3.6.2 *KÖZLEMÉNY ÁTVITELI ELJÁRÁS*

8.6.3.6.2.1 A "B" rendszer kategória közlemény-továbbítás hosszúsági ellenőrzéssel összekapcsolt blokkolást és modulo 8 számozású nyugtázásokat szolgáltat a közlemény részére.
8.6.3.6.2.2 Az átviteli blokk egy teljes üzenet, vagy egy üzenet-rész is lehet. A küldő állomásnak az átvitelt az SOTB N-el kell kezdeményezni, amelyet az alábbiak követnek:
a) SOH, ha ez egy olyan közlemény kezdete, amely fej-részt tartalmaz;
b) STX, ha ez egy olyan közlemény kezdete, amelynek nincs fej-része;
c) SOH, ha ez egy közbenső blokk, amely egy fej-részt folytat;
d) STX, ha ez egy közbenső blokk, amely szöveget folytat.

Megjegyzés. – Az SOTB N a két-karakteres átviteli vezérlési sorozat DLE = (1/0 és 3/13 karakterek), amelyet az N blokkszám követ, ahol N az IA-5 karakterek egyike 0,1 . . ., 7 (3/0, 3/1, … 3/7 karakterek) .

8.6.3.6.2.3 Egy olyan blokkot, amely egy közleményen belüli közbenső pontban végződik, ETB-vel kell befejezni; egy blokkot, amely a közlemény végénél fejeződik be, ETX-el kell befejezni.
8.6.3.6.2.4 Minden állomásnak megengedett hogy kezdeményezze vagy folytassa a közlemény küldését a másiknak, párhuzamosan, a következő sorrendnek megfelelően:
a) A küldő állomás részére (vezér-állomás) megengedett az, hogy közleményeket vagy közlemény-részeket blokkok formájában folyamatosan küldje a vevő állomásnak (mellék-állomás) anélkül, hogy válaszra várna.
b) A válaszok részére megengedett az, hogy mellék-állomás válaszok formájában továbbítson vevő-állomás, miközben a küldő állomás küldi az egymás után következő blokkokat.

Megjegyzés. – A blokkok és válaszok modulo 8 számozásának használatával megengedhető a küldő állomásnak még hét blokk küldése is a vett válaszok előtt, mielőtt megkövetelnék a továbbítás leállítását addig, amíg hat vagy kevesebb blokk marad meg.

c) Ha negatív választ vesznek, akkor a küldő állomásnak (vezér-állomás) meg kell kezdenie az utolsó blokkot követő blokkal az újra-átvitelt, attól a blokktól kezdődően, amelynél a helyes pozitív nyugtázást vette.
8.6.3.6.2.5 A mellék-állomás válaszoknak a következők valamelyikének kell lenni:
a) ha az átviteli blokkot hiba nélkül veszik és az állomás egy másik blokk vételére kész, akkor egy DLE-t kell küldenie, egy kettőspontot, egy tetszőleges előtagot és a megfelelő ACKN nyugtázást (hivatkozva az SOTB N-el kezdődő vett blokkra, pl. ACK0-t, amelyet DLE0-ként visznek át, a SOTB0, DLE1 számozású blokkra adott pozitív válaszként használnak az SOTB1-nél stb.);
b) ha egy átviteli blokk nem elfogadható, akkor a vevő állomás DLE-t, kettőspontot, tetszőleges előtagot és a NAK-ot fogja elküldeni.

8.6.3.6.2.6 **Ajánlás.** – *A mellék-állomás válaszokat a közlemény blokkok közé kell beiktatni és a lehető legkorábbi időben továbbítani.*

8.6.3.6.3 *KAPCSOLAT BEFEJEZÉSI ELJÁRÁS*

8.6.3.6.3.1 Ha a kapcsolatot létrehozták a közlemény átvitelekhez az egyik vagy mindkét irányban, az EOT egy állomás általi küldése a közlemény továbbítások befejezését jelzi abban az irányban. Az EOT elküldése után a közlemény továbbítás folytatásához a kapcsolatot abban az irányban újra létre kell hozni.
8.6.3.6.3.2 Az EOT-t egy állomás csak az összes hátralévő mellék-állomási válaszok vétele, vagy más módú figyelembevétele után továbbítja.

8.6.3.6.4 *AZ ÁRAMKÖR SZÉTKAPCSOLÁSA*

8.6.3.6.4.1 A kapcsolt összeköttetéseknél az adatkapcsolatokat mindkét irányban be kell fejezni, mielőtt az összeköttetés szétkapcsolásra kerülne. Ezenkívül az összeköttetés törlését kezdeményező állomás jelenti be először ilyen irányú szándékát a két-karakteres DLE EOT sorozat átvitelével, amelyet bármilyen más, az összeköttetés törlést igénylő jelzés követ.
8.6.3.7 *A "C" (központosított) rendszer kategória leírása.* "C" (központosított) rendszer kategória olyan kategória (hasonlóan az "A" rendszer kategóriához), amelyben bizonyos számú állomás több-pontos kapcsolaton keresztül össze van kötve, és az egyik állomásvezérlő állomásnak van kijelölve, de (eltérően az "A" rendszer kategóriától) csak központosított (számítógéptől-terminálhoz) üzemelést szolgáltat, ahol a közlemény-cserét (válaszokkal) csak a vezérlő és a kiválasztott mellék-állomás közötti esetre korlátozzák.
8.6.3.7.1 *KAPCSOLAT LÉTREHOZÁSI ELJÁRÁS*

8.6.3.7.1.1 Az adat-átviteli kapcsolat létrehozásához a vezérlő állomás vagy:
a) kiválasztja az egyik mellék-állomást vezér állomás helyzettel való felhatalmazásra, vagy
b) felveszi a vezér-állomás helyzetet és kiválaszt egy mellék-állomást mellék-állomás helyzet felvételére, és az alább előírt két kiválasztási eljárás valamelyikének megfelelően vesz egy közleményt.
1) Kiválasztás válasszal (lásd az alábbi 8.6.3.7.1.5 pontot); vagy
2) gyors-kiválasztással (lásd az alábbi 8.6.3.7.1.7 pontot).
8.6.3.7.1.2 A lekérdezést a vezérlő állomás végzi egy lekérdező ellenőrző jelsorozat küldésével, amely az egyedi alárendelt állomásazonosító jeléből és az ENQ előtagból áll.
8.6.3.7.1.3 Az az alárendelt állomás, amelyik észleli a kijelölt lekérdező ellenőrző jelsorozatot, felveszi a vezér-állomás helyzetet, és az alábbi két mód egyikével válaszol:
a) ha az állomásnak van továbbítandó közleménye, akkor a közlemény továbbítását kezdeményezi. A vezérlő állomás mellék-állomás állapotot vesz fel;
b) ha az állomásnak nincs továbbítandó közleménye, egy EOT-t küld, és a vezér-állomás visszatér a vezérlő- állomás állapotba.
8.6.3.7.1.4 Ha a vezérlő állomás a lekérdezésből eredően érvénytelen választ észlel, vagy nem észlel választ, akkor az EOT küldésével lezárást hajt végre, mielőtt folytatná a lekérdezést vagy a kiválasztást.
8.6.3.7.1.5 A kiválasztás válasszal-t a vezérlő állomás hajtja végre a vezér-állomás helyzetet felvéve és ezt egy kiválasztást ellenőrző jelsorozatot küldve hajtja végre, amely az ellenőrző jelsorozat egy olyan előtagot tartalmaz, amely az egyedi alárendelt állomást azonosítja és ENQ-val végződik.
8.6.3.7.1.6 Egy alárendelt állomásnak, amely a kijelölt kiválasztási ellenőrző jelsorozatot észleli, mellék-állomás helyzetet kell felvennie, és az alábbi két válasz egyikét elküldenie:
a) ha az állomás vételre kész, egy tetszőleges előtagot küld, amelyet az ACK követ. Ennek a válasznak a vétele után, a vezér-állomásnak a közlemény továbbítással kell folytatnia;
b) ha az állomás vételre nem kész, egy tetszőleges előtagot küld, amelyet a NAK követ. A NAK észlelése után a vezér-állomásnak megengedhető, hogy újra megkísérelje ugyanazon alárendelt állomás kiválasztását, vagy a lezárás kezdeményezését az EOT küldésével.

Megjegyzés. – Ha a vezérlő állomás érvénytelen választ vesz, vagy egyáltalán nem vesz választ, megengedett az, hogy újra megkísérelje ugyanazon alárendelt állomás kiválasztását, vagy N próbálkozás után $(N \geq 0)$ *vagy kilép egy visszaállítási eljáráshoz, vagy befejezést kezdeményez az EOT küldésével*

.

8.6.3.7.1.7 A gyors kiválasztás végrehajtását a vezérlő állomás vezér-állomás helyzetet felvéve és a kiválasztási ellenőrző jelsorozatot elküldve végzi, és ennek az átvitelnek az ENQ-val való befejezése nélkül vagy anélkül, hogy várna arra, hogy a kiválasztott alárendelt állomás válaszoljon, közvetlenül a közlemény továbbításával folytatja a tevékenységét.

8.6.3.7.2 *KÖZLEMÉNY ÁTVITELI ELJÁRÁS*

8.6.3.7.2.1 A vezér-állomás egy egyedi közleményt küld a mellék-állomásnak és várja a választ.
8.6.3.7.2.2 A közlemény átvitel
a) kezdődik:
- SOH-val, ha a közleménynek van fej-része;
- STX-szel, ha a közleménynek nincs fej-része;
és
b) folytatódik az ETX-szel végződve, amelyet közvetlenül a BCC követ.
8.6.3.7.2.3 A mellék-állomásnak, miután észlelte az ETX-et, amelyet a BCC követ, el kell az alábbi két válasz egyikét kell elküldenie:
a) ha a közleményt fogadták, és a mellék-állomás kész egy másik közlemény fogadására, akkor egy tetszőleges előtagot küld, amelyet egy ACK követ. A vezér-állomásnak, miután észlelte az ACK-t, részére megengedetté válik a következő közlemény elküldése, vagy a lezárás kezdeményezése;
b) ha közleményt nem vettek és a mellék-állomás kész egy másik közlemény vételére, egy tetszőleges előtagot küld, amelyet a NAK követ. A vezér-állomás, miután észlelte a NAK-t, vagy továbbít egy másik közleményt, vagy lezárást kezdeményez. A NAK választ követően a következő átvitt közleménynek nem szükséges egy olyan közlemény újra-átvitelének lennie, amelyet nem fogadtak.
8.6.3.7.2.4 Ha a vezér-állomás érvénytelen közleményt vesz, vagy egyáltalán nem vesz közleményt, akkor megengedett számára egy továbbítási ellenőrző jelsorozat küldése, amely egy tetszőleges előtagból és az azt követő ENQ-ból áll. A továbbítási ellenőrző jelsorozat vétele után a mellék-állomás megismétli az utolsó válaszát.
8.6.3.7.2.5 A vezér-állomás N újra-próbálkozást végezhet $(N \geq 0)$, hogy érvényes mellék-állomás választ kapjon. Ha az N újra-próbálkozás után válasz nem érkezik, a vezér-állomás kilép egy visszaállítási folyamathoz.

8.6.3.7.3 *KAPCSOLAT BEFEJEZÉSI ELJÁRÁS*

8.6.3.7.3.1 A vezér-állomásnak egy EOT-t kell küldenie annak jelzésére, hogy nincs több továbbítandó közleménye. Az EOT-nek kell negálnia mindkét állomás vezér-/mellék-állomás állapotát, és visszakapja a vezérlő állomás helyzetet.

8.6.4 Föld-föld bit-orientált adat kapcsolat vezérlés eljárás

Megjegyzés. – Ennek a szakasznak az előírásai a föld-föld adatcsere alkalmazásokhoz tartoznak, amelyek bit-orientált adatkapcsolat eljárásokat használnak átlátható, szinkron átvitelt téve lehetővé, amely bármilyen kódolástól független; az adatkapcsolat irányítás funkciókat a keretben kijelölt bit-pozíciók értelmezésével hajtják végre.

8.6.4.1 A következő leírásokat fogjuk alkalmazni az ebben a szakaszban tartalmazott adatkapcsolat alkalmazásokhoz:
a) A bit-orientált adatkapcsolat vezérlési eljárások átlátható átvitelt tesznek lehetővé, amelyek bármilyen kódolástól függetlenek.
b) Az adatkapcsolat két egymással összekötött állomás logikai összekapcsolása, beleértve az össze-kapcsolt állomások összeköttetés vezérlési képességét is.
c) Egy állomás logikai elemek konfigurációja, amelytől, vagy amelyhez az adatkapcsolaton keresztül közleményeket továbbítanak, beleértve azokat az elemeket is, amelyek a közlemények áramlását a kapcsolaton, az összeköttetés vezérlési eljárásokon keresztül szabályozzák.
d) Egy kombinált állomás mind utasításokat, mind válaszokat küld és vesz, és felelős az adatkapcsolat szabályozásáért.
e) Az adatátviteli összeköttetési vezérlő eljárások képezik azokat az eszközöket, amelyeket az állomások között az adatkapcsolaton lebonyolódó szabályos információ-csere irányítására és védelmére használnak.
f) Egy összetevőt úgy határoztak meg, mint egy sorozaton belül előírt sorrendben lévő bitek számát az adatkapcsolat vezérlésére és felügyeletére.
g) Egy oktett nyolc egymás utáni bitből álló csoport.

h) Egy sorozat egy vagy több összetevő előírt sorrendben, amely az oktettek integrál számát tartalmazza.
i) Egy mező meghatározott számú bit, vagy meghatározott maximális számú bit sorozata, amely adatkapcsolati vagy összeköttetés vezérlési funkciót lát el, vagy az átvitelhez adatokat képez.
j) Egy keret az adatkapcsolaton továbbításra kerülő adatok egy egysége, amely egy vagy több mezőt foglal magába előírt sorrendben.
k) A közös ICAO adat-csere hálózat (CIDIN) kapcsoló-központ egy automatikus AFTN kapcsoló- központnak az a része, amely belépési, közvetítési és kilépési funkciókat lát el bit-orientált kapcsolati és CIDIN hálózati eljárásokat használva, amelyek ebben a szakaszban kerültek meghatározásra, és magába foglalja a megfelelő interfész(eke)t az AFTN más részeivel és más hálózatokkal is.

8.6.4.2 BIT-ORIENTÁLT ADATKAPCSOLAT ELJÁRÁSOK A SZINKRON ÁTVITELI BERENDEZÉSEKET ALKALMAZÓ PONTTÓL-PONTIG, FÖLD-FÖLD ADATCSERÉHEZ

Megjegyzés. – A következő adatkapcsolati szint eljárások ugyanazok, mint azok LAPB adatkapcsolati eljárások, amelyek az ITU CCITT X.25 Ajánlás, 2. szakasz, Sárga Könyv-ben /ITU CCITT Recommendation X.25 Section 2, Yellow Book/ (1981-es kiadás) találhatók. Az X.25 Ajánlások későbbi változatai akkor kerülnek figyelembevételre, amikor tisztázódik, hogy elfogadásra kerül, vagy sem.
8.6.4.2.1 *Keret formátum.* A keretek nem tartalmazhatnak 32-nél kevesebb bitet, kivéve a nyitó és záró jelző biteket, és a következő formátumnak kell megfelelniük:

JELZŐ BITEK F	CÍMZÉS A	VEZÉRLÉS C	INFORMÁCIÓ I	FCS	JELZŐ BITEK F

8.6.4.2.1.1 Egy keretnek tartalmaznia kell: a nyitó jelző biteket (F), egy címzés mezőt (A), egy vezérlési mezőt (C), egy választható információs mezőt (I), egy keret ellenőrző sorozatot (FCS) és a záró jelző biteket (F), és a keretet ebben a sorrendben kell átvinni.
Megjegyzés. – A CIDIN vonatkozásában a nyitó jelző bitek, az A és a C mező, az FCS és a záró jelző bitek (F) együttesen alkotják az Adatkapcsolat Vezérlő Mezőt (DLCF). Az I mezőt Adatkapcsolati Mezőként (LDF) jelölik.

8.6.4.2.1.1.1 A jelző biteknek (F) a 8-bites 01111110 sorozatnak kell lenniük, amelyek mindegyik keret elejét és végét határolják. Megengedett az, hogy a keretet lezáró jelző bitek a következő keretnyitó jelző bitjeiként is szolgáljanak.
8.6.4.2.1.1.2 A címzés (A) mezőnek egy oktettből kell állnia, kivéve a 0 biteket, amelyeket azért adnak hozzá, hogy átlátható átvitelt érjenek el, amelynek tartalmaznia kell a kombinált állomás kapcsolati címzést.
8.6.4.2.1.1.3 A vezérlési (C) mezőnek egy oktettből kell állnia, kivéve a 0 biteket, amelyeket azért adnak hozzá, hogy átlátható átvitelt érjenek el, és az adatkapcsolat szabályozáshoz tartalmazniuk kell az utasításokat, a válaszokat és keret sorszám összetevőket az adatkapcsolat vezérléséhez.
8.6.4.2.1.1.4 Az információs (I) mezőnek kell magába foglalnia a digitális adatokat, amelyek bármely kódban vagy sorozatban jelen lehetnek, de nem haladhatják meg a 259 oktettes maximális értéket, kivéve a 0 biteket, amelyeket azért adnak hozzá, hogy átlátható átvitelt érjenek el. Az I mező hosszban mindig a 8 bit többszöröse.
8.6.4.2.1.1.5 A keret ellenőrző sorozatnak (FCS) két oktettből kell állnia, kivéve a 0 biteket, amelyeket azért adnak hozzá, hogy átlátható átvitelt érjenek el, és tartalmazzák a hiba-észlelő biteket is.
8.6.4.2.2 Egy keret ellenőrzési sorozatot (FCS) mindegyik keretbe be kell építeni a hiba ellenőrzése céljából.
8.6.4.2.2.1 A hiba ellenőrző algoritmus egy ciklikus redundancia ellenőrzés (CRC).
8.6.4.2.2.2 A CRC polinom (P(x)) a következő:
$x^{16} + x^{12} + x^5 + 1$

8.6.4.2.2.3 Az FCS egy 16-bites sorozat. Ez az FCS az R(x) maradék kiegészítője, amely maradékot az
$x^{16}\,[G(x)] + x^K\,(x^{15} + x^{14} + x^{13} + \ldots + x^2 + x^1 + 1)$-nek

a P(x) CRC polinommal való modulo 2 osztásával nyerjük.
A G(x)-nek a keret tartalmának kell lenni, de nem foglalja magába a nyitó jelző bit utolsó bitjét, sem az FCS első bitjét, és kizárja azokat a biteket, amelyeket az átlátható átvitel kedvéért illesztettek be.
K-nak a G(x) hosszának kell lenni (bitek száma).

8.6.4.2.2.4 Az FCS összegyűjtésének és ellenőrzésének generálása a következőkből áll:

a) az átvivő állomás kezdeményezi az FCS össszegyűjtést a címzés (A) mező első (legkisebb helyi értékű) bitjével és magába kell, hogy foglalja az összes bitet az FCS sorozatot megelőző utolsó bitig, ezt is tartalmazva, de az összes 0 bitje (ha van) kivételével, amelyeket az átlátható átvitel érdekében illesztettek be;

b) az összegyűjtés elvégzése után az FCS továbbításra kerül a b1 bittel (a legmagasabb helyi értékű együttható) kezdve és a sorozatban továbbhaladva a b16 bittel (legalacsonyabb helyi értékű együttható), ahogyan az alább bemutatásra kerül:

Az első átvitt bit

b16	b15	b14	- - - -	b3	b2	b1
x^0	x^1	x^2		x^{13}	x^{14}	x^{15}

c) a vevő állomás hajtja végre a ciklikus redundancia ellenőrzést (CRC) a keret tartalmán, kezdve az első bittel, amelyet a nyitó jelző biteket követően vettek, és beleértve az összes bitet a záró jelző bitet megelőző utolsó bitig, azt is magába foglalva, de kizárva az összes 0 bitet (ha van), amelyeket az átlátszóság elérési szabályainak megfelelően töröltek;

d) az FCS összegyűjtésének elvégzése után a vevő állomásnak meg kell vizsgálnia a maradékot. Ha átviteli hiba nincs, a maradék 1111000010111000 lesz (x^0-tól – x^{15}-ig külön-külön).

8.6.4.2.3 *Az átláthatóság elérése.* A keret formátumnak (A, C, kapcsolati adat mező és FCS) képesnek kell lenni bármely bit konfiguráció magába foglalására.

8.6.4.2.3.1 A következő szabályokat kell alkalmazni az összes keret tartalomhoz, kivéve a jelző bit sorozatokat:

a) a továbbító állomásnak kell megvizsgálnia a keret tartalmat az átvitel előtt, és beilleszteni egy 0 bitet, közvetlenül minden 5 egymást követő 1-es bitből álló sorozat után;

b) a vevő állomásnak kell megvizsgálnia a vett keretek tartalmát az 5 egymást követő 1-bitből és az azt közvetlenül követő egy (vagy több) 0 bit (ek)ből álló sémák szerint, és el kell távolítani azokat a 0 biteket, amelyek az 5 egymás utáni 1-es biteket közvetlenül követik.

8.6.4.2.4 *Speciális átviteli sorozatok és vonatkozó kapcsolati állapotok.* Az adatcsere és vezérlő információk irányítását szolgáló utasítások és válaszok repertoárján kívül az állomások a következő hagyományos eljárásokat alkalmazzák az közölt körülmények jelzésére:

a) *Megszakítás* az az eljárás, amellyel az állomás egy keret küldésének folyamatánál a keretet nem a szokásos módon fejezi be úgy, hogy a keretet vevő állomásnak figyelmen kívül kell hagyni azt. A hagyományos eljárások egy keret megszakításához a következők:

1) legalább hét, de tizenötnél kevesebb egyes bit továbbítása (közbeiktatott nullák nélkül);

2) hét egyes bit vétele;

b) *Aktív kapcsolat állapot.* Egy kapcsolat aktív állapotban van akkor, amikor egy keretet, egy megszakítás sorozatot, vagy keretközi idő-kitöltést továbbít. Amikor a kapcsolat aktív állapotban van, a továbbító állomás részére fenn kell tartani a továbbítás folytatásának jogát.

c) *Keretközi idő-kitöltés.* Keretközi idő-kitöltést a keretek közötti folyamatos jelző bitek továbbításával kell végrehajtani. Nincs időkitöltés a kereten belül.

d) *Inaktív kapcsolat állapot.* A kapcsolat inaktív állapotban van akkor, amikor olyan folyamatos egyes helyzetet észlelnek, amely 15 bit vagy ennél hosszabb időn át tart. Az inaktív állapot időkitöltésnek egy folyamatos egyes állapotnak kell lenni a kapcsolaton.

e) *Érvénytelen keret.* Az érvénytelen keret egy olyan keret, amelyet nem megfelelően határol két jelző bit, vagy olyan keret, amelynél a jelző bitek közötti bitek száma kevesebb, mint 32.

8.6.4.2.5 *ÜZEMMÓDOK*

8.6.4.2.5.1 *Működési üzemmód*. A működési üzemmódnak aszinkron szimmetrikus üzemmódnak (ABM) kell lenni.

8.6.4.2.5.1.1 Aszinkron szimmetrikus üzemmódban lévő kombinált állomás részére megengedett kell, hogy legyen az átvitel, a hozzátartozó állomástól jövő meghívás nélkül.

8.6.4.2.5.1.2 Az ABM üzemmódban lévő kombinált állomás részére megengedett kell, hogy legyen, hogy bármilyen

utasítás vagy válasz típusú keretet továbbítson a DM kivételével.
8.6.4.2.5.2 *Működésen kívüli üzemmód.* A működésen kívüli üzemmód az aszinkron szétkapcsolt üzemmód (ADM), amelyben egy kombinált állomás logikailag le van kapcsolva az adatkapcsolatról.
8.6.4.2.5.2.1 Az ADM üzemmódban lévő kombinált állomás részére megengedhető kell, hogy legyen az átvitel, a hozzátartozó állomástól jövő meghívás nélkül.
8.6.4.2.5.2.2 Az ADM üzemmódban lévő kombinált állomás csak SABM, DISC, UA és DM kereteket továbbíthat. (Lásd az alábbiakban a 8.6.4.2.7 pontban azoknak az utasításoknak és válaszoknak a leírását, amelyek ezekre a keret típusokra vonatkoznak.)
8.6.4.2.5.2.3 Az ADM üzemmódban lévő kombinált állomásnak DM-et kell továbbítania, ha DISC-t vesz, és minden más vett utasítás keretet érvényteleníteni kell az SABM kivételével. Ha egy érvénytelenített utasítás keret a P-bitet “1”-re állította, akkor a kombinált állomásnak “1”-re állított F-bites DM-et kell továbbítania.

8.6.4.2.6 *Vezérlő mező funkciók és paraméterek.* A vezérlő mezők utasítást vagy választ és sorszámokat tartalmaznak, ahol alkalmazható. Három típusú vezérlő mezőt kell használni a következők végrehajtásához:

a) számozott információ átadás (I-keretek);

b) számozott ellenőrző funkciók (S-keretek); és

c) számozatlan vezérlő funkciók (U-keretek).

A vezérlő mező formátumok a 8-5. táblázatban megadottaknak kell lenniük. A funkcionális keret kijelölés, amely az egyes típusú vezérlő mezőkkel, valamint az ezeknek a funkcióknak az ellátásában alkalmazott vezérlő mező paraméterekkel kapcsolatosak, a következő pontokban kerülnek leírásra.
8.6.4.2.6.1 Az I-keret típust az információ továbbítások teljesítésére használják. Néhány speciális eset kivételével ez az egyetlen formátum, amelynek részére engedélyezett, hogy egy információs mezőt tartalmazzon.
8.6.4.2.6.2 Az S-keret típust ellenőrző utasításokhoz és válaszokhoz használják, azokhoz, amelyek olyan kapcsolat ellenőrző szabályozási funkciókat teljesítenek, mint az információ keretek nyugtázása, az információs keretek átvitelének és újra-átvitelének kérése, valamint az I-keretek átvitelének az ideiglenes felfüggesztési kérésre. Az S-keret nem tartalmazhat információs mezőt.
8.6.4.2.6.3 Az U-keret típust számozatlan utasítások és válaszok esetében használják, azokban, amelyek kiegészítő kapcsolat vezérlési funkciókat látnak el. Az U-keret válaszok egyike, a keret visszautasítás (FRMR) válasz információs mezőt tartalmaz; az U-keret típus összes többi kerete információs mezőt nem tartalmazhat.
8.6.4.2.6.4 A három vezérlő mező típushoz kapcsolódó állomás paraméterek a következők:

a) *Tényező.* Mindegyik I-keretet sorszámmal látnak el N (S) sorszám küldésével, ami 0 értékkel bír a mínusz egy tényezőn keresztül (ahol a tényező a sorszám tényezője). A tényezőnek 8-nak kell lenni. A sorrend szerint számozott azon I-keretek maximális száma, amellyel egy állomás bármely adott időpontban elintézetlenül (azaz visszaigazolatlanul) rendelkezik, soha nem haladhatja meg egynél kevesebbel a sorszámok tényezőjét. Az elintézetlen keretek számának ez a korlátozása azért szükséges, hogy megakadályozzon bármely félreérthetőséget az átviteli kereteknek a sorszámokhoz való kapcsolódásánál a normál működés és/vagy a hiba kijavítása során.

b) A küldés állapot változó V(S) jelöli ki a soron következő, átvitelre kerülő I-keret sorszámát.

1) A küldés állapot változó felveszi a 0 értéket a modulusz mínusz egy tényezőn keresztül (a tényező a sorszámozás és a teljes intervallumon keresztüli számciklusok tényezője).

2) A V(S) értéke minden egymást követő sorrendi I-keret átvitellel eggyel növekszik, de nem haladhatja meg többel, az N(R) értéket, mint az elintézetlen I-keretek maximálisan megengedett száma (k), amelyet az utolsó vett keret tartalmaz. Lásd a k meghatározását az alábbi i) pontban.

c) A sorra következő I-keret átvitelét megelőzően az N(S) értékét fel kell frissíteni, hogy egyenlő legyen V(S) értékével.

d) A vételi állapot változó, V(R) jelöli ki a vételre sorban következő I-keret sorszámát.

1) A V(R)-nek fel kell venni a 0 értéket a modulusz mínusz egyen keresztül.

2) A V(R) értéket eggyel növelik egy hibamentes, sorozatban lévő I-keret vétele után, ahol az I-keret N(S) küldési sorszáma V(R)-el egyenlő.

e) Az összes I-keretnek és S-keretnek tartalmaznia kell az N(R)-t, a soron következő vett keret várható sorszámát. Egy I vagy S típusú keret továbbítása előtt az N(R) értéket fel kell frissíteni úgy, hogy egyenlő legyen a vételi állapot változó aktuális értékével. Az N(R) jelzi azt, hogy az N(R)-t átvivő állomás megfelelően vette az összes I-keretet, amely (N(R)-1)-ig van számozva, beleértve az N(R)-1 számút is.

f) Mindegyik állomás fenntart egy független küldés állapot változót V(S) és egy vétel állapot változót V(R) az I-kereten, amelyen küld és vesz. Azaz mindegyik kombinált állomásnak egy V(S) számot kell fenntartani az

I-kereteken, amelyeket továbbít, és egy V(R) számot az I-kereteken, amelyeket megfelelően vett a távoli kombinált állomástól.

g) A lekérdező (P/F) bitet a kombinált állomás használja egy válasz, vagy egy válasz-sorozat kérésére (nyomatékosan kér) a távoli kombinált állomástól.

h) A záró (P/F) bitet a távoli kombinált állomás használja egy lekérés (lehívás) utasítás eredményeként továbbított válasz keret jelzésére.

i) Azon sorszámozott I-keretek maximális száma (k), amelyeket egy állomás elintézetlenül (nyugtázatlanul) birtokolhat egy adott, tetszőleges időpontban, egy állomás paraméter, amely a tényezőt soha sem haladhatja meg.

Megjegyzés. – A k-t az állomás tárolási korlátai határozzák meg, és az áramkör létrehozása idején kötött kétoldalú egyezmények tárgyát kell, hogy képezze.

8.6.4.2.7 *Utasítások és válaszok.* A kombinált állomás részére megengedett kell, hogy legyen az, hogy akár utasításokat, akár válaszokat hozzon létre. Az utasításnak a távoli állomás címzését, míg a válasznak a küldő állomás címzését kell tartalmaznia. Az összes utasítással és válasszal kapcsolatos emlékeztető az, amely a három keret típus (I, S és U) mindegyikére elő van írva és a vezérlési mező hozzátartozó kódolásának a 8-6. táblázatban megadottnak kell lenni.

8.6.4.2.7.1 Az I-keret utasítás szolgáltatja az eszközt a sorszámmal ellátott keretek átviteléhez, amelyek mindegyikének megengedett kell, hogy legyen az, hogy egy információ mezőt tartalmazzon.

8.6.4.2.7.2 Az S-keret utasításokat és válaszokat a számozott ellenőrző funkciók teljesítésére kell használni (mint például nyugtázás, lekérdezés, az információ továbbítás átmeneti felfüggesztése, vagy hibajavítás).

8.6.4.2.7.2.1 A vételre kész utasítást vagy választ (RR) az állomás a következőkre használja:

a) jelzi, hogy kész egy I-keret vételére;

b) visszaigazolja az előzőleg vett, számozott I-kereteket N(R)-1-ig, ez utóbbit is beleértve;

c) törli a foglalt állapotot, amelyet az RNR átvitele kezdeményezett.

Megjegyzés. – Egy kombinált állomás részére megengedett az RR utasítás használata egy olyan távoli kombinált állomástól való válasz kérésére, amelynek a lekérdező bitje "1"-re van beállítva.

8.6.4.2.7.2.2 Megengedettnek kell lenni egy visszautasító parancs vagy válasz (REJ) utasítás kiadására az N(R) számozású I-kerettel kezdődő keretek újra-továbbítás kérésére, ahol:

a) N(R)-1 és az ez alatti számozású I-kereteket nyugtázták;

b) a további kezdeti átvitelre váró I-kereteket az újra átvitt I-keret(ek)et követően kell továbbítani;

c) csak egy REJ mentességi feltétel állapotot lehet létrehozni egyik adott állomástól egy másik állomáshoz, bármely adott időpontban; másik REJ nem adható ki addig, amíg az első REJ mentességi feltételt nem szabadították fel;

d) a REJ mentességi állapotot törlik (visszaállítják) egy olyan I-keret fogadása után, amelynek száma egyenlő a REJ utasítás/válasz N(R)-jével.

8-6. táblázat. Utasítások és válaszok

Típus	Utasítások		Válaszok		C-mezőkódolás							
1	2	3	4	5	6	7	8					
Információ átvitel	I	(információ)			0		N(S)		P		N(R)	
Ellenőrzés	RR	(vételre kész)	RR	(vételre kész)	1	0	0	0	P/F		N(R)	
	RNR	(vételre nem kész)	RNR	(vételre nem kész)	1	0	1	0	P/F		N(R)	
	REJ	(visszautasítás)	REJ	(visszautasítás)	1	0	0	1	P/F		N(R)	
Számozatlan			DM	(szétkapcsolt mód)	1	1	1	1	P/F	0	0	0

	SABM	(beállítás aszinkron szimmetrikus mód)			1	1	1	1	P	1	0	0
	DISC	(szétkapcsolás)			1	1	0	0	P	0	1	0
			UA	(számozatlan nyugtázás)	1	1	0	0	F	1	1	0
			FRMR	(keret visszautasítás)	1	1	1	0	F	0	0	1

8.6.4.2.7.2.3 A vételre nem kész utasítást vagy választ (RNR) egy foglalt állapot jelzésére használják, azaz további bejövő I-keretek átmeneti fogadásképtelenségének jelzésére ott, ahol:
a) a kereteket, amelyek N(R)-1-ig, az utóbbit is beleszámítva, vannak számozva, nyugtázták;
b) az N(R) keret és bármely azt követő vett I-keret, ha van ilyen, nem került nyugtázásra (ezeknek a kereteknek a fogadási helyzetét a következő összekötetésekben kell jelezni);
c) a foglalt állapot törlését egy RR-, REJ-, SABM- vagy UA "I"-re állított P/F bittel vagy anélkül történő továbbítása jelzi.
8.6.4.2.7.2.3.1 **Ajánlás.** –
a) Egy RNR keretet az átviteli folyamatban vevő állomásnak az I-keretek továbbítását a lehető leghamarabb le kell állítania.
b) Bármely REJ utasítást vagy választ, amelyet az RNR előtt vettek, be kell indítani az átvitel befejezése előtt.
c) Kombinált állomás számára megengedett az "I"-re állított lekérdező bites RNR utasítás használata azért, hogy "I"-re állított záró bites ellenőrző keretet kapjanak a távoli kombinált állomástól.
8.6.4.2.7.2.4 Megengedhetőnek kell lenni annak, hogy a szelektív elutasítás parancs vagy válasz (SREJ) felhasználható legyen egy N(R) számozású egyedüli I-keret újra-továbbítási kérésére akkor, amikor:
a) az N(R-1)-ig számozott keretek nyugtázottak; N(R) keretet nem fogadtak; csak azokat az I-kereteket fogadják el, amelyeket megfelelően vettek és sorrendben a kért I-keretet követik; a továbbításra kerülő specifikus I-keretet az N(R) jelzi a SREJ utasítás/válaszban;
b) az SREJ kivétel állapotot törlik (újra-állítják), amint olyan I-keretet vesznek, amelynél egy N(S) szám egyenlő az SREJ N(R)-jével;
c) azután, hogy az állomás egy SREJ-t továbbít, nem megengedett az SREJ vagy az REJ továbbítása egy további sorozat hibánál addig, amíg az első SREJ hiba körülmény nem került törlésre;
d) azok az I-keretek, amelyeket az SREJ által jelzett I-keretet követően továbbításra engedélyeztek, nem kerülnek újra-továbbításra egy SREJ vétele eredményeként; és
e) megengedett további I-kereteknek a kezdeti átvitel alatt az, hogy az SREJ által kért specifikus I-keret újra-átvitelét követően továbbításra kerüljenek.
8.6.4.2.7.3 Az U-keret utasításokat és válaszokat a vezérlő funkciók számának kiterjesztésére használják. A továbbított U-keretek nem növelik a sorszámot sem a leadó, sem a vételi állomáson.
a) Az U-keret a mód-beállító utasításokat (SABM és DISC) a címzett állomásnak a megfelelő válaszmódba való (ABM vagy ADM) beállítására kell használni, ahol:
1) az utasítás elfogadása után a vevő-állomás elküld egy vételi állapot változót, V(S) és V(R), amelyek nullára vannak állítva;
2) a címzett állomás megerősíti az elfogadást a lehető leghamarabbi időpontban egyetlen, számozatlan UA nyugtázás küldésével;
3) az előzőleg továbbított keretek, amelyek az utasítás elküldése idején nyugtázatlanok, megmaradnak nyugtázatlanoknak;
4) a DISC utasítást egy logikai szétkapcsolás végrehajtására használják, azaz a címzett kombinált állomás informálására arról, hogy a továbbító kombinált állomás szünetelteti a működését. A DISC utasításhoz kapcsolódó információs mező nincs megengedve.
b) A számozatlan nyugtázási választ (UA) a kombinált állomásnak kell felhasználnia egy számozatlan utasítás vételének és elfogadásának visszaigazolására. A vett számozatlan utasítások nem aktivizálódnak addig, amíg az UA választ nem továbbítják. Az UA válaszhoz kapcsolódóan információ nem megengedett.
c) A keret visszautasító választ (FRMR), amely az alábbiakban ismertetett információs mezőt alkalmazza, egy kombinált állomás üzemelési módban (ABM) kell alkalmazni, hogy egy FCS hiba nélküli keret vételéből az alábbi

körülmények egyike következett be:
1) utasítás/válasz, amely érvénytelen vagy nem megvalósított;
2) keret információs mezővel, amely meghaladja a rendelkezésre álló tároló méretét;
3) érvénytelen N(R) számmal rendelkező keret.

Megjegyzés. – Az érvénytelen N(R) egy olyan szám, amely olyan I-keretre utal, amelyet előzőleg már továbbítottak és visszaigazoltak, vagy olyan I-keretre, amelyet még nem továbbítottak és nem az a következő átvitelre kerülő I-keret.

d) A szétkapcsolt módú választ (DM) egy nem-üzemelő státusz jelentésére kell használni akkor, amikor az állomás logikailag szét van kapcsolva az összeköttetéstől. A DM válaszhoz kapcsolódóan információs mező nem engedélyezett.

Megjegyzés. – A DM választ azért küldik, hogy kérjék a távoli kombinált állomást, hogy adjon ki egy mód-beállítás utasítást, vagy ha küldött egy mód-beállítás utasítás vételére adott választ, akkor a távoli kombinált állomás tájékoztatására arról, hogy az átvivő állomás még mindig ADM-ben van, és nem tudja a mód-beállítás utasítást aktivizálni.

8.6.4.3 KIHAGYÁSI HELYZETJELENTÉS ÉS HELYREÁLLÍTÁS

Ez a szakasz azokat az eljárásokat határozza meg, amelyeket egy kihagyási helyzet észlelését vagy megjelenését követő helyreállítás végrehajtásához alkalmaznak a kapcsolat szinten. A kihagyási helyzetek azok a szituációk, amelyek átviteli hibák, állomás meghibásodás vagy üzemelési helyzetek eredményeként lépnek fel.

8.6.4.3.1 *Foglaltság állapot.* A foglaltság állapot akkor lép fel, amikor egy állomás átmenetileg nem tud I-kereteket venni, vagy nem tudja folytatni a vételüket belső kényszer, pl. tárolási korlátok miatt. A foglaltság állapotot a távoli kombinált állomásnak a következőnek várt I-keret N(R) számával rendelkező RNR keret továbbításával kell jelezni. Megengedhető az, hogy a foglalt állomás egy forgalom felfüggesztési adást továbbítson az RNR-t megelőzően vagy azt követően.

Megjegyzés. – A foglaltság állapot folytatódó fennállását jelenteni kell az RNR ismételt leadásával mindegyik P/F keret cserénél.

8.6.4.3.1.1 Egy RNR fogadása után egy kombinált állomásnak ABM-ben a lehető legrövidebb időn belül meg kell szünteti az I-keretek továbbítását a folyamatban lévő keretet befejezve vagy leállítva. Egy RNR-t vevő kombinált állomásnak végre kell hajtania az idő-túllépési üzemeltetést, mielőtt folytatja az I-keretek aszinkron átvitelét, kivéve, ha a foglaltság állapotot nem jelenti töröltként a távoli kombinált állomás. Ha az RNR-t "1"-re állított P-bites utasításként vették, akkor a vevő állomásnak egy "1"-re állított F bites S-kerettel kell válaszolnia.
8.6.4.3.1.2 A foglaltság állapotot törölni kell annál az állomásnál, amelyik az RNR-t továbbította, amikor a belső kényszer megszünik. A foglalt állapot törlését egy RR, REJ, SABM vagy UA keret ("1"-re állított P/F bittel vagy anélküli) továbbításával kell jelenteni.

FRMR INFORMÁCIÓS MEZŐ BITEK ALAP (SABM) ÜZEMELÉSNÉL

Az első
továbbí-
tott bit

1 8	9	10 12	13	14 16	17	18	19	20	21 24
Visszautasított alap vezérlési mező	0	V(S)	v	V(R)	w	x	y	z	Beállítás nullára

ahol:
a visszautasított alap vezérlési mező annak annak a vett keretnek a vezérlési mezője, amely a keret elutasítását hozta

létre;
a *V(S)* a küldés állapot változó aktuális értéke annál a távoli kombinált állomásnál, amely a hiba állapotot jelenti (10-es bit = legkisebb helyiértékű bit);
a *V(R)* a vétel állapot változó aktuális értéke annál atávoli kombinált állomásnál, amely a hiba állapotot jelenti (14-es bit = legkisebb bit);
az "1"-re állított *v* azt jelzi, hogy a vett keret, amely a visszautasítást okozta, egy válasz volt;
az "1"-re állított *w* azt jelzi, hogy a vett és visszaküldött vezérlési mező az 1-től 8-ig terjedő bitjei érvénytelenek vagy nem feltöltöttek voltak;
az "1"-re állított *x* azt jelzi, hogy a vett és visszaküldött vezérlési mezőt az 1-től 8-ig terjedő biteknél érvénytelennek tekintették, mert a keret egy információs mezőt tartalmazott, amely ezzel az utasítással nem megengedett. A *w* bitet ezzel összekapcsoltan "1"-re kell beállítani;
az "1"-re állított *y* az jelzi, hogy a vett információs mező meghaladta azt a maximális információs mező hosszt, amelyet a hiba körülményt jelentő állomás még be tud fogadni. Ez a bit a fenti *w* és *x* bitekkel kölcsönösen kizárják egymást;
az "1"-re állított *z* azt jelzi, hogy a vett és visszaküldött vezérlés mező az 1–8 intervallumban lévő biteknél érvénytelen N(R) számot tartalmaz. Ez a bit a *w* bittel kölcsönösen kizárják egymást.

8.6.4.3.2 *N(S) sorszám hiba.* Egy N(S) sorszám elhagyás jön létre a vevő állomáson akkor, ha egy I-keret, amelyet hibamentesen vettek (nincs FCS hiba), egy olyan N(S) sorszámot tartalmaz, amely nem egyenlő a V(R) vételi változóval a vevő állomáson. A vevő állomás nem nyugtázza le a keretet (nem növelheti a V(R) vételi változóját), amely a sorszám hibát okozza, vagy semelyik I-keretet sem, amely követheti, amíg egy helyes N(S) számú I-keretet nem vesz. Egy állomásnak- amely egy vagy több olyan I-keretet vesz, amely sorszám hibával rendelkezik, de amelyek egyébként hibamentesek- el kell, hogy fogadja az N(R) mezőben és a P/F bitben lévő információkat, hogy teljesítse a kapcsolat vezérlési funkciókat, azaz, hogy vegye az előzőleg továbbított I-keretek nyugtását, az N(R)-en keresztül, hogy válaszra késztesse az állomást (p bit "1"-re állítva).
8.6.4.3.2.1 Az alábbi 8.6.4.3.2.1.1 és 8.6.4.3.2.1.2 pontokban meghatározott körülmények egy sorszám hiba előfordulást követő, elveszett vagy elhibázott I-keretek újra-továbbításának kezdeményezésére szolgálnak.
8.6.4.3.2.1.1 Ahol a REJ utasítás/válasz-t használják egy kihagyási helyreállítás kezdeményezésére egy sorszám hiba észlelését követően, ott csak egy "küldött REJ" kihagyási állapot jöhet létre egyidőben az egyik állomástól a másik állomáshoz. Egy "küldött REJ" kihagyás akkor szabadul fel, amikor a kért I-keretet veszik. A REJ-t vevő állomás az I-keretek egymás utáni (újra) továbbítását kezdeményezi a REJ keret által tartalmazott N(R) által jelölt I-kerettel indulva.
8.6.4.3.2.1.2 Abban az esetben, ha a vevő állomás átviteli hiba miatt nem fogad (vagy fogad és érvénytelenít) egy egyedülálló I-keretet, vagy az utolsó I-keret (ek) et az I-keretek egy sorozatában, nem kell, hogy egy sorozaton kívüli kihagyást észleljen, és ennek folytán nem kell REJ-t továbbítania. Az állomás, amely a nyugtázatlan I-keret(ek)et továbbította, egy rendszer-specifikus szünetelés befejezését követően megfelelő helyreállítási műveletet végez, hogy meghatározza a sorszámot, amelynél az újra-továbbítást meg kell kezdeni.
8.6.4.3.2.1.3 **Ajánlás.** *– Egy szünetelő kombinált állomás, amely válaszra vár, nem továbbíthatja újra az összes nyugtázatlan keretet azonnal. Az állomás érdeklődhet az állapot felől az ellenőrző kerettel.*

1. Megjegyzés. – Ha egy állomás újra továbbítja az összes nyugtázatlan I-keretet egy szünet után, akkor az állomásnak elő kell készülnie egy utána következő olyan REJ keret vételére, amelynél az N(R) nagyobb, mint a V(S) küldési változó.

2. Megjegyzés. – Mivel verseny léphet fel a kétféle alternatív kommunikáció esetében - az ABM-ben vagy ADM-ben, -az egyik kombinált állomás által alkalmazott szünet időtartamnak nagyobbnak kell lennie, mint a másik kombinált állomás által alkalmazottének, ezáltal a verseny megoldása lehetségessé válik.

8.6.4.3.3 *FCS hiba.* Semmilyen FCS hibás keretet nem fogadhat el a vevő állomás és az ilyeneket érvényteleníteniekell. A vevő állomás ilyen keret hatására semmilyen műveletet nem végez.
8.6.4.3.4 *Keret visszautasítás kihagyás állapot.* A keret visszautasítás kihagyás állapot egy hibamentes keret elfogadásánál lép fel, amely keret egy érvénytelen vagy nem megvalósított vezérlési mezőt, érvénytelen N(R)-t, vagy egy olyan információs mezőt tartalmaz, amely meghaladja a létrehozott tároló kapacitás maximumát. Ha keret visszautasítás kihagyás állapot lép fel egy kombinált állomáson, akkor az állomásnak vagy:
a) visszaállítási műveletet kell végeznie anélkül, hogy jelentené az állapotot a távoli kombinált állomásnak; vagy

b) jelenti az állapotot a távoli kombinált állomásnak egy FRMR válasszal. A távoli állomástól ekkor elvárják, hogy végezze el a helyreállítási műveletet, ha bizonyos idő kivárása után nem jelenik meg a helyreállítási művelet végrehajtása, akkor a kombinált állomás, amely jelenti a keret visszautasítás kihagyási állapotot, végrehajtja a helyreállítási műveletet.
A helyreállítási művelet a szimmetrikus üzemelésnél magába foglalja egy megvalósított mód-beállítási utasítás átvitelét. Magasabb szintű funkciók ugyancsak részt vehetnek a helyreállításban.
8.6.4.3.5 *Mód-beállítási verseny.* Egy mód-beállítási verseny szituáció akkor lép fel, amikor egy kombinált állomás egy mód-beállítási utasítást ad ki és a megfelelő válasz (UA vagy DM) vétele előtt egy mód-beállítás utasítást vesz a távoli kombinált állomástól. A verseny helyzeteket a következő módon kell megoldani:
a) amikor a küldés és vétel mód-beállítás utasítások ugyanazok, mindegyik kombinált állomásnak egy UA választ kell küldenie a válaszküldésre adódó legelső alkalomkor. Az egyes kombinált állomások vagy belépnek a jelzett módba azonnal, vagy késleltetik a belépést a jelzett módba addig, amíg egy UA választ nem vesznek. Ez utóbbi esetben, ha az UA válasz nem kerül vételre:
1) a módot beléptetik akkor, amikor a válasz időzítés lejár; vagy
2) a mód-beállítás utasítást újra kiadják;
b) ha a mód-beállítási utasítások különbözőek, mindegyik kombinált állomásnak be kell lépnie az ADM-be és egy DM választ kell kiadnia a válasz küldésére adódó legelső alkalomkor. DISC verseny esetében egy eltérő mód-beállítási utasítással további műveletre nincs szükség.
8.6.4.3.6 *Idő-túllépés funkciók.* Az idő-túllépés funkciókat annak észlelésére használják, amikor egy kívánt vagy elvárt visszaigazolási műveletet vagy választ egy előzőleg továbbított keretre még nem vettek. Az idő-túllépési funkció lejártának megfelelő műveleteket el kell indítani, pl. a hibaelhárítás a P bit újra-kiadására. A következő idő-túllépési funkciók ideje rendszer-függő és kétoldalú egyezmény tárgyát képezi:
a) kombinált állomásoknak idő-túllépési funkciót kell biztosítani annak megállapítására, hogy egy “1”-re állított P-bites utasítás keret részére adott “1”-re állított F-bites válasz keret nem került-e vételre. Az idő-túllépési funkció automatikusan megszűnik az “1”-re állított F-bites érvényes keret vétele után;
b) egy kombinált állomás, amelynek nincs elintézetlen P-bitje és amely egy vagy több keretet továbbított, amelyre válasz várható, idő-túllépés funkciót indít ahhoz, hogy észlelje a válasz nélküli állapotot. Az idő-túllépési funkció megszűnik, amikor egy I- vagy S-keret kerül vételre, ahol az N(R) nagyobb, mint az utoljára vett N(R) (ténylegesen egy vagy több I-keret nyugtázás).

8.6.5 Közös ICAO adatcsere hálózat (CIDIN)

8.6.5.1 BEVEZETÉS

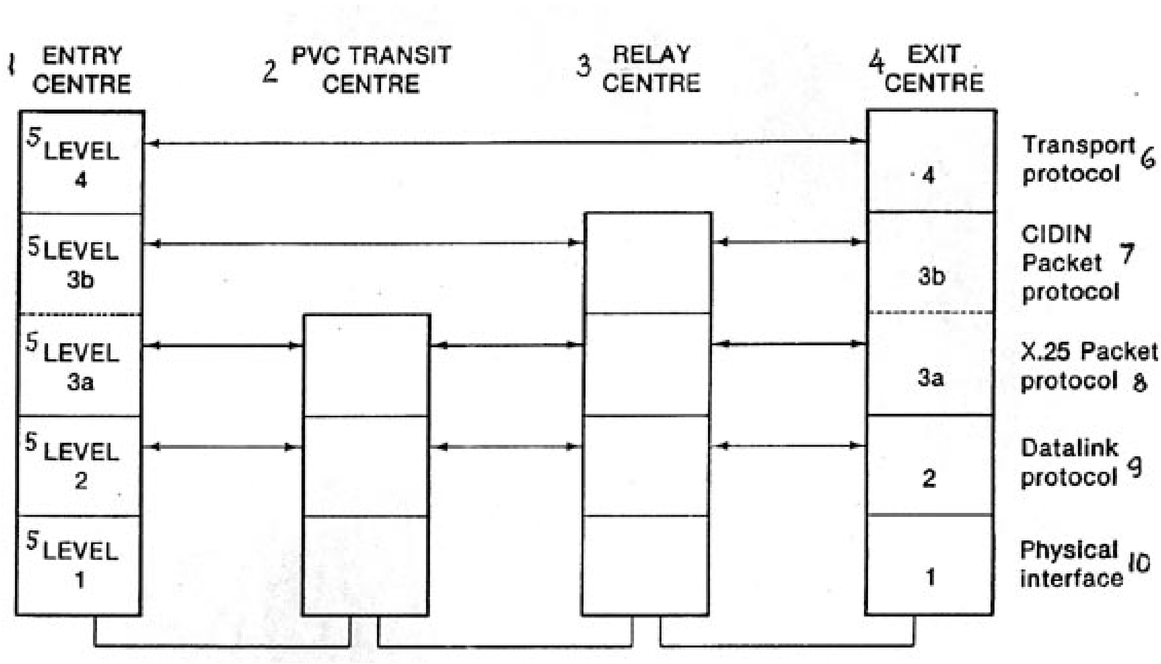
1. Megjegyzés. - A közös ICAO adatcsere hálózat (CIDIN) A Légiforgalmi Állandóhelyű Szolgálat (AFS) egy eleme, amely bit-orientált eljárásokat, tárolási és továbbítási technikákat és csomag kapcsolatú technikát használ és a CCITT X.25. Ajánlásán alapulóan továbbítja a közleményeket az AFS meghatározott alkalmazásaihoz, mint például az AFTN részére és a repülés-üzemi meteorológiai tájékoztatásokhoz (OPMET).

2. Megjegyzés. - A CIDIN egy megbízható közös hálózati szolgáltatást biztosít a felhasználói közlemények továbbításához, a légiforgalmi szolgálatokat biztosítók és a légijármű üzemeltető ügynökségek /vállalatok/ részére.

8.6.5.1.1 CIDIN belépési és kilépési központokat vagy állomásokat kell biztosítani a CIDIN alkalmazási entitásokhoz történő csatlakozásokhoz.

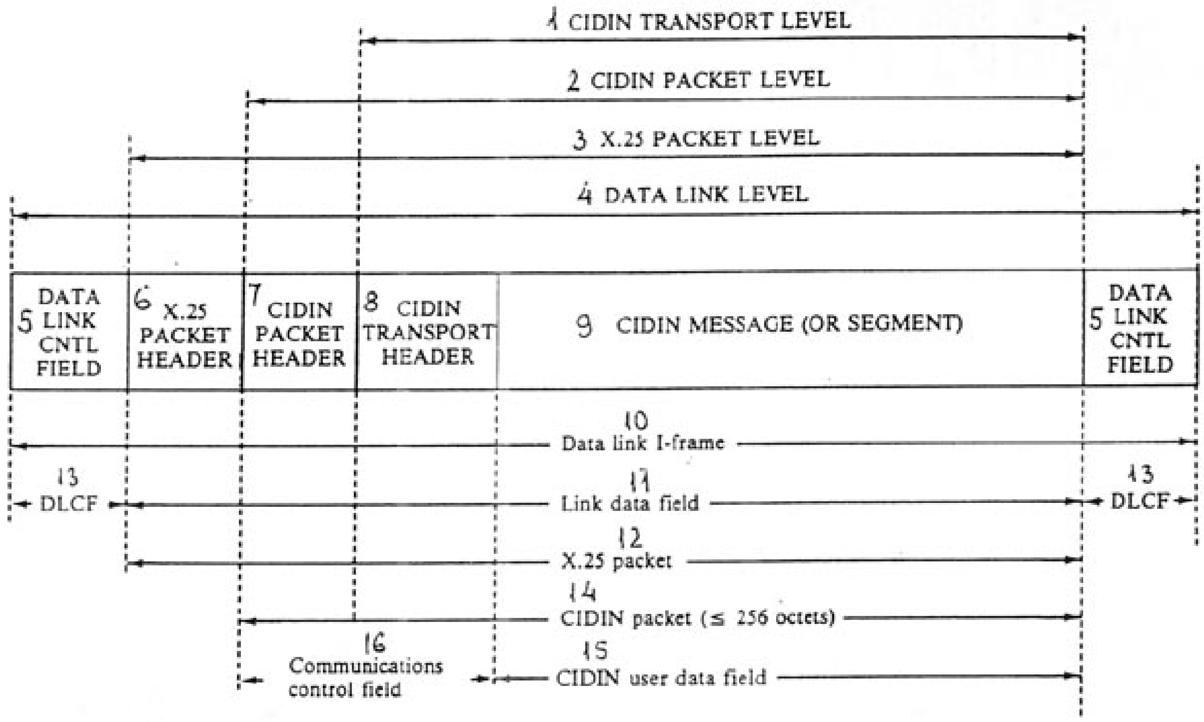
Megjegyzés. - A CIDIN és az alkalmazási entitások közötti interfész helyi kivitelezések tárgyát képezi.

8.6.5.1.2 A CIDIN közvetítő központokat az olyan CIDIN belépési és kilépési központok közötti csomagok továbbítására kell használni, amelyek nincsenek közvetlenül kapcsolva.



8-1. ábra. CIDIN protokoll szintek

8-1 ábra szövege:
1 Belépési központ
2 PVC átmenő központ
3 Átviteli központ
4 Kilépési központ
5 Szint
6 Átviteli protokoll
7 CIDIN csomag protokoll
8 X. 25 csomag protokoll
9 Kapcsolat protokoll
10 Fizikai interfész



8-2 ábra. CIDIN terminológia

8-2 .ábra szövege:
1 CIDIN átviteli szint
2 CIDIN csomag szint
3 X. 25 csomag szint
4 Adatkapcsolat szint
5 Adatkapcsolat CNTL mező
6 X. 25 csomag fej-rész
7 CIDINcsomag fej-rész
8 CIDIN átviteli fej-rész
9 CIDIN közlemény (vagy szegmens)
10 Adatkapcsolat I-keret
11 Adatkapcsolat mező
12 X. 25 csomag
13 Adatkapcsolat vezérlő mező
14 CIDIN csomag (≤ 256 oktett)
15 CIDIN felhasználói adat mező
16 Kommunikációs szabályozás mező

8.6.5.2 ÁLTALÁNOS

8.6.5.2.1 Négy protokoll szintet kell meghatározni a CIDIN kapcsoló-központok közötti adatátvitel vezérléséhez.
- Az adatkapcsolat protokoll szintet,
- az X.25 csomag protokoll szintet,
- a CIDIN csomag protokoll szintet,
- a CIDIN átviteli protokoll szintet.

1. Megjegyzés. - Az alkalmazott szakkifejezések közötti összefüggéseket a 8-1. és 8-2. ábra mutatja be.

2. Megjegyzés. - A CIDIN összeköttetési eljárások és rendszer előírások részletes leírása - ahogy az Európában megvalósításra került - az EUR CIDIN Kézikönyvben került megadásra (EUR Doc 005).

8.6.5.2.2 *AZ ADATKAPCSOLATI PROTOKOLL SZINT*

8.6.5.2.2.1 Az X.25 csomagot, amely továbbításra kerül két CIDIN kapcsoló-központ vagy egy CIDIN kapcsoló-központ és egy csomag-kapcsolt adatátviteli hálózat között, adatkapcsolati keretekbe kell formattálni.

8.6.5.2.2.2 Az egyes adatkapcsolati kereteknek magukba kell foglalni egy adatkapcsolat vezérlő mezőt, esetlegesen egy kapcsolat adatmezővel folytatva és jelző bitekkel kell befejezni azokat (ezek a DLCF második részét képezik). Ha van kapcsolat adatmező, akkor a keretet információs keretként kell megjelölni.
8.6.5.2.2.3 Az X.25 csomagokat az információs mezők kapcsolat adatmezőin belül kell továbbítani. A kapcsolat adatmező csak egy csomagot foglalhat magába.
8.6.5.2.3 *AZ X.25 CSOMAG PROTOKOLL SZINT*
8.6.5.2.3.1 Minden egyes, a CIDIN kapcsoló-központok között, a CIDIN-áramkörökön továbbított CIDIN csomagnak egy X.25 csomagba formattált csomagnak kell lenni. Amikor egy csomag-kapcsolt adatátviteli hálózat használatos, akkor megengedhetőnek kell lenni annak, hogy a CIDIN keret egynél több csomagba kerüljön formattálásra.
8.6.5.2.3.2 Az egyes CIDIN csomagok integritását a CIDIN csomagnak kell megőriznie az egyes CIDIN csomagoknak egy teljes X.25 keret sorozatba való leképezésével, ahogy azt a CCITT X.25 Ajánlása meghatározza.
8.6.5.2.3.3 Az egyes X.25 csomagoknak magukba kell foglalniuk az X.25 csomag fej-részt, amit esetlegesen a felhasználói adatmező (UDF) követ.
8.6.5.2.3.4 Az X.25 csomag protokoll a virtuális áramköri eljárások alkalmazásán alapszik. Egy virtuális áramkört úgy kell meghatározni, hogy az egy logikai út két CIDIN kapcsoló-központ között. Ha csomag- kapcsolt adatátviteli hálózatot használnak, a CIDIN kapcsoló-központok közötti összekapcslódáshoz, akkor biztosítani kell a teljes kompatibilitást azokkal az eljárásokkal, amit a CCITT X.25 Ajánlása szerint a virtuális áramkörök megkövetelnek.
8.6.5.2.4 *A CIDIN CSOMAG PROTOKOLL SZINT*
8.6.5.2.4.1 Minden egyes átviteli fej-részt és a hozzá kapcsolódó szegmensét egy CIDIN csomag fej- résznek kell megelőzni. A CIDIN közlemény semmilyen további szegmentálására nincs szükség az átviteli protokoll szint és a CIDIN csomag protokoll szint között. Ennek megfelelően mindkét fej-részt összekapcsolva fel kell használni. Együtt ezeket összeköttetési vezérlő mezőnek (CCF) nevezik. A közlemény szegmenssel együtt ezek képezik azokat a CIDIN csomagokat, amelyeket a belépési központtól a kilépési központ (ok) ig továbbítani kell, amikor szükséges, egy vagy több közvetítő központon keresztül egy entitásként.
8.6.5.2.4.2 Egy CIDIN közlemény CIDIN csomagjait önállóan kell továbbítani a hálózat előre kijelölt útvonalain keresztül, ami ezáltal lehetővé teszi az alternatív továbbítási útvonalakat a CIDIN csomag alapján, ahogy szükséges.
8.6.5.2.4.3 A CIDIN csomag fej-résznek tartalmaznia kell azt az információt, ami lehetővé teszi a közvetítő központoknak a CIDIN csomagok prioritás szerinti kezelését, a CIDIN csomagoknak a megfelelő kimeneti áramkör(ök)ön való továbbítását és a CIDIN csomagok duplikálását, vagy megtöbbszörözését, amikor ez a többszörös elosztás céljából szükséges. Az információnak kielégítőnek kell lenni ahhoz, hogy a kilépő címzettnél alkalmazzák a címzés szerinti leválasztást, valamint az AFTN-formátumnál a közlemények a címzett indikátorának meghatározását.
8.6.5.2.5 *ÁTVITELI PROTOKOLL SZINT*
8.6.5.2.5.1 A CIDIN /hálózaton/ cserélt információkat CIDIN-közleményekként kell továbbítani.
8.6.5.2.5.2 A CIDIN közlemény hosszát a CIDIN csomag sorozatszám (CPSN) határozza meg. A maximális megengedhető hossz 2^{15} csomag, ami valójában nem eredményez gyakorlati korlátozást.
8.6.5.2.5.3 Ha a CIDIN közlemény és annak átviteli és csomag fej-részeinek a hossza (ahogy az az alábbiakban meghatározásra kerül) meghaladja a 256 oktettet, akkor a közleményt szegmensekre kell osztani, és a CIDIN csomagokat a CIDIN felhasználói adatmezőjébe kell behelyezni. Minden egyes szegmenset meg kell, hogy előzzön egy olyan átviteli fej-rész, amely elegendő információt tartalmaz ahhoz, hogy a kilépő állomás (ok) az egyedileg vett szegmensekből újra összeállítsák a CIDIN közleményt, és meghatározzák a vett teljes CIDIN közlemény további kezelését.
8.6.5.2.5.4 A CIDIN közlemény összes szegmensének a továbbítási fej-részben ugyanazon közlemény azonosító információval ellátottnak kell lenni. Csak a CSPN és az utolsó CIDIN csomag (FCP) jelzése lehet eltérő.
8.6.5.2.5.5 A közlemények helyreállítását az átviteli szinten kell elvégezni.

9. FEJEZET. LÉGIJÁRMŰ CÍMZÉSI RENDSZER

9.1 A légijármű címzéseknek a 16777214 huszonnégy-bites légijármű címzések egyikének kell lenni, amelyet az ICAO osztott ki a lajstromozó Államoknak vagy az Európai Gazdasági Közösség lajstromozó hatóságainak, és az ehhez a fejezethez tartozó Függelékben leírtaknak megfelelően van kijelölve.

FÜGGELÉK A 9. FEJEZETHEZ. VILÁGMÉRETŰ SÉMA A LÉGIJÁRMŰ CÍMZÉSEK KIOSZTÁSÁHOZ, KIJELÖLÉSÉHEZ ÉS ALKALMAZÁSÁHOZ

1. Általános

1.1 Világméretű kommunikációs, navigációs és légtér-ellenőrzési rendszerek 24 bitből álló egyedi légijármű címzést használnak. Egy címzést egy időben csak egy légijárműnek jelölhetnek ki. A légijármű címzések kijelölése átfogó sémát igényel, amely világméretekben alkalmazható, kiegyensúlyozott és kiterjeszthető légijármű címzés elosztást szolgáltat.

2. A séma leírása

2.1 A 9-1 táblázat tartalmazza az Államok részére a légijármű kijelöléshez rendelkezésre álló, egymásután következő címzések blokkjait. Mindegyik blokkot a 24-bites címzés első 4, 6, 9, 12 vagy 14 bitjének rögzített sémája definiálja. Így különböző méretű blokkok (1048576, 262144, 32768, 4096 és 1024 egymást követő címzések) állnak rendelkezésre.

3. A séma kezelése

3.1 A Nemzetközi Polgári Repülési Szervezetnek (ICAO) a sémát úgy kell adminisztrálnia, hogy a légijármű címzések megfelelő nemzetközi elosztása fenntartható legyen.

4. Légijármű címzések kiosztása

4.1 A légijármű címzés blokkokat az ICAO kiosztja a Lajstromozó Államnak vagy az Európai Gazdasági Közösség lajstromozó hatóságainak. A címzések kiosztását az Államok között a 9-1 táblázat mutatja be.
4.2 A Lajstromozó Államnak vagy az Európai Gazdasági Közösség lajstromozó hatóságainak közölnie kell az ICAO-val, ha a címzések egy további blokkjának kiosztása válik szükségessé részére, a légijárműveknek való kijelölése céljából.
4.3 A séma jövőbeni kezelésében előnyben kell részesíteni azokat a légijármű címzés blokkokat, amelyek még nem kerültek kiosztásra. Ezeket a tartalék blokkokat a vonatkozó ICAO régiók bázisán kell szétosztani.
00100 bit kombinációval kezdődő címzések: AFI régió
00101 bit kombinációval kezdődő címzések: SAM régió
0101 bit kombinációval kezdődő címzések: EUR és NAT régió
01100 bit kombinációval kezdődő címzések: MID régió
01101 bit kombinációval kezdődő címzések: SEA régió
1001 bit kombinációval kezdődő címzések: NAM és PAC régió
111011 bit kombinációval kezdődő címzések: CAR régió
Ezeken kívül a 1011, 1101 és 1111 bit kombinációkkal kezdődő légijármű címzéseket jövőbeni alkalmazásokra tartják fenn.
4.4 További légijármű címzésre vonatkozó bármely jövőbeli igényt az ICAO és lajstromozó államok vagy az Európai Gazdasági Közösség regisztráló hatóságai közötti együttműködés keretében kell benyújtani. További légijármű címzések iránti kérést a lajstromozó hatóság csak akkor nyújthat be, ha e lajstromozó hatóság részére kiosztott címzések számának legalább 75 százalékát már kijelölték légijárművek részére.
4.5 Az ICAO kérésükre légijármű címzés blokkokat a nem-tagállamok részére is kioszt.

5. Légijármű címzések kijelölése

5.1 Ha megfelelően felszerelt nemzeti vagy nemzetközi regiszterbe felvett légijármű használatra igényelte, a lajstromozó állam vagy az Európai Gazdasági Közösség regisztráló hatósága az egyes blokkokból egyéni légijármű címzést jelöl ki a légijármű részére.
5.2 A légijármű címzéseket a következő alapelveknek megfelelően kell a légijárművek részére kijelölni:
a) egyidőben egy címzés csak egy légijármű részére jelölhető ki;

b) egy légijármű számára csak egy címzés jelölhető ki, tekintet nélkül a légijármű fedélzeten lévő berendezés kompozíciókra;
c) a címzést változtatni nem lehet, különleges körülményektől eltekintve, és repülés alatt nem változtatható;
d) amikor egy légijármű megváltoztatja lajstromozó államát, az előzőleg kijelölt címzést le kell adni és az új lajstromozó hatóságnak egy új címzést kell részére kijelölni;
e) a címzés kizárólag technikai szerepet tölt be a légijármű címzésében és azonosításában, és semmilyen specifikus információ továbbítására nem használható; és
f) a 24 NULLA-ból vagy 24 EGY-esből összeállított címzéseket nem lehet légijárművek részére kijelölni.

6. Légijármű címzések alkalmazása

6.1 A légijármű címzéseket olyan alkalmazásokban lehet felhasználni, amelyek információ irányítást igényelnek az egyes, alkalmasan felszerelt légijárművek részére vagy részéről.
1. Megjegyzés. - Ilyen alkalmazásokra példák a légiforgalmi távközlési hálózat (ATN), S-módú másodlagos légtérellenőrző radar és az összeütközési veszélyt jelző fedélzeti rendszer (ACAS).
2. Megjegyzés. - Ez a Szabvány nem zárja ki légijármű címzések kijelölését az olyan speciális alkalmazásokra, amelyek az általános alkalmazásokhoz kapcsolódnak, és abban meghatározottak. Példák az ilyen alkalmazásokra a 24-bites címzés felhasználása a pszeudo-légiforgalmi földi állomásnál a légiforgalmi mozgó-műholdas szolgálat földi telepítésű földi állomásának ellenőrzésére, és az állandó-helyű S-módú válaszjeladóknál való alkalmazás (a "földön" állapot jelzésére, ahogy az az Annex 10, IV. Kötete 3.1.2.6.10.1.2 pontjában meghatározásra került) az S-módú földi állomás működésének ellenőrzésére. A speciális alkalmazások címzés kijelölését az Állam által a 24-bites légijármű címzések kijelölésére meghatározott eljárásnak megfelelően kell elvégezni.
6.2 A 24 NULLA-ból álló címzés semmilyen alkalmazásnál nem használható fel.

7. Az ideiglenes légijármű címzések kijelölésének intézése

7.1 Egy légijármű részére ideiglenes cím kivételes körülmények esetén kerül kijelölésre, mint például akkor, ha az üzemeltetők nem képesek a címzést beszerezni a saját Államuk Lajstromozó Hatóságától, vagy az Európai Gazdasági Közösség lajstromozó hatóságától a kellő időben történő módon. Az ICAO-nak az ideiglenes címzést a 9-1. táblázatban bemutatott ICAO blokkból kell kijelölni.
7.2 Az ideiglenes címzés kérésekor a légijármű üzemeltetőjének meg kell adni az ICAO-nak: a légijármű azonosító jelét, a típusát és a légijármű gyártóját, az üzemeltető nevét és címét, valamint a kérés okának magyarázatát.
7.2.1 Az ideiglenes címzésnek a légijármű járatói részére történő kiadásakor az ICAO tájékoztatni fogja a Lajstromozó Államot az ideiglenes címzés kiadásáról, az okáról és érvényességi idejéről.
7.3 A légijármű üzemeltetője:
a) Tájékoztatni fogja a Lajstromozó Államot az ideiglenes kijelölésről és megismétli az állandó címzés iránti kérését; és
b) Tájékoztatja a légijármű gyártóját.
7.4 Amikor a légijármű a Lajstromozó Hatóságától az állandó címzést megkapja, akkor az üzemeltetőnek:
a) Késés nélkül tájékoztatnia kell az ICAO-t;
b) Le kell mondania az ideiglenes címzésről; és
c) Elrendeznie az érvényes egyedi címzésnek a bekódolását 180 naptári napon belül.
7.5 Ha az állandó címet egy éven belül nem kapja meg, akkor a légijármű üzemeltetőjének újra kérnie kell egy új ideiglenes légijármű címzést. Semmilyen esetben sem használhat egy ideiglenes légijármű címzést a légijármű üzemeltetője egy évnél tovább.

9-1. táblázat. Légijármű címzések kiosztása az Államoknak

Megjegyzés. – A 24 bites címzés sémák baloldali oszlopa a címzés legmagasabb helyiértékű bitjét (MSB) reprezentálja.

Állam	Címzések száma a blokkban					A címzés blokkok kiosztása (egy vonás egy 0-val vagy 1-gyel egyenlő bit értéket képvisel)					
	1024	4096	32768	262144	1048576

1. Ezt a blokkot az ICAO kezeli az ideiglenes légijármű címzések kijelölésére, ahogy az a 7. részben leírásra került.
2. Repülésbiztonság érdekében speciális felhasználásra kiosztott blokk.

10. FEJEZET. PONTBÓL-TÖBB-PONTBA KOMMUNIKÁCIÓ

10.1 REPÜLÉSI INFORMÁCIÓK MŰHOLDON KERESZTÜLI TERJESZTÉSÉT VÉGZŐ SZOLGÁLTATÁS

10.1.1 A Pontból-Több-pontba műholdon keresztüli távközlési szolgáltatás a repülési információk terjesztésének elősegítésére szünet nélküli, nem előre lefoglalható, védett szolgáltatáson alapszik a vonatkozó CCITT Ajánlásokban definiáltaknak megfelelően.

10.2 A TERÜLETI ELŐREJELZŐ VILÁGRENDSZER /WAFS/ ELŐREJELZÉSEK MŰHOLDON KERESZTÜLI TERJESZTÉSÉT VÉGZŐ SZOLGÁLTATÁS

10.2.1 **Ajánlás.** – *Rendszerjellemzők a következőket foglalják magukba:*
a) frekvencia – C-sáv, földtől-műholdhoz, 6 GHz-es sáv, műholdtól-földre, 4 GHz-es sáv;
b) kapacitás nem kisebb, mint 9600 bit/s tényleges jelsebességgel;
c) bit hiba-arány – jobb, mint 1 a 10^7 esetben;
d) vevő-oldali hibajavítás; és
e) 99,95 százalékos rendelkezésre állás.

11. FEJEZET. RÖVIDHULLÁMÚ /HF/ ADATKAPCSOLAT

11.1 MEGHATÁROZÁSOK ÉS RENDSZER TELJESÍTŐKÉPESSÉGEK

Megjegyzés. – A következő Szabványok és Ajánlott Gyakorlatok a Rövidhullámú adatkapcsolatra (HFDL) jellemzőek, és kiegészítésként szolgálnak a Nemzetközi Távközlési Unió /ITU/ Nemzetközi Rádió-Rendszabályzatban (27. Függelék) meghatározott követelményekhez. A Rövidhullámú adatkapcsolat /HFDL/ a Légiforgalmi Távközlési Hálózat (ATN) egy lényeges mozgó alhálózata és a légiforgalmi mozgó szolgálat (R) rövidhullámú frekvenciasávjaiban működik. Ezenkívül még a HFDL nem-légiforgalmi távközlési hálózati ATN funkciókat is tud biztosítani, például a közvetlen kapcsolat szolgáltatást (DLS). A HFDL rendszernek lehetővé kell tenni a légijármű adat-cseréjét a földi bázisú felhasználókkal.

11.1.1 Meghatározások

Kódolt chip *(Coded chip).* Az ½ vagy ¼ mértékű konvolúciós kód kódolónak az „1” vagy a „0” kimenete.
A kijelölt üzemeltetési fedésterület (DOC) területe *(Designated operational coverage (DOC) area).* Az a terület, amelyen belül egy adott szolgáltatást biztosítanak, és amelyen belül a szolgáltatásra frekvencia védelem biztosított.
Megjegyzés. – Ez a terület a megfelelő koordinációjú frekvencia védelem biztosítása után kiterjedhet a Nemzetközi Rádió-Rendszabályzat 27. Függelékében található kijelölési területen túlra.
Közvetlen kapcsolat szolgáltatás (DLS) *(Direct link service (DLS).* Adatátviteli mód, amely nem próbálja automatikusan kijavítani az észlelt vagy nem-észlelt hibákat, a levegő-föld adatátviteli irányú kapcsolat rétegénél. (A hiba ellenőrzést a vég-felhasználói rendszerek hajtják végre.)
Rövidhullámú hálózati protokoll adat egység (HFNPDU) *High frequency network protocol data unit (HFNPDU).* A felhasználói adat csomag.
Kapcsolat protokoll adat egység (LPDU) *(Link protocol data unit (LPDU)).* Adat egység, amely a HFNPDU egy szegmensét zárja magába.
Adathordozó hozzáférési protokoll adat egység (MPDU) *(Media access protocol data unit (MPDU).* Adat egység, amely egy vagy több kapcsolat protokoll adat egységet zár magába.
M-együtthatójú digitális fázis-billentyűzéses (M-PSK) moduláció *(M-ary phase shift keying (M-PSK) modulation).* Digitális fázis-moduláció, amely létrehozza azt, hogy a vivőhullám hullám-formájának fázisa az M-érték-sorozat valamelyikét felvegye.
M-PSK jel *(M-PSK symbol).* Az M-PSK modulációs vivőhullám lehetséges ’M’ fázis-eltolásának egyike, ami a $\log_2$ M kódolt chip-ek csoportját jelképezi.
Modulációs csúcs-teljesítmény (PEP) *(Peak envelope power (PEP)).* Az adó által az antenna tápvonalába betáplált modulált jel csúcs-teljesítménye.
Fizikai réteg protokoll adat egység (PPDU) *(Physical layer protocol data unit (PPDU)).* A fizikai réteghez leadásra továbbított vagy a vétel után a fizikai réteg által dekódolt adat egység.
A szolgáltatás minősége (QOS) *(Quality of service (QOS)).* Az adatátviteli jellemzőkre vonatkozó azon információ,

amelyet a különféle összeköttetési protokollok által a hálózat felhasználók részére biztosított teljesítmény különböző szintjének eléréséhez használnak.
Megbízható kapcsolat szolgáltatás (RLS) *(Reliable link service (RLS)).* Az alhálózat által nyújtott olyan adat-csere szolgáltatás, amely az összeköttetéseire automatikusan biztosítja a hiba-ellenőrzést, a hiba érzékelésével és a hibásnak talált elemi jelek kért adás-ismétlésével.
Szkvitter protokoll adat egység (SPDU) *(Squitter protocol data unit (SPDU)).* A rövidhullámú adatkapcsolat (HFDL) földi állomásai által minden egyes üzemelési frekvenciájukon 32 másodpercenként kisugárzott azon adat egység, amely a kapcsolat kezelési információkat foglalja magába.

11.2 A RÖVDHULLÁMÚ /HF/ ADATKAPCSOLAT RENDSZER

11.2.1 A rendszer felépítése

A rövidhullámú adatkapcsolat /HFDL/ rendszernek egy vagy több olyan földi és légijármű fedélzeti alrendszerből kell állni, amelyek rendelkeznek a HFDL protokollal (lásd a 11.3 pontot). A HFDL rendszernek magába kell foglalnia egy földi kezelő alrendszert is (lásd a 11.4 pontot).

11.2.1.1 A LÉGIJÁRMŰ FEDÉLZETI ÉS FÖLDI ÁLLOMÁSOK ALRENDSZEREI
A rövidhullámú adatkapcsolat /HFDL/ légijármű fedélzeti állomások alrendszereinek és a HFDL földi állomások alrendszereinek a következő funkciókat kell magukba foglalniuk:
a) Rövidhullámú /HF/ adás és vétel;
b) Adat moduláció és demoduláció; és
c) A HFDL protokollal és a frekvencia választással való rendelkezés.

11.2.2 Üzemeltetési fedésterület

A rövidhullámú adatkapcsolat /HFDL/ frekvencia kijelöléseknek a kijelölt üzemeltetési fedésterületek /DOC/ teljes egészében védettnek kell lenni.
1. Megjegyzés. – A kijelölt üzemeltetési fedésterületek (DOC) területei eltérőek lehetnek az ITU Nemzetközi Rádió-Rendszabályzatának S27 Függelékében meghatározott jelenlegi MWARA /a Világ Fő Légiútvonalainak Területe/ vagy RDARA /Körzeti és Belföldi Légiútvonalak Területe/ kijelölt területektől.
2. Megjegyzés. – Kiegészítő koordinációra van szükség az ITU-val az olyan esetekben, amikor a DOC területek nincsenek összhangban az ITU Nemzetközi Rádió-Rendszabályzatának meghatározottan felosztott területekkel.

11.2.3 A rövidhullámú adatkapcsolat /HFDL/ berendezésekkel való felszereltségi követelmény

A rövidhullámú adatkapcsolati /HFDL/ berendezésekkel való kötelező felszereltség követelményt a körzeti léginavigációs egyezmények alapján kell előírni, amelyek meghatározzák az üzemeltetés légterét és a bevezetés idő-rendjét.

11.2.3.1 ÉRTESÍTÉS
A fenti egyezményeknek legkevesebb két éves előzetes értesítést kell biztosítani a légijármű fedélzeti rendszerek kötelező felszereléséhez.

11.2.4 A földi állomások hálózatba szervezése

11.2.4.1 **Ajánlás. –** *A rövidhullámú adatkapcsolat /HFDL/ földi állomások alrendszereit egy közös földi kezelő alrendszeren keresztül össze lehet kapcsolni.*

Megjegyzés. – Ez egy elosztott alhálózatot biztosít egy alhálózat csatlakozási ponttal (SNPA) a megvalósítás módjától függően, ami lehetővé teszi a virtuális áramköri kapcsolatoknak légijármű állomásokként való fenntartását a kijelölt *üzemeltetési fedésterületek közötti átmenetnél. Az elosztás lehet körzetek közötti vagy világméretű.*

11.2.5 A földi állomások szinkronizálása

A rövidhullámú adatkapcsolat /HFDL/ földi állomás alrendszerek szinkronizálásának az UTC-hez viszonyítottan ±25 ms-on belül kell lenni. Bármely olyan állomásról, amely nem az UTC-hez viszonyított ±25 ms-on belül működik, a megfelelő figyelmeztetést kell kiadni az összes légijármű és földi állomás alrendszer részére, hogy a folyamatos rendszer működés lehetséges legyen.

11.2.6 A szolgáltatás minősége

11.2.6.1 CSOMAG MARADÉK-HIBA ARÁNY

A felderítetlen hiba aránynak egy olyan hálózati felhasználói csomagnál, amely a felhasználói adat 1. és 128. közötti oktettjét foglalja magába, az 1 a 10^6-nál kevesebbnek vagy azzal egyenlőnek kell lenni.

11.2.6.2 A SZOLGÁLATÁS SEBESSÉGE

A hálózati felhasználói csomagoknál (128 oktett) az átviteli és továbbítási késések az I. Kötet, 4. Fejezetének 4-26. táblázatában a 7.-től a 14.-ig terjedő közlemény elsőbbségekre meghatározott prioritás nem haladhatja meg a 11-1. táblázatban megadott értékeket.

11-1. táblázat. Továbbítási késések

	Irány	*Prioritás*	*Késés*
Átviteli késés	A légijárműhöz	7-től 14-ig	45 s
	A légijárműtől	7 -től 14-ig	60 s
Továbbítási késés (95 százalékos)	A légijárműhöz	11-től 14-ig 7-től 10-ig	90 s 120 s
	A légijárműtől	11-től 14-ig 7 -től 10-ig	150 s 250 s

11.3 RÖVIDHULLÁMÚ ADATKAPCSOLAT /HFDL/ PROTOKOLL

A rövidhullámú adatkapcsolat /HFDL/ protokollnak egy fizikai rétegből, egy kapcsolat rétegből és egy alhálózat rétegből kell állnia az alábbiak szerint.

Megjegyzés. – A rövidhullámú adatkapcsolat /HFDL/ protokoll egy rétegelt protokoll, és kompatibilis a nyílt rendszerek összekapcsolása (OSI) referencia modellel. Ez lehetővé teszi a HFDL részére azt, hogy a légiforgalmi távközlési hálózat (ATN) kompatibilis alhálózataként működjön. A protokoll részletes leírását a Rövidhullámú /HF/ Adatkapcsolat Kézikönyv *(Doc 9741) tartalmazza.*

11.3.1 A fizikai réteg rádiófrekvenciás /RF/ jellemzői

A légijármű fedélzeti és a földi állomások a fizikai adathordozó működéséhez szimplex módon férnek hozzá.

11.3.1.1 FREKVENCIA SÁVOK

A rövidhullámú adatkapcsolati /HFDL/ berendezéseknek képeseknek kell lenniük arra, hogy bármelyik olyan Egy-oldalsávos (SSB) vivőhullám (referencia) frekvencián működjenek, amely a légiforgalmi mozgó (R) szolgálat részére áll rendelkezésre a 2,8-tól a 22 MHz-ig terjedő sávcsoportban, és megfelel a Nemzetközi Rádió-Rendszabályzat vonatkozó előírásainak.

11.3.1.2 CSATORNÁK

A csatorna felhasználásnak összhangban kell lenni az ITU Nemzetközi Rádió-Rendszabályzat S27 Függelékében lévő vivőhullám /referencia/ frekvencia táblázattal.

11.3.1.3 HANGOLÁS

A berendezéseknek képesnek kell lenniük arra, hogy az 1 kHz egészszámú többszörösén működjenek.

11.3.1.4 OLDALSÁV

Az átvitelre használt oldalsávnak a vivőhullám (referencia) frekvencia magasabb oldalán kell lenni.

11.3.1.5 MODULÁCIÓ

A rövidhullámú adatkapcsolatnak /HFDL/ az M-együtthatójú digitális fázis-eltolásos módot (M-PSK) kell alkalmazni a kijelölt frekvencia rádiófrekvenciás vivőhullámának modulálására. A jel-sebességnek másodpercenként 1800 jelnek kell lenni ± 10 rész per millió résszel /ppm/ (azaz 0,018 jel másodpercenként). Az M értéke és az információs adat sebessége a 11-2. táblázatban meghatározott lesz.

11-2. táblázat. M értéke és az információs adat sebesség

M	*Információs adat-sebesség (bit másodpercenként)*
2	300 vagy 600
4	1 200
8	1 800

Megjegyzés. – Ha az M egyenlő a 2 értékkel, akkor az adat-sebesség másodpercenként 300 vagy 600 bit lehet, ahogy azt a csatorna kódolási sebessége meghatározza. Az M értéke az egyik adat-átvitelről a másikra megváltozhat a kiválasztott adat-sebességtől függően. A csatorna kódolási sebesség a Rövidhullámú /HF/ Adatkapcsolat Kézikönyv*-ben (Doc 9741) került leírásra.*

11.3.1.5.1 *M-PSK VIVŐHULLÁM*

Az M-PSK vivőhullámot matematikailag kifejezve a következők szerint kell meghatározni:

$s(t) = A\Sigma(p(t-kT)\cos[2\pi f_0 t + \varphi(k)])$, $k = 0, 1 \ldots, N-1$

ahol:

N = Az M-PSK jelek száma a továbbított fizikai réteg protokoll adat egységben (PPDU)

s (t) = Az analóg hullámforma vagy jel a 't' időben

A = Csúcs amplitúdó

f_0 = Az SSB vivőhullám (referencia) + 1 440 Hz

T = M-PSK jel periódus (1/1 800 s)

φ (k) = A k-ik M-PSK jel fázisa

p (t-kT) = A k-ik M-PSK jel impulzus alakja a 't' időben

Megjegyzés. – Az elküldött jelek száma, az N, határozza meg a fizikai réteg protokoll adat egység /PPDU/ hosszát (időtartam = NT másodperc). Ezek a paraméterek a Rövidhullámú /HF/ Adatkapcsolat Kézikönyv*-ben (Doc 9741) kerültek meghatározásra.*

11.3.1.5.2 *IMPULZUS ALAK*

Az impulzus alak, p(t), fogja meghatározni a kisugárzott jel spektrális eloszlását. Az impulzus alak Fourier transzformáltját, a P(f)-t, a következők szerint kell meghatározni:

$P(f) = 1$,   ha $0 < |f| < (1 - b)/2T$

$P(f) = \cos\{\pi(2|f|T - 1 + b)/4b\}$,   ha $(1 - b)/2T < |f| < (1 + b)/2T$

$P(f) = 0$,   ha $|f| > (1 + b)/2T$

Ahol a spektrális határ paraméter, a b = 0,31, úgy került kiválasztásra, hogy a jel -20 dB-es pontjai az SSB vivőhullám (referencia) +290 Hz-es és az SSB vivőhullám (referencia) +2590 Hz-es értékeinél vannak, és a hullámforma csúcs - átlagos teljesítmény viszonya kisebb, mint 5 dB.

11.3.1.6 ADÓ STABILITÁS

Az adási funkció alap frekvenciája stabilitásának jobbnak kell lenni, mint:

a) ±20 Hz a rövidhullámú adatkapcsolat /HFDL/ légijármű fedélzeti állomás alrendszereknél; és

b) ±10 Hz a HFDL földi állomás alrendszereknél.

11.3.1.7 VEVŐ STABILITÁS

A vevő funkció alap frekvencia stabilitásának olyannak kell lenni, hogy a 11.3.1.6 pontban meghatározott adási funkció stabilitással együtt a földi és a légijármű fedélzeti funkciók között elért teljes frekvencia-különbség a szolgáltatásban ne haladja meg a 70 Hz-et.

11.3.1.8 VÉDELEM

A rövidhullámú adatkapcsolatnál /HFDL/ az azonos csatorna védelemre 15 dB-es megkívánt – nem-kívánt (D/U) jel-arányt kell alkalmazni a következők szerint:

a) Adat adat ellen;

b) Adat hang ellen; és

c) Hang adat ellen.

11.3.1.9 EMISSZIÓ OSZTÁLY

Az emisszió osztálynak a 2K80J2DEN-nek kell lenni.

11.3.1.10 KIJELÖLT FREKVENCIA

A HFDL-nél a kijelölt frekvenciának 1 400 Hz-el magasabbnak kell lennie az SSB vivőhullám (referencia) frekvenciánál.

Megjegyzés. – Egyezményesen a rövidhullámú adatkapcsolat /HFDL/ kijelölt frekvenciája 1 400 Hz-el el van tolva az SSB vivőhullám (referencia) frekvenciától. A HFDL M-PSK digitális modulációs vivőhulláma 1 440 Hz-el van eltolva az SSB vivőhullám (referencia) frekvenciától. A digitális modulációt teljes egészében magába foglalja az azonos teljes csatorna sávszélesség ugyanúgy, mint a hang jelet, és kielégíti az ITU Nemzetközi Rádió-Rendszabályzatok S27 Függelékének előírásait.

11.3.1.11 EMISSZIÓ HATÁRÉRTÉKEK

A Rövidhullámú adatkapcsolat /HFDL/ légijármű fedélzeti és földi állomások adói modulációs csúcsteljesítményének (Pp) bármely emisszióra és bármely diszkrét frekvenciára kevesebbnek kell lenni, mint az adó modulációs csúcs-teljesítményének (Pp), a következőknek megfelelően (lásd a 11-1. ábrát):
a) Bármilyen frekvencián a kijelölt HFDL frekvenciától az 1,5 kHz és a 4,5 kHz közötti tartománnyal alacsonyabb, és bármely frekvencián a kijelölt HFDL frekvenciától az 1,5 kHz és a 4,5 kHz közötti tartománnyal magasabb frekvencián: legalább 30 dB-el;
b) Bármilyen frekvencián a kijelölt HFDL frekvenciától a 4,5 kHz és a 7,5 kHz közötti tartománnyal alacsonyabb, és bármely frekvencián a kijelölt HFDL frekvenciától a 4,5 kHz és a 7,5 kHz közötti tartománnyal magasabb frekvencián: legalább 38 dB-el;
c) Bármely olyan frekvencián, ami a HFDL kijelölt frekvencia alatt 7,5 kHz-nél alacsonyabb frekvencia, és bármely olyan frekvencián, ami a HFDL kijelölt frekvencia felett 7,5 kHz-nél magasabb frekvencia:
1) A HFDL légijármű fedélzeti állomás adóira: 43 dB;
2) A HFDL földi állomás adóira az 50 W-ig, azt is beleértve:
$[43 + 10 \log_{10} P_p \text{ (W)}]$ dB; és
3) A HFDL földi állomás adóira, amelyek 50 W-nál nagyobb teljesítményűek: 60 dB.

11.3.1.12 TELJESÍTMÉNY

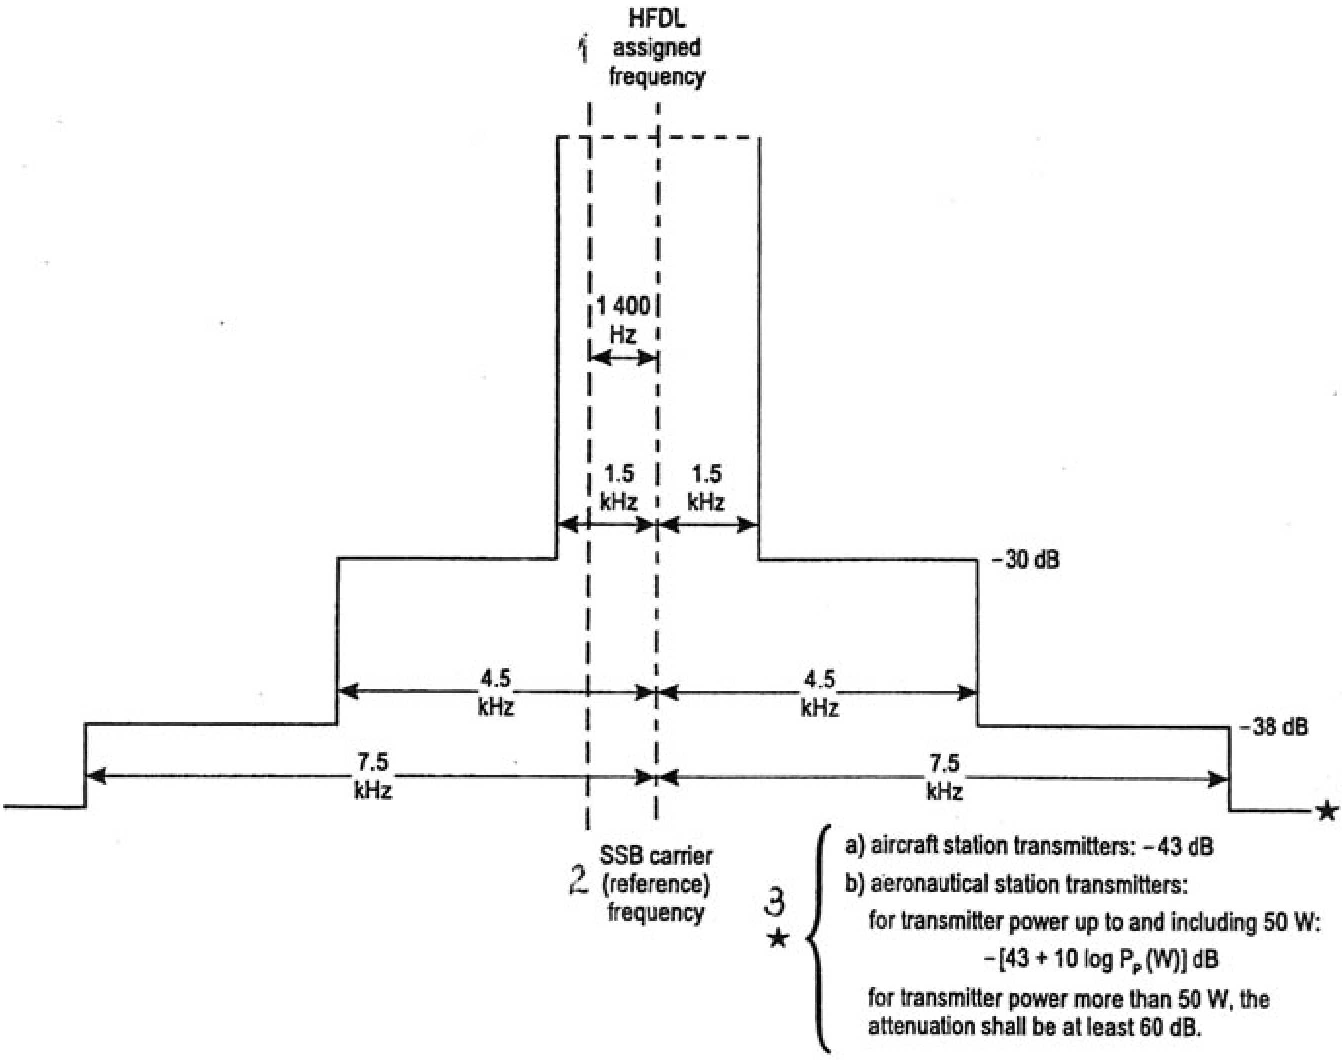
11.3.1.12.1 *A Földi állomás berendezései.* Az antenna tápvonalába betáplált modulációs csúcs-teljesítmény (Pp) nem haladhatja meg a 6 kW-os maximális értéket a Nemzetközi Rádió-Rendszabályzat S27 Függelékében megadottaknak megfelelően.
11.3.1.12.2 *Légijármű fedélzeti állomás berendezések.* Az antenna tápvonalába betáplált modulációs csúcs-teljesítmény (Pp) nem haladhatja meg a 400 W-os maximális értéket, kivéve azt, ami a Nemzetközi Rádió-Rendszabályzat S27/62 Függelékében megadásra került.

11.3.1.13 A NEM-KÍVÁNT JEL KISZŰRÉSE

A Rövidhullámú adatkapcsolat /HFDL/ légijármű fedélzeti és földi állomásainak vevőinél, a nem-kívánt bemenő jeleket a következőknek megfelelően kell csillapítani:
a) Az f_c és (f_c - 300 Hz) közötti, vagy az (f_c + 2 900 Hz) és az (f_c+3300 Hz) közötti bármely frekvencián: legalább 35 dB-el a kívánt jelszint csúcs alá; és
b) Bármely frekvencián az (f_c - 300 Hz) alatt, vagy az (f_c+3300 Hz) felett: legalább 60 dB-el a kívánt jelszint csúcs alá, ahol az f_c a vivőhullám (referencia) frekvencia.

11.3.1.14 A VEVŐ ÉRZÉKENYSÉGE A TRANZIENSEKRE

Ajánlás. – *A vételi funkciónak egy, az antenna végpontjánál fellépő 60 dB-es pillanatnyi rádiófrekvenciás teljesítmény növekedésből 10 milliszekundumon belül fel kell éledni. A vételi funkciónak egy, az antenna végpontjánál fellépő 60 dB-es pillanatnyi rádiófrekvenciás teljesítmény csökkenésből 25 milliszekundumon belül fel kell éledni.*



11-1. ábra: A Rövidhullámú adatkapcsolat /HFDL/ légijármű fedélzeti és földi állomásai adóira megkívánt spektrum határértékek (csúcs-teljesítményben kifejezve).

1 - Rövidhullámú adatkapcsolat /HFDL/ kijelölt frekvencia
2 - Egy-oldalsávos átvitel vivőhullám (referencia) frekvencia
3 - a) légijármű fedélzeti állomás adók: -43 dB
3 - b) légiforgalmi állomás adók:
Az 50 W-os és az alatti teljesítményű adóknál:
- [43+10 log P_P(W)] dB
az 50 W-nál nagyobb teljesítményű adóknál,
a csillapításnak legalább 60 dB-nek kell lenni.

11.3.2 Fizikai réteg funkciók

11.3.2.1 FUNKCIÓK

A fizikai réteg által biztosított funkcióknak a következőket kell magukba foglalni:

a) Adó és vevő vezérlés;

b) Adat-továbbítás; és
c) Adat vétel.

11.3.2.2 ADÓ ÉS VEVŐ VEZÉRLÉS

A Rövidhullámú adatkapcsolat /HFDL/ fizikai rétegének kell elvégezni az adó/vevő kapcsolást és a frekvencia hangolást úgy, ahogy azt a kapcsolat réteg utasítja. A fizikai rétegnek kell végrehajtania a kapcsolat rétegből eredő kérésre az adó billentyűzését a csomag továbbításához.

11.3.2.2.1 *ADÓ - VEVŐ ÁTFUTÁSI IDŐ*

A továbbítási teljesítmény szintnek az adás befejezése után 100 milliszekundumon belül legalább 10 dB-el le kell csengenie. Egy HFDL állomás alrendszernek képesnek kell lenni a névleges teljesítményével venni és demodulálni egy bejövő jelet a következő vételi rés megkezdése előtti 200 milliszekundumon belül.

11.3.2.2.2 *VEVŐ - ADÓ ÁTFUTÁSI IDŐ*

Egy HFDL állomás alrendszernek plusz vagy mínusz 1 dB-en belül biztosítania kell a névleges kimenő teljesítményét az antenna tápvonalába, az adási rés kezdetétől 200 milliszekundumon belül.

11.3.2.3 ADAT-ÁTVITEL

Az adat-átvitelt Időosztásos többszörös elérésű (TDMA) technikával kell végrehajtani. A HFDL adatkapcsolat földi állomás alrendszereinek fenn kell tartaniuk a TDMA keret és rés szinkronizálást a HFDL rendszer részére. Annak biztosítására, hogy a szinkronizálás fennmaradjon, az egyes HF adatkapcsolat modulátoroknak az adatok adását egy elő-billentyűző szegmenssel kell megkezdeni a rés-idő kezdeténél plusz vagy mínusz 10 milliszekundumon belül.

11.3.2.3.1 *A TDMA SZERKEZETE*

Minden egyes TDMA keretnek 32 másodpercesnek kell lenni. Az egyes TDMA kereteket tizenhárom egyenlő időtartamú résre kell felosztani, a következők szerint:
a) Az egyes TDMA keretek első rését fenn kell tartani a HFDL földi állomás alrendszerek általi, a Szkvitter protokoll adat egység /SPDU/ csomagokban lévő kapcsolat kezelési adatok sugárzása részére; és
b) A fennmaradó réseket ki kell jelölni egyrészt, mint fedélzetre irányuló adás réseket, másrészt, mint meghatározott HFDL légijármű fedélzeti állomások részére fenntartott, fedélzetről továbbított adat réseket, vagy mint fedélzetről leadott közvetlen hozzáférésű adat réseket az összes HFDL légijármű fedélzeti állomás alrendszerek általi felhasználásra, versenyhelyzeti alapon. Ezeket a TDMA réseket dinamikus alapon kell kijelölni a fenntartás, a lekérdezés és a tetszőleges hozzáférés kijelölési kombinációval.

11.3.2.3.2 *ADÁS*

A HFDL földi állomás alrendszerének egy Szkvitter protokoll adat egységet /SPDU/ kell sugározni 32 másodpercenként minden egyes üzemelési frekvenciáján.

Megjegyzés. – A TDMA keret és rés szerkezetének, az elő-billentyűző szegmensének, továbbá az adat szerkezetének – az SPDU-t is beleértve – a részletezését a Rövidhullámú Adatkapcsolat (HFDL) Kézikönyv *(Doc 9741) tartalmazza.*

11.3.2.4 AZ ADATOK VÉTELE

11.3.2.4.1 *FREKVENCIA KERESÉS*

Minden egyes HFDL légijármű fedélzeti állomásnak automatikusan keresnie kell a kijelölt frekvenciákat addig, amíg egy működési frekvenciát nem talál.

11.3.2.4.2 *A FIZIKAI RÉTEG PROTOKOLL ADAT EGYSÉGEK /PPDU-k/ VÉTELE*

A HF adatkapcsolat vevőnek kell biztosítania azoknak a PPDU-knak a detektálását, szinkronizálását, demodulálását és dekódolását, amelyek a 11.3.1.5 pontban meghatározott hullámforma szerint moduláltak, a következő torzításokon belül:
a) Az 1440 Hz-es hangfrekvenciás vivőhullám eltolásnál plusz vagy mínusz 70 Hz-el;
b) A nem folytonos és/vagy szórt több-utas torzításnál 5 ms-os több-utas szóródásig;
c) A több-utas amplitúdó elhalkulásnál /fading/ maximum 2 Hz-es két-oldalú RMS Doppler szóródásig és Rayleigh statisztikai szóródásig; és
d) Összetevődő Gauss eloszlású és széles-sávú gerjesztő zajt változó amplitúdóval és véletlenszerű érkezési idővel.

Megjegyzés. - Referencia a CCIR 549-2 Jelentés.

11.3.2.4.3 *A FIZIKAI RÉTEG PROTOKOLL ADAT EGYSÉGEK /PPDU-k/ DEKÓDOLÁSA*
A bevezető szegmens vétele után a vevőnek kell:
a) Meghatározni az adat-sorozat kezdetét;
b) Megmérni és helyesbíteni az adó és a vevő közötti Doppler eltolódást és az adó/vevő frekvencia-eltolódásokat;
c) Meghatározni az adat sebességet és az adat demoduláció során használatos összesorolási beállításokat,
d) Végrehajtani az M-PSK jel szinkronizációt; és
e) Irányítani a kiegyenlítő kört.
11.3.2.4.4 *SZINKRONIZÁCIÓ*
Minden egyes HFDL légijármű fedélzeti állomás alrendszernek szinkronizálnia kell a rés időzítését a megfelelő földi állomás rés-idejéhez az utolsó vett SPDU vételi idejéhez vonatkoztatva.
11.3.2.4.5 *A MEGHATÁROZOTT CSOMAG HIBA GYAKORISÁGI TELJESÍTMÉNY*
Azoknak a HFDL adathordozó hozzáférési protokoll adat egységeknek (MPDU) a száma, amelyek egy vagy több bit hibával kerülnek vételre, nem haladhatja meg az összes vett MPDU számának 5 százalékát akkor, ha az 1,8 másodperces összesorolás használatos, és a térbeli-jel körülmények megfelelnek a 11-3. táblázatban bemutatottaknak.

Ajánlás. – *Azoknak a HFDL adathordozó hozzáférési protokoll adat egységeknek (MPDU) a száma, amelyek egy vagy több bit hibával kerülnek vételre, nem haladhatja meg az összes vett MPDU számának 5 százalékát akkor, ha az 1,8 másodperces összesorolás használatos, és a térbeli-jel körülmények megfelelnek a 11-3a. táblázatban bemutatottaknak.*

11.3.3 Kapcsolat réteg

Megjegyzés. - A kapcsolat réteg funkcióinak részleteit a Rövidhullámú /HF/ Adatkapcsolat Kézikönyv *(Doc 9741) tartalmazza.*

A kapcsolat réteg biztosítj a fizikai réteg, a kapcsolat kezelés és az adat szolgáltatási protokoll részére a vezérlő funkciókat.

11.3.3.1 VEZÉRLŐ FUNKCIÓK

A kapcsolat réteg továbbítja a frekvencia hangolási, az adó billentyűzési és az adó/vevő kapcsolási parancsokat a fizikai réteg részére.

11.3.3.2 KAPCSOLAT KEZELÉS

A kapcsolat réteg kezeli a TDMA rés kijelöléseket, a bejelentkezési és kijelentkezési eljárásokat, a földi állomás és a légijármű fedélzeti állomás TDMA szinkronizálást és az egyéb szükséges funkciókat, figyelembe véve a közlemény prioritásokat az összeköttetés létrehozásához és fenntartásához.

11.3.3.3 ADAT SZOLGÁLTATÁSI PROTOKOLLOK

A kapcsolat réteg támogat egy megbízható kapcsolat szolgáltatás (RLS) protokollt és egy közvetlen kapcsolat szolgáltatás (DLS) protokollt.
11.3.3.3.1 *Megbízható kapcsolat szolgáltatás /RLS/*
Az RLS protokollt kell felhasználni a nyugtázott felhasználói adat csomagoknak a légijármű és a földi társ-kapcsolat rétegek közötti adatcserére.
11.3.3.3.2 *Közvetlen kapcsolat szolgáltatás /DLS/*
A DLS protokollt kell felhasználni a nem-szegmentált fedélzetre irányuló rövidhullámú hálózati protokoll adat egységek (HFNPDU-k) sugárzására és a többi olyan HFNPDU-k továbbítására, amelyek nem igénylik a kapcsolat réteg automatikus adás-ismétlését.

11.3.4 Alhálózat réteg

Megjegyzés. - Az alhálózat réteg protokollok és szolgáltatások részletes leírását a Rövidhullámú /HF/ Adatkapcsolat Kézikönyv *(Doc 9741) foglalja magába.*

11.3.4.1 ADAT CSOMAG

A rövidhullámú adatkapcsolat /HFDL/ légijármű fedélzeti állomás alrendszerében és a HFDL földi állomás alrendszereiben a HFDL alhálózat réteg biztosítja az alhálózati szolgáltatás felhasználók közötti alhálózati kapcsolat létrehozásával az összeköttetés-irányított adatcsomag szolgáltatást.

11.3.4.2 ÖSSZEKAPCSOLHATÓSÁGI ÉRTESÍTÉS SZOLGÁLTATÁS

A HFDL légijármű fedélzeti alrendszerben lévő HFDL alhálózat réteg biztosítja a kiegészítő összekapcsolhatósági értesítés szolgáltatást, azáltal, hogy elküldi az összekapcsolhatósági értesítés esemény közleményt a kapcsolt Légiforgalmi távközlési hálózat /ATN/ útvonal kijelölés részére.

11.3.4.2.1 *ÖSSZEKAPCSOLHATÓSÁGI ÉRTESÍTÉS ESEMÉNY KÖZLEMÉNYEK*

Az összekapcsolhatósági értesítés szolgáltatás küldi el az összekapcsolhatósági értesítés esemény közleményt a kapcsolt ATN útvonal kijelölés részére, az alhálózati hozzáférési funkción keresztül.

11.3.4.3 HFDL ALHÁLÓZAT RÉTEG FUNKCIÓK

A rövidhullámú adatkapcsolat /HFDL/ alhálózati rétegnek mind a HFDL légijármű fedélzeti állomás alrendszerben, mind a HFDL földi állomás alrendszerben a következő három funkciót foglalja magába:

a) A HFDL alhálózat-függő (HFSND) funkciót;

b) Az alhálózat hozzáférési funkciót; és

c) Az összedolgozói funkciót.

11.3.4.3.1 *RÖVIDHULLÁMÚ ADATKAPCSOLAT ALHÁLÓZAT-FÜGGŐ FUNKCIÓ /HFSND/*

A HFSND funkció hajtja végre a HFSND protokollt a HFDL adat egységek cseréjével, az egyes HFDL légijármű állomás alrendszerek és a HFDL földi állomás alrendszerpárok között. Ez fogja végrehajtani a HFSND protokoll légijármű fedélzeti funkciót a HFDL légijármű fedélzeti állomás alrendszerben és a HFSND protokoll földi funkciót a HFDL földi állomás alrendszerben.

11.3.4.3.2 *ALHÁLÓZAT HOZZÁFÉRÉSI FUNKCIÓ*

Az alhálózat hozzáférési funkciót az ISO 8208 protokoll hajtja végre a HFDL légijármű fedélzeti állomás alrendszer vagy a HFDL földi állomás alrendszer és a kapcsolt útvonal kijelölések között az ISO 8208 csomagok cseréjével. Ennek kell elvégezni az ISO 8208 Hálózati végponti berendezés /DCE/ funkciót a HFDL légijármű fedélzeti állomás alrendszerben és a HFDL födi állomás alrendszerben.

11.3.4.3.3 *EGYÜTTMŰKÖDÉSI FUNKCIÓ*

Az együttműködési funkció biztosítja a HFSND, az alhálózat hozzáférés és az összekapcsolhatósági értesítés funkciók között szükséges harmonizációt.

11.4 A FÖLDI KEZELŐ ALRENDSZER

Megjegyzés. - A földi kezelő alrendszer funkcióiról és illesztéseiről a Rövidhullámú /HF/ Adatkapcsolat Kézikönyv *(Doc 9741) tartalmaz részletes leírást.*

11.4.1 Kezelési funkciók

A földi kezelő alrendszernek kell végrehajtania azokat a funkciókat, amelyek a HFDL földi és légijármű fedélzeti alrendszerei közötti összeköttetési csatornák létrehozásához és fenntartásához szükségesek.

11.4.2 Kezelési/vezérlési információ csere

A földi kezelő alrendszernek kell az illesztést biztosítani a földi állomás alrendszerrel abból a célból, hogy a frekvencia kezeléshez, a rendszer táblázat kezeléshez, a napló állapot kezeléshez, a csatorna kezeléshez és az adatgyűjtési szolgáltatás minőségéhez (QOS) szükséges vezérlő információk cseréje megtörténjen.

11-3. táblázat. HF térbeli-jel feltételek

Adatsebesség (bit per mperc)	Csatorna utak száma	Több-utas terjedés (milliszekundum)	Elhalkulási sávszélesség (Hz) a CCIR 549-2 jelentés szerint	Frekvencia-eltolás (Hz)	Jel/zaj arány (dB) a 3 kHz-es sávszélességben	MPDU méret (oktett)
1200	1 állandó	–	–	40	4	256
1800	2 elhalkuló	2	1	40	16	400
1200	2 elhalkuló	2	1	40	11	256

12. FEJEZET: Univerzális adó-vevő készülék – Universal Access Transceiver (UAT)

12.1. MEGHATÁROZÁSOK ÉS ÁLTALÁNOS RENDSZERJELLEMZŐK

12.1.1 Meghatározások

Nagyteljesítményű adó (High performance receiver). Az UAT kiterjesztett szelektivitású adóberendezés, amely jelentősen javítja a szomszéd frekvenciaszűrés DME interferenciát (további részleteket lásd 12.3.2.2 pontban).

Optimális mintavételi pont (Optimum sampling point) Egy fogadott UAT bit-sáv optimális mintavételi pontja az egyes bit-periódus névleges centruma, amikor is a frekvencia eltérés vagy plusz, vagy mínusz 312.5 kHz.

Teljesítménymérési pont (Power measurement point (PMP). Kábel köti az antennát az UAT berendezéshez. A PMP annak a kábelnek a vége, amelyik az antennához csatlakozik. Minden teljesítmény mérést a PMP-nél ajánlott elvégezni, ha nincs egyéb rendelkezés. A kábel, amelyik az UAT berendezést az antennához köti feltehetően 3dB veszteségű.

Ál véletlen közlemény adatblokk (Pseudorandom message data block.) Számos UAT követelmény szerint a teljesítmény ál véletlennek tűnő közlemény adatblokkok segítségével ellenőrizhető. Az ál véletlennek tűnő közlemény adatblokkok statisztikai tulajdonságokkal rendelkezhetnek, amelyeket szinte nem lehet megkülönböztetni az igazi bitek véletlenszerű kiválasztásától. Például minden egyes bit hasonló valószínűséggel EGY, vagy NULLA, függetlenül a szomszédos bit-ektől. Minden egyes közlemény típusnak megfelelően léteznie kell számos ilyen ál véletlennek tűnő közlemény adatblokknak (Basic ADS-B, Long ADS-B, vagy Ground Uplink) ahhoz, hogy elegendő független adatokat szolgáltasson statisztikai teljesítmény mérésére. Lásd az Univerzális Adó-vevőkészülék (UAT) Kézikönyv I. rész 2.3. fejezetét (Doc 9861) annak illusztrálására, hogyan kell szolgáltatni megfelelő véletlennek tűnő közlemény adatblokkokat.

A szolgáltatás volumene (Service volume). Egy szolgáltatási komplexum része, amely a fontos SARP-okkal összhangban különleges szolgáltatásokat biztosít, és amely szolgáltatások frekvenciavédelmet nyújtanak.

Szabvány UAT vevő (Standard UAT receiver). Többcélú UAT adóberendezés, amely kielégíti a minimális interferencia -szűrési követelményeket a szomszéd frekvencia távolságmérő berendezéstől (DME) (további részleteket lásd 12.3.2.2 pontban).

Sikeres közlemény vétel (Successful message reception (SMR). Az UAT adó-vevő készülék funkciója, amellyel a készülék igazolja a közlemény érvényes továbbításra történő vételét az UAT közlemények vételére vonatkozó alkalmazási eljárás szerint. Lásd az Univerzális Adó-vevőkészülék (UAT) (Doc9861) Kézikönyv I. rész 4. fejezetét az eljárás részletes leírására vonatkozóan, az UAT adó-vevő készülék sikeres közlemény-vételével kapcsolatban.

UAT ADS-B közlemény (UAT ADS-B message). Minden légijármű által másodpercenként egyszer leadott közlemény a légijármű vektor helyzetével és egyéb információk adásával kapcsolatban. Az UAT ADS-B közlemények egy- vagy két formában léteznek az adott információ mennyiségtől függően, amelyeket egy adott másodperc alatt továbbítanak: *a Basic UAT ADS-B közlemény*, vagy a *Long UAT ADS-B közlemények* (lásd 12.4.4.1 az egyes meghatározásokra).

Az UAT földi állomások támogatják a forgalmi információs szolgáltatási adást (TIS-B) egyéni ADS-B közlemények továbbítása révén az UAT keret ADS-B szegmensben.

UAT földről fedélzetre küldött közlemény (UAT ground uplink message). A földi állomások által továbbított közlemények, az UAT keret földi szegmensén belül, tartalmaznak járatinformációkat, mint például szöveges és grafikai meteorológiai adatokat, tájékoztatást és egyéb léginavigációval kapcsolatos információkat továbbítanak a légijármű részére, amely szolgáltatások a földi állomás illetékességébe tartoznak. (további részleteket lásd 12.4.4.2 pontban)

UAT Univerzális adó-vevő készülék (Universal access transceiver (UAT). A rádióadás-adatkapcsolat, amely a 978 MHz állományban üzemel 1.041667 Mbps modulációval.

12.1.2 Az UAT földi- és fedélzeti állomások átfogó rendszereinek jellemzői

Megjegyzés.- Az UAT SARP-ok telepítésére vonatkozó műszaki követelmények részletei az Univerzális Adó-vevőkészülék (UAT) (Doc9861) Kézikönyv 1. részében találhatók. Az Univerzális Adó-vevőkészülék (UAT) (Doc9861). *II. Rész (kidolgozás alatt) tartalmazni fog egyéb útmutatásra szolgáló anyagokat).*

12.1.2.1 ÁTVITELI
FREKVENCIA

Az átviteli frekvencia 978 MHz legyen.

12.1.2.2 FREKVENCIA
STABILITÁS

Az UAT berendezés rádió frekvenciája nem térhet el több mint ±0.002 százalékkel (20 ppm) a kijelölt frekvenciától.

12.1.2.3 TELJESÍTMÉNY
ÁTVITEL

12.1.2.3.1 *TELJESÍTMÉNY ÁTVITELI SZINTEK*

Az UAT berendezés a 12-1* táblázatban feltüntetett egyik teljesítmény szinten üzemeljen.

12.1.2.3.2 *MAXIMÁLIS TELJESÍTMÉNY*

Az UAT földi és fedélzeti állomások maximálisan egyenértékű izotropikusan sugárzott teljesítménye (EIRP) nem haladhatja meg a +58 dBm értéket.

Megjegyzés.- például a fent említett EIRP maximum származhat a légijármű maximálisan megengedett átviteli teljesítményéből (lásd 12-1 táblázat) maximum 4dBi antenna erősítéssel.

12.1.2.3.3 *ÁTVITELI MASZK*

Az UAT ADS-B közlemény spektruma, amely ál véletlennek tűnő közlemény adatblokk átvitellel modulált (MDB), a 12-2 számú táblázat szerinti korlátozások alá esik, ha 100kHz sávszélességben kerül mérésre.

Megjegyzés -12-1 sz. ábra a 12-2 sz. táblázat grafikai ábrázolása.*

12.1.2.4 ZAVARÓ SUGÁRZÁSOK

A zavaró sugárzásokat a lehető legalacsonyabb értéken kell tartani, amelyet a technika és a szolgáltatás természete megenged.

Megjegyzés- Az ITU Rádió Rendszabályzat 3. sz. Függeléke előírja, hogy az átviteli állomások meg feleljenek a zavaró sugárzásokkal szembeni maximálisan megengedett teljesítmény szinteknek, illetve a zavaró tartományban lévő nem kívánt sugárzásnak.

---

* Valamennyi ábra és táblázat e fejezet végén található.

12.1.2.5 POLARIZÁCIÓ

A sugárzások polarizáció konstrukciója függőleges legyen.

12.1.2.6 AZ UAT KÖZLEMÉNY ÁTVITELI IDŐ/AMPLITÚDÓ PROFILJA

Az UAT közlemény átviteli idő/amplitúdó profilja meg kell feleljen azon követelményeknek, amelyekben a *referencia idő* a szinkronizációs sorrend első bit-jeként van meghatározva (lásd a 12.4.4.1.1 és 12.4.4.2.1 pontokat), és amely megjelenik a berendezés kimeneti portjánál.

Megjegyzések.—

1. Az „a”-tól „f”-ig terjedő al-fejezetekben szereplő valamennyi teljesítmény követelmény a PMP-re vonatkoznak. A telepítéseknél, amelyek támogatják az adó diverzitását, az RF kimeneti teljesítménynek a nem kiválasztott antenna portálon legalább 20dB-el kell a kiválasztott port szintje alatt lennie.

2. Az „a”-tól „f”-ig terjedő al-fejezetekben szereplő valamennyi teljesítmény követelmény 300 kHz sávszélesség mérést feltételez. A „b”, „c”, „d” és „e” al-fejezetekben szereplő valamennyi teljesítmény követelmény 2MHz sávszélesség mérést feltételez.

3. A bit kezdete egy ½ bit-es periódus az optimális mintavételi pont előtt.

4. Ezeket a követelményeket grafikusan a 12-2 ábra szemlélteti.

a) A referencia időt megelőző 8 bit periódus előtt az RF kimeneti teljesítménye a PMP-nél nem haladhatja meg a 80 dBm értéket.

Megjegyzés.- Ez a nem kívánt kisugárzott teljesítménykorlátozás szükséges annak biztosítására, hogy az UAT adó alrendszere ne akadályozza meg a szorosan mellette elhelyezett UAT vevő-berendezés működését, a követelményeknek való megfelelését ugyanazon a légijárművön. Az adó és vevő berendezések közötti leválasztás a PMP-nél haladja meg a 20dB értéket.

b) A referencia időt megelőző 8 és 6 bit közötti periódusoknál, az RF kimeneti teljesítménye a PMP-nél legalább 20 dB érték alatt maradjon az UAT berendezés osztályának megfelelő minimális teljesítmény követelményhez képest.

Megjegyzés.— Az UAT berendezések osztályainak meghatározására vonatkozó tájékoztató anyagok az UAT adó-vevő készülékek Kézikönyv II. részében lesznek találhatók (Doc 9861) (kidolgozás alatt).

c) Az aktív állapot időtartama alatt, amely a referencia idő kezdetekor határozható meg, és amely tart a közlemény teljes időtartamáig, az RF kimenő teljesítménye nagyobbnak, vagy legalább azzal egyenlőnek kell lennie, figyelemmel az UAT vonatkozó osztályának megfelelő minimális teljesítményi előírásoknak.

d) Az RF kimeneti teljesítmény a PMP-nél nem lépheti túl az UAT berendezés osztályára vonatkozóan előírt maximális teljesítmény értéket az aktív állapot ideje alatt.

e) 6 bit perióduson belül az aktív állapot befejezése után az RF kimeneti teljesítménye a PMP-nél legalább 20dB értékkel a vonatkozó UAT berendezés osztályának megfelelő teljesítményi követelmények alatt legyen.

f) Az aktív állapot vége után 8 bit perióduson belül az RF kimeneti teljesítménye olyan szintre essen vissza, amely nem haladja meg a 80 dBm értéket.

Megjegyzés.- Ez a nem kívánt kisugárzott teljesítménykorlátozás szükséges annak biztosítására, hogy az UAT adó alrendszere ne akadályozza meg a szorosan mellette elhelyezett UAT vevő-berendezés működését, a követelményeknek való megfelelését ugyanazon a légijárművön. Az adó és vevő berendezések közötti leválasztás a PMP-nél haladja meg a 20dB értéket.

12.1.3 Előírt üzemeltetési követelmények

Az UAT berendezésekre előírt üzemeltetési követelményeket regionális léginavigációs megállapodások határozzák meg, amelyek feltüntetik az üzemelési légteret, az időbeosztás létrehozását a berendezés üzemeltetésére vonatkozóan, beleértve a megfelelő időtartamok kijelölését.

Megjegyzés.-Nincs változásokra szükség olyan fedélzeti, vagy a földi rendszerekben, amelyek kizárólag olyan régiókban üzemelnek, amelyekben nem használnak UAT-t.

12.2 A FÖLDI TELEPÍTÉSI RENDSZER JELLEMZŐ TULAJDONSÁGAI

12.2.1 A földi adóállomás funkciója

12.2.1.1 FÖLDI ADÓ-ÁLLOMÁS TELJESÍTMÉNYE

12.2.1.1.1 **Ajánlás.**— *A hasznos kisugárzott teljesítménynek olyannak kell lennie, hogy a szolgáltatási volumenen belül biztosítható legyen legalább 280 mikrovolt/méter (mínusz 97 dbW/m²) térerő szabad térben való terjedése.*

Megjegyzés.- Ezt egy -91 dBm (200 mikrovolt/méternek megfelelő) jel szinttel határozzák meg a PMP-nél (körsugárzó antenna esetén). A 280 µV/m ajánlás megfelel egy -88 dBm jel szintnek a vevő berendezés PMP-jénél. A 3 dB különbség a –88 dBm és a –91 dBm között határzónát képez a túlzott pályavesztésre a szabad térben való terjedésnél.

12.2.2 A földi vevőállomás funkciója

Megjegyzés.- Egy földi vevőállomásra vonatkozó példa kerül megtárgyalásra az UAT Kézikönyv II. részének 2.5. számú fejezetében) (Doc 9861), az UAT levegő-föld teljesítmény becslésekkel a rendelkezésre álló vevő készülék használatával, amely a kézikönyv B függelékében található.

12.3 A FEDÉLZETI TELEPÍTÉSI RENDSZER JELLEMZŐ TULAJDONSÁGAI

12.3.1 A fedélzeti adó funkciója

12.3.1.1 FEDÉLZETI
ADÓTELJESÍTMÉNY

A hasznos kisugárzott teljesítménynek olyannak kell lennie, hogy biztosítható legyen egy legalább 225 mikrovolt/méter (mínusz 99 dbW/m²) térerő szabad térben való terjedéssel, olyan hatótávolságnál és magasságnál, amely megfelel azoknak az üzemelési feltételeknek, amelyek azon területekre jellemzőek, amelyek fölött a légijármű üzemel. Az adó teljesítménye nem lépheti túl az 54 dBm értéket a PMP-nél.

1. Megjegyzés.- A fenti térerőt egy -93 dBm (160 mikrovolt/méternek megfelelő) jel szinttel határozzák meg a PMP-nél (körsugárzó antenna esetén). A 3 dB különbség a 225 V/m és a 160 µV/m között határzónát képez a túlzott pályavesztésre a szabad térben való terjedésnél, amikor egy hosszú UAT ADS-B közleményt vesz. Egy 4dB határzóna szükséges alap az UAT ADS-B közlemények vételére.
A 280 µV/m ajánlás megfelel egy -88 dBm jel szintnek a vevő berendezés PMP-jénél.

2. Megjegyzés.- Különböző légijárművek üzemelése során adódhatnak különböző levegő-levegő tartománnyal kapcsolatos követelmények, amelyek az UAT berendezés ADS-B funkciójától függenek. Ezért különböző telepítésű telepítési berendezések másképpen működhetnek eltérő teljesítmény szintek mellett. (lásd 12.1.2.3.1 alatt).

12.3.2 Vételi funkció

12.3.2.1 A VEVŐBERENDEZÉS ÉRZÉKENYSÉGE

12.3.2.1.1 *A HOSSZÚ UAT ADS-B KÖZLEMÉNY, MINT SZÜKSÉGES JEL*

A- 93 dBm PMP alkalmazású szükséges jel-színt sikeres számban produkálja a sikeres, 90 százalékos, sőt még kedvezőbb számú közlemény vételét a következő feltételek esetében:

a) Ha a szükséges jel névleges modulációjú (vagyis az FM eltérés 625kHz értékű) maximális jelfrekvencia eltolódásnál, és függ a Doppler eltolódástól ±1 200 csomónál;

b) Ha a szükséges jel maximális moduláció-torzulású, amely a 12.4.3 pontban megengedett névleges átviteli frekvencián ±1 parts/millió (ppm), és függ a Doppler eltolódástól ±1200 csomónál;

Megjegyzés.-Az UAT ADS-B közlemények sikeres vételének szempontjai az Univerzális Adó-vevőkészülék (UAT) (Doc9861) Kézikönyv *1. részének 4. fejezetében találhatók.*

12.3.2.1.2 *AZ* ALAP *UAT ADS-B KÖZLEMÉNY, MINT SZÜKSÉGES JEL*

A PMP-nél alkalmazott -94 dBm szükséges jel szint 90%-os, vagy annál kedvezőbb arányú SMR-t nyújt, az alábbi feltétetlek esetében:

a) Ha a szükséges jel névleges modulációjú (vagyis az FM eltérés 625kHz értékű) maximális jelfrekvencia eltolódásnál, és függ a Doppler eltolódástól ±1 200 csomónál;

b) Ha a szükséges jel maximális moduláció-torzulású, amely a 12.4.3 pontban megengedett névleges átviteli frekvencián ±1 parts/millió (ppm), és függ a Doppler eltolódástól ±1200 csomónál;

Megjegyzés.-Az UAT ADS-B közlemények sikeres vételének szempontjai az Univerzális Adó-vevőkészülék (UAT) (Doc9861) Kézikönyv *1. részének 4. fejezetében találhatók.*

12.3.2.1.3 *UAT FÖLDI KÖZLEMÉNYEK LÉGIJÁRMŰRE TÖRTÉNŐ TOVÁBBÍTÁSA SZÜKSÉGES JELKÉNT*

A PMP-nél alkalmazott -94 dBm szükséges jel szint 90%-os, vagy annál kedvezőbb arányú SMR-t nyújt, az alábbi feltétetlek esetében:

a) Ha a szükséges jel névleges modulációjú (vagyis az FM eltérés 625kHz értékű) maximális jelfrekvencia eltolódásnál, és függ a Doppler eltolódástól ±850;

b) Ha a szükséges jel maximális moduláció-torzulású, amely a 12.4.3 pontban megengedett névleges átviteli frekvencián ±1 parts/millió (ppm), és függ a Doppler eltolódástól ±850 csomónál

Megjegyzések -

1. Megjegyzés.-Az UAT földi közlemények légijárművön történő sikeres vételével kapcsolatban az Univerzális Adó-vevőkészülék (UAT) (Doc9861) Kézikönyv *1. részének 4. fejezetében találhatók (kidolgozás alatt).*

2. Ez a követelmény biztosítja a demodulációt támogató bit-arány pontosságát az UAT berendezésben, hogy az megfeleljen a hosszabb UAT földi közleményeknek a légijárműveken történő pontos vételére.

12.3.2.2 A VEVŐ KÉSZÜLÉK SZELEKTIVITÁSA

Megjegyzések.-

1. A szükségtelen jel modulálatlan hordozó vivőhullámú rendszerre alkalmazva.

2. Ez a követelmény hozza létre az adóberendezés szűrését a csatornán kívüli energiától.

3. Feltételezhető, hogy az előírt eltérések közötti eltolódási arányok az interpolált értékhez közel esnek.

4. A szükséges jel UAT ADS-B hosszú közleményként használható 90 dBm-en a PMP-nél, amely 90%-ban biztosítja a közlemény sikeres vételét.

5. A tolerálható mellék-csatorna folyamatos hullám interferencia teljesítmény szintje a fedélzeti UAT vevő-berendezésre lehet 101 dBm vagy ennél kisebb a PMP-nél.

6. Az Univerzális Adó-vevő készülék (UAT) Kézikönyv (Doc 9861) II. rész 2.4.2. fejezetében kerül tárgyalásra, hogy mikor van szükség egy nagyteljesítményű vevő-berendezésre.

a) A szabvány UAT vevő-berendezéseknek meg kell felelniük a 12-3 táblázatban szereplő szelektivitási jellemzőknek.

b) A nagyteljesítményű vevő-készülékeknek még szorosabb szelektivitási jellemzőknek kell megfelelniük a 12-4 táblázatban foglaltak szerint.

Megjegyzés.- Az Univerzális Adó-vevő készülék (UAT) Kézikönyv (Doc 9861) II. rész 2.4.2. fejezetében útmutató anyagok találhatók a nagyteljesítményű vevő-berendezések telepítésével kapcsolatban.

12.3.2.3 SZÜKSÉGES VEVŐ BERENDEZÉSI JEL DINAMIKUS TARTOMÁNY

A vevő berendezés a hosszú ADS-B közlemények 99%-át meghaladó mértékben sikeresen veszi, ha a szükséges jel szint –90 dBm és –10 dBm között van a PMP-nél, ha nincs egyáltalán jel-interferencia.

Megjegyzés.- A –10 dBm érték 120 láb elválasztást jelent a fedélzeti adóberendezéstől maximális megengedett teljesítmény mellett.

12.3.2.4 A VEVŐBERENDEZÉS IMPULZUSOS INTERFERENCIA TŰRÉSE

Megjegyzés – Ebben a fejezetben valamennyi teljesítmény szint követelmény a PMP-re vonatkozik

a) A szabvány- és nagyteljesítményű vevő-berendezésekre az alábbi követelmények alkalmazandók:

1) A vevő-berendezésnek fogadnia kell a hosszú UAT ADS-B közlemények 99 százalékát, ha a szükséges jel-szint –90 dBm és –10 dBm között van a DME interferencia függvényében, az alábbi feltételek esetén: a DME impulzuspárok másodpercenkénti névleges 3600 impulzus-páron vagy 12, illetve 30 mikro szekundum impulzustávolságon -36 dBm szinten vannak bármely 1 MHz csatorna frekvencián 980 MHz és 1212 MHZ között.

2) Követve a 21 mikro szekundum impulzust ZERO (0) dBm-en és 10090 MHz-en, a vevő-berendezés visszatér a dB értéken belül meghatározott érzékenységi szintre (lásd a12.3.2.1 pontot) 12 mikro szekundumon belül.

b) A szabvány UAT vevő-berendezésre az alábbi külön követelmények alkalmazandók:

1) A vevő-berendezésnek fogadnia kell a hosszú UAT ADS-B közlemények 90 SMR százalékát, ha a szükséges jel-szint –87 dBm és –10 dBm között van a DME interferencia függvényében, az alábbi feltételek esetén: a DME impulzuspárok névleges másodpercenkénti 3600 impulzus-páron 12 mikro szekundum impulzustávolságon -56 dBm szinten vannak 979 MHZ frekvencián.

.

2) A vevő-berendezésnek fogadnia kell a hosszú UAT ADS-B közlemények 90 SMR százalékát, ha a szükséges jel-szint –87 dBm és –10 dBm között van a DME interferencia függvényében, az alábbi feltételek esetén: a DME impulzuspárok névleges másodpercenkénti 3600 impulzus-páron 12 mikro szekundum impulzustávolságon -70 dBm szinten vannak 978 MHZ frekvencián.

c) a nagyteljesítményű vevő-berendezésre az alábbi külön követelmények alkalmazandók:

1) A vevő-berendezésnek fogadnia kell a hosszú ADS-B közlemények 90 SMR százalékát, ha a szükséges jel szint -87 dBm és -10dBm között van a DME interferencia függvényében, az alábbi feltételek esetén: A DME impulzuspárok névleges másodpercenkénti 3600 impulzus-páron 12 mikro szekundum impulzustávolságon -43dBm szinten vannak 979 MHz frekvencián.

2) A vevő-berendezésnek fogadnia kell a hosszú ADS-B közlemények 90 SMR százalékát, ha a szükséges jel szint -87 dBm és -10dBm között van a DME interferencia függvényében, az alábbi feltételek esetén: A DME impulzuspárok névleges másodpercenkénti 3600 impulzus-páron 12 mikro szekundum impulzustávolságon -43dBm szinten vannak 978 MHz frekvencián.

12.4 FIZIKAI RÉTEG JELLEMZŐK

12.4.1 Moduláció- arány

A moduláció arány 1.041 667 Mbps, fedélzeti adóberendezési tolerancia ±20 ppm és a földi adóberendezések esetében ±2 ppm.

Megjegyzés.-A moduláció arány tolerancia megegyezik a moduláció torzulási követelményekkel (lásd a 12.4.3. pontot).

12.4.2 Moduláció típus

a) Az adatokat modulálni kell a rendszerben bináris folyamatos fázis frekvencia emelő billentyűzéssel. A modulációs index h nem lehet 0.6 értéknél kisebb;

b) A bináris ONE (1) frekvenciát billentyűemeléssel kell jelezni és a bináris ZERO (0) billentyű visszaváltással a névleges frekvenciáról.

Megjegyzések.-

1. *A továbbított jel szűrése (alap sávon és/vagy frekvencia moduláció után) meg kell feleljen a spektrum-szigetelés követelményeinek a 12.1.2.3.3 szerint Ez a szűrés eltérést okozhat ezeknek az értékeknek a túllépésével az optimális mintavételi pontokon kívüli egyéb pontoknál.*

2. A kisugárzott jel szűrése következtében folyamatosan változik a fogadott frekvencia eltolódás névleges ±312.5 kHz (és azon túli) érték között és az optimális mintavételi hely nem könnyen azonosítható. Ez a pont a fogadott jel úgynevezett „szemábra" segítségével határozható meg. Az ideális „szemábra" nem torzult, utólag érzékelt minták egymásra illesztéséből eredő hullámforma, amelyet 0.96 mikro szekundos bit periódusok sokasága hozott létre. Az optimális mintavételi pont az a pont a bit periódus alatt, amelynél a" szemábra" nyílása (vagyis amikor a pozitív és a negatív frekvencia kiegyenlítés nagyon magas zajszint arányt képvisel) maximális értéket jelez. A „szemábra" bemutatása a 12-3 számú ábrán látható. Azoknak a pontoknak az időzítése, ahol a vonalak összetartanak, ott határozható meg az „optimális mintavételi pont". A 12. ábra bemutat egy szem mintát, amelyet modulációs torzulás részlegesen lezárt.

12.4.3 Modulációs torzulás

a) A fedélzeti adóknál a továbbított jel (amelyet az optimális mintavételi ponton mértek) szemábrájának minimális vertikális nyílása legalább 560kHz legyen, ha olyan hosszú UAT ADS-B közleményen végezték a mérést, amely számos ál-véletlen közlemény adatblokkokat tartalmazott.

b) Földi adóknál a továbbított jel (amelyet az optimális mintavételi ponton mértek) szemábrájának minimális vertikális nyílása legalább 560kHz legyen, ha olyan hosszú UAT ADS-B földi állomásról fedélzeti állomásra továbbított közleményen végezték a mérést, amely számos ál-véletlen közlemény adatblokkokat tartalmazott.

c) Fedélzeti adóknál a továbbított jel szemábrájának minimális vízszintes nyílása (978 MHz-en mérve) nem lehet kisebb 0.624 mikro szekundumnál (0.65 szimbólum periódusok), ha olyan hosszú UAT ADS-B földi állomásról fedélzeti állomásra továbbított közleményen végezték a mérést, amely számos ál-véletlen közlemény adatblokkokat tartalmazott.

d) Földi adóknál a továbbított jel (amelyet 978 MHz-en mértek) szemábrájának minimális horizontális nyílása legalább 0.624 mikro szekundum legyen, (0.65 szimbólum periódusok), ha olyan hosszú UAT ADS-B földi állomásról fedélzeti állomásra továbbított közleményen végezték a mérést, amely számos ál-véletlen közlemény adatblokkokat tartalmazott

Megjegyzések.-

1. *A 12.4.4 részben kerülnek meghatározásra az UAT ADS-B közlemény típusok.*

2. *Az ideális „szemábra" nem torzult, utólag érzékelt minták egymásra illesztéséből eredő hullámforma, amely (0.96 mikro szekundos) bit periódusok sokasága hozott létre.*

12.4.4 Rádióközlemény jellemzők

Az UAT rendszer két különböző típusú közlemény-típust támogat: az UAT ADS-B közleményeket és az UTA földi állomásról fedélzetre küldött közleményeket.

12.4.4.1 AZ UAT ADS-B KÖZLEMÉNY

Az UAT ADS-B közlemény aktív része (lásd 12.1.2.6) az alábbi elemeket az alábbi sorrendben tartalmazza:

— Bit szinkronizáció
— Közlemény adatblokk
— FEC paritás.

12.4.4.1.1 *BIT SZINKRONIZÁCIÓ*

Az UAT ADS-B közlemény aktív részének első eleme egy 36-bit szinkronizációs sorrend. Az UAT ADS –B közleményeknél ez a következőképpen alakul:

111010101100110111011010010011100010

A bal legszélső bit kerül először átvitelre.

12.4.4.1.2 A KÖZLEMÉNY ADATBLOKK

Az UAT ADS-B közlemény aktív részének második eleme a közleményadat blokkja. Két UAT ADS-B hosszúságú adatblokk kap támogatást. Az alap UAT ADS-B közlemény egy 144 bit közlemény adatblokkal, a hosszú UAT ADS-B közlemény pedig egy 272 bit közlemény adatblokkal kell rendelkezzen.

Megjegyzés.-A közlemény adatblokk elemének átviteli sorrendje, kódolása és formátuma az Univerzális Adó-vevőkészülék (UAT) *(Doc 9861) kézikönyv I. rész 2.1. fejezetében található*

12.4.4.1.3 *FEC PARITÁS*

Az UAT ADS-B közlemények aktív részének harmadik és utolsó eleme a FEC paritás.

12.4.4.1.3.1 *Kód típus*

A FEC paritásfejlesztés egy szisztematikus Reed-Solomon (RS) rendszeren alapul, 256 rendű kód 8 bites kód szó szimbólummal. A FEC paritásfejlesztés a következő kódokra kerül alkalmazásra

a) **Alap UAT ADS-B közlemény**: Paritás RS (30, 18) kód.

Megjegyzés.-Ez 12 bájt szimbólum hibák javítására alkalmas hibajavító kód, amely blokkonként 6 szimbólum hiba kijavítására képes.

b) Hosszú **UAT ADS-B közlemény**: Paritás RS (48,34) kódnak kell lennie.

Megjegyzés.-Ez 14 bájt szimbólum hibák javítására alkalmas hibajavító kód, amely blokkonként 7 szimbólum hiba kijavítására képes.

Mindkét közlemény hosszúságra az egyszerű többtagú kód az alábbi:

$$p(x) = x^8 + x^7 + x^2 + x + 1$$

A generátor polinom az alábbi:

$$\prod_{i=120}^{P}(x-\alpha^{i})$$

ahol:

P = 131 az RS (30, 18) kódra,

P = 133 az RS (48, 34) kódra, és

α egy egyszerű eleme a 256 méretű (azaz GF(256) Galois mezőnek).

12.4.4.1.3.2 *A FEC paritás átviteli sorrendje*

FEC paritás bájtokat a legjelentősebbtől a legkevésbé jelentősig kell rendelni az általuk képviselt polinom együtthatók szerint. A bitek hozzárendelése az egyes bájtokon belül a legfontosabbtól a legkevésbé fontosig kell történnie. A FEC paritás bájtoknak követniük kell a közlemény adatblokkot.

12.4.4.2 UAT FÖLDRŐL A FEDÉLZETRE TOVÁBBÍTOTT KÖZLEMÉNY

Az UAT földi állomásról a fedélzetre továbbított közlemény aktív részének a következő elemeket kell tartalmaznia a következő sorrendben:

— Bit szinkronizáció
— Összerendező közlemény adatblokk és FEC paritás.

12.4.4.2.1 *BIT SZINKRONIZÁCIÓ*

Az UAT ADS-B közlemény földi állomásról a fedélzetre továbbított közlemény aktív részének első eleme egy 36-bit szinkronizáció sorrend. Az UAT ADS –B közleményeknél ez a következőképpen alakul:

000101010011001000100101101100011101

A bal legszélső bit kerül először átvitelre.

12.4.4.2.2 *ÖSSZERENDEZŐ KÖZLEMÉNY ADATBLOKK ÉS FEC PARITÁS*

12.4.4.2.2.1 *Közlemény adatblokk (összerendezés előtt és kibontás után)*

Az UAT földi állomásról a fedélzetre továbbított közlemény 3456 bit közlemény adatblokkal rendelkezik. Ezek a bit-ek 6 db 576 bit-es csoportra vannak osztva. Az egyes csoportokra történő FEC alkalmazás a 12.44.222. pont alatt szerepel.

Megjegyzés.- További részletek az UAT földi állomásról a fedélzetre továbbított közlemények formátumával, kódolásával és adatblokk átviteli sorrendjével kapcsolatban az Univerzális Adó-vevőkészülék (UAT) *(Doc 9861) kézikönyv I. rész 2.2. fejezetében találhatók*

12.4.4.2.2.2 FEC paritás *((összerendezés előtt és kibontás után)*

12.4.4.2.2.2.1 *Kód típus*

A FEC paritásfejlesztés egy Reed-Solomon szisztematikus (RS) rendszeren alapul, 256-rendű kód, 8 bit kód szó szimbólummal. A FEC paritásfejlesztés a hat blokk mindegyikére RS (92,72) kód érték kell legyen.

Megjegyzés.-

1. *A 12.4.4.2.2.3részben az összerendező eljárással kapcsolatos részletek találhatók.*

2. *Ez 20 bájt paritási szimbólumot eredményez, amely blokkonként képes 10 szimbólum kijavítására. Az összerendezés egyéb használata az UAT földről a fedélzetre történő események továbbítására külön hibatűrő képességet nyújt impulzus kötegek hibái ellen.*

A kód egyszerű polinom az alábbi:

$$p(x) = x^8 + x^7 + x^2 + x + 1$$

A generátor polinom az alábbi:

$$\prod_{i=120}^{P}(x-\alpha^{i})$$

ahol is:

P = 139, és

α egy egyszerű eleme a 256 méretű (azaz GF(256) Galois mezőnek).

12.4.4.2.2.2.2 *A FEC paritás átviteli sorrendje*

FEC paritás bájtokat a legjelentősebbtől a legkevésbé jelentősig kell rendelni az általuk képviselt polinom együtthatók szerint. A bitek hozzárendelése az egyes bájtokon belül a legfontosabbtól a legkevésbé fontosig kell történnie. A FEC paritás bájtoknak követniük kell a közlemény adatblokkot.

12.4.4.2.2.3 *Összerendező eljárás*

Az UAT földről a fedélzetre továbbított eseményeket, amelyeket a földi állomás továbbít, az alábbiak szerint kell összerendezni:

a) **Összerendező eljárás**: Az összerendező közlemény adatblokk és a FEC paritás 6 összerendező Reed-Solomon blokkból áll. Az összerendezőt egy 6x92 mátrix képviseli, ahol minden egyes bevitel egy RS 8-bit szimbólum. Minden sor tartalmaz egy RS (92,72) blokkot, amint az a 12-5 sz. táblázatban megtekinthető. Ebben a táblázatban az összerendezést megelőzően a blokk számokat „A”-tól „F”-ig terjedő betűkkel ábrázolják. Az információ átviteli sorrendje hasábról hasábra történik a mátrix bal felső sarkától kezdődően.

b) **Az átvitel sorrendje:** A bájtok ezután az alábbi sorrendben kerülnek átvitelre:

1,73,145,217,289,361,2,74,146,218,290,362,3,. . .,C/20,D/20,E/20,F/20.

Megjegyzés.- Vételkor ezeket a bájtokat úgy kell kibontani, hogy az RS blokkok összeállíthatók legyenek a hiba kijavítások dekódolása előtt.

12.5 ÚTMUTATÓ ANYAG

Megjegyzések.-

1. Az UAT Univerzális Adó-vevő készülék kézikönyv (*Doc 9861), I rész részletes műszaki információkkal szolgál az UAT-vel kapcsolatban, beleértve az ADS-B küldemény adatblokkokról és* *formátumokról, az UAT átviteli alrendszerek üzemelési eljárásairól és a repüléselektronikari interfész követelményekről más légijármű rendszerekkel.*

2. Az UAT Univerzális Adó-vevő készülék kézikönyv (*Doc 9861) II. információkat nyújt az UAT rendszer működéséről, leírást ad számos példákkal a repüléselektronikai berendezések osztályairól és azok alkalmazásáról, útmutatást ad az UAT légijárművekről és a földi állomások telepítési szempontjairól, valamint részletes útmutatással szolgál az UAT rendszer teljesítmény-szimulációról.*

A 12. FEJEZET TÁBLÁZATAI

12-1 Táblázat
. Átviteli teljesítmény szintek

Adóberendezés-típus	*Minimális teljesítmény aPMP-nél*	*Maximális teljesítmény A PMP-nél*	Tervezett minimális Levegő-levegő tartományok
Légijármű (kisméretű)	7 watts (+38.5 dBm)	18 watts (+42.5 dBm)	20 NM
Légijármű (közepes)	16 watts (+42 dBm)	40 watts (+46 dBm)	40 NM
Légijármű (nagy)	100 watts (+50 dBm)	250 watts (+54 dBm)	120 NM
Földi állomás	A szolgáltatást nyújtó előrása alapján, a helyi követelmények szerint, figyelembe véve a 12.1.2.3.2 pontban szereplőkorlátozásokat		

Megjegyzések:

1. A repüléselektronika számára listán szereplő készülékek mind a három szinten rendelkezésre állnak különféle hatósugarú alkalmazási követelmények kielégítésére. Lásd az UAT légijármű felszerelési tárgyakról szóló értekezést az UAT Univerzális Adó-vevő készülékek (Doc 9861) Kézikönyv II. rész 2.4.2 pontját (kidolgozás alatt)

2. A tervezett minimális levegő-levegő tartományok nagy sűrűségű légiforgalmi környezetre kerültek kialakításra. Ettől nagyobb sűrűségű levegő-levegő tartományok csak alacsony sűrűségi légiforgalmi környezetben érhetők el.

12-2 Táblázat UAT átvitel spektrum

Frekvencia eltérés a központtól	*A maximális teljesítmény szinttől való kívánt csillapítás (dB mérés a PMP-nél) 1*
Minden frekvencia 0 – 0.5 MHz között	0
Minden frekvencia 0.5 – 1.0 MHz között	Lineáris interpolációra* alapozva e pontok közt
1.0 MHz	18
Minden frekvencia 1.0 – 2.25 MHzközött	Lineáris interpolációra* alapozva e pontok közt
2.25 MHz	50
Minden frekvencia2.25 – 3.25 MHz között	Lineáris interpolációra* alapozva e pontok közt

3.25 MHz	60

* csillapítás dB-ben és lineáris frekvenciaskálán

12-3. TÁBLÁZAT Szabvány UAT vevő szűrésarányai

Frekvencia eltérés a központtól	*Minimális szűrésarány (Szükségtelen/szükséges szint dB-ben)*
–1.0 MHz	10
+1.0 MHz	15
(±) 2.0 MHz	50
(±) 10.0 MHz	60

Megjegyzés.-Feltételezve, hogy az arányok a megadott eltérések között az interpolált érték közelébe esik.

12-4 TÁBLÁZAT Nagyteljesítményű vevőszűrési arányok

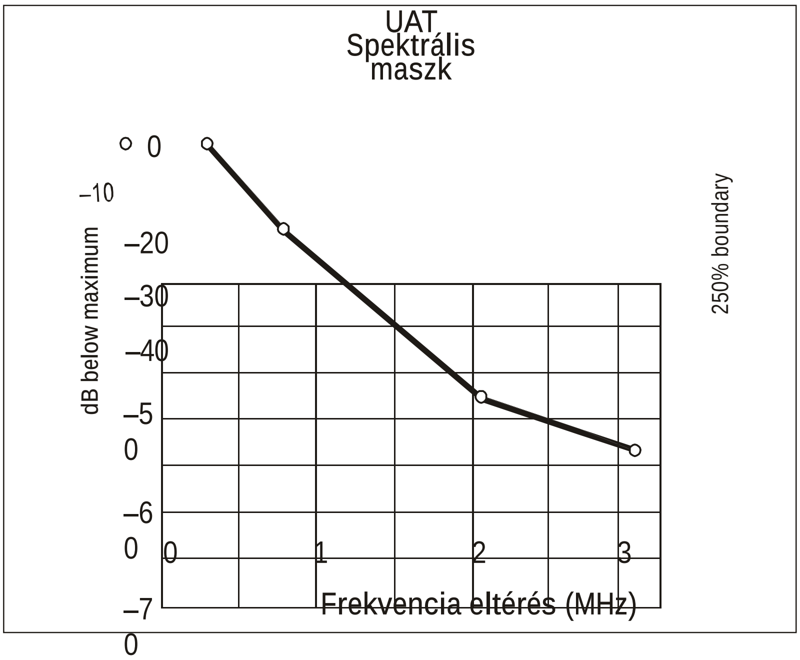
Frekvencia eltérés a központtól	*Minimális szűrési arány (nem-szükséges/szükséges szint dB-ben)*
–1.0 MHz	30
+1.0 MHz	40
(±) 2.0 MHz	50
(±) 10.0 MHz	60

12-5.TÁBLÁZAT Földi-adó összerendező mátrix

RS Blokk	*MDB Byte #*						*FEC Parity (Block/Byte #)*			
A	1	2	3	...	71	72	A/1	...	A/19	A/20
B	73	74	75	...	143	144	B/1	...	B/19	B/20
C	145	146	147	...	215	216	C/1	...	C/19	C/20
D	217	218	219	...	287	288	D/1	...	D/19	D/20
E	289	290	291	...	359	360	E/1	...	E/19	E/20
F	361	362	363	...	431	432	F/1	...	F/19	F/20

Megjegyzés.- A 12-5 táblázatban a közlemény adatblokk Byte #1-tól #72-ig a közlemény adatblokk 72 bájtja (egyenként 8 bit) információ kerül az első RS (92,72) blokkba. A FEC paritás A/1-től A/20-ig az a bizonyos 20 bájtja a FEC paritásnak, amely az (A) blokkal kapcsolódik.

A 12FEJEZET ÁBRÁI



(ábrában baloldalon függőlegesen:" dB maximum alatt" – jobb oldalon: 250% határvonal)

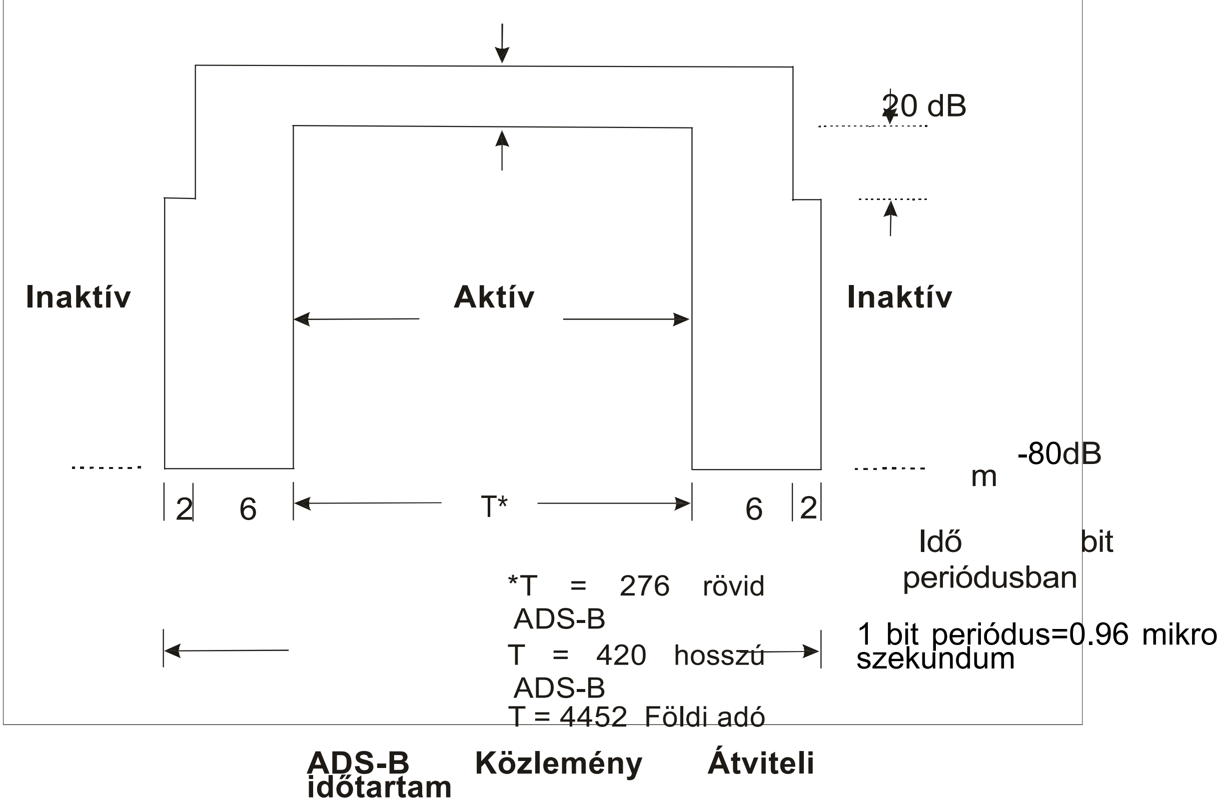
Megjegyzések

1. *Az UAT spektrum teljesítményének 99 százaléka a 1.3 MHz (±0.65 MHz) tartományban van. Ez nagyjából a 2dB sávszélességgel egyenértékű.*

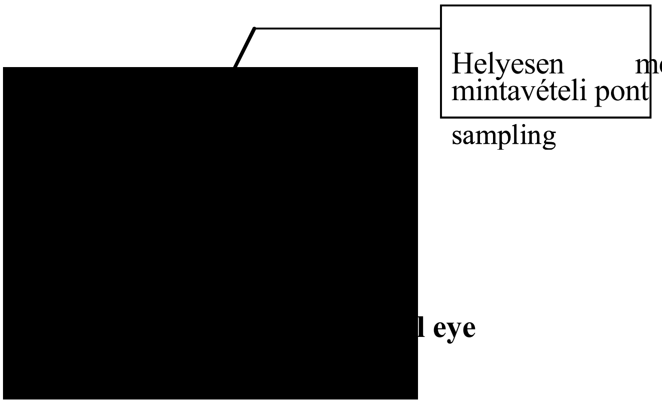
2. *A hamis sugárzási követelmények az 1.3 MHz érték ±250 százalékánál kezdődnek ezért az átviteli maszk követelmény ±3.25 MHz-re terjed.*

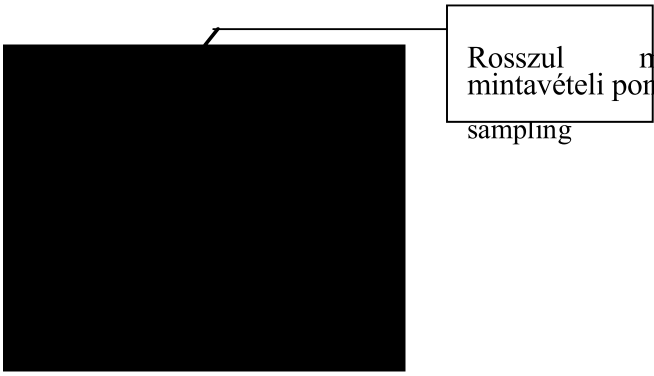
12-1 ábra UAT átviteli spektrum

A berendezés osztályának megengedett teljesítmény-tartománya



12-2.ábra Az UAT közlemény átvitel idő/amplitúdó profilja





12-4 Ábra A torzított szemábra

II. RÉSZ – HANG TÁVKÖZLŐ RENDSZEREK

1. FEJEZET. DEFINÍCIÓK

Megjegyzés. – A másodlagos energiaellátásról szóló anyag és az összeköttetési rendszerek megbízhatóságával és rendelkezésre állásával foglalkozó útmutató anyag a 10. Annex, I. kötet 2.9 szakaszban és az I. kötet F mellékletben találhatók.

2. FEJEZET. LÉGIFORGALMI MOZGÓ SZOLGÁLAT

2.1 A LEVEGŐ-FÖLD VHF ÖSSZEKÖTTETÉSI RENDSZER JELLEMZŐK

Megjegyzés. – Az itt következő szövegben a 8,33 kHz-es csatorna kijelölések csatorna távolságai úgy vannak meghatározva, mint 25 kHz osztva 3-mal, amely 8,3333...-al egyenlő.

2.1.1 A nemzetközi légiforgalmi mozgó szolgálatban használt levegő-föld VHF összeköttetési rendszer jellemzőinek meg kell felelniük a következő előírásoknak:
2.1.1.1 A rádiótelefon sugárzásoknak két-oldalsávos (DSB) amplitúdó-modulált (AM) vivőhullámnak kell lenniük. A sugárzás jelölése az ITU Rádió-Rendszabályzat szerinti jelölése A3E.
2.1.1.2 A hamis sugárzást a műszaki fejlődés jelenlegi állapota és a szolgáltatás jellege által lehetővé tett legalacsonyabb értéken kell tartani.
Megjegyzés. – Az ITU Rádió-Rendszabályzat S3 Függeléke tartalmazza a hamis sugárzások szintjeire vonatkozó tűréseket, azokat, amelyeknek az adók meg kell, hogy feleljenek.
2.1.1.3 A felhasznált rádiófrekvenciákat a 117,975–137 MHz-es sávokból kell kiválasztani. A kijelölhető frekvenciák közötti távolságoknak (csatorna-távolság) a rendszer elemekre alkalmazható frekvenciatűréseknek az V. kötetben meghatározottaknak kell lenniük.

Megjegyzés. - A 117,975 - 137 MHz-es sávot a Légiforgalmi Mozgó (R) Szolgálatnak az ITU Rádió-Rendszabályzat 1947-ben osztotta ki. Az ITU adminisztratív Rádió Világ-Konferenciák egymást követő sorozatos módosításai a 132 - 136 MHz-es sávot is hozzáadták az R-kiosztásokhoz, olyan feltételek mellett, amelyek különböznek az ITU régióktól, illetve meghatározott országoknak, ország-csoportoknak (lásd RRs S5.203-at, S5.203A-t, S5.203B-t, mint a 136 - 137 MHz-es sáv kiegészítő kijelölését, és S5.201-et a 132 - 136 MHz-es sávra).

2.1.1.4 A sugárzások tervezési polarizációjának függőlegesnek kell lenni.

31

2.2 A FÖLDI BERENDEZÉS RENDSZER JELLEMZŐI

2.2.1 Adás funkció

2.2.1.1 *Frekvencia stabilitás.* Az üzemi rádiófrekvencia nem térhet el a kijelölt frekvenciától plusz vagy mínusz 0,005 százaléknál nagyobb mértékben. Ahol az V. Kötet előírásainak megfelelően 25 kHz-es csatorna-távolságot alkalmaznak, ott az üzemi rádiófrekvencia nem térhet el a kijelölt frekvenciától plusz vagy mínusz 0,002 százaléknál nagyobb mértékben. Ahol az V.Kötet előírásainak megfelelően 8,33 kHz-es csatorna-távolságot vezetnek be, ott az üzemi rádiófrekvencia nem térhet el a kijelölt frekvenciától plusz vagy mínusz 0,0001 százaléknál nagyobb mértékben.

Megjegyzés. – A fenti tűrések nem lesznek megfelelők az eltolt vivőhullámú rendszerekre.

2.2.1.1.1 Eltolt vivőhullámú rendszerek 25 kHz-es, 50 kHz-es és 100 kHz-es csatorna-távolságú környezetben. Az eltolt vivőhullámú rendszerekben az egyes vivők stabilitásának olyannak kell lenni, hogy megakadályozza a 4 kHz-nél kisebb elsőrendű heterodin frekvenciákat, és ezenkívül a külső vivőhullám frekvenciák maximális frekvencia eltérése a kijelölt vivő frekvenciától ne haladja meg a 8 kHz-et. Az eltolt vivőhullámú rendszerek a 8,33 kHz-es csatorna-távolságú frekvenciákon nem használhatók.

Megjegyzés. – Az eltolt vivőhullámú rendszerek egyes vivőinek megkívánt stabilitására a II. rész "A" Mellékletében találhatók példák.

2.2.1.2. TELJESÍTMÉNY

Ajánlás. – *Az esetek magas százalékában a kisugárzott teljesítménynek olyannak kell lenni, hogy legalább 75 mikrovolt per méter (mínusz 109 dBW/m^2) térerősséget szolgáltasson a létesítmény meghatározott működési fedésterületén belül szabad térbeli terjedés alapján.*

2.2.1.3 *Moduláció.* A kivezérlési csúcsoknál a modulációs tényezőnek legalább a 0,85-öt elérőnek kell lenni.

2.2.1.4 **Ajánlás. –** *Kiegészítő áramköri elemeket kell biztosítani ahhoz, hogy az átlagos modulációs tényezőt a gyakorlatilag lehetséges legnagyobb értéken tartsák túlmodulálás nélkül.*

2.2.2 Vételi funkció

2.2.2.1 *Frekvencia stabilitás.* Ahol az V.Kötet előírásainak megfelelően 8,33 kHz-es csatorna-távolságot vezettek be, ott az üzemi rádiófrekvencia nem térhet el a kijelölt frekvenciától plusz vagy mínusz 0,0001 százaléknál nagyobb mértékben.

2.2.2.2 *Érzékenység.* A tápvonal veszteségét és az antenna iránykarakterisztikáját is figyelembe véve, a vevő érzékenységének olyannak kell lennie, hogy az esetek nagy százalékában egy 15 dB megkívánt/nem-kívánt arányú audio kimenő jelet szolgáltasson 50 százalékos amplitúdó-modulált (A3E) rádiójellel, amely 20 mikrovolt per méter (mínusz 120 dBW/m^2) vagy nagyobb térerősséggel rendelkezik.

2.2.2.3 *Effektív vételi sávszélesség.* 25 kHz-es, 50 kHz-es vagy 100 kHz-es sávszélességű csatornára hangolva, a vevő rendszernek kielégítő szintű és érthető hangfrekvenciás jelet kell szolgáltatnia, amikor a fenti 2.2.2.2 pontban meghatározott rádiófrekvenciás jelnek a kijelölt vételi frekvencia értékekkel plusz vagy mínusz 0,005 százalékon belül megegyező vivőfrekvenciája van. 8,33 kHz-es szélességű csatornára hangolva a vevő rendszernek kielégítő szintű és érthető hangfrekvenciás jelet kell szolgáltatnia, amikor a fenti 2.2.2.2 pontban meghatározott rádiófrekvenciás jelnek a kijelölt vételi frekvencia értékkel plusz vagy mínusz 0,0005 százalékon belül megegyező vivőfrekvenciája van. Az effektív vételi sávszélességről további információkat a II. Rész "A" Melléklete tartalmaz.

Megjegyzés. – Az effektív vételi sávszélesség a Doppler eltolódást is magában foglalja.

32

2.2.2.4 *Szomszédos csatorna elnyomás.* A vevő rendszernek biztosítani kell 60 dB-es vagy annál nagyobb tényleges elnyomást a szomszédos kijelölhető csatorna jeleire vonatkozóan.
Megjegyzés. – A szomszédos kijelölhető frekvencia általában plusz vagy mínusz 50 kHz. Ahol ez a csatorna-távolság nem kielégítő, ott a szomszédos kijelölhető frekvencia plusz vagy mínusz 25 kHz vagy plusz, vagy mínusz 8,33 kHz az V. Kötetben lévő előírásoknak megfelelően. Megengedett az, hogy a föld néhány területén a 25 kHz-es, 50 kHz-es vagy 100 kHz-es csatorna-távolságra tervezett vevők továbbra is használatban maradjanak.

2.3 A FEDÉLZETI BERENDEZÉS RENDSZER JELLEMZŐI

2.3.1 Adás funkció

2.3.1.1 *Frekvencia stabilitás.* Az üzemelési rádiófrekvencia a kijelölt frekvenciától nem térhet el plusz vagy mínusz 0,005 százalékértéknél nagyobb mértékben. Ahol 25 kHz-es csatorna-távolságot alkalmaznak, ott az üzemelési rádiófrekvencia a kijelölt frekvenciától nem térhet el plusz vagy mínusz 0,003 százaléknál nagyobb mértékben. Ahol 8,33 kHz-es csatorna-távolságot alkalmaznak, ott az üzemelési rádiófrekvencia a kijelölt frekvenciától nem térhet el 0,0005 százaléknál nagyobb mértékben.
2.3.1.2 *Teljesítmény.* Az esetek nagy százalékában a kisugárzott teljesítménynek olyannak kell lenni, hogy legalább 20 mikrovolt per méter (mínusz 120 dBW/m^2) térerősséget szolgáltasson a szabad térbeli terjedés alapján, olyan távolságokon és magasságokon, amelyek megfelelnek azoknak az üzemelési feltételeknek, amelyeket azokra a területekre engedélyezettek, amelyek felett a légijármű üzemel.
2.3.1.3 *Szomszéd csatorna teljesítmény.* Egy 8,33 kHz-es fedélzeti adótól bármely üzemelési feltételek esetén a kisugárzott teljesítmény, az első 8,33 kHz-es szomszédos csatorna középvonalától szimmetrikusan elhelyezkedő 7 kHz-es sávszélesség felett mérve, nem lépheti túl az adó vivő-teljesítménye alatti -45 dB-es szintet. A fenti szomszéd csatorna teljesítménynek számításba kell venni a jellemző beszéd-üzemi spektrumot.

Megjegyzés. – A beszéd-üzemi spektrumot állandó szintűnek feltételezik 300 és 800 Hz között és oktávonként 10 dB-lel csillapítottnak a 800 Hz felett.

2.3.1.4 *Moduláció.* A legalább 0,85-ös csúcs modulációs tényezőnek elérhetőnek kell lenni.
2.3.1.5 **Ajánlás.** – *Kielégítő áramköri elemeket kell biztosítani ahhoz, hogy az átlagos modulációs tényezőt a gyakorlatilag lehetséges legnagyobb értéken tartsák túlmodulálás nélkül.*

2.3.2 Vételi funkció

2.3.2.1 *Frekvencia stabilitás.* Ahol 8,33 kHz-es csatorna-távolságot vezettek be az V. Kötetnek megfelelően, ott az üzemi frekvencia nem térhet el a kijelölt frekvenciától plusz vagy mínusz 0,0005 százaléknál nagyobb értékkel

2.3.2.2 ÉRZÉKENYSÉG

2.3.2.2.1 **Ajánlás.** – *Figyelembe véve a légijármű tápvonal illesztési hibáit, a csillapítási veszteséget és az antenna iránykarakterisztikáját, a vevő érzékenységének olyannak kell lenni, hogy az esetek nagy százalékában egy 15 dB megkívánt/nem-kívánt arányú audió kimenet jelet szolgáltasson 50 százalékos amplitúdó-modulált (A3E) rádió jellel, amely 75 mikrovolt per méter (mínusz 105 dBW/m^2) térerőséggel rendelkezik.*

Megjegyzés. – Kiterjesztett hatótávolságú VHF berendezések tervezésénél 30 mikrovolt per méter fedélzeti vételi érzékenység feltételezhető.

2.3.2.3 *Effektív vételi sávszélesség a 100 kHz, 50 kHz és 25 kHz-es csatorna-távolságú vevő berendezéseknél.* Az V. Kötetben kijelölt 25 kHz, 50 kHz vagy 100 kHz-es csatorna-távolságú rendszerben a vevőnek tényleges vételi

sávszélességet kell biztosítani a következők szerint:
a) azokon a területeken, ahol eltolt vivő rendszereket alkalmaznak, a vevőnek kielégítő audio-kimenetet kell szolgáltatnia akkor, amikor a fenti 2.3.2.2 pontban meghatározott vivő frekvencia eltérése a kijelölt frekvenciától 8 kHz-en belül van;
b) azokon a területeken, ahol eltolt vivő rendszereket nem alkalmaznak, a vevőnek kielégítő hangfrekvenciás kimenetet kell szolgáltatnia akkor, amikor a fenti 2.3.2.2 pontban meghatározott jel vivőfrekvenciájának eltérése a kijelölt frekvenciától plusz vagy mínusz 0,005 százalék.
2.3.2.4 *Effektív vételi sávszélesség a 8,33 kHz-es csatorna-távolságú vevő berendezéseknél.* Amikor a vevő az V.Kötetben kijelölt 8,33 kHz-es sávszélességű csatornára van hangolva, a vételi funkciónak egy kielégítő hangfrekvenciás kimenetet kell szolgáltatnia akkor, amikor a fenti 2.3.2.2 pontban meghatározott jel vivőfrekvenciájának eltérése a kijelölt frekvenciától plusz vagy mínusz 0,0005 százalék. Az effektív vételi sávszélességről bővebb információt a II. Rész "A" Melléklete tartalmaz.

Megjegyzés. – Az effektív vételi sávszélesség a Doppler eltolódást is magában foglalja.

2.3.2.5 *Szomszédos csatorna elnyomás.* A vételi funkció tényleges szomszédos csatorna elnyomást biztosít a következők szerint:
a) *8,33 kHz-es csatornák:* 60 dB vagy több a plusz vagy mínusz 8,33 kHz-nél a kijelölt frekvenciára vonatkoztatva, és 40 dB vagy több a plusz vagy mínusz 6,5 kHz-nél:

Megjegyzés. – A vevő helyi oszcillátora fázis-zajának elegendően kicsinek kell lenni ahhoz, hogy elkerüljék a vevő teljesítőképességének leromlását a vivőhullám jelek leválasztására. Egy mínusz 99 dBc/Hz-nél jobb fázis zajszint szükséges a 8,33 kHz-es távolságoknál ahhoz, hogy kielégítsék a 45 dB-es szomszédos csatorna elnyomás követelményét az összes üzemelési feltétel mellett.

b) A *25 kHz-es csatorna-távolságú környezetnél:* 50 dB vagy több a plusz vagy mínusz 25 kHz-nél a kijelölt frekvenciára vonatkoztatva, és 40 dB vagy több a plusz vagy mínusz 17 kHz-nél;
c) *Az 50 kHz-es csatorna-távolságú környezetnél:* 50 dB vagy több a plusz vagy mínusz 50 kHz-nél a kijelölt frekvenciára vonatkoztatva, és 40 dB vagy több a plusz vagy mínusz 35 kHz-nél;
d) *A 100 kHz-es csatorna-távolságú környezetnél:* 50 dB vagy több a plusz vagy mínusz 100 kHz-nél a kijelölt frekvenciára vonatkoztatva..
2.3.2.6 **Ajánlás.** – *A 25 kHz-es, 50 kHz-es vagy 100 kHz-es csatorna-távolságú környezetben alkalmazandó vevő rendszernek lehetőleg 60 dB-es vagy több effektív szomszédos csatorna elnyomási jellemzőt kell biztosítani a kijelölt vételi frekvenciához viszonyítva plusz vagy mínusz 25 kHz-nél, 50 kHz-nél vagy 100 kHz-né ltalálható csatornákra vonatkozóan.*

Megjegyzés. – A frekvenciatervezés általában azon az alapfeltételen nyugszik, hogy a 60 dB-es vagy több tényleges szomszédos csatorna elnyomási jellemző biztosítva van a 25 kHz-re, 50 kHz-re vagy 100 kHz-re kijelölt frekvenciáktól, ahogy az megfelelő a csatorna-távolsági környezetnek.

2.3.2.7 **Ajánlás.** – *A 2.3.2.3 pontnak megfelelő vevők eltolt vivőjű rendszerekkel ellátott területeken történő használaakor a vevő jellemzőknek a következők szerintieknek kell lenniük:*
a) a hangfrekvenciás átviteli karakterisztika kizárja a két vagy több eltolt vivőfrekvencia vételéből eredő audio heterodinek káros szintjeit;
b) a vevő zajzár áramkörei, ha ilyeneket alkalmaznak, kielégítően működnek a két- vagy több eltolt vivőfrekvencia vételéből eredő audio heterodinek jelenléte esetén.

2.3.2.8 *VDL-INTERFERENCIA ÉRZÉKETLENSÉGI TELJESÍTMÉNY*

2.3.2.8.1 Ugyanazon légijármű fedélzetén DSB-AM és VDL technológiát alkalmazó független üzemeltetésű használatra szánt berendezések esetében a vevőnek kielégítő és jól érthető hangkimenetet kell szolgáltatnia nem

több, mint 150 mikrovolt per méter (mínusz 102 dBW/m^2) hasznos rádiófrekvenciás térerővel a hasznos jel szintjét legalább 50 dB értékkel meghaladó nem-kívánt VDL jel térerősség mellett. A feltételnek bármely kijelölhető csatornán attól legalább 100 kHz-re található VDL zavarjel esetében teljesülnie kell.
Megjegyzés. – Ez a VDL interferencia érzéketlenség a III. Kötet I. Rész 6.3.4. pontjában ismertetett VDL RF spektrum maszk és 68 dB-es adó/vevő elválasztás melletti követelmény. Jobb adó és vevő paraméterek kisebb megkívánt elkülönítést eredményezhetnek.

2.3.2.8.2 Minden 2002. január 1. után újonnan felszerelt ugyanazon légijármű fedélzetén lévő DSB-AM és VDL technológiát alkalmazó szolgáltatások független üzemeltetésénél való felhasználására szánt berendezés vétel funkciójának ki kell elégítenie a 2.3.2.8.1 pont előírásait.
2.3.2.8.3 Minden 2005. január 1. után felszerelt, ugyanazon légijármű fedélzetén DSB-AM és VDL technológiát alkalmazó szolgáltatások független üzemeltetésénél való felhasználására szánt berendezés vétel funkciójának ki kell elégítenie a 2.3.2.8.1 pont előírásait a 2.3.2.8.4 pont feltételei mellett.
2.3.2.8.4 A 2.3.2.8.3 pont előírásainak kötelező teljesítésére vonatkozó követelményeket az olyan körzeti léginavigációs egyezmények alapján kell megszabni, amelyek az üzemelési légteret és a megvalósítási időrendjét határozzák meg.
2.3.2.8.4.1 A 2.3.2.8.4 pontban jelzett egyezménynek a fedélzeti rendszerek kötelező teljesítésére legalább kétéves előzetes bejelentést kell biztosítania.

2.3.3 Interferencia érzéketlenségi teljesítmény

2.3.3.1 1998. január 1-je után a VHF kommunikációs vételi rendszereknek kielégítően kell működniük két bemeneti jel esetén is akkor, ha a harmadrendű intermodulációt létrehozó VHF FM műsorszóró jel szintje a bemeneten mínusz 5 dBm.
2.3.3.2 1998. január 1-je után a VHF kommunikációs vételi rendszerekben nem szabad fellépnie érzéketlenítési jelenségnek mínusz 5 dBm-es szintű VHF FM rádióadás jelek vevőbemenetre kerülése esetén.

Megjegyzés. – A fenti 2.3.3.1 és 2.3.3.2 pontokban idézett érzéketlenítési kritériumokra vonatkozó útmutató anyagot a II. Rész "A" Mellékletének 1.3 pontja tartalmazza.

2.3.3.3 1995. január 1-je utána a fedélzeti VHF kommunikációs vételi rendszerek minden új felszerelésű berendezésének ki kell elégítenie a fenti 2.3.3.1 és 2.3.3.2 pontok előírásait.
2.3.3.4 **Ajánlás.** – *A fenti 2.3.3.1 és 2.3.3.2 alatti érzéketlenségi előírásokat kielégítő fedélzeti VHF kommunikációs vételi rendszereket a lehető legrövidebb időn belül üzembe kell helyezni.*

2.4 EGY-OLDALSÁVOS (SSB) HF ÖSSZEKÖTTETÉSI RENDSZERJELLEMZŐK A LÉGIFORGALMI MOZGÓ SZOLGÁLATOKNÁL TÖRTÉNŐ FELHASZNÁLÁSNÁL

2.4.1 A levegő-föld HF SSB rendszer jellemzőinek, ahol a légiforgalmi mozgó szolgálatoknál felhasználásra kerülnek, a következő előírásoknak kell megfelelniük.

2.4.1.1 FREKVENCIA TARTOMÁNY

2.4.1.1.1 A HF SSB berendezéseknek alkalmazhatónak kell lenniük bármely SSB vivő (referencia) frekvenciánál, amely a légiforgalmi mozgó (R) szolgáltatás részére rendelkezésre áll a 2,8 MHz-től a 22 MHz-ig terjedő sávban, és szükségszerű az, hogy kielégítsék a körzet (ek) részére jóváhagyott kijelölési tervet, valamint összhangban legyenek a Rádió-Rendszabályzat vonatkozó előírásaival.

1. Megjegyzés. – Lásd a Bevezetést az V. Kötet 3.Fejezetéhez és a 2-1. és 2-2. ábrákat.

2. Megjegyzés. – Az ITU Világ Adminisztrációs Rádió Konferencia, Légiforgalmi Mozgó (R) Szolgálat, Genf, 1978.

35

(ITU World Administrative Radio Conference, Aeronautical Mobile (R) Service, Geneva, 1978.) egy új kiosztási tervet hozott létre (Allotment Plan) az Aer Rádió-Rendszabályzatok 27. Függelékéhez (Appendix 27, Aer to the Radio Regulations), amely az egy-oldalsávos üzemelésre van alapozva, a korábbi két-oldalsávos kijelöléssel szemben. A Világ Rádió-Összeköttetési Konferencia (World Radiocommunication Conference) 1995-ben ezt S.27 Függelékként jelölte ki újra. Kisebb szerkesztői változtatásokat hajtott végre a Világ Rádió-Összeköttetési Konferencia 1997-ben.

2.4.1.1.2 A berendezéseknek alkalmasnak kell lenniük az 1 kHz egész számú többszörösein való üzemelésre.

2.4.1.2 OLDALSÁV KIVÁLASZTÁS

2.4.1.2.1 Az átvitt oldalsávnak a vivő- (referencia) frekvencia nagyobb frekvenciájú oldalán lévőnek kell lennie.

2.4.1.3. VIVŐ (REFERENCIA) FREKVENCIA

2.4.1.3.1 A csatorna felhasználásnak összhangban kell lenni az S27 Függelék 27/16-os és a Kijelölési Terv 27/186-tól 27/207-ig terjedő, azt is magában foglaló vivőhullám (referencia) frekvencia táblázatokkal (vagy a 27/21 alapján megállapított frekvenciákkal).

Megjegyzés. - Az a cél, hogy csak a vivő- (referencia) frekvencia kerüljön közzétételre a Körzeti Tervekben, vagy a Légiforgalmi Tájékoztató Kiadványokban.

2.4.1.4 SUGÁRZÁSI OSZTÁLYOK ÉS VIVŐFREKVENCIA ELNYOMÁS

2.4.1.4.1 A rendszernek J3E elnyomott vivőfrekvenciájú modulációval kell működnie. (J7B és J9B is használható). SELCAL II. Rész 3. Fejezet által ismertetett előírások szerinti alkalmazásakor a berendezésnek a H2B sugárzással kell üzemelnie.

2.4.1.4.2 1982. február 1-jéig a légiforgalmi állomásoknak és a légijármű fedélzeti állomásoknak be kell vezetniük a fenti 2.4.1.4.1 pontban előírt megfelelő sugárzási osztály (oka) t. Ettől a dátumtól kezdve az A3E sugárzási osztályt meg kell szűntetni, kivéve az alábbi 2.4.1.4.4 pontban megadott előírásokat.

2.4.1.4.3 1982. február 1-jéig az egy-oldalsávos működéshez felszerelt légiforgalmi állomásokat és légijármű fedélzeti állomásokat is el kell látni a H3E sugárzási osztályú adáshoz szükséges elemekkel, ahol megkövetelt, hogy kompatibilis legyen a két-oldalsávos vevőberendezésekkel. Ettől a dátumtól kezdve a H3E sugárzási osztályt meg kell szűntetni, kivéve az alábbi 2.4.1.4.4 pontban szereplő előírásokat.

2.4.1.4.4 **Ajánlás.** – *A koordinált kutatási és mentési műveletekben közvetlenül résztvevő állomások, amelyek a 3023 kHz-es és az 5680 kHz-es frekvenciákat használják, a J3E sugárzási osztályt használják; azonban mivel a tengeri mozgó szolgálat és szárazföldi mozgó szolgálat is részt vehet a tevékenységben, az A3E és H3E sugárzási osztályok is használhatók.*

2.4.1.4.5 1981. április 1-je után új DSB berendezések nem szerelhetők fel.

2.4.1.4.6 A légijármű fedélzeti állomási adóberendezéseknek képeseknek kell lenni legalább 26 dB-es vivő-elnyomásra a modulációs csúcs-teljesítményre (P_p) vonatkoztatva a J3E, J7B vagy J9B sugárzási osztályoknál.

2.4.1.4.7 A légiforgalmi állomások adóinak képeseknek kell lenni 40 dB-es vivő-elnyomásra a modulációs csúcs-teljesítményre (P_p) vonatkoztatva a J3E, J7B vagy J9B sugárzási osztályoknál.

2.4.1.5 HANGFREKVENCIÁS SÁVSZÉLESSÉG

2.4.1.5.1 A rádiótelefon sugárzásoknál a hangfrekvenciákat 300 és 2700 Hz közé kell korlátozni és a más, szabályozott sugárzások által elfoglalt sávszélesség nem haladhatja meg a J3E sugárzások felső határát. Ezeknek a határértékeknek a meghatározásánál azonban kiterjedésükben nem lehet korlátozásokat alkalmazni a J3E sugárzástól eltérő sugárzás esetében, feltéve, hogy a nem-kívánt sugárzásokra vonatkozó korlátozások teljesülnek (lásd az alábbi 2.4.1.7 pontot).

Megjegyzés. – Azokra a légijármű fedélzeti és légiforgalmi állomási adó típusokra, amelyeket először 1983. február 1-je előtttelepítettek,, a hangfrekvenciás sáv 3000 Hz-re lesz korlátozva.

36

2.4.1.5.2 Más engedélyezett sugárzási osztályoknál a modulációs frekvenciáknak olyannak kell lenniük, hogy az alábbi 2.4.1.7 pontban ismertetett, megkövetelt spektrum korlátozásokat kielégítsék.

2.4.1.6 FREKVENCIA TŰRÉS

2.4.1.6.1 Az adási funkció alapfrekvencia stabilitásának a J3E, J7B vagy J9B sugárzási osztályoknál olyannak kell lenni, hogy az adás tényleges vivő- frekvenciája és a vivő- (referencia) frekvencia közötti különbség ne haladja meg:
- a 20 Hz-et a fedélzeti telepítéseknél; és
- a 10 Hz-et a földi telepítéseknél.

2.4.1.6.2 A vételi funkció frekvencia stabilitásának olyannak kell lenni, hogy a fenti 2.4.1.6.1 pontban meghatározott sugárzási funkció stabilitásokkal, a szolgáltatásban elért és a Doppler-eltolódást is tartalmazó földi és fedélzeti funkció közötti teljes frekvencia-különbség ne haladja meg a 45 Hz-et. Azonban a szuperszonikus repülőgépek esetén ennél nagyobb frekvencia-különbség is megengedhető.

2.4.1.7 SPEKTRUM HATÁRÉRTÉKEK

2.4.1.7.1 Azoknál a légijármű fedélzeti állomás adó típusoknál és légiforgalmii állomás adóknál, amelyek 1983. február 1-je előtt kerültek először felszerelésre és a H2B, H3E, J3E, J7B vagy J9B sugárzások egy-oldalsávos osztályait használják, bármely sugárzás közepes teljesítményének, bármely frekvencián kisebbnek kell lennie az adó közepes teljesítményénél (P_m), a következőknek megfelelően:
- bármely frekvencián 2 kHz-es vagy nagyobb értékű, maximálisan 6 kHz-es távolságban a kijelölt frekvenciától: legalább 25 dB;
- bármely frekvencián 6 kHz-es vagy nagyobb értékű, maximálisan 10 kHz-es távolságban a kijelölt frekvenciától: legalább 35 dB;
- bármely frekvencián 10 kHz-es vagy nagyobb távolságban a kijelölt frekvenciától:

a) a légijármű fedélzeti állomás adójának: 40 dB;
b) a légiforgalmi állomás adójának:
$[43+10\ \log_{10} P_m\ (W)]$ dB

2.4.1.7.2 Az 1983. február 1-je után először felszerelt légijármű fedélzeti adóknál, és az 1983. február 1-je óta használatban lévő és a H2B, H3E, J3E, J7B vagy J9B sugárzási egy-oldalsávos osztályait használó légiforgalmi állomás adóknál bármely modulációs csúcs-teljesítményének (P_p) bármely frekvencián kisebbnek kell lennie, mint az adó modulációs csúcs-teljesítményének (P_p), a következőknek megfelelően:
- bármely frekvencián 1,5 kHz-es vagy nagyobb értékű, maximálisan 4,5 kHz-es távolságban a kijelölt frekvenciától: legalább 30 dB;
- bármely frekvencián 4,5 kHz-es vagy nagyobb értékű, maximálisan 7,5 kHz-es távolságban a kijelölt frekvenciától: legalább 38 dB;
- bármely frekvencián 7,5 kHz-es vagy nagyobb távolságban a kijelölt frekvenciától:

a) a légijármű fedélzeti állomás adójának: 43 dB;
b) a légiforgalmi állomások adóinak: a maximálisan 50 W teljesítményű adónál.

$$[43+10\ \log_{10} P_m\ (W)]\ \text{dB}$$

az 50 W-nál nagyobb teljesítményű adóknál: 60 dB.

Megjegyzés. – Lásd a 2-1. és a 2-2 ábrát.

2.4.1.8 TELJESÍTMÉNY

2.4.1.8.1 *Légiforgalmi állomási berendezések.* Kivéve az ITU Rádió-Rendszabályzat S27 Függelékének előírásai által engedélyezetteket, az a modulációs csúcs-teljesítmény, amely az antenna tápvonalat látja el a H2B, H3E, J3E, J7B vagy J9B sugárzási osztályoknál, nem haladhatja meg a 6 kW-os maximális értéket.

2.4.1.8.2 *Légijármű fedélzeti állomások.* Az antenna tápvonalhoz szolgáltatott modulációs csúcs-teljesítmény a

37

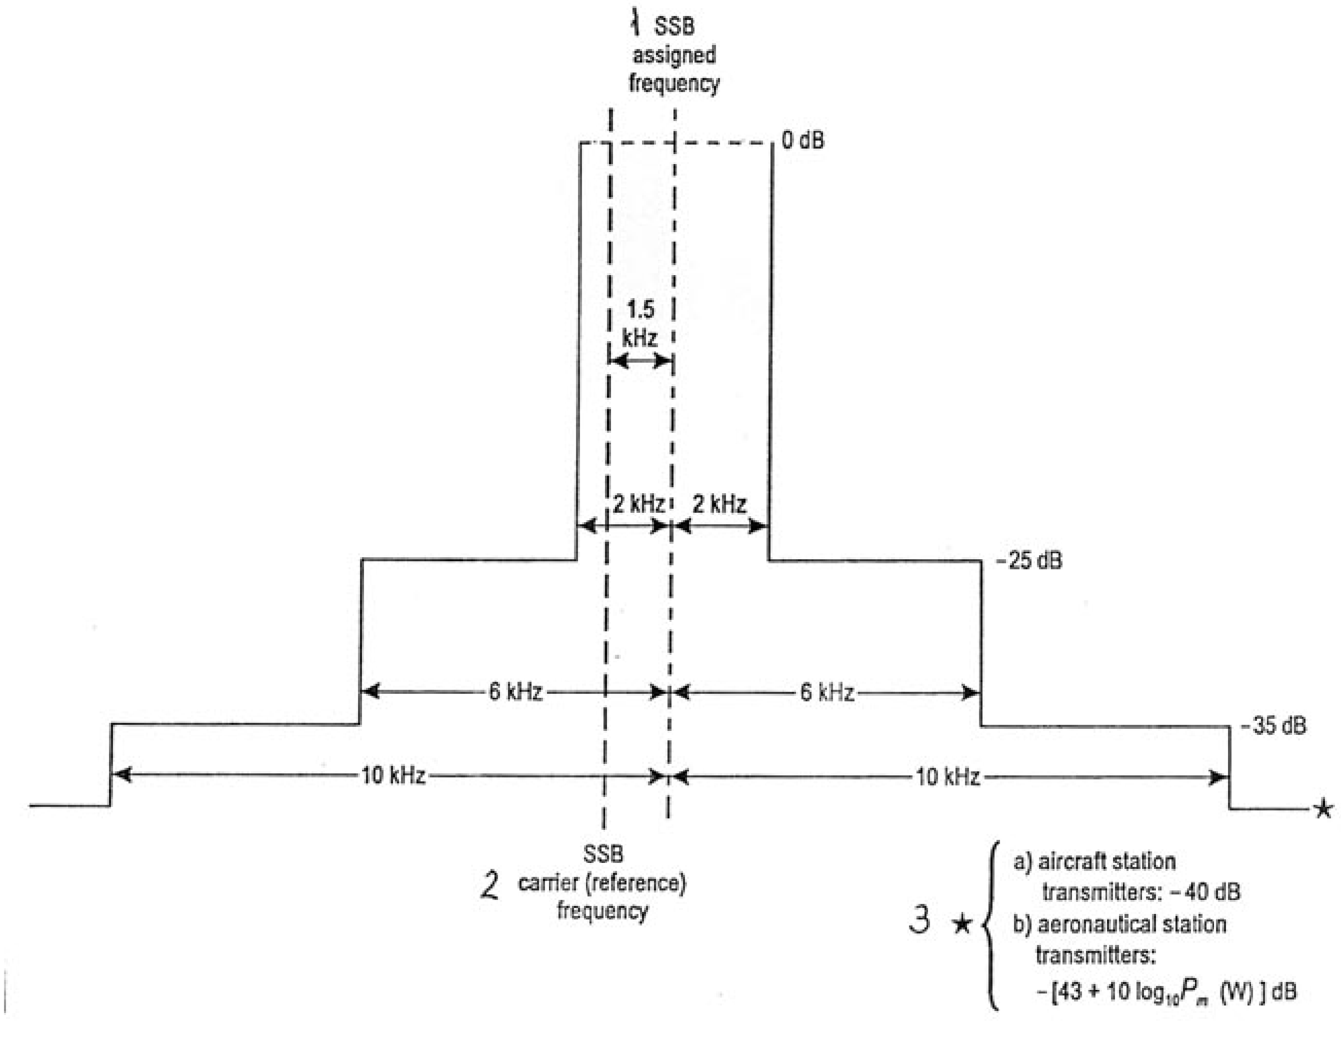
H2B, H3E, J3E, J7B vagy J9B sugárzási osztályoknál nem haladhatja meg a 400 W-ot, kivéve a Rádió-Rendszabályzat S27. Függelékében előírtakat a következők szerint:
S27/68 Elfogadott, hogy a légijármű adók által alkalmazott teljesítmény meghaladhatja a 27/60-ban meghatározott korlátokat. Azonban az ilyen megnövelt teljesítmény (amely általában nem haladhatja meg a 600 W P_p-t) használata nem okozhat káros interferenciát az azon műszaki elvekkel összhangban működő állomásoknál, amely elveken a frekvencia kiosztási terv alapul.
S27/60 Ha ezen Függelék II. Részében nincs másképpen meghatározva, az antenna tápvonalába bevitt modulációs csúcs-teljesítmény nem haladhatja meg az alábbi táblázatban jelzett maximális értékeket; a megfelelő tényleges kisugárzott csúcs-teljesítményekről elfogadott az, hogy az alábbi értékek kétharmadával egyenlők:

38

Sugárzási osztály	Állomások	Maximális modulációs csúcs-teljesítmény (P_p)
H2B, J3E, J7B, J9B	Légiforgalmi állomások	6 kW
J9B, A3E*, H3E* (100% moduláció)	Légijármű fedélzeti állomások	400 W
Egyéb sugárzás mint például A1A, F1B	Légiforgalmi állomások Légijármű fedélzeti állomások	1,5 kW 100 W

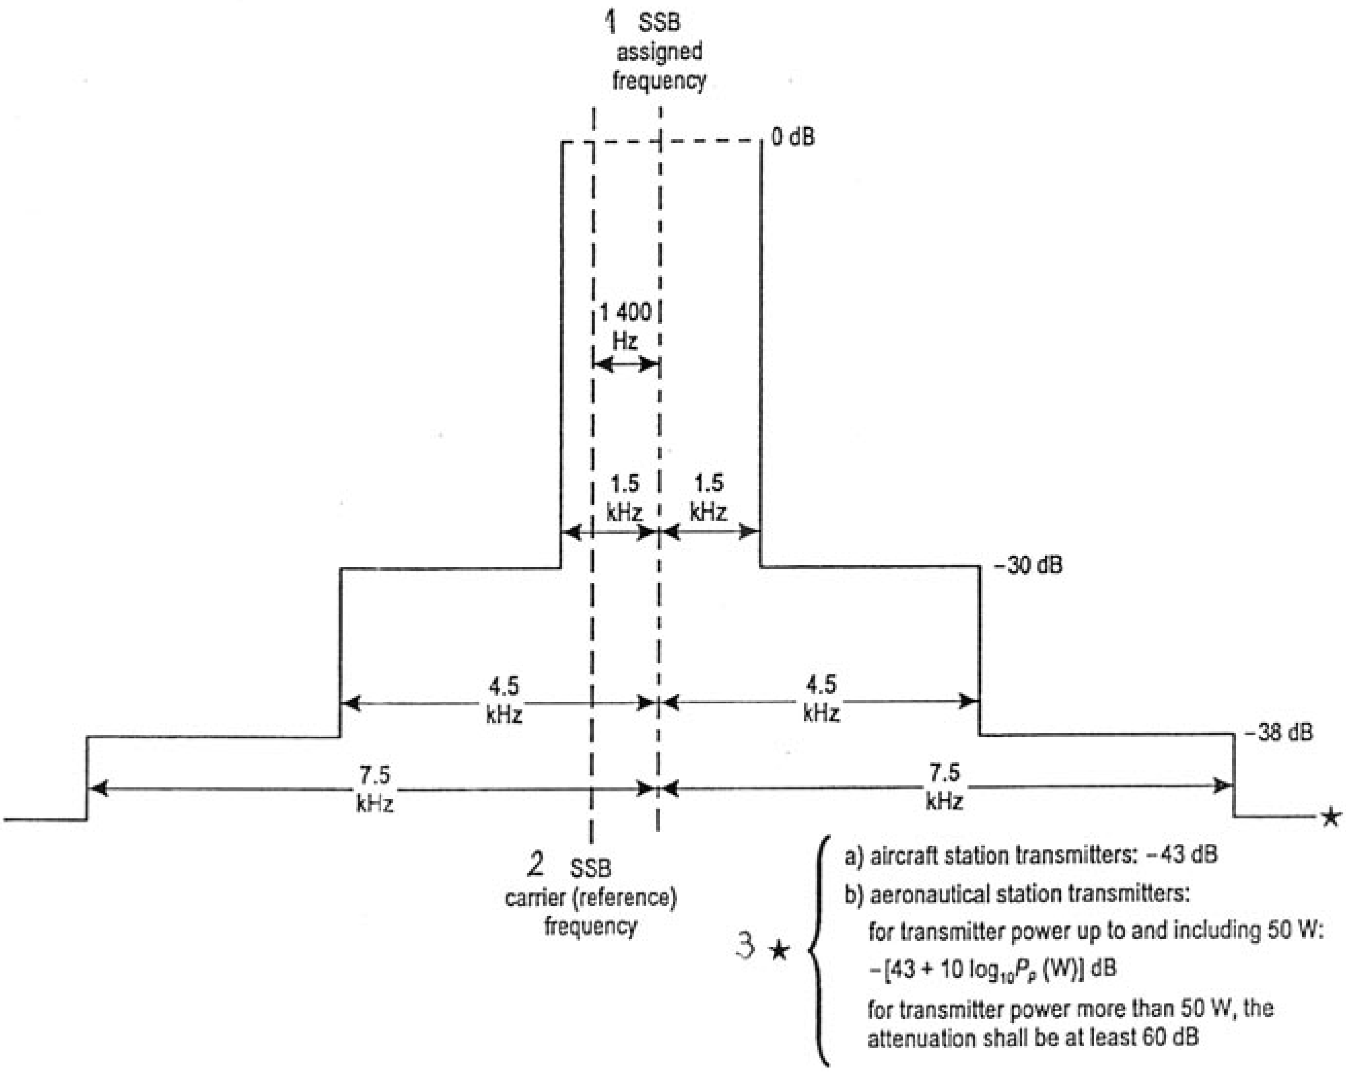
*Az A3E és H3E csak 3023 kHz-en és 5680 kHz-en használhatók.

2.4.1.9 *Üzemmód.* Egy-csatornás szimplex sugárzást kell alkalmazni.



2-1. ábra. Megkívánt spektrum korlátok (közepes teljesítményben kifejezve) a légijármű fedélzeti adó típusoknál és azoknál a légiforgalmi állomások adóinál, amelyeket először 1983. február 1-je előtt szereltek fel.

2-1 ábra szövege:
1 SSB kijelölt frekvencia
2 SSB vivő- (referencia) frekvencia
3 a) légijármű fedélzeti állomás adók: -40 dB
b) légiforgalmi állomási adók:
- [43+10 $\log_{10} P_m$ (W)] dB



2-2. ábra. Megkívánt spektrum korlátok (a csúcs-teljesítményben kifejezve) az először az 1983. február 1-je után felszerelt légijármű fedélzeti állomásoknál és az 1983. február 1-je után használatban lévő légiforgalmi állomási adóknál.

2-2 ábra szövege:
1 SSB kijelölt frekvencia

2 SSB vivő-(referencia) frekvencia
3 a) légijármű fedélzeti állomás adók: -43 dB
b) légiforgalmi állomás adók:
a maximálisan 50 W teljesítményű adóknál:
-[43+10 $\log_{10} P_p$ (W)] dB
az 50 W-nál nagyobb teljesítményű adóknál a csillapítás legalább 60 dB.

3. FEJEZET: SELCAL RENDSZER

3.1 **Ajánlás.** – *Ahol SELCAL rendszert telepítenek, a következő rendszer jellemzőket kell alkalmazni:*
a) Kisugárzott kód. *Mindegyik kisugárzott kódnak két egymást követő hang-impulzusból kell állnia, mindegyik impulzus két szimultán módon átvitt hangot tartalmaz. Az impulzusok 1,0 plusz vagy mínusz 0,25 másodperc idő hosszúságúak, melyeket 0,2 plusz vagy mínusz 0,1 másodperc hosszúságú időközök választanak el.*
b) Stabilitás. *Az átvitt hangok frekvenciáját plusz vagy mínusz 0,15 százalék tűrésen belül kell tartani a fedélzeti dekóder helyes működésének biztosítása érdekében.*
c) Torzítás. *A teljes hangfrekvenciás torzítás az átvitt RF jelen nem haladhatja meg a 15 százalékot.*
d) Százalékos moduláció. *A földi rádióállomás által kisugárzott RF jelnek 3 dB-en belül egyenlő nagyságú, két moduláló hangot kell tartalmaznia. A hangok kombinációja egy modulációs burkológörbét eredményez, amely a lehető legmagasabb névleges modulációs százalékkal bír, és semmi esetre sem kisebb, mint 60 százalék.*
e) Kisugárzott hangok. *A hang-kódok a következő táblázatban felsorolt hangok különböző kombinációiból állnak, és színnel és betűvel vannak jelölve.*

Jelölés	*Frekvencia (Hz)*
Piros A	*312,6*
Piros B	*346,7*
Piros C	*384,6*
Piros D	*426,6*
Piros E	*473,2*
Piros F	*524,8*
Piros G	*582,1*
Piros H	*645,7*
Piros J	*716,1*
Piros K	*794,3*
Piros L	*881,0*
Piros M	*977,2*
Piros P	*1083,9*
Piros Q	*1202,3*
Piros R	*1333,5*
Piros S	*1479,1*

1. Megjegyzés. – Meg kell jegyezni, hogy a hangok frekvenciájának aránya exp(0,045) harmonikus kombinációk lehetőségének elkerülése céljából.
2. Megjegyzés. – Az Összeköttetési Részleg Hatodik Ülése által kifejlesztett alkalmazási elveknek megfelelően, jelenleg nemzetközi használatra csak a piros csoportból választottak kódokat.
3. Megjegyzés. – A SELCAL rendszerek használatára vonatkozó útmutató anyagot a II. Rész "A" Melléklete tartalmazza.
4. Megjegyzés. – A Piros P, Piros Q, Piros R és Piros S hangok 1985. szeptember 1-je után alkalmazhatók, az alábbi 3.2 pontnak megfelelően.

41

3.2 Mivel 1985. szeptember 1-jétől a légiforgalmi állomásokat, amelyektől megkövetelik a kommunikációt a SELCAL-lal felszerelt légijárművekkel, fel kell szerelni SELCAL kódokkal a piros csoportnak megfelelően a fenti 3.1 pontban feltüntetett hangfrekvencia táblázat szerint. 1985. szeptember 1-je után a Piros P, Piros Q, Piros R és Piros S SELCAL kódokat használatra ki lehet jelölni.

4. FEJEZET: LÉGIFORGALMI BESZÉD-ÁTVITELI ÁRAMKÖRÖK

4.1 A FÖLD-FÖLD KÖZÖTTI ALKALMAZÁSÚ NEMZETKÖZI LÉGIFORGALMI BESZÉD-ÁTVITELI ÁRAMKÖRÖK KAPCSOLÁSAINAK ÉS JELZÉSEINEK MŰSZAKI ELŐÍRÁSAI

Megjegyzés. - A föld - föld közötti alkalmazású nemzetközi légiforgalmi beszéd-átviteli áramkörök kapcsolásainak és jelzéseinek kivitelezésére vonatkozó útmutató anyagot a Légiforgalmi Szolgálatok (ATS) Föld - Föld Közötti Beszéd-átviteli Kapcsolások és Jelzések Kézikönyve (Doc 9804) tartalmazza. Az anyag magába foglalja a szakkifejezések magyarázatát, a teljesítmény paramétereket, útmutatást ad az alapvető hívás típusokról és a kiegészítő funkciókról, utal a megfelelő ISO/IEC nemzetközi szabványokra és az ITU-T ajánlásokra, útmutatásokat ad a jelzési rendszerek használatáról, részletezi az ajánlott számozási tervezeteket és útmutatásokat ad a jövőbeli tervezetekről.

4.1.1 A nem külön-vonallal összekapcsolt Légiforgalmi Szolgálatoknál a kapcsolás és jelzés felhasználásával biztosított beszéd-átviteli áramkörök alkalmazása az illetékes Hatóságok közötti megállapodás tárgya.

4.1.2 A légiforgalmi beszéd-átviteli áramkörök kapcsolási és jelzési rendszereinek alkalmazását a körzeti léginavigációs egyezmények alapján kell megvalósítani.

4.1.3. **Ajánlás.** – *Az Annex 11, 6.2 Részében meghatározott Légiforgalmi Irányítási összeköttetési követelményeket a következő alap hívástípus közül egynek vagy többnek a megvalósításával kell kielégíteni:*
a) Azonnali hozzáférés;
b) Közvetlen hozzáférés; és
c) Közvetett hozzáférés.

4.1.4 **Ajánlás.** – *A telefon-hívások létrehozásának alap képességéhez kiegészítőleg a következő funkciókat kell biztosítani ahhoz, hogy az Annex 11-ben lefektetett követelmények kielégítésre kerüljenek:*
a) Hívó/hívott fél azonosításának jelzésére szolgáló eszköz;
b) Sürgős/prioritási hívások kezdeményezésére szolgáló eszköz; és
c) Konferencia-beszélgetés képesség.

4.1.5 **Ajánlás.** – *A légiforgalmi beszéd-átviteli áramkörök kapcsolási és jelzési rendszerben használt áramkörök jellemzőinek meg kell felelniük a megfelelő ISO/IEC nemzetközi szabványoknak és az ITU-T ajánlásoknak.*

4.1.6 **Ajánlás.** – *Digitális jelző rendszereket kell felhasználni, amikor a következő tényezők valamelyikénél azok használata indokolható:*
a) A szolgáltatás jobb minősége;
b) Javított minőségű felhasználói berendezések; vagy
c) Csökkentett költségek ott, ahol a szolgáltatás minősége fennmarad.

4.1.7 **Ajánlás.** – *A felhasználandó ellenőrző hangjelzések jellemzői (mint például csengetés, foglaltság, nem-kapcsolható-szám) meg kell, hogy feleljenek a vonatkozó ITU-T ajánlásoknak.*

4.1.8 **Ajánlás.** - *A körzeti és nemzeti légiforgalmi beszéd-átviteli hálózatok összekapcsolási előnyeinek kihasználása érdekében a nemzetközi légiforgalmi telefon-hálózati számozási rendszert kell használni.*

5. FEJEZET: KÉNYSZERHELYZETI HELYJELADÓ (ELT) A KUTATÁSHOZ ÉS MENTÉSHEZ

5.1 ÁLTALÁNOS RÉSZ

42

5.1.1 2005. január 1-ig a kényszerhelyzeti helyjeladó adóberendezéseknek vagy mindkét, a 406 MHz-es és a 121,5 MHz-es frekvencián, vagy a 121,5 MHz frekvencián kell üzemelniük.

Megjegyzés. – 2000. január 1-jétől a 121,5 MHz-en üzemelő kényszerhelyzeti helyjeladókkal szemben az a követelmény, hogy megfeleljenek az 5.2.1.8 pontban leírt tökéletesített műszaki jellemzőknek.

5.1.2 Az összes, 406 MHz-en üzemelő kényszerhelyzeti helyjeladó adóberendezésnek meg kell felelnie az 5.3 pont előírásainak.
5.1.3 Az összes, 121,5 MHz-en üzemelő kényszerhelyzeti helyjeladó adóberendezésnek meg kell felelnie az 5.2 pont előírásainak.
5.1.4 2005. január 1-jétől a kényszerhelyzeti helyjeladók adóberendezéseinek egyidejűleg kell működniük a 406 MHz-en és a 121,5 MHz-en.
5.1.5 A 2002. január 1. után felszerelt összes kényszerhelyzeti helyjeladó adóberendezésnek egyidejűleg a 406 MHz-en és a 121,5 MHz-en kell üzemelniük.
5.1.6 Egy integrált kényszerhelyzeti helyjeladó adóberendezés 406 MHz-es részének a műszaki jellemzői meg kell, hogy feleljenek az 5.3 pontban leírtaknak.
5.1.7 Egy integrált kényszerhelyzeti helyjeladó adóberendezés 121,5 MHz-es részének a műszaki jellemzői meg kell, hogy feleljenek az 5.2 pontban leírtaknak.
5.1.8 Az Államoknak egyezményt kell kötniük egy 406 MHz-es ELT jegyzék elkészítéséről. A kényszerhelyzeti helyjeladóra vonatkozó jegyzék információit - amint rendelkezésre állnak - azonnal a kutató és mentő hatóságok rendelkezésére kell bocsájtani. Az Államoknak biztosítaniuk kell, hogy amikor az szükséges, a jegyzék felfrissítésre kerüljön.
5.1.9 Az ELT jegyzék információinak a következőket kell magába foglalniuk:
a) Az adó azonosítóját (15 hexadecimális karakterből álló alfanumerikus kód formájában kifejezve);
b) Az adó gyártóját, modelljét és - amikor rendelkezésre áll - a gyártási sorozatszámát;
c) A COSPAS-SARSAT típus engedélyezési számot;
COSPAS = A vészhelyzetben lévő hajók kutatási műholdas rendszere;
SARSAT = Kutatási és mentési műholdas automatikus pályakövetés.
d) A tulajdonos és járató nevét, címét (postai és e-mail) és kényszerhelyzeti telefonszámát;
e) Az olyan más kényszerhelyzeti kapcsolatok (kettő, ha lehetséges) nevét, címét (postai és e-mail) és telefonszámát, akiket a tulajdonos vagy az üzemeltető ismer;
f) A légijármű gyártóját és típusát; és
g) A légijármű színét.

1. Megjegyzés. - Különféle kódolási protokollok állnak az Államok rendelkezésére. Az elfogadott protokolloktól függően az Államok, saját belátásuk szerint beépíthetik az alábbiak egyikét, mint nyilvántartásba vett, kiegészítő azonosító információt:
a) A légijármű üzemeltető 'ügynökség' megnevezése és az üzemeltetők sorozatszáma; vagy
b) A légijármű 24-bites címzése; vagy
c) A légijármű 'nemzetisége' és lajstromozási jelzése.
A légijármű üzemeltető 'ügynökségének' megjelölését az üzemeltető részére az ICAO jelöli ki az Állam hatóságán keresztül és az üzemeltetők sorozatszámát az üzemeltető foglalja le a 0001-től a 4096-ig terjedő blokkból.

2. Megjegyzés. - Az Államok a saját belátásuk szerint az érvényben lévő megállapodásoktól függően beépíthetnek olyan nyilvántartásba veendő egyéb lényeges információkat is, mint például a lajstromozás utolsó dátuma, az akkumulátor 'lejárati dátuma' és az ELT elhelyezése a légijárművön (például: "elsődleges ELT" vagy "1.számú mentőtutaj").

5.2 A KUTATÓ ÉS MENTŐ KÉNYSZERHELYZETI HELYJELADÓ ADÓBERENDEZÉSEK (ELT) 121,5 MHz-ES RÉSZÉNEK ELŐÍRÁSAI

43

1. Megjegyzés. - A 121,5 MHz-es kényszerhelyzeti helyjeladók /ELT/ műszaki jellemzőire és üzemeltetési teljesítményére vonatkozó tájékoztatásokat az RTCA Dokumentum DO-183 és a Polgári Repülési Berendezések Európai Szervezete (EUROCAE) Dokumentum ED.62 tartalmazza.

2. Megjegyzés. - A 121,5 MHz-en üzemelő kényszerhelyzeti helyjeladó adóberendezések műszaki jellemzőit a Nemzetközi Távközlési Unió - Ajánlás M.690-1 /ITU-R Recommendation M.690-1/ foglalja magába. Egy kényszerhelyzeti helyjeladó /ELT/ ITU-meghatározása a Kényszerhelyzeti Helyzet - Jelző Rádió Helyjeladó (EPIRB).

5.2.1 Műszaki jellemzők

5.2.1.1 A kényszerhelyzeti helyjeladó adóberendezéseknek (ELT) a 121,5 MHz-es frekvencián kell üzemelni. A frekvencia tűrés nem haladhatja meg a plusz vagy mínusz 0,005 százalékot.
5.2.1.2 Egy ELT sugárzásának szabvány körülmények közötti és helyzetű antenna mellett függőlegesen polarizáltnak és a vízszintes síkban alapvetően körsugárzónak kell lenni.
5.2.1.3 48 órás folyamatos működési időtartam alatt és mínusz 20°C üzemelési hőmérséklet mellett a csúcs kisugárzott teljesítmény semmilyen esetben nem lehet 50 mW-nál kevesebb.
5.2.1.4 A sugárzás típusának A3X-nek kell lenni. Bármilyen más típusú modulációt, amely megfelel az alábbi 5.2.1.5, 5.2.1.6 és 5.2.1.7 pont követelményeinek, fel lehet használni, feltéve, hogy az nem fogja károsan befolyásolni a helyjeladónak a célkereső berendezés általi pontos hely-meghatározását.

Megjegyzés. – Néhány ELT fel van szerelve egy választható beszéd-átviteli képességgel (A3E) az A3X sugárzáshoz kiegészítőleg.

5.2.1.5 A vivőhullámnak amplitúdó-moduláltnak kell lenni, legalább 0,85-os modulációs tényezővel.
5.2.1.6 A vivőhullámra alkalmazott modulációnak minimum 33 százalékos kitöltési tényezővel kell rendelkezni.
5.2.1.7 A sugárzásnak megkülönböztető hangfrekvenciás jellemzővel kell rendelkezni, amelyet a vivőhullámnak az 1600 Hz - 300 Hz közötti tartományon belül nem kisebb, mint 700 Hz-es tartomány felett lefelé eltérített 2 Hz és 4 Hz közötti eltérítés ismétlési gyakoriságú hangfrekvenciás amplitúdó-moduláció valósít meg.
5.2.1.8 2000. január 1. után a sugárzásnak egy világosan meghatározott, a modulációs oldalsáv összetevőktől eltérő frekvencia- különbséget kell tartalmazni; nevezetesen, a teljesítménynek legalább a 30 százalékát kell ennek tartalmaznia, mindenkor a vivő- hullám plusz vagy mínusz 30 Hz-en belül a 121,5 MHz-en.

5.3 A KUTATÓ ÉS MENTŐ KÉNYSZERHELYZETI HELYJELADÓ ADÓBERENDEZÉSEK (ELT) 406 MHz-ES RÉSZÉNEK ELŐÍRÁSAI

5.3.1 Műszaki jellemzők

1. Megjegyzés. – A 406 MHz-es kényszerhelyzeti helyjeladóadó berendezések sugárzási jellemzőit az ITU-R M.633 tartalmazza.

2. Megjegyzés. – A 406 MHz-es kényszerhelyzeti helyjeladók /ELT/ műszaki jellemzőire és üzemeltetési teljesítményére vonatkozó tájékoztatásokat az RTCA Dokumentum DO-204 és a Polgári Repülési Berendezések Európai Szervezete (EUROCAE) Dokumentum ED.62 tartalmazza.

5.3.1.1 A kényszerhelyzeti helyjeladó adóberendezéseknek a 406,0 - 406,1 MHz-es frekvencia-sávban való használatra kijelölt frekvencia csatornák egyikén kell üzemelni.

44

Megjegyzés. - A COSPAS-SARSAT 406 MHz-es csatorna kijelölési tervet a COSPAS-SARSAT Dokumentum C/S T.012 tartalmazza.

5.3.1.2 Az adások közötti időtartamnak 50 másodperc plusz/mínusz 5 százaléknak kell lenni.
5.3.1.3 Egy 24 órás folyamatos működési időtartam alatt -20°C-os üzemelési hőmérséklet mellett az adó kimenő teljesítményének az 5 W plusz vagy mínusz 2 dB-es határértékeken belül kell lenni.
5.3.1.4 A 406 MHz-es ELT-nek képesnek kell lenni egy digitális közlemény továbbítására.

5.3.2 Adó azonosító kódolás

5.3.2.1 A 406 MHz-en üzemelő kényszerhelyzeti helyjeladó adóberendezésének kijelölt egyedülálló kóddal kell rendelkezni az adónak vagy annak a légijárműnek az azonosításához, amelyre fel van szerelve.
5.3.2.2 A kényszerhelyzeti helyjeladó adóberendezést vagy a légiközlekedési felhasználói protokollnak megfelelően, vagy egy, az ennek a fejezetnek az 1. Függelékében leírt soros műveletű felhasználói kódnak megfelelően kell kódolni, és az illetékes hatósággal „lajstromoztatni" kell.

AZ 5. FEJEZET 1. FÜGGELÉKE: KÉNYSZERHELYZETI HELYJELADÓ ADÓBERENDEZÉS KÓDOLÁS

(lásd az 5. Fejezet 5.3.2 pontját)

Megjegyzés. - A helyjeladó kódolásának részletes leírását az ITU-R Ajánlás M.633-1 tartalmazza. A következő információk a légiközlekedésben használatos jellegzetes kényszerhelyzeti helyjeladó adóberendezésekre vonatkoznak.

1. ÁLTALÁNOS

1.1 A 406 MHz-en üzemelő kényszerhelyzeti helyjeladó adóberendezés (ELT) rendelkezik azzal a képességgel, hogy egy olyan programozott digitális közleményt sugározzon, amely az ELT-re és/vagy arra a légijárműre vonatkozik, amelyre fel van szerelve.
1.2 Az ELT-nek egyedileg kódoltnak kell lenni az alábbi 1.3 pontban megadottaknak megfelelően, és az illetékes hatóság által 'lajstromozott' kell, hogy legyen.
1.3 Az ELT digitális közleményének tartalmaznia kell vagy az helyjeladó adóberendezés sorozat-számát, vagy a következő információ elemek egyikét:
a) A légijármű üzemeltető 'ügynökség' megnevezése és a sorozat-szám 0001-től 4096-ig;
b) A 24-bites légijármű címzés;
c) A légijármű nemzetisége és lajstromozási jelzések.
1.4 Az összes kényszerhelyzeti helyjeladó adóberendezésnek a COSPAS-SARSAT rendszerrel együttműködő rendszerűnek és típus-engedélyezettnek kell lenni.
COSPAS = A vészhelyzetben lévő hajók kutatási műholdas rendszere;
SARSAT = Kutatási és mentési műholdas automatikus pályakövetés.
Megjegyzés. - Az ELT jel sugárzási jellemzőit a gyártásnál felhasznált COSPAS-SARSAT Típus Alkalmassági Szabvánnyal (C-S T.007) lehet hitelesíteni.

2. A KÉNYSZERHELYZETI HELYJELADÓ ADÓBERENDEZÉS /ELT/ KÓDOLÁSA

2.1 Az ELT digitális közlemény tartalmazza a közlemény formátumra, a kódolási protokollra, az ország kódra és a fenti 1.3 pontban az információ-elemekben megadott azonosító adatok valamelyikére vonatkozó információkat.
2.2 Azoknál az ELT-knél, amelyek nem biztosítanak navigációs adatokat, az ITU-R Ajánlás M.633-1-ben leírt

45

rövid közlemény formátumot kell alkalmazni, az 1.-től a 112.-ig terjedő bitek felhasználásával.

2.3 Védett adat mező

2.3.1 A védett adat mezőt, ami a 25.bittől a 85.bitig tart, egy hiba-javító kóddal kell védeni, és ez annak a közleménynek a része kell, hogy legyen, aminek minden egyes vészhelyzeti ELT-ben egyedinek kell lenni.
2.3.2 A közlemény formátumjelzést, amelyet a 25.bit mutat, "0"-ra kell állítani a rövid közlemény formátum jelzésére, vagy "1"-re az olyan hosszú formátumú ELT-k jelzésére, amelyek képesek a helyzet adat biztosítására.
2.3.3 A protokoll jelzést az "1"-re állított 26.bitnek kell jelezni.
2.3.4 Az ország kódot, ami azt az Államot jelzi, ahol kiegészítő adatok állnak rendelkezésre arról a légijárműről, amely az ELT-vel el van látva, a 27.-től a 36.-ig terjedő bitek foglalják magukba, ezek adják meg a három-számjegyű decimális ország kód számot bináris számrendszerben kifejezve.

Megjegyzés. – Az ország kódok a Nemzetközi Távközlési Unió (ITU) ország kódjai, azok, amelyek az ITU Hívójelek és Számjegyes Azonosítók Jegyzéke I. Kötete I. Részének 4. táblázatában kerültek megadásra.

2.3.5 A 37.-től a 39.-ig terjedő bitek jelzik a felhasználói protokollok egyikét, ahol a "001" és a "011" értékek használatosak a légiközlekedésben, ahogy azt az ebben a Függelékben lévő példák bemutatják.
2.3.6 Az ELT digitális közleménynek magába kell foglalnia vagy az adó sorozat-számát, vagy a légijármű, illetve a járató azonosítóját a 40.-től a 83.-ig terjedő bitekben, ahogy az az alábbiakban bemutatásra kerül. Ezt az információt bináris számrendszerben kell kódolni a legkisebb helyi értékű bitekkel a jobb oldalon, vagy az 5-1. táblázatban bemutatott módosított Baudot kódot felhasználva.
2.3.7 A soros felhasználói protokollban (amelyet a 37.-től a 39.-ig terjedő bitekben "011"-ként jelöltek) a 40.-től a 42.-ig terjedő biteknek kell jelölni a helyjeladó típusát, ahol a:
- "000" azt jelzi, hogy az ELT sorozat-száma a 44.-től a 63.-ig terjedő bitekben van kódolva;
- "001" azt jelzi, hogy a légijármű üzemeltetője és a sorozat-szám a 44.-től a 61.-ig és a 62.-től a 73.-ig terjedő bitekben van kódolva külön külön;
- "011" azt jelzi, hogy a 24-bites légijármű címzés a 44.-től a 67.-ig terjedő bitekben van kódolva, és az ugyanazon a légijárművön lévő további ELT-k a 68.-tól a 73.-ig terjedő bitekben kódoltak.

Megjegyzés. - Az Államok fogják biztosítani azt, hogy az egyes olyan helyjeladók, amelyek az Állam ország kódjával vannak kódolva, egyedileg legyenek kódolva és lajstromozva egy adatbázisban. A sorosan kódolt helyjeladók egyedi kódolását elő lehet segíteni azzal, hogy a COSPAS-SARSAT Típus Alkalmassági Bizonyítvány számát építik be, ami egy, a COSPAS-SARSAT által kijelölt egyedi szám minden egyes jóváhagyott ELT modellre, az ELT közlemény részeként.

2.3.8 A légiközlekedési felhasználói protokollba (a 37.bittől a 39.bitig "001"-ként kijelölve), a légijármű nemzetiségi és lajstromozási jelét kell kódolni a 40.-től a 81.-ig terjedő bitekbe, az 5-1. táblázatban bemutatott módosított Baudot kódot használva, hét alfanumerikus karakterrel. Ezt az adatot pontosan kell indokolni azzal, hogy a módosított Baudot „szóköz” /üres jel/ ("100100") kerül alkalmazásra ott, ahol nincs karakter.
2.3.9 A 84. és 85. bitnek kell jeleznie bármilyen 'célra repülési' /rávezető/ adó meglétét, ami a kényszerhelyzeti helyjeladó adóberendezésbe beépítésre kerülhetett.
2.3.10 A szabvány és a nemzeti protokollokban minden azonosítási és helyi adatot bináris jelöléssel kell kódolni a lehető legkisebb helyiértékű bit-el.. A légijármű üzemeltetőjének 3 betűből álló azonosítóját 1 5 bit-el kell kódolni a módosított Baudot kód használatával (5-1 táblázat) csak a legnagyobb helyiértékű 5 bit-et betűnként és kihagyva azt a bit-et, amelyik 1 betű értéket képvisel.

5-1. táblázat. Módosított Baudot kód

2. Megjegyzés. – COSPAS-SARSAT Típus Alkalmassági Bizonyítvány szám bináris számokban, a legkisebb helyiértékű bittel a jobb oldalon vagy ország szerinti felhasználás.

3. Megjegyzés. – Sorszám, bináris számjegyekben, a legkisebb helyiértékű bittel a jobb oldalon, további ELT-k ugyanazon légijárművön, vagy 0-k, amikor csak egy ELT van felszerelve.

„B” Melléklet az I. Részhez: ÚTMUTATÓ ANYAG A VHF DIGITÁLIS KAPCSOLATOKHOZ (VDL)

1. ÚTMUTATÓ ANYAG A VHF DIGITÁLIS KAPCSOLATOKHOZ (VDL)

Megjegyzés. – A hivatkozott Szabványok és Ajánlott Gyakorlatokat (SARPs) az Annex 10, III. Kötet, I. Rész, 6. Fejezete tartalmazza.

2. RENDSZER LEÍRÁS

2.1 A VDL rendszer levegő-föld adat-összeköttetési kapcsolatot szolgáltat a Légiforgalmi Távközlési Hálózaton (ATN) belül. A VDL párhuzamosan üzemel a többi ATN levegő-föld alhálózatokkal.

2.2 A VDL földi állomások egy VHF rádióból és a VDL protokollt a fedési területen belül kezelni képes számítógépből áll. A VDL állomások összekapcsolhatósági lehetőséget nyújtanak egy földi telepítésű távközlési hálózaton keresztül (pl. X. 25 alapon) az ATN közbenső rendszerekkel, amelyek hozzáférést biztosítanak a földi telepítésű ATN végrendszerekhez.

2.3 A VDL földi állomásokkal való kommunikálás érdekében megkövetelt az, hogy a légijármű fel legyen szerelve VDL repülés-elektronikával, amely egy VHF rádiót és a VDL protokoll kezelésére képes számítógépet tartalmaz. A levegő-föld kommunikáció 25 kHz-es csatornákat használ a VHF légiforgalmi mozgó (útvonal) szolgáltatás sávban.

3. VDL alapelvek

3.1 Összeköttetési átviteli alapelvek

3.1.1 Az összekapcsolhatóságot az ATN végrendszerekben (ES) lévő alkalmazások között, amelyek a levegő-föld összeköttetéshez az ATN-t és ennek alrendszereit használják, beleértve a VDL-t is, az ezekben a végrendszerekben lévő átviteli réteg entitások szolgáltatják. A légijármű fedélzeti és földi végrendszerek közötti adat-továbbítási kapcsolatokat az ezeket szolgáltató precíz ATN közbenső rendszerek (IS) és VDL hálózati elemek vezérelt átalakításain keresztül tartják fenn.

3.1.2 Az ATN ES közötti adat-átviteli összeköttetések nincsenek egy meghatározott alrendszerhez hozzákötve és az ISO 8473 alhálózati protokoll adat egységek, amelyeket egy ES továbbít, bármely levegő-föld ATN kompatíbilis alhálózaton átvihetők (olyanokon, mint például a légiforgalmi mozgó műholdas szolgáltatás (AMSS) adatkapcsolat, SSR S-módú adatkapcsolat vagy VDL), amelyek kielégítik a szolgáltatás minőségi (QOS) követelményeit. Egy légijármű ES és egy földi ES közötti adat-átviteli összeköttetést addig kell fenntartani, amíg a légijármű IS és a földi IS között legalább egy olyan levegő-föld alrendszeri összekapcsolhatóság van, amelynek összeköttetése van a földi ES-sel. Az alhálózati összekapcsolhatóság maximalizálása érdekében a légijárművektől elvárják, hogy levegő-föld alhálózati összeköttetéseket tartsanak fel bármely alhálózaton (AMSS, S-mód vagy VDL) keresztül, amelyekkel kapcsolat réteg összekapcsolhatóság létesíthető.

3.1.3 A VDL alhálózat összekapcsolhatóságot biztosít a kapcsolt virtuális áramkör formájában a légijármű ISO 8208 adat terminál berendezés (DTE) entitások és a földi bázisú ATN közbenső rendszerek között. Azon tény következtében, hogy a VHF jelek csak rálátás vonali terjedéssel rendelkeznek, a repülést végrehajtó légijárműnek meg szükséges az, hogy rendszeresen kapcsolati összeköttetést létesítsen az új VDL földi állomásokkal, hogy a VHF fedésterületet fenntartsa. Egy légijármű DTE és egy földi DTE között létrehozott VDL virtuális áramkört olyan földi állomási vezérelt adatcserén keresztül tartják fenn, amelyen keresztül a földi DTE elérhető.

3.1.4 A VDL virtuális áramkörök felszabadíthatók, amikor a légijármű vagy földi IS olyan döntési helyzetet azonosít, amikor a virtuális áramkör a földi DTE-hez már nem szükséges, de ez csak akkor következhet be, ha egy másik VDL virtuális áramkör nyitva marad. A döntési helyzet olyan helyzet, ahol a lefedettségen kívül más megfontolások is befolyásolják az összeköttetés létrehozására vonatkozó döntést. Ilyen szituáció lehet például az, amikor egy légijármű különböző üzemeltetők által üzemeltetett földi állomások kijelölt üzemelési területén belül van és döntést kell hozni, hogy melyik üzemeltetővel létesítsen kapcsolatot. Az az eset, amikor egy légijármű két ország közötti határt keresztez, különös figyelmet igényel. Egy légijárműnek virtuális áramköri kapcsolatot kell létesítenie annak az államnak az IS-ében lévő DTE-hez, amelybe belép, mielőtt felszabadítaná az elhagyott ország IS-ében lévő DTE-vel létesített virtuális áramkört.

3.1.5 Az alhálózat kapcsolat fenntartás forgatókönyveit a B-1. ábra* mutatja be. Ha az államhatár egyes oldalain lévő földi állomások nem nyújtanak ISO 8208 összekapcsolhatósági lehetőséget a két államban lévő IS-ek DTE-inek, a határt keresztező légijárműnek kapcsolati összeköttetést kell létesíteni annak az országnak a területén lévő földi állomással, amelybe belép, mielőtt képes lenne ennek az államnak az IS-éhez virtuális áramkört létrehozni. Csak az új kapcsolati összeköttetés és a virtuális áramkör létrehozása után fogja a légijármű felszabadítani a virtuális áramkört az elhagyott ország IS-ének DTE-jével azon a kapcsolaton keresztül, amely hozzáférést biztosít ahhoz az IS-hez. Ha a VDL légiforgalmi állomások az államhatár mindkét oldalán összeköttetést nyújtanak a mindkét államban lévő IS-hez, a virtuális áramkörök cseréje ugyanazon kapcsolati összeköttetésen keresztül kell, hogy végbemenjen.

* Minden ábra jelen melléklet végén van elhelyezve.

3.2 VDL szolgáltatás minőség ATN útvonal kijelöléssel

3.2.1 A VDL rendszer levegő-föld kommunikációhoz való felhasználása a légijármű és a földi bázisú ATN közbenső rendszerek (IS) útvonal kijelölési döntéseitől függ. Ezek az IS-ek határozzák meg azokat a pályákat, amelyeket a levegő-föld kommunikációhoz használnak az átviteli végberendezések (ES) által kért szolgáltatás minőség értékek alapján.

3.2.2 A levegő-föld összeköttetések egyes végein lévő IS-eknek értelmezniük kell a kívánt QOS értéket és el kell dönteniük, hogy a rendelkezésre álló összeköttetések közül melyiket lehet a legjobban felhasználni. Nagyon fontos, hogy a QOS szint, amely a VDL kapcsolatot szolgáltatásnak érzékeli, olyan szintre beállított legyen, amely a valódi teljesítményének felel meg.

3.2.3 Azokban az esetekben, amelyekben a VDL az egyetlen adatkapcsolat, amellyel a légijármű el van látva, az összes kommunikációt VDL összekapcsoláson keresztül kell lebonyolítani és a QOS értékek, amelyeket az összeköttetés szolgáltat, nem zárhatják le a kommunikációt.

3.2.4 Más esetekben, amikor a légijármű más levegő-föld adatkapcsolatokkal is fel van szerelve (mint például AMSS és SSR S-mód), lehetséges a több egyidejű párhuzamos összekapcsolás többszörös alhálózaton keresztül. Ezekben az esetekben az egyes alhálózatok által szolgáltatott QOS értékeket úgy kell beállítani, hogy biztosítsák azt, hogy a VDL kapcsolatot a megfelelő helyen alkalmazzák.

3.2.5 Szükséges az, hogy koordináció történjen a légijármű üzemeltetők, a földi állomás üzemeltetők és a földi rendszer üzemeltetők között annak biztosítása érdekében, hogy a különböző alhálózatok között helyes egyensúly álljon be.

4. VDL FÖLDI ÁLLOMÁS HÁLÓZAT KONCEPCIÓ

4.1 Hozzáférés

4.1.1 A VDL földi állomás hozzáférést biztosít a légijárműnek a földi ATN IS-hez, felhasználva a VDL protokollt egy VHF csatornán keresztül.

4.2 A VDL földi állomás hálózat üzemeltetők intézményi ügyeit érintő általános kérdések

4.2.1 Egy ATS szolgáltatónak, amely a VDL-t légiforgalmi szolgálati (ATS) összeköttetésekre kívánja használni, biztosítania kell, hogy a VDL szolgáltatás rendelkezésre álljon. Az ATS szolgáltató vagy magát, a VDL földi állomás hálózatot tudja üzemeltetni, vagy gondoskodik arról, hogy a VDL állomásokat (vagy a VDL hálózatot) egy távközlési szolgáltatást nyújtó üzemeltesse. Valószínűnek látszik, hogy az egyes országok különféle intézkedéseket tesznek a VDL szolgáltatás biztosítására a légijárművek részére. A VDL üzemeltetést és megvalósítást körzeti szinten kell koordinálni, hogy a nemzetközi útvonalakon elfogadható üzemelést biztosítsanak.

4.2.2 A VDL földi állomás hálózat az ATS szolgáltatóhoz külső entitás általi használata az ATS szolgáltató és a

51

távközlési szolgáltatást nyújtó közötti szolgáltatási egyezmények tárgya. Ezek a szerződések rögzítik a két fél kötelezettségeit és különösen fontos, hogy meg legyen határozva benne a nyújtott szolgáltatások minősége, valamint a felhasználói interfész.
4.2.3 Valószínűnek látszik, hogy néhány VDL földi állomás hálózat üzemeltető használati díjat fog kivetni. A fizetésre kötelezettek vagy a légijármű üzemeltetők és/vagy az ATS szolgáltatók lesznek. Biztosítani kell azt, hogy a VDL használata megvalósítható legyen azoknak a légijármű üzemeltetőknek a számára, amelyek a VDL-t az ATS/AOC kommunikációkhoz akarják felhasználni.

4.3 VDL földi állomás berendezés

4.3.1 A VDL földi állomás egy VHF rádióból és egy számítógépből áll, amely egy különálló, vagy vele integrált számítógép lehet. A VHF rádióberendezés VHF-el kapcsolatos funkciója hasonló a légijárművekre felszereltekével.
4.3.2 A hálózati állapot figyelés előírása fontos elem a lehetséges legnagyobb mértékű rendelkezésre állás fenntartásában.

4.4 Földi állomás telepítése

4.4.1 A VHF terjedés rálátási egyenes vonalának korlátozása fontos tényező a földi állomások telepítésénél. Biztosítani kell, hogy a földi állomásokat olyan módon telepítsék, hogy fedést szolgáltassanak a kijelölt üzemelési fedésterület (DOC) felett.
4.4.2 A VDL-el szembeni fedési követelmények függnek azoktól az alkalmazásoktól, amelyekre a VDL üzemeltetést szánják. Ezek az alkalmazások például akkor funkcionálhatnak, amikor a légijármű útvonal-utazási magasságon, a közel-körzeti területen, vagy egy repülőtéren, a földön van.
4.4.3 Az útvonali fedést biztosítani lehet kis számú, nagy DOC-val rendelkező földi állomás felhasználásával (például a VHF jel hatótávolsága egy tengerszinten lévő állomástól egy 37000 láb magasságon lévő légijárműhöz közelítőleg 200 tengeri mérföld). Ebből következően valóban kívánatos az, hogy a lehető legkisebb számú földi állomást használják útvonali lefedésre, azért, hogy minimalizálják az egyidejű felfelé irányú kapcsolati átviteleket a földi állomásoktól, amelyek közlemény ütközést okozhatnak a VHF csatornán. Az útvonali lefedést korlátozó tényezők a terep rendelkezésre állás és egy földi állomástól más földi rendszerekhez vezető összeköttetési kapcsolat rendelkezésre állása.
4.4.4 A közel-körzeti terület fedés általában megköveteli földi állomások felszerelését minden olyan repülőtéren, ahol VDL operáció szükséges ahhoz, hogy a közel-körzeti területen fedést biztosítsanak.
4.4.5 Repülőtér felszíni kommunikációs fedést kell szolgáltatni egy földi állomás által a repülőtéren, azonban a repülőtér fizikai felépítése miatt lehetséges az, hogy nem lehet a teljes terület lefedését egyetlen állomással garantálni.

4.5 Földi állomás frekvencia műszaki kezelése

4.5.1 Annak a VHF csatornának a megválasztása, amelyen egy földi állomás üzemelni fog, attól a fedéstől függ, amelyen a szolgáltatást a földi állomástól megkövetelik. A fedést egy adott csatornán az ezen a csatornán üzemelő földi állomások egy együttese szolgáltatja és az ezen a csatornán zajló kommunikáció lefoglalja a csatornát a fedési területen lévő összes földi állomás részére.
4.5.2 A VHF beszéd kommunikációtól eltérően, a VDL kommunikációt nem lehet terjedésben csak országokon belülre korlátozni és az államok között koordináció szükséges a VDL frekvenciák elosztásában. A protokoll jellege viszont lehetővé teszi a frekvencia újra-felhasználását több, ugyanazon fedési területen belüli földi állomás részére, és ebből eredően a frekvencia kijelölésre vonatkozó rendszabályok nem ugyanazok, mint amik a beszéd-üzemű összeköttetésekre vonatkozók.
4.5.3 A vivőhullám érzékelő idő-osztásos hozzáférésű (CSMA) és az adathordozó hozzáférési vezérlő (MAC) protokoll réteg, amelyet a VDL-nél használnak, nem tudják kizárni a közlemény ütközéseket, ha egy frekvencia-csatornát használó állomások nem tudják venni más állomások továbbításait, ez a helyzet "rejtett adó" helyzetként ismert. A rejtett adók egyidejű átvitelekhez vezetnek, amelyek olyan jelenséget idézhetnek elő, hogy az egyik vagy mindkét átvitel megcélzott vevője a vett jelet nem tudja dekódolni.

52

4.5.4 Egy frekvenciát jelölnek ki az útvonal fedés biztosítására, és az összes útvonali állomást ezen a frekvencián való üzemelésre állítják be. Ahhoz, hogy minimalizálják a rejtett adók általi, CSMA környezetben történő szimultán átvitelek valószínűségét a csatornán, ezt a csatornát lehetőleg nem használják a közel-körzeti vagy a repülőtéri felszíni kommunikációkhoz, kivéve a nagyon kis csatorna terhelésű területeket.
4.5.5 A VDL-re vonatkozó SARP előírja egy közös jelzés csatorna (CSC) biztosítását, amelyen a hozzáférés a VDL szolgáltatáshoz garantált az összes területen, ahol a VDL 2-módú szolgáltatás rendelkezésre áll. Ez különösen fontos azoknál a repülőtereknél és a VDL útvonal lefedési zónák peremén, ahol a légijármű minden valószínűség szerint "kezdeti" VDL összekapcsolást hoz létre. Mivel az 1.-módú és a 2.-módú rádiófrekvenciás átvitel jellemzői nem kompatibilisek, a CSC nem használható 1.-módú kommunikációhoz. Nincs követelmény a CSC-re 1.-módú VDL-nél.

4.6 A földi állomás összeköttetése közbenső rendszerekkel

4.6.1 Ahhoz, hogy hozzáférést biztosítson azokhoz a földi rendszerekhez, amelyek össze vannak kötve a légiforgalmi távközlési hálózattal, a VDL földi állomásnak összekapcsolva kell lennie egy vagy több ATN IS-el. A VDL földi állomás rendeltetése az, hogy összekösse a légijárműveket a földi bázisú ATN-el, amelyen keresztül a kommunikáció a felszíni ATN ES-ekkel történik.
4.6.2 A földi bázisú ATN IS társítva lehet elhelyezve a VDL földi állomás számítógépben, amely esetben a VDL alhálózati virtuális áramkör ebben a számítógépben végződik. Ennek a felépítésnek hatása van arra a megkívánt cserére, amikor a légijármű VDL kapcsolatot hoz létre egy új földi állomással. Az egzakt csere attól függ, hogy a földi állomások külön IS-t tartalmaznak, vagy ugyanannak az elosztott közbenső rendszernek az elemei.
4.6.3 Ha az IS-t a VDL földi állomás nem tartalmazza, akkor azt a következő eszközök egyikével kapcsolják a földi állomáshoz:
a) széles területi hálózat (WAN);
b) helyi területi hálózat (LAN); és
c) célra rendelt összeköttetési vonal.
4.6.4 Mindegyik esetben annak érdekében, hogy összhangban legyen a Légiforgalmi Távközlési Hálózati Kézikönyv (ATN) (*Manual of the Aeronautical Telecommunication Network (ATN)*) (Doc 9578) kiadvánnyal, egy Nyílt Rendszerek Összekapcsolása (OSI) szolgáltatást biztosítson, amely kompatíbilis kapcsolat-orientált alhálózat szolgáltatás,a légijármű IS és a földi bázisú IS között, a VDL földi állomás számítógéptől megkövetelik, hogy terjessze ki a VDL virtuális áramkört a felszíni hálózaton vagy kapcsolaton keresztül.
4.6.5 Azért, hogy szimultán virtuális áramköröket szolgáltasson több felszíni IS-nek, a VDL földi állomás számítógépnek tartalmaznia kell egy VDL alhálózat entitást, amely képes a VDL alhálózat hibás kérésekben lévő címzéseket a földi bázisú hálózatban lévő címzésekbe konvertálni.

5. VDL LÉGIJÁRMŰ FEDÉLZETI ÜZEMELÉSI KONCEPCIÓ

5.1 Repüléselektronika

5.1.1 *VDL repüléselektronika.* Ahhoz, hogy egy VDL hálózatban üzemelni tudjon, a légijárműnek egy olyan repüléselektronikai rendszerrel felszereltnek kell lennie, amely a VDL alhálózat felhasználói (ISO 8208 DTE) funkciót szolgáltatja. A rendszer, amely ezt a funkciót szolgáltatja, az alhálózat felhasználói funkciókat a többi levegő-föld ATN kompatíbilis alhálózatnak is szolgáltatja azt, és a légijármű ATN közbenső rendszer funkció és következésképpen annak fejlesztése szükséges ahhoz, hogy ATN kommunikációt szolgáltasson a többszörös vég-rendszereknek vagy többszörös levegő-föld alhálózatokon keresztül.

5.2 VDL repüléselektronikai alkalmassági bizonyítvány

5.2.1 A VHF digitális rádió ugyancsak szolgáltathat két-oldalsávos amplitúdó-modulációs (DSB-AM) beszéd-üzemű képességet kényszerhelyzeti alátámasztásra a VHF rádióknak, amelyeket a beszéd-összeköttetésre használnak. Ebben az esetben szükség lenne demonstrálni, hogy a VDL VDR-funkcionalitása nem interferál a DSB-AM beszéd-funkcionalitással.
5.2.2 A VDL funkció a VHF digitális rádióban egy levegő-föld adatkapcsolat szolgáltatást nyújt a légijármű ATN

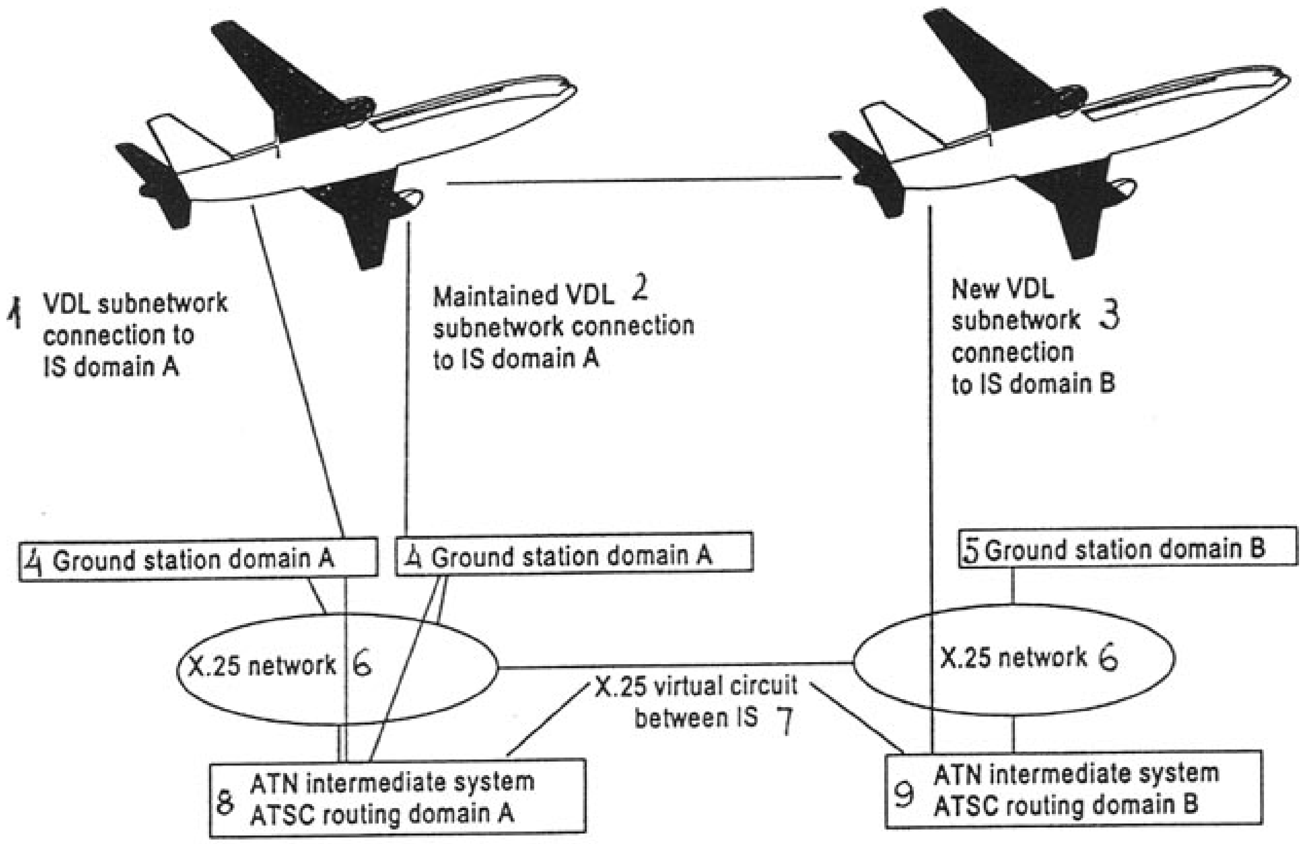
53

közbenső rendszer VDL alhálózat felhasználó entitásnak. Ha a VHF alhálózat szolgáltatás nyújtását egy ATN közbenső rendszer részére lényeges szolgáltatásnak tekintik, akkor egy adott telepítésnél, a VDL VDR-funkcionalitását lényeges funkciónak kell elismerni. A VDL használata az ATS kommunikációra azonban nem igényli két légijármű-rádió egyidejű üzemelését a VDL üzemmódban.

5.3 Légijármű regisztráció a VDL hálózat üzemeltetőknél

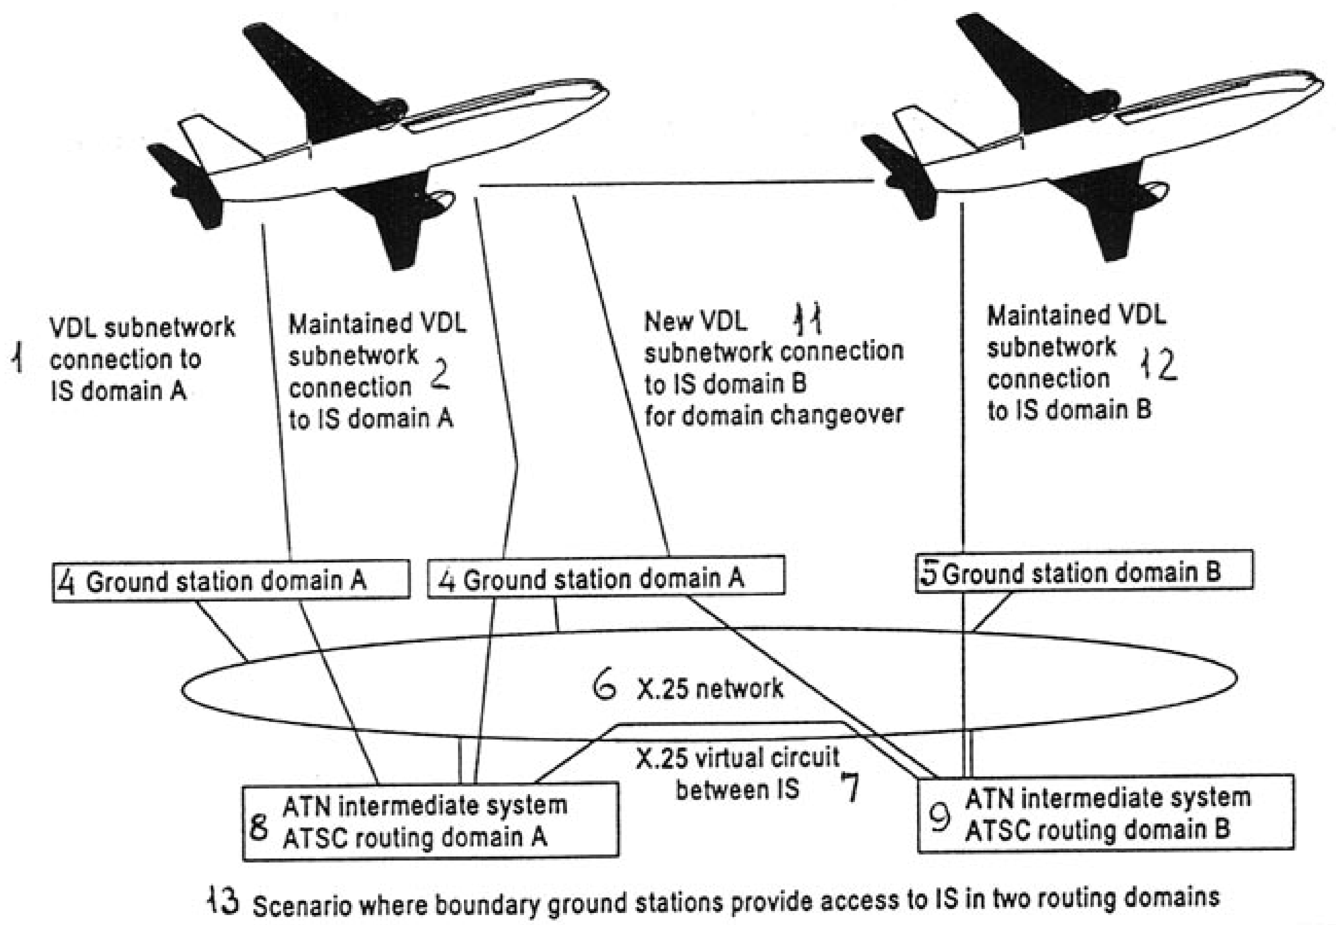
5.3.1 Normál összeköttetési szolgáltatásnál elvárható, hogy a légijármű üzemeltetőktől megköveteljék a légijárműveik regisztráltatását a hálózat üzemeltetőkkel. Vészhelyzetben, vagy "alátámasztási /tartalék/ szituációkban" bármely VDL-el felszerelt légijárműnek lehetőségének kell lennie kapcsolatot létrehozni bármely VDL földi állomás hálózaton keresztül.
5.3.2 A légijármű VDL állomások regisztráltatása VDL hálózat üzemeltetőkkel kívánatos a hálózat kezeléshez, mivel például egy hálózat üzemeltető felismerhet egy átmeneti meghibásodást a légijárműtől eredő kommunikációban, és érintkezésbe kívánna lépni a légijármű üzemeltetővel, hogy a hibát megoldják. A légijármű regisztráció hasznos a megkívánt állomás hálózat kapacitás megtervezésénél is. Egy VDL földi állomás hálózat üzemeltetővel való regisztráltatás nem szükségszerűen vonja maga után azt, hogy a légijármű üzemeltetőnek a VDL földi állomás hálózat használatáért fizetnie kell.

A „B" MELLÉKLET ÁBRÁJA



10 Scenario where boundary ground stations provide access to a single IS

54



B-1 ábra.

A B-1. ábra szövegei:
1 VDL alhálózat összeköttetés az IS-hez az A területen
2 Fenntartott VDL alhálózat összeköttetés az IS-hez az A területen
3 Új VDL alhálózat összeköttetés az IS-hez a B területen
4 Földi állomás az „A" területen
5 Földi állomás a „B" területen
6 X. 25 hálózat
7 X. 25 virtuális áramkör az IS-ek között
8 ATN közbenső rendszer az ATSC-útválasztó az A területen
9 ATN közbenső rendszer ATSC útválasztó a B területen
10 Forgatókönyv, ahol határállomások hozzáférést szolgáltatnak egy egyedülálló IS-hez
11 Új VDL alhálózat összeköttetés az IS-hez aB területen terület-váltásnál
12 Fenntartott VDL alhálózat összeköttetés az IS-hez a B területen
13 Forgatókönyv, ahol határállomások hozzáférést szolgáltatnak az IS-hez két útvonal-vezetésű területen

„A” Melléklet a II. Részhez: Útmutató anyag az összeköttetési rendszerekhez

1. VHF ÖSSZEKÖTTETÉS

1.1 A VHF összeköttetési berendezések hangfrekvenciás jellemzői

1.1.1 A légiforgalmi rádiótelefon szolgáltatások a rádiótelefon alkalmazásoknak egy speciális esetét képezik, amelyben a közlemény átvitelének követelménye oly módon érvényesül, hogy a hullámforma torzításmentessége másodrendű fontosságú, a hangsúly az alapértelem torzításmentességén van. Ez azt jelenti, hogy nem szükséges a hullámformának azokat a részeit átvinni, amelyek csupán az egyediséget, a hangsúlyozást és a kiemelést érintik.
1.1.2 A tényleges megengedhető sávszélességtől a 8,33 kHz-es berendezésnél megkövetelt, hogy legalább plusz / mínusz 3462 Hz legyen. Ez az érték általános esetre, azaz a levegő-föld összeköttetésekre vonatkozik, és a következőkből áll: a 2500 Hz-es hang- frekvenciás sávszélességből, a 685 Hz-es légijármű adó instabilitásból - egy 5 rész per millió - és a 137 Hz-es földi vevő instabilitásbó1- 1 rész per millió -, valamint a Doppler eltolódás miatti 140 Hz-ből (II. Rész 2.2.2.4 és 2.3.2.6 pont).

1.2 Frekvencia eltolásos vivőhullám rendszer

A következők példák azokra az eltolt vivőhullámú rendszerekre vonatkoznak, amelyek kielégítik a II. Rész, 2.2.1.1.1 pont követelményeit.
a) *Két-vivőhullámos rendszer.* A vivőhullámot plusz és mínusz 5 kHz-nél kell elhelyezni. Ez plusz vagy mínusz 2 kHz-es frekvencia stabilitást követel meg (15,3 rész per millió 130 MHz-nél).
b) *Három-vivőhullámos rendszer.* A vivőhullámokat a nullánál és a plusz és a mínusz 7,3 kHz-nél kell elhelyezni. Ez egy plusz vagy mínusz 0,65 kHz-es frekvencia stabilitást követel meg (5 rész per millió 130 MHz-nél).
A következő példák a négy-vivőhullámú és öt-vivőhullámú rendszerekre vonatkoznak, amelyek kielégítik a II. Rész, 2.2.1.1.1 pont követelményeit.
c) *Négy-vivőhullámos rendszer.* A vivőhullámokat a plusz és a mínusz 2,5 kHz-nél, valamint a plusz és a mínusz 7,5 kHz-nél kell elhelyezni. Ez plusz vagy mínusz 0,5 kHz-es frekvencia stabilitást követel meg (3,8 rész per millió 130 MHz-nél).
d) *Öt-vivőhullámos rendszer.* A vivőhullámokat a nullánál, a plusz és a mínusz 4 kHz-nél, valamint a plusz és a mínusz 8 kHz-nél kell elhelyezni. Egy plusz vagy mínusz 40 Hz-es nagyságrendű frekvencia stabilitás (0,3 rész per millió 130 MHz-nél) a követelményeknek egy elérhető és megvalósítható interpretációja ebben az esetben.

1. Megjegyzés. – A fentiekben hivatkozott vivőfrekvencia távolságok a kijelölt csatorna frekvenciára vonatkoznak.

2. Megjegyzés. – Azokban a légijármű vevőkben, amelyek vett vivőhullám-zajviszony mérést alkalmaznak a zaj-zár működtetésére, a két vagy több eltolású vivőfrekvencia vétele által okozott audio heterodineket zajként lehet értelmezni, és azt eredményezik, hogy az audio kimeneten a zaj-zár működését idézik elő még akkor is, amikor kielégítő megkívánt jel van. Annak érdekében, hogy a fedélzeti vevő rendszer megfeleljen a II. Rész 2.3.2.2 pontjába foglalt érzékenységre vonatkozó ajánlásoknak, a vevők tervezésénél szükség lehet annak biztosítására, hogy érzékenységüket magas szinten tartsák, amikor eltolt vivőfrekvenciás átviteleket vesznek. A zajzár működtetés vivőszintfüggő módosítása nem megfelelő megoldás erre a követelményre, a szintfüggő zajzár nyitási szint lehető legalacsonyabbra történő állítása javít a helyzeten.

1.3 A COM vevő rendszerek érzéketlenségi teljesítménye a VHF FM rádióadás interferencia jelenlétében

1.3.1 Hivatkozással a II. Rész 2.3.3.2 pontjának Megjegyzésére, a meghatározott érzéketlenségi paramétert a vevő rendszer normál vételi paramétereihez képesti romlásként kell definiálni és mérni, a megkívánt bemenő jel jelenléte esetén szabványos feltételek között. Ez a vevőállomás berendezéseinek rendszeresen ismételt

56

ellenőrzését teszi lehetővé és megkönnyíti annak minősítését. Megfelelő immunitási méréshez mínusz 87 dBm-es hasznos jel alkalmazható 1 kHz-es hang-frekvenciás modulációval 30 százalékos modulációs mélység mellett. A jel-zaj viszony nem eshet 6 dB alá akkor, amikor a II. Rész 2.3.3.1 és 2.3.3.2 pontjában meghatározott interferáló jeleket alkalmazzák. A műsorszóró sávbeli jeleket a 87,5 és a 107,9 MHz közötti intervallumban lévő frekvenciákból kell kiválasztani és egy reprezentatív rádióadás jellemző jellel kell modulálni.

1. Megjegyzés. – A mínusz 87 dBm-es jelszint együttesen 0 dB tápvonalveszteséget és antennanyereséget feltételez.

2. Megjegyzés. – A jel-zaj viszony fent idézett csökkentése a szabványosítás célját szolgálja, amikor azt ellenőrzik, hogy a vevőállomás berendezés a próbapadi méréseken kielégíti-e a megkövetelt érzéketlenséget. A frekvenciák tervezésében és az FM rádióadás interferenciától való védelem becslésében egy ennél nem kisebb, és sok esetben nagyobb értéket kell választani, amely függ az üzemelési körülményektől egyedi esetekben az interferencia becslések alapjaként.

2. SELCAL RENDSZER

2.1 Ennek az anyagnak az a célja, hogy a SELCAL rendszer működésére vonatkozó információt és útmutatást szolgáltasson. Ez kapcsolódik a II. Rész, 3. Fejezet által tartalmazott Ajánlott Gyakorlatokhoz.
1) *Funkció.* A SELCAL rendszer célja lehetővé tenni az egyes légijárművek szelektív hívását a földi állomást a légijárművel összekötő rádiótelefon csatornákon keresztül, és az a célja, hogy az útvonal-frekvenciákon üzemeljen a meglévő HF és VHF föld-levegő kommunikációs adókkal és vevőkkel, minimális elektromos és mechanikai módosítással. A föld-levegő kommunikációs kapcsolat normális működésének érintetlennek kell maradnia, kivéve az olyan időszakokat, mint például amikor a szelektív hívási funkciót kialakítják.
2) *Üzemelési alapelvek.* A szelektív hívást a földi adó kódolója hajtja végre, amely kódolt hang-impulzusok egy csoportját küldi a légijármű vevőnek és dekódolónak. A fedélzeti vevő és dekódoló berendezés egy indikátor segítségével képes a helyes kód vételére és értelmezésére, és az összes többi kód elutasítására véletlen zaj és interferencia jelenlétében. A kódoló berendezés földi része (földi szelektív hívó egység) szállítja a kódolt információt a föld-levegő adónak. A fedélzeti szelektív hívó egység az a speciális fedélzeti berendezés, amely a légijárművön meglévő kommunikációs vevővel üzemel, lehetővé téve a föld-levegő jelek dekódolását a jel indikátoron lévő kijelző számára. A jelzőeszközt úgy lehet választani, hogy illeszkedjen a felhasználó üzemelési követelményeihez és egy lámpából, egy csengőből, egy jelzőhang-adóból vagy ilyen jelző berendezések tetszőleges kombinációjából állhat.

VÉGE

ANNEX 10/IV.

Légiforgalmi távközlés: Légtérellenőrző radar és összeütközés-elhárító fedélzeti rendszerek

IV. kötet 4. kiadás – 2007. július
82. módosítással
A jelen kiadvány magába foglalja a Tanács által 2007. február 27-e előtt elfogadott minden módosítást, és 2007. november 22-től hatálytalanítja a 10. Annex IV. kötetének összes korábbi kiadásait.

A nemzetközi előírások és ajánlott gyakorlati eljárások alkalmazhatóságára vonatkozóan lásd az Előszót.

Nemzetközi Polgári Repülési Szervezet

Módosítások

A módosítások kiadásáról az ICAO Journal és az ICAO kiadványok valamint Audio-vizuális kiképzési segédanyagok katalógusának havi Kiegészítései rendszeres tájékoztatást biztosítanak. Kísérjék figyelemmel a fenti kiadványokat és a módosításokat az alábbi rovatokba vezessék be:

A módosítások és helyesbítések bejegyzése

Tartalomjegyzék

Előszó

Történelmi háttér

A repülési távközlésre vonatkozó nemzetközi előírásokat és ajánlott gyakorlati eljárásokat a Tanács először a Nemzetközi Polgári Légiközlekedési Egyezmény (1944. Chicago) 37. cikkelyének rendelkezései alapján 1949 május 30-án fogadta el és foglalta a 10. számú Annex-be. Az előírások 1950 március 1-én léptek hatályba. A nemzetközi előírások és ajánlott gyakorlati eljárások az Távközlési Részleg 1949 januári harmadik ülésének ajánlásain alapszanak.

A 10. Annex Hetedik Kiadását és az ezt megelőző kiadásokat egy kötetben adták ki, amely négy részt tartalmazott a hozzátartozó mellékletekkel együtt: I. Rész – Berendezések és rendszerek, II. Rész – Rádió frekvenciák, III. Rész – Eljárások, és IV. Rész – Kódok és rövidítések.

A 42. Módosítással a IV. Részt törölték az Annexből; az ebben a Részben szereplő kódokat és rövidítéseket egy új dokumentumba, a Doc 8400-ba vitték át.

A 44. Módosítás 1965 május 31-i elfogadásával a 10. Annex Hetedik Kiadását két kötettel helyettesítették: I. Kötet (Első Kiadás), amely az I. Rész – Berendezések és rendszerek és a II. Rész – Rádió frekvenciák részeket tartalmazza, és a II. Kötet (Első Kiadás), amely az Összeköttetési eljárásokat tartalmazza.

A 70. Módosítás 1995 március 20-i elfogadásával a 10. Annex-et öt kötetből állóra szerkesztették át: I. Kötet – Rádiónavigációs segédeszközök; II. Kötet – Összeköttetési eljárások; III. Kötet – Összeköttetési rendszerek; IV. Kötet – Légtérellenőrző radar és összeütközés-elhárító fedélzeti rendszerek; és V. Kötet – Repülési rádió frekvencia spektrum felhasználása. A 70. Módosítás alapján a III. és IV. Köteteket 1995-ben adták ki, és az V. Kötet kiadását a 71. Módosítással tervezték.

Az A. táblázat a 10. Annex, IV. Kötet módosításainak forrását, valamint a vonatkozó fontosabb témakörök rövid összefoglalását mutatja be a 70. Módosítást követően és megadja azokat a dátumokat, amelyeken az Annexet és a módosításokat a Tanács elfogadta, amikor azok érvénybe léptek illetve amikor alkalmazhatóvá váltak.

A Szerződő Államok tevékenysége

Az eltérések jelentése

Felhívjuk a szerződő államok figyelmét az Egyezmény 38. cikkelyéből adódó azon kötelezettségükre, hogy a szerződő állam értesítse a Szervezetet bármely eltérésről, amely saját nemzeti előírásai és gyakorlata illetve a jelen Annex nemzetközi előírásai és ennek bármely módosítása között van. Felkérjük továbbá a szerződő államokat, hogy az ilyen értesítést terjesszék ki valamennyi olyan eltérésre is, amely a jelen Annex-ben található ajánlott gyakorlati eljárásokat és ezek bármely módosítását érinti, amennyiben ezen eltérések a légiközlekedés biztonsága szempontjából lényegesek. Ezen felül kérjük, hogy a szerződő államok folyamatosan tájékoztassák a Szervezetet bármilyen jövőbeni eltérésről valamint a korábbiakban jelzett eltérés megszűnéséről. A jelen Annex minden egyes módosításának elfogadása után külön az eltérésekről szóló értesítést kérő levelet küldünk majd minden szerződő államnak.

Felhívjuk a szerződő államok figyelmét a 15. Annex rendelkezéseire, amelynek alapján saját nemzeti előírásaik és gyakorlatuk valamint a vonatkozó ICAO előírások és ajánlott gyakorlati eljárások közötti eltérésekről szóló tájékoztatásaikat az Egyezmény 38. cikkelyében előírt kötelezettségük mellett a Légiforgalmi Tájékoztató Szolgálat útján is tegyék közzé.

A tájékoztatások továbbítása és közzététele

A jelen Annex-ben ismertetett nemzetközi előírások és ajánlott gyakorlati eljárások alapján biztosított, a légijárművek üzemeltetését érintő létesítmények, szolgálatok és eljárások létrehozását illetve megszüntetését a 15. Annex előírásainak megfelelően jelentsék be.

Az Annex szövegének felhasználása a nemzeti szabályozásokban.

A Tanács 1948. április 13-án elfogadott egy határozatot, amely felhívja a Szerződő Államok figyelmét arra, hogy kívánatos saját nemzeti szabályozásaikban, amennyiben lehetséges, azoknak az ICAO előírásoknak a pontos nyelvezetét használni, amelyek szabályozó jellegűek; továbbá, hogy kívánatos a nemzetközi előírásoktól való eltérések közlése, beleértve bármely pótlólagos nemzeti szabályozásról adott tájékoztatást, amely fontos a légiközlekedés biztonsága és rendszeressége szempontjából. Ahol csak lehetséges volt, jelen Annex rendelkezései szándékosan olyan módon íródtak, hogy megkönnyítsék a nemzeti rendelkezésekbe a nagyobb szövegváltoztatások nélküli beillesztést.

Az Annex részeinek jogállása

Egy Annex a következő részekből áll, de nem feltétlenül szükséges, hogy minden rész megtalálható legyen minden egyes Annex-ben. Az egyes részek jogállása a következő:

1.— Az Annex anyaga:

a) *Nemzetközi előírások és ajánlott gyakorlati eljárások*, amelyeket az Egyezmény rendelkezései szerint a Tanács fogad el. Ezek meghatározása a következő:

Előírás vagy Szabvány: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amelynek egységes alkalmazását szükségesnek tartják a nemzetközi légiközlekedés biztonsága és menetrendszerű fenntartása érdekében, és amelynek az Egyezmény alapján a Szerződő Államok megfelelnek. Amennyiben a megfelelés nem lehetséges, az eltérést az Egyezmény 38. cikkelyében foglaltak alapján a Tanács felé jelenteniük kell.

Ajánlott gyakorlati eljárás: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amely egységes alkalmazását a nemzetközi légiközlekedés biztonsága, menetrendszerű és hatékony lebonyolítása érdekében, kívánatosnak értékelik és amelynek való megfelelésre a Szerződő Államok az Egyezmény értelmében törekszenek.

b) *Függelékek:* A célszerűség érdekében külön csoportosított anyagok, amelyek azonban a Tanács által elfogadott nemzetközi előírások és ajánlott gyakorlati eljárások szerves részét képezik.

c) *Meghatározások:* A nemzetközi előírásokban és ajánlott gyakorlati eljárásokban alkalmazott azon szakkifejezések pontos magyarázata, amelyek elfogadott szótári jelentés hiányában nem maguktól értetődőek. A meghatározás külön jogállással nem rendelkezik, azonban szerves részét képezi azon nemzetközi előírásnak vagy ajánlott gyakorlati eljárásnak, amelyben a szakkifejezés előfordul, mert a szakkifejezés értelmének megváltoztatása a követelményt befolyásolja.

d) *Táblázatok és ábrák:* Ezek egy nemzetközi előírást vagy ajánlott gyakorlati eljárást egészítenek ki vagy szemléltetnek, és amelyekre az adott nemzetközi előírásban vagy ajánlott gyakorlati eljárásban utalnak. A táblázatok és az ábrák az adott nemzetközi előírás vagy ajánlott gyakorlati eljárás részét képezik és jogállásuk ezekkel megegyező.

2.— A nemzetközi előírásokkal és ajánlott gyakorlati eljárásokkal együtt, a Tanács által kiadásra jóváhagyott egyéb anyagok:

a) *Előszó: A* Tanács tevékenységén alapuló történeti áttekintő és magyarázó anyagot tartalmaz, amely magában foglalja továbbá az államok nemzetközi előírások és gyakorlati eljárások alkalmazására vonatkozó, az Egyezményből és a Bevezetési Határozatból következő kötelezettségeinek magyarázatát is.
b) *Bevezető:* Az Annex egyes részeinek, fejezeteinek vagy bekezdéseinek elején található magyarázó anyag, amely segítséget nyújt a vonatkozó szöveg megértéséhez illetve alkalmazásához.

c) *Megjegyzések:* Szükség szerint a szövegbe iktatott anyag, amely tényszerű tájékoztatást vagy utalást tartalmaz a szóban forgó nemzetközi előírásra vagy ajánlott gyakorlati eljárásra vonatkozóan, azonban nem képezi ezek szerves részét.

d) *Mellékletek:* A nemzetközi előírást és ajánlott gyakorlati eljárást kiegészítő anyagot tartalmaznak, vagy azok alkalmazásához szükséges útmutatásként szolgálnak.

Felelősség elhárítás szabadalmakra vonatkozóan

Felhívjuk a figyelmet arra a lehetőségre, hogy ebben az Annexben a nemzetközi előírások és ajánlott gyakorlati eljárások bizonyos elemei szabadalmak vagy más szellemi tulajdonjog tárgyát képezhetik. Az ICAO-t nem lehet felelőssé tenni, ha ilyen jogokat nem ismer fel. Az ICAO nem foglal állást bejelentett szabadalmak vagy más szellemi tulajdonjog létezése, érvényessége, hatásköre vagy alkalmazhatósága vonatkozásában és nem vállal felelősséget azok vonatkozásában.

Az alkalmazandó nyelv kiválasztása

A jelen Annex-et négy nyelven — angol, francia, orosz és spanyol nyelven fogadták el. Minden egyes szerződő államot felkérünk, hogy ezek közül válasszon ki egy szöveget a nemzeti bevezetés céljára vagy egyéb, az egyezményben számításba vett célra akár az adott nyelv közvetlen felhasználásával, akár saját nemzeti nyelvére történő lefordításával, és erről értesítse a Szervezetet.

Szerkesztői gyakorlat

Annak érdekében, hogy minden egyes mondat jogállását az első pillantásra jelezhessük, az alábbi szerkesztői gyakorlatot követjük: A *nemzetközi előírásokat* vékony álló, az *ajánlott gyakorlati eljárásokat* vékony *dőlt* betűkkel nyomtatjuk. Ez utóbbiak jogállását ***"Ajánlás"*** előtaggal jelezzük. A *Megjegyzéseket* vékony dőlt betűvel nyomtatjuk és jogállásukat "*Megjegyzés* " előtaggal jelezzük.

Az írásmód szempontjából az angol szövegben az előírások esetén alkalmazott „shall" ige helyett a „kell" kifejezést, az ajánlott gyakorlati eljárások esetén alkalmazott "should" ige helyett a „szükséges" kifejezést használjuk.
Megjegyzés: a magyar fordítás alkalmával ezt a gyakorlatot nem minden esetben alkalmazzuk, mert a jelzett jogállás és a nyelvi sajátosságok ezt szükségtelenné teszik. Ha ez szükséges, a fordításban nyomatékos (kell) felszólító módot alkalmazunk.

A jelen kiadványban alkalmazott mértékegységek a nemzetközi polgári légiközlekedésről szóló Egyezmény 5. Annex előírásainak megfelelően a nemzetközi mértékegység rendszerrel /SI/ összhangban állnak. Ahol az 5. Annex lehetővé teszi a nem SI, alternatív mértékegységek alkalmazását, ott az alapegységet követően ezen mértékegységek zárójelben szerepelnek. Ahol az anyagban két mértékegység fajtát alkalmazunk, ott nem szabad azt feltételezni, hogy a mértékegységek értékei egyenlők és azok egymással felcserélhetők. Mindazonáltal lehetséges, hogy azonos biztonsági szint érhető el bármelyik mértékegység kizárólagos alkalmazásával.

A jelen kiadvány bármely, számmal és/vagy címmel azonosított részére történő hivatkozás vonatkozik az adott rész minden egyes pontjára is.

A. táblázat — A 10. Annex IV. kötetének módosításai

módosítás	*forrás(ok)*	*tárgy*	*elfogadva/ hatályos/ alkalmazható*
70	Léginavigációs Bizottság Másodlagos Légtérellenőrző Radar Tökéletesítési és Összeütközés-elhárító fedélzeti rendszerek Munkacsoport ötödik ülése	A IV. Kötet megalkotása, és a nemzetközi előírások és ajánlott gyakorlati eljárások és a vonatkozó útmutató anyagok bevezetése az összeütközés-elhárító fedélzeti rendszerre (ACAS) vonatkozóan.	1995. március 20. 1995. július 24. 1995. november 9.
71	Léginavigációs Bizottság Másodlagos Légtérellenőrző Radar Tökéletesítési és Összeütközés-elhárító fedélzeti rendszerek Munkacsoport (SICASP) negyedik és ötödik ülése	Az SSR S-módú levegő-föld adatkapcsolati rendszerre és az SSR válaszjeladók felszerelésére vonatkozó anyagok változásai.	1996. március12. 1996. július 15. 1996. november 7.

77 **(3. kiadás)**	Másodlagos Légtérellenőrző Radar Tökéletesítési és Összeütközés-elhárító fedélzeti rendszerek Munkacsoport (SICASP) hetedik ülése	SSR S-mód (2. és 3. fejezet); és ACAS (1. és 4. fejezet)	2002. február 27. 2002. július 15. 2002. november 28.
78-81	—	Nincs változás	—
82	Légtérellenőrző és Konfliktusmegoldási Rendszerek munkacsoport (SCRSP)	A Nemzetközi előírások és ajánlott gyakorlati eljárások (SARP-ok) naprakész állapotba hozása az ADS-B vonatkozásában	2007. február 26. 2007. július 16. 2007. november 22.

NEMZETKÖZI ELŐÍRÁSOK ÉS
AJÁNLOTT GYAKORLATI ELJÁRÁSOK

1. fejezet Meghatározások

1. Megjegyzés.— A "Nemzetközi Rádiószabályzat"-ra vonatkozó minden hivatkozás a Nemzetközi Távközlési Egyesület (ITU) által közzétett Nemzetközi Rádiószabályzatra vonatkozik. A Nemzetközi Rádiószabályzat időről időre módosításra kerül az általában két vagy három évenként megrendezésre kerülő Rádiótávközlési Világértekezletek záróközleményeiben kifejezett döntéseknek megfelelően. További információt a Nemzetközi Távközlési Egyesület /ITU/ eljárásairól, amelyek a légiforgalmi rádió-rendszerek frekvenciáinak felhasználására vonatkoznak, a Polgári Légiközlekedés Rádió Frekvencia Spektrum Követelmények kézikönyve tartalmaz, amely a jóváhagyott ICAO álláspontot is magába foglalja *(DOC 9718).*

2 Megjegyzés: — Az S-módú kiterjesztett squitter rendszer a Massachusetts Institute of Technology (MIT) Lincoln Laboratory által bejegyzett szabadalom. A MIT Lincoln Laboratory 1966. augusztus 22-én közleményt adott ki a Commerce Business Daily-ben (CBD), az Egyesült Államok Kormányának egyik kiadványában, amely szerint nem kívánja szabadalom tulajdonosi jogát érvényesíteni senki ellen a szabvány kereskedelmi vagy nem-kereskedelmi használatánál annak érdekében, hogy elősegítse az S-módú kiterjesztett squitter technológia lehető legszélesebb felhasználását. Továbbá az ICAO-hoz írott 1998. augusztus 27-én kelt levelében a MIT Lincoln Laboratory megerősítette, hogy a CBD közleményt azért adták ki, hogy kielégítsék a szabadalmi jogra vonatkozó nyilatkozattal szembeni ICAO követelményeket a nemzetközi előírásokban és ajánlott gyakorlati eljárásokban foglalt műszaki eljárásokra nézve,, és hogy a szabadalom tulajdonosai ezt a műszaki eljárást díjmentesen felajánlják bármilyen célú felhasználásra.

Airborne collision avoidance system (ACAS) – Összeütközés-elhárító fedélzeti rendszer
A másodlagos légtérellenőrző radar (SSR) válaszjeladó egysége jeleinek segítségével működő fedélzeti rendszer, amely a földi berendezésektől függetlenül működik és tájékoztatja a légijármű vezetőjét az SSR válaszjeladóval felszerelt, összeütközési veszélyt jelentő egyéb légijárművekről.

Megjegyzés. - A fent hivatkozottak azok az SSR válaszjeladók, amelyek C-módban vagy S-módban működnek.

Aircraft address – Légijármű címzés
Huszonnégy bit egyedi kombinációja, amely egy légijárműhöz való hozzárendelésre használható levegő-föld kommunikáció, navigáció és légtérellenőrzés céljára.

Megjegyzés. – SSR S-módú válaszjeladók kiterjesztett squittereket továbbítanak, hogy biztosítsák a légijármű származtatású helyzet sugárzását légtérellenőrzési célokból. Az ilyen típusú információ sugárzása a helymeghatározó rendszertől függő automatikus légtérellenőrzés (ADS) egy formája, amely ADS - adatsugárzásként (ADS-B) ismert.

Automatic dependent surveillance-broadcast (ADS-B) OUT – Adatsugárzás üzemmódban működő, helymeghatározó rendszertől függő automatikus légtérellenőrzés
Egy légijárművön vagy egy közlekedési eszközön, azok állapotvektorának (helyzet és sebesség) valamint a fedélzeti rendszerekről származó egyéb információknak az ADS-B IN képességgel rendelkező vevőkészülékek számára alkalmas formában történő időközönkénti sugárzására alkalmazott működési mód.

Automatic dependent surveillance-broadcast (ADS-B) IN - Adatvétel üzemmódban működő, helymeghatározó rendszertől függő automatikus légtérellenőrzés
Az ADS-B OUT adatforrásoktól kapott felderítési adatok vételére alkalmazott működési mód.

Collision avoidance logic - Összeütközés elhárító logika
Az ACAS alrendszere vagy része, amely analizálja a megközelítő- és a saját légijárműre vonatkozó adatokat, eldönti, hogy a tanácsadások alkalmasak-e vagy nem, ha igen, akkor a tanácsadásokat generálja. A következő feladatokat látja el: távolság- és tengerszint feletti magasság követés, veszélyérzékelés és megoldási tanácsadás (bólintási utasítás) létrehozás. Nem tartalmazza a felderítést.

Human Factors principles - Emberi tényező alapelvek
A tervezésre, tanúsításra, kiképzésre, üzemeltetésre és karbantartásra vonatkozó alapelvek, amelyek célja az emberi teljesítmény és teljesítőképesség tényezőinek átfogó és teljes mértékű figyelembevételével biztonságos kapcsolat kialakítása az ember és a rendszer egyes (műszaki) elemei között.

Secondary surveillance radar (SSR) - Másodlagos légtérellenőrző radar
Légtérellenőrző radar rendszer, amely adókat/vevőket (lekérdező) és válaszjeladókat használ.

Megjegyzés. - A lekérdezőkkel és válaszjeladókkal szembeni követelményeket a 3. fejezet tartalmazza.

Légtérellenőrző radar - Surveillance radar
A légijármű, távolság és azimut szerinti helyzetének meghatározására használatos radarberendezés.

Traffic information service – broadcast (TIS-B) IN - Adatvétel üzemmódban működő, légiforgalmi információs szolgáltatás
Egy felderítési megoldás a TIS-B OUT adatforrásoktól kapott felderítési adatok vételére és feldolgozására.

Traffic information service – broadcast (TIS-B) OUT – Adatsugárzás üzemmódban működő, légiforgalmi információs szolgáltatás
A földön telepített érzékelők által biztosított felderítési információk földről történő rendszeres időközönkénti sugárzására alkalmazott működési megoldás, amely az adatokat a TIS-B IN képességgel rendelkező vevőkészülékek számára alkalmas formában sugározza.

Megjegyzés: Ez a műszaki megoldás különböző adatkapcsolatokon keresztül érhető el. Az S módú kiterjesztett squitter-re vonatkozó követelményeket az Annex 10, IV kötet, 5. fejezete tartalmazza. A VHF-sávú digitális adatkapcsolat 4-es üzemmód és az általános hozzáférésű adóvevő (UAT) követelményeit az Annex 10, III. kötet, I. Rész tartalmazza.

2. fejezet Általános ismertetés

2.1 Másodlagos légtérellenőrző radar (SSR)

2.1.1 Amikor légiforgalmi szolgálatok berendezéseként egy másodlagos légtérellenőrző radart felállítanak és üzemben tartanak, annak meg kell felelnie a 3.1 pont szerinti rendelkezéseknek, hacsak a jelen 2.1 pontban nincs másképpen előírva.

Megjegyzés. – Ahogyan a jelen Annexben említést nyert, az A/C módú válaszjeladók azok, amelyek a 3.1.1 pontban leírt jellemzőknek megfelelnek. Az S-módú válaszjeladók azok, amelyek a 3.1.2 pontban *leírt jellemzőknek megfelelnek. Az A/C-módú válaszjeladók funkcionális képességei az S-módú válaszjeladók funkcionális képességeinek integrált részét képezik.*

2.1.2 Lekérdezési módok (föld-levegő)

2.1.2.1 A lekérdezést a légiforgalmi szolgálatoknál a 3.1.1.4.3 vagy 3.1.2 pontban leírt módokban kell végrehajtani. Az egyes módok használata a következő:

1) *A-mód* – válaszjeladó válaszokat kapni azonosítás és felderítés céljából.

2) *C-mód* –válaszjeladó válaszokat kapni automatikus nyomásmagasság átvitel és felderítés céljából.

3) *Inter (közös) mód –*

a) *A/C/S körhívás mód:* válaszokat kapni az A/C-módú válaszjeladók felderítése és az S-módú válaszjeladók begyűjtése céljából.

b) *Csak A/C körhívás mód*: válaszokat kapni az A/C válaszjeladók felderítése céljából. Az S-módú válaszjeladók nem válaszolnak.

4) *S-mód –*

a) *Csak S körhívás mód:* válaszokat kapni az S-módú válaszjeladók begyűjtése céljából

b) *Közvetítés:* információkat továbbítani az összes S-módú válaszjeladóhoz. Válaszokat nem kapnak.

c) *Szelektív:* az egyedi S-módú válaszjeladók felderítésére és az egyedi S-módú válaszjeladókkal való kommunikációra. Az egyes lekérdezésekre választ csak a lekérdezés által egyedileg megcímzett válaszjeladóktól kapnak.

1. Megjegyzés. – Az A/C-módú válaszjeladókat az S-módú lekérdezések elnyomják, és ezek nem válaszolnak.

2. Megjegyzés. – 25 lehetséges lekérdezési (fedélzetre irányuló adattovábbítás) formátum és 25 lehetséges S-módú válasz (fedélzetről leadott adattovábbítás) formátum van. A formátum meghatározásokat lásd a 3.1.2.3.2 pont, 3-7 és 3-8 ábrákon.

2.1.2.1.1 **Ajánlás.** – *Az igazgatásoknak a megfelelő nemzeti és nemzetközi hatóságokkal kell koordinálni a másodlagos légtérellenőrző radarrendszer azon megvalósítási szempontjait illetően, amelyek lehetővé teszik annak optimális használatát.*

Megjegyzés. – Hogy lehetővé tegyék azoknak a földi berendezéseknek a hatékony működését, amelyeket az egymáshoz közeli lekérdező berendezéseknek a légijármű válaszjeladó által adott nem-kívánt válaszaiból adódó zavarok kiküszöbölésére terveztek (aszinkron impulzus jelek elnyomására szolgáló berendezések), az Államoknak szüksége lehet koordinált tervek kialakítására az impulzus-ismétlődési frekvenciák (PRF) kijelölésére vonatkozóan a másodlagos légtérellenőrző radar lekérdező berendezésekhez.

2.1.2.1.2 A lekérdező azonosító (II) kódok kijelölése, ahol a repülési információs körzetek nemzetközi határain keresztül átlapoló lefedési területeken szükséges, körzeti léginavigációs egyezmények tárgyát kell, hogy képezze.

2.1.2.1.3 A légtérellenőrző azonosító (SI) kódok kijelölése, ahol az átlapoló lefedési területeken szükséges, körzeti léginavigációs egyezmények tárgyát kell, hogy képezze.

Megjegyzés. – Az SI kizárási eszköz nem használható, hacsak a fedési távolságon belül az összes S-módú válaszjeladó nincs erre a célra alkalmassá téve.

2.1.2.2 A-módú és C-módú lekérdezéseket biztosítani kell.

Megjegyzés. – Ezt a követelményt kielégíthetik azok a közös módú lekérdezések, amelyek A-módú és C-módú válaszokat váltanak ki A/C-módú válaszjeladóktól.

2.1.2.3 **Ajánlás. –** *Azokon a területeken, ahol a Légiforgalmi irányítási rendszer hatékonyságának növeléséhez korszerűsített légijármű azonosítás szükséges, az S-módú lehetőséggel bíró másodlagos légtérellenőrző radar földi berendezéseknek légijármű azonosító képességgel kell rendelkezniük.*

Megjegyzés. – Az S-módú adatkapcsolaton keresztül történő légijármű azonosítás jelentés biztosítja az alkalmasan felszerelt légijármű egyértelmű azonosítását.

2.1.2.4 Oldalszirom elnyomását szabályozó lekérdezés

2.1.2.4.1 Oldalszirom elnyomást a 3.1.1.4 és 3.1.1.5 pontok rendelkezéseivel összhangban kell biztosítani minden A-módú, C-módú és közös módú lekérdezésnél.

2.1.2.4.2 Oldalszirom elnyomást a 3.1.2.1.5.2.1 pont rendelkezéseivel összhangban kell biztosítani minden csak S körhívás módú lekérdezésnél.

2.1.3 Válaszjeladó válasz módok (levegő-föld)

2.1.3.1 A válaszjeladóknak az A-módú lekérdezésekre a 3.1.1.7.12.1 pont rendelkezéseinek megfelelően, a C-módú lekérdezésekre a 3.1.1.7.12.2 pont rendelkezéseinek megfelelően kell válaszolniuk.

Megjegyzés. – Ha nyomásmagasság információ nem áll rendelkezésre, a válaszjeladók a C-módú lekérdezésekre csak keretimpulzusokkal válaszolnak.

2.1.3.1.1 Az S-módú válaszokban foglalt nyomásmagasság jelentéseket a 3.1.1.7.12.2 pontban meghatározottak szerint kell származtatni.

Megjegyzés. – A 3.1.1.7.12.2 a C-módú válaszokra vonatkozik, és többek között megadja, hogy a C-módú nyomásmagasság jelentéseket az 1013,25 hektopascal szabványos nyomásbeállításra vonatkoztassák. A 2.1.3.1.1 pont szándékozik biztosítani, hogy ne csak a C-módú válaszjeladók, hanem az összes válaszjeladó korrigálatlan nyomásmagasságot jelentsen.

2.1.3.2 Ahol a C-módú automatikus nyomásmagasság továbbítási képesség szükségességét egy megadott légtéren belül megállapították, a válaszjeladóknak, amikor a szóban forgó légtéren belül kerülnek használatra, a C-módú lekérdezésekre nyomásmagasság kódolással kell válaszolniuk az információ impulzusokban.

2.1.3.2.1 1999. Január 1-jétől minden válaszjeladónak tekintet nélkül a légtérre, amelyben használni fogják, a C-módú lekérdezésekre nyomásmagasság információval kell válaszolnia.

Megjegyzés. – Az összeütközés-elhárító fedélzeti rendszer (ACAS) működése a veszélyeztető légijármű C-módú válaszaiban foglalt nyomásmagasság közlésétől függ.

2.1.3.2.2 **Ajánlás.** – *A 7,62 m (25 láb) vagy ennél jobb nyomásmagasság forrású légijárműveknél az S-módú válaszjeladók által a szelektív lekérdezésekre adott válaszban (azaz az AC mezőben, 3.1.2.6.5.4 pont) szolgáltatott nyomásmagasság információt 7,62 m (25 láb) növekményekben kell jelenteni.*

Megjegyzés. – Az ACAS teljesítménye jelentősen megnövekszik, ha egy veszélyeztető légijármű 7,62 m 25 láb) növekményekben jelenti a nyomásmagasságot.

2.1.3.2.3 Minden A/C-módú válaszjeladónak a nyomásmagasságot C-módú válaszokban, az információ impulzusokban kódolva kell jelentenie.

2.1.3.2.4 Minden S-módú válaszjeladónak a nyomásmagasságot C-módú válaszokban az információ impulzusokban kódolva, és az S-módú válaszok AC mezejében kell jelentenie.

2.1.3.2.5 Amikor egy S-módú válaszjeladó nem kap több nyomásmagasság információt a 7,62 m (25 láb) vagy annál jobb növekményt biztosító forrástól, akkor a jelentett magasság érték legyen azonos a légijármű nem-korrigált nyomásmagassága mért értékének 30,48 m (100 láb) növekményekben való kifejezéséből nyert értékével és a Q bit értékét (lásd 3.1.2.6.5.4 b)) 0-ra kell beállítani.

Megjegyzés. – Ez az előírás az S-módú válaszjeladó beépítésére és használatára vonatkozik. A cél annak biztosítása, hogy egy 30,48 m (100 láb) növekmény forrásból nyert magasság adatokat ne jelentsék a 7,62 m (25 láb) kifejezésű adatok számára szolgáló formátumok felhasználásával.

2.1.3.3 Azon válaszjeladóknak, amelyeket azon légtéren belül használnak, amelyre S-módú fedélzeti képesség szükségességét állapították meg, szintén válaszolniuk kell a közös módú és S-módú lekérdezésekre a 3.1.2 pont alkalmazható rendelkezéseivel összhangban.

2.1.3.3.1 A másodlagos légtérellenőrző radar S-módú válaszjeladók kötelező felszerelésére vonatkozó követelményeknek körzeti léginavigációs egyezményeken kell alapulniuk, amelyeknek meg kell határozniuk a légteret és a fedélzethez kapcsolódó megvalósítás időléptékét.

2.1.3.3.2 **Ajánlás.** – *A 2.1.3.3.1 pontban jelzett egyezményeknek biztosítaniuk kell a legalább öt évvel korábbi előzetes értesítés lehetőségét.*

2.1.4 A-módú válasz kódok (információ impulzusok)

2.1.4.1 Minden válaszjeladó legyen képes 4096, a 3.1.1.6.2 pontban megadott jellemzők szerinti válasz kód generálására.

2.1.4.1.1 **Ajánlás** – *A légiforgalmi szolgálatok hatóságai hozzák létre a másodlagos légtérellenőrző radar kódok kijelölési eljárásait a körzeti léginavigációs egyezményeknek megfelelően, figyelembe véve a rendszer többi felhasználóit is.*

Megjegyzés. – A másodlagos légtérellenőrző radar kódok kijelölésének alapelvei a Doc 4444, 8. fejezetében találhatók.

2.1.4.2 Különleges célokra az alábbi A-módú kódokat fenn kell tartani:

2.1.4.2.1 A 7700-as kódot a vészhelyzetben lévő légijármű felismerésének biztosításához.

2.1.4.2.2 A 7600-as kódot rádiókommunikáció meghibásodással rendelkező légijármű felismerésének biztosításához.

2.1.4.2.3 A 7500-as kódot a jogellenes beavatkozás alatt lévő légijármű felismerésének biztosításához.

2.1.4.3 A földi dekódoló berendezések esetén megfelelően biztosítani kell, hogy az A-módú 7500-as, 7600-as és 7700-as kódokat azonnal felismerjék.

2.1.4.4 **Ajánlás**. – *A körzeti egyezménytől függően az A-módú 0000 kódot általános célú kódként való kijelölésre kell fenntartani.*

2.1.4.5 Az A-módú 2000-es kódot olyan légijármű felismerésére kell fenntartani, amely a légiforgalmi irányító egységtől nem kapott utasítást a válaszjeladó működtetésére.

2.1.5 Az S-módú fedélzeti berendezés képességei

2.1.5.1 Minden S-módú válaszjeladó az alábbi öt szint egyikének feleljen meg:

2.1.5.1.1 Szint 1 – az 1. szintű válaszjeladók rendelkezzenek a következőkhöz előírt képességekkel:

a) A-módú azonosság és C-módú nyomásmagasság közlés (3.1.1 pont);

b) közös módú és S-módú körhívás tranzakciók (3.1.2.5 pont);

c) címzett felderítési magasság és azonosság tranzakciók (3.1.2.6.1, 3.1.2.6.3, 3.1.2.6.5 és 3.1.2.6.7 pontok);

d) kizárás protokollok (3.1.2.6.9 pont);

e) alapvető adat protokollok, kivéve az adatkapcsolat képesség közlés (3.1.2.6.10 pont); és

f) levegő-levegő szolgáltatás és squitter tranzakciók (3.1.2.8 pont).

Megjegyzés. – Az 1. szint lehetővé teszi a másodlagos légtérellenőrző radarral történő felderítést, a nyomásmagasság közlés és az A-módú azonosítási kód alapján. A másodlagos légtérellenőrző radar S-módú környezetében, az S-módú szelektív légijármű lekérdezés miatt, az A/C-módú válaszjeladóra vonatkozóan tökéletesítették a műszaki teljesítőképességet .

2.1.5.1.2 Szint 2 – a 2. szintű válaszjeladók rendelkezzenek a 2.1.5.1.1 pont szerinti képességekkel, és rendelkezzenek a következőkhöz előírt képességekkel is:

a) szabványos hosszúságú kommunikáció (Comm-A és Comm-B) (3.1.2.6.2, 3.1.2.6.4, 3.1.2.6.6, 3.1.2.6.8 és 3.1.2.6.11 pontok);

b) adatkapcsolat képességének közlése (3.1.2.6.10.2.2 pont); és

c) légijármű azonosítás közlés (3.1.2.9 pont).

Megjegyzés. – A 2. szint lehetővé teszi a légijármű azonosítás közlést és más szabványos hosszúságú adatkapcsolat kommunikációt a földről a levegőbe és levegőből a földre. A légijármű azonosítás közlés képesség egy illesztő egységet és megfelelő bemeneti eszközt igényel.

2.1.5.1.3 Szint 3 – a 3. szintű válaszjeladók rendelkezzenek a 2.1.5.1.2 pont szerinti képességekkel, és rendelkezzenek azokkal is, amelyek föld-levegő kiterjesztett hosszúságú közlemény (ELM) kommunikációhoz vannak előírva (3.1.2.7.1-től 3.1.2.7.5-ig pontok).

Megjegyzés. – A 3. szint lehetővé teszi a kiterjesztett hosszúságú adatkapcsolat kommunikációt a földről a levegőbe és így biztosíthatja a visszakeresést földi adattárakból, és más légiforgalmi szolgáltatások fogadását, amelyek a 2. szintű válaszjeladóknál nem állnak rendelkezésre.

2.1.5.1.4 Szint 4 – a 4. szintű válaszjeladók rendelkezzenek a 2.1.5.1.3 pont szerinti képességekkel, és rendelkezzenek azokkal is, amelyek levegő-föld kiterjesztett hosszúságú közlemény (ELM) kommunikációhoz vannak előírva (3.1.2.7.7 és 3.1.2.7.8 pontok).

Megjegyzés. – A 4. szint lehetővé teszi a kiterjesztett hosszúságú adatkapcsolat kommunikációt a levegőből a földre és így hozzáférést biztosíthat a földről a fedélzeti adatforrásokhoz és más adatok átviteléhez, amelyeket a légiforgalmi szolgálatok igényelnek és amelyek a 2. szintű válaszjeladóknál nem állnak rendelkezésre.

2.1.5.1.5 Szint 5 – az 5. szintű válaszjeladók rendelkezzenek a 2.1.5.1.4 pont szerinti képességekkel, és azokkal is, amelyek megnövelt Comm-B és kiterjesztett hosszúságú közlemény (ELM) kommunikációhoz vannak előírva (3.1.2.6.11.3.4, 3.1.2.7.6 és 3.1.2.7.9 pontok).

Megjegyzés. – Az 5. szint lehetővé teszi a Comm-B és kiterjesztett hosszúságú adatkapcsolat kommunikációt több lekérdezővel anélkül, hogy többszörös telephely igénye lenne. Az ilyen szintű válaszjeladó magasabb adatkapcsolati kapacitás minimummal rendelkezik, mint más válaszjeladó szintek.

2.1.5.1.6 *Kiterjesztett squitter – A* kiterjesztett squitter válaszjeladók rendelkezzenek:
- a 2.1.5.1.2, 2.1.5.1.3, 2.1.5.1.4 vagy 2.1.5.1.5 pontokban előírt képességekkel;
- a kiterjesztett squitter üzemeléshez előírt képességekkel (3.1.2.8.6);
- és az ACAS keresztkapcsolati működési módra előírt képességekkel (3.1.2.8.3 és 3.1.2.8.4).

Az ilyen képességekkel rendelkező válaszjeladókat az “e” utótaggal kell megjelölni.

Megjegyzés. – Például egy kiterjesztett squitter képességgel rendelkező 4. szintű válaszjeladót "4.e szint"-tel kell jelölni.

2.1.5.1.7 *SI képesség* – SI kódok feldolgozására képes válaszjeladóknak a 2.1.5.1.2, 2.1.5.1.3, 2.1.5.1.4 vagy 2.1.5.1.5 pontokban ismertetett, valamint az SI kód üzemelésre előírt (3.1.2.3.2.1.4, 3.1.2.5.2.1, 3.1.2.6.1.3, 3.1.2.6.1.4.1, 3.1.2.6.9.1.1 és 3.1.2.6.9.2) képességekkel kell rendelkezniük. Az ilyen képességgel rendelkező válaszjeladókat az "s" utótaggal kell megjelölni.

Megjegyzés. – Például egy kiterjesztett squitter képességgel és SI képességgel rendelkező 4. szintű válaszjeladót "4-es szint"-tel kell jelölni.

2.1.5.1.7.1 SI kód képességgel kell ellátni a 2.1.5.1.7 pont előírásainak megfelelően az összes 2003. január 1-jén vagy azután felszerelt S-módú válaszjeladót, és 2005. január 1-jéig az összes S-módú válaszjeladót.

Megjegyzés. – Egyes Államok rendelkezései az alkalmazhatóságot ennél a dátumnál előbb megkövetelhetik.

2.1.5.1.8 V*álaszjeladóval nem azonos kiterjesztett squitter eszközök.* Azok az eszközök, amelyek kiterjesztett squitter-ek sugárzására képesek, és nem részei egy S-módú válaszjeladónak, feleljenek meg az 1090 MHz RF térbeli jelekre vonatkozó összes követelménynek, amelyek egy S-módú válaszjeladóra vannak megadva, az 5.1.1 pontban meghatározott azonosított berendezés osztályra vonatkozó adási teljesítmény szintek kivételével.

2.1.5.2 Minden, a nemzetközi polgári légiforgalom által használt S-módú válaszjeladó feleljen meg legalább a 2.1.5.1.2 pontban előírt 2. szint követelményeinek.

1. Megjegyzés. – Az 1. szint használata megengedett lehet valamelyik Államon belül vagy egy körzeti léginavigációs egyezmény kitételein belül. Az S-módú 1. szintű válaszjeladó a tulajdonságok minimális együttesére szorítkozik az S-módú válaszjeladók másodlagos légtérellenőrző radar S-módú lekérdezőkkel megegyező működésénél. Ez a meghatározás azért szükséges, hogy megakadályozzák a 2. szint alatti válaszjeladó típusok elszaporodását, amelyek nem illeszthetők a másodlagos légtérellenőrző radar S-módú lekérdezőihez.

2. Megjegyzés. – A 2. szintű képességre vonatkozó követelmény szándéka az, hogy biztosítsa egy ICAO szabvány szerinti válaszjeladó képesség széleskörű felhasználását, ami lehetővé teszi az S-módú földi berendezések és szolgálatok tervezését világszerte. A követelmény azon kívül visszatartó erőt képvisel az 1. szintű válaszjeladók kezdetiként történő felszerelésével szemben, amelyeket elavulttá tesznek bizonyos légtérre vonatkozó későbbi követelmények, amelyek ott 2. szintű képességekkel bíró válaszjeladók kötelező felszerelését írják elő.

2.1.5.3 Az 5700 kg bruttó tömeget meghaladó, vagy a 463 km/óra (250 csomó) tényleges utazósebességet meghaladó képességű légijárművekre szerelt S-módú válaszjeladóknak a 3.1.2.10.4 pontban előírtaknak megfelelő antenna eltéréssel kell működniük, ha:

a) a légijármű egyedi légialkalmassági bizonyítványát első ízben 1990. január 1-jén vagy azután adták ki; vagy

b) S-módú válaszjeladó fedélzeti felszerelését körzeti léginavigációs egyezmény alapján a 2.1.3.3.1 és 2.1.3.3.2 pontoknak megfelelően követelik meg.

Megjegyzés. – 324 km/h (175 csomó) sebességet meghaladó maximális tényleges utazósebességű légijárművek számára előírt, hogy 21,0 dBW-nál nem kisebb csúcsteljesítménnyel üzemeljenek, ahogyan azt a 3.1.210.2 c) pontban meghatározták.

2.1.5.4 Képesség közlés S-módú squitter-ek esetén

2.1.5.4.1 S-módú adatgyűjtő squitter (kérés nélküli fedélzetről leadott sugárzás) esetén, a 3.1.2.8.5.1 pont rendelkezéseivel összhangban kell biztosítani a képesség közlést minden 1995. január 1-jén vagy ezután felszerelt S-módú válaszjeladó számára.

2.1.5.4.2 **Ajánlás. –** *Kiterjesztett squitter üzemelésre kialakított válaszjeladók rendelkezzenek olyan lehetőséggel, hogy az adatgyűjtő squitter-eket üzemen kívül helyezzék, amikor a kiterjesztett squitter-ek kerülnek sugárzásra.*

Megjegyzés. – Ez megkönnyíti az adatgyűjtő squitter-ek elnyomását, ha az összes ACAS egységet átalakították a kiterjesztett squitter vételére.

2.1.5.5 Kiterjesztett hosszúságú közlemény (ELM) sugárzási teljesítménye

Annak érdekében, hogy megkönnyítsék a meglévő S-módú válaszjeladók olyan átalakítását, hogy a teljes S-mód képességet magukban foglalják, az eredetileg 1999. január 1-je előtt gyártott válaszjeladóknak lehetővé kell tenniük 16 ELM szegmensből álló köteg sugárzását 20 dBW minimális teljesítmény szinten.

Megjegyzés. – Ez 1 dB engedményt jelent a 3.1.2.10.2 pontban megadott teljesítmény előíráshoz képest.

2.1.6 SSR S-módú címzés (légijármű címzés)

A másodlagos légtérellenőrző radar S-módú címzése a 16 777 214 huszonnégy-bites légijármű címek egyike, amelyet az ICAO a Lajstromozó Államnak, vagy a közös jel regisztráló hatóságnak osztott ki és a 3.1.2.4.1.2.3.1.1 pontban és a 10. Annex III. kötet, I. rész, 9. fejezet Függelékében leírtaknak megfelelően kijelölt.

2.2 Emberi tényezőkre vonatkozó meggondolások

Ajánlás. – *Az emberi tényezők alapelveit a légtérellenőrző radar és összeütközés-elhárító fedélzeti rendszerek tervezésénél és tanúsításánál figyelembe kell venni.*

Megjegyzés. – Az emberi tényezők alapelveire vonatkozó útmutató anyag a Doc 9683-ban, Emberi tényezők oktatási kézikönyv (Human Factors Training Manual) *és a Circular 249-ben* (Emberi tényezőkre vonatkozó tömör kivonat 11. szám – Emberi tényezők a CNS/ATM rendszerekben) (Human Factors Digest No. 11 – Human Factors in CNS/ATM Systems) *kiadványokban található.*

3. fejezet Légtérellenőrző radarrendszerek

3.1 Másodlagos légtérellenőrző radar (SSR) rendszer jellemzők

1. Megjegyzés. – A 3.1.1 szakasz csak azoknak a másodlagos radar rendszereknek a műszaki jellemzőit írja elő, amelyek A-módú és C-módú képességekkel rendelkeznek. Az S-módú képességekkel rendelkező rendszer jellemzőit a 3.1.2 szakasz írja elő. Az 5. fejezet kiegészítő követelményeket tartalmaz az S-módú kiterjesztett squitter műveletekre.

2 Megjegyzés. – S-módú képességeket használó rendszereket általában légiforgalmi irányítási légtérellenőrző rendszereknél használnak. Ezen kívül, bizonyos ATC alkalmazások használhatnak S-módú kisugárzókat, pl. jármű földi felderítésére, vagy rögzített céltárgy észlelésére alkalmas légtérellenőrző rendszereken. Ilyen különleges feltételek között a "légijármű" fogalom alatt "légijármű vagy jármű (A/V)" érthető. Míg ezek az alkalmazások az adatok korlátolt halmazára használhatók, a szabványos fizikai jellemzőktől való eltéréseket az illetékes hatóságoknak nagyon óvatosan kell kezelniük. Nemcsak a saját felderítési (SSR) környezetüket kell figyelembe venniük, hanem más rendszerekre, mint például az ACAS, gyakorolt lehetséges hatásokat is.

3. Megjegyzés. – A szabványostól eltérő nemzetközi alternatív egységeket az 5. Annex, 3. fejezet, 3.2.2 pontjában engedélyezettek szerint használják.

3.1.1 Csak A-módú és C-módú képességekkel rendelkező rendszerek

1. Megjegyzés. – Ebben a szakaszban a másodlagos légtérellenőrző radar üzemmódokat A és C betűkkel jelöljük. Az indexszel ellátott betűket, pl. A_2, C_4, a levegő-föld impulzussorozatokban lévő egyes impulzusok jelölésére használják. A betűknek ezt a közös használatát nem úgy kell értelmezni, mint módok és kódok valamilyen konkrét összetársítását.

2. Megjegyzés. – A radar adatok rögzítésére és megőrzésére vonatkozó rendelkezéseket a 11. Annex 6. fejezete tartalmazza.

3.1.1.1 Lekérdezési és vezérlési (lekérdezési oldalszirom elnyomás) rádió frekvenciák (föld-levegő)

3.1.1.1.1 A lekérdezési és vezérlési sugárzási vivőfrekvencia 1030 MHz.

3.1.1.1.2 A frekvencia tűrés plusz vagy mínusz 0,2 MHz legyen.

3.1.1.1.3 A vezérlési átvitel és a lekérdezési impulzus átvitelek vivő frekvenciái egymástól nem különbözhetnek 0,2 MHz-nél nagyobb értékkel.

3.1.1.2 Válaszvivő frekvencia (levegő-föld)

3.1.1.2.1 A válasz átvitel vivő frekvenciája 1090 MHz legyen.

3.1.1.2.2 A frekvenciatűrés plusz vagy mínusz 3 MHz legyen.

3.1.1.3 Polarizáció

3.1.1.3.1 A lekérdezés, vezérlés és válasz átvitelek polarizációja túlnyomóan függőleges.

3.1.1.4 Lekérdezési módok (térbeli jelek)

3.1.1.4.1 A lekérdezés két, P_1 és P_3-al jelölt, továbbított impulzusból áll. Az első P_1 lekérdezési impulzust követően egy P_2 vezérlő impulzust kell átvinni.

3.1.1.4.2 Az A- és C-módú lekérdezés a 3.1.1.4.3 pontban meghatározottaknak feleljen meg.

3.1.1.4.3 A P_1 és P_3 közötti időköz határozza meg a lekérdezési módot a következők szerint:

A-mód	8 ± 0,2 mikromásodperc
C-mód	21 ± 0,2 mikromásodperc

3.1.1.4.4 A P_1 és P_2 közötti időköz 2,0 plusz, vagy mínusz 0,15 mikromásodperc legyen.

3.1.1.4.5 A P_1, P_2 és P_3 impulzusok időtartama 0,8 plusz vagy mínusz 0,1 mikromásodperc legyen.

3.1.1.4.6 A P_1, P_2 és P_3 impulzusok felfutási ideje 0,05 és 0,1 mikromásodperc között legyen.

1. Megjegyzés. – A meghatározásokat a 3-1 ábra "Másodlagos légtérellenőrző radar hullámforma alakjainak, időközeinek és az érzékenységi és teljesítmény referencia pontjainak meghatározása" tartalmazza.

2. Megjegyzés. – A felfutási idő alsó korlátjának (0,05 mikromásodperc) szerepe az oldalsáv sugárzás csökkentése. A berendezések akkor teljesítik ezt a követelményt, ha az oldalsáv sugárzás nem nagyobb, mint az, amelyet egy megállapított felfutási idővel rendelkező, trapezoid formájú hullám elméletileg létrehozna.

3.1.1.4.7 A P_1, P_2 és P_3 impulzus lefutási ideje 0,05 és 0,2 mikromásodperc között legyen.

Megjegyzés. – A lefutási idő alsó korlátjának (0,05 mikromásodperc) szándéka az oldalsáv sugárzás csökkentése. A berendezések kielégítik ezt a követelményt, ha az oldalsáv sugárzás nem nagyobb, mint az, amelyet egy megállapított lefutási idővel rendelkező trapezoid formájú hullám elméletileg létrehozna.

3.1.1.5 Lekérdező és vezérlő sugárzási jellemzők (Lekérdezés oldalszirom elnyomás – Térbeli jelek)

3.1.1.5.1 A P_2 sugárzott amplitúdója a válaszjeladó antennánál legyen:

a) egyenlő vagy nagyobb, mint a P_1 sugárzott amplitúdója a P_1-et sugárzó antenna oldalszirom sugárzásai következtében; és

b) a P_1 sugárzott amplitúdója alatt 9 dB-el alacsonyabb szinten a lekérdezés kívánt körívén belül.

3.1.1.5.2 Az irányított lekérdezés (sugárzási főirány) kívánt sugárnyaláb szélességén belül a P_3 sugárzott amplitúdójának a P_1 sugárzott amplitúdójának 1 dB értékén belül kell lennie.

3.1.1.6 Válaszsugárzási jellemzők (Térbeli jelek)

3.1.1.6.1 Keret impulzusok. A válasz feladat két keret impulzust magában foglaló, egymástól 20,3 mikromásodperc távolságra lévő jelet alkalmaz, mint legelemibb kódot.

3.1.1.6.2 Információ impulzusok. Az információ impulzusokat 1,45 mikromásodperces növekményekkel kell elválasztani az első keret impulzustól. Ezeknek az információ impulzusoknak a jelölése és helyzete a következő:

Impulzusok	Helyzet (mikromásodperc)
C_1	1,45
A_1	2,90
C_2	4,35
A_2	5,80
C_4	7,25
A_4	8,70
X	10,15
B_1	11,60
D_1	13,05
B_2	14,50
D_2	15,95
B_4	17,40
D_4	18,85

Megjegyzés. – Ezen impulzusok használatára vonatkozó előírást a 2.1.4.1 pont tartalmazza. Azonban az "X" impulzus helyzete csak műszaki előírásként szerepel, a lehetséges jövőbeni használat biztosítása érdekében.

3.1.1.6.3 *Különleges helyzetazonosítási impulzus (SPI).* A szolgáltatott információ impulzusokon kívül egy különleges helyzetazonosítási impulzust is továbbítani kell, de csak manuális (repülőgépvezetői) kiválasztás eredményeként. Amikor továbbítják, egy 4,35 mikromásodperces időközzel kell elválasztani, a csak A-módú válaszok utolsó keret impulzusától.

3.1.1.6.4 *Válasz impulzus alakok.* Minden válasz impulzusnak 0,45 plusz vagy mínusz 0,1 mikromásodperc hosszúságú impulzussal, 0,05 és 0,1 mikromásodperc közötti impulzus felfutási idővel, és 0,05 és 0,2 mikromásodperc közötti lefutási idővel kell rendelkeznie. Egy impulzus amplitúdó változása a válasz sorozatban lévő bármely más impulzushoz képest, nem haladhatja meg az 1 dB-t.

Megjegyzés. – A felfutási és lefutási idők alsó korlátjának (0,05 mikromásodperc) rendeltetése az oldalsáv sugárzás csökkentése. A berendezés kielégíti ezt a követelményt, ha az oldalsáv sugárzás nem nagyobb, mint az, amelyet elméletileg az adott felfutási és lefutási idővel rendelkező trapezoid hullám állítana elő.

3.1.1.6.5 *Válasz impulzus helyzet tűrései.* Az impulzustávolság tűrése az egyes impulzusoknál (beleértve az utolsó keret impulzust) a válasz csoport első keret impulzusához viszonyítva plusz vagy mínusz 0,10 mikromásodperc legyen. A különleges helyzetazonosítási impulzus impulzustávolság tűrése a válasz csoport utolsó keret impulzusához viszonyítva plusz vagy mínusz 0,10 mikromásodperc legyen. A válasz csoportban lévő bármely impulzus impulzustávolság tűrése bármely más impulzushoz viszonyítva (kivéve az első keret impulzust) nem haladhatja meg a plusz vagy mínusz 0,15 mikromásodpercet.

3.1.1.6.6 *Kód nomenklatúra.* A kód jelölés 0-tól 7-ig terjedő számjegyeket tartalmazzon, és a fenti 3.1.1.6.2 pontban megadott impulzus számok indexeinek összegét tartalmazza, a következők szerint alkalmazva:

Számjegy	*Impulzus csoport*
Első (legnagyobb helyértékű)	A
Második	B
Harmadik	C
Negyedik	D

3.1.1.7 Csak A-mód és C-mód képességgel rendelkező válaszjeladók műszaki jellemzői

3.1.1.7.1 *Válasz.* A válaszjeladó válaszoljon (nem kisebb, mint 90 százalékos indítással), ha az összes alábbi feltétel fennáll:

a) a P_3 vett amplitúdója meghaladja a P_1 vett amplitúdójánál 1 dB-el lejjebb lévő szintet, de nem nagyobb, mint a P_1 vett amplitúdója plusz 3 dB;

b) vagy nem vesznek impulzust a P1 utáni 1,3 mikromásodperc és 2,7 mikromásodperc közti időközben, vagy a P_1 több mint 9 dB-el meghalad bármely ebben az időközben vett impulzust;

c) egy megfelelő lekérdezés vett amplitúdója több mint 10 dB-el fölötte van a véletlen impulzusok vett amplitúdójának, ahol az utóbbiakat a válaszjeladó nem ismeri fel, mint a P_1, P_2 vagy P_3.

3.1.1.7.2 A válaszjeladó ne válaszoljon az alábbi körülmények között:

a) olyan lekérdezésekre, amikor a P_1 és P_3 közötti időköz több mint plusz vagy mínusz 1,0 mikromásodperccel különbözik a 3.1.1.4.3 pontban megadott időközöktől;

b) bármely olyan egyedülálló impulzus vétele után, amelynek nincsenek normál lekérdezési körülményeket megközelítő amplitúdó változásai.

3.1.1.7.3 *Holtidő.* Egy megfelelő lekérdezés felismerése után a válaszjeladó nem válaszolhat semmilyen más lekérdezésre, legalább a válasz impulzus sorozat időtartama alatt. Ennek a holtidőnek nem később, mint 125 mikromásodperccel a csoport utolsó válasz impulzusának továbbítása után kell véget érnie.

3.1.1.7.4 *Elnyomás*

Megjegyzés. – Ezt a jellemzőt a lekérdező antenna oldalszirmai révén vett lekérdezések megválaszolásának megakadályozására használják, és hogy megóvják az A/C-módú válaszjeladókat az S-módú lekérdezések megválaszolásától.

3.1.1.7.4.1 A válaszjeladót el kell nyomni, ha a P_2 vett amplitúdója egyenlő vagy nagyobb, mint a P_1 vett amplitúdója, és 2,0 plusz vagy mínusz 0,15 mikromásodperc impulzustávolsággal rendelkezik. A P_3 észlelését nem követelik meg előfeltételként az elnyomási művelet kezdeményezésénél.

3.1.1.7.4.2 A válaszjeladó elnyomás 35 plusz vagy mínusz 10 mikromásodperc időperiódusig tartson.

3.1.1.7.4.2.1 Az elnyomásnak a teljes időtartam alatt bármely elnyomási időperiódus befejeződése után 2 mikromásodpercen belül képesnek kell lennie újra indulni.

3.1.1.7.5 *Vevő érzékenység és dinamikatartomány*

3.1.1.7.5.1 A válaszjeladó minimális indítási szintjének olyannak kell lenni, hogy válaszokat generáljon a lekérdezési jeleknek legalább a 90 százalékára, amikor:

a) a P_1 és P_3 impulzusok, amelyek lekérdezést képeznek, egyenlő amplitúdójúak és a P_2 -t nem érzékelik; és

b) ezeknek a jeleknek az amplitúdója névlegesen 71 dB 1 mW alatt, 69 dB és 77 dB közötti korlátokkal 1 mW alatt.

3.1.1.7.5.2 A válasz és elnyomás jellemzők a P_1 impulzusnak a minimális indító szint és 50 dB-el ezen szint felett vett amplitúdó értékei között érvényesek.

3.1.1.7.5.3 A minimális indító szint változása az üzemmódok között nem haladhatja meg az 1 dB-t névleges impulzustávolság és impulzus szélesség esetén.

3.1.1.7.6 *Impulzus időtartam megkülönböztetés.*

A minimális indítási szint és a 6 dB-el e fölötti szint közötti vett amplitúdójú és 0,3 mikromásodpercnél rövidebb időtartamú jelek, nem válthatják ki, hogy a válaszjeladó válasz vagy elnyomás műveletet kezdeményezzen. Egy lekérdezést közelítő amplitúdó változásokkal bíró egyedülálló impulzusok kivételével, bármely 1,5 mikromásodperccel hosszabb időtartamú egyedülálló impulzus nem válthatja ki, hogy a válaszjeladó válasz vagy elnyomás műveletet kezdeményezzen a minimális indító szinttől (MTL) az e fölött 50 dB-ig terjedő jel amplitúdó tartomány felett.

3.1.1.7.7 V*isszavert jel elnyomás és visszaállítás.*

A válaszjeladónak visszavert jel elnyomó eszközt kell tartalmaznia, ami arra szolgál, hogy lehetővé tegye a normális üzemelést visszavert térbeli jelek jelenléte esetén. Ennek az eszköznek a szolgáltatása kompatibilis legyen az oldalszirmok elnyomásának 3.1.1.7.4.1 pontban megadott előírásaival.

3.1.1.7.7.1 *Érzékenység csökkentés.* Bármely 0,7 mikromásodpercnél hosszabb időtartamú impulzus vétele után a vevő érzékenységét olyan értékkel kell csökkenteni, ami az érzékenységet csökkentő impulzus amplitúdójának értékén legalább 9 dB-el belül van, de ami soha nem haladja meg az érzékenységet csökkentő impulzus amplitúdóját, kivéve az érzékenységet csökkentő impulzust követő első mikromásodperc alatti túlszabályozás lehetőségét.

Megjegyzés. – 0,7 mikromásodpercnél kisebb időtartamú egyedülálló impulzusokkal szemben nem követelmény, hogy előidézzék a megadott érzékenység csökkentést, sem az, hogy a 3.1.1.7.7.1 és 3.1.1.7.7.2 által megengedettnél nagyobb időtartamú érzékenység csökkentést okozzanak.

3.1.1.7.7.2 *Helyreállítás*. Érzékenység csökkentést követően, a vevőnek helyre kell állítani az érzékenységet (a minimális indító szint 3dB értékén belül) 15 mikromásodpercen belül egy érzékenységet csökkentő impulzus vétele után, amely a minimális indító szint felett maximálisan 50 dB-ig terjedő jelerősséggel rendelkezik. A helyreállításnak 4,0 dB per mikromásodpercet nem meghaladó átlagsebességgel kell megvalósulnia.

3.1.1.7.8 *Véletlen indítási sebesség.*

Érvényes lekérdezési jelek hiányában az A/C-módú válaszjeladók nem generálhatnak több mint 30 nem kívánatos A-módú vagy C-módú választ másodpercenként, összesítve egy olyan időintervallum alatt, amely egyenértékű legkevesebb 300 véletlen indítással vagy 30 másodperccel, amelyik a kisebb. Ezt a véletlen indítási sebességet nem múlhatják felül, amikor az összes lehetséges, ugyanarra a légijárműre telepített zavaró berendezés maximális zavarszintekkel üzemel.

3.1.1.7.8.1 *Véletlen indítási sebesség alacsony szintű, hullámsávon belüli folyamatos hullámú (CW) interferencia jelenlétében.* A véletlen indítási sebesség teljes értéke az összes A-módú és/vagy C-módú válaszoknál nem haladhatja meg a 30 másodperces időtartam alatt átlagolt, másodpercenkénti 10 válaszimpulzus csoportot vagy elnyomást, amikor nem-koherens CW interferencia jelenlétében működik 1030 ± 0,2 MHz frekvencián és -60dBm vagy annál alacsonyabb jelszinten.

3.1.1.7.9 *Válasz sebesség*

3.1.1.7.9.1 A válaszjeladó másodpercenként legyen képes legalább 1200 válaszra egy 15-impulzusú kódolt válasznál, kivéve, hogy a kizárólag 4500m (15000 láb) alatt, vagy az illetékes hatóság vagy körzeti léginavigációs egyezmény által megállapított kisebb magasság alatt használt válaszjeladó beépítéseknél a 15-impuzusú kódolt válasznál másodpercenként legalább 1000 válaszra képes válaszjeladókat engedélyezni kell.

3.1.1.7.9.2 *Válasz sebesség korlát szabályozás.* Hogy a rendszert megvédjék a válaszjeladó túlkérdezés hatásaitól azáltal, hogy megakadályozzák a gyengébb jelekre adott választ, amikor egy előre meghatározott válasz sebességet elértek, egy érzékenység csökkentés típusú válasz korlát szabályozást kell beépíteni a berendezésbe. Ezen szabályozás tartománya tegye lehetővé a beállítást minimum, bármely 500 és 2000 válasz per másodperc közötti értékre, vagy a maximális válasz sebesség képességre, ha kevesebb, mint 2000 válasz van másodpercenként, tekintet nélkül az egyes válaszokban lévő impulzusok számára. 3 dB-t meghaladó érzékenység csökkenés nem következhet be, amíg a kiválasztott érték 90 százalékát túl nem lépik. Az érzékenység csökkenésnek legalább 30 dB-nek kell lenni a kiválasztott érték 150 százalékát meghaladó sebességeknél.

3.1.1.7.9.3 **Ajánlás**. – *A válasz sebesség korlátot 1200 válasz per másodpercre kell beállítani, vagy 1200 válasz per másodperc alatt a maximális értékre, amelyre a válaszjeladó képes.*

3.1.1.7.10 *Válasz késés és vibrálás*

Az időbeli késés a P_3 felfutó élének válaszjeladó vevőhöz érkezése és a válasz első impulzusa felfutó élének átvitele között 3 plusz vagy mínusz 0,5 mikromásodperc legyen. A válasz impulzus kódcsoport teljes vibrálása a P_3-ra vonatkoztatva nem haladhatja meg a 0,1 mikromásodpercet 3 dB és 50 dB közötti vevő bemenet szinteknél a minimális indító szint felett. A késés változások azon üzemmódok között, amelyeken a válaszjeladó válaszra képes, nem haladhatják meg a 0,2 mikromásodpercet.

3.1.1.7.11 *Válaszjeladó teljesítmény kimenet és működési ciklus*

3.1.1.7.11.1 A válaszjeladó átviteli vonalának antenna felőli végén rendelkezésre álló impulzus-csúcsteljesítmény 1W felett legalább 21 dB és nem több, mint 27 dB legyen, kivéve hogy azon válaszjeladó berendezéseknél, amelyeket kizárólag 4500 m (15000 láb) alatti magasságokon, vagy a megfelelő hatóság vagy körzeti léginavigációs egyezmény által megállapított kisebb magasságokon használnak, a válaszjeladó átviteli vonalának antenna felőli végén rendelkezésre álló impulzus-csúcsteljesítményként 1 W felett legalább 18,5 dB-t és nem több, mint 27 dB-t kell megengedni.

Megjegyzés: Egy repülőtéri földi járművön alkalmazott, a válaszjeladóval nem azonos kiterjesztett squitter eszköz az 5.1.1.2 fejezetben meghatározottak szerinti alacsonyabb minimális kimenő teljesítménnyel működhet.

3.1.1.7.11.2 **Ajánlás.** – *A 3.1.1.7.11.1 pontban megadott impulzus-csúcsteljesítményt fenn kell tartani a 0000 kódtól és 400 válasz per másodperc sebességtől, egy maximális impulzus tartalomig és 1200 válasz per másodperc sebességig vagy egy 1200 válasz per másodperc alatti maximális értékig terjedő tartományban, amelyre a válaszjeladó képes.*

3.1.1.7.12 *Válasz kódok*

3.1.1.7.12.1 *Azonosítás.* Egy A-módú lekérdezésre adott választ a 3.1.1.6.1 pontban meghatározott két keret impulzusnak a 3.1.1.6.2 pontban meghatározott információ impulzusokkal (A-módú kód) együttesen kell alkotniuk.

Megjegyzés. – Az A-mód kód jelölés egy négy-számjegyű sorozat a 3.1.1.6.6 ponttal összhangban.

3.1.1.7.12.1.1 Az A-mód kódot manuálisan kell kiválasztani a rendelkezésre álló 4096 kódból.

3.1.1.7.12.2 *Nyomásmagasság továbbítás.* A C-módú lekérdezésre adott válasznak a fenti 3.1.1.6.1 pontban megadott két keret impulzusból kell állnia. Ha digitalizált nyomásmagasság információ rendelkezésre áll, a 3.1.1.6.2 pontban megadott információ impulzusokat is továbbítani kell.

3.1.1.7.12.2.1 A válaszjeladókat el kell látni az információ impulzusok eltávolítására, de a keret impulzusok megtartására szolgáló eszközzel arra az esetre, amikor a lentebbi 3.1.1.7.12.2.4 pont előírásai nem teljesülnek a C-módú lekérdezésre adott válaszban.

3.1.1.7.12.2.2 Az információ impulzusokat automatikusan kell kiválasztani egy analóg – digitális átalakító segítségével, amely a légijárművön lévő, az 1013,25 hektopascal szabványos nyomásbeállításra vonatkoztatott. nyomásmagasság adatforráshoz kapcsolódik.

Megjegyzés. – Az 1013,25 hektopascal nyomás beállítás 29,92 higany-inch értékkel egyenlő.

3.1.1.7.12.2.3 A nyomásmagasságot 100-láb növekményekben kell jelenteni, az impulzusok jelen fejezethez tartozó Függelékben bemutatott kiválasztásával.

3.1.1.7.12.2.4 Az analóg – digitális átalakító kiválasztott kódjának plusz vagy mínusz 38,1 m (125 láb) értéken belüli eltéréssel, 95 százalékos valószínűségi alapon meg kell egyeznie a légijármű fedélzetén használt nyomásmagasság információval (az 1013,25 hektopascal szabványos magasság beállításra vonatkoztatva), hogy a kijelölt repülési profilt tartani lehessen.

3.1.1.7.13 *Különleges helyzetazonosítási (SPI) impulzus továbbítása.* Ha előírt, ezt az impulzust a 3.1.1.6.3 pontban meghatározottaknak megfelelően az A-módú válaszokkal kell továbbítani, 15 és 30 másodperc közötti időtartamon keresztül.

3.1.1.7.14 *Antenna*

3.1.1.7.14.1 A válaszjeladó antennarendszernek, ha légijárműre szerelik, olyan sugárzási diagrammal kell rendelkeznie, amely lényegében 360 fokos a vízszintes síkban.

3.1.1.7.14.2 **Ajánlás. –** *A függőleges sugárzási diagram legyen névlegesen azonos egy vízszintes síkon elhelyezett negyedhullámú monopolantenna sugárzási diagramjával.*

3.1.1.8 Csak A-módú és C-módú képességekkel rendelkező földi lekérdezők műszaki jellemzői

3.1.1.8.1 *Lekérdezés ismétlési gyakoriság*

A maximális lekérdezés ismétlési gyakoriság 450 lekérdezés per másodperc lehet.

3.1.1.8.1.1 **Ajánlás. –** *A szükségtelen válaszjeladó indítás és az ebből eredő nagysűrűségű kölcsönös interferencia minimalizálása érdekében minden lekérdezőnek a lehető legalacsonyabb lekérdező ismétlési gyakoriságot kell használnia, amely összhangban van a kijelzési jellemzőkkel, a lekérdező antenna nyalábszélességgel, és az alkalmazott antenna forgási sebességgel.*

3.1.1.8.2 *Sugárzási teljesítmény*

Ajánlás. – *A rendszer interferencia minimalizálása érdekében a lekérdezők effektív sugárzási teljesítményét arra a legkisebb értékre kell csökkenteni, amely összhangban van az egyes lekérdező helyek üzemelés szempontjából megkívánt távolságával.*

3.1.1.8.3 **Ajánlás. –** *Ha az átmeneti magasságszintek alatt repülő légijárműtől származó C-módú információt kell felhasználni, a magasságmérő nyomás referenciaadatot figyelembe kell venni.*

Megjegyzés. – Az átmeneti szintek alatti C-módú használat összhangban van azzal a filozófiával, hogy a C-mód hasznosan alkalmazható minden környezetben.

3.1.1.9 A lekérdező sugárzási diagramja

Ajánlás- – *A P_3-at sugárzó irányított lekérdező antenna sugárnyaláb szélessége nem lehet nagyobb, mint az üzemeltetés szempontjából megkívánt. Az irányított antenna oldal- és hátszirom sugárzása legalább 24 dB-el alatta legyen a fő szirom sugárzás csúcsértékének.*

3.1.1.10 Lekérdező ellenőrző-berendezés

3.1.1.10.1 A földi lekérdező berendezés távolság és azimut pontosságát elegendően gyakori időközönként folyamatosan ellenőrizni kell a rendszer integritásának biztosítása érdekében.

Megjegyzés. – Azok a lekérdező berendezések, amelyek elsődleges radarral vannak társítva és azzal együtt működnek, az elsődleges radart ellenőrző berendezésként használhatják, vagy alternatív lehetőségként elektronikus távolság és azimut pontosság ellenőrző-berendezés szükséges.

3.1.1.10.2 **Ajánlás**. – *A távolság és azimut ellenőrzésen felül folyamatosan ellenőrizni kell a földi lekérdező berendezés többi kritikus paraméterét is a megengedett rendszertűrést meghaladó teljesítmény romlás szempontjából, és jelzést kell biztosítani, ha ilyen eset előfordul.*

3.1.1.11 Parazita sugárzások és téves válaszok

3.1.1.11.1 *Parazita sugárzás*

Ajánlás. – *A CW sugárzás nem haladhatja meg 1 W alatt a 76 dB-t a lekérdező berendezés, és 1W alatt a 70 dB-t a válaszjeladó esetén.*

3.1.1.11.2 *Téves válaszok*

Ajánlás. – *Úgy a fedélzeti, mint a földi berendezések válaszjelének az olyan jelekre, amelyek nem a vevő áteresztő sávján belülre esnek, legalább 60 dB-el a normál érzékenység alatt legyen.*

3.1.2 S-módú képességekkel rendelkező rendszerek

3.1.2.1 Lekérdezés térközi jel jellemzők.

A jelen bekezdés pontjai a térközi jeleket úgy írják le, ahogyan azok várhatóan a válaszjeladó antennánál megjelennek.

Megjegyzés. – Mivel a jelek a terjedés során leromolhatnak, bizonyos lekérdezési impulzus időtartam, impulzus távolság és impulzus amplitúdó tűrések a lekérdezőknél szigorúbbak, ahogyan az a 3.1.2.11.4 pontban le van írva.

3.1.2.1.1 *Lekérdezési vivőfrekvencia.* Minden S-módú képességgel rendelkező földi berendezéstől jövő lekérdezés és vivőfrekvenciája (fedélzetre irányuló közlemény továbbítás) 1030 plusz vagy mínusz 0,01 MHz legyen.

3.1.2.1.2 *Lekérdezési spektrum.* Az S-módú vivőfrekvencia lekérdezési spektruma nem lépheti túl a 3-2 ábrán megadott határokat.

Megjegyzés. – Az S-módú lekérdezési spektrum adatfüggő. A legszélesebb spektrumot olyan lekérdezés generálja, amely az összes bináris EGY-et tartalmazza.

3.1.2.1.3 *Polarizáció.* A lekérdező és vezérlő átvitelek polarizációja névlegesen függőleges legyen.

3.1.2.1.4 *Moduláció.* S-módú lekérdezéseknél a vivőfrekvencia impulzus-modulált. Ezenkívül a P_6 adat-impulzus belső fázis modulációval is rendelkezik.

3.1.2.1.4.1 *Impulzus moduláció.* A közös módú és S-módú lekérdezések az impulzusok egy sorozatát tartalmazzák a 3.1.2.1.5 pontban és a 3-1, 3-2, 3-3 valamint a 3-4 táblázatban meghatározottak szerint.

Megjegyzés. – A közös módú és S-módú lekérdezésekben használt 0,8 mikromásodperces impulzusok alakban azonosak azokkal, amelyeket az A- és C-módban használnak úgy, ahogyan azt a 3.1.1.4 pont meghatározza.

3.1.2.1.4.2 *Fázis moduláció.* A 3.1.2.1.4.1 alpont rövid (16,25 mikromásodperces) és a hosszú (30,25 mikromásodperces) P_6 impulzusai belső bináris differenciál fázis modulációval rendelkeznek, amelyek 4 megabit per másodperc sebességnél tartalmazzák a vivő 180 fokos fázis megfordítását.

3.1.2.1.4.2.1 *Fázisváltási intervallum.* A fázisváltás időtartama legyen kisebb, mint 0,08 mikroszekundum és a fázisváltás folyamatos legyen („siessen˝” vagy „késsen”) a fázisváltás időtartama alatt. A fázisváltási intervallumra nem szuperponálódhat amplitúdó moduláció.

Megjegyzés. – A fázisváltás minimális időtartama nincs meghatározva. Mindazonáltal a 3.1.2.1.2 pont spektrum követelményeit ki kell elégíteni.

3.1.2.1.4.2.2 *Fázisviszony*. Az egymást követő bit helyi értékek és a P6-os impulzuson belüli szinkronizáló fázisváltás (3.1.2.1.5.2.2), 0 és 180 fokos fázisviszony tűrése nem lehet nagyobb, mint +/- 5 fok.

Megjegyzés: Az S-módú lekérdezés egy bit helyiértéke, két egymást követő lehetséges fázisváltás közötti, 0.25 mikroszekundomos, rádiófrekvenciás vivő-intervallum.

3.1.2.1.5 *Impulzus és fázisváltás sorozatok.* A 3.1.2.1.4 pontban leírt impulzusok vagy fázisváltások specifikus sorozatai lekérdezéseket hoznak létre.

3.1.2.1.5.1 Közös módú lekérdezés

3.1.2.1.5.1.1 *A/C/S-módú körhívás lekérdezés.* Ez a lekérdezés három impulzust tartalmaz: P_1-et, P_3-at és a hosszú P_4-et, ahogyan azt a 3-3 ábra mutatja. Egy vagy két szabályozó impulzust (P_2 egyedül, vagy P_1 és P_2) továbbítanak, egy külön antenna diagramot használva a légijárműtől jövő reagálások elnyomására a lekérdező antenna oldalszirmokban.

Megjegyzés. – Az A/C/S-módú körhívás lekérdezés egy A-módú vagy C-módú választ vált ki (a P_1-P_3 impulzus távolságtól függően) egy A/C-módú válaszjeladóból, mivel ez a P_4 impulzust nem ismeri el. Egy S-módú válaszjeladó elismeri a hosszú P_4 impulzust és S-üzemmóddal válaszol. Ezt a lekérdezést eredetileg izolált vagy kötegelt lekérdezők számára tervezték. A kizárás ennél a lekérdezőnél II=0 használatán alapszik. Az S-módú alhálózat fejlesztése most egy zérustól különböző II kód használatát diktálja kommunikációs célokra. Ezen okból kifolyólag II egyenlő 0-t fenntartják az S-módú adatgyűjtést támogató használatra, amely sztochasztikus/ kizárás felülbírálást használ (3.1.2.5.2.1.4 és 3.1.2.5.2.1.5 pontok). Az A/C/S körhívás mód nem használható teljes S-módú művelethez, mivel II egyenlő 0 csak rövid időperiódusra zárható ki (3.1.2.5.2.1.5.2.1 pont). Ezt a lekérdezést nem lehet sztochasztikus/kizárás felülbírálással használni, mivel a válasz valószínűségét nem lehet megadni.

3.1.2.1.5.1.2 *Csak A/C-módú körhívás lekérdezés.* Ez a lekérdezés azonos az A/C/S-módú körhívás lekérdezéssel, azzal az eltéréssel, hogy a rövid P_4 impulzust használja.

Megjegyzés. – A csak A/C-módú körhívás lekérdezés A-módú vagy C-módú válaszra készteti az A/C-módú válaszjeladót. Az S-módú válaszjeladó felismeri a rövid P_4 impulzust és nem válaszol erre a lekérdezésre.

3.1.2.1.5.1.3 *Impulzus időközök.* A P1, P2 és P3 közötti impulzus időközök értéke feleljen meg a 3.1.1.4.3 és 3.1.1.4.4 pontokban meghatározottaknak. A P3 és P4 közötti impulzus időközök értéke legyen 2 plusz vagy mínusz 0,05 mikromásodperccel azonos.

3.1.2.1.5.1.4 *Impulzus amplitúdók.* A P_1, P_2 és P_3 impulzusok közötti relatív amplitúdók összhangban vannak a 3.1.1.5 pontban leírtakkal. A P_4 amplitúdójának eltérése a P_3 amplitúdójától 1 dB-en belül van.

3.1.2.1.5.2 *S-módú lekérdezés*. Az S-módú lekérdezés három impulzusból áll: P_1, P_2 és P_6, ahogyan azt a 3-4 ábra mutatja.

Megjegyzés. – A P_6-ot megelőzi a P_1 - P_2 pár, amely elnyomja az A/C válaszjeladóktól jövő válaszokat, hogy elkerüljék az S-módú lekérdezés által keltett véletlen indítás miatti szinkron csonkítást. A P_6-on belüli szinkronizáló fázis megfordítás az időjel a 0,25 mikromásodperc időtartamú időközök (chipek) sorozatának demodulációjához. A chipeknek ez a sorozata a szinkronizáló fázis után 0,5 mikromásodperccel kezdődik és a P_6 lefutó éle előtt 0,5 mikromásodperccel végződik. Egy fázis megfordítás megelőzheti, vagy nem kell, hogy megelőzze az egyes chipeket a bináris információs érték kódolásához.

3.1.2.1.5.2.1 *S-módú oldal-szirom elnyomás*. A P_5 impulzust a csak S körhívás módú lekérdezéssel használják (UF=11 lásd 3.1.2.5.2 pont), hogy megakadályozzák a válaszokat a légijárműtől az antenna oldal- és hátsó szirmában (3.1.2.1.5.2.5 pont). Amikor használják, P_5-öt külön antenna diagram felhasználásával továbbítják.

1. Megjegyzés. – A P_5 beavatkozása automatikus. Ennek jelenléte, ha kielégítő amplitúdójú a vevő helyén, eltakarja a P_6 szinkronizáló fázis megfordítását.

2. Megjegyzés. – A P_5 impulzus más S-módú lekérdezésekkel is használható.

3.1.2.1.5.2.2 *Szinkronizáló fázis megfordítás*. Az első fázis megfordítás a P_6 impulzusban a szinkronizáló fázis megfordítás. Ez lesz az idő referencia a lekérdezésre vonatkozó egymást követő válaszjeladó működésekre.

3.1.2.1.5.2.3 *Adat fázis megfordítások.* Mindegyik adat fázis megfordítás csak egy (N-szer 0,25) plusz vagy mínusz 0,02 mikromásodperc (N egyenlő vagy nagyobb, mint 1) időközzel a szinkronizáló fázis megfordítás után jelenik meg. A 16,25 mikromásodperces P_6 impulzus legfeljebb 56 adat fázis megfordítást tartalmazhat. A 30,25 mikromásodperces P_6 impulzus legfeljebb 112 adat fázis megfordítást tartalmazhat. Az utolsó chipet, vagyis a 1,25 mikromásodperces időközt, amely az utolsó adat fázis megfordítási pozíciót követi, egy 0,5 mikromásodperces őr időköz követi.

Megjegyzés. – A 0,5 mikromásodperces őr időköz, amely az utolsó chipet követi, megakadályozza, hogy a demodulációs folyamattal a P_6 lefutó ága interferáljon.

3.1.2.1.5.2.4 *Időközök.* A P_1 és P_2 közötti impulzus időköz 2 plusz vagy mínusz 0,05 mikromásodperc. A P_2 közötti impulzus időköz 2 plusz vagy mínusz 0,05 mikromásodperc. A P_2 felfutó éle és a P_6 szinkronizáló fázis megfordítás közötti időköz 2,75 plusz vagy mínusz 0,05 mikromásodperc. A P_6 felfutó éle 1,25 plusz vagy mínusz 0,05 mikromásodperccel a szinkronizáló fázis megfordítás előtt jelenik meg. A P_5, ha továbbításra kerül, a szinkronizáló fázis megfordítása fölött legyen központosítva; a P_5 felfutó éle 0,4 plusz vagy mínusz 0,05 mikromásodperccel a szinkronizáló fázis megfordítása előtt jelenik meg.

3.1.2.1.5.2.5 *Impulzus amplitúdók.* A P_2 amplitúdója és a P_6 első mikromásodpercének amplitúdója nagyobb, mint a P_1 amplitúdója mínusz 0,25 dB. Nem számítva a fázis megfordítással kapcsolódó amplitúdó tranzienseket, a P_6 amplitúdó változása kisebb, mint 1 dB, és a P_6-ban az egymást követő chipek közötti amplitúdó kisebb, mint 0,25 dB. A P_5 sugárzott amplitúdója a válaszjeladó antennájánál:

a) egyenlő vagy nagyobb, mint a P_6 sugárzott amplitúdója, amely a P_6-ot sugárzó antenna oldalszirom átviteleitől érkezik; és

b) olyan szinten, amely a P_6 sugárzott amplitúdója alatt 9 dB-nél alacsonyabban helyezkedik el, a lekérdezés kívánt ívén belül.

3.1.2.2 Válasz térbeli jelek jellemzői

3.1.2.2.1 *Válasz vivő frekvenciája*. Az S-módú képességgel rendelkező válaszjeladóktól jövő (fedélzetről leadott adattovábbítás) összes válasz vivő frekvenciája 1090 plusz vagy mínusz 1 MHz.

3.1.2.2.2 *Válasz spektrum.* Az S-módú válasz spektrum a vivő frekvenciánál nem haladhatja meg a 3-5 ábrán megadott határokat.

3.1.2.2.3 *Polarizáció.* A válasz továbbítások polarizációja névlegesen függőleges legyen.

3.1.2.2.4 *Moduláció.* Az S-módú válasz egy bevezetőből és egy adat blokkból áll. A bevezető egy 4-impulzusos sorozat, és az adatblokk bináris impulzus-pozíció modulált 1 megabit per másodperc adat sebességgel.

3.1.2.2.4.1 *Impulzus alakok.* Az impulzus alakok a 3-2 táblázatban előírtaknak feleljenek meg. Az összes érték mikromásodpercben van megadva.

3.1.2.2.5 *S-módú válasz.* Az S-módú válasz a 3-6 ábrán bemutatottnak megfelelő. Az adatblokk S-módú válaszokban vagy 56 vagy 112 információs bitből áll.

3.1.2.2.5.1 *Impulzus időközök.* Minden válasz impulzus a 0,5 mikromásodperc meghatározott többszöröseinél kezdődik az első továbbított impulzustól számítva. A tűrés minden esetben plusz vagy mínusz 0,05 mikromásodperc.

3.1.2.2.5.1.1 *Válasz bevezetés*. A bevezetés négy impulzusból áll, egyenként 0,5 mikromásodperc időtartammal. Az impulzus időközöknek az első továbbított impulzustól a második, harmadik és negyedik átvitt impulzusig 1, 3,5 és 4,5 mikromásodpercnek kell lenniük, a felsorolás egyező sorrendjében.

3.1.2.2.5.1.2 *Válasz adat impulzusok*. A válasz adatblokk 8 mikromásodperccel az első továbbított impulzus felfutó éle után kezdődik. Az egyes továbbításokhoz vagy 56, vagy 110 mikromásodperces bit intervallumokat jelölnek ki. Egy 0,5 mikromásodperces impulzust továbbítanak az egyes intervallumok első vagy második felében. Amikor az impulzust, amelyet az egyik tartomány második felében továbbítanak, egy másik, a következő időköz első felében továbbított impulzus követi, a két impulzus egyesül és egy-mikromásodperces impulzust kell továbbítani.

3.1.2.2.5.2 *Impulzus amplitúdók*. Az egyik impulzus és egy másik impulzus közötti impulzus amplitúdó változás S-módú válaszban nem haladhatja meg a 2 dB-t.

3.1.2.3 Az S-mód adatszerkezete

3.1.2.3.1 *Adatkódolás*

3.1.2.3.1.1 *Lekérdezési adat*. A lekérdezési adatblokkot egy 56 vagy 112 adat chipből álló sorozat alkotja, amely a P_6 impulzuson belül, az adatfázis megfordítások után helyezkedik el (3.1.2.1.5.2.3

pont). Egy chipet megelőző 180 fokos hordozó fázis megfordítás az adott chip-et bináris EGY-ként jellemzi. A megelőző fázis megfordítás hiánya egy bináris ZÉRO-t jelez.

3.1.2.3.1.2 *Válasz adatok.* A válasz adatblokk 56 vagy 112 adat bitből áll, amelyet a válasz adat bináris impulzus pozíció modulációval alakítanak ki a 3.1.2.2.5.1.2 pontban leírtak szerint. Az időköz első felében továbbított impulzus egy bináris EGY-et jelent, míg a második felében továbbított impulzus egy bináris ZÉRO-t jelent.

3.1.2.3.1.3 *Bit számozás.* A biteket továbbításuk sorrendjének megfelelően kell számozni az 1-es bittel kezdve. Ha nincs másképpen elrendelve, a bit csoportokkal (mezők) kódolt numerikus értékek kódolása pozitív bináris jelek felhasználásával történik, és az első továbbított bit a legjelentősebb bit (MSB). Az információkat olyan mezőkben kell kódolni, amelyek legalább egy bitből állnak.

Megjegyzés. – Az S-módú formátumok leírásában a bit sorozatok által egy mezőn belül kialakított bináris kód decimális megfelelőjét, mező funkció vagy utasítás jelölőjeként használják.

3.1.2.3.2 *S-módú lekérdezések és válaszok formátumai*

Megjegyzés. – Minden S-módú lekérdezési és válasz formátum összesítve a 3-7 és 3-8 ábrákon látható. A fedélzetre irányuló és a fedélzetről leadott adattovábbítás formátumokban megjelenő összes mező összegezését a 3-3 táblázat mutatja, és az összes almező összegezését a 3-4 táblázat tartalmazza.

3.1.2.3.2.1 *Lényeges mezők.* Minden S-módú továbbítás két lényeges mezőt tartalmaz. Az egyik egy olyan kulcs-szó (deszkriptor), amely egyértelműen meghatározza a továbbítás formátumát. Ez minden formátumnál a továbbítás elején jelenik meg. A deszkriptorokat az UF (fedélzetre irányuló adattovábbítási formátum) vagy DF (fedélzetről leadott adattovábbítás formátum) mezőt jelölik. A második lényeges mező egy 24-bites mező, amely az egyes továbbítások végén jelenik meg és paritás információkat tartalmaz. Minden fedélzetre irányuló adattovábbítási formátumban és a folyamatosan meghatározott fedélzetről leadott adattovábbítás formátumban a paritás információ rákerül vagy a légijármű címzésre (3.1.2.4.1.2.3.1 pont) vagy a lekérdező azonosítóra a 3.1.2.3.3.2 pontnak megfelelően. A megjelölések AP (cím/paritás) vagy P_1 (paritás/lekérdező azonosító).

Megjegyzés. – A megmaradó kódolási helyeket a missziós mezők továbbítására használják. Különleges feladatokra a missziós mezők különleges halmazát írják elő. Az S-módú missziós mezőknek kétbetűs jelzésük van. Az almezők a missziós mezőkön belül jelenhetnek meg. Az S-módú almezők hárombetűs jelöléssel vannak címkézve.

3.1.2.3.2.1.1 *UF: fedélzetre irányuló adattovábbítási formátum.* Ez a fedélzetre irányuló adattovábbítási formátum mező (5 bit hosszúságú, kivéve a 24 számú formátumot, ahol ez 2 bit hosszúságú) fedélzetre irányuló adattovábbítási formátum kulcs-szóként (deszkriptorként) szolgál minden S-módú lekérdezésben, és a 3-7 ábrának megfelelően kell kódolni.

3.1.2.3.2.1.2 *DF: fedélzetről leadott adattovábbítási formátum.* Ez a fedélzetről leadott adattovábbítás formátum mező (5 bit hosszúságú, kivéve a 24 számú formátumban, ahol ez 2 bit hosszúságú) fedélzetről leadott adattovábbítás kapcsolat formátum kulcs-szóként (deszkriptorként) szolgál minden S-módú válaszban, és a 3-8 ábrának megfelelően kell kódolni.

3.1.2.3.2.1.3 *AP: címzés/paritás*. Ez a 24-bites (33-56 vagy 89-112) mező minden fedélzetre irányuló adattovábbítási és jelenleg meghatározott fedélzetről leadott adattovábbítási formátumban megjelenik, kivéve a csak S körhívás módú választ, a DF = 11-el. A mező paritást tartalmaz, amely rákerül a légijármű címzésre a 3.1.2.3.3.2 pontnak megfelelően.

3.1.2.3.2.1.4 *PI: paritás/lekérdező azonosító.* Ez a 24-bites (33-56) fedélzetről leadott adattovábbítási mező rendelkezzen paritással, amely rákerül a lekérdező azonosítási kódjára a 3.1.2.3.3.2 pontnak megfelelően, és az S körhívás módú válaszban jelenjen meg, DF = 11-el és a kiterjesztett squitterben DF = 17-el vagy DF = 18-al. Ha a választ egy A/C/S körhívásra, egy S-módú CL mező (3.1.2.5.2.1.3 pont) és IC mező (3.1.2.5.2.1.2 pont) egyenlők 0-val esetekre való reagálásnál adják, vagy egy adatgyűjtő vagy kiterjesztett squitternél (3.1.2.8.5, 3.1.2.8.6 pontok), akkor a II és az SI kódok O értékűek legyenek.

3.1.2.3.2.2 *Kijelöletlen kódolási térköz.* A kijelöletlen kódolási térköz tartalmazza az összes ZÉRO-t, mint a lekérdező berendezések és a válaszjeladók által továbbított értékeket.

Megjegyzés: – Bizonyos kódolási térköz, amely ebben a szakaszban kijelöletlennek van jelezve, más alkalmazásokra, mint például ACAS, adat kapcsolat, stb. van fenntartva.

3.1.2.3.2.3 *Nulla és kijelöletlen kódok.* A nulla kód kijelölés minden meghatározott mezőben azt jelöli, hogy a mező nem igényel beavatkozást. Ezenkívül, a mezőkön belüli kijelöletlen kódok azt jelzik, hogy nincs igény beavatkozásra.

Megjegyzés. – A 3.1.2.3.2.2 és 3.1.2.3.2.3 pontok rendelkezési biztosítják, hogy az előzőleg kijelöletlen kódolási térköz jövőbeli kijelölései nem okoznak kétértelműséget. Azaz, az S-módú berendezés, amelyben az új kódolás nincs megvalósítva, tisztán fogja jelezni, hogy nincs továbbított információ az újonnan kijelölt kódolási térközben.

3.1.2.3.2.4 *Katonai célra tartalékolt formátumok.* Az államok biztosítsák, hogy a fedélzetre irányuló adattovábbítási formátumokat csak kiválasztott címzésű lekérdezésekhez alkalmazzák és a fedélzetre irányuló, vagy a fedélzetről leadott formátumok ne haladják meg a 10. Annexben a rádiófrekvenciás teljesítményre, lekérdezési és válaszadási sebességre, és squitter sebességre meghatározott követelményeket.

3.1.2.3.2.4.1 **Ajánlás.** – *Kivizsgálások és megerősítések útján az államok tegyék lehetővé, hogy a katonai alkalmazások ok nélkül ne befolyásolják a meglévő polgári felhasználású 1030 / 1090 Mhz üzemeltetési környezetet.*

3.1.2.3.3 *Hiba védelem*

3.1.2.3.3.1 *Eljárás.* Paritás ellenőrző kódolást használjanak az S-módú lekérdezéseken és válaszokon belül, hogy védelmet nyújtsanak hibák előfordulása ellen.

3.1.2.3.3.1.1 *Paritás ellenőrzési sorozat.* A 3.1.2.3.3.1.2 pontban leírt szabály szerint egy 24 paritás ellenőrzési bitből álló sorozatot generáljanak és ez kerüljön beépítésre az összes S-módú sugárzás utolsó 24 bitje által formált mezőbe. A 24 paritás ellenőrzés bitet vagy a címzés kódolóval, vagy a lekérdező azonosító kóddal kombinálják, a 3.1.2.3.3.2 pontban leírtak szerint. A létrejövő kombináció akkor vagy az AP (címzés/paritás, 3.1.2.3.2.1.3 pont) mezőt, vagy a PI (paritás/lekérdező azonosító, 3.1.2.3.2.1.4 pont) mezőt fogja kialakítani.

3.1.2.3.3.1.2 *Paritás ellenőrzés sorozat generálás.* A (p_1, p_2 ..., p_{24}) 24 paritás bitből álló sorozat az ($m_1, m_2, ..., m_k$) információs bitek sorozatából generálódik, ahol a rövid vagy hosszú sugárzásoknál a k értéke 32-vel vagy 88-al egyenlő. Ezt a következő többtagú kifejezés (polinommal) útján generált kód segítségével készítik:

$$G(x) = 1 + x^3 + x^{10} + x^{12} + x^{13} + x^{14} + x^{15} + x^{16} + x^{17} + x^{18} + x^{19} + x^{20} + x^{21} + x^{22} + x^{23} + x^{24}$$

Amikor a bináris polinom algebra alkalmazásával, x^{24} [*M(x)*]-et elosztjuk *G(x)*-el, ahol *M*(*x*) információ sorozat a következő kifejezéssel egyenlő:

$$m_k + m_{k-1}x + m_{k-2}x^2 + \ldots + m_1x^{k-1},$$

akkor az eredmény egy hányados és egy 24-nél alacsonyabb fokú R(x) maradék. E maradék által formált bit sorozat a paritás ellenőrzés sorozatot képviseli. A p_i paritás bit bármely i értékre az 1-től 24-ig terjedő kitevők esetén, az x^{24-i} együtthatójaként jelenik meg az *R(x)*-ben.

Megjegyzés. – Az M(x) és az x^{24} *szorzásának eredményeként 24 ZÉRUS bitet kell csatolni a sorozat végéhez.*

3.1.2.3.3.2 *AP és PI mező generálás.* A fedélzetre irányuló- és fedélzetről leadott adattovábbításhoz különböző címzés paritás sorozatokat használnak.

Megjegyzés. – A fedélzetre irányuló adattovábbítási sorozat elegendő egy válaszjeladó dekódoló megvalósításhoz. A fedélzetről leadott adattovábbítás sorozat a hiba korrekció alkalmazását teszi lehetővé a fedélzetről leadott adattovábbítás dekódolásban.

A fedélzetre irányuló adattovábbítási AP mező generálásában használt kódot az alább ismertetett módon vagy a légijármű címzésből (3.1.2.4.1.2.3.1.1 pont), vagy az körhívás címzésből (3.1.2.4.1.2.3.1.2 pont), vagy az adási címzésből (3.1.2.4.1.2.3.1.3) kell képezni.

A fedélzetről leadott adattovábbítás AP mező generálásában használt kódot közvetlenül az ($a_1, a_2, \ldots, a_{24}$) 24 S-módú címzés bit sorozatból képezik, ahol az a_i az i-edik bit, amelyet egy körhívás válasz légijármű címzés (AA) mezejében továbbítanak (3.1.2.5.2.2.2 pont).

A fedélzetről leadott adattovábbítás PI mező generálásában használt kódot az ($a_1, a_2, \ldots, a_{24}$) 24 bites sorozatból képezik, ahol az első 17 bit ZÉRO, a következő három bit a kód címke (CL) mezőre adott válasz (3.1.2.5.2.2.2), és az utolsó négy bit válasz a lekérdező azonosító (IC) mezőre (3.1.2.5.2.1.2 pont).

Megjegyzés. – A PI kódot fedélzetre irányuló közlemények átvitelében nem használják.

Egy ($b_1, b_2, \ldots, b_{24}$) módosított sorozatot használnak a fedélzetre irányuló adattovábbítási AP mező generálásnál. A b_i bit az x^{48-i} együtthatója a *G(x)A(x)* többtagú kifejezésben, ahol

$$A(x) = a_1x^{23} + a_2x^{22} + \ldots + a_{24}$$

és

G(x) megfelel a 3.1.2.3.3.1.2 pontban megfogalmazottnak.

A légijármű címzésben a_i az i-edik bit, amelyet egy körhívás válasz AA mezőjében továbbítanak. A körhívás és adási címzésekben $a_i = 1$, az i minden értékénél.

3.1.2.3.3.2.1 *Fedélzetre irányuló közlemények átviteli sorrendje.* A fedélzetre irányuló AP mezőben átvitt bitek sorozat:

$$t_{k+1}, + t_{k+2}, \ldots, t_{k+24}$$

ahol a bitek k+1-el kezdődően az átvitel sorrendje szerint vannak számozva.

Fedélzetre irányuló közlemények esetén:

$$t_{k+1} = b_i + p_i$$

ahol a ”+” modulo-2 összeadást jelöl: i = 1 az AP mezőben átvitt első bit.

3.1.2.3.3.2.2 *Fedélzetről leadott közlemények átviteli sorrendje.* A fedélzetről leadott AP és PI mezőkben átvitt bit sorozat:

$$t_{k+1}, t_{k+2}, \ldots, t_{k+24}$$

ahol a bitek k+1-el kezdődően az átvitel sorrendje szerint vannak számozva. Fedélzetről leadott közlemények esetén:

$$t_{k+1} = a_i + p_i$$

ahol a ”+” moduló-2 összeadást jelöl: i = 1 az AP vagy PI mezőben átvitt első bit.

3.1.2.4 Általános lekérdezés – válasz protokoll

3.1.2.4.1 *Válaszjeladó tranzakció ciklus.* A válaszjeladó tranzakció ciklus akkor kezdődik, amikor a másodlagos légtérellenőrző radar S-módú válaszjeladója egy lekérdezést felismer. A válaszjeladó ezután értékeli a lekérdezést és megállapítja, hogy azt fogadja-e. Ha igen, akkor a kapott lekérdezést feldolgozza és választ generál, ha az megfelelő. A tranzakció ciklus befejeződik, ha:

a) a vételhez szükséges feltételek valamelyike nincs kielégítve, vagy

b) egy lekérdezést vettek és a válaszjeladó vagy

   1) a vett lekérdezés feldolgozását befejezte és válaszra nincs igény, vagy

   2) a válasz továbbítását befejezte.

Új válaszjeladó tranzakció ciklus nem kezdődik el, amíg az előző ciklus nem fejeződik be.

3.1.2.4.1.1 *Lekérdezés felismerés.* A másodlagos légtérellenőrző radar S-módú válaszjeladója a lekérdezések következő különböző típusait képes megkülönböztetni:

a) A- és C-módú
b) közös módú; és
c) S-módú.

Megjegyzés. – A felismerési folyamat a jel bemeneti szinttől és az előírt dinamikus távolságtól függ (3.1.2.10.1 pont).

3.1.2.4.1.1.1 *A-módú és C-módú lekérdezés nyugtázás.* A-módú vagy C-módú lekérdezés akkor kerüljön visszaigazolásra, ha egy, a 3.1.1.4 pont követelményeit kielégítő P_1-P_3 impulzus pár vétele megtörtént és a P_3 amplitúdójánál 6 dB-el lejjebb lévő szintnél nagyobb amplitúdó P_4 impulzus felfutó éle nem érkezik be a P_3 felfutó élét követő, 1,7-től 2,3 mikromásodpercig terjedő időközön belül.

Ha egy P_1–P_2 elnyomás pár és egy A-módú leképezés egyidőben kerül felismerésre, a válaszjeladó kerüljön elnyomásra. Egy lekérdezés ne kerüljön elismerésre, mint A-módú vagy C-módú, ha a válaszjeladó elnyomásban van (3.1.2.4.2 pont). Ha egy A-módú és egy C-módú lekérdezés egyidejűleg elismerésre kerül, a válaszjeladó a tranzakció ciklust úgy hajtsa végre, mintha csak C-módú lekérdezést ismert volna el.

3.1.2.4.1.1.2 *Inter (közös) módú lekérdezés elismerés.* Inter (közös) módú lekérdezést ismerjenek el, amikor egy, a 3.1.2.1.5.1 pont követelményeit kielégítő P_1–P_3–P_4 impulzus hármas vételére kerül sor. Egy lekérdezést ne ismerjenek el inter (közös) módú lekérdezésként, ha:

a) a P_4 pozícióban lévő impulzus vett amplitúdója kisebb, mint a P_3 amplitúdójánál 6 dB-el lejjebb lévő szint; vagy

b) a P_3 és P_4 között lévő impulzus időköz nagyobb, mint 2,3 mikromásodperc, vagy kisebb, mint 1,7 mikromásodperc; vagy

c) P_1 és P_3 impulzusa a minimális indító szint és -45 dBm között van és P_1 vagy P_3 impulzus időtartama kisebb, mint 0,3 mikromásodperc; vagy

d) a válaszjeladó elnyomásban van (3.1.2.4.2 pont)

Ha a P_1 – P_2 elnyomás pár és egy A-módú vagy C-módú közös módú lekérdezést egyidőben ismer el, a válaszjeladót el kell nyomni.

3.1.2.4.1.1.3 *S-módú lekérdezés elismerés*. Egy S-módú lekérdezést el kell ismerni, ha egy P_6 impulzus egy szinkronizáló fázis megfordítással P_6 felfutó élét követő, 1,20-tól - 1,30 mikromásodpercig terjedő időközön belül kerül vételre. Egy S-módú lekérdezés ne legyen elismerve, ha egy szinkronizáló fázis megfordítás a P_6 felfutó élét követő, 1,05-től – 1,45 ezredmásodpercig terjedő intervallumon belül nem kerül vételre.

3.1.2.4.1.2 *Lekérdezés vétel*. A 3.1.2.4.1 pontnak megfelelő felismerés előfeltétele bármely lekérdezés vételének.

3.1.2.4.1.2.1 *A-módú és C-módú lekérdezés vétele*. A-módú és C-módú lekérdezéseket fogadni kell, ha felismerik őket (3.1.2.4.1.1.1 pont).

3.1.2.4.1.2.2 *Közös módú lekérdezés vétel.*

3.1.2.4.1.2.2.1 *A/C/S-módú körhívás lekérdezés vétel.* A/C/S-módú körhívás lekérdezést fogadják, ha a P_4 lefutó élét a P_3 felfutó élét követően 3,45-3,75 mikromásodpercen belül veszik és a vételt kizárási feltételek (3.1.2.6.9 pont) nem akadályozzák. A/C/S-módú körhívás lekérdezést ne fogadjanak, ha P_4 lefutó élét a P_3 felfutó élét követő 3,3 mikromásodpercnél korábban és 4,2 mikromásodpercnél később veszik, vagy ha a vételt kizárási feltétel (3.1.2.6.9 pont) akadályozza.

3.1.2.4.1.2.2.2 *Csak A/C-módú körhívás lekérdezés vétel.* Csak A/C-módú körhívás lekérdezést S-módú válaszjeladó ne fogadjon.

Megjegyzés. – Csak A/C-módú körhívás elutasításának műszaki feltételét az előző alpont tartalmazza azon követelményen keresztül, amely egy olyan impulzusos közös módú lekérdezés elvetését írja elő, ahol a P_4 impulzus lefutó éle a P_3 felfutó élét 3,3 mikromásodpercnél rövidebb időn belül követi.

3.1.2.4.1.2.3 *S-módú lekérdezés vétele.* S-módú lekérdezés csak akkor kerüljön vételre, ha:

a) a válaszjeladó képes a lekérdezés fedélzetre irányuló adattovábbítási formátumának (UF) feldolgozására (3.1.2.3.2.1.1);

b) a lekérdezés címzése a címzések egyikéhez illeszkedik a 3.1.2.4.1.2.3.1 pontban előírtak szerint, amely magában foglalja, hogy a paritás létrejött, ahogyan a 3.1.2.3.3 pontban előírták;

c) nincs körhívás kizárás feltétel érvényben, ahogy a 3.1.2.6.9 pontban előírásra került; és

d) a válaszjeladó képes a fedélzetre irányuló hosszú levegő-levegő felderítő (ACAS) lekérdezés (UF – 16) adatának feldolgozására és bemutatására egy kimeneti csatlakozó felületnél, ahogyan azt a 3.1.2.10.5.2.2.1 alpont előírja.

Megjegyzés: Az S-módú lekérdezést csak abban az esetben lehet elfogadni, ha a 3.1.2.4.1.2.3.a) és b) alpontokban leírt követelmények teljesülnek és a válaszjeladó nem képes sem a fedélzetre irányuló Comm-A lekérdezés (UF=20 és 21) létrehozására sem annak egy kimeneti csatoló egységen való megjelenítésére, ahogy azt a 3.1.2.10.5.2.2.1 előírja.

3.1.2.4.1.2.3.1 *Címzések.* Az S-módú lekérdezések tartalmazzák vagy

a) a légijármű címzést; vagy

b) a körhívás címzést; vagy

c) az adás címzést.

3.1.2.4.1.2.3.1.1 *Légijármű címzés*. Ha a légijármű címzés azonos egy, a 3.1.2.3.3.2 és 3.1.2.3.3.2.1 pontok szerinti eljárással összhangban vett lekérdezésből származtatott címzéssel, akkor a származtatott címzést korrektnek kell tekinteni az S-módú lekérdezés vételének céljára.

3.1.2.4.1.2.3.1.2 *Körhívás címzés.* Egy csak S körhívás módú lekérdezés (fedélzetre irányuló adattovábbítási formátum UF = 1) egy körhívás címzéssel jelölt címzést tartalmaz, amely huszonnégy egymást követő EGY-et tartalmaz. Ha a körhívás címzést egy UF = 11 formátumban fogadott lekérdezésből a 3.1.2.3.3.2 és a 3.1.2.3.3.2.1 pontok eljárása szerint származtatták, akkor a címzést megfelelőnek kell tekinteni a csak S körhívás módú lekérdezés fogadásához.

3.1.2.4.1.3.1.3 *Adási címzés*. Egy közlés továbbításához minden S-módú válaszjeladóhoz a lekérdezési sugárnyalábon belül 20-as vagy 21-es számú S-módú lekérdezési fedélzetre irányuló adattovábbítási formátumot használnak és egy huszonnégy egymást követő EGY-ből álló címzés helyettesíti a légijármű címzést. Ha az UF kód 20-as vagy 21-es, és ezt az adási címzést egy vett lekérdezésből a 3.1.2.3.3.2 és 3.1.2.3.3.2.1 pontok szerinti eljárás alapján nyerték, a címzést S-módú adási lekérdezés vételére alkalmasnak kell tekinteni.

Megjegyzés. – Összeütközés-elhárító fedélzeti rendszerekhez kötődő válaszjeladók szintén fogadnak UF = 16 adásokat.

3.1.2.4.1.3 *Válaszjeladó válaszok.* Az S-módú válaszjeladók a következő válasz típusokat továbbítják:

a) A-módú és C-módú válaszok; és

b) S-módú válaszok.

3.1.2.4.1.3.1 *A-módú és C-módú válaszok.* A-módú (C-módú) választ kell továbbítani a 3.1.1.6 pontban meghatározott módon, ha A-módú (C-módú) lekérdezést vettek.

3.1.2.4.1.3.2 *S-módú válaszok.* Az A-módú és C-módú lekérdezésektől eltérő lekérdezésekre a válaszok S-módúak.

3.1.2.4.1.3.2.1 *Válaszok közös módú lekérdezésekre.* Fedélzetről leadott 11-es formátumú S-módú választ a 3.1.2.5.2.2 alpont rendelkezéseivel összhangban kell továbbítani, ha A/C/S-módú körhívás lekérdezést vettek.

Megjegyzés. – Mivel S-módú válaszjeladók nem vesznek csak A/C-módú lekérdezéseket, választ nem generálnak.

3.1.2.4.1.3.2.2 *Válaszok S-módú lekérdezésekre*. Az S-módú választ tartalmazó információk azokat a körülményeket tükrözzék vissza, amelyek a válaszjeladókban ezt a választ kiváltó lekérdezés teljes feldolgozásának befejezése után fennállnak. A fedélzetre irányuló- és fedélzetről leadott közlemények formátumai közötti összefüggés feleljen meg a 3-5 táblázatban összegezetteknek.

Megjegyzés. – Az S-módú válaszok négy kategóriáját lehet átvinni az S-módú lekérdezésekre adott válaszokban:

a) S-módú körhívás válaszok (DF = 11)

b) felderítési és szabványos hosszúságú kommunikációs válaszok (DF = 4, 5, 20 és 21);

c) kiterjesztett hosszúságú kommunikációs válaszok (DF = 24

d) levegő-levegő felderítési válaszok (DF = O és 16)

3.1.2.4.1.3.2.2.1 *Válaszok a másodlagos légtérellenőrző radar csak S körhívás módú lekérdezéseire.* Egy csak S körhívás módú lekérdezésre adott válasz (ha igényelt) fedélzetről leadott adattovábbítási formátuma DF = 11 legyen. A válasz tartalma és a válasz megkövetelésének meghatározásához szükséges szabályok a 3.1.2.5 pontban előírtaknak feleljenek meg.

Megjegyzés. – Egy S-módú választ, vagy továbbítanak, vagy nem továbbítanak, ha egy S-módú lekérdezést UF = 11-el vettek.

3.1.2.4.1.3.2.2.2 *Válaszok felderítési és szabványos hosszúságú lekérdezésekre*. S-módú választ akkor kell továbbítani, ha S-módú lekérdezést UF = 4, 5, 20 vagy 21-el vettek és egy légijármű címzés elfogadásra került. Ezeknek a lekérdezéseknek és válaszoknak a tartalma a 3.1.2.6 pontban előírtaknak feleljen meg.

Megjegyzés. – Ha egy UF = 20 vagy 21 értékű S-módú lekérdezést és egy adás címzést vesznek, akkor választ nem továbbítanak (3.1.2.4.1.2.3.1.3 alpont).

3.1.2.4.1.3.2.2.3 *Válaszok kiterjesztett hosszúságú kommunikációs lekérdezésekre.* Egy értéktartományon belül 0-tól - 16-ig terjedő S-módú válasz sorozatot kell továbbítani, ha egy S-módú lekérdezést UF = 24-el vettek. A válasz (ha van) fedélzetről leadott adattovábbítási formája DF = 24. A válasz számát és tartalmát meghatározó protokollok a 3.1.2.7 pontban előírtaknak feleljenek meg.

3.1.2.4.1.3.2.2.4 *Válaszok a levegő-levegő felderítési lekérdezésekre.* S-módú választ kell továbbítani, ha egy UF = 0 értékű S-módú lekérdezést és egy légijármű címzést vettek. Ezeknek a lekérdezéseknek és válaszoknak a tartalma a 3.1.2.8 pontban előírtaknak feleljen meg.

3.1.2.4.2 *Elnyomás*

3.1.2.4.2.1 *Az elnyomás hatásai.* Elnyomásban lévő válaszjeladó (3.1.1.7.4 pont) ne fogadjon el A-módú, C-módú vagy közös módú lekérdezéseket, ha a lekérdezés a P_1 impulzusát akár egyedül, akár a P_1 és P_3 impulzusát együtt vette az elnyomási időköz során. Az elnyomás nincsen hatással az S-módú lekérdezések felismerésére, vételére vagy a reá adott válaszokra.

3.1.2.4.2.2 *Elnyomás párok.* A 3.1.7.4.1 pontban meghatározott két-impulzusú A/C elnyomás pár kezdeményezzen elnyomást az S-módú válaszjeladóban, tekintet nélkül az impulzus párnak az impulzus csoportban elfoglalt pozíciójára, feltéve, hogy a válaszjeladó nem került már elnyomásba, vagy nincs átviteli ciklusban.

Megjegyzés. – A csak A/C-módú lekérdezés P_3 - P_4 párja megakadályozza a választ, és elnyomást indít el. Hasonlóan, az S-módú lekérdezés P_1 - P_2 bevezetője elnyomást indít be, függetlenül az őt követő hullámformától.

3.1.2.5 Inter (közös) módú és S-módú körhívás tranzakciók

3.1.2.5.1 *Közös módú tranzakciók*

Megjegyzés. – A közös módú tranzakciók lehetővé teszik csak A/C-módú légijárművek felderítését és S-módú légijárművek kiválasztását. Az A/C/S-módú körhívás lekérdezések lehetővé teszik, hogy ugyanazok az átvitelek kérdezzék le a csak A/C-módú és S-módú válaszjeladókat. A csak A/C-módú körhívás lekérdezés kizárólag A/C-módú válaszjeladók válaszra késztetését teszi lehetővé. Többhelyes körülmények között a lekérdezőnek az azonosító kódját továbbítania kell csak S-módú körhívás lekérdezésben. Így egy csak S-módú és egy csak A/C-módú körhívás pár lekérdezést használnak. A közös módú lekérdezéseket a 3.1.2.1.5.1 alpont írja elő és a hozzátartozó lekérdezés-válasz protokollok a 3.1.2.4 pontban vannak meghatározva.

3.1.2.5.2 *Csak S körhívás módú tranzakciók*

Megjegyzés. – Ezek a tranzakciók lehetővé teszik, hogy a föld befogja az S-módú légijárművet az összes S móddal ellátott légijárműnek címzett lekérdezés alkalmazásával. A válasz 11-es fedélzetről leadott adattovábbítási formátumon keresztüli, amely visszaküldi a légijármű címzést. A lekérdezés-válasz protokollok a 3.1.2.4 pontban lettek meghatározva.

3.1.2.5.2.1 *Csak S körhívás módú lekérdezés*, *fedélzetre irányuló 11-es adattovábbítási formátum*

1	6	10	14	17	33	
UF	PR	IC	CL		AP	
5	9	13	16	32		56

Ennek a lekérdezésnek a formátuma az alábbi mezőkből áll:

Mező	*Hivatkozás*
UF fedélzetre irányuló adattovábbítási formátum	3.1.2.3.2.1.1
PR a válasz valószínűsége	3.1.2.5.2.1.1
IC lekérdező kód	3.1.2.5.2.1.2
CL kód címke tartalék - 16 bit	3.1.2.5.2.1.3
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.5.2.1.1 *PR: válasz valószínűsége*. Ez a 4-bites (6-9) fedélzetre irányuló adattovábbítási mező utasításokat tartalmaz a válaszjeladó részére, amelyek meghatározzák a lekérdezésre adott válasz valószínűségét. A kódok a következők:

0	1 valószínűséggel rendelkező választ jelent
1	1/2 valószínűséggel rendelkező választ jelent
2	1/4 valószínűséggel rendelkező választ jelent
3	1/8 valószínűséggel rendelkező választ jelent
4	1/16 valószínűséggel rendelkező választ jelent
5, 6, 7	nincs kijelölve
8	elhanyagolási kizárást, 1 valószínűséggel rendelkező választ jelent
9	elhanyagolási kizárást, 1/2 valószínűséggel rendelkező választ jelent
10	elhanyagolási kizárást, 1/4 valószínűséggel rendelkező választ jelent
11	elhanyagolási kizárást, 1/8 valószínűséggel rendelkező választ jelent
12	elhanyagolási kizárást, 1/16 valószínűséggel rendelkező választ jelent
13, 14, 15	nincs kijelölve

3.1.2.5.2.1.2 *IC: Lekérdező kód.* Ez a 4-bites (10-13) fedélzetre irányuló adattovábbítási mező vagy egy 4-bites érték vagy lekérdező azonosító kódot (3.1.2.5.2.1.2.3 alpont) vagy a 6-bites ellenőrzés azonosító kód alsó 4-bitjét (3.1.2.5.2.1.2.4 alpont) tartalmazza a CL mező értékétől függően (3.1.2.5.2.1.3 pont).

3.1.2.5.2.1.2.1 **Ajánlás. –** Ajánlott, hogy amikor lehetséges, a lekérdező egyetlen lekérdező kódot használjon.

3.1.2.5.2.1.2.2 *Többszörös lekérdező kód egy lekérdező berendezés általi használata.* Egy lekérdező nem illeszthet be csak S körhívás módú lekérdezéseket különböző lekérdező kódok alkalmazásával.

Megjegyzés: A rádiófrekvenciás interferencia kibocsátások, a szektor méretek és az adatkapcsolatokra gyakorolt hatások magyarázata a ”Manual of the Secondary Surveillance Radar (SSR) Systems *(Doc 9684)” kiadványban találhatók.*

3.1.2.5.2.1.2.3. *II. Lekérdező azonosító.* Ez a 4-bites érték egy lekérdező azonosító (II) kódot határoz meg. Ezeket az II kódokat a lekérdezőknek a 0-tól 15-ig terjedő értéktartományban jelölik ki. A 0 értékű II kódot csak a kiegészítő adatgyűjtésre használják, a kizárás hatálytalanításon alapuló adatgyűjtéssel kapcsolatban (3.1.2.5.2.1.4 és 3.1.2.5.2.1.5 pontok). Amikor két II kód csak egy lekérdezőhöz van kijelölve, az egyik kódot teljes adatkapcsolati célokra kell használni.

Megjegyzés: Korlátozott adatkapcsolati tevékenységet, amely egyetlen szegmens Comm-A szegmenst, fedélzetre irányuló adattovábbítási és fedélzetről leadott adattovábbítás adási protokollokat és GICB kivonatot tartalmaz, mindkét II kód végezhet.

3.1.2.5.2.1.2.4 *SI: Felderítési azonosító.* Ez a 6-bites érték egy ellenőrzés azonosító (SI) kódot határoz meg. Ezeket az SI kódokat a lekérdezőkhöz az 1-től 63-ig terjedő értéktartományban jelölik ki. A 0 értékű SI kódot nem használják. Az SI kódokat többhelyes kizárás protokollokkal használják (3.1.2.6.9.1). Az SI kódokat többhelyes kommunikációs protokollokkal nem használják. (3.1.2.6.11.3.2, 3.1.2.7.4 vagy 3.1.2.7.7 pontok).

3.1.2.5.2.1.3 *CL: Kód címke.* Ez a 3-bites (14-16) fedélzetre irányuló adattovábbítási mező az IC mező tartalmát határozza meg.

Kódolás (bináris)

000	azt jelöli, hogy az IC mező a II kódot tartalmazza
001	azt jelöli, hogy az IC mező az SI kódokat 1-től 15-ig tartalmazza
010	azt jelöli, hogy az IC mező az SI kódokat 16-tól 31-ig tartalmazza
011	azt jelöli, hogy az IC mező az SI kódokat 32-től 47-ig tartalmazza
100	azt jelöli, hogy az IC mező az SI kódokat 48-tól 63-ig tartalmazza

A CL mező többi értékét nem használják.

3.1.2.5.2.1.3.1 *Felderítés azonosító (SI) kód képesség jelentés.* Azon válaszjeladók, amelyek feldolgozzák az SI kódokat (3.1.2.5.2.1.2.4 pont), ezt a képességet a 35-ös bit 1-re állításával jelentik az adatkapcsolat képesség jelentés (3.1.2.6.10.2.2 pont) MB mezője felderítés azonosító képesség (SIC) almezőjében.

3.1.2.5.2.1.4 *Kizárás felülbírálásán alapuló működés.*

1. Megjegyzés – A csak S körhívás módú kizárás felülbírálásának használata teszi lehetővé a lekérdezők számára az adatgyűjtést, azon S-módú légijárművekről, amelyek számára egyedi IC (II vagy SI kód) nincs kijelölve a teljes S-módú működéshez (védett adatgyűjtési üzemmód, amely biztosítja, hogy más lekérdezők, azonos IC kóddal ne zárhassák ki az azonos lefedettségükben lévő céltárgyakat).

2. Megjegyzés – A kizárás felülbírálása bármely lekérdező kóddal megvalósítható.

3.1.2.5.2.1.4.1 *Maximális csak S körhívás módú lekérdezési sebesség.* Egy kizárás felülbírálásán alapuló kiválasztást felhasználó lekérdező által végzett csak S körhívás módú lekérdezések maximális sebessége a válaszolási valószínűségtől függ az alábbiak szerint:

a) 1,0-el egyenlő válaszadási valószínűségnél:

a 3 lekérdezés per 3 dB-es sugárszünet vagy 30 lekérdezés per másodperc közül a kisebbik;

b) 0,5-el egyenlő válaszadási valószínűségnél:

az 5 lekérdezés per 3 dB-es sugárszünet vagy 60 lekérdezés per másodperc közül a kisebb; és

c) 0,25-el vagy kevesebbel egyenlő válaszadási valószínűségnél:

a 10 lekérdezés per 3 dB-es sugárszünet vagy 125 lekérdezés per másodperc közül a kisebb.

Megjegyzés: Ezeket a határértékeket abból a célból határozták meg, hogy minimumra lehessen csökkenteni az ilyen módszerek által keltett rádiófrekvenciás zajokat, miközben a sugárszüneteken belül a légijárművek begyűjtése érdekében a válaszokat minimumon tartják.

3.1.2.5.2.1.4.2 *Olyan szelektíven címzett lekérdezés mező tartalma, amely kijelölt lekérdező kóddal nem rendelkező lekérdezőtől származik.* Az egyedi kijelölt lekérdező kóddal nem rendelkező, adatsugárzásra engedélyezett lekérdező, a szelektív lekérdezéshez, használja a II kód 0 értéket. Ebben az esetben az olyan szelektíven címzett lekérdezések, amelyek adatgyűjtéshez kizárás felülbírálást használnak a lekérdezés adatmezők a következő tartalomkorlátozással rendelkezzenek:

UF = 4, 5, 20 vagy 21
PC = 0
RR $\neq$ 16, ha RRS = 0
DI = 7
IIS = 0
LOS = 0, kivéve a 3.1.2.5.2.1.5 pontban előírtakat
TMS = 0

Megjegyzés. – Ezek a korlátozások az ellenőrzési és GICB tranzakciókat lehetővé teszik, de megakadályozzák a lekérdezést a válaszjeladó többhelyes kizárást vagy kommunikáció protokoll állapot változást előidézőktől.

3.1.2.5.2.1.5 *0-val egyenlő lekérdező azonosítót (II) használó kiegészítő adatgyűjtés*

1. Megjegyzés. – A 3.1.2.5.2.1.4 pontban meghatározott adatgyűjtési eljárás gyors befogási lehetőséget ad a legtöbb légijármű számára. A folyamat valószínűségi jellege miatt ez sok lekérdezést jelenthet, hogy egy nagy légijármű együttesből az utolsó légijármű befogásra kerüljön ugyanazon sugárszünetben és majdnem ugyanazon távolságban (helyi csonkítás zónának nevezik). A megszerzési teljesítmény nagymértékben javul ezeknek a légijárműveknek a megszerzésével a 0-val egyenlő lekérdezési azonosítót használó korlátozott szelektív kizárás alkalmazása által.

2. Megjegyzés. - A kiegészítő adatgyűjtés a II = 0 értékig befogott légijárművek kizárásából áll, a II = 0 értékkel bíró csak S körhívás módú lekérdezési eszközökkel történő adatgyűjtéseket követően. Csak azok a légijárművek válaszolnak az egyszerűsített adatgyűjtésre,amelyek még nem lettek befogva és nincsenek kizárva sem.

3.1.2.5.2.1.5.1 *Kizárás egy sugárszüneten belül*

3.1.2.5.2.1.5.1.1 **Ajánlás.** – *Amikor II egyenlő 0 kizárást használnak az adatgyűjtési eljárás kiegészítésére, akkor a befogott légijármű sugárszünetén belüli összes légijárművet utasítani kell az II egyenlő 0 kizárásra, nemcsak azokat, amelyek a csonkítás zónán belül vannak.*

Megjegyzés. – A sugárszüneten belül lévő összes légijármű kizárása lecsökkenti az II egyenlő 0 körhívás lekérdezésekre generált körhívás válaszok mennyiségét.

3.1.2.5.2.1.5.2 *Kizárás időtartama*

3.1.2.5.2.1.5.2.1 Kiegészítő adatgyűjtést teljesítő, II egyenlő 0-t használó lekérdezőknek az adatgyűjtést egy kizárás utasítás továbbításával kell végrehajtani nem több, mint két egymást követő pásztázással a befogott légijármű mindegyikéhez a csonkítás zónát tartalmazó sugárszünetben, és nem ismételhetik meg azt, mielőtt 48 mp eltelne.

Megjegyzés: A kizárási idő minimalizálása lecsökkenti a konfliktus valószínűségét ami a kiegészítő adatgyűjtéshez II egyenlő 0-t használó szomszédos lekérdező adatgyűjtési aktivitása során alakulhat ki.

3.1.2.5.2.1.5.2.2 **Ajánlás**. – *A kiegészítő adatgyűjtésre szolgáló II = 0 értékű csak S körhívás módú lekérdezéseket csak két egymást követő pásztázásnál, vagy maximum 18 mp-ig alkalmazzák a csonkításos zónán belül.*

3.1.2.5.2.2 *Körhívás válasz, fedélzetről leadott 11-es adattovábbítási formátum:*

1	6	9	33
DF	CA	AA	PI
5	8	32	56

A válasz a csak S körhívás módú vagy A/C/S-módú körhívás lekérdezésekre az S-módú körhívás, 11-es fedélzetről leadott adattovábbítás formátum legyen. Ennek a válasznak a formátuma a következő mezőkből áll.

Mező	Hivatkozás
DF fedélzetről leadott adattovábbítás formátum	3.1.2.3.2.1.2
CA képesség	3.1.2.5.11.1
AA közölt cím	3.1.2.5.2.2.2
PI paritás/lekérdezés azonosító	3.1.2.3.2.1.4

3.1.2.5.2.2.1 *CA: képesség*. Ez a 3-bites (6-8) fedélzetről leadott adattovábbítási mező a válaszjeladó kommunikációs képességének kódolt meghatározását tartalmazza és DF= 11 valamint DF = 17 formátumokban kerül felhasználásra.

Kódolás

0 azt jelenti, hogy a válaszjeladó 1. szintű (csak felderítés), és nem rendelkezik a CA 7 kód valamint a földön vagy a levegőben való tartózkodás beállításának képességével

1 fenntartott

2 fenntartott

3 fenntartott

4 azt jelenti, hogy a válaszjeladó 2. szintű vagy afölötti és rendelkezik a CA 7 kód valamint a földön való tartózkodás beállításának képességével

5 azt jelenti, hogy a válaszjeladó 2. szintű vagy afölötti és rendelkezik a CA 7 kód valamint a levegőben való tartózkodás beállításának képességével

6 azt jelenti, hogy a válaszjeladó 2. szintű vagy afölötti és rendelkezik a CA 7 kód valamint a földön vagy a levegőben való tartózkodás beállításának képességével

7 azt jelenti, hogy a DR mező nem egyenlő 0-val és az FS mező egyenlő 2, 3, 4 vagy 5-el, és vagy a földön vagy a levegőben való állapot áll fenn.

Amikor a CA 7 kódhoz tartozó feltételek nem teljesülnek, akkor a 2. szintű vagy afölötti válaszjeladók melyek nem rendelkeznek automatikus eszközökkel a földön való tartózkodási feltételek beállítására, CA 6 kódot használnak. A földön való tartózkodás automatikus meghatározására alkalmas légijárművek CA 4 kódot használnak amikor a földön tartózkodnak és 5 kódot használnak amikor a levegőben vannak. Adatkapcsolat képesség közlések (3.1.2.6.10.2.2 pont) olyan felszereltségű légijárműveknél állnak rendelkezésre, amelyeken a CA 4, 5, 6 vagy 7 kód beállítható.

Megjegyzés. – A CA 1-től 3-ig kódok a visszafelé irányuló kompatibilitás megteremtésére vannak fenntartva.

3.1.2.5.2.2.2 *AA: közölt cím.* Ez a 24-bites (9-32) fedélzetről leadott adattovábbítási mező tartalmazza a légijármű címzést, amely a légijármű egyértelmű azonosítását biztosítja.

3.1.2.5.3 *Kizárás protokoll.* A 3.1.2.6.9 pontban megfogalmazott körhívás kizárás protokollt azok a lekérdezők használják egy adott légijármű vonatkozásában, ha az adott légijármű címzését egy lekérdező befogta, feltéve, hogy:

– a lekérdező IC kód nullától különbözik; és

– a légijármű olyan légtérben tartózkodik, ahol a lekérdező kizárásra engedélyezett.

1. Megjegyzés – Az adatgyűjtést követően a válaszjeladót szelektíven címezve kérdezik, ahogy azt 3.1.2.6, 3.1.2.7 és 3.1.2.8 leírja és a körhívás kizárás protokollt a további körhívás lekérdezésekre adandó válaszok kiküszöbölésére használják.

2. Megjegyzés – A körzeti IC kód kijelölésért felelős hatóságok szabályozásában a szelektív lekérdezések és kizárás protokollok alkalmazása korlátozható (pl. kizárás tiltása egy meghatározott korlátozott légtérben, időszakos kizárás alkalmazás egy meghatározott légtérben, a légijárművek kizárásának tiltása SI kód kapacitás hiánya miatt).

3.1.2.5.4 *Sztochasztikus körhívás protokoll.* A válaszjeladónak véletlenszerű folyamatot kell végrehajtania olyan csak S körhívás módú vételnél, amelynek PR kódja 1-től 4-ig vagy 9-től 12-ig terjedő értékű. A válaszra vonatkozó döntést a lekérdezésben előírt valószínűséggel kell meghozni. A válaszjeladónak nem kell válaszolnia, ha 5, 6, 7, 13, 14 vagy 15-el egyenlő PR kód került vételre (3.1.2.5.2.1.1 alpont).

Megjegyzés. – A válaszok véletlen előfordulása lehetővé teszi a lekérdező számára, hogy befogjon közelben tartózkodó légijárműveket, amelyektől a válaszok más esetben szinkron módon csonkítanák egymást.

3.1.2.6 Címzett felderítés és szabványos hosszúságú kommunikációs tranzakciók

1. Megjegyzés. – Az ebben a szakaszban leírt lekérdezések meghatározott légijárműveknek vannak címezve. Két lekérdezési és válasz típus van, rövid és hosszú. A rövid lekérdezések és válaszok UF 4 és 5, míg a hosszú lekérdezések és válaszok UF 20 és 21 és DF 20 és 21.

2. Megjegyzés. – A kommunikációs protokollokat a 3.1.2.6.11 alpont tartalmazza. Ezek a protokollok az adatcsere szabályozást írják elő.

3.1.2.6.1 *Felderítés, magasság kérés, 4-es fedélzetre irányuló adattovábbítási formátum*

1	6	9	14	17	33
UF	PC	RR	DI	SD	AP
5	8	13	16	32	56

Ennek a lekérdezésnek a formátuma a következő mezőkből áll:

Mező	*Hivatkozás*
UF felfelé irányuló	3.1.2.3.2.1.1
kapcsolat formátum	3.1.2.6.1.1
PC protokoll	3.1.2.6.1.2
RR válasz kérés	3.1.2.6.1.3
DI jelölő azonosító	3.1.2.6.1.4
SD különleges jelölő	3.1.2.3.2.1.3
AP címzés/paritás	

3.1.2.6.1.1 *PC protokoll.* Ez a 3-bites (6-8) fedélzetre irányuló adattovábbítási mező működési utasításokat tartalmaz a válaszjeladó számára. A PC mezőt elhanyagolják a felderítés vagy DI=3-at tartalmazó Comm-A lekérdezések feldolgozásánál (3.1.2.6.1.4.1).

Kódolás

0	azt jelenti, hogy nincs beavatkozás
1	a nem-szelektív körhívás kizárást (3.1.2.6.9.2 pont) jelenti
2	nincs kijelölve
3	nincs kijelölve
4	a Comm-B kizárást (3.1.2.6.11.3.2.3 pont) jelenti
5	a fedélzetre irányuló ELM kizárást (3.1.2.7.4.2.8 pont) jelenti
6	a fedélzetről leadott ELM kizárást (3.1.2.7.7.3 pont) jelenti
7	nincs kijelölve

3.1.2.6.1.2 *RR: válasz kérés.* Ez az 5-bites (9-13) fedélzetre irányuló adattovábbítási mező a kért válasz hosszúságára és tartalmára ad utasítást.

Az 5-bites RR kód utolsó négy bitje át lett alakítva a annak decimális megfelelőjévé, és kijelöli az igényelt Comm-B közlés BDS1 kódját (3.1.2.6.11.2 vagy 3.1.2.6.11.3 pont), ha az RR kód legértékesebb bitje 1-el egyenlő (RR egyenlő vagy nagyobb mint 16).

Kódolás

RR =	0-15 felderítési formátummal (DF = 4 vagy 5) válasz kérésére használják;
RR =	16-31 Comm-B formátummal (DF = 20 vagy 21) válasz kérésére használják;
RR =	16 a 3.1.2.6.11.3 alpontnak megfelelően, levegőből kezdeményezett Comm-B adattovábbítás kérésére használják;
RR =	17 a 3.1.2.6.10.2.2 alpont szerinti adatkapcsolat képességi közlés kérésére használatos;
RR =	18 a 3.1.2.9 pontnak megfelelő légijármű azonosítás kérésére használatos;
19-31	nincs kijelölve a 3.1 szakaszban.

Megjegyzés. – A 19-31 kódok olyan alkalmazásokra vannak fenntartva, mint például adat kapcsolat kommunikáció, összeütközés-elhárító fedélzeti rendszer (ACAS), stb.

3.1.2.6.1.3 *DI: jelölő azonosító.* Ez a 3-bites (14-16) fedélzetre irányuló adattovábbítási mező azonosítja az SD mező struktúráját (3.1.2.6.1.4 pont).

Kódolás

0	azt jelenti, hogy az SD nincs kijelölve, kivéve az IIS esetét
1	azt jelenti, hogy az SD többhelyes és kommunikáció szabályozási információt tartalmaz
2	azt jelenti, hogy az SD irányítás adatokat tartalmaz a kiterjesztett squitter számára
3	azt jelenti, hogy az SD SI többhelyes kizárási, rádióadási és GICB irányítás információkat tartalmaz
4-6	azt jelenti, hogy az SD nincs kijelölve
7	azt jelenti, hogy az SD kiterjesztett adat kiolvasás kérést, többhelyes és kommunikáció szabályozási információt tartalmaz.

3.1.2.6.1.4 *SD: különleges jelölő.* Ez a 16-bites (17-32) fedélzetre irányuló adattovábbítási mező szabályozási kódokat tartalmaz, melyek a DI mezőben való kódolástól függnek.

Megjegyzés. – A különleges jelölő (SD) mező feladata a többhelyes, kizárási és kommunikációs szabályozási információk továbbítása a földi állomástól a válaszjeladóig.

DI KÓD *SD MEZŐ STRUKTÚRA*

	17	21					
0	IIS						
	20					32	

	17	21	23	26	27	29	
1	IIS	MBS	MES	LOS	RSS	TMS	
	20	22	25		28	32	

	17	21	24	27	29		
2		TCS	RCS	SAS			
	20	23	26	28		32	

	17	23	24	28			
3	SIS	LSS	RRS				
	22		27			32	

	17	21	25	26	27	29	
7	IIS	RRS		LOS		TMS	
	20	24			28	32	

3.1.2.6.1.4.1 *Almezők az SD-ben.* Az SD mező a következő információkat tartalmazza:

a) Ha DI = 0, 1 vagy 7:

IIS, a 4 bites (17-20) lekérdező azonosító almező tartalmazza a lekérdező egy kijelölt azonosító kódját (3.1.2.5.2.1.2 pont).

b) Ha DI = 0
21-32 bitek nincsenek kijelölve

c) Ha DI = 1

MBS, a 2-bites (21-22) többhelyes Comm-B almező a következő kódokkal rendelkezzen:

0 azt jelenti, hogy nincs Comm-B akció
1 a levegőből kezdeményezett Comm-B helyfoglalás kérést (3.1.2.6.11.3.1 pont) jelenti
2 a Comm-B kizárást (3.1.2.6.11.3.2.3 pont) jelenti
3 nincs kijelölve

MES, a 3-bites (23-25) többhelyes ELM almező tartalékolási és kizárási utasításokat tartalmaz az ELM részére a következők szerint:

0 azt jelenti, hogy nincs ELM beavatkozás
1 a fedélzetre irányuló ELM helyfoglalás kérést (3.1.2.7.4.1 pont) jelenti
2 a fedélzetre irányuló ELM kizárást (3.1.2.7.4.2.8 pont) jelenti
3 a fedélzetről leadott ELM helyfoglalás kérést (3.1.2.7.7.1.1 pont) jelenti
4 a fedélzetről leadott ELM kizárást (3.1.2.7.7.3 pont) jelenti
5 a fedélzetre irányuló- ELM helyfoglalás kérést és fedélzetről leadott ELM kizárást jelenti
6 a fedélzetre irányuló ELM kizárást és fedélzetről leadott adattovábbítási helyfoglalás kérést jelenti
7 a fedélzetre irányuló ELM és fedélzetről leadott ELM kizárásokat jelenti.

RSS, a 2-bites (27, 28) helyfoglalási állapot almező a válaszjeladótól közlést kér tartalékolási állapotáról az UM mezőben. A következő kódok lettek kijelölve:

0 azt jelenti, hogy nincs kérés
1 a Comm-B tartalékolási állapot UM-ben közlést jelenti
2 a fedélzetre irányuló ELM foglalási állapot közlést jelenti
3 a fedélzetről leadott ELM foglalási állapot közlést jelenti.

d) Ha DI = 1 vagy 7:

LOS, az 1-bites (26) kizárás almező egy többhelyes kizárási utasítást jelöl az IIS-ben jelzett lekérdezőtől. A LOS 0-ra állítását annak jelölésére használják, hogy nincs utasítás a kizárás állapot megváltoztatására.

TMS, a 4-bites (29-32) taktikai közlemény almező az adatkapcsolati repüléselektronika által használt kommunikáció szabályozási információkat tartalmaz.

e) Ha DI = 7:
RRS, a 4-bites (21-24) válasz kérési almező SD-ben megadja a kért Comm-B válasz BDS2 kódját.
A 25, 27 és 28-s bitek nincsenek kijelölve.

f) Ha DI = 2:

TCS, a 3-bites (21-23) típus irányítás almező SD-ben irányítja a válaszjeladó által használt pozíció típust. A következő kódok lettek kijelölve:

0 azt jelenti, hogy nincs helyzet típusú utasítás
1 a földi helyzet típus használatát jelenti a következő 15 másodpercre
2 a földi helyzet típus használatát jelenti a következő 60 másodpercre
3 a felszín típusú utasítás törlését jelenti
4-7 nincs kijelölve

RCS, a 3-bites sebesség szabályozás almező SD-ben szabályozza a válaszjeladó squitter sebességét a földi formátum jelentése során. Ennek az almezőnek nincs hatása a válaszjeladó squitter sebességére, a levegőben lévő helyzet típusának jelentése során. A következő kódok lettek kijelölve:

0 azt jelzi, hogy nincs földfelszíni pozícióról szóló kiterjesztett squitter sebesség utasítás
1 a 60 másodpercig tartó, nagy magasságú földfelszíni pozíció kiterjesztett squitter sebesség jelentést jelzi
2 a 60 másodpercig tartó, kismagasságú földfelszíni pozíció kiterjesztett squitter sebesség jelentést jelzi
3 az összes földfelszíni pozíció kiterjesztett squitter 60 másodpercig tartó elnyomását jelzi
4 az összes földfelszíni pozíció kiterjesztett squitter 120 másodpercig tartó elnyomását jelzi
5-7 nincs kijelölve

Megjegyzés. – Nagy- és kissebességű squitter sebesség meghatározását a 3.1.2.8.6.4.3 pont tartalmazza.

Megjegyzés: a 3.1.2.8.5.2 d) alpontban közöltek szerint az adatbegyűjtési squitter-ek sugárzására csak akkor kerül sor, ha a földi elhelyezésű kiterjesztett squitterek összenyomását RCS = 3 vagy 4 felhasználásával végzik.

SAS, a 2-bites (27-28) felületi antenna almező SD-ben irányítja a válaszjeladó eltérés antennát, amelyet (1) a kiterjesztett squitter-hez használnak, amikor az a felületi formátumot közli és (2) adatbegyűjtési squitter-hez használnak, amikor az a földi állapotot jelzi. Ez az almező nincs hatással a válaszjeladó eltérés antenna megszerzésére, amikor az a fedélzeti pozíció típust közli. A következő kódok lettek kijelölve:

0 azt jelöli, hogy nincs antenna utasítás
1 az egymást felváltó felső és alsó antennákat jelöli 120 másodpercig
2 az alsó antennát jelöli 120 másodpercig
3 az alapértelmezéshez való visszatérést jelenti.

Megjegyzés. – A felső (tető) antenna az alapértelmezett állapot (3.1.2.8.6.5 pont).

g) Ha DI = 3

SIS a 6-bites (17-22) felderítés azonosító almező az SD-ben, amelynek tartalmaznia kell a lekérdező kijelölt felderítési azonosító kódját (3.1.2.5.2.1.2.4).

LSS, az 1-bites (23) kizárás felderítés almező, ha 1-re állítják, egy többhelyes kizárás utasítást jelöl a SIS-ben jelzett lekérdezőtől. Ha 0-ra állítják, LSS azt jelöli, hogy nincs változás, a kizárás állapotban utasítás van.

RRS, a 4-bites (24-27) válasz kérés almező SD-ben a kért GICB regiszter BDS2 kódot tartalmazza.

A 28 -32 bitek nem lettek kijelölve.

3.1.2.6.1.5 *PC és SD mező feldolgozás*. Amikor DI = 1, a PC mező feldolgozás az SD mező feldolgozás előtt befejeződik.

3.1.2.6.2 *Comm-A magasság kérés, fedélzetre irányuló 20-as adattovábbítási formátum*

1	6	9	14	17	33	89
UF	PC	RR	DI	SD	MA	AP
5	8	13	16	32	88	112

Ennek a lekérdezésnek a formátuma a következő mezőkből tevődik össze:

Mező *Hivatkozás*

UF fedélzetre irányuló adattovábbítási formátum 3.1.2.3.2.1.1
PC protokoll 3.1.2.6.1.1
RR válasz kérés 3.1.2.6.1.2
DI jelölő azonosítás 3.1.2.6.1.3
SD különleges jelölő 3.1.2.6.1.4
MA közlemény, Comm-A 3.1.2.6.2.1
AP címzés/paritás 3.1.2.3.2.1.3

3.1.2.6.2 1 *MA: Közlemény, Comm-A. Ez az 56-bites (33-88) mező egy adat kapcsolat közleményt tartalmaz a légijárműhöz.*

3.1.2.6.3 *Felderítési azonosság kérés, fedélzetre irányuló 5-ös adattovábbítási formátum*

1	6	9	14	17	33
UF	PC	RR	DI	SD	AP
5	8	13	16	32	56

Ennek a lekérdezésnek a formátuma a következő mezőkből áll:

Mező Hivatkozás

UF fedélzetre irányuló adattovábbítási formátum 3.1.2.3.2.1.1
PC protokoll 3.1.2.6.1.1
RR válasz kérés 3.1.2.6.1.2
DI jelölő azonosítás 3.1.2.6.1.3
SD különleges jelölő 3.1.2.6.1.4
AP címzés/paritás 3.1.2.3.2.1.3

3.1.2.6.4 *Comm-A azonosság kérés, fedélzetre irányuló 21-es adattovábbítási formátum*

1	6	9	14	17	33	89
UF	PC	RR	DI	SD	MA	AP
5	8	13	16	32	88	112

Ennek a lekérdezésnek a formátuma a következő mezőkből áll:

Mező	Hivatkozás
UF fedélzetre irányuló adattovábbítási formátum	3.1.2.3.2.1.1
PC protokoll	3.1.2.6.1.1
RR válasz kérés	3.1.2.6.1.2
DI jelölő azonosítás	3.1.2.6.1.3
SD különleges kijelölő	3.1.2.6.1.4
MA közlemény, Comm-A	3.1.2.6.2.1
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.6.5 *Felderítési magasság válasz, fedélzetről leadott 4-es adattovábbítási formátum*

1	6	9	14	20	33
DF	FS	DR	UM	AC	AP
5	8	13	19	32	56

Ez a válasz egy 16-nál kisebb értékű RR mezőjű UF4 vagy 20 lekérdezésre adott visszajelzésre jön létre. Ezen válasz formátuma a következő mezőkből áll:

Mező	*Hivatkozás*
DF fedélzetről leadott adattovábbítási formátum	3.1.2.3.2.1.2
FS repülési állapot	3.1.2.6.5.1
DR fedélzetről leadott adattovábbítás kérés	3.1.2.6.5.2
UM közlemény	3.1.2.6.5.3
AC magasság kód	3.1.2.6.5.4
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.6.5.1 *FS: repülési állapot. Ez a 3-bites (6-8) fedélzetről leadott adattovábbítási mező a következő információkat tartalmazza:*

Kódolás

0 azt jelenti, hogy nincs figyelmeztetés és nincs SPI, a légijármű a levegőben van
1 azt jelenti, hogy nincs figyelmeztetés és nincs SPI, a légijármű a földön van
2 azt jelenti, hogy figyelmeztetés van, nincs SPI, a légijármű a levegőben van
3 azt jelenti, hogy figyelmeztetés van, nincs SPI, a légijármű a földön van
4 azt jelenti, hogy figyelmeztetés és SPI van, a légijármű a levegőben vagy a földön van
5 azt jelenti, hogy nincs figyelmeztetés és SPI, a légijármű a levegőben vagy a földön van
6 fenntartott

7 nincs kijelölve

Megjegyzés. – Azok a feltételek, amelyek figyelmeztetést váltanak ki, a 3.1.2.6.10.1.1 pontban találhatók.

3.1.2.6.5.2 *DR: fedélzetről leadott adattovábbítási kérés*. Ez az 5-bites (9-13) fedélzetről leadott adattovábbítás mező fedélzetről leadott adattovábbítási információ kéréseket tartalmaz.

Kódolás

0	azt jelenti, hogy nincs fedélzetről leadott adattovábbítási kérés
1	Comm-B közlemény küldése iránti kérést jelent
2	ACAS részére fenntartva
3	ACAS részére fenntartva
4	azt jelenti, hogy Comm-B adás közlemény 1 rendelkezésre áll
5	azt jelenti, hogy Comm-B adás közlemény 2 rendelkezésre áll
6	ACAS részére fenntartva
7	ACAS részére fenntartva
8-15	nincs kijelölve
16-31	lásd a fedélzetről leadott ELM protokollt (3.1.2.7.7.1 pont)

Az 1-15 kódok elsőbbséget élveznek a 16-31 kódokkal szemben.

Megjegyzés. – Az 1-15 kódoknak adott elsőbbség lehetővé teszi egy Comm-B közlemény számára, hogy egy fedélzetről leadott ELM bejelentést félbeszakítson. Ez prioritást ad a rövidebb közlemény közzétételének.

3.1.2.6.5.3 *UM: Végső közlemény.* Ez a 6-bites (14-19) fedélzetről leadott adattovábbítási mező válaszjeladó kommunikáció állapot információt tartalmaz a 3.1.2.6.1.4.1 és 3.1.2.6.5.3.1 pontokban előírtak szerint.

3.1.2.6.5.3.1 Almezők UM-ben többhelyes protokollok számára

UM mező struktúra

	14	18	
	IIS	IDS	
17	19		

A válaszjeladó a következő almezőket illeszti be a válasz UM mezejébe, ha egy ellenőrzés vagy Comm-A lekérdezés (UF egyenlő 4, 5, 20, 21) DI = 1 és RSS 0-tól különböző értéket tartalmaz:

IIS: A 4-bites (14-17) lekérdezés azonosító almező a lekérdező azonosítót közli, amely többhelyes kommunikáció részére van fenntartva.

IDS: A 2-bites (18-29) azonosító jelölő közli az IIS-ben azonosított lekérdező által eszközölt helyfoglalás típusát.

A kijelölt kódolás:

0	azt jelenti, hogy nincs információ
1	azt jelenti, hogy az IIS Comm-B II kódot tartalmaz

2 azt jelenti, hogy az IIS Comm-C II kódot tartalmaz
3 azt jelenti, hogy az IIS Comm-D II kódot tartalmaz

3.1.2.6.5.3.2 *Többhelyes tartalékolási állapot*. A földi állomás lekérdező azonosítója, amelyet a többhelyes Comm-B továbbítás részére (3.1.2.6.11.3.1 pont) éppen tartalékoltak, az IIS almezőben kerül továbbításra az 1-es kóddal együtt az IDS almezőben, ha az UM tartalma nincs a lekérdezés által előírva (ha DI = 0 vagy 7, vagy amikor DI = 1 és RSS = 0).

A földi állomás lekérdező azonosítója, amely jelenleg tartalékolva van a fedélzetről leadott ELM továbbítás (3.1.2.7.6.1 pont) részére, ha van ilyen, az IIS almezőben a 3-as kóddal együtt az IDS almezőben kerül továbbításra, ha az UM tartalmát a lekérdezés nem határozza meg és nincs éppen Comm-B helyfoglalás.

3.1.2.6.5.4 *AC: magasság kód.* Ez a 13-bites (20-32) mező a magasságot tartalmazza, amely a következők szerint van kódolva:

a) A 26-os bit M bit-ként van jelölve és 0, ha a magasság értékét lábban közlik. M egyenlő 1 értéket fenntartják arra az esetre, ha a magasság közlése metrikus egységekben történik.

b) Ha M egyenlő 0, akkor a 28-as bit Q bit-ként van jelölve. Q egyenlő 0-t annak jelölésére használják, hogy a magasságot 100-lábas növekményekben közöljék. A Q egyenlő 1-et annak jelzésére használják, hogy a magasságot 25-lábas növekményekben közöljék.

c) Ha az M bit (26-os bit) és a Q bit (28-as bit) egyenlő 0, a magasságot a 3.1.1.7.12.2.3 pont C-módú válaszai sémájának megfelelően kell kódolni. A 20-as bit-el kezdve a sorozat C1, A1, C2, A2, C4, A4, ZÉRO, B1, ZÉRO, B2, D2, B4, D4 lesz.

d) Ha az M bit egyenlő 0, és a Q bit egyenlő 1, a 20-tól-25-ig, 27 és 29-től 32 bit-ek által képviselt mező a 25 láb legkisebb jelentésű bit-hez (LSB) tartozó bináris kódolású mezőt reprezentál. “N” pozitív decimális egész szám bináris értékét kódolni kell a nyomásmagasság ((25 N-1000) plusz vagy mínusz 12,5 láb) tartományban való közlésére. A 3.1.2.6.5.4c pontnak megfelelő kódolást az 50 187,5 láb feletti nyomásmagasság közlésére használják.

1. Megjegyzés. – Ez a kódolási módszer csak mínusz 1000 láb és plusz 50 175 láb közötti értékek szolgáltatására képes.

2. Megjegyzés. – Ennek a mezőnek a legjelentősebb bitje (MSB) a 20-as bit, ahogyan azt a 3.1.2.3.1.3 pont megköveteli.

e) Ha az M bit egyenlő 1-el, a 20-tól - 25-ig és a 27-től - 31-ig bit-ek által reprezentált 12 bit-es mezőt a magasság metrikus egységekben történő kódolására tartják fenn.

f) 0-t az AC mező 13 bit-jének mindegyikében át kell vinni, ha magassági információ nem áll rendelkezésre, vagy a magasság értékét érvénytelenül határozták meg.

3.1.2.6.6 *Comm-B magasság válasz, fedélzetről leadott 20-as adattovábbítási formátum*

1	6	9	14	20	33	89
DF	FS	DR	UM	AC	MB	AP
5	8	13	19	32	88	112

Ez a válasz egy UF 4 vagy 20 lekérdezésre jön létre 15-nél nagyobb értékű RR mezővel. Ennek a válasznak a formátuma a következő mezőkből áll:

Mező	Hivatkozás
DF fedélzetről leadott adattovábbítás formátum	3.1.2.3.2.1.2
FS repülési állapot	3.1.2.6.5.1
DR fedélzetről leadott adattovábbítás kérés	3.1.2.6.5.2
UM közlemény	3.1.2.6.5.3
AC magasság kód	3.1.2.6.5.4
MB közlemény, Comm-B	3.1.2.6.6.1
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.6.6.1 *MB: közlemény, Comm-B.* Ezt az 56 bit-es (33-88) fedélzetről leadott adattovábbítási mezőt adatkapcsolati közleményeknek a földre való továbbítására használják.

3.1.2.6.7 *Felderítési azonosítási válasz, fedélzetről leadott 5-ös adattovábbítási formátum*

1	6	9	14	20	33
DF	FS	DR	UM	ID	AP
5	8	13	19	32	56

Ez a válasz egy UF 5 vagy 21 lekérdezésre adott válaszként jön létre, egy 16-nál kisebb értékű RR mezővel. Ennek a válasznak a formátuma a következő mezőkből áll:

Mező	Hivatkozás
DF fedélzetről leadott adattovábbítás formátum	3.1.2.3.2.1.2
FS repülési állapot	3.1.2.6.5.1
DR fedélzetről leadott adattovábbítás kérés	3.1.2.6.5.2
UM közlemény	3.1.2.6.5.3
ID azonosság	3.1.2.6.7.1
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.6.7.1 ID: azonosság (A-módú kód). Ez a 13 bit-es (20-32) mező légijármű azonossági kódot tartalmaz a 3.1.1.6 pontban lévő A-módú válaszok sémájának megfelelően. A 20-as bittel kezdve a sorozat C1, A1, C2, A2, C4, A4, ZÉRO, B1, D1, B2, D2, B4, D4 lesz.

3.1.2.6.8 *Comm-B azonosság válasz, 21-es fedélzetről leadott adattovábbítási formátum*

1	6	9	14	20	33	89
DF	FS	DR	UM	ID	MB	AP
5	8	13	19	32	88	112

Ez a válasz az UF 5 vagy 21 formátumú lekérdezés hatására jön létre, amikor az RR mező értéke nagyobb lesz, mint 15. A válasz formátuma az alábbi mezőket tartalmazza:

Mező	Hivatkozás
DF fedélzetről leadott adattovábbítás formátum	3.1.2.3.2.1.2
FS repülési állapot	3.1.2.6.5.1
DR fedélzetről leadott adattovábbítás kérés	3.1.2.6.5.2
UM közlemény	3.1.2.6.5.3
ID azonosság	3.1.2.6.7.1
MB közlemény, Comm-B	3.1.2.6.6.1
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.6.9 *Kizárás protokollok*

3.1.2.6.9.1 *Többhelyes körhívás kizárás*

Megjegyzés. – A többhelyes kizárás protokoll megakadályozza, hogy egy válaszjeladó kiválasztást egy földi állomás letiltson egy olyan szomszédos földi állomástól jövő letiltási utasítással, amely földi állomás átlapoló lefedéssel rendelkezik.

3.1.2.6.9.1.1 A többhelyes kizárási utasítást az SD mezőben (3.1.2.6.1.4.1 pont) továbbítják. Egy kizárás utasítást egy II kód számára egy SD-ben továbbítják DI = 1, vagy DI = 7 mellett. Egy kizárás utasítást egy SI kód számára egy DI = 3 beállítású SD-ben továbbítanak. SI kizárást 1-el egyenlő LSS és az SD SIS almezőjében, egy nem-zérus lekérdező azonosító jelenléte jelzi. Egy II kizárás utasítást LOS kód egyenlő 1-el jelzik és egy nem-zérus lekérdező azonosító jelenlétével az SD IIS almezőjében. Miután egy válaszjeladó egy többhelyes kizárási utasítást tartalmazó lekérdezést vesz, ez a válaszjeladó elkezdi bármely csak S körhívás módú lekérdezés kizárását (azaz nem-vételét), amely tartalmazza a kizárás utasítást adó lekérdező azonosítóját. A kizárás a többhelyes kizárás utasítást tartalmazó lekérdezés utolsó vétele utáni T_L időközön keresztül tart (3.1.2.10.3.9 pont). Többhelyes kizárás nem akadályozza meg egy PR 8-tól 12-ig kódokat tartalmazó, csak S körhívás módú lekérdezés vételét. Ha egy kizárás utasítást (LOS = 1) IIS = 0-val együtt fogadnak, ezt nem-szelektív körhívás kizárásként kell értelmezni (3.1.2.6.9.2 pont).

1. Megjegyzés. – Tizenöt lekérdező tud független többhelyes II kizárás utasítást küldeni. Kiegészítésként, 63 lekérdező tud független SI kizárás utasítást küldeni. Ezeknek az utasításoknak mindegyikét külön kell időzíteni.

2. Megjegyzés. – Többhelyes kizárás (amely csak nem-zérus II kódokat használ) nem befolyásolja a válaszjeladó reagálását II egyenlő 0-t tartalmazó, csak S körhívás módú lekérdezésekre vagy A/C/S-módú lekérdezésekre.

3.1.2.6.9.2 *Nem szelektív körhívás kizárás*

1. Megjegyzés. – Azokban az esetekben, ahol a többhelyes kizárás protokollt nem igénylik (pl. nincs átlapoló lefedés, vagy földi állomás koordináció van föld-föld kommunikáción keresztül), a nem-szelektív kizárás protokoll használható.

A PC mezőben 1-es kódot tartalmazó lekérdezés vétele után a válaszjeladó kizárást indít (azaz nem vesz) a körhívás lekérdezés két típusánál:

a) csak S körhívás módú (UF = 11) II egyenlő 0 mellett; és

b) a 3.1.2.1.5.1.1 pont szerinti A/C/S körhívás mód mellett.

Ez a kizárás állapot egy T_D időközön keresztül tart (3.1.2.10.3.9 alpont) az utasítás utolsó vétele után. Nem-szelektív kizárás nem akadályozza meg PR 8-tól 12-ig kódokat tartalmazó, csak S körhívás módú lekérdezés vételét.

2. Megjegyzés. – Nem szelektív kizárás nem befolyásolja a válaszjeladó reagálását a II nem egyenlő 0-t tartalmazó, csak S körhívás módú lekérdezésekre.

3.1.2.6.10 *Alapvető adat protokollok*

3.1.2.6.10.1 *Repülési állapot protokoll.* Repülési állapotot az FS mezőben kell jelenteni (3.1.2.6.5.1 alpont).

3.1.2.6.10.1.1 *Figyelmeztetés.* Figyelmeztetés állapotot az FS mezőben kell közölni, ha A-módú válaszokban és DF egyenlő 5 és DF egyenlő 21 fedélzetről leadott adattovábbítási formátumokban átvitt azonosítás kódot a pilóta megváltoztatja.

3.1.2.6.10.1.1.1 *Permanens figyelmeztetés állapot.* A figyelmeztetés állapot fennmarad, ha az A-módú azonosítás kódot 7500-ra, 7600-ra vagy 7700-ra változtatják.

3.1.2.6.10.1.1.2 *Átmeneti figyelmeztetés állapot.* A figyelmeztetés állapot átmeneti és megszünteti magát T_c másodperc múlva, ha az A-módú azonosítás kódot a 3.1.2.6.10.1.1.1 pontban felsoroltaktól különböző értékűre változtatják.

Megjegyzés. – A T_c értéket a 3.1.2.10.3.9 alpont tartalmazza.

3.1.2.6.10.1.1.3 *A permanens figyelmeztetés állapot befejeződése.* A permanens figyelmeztetés állapotot be kell fejezni és átmeneti figyelmeztetés állapottal kell helyettesíteni, amikor az A-módú azonosítás kódot 7500, 7600 vagy 7700-tól eltérő értékre állítják.

3.1.2.6.10.1.2 *Földi közlés.* A légijármű földi állapotát az FS mezőben (3.1.2.6.5.1), a VS mezőben (3.1.2.8.2.1 alpont) és a CA mezőben (3.1.2.5.2.2.1) kell jelenteni Ha a földi állapotot (azaz a kerekeket vagy a futómű támaszokat terhelő súly) automatikusan jelző eszköz rendelkezésre áll a válaszjeladó adat csatoló felületnél, akkor ezt alapként kell használni a földi állapot jelentéséhez, ahogy ezt a 3.1.2.6.10.3.1 alpontban meghatározták. Ha a válaszjeladó adat csatoló felületénél nem áll rendelkezésre eszköz a földi állapot automatikus jelzésére (3.1.2.10.5.1.3 alpont), az FS és VS kódoknak jelezniük kell, hogy a légijármű a levegőben van, és a CA mezőnek jeleznie kell, hogy a légijármű vagy a levegőben, vagy a földön van (CA=6).

3.1.2.6.10.1.3 *Különleges pozíció azonosítás (SPI).* Az SPI impulzus egyenértékű jelét az S-módú válaszjeladókkal az FS mezőben kell továbbítani, és a felderítési állapot almezőben (SSS) kell továbbítani, amikor manuálisan aktivizálják. Ezt az impulzust a megkezdés után T_1 másodpercig továbbítják (3.1.1.6.3, 3.1.1.7.13 és 3.1.2.8.6.3.1.1 pontok).

Megjegyzés. – A T_1 értékét a 3.1.2.10.3.9 pont tartalmazza.

3.1.2.6.10.2 *Képesség közlés protokoll.* Az adatkapcsolat képesség jelentés regiszterének adatszerkezetét és tartalmát az együttműködési képesség figyelembevételével alakítsák ki.

1. Megjegyzés. – A légijármű képességet különleges mezőkben kell közölni, a következő pontokban megfogalmazottaknak megfelelően.

2. Megjegyzés. – A jelentési képesség regiszterének adatformátumát a "Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)" határozza meg.

3.1.2.6.10.2.1 *Képesség közlés.* A 3-bites CA mező, amelyet a körhívás válasz foglal magában DF egyenlő 11 mellett, az S-módú válaszjeladó alap-képességét közli a 3.1.2.5.2.2.1 pontban leírtaknak megfelelően.

3.1.2.6.10.2.2 *Adatkapcsolat képesség közlés*. Az adatkapcsolat közlés a lekérdezőt az S-mód telepítésével összefüggő adatkapcsolat képességének leírásával látja el.

Megjegyzés. – Az adatkapcsolat képesség közlését a 10_{16} regiszter tartalmazza a 11_{16} - 16_{16} közötti regiszterekben való kiterjesztés lehetőségével, amikor egy folytatás válik szükségessé.

3.1.2.6.10.2.2.1 *Kivonat és almezők MB-ben adatkapcsolat képességi közlésben*.

3.1.2.6.10.2.2.1.1 *A 10_{16} regiszterben tárolt adatkapcsolat képesség jelentés leh*ívása. A jelentés egy földi kezdeményezésű Comm-B típusú válaszként nyerhető ki, egy olyan lekérdezésre, amelyben RR=17 és DI≠7 vagy DI=7 és RRS=0 (lásd 3.1.2.6.11.2).

3.1.2.6.10.2.2.1.2 *Adatkapcsolat képesség eredete*. Az adatkapcsolat képesség jelentés a válaszjeladó, az ADLP és az ACAS képességét jelenti. A külső bemenet elvesztése esetén a válaszjeladó állítsa 0-ba az adatkapcsolat képesség jelentés megfelelő bitjeit.

3.1.2.6.10.2.2.1.3 Az adatkapcsolat képesség jelentés tartalmazza a 3-6 Táblázatban meghatározott információkat.

3.1.2.6.10.2.2.1.4 Az S-módú alhálózati verzió számozás, tartalmazzon - a korábbi fedélzeti berendezésekkel történő együttműködést biztosító információkat.

3.1.2.6.10.2.2.1.4.1 Az S-módú alhálózati verziószámozás jelezze, hogy az összes bennfoglalt alhálózati funkció megfelel a jelzett verzió számozás követelményeinek. Az S-módú alhálózati számozás nullától különbözzön, ha legalább egy DTE vagy specifikus S-módú szolgáltatást biztosít.

Megjegyzés – A verziószámozás nem jelzi az összes a verzió által tartalmazott lehetséges funkciót.

3.1.2.6.10.2.2.2 *Az adatkapcsolat képesség jelentés frissítése.* A válaszjeladó nem kevesebb, mint 4 sec időintervallumonként hasonlítsa össze a jelenlegi adatkapcsolat képesség státuszt (41-88 bitek az adatkapcsolat képesség jelentésben) a legutolsóként jelentettel, ha különbség áll fenn, kezdeményezzen egy módosított, Comm-B adatsugárzás (lásd 3.1.2.6.11.4) adatkapcsolat képesség jelentést, BDS1=1 (33-36) és BDS2=0 (37-40). A válaszjeladó, akkor is kezdeményezzen, szerkesszen és sugározzon adatkapcsolat képesség jelentésfrissítést, ha a légijármű adatkapcsolat képesség lecsökkent vagy elveszett. A válaszjeladó állítsa be a BDS kódot az adatkapcsolat képesség jelentéshez.

Megjegyzés – A BDS kód, válaszjeladó által történő beállítása biztosítja, hogy az adatkapcsolat képesség jelentés adatsugárzása tartalmazza az összes lehetséges kódot az adatkapcsolat képesség hibája esetén (pl. a válaszjeladó adatkapcsolat interfész meghibásodása).

3.1.2.6.10.2.2.3 *Az adatkapcsolat képesség jelentés bitek nullára állítása.*

Ha a válaszjeladó képesség, legalább 4 sec-os gyakorisággal meghibásodik, a válaszjeladó állítsa nullára (ZÉRÓ) az adatkapcsolat képesség jelentés 41 – 56 bitjeit (a válaszjeladó 10_{16} regisztere).

Megjegyzés – Az 1-8 bitek tartalmazzák a BDS1 és BDS2 kódokat. A 16-os bit és 37-40 bitek tartalmazzák az ACAS képesség információt. A 33-as bit jelzi a légijármű azonosító adat rendelkezésre állását és a válaszjeladó állítja be, ha az adat nem az ADLP-l, hanem különálló interfésztől származik. A 35-s bit az SI kódot mutatja. Az összes felsorolt bitet a válaszjeladó állítja be.

3.1.2.6.10.2.3 *Általános használatú GICB képesség jelentés*. A folyamatosan frissített, általános használatú GICB szolgáltatást a válaszjeladó 17_{16} regisztere tartalmazza.

3.1.2.6.10.2.4 S-*módú specifikus GICB képesség jelentés.* A rendelkezésre álló, S-módú specifikus GICB szolgáltatást a 18_{16} - $1C_{16}$ regiszterek tartalmazzák.

3.1.2.6.10.2.5 S-*módú specifikus MSP képesség jelentés*. A rendelkezésre álló, S-módú specifikus MDSP szolgáltatást a $1D_{16} – 1F_{16}$ regiszterek tartalmazzák.

3.1.2.6.10.3 A*utomatikus eszközökkel bejelentett földi telepítésű állomás érvényesítése*

Megjegyzés. – A függőleges állapot meghatározásához automatikus eszközökkel rendelkező légijárműveknél a CA mező jelenti, hogy a légijármű a levegőben van-e vagy a földön. Az ACAS II befogja a rövid vagy kiterjesztett squittert használó légijárművet ahol mindkettő tartalmazza a CA mezőt. Ha a légijármű földön tartózkodási állapotot jelent, az ACAS II ezt a légijárművet nem fogja lekérdezni annak érdekében, hogy csökkentsék a szükségtelen lekérdezési aktivitást. Ha a légijármű kiterjesztett squitter közlemények jelentésére alkalmas felszereléssel el van látva, a funkció, amely ezeket a közléseket megformázza, rendelkezhet információval, amely lehetővé teszi annak érvényesítését, hogy egy "földön" tartózkodást jelentő légijármű ténylegesen a levegőben van.

3.1.2.6.10.3.1 A földön tartózkodási feltétel meghatározására szolgáló automatikus eszközökkel felszerelt légijárműveknek, amelyek el vannak látva kiterjesztett squitter közlemények megformázására szolgáló eszközökkel, a következő érvényességi ellenőrzéseket kell elvégezniük:

Ha az automatikusan meghatározott levegő/föld állapot nem áll rendelkezésre vagy "levegőben" állapotú, érvényesítés nem végezhető. Ha az automatikusan meghatározott levegő/föld állapot rendelkezésre áll, és "a földön" állapotot jelentenek, a levegő/föld állapotot felülírja és "levegőben" jelzésre változtatja, ha a jármű kategóriára a 3-6 táblázatban adott feltételek teljesülnek.

Megjegyzés. – Bár ezt a vizsgálatot csak olyan légijárműtől követelik meg, amely kiterjesztett squitter közlemények megformázására fel van szerelve, ez minden légijármű számára kívánatos lenne.

3.1.2.6.11 *Szabványos hosszúságú kommunikáció protokollok*

1. Megjegyzés. – A szabványos hosszúságú kommunikációs protokollok a Comm-A és a Comm-B; az ezeket a protokollokat használó közleményeket a lekérdező irányítása alatt továbbítják. A Comm-A közleményeket közvetlenül a válaszjeladónak küldik, és egy tranzakción belül befejezik. A Comm-B közleményt levegőből a földre történő információ továbbításhoz használják és vagy a lekérdező, vagy a válaszjeladó kezdeményezi ezt. A földi kezdeményezésű Comm-B átadások esetében a lekérdező adatokat kér a válaszjeladótól, amely a közleményt ugyanabban a tranzakcióban szállítja. Levegő kezdeményezésű Comm-B átadások esetében a válaszjeladó közli a közlemény átadásának szándékát; egy ezt követő tranzakcióban egy lekérdező kivonatolja a közleményt.

2. Megjegyzés. – Nem-szelektív levegőből történő kezdeményezésű Comm-B protokollban minden szükséges tranzakciót bármelyik lekérdező irányíthatja.

3. Megjegyzés. – Az átlapoló lekérdezési lefedés néhány területén lehet, hogy nincsenek eszközök lekérdezési tevékenységek összehangolására földi kommunikáción keresztül. Levegőből történő kezdeményezésű Comm-B kommunikációs protokollok egynél több tranzakciót igényelnek a végrehajtáshoz. Gondoskodás történik annak biztosításáról, hogy egy Comm-B közleményt csak olyan lekérdező zárhasson ki, amely ténylegesen átviszi a közleményt. Ezt a többhelyes Comm-B kommunikációs protokollok használatán keresztül, vagy a megnövelt Comm-B kommunikációs protokollok használatán keresztül lehet megvalósítani.

4. Megjegyzés. – A többhelyes és a nem-szelektív kommunikációs protokollok nem használhatók egyidejűleg átlapoló lekérdező lefedésű régióban, hacsak a lekérdezőik nem koordinálják kommunikációs tevékenységüket a földi kommunikáción keresztül.

5. Megjegyzés. – A többhelyes kommunikációs protokoll független a többhelyes kizárási protokolltól. Azaz a többhelyes kommunikációs protokoll nem-szelektív kizárás protokollal használható és fordítva. A használatra kerülő kizárás és kommunikáció protokollok kiválasztása a felhasznált hálózati management eljárástól függ.

6. Megjegyzés. – A Comm-B protokoll rádióadása egy közlemény készítésére használható, amely minden aktív lekérdező rendelkezésére áll.

3.1.2.6.11.1 *Comm-A.* A lekérdező egy Comm-A közleményt szállít egy lekérdezés MA mezejében UF = 20 vagy 21 lekérdezés esetében.

3.1.2.6.11.1.1 *Comm-A műszaki nyugtázása*. Egy Comm-A lekérdezést egy válaszjeladó automatikusan műszakilag nyugtáz a kívánt válasz továbbításával (3.1.2.10.5.2.2.1 pont).

Megjegyzés. – Egy, a válaszjeladótól érkező, a 3.1.2.4.1.2.3 d) és 3.1.2.4.1.3.2.2.2 pontok szabályainak megfelelő válasz annak elismerését jelenti a lekérdező részére, hogy a közlést megkapta és a válaszjeladó tárolta. Ha vagy a föld-légijármű kapcsolat, vagy fedélzetről leadott adattovábbítás hiányzik, ez a válasz is hiányozni fog, és a lekérdező normálisan a közleményt újra elküldi. A fedélzetről leadott adattovábbítás hiányának esetében a válaszjeladó a választ többször is megkaphatja.

3.1.2.6.11.1.2 *Comm-A adás.* Ha egy Comm-A sugárzású lekérdezés érkezik (3.1.2.4.1.2.3.1.3 alpont), az információ továbbítást a 3.1.2.10.5.2.1.1 pontnak megfelelően kezelik, de más válaszjeladó feladatot nem befolyásol és válasz továbbítás nem történik.

1. Megjegyzés. – Nincs műszaki nyugtázás egy Comm-A sugárzású közlemény számára.

2. Megjegyzés. – Mivel a válaszjeladó nem dolgozza fel a Comm-A sugárzású lekérdezés szabályozási mezejét, az UF mezőt követő 27 bit is a felhasználói adatok rendelkezésére áll.

3.1.2.6.11.2 *Földi kezdeményezésű Comm-B*

3.1.2.6.11.2.1 *Comm-B adat szelektor, BDS.* A 8-bites BDS kód határozza meg a regisztert, amelynek tartalmát a Comm-B válasz MB mezejében továbbítják. Ezt két, egyenként 4-bites csoportban fejezik ki: BDS1 (legjelentősebb 4 bit) és BDS2 (legkisebb jelentőségű 4 bit).

Megjegyzés. – A válaszjeladó regiszter szétosztás a 10. Annex, III. kötet, I. rész, 5. Fejezet 5-24 táblázatban kerül ismertetésre.

3.1.2.6.11.2.2 *BDS1 kód.* A BDS1 kód az ellenőrzés vagy a Comm-A lekérdezés RR mezejében meghatározottaknak megfelelő.

3.1.2.6.11.2.3 *BDS2 kód.* A BDS2 kód az SD mező RRS almezejében (3.1.2.6.1.4.1 alpont) előírtaknak felel meg, amikor DI = 7. Ha nincs BDS2 kód meghatározva (azaz DI nem egyenlő 7), ez azt jelenti, hogy BDS2 = 0.

3.1.2.6.11.2.4 *Protokoll.* Ilyen kérés vétele esetén, a válaszadás MB mezőjének tartalmaznia kell a kért, földről történő kezdeményezésű Comm-B regiszter tartalmát.

3.1.2.6.11.3 *Levegőből történő kezdeményezésű Comm-B.*

3.1.2.6.11.3.1 *Általános protokoll.* A válaszjeladó közli egy levegőből történő kezdeményezésű Comm-B közlemény meglétét az 1-es kódnak a DR mezőbe való beillesztésével. Egy levegőből történő kezdeményezésű Comm-B közlemény kinyeréséhez a lekérdező egy Comm-B közlés válasz iránti igényt továbbít egy sorra következő lekérdezésben, RR egyenlő 16 segítségével, és ha DI egyenlő 7, RRS-nek egyenlőnek kell lenni 0-val. (3.1.2.6.11.3.2.1 és 3.1.2.6.11.3.3.1 pontok). Ennek a kérés kódnak a vétele a válaszjeladót egy levegőből történő kezdeményezésű Comm-B közlemény átvitelére készteti. Ha egy levegőből történő kezdeményezésű Comm-B közlemény továbbítására vonatkozó parancsot vesz, míg nincsen továbbításra váró közlemény, a válasz MB mezőben lévő összes ZÉRO-t tartalmazza.

A közleményt szállító válasz továbbra is az 1-es kódot tartalmazza a DR mezőben. Miután egy Comm-B kizárást valósítanak meg, a közleményt törlik és az ehhez a közleményhez tartozó DR kódot azonnal eltávolítják. Ha egy másik levegőből történő kezdeményezésű Comm-B közlemény vár továbbításra, a válaszjeladó a DR kódot 1-re állítja, úgyhogy a válasz ennek a következő közleménynek a bejelentését tartalmazza.

Megjegyzés. – A közlési és törlési protokoll biztosítja, hogy egy légi kezdeményezésű közlemény nem vész el a fedélzetre irányuló vagy fedélzetről leadott adattovábbítás meghibásodása miatt, amely a kézbesítési folyamat során fordul elő.

3.1.2.6.11.3.2 *Kiegészítő protokoll a többhelyes levegőből történő kezdeményezésű Comm-B-hez.*

Megjegyzés. – Egy légi kezdeményezésű, továbbításra váró Comm-B közlemény bejelentését egy többhelyes foglalási állapot közlemény kisérheti az UM mezőben (3.1.2.6.5.3.2 alpont).

Ajánlás. – *Egy lekérdező ne kisérelje meg egy közlemény kinyerését, ha megállapította, hogy az nem a fenntartott hely.*

3.1.2.6.11.3.2.1 *Közlemény továbbítás.* Egy lekérdező egy Comm-B helyfoglalást és egy légi kezdeményezésű Comm-B közlemény kinyerését egy ellenőrzési vagy Comm-A lekérdezés UF egyenlő 4, 5, 20 vagy 21 továbbításával kérheti, amely a következőket tartalmazza:

RR = 16
DI = 1
IIS = kijelölt lekérdező azonosító
MBS = 1 (Comm-B helyfoglalás kérés)

Megjegyzés. – Egy Comm-B többhelyes helyfoglalási kérést normál módon egy Comm-B helyfoglalási állapot kérés kisér (RRS = 1). Ez azt idézi elő, hogy a fenntartott helyű lekérdező azonosítót a válasz UM mezejébe illesztik be.

3.1.2.6.11.3.2.1.1 Az erre a lekérdezésre reagáló protokoll eljárás a B-időzítő állapotától függ, amely azt jelzi, hogy a Comm-B helyfoglalás működik-e. Ez az időzítő T_R másodpercig fut.

1. Megjegyzés. – A T_R értéke a 3.1.2.10.3.9 pontban található.

a) Ha a B-időzítő nem működik, a válaszjeladó a következők által biztosít helyfenntartást a kérő lekérdezőnek:

1) a lekérdezés IIS-ének tárolása mint a Comm-B II; és

2) a B-időzítő indításával.

Többhelyes Comm-B tartalékolást a válaszjeladó nem tud biztosítani, hacsak egy levegőből történő kezdeményezésű Comm-B közlemény nem vár továbbításra és a hívó lekérdezés nem tartalmazza az RR egyenlő 16, DI egyenlő 1, MBS egyenlő 1 és IIS nem egyenlő 0 értékeket.

b) Ha a B-időzítő működik és a lekérdezés IIS-e egyenlő a Comm-B II-vel, a válaszjeladó újra indítja B-időzítőt.

c) Ha a B-időzítő működik és a lekérdezés IIS-e nem egyenlő a Comm-B II-vel, akkor nincs változás a Comm-B II-nél vagy a B-időzítőnél.

2. Megjegyzés. – A c) esetében a helyfoglalás kérést megtagadták.

3.1.2.6.11.3.2.1.2 Mindegyik esetben a válaszjeladó Comm-B közleménnyel válaszol az MB mezőben.

3.1.2.6.11.3.2.1.3 Egy lekérdező az UM mezőben való kódoláson keresztül meghatározza, hogy ennek a közleménynek ez egy fenntartott helye-e. Ha ez a fenntartott hely, törekedni fog a közlemény kizárására a következő lekérdezésben. Ha az nem a fenntartott hely, akkor nem fogja megkísérelni a közlemény kizárását.

3.1.2.6.11.3.2.2 *Többhelyes irányított Comm-B átvitelek.* Egy levegőből történő kezdeményezésű Comm-B közleménynek egy meghatározott lekérdezőhöz való irányítására a többhelyes Comm-B protokollt használják. Ha a B-időzítő nem működik, a kívánt rendeltetési hely leképező azonosítóját, mint Comm-B II-t kell tárolni. Ezzel egyidőben a B-időzítőt indítani kell és a DR-kódot 1-esre kell állítani. Többhelyes irányított Comm-B közleménynél a B-időzítő nem fog automatikusan kiidőzíteni, hanem folytatja a működését, amíg:

a) a tárolt hely az üzenetet olvassa és kizárja; vagy

b) az adatkapcsolati repüléselektronika a közleményt törli (3.1.2.10.5.4 alpont)

Megjegyzés. – A 3.1.2.6.5.3 és 3.1.2.6.11.3.2.1 pontok protokolljai a közleménynek a fenntartott helyre való juttatását fogják eredményezni. Az adatkapcsolati repüléselektronika a közleményt törölheti, ha a fenntartott helyre való juttatást nem lehet megvalósítani.

3.1.2.6.11.3.2.3 *Többhelyes Comm-B kizárás.* A lekérdező egy többhelyes levegőből történő kezdeményezésű Comm-B-t vagy egy ellenőrzési, vagy egy Comm-A lekérdezéssel zár ki, amely tartalmazza:

vagy DI = 1
IIS = kijelölt lekérdező azonosító
MBS = 2 (Comm-B kizárás)

vagy DI = 0, 1, vagy 7
IIS = kijelölt lekérdező azonosító
PC = 4 (Comm-B kizárás)

A válaszjeladó összehasonlítja a lekérdező IIS-ét a Comm-B II-vel és ha a lekérdező azonosítók nem illeszkednek, a közlemény nem kerül törlésre, a Comm-B II, a B-időzítő és a DR kód változatlan marad. Ha a lekérdező azonosítók illeszkednek, a válaszjeladó a Comm-B II-t 0-ra állítja, visszaállítja a B-időzítőt, törli a DR kódot ehhez a közleményhez és törli magát a közleményt is. A válaszjeladó nem zár ki többhelyes levegő kezdeményezésű Comm-B közleményt, hacsak ezt nem olvasta le legalább egyszer a fenntartott hely.

3.1.2.6.11.3.2.4 *A Comm-B helyfoglalás automatikus megszűnése.* Ha a B-időzítő periódus lejár, mielőtt a többhelyes kizárás végbemegy, a Comm-B II-t 0-ra állítják és a B-időzítőt visszaállítják. A Comm-B közleményt és a DR mezőt a válaszjeladó nem törli.

Megjegyzés. – Ez lehetővé teszi egy másik hely számára ennek a közleménynek a leolvasását és törlését.

3.1.2.6.11.3.3 *Kiegészítő protokoll nem-szelektív levegőből történő kezdeményezésű Comm-B-hez.*

Megjegyzés. – Azokban az esetekben, amikor nem igényelnek többhelyes protokollt (azaz nincs átlapoló lefedés vagy érzékelő koordináció a föld-föld kommunikáción keresztül), a nem-szelektív levegő kezdeményezésű Comm-B protokoll használható.

3.1.2.6.11.3.3.1 *Közlemény továbbítás*. A lekérdező a közleményt vagy RR egyenlő 16 és DI nem egyenlő 7, vagy RR egyenlő 16, DI egyenlő 7 és RRS egyenlő 0 továbbításával nyeri ki egy ellenőrzési vagy Comm-A lekérdezésben.

3.1.2.6.11.3.3.2 *Comm-B kizárás.* A lekérdező a PC egyenlő 4 továbbításával kizár egy nem-szelektív, levegőből történő kezdeményezésű Comm-B közleményt (Comm-B kizárás). Ennek az utasításnak a vétele nyomán a válaszjeladó kizárást végez, hacsak a B-időzítő nem működik. Ha a B-időzítő működik, jelezve azt, hogy többhelyes helyfoglalás van érvényben, kizárás megy végbe a 3.1.2.6.11.3.2.3 pontnak megfelelően. A válaszjeladó nem zár ki nem-szelektív levegő kezdeményezésű Comm-B közleményt, hacsak azt egy lekérdezés, nem-szelektív protokollt használva, nem olvasta le legalább egyszer.

3.1.2.6.11.3.4 *Megnövelt, levegőből történő kezdeményezésű Comm-B protokoll.*

Megjegyzés. – A megnövelt, levegőből történő kezdeményezésű Comm-B protokoll nagyobb adatkapcsolat kapacitást szolgáltat levegőből történő kezdeményezésű Comm-B közlemények párhuzamos továbbításának lehetővé tételével maximálisan tizenhat lekérdező által mindegyik II kódnál egyet. Többhelyes Comm-B helyfoglalás szükségessége nélküli működés átlapolásos lefedési régiókban lehetséges olyan lekérdezők számára, amelyek a megnövelt levegőből történő kezdeményezésű Comm-B protokollal fel vannak szerelve. A protokoll teljesen megegyezik a szabványos többhelyes protokollal és így kompatibilis azokkal a lekérdezőkkel, amelyek nincsenek felszerelve a megnövelt protokollal.

3.1.2.6.11.3.4.1 A válaszjeladó képes a tizenhat II kód mindegyikének tárolására: (1) levegőből történő kezdeményezésű vagy többhelyes-irányított Comm-B közlemény és (2) GICB 2-4 regiszterek tartalma.

Megjegyzés. – A 2-4 GICB regisztereket a SARP S-módú alhálózatban meghatározott Comm-B kapcsolati protokollhoz használják (10. Annex, III. kötet, I. rész, 5. Fejezet).

3.1.2.6.11.3.4.2 *Megnövelt többhelyes levegőből történő kezdeményezésű Comm-B protokoll.*

3.1.2.6.11.3.4.2.1 *Kezdeményezés*. Levegő kezdeményezésű Comm-B közlemény belépést a válaszjeladóba a II = 0-nak kijelölt regiszterekben tárolják.

3.1.2.6.11.3.4.2.2 *Bejelentés és kinyerés*. Várakozási levegőből történő kezdeményezésű Comm-B közleményt a válasz DR mezőjében bejelentik minden lekérdezőnek, amely részére többhelyes irányított Comm-B közlemény nem várakozik. A bejelentés válasz UM mezője mutatja, hogy a közlemény nincs fenntartva semmilyen II kód részére, azaz az IIS almező 0-ra van állítva. Ha ennek a közleménynek az olvasására vonatkozó utasítás érkezik egy adott lekérdezőtől, a közleményt tartalmazó válasz IIS almező tartalmat foglal magában, amely jelzi, hogy a közlemény az II kód részére van fenntartva, amely attól a lekérdezőtől származó lekérdezésben szerepel. A kiolvasás után és a kizárásig a közlemény továbbra is ennek a II kódnak van kijelölve. Ha egy közlemény egy II kód részére egyszer ki van jelölve, ennek a közleménynek a bejelentését már nem lehet más II kódú lekérdezőknek adott válaszokban megtenni. Ha a közleményt a kijelölt lekérdező nem zárja ki a B-időzítő periódusa alatt, a közlemény visszatér a többhelyes levegőből történő kezdeményezés állapothoz, és a folyamat megismétlődik. Egyidőben csak egy többhelyes levegőből történő kezdeményezésű Comm-B közleményt lehet feldolgozni.

3.1.2.6.11.3.4.2.3 *Kizárás*. Többhelyes levegőből történő kezdeményezésű közlemény kizárása csak olyan lekérdezőtől vehető, amelyik akkor ki van jelölve a közlemény továbbítására.

3.1.2.6.11.3.4.2.4 *A következő közlemény várakozásának bejelentése.* A DR mező egy Comm-B kizárást tartalmazó lekérdezésre adott válaszban várakozó közleményt jelez, ha egy kijelöletlen levegőből történő kezdeményezésű közlemény várakozik, és nincs kijelölve egy II kódnak, vagy egy többhelyes irányított közlemény várakozik erre az II kódra (3.1.2.6.11.3.4.3 pont)

3.1.2.6.11.3.4.3 *Megnövelt többhelyes irányított Comm-B protokoll.*

3.1.2.6.11.3.4.3.1 *Kezdeményezés.* Ha egy többhelyes irányított közlemény a válaszjeladó bemeneteként szerepel, akkor azt a közlemény részére meghatározott II-kód részére kijelölt Comm-B regiszterekbe helyezik el. Hogyha ennek az II-kódnak a regiszterei már foglaltak, (azaz a többhelyes irányított kód már feldolgozásban van ehhez az II-kódhoz) az új közleménynek sorba kell állnia, amíg ennek az II-kódnak a folyó tranzakciója ki nem záródik.

3.1.2.6.11.3.4.3.2 *Bejelentés.* A továbbításra váró Comm-B közlemény bejelentését a 3.1.2.6.5.2 pontban meghatározott DR mező felhasználásával lehet biztosítani a rendeltetési hely lekérdező II-kódjával, amelyet az IIS almező tartalmaz, ahogyan azt a 3.1.2.6.5.3.2 pontban meghatározták. A DR mező és az IIS almező tartalmát meghatározva annak a lekérdezőnek a részére kell beállítani, amelynek a választ fogadnia kell. A várakozó többhelyes irányított közleményt csak a szándékozott lekérdezőnek adott válaszokban lehet bejelenteni. Nem lehet bejelentést alkalmazni más lekérdezőknek adott válaszokban.

1. Megjegyzés. – Ha egy többhelyes irányított közlemény II = 2-re vár, ennek a lekérdezőnek adott ellenőrzési válaszok DR = 1 és IIS = 2 tartalmuk lesz. Ha ez az egyetlen közlemény áll feldolgozás alatt, az összes többi lekérdezőnek adott válasz azt fogja jelölni, hogy nincs várakozó közlemény.

2. Megjegyzés. – A párhuzamos működés engedélyezésén felül a bejelentésnek ez a formája a fedélzetről leadott ELM-ek bejelentésének magasabb fokát teszi lehetővé. A fedélzetről leadott ELM és a Comm-B bejelentések felosztják a DR mezőt. A kódolási korlátozások miatt egyidőben csak egy bejelentés mehet végbe. Abban az esetben, ha egy Comm-B és egy fedélzetről leadott ELM várakozik, a Comm-B-nek van bejelentés elsőbbsége. A fenti példában, ha egy levegőből irányított Comm-B várt II = 1-re, és egy többhelyes irányítású fedélzetről leadott ELM várt II = 6-ra, mindkét lekérdező az első pásztában keresi a bejelentést, mivel nem volt Comm-B bejelentés II = 6-ra, amely blokkolná a várakozó fedélzetről leadott ELM-et.

3.1.2.6.11.3.4.3.3 *Kizárás*. Kizárás végrehajtása a 3.1.2.6.11.3.2.3 pontban meghatározottak szerint történik.

3.1.2.6.11.3.4.3.4 *A következő várakozó közlemény bejelentése.* A DR mező egy Comm-B kizárást tartalmazó lekérdezésre adott válaszban várakozó közleményt jelez, ha egy másik többhelyes irányítású közlemény várakozik erre a II kódra, vagy ha egy levegő kezdeményezésű közlemény várakozik és nem lett kijelölve II kód részére (lásd 3.1.2.6.11.3.4.4.2 alpont).

3.1.2.6.11.3.4.4 *Megnövelt nem-szelektív Comm-B protokoll.* Egy nem-szelektív Comm-B közlemény rendelkezésre állását minden lekérdezőnek bejelentik. Más esetben a protokoll a 3.1.2.6.11.3.3 pontban meghatározottaknak megfelelő.

3.1.2.6.11.4 *Comm-B közvetítés.*

1. Megjegyzés. – Egy Comm-B üzenet az értéktartományon belül lévő valamennyi aktív lekérdező számára közvetíthető. Az üzeneteket váltogatva 1 és 2 számjegyekkel látják el és 18 másodperc után maguktól törlődnek. Lekérdezők semmiképpen sem törölhetnek Comm-B közvetítéses üzeneteket.

2. Megjegyzés. – A Comm-B közvetítés használata olyan információk továbbítására korlátozódik, amelyek nem igényelnek rákövetkező földi kezdeményezésű fedélzetre irányuló adattovábbítási reagálást.

3. Megjegyzés. – A Comm-B közvetítés ciklushoz használt időzítő ugyanaz, mint amit a Comm-B többhelyes protokollhoz használnak.

4. Megjegyzés. - A Comm-B adatközléshez használt adatformátumot a "Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)"határozza meg

3.1.2.6.11.4.1 *Kezdeményezés.* Comm-B közvetítést nem kezdeményeznek, ha egy légi kezdeményezésű Comm-B továbbításra vár. A Comm-B közvetítés ciklus a következőkkel kezdődhet:

a) a DR 4-es vagy 5-ös kód (3.1.2.6.5.2 pont) behelyezése a válaszokba DF4, 5, 20 vagy 21-el; és

b) a B-számláló indításával.

3.1.2.6.11.4.2 *Kinyerés.* A közvetítés közlemény kinyeréséhez egy lekérdező RR egyenlő 16 és DI nem egyenlő 7 vagy RR egyenlő 16 és DI egyenlő 7, RRS egyenlő 0 továbbítást végez egy következő lekérdezésben.

3.1.2.6.11.4.3 *Megszűnés.* Amikor a B-időzítő periódus letelik, a válaszjeladó törli a DR kódot ehhez a közleményhez, félreteszi az éppen ott lévő közvetítési közleményt és megváltoztatja a közvetítési közlemény számozását (1-ről 2-re vagy 2-ről 1-re) a következő Comm-B közvetítés előkészítésében.

3.1.2.6.11.4.4 *Megszakítás.* Hogy megakadályozzuk a Comm-B közvetítés ciklust a légi kezdeményezésű Comm-B közlemény továbbításának elhalasztásában, gondoskodni kell, hogy egy légi kezdeményezésű Comm-B megszakítsa a közvetítési ciklust. Ha egy közvetítési ciklust megszakítanak, a B-időzítőt visszaállítják, a megszakított közvetítési közleményt visszatartják, és a közlemény számozást nem változtatják meg. A megszakított közvetítési közlemény továbbítása akkor kezdődik el, amikor nincs érvényben légi kezdeményezésű Comm-B tranzakció. A közlemény közvetítése akkor a B-időzítő teljes időtartama alatt folyik.

3.1.2.6.11.4.5 *Megnövelt közvetítési Comm-B protokoll.* Közvetítési Comm-B közleményt minden II kódot használó lekérdezőnek be kell jelenteni. A közlemény aktív marad a B-időzítő periódusa alatt minden II kód számára. A közvetítés nem közvetítési Comm-B által történő megszakításáról való gondoskodást a 3.1.2.6.11.4.4 alpont szerint minden egyes II kódra biztosítani kell. Amikor a B-időzítő az összes II kódot elérte, a közvetítési közlemény automatikusan törlődik a 3.1.2.6.11.4.3 alpont szerint. Új közvetítési közleményt nem kezdeményeznek, amíg a meglévő közvetítést nem szabadítják fel.

Megjegyzés. – Annak következtében, hogy a közvetítési közlemény megszakítás mindegyik II kódtól függetlenül történik, lehetséges, hogy a közvetítési közlemény szünet különböző II kódoknál különböző időben jelenik meg.

3.1.2.7 Kiterjesztett hosszúságú kommunikációs tranzakció

1. Megjegyzés. – Hosszú közleményeket akár fedélzetre irányuló-, akár fedélzetről leadott adattovábbításon kiterjesztett hosszúságú közlemény (ELM) protokollal lehet továbbítani Comm-C (UF = 24) és Comm-D (DF = 24) formátumok felhasználásával. A kiterjesztett hosszúságú közlemény fedélzetre irányuló adattovábbítási protokoll maximum tizenhat 80-bites közlemény szegmens továbbításáról gondoskodik a fedélzetre irányuló kapcsolaton, mielőtt válasz kérés érkezne a válaszjeladótól. Ezek lehetővé teszik a megfelelő eljárást a fedélzetről leadott adattovábbításon is.

2. Megjegyzés. – Az átlapolási lekérdező lefedés bizonyos területein semmiképpen sem lehet koordináló lekérdező tevékenység a földi kommunikáción keresztül. Azonban az ELM kommunikációs protokollok egynél több tranzakciót igényelnek a végrehajtáshoz; koordináció ily módon ahhoz szükséges, hogy biztosítsák a különböző közleményektől származó szegmensek átlapolódásának megakadályozását, és hogy a nem odatartozó lekérdező ne zárja ki elkerülhetetlenül ezt a tranzakciót. Ezt vagy a többhelyes kommunikációs protokollok használatával, vagy megnövelt kiterjesztett hosszúságú közlemény protokollok használatával lehet megvalósítani.

3. Megjegyzés. – Fedélzetről leadott kiterjesztett hosszúságú közleményeket csak a lekérdező engedély adása után továbbítanak. A továbbításra kerülő szegmenseket a Comm-D válaszok tartalmazzák. Mint a légi kezdeményezésű Comm-B közleményeknél, a fedélzetről leadott adattovábbítás kiterjesztett hosszúságú közleményeket vagy az összes lekérdezőnek bejelentik, vagy csak egy meghatározott lekérdezőhöz irányítják. Az előző esetben egy egyedi lekérdező használhatja a többhelyes protokollt, hogy fenntartsa magának a lehetőséget a fedélzetről leadott adattovábbítás kiterjesztett hosszúságú közlemény tranzakciójára. A válaszjeladót utasítani lehet a lekérdező azonosítására, amelyik lefoglalta a válaszjeladót egy kiterjesztett hosszúságú közlemény tranzakcióhoz. Csak ez a lekérdező zárhatja ki a kiterjesztett hosszúságú közlemény tranzakciót és tartalékolást.

4. Megjegyzés. – A többhelyes protokollt és a nem-szelektív protokollt nem lehet egyidejűleg felhasználni átlapoló lekérdező átfedéses régióban, hacsak a lekérdezők nem koordinálják kommunikációs tevékenységüket egy földi kommunikáción keresztül.

3.1.2.7.1 *Comm-C, 24-es fedélzetre irányuló adattovábbítási formátum*

1	3	5	9	89
UF	RC	NC	MC	AP
2	4	8	88	112

Ennek a lekérdezőnek a formátuma a következő mezőket tartalmazza:

Mező	*Hivatkozás*
UF fedélzetre irányuló adattovábbítási formátum	3.1.2.3.2.1.1
RC válasz szabályozás	3.1.2.7.1.1
NC C szegmens száma	3.1.2.7.1.2
MC közlemény, Comm-C	3.1.2.7.1.3
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.7.1.1 *RC: válasz szabályozás.* Ez a 2-bites (3 - 4) fedélzetre irányuló kapcsolati mező jelöli ki a szegmens fontosságát és a válasz döntést.

Kódolás

RC	=	0	jelöli a fedélzetre irányuló ELM kezdeti szegmenst MC-ben
	=	1	jelöli a fedélzetre irányuló ELM közbenső szegmenst MC-ben
	=	2	jelöli a fedélzetre irányuló ELM végső szegmenst MC-ben
	=	3	a fedélzetről leadott ELM küldés iránti kérést jelöli

3.1.2.7.1.2 *NC: C szegmens száma.* Ez a 4-bites (5 - 8) fedélzetre irányuló adattovábbítási mező az MC által tartalmazott közlemény számát jelöli ki (3.1.2.7.4.2.1 pont). Az NC-t bináris számként kódolják.

3.1.2.7.1.3 *MC: közlemény, Comm-C.* Ez a 80-bites (9 - 88) fedélzetre irányuló adattovábbítási mező tartalmazza:

a) a 4-bites (9 - 12) IIS almezőt tartalmazó válaszjeladóhoz tartozó fedélzetre irányuló ELM átvitelére használt sorozat egyik szegmensét;

b) a fedélzetről leadott ELM, a 16-bites (9-24) SRS almező (3.1.2.7.7.2.1 alpont) és a 4-bites (25-28) IIS altér szabályozó kódját.

Megjegyzés. – A közlemény tartalmát és a kódokat ez a fejezet nem tartalmazza, kivéve a 3.1.2.7.7.2.1 pontot.

3.1.2.7.2 *Lekérdező-válasz protokoll UF-24-nél*

Megjegyzés. – Lekérdezés-válasz koordináció a fenti formátumnál a 3-5 táblázatban körvonalazott protokollt követi (3.1.2.4.1.3.2.2 alpont).

3.1.2.7.3 *Comm-D, 24-es fedélzetről leadott adattovábbítási formátum*

1		4	5	9	89
DF		KE	ND	MD	AP
2			8	88	112

A jelen válasz formátuma tartalmazza ezeket a mezőket:

Mező	*Hivatkozás*
DF fedélzetről leadott adattovábbítási formátum	3.1.2.3.2.1.2
tartalék - 1 bit	
KE szabályozás, ELM	3.1.2.7.3.1
ND D-szegmens száma	3.1.2.7.3.2
MD közlemény, Comm-D	3.1.2.7.3.3
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.7.3.1 *KE: Szabályozás, ELM.* Ez az 1-bites (4) fedélzetről leadott adattovábbítás mező az ND és MD mezők tartalmát határozza meg.

Kódolás

KE = 0 jelöli a fedélzetről leadott ELM továbbítást
1 jelöli a fedélzetre irányuló ELM elismerést

3.1.2.7.3.2 *ND: D-szegmens száma.* Ez a 4-bites (5-8) fedélzetről leadott adattovábbítási mező az MD által tartalmazott közlemény szegmens számát jelöli ki (3.1.2.7.7.2 alpont). Az ND-t bináris számként kódolják.

3.1.2.7.3.3 *MD: Közlemény, Comm-D.* Ez a 80-bites (9-88) fedélzetről leadott adattovábbítási mező tartalmazza:

a) a lekérdezőhöz tartozó fedélzetről leadott ELM továbbítására használt sorozat egyik szegmensét, vagy

b) fedélzetre irányuló ELM szabályozó kódját.

3.1.2.7.4 *Többhelyes fedélzetre irányuló ELM protokoll*

3.1.2.7.4.1 *Többhelyes fedélzetre irányuló ELM helyfoglalás.* Egy lekérdező kérjen egy helyfoglalást egy fedélzetre irányuló ELM részére az alábbi tartalmú felderítési vagy Comm-A lekérdezés továbbításával:

DI = 1
IIS = kijelölt lekérdező azonosító
MES = 1 vagy 5 (fedélzetre irányuló ELM helyfoglalás kérés)

Megjegyzés. – Többhelyes fedélzetre irányuló ELM helyfoglalás kérést általában egy fedélzetre irányuló ELM helyfoglalási állapot kérés kísér (RSS = 2). Ez azt idézi elő, hogy a lefoglalt hely lekérdező azonosítóját behelyezik a válasz UM mezőjébe.

3.1.2.7.4.1.1 Protokoll eljárás erre a lekérdezésre való reagálásban a C-időzítő állapotától függ, amely jelzi, ha egy fedélzetre irányuló ELM helyfoglalás aktív. Ez az időzítő T_R másodpercen át fut.

1. Megjegyzés. – A T_R értéket a 3.1.2.10.3.9 alpont tartalmazza.

a) ha a C-időzítő nem működik, a válaszjeladó az alábbiak segítségével nyújt helyfoglalást a lekérdező kezdeményező számára:

1) a lekérdező IIS tárolása, minta Comm-C II és

2) a C-időzítő elindítása

b) Ha a C-időzítő működik és a lekérdező IIS-e egyenlő a Comm-C II-vel, a válaszjeladó a C-időzítőt újraindítja.

c) Ha a C-időzítő működik és a lekérdező IIS-e nem egyenlő a Comm-CII-vel, a Comm-CII vagy a CS-időzítő változatlan marad.

2. Megjegyzés. – A c) esetben a helyfoglalási kérést megtagadták.

3.1.2.7.4.1.2 A lekérdező nem indít ELM aktivitást, hacsak, ugyanazon pászta során, miután fedélzetre irányuló ELM állapot közlést kért, nem a saját lekérdező azonosítóját kapta helyfoglalási lekérdezőként a fedélzetre irányuló ELM-nél az UM mezőben.

Megjegyzés. – Ha ELM tevékenység ugyanazon pásztában nem indul helyfoglalásként, akkor a következő pászta során új helyfoglalás kérést lehet csinálni.

3.1.2.7.4.1.3 Ha a fedélzetre irányuló ELM továbbítása nem fejeződik be az aktuális pászta során, a lekérdező biztosítson magának helyfoglalást, mielőtt további szegmenseket továbbítana a következő pászta során.

3.1.2.7.4.2 *Többhelyes fedélzetre irányuló ELM továbbítás.* A fedélzetre irányuló ELM minimális hossza 2 szegmens, a maximális hossz 16 szegmens.

3.1.2.7.4.2.1 *Kezdeti szegmens átvitel.* A lekérdező az ELM fedélzetre irányuló adat továbbítást egy n-szegmensű közlemény (NC a 1-tól n-ig terjedő értékeket veszi fel) részére egy RC egyenlő 0-t tartalmazó Comm-C átvitelével kezdi. Az MC mezőben továbbított közlemény szegmens a közlemény utolsó szegmense és NC egyenlő n-1 értéket hordoz.

Egy szegmens kezdet beállítás (RC = 0) vétele után a válaszjeladó létrehoz egy (kezdeti) "beállítást", amelyet a következők határoznak meg:

a) az előző szegmens tárolási regiszterek és a hozzájuk tartozó TAS mező számának és tartalmának felszabadítása;

b) tároló térköz kijelölése ennek a lekérdezésnek az NC-jében bejelentett szegmensek száma részére; és

c) a vett szegmens MC mezejének tárolása.

A válaszjeladó erre a lekérdezésre nem válaszolhat.

Egy másik kezdeti szegmens vétele egy új felállítást eredményez a válaszjeladón belül.

3.1.2.7.4.2.2 *Továbbítás nyugtázás.* A válaszjeladó a TAS almezőt egy fedélzetre irányuló ELM sorozatban addig vett szegmensek közlésére használja. A TAS almező által tartalmazott információkat a válaszjeladó folyamatosan felfrissíti, ahogyan a szegmensek érkeznek.

Megjegyzés. – A fedélzetre irányuló átvitelben elvesztett szegmenseket a TAS közlésben lévő hiányukkal jelzi, és a lekérdező újra továbbítja őket, amely aztán végső szegmenseket küld tovább a közlemény terjedelmének értékelése céljából.

3.1.2.7.4.2.2.1 *TAS, továbbítás nyugtázás almező MD-ben.* Ez a 16-bites (17-32) fedélzetről leadott adattovábbítás almező MD-ben közli a fedélzetre irányuló ELM sorozatban addig vett szegmensek számait. A 17-es bittel kezdve, amely a 0 számú szegmenset jelöli, az ezt követő bitek mindegyikét EGY-re állítják, ha a sorozat megfelelő szegmensét már vették. A TAS megjelenik az MD-n, ha KE egyenlő 1 ugyanabban a válaszban.

3.1.2.7.4.2.3 *Közbenső szegmens továbbítása.* A lekérdezőnek közbenső szegmenseket RC egyenlő 1 Comm-C lekérdezések átvitelével kell továbbítania. A válaszjeladó csak akkor tárolja a szegmenseket és frissíti fel a TAS-t, ha a 3.1.2.7.4.2.1 alpont szerinti beállítás érvényben van, és ha a vett NC kisebb, mint a kezdeti szegmens vételénél tárolt érték. Közbenső szegmens vételekor nem jön létre válasz.

Megjegyzés. – Közbenső szegmensek bármilyen sorrendben továbbíthatók.

3.1.2.7.4.2.4 *Végső szegmens továbbítása.* A lekérdező a végső szegmenst Comm-C lekérdezés egyenlő 2 melletti továbbítással visz át. Ez a lekérdezés bármely közlemény szegmenst tartalmazhat. A válaszjeladó tárolja az MC mező tartalmát és felfrissíti a TAS-t, ha a 3.1.2.7.4.2.1 alpont szerinti beállítás érvényben van., és ha a vett NC kisebb, mint a kezdeti NC szegmens értéke. A válaszjeladó minden körülmények között válaszol a 3.1.2.7.4.2.5 alpont szerint.

1. Megjegyzés. – Ez a végső szegmens továbbítású lekérdezés bármilyen üzenet szegmenst tartalmazhat.

2. Megjegyzés. – RC egyenlő 2 bármikor továbbításra kerül, amikor a lekérdező a válaszban fogadni akarja a TAS almezőt. Ezért egynél több “végső” szegmens továbbítható egy fedélzetre irányuló ELM szállítása alatt.

3.1.2.7.4.2.5 *Nyugtázási válasz.* Végső szegmens vétele után a válaszjeladó Comm-D választ (DF=24) továbbít KE egyenlő 1 mellett és az MD mezőben lévő TAS almező mellett. Ezt a választ 128 mikromásodperc plusz vagy mínusz 0,25 mikromásodperc idővel a végső szegmenset szállító lekérdezés szinkronizáló fázis megfordítást követően továbbítják.

3.1.2.7.4.2.6 *Befejezett közlemény*. A válaszjeladó a közleményt befejezettnek ítéli, ha az NC által a kezdeti szegmensben bejelentett összes szegmenst vették. Ha a közlemény teljesen készen van, a küldemény tartalmát kívülre szállítják a 3.1.2.10.5.2.1.3 pont szerinti ELM csatoló felületen keresztül és törlik. Semmilyen ezután érkező szegmenst nem tárolnak. A TAS tartalom változatlan marad, amíg vagy egy új felállítás igénye jelentkezik (3.1.2.7.4.2.1 pont) vagy a kizárásig (3.1.2.7.4.2.8 pont).

3.1.2.7.4.2.7 *C-időzítő újraindítás.* A C-időzítőt újraindítják mindannyiszor, amikor egy vett szegmenst tárolnak és a Comm-C II nem 0.

Megjegyzés. – A Comm-C II nem zérus követelmény megakadályozza, hogy a C-időzítőt újraindítsák egy nem szelektív fedélzetre irányuló ELM tranzakció alatt.

3.1.2.7.4.2.8 *Többhelyes fedélzetre irányuló ELM kizárás.* Egy felderítés, vagy az alábbiakat tartalmazó Comm-A lekérdezés továbbításával a lekérdező kizárja a többhelyes fedélzetre irányuló ELM-et:

vagy DI = 1
IIS = kijelölt lekérdező azonosító
MES= 2,6 vagy 7 (fedélzetre irányuló ELM kizárás)

vagy DI = 0, 1, vagy 7
IIS = kijelölt lekérdező azonosító
PC = 5 (fedélzetre irányuló ELM kizárás)

A válaszjeladó összehasonlítja a lekérdezés IIS-ét a Comm-C II-vel, és ha a lekérdező azonosítók nem illeszkednek, az ELM fedélzetre irányuló adattovábbítási folyamatának állapotában nem eszközölnek változást.

Ha a lekérdező azonosítók illeszkednek, a válaszjeladó a Comm-C II-t 0-ra állítja, visszaállítja a C-időzítőt, törli a tárolt TAS-t és a befejezetlen közlemények tárolt szegmenseit kiselejtezi.

3.1.2.7.4.2.9 *Automatikus többhelyes fedélzetre irányuló ELM kizárás.* Ha a C-időzítő periódus lejár, mielőtt egy többhelyes kizárás végbement volna, a 3.1.2.7.4.2.8 pontban leírt kizárási akciókat a válaszjeladó automatikusan kezdeményezi.

3.1.2.7.5 *Nem szelektív* fedélzetre *irányuló ELM*

Megjegyzés. – Azokban az esetekben, amikor a többhelyes protokollokat nem igénylik (például nincs átlapoló lefedés vagy érzékelő koordináció a föld-föld kommunikáción keresztül), a nem-szelektív fedélzetre irányuló ELM protokoll használható.

A nem-szelektív fedélzetre irányuló ELM továbbítás úgy történik, ahogyan az a többhelyes fedélzetre irányuló ELM-ekre a 3.1.2.7.4.2 pontban le van írva. A lekérdező a fedélzetre irányuló ELM-et a PC egyenlő 5 továbbításával (fedélzetre irányuló ELM kizárás) zárja ki egy ellenőrzési vagy Comm-A lekérdezésben. Ennek az utasításnak a vétele után a válaszjeladó kizárást hajt végre, hacsak a C-időzítő nem működik, amely azt mutatja, hogy egy többhelyes helyfoglalás van érvényben, a kizárás a 3.1.2.7.4.2.8 pont szerint megy végbe. A befejezetlen közlemény, amely a kizárás vételekor van jelen, törlésre kerül.

3.1.2.7.6 *Megnövelt fedélzetre irányuló ELM protokoll*

Megjegyzés. – A megnövelt fedélzetre irányuló ELM protokoll nagyobb adat összeköttetési kapacitást nyújt a fedélzetre irányuló ELM közlemények párhuzamos szállításának lehetővé tételével, maximálisan tizenhat lekérdezővel, minden II kódnak egyet. Többhelyes fedélzetre irányuló ELM, helyfoglalás igénye nélküli működés átlapolásos lefedésű régiókban lehetséges a megnövelt fedélzetre irányuló ELM protokollhoz felszerelt lekérdezők számára. A protokoll teljes mértékben megegyezik a szabványos többhelyes protokollal, és így csereszabatos azokkal a lekérdezőkkel, amelyek nincsenek ellátva megnövelt protokollal.

3.1.2.7.6.1 *Általános*

3.1.2.7.6.1.1 Az adatkapcsolati képesség közlésből a lekérdező megállapítja, hogy a válaszjeladó alátámasztja-e a megnövelt protokollokat. Ha a megnövelt protokollokat sem a lekérdező, sem a válaszjeladó nem támasztja alá, a 3.1.2.7.4.1 pontban részletezett többhelyes helyfoglalási protokollt kell használni.

Megjegyzés. – Ha a megnövelt protokollt alátámasztják, akkor a fedélzetre irányuló többhelyes protokollok felhasználásával továbbított ELM-ek továbbítása előzetes helyfoglalás nélkül történhet.

3.1.2.7.6.1.2 ***Ajánlás****. – Ha a válaszjeladó és a lekérdező fel lett szerelve a megnövelt protokollhoz, akkor a lekérdező használja a megnövelt fedélzetre irányuló adattovábbítási protokollt.*

3.1.2.7.6.1.3 A válaszjeladó tizenhat szegmenses közlemény tárolására képes a tizenhat II kód mindegyikéhez.

3.1.2.7.6.2 *Helyfoglalási eljárás*. A válaszjeladó támogatja a helyfoglalási eljárást mindegyik II kódhoz, ahogyan azt a 3.1.2.7.4.1 pontban meghatározták.

1. *Megjegyzés. – Helyfoglalási eljárást kérnek azon lekérdezők részére, amelyek nem támogatják a megnövelt protokollt.*

2. Megjegyzés. – Mivel a válaszjeladó szimultán képes feldolgozni a fedélzetre irányuló ELM-eket mind a tizenhat II kódra, így a helyfoglalás minden esetben garantált.

3.1.2.7.6.3 *Megnövelt fedélzetre irányuló ELM továbbítás és kizárás.* A válaszjeladó a vett szegmenseket külön-külön dolgozza fel a II kóddal. Az II kód mindegyik értékére fedélzetre irányuló ELM továbbítást és kizárást hajt végre, ahogyan azt a 3.1.2.7.4.2 alpont meghatározza, kivéve hogy a technikai visszaigazolás átvitelére használt MD mező a 4-bites (33-36) IS almezőt is tartalmazza.

Megjegyzés. –A technikai visszaigazolást tartalmazó II-kódot a lekérdező használhatja a helyes technikai visszaigazolást vételének megerősítésére.

3.1.2.7.7 *Többhelyes fedélzetről leadott ELM protokoll*

3.1.2.7.7.1 *Kezdőérték megadása.* A válaszjeladó az n szegmensből álló fedélzetről leadott adattovábbítás ELM meglétét a 15+n decimális értékhez tartozó bináris kód képzésével jelentheti be, amely egy ellenőrzési, vagy Comm-B válasz DR mezőbe való beillesztéshez rendelkezésre áll, és a DF egyenlő 4, 5, 20, 21. Ez a bejelentés aktív mard, amíg az ELM-et ki nem zárják (3.1.2.7.7.3, 3.1.2.7.8 pontok).

3.1.2.7.7.1.1 *Többhelyes fedélzetről leadott ELM helyfoglalás.* A lekérdezőnek helyfoglalást kell kérnie egy fedélzetről leadott adattovábbítás ELM kinyeréséhez egy ellenőrzési, vagy Comm-A lekérdezés továbbításával, amely a következőket tartalmazza:

DI = 1
IIS = kijelölt lekérdező azonosító
MES = 3 vagy 6 (fedélzetről leadott adattovábbítás ELM helyfoglalás kérés)

Megjegyzés. – A többhelyes fedélzetről leadott ELM helyfoglalási kérést általában egy fedélzetről leadott adattovábbítás helyfoglalási állapotkérés (RSS = 3) kísér. Ez a fenntartott lekérdező azonosítójának a válasz UM mezőjébe való beillesztését eredményezi.

3.1.2.7.7.1.1.1 A protokoll eljárás erre a lekérdezésre történő reagálásban a D-időzítő állapotától függ, amely jelzi, ha egy fedélzetről leadott ELM helyfoglalás még aktív. Ez az időzítő T_R másodpercig működik.

1. Megjegyzés. – A T_R értékét a 3.1.2.10.3.9 alpont határozza meg.

a) ha a D-időzítő nem működik, a válaszjeladónak a kérő lekérdező számára helyfoglalást kell biztosítania a következőképpen:

   1) A lekérdezés IIS tárolása mint Comm-DII; és

   2) A D-időzítő indítása

   Többhelyes fedélzetről leadott ELM helyfoglalást a válaszjeladó nem szolgáltathat, hacsak egy fedélzetről leadott ELM nem vár továbbításra.

b) ha a D-időzítő működik, és a lekérdezés IIS egyenlő a Comm-DII-vel, a válaszjeladónak újra kell indítania a D-időzítőt; és

c) ha a D-időzítő működik és a lekérdező IIS nem egyenlő a Comm-DII-vel, akkor a Comm-DII vagy D-időzítőnek változatlannak kell maradnia.

2. Megjegyzés. – c) esetben a helyfoglalási kérést elutasították.

3.1.2.7.7.1.1.2 A lekérdező megállapítja, hogy van-e lefoglalt hely a kódoláson keresztül az UM mezőben, és ha igen, akkor folytatódhat a fedélzetről leadott ELM kérés továbbítása. Ellenkező esetben az ELM működése nem kezdődik meg ezalatt a pásztázás alatt.

Megjegyzés. – Ha a lekérdező nem egy lefoglalt hely, akkor a következő pásztázás során új helyfoglalási kérést kell készíteni.

3.1.2.7.7.1.1.3 Ha a fedélzetről leadott ELM működése az éppen folyó pásztázás során nem fejeződik be, a lekérdezőnek meg kell győződnie, hogy van-e még egy helyfoglalás, mielőtt további szegmenseket kérne a következő pásztázásra.

3.1.2.7.7.1.2 *Többhelyes irányítású fedélzetről leadott ELM átvitele.* A fedélzetről leadott ELM közlemény egy adott lekérdezőhöz történő irányításához a többhelyes, fedélzetről leadott adattovábbítás ELM protokollt kell használni. Amikor a D-időzítő nem működik, a kívánt rendeltetési hely lekérdező azonosítóját Comm-D II-ként kell tárolni. Ezzel egyidőben a D-időzítőt indítani kell és a DR-kódot (3.1.2.7.7.1 alpont) be kell állítani. Többhelyes irányított fedélzetről leadott ELM-nél a D-időzítő nem járhat le automatikusan, hanem működését addig kell folytatnia, amíg:

a) a fenntartott hely a közleményt elolvassa és kizárja; vagy

b) a közleményt az adatkapcsolati repüléselektronika törli (3.1.2.10.5.4 alpont).

Megjegyzés. – A 3.1.2.7.7.1 alpont protokolljai ekkor a közleménynek a lefoglalt helyre való továbbítását eredményezik. Az adatkapcsolati repüléselektronika a közleményt törölheti, ha a lefoglalt helyre való továbbítást nem lehet végrehajtani.

3.1.2.7.7.2 *A fedélzetről leadott adat ELM-ek továbbítása.* A lekérdező a fedélzetről leadott ELM-et egy Comm-C lekérdezés továbbításával nyeri ki az RC egyenlő 3 segítségével. Ez a lekérdezés a SRS almezőt hordozza, amely a továbbításra kerülő szegmenseket határozza meg. Ennek a kérésnek a vétele után a válaszjeladó továbbítja a kért szegmenseket a Comm-D válaszok segítségével KE egyenlő 0 és az MD-ben lévő szegmensek számának megfelelő ND esetén. Az első szegmenst 128 mikromásodperc + vagy -0,25 mikromásodperc idő után a továbbítást kérő lekérdezés szinkronizáló fázis megfordítását követően viszi át, és a következő szegmenseket egyenként minden 136 mikromásodperc + vagy -1 mikromásodperc sebességgel továbbítja. Ha a fedélzetről leadott ELM szegmensek továbbítására vonatkozó kérés érkezik, és közlemény nem várakozik, minden válasz szegmense az összes ZÉRO-t tartalmazza az MD mezőben.

1. Megjegyzés. – A kért szegmenseket bármilyen sorrendben lehet továbbítani.

2. Megjegyzés. – A fedélzetről leadott adattovábbításoknál elveszett szegmenseket a lekérdező újra kéri egy következő lekérdezésben, amely az SRS almezőt hordozza. Ez a folyamat addig ismételhető, amíg az összes szegmenst nem továbbították.

3.1.2.7.7.2.1 *SRS, szegmenskérő almező MC-ben.* Ez a 16-bites (9-24) fedélzetről leadott adattovábbítási almező MC-ben kéri a válaszjeladót fedélzetről leadott ELM szegmensek továbbítására. A 9-es bittel kezdve, amely a 0 számú szegmenset jelöli, a következő bitek mindegyikét EGY-re kell állítani, ha a megfelelő szegmens továbbítását kérik. SRS az MC-ben jelenik meg, ha RC egyenlő 3 ugyanabban a lekérdezésben.

3.1.2.7.7.2.2 *D-időzítő újraindítása.* A D-időzítőt újra kell indítani mindannyiszor, amikor Comm-D szegmensek iránti kérelem érkezik, ha a Comm-D II nem zérus.

Megjegyzés. – Az a követelmény, hogy a Comm-D II zérustól különböző legyen, megakadályozza, hogy a D-időzítőt újra indítsák nem szelektív fedélzetről leadott ELM tranzakció alatt.

3.1.2.7.7.3 *Többhelyes fedélzetről leadott ELM kizárás.* A lekérdező a többhelyes fedélzetről leadott ELM-et vagy egy ellenőrzési vagy egy Comm-A lekérdezés továbbításával zárja ki. Az ellenőrzési, illetve Comm-A lekérdezés a következőket tartalmazza:

vagy DI = 1
IIS = kijelölt lekérdező azonosító
MES = 4, 5, vagy 7 (fedélzetről leadott ELM kizárás)

vagy DI = 0, 1, vagy 7
IIS = kijelölt lekérdező azonosító
PC = 6 (fedélzetről leadott ELM-kizárás)

A válaszjeladó összehasonlítja a lekérdező IIS-ét a Comm-D II-vel és ha a lekérdező azonosítók nem illeszkednek, a fedélzetről leadott adattovábbítási folyamat állapota változatlan marad.

Ha a lekérdező azonosítók illeszkednek és a továbbítás iránti kérelem legalább egyszer teljesül, a válaszjeladó a Comm-D II-t 0-ra állítja, a D-időzítőt visszaállítja, törli a DR kódot ehhez a közleményhez és törli magát a követelményt.

Ha egy fedélzetről leadott ELM továbbításra vár, a válaszjeladó a DR-kódot (ha a Comm-B üzenet nem vár továbbításra) úgy állítja be, hogy a válasz tartalmazza a következő közlemény bejelentését.

3.1.2.7.7.4 *Fedélzetről leadott adattovábbítás ELM helyfoglalás automatikus lejárata.* Ha a D-időzítő periódus lejár, mielőtt egy többhelyes kizárás lezajlik, a Comm-D II-t 0-ra állítják, és a D-időzítőt visszaállítják. A közleményt és a DR-kódot nem törlik.

Megjegyzés. – Ez lehetővé teszi egy másik hely számára ennek a közleménynek az elolvasását és szabaddá tételét.

3.1.2.7.8 *Nem szelektív fedélzetről leadott ELM*

Megjegyzés. – Azokban az esetekben, amikor a többhelyes protokollokat nem igénylik (azaz nincs átlapoló lefedés vagy érzékelő koordináció a föld-föld kommunikáción keresztül), a nem-szelektív fedélzetről leadott adattovábbítás ELM protokoll használható.

Nem-szelektív fedélzetről leadott ELM továbbítás úgy történik, ahogyan a 3.1.2.7.7.2 pontban meghatározták.

3.1.2.7.8.1 *Nem-szelektív fedélzetről leadott ELM kizárás*. A lekérdező egy nem-szelektív fedélzetről leadott ELM-et PC egyenlő 6 (fedélzetről leadott ELM kizárás) átvitelével zár ki egy ellenőrzési vagy Comm-A lekérdezésben. Ennek az utasításnak a vétele után, és ha továbbítás iránti kérelemnek már legalább egyszer eleget tett, a válaszjeladó kizárást hajt végre, hacsak a D-időzítő nincs működésben. Ha a D-időzítő működésben van és jelzi, hogy a többhelyes foglalás érvényben van, akkor a kizárást a 3.1.2.7.7.3 alpont szerint kell végrehajtani.

3.1.2.7.9 *Megnövelt fedélzetről leadott ELM protokoll*

Megjegyzés. – A megnövelt fedélzetről leadott adattovábbítási protokoll nagyobb adatkapcsolat kapacitást szolgáltat azáltal, hogy megengedi a fedélzetről leadott ELM közlemények párhuzamos továbbítását maximálisan tizenhat lekérdező által, mindegyik II kódhoz egyet. Többhelyes fedélzetről leadott adattovábbítási helyfoglalások szükségessége nélküli működés átlapolási lefedési régiókban lehetséges a megnövelt fedélzetről leadott ELM protokollhoz felszerelt lekérdezők számára. A protokoll teljesen megegyezik a szabványos többhelyes protokollal és így csereszabatos azokkal a lekérdezőkkel, amelyek nincsenek megnövelt protokollhoz felszerelve.

3.1.2.7.9.1 *Általános.*

3.1.2.7.9.1.1 A lekérdező az adatkapcsolati képesség közlésből megállapítja, hogy a válaszjeladó támogatja-e a megnövelt protokollokat. Ha a megnövelt protokollokat sem a lekérdező, sem a válaszjeladó nem támogatja, a 3.1.2.6.11 pontban előírt többhelyes helyfoglalási protokollokat kell felhasználni a többhelyes és a többhelyes-irányítású fedélzetről leadott adattovábbítású ELM-ekhez.

Megjegyzés. - Hogyha a megnövelt protokollok támogatást kapnak, akkor a többhelyes irányított protokoll felhasználásával továbbított fedélzetről leadott ELM-eket előzetes helyfoglalás nélkül lehet továbbítani.

3.1.2.7.9.1.2 **Ajánlás. –** *Ha a válaszjeladó és a lekérdező fel van szerelve a megnövelt protokollhoz, akkor a lekérdező használja a megnövelt fedélzetről leadott adattovábbítási protokollt.*

3.1.2.7.9.2 *Megnövelt többhelyes fedélzetről leadott ELM protokoll.*

3.1.2.7.9.2.1 A válaszjeladó tizenhat szegmensű közlemény tárolására képes, a tizenhat II kódok mindegyikéhez.

3.1.2.7.9.2.2 *Kezdőérték beállítása*. A válaszjeladóba belépő többhelyes közleményt az II = 0-hoz kijelölt regiszterekben tárolják.

3.1.2.7.9.2.3 Bejelentés és kinyerés. Többhelyes fedélzetről leadott ELM közlemény várakozását a válaszok DR mezejében jelentik be az összes lekérdezőnek, amelyek részére többhelyes irányított fedélzetről leadott ELM közlemény nem várakozik. A bejelentési válasz UM mezője jelzi, hogy a közleményt nem foglalták le egyetlen II-kód részére sem, azaz az IIS 0-ára van állítva. Ha ennek a közleménynek a helyfoglalására vonatkozó utasítás érkezik egy adott lekérdezőtől, a közleményt az II kód számára lefoglalják, amely kódot a lekérdezőtől érkező lekérdezés tartalmazza. A kiolvasás után és kizárólag a közlemény továbbra is ennek a II kódnak a részére lesz kijelölve. Ha egy közlemény egyszer egy meghatározott II kód számára ki van jelölve, ennek a közleménynek a bejelentését már nem alkalmazzák a lekérdezőnek adott válaszban más II-kódokkal. Ha a közleményt a kapcsolódó lekérdező nem zárja ki a D-időzítő periódusa alatt, a közlemény visszatér a többhelyes állapotba és a folyamat megismétlődik. Egyidőben csak egy többhelyes fedélzetről leadott ELM közlemény lehet folyamatban.

3.1.2.7.9.2.4 *Kizárás.* Többhelyes közlemény kizárását csak olyan lekérdezőtől vehetik, amelyet a közlemény továbbítására legutoljára kijelöltek.

3.1.2.7.9.2.5 *A következő közlemény várásának bejelentése*. A DL mező jelzi egy fedélzetről leadott ELM kizárást tartalmazó lekérdezésre adott válaszban várakozó közleményt, ha egy kijelöletlen többhelyes fedélzetről leadott ELM várakozik, vagy ha egy többhelyes irányított közlemény várakozik erre az II-kódra (3.1.2.7.9.2 alpont).

3.1.2.7.9.3 Megnövelt többhelyes irányított fedélzetről leadott ELM protokoll.

3.1.2.7.9.3.1 *Kezdőérték beállítása.* Ha egy többhelyes irányított közlemény a válaszjeladó bemenetét képezi, akkor abba a fedélzetről leadott ELM regiszterekbe helyezik el, amelyet a közlemény részére meghatározott II-kódnak jelölnek ki. Ha ennek az II-kódnak a regiszterei már használatban vannak (azaz a többhelyes irányított fedélzetről leadott ELM közlemény már feldolgozásban van ennek az II-kódnak a részére), az új közlemény sorban fog állni, amíg az éppen folyó tranzakciót ezzel az II-kóddal kizárják.

3.1.2.7.9.3.2 *Bejelentés.* Továbbításra váró fedélzetről leadott ELM közlemény bejelentését a DR mező felhasználásával végzik a 3.1.2.7.7.1 pontban meghatározottak szerint az IIS almező által tartalmazott, a 3.1.2.6.5.3.2 pontban meghatározottak szerinti rendeltetési lekérdező II-kóddal. A DR-mező és az IIS almező tartalmát meghatározva annak a lekérdezőnek a részére állítják be, amelynek a választ venni kell. Egy várakozó többhelyes irányított közleményt csak a szándékolt lekérdező részére szolgáltatott válaszokban kell bejelenteni. A várakozó többhelyes irányított közleményt nem kell bejelenteni más lekérdezők részére adott válaszokban.

3.1.2.7.9.3.3. *Továbbítás.* Egy lekérdező az UM mező kódolásán keresztül állapítja meg, hogy fenntartott helyként szerepel-e. A továbbítást csak akkor lehet lekérni, amennyiben a lekérdező tartalék helyként szerepel és megfelel a 3.1.2.7.7.2 pontban meghatározottaknak. A válaszjeladó továbbítja a pufferben lévő közleményt, amely puffer a II-kódhoz kapcsolódik, amelyet viszont a lekérdezés kérési szegmens IIS almező határoz meg.

3.1.2.7.9.3.4 *Kizárás.* Kizárást a 3.1.2.7.7.3 pontban előírtak szerint kell végrehajtani, kivéve, amikor a közlemény kizárást csak az II-kóddal rendelkező lekérdezőtől veszik, amely kód egyenlő azzal, amelyet a közlemény továbbított.

3.1.2.7.9.3.5 *Következő közlemény várakozásának bejelentése.* A DR mező jelzi egy fedélzetről leadott ELM kizárást tartalmazó lekérdezésre adott válaszban várakozó közleményt, ha egy másik többhelyes irányított közlemény várakozik erre az II-kódra, vagy ha egy fedélzetről leadott adattovábbítási közlemény várakozik, amely nem lett kijelölve a II-kódnak (3.1.2.7.9.2 alpont).

3.1.2.7.9.4 *Megnövelt nem-szelektív fedélzetről leadott ELM protokoll.* Egy nem-szelektív kapcsolati ELM közlemény rendelkezésre állását az összes lekérdező részére be kell jelenteni. Más esetben a protokoll a 3.1.2.7.7 pontban meghatározottnak fog megfelelni.

3.1.2.8 Levegő-levegő forgalom és squitter tranzakció

Megjegyzés. – Az összeütközés-elhárító fedélzeti rendszer (ACAS) berendezése az UF vagy DF egyenlő 0 vagy 16 formátumokat használja levegő-levegő felderítésre.

3.1.2.8.1 *Rövid levegő-levegő forgalom, fedélzetre irányuló 0-s adattovábbítási formátum*

1		9		14	15		33
UF		RL		AQ	DS		AP
5					22		56

E lekérdezés formátuma ezekből a mezőkből áll:

Mező	*Hivatkozás*
UF fedélzetre irányuló adattovábbítási formátum	3.1.2.3.2.1.1
tartalék - 3 bit	
RL válaszhossz	3.1.2.8.1.2
tartalék - 4 bit	
AQ elfogás	3.1.2.8.1.1
DS adat választó	3.1.2.8.1.3
tartalék - 10 bit	
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.8.1.1 *AQ: Adatgyűjtés.* Ez az egy-bites (14) fedélzetre irányuló adattovábbítási mező olyan kódot tartalmaz, amely szabályozza az RI mező tartalmát.

3.1.2.8.1.2 *RL: Válasz hosszúság.* Ez az 1-bites (9) fedélzetre irányuló adattovábbítási mező ad utasítást a válaszhoz használt formátumra.

Kódolás

0 jelöli a DF = 0 választ
1 jelöli a DF = 16 választ

Megjegyzés. – Egy válaszjeladó ha nem támogatja a DF = 16 választ (vagyis az a válaszjeladó, amelyik nem támogatja az ACAS keresztcsatolási képességet és nem társul egy összeütközés-elhárító fedélzeti rendszerrel), nem fog válaszolni az RL = 1 tartalmú UF = 0 lekérdezésre.

3.1.2.8.1.3 *DS: Adat Kiválasztó.* Ez a 8 bites (15-22) fedélzetre irányuló adattovábbítási mező a GICB adattároló BDS kódját (3.1.2.6.11.2.1 alpont) tartalmazza, amelynek tartalmát vissza kell küldeni a megfelelő, DF = 16 értékű válasz részére.

3.1.2.8.2 *Rövid levegő-levegő felderítés, 0 értékű fedélzetről leadott adattovábbítási formátum*

1	6	7		14		20	33
DF	VS	CC		RI		AC	AP
5				17		32	56

Ezt a választ egy UF egyenlő 0 és RL egyenlő 0 lekérdezésre történő reagálásban küldik el. Ennek a válasznak a formátuma a következő mezőkből áll:

Mező		*Hivatkozás*
DF	fedélzetről leadott adattovábbítási formátum	3.1.2.3.2.1.2
VS	függőleges állapot	3.1.2.8.2.1
CC	kereszt-kapcsolati képesség tartalék	3.1.2.8.2.3
tartalék - 6 bit		
RI	válasz információ	3.1.2.8.2.2
tartalék - 2 bit		
AC	magasság kód	3.1.2.6.5.4
AP	címzés/paritás	3.1.2.3.2.1.3

3.1.2.8.2.1 *VS: függőleges állapot.* Ez az 1-bites (6) kapcsolati mező a légijármű állapotát jelzi (3.1.2.6.10.1.2 alpont).

Kódolás

0 azt jelenti, hogy a légijármű a levegőben van.
1 azt jelenti, hogy a légijármű a földön van.

3.1.2.8.2.2 *RI: válaszinformáció, levegő-levegő.* Ez a 4-bites (14-17) fedélzetről leadott adattovábbítási mező közli a légijármű maximális tényleges utazósebesség képességét és a lekérdező légijárműnek adott válasz típusát. A kódolás a következők szerint történik:

0 egy levegő-levegő lekérdezésre adott választ jelöl, UF = 0, AQ = 0, nincs működő ACAS
1-7 ACAS részére fenntartott
8-15 egy levegő-levegő lekérdezésre adott választ jelöl, ahol UF = 0, AQ = 1 és azt, hogy a maximális önsebesség a következő:
8 maximális önsebesség adat nem áll rendelkezésre
9 maximális önsebesség .KE. 140 kilométer/h (75 csomó)
10 maximális önsebesség .NM. 140 és .KE.28O km/h (75 és 150 csomó)
11 maximális önsebesség .NM. 280 és .KE. 560 km/h (150 és 300 csomó)
12 maximális önsebesség .NM. 560 és .KE. 1110 km/h (300 és 600 csomó)
13 maximális önsebesség .NM. 1110 és .KE. 2220 km/h (600 és 1200 csomó)
14 maximális önsebesség nagyobb, mint 2220 km/h (1200 csomó)
15 nincs kijelölve.

Megjegyzés. – “.KE.” azt jelenti, hogy “kisebb vagy egyenlő” és “.NM.” jelenti: “nagyobb, mint”

3.1.2.8.2.3 *CC: Kereszt-kapcsolat képesség.* Ez az 1-bites (7) fedélzetről leadott adattovábbítási mező a válaszjeladónak azt a képességét jelzi, hogy keresztkapcsolat képességet tud fenntartani, azaz dekódolja a DS mező tartalmát UF egyenlő 0 lekérdezésben és válaszol a specifikus GICB regiszter tartalmával a DF egyenlő 16 megfelelő válaszban.

Kódolás

0 azt jelenti, hogy a válaszjeladó nem tudja a keresztkapcsolat képességet fenntartani
1 azt jelenti, hogy a válaszjeladó fenntartja a kereszt-kapcsolat képességet

3.1.2.8.3 *Hosszú levegő-levegő felderítés, fedélzetről leadott 16-os adattovábbítási formátum*

1	6		14		20	33	89
DF	VS		RI		AC	MV	AP
5			17		32	88	112

Ezt a választ egy UF egyenlő 0 és RL egyenlő 1 lekérdezésre adott válaszban küldik el. Ennek a válasznak a formátuma a következő mezőket tartalmazza:

Mező	*Hivatkozás*
DF fedélzetről leadott adattovábbítási formátum	3.1.2.3.2.1.2
VS függőleges állapot	3.1.2.8.2.1
tartalék – 7 bit	
RI válasz információ	3.1.2.8.2.2
tartalék – 2 bit	
AC magasság kód	3.1.2.6.5.4
MV közlemény, ACAS	3.1.2.8.3.1
AP címzés/paritás	3.1.2.3.2.1.3

3.1.2.8.3.1 *MV: Közlemény, ACAS.* Ez az 56-bites (33-88) fedélzetről leadott adattovábbítási mező, amely a kérés szerint GICB információt tartalmazza az UF 0 lekérdezés DS mezejében, amely lekérdezés a választ kiváltotta.

Megjegyzés. – Az MV mezőt az ACAS is használja levegő-levegő koordinációhoz (4.3.8.4.2.4 alpont)

3.1.2.8.4 *Levegő-levegő tranzakció protokoll*

Megjegyzés. – Lekérdezés-válasz koordináció a levegő-levegő formátumoknál a 3-5 táblázatban körvonalazott protokollt követi (3.1.2.4.1.3.2.2 alpont).

Egy levegő-levegő válasz RI mezőjének a legjelentősebb bitje (14-es bit) megismétli az AQ mező értékét (14-es bit), amely egy UF egyenlő 0 lekérdezésben érkezett.

Ha AQ egyenlő 0 a lekérdezésben, a válasz RI mezője tartalmazni fogja a 0-kódot.

Ha AQ egyenlő 1 a lekérdezésben, a válasz RI mezője a légijármű maximális tényleges utazósebesség képességét tartalmazza, ahogyan azt 3.1.2.8.2.2 alpont meghatározza.

Az UF = 0-ra, az RL = 1 és DS nem egyenlő 0 esetén való válaszban a válaszjeladó egy DF = 16 válasszal felel, amelyben az MV mező a DS értékkel jelölt GICB regiszter tartalmát tartalmazza. Az UF = 0-ra, az RL = 1 és DS = 0 esetén adott válaszban a válaszjeladó egy mindenütt zérus mezőjű DF = 16-tal felel. UF = 0 vételéhez DS $\neq$ 0, de RL = 0 esetén nem tartozik ACAS kereszt-kapcsolás akció és a válaszjeladó a 3.1.2.8.2.2 pontban leírtak szerint válaszol.

3.1.2.8.5 *Adatgyűjtő squitter*

Megjegyzés. – Másodlagos légtérellenőrző radar S-módú válaszjeladók adatgyűjtő squittereket továbbítanak (nem-kért fedélzetről leadott közlemények), hogy lehetővé tegyék a széles antenna sugarakkal rendelkező lekérdezők passzív befogását, ahol az aktív befogást a körhívás szinkron csonkítás akadályozhatja. Ilyen lekérdezőkre példák az összeütközés-elhárító fedélzeti rendszer és egy repülőtéri földi légtérellenőrző rendszer.

3.1.2.8.5.1 *Adatgyűjtő squitter formátum.* Az adatgyűjtő squitter átvitelekhez használt formátum körhívás válasz lesz (DF = 11) II = 0 beállítással.

3.1.2.8.5.2 *Adatgyűjtő squitter sebesség*. Az adatgyűjtő squitter sugárzások véletlen időközönként kerülnek szétosztásra, amelyek egyenletesen vannak elosztva a 0,8- 1,2 másodperc időtartamon belül. Az elosztás a megelőző adatgyűjtő squitterhez képest legfeljebb 15 ezredmásodpercnél nagyobb időkvantálással kerül kialakításra, a következő kivételekkel:

a) az időütemezett adatgyűjtő squittert késleltetni kell, ha a válaszjeladó tranzakciós ciklusban van (3.1.2.4.1 alpont).

b) az időütemezett adatgyűjtő squittert késleltetni kell, ha kiterjesztett squitter folyamatban van;

c) az időütemezett adatgyűjtő squittert késleltetni kell, ha egy közös elnyomás csatoló felület működésben van (lásd az alábbi 1. megjegyzést); vagy

d) adatgyűjtő squitter-eket csak akkor sugároznak ki a földön, ha a válaszjeladó nem jelenti az S-módú kiterjesztett squitter földi elhelyezésének típusát.

Az adatgyűjtő squittert nem szakíthatják meg kapcsolati tranzakciók, vagy közös elnyomás működés azután, hogy a squitter átvitel elkezdődött.

1. Megjegyzés. – Közös elnyomási rendszer használható az ugyanazon frekvenciasávban működő fedélzeti berendezések összekapcsolására, hogy a közös interferenciát megakadályozza. Az adatbegyűjtő squitter tevékenység folytatódik egy közös elnyomási időköz után.

2. Megjegyzés. – A földi jelentés típust vagy a légijármű, vagy egy squitter földi állomástól jövő utasítások automatikusan választják ki (3.1.2.8.6.7 pont).

3.1.2.8.5.3 *Adatbegyűjtő squitter antenna kiválasztás*. Eltérő antennákkal működő válaszjeladók (3.1.2.10.4 pont) a squittereket a következők szerint viszik át:

a) a levegőben tartózkodáskor (3.1.2.8.6.7 pont), a válaszjeladó adatbegyűjtő squittert továbbít felváltva a két antennától¸és

b) a földön tartózkodáskor (3.1.2.8.6.7 pont), a válaszjeladó adatbegyűjtő squittert továbbít SAS irányítása alatt (3.1.2.6.1.4.1f) alpont). SAS utasítás elmaradása esetén, a felső antenna alkalmazása csak alapértelmezett módon történhet.

Megjegyzés. – Adatbegyűjtő squittereket nem késztetik kisugárzásra a földön, ha a válaszjeladó a kiterjesztett squitter földi típusát jelenti (3.1.2.8.6.4.3 alpont).

3.1.2.8.6 *Kiterjesztett squitter*, *fedélzetről leadott 17-es adattovábbítási formátum*

1	6	9	33	89
DF	CA	AA	ME	PI
5	8	32	88	112

Megjegyzés. – SSR S-módú válaszjeladók kiterjesztett squittereket továbbítanak, hogy fenntartsák a légijármű származtatású helyzet adatsugárzást felderítési célokból. Az ilyen típusú adatsugárzás a helymeghatározó eszköztől függő automatikus felderítés (ADS) egy formája, amely ADS adatsugárzásként (ADS-B) ismert.

3.1.2.8.6.1 *Kiterjesztett squitter formátum.* A kiterjesztett squitterhez használt formátum egy 112-bites fedélzetről leadott adattovábbítási formátum (DF = 17), amely a következő mezőket tartalmazza:

Mező	*Hivatkozás*
DF fedélzetről leadott adattovábbítás formátum	3.1.2.3.2.1.2
CA képesség	3.1.2.5.2.2.1
AA címzés, bejelentett	3.1.2.5.2.2.2
ME közlemény, kiterjesztett squitter	3.1.2.8.6.2
PI paritás/lekérdező azonosító	3.1.2.3.2.1.4

A PI mezőt II egyenlő 0-ként kell kódolni.

3.1.2.8.6.2 *ME: Kiterjesztett squitter közlemény.* Ez a DF=17, 56 bites (33-88) lefelé irányuló üzenetmezőt kell használni az adatsugárzás közleményekhez. A 05, 06, 07, 08, 09, 0A {HEX} és a 61-6F {HEX} regiszterek támogassák a kiterjesztett squitter közleményeket és egyaránt feleljenek meg a verzió 0 és verzió 1 közlemény formátumoknak a lentiek szerint:

a) A verzió 0, ES közlemény formátumok és vonatkozó követelmények a korai kiterjesztett squitter alkalmazásoknak felelnek meg. A felderítés minőségét, az ADS-B által használatos, navigációs adatok pontosságát vagy integritását kifejező navigációs bizonytalanság kategória (NUC) kell jelenteni. Ugyanakkor nincs jelzés arról, hogy ezek közül melyik, a bizonytalanság vagy integritás határozza meg a NUC értékét.

b) A verzió 1, ES közlemény formátumok az emelt szintű követelményeknek megfelelő ADS-B alkalmazásoknak felel meg. A felderítés minőségét és integritását egymástól függetlenül, úgy, mint navigációs pontosság (NAC), navigációs integritás (NIC) és felderítési integritási szint (SIL) kell jelenteni.

1. Megjegyzés – Az összes regiszter formátumára és frissítési gyakoriságára vonatkozó meghatározásokat a ”Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)” ismerteti.

2. Megjegyzés – A két verzióra vonatkozó formátumok együtt működnek .A kiterjesztett squitter vevőrendszerek, fel kell, hogy ismerjék és dekódolják mindkét, verzió 0 és verzió 1 közlemény formátumot.

3. Megjegyzés – A válaszjeladó regiszter formátumokra és adatforrásokra vonatkozó útmutató a ”Manual on Mode S Specific Services *(Doc.9688)*” *kiadványban található.*

3.1.2.8.6.3 *Kiterjesztett squitter fajták*

3.1.2.8.6.3.1 R*epülés közbeni helyzet squitter*. A repülés közbeni helyzet kiterjesztett squitter típus DF = 17 formátumot használ az ME mezőbe beillesztett GICB 05 {HEX} regiszter tartalmával.

Megjegyzés. – Egy GICB kérés (3.1.2.6.11.2 pont), amely RR egyenlő 16 és DI egyenlő 7 és RRS egyenlő 5 értékű jelet tartalmaz, egy olyan választ idéz elő, amely tartalmazza a repülés közbeni helyzet jelentést az MB mezőjében.

3.1.2.8.6.3.1.1 *SSS, légtérellenőrzés állapot almező ME-ben*. A válaszjeladó jelenti a válaszjeladó légtérellenőrzés állapotát az ME-nek, ebben a 2-bites (38-39) almezőben, ha az ME egy repülés közbeni helyzet squitter jelentést tartalmaz.

Kódolás
0 azt jelzi, hogy nincs állapot információ
1 azt jelzi, hogy a válaszjeladó folyamatos riasztás körülményeket jelent (3.1.2.6.10.1.1.1 pont)
2 azt jelzi, hogy a válaszjeladó átmeneti riasztás körülményeket jelent (3.1.2.6.10.1.1.2 pont)
3 azt jelzi, hogy a válaszjeladó SPI körülményeket jelent (3.1.2.6.10.1.3 pont)

Az 1. és 2. kód elsőbbséget élvez a 3. kóddal szemben.

3.1.2.8.6.3.1.2 *ACS, magasság kód almező ME-ben*. ATS irányítás alatt (3.1.2.8.6.3.1.3 pont) a válaszjeladó a barometrikus magasság kódot jelenti ebben a 12-bites (41-52) ME almezőben, amikor ME egy repülés közbeni helyzet jelentést tartalmaz. Az ACS tartalma olyan, ahogyan a 13-bites AC mezőnél meghatározásra került (3.1.2.6.5.4 pont), kivéve, hogy az M-bit (26-os bit) elhagyásra kerül.

3.1.2.8.6.3.1.3 *ACS jelentésadás irányítása.* A magassági adatok válaszjeladóval történő jelentése akkor kerül adásba, amikor az 1-bites magasság típusú almező (ATS) (3.1.2.8.6.8.2 pont) 0 értékű. Az ACS almezőben a barometrikus magasság adatot a válaszjeladónak akkor illeszti be, ha az ATS almező értéke ZERO nagyságú. A válaszjeladó magassági adat beillesztését ACS-ben megakadályozzák, amikor ATS 1-es értékű.

3.1.2.8.6.3.2 *Földi helyzet squitter.* A földi helyzet kiterjesztett squitter típus a DF = 17 formátumot használja az ME mezőbe beillesztett 06 {HEX} GICB regiszter tartalmával.

Megjegyzés. – Egy GICB kérés (3.1.2.6.11.2 pont), amely RR egyenlő 16 és DI egyenlő 7 és RRS egyenlő 6 értékű jelet tartalmaz, egy olyan választ idéz elő, amely tartalmazza a földi helyzet jelentést az MB mezőjében.

3.1.2.8.6.3.3 *Légijármű azonosítás squitter.* A légijármű azonosítás kiterjesztett squitter típus a DF = 17 formátumot használja az ME mezőbe beillesztett 08 {HEX} GICB regiszter tartalmával.

Megjegyzés. – Egy GICB kérés (3.1.2.6.11.2 pont), amely RR egyenlő 16 és DI egyenlő 7 és RRS egyenlő 8 értékű jelet tartalmaz, olyan választ idéz elő, amely tartalmazza a légijármű azonosítás jelentést az MB mezőjében.

3.1.2.8.6.3.4 R*epülés közbeni sebesség squitter.* A repülés közbeni sebesség kiterjesztett squitter típus a DF = 17 formátumot használja az ME mezőjébe beillesztett 09 {HEX} GICB regiszter tartalmával.

Megjegyzés. – Egy GICB kérés (3.1.2.6.11.2 pont), amely RR egyenlő 16 és DI egyenlő 7 és RRS egyenlő 9 értékű jelet tartalmaz, olyan választ idéz elő, amely tartalmazza a repülés közbeni sebesség jelentését az MB mezőjében.

3.1.2.8.6.3.5 *Esemény-működtetett squitter.* Az esemény-működtetett kiterjesztett squitter típus a DF = 17 formátumot használja az ME mezőbe beillesztett QA {HEX} GICB regiszter tartalmával.

Megjegyzés. – Egy GICB kérés (3.1.2.6.11.2 pont), amely RR egyenlő 16 és DI egyenlő 7 és RRS egyenlő 10 értékű jelet tartalmaz, olyan választ idéz elő, amely tartalmazza az esemény-működtetett jelentést az MB mezőjében.

3.1.2.8.6.4 *Kiterjesztett squitter sebesség*

3.1.2.8.6.4.1 *Kezdőérték megadása.* Bekapcsoláskor bekövetkező kezdőérték megadáskor a válaszjeladó abban az üzemmódban kezdi a működését, amelyben csak befogási squittereket tud sugározni (3.1.2.8.5 pont). A válaszjeladó elindítja a kiterjesztett squitterek sugárzását repülés közbeni helyzetre, földi helyzetre, repülés közbeni sebességre és légijármű azonosításra, amikor az adatok a 0,5 , 0,6, 09 és 08 {HEX} GICB regiszterekbe be vannak illesztve, a két felsorolás összeillő sorrendjében. Ezt a meghatározást egyedenként mindegyik típusra meg kell csinálni. Amikor kiterjesztett squittereket közvetítenek, a továbbítási sebességeknek a következő pontokban jelzettnek megfelelőnek kell lenniük. A kiterjesztett squittereken kívül adatgyűjtő squittereket is jelentenek, hacsak az adatgyűjtő squitter nincs gátolva (2.1.5.4). Adatgyűjtő squittereket mindig jelenteni kell, amennyiben kiterjesztett helyzet vagy sebesség squittereket nem jelentenek.

1. Megjegyzés. – Ez elnyomja a légijárműtől jövő hosszú squittereket, s így a légijármű nem tud helyzetet, sebességet vagy azonosítást jelenteni. Ha egy squitter típusú regiszter bemenete 60 másodpercig áll, akkor ennek a kiterjesztett squitter típusnak az adása szünetel addig, amíg az adat bevitel újra nem kezdődik.

2. Megjegyzés. – Rövid szünet után (3.1.2.8.6.6.) ez a squitter típus egy mindenütt zérus ME mezőt tartalmazhat.

3.1.2.8.6.4.2 *Repülés közbeni helyzet squitter sebesség*. Repülés közbeni helyzet squitter adásokat akkor sugároznak, amikor a légijármű a levegőben van (3.1.2.8.6.7 alpont). A sugárzás véletlenszerű időközökkel történik, amelyek egyenletesen oszlanak el a 0,4-től 0,6 másodpercig tartó értéktartományon belül. Az elosztás a megelőző repülés közbeni helyzet squitterhez képest legfeljebb 15 ezredmásodpercnél nagyobb időkvantálással kerül kialakításra, a 3.1.2.8.6.4.7 pontban ismertetett kivételekkel.

3.1.2.8.6.4.3 *Földi helyzet squitter sebesség.* Földi helyzet squitter közleményeket akkor sugároznak, amikor a légijármű a földön tartózkodik (3.1.2.8.6.7 pont), egy vagy két sebességet használva attól függően, hogy kis vagy nagy squitter sebességet választottak ki (3.1.2.8.6.9 pont). Amikor a nagy squitter sebességet választották ki, a földi helyzet squittereket véletlenszerű időközökkel sugározzák, amelyek egyenletesen oszlanak el a 0,4-től 0,6 másodpercig tartó értéktartományon keresztül. Az elosztás a megelőző földi helyzet squitterhez képest legfeljebb 15 ezredmásodpercnél nagyobb időkvantálással kerül kialakításra (ezt nagy sebességnek nevezzük). Ha a kis squitter sebességet választották ki, akkor a földi helyzet squittereket olyan véletlenszerű időközökkel sugározzák ki, amelyek 4,8-tól 5,2 másodpercig tartó értéktartományon belül egyenletesen oszlanak el. Az elosztás a megelőző földi helyzet squitterhez képest legfeljebb 15 ezredmásodpercnél nagyobb időkvantálással kerül kialakításra (ezt kis sebességnek nevezzük). Ezen továbbítási sebességekhez viszonyított kivételek a 3.1.2.8.6.4.7 pontban kerülnek ismertetésre.

3.1.2.8.6.4.4 *Légijármű azonosítás squitter sebesség.* Légijármű azonosító squitter közleményt véletlenszerű időközökkel sugároznak, amelyek egyenletesen oszlanak el a 4,8-tól 5,2 másodpercig tartó értéktartományon belül. Az elosztás legfeljebb 15 ezredmásodpercnél nagyobb időkvantálással kerül kialakításra az előző azonosítási squitterhez viszonyítva, amikor a légijármű a repülés közbeni helyzet squitter típusú jelentését végzi, vagy amikor a légijármű a földi helyzet squitter típusú jelentését adja le, és a nagy földi squitter sebességet választották ki. Amikor a földi helyzet squitter típust kis földi sebességgel jelentik, a légijármű azonosítási squitter véletlenszerű időközökkel sugározzák, amelyek egyenletesen oszlanak el a 9,8-tól 10,2 másodpercig tartó értéktartományon belül. Az elosztás legfeljebb 15 ezredmásodpercnél nagyobb időkvantálással kerül kialakításra az előző azonosítási squitterhez viszonyítva. Ezen átviteli sebességek alóli kivételek a 3.1.2.8.6.4.7 pontban találhatók.

3.1.2.8.6.4.5 *Repülés közbeni sebesség squitter gyakoriság.* Repülés közbeni sebesség squitter adásokat akkor sugároznak, amikor a légijármű a levegőben van (3.1.2.8.6.7 alpont). A sugárzás véletlenszerű időközökkel történik, amelyek egyenletesen oszlanak el a 0,4-től 0,6 másodpercig tartó értéktartományon belül. Az eloszlás legfeljebb 15 ezredmásodpercnél nagyobb időkvantálással kerül kialakításra az előző repülés közbeni sebesség squitterhez viszonyítva. Kivételt képeznek a 3.1.2.8.6.4.7 alpontban előírtak.

3.1.2.8.6.4.6 *Esemény-működtetett squitter sebesség.* Esemény-működtetett squittert egyszer továbbítanak, mindig akkor, amikor az OA {HEX} GICB regiszter le van terhelve, mialatt a 3.1.2.8.6.4.7 alpontban ismertetett késleltetés körülményeket figyelik. Az esemény-működtetett squitternél a maximális adási sebességet a válaszjeladó kettő per másodperc értékben korlátozza. Ha egy közlemény az esemény-működtetett regiszterbe be van illesztve, és a sebesség korlátozás miatt nem lehet továbbítani, azt meg kell tartani és akkor kell továbbítani, amikor a sebesség korlátozás feloldódott. Ha az adás engedélyezése előtt új közleményt vesznek, ez a korábbi közleményt felülírja.

Megjegyzés. – A squitter átviteli sebesség és a squitter átvitelek időtartama alkalmazás-függő. Az egyes alkalmazásoknál végrehajtott választásoknak figyelemmel kell lenniük az interferencia meggondolásokra (hivatkozással a ”Manual of the Secondary Surveillance Radar (SSR) Systems *(Doc 9684)*” *kiadvány 8. fejezetére).*

3.1.2.8.6.4.7 *Késleltetett továbbítások.* Kiterjesztett squitter átvitelt az alábbi körülmények között kell késleltetni:

a) ha a válaszjeladó tranzakció ciklusban van (3.1.2.4.1 alpont);

b) ha egy adatbegyűjtési vagy más típusú kiterjesztett squitter feldolgozás alatt van; vagy

c) vagy közös elnyomás csatoló elem van működésben.

A késleltetett squittert azonnal továbbítani kell, mihelyt a válaszjeladó működésre kész.

3.1.2.8.6.5 *Kiterjesztett squitter antenna kiválasztás*. Antenna eltéréssel működő válaszjeladók (3.1.2.10.4 alpont) a következők szerint továbbítanak kiterjesztett squittereket:

a) a levegőben (3.1.2.8.6.7 alpont), a válaszjeladó az összes típusú kiterjesztett squittert felváltva továbbítja a két antennáról; és

b) a földön (3.1.2.8.6.7 alpont), a válaszjeladó a SAS irányítása alatt (3.1.2.6.1.4.1f) továbbít kiterjesztett squittereket.

SAS utasítások hiányában a tetőantenna használata az alaphelyzet.

3.1.2.8.6.6 *Regiszter üzemszünet.* A válaszjeladó felszabadítja a repülés közbeni helyzet, a földi helyzet, a squitter állapot és a repülés közbeni sebesség információ 05, 06, 07 és 09 {HEX} GICB regiszterek mind az 56 bitjét, ha ezeket a regisztereket az előző felfrissítéshez viszonyított két másodpercen belül nem frissítik fel. Ezt az üzemszünetet ezeknek a regisztereknek mindegyikére külön-külön kell meghatározni.

1. Megjegyzés. - A kiterjesztett squitter adatsugárzás befejezési időpontját a "Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)" kiadvány határozza meg.

2. Megjegyzés. – Ezeket a regisztereket azért szabadítják fel, hogy megakadályozzák idejétmúlt helyzet, sebesség és squitter sebesség információk jelentését.

3.1.2.8.6.7 *Levegő/föld helyzet meghatározása.* Azon légijárművek, amelyek a földi helyzet automatikus meghatározására szolgáló eszközökkel rendelkeznek, ezt a bemenetet használják a légi vagy földi közlemény típusok kiválasztásához. Ilyen alkalmazás hiányában - a légijárművek légi típusú közleményeket jelentsenek, kivéve a 3-8 Táblázatban meghatározott eseteket. A táblázat csak olyan légijárművek esetében alkalmazható, amelyeken rendelkezésre áll a rádiómagasság ÉS minimálisan a levegőhöz viszonyított sebesség VAGY a földhöz viszonyított sebesség. Egyébként, ha ebbe a kategóriába tartozó légijárművön csak a levegőhöz viszonyított sebesség és a földhöz viszonyított sebesség áll rendelkezésre, csak akkor sugározzon földi közlemény formátumot ha:

a levegőhöz viszonyított sebesség < 50 knots (csomó) ÉS a földhöz viszonyított sebesség < 50 knots (csomó).

Az automatikus földi helyzet meghatározással rendelkező vagy nem rendelkező légijárművek alkalmazzák a TCS vezérlő kódok (3.1.2.6.1.4.1 f)) szerint meghatározott közlemény típust. A TCS vezérlő kódok időzítésének lejárata után a levegő/föld típusú közlemény választás a fent leírtak szerint történjék.

1. Megjegyzés – A fenti eljárás - földi közlemény típus sugárzásakor – eredményezheti a levegő-föld helyzet jelzését a CA mezőben, „levegőben vagy földön”értéket.

2. Megjegyzés – A kiterjesztett squitter földi állomások, a légijárművek - „levegőben” vagy „földön” – helyzetét a légijármű pozíció, magasság és földhöz viszonyított sebesség paraméterek alapján határozzák meg. Földi/légi helyzetet nem jelentő, földi helyzetben lévő légijárművet a TCS (lásd 3.1.2.6.1.4.1 f) kóddal lehet földi közlemény formátum sugárzására utasítani. A légi közlemény formátumhoz való visszatérés szokásos módja, egy földi utasítás, amely elrendeli a légi közlemény típust. A felszállást követő, kommunikáció megszakadása elleni biztosítást a földi közlemény formátum sugárzására utasító parancs automatikus időzítése jelenti.

3.1.2.8.6.8 S*quitter állapot jelentés.* Egy GICB kérés (3.1.2.6.11.2 alpont), amely RR egyenlő 16 és DI egyenlő 7 és RRS egyenlő 7 tartalommal bír, előidézi, hogy az eredményezett válasz squitter állapot jelentést tartalmazza az MB mezőjében.

3.1.2.8.6.8.1 *TRS, átviteli sebesség almező MB-ben.* A válaszjeladónak jelentenie kell a légijármű képességét a földi squitter sebességének automatikus megállapítására és a fennálló squitter sebességet az MB-nek ebben a 2-bites (33, 34) almezőjében.

Kódolás

0 azt jelzi, hogy nincs automatikus földi squitter sebesség meghatározás képesség
1 azt jelzi, hogy nagy földi squitter sebességet választottak ki
2 azt jelzi, hogy kis földi squitter sebességet választottak ki
3 kijelöletlen

1. Megjegyzés. – Nagy és kis squitter sebességet a légijármű fedélzetén határozzák meg.

2. Megjegyzés. – A kis sebességet akkor használják, amikor a légijármű nem mozog, és a nagy sebesség akkor használatos, amikor a légijármű mozog. Az, hogy a légijármű miként „mozog”, a ”Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)” című előírásból határozható meg a 07_{16} regiszter adatformátuma segítségével.

3.1.2.8.6.8.2 *ATS, magasság típusú almező MB-ben.* A válaszjeladó jelenti a magasság típusát, amelyet az MB-nek ebben az 1-bites (35) almezőjében lévő repülés közbeni kiterjesztett squitterben szolgáltatnak, amikor a válasz a 07 {HEX} GICB regiszter tartalmát magában foglalja.

Kódolás

0 azt jelzi, hogy a barometrikus magasságot a 05 {HEX} válaszjeladó regiszter ACS-ben (3.1.2.8.6.3.1.2 pont) kell jelenteni.
1 azt jelzi, hogy a navigációból származtatott magasságot a 05 {HEX} válaszjeladó regiszter ACS-ben (3.1.2.8.6.3.1.2 pont) kell jelenteni.

Megjegyzés. – A 05 {HEX} és a 07 {HEX} válaszjeladó regiszterek tartalmának részleteiről lásd a ”Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)” című előírást.

3.1.2.8.6.9 *Földi squitter sebesség irányítás*. A földi squitter sebességet a következők szerint határozzák meg:

a) másodpercenként egyszer leolvassák a TRS tartalmát. Ha a TRS értéke 0 vagy 1, a válaszjeladó a földi squittereket nagy sebességgel továbbítja. Ha a TRS értéke 2, a válaszjeladó a földi squittereket kis sebességgel továbbítja;

b) a TRS-en keresztül meghatározott squitter sebességet az RCS-en keresztül vett utasításokkal felül kell bírálni (3.1.2.6.1.4.1f) pont). Az RCS 1 kód a válaszjeladót 60 másodpercen keresztül nagysebességű squitterelésre készteti. Az RCS 2 kód a válaszjeladót 60 másodpercen át kis sebességű squitterelésre készteti. Ezek az utasítások felfrissítésre képesek egy új 60 másodperces periódus alatt az előző periódus üzemszünetét megelőzően; és

c) az üzemszünet után és az RCS 1 és 2 kódok hiányában az irányítás visszatér a TRS-hez.

3.1.2.8.6.10 Hosszúság/szélesség kódolás kompakt helyzet-jelentés (CPR) felhasználásával. S-módú kiterjesztett squitter kompakt helyzetjelentést (CPR) használ a szélesség és hosszúság hatékony kódolására a közleményekben.

Megjegyzés. - A CPR kódolásra/dekódolásra használt módszert a ”Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)” *határozza meg.*

3.1.2.8.6.11 *Adatbevitel.* Amikor a válaszjeladó szerint elérkezett a fedélzeti pozíció squitter kisugárzásának az ideje, be kell illesztenie a barometrikus magasság pillanatnyi értékét (hacsak nincs letiltva az ATS almező által – lásd 3.1.2.8.6.8.2) és a felderítési állapotot a 05 {HEX} megfelelő regisztermezőbe. Ezt követően a regisztertartalmat beszúrják a DF=17, ME mezőbe, majd kisugározzák.

Megjegyzés – A fentiek szerinti adatbetöltés biztosítja: (1) a squitter a legfrissebb barometrikus magasságot és felderítési állapotot tartalmazza, (2) a földi kiolvasó regiszter 05 {HEX} ugyanazt az információt nyeri ki, amely az S-módú felderítési válasz AC mezőben is található.

3.1.2.8.7 *Lefelé irányuló, kiterjesztett squitter /kiegészítő adatsugárzás - 18. formátum*

10010	CF:3			PI:24

1. Megjegyzés – Ez a formátum támogatja a nem válaszjeladó típusú eszközök által létrehozott ADS-B kiterjesztett squitter sugárzást. A nem válaszjeladó típusú eszközök nem részei az S-módú válaszjeladónak. Egy elkülönített formátum biztosítja a nem válaszjeladó típusú berendezést, azért, hogy az ACAS II vagy földi, kiterjesztett squitter adóállomás ne kérdezhesse az ilyen típusú berendezéseket.

2. Megjegyzés –Mint az Adatsugárzás Üzemmódban Működő Légiforgalmi Információs Szolgáltatás (TIS-B), ez az formátum használatos a földi ADS-B adatsugárzás szolgáltatások esetében is.

3. Megjegyzés – A DF 18 adatsugárzás formátumot, a CF mező értéke határozza meg.

3.1.2.8.7.1 *ES kiegészítő formátum.* Az ES kiegészítő formátum a következő mezőket (DF=18) tartalmazó, 112 bites lefelé irányuló adatátviteli formátum:

Mező	Hivatkozás
DF lefelé irányuló adatátviteli formátum	3.1.2.3.2.1.2
CF vezérlő mező	3.1.2.8.7.2
PI paritás/lekérdező azonosító	3.1.2.3.2.1.4

A PI mezőt a nullával azonos II mezővel kell kódolni.

3.1.2.8.7.2 *Vezérlő mező.* Ez a lefelé irányuló, 3 bites mező a DF=18-n kell, hogy meghatározza 112 bites adatsugárzás formátumot a következők szerint.

Kód 0 = Az AA mezőben (lásd 3.1.2.8.7), az ICAO 24 bites címzést jelentő ADS-B ES/NT eszközök

Kód 1 = Fenntartva azon ADS-B ES/NT eszközök számára, amelyek az AA (lásd 3.1.2.8.7.3), mezőben más címzési eljárást használnak.

Kód 2 = Finom felbontású TIS-B közlemény formátum

Kód 3 = Durva felbontású TIS-B közlemény formátum

Kód 4 = Fenntartva a TIS-B adatkezelés közleményeknek.

Kód 5 = Az AA mezőben más címzési eljárást alkalmazó ADS-B közleményeket átjátszó TIS-B közlemények

Kód 6 = Az ADS-B közlemények újrasugárzása, amely ugyanazt a kódot és közlemény formátumot használja, amelyet a DF=17 ADS-B közlemény definiál.

Kód 7 = Fenntartva

1. Megjegyzés – Azért, hogy a 24-bites címtartomány növelhető legyen, az ES/NT eszközök számára, a hatóságok – az ICAO (10. Annex, III Kötet, I Rész, 9. Fejezet) 24-bites címtartományon túl – kijelölhetnek más címzést is.

2. Megjegyzés – Ez, a nem ICAO 24 bites címtartomány nem használatos a nemzetközi gyakorlatban.

3.1.2.8.7.3 *ADS-B kiterjesztett adatsugárzás nem válaszjeladó típusú (ES/NT) eszközök számára*

10010	CF=0	AA:24	ME:56	PI:24

3.1.2.8.7.3.1 *ES/NT formátum*. A formátum az ES/NT alkalmazásokhoz használatos, 112 bites lefelé irányuló formátum (DF = 18) és a következő mezőket tartalmazza:

Mező	Hivatkozás
DF lefelé irányuló adatátviteli formátum	3.1.2.3.2.1.2
CF vezérlő mező = 0	3.1.2.8.7.2
AA regisztrált címzés	3.1.2.5.2.2.2
ME közlemény, kiterjesztett squitter	3.1.2.8.6.2
PI paritás/lekérdező azonosító	3.1.2.3.2.1.4

A PI mezőt a nullával azonos II mezővel kell kódolni.

3.1.2.8.7.3.2 *ES/NT squitter típus*

3.1.2.8.7.3.2.1 *Repülés közbeni pozíció squitter*. A repülés közbeni pozíció típusú ES/NT a DF=18 formátumot az ME mezőbe beillesztett, és a 3.1.2.8.6.2 pontban meghatározott a 05 {HEX} regiszter formátummal együtt használja.

3.1.2.8.7.3.2.2 *Földi pozíció squitter*. A földi pozíció típusú ES/NT a DF=18 formátumot az ME mezőbe illesztett, és a 3.1.2.8.6.2 pontban meghatározott 06 {HEX} regiszter formátummal együtt használja.

3.1.2.8.7.3.2.3 *Légijármű azonosító squitter*. A légijármű azonosító típusú ES/NT a DF=18 formátumot az ME mezőbe illesztett, és a 3.1.2.8.6.2 pontban meghatározott 08 {HEX} regiszter formátummal együtt használja.

3.1.2.8.7.3.2.4 *Repülés közbeni sebesség squitter*. A repülés közbeni sebesség típusú ES/NT a DF=18 formátumot az ME mezőbe illesztett, és a 3.1.2.8.6.2 pontban meghatározott 09 {HEX} regiszter formátummal együtt használja.

3.1.2.8.7.3.2.5 *Esemény vezérelt squitter*. Az esemény vezérelt típusú ES/NT a DF=18 formátumot az ME mezőbe illesztett, és a 3.1.2.8.6.2 pontban meghatározott 0A {HEX} regiszter formátummal együtt használja.

3.1.2.8.7.3.3 *ES/NT squitter gyakoriság*

3.1.2.8.7.3.3.1 *Kezdőérték megadása*. A táplálás bekapcsolását követő kezdőérték beállítás során a nem válaszjel típusú eszközök a működésüket úgy indítsák, hogy közben semmilyen squitter-t ne sugározzanak. A nem válaszjeladó típusú eszközök a repülés közbeni pozíció, földi pozíció, repülés közbeni sebesség és légijármű azonosító típusú ES/NT squitter-t akkor kezdeményezzék, ha a szükséges adatok rendelkezésre állnak az adott squitter típus ME mezőbe illesztéshez. A fentiek eldöntése egyedi eljárást igényel mindegyik squitter típus esetében. Az ES/NT squitter adatátviteli gyakorisága feleljen meg a 3.1.2.8.6.4.2 - 3.1.2.8.6.4.6 fejezeteknek.

1. Megjegyzés – Ha a légijármű nem képes pozíciót, sebességet vagy azonosítót jelenteni, ez megakadályozza a kiterjesztett squitter adatsugárzást is. Ha a bemeneti adatközlés a különböző squitter típus regiszterekhez 60 sec-ra megszakad, az adott squitter típus adatsugárzása szünetel, amíg az adatközlés helyre nem áll, kivéve a földön üzemelő ES/NT eszközöket (ahogy azt az 1. változatú kiterjesztett squitter formátumokhoz a "Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)" meghatározza).

2. Megjegyzés – Az időzítés (3.1.2.8.7.6) leteltével az ilyen squitter típus az ME mező összes helyi értékén zérót tartalmaz.

3.1.2.8.7.3.3.2 *Késleltetett adatsugárzás*. Az ES/NT squitter adatsugárzást késleltetni kell, ha a nem válaszjeladó típusú eszköz más egyéb típusú squitter-t sugároz.

3.1.2.8.7.3.3.2.1 A késleltetett squitter-t azonnal ki kell sugározni amint a nem válaszjeladó típusú eszköz felszabadult.

3.1.2.8.7.3.3.3 *ES/NT antenna kiválasztás*. Az antenna átkapcsolással (3.1.2.10.4) működő, nem válaszjeladó típusú eszközök az ES/NT squitter-t a következők szerint sugározzák:

a) a levegőben (3.1.2.8.6.7), a nem válaszjeladó típusú eszközök a különböző típusú ES/NT squitter-t felváltva sugározzák a két antennáról ; és

b) a földön (3.1.2.8.6.7), a nem válaszjeladó típusú eszközök az ES/NT squitter-t a felső antennáról sugározzák ki.

3.1.2.8.7.3.3.4 *Regiszter időzítés*. A nem válaszjeladó típusú eszközök törlik a repülés közbeni pozíció, földi pozíció, sebesség közleményekhez használatos 56 bites regiszterek tartalmát, ha az utolsó frissítéstől számított 2 sec-n belül a regiszter tartalom nem került frissítésre. Ez az időzítés, az összes regiszter esetében, egymástól függetlenül kerül megállapításra.

1. Megjegyzés – A kiterjesztett squitter adatsugárzás lezárásának meghatározását a "Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)" tartalmazza.

2. Megjegyzés – A fenti regiszter tartalmakat törlik annak érdekében, hogy az idejétmúlt pozíció és sebesség adatok ne kerüljenek kisugárzásra.

3.1.2.8.7.3.3.5 *Repülés közbeni/földi helyzet meghatározása*. A földi helyzetet automatikusan meghatározó légijárművek, ezt az interfész bemenetet használják, a légi vagy földi közlemény típusok kiválasztásához, kivéve a 3.1.2.6.10.3.1 pontban leírtakat. Azok a légijárművek, amelyek nem rendelkeznek automatikus földi helyzet meghatározással, a 3.1.2.8.6.7 pontban leírtak kivételével, repülés közbeni típusú közleményeket jelentenek.

3.1.2.8.7.3.3.6 *Földi squitter sűrűség vezérlés*. A légijármű mozgását 1 másodpercenként kell ellenőrizni. A földi squitter sűrűséget az ellenőrzés eredményétől függően kell meghatározni.

Megjegyzés – A légijármű mozgásának meghatározásához szüksége algoritmust a "Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)" dokumentumban a 0716 regiszterre vonatkozó előírások határozzák meg.

3.1.2.8.8 *Kiterjesztett squitter katonai alkalmazása, fedélzetről leadott 19-es adattovábbítási formátum*

10010	AF:3	

Megjegyzés. – Ez a formátum támogatja a kiterjesztett squitter ADS-B közlemények rádióadását katonai alkalmazások támogatásában. Külön formátumot használnak ezeknek a kiterjesztett squittereknek a megkülönböztetésére a szabványos ADS-B közlés együttes rádióadásoktól, amelyek DF = 17 vagy 18-at használnak.

3.1.2.8.8.1 *Katonai formátum.* A DF = 19-hez használt formátum egy 112-bites fedélzetről leadott adattovábbítási formátum, amely a következő mezőket tartalmazza:

Mező	*Hivatkozás*
DF fedélzetről leadott adattovábbítási formátum	3.1.2.3.2.1.2
AF irányítás mező	3.1.2.8.8.2

3.1.2.8.8.2 *Alkalmazás mező.* Ez a 3-bites (6 – 8) fedélzetről leadott adattovábbítási mezőt DF = 19-ben a 112-bites átvitel formátumának meghatározásához kell használni.

0 – 7 kód = Fenntartott

3.1.2.8.9 Kiterjesztett squitter maximális átviteli sebesség

Egy kiterjesztett squitter alkalmazás által sugárzott kiterjesztett squitterek (DF = 17, 18 vagy 19) maximális teljes száma nem haladhatja meg a 6,2 per másodpercet.

3.1.2.9 Légijármű azonosítási protokoll

3.1.2.9.1 *Légijármű azonosítás jelentés*. Egy földi kezdeményezésű Comm-B kérés (3.1.2.6.11.2 pont), amely RR egyenlő 18 és vagy DI nem egyenlő 7, vagy DI egyenlő 7 és RRS egyenlő 0 megfeleléseket tartalmaz, olyan választ állíthat elő, amely a légijármű azonosítását tartalmazza az MB mezőjében.

3.1.2.9.1.1 *AIS, légijármű azonosítási almező MB-ben.* A válaszjeladó a légijármű azonosítását a 48-bites (41-88) AIS MB almezőben jelenti. Az átvitt légijármű azonosítás lesz az, ami a repülési tervben alkalmazásra kerül. Hogyha repülési terv nem áll rendelkezésre, a légijármű lajstromjele kerül beillesztésre ebbe az almezőbe.

Megjegyzés. – Ha a légijármű lajstromjelét használják, ezt "rögzített közvetlen adatként" minősítik (3.1.2.10.5.1.1 pont). Ha egy másik légijármű azonosítási fajtát használnak, ezt "változó közvetlen adatként" minősítik (3.1.2.10.5.1.3 pont).

3.1.2.9.1.2 *AIS almező kódolása*. Az AIS almezőt a következőképpen kódolják:

33	41	47	53	59	65	71	77	83
BDS	Char. 1	Char. 2	Char. 3	Char. 4	Char. 5	Char. 6	Char. 7	Char. 8.
40	46	52	58	64	70	76	82	88

Megjegyzés. – Légijármű azonosítás kódolás maximum 8 karaktert szolgáltat.

A légijármű azonosítási közleményhez használt BDS kód legyen: BDS1 egyenlő 2 (33-36) és BDS2 egyenlő 0 (37-40).

Minden karaktert az 5. számú Nemzetközi Betűrend Sorszám (IA-5) 6-bites almezőjeként kódolnak, ahogyan az a 3-6 táblázatban fel van tüntetve. A karakter kódot először a magasabb rendű egységével (b_6) kell továbbítani, és a közölt légijármű azonosítást a balszélső karakterrel kell kezdeni. A karaktereket egymás után, SPACE kód közbeiktatása nélkül kell kódolni. Bármely nem használt karakter az almező szélén egy SPACE karakter kódot tartalmaz.

3.1.2.9.1.3 *Légijármű azonosítási képesség jelentés*. A válaszjeladók, amelyek egy földi kezdeményezésű légijármű azonosításra vonatkozó kérésre reagálnak, ezt a képességet az adatkapcsolati képesség közlésben (3.1.2.6.10.2.2.2 alpont) jelentik a MB almező 33-as bitjének 1 értékre állításával.

3.1.2.9.1.4 *Légijármű azonosítás változás*. Ha az AIS almezőben közölt légijármű azonosítás repülés közben változik, a válaszjeladó közli a földdel az új azonosítást a Comm-B adás közlemény protokoll felhasználásával, amely a 3.1.2.6.11.4 pontban szerepel.

3.1.2.10 A másodlagos felderítő radar S-módú válaszjeladójának lényeges rendszer jellemzői

3.1.2.10.1 *Válaszjeladó érzékenység és dinamikus tartomány*. A válaszjeladó érzékenységét egy adott lekérdezési jel bemeneti szintjének és a hozzátartozó válaszok adott százalékának fogalmával határozzák meg. Csak a vett lekérdezéshez tartozó kért bit-sémát tartalmazó helyes válaszok jönnek számításba. Egy adott lekérdezésnél, amely a 3.1.2.4 pontnak megfelelő választ igényel, a minimális indító szintet, MTL-t, a 90%-os válasz-lekérdezés arányhoz tartozó minimális bemenő teljesítmény szintként határozzák meg. A MTL értéke -74 dBm ±3 dB. Egy S-módú válaszjeladó válasz-lekérdezés aránya a következő:

a) legalább 99% a 3 dB-el MTL fölött és a -21 dBm közötti jel bemeneti szinteknél; és

b) nem több, mint 10% -81 dBm alatti jel bemeneti szinteknél.

Megjegyzés. – A válaszjeladó érzékenység és kimenő teljesítmény ebben a szakaszban az antenna termináloknál lévő jelszint fogalmában van leírva. Ez szabadságot ad a tervezőnek a beszerelés elrendezéséhez a kábelhossz optimalizálására és a vevő-adó tervezéshez és nem zárja el a vevő és/vagy adó alkatrészeket attól a lehetőségtől, hogy az antenna alszerelvény integrált részévé váljanak.

3.1.2.10.1.1 *Válasz-arány interferencia jelenlétében.*

Megjegyzés.– A következő pontok az S-módú válaszjeladó teljesítmény mérését mutatják be interferáló A/C-módú lekérdezés impulzusok és alacsony szintű hullámsávon belüli CW interferencia jelenlétében.

3.1.2.10.1.1.1 *Válasz-arány interferáló impulzus jelenlétében.* Ha adott egy S-módú lekérdezés, amely választ igényel (3.1.2.4 alpont), a válaszjeladó válasz aránya legalább 95% egy zavaró A/C-módú lekérdezés impulzus jelenlétében, ha a zavaró impulzus szintje 6 dB-vel vagy ennél nagyobb értékkel a -68 dBm és -21 dBm közötti S-módú input jel jelszintje alatt van és az interferáló impulzus S-módú lekérdezés P_6 impulzusát átlapolja, bárhol a szinkronizáló fázis megfordítás után.

Ugyanazon feltételek mellett a válasz arány legalább 50 százalék, ha az interferencia impulzus szint 3 dB-el vagy ennél többel a jelszint alatt van.

3.1.2.10.1.1.2 *Válasz-arány impulzus pár interferencia jelenlétében*. Ha adott egy lekérdezés, amely választ igényel (3.1.2.4 alpont), a válaszjeladó válasz aránya legalább 90 százalék egy P_1 és P_2 impulzus pár jelenlétében, ha az interferáló impulzuspár 9 dB-el vagy többel a jelszint alatt van - 68 dBm és -21 dBm közötti bemeneti jel szinteknél, és az interferáló pár P_1 impulzusa nem előbb jelenik meg, mint az S-módú jel P_1 impulzusa.

3.1.2.10.1.1.3 *Válasz-arány alacsonyszintű aszinkron interferencia jelenlétében*. Az összes, -65 dBm és -21 dBm közötti vett jelnél és adott egy S-módú lekérdezés, amely a 3.1.2.4 pontnak megfelelő választ kér, és ha nincs kizárási feltétel érvényben, a válaszjeladó legalább 95 százalékos válaszaránnyal helyesen válaszol aszinkron interferencia jelenlétében. Az aszinkron interferenciát egyetlen A/C-módú lekérdezési impulzusnak vesszük, amely maximálisan 10000 Hz-es ismétlési sebességgel fordul elő 12 dB-el vagy többel az S-módú jel szintje alatt.

Megjegyzés. – Az ilyen impulzusokat kombinálni lehet az S-módú lekérdezés P_1 és P_2 impulzusaival egy érvényes, csak A/C módú körhívás lekérdezés kialakításához. Az S-módú válaszjeladó nem reagál a csak A/C-módú körhívás lekérdezésekre. Az előző impulzus ugyancsak kombinálható az S-módú lekérdezés P_2-jével egy érvényes A-módú vagy C-módú lekérdezés kialakítására. Azonban az S-módú bevezetés P_1 és P_2 párja elsőbbséget élvez (3.1.2.4.1.1.1 alpont). Az S-módú dekódolási eljárás független az A-módú/C-módú dekódoló eljárástól és a vett S-módú lekérdezéstől.

3.1.2.10.1.1.4 *A válasz sűrűség alacsonyszintű, azonos sávú, CW interferencia mellett*. 1030 ± 0.2 MHz-es, az elvárt Mode A/C vagy S-módú lekérdező jelszinttől legalább 20 dB-l vagy annál nagyobb mértékben, kisebb jelszintű, nem koherens CW interferencia esetén, a válaszjeladó a lekérdezések legalább 90 %-ra helyesen kell, hogy válaszoljon.

3.1.2.10.1.1.5 *Hamis reagálás*

Ajánlás. – *A nem a vevő sáváteresztőjén belüli jelekre való reagálásnak legalább 60 dB-el a normál érzékenység alatt kell lennie.*

3.1.2.10.2 V*álaszjeladó impulzus-csúcsteljesítmény.* Egy válasz mindegyik impulzusának csúcsteljesítménye a következők szerinti:

a) nem kisebb, mint 18,5 dBW olyan légijárműveknél, amelyek 4570 m (15000 láb) feletti magasságokon nem tudnak üzemelni;

b) nem kisebb, mint 21,0 dBW olyan légijárműveknél, amelyek 4570 m (15000 láb) feletti magasságokon képesek üzemelni;

c) nem kisebb, mint 21,0 dBW olyan légijárműveknél, amelyek maximális utazó sebessége meghaladja 324 km/h-t (175 csomó); és

d) nem haladja meg a 27,0 dBW-t.

3.1.2.10.2.1 *Inaktív állapotú válaszjeladó kimenő teljesítmény.* Amikor a válaszjeladó inaktív állapotban van, az impulzus-csúcsteljesítmény 1090 MHz plusz vagy mínusz 3 MHz-nél nem haladja meg a -50 dBm-et. Az inaktív állapot úgy lett meghatározva, hogy benne van az első átviteli impulzust megelőző és az utolsót követő 10 mikromásodpercnél kisebb átviteli periódusú átvitelek közötti teljes periódusban.

Megjegyzés. – Inaktív állapotú válaszjeladó teljesítmény ily módon arra szorítkozik, hogy egy légijármű számára biztosítsa, hogy amikor nagyon közel, 185 m-re (0,1 NM) van egy A/C-módú vagy S-módú lekérdezőhöz, ne okozzon a válaszjeladónál interferenciát. Az S-mód bizonyos alkalmazásainál, például az összeütközés-elhárító fedélzeti rendszernél, ahol 1090 MHz-es adó és vevő van ugyanazon a légijárművön, az inaktív állapotú válaszjeladó teljesítmény további korlátozására lehet szükség.

3.1.2.10.2.2 *Hamis emisszió sugárzás*

Ajánlás – *CW sugárzás nem haladhatja meg a 70 dB-t 1 Watt alatt.*

3..1.2.10.3 *Különleges jellemzők*

3.1.2.10.3.1 *S-módú oldalszárny elnyomás*

Megjegyzés. – Oldalszárny elnyomás S-módú formátumoknál akkor fordul elő, amikor a P_5 impulzus rákerül a P_6 szinkronizáló fázis megfordítás elhelyezésre, amelynek az a következménye, hogy a válaszjeladó nem nyugtázza a lekérdezést (3.1.2.4.1.1.3 alpont).

Ha adott egy választ igénylő S-módú lekérdezés, a válaszjeladónak:

a) minden MTL +3 dB és -21 dBm közötti jelszintnél 10 százaléknál kisebb válasz aránya lesz, ha a P_5 vett amplitúdó 3 dB-el vagy többel meghaladja a P_6 vett amplitúdót;

b) minden MTL +3 dB és -21 dBm közötti jelszintnél legalább 99 százalékos válasz aránya lesz, ha a vett P_6 amplitúdó 12 dB-el vagy többel meghaladja a P_5 vett amplitúdót.

3.1.2.10.3.2 *S-módú holtidő.* A holtidő olyan időközként lett meghatározva, amely egy válasz továbbítás végénél kezdődik, és akkor fejeződik be, amikor a válaszjeladó visszanyeri az érzékenységét az MTL 3 dB-én belül. S-módú válaszjeladónak nem lehet 125 mikromásodpercnél hosszabb holtideje.

3.1.2.10.3.3 *S-módú vevő érzékenység csökkentés.* A válaszjeladó vevőjének érzékenységét a 3.1.1.7.7.1 pontnak megfelelően csökkentik a 0,7 mikromásodpercnél hosszabban tartó impulzusok vételével szemben.

3.1.2.10.3.3.1 *Helyreállítás érzékenység csökkentésből.* Az érzékenység csökkentésből történő helyreállítás a vett jel mindegyik impulzusának a lefutó élénél kezdődik, és a 3.1.1.7.7.2 pontban előírt sebességgel folyik le, feltéve, hogy nincs válasz- vagy adatátvitel a vett jelre való reagálás keretében.

3.1.2.10.3.4 *Helyreállítás olyan S-módú lekérdezések után, amelyek nem váltanak ki választ.*

3.1.2.10.3.4.1 *Helyreállítás egyedüli S-módú lekérdezés után.*

3.1.2.10.3.4.1.1 A válaszjeladó az MTL 3 dB-jén belüli érzékenységét nem később, mint 128 mikromásodperccel a szinkronizáló fázis megfordítás vétele után állítja helyre, egy olyan S-módú lekérdezést követően, amelyet nem fogadnak (3.1.2.4.1.2 alpont), vagy amelyet fogadnak, de nem igényel választ.

3.1.2.10.3.4.1.2 **Ajánlás**. – *A válaszjeladó az MTL 3 dB-jén belüli érzékenységét nem később, mint 45 mikromásodperccel a szinkronizáló fázis megfordítás vétele után állítja helyre, egy olyan S-módú lekérdezést követően, amelyet nem fogadnak (3.1.2.4.1.2 alpont), vagy amelyet fogadnak, de nem igényel választ.*

3.1.2.10.3.4.1.3 Minden S-módú válaszjeladó, melyet 1999. Január 1-jén vagy azután szerelnek fel, az MTL 3 dB-jén belüli érzékenységét nem később, mint 45 mikromásodperccel a szinkronizáló fázis megfordítás vétele után állítja helyre, egy olyan S-módú lekérdezést követően, amelyet nem fogadnak (3.1.2.4.1.2 alpont), vagy amelyet fogadnak, de nem igényel választ.

3.1.2.10.3.4.2 *Helyreállítás S-módú Comm-C lekérdezés után.* Comm-C képességgel rendelkező S-módú válaszjeladó az MTL 3 dB-je belüli érzékenységét nem később, mint 45 mikromásodperccel a szinkronizáló fázis megfordítás vétele után állítja helyre, egy olyan Comm-C lekérdezés vételét követi, amelynek részére nincs válasz igény.

3.1.2.10.3.5 *Nem-kívánt S-módú válaszok.* Az S-módú válaszjeladók nem-kívánt S-módú válaszokat, 10 másodpercenként legfeljebb egyszer állíthatnak elő. A légijárműben a felszerelést úgy kell elvégezni, hogy ezt a szintet elérjék, amikor az összes lehetséges interferáló berendezés, amelyet ugyanarra a gépre felszereltek, maximális interferencia szinten működik.

3.1.2.10.3.5.1 *Nem-kívánt S-módú válaszok, alacsonyszintű, azonos sávú, CW interferencia mellett.* 1030 ± 0.2 MHz-es, -60dBm vagy kisebb jelszintű, nem koherens CW interferencia és érvényes S-módú lekérdezés esetén, az S-módú válaszjeladó nem-kívánat S-módú választ legfeljebb egyszer sugározhat minden 10 másodperc alatt.

3.1.2.10.3.6 *Válasz sebesség korlátozás*

Megjegyzés. – A válasz sebesség korlátozás külön van előírva A és C-módra és S-módra.

3.1.2.10.3.6.1 *S-módú válasz sebesség korlátozás*. Egy válaszjeladó S-módú formátumainál nem kívánnak válasz sebesség korlátozást. Ha ilyen korlátozó az áramkör védelem céljából be van építve, ez a 3.1.2.10.3.7.2 és 3.1.2.10.2.7.3 pontokban megkövetelt minimális lekérdezési sebességet teszi lehetővé.

3.1.2.10.3.6.2 *A- és C-módú válasz sebesség korlátozás.* A válasz sebesség korlátozás A- és C-módnál a 3.1.1.7.9.1 pontnak megfelelően érvényesül. Az előírt érzékenység csökkentés (3.1.1.7.9.2 alpont) nem befolyásolja a válaszjeladó S-módú teljesítményét.

3.1.2.10.3.7 *Minimális válasz sebesség képesség, A-, C- és S-módok.*

3.1.2.10.3.7.1 A 3.1.2.10.3.7 pontban meghatározott összes válasz-sebesség hozzáadódik bármely squitter továbbításhoz, amelynek megvalósítását a válaszjeladó megköveteli.

3.1.2.10.3.7.2 *Minimális válasz sebesség képesség, A- és C-módok.* A minimális válasz sebesség képesség A- és C-módnál a 3.1.1.7.9. pontnak felel meg.

3.1.2.10.3.7.3 *Minimális válasz sebesség képesség, S-mód.* A csak rövid S-módú válaszok továbbítására képes válaszjeladó a következő sebességekkel képes válaszokat generálni.

50 S-módú válasz bármely 1-másodperces időközben
18 S-módú válasz egy 100 ezredmásodperces időközben
8 S-módú válasz egy 25 ezredmásodperces időközben
4 S-módú válasz egy 1,6 ezredmásodperces időközben

A fedélzetről leadott ELM továbbításokon kívül, egy 2-es, 3-as, vagy 4-es szintű válaszjeladó hosszú válaszokként képes generálni legalább az alábbiaknak megfelelő számban:

16 az 50 S-módú válaszból bármely 1 másodperces időközben
6 a 18 S-módú válaszból egy 100 ezredmásodperces időközben
4 a 8 S-módú válaszból egy 25 ezredmásodperces időközben
2 a 4 S-módú válaszból egy 1,6 ezredmásodperces időközben

A fedélzetről leadott ELM továbbításokon kívül egy 5-ös szintű válaszjeladó hosszú válaszokként képes generálni legalább az alábbiaknak megfelelően:

24 az 50 S-módú válaszból bármely 1-másodperces időközben
9 a 18 S-módú válaszból egy 100 ezredmásodperces időközben
6 a 8 S-módú válaszból egy 25 ezredmásodperces időközben
2 a 4 S-módú válaszból egy 1,6 ezredmásodperces időközben

Ezenkívül egy ACAS berendezésen belüli válaszjeladó ACAS koordinációs válaszként képes legalább 3-at generálni az 50 S-módú válaszból 1-másodperces időközben.

3.1.2.10.3.7.4 *Minimális S-módú ELM csúcs válasz sebesség*

1. Megjegyzés. – Amikor egy fedélzetről leadott ELM kezdeményezése történik (3.1.2.7.7.1 alpont), az S-módú válaszjeladó közli a várakozó közlemény hosszát (szegmensekben). A válaszjeladó legyen képes ilyen számú szegmens, plusz a hiányzó válaszok pótláshoz még egy ráhagyás átvitelére a földi lekérdező sugárzási szünete alatt.

Minden másodpercben legalább egyszer, a fedélzetről leadott ELM továbbítás üzemelésére kialakított S-módú válaszjeladó képes egy 25-ezredmásodperces időközben legalább 25 százalékkal több szegmenst továbbítani, mint amennyit a kezdeményezésben közölt (3.1.2.7.7.1 alpont). A fedélzetről leadott minimális hosszúságú ELM továbbítási képesség 4-es és 5-ös szintű válaszjeladóknál a 3.1.2.10.5.2.2.2 pontban meghatározottaknak felel meg.

2. Megjegyzés. – A fedélzetről leadott, maximális hosszúságú ELM továbbítás (16 szegmens) feldolgozására képes válaszjeladótól ezért megkövetelik, hogy képes legyen a fenti körülmények között 20-as hosszúságú válaszok átvitelére. A 4-es szintű válaszjeladók épülhetnek arra a folyamatra, amelynek hosszúsága kisebb, mint a maximális közlemény hossz. Ezek a válaszjeladók nem tudnak olyan közlemény hosszt kezdeményezni, amely meghaladja az adattovábbítási-képességeket. Pl. egy válaszjeladó, amely legfeljebb 10-es hosszúságú válaszokat tud átvinni, a fenti feltételek mellett soha nem tud bejelenteni egy 8 szegmensnél hosszabb közleményt.

3.1.2.10.3.8 *Válaszkésés és vibrálás*

Megjegyzés. – Egy lekérdezést vétele után amennyiben választ kértek rá, akkor ennek a válasznak a továbbítása a protokollok kivitelezéséhez szükséges rögzített késleltetés után kezdődik. Ehhez a késéshez különböző értékek vannak hozzárendelve az A- és C-módú, S-módú és A/C/S-módú körhívás válaszoknál.

3.1.2.10.3.8.1 *Válaszkésés és vibrálás A- és C-módoknál.* A válaszkésés és vibrálás az A- és C-módú tranzakcióknál a 3.1.1.7.10 pontban előírtaknak felel meg.

3.1.2.10.3.8.2 *Válaszkésés és vibrálás S- és C-módnál.* Az MTL és -21 dBm közötti összes bemeneti jelszintnél a válasz első bevezető impulzusának felfutó éle (3.1.2.1.5.1.1 alpont) 128 plusz vagy mínusz 0,25 mikromásodperccel a vett P_6 impulzus fordított szinkronizáló fázisában (3.1.2.1.5.2.2 alpont) jelenik meg. A válaszkésés vibrálása nem haladhatja meg a 0,08 mikromásodpercet, a csúcs (99,9 %-os).

3.1.2.10.3.8.3 *Válaszkésés és vibrálás A/C/S körhívás módnál.* MTL jellel +3 dB és -21 dBm közötti összes bemeneti jelszintnél a válasz első bevezető impulzusának felfutó éle (3.1.2.2.5.1.1) 128 plusz vagy mínusz 0,5 mikromásodperccel a lekérdezés P_4 impulzusának lefutó éle után jelenik meg (3.1.2.1.5.1.1 alpont). A vibrálás nem haladhatja meg a 0,1 mikromásodpercet, a csúcs (99,9 %-os).

Megjegyzés. – Egy 0,1 mikromásodperces csúcs vibrálás megegyezik a 3.1.1.7.10 pontban előírt vibrálással.

3.1.2.10.3.9 *Időzítő*. Az időzítők időtartama és sajátosságai a 3-10 táblázatban találhatók.

Minden időzítő legyen képes az újraindulásra. Valamilyen indítási utasítás vételére saját előírt idejükig fognak futni. Ez attól függetlenül megy végbe, hogy az indítási utasítás vételének idején működő vagy nem működő állapotban vannak. Az időzítő újraállítására vonatkozó utasítás az időzítő működését megállítja és visszaviszi a kezdeti állapotába egy következő indítási utasítás előkészítéseként.

3.1.2.10.3.10 *Válaszok gátlása*. Az A/C/S körhívás módú és csak S körhívás módú lekérdezésekre adott válaszokat mindig gátolni kell, ha a légijármű a földön van. Nincs lehetőség külön címzett S-módú lekérdezésekre adott válaszok gátlására, függetlenül attól, hogy a légijármű a levegőben vagy a földön van.

3.1.2.10.3.10.1 **Ajánlás.** – *A légijárműnek eszközzel kell rendelkeznie a földön tartózkodás megállapítására, és ennek az információnak a válaszjeladóhoz továbbítására.*

3.1.2.10.3 10.2 **Ajánlás.** – *Az A/C-módú válaszokat gátolni kell amikor a légijármű a földön van, hogy megakadályozzák az interferenciát, amikor szoros közelségben van egy lekérdezőhöz, vagy egy másik légijárműhöz.*

Megjegyzés. – Az S-módú különállóan címzett lekérdezések nem keltenek ilyen interferenciát, és a repülőtéren tartózkodó légijárművekkel való adatkapcsolati kommunikációnál kerülhetnek alkalmazásra. Adatbegyűjtő squitter sugárzások használhatók a repülőtéren lévő légijárművek passzív felderítésére.

3.1.2.10.3.10.3 *Squitter adatátvitelek gátlása.* Nem lehet kiterjesztett squitter adatátviteleket gátolni, kivéve a 3.1.2.8.6 pontban előírtakat, és nem lehet adatbegyűjtési squitter közleményeket gátolni, kivéve a 3.1.2.8.5 pontban előírtakat, függetlenül attól, hogy a légijármű a levegőben vagy a földön van.

Megjegyzés. – A squitter gátlására vonatkozó további információk a „Manual of Secondary Surveillance Radar (SSR) Systems *(Doc 9684)”* kiadványban találhatók.

3.1.2.10.4 V*álaszjeladó antenna rendszer és széttelepített üzemelés.* A széttelepített működésre alkalmas S-módú válaszjeladók két RF csatlakozási ponttal rendelkeznek a két antennával való üzemeléshez, melyek közül az egyik antenna a légijármű törzsének tetején, a másik az alján van elhelyezve. Az antennák egyikéről vett jelet a vételhez választják ki és a választ csak a kiválasztott antennáról továbbítják.

3.1.2.10.4.1 *Sugárzási diagram.* Egy légijárműre szerelt S-módú antenna sugárzási diagramja legyen névlegesen azonos egy vízszintes síkon elhelyezett negyedhullámú monopolantenna sugárzási diagramjával.

Megjegyzés. – Az olyan válaszjeladó antennák, amelyek a függőleges sugárnyaláb szélességnél való nyereség növelésére szolgálnak, nem kívánatosak, az elfordulásuk alatti alacsony teljesítményük miatt.

3.1.2.10.4.2 *Antenna elhelyezés.* A légijármű tetején és alján elhelyezett antennákat úgy kell felszerelni, hogy minél közelebb legyenek a törzs középvonalához. Az antennák elhelyezése tegye lehetővé a vízszintes síkban lévő mezőjük akadályozásának minimalizálását.

3.1.2.10.4.2.1 **Ajánlás**. – A törzs tetején és alján elhelyezett antennák közötti vízszintes távolság nem lehet nagyobb, mint 7,6 m (25 láb).

Megjegyzés. – Ez az ajánlás arra szolgál, hogy fenntartsa bármely széttelepített válaszjeladó (a kábeleket is beleértve) működését bármilyen széttelepített antenna felszereléssel és még kielégítse a 3.1.2.10.4.5 alpont követelményeit.

3.1.2.10.4.3 *Antenna kiválasztás.* A széttelepített működésre alkalmas S-módú válaszjeladók azzal a képességgel rendelkeznek, amely lehetővé teszi a két antenna csatornára egyidőben érkező impulzus sorozat értékelését. Az értékeléssel mindkét antennára egyenként határozzák meg, hogy az S-módú lekérdezés bekezdő jelszakaszának P_1 impulzusa és P_2 impulzusa kielégíti-e az S-módú lekérdezésre a 3.1.2.1 pontban előírt követelményeket, valamint az A-módú, C-módú vagy a közös lekérdezés P_1 impulzusa és P_3 impulzusa kielégíti-e az A-módú, és C-módú lekérdezésekre a 3.1.1 pontban előírt követelményeket.

Megjegyzés. – A széttelepített működésre felszerelt válaszjeladók nem kötelezően rendelkezhetnek azzal a képességgel, hogy a lekérdezések vett impulzusainak további jellemzőit értékeljék a széttelepített csatorna kiválasztások végrehajtásánál. A válaszjeladó opcióként értékelhet egy teljes S-módú lekérdezést, amelyet mindkét csatornán egyidőben vett, hogy egyenként megállapítsa az egyes csatornáknál, hogy a lekérdezés kielégíti-e a 3.1.2.4.1.2.3 pontban meghatározott, az S-módú lekérdezés vételére vonatkozó követelményeket.

3.1.2.10.4.3.1 Ha a két csatorna egyidőben veszi legalább a P_1 – P_2 impulzus párt, amely kielégíti az S-módú lekérdezésre vonatkozó követelményeket, vagy egy P_1-P_3 impulzus párt, amely kielégíti az A-módú vagy C-módú lekérdezésre vonatkozó követelményeket, vagy ha a két csatorna egyidőben vesz egy komplett lekérdezést, akkor azt az antennát választja ki a megmaradó lekérdezés (ha van ilyen) vételére és a válasz továbbítására, amelyiknél a jelerősség nagyobb.

3.1.2.10.4.3.2 Ha csak egy csatorna vesz egy olyan impulzus párt, amely kielégíti a lekérdezéssel szembeni követelményeket, vagy ha csak egy csatorna vesz egy lekérdezést, az ezzel összekötött antennát választja ki, tekintet nélkül a vett jel erősségére.

3.1.2.10.4.3.3 *Kiválasztási küszöb.* Ha az antenna kiválasztás jelszinten alapul, ezt az összes MTL és -21 dBm között lévő szintre elvégzik.

Megjegyzés. – A kettő közül bármelyik antenna választható, ha a különbség a jelszintben kisebb, mint 3 dB.

3.1.2.10.4.3.4 *A vett jel késési tűrése.* Ha egy lekérdezés vételére az egyik antennánál 0,125 mikromásodperccel, vagy ennél rövidebb idővel kerül sor, mint a másik antennánál, akkor a lekérdezéseket egyidejű lekérdezéseknek kell tekinteni, és a fenti antenna kiválasztási követelményt kell alkalmazni. Ha egy lekérdezés vételére az egyik antennánál a másik antenna vétele előtt 0,375 mikromásodperccel vagy ennél nagyobb időértékkel kerül sor, akkor azt az antennát választják ki a válaszadásra, amelyik a korábbi lekérdezést vette. Ha a vételek közötti időkülönbség 0,125 és 0,375 mikromásodperc között van, akkor a válaszjeladó a válaszadáshoz vagy az egyidejű lekérdezés alapján, vagy a korábbi érkezési idő alapján választja ki az antennát.

3.1.2.10.4.4 *Széttelepített átviteli csatorna elkülönítése.* A kiválasztott antennáról átvitt RF csúcs teljesítmény legalább 20 dB-el haladja meg a nem kiválasztott antennáról továbbított teljesítményt.

3.1.2.10.4.5 *Széttelepített válaszjeladók válaszkésése.* A két antenna csatorna (beleértve a válaszjeladótól az antennáig vezető kábelek és a két antenna között a légijármű középvonala mentén mért vízszintes távolság által okozott különbözeti késést is) közötti válaszadási késleltetés vonatkozásában megállapított kétirányú adatátvitel teljes különbsége nem haladhatja meg a 0,13 mikromásodpercet egyenlő amplitúdójú lekérdezéseknél. Ez a követelmény fennáll MTL +3 dB és 21 dBm közötti lekérdezési jel erősségekre is. A vibrálási követelmények mindegyik csatornára megmaradnak úgy, ahogy a nem széttelepített válaszjeladóra azt előírták.

Megjegyzés. – Ez a követelmény korlátozza az antenna bekapcsolás és a kábelkésés különbségek okozta látszólagos vibrálást.

3.1.2.10.5 *Adatfeldolgozás és csatolóegységek*

3.1.2.10.5.1 *Közvetlen adatok.* Közvetlen adatok azok, amelyeket az S-módú rendszer felderítési protokollja igényel.

3.1.2.10.5.1.1 *Rögzített közvetlen adatok.* Rögzített közvetlen adatok azok a légijárművektől érkező adatok, amelyek repülés közben nem változnak és ezek a következők:

a) a légijármű címzés (3.1.2.4.1.2.3.1.1 és 3.1.2.5.2.2.2 pontok);
b) a levegőhöz viszonyított maximális sebesség (3.1.2.8.2.2 pont); és
c) a lajstromozási jel, ha repülési azonosításra használják (3.1.2.9.1.1 pont).

3.1.2.10.5.1.2 *Rögzített közvetlen adatok csatolóegységei*

Ajánlás. – *A válaszjeladó és a légijármű közötti csatolóegységeket úgy kell tervezni, hogy a rögzített közvetlen adat értékek inkább a légijármű telepítés függvényévé, mint a válaszjeladó összeállításának függvényévé váljanak.*

Megjegyzés. – Ennek az ajánlásnak az a célja, hogy olyan csatolóegység eljárást bátorítson, amely lehetővé teszi a válaszjeladó cseréjét a válaszjeladó befolyásolása nélkül, a rögzített közvetlen adat beállításánál.

3.1.2.10.5.1.3 *Változó közvetlen adatok.* A változó közvetlen adatok azok a légijárműtől jövő adatok, amelyek repülés közben változhatnak és ide sorolhatók:

a) a C-módú magasság kód (3.1.2.6.5.4 alpont);

b) az A-módú azonosítás kód (3.1.2.6.7.1 alpont);

c) a földön levő állapot (3.1.2.5.2.2.1, 3.1.2.6.5.1 és 3.1.2.8.2.1 pontok);

d) a légijármű azonosítás, ha az nem a lajstrom jel (3.1.2.9.1.1 alpont); és

e) az SPI feltétel (3.1.2.6.10.1.3 pont).

3.1.2.10.5.1.4 *Változó közvetlen adatok csatolóegységei.* Egy eszközt kell alkalmazni az A-módú azonosítási kódhoz, az SPI állapothoz és a 2-es és e feletti szintű válaszjeladókhoz, és a repülőgép azonosítás pilóta által történő a változó adat csatolóegységen keresztül történő beállításához.

Csatolóegységeket kell alkalmazni a nyomásmagasság és a földön tartózkodás kódolásának elfogadásához.

Megjegyzés. – A változó közvetlen adatokhoz nincsen specifikus csatolóegység kialakítás előírva.

3.1.2.10.5.2 *Közvetett adatok.*

Megjegyzés. – Közvetett (indirekt) adatok azok, amelyek valamilyen irányban keresztül haladnak a válaszjeladón, de nincsenek hatással a felderítési feladatra.

Ha a közvetett adatok forrása és/vagy rendeltetési helye nincs a válaszjeladó zárt egységén belül, a szükséges kapcsolatokhoz csatolóegységeket kell használni.

3.1.2.10.5.2.1 *A csatolóegységek feladata*

Megjegyzés. – A közvetett adat csatolóegységek a szabványos tranzakcióknál olyan lekérdezéseket szolgálnak ki, amelyek választ és általános adási feladatot igényelnek. A közvetett adat csatolóegységek ELM-nél ezt a rendszert szolgálják ki és pufferolást és protokoll áramkört igényelnek a válaszjeladón belül. A csatolóegységek csatlakozó pontjait az egyes irányok és az egyes kiszolgálások szerint el lehet különíteni, vagy bármilyen módon kombinálni lehet őket.

3.1.2.10.5.2.1.1 *Fedélzetre irányuló szabványos hosszúságú tranzakció csatolóegységek.* A fedélzetre irányuló szabványos hosszúságú tranzakció csatolóegység a vett lekérdezések összes bitjét átviszi (az AP mező lehetséges kivételével) kivéve UF = 0, 11, vagy 16 esetét.

Megjegyzés. – AP szintén átvihető, az integritás megvalósításának elősegítésére.

3.1.2.10.5.2.1.2 *Fedélzetről leadott szabványos hosszúságú tranzakció csatolóegység.* Egy válaszjeladó, amely perifériális berendezéstől származó információkat továbbít, képes bitek, vagy bitminták vételére, a megfelelő helyre való beillesztéshez az adatátvitelen belül. Ezen adatforrás helyek nem tartalmazzák sem azokat, melyeken belül a saját válaszjeladó hozza létre a bitmintákat, sem a válasz AP mezőjét.

Egy válaszjeladó amely a Comm-B formátum felhasználásával információkat továbbít, azonnali hozzáféréssel rendelkezik a kért adatokhoz olyan értelemben, hogy a válaszjeladó egy lekérdezésre a lekérdezés által kért adatokkal válaszol.

Megjegyzés. – Ez a követelmény két módon elégíthető ki:

a) a válaszjeladó rendelkezik belső adat- és protokoll pufferrel;

b) a válaszjeladó "valós idejű" ("real time") csatolóegységet alkalmaz, amelynek működése során a fedélzetre irányuló adatok még azelőtt elhagyják a válaszjeladót, mielőtt a megfelelő válasz létrejön és a fedélzetről leadott adatok időben belépnek a válaszjeladóba, hogy a válaszba beépüljenek.

3.1.2.10.5.2.1.3 *Kiterjesztett hosszúságú közlemény csatolóegység.*

Megjegyzés. – Az ELM csatolóegység kinyeri a válaszjeladóból és beviszi a válaszjeladóba a levegő és föld között cserélődő adatokat az ELM protokoll segítségével (3.1.2.7 alpont).

3.1.2.10.5.2.2 *Közvetett adat tranzakció sebességek*

3.1.2.10.5.2.2.1 Szabványos *hosszúságú tranzakciók.* Az a válaszjeladó, amely lehetővé teszi a külső berendezésekbe és a külső berendezésekből való adattovábbítást, legalább annyi választ képes létrehozni, amennyit a minimális válasz sebességre a 3.1.2.10.3.7.2 pont előír, valamint a lekérdezőtől származó adatokat a legalább az alábbi sebességgel továbbítja a fedélzet felé:

50 hosszú lekérdezés minden 1-másodperces időközben
18 hosszú lekérdezés egy 100 ezredmásodperc időközben
8 hosszú lekérdezés egy 25 ezredmásodperc időközben
4 hosszú lekérdezés 1,6 ezredmásodperc időközben.

1. Megjegyzés. – Egy válaszjeladó, amely a 3.1.2.10.3.7.2 pont szerinti minimálisnál nagyobb válasz sebességre képes, nem kell hosszú lekérdezéseket vennie azután, hogy elérte a fenti fedélzetre irányuló adatok feldolgozási korlátait.

2. Megjegyzés. – Az S-módú válasz az egyetlen eszköz egy S-módú lekérdezés adat tartalma vételének visszaigazolására. Így, ha a válaszjeladó képes egy lekérdezésre válaszolni, az S-módú kialakításnak képesnek kell lennie az ebben a lekérdezésben tartalmazott adatok vételére, tekintet nélkül ez és más vett lekérdezések közötti időütemezésre. Néhány lekérdező átlapoló S-módú sugárnyalábjai jelentős mennyiségű adatfeldolgozás és pufferolás igényléshez vezethetnek. Az itt leírt minimum egy realisztikus szintre csökkenti az adatfeldolgozást és nem-vételi kikötés bejelentést szolgáltat a lekérdezőnek, hogy az adatokat átmenetileg nem veszi.

3.1.2.10.5.2.2.2 *Kiterjesztett hosszúságú tranzakciók.* A 3-as szintű (2.1.5.1.3 pont) és a 4-es szintű (2.1.5.1.4 pont) válaszjeladók képesek adatokat átadni legalább négy komplett tizenhat-szegmenses fedélzetre irányuló ELM-ektől (3.1.2.7.4 pont) négy másodperces időtartományban. Egy 5-szintes válaszjeladó (2.1.5.1.5 pont) képes adatok átvitelére legalább négy komplett tizenhat-szegmenses fedélzetre irányuló ELM-ből bármely egy-másodperces időközben, és képes legalább két komplett tizenhat-szegmenses fedélzetre irányuló ELM vételére ugyanazon II kóddal egy 250 ezredmásodperces időközben. Egy 4-es szintű válaszjeladó képes átvinni legalább egy négyszegmenses fedélzetre irányuló ELM-et (3.1.2.7.7 és 3.1.2.10.3.7.3 pontok) egy-másodperces időközben. Egy 5-ös szintű válaszjeladó képes átvinni legalább egy tizenhat-szegmensű fedélzetről leadott ELM-et bármely egy másodperces időközben.

3.1.2.10.5.2.2.2.1 **Ajánlás**. – *3-as szintű és 6-os szintű válaszjeladóknak képesek legalább két komplett tizenhat-szegmenses fedélzetre irányuló ELM vételére egy 250 ezredmásodperces időközben.*

3.1.2.10.5.2.3 *A szabványos hosszúságú tranzakciók adat formátumai és a megkövetelt lefelé irányuló légijármű paraméterek (DAPs)*

3.1.2.10.5.2.3.1 Az összes 2-es és magasabb szintű válaszjeladó, támogassa a következő regiszter alkalmazásokat:

- képesség jelentés (3.1.2.6.10.2);

- légijármű azonosító protokoll regiszter 20 {HEX} (3.1.2.9); és

- az ACAS rendszerrel felszerelt légijárművek részére az aktív döntési tanácsadás regiszter 30 {HEX} (4.3.8.4.2.2).

3.1.2.10.5.2.3.2 Ha szükséges, a 3-11 Táblázat szerinti regiszterek támogassák a DAPs-t. A válaszjeladók regisztereinek formátumát és a minimum frissítési időket, az együttműködés érdekében konzisztensen kell megválasztani.

3.1.2.10.5.2.3.3 A szabványos hosszúságú tranzakció interfészek továbbítják a lefelé irányuló légijármű paramétereket (DAPs) a válaszjeladókhoz, amelyek továbbítják azokat a föld felé. Mindegyik DAP-t egy Comm-B formátumba (MB mező) kell illeszteni, és kiolvasható kell, hogy legyen egy földi kezdeményezésű Comm-B (GICB) protokoll által vagy a flash háttértároló alkalmazásával az MSP lefelé irányuló 3-as csatornán keresztül.

Megjegyzés – A regiszterekre vonatkozó formátumokat és frissítési időket valamint a flash háttértároló alkalmazást, a "Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)" ismerteti.

3.1.2.10.5.3 *Adat tartalom átvitel integritása.* Egy válaszjeladó, amely adat csatolóegységeket alkalmaz, elegendő védelmet tartalmaz ahhoz, hogy kisebb hiba rátát biztosítson mint, egy hiba minden 10^3 közleményben és kevesebb, mint egy nem-észlelt hibát 10^7 112-bites átvitelben az antenna és a minden csatolóegység bekötési pontjai között mindkét irányban.

3.1.2.10.5.4 *Közlemény törlés*. A fedélzetről leadott szabványos hosszúságú tranzakció csatolóegység és a kiterjesztett hosszúságú közlemény csatolóegység magában foglalja azt a képességet, hogy töröljön egy közleményt, amelyet a válaszjeladónak küldtek a földre továbbítás céljából, de amelynek továbbítási ciklusa még nem fejeződött be (azaz a kizárást földi lekérdező nem hajtotta végre.)

Megjegyzés. – Egy példa ennek a képességnek a szükségességére egy közlemény törlése, ha szállítást kísérel meg, amikor a légijármű nincs S-módú földi állomás lefedésén belül. A közleményt ekkor törlik, hogy megakadályozzák, annak leolvasását, és éppen aktuális közleményként értelmezzék, amikor a légijármű visszatér az S-módú légtérbe.

3.1.2.10.5.5 *Légi-irányítású közlemények.* Az ilyen fajtájú közlemény az összes 3.1.2.10.5.4 pontban jelzett tevékenységet igényli plusz a továbbítást a hely lekérdező azonosítójának válaszjeladójához, amelynek a közleményt vennie kell.

3.1.2.11 A földi lekérdező lényeges rendszer jellemzői

Megjegyzés. – Annak biztosítására, hogy az S-módú lekérdező akció ne legyen káros az A/C-módú lekérdezőkre, az S-módú lekérdezőkre teljesítmény korlátok léteznek.

3.1.2.11.1 *Lekérdezés ismétlési sebességek*. Az S-módú lekérdezők a legkisebb megvalósítható lekérdezési ismétlési sebességet használják az összes lekérdezési módra.

Megjegyzés. – Kis lekérdezés ismétlési sebességeknél, pontos azimut adatok monoimpulzus eljárással nyerhetők.

3.1.2.11.1.1 K*örhívás lekérdezés ismétlési sebesség.* A befogásnál használt lekérdezési ismétlési sebesség A/C/S körhívás mód esetén, kisebb, mint 250 per másodperc. Ez a sebesség érvényes a párosított csak S körhívás módú és csak A/C körhívás módú lekérdezésekre, amelyeket többhelyes módban történő befogásra használnak.

3.1.2.11.1.2 *Lekérdezési ismétlési sebesség egyedülálló légijárműnél***.**

3.1.2.11.1.2.1 *Választ igénylő lekérdezések.* Választ igénylő S-módú lekérdezéseket nem továbbítanak egyedülálló légijárműhöz 400 mikromásodpercnél rövidebb időközöknél.

3.1.2.11.1.2.2 *Fedélzetre irányuló ELM lekérdezések.* Az egymást követő Comm-C lekérdezések kezdete közötti minimális idő 50 mikromásodperc.

3.1.2.11.1.3 *Átviteli sebesség szelektív lekérdezéseknél.*

3.1.2.11.1.3.1 Minden S-módú lekérdezőnél az átviteli sebesség szelektív lekérdezéseknél a következő:

a) kisebb, mint 2400 per másodperc egy 40-ezredmásodperces időköz felett átlagolva; és
b) kisebb, mint 480 bármely 3-fokos szektorban egy 1-másodperces időköz felett átlagolva.

3.1.2.11.1.3.2 Kiegészítőleg, egy S-módú lekérdezőnél, amelynek átlapoló lefedése van bármely más S-módú lekérdező oldalszirmaival, az átviteli sebesség szelektív lekérdezéseknél a következő lesz:

a) kisebb, mint 1200 per másodperc egy 4-másodperces időköz felett átlagolva; és

b) kisebb 1800 per másodperc egy egy-másodperces időköz felett átlagolva.

Megjegyzés. – A lekérdezők között oldalszirom elválasztását biztosító tipikus minimális távolság 35 km.

3.1.2.11.2 *Lekérdező-effektív sugárzott teljesítmény*

Ajánlás. – *Az összes lekérdezési impulzus effektív sugárzott teljesítményét a 3.1.1.8.2 pontban leírtak szerint kell minimalizálni.*

3.1.2.11.3 *Inaktív állapotú lekérdező kimenő teljesítmény.* Amikor a lekérdező adó berendezés nem továbbít lekérdezést, a kimenet nem haladhatja meg a -5 dBm effektív sugárzott teljesítményt, bármely 960 MHz és 1215 MHz közötti frekvenciánál.

Megjegyzés. – Ez a korlátozás biztosítja, hogy a lekérdező közelében repülő légijárművek 1,85 km (1 NM) közelségben nem vesznek interferenciát, amely megvédi őket attól, hogy egy másik lekérdező által követve legyenek. Bizonyos esetekben még kisebb lekérdező-légijármű távolságok bírnak jelentőséggel, pl. ha S-módú felderítést repülőtéri felszínen használnak. Ilyen esetekben az inaktív állapotú lekérdező kimenő teljesítményre további korlátozás válhat szükségessé.

3.1.2.11.3.1 *Hamis emisszió sugárzás*

Ajánlás. – *A CW-sugárzás nem haladhatja meg a 76 dB-t egy Watt alatt.*

3.1.2.11.4 *Továbbított jelek tűrései.* Hogy a térköz jelet a válaszjeladó a 3.1.2.1 pontban leírtaknak megfelelően venni tudja, a továbbított jelek tűrései megfelelnek a 3-12 táblázatban összegezettekkel.

3.1.2.11.5. *Hamis reagálás*

Ajánlás. – *A nem sáváteresztőn belüli jelekre való reagálásnak legalább 60 dB-el a normál érzékenység alatt kell lennie.*

3.1.2.11.6 *Kizárás koordináció.* Egy S-módú lekérdező nem üzemel körhívás kizárást alkalmazva, amíg nem érték el az együttműködést az összes többi működő S-módú lekérdezőkkel, amelyek átlapoló lefedés térfogattal rendelkeznek, azért, hogy biztosítsák, hogy ne lehessen a lekérdezőtől megtagadni az S-móddal felszerelt légijármű befogását.

Megjegyzés. – Ezt a koordinációt földi hálózaton keresztül vagy a lekérdező azonosító (II) kódokon keresztül lehet megvalósítani, és körzeti megegyezések szükségesek, ahol a lefedés nemzetközi határokat lapol át.

3.1.2.11.7 *Mobil lekérdezők*

3.1.2.11.7.1 **Ajánlás** – *Mobil lekérdezők S-módú légijárműveket, ahol csak lehet, squitterek vételén keresztül fogjanak be.*

Megjegyzés. – Passzív squitter megszerzés csökkenti a csatorna terhelést és koordináció szükségessége nélkül végrehajtható.

A 3. FEJEZET TÁBLÁZATAI

3-1 táblázat. Impulzus alakok, S-módú és közös módú lekérdezések

Impulzus	*Időtartam*	*Időtartam tűrés*	*(Felfutási idő)*		*(Lefutási idő)*	
			Min.	*Max.*	*Min.*	*Max.*
P_1, P_2, P_3, P_5	0,8	±0,1	0,05	0,1	0,05	0,2
P_4 (rövid)	0,8	±0,01	0,05	0,1	0,05	0,2
P_4 (hosszú)	1,6	±0,1	0,05	0,1	0,05	0,2

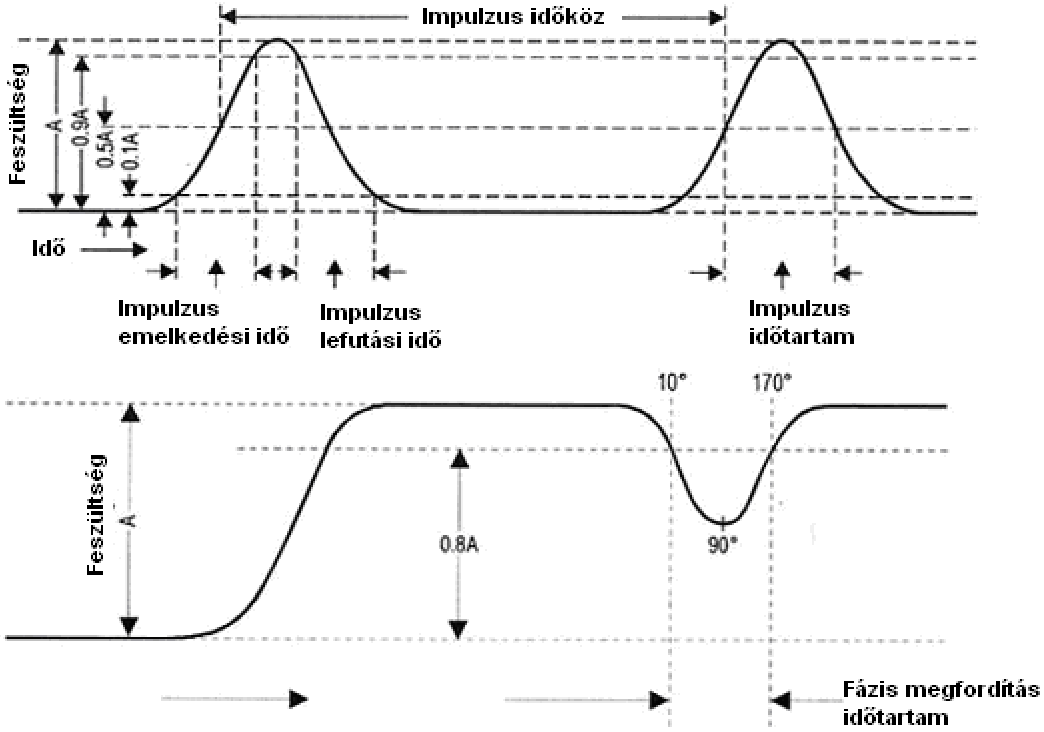
A 3. FEJEZET ÁBRÁI



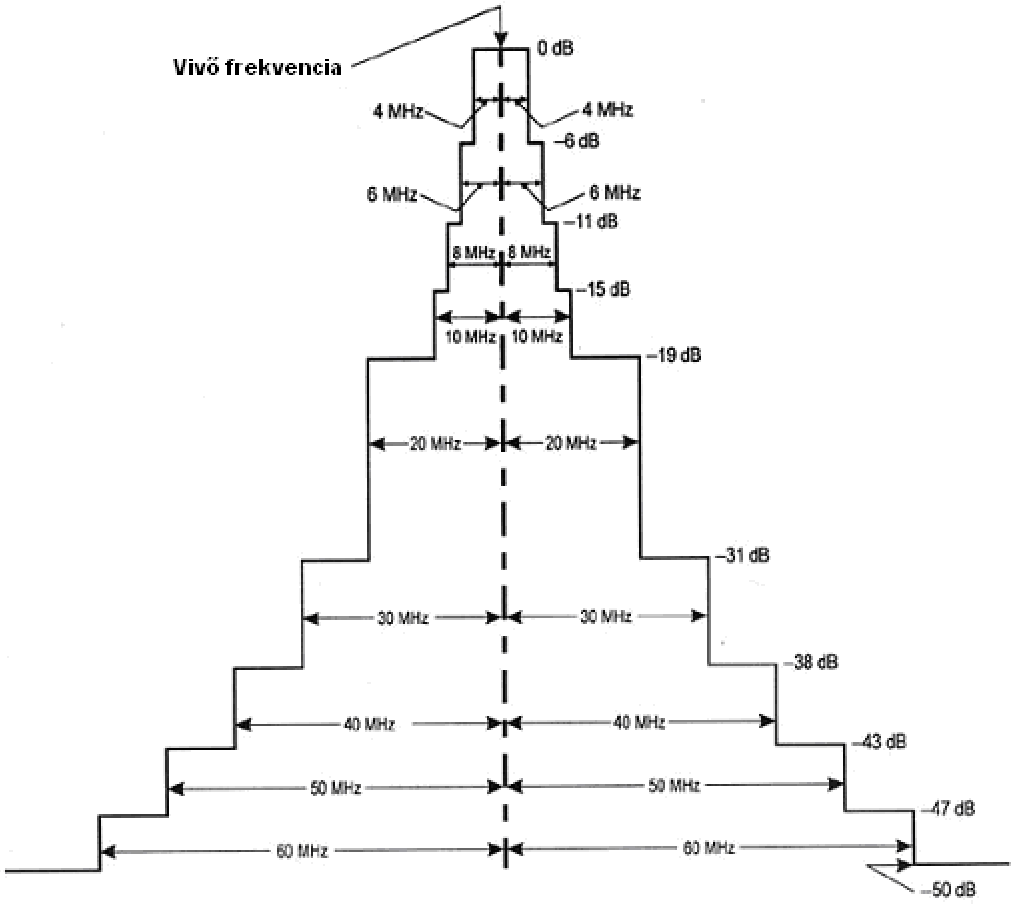
Meghatározások

Fázis megfordítás. A rádiófrekvencia hordozó fázisában 180 fokos váltás.
Fázis megfordítás időtartam. A fázis megfordítás 10 fokhoz és 170 fokhoz tartozó pontjai közötti idő.
Impulzus amplitúdó. Az impulzus burkológörbe csúcsfeszültségű amplitúdó.
Impulzus késési idő. Az impulzus burkoló görbe lefutó élén lévő 0,9A és 0,1A közötti idő.
Impulzus időtartam. Az impulzus burkoló görbe felfutó és lefutó éle 0,5A pontjai közötti időintervallum.
Impulzus időköz. Az első impulzus felfutó élén lévő 0,5A pontja és a második impulzus felfutó élén lévő 0,5A pont közötti időköz.
Impulzus felfutási idő. Az impulzus burkoló görbe felfutó élén a 0,1A és 0,9A pontok közötti idő.
Időközök. Az időközök a következőkre vonatkoznak:
a) 0,5 A pont az impulzus felfutó élén;
b) 0,5 A pont az impulzus lefutó élén; vagy
c) a fázis megfordítás 90 fokos pontján.

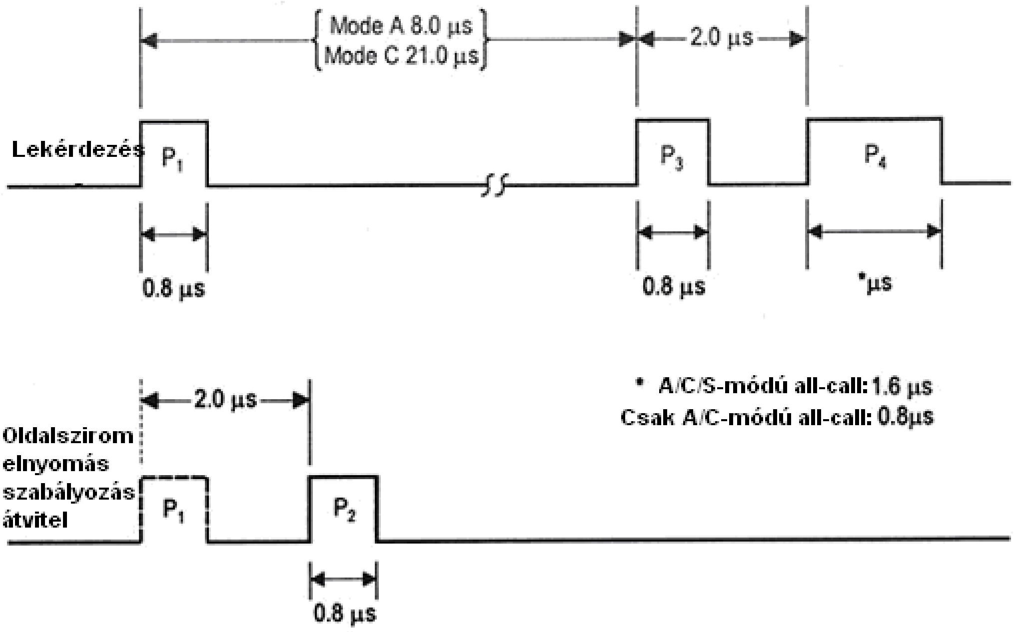
Válaszjeladó érzékenység és teljesítmény referencia pont. A válaszjeladó átviteli vonalának antenna vége.

Megjegyzés. – A fázis megfordítás 90 fokos pontja közelíthető a fázis megfordítással kapcsolódó amplitúdó tranziens burkológörbén lévő minimális amplitúdó tranziens burkológörbén lévő 0,8A pontok közötti idővel

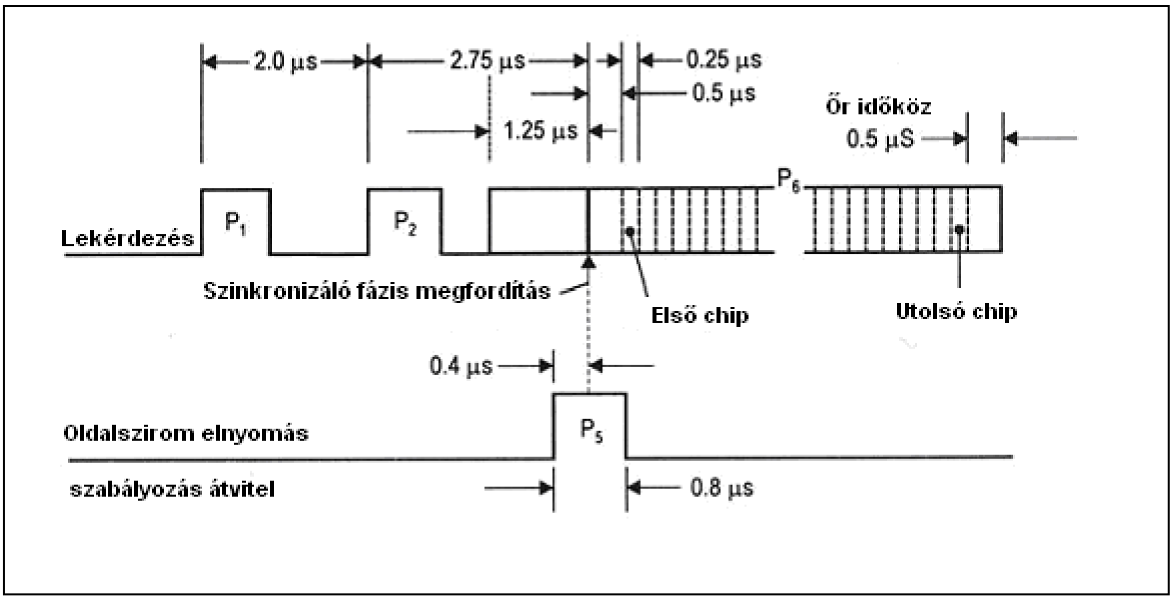
3.1. ábra. Másodlagos felderítő radar hullámforma alakjainak, időközeinek és az érzékenységi és teljesítmény referencia pontjainak meghatározása



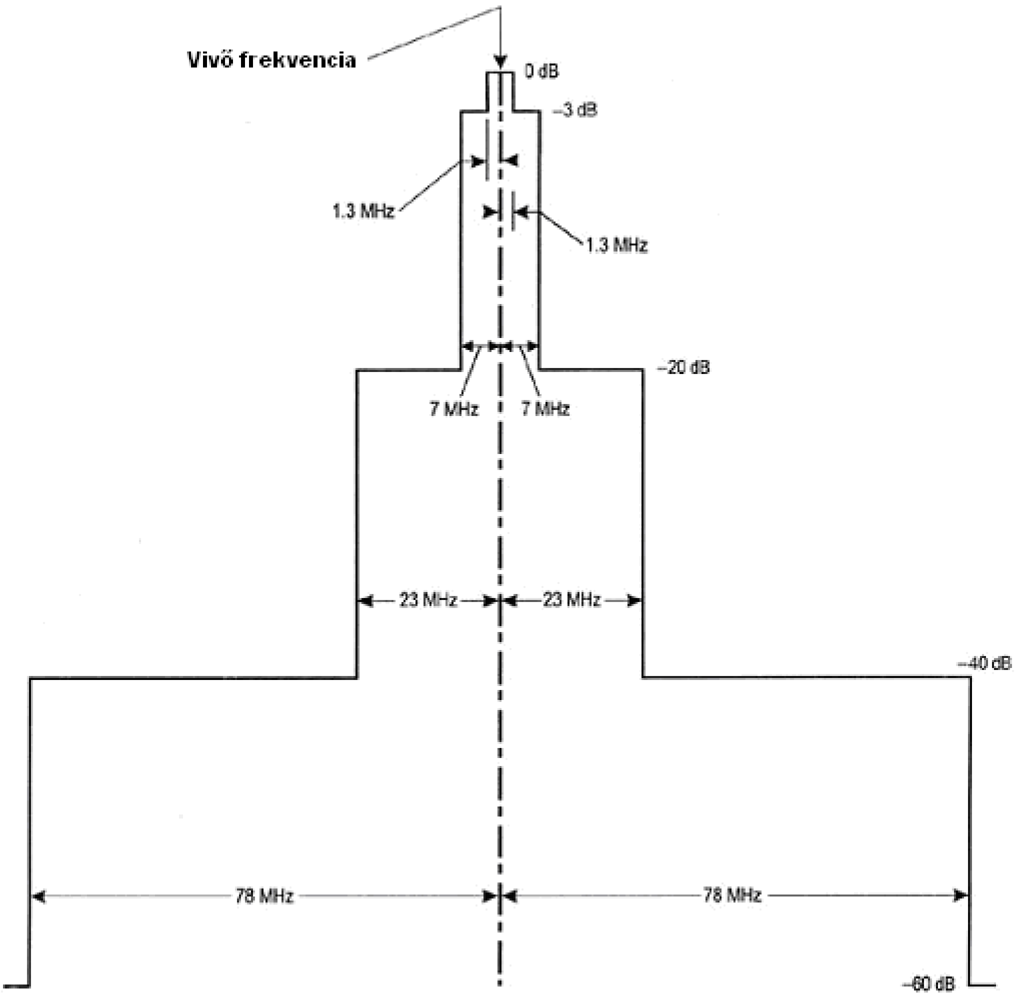
3-2 ábra. Az előírt spektrum határok a lekérdező adóberendezéshez



3-3 ábra. Közös módú lekérdezés impulzus sorozat

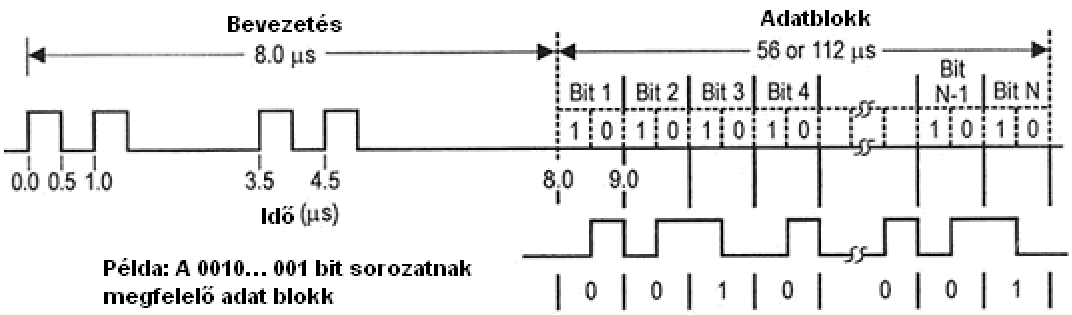


3-4 ábra. S-módú lekérdezés impulzus sorozat

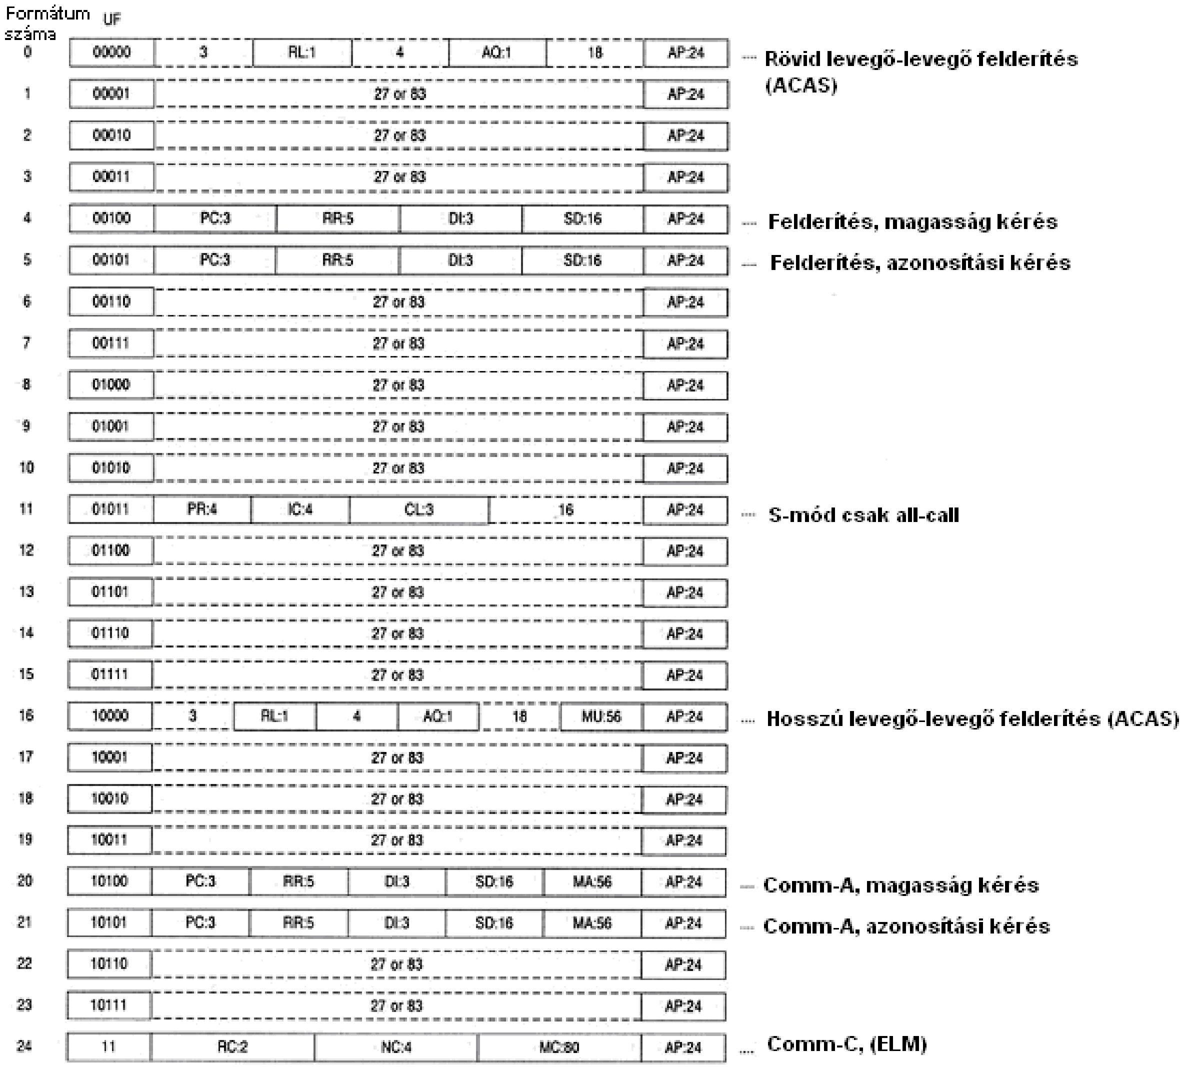


3-5 ábra. Válaszjeladó adó-berendezésétől elvárt spektrum korlátok

Megjegyzés. – A jelen ábra a vivőfrekvencián összpontosuló spektrumot mutatja, és emiatt összességében plusz vagy mínusz 1 MHz értékben fog elmozdulni a vivőfrekvencia mentén.



3-6 ábra. S-módú válasz



MEGJEGYZÉSEK

1. XX: M - egy “XX” jelölésű mezőt jelöl, amelyet M bit jelöl ki.

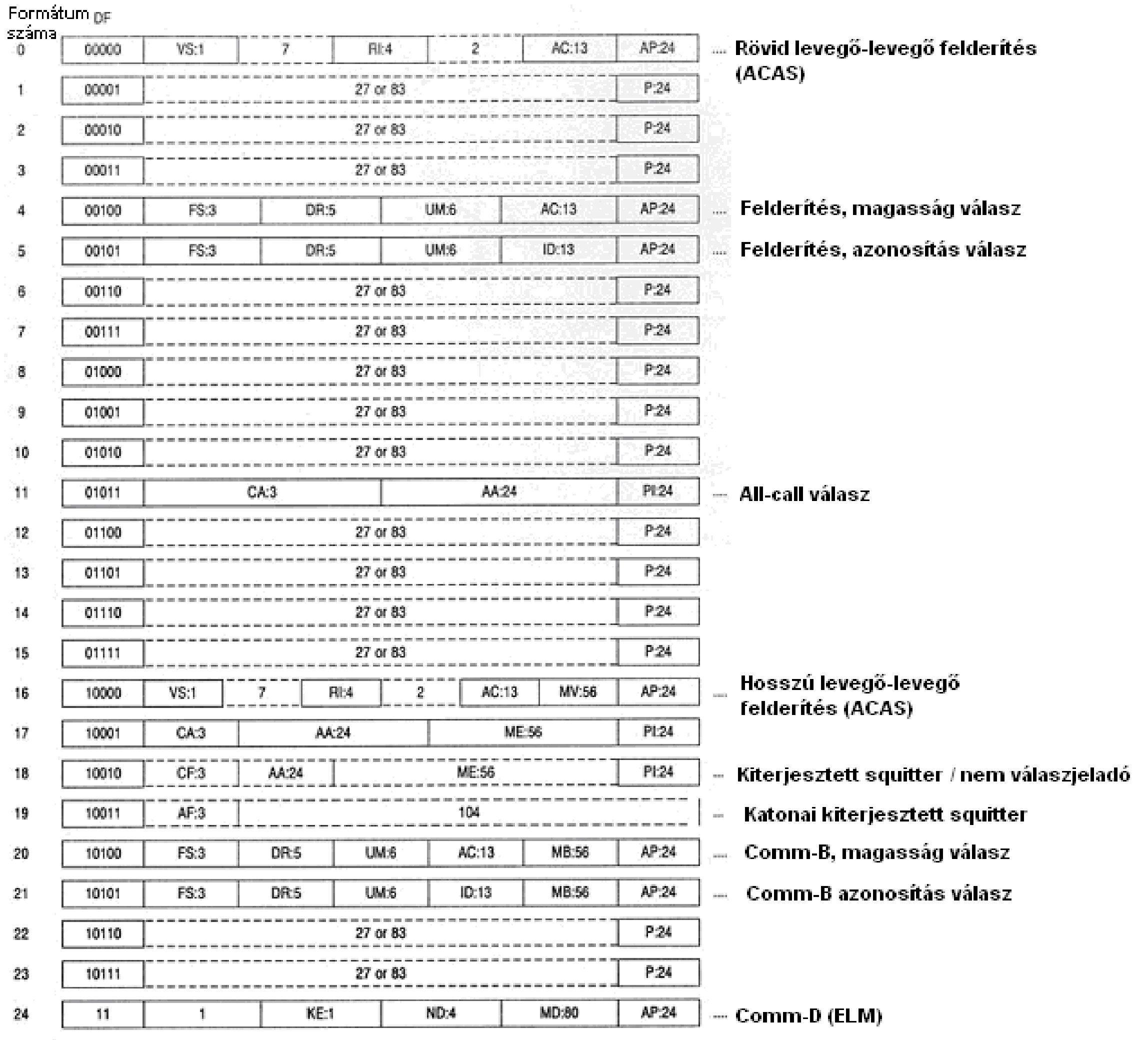
2. N - kijelöletlen kódolási térközt jelöl, N rendelkezésre álló bittel. Ezeket ZÉRO-val kell kódolni a továbbításhoz.

3. A 0-tól 23-ig formátum-számú fedélzetre irányuló adattovábbítási formátumoknál (UF) a formátum szám a lekérdezés első öt bitjében lévő bináris kódhoz tartozik. A 24. számú formátum olyan formátumként lett meghatározva, amely az első két bit pozícióban “11”-el kezdődik, míg a következő három bit a lekérdezés tartalmával változik.

4. A teljesség kedvéért az összes formátum bemutatásra kerül, bár közülük számosat nem használnak. Azok a formátumok, amelyekre jelenleg nincs felhasználás meghatározva, hosszban meghatározás nélkül maradnak. A jövőben kijelöléstől függően, ezek rövid (56 bit) vagy hosszú (112 bit) formátumok lehetnek. Az S-módú képességi szintekhez kapcsolódó különleges formátumok a későbbi pontokban kerülnek leírásra.

5. A PC, RR, DI és SD mezőket ne alkalmazzák a Comm-A adatsugárzású lekérdezéseknél.

3-7. ábra. S-módú lekérdezés vagy fedélzetre irányuló adattovábbítási formátumainak összessége



MEGJEGYZÉSEK

1. XX: M - egy "XX" jelölésű mezőt jelöl, amelyet M bit jelöl ki.

P: 24 - egy 24-bites mezőt jelöl, amely paritás információ részére van fenntartva.

2. N kijelöletlen kódolási térközt jelöl N rendelkezésre álló bittel. Ezeket ZÉRO-ként kell kódolni a továbbításhoz.

3. A 0-tól 23-ig számozású fedélzetről leadott adattovábbítás formátumoknál (DF) a formátum szám megfelel a válasz első öt bitjében lévő bináris kódnak. A 24 számú formátum az első két bit pozícióban "11"-el kezdődő formátumként lett meghatározva, míg a következő három bit a válasz tartalmával változhat.

4. A teljesség kedvéért az összes formátum bemutatásra kerül, bár közülük számosat nem használnak. Azok a formátumok, amelyekre jelenleg nincs felhasználás meghatározva, hosszban meghatározatlanok maradnak. A jövőben kijelöléstől függően, ezek rövid (56 bit), vagy hosszú (112 bit) formátumok lehetnek. Az S-módú képességi szintekhez kapcsolódó különleges formátumok a későbbi alpontokban kerülnek leírásra.

3-8 ábra. S-módú lekérdezés vagy fedélzetről leadott adattovábbítás formátumainak összessége

4. fejezet Összeütközés-elhárító fedélzeti rendszer

1. *Megjegyzés. – Az összeütközés-elhárító fedélzeti rendszerre vonatkozó útmutató anyagot az A melléklet tartalmazza.*

2. Megjegyzés. – Nem-SI alternatív mértékegységek az 5. Annex, 3. fejezet, 3.2.2 pontja által megengedett módon kerülnek használatra. Korlátozott esetekben, a következetesség biztosítása céljából - a logikai számítások szintjén - olyan mértékegységek kerülnek felhasználásra, mint láb/s, NM/s és kt/s.

4.1 Az összeütközés-elhárító fedélzeti rendszerekre vonatkozó meghatározások

ACAS I
Egy olyan ACAS, amely "lásd és kerüld el" cselekvést elősegítő információt állít elő, de nincs megoldási tanácsadás (RA) generáló képessége.

Megjegyzés. – Az ICAO nem törekszik az ACAS I. nemzetközi bevezetésére és szabványosítására. Ezért az ACAS I. jellemzőitől csupán más ACAS konfigurációkkal összeegyeztethető működés biztosítását és interferencia korlátozást követelnek meg a 4.2 pontban meghatározottak szerint.

ACAS II
Egy olyan ACAS, amely a forgalmi tanácsadás (TA) mellett függőleges megoldási javaslatot (RA) is szolgáltat.

ACAS III
Egy olyan ACAS, amely a forgalomi tanácsadás (TA) mellett függőleges és vízszintes megoldás javaslatot (RA) is szolgáltat.

ACAS broadcast – ACAS adatsugárzás
Hosszú S-módú levegő-levegő felderítési lekérdezés (UF = 16) az adatsugárzás címekkel.

Active RAC – Aktív RAC
A RAC aktív, ha folyamatosan korlátozza az RA szelektálását. RAC-ok, amelyeket az utolsó hat másodpercen belül vettek, és nincsenek félreérthetetlenül törölve, aktívak.

Altitude crossing RA – Magasság keresztezési megoldási tanácsadás
A magasság keresztezésére szolgáló megoldási tanácsadás, ha a saját ACAS légijármű jelenleg legalább 30 m-el (100 láb) van a fenyegető légijármű felett vagy alatt, megfelelőképpen lefelé- vagy felfelé irányuló mozgásra szóló javaslatként.

Climb RA – Emelkedési megoldási tanácsadás
Pozitív megoldási tanácsadás, amely emelkedést, de nem egy fokozott emelkedést tanácsol.

Closest approach – Legszorosabb megközelítés
A saját ACAS légijármű és a megközelítő légijármű közötti minimális távolság bekövetkezése. Így a legszorosabb megközelítés tartománya a két légijármű közötti legkisebb távolság, és a legszorosabb megközelítés ideje az az időpont, amelynél ez bekövetkezik.

Coordination – Koordináció
Az a folyamat, amelynek során két ACAS-al felszerelt légijármű összeegyeztethető megoldási javaslatokat (RA) választ a megoldási javaslatok kiegészítésének (RAC) cseréje útján.

Coordination interrogation – Koordinációs lekérdezés
ACAS II vagy III által sugárzott S-módú lekérdezés (fedélzetre irányuló adattovábbítás), amely megoldási közleményt tartalmaz.

Coordination reply – Koordinációs válasz
Az ACAS II vagy III kialakítású rendszer részét képező S-módú válaszjeladónak, a koordinációs lekérdezés fogadását visszaigazoló S-módú válasza (fedélzetről leadott adattovábbítás).

Corrective RA – Korrekciós megoldási tanácsadás
Megoldás tanácsadás, amely azt tanácsolja a légijárművezetőnek, hogy térjen le a jelenlegi repülési pályáról.

Cycle – Ciklus
Az ebben a fejezetben használt "ciklus" fogalom egy teljes áthaladást jelent az ACAS II vagy ACAS III által végrehajtott feladatok sorozatán, névlegesen egyszer egy másodperc alatt.

Descend RA – Süllyedés megoldási tanácsadás
Pozitív megoldási javaslat, amely süllyedést, de nem fokozott süllyedést tanácsol.

Established track – Létrehozott nyomvonal
ACAS levegő-levegő felderítés által generált nyomvonal, melyet tényleges légijármű nyomvonalként kezelnek.

Increased rate RA – Megnövelt mértékű megoldási tanácsadás
Megoldási javaslat, amely azt tanácsolja, hogy a magasságváltozási sebességet az előző emelkedési vagy süllyedési javaslatot meghaladó mértékben növeljék.

Intruder – Megközelítő légijármű
SSR válaszjeladóval felszerelt légijármű az ACAS felderítési távolságán belül, amelyre az ACAS-nek létrehozott nyomvonala van.

Own aircraft – Saját légijármű
A tárgybani ACAS-al felszerelt légijármű, amely ACAS a lehetséges összeütközés elleni védelemre szól, és amely légijármű manőverezésbe kezdhet egy ACAS kijelzésre válaszolva.

Positive RA – Pozitív megoldási tanácsadás
Megoldás javaslat, amely a légijárművezetőnek vagy emelkedést vagy süllyedés végrehajtását tanácsolja (csak ACAS II esetén alkalmazzák).

Potential threat – Potenciális veszélyeztető légijármű
Egy megközelítő légijármű, amely különleges figyelmet érdemel vagy a saját légijárműhöz valós szoros közelsége miatt, vagy mert az egymást követő távolság és magasság mérések azt jelzik, hogy összeütközésbe vagy összeütközés közelségbe kerülhet a saját repülőgéppel. A figyelmeztetési idő, amelyet egy potenciális veszélyeztetéssel szemben biztosítanak, elegendően kicsi, hogy egy forgalmi javaslatot (TA) indokoljon, de nem annyira kicsi, hogy megoldás javaslatot (RA) indokolna.

Preventive RA – Megelőző megoldási tanácsadás
Megoldás javaslat, amely azt tanácsolja a repülőgépvezetőnek, hogy kerüljön el bizonyos eltéréseket a jelenlegi repülési pályától, de nem kíván semmilyen változást a jelenlegi repülési pályában.

RA sense – Megoldási tanácsadás értelme
Egy ACAS II megoldási tanácsadás "felfelé irányuló" (upward) értelmű, ha emelkedést, vagy süllyedési sebesség korlátozást igényel, és "lefelé irányuló" (downward) értelmű, ha süllyedést, vagy emelkedési sebesség korlátozást igényel. Úgy a felfelé irányuló mint a lefelé irányuló mozgás is megjelenhet egyidőben, ha a függőleges sebességet meghatározott értéktartományon belül kell tartani.

Megjegyzés. – A megoldás tanácsadás értelme mind felfelé, mind lefelé irányulhat egyszerre, amikor egyidőben több veszélyeztetés lép fel, és az ACAS olyan megoldási javaslatot generál, amely valamely veszélyeztető(k) alatt és valamely másik veszélyeztető(k) felett megfelelő elkülönítés biztosítását célozza.

Resolution advisory (RA) – Megoldási tanácsadás
A repülőszemélyzet részére adott kijelzés, amely javaslatot ad:

a) egy manőverre, amely minden veszélyeztetőtől való elkülönítés biztosítását célozza; vagy

b) manőver korlátozására, amely a meglévő elkülönítés fenntartására törekszik.

Resolution advisory complement (RAC) – Megoldási tanácsadás kiegészítés
Egy ACAS által a másiknak egy S-módú lekérdezésen keresztüli információ szolgáltatása annak érdekében, hogy RAC-t fogadó ACAS részére rendelkezésre álló manőverek választékának korlátozásával biztosítsák a kiegészítő manővereket.

Resolution advisory complements record (RAC record) – Megoldási tanácsadás kiegészítéseinek rögzítése
Az összes jelenleg aktív függőleges RAC (VRC) és vízszintes RAC (HRC) együttese, amelyet az ACAS vett. Ezeket az információkat egyik ACAS szolgáltatja egy másik ACAS-nak, vagy egy S-módú földi állomásnak, S-módú válaszon keresztül.

Resolution advisory strength – Megoldási tanácsadás erőssége
Az RA által jelzett manőver nagysága. Egy RA több egymás utáni erősséget is felvehet, mielőtt törlésre kerül. Amikor új RA erősség kerül kiadásra, az előző automatikusan érvényét veszti.

Resolution message – Megoldási közlemény
A megoldás tanácsadás kiegészítését (RAC) tartalmazó közlés.

Reversed sense RA – Fordított értelmű megoldási tanácsadás
Megoldási tanácsadás amelynek értelme megfordult.

Sensitivity level (S) – Érzékenységi szint
Egy egész szám, amely a paraméterek egy halmazát definiálja, amelyeket a forgalmi tanácsadás (TA) és összeütközés elhárító algoritmusok használnak fel a figyelmeztetési idő szabályozására, amelyet a potenciális veszélyeztető és a veszélyeztető észlelési logika szolgáltat, valamint meghatározza az RA kiválasztási logika szempontjából releváns paraméterek értékeit.

Threat – Veszélyeztető légijármű
Egy megközelítő légijármű, amely különös figyelemre szolgál vagy a saját légijárműhöz való szoros közelsége miatt, vagy mert egymás utáni távolság és magasság mérések jelzik, hogy összeütközési vagy majdnem ütközési útvonalon lehet a saját légijárművel. A veszéllyel szemben rendelkezésre álló figyelmeztetési idő elegendően kicsi ahhoz, hogy egy RA-t indokoljon.

Track – Nyomvonal
Legalább három egymás utáni mérés, amely olyan pozíciókat mutat, amelyet egy légijármű ésszerűen elfoglalhat.

Traffic advisory (TA) – Forgalmi tanácsadás
A repülő személyzet részére adott jelzés arról, hogy bizonyos megközelítő légijármű egy potenciális veszélyt jelent.

Vertical speed limit (VSL) RA – Függőleges sebességhatár megoldási tanácsadás
Megoldás tanácsadás, amely azt tanácsolja a légijármű vezetőnek, hogy kerüljön bizonyos adott emelkedési sebesség tartományokat. A függőleges sebességhatár megoldási tanácsadás vagy helyesbítésre (corrective), vagy megelőzésre (preventive) ad lehetőséget.

Warning time – Figyelmeztetési idő
A potenciális veszélyeztető légijármű vagy a veszélyeztető légijármű észlelése és a legszorosabb megközelítés közötti időtartam, ha egyik légijármű sem gyorsul.

4.2 ACAS I általános előírások és jellemzők

4.2.1 *Funkcionális követelmények.* Az ACAS I-nek a következő feladatokat kell ellátnia:

a) a közelben lévő SSR válaszjeladóval felszerelt légijármű felderítése; és

b) jelzések szolgáltatása a repülő személyzet részére, amely azonosítja a közelben lévő légijármű megközelítési pozícióját a vizuális észlelés segítéseként.

Megjegyzés. – Az ACAS I csak A/C-módú lekérdezésre van szánva. Továbbá nem koordinál másik ACAS berendezéssel. Ennek folytán az ACAS I telepítésének részeként S-módú válaszjeladót nem igényel.

4.2.2 *Jel formátum.* Minden ACAS I jel RF jellemzőjének összhangban kell lennie a 3. fejezet 3.1.1.1-től – 3.1.1.6-ig és 3.1.2.1-től – 3.1.2.4-ig terjedő pontjainak rendelkezéseivel.

4.2.3 Interferencia szabályozás

4.2.3.1 *Maximális sugárzott RF teljesítmény.* Az ACAS I adattovábbítás effektív sugárzott teljesítménye a légijármű hosszanti tengelyéhez viszonyított nulla fokos látóhatár fölötti szögmagasságánál (elevációs szögnél) nem haladhatja meg a 24 dBW értéket.

4.2.3.2 *Nem-kívánt sugárzott teljesítmény.* Amikor az ACAS I nem továbbít lekérdezést, az effektív sugárzott teljesítmény egyik irányban sem haladhatja meg a -70 dBm-et.

Megjegyzés. – Ennek a követelménynek kell biztosítania, hogy amikor nem továbbít lekérdezést, az ACAS I ne sugározzon RF teljesítményt, amely interferálhatna másik közelben lévő légijárművön vagy *földi létesítményben elhelyezett SSR válaszjeladóval vagy rádió berendezéssel, vagy csökkentené azok érzékenységét.*

4.2.3.3 *Interferencia lehatárolás.* Mindegyik ACAS I lekérdezőnek szabályoznia kell lekérdezési sebességét vagy teljesítményét vagy mindkettőt az összes SSR módokban, hogy minimumra csökkentse az interferencia hatásokat (4.2.3.3.3 és 4.2.3.3.4).

Megjegyzés. – Ezek a korlátok arra szolgálnak, hogy az összes interferencia hatás, amely ezekből a lekérdezésekből származik, a közelben lévő többi ACAS I, ACAS II és ACS III lekérdezőktől származókkal együtt, alacsony szinten maradjon.

4.2.3.3.1 *Saját válaszjeladó válasz sebesség meghatározás.* Az ACAS I-nek figyelnie kell a sebességet, amellyel a saját válaszjeladója válaszol a lekérdezésekre, hogy biztosítsa a 4.2.3.3.3 pont rendelkezéseinek kielégítését.

4.2.3.3.2 *Az ACAS II és ACAS III lekérdezők számának meghatározása.* Az ACAS I-nek számolnia kell a közelben lévő ACAS II és ACAS III lekérdezők számát, hogy a 4.2.3.3.3, illetve 4.2.3.3.4 pontban lévő rendelkezéseket kielégítsék. Ezt a számlálást az ACAS adások (UF = 16) figyelemmel kisérésével lehet megszervezni (4.3.7.1.2.4) és fel kell frissíteni, a különböző S-módú ACAS címzések számával, amelyeket a megelőző 20 másodperces periódus során a legalább 1 Hz-es névleges frekvenciánál vettek.

4.2.3.3.3 *A/C ACAS I interferencia korlátok.* A lekérdezési teljesítmény nem haladhatja meg a következő korlátokat:

n_a	Felső határ $\{\sum_{k=1}^{k_1} P_a(k)\}$ esetén	
	Ha $f_r \leq 240$	Ha $f_r > 240$
0	250	118
1	250	113
2	250	108
3	250	103
4	250	98
5	250	94

16	144	41
17	126	36
18	109	31
19	91	26
20	74	21

21	60	17
$\geq$ 22	42	12

ahol:

n_a = ACAS II-vel és ACAS III-mal felszerelt, a saját légijármű közelében repülő légijárművek száma (egy -74 dBm küszöbű válaszjeladó vevővel vett ACAS adásokra alapozva);

{ } = a zárójeleken belüli kifejezésnek az utolsó 8 lekérdezési ciklusra vonatkozó átlagértéke;

$P_a(k)$ = csúcsteljesítmény, amelyet az antenna sugároz annak az impulzusnak az összes irányában, amely a legnagyobb amplitúdóval rendelkezik abban az impulzus csoportban, amelyben az impulzusok egyetlen lekérdezést tartalmaznak egy 1 másodperces lekérdezési ciklusban a k-adik A/C-módú lekérdezés során, W;

k = A/C- módú lekérdezések index száma, $k = 1, 2.., k_t$;

k_t = egy 1 másodperces lekérdezési ciklusban továbbított A/C-módú lekérdezések száma;

f_r = saját válaszjeladó A/C-módú válasz sebessége.

4.2.3.3.4 *S-módú ACAS I interferencia korlátok.* Egy ACAS I, amely S-módú lekérdezéseket használ, nem okozhat nagyobb interferencia hatásokat, mint egy csupán A/C-módú lekérdezéseket használó ACAS I.

4.3 ACAS II-re és ACAS III-ra vonatkozó általános előírások

1. Megjegyzés. – Ebben a szakaszban az ACAS II és az ACAS III jelölésére a CAS betűszót használjuk.

2. Megjegyzés. – Az ACAS berendezések felszerelésére vonatkozó követelményeket a 6. Annex, I. Rész, 6. fejezete tartalmazza.

3. Megjegyzés. – A "felszerelt veszélyeztető légijármű" fogalmát ebben a szakaszban ACAS II-vel vagy ACAS III-mal felszerelt veszélyeztető légijármű megjelölésére használjuk.

4.3.1 Funkcionális követelmények

4.3.1.1 *ACAS tevékenységek.* Az ACAS-nak a következő feladatokat kell ellátnia:

a) felderítés;

b) forgalom tanácsadások generálása;

c) veszélyeztetés észlelés;

d) megoldás tanácsadások generálása;

e) koordinálás; és

f) kommunikáció földi állomásokkal.

A berendezéseknek a b) - e) feladatokat mindegyik működési ciklusban végre kell hajtani.

Megjegyzés. – A fenti tevékenységek bizonyos jellemzőinek szabványosítottaknak kell lenniük annak érdekében, hogy az ACAS egységek kielégítően kooperáljanak más ACAS egységekkel, S-módú földi állomásokkal és a légiforgalmi irányítási rendszerekkel. Az egyes szabványosított jellemzőket az alábbiakban tárgyaljuk Más jellemzőket ajánlásként ismertetünk.

4.3.1.1.1 Egy ciklus időtartama nem haladhatja meg az 1, 2 másodpercet.

4.3.2 Felderítés végrehajtási követelmények

4.3.2.1 *Általános felderítési követelmények.* Az ACAS-nak le kell kérdeznie más légijárműveken lévő SSR A/C-módú és S-módú válaszjeladókat és észlelnie kell a válaszjeladó válaszokat. Az ACAS-nak mérnie kell a válaszoló légijármű távolságát és viszonylagos helyzetét. Ezen mérések eredményeit és a válaszjeladó válaszok által szolgáltatott információkat felhasználva, az ACAS-nak meg kell becsülnie az egyes válaszoló légijárművek pozícióját. Az ACAS-nak tartalmazni kell rendelkezéseket ilyen pozíció meghatározás megvalósítására földi visszaverődések, interferencia és jel erősség változások megléte esetén.

4.3.2.1.1 N*yomvonal létrehozásának valószínűsége.* Az ACAS-nak olyan létrehozott nyomvonalat kell generálnia, amely legalább 0,90-es valószínűséggel rendelkezik arra vonatkoztatva, hogy a nyomvonal, a válaszjeladóval felszerelt légijárművek esetén, 30 másodperccel a legszorosabb megközelítés előtt létrejön, ha az alábbi feltételek mindegyike teljesül:

a) ezeknek a légijárműveknek a látóhatár fölötti szögmagasságai (elevációs szögei) az ACAS légijármű bólintási síkjához viszonyítva ±10 fokon belül vannak;

b) ezeknek a légijárműveknek a magasság változási sebesség mértéke kisebb vagy egyenlő 51 m/s-al (10 000 láb/perc);

c) ezeknek a légijárműveknek a válaszjeladói és antennái kielégítik a 3. fejezet 3.1.1 és 3.1.2 pontjában megadott szabványok előírásait;

d) ezeknek a légijárműveknek a közeledési sebességei és irányai, az SSR válaszjeladóval felszerelt légijárművek helyi sűrűsége, más ACAS lekérdezők száma a szomszédos környezetben (ahogyan az ACAS rádióadások figyelése által meg vannak határozva a 4.3.7.1.2 pont szerint) kielégítik a 4-1 táblázatban megadott feltételeket; és

e) a minimális ferde távolság egyenlő vagy nagyobb, mint 300 m (1000 láb).

4-1 táblázat: ACAS tervezési előfeltételek

Feltételek									*Teljesítmény*
Kvadráns						*Maximális forgalom sűrűség*		*56 km-en (30 NM) belül lévő más ACAS-ok max. száma*	*Sikeresség valószínűsége*
Előre		*Oldalt*		*Hátra*					
Maximális közeledési sebesség									
m/s	*csomó*	*m/s*	*csomó*	*m/s*	*csomó*	*ljmű/km^2*	*ljmű/km^2*		
260	500	150	300	93	180	0,087	0,30	30	0,90
620	1200	390	750	220	430	0,017	0,06	30	0,90

Megjegyzés. – A 4-1 táblázat azokat a tervezési előfeltételeket tartalmazza, amelyekre az ACAS kidolgozását alapozták. Az üzemeltetési gyakorlat és szimulációk azt mutatják, hogy az ACAS akkor is megfelelő felderítést biztosít az összeütközések elkerülése érdekében, ha az 56 km-en (30 NM) belül lévő más ACAS-ok max. száma egy kissé magasabb a 4-1 táblázatban megadott értéknél. A jövőbeni ACAS kidolgozások figyelembe fogják venni a jelenlegi és a várható ACAS sűrűséget.

4.3.2.1.1.1 Az ACAS-nak folytatnia kell a légtér ellenőrzést a nyomvonal létrejöveteli valószínűségének hirtelen leromlása nélkül, ha a 4.3.2.1.1 pontban meghatározott feltétel határok bármelyikét a valóságos értékek meghaladják.

4.3.2.1.1.2 Az ACAS nem követi azokat az S-módú légijárműveket, amelyek jelentik, hogy a földön vannak.

Megjegyzés. – Egy S-módú légijármű azt, hogy a földön van, a képesség (CA) mezőben DF=11 vagy DF=17 kódolás továbbítással (3. fejezet, 3.1.2.5.2.2.1 pont), vagy a függőleges állapot (VS) mezőben DF=0 kódolás továbbításával jelentheti (3. fejezet, 3.1.2.8.2.1 pont). Megfordítva, ha a légijármű S-módú földi ellenőrzés alatt áll, a földön tartózkodása a repülés-állapot (FS) mező figyelésével fedélzetről leadott adattovábbítási DF= 4, 5, 20 vagy 21 formátumokban állapítható meg (3. fejezet, 3.1.2.6.5.1 pont).

4.3.2.1.1.3 **Ajánlás –** *Az ACAS akkor éri el a kívánt követési teljesítményt, amikor az A/C-módú SSR átlagos aszinkron válasz sebesség az ACAS légijármű környezetében lévő válaszjeladóktól, 240 válasz per másodperc, és amikor a csúcs lekérdezési sebesség az egyes válaszjeladóktól ellenőrzések alatt 500 per másodperc.*

Megjegyzés. – A fent említett csúcs lekérdezési sebesség az összes forrásból származó lekérdezést tartalmazza.

4.3.2.1.2 *Téves nyomvonal valószínűsége.* Annak valószínűsége, hogy egy létrehozott A/C-módú nyomvonal távolságban és magasságban nem felel meg, ha jelentették, egy tényleges légijárműnek, kisebb kell legyen mint 10^{-2}. Egy megvalósított S-módú útvonalnál ennek a valószínűségnek kisebbnek kell lenni, mint 10^{-6}. Ezeket a határokat semmilyen forgalmi környezetben sem lehet túllépni.

4.3.2.1.3 *Távolság és irányhelyzet pontosság*

4.3.2.1.3.1 A távolságot 14,5 m (1/128 NM) vagy ennél jobb felbontással kell mérni.

4.3.2.1.3.2 **Ajánlás.** – *A megközelítő légijárművek becsült helyzeteinek viszonylagos hibái nem haladhatják meg a 10 fokos négyzetes középhibát.*

Megjegyzés. – A megközelítő légijárművek viszonyított irányhelyzeteinek ez a pontossága alkalmazható és kielégítő a potenciális veszélyeztetés vizuális észlelésének eszközeként. Ezen felül, az ilyen viszonyított irányhelyzet információt hasznosnak találták a veszélyeztetés észlelésében, ahol ez azt mutatja, hogy egy megközelítő légijármű a veszélyeztetés oka. Azonban ez a pontosság nem kielégítő mint bázis a vízszintes megoldási javaslatokhoz, és nem kielégítő a vízszintes elkerülési távolság megbízható becsléséhez sem.

4.3.2.2 Interferencia szabályozás

4.3.2.2.1 *Maximális sugárzott RF teljesítmény* Egy ACAS átvitel effektív sugárzott teljesítménye a légijármű hossztengelyéhez viszonyított zérus értékű látóhatár fölötti szögmagasságnál (elevációs szögénél) nem haladhatja meg a 27 dBW értéket.

4.3.2.2.1.1 *Nem-kívánt sugárzott teljesítmény.* Amikor az ACAS nem továbbít lekérdezést, az effektív sugárzott teljesítmény semmilyen irányban sem haladhatja meg a -70 dBm értéket.

4.3.2.2.2 *Interferencia lehatárolás.* Mindegyik ACAS lekérdezőnek, amelyik 5490 m (18000 láb) nyomásmagasság alatt repül, ellenőriznie kell a lekérdezési sebességét vagy teljesítményét, vagy mindkettőt, hogy összeegyeztethető legyen specifikus egyenlőtlenségekkel (4.3.2.2.2.2 pont).

4.3.2.2.2.1 *Más ACAS-ok számának meghatározása.* Az ACAS megállapítja a környezetében lévő más ACAS II és III lekérdezők számát, hogy biztosítsa az interferencia korlátozások kielégítését. Ezt a számot az ACAS adások figyelésével nyerik (UF=16), (4.3.7.1.2.4 pont). Mindegyik ACAS-nak figyelnie kell az ilyen rádióadásos lekérdezéseket, hogy meghatározzák az észlelési távolságon belül lévő többi ACAS-ok számát.

4.3.2.2.2.2 *ACAS interferencia határoló egyenlőtlenségek.* Az ACAS-nak úgy kell beállítani a lekérdezési sebességét és lekérdezési teljesítményét, hogy a következő három egyenlőtlenség igaz maradjon, kivéve a 4.3.2.2.2.1 pontbeli előírások szerintieket.

$$\left\{ \sum_{i=1}^{i_1} \left[\frac{p(i)}{250}\right]^{\alpha} \right\} < minimum \left[\frac{280}{1+n_a}, \frac{11}{\alpha^2}\right] \qquad (1)$$

$$\left\{ \sum_{i=1}^{i_1} m(i) \right\} < 0.01 \qquad (2)$$

$$\left\{ \frac{1}{B} \sum_{k=1}^{k_1} \frac{P_a(k)}{250} \right\} < minimum \left[\frac{80}{1+n_a}, 3\right] \qquad (3)$$

Az ezekben az egyenlőtlenségekben szereplő változók meghatározásai a következők:

i_t = az 1 másodperces lekérdezési ciklusban továbbított lekérdezések (A/C-módú és S-módú) száma;

i = A/C-módú és S-módú lekérdezések indexszáma, i=1, 2, ...,i_t;

α = az α_1 minimuma, amelyet $1/4[n_b/n_c]$-ként számítanak, a lentebb megadott különleges körülményeknek van kitéve, és alfa$_2$ $\mathrm{Log}_{10}[n_a/n_b]\mathrm{Log}_{10}25$-ként számított, ahol n_b és n_c úgy van definiálva, mint ACAS II és ACAS III rendszerekkel felszerelt üzemelő légijárművek száma (a levegőben vagy a földön), 11,2 km (6 NM) és 5,6 km (3NM) távolságon belül a saját ACAS-ra számítva (ACAS ellenőrzésre alapozva). A 610 m (2000 láb) föld feletti rádiómagasságon vagy az alatt üzemelő ACAS légijárműveknek mind a földön, mind a levegőben tartalmazni kell ACAS II és ACAS III légijárművet n_b és n_c számban. Egyébként az ACAS-nak csak levegőben lévő ACAS II és ACAS III légijárműveket n_b és n_c értékben. Az α értéke tovább korlátozódik 0,5 minimumra és 1,0 maximumra.

Továbbá:

HA [(n_b≤1) VAGY (n_b>4n_c) VAGY (n_b≤4 ÉS n_c ≤ 2 ÉS n_a>25)] AKKOR α_1=1,0

HA [(n_c>2) ÉS (n_b>2n_c) ÉS (n_a<40)] AKKOR α_1=0,5

p(i) = csúcsteljesítmény, amelyet az antenna sugároz annak az impulzusnak az összes irányában, amely a legnagyobb amplitúdóval rendelkezik abban az impulzus csoportban, amelyben az impulzusok egyetlen lekérdezést tartalmaznak egy 1-másodperces ciklusban az *i*-edik lekérdezés során, W;

m(i) = a kölcsönös elnyomási tartomány a saját válaszjeladónál, amely egy 1-másodperces lekérdezési ciklusban az *i*-edik lekérdezéshez kapcsolódik, s;

B = sugárnyaláb élezési tényező (3dB-es sugárszélesség aránya a lekérdezési mellékirány elnyomásból eredő sugárszélességhez). Olyan lekérdezőknél, amelyek adóberendezés oldalszirom elnyomást (SLS), alkalmaznak az alkalmas sugárszélesség egy válaszjeladóból jövő A/C-módú válaszok azimut szögének kiterjedése lesz, az SLS által limitálva, a válaszjeladó populáció felett átlagolva.

{ } lásd 4.2.3.3.3
$P_a(k)$ "
k "
k_t "
n_a "

Megjegyzés. – Az RA és ACAS adatsugárzások (4.3.6.2.1 és 4.3.7.1.2.4 pontok) lekérdezésekkel azonosak.

4.3.2.2.2.2.1 *Adattovábbítások megoldás javaslatok alatt.*. Az összes levegő-levegő koordinációs lekérdezéseket és megoldási javaslatot és ACAS adásokat teljes teljesítménnyel kell továbbítani és ezeket a lekérdezéseket ki kell hagyni az S-módú lekérdezések összegezéséből az (1) és (2) egyenlőtlenség baloldali tagjaiban a 4.3.2.2.2.2 pontban az RA tartama alatt.

4.3.2.2.2.2.2 *Adattovábbítások ACAS egységektől a földön.* Amikor az ACAS légijármű jelzi, hogy a földön van, az ACAS lekérdezéseket korlátozni kell a többi ACAS II és III légijárművek számának (n_a) beállításával, amelyeket az interferencia határoló egyenlőtlenségbe számítanak be egy olyan értékig, amely háromszorosa annak az értéknek, amelyet egy -74 dBm-es válaszjeladó vevő küszöbbel vett ACAS rádióadás alapján nyertek. Amikor az A/C lekérdezési teljesítményt az interferencia korlátozás miatt lecsökkentik, először az előremenő sugárban kell csökkenteni az A/C-módú lekérdezési teljesítményt, amíg az előreirányuló sorozat nem illeszkedik a jobb és bal sorozatokhoz. Az előreirányuló, jobb és bal lekérdezési teljesítményeket akkor egymásután addig kell csökkenteni, amíg nem illeszkednek a hátsó lekérdezési teljesítményhez. Az A/C-módú teljesítmény további csökkentését az előremenő, az oldal és hátsó lekérdezési teljesítmények egymás utáni csökkentésével kell végrehajtani.

4.3.2.2.2.2.3 *Adatátvitelek 5490 m (18000 láb) tengerszint feletti magasság feletti ACAS egységektől.* Mindegyik ACAS lekérdező, amely 5490 m (18000 láb) nyomásmagasság felett repül, úgy kell szabályoznia a lekérdezési sebességet vagy teljesítményt vagy mindkettőt, hogy a 4.3.2.2.2.2 pont (1) és (3) egyenlőtlensége igaz maradjon, amikor n_a és α egyenlő 1, kivéve a 4.3.2.2.2.2.1 pontban leírtakat.

4.3.3 Forgalmi tanácsadások (TA)

4.3.3.1 *Forgalmi tanácsadás funkció.* Az ACAS forgalmi tanácsadást szolgáltat, hogy figyelmeztesse a repülő személyzetet a potenciális veszélyeztetésre. Az ilyen forgalmi tanácsadásokat a potenciális veszélyeztetés közelítőleg viszonylagos pozíciójának jelzése kell, hogy kísérje.

4.3.3.2 *Közeli forgalom kijelzése*

***Ajánlás. –** Míg bármely megoldási tanácsadás és/vagy forgalmi tanácsadás kijelzésre kerül, a 11 km (6 NM) távolságon belüli közeli forgalmat és, ha magasságot jelentenek, ±370 m (1200 láb) magasságot ki kell jelezni. Ezt a közeli forgalmat meg kell különböztetni (például színnel vagy szimbólum típussal) a veszélyeztetőtől és potenciális veszélyeztetőtől, amelyeket szembetűnő módon kell jelezni.*

4.3.3.3 *Forgalmi tanácsadások, mint megoldási javaslatok előzményei.* A forgalmi tanácsadás kritériumai olyanok, hogy ezek a megoldási tanácsadás kritériumai előtt teljesülnek.

4.3.3.3.1 *Forgalmi tanácsadás figyelmeztetési idő.* A megközelítő légijárművek magasság jelentéseinél, a névleges forgalmi tanácsadás figyelmeztetési idő nem lehet nagyobb, mint (T+20 s), ahol T a névleges figyelmeztetési idő a megoldási tanácsadás generálásához.

Megjegyzés. – Ideálisan a megoldási javaslatot a forgalmi tanácsadás mindig megelőzné, de ez nem mindig lehetséges, pl. a megoldási tanácsadás kritériumok már teljesülhetnek, amikor egy nyomvonal először létrejön, vagy a megközelítő légijármű egy hirtelen és éles manővere előidézheti, hogy a forgalmi tanácsadás vezetési ideje kisebb lesz, mint egy ciklus.

4.3.4 Veszélyeztető légijármű észlelése

4.3.4.1 *Veszélyeztető légijármű deklarálása.* Az ACAS-nak értékelnie kell az egyes megközelítő légijárművek jellemzőit, hogy megállapítsa, hogy az veszélyeztetést jelent-e vagy nem.

4.3.4.1.1 *A megközelítő légijárművek jellemzői.* Minimumként egy megközelítő légijármű jellemzői között, amelyeket a veszélyeztetés azonosításhoz felhasználnak, szerepelnie kell a következőknek:

a) követett magasság;

b) a követett magasság változás sebessége;

c) követett ferde távolság;

d) ferde távolság változásának követési sebessége; és

e) a megközelítő légijármű ACAS-ának érzékenységi szintje, S_i

Egy megközelítő légijárműnél, amely nincs ACAS II-vel vagy ACAS III-mal felszerelve, S_i-t 1-re kell beállítani.

4.3.4.1.2 *Saját légijármű jellemzők.* Minimumként a veszélyeztető légijármű felismeréséhez használt saját légijármű jellemzői között az alábbiaknak kell szerepelni:

a) magasság

b) magasság változtatás sebessége; és

c) saját ACAS érzékenységi szintje (4.3.4.3 pont)

4.3.4.2 *Érzékenységi szintek.* Az ACAS-nak működőképesnek kell lennie bármely érzékenységi szint számnál. Ezeknek tartalmazniuk kell a következőket:

a) S = 1 "tartalék" mód, amelyben a többi légijármű lekérdezése és az összes tanácsadás tiltott;

b) S = 2, "csak TA" mód, amelyben a megoldási javaslatok tiltottak; és

c) S = 3-7, további szintek, amelyek képesek a forgalmi tanácsadások és megoldási javaslatok kiadására, amelyek a 4-2 táblázatban feltüntetett figyelmeztetési időket, valamint a forgalmi tanácsadásokat szolgáltatják.

4-2 táblázat

Érzékenységi szint	*2*	*3*	*4*	*5*	*6*	*7*
Névleges figyelmeztetési idő	nincs RA	15s	20s	25s	30s	35s

4.3.4.3 *Saját érzékenységi szint (S_o) megválaszolása.* A saját ACAS érzékenységi szint megválasztását az érzékenységi szint szabályozó (SLC) utasítások határozzák meg, amelyeket egy sor, az alábbiakban felsorolt forrásból kapnak:

a) SLC utasítás, amelyet az ACAS automatikusan generál a magasság sávra vagy más külső tényezőkre alapozva;

b) SLC utasítás repülőgépvezető inputból; és

c) SLC utasítás S-módú földi állomásoktól.

4.3.4.3.1 *Engedélyezett SLC utasítás kódok.* Minimumként az elfogadható SLC utasítás kódoknak tartalmazniuk kell a következőket:

	Kódolás
Magasság sávon alapuló SLC-re	2-7
Repülőgépvezetőtől	0, 1, 2
S-módú földi állomásoktól	0, 2 - 6

4.3.4.3.2 *Magasság-sáv SLC utasítás.* Ahol az ACAS magasságon alapuló SLC utasítást választ, a névleges magasság küszöbhöz olyan hiszterézist kell alkalmazni, amelynél a következők szerinti SLC utasítás értékváltozást követelnek meg: emelkedő ACAS légijárműnél az SLC utasításnak növekedni kell a megfelelő magasság küszöb plusz a hiszterézis értéknél; süllyedő ACAS légijárműnél az SLC utasításnak csökkenni kell a megfelelő magasság küszöb mínusz hiszterézis értéknél.

4.3.4.3.3 *Repülőgépvezető SLC utasítás.* Az SLC utasítás repülőgépvezető általi 0 értékre állítása az "automatikus" mód választását jelöli, amelynél az érzékenységi szint kiválasztás a többi utasításon alapszik.

4.3.4.3.4 *S-módú földi állomás SLC utasítás.* S-módú földi állomásokon keresztül továbbított SLC utasításoknál (4.3.8.4.2.2.1 pont) a 0 érték azt jelzi, hogy a szóban forgó állomás nem ad ki SLC utasítást és hogy az érzékenységi szint kiválasztása a többi utasításon alapszik, köztük más S-módú földi állomásoktól jövő nem 0 utasításokon. Az ACAS nem dolgoz fel 1-értékű fedélzetre irányuló adattovábbítási SLC utasítást.

4.3.4.3.4.1 *SLC utasítás kód ATS kiválasztása.* ATS hatóságoknak biztosítaniuk kell, hogy eljárások legyenek a repülőgépvezető informálására bármely, a 0-tól eltérő ATS kiválasztású SLC utasításról (4.3.4.3.1 pont).

4.3.4.3.5 *Kiválasztási szabály.* A saját ACAS érzékenységi szintet a legkisebb, nem-0 SLC utasításra kell beállítani, amely utasítás a 4.3.4.3 pontban felsorolt bármely forrástól jöhetett.

4.3.4.4 *Paraméter értékek kiválasztása RA generálásához.* Ha a saját ACAS érzékenységi szintje 3 vagy ennél nagyobb, az RA generálására használt paraméter értékeknek, amelyek érzékenységi szinttől függnek, az S_0 saját ACAS érzékenységi szint és a megközelítő ACAS S_i érzékenységi szintje közül a nagyobbikon kell alapulniuk.

4.3.4.5 *Paraméter értékek kiválasztása TA generálásához.* A forgalmi tanácsadás generálásához használt paraméter értékeket, amelyek az érzékenységi szinttől függnek, ugyanazon az alapon kell kiválasztani, mint a megoldási javaslatnál (4.3.4.4 pont), kivéve, amikor egy 2 értékű ("csak TA" mód) SLC utasítás érkezett vagy a légijárművezetőtől vagy egy S-módú földi állomástól. Ebben az esetben a paraméter értékek a forgalmi tanácsadás generálásához azok az értékek maradnak, amelyeket azok a légijárművezetőtől vagy az S-módú földi állomástól felvettek volna érkező SLC utasítás hiányában.

4.3.5 Megoldási tanácsadás (RA)

4.3.5.1 *RA generálás*. Minden veszélyeztetésre az ACAS egy megoldási javaslatot generál, kivéve, ahol nem lehetséges kiválasztani egy olyan megoldást, amelytől adekvát elkülönítés várható vagy a megközelítő légijármű repülési pályájának diagnózisában lévő bizonytalanság miatt, vagy mert nagy a kockázata annak, hogy veszélyeztető légijármű által végrehajtott manőver érvényteleníteni fogja a megoldási javaslatot, amely esetben tanácsadást nem továbbítanak.

4.3.5.1.1 *RA törlés.* Ha egy vagy több veszélyeztető légijármű ellen egy megoldási javaslatot egyszer már generáltak, azt fenn kell tartani, vagy módosítani kell, amíg a vizsgálatok, amelyek kevésbé szigorúak, mint a veszélyeztető légijármű észlelésére vonatkozó vizsgálatok, két egymás utáni cikluson keresztül nem jelzik, hogy a megoldási tanácsadás törölhető, amikor is azt törölni kell.

4.3.5.2 *Az RA kiválasztása.* Az ACAS-nak azt a megoldási javaslatot kell generálnia, amely várhatóan adekvát elkülönítést szolgáltat az összes veszélyeztetéstől, és amelynek a legkisebb hatása van az ACAS légijármű repülési útvonalára, megfelelve az ebben a fejezetben leírt többi rendelkezésnek.

4.3.5.3 *RA hatékonyság.* Az ACAS nem generál vagy nem folytatja a kijelzését olyan megoldási javaslatnak, amely megfontolva a veszélyeztető légijármű valószínű pályáit, valószínűbb, hogy csökkenti az elkülönítést, mint hogy növelje azt a legszorosabb megközelítés előre jelzett időpontjában, a 4.3.5.5.1.1 és 4.3.5.6 pontokban leírt rendelkezésnek megfelelően.

Megjegyzés. – Lásd a 4.3.5.8 pontot is.

4.3.5.4 *Légijármű képesség.* Az ACAS által generált megoldási javaslatnak összhangban kell lenni a légijármű teljesítőképességével.

4.3.5.4.1 *Földközelség.* Süllyedési megoldási javaslatokat nem generálnak vagy tartanak fenn, amikor a saját légijármű 300 m (1000 láb) föld feletti magasság alatt van.

4.3.5.4.2 ACAS nem működhet 3-7 érzékenységi szinteken, amikor a saját légijármű 300 m (1000 láb) földfeletti magasság alatt van.

4.3.5.5. *Az értelem megfordítása.* Az ACAS nem fordíthatja meg egy megoldási tanácsadás értelmét egyik ciklustól a következőig, kivéve a 4.3.5.5.1 pontban engedélyezettet koordináció biztosításához, vagy amikor az előrejelzett elkülönítés a legszorosabb megközelítésnél a meglévő értelemnél nem adekvát.

4.3.5.5.1 *Értelem megfordítások felszerelt veszélyeztető légijárművekkel szemben.* Ha egy felszerelt veszélyeztető légijárműtől kapott megoldási tanácsadás kiegészítés nem összeegyeztethető a meglévő megoldási tanácsadás értelmével, az ACAS-nak módosítania kell a megoldási tanácsadás értelmét, hogy összhangban legyen a vett megoldási tanácsadás kiegészítéssel, ha a saját légijármű S-módú címzése értékben magasabb, mint a veszélyeztetőé.

Megjegyzés. – A 4.3.6.1.3 pont megkívánja, hogy a saját megoldási tanácsadás kiegészítés a veszélyeztető részére szintén megfordításra kerüljön.

4.3.5.5.1.1 Az ACAS nem módosíthatja a megoldási tanácsadás értelmét olyan módon, amely azt összeférhetetlenné teszi egy felszerelt veszélyeztető légijárműtől kapott megoldási tanácsadás kiegészítéssel, ha a saját légijármű S-módú címzése értékben nagyobb, mint a veszélyeztetőé.

4.3.5.6 *RA erősség fenntartás.* Annak a követelménynek alávetve, hogy egy süllyedési megoldási tanácsadás ne kerüljön generálásra kis magasságon (4.3.5.4.1 pont), megoldási javaslatot nem szabad módosítani, ha a legszorosabb megközelítésig az idő túl rövid ahhoz, hogy szignifikáns reagálást lehessen elérni, vagy ha a veszélyeztető távolságban irányát megváltoztatja.

4.3.5.7 *RA gyengítés.* Megoldási tanácsadás nem gyengíthető, ha valószínű, hogy a későbbiekben erősíteni kell.

4.3.5.8 *ACAS-al felszerelt veszélyeztetők.* A megoldási javaslatnak összeegyeztethetőnek kell lennie a veszélyeztető légijárműveknek közvetített összes megoldási tanácsadás kiegészítéssel (4.3.6.1.3). Ha egy veszélyeztető légijárműtől egy megoldási tanácsadás kiegészítés előbb érkezik, mint hogy a saját ACAS a veszélyeztető számára megoldási tanácsadás kiegészítést generál, a generált megoldási javaslatnak összeegyeztethetőnek kell lenni a vett megoldási tanácsadás kiegészítéssel, hacsak egy ilyen megoldás nem nagyobb valószínűséggel csökkenti az elkülönítést, mint növeli azt, és a saját S-módú címzés értékben alacsonyabb, mint a veszélyeztetésé.

Megjegyzés. – Egynél több veszélyeztető légijárművel való találkozásnál, amikor néhány veszélyeztető felett és más veszélyeztetők alatt kell elhaladni, ezt az előírást úgy lehet értelmezni, mint a megoldási tanácsadás teljes időtartamára vonatkozót. Speciálisan, megengedhető egy megoldási javaslatot egy veszélyeztető fölé emelkedést (süllyedést) tartalmazó megoldási tanácsadás megtartása, amely veszélyeztető légijármű a saját légijármű felett (alatt) van, feltéve, hogy van egy számított törekvés megfelelő elkülönítésre az összes veszélyeztető légijárműtől a rákövetkező vízszintes kirepülés által.

4.3.5.9 *ARA almező kódolás.* Mindegyik ciklust, a megoldási tanácsadás értelmet, erősséget és jellegzetességeket kódolni kell az aktív megoldás tanácsadás (ARA) almezőben (4.3.8.4.2.2.1.1 pont). Ha az ARA almezőt nem frissítették fel egy 6 másodperces időtartam alatt, azt 0-ra kell állítani az MTE almezővel együtt ugyanabban a közleményben (4.3.8.4.2.2.1.3 pont).

4.3.5.10 *Rendszer válaszidő.* A rendszer késés a releváns SSR válasz vételétől egy megoldási tanácsadás értelem és erősség szolgáltatásig a repülőgépvezető számára a lehető legrövidebb legyen és nem haladhatja meg az 1,5 másodpercet.

4.3.6 Koordináció és kommunikáció

4.3.6.1 Az ACAS-al felszerelt veszélyeztető légijárművekkel való koordinációra vonatkozó előírások

4.3.6.1.1 *Több légijárművel való koordináció.* Több-légijárműves szituációban az ACAS-nak minden felszerelt veszélyeztető légijárművel egyedenként kell együttműködnie.

4.3.6.1.2 *Adatvédelem a koordináció során.* Az ACAS-nak meg kell akadályoznia párhuzamos folyamatoknál a tárolt adatokhoz való egyidejű hozzáférést az ACAS-on belül, különösen megoldás közlemény feldolgozás alatt.

4.3.6.1.3 *Koordináció lekérdezés.* Az ACAS-nak minden ciklusban koordináció lekérdezést kell továbbítani minden egyes felszerelt veszélyeztető légijárműnek, hacsak a megoldási tanácsadás generálásnak nincs késleltetése amiatt, hogy nincs lehetőség olyan megoldási tanácsadás kiválasztására, amelyről előre látható, hogy adekvát elkülönítést tud biztosítani (4.3.5.1 pont). A veszélyeztető légijárműnek továbbított közlemény egy, a veszélyeztető számára kiválasztott megoldási tanácsadás kiegészítést tartalmaz. Ha a veszélyeztető légijárműtől a megoldási tanácsadás kiegészítés előbb érkezne, mint ahogy az ACAS a veszélyeztető légijármű részére egy megoldási tanácsadás kiegészítést kiválasztana, a kiválasztott megoldási tanácsadás kiegészítőnek összeegyeztethetőnek kell lennie a vett megoldási tanácsadás kiegészítővel, hacsak háromnál nem több ciklus múlt el azóta, amióta a megoldási tanácsadás kiegészítést vették, a megoldási tanácsadás kiegészítés magasságkeresztező, és a saját légijármű címzés értékben kisebb, mint a veszélyeztető légijárműé, amely esetben az ACAS a megoldási javaslatot függetlenül választja ki. Ha egy felszerelt veszélyeztető légijárműtől kapott megoldási tanácsadás kiegészítés összeegyeztethetetlen a megoldási tanácsadás kiegészítéssel, amelyet a saját ACAS választott ki ennek a veszélyeztető légijárműnek, az ACAS-nak módosítania kell a kiválasztott megoldási tanácsadás kiegészítést, ha a saját légijármű címzése értékben nagyobb, mint a veszélyeztetés.

Megjegyzés. – A megoldási közlemény által tartalmazott megoldási tanácsadás kiegészítés függőleges tanácsadás kiegészítés (VRC) formában van az ACAS II esetében (4.3.8.4.2.3.2.2 pont) és/vagy vízszintes megoldási tanácsadás kiegészítés (HRC) formában ACAS III. esetén.

4.3.6.1.3.1 *Koordináció befejezés.* Egy olyan cikluson belül, amikor egy megközelítő légijármű megszűnik megoldási tanácsadás fenntartás okának lenni, az ACAS megoldási közleményt küld ennek a megközelítő légijárműnek egy koordinációs lekérdezés segítségével. A megoldási közleménynek tartalmaznia kell a törlési kódját az utolsó megoldási tanácsadás kiegészítésnek, amelyet ennek a megközelítő légijárműnek küldtek, amíg oka volt a megoldási tanácsadás fenntartásának.

Megjegyzés. Egy egyedülálló veszélyeztető légijárművel való találkozás során a veszélyeztető légijármű megszűnik megoldási tanácsadás okának lenni, ha a megoldási tanácsadás törlésének feltételei teljesülnek. Több veszélyeztető légijárművel való találkozás során a veszélyeztető légijármű megszűnik megoldási tanácsadás okának lenni, ha a megoldási tanácsadás törlésének feltételei erre a veszélyeztető légijárműre vonatkozóan fennállnak, még akkor is, ha a megoldási javaslatot esetleg a többi veszélyeztető légijármű miatt fenn kell tartani.

4.3.6.1.3.2 Az ACAS-nak koordináció lekérdezéseket kell továbbítania, amíg nem kap koordinációs választ a veszélyeztető légijárműtől egy nem kevesebb, mint hat, és nem több, mint tizenkét maximális számú kísérletezésig. Az egymást követő lekérdezéseknek névlegesen egyenlő időközökkel kell követniük egymást egy 100 ± 5 ms-os periódus alatt. Ha a maximális számú kísérletezést elvégezték, és válasz nem érkezett, az ACAS-nak szabályos feldolgozási sorrendjét kell folytatnia.

4.3.6.1.3.3 Az ACAS-nak paritásos védelmet kell nyújtani (4.3.8.4.2.3.2.6 és 4.3.8.4.2.3.2.7 pontok) mindegyik mező számára a koordináció lekérdezésében, amely megoldási tanácsadás kiegészítési információt szolgáltat.

Megjegyzés. – Ez tartalmazza a függőleges megoldási tanácsadás kiegészítést (VRC), a függőleges megoldási tanácsadás kiegészítés törlését (CVC), a vízszintes megoldási tanácsadás kiegészítést (HRC), és a vízszintes megoldási tanácsadás kiegészítés törlését (CHC).

4.3.6.1.3.4 Valahányszor a saját ACAS megfordítja az értelmét egy felszerelt veszélyeztető légijárművel szemben, a megoldás közlésnek, amelyet az éppen folyó és a rákövetkező ciklusban küldenek ennek a veszélyeztető légijárműnek, mind az újonnan kiválasztott megoldási tanácsadás kiegészítést, mind a megfordítás előtt küldött megoldási tanácsadás kiegészítés törlési kódját tartalmaznia kell.

4.3.6.1.3.5 Amikor egy függőleges megoldási tanácsadást kiválasztanak, a függőleges megoldási tanácsadás kiegészítés VRC) (4.3.8.4.2.3.2.2 pont), amelyet saját ACAS egy, a veszélyeztető légijárműnek szóló tanácsadás közlésben tartalmaz, a következő lesz:

a) “ne haladj el felül”, amikor a megoldási tanácsadás a veszélyeztető légijármű feletti elkülönítést szándékozik biztosítani;

b) “ne haladj el alul”, amikor a megoldási tanácsadás a veszélyeztető légijármű alatti elkülönítést szándékozik biztosítani.

4.3.6.1.4 *Megoldási közlemény feldolgozás.* Megoldási közleményeket a vétel sorrendjében dolgozzák fel, és olyan késleltetéssel, amelyet a tárolt adatokhoz való párhuzamos hozzáférés lehetőségének megakadályozása és az előzőleg vett megoldási közlemények feldolgozása miatti késések limitálnak. A késleltetés alatt álló közlemények átmenetileg sorban állnak a közlemények esetleges elvesztésének megelőzése céljából. A megoldási közlemény feldolgozásnak magában kell foglalnia a közlemény dekódolását és a megfelelő adatszerkezetek felfrissítését a közleményből kivonatolt információkkal.

Megjegyzés. – A 4.3.6.1.2 pontnak megfelelően a megoldási közlemény feldolgozásnak nem szabad olyan adathoz jutnia, amelynek felhasználása nincs védve a koordináció zárlat állapot által.

4.3.6.1.4.1 Egy másik ACAS-tól kapott megoldási tanácsadás törlést el kell utasítani, ha a kódolt értelem bitek paritás hiba fennállását mutatják, vagy ha megfogalmazatlan értékeket észleltek a megoldási közleményben. Egy megoldási tanácsadás kiegészítést, vagy megoldási tanácsadás kiegészítés törlést, amelyet paritás hibáktól és megfogalmazatlan megoldási közlemény értékektől mentesen vesznek, érvényesnek kell tekinteni.

4.3.6.1.4.2 *RAC tárolás.* Egy másik ACAS-tól érkező érvényes megoldási javaslatot el kell tárolni vagy ahhoz az ACAS-hoz tartozó előzőleg eltárolt RAC felfrissítésére kell használni. Egy érvényes megoldási tanácsadás kiegészítés törlés előidézi az előzőleg eltárolt RAC törlését. Ha az eltárolt RAC 6 mp időtartam alatt sem került frissítésre, akkor azt ki kell törölni.

4.3.6.1.4.3 *Rögzített RAC-ok frissítése.* Ha egy másik ACAS-ról kapott RAC törlés, vagy érvényes RAC a RAC rögzítések frissítését kell, hogy szolgálják. Ha bármely veszélyeztető légijármű által a rögzített megoldási tanácsadás kiegészítésében (RAC) egy bit nem kerül frissítésre 6 mp időtartamon belül, akkor ezt a bitet 0-ra kell beállítani.

4.3.6.2 Az ACAS földi állomásokkal való kommunikációjára vonatkozó előírások

4.3.6.2.1 *ACAS megoldási javaslatok légi kezdeményezésű fedélzetről leadott kapcsolata.* Ha egy ACAS megoldási tanácsadás létezik, akkor az ACAS:

a) adjon át S-módú válaszjeladójának egy megoldási tanácsadás jelentést a földre történő továbbításra egy Comm-B válaszban (4.3.11.4.1 pont) és

b) továbbítson periodikus megoldási tanácsadás közvetítéseket (4.3.7.3.2 pont).

4.3.6.2.2 *Érzékenységi szint szabályozás (SLC) utasítás.* Az ACAS-nak tárolni kell az S-módú földi állomásoktól jövő szintszabályozás utasításokat. Az S-módú földi állomástól kapott érzékenységi szint-szabályozás utasítás érvényben marad, amíg nem lép helyébe ugyanazon állomástól jövő érzékenységi szint-szabályozás utasítás, ahogyan azt a lekérdezési IIS almezőben lévő helyszín szám jelzi. Ha egy S-módú földi állomástól származó tárolt utasítást 4 percen belül nem frissítenek fel, vagy ha a kapott érzékenységi szint szabályozási utasítás 15-ös értékű (4.3.8.4.2.1.1 pont), a tárolt érzékenységi szint szabályozási utasítást ezen S-módú földi állomás részére 0-ra kell beállítani.

4.3.6.3 Az ACAS és S-módú válaszjeladója közötti adatátvitelre vonatkozó előírások

4.3.6.3.1 *Adatátvitel az ACAS-tól az S-módú válaszjeladóhoz:*

a) az ACAS-nak megoldási tanácsadás információt kell átadni az S-módú válaszjeladójának egy megoldási tanácsadás jelentésben (4.3.8.4.2.2.1 pont) és a koordinációs válaszban (4.3.8.4.2.4.2 pont) való továbbítására;

b) az ACAS-nak az aktuális érzékenységi szintet továbbítania kell az S-módú válaszjeladójának egy érzékenységi szint jelentésben (4.3.8.4.2.5) való továbbítás céljából; és

c) az ACAS-nak képességi információt kell átadni az S-módú válaszjeladójának egy adat kapcsolati képesség jelentésben (4.3.8.4.2.2.2 pont) való továbbítás céljából.

4.3.6.3.2 *Adatátvitel az S-módú válaszjeladótól a hozzátartozó ACAS-hoz:*

a) az ACAS-nak az S-módú válaszjeladójától kapnia kell az S-módú földi állomások által továbbított érzékenységi szint szabályozási utasításokat (4.3.8.4.2.1.1 pont);

b) az ACAS-nak az S-módú válaszjeladójától kapnia kell más ACAS által továbbított ACAS közléseket (4.3.8.4.2.3.3 pont); és

c) az ACAS-nak az S-módú válaszjeladójától kapnia kell más ACAS által továbbított megoldási közleményeket (4.3.8.4.2.3.2 pont) levegő-levegő koordinációs célokra.

4.3.7 ACAS protokollok

4.3.7.1 Felderítési protokollok

4.3.7.1.1 *A/C-módú válaszjeladók felderítése.* Az ACAS a C-módot csak körhívás lekérdezés (3. Fejezet 3.1.2.1.5.1.2 pont) A/C-módú válaszjeladókkal felszerelt légijárművek felderítésére használják.

4.3.7.1.2 *S-módú* válaszjeladók *felderítése*

4.3.7.1.2.1 *Detektálás.* Az ACAS-nak figyelnie kell az 1090 MHz-et az S-módú befogó squitterek céljából (DF = 11). Az ACAS-nak észlelnie kell az S-móddal felszerelt légijárműveket, és meg kell határoznia a címzésüket S-módú befogó squitterek (DF = 11) vagy kiterjesztett squitterek (DF = 17) használatával.

1. Megjegyzés. – Elfogadható egyedi légijármű befogása vagy adatgyűjtő vagy kiterjesztett squitterek (DF = 11 vagy DF = 17) felhasználásával. Azonban az ACAS-nak figyelnie kell a beszerző squittert, mivel nem fogja bármely időben az összes légijármű a kiterjesztett squittert továbbítani.

2. Megjegyzés. – Ha a jövőben a légijárművek számára megengedetté válik, hogy ne továbbítsák az adatbegyűjtő squittert, hanem, helyette a kiterjesztett squitter folyamatos továbbítására támaszkodjanak, az összes ACAS egység számára lényegessé válik mind az adatgyűjtési, mind a kiterjesztett squitter figyelése.

4.3.7.1.2.2 *Felderítési lekérdezések.* Miután először vettek egy 24-bites légijármű címzést egy légijárműtől, amelyről megállapították, hogy a vétel megbízhatóságon alapuló, az ACAS megbízható felderítési távolságon belül van és a saját légijármű felett és alatt elhelyezkedő 3050 m (10000 láb) sávon belül tartózkodik, az ACAS egy rövid levegő-levegő lekérdezést továbbít (UF=0) a távolsági adat beszerzéséhez. A felderítési lekérdezéseket minden öt ciklusban legalább egyszer továbbítani kell, amikor ez a magasság feltétel ki van elégítve. Felderítési lekérdezéseket minden ciklusban továbbítani kell, ha az észlelt légijármű távolsága kisebb, mint 5,6 km (3 NM), vagy a számított idő a legszorosabb megközelítésig kevesebb, mint 60 másodperc, feltéve, hogy mind az észlelt, mind a saját légijármű a meglévő pozíciójából gyorsulás nélküli mozgással halad, és hogy a távolság a legszorosabb megközelítésnél egyenlő 5,6 km (3 NM). A felderítési lekérdezést 5 ciklusos perióduson át fel kell függeszteni, ha:

a) egy választ sikeresen vettek; és

b) a saját légijármű a megközelítő légijármű 5490 m (18000 láb) nyomásmagasság alatt repül; és

c) az észlelt légijármű távolsága nagyobb, mint 5,6 km (3 NM) és a számított idő a legszorosabb megközelítésig meghaladja a 60 másodpercet, feltéve, hogy mind az észlelt, mind a saját légijármű a meglévő pozíciójából gyorsulás nélküli mozgással halad, és hogy a távolság a legszorosabb megközelítésnél 5,6 km-el (3 NM) egyenlő.

4.3.7.1.2.2.1 *Távolság beszerzési lekérdezések.* Az ACAS-nak rövid levegő-levegő felderítési formátumot (UF = 0) kell használni a távolság beszerzéséhez. Az ACAS-t AQ = 1 (3. fejezet, 3.1.2.8.1.1 pont) és RL = 0 (3. fejezet, 3.1.2.8.1.2 pont) értékekre kell beállítani a beszerzési lekérdezéshez.

1. Megjegyzés. – AQ = 1 beállítás az RL mező 14-es bitje egyenlő 1 válaszát eredményezi és segédeszközként szolgál a saját lekérdezésre érkezett válasznak más ACAS egységektől kapott válaszoktól való megkülönböztetésére (4.3.7.1.2.2.2 pont).

2. Megjegyzés. – Az adatgyűjtési lekérdezésben RL 0-ra van beállítva rövid beszerzési válasz utasításhoz (DF = 0).

4.3.7.1.2.2.2 *Követési lekérdezés.* ACAS-nak követési lekérdezésekhez rövid levegő-levegő ellenőrzési formátumot (UF = 0) RL = 0 és AQ = 0 beállításokkal kell alkalmaznia.

4.3.7.1.2.3 *Felderítési válaszok.* Ezeket a protokollokat a 4.3.11.3.1 pont írja le.

4.3.7.1.2.4 *ACAS adás.* Névlegesen minden 8-10 másodpercben sugározni kell egy ACAS adást a tetőantennából. Az irányantennát használó berendezéseknek úgy kell működniük, hogy névlegesen minden 8-10 másodpercben egy teljes kör lefedést szolgáltassanak.

Megjegyzés. – Egy adás más S-módú válaszjeladónál a lekérdezés vételét idézi elő és azt, hogy az MU mező által tartalmazott lekérdezés tartalmát szolgáltatja a válaszjeladó kimenő adat csatolóegységnél. Az UDS1 = 3, UDS2 = 2 kombináció az adatokat ACAS adásként azonosítja, amely a lekérdező ACAS légijármű diszkrét címzését tartalmazza. Ez mindegyik ACAS-nak eszközt szolgáltat az észlelési távolságon belül lévő többi ACAS számának megállapítására az interferencia korlátozásához. Az MU mező formátuma a 4.3.8.4.2.3 pontban kerül leírásra.

4.3.7.2 Levegő-levegő koordinációs protokollok

4.3.7.2.1 *Koordinációs lekérdezések.* Az ACAS UF=16 lekérdezéseket továbbít (3. Fejezet 3.1.2.3.2 pont, 3,7 ábra) AQ = 0 és RL = 1 beállításokkal, amikor RI = 3 vagy 4-et jelentő másik légijárművet veszélyeztető légijárműnek nyilvánítanak (4.3.4 alpont). Az MU mező tartalmazza a megoldási közleményt a 4.3.8.4.2.3.2 pontban ismertetett almezőkben.

1. Megjegyzés. – Az UF 16 lekérdezést AQ = 0 és RL = 1-el arra szánták, hogy egy DF=16 választ váltson ki a másik légijárműtől.

2. Megjegyzés. – Egy RI = 3 illetve RI = 4-et jelentő légijármű egy működő ACAS-al felszerelt légijármű, amelynek csak függőleges, illetve függőleges és vízszintes megoldási képessége van.

4.3.7.2.2 *Koordinációs válasz.* Ezek a protokollok a 4.3.11.3.2 pontban kerülnek ismertetésre.

4.3.7.3 Protokollok ACAS földi állomásokkal folytatott kommunikációhoz

4.3.7.3.1 *RA jelentések S-módú földi állomásoknak.* Ezeket a protokollokat a 4.3.11.4.1 pont tartalmazza.

4.3.7.3.2 *RA adások.* Megoldási javaslatokat teljes teljesítménnyel a törzs alján elhelyezett antennától kell továbbítani vibráló, névlegesen 8 másodperces időközöknél azokban az időszakokban, amikor a megoldási javaslatot jelzik. A megoldási tanácsadás közvetítésének tartalmaznia kell az MU-mezőt, ahogyan azt a 4.3.8.4.2.3.4 pont ismerteti. A megoldási javaslatnak ismertetnie kell a legutóbbi megoldási javaslatot, amely a megelőző 8 másodperces időszakban állt fenn. Irány antennát használó berendezéseknek úgy kell működniük, hogy névlegesen minden 8 másodpercben teljes körkörös lefedést biztosító tanácsadási értelmet és erősséget közvetítsenek.

4.3.7.3.3 *Adat kapcsolat képesség jelentés.* Ezeket a protokollokat a 4.3.11.4.2 pont tartalmazza.

4.3.7.3.4 *ACAS érzékenységi szint szabályozás.* Az ACAS akkor és csak akkor hajt végre érzékenységi szint utasítást, ha a TMS (3. fejezet, 3.1.2.6.1.4.1 pont) 0 értékű és DI vagy 1 vagy 7 ugyanabban a lekérdezésben.

4.3.8 Jel formátumok

4.3.8.1 Az összes ACAS jel RF jellemzői feleljenek meg a 3. fejezet 3.1.1.1 – 3.1.1.6, 3.1.2.1 – 3.1.2.3, 3.1.2.5 és 3.1.2.8 pontok előírásainak.

4.3.8.2 Kapcsolat az ACAS és S-módú jelformátumok között

Megjegyzés. – Az ACAS S-módú továbbításokat használ ellenőrzésre és kommunikációhoz. Az ACAS levegő-levegő kommunikációk lehetővé teszik a megoldási tanácsadás döntések koordinációját az ACAS-al felszerelt veszélyeztető légijárművekkel. Az ACAS föld-levegő kommunikációs tevékenységek lehetővé teszik a megoldási javaslatok jelentését a földi állomásoknak, és az utasítások továbbítását az ACAS-al felszerelt légijárművekhez az összeütközés elhárító algoritmusok paramétereinek szabályozására.

4.3.8.3 *Jel formátum szabályok.* Valamennyi ACAS jel adat kódolása egyezzen meg a 3. fejezet 3.1.2.3 pontjának előírásaival.

Megjegyzés. – Az ACAS által használt levegő-levegő adatsugárzásokban az 1030 MHz-en továbbított lekérdezéseket "fedélzetre irányuló kapcsolási" (uplink) továbbításnak nevezik és fedélzetre irányuló kapcsolási formátum (UF) kódokat tartalmaznak. Az 1090 MHz-en vett válaszokat "fedélzetről leadott kapcsolási" (downlink) továbbításnak nevezik és fedélzetről leadott kapcsolási formátum(DF) kódokat tartalmaznak.

4.3.8.4 Mező leírás

1. Megjegyzés. – A levegő-levegő ellenőrzési és kommunikációs formátumok, amelyeket az ACAS használ, de a 3. Fejezet, 3.1.2 pontjában nincsenek teljes mértékben ismertetve, a 4-1 ábrán vannak megadva.

Uplink: fedélzetre irányuló adattovábbítás

UF=0	0000	3	RL:1	4	AQ:1	18	AP:24	
UF=16	10000	3	RL:1	4	AQ:1	18	MU:56	AP:24

Downlink: fedélzetről leadott adattovábbítás

DF=0	00000	VS:1	2	SL:3	2	RI:4	2	AC:13	AP:24	
DF=16	10000	VS:1	2	SL:3	2	RI:4	2	AC:13	MV:56	AP:24

4-1 ábra. Az ACAS által használt felderítési és kommunikációs formátumok

2. Megjegyzés. – Ez a szakasz azokat az S-módú mezőket (és azok almezőit) definiálja, amelyeket az ACAS feldolgoz, hogy az ACAS feladatokat teljesítse. Az ACAS mezők közül néhány (azok is, amelyet más SSR S-módú tevékenységhez használnak) kijelöletlen ACAS kódokkal vannak leírva a 3. fejezet, 3.1.2.6 pontjában. Ilyen kódok a 4.3.8.4.1 pontban vannak kijelölve. A csak ACAS berendezések által használt mezők és almezők a 4.3.8.4.2 pontban kerülnek kijelölésre.

3. Megjegyzés. – A 4.3.8.4 pontban használt bit számozási szokás inkább a teljes fedélzetre irányuló vagy fedélzetről leadott kapcsolati formátumon belüli bit számozást tükrözi, semmint az egyedi mezőkön, illetve almezőkön belüli biteket.

4.3.8.4.1 *A 3. fejezet, 3.1.2 pontban bevezetett mezők és almezők*

Megjegyzés. – A 3. fejezet, 3.1.2 pontjában "ACAS részére fenntartott" jelölésű missziós mezők és almezők kódjai kerülnek leírásra.

4.3.8.4.1.1 *DR (fedélzetről leadott adattovábbítási igény).* A fedélzetről leadott adattovábbítási igény mező kódolásának jelentése a következő:

Kódolás

0 - 1	Lásd 3. fejezet 3.1.2.6.5.2 pont
2	ACAS üzenet rendelkezésre áll
3	Comm-B közlés rendelkezésre áll és ACAS közlés rendelkezésre áll
4-5	Lásd 3. fejezet 3.1.2.6.5.2 pont
6	Comm-B adás közlemény 1 rendelkezésre áll és ACAS közlés rendelkezésre áll
7	Comm-B adás közlemény 2 rendelkezésre áll és ACAS közlés rendelkezésre áll
8-31	Lásd 3. fejezet, 3.1.2.6.5.2 pont

4.3.8.4.1.2 *RI (levegő-levegő válaszinformáció).* A kódolás jelentése az RI mezőben a következő:

Kódolás

0	Nem működő ACAS
1	Nem kijelölt
2	ACAS gátolt megoldás képessége
3	ACAS csak függőleges megoldás képességgel
4	ACAS függőleges és vízszintes megoldás képességgel
5-7	Nem kijelölt
8-15	Lásd 3. fejezet, 3.1.2.8.2.2 pont

A válasz formátum 14 bitje, amely ezt a mezőt tartalmazza, válaszol a lekérdezés AQ bitjére. Az RI mező "nem működő ACAS" szöveget jelent (RI=0), ha az ACAS egység meghibásodott, vagy tartalékban van. Az RI mező ACAS gátolt megoldás képességgel (RI = 2) szöveget jelent, ha az érzékenységi mező 2 vagy TA az egyetlen kiválasztott üzemmód.

Megjegyzés. – A 0-7 kód az RI mezőn azt jelzi, hogy a válasz egy követési válasz, és a lekérdezett légijármű ACAS képességét is adja. A 8-15 kódok azt jelzik, hogy a válasz egy befogási válasz, és a lekérdezett légijármű maximális tényleges önsebesség képességét jelenti.

4.3.8.4.1.3 *RR (válasz kérés).* A kódolás jelentése a válasz igény mezőben a következő:

Kódolás:

0-18	Lásd 3. fejezet, 3.1.2.6.1.2 pont
19	Megoldási tanácsadás jelentést továbbítani
20-31	Lásd 3. fejezet, 3.1.2.6.1.2 pont

4.3.8.4.2 *ACAS mezők és almezők*

Megjegyzés. – A következő pontok azoknak a mezőknek és almezőknek az elhelyezkedését és kódolását írják le, amelyeket a 3. fejezet, 3.1.2 pontjában nem határoztak meg, de az ACAS-al felszerelt légijárművek használnak.

4.3.8.4.2.1 *Almező MA-ban*

4.3.8.4.2.1.1 *ADS (A-definíciós almező)* Ez a 8-mezős (33-40) almező az MA megmaradó részét írja le.

Megjegyzés. – A kényelmes kódolás kedvéért két, egyenként négy bitből álló csoportban van kifejezve: ADS1 és ADS2.

4.3.8.4.2.1.2 Amikor ADS1 = 0 és ADS2 = 5, MA a következő almezőt tartalmazza:

4.3.8.4.2.1.3 *SLC (ACAS érzékenységi szint szabályozás (SLC) utasítás).* Ez a bit 4-es (41-44) almező egy érzékenységi szint utasítást jelöl a saját ACAS részére.

Kódolás

0	Nincs utasítás kiadva
1	Nincs kijelölve
2	ACAS érzékenységi szintet 2-re állítani
3	ACAS érzékenységi szintet 3-ra állítani
4	ACAS érzékenységi szintet 4-re állítani
5	ACAS érzékenységi szintet 5-re állítani
6	ACAS érzékenységi szintet 6-ra állítani
7-14	Nincs kijelölve
15	Az ettől a földi állomástól jövő előző SLC utasítást törölni.

Megjegyzés. – Az MA szerkezete érzékenységi szint utasításnál:

33	37	41	45
ADS1=0	ADS2=5	SLC	44
36	40	44	88

4.3.8.4.2.2 *Almezők MB-ben*

4.3.8.4.2.2.1 *Almezők MB-ben RA jelentés részére.* Amikor BDS1=3 és BDS2=0, az alább jelzett almezőket az MB-nek tartalmaznia kell.

Megjegyzés. – Az érvényben lévő vagy a legfrissebb megoldási tanácsadásra vonatkozó információk közlésére vonatkozó követelményeket a 4.3.11.4.1 tartalmazza.

4.3.8.4.2.2.1.1 *ARA (aktív RA-k).* Ez a 14 bites (41-54) almező jelzi a megoldási tanácsadás jellemzőket, ha van megoldási tanácsadás, amelyet az almezőt továbbító válaszjeladóval kapcsolatos ACAS generál (4.3.6.2.1 a)) pont). Az aktív megoldási javaslatnál lévő bitek jelentését az MTE almező (4.3.8.4.2.2.1.4 pont) értéke határozza meg és függőleges megoldási javaslatnál az aktív megoldási tanácsadás 41-es bitjének értéke. Az aktív megoldási tanácsadás 41-es bitjének jelentése a következő:

Kódolás

0 Egynél több veszélyeztető légijármű van és a megoldási tanácsadás létrehozására törekszik veszélyeztető légijármű(vek) alatt és más veszélyeztető légijármű(vek) felett, vagy nem történt megoldási tanácsadás generálás (amikor MTE = 0)

1 Vagy csak egy veszélyeztető légijármű van, vagy a megoldási tanácsadás minden veszélyeztető légijárműnél ugyanolyan irányban törekszik elkülönítés biztosítására.

Amikor az aktív megoldási tanácsadás 41-es bitje = 1 és MTE = 0 vagy 1, a 42-47-es biteknek a következő jelentésük van:

Bit	*Kódolás*	
42	0	Megoldási tanácsadás preventív
	1	Megoldási tanácsadás helyesbítő
43	0	Felfelé értelmű elmozdulásra szóló megoldási tanácsadás került generálásra
	1	Lefelé értelmű elmozdulásra szóló megoldási tanácsadás került generálásra
44	0	Megoldási tanácsadás nem növelt sebesség
	1	Megoldási tanácsadás növelt sebesség
45	0	Megoldási tanácsadás nem az értelem megfordítása
	1	Megoldási tanácsadás az értelem megfordítása
46	0	Megoldási tanácsadás nem magasság keresztezés
	1	Megoldási tanácsadás magasság keresztezés
47	0	Megoldási tanácsadás függőleges sebességkorlátozás
	1	Megoldási tanácsadás pozitív
48-54		ACAS III. részére fenntartott

Amikor az aktív megoldási tanácsadás 41-es bitje = 0 és MTE = 1, a 42-47-es bitek jelentése a következő:

Bit	*Kódolás*	
42	0	Megoldási tanácsadás nem kíván helyesbítést a felfelé értelmű elmozdulásnál
	1	Megoldási tanácsadás helyesbítést kíván a lefelé értelmű elmozdulásnál
43	0	Megoldási tanácsadás nem kíván határozott emelkedést
	1	Megoldási tanácsadás határozott emelkedést kíván

44	0	Megoldási tanácsadás nem kíván helyesbítést a lefelé értelmű elmozdulásnál
	1	Megoldási tanácsadás helyesbítést kíván a lefelé értelmű elmozdulásnál
45	0	Megoldási tanácsadás nem kíván határozott süllyedést
	1	Megoldási tanácsadás határozott süllyedést kíván
46	0	Megoldási tanácsadás nem kíván keresztezést
	1	Megoldási tanácsadás keresztezést kíván
47	0	Megoldási tanácsadás nem az értelem megfordítása
	1	Megoldási tanácsadás az értelem megfordítása
48-54		ACAS III. részére fenntartott

Megjegyzés. – Ha az aktív megoldás tanácsadás 41-es bitje = 0 és MTE = 0, függőleges megoldási tanácsadás nem került generálásra.

4.3.8.4.2.2.1.2 *RAC (RAC-k rögzítése).* Ez a 4-bites (55-58) almező jelzi az összes éppen aktív megoldási tanácsadás kiegészítést, ha van, amelyeket másik ACAS légijárműtől kaptak. A megoldási tanácsadás kiegészítésben lévő biteknek a következő jelentésük van:

Bit	*Megoldási tanácsadás kiegészítés*
55	Ne haladj el alul
56	Ne haladj el felül
57	Ne fordulj balra
58	Ne fordulj jobbra

Egy bit az 1 állásban azt jelzi, hogy a kapcsolódó megoldási tanácsadás kiegészítés aktív. Egy bit 0 állásban azt jelzi, hogy a kapcsolódó megoldási tanácsadás kiegészítés inaktív.

4.3.8.4.2.2.1.3 *RAT (RA befejezését kijelző).* Ez az 1-bites (59) almező akkor jelez, ha az ACAS által előzőleg generált megoldási tanácsadás generálása megszűnik.

Kódolás

0 Az aktív megoldási tanácsadás almező által jelzett megoldási tanácsadás jelenleg aktív
1 Az aktív megoldási tanácsadás almező által jelzett megoldási tanácsadás megszűnt (4.3.11.4.1 pont).

1. Megjegyzés. – Azután, hogy az ACAS a megoldási javaslatot megszüntette, még 18 ± 1 másodpercig szükséges, hogy az S-módú válaszjeladó jelentse azt (4.3.11.4.1 pont). A megoldási tanácsadás befejezését kijelző használható például egy megoldási tanácsadás jelzés egy légiforgalmi irányító kijelzőjéről való időleges eltávolításának engedélyezésére vagy megoldási tanácsadás időtartam értékelésére egy adott légtéren belül.

2. Megjegyzés. – A megoldási tanácsadás számos okból megszűnhet; normálisan, ha a konfliktus megoldódott és a veszélyeztető légijármű távolodik; vagy amikor a veszélyeztető légijármű S-módú válaszjeladója valamilyen ok miatt szünetelteti a magasság jelentését a konfliktus alatt. A megoldási tanácsadás befejezését kijelző arra használatos, hogy kimutassa, hogy a megoldási tanácsadás ezen esetek egyikében megszűnt.

4.3.8.4.2.2.1.4 *MTE (többszörös veszélyeztető légijármű előfordulás).* Ez az 1-bites (60) almező jelzi, hogy két vagy több egyidejű veszélyeztető légijármű éppen feldolgozás alatt áll az ACAS veszélyeztető légijármű megoldási logikája által.

Kódolás

0 A megoldási logika éppen az egyik veszélyeztető légijárművet dolgozza fel (amikor az aktív megoldási tanácsadás 41-es bitje = 1); vagy a veszélyeztető légijármű nem áll megoldási logika által történő feldolgozás alatt.

1 Két vagy több egyidejű veszélyeztető légijármű megoldási logika által történő feldolgozás alatt áll.

4.3.8.4.2.2.1.5 *TTI (veszélyeztető légijármű típusát kijelző almező).* Ez a 2-bites almező (61-62) határozza meg a TID almező által tartalmazott azonosítási adatok típusát.

Kódolás

0	Nincs azonosítási adat a TID-ben
1	A TID egy S-módú válaszjeladó címzést tartalmaz
2	A TID magassági, távolsági és irány adatokat tartalmaz
3	Nincs kijelölve

4.3.8.4.2.2.1.6 *TID (veszélyeztető légijármű azonosítás adat almező).* Ez a 26-bites almező (63-88) tartalmazza a veszélyeztető légijármű S-módú címzését, vagy magasságát, távolságát és irányhelyzetét, ha a veszélyeztető légijármű nincs S-móddal felszerelve. Ha az ACAS megoldási logika két vagy több veszélyeztető légijárművet dolgoz fel egyidőben, a TID a legutoljára bejelentett veszélyeztető légijármű azonosítási vagy pozíciós adatait tartalmazza. Ha TTI = 1, a TID a 63-86 bitekben az S-módú címzést tartalmazza és a 87- és 88-as biteket 0-ra kell állítani. Ha TTI = 2, a TID a következő három almezőt tartalmazza:

4.3.8.4.2.2.1.6.1 *TIDA (veszélyeztető légijármű azonosítási adat magassági almező).* Ez a 13-bites almező (63-75) a veszélyeztető légijármű legutoljára jelentett C-módú magassági kódját tartalmazza.

Kódolás

Bit	63	64	65	66	67	68	69	70	71	72	73	74	75
C-mód	C_1	A_1	C_2	A_2	C_4	A_4	0	B_1	D_1	B_2	D_2	B_4	D_4

4.3.8.4.2.2.1.6.2 *TIDR (veszélyeztető légijármű azonosítási adat távolság almező).* Ez a 7-bites almező (76-82) a veszélyeztető légijármű ACAS által legutoljára becsült távolságát tartalmazza.

Kódolás (n)

n	*Becsült távolság (NM)*
0	Távolság becslés nem áll rendelkezésre
1	Kisebb, mint 0,05
2-126	$(n\text{-}1)/10 \pm 0{,}05$
127	Nagyobb, mint 12,55

4.3.8.4.2.2.1.6.3 *TIDB (veszélyeztető légijármű azonosítás adat irányhelyzet almező).* Ez a 6-bites almező (83-88) a veszélyeztető légijármű legutolsó becsült iránytartását az ACAS légijármű iránytengelyéhez viszonyítva tartalmazza.

Kódolás (n)

n	*Becsült iránytartás (fok)*
0	Irány becslés nem áll rendelkezésre
1-60	$6(n\text{-}1)$ és $6n$ között

61-63 Nem kijelölt

Megjegyzés. – Az MB szerkezete megoldási tanácsadás jelentéshez:

33	37	41	55	59	60	61	63
BDS1=3	BDS2=0	ARA	RAC	RAT	MTE	TTI = 1	TID
36	40	54	58	59	60	62	88

33	37	41	55	59	60	61	63	76	83
BDS1=3	BDS2=0	ARA	RAC	RAT	MTE	TTI = 2	TIDA	TIDR	TIDB
36	40	54	58	59	60	62	75	82	88

4.3.8.4.2.2.2 *Almezők az MB-ben az adatkapcsolat képesség jelentésére.* Amikor BDS1 = 1 és BDS2 = 0, a következő bit sémákat kell biztosítani a válaszjeladó részére, annak adatkapcsolati képességi jelentéséhez:

Bit	*Kódolás*
48	0 ACAS meghibásodott vagy tartalékon van
	1 ACAS működik
69	0 ACAS II
	1 ACAS III
70	0 ACAS csak TA-kat generál
	1 ACAS TA-kat és RA-kat generál
71	0 ACAS-al nincs ellátva
	1 ACAS-al ellátott
72	0 Hibrid felderítés nincs felszerelve
	1 Hibrid felderítés felszerelve

1. Megjegyzés. – Az adatkapcsolati képesség jelentés szerkezet MB altereinek összefoglalása a 3. fejezet 3.1.2.6.10.2.2 pontjában található.

2. Megjegyzés. – Az ACAS aktív lekérdezéseket limitáló hibrid felderítés használatát a 4.5.1 szakasz írja le. Csak a DF = 17 kiterjesztett squitter közlemények dekódolásának támogatására szóló képesség nem elegendő a 72-es bit beállításához.

4.3.8.4.2.3 *MU mező.* A hosszantartó levegő-levegő ellenőrzési lekérdezésnek (4-1 ábra) ezt az 56-bites (33-88) mezejét megoldás közlések, ACAS adások és megoldási tanácsadás közvetítések továbbítására használják.

4.3.8.4.2.3.1 *UDS (U-definíciós almező).* Ez a 8-bites (33-40) almező az MU maradék részét határozza meg.

Megjegyzés. – A kódolás kényelmesebbé tételének kedvéért az UDS-t két, egyenként négy bitből álló csoportban fejezik ki; UDS1 és UDS2.

4.3.8.4.2.3.2 *Almezők MU-ban megoldás közlés részére.* Amikor UDS1 = 3 és UDS2 = 0, az MU a következő almezőket tartalmazza:

4.3.8.4.2.3.2.1 *MTB (többszörös veszélyeztető légijármű bit).* Ez az 1-bites (42) almező többszörös veszélyeztető légijármű jelenlétét vagy hiányát jelöli.

Kódolás

0 Lekérdező ACAS-nak egy veszélyeztető légijárműve van

1 Lekérdező ACAS-nak egynél több veszélyeztető légijárműve van

4.3.8.4.2.3.2.2 *VRC (függőleges RAC).* Ez a 2-bites (45-46) a címzett légijárműre vonatkozó függőleges megoldási tanácsadás kiegészítését jelöli.

Kódolás

0 Nem küldtek függőleges megoldási tanácsadás kiegészítést

1 Ne haladjon el alul

2 Ne haladjon el felül

3 Nem kijelölt

4.3.8.4.2.3.2.3 *CVC (függőleges RAC törlés).* Ez a 2-bites (43-44) almező a címzett légijárműnek előzőleg küldött függőleges megoldási tanácsadás kiegészítés törlését jelöli. Ezt az almezőt 0-ra kell állítani új veszélyeztető légijárműnél.

Kódolás

0 Nincs törlés

1 Törölni az előzőleg küldött "Ne haladjon el alul" függőleges megoldási tanácsadás kiegészítést.

2 Törölni az előzőleg küldött "Ne haladjon el felül" függőleges megoldási tanácsadás kiegészítést.

3 Nem kijelölt

4.3.8.4.2.3.2.4 *HRC (vízszintes RAC).* Ez a 8-bites (50-52) almező a címzett légijárműre vonatkozó vízszintes megoldási tanácsadás kiegészítést jelöl.

Kódolás

0 Nincs vízszintes megoldási tanácsadás kiegészítés vagy nincs vízszintes megoldási tanácsadás

1 Másik ACAS-nak forduljon balra értelme van; ne forduljon balra

2 Másik ACAS-nak forduljon balra értelme van; ne forduljon jobbra

3 Nem kijelölt

4 Nem kijelölt

5 Másik ACAS-nak forduljon jobbra értelme van; ne forduljon balra;

6 Másik ACAS-nak forduljon jobbra értelme van; ne forduljon jobbra

7 Nem kijelölt

4.3.8.4.2.3.2.5 *CHC (vízszintes RAC törlés).* Ez a 3-bites (47-49) almező a címzett légijárműnek előzőleg küldött vízszintes megoldási tanácsadás kiegészítés törlését jelöli. Ezt az almezőt 0-ra kell állítani új veszélyeztető légijárműnél.

Kódolás

0 Nincs törlés vagy nincs vízszintes megoldási képesség

1 Előzőleg küldött "Ne forduljon balra" törlése

2 Előzőleg küldött "Ne forduljon jobbra" törlése

3-7 Nem kijelölt

4.3.8.4.2.3.2.6 *VSB (függőleges értelmű bit almező).* Ez a 4-bites (61-64) almezőt a CVC és VRC almezőkben lévő adatok védelmére használják. A 43-46 bitek 16 lehetséges kombinációhoz a következő VSB kódokat kell továbbítani:

	CVC		VRC		VSB			
Kódolás	43	44	45	46	61	62	63	64
0	0	0	0	0	0	0	0	0
1	0	0	0	1	1	1	1	0
2	0	0	1	0	0	1	0	1
3	0	0	1	1	1	0	0	1
4	0	1	0	0	1	0	1	1
5	0	1	0	1	0	1	0	1
6	0	1	1	0	1	1	0	0
7	0	1	1	1	0	0	1	0
8	1	0	0	0	1	1	0	1
9	1	0	0	1	0	0	1	1
10	1	0	1	0	1	0	1	0
11	1	0	1	1	0	1	0	0
12	1	1	0	0	0	1	1	0
13	1	1	0	1	1	0	0	0
14	1	1	1	0	0	0	0	1
15	1	1	1	1	1	1	1	

Megjegyzés. – A szabály, amelyet a VSB almező bit beállításra használnak, egy 3 Hamming kód távolság, megnövelve egy paritás bittel, amely az érzékelés képességét produkálja három hibáig a nyolc továbbított bitben.

4.3.8.4.2.3.2.7 *HSB (vízszintes értelmű bit almező).* Ezt az 5-bites (56-60) almezőt a CHC és HRC almezőkben lévő adatok védelmére használják. A 47-52 bitek 64 lehetséges kombinációihoz a következő HSB kódokat kell továbbítani.

	CHC			HRC			HSB				
Kódolás	47	48	49	50	51	52	56	57	58	59	60
0	0	0	0	0	0	0	0	0	0	0	0
1	0	0	0	0	0	1	0	1	0	1	1
2	0	0	0	0	1	0	1	0	0	1	1
3	0	0	0	0	1	1	1	1	0	0	0
4	0	0	0	1	0	0	1	1	1	0	0

63	1	1	1	1	1	1	0	0	1	0	1

Megjegyzés. – A szabály, amelyet a HSB almező bit beállításra használnak, egy 3 Hamming kód távolság, megnövelve egy paritás bittel, amely a detektálás képességét produkálja három hibáig nyolc továbbított bitben.

4.3.8.4.2.3.2.8 *MID (Légijármű címzés.).* Ez a 24-bites (65-88) almező a lekérdező ACAS légijármű 24-bites légijármű címzését tartalmazza.

Megjegyzés. – MU szerkezete megoldás közlésnél:

33	37	41	42	43	45	47	50	53	56	61	65
UDS1=3	UDS2=0	-1-	MTB	CVC	VRC	CHC	HRC	-3-	HSB	VSB	MID
36	40	41	42	44	46	49	52	55	60	64	88

4.3.8.4.2.3.3 *Almező MU-ban ACAS adásnál.* Amikor UDS1 = 3 és UDS2 = 2, az MU a következő almezőt tartalmazza:

4.3.8.4.2.3.3.1 *MID (Légijármű címzés).* Ez a 24-bites (65-88) almező a lekérdező ACAS légijármű 24-bites légijármű címzését tartalmazza.

Megjegyzés. – MU szerkezete ACAS adásnál:

33	37	41	65
UDS1=3	UDS2=2	24	MID
36	40	64	88

4.3.8.4.2.3.4 *Almezők MU-ban RA adásnál.* Amikor UDS1 = 3 és UDS2 = 1, az MU a következő almezőket tartalmazza:

4.3.8.4.2.3.4.1 *ARA (aktív RA-k).* Ezt a 14-bites (41-54) almezőt a 4.3.8.4.2.2.1.1 pontban meghatározott módon kell kódolni.

4.3.8.4.2.3.4.2 *RAC (RAC rekord).* Ezt a 4 bites (55-58) almezőt a 4.3.8.4.2.2.1.2 pontban meghatározottak szerint kell kódolni.

4.3.8.4.2.3.4.3 *RAT (RA befejezését kijelző).* Ezt az 1-bites (59) almezőt a 4.3.8.4.2.2.1.3 pontban meghatározott módon kell kódolni.

4.3.8.4.2.3.4.4 *MTE (többszörös veszélyeztető előfordulás).* Ezt az 1-bites (60) almezőt a 4.3.8.4.2.2.1.4 pontban meghatározott módon kell kódolni.

4.3.8.4.2.3.4.5 *AID (A-módú azonosítási kód).* Ez a 13-bites (63-75) almező a jelentő légijármű A-módú azonosítási kódját jelöli.

Kódolás

Bit	63	64	65	66	67	68	69	70	71	72	73	74	75
A-módú kód bit	C_1	A_1	C_2	A_2	C_4	A_4	0	B_1	D_1	B_2	D_2	B_4	D_4

4.3.8.4.2.3.4.6 *CAC (C-módú magasság kód).* Ez a 13-bites (76-88) almező a jelentő légijármű C-módú azonosítási kódját jelöli.

Kódolás

Bit	76	77	78	79	80	81	82	83	84	85	86	87	88
C-módú kód	C_1	A_1	C_2	A_2	C_4	A_4	0	B_1	D_1	B_2	D_2	B_4	D_4

Megjegyzés. – Az MU szerkezete megoldási tanácsadás közvetítésnél.

33	37	41	55	59	60	61	63	76
UDS1=3	DS2=1	ARA	RAC	RAT	MTE	-2-	AID	CAC
36	40	54	58	59	60	62	75	88

4.3.8.4.2.4 *MV mező.* A hosszú levegő-levegő ellenőrző válaszok (4-1 ábra) 56-bites (33-88) mezőjét levegő-levegő koordinációs válasz közlések továbbítására használják.

4.3.8.4.2.4.1 *VDS (V-definíciós almező).* Ez a 8-bites (33-40) almező az MV megmaradó részét határozza meg.

Megjegyzés. – A kódolás megkönnyítése érdekében a VDS-t két, egyenként négy bitből álló csoportban fejezik ki: VDS1 és VDS2.

4.3.8.4.2.4.2 *Almezők MV-ben koordinációs válaszhoz.* Amikor VDS1 = 3 és VDS2 = 0, az MV a következő altereket tartalmazza:

4.3.8.4.2.4.2.1 *ARA (aktív RA-k).* Ezt a 14-bites (41-54) almezőt a 4.3.8.4.2.2.1.1 pontban meghatározott módon kell kódolni.

4.3.8.4.2.4.2.2. *RAC (RAC-k rögzítése).* Ezt a 4-bites (55-58) almezőt a 4.3.8.4.2.2.1.2 pontban meghatározott módon kell kódolni.

4.3.8.4.2.4.2.3 *RAT (RA befejezését kijelző).* Ezt az 1-bites (59) almezőt a 4.3.8.4.2.2.1.3 pontban meghatározott módon kell kódolni.

4.3.8.4.2.4.2.4 *MTE (többszörös veszélyeztető előfordulás).* Ezt az 1-bites (60) almezőt a 4.3.8.4.2.2.1.4 pontban meghatározott módon kell kódolni.

Megjegyzés. – Az MV szerkezete koordinációs válasznál:

33	37	41	55	59	60	61
VDS1 = 3	VDS2 = 0	ARA	RAC	RAT	MTE	-28-
36	40	54	58	59	60	88

4.3.8.4.2.5 *SL (érzékenységi szint jelentés).* Ezt a 3-bites (9-11) fedélzetről leadott adattovábbítási almezőt mind rövid, mind hosszú levegő-levegő válasz formátumok (DF = 0 és 16) tartalmazzák. Ez a mező jelöli azt az érzékenységi szintet, amelynél az ACAS éppen működik.

Kódolás

0	ACAS nem működik
1	ACAS az 1-es érzékenységi szinten működik
2	ACAS a 2-es érzékenységi szinten működik
3	ACAS a 3-as érzékenységi szinten működik
4	ACAS a 4-es érzékenységi szinten működik
5	ACAS az 5-ös érzékenységi szinten működik
6	ACAS a 6-os érzékenységi szinten működik
7	ACAS a 7-es érzékenységi szinten működik

4.3.9 ACAS berendezés jellemzők

4.3.9.1 *Csatolóegységek.* Az ACAS részére minimálisan a következő bemenő adatokat kell biztosítani:

a) légijármű címzés kód;

b) S-módú levegő-levegő és föld-levegő adatátvitelek, amelyeket az S-módú válaszjeladó vesz ACAS általi felhasználásra (4.3.6.3.2 pont);

c) saját légijármű maximális, tényleges utazósebesség képessége (3. Fejezet, 3.1.2.8.2.2 pont);

d) nyomásmagasság; és

e) rádiómagasság

Megjegyzés. – Az ACAS II és ACAS III bemeneteire vonatkozó különleges követelmények alább, a megfelelő szakaszokban kerülnek felsorolásra.

4.3.9.2 *Légijármű antenna rendszer.* Az ACAS két antennán keresztül továbbít lekérdezéseket és veszi a válaszokat, egyik a légijármű tetejére, másik a légijármű aljára van szerelve. A tetőre szerelt antenna irányantenna és iránykeresésre lehet használni.

4.3.9.2.1 *Polarizáció.* Az ACAS adatátvitel polarizációja névlegesen függőleges.

4.3.9.2.2 *Sugárzási iránykarakterisztika*. A légijármű fedélzeti antenna sugárzási iránykarakterisztikájának elevációs szöge legyen névlegesen azonos egy vízszintes síkon elhelyezett, földfelszíni negyedhullámú függőleges sugárzó ekvivalenssel.

4.3.9.2.3 *Antenna kiválasztás*

4.3.9.2.3.1 *Squitter vétel.* Az ACAS-nak képesnek kell lenni squitterek vételére a törzs tetején és alján elhelyezett antennán keresztül.

4.3.9.2.3.2 *Lekérdezések.* ACAS lekérdezéseket nem lehet egyidőben mindkét antennán keresztül továbbítani.

4.3.9.3 *Nyomásmagasság forrás.* Az ACAS részére szolgáltatott saját légijárműre vonatkozó magasság adatokat abból a forrásból kell venni, amely a saját C-módú vagy S-módú jelentések alapjául szolgál a rendelkezésre álló legfinomabb kvantálásnál (mérhető felbontásnál).

4.3.9.3.1 **Ajánlás. –** *Olyan forrást kell használni, amely 7,62 m-nél (25 láb) finomabb felbontást szolgáltat.*

4.3.9.3.2 Ha 7,62 m-nél (25 láb) finomabb felbontást szolgáltató forrás nem áll rendelkezésre, és csak a saját légijármű részére rendelkezésre álló magassági adatok Gilham kódolásúak, legalább két független forrást kell használni és ezeket folyamatosan összehasonlítani, hogy a kódolási hibákat észrevegyék.

4.3.9.3.3 **Ajánlás. –** *Két magassági adatforrást kell használni és összehasonlítani, hogy a hibákat észleljék az ACAS részére történő szolgáltatás előtt.*

4.3.9.3.4 A 4.3.10.3 pont előírásait kell alkalmazni, amikor a két magassági adat összehasonlítása azt jelzi, hogy a források közül az egyik hibás.

4.3.10 Megfigyelés

4.3.10.1 *Megfigyelési tevékenység.* Az ACAS-nak folyamatosan figyelési feladatokat kell teljesítenie, hogy figyelmeztetést adjon ki, ha a következő feltételek közül legalább valamelyik teljesül:

a) nincsen lekérdezés teljesítmény korlátozás interferencia szabályozás miatt (4.3.2.2.2 pont) és a maximális sugárzott teljesítmény kisebbre csökken, mint ami a 4.3.2 pontban részletezett felderítési követelmények kielégítéséhez szükséges; vagy

b) a berendezésben észlelt bármely más meghibásodás, amely a forgalmi tanácsadás vagy megoldási tanácsadás szolgáltatási képességet csökkenti; vagy

c) külső források nem szolgáltatják az ACAS működéséhez elengedhetetlenül szükséges adatokat, vagy a szolgáltatott adatok nem hitelesek.

4.3.10.2 *Hatás az ACAS működésére.* Az ACAS felügyeleti tevékenysége nem befolyásolhatja károsan a többi ACAS funkciót.

4.3.10.3 *Megfigyelési reakció.* Amikor a megfigyelési tevékenység meghibásodást észlel (4.3.10.1 pont), az ACAS:

a) jelzi a repülőszemélyzetnek, hogy rendellenes körülmények állnak fenn;

b) megakadályozza a további ACAS lekérdezéseket; és

c) S-módú adattovábbítást hoz létre, amely a saját légijármű megoldási képességét tartalmazza jelezve, hogy az ACAS nem működik.

4.3.11 Az ACAS-al együtt használt S-módú válaszjeladóval szembeni követelmények

4.3.11.1 V*álaszjeladó képességek.* A 3. fejezet 3.1 pontjában meghatározott minimális válaszjeladó képességeken kívül az ACAS-al együtt használt S-módú válaszjeladónak a következő képességekkel kell rendelkeznie:

a) a következő formátumok kezelésének képessége:

Formátum szám	*Formátum név*
UF = 16	Hosszú levegő-levegő felderítési lekérdezés
DF = 16	Hosszú levegő-levegő felderítési válasz

b) képesség hosszú S-módú lekérdezések (UF = 16) vételére és hosszú S-módú válaszok (DF = 16) generálására 16,6 ms (60 per másodperc) folytonos sebességgel;

c) eszközök az ACAS berendezésekhez címzett összes vett lekérdezés adat tartalmának továbbítására;

d) antenna széttelepítés (ahogyan azt a 3. fejezet, 3.1.2.10.4 pontja meghatározza);

e) kölcsönös elnyomó képesség; és

f) inaktív állapotú válaszjeladó kimenő teljesítmény korlátozás.

Amikor az S-módú válaszjeladó adó inaktív állapotban van, az impulzus-csúcsteljesítmény 1090 MHz ± 3 MHz-nél az S-módú válaszjeladó antenna kimeneténél nem haladhatja meg a -70 dBm-et.

4.3.11.2 Adatátvitel az ACAS és S-módú válaszjeladója között

4.3.11.2.1 *Adat átvitel az ACAS-tól az S-módú válaszjeladójához*

a) Az S-módú válaszjeladó az ACAS-tól megoldási tanácsadás információkat kap, egy megoldási tanácsadás jelentésben (4.3.8.4.2.2.1 pont) és koordinációs válaszban 4.3.8.4.2.4.2 pont) való továbbítás céljából:

b) az S-módú válaszjeladó megkapja az ACAS-ától az aktuális érzékenységi szintet egy érzékenységi szint jelentésben való (4.3.8.4.2.5 pont) továbbítás céljából; és

c) az S-módú válaszjeladó képességi információkat kap az ACAS-ától adatkapcsolati képesség jelentésben (4.3.8.4.2.2.2 pont) való továbbítás céljából és DF = 0 és DF = 16 levegő-levegő fedélzetről leadott kapcsolati formátumok RI mezejében való (4.3.8.4.1.2 pont) továbbítás céljából; és

d) az S-módú válaszjeladó jelzést vesz az ACAS-ától, hogy a megoldási javaslatok képtelenek vagy gátoltak a 0 és 16 fedélzetről leadott kapcsolati formátumok RI mezőjében való továbbításra.

4.3.11.2.2 *Adatátvitel az S-módú válaszjeladótól a saját ACAS-hoz:*

a) az S-módú válaszjeladó átadja a saját ACAS részére a vett érzékenységi szint szabályozás utasításokat (4.3.8.4.2.1.1 pont), amelyeket az S-módú állomások továbbítanak;

b) az S-módú válaszjeladó átadja a saját ACAS részére más ACAS-ok által továbbított ACAS közvetítési közleményeket (4.3.8.4.2.3.3 pont);

c) az S-módú válaszjeladó átadja a saját ACAS részére más ACAS-ok által levegő-levegő koordinációs célokra továbbított megoldási közleményeket (4.3.8.4.2.3.2 pont); és

d) az S-módú válaszjeladó átadja a saját ACAS részére a saját légijármű A-módú azonosítás adatait egy megoldási tanácsadás rádióadásban való továbbítása céljából (4.3.8.4.2.3.4.5 pont).

4.3.11.3 Az ACAS információ közlése más ACAS részére

4.3.11.3.1 *Ellenőrzési válasz.* Az ACAS S-módú válaszjeladónak a rövid (DF = 0) vagy hosszú (DF = 16) ellenőrzési formátumot kell használnia az ACAS ellenőrzési lekérdezésekre adott válaszokhoz. Az ellenőrzési válasznak tartalmaznia kell a VS mezőt, ahogyan azt a 3. fejezet 3.1.2.8.2 pontjában meghatározták, az RI mezőt, ahogyan azt a 3.1.2.8.2 pontban és 4.3.8.4.1.2 pontban meghatározták, és az SL mezőt, ahogyan azt a 4.3.8.4.2.5 pontban meghatározták.

4.3.11.3.2 *Koordinációs válasz.* Az ACAS S-módú válaszjeladójának koordinációs választ kell továbbítania egy felszerelt veszélyeztető légijárműtől vett koordinációs lekérdezésre, alávetve a 4.3.11.3.2.1 pont feltételeinek. A koordinációs válaszhoz a DF = 16 hosszú levegő-levegő ellenőrzési válasz formulát kell használni a VS mezővel, ahogyan az a 3. fejezet 3.1.2.8.2 pontban elő lett írva, az RI mezőt, ahogyan az a 3. fejezet 3.1.2.8.2 és 4.3.8.4.1.2 pontjában meg lett határozva, az SL mezőt, ahogyan az a 4.3.8.4.2.5 pontban megtalálható; és az MV mezőt, ahogyan azt a 4.3.8.4.2.4 pont előírja. Koordinációs válaszokat még akkor is továbbítani kell, ha a válaszjeladó minimális válaszsebesség korlátait (3. fejezet, 3.1.2.10.3.7.2 pont) túllépik.

4.3.11.3.2.1 Az ACAS S-módú válaszjeladójának egy másik ACAS-tól kapott koordinációs lekérdezésre akkor és csak akkor kell koordinációs válasszal válaszolni, ha a válaszjeladó képes a lekérdezés ACAS adat tartalmát a válaszjeladóhoz tartozó ACAS-nak továbbítani.

4.3.11.4 Az ACAS információ közlése földi állomások részére

4.3.11.4.1 *RA jelentések S-módú földi állomásoknak.* A megoldási tanácsadás időszaka alatt és a megoldási tanácsadás végét követő 18 ±1 másodperc során az ACAS S-módú válaszjeladó a megfelelő DR mező kód beállítással jelzi, hogy megoldási tanácsadás jelentése van az S-módú érzékelőnek adott válaszokban, ahogyan azt a 4.3.8.4.1.1 pont ismerteti. A megoldási tanácsadás jelentés leírja a legújabb megoldási javaslatot, amely a megelőző 18 ±1 másodperces időszak alatt fennállt.

1. Megjegyzés. – A 4.3.11.4.1 alpont utolsó mondata azt jelenti, hogy egy megoldási tanácsadás befejezését követő 18 ±1 másodperces időszak részére, az 59-es bit (a megoldási tanácsadás befejezésének jelzése) kivételével a megoldási tanácsadás jelentésben lévő összes MB mező megőrzi a megoldási tanácsadás utolsó aktív időpontjáig jelentett közléseket.

2. Megjegyzés. - DR = 2, 3, 6 vagy 7 válasz vétele után egy S-módú földi állomás a megoldási tanácsadás jelentés fedélzetről leadott kapcsolását kérheti RR = 19 beállítással, és vagy DI = 7 vagy DI = 7 és RRS = 0 beállítással az ACAS légijármű egy felderítésében vagy Comm-A lekérdezésében. Amikor ezt a lekérdezést veszi, a válaszjeladó Comm-B válasszal válaszol, amelynek MB mezeje tartalmazza a megoldási tanácsadás jelentést.

4.3.11.4.2 *Adatkapcsolat képességi jelentés*. Egy ACAS meglétét jelenteni kell a földi állomás részére. A jelentés az ACAS saját S-módú válaszjeladójával történik egy S-módú adatkapcsolat képességi jelentésben.

Megjegyzés. – Ez a jelzés a válaszjeladót arra készteti, hogy az adatkapcsolat képességi jelentésben beállítsa a 4.3.8.4.2.2.2 alpontban meghatározottak szerinti kódokat.

4.3.12 Jelzések a hajózó személyzetnek

4.3.12.1 Helyesbítő és megelőző RA-k

Ajánlás. – *A hajózó személyzetnek szóló jelzések között megkülönböztetünk megelőző és helyesbítő megoldási javaslatot.*

4.3.12.2 Magasság keresztezési RA-k

Ajánlás. – *Ha az ACAS magasság keresztezési megoldási javaslatot generál, specifikus jelzést kell adni a hajózó személyzet részére, hogy keresztezés megy végbe.*

4.4 ACAS II összeütközés-elhárító logika működése

Megjegyzés. – Óvatossággal kell eljárni, amikor az A mellékletben közölt útmutató anyag 4. Részében az ACAS II rendszer hivatkozásaival kapcsolatban potenciális javításokat fontolgatunk, mivel a változások a rendszer teljesítmény több aspektusára is kihatással lehetnek. Lényeges, hogy alternatív elgondolás ne rontsa le a másik elgondolás működését és hogy az ilyen összeegyeztethetőség nagyfokú magabiztossággal legyen demonstrálva.

4.4.1 Az összeütközés-elhárító logika működésére vonatkozó meghatározások

Megjegyzés . – A [t_1, t_2] jelölést a t_1 és t_2 közötti időtartam jelölésére használják.

Altitude layer – Tengerszint feletti magasság réteg
Minden találkozást a következő tengerszint feletti magasság réteg egyike jellemez:

Réteg	1	2	3	4	5	6
-tól		2 300 ft	5 000 ft	10 000 ft	20 000 ft	41 000 ft
-ig	2 300 ft	5 000 ft	10 000 ft	20 000 ft	41 000 ft	

A találkozás tengerszint feletti magasság rétegét a két légijárműnek a legszorosabb megközelítésnél lévő átlagos tengerszint feletti magassága határozza meg.

Megjegyzés. – Az összeütközés elhárító logika működésének meghatározása céljából nincs szükség a magasságmérés vagy a talajszint és a magasság közötti összefüggés fizikai alapjának megadására.

Approach angle – Megközelítési szög
A két légijárműnek a legszorosabb megközelítésnél a földi irányszögek szerinti különbsége, 180 fokkal leírva a szembeni irányokat, és 0 fokkal leírva a párhuzamos irányokat.

Crossing encounter – Keresztező találkozás
Egy olyan találkozás, amelynél a két légijármű magasság elkülönítése a találkozási ablak kezdetén és végén meghaladja a 100 lábat, és a két légijármű egymáshoz viszonyított függőleges helyzete a találkozási ablak végén fordítottja a találkozási ablak elejéhez tartozó helyzetnek.

Encounter – Találkozás
Az összeütközés elkerülés logika működésének meghatározása céljából egy találkozás két utánzott légijármű repülési pályából áll. A légijármű vízszintes koordinátái a légijármű elfoglalt helyzeteit mutatják, míg a függőleges koordináta a tengerszint feletti magasság magasságmérővel mért értékét képviseli.

Encounter class – Találkozási osztály
A találkozásokat aszerint osztályozzák, hogy a légijármű átmenőben van-e a találkozási ablak kezdeténél és végénél és hogy a találkozás keresztező-e vagy nem.

Encounter window - Találkozási ablak
A [*tca* - 40s, *tca* + 10s] időköz

Horizontal miss distance (hmd) – Vízszintes elkerülési távolság
Egy találkozásnál megfigyelt minimális vízszintes elkülönítés.

Level aircraft – Szintbeli légijármű
Légijármű, amely nem átmenő.

Original trajectory – Eredeti repülési pálya
Egy ACAS-al felszerelt légijármű eredeti repülési pályája az, amelyet a légijármű követne ugyanannál a találkozásnál, ha nem lenne ACAS-al felszerelve.

Original rate – Eredeti függőleges sebesség
Egy ACAS-al felszerelt légijármű eredeti sebessége bármely időpontban a légijármű azon magasságváltozási sebessége, amely ugyanabban az időpontban akkor lépne fel, ha az eredeti repülési pályát követné.

Required rate – Megkívánt függőleges sebesség
A szabvány repülőgépvezető modellnél a megkívánt sebesség az, amely a megoldási javaslattal összhangban az eredeti sebességhez legközelebb esik.

Tca
Névlegesen a legszorosabb megközelítés időpontja. A szabványos találkozási modellben (4.4.2.6 pont) lévő találkozásoknál referencia időpont a találkozás létrehozásához, amelynél különböző paraméterek, közöttük a függőleges és vízszintes elkülönítés (vmd és hmd) meg vannak adva.

Megjegyzés. – A szabványos találkozási modellben (4.4.2.6 pont) lévő találkozásokat a két légijármű repülési pályáinak a tca*-nál kezdve, kifelé történő felépítésével konstruálják meg. Amikor a folyamat készen van, a* tca *lehetséges, hogy nem lesz pontosan a legszorosabb megközelítés időpontja, és néhány másodperces eltérés elfogadható.*

Transitioning aircraft – Átmenő légijármű
Egy olyan légijármű, amely 400 láb per perc (láb/p) nagyságot meghaladó, valamilyen alkalmas periódus alatt mért átlagos függőleges sebességgel rendelkezik.

Turn extent – Forduló mértéke
Oly módon meghatározott irányszög különbség, amely a légijármű forduló végén mért földi irányszögéből és mínusz a forduló elején mért földi irányszögéből áll.

Vertical miss distance (vmd) – Függőleges elkerülési távolság
Fogalmilag, a függőleges elkülönítés a legszorosabb megközelítésnél. A szabványos találkozási modellben lévő találkozásoknál (4.4.2.6 pont) a *tca* időpontban a függőleges elkülönítés létrehozásával.

4.4.2 Feltételek, amelyek között a követelmények érvényesek

4.4.2.1 A következő feltételeknek kell teljesülniük a 4.4.3 és 4.4.4 pontokban ismertetett működési követelményeknél:

a) távolság és irány mérések és magasság jelentés áll rendelkezésre a megközelítő légijármű egyes ciklusaira, amennyiben a 14 NM-en belül van, de akkor nem, ha a távolság meghaladja a 14 NM-t;

b) a távolság és irány mérések hibái összhangban vannak a szabványos távolság és irány hiba modellekkel (4.4.2.2 és 4.4.2.3 pontok);

c) a megközelítő légijármű magasság jelentései, amelyek annak C-módú válaszai, 100 lábas kvantumokban vannak kifejezve;

d) egy magasságmérés, amelyet nem kvantáltak és 1 láb vagy nagyobb pontossággal van kifejezve, a saját légijárműre rendelkezésre áll;

e) mindkét légijárműre vonatkozó magasságmérések hibái állandóak bármely adott előfordulás során;

f) mindkét légijárműre vonatkozó magasságmérések hibái összhangban vannak a szabványos magasságmérési hiba modellel (4.4.2.4 pont);

g) a megoldás tanácsadásokra adott repülőgépvezető válaszok összhangban vannak a szabványos repülőgépvezető modellel (4.4.2.5 pont);

h) a légijárművek olyan légtérben repülnek, amelyben szoros találkozások, köztük azok is, amelyeknél az ACAS egy megoldási javaslatot generál, összhangban vannak a szabványos találkozás modellel (4.4.2.6 pont);

i) ACAS-al felszerelt légijárművek képességeikben nem korlátozottak a megoldási javaslataik által megkövetelt manőverek végrehajtásában; és

j) ahogyan 4.4.2.7-ben ismertetve van:

   1) az egyes találkozásokban résztvevő megközelítő légijármű nem felszerelt (4.4.2.7 a) pont); vagy

   2) a megközelítő légijármű ACAS-al felszerelt, de olyan repülési pályát követ, amely azonos a nem felszerelt találkozásban levőével (4.4.2.7 b) pont); vagy

   3) a megközelítő légijármű ACAS-al van felszerelve, amely a saját ACAS-al azonos összeütközés elhárító logikával rendelkezik (4.4.2.7 c) pont).

Megjegyzés. – A "magasságmérés" fogalom egy magasságmérővel a kvantálást megelőzően végzett mérésekre vonatkozik.

4.4.2.1.1 Az összeütközés elhárító logika működése nem romlik le hirtelen a magasság hibák statisztikai eloszlásának, vagy a szabványos találkozási modellt jellemző különböző paraméterek statisztikai eloszlásának változásával, vagy ha a repülőgépvezetőnek a tanácsadásokra adott válasza változik, amikor a felderítési jelentések nem állnak rendelkezésre minden ciklusban, vagy amikor a megközelítő légijárműre vonatkozó magasságmérések kvantálása változik, vagy a saját légijárműre vonatkozó magasságméréseket kvantálják.

4.4.2.2 Szabványos távolság hiba modell

4.4.2.2.1 Az utánzott távolságmérések hibáit normál eloszlásból veszik, 0 láb középérték és 50 láb szabványos eltérés mellett.

4.4.2.3 Szabványos irányszög hiba modell

4.4.2.3.1 Az utánzott irányszög mérések hibáit normál eloszlásból 0,0 fokos középpel és 10,0 fok szabványos eltéréssel veszik.

4.4.2.4 Szabványos magassági hiba modell

4.4.2.4.1 Az utánzott magasság mérések hibáiról feltételezzük, hogy Laplace eloszlásúak zérus középérték mellett, amelynek valószínűségi sűrűségfüggvénye

$$p(e) = \frac{1}{2\lambda}\exp\left(-\frac{|e|}{\lambda}\right)$$

4.4.2.4.2 A λ paraméter, amely a magasságmérő hiba statisztikai eloszlásának definíciójához szükséges, a λ_1 és λ_2 értéke közül mindegyik légijárműre az egyiket veszi fel, amely a találkozási réteg magasságától függ a következők szerint:

Réteg	*1*		*2*		*3*		*4*		*5*		*6*	
	m	*láb*	*m*	*láb*	*m*	*láb*	*m*	*láb*	*m*	*láb*	*m*	*láb*
λ_1	10	35	11	38	13	43	17	58	22	72	28	94
λ_2	18	60	18	60	21	69	26	87	30	101	30	101

4.4.2.4.3 ACAS-al felszerelt légijárműnél a λ értéke λ_1 lesz.

4.4.2.4.4 ACAS-al nem felszerelt légijárműnél λ értékét véletlenszerűen választják ki a következő valószínűségek felhasználásával:

Réteg	*1*	*2*	*3*	*4*	*5*	*6*
Valószín.(λ_1)	0,391	0,320	0,345	0.610	0.610	0.610
Valószín.(λ_2)	0,609	0,680	0,655	0,390	0,390	0.390

4.4.2.5 Szabványos repülőgépvezető modell

4.4.2.5.1 A szabványos repülőgépvezető modell, amit az összeütközés elhárító logika működésének értékelésére használnak, a következő lesz:

a) bármely megoldási tanácsadás teljesül az előírt függőleges sebességre való gyorsítás mellett (ha szükséges) egy alkalmas késleltetés után;

b) amikor a légijármű fennálló függőleges sebessége ugyanaz, mint az eredeti és az eredeti függőleges sebesség eleget tesz a megoldási javaslatnak, a légijármű eredeti függőleges sebességét folytatja, amely nem feltétlenül állandó a gyorsulás lehetősége miatt az eredeti repülési pályán;

c) amikor a légijármű eleget tesz a megoldási javaslatnak, a meglévő függőleges sebessége ugyanaz, mint az eredeti függőleges sebesség és az eredeti függőleges sebesség változik, és következésképpen ellentmondásba kerül a megoldási javaslattal, a légijármű továbbra is a megoldási javaslatnak tesz eleget;

d) amikor egy kezdeti megoldási tanácsadás a magasságváltozási sebesség módosítását kívánja, a légijármű egy 0,25 g-s gyorsulással reagál egy 5 másodperces késleltetés után a megoldási tanácsadás kijelzésétől számítva;

e) amikor a megoldási tanácsadás módosul és az eredeti függőleges sebesség eleget tesz a módosított megoldási javaslatnak, a légijármű visszatér eredeti függőleges sebességéhez (ha szükséges) a g) pontban ismertetett gyorsulással a h) pontban meghatározott késleltetés után;

f) amikor a megoldási tanácsadás módosul és az eredeti függőleges sebesség nem tesz eleget a módosított javaslatnak, a légijármű a megoldási tanácsadás g) pontban meghatározott gyorsulással való teljesítésével reagál a h) pontban ismertetett késleltetés után;

g) a megoldási tanácsadás módosulásakor alkalmazott gyorsítás értéke 0,25 g, hacsak a módosított megoldási tanácsadás nem egy fordított értelmű megoldási tanácsadás vagy egy megnövelt függőleges sebességű megoldási tanácsadás, amely esetben a gyorsulás 0,35 g;

h) egy megoldási tanácsadás módosulásánál alkalmazott késleltetés 2,5 s, hacsak ez azt nem eredményezi, hogy a gyorsulás korábban kezdődik, mint 5 másodperc a kezdeti megoldási javaslattól számítva, amely esetben a gyorsulás a kezdeti megoldástól számítva 5 másodpercre kezdődik; és

i) ha a megoldási javaslatot törlik, a légijármű visszatér az eredeti függőleges sebességéhez (ha szükséges) 0,25 g gyorsulással 2,5 másodperces késleltetés után.

4.4.2.6 Szabványos találkozási modell

4.4.2.6.1 *A szabványos találkozási modell elemei*

4.4.2.6.1.1 Hogy számítani tudják az ACAS hatását az összeütközés kockázatára (4.4.3 alpont) és az ACAS-nak a légiforgalmi áramlásszervezéssel (ATM) (4.4.4 paragrafus) való összeegyeztethetősége érdekében a találkozások együtteseit hozzák létre az alábbiak mindegyikére:

a) a két légijármű címzés elrendezése;

b) a hat magasság réteg;

c) tizenkilenc találkozás osztály; és

d) kilenc vagy tíz *vmd* befoglaló a 4.4.2.6.4 pontban ismertetettek szerint.

Az eredményeket ezeknél az együtteseknél kombinálni kell a 4.4.2.6.2 pontban megadott viszonylagos súlyozások felhasználásával.

4.4.2.6.1.1.1 A találkozás együttesek mindegyike legalább 500 független véletlenszerűen generált előfordulást tartalmaz.

4.4.2.6.1.2 A két légijármű repülési pályáját mindegyik találkozásnál a következő, véletlenszerűen kiválasztott jellemzőkkel szerkesztik meg:

a) a függőleges síkban:

1) *vmd* a megfelelő *vmd* befoglaló belsejéből;

2) függőleges sebesség mindegyik légijárműnél a találkozás ablak kezdeténél, $\dot{z}_1$, és a találkozás ablak végénél, $\dot{z}_2$;

3) függőleges gyorsulás; és

4) a függőleges gyorsulás kezdeti időpontja; és

b) a vízszintes síkban pedig:

1) *hmd;*

2) megközelítési szög;

3) az egyes légijárművek sebessége a legszorosabb megközelítésnél;

4) döntés, hogy az egyes légijárművek fordulóban vannak-e vagy nem;

5) a forduló terjedelme; a bedőlési szög; és a forduló végének időpontja;

6) döntés mindegyik légijárműről, hogy változtatja-e a sebességet vagy nem;

7) a sebességváltozás nagysága

Megjegyzés. – Egy találkozás különböző jellemzőire végzett kiválasztásoknál lehetséges, hogy ellentmondások lesznek. Amikor ez előfordul, a problémát vagy egy adott jellemző kiválasztásának, vagy a teljes találkozás félretételével lehet megoldani, ahogyan a legalkalmasabb.

4.4.2.6.1.3 A *hmd* statisztikai eloszlására két modellt használnak (4.4.2.6.4.1 pont). Az ACAS-nak az összeütközés kockázatára gyakorolt hatásának számításánál (4.4.3 paragrafus) a *hmd* kevesebb, mint 500 lábra korlátozódik. Az ACAS ATM-el való összegyeztethetőségének számításánál (4.4.4 alpont), a *hmd*-t az értékek nagyobb tartományából választják ki (4.4.2.6.4.1.2 pont).

Megjegyzés. – A 4.4.2.6.2 és 4.4.2.6.3 pontok függőleges jellemzőket határoznak meg a légijármű repülési pályákra vonatkoztatva a szabványos előfordulási modellben, amelyek függnek attól, hogy a hmd *kicsinyre szűkül össze (“kockázati arány számításához”), vagy nagyobb értékeket képes felvenni (“ATM kompatibilitásnál”). Más esetben az előfordulások jellemzői a függőleges és vízszintes síkban függetlenek.*

4.4.2.6.2 *Találkozási osztályok és súlyok*

4.4.2.6.2.1 *Légijármű címzés.* Mindegyik légijármű egyenlő valószínűséggel kapja a magasabb légijármű címet.

4.4.2.6.2.2 *Magasság rétegek.* A magasságrétegek viszonylagos súlyai a következők:

Réteg	*1*	*2*	*3*	*4*	*5*	*6*
Valószín.(réteg)	0.13	0,25	0,32	0,22	0,07	0,01

4.4.2.6.2.3 *Találkozás osztályok*

4.4.2.6.2.3.1 A találkozásokat aszerint osztályozzák, hogy a légijárművek vízszintes repülést végzők (L) vagy átmenők (T) a találkozási ablak kezdeténél (*tca* előtt) és a végénél (*tca* után), függetlenül attól, hogy a találkozás keresztező-e vagy nem.

Osztály	*1.sz. légijármű*		*2.sz. légijármű*		*Keresztezés*
	tca *előtt*	tca *után*	tca *előtt*	tca *után*	
1	L	L	T	T	Igen
2	L	L	L	T	Igen
3	L	L	T	L	Igen
4	T	T	T	T	Igen
5	L	T	T	T	Igen
6	T	T	T	L	Igen
7	L	T	L	T	Igen
8	L	T	T	L	Igen
9	T	L	T	L	Igen
10	L	L	L	L	Nem
11	L	L	T	T	Nem
12	L	L	L	T	Nem
13	L	L	T	L	Nem
14	T	T	T	T	Nem
15	L	T	T	T	Nem
16	T	T	T	L	Nem
17	L	T	L	T	Nem
18	L	T	T	L	Nem
19	T	L	T	L	Nem

4.4.2.6.2.3.2 A találkozási osztályok viszonylagos súlyai a következőképpen függnek a rétegtől:

Osztály	*a kockázati arány számításnál*		*ATM kompatibilitásnál*	
	1-3 rétegek	*4-6 rétegek*	*1-3 rétegek*	*4-6 rétegek*
1	0,00502	0,00319	0,06789	0,07802
2	0,00030	0,00018	0,00408	0,00440
3	0,00049	0,00009	0,00664	0,00220
4	0,00355	0,00270	0,04798	0,06593
5	0,00059	0,00022	0,00791	0,00549
6	0,00074	0,00018	0,00995	0,00440
7	0,00002	0,00003	0,00026	0,00082
8	0,00006	0,00003	0,00077	0,00082
9	0,00006	0,00003	0,00077	0,00082
10	0,36846	0,10693	0,31801	0,09011
11	0,26939	0,41990	0,23252	0,35386
12	0,06476	0,02217	0,05590	0,01868
13	0,07127	0,22038	0,06151	0,18571
14	0,13219	0,08476	0,11409	0,07143
15	0,02750	0,02869	0,02374	0,02418
16	0,03578	0,06781	0,03088	0,05714
17	0,00296	0,00098	0,00255	0,00082
18	0,00503	0,00502	0,00434	0,00440
19	0,01183	0,03651	0,01021	0,03077

4.4.2.6.2.4 vmd *befoglalók*

4.4.2.6.2.4.1 Mindegyik előfordulás *vmd*-jét a nem-keresztező találkozási osztályok tíz *vmd* befoglalójának egyikéből és a keresztező találkozási osztályok kilenc vagy tíz *vmd* befoglalójának egyikéből veszik. Mindegyik *vmd* befoglalójának 100 láb kiterjedése van a kockázat számításnál vagy 200 láb kiterjedése az ATM-el való kompatibilitás számításnál. A maximális *vmd* 1000 láb a kockázati arány számításnál és 2000 láb egyébként.

4.4.2.6.2.4.2 Nem-keresztező találkozási osztályoknál a *vmd* befoglaló viszonylagos súlyai a következők lesznek:

vmd *befoglaló*	*Kockázati arány számításához*	*ATM egyezőséghez*
1	0 ,013	0,128
2	0,026	0,135
3	0,035	0,209
4	0,065	0,171
5	0,100	0,160
6	0,161	0,092
7	0,113	0,043
8	0,091	0,025
9	0,104	0,014
10	0,091	0,009

Megjegyzés. – A vmd *befoglaló súlyainak összege nem adja ki az 1,0-t. A specifikus súlyok a légiforgalmi irányítási földi radar adatokban felfogott találkozások analízisén alapulnak. A hiányzó* *részek azt a tényt tükrözik, hogy az észlelt találkozások néhány olyan* vmd-*t tartalmaznak, amelyek meghaladják a modellben lévő maximális* vmd-*ket.*

4.4.2.6.2.4.3 A keresztező osztályoknál a *vmd* befoglalók viszonylagos súlyai a következők lesznek:

vmd *befoglaló*	*kockázati arány számításához*	*ATM egyezőséghez*
1	0.0	0.064
2	0.026	0.144
3	0.036	0,224
4	0,066	0,183
5	0,102	0,171
6	0,164	0,098
7	0,115	0,046
8	0,093	0,027
9	0,106	0,015
10	0,093	0,010

Megjegyzés. – A keresztező osztályoknál a vmd-*nek meg kell haladnia 100 lábat, hogy a találkozás keresztező találkozásnak minősüljön. Így a kockázati arány számításánál nincs 1-es* vmd *befoglaló, és az ATM-el való kompatibilitás számításainál az 1-es* vmd [*100 láb, 200 láb*] *értékre korlátozódik.*

4.4.2.6.3 *Légijármű repülési pályák jellemzői függőleges síkban*

4.4.2.6.3.1 *vmd.* A *vmd*-t minden találkozásnál véletlenszerűen kell kiválasztani az eloszlásból, amely egyenletes a megfelelő *vmd* befoglaló által lefedett sávban.

4.4.2.6.3.2 *Függőleges sebesség*

4.4.2.6.3.2.1 Mindegyik légijárműnél az egyes találkozásokban vagy a függőleges sebesség állandó ($\dot{z}$), vagy a repülési pályát úgy kell megszerkeszteni, hogy a függőleges sebesség *tca* - 35s-nél $\dot{z}_1$ legyen és a függőleges sebesség *tca* + 5-s-nél $\dot{z}_2$ legyen. Az egyes $\dot{z}$, $\dot{z}_1$ vagy $\dot{z}_2$ függőleges sebességeket úgy kell meghatározni, hogy először véletlenszerűen kiválasztanak egy tartományt, amelyen belül az fekszik, azután kiválasztják a pontos értéket egy eloszlásból, amely egyenletes a kiválasztott tartományon keresztül.

4.4.2.6.3.2.2 A sávok, amelyeken belül a függőleges sebességek fekszenek, függnek attól, hogy a légijármű vízszintesen repül, azaz a 4.4.2.6.2.3.1 pontban "L"-el van jelölve, vagy átmenő állapotban , azaz a 4.4.2.6.2.3.1 pontban "T"-vel van jelölve, és a következők lesznek:

L	*T*
[240 láb/perc, 400 láb/perc]	[3200 láb/perc, 6000 láb/perc]
[80 láb/perc, 240 láb/perc]	[400 láb/perc, 3200 láb/perc]
[-80 láb/perc, 80 láb/perc]	[-400 láb/perc, 400 láb/perc]
[-240 láb/perc, 80 láb/perc]	[-3200 láb/perc, 400 láb/perc]
[-400 láb/perc, 240 láb/perc]	[-6000 láb/perc, 3200 láb/perc]

4.4.2.6.3.2.3 Azoknál a légijárműveknél, amelyek a teljes találkozási ablak felett vízszintesen repülnek, a $\dot{z}$ függőleges sebesség állandó. A sávok valószínűségei, amelyeken belül a $\dot{z}$ fekszik, a következők lesznek:

$\dot{z}$ (láb/perc)	*prob ($\dot{z}$)*
[240 láb/perc, 400 láb/perc]	0,0382
[80 láb/perc, 240 láb/perc]	0,0989
[-80 láb/perc, 80 láb/perc]	0,7040
[-240 láb/perc, 80 láb/perc]	0,1198
[-400 láb/perc, 240 láb/perc]	0,0391

4.4.2.6.3.2.4 Azoknál a légijárműveknél, amelyek a teljes találkozási ablak felett nem vízszintes repülést végeznek, az időközöket a $\dot{z}_1$*-re és* $\dot{z}_2$-re közösen kell véletlenszerű kiválasztással meghatározni, közös valószínűségeket használva, amelyek a magassági rétegtől és attól függnek, hogy a légijármű átmenő-e a találkozási ablak kezdeténél (sebesség-vízszintes), a találkozás ablak végénél (vízszintes-sebesség), vagy mind az elején, mind a végén (sebesség-sebesség). A közös valószínűségek a függőleges sebesség sávokra a következők lesznek.

Sebesség-vízszintes repülési pályával rendelkező légijárművekre az 1-3 rétegekben,

$\dot{z}_2$ tartomány	*$\dot{z}_1$ és $\dot{z}_2$ tartomány közös valószínűsége*				
[240 láb/perc, 400 láb/perc]	0,0019	0,0169	0,0131	0,1554	0,0000
[80 láb/perc, 240 láb/perc]	0,0000	0.0187	0,0019	0,1086	0,0000
[-80 láb/perc, 80 láb(perc]	0,0037	0,1684	0,0094	0,1124	0,0075
[-240 láb/perc, -80 láb/perc]	0,0037	0,1461	0,0094	0,0243	0,0037
[-400 láb/perc, -240 láb/perc]	0,0000	0,1742	0,0094	0,0094	0,0019

-6000 láb/perc -3200 láb/perc -400 láb/perc 400 láb/perc 3200 láb/perc 6000 láb/perc $\dot{z}_1$

Sebesség-vízszintes repülési pályával rendelkező légijárművekre a 4-6 rétegekben,

$\dot{z}_2$ tartomány	*$\dot{z}_1$ és $\dot{z}_2$ tartományok közös valószínűsége*				
[240 láb/perc, 400 láb/perc]	0,0105	0,0035	0,0000	0,1010	0,0105

4.4.2.6.3.2.5 Sebesség-sebesség nyomvonal esetén, ha $|\dot{z}_2 - \dot{z}_1| < 566$ láb/perc, akkor a nyomvonalat állandó értékű, $\dot{z}_1$-el egyenlő sebességgel kell létrehozni.

4.4.2.6.3.3 *Függőleges gyorsulás*

4.4.2.6.3.3.1 A 4.4.2.6.3.2.5 pontnak megfelelő esetben, amikor a légijárművek nem vízszintesen repülnek az egész találkozási ablak felett, a függőleges sebesség állandó és $\dot{z}_1$-al egyenlő legalább a [*tca* - 40 s, *tca* - 35 s] tartomány felett a találkozási ablak kezdeténél, és állandó és egyenlő $\dot{z}_2$-al legalább a [*tca* + 5s, *tca* + 10 s] a találkozási ablak végénél. A függőleges gyorsulás állandó a közbenső időszakban.

4.4.2.6.3.3.2 A függőleges gyorsulást ($\ddot{z}$) a következőképpen kell modellezni:

$$\ddot{z} = (A\dot{z}_2 - \dot{z}_1) + \varepsilon$$

ahol az A paraméter esetfüggő az alábbiak szerint:

	$A(s^{-1})$	
Eset	*1-3 rétegek*	*4-6 rétegek*
Sebesség-egyenletes	0,071	0,059
Egyenletes-sebesség	0,089	0,075
Sebesség-sebesség	0,083	0,072

és az ε hibát véletlenszerűen választják ki, a következő valószínűségi sűrűséget használva

$$p(\varepsilon) = \frac{1}{2\mu}\exp\left(-\frac{|\varepsilon|}{\mu}\right)$$

ahol $\mu = 0{,}3$ láb s^{-2}

Megjegyzés. - A $\ddot{z}$ *gyorsulás előjelét a* $\dot{z}_1$ *és* $\dot{z}_2$ *határozza meg. Egy* ε, *hibát, amely ezt az előjelet megváltoztatja, el kell vetni, és a hibát újra kell választani.*

4.4.2.6.3.4 *Gyorsulás kezdetének időpontja*. Gyorsulás kezdetének időpontja egyenletesen oszlik el a [*tca* - 35 s, *tca -5 s*] sávban, és olyannak kell lennie, hogy a $\dot{z}_2$ elérése *tca* + 5 s-nál ne későbben következzék be.

4.4.2.6.4 *A légijármű repülési pályáinak jellemzői vízszintes síkban*

4.4.2.6.4.1 *Vízszintes elkerülési távolság*

4.4.2.6.4.1.1 Az ACAS-nak az összeütközés kockázatára gyakorolt hatásának számításánál (4.4.3 alpont), a *hmd* egyenletes eloszlású a [0,500 láb] sávban.

4.4.2.6.4.1.2 Az ACAS ATM-el való összeegyeztethetőségére vonatkozó számításoknál (4.4.4 alpont), *hmd* eloszlása olyan legyen, hogy a *hmd* értékei a következő kumulatív valószínűségekkel rendelkezzenek:

hmd (láb)	*kumulatív valószínűség*	
	1-3 rétegek	*4-6 rétegek*
0	0,000	0,000
1215	0,152	0,125
2430	0,306	0,195
3646	0,482	0,260

21874		0,939
23089		0,946
24304		0,952
25520		0,965
26735		0,983
27950		0,993
29165		0,996
30381		0,999
31596		1,000

4.4.2.6.4.2 *Megközelítési szög.* A kumulatív eloszlás a vízszintes megközelítési szögnél a következők szerinti lesz:

Megközelítési szög (fok)	*Kumulatív valószínűség*	
	1-3 rétegek	*4-6 rétegek*
0	0,00	0,00
10	0,14	0,05
20	0,17	0,06
30	0,18	0,08
40	0,19	0,08
50	0,21	0,10
60	0,23	0,13
70	0,25	0,14
80	0,28	0,19
90	0,32	0,22
100	0,38	0,28
110	0,43	0,31

120	0,49	0,35
130	0,55	0,43
140	0,62	0,50
150	0,71	0,59
160	0,79	0,66
170	0,88	0,79
180	1,00	1,00

4.4.2.6.4.3 *Légijármű sebesség.* A kumulatív eloszlás az egyes légijármű vízszintes földhöz viszonyított sebességekre a legszorosabb megközelítésnél a következők szerinti lesz:

Földfeletti sebesség (csomó)	*Halmozott valószínűség*	
	1-3 rétegek	*4-6 rétegek*
45	0,000	
50	0,005	
75	0,024	0,000
100	0,139	0,005
125	0,314	0,034
150	0,486	0,064
175	0,616	0,116
200	0,700	0,071
225	0,758	0,211
250	0,821	0,294
275	0,895	0,361
300	0,949	0,427
325	0,977	0,528
350	0,988	0,602
375	0,997	0,692
400	0,998	0,813
425	0,999	0,883
450	1,000	0,940
475		0,972
500		0,987
525		0,993
550		0,998
575		0,999
600		1,000

4.4.2.6.4.4 *Vízszintes manőver valószínűségek.* Az egyes légijárművekre az egyes találkozásoknál egy forduló valószínűsége az adott fordulóhoz tartozó sebességváltozás valószínűsége és a forduló nélküli adott sebességváltozás valószínűsége a következő lesz:

Réteg	*Prob (forduló)*	*Prob (sebességváltozás) fordulóval*	*Prob (sebességváltozás) forduló nélkül*
1	0,31	0,20	0,50
2	0,29	0,20	0,25
3	0,22	0,10	0,15

4, 5, 6	0,16	0,05	0,10

4.4.2.6.4.4.1 Egy adott sebességváltozásnál a sebesség növekedésének valószínűsége 0,5, a sebesség csökkenésének valószínűsége 0,5.

4.4.2.6.4.5 *Forduló terjedelem.* Bármely forduló terjedelmének kumulatív eloszlása a következő:

Forduló terjedelem(fok)	*Kumulatív valószínűség*	
	1-3 rétegek	*4-6 rétegek*
15	0,00	0,00
30	0,43	0,58
60	0,75	0,90
90	0,88	0,97
120	0,95	0,99
150	0,98	1,00
180	0,99	
210	1,00	

4.4.2.6.4.5.1 A forduló iránya véletlenszerű, 0,5-ös balforduló valószínűséggel és 0,5-ös jobbforduló valószínűséggel.

4.4.2.6.4.6 *Bedőlési szög.* A légijármű forduló alatti bedőlési szöge nem lehet 15 foknál kisebb. Annak valószínűsége, hogy 15 fokkal lesz egyenlő, 0,79 az 1-3 rétegekben, és 0,54 és 4-5 rétegekben. Az összesített eloszlás nagyobb bedőlési szögeknél a következő:

Bedőlési szög (fok)	*Összesített valószínűség*	
	1-3 rétegek	*4-6 rétegek*
15	0,79	0,54
25	0,96	0,82
35	0,99	0,98
50	1,00	1,00

4.4.2.6.4.7 *Forduló befejezési időpont.* Az egyes légijármű fordulók befejezési időpontjának összesített eloszlása a következő:

Forduló befejezése időpont (másodperc tca előtt)	*Összesített valószínűség*	
	1-3 rétegek	*4-6 rétegek*
0	0,42	0,28
5	0,64	0,65
10	0,77	0,76
15	0,86	0,85
20	0,92	0,94
25	0,98	0,99
30	1,00	1,00

4.4.2.6.4.8 *Sebesség változás.* Állandó gyorsulás vagy lassulás véletlenszerűen kerül kiválasztásra minden légijárműnél, amely sebességváltoztatást hajt végre egy adott találkozásnál, és a találkozás időtartama alatt ez kerül alkalmazásra. A gyorsulások 2 csomó/s és 6 csomó/s között egyenletes eloszlásúak. A lassulások 1 csomó/s és 3 csomó/s között egyenletes eloszlást mutatnak.

4.4.2.7 Megközelítő légijármű ACAS-al való felszerelése

A 4.4.3 és 4.4.4 pontokban ismertetett teljesítmény követelmények három különböző szituációra érvényesek, amelyekben a megközelítő légijármű ACAS-ára és repülési pályájára vonatkozó alábbi feltételek érvényesek:

a) ahol az egyes találkozásokban résztvevő megközelítő légijármű nincs felszerelve (4.4.2.1 j) 1) pont); és olyan repülési pályát követ, amely azonos azzal, amit akkor követ, amikor a saját légijármű nincs felszerelve;

b) ahol a megközelítő légijármű ACAS-al rendelkezik, de olyan repülési pályát követ, amely azonos a nem felszerelt találkozásban levőével (4.4.2.1 j) 2) pont);

   1) az azonos repülési pályát követi függetlenül attól, hogy van megoldási tanácsadás, vagy nincs;

   2) a megközelítő légijármű ACAS-a megoldási javaslatot generál és megoldási tanácsadás kiegészítést továbbít, amelyet azonnal vesznek azután, hogy valamilyen megoldási javaslatot először közöltek a saját légijármű vezetőjével;

   3) a megközelítő ACAS-a által generált és a saját légijárműnek továbbított megoldási tanácsadás kiegészítés értelme ellentétes a saját légijármű által kiválasztott és a megközelítő légijárműnek továbbított első megoldási tanácsadás kiegészítés értelmével (4.3.6.1.3 pont);

   4) a megközelítő légijármű által továbbított megoldási javaslatot a saját légijármű veszi; és

   5) a követelmények érvényesek akkor is, amikor a saját légijárműnek van az alacsonyabb légijármű címzése, és akkor is, amikor a megközelítő légijárműnek van az alacsonyabb légijármű címzése; és

c) ahol a megközelítő légijármű olyan ACAS-al van felszerelve, amely a saját ACAS összeütközés elhárító logikájával azonos összeütközés elhárító logikával rendelkezik (4.4.2.1.j) 3) pont)

   1) a saját légijármű ACAS és repülőgépvezető működésére vonatkozó feltételek egyenlően érvényesek a megközelítő légijárműre, ACAS-ra és légijárművezetőre;

   2) az egyik légijármű által továbbított megoldási tanácsadás kiegészítéseket a másik veszi; és

   3) a követelmények egyaránt érvényesek akkor is, ha a saját légijárműnek van alacsonyabb légijármű címzése, és akkor is, ha a megközelítő légijárműnek van alacsonyabb légijármű címzése.

4.4.2.8 Összeegyeztethetőség a különböző összeütközés elhárító logikák tervezése között

Ajánlás. – *Alternatív összeütközés elhárító logikai tervezéseket illetően a vizsgáztató hatóságoknak a következőket kell megvizsgálniuk:*

a) *az alternatív tervezés működési formái elfogadhatóak-e azoknál a találkozásoknál, amelyekben olyan ACAS egységek vesznek részt, amelyek meglévő tervezéseket használnak; és*

b) *a meglévő tervezések működését nem rontja-e le az alternatív tervezés használata.*

Megjegyzés. – A különböző összeütközés elhárító logikák tervezése közötti összhangot illetően, a 4.4.2.7 b) pontban leírt feltételek a legszigorúbbak, ami ebben a vonatkozásban elképzelhető.

4.4.3 Az összeütközés kockázatának csökkentése

A 4.4.2 pontok feltételei között az összeütközés elhárító logika olyan, hogy az összeütközések várható száma az ACAS hiányában várt szám következő arányaira redukálódik:

a) amikor a megközelítő légijármű nincs ACAS-al felszerelve 0,18;
b) amikor a megközelítő légijármű felszerelt, de nem válaszol 0,32; és
c) amikor a megközelítő légijármű felszerelt és válaszol 0,04.

4.4.4 Összeegyeztethetőség a légiforgalmi áramlásszervezéssel (ATM)

4.4.4.1 Zavarásos riasztási arány

4.4.4.1.1 A 4.4.2 alpont feltételei között az összeütközés elhárító logika olyan, hogy azoknak a megoldási javaslatoknak a száma, amelyek "zavarások" (4.4.4.1.2 pont) nem haladhatja meg:

a 6 %-ot, amikor a saját légijármű függőleges sebessége a megoldási tanácsadás első ízben történő kiadásának időpontjában kisebb, mint 400 láb/perc; vagy

8 %-ot, amikor a saját légijármű függőleges sebessége a megoldási tanácsadás első ízben történő kiadásának időpontjában meghaladja a 400 láb/percet.

Megjegyzés. – Ezt a követelményt a megközelítő légijármű ACAS felszerelése nem elégíti ki (4.4.2.7 pont), mivel ennek elhanyagolható hatása van a találkozásra és a zavarásos megoldási javaslatok gyakoriságára.

4.4.4.1.2 Egy megoldási javaslatot "zavarás"-nak kell tekinteni a 4.4.4.1.1 pont szerinti célból, hacsak ACAS hiányában a találkozás valamely pontjában a vízszintes elkülönítés és a függőleges elkülönítés nem lesz kisebb a következő értékeknél:

	Vízszintes elkülönítés	*Függőleges elkülönítés*
FL 100 felett	2,0 NM	750 láb
FL 100 alatt	1,2 NM	750 láb

4.4.4.2 Összeegyeztethető értelem választás

A 4.4.2 alpont feltételei között az összeütközés elhárító logikának olyannak kell lenni, hogy azoknak a találkozásoknak az aránya, amelyekben a megoldási javaslatot követően ez a legszorosabb megközelítésnél ellenkező előjelű magassági elkülönítést eredményez, mint ami az ACAS hiányában következik be, nem haladhatja meg a következő értékeket:

a) amikor a megközelítő légijármű nincs ACAS-al felszerelve 0.08;
b) amikor a megközelítő légijármű fel van szerelve, de nem válaszol 0.08; és
c) amikor a megközelítő légijármű fel van szerelve, és válaszol , 0.12.

4.4.4.3 Az ACAS által okozott eltérések

4.4.4.3.1 A 4.4.2 alpont feltételei között az összeütközés elhárító logikának olyannak kell lenni, hogy a jelzett értékeknél nagyobb "eltéréseket" eredményező megoldási javaslatok száma ne haladja meg a megoldási javaslatok teljes számához viszonyított következő arányokat:

	Amikor a saját légijármű függőleges sebessége a RA első kiadásának időpontjában	
	kisebb, mint 400 láb/perc	*nagyobb mint 400 láb/perc*
amikor a megközelítő légijármű nincs ACAS-al felszerelve, *eltérés 300 láb esetén, vagy afölött* *eltérés 600 láb esetén, vagy afölött* *eltérés 1000 láb esetén, vagy afölött*	*0,15* *0,04* *0,01*	*0,23* *0,13* *0,07*
amikor a megközelítő légijármű fel van szerelve, de nem válaszol, *eltérés 300 láb esetén, vagy afölött* *eltérés 600 láb esetén, vagy afölött* *eltérés 1000 láb esetén, vagy afölött*	0,23 0,06 0,02	0,35 0,16 0,07
amikor a megközelítő légijármű fel van szerelve és válaszol, *eltérés 300 láb esetén, vagy afölött* *eltérés 600 láb esetén, vagy afölött* *eltérés 1000 láb esetén, vagy afölött*	0,11 0,02 0,01	0,23 0,12 0,06

4.4.4.3.2 A 4.4.4.3.1 alpont céljainak megfelelően, a felszerelt légijármű "eltérések"-et az eredeti repülési pályától abban az időtartományban kell mérni, amely attól az időponttól, amelynél a megoldási tanácsadás első ízben kiadásra kerül, addig az időpontig terjed, amelynél a megoldási tanácsadás törlését követően, a felszerelt légijármű visszaállítja eredeti magasság változtatási sebességét. Az eltérést úgy kell számítani, mint ebben az időtartományban felvett legnagyobb magasság különbséget a felszerelt légijármű által eredetileg követett repülési pálya és a megoldási tanácsadás hatására létrejött repülési pálya között.

4.4.5 Konfliktusban álló célpontok viszonylagos értéke

Ajánlás. – *Az összeütközés elhárító logikának olyannak kell lenni, hogy amennyire megvalósítható, csökkentse az összeütközés kockázatát (a 4.4.3 pontban meghatározottak szerint mérve) és amennyire* *megvalósítható, korlátoznia kell a széttagolást az ATM-nél (a 4.4.4 pontban meghatározottak szerint mérve.)*

4.5 Kiterjesztett squitter jelentések ACAS használata

4.5.1 ACAS hibrid felderítés kiterjesztett squitter helyzetadatok felhasználásával

Megjegyzés. – Hibrid felderítés az az eljárás, amelyet az ACAS használ a kiterjesztett squitteren keresztül rendelkezésre álló passzív helyzetinformáció lehetőségének kihasználására. A hibrid felderítés felhasználásával az ACAS érvényesíti a kiterjesztett squitter által a közvetlen aktív távolságmérésen keresztül szolgáltatott helyzetet. A kezdeti érvényesítést a nyomvonal kezdeténél végzik. Újraérvényesítést 10 másodpercenként egyszer végeznek, ha a megközelítő légijármű egy majdnem veszélyeztető légijárművé válik magasság vagy távolság szerint. Végezetül rendszeres aktív felderítést végeznek másodpercenként egyszer azoknál a megközelítő légijárműveknél, amelyek mind magasság, mind távolság szerint majdnem veszélyeztető légijárművé válnak. Ilyen módon passzív felderítést (egyszer érvényesített) alkalmaznak nem veszélyeztető megközelítő légijárműveknél, így lassítva az ACAS lekérdezési gyakoriságot. Aktív felderítést akkor használnak, amikor egy megközelítő légijármű majdnem veszélyeztető légijárművé válik, hogy megőrizzék az ACAS függetlenségét független biztonsági figyelőként.

4.5.1.1 Meghatározások

Active surveillance – Aktív felderítés
Egy megközelítő légijármű nyomonkövetésének folyamata a saját légijármű lekérdezéseire adott válaszokból nyert információk felhasználásával.

Active track – Aktív nyomvonal
Aktív lekérdezéssel nyert mérések által kialakított nyomvonal.

Hybrid surveillance – Hibrid felderítés
Aktív felderítés használatának folyamata más légijárművek érvényesítésére és figyelésére, amely légijárműveket alapvetően passzív felderítés felhasználásával követik, hogy megőrizzék az ACAS függetlenségét.

Initial aquisition – Kezdeti adatgyűjtés
Új nyomvonal kialakítás elkezdésének folyamata S-módú légijárműtől származó squitter vétele után, amely légijárműre vonatkozóan nincs aktív lekérdezés alapján kialakított nyomvonal.

Initial validation – Kezdeti érvényesítés
Új nyomvonal viszonylagos helyzetének megerősítési folyamata passzív információk felhasználásával az aktív lekérdezéssel nyert viszonylagos helyzettel való összehasonlítása útján.

Passive surveillance – Passzív felderítés
Egy másik légijármű követése annak lekérdezése nélkül, a másik légijármű kiterjesztett squittereinek felhasználásával. Az ACAS a passzív nyomvonalakban tartalmazott információkat az aktív ellenőrzés szükségletének figyelésére, de semmilyen más célra nem használja.

Passive track – Passzív nyomvonal
A kezdeti adatgyűjtés után, aktív lekérdezés nélkül, kiterjesztett squitterekben tartalmazott információ felhasználásával fenntartott nyomvonal.

4.5.1.2 Kiterjesztett squitter helyzet jelentések vételére felszerelt ACAS, nem-veszélyeztető légijármű passzív felderítésénél ezen passzív információkat a következő módon hasznosítja:

4.5.1.3 Passzív felderítés

4.5.1.3.1 *Kezdeti megerősítés.* Egy kiterjesztett squitter információkat jelentő légijármű kezdeti adatgyűjtésénél az ACAS meghatározza a viszonylagos távolságot és tengely irányszöget, ahogyan a saját légijármű helyzetéből és a megközelítő légijárműnek a kiterjesztett squitterben jelentett helyzetéből kiszámították. Ezt a leszármaztatott távolságot és tengely irányszöget és a squitterben jelentett magasságot kell összehasonlítani a légijármű aktív ACAS lekérdezéséből megállapított távolsággal, tengelyirányszöggel és magassággal. A leszármaztatott és mért távolság és tengelyirányszög, és a squitter és squitter és válasz magasság közötti különbségeket ki kell számítani és felhasználni a vizsgálatoknál, melyet annak megállapítására végeznek, hogy a kiterjesztett squitter adatok érvényesek-e. Ha ezek a vizsgálatok kielégítőek, a passzív helyzetet érvényesítettnek kell tekinteni, és a nyomvonalat passzív adaton kell fenntartani. Ha a fenti vizsgálatok bármelyike hibás eredményű, a nyomvonalat aktív nyomvonalnak kell tekinteni, és az ettől a nyomvonaltól vett egymás utáni passzív ellenőrzési adatokat nem használják tovább.

4.5.1.3.2 **Ajánlás**. – *A kiterjesztett squitter közleményben jelentett helyzet megerősítésére a következő vizsgálatokat kell alkalmazni:*

|*ferde távolság különbség*| $\leq$ 200 m;

|*irányszög különbség* | $\leq$ 45 fok; és
|*magasság különbség*| $\leq$ 100 láb.

4.5.1.3.3 *Kiegészítő aktív lekérdezések.* Annak biztosítása érdekében, hogy egy megközelítő légijármű nyomvonalát legalább olyan gyakran felfrissítsék, amilyen kiterjesztett squitter adatok hiányában megkövetelt (4.3.7.1.2.2 pont), egyes időpontokban egy adatot felfrissítenek squitter információk felhasználásával, az időpontot, amelynél egy következő aktív lekérdezésnek kell sorra kerülni, ki kell számítani. Aktív lekérdezést kell végezni ebben az időpontban, ha előtte még nem vették az esedékes lekérdezést.

4.5.1.4 Újraérvényesítés és figyelés. Ha a következő feltétel teljesül egy nyomvonalnál, amelyet passzív ellenőrzési adatok felhasználásával felfrissítettek:

a) $|a| \leq$ 10000 láb és vagy;

b) $|a| \leq$ 3000 láb vagy |a - 3000 láb| / | $\dot{a}$ | $\leq$ 60 s; vagy

c) r $\leq$ 3 NM vagy (r - 3 NM) / | $\dot{r}$ | $\leq$ 60 s

ahol:

a = a megközelítő légijármű magassági elkülönítése, láb
$\dot{a}$ = becsült magasságváltoztatási sebesség, láb/s
r = a megközelítő légijármű ferde távolsága, NM
$\dot{r}$ = becsült távolságváltozási sebesség, NM/s

aktív lekérdezést kell végezni minden 10 másodpercben, hogy folyamatosan újraérvényesítsék és figyeljék a kiterjesztett squitter adatokat, ameddig a fenti feltétel teljesül. A 4.5.1.3.1 pontban megkövetelt vizsgálatokat mindegyik aktív felderítésnél végre kell hajtani. Ha e vizsgálatok közül valamelyik hibás eredményt mutat, a nyomvonalat aktív nyomvonalnak deklarálják.

4.5.1.5 *Teljes aktív felderítés.* Ha a következő feltétel teljesül egy passzív felderítési adatokon keresztül felfrissített nyomvonalra:

a) $|a| \leq 10000$ láb és mindkettő

b) $|a| \leq 3000$ láb vagy $|a$ - 3000 láb$| / |\dot{a}| \leq 60$ s; vagy

c) $r \leq 3$ NM vagy (r - 3 NM) / $|\dot{r}| \leq 60$ s

ahol:

a	=	*a megközelítő légijármű magassági elkülönítése, láb*
$\dot{a}$	=	*becsült magasságváltoztatási sebesség, láb/s*
r	=	*a megközelítő légijármű ferde távolsága, NM*
$\dot{r}$	=	*becsült távolságváltozási sebesség, NM/s*

akkor a légijárműnek jelöljenek ki egy aktív nyomvonalat és frissítsék fel aktív távolság mérésekkel másodpercenként egyszer, amíg a fenti feltétel nem teljesül.

4.5.2 ACAS művelet tökéletesített MTL vevővel

Megjegyzés. – A kiterjesztett squitter alkalmazások, amelyek az ACAS-tól függetlenek, (a kényelem kedvéért) az ACAS használatával valósíthatók meg. Tökéletesített vevő minimális beindítási szint (MTL) használata lehetővé teszi kiterjesztett squitterek vételét maximálisan 60 NM-ről és azon túlról ilyen alkalmazások fenntartásánál.

4.5.2.1 ACAS, amely egy -74 dBm-nél nagyobb érzékenységű vevővel működik, megvalósítja a következő alpontokban ismertetett képességeket.

4.5.2.2 *Kettőzött minimális beindítási szintek.* Az ACAS vevő képes beállítani egy kijelzést minden squitter vételhez, mintha a választ egy hagyományos MTL-el (-74 dBm) működő ACAS észlelte volna. A hagyományos MTL-nél vett squitter vételeket továbbítani kell az ACAS felderítési tevékenységének további feldolgozásra. Azok a squitter vételek, amelyek ezt a feltételt nem elégítik ki, nem továbbíthatók az ACAS felderítési tevékenységének.

1. Megjegyzés. – Helyzet jelentés információkat tartalmazó kiterjesztett squittereket terjeszteni fogják kijelzésre egy kiterjesztett squitter alkalmazással kapcsolatosan.

2. Megjegyzés. – A hagyományos MTL használata az ACAS felderítési tevékenységénél megőrzi az ACAS folyó felderítési műveletvégzését, amikor tökéletesített MTL-es vevővel működik.

4.5.2.3 *Kettőzött vagy újra beindításra képes válasz processzor.* Az ACAS S-módú válasz feldolgozási tevékenysége a következő használati módokat foglalja magában:

a) különálló válaszprocesszorok használata S-módú válasz formátumokhoz, amelyeket a hagyományos MTL-nél vagy afölött vesznek és külön válasz processzor az S-módú válasz formátumokhoz, amelyeket a hagyományos MTL alatt vesznek; vagy

b) S-módú válasz processzor használata, amely újraindítja, ha S-módú bevezetőt észlel, amely 2-3 dB-el erősebb, mint az a válasz, amelynek feldolgozása éppen folyamatban van.

Megjegyzés. – Figyelmet kell fordítani annak biztosítására, hogy az alacsonyszintű squitterek (azaz a hagyományos MTL alattiak) ne interferáljanak az ACAS adatgyűjtő squitterek feldolgozásával. Ez akkor következhet be, ha az alacsonyszintű squitternek lehetősége van a válasz processzor befogására. Ez megelőzhető, ha minden egyes tevékenységhez külön válasz processzort használnak, vagy annak megkövetelésével, hogy a válasz processzor egy magasabb szintű squitter által beindítható legyen.

5. FEJEZET AZ S-MÓDÚ KITERJESZTETT SQUITTER

1. Megjegyzés – Az ADS-B és/vagy TIS-B rendszereket támogató S-módú kiterjesztett squitter funkcionális modellt az 5-1. ábra tartalmazza..

2. Megjegyzés – A fedélzeti rendszerek ADS-B közleményeket (ADS-B OUT) sugároznak és még ADS-B és TIS-B közleményeket (ADS-B és TIS-B) vehetnek. A földi telepítésű rendszerek (azaz földi adókészülékek) TIS-B közleményeket (opcionális) sugároznak és ADS-B közleményeket, vesznek.

3. Megjegyzés – Habár az 5-1. ábra szerinti funkcionális modell nyíltan nem mutatja, a repülőtéri mozgójárművekre vagy domborzati tereptárgy akadályokra telepített S-módú kiterjesztett squitter rendszerek sugározhatnak ADS-B közleményeket (ADS-B OUT) is.

5.1 Az S-módú kiterjesztett squitter adók rendszerjellemzői

Megjegyzés – Számos, a 2. fejezetben található a S-módú kiterjesztett squitter adáshoz kapcsolódó, és a 3. fejezetben található a S-módú válaszjeladók és nem válaszjeladó típusú eszközökhöz kapcsolódó követelményt a "Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)" kiadvány tartalmazza. A következő alfejezetekben megjelenített műszaki előírások, a specifikus osztályba sorolt, ADS-B és TIS-B alkalmazásokat támogató fedélzeti és földi rendszerekkel szemben támasztott követelményekre összpontosítanak.

5.1.1 ADS-B Out követelmények

5.1.1.1 Az ADS-B szolgáltatást támogató légijármű fedélzeti, mozgó földi és fix tereptárgy akadályokra telepített rendszerek legyenek képesek az ADS-B típusú közlemények szerkesztésére és az ADS-B típusú üzenetváltásra, ahogy az 5-1. ábra mutatja.

5.1.1.1.1 A légijármű fedélzetéről kezdeményezett ADS-B adatsugárzás tartalmazza a légijármű pozícióját, azonosítóját és típusát, a repülés közbeni sebesség vektorát és a közlemény generálását, kiváltó eseményt beleértve a vészhelyzeti és prioritási információkat is.

Megjegyzés – A kiterjesztett squitter típusú adatátviteli formátumokat és protokollokat a "Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)" kiadvány határozza meg.

5.1.1.2 Az ADS-B, kiterjesztett squitter adatsugárzással szemben támasztott követelmények. Az S-módú kiterjesztett squitter adatsugárzó berendezéseket az alább felsorolt, általános berendezés osztály meghatározásoknak, és az 5-1 és 5-2 táblázatok szerinti specifikus berendezés osztály meghatározásoknak megfelelően a hatótávolság egységek, és a sugárzott paraméterkészlet képességek szerint kell osztályozni.

a) Az „A" osztályú, fedélzeti, kiterjesztett squitter rendszerek támogatják, a kiterjesztett squitter adatsugárzást (úgy, mint ADS-B OUT) és a komplementer kiterjesztett squitter vételt (úgy, mint ADS-B IN) magába foglaló, fedélzeti ADS-B alkalmazást támogató, interaktív képességet.

b) A „B" osztályú, légijármű fedélzeti, földi mozgó járműre vagy fix tereptárgyra telepített kiterjesztett squitter rendszerek csak rádióadásra képesek (úgy, mint ADS-B OUT) kiterjesztett squitter rádióvétel képesség nélkül; és

c) A „C" osztályú kiterjesztett squitter rendszerek csak rádióvételre képesek és így rádióadás képességet velük szemben, nem támasztanak.

5.1.1.3 *Az „A" osztályú, kiterjesztett squitter rendszerekkel szemben támasztott követelmények*. Az „A" osztályú fedélzeti, kiterjesztett squitter rendszerek feleljenek meg az 5.1.1.1 és 5.2.12. alfejezetekben meghatározott, azonos osztályba sorolt (úgy, mint A0, A1, A2 vagy A3) adó és vevő alrendszerek jellemzőinek.

Megjegyzés – Az azonos specifikus osztályba sorolt (pl. A2 osztály) „A" osztályú, kiterjesztett squitter rendszereket úgy tervezték, hogy funkcionálisan és teljesítőképesség szempontjából egymás komplementerei legyenek. Az ugyanabba az osztályba sorolt kiterjesztett squitter adó és vevő rendszerek által támogatott minimum levegő-levegő hatótávolságok:

a) A0 – A0 névleges levegő-levegő hatótávolság 10 NM;

b) A1 – A1 névleges levegő-levegő hatótávolság 20 NM;

c) A2 – A2 névleges levegő-levegő hatótávolság 40 NM; és

d) A3 – A3 névleges levegő-levegő hatótávolság 90 NM;

A felsorolt hatótávolság adatok tervezési paraméterek a tényleges „A" osztályú, kiterjesztett squitter rendszer levegő-levegő hatótávolság egyes esetekben lehet nagyobb (pl. 1090 MHz interferenciával kevésbé terhelt légtérben) és lehet kisebb (pl. 1090 MHz interferenciával erősen terhelt légtérben).

5.1.2 TIS-B OUT követelmények

5.1.2.1 A TIS-B szolgáltatást támogató földi rendszerek legyenek képesek a TIS-B típusú közlemények szerkesztésére és az ADS-B típusú üzenetváltásra.

5.1.2.2 A TIS-B kiterjesztett squitter közleményeket, egy megfelelő légtérellenőrzési adatállományhoz hozzáférő, földi kiterjesztett squitter adóállomás sugározza.

1. Megjegyzés – A TIS-B típusú kiterjesztett squitter közleményt a "Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)" kiadvány írja le.

2. Megjegyzés – A TIS-B szolgáltatást támogató földi rádióállomás kiterjesztett squitter adatátvitelre képes. A földi rádióállomás műszaki jellemzőit, nevezetesen az adóteljesítményt, antennaerősítést, adatátviteli sebességet és az adatátvitel hatásos lesugárzott teljesítményét olyan TIS-B szolgáltatásra tervezték, amely azt feltételezi, hogy a fedélzeti felhasználó legalább „A" osztályú vevőkészülékkel rendelkezik.

5.1.2.3 **Ajánlás** – *A maximális adatátviteli sebességet és a hatásos lesugárzott teljesítményt szabályozni kell, azért hogy az interferencia az 1090 MHz-es rendszerekkel (úgy, mint SSR és ACAS) ne haladja meg, a még elfogadható szintet.*

5.2 Az S-módú kiterjesztett squitter vevő rendszerek műszaki jellemzői (ADS-B IN, TIS-B IN)

1. Megjegyzés – Az alábbi alpontok az ADS-B és/vagy TIS-B közleményeket hordozó S-módú kiterjesztett squitter adatsugárzás vételére használatos 1090 MHz-es vevőkészülékekkel szemben támasztott követelményeket ismertetik. A fedélzeti vevőkészülékek az ADS-B és TIS-B vételt, míg a földi vevőkészülékek csak az ADS-B vételt támogatják.

2. Megjegyzés – Az S-módú kiterjesztett squitter vevőkészülékekre vonatkozó részletes műszaki előírást az RTCA DO-260A, "Minimum Operational Performance Standards for 1 090 MHz Extended Squitter Automatic Dependent Surveillance – Broadcast (ADS-B) and Traffic Information Services – Broadcast (TIS-B)" kiadvány ismerteti.

5.2.1 Az S-módú kiterjesztett squitter vételi rendszerek funkcionális követelményei

5.2.1.1 Az S-módú kiterjesztett squitter vételi rendszerek legyenek képesek az üzenetváltási (vétel) és a jelentés szerkesztés feladatokra.

Megjegyzés – A kiterjesztett squitter vételi rendszerek veszik az ADS-B S-módú kiterjesztett squitter közleményeket és ADS-B jelentéseket továbbítanak a kliens alkalmazásoknak. A fedélzeti vevőrendszerek ezen túl, veszik a TIS-B kiterjesztett squitter közleményeket és jelentéseket továbbítanak a kliens alkalmazásoknak. Ez, az 5-1. ábrán látható funkcionális modell ábrázolja a fedélzeti és földi 1090 MHz-es, ADS-B vevőrendszereket egyaránt.

5.2.1.2 *Az S-módú kiterjesztett squitter vevő osztályok.* Az S-módú kiterjesztett squitter vevőrendszerekkel szemben támasztott funkcionális és képesség követelmények annak függvényében változnak, hogy milyen ADS-B vagy TIS-B alkalmazást támogatnak, és milyen célra használják a rendszert. A fedélzeti S-módú kiterjesztett squitter vevőkészülékek feleljenek meg az 5-3 táblázatban felsorolt vevőrendszer osztályozás meghatározásoknak.

Megjegyzés – Különböző S-módú kiterjesztett squitter készülék kiépítés lehetséges. Egy meghatározott készülék osztályhoz tartozó vevőkészülék karakterisztikának támogatnia kell a megkövetelt működési képességi szintet. Az A0-A3 készülék osztályok kielégítik az S-módú kiterjesztett squitter adatsugárzásra (ADS-B OUT) és vételre (ADS-B IN) alkalmas, S-módú kiterjesztett fedélzeti kiépítéseket. A B0-B3 készülék osztályok kielégítik a csak S-módú kiterjesztett squitter adatsugárzásra (ADS-B OUT) alkalmas, S-módú kiterjesztett fedélzeti kiépítéseket és megfelelnek a fedélzeti, mozgó földi és fix tereptárgyra telepített készülék osztályba sorolásnak. A C0-C3 készülék osztályok kielégítik az S-módú kiterjesztett squitter földi telepítésű vevőrendszerekkel szemben támasztott követelményeket. Az S-módú kiterjesztett squitter készülékosztályozáshoz, útmutatást a "Manual of the Secondary Surveillance Radar (SSR) Systems (Doc 9684)" *kiadvány tartalmazza*.

5.2.2 Üzenetváltás feladat

5.2.2.1 Az üzenetváltási feladat tartalmazza az 1090 MHz vevőantennát és a szokványos rádiókészülék (vevő/demodulátor/dekódoló/adat puffer) részfeladatokat.

5.2.2.2 *Az üzenetváltási feladat műszaki jellemzői*. A fedélzeti S-módú kiterjesztett squitter vevőrendszer támogassa az 5-3 táblázatban felsorolt összes kiterjesztett squitter közlemény vételét és dekódolását. A földi ADS-B kiterjesztett squitter vevőrendszer, minimálisan támogassa az összes kiterjesztett squitter típusú közlemény vételét és dekódolását, amelynek továbbítása a földi ATM (Automatic Traffic Management – Automatikus Forgalom Szervezés) kliens alkalmazásokat támogató ADS-B jelentések szerkesztéséhez szükséges.

5.2.2.3 *Követelmény a közlemény vételi jellemzőkhöz*. A fedélzeti S-módú kiterjesztett squitter vevő/demodulátor/dekóder vételi megoldásai, és minimum triggerelési küszöb (MTL) értékei feleljenek meg az 5-3 táblázatban a fedélzeti vevőkészülék osztályokra felsorolt követelményeknek. A földi telepítésű kiterjesztett squitter vevőkészüléket úgy kell megválasztani, hogy a vételi megoldásai és minimum triggerelési küszöbe (MTL) biztosítsa az ATN kliens alkalmazásokhoz szükséges vételi jellemzőket (úgy, mint hatótávolság és frissítés).

5.2.2.4 *Emeltszintű vételi megoldások.* Az A1, A2 és A3 osztályú fedélzeti vevő rendszerek, Mode A/C interferencia vagy/és intenzív S-módú átfedés esetén rendelkezzenek az alább felsorolt, az S-módú kiterjesztett squitter közlemény vételének képességével - az A0 osztályú fedélzeti vevőrendszerekben alkalmazott vételi eljárásokkal szemben támasztott követelményekhez viszonyítva - megnövelt vételi valószínűséggel:

a) Tökéletesített S-módú kiterjesztett squitter előzetes észlelés.

b) Emeltszintű hiba észlelés és javítás.

c) Az egyes fedélzeti vevőkészülék osztályokban használatos, emeltszintű bit és megbízhatóság vizsgálati eljárás az alábbiak szerint:

1) A1 osztály – az „amplitúdó közép” vizsgálati eljárással azonos vagy jobb eredményt biztosító.

2) A2 osztály – a „többszörös amplitúdó minta” bázis vizsgálati eljárással azonos vagy jobb eredményt biztosító, ahol minden S-módú bit pozícióból legalább 8 mintavétel használatos a döntési folyamatban.

3) A3 osztály - a „többszörös amplitúdó minta” bázis vizsgálati eljárással azonos vagy jobb eredményt biztosító, ahol minden S-módú bit pozícióból legalább 10 mintavétel használatos a döntési folyamatban.

1. Megjegyzés – A fenti emeltszintű vételi eljárásokat az RTCA DO260A, I. Függelék tartalmazza.

2. Megjegyzés – A fenti emeltszintű vételi eljárások használata esetén, erős interferenciával terhelt környezetben (úgy, mint többszörös Mode A/C átfedés), legalább az RTCA DO260A, I. Függelék-ben definiált eljárással azonos teljesítés várható el.

3. Megjegyzés – A földi kiterjesztett squitter vevőrendszerek esetében az A2 és A3 fedélzeti vevőrendszerekben használatos emeltszintű eljárások alkalmazása tekinthető megfelelőnek.

5.2.3 Jelentés szerkesztés feladat

5.2.3.1 A jelentés szerkesztés feladat tartalmazza a közlemény dekódolási, a jelentés szerkesztési és a kimeneti csatlakozási alfeladatokat.

5.2.3.2 Egy kiterjesztett squitter közlemény vétele esetén, 0.5 sec-on belül dekódolni kell a közleményt, és meg kell szerkeszteni az 5.2.2.3 pontban definiált ADS-B típusú jelentést.

1. Megjegyzés – Az ADS-B típusú üzenetváltás és ADS-B/TIS-B jelentés szerkesztés vételi feladatokat tartalmazó, fedélzeti, kiterjesztett squitter vevőrendszerek két konfigurációja megengedett:

a) Az I. típusú fedélzeti, kiterjesztett squitter vevőrendszerek veszik az ADS-B és TIS-B közleményeket és alkalmazás specifikus ADS-B és TIS-B jelentéseket szerkesztenek. Az I. típusú fedélzeti, kiterjesztett squitter vevőrendszerek egy meghatározott ADS-B és TIS-B jelentéseket felhasználó kliens alkalmazás felhasználói igényei szerint vannak kialakítva. Azon felül, az I. típusú fedélzeti, kiterjesztett squitter vevőrendszerek egy külső egység által vezérelhetők és így előállíthatnak egy olyan kiépítéstől függő, kiegészítő jelentéskészletet, amelyre a vevőrendszer alkalmas.

b) A II. típusú kiterjesztett squitter vevőrendszerek veszik az ADS-B és TIS-B közleményeket, és a berendezések osztályba sorolásától függően képesek teljes ADS-B és TIS-B közlemények kidolgozására. A II. típusú fedélzeti, kiterjesztett squitter vevőrendszerek egy külső egység által vezérelhetők és így előállíthatnak egy olyan kiépítéstől függő, kiegészítő jelentéskészletet, amelyre a vevőrendszer alkalmas.

2. Megjegyzés – A földi, kiterjesztett squitter vevőrendszerek ADS-B közleményeket vesznek és vagy alkalmazás specifikus kiegészítő jelentéskészletet vagy teljes, a földi szolgáltató igényeinek megfelelő ADS-B jelentést szolgáltatnak beleértve a támogatott kliens alkalmazást is.

3. Megjegyzés – A kiterjesztett squitter közlemény vételi feladat fizikailag elkülöníthető a jelentés szerkesztés feladatot megvalósító berendezéstől.

5.2.3.3 ADS-B JELENTÉS TÍPUSOK

1. Megjegyzés – Az ADS-B jelentés szerkesztés az S-módú kiterjesztett squitter adatsugárzásból nyert ADS-B közlemény átstrukturálást (felbontását) jelenti, olyan jelentésekre, amelyeket kliens alkalmazás csoport közvetlenül használhat. A következő alpontok öt, a kliens alkalmazásoknak továbbított ADS-B jelentés típust határoznak meg. További információ az ADS-B jelentések tartalmáról, és az S-módú kiterjesztett squitter közlemények ADS-B közleményként történő leképezéséről, a ”Manual of the Secondary Surveillance Radar (SSR) Systems (Doc 9684)” *kiadványban és az RTCA DO-260A-ban található.*

2. Megjegyzés – Az időjelentéshez szükséges precíziós (pl. GNSS UTC mért idő) kontra nem-precíziós (pl. vevőrendszer belső órája) időmérési források használhatóságát az 5.2.3.5 alpont ismerteti

5.2.3.3.1 *Állapotvektor jelentés.* Az állapotvektor tartalmazza az alkalmazhatósági időt, a repülés közben vagy a földön mozgó jármű mozgási állapotát (pl. pozíció, sebesség vektor), valamint a repülés közben vagy a földön vett információk alapján a navigációs adatok integritásának mérését, a repülés közbeni sebességet, valamint a kiterjesztett squitter közlemény azonosítóját és típusát. Mivel a pozíció és a sebességvektor közlemények elkülönülnek, az alkalmazhatósági időt külön kell jelenteni a pozíció és sebesség vektor paraméter jelentésekben. Továbbá, az állapotvektor jelentésnek tartalmaznia kell a várható pozíció vagy/és várható sebességvektor alkalmazhatósági időadatot (úgy, mint olyan adat, amely nem a frissített várható pozíció vagy/és várható sebességvektor adaton alapul) is, ha ilyen, várható pozíció vagy/és várható sebességvektor információt is tartalmaz az állapotvektor.

Megjegyzés – A kliens alkalmazás szereplőinek (fedélzeti vagy földi) igényei szerint a specifikus felhasználói követelmények változhatnak. A négy ADS-B jelentés közül a legdinamikusabb az állapotvektor, ezért a fedélzeti vagy mozgó földi eszközök légi és földi műveleteinek dinamikájához megkövetelt pontosság elérése érdekében az alkalmazások az állapotvektor gyakori frissítését igénylik.

5.2.3.3.2 *Mód állapot jelentés.* A mód állapot jelentés tartalmazza az alkalmazhatósági időt és az adatsugárzásban résztvevők pillanatnyi műveleti információit, és foglalja magába a fedélzeti/földi mozgó jármű címzését, hívójelét, ADS-B verzió számát, a fedélzeti/földi mozgó jármű hossz és szélességi adatait, az állapotvektor minőségi adatait és más az adott műveleti állapotban vett információkra épülő adatokat, mint a repülés közbeni azonosítót és típust, a repülés közbeni sebességet és a repülés közbeni állapot kiterjesztett „Squitter" közleményét. Minden alkalommal, amikor mód állapot jelentés készült, a jelentésszerkesztő feladat frissítse fel a jelentés alkalmazhatósági időt. Az érvényes adattal nem rendelkező paramétereket, érvénytelenként kell jelölni, vagy ki kell zárni a mód állapot jelentésből

1. Megjegyzés – A kliens alkalmazás szereplőinek (fedélzeti vagy földi) igényei szerint a specifikus felhasználói követelmények változhatnak.

2. Megjegyzés – Amikor a céltárgy állapotvektor és a mód állapot jelentés (ahogy azt a ”Manual on Mode S Specific Services (Doc.9688)*” kiadvány ismerteti) rendelkezésre áll, a jelentés bizonyos paraméterei abból a közlemény típusból megjelennek a mód állapot jelentésben is.*

3. Megjegyzés – A Mode állapot jelentés különböző adatelemeiben jelentett információkhoz tartozó alkalmazhatósági idő változhat attól függően, hogy az adott információ, különböző időpontban vett kiterjesztett squitter közleményből származik. Azt az adatot, amely a paraméter típus hasznos élettartamán túl jelentettek érvénytelenként kell jelölni, vagy ki kell zárni a mód állapot jelentésből, *ahogy azt a* ”Manual of the Secondary Surveillance Radar (SSR) Systems *(Doc 9684)” kiadvány ismerteti.*

5.2.3.3.3 *Levegőhöz viszonyított sebesség jelentés.* Levegőhöz viszonyított sebesség jelentést kell szerkeszteni, amikor egy olyan repülés közbeni sebesség kiterjesztett squitter közleményt vesznek, amely tartalmazza a levegőhöz viszonyított sebesség információt. A levegőhöz viszonyított sebesség jelentés tartalmazza az alkalmazhatósági időt, a levegőhöz viszonyított sebesség adatot és az irányszög adatot. Csak az 5.2.3.5 alpontban előírt típusú kiterjesztett squitter vevőrendszerekre írják elő a levegőhöz viszonyított sebesség jelentések szerkesztési feladatát. Minden esetben, amikor egyedi mód állapot jelentést szerkesztenek, a jelentés szerkesztő üzemmód frissítse a jelentés alkalmazhatósági idejét.

1. Megjegyzés – A levegőhöz viszonyított sebesség jelentés sebesség információt tartalmaz, amely a vett fedélzeti sebesség közleményekből származik más egyéb, a fedélzeti azonosító és típus kiterjesztett squitter közleményből származó információkkal együtt. A levegőhöz viszonyított sebesség jelentés nem kerül kialakításra, ha a vett repülés közbeni sebesség kiterjesztett squitter közlemény földhöz viszonyított sebesség információt tartalmaz. A levegőhöz viszonyított sebesség jelentés tartalmáról szóló útmutatót a ”Manual of the Secondary Surveillance Radar (SSR) Systems (Doc 9684)” *kiadvány tartalmaz.*

2. Megjegyzés – A kliens alkalmazás szereplőinek (fedélzeti vagy földi) igényei szerint a specifikus felhasználói követelmények változhatnak.

5.2.3.3.4 *Döntési tanácsadás (RA) jelentés.* Az RA jelentés tartalmazza az alkalmazhatósági időt és az aktív ACAS döntési tanácsadás (RA) tartalmát, a Típus=28 és Altípus=2 kiterjesztett squitter közleményben foglalt vételnek megfelelően.

Megjegyzés – Földi vevő alrendszer csak akkor fog RA jelentést szerkeszteni, ha aktív RA információt, elváró kliens alkalmazást támogat. Egy RA jelentés névlegesen csak Típus=28 és Altípus=2 kiterjesztett squitter közlemény vétele esetén tud kialakulni.

5.2.3.3.5 CÉLTÁRGY ÁLLAPOT JELENTÉS.

Megjegyzés – A céltárgy állapot jelentés információkra vonatkozó követelményrendszer még nem olyan mértékben kidolgozott, mint más ADS-B jelentés típusokra. A céltárgy állapot jelentés jelenleg nem követelmény, de a jövőben követelmény lehet az A2 és A3 típusú fedélzeti vevőrendszerek esetében. Amennyiben támogatott, a céltárgy állapot jelentés kialakításra kerül, ha más kiegészítő információkkal együtt a fedélzeti azonosítót és típust tartalmazó kiterjesztett squitter közleményekben a céltárgy állapot és helyzet információ vételre kerül. A céltárgy állapot és helyzet jelentést a ”Manual on Mode S Specific Services *(Doc.9688)” kiadvány ismerteti. A kliens alkalmazás szereplőinek (fedélzeti vagy földi) igényei szerint a specifikus felhasználói követelmények változhatnak. A céltárgy állapot jelentés tartalmáról szóló útmutató a* ”Manual of the Secondary Surveillance Radar (SSR) Systems *(Doc 9684)” kiadványban található.*

5.2.3.4 TIS-B JELENTÉS TÍPUSOK

5.2.3.4.1 Amikor a fedélzeti vevőrendszer egy TIS-B közleményt vesz, ezt az információt jelenteni kell a kliens alkalmazásnak. Minden alkalommal, amikor egyedi TIS-B jelentés készül, a jelentés szerkesztő feladat frissítse a jelentés alkalmazhatósági időt az aktuális időpontnak megfelelően.

1. Megjegyzés – A TIS-B közlemény formátumokat a ”Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)” ismerteti.

2. Megjegyzés – Az TIS-B jelentés szerkesztés az S-módú kiterjesztett squitter adatsugárzásból nyert TIS-B közlemény átstrukturálását (felbontását) jelenti, olyan jelentésekre, amelyeket kliens alkalmazás csoport közvetlenül használhat. A következő alpontok két, a kliens alkalmazásoknak továbbított ADS-B jelentés típust határoznak meg. További információ az TIS-B jelentések tartalmáról, és az S-módú kiterjesztett squitter közlemények ADS-B közleményként történő leképezéséről, a ”Manual of the Secondary Surveillance Radar (SSR) Systems *(Doc 9684)” kiadványban található.*

3. Megjegyzés – A precíziós (pl. GNSS UTC mért idő) kontra nem-precíziós (pl. vevőrendszer belső órája) időmérési források idő-jelentéshez való használhatóságát, az 5.2.3.5. alpont ismerteti.

5.2.3.4.2 *TIS-B céltárgy jelentés*. A pozíció kivételével, az összes információs elemet, beleértve az összes, a precíziós TIS-B közlemény formátumokra tartalékolt mezőket és bármely TIS-B adatkezelő közlemény teljes tartalmát közvetlenül jelenteni kell. A jelentés formátum részletesen nincs meghatározva, annak kivételével, hogy a jelentett információ tartalom meg kell, hogy egyezzen a vett információ tartalommal.

5.2.3.4.3 Egy TIS-B pozíció közlemény vételekor, az útvonal adatokkal összevetve, meghatározható, hogy az dekódolható-e céltárgy pozícióként (azaz összefüggésbe hozható-e egy létező útvonallal). Ha a közlemény céltárgy pozícióként dekódolható, akkor 0.5 sec-t jelentést kell szerkeszteni. A jelentés tartalmazza a vett pozíció információt az alkalmazhatóság idejével, a legutoljára vett sebességvektor információt és annak alkalmazhatósági idejét, a várható pozíciót és sebességvektort hozzárendelve egy közös alkalmazhatósági időponthoz, a fedélzeti/földi mozgó jármű címzését és a vett közleményben továbbított minden egyéb információt is. Az adatok várható értékei a célpont pozíció vett értékein és az útvonal történeten alapuljanak.

5.2.3.4.4 Egy TIS-B sebességvektor közlemény vételekor - ha az hozzárendelhető egy kész útvonalhoz – a közlemény vételétől számított 0.5 sec belül jelentést kell szerkeszteni. A jelentésnek tartalmaznia kell a vett sebességvektor információt az alkalmazhatósági idővel együtt, a várható pozíciót és sebességvektort egy közös alkalmazhatósági idővel, és a vett közleményben továbbított minden egyéb információt is. Az adatok várható értéke a földhöz viszonyított sebességről vett információn és a céltárgy útvonal történetén alapszik.

5.2.3.4.5 *TIS-B adatkezelő közlemény.* A vett TIS-B adatkezelő közlemény teljes közlemény tartalmát közvetlenül kell jelenteni a kliens alkalmazásnak. A vett információ tartalommal azonos információ tartalmat kell jelenteni.

5.2.3.4.5.1 A TIS-B adatkezelő közlemény tartalmát bitről bitre jelenteni kell a kliens alkalmazásnak.

Megjegyzés – A TIS-B adatkezelő közlemény feldolgozását a ”Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)” ismerteti.

5.2.3.5 ALKALMAZHATÓSÁGI IDŐ JELENTÉSE

Ahogy az meghatározott (lásd 5.2.3.3 és 5.2.3.4), az összes specifikus ADS-B és TIS-B jelentés típus alkalmazhatósági idejének referenciájaként, a vevőrendszerek alkalmazzanak belső időalapot.

5.2.3.5.1 *Precíziós időalap.* Felszíni pozíció közlemények, fedélzeti pozíció közlemények és/vagy TIS-B közlemények szerkesztésére szolgáló vevőrendszerek, a jelentés alkalmazhatósági idő céljára, a következő közlemények esetében alkalmazzák a GNSS UTC rendszerben mért időt:

a) a 3.1.2.8.6.2 szerint meghatározott, zero (0) változatú ADS-B közlemény esetén, ha a navigációs bizonytalansági kategória (NUC) 8 vagy 9;

vagy

b) a 3.1.2.8.6.2 és 3.1.2.8.7 szerint meghatározott, egyes (1) változatú ADS-B vagy TIS-B közlemény esetén, ha a navigációs integritás kategória (NIC) 10 vagy 11;

a mért (UTC) időadat tartomány minimum 300 sec, a felbontás pedig 0.0078125 (1/128) sec legyen.

5.2.3.5.2 *NEM PRECÍZIÓS BELSŐ IDŐALAP*

5.2.3.5.2.1 Azok a vevőrendszerek esetében, amelyek nem szerkesztenek, NUC vagy NIC (lásd az 5.2.3.5.1) kritériumoknak megfelelő ADS-B vagy TIS-B közlemények vételén alapuló ADS-B vagy/és TIS-B jelentéseket, megengedett a nem precíziós időalap forrás használata. Az ilyen esetekben, amikor megfelelő precíziós időalap forrás nem áll rendelkezésre, a vevőrendszer rendelkezzen olyan, megfelelő belső órával vagy számlálóval, ahol a maximális óra ciklus vagy számlálási ciklus 20 msec. A létrehozott belső óra vagy számláló rendelkezzen legalább 300 sec-os számlálási tartománnyal és 0.0078125 (1/128) sec felbontással.

Megjegyzés – Az előzőekben ismertetett nem precíziós időalap lehetővé teszi az alkalmazhatósági idő jelentésekor - egy szekvencián belül – a jelentés időtartamának pontos meghatározását. Például az állapotvektor jelentések között alkalmazott időtartamokat a kliens alkalmazások pontosan meg kell, hogy határozzák, akkor is, ha a jelentés nem tartalmazza az abszolút időt (pl. UTC-ben mért időt).

5.2.3.6 JELENTÉSI KÖVETELMÉNYEK

5.2.3.6.1 *Az I. típusú S-módú kiterjesztett squitter fedélzeti vevőrendszerek jelentési követelményei*. Az I. típusú S-módú kiterjesztett squitter fedélzeti vevőrendszerek jelentés szerkesztési feladatai, az 5.2.3 pontban meghatározottak szerint, minimum támogassák az ADS-B és TIS-B jelentések azon alcsoportjait és jelentik azon értékeket, amelyek szükségesek a vevőrendszerek által kiszolgált kliens alkalmazások számára.

5.2.3.6.2 *A II. típusú S-módú kiterjesztett squitter fedélzeti vevőrendszerek jelentési követelményei.* A II. típusú S-módú kiterjesztett squitter fedélzeti vevőrendszerrel összefüggő jelentés szerkesztési feladatok, az 5.2.3 pontban meghatározottak szerint, a vevőrendszer 5-4 táblázatban ismertetett osztályba sorolásának megfelelően hozzák létre az ADS-B és TIS-B jelentéseket, amikor a jelentés előfeltételeként szolgáló ADS-B és/vagy TIS-B közleményt vesznek.

5.2.3.6.3 *A földi S-módú kiterjesztett squitter vevőrendszerek jelentési követelményei.* A földi S-módú kiterjesztett squitter fedélzeti vevőrendszerek jelentés szerkesztési feladatai, az 5.2.3 pontban meghatározottak szerint minimum támogassák az ADS-B jelentések azon alcsoportjait és jelentsék azon értékeket, amelyek szükségesek a vevőrendszerek által kiszolgált kliens alkalmazások számára.

5.2.4 Együttműködő-képesség

Az S-módú kiterjesztett squitter vevőrendszerek egyaránt kezeljék a verzió 0 és verzió 1 típusú ADS-B kiterjesztett squitter közlemény formátumokat.

1. Megjegyzés - A verzió 0 és verzió 1 típusú közlemények meghatározását a "Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)"tartalmazza.

2. Megjegyzés - A verzió 0 és verzió1 típusú ADS-B kiterjesztett squitter közlemény formátumok együttműködési eljárásait a "Manual of the Secondary Surveillance Radar (SSR) Systems *(Doc 9684)" kiadvány ismerteti és további információk találhatók az RTCA DO-260A, N Függelékben.*

5.2.4.1 KEZDETI KÖZLEMÉNY DEKÓDOLÁS

Az S-módú kiterjesztett squitter vevőrendszere egy új, ADS-B céltárgy befogása után, először a verzió 0 (zéró) ADS-B közlemények formátumokhoz alkalmazott dekódolási eljárást alkalmazza, amíg a vett, verzió 1 formátumú műveleti állapot közlemény használatban van.

5.2.4.2 VERZIÓ SZÁM ALKALMAZÁS

Az S-módú kiterjesztett squitter vevőrendszere dekódolja a műveleti állapot közleményben továbbított verzió számot, és a megfelelő, verzió – 0 (zéró) vagy verzió – 1 (egy), dekódolási eljárást alkalmazza az adott fedélzeti vagy földi mozgó járműről sugározott kiterjesztett squitter ADS-B közleményhez.

5.2.4.3 FENTTARTOTT MEZŐK KEZELÉSE

Az S-módú kiterjesztett squitter vevőrendszerek hagyják figyelmen kívül a tartalékolt mező tartalmat.

Megjegyzés – Ez a követelmény - lehetővé téve további paraméterek meghatározását, amelyek a korábbi közlemény verziók figyelmen kívül hagytak - biztosítja az együttműködést a korábbi és az újabb közleményeket helyesen dekódoló, újabb verziójú vevők között.

AZ 5. FEJEZET TÁBLÁZATAI

5-1. Táblázat - Az „A” osztályú ADS-B berendezések műszaki jellemzői

1. Megjegyzés – Passzív antennát feltételezve, a specifikus MTL szint az antenna talpponti kimeneti csatlakozására vonatkozik. Ha az antenna aktív erősítőt is tartalmaz, akkor az MTL szint az antennaerősítő kimenetére vonatkozik. Az A3 osztályú vevők esetében, a második, -87 dBm jelszint esetén a közlemények 15%-t kell sikeresen dekódolni. Az MTL szintek interferencia mentes vételi környezetre vonatkoznak. *2. Megjegyzés – Az 5.2.2.4 fejezetben előírt kiterjesztett squitter vételi eljárás az ACAS 1090 MHz-es alapvető vételi eljárásként megköveteltre utal mint alap vételi eljárás és amely kezeli a Mode A/C jelek szimpla átfedését. Az „emeltszintű" vételi eljárás olyan vevő teljesítőképességre utal, amely a Mode A/C jelek többszörös átfedése esetére továbbfejlesztett vevő teljesítőképességet és S-módú többszörös átfedés okozta erős zavaró jelszint esetén továbbfejlesztett dekóder újraindítást jelent. A specifikus vevőrendszerekre alkalmazott emeltszintű vételi eljárásokkal szemben támasztott követelményeket az 5.2.2.4 fejezet ismerteti.* *3. Megjegyzés – A kiterjesztett squitter közleményeket a "Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)" írja le. Ugyanakkor a céltárgy állapot és üzemmód közleményeket* a Mode S Speciális Szolgáltatás Kézikönyv (Doc.9688) *ismerteti, de még nem olyan kiforrott állapotban mint a többi ADS-B közlemény esetében.* *4. Megjegyzés – A TIS-B közleményeket a "Technical Provisions for Mode S Services and Extended Squitter (Doc. 9871)" írja le.*

5-4. Táblázat – Az S-módú kiterjesztett squitter vevőrendszer – jelentés követelmények

Vevő osztály	*ADS-B jelentés követelmények minimuma*	*TIS-B jelentés követelmények minimuma*
A0 (alap VFR)	ADS-B állapotvektor jelentés (lásd 5.2.3.1.1) és ADS-B Mode üzemmód jelentés (lásd 5.2.3.1.2)	TIS-B állapot jelentés és TIS-B adatkezelés jelentés
A1 (alap IFR)	ADS-B állapotvektor jelentés (lásd 5.2.3.1.1) és ADS-B Mode üzemmód jelentés (lásd 5.2.3.1.2) és ADS-B levegőhöz viszonyított sebességvektor jelentés (lásd 5.2.3.1.3)	TIS-B állapot jelentés és TIS-B adatkezelés jelentés

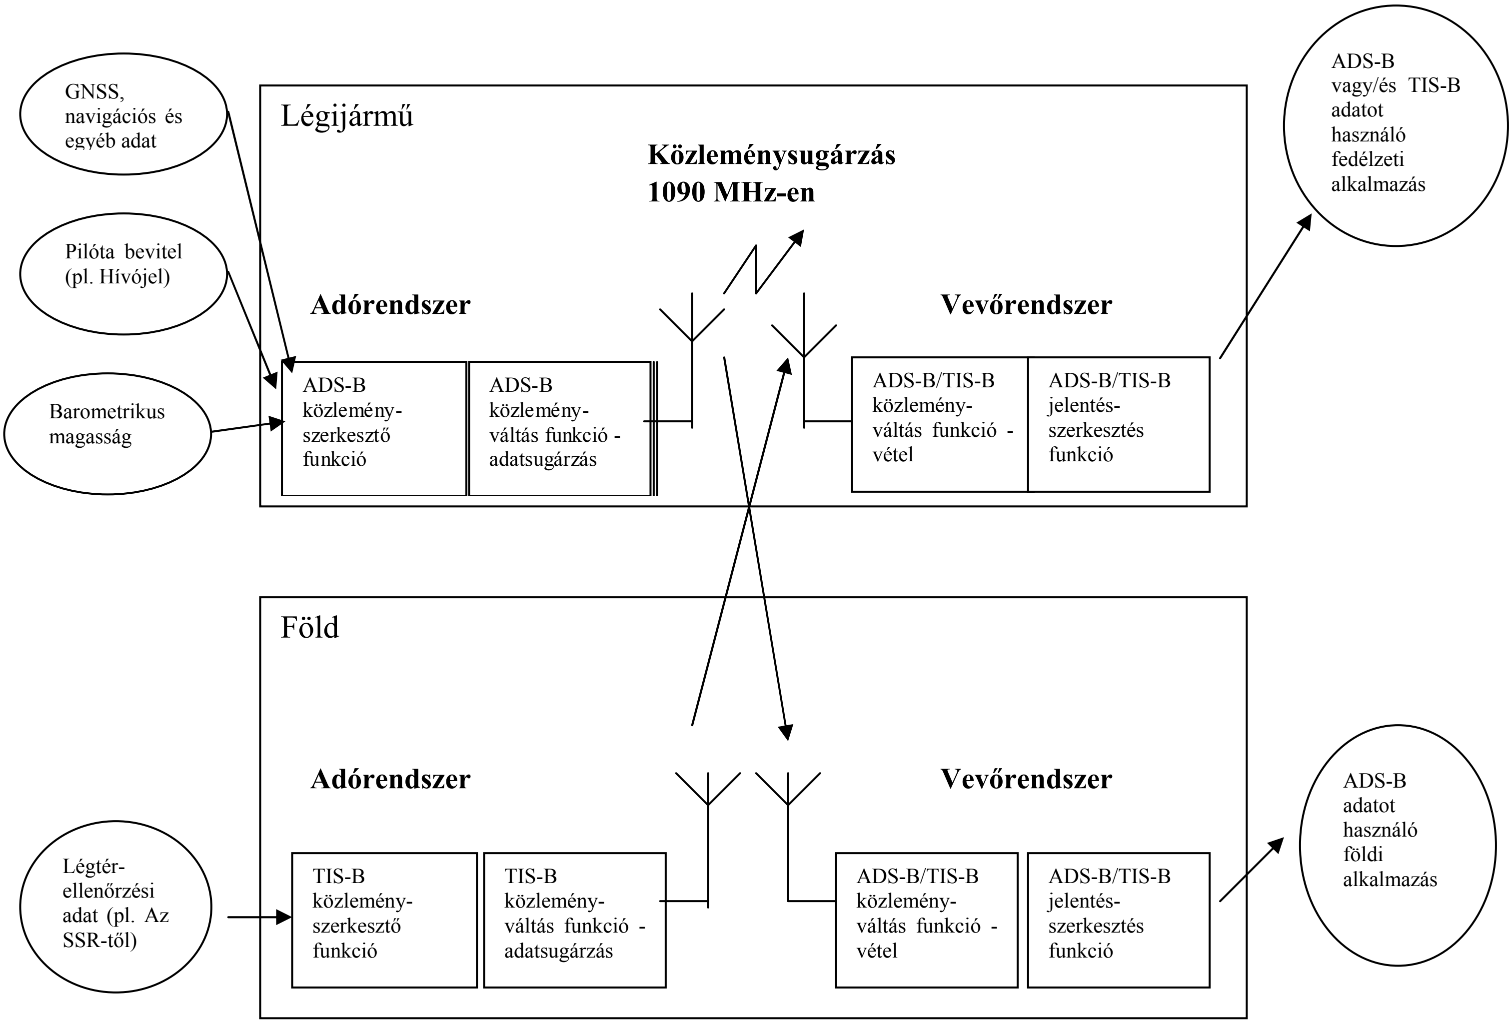
5. FEJEZETHEZ TARTOZÓ ÁBRA



MELLÉKLET A IV. KÖTETHEZ

Összeütközés-elhárító fedélzeti rendszerre (ACAS) vonatkozó útmutató anyag

1. Megjegyzés. – A következő anyag útmutatást kíván adni a függőleges megoldási képességgel rendelkező összeütközés-elhárító fedélzeti rendszer (ACAS II) műszaki jellemzőiről. Az ACAS SARP-okat a 4. fejezet tartalmazza.

2. Megjegyzés. – A nem-SI alternatív egységek használata az 5. Annex, 3. fejezet 3.2.2 szakaszában engedélyezett módon történik. Korlátozott számú esetben a logikai számítások szintjén a következetesség biztosítása érdekében olyan mértékegységek használata is előfordul, mint láb/s, NM/s és csomó/s.

1. Berendezések, feladatok és képességek

1.1 ACAS berendezés jellemzők

1.1.1 Az ACAS berendezés egy ACAS feldolgozó egységet, S-módú válaszjeladót, szabályozó egységet, megfelelő antennákat és tanácsadás szolgáltató eszközöket tartalmaz.

1.1.2 A légijárművön lévő ACAS berendezés lekérdezi a környezetében tartózkodó más légijárműveken lévő SSR válaszjeladókat és meghallgatja a válaszjeladó válaszokat. Ezeknek a válaszoknak a számítógépes elemzésével az ACAS berendezés megállapítja, hogy mely légijárművek jelentenek potenciális összeütközés veszélyt és megfelelő jelzéseket (tanácsadásokat) szolgáltat a személyzetnek az összeütközés elkerülése érdekében.

1.1.3 Az ACAS berendezés kétféle tanácsadás szolgáltatásának képességével rendelkezik. Forgalmi tanácsadás (TA) jelzi a veszélyeztető légijárművek közelítő pozícióit, amely légijárművek később megoldás tanácsadásokat kényszerítenek ki. A megoldási tanácsadás (RA) függőleges manővereket javasol, amelyek várhatóan növelik, vagy fenntartják az elkülönítést a veszélyeztető légijárműtől.

1.2 Szolgáltatott tanácsadások

1.2.1 FORGALMI TANÁCSADÁSOK

A forgalmi tanácsadások jelzik a veszélyeztető légijárműnek a saját légijárműhöz viszonyított távolságát, távolság változási sebességét, magasságát, magasság változási sebességét és iránytengelyét. Magasság információ nélküli forgalmi tanácsadás is szolgáltatható C-módú vagy S-módú felszereltségű légijárművön, amely nem rendelkezik automatikus jelentő képességgel. Az információ, amelyet az ACAS forgalmi tanácsadásban szolgáltat, azt a célt szolgálja, hogy segítse a repülő-személyzetet a közeli forgalom figyelésében.

1.2.2 MEGOLDÁSI TANÁCSADÁS

1.2.2.1 Ha a veszélyeztetés észlelési logika az ACAS számítógépben megállapítja, hogy a találkozás egy közelben lévő légijárművel majdnem összeütközéshez vagy összeütközéshez vezethet, a számítógép veszélyeztetés megoldási logikája megfelelő függőleges manővert határoz meg, amely az ACAS légijármű biztonságos függőleges elkülönítését fogja biztosítani. A kiválasztott manőver megfelelő függőleges elkülönítést olyan korlátokon belül biztosít, amelyeket az ACAS légijármű emelkedő képessége és a földhöz való közelsége határoz meg.

1.2.2.2 A repülőgépvezető részére szolgáltatott megoldási tanácsadások két kategóriába sorolhatók: helyesbítési (corrective) tanácsadások, amelyek a légijárművezetőt a követett repülési pályáról való letérésre utasítják (pl. "EMELKEDJ", amikor a légijármű vízszintes repülést végez); és megelőzési (preventive) tanácsadás, amely a légijárművezetőnek bizonyos függőleges sebességek megtartását vagy elkerülését tanácsolja (pl. "NE EMELKEDJ", amikor a légijármű vízszintes repülést végez).

1.2.2.3 Normál körülmények között az ACAS csak egy megoldási tanácsadást ad ki egy vagy több megközelítő légijárművel való találkozás esetén. A megoldási tanácsadást akkor, vagy röviden azután adja ki, amikor a (az első) megközelítő légijármű veszélyeztető légijárművé válik, és addig marad érvényben, amíg a (valamelyik) megközelítő légijármű veszélyeztető marad, és akkor kerül törlésre, amikor a (az utolsó) megközelítő légijármű megszűnik veszélyeztető lenni. Azonban a repülőszemélyzet részére a megoldási tanácsadás részeként kiadott jelzés módosulhat. Megerősítést nyerhet, vagy még ellenkezőjére is változhat, ha a veszélyeztető légijármű módosítja magasság profilját, vagy amikor a második vagy harmadik veszélyeztető légijármű észlelése megváltoztatja a találkozó kezdeti értékelését. Gyengülhet is, amikor megfelelő elkülönítés megtörtént, de a (bármelyik) megközelítő légijármű átmenetileg veszélyeztető marad.

1.2.3 FIGYELMEZTETÉSI IDŐK

Ha veszélyeztető légijárművet észlelnek, az ACAS berendezés bizonyos idővel a légijármű legszorosabb megközelítése előtt megoldási tanácsadást generál. A figyelmeztetési idő nagysága függ az ACAS rendszer számára használatra kiválasztott védett tér nagyságától. Az ACAS által használt, a legszorosabb megközelítés előtti névleges megoldási tanácsadási idő 15 és 35 másodperc között változik. Forgalmi tanácsadás névlegesen 5-20 másodperc közötti idővel előzi meg a megoldási tanácsadás kiadását. A figyelmeztetési idők függnek az érzékenységi szinttől, ahogyan az a 3.5.12 pontban ismertetésre került.

1.2.4 MEGOLDÁSI TANÁCSADÁSOK LEVEGŐ-LEVEGŐ KOORDINÁCIÓJA

1.2.4.1 Ha az ACAS berendezés által észlelt légijármű csak A/C-módú válaszjeladóval és automatikus nyomásmagasság jelentő berendezéssel rendelkezik, akkor a légijármű pilótája nem lesz tudatában annak, hogy az ACAS berendezéssel felszerelt légijármű figyelemmel követi őt. Ha az ACAS légijármű pilótája egy ilyen légijárművel való találkozáskor megoldási tanácsadást kap, és a tanácsolt manővert végrehajtja, az ACAS légijármű képes lesz a megközelítő légijárművet elkerülni, feltéve, hogy a megközelítő légijármű nem gyorsul fel olyan módon, hogy az ACAS légijármű manőverének hatását lerontja, vagy semmissé teszi.

1.2.4.2 Ha a megközelítő légijármű fel van szerelve ACAS berendezéssel, akkor koordinációs eljárást alkalmaznak a levegő-levegő S-módú adat kapcsolaton keresztül annak biztosítása érdekében, hogy az ACAS megoldási tanácsadások összeegyeztethetők legyenek.

1.2.5 LEVEGŐ-FÖLD KOMMUNIKÁCIÓ

1.2.5.1 Az ACAS az S-módú levegő-föld adatösszeköttetés felhasználásával kommunikálni tud földi állomásokkal. A kommunikáció egyik formája az érzékenységi szint szabályozási utasítás S-módú földi állomások általi továbbítása az ACAS berendezéshez. Ez a tulajdonság lehetővé teszi egy S-módú földi állomás számára, hogy a megoldási tanácsadás figyelmeztetési időt a helyi forgalmi körülményekhez adaptálja, amikor egy ACAS légijármű áthalad az állomás által lefedett körzeten. Ezáltal hatékony összhang jön létre az összeütközés figyelmeztetési idő és a riasztás gyorsasága között.

1.2.5.2 Az S-módú levegő-föld adat-összeköttetés felhasználható az ACAS megoldási tanácsadások S-módú földi állomásokhoz való továbbítására is. Ezeket az információkat azután a légiforgalmi szolgálatok felhasználhatják az ACAS megoldási tanácsadások figyelésére az érdekelt légteren belül.

1.2.6 AZ ACAS ÁLTAL VÉGZETT FELADATOK

1.2.6.1 Az ACAS által végzett feladatokat az A-1 ábra illusztrálja. Az ábrázolás leegyszerűsítése érdekében a "saját légijármű követés" és a "megközelítő légijármű követés" feladatokat egyszerre képviseli a "felderítés" feladat az A-1 ábrán. Azonban a követők, amelyeket az összeütközés elhárító feladat fenntartására szánnak, lehet, hogy nem alkalmasak a felderítés feladatának fenntartására. Különálló követési feladatok válhatnak szükségessé mind az összeütközés elkerülés, mind a felderítési feladatok megfelelő támogatására.

1.2.6.2 Felderítést normál körülmények között ciklusonként egyszer hajtanak végre; azonban bizonyos megközelítő légijárműveknél ezt gyakrabban vagy ritkábban lehet végezni. Például felderítést ritkábban lehet végrehajtani néhány nem veszélyeztető légijárműnél, tekintetbe véve az interferencia korlátozási egyenlőtlenségeket, vagy gyakrabban lehet végrehajtani más megközelítő légijárműveknél az azimut becslés javítása érdekében.

1.2.6.3 Az ACAS feladatok megvalósításánál használt paramétereket automatikusan vagy manuálisan állítják be, hogy a normál légiforgalmi irányítás (ATC) műveletek legkisebb mértékű zavarásával tartsák fenn az összeütközés elkerülés megőrzését.

1.3 Veszélyeztető légijármű jellemzői

1.3.1 A VESZÉLYEZTETŐ LÉGIJÁRMŰ VÁLASZJELADÓ FELSZERELÉSE

Az ACAS megoldási tanácsadásokat szolgáltat magasság jelentő A/C-módú vagy S-módú válaszjeladókkal felszerelt légijárműveken. Néhány légijármű SSR válaszjeladóval van felszerelve, de nincs magasság kódolója. Az ACAS nem tud megoldási tanácsadásokat generálni ilyen légijárművekkel való konfliktus esetén, mert magasság információ nélkül az összeütközés veszélyeztetés becslését nem lehet elvégezni. Az ACAS berendezés ilyen légijárműveken csak forgalmi tanácsadást tud generálni, jellemezve távolságukat, távolság változási sebességüket és iránytengelyüket. Azokat a légijárműveket, amelyek csak A-módú válaszjeladóval vannak felszerelve és nincsenek felszerelve A/C-módú vagy S-módú válaszjeladóval, vagy azok nem működnek, az ACAS nem tudja követni.

1.3.2 A VESZÉLYEZTETŐ LÉGIJÁRMŰ KÖZELÍTŐ SEBESSÉGE ÉS A FORGALOM SŰRŰSÉGE

1.3.2.1 Nagy forgalom sűrűségű légtérben való üzemeltetésre tervezett ACAS berendezés képes a veszélyeztető légijárművekre vonatkozó átfogó felderítési teljesítményt nyújtani a 4. fejezet 4.3.2 pontban és a 4-1 táblázatban meghatározottaknak megfelelően.

1.3.2.2 A 4-1 táblázatban felsorolt körülményeket, amely táblázat két sűrűségi régiót határoz meg a többdimenziós feltétel térben, amely az ACAS teljesítményt befolyásolja, egy tipikus ACAS teljesítményének fedélzeti méréseiből extrapolálták. A fedélzeti mérési adatok azt mutatták, hogy a nyomvonal létrejöttének valószínűsége nem zuhan hirtelen, amikor a feltétel határok egyikét átlépik.

1.3.2.3 A teljesítményt az illető cél követési valószínűségének fogalmával fejezik ki egy maximális közelítési sebességnél adott forgalom sűrűségnél legalább 30 másodperccel a legszorosabb megközelítés előtt. A két sűrűségi régióhoz (egyenként) tartozó maximális forgalomsűrűség definíciója a következő:

$$\zeta = n(r)/\pi r^2$$

ahol n*(r)* az SSR válaszjeladóval felszerelt légijárművek maximálisan 30 másodperc időre vett átlagos száma (a saját légijárművet nem számítva) az ACAS légijármű földi pozíciója feletti *r*-sugarú kör területe felett. A levegőben történő méréseknél a rádiuszok különbözőek voltak a két sűrűségi régiónál. A nagy sűrűség értékű méréseknél a rádiusz 9,3 km (5 NM) volt. A kis sűrűség értékű méréseknél a rádiusz 19 km (10 NM) volt. A forgalom sűrűségről az állandó sűrűségű kör terület határain kívül feltételezhető, hogy a távolsággal fordított arányban csökken, így a légijárművek számát

az

$$n(r) = n(r_0)r/r_0$$

összefüggés adja meg, ahol r_0 az állandó sűrűségű régió sugara.

1.3.2.4 Amikor a sűrűség nagyobb, mint 0,017 légijármű/km^2 (0,06 légijármű/NM^2), az egyenletes sűrűség névleges rádiuszát 9,3 km-nek (5 NM) vesszük. Ha a sűrűség egyenlő vagy kisebb a fenti jelzettnél, r_0 névlegesen 18,5 km (5 NM).

1.3.2.5 A táblázat azon a kiegészítő feltételezésen alapszik, hogy a legnagyobb sűrűségű, 0,087 légijármű/km^2 (0,3 légijármű/NM^2) légtérben a válaszjeladóval felszerelt összes légijármű legalább 25 százaléka S-móddal felszerelt. Ha 5 százaléknál kevesebb van S-móddal felszerelve, a követési valószínűség A/C-módú légijárművek esetében a megnövelt szinkron csonkítás miatt kisebb, mint 0,90. Ha r_0-on belül a forgalom sűrűség meghaladja a táblázatban megadott határokat, vagy ha a forgalom számossága az r_0-on kívül folytatódóan gyorsabban nő, mint *r*, a tényleges nyomvonal megállapítás valószínűsége A/C-módú légijárműveknél ugyancsak kisebb lesz, mint 0,90, a megnövekedett szinkron csonkítás miatt. Ha a közeledési sebesség meghaladja a megadott határokat, a követés az A/C-módú és az S-módú légijárműveknél későn jöhet létre. Ha a más ACAS-ok száma a területen belül meghaladja a táblázatban megadott határokat, a 4. fejezet 4.3.2.2 pontjában szereplő interferencia korlátozó követelmények megkövetelik, hogy az ACAS adattovábbítási teljesítmény és a vevő érzékenység tovább csökkenjen, és ezáltal egy később létrehozott időt eredményez. Mindazonáltal a követési valószínűség várhatóan fokozatosan csökken, ahogyan ezeknek a korlátoknak valamelyikét túlhaladják.

1.3.2.6 A táblázat tükrözi azt a tényt, hogy az ACAS követés teljesítésében a közelítési sebesség és a forgalom sűrűség közötti kompromisszum jut szerephez. Bár előfordulhat, hogy nem lehet fenntartani a nyomvonal nagy valószínűség értékét, amikor a forgalom sűrűség és a megközelítő légijármű közeledési sebessége egyaránt nagy, az ACAS-nak megvan a megbízható nyomvonal létrehozásának képessége nagysebességű megközelítők légijárművekre viszonylag kis sűrűségű útvonali légtérben (amelyeket tipikusan jellemez a 0,017 légijármű/km^2, azaz 0,06 légijármű/NM^2 értéknél kisebb sűrűség), vagy amikor nagyobb sűrűségű, kismagasságú terminál légtérben üzemel, ahol a közlekedési sebességek üzemelési okok miatt tipikusan 260 m/s (500 csomó) alatt vannak.

1.3.2.7 A táblázat arról a tényről is tanúskodik, hogy nagyobb közeledési sebességek inkább az előre tartó irányhoz kapcsolódnak, mint az oldalsó vagy hátrafelé tartó irányhoz, úgy, hogy az ACAS felderítési kialakítás nem kíván megbízható észlelést a legnagyobb közelítési sebességekre oldal vagy hátrafelé irányokban.

1.3.3 RENDSZER TÁVOLSÁGI KORLÁTOZÁSOK

Az ACAS megkövetelt névleges követés hatótávolsága 26 km (14 NM). Azonban amikor nagy sűrűségben üzemel, az interferencia korlátozási sajátosság a rendszer hatótávolságát közelítőleg 9,3 km-re (5 NM) csökkentheti. A 9,3 km-es (5 NM) távolság megfelel egy 260 m/s-os (500 csomó) találkozás elleni védelem létrehozásának.

1.4 Az elektromágneses környezet zavarásának szabályai

1.4.1 Az ACAS berendezés minden forgalom sűrűségben működőképes az elektromágneses környezet lerontása nélkül. Mindegyik ACAS berendezés ismeri a helyi légtérben működő többi ACAS egység számát. Ezt az ismeretet használják fel annak biztosítására, hogy ACAS működés ne nyomja el az idő 2 százalékánál hosszabb ideig a válaszjeladó működését, és annak biztosítására, hogy az ACAS ne járuljon hozzá egy elfogadhatatlanul magas működési sebesség előidézéséhez, amely leronthatná a földi SSR felderítési teljesítményét. Több ACAS egység egymás közelében együttműködően limitálja a saját továbbításait. Ahogyan az ilyen ACAS egységek száma növekszik, mindegyikük lekérdezési kiosztása úgy csökken. Így mindegyik ACAS egység figyeli az észlelési távolságon belül lévő többi ACAS egység számát. Ezt az információt azután saját lekérdezési sebességük és teljesítményük limitálására használják szükség szerint. Amikor ez a korlátozás teljes érvényű, az ACAS egységek hatásos távolsága lehetséges, hogy nem megfelelő elfogadható figyelmeztetési idők szolgáltatására 260 m/s (500 csomó) meghaladása esetén. Ez a körülmény általában kismagasságon fordul elő, ahol ez a közeledési sebesség képesség kielégítő. Amikor az ACAS légijármű a földön van, az ACAS automatikusan limitálja lekérdezésének teljesítményét. Ezt a korlátozást az ACAS számának (n_a) az interferencia korlátozó egyenlőtlenségekben a mért érték háromszoros értékére történő állításával végzik. Ezt az értéket úgy választják, hogy biztosítsa, hogy az ACAS egység a földön ne járuljon hozzá több interferenciával az elektromágneses környezethez, mint ami elkerülhetetlen. Ez az érték egy közelítőleg 5,6 km-es (3 NM) felderítési távolságot szolgáltat a legnagyobb sűrűségű terminál területeken a helyi légiforgalom megbízható földi ACAS felderítés fenntartására, és 26 km-es (14 NM) távolságot nagyon kis sűrűségű légtérben széles területű felderítés biztosítására SSR hiányában.

1.4.2 Egy ACAS egység jelenlétét a többi ACAS egységnek egy ACAS lekérdezés periódikus továbbítása közli, amely az ACAS légijármű címzését megadó közleményt tartalmaz. Ezt a továbbítást névlegesen minden 8-10 másodpercben küldik S-módú közvetítés címzés felhasználásával. Az S-módú válaszjeladók úgy vannak kiképezve, hogy közlési adatokat a közvetítési lekérdezéstől válasz nélkül vegyék. Az ACAS légijármű S-módú válaszjeladója által vett bejelentés közléseket az interferencia korlátozási algoritmus figyeli, hogy a környezetében lévő ACAS egységek számának a becslését kialakítsa.

2. Rendszer teljesítményt befolyásoló tényezők

2.1 Szinkron csonkítás

Amikor egy C-módú lekérdezést továbbítanak, az összes válaszjeladó, amely észleli azt, válaszol. Mivel a válasz időtartama 21 mikromásodperc, azok a légijárművek, amelyek távolsága az ACAS-tól körülbelül 2,8 km-en (1,5 NM) belül van, egymásnak generálnak válaszokat, amelyek a lekérdező légijárműveknél folytonosan és szinkron átfedik egymást. Az egymást átfedő válaszok száma arányos a légijármű sűrűséggel és az ACAS-tól való távolságukkal. Tíz vagy több átfedő választ lehet venni mérsékelten sűrű terminál légtérben. Megbízhatóan dekódolni csak körülbelül három átfedő választ lehet. Ennélfogva redukálni kell az egyes lekérdezésekre válaszoló válaszjeladók számát. Suttogás-kiabálás és irány átvitel eljárások állnak rendelkezésre az ilyen szinkron csonkítások szabályozására (lásd 3.2 és 3.3 pontok). Mindkettő szükséges a legnagyobb forgalomsűrűségben üzemelő ACAS-okhoz.

2.2 Többszörös nyomvonal terep visszaverődésektől

2.2.1 Az SSR válaszjeladók a légijármű aljára szerelt negyed-hullámú monopol antennákat használnak. Ennek a fajtának a végantennája a vízszintes sík alatt 20-30 fok közötti szögeknél csúcs elevációs (látóhatár fölötti szögmagasság) nyereséggel rendelkezik. Ez megfelel a föld-levegő felderítés számára, de a közvetlen levegő-levegő felderítési nyomvonal kedvezőtlen vonatkozásban működhet a föld visszaverődési pályához, különösen víz felett.

2.2.2 Ha az ACAS egység alulra szerelt antennát használ, akkor vannak geometriák, amelyeknél a visszavert jel következetesen erősebb, mint a közvetlen jel. Azonban amikor tetőre szerelt antennát használnak lekérdezéshez, csúcsnyereség jelenik meg egy pozitív látóhatár fölötti szögmagasságnál (elevációs szögnél), és a jel-többszörös nyomvonal arány javul. Így, amikor az ACAS a tetőre szerelt antennáról továbbít adást, a többszörös nyomvonal hatásai jelentősen csökkennek. De még akkor is, amikor tetőre szerelt antennát használnak, a többszörös nyomvonal esetenként meghaladja a vevő küszöböt. Így szükség van alacsonyszintű többszörös nyomvonal kiküszöbölésére. Ezt az ACAS változó vevő küszöb segítségével éri el (lásd 3.4 alpont).

2.3 Magasságmérési adatok minősége

2.3.1 MÉRÉSI HIBÁK

2.3.1.1 Két konfliktusban lévő légijármű közötti függőleges elkülönítést a saját magasság és a megközelítő légijármű magassága közötti különbségként mérik a C-módú vagy S-módú válaszokban közöltek alapján. Ha az ACAS légijármű egy szállító-repülőgép, akkor ez általában pontos magasságméréssel rendelkezik; a megközelítő légijármű kevésbé pontos magasságméréssel rendelkezhet.

2.3.1.2 A magasságmérés hibája kétféle hatást okozhat: először is, ha a légijármű majdnem összeütközési útvonalon repül, a hibák biztonságos elhaladást jelezhetnek, és a fenyegető légi majdnem-összeütközést az ACAS nem háríthatja el; másodszor, ha a légijárművek majdnem-összeütközés útvonalon repülnek, de magasság szerint elkülönítettek, a hibák rossz irányban végrehajtott ACAS manőverekhez vezetnek, amely egy még szorosabb találkozást eredményezhet.

2.3.1.3 Az ACAS a jelentett magasság alapján a legszorosabb megközelítésnél a légijárművek között legalább 90 m-es (300 láb) különbség elérésére törekszik. Így, ha a megközelítő légijármű és az ACAS magasságmérési hibájának kombinációja a 90 m-t (300 láb) megközelíti, az ACAS jelenléte ellenére véges kockázata lenne egy nem megfelelő függőleges elkülönítésnek. A tengerszinttől a 400-as repülési szintig terjedő magasságokban repülő ACAS és nem-ACAS légijárművek várható magasságmérési hibáinak vizsgálata ahhoz a következtetéshez vezetett, hogy a kockázat lényegében elhanyagolható, ha mindkét légijármű nagypontosságú magasságmérő rendszerrel van ellátva, amelyek közelítőleg 15 m-es (50 láb) négyzetes középhiba (RRS) elérésére képesek. Az a következtetés is adódott, hogy ha nagypontosságú magasságmérővel ellátott tipikusan általános célú ACAS légijárműveket tartalmazó légtérben repül (amelyeknek négyzetes középhibája közelítőleg 30 m (100 láb) és normál eloszlású), akkor a magasságmérési hibák alkalmanként nem megfelelő ACAS megoldási tanácsadásokhoz vezetnek. Azonban ez nem fordul elő olyan gyakran, hogy a rendszer hatásosságát komoly mértékben zavarná. A működés nem-megfelelőnek tekinthető akkor, ha mindkét találkozó légijárműnek kispontosságú magasságmérő rendszere van. Ez vezetett ahhoz a követelményhez, hogy az ACAS nagypontosságú rendszerrel rendelkezzen.

2.3.2 MAGASSÁG BIT MEGHIBÁSODÁS

Ha a megközelítő légijárműtől kapott C-módú vagy S-módú magasság jelentések bit hibát tartalmaznak, az ACAS a megközelítő légijármű hibás függőleges helyzet és/vagy hibás sebesség értékelését alakíthatja ki. Ezeknek a hibáknak hasonló hatásuk lehet, mint a mérési hibáknak. Az ilyen hibák a legnagyobb valószínűséggel akkor fordulnak elő, amikor a magassági adat forrás egy Gilham kódoló, és a Gilham kódolású adatok használatának saját légijármű magasságra súlyosan káros következményei lehetnek. Amikor nincs más forrás, mint Gilham kódolású adatok, két kódolót kell használni, és egy összehasonlítási feladatot az S-módú válaszjeladónál, amelyet a magassági adatok hibáinak észleléséhez használnak, mielőtt azokat az ACAS részére szolgáltatják.

2.3.3 SAJÁT LÉGIJÁRMŰ MAGASSÁG HITELESSÉGE

A saját légijármű összes magassági adat forrását meg kell vizsgálni hitelesség szempontjából, beleértve a finom magasság adatokat (amelyek különböző forrásokból származhatnak: giroszkóp, légjel számítógép, stb.) és radar magasság adatokat.

2.4 Annak veszélye, hogy földi SSR helyszíni monitorok (PARROT-ok) hamis forgalmi és megoldási tanácsadásokat váltanak ki

Az ACAS a hatótávolságába eső összes SSR válaszjeladót lekérdezi, beleértve a földi elhelyezésű válaszjeladó telepítéseket, amelyeket földi radarrendszerek működésének figyelésére használnak, vagy a vizsgálati válaszjeladókat is. Ha ezek a földi elhelyezésű válaszjeladók hamis magassági adatokkal válaszolnak, fennáll a potenciális veszélye annak, hogy az ACAS hamis forgalmi tanácsadást vagy megoldási tanácsadást generál. Ennek a problémának a megelőzéséhez a *"Manual of Secondary Surveillance Radar (SSR) Systems* (Doc 9684)" kiadvány információkat szolgáltat a pozíció szerint beállítható távolság referencia orientációs válaszjeladó (PARROT) működéséről és a válaszjeladó vizsgálati berendezésekről.

2.5 SSR S-módú címzések kiosztása és kijelölése

A biztonságos üzemelés érdekében a rendszer megkívánja, hogy az összes S-móddal felszerelt légijármű egyéni címzéssel rendelkezzen. Több légijármű ugyanazon címzéssel vagy légijármű olyan címzéssel, amely nem felel meg a 10. Annex, III. Kötet I. Rész 9. fejezetének, károsan befolyásolhatja a felderítési és koordinációs feladatot.

2.6 ACAS II működésének TCAS I rendszerek általi befolyásolásának lehetősége

Megjegyzés. – Ebben az anyagban a TCAS I, mint olyan rendszer lett meghatározva, amely SSR lekérdezéseket használ a repülőszemélyzet forgalom riasztás figyelmeztető információkkal való ellátására a "láss és kerülj" alapelv kiegészítéseként.

Néhány TCAS I rendszer elnyomott megoldási tanácsadású ACAS II interferencia korlátozó eljárást alkalmaz. Ezek a rendszerek nem elégítik ki az ACAS I Szabványok és Ajánlott Eljárások-at. Mivel az ACAS II interferencia korlátozó más ACAS II légijárművekkel való közvetlen kölcsönhatáson nyugszik (ACAS rádióadást és S-módú válaszjeladó válaszokat használva), ilyen TCAS I légijárművek jelenléte közvetlenül befolyásolhatja a közelben lévő ACAS II légijárművek felderítési működését. Ha a légijárművekre ilyen TCAS I rendszerek vannak felszerelve, amely légijárművekről tudott, hogy egymáshoz szoros közelségben repülnek (pl. helikopterek vagy vitorlázó repülőgépek), akkor a hatás csökkentheti más ACAS II légijárművek ellenőrzési távolságát és késleltetheti az összeütközés elhárító figyelmeztetéseket. Ezeknek a gondoknak a fényében, a TCAS I rendszereket (amelyek ACAS II interferencia korlátozó eljárást alkalmaznak), nem szabad alkalmazni olyan légijárműveknél, amelyekről tudott, hogy egy hosszabb időszakon keresztül egymáshoz szoros közelségben üzemelnek. Gondos figyelmet kell fordítani annak biztosítására, hogy a hatás az SSR elektromágneses környezetére elfogadható legyen, mivel ilyen TCAS I egységek nagyon nagy számban lehetnek felszerelve.

3. Megfontolások a műszaki megvalósításról

3.1 Rendszer működés

3.1.1 VESZÉLYEZTETŐ LÉGIJÁRMŰVEK FELDERÍTÉSE

3.1.1.1 Az alábbiakban ismertetett felderítési eljárások fő célja, hogy helyzet jelentéseket szerezzenek be és ezeket korrelációba (összefüggésbe) hozzák útirányok kialakításához. Ez magában foglalja a célkövetők használatát és megkívánja a sebességek becslését.

3.1.1.2 Az ACAS egység névlegesen másodpercenként egy lekérdezés sorozatot továbbít. A lekérdezéseket +54 +2 dBm névleges effektív sugárzott teljesítménnyel továbbítják, amelyet a légijármű hossztengelyéhez viszonyítva zérus fok látóhatár fölötti szögmagasságnál (elevációs szögnél) mérnek. Amikor az A/C-módú és S-módú magasság jelentő válaszjeladók ezeket a lekérdezéseket veszik, a válaszjeladók válaszokat továbbítanak, amelyek közlik a magasságukat. Az ACAS egység kiszámítja mindegyik megközelítő légijármű távolságát a lekérdezés továbbítás és a válasz vétele között eltelt idő felhasználásával. A magasság és távolság változás mértékét a válasz információk követésével határozzák meg.

3.1.1.3 Ha nincsenek zavarás, túlterhelés, interferencia-korlátozó feltételek, vagy más rontó hatások, a berendezés nominálisan képes felderítés ellátására 26 km-es (14 NM) távolságon belüli A/C-módú és S-módú célok esetében. Azonban, mivel a felderítés megbízhatósága csökken a távolság növekedésével, a berendezés csak azokat a célokat értékeli lehetséges veszélyeztető légijárműként, amelyek egy maximálisan 22 km-es (12 NM) távolságon belül vannak. Ezen a távolságon kívül eső cél nem lehet alkalmas megoldási tanácsadás generálás előidézésére. Azonban az ACAS képes 56 km-es (30 NM) névleges távolságon belüli ACAS-szal felszerelt légijárműtől származó ACAS rádióközvetítésű lekérdezések észlelésére.

3.1.1.4 A berendezésnek képesnek kell lennie A/C-módú vagy S-módú célok bármely kombinációinak ellenőrzésére maximálisan 30 légijárműből álló teljes csúcs kapacitásig. Az ACAS berendezés névlegesen képes nagy közeledési sebességű célok megbízható felderítésére maximálisan 0,017 légijármű per négyzetkilométer (0,06 légijármű per négyzet-NM) csúcs forgalom-sűrűségben, vagy közelítőleg 27 légijármű felderítésére 26 km-es (14 NM) rádiuszon belül.

3.1.1.5 Ha az átlagos forgalom-sűrűség meghaladja a fenti értéket, a megbízható felderítési távolság csökken. Az ACAS berendezés csak maximálisan 260 m/s (500 csomó) közeledési sebességű járműnél tud megbízható ellenőrzést biztosítani 0,087 légijármű per négyzetkilométer (0,3 légijármű per négyzet NM) átlagos forgalom sűrűségnél. A 260 m/s (500 csomó) közeledési sebességű céloknál megkövetelt felderítési távolság körülbelül 9,3 km (5 NM). Lehetséges 9,3 km-es (5NM) felderítést biztosítani egy rövid idejű 0,087 légijármű/km^2 (0,3 légijármű/NM2) vagy nagyobb csúcs forgalom-sűrűségben 30-as teljes cél kapacitás túllépése nélkül. Ha a teljes cél szám meghaladja 30-at bármely 26 km-es (14 NM) maximális távolságnál, a nagytávolságú célokat mindig elhagyhatják a kisebb sebességű célok megbízható felderítési képességének csorbítása nélkül. Így a 30 célhoz tartozó képesség csúcs (az A/C-módú és S-módú bármely kombinációja) megfelel az ACAS-nak, és ha a felderítés alatt álló A/C-módú plusz S-módú célok száma meghaladja a 30-at, az ezen felüli célokat törölni kell a csökkenő távolság sorrendjében, tekintet nélkül a cél típusára.

3.1.2 A/C-MÓDÚ VÁLASZJELADÓKKAL ELLÁTOTT MEGKÖZELÍTŐ LÉGIJÁRMŰVEK FELDERÍTÉSE

3.1.2.1 A/C-módú válaszjeladók felderítési tevékenységét egy csak C-módú körhívás (közös mód) lekérdezés periodikus továbbításával valósítja meg (3. fejezet, 3.1.2.1.5.1.2 pont). Ez válaszokra készteti az A/C-módú válaszjeladókat, de az S-módú válaszjeladókat nem, így megakadályozzák, hogy az S-módú válaszjeladók válaszai szinkron csonkulást szenvedjenek az A/C-módú válaszjeladók válaszaitól. A szinkron csonkulás egyéb eljárásai a következők: (1) irány antennák használata, hogy csak egy azimut szögtartományban lévő légijárműveket kérdezzen le, és (2) teljesítmény elnyomások és lekérdezések egymásutánisága sorozatának alkalmazása ("suttogás-kiabálás"-ként ("whispers-shout") ismert), amely csak azokat a légijárműveket kérdezi le, amelyek hasonló kapcsolat tartalékkal rendelkeznek (lásd 3.2.2 alpont). E két eljárás együttes használata hatékony eszközt szolgáltat a szinkron csonkulás hatásainak leküzdéséhez.

3.1.2.2 A suttogás-kiabálás lekérdezések sorozatát alkalmazza különböző teljesítmény szinten, amelyet az egyes felderítési felfrissítés idején továbbítanak. A lekérdezések mindegyikét a sorozatban, a legkisebb teljesítményhez tartozó kivételével, egy elnyomás továbbítás előz meg, ahol a lekérdezés első impulzusa az elnyomás továbbítás második impulzusaként szolgál. Az elnyomás továbbítási impulzus a lekérdezés első impulzusa előtt 2 mikromásodperccel kezdődik. Az elnyomás impulzust alacsonyabb teljesítmény szinten továbbítják, mint az azt kísérő lekérdezést, úgy, hogy a válaszjeladók, amelyek erre válaszolnak, csak olyanok lehetnek, amelyek a lekérdezést észlelik, de az elnyomást nem. Hogy védekezzenek annak lehetősége ellen, hogy bizonyos válaszjeladók nem válaszolnak a lekérdezésekre a sorozatban, az elnyomás impulzus továbbítás valamivel alacsonyabb teljesítmény szinten történik, mint a következő alacsony lekérdezés teljesítmény szintje. Az egymást követő lekérdezések közötti időközöknek legalább 1 ezredmásodpercnek kell lenni. Ez biztosítja azt, hogy a nagy távolságban lévő válaszjeladóktól érkező válaszokat nem tévesztik össze a rákövetkező lekérdezésre adott válaszokkal. Minden lekérdezést a sorozatban egyetlen felderítés felfrissítési időközön belül továbbítanak.

3.1.2.3. Az egyes csak C-módú körhívás lekérdezésekre adott válaszokat feldolgozzák, hogy meghatározzák az egyes válaszok távolsági és magassági kódját. A magasság kódokat maximálisan három átfedő válasznál lehet meghatározni, ha kellő figyelmet fordítanak a vett impulzusok mindegyike helyének azonosítására.

3.1.2.4 Az összes válasz vétele után, amelyek a suttogás/kiabálás sorozatra való reagálásként érkeztek, a megkettőzött válaszokat egyesíteni kell úgy, hogy mindegyik észlelt légijárműnél csak egy "jelentést" állítsanak elő. A jelentések távolságban és magasságban korrelációba (összefüggésbe) hozhatók az ismert megközelítő légijárművek előrejelzett pozícióival (azaz a meglévő nyomvonalakkal). Mivel a megközelítő légijárműveket nagy gyakorisággal kérdezik le (névlegesen másodpercenként egyszer), szoros korrelációt érnek el a távolság és magasság felhasználásával. A-módú kód nem igényel korrelációt. A jelentéseket, amelyek korrelációban állnak egymással, felhasználják a hozzájuk tartozó nyomvonalak kiterjesztésére. Azok a jelentések, amelyek nem hozhatók korrelációba a meglévő nyomvonalakkal, összehasonlíthatók az előzőleg korrelációba nem hozott jelentésekkel új nyomvonalak indítása érdekében. Új nyomvonal indítása előtt a válaszokat, amelyek a nyomvonal indításához vezetnek, meg lehet vizsgálni annak biztosítására, hogy ezek megegyezzenek az összes jelentősebb magassági kód bitekkel. Geometriai számításokat lehet végezni a terepről való többszörös pálya visszaverődések által okozott visszavert hamis célok azonosítására és kiszűrésére.

3.1.2.5 A megindítandó nyomvonalak megvizsgálhatók nyomvonal érvényességi kritériumok szempontjából, mielőtt beviszik az összeütközés elhárító algoritmusba. Ezeknek a vizsgálatoknak a célja a csonkulások és többszörös repülési pálya által létrehívott hamis nyomvonalak kiselejtezése. A hamis útirányokat általában rövid élettartam jellemzi.

3.1.2.6 Azokat a légijárműveket, amelyek nem jelentenek magasságot a C-módú válaszokban, a C-módú válasz keret impulzusok felhasználásával észlelik. Ezeket a légijárműveket a távolság, mint korrelációs kritérium felhasználásával követik. Az iránytengely kiegészítő felhasználása a korreláció céljából, segít csökkenteni a hamis nem C-módú nyomvonalak számát.

3.1.2.7 *Válasz egyesítés.* Többszörös választ generálhat az A/C-módú cél, amely egynél több suttogás-kiabálás lekérdezésre válaszol az egyes suttogás-kiabálás sorozatok során, vagy az a cél, amely a lekérdezésekre a felső és alsó antennáról egyaránt válaszol. A berendezéstől elvárható, hogy egynél több pozíció jelentést nem generál bármely cél esetén, még ha az a cél egynél több lekérdezésre válaszol az egyes felderítés felfrissítési időközök alatt.

3.1.2.8 *A/C-módú felderítés indítás.* A berendezés csak akkor viszi be a kezdeti pozíció jelentéseket az összeütközés elhárító algoritmusba, ha az alábbi a)-ban és b)-ben közölt feltételek teljesülnek:

a) kezdetben C-módú válasz érkezik a céltól a három egymás utáni ellenőrzés felfrissítési periódus mindegyikében, és

1) a válaszok nincsenek kölcsönös összefüggésben a felderítési válaszokkal, amelyek más nyomvonalakkal kapcsolódnak;

2) a két legutolsó válasz által jelzett távolság változási sebesség kisebb, mint 620 m/s (1200 csomó);

3) a legrégebbi válasz megegyező a fenti távolság változás sebességgel abban az értelemben, hogy a távolsága 95,3 m-en (312,5 láb) belül van egy olyan egyenes vonalon, amely a két legutolsó válaszon megy keresztül;

4) a válaszok korrelációban állnak egymással a magasság kód bitjeikben;

b) egy negyedik összefüggő válasz érkezik öt felderítés felfrissítési időközön belül, amely a három fenti a)-beli három egymás utáni válasz közül a harmadikat követi, és az a)4) fenti pontban meghatározott előrejelzett magasság kód becslés ±60 m-en (±200 láb) belül van.

3.1.2.8.1 Az itt következő példa a szabályok elfogadható együttesére a válasz kód bitek korrelációinak értékeléséhez és a kezdeti magasság nyomvonal kód meghatározásához, amelyek egy célt értékelnek. Három válasz csak akkor kerül összefüggésbe, ha:

a) mind a nyolc D, A és B kód impulzusaik megegyezők, vagy

b) a D, A és B kód impulzusaik közül hét és legalább egy C kód impulzus megegyező.

3.1.2.8.2 A három válasz közötti kód megegyezés vizsgálatát egyedileg végzik a válasz impulzus pozíciók mindegyikére. Ez a vizsgálat egyedül kód impulzusok jelenlétén alapszik; egyezés akkor van egy adott válasz impulzus pozíciónál, ha mind a három választ EGY-el észlelik a pozícióban, vagy mind a három választ ZÉRUS-sal észlelik ebben a pozícióban. Az ezekkel az impulzus észlelésekkel kapcsolatos megbízhatóság az egyezést nem befolyásolja.

3.1.2.8.3 A megbízhatósági jelző egy válaszimpulzus pozíciónál "alacsonyra" állított, ha létezik egy másik vett válasz (akár valódi, akár fantom), amelynek ugyanazon pozícióihoz tartozó ±0,121 mikromásodpercen belül egy impulzusa lehetett volna. Egyéb esetben a megbízhatósági jelző "magasra" van beállítva.

3.1.2.8.4 Ha a három válasz között egy adott válasz impulzus pozíciónál nincs egyezés, a kezdeti nyomvonal impulzus kód becslés erre a pozícióra az egyedi impulzus kódok értékein alapul és ezekkel az impulzus kódokkal három válaszban kapcsolódó megbízhatósági zászló értékeken.

3.1.2.8.5 Amikor a megegyezés egy adott impulzus pozíciónál hiányzik, a kezdeti nyomvonal becslés szabályai ennél a pozíciónál azon az elven alapulnak, hogy "alacsony" megbízhatósági EGY-ek gyanúsak. A szabályok a következők:

a) Ha a legfrissebb (harmadik) válaszban az észlelt kód egy adott impulzus pozícióban “magas” megbízhatóságú vagy ZÉRUS, a kezdeti nyomvonal impulzus kód becslés ennél a pozíciónál ugyanaz, mint az ebben a pozícióban a legfrissebb válaszban észlelt kód.

b) Ha a legfrissebb válaszban az észlelt kód egy adott impulzus pozícióban “alacsony” megbízhatóságú EGY, a kezdeti nyomvonal impulzus kód becslés a pozíciónál ugyanaz, mint az ebben a pozícióban a második válaszban megfigyelt kód, amely nem volt szintén “alacsony” megbízhatóságú EGY. Ha a második szinten egy “alacsony” megbízhatóságú EGY, a kezdeti nyomvonal impulzus kód becslés ugyanaz, mint az a kód, amelyet ebben a pozícióban az első válaszban észleltek.

3.1.2.9 *A/C-MÓDÚ FELDERÍTÉS KITERJESZTÉSE*

3.1.2.9.1 *Általános.* A berendezés csak akkor folytatja egy célra vonatkozó helyzet jelentések bevitelét az összeütközés elkerülési algoritmusba, ha:

a) a nyomvonalat nem azonosították képként (lásd 3.1.2.9.6 pont); és

b) a válasz magasságok egy ±60 m-es (200 láb) magasság ablakon fordulnak elő, amely a válasz előzményeiből előrejelzett magasságon központosul; és

c) az összes válasz, amelyet a veszélyeztető légijármű értékelésére használnak, a kezdeti eljárás után egy távolság ablakban helyezkedik el, amely a válasz előzményeiből előrejelzett távolságon központosul.

3.1.2.9.2 *Távolság korreláció* Az itt következő egy példa a szabályok egy elfogadható együttesére a távolság ablak méreteinek meghatározásához:

a) A nyomvonalakat egyedenként dolgozzák fel növekvő távolság szerinti sorrendben legalább 15 m-es (50 láb) input távolság pontossággal és legalább 1,8 m-es (6 láb) számítási pontossággal. A távolság becslését rekurzív (alfa-béta) célkövetővel végzik, és 0,67-es alfával és 0,25-ös bétával előrejelzik.

b) Mindegyik felderítési felfrissítés után új távolságmérési eredmény áll rendelkezésre mindegyik célra. Mivel a mérés hibákat tartalmaz, ki kell igazítani az előző mérések alapján, hogy az éppen aktuális cél helyzetére és sebességére javított becsléseket nyerjenek. A távolság és távolság változási sebesség becslési egyenletei a következők:

$r(t)$ becslés = $r(t)$ előrejelzés + [alfa x ($r(t)$ mérés - $r(t)$ előrejelzés)]

$\dot{r}(t)$ becslés = $\dot{r}(t - T_p)$ becslés + [(beta /T_p) x ($r(t)$ mérés - $r(t)$ előrejelzés)],

ahol T_p az éppen folyó és az előző mérés közötti időkülönbség.

c) A növekedések, alfa és beta meghatározzák a megbízhatóság viszonylagos fokát az éppen folyó és a megelőző mérésre vonatkozóan; az egység növekedései teljesen megbízhatóak az éppen folyó mérést illetően, és nincs szükség kiigazításra.

d) A fenti egyenletekből nyert becsléseket ezt követően felhasználják a következő mérés időpontjában fennálló távolság előrejelzésére a következőképpen:

$r(t+T_n)$ előrejelzés = $r(t)$ becslés + [$\dot{r}(t)$ becslés x T_n],

ahol T_n az éppen folyamatban lévő és a következő mérés közötti időkülönbség.

e) A távolság korreláció ablak az előrejelzett távolságnál központosul, és fél-ablak szélessége van a következők szerint:

760 láb, ha érintetlen utolsó időköz 570 láb, ha felfrissített utolsó időköz	+	**ha nyomvonalat nem hoztak létre:** 0 **ha nyomvonalat létrehoztak:** 2000 láb, ha 0,00 NM <= r<0,17 NM 1000 láb, ha 0,17 NM <= r<0,33 NM 600 láb, ha 0,33 NM <= r<1,00 NM 240 láb, ha 1,00 NM <= r<1,50 NM 0 láb, ha 1,50 NM <= r

f) Ha a nyomvonal 3050 m (10000 láb) felett van, a második zárójelben lévő tagokat néggyel meg kell szorozni.

3.1.2.9.3 *Magasság korreláció.* A magasság korreláció céljából a magasságot egy 0,28-as alfájú és 0,06-os bétájú alfa-béta követővel becsülik és előrejelzik. A követő 30 m (100 láb) osztva 16-al pontossággal rendelkezik. A magasság előrejelzést a legközelebbi 30 m-re (100 láb) kikerekítik és a szürke kódjait is kiszámítják. A hosszabb távú magasság előrejelzések, amelyeket veszélyeztető észlelési logikával végeznek, pontosabb magasság követési eljárást igényelnek (lásd 3.5.3 alpont). A távolság korrelációs ablakban fekvő válasz(oka)t növekvő távolsági sorrendben vizsgálják magassági korreláció szempontjából. A nyomvonalat első válasszal felfrissítik, amely pontosan megegyezik (minden bitben) a fentiek szerint számolt három szürke kód bármelyikével. Ha a válasz nem illeszthető, két további szürke kódot számolnak ki, és az eljárást újra megpróbálják. A két kód lesz az előrejelzett magasság ±60 m (200 láb).

3.1.2.9.4 *Nyomvonal felfrissítés – létrehozás.* A felfrissítő válasz (ha van) más nyomvonalak felfrissítésénél a további megfontolásoknál, vagy a nyomvonal kezdési folyamatokban kizárásra kerül. Ha nincs felfrissítő válasz, a távolság és magasság becsléseket egyenlővé teszik a megfelelő előrejelzett értékkel. Ha ez a hatodik egymásután következő időköz, amelynek nincs felfrissítő válasza, a nyomvonalat elvetik. Ha felfrissítő válasz esete áll fenn, és a nyomvonalat nem képként azonosították (lásd 3.1.2.9.6 alpont), a nyomvonal létrehozottnak tekinthető, azaz veszélyeztető észlelés logikai felhasználásra rendelkezésre áll. Ha egyszer létrejött, egy nyomvonal megalapozott marad, amíg el nem vetik, még ha sorozatosan egy képi nyomvonal feltételeit elégíti is ki.

3.1.2.9.5 *Nyomvonal szakadások vizsgálata.* Amikor az összes nyomvonalat feldolgozták, ezeket összekombinálják azokkal a nyomvonalakkal, amelyeket az éppen folyamatban lévő pásztázás során újonnan indítottak, azután az összes nyomvonalat párként vizsgálják annak megállapítására, hogy egy adott nyomvonal-pár nagy valószínűséggel ugyanazt a megközelítőt képviseli-e. Ha:

a) a távolságok legalább 150 m-rel (500 láb) eltérnek

b) a távolság változási sebességek legfeljebb 4,6 m/s-al (8,9 csomó) különböznek, vagy

c) vagy

1) a magasságok legfeljebb 30 m-el (10 láb) különböznek, vagy

2) a magasság változási sebességek legfeljebb 3 m/s-al (10 láb/s) különböznek és mindkét nyomvonal ugyanazon pásztázás során indult,

akkor csak az egyik nyomvonalat tartják meg, és annak a nyomvonalnak van preferenciája, amely a válaszok nagyobb számát mutatja fel az indulás óta.

3.1.2.9.6 *Képi nyomvonal feldolgozás.* Azokat a nyomvonalakat, amelyeket a földről tükörszerűen visszavert válaszok alakíthattak volna ki, képi nyomvonalnak nevezzük. Egy nyomvonalat képinek azonosítunk, ha létezik egy nyomvonal a rövidebb távolságnál (valódi nyomvonalnak nevezik) úgy, hogy:

a) a különbség a valódi magasság és a képi magasság között kisebb vagy egyenlő 60 m (200 láb) magasság-jelentő céloknál, vagy mind a képi nyomvonal, mind a valódi nyomvonal nem-magasság-jelentő; és

b) a különbség a mért képi távolság változási sebesség és az $\dot{r}_i$ számított képi távolság változási sebesség között kisebb vagy egyenlő 21 m/s (40 csomó), ahol a számított képi távolság változási sebesség vagy (egyetlen visszaverődés esetére):

$$\dot{r}_i = \left(\frac{1}{2}\right)[\dot{r} + \left(\frac{1}{2r_i - r}\right)[((2r_i - r)^2 - r^2 + (Z_0 - Z)^2)^{\frac{1}{2}}(\dot{Z}_0 + \dot{Z})$$
$$+ r\dot{r} - (Z_0 - Z)(\dot{Z}_0 - \dot{Z})]]$$

vagy (kettős-visszaverődés esetére):

$$\dot{r}_i = \left(\frac{1}{r_i}\right)\left[\left(r_i^2 - r^2 + (Z_0 - Z)^2\right)^{\frac{1}{2}}(\dot{Z}_0 + \dot{Z}) + r\dot{r} - (Z_0 - Z)\ (\dot{Z}_0 - \dot{Z})\right]$$

ahol:

r_i a képi távolság,

r a valódi távolság,

Z a valódi magasság magasságjelentés célok esetében, vagy Z a saját magasságra van beállítva nem-magasság jelentés célok esetén, és

Z_0 a saját magasság

Ha egy nyomvonalat képi nyomvonalként azonosítanak, az megtartható, de nem tekinthető létrehozottnak veszélyeztetés észlelési logika általi felhasználáshoz.

3.1.2.10 *A/C-módú jelentések hiánya.* A berendezés az előrejelzett pozíció jelentések továbbítását A/C-módú céloknál az összeütközés elkerülési algoritmushoz az utolsó érvényes korrelációs választ követő hat ellenőrzés felfrissítési intervallumon keresztül folytatja, hacsak a cél újra ki nem elégíti a 3.1.2.8 alpont ellenőrzés indítási kritériumait.

3.1.3 AZ S-MÓDÚ VÁLASZJELADÓVAL FELSZERELT MEGKÖZELÍTŐ LÉGIJÁRMŰVEK FELDERÍTÉSE

3.1.3.1 Hatékony levegő-levegő felderítési eljárásokat fejlesztettek ki S-módú válaszjeladóval felszerelt megközelítő légijárművekre. Az S-módú szelektív címzés miatt nincs az S-módú válaszjeladók felderítésével kapcsolatos szinkron csonkulás. Azonban a többszörös nyomvonallal foglalkozni kell és az S-módú válaszjeladók felderítését a lehető legkevesebb lekérdezéssel kell végezni a zavarás minimalizálás érdekében.

3.1.3.2 Az S-módú modulációs formátumok jellegüknél fogva inkább többszörös nyomvonal állóak, mint az A/C-módú modulációs formátumok. Azonban az S-módú átvitelek nagyobb hossza valószínűbbé teszi a többszörös nyomvonal általi átlapolást. A felső szerelésű antennák és változó vevő küszöbök használata (az S-módú válasz bevezetés védelmére) elfogadható szintre növeli a többszörös nyomvonal állóságot megbízható levegő-levegő ellenőrzéshez. Széttelepített antennájú válaszjeladók használata ACAS légijárműveken további megbízhatósági tartalékot szolgáltat a konfliktusban lévő ACAS légijármű párok közötti koordinációhoz.

3.1.3.3 Az S-módú lekérdezés gyakoriságokat alacsony szinten tartják a válaszjeladó átvitelek passzív észlelésével és azáltal, hogy csak azokat a megközelítő légijárműveket kérdezik le másodpercenként egyszer, amelyek rövid időn belül veszélyeztető légijárművekké válhatnak. Azokat a megközelítő légijárműveket, amelyek nem valószínű, hogy rövid időn belül veszélyeztető légijárművekké válnak, kisebb gyakorisággal (azaz minden 5 másodpercben egyszer) kell lekérdezni. A passzív címzésre vonatkozó adatbegyűjtés megakadályozza az SSR és ACAS rendszer többi elemével való szükségtelen interferenciát. Az ACAS lehallgatja az S-módú körhívás válaszokat (DF=11, adatgyűjtő squitter adások, 3. fejezet, 3.1.2.8.5.1 pont, vagy DF=17, kiterjesztett squitter átvitelek, 3. fejezet, 3.1.2.8.6.1 pont). Ezek az S-módú földi állomások körhívás lekérdezéseire adott válaszban vagy spontán adattovábbításokban (ezeket nevezzük squitter-nek) jelennek meg, 0,8-1,2 másodperces időközökben. A squitterek vétele váltakozhat a felső és alsó antenna között. Ha vételt kapcsolnak, a kapcsolási idők szabályozása szükséges, a széttelepített antennával rendelkező S-módú válaszjeladók által továbbított squiterekkel való nemkívánatos egyidejűség elkerülése érdekében.

3.1.3.4 A 24-bites légijármű címzést a squitterben hiba kódolás védi, hogy a helyes címzés kinyerését nagy valószínűségét biztosítsák. Mivel a squitter továbbítás nem tartalmaz magassági információt, az ACAS a magasság beszerzését passzív módon, az S-módú válaszokból próbálja megoldani, amely válaszokat a földi lekérdezésekre, vagy más ACAS légijárművektől eredő lekérdezésekre generálták. Ha a magasságot nem veszik röviddel a címzés észlelése után, az S-módú légijárművet aktívan lekérdezik a magasság megszerzése céljából.

3.1.3.5 Miután az ACAS meghatározta egy észlelt S-módú légijármű magasságát, ennek a légijárműnek a magasságát összehasonlítja a saját magasságával. A magasság összehasonlításnak az a célja, hogy meg lehessen határozni a cél elhanyagolhatóságát, vagy azt, hogy a célt le kell-e kérdezni a cél távolságának és sebességének meghatározása érdekében. Ha a mért távolság és a létrehozott sebesség azt jelzi, hogy összeütközés veszélyeztetése áll fenn (vagy hamarosan bekövetkezhet), a megközelítő légijárművet másodpercenként egyszer le kell kérdezni, és az eredményezett nyomvonal adatokat be kell táplálni az összeütközés elhárító algoritmusokba. Egy nagyobb távolságban lévő légijárművet csak olyan gyakran kell lekérdezni, amely a nyomvonal fenntartásához szükséges, és biztosítja, hogy másodpercenként egyszer a légijárművet lekérdezzék, mielőtt veszélyeztető légijárművé válna.

3.1.3.6 Passzív észlelés használata magasság összehasonlítással kombinálva és a nem-veszélyeztető megközelítő légijármű kevésbé gyakori lekérdezése automatikusan csökkenti az S-módú lekérdezési sebességet, amikor a többi ACAS légijármű helyi sűrűsége nagyon nagy. Ezért egy magasabb lekérdezési teljesítmény szint áll rendelkezésre az ellenőrzési teljesítmény növelésére.

3.1.3.7 AZ *S-MÓDÚ FELDERÍTÉS KEZDEMÉNYEZÉSE*

3.1.3.7.1 A berendezést S-módú felderítés minimális S-módú lekérdezéssel való megvalósítására tervezték. Az S-módú célok identitását a DF=11 vagy DF=17 értékekkel vett passzív figyelési adatátvitelekkel határozzák meg. A vett squitterekhez hiba észlelést és helyesbítést alkalmaznak, hogy csökkentsék a feldolgozandó címzések számát. Az S-módú célok magassága, amelyektől squittert kaptak, a DF = 0-val (rövid levegő-levegő ellenőrző válaszok, 3. fejezet, 3.1.2.8.2 alpont) vagy DF = 4-el (ellenőrző magasság válaszok, 3. fejezet 3.1.2.6.5 alpont) vett figyelő adásokkal határozzák meg.

A berendezés figyeli a squittert és a magasság válaszokat, amikor ez nem továbbít vagy vesz S-módú vagy C-módú lekérdezésekre küldött válaszokat. Minden vett választ megvizsgálnak, a további elvégzendő műveletek szempontjából.

3.1.3.7.2 Hogy csökkentsék a szükségtelen lekérdezések számát, egy squitter célt nem kérdeznek le, ha olyan kevés squittert és magasság választ kaptak tőle, hogy ez nem jelez veszélyeztető légijárművet. A célokat, amelyek veszélyeztetők lehetnek, érvényes céloknak nevezik. A berendezés úgy van kialakítva, hogy egy célt nem kérdez le, csak ha a magasság információ azt jelzi, hogy a cél a saját magassághoz képest 3050 m-en (10000 láb) belül van. Az ACAS légijármű lekérdezi azokat a célokat, amelyektől nem kap magasság információt, de folyamatosan kap hibamentes squittereket. Azokat a célokat, amelyek magassága túl van a saját 3050 m-es (10000 láb) magasságon, önkéntes DF = 0 vagy DF = 4 válaszok felhasználásával figyelik, vagy ilyen válaszok hiányában periodikusan lekérdezik egy DF = 0 válasz kiváltásával, hogy megvalósítsák azoknak a céloknak az időben történő megszerzését, amelyek áthaladnak a 3050 m-es (10000 láb) relatív magassági határon,

3.1.3.7.3 A következőkben leírtak példát szolgáltatnak squitterek és magasság válaszok feldolgozásának egyik elfogadható módjára a szükségtelen lekérdezések csökkentéséhez.

a) Amikor egy érvényes squittert először vesznek, egy 0-ról indított futó összeg kapcsolódik hozzá. Mindegyik egymást követő ellenőrzési felfrissítési időköz alatt az összeg 1-el csökken, ha squitterek vagy magasság válaszok egy adott címzéssel nem érkeznek és az összeg 16-al emelkedik egy squitter vagy magasság válasz vételénél. A folyamat addig folytatódik, amíg az összeg egyenlő vagy nagyobb nem lesz 20-nál. Amikor az összeg kisebb vagy egyenlő lesz -20-al, a címet kivonják a rendszerből. Amikor ez egyenlő 20-al vagy nagyobb, mint 20, a célt érvényesnek nyilvánítják.

b) Amikor a célt érvényesnek nyilvánították, akkor lekérdezik, hacsak a magassága az ACAS magasságtól nem különbözik több mint 3050 m-el (10000 láb). Egyéb esetben a magasságát DF = 0 vagy DF= 4 válaszokkal figyelik, vagy ilyen válaszok hiányában minden 10 másodpercben egy lekérdezéssel DF = 0 válasz kiváltásával.

c) Amikor e feltételek közül valamelyik teljesül, a futó összeg folytatja emelkedését vagy csökkenését, még akkor is, ha értéke meghaladja 20-at.

3.1.3.8 *S-MÓDÚ TÁVOLSÁGI ADAT BEGYŰJTÉSE*

3.1.3.8.1 A berendezésnek adatbegyűjtési lekérdezést kell továbbítania (UF = 0, AQ = 1, 3. fejezet, 3.1.2.8.1.1 alpont), hogy meghatározzák az egyes érvényes célok viszonylagos távolságát, amelyek a fent előírt magassággal rendelkeznek, vagy amelyektől nem-megfelelő magasság információt kaptak.

3.1.3.8.2 Ha egy adatbegyűjtési lekérdezésre nem sikerül érvényes választ kapni, további lekérdezéseket kell továbbítani. Egy célnak címzett adatbegyűjtési lekérdezések teljes száma egy ellenőrzési felfrissítési perióduson belül, nem haladhatja meg a hármat. Az első adatbegyűjtési lekérdezést a felső antenna használatával kell továbbítani. Ha két adatbegyűjtési lekérdezésnek egy céltól nem sikerül érvényes választ kiváltani, a következő két adatbegyűjtési lekérdezést ehhez a célhoz az alsó antenna használatával kell továbbítani. Ha az adatbegyűjtési kísérletnél az első felderítés felfrissítés periódusban érvényes válaszok nem érkeznek, az ACAS kilenc adatbegyűjtési lekérdezést továbbít, elosztva az első hat egymást követő felderítés felfrissítési periódus között. Ha az adatbegyűjtési lekérdezéseknek nem sikerül választ kiváltani hat ellenőrzés felfrissítési perióduson belül, az adatbegyűjtési folyamatot meg kell szakítani, amíg elegendő kiegészítő squittert nem sikerül venni, ami jelzi, hogy sikeres adatbegyűjtés valószínű. Egyik eszköz ennek megvalósítására egymás utáni squitterek feldolgozása, ahogyan az a 3.1.3.7 pontban ismertetésre került, de a 16-os növekmény 8-cal helyettesítendő. Ha az adatbegyűjtés második sikertelensége fordul elő, a feldolgozást egy 4-es növekménnyel megismétlik. Bármely ezután bekövetkezett egymást követő sikertelenség esetén 2-es növekményt használnak.

3.1.3.8.3 Ha további kísérletek történnek a céltárgy befogására, akkor azok megegyeznek a fent leírt mintával, kivéve:

a) A második és harmadik kísérletben csak egy kísérletet kell tenni egyetlen ellenőrzési felfrissítési időtartományban; és érvényes válasz hiányában hat lekérdezést kell továbbítani az első hat ellenőrzési felfrissítési időköz során.

b) Bármely további kísérlet a teljes hat felfrissítési időköz során egyetlen lekérdezésből áll.

3.1.3.8.4 Amikor érvényes adatbegyűjtési választ vesznek, a VS mezőt a válaszban megvizsgálják, hogy megállapítsák a cél függőleges állapotát. Ha egy céltárgyat a földön meghatároztak, függőleges állapotát periodikusan figyelik olyan gyakoriságú lekérdezésekkel, amely az idejében történő adatbegyűjtéshez szükséges, amikor az a levegőben van. Amikor érvényes adatbegyűjtési választ vesznek egy levegőben lévő céltól, egy vagy több lekérdezést kell továbbítani a célhoz két felderítési felfrissítési intervallumon belül, hogy megerősítést nyerjen a magassági adat és a magasság kvantálás bit. Ha két választ kaptak egy levegőben lévő céltól, melyiknek magassági értékei egymástól 150 m-en (500 láb) belülre esnek és 3050 m-en (10000 láb) belüli saját magassággal rendelkezik, és azonos kvantálási bit értékük van, periodikus felderítési lekérdezéseket ("követő" lekérdezésnek nevezik) kell indítani ennél a céltárgynál.

3.1.3.8.5 A cél távolságát a becsült távolság változási sebességével használják a potenciális veszélyeztető légijármű meghatározásához az ACAS-felé. Ha a cél nem egy azonnali veszélyeztető légijármű, akkor kisebb gyakorisággal kérdezhető le, mintha potenciális veszélyeztető légijármű lenne, amelynek részére igen nagy valószínűséggel tanácsadást adnának ki. Mindegyik 1-másodperces felderítés felfrissítési időtartományban a cél potenciális veszélyeztetési szintjét (*TAU)* a következőképpen számolják ki.

$$TAU = \text{--}\ (r - \mathrm{SMOD}^2/r)/\acute{r}$$

ahol r a követett távolság, $\acute{r}$ a becsült viszonylagos távolságváltozási sebesség és SMOD egy felderítés távolság modifikátor, amely 5,6 km-el (3 NM) egyezik meg. Ha a becsült távolsági sebesség vagy -6 csomónál kisebb negatív érték, vagy pozitív (vagy egy lassú összetartás, vagy a légijárművek egymástól széttartanak), a *TAU* számításához használt érték -6 csomó. Egy 5,6 km-es *SMOD* érték biztosítja, hogy az ACAS mindig a névleges 1-másodperces lekérdezési ciklust használja olyan szituációkban, ahol a *TAU* értéke gyorsan változhat úgy, mint párhuzamos megközelítésben. Egy 60 másodperces vagy ennél kisebb *TAU* értékkel rendelkező célt másodpercenként 1 névleges gyakorisággal kérdeznek le. Egy 60 másodperces *TAU* értékkel rendelkező célt 5 másodpercenként egyszeres gyakorisággal kérdeznek le, ha a cél és a saját légijármű magassága egyaránt kisebb, mint 5490 m (18000 láb), és legalább öt-másodpercenként egyszer, ha a cél vagy a saját légijármű magassága nagyobb, mint 5490 m (18000 láb).

3.1.3.9 *S-MÓDÚ FELDERÍTÉS KITERJESZTÉSE*

3.1.3.9.1 A berendezés csak akkor továbbít helyzet jelentéseket egy S-módú cél részére az összeütközés elkerülési algoritmusokhoz, ha a kezdeti távolságra vonatkozó adatbegyűjtés után a veszélyeztető légijármű értékelésére használt összes válasz egy, a megelőző válaszokból előrejelzett távolság és magasság középpontú távolság- és magasság-ablakon belül jelenik meg, a magasság kvantálási bit illeszkedik az előző értékhez, és a VS mező a rövid különleges ellenőrzési válaszban jelzi, hogy a cél az előző három felfrissítési ciklus során legalább egyszer a levegőben volt. A távolság- és magasság-ablak ugyanaz, mint a 3.1.2.9.2 és 3.1.2.9.3 pontban leírt, az A/C-módú követésre használt távolság-ablak.

3.1.3.9.2 Ha egy követési lekérdezés nem vált ki érvényes választ, további lekérdezéseket továbbítanak. Egyetlen célnak címzett követő lekérdezések teljes száma várhatóan nem haladja meg az ötöt egyetlen felderítési felfrissítési periódus során, vagy tizenhatot hat egymást követő felfrissítési periódus felett elosztva. Az első követő lekérdezést annak az antennának a felhasználásával továbbítják, amelyet ennek a célnak az utolsó sikeres lekérdezésénél használtak. Ha két egymás utáni követési lekérdezés nem vált ki egy céltól érvényes válaszokat, a következő két lekérdezést ehhez a célhoz a másik antenna felhasználásával kell továbbítani.

3.1.3.10 *S-módú válaszok elmaradása.* A berendezés folytatja az előrejelzett helyzet jelentések továbbítását az összeütközés elkerülési algoritmusokhoz az S-módú célok részére hat ellenőrzési felfrissítési időközön keresztül, amelyek egy követő lekérdezésre adott utolsó érvényes válasz vételét követik, ha a célt minden másodpercben egyszer kérdezik le, vagy tizenegy 1-másodperces felderítés felfrissítési időköz alatt, amelyek egy követő lekérdezésre adott utolsó érvényes válasz vételét követik, ha a célt minden öt másodpercben egyszer kérdezik le. A berendezés nem továbbít helyzet jelentést S-módú céloknál hatnál több felderítés felfrissítés időköz alatt, amelyek egy követő lekérdezésre adott utolsó választ követik, amely lekérdezés sebessége másodpercenként egy, vagy több mint tizenegy 1-másodperces felderítés felfrissítési időköz alatt, amelyek egy követő lekérdezésre adott utolsó érvényes válasz vételét követik, amely lekérdezés sebessége minden öt másodpercben egy, hacsak a cél újra ki nem elégíti a 3.1.3.7 pont távolsági adatok beszerzési kritériumait. Egy elvetett nyomvonal S-módú címzését négy további másodpercig fenntartják az ismételt adatbegyűjtési folyamat lerövidítése érdekében, ha squitterek vétele történik.

3.1.3.11 *S-mód túlterhelés.* A berendezés pozíció jelentéseket továbbít az összes S-módú cél részére, tekintet nélkül a célok távolság szerinti eloszlására, feltéve, hogy a teljes csúcs célszám nem haladja meg a 30-at.

3.1.3.12 *S-módú teljesítmény programozás.* A célok részére közvetített S-módú követő lekérdezés sugárzási teljesítmény szintjét (kivéve a levegő-levegő koordinációs lekérdezéseket), automatikusan csökkenteni kell a 18,5 km-en (10 NM) belül lévő célok távolságának függvényében az alábbiak szerint.

$$P_T = P_{\max} + 20 \log \frac{r}{10}$$

ahol P_T a beállított teljesítmény szint, $P_{\max}$ a névleges teljesítmény szint (tipikusan 250 W), amelyet 18,5 km (10 NM) vagy nagyobb távolságban lévő célok részére továbbítanak, és r a cél előrejelzett távolsága. A ténylegesen továbbított teljesítmény a P_T és a 4. fejezet 4.3.2.2.2.2 alpont szerinti interferencia korlátozó egyenlőtlenségek által megszabott korlát közül a kisebbik.

3.1.3.13 *S-módú nyomvonal kapacitás.* Amikor a légijármű sűrűség névlegesen 0,087 S-módú légijármű per km^2 (0,3 légijármű per NM^2) az ACAS légijármű környezetében, akkor az ACAS légijárműtől 9,3 km (5 NM) távolságon belül körülbelül 24 légijármű, 56 km (30 NM) távolságon belül pedig körülbelül 142 légijármű van. Így az ACAS berendezésnek várhatóan legalább 150 S-módú címzés kapacitással kell rendelkeznie.

3.1.3.14 *IRÁNYSZÖGBECSLÉSEK HASZNÁLATA S-MÓDÚ FELDERÍTÉSNÉL*

3.1.3.14.1 Nagysűrűségű S-módú felderítésnél az irányszög becslés képességet nem követelik meg. Azonban ha irányszög becslések rendelkezésre állnak, látható, hogy irányításos S-módú leképezések használata jelentősen csökkenti a berendezés megkívánt teljesítményét. Az irányításos S-módú lekérdezések irányszög információk hiányában is használhatók, feltéve, hogy az interferencia limiteket nem lépik túl.

3.1.3.14.2 Irányszög becslések a saját sebesség ismeretével összekapcsolva ugyancsak használhatók az általános S-módú leképezési sebesség csökkentésekre. A következőkben az ilyen csökkentésnek egyik lehetséges módját írjuk le.

3.1.3.14.3 Az "idő-a-veszélyeztetésig" számítás helyett, amely azon a konzervatív feltételezésen alapul, hogy két légijármű frontális összeütközési nyomvonalon halad, az "idő-a-veszélyeztetésig" növelhető a veszélyeztető légijármű irányszöge és a saját légijármű korlátozott fordulási sebessége figyelembevételével, és annak az időnek a megengedésével, amely a saját légijárműnek a veszélyeztető légijármű irányába fordulásához szükséges. Egy ilyen számításnál továbbra is fel kell tenni, hogy a cél légijármű a jelentett maximális képességének megfelelő sebességgel repül közvetlenül az összeütközési pont felé.

3.2 Adóállomás

3.2.1 TELJESÍTMÉNY SZINTEK

3.2.1.1 Interferenciamentes esetben és amikor olyan antennát használnak, amelynek diagramja azonos a negyedhullámú aszimmetrikus dipóluséval a föld síkja felett, akkor 54 dBm (250 W) névleges effektív sugárzási teljesítmény használatával a válaszjeladók megbízható levegő-levegő felderítését lehet biztosítani 26 km (14 NM) távolságoknál.

3.2.1.2 Az adóállomás kimenő teljesítményt gondosan korlátozni kell az adattovábbítások között, mivel bármilyen átvezetés komolyan befolyásolja az ACAS légijármű fedélzetén lévő S-módú válaszjeladó teljesítményét. Az átvezetési teljesítmény a válaszjeladóhoz 1030 mHz-nél általában -90 dBm szint alatt kell hogy maradjon. Ha a válaszjeladó antenna és az ACAS antenna közötti fizikai elválasztódás nem kevesebb, mint 50 cm, a két antenna közötti csatolási vesztesége meghaladja a 20 dB-t. Így ha az RF teljesítmény 1030 MHz-nél az ACAS antenna csatlakozó pontjánál nem haladja meg a -70 dBm-et az inaktív állapotban, és ha egy 50 cm-es minimális antenna távköz tartozik hozzá, az ACAS antennától származó válaszjeladó antenna zavarás nem haladja meg a -90 dBm-et. Ez a követelmény hivatott biztosítani, hogy – amikor nem továbbít lekérdezést – az ACAS nem sugároz RF energiát, amely az SSR válaszjeladót vagy más rádió berendezést zavarhatná, vagy érzékenységét csökkentené a légijármű vagy földi létesítmény közelében.

3.2.1.3 Intézkedéseket kell tenni annak biztosítására, hogy a közvetlen 1030 MHz-es átvezetés az ACAS borítástól a válaszjeladó borításhoz kisebb legyen, mint -110 dBm, amikor a két egység egymás mellé van szerelve egy légijárműre történő tipikus szerelésnél.

3.2.1.4 Várható, hogy az ACAS berendezés az ekvivalens osztályozású S-módú válaszjeladókkal egymás mellett kerül vizsgálatra annak biztosítására, hogy mindegyik egység kielégítse a saját érzékenységi követelményeit a másiktól jövő adattovábbítási átvezetés megléte esetén.

3.2.2 SZINKRON INTERFERENCIA SUTTOGÁS-KIABÁLÁS ÁLTALI SZABÁLYOZÁSA

3.2.2.1 Az A/C-módú szinkron interferencia szabályozása, és nagyobb forgalomsűrűségű légtérben történő ACAS üzemelés megkönnyítése érdekében egy lekérdezés sorozatot lehet különböző energiaszinteken továbbítani minden egyes felderítés felfrissítési periódus alatt. A sorozatban lévő minden egyes lekérdezést az egy, legkisebb teljesítményű kivételével, egy elnyomási impulzus előz meg (S_1 -el jelölve) 2 mikromásodperccel megelőzve a P_1 impulzust. Az S_1 és P_1 kombinációja elnyomás átvitelként szolgál. S_1 -et a P_1-énél alacsonyabb teljesítményszinten viszik át. Az egymás utáni lekérdezések közötti minimális időnek 1 ezredmásodpercnek kell lenni. A sorozatban lévő összes lekérdezést egyetlen felderítés felfrissítési időtartamon belül kell továbbítani.

3.2.2.2 Mivel az elnyomási átvitel mindegyik lépésben mindig alacsonyabb teljesítményszinten van, mint a következő lekérdezés, ezt az eljárást suttogás-kiabálásnak nevezik. A szándékolt mechanizmus az, hogy az egyes légijárművek egy sorozatban csak egy vagy két lekérdezésre válaszolnak. Az A/C-módú válaszjeladók bármely adott távolságon nagy effektív érzékenységi terjedelemmel rendelkezhetnek a vevők változása, a kábel-veszteségek és antenna árnyékolása miatt. Ideálisan minden egyes válaszjeladó a populációban két lekérdezésre válaszol a sorozatban és a sorozatban lévő magasabb teljesítményű lekérdezéseket kísérő nagyobb teljesítményű elnyomási átvitelek kikapcsolják ezeket. Egy adott szituációnál, amelyben több légijármű elég közel van egymáshoz, hogy válaszoljanak a szinkron zavarásra, nagyon valószínűtlen, hogy mindnyájan ugyanarra a lekérdezésre válaszoljanak és ennek eredményeként a szinkron zavarás erőssége csökken. A suttogás-kiabálás használata szintén csökkenti a leképezési kapcsolatban lévő többszörös út hatások erősségét.

3.2.2.3 Az A-2a ábra egy suttogás-kiabálás sorozatot határoz meg, amely illeszkedik a nagysűrűségű A/C-módú ellenőrzési követelményekhez, az A-2b ábra pedig olyan suttogás-kiabálás sorozatot jelöl, amely a kissűrűségű A/C-módú felderítési követelményekhez illeszkedik. Öt különböző sorozat lett meghatározva: a felsőszerelésű antenna négy sugarának mindegyikéhez egy, és egy az alsó szerelésű körsugárzó antennához. A lekérdezések bármilyen sorrendben továbbíthatók. Amikor az A-2a ábra nagysűrűségű sorozatát a zavarás lecsonkítása érdekében korlátozzák, a lépéseket a Zavarás korlátozás prioritás oszlopában bemutatott sorrendben ejtik el. Amikor az A-2b ábra kissűrűségű sorozatát teljesítményben csökkentik, a zavarás limitálása érdekében, mindegyik lekérdezés és a vonatkozó MTL értéke, ahogy az utolsó oszlopban látszik, 1 dB-el csökken abban a sorrendben, ahogyan a Zavarás korlátozás prioritás oszlopában fel van tüntetve. A legkisebb számozású lépéseket vetik el elsőként. Az Egyedi impulzusok vagy lépcsők időzítését a sorozatban az A-3 ábra mutatja, amely a legalsó három legkisebb teljesítmény lépcsőt illusztrálja a belső előre irányuló antenna sorozatban. A lekérdezés első impulzusa az elnyomás második impulzusaként szolgál.

3.2.2.4 Az A-2a és az A-2b ábrán tabellázott minimális beindítási szint (MTL) értékek azon a feltételezésen alapulnak, hogy az összes lekérdezésre adott választ körsugárzással veszik. Ha irány-vevő antennát használnak, az MTL értékkel be kell állítani, hogy az antenna nyereséget figyelembe vegyék. Például egy hálózat antenna 3 dB-es nyereségéhez a táblázatban lévő összes MTL értéket 3 dB-el növelik, és a MTL az 1.sz. lépésnél inkább -71 dBm, mint -74 dBm.

3.2.2.5 A teljesítményt, effektív sugárzott teljesítményként határozzák meg a lekérdezéshez. Minden teljesítményszintnek a névleges ±2 dB-en belül kell lennie. A lépésnövekmény tűrésének ±1/2 dB-nek kell lennie, a növekményeknek monotonnak kell lenniük a sorozat teljes teljesítmény tartományában.

3.2.2.6 A legtöbb lekérdezést a felső antennától továbbítják, mivel ez kevésbé érzékeny a földről jövő többutas interferenciára.

3.2.2.7 A megfelelő suttogás-kiabálás sorozat kiválasztása egy adott antennasugárhoz mindegyik lekérdezés ciklusnál az ebben a sugárban jelenlévő A/C-módú szinkron csonkítás éppen aktuális vagy előrelátható szintjén alapul, ahogyan az ACAS felderítés meghatározza. A nagysűrűségű suttogás-kiabálás sorozatot akkor választják ki egy antenna sugárhoz, amikor szinkron csonkítás van jelen ebben a sugárban, ahogyan ez evidens a legalább egy kis megbízhatóságú magasság kód bit létezéséből két egymás utáni S-módú válaszban. A 6-szintű suttogás-kiabálás sorozatot egy antennasugárhoz akkor választanak ki, ha vagy:

a) egy egyedülálló A/C-módú légijármű van ennek a sugárnak a felderítési távolságán belül és szinkron csonkítás nincs jelen; vagy

b) szinkron csonkítás nincs jelen, A/C-módú célok nincsenek egymás csonkítási távolságán belül, és az A/C-módú légijármű sűrűség a megbízható felderítési távolságon belül egyenlő vagy kisebb, mint 0,23 légijármű/km (0,43 légijármű/NM). Amikor forgalmi tanácsadás generálódik egy adott antenna sugáron belüli veszélyeztető légijárműre, a magasszintű sorozatot használják ehhez a sugárhoz a tanácsadás ideje alatt. Amikor megoldási tanácsadás generálódik, a magasszintű sorozatot használják az összes antennasugárhoz a tanácsadás ideje alatt.

3.2.2.8 Ha sem létrehozott A/C-módú felderítési nyomvonal, sem semmilyen jelölt nyomvonal, amely három korreláló C-módú adatbegyűjtési választ tartalmaz, nincsen egy antennasugár felderítési távolságán belül, az ACAS egyedüli C-módú lekérdezést továbbít ebben a sugárban. Az egyedüli lekérdezés szintje és a hozzá kapcsolódó MTL mindegyik sugárnál megegyezik a hozzá tartozó alacsonyszintű suttogás-kiabálás sorozat legmagasabb rendelkezésre álló teljesítmény szintjével, ahogyan azt a zavarás limitálás meghatározza. Egyedüli C-módú lekérdezések érzékenyek a több út miatti fedélzetre irányuló kapcsolati mód váltásra és egy A-módú és C-módú válasz keverékét eredményezi egy megközelítő légijárműtől, amely válaszok 13 mikromásodpercre vannak elválasztva. Az ACAS ennélfogva az alacsonyszintű suttogás-kiabálás sorozatot választja ki egy sugárhoz megbízható felderítési adatbegyűjtéshez és követéshez valahányszor:

a) az egyedüli lekérdezés ebben a sugárban egy A/C-módú választ eredményez, amely egy 1525 m-es (5000 láb) távolság ablakon belül jelenik meg, amely ablak középpontja vagy az előző felderítés felfrissítés időközében vett A/C-módú válasz mért távolságnál, vagy az előző válasz távolságtól ±13 mikromásodperccel való távolság-eltérésnél van; vagy

b) egy létrehozott C-módú nyomvonal vagy egy C-módú nyomvonal, amely az ebbe a sugárba a másik sugárból átmenő adatbegyűjtési átmenetek folyamatában van. Az ACAS visszakapcsol az egyedi lekérdezéshez tíz felderítési felfrissítés időköz után, amelyekben két egymásra ható adatbegyűjtési választ nem vettek.

3.2.3 INTERFERENCIA KORLÁTOZÁS

3.2.3.1 Az ACAS berendezés összhangban van három különleges egyenlőtlenségből álló egyenlőtlenség-rendszerrel (4. fejezet, 4.3.2.2.2.2 alpont) az interferencia hatások szabályozása érdekében. A három egyenlőtlenség a következő fizikai mechanizmushoz kapcsolódik: (1) az ACAS lekérdezések által kiváltott más válaszjeladók működési idejének csökkentése, (2) a lekérdezések átvitele alatt kölcsönös elnyomás által létrehozott, saját válaszjeladó működés idejének csökkentése, és (3) ACAS A/C-módú lekérdezések által kiváltott A/C-módú termék. Az n_a 1-re állítása az (1) és (3) egyenlőtlenségben az 5490 m (18000 láb) nyomásmagasság felett üzemelő ACAS-nál megóvja az egyedüli ACAS-t korlátlan teljesítmény továbbításától egy felső korlát biztosításával az ACAS egy másodperces lekérdezés teljesítmény/sebesség szorzatára.

3.2.3.2 Az (1) egyenlőtlenség biztosítja, hogy egy “áldozat” válaszjeladó soha nem észlel 280-nál több olyan ACAS lekérdezést egy egymásodperces időszakon belül, amelyek az összes 56 km-en (30 NM) belül lévő ACAS lekérdezőtől származnak, bármely ACAS eloszlásnál, amely körülveszi az “áldozat” válaszjeladót a távolság szerint egyenletestől a terület szerint egyenletesig terjedő korlátokon belül. Az egyenlőtlenség baloldala lehetővé teszi az ACAS egység számára a lekérdezés gyakoriságának növelését, ha 250 W-nél kisebb teljesítménnyel végzi az átvitelt, mivel kisebb teljesítményű átvitelt kevesebb válaszjeladó észlel. Mindegyik normalizált teljesítmény érték ezen egyenlőtlenség baloldalán az összegezésen belül egy kitevőt tartalmaz, amely az egyenlőtlenségnek a lokalizált ACAS elosztáshoz való hozzáigazítását szolgálja. Az α értéke a helyi ACAS légijármű eloszlási görbét definiálja és az eloszlás saját ACAS mérésből az 56 km (30 NM) távolságon belül lévő többi ACAS számából származtatják le. Mivel az ACAS eloszlás a terület szerint egyenletestől (α = 1) a távolság szerinti egyenletesig (α = 0,5) változik, az ACAS légijármű sűrűség és ennek következtében az elektromágneses behatásuk az “áldozat” válaszjeladó közelében megnő. Az ACAS interferenciának ez a megnövekedett potenciálját eltéríti az interferencia korlátozás magasabb foka, amely az egyenlőtlenség normalizált értékében egy 1-nél kisebb kitevőhasználatából ered. Ennek az egyenlőtlenségnek a jobboldalán lévő első tagnak a nevezője a környezetben lévő többi ACAS lekérdezőkre és arra a tényre vezethető vissza, hogy minden ACAS egységnek hasonló módon kell korlátoznia a lekérdezési sebességét és teljesítményét úgy, hogy ahogyan a régióban az ACAS egységek száma növekszik, azok mindegyikétől jövő lekérdezési gyakoriság és teljesítmény úgy csökken, és a teljes ACAS lekérdezési gyakoriság bármely válaszjeladónál kisebb marad, mint 280 per másodperc.

3.2.3.3 Egy légtéren belül, amelyben az ACAS légijárművek távolság szerint egyenletes-től a terület szerint egyenletes-ig terjedő korlátok között oszlanak el, és feltételezve, hogy az "áldozatot" 35 mikromásodperces perióduson keresztüli elnyomással vagy válasz holtidővel kiiktatják, valahányszor egy ACAS lekérdezést vesz, a teljes kikapcsolt idő, amelyet ACAS lekérdezések okoztak, nem fogja meghaladni az 1 százalékot. Mérések és szimulációs vizsgálatok azt mutatták, hogy a teljes kikapcsolt idő nagysűrűségű terminál körzeteken belül 1 százaléknál nagyobb is lehet az ACAS légijármű eloszlások miatt, amely a terület szerint egyenletestől a távolság szerint egyenletesig terjedően meghatározott régión túl vannak és bizonyos lekérdezésekhez tartozó S-módú válaszjeladó visszaállási idő miatt, amely várhatóan nagyobb, mint 35 mikromásodperc lehet. Ennek az egyenlőtlenségnek a jobboldalán a második tag korlátozza az ACAS II részére a lekérdezési teljesítmény-sebesség szorzatot tekintet nélkül az n_a-ra, hogy lehetővé tegye a teljes interferencia korlátozás egy részének ACAS I általi felhasználását. A tag, amelyet az α nevezőben lévő értéke illeszt az ACAS eloszláshoz, biztosítja, hogy egy egyedi ACAS II egység sohasem továbbít nagyobb átlagos teljesítményt, mint ha közelítőleg 26 másik ACAS II lenne közvetlen közelben terület szerint egyenletes eloszlásban, vagy közel 6 másik ACAS II a közelben, távolság szerint közel egyenletes eloszlásban.

3.2.3.3.1 A nagysűrűségű terminál körzetek nagyobb terheléstől fognak szenvedni az 1 százalék becslés megsértés miatt, a földetérési ponttól közelítőleg 14,8 - 18,5 km-ig (8 - 10 NM) terjedő nagyobb terhelésből kifolyólag. Hogy kielégítő felderítési teljesítményt biztosítsanak mind az ACAS, mind földi légtérellenőrző rendszerek számára az ilyen területeken, a 610 m (2000 láb) föld feletti magasság alatt repülő ACAS földön üzemelő ACAS II-t és ACAS III-t is tartalmaz n_b és n_c számításánál. Ezt az értéket a következő gyakorlati okokból választották:

a) a rádió magasságmérő használata elegendő mérési pontosságot tesz lehetővé 610 m-en (2000 láb) és ez alatt; és

b) feltételezi, hogy a légijárművek egy ILS siklópályán végeznek megközelítést. Ebben az esetben 610 m (2000 láb) föld feletti magasság megfelel egy repülőtértől való közelítőleg 11,2 km (6 NM) távolságnak.

Új megközelítési eljárások (pl. MLS-en vagy GNSS-en alapuló) további meggondolásokat igényelhetnek az interferencia csökkentésére. És még ILS megközelítésnél is ajánlatos olyan eljárásokat létrehozni, amelyek "tartalékra" ("stand-by"-ra) kapcsolják az ACAS II-t és ACAS III-at, amíg a légijármű nincsen aktív futópályán.

3.2.3.4 A (2) egyenlőtlenség biztosítja, hogy az ACAS légijármű fedélzetén lévő válaszjeladót ne kapcsolják ki az ACAS egységtől jövő kölcsönös elnyomási jelek ugyanazon légijárművön az idő több mint 1 százalékát kitevő ideig.

3.2.3.5 A (3) egyenlőtlenség biztosítja, hogy az "áldozat" A/C-módú választ egymásodperces periódus során nem fog 40-nél több A/C-módú választ generálni, az észlelési távolságán belül lévő összes ACAS lekérdezőtől jövő lekérdezésekre reagálva. Akárcsak az (1) egyenlőtlenség, ez is tartalmaz tagokat csökkentett sugárzási teljesítmény, és a környezetben lévő többi ACAS lekérdező tekintetbe vételére, és egy egyedülálló ACAS egység teljesítményének korlátozására. 40 A/C-módú válasz másodpercenként közelítőleg 20 százaléka a válasz sebességnek olyan válaszjeladónál, amely ACAS nélkül működik többszörös A/C-módú földi érzékelő lefedéses forgalmas területen.

3.2.3.6 *PÉLDA INTERFERENCIA KORLÁTOZÁSRA*

3.2.3.6.1 Példaként, amikor a lekérdezési korlátozás nincs megidézve, az irányított ACAS egység általános A/C-módú és S-módú lekérdezési gyakoriságok tipikusan a következők: az A/C módú lekérdezési k_t gyakoriság tipikusan konstans 83 suttogás-kiabálás lekérdezés per másodpercnél. Tegyük fel, hogy a normalizált suttogás-kiabálás teljesítmények összege, azaz az A/C-módú hozzájárulás az (1) egyenlőtlenség baloldalához közelítőleg 3. Az S-módú lekérdezési gyakoriság függ a környezetben lévő S-módú légijárművek számától. Az útvonalhoz tartozó légtérben a tipikus érték körülbelül 0,08 leképezés per másodperces átlag minden S-módú légijárműnél 56 km-en (30 NM) belül. Egyenletes 0,006 légijármű per négyzetkilométer (0,02 légijármű per négyzet-NM) légijármű sűrűségnél 56 km-en (30 NM) belül a légijárművek száma 57. Ha ezeknek 20 százaléka ACAS-al felszerelt, n_a=12, és a változó tag az egyenlőtlenség jobboldalán 21,5. Ha az ACAS légijárművek száma a területen nem haladja meg a 15-öt, az állandó tag folytatja a szabályozást, és korlátozás nem jelenik meg, amíg nem lesz közelítőleg 100 S-módú légijármű 56 km-en (30 NM) belül.

3.2.3.6.2 Hasonló meggondolások érvényesek a (2) és (3) egyenlőtlenségekre is. A (2) egyenlőtlenségben a kölcsönös elnyomási időköz, amely az összes felső antenna lekérdezésekkel kapcsolatos, 70 mikromásodperc. Az alsó antenna kölcsönös elnyomási időköze 90 mikromásodperc. Igy az A/C-mód hozzájárulása a (2) egyenlőtlenség baloldalához 0,0059, és az S-módú lekérdezési gyakoriság elérheti még az 59 felső antenna lekérdezés per másodperc értéket is, mielőtt korlát átlépést kockáztatna. Tipikus suttogás-kiabálás sorozattal a (3) egyenlőtlenség baloldala közelítőleg 3. Az ACAS légijárművek száma 56 km-en (30 NM) belül elérheti a 26-ot is, a (3) egyenlőtlenség megsértése nélkül.

3.2.6.3 Ha a lekérdezési sebesség vagy a sűrűség egy olyan pontig növekszik, amelynél a korlátozások egyikét megszegik, akkor vagy az A/C-módú, vagy az S-módú normalizált lekérdezési sebességet, vagy mindkettőt csökkenteni kell, hogy az egyenlőtlenség feltételei teljesüljenek. Ha a sűrűség elérné a 0,029 légijármű per km^2-t (0,1 légijármű per NM^2) egyenletesen 56 km-re (30 NM) kiterjedően, akkor az 56 km (30 NM) sugarú körön belül 283 légijármű tartózkodna. Ha ezeknek 10 százaléka ACAS-al van felszerelve, akkor n_a=28. Az (1) és (3) egyenlőtlenségek jobboldali korlátjai akkor 9,66 és 2,76 megfelelőképpen. Ezeknek az alsó korlátoknak a kielégítéséhez az A/C-módú és S-módú járulékokat az (1) egyenlőtlenség baloldalához egyaránt csökkenteni kell. Ennek eredményeként mind az A/C-módú, mind az S-módú célok felderítési távolsága kisebb lesz.

3.2.3.6.4 Az (1) egyenlőtlenség egy kitevőt tartalmaz, amely az egyenlőtlenségnek a specifikus helyi ACAS légijármű sűrűséghez való illesztését szolgálja úgy, hogy egy "áldozat" válaszjeladó, amely olyan ACAS-ok közelében működik, amelyek a terület szerint egyenletestől a távolság szerint egyenletesig terjedő határokon belül oszlanak meg, sohasem észlel 280-nál több ACAS lekérdezést egy másodperces periódus alatt.

A helyi ACAS eloszlási jellemzőjét a saját ACAS környezeten belül az α értéke határozza meg.

Ez az 56 km-en (30 NM) belül, 11,2 km-en (6 NM) belül, 5,6km-en (3 NM) belül lévő ACAS-ok viszonylagos számain alapszik, ahogyan azokat az ACAS rádióadás lekérdezésekből és ACAS felderítésekből leszármaztatják. Az α értéke a következőknek a minimuma:

a) az 56 km-en (30 NM) belül található ACAS légijárművek n_a számának a 11,2 km-en (6 MN) belül található ACAS légijárművek n_b számához viszonyított arányának a logaritmusa osztva 25 logaritmusával; és

b) a 11,2 km-en (6 MN) belül található ACAS légijárművek n_b számának az 5,6 km-en belül található ACAS légijárművek n_c számához viszonyított arányának az egynegyede.

Az 56 km-en belüli ACAS légijárművek terület szerinti egyenletes eloszlása 1,0 értékű α-t eredményez, és a távolság szerinti egyenletes eloszlása 0,5-ös α értéket eredményez. Mivel α csökkenő értékei növekvő teljesítmény csökkenést, és ennek folytán rövidebb felderítési távolságokat eredményeznek, α minimális értéke 0,5-re zsugorodik, hogy megőrizze adekvát felderítési távolságát a legnagyobb sűrűségű terminál területeken. Az α_1 értékét tovább szűkítik, hogy figyelembe vegyék a különleges helyzeteket, amelyeknél a mért helyi ACAS eloszlás:

1) annyira kis számokon alapszik, hogy azok nem meggyőzőek (n_b=1), amely esetben α_1 egynek megfelelő értékre zsugorodik;

2) ellentmondásos egy viszonylag nagy teljes ACAS számmal ($n_b \leq 4$, $n_c \leq 2$, $n_a > 25$), amely esetben α_1 egynek megfelelő értékre zsugorodik;

3) ellentmondásos egy viszonylag kis teljes ACAS számmal ($n_c > 2$, $n_b > 2\ n_c$, $n_a < 40$) amely esetben α_1 0,5-nek megfelelő értékre zsugorodik.

3.2.3.7 *INTERFERENCIA KORLÁTOZÓ ELJÁRÁSOK*

3.2.3.7.1 Mindegyik felderítés felfrissítési időköz kezdetén, ahogy fentebb mutattuk, n_a-t, n_b-t és n_c-t meg kell határozni. n_a-t ezután az (1) és (3) egyenlőtlenség éppen aktuális jobboldali korlátjainak értékelésére használják. Az S-módú változók kiegyenlített értékeit az egyenlőtlenségekben szintén ki kell számítani.

n_b-t és n_c-t az α_1 értékének kiszámítására használják a következő kifejezésnek megfelelően:

$$\alpha_1=1/4\ [n_b/\ n_c]$$

n_a-t és n_b-t az α_2 értékének kiszámítására használják a következő kifejezésnek megfelelően:

$$\alpha_2 = \frac{Log_{10}[n_a/n_b]}{Log_{10}25}$$

Továbbá:

HA [($n_b \leq 1$) VAGY ($n_b > n_c$) VAGY ($n_b \leq 4$ ÉS $n_c \leq 2$ ÉS $n_a > 25$)] AKKOR $\alpha_1 = 1{,}0$;

HA [($n_b < 2n_c$ VAGY (($n_c > 2$) ÉS ($n_b > 2n_c$) ÉS ($n_a < 40$))] AKKOR $\alpha_1 = 0{,}5$;

HA ($n_a > 25n_b$) AKKOR $\alpha_2 = 1{,}0$;

HA ($n_a < 5n_b$) AKKOR $\alpha_2 = 0{,}5$;

α értéke az α_1 és α_2 minimuma.

3.2.3.7.2 Az összes levegő-levegő koordinációs lekérdezés és megoldási tanácsadás és ACAS rádiós lekérdezések továbbítása teljes teljesítménnyel történik. Levegő-levegő koordinációs lekérdezéseket és megoldási tanácsadást és ACAS rádiós lekérdezéseket nem tartalmazzák az S-módú lekérdezések összegei ezeknek az egyenlőtlenségeknek a baloldalán lévő tagjaiban. Valahányszor egy megoldási tanácsadást elküldenek, felderítési lekérdezéseket ehhez a megközelítő légijárműhöz teljes teljesítménnyel lehet továbbítani a maximális kapcsolat megbízhatóság lehetővé tétele érdekében. Mivel a megoldási tanácsadások frekvenciája nagyon alacsony, ezek a továbbítások nem eredményezik az interferencia mérhető növekedését.

3.2.3.7.3 Ha akár az (1), akár a (2) egyenlőtlenség baloldalának kiegyenlített értéke egyenlő vagy meghaladja az éppen aktuális korlátot, és a saját ACAS légijármű 5490 m (18000 láb) nyomásmagasság alatt repül, akkor mind az S-módú, mind az A/C-módú elderítési paramétereket módosítani kell, hogy kielégítsék az egyenlőtlenségeket. Ha a (3) egyenlőtlenség baloldala meghaladja az éppen aktuális korlátot, és a saját ACAS légijármű 5490 m (18000 láb) nyomásmagasság alatt repül, akkor mind az S-módú, mind az A/C-módú felderítési paramétereket módosítani kell, hogy kielégítsék az egyenlőtlenségeket.

3.2.3.7.4 Az A/C-módú felderítést úgy lehet módosítani, hogy a 3.2.2 szakaszban leírt suttogás-kiabálás sorozat lépéseit egymás után figyelmen kívül hagyják. Mindegyik suttogás-kiabálás lépés egyedileg kapcsolódik egy vevő minimális beindulási szint (MTL) beállításához. Így a vevő érzékenység A/C-módú felderítési periódusokban automatikusan hozzá igazításra kerül, az említett teljesítmény csökkentésekhez való illeszkedés érdekében.

3.2.3.7.5 Az általános felderítési érzékenységet S-módú céloknál a lekérdezési teljesítmény csökkentésével és a vevő minimális beindítási szintjének növelésével lehet csökkenteni az összes S-módú squitter lehallgató periódus alatt. Ez közvetve csökkenti az S-módú lekérdezés sebességét a cél szám csökkentésével. Sok S-módú lekérdezés olyan adatbeszerző lekérdezés, amelyeket ismeretlen távolságú célokhoz továbbítanak. Így ez nem szabályozza az S-módú lekérdezési sebességet egyszerűen a nagy-távolságú célok törlésével a nyomvonal fájlból.

3.2.3.7.6 A levegőben lévő ACAS-nál az A/C-módú és S-módú felderítési teljesítmény csökkentését úgy kell végrehajtani, hogy a felderítési távolságok közötti egyenlőség S-módú és A/C-módú céloknál fennálljanak az előre irányuló sugárban. Hogy egy megbízható 11,2 km (6 NM) távolságot biztosítsanak minden irányban n_b esetén, a maximális megengedett interferencia, amely limitálja a teljesítmény csökkenést bármely irányban, egy levegőben lévő ACAS egységnél 10 dB S-módnál és 7 dB A/C-módnál. Az A/C-módú felderítési teljesítmény és érzékenység csökkentéseket úgy kell végrehajtani, hogy egyenlő suttogás-kiabálás képességet érjenek el minden irányban. Ez megkívánja, hogy az A/C-módú teljesítmény és érzékenység csökkentést addig végezzék, az előre irányuló sugárban, amíg az megegyező lesz az oldalsugarakkal, és azután az előre irányuló és oldalsugarakban, amíg a hátsó sugárral megegyezőek lesznek. Hogy egy megbízható 5,6 km-es (3 NM) ellenőrzési távolságot biztosítsanak minden irányban az indulás előtti ellenőrzéshez, a maximális megengedett interferencia korlátozó teljesítmény csökkentés egy a földön lévő ACAS-nál a következők szerinti:

a) előre irányuló sugár: 13 dB S-módnál, és 10 dB A/C-módnál;

b) oldalsugár: 13 dB S-módnál, és 6 dB A/C-módnál; és

c) hátsó sugár: 13 dB S-módnál, és 6 dB A/C-módnál.

Továbbá az A/C-módú és S-módú felderítési érzékenység csökkentéseket úgy kell végrehajtani, hogy az ACAS berendezés ne legyen idő előtt korlátozott, és képes legyen a három korlátozó egyenlőtlenségben részletezett lehetőség legalább 75 százalékának kihasználására az összes cél-típus összetételnél, és a rendszer maximális sűrűség kapacitásáig minden sűrűségnél. Ha a kiegyenlített korlátok közül valamelyiknek az értékét átlépik, megfelelő akció szükséges az interferencia korlátozására egy felderítés felfrissítési időközön belül. Eszközöknek kell rendelkezésre állniuk a felderítési érzékenység helyreállítására, amikor a környezet eléggé javul ahhoz, hogy az interferencia korlátok feloldhatók legyenek.

3.2.3.7.7 ACAS kereszt-kapcsolat lekérdezéseket az S-módú lekérdezések összege tartalmazza az interferencia korlátozó egyenlőtlenségek baloldalának tagjaiban.

3.2.3.8 *TIPIKUS INTERFERENCIA KORLÁTOZÓ ELJÁRÁS MEGVALÓSÍTÁSA*

3.2.3.8.1 Az alábbiakban következő ismertetés egy interferencia korlátozó eljárás egyik lehetséges megvalósítása. Ez az (1), (2) és (3) egyenlőtlenségekben megjelenő rendszer paramétereket változtatja, hogy maximálja és fenntartsa a közelítő egyenlőséget a számított felderítési távolságok között az S-módú és A/C-módú céloknál. Ezeknek az egyenlőtlenségeknek az értékelésében az S-módú paraméterek 8 másodperces átlagát használják és az A/C-módú paraméterek aktuális vagy várható értékeit használják. Az eljárást az A-4 ábrán lévő folyamat ábra illusztrálja.

3.2.3.8.2 *1. lépés.* Az első lépés a szabályozási folyamatban a használatra próbaképpen ütemezett suttogás-kiabálás lépések számának csökkentése az aktuális pásztázás során, ha:

a) a (3) egyenlőtlenséget megszegik; vagy

b) az (1) vagy (2) egyenlőtlenséget megszegik, és az utolsó pásztázás S-módú ellenőrzési távolsága nem haladja meg az A/C-módú felderítési távolságot, amelyet az ütemezett suttogás-kiabálás sorozat használata eredményez.

Suttogás-kiabálás lépéseket az A/C-módú processzor tervezése által diktált sorrendben elhagyják, és az elhagyott lépések száma éppen elég nagy annak biztosítására, hogy a fenti feltételek egyike se álljon fenn. A felhasználásra kísérleti jelleggel ütemezett suttogás-kibálás lépések számának értéke az utolsó pásztázásnál használt számnál kezdődik.

Az S-módú és A/C-módú felderítési távolságok relatív nagyságát a becsült effektív sugárzási teljesítményből (ERP) határozzák meg, amelyet az ACAS légijárműnek közvetlen az elején található S-módú és A/C-módú válaszjeladókkal ellátott célok látnak. Az ERP-t egy adott irányban az antenna teljesítmény bement és az ezirányú antenna séma nyereség szorzata határozza meg. Ha a válaszjeladó érzékenységek azonosak lennének, az S-módú távolság nagyobb vagy kisebb lenne, mint az A/C-módú távolság, attól függően, hogy az S-módú továbbított teljesítmény nagyobb vagy kisebb, mint az A/C-módú továbbított teljesítmény. Mivel az A/C-módú válaszjeladónak valamivel kisebb érzékenysége lehet, mint az S-módú válaszjeladónak, az A/C-módú távolságról felteszik, hogy akkor és csak akkor nagyobb, mint az S-módú távolság, ha az A/C-módú teljesítmény 3 dB-el meghaladja az S-módú teljesítményt.

3.2.3.8.3 *2. lépés.* A második lépés a szabályozási folyamatban az S-módú adatlekérdezési teljesítmény 1dB-el való csökkentése, és az MTL növelése az S-módú squitter lehallgatásához, 1 dB-el az utoljára használt értékekről, ha az (1) vagy (2) egyenlőtlenség megszegése következik be, és az utolsó pásztázás S-módú felderítési távolsága meghaladja az A/C-módú felderítési távolságot, amelyet az ütemezett suttogás-kiabálás sorozat eredményezne.

Ha egyszer egy ilyen változtatást végrehajtottak, az ezt követő 8 másodperc alatt az egyetlen megengedett változtatás a suttogás-kiabálás lépések számának csökkentése, ha ez szükséges a (3) egyenlőtlenség kielégítéséhez. Ez a 8-másodperces befagyasztás lehetővé teszi az S-módú változtatások hatásának láthatóvá válását, mivel a 8-másodperces átlagokat, amelyeket az (1) és (2) egyenlőtlenségekben használnak, azután a rendszereknek a változtatás pillanata utáni viselkedése fogja meghatározni.

3.2.3.8.4 *3. lépés.* A 3. lépés arra szolgál, hogy hozzá lehessen adni egy suttogás-kiabálás lépést ahhoz a próbaképpen előírányzotthoz, ha ez nem akadályozza meg egy 8-másodperces befagyasztást, és a következő feltételek teljesülnek:

a) az (1), (2) és (3) egyenlőtlenségek teljesülnek, és a lépés hozzáadása után továbbra is teljesülnek; és

b) az utolsó pásztázás S-módú felderítési távolsága meghaladja az A/C-módú felderítési távolságot, amely az ütemezett sorozat használatából ered; és annyi lépést adnak hozzá, amennyit a fenti a) vagy b) megsértése nélkül lehet.

3.2.3.8.5 *4. lépés* Végül, ha a fenti 3.2.3.8.4 alpont a) feltétele teljesül, de a b) feltétel nem teljesül, akkor számítást végeznek az adatbegyűjtési S-módú lekérdezési teljesítmény 1 dB-el való növelése, és az S-módú squitterek MTL-jének 1 dB-el való csökkentésének hatásaira vonatkozóan. Ha a számítás azt mutatja, hogy az (1) és (2) egyenlőtlenségek már nem teljesülnek, az 1 dB-es változtatást nem végzik el. Ha a számítás azt eredményezi, hogy ezek továbbra is teljesülnek, az 1 dB-es változtatást elvégzik, és a következő 8 másodpercben sem az A/C-módú, sem az S-módú paramétereket nem változtatják meg, kivéve a fenti 3.2.3.8.3 pontban ismertetetteket.

3.2.4 LEKÉRDEZÉSI VIBRÁLÁS

Az ACAS berendezéstől jövő A/C-módú lekérdezések szándékosan vibráltatásra kerülnek, hogy elkerüljék a más földi és fedélzeti lekérdezőkkel való szinkron interferencia lehetőségét. Az S-módú felderítések lekérdezéseit nem szükséges vibráltatni az S-módú lekérdezés ütemezési folyamatának megnövekedett véletlenszerű jellege miatt.

3.3 Antennák

3.3.1 IRÁNYÍTOTT LEKÉRDEZÉS HASZNÁLATA

3.3.1.1 Irányantenna ajánlott A/C-módú célok megbízható ellenőrzésére 0,087 légijármű per négyzetkilométer (0,3 légijármű per négyzetmérföld) légijármű sűrűségig. Az ajánlott antenna rendszer egy négysugaras, a légijármű tetejére szerelt antennából és a légijármű aljára szerelt körsugárzó antennából áll. Egy irányantenna is lehet használatos a légijármű aljára szerelt körsugárzó antenna helyett. Az irányantenna sorozatosan generál sugarakat, amelyek előre, hátra, balra és jobbra irányulnak. Ezek együttesen légtér ellenőrzési fedést szolgáltatnak minden azimut szögnél anélkül, hogy közbenső beállítási szögre lenne szükség.

3.3.1.2 Az irány antennának tipikusan 3 dB-es sugárszélessége (BW) van 90 ± 10 fokos azimutban +20 fok és -15 fok közötti összes elevációs szögnél. A lekérdezési sugárszélességet egy mellékhurok elnyomási impulzus korlátozza, amely az egyes P_1 lekérdezési impulzusokat 2 mikromásodperccel követi. A P_2 impulzust egy különálló irányító sugárzási diagramon (amely körsugárzó lehet) továbbítják.

3.3.1.3 Időnként szükség van a kis közeledési sebességgel fentről vagy lentről közelítő légijárművek detektálására is. Az ilyen légijárművek észlelése kielégítő antenna nyereséget tesz szükségessé az ACAS légijármű bólintási síkjához képesti ± 10 fokos elevációs szögön (látóhatár fölötti szögmagasság) belül. Az ACAS irányantennának tipikusan 3 dB névleges függőleges, 30 fokos sugárszélessége van.

3.3.1.4 Az irányantenna sugárzási diagramjának formáját és a P_2 adatátvitelek relatív amplitúdóját úgy szabályozzák, hogy a) bármely 0 és 360 fok közötti azimut szögnél és +20 és -15 fok közötti elevációs szögnél elhelyezett maximális elnyomással rendelkező válaszjeladó válaszoljon a négy iránysugár közül legalább az egyikre, és b) egy minimális elnyomással rendelkező válaszjeladó nem több, mint két szomszédos iránysugárból jövő lekérdezésre válaszoljon. A maximális elnyomással rendelkező válaszjeladót úgy határozták meg, mint olyan válaszjeladót, amely csak akkor válaszol, ha a vett P_1/P_2 arány meghaladja a 3 dB-t. A minimális elnyomással rendelkező válaszjeladót úgy határozták meg, mint olyan válaszjeladót, amely csak akkor válaszol, ha a vett P_1/P_2 arány meghaladja a 0 dB-t.

3.3.1.5 Az egyes antenna sugaraktól (előre, balra, jobbra, hátra, körbe) származó effektív sugárzott teljesítmény (ERP) várhatóan a megfelelő névleges ±2 dB értéken belül marad, ahogyan azt az A-2a ábra mutatja.

3.3.1.6 Egy előreirányuló átvitelnek, amelyre TRP = 49 dBm és BW = 90^0, teljesítmény nyeresége van a sugár közepén, amely közelítőleg

$$PG = \frac{TRP}{BW/360^{\circ}} = 55 \text{ dBm}$$

Ez 1 dB-el nagyobb, mint a névleges, és megfelelő lefedést tesz lehetővé az iránysugarak keresztezési pontjainál. Az oldalsó és hátsó sugarakat csökkentik az elülső sugárhoz képest, hogy figyelembe vegyék a kisebb közeledési sebességeket, amelyek akkor jelennek meg, amikor a légijárművek ezekből az irányokból közelednek. Az A/C-módú ellenőrzés teljesítménye általában javul, ahogyan az irányultság (és ezáltal a sugarak száma) növekszik a tetőre szerelt antennánál. Azonban az alsó irány antenna használata csak marginális javulást eredményezne az észlelőképességben, és ha teljes teljesítménnyel használják, lerontja a berendezés általános teljesítményét a hamis nyomvonal ráta növelésével a földről visszaverődő többszörös nyomvonal miatt.

3.3.2 IRÁNYKERESÉS

A válaszoló válaszjeladóktól jövő átvitelek érkezési szögét 10-fokos RMS pontosságnál nagyobb pontossággal lehet meghatározni néhány egyszerű és praktikus iránykereső eljárással. Ezek az eljárások tipikusan négy vagy öt egypólusú sugárzó elem együttest alkalmaznak, amelyek a légijármű felületén negyed hullámközökkel négyszögekben vannak felszerelve. Az ezektől az elemektől jövő jelek kombinálhatók úgy, hogy 2-4 különálló sugarat generáljanak, amelyek fázisban vagy amplitúdóban egybevethetők, hogy a vett jel érkezési irányának számítását produkálják. Az iránykeresés pontossági szintje kielégítő a repülőgépvezető forgalmi tanácsadással való ellátásával, hogy hatékonyan segítse a megközelítő légijármű vizuális befogását.

3.3.3 IRÁNYÍTOTT ÁTVITEL SZINKRON CSONKÍTÁS SZABÁLYOZÁSHOZ

3.3.3.1 Az irányított lekérdezés használata az egyik eljárási mód a szinkron csonkítás csökkentésére. Az irányított lekérdezés csökkenteni képes a lekérdezési régió méretét. Lefedést az összes irányban biztosítani kell. Ebből kifolyólag többszörös sugarakat használnak válaszok kiváltására az ACAS-al felszerelt légijárművek környezetében lévő összes légijárműtől. Figyelmet kell fordítani arra, hogy a sugarak között átfedés legyen, hogy ne keletkezzen lefedetlen rész közöttük.

3.3.3.2 Az antennának viszonylag egyszerű elrendezési képességgel kell rendelkeznie tipikusan négy vagy nyolc pozícióba való kapcsoláshoz. Négy sugár pozíció esetén az antenna nyaláb szélessége várhatóan 100^0 körüli. Az effektív antenna nyaláb szélességét A/C-módú válaszjeladó lekérdezéseknél 3dB-nél keskenyebbre lehet leszűkíteni az adóberendezés oldalszirom elnyomásával.

3.3.4 ANTENNA ELHELYEZÉS

A légijármű tetejére szerelt irány antennát a légijármű középvonalában, amennyire csak lehet, előre kell helyezni. Az ACAS antennákat és az S-módú válaszjeladó antennákat egymástól a lehető legtávolabb kell felszerelni a légijármű sárkányszerkezeten, hogy minimalizálják az energia átvezetést egyik egységről a másikra. A közök soha nem lehetnek 0,5 m-nél (1,5 láb) kisebbek, mivel ez a térköz elrendezés legalább 20 dB kapcsolási veszteséget eredményez.

3.4 Vevő és processzor

3.4.1 ÉRZÉKENYSÉG

Egy S-módú válaszjeladó érzékenységével (-74 dBm minimális beindítási szintű) ekvivalens érzékenység elegendő kapcsolat tartalékot szolgáltat, hogy közel azonos magasságban vízszintes repülést végző 26 km (14 NM) távolságban lévő légijárművek megbízható észlelését szolgáltassa azoknak a légijárműveknek, amelyek maguk is névleges sugárzási teljesítményű válaszjeladókkal vannak felszerelve.

3.4.2 VEVŐ KÜSZÖB SZABÁLYOZÁS

3.4.2.1 ACAS vevők egy változó (dinamikus) küszöböt használnak a többutas hatások szabályozására. Amikor a válasz első impulzusát veszik, a változó vevőküszöb eljárás a vevőküszöböt a minimális beindítási szintről (MTL) a vett impulzuscsúcs szintje alatt rögzített mennyiséggel (pl. 9 dB-el) lejjebb lévő szintre emeli. A vevő küszöböt ezen a szinten tartják az A/C-módú válasz ideje alatt, ami után ez visszatér az MTL-hez. Amikor a többutas visszaverődések gyengék a közvetlen nyomvonal válaszokhoz képest, a közvetlen nyomvonal válasz első impulzusa a vevő küszöböt elegendően megnöveli ahhoz, hogy a többutas visszaverődéseket ne észleljék.

3.4.2.2 A változó küszöbű vevőket történelmileg mellőzték az A/C módú válasz processzoroknál, mivel az ilyen jellegű küszöbök a gyenge válaszok elleni megkülönböztetéssel élnek. Bár, amennyiben a suttogás-kiabálás jellegű lekérdezéssel együtt használják, akkor az előnyös tulajdonságaik kerekednek felül. A lekérdezési sorrend bármely meghatározott lépésénél lehetőség nyílik a küszöb megemelése érdekében egy erős válaszra és lehetővé válik a gyengébb átfedő válasz visszautasítása. Bár, a suttogás-kiabálás jellegű lekérdezésnél, megközelítőleg azonos amplitudójú átfedő válasz érkezik az összes lekérdezésre, mivel a suttogás-kiabálás módszer a célokat a jel erősség szerinti csoportba sorolja be.

3.4.2.3 Az összes suttogás-kiabálás jellegű lekérdezést követő válasz lehallgatási periódusban használt ACAS vevő minimum beindítási szint (MTL) az előírt módon kapcsolódik a lekérdezési teljesítményhez. Nevezetesen, alacsonyabb lekérdezési teljesítményeknél minél kisebb minimum beindítási szintet használnak, hogy az A/C-módú aszinkron impulzus zavarások sebességének szabályozásával az ACAS vevőben amíg csak lehet egyensúlyt teremtsenek a lekérdezési- és a válasz adatkapcsolatok között, hogy az összes felszínre hozott választ észlelni lehessen.

3.4.3 IMPULZUS FELDOLGOZÁS

3.4.3.1 Egy viszonylag széles dinamikus távolság vevő hűen reprodukálja a vett impulzusokat. Gondoskodás történhet a vett impulzus szélek pontos elhelyezéséről és a hamis keret impulzusok elhagyásáról, amelyeket kód impulzusok szintetizálnak a valós válaszokból. A processzor képes impulzusok feldolgozására olyan szituációkban, ahol átfedett impulzus szélek tisztán megkülönböztethetőek. Megvan a képessége arra is, hogy a rejtett impulzusok pozícióit rekonstruálja, amikor közel azonos amplitúdójú átfedő impulzusok okozzák a következő impulzusok elrejtését. A válasz processzornak megvan a képessége legalább három átlapoló válasz kezelésére és korrekt dekódolására. Megfelelő eszközök gondoskodnak a sávon kívüli jelek elvetéséről, és a 0,5 mikromásodperc felfutási idejű impulzusok (tipikusan DME impulzusok) elvetéséről.

3.4.3.2 Ha egy S-módú válasz egy C-módú lehallgatási priódus alatt érkezik, egy hamis C-módú válasz-lánc generálódhat. Az ACAS berendezéstől elvárható, hogy ezeket a hamis válaszokat kiselejtezze.

3.4.4 HIBA ÉSZLELÉS ÉS KORREKCIÓ

3.4.4.1 Az ACAS elektronika, amely a 260 m/s-nál (500 csomó) nagyobb közeledési sebességgel, és négyzet kilométerenként 0,009 légijárműnél (négyzet tengeri mérföldenként 0,03 légijárműnél) nagyobb sűrűséggel, vagy 260 m/s-nél (500 csomó) kisebb közeledési sebességgel és négyzet kilométerenként 0,04 légijárműnél (négyzet tengeri mérföldenként 014 légijárműnél) nagyobb sűrűséggel jellemzett légtérben való használatra terveztek, S-módú válasz hibakorrekciót igényel. Ezekben a nagysűrűségekben hibakorrekció szükséges, hogy felülmúlja az A/C-módú hatásokat. S-módú hibakorrekció lehetővé teszi az S-módú válaszok sikeres vételét egy átlapoló A/C-módú válasz jelenlétében.

3.4.4.2 Hibakorrekció dekódolást használnak a következő válaszoknál: DF = 11 körhívás válaszok, DF = 0 rövid levegő-levegő ellenőrzési válaszok, és DF = 16 hosszú levegő-levegő ellenőrzési válaszok (adatbegyűjtési és nem adatbegyűjtési egyaránt).

3.4.4.3 Ha kettő vagy több olyan adatbegyűjtési választ vesznek, amely hibakorrekciót kíván az S-módú távolság adat beszerzési ablakon belül, gyakorlatiatlan lehet az első vett válaszon kívül további hibakorrekciót alkalmazni. Adatlekérdezési válaszokat az elsőn kívül nem kell korrigálni, amikor ez megjelenik.

3.4.5 VEVŐ OLDALSZIROM ELNYOMÁS

Az irányítottan lekérdező ACAS berendezés vevő oldalszirom elnyomási eljárást alkalmazhatnak a lekérdezett szektoron kívül lévő közeli légijárművek által generált válaszok elhanyagolására. Ez csökkenti az ellenőrzési felfrissítési periódus alatt feldolgozott válaszok számát.

3.4.6 KETTŐS MINIMÁLIS BEINDÍTÓ SZINTEK

Ha az ACAS által használt vevő minimális beindítási szintjét (MTL) lejjebb veszik, hogy nagyobb távolságú működést nyerjenek kiterjesztett squitterrel, intézkedni kell a squitter vételek címkézésére, amelyeket hagyományos MTL-nél vettek, és amelyeket egy módosítás nélküli ACAS vevő használt volna fel. Squitter vételeket, amelyeket hagyományos MTL-nél vagy magasabban vesznek, az ACAS felderítési tevékenységhez táplálják. Squitter vételeket, amelyeket hagyományos MTL alatt vesznek, nem használnak ACAS felderítésre, de közvetlenül a kiterjesztett squitter alkalmazáshoz irányítják. Ez az MTL általi szűrés szükséges ahhoz, hogy megóvják az ACAS-t attól, hogy olyan légijármű lekérdezést kíséreljen meg, amely túl van az aktív elderítési képességen. Ez megnöveli az ACAS lekérdezési sebességét minden tökéletesített teljesítmény szolgáltatás nélkül. A hagyományos MTL használata az ACAS felderítési tevékenységéhez megőrzi az ACAS éppen zajló felderítési műveletét, amikor egy feljavított MTL-elt használó vevővel üzemel.

3.5 Összeütközés-elhárító algoritmus

Megjegyzés. – Az ACAS II összeütközés elhárító logikájáról szóló útmutató anyag két szakaszba van szervezve. Ez a szakasz az ACAS SARP-okban lévő szabványokkal foglalkozik, és fontos koncepciókat fejt ki, az ACAS logika egy specifikus megvalósításának tervezési sajátságait felhasználva példaként. A 4. Szakasz további részletekkel szolgál ezen adott ACAS alkalmazás által használt algoritmusokról és paraméterekről. Ennek az elrendezésnek a következményeként az ebben a Szakaszban lévő pontok gyakran hivatkoznak a következő Szakaszban lévő pontokra.

3.5.1 ÁLTALÁNOS ISMERTETÉS

3.5.1.1 Az ACAS algoritmus névlegesen másodpercenként egyszer ismétlődő ciklusban működik. A ciklus elején a felderítési közléseket az összes megközelítő légijármű nyomvonalainak felfrissítésére, és ha szükséges, új nyomvonalak beindítására használják. Mindegyik megközelítő légijárművet azután távolságának, távolságváltozási sebességének, magasságának, magasság változási sebességének és esetlegesen iránytengelyének éppen folyó számítása képviseli. A saját légijármű magasságának és magasság változásának számításait is fel kell frissíteni.

3.5.1.2 Miután a nyomvonalakat felfrissítették, a megközelítő légijármű észlelési algoritmusokat annak meghatározására használják, hogy mely megközelítő légijárművek jelentenek potenciális összeütközési veszélyt. Két veszélyeztető légijármű szintet határoznak meg: potenciálisan veszélyeztető légijárművek és veszélyeztető légijárművek. Potenciálisan veszélyeztető légijárművek forgalmi tanácsadást, míg a veszélyeztető légijárművek megoldási tanácsadást indokolnak.

3.5.1.3 A megoldási algoritmusok egy megoldási tanácsadást generálnak, az összes veszélyeztető légijárműtől való függőleges elkülönítés végett, amelyeket a veszélyeztető észlelési algoritmusok azonosítanak. Az egyes felszerelt veszélyeztető légijárművekkel való koordináció a megoldási tanácsadás kiválasztási folyamatának részeként jelenik meg. Páronkénti koordináció az egyes felszerelt veszélyeztető légijárművekkel szükséges ahhoz, hogy megállapítsák, melyik légijárműnek kell a másik felett elhaladnia, és így garantálni olyan elkerülő manővereket, amelyek összeegyeztethetőek.

3.5.2 VESZÉLYEZTETÖ LÉGIJÁRMŰ ÉSZLELÉSE

3.5.2.1 Az összeütközési veszély észlelése a távolságban és magasságban való egyidejű közelségen alapszik. Az ACAS távolság változási és magasság változási adatokat használ a veszélyeztető és a saját légijármű helyzetének extrapolálására. Ha rövid időtartamon belül (pl. 25 másodperc) a megközelítő légijármű távolsága várhatóan "kicsi", és a magasság elkülönülés várhatóan "kicsi", a megközelítő légijárművet veszélyeztetőnek nyilvánítják. Megfordítva, a veszélyeztető légijármű deklarálás azon aktuális távolság és magasság elkülönülésen alapulhat, amelyek "kicsik". Az algoritmus paramétereket, amelyek megállapítják, hogy a jövőbeli helyzeteket milyen mértékben extrapolálják, és amelyek megállapítják a küszöböket annak meghatározásához, hogy az elkülönülések mikor "kicsik", a veszélyeztető észlelési algoritmus működési érzékenységi szintjével összhangban választják ki.

3.5.2.2 Mindegyik érzékelési szint az algoritmusok által felhasznált észlelési paraméterekhez egy különleges értékkészletet határoz meg. Ezek tartalmazzák a küszöbértékeket a legszorosabb megközelítés számított időpontjára, a minimális ferde távolságra és a függőleges elkülönítésre vonatkozóan. Az érzékenységi szint szabályozás folyamatán keresztül ezeknek a paramétereknek különböző értékeket adnak a kisebb légijármű elkülönítések figyelembe vételével, amelyek sűrű terminál légtérben fordulnak elő. Az érzékenységi szintet automatikusan, a saját légijármű magasságának felhasználásával, vagy egy S-módú földi állomástól, vagy egy repülőgépvezető kézi kapcsolástól jövő utasítás által lehet kiválasztani (lásd 3.5.12 Szakasz).

3.5.2.3 A veszélyeztető légijárművet észlelő paraméterekhez használt értékek nem lehetnek optimálisak minden szituációra vonatkozóan, mivel az ACAS hátrányt szenved a megközelítő légijármű szándéka ismeretének hiánya miatt. Az eredmény az, hogy egyensúlyt kell teremteni annak szükséglete, hogy elégséges figyelmeztetést adjanak egy fenyegető összeütközésről és a lehetséges felesleges figyelmeztetések generálása között. Ez utóbbi olyan találkozásokból ered, amelyet a megközelítő légijármű manőverekkel az utolsó pillanatban old meg. Az ACAS egyik tulajdonsága, amely ebben a vonatkozásban segít, a légtér védett térfogatának a változtathatósága. Ez a térfogat méretben automatikusan kapcsolódik a két légijármű közötti viszonylagos sebességhez, és automatikusan a relatív sebességvektorral párhuzamos irányba áll be. A tengelyirány nem játszik szerepet ebben a folyamatban. Mindegyik találkozás növeli a védett térfogatot, amely ehhez a találkozáshoz van szabva. Egy több-légijárműves szituációban egyéni védett térfogat van az ACAS légijármű számára, amely az egyes veszélyeztető légijárművekkel párosul.

3.5.3 VÉDETT TÉRFOGAT

Egy megközelítő légijármű akkor válik veszélyeztetővé, amikor behatol a saját légijárművet körülvevő védett térfogatba. A védett térfogatot távolság vizsgálattal (csak távolság adatot felhasználva) és magasság vizsgálattal (magassági és távolsági adatokat felhasználva) határozzák meg. Ezeknek a vizsgálatoknak az elvégzése pozitív vagy negatív értéket szolgáltat (attól függően, hogy a veszélyeztető légijármű a védett térfogat megfelelő részén kívül vagy belül van). Egy megközelítő légijárművet veszélyeztetőnek nyilvánítanak, ha mindkét vizsgálat pozitív eredményt szolgáltat.

3.5.3.1 *A VÉDETT TÉRFOGAT FOGALMAINAK ISMERTETÉSE*

Collision plane - Összeütközési sík. A távolság vektort és a megközelítő légijárműtől kiinduló pillanatnyi relatív sebesség vektort magában foglaló sík.

Critical cross-sectional area - Kritikus keresztmetszet terület. A védett térfogatnak a főtengelyre merőleges síkban fekvő maximális keresztmetszeti területe.

Instantaneous relative velocity(ies) - Pillanatnyi relatív sebesség(ek). A relatív sebesség aktuális értékének a modulusza.

Linear miss distance (m_a) - Lineáris elkerülési távolság (m_a). Az a minimális érték, amelyet a távolság fel fog venni azon feltételezés mellett, hogy mind a megközelítő, mind a saját légijármű az éppen elfoglalt helyzetéből kiindulva, gyorsulás nélkül mozog.

Linear time to closest approach (t_a) - Lineáris idő a legszorosabb megközelítésig (t_a). Az az idő, amely a legszorosabb megközelítésig telne el, ha mind a megközelítő, mind a saját légijármű az éppen elfoglalt helyzetéből kiindulva, gyorsulás nélkül mozogna.

Feltéve, hogy az ACAS részére a távolság számítások készítéséhez csak a távolság és a távolság változási sebesség becslési információ áll rendelkezésre, mind a lineáris elkerülési távolság, mind a lineáris idő a legszorosabb megközelítésig észlelhetetlen mennyiségek.

Az észlelhetetlen mennyiségek, a lineáris elkerülési távolság és a lineáris idő a legszorosabb megközelítésig, valamint az észlelhető mennyiségek, az r távolság, és az $\dot{r}$ távolság változási sebesség közötti összefüggést a következő egyenlőség fejezi ki:

$$t_a = \frac{(r^2 - m_a{}^2)}{(-r\dot{r})}$$

Major axis - Főtengely. A védett térfogathoz kapcsolódó, az ACAS II légijárművön keresztül haladó vonal, amely párhuzamos a pillanatnyi relatív sebesség vektorral.

Range convergence - Távolság konvergencia. Egy légijárművet távolságban egymáshoz közeledőnek (konvergálónak) tartanak, ha a távolság változási sebesség kisebb vagy egyenlő zérus.

3.5.4 TÁVOLSÁG VIZSGÁLAT

3.5.4.1 A távolság vizsgálatból adódó védett térfogatot, amelyet az ACAS 4. Szakaszban leírt megvalósításában használnak, az A-5 ábrán illusztrált vizsgálat realizálható megvalósításának maximális méretei fogalmaiban határozzák meg. Ez egy védett térfogaton átmenő metszetet mutat, amelyet a távolság vizsgálat a légijárművet és a pillanatnyi relatív sebességet magában foglaló síkban generál. A védett térfogat a folyamatos vonallal ábrázolt görbének az x tengely körüli forgatásával keletkezik. Érdemes megjegyezni, hogy a főtengely hossza az s relatív sebesség függvénye. A realizálható távolság vizsgálatánál a pillanatnyi relatív sebesség vektorra merőleges síkban lévő, a védett térfogaton átmenő maximális keresztmetszet sugara az m_c Ez a maximális elkerülési távolságot mutatja, amelynél figyelmeztetés generálódhat, ha a védett térfogatba belépés idején a meglévő sebesség a legszorosabb megközelítésig fennmarad. A főtengely hossza az az alapvető sajátosság, amely a figyelmeztetési időpontot meghatározza, míg m_c a tervezett elkerülési távolságot szabályozza, amely valószínűleg figyelmeztetést generál. Ideális esetben a figyelmeztetési idő T másodperc lenne, és m_c pedig olyan, hogy csak azok a megközelítő légijárművek minősülnének figyelmeztetés kiadását kiváltónak, amelyek a tervezet szerint D_m-nél (a szaggatott vonallal rajzolt kör az A-5 ábrán) kisebb hiányzó távolsággal bírnak. A D_m jelentése az, hogy amikor mint a 4. Szakaszban leírt ACAS megvalósításban lévőt specifikálják, jó megközelítéssel azt a hosszanti elmozdulást képviseli, amelyet egy légijármű a T. idő után tapasztal, amikor konstans $g/3$ gyorsulással (bedöntési szög = 18°) fordulót hajt végre. Így D_m előretervezett elkerülési távolság esetén, amikor az idő a legszorosabb megközelítésig T, összeütközés következhet be, ha a két légijármű közül az egyik egy $g/3$ gyorsulásos manővert hajt végre. Megfelelő iránytengely változási sebesség és távolság változás sebesség adatok híján az ACAS nem tudja az ideális esetet elérni Az A-6 ábra m_c maximális megengedett értékét mutatja (azaz m_c-t, mint a relatív sebesség és az érzékenységi szint függvényét). Amikor a relatív sebesség nagyon kicsi, ami egy hátulról való közeledés esetén fordulhat elő, a távolság vizsgálat által előállított védett térfogat egy D_m sugarú gömb lesz, amelynek középpontja az ACAS légijármű.

3.5.4.2 Lényegében a távolság vizsgálat pozitív eredményt ad, ha közelítőleg T másodperc marad a legszorosabb megközelítés előtt, a relatív sebesség vektort úgy lehet előre tervezni, hogy áthaladjon egy m_c sugarú körön, amelynek középpontja az ACAS légijárművön van, és a relatív sebesség vektorra merőleges síkban helyezkedik el. Mivel m_c értéke a megfelelő függőleges elkülönülés értékéhez képest nagyon nagy, a vizsgálat önmagában nagyszámú felesleges figyelmeztetést generál. Ezért a távolság vizsgálati védett térfogatot szerényebb arányban kell kiszabni, magassági adatok felhasználásával. Ez elkerülhetetlenül csökkenti a függőleges síkban végrehajtott manőverektől való immunitást.

3.5.4.3 A távolság vizsgálatra vonatkozó korlátozásokat úgy tervezik meg, hogy T másodperc névleges figyelmeztetési időt adjon, amely a relatív sebesség vektorra merőleges D_m elmozdulást létrehozó manővert tesz lehetővé. Ezt demonstrálja az, hogy egy elegendően nagy relatív sebességgel történő találkozásnál a fordulót végző légijármű által létrehozott gyorsulás közel merőleges a relatív sebesség vektorra. Kis relatív sebességnél jelentős, a relatív sebesség vektor irányába mutató gyorsulás komponens léphet fel. A figyelmeztetési idő e komponens miatti erózióját a védett térfogat főtengelyének minimális hossza kompenzálja, amely nagyobb, mint sT.

3.5.5 MAGASSÁG VIZSGÁLAT

3.5.5.1 A magasság vizsgálat célja kiszűrni azokat a megközelítő légijárműveket, amelyek pozitív eredményt adnak a távolság vizsgálatnál, de nincsenek megfelelően elkülönítve a függőleges méretekben. A magassági vizsgálatot a figyelmeztetés mértékének csökkentésére használják annak ismeretében, hogy a szabványos függőleges elkülönítési távolságok a légijárműveknél általában sokkal kisebbek, mint a szabványos vízszintes elkülönítési távolságok. Elkerülhetetlen eredmény az, hogy a gyorsulás védelem, amelyet névlegesen a távolság vizsgálat az összes síkban szolgáltat, nagymértékben korlátozott a vízszintes síkban. Továbbá, még relatív gyorsulás nélkül is, a magasság vizsgálat késleltetheti a figyelmeztetések kiadását, ha valamilyen függőleges elkülönülés létezése a legszorosabb megközelítésnél előrejelzett. Két légijármű relatív mozgásának elevációs (látóhatár fölötti szögmagasság szerinti) nézetét mutatja az A-7 ábra. AOB egy olyan síkot képvisel, amely merőleges a relatív sebesség vektorra és az ACAS légijárművet tartalmazza. A megközelítő légijármű vízszintesen elmozdulhat az ACAS-tól, így nincs szükségszerűen az ábra síkjában. A magasság vizsgálat lényeges tulajdonsága, hogy pozitív eredmény hozását célozza, ha az előretervezett függőleges hiányzó távolság kisebb, mint Z_m. A 4. Szakaszban ismertetett ACAS megvalósításban Z_m 180 m-től (600 láb) 240 m-ig (800 láb) terjedő lépcsőkben változik a magassággal .

3.5.5.2 Mivel a fő érdeklődés a D_m-nél kisebb előretervezett elkerülési távolságú megközelítő légijárművek felé irányul, egy ideális magasság vizsgálat (kombinálva egy ideális távolság vizsgálattal) pozitív eredményt szolgáltat, ha *többek között,* a viszonylagos sebesség vektor úgy tervezett, hogy keresztül halad az A-7 ábrán folytonos vonallal feltüntetett kritikus területen. A gyakorlatban a 3.5.1.2 pontban felvázolt távolsági vizsgálat és a magassági vizsgált teljesül, ha a vektor keresztül halad a szaggatott vonallal meghatározott nagyobb területen. Azok a megközelítő légijárművek, amelyek a vonal közötti területeken haladnak át, valószínűleg növelik a szükségtelen figyelmeztetések számát.

3.5.5.3 A magasság vizsgálat nem eredményesebb a legszorosabb megközelítés idejének előrejelzése szempontjából, mint a távolság vizsgálat. Ez azt jelenti, hogy ha más feltételek nem állnak fenn, a távolság vizsgálat meghatározza a figyelmeztetés idejét. Azonban a 4. Szakaszban leírt ACAS megvalósítás magasság vizsgálatának egy további sajátossága annak a lehetőségnek ellenében törekszik hatni, hogy a légijárművek egyike a másiknál kisebb vagy nagyobb magassági szintre kerüljön, így elkerüljenek egy szoros találkozást. A találkozások két típusa ismeretes: az első, amelyben az éppen meglévő függőleges elkülönülés kisebb, mint Z_t, (lásd 4.3.4.2 alpont) és egy másik, amelyben a meglévő elkülönülés nagyobb, mint Z_t, és a légijárművek magasságban összetartanak (konvergálnak). Az első típusnál az ACAS magasság vizsgálat csak azt igényli, hogy a kritikus terület úgy legyen előre tervezve, hogy abba behatolás történjen. A másodiknál egy pótlólagos feltétel, hogy a közös magasság szint elérési ideje kisebb vagy egyenlő legyen egy időküszöbbel, amely néha kisebb, mint *T,* a névleges figyelmeztetési idő. A hatás az, hogy a figyelmeztetési időt a távolság vizsgálat szabályozza azoknál a megközelítő légijárműveknél, amelyekre magasság kereszteződés van előretervezve a legszorosabb megközelítés előtt, míg későbbi figyelmeztetéseket adnak a legszorosabb megközelítés utáni magasságkereszteződéseknél.

3.5.6 MEGALAPOZOTT VESZÉLYEZTETÉSEK

3.5.6.1 Megalapozott veszélyeztető egy olyan megközelítő légijármű, amelyet veszélyeztetőnek minősítettek és még kiérdemli a megoldási tanácsadást.

3.5.6.2 A követelmény, hogy mind a távolság vizsgálat, mind a magasság vizsgálat ugyanazon működési ciklusban pozitív eredményt adjon, mielőtt egy megközelítő légijárművet veszélyeztetőnek nyilvánítanának (3.5.2.1 alpont), csak új veszélyeztető légijárművekre érvényes. Következésképpen csak a távolság vizsgálatot alkalmazzák, és pozitív eredménynek az a hatása, hogy a veszélyeztető státusz fennmarad. A magasság vizsgálat elhagyásának az oka az, hogy egy gyors repülőgépvezető reagálás, vagy az a tény, hogy a megközelítő légijármű kezdetben még éppen kielégíti a magassági kritériumokat, a veszélyeztető státusz törlését okozhatja a legszorosabb megközelítés elérése előtt.

3.5.7 FIGYELMEZTETÉSI SZINT

3.5.7.1 A figyelmeztetési szintet szabályozó alapvető változók: a relatív sebesség, az elkerülési távolság és a környező légijármű sűrűség. A figyelmeztetési szintet befolyásoló alapvető ACAS paraméterek: *T, D_m és Z_m.* A figyelmeztetési szintet állandó sebességű véletlen forgalom esetére lehet számítani, de a látod-és-elkerülöd hatások és a légiforgalmi irányítás az ilyen számításokat a valódi forgalomra nagyon bonyolulttá teszik. Az A-6 ábra némi iránymutatást ad egy előfordulás néhány sajátosságáról, amely figyelmeztetés kiadását idézheti elő, bár nem ad segítséget a magasság vizsgálat eredményének meggondolásához. Például látható, hogy 5-ös érzékenységi szintnél (50-es és 100-as repülési magasságszint között) nem lehet figyelmeztetés, ha a vízszintes elkülönülés nagyobb, mint 5,5 km (3 NM) és a relatív sebesség kisebb, mint körülbelül 440 m/s (850 csomó).

3.5.7.2. Földi radar felderítési adatokat felhasználó szimulációk és az ACAS berendezésekkel nyert kezdeti tapasztalatok azt mutatták, hogy a figyelmeztetési szint értéke tipikus sűrűségű légtérben 30 repült órában kapott 1 értékű arányszámtól, az 50 repült órában kapott 1 értékű arányszámig terjedő tartományban helyezkedik el.

3.5.8 VESZÉLYEZTETŐ MEGOLDÁS

3.5.8.1 *KOORDINÁCIÓ*

Ha a veszélyeztető státuszú légijármű ACAS II-vel vagy ACAS III-mal van felszerelve, a saját ACAS-tól megkövetelt, hogy koordináljon a veszélyeztető státuszú légijármű ACAS-ával az S-módú adatkapcsolaton keresztül, hogy biztosítsa összeegyeztethető megoldási tanácsadások kiválasztását. A kiválasztott tanácsadás jellegét befolyásolja az a tény, hogy a veszélyeztető ACAS-al felszerelt.

3.5.8.2 *MEGOLDÁSI TANÁCSADÁSOK OSZTÁLYOZÁSA*

3.5.8.2.1 Az ACAS elkerülési manőverek a függőleges síkra korlátozódnak és az értelem (fel vagy le) és az erősség jellemzi őket. Egy felfelé történő elmozdulás értelmű megoldási tanácsadás célja biztosítani, hogy a saját légijármű biztonságosan haladjon el a veszélyeztető légijármű felett. Egy lefelé történő elmozdulás értelmű megoldási tanácsadás célja biztosítani, hogy a saját légijármű biztonságosan haladjon el a veszélyeztető légijármű alatt. A felfelé történő elmozdulás értelmű megoldási tanácsadás erősségekre példák: "korlátozni a függőleges sebességet" (meghatározott célnak süllyedési sebesség), “nem süllyedni” vagy “emelkedni”. Lefelé irányúló értelmű azonos megoldási tanácsadás erősségre példák: “korlátozni a függőleges sebességet” (meghatározott célnak emelkedési sebesség), “nem emelkedni” vagy “süllyedni”. A megoldási tanácsadásoknak két típusa van: “pozitív”, egy kívánságot jelent bizonyos sebességgel történő emelkedésre vagy süllyedésre; és “függőleges sebesség korlátozás” azt jelenti, hogy a függőleges sebesség előírt tartományát kerülni kell. Bármely tanácsadás lehet “helyesbítési” vagy “megelőző”. Helyesbítési tanácsadás a saját légijármű fennálló függőleges sebességének változtatását kívánja, míg a megelőző tanácsadás nem kívánja.

3.5.8.2.2 Elvárás, hogy a generált megoldási tanácsadás ellentmondásmentes legyen a repülési pálya korlátozásokkal bizonyos repülési üzemmódokban a repülési burkológörbe korlátozások és az emelkedő képességet csökkentő légijármű konfigurációk miatt. Elvárható, hogy a légijármű manőver korlátozási kijelzései, amelyek az ACAS részére rendelkezésre állnak, a tényleges légijármű teljesítőképesség konzervatív értékelését ajánlják. Ez különösen igaz az emelkedés gátlására. Abban a ritka és sürgős esetben, amikor egy nagymagasságú lefelé irányuló értelmű megoldási tanácsadást emelkedésbe fordítanak át, várható, hogy nagyon gyakran a légijármű teljesítőképessége, amelyet összhangba kell hozni a megoldás tanácsadással, rendelkezésre fog állni az emelkedés korlátozás dacára. Amikor ilyen képességek nem állnak rendelkezésre, várható, hogy legalább részben a repülőgépvezető mindig képes lesz eleget tenni az irányváltásnak egy azonnali vízszintes repülésbe való átmenettel.

3.5.8.3 *MAGASSÁGI ELKÜLÖNÍTÉSI CÉL*

3.5.8.3.1 Hogy biztosan el lehessen kerülni az összeütközést, az ACAS-nak valódi magassági elkülönítést kell biztosítania a legszorosabb megközelítésnél, amely a légijármű méreteihez és a legrosszabb esethez tartozó iránybeállításához igazodik. Mivel csak mért adatok állnak rendelkezésre, megfelelően figyelembe kell venni a magassági hibákat mindkét légijárműnél. Továbbá, az elkerülési műveletet a legszorosabb megközelítés előtt meg kell kezdeni, így lehetséges, hogy ez a művelet a legszorosabb megközelítésnél előrejelzett magassági elkülönítésen alapul, amely további hibaforrást visz be. Ezek a tényezők egy olyan követelményhez vezetnek, hogy a repülőgépvezető részére szolgáltatott megoldási tanácsadásnak olyannak kell lenni, hogy a kívánt magassági elkülönítést a legszorosabb megközelítésnél a rendelkezésre álló idő alatt elérje. Ez az A_1 magassági elkülönítési cél, a magasságmérési hibák megfelelő kompenzálása érdekében a magasság függvényében kell, hogy változzon. A 4. Szakaszban ismertetett ACAS megvalósításnál A_1 90 m-től (300 láb) 210 m-ig (700 láb) változik.

3.5.8.3.2 A legszorosabb megközelítés időpontját nem lehet pontosan számítani, mivel az elkerülési távolság nem ismert, a veszélyeztető légijármű manővert hajthat végre és a távolság megfigyelések nem tökéletesek. Azonban a hasznosnak és elfogadhatónak talált korlátozások nem mások, mint azok a idők a legszorosabb megközelítésig, feltételezve, hogy az elkerülési távolság felveszi a legnagyobb értéket (D_m) és a zérus értéket és minden más hibaforrás elhanyagolásra került. Ez a tartomány kritikus azoknál a találkozásoknál, amelyeknél a távolság változási sebesség nagyon kis értékeket vesz fel. A magasság szerinti elkülönítés értéknek a teljes időköz alatti fenntartásával a megoldási tanácsadás kiválasztása közömbössé van téve a minimális távolsági idő számításában fellépő potenciálisan nagy hibákkal szemben. Ilyen hibák a távolság változási sebesség számításában fellépő kis abszolút hibákból származnak. Megelőző megoldási tanácsadásoknál a megoldási tanácsadás által ajánlott korláthoz való arány azonnali megváltozásának feltételezése azt fogja eredményezni, hogy a számítás egy határt szolgáltat (felsőt lefelé irányuló értelmű megoldási tanácsadás esetén, alsót felfelé irányuló értelmű megoldási tanácsadás esetén) a saját légijármű magasságára a legszorosabb megközelítésnél.

3.5.8.4. *MINIMÁLIS ELSZAKADÁS*

3.5.8.4.1 Elvileg a nagyobb megkívánt magasság elkülönítéseket élénkebb elkerülési manőverrel el lehet érni, de akadályt jelent az utaskényelem, légijármű képességei és a légiforgalmi irányítás engedélyétől való eltérés. Az alább következő 4. Szakaszban leírt ACAS paraméterek azon a számításon alapulnak, hogy a tipikus magasságváltoztatási sebesség, ami egy összeütközés elkerüléshez szükséges, 1500 láb/perc.

3.5.8.4.2 A tanácsadás irányának és erősségének kezdeti megválasztása, az alább ismertetett kivételektől eltekintve, arra irányul, hogy az ACS légijármű függőleges repülési pályájában a lehető legkisebb változtatást igényelje. És a tanácsadástól elvárják, hogy ha lehetséges, a találkozás későbbi stádiumában megfelelő mértékben legyengített legyen és végképpen megszűnjön, amikor a kívánt elkülönítést a legszorosabb megközelítésnél elérte. Elsődleges szempont a légiforgalmi irányítás engedélyezéseitől való eltérés minimalizálása.

3.5.8.5 *REPÜLŐGÉPVEZETŐ REAGÁLÁS*

Mivel a repülőgépvezető döntő befolyást gyakorol a rendszer hatékonyságára, az ACAS-nál bizonyos feltételezéseket kell tenni a repülőgépvezető reagálására vonatkozóan. A 4. Szakaszban leírt ACAS megvalósítás 5 másodperc reakció időt használ egy új tanácsadásnál, és *g/4* gyorsulást az elkerülési sebesség létrehozásánál. A reakció idő 2,5 másodpercre csökken az ezt követő tanácsadás változásoknál. Az ACAS nem szolgáltathat megfelelő függőleges elkülönítést, ha a repülőgépvezető reakció késése meghaladja a tervezet által feltételezett repülőgépvezető reagálási késést.

3.5.8.6 *VÍZSZINTES REPÜLÉST VÉGZŐ MEGKÖZELÍTŐ LÉGIJÁRMŰVEK*

3.5.8.6.1 A figyelmeztetés idején vízszintes repülést végző és ezt azután is folytató megközelítő légijárművek kevés problémát okoznak az ACAS számára. Ha a saját légijármű is vízszintes repülést végez, nem áll fenn számítási probléma. Amit az összes ACAS légijárműnek csinálni kell az az, hogy abban az irányban kell mozognia, amely növeli a céltól való elkülönülés meglévő értékét. Ennek az egyszerű logikának olyan akadályai lehetnek, hogy az ACAS légijármű esetleg nem képes emelkedni, vagy túl közel lehet a földhöz ahhoz, hogy biztonságosan süllyedni tudna.

3.5.8.6.2 A manőverezés korlátozottsági problémák nagyrészt eltűnnek, amikor az ACAS légijármű emelkedést vagy süllyedést hajt végre, mivel az elkülönítést gyakran el lehet érni a vízszintes repülésbe való átmenettel. És a számítási probléma valószínűleg igen csekély lesz, ha az ACAS-ba nagy feloldású, saját magasságra vonatkozó adatok vannak betáplálva.

3.5.8.7 *EMELKEDÉST/SÜLLYEDÉST VÉGZŐ MEGKÖZELÍTŐ LÉGIJÁRMŰVEK*

Emelkedést, vagy süllyedést végrehajtó megközelítő légijárművek több nehézséget okoznak, mint a vízszintes repülést végzők. Gyakran jelent problémát a magasságváltozási sebességük megállapítása. Az is nyilvánvaló, hogy egy emelkedést vagy süllyedést végrehajtó veszélyeztető légijármű, amely a számítások szerint a saját légijárműhöz közel fog elhaladni, nagyobb valószínűséggel vízszintes repülésbe megy át, mint hogy megtartaná a megfigyelt magasság változtatási sebességét, így kerülve el a szoros találkozást. Ezért az ACAS-nak a megoldási tanácsadás kiválasztásnál figyelembe kell venni azt a lehetőséget, hogy a veszélyeztető légijárművek vízszintes repülésbe mehetnek át, pl. a légiforgalmi irányítás utasítására reagálva. A veszélyeztető légijármű nyomon követett magasság változási sebességének alacsony megbízhatósága azt okozhatja, hogy a megoldási tanácsadás generálás e sebességnek egy jobb becslésére várva késedelmet szenved.

3.5.8.8 *MAGASSÁG KERESZTEZÉS MEGOLDÁS TANÁCSADÁSOK*

3.5.8.8.1 Megközelítő légijárművek, amelyeknél egy ACAS légijármű repülési magasságának keresztezése tervezett, egy teljesen hatékony ACAS tervezését rendkívüli mértékben megnehezíti, mivel az ilyen megközelítő légijárművek vízszintes repülésbe mehetnek át. Néhány magasság keresztező megoldási tanácsadást a repülőgépvezetők intuició ellenesnek találnak. Valóban, az ilyen megoldási tanácsadások kezdetben a repülőgépvezetőtől olyan manővert igényelnek, amely a megközelítő légijármű felé irányul, átmenetileg csökkentve a magasság szerinti elkülönülést. Mindazonáltal megfigyeltek olyan eseteket, amelyekben magasság keresztezési megoldási tanácsadások nyilvánvalóan megfelelőek, és még nem demonstrálták, hogy ezeket kívánatos, vagy lehetséges teljesen elkerülni. A magasság keresztezés megoldási tanácsadások gyakorisága valószínűleg függ a légijármű vezetésétől és viselkedésétől. Ismert, hogy a nagy sebességgel emelkedő, vagy süllyedő légijármű gyakrabban vált ki megoldási tanácsadást, közöttük magasság keresztező megoldás tanácsadást, mint más légijármű. Egy engedélyezett repülési magassághoz nagy sebességgel közeledő és azután egy másik légijármű közelében vízszintes repülésbe átmenő légijármű hatását lentebb ismertetjük. Ezeknek a hatásoknak a mérséklésére szolgáló intézkedéseket a 3.5.8.9 alpont írja le.

3.5.8.8.2 Az A-8 ábrán illusztrált helyzetnél feltételezzük, hogy a figyelmeztetés akkor következik be, amikor a megközelítő légijármű emelkedő repülést végez a vízszintes repülést végző ACAS légijármű irányába. Adottnak vesszük, hogy az emelkedés folytatódik, akkor a legjobb elkerülő stratégia a saját légijármű részére süllyedés a veszélyeztető légijármű felé, amely a veszélyeztető légijármű magasságának keresztezésével jár. Egy elemelkedés esetleg szolgáltathat elegendő függőleges távolságot, de ugyanazon elkerülési sebesség mellett a süllyedés nagyobb távolságot biztosít a veszélyeztető légijárműtől. Ha a saját légijármű süllyed, látható, hogy veszélyes helyzet alakulhat ki, ha a veszélyeztető légijármű vízszintes repülésbe megy át kardinális repülési szinten a saját légijármű alatt. Az ilyen manőverek megszokottak bizonyos ellenőrzött légterekben, mivel ezeket a légiforgalmi irányítók arra használják, hogy a légijárműveket biztonságosan átvigyék a megkívánt függőleges elkülönítésbe olyan helyzetek esetén, amikor a vízszintes elkülönítés kicsi. Az ACAS tervezés, amely az értelem olyan választásán alapszik, amely valószínűleg a legnagyobb magasság szerinti elkülönítést adja, szoros találkozást hozhat létre, amikor ilyen egyébként nem jönne létre. Egy ACAS tervnek intézkedéseket kell tartalmaznia, hogy azt a lehető legnagyobb mértékben immunenssé tegye az ilyen eseményekkel szemben.

3.5.8.9. *Gondoskodás az indukált szoros találkozások elkerüléséről.* A veszélyeztető légijármű szándékaira vonatkozó ismeretek teljes hiányában az ACAS jellege olyan, hogy azt feltételezi, hogy a veszélyeztető légijármű fenn fogja tartani meglévő magasság változtatási sebességét, de olyan megoldási tanácsadást választ, amely csökkenti a veszélyeztető légijármű valószínű manőverének hatását. Egyéb tulajdonságok gondoskodnak annak lehetőségéről, hogy a veszélyeztető légijármű következő manőverét észleljék. Például a 4. Szakaszban ismertetett megvalósítás az alább közölt logikát használja.

3.5.8.9.1 *Az értelem választás eltérítése*. Ha egy pozitív nem-magasság-keresztezési tanácsadásnál előrejelzik, hogy legalább elegendő magasság elkülönítést ad a legszorosabb megközelítésnél (A_l), akkor előnyben részesül az az értelem, amely megakadályozza, hogy a légijármű a legszorosabb megközelítés előtt keresztezze a magasságot, ha a veszélyeztető légijármű nem megy át vízszintes repülésbe. Nyilvánvaló, hogy bizonyos körülmények között a magasság keresztező megoldási tanácsadás rosszabb lehet, mint a nem magasság keresztező megoldás tanácsadás.

3.5.8.9.2 *Növelt sebességű megoldási tanácsadás*. Ha az értelem választása a 3.5.8.9.1 pontban leírt eljárás eredményeképpen valósult meg, azt eredményezi, hogy a saját légijármű eltávolodik a veszélyeztető légijárműtől, a találkozás még nincs megoldva, ha a veszélyeztető légijármű megnöveli a magasság változtatási sebességét. Ilyen esetben az ACAS légijármű repülőgépvezetője arra van késztetve, hogy növelje saját magasság változtatási sebességét abban a törekvésében, hogy megszökjön a veszélyeztető légijármű elől.

3.5.8.9.3 *Magassági elkülönítés vizsgálat.* Az értelem választás eltérítés nem mindig eredményez olyan tanácsadást, hogy távolodjon el a veszélyeztető légijárműtől, és magasság szerinti elkülönítési vizsgálatot is végeznek, hogy tovább csökkentsék egy indukált szoros találkozás esélyét, amely amiatt jönne létre, mert a veszélyeztető légijármű vízszintes repülésbe megy át, vagy csökkenti magasság változtatási sebességét. A vizsgálat a megoldási tanácsadás kiadásának a késleltetését idézi elő, amíg a veszélyeztető légijármű szándékának nagyobb biztonságú kikövetkeztetését el lehet érni. Ez nem mentes attól a kockázattól, hogy az ACAS nem lesz képes a találkozást megoldani. A 4. Szakaszban ismertetett ACAS megvalósítás kiegyenlíti ezeket a konfliktusos kockázatokat az alább ismertetett logikával.

3.5.8.9.3.1 Az A-8 ábrán bemutatott típusú helyzetnél, amely egy jelentős magasságváltoztatási sebességgel rendelkező veszélyeztető légijárművet ábrázol, a figyelmeztetés késleltetés nélkül akkor kerülne kiadásra, amikor a légijárművek magasság szerint még jól elkülönültek. Például, amikor a figyelmeztetési idő 5 másodperc és a magasság változási sebesség 900 m/perc (3000 láb/perc), a kezdeti elkülönülés 380 m (1250 láb). Ha a helyzet olyan, hogy egy magasság keresztezési megoldási tanácsadást igényel, azaz az eltérő értelem választás hatástalan, az ACAS késlelteti a tanácsadás kiadását, amíg a meglévő magassági elkülönülés egy küszöb (A_c) alá esik, azaz kisebb, mint a szabványos IFR elkülönítés. Ha a veszélyeztető légijármű ténylegesen átmegy vízszintes repülésbe valamilyen magasságban, mielőtt átlépi ezt a küszöböt, ami nagyon valószínű, a figyelmeztetést vagy törlik (Z_m-en kívül történő vízszintes repülésbe való átmenetnél), vagy nem magasság keresztezési tanácsadás kerül generálásra. Más esetben, eltekintve attól a lehetőségtől, hogy a veszélyeztető légijármű éppen túllépte az engedélyezett magasságot, minden jele megvan, hogy folytatja a magasság változtató repülést a saját légijármű repülési szintjéig vagy azon túl, és a magasság keresztezési tanácsadás nagyobb megbízhatósággal adható ki. Ha a helyzet olyan, hogy nem magasság keresztező tanácsadást igényel, csökkentett időküszöböt (T_v) használnak a magassági vizsgálathoz. Ez a függőleges küszöb vizsgálat (VTT) azt a célt szolgálja, hogy visszatartsa a megoldási tanácsadást annyi időre, ami éppen elég ahhoz, hogy a megközelítő légijármű által indított vízszintes repülésbe való átmenet észlelhető legyen.

3.5.8.9.3.2 A magasság szerinti elkülönítés vizsgálat alapvetően azt a célt szolgálja, hogy enyhítse a problémákat, amelyeket műszer szerinti repülésnek megfelelő forgalmi környezetben tapasztalnak. Kívánatosnak tűnhet az A_c érték olyan megválasztása, hogy magasság túlszabályozások, vagy még a nem-műszeres repülési szabályok szerinti elkülönítés is lefedett legyen. Azonban az ACAS kockázatát, hogy nem képes a találkozásokat megoldani, gondosan meg kell fontolni.

3.5.8.9.3.3 A vizsgálat két felszerelt légijármű közötti kooperáció előnyét hordozza azáltal, hogy a vízszintes repülést végző légijárművön lévő ACAS-t arra készteti, hogy késleltesse a megoldási tanácsadás kiválasztását, amíg megoldás közlést kap a felszerelt megközelítőtől. Ez utóbbin lévő ACAS-nak csaknem biztosan a magasság változtatási sebességének csökkentését kell választania, és a koordinációs folyamat azt fogja eredményezni, hogy a vízszintes repülést végző légijármű képes fenntartani vízszintes repülési állapotát. A gyakorlatban a késleltetés a találkozás megoldás megkezdésében kicsi lesz, de a kockázat a megoldás elszalasztására kevésbé érzékeny a késleltetésre, mert mindkét légijármű elkerülési műveletet végez. A késleltetés 3 másodpercre van korlátozva, amely normálisan elegendő a veszélyeztető légijárműnek, hogy koordinációt kezdeményezzen.

3.5.8.9.4 *Értelem megfordítás*. Az elővigyázatosság ellenére, amelyet a fent ismertetett indukált szoros találkozások elkerülésére tesznek, még mindig vannak olyan helyzetek, amelyek nincsenek lefedve. Például látás szerinti repülés szabályai szerinti forgalmat tartalmazó légtérben egy veszélyeztető légijármű vízszintes repülésbe való átmenete fordulhat elő 150 m-es (500 láb) névleges elkülönítés mellett. A magassági elkülönítés vizsgálat ilyen körülmények között kevésbé hatékony lehet. Amikor az ACAS megállapítja, hogy a veszélyeztető légijármű manővere semmissé teszi a megoldási tanácsadás kezdeti választását, a tanácsadás értelmét meg lehet fordítani. Azt a követelményt, hogy elérjék a cél magassági elkülönítését a legszorosabb megközelítésnél, fel lehet oldani, amikor ezt a művelet folyamatot végrehajtják.

3.5.8.10 *INDUKÁLT SZOROS TALÁLKOZÁSOK EGYÉB OKAI*

3.5.8.10.1 *Magasságmérési hibák*. Az A_1 elkülönítési célt reprezentáló magasság szerinti elkülönítési paraméternek tartalmaznia kell olyan magasságmérési hiba figyelembe vételét, amely elegendő ahhoz, hogy nagy valószínűségét szolgáltassa annak, hogy nem készteti az ACAS-al felszerelt légijárművet arra, hogy szoros találkozást provokáljon ki, ahol ez reálisan nem áll fenn. Durva magasságmérési hiba esetén azonban kis valószínűsége marad annak, hogy szoros találkozás indukálódik, amikor az eredeti elkülönülés megfelelő. Hasonlóan, kicsi valószínűsége van annak, hogy az ACAS nem lesz képes megoldani egy szoros találkozást magasságmérési hiba miatt.

3.5.8.10.1.1 A Gilham-kódolt adatok használata bármelyik légijárműnél a magasságjelentésben fellépő hibák egy sajátos példája, ami veszélyes közelségeket eredményezett. A saját légijármű esetében az ilyen jellegű hibák megelőzhetők, ha olyan magasságforrást alkalmazunk, amely nem Gilham-kódolt.

3.5.8.10.2 *C-módú hibák*

3.5.8.10.2.1 A veszélyeztető légijármű magasságának a C-módú adatszolgáltatását célzó kódolásban lévő hibák, ha elegendően nagyok, szoros találkozásokat indukálhatnak, nagyjából ugyanolyan módon, mint a durva magasságmérési hibánál. Ilyen találkozások előfordulásának gyakorisága nagyon kicsi olyan légterekben, ahol a légiforgalmi irányítás lépéseket tesz, hogy közölje a repülőgépvezetővel, hogy a légijármű jelentett magassága nem helyes.

3.5.8.10.2.2 A C-módú hiba komolyabb formája akkor fordul elő, amikor a hiba a C-bitekre szorítkozik. Ezeket a légiforgalmi irányítás nem ellenőrzi, amely általában megelégszik azzal, hogy úgy találja, hogy a légijármű a jelentett magasságának előírt tűrésértékén belül van. Egy elakadt vagy hiányzó C bit csak 30 m-es (100 láb) hibát tud létrehozni. Azonban egy ilyen hibának komolyabb hatása lehet a megközelítő légijármű magasság változási sebességének ACAS általi érzékelésére és emiatt indukált szoros megközelítés jöhet létre, vagy elmaradhat a szoros találkozás megoldása.

3.5.8.10.3 *Ellentétes repülőgépvezető reagálás.* A megoldási tanácsadás értelmével ellentétes manőverek a függőleges elkülönülést a veszélyeztető státuszú légijárműtől csökkenthetik, ezért ezeket kerülni kell. Ez különösen igaz egy ACAS-ACAS koordinált találkozás esetén.

3.5.8.11 *TÖBB-LÉGIJÁRMŰVES TALÁLKOZÁSOK*

3.5.8.11.1 Az ACAS számításba veszi három vagy attól több légijármű szoros közelségbe kerülésének lehetőségét és ez megköveteli egy általános megoldási tanácsadás létrehozásának szükségességét, amely ellentmondásmentes a tanácsadások mindegyikével, amelyet az egyes követett veszélyeztető légijárművekkel szemben individuális alapon adnának ki. Ilyen körülmények között nem várható mindig, hogy az ACAS légijármű A_l magassági elkülönítést érjen el az összes veszélyeztető légijárműre vonatkozóan.

3.5.8.11.2 Rögzített földi radar felderítési adatokon alapuló szimulációk és az ACAS berendezésekkel nyert kezdeti tapasztalatok azt mutatták, hogy többszörös légijármű konfliktusok előfordulása ritka. Ugyancsak nincs bizonyíték "domino" hatásra, amelynél az ACAS légijárműnek egy veszélyeztető légijármű elkerülésére irányuló manővere egy harmadik, és azt követően további, felszerelt légijárművel való összeütközését idézné elő. Ilyen esemény várakozás (holding) közben jöhet létre, de a rendelkezésre álló tények ezt nem támasztják alá.

3.5.9 FÜGGŐLEGES SEBESSÉG BECSLÉS

3.5.9.1 Az ACAS függőleges követő algoritmusnak képesnek kell lennie 25 vagy 100 láb kvantált magasságnövekmény információk használatára a légijármű függőleges sebesség becslések végzése céljából. Ennek a követőnek el kell kerülnie a függőleges sebesség fölé becslését, amikor a jelentett magasságban ugrás következik be, mivel egy légijármű kis függőleges sebességgel az egyik kvantált magasság szintről egy másikra emelkedik. De reagálási korlátozás nem érhető el pusztán a követő kiegyenlítettségének növelésével, mivel a követő akkor lassú lenne a tényleges sebesség változásokra való reagálásoknál, 100 lábra kvantált magasság jelentéseknél a magasság követő (4. Szakaszban) különleges nyomvonal adat-felfrissítési eljárásokat használ, amelyek elnyomják egy izolált magasság átmenetre való reagálást (magasság jelentést, amely különbözik a megelőző magasság jelentéstől) a gyorsulásra való reagálás feláldozása nélkül. A követő szintén tartalmaz néhány olyan tulajdonságot, amely hozzájárul a megbízhatósághoz.

3.5.9.2 A függőleges követő algoritmus néhány kulcsfontosságú tulajdonsága a következő:

a) Mielőtt valamilyen magasság jelentést vesznek az adat felfrissítési rutinok általi felhasználás céljára, vizsgálatokat végeznek annak megállapítására, hogy a jelentés elfogadhatónak tűnik-e, feltéve, hogy a jelentés-sorozatot előzőleg vették. Ha a jelentés elfogadhatatlannak tűnik, félreteszik, bár később felhasználásra kerülhet későbbi jelentések hitelességének ellenőrzésénél.

b) A referencia követő által használt algoritmus rekurzíve átlagolja az időt, inkább a magasság átmenetek között, mint a magasság jelentések között.

c) A követő szigorúan az izolált magasság átmenetekre (azaz azokra az átmenetekre, amelyek nem részei valamilyen magassági trendnek) korlátozza a reagálást. Az izolált magasság átmenet a sebesség becslés megkezdését eredményezi egy meghatározott mérsékelt sebességre az átmenet irányában. A sebesség becslése zérus felé tendál minden egymást követő magasság átmenet nélküli pásztázásnál.

d) Amikor egy átmenetről megfigyelték, hogy irányban ellentmondásmentes az előző átmenettel, akkor azt trendnek nyilvánítják. A magasság változtatási sebesség kezdeti értéke ellentmondásmentes két átmenet közötti idővel.

e) A kvantálási hatások miatti sebesség ingadozások elnyomódnak, amikor trend vagy szint követés kinyilvánítása történik. Trend periódus alatt a magasság átmenetet nem jelző jelentéseket megvizsgálja, annak megállapítása érdekében, hogy az átmenet hiánya összhangban van-e irány és idő szerint az előzőleg számított sebességgel. Ha nincs ellentmondás mentesség ezekkel, akkor a sebességet egy alacsonyabb értékre állítják vissza. Ha ellentmondás mentesség áll fenn, a sebesség változatlan marad.

f) Ha trend kinyilvánítás történik és átmenet figyelhető meg, akkor vizsgálatot végez, hogy megnézze, hogy az átmenet irány és időzítés szempontjából ellentmondásmentes-e az előzőleg számított sebességgel. Ha nem ellentmondásmentes a sebességgel, újra beállítják. Ha ellentmondásmentes, a sebességet kiegyenlítéssel felfrissítik. Az átmenet ingadozás miatti lehet, és a valóságban a trend folytatódhat.

g) Minden egyes pásztázás alatt a követő egy nyomvonal megbízhatósági indexet szolgáltat, amely a megbízhatósági fokot jelzi, amelyet a magasság változtatási sebesség számításba lehet behelyezni. "Nagy" megbízhatóságot jelent, ha az utolsó jelentések ellentmondásmentesek a követő által számított magasság és magasság változtatási sebesség számításokkal. "Kicsi" megbízhatóságot jelent, ha a magasság jelentések nem ellentmondásmentesek, egy lehetséges függőleges gyorsulást sejttetve, vagy amikor a magasság jelentések két vagy több cikluson keresztül hiányoznak. A "kicsi" megbízhatóság késleltetést indokolhat a megoldási tanácsadás generálásában.

h) A követő felső és alsó határokat szolgáltat, amelyeken belül fekszik várhatóan a valódi magasság. A magasság változtatási sebesség határokat annak megállapítására használják, hogy késleltetni kell-e a megoldási tanácsadás generálását és egy értelem megfordítás szükségességének értékelésében, ha a magasság változtatási sebesség megbízhatósága "kicsi".

3.5.10 LEVEGŐ-LEVEGŐ KOORDINÁCIÓ

3.5.10.1 *Koordinációs lekérdezések.* Amikor az ACAS egy hasonlóan felszerelt megközelítő légijárművet veszélyeztetőnek nyilvánít, az utóbbihoz lekérdezéseket továbbít az S-módú adatkapcsolaton keresztül megoldási tanácsadási koordinációhoz. Ezeket a lekérdezéseket, amelyek megoldási közléseket tartalmaznak, feldolgozási ciklusonként egyszer végzik addig, amíg a megközelítő légijármű veszélyeztető marad. A felszerelt veszélyeztető légijármű koordinációs válasz küldésével mindig visszaigazolja a megoldás közlés vételét.

3.5.10.2 *KOORDINÁCIÓ LEKÉRDEZÉS FELDOLGOZÁS*

3.5.10.2.1 Az ACAS egy másik ACAS-al felszerelt megközelítő légijárműtől kapott megoldás közlést a megoldási tanácsadás kiegészítésnek a megközelítő részére történő tárolásával és a megoldási tanácsadás kiegészítés rögzítés felfrissítésével dolgozza fel.

3.5.10.2.2 A megoldási tanácsadás egy általános fogalom, amely függőleges megoldási tanácsadás kiegészítést (VRC) és/vagy vízszintes megoldási tanácsadás kiegészítést (HRC) jelent, ahogy éppen megfelel. Speciálisan az S-módú lekérdezésben szolgáltatott információ az ACAS II részére VRC, az ACAS III részére pedig a VRC és/vagy a HRC.

3.5.10.2.3 A megoldás tanácsadás kiegészítés (HRC) rekord az összes éppen aktív megoldás tanácsadás kiegészítések (VRC-k és/vagy HRC-k) együttese, amelyet az ACAS vett. A négy bit a megoldási tanácsadás kiegészítés rekordban megfelel a két VRC értéknek ("ne haladj el alul" és "ne haladj el felül"), amelyet a két HRC érték (" ne fordulj balra" és "ne fordulj jobbra") követ. Ha a RAC rekordban egy bit beállítás történik, az azt jelenti, hogy a megfelelő megoldási tanácsadás kiegészítést egy vagy több ACAS-tól vették. Amikor egy megoldási tanácsadás kiegészítést vesznek egy másik ACAS-tól, a megfelelő bit(ek) beállítása a RAC rekordban megtörténik. Minden alkalommal, amikor egy másik ACAS-tól egy megoldási tanácsadás törlését veszik, a megfelelő bit(ek) törlésre kerül(nek), amíg egy másik ACAS nem idézi elő a bit(ek) beállítását.

3.5.10.3 *KOORDINÁCIÓS SOROZAT*

A koordinációs üzenetek sorozatát és a hozzátartozó feldolgozást az A-9 ábra illusztrálja. A koordináció megvalósításának elmulasztása a veszélyeztető légijármű által nem összeegyeztethető megoldási tanácsadás értelem kiválasztást eredményezhet.

3.5.10.4 *KOORDINÁCIÓ PROTOKOLL*

3.5.10.4.1 Miután egy felszerelt megközelítő légijárművet veszélyeztetőnek nyilvánítottak, az ACAS először ellenőrzi, hogy érkezett-e megoldási tanácsadás ettől a veszélyeztető légijárműtől. Ha igen, akkor az ACAS választ egy megoldási tanácsadást, amely összeegyeztethető a veszélyeztetés függőleges értelmével. Ha nem érkezett megoldási tanácsadás, akkor az ACAS a találkozás geometriájára alapozva kiválaszt egy megoldási tanácsadást (3.5.2 Szakasz). Bármelyik esetben az ACAS elkezdi a függőleges értelemre vonatkozó információ továbbítását a veszélyeztető légijárműnek, pásztázásonként egyszer, megoldási tanácsadás kiegészítés formájában, egy megoldási tanácsban. A megoldási tanácsadás kiegészítés “ne haladj felül”, ha az ACAS a veszélyeztető légijármű feletti elhaladást választotta, “ne haladj alul”, ha az ACAS a veszélyeztető légijármű alatti elhaladást választotta.

3.5.10.4.2 Miután egy ACAS-t veszélyeztetőként észlelnek, a veszélyeztetés összehasonlítási folyamaton megy keresztül. Ha valamilyen oknál fogva a két légijármű ugyanazt az (nem összeegyeztethető) elkülönítési értelmet választja, a magasabb 24-bites légijármű címzéssel rendelkező légijármű megfordítja az értelmet. Ez akkor következhet be, ha a két légijármű egyidejűleg veszélyeztetőnek észleli egymást, vagy egy átmeneti kapcsolat hiány megakadályozza a sikeres kommunikációt.

3.5.10.5 *KOORDINÁCIÓS ADATVÉDELEM*

Az ACAS tárolja az éppen aktuális megoldási tanácsadást és más ACAS-al felszerelt légijármű(vek)től vett aktív megoldás tanácsadás kiegészítés(ek)t, amelyek a saját légijárművet veszélyeztetőnek érzékeli. Annak érdekében, hogy a tárolt információ ne kerüljön módosításra egy vagy több ACAS-ra való reagálásban, amíg azt a saját ACAS általi megoldási tanácsadás kiválasztásra használják, az adatokat védik úgy, hogy azok csak egy ACAS részére álljanak rendelkezésre, vagy csak egy ACAS-ra való reagálásban lehessen módosítani egyidőben. Ezt például koordinációs zárlat állapotba való bemenettel hajtják végre, amikor az adattár a saját ACAS által hozzáférhető, vagy egy veszélyeztető ACAS új adatokat nyújt. Ha megoldás közlés érkezik, mialatt a koordinációs zárlat állapot fennáll, az adatokat megtartják, amíg a fennálló koordináció zárlat állapot véget nem ér. Az adatok különböző folyamatok általi szimultán elérésének lehetősége az ACAS-on belül fennáll, mert a bejövő veszélyeztető megoldási közlések aszinkron módon érkeznek az ACAS adatfeldolgozáshoz, ténylegesen megszakítva ezt a feldolgozást.

3.5.11 FÖLDI KOMMUNIKÁCIÓ

3.5.11.1 *ACAS megoldási tanácsadások jelentése a földnek.* Amikor megoldási tanácsadás létezik, az ACAS jelzi a légijármű S-módú válaszjeladójának, hogy megoldási tanácsadással rendelkezik az S-módú földi állomás számára. Ez a válaszjeladót arra készteti, hogy jelzést állítson be, amely mutatja, hogy egy közlés a földhöz való továbbításra vár. E jelzés vétele után egy S-módú érzékelő kérheti a megoldási tanácsadás továbbítását. Amikor ezt a kérést veszi, a saját S-módú válaszjeladó az üzenetet Comm-B válasz formátumban szolgáltatja. Ezenkívül az ACAS periódikus rádióadásokat generál 8 másodperces időközökben azalatt az idő alatt, amíg a repülőgépvezető részére megoldási tanácsadás jelzés van. A rádióadás megoldási tanácsadás paraméterek utolsó értékeit jelenti, amelyeket az előző 8 másodperces periódusban felvesznek, még ha a tanácsadás be is fejeződött. Ez lehetővé teszi az ACAS megoldási tanácsadás tevékenységének figyelését azokon a területeken, amelyeket földi különleges megoldási tanácsadás rádióadás jel vevők segítségével az S-módú földi állomás felderítése nem fed le,. A megoldási tanácsadás rádióadásokat általában földi berendezéseknek sugározzák, de fedélzetre irányuló adattovábbításnak jellemzik őket.

3.5.11.2 *Veszélyeztető légijármű észlelési paramétereinek felügyelete földi állomásról.* Veszélyeztető légijármű észlelési paramétereit egy vagy több S-módú földi állomás felügyelheti az ACAS légijárműnek küldött érzékenység szint szabályozó (SLC) utasítást tartalmazó lekérdezések továbbításával. Miután egy adott S-módú földi állomástól jövő SLC utasítás közlést vett, az ACAS tárolja az SLC utasítás értéket a földi állomás számának indexével ellátva. Az ACAS a vett legkisebb értékeket használja fel, ha egynél több földi állomás küld ilyen közlést. Az ACAS idő szerint külön értékeli mindegyik hely SLC utasítását és törli azt, ha ugyanerről a helyről egy másik közlés 4 percen belül nem frissíti fel. Az ACAS ugyancsak azonnal töröl egy SLC utasítást, ha ettől az állomástól specifikus törlési kódot kap. SLC utasítások nem használhatók fel kapcsolt Comm-A lekérdezéseken belül.

3.5.12 ÉRZÉKENYSÉGI SZINT SZABÁLYOZÁS

Az ACAS veszélyeztető észlelési paraméterek felügyelete a következők által szolgáltatott SLC utasítások segítségével történik:

a) magasság sávon alapuló belsőleg generált érték;

b) S-módú földi állomástól (lásd 3.5.11.2 alpont); és

c) repülőgépvezető által működtetett kapcsolóról.

Az ACAS által használt érzékenységi szintet ezen három forrás által szolgáltatott legkisebb nem zérus SLC utasítás állítja be. Amikor egy S-módú földi állomás vagy a repülőgépvezető számára nem különösebben érdekes az érzékenységi szint beállítás, akkor ettől a forrástól az ACAS részére zérus értéket kapja és ezt nem veszik figyelembe a kiválasztási folyamatban. Az érzékenységi szintet általában a magasság sávon alapuló belsőleg generált értékek állítják be. A magasság küszöbök körül hiszterézist alkalmaznak, hogy megakadályozza az SLC utasítás értékben az ingadozást, amikor az ACAS légijármű egy magasság küszöb környezetében marad.

3.6 Összeegyeztethetőség fedélzeti S-módú válaszjeladókkal

3.6.1 Az ACAS és az S-módú válaszjeladó összeegyeztethető működését tevékenységüknek a repüléselektronikai elnyomás buszon keresztüli összehangolásával érik el. Az S-módú válaszjeladót az ACAS továbbítás alatt és röviddel utána nyomják el. A tipikus elnyomási periódusok: a) 70 mikromásodperc a felső antennáról és b) 90 mikromásodperc az alsó antennáról. Ezek az elnyomás periódusok megakadályozzák, hogy az ACAS lekérdezés által okozott több-nyomvonal SSR választ provokáljon ki az S-módú válaszjeladótól.

3.6.2 Nem-kívánt teljesítmény korlátozás egy ACAS-al összekapcsolt S-módú válaszjeladónál szigorúbb, mint a 3. fejezet, 3.1.2.10.2.1 pontjában, hogy biztosítsa azt, hogy az S-módú válaszjeladó ne akadályozza meg az ACAS-t vele szemben támasztott követelmények teljesítésében. Egy -70 dBm nem kívánt sugárzási teljesítmény szintű válaszjeladót (4. fejezet, 4.3.11.1 alpont) és egy -20 dBm válaszjeladó ACAS antenna elszigetelést feltételezve, az eredő interferencia szint az ACAS RF portnál -90 dBm alatt lesz.

3.6.3 További összeegyeztethetőségi követelmény, hogy az ACAS adóberendezés átvezetési teljesítményt alacsony szinten kell tartani (lásd 3.2.1 alpont).

3.7 Kijelzések a repülő személyzetnek

3.7.1 VIZUÁLIS KIJELZÉS

3.7.1.1 Az ACAS megvalósítások a megoldás tanácsadási információkat tipikusan egy vagy két vizuális megjelenítőn jelzik ki. A forgalmi tanácsadás kijelzés ellátja a repülőgépvezetőt a közeli forgalomra vonatkozó terv információval. A megoldási tanácsadás kijelzés megismerteti a személyzetet a végrehajtandó vagy elkerülendő manőverekről függőleges síkban. A forgalmi tanácsadás kijelzés és a megoldási tanácsadás kijelzés különálló kijelzőket vagy műszereket használhat az információ átadására a repülőgépvezető felé, vagy a két feladatot egyetlen kijelzőn össze lehet vonni. A kijelzett megoldási tanácsadás információkat vagy integrálni lehet a fedélzeten rendelkezésre álló meglévő kijelzőkkel, vagy egy erre célra szolgáló külön kijelzőn lehet megjeleníteni.

3.7.1.2 *FORGALMI TANÁCSADÁSOK*

3.7.1.2.1 A forgalmi tanácsadás kijelzés képet nyújt a repülőszemélyzetnek a környező forgalomról. Az így nyújtott információ arra szolgál, hogy segítse a repülőszemélyzetet a környező forgalom áttekintésében. Szimulációs vizsgálatok azt mutatták, hogy a forgalom táblázatos, alfanumerikus kijelzését bonyolult a repülőszemélyzetnek leolvasni és összehasonlítani, és a kijelzésnek ez a típusa a forgalmi információ elsődleges kijelzésének használatára nem ajánlott. A forgalmi tanácsadás kijelzés a megközelítő légijárművek vonatkozásában a következő információk kijelzésének képességét szolgáltatja:

a) helyzet (távolság és iránytengely);

b) magasság (relatív vagy abszolút, ha a megközelítő légijármű magasságot jelent); és

c) magasság változtatási sebesség magasságot jelentő megközelítő légijárműnek, (emelkedés vagy süllyedés).

3.7.1.2.2 A forgalmi tanácsadás kijelzés alakokat és színeket használhat az egyes kijelzett megközelítő légijárművek veszélyeztetési szintjének, azaz megoldási tanácsadások, forgalmi tanácsadások és közeli forgalom jelzésére. A forgalmi tanácsadás generálás vizsgálatok és a veszélyeztető észlelés vizsgálatok közötti lényeges különbség a nagyobb figyelmeztetési idő értékek használatában van.

3.7.1.2.3 A közeli forgalom folyamatos kijelzése nem megkövetelt összetevője az ACAS-nak. Azonban a repülőgépvezetőknek szükségük van a közeli forgalommal, valamint a potenciális veszélyeztetésekkel kapcsolatos útmutatásra, hogy helyesen azonosítsák a potenciális veszélyeztetést jelentő légijárműveket. A “display - vizuális kijelzés” szó nem azt jelenti, hogy a vizuális kijelzés az egyetlen elfogadható a megközelítő légijárművek helyzetének a jelzésére.

3.7.1.2.4 Ideális esetben egy megoldási tanácsadást mindig megelőz egy forgalmi tanácsadás, de ez nem mindig lehetséges, pl. a megoldási tanácsadás kritériumok már lehet, hogy ki vannak elégítve, amikor egy nyomvonalat először létrehoznak, vagy a megközelítő légijármű hirtelen és éles manővere előidézheti, hogy a forgalmi tanácsadás vezetési ideje egy ciklusnál kisebb lesz.

3.7.1.3 *MEGOLDÁSI TANÁCSADÁSOK*

A megoldási tanácsadás vizuális kijelzése tájékoztatást ad a repülőszemélyzet részére a függőleges sebességről, amelyet el kell érni, vagy el kell kerülni. A megoldási tanácsadás kijelzést be lehet építeni a pillanatnyi függőleges sebességjelző műszerbe (IVSI) vagy az elsődleges repülési képernyőbe (PFD). A megoldási tanácsadás kijelzője eszközt szolgáltathat a megelőző és a helyesbítő megoldási tanácsadás megkülönböztetésére.

3.7.2 HALLHATÓ ÉS BESZÉDHANG FIGYELMEZTETÉSEK

Hallható figyelmeztetéseket használnak a repülőszemélyzet részére arról, hogy egy forgalmi tanácsadás vagy megoldási tanácsadás kiadásra került. Amikor kiválasztják a szókészletet, amelyet megoldási tanácsadás bejelentésére használnak, figyelmet kell fordítani arra, hogy olyan frázisokat válasszanak, amelyek minimalizálják a félreértett utasítás valószínűségét. Egy hallható bejelentést is kell biztosítani a repülőszemélyzet részére annak jelzésére, hogy az ACAS légijármű konfliktusmentes az összes veszélyeztetést jelentő légijárművel.

3.8 Repülőszemélyzet kezelési feladatai

Minimumként elvárják, hogy a repülőszemélyzet tevékenysége által lehetőség nyíljon vagy egy “AUTOMATIKUS” üzemmód kiválasztására, amelynél az érzékenységi szintek más bemeneteken alapulnak, vagy egy olyan üzemmód kiválasztására, amelyben csak forgalmi tanácsadásokat lehet kiadni, vagy olyan különleges érzékenységi szintek kiválasztására, amelyek legalább az 1-es érzékenységi szintet tartalmazzák. Amikor az 1-es érzékenységi szintet választják, az ACAS berendezés lényegében “tartalék” körülmények között van. A TARTALÉK fogalmat ennek a választásnak a jelölésére lehet használni. A meglévő ACAS érzékenységi szint különbözhet attól, amit a repülőszemélyzet választ. Intézkedéseket kell tenni, hogy a repülőszemélyzet jelzést kapjon arról, hogy az ACAS éppen TARTALÉK állapotban van, vagy amikor csak forgalmi tanácsadást adnak ki. Az ACAS kezelését integrálni lehet az S-módú válaszjeladó kezelésével, vagy a két rendszernek különböző kezelése is lehet. Ha az ACAS és az S-módú kezelések integrálva vannak, olyan eszközt kell biztosítani, amely lehetővé teszi a repülő személyzet számára a kizárólagosan válaszjeladó működési mód kiválasztását.

3.9 Működés figyelése

Az ACAS berendezéstől elvárható, hogy automatikus működés figyelési tevékenységet is foglaljon magában, hogy az összes kritikus ACAS tevékenység műszaki állapotát egy folyamatos bázison meghatározhassa a berendezés normális működésének megzavarása vagy esetleges megszakítása nélkül. Gondoskodni kell arról, hogy a repülő személyzet jelzést kapjon abnormális körülmények fennállásáról, amint ez a figyelési tevékenység ezt meghatározza.

4. Veszély észlelést és tanácsadás generálást szolgáló tipikus algoritmusok és paraméterek

1. *Megjegyzés. – A jellemzők, amelyeket az alábbiakban adunk meg, az ACAS II összeütközés elhárító logikájának egy referencia tervezését írják le. Ez a leírás azonban nem zárja ki egyenlő vagy jobb működés alternatív terveinek használatát.*

2. *Megjegyzés. – Nyomtatott kisbetűs matematikai szimbólumokat használnak változók jelölésére ebben a fejezetben. Nagybetűs szimbólumokat a paraméterek jelölésére használják. A pontozás jelölés, amelyet néhány paraméternél használtak, nem azt mutatja, hogy azok derivált mennyiségek, hanem, hogy a jelölés által meghatározott dimenziója van, pl. távolság/idő a sebesség paraméternél.*

4.1 Követési teljesítmény jellemzők

4.1.1 TÁVOLSÁGI KÖVETÉS

4.1.1.1 Távolság, távolságváltozási sebesség és távolságváltozási gyorsulás, (r, $\dot{r}$, $\ddot{r}$) becslése adaptív α-ß-γ követő segítségével történik, az α, ß és γ tényezőinél olyan értékek felhasználásával, amelyek az összes egymást követő távolság méréseknél folyamatosan csökkennek, amíg megfelelőképpen el nem érik a saját 0,40, 0,10 és 0,01 minimumaikat. A távolság változás gyorsulás becslést az *m* várt elkerülési távolság számítására használják a legszorosabb megközelítésnél, a következő formula felhasználásával:

$$m^2 = r^2 - \frac{r^2}{1 + r\ddot{r}/\dot{r}^2}$$

Ezt a becslést nem számolják ki akkor, amikor további számítások azt jelzik, hogy ez nem lehet megbízható, vagy a becslési hibák nagysága miatt, vagy a légijárművek egyike által a vízszintes síkban végrehajtható manőver lehetősége miatt. Az utóbbi számítások a követés eddigi időszakán, az egymás utáni távolság előrejelzések megfigyelt pontosságán, a távolság változás gyorsulás számítások észlelt azonosságán, az előzőleg számított elkerülési távolsággal megegyező, linearizált repülési pályán alapuló második távolság követésen, és a durva-iránytengely követés megfigyelt azonosságán nyugszanak.

4.1.2 MAGASSÁG KÖVETÉS

4.1.2.1 *Magassági adatforrások.* A megközelítő légijármű magasságát a megközelítő légijármű C-módú vagy S-módú jelentéseiből nyerik. A saját légijármű magasságát abból a forrásból nyerik, amely a saját C-módú vagy S-módú jelentések alapjául szolgál és a legfinomabb elérhető kvantálásra használják fel.

4.1.2.1.1 *Magasság jelentés hitelesség.* Mielőtt bármilyen magasság jelentés vételére sor kerül, vizsgálatot végeznek annak eldöntésére, hogy a jelentés hiteles-e. Egy hitelességi ablakot számolnak ki az előzőekben számított magasság és magasság változási sebesség alapján. A magasság jelentést félreteszik, és a magasság követést felfrissítik, mintha a jelentés hiányozna (4.1.2.3.7 alpont), ha a jelentés kívül esik a hitelességi ablakon.

4.1.2.2 *Saját magasság változási sebesség.* A saját ACAS légijármű magasság változási sebességét olyan forrásból nyerik, amely a lehető legkisebb hibákkal rendelkezik és semmilyen esetben sem nagyobb, mint a 4.1.2.3.6 pontban leírt követő sebesség kimenetének a hibája.

4.1.2.3 *A MEGKÖZELÍTŐ LÉGIJÁRMŰ MAGASSÁGÁNAK KÖVETÉSE*

4.1.2.3.1 *Magasság követés fogalmainak leírása*

Established rate track - Megalapozott sebesség nyomvonal. Egy magasság nyomvonal, amelynél a megközelítő légijárműtől kapott utolsó néhány magassági jelentés sémája arra enged következtetni, hogy ez a megközelítő állandó, zérustól különböző magasság változási sebességgel emelkedik vagy süllyed.

Level track - Vízszintes repülési nyomvonal. Egy magasság nyomvonal, amelynél a megközelítő légijárműtől kapott utolsó néhány jelentés sémája arra enged következtetni, hogy a megközelítő vízszintes repülést végez.

New track - Új nyomvonal. Egy újonnan kezdett magasság nyomvonal.

Oscillating track - Ingadozó nyomvonal. Egy magasság nyomvonal, amelynél a megközelítő légijárműtől kapott utolsó néhány jelentés sémája két vagy több érték között olyan módon ingadozik, amely arra enged következtetni, hogy a megközelítő vízszintes repülést végez.

Transition - Átmenet. Egy nyomvonalra vonatkozó magasság jelentés, amely különbözik az erre a nyomvonalra vonatkozó utolsó hiteles magasság jelentéstől.

Trend. Trend áll fenn a magasság változás sebességére vonatkozóan, ha két legutolsó magasság szint átmenet ugyanabban az irányban ment végbe.

Unconfirmed rate track - Nem-megerősített nyomvonal. Egy magasság nyomvonal, amelynél a megközelítő légijárműtől kapott utolsó néhány magasság jelentés sémája a nyomvonal más módon történő minősítését nem teszi lehetővé.

4.1.2.3.1.1 Bármely követési ciklusra fennáll, hogy mindegyik nyomvonal egy és csakis egy nyomvonal minősítéssel rendelkezik.

4.1.2.3.1.2 Bármely nyomvonal besorolás létrejöhet, amíg más nyomvonal besorolásra vonatkozó feltételeket nem igazolják.

4.1.2.3.2 Az ACAS II követi a megközelítő légijárművek magasságát. A követés a válaszjeladóiktól kapott automatikus nyomásmagasság jelentéseken alapszik, magasság jelentéseket használva fel, amelyeket átvettként kvantálnak. Minden megközelítőről minden ciklusban a követő magasság és magasság változtatási sebesség számításokat szolgáltat.

Megjegyzés. – A C-módú magassági adatokat a nyomvonalakkal összekapcsoló függvényt a 4. fejezet 4.3.2.1 pontja írja le. Az alábbiakban ismertetett magasság követő feltételezi, hogy ez a függvény már működött, mielőtt a követő alkalmazására sor került.

4.1.2.3.2.1 A referencia magasság követő tervezés feltételezi, hogy minden nyomvonalra magasság jelentéseket vesznek egy magasság jelentés per másodperc névleges sebességgel. Azonban ez figyelembe veszi a hiányzó jelentéseket, más szóval azokat az eseteket, amikor nem vettek magasság jelentéseket egy adott nyomvonalra egy követő ciklus előtt.

4.1.2.3.2.2 Egy vagy két fajta megközelítő nyomvonalat hoznak létre és tartanak fenn. Úgynevezett 100-lábas nyomvonalakat nyernek akkor, amikor a magassági jelentéseket 100-lábnak megfelelő egységekben szolgáltatják. Az ilyen nyomvonalakat egy erre a célra szolgáló követővel frissítik fel, amelyet 100-lábas magassági követőnek neveznek. Úgynevezett 25-lábas nyomvonalakat nyernek, amikor a magasság jelentéseket 25-lábas egységekben szolgáltatják. Az ilyen nyomvonalakat egy erre a célra szolgáló követővel frissítik fel, amelyet 25-lábas magasság követőnek neveznek.

4.1.2.3.2.3 Különleges logika automatikusan kapcsolja a megközelítő légijármű magassági nyomvonalait a 100-lábas magasság követő és a 25-lábas magasság követő között az egységekben egy megerősítő változást követve, amely egységekben a magasság jelentéseket szolgáltatják. Egy ilyen változást megerősítettnek tekintenek, ha három egymást követő érvényes magasság jelentést ugyanazon egységben vettek.

4.1.2.3.2.4 Amikor magasság jelentés egység változást észleltek, de még nincs megerősítve, a meglévő nyomvonalat lebegtetik és a magasság jelentést átmenetileg tárolják. Amikor az egységváltozást megerősítik, a nyomvonalat újraindítják az utolsó magasságváltozási sebesség becslést használva, amelyet a változás, valamint az összes ideiglenesen tárolt magasság jelentés előtt számoltak.

4.1.2.3.2.5 A 25-lábas követő egy adaptív alfa-béta követő. Ez a 4.1.2.3.5 pontban kerül rövid ismertetésre.

4.1.2.3.2.6 A 100-lábas követő tervezését az motiválja, hogy szükség van egy stabil magasság változási sebesség becslésre, amikor a veszélyes megközelítő légijármű valódi magasság változási sebessége kisebb, mint 100 láb/s, más szóval, kisebb, mint egy kvantálási köz per követő ciklus. Ez a követő közvetve számítja a magasság változási sebességet az időnek a számításával, amelyet egy kvantálási szint keresztezése igényel. Ennek a tervnek további részleteivel szolgál a 4.1.2.3.6 alpont.

4.1.2.3.3 *Magasság változtatási sebesség megbízhatósága.* Minden megközelítő légijárműre vonatkozóan, minden ciklusban a követő vagy “nagy” vagy “kicsi” megbízhatósági jelzőt szolgáltat a magasság változtatási sebesség becslésben (4.1.3.3.6.9 és 4.1.3.3.6.10 pontok).

4.1.2.3.4 *Magasság változtatási sebesség indokoltsága.* A követés “legjobb becslésű” magasság változtatási sebesség becslést és felső és alsó határokat szolgáltat ehhez a magasság változtatási sebességhez, amely összhangban áll a vett jelentés sorozattal.

4.1.2.3.5 *25-láb értékű kvantálási jelentések*

4.1.2.3.5.1 A 25-láb értékű növekményekre kvantált magassági jelentéseknél egy adaptív α-ß követőt használnak. Ez a követő adaptív abban az értelemben, hogy az α és ß értékek három együttese között választ, amelyek az előrejelzett szabályoktól függnek, azaz az előrejelzett magasság és a jelentett magasság közötti különbségtől, valamint a sebesség becslés nagyságától. Ezek az α és ß értékek a következők:

- α = 0,4 és ß = 0,100, amikor a fennálló magasság változás becslés értéke kisebb, mint 7,0 láb/s; egyébként,
- α = 0,5 és ß 0 0,167, amikor az előrejelzett hiba kisebb, mint 22,5 láb; és egyébként,
- α = 0,6 és ß = 0,257

4.1.2.3.5.2 A követő két különálló magasság és magasság változás sebesség együttest tart fenn. Az elsőt közvetlenül a standard α-ß simulási egyenletekből származtatják. Ez az együttes tisztán belső a követőkhöz viszonyítva. A második együttes tartalmazza a számításokat, amelyek az összeütközés elkerülési logikához illenek. Ez az első együttesből a következőkben különbözik. A logikának juttatott magasság számítás a jelentett magasság kvantálási tartomány egyik felének belsejére korlátozódik (±12,5 láb). A logikának juttatott magasság változás sebesség számítás a zérussal egyenlő együttes, amikor a belső számítás abszolút értékben 2,5 láb/s alá csökken és zérussal egyenlő értékben marad, amíg a belső számítás 5,0 láb/s fölé emelkedik abszolút értékben.

4.1.2.3.5.3 A követő csak az előzőleg definiált két nyomvonal osztályozást használja, vízszintes repülési nyomvonal és megalapozott sebesség nyomvonal (4.1.2.3.1 pont). Egy nyomvonalat vízszintes repülési nyomvonalnak jelentenek, ha legalább két követő ciklus elmúlt az utolsó magasság átmenet óta (4.1.2.3.1 pont). A belső sebesség számítást akkor zérusra állítják vissza. Nyomvonalat megalapozott sebesség nyomvonalnak jelentenek, ha a következő két elegendően szorosan elhelyezkedő magasság átmenetet követően a belső sebesség számítás (és így a logikának átadott sebesség számítás is) 5,0 láb/s fölé emelkedik.

4.1.2.3.5.4 A számítások megbízhatóságát “nagynak” jelentik, amikor a nyomvonal legalább négy követő cikluson keresztül fennállt és az előrejelzési hiba nem volt nagyobb, mint 22,5 láb legalább két egymást követő követési ciklusban. “Kicsire” állítják, ha az előrejelzési hiba nagyobb, mint 22,5 láb. Ugyancsak “kicsire” állítják, ha a magassági jelentés két egymást követő ciklusban hiányzott.

4.1.2.3.6 *100 láb növekmény kvantálási jelentések.* 100 láb növekményekre kvantált magasság jelentéseknél a magasság követő teljesítménye minden vonatkozásban egyenlő, vagy jobb, mint egy referencia követőé, amely úgy állítja be a magasság változtatás sebesség számítást, hogy megfelelő előjele legyen és a nagysága az ebben a paragrafusban ismertetetteknek feleljen meg.

4.1.2.3.6.1 *Követő változók.* A referencia követő a következő változókat használja:

$\dot{z}$	magasság változtatás sebesség becslés m/s (láb/s);
$\dot{Z}_{gu}$	lásd 4.1.3.6.5.1 alpont;
Δz	a jelenlegi jelentés és a legutóbbi hiteles jelentés közötti magasság különbség;
T_n	1 s
Q	30,5 m (100 láb)
t_r	a legutolsó hiteles jelentés óta eltelt idő, *s;*
t_p	a két legutolsó magasságszint átmenet közötti idő, vagy egy cikluson belüli többszörös átmenet esetén, ezen átmenetek közötti átlagos idő*, s;*
t_b	becsült szint elfoglalási idő a legutóbbi átmenet után, *s*
t_{bm}	a szint elfoglalási idő számított alsó határa, *s;*
β	számított kiegyenlítési együttható t_b-re;
β_l	β korlátja t_b alapján;
b_t	a két legutóbbi magasság szint átmenet között keresztezett magasság szintek száma;
$b_{\dot{z}}$	a legutóbbi sebességgel keresztezett magassági szintek száma;
ε	a t_b számítás kiegyenlített hibája, *s;*
d_t	a legutóbbi magasság átmenet előjele (=+1 magasság növekedés esetén, = -1 csökkenés esetén); és
x^*	valamely *x* változó értéke mielőtt egy magasság szint átmenetet követően felfrissítésre kerül

4.1.2.3.6.2 *Jelentés hitelesség.* Egy magasság jelentés hitelesnek tekinthető, ha a következő feltételek egyike teljesül:

a) $\Delta z = 0$

b) $|\Delta z - \dot{z}t_r| - Q\, t_r / T_n - \dot{Z}_{gu}\, t_r \leq 0$

4.1.2.3.6.3 *Nyomvonal minősítési séma*

Megalapozott sebesség nyomvonal. Egy magasság nyomvonalat megalapozott sebesség nyomvonalnak minősítenek, ha két vagy több egymást követő átmenetet észlelnek ugyanabban az irányban és a két átmenet közötti időtartam elegendően rövid ahhoz, hogy a nyomvonal minősítés ne változzon vízszintes repülési nyomvonallá ezalatt az időtartam alatt (lásd vízszintes repülési nyomvonal meghatározását), vagy ha egy észlelt átmenet egy meglévő irányzattal ellentétes irányú és az előző átmenet óta eltelt idő "váratlanul kicsi" (4.1.2.3.6.8.1 alpont).

Vízszintes repülési nyomvonal. Egy magassági nyomvonalat vízszintes repülési nyomvonalnak minősítenek, ha ugyanazon a repülési magasságon a jelentéseket a soronkövetkező várható átmenet, várható idejéhez képest T_1-nél hosszabb idő múlva kapják meg, vagy a jelentéseket T_2 idő múlva kapják meg, függetlenül attól, hogy egy átmenet várható vagy sem (4.1.2.3.6.3.1 alpont).

Új nyomvonal. Egy nyomvonalat újnak minősítenek az első magasság jelentés és az első átmenet közötti időben, vagy pedig T_2 idő elmúlásával (4.1.2.3.6.3.1 pont).

Ingadozó nyomvonal. Egy magasság nyomvonal ingadozó nyomvonalnak minősül, ha a közvetlen megelőző átmenethez képest ellenkező irányú átmenet jelenik meg, csak egy szint keresztezés megy végbe, a két átmenet közötti időköz elegendően rövid ahhoz, hogy a nyomvonal minősítés ne változzon át vízszintes repülési nyomvonallá ezen időtartam alatt (lásd a vízszintes repülési nyomvonal meghatározását, és ha a nyomvonalat megalapozott sebesség nyomvonalnak minősítették, az ezen átmenet óta eltelt idő nem "váratlanul kicsi" (4.1.2.3.6.8.1 alpont).

Nem megerősített sebesség nyomvonal. Egy magasság nyomvonalat nem-megerősített sebesség nyomvonalnak minősítenek, ha egy új vagy egy vízszintes repülési nyomvonalnál átmenet jelenik meg, vagy ha az előző átmenettel ellenkező irányú átmenet jelenik meg és egynél több szint keresztezése ment végbe egy megalapozott, ingadozó vagy nem megerősített sebesség nyomvonalnál.

4.1.2.3.6.3.1 A következő értékeket használják:

$T_1 = 4{,}0$ s

$T_2 = 20$ s

4.1.2.3.6.3.2 Ha egy nyomvonalat már nem megerősített sebesség nyomvonalként minősítettek, és az előző átmenettel ellenkező irányú átmenet jelenik meg, és egynél több szint keresztezése ment végbe, a magasság változtatás sebességét úgy határozzák meg, mintha a nyomvonal éppen most nyert volna nem megerősített sebesség nyomvonal minősítést (4.1.3.3.6.5 alpont).

4.1.2.3.6.3.3 A nyomvonalakat osztályozzák (4.1.2.3.6.3 alpont) és a nyomvonalak közötti átmenetek osztályait az A-10 ábra mutatja. A nyomvonalakat azért osztályozzák, hogy meghatározzák, hogy milyen új méréseket kell használni a magasság változtatási sebesség becslés megújításához.

4.1.2.3.6.4 A sebesség nagyságát zérusra kell állítani, ha a nyomvonal új, vízszintes repülési vagy ingadozó.

4.1.2.3.6.4.1 Az ε és $b_{\dot{z}}$ mennyiségeket zérusra és a t_b-t 100 sec-ra kell állítani.

4.1.2.3.6.4.2 Amikor egy nyomvonalat vízszintes repülésinek minősítenek, az összes előző átmenetet és bármilyen meglévő trendet figyelmen kívül kell hagyni.

4.1.2.3.6.5 A sebesség nagyságát $\dot{Z}_{gu}$-ra kell állítani, amikor a nyomvonal először válik nem megerősített sebesség nyomvonallá és utána lefutóvá mindegyik ciklusban az előző ciklus által megállapított értéktől, amíg egy másik átmenetet nem észlelnek.

4.1.2.3.6.5.1 A $\dot{Z}_{gu}$ értéke 2,4 m/s (480 láb/perc) és a lefutási állandó 0,9.

4.1.2.3.6.5.2 Az ε és $b_{\dot{z}}$ mennyiségeket zérusra és t_b -t $Q/|\dot{z}|$-ra kell állítani.

4.1.2.3.6.6 Megalapozott sebesség nyomvonalaknál a sebességet a számított szint elfoglalási idő által elosztott kvantálási intervallumra kell állítani. A szint elfoglalási időt az átvitelek vétele alapján számítják a trend irányában és állandónak tartják, amíg a következő átmenet vagy megjelenik, vagy érvénytelenné válik (4.1.2.3.6.7 pont).

4.1.2.3.6.6.1 Amikor egy nyomvonalat először hoznak létre, az ε, $b_{\dot{z}}$ és t_b mennyiségeket a következők szerint állítják be:

$\varepsilon = 0$, $b_{\dot{z}} = 1$ és t_b = maximum (t_p , 1,4 s)

4.1.2.3.6.6.2 Hacsak az átmenet nem korai vagy késői (4.1.2.3.6.6.3 alpont), az ε, $b_{\dot{z}}$ és t_b mennyiségeket számítják ki a harmadik és következő átvitelek rekurzív átlagolásával a következők szerint:

$\varepsilon' = 0{,}8\ \varepsilon^* + (t_{tp} - t_b^*)$

$\beta_\int = (t_b^* - T_n)^2 / [(t_b^*)^2 + 64\ T_n^2]$

$b_{\dot{z}} = b_{\dot{z}}^* + b_t$ és

β = maximum $(b_t / b_{\dot{z}}, \beta_\int)$ és

$\varepsilon = \varepsilon'$

$|\varepsilon| \leq 1{,}35$ (vagy 2,85, ha a legutóbbi átmenetet egy vagy több elmaradt jelentést követően észlelték) esetén;

$b_{\dot{z}} = 3$ és

ß = 0,5 és

$\varepsilon = 0{,}3\varepsilon'$ egyébként

és mindkét esetben: $t_b = t_b^* + \beta\,(t_p - t_b)$

4.1.2.3.6.6.3 *Korai vagy késői átmenetek*

Ha $|t_p - t_b^*| > 1{,}5$ s (vagy 3,0 s, ha a legutóbbi átmenetet egy vagy több elmaradt jelentést követően észlelték), vagy b_t a $(t_r/t_b^* + 1{,}1) \geq b_t \geq (t_r/t_b^* - 1{,}1)$ tartományon kívül esik, akkor ε, $b_{\dot{z}}$ és t_b értékeket a következőképpen állítják be:

$b_{\dot{z}} = 1$
$\varepsilon = 0$
t_{bm} = minimum $((0{,}7t_p + 0{,}3t_b^*), 1{,}4$ s)
t_b = maximum $(t_p, , t_{bm})$

A sebességet a következőképpen számolják ki: $\dot{z} = d_tQ / t_b$

4.1.2.3.6.7 *Elévült átmenet.* A sebesség nagysága elhal mindegyik ciklusban az előző ciklusban nyert értéktől, ha ugyanazon szintről érkeznek jelentések legalább T_3 ideig a következő várható továbbítás időpontja után (vagy T_4 ideig, ha a legutóbbi átvitelt egy vagy több elmaradt jelentést követően észlelték. A t_b értéke ilyen körülmények között nem változik.

4.1.2.3.6.7.1 A következő értékeket használják:

$T_3 = 1{,}5$ s

$T_4 = 3{,}0$ s

A következő képletet a sebesség lefutáshoz használják:

$\dot{z} = d_tQ/[t_b + (0{,}3\ t_b + 0{,}5\ T_n)(0{,}7 + (t_l - t_b) / T_n)^2]$

ahol t_l = a legutóbbi átmenet óta eltelt idő, s.

4.1.2.3.6.7.2 A $b_{\dot{z}}$ mennyiséget a maximum (2, $b_{\dot{z}}^* - 1$) -re állítják be.

4.1.2.3.6.8 *Vibrálás miatti átmenetek.* A sebesség nagyságát az előző ciklusban nyert értékre állítják be, ha a trend irányával ellentétes irányú átmenetet észleltek, a közvetlenül megelőző átmenet követte a trendet, csak egy szint keresztezése ment végbe, a közvetlen megelőző átmenet óta eltelt idő "váratlanul kicsi". Az ilyen átmenetet következésképpen mint hiányzót kell kezelni, kivéve a 4.1.2.3.4 és 4.1.2.3.6.10 e) pontokban szereplő követelményeknek megfelelő esetek.

4.1.2.3.6.8.1 A közvetlen megelőző átmenet óta eltelt időt "váratlanul kicsi"-nek deklarálják, amikor $t_p \leq 0{,}24\ t_b^*$.

4.1.2.3.6.8.2 Az ε, $b_{\dot{z}}$ és t_b mennyiségek nem változnak.

4.1.2.3.6.9 *Nyomvonal nagy megbízhatóság deklarálása.* "Nagy megbízhatóságot nyilvánítnak a követett sebességnél, ha az éppen aktuális magasság jelentés hiteles, és a következő feltételek közül egy vagy több teljesül:

a) Új nyomvonalat észleltek T_5-nél hosszabb időn keresztül (4.1.2.3.6.9.1 pont) magasság átmenet nélkül; vagy

b) nem megerősített nyomvonalat észleltek T_6-nál hosszabb időn keresztül (4.1.2.3.6.9.1 pont) magasság átmenet nélkül; vagy

c) a nyomvonalat vízszintes repülésnek jelentik; vagy

d) a nyomvonalat először megalapozott sebesség nyomvonalnak minősítik; vagy

e) megalapozott sebesség nyomvonalnál, amikor átmenet jelent meg, a megfigyelt átmenet idejének a várt átmenet időhöz viszonyított aránya (felfrissítés előtti) R_1 és R_2 közé esik (4.1.2.3.6.9.1 pont); vagy az ezek az idők közötti különbség abszolút értéke kisebb, mint T_8; vagy a legutóbb észlelt és az előző átmenet közötti időkülönbség nagyobb, mint T_8 (4.1.2.3.6.9.1 pont); vagy

f) megalapozott sebesség nyomvonalnál, amikor átmenet fordult elő, az előző jelentés hiányzott,

$$|t_p - t_b^*| \geq T_7,\ t_p/t_b^* \geq 1 \text{ és } -t_p - T_9 \leq (t_b - t_p)\ b_1 \leq T_9 \text{ vagy}$$

g) a nyomvonalat ingadozónak minősítik; vagy

h) megbízhatóságot előzőleg "nagy"-ra állították be, miután az utolsó hiteles magasság jelentést feldolgozták, és az a)-e) feltételek a 4.1.2.3.6.10 pontban "kicsi" megbízhatóság jelentéshez nem teljesülnek.

4.1.2.3.6.9.1 A következő értékek kerülnek felhasználásra

$T_5 = 9$ s
$T_6 = 9$ s

T_7 = 1,1 s
T_8 = 8,5 s
T_9 = 1,25 s
R_1 = 2/3
R_2 = 3/2

4.1.2.3.6.10 *Kis megbízhatóságú nyomvonal bejelentés*. A követett sebességnél "kis" megbízhatóságot jelentenek, ha a következő feltételek közül egy vagy több teljesül:

a) új nyomvonalnál, amíg a 4.1.2.3.6.9 pont a) feltétele teljesül; vagy

b) nem megerősített sebesség nyomvonalnál, amíg a 4.1.2.3.6.9 pont b) feltétele teljesül; vagy

c) amikor egy észlelt átmenet ideje egy megalapozott sebesség nyomvonalnál nem elégíti ki a 4.1.2.3.6.9 pont e) feltételét vagy f) feltételét; vagy

d) amikor egy várt átmenet több mint T_{10} időt (4.1.2.3.6.10 pont) késik;

e) megalapozott sebesség nyomvonalnál, amikor a 4.1.2.3.6.8 pont feltétele teljesül; vagy

f) a megbízhatóság előzőleg "kicsi" volt és a feltételek a "nagy" megbízhatóság jelentéséhez nem teljesültek (4.1.2.3.6.9 pont)

4.1.3.3.6.10.1 A T_{10} = 0,25 s értéket alkalmazzák.

4.1.2.3.7 *Hiányzó magasság jelentések*. Amikor magasság-jelentések hiányoznak:

a) a magasság változtatás sebesség számítás előző értékét fenntartják; és

b) a megbízhatóságot a követett sebességnél "kicsi"-nek jelentik, amikor a magasság jelentések két vagy több egymást követő cikluson keresztül hiányoznak.

4.2 Forgalmi tanácsadások (TA)

4.2.1 TA GENERÁLÁS

4.2.1.1 Forgalmi tanácsadást generálnak egy C-módú magasságot jelentő megközelítő légijármű részére, amikor mind a távolság vizsgálat (4.2.3 pont), mind a magasság vizsgálat (4.2.4 pont) alkalmazása pozitív eredményt szolgáltat ugyanazon működési ciklusban.

4.2.1.2 Forgalmi tanácsadást generálnak egy nem-magasság-jelentő válaszjeladóval felszerelt megközelítő légijármű részére, amikor egy távolság vizsgálat eredménye (4.2.3 pont) pozitív.

4.2.2 TA FIGYELMEZTETÉSI IDŐ

Magasságot jelentő megközelítő légijárműveknél a távolság vizsgálat a forgalmi tanácsadásoknál a következők szerint adja a figyelmeztetési időt:

S	2	3	4	5	6	7
TA figyelmeztetési idő	T + 10	T + 10	T + 10	T + 15	T + 15	T + 13

ahol S = érzékenységi szint

4.2.2.1 A 3-7 érzékenységi szintekhez tartozó értékek *T*-hez azok, amelyek a 4.3.3.3.1 pontban lettek megadva. Az érték *T*-hez a 2-es érzékenységi szintnél 10 s.

4.2.3 TA TÁVOLSÁG VIZSGÁLAT

A forgalmi tanácsadásokhoz tartozó távolság vizsgálatnak ugyanolyan formája van, mint amit a veszélyeztető légijármű észlelésnél használnak (4.3.3 pont). A D_m-hez a 3-7 érzékenységi szinteknél használt értékek azok, amelyek a 4.3.3.1.1 pontban vannak megadva, megnövelve $g(T_w\text{-}T)^2/6$ értékével, ahol T_w a kívánt forgalmi tanácsadás figyelmeztetési idő. A 2-es érzékenységi szintnél a D_m alapértékéhez 0,19 km (0,10 NM) tartozik.

4.2.4 TA MAGASSÁG VIZSGÁLAT

A magasság vizsgálat pozitív eredményt ad, ha a következő feltételek közül valamelyik teljesül:

a) az éppen aktuális magassági elkülönülés “kicsi”; vagy

b) a légijárművek magasság szerint összetartanak és az egy magasságba kerülésig az idő “kicsi”.

Ezek a fogalmak és feltételek a 4.3.4.1, 4.3.4.2, 4.3.4.3 és 4.3.4.5 pontokban vannak definiálva. Az időküszöb az egy magasságba kerülésig a forgalom tanácsadás figyelmeztetési idő lesz (4.2.2 pont) és a Z_t -nél használt értékek a következők:

z_0 repülési magasságszint	300 alatt	300 felett
Z_t m	260	370
(Z_t láb	850	1200)

4.3 Veszélyeztető légijármű meghatározása

4.3.1 VESZÉLYEZTETŐ LÉGIJÁRMŰ ÉSZLELÉSI JELLEMZŐI

4.3.1.1 *Megközelítő légijármű jellemzői.* Egy megközelítő légijármű jellemzői, amelyeket a veszélyeztető légijármű meghatározásához használnak a következők:

a) követett magasság: z_1

b) követett magasság változtatási sebesség: $\dot{z}_1$

c) követett ferde távolság: r

d) követett ferde távolság változás sebesség: $\dot{r}$

e) megközelítő légijármű ACAS-ának érzékenységi szintje: S_i

Egy megközelítő légijárműnél, amely nincs ACAS II-vel vagy ACAS III-mal felszerelve, az S_i-t 1-esre kell állítani.

4.3.1.2 *Saját légijármű jellemzők.* Minimumként a saját légijármű következő jellemzőit használják a veszélyeztető légijármű meghatározásánál:

a) magasság: z_0

b) magasság változtatási sebesség: $\dot{z}_0$

c) saját ACAS érzékenységi szint (4. fejezet 4.3.4.3 alpont): S_0

4.3.1.3 *Magasság-tartomány SLC utasítás.* A referencia logika az SLC utasítást a magasság tartomány alapján az A-1 táblázatban bemutatottak szerint választja ki.

4.3.2 VESZÉLYEZTETŐ LÉGIJÁRMŰVÉ NYILVÁNÍTÁS KRITÉRIUMAI

Egy megközelítő légijármű veszélyeztetővé válik akkor és csakis akkor, ha mindkét alábbi feltétel érvényes ugyanabban a ciklusban:

a) a távolság vizsgálat pozitív eredményt szolgáltat; és

b) vagy

1) a magasság vizsgálat pozitív eredményt szolgáltat; vagy

2) magasság keresztezés megoldási javaslat kiegészítést (RAC) vesznek a veszélyeztető légijárműtől.

4.3.2.1 *Elfogadott veszélyeztetés.* Egy elfogadott veszélyeztetésnek a veszélyeztető légijármű státusza a következő ciklusokban fennmarad, ha minimum a távolság vizsgálat pozitív eredményt szolgáltat.

4.3.3 TÁVOLSÁG VIZSGÁLAT

4.3.3.1 *Távolság összetartás (konvergencia).* Légijárműveket távolságban összetartónak tekintjük, ha a számított távolság változtatási sebesség kisebb, mint $\dot{R}_t$. Ebben az esetben a távolság változtatási sebesség számítási eredmény, amelyet a távolság vizsgáltban használnak, a számított távolság változtatás és $-\dot{R}_t$ közül a kisebbik.

4.3.3.1.1 $\dot{R}_t$-hez a 3 m/s (6 csomó) értéket használják.

4.3.3.2 *Távolság széttartás (divergencia).* Azok a légijárművek, amelyeket nem tekintenek távolságban összetartónak (konvergálónak), távolságban széttartónak (divergálónak) számítanak. A távolság széttartása “lassú”, ha a számított távolság és a számított távolság változás sebesség szorzata kisebb, mint $\dot{P}_m$

4.3.3.2.1 P_m-re a következő értékeket használják:

S	*3*	*4-6*	*7*
$\dot{P}_m$ km^2/s	0,0069	0,096	0,0137
($\dot{P}_m$ NM^2/s	0,0020	0,0028	0,0040)

4.3.3.3 *Távolság vizsgálat kritériumai.* A távolság vizsgálat akkor ad pozitív eredményt, amikor a következő feltételek valamelyike teljesül:

a) együttesen:

1) a légijárművek távolságban összetartanak; és

2) teljesül a következő egyenlőtlenség:

$$(r-D_m^2/r) / |\dot{r}'| < T;$$

ahol $\dot{r}' = \text{minimum}(\dot{r}, -\dot{R}_t)$

b) a légijárművek távolságban széttartanak, de a távolság kisebb, mint D_m és a távolság széttartás "lassú"; vagy

c) nem lehetett egy elkerülési távolságot számítani az éppen aktuális ciklusra, vagy a számított elkerülési távolság kisebb, mint H_m

és az összes többi feltételnél a vizsgálat eredménye negatív.

Megjegyzés. – A fenti a) 2) tételben szereplő képlet gyakorlati szöveget szolgáltat a következő feltételhez: a távolság és távolság változási sebesség számítások azt mutatják, hogy az előfordulás olyan lehet, hogy a lineáris hiányzó távolság kisebb vagy egyenlő D_m-el, és a lineáris idő a legszorosabb megközelítésig kisebb, mint T.

4.3.3.3.1 A T, D_m és H_m paraméterek értékei a következők:

S	*3*	*4*	*5*	*6*	*7*
T s	15	20	25	30	35
D_m (km)	0,37	0,65	1,0	1,5	2,0
(D_m (NM)	0,20	0,35	0,55	0,8	1,1)
H_m (m)	382	648	1019	1483	2083
(H_m (láb)	1251	2126	3342	4861	6683)

4.3.4 MAGASSÁG VIZSGÁLAT

4.3.4.1 *MAGASSÁG VIZSGÁLATI FOGALMAK ISMERTETÉSE*

Altitude divergence rate ($\dot{a}$) - Magasság széttartási sebesség ($\dot{a}$). Az *a* változásának sebessége.

*Current altitude separation (a) - Meglévő magassági elkülönítés (*a*).* Az éppen követett, a saját légijármű és a megközelítő légijármű közötti magassági elkülönítési modulus.

Times to closest approach (τ_μ, τ_m) - Idők a legszorosabb megközelítésig (τ_μ, τ_m). A minimális távolság eléréséhez elvileg szükséges számított idő. τ_μ a maximális érték (egyenesvonalú relatív mozgást és zérus elkerülési távolságot feltételezve), és τ_m a minimális érték (egyenesvonalú relatív mozgást és a maximális elkerülési D_m távolságot feltételezve).

Time to co-altitude (τ_V) - *Idő az azonos magasságba kerülésig* (τ_V). Az a számított idő, amely az azonos magasságba kerülés eléréséhez szükséges.

Vertical miss distance (v_m) *- Függőleges elkerülési távolság* (v_m). Számított alsó határ a tervezett magasság szerinti elkülönítésnél a legszorosabb megközelítés számított időpontjában.

4.3.4.2 *Meglévő magasság szerinti elkülönítés*. Meglévő magasság szerinti elkülönítést "kicsinek" jeleznek, ha $a < Z_t$, ahol Z_t a Z_m-el egyenlő értékre van beállítva (4.3.4.4.2 alpont) a referencia logikánál.

4.3.4.3 *MAGASSÁGI ÖSSZETARTÁS*

4.3.4.3.1 Az $\dot{a}$ -t a következők szerint számítják:

$\dot{a} = \dot{z}_o - \dot{z}_i$ $z_o - z_i \geq 0$ esetén

$\dot{a} = \dot{z}_i - \dot{z}_o$ $z_o - z_i < 0$ esetén.

4.3.4.3.2 A légijárműveket magasság szerint összetartónak minősítik, ha $\dot{a} < - \dot{Z}_c$

4.3.4.3.3 A $\dot{Z}_c$ értéke pozitív és nem nagyobb, mint 0,3 m/s (60 láb/perc)

4.3.4.4 *FÜGGŐLEGES ELKERÜLÉSI TÁVOLSÁG*

4.3.4.4.1 Amikor a légijárművek távolságban összetartanak ($\dot{r} \leq 0$), az időt a legszorosabb megközelítésig és, a függőleges elkerülési távolságot a következők szerint számolják:

$\dot{r}' = \text{minimum}(\dot{r}, -\dot{R}_t)$

$\tau_\mu = \text{minimum}(|r / \dot{r}|, T)$

$\tau_m = |(r - D_m^2/r) / \dot{r}'|$

$r \geq D_m$ esetén

$= 0$ az $r < D_m$ esetén

$v_{m1} = (z_o - z_i) + (\dot{z}_o - \dot{z}_i)\ \tau_u$

$v_{m2} = (z_o - z_i) + (\dot{z}_o - \dot{z}_i)\ \tau_m$

$v_m = 0$ a $v_{m1}\ v_{m2} \leq 0$ esetén, egyébként

$v_m = \text{minimum}(v_{m1}, v_{m2})$ a $v_{m1} > 0$ esetén

$= \text{maximum}(v_{m1}, v_{m2})$ a $v_{m1} < 0$ esetén

4.3.4.4.2 A függőleges elkerülési távolságot "kicsinek" jelzik, ha $|v_m| < Z_m$. A Z_m maximális értékei a következők szerint adódnak:

z_o *repülési szint*	*200 alatt*	*200-420*	*420 felett*
Z_m (m)	183	213	244
(Z_m (láb)	600	700	800)

4.3.4.5 *AZONOS MAGASSÁGRA KERÜLÉSIG TERJEDŐ IDŐ*

4.3.4.5.1 Az $\dot{a}$ esetén, az azonos magasságra kerülésig terjedő idő kisebb, mint -Z_c esetén és a következőképpen számolják:

$\tau_v = - a/\dot{a}$

Megjegyzés. – A τ_v *-t nem használják, ha a légijárművek magasságban és távolságban nem tartanak össze.*

4.3.4.5.2 A τ_v -t "kicsinek" jelzik, ha $\tau_v < T_v$ olyan találkozásoknál, amikor a saját légijármű függőleges sebessége nem nagyobb, mint 600 láb/perc, vagy a saját légijármű függőleges sebességének ugyanolyan előjele van, mint a veszélyeztető légijármű függőleges sebességének, de a nagysága kisebb. Minden más találkozásnál a τ_v -t "kicsinek" jelzik, ha $\tau_v < T$. A T_v paraméter értékei a következők:

S	*3*	*4*	*5*	*6*	*7*
T_vs	15	18	20	22	25

4.3.4.6 *Magasság vizsgálati kritériumok.* A referencia logika magasság vizsgálata pozitív eredményt ad, ha az alábbi három feltétel közül valamelyik teljesül:

a) a légijárművek távolságban összetartanak, a meglévő magassági elkülönítés "kicsi", és a függőleges elkerülési távolság "kicsi"; vagy

b) a légijárművek távolságban és magasságban összetartanak, az idő az azonos magasság eléréséig és a függőleges hiányzó távolság egyaránt "kicsi", vagy az azonos magasságra kerülést a legszorosabb megközelítés előttre jelzik ($\tau_v < \tau_u$); vagy

c) a légijárművek távolságban széttartanak, és a meglévő magasság szerinti elkülönítés "kicsi";

és minden más feltételnél a magasság vizsgálat eredménye negatív.

4.4 Megoldási tanácsadások (RA) generálása

4.4.1 A megoldási tanácsadások fajtáinak meghatározását a 4. fejezet 4.1 Szakasza tartalmazza.

4.4.2 KÉSÉS AZ RA GENERÁLÁSÁBAN

Megjegyzés. – Megoldási tanácsadást minden veszélyeztető légijárműre, kivéve az itt leírt körülményeket, vagy koordinációs célokra generálnak.

A referencia logika nem generál megoldási tanácsadást, vagy módosít egy meglévő megoldási tanácsadást egy új veszélyeztető légijármű részére, ha a következő feltételek valamelyike teljesül:

a) egy magasság-keresztezési megoldási tanácsadás kiegészítés nem érkezett a veszélyeztető légijárműtől; és

b) vagy

1) a magassági elkülönítés vizsgálat (4.4.2.1 alpont) negatív eredményt ad;

2) a megközelítő légijármű követett magasság változtatási sebességénél a meggyőződés “alacsony”, és nincs megoldási manőver, amely legalább A_t előrejelzett elkülönítést szolgáltatna (4.4.2.2 alpont), függetlenül attól, hogy a veszélyeztető légijárműnek akár a felső magasság változtatási sebesség határral, akár az alsó magasság változtatási sebesség határral egyenlő magasság változtatási sebessége, akár e két határ közötti tetszőleges értékkel egyenlő magasság változtatási sebessége van (4.1.2.3.4 alpont); vagy

3) “alacsony” meggyőződés áll fenn a veszélyeztető légijármű által követett magasság változtatási sebességnél, a fennálló elkülönítési magasság nagyobb, mint 46 m (150 láb), és a generált megoldási tanácsadás, amelyet a veszélyeztető légijárművel szemben választanának, ha a többi lehetséges veszélyeztető légijárműtől különállónak tekintenék, magasság keresztező.

4.4.2.1 *MAGASSÁGI ELKÜLÖNÍTÉS VIZSGÁLAT*

4.4.2.1.1 A saját ACAS II légijármű magasság változtatási sebességét “kicsinek” nyilvánítják, ha $|\dot{z}_o| \leq \dot{Z}_l$

4.4.2.1.2 A $\dot{Z}_l$ -ra a 3,0 m/s (600 láb/perc) értéket alkalmazzák

4.4.2.1.3 A veszélyeztető légijárművé nyilvánítás késését ”elfogadhatónak” tekintik, ha ez kisebb, mint 3,0 s.

4.4.2.1.4 A maximális magasság szerinti A_c elkülönítési küszöb 260 m (850 láb) értékre adódik, amikor a saját és a veszélyeztető légijármű függőleges sebessége ellentétes irányú és egyikük sem “kicsi”, és 183 m (600 láb) értékű egyébként.

4.4.2.1.5 A magasság szerinti elkülönítést “minimálisnak” deklarálják, ha 100 lábbal egyenlő.

4.4.2.1.6 Egy találkozást “lassan közeledőnek” nyilvánítanak, ha a távolság változás sebessége nagyobb, mint D_m/T.

4.4.2.1.7 *Vizsgálati feltételek*. A magassági elkülönítés negatív eredményt ad, ha a veszélyeztető légijármű egy új veszélyeztető, és a megoldási tanácsadás, amelyet a többi lehetséges egyidejű veszélyeztető légijárműtől elkülönítve tekintenek, a következő lehet, vagy:

a) magasság keresztező és vagy:

1) a fennálló magasság szerinti elkülönítés meghaladja az A_c-t; vagy

2) a veszélyeztető légijármű felszerelt, érvényes megoldási tanácsadás kiegészítést nem kaptak még tőle, a saját légijármű magasság változtatási sebessége “kicsi”, a veszélyeztető légijármű magasság változtatási sebessége nem “kicsi”, és a késleltetés egy megoldási tanácsadás kiadásában, vagy a fennálló megoldási tanácsadás módosításában “elfogadható”; vagy

b) képtelen legalább “minimális” elkülönítést generálni a kritikus tartomány felett, ha a találkozás nem “lassú közelítő”; vagy

c) képtelen legalább “minimális” elkülönítést generálni a legszorosabb megközelítésnél (τ_u), ha a találkozás “lassan közelítő” és vagy a távolság kisebb, mint D_m, vagy az idő a D_m, τ_m távolsághoz kisebb, mint 5 s.

Egyéb esetben a magasság szerinti elkülönítés vizsgálat eredménye pozitív.

4.4.2.2 Az A_t-re a következő értékeket használják:

z_o	A_t m	(A_t láb)
kisebb, mint a 100-as repülési szint	61	(200)
100-astól a 200-as repülési szintig	73	(240)
201-estől a 420-as repülési szintig	122	(400)
420-as repülési szint felett	146	(480)

4.4.2.2.1 ±500 lábas hiszterézist alkalmaznak a szomszédos magasság rétegek közötti határokhoz.

4.4.3 *Magasság szerinti elkülönítési cél.* A megoldási tanácsadás kezdeti erősségét úgy választják, hogy teljesítse a legszorosabb megközelítésnél legalább A_1 magasság szerinti elkülönítés célkitűzését, kivéve a 4.4.3.2 pontban leírt körülmények fennállásának esetét.

z_o	A_t m	(A_t láb)
kisebb, mint az 50-es repülési szint	91	(300)
50-estől a 100-as repülési szintig	107	(350)
100-astól a 200-as repülési szintig	122	(400)
201-estől a 420-as repülési szintig	183	(600)
420-as repülési szint felett	213	(700)

4.4.3.1.1 ±500 láb értékű hiszterézist alkalmaznak a szomszédos magasság rétegek közötti határokhoz.

4.4.3.2 *Nem megfelelő függőleges elkülönítés*. Ha a megoldás tanácsadásokra vonatkozó korlátozások (4.fejezet, 4.3.5 és 4.4.4 pontok alább) eleve kizárják egy megoldási tanácsadás generálását, amely várhatóan legalább A_1 magasság szerinti elkülönítést szolgáltat a legszorosabb megközelítésnél, a megoldás tanácsadás az, amely várhatóan a legszorosabb megközelítésnél a legnagyobb magasság szerinti elkülönítést szolgáltatja, amely összhangban van az ebben a fejezetben leírt többi előírással.

4.4.3.3 *Kritikus tartomány.* Előrejelzések a legszorosabb megközelítésre vonatkozóan arra az időtartamra szólnak, amely alatt összeütközés következhet be.

4.4.3.3.1 A kritikus tartomány az a $\tau_{m\ell}$ és $\tau_{u\ell}$ közötti idő, amelynél:

$\dot{r}' = \text{minimum}\,(\dot{r}, -\dot{R}_t)$

$\tau_{ul} = \text{minimum}\,(\tau *_{u\ell}, |r / \dot{r}'|, T_e)$

$\tau_{ml} = \text{minimum}\,(\tau *_{m\ell}, |r - D_m^2|/r) / \dot{r}'|)$

$r \geq D_m$ esetén

$T_{m1} = 0$, $r < D_m$ esetén

ahol $\tau *_{u\ell}$ és $\tau *_{m\ell}$ egyaránt T_e-vel egyenlő egy olyan veszélyeztető légijárműnél, amely újonnan esett át a távolság vizsgálaton (4.3.3 Szakasz), máskülönben a τ_{ul} és τ_{ml} előző ciklusbeli értékeit veszi fel.

4.4.3.3.1.1 A következő paraméter értékeket használják:

S	*3*	*4*	*5*	*6*	*7*
T_e, s	25	30	30	35	40

4.4.3.4 *A veszélyeztető légijármű repülési pályája.* A megoldási tanácsadás arra szolgál, hogy olyan magassági elkülönítést szolgáltasson, amely elegendő ahhoz, hogy a veszélyeztető légijárművekkel az összeütközést elkerüljék, amikor is a veszélyeztető légijárművek:

a) megtartják meglévő magasságváltoztatási sebességüket; vagy

b) emelkednek vagy süllyednek, amikor először válnak veszélyeztetőkké, és csökkentik magasságváltoztatási sebességüket, vagy vízszintes repülésbe manővereznek át.

4.4.3.4.1 Az előrejelzett magassági elkülönítés azon a feltevésen alapszik, hogy a veszélyeztető légijármű fenntartja meglévő magasság változtatási sebességét, kivéve a 4.4.4.4 pontban az ACAS-al felszerelt veszélyeztető légijárművekre vonatkozóan leírtakat.

4.4.3.5 *Saját légijármű repülési pályája.* Az előrejelzett magassági elkülönítés a legszorosabb megközelítésnél a következő feltételezéseken alapul, amelyek az ACAS II légijárműnek a megoldási tanácsadásra való reagálásával kapcsolatosak:

a) megelőző megoldási tanácsadásoknál a saját légijármű magasság változtatási sebessége a megoldási tanácsadás által előírt határokon belül marad;

b) helyesbítési megoldási tanácsadásoknál a saját légijármű repülési pályája a következőkből áll: gyorsulás nélküli repülés a meglévő sebességgel $T_p + T_S$ időn keresztül, ezt követi egy állandó gyorsulás ($\ddot{Z}_g$) a függőleges síkban, amíg eléri a választott magasság változtatási sebességet ($\dot{Z}_g$) és ezután gyorsulás nélküli mozgás ezzel a sebességgel.

Megjegyzés. – Az előrejelzett idő a legszorosabb megközelítésig olyan rövid lehet, hogy a kiválasztott $\dot{Z}_g$ *sebességet nem tudja elérni.*

4.4.3.5.1 A T_p paraméter, amely a repülőgépvezető reakció idejét jelenti, az 5 s értéket veszi fel a kezdeti megoldási tanácsadás erősségnél, vagy 2,5 s bármely következő megoldási tanácsadás erősségnél.

4.4.3.5.2 A T_S paraméter értékét úgy választják meg, hogy a rendszer késését modellezi a releváns SSR válasz fogadásától a megoldási tanácsadásnak a repülőgépvezető részére történő bemutatásáig (4. fejezet, 4.3.5.10 alpont).

4.4.3.5.3 A $\ddot{Z}_g$ paraméter a 0,35 g értéket veszi fel egy fordított értelmű megoldási tanácsadás, vagy 0,25 g értéket más esetekben.

4.4.3.5.4 Ha a $\dot{Z}_g$ választott magasság változtatási sebesség meghaladja a légijármű teljesítőképességét, a légijárműnek megfelelő értékkel helyettesítik.

4.4.4 MEGOLDÁSI TANÁCSADÁSOKRA VONATKOZÓ KORLÁTOZÁSOK

4.4.4.1 *A rendelkezésre álló RA erősségek.* A referencia logikának megvan az a képessége, hogy legalább a függőleges megoldási tanácsadás erősség A-2 táblázat szerinti választási lehetőségét nyújtsa a találkozási megoldásoknál.

4.4.4.1.1 *Megnövelt sebesség RA-k.* A referencia logika nem veszi figyelembe a növekedés emelkedés, növekedés süllyedés erősséget, amikor kiválasztja a megoldási tanácsadás kezdő erősségét. Ezeket a megoldási tanácsadásokat csak akkor használják, amikor az előrejelzett elkülönítés a meglévő megoldási tanácsadásnál nem megfelelő, és a megoldási tanácsadás értelmének megfordítása nem elfogadható választás. Ezek a megoldási tanácsadás erősségek arra szolgálnak, hogy átadjanak egy megnövelt sürgetés értelmet a repülőgépvezetőnek. Ezek megfelelnek a $\dot{Z}_g$ kiválasztott magasság változtatási sebesség $\dot{Z}_{clm}$ vagy $\dot{Z}_{des}$ fölé növekedésének, amelyik a megfelelő.

4.4.4.1.1.1 A választott magasság változtatási sebesség 13 m/s-re (2500 láb/perc) növelését generálják, amikor a következő feltételek mindegyike teljesül:

a) ugyanolyan értelmű pozitív megoldási tanácsadás kijelzés van és volt egynél több cikluson keresztül, és vagy

   1) ha a veszélyeztető légijármű felszerelt, vagy a meglévő megoldási tanácsadás nem magasság keresztező, a veszélyeztető légijármű által követett magasság változtatási sebességének bizonyossága “nagy” (4.1.2.3.6.9 alpont), és a meglévő megoldási tanácsadás erőssége várhatóan 61 m-nél (200 láb) kisebb magasság szerinti elkülönítést hoz a legszorosabb megközelítésnél; vagy

   2) a veszélyeztető légijármű nem felszerelt és a meglévő megoldási tanácsadás magasság keresztező és a legszorosabb megközelítésig 10 s vagy kevesebb maradt, és a veszélyeztető légijármű magassága a legszorosabb megközelítésnél előreláthatólag kevesebb, mint 61 m-el (200 ft) a saját légijármű felett, illetve alatt lesz süllyedési, illetve emelkedési megoldási tanácsadás esetén;

b) a legszorosabb megközelítésig hátramaradt idő kevesebb, mint T_{ir} és nagyobb, mint 4 s;

c) saját légijármű vagy süllyed és 1450 láb föld feletti magasság felett van, vagy emelkedik és 1650 láb földfeletti magasság felett van és növekvő emelkedési tanácsadásokat nem akadályozzák a légijármű teljesítmény korlátjai és

d) a Tau_u értéke (4.3.4.4.1 alpont) már nem növekszik, vagy ha van, a veszélyeztető légijárműtől való távolság kisebb, mint 3,2 km (1,7 NM).

T_{ir}-re a következő értékeket használják)

S	*3*	*4*	*5*	*6*	*7*
T_{ir}, *s*	13	18	20	24	26

1. Megjegyzés. – A fenti a) 2) feltétel lehetővé teszi megnövelt sebesség megoldási tanácsadás használatát a vízszintes repülésbe való átmenetet végző nem-felszerelt veszélyeztető légijárművel szemben egy magasság keresztező találkozásban, amely nem teszi képessé értelem felcserélésére (4.4.4.3.1 alpont). Ez a helyzet előállhat, mivel a veszélyeztető légijármű kismértékű lassulással megy át vízszintes repülésbe úgy, hogy várható magassága a legszorosabb megközelítési pontban követi az ACAS II légijármű meglévő magasságát mindegyik rákövetkező ciklusban. Növelt sebesség megoldási tanácsadás további magasság szerinti elkülönítést generálhat.

2. Megjegyzés. – A c) állapot megakadályozza a nem kívánatos együttműködést az összeütközés elhárító logika és a földközelségre figyelmeztető rendszer (GPWS) között.

4.4.4.1.2 Az alapértelmezett értékek Z_{clm}-re és Z_{des}-re 7,6 m/s (1500 láb/perc) és -7,6 m/s (-1500 láb/perc). Ha 7,6 m/s (1500 láb/perc) meghaladja a légijármű emelkedő képességét, alkalmas érték helyettesítésével lehet lehetővé tenni emelkedési megoldás tanácsadások generálását. Ha az emelkedés vagy süllyedés tényleges sebessége meghaladja az alapértelmezett sebességet, a tényleges sebességet helyettesítik be, ha az kisebb, mint a 4400 láb/perc maximális sebesség; más esetben a maximális 4400 láb/perc sebesség használatos.

Megjegyzés. – Emelkedéseket akadályozhatja diszkrét jelzésekre való reagálásban pl. az, hogy a légijármű csúcsmagasságon van. Azonban lehetséges, hogy bizonyos légijárműveknek olyan korlátozott emelkedőképessége lesz, hogy a megoldási tanácsadásokat 7,6 m/s (1500 láb/perc) sebességű emelkedésre folyamatosan korlátozni kell, hogy összhangban legyen a 4. fejezet, 4.3.5.4 pontjával.

4.4.4.1.3. *RA megtartás.* Kielégítve azt a követelményt, hogy süllyedő megoldási tanácsadást nem generálnak kis magasságokon (4. fejezet, 4.3.5.4.1 pont), a megoldási tanácsadást nem módosítják (4. fejezet, 4.3.5.6 alpont), ha a következők közül valamelyik érvényes:

a) a távolság vizsgálat negatív eredményt szolgáltat, de a megközelítő légijármű veszélyeztető marad (4.3.5.1.1 pont); vagy

b) 2,5 s-nál kevesebb marad a legszorosabb megközelítésig: vagy

c) a megközelítő légijármű távolságban széttartó, de a megoldási tanácsadást nem törölték (4.3.5.1.1 pont).

4.4.4.1.4 *Gyengülő RA-k.* Kielégítve azt a követelményt, hogy süllyedési megoldási tanácsadást kis magasságon nem generálnak, (4. fejezet, 4.3.5.4.1 pont), egy megoldási tanácsadás nem gyengül (4. fejezet, 4.3.5.7 pont), ha a következő feltételek közül valamelyik érvényes;

a) pozitív és a meglévő magasság szerinti elkülönülés kisebb, mint $A_{l;}$

b) (bármilyen erősségű is) kevesebb, mint 10 s, vagy megcserélt értelmű megoldási tanácsadás esetén, 5 s volt kijelezve;

c) a veszélyeztető légijármű által követett magasság változtatási sebesség "kis" bizonyosságú;

d) a megoldási tanácsadás egy függőleges sebesség határ megoldási tanácsadás.

Továbbá pozitív megoldás tanácsadások nem gyengülnek egy megoldási tanácsadás erősségen túl, amely lehetővé teszi a visszatérést a vízszintes repüléshez ("ne emelkedj" egy a lefelé irányuló megoldási tanácsadásnál; "ne süllyedj" egy felfelé irányuló megoldási tanácsadásnál).

Megjegyzés. – A gyengülő megoldási tanácsadásnak ez a korlátozása nem érvényes egy légijármű olyanná nyilvánítására, hogy az nem veszélyeztető légijármű (4. fejezet, 4.3.5.1.1 alpont).

4.4.4.2 *Kezdeti ellenállás a magasság keresztezéssel szemben.* Újonnan generált megoldási tanácsadás nem-keresztező, feltéve, ha:

a) egy nem-keresztező megoldási tanácsadás várhatóan egy legalább A_l nagyságú magasság szerinti elkülönítést szolgáltat a legszorosabb megközelítésnél; és

b) egy nem-keresztező megoldási tanácsadásra szabványos válasszal való reagálást (4.4.3.5 pont) jelzik előre, hogy megőrizzék legalább a "minimális" függőleges elkülönítést (4.4.2.1 pont) a legszorosabb megközelítésig terjedő teljes időtartományban.

4.4.4.3 *Értelem megfordulás elfogadott veszélyeztető légijárműnél.* Értelem megfordításokat generálnak, amikor a következő feltételek érvényesek:

a) a nem felszerelt veszélyeztető légijármű, vagy a felszerelt veszélyeztető légijármű, magasabb légijármű címzéssel rendelkezik, és legalább 9 s telt el azóta, mióta veszélyeztetővé vált, és a saját ACAS előzőleg nem fordította meg megoldási tanácsadásának értelmét; és

b) több mint 4 s maradt a legszorosabb megközelítésig;

c) a τ_u érték (4.3.4.4.1 pont) már nem emelkedett addig az ideig, amíg a veszélyeztető légijárműtől való távolság 3,2 km (1,7 NM) volt; és

d) vagy:

1) i) a meglévő megoldási tanácsadás keresztező; és

ii) a meglévő magasság szerinti elkülönítés legalább 61 m (200 láb), vagy 30 m (100 láb), ha több mint 10 s marad a legszorosabb megközelítés előtt;

iii) vagy

- a megoldási tanácsadás generálásának idején azt jelezték előre, hogy a veszélyeztető légijármű keresztezi a saját légijármű kezdeti magasságát, de jelenleg emelkedésnél a veszélyeztető légijármű magasságát a legszorosabb megközelítésnél, a saját légijármű jelenlegi magassága fölé, illetve süllyedés esetén alá jelzik előre; vagy

- a megoldási tanácsadás generálásának idején nem volt előrejelzés arról, hogy a veszélyeztető légijármű keresztezi a saját légijármű kezdeti magasságát, de az emelkedés és süllyedés megoldási tanácsadásoknál a legszorosabb megközelítésnél elérhetőnek jelzett elkülönítésre vonatkozó jelenlegi számítások azt mutatják, hogy fordított értelmű megoldási tanácsadás esetén nagyobb elkülönítést nyernek; és

iv) a legszorosabb megközelítés elérésének idejéig a saját légijármű felcserélt értelemmel képes lesz meghaladni a veszélyeztető légijármű magasságának maximum-határát a legszorosabb megközelítésnél (tervezett a maximum magasság változtatási sebesség határ használata (4.1.2.3.4 pont)); vagy

2) i) a meglévő megoldási tanácsadás nem magasság keresztező, és

ii) a következők közül legalább az egyik:

- a veszélyeztető légijármű keresztezte a saját légijármű magasságát legalább 30 m-el (100 láb) a megoldási tanácsadás értelmének irányában; vagy

- a veszélyeztető légijármű nem felszerelt és a saját légijármű még nem keresztezte a veszélyeztető légijármű magasságát, de függőleges sebessége ellenkező a megoldási tanácsadással, és a megoldási tanácsadás végrehajtására irányuló azonnali manőver nem akadályozná meg a legszorosabb megközelítés előtti magasság keresztezését; vagy

- a veszélyeztető légijármű nem felszerelt és a meglévő elkülönítés nem haladja meg az A_c-t (4.4.2.1.4 alpont), a saját és a veszélyeztető légijármű függőleges sebessége meghaladja az 1000 láb/perc értéket ugyanabban az irányban, a megoldási tanácsadás pozitív volt legalább 9 másodpercen keresztül, a veszélyeztető követett sebességének a bizonyossága nagy, és vagy a legszorosabb megközelítés előtti magasság kereszteződést jeleztek előre, vagy a függőleges elkülönülést a legszorosabb megközelítésnél 30 m-nél (100 láb) kisebbre jelezték előre.

Megjegyzés. – A megoldási tanácsadás értelme egy megalapozott veszélyeztető légijárműnél nem fordítható meg, kivéve a koordinációs célok esetét, vagy ha az előrelátható elkülönítés a legszorosabb megközelítésnél a meglévő értelemnél nem kielégítő (4. fejezet, 4.3.5.5 alpont).

4.4.4.3.1 Emelkedés megoldási tanácsadások, amelyek lefelé irányuló értelmű megoldási tanácsadások megfordítottjaiként jelennek meg, kiadásra kerülnek, tekintet nélkül a manőver korlátozási jelzésekre.

4.4.4.4 *Erős kiválasztás nem-keresztező megoldási tanácsadásoknál ACAS-al felszerelt veszélyeztető légijárművekkel szemben.* Egy ACAS-al felszerelt veszélyeztető légijárművel való konfliktusban, amelyben a referencia logika általában egy nem-keresztező emelkedés vagy süllyedés megoldási tanácsadást generálna, amely ellentétes irányú a saját légijármű fennálló függőleges sebességével, helyette olyan megoldási tanácsadást generál, amely a függőleges sebességet 0 láb/percre limitálja, amennyiben teljesülnek a következő feltételek:

a) a saját légijármű és a veszélyeztető függőlegesen összetartanak;

b) a saját légijármű függőleges sebessége meghaladja a $\dot{Z}_{lo}$-t;

c) a veszélyeztető légijármű függőleges sebessége kisebb, mint $\dot{Z}_{lo}$

d) és a függőleges elkülönítés, amelyet a legszorosabb megközelítésnél érnének el, ha mindkét légijármű vízszintes repülésbe megy át, meghaladva Z_{losep}-t.

4.4.4.4.1 A függőleges sebesség 0 láb/perc limitjét, amelyet a megoldási tanácsadás generál a 4.4.4.4 pontnak megfelelően, megtartják, ha egyik légijármű sem gyorsul függőlegesen a másik felé olyan sebességváltozással, amely meghaladja a $\dot{Z}_l$-t. Ettől eltérő esetben a referencia logika azonnal emelkedés vagy süllyedés megoldási tanácsadást generál, ahogy a megoldási tanácsadás értelmének megfelel.

4.4.4.4.2 A $\dot{Z}_{lo}$ számára 6 m/s (1000 láb/perc) értéket használnak, a Z_{losep}-nél pedig 244 m (800 láb) értéket.

5. Hibrid légtérellenőrzési eljárások ACAS II használata

5.1 Áttekintés

5.1.1 A hibrid légtérellenőrzés olyan eljárás, amelyet az ACAS a kiterjesztett squitteren keresztül rendelkezésre álló passzív helyzet információk előnyeinek kihasználására alkalmaz. A hibrid légtérellenőrzést felhasználva az ACAS érvényesíti a kiterjesztett squitter által közvetlen aktív távolságméréssel szolgáltatott helyzetet. A kezdeti érvényesítést a nyomvonal indításnál végzik. Újraérvényesítést 10 másodpercenként egyszer végeznek, ha a megközelítő légijármű majdnem veszélyeztetővé válik magasság vagy távolság szerint. Végül rendszeres, másodpercenként-egyszer értékű aktív felderítést végeznek a megközelítő légijárműveken, amelyek majdnem-veszélyeztetővé válnak mind magasság, mind távolság szerint. Ilyen módon passzív felderítést (egyszer érvényesített) használnak nem-veszélyeztető megközelítő légijárművekkel szemben, így csökkentve az ACAS lekérdezési gyakoriságot. Aktív felderítést használnak akkor, amikor egy közelítő légijármű majdnem veszélyeztetővé válik, hogy megőrizze az ACAS, mint független biztonsági figyelő rendszer, függetlenségét. A hibrid ellenőrzési algoritmus blokk diagramját az A-11 ábra mutatja be.

5.1.2 A kiterjesztett squitter helyzet jelentésben jelentett magasság az S-módú válaszjeladón belül ugyanazon forrásból táplálkozik, mint amit az ACAS lekérdezésre adott válaszban jelentett magasság szolgáltatásához használnak. A kiterjesztett squitter helyzet jelentésben jelentett magasságot ezért egy aktív felderítés alatt álló nyomvonal magasságának felfrissítésére is lehet használni abban az esetben, amikor a válaszjeladó nem válaszol az aktív lekérdezésekre.

5.2 Hibrid felderítési berendezés jellemzői

5.2.1 KEZDETI ÉRVÉNYESÍTÉS

5.2.1.1 Passzív nyomvonalat egy 24-bites címzésű kiterjesztett squitter vétele indít el, amely nincsen a nyomvonal fájlban és nem is kapcsolódik felderítés alatt álló nyomvonallal. Ez utóbbi eset akkor fordulhat elő, ha az aktív nyomvonalat létrehozott rövid squittert helyzet jelentéseket tartalmazó kiterjesztett squitter előtt veszik.

5.2.1.2 Az ACAS a kiterjesztett squitter adatbegyűjtést ugyanazon a módon kezeli, mint a rövid squitter adatbegyűjtést. Az igényelt squitter vétele után az ACAS MTL-nél (ugyanazon számút, mint amely a rövid squitterekre van előírva a 3. fejezet, 3.1.2.8.5 pontban), kísérletet tesznek aktív felderítésre előírt számú időpontokban. Sikeres válasz nyomvonal adatbegyűjtésekhez vezet. Sikertelen kísérlet az adatbegyűjtés félretevéséhez vezet ennél a légijármű címzésnél, mivel az ADS adatokat nem lehet érvényesíteni. Kiterjesztett squitterek vételének folytatása egy rákövetkező adatbegyűjtési kísérlethez vezet.

5.2.1.3 Kiterjesztett squitter információkat szolgáltató légijármű esetében egy sikeres adatbegyűjtési válasz alkalmat szolgáltat az információk érvényesítésére. De bármelyik esetben (rövid vagy hosszú squitter), ugyanazok a nyomvonal adatbegyűjtésre vonatkozó kritériumok következnek, a korrelációban lévő megkövetelt squitterek számának, és a végrehajtott lekérdezési kísérletek számának fogalmában kifejezve.

5.2.1.4 Kezdeti ADS információ érvényesítést végeznek passzív nyomvonal indításnál annak megállapítására, hogy a nyomvonal fenntartható-e passzív adatokon. Aktív légtérellenőrzést mérést végeznek egy rövid címzett lekérdezés felhasználásával, amely egy ACAS keresztkapcsolat utasítást hordoz a 05{HEX} regiszter tartalmának szolgáltatására (kiterjesztett squitter repülés közbeni helyzet) a válaszban. A válasz erre a lekérdezésre a légijármű sebesség képességét és a jelentett barometrikus magasságot is szolgáltatja az ADS-B repülés közbeni helyzet jelentésen kívül. A saját és megközelítő légijármű jelentett helyzetéből számított viszonylagos távolságot és irányszöget összehasonlítják az aktív lekérdezésből nyert magassággal. Ha a jelentett információk nem egyeznek meg a 4. fejezet 4.5.1.3.2 pontban ajánlott határokon belül az aktív lekérdezés által nyert távolsággal, irányszöggel vagy magassággal, a nyomvonalat aktív nyomvonalnak nyilvánítják és a jövőbeni kiterjesztett squittereket az ACAS elhanyagolja.

5.2.2 ÚJRAÉRVÉNYESÍTÉS ÉS FIGYELÉS

Ha egy relatív magasság ≤ 10000 láb feltételt kielégítő légijárműnél a következő feltételek teljesülnek:

(A megközelítő légijármű magasságkülönbsége ≤ 3000 láb VAGY függőleges TAU 3000 lábra ≤ 60 másodperc) VAGY

(Távolság különbség ≤ 3 NM VAGY távolság TAU 3 NM-re ≤ 60 másodperc)

egy aktív lekérdezést végeznek minden 10 másodpercben, hogy folyamatosan újraérvényesítsék és figyeljék a helyzet jelentéseket. Bármely észlelt különbség azt eredményezi, hogy a légijárművet aktív nyomvonalnak nyilvánítsák.

5.2.3 AKTÍV FELDERÍTÉS

5.2.3.1 Ha egy relatív magasság ≤ 10000 láb feltételt kielégítő légijárműnél, a következő feltételek teljesülnek:

(A megközelítő légijármű magasság különbsége ≤ 3000 láb VAGY függőleges TAU 3000 lábra ≤ 60 másodperc) VAGY

(Távolság különbség ≤ 3 NM VAGY távolság TAU 3 NM-re ≤ 60 másodperc)

a légijárművet aktív nyomvonalnak nyilvánítják, és másodpercenként egyszer aktív távolságmérések alapján frissítik.

5.2.4 VESZÉLYEZTETŐ LÉGIJÁRMŰ ÉRTÉKELÉSÉNEK BEJELENTÉSE

Ha a megközelítő légijárművet veszélyeztetőnek, vagy potenciális veszélyeztetőnek nyilvánítanak, az aktív távolságmérés folytatódik.

6. Az összeütközés elhárító logika működése

6.1 A működési követelmények célja

6.1.1 Az ACAS összeütközés elhárító logika az ACAS része, amely az azonosított megközelítő légijárművekre (azaz bármely légijárműre, amelyre az ACAS nyomvonalat hozott létre) vonatkozó információkat vesz és ezeknek az információknak az alapján összeütközés elkerülési tanácsadásokat generál. Mindegyik ACAS berendezésben egy mikroprocesszorba szoftvert telepítenek és ez a szoftver matematikai algoritmusok együttesét valósítja meg. Ezek az algoritmusok ACAS-ra különbözőek lehetnek, és az összeütközés elhárító logikával szembeni követelmények célja biztosítani azt, hogy a matematikai algoritmusok működése elfogadható legyen.

6.1.2 Az összeütközés elhárító algoritmusok kialakítását és szoftverként való megvalósítását különálló folyamatnak gondolják, és ezek a szabványok az algoritmusokra vonatkoznak, mégis a gyakorlatban a szoftver szokta demonstrálni, hogy az algoritmusok, amelyek kielégítőek, szorosan vonatkoznak arra az ACAS-ra, amellyel telepítik. Az összeütközés elkerülés logikával szemben támasztott működési követelmények nem törekszenek annak garantálására, hogy az összeütközés elkerülés szoftver szoftverként kielégítő legyen, bár ezek egy ilyen garanciának lényeges alkotóelemei. A szoftver kielégítő működését megfelelő szoftver-kezelési gyakorlattal kell elérni, amely biztosítja, hogy az algoritmusokat megbízhatóan megvalósítsák.

6.1.3 Az összeütközés elhárító logikák együttműködési képességét bármely két berendezésben annak biztosításával érik el, hogy megoldás tanácsadásaik összefüggenek és hogy bármelyik megoldási tanácsadás egyedül is elegendő a rendszer, mint egész célkitűzéséhez. A konzisztenciát a koordinációra vonatkozó követelmények biztosítják. (4. fejezet 4.3.5.5.1, 4.3.5.8 és 4.3.6.1.3 pontok). Hogy a kettő közül az egyik megoldási tanácsadás elegendő, azt az összeütközés elhárító logika működési követelményei garantálják és különösen az elegendő teljesítmény követelménye, amikor a másik légijármű ACAS-al felszerelt, de nem együttműködő (4. fejezet 4.4.2.1 j) 2) alpont.

6.1.4 A működési követelmények arra szolgálnak, hogy teljes garanciát nyújtsanak arra vonatkozóan, hogy a szóbanforgó ACAS logikának általános teljesítménye van, amely egyenrangú vele, vagy felülmúlja a többi ACAS logika teljesítményét. Ezek nem írják le a logika működését semelyik adott légtérben. Több okból kifolyólag a legjobb módszer egy ACAS logikának egy adott légtérben való működésének meghatározására vagy tanulmányozására légiforgalmi irányítási földi radar adatokon alapuló szimulációk végzése. Ennek lehetőségét tárgyalja tovább a 6.4.4 alpont.

6.2 Feltételek, amelyek mellett a követelmények érvényesek

6.2.1 ÉSZREVÉTEL

A 4. fejezet, 4.4.2 pontjában adott feltételek úgy lettek meghatározva, hogy megfogalmazzák a rákövetkező követelményeket, de kielégítő működést követelnek meg az összes normál működési feltételnél. Ezt kell alátámasztania a feltételek változásának, amelyben a teljesítmény mértékét számolják olyan módon, amely a várható normál változatokat tükrözi, és biztosítva azt, hogy a számított teljesítmény mértékek robusztusak, azaz nem romlanak le hirtelen, amikor romlanak a feltételek.

6.2.2 FELDERÍTÉSI HIBÁK

6.2.2.1 A felderítési hibák számos formát ölthetnek:

a) nem képződik nyomvonal a megközelítő légijárműre;

b) a nyomvonal későn képződik;

c) a nyomvonalat idő előtt ejtik;

d) nyomvonal képződik, de nem állnak rendelkezésre jelentések mindegyik ciklusra; és

e) a jelentések pl. a távolságról, mérési hibákkal terheltek.

6.2.2.2 Bár az ACAS, mint egész, hatékonysága értékelésének figyelembe kell vennie a nyomvonalak képzésének az a) tétel szerinti elmulasztását, nincs szükség annak bizonyítására, hogy a logika hatékony, amikor nincs adata.

6.2.2.3 A b) tétel szerinti késői nyomvonal képződés késleltetheti a megoldási tanácsadások generálását (talán amiatt, hogy a különböző követők a logikában nem azonos irányba hatnak és a megoldási tanácsadást a kis megbízhatóság késlelteti), vagy nem megfelelő kezdeti megoldási tanácsadást eredményez (esetleg azért, mert a követők kimenetét felhasználták, mielőtt az azonos hatott volna). A legjobb megoldás lenne meghatározni a késői nyomvonal kialakulás gyakoriságát a meglévő felderítési rendszernél, amit a vizsgálatra kerülő logikával használnak.

6.2.2.4 Amikor nyomvonal alakul ki, a hiányzó jelentések leronthatják a nyomvonal pontosságát, vagy a nyomvonal kis megbízhatóságát okozhatják, ezek mindegyike késleltetheti a kezdeti megoldási tanácsadást, nem megfelelő megoldási tanácsadást eredményezhet, vagy késleltetheti a változtatásokat a megoldási tanácsadásban, ha azt már generálták. A legjobb megoldás lenne meghatározni a hiányzó jelentések gyakoriságát a meglévő felderítési rendszernél, amelyet a vizsgálatra kerülő logikánál használnak. Annak valószínűsége, hogy egy jelentés valamely adott ciklusban hiányzik, a megközelítő légijármű távolságának, magasságának és annak a függvénye, hogy egy jelentés az előző ciklusban hiányzott vagy nem.

6.2.2.5 Tényleges iránytengely mérések hibái nagymértékben függnek a légijármű szerkezettől és az ACAS antenna és a többi antenna elhelyezésétől és az ugyanazon légijármű szerkezeten elhelyezett akadálytárgyaktól. Az iránytengely mérések tipikusan annyira gyengék, hogy a korai ACAS tervezések nem használták azokat az összeütközés elhárító logikában. Egy későbbi tervezés, amely tartalmazott egy, a megoldási tanácsadásokat gátoló szűrőt, amikor a távolságmérések sorozata jelentős vízszintes hiányzó távolságot jelzett, felhasználta az iránytengelyre és iránytengely változásának sebességére vonatkozó méréseket annak igazolására, hogy egyik légijármű sem gyorsul; a szűrő alkalmatlan, ha az iránytengelyre vonatkozó mérések nem állnak összhangban a diagnosztizált elkerülési távolsággal. A 4. fejezet 4.4.2 pontjában ismertetett feltételek szolgálnak arra, hogy lefedjék a logikának ezt a fajta tulajdonságát.

6.2.2.6 Nagyon valószínűtlen, hogy valamely ACAS felszerelés olyan iránytengely méréseket szolgáltasson, amelyek elegendő pontosságúak, hogy elsődleges alapként szolgáljanak egy hiányzó távolság szűrőnek, vagy az összeütközés elhárító logika bármely más aspektusának.

6.2.2.7 Távolság és iránytengely méréseket a megközelítő légijármű viszonylagos helyzetének meghatározására is használják a forgalmi kijelzésben való felhasználáshoz. Ennek a felhasználásnak a követelményei sokkal kevésbé szigorúak, mint az összeütközés elhárító logika követelményei és a 4. fejezet 4.4.2.2 és 4.4.2.3 pontjában ismertetett modelleknek nincs ilyen iránytengely felhasználása.

6.2.3 MAGASSÁG KVANTÁLÁS

6.2.3.1 A megközelítő légijármű magassága vagy C-módú vagy S-módú jelentésként és így 100 láb vagy 25 láb kvantumokban kifejezve állhat rendelkezésre. A 4. fejezet, 4.4.2.1 c) pont határozza meg, hogy a 100 láb értékű kvantum hordozza annak megerősítési célját, hogy a működési követelmények teljesülnek. Az összeütközés elhárító logika működésének javulása várható, amikor a megközelítő légijármű magassága 25 láb értékű kvantumokban áll rendelkezésre, és kívánatos megerősíteni, hogy ez az eset áll fenn.

6.2.3.2 A legtöbb esetben a saját légijármű magassága az ACAS részére C-módú vagy S-módú jelentés megformálása előtti mérés formájában áll rendelkezésre és a 4. fejezet 4.4.4.2.1 d) pont határozza meg, hogy ez feltételezés. Olyan felszereléseknél, ahol nem lehetséges az eredeti magasságmérés szolgáltatása az ACAS részére, az összeütközés elhárító logikának a saját légijármű által készített C-módú vagy S-módú jelentéseket kell használni. Ez várhatóan lerontja a logika működési eredményességét, de a 4. fejezet 4.4.2.1.1 pontja megköveteli, hogy ez a romlás még elfogadható legyen. A logika várhatóan nem elégíti ki a működési követelményeket, ha magasság jelentéseket (mint a mérésekkel szembenállókat) saját légijárműnél használják fel. A próba az, hogy a mérési eredményeket elfogadhatónak ítélik-e, amikor ezek olyan telepítésből származnak, ahol szükség volt teljesítmény kompromisszumra olyan bemenet használatának formájában, amely nem illeszkedik a normál szabványokhoz, és hogy ezek jelzik-e, hogy a logika túlzottan érzékeny a saját légijárműre vonatkozó magasság adatok kvantálásával szemben.

6.2.4 SZABVÁNYOS MAGASSÁGMÉRÉSI HIBA MODELL

6.2.4.1 A szabványos magasságmérési hiba modell az ACAS-nak az összeütközés kockázatára gyakorolt hatása számításához szükséges (6.3.2 alpont). Bár ez az üzemelő magasságmérők megfigyelt működésén alapszik, nincs olyan törekvés, hogy a modellt ennek a működésnek a referencia rögzítésére használják. Még kevésbé áll fenn olyan rejtett követelmény a magasságmérővel szemben, hogy illeszkedjen a modellben leírt működéshez, akár felhasználják az ACAS-al kapcsolatban, akár nem. A modellt csupán azon feltételek meghatározási céljára használják, amelyek között az összeütközés elhárító logika működésére vonatkozó követelmények érvényesek.

6.2.4.2 A modell leírja a magasságmérések feltételezett hibaeloszlását. Ez kizárja a kvantálás hatását, amely kvantálás C-módú és S-módú jelentések létrehozásához szükséges. Mindazonáltal az ACAS-nak az összeütközés kockázatára kifejtett hatása számításánál teljes mértékben figyelembe kell venni ezt a kvantálást, és ezt a szimulált magasságmérések kvantálásával kell elérni, és ebből fakadóan szimulált jelentések kialakításával, amelyeket a szimulált ACAS logikának szolgáltatnak.

6.2.4.3 Az ACAS hatásának szimulációi magukban foglalják a légijárművek mért magasságainak ismeretét. A tényleges magasságaik nem ismertek sem a légiforgalmi irányításnál, sem a légijárműnél; ezek a szimulált mérés és a véletlen magasságmérő hiba összegeként adódnak. Minden előfordulásnál, ahol a vízszintes elkerülési távolság nagyon kicsi, van valamilyen kockázata az összeütközésnek és ez egyenlő annak valószínűségével, hogy a két légijármű magasságának tényleges különbsége elég kicsi az összeütközés létrejöttéhez. Így az ACAS-nak az összeütközés kockázatára kifejtett hatásának a számolása (6.3.2 alpont) részt vesz a két légijármű mért magasságkülönbsége hibájára vonatkozó statisztikus eloszlás kialakításában: a két statisztikai eloszlás konvolúciója (spirálmenete), mindegyik légijárműhöz egy.

6.2.4.4 A 4. fejezet, 4.4.2.4 pontjában leírt szabványos magasságmérési hiba modellnél annak valószínűsége, hogy a tényleges függőleges elkülönítés kisebb, mint egy h küszöbérték, (amelyet a 6.3.2 pontban 100 lábnak vettek), a következő lesz:

for $\lambda_1 = \lambda_2$ and $a \geq h$

$$Prob(|d| \leq h) =$$

$$\frac{1}{4\lambda}\exp\left(\frac{-(a+h)}{\lambda}\right)\left[\exp\left(\frac{2h}{\lambda}\right)(2\lambda + a - h) - (2\lambda + a + h)\right]$$

for $\lambda_1 = \lambda_2$ and $a < h$

$$Prob(|d| \leq h) =$$

$$1 - \frac{1}{4\lambda}\exp\left(\frac{-(a+h)}{\lambda}\right)\left[\exp\left(\frac{2a}{\lambda}\right)(2\lambda - a + h) + (2\lambda + a + h)\right]$$

for $\lambda_1 \neq \lambda_2$ and $a \geq h$

$$Prob(|d| \leq h) =$$

$$\frac{\lambda_1^2 \exp\left(\frac{-a}{\lambda_1}\right)\sinh\left(\frac{h}{\lambda_1}\right) - \lambda_2^2 \exp\left(\frac{-a}{\lambda_2}\right)\sinh\left(\frac{h}{\lambda_2}\right)}{\lambda_1^2 - \lambda_2^2}$$

and for $\lambda_1 \neq \lambda_2$ and $a < h$

$$Prob(|d| \leq h) =$$

$$\frac{\lambda_1^2\left[1 - \exp\left(\frac{-h}{\lambda_1}\right)\cosh\left(\frac{a}{\lambda_1}\right)\right] - \lambda_2^2\left[1 - \exp\left(\frac{-h}{\lambda_2}\right)\cosh\left(\frac{a}{\lambda_2}\right)\right]}{\lambda_1^2 - \lambda_2^2}$$

ahol λ_1 és λ_2 a λ értékei a két légijárműnél, míg az a a látszólagos függőleges elkülönítés a 6.3.2 pontban, azaz a függőleges elkülönítés a két légijárművön elhelyezett magasságmérő mérése szerint.

6.2.5 SZABVÁNYOS REPÜLŐGÉPVEZETŐ MODELL

6.2.5.1 A szabványos repülőgépvezető modell a repülőgépvezető megoldási tanácsadásokra való elfogadható reagálását képviseli. Azonban nem fogja át a potenciális reagálások teljes tartományát, például a lassú reagálásokat, amelyek veszélyeztetik az összeütközés elkerülést és a túlságosan heves reakciókat, amelyek az engedélyezettől való nagy eltéréseket okoznak. Néhány reagálásnál, például a reagálás elmulasztása, vagy döntés a következő repülési magasságszintre való átmenetről egy emelkedési megoldási tanácsadásra való reagálásban, nem megfelelő alkalom a logika működésének vizsgálatára, de a szabványos modell következő módosításai jelzést szolgáltatnak, hogy a logika nem függ-e túlságosan a repülőgépvezető pontos reagálásától.

6.2.5.2 A 4. fejezet, 4.4.3 pontjával összefüggésben, az összeütközés kockázatának csökkentése, egy feltételezett hibás repülőgépvezető reagálás:

a) a repülőgépvezető lassan reagál, nevezetesen 8 s-ra rá egy kezdeti megoldási tanácsadásra és 5 s-ra rá egy megváltoztatott megoldási tanácsadásra; és

b) a repülőgépvezető nem megfelelő sebességet valósít meg, nevezetesen 200 láb/perc értékkel kevesebbet, mint a megkívánt sebesség.

6.2.5.3 A 4. fejezet, 4.4.4 pontjával összefüggésben, az ACAS hatása a légiforgalmi áramlásszervezésre (ATM), egy feltételezett reagálás:

a) a repülőgépvezető gyorsan reagál, nevezetesen 3 s-on belül egy kezdeti megoldás tanácsadásra és 1 s-on belül rá egy megváltoztatott megoldási tanácsadásra;

b) a repülőgépvezető túlzott sebességet valósít meg, nevezetesen 500 láb/perc értékkel nagyobbat, mint a megkívánt sebesség; és

c) a repülőgépvezető elmulaszt reagálni a gyengülő megoldási tanácsadásokra.

6.2.5.4 A logikától nem várják el, hogy kielégítse a működési követelményeket, amikor a repülőgépvezető a fentiek szerint reagál, de a teljesítmény mértékek számítása, amely ezeket a nem szabványos repülőgépvezető reagálásokat használja, némi betekintést nyújt a logika a repülőgépvezető reagálásra való érzékenységébe. A próba az, hogy a mértékváltozásokat elfogadhatónak ítélik, amikor ezek egy pontatlan reagálásból erednek, és hogy ezek jelzik-e, hogy a logika túlzottan érzékeny a repülőgépvezető feltételezett reagálására.

6.2.6 SZABVÁNYOS TALÁLKOZÁSI MODELL

6.2.6.1 Ténylegesen két találkozási modell van, egyik a kockázati arány számításaiban való felhasználásra (ahol a vízszintes elkerülési távolság kicsi), és a másikat akkor használják, amikor a logika tervezésének ATM-el való összeegyeztethetőségét értékelik (ahol a vízszintes elkerülési távolság közel egyezést mutat a légiforgalmi irányítási vízszintes elkülönítési minimummal). Ez felülkerekedik egy más esetben elfogadhatatlan egyszerűsítésen: mindkét modell a találkozás vízszintes és függőleges jellemzőit egymástól függetlenül kezeli.

6.2.6.2 A szabványos modell két Államban gyűjtött nagy mennyiségű földi radar-adat analízisének az eredménye. Ez azt jelenti, hogy elvárható, hogy ennek a modellnek a segítségével számított teljesítmény mértékek az üzemelés realitására vannak vonatkoztatva még akkor is, ha a számításoknak nem ez a célja. Az analizált adatok nagyon figyelemreméltó változatosságot tártak fel a légtér jellemzőkben, amely a találkozás modellnek az adatokat szolgáltató radar földrajzi helyétől való függőségében fejeződött ki. A két Államtól származó adatok jellemzői radikális különbséget mutattak. Ez azt jelenti, hogy egy szabványos találkozás modell nem tud olyan előrejelzéseket biztosítani, amelyek bármely adott földrajzi helyre érvényesek. Azonban, elfogadva, hogy egy szabványos modell a szabványos működés meghatározásához lényeges, a szabványosított modellt elegendően komplexnek és reprezentatívnak tekintik.

6.2.6.3 A szabványos találkozás modell paramétereinek meghatározásához (4. fejezet, 4.4.2.6 alpont), például a találkozás osztályok viszonylagos súlyának meghatározásához, a találkozásokat rekonstruálták a földi radar adatokból. Ez a találkozások aspektusainak újraértelmezését kívánta, amelyekre példák lentebb következnek.

6.2.6.3.1 A szabványos találkozás modellhez adott "Magasság réteg" meghatározása (4. fejezet, 4.4.1 alpont) egyszerű, mert ezt csupán az összeütközés elkerülés logika szabványosítása céljára csinálják. Amikor a földi radar adatokban észlelt valós találkozásoknál a talajszint nem felelt meg a 0 láb nyomásmagasságnak, szükséges volt különbséget tenni a földfeletti magasság és a közepes tengerszintre vonatkoztatott nyomásmagasság között. A módszer, amelyet magasság réteg meghatározására használnak, a valós radar adatokban észlelt találkozást az 1 rétegben helyezi el, ha ez 2300 láb földfeletti magasság (AGL) alatt történik, és a közepes tengerszintre MSL vonatkoztatott magasságot használja minden más esetben. Nagy magasságú elhelyezéseknél egy vagy több réteg néha hiányzik.

6.2.6.3.2 Egy légijármű függőleges sebessége egy találkozás elején és végén, $\dot{z}_1$, $\dot{z}_2$ a szabványos találkozás modellben, precíz időpontban fellépő értékek, azaz tca - 35 s-nál és tca + 50 s-nál. Amikor az adatokat a földi radar adatokban megfigyelt valódi találkozásoknál dolgozzák fel, a $\dot{z}_1$ és $\dot{z}_2$ pontoknál használt értékek a találkozó első 10 másodperce feletti azaz [*tca - 40 s, tca - 30s*] feletti, és az utolsó 10 s azaz [*tca, tca + 10*] feletti átlagértékek.

6.2.6.3.3 Hasonló módon, a valóságos találkozásoknál *tca* volt a legszorosabb megközelítés tényleges időpontja és *hmd* volt a tényleges vízszintes elkülönítés a legszorosabb megközelítésnél. A függőleges elkerülési távolság, *vmd* vagy a függőleges elkülönítés a legszorosabb megközelítésnél, olyan találkozásoknál, amelyeknél *hmd* $\geq$ 500 láb, vagy a minimális függőleges elkülönítés az alatt az időperiódus alatt, amelyben a két légijármű vízszintes elkülönítése 500 lábnál kisebb volt.

6.2.6.3.4 A szabványos találkozás modell néhány aspektusa, például a sebességváltozások nagysága a találkozás alatt, nem határozható meg a földi radar adatokból (az adatok jellege miatt) és a légijármű dinamika általános ismeretének felhasználásával kellett ezeket jellemezni.

6.2.6.3.5 Hogy a modell találkozások és a radar megfigyelési adatokból nyert találkozások közötti precíz összefüggés hiányát figyelembe vegyék, nem szabad megfeledkezni arról, hogy a szabványos találkozás modell célja az összeütközés elhárító logika működésének szabványosítása. Míg természetesen minden lehetséges erőfeszítést megtettek annak biztosítására, hogy a modell a lehető leghűbben tükrözze az üzemelés valóságát, a pontos hűség nincs megkövetelve és nem is sikerült elérni. Ez nem ad okot egy másik modell használatára, az egyetlen modell, amely az összeütközés elhárító logika működésének értékelésére érvényes, az itt ismertetett követelmények alapján az a modell, amely erre a célra itt került ismertetésre.

6.2.6.4 A szabványos találkozás modell bármilyen konstrukciója, amelyről bizonyítható, hogy ekvivalens a 4. fejezet 4.4.2.6 pontban ismertetettel, elfogadható. Két ilyen alternatív modellre az alábbiakban adunk két példát.

6.2.6.4.1 A 4. fejezet, 4.4.2.6.1 pontja írja elő, hogy a teljesítmény mértékeket a jellemzők széles körével meghatározott találkozások együttesének létrehozásával lehet kiszámolni (speciálisan: a légijármű címzések rendezése; a magasság réteg; a találkozás osztály; és a függőleges elkerülési távolság közelítő értéke) és az ezektől az együttesektől kapott eredmények kombinálásával, felhasználva a 4. fejezet 4.4.2.6.2 pontjában előírt súlyozásokat. Ez a viszonylag ritka fajtájú szimulációkból, pl. keresztező találkozások, annyit von be, mint amennyit a gyakoribb fajtájú találkozások szimulációiból, pl. nem-keresztező találkozások. Ez a megközelítés biztosítja, hogy az egyes együtteseken belül a lehetőségek teljes skálája megfelelően meg legyen vizsgálva. Azonban ugyanoda lehet jutni bizonyos számú találkozás megalkotásával mindegyik együttesnél, amelyek arányosak a fajlagos súlyukkal és az összes találkozást egyetlen nagyobb készletbe való összekombinálásával. Az egyetlen kifogás ezen alternatív megközelítés ellen az lehet, hogy a találkozások teljes számának elég nagynak kell lennie ahhoz, hogy biztosítsa, hogy a legkisebb együttestől származó eredmények, amelyet elszigetelten vesznek figyelembe, statisztikailag megbízható legyen.

6.2.6.4.2 Minden egyes függőleges sebességhez tartozó statisztikai eloszlást azzal a követelménnyel határozták meg, hogy először kiválasztanak egy tartományt, amelyen belül kell esnie a végső értéknek és azután választják ki a végső értéket egy olyan eloszlás felhasználásával, amely a tartományon belül egyenletes. Ez csupán egy eszköz, amelyet a 4. fejezet, 4.4.2.6.3.2.4 pontjában lévő táblázatok világos bemutatása kedvéért fogadtak el. Ez ekvivalens azzal a módszerrel, amikor az értéket közvetlenül a tartományokon belül lineáris statisztikai eloszlás felhasználásával választják ki, és amelyekre a kumulatív valószínűség mindegyik tartományon keresztül az erre a tartományra meghatározott valószínűséggel egyenlő mennyiséggel növekszik.

6.2.6.5 A szabványos találkozás modellben lévő találkozásokat egy képzeletbeli legszorosabb megközelítésből kifelé konstruálják. Ennek az elképzelt legszorosabb megközelítésnek az időpontja rögzített és *"tca"*-ként van leírva a 4. fejezet, 4.4.2.6 pontban. A függőleges síkban kiválasztják a *tca* előtt 35 s-hoz és a *tca* után 5 s-hoz tartozó függőleges sebességeket és ha szükséges, gyorsulási periódussal egyesítik őket, és azután a magasságokat rögzítik a repülési pályán azzal a követelménnyel, hogy a függőleges elkülönítés *tca*-nál egyenlő a *hmd*-re választott értékkel. A vízszintes síkban a *"hmd"*-re választott érték, a megközelítési szög és a légijármű sebességek meghatározzák a két légijármű viszonylagos repülési pályáit a *tca* időpontban. A légijármű fordulók és sebesség változások módosítják a repülési pályákat *tca* előtt és után. Ennek a folyamatnak a következményeként a legszorosabb megközelítés időpontja csak megközelíti a *tca*-t.

6.2.7 A MEGKÖZELÍTŐ LÉGIJÁRMŰ ACAS FELSZERELÉSE

6.2.7.1 A szabványok a megközelítő felszerelésével foglalkozó feltételek három együttesét határozzák meg és a megközelítő légijármű következő viselkedési módját feltételezik:

a) az egyes találkozásokban résztvevő másik légijármű nem-felszerelt;

b) a másik légijármű fel van szerelve ACAS-al, de egy olyan repülési pályát követ, amely azonos a nem-felszerelt találkozásban követettel; és

c) a másik légijármű fel van szerelve ACAS-al, amely a saját ACAS-ával megegyező összeütközés elhárító logikával rendelkezik.

6.2.7.2 Az a) körülmény biztosítja, hogy a logika kielégítően működik felszereletlen megközelítő légijárművel történő találkozásoknál. A másik két körülmény az összeütközés elhárító logikát vizsgálja, amikor a másik légijármű felszerelt, de ezt különböző szempontból végzi. A b) körülmény biztosítja, hogy a logika kifogástalanul működik a koordinációs folyamat korlátozásai közepette, míg a c) körülmény biztosítja, hogy kihasználják annak előnyeit, ami elvárt akkor, amikor mindkét légijármű felszerelt.

6.2.7.3 A b) körülmények között érvényes feltételek arra szolgálnak, hogy lehetővé tegyék a saját ACAS részére kezdeti megoldási tanácsadás kiválasztását, de azután a legpesszimistább elfogadható feltételezéseket kell alkalmazni a saját ACAS logika működésére vonatkozó koordinálás szükségességének hatásáról. Amikor a saját légijárműnek alacsonyabb légijármű címzése van, a vizsgálat feltételei magukban foglalják, hogy a megoldási tanácsadás értelmét nem lehet megfordítani. Továbbá, a megközelítő légijármű nem generál sem megoldási tanácsadást, sem megoldási tanácsadás kiegészítést, amíg a saját ACAS megoldási tanácsadás be van jelentve, mert egy korai terv egy kezdeti koordináció késleltetést tartalmaz (amelynek célja az volt, hogy lehetővé tegye a koordináció elvégzését és elkerülje, hogy a repülőgépvezető gyors változásokat észleljen a megoldási tanácsadásokban); a követelmény arra szolgál, hogy a teljesítmény kielégítő voltát biztosítsák, bármiféle késleltetés káros hatása ellenére.

6.2.7.4 A c) körülmények azt követelik meg, hogy a két légijármű viselkedése teljes mértékben együttműködő legyen, de az a tény, hogy mindkét ACAS tárgyi logikát használja, biztosítja, hogy a teljesítmény mérték a tárgyi logikára vonatkozzon, és a tárgyi logika hatékony legyen.

6.2.7.5 A fenti okfejtésnek megfelelően, a teljesítmény követelmények arra szolgálnak, hogy a logika kielégítő működését biztosítsák és nem a rendszernek, mint egésznek a működését. Olyan kiterjesztéshez, hogy ezek a rendszerek, mint egész előnyeinek szélesebb értelmezésére legyenek alkalmasak üzemelési körülmények között, a c) körülményről elgondolható, hogy hitelesebb teljesítmény mértéket szolgáltat ACAS-ACAS találkozásoknál. A logika részletezett teljesítménye a b) körülménynél rosszabb, mint amikor a megközelítő légijármű nincs felszerelve, mert a b) körülmény csak a koordináció általi korlátozásokat tartalmazza. Azonban az a tény, hogy egy megközelítő légijármű együttműködése nem garantálható, és hogy egyes repülőgépvezetők néha elmulasztják a reagálást a megoldási tanácsadásokra, azt jelenti, hogy mindhárom mértéknek üzemelési relevanciája van.

6.3 Az összeütközés kockázatának csökkentése

6.3.1 A LOGIKAI KOCKÁZATI ARÁNY STÁTUSZA

6.3.1.1 A 4. fejezet, 4.4.3 alpont céljaira számított kockázati arány a logika teljesítményének mértéke és nem az ACAS-é, mint egészé. Például az ACAS megakadályozhat egy összeütközést a repülőgépvezető ösztönzésével a megközelítő légijármű egy sikeres vizuális keresésének kivitelezésére és ez elmaradhat, mert nem létesült nyomvonal, vagy a repülőgépvezető figyelmen kívül hagyja a megoldási tanácsadást; ezek a teljes rendszer szempontjai, amelyek nem tükröződnek a 4. fejezet 4.4.3 pontjában megkövetelt számításokban.

6.3.1.2 A "logikai kockázati arány" helytállósága a 4. fejezet 4.4.3 pontja szerint számolt számainak az üzemelési vagy stratégiai döntésekhez való figyelembevételénél hasznos lehet ezeket csupán megbízhatóságnak tekinteni, amelyet a megoldási tanácsadásokhoz illesztenek. Ezek azt a hatást fejezik ki, amely egy megoldási tanácsadást követően az összeütközés közvetlen kockázatára kifejtődik, ha a kiadás időpontjában a repülőgépvezetőnek nincs más információja, mint a megoldási tanácsadás, amire azt a döntését alapozná, hogy kövesse vagy figyelmen kívül hagyja a megoldási tanácsadást. Durva iránymutatásként, az ACAS által létrehozott összeütközés kockázat a megoldási tanácsadás követéséből ered, így a logikai kockázati arány eltúlozza ezt az "indukált" kockázati arányt; másrészt pedig eltúlozza az ACAS-nak a képességét az összeütközések megelőzésére a teljes rendszerben lévő sok más hibázási mód miatt.

6.3.1.3 A 4. fejezet 4.4.3 paragrafusának céljaira kiszámolt számok nem alkalmazhatók meggondolási iránymutatókként az ACAS-nak az összeütközés teljes kockázatára kifejtett hatását illetően egy légtérben, vagy mint olyan kockázatra vonatkozóan, amellyel egy légijárműnek kell szembenéznie.

6.3.2 A LOGIKAI KOCKÁZATI ARÁNY SZÁMÍTÁSA

6.3.2.1 Az R kockázati arány a következőképpen írható fel:

$$R = \frac{\sum \textit{probability of a collision with ACAS}}{\sum \textit{probability of a collision without ACAS}}$$

ahol az összegezés az összes találkozásra vonatkozik, vagy gyakorlatiasabban, az összes olyan találkozásra, amely hozzájárul az összeütközés teljes kockázatához ACAS-al vagy anélkül. Ami a találkozások jellemzőihez és statisztikájához az üzemelési realitások reprezentálásához szükséges, a 4. fejezet, 4.4.2.6 pontjában lett szabványosítva és a 6.2.6 pontban került tárgyalásra.

6.3.2.2 Az összeütközés becsült kockázata az "összeütközés" szó értelmezésétől függ. Míg ezt a problémát messze elkerüli az összeütközési kockázat ACAS-al és ACAS nélkül közötti arány fogalmaiban kifejezett követelmény, nagyon fontos, hogy reálisan veszi figyelembe a legnagyobb légijármű méretét. Ésszerű lenne a két légijármű középpontja közötti 100 lábnál kisebb függőleges elkülönülést úgy kezelni, mint amely elegendő egy összeütközés lehetővé válásához. Nem lenne tanácsos jelentősen nagyobb elkerülési távolságokat használni összeütközések közelítéseként, mert azt találnák, hogy a számított kockázati arány érzékeny az "összeütközés" definíciójára még akkor is, ha ez egy arány.

6.3.2.3 Ha azt a közelítést tesszük, hogy egy összeütközés akkor következik be, amikor $|d| < 100$ láb, ahol d a tényleges függőleges elkülönítés, akkor:

$$R = \frac{\sum \text{prob}(|d| < \mathit{100\ ft\ with\ ACAS})}{\sum \text{prob}(|d| < \mathit{100\ ft\ without\ ACAS})}$$

ahol most az összegezés az összes zérus vagy rendkivül kicsi vízszintes elkerülési távolságú találkozásra terjed ki.

6.3.2.4 Most vezessük be e-t, a magasságmérő hibáját, és a t-t, a látszólagos függőleges elkülönítést, és jegyezzük meg, hogy

$$a = d + e$$

a fogalmilag a magasság szerinti elkülönítés, ahogyan a magasságmérő méri. Nincs szükség kvantálási hibákra vonatkozó megfontolásokra, mert a modellezett magasságmérő leolvasások tetszőleges pontossággal ismertek lehetnek a számítógépes szimulációban. Ezek kvantálva vannak, mielőtt az ACAS számára szolgáltatják őket modellezett C-módú jelentésekként, amelyek ACAS nyomvonalak. Ez az, amiért a 4. fejezet, 4.4.2 pontjának szabványa kizárja a kvantálási hatásokat.

6.3.2.5 Fogadjuk el, hogy az a_{with} a nyilvánvaló függőleges elkülönítés ACAS megléte esetén, és az $a_{without}$ a nyilvánvaló függőleges elkülönítés ACAS megléte nélkül. Ekkor

$|d| < 100$ láb ACAS-al

akkor és csakis akkor, ha $|a_{with} - e| < 100$ láb

azaz a_{with} -100 láb $< e < a_{with}$ + 100 láb

és hasonlóan

$|d| < 100$láb ACAS nélkül

akkor és csakis akkor, ha $a_{without}$ -100 láb $< e < a_{without}$ + 100 láb

6.3.2.6 A kockázati arányra így a következőképpen adódik:

$$R = \frac{\sum \text{prob}(a_{with} - 100\,ft < e < a_{with} + 100\,ft)}{\sum \text{prob}(a_{without} - 100\,ft < e < a_{without} + 100\,ft)}$$

Hogy ez a képlet használható legyen a kockázati arány számításához a_{with} és $a_{without}$ értékeket meg kell határozni a találkozások egy olyan együttesénél, amely teljes mértékben képviseli az összes potenciális tényleges találkozást, amelyekben jelen van az összeütközési kockázat ACAS nélkül és a kockázat, hogy az ACAS fog indukálni egy összeütközést. Amikor ezek a hipotetikusan mért magasság szerinti elkülönítések ismertek, a magasság mérési hibák ismerete teljessé teszi a számításokat.

6.3.3 INDUKÁLT ÉS MEGOLDATLAN KOCKÁZAT

6.3.3.1 Nem elegendő demonstrálni, hogy az ACAS megelőzi az összeütközéseket, amelyek nélküle bekövetkezhetnek. A kockázatot, hogy az ACAS logika összeütközéseket okozhat egyébként biztonságos körülmények között, teljesen végig kell gondolni, nem kis mértékben azért, mert ellenőrzött légtérben azoknak a találkozásoknak a száma, amelyek potenciálisan egy indukált kockázatot viselnek, jelentősen felülmúlják a majdnem összeütközések számát.

6.3.3.2 A 4. fejezet, 4.4.3 pontnál szabványosított logikai kockázati arány felső határa ténylegesen egy felső határt helyez el az ACAS indukált összeütközési kockázaton. Bár néhány más hibázás késztetheti az ACAS-t összeütközés indukálására, pl. repülőgépvezetők manőverezése egy forgalmi tanácsadásra vagy megoldási tanácsadásra, amely a légijárművet egy nem látható harmadik fél repülési pályájára irányítja, az indukált kockázat nagymértékben tulajdonítható a következő megoldási tanácsadásoknak. Üzemi feltételek között egy megoldási tanácsadás létrehozásának vagy követelésének az elmulasztása csökkenti egy indukált összeütközés kockázatát (még ha növeli is az abszolút kockázatot).

6.3.3.3 Követelmény az, hogy a logikát az összeütközés kockázat csökkentésére tervezzék és ne legyen különbségtétel a logika által indukált kockázat és a megoldásképtelen kockázat között. Lehetséges ilyen különbségi határt meghúzni és még fel is lehet osztani a kockázatot magasságmérő hiba miatti és a logika nem megfelelő működése miatti kockázatra, de számításba kell venni, hogy ennek a gyakorlatnak nincs nagy értéke a logika tervezése szempontjából.

6.3.4 FÖLDI RADAR ADATOK FELHASZNÁLÁSA KOCKÁZATI ARÁNY SZÁMÍTÁSHOZ

6.3.4.1 Lehetőség van földi radar adatokban észlelt találkozások felhasználására a 6.3.2 pontban leírt biztonsági számítások alapjaként. Azonban nehéz az eredményeket értelmezni, mert a számítás rendkívülien ritka eseményekkel foglalkozik még akkor is, ha több hónapon át gyűjtött adatokat használ fel, a repülési pályákat módosítani kell, hogy bekerüljön olyan összeütközési kockázat, amely hiányzott a tényleges találkozásokból. Sokkal ésszerűbb a radar adatokat a súlyozások választásához információként felhasználni, amely súlyozásokat a különböző találkozási osztályoknak tulajdonítanak a találkozási modellben és így létrehozzák az idealizált találkozási modellnek egy változatát, amely jóval reprezentatívabb a szóbanforgó légtérre vonatkozóan, mint az itt bemutatott modell.

6.4 Összeegyeztethetőség az ATM-mel

6.4.1 ZAVARÓ FIGYELMEZTETÉSI ARÁNY

6.4.1.1 Az ACAS-tól megkövetelik a fenyegető összeütközés diagnosztizálását hiányos információk alapján. Továbbá, ezeknek az információknak függetleneknek kell lenniük azoktól, amelyek a légijármű elkülönítés elsődleges alapját szolgáltatják. Ebből következően figyelmeztetések fordulnak majd elő a találkozásoknál, ahol üzemelési szempontból nézve úgy tűnik, hogy nincs összeütközési kockázat. A 4. fejezet, 4.4.4.1 pontjában közölt szabvány megköveteli, hogy ezek a zavaró figyelmeztetések a lehető legritkábban forduljanak elő.

6.4.1.2 A zavaró megoldási tanácsadás 4. fejezet, 4.4.4.1.2 pontjában megadott követelményeket olyan szempontból készítették el, hogy egy megoldási tanácsadás akkor zavaró, ha a szokásos szabvány elkülönítés nincs tisztán elveszítve. Ezen kívül ez azt szolgálja, hogy a vízszintes elkülönítési küszöb elegendően szigorú legyen ahhoz, hogy vízszintes elkerülési távolság szűrő használatát követelje meg. A vízszintes elkülönítési küszöböt a szokásos elkülönítés 40 százalékára állították be, és a függőleges elkülönítési küszöböt az engedélyezett magasságtól 200 láb eltérésnek megfelelő légiforgalmi irányítási tűrésen alapuló számra állították be.

6.4.2 ÖSSZEEGYEZTETHETŐ ÉRTELEM KIVÁLASZTÁS

6.4.2.1 A 4. fejezet, 4.4.4.2 pontnál leírt követelmény nem szándékozik korlátozni a módot, amelyben veszélyes találkozásokat oldanak meg, hanem inkább annak méltánylásán alapul, hogy a megoldási tanácsadások többségét valószínűleg olyan találkozásoknál generálják, ahol összeütközés veszélye nem áll fenn. Ez statisztikai korlátot képez a gyakoriságra, amellyel az ACAS megszakítja a légiforgalmi irányítást vagy a légijármű normál üzemelését a két légijármű függőleges elkülönítésének megfordításával.

6.4.3 AZ ACAS ÁLTAL OKOZOTT ELTÉRÉSEK

6.4.3.1 Az eltérések korlátai, amelyeket a 4. fejezet, 4.4.4.3 pontja szerinti megoldási tanácsadások követése okozhat, limitálják a normál légijármű üzemeltetés, valamint a légiforgalmi irányítás megszakítását. Míg a magasság engedélyektől való eltérések a legnyilvánvalóbb megszakításai a légiforgalmi irányításnak, más eltéréseket, mint például azokat, amit az emelkedésre szóló megoldási tanácsadás okoz, amikor a légijármű éppen süllyed, a légiforgalmi irányítás éppen olyan súlyosnak tekint.

6.4.4 A FÖLDI RADAR ADATOK VAGY A SZABVÁNYOS TALÁLKOZÁS MODELL HASZNÁLATA

6.4.4.1 Az ATM-el való összeegyeztethetőség követelményének betartását legkényelmesebben a légiforgalmi irányítási földi radarok lefedésén belül előforduló tényleges üzemelési találkozások rekonstruálásán alapuló szimulációk felhasználásával lehet vizsgálni, feltéve, hogy az így megfigyelt légijárműveknek csak kis hányada van ACAS-al felszerelve. Azonban a tényleges adatokon alapuló ilyen szimulációk a légtér (vagy légterek) egyedi tulajdonságait tükrözik, amely(ek)ben ezeket az adatokat gyűjtötték, és amennyire az összeütközés elkerülési logika ezeket az adatokat felhasználta. Így jelentős gyakorlati nehézségek lépnek fel valóságos találkozási adatok felhasználásával összeütközés elkerülési logika érvényesítésére, és a 4. fejezet, 4.4.4 pontjában közölt rendelkezések feltételezik a 4. fejezet, 4.4.4.2.6 pontjában ismertetett szabványos találkozási modellen alapuló mesterséges találkozások felhasználását.

6.4.4.2 A szabványos találkozási modell használata az összeütközés elkerülési logika működését leíró teljesítmény mértékek nyeréséhez csak közvetett bizonyítékot szolgáltat, amely valamely adott légtérben való üzemelésre vonatkozik. Azoknak a hatóságoknak, amelyeknek hozzáférésük van a földi radar adatokhoz és meg akarják ismerni az ACAS kölcsönhatását a helyi légiforgalmi irányítási gyakorlattal, azt tanácsolják, hogy inkább a földi radar adatain alapuló szimulációkat használják, mint a szabványos találkozási modellt. Így cselekedve, meg kell jegyezniük, hogy az eredmények fordítottak lehetnek, ha a megfigyelt légijárművek már ACAS-al felszereltek. Arra is szükség lesz, hogy elegendő adatokat gyűjtsenek össze annak biztosításához, hogy ezen adatokból származtatott megoldás tanácsadások statisztikailag reprezentatívak legyenek; például nagyon kevés példát tartalmaznának a megoldási tanácsadás néhány típusára.

6.5 Konfliktusba kerülő célok relatív értéke

Az ACAS összeütközés elhárító logika tervezésének egy üzemelési szempontból elfogadható egyensúlyt kell teremteni az összeütközés kockázatának csökkentése és az ACAS figyelmeztetések által okozott megszakítások között. Az összeütközési kockázatra (4. fejezet, 4.4.3 pont) és a légiforgalmi irányítás megszakítására (4. fejezet, 4.4.4 pont) vonatkozó követelmények minimális előírások, amelyek mint elérhetők ismertek egy prototípus rendszerrel végzett működtetésből. Más tervezések csak akkor elfogadhatók, ha bemutatható, hogy az összeütközés kockázata és a légiforgalmi irányítás megszakítása egyaránt minimalizált, amennyire megvalósítható a másik minimalizálásnak szükségessége vonatkozásában.

TÁBLÁZATOK

A-1 táblázat

Névleges magasság tartomány	*SLC utasítás*	*Magasságküszöb, amelynél az érzékenységi szint értéke változik*	*Hiszterézis értékek*
0-tól 1000 láb földfeletti magasság	2	1000 láb földfeletti magasság	±100 láb
1000 lábtól 2350 láb földfeletti magasság	3	2350 láb földfeletti magasság	±200 láb
2350 láb földfeletti magasságtól 50-es repülési szintig	4	50-es repülési szint	±500 láb
50-es repülési szinttől 100-as repülési szintig	5	100-as repülési szint	±500 láb
100-as repülési szinttől 200-as repülési szintig	6	200-as repülési szint	±500 láb
200-as repülési szint felett	7

ANNEX 11.
Légiforgalmi Szolgálatok

13. kiadás – 2001. július
45. módosítással
Légiforgalmi Irányító Szolgálat
Repüléstájékoztató Szolgálat
Riasztó Szolgálat
A jelen kiadvány magába foglalja a 11. Annex 2001. március 13. előtt elfogadott összes módosítását és 2001. november 1.-től hatálytalanítja a 11. Annex összes korábbi kiadásait.
A nemzetközi előírások és ajánlott gyakorlati eljárások alkalmazhatóságával kapcsolatosan lásd az Előszót.

Módosítások

A módosítások kiadásáról az ICAO Journal valamint az egyéb ICAO kiadványok és audiovizuális képzési segédanyagok havi katalógusa rendszeres tájékoztatást biztosítanak. A fenti kiadványok figyelemmel kísérendők, a módosítások az alábbi rovatokba bevezetendők:

Módosítás			
száma	kiadás időpontja	alkalmazhatóság időpontja	bevezette

Előszó

Történeti háttér

A Repülési és Légiforgalmi Irányítási Szabályok (RAC) munkacsoport első ülésszakán, 1945 októberében, ajánlásokat tett a légiforgalmi irányító szolgálatok előírásaira és ajánlott gyakorlati eljárásaira. Ezeket az akkor működő Léginavigációs Bizottság áttanulmányozta, majd 1946. február 25.-én a Tanács jóváhagyta a nemzetközi előírásokat és ajánlott gyakorlati eljárásokat. Ezeket az 1946 februárjában kiadott Doc 2010. kiadvány második részében „Előírások és ajánlott gyakorlati Eljárások — *Légiforgalmi Irányítás*" címen tették közzé.

A Repülési és Légiforgalmi Irányítási Szabályok (RAC) munkacsoport második ülésszakán – 1946 decemberétől 1947 januárjáig -- felülvizsgálta a Doc. 2010-et és javaslatokat tett a légiforgalmi irányítás nemzetközi előírásaira és ajánlott gyakorlati eljárásaira. Nem tűnt azonban lehetségesnek, hogy ezek a szabályok véglegesíthetők legyenek, mielőtt a munkacsoport kidolgozza az alapelveket a vonatkozó szolgálatok megszervezésére.

1948. április-májusban a harmadik ülésszakon azután kidolgozták az alapelveket, majd az Annex tervezetét benyújtották az Államok részére. A 11. Annex — Nemzetközi előírások és ajánlott gyakorlati eljárások — *Légiforgalmi Szolgálatok* — szövegét a Tanács először a Nemzetközi Polgári Légiközlekedési Egyezmény (Chicago, 1944.) 37. cikkelyének rendelkezései alapján 1950. május 18.-án fogadta el. Az előírások 1950. október 1.-én léptek hatályba. A nemzetközi előírások és ajánlott gyakorlati eljárások így megkülönböztetett új címét, azaz a *Légiforgalmi Szolgálatok* kifejezést a *Légiforgalmi Irányítás* kifejezéssel szemben azért részesítették előnyben, hogy világosan jelezzék: a 11. Annexben ismertetett szolgálatoknak csak egy része a légiforgalmi irányító szolgálat, a kiadvány vonatkozik a repüléstájékoztató, valamint a riasztó szolgálatokra is.

Az A. táblázat a vonatkozó fontosabb témakörök felsorolásával és az időpontok megjelölésével mutatja a módosításokat, amely időpontokban azokat a Tanács elfogadta, azok érvénybe léptek valamint alkalmazhatóvá váltak.

Alkalmazhatóság

A 11. Annexben található nemzetközi előírások és ajánlott gyakorlati eljárások a 2. Annex rendelkezéseivel együttesen szabályozzák a „Légiközlekedési Szolgálatok Eljárásai — *Repülési szabályok és Légiforgalmi szolgálatok*" valamint a „Körzeti Kiegészítő Eljárások — *Repülési szabályok és Légiforgalmi szolgálatok*" alkalmazását, amely utóbbi kiadványban a körzeti alkalmazáshoz szükséges kiegészítő eljárásokat teszik közzé.

A 11. Annex azoknak a légtereknek, egységeknek és szolgálatoknak a kijelölésével foglalkozik, amelyek a légiforgalom gyors, rendezett és biztonságos áramlásának elősegítéséhez szükségesek. Világos különbséget tesz a légiforgalmi irányító szolgálat, a repüléstájékoztató szolgálat valamint a riasztó szolgálat között azzal a céllal, hogy a nemzetközi légi útvonalakon a 2. Annex-el együttesen biztosítsa a repülések olyan, egységes körülmények között történő végrehajtását, amelyek a légiüzemeltetés biztonságának és hatékonyságának fenntartása és növelése érdekében szükségesek.

A 11. Annex nemzetközi előírásai és ajánlott gyakorlati eljárásai érvényesek a szerződő Állam fennhatósága alá tartozó azon légtérszakaszokra, amelyekben légiforgalmi szolgálatokat létesítettek, továbbá olyan nemzetközi nyílt vizek felett illetve nem meghatározott állami hovatartozású légterekben, amelyeknél a szerződő Állam elfogadja és vállalja a légiforgalmi szolgálatok biztosításának felelősségét. Az a szerződő Állam, amely elfogadja és vállalja ezt a felelősséget, a nemzetközi előírásokat és ajánlott gyakorlati eljárásokat ezen légterekben a fennhatósága alá tartozó saját légterekhez hasonló formában alkalmazhatja.

A szerződő Államok tevékenysége

Az eltérések jelentése

Felhívjuk a szerződő Államok figyelmét az Egyezmény 38. cikkelyéből adódó azon kötelezettségükre, hogy a szerződő Állam értesítse a Szervezetet bármely eltérésről, amely saját országos előírásai és gyakorlata illetve a jelen Annex nemzetközi előírásai és ennek bármely módosítása között fennáll. Felkérjük továbbá a szerződő Államokat, hogy az ilyen értesítést terjesszék ki valamennyi olyan eltérésekre is, amely a jelen Annex-ben található ajánlott gyakorlati eljárásokat és ezek bármely módosítását érintik, amennyiben ezen eltérések a légiközlekedés biztonsága szempontjából lényegesek. Ezen felül kérjük, hogy a szerződő Államok folyamatosan tájékoztassák a Szervezetet bármilyen jövőbeni eltérésről valamint a korábbiakban jelzett eltérés megszűnéséről. A jelen Annex minden egyes módosításának elfogadása után külön az eltérésekről szóló értesítést kérő levelet küldünk majd minden szerződő Államnak.
Felhívjuk a szerződő Államok figyelmét a 15. Annex rendelkezéseire, amelynek alapján saját országos szabályaik és gyakorlatuk, valamint a vonatkozó ICAO előírások és ajánlott gyakorlati eljárások közötti eltérésekről szóló tájékoztatásaikat az Egyezmény 38. cikkelyében előírt kötelezettségük mellett a Légiforgalmi Tájékoztató Szolgálat útján is tegyék közzé.

A tájékoztatások továbbítása és közzététele

A jelen Annex-ben ismertetett nemzetközi előírások és ajánlott gyakorlati eljárások alapján biztosított, a légijárművek üzemeltetését érintő létesítmények, szolgálatok és eljárások létrehozását illetve megszüntetését a 15. Annex előírásainak megfelelően jelentsék be.
Az Annex szövegének alkalmazása a nemzeti előírásokban
A Tanács 1948. április 13.-án elfogadta azt a határozatot, amelyben felhívják a szerződő Államok figyelmét saját országos, nemzeti előírásaikban a szabályozó jellegű ICAO előírások pontos nyelvezetének lehetőség szerint **azonos** alkalmazásának kívánatosságára, továbbá hogy az Államok jelezzék a nemzetközi előírásoktól és ajánlott gyakorlati eljárásoktól való eltéréseket, ismertetve azokat a nemzeti előírásokat, amelyek a légiközlekedés biztonsága és rendezettsége szempontjából fontosak. Ahol ez lehetséges, a jelen Annex előírásait úgy fogalmaztuk meg és tettük közzé, hogy ezzel megkönnyítsük az országos jogszabályokba lényeges szövegi módosítás nélkül történő átvételüket.

Az Annex részeinek jogállása

Az Annex a következő részekből áll, de nem feltétlenül szükséges, hogy minden rész megtalálható legyen minden egyes Annexben.
Az egyes részek jogállása a következő:
1.— Az Annex anyaga:
a) *Nemzetközi előírások és ajánlott gyakorlati eljárások*, amelyeket az Egyezmény rendelkezései szerint a Tanács fogad el. Ezek meghatározása a következő:
Előírás vagy Szabvány: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amelynek egységes alkalmazását a nemzetközi légiközlekedés biztonsága és menetrendszerű fenntartása érdekében szükségesnek tartják és amellyel kapcsolatban az Egyezmény alapján a Szerződő Államok megállapodnak. Amennyiben a teljes megállapodás nem lehetséges, az eltérést az Egyezmény 38. cikkelyében foglaltak alapján az érintett Államoknak a Tanács felé jelenteniük kell.
Ajánlott gyakorlati eljárás: Bármilyen fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó követelmény, amely egységes alkalmazását a nemzetközi légiközlekedés biztonsága, menetrendszerű és hatékony lebonyolítása érdekében kívánatosnak minősítenek, és amelyek alkalmazására a Szerződő Államok az Egyezmény értelmében törekszenek.
b) *Függelék:* A célszerűség érdekében külön csoportosított anyagok, amelyek azonban a Tanács által

elfogadott nemzetközi előírások és ajánlott gyakorlati eljárások szerves részét képezik.
c) *Meghatározások:* A nemzetközi előírások és az ajánlott gyakorlati eljárások ismertetésénél alkalmazott azon fogalmak pontos magyarázata, amelyek elfogadott szótári jelentés hiányában nem maguktól értetődőek. A meghatározás külön jogállással nem rendelkezik, azonban szerves részét képezi azon nemzetközi előírásnak vagy ajánlott gyakorlati eljárásnak, amelyben előfordul, mert a meghatározás értelmének megváltoztatása az előírást befolyásolja.
d) *Táblázatok és ábrák:* Ezek egy nemzetközi előírást vagy ajánlott gyakorlati eljárást egészítenek ki vagy szemléltetnek, és amelyekre egy adott nemzetközi előírásban vagy ajánlott gyakorlati eljárásban utalnak. A táblázatok és az ábrák az adott nemzetközi előírás vagy ajánlott gyakorlati eljárás részét képezik és jogállásuk ezekkel megegyező.
Megjegyzendő, hogy a jelen Annex egyes előírásai olyan követelményeket is tartalmaznak, melyek jogállása ajánlott gyakorlati eljárás. Az ilyen esetekben a Szerződő Államok az Egyezmény értelmében törekszenek ezek alkalmazására.
2.— A nemzetközi előírásokkal és az ajánlott gyakorlati eljárásokkal együtt, a Tanács egyetértésével kiadott egyéb anyagok:
a) Előszó: Történeti áttekintés és magyarázat a Tanács tevékenysége alapján. Tartalmazza továbbá az Államok kötelezettségeit, illetve az ezekre vonatkozó magyarázatokat a nemzetközi eljárások és gyakorlati eljárások alkalmazására, az Egyezmény és a Bevezetési Határozat előírásainak megfelelően.
b) Bevezető: Az Annex egyes köteteinek, részeinek vagy fejezeteinek elején található magyarázó szöveg, amely segítséget nyújt a vonatkozó szöveg megértéséhez, illetve alkalmazásához.
c) Megjegyzések: Szükség szerint a szövegbe iktatott anyag, amely tényszerű tájékoztatást vagy utalást tartalmaz a szóban forgó nemzetközi előírásra vagy ajánlott gyakorlati eljárásra vonatkozóan, azonban nem képezi ezek szerves részét.
d) Mellékletek: A nemzetközi előírást és ajánlott gyakorlati eljárást kiegészítő anyagot tartalmaznak, vagy azok alkalmazásához szükséges tájékoztatással szolgálnak.

Az alkalmazandó nyelv kiválasztása

A jelen Annex-et hat nyelven — angolul, arabul, franciául, kínaiul, oroszul és spanyolul — fogadták el. Minden egyes szerződő Államot felkérünk, hogy ezek közül válasszon ki egy nyelvet az országos bevezetés céljára vagy bármely egyéb, az egyezményben előirt ténykedés végrehajtására akár az adott nyelv közvetlen felhasználásával, akár saját nemzeti nyelvére történő lefordításával. Erről kérjük, értesítsék a Szervezetet.
Szerkesztői gyakorlat
Annak érdekében, hogy minden egyes szerkezeti anyag jogállását az első pillantásra jelezhessük, az alábbi szerkesztői gyakorlatot követjük: A nemzetközi előírásokat vékony álló, az *ajánlott gyakorlati eljárásokat* vékony *dőlt* betűkkel nyomtatjuk. Ez utóbbiak jogállását ***„Ajánlás”*** felirattal is jelezzük. A vékony dőlt betűvel szedett megjegyzéseket a „*Megjegyzés:* „ felirat egészíti ki.
Az írásmód / stílus szempontjából az angol szövegben az előírásokat „shall – kell” kifejezéssel és az ajánlott gyakorlati eljárásokat „should – szükséges” kifejezéssel jelezzük. Mindazonáltal a magyar fordítás alkalmával ezt a gyakorlatot nem minden esetben alkalmazzuk, mert a jelzett jogállás és a nyelvi sajátosságok ezt szükségtelenné teszik. Ha ez szükséges, a fordításban nyomatékos (kell) felszólító módot alkalmazunk.
A jelen kiadványban alkalmazott mértékegységek a nemzetközi polgári légiközlekedésről szóló Egyezmény 5. Annex előírásainak megfelelően a nemzetközi mértékegység rendszerrel /SI/ összhangban állnak. Ahol az 5. Annex lehetővé teszi a nem SI, alternatív mértékegységek alkalmazását, ott az alapegységet követően ezen mértékegységek zárójelben szerepelnek. Ahol az anyagban két mértékegység-fajtát alkalmazunk, ott nem szabad azt feltételezni, hogy a mértékegységek értékei egyenlőek és azok egymással korlátlanul felcserélhetők. Mindazonáltal lehetséges, hogy azonos biztonsági szint érhető el bármelyik mértékegység kizárólagos alkalmazásával. A jelen kiadvány bármelyik részére történő hivatkozás -- akár számmal, akár címmel vagy mindkettővel - vonatkozik az adott rész minden egyes

alpontjára is.

A. táblázat — A 11. Annex módosításai

(módosítás — forrás — tárgy — elfogadva/ hatályos/ alkalmazható)

Első kiadás
Repülési és Légiforgalmi Irányítási Szabályok (RAC) munkacsoport 3. ülése (1948.)
Nemzetközi előírások és ajánlott gyakorlati eljárások — Légiforgalmi Szolgálatok
1950. május 18. 1950. október 1. 1951. június 1.

1-6) — Második kiadás — Repülési és Légiforgalmi Irányítási Szabályok (RAC) munkacsoport 4. ülése (1950.)
Repülőtéri forgalom; irányítás átadása; engedély tartalma; kényszerhelyzeti állapot; összeköttetési előírások és követelmények; magaslégtéri repüléstájékoztató körzetek és magaslégtéri irányítási körzetek; függőleges elkülönítés.
1951. november 27. 1952. április 1. 1952. szeptember 1.

7) — Léginavigációs Bizottság
Az ATS egységeknek szóló tájékoztatások szétosztására vonatkozó útmutató anyag törlése.
1956. február 22.

8) — Harmadik kiadás — Második Léginavigációs Konferencia (1955.)
Meghatározások; illetékesség meghatározása; légterek megjelölése; légijárművek elkülönítése; összeköttetési előírások; meteorológiai tájékoztatásokra vonatkozó előírások; ellenőrzött légterek meghatározása és kijelölése; összeköttetési diagrammok.
1956. május 11. 1956. szeptember 15. 1956. december 1.

9) — Negyedik kiadás — Repülési és Légiforgalmi Irányítási Szabályok (RAC) valamint a Kutatás és Mentés (SAR) munkacsoportok (1958.)
Meghatározások; légiforgalmi szolgálatok feladatai; légterek és ellenőrzött repülőterek kijelölése; légtér meghatározások; légiforgalmi irányító szolgálat; összeköttetési követelmények; ellenőrzött légterek meghatározása és kijelölése; jelentőpontok elnevezése; légiforgalmi irányítás automatizálása.
1959. december 8. 1960. május 1. 1960. augusztus 1.

10) — A repülési műveletekre vonatkozó tájékoztatások egyeztetett kiadásával kapcsolatos szakbizottsági ülés (1959.)
SIGMET tájékoztatás; repüléstájékoztató szolgálat alkalmazása és annak átruházása; meteorológiai tájékoztatásokra vonatkozó előírások.
1960. december 2. 1961. április 1. 1961. július 1.

11) — Léginavigációs Bizottság
A légiforgalmi szolgálatok tájékoztató térképeire vonatkozó útmutató anyag törlése.
1961. június 26.

12) — Léginavigációs Bizottság
Az ellenőrzött légtérben létesített útvonalak megjelölésének kiválasztására vonatkozó útmutató anyag kiadása.
1961. december 15.

13) — Léginavigációs Bizottság
A mentést koordináló központok értesítése a bizonytalanság, a riasztás és a vészhelyzet állapotokban.
1962. április 13. 1962. augusztus 1. 1962. november 1.

14) — Léginavigációs Bizottság
A kényszerhelyzetben levő légijármű közelében tartózkodó egyéb légijárművek értesítésének szükségessége a kényszerhelyzet típusáról.
1964. június 19. 1964. november 1. 1965. február 1.

15) — Ötödik kiadás — Repülési szabályok és Légiforgalmi szolgálatok munkacsoport ülés (1963.)
Függőleges elkülönítés alkalmazása a FL290 feletti repülések esetében; légiforgalmi irányító szolgálat biztosítása VFR repülések számára; légtérhatárok kijelölése; repüléstájékoztató körzetek felső határa;

légiforgalmi szolgálati útvonalak és jelentőpontok megjelölése; együttműködés a járatókkal; elkülönítések típusai; összeköttetési követelmények; az ellenőrzött légtér létesítésére és meghatározására vonatkozó útmutató anyag kiadása.
1965. március 17. 1966. március 29. 1966. augusztus 25.

16) — Légiforgalmi irányítás automatizálása munkacsoport 5. ülése (1966.)
Az irányítás átadásának felelőssége; a légiforgalom áramlásának szabályzása.
1967. június 7. 1967. október 5. 1968. február 8.

17) — Ötödik Léginavigációs Konferencia (1967.)
Légiforgalmi szolgálatok bejelentő irodája és összeköttetési követelmények; engedélyek és elkülönítés; repüléstájékoztató szolgálat működési területe; a repülőtér területén működő járművek irányítására használatos összeköttetések; a légiforgalmi irányító szolgálatok követelményei a meteorológiai tájékoztatásokra vonatkozóan; tájékoztatások a repülőtér állapotáról és a navigációs segédeszközök működéséről.
1969. január 23. 1969. május 23. 1969. szeptember 18.

18) — Hatodik kiadás — Hatodik Léginavigációs Konferencia (1969.) — Léginavigációs Bizottság
Meghatározások; ellenőrzött légterek meghatározásának kifejezései; légiforgalmi szolgálati légterek függőleges határai; legalacsonyabb repülési magasságok; elkülönítési minimumok meghatározása és alkalmazása; engedélyek és elkülönítés; szabvány indulási és érkezési útvonalak kijelölése és azonosítása; repüléstájékoztató szolgálat biztosítása IFR repülések számára nyílt vizek felett; levegő-föld összeköttetés létesítése ATS célokra.
1970. május 25. 1970. szeptember 25. 1971. február 4.

19) —Léginavigációs Bizottság
Nemzetközi vizek felett üzemelő légijárművek felügyelete; SIGMET tájékoztatások.
1972. november 15. 1973. március 15. 1973. augusztus 16.

20) — Hetedik Léginavigációs Konferencia (1972)
Meghatározások; területi navigáció (RNAV); ATS útvonalak és jelentőpontok elnevezése.
1973. március 23. 1973. július 30. 1974. május 23.

21) — A Tanács határozata az A17/10 és A18/10 ajánlások bevezetésére
A jogellenes beavatkozás alatt álló légijárművel kapcsolatosan követendő eljárások a légiforgalmi szolgálati egységek számára.
1973. április 7. 1973. december 7. 1974. május 23.

22) — Hangsebesség feletti légi-szállítási munkacsoport (SSTP) 4. ülése (1973) — Léginavigációs Bizottság
Hangsebesség feletti repülések hangsebességre történő gyorsítására és lassítására vonatkozó engedélyek; együttműködés a katonai hatóságok és a légiforgalmi szolgálatok között; összeköttetésekre vonatkozó követelmények.
1975. február 4. 1975. június 4. 1975. október 9.

23) — Léginavigációs Bizottság
A 7500-as másodlagos radar-kód használata jogellenes beavatkozás esetén; a légiforgalmi szolgálati egységek és a meteorológiai hivatalok közötti összeköttetésekre vonatkozó követelmények.
1975. december 12. 1976. április 12. 1976. augusztus 12.

24) — Léginavigációs Bizottság
Meghatározások; az időmérés pontossága.
1976. április 7. 1976. augusztus 7. 1976. december 30.

25) — Hetedik kiadás — Léginavigációs Bizottság
Meghatározások; VOR átkapcsolási pontok; ATS útvonalak megjelölése; fontos pontok kijelölése és megjelölése; repüléstájékoztató szolgálat; a légiforgalmi szolgálatok tájékoztatási követelményei.
1977. december 7. 1978. április 7. 1978. augusztus 10.

26) — Léginavigációs Bizottság
Szabvány érkezési és indulási útvonalak megjelölése.

1979. december 3. 1980. április 3. 1980. november 27.
27) — Léginavigációs Bizottság
A polgári légijárművek repülésére tényleges veszélyt jelentő műveletek egyeztetése; személyzet nélküli szabad léggömbök.
1981. március 4. 1981. július 4. 1981. november 26.
28) — Léginavigációs Bizottság
A légiforgalmi szolgálati egységek és a katonai szervek közötti kapcsolattartásra vonatkozó előírások.
1981. április 1. 1981. augusztus 1. 1981. november 26.
29) — Léginavigációs Bizottság — Repüléstájékoztató szolgálat üzemeltetési munkacsoport (OPIS) második ülése (1980.) — Elkülönítési munkacsoport általános elveinek felülvizsgálatával foglalkozó negyedik ülés (1980.)
AIS/ATS/MET és egyéb vonatkozó tájékoztatások repülés közben levő légijármű részére történő továbbítása; összetett elkülönítés; radar adatok automatikus rögzítése; légijármű által adott forgalmi tájékoztatás.
1982. április 2. 1982. augusztus 2. 1982. november 25.
30) — Léginavigációs Bizottság — Légiforgalmi szolgálatok adattovábbítási és adat-feldolgozási munkacsoport (ADAPT) harmadik ülése (1981.) — AGA részleg ülés (1981.)
Az összeköttetésekre vonatkozó ATS előírások; a felszíni szélkijelzők jelölése; földi mozgás irányító és ellenőrző rendszerek; mértékegységek; meghatározások.
1983. március 16. 1983. július 29. 1983. november 24.
31) — Tanács — Léginavigációs Bizottság
Polgári és katonai együttműködés; repülés közben bekövetkező, az eltévedt vagy azonosítatlan légijárművekre és/vagy polgári légijárművek elfogására vonatkozó különleges helyzetek és intézkedések; összeköttetési előírások; légijármű által adott forgalmi tájékoztatás.
1986. március 12. 1986. július 27. 1986. november 20.
32) — Nyolcadik kiadás — Elkülönítési munkacsoport általános elveinek felülvizsgálatával foglalkozó ötödik ülés (1985.) — Léginavigációs Bizottság
Meghatározások; Egyetemes egyeztetett világidő (UTC); vulkáni hamuról szóló figyelmeztetések; VOR berendezéssel kijelölt és meghatározott légiforgalmi szolgálati útvonalak; az alábbi Mellékletek törlése: A B C D F és G.
1987. március 18. 1987. július 27. 1987. november 19.
33) — Kilencedik kiadás — Titkárság — VFR üzemelési munkacsoport harmadik ülése (1986.) — Léginavigációs Bizottság: módosítások a 6. Annex módosításainak elfogadása miatt
Légijármű látvarepülési és műszerrepülési szabályok szerint történő vegyes üzemeltetése; a NOTAM kiadványok kiadásával kapcsolatos légiforgalmi szolgálati előírások; földi mozgás irányító és ellenőrző rendszerek; a légiforgalmi szolgálat felelőssége a jogtalan beavatkozás eseteiben.
1990. március 12. 1990. július 30. 1991. november 14.
34) — A Másodlagos radarberendezések továbbfejlesztésével, valamint az Összeütközés elkerülését biztosító rendszerekkel foglalkozó munkacsoportok negyedik ülése (SICASP/4)
Meghatározások; a légiforgalmi szolgálatok a fedélzeti összeütközés-elkerülő rendszerek (ACAS) működésétől független biztosítása.
1993. február 26. 1993. július 26. 1993. november 11.
35) — Elkülönítési munkacsoport (RGCSP) általános elméletének módosítását célzó hatodik, hetedik és nyolcadik ülés (1988., 1990., 1993.) — Automatikus légtérfelderítési munkacsoport (ADSP) második ülése (1992.) — Léginavigációs Bizottság
Meghatározások; 1000 láb (300 méter) csökkentett függőleges elkülönítési minimum FL 290 felett; a forgószárnyas légijármű forgalom beillesztése a hagyományos légijármű forgalomba; a VOR berendezéssel kijelölt, valamint RNAV berendezéssel felszerelt légijárművek által használható ATS útvonalak; előírt navigációs teljesítmény; automatikus légtérfelderítés; az egész világon egységesen alkalmazható földrajzi hely megjelölési rendszer (WGS-84) alapadat bevezetésével kapcsolatos előírások;

tájékoztatások továbbítása légijárművek részére radioaktív anyagokról és mérgező kémiai felhőkről.
1994. március 18. 1994. július 25. 1994. november 10.

36) — Másodlagos radarberendezések továbbfejlesztésével, valamint az Összeütközés elkerülését biztosító rendszerekkel foglalkozó munkacsoportok negyedik ülése (SICASP/4) — Időjárási körülmények alapján történő üzemeltetés (AWOP) munkacsoportjának tizenharmadik és tizennegyedik ülése; Akadály korlátozási munkacsoport tizedik ülése
A nyomásmagasság-adó másodlagos válaszjeladók; mikrohullámú leszállító rendszer; útvonal akadály korlátozási követelmények.
1996. március 8. 1996. július 15. 1996. november 7.

37) — Léginavigációs Bizottság — A 3. Annex 70. módosítása
Léginavigációs adatbázisok; AIRMET tájékoztatások, szélnyírás.
1997. március 20. 1997. július 21. 1997. november 6.

38) — Automatikus légtérfelderítés munkacsoport negyedik ülése (1996.), Az elkülönítés általános elméletével foglalkozó munkacsoport kilencedik ülése (1996.), a 3. Annex 71. módosítása; Léginavigációs Bizottság.
Meghatározások; automatikus légtér-felderítési rendszerek és eljárások; automatizált légiforgalmi szolgálati rendszerek közötti adatcsere; levegő-föld adatösszeköttetés alkalmazása az ATS területén; légijárművek elkülönítése; RNP és RNAV az útvonal-repülés végrehajtása során; az OPMET tájékoztatás továbbítása a levegőben repülő légijármű részére; vulkáni hamuval kapcsolatos tanácsadás; emberi tényezők.
1998. március 19. 1998. július 20. 1998. november 5.

39) — Léginavigációs Bizottság
ATS légiforgalmi szolgálati légterek osztályozása; látás utáni időjárási körülmények (VMC); legalacsonyabb biztonságos tengerszint feletti magasság figyelmeztető jelzés
1999. március 10. 1999. július 19. 1999. november 4.

40) — Tizenharmadik kiadás — Léginavigációs Bizottság — Automatikus légtérfelderítés munkacsoport ötödik ülése (ASDP/5) — Európai Léginavigációs Tervező Munkacsoport 39. ülése (EANPG/39)— Akadálymentességi Munkacsoport 12. ülése (OCP/12) — a 6. Annex I/25, II/20 és III/7 módosításainak elfogadása miatt szükséges változások — Titkárság
Meghatározások; légiforgalmi szolgálatok biztonságszervezési rendszere; légijármű kényszerhelyzet jelzése az automatikus légtér-felderítési rendszerben; a légtér rugalmas felhasználása; legalacsonyabb repülési magasságok; biztonságos elkülönítés a talajfelszíntől radar irányítás (irányvezetés) alkalmával; előzetes engedély továbbítási rendszer; az irányítási felelősség átadása; a légiforgalmi irányítói engedélyek visszaolvasása; légiforgalmi áramlásszervezés; automatikus közelkörzeti tájékoztató szolgálat; VOLMET; D-VOLMET; RVR értékek kijelzői és azok előírásai az ATS egységeknél; szerkesztői változtatások.
2001. március 12. 2001. július 16. 2001. november 1.

41) — Az elkülönítés általános elméletével foglalkozó munkacsoport tizedik ülése (RGCPS/10); Veszélyes áruk munkacsoport tizenhetedik ülése (DGP/17).
Párhuzamos területi navigációs útvonalak közötti elkülönítési távolság; a veszélyes árukról szóló tájékoztatások továbbítása a mentést koordináló központok (RCC) felé.
2002. február 21. 2002. július 15. 2002. november 28.

42) — Lézersugár kibocsátás és Repülésbiztonsági munkacsoport; Titkárság; Általános angol nyelvismereti munkacsoport; Léginavigációs Bizottság
Lézersugár kibocsátás; Idegen nyelvismeretre vonatkozó előírások; Légiforgalmi szükség-intézkedések.
2003. március 7. 2003. július 14. 2003. november 27.

Nemzetközi előírások és ajánlott gyakorlati eljárások

43) – Titkárság; Légiforgalmi Tájékoztató Szolgálatok/Légiforgalmi Térképek (AIS/MAP) részleg ülése (1998)
Meghatározások; felszíni mozgásellenőrző radar használata; ATS kommunikációs követelmények;

meteorológiai tájékoztatás; légijárművek magasságtartási teljesítménye; ATS repülésbiztonság-irányítás; elektronikus domborzati és akadályadatok; szerkesztői módosítások.

2005. március 2.	2005. július 11.	2005. november 24.

44) – Az ICAO Közgyűlés 35. ülése; Tizenegyedik Léginavigációs Konferencia; Léginavigációs Bizottság ATS repülésbiztonság-irányítás; felvételkészítő eszközök.

2006. március 14.	2006. július 17.	2006. november 23.

45) – Léginavigációs Bizottság
Meghatározások és kapcsolódó eljárások ADS-B-hez, ADS-C-hez és RCP-hez; kooridnációs eljárások az ATS és egyéb szervezetek között; névkód jelölések; szélnyírás-riasztások bevezetése.

2007. február 26.	2007. július 16.	2007. november 22.

1. fejezet
Meghatározások

1. Megjegyzés: A jelen Annex szövegében a „szolgálat” kifejezés mindvégig a feladatkörök vagy biztosított szolgáltatások megjelölésre vonatkozó elvont fogalom, míg az „egység” kifejezés egy szolgálatot ellátó kollektív testület megjelölésére szolgál.
2. Megjegyzés: A meghatározásokban szereplő (RR) jelzés azt jelenti, hogy a kifejezést a Nemzetközi Távközlési Szervezet (ITU) Rádiószabályzatából vettük át. (lásd *Rádió Frekvencia Tartomány Előírások a Polgári Légiközlekedés Részére, az ICAO előírások jóváhagyásával* — Doc 9718)
A jelen Annex szövegében a nemzetközi előírások és ajánlott gyakorlati eljárások esetében használt kifejezések jelentése a következő:

Vonatkozási alapadat – Datum
Bármely mennyiség vagy mennyiségi halmaz, amely egyéb mennyiségek kiszámításának alapjául szolgál (ISO19104*[*]).

Adat minőség — Data quality
Megbízhatósági fok vagy szint, amely azt mutatja, hogy a megadott adat pontosság, felbontás és megbízhatóság[1] Szerk. Megjegyzés: A léginavigációs adat és értékei megbízhatóságának és pontosságának foka, amely jelzi, hogy az a meghatározás vagy az elfogadott módosítás óta nem változik vagy veszik el.
1 szempontjából megfelel az adatfelhasználó igényeinek.

Adathálózati összeköttetések — Data link communications
Távközlési összeköttetés, amely a közleményeket adathálózaton keresztül továbbítja.

ADS-C megállapodás – ADS-C agreement
Jelentéstételi terv, amely meghatározza az ADS-C adatjelentés körülményeit (azaz a légiforgalmi szolgálati egység által követelt adatokat és az ADS-C jelentések gyakoriságát, amelyek az ADS-C a légiforgalmi szolgálatok nyújtása során történő használatát megelőzően állapítandók meg).
Megjegyzés – A megállapodás feltételei a földi rendszer és a légijárművek közötti címzett kapcsolat, vagy kapcsolatok sorozata útján valósulnak meg.

AIRMET tájékoztatás — AIRMET information
A meteorológiai hivatal figyelőszolgálata által kiadott tájékoztatás azon időjárási jelenségek várható vagy tényleges bekövetkezéséről, amelyek befolyásolhatják az alacsony repülési magasságon üzemelő légijárművek biztonságát, és amelyeket az érintett repüléstájékoztató körzetre vagy ennek részterületére kiadott alacsony repülési magasságra vonatkozó előrejelzés nem tartalmaz.

Akadály – Obstacle
Valamennyi rögzített (akár ideiglenes, akár állandóhelyű) és mozgó tárgy vagy annak részei, amely a légijárművek földfelszíni mozgására kijelölt területen helyezkedik el, vagy amely túlnyúlik egy, a légijárművek repülés közbeni védelmére kijelölt felületen.

Alapforduló — Base turn

[*] Valamennyi ISO szabvány a jelen fejezet végén kerül felsorolásra.

Az a forduló, amit a légijármű a kezdeti megközelítés során a kirepülési útirány vége és a közbenső vagy végső megközelítési útirány kezdete között hajt végre. Az útirányok nem reciprok irányok.
Megjegyzés: Az alapforduló az adott egyedi eljárásnak megfelelő módon szinttartással vagy süllyedés közben is kijelölhető.
ALERFA
A „riasztás állapota" megjelölésére használt kód-név.
Állomás mágneses elhajlás — Station declination
Egy VOR állomás nulla fokos radiálja és a földrajzi észak közötti, a VOR állomás kalibrálásának időpontjában meghatározott iránykülönbség.
Átadó egység — Transferring unit
Az a légiforgalmi irányító szolgálati egység, amely a légijármű irányításával kapcsolatos felelősségét a repülés útvonala mentén soron következő légiforgalmi irányító szolgálati egységnek adja át.
Átkapcsolási pont — Change over point
Az a pont, ahol a VOR berendezéssel kijelölt ATS útvonalszakaszon üzemelő légijárműtől elvárják, hogy a már átrepült berendezés — mint elsődleges navigációs referencia hely — követéséről átálljon az előtte levő berendezés követésére.
Megjegyzés: Az átkapcsolási pontokat azért jelölik ki, hogy a jelek erőssége és minősége a legmegfelelőbb egyensúlyban legyen a navigációs berendezések között minden használatos szinten, továbbá hogy azonos berendezéstől származó irányszög vezetést biztosítsanak az azonos útvonalszakaszon üzemelő összes légijármű számára.
Átvevő egység — Accepting Unit
Egy légijármű irányításának átvételére következő légiforgalmi irányító szolgálati egység.
Automatikus közelkörzeti tájékoztató szolgálat — Automatic terminal information service (ATIS)
Az érkező és induló légijárművek számára napi 24 órán vagy meghatározott részidőtartamon keresztül az érvényes és az állandó jellegű tájékoztatások automatikus biztosítása:
Adathálózati automatikus közelkörzeti tájékoztató szolgálat —Data link automatic terminal information service (D-ATIS)
Adathálózaton keresztül továbbított tájékoztatás.
Beszéd-üzemű automatikus közelkörzeti tájékoztató szolgálat — Voice-automatic terminal information service (Voice-ATIS)
Folyamatos és ismétlődő szóbeli rádióközleménnyel továbbított tájékoztatás.
Berendezésfüggő automatikus légtérfelderítés – általános adás (ADS-B) — Automatic dependent surveillance – broadcast (ADS-B)
Technológia, amelynek segítségével légijárművek, repülőtéri járművek és egyéb eszközök automatikusan képesek adatkapcsolaton történő, általános adás keretében olyan adatok adására és/vagy vételére, mint például azonosítójel, helyzet -, és egyéb kiegészítő tájékoztatás.

Berendezésfüggő automatikus légtérfelderítés – címzett adás (ADS-C) – Automatic dependent surveillance – contract (ADS-C)
Technológia, amellyel az ADS-C megállapodások feltételei adatkapcsolat útján egyeztetésre kerülnek a földi rendszer és a légijármű között, hogy mely körülmények között kezdeményeznek ADS-C jelentéseket, és milyen adatokat tartalmazzanak a jelentések.
Megjegyzés: Az „ADS elektronikus protokollegyeztetés" olyan gyűjtőfogalom, mely felváltva jelenthet ADS esemény alapú protokollegyeztetést, kérést tartalmazó ADSprotokollegyeztetést, időszakos ADS protokollegyeztetést, vagy egy kényszerhelyzeti módot.
Légiközlekedési baleset — Accident

A repülés tartalma alatt bekövetkezett esemény, attól az időponttól számítva, amikor bármilyen személy repülési céllal a légijármű fedélzetére lép, illetve addig az időpontig tart, amikor az összes ilyen személy el nem hagyja a légijármű fedélzetét, és amely során:

a) valamely személy halálos kimenetelű, vagy súlyos sérülést szenvedett el annak következtében, hogy:

- a személy a légijármű fedélzetén tartózkodott; vagy
- a légijármű bármely részével közvetlen érintkezésbe került – beleértve légijárműről levált alkatrészeket is, vagy
- annak következtében, hogy a sugárhajtómű kiáramló gázsugarának közvetlenül volt kitéve,

kivéve, ha sérülései természetes okoknak tulajdoníthatók, vagy azokat maga, vagy más személy okozza, vagy ha olyan jogellenesen utazó személy sérüléséről van szó, aki az utasok és a személyzet számára rendesen hozzáférhető területeken kívül rejtőzködik, vagy

b) a légijármű olyan károsodást, vagy szerkezeti hibát szenved, amely:

- a légijármű szerkezeti szilárdságát, teljesítményét vagy repülési jellemzőit hátrányosan befolyásolja, és
- rendes körülmények között a károsodott alkotórész nagyjavítását vagy cseréjét igényelné,

kivéve, a hajtóműhiba vagy –károsodás esetét, amikor a károsodás csak a hajtóműre, annak burkolatára, vagy tartozékaira korlátozódik, illetve ha a károsodás kizárólag a légcsavarokra, a szárnyvégekre, antennákra, kerékgumikra, a fékekre, áramvonalazó burkolatra vagy a légijármű borításán történt kisebb horpadásokra és apró átlyukadásokra korlátozódik; vagy

c) a légijármű eltűnt, vagy teljesen hozzáférhetetlen.

1. Megjegyzés.- Az egységes statisztika érdekében az ICAO akkor tekinti halálos kimenetelűnek az elszenvedett sérülést, amikor az elhalálozás a légiközlekedési balesettől számított harminc napon belül következik be.

2. Megjegyzés.- Egy légijárművet akkor tekintenek eltűntnek, ha a hivatalos keresést beszüntették és a roncsot nem találták meg.

Bevezető irányító egység — Approach control unit
Egy vagy több repülőtér érkező vagy induló ellenőrzött forgalma számára történő légiforgalmi irányító szolgálat biztosítása céljából létesített egység.
Bevezető irányító szolgálat — Approach control service
Az érkező vagy induló ellenőrzött repülések irányítására létesített légiforgalmi irányító szolgálat.
Bizonytalanság állapota — Uncertainty phase
Olyan helyzet, amelyben egy légijármű és annak fedélzetén tartózkodó személyek biztonságával kapcsolatosan bizonytalanság áll fenn.

CRC matematikai képlet ellenőrzés[2] Szerk. Megjegyzés: A teljes adatblokkra kiterjedő rendszeres időszaki paritás ellenőrzés a rendszerben a küldő és fogadó állomáson — ellenőrző adat összevetése és paritásos felülvizsgálata (adatvesztéssel és adatváltozással szemben) illetve az eredetileg meghatározott adat és a felhasznált adat azonosságának biztosítása.
2 **Ciklikus Redundancia Ellenőrzés — Cyclic Redundancy check (CRC)**
Az adatok digitális kifejezéséhez használt matematikai algoritmus, amely megfelelő biztonsági szintet nyújt az adat vesztéssel vagy változással szemben.
DETRESFA
A „veszély állapot” megjelölésére használt kód-név.
Ellenőrzött légtér — Controlled airspace
Meghatározott kiterjedésű légtér, amelyen belül a légtér osztályozásnak megfelelő légiforgalmi irányító szolgálatot biztosítanak.
Megjegyzés: Az ellenőrzött légtér olyan gyűjtőfogalom, amelybe beletartoznak a 2.6 pontban ismertetett A, B, C, D valamint E osztályú légiforgalmi szolgálati légterek.
Ellenőrzött repülés — Controlled flight
Bármely repülés, amely légiforgalmi irányítói engedély függvénye.
Ellenőrzött repülőtér — Controlled aerodrome
Olyan repülőtér, amelyen a repülőtéri forgalom számára légiforgalmi irányító szolgálatot biztosítanak.

Megjegyzés: Az „ellenőrzött repülőtér” kifejezés azt jelzi, hogy a repülőtéri forgalom számára légiforgalmi irányító szolgálatot biztosítanak, azonban ez nem jelenti szükségszerűen azt, hogy ott repülőtéri irányítói körzet is van.
Előírt kommunikációs teljesítmény (RCP) – Required communication performance (RCP)
Az egyes ATM funkciókat támogató operatív kommunikáció teljesítmény-követelményeinek meghatározása.
Előírt kommunikációs teljesítmény (RCP) típus – RCP type
Egy, a kommunikációs adás ideje, folyamatossága, elérhetősége és integritása alapján meghatározott RCP paraméterekhez fűzött értéket jelölő címke (pl. RCP 240).
Előírt navigációs pontosság — Required navigation performance (RNP)
Egy meghatározott légtérben történő repülés-végrehajtáshoz szükséges navigációs teljesítmény pontossági szintje.
Megjegyzés: A navigációs pontosság és teljesítmény előírásokat egy adott RNP típus és/vagy feladat-végrehajtás vonatkozásában határozzák meg.
Előírt navigációs pontosság / teljesítmény szint típus — Required navigation performance type (RNP type)
Tengeri mérföldben kifejezett távolság érték, azaz pontossági határérték. A repülés-végrehajtás során a repülőgép tervezett repülési helyzetéhez viszonyítva a repülési idő legalább 95 %-ában ezen határértéken belül repüljön.
Például: RNP 4 olyan navigációs pontosság határértéket jelent, amelynek alapján az adott repülőgép repülési idejének legalább 95 %-ában mindenkori tervezett repülési helyzetéhez viszonyítva plusz/minusz 4 tengeri mérföld (7.4 km) távolságon belül repül.
Előrejelzés — Forecast
Várható időjárási körülmények megállapítása meghatározott időpontra vagy időtartamra valamint meghatározott területre vagy légtér szakaszra.
Előzetes engedély — Downstream clearance
A légijármű részére olyan légiforgalmi irányító szolgálati egység részéről kiadott engedély, amely nem azonos a légijárművet jelenleg irányító egységgel.
Emberi teljesítmény és teljesítőképesség — Human performance
Az emberi egyéni képességek és korlátozó tényezők, amelyek hatással vannak a légiközlekedés üzemeltetésének biztonságára és hatékonyságára.
Emberi tényezők alapelvei — Human Factors principles
A légiközlekedési tervezés, jogosítás, kiképzés, üzemeltetés és karbantartás vonatkozó alapelvei, amelyek célja az emberi teljesítmény és teljesítőképesség tényezőinek teljes mértékű figyelembevételével biztonságos kapcsolat kialakítása a személyek és a rendszer egyes (műszaki) egységei között.
Engedélyhatár — Clearance limit
Az a pont, ameddig a légijármű részére légiforgalmi irányítói engedélyt adtak ki.
Esemény — Incident
A légijármű üzemeltetésével összefüggő, nem baleset kategóriába tartozó esemény, amely hatással van vagy lehet az üzemeltetés biztonságára.
Megjegyzés: Az ICAO baleset megelőzési tanulmányai szempontjából legfontosabb esemény típusok felsorolása a *Baleset és Esemény Jelentési Kézikönyv*ben (Doc 9156) található.
Fontos pont — Significant point
Meghatározott földrajzi hely, amelyet valamely légiforgalmi szolgálati útvonal vagy egy légijármű repülési útvonalának meghatározására, valamint egyéb navigációs és légiforgalmi szolgálati célokra használnak.
Forgalmi előtér — Apron
A szárazföldi repülőtéren kijelölt terület, amely az utasok, posta vagy teheráru küldemények be- és kirakodására, valamint a légijármű üzemanyaggal történő feltöltésére, parkírozására vagy karbantartására szolgál.
Forgalmi előtér ügyeleti szolgálat — Apron management service

A forgalmi előtér légijármű és gépjármű forgalmának szabályzására és ellenőrzésére biztosított szolgálat.
Forgalmi tájékoztatás — Traffic information
A légiforgalmi szolgálati egységtől származó, az adott légijármű közelében vagy annak tervezett útvonalán előforduló ismert vagy észlelt légi forgalomról szóló tájékoztatás, annak érdekében, hogy a repülőgépvezető figyelmének felkeltésével segítséget nyújtson számára az összeütközés elkerüléséhez.
Forgalom elkerülésére adott tanács — Traffic avoidance advice
Repülési műveletek végrehajtására vonatkozó tanács a légiforgalmi szolgálati egységtől annak érdekében, hogy segítséget nyújtson a repülőgépvezető számára az összeütközés elkerülésére.
Geodéziai alaprendszer — Geodetic datum
Olyan adatok összessége, amelyek a globális referenciarendszerhez képest a helyi referenciarendszer tájolásának és helyzetének meghatározásához minimálisan szükségesek.
Futópálya — Runway
Egy szárazföldi repülőtéren meghatározott négyszögletű terület, amelyet a légijármű le és felszállására alakítottak ki.
Futópályamenti látástávolság — Runway visual range (RVR)
Az a távolság, ameddig a futópálya középvonalán álló légijármű vezetője látja a futópálya felületi jelöléseket vagy a futópálya szélét kijelölő, illetve középvonalát azonosító fényeket.
Gergely-naptár – Gregorian calendar
Az általánosan használt naptár, amelyet először 1582-ben vezettek be az egy év időtartam meghatározására, és amely pontosabban megközelíti a tropikus évet, mint a Juliánus naptár (ISO 19108[*]).
Megjegyzés: A Gergely-naptárban egy év 365 napból, míg egy szökőév 366 napból áll, amelyek 12 egymást követő hónapokra tagolódnak.
Gurulás — Taxiing
A légijármű mozgása a repülőtér területén saját hajtóművei segítségével, a fel és leszállás eseteit kivéve.
Hajózószemélyzeti tag — Flight crew member
Szakszolgálati engedéllyel rendelkező személyzeti tag, akinek munkája a repülési szolgálati időtartam alatt nélkülözhetetlen a légijármű üzemeltetéséhez.
IFR — Instrument Flight Rules
A műszerrepülési szabályok jelzésére alkalmazott rövidítés.
IFR repülés — IFR flight
A műszerrepülési szabályok szerint végrehajtott repülés.
Illetékes légiforgalmi szolgálati hatóság — Appropriate ATS authority
Az adott légtérben a légiforgalmi szolgálatok biztosításáért felelős, az állam által kijelölt megfelelő hatóság.
IMC — Instrument Meteorological Conditions
A műszeres időjárási körülmények jelzésére alkalmazott rövidítés.
INCERFA
A „bizonytalanság állapota" megjelölésére használt kód-név.
Irányítás átadási pont — Transfer of control point
A légijármű repülési útvonalán levő azon meghatározott pont, amelynél a légijármű részére biztosított légiforgalmi irányító szolgálat ellátásának felelősségét az egyik irányítói egységtől vagy irányítói munkahelytől átadják a következőnek.
Irányítói terület — Control area
A földfelszín felett meghatározott határtól felfelé terjedő ellenőrzött légtér.
Irányítói körzet — Control zone
A földfelszíntől egy meghatározott felső magasság határig terjedő ellenőrzött légtér.
Járató — Operator
Valamely személy, szervezet vagy vállalat, amely légijárműveket üzemeltet vagy ilyen tevékenység végzésére jelentkezik.

[*] Valamennyi ISO szabvány a jelen fejezet végén kerül felsorolásra.

Jelentőpont — Reporting point
Meghatározott földrajzi hely, amelyhez viszonyítva egy légijármű helyzete jelenthető.
Kényszerhelyzet (állapot) — Emergency phase
Általános kifejezés, amely bizonytalanság, riasztás vagy veszély állapotokat jelenthet.
Kitérő repülőtér — Alternate aerodrome
Olyan repülőtér, amelyre a légijármű abban az esetben folytathatja az útját, ha a tervezett célállomás repülőtere felé történő repülés folytatása vagy az oda történő leszállás végrehajtása lehetetlenné válik vagy nem tanácsos. A kitérő repülőterek köze tartoznak az alábbiak:
Felszálló kitérő — Take-off alternate
Olyan kitérő repülőtér, amelyen a légijármű leszállhat, ha ez röviddel a felszállás után szükségessé válik és erre az indulási repülőtér nem használható.
Útvonal kitérő — En-route alternate
Olyan kitérő repülőtér, amelyen egy légijármű leszállhat, ha az útvonal-repülés közben a hajózószemélyzet rendkívüli vagy kényszerhelyzetet tapasztal.
Megnövelt hatótávolságú üzemeltetés útvonal kitérő — ETOPS en-route alternate
Olyan alkalmas és megfelelő kitérő repülőtér, amelyen egy légijármű leszállhat, ha a megnövelt hatótávolságú üzemeltetés közben egy hajtómű leáll vagy a hajózószemélyzet egyéb rendkívüli vagy kényszerhelyzetet tapasztal.
Célállomás kitérő — Destination alternate
Olyan kitérő repülőtér, amely felé a légijármű folytathatja az útját, ha a tervezett célállomás repülőterén történő leszállás végrehajtása lehetetlenné válik vagy nem tanácsos.

Megjegyzés: Az a repülőtér, amelyről a járat elindult, az adott járat számára útvonal vagy célállomás kitérőként is megjelölhető.
Konferencia összeköttetés — Conference communications
Olyan távközlési létesítmények, amelyek segítségével közvetlen szóbeli közleményváltás folytatható egyidejűleg három vagy több hely között.
Körzeti irányító központ — Area control centre
Az illetékessége alá tartozó irányítói területeken üzemelő ellenőrzött forgalom számára légiforgalmi irányító szolgálat biztosítása céljából létesített egység.
Körzeti irányító szolgálat — Area control service
Az irányítói körzetekben üzemelő ellenőrzött repülések számára létesített légiforgalmi irányító szolgálat.
Közelkörzet — Terminal control area
Egy vagy több nagyobb repülőtér közelében, rendszerint a légiforgalmi szolgálati útvonalak találkozási pontjánál létesített irányítói terület.
Közzétett kapacitás — Declared capacity
Légiforgalmi irányító rendszer, annak bármely alrendszere vagy munkahelye által légijárművek részére nyújtott szolgáltatás képességének mértéke általános üzemeltetési körülmények között. Ezt a mértéket egy adott légtérbe egy meghatározott időszakon belül belépő légijárművek számával fejezik ki, figyelembe véve az időjárási körülményeket, a légiforgalmi irányító szolgálati egység aktuális elrendezését, a rendelkezésre álló személyzetet és berendezéseket, valamint bármely olyan tényezőt, amely befolyásolhatja a légtérért felelős légiforgalmi irányító munkaterhelését.
Különleges VFR repülés — Special VFR flight
A repülőtéri irányítói körzeten belül, a látási meteorológiai körülményeknél rosszabb időjárási helyzetben a légiforgalmi irányító szolgálat által engedélyezett VFR repülés.
Látás utáni időjárási körülmények — Visual meteorological conditions (VMC)
Látástávolsággal, felhőzettől mért távolsággal és felhőalappal kifejezett időjárási körülmények, ha azok a látás utáni időjárási körülményekre meghatározott minimum értékeknél jobbak.
Megjegyzés: A látás utáni időjárási körülményekre meghatározott minimum értékeket a 2. Annex tartalmazza.
Levegő-föld összeköttetés — Air-ground communication
A légijárművek valamint a földi állomások vagy létesítmények közötti kétirányú összeköttetés.

Légi gurulás — Air-taxiing
A forgószárnyas vagy VTOL légijármű mozgása a repülőtér felszíne felett, rendszerint földpárna-hatás mellett és 37 km/h (20 csomó) értéknél kisebb földfelszín feletti sebességgel.
Megjegyzés: A tényleges magasság változhat, valamint bizonyos forgószárnyas légijárművek a földpárna-hatás turbulencia csökkentése vagy felfüggesztett teheráru rakományok védelme érdekében 25 lábnál (8 méter) AGL nagyobb magasságot igényelhetnek.
Légi útvonal — Airway
Folyosó formájában kijelölt irányítói terület vagy ennek egy része.
Légiforgalmi állandó helyű szolgálat — Aeronautical fixed service (AFS)
Meghatározott állandó helyek között létesített távközlési szolgálat, amelyet elsősorban a léginavigáció biztonsága illetve a légiforgalom rendezett, hatékony és gazdaságos működésének elősegítése érdekében létesítettek.
Légiforgalmi állomás — Aeronautical station (RR S1.81)
A légiforgalmi mozgó szolgálat földi állomása. Bizonyos esetekben a légiforgalmi állomás például hajó fedélzetén vagy vízfelszínen létesített építményen is elhelyezhető.
Légiforgalmi áramlásszervezés — Air traffic flow management (ATFM)
A légiforgalom biztonságos, rendezett és folyamatos áramlásának elősegítésére létrehozott szolgálat, amely biztosítja a rendelkezésre álló légiforgalmi irányítói kapacitás lehető legnagyobb mértékű kihasználását valamint azt, hogy a forgalom nagysága megfeleljen az illetékes ATS hatóság részéről közzétett kapacitás értékeknek.
Légiforgalmi irányító és légijármű-vezető közötti adatcsere — Controller - pilot data link communications (CPDLC)
A légiforgalmi irányító és a légijármű-vezető közötti távközlési módszer, amely az légiforgalmi irányítói szolgálati közleményeket adatátviteli összeköttetéssel továbbítja.
Légiforgalmi irányító szolgálat — Air traffic control service
A következő célokra létesített szolgálat:
a) összeütközés megelőzése:
1) a légijárművek között;
2) a mozgási területen üzemelő légijárművek és az akadályok között;
b) a légiforgalom rendezett és folyamatos áramlásának elősegítése.
Légiforgalmi irányító szolgálati egység — Air traffic control unit
Különböző, körzeti irányító, közelkörzeti irányító vagy repülőtéri irányító egységeket magába foglaló gyűjtőfogalom.
Légiforgalmi irányítói engedély — Air traffic control clearance
Felhatalmazás a légijármű részére ahhoz, hogy valamely légiforgalmi irányító szolgálati egység által meghatározott feltételek szerint üzemeljen.
1. Megjegyzés: A légiforgalmi irányítói engedély kifejezést, megfelelő szövegkörnyezetben gyakran engedélyre rövidítik.
2. Megjegyzés: A rövidített engedély kifejezést gyakran megelőzhetik a következő — „gurulási", „felszállási", „indulási", „útvonal", „megközelítési" vagy „leszállási" — szavak, amelyek a repülés azon szakaszát jelzik, amelyre az engedély vonatkozik.
Légiforgalmi mozgó szolgálat — Aeronautical mobile service (RR S1.32)
Légiforgalmi állomások és légijármű állomások illetve légijármű állomások közötti mozgó-szolgálat, amelyek közé tartozhatnak mentőtutajok is. A szolgálathoz sorolhatók továbbá a kijelölt segélykérő és kényszerhelyzeti frekvenciákon üzemelő kényszerhelyzeti helyzetjeladó állomások is.
Légiforgalmi szolgálat — Air traffic service
Különböző, repüléstájékoztató, riasztó, tanácsadó és légiforgalmi irányító (körzeti irányító, közelkörzeti irányító vagy repülőtéri irányító) szolgálatokat magába foglaló gyűjtőfogalom.
Légiforgalmi szolgálati egység — Air traffic services unit
Különböző, légiforgalmi irányító egységet, repüléstájékoztató központot vagy a légiforgalmi szolgálatok bejelentő irodáját magába foglaló gyűjtőfogalom.

Légiforgalmi szolgálati légterek — Air traffic services airspaces
Meghatározott kiterjedésű, az ABC betűivel azonosított légterek, amelyeken belül adott típusú repülések üzemelhetnek és amelyek számára légiforgalmi szolgálatokat, valamint üzemeltetési előírásokat jelöltek ki.
Megjegyzés: Az A — G osztályokba tartozó légiforgalmi szolgálati légterek a 4. Függelékben találhatók.
Légiforgalmi szolgálati útvonal — ATS route
A légiforgalmi szolgálatok biztosítására, a forgalom áramlásának megfelelő szabályozására kijelölt repülési útvonal.
1. Megjegyzés: A „légiforgalmi szolgálati (ATS) útvonal" kifejezés általános megnevezés, amely többek között légiútvonal, tanácsadói, ellenőrzött vagy nem ellenőrzött, érkezési vagy indulási útvonalat is jelenthet.
2. Megjegyzés: A légiforgalmi szolgálati (ATS) útvonalat útvonal leírással határozzák meg, amely tartalmazza az ATS útvonal jelzést, a jelentős pontok (útvonal pontok) közötti rárepülési vagy kirepülési irányszöget, a helyzetjelentési előírásokat valamint, az illetékes légiforgalmi szolgálati hatóság által megállapított legalacsonyabb biztonságos tengerszint feletti repülési magasságot.
Légiforgalmi szolgálatok bejelentő irodája — Air traffic services reporting office
A légiforgalmi szolgálatokat érintő jelentések, valamint az indulás előtt a légiforgalmi szolgálati egységeknek benyújtott repülési tervek átvételére létesített egység.
Megjegyzés: A légiforgalmi szolgálatok bejelentő irodája különálló vagy egy már meglevővel — mint például egy másik légiforgalmi szolgálati egység vagy a légiforgalmi tájékoztató szolgálat irodája — együtt kialakított egység is lehet.
Légiforgalmi tájékoztató Kiadvány — Aeronautical Information Publication (AIP)
A léginavigáció szempontjából fontos és tartós jellegű légiforgalmi tájékoztatásokat tartalmazó kiadvány, amelyet az érintett Állam vagy annak megbízott szervezete tesz közzé.
Légiforgalmi tanácsadó szolgálat — Air traffic advisory service
A tanácsadói légtéren belül nyújtott szolgálat, amely a lehetséges mértékben elkülönítést biztosít IFR repülési tervek szerint üzemelő légijárművek között.
Légiforgalmi távközlési állomás — Aeronautical telecommunication station
A légiforgalmi távközlési szolgálat állomása.
Légiforgalom — Air traffic
A levegőben levő valamint a repülőtér munkaterületén üzemelő légijárművek összessége.
Légijármű — Aircraft
Minden olyan szerkezet, amelynek levegőben maradását olyan aerodinamikai reakcióerők biztosítják, amelyek nem azonosak a földfelszínre ható aerodinamikai reakcióerőkkel.
Légijármű parancsnoka — Pilot-in-command
A repülés biztonságos végrehajtásáért felelős, a járató vagy az általános célú légiközlekedés esetében a légijármű tulajdonosa részéről parancsnoknak kijelölt repülőgépvezető.
Magasság - Height
Egy pontként értelmezett szint, tárgy vagy pont valamint egy meghatározott vonatkozási alap (alapadat) közötti függőleges távolság.
Megbízhatóság — Integrity (aeronautical data)
A léginavigációs adat és értékei megbízhatóságának és pontosságának foka, amely jelzi, hogy az a meghatározás vagy az elfogadott módosítás óta nem változik vagy nem veszik el.
Mentést koordináló központ — Rescue Co-ordination Centre
Egy kutatási és mentési körzeten belül a kutató és mentő szolgálat hatékony megszervezésére valamint a kutató és mentő tevékenység elősegítésére és egyeztetésére létesített egység.
Meteorológiai hivatal — Meteorological office
A nemzetközi légiközlekedés részére meteorológiai szolgálat nyújtására kijelölt hivatal.
Mozgási terület — Movement area
Egy repülőtérnek a légijárművek fel és leszállására valamint gurulására használandó része, amely a munkaterületet és a forgalmi előtere(ke)t foglalja magába.

Munkaterület — Manoeuvring area
Egy repülőtérnek a légijárművek fel és leszállására valamint gurulására használandó része a forgalmi előterek kivételével.
Műszeres időjárási körülmények — Instrument meteorological conditions (IMC)
Látástávolsággal, felhőzettől mért távolsággal és felhőalappal kifejezett időjárási körülmények, amelyek a látás utáni időjárási körülményekre meghatározott minimum értékeknél alacsonyabbak.
Megjegyzés: A látás utáni időjárási körülményekre meghatározott minimum értékeket a 2. Annex tartalmazza.
Naptár – Calendar
Meghatározott időbeli vonatkozási rendszer, amely valamely időpont egynapos pontossággal történő meghatározásához szolgál alapul (ISO19108*).
Nemzetközi NOTAM iroda — International NOTAM office
Egy Állam által a NOTAM értesítések nemzetközi cseréjére kijelölt iroda.
NOTAM
Bármely légiforgalmi berendezés, szolgálat, eljárás állapotáról, változásáról, létrehozásáról vagy veszély fennállásáról szóló távközléssel közzétett értesítés, amelynek időben való ismerete a légijármű üzemeltetésével foglalkozó személyek részére alapvetően szükséges.
Nyomtatott formájú közleményváltás — Printed communications
Olyan közleményváltás, ahol a rendszerbe tartozó egységek mindegyik terminálján automatikus nyomtatott feljegyzés készül a rendszeren áthaladó összes közleményről.
Összeütközés elkerülését biztosító fedélzeti rendszer — Airborne collision avoidance system (ACAS)
A másodlagos légtérfelderítő radar berendezés válaszjeladó egysége jeleinek alapján működő fedélzeti rendszer, amely a földi berendezésektől függetlenül működve tájékoztatja a légijármű vezetőjét az SSR válaszjeladóval felszerelt, összeütközési veszélyt jelentő egyéb légijárművekről.
Pontosság — Accuracy
A számított vagy mért, valamint a tényleges érték egyezésének mértéke.
Megjegyzés: A mért helyzetadatok esetében a pontosságot általában a jelzett helyzethez viszonyított távolság értékben fejezik ki és a tényleges helyzet meghatározott valószínűséggel ezen belülre esik.
Rádió-távbeszélés — Radiotelephony
Olyan rádió-távközlési módszer, amelynek során az információcsere elsősorban szóbeli közleményváltással történik.
Repülésbiztonság-irányítási rendszer – Safety management system
A repülésbiztonság irányításának szisztematikus megközelítése, beleértve a szükséges szervezeti struktúrákat, felelősségre vonhatóságokat, irányelveket és eljárásokat.
Repülésbiztonsági program – Safety programme
A repülésbiztonság növelését célzó egységes szabályozások és tevékenységek összessége.
Repülési szint — Flight level
Meghatározott 1013.2 hectopascal (hPa) alap-nyomás értékhez viszonyított állandó atmoszférikus légnyomású felület, amely más ilyen felületektől meghatározott légnyomáskülönbséggel különül el.
1. Megjegyzés: Az egyezményes nemzetközi műlégkörnek megfelelően kalibrált nyomásmagasság-mérő:
a) QNH beállításra állítva tengerszint feletti magasság;
b) QFE beállításra állítva a QFE földfelszín feletti magasság;
c) 1013.2 hectopascal (hPa) beállításra állítva a repülési szint (FL) kijelzésére használható.
2. Megjegyzés: A fenti 1. megjegyzésben használt tengerszint és földfelszín feletti magasság kifejezések inkább barometrikus, azaz nyomásmagasságot, mint geometrikus, azaz földméréssel számított terepmagasságot jelentenek.
Repülési terv — Flight plan
A légiforgalmi szolgálati egységek rendelkezésére bocsátott, a légijármű tervezett repülésére vagy a repülés egy szakaszára vonatkozó meghatározott tájékoztatás.

* Valamennyi ISO szabvány a jelen fejezet végén kerül felsorolásra.

Megjegyzés: A repülési tervre vonatkozó előírások a 2. Annexben találhatók. A „repülési terv űrlap" kifejezés a PANS-ATM 2. Függelékében található repülési terv mintát jelzi.
Repüléstájékoztató körzet — Flight information region
Meghatározott kiterjedésű légtér, amelyen belül repüléstájékoztató és riasztó szolgálatot biztosítanak.
Repüléstájékoztató központ — Flight information centre
Repüléstájékoztató és riasztó szolgálat biztosítására létrehozott egység.
Repüléstájékoztató szolgálat — Flight information service
A repülések biztonságos és eredményes végrehajtásához hasznos tanácsok és tájékoztatások nyújtása céljából biztosított szolgálat.
Repülőtér — Aerodrome
Szárazföldön vagy vízfelszínen kijelölt terület (beleértve bármely épületet, létesítményt és berendezést), amelyet egészében vagy részben a légijárművek érkezésére, indulására és felszíni mozgására kívánnak felhasználni.
Repülőtéri forgalom — Aerodrome traffic
A repülőtér munkaterületén üzemelő összes légijármű és egyéb járművek valamint a repülőtér körzetében repülő összes légijármű forgalma.
Megjegyzés: A repülőtér körzetében repülő légijárművökön a repülőtér forgalmi körén működő, az oda besoroló és az onnan kilépő légijárművek értendők.
Repülőtéri irányító szolgálat — Aerodrome control service
A repülőtéri forgalom számára létesített légiforgalmi irányító szolgálat.
Repülőtéri irányító torony — Aerodrome control tower
A repülőtéri forgalom számára légiforgalmi irányító szolgálat biztosítása céljából létesített egység.
Riasztás állapota — Alert phase
Olyan helyzet, amelyben egy légijármű és annak fedélzetén tartózkodó személyek biztonságával kapcsolatosan kétség áll fenn.
Riasztó szolgálat — Alerting service
A kutatásra és mentésre szoruló légijárművek vonatkozásában a megfelelő szervek értesítésére és szükség esetén az ezekkel történő együttműködésre létesített szolgálat.
SIGMET tájékoztatás — SIGMET information
A meteorológiai hivatal figyelő szolgálata által kiadott olyan meghatározott, az útvonalon várható vagy ténylegesen előforduló időjárási jelenségekről szóló tájékoztatás, amelyek befolyásolhatják a légijárművek üzemeltetésének biztonságát.
Szint — Level
A levegőben levő légijármű függőleges helyzetére vonatkozó általános kifejezés, amely jelenthet földfelszín feletti vagy tengerszinthez viszonyított magasságot, illetve repülési szintet.
Tanácsadói légtér — Advisory airspace
Meghatározott kiterjedésű légtér vagy kijelölt útvonal, amelyen belül légiforgalmi tanácsadói szolgálat áll rendelkezésre.
Tanácsadói útvonal — Advisory route
Kijelölt légiútvonal, amelyen légiforgalmi tanácsadói szolgálat áll rendelkezésre.
Tengerszint feletti magasság — Altitude
Egy szint, egy pont vagy egy tárgy a közepes tengerszinthez viszonyított függőleges magassága.
Területi navigáció — Area navigation (RNAV)
Olyan navigációs módszer, amely lehetővé teszi, hogy a légijármű a földi állomásokon alapuló navigációs berendezések fedésterületén belül vagy saját önálló navigációs eszközei lehetőségeinek határain belül illetve ezek kombinációjával bármely kívánt repülési pályát kövessen.
Területi navigációs útvonal — Area navigation route
Területi navigáció végrehajtására képes légijárművek részére kijelölt légiforgalmi szolgálati útvonal.
Utazómagasság — Cruising level
Az a repülési szint, amelyet a légijármű a repülés jelentős szakasza során tart.
Útirány — Track

A légijármű repülési útvonalának vetülete a föld felületén, amelynek földrajzi irányát bármely adott pontban általában északhoz (földrajzi, mágneses vagy földrajzi hálózati) viszonyítva határozzák meg.
Útvonal pont — Way-point
Meghatározott földrajzi hely, amelyet valamely területi navigációs útvonal vagy egy területi navigációt alkalmazó légijármű repülési útvonalának meghatározására használnak. Az útvonal pont lehet:
Oldalirányú érintésű útvonal pont (fly-by way-point) — Olyan útvonal pont, ahol a következő útvonal vagy eljárás szakasz érintő menti eléréséhez előzetesen számított forduló szükséges.
Ténylegesen átrepült útvonal pont (flyover way-point) — Olyan útvonal pont, amelynél a következő útvonal vagy eljárás szakasz eléréséhez fordulót kezdenek.
Végső megközelítés — Final approach
A műszeres megközelítési eljárás azon szakasza, amely a kijelölt végső megközelítési pontnál, vagy ahol ilyen pontot nem jelöltek ki:
a) az utolsó eljárás-forduló, az alap forduló vagy a lóversenypálya alakú várakozási eljárás rárepülési fordulójának végén, ha ilyet kijelöltek; vagy
b) a megközelítési eljárásban meghatározott utolsó földrajzi útirány elérési pontjánál
kezdődik; és a repülőtér közelében ott ér véget, ahonnan:
1) a leszállás végrehajtható; vagy
2) megszakított megközelítési eljárás kezdeményezhető.
Veszély állapota — Distress phase
Olyan tényleges helyzet, amelyben okkal feltételezhető, hogy egy légijárművet és annak fedélzetén tartózkodó személyeket súlyos és közvetlen veszély fenyegeti, vagy azonnali segítségre szorul(nak).
VFR
A látvarepülési szabályok szerint történő üzemeltetés jelzésére használt rövidítés.
VFR repülés — VFR flight
A látvarepülési szabályok szerint végrehajtott repülés.
VMC — Visual Meteorological Conditions
A látás utáni időjárási körülmények jelzésére alkalmazott rövidítés.

* ISO szabványok
19104 – *Földrajzi tájékoztatás – Terminológia*
19108 – *Földrajzi tájékoztatás – Időbeli minták*

2. Fejezet
Általános rész

2.1 Az illetékesség meghatározása

2.1.1 A szerződő Államok a jelen Annex előírásai alapján és a joghatóságuk alá tartozó területekre vonatkozóan határozzák meg azokat a légtérszakaszokat és azokat a repülőtereket, ahol légiforgalmi szolgálatokat biztosítanak. Ezt követően a jelen Annex előírásainak megfelelően intézkedjenek ezen szolgálatok létesítéséről és fenntartásáról, hacsak közös megegyezés alapján az egyik Állam a másik Államra át nem ruházza a légiforgalmi szolgálatok létesítésének és biztosításának felelősségét azokban a repüléstájékoztató körzetekben, irányítói körzetekben vagy repülőtéri irányítói körzetekben, amelyek a saját felségterülete felett helyezkednek el.
Megjegyzés: Ha egy Állam saját területe felett egy másik Államra ruházza át a légiforgalmi szolgálatok biztosításának felelősségét, azt a saját nemzeti szuverenitásának megsértése nélkül teszi. Hasonlóképpen, a légiforgalmi szolgálatokat biztosító Állam felelőssége műszaki és üzemeltetési szempontokra korlátózódik, és nem terjed túl az érintett légteret használó légijárművek biztonságának és hatékony

működésének biztosításán. Továbbá, a légiforgalmi szolgálatokat biztosító Államnak ezen szolgálatok ellátásakor a felelősséget átruházó Állam területén érvényes követelményeknek megfelelően kell eljárnia és az átruházó Államtól elvárják, hogy olyan berendezéseket és szolgáltatásokat biztosítson a légiforgalmi szolgálatokat ellátó ország számára, amelyek szükségességében kölcsönösen megegyeztek. Ezeken felül, az is elvárt, hogy a felelősséget átruházó Állam ne vonja meg, szüntesse be vagy ne módosítsa ezeket a berendezéseket és szolgáltatásokat a szolgáltatásokat biztosító Állammal történő előzetes egyeztetés nélkül. Mind a felelősséget átruházó, mind a légiforgalmi szolgálatokat biztosító Állam bármikor felbonthatja a kettőjük közötti megállapodást.
2.1.2 A nyílt tengerek feletti légterek vagy a nem meghatározott állami hovatartozású légterek azon részeit, ahol légiforgalmi szolgálatokat biztosítanak, a körzeti légiközlekedési egyezmények alapján határozzák meg. A légterek ilyen részein a légiforgalmi szolgálatok biztosításának felelősségét elfogadó szerződő Állam a szolgálatok létesítéséről és biztosításáról a jelen Annex előírásai szerint intézkedjen.
1. Megjegyzés: A „körzeti légiközlekedési egyezmények" kifejezés azokra az egyezményekre utal, amelyeket az ICAO Tanácsa rendszerint a Körzeti Légiközlekedési Értekezletek javaslatára fogad el.
2. Megjegyzés: A jelen Annex előszavának elfogadása alkalmával a Tanács jelezte, hogy az a szerződő Állam, amely a nyílt tengerek, vagy meg nem határozott állami hovatartozású légterek felett a légiforgalmi szolgálatok biztosításának felelősségét elfogadta, a nemzetközi előírásokat és ajánlott gyakorlati eljárásokat a saját illetékességi területe feletti légtérnél elfogadottakkal megegyezően alkalmazhatja.
2.1.3 Amennyiben úgy határoztak, hogy légiforgalmi szolgálatokat biztosítanak, az érintett államok jelöljék ki az ilyen szolgálatok biztosításáért felelős hatóságot.
1. Megjegyzés: A szolgálatok létesítéséért és üzemeltetéséért felelős hatóság lehet állami szervezet vagy erre alkalmas vállalat is.
2. Megjegyzés: Azok a lehetőségek, amelyek egy nemzetközi repülés egy részére vagy teljes egészére vonatkozóan a légiforgalmi szolgálatok létesítésére és üzemeltetésére vonatkoznak, a következők:
Első lehetőség: *Az útvonal vagy útvonalszakasz olyan Állam fennhatósága alá tartozó légtéren belül van, amelyen belül az saját légiforgalmi szolgálatokat alakít ki és tart fenn.*
Második lehetőség: *Az útvonal vagy útvonalszakasz olyan Állam fennhatósága alá tartozó légtéren belül van, amelyen belül ez az Állam közös megegyezés alapján egy másik Államra ruházta át a légiforgalmi szolgálatok kialakításának és fenntartásának felelősségét.*
Harmadik lehetőség: *Az útvonalszakasz nyílt tenger vagy olyan meg nem határozott nemzeti hovatartozású légtéren belül van, amelyre vonatkozóan egy Állam elfogadta a légiforgalmi szolgálatok kialakításának és fenntartásának felelősségét.*
A jelen Annex alkalmazásában az Állam, amely kijelöli a légiforgalmi szolgálatok létesítéséért és biztosításáért felelős hatóságot:
— az első esetben *az az Állam, amely fennhatósággal rendelkezik adott légtérszakasz felett;*
— a második esetben *az az Állam, amelyre a légiforgalmi szolgálatok létesítésének és biztosításának felelősségét átruházták;*
— a harmadik esetben *az az Állam, amely elfogadta a légiforgalmi szolgálatok létesítésének és biztosításának felelősségét.*
2.1.4 Ahol légiforgalmi szolgálatokat létesítettek, erről szükség szerint tegyenek közzé tájékoztatást, hogy lehetővé tegyék a szolgálatok igénybevételét.

2.2 A légiforgalmi szolgálatok céljai

A légiforgalmi szolgálatok céljai a következők:

a) összeütközések megelőzése a légijárművek között;

b) összeütközések megelőzése munkaterületeken a légijárművek valamint az ott található akadályok között;

c) a légiforgalom rendezett áramlásának elősegítése és fenntartása;

d) a repülések biztonságos és hatékony lebonyolításához hasznos tanácsok és tájékoztatások adása;

e) az illetékes szervezetek értesítése a kutatási és mentési segítségre szoruló légijárműről, továbbá szükség szerint segítség-nyújtás ezen szervezetek számára.

2.3 A légiforgalmi szolgálatok felosztása

A légiforgalmi szolgálatok a következő három szolgálatot foglalják magukba:
2.3.1 A *légiforgalmi irányító szolgálat* a 2.2 pont a), b) és c) alpontjában ismertetett feladatok ellátására, amely a következő három egységre tagolódik;

a) Körzeti irányító szolgálat

ellenőrzött repülések részére légiforgalmi irányítás nyújtása céljából létesített szolgálat a 2.2 pont a) és c) feladatainak ellátására, kivéve ezeknek a repüléseknek az alábbi b) és c) alpontokban meghatározott szakaszait;

b) Bevezető irányító szolgálat

ellenőrzött repülések érkezési és indulási szakaszaiban légiforgalmi irányítás nyújtása céljából létesített szolgálat a 2.2 pont a) és c) feladatainak ellátására,

c) Repülőtéri irányító szolgálat

repülőtéri forgalom részére légiforgalmi irányítás nyújtása céljából létesített szolgálat, a 2.2 pont a), b) és c) feladatainak ellátására, a fenti 2.3.1 b) alpontban ismertetett repülési szakaszok kivételével.

2.3.2 *Repüléstájékoztató szolgálat* a 2.2 pont d) alpontjában ismertetett feladatok ellátására.

2.3.3 *Riasztó szolgálat* a 2.2 pont e) alpontjában ismertetett feladatok ellátására.

2.4 Légiforgalmi szolgálatok szükségességének meghatározása

2.4.1 A légiforgalmi szolgálatok biztosításának szükségességét az alábbiak figyelembevételével határozzák meg:
a) a terület felett üzemelő légiforgalom típusai;
b) a légiforgalom sűrűsége;
c) az időjárási körülmények;
d) egyéb, lényeges tényezők.
Megjegyzés: A figyelembe veendő tényezők nagy száma miatt a légiforgalmi szolgálatok egy adott területen vagy helyen történő biztosításának szükségességére vonatkozóan általánosan meghatározott adatokat megállapítani nem lehetséges. Például:

a) a különböző típusokkal üzemelő légiforgalom összetétele, különböző repülési sebességű légijárművek (hagyományos, sugárhajtású, stb.), szükségessé tehetik a légiforgalmi szolgálatok biztosítását ott, ahol egy viszonylag nagyobb sűrűségű, azonban csak egy üzemeltetési típusú forgalom ezt nem tenné szükségessé;

b) az időjárási körülmények hatása nagy jelentőségű lehet olyan területeken, ahol a légiforgalom áramlása állandó jellegű (például menetrendszerű forgalom), míg hasonló vagy rosszabb meteorológiai körülmények viszonylag kevésbé lehetnek fontosak olyan területen, ahol a repülés ilyen körülmények között megszakítható (például helyi VFR repülések);

c) a nagy kiterjedésű vízfelületek, hegyes, lakatlan vagy sivatagos területek szükségessé tehetik légiforgalmi szolgálatok biztosítását még akkor is, ha repülések gyakorisága rendkívül ritka.

2.4.2 Egy adott területen belül a légiforgalmi szolgálatok szükségességének meghatározása alkalmával nem lehet tényezőként figyelembe venni a légijárművek összeütközés elkerülését biztosító fedélzeti rendszerrel (ACAS) történő felszerelését.

2.5 Azon légtérszakaszok és ellenőrzött repülőterek minősítése, amelyekben légiforgalmi szolgálatokat biztosítanak

2.5.1 A légtér adott szakaszaiban vagy egyes repülőtereken légiforgalmi szolgálat biztosításáról szóló döntés meghozatala után, a légterek ezen szakaszait vagy a repülőtereket a létesítendő légiforgalmi szolgálatoknak megfelelően minősíteni kell.
2.5.2 A légtér meghatározott szakaszai vagy az adott repülőterek a következők alapján minősítendők:

2.5.2.1 *Repüléstájékoztató körzetek* — A légtér azon szakaszait, amelyekben repüléstájékoztató és riasztó szolgálat biztosítását határozták el, repüléstájékoztató körzetnek minősítsék.
2.5.2.2 *Ellenőrzött légterek és irányítói körzetek*
2.5.2.2.1 A légtér azon szakaszait, amelyekben a műszerrepülési szabályok szerint üzemeltetett légijárművek részére légiforgalmi irányító szolgálat biztosítását határozták el, irányítói körzeteknek vagy repülőtéri irányító körzetnek minősítsék.
Megjegyzés: Az irányítói körzetek és a repülőtéri irányító körzetek közötti különbséget a 2.10 pontban ismertetjük.
2.5.2.2.1.1 Az ellenőrzött légtér azon szakaszait, amelyekben a látvarepülési szabályok szerint üzemeltetett légijárművek részére is elhatározták a légiforgalmi irányító szolgálat biztosítását, „B”, „C” vagy „D” osztályú légtérnek minősítsék.
2.5.2.2.2 Egy repüléstájékoztató körzeten belül kijelölt ellenőrzött légterek és irányító körzetek ennek a repüléstájékoztató körzetnek a részét képezzék.
2.5.2.3 *Ellenőrzött repülőterek* — Azokat a repülőtereket, amelyeken a repülőtéri forgalom részére légiforgalmi irányító szolgálat biztosítását határozták el, ellenőrzött repülőtérnek minősítsék.

2.6 A légterek osztályozása

2.6.1 Az légiforgalmi szolgálat légtereit az alábbiak szerint osztályozzák és jelöljék ki:
A. osztály — A légtérben csak IFR repüléseket engedélyeznek, az összes légijármű részére légiforgalmi irányító szolgálatot biztosítanak és az összes légijárművet elkülönítik egymástól.
B. osztály — A légtérben IFR és VFR repüléseket engedélyeznek, az összes légijármű részére légiforgalmi irányító szolgálatot biztosítanak és az összes légijárművet elkülönítik egymástól.
C. osztály — A légtérben IFR és VFR repüléseket engedélyeznek, az összes légijármű részére légiforgalmi irányító szolgálatot biztosítanak és az IFR légijárműveket elkülönítik egymástól, valamint a VFR légijárművektől; a VFR légijárműveket elkülönítik az IFR légijárművektől továbbá a VFR légijárművek tájékoztatást kapnak a többi VFR légijárműről.
D. osztály — A légtérben IFR és VFR repüléseket engedélyeznek, az összes légijármű részére légiforgalmi irányító szolgálatot biztosítanak. Az IFR légijárműveket elkülönítik egymástól és azok tájékoztatást kapnak a VFR légijárművekről. A VFR légijárművek tájékoztatást kapnak az összes egyéb légijárműről.
E. osztály — A légtérben IFR és VFR repüléseket engedélyeznek, az IFR légijárművek részére légiforgalmi irányító szolgálatot biztosítanak és elkülönítik azokat a többi IFR légijárműtől. Amennyire ez gyakorlati szempontból lehetséges, minden légijármű forgalmi tájékoztatást kap. A repülőtéri irányítói körzetek esetében az E osztály nem használható.
F. osztály — A légtérben IFR és VFR repüléseket engedélyeznek, minden IFR légijármű részére légiforgalmi tanácsadói szolgálatot és kérésre minden légijármű részére repüléstájékoztató szolgálatot biztosítanak.
Megjegyzés: Ahol légiforgalmi tanácsadó szolgálatot létesítenek, ezt általában a légiforgalmi irányító szolgálattal történő felváltásig csak ideiglenes intézkedésnek tekintik. (Lásd még PANS-ATM 9. fejezet).
G. osztály — A légtérben IFR és VFR repüléseket engedélyeznek és kérésre minden légijármű részére repüléstájékoztató szolgálatot biztosítanak.
2.6.2 Az Államok válasszanak ki igényeiknek megfelelő osztályú légtereket.
2.6.3 Az egyes légtérosztályokban történő repülésekre vonatkozó előírásokat a 4. Függelékben található táblázatban mutatjuk be.
Megjegyzés: Ahol az ATS légterek függőlegesen határosak, azaz egymás felett helyezkednek el, a közös magasságon végrehajtott repülések a kevésbé szigorú légtérosztály követelményeinek tegyenek eleget és részükre a kevésbé szigorú légtérben nyújtott szolgálatot biztosítsák. Így ezen követelmények alkalmazásakor a B osztályú légteret kevésbé szigorúnak tekintik az A osztályúhoz viszonyítva; a C osztályú légteret kevésbé szigorúnak tekintik a B osztályúhoz viszonyítva és így tovább.

2.7 Előírt navigációs teljesítmény (RNP) útvonalrepülésnél

2.7.1 Az RNP típusokat az Államok határozzák meg. Amikor lehetséges, a kijelölt területek, földrajzi

útirányok vagy légiforgalmi szolgálati útvonalak RNP típusait a körzeti légiközlekedési egyezmények alapján írják elő.
2.7.2 ***Ajánlás*** *— A repülés útvonalrepülési szakaszára az RNP1, RNP4, RNP 10, RNP12.6 valamint az RNP20 típusok a lehető legrövidebb időn belül kerüljenek bevezetésre.*
2.7.3 Az előírt navigációs teljesítmény (RNP) típusa feleljen meg az érintett légtérben biztosított távközlési, léginavigációs és légiforgalmi szolgálatok színvonalának.
Megjegyzés: Az alkalmazható RNP típusok és a hozzájuk kapcsolódó eljárások az *Előírt Navigációs Teljesítmény (RNP) Kézikönyvben* (Doc 9613) találhatók.

2.8 Előírt kommunikációs teljesítmény (RCP)

2.8.1 Az RCP típusokat az Államok határozzák meg. Amikor lehetséges, az RCP típus(oka)t a körzeti légiközlekedési egyezmények alapján írják elő.
2.8.2 Az előírt kommunikációs teljesítmény (RCP) típusa feleljen meg az érintett légtérben biztosított légiforgalmi szolgálatok színvonalának.
Megjegyzés Az alkalmazható RCP típusok és a hozzájuk kapcsolódó eljárások az *Előírt Kommunikációs Teljesítmény (RCP) Kézikönyvben* (Doc 9869) lesznek megtalálhatók (kidolgozás alatt).

2.9 A légiforgalmi szolgálatokat biztosító egységek létesítése és kijelölése

A légiforgalmi szolgálatokat a következők alapján létrehozott és kijelölt egységek biztosítják:
2.9.1 A repüléstájékoztató körzeteken belül a repüléstájékoztató és riasztó feladatok ellátására létesítsenek repüléstájékoztató központokat, kivéve, ha egy repüléstájékoztató körzetben ezen szolgálatok ellátásának felelősségét egy olyan légiforgalmi irányító szolgálati egységre ruházták át, amely az ilyen feladatok ellátására megfelelő felszereltséggel rendelkezik.
Megjegyzés: Ez nem zárja ki annak lehetőségét, hogy a repüléstájékoztató szolgálat bizonyos feladatainak ellátását más egységekre ruházzák át.
2.9.2 Az ellenőrzött légtereken és irányító körzeteken belül, továbbá az ellenőrzött repülőtereken a légiforgalmi irányítói, a repüléstájékoztató és riasztó szolgálatok ellátására létesítsenek légiforgalmi irányító egységeket .
Megjegyzés A különböző légiforgalmi irányító egységek által biztosított szolgálatokat a 3.2 pontban ismertetjük.

2.10 Repüléstájékoztató körzetekre, irányítói körzetekre és repülőtéri irányító körzetekre vonatkozó előírások

2.10.1 ***Ajánlás*** *— Azon légtér határainak kijelölése, amelyben légiforgalmi szolgálatokat biztosítanak, inkább az útvonalszerkezet természete és a hatékony szolgálat biztosításának követelményei, mint a nemzeti (ország) határok szerint történjen.*
1. Megjegyzés: Amennyiben ez a légiforgalmi szolgálatok biztosítását megkönnyíti, tanácsos olyan egyezményeket kötni, amelyek tartalma lehetővé teszi egy légtér nemzeti határokon átnyúló kijelölését (lásd 2.1.1). Azon egyezmények például, amelyek lehetővé teszik a légtérhatárok egyenes vonallal történő meghúzását, nagyon kedvezőek az adatfeldolgozási módszereket alkalmazó légiforgalmi szolgálati egységek esetében.
2. Megjegyzés: Ahol a légtér határainak kijelölése az országhatárok szerint történik, szükség van megfelelő helyen levő átadási pontok közös megegyezéssel történő meghatározására is.
2.10.2 Repüléstájékoztató körzetek
2.10.2.1 A repüléstájékoztató körzeteket úgy jelöljék ki, hogy azok fedjék az ilyen körzetek által meghatározott teljes útvonalszerkezetet.
2.10.2.2 A repüléstájékoztató körzet oldalsó határain belül az egész légteret foglalja magába, kivéve, ha azt felülről egy magaslégtéri repüléstájékoztató körzet határolja.
2.10.2.3 Ahol a repüléstájékoztató körzetet magaslégtéri repüléstájékoztató körzet határolja, a

magaslégtéri repüléstájékoztató körzet alsó határa legyen azonos a repüléstájékoztató körzet felső függőleges határával és essen egybe a 2. Annex 3. Függelék táblázataiban ismertetett VFR utazómagasságok egyikével.
Megjegyzés: Azokban az esetekben, amikor magaslégtéri repüléstájékoztató körzetet létesítettek, az ott alkalmazandó eljárásoknak nem szükségesek azonosnak lenniük magaslégtéri repüléstájékoztató körzet alatt elhelyezkedő repüléstájékoztató körzetben alkalmazandó eljárásokkal.
2.10.3 Irányítói körzetek
2.10.3.1 A *többek között* útvonalakat, valamint közelkörzeteket magukba foglaló irányítói körzetek határait úgy jelöljék ki, hogy azok olyan megfelelő nagyságú légtérrel rendelkezzenek, amelyek magukba foglalják azokat a műszerrepülési szabályok szerint végrehajtott repülések számára kijelölt útvonalakat vagy útvonal szakaszokat, melyek a területen általában alkalmazott navigációs berendezések lehetőségeit figyelembe véve, a légiforgalmi irányító szolgálatok megfelelő egységeinek működéséhez kívánatosak.
Megjegyzés: Abban az irányítói körzetben, amelyet nem útvonalrendszer alapján alakítottak ki, létesíthetnek olyan útvonalrendszert, amely lehetővé teszi a légiforgalmi irányító szolgálat biztosítását.
2.10.3.2 Az irányítói körzet alsó határát talaj vagy vízfelszín felett legalább 200 méter (700 láb) magasság felett jelöljék ki.
Megjegyzés: Ez nem jelenti azt, hogy egy adott irányító körzeten belül az alsó határt egységesen kell kijelölni (lásd a *Légiforgalmi Szolgálatok Tervezési Kézikönyve* (Doc 9426) I. Rész, 2. Kötet, 3. Fejezet: A-5 ábra).
2.10.3.2.1 ***Ajánlás** — Amikor lehetséges és kívánatos, hogy az irányítói körzet alatt a VFR repülések számára szabad működést biztosítsanak, az ellenőrzött légtér alsó határát a 2.10.3.2 pontban meghatározott minimumnál magasabban jelöljék ki.*
2.10.3.2.2 ***Ajánlás** — Amikor az irányítói körzet alsó határa 900 m (3000 láb) közepes tengerszint feletti magasság felett van, akkor az a 2. Annex 3. Függelékben ismertetett VFR utazómagasságok egyikével essen egybe.*
Megjegyzés: Ebből következik, hogy olyan VFR utazómagasságot válasszanak ki, amelynél a várható helyi atmoszférikus nyomásváltozások ne okozzák ennek a magasságnak talaj vagy vízfelszín felett 200 méter (700 láb) értéknél alacsonyabbra történő csökkenését.
2.10.3.3 Az irányító körzet felső határát akkor határozzák meg, ha:
a) ezen felső határ felett légiforgalmi irányító szolgálatot nem biztosítanak; vagy
b) az irányítói körzet magaslégtéri irányítói körzet alatt helyezkedik el, amely esetben a felső határ essen egybe a magaslégtéri irányítói körzet alsó határával.
Amennyiben ilyen felső határt jelöltek ki, az essen egybe a 2. Annex 3. Függelékben ismertetett VFR utazómagasságok egyikével.
2.10.4 Magaslégtéri repüléstájékoztató vagy irányító körzetek
***Ajánlás** —Ahol kívánatos azon repüléstájékoztató körzetek vagy irányítói körzetek számának korlátozása, amelyeken a nagyobb repülési magasságon üzemelő légijárműveknek egyébként át kellene repülniük, a repüléstájékoztató körzet vagy irányítói körzet határát úgy jelöljék ki, hogy az több, alatta elhelyezkedő repüléstájékoztató körzetet vagy irányítói körzetet fedjen.*
2.10.5 Repülőtéri irányító körzetek
2.10.5.1 A repülőtéri irányító körzetek oldalsó határai foglalják magukba legalább a légtér nem irányító körzeten belül eső azon szakaszait, amelyek fedik a repülőtéren műszeres időjárási körülmények között műszerrepülési szabályok szerint üzemeltetett érkező és induló légijárművek repülési pályáját.
Megjegyzés: A repülőterek közelében várakozó légijárművek érkezőnek tekintendők.
2.10.5.2 A repülőtéri irányító körzetek oldalsó határai az adott repülőtér vagy repülőterek középpontjától legalább 9.3 km (5 tmf) távolságra terjedjenek azokba az irányokba, amelyekből a megközelítések végrehajthatók.
Megjegyzés: Egy repülőtéri irányító körzet két vagy több, egymáshoz közel elhelyezkedő repülőteret is magába foglalhat.
2.10.5.3 Ha a repülőtéri irányító körzetet az irányító körzet oldalsó határain belül létesítették, akkor az függőlegesen a talaj szintjétől legalább az irányító körzet alsó határáig terjedjen.

Megjegyzés: Amennyiben ez kívánatos, a repülőtéri irányító körzet felső határa a felette elhelyezkedő irányító körzet alsó határánál magasabban is kijelölhető.
2.10.5.4 ***Ajánlás*** *— Ha a repülőtéri irányító körzet az irányító körzet oldalsó határain kívül helyezkedik el, jelöljenek ki felső határt.*
2.10.5.5 ***Ajánlás*** *— Amennyiben kívánatos, hogy a repülőtéri irányító körzet felső határát magasabban jelöljék ki, mint a felette elhelyezkedő irányító körzet alsó határa, vagy ha a repülőtéri irányító körzet az irányító körzet oldalsó határán kívül fekszik, annak felső határát úgy határozzák meg, hogy az a repülőgép-vezetők számára jól azonosítható legyen. Ha ez a határ 900 m (3000 láb) közepes tengerszint feletti magasság felett van, akkor lehetőleg essen egybe a 2. Annex 3. Függelékben ismertetett VFR utazómagasságok egyikével.*
Megjegyzés: Ezen pont alkalmazása esetén olyan VFR utazómagasságot válasszanak, amelynél a várható helyi atmoszférikus nyomásváltozások ne eredményezzék ennek a magasságnak talaj vagy vízfelszín felett 200 méter (700 láb) értéknek alacsonyabbra történő csökkenését.

2.11 A légiforgalmi szolgálati egységek és légterek elnevezése

2.11.1 ***Ajánlás*** *— A körzeti irányító központot vagy repüléstájékoztató központot egy közeli városról vagy földrajzi jellegzetességről nevezzék el.*
2.11.2 ***Ajánlás*** *— A repülőtéri irányítótornyot vagy bevezető irányító egységet arról a repülőtérről nevezzék el, ahol azt létesítették.*
2.11.3 ***Ajánlás*** *— A repülőtéri irányító körzetet, az irányító vagy repüléstájékoztató körzetet az adott légtér felett felügyeletet gyakorló egység nevével azonosítsák.*

2.12 A légiforgalmi szolgálati útvonalak létesítése és elnevezése

2.12.1 Amikor légiforgalmi szolgálati útvonalakat jelölnek ki, minden egyes ATS útvonal mentén határozzanak meg védett (biztonsági) légtereket és biztosítsák a szomszédos ATS útvonalak közötti megfelelő elkülönítést.
2.12.2 ***Ajánlás*** *— Amikor a légiforgalom sűrűsége, összetettsége vagy természete indokolja, az alacsony repülési magasságon üzemelő légiforgalom részére — beleértve a nyílt vizeken létesített helikopter leszállóhelyekre/ről üzemelő forgószárnyas légijárműveket is — jelöljenek ki különleges útvonalakat. Az ilyen útvonalak közötti oldalirányú távolság meghatározása alkalmával vegyék figyelembe a forgószárnyas légijármű fedélzetén elhelyezett navigációs berendezéseket és rendelkezésre álló navigációs eszközöket is.*
2.12.3 Az ATS útvonalakat elnevezéssel azonosítsák.
2.12.4 Az ATS útvonalak elnevezését a szabvány indulási és érkezési útvonalak kivételével az 1. Függelék alapelvei szerint határozzák meg.
2.12.5 A szabvány indulási és érkezési útvonalakat valamint az azokkal kapcsolatos eljárásokat a 3. Függelék alapelvei szerint azonosítsák.
1. Megjegyzés: A légiforgalmi szolgálati útvonalak létesítésével kapcsolatos útmutató a *Légiforgalmi Szolgálati Tervezési Kézikönyvben* (Doc 9426) található.
2. Megjegyzés: A VOR berendezéssel meghatározott ATS útvonalak létesítésével kapcsolatos útmutató az A. Mellékletben található.
3. Megjegyzés: Az olyan párhuzamos útirányok vagy ATS útvonal középvonalak közötti oldaltávolság, amelyeknél előírt navigációs teljesítmény típus kijelölése szükséges, a meghatározott RNP típustól függ. A területi navigációs berendezéssel (RNAV) felszerelt légijárművek számára kijelölt ATS útvonalakra valamint az RNP típus alapján meghatározott útvonalak közötti elkülönítésre vonatkozó tájékoztató anyag a B. Mellékletben található.

2.13 Átkapcsolási pontok kijelölése

2.13.1 ***Ajánlás*** *—Azokon a VOR berendezésekkel kijelölt légiforgalmi szolgálati útvonal szakaszokon, ahol ez az adott útvonal szakasz mentén segítheti a pontos navigációt, jelöljenek ki átkapcsolási pontokat. Az átkapcsolási pontok kijelölését kívánatos 110 km-es (60 tmf) vagy ennél hosszabb útvonalszakaszokra*

korlátozni, kivéve ha az ATS útvonalak bonyolultsága, a navigációs berendezések sűrűsége vagy más műszaki illetve üzemeltetési szempontok az átkapcsolási pontok rövidebb útvonalszakaszokon történő kijelölését is indokolják.
2.13.2 ***Ajánlás*** *— Amennyiben a navigációs berendezések teljesítménye vagy a rádió frekvencia tartományok védelme mást nem tesz szükségessé, az útvonalszakaszon az átkapcsolási pontot a két berendezés között egyenes útvonalszakasznál félúton, illetve olyan VOR radiálok esetében, ahol az útvonal iránya megváltozik, azok kereszteződésénél jelöljék ki.*
Megjegyzés: Az átkapcsolási pontok kijelölésével kapcsolatos tájékoztatót az A. Melléklet tartalmazza.

2.14 Fontos pontok kijelölése és elnevezése

2.14.1 A légiforgalmi szolgálati útvonalak meghatározására és/vagy a légiforgalmi szolgálatok azon igényeinek kielégítésére, hogy azok a levegőben levő légijármű mozgásáról megfelelő tájékoztatásokat szerezhessenek be, jelöljenek ki fontos pontokat.
2.14.2 A fontos pontokat elnevezéssel azonosítsák.
2.14.3 A fontos pontokat 2. Függelék alapelvei szerint jelöljék ki és nevezzék el.

2.15 Szabvány útvonalak kijelölése és elnevezése guruló légijárművek számára

2.15.1 ***Ajánlás*** *— Ahol ez szükséges, a guruló légijárművek részére szabvány útvonalakat határozzanak meg egy repülőtéren a futópályák, a forgalmi előterek és a karbantartási területek között. Ezek az útvonalak legyenek közvetlenek és egyszerűek, továbbá amennyiben lehetséges, ezeket úgy jelöljék ki, hogy a forgalmi konfliktusokat elkerüljék.*
2.15.2 ***Ajánlás*** *— A gurulást végző légijárművek részére meghatározott szabvány útvonalakat olyan azonosítóval lássák el, amelyek jól megkülönböztethetők a futópályák és a légiforgalmi szolgálati útvonalak megnevezéseitől.*

2.16 Együttműködés a járató és a légiforgalmi szolgálatok között

2.16.1 A légiforgalmi szolgálati egységek saját feladataik ellátása mellett vegyék figyelembe a járatóknak a 6. Annex-ben meghatározott kötelezettségeiből származó igényeit és kérésre a járatók vagy kijelölt képviselőik számára adják meg azokat a rendelkezésre álló tájékoztatásokat, amelyek lehetővé teszik ezen kötelezettségeik teljesítését.
2.16.2 Amennyiben a járató ezt kéri, a légiforgalmi szolgálati egységek az elfogadott helyi együttműködési eljárás alapján, a gyakorlati lehetőségek határain belül azonnal adják meg a járató vagy kijelölt képviselője számára azon légijármű üzemeltetésére vonatkozóan vett tájékoztatásokat (beleértve a helyzetjelentéseket is), amelynek a járató repülésüzemi irányítást biztosít.
Megjegyzés: A jogellenes beavatkozás alatt álló légijárművekre vonatkozókat lásd a 2.23.3 pontban.

2.17 Együttműködés a katonai hatóságok és a légiforgalmi szolgálatok között

2.17.1 A légiforgalmi szolgálatok hatóságai alakítsanak ki és tartsanak fenn szoros együttműködést azokért a tevékenységekért felelős katonai hatóságokkal, amelyek befolyásolhatják a polgári légijárművek repülését.
2.17.2 A polgári légijárművekre gyakorlati veszélyt jelentő tevékenységek egyeztetését a 2.18 pontban előírtaknak megfelelően végezzék.
2.17.3 Foganatosítsanak intézkedéseket annak érdekében, hogy a légiforgalmi szolgálati és az illetékes katonai egységek között azonnal kicserélhessék a polgári légijárművek repülésének biztonságos és hatékony lebonyolításához szükséges vonatkozó információkat.
2.17.3.1 A légiforgalmi szolgálati egységek, az elfogadott helyi együttműködési eljárásoknak megfelelően, a szokásos munkamenet részeként, vagy kérésre adják meg az illetékes katonai egységek számára a polgári légijárművek repülésére vonatkozó repülési terv- és egyéb adatokat. A polgári légijárművek elfogása szükségességének csökkentése vagy kiküszöbölése érdekében a légiforgalmi szolgálati hatóságok jelöljék ki azokat a területeket vagy útvonalakat, amelyeken a 2. Annex repülési

tervekre, kétirányú rádió-összeköttetés fenntartásra valamint a helyzetjelentésekre vonatkozó előírásai minden repülésre vonatkoznak, hogy a polgári légijárművek azonosítása érdekében minden szükséges adat az illetékes légiforgalmi szolgálati egységek rendelkezésére álljon.
Megjegyzés: A jogellenes beavatkozás alatt álló légijárművekre vonatkozókat lásd a 2.23.3 és 2.24.1.3 pontokban.
2.17.3.2 Vezessenek be különleges eljárásokat annak biztosítására, hogy:

a) a légiforgalmi szolgálati egységek kapjanak tájékoztatást arról, ha a katonai egység olyan ténylegesen vagy valószínűsíthetően polgári légijárművet figyel meg, amely egy olyan légteret közelít meg vagy lép be oda, amelyben elfogás válhat szükségessé;

b) tegyenek meg minden lehetséges intézkedést a kérdéses légijármű azonosítására és adják meg számára az elfogás elkerüléséhez szükséges összes navigációs tájékoztatást.

2.18 A polgári légijárművekre gyakorlati veszélyt jelentő tevékenységek egyeztetése

2.18.1 A polgári légijárművekre gyakorlati veszélyt jelentő tevékenységre vonatkozó intézkedéseket — függetlenül attól, hogy azok egy Állam területe vagy nyílt vizek felett történnek-e — egyeztessék az illetékes légiforgalmi szolgálati hatósággal. Az egyeztetést időben végezzék el ahhoz, hogy a vonatkozó tájékoztatásokat a 15. Annex előírásainak megfelelően időben közzétehessék.

2.18.1.1 ***Ajánlás*** *— Ha az illetékes légiforgalmi szolgálati hatóság nem annak az Államnak hatósága, ahol a tevékenységet tervező szervezet van, az előzetes egyeztetést azon légiforgalmi szolgálati hatóság útján végezzék el, amely azért a légtérért felelős, ahol a szervezet működik.*

2.18.2 Az egyeztetés célja a lehatásosabb intézkedések végrehajtása, amelyekkel elkerülhető a polgári légijármű veszélyeztetése és biztosítható az ilyen légijármű általános jellegű üzemeltetésének lehető legkisebb mértékű megzavarása illetve korlátozása.

2.18.2.1 ***Ajánlás*** *— Az ilyen intézkedések meghatározásánál a következőket hajtsák végre, illetve vegyék figyelembe:*

a) a tevékenység helyszíne(i) vagy területe(i), időpontjai valamint időtartama, amelyeket úgy válasszanak meg, hogy elkerüljék a légiforgalmi szolgálati útvonalak lezárását vagy átirányítását, a leginkább használatos repülési szintek használatának korlátozását vagy a menetrendszerű légiforgalom késleltetését, kivéve ha más lehetőség nincs;

b) a tevékenység végrehajtására kijelölt légtér méretét korlátozzák a lehető legkisebbre;

c) létesítsenek közvetlen összeköttetést az illetékes légiforgalmi szolgálati hatóság vagy egység valamint a tevékenységet végrehajtó szervezet vagy egység között arra az esetre, ha polgári légijárművek kényszerhelyzete vagy más, előre nem látható események miatt a tevékenység(ek) megszakítása válik szükségessé.

2.18.3 Az illetékes légiforgalmi szolgálati hatóságok felelősek a veszélyt jelentő tevékenységekkel kapcsolatos tájékoztatások közzétételéért.

2.18.4 ***Ajánlás*** *— Amennyiben a polgári légijárművekre tényleges veszélyt jelentő tevékenységek rendszeresek vagy folyamatosan ismétlődnek, szükség szerint hozzanak létre külön bizottságokat annak érdekében, hogy az együttműködés az összes érdekelt fél igényeinek megfelelően biztosítható legyen.*

2.18.5 *Foganatosítsanak megfelelő intézkedéseket a repülési üzemeltetést hátrányosan befolyásoló lézersugár kibocsátás megelőzésére.*

1. Megjegyzés: A repülési üzemeltetést hátrányosan befolyásoló lézersugár kibocsátásra vonatkozó tájékoztató anyag a Lézersugár Kibocsátás és Repülésbiztonság Kézikönyvben (Doc 9815) található.

2. Megjegyzés: Lásd továbbá 14. Annex — Repülőterek, I. kötet — Repülőtér tervezés és üzemeltetés 5. fejezetét.

2.18.6 **Ajánlás** — *A légtérkapacitás növelése, valamint a légijármű üzemeltetés hatékonyságának és rugalmasságának biztosítása érdekében az Államok dolgozzanak ki eljárásokat a katonai vagy más különleges tevékenységekre fenntartott légterek rugalmas felhasználására. Az eljárások tegyék lehetővé az összes légtérfelhasználó biztonságos belépését az ilyen fenntartott légtérbe.*

2.19 Léginavigációs adatok

2.19.1 A légiforgalmi szolgálatokra vonatkozó léginavigációs adatok meghatározását és közzétételét az 5. Függelék 1. — 5. táblázataiban található pontossági és megbízhatósági előírások szerint, a kidolgozott minőségbiztosítási eljárások figyelembevételével végezzék. A léginavigációs adatok pontossága 95 %-os megbízhatósági szintű legyen és ebben a vonatkozásban három típusú helyzetadatot azonosítsanak az alábbiak szerint: földméréssel felmért pontok (pl. a navigációs berendezések helyzete); számított pontok (a térben felmért pontok alapján matematikai számítással meghatározott állandó pontok); kijelölt és közzétett pontok (pl. repüléstájékoztató körzet határpontok).

Megjegyzés: A minőség-biztosítási rendszerre vonatkozó előírások a 15. Annex 3. fejezetében találhatók.

2.19.2 A szerződő Államok biztosítsák, hogy a léginavigációs adatok megbízhatósága az adatfeldolgozás során, a felméréstől vagy első számítástól a várható felhasználóig folyamatosan állandó legyen. A léginavigációs adatok megbízhatósági követelményeit az adat felhasználás során bekövetkező, lehetséges változását valamint az adatra vonatkozó felhasználói igényeket jelző kockázati tényező alapján határozzák meg. Ennek megfelelően a következő osztályozás és adat megbízhatósági szint alkalmazandó:

a) kritikus adat — megbízhatósági szint 1×10^{-8}*:* a hibás vagy pontatlan kritikus adat felhasználásánál nagy valószínűsége van annak, hogy egy légijármű biztonságos repülésének folytatása és a leszállás végrehajtása komoly veszélybe kerül, kockáztatva akár a légikatasztrófa lehetőségét is;

b) alapvető adat — megbízhatósági szint 1×10^{-5}*:* a hibás vagy pontatlan alapvető adat felhasználásánál csekély valószínűsége van annak, hogy egy légijármű biztonságos repülésének folytatása és a leszállás végrehajtása komoly veszélybe kerül, kockáztatva akár a légikatasztrófa lehetőségét is;

c) általános felhasználású adat — megbízhatósági szint 1×10^{-3}*:* a hibás vagy pontatlan általános adat felhasználásánál nagyon csekély valószínűsége van annak, hogy egy légijármű biztonságos repülésének folytatása és a leszállás végrehajtása komoly veszélybe kerül, kockáztatva akár a légikatasztrófa lehetőségét is.

2.19.3 Az elektronikus léginavigációs adatok tárolása és átvitele alkalmával azokat teljes egészében rendszeres időszakos felülvizsgálattal (CRC1) ellenőrizzék. A fenti 2.19.2 pont szerint osztályozott kritikus és alapvető léginavigációs adatok megbízhatóságának védelméhez 32 illetve 24 bites CRC algoritmust használjanak.

2.19.4 ***Ajánlás*** *— A fenti 2.19.2 pont szerint osztályozott általános felhasználású léginavigációs adatok megbízhatóságának a védelméhez 16 bites CRC algoritmust használjanak.*

Megjegyzés: A léginavigációs adatminőségi követelményeket (pontosság, felbontás, megbízhatóság, adatvédelem és eredetvizsgálat) az *Egész világon egységesen alkalmazható földrajzi hely meghatározási rendszer (WGS-84) Kézikönyv* (Doc 9674) tartalmazza. Az 5. Függelék a léginavigációs adatok pontossági és megbízhatósági előírásaira vonatkozó kiegészítő tájékoztatás az RTCA DO-201A és az Európai Polgári Légiközlekedési Berendezések EUROCAE ED-77 *A Léginavigációs Tájékoztatás Ipari Előírásai* kiadványokban található.

2.19.5 A szélességi és hosszúsági fokokat jelző földrajzi koordinátákat az egész világon egységesen alkalmazható földrajzi hely meghatározási rendszer (World Geodetic System — WGS-84) alapadat formátumban határozzák meg és jelentsék a légiforgalmi tájékoztató szolgálat hatósága számára, külön megjelölve azokat a földrajzi koordinátákat, amelyeket matematikai módszerrel a fenti WGS-84 alap-adattá számoltak át, és amelyeknél az eredeti földmérési adatok nem felelnek meg az 5. Függelék 1. táblázat előírásainak.

2.19.6 A tényleges földmérési munka, valamint az ebből meghatározott és számított adatok pontossága olyan legyen, hogy a kapott üzemeltetési navigációs adatok legnagyobb eltérései a repülés végrehajtásának szakaszaiban az adott koordináta rendszer jellegét figyelembe véve az 5. Függelék táblázataiban jelzett értékeken belül legyenek.

1. Megjegyzés: A megfelelő alkalmas koordináta rendszer az, amely lehetővé teszi az adott hely minden szükséges földrajzi adatának WGS-84 alapján történő felmérését.

2. Megjegyzés: A WGS-84 koordináta rendszer alapján meghatározott koordináták közzétételével kapcsolatos előírásokat a 4. Annex 2. fejezete, valamint a 15. Annex 3. fejezete tartalmazza.

3. Megjegyzés: A kettős célt szolgáló helyek vagy pontok, mint például a várakozási pont és megszakított megközelítés pontja esetében a nagyobb pontossági értéket alkalmazzák.

2.20 Együttműködés a meteorológiai és a légiforgalmi szolgálati hatóságok között

2.20.1 Annak érdekében, hogy a légijármű az üzemeltetéséhez szükséges legfrissebb időjárási tájékoztatásokat kapja, szükség szerint hozzanak intézkedéseket a meteorológiai és a légiforgalmi szolgálati hatóságok között, hogy a légiforgalmi szolgálatok személyzete:

a) a kijelző műszerek használatán túlmenően, a megállapodásoknak megfelelően jelentse a légiforgalmi szolgálati egységek személyzete által megfigyelt vagy a légijárművektől kapott tájékoztatás alapján tudomására jutott időjárási tényezőket (elemeket);

b) a lehető a lehető legrövidebb időn belül jelentse a társított meteorológiai hivatalnak a légiforgalmi szolgálati egység személyzete által megfigyelt vagy a légijárművek által jelentett, az üzemeltetés szempontjából lényeges időjárás-jelenségeket, amelyek a repülőtéri időjárás jelentésbe nem kerültek be;

c) a lehető legrövidebb időn belül jelentse a társított meteorológiai hivatalnak a vulkán kitörés bekövetkezésére utaló előjeleket, a vulkán kitöréseket valamint a vulkánikus hamufelhőre vonatkozó tájékoztatásokat. Ezen kívül a körzeti irányító valamint a repüléstájékoztató központok továbbítsák a tájékoztatást a társított időjárás észlelő hivatalnak és a vulkáni tevékenység (hamu) tanácsadói központoknak (VAAC) is.

1. Megjegyzés: A vulkáni tevékenység (hamu) tanácsadói központokat (VAAC) a 3. Annex 3.6.1 pontja alapján a körzeti légiközlekedési egyezményekben jelölik ki.

2. Megjegyzés: A rendkívüli légi jelentések továbbítására vonatkozóan lásd a 4.2.3 pontot.

2.20.2 Tartsanak fenn szoros együttműködést a körzeti irányító központok, a repüléstájékoztató központok valamint a társított időjárás észlelő hivatalok között annak biztosítása érdekében, hogy a NOTAM és SIGMET közleményekben jelzett vulkáni hamuról szóló tájékoztatások egymással megegyezők legyenek.

2.21 Együttműködés a légiforgalmi tájékoztató szolgálatok és a légiforgalmi szolgálati hatóságok között

2.21.1 Annak érdekében, hogy a légiforgalmi tájékoztató szolgálati egységek beszerezzék azokat a tájékoztatásokat, amelyek lehetővé teszik, hogy a légijármű számára megadják a legfrissebb repülés előtti tájékoztatásokat és kielégítsék a repülés közbeni tájékoztatásokra vonatkozó igényeket is, szükség szerint hozzanak intézkedéseket a légiforgalmi tájékoztató szolgálatok és a légiforgalmi szolgálati hatóságok között, hogy a légiforgalmi szolgálatok személyzete a felelős légiforgalmi tájékoztató szolgálati egységnek a lehető legkisebb késéssel jelentse:

a) a repülőtér állapotára vonatkozó tájékoztatásokat;

b) az illetékességi területükön elhelyezett navigációs berendezések, létesítmények és szolgálatok működési állapotát;

c) a légiforgalmi szolgálati egység személyzete által megfigyelt vagy a légijárművek által jelentett vulkáni tevékenységet; és

d) bármely más, az üzemeltetés szempontjából lényegesnek ítélt tájékoztatást.

2.21.2 A léginavigációs rendszer megváltoztatásának bevezetése előtt az ilyen változtatásért felelős szolgálatok vegyék figyelembe azt az időtartamot, amely a légiforgalmi tájékoztató szolgálatnak a tájékoztató anyagok kidolgozásához, elkészítéséhez és kiadásához szükséges. Ezért az érintett szervezetek szoros együttműködése szükséges annak biztosítása érdekében, hogy a légiforgalmi tájékoztató szolgálat a vonatkozó tájékoztatásokat időben megkapja.

2.21.3 Különösen fontosak azok a térképeket és/vagy a számítógépes navigációs rendszereket érintő léginavigációs tájékoztatások, amelyek változásáról a 15. Annex 6. fejezete és 4. Függeléke előírásai szerint az AIRAC — léginavigációs tájékoztató szabályozó és ellenőrző rendszer — tájékoztatást kell, hogy biztosítson. A felelős légiforgalmi szolgálatok a légiforgalmi tájékoztató szolgálat számára benyújtandó tájékoztató anyagok és adatok továbbításánál a meghatározott és nemzetközileg elfogadott AIRAC hatálybalépési időpontokat a 14 napos postai átfutási idővel együtt vegyék figyelembe.

2.21.4 A légiforgalmi tájékoztató szolgálatok számára szükséges tájékoztató anyagok és adatok biztosításáért felelős légiforgalmi szolgálatok a jelen Annex 5. Függelékében meghatározott léginavigációs adatpontossági és -megbízhatósági követelmények figyelembevételével végezzék ezt a feladatot.

1. Megjegyzés: A NOTAM, SNOWTAM és ASHTAM kiadására vonatkozó előírások a 15. Annex 5. fejezetében találhatók.

2. Megjegyzés: A vulkáni tevékenységre vonatkozó jelentések a 3. Annex 4. fejezetében részletesen

ismertetett tájékoztatásokból álljanak.
3. Megjegyzés: Az AIRAC tájékoztatást a légiforgalmi tájékoztató szolgálat legalább 42 nappal az AIRAC hatálybalépési időpontja előtt ossza szét azzal a céllal, hogy az anyag legalább a hatálybalépés előtt 28 nappal eljusson az érintettekhez (címzettekhez).
4. Megjegyzés: A meghatározott és nemzetközileg elfogadott AIRAC hatálybalépési időpontok tervezett 28 napos beosztását, -- 1997. november 6.-ával együtt -- valamint az AIRAC felhasználásra vonatkozó tájékoztatót az *AIS Légiforgalmi Tájékoztató Szolgálati Kézikönyv* (Doc 8126, 2. fejezet 2.6 pont) tartalmazza.

2.22 Legalacsonyabb repülési magasságok

Minden szerződő Állam jelölje ki és tegye közzé a legalacsonyabb repülési magasságokat minden egyes olyan légiforgalmi szolgálati útvonalon és irányítói körzetben, amely területe felett helyezkedik el. A meghatározott legalacsonyabb repülési magasságok tartsanak biztonságos elkülönítést az érintett területen levő mérvadó akadály felett.
Megjegyzés: A legalacsonyabb repülési magasságok meghatározására és a szerződő Államok általi közzétételére vonatkozó előírásokat a 15. Annex 1. Függeléke tartalmazza. Az akadálymentességi előírások részletezése a PANS-OPS (Doc 8168) kiadvány II. kötetében található.

2.23 Kényszerhelyzetben levő légijármű részére biztosított szolgálat

2.23.1 Ha egy légijárműről ismert, vagy feltételezett, hogy kényszerhelyzetben van — beleértve a jogellenes beavatkozás esetét is — más légijárművekkel szemben a legnagyobb figyelmet, segítséget és elsőbbséget kell biztosítani, ahogy azt a körülmények szükségessé teszik.
Megjegyzés: A megfelelő adathálózati összeköttetési egységgel és/vagy másodlagos radar válaszjeladóval felszerelt légijármű a kényszerhelyzet állapotának jelzésére berendezését a következők szerint üzemeltetheti:
a) A módban 7700-as kód; vagy
b) A módban 7500-as kód annak külön jelzésére, hogy jogellenes beavatkozás alatt áll; vagy
c) ADS-B vagy ADS-C egységét a megfelelő kényszerhelyzeti és/vagy sürgősségi üzemmódba kapcsolja; vagy
d) a légiforgalmi irányító és repülőgépvezető közötti adat-távközlési összeköttetésen (CPDLC) keresztül megfelelő kényszerhelyzeti közleményt ad.
2.23.1.1 ***Ajánlás*** *— Kényszerhelyzet esetén a légiforgalmi szolgálati egység és a légijármű közötti közleményváltásoknál az Emberi Tényezők Alapelveit vegyék figyelembe.*
Megjegyzés: Az Emberi Tényezők Alapelveivel kapcsolatos útmutatás az *Emberi Tényezők Kiképzési Kézikönyv*ben (Doc 9683) található.
2.23.2 Amikor egy légijármű jogellenes beavatkozás alatt áll, vagy azt feltételezik, hogy jogellenes beavatkozás alatt állhat, a légiforgalmi szolgálati egységek azonnal vegyék figyelembe a légijármű kéréseit. Folytassák a repülés biztonságos lebonyolításához szükséges lényeges tájékoztatások megadását és hajtsák végre azokat a szükséges intézkedéseket, amelyekkel a repülés egyes szakaszait — különös tekintettel a légijármű biztonságos leszállására — meggyorsíthatják.

2.23.3. Amikor egy légijármű jogellenes beavatkozás alatt áll, vagy azt feltételezik, hogy jogellenes beavatkozás alatt állhat, az ATS egységeknek a helyi előírásoknak megfelelően azonnal értesíteni kell az Állam által kijelölt megfelelő hatóságot, és meg kell adniuk a járatónak, vagy kijelölt képviselőjének a szükséges tájékoztatásokat.

1. Megjegyzés: Az útvonalától eltért vagy azonosítatlan légijárműről feltételezhető, hogy jogellenes beavatkozás alatt áll. Lásd 2.24.1.3 pont.
2. Megjegyzés: Az útvonalától eltért vagy azonosítatlan légijárművek kezelésére vonatkozó eljárások a 2.24.1 pontban találhatók.
3. Megjegyzés: A jogellenes beavatkozással kapcsolatos részletesebb eljárások a PANS-ATM (Doc 4444)

15. fejezet, 15.1.3 pontban találhatók.

2.24 Repülés közben bekövetkező váratlan események

2.24.1 Útvonalától eltért vagy azonosítatlan légijármű

1. Megjegyzés: A jelen pontban az „útvonalától eltért” és az „azonosítatlan” légijármű kifejezések az alábbi jelentéssel rendelkeznek:

Útvonalától eltért légijármű: Olyan légijármű, amely tervezett útvonalától jelentősen eltért vagy jelentette, hogy eltévedt.

Azonosítatlan légijármű: Olyan légijármű, amelynek működését egy adott légtéren belül megfigyelték, vagy ezt jelentették, azonban azonosságát nem állapították meg.

2. Megjegyzés: Ugyanabban az időben ugyanazt a légijárművet az egyik egység „útvonalától eltért légijárműként” míg egy másik egység „azonosítatlan légijárműként” tekintheti.

3. Megjegyzés: Az útvonalától eltért vagy azonosítatlan légijárműről feltételezhető, hogy jogellenes beavatkozás alatt áll.

2.24.1.1 Amint egy légiforgalmi szolgálati egység egy útvonalától eltért légijárműről szerez tudomást, a légijármű segítése és repülésének biztosítása érdekében hajtsa végre a 2.24.1.1.1 és 2.24.1.1.2 alpontokban előírt összes szükséges intézkedést.

Megjegyzés: Különösen fontos a légiforgalmi szolgálati egység részéről nyújtott navigációs segítség abban az esetben, ha az egység olyan légijárműről szerez tudomást, amely egy olyan légtérbe tévedt be vagy nagy valószínűséggel be fog tévedni, ahol fennáll az elfogás lehetősége vagy a légijármű biztonsága más okból veszélybe kerülhet.

2.24.1.1.1 Amennyiben a légijármű helyzete nem ismert, a légiforgalmi szolgálati egység:

a) kíséreljen meg kétirányú rádió-összeköttetést létesíteni a légijárművel, kivéve, ha az ez összeköttetés már fennáll;

b) minden rendelkezésre álló eszközt és módszert használjon fel a légijármű helyzetének meghatározására;

c) tájékoztassa azokat a légiforgalmi szolgálati egységeket, amelyek területére a légijármű betévedt vagy betévedhet, figyelembe véve mindazokat a tényezőket, amelyek a légijármű navigációját az adott körülmények között befolyásolhatják;

d) az elfogadott helyi együttműködési eljárásoknak megfelelően tájékoztassa az illetékes katonai egységeket és adja meg részükre a repülési terv vonatkozó adatait, valamint az útvonalától eltért légijárművet érintő más tájékoztatást;

e) kérje fel a c) és d) alpontokban jelzett egységeket valamint a levegőben levő többi légijárművet, hogy adjanak meg minden segítséget a légijárművel történő összeköttetés felvételére és helyzetének meghatározására.

Megjegyzés: A d) és e) alpontok előírásai a c) alpont szerint értesített légiforgalmi szolgálati egységekre is vonatkoznak.

2.24.1.1.2 Amikor a légijármű helyzetét megállapították, a légiforgalmi szolgálati egységek:

a) a légijárművet tájékoztassák helyzetéről és a szükséges végrehajtandó tevékenységről; valamint

b) a többi légiforgalmi szolgálati és katonai egységnek szükség szerint adják meg az útvonalától eltért légijárműre vonatkozó tájékoztatásokat és a légijármű részére adott bármely tanácsot.

2.24.1.2 Amint egy légiforgalmi szolgálati egység tudomást szerez egy, a területén levő azonosítatlan légijárműről, kísérelje meg a légijármű azonosságát megállapítani, ha ez a légiforgalmi szolgálat ellátásához szükséges vagy ezt az illetékes katonai hatóságok az elfogadott helyi együttműködési eljárás alapján kérik. Ennek érdekében a légiforgalmi szolgálati egység, a körülmények figyelembevételével:

a) kíséreljen meg kétirányú rádió-összeköttetést létesíteni a légijárművel,;

b) a repüléstájékoztató körzeten belül levő többi légiforgalmi szolgálati egységnél érdeklődjön a légijárműről és kérje segítségüket a légijárművel történő kétirányú rádió-összeköttetést létesítésére;

c) a szomszédos repüléstájékoztató körzetekben levő légiforgalmi szolgálati egységeknél érdeklődjön a légijárműről és kérje segítségüket a légijárművel történő kétirányú rádió-összeköttetést létesítésére;

d) kíséreljen meg tájékoztatást beszerezni a területén üzemelő többi légijárműtől.
2.24.1.2.1 A légiforgalmi szolgálati egység szükség szerint tájékoztassa az illetékes katonai egységet, amint a légijármű azonosságát megállapították.
2.24.1.3 Amennyiben a légiforgalmi szolgálati egység úgy ítéli meg, hogy egy, az útvonalától eltért légijármű jogellenes beavatkozás alatt áll, a helyi együttműködési eljárások szerint haladéktalanul értesítse az Állam által kijelölt illetékes hatóságot.
2.24.2 Polgári légijármű elfogása
2.24.2.1 Amint egy légiforgalmi szolgálati egység tudomást szerez arról, hogy illetőségi területén belül egy légijárművet elfogtak, a körülményeknek megfelelően foganatosítsa az alábbi intézkedéseket:
a) kíséreljen meg kétirányú rádió-összeköttetést létesíteni a légijárművel minden rendelkezésre álló rádió frekvencián , beleértve a 121.1 Mhz-es kényszerhelyzeti frekvenciát is kivéve, ha az ez összeköttetés már fennáll;
b) tájékoztassa az elfogott légijármű vezetőjét az elfogásról;
c) vegye fel az összeköttetést az elfogó légijárművel kétirányú rádió-összeköttetést fenntartó elfogást irányító egységgel és adja meg részére a légijárműre vonatkozó összes rendelkezésére álló információt;
d) szükség szerint közvetítse a közleményeket az elfogó légijármű vagy az elfogást irányító egység és az elfogott légijármű között;
e) az elfogást irányító egységgel szorosan együttműködve tegyen meg minden szükséges intézkedést az elfogott légijármű biztonsága érdekében;
f) amennyiben úgy látszik, hogy a légijármű a szomszédos repüléstájékoztató körzetekből tévedt be, az elfogásról tájékoztassa a szomszédos repüléstájékoztató körzetek légiforgalmi szolgálati egységeit.
2.24.2.2 Amint egy légiforgalmi szolgálati egység tudomást szerez arról, hogy illetékességi területén kívül egy légijárművet elfogtak, a körülményeknek megfelelően alábbi intézkedéseket foganatosítsa:
a) tájékoztassa azt a légiforgalmi szolgálati egységet, amelynek területén az elfogás megtörtént, megadva részére azokat a rendelkezésére álló tájékoztatásokat, amelyek segíthetik a légijármű azonosítását és kérje fel azt a 2.24.2.1 pontban foglaltak végrehajtására;
b) szükség szerint közvetítse a közleményeket az elfogott légijármű valamint az illetékes légiforgalmi szolgálati egység, az elfogást irányító egység vagy az elfogó légijármű között.

2.25 Óra idő a légiforgalmi szolgálatoknál

2.25.1 A légiforgalmi szolgálati egységek az éjféllel kezdődő 24-órás nap órában, percben és szükség szerint másodpercben történő kifejezésére az Egyeztetett Világidőt (UTC) használják.
2.25.2 A légiforgalmi szolgálati egységeket olyan órával lássák el, amely az időt az érintett egység minden egyes munkahelyről jól látható módon órában, percben és másodpercben jelzi.
2.25.3 A légiforgalmi szolgálati egységek óráit és egyéb időrögzítő berendezéseit szükség szerint ellenőrizzék annak biztosítása érdekében, hogy azok mindenkor az UTC idő plusz/minusz 30 másodperces határértékén belül működjenek. Ahol egy légiforgalmi szolgálati egység adatátviteli összeköttetést alkalmaz, óráikat és egyéb időrögzítő berendezéseit szükség szerint úgy ellenőrizzék, hogy ezek pontossága 1 másodperc UTC értéken belül legyen.
2.25.4 A pontos időt szabványos időjelző állomástól, vagy ha ez nem lehetséges, más olyan egységtől szerezzék be, amely a pontos időt ilyen állomástól kapta.
2.25.5 A légijármű felszálláshoz történő gurulásának megkezdése előtt a repülőtéri irányító torony a repülőgépvezető részére adja meg a pontos időt kivéve, ha más intézkedések révén a repülőgépvezető azt egyéb forrásból megkapja. A légiforgalmi szolgálati egységek a légijármű részére kérésre ezen kívül is adják meg a pontos időt. A pontos időt a legközelebbi fél percre kerekítve adják meg.

2.26 A nyomásmagasság-adó másodlagos radar válaszjeladók szállítására és üzemeltetésére vonatkozó előírások kidolgozása és kiadása

Az Államok vezessenek be előírásokat a nyomásmagasság-adó másodlagos radar válaszjeladóknak a légtér meghatározott szakaszain, illetve területein belül történő szállítására és üzemeltetésére.

Megjegyzés: Ennek az előírásnak célja a légiforgalmi szolgálatok hatékonyságának valamint az összeütközést elkerülő fedélzeti rendszerek hatékonyságának fejlesztése.

2.27 Repülésbiztonság-irányítási rendszer

2.27.1 Az Államok dolgozzanak ki repülésbiztonság-irányító programot annak érdekében, hogy a légiforgalmi szolgálatok biztosítása során elérjék az elfogadható repülésbiztonsági szintet.
2.27.2 Az elérendő elfogadható repülésbiztonsági szintet az érintett Állam(ok) határozzák meg.
Megjegyzés: A repülésbiztonsági programokra és az elfogadható repülésbiztonsági szintre vonatkozó útmutató az E Mellékletben, valamint a Repülésbiztonság-irányítási Kézikönyvben (SMM) (Doc 9859) található.
2.27.3 A szerződő Államok repülésbiztonsági programjuk keretein belül követeljék meg, hogy a légiforgalmi szolgáltatók olyan, az Állam számára elfogadható repülésbiztonság-irányítási rendszert vezet be, amely legalább:
a) azonosítja a repülésbiztonságra veszélyes tényezőket;
b) biztosítja, hogy az elfogadható repülésbiztonsági szint fenntartásához szükséges javító intézkedés bevezetésre kerül;
c) biztosítja az elért repülésbiztonsági szint folyamatos nyomon követését, valamint rendszeres értékelését; valamint
d) célja az általános repülésbiztonsági szint folyamatos javítása.
2.27.4 A repülésbiztonság-irányítási rendszer jól értelmezhetően határozza meg a repülésbiztonsági felelőségi viszonyokat a légiforgalmi szolgáltatón belül, beleértve a felső vezetés a repülésbiztonságért történő közvetlen felelősségre-vonhatóságát is.
Megjegyzés: A repülésbiztonság-irányítási rendszerekre vonatkozó útmutató a *Repülésbiztonság-irányítási Kézikönyv*ben (SMM) Doc 9859), valamint az azzal kapcsolatos eljárások a *PANS-ATM*-ben (Doc 4444) találhatók.
2.27.5 A légiforgalmi szolgálatok rendszerében bevezetett bármely, a repülésbiztonságot érintő változtatás, beleértve egy csökkentett elkülönítési minimum vagy egy új eljárás bevezetését, csak akkor hajtható végre, ha a repülésbiztonsági elemzés kimutatta, hogy fennmarad az elfogadható repülésbiztonsági szint és egyeztettek a felhasználókkal. Amennyiben szükséges, a felelős hatóság biztosítsa, hogy megfelelő intézkedéseket hoztak a bevezetést követő nyomon követésre annak ellenőrzésére, hogy továbbra is fennmarad a meghatározott repülésbiztonsági szint.
Megjegyzés: Amennyiben a változtatás természetéből adódóan az elfogadható repülésbiztonsági szint mennyiségi fogalmakkal nem kifejezhető, a repülésbiztonsági elemzés operatív értékelésen is alapulhat.

2.28 Egységes vonatkozási-rendszerek

2.28.1 Vízszintes vonatkozási rendszer
A léginavigációban vízszintes (geodéziai) vonatkozási-rendszerként a Geodéziai Világrendszer-1984-et (World Geodetic System – 1984 (WGS-84) kell használni. A jelentett légiforgalmi földrajzi koordinátákat (a szélesség és hosszúság megadásával) a WGS-84 -ben kell megadni.
Megjegyzés: A WGS-84-re vonatkozó átfogó útmutató anyag az *ICAO Geodéziai Világrendszer – 1984 (WGS-84) Kézikönyv*ben (Doc 9674) található.
2.28.2 Függőleges vonatkozásirendszer
A léginavigációban függőleges referencia-rendszerként a közepes tengerszint feletti magasság (MSL) alkalmazandó. Az MLS a gravitációval összefüggő tengerszinthez viszonyított magasság (elevation) és a geoid földfelszin közötti viszonyt adja meg.
Megjegyzés: A geoid világszinten leginkább az MLS-vel azonosnak tekinthető. Ez azt jelenti, hogy a Föld azonos tömegvonzási erővel rendelkező pontjai egybeesnek a nyugalmi állapotú, a kontinensekre összefüggően kiterjedő MLS-vel.
2.28.3 Időbeli vonatkozásirendszer
2.28.3.1 A léginavigációban időbeli vonatkozásirendszerként a Gergely-naptár, valamint Egyeztetett Világidő (UTC) alkalmazandó.

2.28.3.2 Amennyiben ettől eltérő időbeli vonatkozásirendszert alkalmaznak, azt a Légiforgalmi Tájékoztató Kiadvány (AIP) GEN 2.1.2 részében fel kell tüntetni.

2.29 Nyelvismeret ellenőrzése

2.29.1 A légiforgalmi szolgálatot ellátó szervezet biztosítsa, hogy a légiforgalmi irányítók értsék és beszéljék a rádió-távbeszélő összeköttetéseknél használt nyelve(ke)t, ahogy az az 1. Annexben meghatározásra került.
2.29.2 A légiforgalmi irányító egységek közötti összeköttetések esetében egyéb nyelvre vonatkozó közös megállapodás hiányában az angol nyelvet használják.

2.30 Rendkívüli helyzetekre vonatkozó előírások

A légiforgalmi szolgálati hatóságok dolgozzanak ki és tegyenek közzé megfelelő a rendkívüli helyzetekre vonatkozó terveket a légforgalmi szolgálatok és az ezekhez szükséges kiegészítő szolgáltatások tényleges, illetve lehetséges megszakadása esetére azon légterek vonatkozásában, amelyekben a szolgáltatások biztosításáért felelősek. A rendkívüli helyzetekre vonatkozó terveket szükség szerint az ICAO segítségével, a szomszédos légterekében légiforgalmi szolgálatok biztosításáért felelős hatóságokkal, valamint az érintett légtérfelhasználókkal szoros együttműködésben dolgozzák ki.
1. Megjegyzés: A rendkívüli helyzetekre vonatkozótervek kidolgozására, közzétételére és bevezetésére vonatkozó útmutató a D. Mellékletben található.
2. Megjegyzés: A rendkívüli helyzetekre vonatkozó tervek tartalmazhatnak ideiglenes eltéréseket az elfogadott helyi körzeti légiközlekedési előírásoktól; ezeket az eltéréseket szükség szerint a Tanács nevében az ICAO Tanácsának elnöke hagyja jóvá.

3. fejezet
Légiforgalmi irányító szolgálat

3.1 Alkalmazás

Légiforgalmi irányító szolgálat biztosítandó:
a) az A, B, C, D és E osztályú légterekben valamennyi műszerrepülési szabályok (IFR) szerint végrehajtott repülés részére;
b) a B, C és D osztályú légterekben valamennyi látvarepülési szabályok (VFR) szerint végrehajtott repülés részére;
c) valamennyi különleges VFR repülés részére;
d) az ellenőrzött repülőtéren a teljes repülőtéri forgalom részére.

3.2 A légiforgalmi irányító szolgálat biztosítása

A 2.3.1 pontban ismertetett légiforgalmi irányító szolgálat egyes részeit az alábbiakban ismertetett különböző egységek lássák el:
a) *Körzeti irányító szolgálatot:*
1) egy körzeti irányító központ; vagy
2) ahol körzeti irányító központot nem létesítettek, a repülőtéri irányítói körzetben, vagy egy elsődlegesen bevezető irányító szolgálat ellátására kijelölt korlátozott kiterjedésű irányító körzetben a bevezető irányító szolgálatot ellátó egység;
b) *Bevezető irányító szolgálatot:*
1) a repülőtéri irányító torony vagy a körzeti irányító központ, ha szükséges vagy kívánatos a bevezető irányító szolgálatnak egy egység felelősségi körbe történő összevonása a repülőtéri irányító torony vagy a körzeti irányító központ feladataival;
2) a bevezető irányító szolgálat, ha szükséges vagy kívánatos egy különálló egység kijelölése;
c) *Repülőtéri irányító szolgálatot:* a repülőtéri irányító torony.

Megjegyzés: A forgalmi előtéren meghatározott szolgálatok ellátására, azaz a forgalmi előtér ügyeleti szolgálat feladataira kijelölhető a repülőtéri irányító torony vagy egy másik önálló egység.

3.3 Légiforgalmi irányító szolgálat működése

3.3.1 A légiforgalmi irányító szolgálat ellátása érdekében egy légiforgalmi irányító egység:

a) kapja meg minden egyes légijármű tervezett mozgására vagy az ezektől való eltérésekre, valamint az egyes légijárművek tényleges haladására vonatkozó tájékoztatásokat;

b) a kapott tájékoztatások segítségével határozza meg az ismert légijárművek egymáshoz viszonyított helyzetét;

c) az irányítása alatt álló légijárművek közötti összeütközések megelőzése valamint a légiforgalom rendezett áramlásának elősegítése és fenntartása érdekében adjon ki légiforgalmi irányítói engedélyeket és tájékoztatásokat;

d) az engedélyeket szükség szerint egyeztesse a többi egységgel:

1) amennyiben egy légijármű ennek hiányában konfliktushelyzetbe kerülhet más ilyen egység irányítása alatt álló forgalommal;

2) a légijármű irányításának más egység számára történő átadása előtt.

3.3.2 A légijárművek mozgására vonatkozó tájékoztatásokat valamint a légijárművek számára kiadott légiforgalmi irányítói engedélyeket úgy tartsák nyilván és jelenítsék meg, hogy ez lehetővé tegye a forgalmi helyzet azonnali áttekintését annak érdekében, hogy a légijárművek közötti megfelelő elkülönítések segítségével fenntartsák a forgalom áramlását.

3.3.3 **Ajánlás.** – *A légiforgalmi irányító egységeket szereljék fel olyan eszközökkel, amelyek a légiforgalmi irányító munkahelyeken felveszik a háttérben zajló kommunikációt és a hallható környezetet, és amelyek képesek legalább a működés utolsó huszonnégy órájában felvett információ tárolására.*

*Megjegyzés. – A légiforgalmi irányító egységeknél készült felvételek és ezen felvételek átiratainak titkosítására vonatkozó rendelkezések a 13. Annex 5.12 szakaszában találhatók.*3.3.4 A légiforgalmi irányító egységek által kiadott engedélyek biztosítsanak elkülönítést:

a) az A és B osztályú légterekben üzemelő valamennyi légijármű között;

b) a C, D és E osztályú légterekben a műszerrepülési szabályok (IFR) szerint végrehajtott repülések között;

c) a C osztályú légterekben a műszerrepülési szabályok (IFR) és a látvarepülési szabályok (VFR) szerint végrehajtott repülések között;

d) a műszerrepülési szabályok (IFR) szerint és a különleges VFR szerint végrehajtott repülések között;

e) a különleges VFR szerint végrehajtott repülések között, amennyiben az illetékes légiforgalmi szolgálati hatóság így rendelkezik; kivéve, amikor a fenti b) alpontban jelzett D és E osztályú légterek esetében egy légijármű kéri és ha az illetékes légiforgalmi szolgálati hatóság így írja elő, a repülést egy meghatározott, látás utáni időjárási körülmények között végrehajtandó szakaszon elkülönítés fenntartása nélkül is engedélyezhetik.

3.3.5 A légiforgalmi irányító egység az elkülönítést legalább a következők egyikével biztosítsa:

a) függőleges elkülönítés a különböző repülési szintek kijelölésével:

1) a 2. Annex 3. Függelékében található utazómagasság táblázatokból; vagy

2) a módosított utazómagasság táblázatból, amennyiben a FL 410 feletti repülés esetében a 2. Annex 3. Függelékének megfelelően így írják elő;

kivéve, ha a fentiekben jelzett repülési szintek nem az útirányszögnek megfelelően alkalmazandók, és ezt a vonatkozó légiközlekedési tájékoztató kiadványokban vagy a légiforgalmi irányítói engedélyben jelzik;

Megjegyzés: A függőleges elkülönítéssel kapcsolatos tájékoztatót a *300 méter (1000 láb) Csökkentett Függőleges Elkülönítési Minimum FL290 és FL410 Között Bevezetési Kézikönyv* (Doc 9574) tartalmazza.

b) vízszintes elkülönítés, amely:

1) időben vagy távolságban kifejezett térköz tartásával hosszirányú elkülönítést biztosít az azonos, összetartó vagy szembetartó útirányon haladó légijárművek között;

2) a légijárművek különböző útvonalakon vagy földrajzi területeken történő tartásával oldalirányú elkülönítést biztosít azok között;
c) összetett elkülönítés, amely a függőleges valamint a fenti b) alpontban jelzett egyéb elkülönítési változatok kombinációjával biztosít elkülönítést a légijárművek között úgy, hogy felhasznál minden egyes minimumot, azonban ez nem lehet kevesebb, mint az egyedileg alkalmazott elkülönítés változatok minimumának fele. Az összetett elkülönítést csak a helyi körzeti légiközlekedési egyezmények alapján lehet alkalmazni.
Megjegyzés: Az összetett függőleges és oldalirányú elkülönítés bevezetésével kapcsolatos tájékoztató anyagot a *Légiforgalmi Szolgálatok Tervezési Kézikönyve* (Doc 9426) tartalmazza.

3.4 Elkülönítési minimumok

3.4.1 Egy adott légtérszakaszban alkalmazott elkülönítési minimum kiválasztása az alábbiak szerint történjen:
a) az elkülönítési minimumot a PANS-ATM és a helyi *Körzeti Kiegészítő Eljárások* előírásaiban meghatározottakból, a helyi uralkodó körülmények alapján válasszák ki, kivéve ha olyan berendezéseket használnak vagy olyan körülmények uralkodnak, amelyekre a jelenleg érvényes ICAO előírások nem terjednek ki, mert ezekben az esetekben az alábbiak szükség szerint más elkülönítési minimumot határozzanak meg:
1) az illetékes légiforgalmi szolgálati hatóság, a járatókkal történő egyeztető megbeszélések után az állam fennhatósága alá tartozó útvonalakra vagy útvonalszakaszokra;
2) helyi körzeti légiközlekedési egyezményben, a nyílt vizek feletti vagy nem meghatározott állami fennhatóság alá tartozó útvonalakra vagy útvonal szakaszokra.
Megjegyzés: A jelenleg érvényes ICAO elkülönítési minimumok részletes ismertetését a PANS-ATM (Doc 4444) valamint a *Helyi Kiegészítő Eljárások* (Doc 7030) 1. része című kiadványok tartalmazzák.
b) az elkülönítési minimumot a szomszédos légterekben légiforgalmi szolgálatok biztosításáért felelős illetékes légiforgalmi szolgálati hatóságok közötti egyeztetéssel válasszák ki, amennyiben:
1) a forgalom két szomszédos légtér egyikéből a másikba lép be;
2) az útvonalak közelebb vannak a szomszédos légterek közös határához, mint az adott körülmények között alkalmazható elkülönítési minimum.
Megjegyzés: Ezen rendelkezés célja annak biztosítása, hogy először: a forgalom átadása mindkét fél szempontjából egyeztethető legyen és másodszor: kielégítő elkülönítést biztosítsanak a közös határ két oldalán üzemelő légijárművek között.
3.4.2 A választott elkülönítési minimumról és alkalmazási területéről adjanak részletes tájékoztatást:
a) az érintett légiforgalmi szolgálati egységeknek; és
b) a légiforgalmi tájékoztató kiadványok segítségével a légijármű-vezetőknek és járatóknak ott, ahol az elkülönítést a légijármű meghatározott navigációs berendezéseinek felhasználása vagy bizonyos navigációs módszerek alkalmazása alapján biztosítják.

3.5 Az irányítás felelőssége

3.5.1 Az egyes repülések irányításának felelőssége
Egy ellenőrzött repülés egy időben csak egy légiforgalmi irányító egység irányítása alatt állhat.
3.5.2 Egy adott légtérszakaszon belüli irányítás felelőssége
Egy adott légtérszakaszon belül az összes légijármű irányításának felelősségét egyetlen légiforgalmi irányító egységre ruházzák. Mindazonáltal egy légijármű, vagy légijármű csoport irányítását átadhatják más légiforgalmi irányító egység számára, feltéve, hogy biztosítják a koordinációt az összes érintett légiforgalmi irányító egység között.

3.6 Az irányítás felelősségének átadása

3.6.1 Az átadás helye vagy időpontja
A légijármű irányításának felelősségét az egyik légiforgalmi irányító egységtől a másiknak a következők szerint adják át:

3.6.1.1 *Két körzeti irányító szolgálatot ellátó egység között* — A légijármű irányításának felelősségét az egyik irányító körzetben körzeti irányító szolgálatot ellátó egységtől a szomszédos irányító körzetben körzeti irányító szolgálatot ellátó egységnek abban az időpontban adja át, amikorra a légijárművet irányító körzeti irányító központ a közös irányító körzethatár átlépését számítja illetve más olyan helyen vagy időpontban, amelyben a két egység megegyezett.
3.6.1.2 *Körzeti irányító szolgálatot és bevezető irányító szolgálatot ellátó egységek között* — A légijármű irányításának felelősségét a körzeti irányító szolgálatot ellátó egységtől a bevezető irányító szolgálatot ellátó egységnek és viszont olyan helyen illetve időpontban adják át, amelyben a két egység megegyezett.
3.6.1.3 *Bevezető irányító szolgálatot ellátó egység és a repülőtéri irányító torony között*
3.6.1.3.1 *Érkező légijármű* — A leszálláshoz közeledő légijármű irányításának felelősségét a bevezető irányító szolgálatot ellátó egység akkor adja át a repülőtéri irányító toronynak, amikor:
a) a légijármű a repülőtér közelében van és:
1) úgy ítélik meg, hogy a megközelítést és leszállást föld-látással végre tudja hajtani; vagy
2) folyamatos látás utáni időjárási körülmények közé került; vagy
b) elér az együttműködési megállapodásban vagy a légiforgalmi szolgálati egység utasításaiban meghatározott helyet vagy magasságot; vagy
c) leszállt.
Megjegyzés: Bizonyos repülések irányítását közvetlenül át lehet adni a körzeti irányító központtól a repülőtéri irányító toronynak és viszont még akkor is, ha bevezető irányítást létesítettek, amennyiben az érintett egységek olyan előzetes megállapodást kötöttek, hogy a bevezető irányító szolgálat megfelelő részét a körzeti irányító központ illetve a repülőtéri irányító torony ellátja.
3.6.1.3.2 *Induló légijármű* — Az induló légijármű irányításának felelősségét a repülőtéri irányító torony akkor adja át a bevezető irányító szolgálatot ellátó egységnek, amikor:
a) *amikor a repülőtér környékén látás utáni időjárási körülmények uralkodnak:*
1) mielőtt a légijármű elhagyja a repülőtér környékét; vagy
2) mielőtt a légijármű műszeres időjárási körülmények közé kerül; vagy
3) a légijármű elér egy meghatározott helyet vagy magasságot;
az együttműködési megállapodásban vagy a légiforgalmi szolgálati egység utasításaiban előírtak szerint;
b) *mikor a repülőtér környékén műszeres időjárási körülmények uralkodnak:*
1) közvetlenül a légijármű felszállása után; vagy
2) amikor a légijármű elér egy meghatározott helyet vagy magasságot;
az együttműködési megállapodásban vagy a légiforgalmi szolgálati egység utasításaiban előírtak szerint.
Megjegyzés: Lásd a 3.6.1.3.1 pont után következő megjegyzést.
3.6.1.4 *Azonos légiforgalmi irányító egységen belüli irányító szektorok vagy munkahelyek között*
A légijármű irányításának felelősségét az azonos légiforgalmi irányító egységen belüli irányító szektorok vagy munkahelyek között a légiforgalmi szolgálati egység utasításaiban előírtak szerint egy adott helyen, magasságon vagy időpontban adják át.
3.6.2 Az átadás egyeztetése
3.6.2.1 Egy légijármű irányításának felelősségét az egyik légiforgalmi irányító egység a másiknak ne adja át az átvevő irányító egység beleegyezése nélkül, amelyet a 3.6.2.2, 3.6.2.2.1, 3.6.2.2.2 és 3.6.2.3 pontok előírásainak megfelelően szerezzen be.
3.6.2.2 Az átadó irányító egység tájékoztassa az átvevő irányító egységet az érvényes repülési terv vonatkozó részleteiről és adjon meg minden, az átadásra vonatkozó kért irányítói tájékoztatást.
3.6.2.2.1 Ahol az irányítás átadását radar vagy automatikus légtérfelderítési ADS-B adatok felhasználásával hajtják végre, az átadásra vonatkozó irányítói tájékoztatás tartalmazza a légijármű közvetlenül az átadás előtt radaron vagy berendezésfüggő automatikus felderítési ADS-B-n megfigyelt helyzetét valamint kérés alapján annak repülési útirányát és sebességét is.
3.6.2.2.2 Ahol az irányítás átadását berendezésfüggő automatikus felderítési (ADS-C) adatok felhasználásával hajtják végre, az átadásra vonatkozó irányítói tájékoztatás tartalmazza a légijármű négydimenziós helyzetét és szükség szerint más tájékoztatásokat is.
3.6.2.3 Az átvevő irányító egység:

a) jelezze, ha az átadó irányító egység feltételei szerint képes a légijármű irányításának elfogadására, kivéve ha a két érintett egység közötti előzetes megállapodás alapján az ilyen jelzés elmaradását úgy értelmezik, hogy elfogadják a megadott feltételeket vagy jelzik a bármely szükséges vonatkozó módosítást; és

b) közölje a repülés következő szakaszára vonatkozó bármely egyéb tájékoztatást vagy légiforgalmi irányító engedélyt, amelyet a légijárműnek az átadás időpontjában ismernie kell.

3.6.2.4 Az átvevő irányító egység tájékoztassa az átadó irányító egységet, ha kétirányú beszéd-üzemű és/vagy adathálózati összeköttetést létesített az érintett légijárművel és átvette annak irányítását, kivéve, ha a két érintett egység közötti megállapodás mást ír elő.

3.6.2.5 Az alkalmazható egyeztetési eljárásokat, beleértve az irányítás átadási pontokat, az együttműködési megállapodás vagy a légiforgalmi szolgálati egység utasításai tartalmazzák.

3.7 Légiforgalmi irányító engedélyek

A légiforgalmi irányító engedélyek kizárólag a légiforgalmi irányító szolgálat biztosításának követelményein alapuljanak.

3.7.1 A légiforgalmi irányító engedélyek tartalma

3.7.1.1 Egy légiforgalmi irányító engedély a következőket tartalmazza:

a) a légijármű repülési tervében meghatározott azonosító jele;

b) az engedély határa;

c) a repülés útvonala;

d) a repülés teljes útvonalára vagy annak egy szakaszára engedélyezett repülési szint(ek) és ha szükséges, ennek változásai;

Megjegyzés: Ha a 2. Annex 3.6.5.2.2 a) alpont előírása értelmében szükséges és a repülési szintekre vonatkozó engedély az útvonalnak csak egy részére érvényes, fontos, hogy a légiforgalmi irányító egység meghatározza azt a pontot, ameddig a légiforgalmi irányító engedély repülési szintekre vonatkozó része érvényes.

e) bármely olyan egyéb szükséges utasítás vagy tájékoztatás, amely a megközelítési vagy indulási eljárásokra és repülési műveletekre, rádióösszeköttetésekre, az engedély lejárati idejére vagy egyéb körülményre vonatkozhat.

Megjegyzés: Az engedély lejárati ideje azt az időpontot jelzi, amely után az engedély automatikusan érvényét veszti, ha a repülést még nem kezdték meg.

3.7.1.2 ***Ajánlás*** *— Dolgozzanak ki szabvány érkezési és indulási útvonalakat és kapcsolatos eljárásokat, amikor a következők elősegítésére van szükség:*

a) a légiforgalom biztonságos, rendezett és gyors áramlása;

b) a légiforgalmi irányító engedélyekben kiadott útvonalak és eljárások ismertetése.

Megjegyzés: A szabvány érkezési és indulási útvonalak és eljárások kidolgozásával kapcsolatos útmutató a *Légiforgalmi Szolgálati Tervezési Kézikönyvben* (Doc 9426), a tervezéssel kapcsolatos követelmények a PANS-OPS II. kötetben (Doc 8168) található.

3.7.2 Engedélyek hangsebességgel történő repülések részére

3.7.2.1 A szuperszonikus repülés hangsebességet elérő gyorsítási szakaszára vonatkozó légiforgalmi irányító engedély legalább ezen szakasz végéig terjedjen.

3.7.2.2 ***Ajánlás*** *— A szuperszonikus légijármű hangsebesség alatti sebességre történő lassulására, valamint a szuperszonikus utazó repülésről hangsebesség alatti repülésre történő süllyedésére vonatkozó légiforgalmi irányító engedély legalább a hangsebesség alatti repülési szakaszig biztosítson folyamatos süllyedést.*

3.7.3 Az engedélyek visszaolvasása és a repülésbiztonságot érintő tájékoztatások

3.7.3.1 A hajózószemélyzet olvassa vissza a légiforgalmi irányítótól szóban kapott ATC engedély és utasítás azon részét, amely közvetlenül a repülésbiztonságot érinti. A következő elemeket mindig vissza kell olvasni:

a) légiforgalmi irányító útvonal engedélyek;

b) engedélyek és utasítások bármely futópályára történő belépésre, leszállásra, felszállásra, futópálya keresztezésre és közeli várakozásra valamint a futópályán történő visszagurulásra; valamint
c) használatos futópálya, magasságmérő beállítási értékek, másodlagos válaszjeladó kódok, repülési szint és magasság utasítások, repülési irány és sebesség utasítások valamint az átváltási szint, amikor azt a légiforgalmi irányító közli vagy a légiforgalmi irányítás ATIS közleménye tartalmazza.
3.7.3.1.1 Az egyéb engedélyeket vagy utasításokat, beleértve a feltételes engedélyeket úgy olvassák vissza vagy nyugtázzák, hogy ezzel egyértelműen jelezzék azok megértését és végrehajtásának szándékát.
3.7.3.1.2 A légiforgalmi irányító hallgassa meg a visszaolvasást, hogy megbizonyosodjon arról, hogy a légiforgalmi irányító engedélyt vagy utasítást a hajózószemélyzet helyesen olvasta vissza és a visszaolvasás alkalmával tapasztalt eltérések és ellentmondások tisztázása érdekében azonnal intézkedjen.
3.7.3.2 Amennyiben az illetékes ATS hatóság másképpen nem rendelkezik, a légiforgalmi irányító és légijármű-vezető közötti digitális adat-összeköttetési (CPDLC) közlemények szóbeli visszaolvasása nem szükséges.
Megjegyzés: A légiforgalmi irányító és légijármű-vezető közötti digitális adat-összeköttetési (CPDLC) közleményekre vonatkozó eljárásokat és előírásokat a 10. Annex II. kötete és a PANS-ATM 14. fejezete tartalmazza.
3.7.4 Az engedélyek koordinálása
A légiforgalmi irányító szolgálati egységek egymás között a légijármű egész repülési útvonalára vagy annak meghatározott részére vonatkozó légiforgalmi irányító engedélyt az alábbiak szerint egyeztessék.
3.7.4.1 Egy légijármű részére engedélyezzék a tervezett első leszállási (célállomás) repülőtérig tartó repülést, amennyiben:
a) még az indulás előtt lehetséges volt az engedély egyeztetése valamennyi olyan egységgel, amely a légijárművet irányítani fogja; vagy
b) megfelelő biztosíték van arra, hogy az előzetes egyeztetés megvalósítható azon egységek között, amelyek a légijárművet egymást követően irányítani fogják.
Megjegyzés: Amikor a légiforgalmi irányító engedélyt az induló forgalom gyorsítása érdekében csak a repülés kezdeti szakaszára adják ki, az ezt követő útvonal engedélyt a fentiekben meghatározottak szerint adják ki még akkor is, ha az első tervezett leszállási repülőtér nem az útvonal engedélyt kiadó körzeti irányító központ illetékessége alá tartozik.
3.7.4.2 Amennyiben a 3.7.4.1 pontban meghatározott egyeztetés nem történt meg vagy nem várható, a légijárműnek az engedély csak addig a pontig adható ki, ameddig a koordináció biztosított. Ezen pont elérése előtt vagy ezen pont elérésekor a légijármű a helyzetnek megfelelő további engedélyt vagy várakozási utasításokat kap.
3.7.4.2.1 Amikor az illetékes légiforgalmi szolgálati hatóság ezt írja elő, a légijármű az irányítás átadási pont elérése előtt az előzetes engedély beszerzése érdekében vegye fel a kapcsolatot a repülési útvonalán következő légiforgalmi irányító egységgel.
3.7.4.2.1.1 A légijármű az előzetes engedély beszerzése során tartsa fenn a szükséges kétoldalú rádiókapcsolatot az irányítást végző légiforgalmi irányító egységgel.
3.7.4.2.1.2 Az előzetes engedélyként kiadott légiforgalmi irányító engedély mint olyan a repülőgépvezető számára pontosan azonosítható legyen.
3.7.4.2.1.3 A megfelelő egyeztetés esetét kivéve az előzetes engedély csak abban a légtérben érintse a légijármű eredeti repülési útvonalát és magasságát, amelyért az ilyen engedélyt kiadó légiforgalmi irányító egység felelős.
Megjegyzés: Az előzetes engedély kiadásával, továbbításával és alkalmazásával kapcsolatos előírásokat a 10. Annex II kötet, a tájékoztató anyagot a *Légiforgalmi Szolgálatok Adathálózati Összeköttetéseinek Alkalmazása Kézikönyv* (Doc 9694) tartalmazza.
3.7.4.2.1.4 ***Ajánlás*** *— Ahol ez gyakorlati szempontból alkalmazható és ahol az előzetes engedély továbbításának megkönnyítésére adathálózati összeköttetést használnak, a repülőgépvezető és az előzetes engedélyt kiadó légiforgalmi irányító egység között álljon kétoldalú beszédüzemű összeköttetés rendelkezésre.*
3.7.4.3 Amikor egy légijármű az egyik irányító körzeten levő olyan repülőtérről kíván indulni, amely egy

másik irányító körzethez 30 perc vagy az érintett körzeti irányító központok által közösen elfogadott más repülési időtartamon belül van, a következő körzeti irányító központtal való egyeztetés még az indulási engedély kiadása előtt történjen meg.
3.7.4.4 Amikor egy légijármű irányító körzetből nem ellenőrzött légtérbe kíván kilépni és ezt követően ugyanabba vagy egy másik irányító körzetbe tér vissza, az engedély az indulási repülőtértől az első tervezett leszállási helyig kiadható. Az ilyen engedély vagy annak módosítása csak a repülés azon szakaszaira vonatkozik, amelyet ellenőrzött légtérben hajtanak végre.
3.7.5 A légiforgalom áramlásának szervezése
3.7.5.1 Az olyan légtér esetében, ahol a légiforgalom időnként meghaladja vagy várhatóan meghaladja az érintett légiforgalmi irányító szolgálatok közzétett kapacitását, létesítsenek légiforgalmi áramlásszervező (ATFM) szolgálatot.
Megjegyzés: Az érintett légiforgalmi irányító szolgálatok kapacitását rendszerint az illetékes légiforgalmi szolgálati hatóság határozza meg és teszi közzé.
3.7.5.2 ***Ajánlás*** *— Az ATFM szolgálatot a helyi körzeti légiközlekedési egyezmények vagy esetenként többoldalú megállapodások alapján létesítik. Az ilyen egyezmények tartalmazzanak megfelelő közös eljárásokat és módszereket a kapacitás megállapítására is.*
3.7.5.3 Amikor egy légiforgalmi irányító szolgálati egység számára nyilvánvalóvá válik, hogy a már elfogadotton kívül egy adott helyen vagy meghatározott területen a meghatározott időperióduson belül további forgalmat nem tud vagy csak bizonyos ütemben képes elfogadni, az egység erről értesítse az ATFM egységet -- ha ilyet létrehoztak -- valamint szükség szerint a többi érintett légiforgalmi szolgálati egységet. Értesítsék az adott helyre vagy területre tartó légijárművek személyzetét és az érdekelt járatókat a várható késésekről vagy az alkalmazott korlátozásokról.
Megjegyzés: Ahol lehetséges, az érintett járatókat általában előre értesítsék a légiforgalmi áramlásszervező (ATFM) szolgálat által életbe léptetett korlátozásokról, ahol ilyen szolgálatot létesítettek.

3.8 Személyek és járművek mozgásának irányítása repülőtéren

3.8.1 A repülőtéri irányító torony szükség szerint irányítsa a személyek vagy járművek — beleértve a vontatott légijárműveket is — mozgását a repülőtér munkaterületén annak érdekében, hogy azok ne kerüljenek veszélyhelyzetbe és elkerüljék a leszálló, guruló vagy felszálló légijárművek veszélyeztetését is.
3.8.2 Amikor a repülőtéren rossz látási körülmények között történő üzemeltetésre kidolgozott eljárásokat alkalmaznak:
a) a személyek és járművek működését a repülőtér munkaterületén korlátozzák a lehető legkisebbre és II. vagy III. kategóriás precíziós műszeres üzemeltetés esetén különösen ügyeljenek az ILS/MLS érzékeny területek védelmére vonatkozó előírások betartására;
b) a 3.8.3 pont előírásai mellett, a járművek és a guruló légijármű közötti minimális elkülönítés feleljen meg az illetékes légiforgalmi szolgálati hatóság által a rendelkezésre álló berendezések jellemzői alapján meghatározott előírásainak;
c) amennyiben ugyanazon a futópályán folyamatosan vegyes II. vagy III. kategóriás ILS és MLS precíziós műszeres üzemeltetés történik, a szigorúbb feltételek szerinti ILS vagy MLS kritikus és érzékeny területek védelme biztosítandó.
Megjegyzés: A rossz látási körülményekre kidolgozott eljárások alkalmazásának időszakát a légiforgalmi szolgálati egységek utasításainak megfelelően határozzák meg. A repülőtér rossz látási körülmények között történő üzemeltetésére vonatkozó útmutatást a *Felszíni Mozgás Ellenőrzése és Irányítása (SMGCS) Kézikönyv* (Doc 9476) tartalmazza.
3.8.3 A kényszerhelyzetben levő légijármű segítségére siető mentő járművek számára biztosítsanak elsőbbséget minden egyéb földi forgalommal szemben .
3.8.4 A fenti 3.8.3 pont előírása mellett a munkaterületen működő járművek tartsák be a következő előírásokat:
a) a járművek és légijárművet vontató járművek adjanak elsőbbséget a leszálló, felszálló vagy guruló légijárműveknek;

b) a járművek adjanak elsőbbséget a légijárművet vontató másik járműveknek;
c) a járművek a légiforgalmi szolgálati egység utasításai alapján adjanak elsőbbséget másik járműveknek;
d) a fenti a), b) és c) alpontoktól függetlenül a járművek és légijárművet vontató járművek tartsák be a repülőtéri irányító torony utasításait.

3.9 Radarberendezés és berendezésfüggő automatikus felderítés (ADS-B) biztosítása

Ajánlás *— A radar- és ADS-B földi rendszerek tegyék lehetővé a repülésbiztonságot érintő riasztások és figyelmeztető jelzések, közöttük a konfliktus előrejelzés és riasztás, a legalacsonyabb biztonságos tengerszint feletti magasság megsértése valamint a nem szándékos másodlagos radar válaszjeladó (SSR) kódkiosztás kettőzés jelzések megfelelő megjelenítését.*

3.10 Felszíni mozgást ellenőrző radarberendezés használata (SMR — gurítóradar)

Ajánlás *— Amennyiben a repülőtér munkaterülete vagy egy része szemmel nem látható, vagy a szemmel történő ellenőrzés kiegészítésére a 14. Annex I. kötetének rendelkezései alapján biztosított felszíni mozgást ellenőrző radar (SMR – gurítóradar) vagy egyéb megfelelő felderítő berendezés alkalmazandó:*
a) légijárművek- és járművek munkaterületen történő mozgásának nyomon követésére ;
b) szükség esetén iránymutatás adása a légijármű- és járművezetőknek; valamint
c) tanácsadás és segítségnyújtás a légijárművek- és járművek munkaterületen való biztonságos és hatékony mozgásának elősegítésére .
Megjegyzés – A felszíni mozgást ellenőrző radarberendezés használatáról lásd még a *Felszíni Mozgást Támogató és Irányító Rendszerek (SMGCS) Kézikönyv*et (Doc 9476), a *Fejlett felszíni mozgást Támogató és Irányító Rendszerek (A-SMGCS) Kézikönyv*et (Doc 9830), valamint a *Légiforgalmi Szolgálati Tervezési Kézikönyv*et (Doc 9426).

6. fejezet
A légiforgalmi szolgálatok távközlési követelményei

6.1 Légiforgalmi mozgó szolgálat (levegő-föld összeköttetések)

6.1.1 Általános rész
6.1.1.1 A légiforgalmi szolgálatok céljaira használt levegő-föld összeköttetések esetében közvetlen rádió-távbeszélő és/vagy digitális adathálózati összeköttetés alkalmazandó.
Megjegyzés: A légiforgalmi szolgálati egységek vészhelyzeti 121.5 MHz frekvencia csatornával történő felszerelésére és ezen frekvencia állandó figyelésének fenntartására vonatkozó előírás a 10. Annex II. és V. köteteiben található.
6.1.1.2 Ahol az Államok az ATM funkciókra kommunikációs teljesítmény RCP típust írnak elő, a légiforgalmi szolgálati egységeket a 6.1.1.1 pontban előírt követelményeken túlmenően olyan kommunikációs eszközökkel kell ellátni, amely lehetővé teszi, hogy a légiforgalmi szolgálatokat az előírt RCP típus(ok)nak megfelelően nyújtsák.
Megjegyzés: Az RCP-re és kapcsolódó eljárásokra vonatkozó információk, valamint a jóváhagyási folyamatra vonatkozó útmutató az *Előírt Kommunikációs Teljesítmény (RCP) Kézikönyv*ben (Doc 9869) lesz megtalálható (előkészítés alatt). Ezen dokumentum továbbá referenciákat tartalmaz egyéb, az Államok és nemzetközi testületek által a kommunikációs rendszerekre és RCP-re vonatkozó dokumentumokra.
6.1.1.3 Amikor a légiforgalmi irányító szolgálat biztosítására közvetlen, a repülőgépvezető és a légiforgalmi irányító közötti kétirányú rádiótávbeszélőt és/vagy digitális adathálózati összeköttetést alkalmaznak, az összes ilyen levegő-föld távközlési csatornát adatrögzítő berendezéssel lássanak el.
Megjegyzés: A légiforgalmi irányító szolgálatnál készített automatikus hangfelvételek megőrzésének követelményeit a 10. Annex, II. Kötet 3.5.1.5 pont tartalmazza.

6.1.1.4 A kommunikációs csatornákról a 6.1.1.3 pontban meghatározottak szerint készített felvételeket legalább harminc napig meg kell őrizni.
6.1.2 A repüléstájékoztató szolgálat esetében
6.1.2.1 A levegő-föld távközlési berendezés tegyen lehetővé kétirányú összeköttetést a repüléstájékoztató szolgálatot ellátó egység és a repüléstájékoztató körzetben bárhol repülő, megfelelően felszerelt légijárművek között.
6.1.2.2 ***Ajánlás** — A repüléstájékoztató szolgálat rendelkezésére álló levegő-föld távközlési berendezések lehetőség szerint közvetlen, gyors, folyamatos és légköri rádiózavar mentes kétirányú összeköttetést tegyenek lehetővé.*
6.1.3 Körzeti irányító szolgálat esetében
6.1.3.1 A levegő-föld távközlési berendezés tegyen lehetővé kétirányú összeköttetést a körzeti irányító szolgálatot ellátó egység és az irányítói terület(ek)en belül bárhol repülő, megfelelően felszerelt légijárművek között.
6.1.3.2 ***Ajánlás** — A körzeti irányító szolgálat rendelkezésére álló levegő-föld távközlési berendezések lehetőség szerint közvetlen, gyors, folyamatos és légköri rádiózavar mentes kétirányú összeköttetést tegyenek lehetővé.*
6.1.3.3 ***Ajánlás** — Ahol a körzeti irányító szolgálat céljaira levegő-föld beszédüzemű távközlési csatornákat használnak és ezeket rádiótávbeszélő kezelők üzemeltetik, hozzanak megfelelő intézkedéseket arra, hogy amikor és ahogy ez szükséges, közvetlen légijármű vezető — légiforgalmi irányító közötti összeköttetés alakulhasson ki.*
6.1.4 Bevezető irányító szolgálat esetében
6.1.4.1 A levegő-föld távközlési berendezés tegyen lehetővé közvetlen, gyors, folyamatos és légköri rádiózavar mentes kétirányú összeköttetést a bevezető irányító szolgálatot ellátó egység és az irányítása alatt álló, megfelelően felszerelt légijárművek között.
6.1.4.2 Ahol a bevezető irányító szolgálatot ellátó egység különállóan működik, a levegő-föld távközlési összeköttetést kizárólag ezen egység használatára biztosított távközlési csatornákon tartsák fenn.
6.1.5 Repülőtéri irányító szolgálat esetében
6.1.5.1 A levegő-föld távközlési berendezés tegyen lehetővé közvetlen, gyors, folyamatos és légköri rádiózavar-mentes kétirányú összeköttetést a repülőtéri irányító torony és az érintett repülőtér 45 km-es (25 tmf) körzetén belül bárhol üzemelő, megfelelően felszerelt légijárművek között.
6.1.5.2 ***Ajánlás** — Ahol a körülmények ezt indokolják, a repülőtér munkaterületein működő forgalom irányítására biztosítsanak külön távközlési csatornát.*

6.2 Légiforgalmi állandóhelyű szolgálat (föld-föld összeköttetések)

6.2.1 Általános rész
6.1.1.1 A légiforgalmi szolgálatok céljaira használt föld-föld összeköttetések esetében közvetlen beszéd-üzemű és/vagy digitális adathálózati összeköttetés alkalmazandó.
1. Megjegyzés: Az összeköttetés létrehozásának sebességére utaló jelzés a távközlési szolgálatok számára elsősorban a szükséges távközlési összeköttetés jellegének meghatározása céljából adott útmutatás; például az „azonnali” minősítés olyan összeköttetésre vonatkozik, amely biztosítja az azonnali kapcsolatfelvételt a légiforgalmi irányítók között; a „tizenöt másodperc” azt jelzi, hogy elfogadható a kapcsolótáblás üzem; míg az „öt perc” olyan összeköttetést jelez, amely magába foglalja a hívástovábbítást is.
2. Megjegyzés: A légiforgalmi irányító szolgálatnál készített automatikus hangfelvételek megőrzésének követelményeit a 10. Annex, II. Kötet 3.5.1.5 pont tartalmazza.
6.2.1.2 Ahol az Államok az ATM funkciókra kommunikációs teljesítmény RCP típust írnak elő a légiforgalmi szolgálati egységeket a 6.2.1.1 pontban előírt követelményeken túlmenően olyan kommunikációs eszközökkel kell ellátni, amely lehetővé teszi, hogy a légiforgalmi szolgálatokat az előírt RCP típus(ok)nak megfelelően nyújtsák.
Megjegyzés: Az RCP-re és kapcsolódó eljárásokra vonatkozó információk, valamint a jóváhagyási folyamatra vonatkozó útmutató az *Előírt Kommunikációs Teljesítmény (RCP) Kézikönyv*ben (Doc 9869)

lesz megtalálható (előkészítés alatt). Ezen dokumentum továbbá referenciákat tartalmaz egyéb, az Államok és nemzetközi testületek által a kommunikációs rendszerekre és RCP-re vonatkozó dokumentumokra.

6.2.2 Összeköttetés egy repüléstájékoztató körzeten belül

6.2.2.1 Összeköttetés a légiforgalmi szolgálati egységek között

6.2.2.1.1 A repüléstájékoztató központ rendelkezzen berendezésekkel az illetékességi területén belül szolgálatot ellátó következő egységekkel történő összeköttetéshez:

a) körzeti irányító központ, ha azzal nem közös elhelyezésű;

b) bevezető irányító egységek;

c) repülőtéri irányítótornyok.

6.2.2.1.2 A körzeti irányító központ a repüléstájékoztató központtal való, a 6.2.2.1.1 pontban előírt összeköttetés mellett rendelkezzen berendezésekkel az illetékességi területén belül szolgálatot ellátó következő egységekkel történő összeköttetéshez:

a) bevezető irányító egységek;

b) repülőtéri irányítótornyok;

c) légiforgalmi szolgálatok bejelentő irodája, ha ilyet külön létesítettek.

6.2.2.1.3 A bevezető irányító egység a repüléstájékoztató valamint a körzeti irányító központtal való, a 6.2.2.1.1 és 6.2.2.1.2 pontokban előírt összeköttetés mellett rendelkezzen berendezésekkel a vele együttműködő repülőtéri irányítótoronnyal vagy -tornyokkal, továbbá ha ilyet külön létesítettek, a légiforgalmi szolgálatok bejelentő irodájával történő összeköttetéshez.

6.2.2.1.4 A repülőtéri irányítótorony a repüléstájékoztató valamint a körzeti irányító központtal és a bevezető irányító egységgel való, a 6.2.2.1.1, 6.2.2.1.2 és 6.2.2.1.3 pontokban előírt összeköttetés mellett rendelkezzen berendezésekkel a légiforgalmi szolgálatok bejelentő irodájával történő összeköttetéshez, ha ilyet külön létesítettek.

6.2.2.2 Összeköttetés a légiforgalmi szolgálati egységek és más egységek között

6.2.2.2.1 A repüléstájékoztató és a körzeti irányító központ rendelkezzen berendezésekkel a saját illetékességi területén belül szolgálatot ellátó következő egységekkel történő összeköttetéshez:

a) az illetékes katonai egységek;

b) a központot kiszolgáló meteorológiai hivatal;

c) a központot kiszolgáló légiforgalmi távközlési állomás;

d) a megfelelő járatók hivatalai;

e) a mentést koordináló központ, vagy ennek hiányában bármely más megfelelő mentőszolgálat;

f) a központot kiszolgáló nemzetközi NOTAM iroda.

6.2.2.2.2 A bevezető irányító egység és a repülőtéri irányítótorony rendelkezzen berendezésekkel a saját illetékességi területén belül szolgálatot ellátó következő egységekkel történő összeköttetéshez:

a) az illetékes katonai egységek;

b) a kutató és mentő szolgálatok (beleértve a mentőszolgálatot, tűzoltóságot, stb.);

c) az érintett egységet kiszolgáló meteorológiai hivatal;

d) az érintett egységet kiszolgáló légiforgalmi távközlési állomás;

e) a forgalmi előtér-ügyeleti szolgálatot ellátó egység, ha ilyet külön létesítettek.

6.2.2.2.3 A 6.2.2.2.1 a) és 6.2.2.2.2 a) alpontokban előírt távközlési berendezések biztosítsanak gyors és megbízható összeköttetést az érintett légiforgalmi szolgálati egység és a légiforgalmi szolgálati egység felelősségi területén belül az elfogás irányításáért felelős katonai szervek között.

6.2.2.3 Az összeköttetési berendezések ismertetése

6.2.2.3.1 A 6.2.2.1, 6.2.2.2.1 a) és 6.2.2.2.2 a), b) és c) alpontokban előírt távközlési berendezések biztosítsanak:

a) közvetlen beszédüzemű összeköttetést vagy összetett beszédüzemű és digitális adathálózati összeköttetést ott, ahol a radarirányítás vagy ADS-B irányítás átadásának céljából szükséges összeköttetést azonnal, míg az egyéb célokból szükséges összeköttetést általában tizenöt másodpercen belül lehet létrehozni; és

b) nyomtatott formájú közleményváltásra szolgáló összeköttetést, ahol az írott szövegek tárolása

szükséges; a közlemények továbbítási ideje öt percnél hosszabb ne legyen.
6.2.2.3.2 ***Ajánlás** — A 6.2.2.3.1 pontban nem jelzett összes többi esetben a távközlési berendezések biztosítsanak:*
a) közvetlen beszédüzemű vagy összetett beszédüzemű és digitális adathálózati összeköttetést ott, ahol az összeköttetést általában tizenöt másodpercen belül lehet létrehozni; és
b) nyomtatott formájú közleményváltásra szolgáló összeköttetést, ahol az írott szövegek tárolása szükséges; a közlemények továbbítási ideje öt percnél hosszabb ne legyen.
6.2.2.3.3 Minden olyan esetben, amikor a légiforgalmi szolgálatok számítógépei felé és/vagy a számítógépeitől származó automatikus adattovábbítás szükséges, biztosítsanak megfelelő berendezést az automatikus adatrögzítésre.
6.2.2.3.4 ***Ajánlás** — A 6.2.2.1 és 6.2.2.2 pontokban előírt összeköttetést — ahogyan és ahol szükséges — egyéb vizuális vagy audio-összeköttetést biztosító berendezéssel, például zárt láncú televíziós hálózattal vagy külön információ-feldolgozó rendszerrel egészítsék ki.*
6.2.2.3.5 A 6.2.2.2.2 a), b) és c) alpontokban előírt távközlési berendezések biztosítsák a közvetlen beszédüzemű konferencia összeköttetés lehetőségét.
6.2.2.3.6 ***Ajánlás** — A 6.2.2.2.2 d) alpontban előírt távközlési berendezések biztosítsák a közvetlen beszédüzemű konferencia összeköttetés lehetőségét, ahol az összeköttetést általában tizenöt másodpercen belül lehet létrehozni.*
6.2.2.3.7 Valamennyi, a 6.2.2.2.1 és a 6.2.2.2.2 pontokban előírt, a légiforgalmi szolgálati egységek, valamint légiforgalmi szolgálati egységek és egyéb egységek közötti közvetlen beszédüzemű vagy digitális adathálózati összeköttetésről automatikus felvételt kell készíteni.
6.2.2.3.8 Az adatokról és összeköttetésekről a 6.2.2.3.3 és 6.2.2.3.7 pontokban előírt felvételt legalább harminc napig meg kell őrizni.
6.2.3 Összeköttetés a repüléstájékoztató körzetek között
6.2.3.1 A repüléstájékoztató központok és a körzeti irányító központok rendelkezzenek berendezésekkel az összes szomszédos repüléstájékoztató és a körzeti irányító központtal történő összeköttetéshez.
6.2.3.1.1 Ezek az összeköttetési berendezések megőrzés céljából minden esetben tegyék lehetővé a közlemények megfelelő formában történő rögzítését, továbbá a közlemények továbbítási ideje feleljen meg a körzeti légiközlekedési egyezményekben előírtaknak.
6.2.3.1.2 Ha a körzeti légiközlekedési egyezmények alapján mást nem írnak elő, a szomszédos irányítói körzeteket kiszolgáló körzeti irányító központok közötti összeköttetési berendezések a fentieken túl biztosítsák a közvetlen beszédüzemű és -- ahol ez alkalmazható -- a digitális adathálózati összeköttetést automatikus rögzítéssel, amellyel a radar- vagy ADS-B és ADS-C segítségével történő irányítás átadásának céljából szükséges összeköttetést azonnal, míg az egyéb célokból szükséges összeköttetést általában tizenöt másodpercen belül lehet létrehozni.
6.2.3.1.3 Amikor a kijelölt útvonaltól való eltérés esetében az elfogás szükségességének kiküszöbölése vagy csökkentése érdekében az érintett Államok közötti megállapodás így írja elő, a 6.2.3.1.2 pontban nem jelzett egyéb szomszédos repüléstájékoztató vagy körzeti irányító központok közötti összeköttetési berendezések közvetlen beszédüzemű összeköttetést vagy összetett beszédüzemű és digitális adathálózati összeköttetést tegyenek lehetővé. A berendezéseket megfelelő automatikus rögzítő egységgel lássák el.
6.2.3.1.4 ***Ajánlás** — A 6.2.3.1.3 pontban jelzett összeköttetési berendezések általában tizenöt másodpercen belül tegyék lehetővé az összeköttetés létrehozását.*
6.2.3.2 ***Ajánlás** — A szomszédos ATS egységek között minden olyan esetben alakítsanak ki összeköttetést, amikor különleges körülmények állnak fenn.*
Megjegyzés: A különleges körülményeket a forgalom sűrűsége, az üzemelő légijárművek típusai és/vagy a légtér szervezésének módjai okozhatják és ezek akkor is fennállhatnak, ha az ellenőrzött légterek és/vagy irányító körzetek nem közvetlenül határosak vagy (még) nem kerültek kijelölésre.
6.2.3.3 ***Ajánlás** — Ahol a helyi körülmények olyanok, hogy egy légijármű belépési engedélyét a szomszédos irányító körzetbe az indulás előtt kell megadni, a bevezető irányító egységet és/vagy a repülőtéri irányító tornyot kössék össze a szomszédos területet kiszolgáló körzeti irányító központtal.*
6.2.3.4 ***Ajánlás** — A 6.2.3.2 és 6.2.3.3 pontokban jelzett összeköttetési berendezések biztosítsák a*

közvetlen beszédüzemű vagy összetett beszédüzemű és digitális adathálózati összeköttetést, amellyel a radar- vagy ADS-B és ADS-C adatok segítségével történő irányítás átadásának céljából szükséges összeköttetést azonnal, míg az egyéb célokból szükséges összeköttetést általában tizenöt másodpercen belül lehet létrehozni, valamint annak automatikus rögzítését.

6.2.3.5 Minden olyan esetben, amikor a légiforgalmi szolgálatok számítógépei között automatikus adatcsere szükséges, biztosítsanak megfelelő berendezést az automatikus adatrögzítésre.

6.2.3.6 A 6.2.3.5 pontban meghatározott adatokról és összeköttetésekről készített felvételeket legalább harminc napig meg kell őrizni.

6.2.4 Eljárások a közvetlen beszédüzemű összeköttetésekre

***Ajánlás** — Olyan eljárásokat dolgozzanak ki közvetlen beszédüzemű összeköttetésre, amelyek a légijármű biztonságát érintő nagyon sürgős hívások esetén lehetővé teszik az azonnali kapcsolatfelvételt és -- ha szükséges -- az éppen folyó kevésbé fontos (beszédüzemű) kapcsolatok megszakítását.*

6.3 Földi mozgást irányító szolgálat

6.3.1 Az ellenőrzött repülőterek munkaterületein üzemelő járművek irányítására — a légjárművek kivételével — alkalmazott összeköttetések
6.3.1.1 A repülőtéri irányító szolgálat számára biztosítsanak kétirányú rádió-távbeszélő berendezés(eke)t a munkaterületen üzemelő járművek irányítására, kivéve, ahol a látjelek útján tartott összeköttetést elégségesnek ítélik.
6.3.1.2 Ahol ezt a körülmények indokolják, a munkaterületen üzemelő járművek irányítására külön távközlési csatornákat alkalmazzanak. Minden ilyen csatornát lássanak el automatikus hangrögzítő berendezéssel.
6.3.1.3 A 6.3.1.2 pontban meghatározott összeköttetésekről készített felvételeket legalább harminc napig meg kell őrizni.
Megjegyzés: Lásd még 10. Annex. II. Kötet, 3.5.1.5.

6.4 Légiközlekedési rádiónavigációs szolgálat

6.4.1 A légtér-felderítési adatok automatikus rögzítése
6.4.1.1 Az elsődleges és másodlagos radarberendezésektől származó vagy egyéb rendszerek (pl. ADS-B, ADS-C) útján beszerzett és a légiforgalmi szolgálatok céljaira használt légtérfelderítési adatokat automatikusan rögzítsék légiközlekedési baleset- és repülőesemény kivizsgálás, kutató és mentő feladatok, légiforgalmi szolgálat és a légtérfelderítési rendszer értékelése, valamint kiképzés céljaira.
6.4.1.2 Az automatikusan rögzített adatokat legalább harminc napig őrizzék meg. Amennyiben a rögzített adatok a légiközlekedési baleset és repülő esemény kivizsgáláshoz szükségesek, azokat hosszabb ideig őrizzék meg egészen addig, amíg azokra a továbbiakban nem lesz szükség.

7. fejezet
A légiforgalmi szolgálatok tájékoztatásokra vonatkozó előírásai

7.1 Időjárásról szóló tájékoztatás

7.1.1 Általános rész
7.1.1.1 A légiforgalmi szolgálati egységeket feladataik ellátásához szükséges mértékben lássák el az észlelt tényleges és előrejelzett időjárási körülményekről szóló tájékoztatással, amelyet olyan formában adjanak meg, amely a légiforgalmi szolgálatok személyzete részéről a lehető legkevesebb értelmezést (dekódolást) igényli és olyan gyakorisággal, amely kielégíti az érintett légiforgalmi szolgálati egységek igényeit.
7.1.1.2 ***Ajánlás** — A légiforgalmi szolgálati egységek számára adják meg a repülőtér közelében, különösen az emelkedési és megközelítési területeken tapasztalható, a légijármű üzemeltetés szempontjából veszélyt jelentő időjárási jelenségek elhelyezkedéséről, függőleges kiterjedéséről, haladási irányáról és mozgási sebességéről szóló részletes tájékoztatásokat.*
Megjegyzés: Az ilyen időjárási jelenségek felsorolása a 3. Annex 4. fejezet 4.12.1 pontjában található.
7.1.1.3 ***Ajánlás** — Amikor a számítógéppel feldolgozott magaslégtéri időjárási adatokat a légiforgalmi szolgálati egységek számítógépeivel történő felhasználás céljából digitális formátumban a légiforgalmi szolgálati egységek rendelkezésére bocsátják, azok tartalma, formátuma és az adattovábbítás módja a meteorológiai és az illetékes légiforgalmi szolgálati hatóság közötti megállapodásnak megfelelő legyen.*
7.1.2 Repüléstájékoztató és körzeti irányító központok
7.1.2.1 A repüléstájékoztató és körzeti irányító központokat a lehető leghamarabb lássák el a 3. Annex 9. Melléklet 1.3 pontjában részletezett időjárási körülményekről szóló tájékoztatásokkal, külön kihangsúlyozva az időjárás romlását vagy várható romlását, amint ez megállapítható. Ezek a jelentések és előrejelzések terjedjenek ki a repüléstájékoztató vagy irányító körzetre, továbbá minden más légtérre, amelyet a körzeti légiközlekedési egyezmények alapján meghatároztak.

Megjegyzés: Ezen előírás teljesítése céljából bizonyos időjárás-változásokat időjárás-romlásnak értelmeznek annak ellenére, hogy ezek rendes körülmények között nem így értékelendők. A hőmérséklet növekedése például kedvezőtlenül befolyásolhatja bizonyos légijármű-típusok üzemeltetését.
7.1.2.2 A repüléstájékoztató és körzeti irányító központok számára megfelelő rendszeres időközönként adják meg a magasságmérő beállítás céljára szolgáló, az érintett repüléstájékoztató és körzeti irányító központok által meghatározott helyekre vonatkozó érvényes légnyomás adatokat.
7.1.3 Bevezető irányító szolgálatot ellátó egységek
7.1.3.1 A bevezető irányító szolgálatot ellátó egységeket lássák el az illetékességük alá tartozó légterekre és repülőterekre vonatkozó észlelt tényleges, valamint az előre jelzett, a 3. Annex 9. Melléklet 1.2 pontban meghatározott időjárási körülményekről szóló tájékoztatással. A különleges jelentéseket valamint az időjárás előrejelzések módosításait a lehető legrövidebb időn belül adják meg a bevezető irányító szolgálatot ellátó egységek számára, akkor, amikor azok a meghatározott előírások szerint szükségessé válnak és ne várják meg a következő időjárás jelentés vagy előrejelzés rendes időpontját. Ahol egyszerre több szélmérőt alkalmaznak, azok kijelzőjén azonosítás céljából egyértelműen jelöljék meg, hogy az adott szélmérő melyik futópályára és futópálya szakaszra vonatkozik.
Megjegyzés: Lásd a 7.1.2.1 pontot követő megjegyzést.
7.1.3.2 A bevezető irányító szolgálatot ellátó egységek számára adják meg a magasságmérő-beállítás céljára szolgáló, az érintett bevezető irányító szolgálatot ellátó egység által meghatározott helyekre vonatkozó érvényes légnyomásadatokat.
7.1.3.3 A végső megközelítés, leszállás és felszállás során bevezető irányító szolgálatot ellátó egységeket szereljék fel talajszél-kijelző berendezéssel (berendezésekkel). A kijelző berendezés (berendezések) a repülőtéri irányító torony és -- ha ilyet létesítettek -- a meteorológiai állomás hasonló kijelzőivel együtt ugyanarról a talajszél mérőműszerről (mérőműszerekről) működjön (működjenek).
7.1.3.4 Azokon a repülőtereken, amelyeken a futópályamenti látástávolság értékeket műszerekkel mérik, a végső megközelítés, leszállás és felszállás során bevezető irányító szolgálatot ellátó egységeket szereljék fel kijelző berendezéssel, amely lehetővé teszi az aktuális futópályamenti látástávolság értékek leolvasását. A kijelző berendezés (berendezések) a repülőtéri irányító torony és -- ha ilyet létesítettek -- a meteorológiai állomás hasonló kijelzőivel együtt ugyanarról a futópályamenti látástávolság érték mérőműszerről (mérőműszerekről) működjön (működjenek).
7.1.3.5 ***Ajánlás*** *– Azokon a repülőtereken, ahol a felhőalap magasságát műszeres eszközökkel mérik, a végső megközelítés, leszállás és felszállás során bevezető irányító szolgálatot ellátó egységeket szereljék fel kijelző berendezéssel (berendezésekkel) amely (amelyek) lehetővé teszi (teszik) az aktuális felhőalap-magasság érték leolvasását. A kijelző berendezés (berendezések) a repülőtéri irányító torony és -- ha ilyet létesítettek -- a meteorológiai állomás hasonló kijelzőivel együtt ugyanazon (ugyanazokon) a megfigyelési ponton (pontokon) elhelyezett mérőműszerről (mérőműszerekről) működjön (működjenek).*
7.1.3.6 A végső megközelítés, leszállás és felszállás során bevezető irányító szolgálatot ellátó egységeket lássák el a megközelítési és felszállási útvonalakon közlekedő vagy a körözéses megközelítést végző légijárművek működését hátrányosan befolyásoló szélnyírásra vonatkozó tájékoztatással.
Megjegyzés: A szélnyírás figyelmeztetés kiadására valamint a meteorológiai tájékoztatásokra vonatkozó ATS előírásokat a 3. Annex 7. fejezete, valamint 6. és 9. Melléklete tartalmazza.
7.1.4 Repülőtéri irányítótorony
7.1.4.1 A repülőtéri irányítótornyokat lássák el az illetékességük alá tartozó repülőtérre vonatkozó, a 3. Annex 9 Melléklet 1.1 pontban meghatározott időjárási körülményekről szóló tájékoztatással. A különleges jelentéseket valamint az időjárás előrejelzések módosításait a lehető legrövidebb időn belül adják meg a repülőtéri irányítótornyok számára, akkor, amikor azok a meghatározott előírások szerint szükségessé válnak, és ne várják meg a következő időjárás-jelentés vagy -előrejelzés rendes időpontját.
Megjegyzés: Lásd a 7.1.2.1 pontot követő megjegyzést.
7.1.4.2 A repülőtéri irányítótornyok számára adják meg a magasságmérő-beállítás céljára szolgáló, az adott repülőtérre vonatkozó érvényes légnyomásadatokat.
7.1.4.3 A repülőtéri irányítótornyokat szereljék fel talajszél kijelző berendezéssel (berendezésekkel). A kijelző berendezés (berendezések) a meteorológiai állomás — ha ilyet létesítettek — hasonló kijelzőivel

együtt ugyanarról a talajszél mérőműszerről (mérőműszerekről) működjön (működjenek). Ahol egyszerre több szélmérőt alkalmaznak, azok kijelzőjén azonosítás céljából egyértelműen jelöljék meg, hogy az adott szélmérő melyik futópályára és futópálya szakaszra vonatkozik.
7.1.4.4 Azokon a repülőtereken, amelyeken a futópályamenti látástávolság értékeket műszerekkel mérik, a repülőtéri irányító tornyokat szereljék fel kijelző berendezéssel (berendezésekkel), amely (amelyek) lehetővé teszi (teszik) az aktuális futópályamenti látástávolság értékek leolvasását. A kijelző berendezés (berendezések) a meteorológiai állomás — ha ilyet létesítettek — hasonló kijelzőivel együtt ugyanarról a futópályamenti látástávolság érték mérőműszerről (mérőműszerekről) működjön (működjenek).
7.1.4.5 ***Ajánlás*** *– Azokon a repülőtereken, ahol a felhőalap magasságát műszeres eszközökkel mérik, a repülőtéri irányítótornyot szereljék fel kijelző berendezéssel (berendezésekkel) amely (amelyek) lehetővé teszi (teszik) az aktuális felhőalap-magasság érték leolvasását. A kijelző berendezés (berendezések) a meteorológiai állomás -- ha ilyet létesítettek -- hasonló kijelzőivel együtt ugyanazon (ugyanazokon) a megfigyelési ponton (pontokon) elhelyezett mérőműszerről (mérőműszerekről) működjön (működjenek).*
7.1.4.6 A repülőtéri irányítótornyokat lássák el a megközelítési és felszállási útvonalakon közlekedő vagy körözéses megközelítést, valamint a futópályán felszálláshoz történő nekifutást illetve leszállás utáni kigurulást végző légijárművek működését hátrányosan befolyásoló szélnyírásra vonatkozó tájékoztatással.
7.1.4.7 ***Ajánlás*** *— A repülőtéri irányítótornyokat és/vagy más illetékes egységeket lássák el a földön levő — beleértve a parkoló — légijárműveket, továbbá a repülőtéri létesítményeket és szolgálatokat hátrányosan érintő időjárási körülményekre vonatkozó tájékoztatással.*
Megjegyzés: Az időjárási körülmények felsorolása a 3. Annex 6. Melléklet 5.1.3 pontjában található.
7.1.5 Távközlési állomások
Ahol ez a repüléstájékoztatás céljai érdekében szükséges, a távközlési állomásokat lássák el az észlelt tényleges, valamint az előrejelzett időjárási körülményekről szóló tájékoztatással. A tájékoztatás egy példányát továbbítsák a repüléstájékoztató vagy a körzeti irányító központnak.

7.2 A repülőtér állapotára valamint a berendezések működésére vonatkozó tájékoztatás

A repülőtéri irányítótornyokat és a bevezető irányító szolgálatot ellátó egységeket rendszeresen tájékoztassák a repülőtér mozgási területének az üzemeltetés szempontjából lényeges állapotáról, beleértve az időszakos veszélyeket is. Adjanak továbbá rendszeres tájékoztatást a repülőteret kiszolgáló bármely berendezés üzemi állapotáról.

7.3 A navigációs berendezések működésére vonatkozó tájékoztatás

7.3.1 A légiforgalmi szolgálati egységeket rendszeresen tájékoztassák a felelősségi területükön belül található nem látás utáni navigációs berendezések, a felszállási, indulási, megközelítési és leszállási eljárásokhoz nélkülözhetetlen látás utáni segédeszközök, továbbá a felszíni mozgáshoz szükséges látás utáni és nem látás utáni berendezések üzemi állapotáról.
7.3.2 ***Ajánlás*** *— A 7.3.1 pontban jelzett látás utáni és nem látás utáni berendezések üzemi állapotáról és ennek változásáról szóló tájékoztatásokat az illetékes légiforgalmi szolgálati egység(ek) megfelelő időben kapja(k) meg, az érintett berendezés igénybevételéhez szükséges idő figyelembevételével.*
Megjegyzés: Az ATS egységeknek a látás utáni és nem látás utáni berendezésekről szóló tájékoztatásával kapcsolatos útmutatót a *Légiforgalmi Szolgálati Tervezési Kézikönyv* (Doc 9426), a látás utáni segédeszközök ellenőrzésére vonatkozó előírásokat a 14. Annex I. kötete, a kiegészítő útmutatót a *Repülőtér Tervezési Kézikönyv* 5. része (Doc 9157) tartalmazza. A nem látás utáni berendezések ellenőrzésére vonatkozó előírásokat a 10. Annex I. kötete tartalmazza.

7.4 Személyzet nélküli szabad léggömbökről szóló tájékoztatás

A személyzet nélküli szabad léggömbök üzemeltetői a 2. Annex előírásainak megfelelően folyamatosan tájékoztassák az illetékes légiforgalmi szolgálati egységeket a személyzet nélküli szabad léggömbök repülésének részleteiről.

7.5 A vulkáni tevékenységről szóló tájékoztatás

7.5.1 A légiforgalmi szolgálati egységeket a helyi megállapodásoknak megfelelően tájékoztassák a vulkánkitörés előtti vulkáni tevékenységről, a vulkánkitörésről és a vulkáni hamufelhőről, amelyek hatással lehetnek a felelősségi területükön belül a légijárművek által igénybe vett légtérre.
7.5.2 A körzeti irányító és repüléstájékoztató központokat lássák el a társított vulkáni tevékenység tanácsadó központok (VAAC) által kiadott vulkáni hamuról szóló tanácsadói tájékoztatásokkal.
Megjegyzés: A vulkáni tevékenység (hamu) tanácsadó központokat (VAAC) a 3. Annex 3.5.1 pontja alapján a körzeti légiközlekedési egyezményben jelölik ki.

7.6 A radióaktív anyagokról és mérgező kémiai „felhőkről" szóló tájékoztatás

A légiforgalmi szolgálati egységeket a helyi megállapodásoknak megfelelően tájékoztassák a légtérbe jutott radioaktív vagy mérgező kémiai anyagokról, amelyek hatással lehetnek a felelősségi területükön belül a légijárművek által igénybe vett légtérre.

1. Függelék
Az előírt navigációs teljesítmény (RNP) típusai azonosításának, valamint a szabvány indulási és érkezési útvonalaktól eltérő légiforgalmi szolgálati útvonalak elnevezésének alapelvei

(A 2. fejezet 2.7 és 2.12 ponthoz)

Megjegyzés: A szabvány indulási és érkezési útvonalak azonosításával és a vonatkozó eljárásokkal kapcsolatban lásd a 3. Függeléket. Az ezen útvonalak és eljárások kijelölésével kapcsolatos útmutatót a *Légiforgalmi Szolgálatok Tervezési Kézikönyve* (Doc 9426) tartalmazza.

1. ATS útvonalak és RNP típusok elnevezése

1.1 A meghatározott légiforgalmi szolgálati útvonal szakaszokra, útvonalakra vagy légterekre alkalmazható útvonal megnevezés és előírt navigációs teljesítmény típus meghatározás rendszerének célja, hogy az automatizálás követelményeinek figyelembe vétele mellett a repülőgépvezető és a légiforgalmi szolgálatok:

a) egyértelműen hivatkozhassanak bármely légiforgalmi szolgálati útvonalra anélkül, hogy annak leírásához földrajzi koordinátákat vagy más módszert kellene igénybe venniük;

b) egy légiforgalmi szolgálati útvonalat szükség szerint a légtér meghatározott függőleges szerkezetére vonatkoztassák;

c) a légiforgalmi szolgálati útvonal mentén vagy egy meghatározott légtérben történő üzemelés esetén jelezzék a navigációs pontosság előírt szintjét; és

d) jelezzék, hogy az útvonalat elsősorban vagy kizárólagosan bizonyos légijármű típusok veszik igénybe.

1. Megjegyzés: Az előírt navigációs teljesítmény (RNP) egész világra kiterjedő általános bevezetése előtt a jelen függelékben található, az RNP-re vonatkozó összes utalás a területi navigációs (RNAV) útvonalakra is érvényes, ahol navigációs teljesítmény pontossági előírást is meghatároztak.
2. Megjegyzés: Az RNP típusok közzétételére vonatkozó előírások a 4. Annex 7. fejezetében és a 15. Annex l. Függelékében találhatók.
3. Megjegyzés: Az előírt navigációs teljesítmény szint (RNP) típus a jelen függelék vonatkozásában valamint repülés tervezési célokra nem tekintendő az ATS útvonal megnevezés szerves részének.
1.2 A fenti célok elérése érdekében a megnevezési rendszer:
a) tegye lehetővé bármely légiforgalmi szolgálati útvonal egyszerű és egyedi azonosítását;
b) kerülje a felesleges elemeket;
c) legyen használható úgy a földi, mint a fedélzeti automatikus berendezések számára;
d) a gyakorlati alkalmazás során legyen a lehető legtömörebb; és
e) biztosítsa a bővítés megfelelő lehetőségét, hogy az alapvető változtatások szükségessége nélkül

megfeleljen a jövőbeli követelményeknek.
1.3 Az ellenőrzött, tanácsadói és nem ellenőrzött ATS útvonalakat a szabványos műszeres indulási és érkezési útvonalak kivételével a következőkben ismertetett eljárás alapján azonosítsák.

2. Az útvonal megnevezés összeállítása

2.1 A légiforgalmi szolgálati útvonal megnevezés egy alapjelzésből áll, amelyet szükség szerint a következők egészítenek ki:
a) egy előtag a 2.3 pont előírása szerint; és
b) egy további betű a 2.4 pont előírása szerint.
2.1.1 A megnevezés összeállításhoz szükséges tagok száma ne haladja meg a hatot.
2.1.2 A megnevezés összeállításhoz szükséges tagok számát lehetőség szerint legfeljebb ötre korlátozzák.
2.2 Az alap megnevezés az ABC egy betűjéből álljon, amelyet 1 és 999 között egy szám követ.
2.2.1 Az alkalmazott betűt az alábbiakból válasszák ki:
a) A, B, G, R olyan útvonalak esetén, amelyek a helyi körzeti légiforgalmi szolgálati útvonalak részét képező nem területi navigációs útvonalak;
b) L, M, N, P olyan útvonalak esetén, amelyek a helyi körzeti légiforgalmi szolgálati útvonalak részét képező területi navigációs útvonalak;
c) H, J, V, W olyan útvonalak esetén, amelyek a nem helyi körzeti légiforgalmi szolgálati útvonalak részét képező és nem területi navigációs útvonalak;
d) Q, T, Y, Z olyan területi navigációs útvonalak esetén, amelyek nem képezik a helyi körzeti légiforgalmi szolgálati útvonalak részét.
2.3 Ahol ez alkalmazható, az alap megnevezést a következőknek megfelelően előtagként egy betűvel egészítsék ki:
a) K az elsősorban forgószárnyas légijárművek számára létesített alacsony repülési magasságú útvonal jelölésére;
b) U annak jelölésére, hogy az útvonalat vagy annak egy szakaszát a magaslégtérben létesítették;
c) S annak jelölésére, hogy az útvonalak kizárólag szuperszonikus légijárművek gyorsítására, lassítására valamint hangsebesség feletti repülésére létesítették.
2.4 Amennyiben az illetékes légiforgalmi szolgálati hatóság vagy a körzeti légiközlekedési egyezmény úgy írja elő, a kérdéses ATS útvonal alap megnevezés után a következőknek megfelelően egy kiegészítő betű alkalmazható az adott ATS útvonalon biztosított szolgálat típusának vagy az útvonalon szükséges forduló teljesítmény meghatározásának jelzésére:
a) az RNP 1 útvonalak esetén, FL 200 repülési szinten vagy felette a „Y” betű jelzi, hogy az útvonalon az összes 30 és 90 fok közötti fordulót az egyenes szakaszok között 22.5 tmf sugárral meghatározott érintő ív engedélyezett RNP tűrési határértékén belül kell végrehajtani (például: A123Y{1});
b) az RNP 1 útvonalak esetén, FL 190 repülési szinten vagy alatta a „Z” betű jelzi, hogy az útvonalon az összes 30 és 90 fok közötti fordulót az egyenes szakaszok között 15 tmf sugárral meghatározott érintő ív engedélyezett RNP tűrési határértékén belül kell végrehajtani (például: G246Z{1});
c) az „F” betű azt jelzi, hogy az útvonalon vagy annak egy szakaszán csak tanácsadó szolgálatot biztosítanak;
d) a „G” betű azt jelzi, hogy az útvonalon vagy annak egy szakaszán csak repüléstájékoztató szolgálatot biztosítanak.
1. Megjegyzés: A légijármű fedélzetén elhelyezett megjelenítő berendezések korlátozásai miatt az „F”, „G”, „Y” vagy „Z” betűk a repülőgépvezető számára esetleg nem jeleníthetők meg.
2. Megjegyzés: A 4. és a 15. Annex előírásainak megfelelően kidolgozott és közzétett repülési térképek és légiforgalmi tájékoztató kiadványok jelzik, hogy az útvonal vagy annak egy szakasza ellenőrzött, tanácsadói vagy repüléstájékoztató útvonal.
3 Megjegyzés: Azokat a feltételeket, amelyek alapján az Államok a 2.4 a) és b) alpontokban ismertetett ellenőrzött forduló teljesítményt meghatározhatják, az *Előírt Navigációs Teljesítmény Kézikönyv*ben (Doc 9613) tárgyaljuk.

3. Az alap megnevezések kidolgozása

3.1 A légiforgalmi szolgálati útvonal alap megnevezéseket a következő alapelvek szerint dolgozzák ki.
3.1.1 Egy fő távolsági útvonal teljes hosszában, függetlenül az átrepült közelkörzeti irányító légterektől, körzetektől vagy Államoktól, ugyanazt az alap megnevezést alkalmazzák.
Megjegyzés: Ez különösen fontos ott, ahol automatikus ATS adatfeldolgozást és számítógépes fedélzeti navigációs berendezéseket illetve számítógépes navigációs rendszert használnak.
3.1.2 Ahol két vagy több távolsági útvonal közös szakasszal rendelkezik, a kérdéses szakaszt lássák el mindkét érintett útvonal megnevezésével, kivéve, ha ez a légiforgalmi szolgálat biztosításánál nehézséget okoz, amely esetben közös megegyezés alapján csak egy megnevezést alkalmazzanak.
3.1.3 Egy útvonalhoz már felhasznált alap megnevezés másik útvonalnál nem alkalmazható.
3.1.4 Az Államok az útvonal megnevezésére vonatkozó igényeiket egyeztetés céljából nyújtsák be az ICAO körzeti irodáinak.

4. A megnevezések használata közleményváltásokban

4.1 A nyomtatott formájú összeköttetések esetében a megnevezést minden esetben legalább kettő, de nem több mint hat taggal adják meg.
4.2 A szóbeli összeköttetések esetében a megnevezés alapbetűjét az ICAO kiejtési ABC szerint mondják ki.
4.3 Ahol a 2.3 pontban meghatározott K, U vagy S előtagokat használják, azokat a szóbeli összeköttetések esetében a következők szerint mondják ki:
K — KOPTER
U — UPPER
S — SUPERSONIC
A „kopter” szó kiejtése mint a „helicopter”-nél, az „upper” és „supersonic” szavak kiejtése az angol nyelvi kiejtés szerint történik.
4.4 Amennyiben a 2.4 pontban meghatározott „F”, „G”, „Y” vagy „Z” előtagokat használják, nem lehet elvárás, hogy azokat a hajózószemélyzet tagjai a szóbeli összeköttetések esetében használják.

2. Függelék
Fontos pontok kijelölésének és elnevezésének alapelvei

(A 2. fejezet 2.14 ponthoz)

1. Fontos pontok kijelölése

1.1 A fontos pontokat -- amikor csak lehetséges -- földi rádiónavigációs berendezésekre, lehetőleg URH vagy magasabb frekvencián üzemelő berendezésekre vonatkoztatva jelöljék ki.
1.2 Ahol ilyen földi rádiónavigációs berendezések nem állnak rendelkezésre, a fontos pontokat olyan helyeken jelöljék ki, amelyek önálló fedélzeti navigációs berendezéssel vagy -- ahol földi látjelek útján történő navigációt alkalmaznak -- talajfelszín látással meghatározhatók illetve azonosíthatók. Egyes egyedi pontok az érintett szomszédos légiforgalmi irányító szolgálati egységek vagy irányítói munkahelyek közötti megállapodás alapján „irányítás átadási pont”-ként jelölhetők ki.

2. A rádiónavigációs berendezés helyével kijelölt fontos pontok elnevezése

2.1 A rádiónavigációs berendezés helyével kijelölt fontos pontok nyílt nyelven történő megnevezése
2.1.1 Amikor az lehetséges, a fontos pontokat azonosítható és lehetőleg jellegzetes földrajzi helyre vonatkoztatva nevezzék el.
2.1.2 A fontos pontok megnevezése alkalmával gondoskodjanak a következő feltételek teljesítéséről:
a) a név kiejtése ne jelentsen nehézséget a repülőgépvezetők vagy a légiforgalmi szolgálatok személyzete számára, amikor azok az ATS kommunikációban használatos nyelvet alkalmazzák. Ahol a jelentős pont

elnevezésére kiválasztott földrajzi hely az adott nemzeti nyelvű neve kiejtési nehézségeket okoz, a megnevezés rövidített vagy összevont változatát válasszák ki, amely a lehető legnagyobb mértékben megtartja az eredeti földrajzi név jelentését;

Például: FUERSTENFELDBRUCK = FURSTY

b) a beszédüzemű közleményváltások alkalmával a megnevezés legyen könnyen felismerhető és ne legyen összetéveszthető az azonos területen levő más fontos pontok neveivel. Ezen felül a név a légiforgalmi szolgálatok és a repülőgépvezetők közötti egyéb közleményváltások alkalmával se okozzon zavart;

c) a megnevezés lehetőség szerint legalább hat betűből és kettő, de lehetőleg nem több mint három szótagból álljon;

d) a fontos pont és az azt jelölő rádiónavigációs berendezés kiválasztott neve legyen azonos.

2.2 A rádiónavigációs berendezés helyével kijelölt fontos pontok kódolt megnevezésének összeállítása

2.2.1 A fontos pont kódolt megnevezése és az azt jelölő rádiónavigációs berendezés rádió azonosítója legyen azonos. Ha lehetséges, azt úgy állítsák össze, hogy megkönnyítse a nyílt nyelvű megnevezéssel történő vonatkoztatást.

2.2.2 Az érintett rádiónavigációs berendezés elhelyezkedésének 1100 km-es (600 tengeri mérföldes) körzetén belül a kódolt megnevezés — az alábbi eset kivételével — ne ismétlődjön.

Megjegyzés: Amikor két rádiónavigációs berendezés azonos telepítési hellyel rendelkezik, azonban eltérő frekvencia-sávban üzemelnek, rádióazonosító jelük általában azonos.

2.3 A kódolt megnevezésre vonatkozó állami igényeket egyeztetés céljából nyújtsák be az ICAO körzeti irodáknak.

3. A nem rádiónavigációs berendezés helyével kijelölt fontos pontok elnevezése

3.1 Ahol a fontos pont kijelölésére olyan helyen van szükség, amelyet nem jelöl rádiónavigációs berendezés, a fontos pontot kiejthető, egyedi összeállítású, ötbetűs „név-kód”-dal jelöljék meg. Ezt követően a név-kód lesz a fontos pont megnevezése, valamint annak kódolt jelölése is.

3.2 Ezt a név-kód megnevezést úgy válasszák ki, hogy elkerüljék kiejtési nehézségeket a repülőgépvezetők vagy a légiforgalmi szolgálatok személyzete számára, amikor azok az ATS közleményváltásokban használatos nyelvet alkalmazzák.

Például: ADOLA, KODAP

3.3 A beszédüzemű közleményváltások alkalmával a név-kód megnevezés legyen könnyen felismerhető és ne legyen összetéveszthető az azonos területen levő más fontos pontok név-kódjaival.

3.4 A fontos pont név-kód megnevezését ne adják ki más fontos pontnak. Amennyiben egy fontos pont áthelyezése válik szükségessé, új név-kód megnevezést kell választani. Olyan esetekben, amikor egy Állam meg kíván tartani bizonyos név-kód megnevezéseket más helyszínen történő újbóli felhasználás céljából, a név-kód megnevezés legalább hat hónap időtartamig nem használható újra.

3.5 A név-kód megnevezésre vonatkozó állami igényeket egyeztetés céljából nyújtsák be az ICAO körzeti irodáknak.

3.6 Olyan területeken, amelyeken állandó útvonal rendszert nem határoztak meg vagy ahol a légijárművek által követett útvonalak az üzemeltetési szempontok alapján nagy mértékben változnak, a fontos pontokat az egész világon egységesen alkalmazható földrajzi hely meghatározási rendszer (WGS-84) koordinátáival jelöljék ki és így tegyék közzé, kivéve az ilyen területek be és/vagy kilépési pontjaként szolgáló állandó fontos pontokat, amelyeket a 2. vagy 3. szakasz megfelelő előírásai szerint jelöljék ki.

4. Jelölések alkalmazása közleményváltások során

4.1 A beszédüzemű közleményváltások alkalmával általában a 2. vagy 3. szakasz alapján kiválasztott nevet használják a fontos pont megjelölésére. Ha egy rádiónavigációs berendezéssel jelölt fontos pont 2.1 pont szerint meghatározott nyílt nyelvű megnevezését nem használják, azt kódolt névvel helyettesítsék, amelyet a beszédüzemű közleményváltások alkalmával az ICAO betűzési előírásnak megfelelő módon ejtsenek ki.

4.2 A nyomtatott vagy kódolt közleményváltások esetében csak a kódolt megnevezést vagy a kiválasztott kód-nevet alkalmazzák a fontos pont megjelölésére.

5. A fontos pontok felhasználása jelentési célokra

5.1 Annak érdekében, hogy a légiforgalmi szolgálatok tájékoztatásokat szerezhessenek be a légijárművek repülésének előrehaladásáról, szükséges lehet a kiválasztott fontos pontok jelentő-pontnak történő kijelölése.

5.2 Az ilyen pontok kijelölésnél a következő tényezőket vegyék figyelembe:

a) a biztosított légiforgalmi szolgálat típusa;

b) az általában várható forgalom nagyságrendje;

c) az a pontosság, amellyel a légijárművek be tudják tartani az érvényes repülési tervet;

d) a légijármű sebessége;

e) az alkalmazott elkülönítési minimumok;

f) a légtérszerkezet összetettsége;

g) az alkalmazott irányítási módszer(ek);

h) egy repülés fontos szakaszainak kezdete vagy vége (emelkedés, süllyedés, irányváltoztatás, stb.);

i) irányítás-átadási eljárások;

j) biztonsági valamint kutatás-mentési szempontok;

k) légijármű fedélzeti és a levegő-föld közötti összeköttetés leterheltsége.

5.3 A jelentőpontokat „kötelező” vagy „kérésre” típusúként jelöljék meg.

5.4 A „kötelező” jelentőpontok kijelölésénél a következő alapelveket alkalmazzák:

a) a kötelező jelentőpontok számát a légiforgalmi szolgálati egységeknek a levegőben lévő légijárművek előrehaladásáról szóló tájékoztatás igényével összhangban a lehető legkisebbre korlátozzák, szem előtt tartva a fedélzeti és légiforgalmi irányítói munkaterhelés valamint a levegő-föld közleményváltások számának lehető legalacsonyabb szinten tartásának szükségességét;

b) egy adott helyen rendelkezésre álló rádiónavigációs berendezés nem teszi alapvetően szükségessé annak kötelező jelentőpontként történő kijelölését;

c) a repüléstájékoztató vagy irányító körzet határain nem kell szükségszerűen kötelező jelentőpontokat kijelölni.

5.5 A „kérésre” típusú jelentőpontokat a légiforgalmi szolgálatok kiegészítő helyzetjelentések iránti igényei alapján jelölhetik ki, amennyiben ezt a forgalmi körülmények szükségessé teszik.

5.6 A „kötelező” valamint „kérésre” típusú jelentőpontokat a légiforgalmi szolgálatok hatékony működéséhez szükséges helyzetjelentések számának minimális szinten tartására vonatkozó követelmény figyelembevételével rendszeresen vizsgálják felül.

5.7 A „kötelező” jelentő-pontok jelentését ne tegyék minden repülés számára minden körülmények között kötelezővé. Ezen alapelv alkalmazása során fordítsanak különös figyelmet a következőkre:

a) a nagy sebességgel és nagy repülési magasságon üzemelő légijárműveket ne utasítsák rendszeres helyzetjelentések adására minden olyan jelentőpontnál, amely a kis sebességű és alacsony repülési magasságon üzemelő légijárművek számára kötelező;

b) a közelkörzeten átrepülő légijárműveket ne utasítsák rendszeres helyzetjelentések adására olyan gyakran, mint az érkező és induló légijárműveket.

5.8 Olyan területeken, ahol a jelentőpontok kijelölésére a fenti alapelvek gyakorlati szempontokból nem alkalmazhatók, olyan jelentési rendszert lehet kialakítani, amelynek alapját az egész fokokban kifejezett földrajzi hosszúsági vagy szélességi körök képezik.

3. Függelék
A szabvány indulási és érkezési útvonalak elnevezésének alapelvei valamint az azokkal kapcsolatos eljárások

(lásd 2. fejezet 2.12.3 pont)

Megjegyzés: A szabványos indulási és érkezési útvonalak kijelölésének alapelveire, valamint az azokkal kapcsolatos eljárásokra vonatkozó útmutató a *Légiforgalmi Szolgálati Tervezési Kézikönyv*ben (Doc 9426) található.

1. A szabvány indulási és érkezési útvonalak jelölése, valamint az azokkal kapcsolatos eljárások

Megjegyzés: A következő szövegben az „útvonal és a kapcsolatos eljárások”-ra az „útvonal” szót alkalmazzuk.

1.1 A megnevezés rendszere:

a) egyszerűen és egyértelműen tegye lehetővé minden egyes útvonal azonosítását;

b) világosan különböztesse meg egymástól:

— az indulási és érkezési útvonalakat;

— az indulási vagy érkezési, valamint más légiforgalmi szolgálati útvonalakat;

— azokat az útvonalakat, amelyeken a navigációhoz földi rádióberendezésekre vagy önálló fedélzeti berendezésekre van szükség, valamint azokat, amelyeken a navigáció földlátással történik;

c) feleljen meg a légiforgalmi szolgálatok és a légijárművek adat-feldolgozási és adat-megjelenítési követelményeinek;

d) a gyakorlati alkalmazás során a lehető legtömörebb legyen;

e) kerülje a felesleges elemeket;

f) biztosítsa a bővítés lehetőségét, hogy a rendszer a későbbi bővítés igényeinek alapvető változtatás nélkül megfeleljen.

1.2 Minden egyes útvonalat nyílt nyelvű megnevezéssel és megfelelő kód jelzéssel azonosítsanak.

1.3 A beszédüzemű közleményváltások során könnyen felismerhető legyen, hogy a megnevezés melyik szabványos indulási vagy érkezési útvonalra vonatkozik, továbbá a kiejtése ne okozzon nehézséget a repülőgépvezetők és a légiforgalmi szolgálatok személyzete számára.

2. Jelölések összeállítása

2.1 Nyílt nyelvű megnevezés

2.1.1 A szabvány indulási vagy érkezési útvonal nyílt nyelvű megnevezése a következőkből álljon:

a) alap-azonosító; amit követ

b) az érvényességi jelzés; amit követ

c) az útvonal jelzés, ahol szükséges; amit követ

d) az indulás („departure”) vagy érkezés („arrival”) kifejezések; amit követ

e) a látás utáni („visual”) kifejezés, amennyiben az útvonalat a látvarepülési szabályok (VFR) szerint üzemeltetett légijárművek részére jelölték ki.

2.1.2 Az alap-azonosító annak a fontos pontnak neve vagy név-kódja legyen, amelynél a szabvány indulási útvonal véget ér, vagy amelynél a szabvány érkezési útvonal kezdődik.

2.1.3 Az érvényességi jelzés 1 — 9 közötti szám legyen.

2.1.4 Az útvonal jelzés az ABC egy betűje legyen, azonban az „I” és „O” betűk nem alkalmazhatók.

2.2 Kódolt megjelölés

A műszeres vagy látás utáni szabvány indulási vagy érkezési útvonal kódolt jelölése a következőkből álljon:

a) a 2.1.1 a) alpontban meghatározott fontos pont kód jelzése vagy név-kódja; amit követ

b) a 2.1.1 b) alpontban meghatározott érvényességi jelzés; amit követ

c) a 2.1.1 c) alpontban meghatározott útvonal jelzés, ahol ez szükséges.

Megjegyzés: Ha a jelölés öt betűből álló név-kód, például KODAP, a légijármű fedélzetén levő megjelenítő berendezés korlátozott lehetőségei miatt szükséges lehet az alap-azonosító jelzés rövidítése. Az ilyen jelölés rövidítésének módját és formáját a járatók határozzák meg.

3. Jelölések kiosztása

3.1 Minden egyes útvonalra külön megnevezést jelöljenek ki.

3.2 Ugyanarra a fontos pontra vonatkozó két vagy több útvonal megkülönböztetése érdekében (ahol így az alap-azonosító ugyanaz) minden egyes útvonalra a 2.1.4 alpont szerint külön útvonal jelzést osszanak ki.

4. Érvényességi jelzések kiosztása

4.1 Minden egyes útvonalra osszanak ki érvényességi jelzést annak megjelölése érdekében, hogy az útvonal jelenleg érvényben van-e.

4.2 A kiosztott első érvényességi jelzés az „1" szám legyen.

4.3 Amennyiben az útvonalat módosították, a következő érvényességi jelzés a sorrendben következő nagyobb szám legyen. A „9" szám után ismét az „1" szám következik.

5. Példák a nyílt nyelvű és a kódolt jelölésekre

5.1 1. példa

Szabvány műszeres indulási útvonal

a) Nyílt nyelvű megnevezés: BRECON ONE DEPARTURE

b) Kódolt jelölés: BCN 1

5.1.1 *Értelmezés*

A megnevezés olyan szabvány műszeres indulási útvonalat azonosít, amely a BRECON (alap-azonosító) elnevezésű fontos pontnál végződik. BRECON egy rádiónavigációs berendezés, amelynek azonosítója BCN (a kódolt jelölés alap-azonosítója). Az érvényességi jelzés ONE azaz egyes (a kódolt jelölésben „1"), amely azt jelzi, hogy az útvonal eredeti változata van érvényben vagy változás történt az előző NINE azaz kilences változathoz képest és most az új ONE azaz egyes jelzésű változat van érvényben (lásd 4.3). Az útvonal jelzés hiánya (lásd 2.1.4 és 3.2) azt jelzi, hogy a BRECON rádiónavigációs berendezésre csak egy útvonalat, a jelen esetben egy indulási útvonalat dolgoztak ki.

5.2 2. példa

Szabvány műszeres érkezési útvonal

a) Nyílt nyelvű megnevezés: KODAP TWO ALPHA

b) Kódolt jelölés: KODAP 2 A

5.2.1 *Értelmezés*

A megnevezés olyan szabvány műszeres érkezési útvonalat azonosít, amely a KODAP (alap-azonosító) elnevezésű fontos pontnál kezdődik. KODAP egy rádiónavigációs berendezés helyével nem kijelölt fontos pont és ezért a 11. Annex 2. Függeléke alapján meghatározott öt-betűs név-kóddal rendelkezik. Az érvényességi jelzés TWO, azaz kettes, amely azt jelzi, hogy változás történt az előző ONE, azaz egyes változathoz képest és most az új TWO, azaz kettes jelzésű változat van érvényben. Az ALPHA (A) útvonal jelzés a KODAP fontos ponthoz kidolgozott több útvonal változat közül az egyiket jelzi, mint az ahhoz megállapított külön egyedi jelzés.

5.3 3. példa

Szabvány látás utáni indulási útvonal

a) Nyílt nyelvű megnevezés: ADOLA FIVE BRAVO DEPARTURE VISUAL

b) Kódolt jelölés: ADOLA 5 B

5.3.1 *Értelmezés*

A megnevezés az ellenőrzött VFR repülések számára kidolgozott olyan szabvány látás utáni indulási útvonalat azonosít, amely az ADOLA (alap-azonosító) elnevezésű fontos pontnál végződik, amely rádiónavigációs berendezés helyével nem kijelölt fontos pont. Az érvényességi jelzés FIVE, azaz ötös, amely azt jelzi, hogy változás történt az előző FOUR, azaz négyes változathoz képest és most az új FIVE, azaz ötös jelzésű változat van érvényben. A BRAVO (B) útvonal jelzés az ADOLA fontos ponthoz kidolgozott több útvonal változat közül az egyiket jelzi, mint az ahhoz megállapított külön egyedi jelzés.

6. MLS/RNAV megközelítési eljárások jelöléseinek összeállítása

6.1 Nyílt nyelvű megnevezés
6.1.1 Az MLS/RNAV megközelítési eljárások nyílt nyelvű megnevezése a következőkből álljon:
a) „MLS” betűk; amit követ
b) alap-azonosító; amit követ
c) az érvényességi jelzés; amit követ
d) az útvonal jelzés; amit követ
e) az „approach”, azaz megközelítés kifejezés; amit követ
f) azon futópálya azonosítója, amelyre az eljárást tervezték.
6.1.2 Az alap-azonosító annak a fontos pontnak neve vagy név-kódja legyen, amelynél a megközelítési eljárás kezdődik.
6.1.3 Az érvényességi jelzés 1 — 9 közötti szám legyen.
6.1.4 Az útvonal jelzés az ABC egy betűje legyen, azonban az „I” és „O” betűket ne alkalmazzák.
6.1.5 A futópálya azonosítóját a 14. Annex I. kötet 5.2.2 pontja alapján határozzák meg.
6.2 Kódolt jelölés
6.2.1 Az MLS/RNAV megközelítési eljárás kódolt jelölése a következőkből álljon:
a) „MLS” betűk; amit követ
b) a fontos pont kód jelzése vagy név-kódja a 6.1.1 b) alpont szerint; amelyet követ
c) az érvényességi jelzés a 6.1.1 c) alpont szerint; amelyet követ
d) az útvonal jelzés a 6.1.1 d) alpont szerint; amelyet követ
e) a futópálya azonosító a 6.1.1 f) alpont szerint.
6.3 A megnevezések kiosztása
6.3.1 Az MLS/RNAV megközelítési eljárások megnevezéseinek kiosztását a 3. szakasszal összhangban végezzék el. Az azonos repülési útvonalat követő, azonban egymástól eltérő repülési pályával rendelkező eljárásokat külön útvonal jelöléssel azonosítsák.
6.3.2 Az MLS/RNAV megközelítési eljárás jelölésének betűje egy adott repülőtéren minden megközelítésre legyen egyedi egészen addig, amíg az összes betűt felhasználják. Az útvonal jelölésének betűjét csak ezt követően ismételjék. Azonos MLS földi berendezést felhasználó két útvonal esetében ugyanazon útvonaljelzés használata tilos.
6.3.3 A megközelítési eljárás érvényességi jelzését a 4. ponttal összhangban végezzék el.
6.4 Példa a nyílt nyelvű megnevezésre és a kódolt jelölésekre
6.4.1 *Példa*
a) Nyílt nyelvű megnevezés: MLS HAPPY ONE ALPHA APPROACH RUNWAY ONE EIGHT LEFT
b) Kódolt jelölés: MLS HAPPY 1 A 18L
6.4.2 Értelmezés
A megnevezés olyan MLS/RNAV megközelítési eljárást azonosít, amely a HAPPY (alap-azonosító) elnevezésű fontos pontnál kezdődik. HAPPY egy rádiónavigációs berendezéssel nem kijelölt fontos pont és ezért a 11. Annex 2. Függeléke alapján meghatározott ötbetűs névkóddal rendelkezik. Az érvényességi jelzés ONE azaz egyes, amely azt jelzi, hogy az útvonal eredeti változata van érvényben vagy változás történt az előző NINE azaz kilences változathoz képest és most az új ONE azaz egyes jelzésű változata van érvényben. Az ALPHA (A) útvonal jelzés a HAPPY fontos ponthoz kidolgozott több útvonal változat közül az egyiket jelzi, mint az ehhez megállapított külön egyedi jelzés.

7. A jelölések használata közleményváltások során

7.1 A beszédüzemű közleményváltások alkalmával csak a nyílt nyelvű megnevezést használják.
Megjegyzés: Az útvonalak azonosítása céljából a 2.1.1 d) és 2.1.1 e) alpontokban ismertetett indulási

(departure), érkezési (arrival) valamint látás utáni (visual) kifejezések a nyílt nyelvű megnevezések elválaszthatatlan részét képezik.
7.2 A nyomtatott vagy kódolt összeköttetéseknél csak a kódolt jelölést használják.

8. Az útvonalak és eljárások megjelenítése a légiforgalmi irányító szolgálat számára

8.1 Azokon a munkahelyeken, amelyeken a légijárművek számára a légiforgalmi irányítói engedély részeként ilyen útvonalakat vagy eljárásokat adnak ki vagy azok bármely más kapcsolatban vannak a légiforgalmi irányító szolgálat biztosításával, helyezzék el minden egyes érvényes szabványos indulási és/vagy érkezési és/vagy megközelítési eljárás részletes leírását, beleértve annak nyílt nyelvű megnevezését, valamint kódolt jelölését is.
8.2 Amikor lehetséges, a munkahelyeken helyezzék el az útvonalak vagy eljárások grafikus (térképes) ismertetését is.

4. Függelék

A légiforgalmi szolgálatok légtereinek osztályozása

Biztosított szolgálatok és repülés végrehajtási előírások

(lásd 2. Fejezet — 2.6 pont)

Magyarázat:

* Amennyiben az átváltási magasság 3050 méter (1000 láb) AMSL alatt van, a 10000 láb tengerszint közepes feletti magasság helyett FL 100 alkalmazandó.

Megjegyzés:

AMSL	*közepes tengerszint feletti magasság felett*
IAS	*műszer szerinti repülési sebesség*

Nemzetközi előírások és ajánlott gyakorlati eljárások

A. Melléklet

VOR berendezéssel kijelölt ATS útvonalak meghatározásának módszereire vonatkozó útmutató
(Lásd 2.7.1 pont és 2.12 szakasz)

1. Bevezető

1.1 A jelen mellékletben található útmutató anyag az 1972-ben Európában és 1978-ban az Egyesült Államokban elvégzett átfogó vizsgálatok alapján készült, melyek megállapításai általánosságban egymással azonosak.
Megjegyzés: Az európai vizsgálat részleteit a 120. számú ICAO körlevél — *A légiforgalmi szolgálati útvonal hálózatokban kijelölt egymással párhuzamos repülési útvonalak közötti elkülönítési távolság minimum számítási eljárása* — tartalmazza.
1.2 Az útmutató 3. és 4. pontjában leírtak alkalmazásakor vegyék figyelembe, hogy a felhasznált adatok olyan VOR berendezés segítségével végrehajtott navigáción alapulnak, amelyek teljes mértékben megfelelnek a Doc 8071 — *Rádiónavigációs Berendezések Ellenőrzési Kézikönyve* — I. kötet előírásainak. Vegyenek továbbá figyelembe olyan tényezőket is, mint például a légijárművek útvonal-keresztezésének gyakorisága különleges üzemeltetési körülmények között vagy a rendelkezésre álló tájékoztatás a légijármű tényleges útirány tartási képességéről bizonyos légtérszakaszokon belül.
1.3 Felhívjuk a figyelmet a 4.2 pontban levő alapfeltételezésre valamint arra a tényre, hogy a 4.1 pontban megadott értékek hagyományos és óvatos számítási módszer alapján kerültek meghatározásra. Ezért ezek alkalmazása előtt vegyék figyelembe a kérdéses légtérre vonatkozó gyakorlati tapasztalatokat, valamint a légijármű általános navigációs teljesítménye fejlődésének lehetőségét.
1.4 Felkérjük az Államokat, hogy részletesen tájékoztassák az ICAO-t a jelen útmutató anyag

alkalmazásának eredményeiről.

2. A VOR rendszer teljesítmény értékeinek meghatározása

A teljes VOR rendszert alkotó egyes tényezőkkel kapcsolatos értékek valószínű nagyfokú változékonysága, valamint mindezen hatások egyedi és a kívánt pontossággal történő méréséhez rendelkezésre álló jelenlegi korlátozott módszerek arra a következtetésre vezetnek, hogy a VOR rendszer teljesítmény értékeinek meghatározása céljából valószerűbb módszer a teljes rendszer hiba felmérése. Az útmutató 3. és 4. pontjában található tájékoztatót csak a 120. számú ICAO körlevél megfelelő tanulmányozása után és a helyi környezeti körülmények fokozott figyelembevételével alkalmazzák.
Megjegyzés: A teljes VOR rendszer pontosságával kapcsolatos tájékoztatót a 10. Annex I. kötet C. Melléklete tartalmazza.

3. A VOR berendezéssel kijelölt útvonalak mentén elhelyezkedő védett légtér meghatározása

1. Megjegyzés: A jelen rész anyagát nem az összeütközési veszély kockázati — kívánatos repülésbiztonsági szint módszer alapján készítettük el.
2. Megjegyzés: A „védettség mértéke” kifejezés a jelen részben azt kívánja jelezni, hogy a forgalom a teljes igénybevételi idő (azaz az összes légijármű teljes repülési ideje) 95%-ában a kérdéses útvonal mentén kialakított védett légtéren belül fog működni. Például ahol 95%-os védettséget biztosítanak, feltételezzük, hogy a forgalom a teljes igénybevételi idő 5%-ában a védett légtéren *kívül* repül majd. Ilyen forgalom vonatkozásában nem lehetséges pontos távolsággal meghatározni, hogy ez a forgalom milyen mértékben repül ki a védett légtérből.
3.1 Az alábbi útmutatást azokra a VOR berendezéssel meghatározott útvonalakra vonatkozóan adjuk meg, amelyeken nem használnak radarberendezést vagy berendezésfüggő automatikus felderítés (ADS-B) annak elősegítésére, hogy a légijármű a védett légtérben maradjon. Mindazonáltal amikor a légijármű oldalirányú eltéréseit radar légtérfigyelés vagy berendezésfüggő automatikus felderítés (ADS-B) segítségével ellenőrzik, a gyakorlati tapasztalatok szerint az adott légtér vonatkozásában szükséges védett légtér mérete csökkenthető.
3.2 Az útvonalak melletti légtérben folyó műveletektől legalább 95%-os védettséget biztosítsanak.
3.3 A 120. számú ICAO körlevélben található anyag szerint a VOR rendszer teljesítménye 95%-os védettségi mérték mellett az útvonal középvonala mentén a lehetséges eltérések miatt a következő védett légterek kialakítását teszi szükségessé:
• Olyan VOR útvonalakon, amelyeken a VOR berendezések közötti távolság 93 km (50 tmf) vagy kevesebb: ± 7.4 km (4 tmf)
• Olyan VOR útvonalakon, amelyeken a VOR berendezések közötti távolság legfeljebb 278 km (150 tmf): a VOR berendezéstől számított 46 km (25 tmf) távolságig ± 7.4 km (4 tmf); ezt követően a védett légtér a VOR berendezéstől számított 139 km (75 tmf) távolságban legfeljebb ± 11.1 km-re (6 tmf) szélesedik ki.

A-1. ábra

VOR berendezések közötti távolság legfeljebb 278 km (150 tmf)

3.4 Amennyiben az illetékes légiforgalmi szolgálati hatóság véleménye szerint, például a tiltott, korlátozott vagy veszélyes légterek közelsége, a katonai légijárművek emelkedési és süllyedési repülési útvonalai vagy egyéb okok miatt ennél nagyobb védelem szükséges, magasabb szintű védettség biztosítását határozhatja el. A védett légtér kijelölésére ebben az esetben a következő értékeket alkalmazzák:
• Olyan útvonalszakaszok esetében, amelyeken a VOR berendezések közötti távolság 93 km (50 tmf) vagy kevesebb, az alábbi táblázat „A” sorában levő értékeket használják;
• Olyan útvonalszakaszok esetében, amelyeken a VOR berendezések közötti távolság több mint 93 km (50 tmf) de legfeljebb 278 km (150 tmf), a VOR berendezéstől számított 46 km (25 tmf) távolságig a táblázat „A” sorában levő értékeket használják, ez után egyenes vonallal kössék össze a VOR berendezéstől

számított 139 km (75 tmf) távolságig a táblázat „B” sorában levő, értékkel.

	Védettség százalékos értéke (%)					
	95	*96*	*97*	*98*	*99*	*99.5*
A (km)	± 7.4	± 7.4	± 8.3	± 9.3	± 10.2	± 11.1
A (tmf)	± 4.0	± 4.0	± 4.5	± 5.0	± 5.5	± 6.0
B (km)	± 11.1	± 11.1	± 12.0	± 12.0	± 13.0	± 15.7
B (tmf)	± 6.0	± 6.0	± 6.5	± 6.5	± 7.0	± 8.5

Egy olyan útvonal esetében például, amelyen a VOR berendezések közötti távolság 222 km (120 tmf) és a szükséges védelem mértéke 99.5 %, az útvonal alakja az A-2. ábrának megfelelő lesz.

A-2. ábra

Az ábrázolt VOR berendezések közötti távolság 2 x 111 km (60 tmf)

3.5 Amennyiben egy VOR berendezéssel kijelölt légiforgalmi szolgálati útvonal két szakasza több mint 25 fokos szöget zár be egymással, a forduló külső és szükség szerint belső oldalán is további védett légtér alakítandó ki. Ez a további légtér védőterületként szolgál a légijármű repülési irány 25 fokot meghaladó megváltoztatásakor a gyakorlatban megfigyelt megnövekedett oldalirányú eltérés számára. A kiegészítő légtér nagysága a forduló szögével változik, azaz minél nagyobb a forduló szöge, annál nagyobb a kiegészítő légtér is. Az útmutató a legfeljebb 90 fokos fordulókhoz szükséges védett légtérre vonatkozik. Azokban a különleges esetekben, amikor az ATS útvonalon 90 fokosnál nagyobb forduló szükséges, az Államok biztosítsák a megfelelő védett légtér kijelölését az ilyen forduló úgy belső, mint külső oldalán is.

3.6 A következő példák két olyan Állam gyakorlatának összegzéséből származnak, amelyek a tervezéshez a légtér kijelölés felvázolására sablonokat használnak.

A forduló terület sablon megtervezésekor olyan tényezőket vettek figyelembe, mint a légijármű sebessége, a forduló bedöntési szöge, a valószínű szélsebesség, a helyzet-megállapítás pontatlansága, a repülőgépvezető cselekvési késése és egy legalább 30 fokos közelítő irány felvétele az új repülési pálya elérése előtt. A sablonok legalább 95 %-os védettséget biztosítanak.

3.7 Azon kiegészítő légtér meghatározása érdekében, amely a 30, 45, 60, 75 és 90 fokos fordulót végrehajtó légijármű számára a forduló külső oldalán a védettség fenntartásához szükséges, sablont használtak. Az egyszerűsített ábrák a légtér külső határát legömbölyítés nélkül jelzik és ezzel lehetővé teszik az egyszerű megrajzolást. A kiegészítő légtér minden esetben a nyíllal jelzett irányba repülő légijármű részére került megállapításra. Ahol az útvonalat mindkét irányba használják, a másik irány külső oldalán is jelöljék ki ugyanazt a kiegészítő légteret.

3.8 Az A-3. ábra a VOR berendezés felett egymáshoz 60 fokos szögben csatlakozó útvonal szakaszokat ábrázol.

A-3. ábra

Az irányváltoztatás szöge 60 fok, a repülési irányt a nyíl jelzi

3.9 Az A-4. ábra a VOR berendezés felett olyan, egymáshoz 60 fokos szögben csatlakozó útvonalszakaszokat ábrázol, amelynél a légtér határát a 3.3 pont és az A-1. ábra előírásainak megfelelően ki kellett szélesíteni.

A-4. ábra

3.10 A következő táblázat a példákban szereplő esetekben alkalmazandó távolság értékeket ismerteti, amikor FL 450 repülési szinten vagy ez alatt a VOR berendezés felett vagy az egyes VOR berendezésektől számított legfeljebb 139 km (75 tmf) távolságban a csatlakozó útvonal szakaszokhoz kiegészítő védett légtér kijelölése szükséges.

Megjegyzés: Lásd az A-3. és A-4. ábrákat.

Az útvonalak csatlakozási szöge	*30°*	*45°*	*60°*	*75°*	*90°*
VOR berendezés					
„A” távolság * (km)	5	9	13	17	21

„A” távolság * (tmf)	3	5	7	9	11
„B” távolság * (km)	46	62	73	86	92
„B” távolság * (tmf)	25	34	40	46	50
Csatlakozás					
„A” távolság * (km)	7	11	17	23	29
„A” távolság * (tmf)	4	6	9	13	16
„B” távolság * (km)	66	76	88	103	111
„B” távolság * (tmf)	36	41	48	56	60

** = a távolságok a következő egész km vagy tmf értékre felkerekítve.*

Megjegyzés: A fordulóban levő légijárművek működésére vonatkozóan lásd a 120. számú ICAO körlevél 4.4 pontját.

3.11 Az A-5. ábra egy olyan módszert mutat be, amelynek segítségével a 90 fokos vagy ennél kisebb mértékű forduló belső ívén szükséges kiegészítő védett légtér szerkeszthető meg:

A repülési útvonal középvonalán jelöljenek ki egy pontot, amelynek a névleges forduló pont előtti távolsága megegyezik a forduló sugár és az útvonal menti tűrési határértékek összegével.

Ettől a ponttól húzzanak merőleges egyenest, amely a forduló belső oldalánál keresztezi a repülési útvonal szélét.

A repülési útvonal belső szélén így kijelölt pontból húzzanak egyenest, amely a forduló után a forduló szög érték felének megfelelő szögben metszi az útvonal középvonalát.

A szerkesztés eredményeképpen kapott háromszög a forduló belső oldalán lesz az irányváltáshoz szükséges kiegészítő védett légtér. Minden 90 fokos vagy ennél kisebb mértékű forduló esetén a belső oldalon elhelyezkedő kiegészítő légtér megfelelő lesz mindkét irányból a fordulóhoz érkező légijármű számára.

1. Megjegyzés: Az útvonal mentén szükséges tűrési határérték kiszámításra vonatkozó követelmények a *Léginavigációs Szolgálatok Eljárásai* — Légijármű üzemeltetés — (PANS-OPS Doc 8168) II. kötet III. rész 31. fejezet Függelékében található.

A-5. ábra

Egy forduló sugár

2. Megjegyzés: A forduló sugár kiszámításhoz szükséges útmutató a 7. részben található.

3.12 A VOR berendezés csatlakozásnál végrehajtott fordulók esetében a forduló belső szélén elhelyezkedő kiegészítő védett légtér kialakításához a 3.11 pont alapelvei alkalmazhatók. Az egyik vagy mindkét VOR berendezés és a csatlakozási pont közötti távolságtól függően az egyik vagy mindkét repülési útvonal megfelelő területe kiszélesedhet. Az adott helyzet alapján a kiegészítő légtér a 95 %-os védettségen belül, részben belül vagy ezen kívül helyezkedhet el. Amennyiben az útvonalat mindkét irányba használják, a légtér kialakítást külön végezzék el mindkét irányba.

3.13 A VOR berendezések között 278 km-nél (150 tmf) hosszabb repülési útvonalakra vonatkozóan mért adatok még nem állnak rendelkezésre. A VOR berendezéstől 139 km-nél (75 tmf) távolabbra elhelyezkedő védett légtér kidolgozásához a valószínű rendszer teljesítményt jelző 5 fok körüli szögérték látszik alkalmazhatónak. Az A-6. ábra ezt a módszert mutatja be.

A-6. ábra

4. A VOR berendezésekkel kijelölt párhuzamos útvonalak közötti távolság

Megjegyzés: A jelen rész anyagát az összeütközési veszély kockázati — kívánatos repülésbiztonsági szint módszer felhasználásával kapott mért adatok alapján készítettük el.

4.1 Az 1.1 pontban jelzett európai vizsgálat adataival végzett összeütközési veszély kockázati — kívánatos repülésbiztonsági szint számítás a vizsgált körülmények között azt az eredményt adta, hogy az útvonalak középvonalai közötti távolság (az A-7. ábrán **„S”**) általában legalább az alábbi érték legyen:

a) azokon a párhuzamos útvonalakon, amelyeken a légijárművek egymással ellentétes irányba repülnek, 33.3 km (18 tmf); és
b) azokon a párhuzamos útvonalakon, amelyeken a légijárművek ugyanabba az irányba repülnek, 30.6 km (16.5 tmf).
Megjegyzés: Két repülési útvonal szakasz akkor tekintendő párhuzamosnak, ha:
⇒ *irányuk körülbelül azonos, azaz a közöttük levő irányszög különbség nem haladja meg a 10 fokot;*
⇒ *egymást nem keresztezik, azaz a csatlakozástól vagy keresztezéstől meghatározott távolságban más fajta elkülönítésnek kell fennállnia;*
⇒ *a légiútvonalak forgalma független egymástól, azaz az egyik forgalom nem vezet a másik korlátozásához.*
4.2 A párhuzamos útvonalak közötti ilyen távolság feltételezi, hogy:
a) a légijárművek a két útvonalon az emelkedés, a süllyedés vagy a szinttartó repülés közben ugyanazon a repülési szinten lehetnek;
b) a forgalom sűrűsége egy nagy forgalmú két hónapos időszak alatt 25 - 50 ezer járat között van;
c) az ICAO Doc 8071 — *Rádiónavigációs Berendezések Ellenőrzési Kézikönyve* — I. kötet előírásai alapján rendszeres légi ellenőrzéssel vizsgált VOR adások az adott útvonalon meghatározott navigációs eljárásoknak megfelelően működnek; és
d) valós idejű radar-, vagyberendezésfüggő automatikus felderítés (ADSD-B) megfigyelést vagy az oldalirányú eltérések ellenőrzését el nem végzik.

A-7. ábra

VOR berendezések közötti távolság 278 km (150 tmf) vagy kevesebb

4.3 Az előzetes vizsgálatok azt jelzik, hogy az alábbi a) — c) alpontokban ismertetett körülmények között az útvonalak közötti legkisebb távolság lecsökkenthető. Mindazonáltal a megadott értékeket nem pontosan számították ki és az egyedi körülmények részletes vizsgálatára minden esetben szükség van:
a) amennyiben a szomszédos repülési útvonalakon működő légijárművek részére nem adják ki ugyanazt a repülési szintet, az útvonalak közötti távolság lecsökkenthető; a csökkentés mértéke a szomszédos útvonalakon működő légijárművek közötti függőleges elkülönítéstől, valamint az emelkedő és süllyedő légijárművek százalékos arányától függ, azonban nem valószínű, hogy ez meghaladja az 5.6 km (3 tmf) értéket;
b) amennyiben a forgalom jellemzői jelentős mértékben eltérnek a 120. számú ICAO körlevélben közöltektől, a 4.1 pontban ismertetett minimum módosításra szorulhat. Például ha a forgalom sűrűsége a nagy forgalmú két hónapos időszak alatt tízezer járat körül van, 900 méter és 1850 méter (0.5 — 1.0 tmf) közötti távolság csökkentés lehetséges;
c) a két repülési útvonalat kijelölő VOR berendezések elhelyezkedése és az azok közötti távolság befolyásolja az útvonalak közötti távolságot, azonban ennek mértékét nem határozták meg.
4.4 A radar megfigyelés vagy a berendezésfüggő automatikus felderítés (ADS-B) alkalmazása és a légijármű oldalirányú eltéréseinek ellenőrzése az útvonalak közötti megengedhető legkisebb távolságot nagymértékben befolyásolhatja. A radar megfigyelés hatásaival foglalkozó vizsgálatok azt mutatják, hogy:
⇒ a teljes mértékben megfelelő matematikai modell kidolgozásához további vizsgálatok szükségesek;
⇒ az elkülönítési távolság bármely csökkentése szoros összefüggésben van a következőkkel:
∗ a forgalom (mennyisége és jellemzői);
∗ a radar lefedettség és adatfeldolgozás, az automatikus riasztás lehetősége;
∗ a radarellenőrzés (légtérfigyelés) folyamatossága;
∗ a szektor munkaterhelése; valamint
∗ a rádiótávbeszélő működésének minősége.
Ezen vizsgálatok szerint, továbbá figyelembe véve egyes Államoknak a párhuzamos útvonal rendszerek folyamatos radar ellenőrzése és irányítása során szerzett több éves gyakorlati tapasztalatait, 15 — 18.5 km (8 — 10 tmf) nagyságrendű csökkentés feltételezhető, azonban ez minden valószínűség szerint nem lesz

13 km-nél (7 tmf) kevesebb feltéve, hogy a radarellenőrzéssel járó munkaterhelés a csökkentés következtében nem növekszik jelentős mértékben. Az ilyen csökkentett oldalirányú távolsági elkülönítéssel rendelkező rendszerek tényleges alkalmazásával szerzett tapasztalatok azt jelzik, hogy:

⇒ nagyon fontos az átkapcsolási pontok meghatározása és közzététele (lásd még a 6. pont);

⇒ lehetőség szerint kerüljék a nagyobb mértékű fordulókat; valamint

⇒ ahol ezeket a nagyobb fordulókat nem lehet elkerülni, a 20 fokosnál nagyobb fordulók esetében határozzák meg az előírt forduló profilt.

Még abban az esetben is gondoljanak a teljes radarberendezés vagy a berendezésfüggő automatikus felderítés (ADS-B) meghibásodása esetén alkalmazandó eljárásokra, ha ennek a valószínűsége nagyon csekély.

5. A VOR berendezésekkel kijelölt szomszédos, nem párhuzamos útvonalak közötti távolság

1. Megjegyzés: Ezen rész anyagának célja útmutatás biztosítása olyan esetekre, ahol a VOR berendezésekkel kijelölt, egymást nem keresztező, nem párhuzamos szomszédos útvonalak irányszög különbsége a 10 fokot meghaladja.

2. Megjegyzés: A jelen rész anyagát nem az összeütközési veszély kockázati — kívánatos repülésbiztonsági szint módszer felhasználásával készítettük el.

5.1 Az összeütközési veszély kockázati — kívánatos repülésbiztonsági szint modell jelen fejlettségi állapotában a VOR berendezésekkel kijelölt, egymást nem keresztező, nem párhuzamos szomszédos útvonalak esetére nem teljesen megfelelő. Ezért alkalmazzák a 3. szakaszban ismertetett anyagot.

5.2 Az ilyen útvonalak között levő védett légtér ne legyen kisebb, mint amely átfedés nélkül biztosítja a 3.4 pont táblázatában szereplő 99.5 %-os védettség mértéket (lásd az A-8. ábra példáját).

5.3 Ahol az útvonal szakaszok közötti irányszög különbség több, mint 25 fok, a 3.5 — 3.10 pontok szerint további kiegészítő védett légtér biztosítandó.

A-8. ábra

Egymás mellett elhelyezkedő nem párhuzamos repülési útvonalak

6. VOR berendezések átkapcsolási pontjai

6.1 A VOR berendezéssel kijelölt légiforgalmi szolgálati útvonalak átkapcsolási pontjai kijelölésének tervezésekor, ahol a légijármű az elsődleges navigációs irányvezetés biztosításához az egyik VOR berendezésről a másikra kapcsol át, az Államok a következőket vegyék figyelembe:

a) az átkapcsolási pontok kijelölése az érintett VOR állomások teljesítménye alapján történjen, beleértve az interferencia védelemre vonatkozó előírások értékelését is. Az eljárást repülőgépes légi ellenőrzéssel is erősítsék meg (lásd Doc 8071, I. kötet, II. rész);

b) ahol a frekvenciasáv védelme igen lényeges tényező, a légi ellenőrzést azon a legnagyobb repülési magasságon végezzék, amelyen az adott berendezés frekvencia védelmet élvez.

6.2 A 6.1 pont tartalmából semmi sem értelmezendő úgy, hogy a 10. Annex I. kötet 3.3 szakasz előírásainak megfelelő VOR létesítmény üzemi hatótávolságát azok korlátoznák.

7. A forduló sugár kiszámítása

7.1 A forduló sugár kiszámításának módszere és az alábbiakban jelzett forduló sugár érték állandó forduló értéket tartó légijárművekre alkalmazható. Az anyagot az RNP1 ATS útvonal forduló sugár teljesítmény előírásra dolgozták ki és ez használható a forduló belső oldalán szükséges kiegészítő védett légtér megtervezéséhez a nem VOR berendezéssel kijelölt ATS útvonalak esetében is.

7.2 A forduló teljesítmény két tényezőtől, a légijármű földhöz viszonyított sebességétől és a bedöntéstől függ. Az állandó sugarú forduló során a repülési irányszög változása következtében fellépő szélirány összetevő változás miatt a földhöz viszonyított sebesség és ezzel együtt a bedöntés szöge is változni fog. Mindazonáltal a körülbelül 90 fokosnál nem nagyobb fordulók valamint az alábbiakban vizsgált sebesség értékek esetében az elérhető állandó forduló sugár érték számításához a következő képlet alkalmazható, amelyben a légijármű földhöz viszonyított sebessége a tényleges repülési sebesség és a szélsebesség összege:

$$\textit{Forduló sugár} = \frac{(\textit{földhöz viszonyított sebesség})^2}{\textit{„G” állandó * TAN (bedöntés szöge)}}$$

7.3 Minél nagyobb a légijármű földhöz viszonyított sebessége, annál nagyobb lesz a szükséges bedöntés mértéke. Annak biztosítása érdekében, hogy a forduló sugár minden előre látható körülmény esetére jellemző legyen, szélsőséges értékeket szükséges figyelembe venni. A magasabb repülési szinteken valószínűleg előforduló legnagyobb tényleges (levegőhöz viszonyított) repülési sebesség 1020 km/h (550 csomó). Ez a közepes és magas repülési szinteken várható 370 km/h (200 csomó) legnagyobb szélsebességgel {99.5 százalékos érték a meteorológiai adatok alapján} együtt maximálisan 1400 km/h (750 csomó) földhöz viszonyított sebességnek felel meg. A legnagyobb bedöntési szög értéke elsősorban a légijármű egyedi repülési tulajdonságaitól függ. A nagy szárny-terhelésű, a legmagasabb engedélyezett repülési szintjén vagy ehhez közeli magasságon repülő légijárművek a nagy bedöntéseket rendkívül rosszul viselik. A legtöbb szállító légijármű légialkalmassági bizonyítványa alapján a kormányművek bármely beállítása mellett nem repülhet átesési sebességének 1.3-szeresénél alacsonyabb sebességgel. Mivel az átesési sebesség a bedöntési szöggel (TAN) növekszik, számos járató törekszik arra, hogy a széllökések és a turbulencia elleni védelem érdekében a légijármű utazósebessége ne legyen alacsonyabb, mint az átesési sebesség 1.4-szerese. Ugyanebből az okból a legtöbb szállító légijármű utazó repülés közben csökkentett maximális forduló bedöntést alkalmaz. A fentiek alapján feltételezhetjük, hogy az összes légijármű típus részéről elfogadható legnagyobb bedöntési szög érték 20 fok körül van.
7.4 A számítás szerint az 1400 km/h (750 csomó) földhöz viszonyított sebességgel repülő, 20 fokos bedöntést alkalmazó légijármű forduló sugara 22.51 tmf (41.69 km). A célszerűség érdekében ezt az értéket 22.5 tmf-re (41.6 km) csökkentettük.
Az alacsony légtér esetében ugyanezt a logikát követve megállapították, hogy FL 200 (6100 m) repülési szintig a várható tényleges repülési sebesség 740 km/h (400 csomó) és a hátszél értéke 370 km/h (200 csomó). Ha a legnagyobb bedöntési szög értékét 20 fokon tartják és ugyanezt a számítást végzik el, a forduló 14.45 tmf (26.76 km) forduló sugárral határozható meg. A célszerűség érdekében ez az érték 15 tmf-re (27.8 km) kerekíthető fel.
7.5 A fentiek alapján a két földhöz viszonyított repülési sebesség jellemző legvalószínűbb választó pontja FL 190 (5800 m) és FL 200 (6100 m) között van. Annak érdekében, hogy a jelenleg alkalmazott repülésvezérlő rendszerekben (FMS) használt forduló-számítási képletek minden előre látható körülményre érvényesek legyenek, FL 200 repülési szinten és felette 22.5 tmf (41.6 km) illetve FL 190 repülési szinten és alatta 15 tmf (27.8 km) forduló sugarat határozzanak meg.

B. Melléklet

A területi navigációs (RNAV) berendezéssel felszerelt légijárművek általi használatra kijelölt ATS útvonalak meghatározásának módszere

(Lásd 2.7.1 pont és 2.12 szakasz)

1. Bevezető

1.1 A jelen mellékletben található útmutató anyag több országban elvégzett átfogó vizsgálatok eredményei alapján készült. Az anyag tükrözi továbbá a számos Államban már régóta létező és alkalmazott RNAV követelményrendszert is. Meg kell jegyeznünk, hogy a jelen részben található egyes értékeket nem az összeütközési veszély kockázati — kívánatos repülésbiztonsági szint módszer alapján számítottuk ki. Ezt a megfelelő helyen külön jelezzük.

1.2 Felkérjük az Államokat, hogy részletesen tájékoztassák az ICAO-t a jelen útmutató anyag alkalmazásának eredményeiről.

2. Az RNP 4 alapján kialakított területi navigációs útvonalak gyakorlati felhasználása

2.1 Általános rész

2.1.1 Ez az útmutató anyag olyan területi navigációs útvonalakhoz történő felhasználásra készült, amelyek földi elektronikus navigációs berendezések fedésterületén belül kerültek kialakításra és ezek a berendezések teszik lehetővé a szükséges felülvizsgálati ellenőrzések végrehajtását, így megfelelő védelmet biztosítanak az RNAV helymeghatározási hibákkal szemben.
2.1.2 A jelen anyaggal összhangban kialakított RNAV útvonalakon csak azoknak a légijárműveknek nyújtanak légiforgalmi szolgálatot, amelyek számára a légialkalmassági bizonyítványt — üzemeltetési engedélyt az *Előírt Navigációs Teljesítmény (RNP) Kézikönyv* (Doc. 9613) 5.5 és 5.6 szakaszainak megfelelően adták ki.
2.1.3 A VOR berendezéssel kijelölt légiforgalmi szolgálati útvonalakon történő navigációhoz engedélyezzék a területi navigációs berendezések használatát. Ezen kívül ott, ahol ez gyakorlati szempontból szükséges és az RNAV lehetőséget igénybe vevő légijárművek száma indokolja, ilyen területi navigációs útvonalakat is kijelölhetnek. Ezek az útvonalak lehetnek:
a) állandó RNAV útvonalak;
b) feltételes, szükség szerint igénybe vehető RNAV útvonalak; és
c) eseti jelleggel igénybe vehető RNAV útvonal szakaszok.
2.1.4 Az ilyen RNAV berendezésre előírt navigációs teljesítmény az útvonal repülés esetében olyan navigációs pontossági szintet jelöl meg, amely alapján a területi navigációs berendezést használó minden légijármű útirány tartási pontossága a repülési idejének legalább 99.5%-ában ± 11.1 km (6 tmf) vagy jobb. Ez a fajta navigációs teljesítmény várhatóan olyan pontosságnak felel meg, mely alapján a területi navigációs berendezést használó minden légijármű útirány repülési pálya tartási pontossága a repülési idejének legalább 95%-ában ± 7.4 km (4 tmf). Ez a pontossági teljesítmény szint azonos azzal, amit az a területi navigációs képességgel nem rendelkező légijármű képes tartani, amelyik meglevő VOR vagy VOR/DME berendezésekkel kijelölt olyan útvonalon repül, ahol a VOR berendezések közötti távolság kevesebb mint 93 km (50 tmf).

2.2 Az RNP 4. alapján kialakított RNAV ATS útvonalak védett légtere

2.2.1 Az RNAV légiforgalmi szolgálati útvonalak esetében biztosítsanak legalább 11.1 km (6 tmf) védett légteret a tervezett repülési pálya mindkét oldalán, amelyen belül a területi navigációs (RNAV) berendezéssel felszerelt légijárművek várhatóan a repülési idejük legalább 99.5%-ában repülni fognak. Mielőtt az ebből az elméletből származó értékeket alkalmaznák, vegyenek figyelembe a kérdéses légtérre vonatkozó minden gyakorlati tapasztalatot, valamint a légijárművek általános navigációs teljesítménye fejlődésének lehetőségét is. Ebben az összefüggésben, amennyiben a területi navigációs útvonaltól történő oldalirányú eltéréseket radar-berendezés segítségével ellenőrzik, a szükséges védett légtér a következők szerint lecsökkenthető:

	Védettség százalékos értéke (%)					
	95	*96*	*97*	*98*	*99*	*99.5*
km	± 7.4	± 7.4	± 8.3	± 9.3	± 10.2	± 11.1
tmf	± 4.0	± 4.0	± 4.5	± 5.0	± 5.5	± 6.0

2.2.2 A radarberendezéssel végrehajtott légtérellenőrzést érintő vizsgálatok azt jelezték, hogy a védett légtér bármely tervezett és lehetséges csökkentése szoros összefüggésben van a forgalom jellemzőivel, a légiforgalmi irányító számára rendelkezésre álló tájékoztatásokkal és az irányítói szektor munkaterhelésével. Végül érdemes azon elgondolkodni, hogy néhány európai Államban elvégzett, a

útvonaltartás mértékében kifejezett RNAV pontossági elemzés azt mutatta, hogy a területi navigációra képes járatok RNAV pontossága a repülési idő 99.5%-ában az útvonal középvonalától számított 5 tmf értéken belül volt *(hiv.: EUR Doc 001, RNAV/4)*. Amennyiben az illetékes légiforgalmi szolgálati hatóság véleménye szerint, például a tiltott, korlátozott vagy veszélyes légterek közelsége, a katonai légijárművek emelkedési és süllyedési repülési útvonalai vagy egyéb okok miatt ennél nagyobb védelem szükséges, további biztonsági védő légtereket alakíthatnak ki.
2.2.3 Amennyiben két útvonalszakasz között a repülési irányszög különbség több mint 25 fok, az A. Melléklet 3.5 — 3.12 pontjainak valamint 7. részének megfelelően további védett légtér biztosítandó.
Megjegyzés: Az RNAV berendezésekkel felszerelt légijárművek üzemeltetésére az Államok különböző navigációs pontossági szintet írhatnak elő. A jelen útmutató ezekkel az előírásokkal nem foglalkozik, azonban ezek a védett biztonsági légterekre vonatkozó követelmények bizonyos változtatásait tehetik szükségessé.

2.3 Az RNP4 alapján kialakított párhuzamos RNAV útvonalak közötti távolság

Amikor a 2.2 pont alapján kialakított védett légteret alkalmazzák, az útvonal középvonalak úgy helyezkedjenek el, hogy a 99.5 %-os útvonaltartás értéken belül elhelyezkedő légterek egymást ne fedjék. Amikor olyan oldaltávolságot alkalmaznak, amely kevesebb, mint a fenti 99.5%-os útvonaltartási értéknek megfelelő távolság, a forgalom radar ellenőrzése szükséges.

3. A párhuzamos útvonal szakaszok vagy RNAV útvonal középvonalak közötti távolság az RNP típus alapján

3.1 Meg kell jegyeznünk, hogy az alábbiakban ismertetett oldaltávolságok ott, ahol ezt jeleztük, egy adott útvonalszakasz vagy útvonalhálózat egyedi repülésbiztonsági értékelése alapján kerültek meghatározásra. Ennek megfelelően az értékelt forgalmi jellemzők esetleg az adott útvonalhálózat vonatkozásában egyediek lehetnek. Ezek közé tartozik például a forgalom sűrűsége, az alkalmazható legkisebb elkülönítéssel átrepülő légijárművek száma, illetve az ilyen elkülönítések gyakorisága, a távközlési és légtérfelderítési berendezések és létesítmények. A biztonsági felmérésre és értékelésre vonatkozó további tájékoztató a *Légtér Tervezési Módszer az Elkülönítési Minimumok Meghatározásához Kézikönyv*ben (Doc. 9689) található.
3.2 Amikor a párhuzamos útvonal szakaszok vagy ATS útvonalak (a továbbiakban rendszer) közötti oldaltávolságot határozzák meg, az előzetes repülésbiztonsági értékelést a legalacsonyabb elfogadható repülésbiztonsági szinthez viszonyítva a fenti 3.1 pontban jelzettekhez hasonló jellemzők vizsgálatával végezzék el.
3.2.1 Ahol a „végzetes balesetek számát repülési óránként” megfelelő értékelési egységnek tekintik, a 2000. év után üzembe állítandó jövőbeni útvonalrendszer elfogadhatóságának megállapítására $\mathbf{5 \times 10^{-9}}$ számú végzetes baleset értéket alkalmazzák kívánatos biztonsági szintként (TLS). A fenti időpont előtt repült óránként $\mathbf{2 \times 10^{-8}}$ számú végzetes baleset érték alkalmazható TLS szintként.
3.2.2 Mindazonáltal, ahol a „végzetes balesetek számát repülési óránként” nem tekintik megfelelő értékelési egységnek, olyan megfelelő módon indokolható és igazolható értékelési módot és érték egységet használjanak, amely az Állam légterében elfogadható biztonsági szintet nyújt és amit a körzeti légiközlekedési egyezményekbe szükség szerint fel lehet venni.
3.3 Ha a rendszer kialakításának és üzembe állásának időpontjában vagy bármely későbbi repülésbiztonsági értékelés alkalmával megállapítják, hogy a rendszer nem elégíti ki az értékelési mód alapján meghatározott megfelelő biztonsági szintet, vegyék fontolóra az ismételt ellenőrzés és értékelés végrehajtását, amelyet a Doc. 9689-al összhangban végezzenek el annak megállapítása érdekében, hogy tartani tudják-e a legalacsonyabb vagy ennél magasabb elfogadható repülésbiztonsági szintet.
3.4 Az alábbiakban az RNP típus alapján példákkal mutatjuk be az egyes meghatározott légterek vagy körzetek útvonal-rendszerei közötti biztonsági távolságot. Ahol ezek egy adott légtér vagy körzet egyedi jellemzői alapján kerültek meghatározásra, más Államok vagy körzetek saját rendszereiket ennek megfelelő módon vizsgálják felül.

3.4.1 Eljárás-irányítási körülmények között:

a) **RNP 20**

Oldaltávolság: 185 km (100 tmf);

Értékelés alapja: Régóta fennálló, hosszú időszak alatt beszerzett gyakorlati üzemeltetési tapasztalatok alapján használatos rendszer; valamint

Minimális ATS követelmények:

NAV — A lerepülendő útvonalakra vagy útvonal szakaszokra minden légijármű rendelkezzen RNP 20 jogosítással;

COM — Közvetett, harmadik félen keresztül fenntartott beszédüzemű összeköttetés;

SUR — Repülőgépvezető helyzetjelentések az eljárások szerint.

b) **RNP 12.6**

Oldaltávolság: 110 km (60 tmf);

Értékelés alapja: Összeütközési veszély kockázati modell a NAT repülési útvonalhálózathoz (*Jelentés a Korlátozott/Észak-atlanti Körzeti Légiközlekedési Értekezlet Számára (1976)* Doc. 9182); valamint

Minimális ATS követelmények:

NAV — A lerepülendő útvonalakra vagy útvonal szakaszokra minden légijármű rendelkezzen RNP 12.6 jogosítással;

COM — Közvetett, harmadik félen keresztül fenntartott beszédüzemű összeköttetés;

SUR — Repülőgépvezető helyzetjelentések az eljárások szerint.

Egyéb — A rendszer biztonságát időszakosan felül kell vizsgálni.

Megjegyzés: Bizonyos, mint például ismert kedvezőtlen időjárású légterekben a légiforgalmi irányító és repülőgépvezető közötti közvetlen összeköttetés lehet kívánatos.

c) **RNP 10**

Oldaltávolság: 93 km (50 tmf);

Értékelés alapja: Az Egyesült Államok Szövetségi Légügyi Igazgatóságának az észak-atlanti útvonalhálózatra (annak jellemzői alapján) elvégzett összeütközési veszély kockázati — repülésbiztonsági szint modellje; valamint

Minimális ATS követelmények:

NAV — A lerepülendő útvonalakra vagy útvonal szakaszokra minden légijármű rendelkezzen RNP 10 jogosítással;

COM — Közvetett, harmadik félen keresztül fenntartott beszédüzemű összeköttetés;

SUR — Repülőgépvezető helyzetjelentések az eljárások szerint.

Egyéb — A rendszer biztonságát időszakosan felül kell vizsgálni.

Megjegyzés: Bizonyos, mint például ismert kedvezőtlen időjárású légterekben a légiforgalmi irányító és légijárművezető közötti közvetlen összeköttetés alkalmazásakívánatos lehet.

d) **RNP 5 (vagy RNP 4 vagy jobb)**

Oldaltávolság: egyirányú rendszer esetében 30.6 km (16.5 tmf); kétirányú rendszer esetében 33.3 km (18 tmf);

Értékelés alapja: Az A. Mellékletben leírt nagy forgalomsűrűségű szárazföldi rendszerrel (VOR alapján kialakított oldaltávolság) történő összevetés; valamint

Minimális ATS követelmények:

NAV — A lerepülendő útvonalakra vagy útvonal szakaszokra minden légijármű rendelkezzen RNP 5 jogosítással és az ilyen üzemeltetéshez szükséges megfelelő léginavigációs berendezéseket és létesítményeket kell biztosítani;

COM — Közvetlen légiforgalmi irányító és repülőgépvezető közötti ultrarövidhullámú (URH) beszédüzemű összeköttetés;

SUR — Repülőgépvezető helyzetjelentések az eljárások szerint.

1. Megjegyzés: Az RNP 5 felhasználásra vonatkozó útmutató anyag az *Előírt Navigációs Teljesítmény (RNP) Kézikönyv*ben (Doc. 9613) található.

2. Megjegyzés: Ezt az oldaltávolságot nem a lakott területektől távol eső és/vagy óceáni légterekre dolgozták ki, ahol a megfelelő VOR rendszer nem áll rendelkezésre.

e) **RNP 4**

Oldaltávolság: 55.5 km (30 tmf);

Értékelés 1. alapja: Az Egyesült Államok Szövetségi Légügyi Igazgatóságának az 55.5 km (30 tmf) oldaltávolságú párhuzamos útvonal rendszer általános oldalirányú eltérés hibák jellemzői alapján, a repült óránként **5 x 10^{-9}** számú végzetes baleset kívánatos repülésbiztonsági szint (TLS) érték fenntartásával elvégzett biztonsági vizsgálata;

Értékelés 2. alapja: Az alábbiakban felsorolt minimális távközlési és légtér-felderítési előírások, amelyek gyakorlati szempontból szükségesek az 55.5 km (30 tmf) oldaltávolságú útvonal rendszer sürgősségi és kényszerhelyzeti eseményeinek kezeléséhez.

Megjegyzés: Az elvégzett repülésbiztonsági elemzésre vonatkozó további információ a *Légtér Tervezési Módszer az Elkülönítési Minimumok Meghatározásához Kézikönyv*ben (Doc. 9689) található.

Minimális ATS követelmények:

NAV — A kijelölt területekre, útvonalakra vagy légiforgalmi szolgálati útvonal szakaszokra RNP 4 jogosítást írjanak elő;

COM — Közvetlen légiforgalmi irányító és a légijárművezető közötti ultrarövidhullámú (URH) beszédüzemű vagy légiforgalmi irányító és légijárművezető közötti adatátviteli (CPDLC) összeköttetés;

SUR — Olyan ADS-C rendszer, amely olyan, esemény alapú ADS protokollegyeztetést tartalmaz, amely jelentést küld olyan esetekben, ha egy légijármű oldalirányban több, mint 9.3 km (5 tmf) távolságra eltér az útvonalszakasz középvonalától.

Egyéb — A bevezetés előtt végezzék el a rendszer időbeni és fizikai sértetlenségének vizsgálatát annak bizonyítására, hogy a 27.8 km (15 tmf) vagy nagyobb mértékű oldalirányú eltérések legnagyobb elfogadható aránya nem haladja meg a B-1. táblázatban található értékeket, valamint a rendszer eleget tesz az üzemeltetési és műszaki követelményeknek. A bizonyító vizsgálatot a fenti minimális navigációs, távközlési és légtérfigyelési előírások teljesítése után végezzék. A bevezetés után rendszer-felügyeleti programot kell fenntartani annak időszakonkénti rendszeres ellenőrzésére, hogy a 27.8 km (15 tmf) vagy nagyobb mértékű oldalirányú eltérések tényleges aránya nem haladja meg a B-1. táblázatban található értékeket. A repülésbiztonsági rendszer-felügyeletre vonatkozó további tájékoztató a *Légtér Tervezési Módszer az Elkülönítési Minimumok Meghatározásához Kézikönyv* (Doc. 9689) 8. fejezetében található.

1. Megjegyzés: A légtértervező először állapítsa meg, hogy a kérdéses légtérre a négy rendszerleírás közül melyik alkalmazható. Amennyiben a B-1. táblázatban található négy eset közül egyik sem vonatkozik az adott rendszerre, a légtértervező azt a két esetet válassza ki, amelyik kettő a leginkább hasonlít a rendszerhez és az alacsonyabb oldalirányú eltérési arányt használja fel. Ezt követően az első oszlopból válassza azt az oldalirányú útvonaltartási értéket, amelyet a rendszer a tervezéshez figyelembe vett időtartamon belül várhatóan nem lép túl. A táblázat megfelelő sorának és oszlopának leolvasásával a légtértervező ezután megkapja azt az oldalirányú eltérési arány értéket, amellyel a rendszer a repült óránként 5 x 10^{-9} számú végzetes baleset kívánatos repülésbiztonsági szint (TLS) értéket nem haladja meg.

2. Megjegyzés: A rendszer biztonságának értékelése céljából figyelembe vett oldalirányú eltérések az útvonal középvonaltól számított bármely 27.8 km (15 tmf) vagy nagyobb mértékű eltérések, amelyek nem kapcsolódnak a jóváhagyott kényszerhelyzeti eljárásokhoz.

3. Megjegyzés: Az ADS-C és CPDLC használatára vonatkozó eljárásokat a PANS-ATM (Doc 4444) 13. és 14. fejezet tartalmazza. A CPDLC-re és ADS-C-re vonatkozó követelményeket megfelelő repülésbiztonsági vizsgálat alapján kell meghatározni. A repülésbiztonsági vizsgálatra vonatkozó tájékoztató a *Légtér Tervezési Módszer az Elkülönítési Minimumok Meghatározásához Kézikönyv*ben (Doc. 9689) található.

4. Megjegyzés: Ezt az oldaltávolságot a lakott területektől távol eső és/vagy óceáni légtérhez dolgozták ki, ahol a megfelelő VOR rendszer nem áll rendelkezésre.

5. Megjegyzés: A jelen anyagban az oldalirányú útvonaltartás a légijárművek teljes számának valamint az oldalirányban egymást mellett elhaladó légijármű párok számának hányadosának kétszeresét jelenti.

Az összeütközési veszély kockázati — kívánatos repülésbiztonsági szint modell esetére használt kifejezések *részletes magyarázata a Légiforgalmi Szolgálat Tervezési Kézikönyv (Doc 9426) II. rész, 4. fejezet A és C. függelékében található.*

3.4.2 Radarirányítási körülmények között:

a) **RNP 4**

Oldaltávolság: 14.8 — 22.2 km (8 — 12 tmf);

Értékelés alapja: a referencia-rendszerrel történő összevetés (a fenti 2.2.1 pont szerint meghatározott biztonsági területek nem fedik egymást); valamint

Minimális ATS követelmények:

NAV — A lerepülendő útvonalakra vagy útvonal szakaszokra minden légijármű rendelkezzen legalább RNP 4 jogosítással és az ilyen üzemeltetéshez szükséges megfelelő léginavigációs berendezéseket és létesítményeket kell biztosítani;

COM — Közvetlen légiforgalmi irányító és repülőgépvezető közötti ultrarövidhullámú (URH) beszédüzemű összeköttetés;

SUR — A jelenlegi szabványoknak megfelelő radarberendezés;

Egyéb — Ki kell értékelni a rendszer biztonságát, beleértve a légiforgalmi irányító munkaterhelését is.

b) **RNP 5**

Oldaltávolság: 18.5 — 27.8 km (10 — 15 tmf);

Értékelés alapja: a referencia-rendszerrel történő összevetés (a fenti 2.2.1 pont alapján az RNP 5 igényeire átalakított biztonsági területek nem fedik egymást); valamint

Minimális ATS követelmények:

NAV — A lerepülendő útvonalakra vagy útvonal szakaszokra minden légijármű rendelkezzen legalább RNP 5 jogosítással és az ilyen üzemeltetéshez szükséges megfelelő léginavigációs berendezéseket és létesítményeket kell biztosítani;

COM — Közvetlen légiforgalmi irányító és repülőgépvezető közötti ultrarövidhullámú (URH) beszédüzemű összeköttetés;

SUR — A jelenlegi szabványoknak megfelelő radarberendezés;

Egyéb — Ki kell értékelni a rendszer biztonságát, beleértve a légiforgalmi irányító munkaterhelését is.

C. Melléklet
A légijárművek által adott forgalmi tájékoztató rádióadások (TIBA) és az ezekkel kapcsolatos gyakorlati eljárások

(Lásd 4. fejezet 4.2.2 pont 2. Megjegyzést)

1. Bevezető és a tájékoztató rádióadások alkalmazhatósága

1.1 A légijárművek által rádión adott forgalmi tájékoztatások célja, hogy a repülőgépvezetők számára lehetővé tegye a tájékoztató jellegű jelentések és az ezekkel kapcsolatos kiegészítő tájékoztatások rádióberendezés segítségével történő megadását a közelben tartózkodó más légijárművek repülőgépvezetőinek tájékoztatására egy kijelölt ultrarövidhullámú rádió-távbeszélő (VHF - RTF) frekvencián.

1.2 A légijármű részéről adott forgalmi tájékoztató rádióadások (TIBA) csak szükség esetén és ideiglenes intézkedésként alkalmazhatók.

1.3 A tájékoztató rádióadás eljárások olyan kijelölt légtérben alkalmazhatók, ahol:

a) az ellenőrzött légtéren kívül a légiforgalmi szolgálatok részéről az összeütközési veszélyről megadott tájékoztatások kiegészítésére van szükség; vagy

b) a rendszeres légiforgalmi szolgálatban ideiglenes jellegű fennakadás van.

1.4 Az ilyen légtereket az adott légtéren belül légiforgalmi szolgálat biztosításáért felelős Állam -- szükség esetén az ICAO helyi irodájával együtt -- jelölje ki és a légiforgalmi tájékoztató kiadványaiban vagy NOTAM-ban tegye közzé. Ebben jelölje meg az ultrarövidhullámú rádiótávbeszélő frekvenciát (VHF - RTF), a közlemény formátumot valamint az alkalmazandó eljárásokat is. Ahol az 1.3 a) pont esetében egynél több Állam érintett, a légteret a körzeti légiközlekedési egyezmény alapján határozzák meg és a Doc. 7030 előírásainak megfelelő módon tegyék közzé.

1.5 Amennyiben ilyen kijelölt légteret alakítanak ki, az illetékes légiforgalmi szolgálati hatóságok állapodjanak meg a légtér alkalmazhatóságának felülvizsgálati időpontjában, azonban ez a 12 hónap időtartamot ne haladja meg.

2. Az adások részletei

2.1 Használandó ultrarövidhullámú rádiótávbeszélő (VHF - RTF) frekvencia

2.1.1 A használandó ultrarövidhullámú rádiótávbeszélő (VHF - RTF) frekvenciát a helyi körülményeknek megfelelően jelöljék ki és tegyék közzé. Mindazonáltal az ellenőrzött légtérben bekövetkező ideiglenes zavar esetében a felelős államok — az adott légtér határain belül igénybe veendő ultrarövidhullámú rádiótávbeszélő (VHF - RTF) frekvenciaként — közzétehetnek egy olyan rádió frekvenciát, amelyet általában ezen a légtéren belül a légiforgalmi irányító szolgálat biztosítására használnak.

2.1.2 Ahol a légiforgalmi szolgálattal történő kapcsolattartásra a levegő-föld összeköttetések során ultrarövidhullámú (VHF) frekvenciát használnak és egy légijármű csak két üzemképes URH készülékkel rendelkezik, az egyiket a megfelelő ATS frekvenciára, a másikat pedig a TIBA frekvenciára állítsák be.

2.2 Rádió-figyelés

A TIBA frekvencián a kijelölt légtérbe történő belépést megelőző tíz perctől ezen légtér elhagyásáig tartsanak fenn rádió-figyelést. Egy olyan légijármű, amely a kijelölt légtér oldalhatárain belül elhelyezkedő repülőtérről száll fel, a rádió-figyelést a felszállás után a lehető legrövidebb időn belül kezdje meg és a légtér elhagyásáig tartsa fenn.

2.3 A rádióadások időpontja

Az adás kezdeményezendő:

a) kijelölt légtérbe történő belépés előtt tíz perccel vagy egy olyan repülőgépvezető esetében, aki a kijelölt légtér oldalhatárain belül elhelyezkedő repülőtérről száll fel, a felszállás után a lehető legrövidebb időn belül;

b) tíz perccel a jelentőpont átrepülése előtt;

c) tíz perccel az légiforgalmi szolgálati útvonal keresztezése vagy az arra történő belépés előtt;

d) az egymástól távol elhelyezkedő jelentő pontok között 20 perces időközönként;

e) ahol lehetséges, a repülési szint megváltoztatásának megkezdése előtt 2 — 5 perccel;

f) a repülési szint megváltoztatásának időpontjában; és

g) bármely más időpontban, amikor a repülőgépvezető ezt szükségesnek ítéli.

2.4 A rádióadás formátuma

2.4.1 A repülési szint megváltoztatását jelző adások kivételével a 2.3 a), b), c), d) és g) alpontokban jelzett rádióadások esetén a következő formátumot alkalmazzák:

ALL STATIONS — ÁLTALÁNOS ADÁS (a forgalmi tájékoztató rádióadás meghatározása szükséges)
(a légijármű hívójele)

FLIGHT LEVEL — REPÜLÉSI SZINT (szám) vagy

CLIMBING * A 2.3 a) alpontban jelzett adás esetén, ha a légijármű a kijelölt légtér oldalhatárain belül elhelyezkedő repülőtérről száll fel.

* TO FLIGHT LEVEL (szám) — EMELKEDEK

* A (szám) REPÜLÉSI SZINTRE

(a légijármű repülési iránya)

(ATS útvonal) vagy (DIRECT FROM/TO — KÖZVETLENÜL -TÓL/-IG)

POSITION — HELYZET (helyzet meghatározás ** Olyan adások esetén, amikor a légijármű nincs kijelölt ATS jelentőpont közelében, a repülési helyzetét a lehető legpontosabban, minden esetben legalább a legközelebbi 30 szélességi és hosszúsági fok-perc pontossággal adja meg.

**) AT — IDŐ (időpont)

ESTIMATING — VÁRHATÓ (következő jelentőpont vagy a kijelölt légiforgalmi szolgálati útvonal keresztezésének vagy elérésének időpontja) AT — IDŐ (időpont)
(a légijármű hívóneve)

FLIGHT LEVEL — REPÜLÉSI SZINT (szám)
Elméleti példa:

„ALL STATIONS WINDAR 671 FLIGHT LEVEL 350 NORTHWEST BOUND DIRECT FROM PUNTA SAGA TO PAMPA POSITION 5040 SOUTH 2010 EAST AT 2358 ESTIMATING CROSSING ROUTE LIMA THREE ONE AT 4930 SOUTH 1920 EAST AT 0012 WINDAR 671 FLIGHT LEVEL 350 NORTHWEST BOUND OUT"

2.4.2 A repülési szint megváltoztatása előtt a 2.3 e) alpontban jelzett rádióadás esetén a következő formátumot alkalmazzák:

ALL STATIONS — ÁLTALÁNOS ADÁS
(a légijármű hívójele)
(a légijármű repülési iránya)
(ATS útvonal) vagy (DIRECT FROM/TO — KÖZVETLENÜL -TÓL/-IG)

LEAVING FLIGHT LEVEL (szám) FOR FLIGHT LEVEL (szám) — ELHAGYOM A (szám) REPÜLÉSI SZINTET A (szám) REPÜLÉSI SZINTRE

2.4.3 A 2.4.4 pont előírása kivételével a repülési szint megváltoztatásának időpontjában a 2.3 f) alpontban jelzett rádióadás esetén a következő formátumot alkalmazzák:

ALL STATIONS — ÁLTALÁNOS ADÁS
(a légijármű hívójele)
(a légijármű repülési iránya)
(ATS útvonal) vagy (DIRECT FROM/TO — KÖZVETLENÜL -TÓL/-IG)

LEAVING FLIGHT LEVEL (szám) NOW FOR FLIGHT LEVEL (szám) — MOST ELHAGYOM (szám) A REPÜLÉSI SZINTET A (szám) REPÜLÉSI SZINTRE
majd ezt követően:

ALL STATIONS — ÁLTALÁNOS ADÁS
(a légijármű hívójele)

MAINTAINING FLIGHT LEVEL (szám) — TARTOM A (szám) REPÜLÉSI SZINTET

2.4.4 A közvetlen összeütközési veszély elhárítása céljából végrehajtott ideiglenes repülési szint változtatást bejelentő rádióadás esetén a következő formátumot alkalmazzák:

ALL STATIONS — ÁLTALÁNOS ADÁS
(a légijármű hívójele)
(a légijármű repülési iránya)

LEAVING FLIGHT LEVEL NOW (szám) FOR FLIGHT LEVEL (szám) — MOST ELHAGYOM A (szám) REPÜLÉSI SZINTET A (szám) REPÜLÉSI SZINTRE
majd ezt követően a lehető legrövidebb időn belül:

ALL STATIONS — ÁLTALÁNOS ADÁS
(a légijármű hívójele)

RETURNING TO FLIGHT LEVEL (szám) NOW — MOST VISSZATÉREK A (szám) REPÜLÉSI SZINTRE

2.5 A rádióadások nyugtázása

Az általános adásokat nem szükséges nyugtázni, hacsak nincs közvetlen összeütközési veszély.

3. Az adásokkal kapcsolatos gyakorlati eljárások

3.1 Az utazómagasság megváltoztatása

3.1.1 A kijelölt légtéren belül ne változtassák az utazómagasságot, kivéve ha ezt a repülőgépvezetők a forgalmi konfliktusok elkerülése, időjárási képződmények kikerülése vagy egyéb tényleges légijármű-üzemeltetési okok érdekében szükségesnek ítélik.

3.1.2 Amikor az utazómagasság megváltoztatása elkerülhetetlen, a magasságváltás idejére kapcsolják be a légijármű láthatóságát növelő összes rendelkezésre álló fényt.

3.2 Az összeütközés elkerülése

Amennyiben egy másik légijármű által adott forgalmi tájékoztatás vételét követően a repülőgépvezető a közvetlen összeütközési veszély elkerülése érdekében azonnali intézkedést ítél szükségesnek és ezt nem lehet a 2. Annex útirány jogra vonatkozó előírása szerint végrehajtani, a repülőgépvezető:

a) kivéve ha más repülési művelet végrehajtása célszerűbbnek látszik, azonnal süllyedjen 150 métert (500 láb) vagy ha FL 290 felett repül olyan légtérben, ahol 600 méteres (2000 láb) függőleges elkülönítési minimumot alkalmaznak, 300 métert (1000 láb);

b) kapcsolja be a légijármű láthatóságát növelő összes rendelkezésre álló fényt;

c) a lehető legrövidebb időn belül válaszoljon a rádióadásra, tájékoztatást adva a végrehajtott repülési műveletről;

d) a megfelelő légiforgalmi szolgálati frekvencián közölje a végrehajtott repülési műveletet; valamint

e) amint lehetséges, térjen vissza az eredeti repülési szintre és a megfelelő légiforgalmi szolgálati frekvencián adjon tájékoztatást a végrehajtott repülési műveletről.

3.3 Általános helyzetjelentési eljárások

Minden esetben folytassák a rendszeres helyzetjelentések adását függetlenül attól, hogy az általános forgalmi tájékoztató adás kezdeményezésére vagy nyugtázására bármilyen intézkedés történt.

D. Melléklet
Útmutató a légiforgalmi szükségintézkedések tervezéséhez

(Lásd 2.28 pont)

1. Bevezető

1.1 A légiforgalmi szolgálatok és a kiegészítő szolgáltatások megszakadása esetén foganatosítandó szükség-intézkedésekre vonatkozó irányelveket a Léginavigációs Bizottság tanulmánya után, az érintett Államokkal és szervezetekkel folytatott megbeszéléseket követően, a határozati előírásoknak megfelelően a Tanács először 1984. június 27.-én kelt A23-12 Közgyűlési Határozatával fogadta el. Az irányelveket azután a világ különböző részein és különböző körülmények között a szükségintézkedések alkalmazása során szerzett gyakorlati tapasztalatok alapján felülvizsgálták és módosították.

1.2 Az irányelvek és útmutató anyagok célja a nemzetközi légiforgalom biztonságos és rendezett áramlásának fenntartása a légiforgalmi szolgálatok és a kiegészítő szolgáltatások megszakadása esetén, ilyen körülmények között is biztosítva a világ fő légiközlekedési útvonalainak igénybevételét, illetve ennek lehetőségét.

1.3 Az irányelvek annak a ténynek figyelembevételével kerültek kidolgozásra, hogy a nemzetközi légiközlekedés számára biztosított szolgáltatások megszakadását előidéző események előtt és alatt a körülmények igen változatosak lehetnek és a szükségintézkedéseket, beleértve a kijelölt repülőterek humanitárius célra történő igénybevételének biztosítását is, az egyedi eseményekhez és körülményekhez kell alkalmazni. A szükségintézkedések tervezése, valamint az ilyen tervek alkalmazásának kidolgozása és megvalósítása során szükséges intézkedések meghatározásának felelősségét meg kell osztani az Államok és az ICAO között.

1.4 Az irányelveket a tapasztalatok alapján dolgoztuk ki, amelyek a többek között azt jelezték, hogy a szolgáltatások megszakadása egy adott légtéren belül valószínűleg jelentős mértékben befolyásolják majd a szomszédos légtérben biztosított szolgáltatásokat is. Ezért nemzetközi együttműködésre van szükség, esetenként az ICAO közreműködésével, így az irányelvek és útmutató elkészítésénél a szükségintézkedések kidolgozása és egyeztetése területén vázoltuk az ICAO szerepét is. Az irányelvek azt a gyakorlati tapasztalatot is tükrözik, hogy az ICAO szerepe a légiközlekedési rendszerbe tartozó fő légiútvonalak fenntartása érdekében elvégzendő szükségintézkedési tervek kidolgozása alkalmával az egész világra kiterjedő kell, hogy legyen, nem korlátozódhat kizárólag a nyílt vizek és a nem meghatározott felségterületű területek feletti légterekre. Végül az irányelvek az érintett nemzetközi szervezetek közreműködését is tükrözik, amelyek -- mint a IATA[1] és az IFALPA[2] -- értékes tanácsokkal járultak hozzá a tervek valamint azok egyes elemeinek gyakorlati kidolgozásához.

2. A szükségintézkedési tervek jogi helyzete

A szükségintézkedési tervek célja alternatív szolgáltatások és berendezések biztosítása a körzeti léginavigációs tervben előírt szolgálatok helyett, amikor azok ideiglenesen nem állnak rendelkezésre. Ezért a szükségintézkedések ideiglenes természetűek és csak addig érvényesek, ameddig a körzeti léginavigációs tervben biztosított szolgálatok és berendezések ismét rendelkezésre nem állnak. Ennek megfelelően a szükségintézkedések nem jelentik a körzeti terv kiegészítését vagy módosítását, amelynél a „Jóváhagyott Körzeti Tervek Módosításának Előírásai” szerint kell eljárni. Azokban az esetekben, amikor a szükségintézkedési terv ideiglenesen eltér a jóváhagyott körzeti léginavigációs tervektől, az eltéréseket szükség szerint a Tanács részéről az ICAO Tanács elnökének kell jóváhagyni.

3. A szükségintézkedési tervek kidolgozásának, közzétételének és alkalmazásának felelőssége

3.1 Egy meghatározott légtérben a légiforgalmi szolgálatok és a kiegészítő szolgáltatások biztosításáért felelős Állam(ok) azért is felelősséggel tartoznak, hogy ezen szolgálatok működésének, illetve a szolgáltatások megszakadása vagy ennek lehetőségének esetére kidolgozott intézkedésekkel fenntartsák a nemzetközi polgári légiközlekedés biztonságát, továbbá amennyiben ez lehetséges, alternatív szolgáltatásokat nyújtsanak. Ezért az Állam(ok) dolgozzanak ki, tegyenek közzé és vezessenek be megfelelő szükségintézkedési terveket. Amennyiben a szolgáltatások megszakadása hatással lehet a szomszédos légtérben biztosított szolgáltatásokra, a terveket az érintett Államokkal és légtérfelhasználókkal, valamint szükség szerint az ICAO-val végzett egyeztetés alapján dolgozzák ki.

3.2 A nyílt vizek feletti légtereket érintő megfelelő szükségintézkedések vonatkozásában a felelősség továbbra is azokra az Államokra hárul, amelyek a légtér eléréséig biztosították a szolgáltatásokat, kivéve ha a felelősséget ideiglenesen az ICAO egy másik Államra vagy Államokra hárítja át.

3.3 Ehhez hasonlóan egy olyan légtér vonatkozásában, amelyben a szolgáltatás biztosításának felelősségét egy másik Államra hárították, a megfelelő szükségintézkedések iránti felelősség továbbra is erre az államra hárul, ameddig a felelősséget áthárító Állam ezt ideiglenesen vagy véglegesen vissza nem veszi. Ezt követően az áthárító Állam veszi át a szükségintézkedések kidolgozásának és végrehajtásának felelősségét.

3.4 Az ICAO kezdeményezi és egyezteti a nemzetközi polgári légiközlekedést érintő légiforgalmi szolgálatok működésének és a kiegészítő szolgáltatások biztosításának megszakadása alkalmával szükséges intézkedéseket, amennyiben az Állam, illetve hatósága valamilyen okból nem tudja teljesíteni a 3.1 pontban ismertetett felelősségét. Ezekben az esetekben az ICAO együttműködik a szomszédos légterekért felelős Államokkal és az érintett nemzetközi szervezetekkel. Az ICAO az Államok kérésére is kezdeményezi és egyezteti a megfelelő szükségintézkedéseket .

4. Előkészítő tevékenység

4.1 A szükségintézkedések tervezésénél az idő alapvető fontosságú tényező, amennyiben a légiközlekedést érintő kockázatok az intézkedésekkel megelőzhetők. A szükségintézkedések időben történő bevezetéséhez határozott kezdeményezés és végrehajtás szükséges, amelynek alapján kidolgozzák, az érintett felek jóváhagyják és megfelelő módon és időben közzéteszik a szükségintézkedési terveket, mielőtt bekövetkezik az az esemény, amely a végrehajtást szükségessé teszi.

4.2 A fenti 4.1 pontban ismertetett okból az Államok szükség szerint végezzék el az előkészítést, hogy ezzel megkönnyítsék a szükségintézkedések időben történő közzétételét. Az előkészítés feladatai közé tartoznak az alábbiak:

a) az általános szükségintézkedési tervek elkészítése a légiforgalmi szolgálatok és/vagy a kiegészítő szolgáltatások biztosítását érintő előrelátható eseményekre, mint például érdekvédelmi (szakszervezeti) megmozdulások, munkabeszüntetések. Elfogadva azt a tényt, hogy a világ légiközlekedési közössége nem résztvevő fél az ilyen esetekben, a nyílt vizek és nem meghatározott felségterületű területek feletti légterekben szolgáltatásokat biztosító Államok hozzanak megfelelő intézkedéseket annak érdekében, hogy a nemzetközi polgári légiközlekedés számára a felségjoggal nem rendelkező légtérben továbbra is megfelelő légiforgalmi szolgálatot nyújtsanak. Ugyanebből az okból a saját felségterületek feletti vagy számukra más állam(ok) részéről átadott légtérben légiforgalmi szolgálatot nyújtó államok is hozzanak megfelelő intézkedéseket a légiforgalmi szolgálatok biztosítására a nemzetközi polgári légiközlekedés számára, amely azonban nem vonatkozik érdekvédelmi (szakszervezeti) megmozdulásokban érintett Állam(ok) területén történő le és felszállások végrehajtására;

b) mérjék fel a harci cselekmények vagy a polgári légiközlekedést érintő jogellenes beavatkozások kockázati tényezőit a polgári légiforgalom vonatkozásában, valamint a természeti katasztrófák valószínűségét és lehetséges hatásait is. Az előkészítés terjedjen ki a természeti katasztrófák, harci cselekmények vagy a polgári légiközlekedést érintő jogellenes beavatkozások miatti különleges szükségintézkedések előzetes kidolgozására, amely események valószínűleg befolyásolni fogják a polgári légijárművek üzemeltetésére rendelkezésre álló légteret, a légiforgalmi szolgálatok és/vagy kiegészítő szolgáltatások biztosítását. Vegyék figyelembe, hogy egy adott légtér előzetes értesítés nélkül történő azonnali elkerülése különleges feladatok elé állítja a szomszédos légterekért vagy légtérszakaszokért felelős Államokat és nemzetközi légijármű-üzemeltetőket, mivel alternatív útvonalakat és szolgáltatásokat kell tervezniük. Ezért az Államok légiforgalmi szolgálati hatóságai a lehetőségek szerint előre mérjék fel az ilyen alternatív tevékenységek szükségességének lehetőségét és valószínűségét;

c) kísérjék figyelemmel mindazokat a fejleményeket, amelyek a szükségintézkedések foganatosítását megkövetelő eseményekhez vezetnek. Az Államok gondolják át az ilyen feladathoz, valamint szükség szerint a hatékony intézkedések megkezdéséhez megfelelő személy vagy szervezeti egység kijelölésének lehetőségét; valamint

d) egy központi szervezet kijelölése vagy kialakítása, amely a légiforgalmi szolgálatok megszakadása és a szükségintézkedések bevezetése esetén éjjel-nappal pontos tájékoztatást tud nyújtani a kialakult helyzetről és a vonatkozó szükségintézkedésekről egészen addig, amíg a rendszer rendes működése helyreáll. A központi szervezeten belül vagy e mellett a szolgáltatások megszakadása alkalmával szükséges tevékenységek összehangolására jelöljenek ki egyeztető munkacsoportot.

4.3 Az ICAO rendelkezésre áll mindazon fejlemények figyelemmel kísérésére, amelyek a szükségintézkedések kidolgozását és foganatosítását megkövetelő eseményekhez vezetnek, továbbá szükség szerint segítséget nyújt az intézkedések kidolgozásához. A tényleges kényszerhelyzet esetén az érintett körzeti irodá(k)ban és az ICAO montreáli székhelyén egyeztető csoportot alakítanak és intézkednek, hogy éjjel-nappal szakértő személyzet álljon rendelkezésre vagy legyen elérhető. A csoportok feladata a bármely forrásból származó tájékoztatások folyamatos értékelése, az állami légiforgalmi tájékoztató szolgálat állandó és rendszeres tájékoztatása, az érintett nemzetközi szervezetekkel és helyi szerveivel történő kapcsolattartás, az érintett, valamint a szükségintézkedésekben résztvevő valamennyi Állammal történő közvetlen, aktuális és naprakész információ-csere. A rendelkezésre álló összes adat elemzése alapján a körülményeknek megfelelő tevékenység vagy intézkedés kezdeményezésének jogát a csoport beszerzi az érintett Állam(ok)tól.

5. Egyeztetés

5.1 A szükségintézkedési terv legyen egyaránt elfogadható a szolgálatokat biztosítók és igénybevevők részére, azaz a szolgáltatók legyenek képesek végrehajtani a részükre kijelölt feladatokat, ugyanakkor a körülményeknek megfelelően biztosítani lehessen az üzemeltetés biztonságát valamint a tervben jelzett forgalom kapacitást is.

5.2 Ezért azok az Államok, amelyek feltételezik vagy tapasztalják a légiforgalmi szolgálatok és/vagy a kiegészítő szolgáltatások megszakadását, a lehető leghamarabb tájékoztassák az illetékes ICAO körzeti irodát és azokat az Államokat, amelyek szolgálatait az esemény érintheti. A tájékoztatás tartalmazza a szükségintézkedéseket vagy segítség kérést a szükségintézkedési terv kialakításához.

5.3 Az egyeztetésre vonatkozó részletes követelményeket a fentiek alapján az Államok és/vagy az ICAO határozza meg. Abban az esetben, ha a szükségintézkedések érdemben nem érintik a légtér-felhasználókat vagy az érintett Állam saját légterén kívül szolgáltatást biztosító szervezeteket, természetesen nincs vagy alig van szükség ilyen egyeztetésre, azonban a vélemények szerint az ilyen eset igen ritka.

5.4 Több országot érintő kockázat esetén a szükségintézkedési terv végső kialakításához vezető részletes egyeztetésre van szükség minden egyes érintett állam között. A részletes egyeztetés terjedjen ki azokra az Államokra, amelyek szolgálatait a terv -- például a forgalom átirányítása miatt -- jelentős mértékben érintheti, valamint az érintett nemzetközi szervezetekre is, amelyek komoly üzemeltetési tapasztalatokkal és ismeretekkel rendelkeznek.

5.5 Amikor a szükségintézkedések szabályos és zökkenőmentes alkalmazásához erre szükség van, a fentiekben ismertetett egyeztetés terjedjen ki az általános és pontos NOTAM szövegre is, amelyet a közösen megállapított hatálybalépési időpontban tesznek közzé.

6. A szükségintézkedési tervek kidolgozása, közzététele és alkalmazása

6.1 A teljes értékű szükségintézkedési terv az egyedi körülményektől függ, melyek közé tartozik az is, hogy a korlátozó körülmények érintenek-e a nemzetközi polgári légiközlekedés számára rendelkezésre álló légteret vagy sem. Független légteret csak az érintett Államok hatóságainak kezdeményezése alapján vagy megállapodásban rögzített engedélyével lehet használni. Ellenkező esetben a szükségintézkedéseknek ki kell terjedniük az adott légtér elkerülésére és az intézkedéseket a szomszédos államokkal vagy ezek részéről az ICAO-val történő együttműködéssel dolgozzák ki. A nyílt vizek és a nem meghatározott felségterületek feletti légtér vonatkozásában a szükségintézkedési terv a körülményektől függően, többek között az alternatív szolgáltatások minőségi csökkenésének megfelelően tartalmazhatja az ICAO részéről a légiforgalmi szolgálatok biztosítása felelősségének ideiglenes áthárítását az érintett légtérben.

6.2 A szükségintézkedési terv feltételezi, hogy a lehető legtöbb tájékoztatás áll rendelkezésre a következőkről:

jelenleg rendelkezésre álló és alternatív útvonalak; a légijármű navigációs képessége; a földi berendezések segítségével teljes mértékben vagy részlegesen rendelkezésre álló navigációs irányvezetés; a szomszédos légiforgalmi szolgálati egységek légtérfelderítési és távközlési berendezései vagy képességei; a kiszolgált légijárművek típusai, mérete és a forgalom nagyságrendje; a légiforgalmi szolgálatok, távközlési, meteorológiai és légiközlekedési tájékoztató szolgálatok tényleges üzemi állapota.

Az alábbiakban ismertetjük a szükség-intézkedések tervezésénél a körülményektől függően figyelembe veendő fő tényezőket:

a) a forgalom átirányítása az érintett légtér teljes vagy részleges elkerülése érdekében, általában a kiegészítő útvonalak vagy útvonalszakaszok kijelölésével és használatuk feltételeivel;

b) amennyiben lehetséges, egyszerűsített útvonalhálózat kialakítása az érintett légtérben, az oldalirányú és függőleges elkülönítést biztosító repülési szint kiosztási rendszerrel együtt, továbbá olyan eljárás, amellyel a szomszédos területek irányító központjai a belépési pontokra létrehozzák és a légtérben fenntartják a hosszirányú elkülönítést;

c) a légiforgalmi szolgálatok biztosítása felelősségének átadása a nyílt vizek feletti vagy az erre átadott légtérben;

d) a megfelelő levegő-föld távközlési, AFTN és közvetlen légiforgalmi szolgálati beszédüzemű összeköttetések biztosítása és fenntartása, beleértve az időjárási tájékoztatás valamint a navigációs berendezések üzemi állapotáról szóló információk biztosítására vonatkozó felelősség átadását a szomszédos Államoknak;

e) különleges intézkedések a légijárműtől származó, repülés közbeni és repülés utáni jelentések összegyűjtésére és szétosztására;

f) előírás a légijármű számára a folyamatos rádiófigyelés fenntartására a meghatározott repülőgépvezető-repülőgépvezető közötti URH frekvencián olyan kijelölt légterekben, ahol a levegő-föld összeköttetés bizonytalan vagy ilyen összeköttetés nem létezik; továbbá a tényleges és számított helyzet-információk továbbítása lehetőleg angol nyelven, beleértve az emelkedés valamint süllyedés megkezdését és befejezését;

g) előírás minden légijármű számára, hogy a kijelölt légterekben mindig üzemeltessék az összes navigációs és összeütközés elleni fényeiket;

h) előírás és eljárás a légijárművek számára, hogy azonos utazómagasságon közlekedő légijárművek között nagyobb hosszirányú elkülönítést tartson;

i) előírás a légijárművek számára, hogy az emelkedést és a süllyedést a külön azonosított légiútvonal középvonalától jóval jobbra hajtsa végre;

j) a szükségintézkedések által érintett légtérbe történő belépés szabályozását célzó intézkedések, hogy elkerüljék a szükségintézkedési rendszer túlterhelését; valamint

k) előírás a szükségintézkedés légterében működő összes forgalom számára, hogy IFR szabályok szerint üzemeljen, beleértve a terület légiforgalmi szolgálati útvonalaihoz az IFR repülési szintek kijelölését a 2. Annex 3. Függelék megfelelő utazómagasság táblázataiból.

6.3 A légiforgalmi szolgálatok és/vagy a kiegészítő szolgáltatások várható vagy tényleges megszakadásáról szóló NOTAM tájékoztatást a gyakorlati szempontból lehető leghamarabb továbbítsák a léginavigációs szolgálatok illetve szolgáltatások felhasználói számára. A NOTAM tartalmazza a megfelelő szükségintézkedéseket is. Az előre várható szolgáltatás megszakadás esetében az előzetes értesítés semmi esetre se legyen később, mint 48 órával a várható esemény előtt.

6.4 A szükségintézkedések megszüntetéséről és a szolgálatok illetve szolgáltatások eredeti, a körzeti léginavigációs tervben megállapított szintjének visszaállításáról szóló NOTAM közleményt a lehető leghamarabb továbbítsák az érintettek részére, biztosítva ezzel a szükségintézkedésekről a rendes üzemi körülményekre történő átállás folyamatosságát és rendezettségét.

E. Melléklet

Elfogadható repülésbiztonsági szint

1. Bevezetés

1.1 Az elfogadható repülésbiztonsági szint fogalmának bevezetése azon igényre válaszol, hogy a jelenleg uralkodó, a szabályozónak történő megfelelésen alapuló repülésbiztonság-irányítási szemlélet egy, az általános repülésbiztonsági szint folyamatos javulását célzó, teljesítmény-alapú szemlélettel egészüljön ki.

1.2 Az elfogadható repülésbiztonsági szint egy felügyelő hatóság, egy járató vagy egy szolgáltató repülésbiztonsági céljait fejezi ki. A felügyelő hatóság és a járatók/szolgáltatók közötti viszony szemszögéből kijelöli a járatók/szolgáltatók elsődleges üzleti tevékenységük végzése közben elérendő, a felügyelő hatóság által még elfogadható minimum repülésbiztonsági cél(oka)t. Ez egy olyan vonatkozási pont, ami alapján a felügyelő hatóság mérni képes a repülésbiztonsági teljesítményt.

1.3 Az elfogadható repülésbiztonsági szint(ek) a repülésbiztonsági program céljából történő meghatározása nem helyettesíti a törvényi, szabályozói vagy egyéb fennálló követelményeket, valamint nem menti fel az Államokat a Nemzetközi Polgári Légiközlekedési Egyezményben és kapcsolódó rendelkezéseiben foglalt kötelezettségeik alól.

1.4 Az elfogadható repülésbiztonsági szint(ek) a repülésbiztonság-irányítási rendszer céljából történő meghatározása nem menti fel a járatókat/szolgáltatókat a vonatkozó nemzeti szabályozások és a Nemzetközi Polgári Légiközlekedési Egyezmény általi kötelezettségeik alól.

2. Hatály

2.1 Az egyes Államokban a felügyelő hatóság és az egyes járatók/szolgáltatók részére különböző elfogadható repülésbiztonsági szintek állapíthatók meg.

2.2 Az egyes meghatározott repülésbiztonsági szintek legyenek arányosak az egyes járatók/szolgáltatók üzemelési körülményeinek összetettségével, valamint azzal a szinttel, ameddig a repülésbiztonsági hiányosságok tolerálhatók és azokra reálisan fel lehet készülni.

3. Végrehajtás

3.1 Az elfogadható repülésbiztonsági szint fogalmát repülésbiztonsági teljesítmény-mutatókban és repülésbiztonsági teljesítménycélokban határozzák meg és repülésbiztonsági követelmények útján hajtják végre.

3.2 Az elfogadható repülésbiztonsági szint, repülésbiztonsági teljesítmény-mutatók, repülésbiztonsági teljesítménycélok és repülésbiztonsági követelmények közötti összefüggések az alábbiak: az elfogadható repülésbiztonsági szint az átfogó fogalom; a repülésbiztonsági teljesítmény-mutatók azok a mérőeszközök vagy mértékek, amelyekkel meghatározható, hogy elérték-e az elfogadható repülésbiztonsági szintet, a repülésbiztonsági teljesítménycélok az elfogadható repülésbiztonsági szintre vonatkozó minősített célkitűzések, míg a repülésbiztonsági követelmények a repülésbiztonsági teljesítmény-mutatók eléréséhez szükséges eszközök vagy erőforrások.

3.3 Egy elfogadható repülésbiztonsági szint repülésbiztonsági teljesítmény-mutatói lehetőleg legyenek egyszerűek és kapcsolódjanak egy Állam repülésbiztonsági programjának vagy egy járató/szolgáltató repülésbiztonság-irányítási rendszerének (SMS) főbb alkotóelemeihez. A repülésbiztonsági teljesítmény-mutatókat általában számokkal fejezik ki.

3.4 Egy elfogadható repülésbiztonsági szint repülésbiztonsági teljesítménycéljait lehetőleg annak felmérése után határozzák meg, hogy mi kívánatos és mi reálisan elvárható az egyes járatóktól/szolgáltatóktól. A repülésbiztonsági teljesítménycélok lehetőleg legyenek mérhetők, az érintett felek számára elfogadhatók, valamint az elfogadható repülésbiztonsági szinttel megegyezők.

3.5 Az elfogadható repülésbiztonsági szint repülésbiztonsági teljesítménycéljainak eléréséhez szükséges repülésbiztonsági követelményeket lehetőleg operatív eljárásokban, technológiában és rendszerekben, programokban, előre nem látott eseményekre kidolgozott intézkedésekben, stb. fejezzék ki, amelyekhez hozzáadhatók a megbízhatóságra, rendelkezésre-állásra és/vagy pontosságra vonatkozó mértékek.

3.6 Egy elfogadható repülésbiztonsági szintet lehetőleg több kisebb repülésbiztonsági teljesítmény-mutatóval fejezzenek ki és több repülésbiztonsági teljesítménycélra fordítsanak le, ne egy nagyobb fogalomra.

ANNEX 12.
Kutatás és mentés

Nyolcadik Kiadás – 2004. Július
17. módosítással
A jelen kiadás magába foglalja a Tanács által 2004. február 24. előtt elfogadott összes módosítást, és 2004. november 25-én hatálytalanítja a 12. Annex összes korábbi kiadását.
A szabványok és ajánlott gyakorlatok alkalmazhatóságára vonatkozó tájékoztatást lásd az Előszóban.
Nemzetközi Polgári Repülési Szervezet
KISÉRŐ JEGYZET
A Nemzetközi Polgári Repülésről Szóló Egyezmény Annexeinek új kiadásai
Tudomásunkra jutott, hogy új Annex kiadás közzétételekor a használók az Annex előző kiadásával együtt kidobják a korábbi kiadáshoz tartozó Kiegészítő (Supplement) részeket is.
Kérjük jegyezzék meg, hogy az előző kiadás Kiegészítő (Supplement) részét mindaddig meg kell őrizni, amíg új Kiegészítő részt teszünk közzé.

MÓDOSÍTÁSOK

A módosítások kiadását az ICAO Bulletin és az ICAO Kiadványok és Audio-vizuális Kiképzési segédletek Katalógusának havi kiegészítései rendszeresen közlik, a jelen Kiadvány tulajdonosai kísérjék ezeket figyelemmel.
Az alábbi táblázat a módosítások nyilvántartására szolgál.

ELŐSZÓ

Történeti háttér

1946 decemberében, a Kutatási és Mentési Osztály a második ülésén a kutatás és mentési szabványokra és ajánlott gyakorlatokra vonatkozó eljárásokra tett javaslatokat. Ezeket a Titkárság és az akkori Légi-navigációs Bizottság dolgozta ki, és megfelelő módon a Tanács elé terjesztette. A Tanács a benyújtott formában nem fogadta el a javaslatokat és 1948. április 20-án visszautalta a Légi-navigációs Bizottsághoz további megfontolás céljából.
Ezután újabb Annex tervezetet dolgoztak ki a Körzeti Légi-navigációs Értekezletek tapasztalatának figyelembevételével és ezt a Légi-navigációs Bizottság végül is elvben jóváhagyta és köröztette az államok között véleményezés céljából. Ezt a Légi-navigációs Bizottság az államok véleménye alapján továbbfejlesztette és az így készült ajánlásokat 1950 május 25-én a Tanács elfogadta és a nemzetközi polgári repülésről szóló egyezmény 12. Annex-ének nevezték el. 1950. december 1-jén lépett hatályba és 1951. március 1-jén vált kötelező érvényűvé.
Az A Táblázat a soron következő módosítások eredetét mutatja az érintett fő témák jegyzékével együtt, és azokat az időpontokat, amikor a Tanács az Annexet, illetve módosításait elfogadta, illetve amikor hatályba

léptek, valamint amikortól alkalmazandókká váltak.

Alkalmazhatóság

Az e dokumentumban lévő szabványok és ajánlott gyakorlatok a Doc 7030-ban tartalmazott Körzeti Kiegészítő Eljárások - Kutatás és Mentés - alkalmazását szabályozzák, amely dokumentumban a körzeti alkalmazás kiegészítő eljárásai találhatók.
A 12. Annex alkalmazandó a kutató és mentő szolgálatok létesítéséhez, fenntartásához és működéséhez a szerződő államok területén, valamint a nyílt vizeken, illetve e szolgálatok államok közötti összehangolásához.

A szerződő államok kötelezettségei:

Eltérések jelentése. Felhívjuk a szerződő állam figyelmét az Egyezmény 38. cikkelyéből fakadó kötelezettségére, mely értelmében a Szerződő Állam köteles a szervezet számára bejelenteni minden olyan eltérést, amely nemzeti szabályai és gyakorlatai, illetve a jelen Annexben szereplő Nemzetközi szabványok, illetve ezek bármiféle módosítása között fennállnak. Felkérjük a szerződő államot arra, hogy tegyen ilyen bejelentést minden olyan eltéréssel kapcsolatban is, amely a jelen Annexben és bármely módosításában szereplő ajánlott gyakorlat között fennáll, amennyiben az utóbbi eltérésekre vonatkozó bejelentés lényeges a Légi-navigáció biztonsága szempontjából.
Felkérjük továbbá a szerződő államot arra, hogy folyamatosan tájékoztassa a Szervezetet a jövőben esetleg keletkező minden eltérésről, illetve a korábban már bejelentett bármely eltérés megszűnéséről. A szerződő államhoz a jelen Annex módosításainak elfogadását követően az eltérések bejelentéséhez külön felszólítást juttatunk el.

Az állam figyelmét felhívjuk a 15. Annex rendelkezésére is, miszerint az Egyezmény 38. cikkelyéből fakadó kötelezettségén felül a nemzeti szabályzat és gyakorlat, illetve a vonatkozó ICAO szabványok és ajánlott gyakorlatok közötti eltéréseket Légiforgalmi Tájékoztató Szolgálata révén közzé kell tenni.

A Tájékoztatás közzététele. A jelen Annexben meghatározott szabványok és ajánlott gyakorlatok szerint létesített, légi-járművek üzemeltetését befolyásoló berendezések, szolgálatok és eljárások bevezetéséről, megszüntetéséről, vagy megváltoztatásáról szóló tájékoztatást a 15. Annexnek megfelelően kell közölni és életbe léptetni.

Az Annex szövegének használata a nemzeti szabályozásban. A Tanács 1948. április 13-án elfogadott egyik határozatában felhívja a szerződő állam figyelmét annak szükségességére, hogy saját nemzeti szabályzataiban a megoldható legteljesebb mértékben használja a szabályozó jellegű ICAO szabványok szabatos nyelvezetét, továbbá annak szükségességére, hogy jelezze a szabványoktól való eltéréseket, beleértve mindazon kiegészítő nemzeti előírást, amely a Légi-navigáció biztonságára és rendszerességére nézve lényeges. Jelen Annex előírásainak megszövegezése a lehető legteljesebb mértékben olyan, hogy a nemzeti szabályokba átültetésük szövegbeli lényegesebb változtatás nélkül váljék lehetővé.

Az Annex részeinek jogállása

Egy Annex a következő összetevő részekből áll, de nem szükségszerű, hogy mindegyikük mindegyik Annexben megtatálható legyen. Ezen összetevők a következő jogállás bírnak:

1. *Az Annex alapjait képező anyag:*

a) Szabvány és ajánlott eljárás, melyet az Egyezmény rendelkezése szerint a Tanács fogad el. Ezek meghatározása a következő:
Szabvány (standard): A szabvány fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre, vagy eljárásra vonatkozó bármely követelmény, amelynek egységes alkalmazása szükséges a nemzetközi légi-közlekedés biztonsága, vagy menetrendszerűsége érdekében és amelyet a szerződő állam az Egyezmény értelmében betart; ha nem tartható be, akkor a 38. cikkely értelmében erről a Tanácsot köteles értesíteni.
Ajánlott eljárás (recommended practice): bármely fizikai jellemzőre, kialakításra, anyagra, teljesítményre, személyzetre vagy eljárásra vonatkozó olyan előírás, amely egységes alkalmazása a nemzetközi légi-

közlekedés biztonsága, menetrendszerűsége, vagy hatékonysága szempontjából kívánatos és amely alkalmazására a szerződő állam az Egyezmény értelmében törekszik.

b) *Függelék (Appendices):* A célszerűség érdekében külön csoportosított, de a Tanács által elfogadott szabványok és ajánlott eljárások szerves részét képező szöveg.

c) *Meghatározás (Definitons).* A szabványokban és ajánlott eljárásokban alkalmazott, önmagát elfogadott saját szótári jelentés híján nem magyarázó kifejezés meghatározása. A meghatározás külön jogállással nem rendelkezik, de lényeges része minden szabványnak és ajánlott eljárásnak, amelyben előfordul, tekintve, hogy a meghatározás értelmének megváltoztatása az előírás tartalmát befolyásolhatja.

2. A Tanács által a szabványokkal és ajánlott eljárásokkal kapcsolatban közzétételre jóváhagyott anyag

a) *Előszó (Foreword).* A Tanács ténykedésére alapozott történeti és magyarázó anyagot foglal magába, ismerteti, magyarázza a szabványok és ajánlott eljárások alkalmazásával kapcsolatban az állam mindazon kötelességét, amely az Egyezményből és az Elfogadó határozatból ered.

b) *Bevezető rész (Introduction).* Az Annex részei, fejezetei, vagy szakaszai előtt található, a szöveg alkalmazásának megértését segítő magyarázó anyag.

c) *Megjegyzés (Notes).* Ez a szükséges helyeken a kérdéses szabványra, vagy ajánlott eljárásra vonatkozó tényszerű információt, vagy hivatkozást tartalmaz, de a szabvány, vagy ajánlott eljárás részét nem képezi.

d) *Melléklet (Attachments).* A szabványt és ajánlott eljárást kiegészítő anyagot tartalmaz, vagy azok alkalmazásához nyújt útmutatást.

Nyelv kiválasztás

Ezt az Annexet hat nyelven fogadták el - angolul, arabul, kínaiul, franciául, oroszul és spanyolul. Felkérjük a szerződő államot, hogy a nemzeti bevezetés céljára, illetve az egyezményben előírt egyéb feladatok megvalósítására ezek közül egyet válasszon ki közvetlen használatra, vagy a nemzeti nyelvére történő lefordítás alapjául és, hogy a szervezetet ennek megfelelően értesítse.

Szerkesztői gyakorlat

Annak érdekében, hogy mindegyik kijelentés jogállása első pillantásra felismerhető legyen, a következő gyakorlatot alkalmaztuk. A *szabványokat* vékony álló betűkkel nyomtattuk; az *Ajánlott gyakorlatokat* vékony dőlt betűkkel szedtük, jogállásukat félkövér **Recommendation** kitétellel jeleztük; a *Megjegyzés*eket vékony dőlt betűkkel nyomtattuk, jogállásukat a *Megjegyzés* kitétel mutatja.
Megjegyzendő, hogy az angol szövegben a követelmények leírásánál az alábbi szerkesztői gyakorlatot követtük: a szabványok esetében a kell (shall), és az ajánlott eljárásokban pedig a szükséges (should) szavakat alkalmaztuk.
E dokumentumban végig
a) a mértékegységek metrikus rendszerben szerepelnek, melyeket zárójelben követ a megfelelő láb-font rendszerben kifejezett érték
b) az alkalmazott hímnemű személyes névmást úgy kell tekinteni, mint amely egyaránt vonatkozik a nőnemű és a hímnemű személyekre is.
Jelen dokumentum bármelyik részére számmal és/vagy címmel való hivatkozás magába foglalja az adott rész valamennyi alpontját is.

"A" táblázat - a 12. Annex módosításai

Módosítás	Forrása(i)	Tárgya(i)	Jóváhagyva Hatályba lépés Alkalmazandó

18	Légi-navigációs Bizottság	A mentést koordináló központ (RCC) felelőssége	2007. márc. 16 2007. júl. 16 2007. nov. 22

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT GYAKORLATOK

Megjegyzés.- Ez az Annex kiegészült a Nemzetközi Légiforgalmi és Tengeri Kutató-Mentő (IAMSAR) Kézikönyv I. kötetével – Szervezés és Vezetés, a II. kötetével – Művelet összehangolás és a III. kötetével - Mobil Létesítmények (Doc 9731). A kiegészítés célja az államok segítése kutatás és mentési (SAR) igényeik teljesítésében, illetve a Nemzetközi Polgári Repülési Egyezmény értelmében vállalt kötelmeik teljesítésében. Eme – a kutató és mentőszolgálat biztosításával összefüggő – kötelmek a jelen Annexben szabványok és ajánlott eljárások formájában lettek előírva. Az IAMSAR Kézikönyv három kötete a kutató és mentő szolgálatok megszervezésének és biztosításának közös, repülési és tengerészeti megközelítéséhez szolgál útmutatóul. Az államokat bátorítjuk, hogy a kézikönyv használatával alakítsák ki, illetve javítsák kutató és mentő szolgálataikat, illetve, hogy a szomszédos államokkal működjenek együtt.

4. FEJEZET - ELŐKÉSZÍTŐ INTÉZKEDÉSEK

4.1 Információ igény

4.1.1 A mentés koordináló központ mindenkor rendelkezzen a kutató mentő körzetére vonatkozó, alábbiakkal kapcsolatos naprakész információkkal:

a) mentőegységek, mentési alközpontok és riasztó állomások;
b) légiforgalmi szolgálati egységek;
c) a kutató és mentési műveletekben alkalmazható összeköttetést biztosító eszközök;
d) a körzetben működő minden üzemeltető, vagy kijelölt képviselőik címe és telefonszáma;
e) bármely más, köz- és magán segélyforrás, beleértve azokat az orvosi és szállító eszközöket, amelyek a kutatás és mentés során valószínűleg hasznosak bizonyulhatnak.

4.1.2 **Ajánlás**. - *Minden mentés koordináló központ rendelkezzen minden egyéb, a kutatás és mentés szempontjából hasznos információval, beleértve az alábbiakra vonatkozókat is:*

a) minden olyan rádióállomás helye, hívójele, figyelési ideje és frekvenciája, amelyet valószínűleg felhasználnak a kutatás és mentés során;
b) azon szolgálatok helye és figyelési ideje, amelyek rádiófigyelést tartanak és, hogy mely frekvenciákon tartanak figyelést;
c) a ledobható vésztartalékok és mentőfelszerelések tárolási pontjai;

d) ismert olyan tárgyak, amelyek - különösen a levegőből nézve - be nem jelentett, vagy a fel nem lelt ronccsal összetéveszthetők.

4.1.3 **Ajánlás**. - *A tengerre is kiterjedő kutató-mentő területtel rendelkező minden mentés koordináló központnak, álljon módjában egyszerűen hozzáférni az ezen területen belül tartózkodó és vészhelyzetben lévő légi-járműnek segítséget nyújtani képes hajók helyzetét, tényleges útvonalát, sebességét és a kapcsolatba lépés módját tartalmazó információhoz.*

Megjegyzés. - Eme információ a mentés koordináló központban legyen tárolva, vagy közvetlen hozzáférés legyen biztosított.

4.1.4 **Ajánlás**. - *A tengereken végzett kutató mentő műveletek támogatása érdekében a szerződő állam önállóan, vagy más államokkal együttműködve és a tengerészeti hatóságokkal kooperálva hozzanak létre hajókövető rendszert, avagy intézkedjenek az Amver, illetve a körzeti hajókövető rendszerhez kommunikációs (adat) kapcsolat létrehozásáról.*

Megjegyzés. – Az Amver egy világfedéssel rendelkező és a létező összes mentés koordináló központ által lekérdezhető együttműködéses nemzetközi hajókövető rendszer. A szerződő államok körzeti hajókövető rendszereket is üzemeltetnek.

4.2 Műveleti terv

4.2.1 Minden mentés koordináló központ készítsen részletes tervet a kutató és mentő körzetén belüli kutató és mentő műveletek végrehajtására.

4.2.2 **Ajánlás. -** *A kutató mentő műveleti terveket az üzemeltetők és egyéb olyan közszolgálati-, vagy magán szolgálatok képviselőivel közösen kell kidolgozni, amelyek a kutató mentő szolgáltatás biztosításában segíthetnek, vagy amelyek révén előnyök szerezhetők, tekintetbe véve, hogy a túlélők száma magas is lehet.*

4.2.3 A műveleti terv - a lehetséges mértékig - tartalmazzon megállapodásokat a kutatásban és mentésben alkalmazandó légi-járművek, hajók, gépjárművek kiszolgálására, üzemanyaggal való utántöltésére vonatkozóan, beleértve a más államok által rendelkezésre bocsátott eszközöket is.

4.2.4 *A kutatás mentés műveleti terv részletesen tartalmazza a kutatásban és mentésben résztvevők feladatait, beleértve:*

a) a kutató és mentő körzeten belüli kutató és mentő munkák végrehajtásának módját;

b) a rendelkezésre álló távközlési rendszerek és létesítmények használatát;

c) a többi mentés koordináló központtal közösen végrehajtandó tevékenységeket;

d) az úton lévő légi-járművek és tengeren lévő hajók riasztásának módját;

e) a kutatásra és mentésre kijelölt személyzet kötelességeit és kiváltságait;

f) meteorológiai, vagy más körülmények miatt szükségessé váló esetleges eszköz átcsoportosítási lehetőségeket;

g) a kutató és mentő műveletekhez lényeges információ (például időjárási jelentések és előrejelzések, vonatkozó NOTAM-ok stb.) beszerzési módját;

h) szükségessé váló segítség (légi-jármű, hajó, személyzet, vagy felszerelés) igénylési módja másik mentő központtól;

i) a vészhelyzetben lévő és vízre szállni kényszerülő légi-jármű vízi járműhöz vezetésének módjai;

j) a kutató és mentő, vagy más légi-jármű vészhelyzetben lévő légi-járműhöz vezetésének módjai;

k) a légiforgalmi szolgálati egységekkel és egyéb érdekelt hatóságokkal együttműködésben teendők a tudottan, vagy feltételezetten jogellenes cselekmény tárgyát képező légi-jármű segítésére.

4.2.5 **Ajánlás.** – A *kutató mentő műveleti terv legyen összehangolva a repülőtéri vészhelyzeti tervvel, hogy a kutató mentő szolgáltatás biztosított legyen a repülőterek környezetében, beleértve a parti repülőtereket és a vízzel borított területeket is.*

4.3 Kutató mentőegységek

4.3.1 Minden kutató-mentőegység:

a) ismerje a 4.2 pontban leírt műveleti terv saját feladata eredményes végrehajtásához szükséges minden részletét; és

b) készenléti szintjéről a mentést koordináló központot tartsa naprakészen;
4.3.2 A szerződő állam
a) köteles a szükséges számú kutató mentő létesítményt készenlétben tartani; és
b) köteles megfelelő mennyiségű élelmiszeradagot, gyógyszer készletet, jelzőeszközt és egyéb más túlélési és mentő felszerelést ellátmányként tárolni;

4.4 Kiképzés és gyakorlatozások

A kutatás és mentés legmagasabb fokú hatékonyságának elérése és fenntartása céljából a szerződő állam kutató és mentő személyzeteit részesítse rendszeres kiképzésben és tartasson megfelelő kutató és mentő gyakorlatokat.

4.5 A repülőgép roncs

Ajánlás. – *A szerződő állam gondoskodjon róla, hogy a területén belül, vagy a felelőssége alá tartozó kutatási és mentési körzetekben a nyílt tengeren, vagy a meg nem határozott felségjogú területeken bekövetkezett repülőbalesetekből származó roncsokat a baleset kivizsgálását követően eltávolítsák, vagy megsemmisítsék, illetőleg térképen feltüntessék, ha jelenléte veszélyes, vagy a későbbi kutató mentő műveletekben zavart okozhat.*

ANNEX 13.
Légijármű balesetek és események kivizsgálása

9. kiadás – 2001. július
10. módosítással
A jelen kiadás magába foglalja a Tanács által 2001. február 27. előtt elfogadott összes módosítást, és 2001. november 1-jén hatálytalanítja a 13. Annex összes korábbi kiadását.
A szabványok és ajánlott gyakorlatok alkalmazhatóságára vonatkozó információkat lásd a 2. Fejezetben és az Előszóban.
Kilencedik Kiadás - 2001. július
Nemzetközi Polgári Repülési Szervezet

MÓDOSÍTÁSOK

A módosítások kiadását az ICAO Bulletin és az ICAO Kiadványok és Audio-vizuális Kiképzési segédletek Katalógusának havi kiegészítései rendszeresen közlik, a jelen Kiadvány tulajdonosai kísérjék ezeket figyelemmel.
Az alábbi táblázat a módosítások nyilvántartására szolgál.

A MÓDOSÍTÁSOK ÉS HELYESBÍTÉSEK NYILVÁNTARTÁSA

Módosítások				**Helyesbítések**

1-10	Belefoglalva a jelen kiadásba			3.	15/11/06	08/08/08	

8. FEJEZET - BALESETMEGELŐZŐ INTÉZKEDÉSEK

Megjegyzés.- Az itt közölt rendelkezések célja a balesetmegelőzés elősegítése a baleseti és esemény adatok elemzésével, illetve az információk haladéktalan cseréjével.
Eseményjelentő rendszer
8.1 Az állam alakítson ki kötelező eseményjelentő rendszert a tényleges, vagy a lehetséges biztonsági hiányosságokról szóló információk összegyűjtéséhez.
8.2 **Ajánlás**.- *A kötelező eseményjelentő rendszer által esetleg napvilágra nem kerülő információk összegyűjtése érdekében az állam alakítson ki önkéntes eseményjelentő rendszert.*
8.3 Az önkéntes eseményjelentő rendszer nem lehet büntető célzatú és az információforrás számára védelmet kell, hogy biztosítson.
1. Megjegyzés.- Az önkéntes jelentéstétel tekintetében alapvető a büntetésmentes környezet.
2. Megjegyzés.- Az államokat bátorítjuk, hogy vonatkozó jogszabályaik, törvényeik és irányelveik szükség szerinti módosításával segítsék elő és támogassák a repülésbiztonságot befolyásoló események önkéntes jelentését.
3. Megjegyzés.- Az ICAO Safety Management Manual (Doc 9859) közöl útmutatást mind az önkéntes, mind a kötelező eseményjelentő rendszerről.
4. Megjegyzés. – Az adatgyűjtő- és feldolgozó rendszerekből nyert információ védelmére az E Melléklet

tartalmaz jogi útmutatást.

Adatnyilvántartó rendszer

8.4 **Ajánlás**.- *Az információ –beleértve a saját eseményjelentő rendszer révén nyert információt is- hatékony elemzésének elősegítése érdekében az állam alakítson ki baleset és esemény adatnyilvántartó rendszert.*

8.5 **Ajánlás**.- A*z adatcsere elősegítése érdekében az adatnyilvántartó rendszer szabványosított formátumot alkalmazzon.*

1. Megjegyzés.- Az ICAO az államok kérésére útmutató anyagot biztosít az ilyenfajta adatnyilvántartó rendszerek jellemzőiről.

2. Megjegyzés.- A 8.4 megvalósítása terén az államokat bátorítjuk, hogy törekedjenek regionális megállapodásokra, amikor azt célszerűnek tartják.

Az adatok elemzése – megelőző intézkedések

8.6 A baleset és esemény adatnyilvántartó rendszert, illetve eseményjelentő rendszert kialakító állam elemezze a baleset/eseményjelentésekben és az adatnyilvántartásban szereplő információkat, hogy megállapítsa, szükséges-e megelőző intézkedés kiadása.

Megjegyzés.- A kivizsgált balesetek és események zárójelentései tartalmazhatnak további olyan információkat, amelyekre megelőző intézkedések alapozhatók.

8.7 **Ajánlás**.- *Ha az adatnyilvántartásában szereplő információ elemzése során az állam megítélése szerint más államok érdeklődésére számot tartó biztonsági témára bukkan, az ilyen biztonsági információkat az állam a lehető leggyorsabban továbbítsa a többi állam részére.*

8.8 **Ajánlás**.- *A baleset és esemény kivizsgálásból származó biztonsági ajánlások mellett biztonsági ajánlások egyéb forrásokból is eredhetnek, ideértve a biztonsági tanulmányokat is. Más állam bármely szervezetének küldött biztonsági ajánlást az illető állam kivizsgáló hatósága részére is meg kell küldeni.*

Biztonsági információ cseréje

8.9 **Ajánlás**.- *Az államok támogassák a légiközlekedési rendszer minden felhasználóját összekötő biztonsági információelosztó hálózat felállítását és segítsék elő a tényleges és lehetséges biztonsági hiányosságokról szóló információk szabad cseréjét.*

1. Megjegyzés.- Az adatcsere elősegítéséhez szabványosított meghatározások, besorolások és formátumok szükségesek. Az ICAO az államok kérésére útmutató anyagot biztosít az ilyenfajta információelosztó hálózat jellemzőiről.

ANNEX 15.
Légiforgalmi tájékoztató szolgálatok

12. kiadás – 2004. július
34. módosítással
TIZENKETTEDIK KIADÁS – 2004 JÚLIUS
Ez a Kiadás magában foglalja a Tanács által 2004. február 24-e előtt elfogadott összes módosítást, és 2004. november 25-től helyettesíti a 15. Annex minden korábbi kiadását.
A Szabványok és az Ajánlott Gyakorlati Eljárások felhasználását érintő információkat *lásd* az Előszóban.
NEMZETKÖZI POLGÁRI REPÜLÉSI SZERVEZET - ICAO
A módosítások kiadását rendszeresen közlik az ***ICAO Journal-***ban és a havonta megjelenő ***Supplement to the Catalogue of ICAO Publications and Audio-visual Training Aids (Melléklet, Kiegészítés az ICAO Kiadványok és Audio-vizuális Segédeszközök Listájához)***, melyeket ezen kiadvány tulajdonosai kísérjenek figyelemmel. Az alább biztosított táblázat a módosítások, kiegészítések nyilvántartására szolgál.
Az Annex 15 módosításainak, kiegészítéseinek ellenőrző jegyzéke.

MÓDOSÍTÁSOK, KIEGÉSZÍTÉSEK

A módosítások kiadását rendszeresen közlik az ***ICAO Journal-***ban és a havonta megjelenő ***Supplement to the Catalogue of ICAO Publications and Audio-visual Training Aids (Melléklet, Kiegészítés az ICAO Kiadványok és Audio-vizuális Segédeszközök Listájához)***, melyeket ezen kiadványok tulajdonosai kísérjenek figyelemmel. Az alább biztosított táblázat ezen módosítások, kiegészítések nyilvántartására szolgál.

34. Módosítás (a Tanács 2007. március 2-án fogadta el)	2007. július 16.	2007. november 22.

ELŐSZÓ

Történelmi háttér

A Légiforgalmi Tájékoztató Szolgálatokra vonatkozó Szabványokat és Ajánlott Gyakorlati Eljárásokat a Tanács először 1953. május 15-én fogadta el, a Nemzetközi Polgári Repülési Egyezmény (Chicago, 1944) 37. Cikkelyének előírásai szerint, amelyeket az Egyezmény 15. Annex-ének nevezett el.
A 15. Annex jelenleg érvényes formáját az alábbiakban részletezett fejlődési folyamaton keresztül nyerte el. Az első követelményeket a Körzeti Repülési Értekezletek (*Regional Air Navigation Meetings*) ajánlásai alapján a Repülési Bizottság (*Air Navigation Committee*) alakította ki és ezt a Tanács hatáskörében, mint a "Hajózók Értesítésének Nemzetközi Eljárásai"-t (PANS-NOTAM, PICAO Doc 2713) 1947. januárjában adták ki. Az 1949-ben megtartott Rendkívüli NOTAM Értekezlet ezt felülvizsgálta, és módosításokat, kiegészítéseket javasolt ezekhez az eljárásokhoz, amelyeket később "A Légiforgalmi Szolgálatok Eljárásai" (*Procedures for Air Navigation Services*) (PANS-AIS, Doc 71O6) címen adtak ki, amely 1951. augusztus 1-én vált alkalmazhatóvá. 1952-ben a PANS-AIS-t a Légiforgalmi Tájékoztató Szolgálatok Osztályának (*Aeronautical Information Services Division*) Első Ülése felülvizsgálta, majd a Szabványok

és Ajánlott Gyakorlati Eljárások (SARPS) elfogadását ajánlotta. Valamennyi Szerződő Tagállam figyelmes vizsgálata után, ezeket az ajánlásokat, javaslatokat a Repülési Bizottság felülvizsgálta, majd a Tanács a Szabványok és Gyakorlati Ajánlások első gyűjteményét 1953. május 15-én, a Repülési Egyezmény 15. Annex-eként hagyta jóvá. Ez az Annex 1954. április l-én vált alkalmazhatóvá.
Az "A" Táblázat az egymást követő módosítások forrását, valamint a legfontosabb érintett témák listáját, és azokat az időpontokat tartalmazza, amikor az Annex-et és annak módosításait a Tanács elfogadta, amikor azok érvénybe léptek és alkalmazhatóvá váltak.

A Szerződő Államok tennivalói

Eltérések bejelentése. A Szerződő Államok figyelmét felhívják az Egyezmény 38. Cikkelyében előírt kötelezettségeikre, amelyek értelmében a Szerződő Államokat felkérik arra, hogy értesítsék a Szervezetet minden olyan eltérésről, amely a nemzeti jogszabályaik és gyakorlati eljárásaik, és az ebben az Annex-ben szereplő Nemzetközi Szabványok, illetve a hozzá tartozó bármely módosítás között fennáll. A Szerződő Tagállamokat felkérik arra, hogy a jelen Annex-ben, illetve az annak módosításaiban található Gyakorlati Eljárásoktól való minden eltérésre terjesszék ki az ilyen bejelentéseiket akkor, ha az ilyen eltérések bejelentése fontos a repülés, a légiközlekedés biztonsága érdekében. A továbbiakban felkérik a Szerződő Tagállamokat arra, hogy folyamatosan tájékoztassák a Szervezetet azokról az eltérésekről, amelyek a későbbiek során keletkezhetnek, vagy bármely, korábban bejelentett eltérés megszűnéséről. Ezen Annex minden módosításának elfogadása után azonnal külön kérést küldenek a Szerződő Államok felé az eltéréseik bejelentését kérve.

Az Annex részeinek státusza

Egy Annex az alábbi részekből épül fel, azonban ezek nem mindegyike található meg szükségszerűen minden egyes Annex-ben; ezek a jelzett státusszal rendelkeznek:
1.- *Az Annex állandó részét alkotó anyagok* :
a) *Szabványok és Ajánlott Gyakorlati Eljárások (SARPS)*, amelyeket a Tanács fogadott el, az Egyezmény előírásainak megfelelően.
Ezek az alábbiak szerint kerültek meghatározásra:
Szabvány: Fizikai jellemzőkre, kialakításra, anyagra, teljesítményre, személyekre, vagy eljárásokra vonatkozó bármely előírás, amelynek egységes alkalmazását szükségesnek ítélik a nemzetközi légiközlekedés biztonsága, vagy rendszerességének fenntartása szempontjából és amelyhez a Szerződő Államok az Egyezménynek megfelelően alkalmazkodni fognak; ezek teljesítésének lehetetlensége esetén a Tanácsot a 38. Cikkely értelmében kötelezően értesíteni kell.
Ajánlott Gyakorlati Eljárások: Fizikai jellemzőkre, kialakításra, anyagra, teljesítményre, személyekre, vagy eljárásokra vonatkozó bármely előírás, amelynek egységes alkalmazását kívánatosnak ítélik meg a nemzetközi légiközlekedés biztonsága, rendszeressége, vagy hatékonysága érdekében és amelyekhez a Szerződő Államok igyekeznek alkalmazkodni az Egyezmény értelmében.
b) *Függelékek:* kényelmi okokból külön csoportosított anyagokat tartalmaznak, azonban a Tanács által elfogadott Szabványok és Ajánlott Gyakorlati Eljárások részét képezik.
c) *Meghatározások:* Azoknak a Szabványokban és az Ajánlott Gyakorlati Eljárásokban használt fogalmaknak az értelmezése, amelyek nem nyilvánvalóak, mivel nincs elfogadott szótári meghatározásuk. A meghatározásnak nincs önálló státusza, de nélkülözhetetlen részét képezi azoknak a Szabványoknak és Ajánlott Gyakorlati Eljárásoknak, amelyekben az adott fogalmat használják, mivel a kifejezés értelmezésének megváltozása kihatással lenne magára a meghatározásra is.
d) *Táblázatok és Ábrák:* amelyek kiegészítik, vagy illusztrálják a Szabványokat vagy az Ajánlott Gyakorlati Eljárásokat és azokban hivatkoznak rájuk, a velük kapcsolatos Szabványoknak, vagy Ajánlott Gyakorlati Eljárásoknak részét képezik, valamint a státuszuk is megegyezik vele.
Meg kell jegyezni, hogy ebben az Annex-ben található néhány olyan Szabvány, amelyek utalás formájában olyan más meghatározásokat is tartalmaznak, amelyek státuszukat tekintve Ajánlott Gyakorlati Eljárások. Ilyen esetekben az Ajánlott Gyakorlati Eljárás szövege az adott Szabvány részévé válik.

2.- *A Szabványokkal és az Ajánlott Gyakorlati Eljárásokkal kapcsolatosan a Tanács által kiadásra jóváhagyott anyag*:
a) *Előszó:* a Tanács tevékenységén, intézkedésein alapuló történeti áttekintést és magyarázatot tartalmazó anyag, mely tartalmazza az Államok Egyezményből és Elfogadási Határozatból eredő, a Szabványok és Ajánlott Gyakorlati Eljárások alkalmazásával kapcsolatos kötelezettségeinek magyarázatát is.
b) *Bevezetés:* Magyarázó anyag az Annex egyes részeinek, fejezeteinek, vagy szakaszainak elején, hogy segítséget adjon a szöveg alkalmazásának megértéséhez.
c) *Megjegyzések:* melyek, ahol szükséges, a szövegben találhatók, hogy tárgyszerű tájékoztatást nyújtsanak, vagy utalást tartalmazzanak a kérdéses Szabványok vagy Ajánlott Gyakorlati Eljárások vonatkozásában, de maguknak a Szabványoknak vagy Ajánlott Gyakorlati Eljárásoknak nem képezik részét.
d) *Mellékletek:* Kiegészítő anyagokat tartalmaznak a Szabványokhoz és Ajánlott Gyakorlati Eljárásokhoz, vagy ezek alkalmazásához útmutatóként mellékelték.

A nyelv kiválasztása

Ez az Annex hat nyelven - angolul, arabul, kínaiul, franciául, oroszul és spanyolul - került elfogadásra. Minden egyes Szerződő Tagállamot felkérnek arra, hogy válasszon ki ezen változatok közül egy szöveget, nemzeti alkalmazásra és egyéb, az Egyezmény által biztosított célra, akár a közvetlen adott nyelvű felhasználásra, akár a saját nemzeti nyelvükre lefordítva és erről értesítse a Szervezetet.

A szerkesztés gyakorlati eljárásai

A szerkesztők a következő gyakorlatot követték, hogy az egyes meghatározások státuszát már ránézésre is fel lehessen ismerni: a *Szabványokat* normál vastagságú antikva (egyenes) betűtípussal (*light face roman*) nyomtatták; az *Ajánlott Gyakorlati Eljárásokat* normál vastagságú dőlt betűkkel (*light face italics*) nyomtatták, míg a státuszt eközben az **Ajánlás (Recommendation)** előtaggal jelezték;
A *Megjegyzéseket* normál vastagságú dőlt betűkkel (*light face italics*) nyomtatták, a státuszát pedig *Megjegyzés* (*Note*) előtaggal jelezték.
Az alábbi szerkesztési gyakorlatot használták a részletes, pontos meghatározások esetén: a Szabványok esetében a "*shall*" (nyomatékosító "kell"; "szükséges") szót, az Ajánlott Gyakorlati Eljárásoknál pedig a "*should*" (a kevésbé nyomatékos "kellene"; "szükséges volna") szavakat használták.
Az ebben a dokumentumban használt mértékegységek megfelelnek a International System of Units (SI) - Nemzetközi Mértékegységrendszer előírásainak úgy, ahogy az a Nemzetközi Polgári Repülésügyi Egyezmény 5. Annex-ében található. Ahol az 5. Annex megengedi más, nem SI szabvány szerinti alternatív mértékegység használatát, ott ezek zárójelben követik az alap mértékegységet. Ahol két mértékegység szerepel, ezt az értékpárt nem szabad egyenlőnek és egymással felcserélhetőnek gondolni. Azonban az bizonyítható, hogy bármelyik mértékegység típus kizárólagos használata esetén is a biztonság ugyanolyan szintje valósul meg.
A dokumentum számmal és/vagy címmel jelzett valamely részére való bármely hivatkozás egyben az adott rész minden alpontjára is vonatkozik.

"A" Táblázat. A 15. Annex módosításai, kiegészítései

Módosítás	Forrás/ok/	Téma/ák/, tárgya/i/	Elfogadás Hatályos Alkalmazható

12	Hatodik Légiközlekedési Konferencia és áttérés a Körzeti Kiegészítő Eljárásokról	Tájékoztatás kiadása a Légiforgalmi Szolgálatok rendszereiről, azaz a jelen- tőpontokról és a minimális tengerszint feletti repülési magasságokról; NOTAM tájékoztatás a kutatási és mentési műveletek lebonyolításáról	1970.05.15. 1970.09.15. 1971. 02.04.
13	Légiforgalmi Tájékoztató szolgálatok és Légiforgalmi Térképek Részlege, Hatodik Légiközlekedési Konferencia	Az I. osztályú NOTAM-ok előre meghatározott elosztási rendszere, a NOTAM összeállítása, a nemzetközi légiközlekedés rendelkezésére álló légiforgalmi meteorológiai berendezésekről és szolgálatokról szóló tájékoztatások.	1971.03.19. 1971.09.06. 1972.01.06.
14	Körzeti Léginavigációs Értekezlet Ajánlásai világméretű felhasználásra. CAR IV RAN értekezlet 19/29 számú ajánlása (1966); SAM/SAT/III RAN Értekezlet 19/10 ajánlása (1967); MID/SEA RAN Értekezlet 19/4 és 19/5 számú ajánlásai (1968); NAT/V RAN Értekezlet 17/5 számú ajánlása (1970).	Légiforgalmi Tájékoztató Szolgálat alkalmazhatósága ott, ahol nem biztosítanak 24 órás folyamatos szolgálatot; NOTAM-ok dekódolása a repülés előtti tervezés során; tájékoztatás közzététele arról, hogy nem adtak ki II. osztályú NOTAM-ot; légijárműveket üzemeltető valamennyi állami szolgálat által biztosított tájékoztatások a Légiforgalmi Tájékoztató Szolgálatok számára; a légiforgalmi mozgó szolgálatot és /vagy légiforgalmi navigációs szolgálatot ellátó állomások antenna koordinátáinak közzététele az AIP-ben, legalább 1/10 perc pontossággal.	1971.12.15. 1972.04.15. 1972.12.07.
15	A 4. Annex - *Légiforgalmi Térképek* - 43. számú Módosítása; a PANS-RAC (Doc 4444) 10. kiadásának 1. módosítása; a 6. EUM RAN Értekezlet 16/3, 16/8, 16/10 b) és 16/15 számú Ajánlásai; a 14. Annex - *Repülőterek* - 28. számú Módosítása; a 10. Annex - *Légiforgalmi Távközlés* - 51. számú Módosítása	A repülőtéri VOR és INS ellenőrző pontok helyének AIP-ben való közzététele; ATS útvonalak meghatározó fontos pontok nevének, kódjelzésének és földrajzi koordinátáinak, és a repülőterek környezetében tapasztalható madárcsapatok és madárvándorlás AIP-ben történő közzététele; NOTAM-ba nem illő tájékoztatások típusainak felsorolása; a Légiforgalmi Tájékoztató Körlevelekhez alkalmas tájékoztatástípusok; a talaj felszínén lévő hóra vonatkozó terminológia egyeztetése a 14. Annex-ben található meghatározásokkal.	1973.03.19. 1973.07.30. 1974.05.23.

16	A Tanács kérése (78-14), mely arra vonatkozik, hogy egyeztessék az államokkal az Annex-ektől és a PANS-tól való eltérések AIP-ben való közzétételét; a PANS-RAC 6. Módosítása.	Egy Állam nemzeti előírásai és gyakorlati eljárásai, valamint a vonatkozó ICAO Szabványok, Ajánlott Gyakorlatok és Eljárások közötti eltérések AIP-ben való közzététele; az 1. Függelék követelményei és az Annex-ben található eredeti, forrás előírások közötti ellentmondások megszüntetése; az ATIS-ra vonatkozó tájékoztatásokat érintő követelmények áthelyezése a MET részből az AIP RAC fejezetébe.	1974.06.25. 1974.10.25. 1975.02.27.
17	A Műszaki Bizottság Hangsebesség Feletti Szállítás Üzemeltetésével foglalkozó Negyedik Értekezletének 2/6 Ajánlása; A Léginavigációs Bizottság légijárművek elfogásával foglalkozó tanulmánya	A napból származó kozmikus sugárzás előrejelzésének (ha ez biztosított) NOTAM formájában történő terjesztése; az alkalmazott elfogási eljárások és látás utáni jelzések közzététele az AIP-ben.	1975.02.04. 1975.06.04. 1975.10.09.
18	Körzeti Léginavigációs Értekezletek (EUM 6 Rec 9/4, AFI/5 Rec 6/2 c) d) és ASIA/PAC Rec 6/3 c)) ajánlásai, és a IATA kérése, hogy módosítsák a 14. Annex-et; a 14. Annex teljes felülvizsgálata.	A repülőtereken a mozgásképtelenné vált légijárművek eltávolítására vonatkozó tájékoztatás AIP-ben való közzététele; a repülőtereken rendelkezésre álló mentő és tűzoltó szolgálatok státuszának bejelentése a készenléti szint jelentős mértékű változásairól; a munkaterület és a mozgási terület meghatározása; a "Magasságmérő Ellenőrzési Hely" kifejezés megváltoztatása "Magasságmérő Ellenőrzési Pont"-ra.	1976.02.05. 1976.06.05. 1976.12.30.
19	A 7. Léginavigációs Konferencia 3/16 Ajánlása; a 3. Annex - *Meteorológiai Szolgálat a Nemzetközi Léginavigáció számára* - felülvizsgálata (60. számú Módosítás).	ILS berendezés telepítése esetén a 10. Annex előírásaival összhangban az iránysávadó és a siklópálya sugárzási adatainak és az ILS referencia pont magasságának közzététele az AIP-ben; a 4. Rész - Meteorológia - módosítása a 3. Annex 60. számú Módosításában bevezetett új előírásoknak és szakkifejezéseknek megfelelően.	1977.06.27. 1977.10.27. 1978.02.23.
20	9. Léginavigációs Konferencia	ATS útvonalak leírásának közzététele az AIP-ben; az Északi irány vonatkoztatása (mágneses, földrajzi és koordináta háló szerinti) útirányokra, vagy irányszögekre.	1977.12.09. 1978.04.09. 1978.08.10.
21	A Német Szövetségi Köztársaság (az Egyesült Királyság nevében is) és a Szovjetunió által benyújtott javaslatok.	I. osztályú NOTAM formátum és az AIP módosítások közzététele.	1980.03.31. 1980.07.31. 1980.11.27.

22	A Léginavigációs Bizottság tanulmányából származtatott javaslat és a Titkárság által benyújtott javaslat.	Olyan tevékenységek, melyek potenciális veszélyt jelentenek a polgári légijárművek repülésére és az AIRAC NOTAM vétele az érvénybelépés előtt 28 nappal.	1981.03.13. 1980.07.13. 1981.11.26.
23	A Titkárság és az Egyesült Királyság által benyújtott javaslatok.	Nyílt szövegű repülés előtti tájékoztató bulletinek, polgári légijárművek elfogása és az AIRAC NOTAM "Nincs Értesítés"-e.	1982.04.02. 1982.08.02. 1982.11.25.
24	A Repülőterek, Légiútvonalak és Földi Segédberendezések Részlege Értekezletének (1981) 7/5, 7/8 és 10/2 javaslatai.	Felülvizsgált SNOWTAM formanyomtatvány; a nedves futópálya-felület fékhatás értékeinek és egy akadálymentes zóna meglétének közzététele az AIP-ben.	1982.11.17. 1983.03.17. 1983.11.24.
25	A Repülőterek, Légiútvonalak és Földi Segédberendezések Részlege Értekezletének (1981) 7/7 javaslata.	Dátum/idő hivatkozási módszer.	1985.03.25. 1985.07.29. 1985.11.21.
26	Különféle források, beleértve az Európai Léginavigációs Tervező Csoport (EANPG) 22/24 és 24/20 Határozatai; az Időjárástól Független Repülő üzemeltetés kérdésével foglalkozó Bizottság (AWOP) 9. Javaslata; az Akadálymentesség kérdésével foglalkozó Bizottság (OCP) 1/4 Javaslata; a 3. 4. és 14. Annex-eknek a 64-es, 47-es és 38-as Módosítása; az Egyesült Királyság és a Titkárság által benyújtott javaslatok.	Az A-4es méretű AIP lapok alkalmazására vonatkozó előírások korszerűbbé tétele; a NOTAM és az AIC kiadása és szétosztása; a légiforgalmi tájékoztatás és a Légiforgalmi Tájékoztató Közlemények Meghatározott Kiadási Rendjének (AIRAC) alkalmassága és hitelessége; változások az I. osztályú NOTAM-ok előre meghatározott elosztási rendszerében; a rövidített fejrész bevezetése és változások a SNOWTAM formanyomtatványban, útmutató a kitöltéséhez; a DME zéró-távolság kijelölő pontja helyének közzététele az AIP-ben; az AIP részét képező térképsorozatok jegyzékének korszerűsítése; szabványos légijármű gurulási útvonalakra, precíziós megközelítésű futópályák földetérési zónája legmagasabb pontjának tengerszint feletti magasságára és a küszöbök és légijármű állóhelyek földrajzi koordinátáira vonatkozó további üzemeltetési adatok közzététele az AIP-ben; a címjelzések hetedik és nyolcadik betűjére vonatkozó utalások beépítése az előre meghatározott elosztási rendszerben; és a vulkáni hamufelhőkkel kapcsolatos előzetes figyelmeztetések.	1987.03.06. 1987.07.27. 1987.10.22.

27	Különféle források, beleértve az Európai Léginavigációs Tervező Csoport (EANPG) 30/15 Határozatát; a Léginavigációs Bizottság Annex-felülvizsgálatai; a Látvarepülési Szabályok szerinti Üzemeltetéssel foglalkozó Bizottság (VFOP) 3/3 javaslata; néhány európai állam által benyújtott javaslat; a 14. Annex 39. Módosítása.	Az Integrált Légiforgalmi Tájékoztató Egységcsomag és a felülvizsgált NOTAM Formátum bevezetése; a tájékoztatás közzététele azokról a körzetekről, vagy útvonalakról, ahol fennáll az elfogás lehetősége, tájékoztatások közzététele a nemzetközi polgári repülés jogellenes beavatkozással szemben való védelmére vonatkozóan; új ATS légtér-osztályozás bevezetése; a madárveszély csökkentése; a burkolt felületek fékhatásának mérésére alkalmazott eszközök jegyzékének és az alkalmazott szakkifejezéseknek a pontosítása, frissítése; helikopter repülőterekkel kapcsolatos adatok bevezetése.	1991.03.04. 1991.07.28. 1991.11.14.
28	Különféle források, beleértve az Európai Léginavigációs Tervező Csoport (EANPG) 34/12 Határozatát; a Tanács a WGS-84-et (World Geodetic System) fogadja el, mint szabványos geodéziai vonatkoztatási rendszert a nemzetközi repülés számára; az RGCSP/8 javaslata; a Titkárság.	A helikopter repülőterekre és az Integrált Légiforgalmi Tájékoztató egységcsomagra vonatkozó új és felülvizsgált meghatározások bevezetése az 2. Fejezetben; a légiforgalmi tájékoztatás kölcsönös cseréjével kapcsolatos módosítások és a WGS-84-gyel kapcsolatos földrajzi koordináták közzétételére vonatkozó új előírások beillesztése a 3. Fejezetbe; a 4. fejezet módosítása és átrendezése az AIP átszerkesztett tartalmát és általános előírásait, az AIP Módosítás és az AIP Melléklet előírásait és azok szétosztását illetően; az 5. fejezet módosításai a NOTAM kiadás és szétosztás, és egy olyan új előírás bevezetésének vonatkozásában, amely szabályozza az atmoszférába kerülő radioaktív anyagok és mérgező kémiai anyagok megjelenésével kapcsolatos tájékoztatás közzétételét; a 6. Fejezet szabványos előírás szerinti korszerűsítése az AIRAC dátumoknak a kartográfiai munkát igénylő változások közzétételében és a navigációs adatbázisok korszerűsítésében történő felhasználás vonatkozásában; a repülés előtti tájékoztató bulletinek formátumáról szóló Ajánlott Gyakorlati Eljárás törlése a 8. Fejezetből; a 9. Fejezetben a "Légiforgalmi Állandóhelyű Távközlési Hálózat (AFTN)" szakkifejezés helyettesítése a "Légiforgalmi Állandóhelyű Szolgálat (AFS)" általános kifejezéssel; az AIP teljesen átszerkesztett tartalmának bevezetése az 1. Függelékbe.	1994.02.28. 1994.06.28. 1994.11.10. 1996.04.25. 1998.01.01.
29 (Tizedik Kiadás)	Léginavigációs Bizottság és Vulkanikus Hamu Riasztásokat Tanulmányozó Csoport (VAWSG)	Léginavigációs (légiforgalmi) adatbázisok, humanitárius repülések, a NOTAM-ok egy különleges sorozata, mely a vulkanikus jelenségekkel foglalkozik, és a WGS-84 (World Geodetic System 1984 - Világszintű Geodéziai Rendszer 1984) függőleges komponense	1997.03.20. 1997.07.21. 1997.11.06. 1998.01.01. 1998.11.05.

30	A Légiforgalmi Tájékoztató Szolgálatok/ Légiforgalmi Térképek (AIS/MAP) Körzeti Értekezletének 1.2/1, 3.3/2 és 4.1/2 Ajánlásai (1998); Léginavigációs Bizottság	A léginavigációs adatok, a légiforgalmi tájékoztatások és a Légiforgalmi Tájékoztató Szolgálatok, az ADIZ (Légvédelmi Azonosítási Körzet), az AIS termékek, az Emberi Elem (tényező) Alapelemei, minőségirányítás új fogalmainak, meghatározásainak beillesztése a 2. Fejezetbe; a 3. Fejezetben a minőségbiztosítási rendszerrel, a léginavigációs (légiforgalmi) Információkkal/adatokkal, a szerzői jogokkal (copyright) a költségek fedezetével, az Emberi Elem (Tényező) tekintetbevételével kapcsolatos új rendelkezések; a 6. Fejezetben új és átszerkesztett rendelkezések, melyek az AIRAC információk elektronikus formában történő biztosításával foglalkoznak; és az ADIZ-zal kapcsolatos rendelkezések bevezetése az 1. Függelékben.	2000.02.21 2000.07.17 2000.11.02
31	Titkárság	A 8. Fejezetben új rendelkezések az automatizált légiforgalmi tájékoztató rendszerek és az összehangolt Légiforgalmi Tájékoztató Szolgálatok/Meteorológia (AIS/MET) repülés előtti eligazításának vonatkozásában, valamint az 1. Függelék módosítása a veszélyes természetű és egyéb potenciális veszélyt okozó tevékenységekről szóló információk biztosításával kapcsolatban.	2001.03.07. 2001.07.16. 2001.11.01.
32. (Tizen-egyedik Kiadás)	Különféle források, beleértve az Európai Léginavigációs Tervező Csoport (EANPG) 40/51 b) Határozatát; az AFI Tervező és Megvalósító Körzeti Csoport (APIRG) 13/51 Határozatát; Léginavigációs Bizottság (ANC); és a Titkárság	A 2. Fejezetben a módosított meghatározások bevezetése az Integrált Légiforgalmi Tájékoztató Csomag részére; A 3. Fejezetben az angol nyelvű szöveg használatára vonatkozó előírás átminősítése Szabvánnyá; a 4. Fejezet módosítása az AIP Módosításaira és Mellékleteire vonatkozó előírásokkal; az 5. Fejezet és a 6. Függelék előírásainak újraszerkesztése és kiegészítése; a váratlan eseményekre vonatkozó intézkedések nyilvánosságra hozása NOTAM útján; új előírások a 8. Fejezetben a repülőtereken/helikopter repülőtereken a légijárművek üzemeltetésére veszélyt jelentő madarak jelenléte esetén az információk gyűjtésére; valamint az 1. Függelék összehangolása a 3. Annex előírásaival.	2003. 02. 28. 2003. 07 14. 2003. 11. 27.

A vulkanikus tevékenységgel kapcsolatos NOTAM szétosztásához kapcsolódó érvényben lévő rendelkezések frissítése; az AIRAC rendszer használata; a repülés előtti tájékoztatókban lévő információ; és a Légiforgalmi Tájékoztató Kiadványokban (AIP) közzéteendő információ	2007. 03. 02. 2007. 07 16. 2007 11. 22

NEMZETKÖZI SZABVÁNYOK ÉS AJÁNLOTT GYAKORLATI ELJÁRÁSOK

1. FEJEZET - BEVEZETÉS

A Légiforgalmi Tájékoztató Szolgálat célja a nemzetközi léginavigáció biztonsága, rendszeressége és hatékonysága szempontjából szükséges tájékoztatás áramlásának folyamatos biztosítása. A légiforgalmi tájékoztatások/adatok szerepe és fontossága jelentősen megváltozott a Területi Navigáció (RNAV - Area Navigation), a Megkövetelt Navigációs Teljesítőképesség (RNP - Required Navigation Performance), a fedélzeti számítógépes navigációs rendszerek és az adatkapcsolati rendszerek bevezetésével. A sérült, vagy hibás légiforgalmi tájékoztatások/adatok potenciálisan befolyásolhatják a légiközlekedés, a léginavigáció biztonságát.
Hogy a légiforgalmi tájékoztatások/adatok biztosítása érdekében kielégíthessék az egységesség és a következetesség követelményét, mely elengedhetetlen a számítógépen alapuló navigációs rendszerek üzemeltetéséhez, az Államok, amennyire csak lehetséges, el ***kell*** kerüljék azon Szabványoknak és Eljárásoknak felhasználását, melyeket nem a nemzetközi alkalmazásra állítottak össze.
Ezeket a Szabványokat és Ajánlott Gyakorlati Eljárásokat a Légiforgalmi Szolgálatok Eljárásai – ICAO Rövidítések és Kódokkal *(Procedures for Air Navigation Services – ICAO abbreviations and Codes - PANS-ABC, Doc 8400)* egyetértésben kell felhasználni.
Elfogadott tény, hogy bizonyos esetekben Kiegészítő Eljárásokra lehet szükség, hogy ezzel az ICAO Körzetek bizonyos követelményeit kielégíthessék.
A Légiforgalmi Tájékoztató Szolgálatok megszervezésére és üzemeltetésére vonatkozó tájékoztató anyag a *Légiforgalmi Tájékoztató Szolgálatok Kézikönyve* (Aeronautical Information Services Manual - Doc 8126) című kiadványban található.

2. FEJEZET - MEGHATÁROZÁSOK

Amikor az alábbi fogalmakat használják a Légiforgalmi Tájékoztató Szolgálatok számára készült Szabványok és Gyakorlati Eljárásokban, azok az alábbi jelentéssel rendelkeznek:
Pontosság *(Accuracy)*. A számított, vagy mért érték és a valós érték közötti megegyezőség mértéke.
Megjegyzés: A mért helyzetadatok számára a pontosságot rendes körülmények között távolságban fejezik ki a megállapított helyzettől számítva, melyen belül a valós pozíció meghatározott bizonyossággal megtalálható.
Léginavigációs adat *(Aeronautical Data)*. A léginavigációs tények, fogalmak, vagy utasítások megjelenítése olyan formátumban, amely megfelel a kommunikáció, a kiértékelés, vagy feldolgozás követelményeinek.
Légiforgalmi tájékoztatás *(Aeronautical information)*. Olyan információ, mely a léginavigációs adatok összegyűjtéséből, elemzéséből és megfelelő formába rendezéséből származik.
Légiforgalmi Tájékoztató Körlevél *(Aeronautical Information Circular /AIC/)*. Olyan közlemények, melyek nem teszik szükségessé, hogy miattuk NOTAM-ot adjanak ki, vagy azt, hogy őket az AIP-be illesszék, azonban a repülés biztonságára, a légiforgalomra, műszaki, igazgatási, vagy jogi ügyekre vonatkoznak.
Légiforgalmi Tájékoztató Kiadvány *(Aeronautical Information Publication - AIP)*. Olyan tartósan érvényben maradó Légiforgalmi Tájékoztatásokat tartalmazó kiadvány, mely alapvető fontosságú a légiközlekedés számára, és amelyet az Állam maga, vagy meghatalmazottja útján ad ki.
Légiforgalmi tájékoztató szolgálat *(Aeronautical Information Service - AIS).*
A légi navigáció biztonsága, rendszeressége és hatékonysága számára szükséges légiforgalmi tájékoztatások/léginavigációs adatok biztosításáért felelős szolgálat, melyet egy bizonyos területi egységen belül hoztak létre.
Az AIP Módosítása *(AIP Amendment)*. Az AIP-ben található információk állandó jellegű változtatásai.

Az AIP Kiegészítése *(AIP Supplement)*. Az AIP-ben található információk ideiglenes jellegű változtatásai, melyeket különálló lapok formájában adnak ki.
AIRAC *(Aeronautical Information Regulation And Control - A Légiforgalmi Tájékoztató Közlemények Meghatározott Kiadási Rendje)*. Betűszó - jelentése egy közösen meghatározott időpontokon alapuló olyan rendszer, melynek célja az előzetes tájékoztatás kiadása azokról a körülményekről, melyek az üzemeltetési eljárásokban jelentős változások bevezetését teszik szükségessé.
Légvédelmi Azonosítási Körzet *(ADIZ – Air Defence Identification Zone)*. Egy különlegesen kijelölt légtér, meghatározott fizikai méretekkel, melyen belül a légijárműveknek az ATS (Légiforgalmi Szolgálatok) biztosításával összefüggőkön kívül, más különleges azonosítási és/vagy jelentési eljárásokat is be kell tartaniuk.
AIS termék *(AIS product)*. Az Integrált Légiforgalmi Tájékoztatási Csomag elemeként biztosított Légiforgalmi Tájékoztatás, beleértve a légiforgalmi térképeket is, vagy az olyan légiforgalmi tájékoztatásokat, melyeket megfelelő elektronikus adathordozó segítségével nyújtanak, (kivéve a NOTAM-okat és a Repülés Előtti Bulletineket /PIB/).
Alkalmazás *(Application)* A felhasználó követelményeinek kielégítése érdekében végzett adatkezelés és adatfeldolgozás (ISO 19104[1]*)
ASHTAM *(ASHTAM)*. A NOTAM-ok egy speciális sorozata, mely meghatározott formátumával információkat ad egy vulkán aktivitásának változásáról, egy vulkáni kitörésről és/vagy egy vulkáni hamufelhőről, melyek jelentős hatással lehetnek a légijárművek üzemeltetésére.
Összeállítás *(Assemble)*. A Légiforgalmi Tájékoztatások többféle forrásból egy adatbázisba való összeállításának folyamata, valamint a későbbi feldolgozás alapjának létrehozása.
Megjegyzés.— Az összeállítás fázisa tartalmazza az adatok ellenőrzését és annak biztosítását, hogy a felismert hibák és hiányosságok kijavításra kerülnek.
ATS légtérellenőrző szolgálat *(ATS surveillence service)* A szakkifejezést egy, az ATS légtérellenőrző rendszer segítségével közvetlenül biztosított szolgálat jelzésére használják.
ATS légtérellenőrző rendszer *(ATS surveillence system)*. Általános szakkifejezés, olyan különböző ADS-B, PSR, SSR, vagy más hasonló földi telepítésű rendszert jelent, mely a légijármű azonosítását lehetővé teszi.
Megjegyzés. – A hasonló földi telepítésű rendszer az, melynél összehasonlító értékeléssel, vagy más módszertannal bizonyították, hogy azonos, vagy jobb biztonsági szinttel és teljesítőképességgel rendelkezik, mint a mono (egy) impulzusos SSR Szekunder Légtérellenőrző Radar.
Automatikus függőségen alapuló légtérellenőrzés – sugárzásos *(ADS-B - Automatic dependent surveillance – broadcast)*. Olyan eszköz, aminek segítségével a légijármű, a repülőtéri járművek és más tárgyak sugárzásos módban egy adatvonalon keresztül automatikusan tudnak olyan, szükség szerinti adatot adni és/vagy venni, mint azonosító, pozíció és kiegészítő adat.
Automatikus függőségen alapuló légtérellenőrzés – szerződéses *(ADS-C - Automatic dependent surveillance – contract)*. Olyan eszköz, aminek segítségével egy ADS-C szerződés (kétoldalú kapcsolat) épül ki egy adatvonalon keresztül a légijármű és a földi rendszer között, meghatározva, hogy milyen feltételekkel kezdeményezzenek ADS-C jelentéseket és milyen adat legyen a jelentésekben.
Megjegyzés. – Az "ADS szerződés" rövidített szakkifejezés egyaránt utal az ADS esemény szerződésre, az ADS kényszerített szerződésre, az ADS időszakos szerződésre, vagy egy vészhelyzet módra.
Automatikus Közelkörzeti Tájékoztató Szolgálat - ATIS *(Automatic Terminal Information Service – ATIS)*. Aktuális, rutin információ automatikus biztosítása az érkező és induló légijárműveknek folyamatosan, 24 órán keresztül, vagy egy meghatározott része a következőknek:

> ***Adatvonalas automatikus közelkörzeti tájékoztató szolgálat – D-ATIS*** *(Data link-automatic terminal information service – D-ATIS)*. ATIS információ biztosítása adatvonalon keresztül.
> ***Hang alapú automatikus közelkörzeti tájékoztató szolgálat – Voice-ATIS*** *(Voice-automatic terminal information service – Voice-ATIS)*. ATIS információ biztosítása folyamatos és ismétlődő hang kisugárzásának a segítségével.

Csupasz, kopár földterület *(Bare Earth).* A Föld felszíne, beleértve a felszíni vizeket és állandó jég-, és hómezőket, a vegetáció és ember által létrehozott tárgyak, akadályok kivételével.
Naptár *(Calendar)* Pontosan meghatározott időbeli referencia rendszer, amely alapul szolgál egy időpont meghatározásához, napi felbontással (ISO 19108[2]*).
A lombozat felszíne *(Canopy)* A csupasz, kopár földfelszín kiegészítve a vegetáció magasságával.
Légiforgalmi irányító – pilóta adatkapcsolati összeköttetés *(CPDLC – Controller - pilot data link communication).* A légiforgalmi irányító és a pilóta közötti, adatátviteli kapcsolatot használó összeköttetés az ATC kommunikáció számára.
Műtárgyak *(Culture)* Minden, ember által készített tereptárgy, amely a föld felszínén található, mint például települések, vasútvonalak és csatornák.
CRC *(Cyclic Redundancy Check - Ciklikus Redundancia Vizsgálat).* A digitális formában tárolt adatok ellenőrzésére használt olyan matematikai algoritmus, mely gondoskodik az adatvesztés, vagy a nem szándékos adatváltozás elleni garancia meghatározott szintjéről.
Veszélyes légtér *(Danger area).* Meghatározott kiterjedésű légtér, melyen belül a repülésekre veszélyt jelentő tevékenységeket folytathatnak egy adott időszakban.
Adatbázis *(Database).* Az adatok egy, vagy több állománya olyan módon tárolva, hogy megfelelő alkalmazások (programok) segítségével az adatok visszanyerhetők és frissíthetők legyenek.
Megjegyzés. - Ez elsődlegesen inkább az elektronikus formában tárolt, számítógép segítségével elérhető adatokra vonatkozik, mint a hagyományos nyomtatott formában, dossziéban tároltakra.
Adattermék *(Data product)* Olyan adatállomány, vagy az adatállomány olyan sorozata, amely megfelel az "Adattermék" ISO 19131[3]*-ben található specifikációnak.
Adattermék specifikációja *(Data product specification)* Az adatállomány, vagy az adatállomány sorozatának részletes leírása, további információkkal együtt, amely lehetővé teszi, hogy létrehozzák és egy másik fél számára használatra átadják (ISO 19131[4]*).
Megjegyzés. – Az adattermék specifikációja részletesen leírja a teljes adattartományt, valamint a teljes adattartomány adatkészletté való leképezését. Felhasználhatják az előállítás, eladás, végfelhasználás és egyéb célokra is.
Adatminőség *(Data quality).* A bizonyosságnak az a foka, vagy szintje, hogy a biztosított adatok a pontosság, a felbontóképesség és az integritás tekintetében megfelelnek az adatfelhasználó követelményeinek.
Adatkészlet *(Data set)* Az adatok azonosítható, meghatározható gyűjteménye (ISO 19101[5]*)
Adatkészlet sorozat *(Data set series)* Olyan adatkészletek kollekciója, melyeknek azonos a termék specifikációja (ISO19115[6]*).
Alapadat *(Datum)* Bármely mennyiség, vagy mennyiségek sorozata, amely referenciaként, vagy kiindulási alapként használható fel más mennyiségek kiszámításához. (ISO19104[7]*).
Digitális Közepes Tengerszint Feletti Magassági Modell *(Digital Elevation Model - DEM)* A domborzat felszínének ábrázolása egy meghatározott koordinátaháló valamennyi metszéspontjában folyamatos közepes tengerszint feletti magasságokkal megadva, melyeket egy közös alapadathoz viszonyítanak.
Megjegyzés.- Néha a DTM-re (Digital Terrain Model – Digitális Domborzat Modellre), mint DEM-re hivatkoznak.
Közvetlen Tranzit Megállapodások *(Direct transit arrangements).* Az érintett állami hatóságok által jóváhagyott különleges megállapodások, melyek alapján a Szerződő Államon való áthaladása során, az útját rövid időre megszakító forgalom közvetlen ellenőrzésük alatt maradhat.
Ellipszoid magasság /Geodéziai magasság/ *(Ellipsoid height /Geodetic height/)* - A referencia ellipszoidhoz mért magasság, az ellipszoid külsejére állított, a kérdéses ponton áthaladó merőleges vonalon mérve.
Jellemző tulajdonság, sajátosság *(Feature)* A valós világ jelenségeinek absztrakciója (ISO19101[8]*)
A jellemző tulajdonság, sajátosság attribútuma *(Feature attribute)* A jellemző tulajdonság sajátosságai (ISO19101[9]*).

Megjegyzés.- A jellemző tulajdonság, sajátosság attribútumának van egy hozzá kapcsolt neve, egy adattípusa és egy adattartománya.

A jellemző tulajdonsággal, sajátossággal elvégzett művelet *(Feature operation)* - Olyan művelet, amelyben a jellemző tulajdonság, sajátosság valamennyi példánya szerepelhet (ISO19110[10]*).

Megjegyzés.- Amikor megemelik a duzzasztógát magasságát, az egy a jellemző tulajdonságú duzzasztógáttal végzett művelet. Ennek a műveletnek az eredménye az, hogy a víztározóban lévő víz szintje megemelkedik.

A jellemző tulajdonságok közötti viszony *(Feature relationship)* Kölcsönhatás, amely kapcsolatot teremt a jellemző tulajdonság típusának egyedei és ugyanazon, vagy más jellemző tulajdonság típus egyedei között. (ISO19101[11]*)

A jellemző tulajdonság típusa *(Feature type)* Közös tulajdonságokkal rendelkező valós világbéli jelenségek osztálya (ISO19110[12]*).

Megjegyzés.- A jellemző tulajdonságok valamely jegyzékében az osztályzás alapszintje a jellemző tulajdonság típusa.

Geodéziai távolság *(Geodesic distance)*. A matematikailag meghatározott ellipszoid felületén található két pont közötti legkisebb távolság.

Geodéziai alapadat / földrajzi alappont *(Geodetic datum)*. Egy lokális referenciarendszer helymeghatározása és tájolása során a szükséges paraméterek minimális készlete, a globális referencia rendszer/keret figyelembevételével.

Geoid - Földalak. *(Geoid)* A Föld gravitációs mezejében található equipotenciális felület, mely megegyezik a nyugodt tenger felszínével (MSL = Mean Sea Level), melyet a szárazföldek fölé folytatólagosan kiterjesztenek.

Megjegyzés: - A geoid formája szabálytalan a helyi gravitációs zavarok következtében (szél, árapály, sótartalom, áramlások, stb.) és a gravitáció iránya a geoidra minden pontban merőleges.

A Geoid (földalak) hullámossága, egyenetlensége *(Geoid undulation)*. A geoid távolsága a matematikai referencia ellipszoid felett (pozitív) és alatt (negatív).

Megjegyzés. - A WGS-84 (World Geodetic System – 1984 - Világszintű Geodéziai Rendszer – 1984) által meghatározott ellipszoid tekintetében a WGS-84 ellipszoid magassága és az orthometrikus magasság közötti eltérés adja meg a WGS-84 geoid hullámosságát.

Gergely-naptár (*Gregorian calendar*) Általánosan használt naptár; melyet először 1582-ben alkalmaztak az év meghatározására, amely jobban megközelíti a tropikus évet, mint a Julián-féle naptár (ISO19108[13]*).

Megjegyzés.- A Gergely-naptárban az átlagos évek 365 nap hosszúak, míg a szökőév 366 napos, melyeket 12 egymást követő hónapra osztanak fel.

Magasság *(Height)* Egy szint, pont, vagy egy pontként figyelembe vett tárgy, akadály függőleges távolsága egy meghatározott alapadattól mérve.

Helikopter repülőtér *(Heliport)*. Egy repülőtér, vagy egy szerkezeten, építményen, épületen található meghatározott terület, melyet teljes egészében, vagy részben helikopterek érkezésére, felszállására és földi mozgására szándékoznak felhasználni.

Az Emberi Tényező (Ergonómia) alapelvei *(Human Factors Principles)* Olyan alapelvek, melyeket a léginavigációs, légiforgalmi tervezés, hitelesítés, képzés, üzemeltetés és karbantartás kapcsán alkalmaznak és amelyek biztonságos kapcsolódási, érintkezési felületre törekszenek az emberi és más rendszer komponensek közötti kölcsönhatásban úgy, hogy megfelelő módon veszik figyelembe az emberi teljesítőképesség jellemzőit.

Integrált Légiforgalmi Tájékoztató Csomag *(Integrated Aeronautical Information Package)*. Egy (szolgáltatás)csomag, amely az alábbi elemeket tartalmazza:

· AIP, beleértve az AIP módosítások szolgáltatását (*Amendment*);
· AIP kiegészítések, mellékletek (*Supplement*);
· NOTAM-ok és a repülés előtti Bulletinek *(PIB - pre-flight information bulletins)*;
· AIC - *(Aeronautical Information Circular)* - Légiforgalmi Tájékoztató Körlevél; és

· Az érvényben lévő NOTAM-ok ellenőrző jegyzékei és összesítői;
Integritás /léginavigációs adatok/ *(Integrity /aeronautical data/).* Annak a garanciának a mértéke, hogy a léginavigációs adatok és értékük nem veszett el és nem változott meg, mióta az adat keletkezett, vagy jogosult módon kiegészítésre, frissítésre került.
Nemzetközi Repülőtér *(International airport)*. Bármely repülőtér, melyet a Szerződő Állam saját területén nemzetközi légiforgalom érkezésére és indulására jelöl ki, ahol a vámmal, bevándorlással, közegészségüggyel, állat és növény karanténnal kapcsolatos formaságokat, és ennek megfelelő eljárásokat biztosítanak.
Nemzetközi NOTAM Iroda *(NOF - International NOTAM office)*. Egy Állam által a NOTAM-ok nemzetközi cseréjére kijelölt iroda.
Bejelentkezési Cím *(Logon address)*. Egy meghatározott kód egy ATS egységre adatkapcsolathoz történő bejelentkezésre.
Munkaterület *(Manoeuvring area).* A repülőtér azon része, melyet a légijárművek felszállására, leszállására és gurulására használnak, az előterek kivételével.
Meta-adatok *(Metadata)* Adatok az adatokról (ISO 19115[14]*).
Megjegyzés.- Adatok, melyek adatokat írnak le és adatokat dokumentálnak.
Legkisebb útvonalrepülési magasság *(MEA – Minimum en-route altitude)*. Egy útvonalrepülési szegmenshez tartozó tengerszint feletti magasság, mely a vonatkozó navigációs berendezések és ATS kommunikáció megfelelő vételét biztosítja, eleget tesz a légtér szerkezetnek és biztosítja a szükséges akadálymentes magasságot.
Legkisebb akadálymentes magasság *(MOCA – Minimum obstacle clearance altitude)*. A repülés meghatározott szegmensének legkisebb tengerszint feletti magassága, mely biztosítja a szükséges akadálymentes magasságot.
Mozgási terület *(Movement area)*. A repülőtér azon része, melyet a légijárművek felszállására, leszállására és gurulására használnak, amely a munkaterületből és az előtér(ek)ből áll.
NOTAM *(NOTAM)* Távközlési eszközök segítségével terjesztett tájékoztatás, mely bármely légiforgalmi berendezés, szolgálat, eljárás, vagy veszély létesítéséről, keletkezéséről, állapotáról és változásáról olyan információkat tartalmaz, melyek kellő időben történő ismerete alapvető fontosságú a repülésben érintett személyzet számára.
Akadály *(Obstacle)* Valamennyi rögzített helyű (akár időszakos, vagy állandó) és mozgatható tárgy, vagy azok részei, amelyek olyan területen találhatók, ahol légijárművek földi mozgása történik, vagy amelyek egy a légijárművek repülés közbeni védelmére meghatározott felület fölé nyúlnak.
Akadály/terep adatok gyűjtési felülete *(Obstacle/terrain data collection surface)* Egy meghatározott felület, mely akadály/terep adatok gyűjtésére szolgál.
Orthometrikus magasság *(Orthometric height)*. Egy pont magassága a geoidhoz (földalakhoz) vonatkoztatva, rendszerint tengerszint (MSL) feletti magasságként megadva.
Leírás *(Portrayal)* Információk nyújtása emberek számára (ISO 19117[15]*)
Helyzet /földrajzi/ *(Position /geographical/)* A matematikai referencia ellipszoidra vonatkoztatott olyan koordinátapár (szélesség és hosszúság), amely egy pont helyzetét határozza meg a Föld felszínén.
Jelzőpontok közötti távolság *(Post spacing)* Szögbeli, vagy egyenes irányú távolság két szomszédos magassági pont között.
Ábrázolási pontosság *(Precision)*. Az a legkisebb eltérés, amit még megbízhatóan meg lehet különböztetni egy mérési folyamat során.
Megjegyzés. - A geodéziai terepfelvétel esetében a pontosság a tökéletesség mértéke egy művelet végrehajtásakor, vagy a mérés folyamán az eszközök és módszerek hibátlanság mértéke.
Repülés Előtti Tájékoztató Bulletin *(Pre-flight information bulletin /PIB/)*. A repülés végrehajtása előtt készített összesítés, mely az üzemeltetésre fontos érvényes NOTAM információkat tartalmazza.
Tiltott légtér *(Prohibited area)*. Meghatározott kiterjedésű légtér egy Állam területe, vagy felségvizei felett, amelyben tiltott a légijárművek repülése.
Minőség *(Quality)*. Egy bizonyos dolog, entitás azon hozzátartozó, elválaszthatatlan jellemzőinek összessége, melyek arra a képességére vonatkoznak, hogy az előírt, vagy azokból következő igényeket

mennyiben képes kielégíteni (ISO-9000[16]*)
Megjegyzés 1: - A "minőség" meghatározást együtt lehet használni olyan melléknevekkel, mint gyenge, jó, vagy kiváló.
Megjegyzés 2: - Az "elválaszthatatlan", szemben a „ "kijelölt"-el, valaminek a meglétét jelenti, annál is inkább, mert egy folyamatos jellemző.
Minőségbiztosítás *(Quality assurance)*. A minőségi rendszeren belül megvalósított minden tervezett és rendszeres tevékenység, amelyeket szükségesnek tekintenek, hogy megfelelő bizonyosságról gondoskodjanak arról, hogy egy bizonyos dolog (entitás) kielégítse a minőségre vonatkozó követelményeket (ISO-9000[17]*).
Minőség-ellenőrzés, minőségszabályozás *(Quality control)* A minőségirányítás része, a minőségi követelmények kielégítésére összpontosít (ISO-9000[18]*).
Minőségirányítás *(Quality Management)* Összehangolt tevékenységek, melyek egy szervezet, a minőségi elvárásoknak megfelelően történő irányítására szolgálnak (ISO-9000[19]*).
Domborzat *(Relief)* A Föld felszínének magassági egyenetlenségei, melyeket a léginavigációs térképeken magassági kontúrvonalakkal, magassági (hipszometrikus) színezéssel, árnyalással, vagy magassági pontokkal ábrázolnak.
Követelmény *(Requirement)*. Meghatározott igénynek, vagy valószínűségnek a megfogalmazása, általánosan beleértendő, vagy kötelező (ISO 9000[20]*)
Megjegyzés 1. – Az "általánosan beleértendő" azt jelenti, hogy szokás, vagy együttes gyakorlat a szervezet, a fogyasztói és más érdekelt résztvevők számára, hogy a figyelembevett igény, vagy valószínűség beleértendő.
Megjegyzés 2. – Egy minőségjelző használható a követelmény specifikus típusának megjelölésére, például termék követelmény, minőségirányítási követelmény, fogyasztói követelmény.
Megjegyzés 3. – Egy specifikus követelmény az, ami meg van határozva, például egy dokumentumban.
Megjegyzés 4. – A követelményeket eltérő érdekelt felek állapíthatják meg.
Felbontóképesség *(Resolution)*. A mértékegységek, vagy számjegyek számossága, amellyel a mért, vagy számított adatot kifejezik és használják.
Korlátozott légtér *(Restricted area)*. Meghatározott kiterjedésű légtér, egy Állam területe, vagy felségvizei felett, melyben a légijárművek repülése bizonyos meghatározott feltételek szerint korlátozva van.
Utazási szakasz *(Route stage)*. Útvonal, vagy egy útvonal része, melyet közbülső leszállás nélkül repülnek le.
SNOWTAM *(SNOWTAM)*. Különleges NOTAM sorozat, amely a mozgási területen levő hó, jég, latyak, vagy hóval, latyakkal és jéggel kapcsolatos állóvíz által okozott veszélyes állapotokról és megszüntetésükről tájékoztat kötött, meghatározott formai követelmények szerint.
Telepítési hely mágneses deklinációja *(Station declination)*. Egy VOR állomás nulla fokos radiálja és a földrajzi észak közötti beállított eltérés, melyet a VOR állomás kalibrálásakor határoznak meg.
Terep *(Terrain)*. A Föld felszíne, melyen megtalálhatóak a természetes módon előforduló sajátosságok, jellemző tulajdonságok, amilyenek a hegyek, dombok, hegyláncok, völgyek, víztömegek, állandó jéggel és hóval borított felületek, kivéve a mesterséges akadályokat (*obstacle*).
Megjegyzés - A gyakorlati használatban az alkalmazott adatgyűjtés módjától függően a terep a csupasz földön lévő folyamatos felszínt, a lombozat tetejét, vagy a közöttük lévő valamit jelenti, ami az 'első visszaverő felületként' ismeretes.
Nyomon követhetőség *(Traceability)*. Egy figyelembevett dolog (entitás) időbeli előzményeinek, felhasználásának, elhelyezkedésének nyomon követhetőségi képessége rögzített azonosítók segítségével (ISO 9000[21]*).
Megjegyzés: – Termék figyelembe vételekor a nyomon követhetőség a következőkre vonatkozik:
- *Anyagok és részegységek eredete;*
- *Feldolgozási folyamat; és*
- *A termék szállítás utáni elosztása és elhelyezése.*

Érvényesítés *(Validation)*. Vizsgálat segítségével annak megerősítése és objektív bizonyítása, hogy az adott tervezett felhasználás meghatározott követelményeit teljesítették. (ISO 9000[22]*).

Hitelesítés *(Verification)*. Vizsgálat segítségével annak megerősítése és objektív bizonyítása, hogy a meghatározott követelményeket teljesítették. (ISO 9000[23]*).

Megjegyzés 1: - A "hitelesített" kifejezést használják a megfelelő státusz jelzésére.

Megjegyzés 2: - A megerősítés a következő tevékenységeket foglalhatja magába:

- *alternatív számítások elvégzése;*
- *egy új terv részletezéseinek összehasonlítása egy hasonló, már bizonyított terv részleteivel;*
- *ellenőrzések és szemléltetések elvégzése; és*
- *dokumentumok átnézése a kibocsátás előtt.*

VOLMET. Meteorológiai jelentés a levegőben lévő légijárművek számára.

Adatkapcsolat-VOLMET (D-VOLMET - Data link VOLMET). Aktuális repülőtéri rutin meteorológiai jelentések (METAR), repülőtéri speciális meteorológiai jelentések (SPECI), repülőtéri előrejelzések (TAF), SIGMET, a SIGMET által le nem fedett speciális légi jelentések biztosítása, és ahol rendelkezésre áll, az AIRMET az adatkapcsolaton keresztül.

VOLMET sugárzás (VOLMET broadcast). A megfelelő aktuális METAR, SPECI, TAF és SIGMET biztosítása folyamatos és ismétlődő hang alapú sugárzás segítségével.

4. FEJEZET - LÉGIFORGALMI TÁJÉKOZTATÓ KIADVÁNYOK (AIP)

1. Megjegyzés.- Az AIP elsődleges célja a légiforgalom szempontjából lényeges, tartós jellegű tájékoztatások cseréjére megállapított nemzetközi követelmények kielégítése. Ha lehetséges, a kiadványt olyan formában kell összeállítani, amely elősegíti repülés közbeni használatát.
2. Megjegyzés.- Az AIP a tartós jellegű tájékoztatások és a hosszabb érvényességű ideiglenes változások alapvető információs forrásául szolgál.

4.1. Tartalom

4.1.1. Egy Légiforgalmi Tájékoztató Kiadványnak tartalmaznia kell, három részben, fejezeteket és alfejezeteket, melyekben egységes formában szerepelnek az utalások, hivatkozások, hogy ilyen módon lehetségessé váljon az érvényes információk szabványos elektronikus adattárolása és visszakeresése, azokra a témákra vonatkozóan, melyek az 1. Függelékben antikva betűtípussal (*Roman type*) lettek részletesen felsorolva, kivéve azt az esetet, amikor az AIP, vagy az AIP kötet alapvetően a repülés közbeni használatot támogatva készült, akkor ugyanis a pontos formátum és az elrendezés kérdése az állam önálló megítélésére bízható, feltéve, hogy a kiadvány tartalmaz egy megfelelő formátumú tartalomjegyzéket.
4.1.1.1. **Ajánlás.-** *A Légiforgalmi Tájékoztató Kiadványoknak lehetőség szerint aktuális, naprakész tájékoztatást kell nyújtaniuk azokra a témákra vonatkozóan is, amelyek az 1. Függelékben dőlt betűvel (Italic type) szerepelnek.*
4.1.2. A Légiforgalmi Tájékoztató Kiadványoknak a következőket kell tartalmazniuk az 1. Részben (GEN - Általános Tájékoztatások);
a) az AIP-ben közölt légiforgalmi berendezésekért, szolgálatokért, vagy eljárásokért felelős illetékes hatóság megjelölését;
b) azokat az általános feltételeket, amelyek alapján a szolgálatok, vagy a berendezések nemzetközi használatra igénybe vehetőek;
c) egy listát azokról a jelentős eltérésekről, amelyek az Állam nemzeti szabályozása és gyakorlati eljárásai, valamint a vonatkozó ICAO Szabványok, Gyakorlati Ajánlások és Eljárások között fennállnak; ez a lista olyan formában készüljön, amely lehetővé teszi a felhasználó számára, hogy azonnal különbséget tehessen az Állam követelményei és a kapcsolódó ICAO előírások, rendelkezések között;
d) az Állam választását minden jelentős esetben, ahol az ICAO Szabványok, Gyakorlati Ajánlások és Eljárások alternatív lépések lehetőségét kínálják.
4.1.3. Ha a kijelölt nemzetközi repülőterek/helikopter repülőterek alábbi , ABC sorrendben felsorolt légiforgalmi térképei rendelkezésre állnak, akkor ezek az AIP részét kell képezzék, vagy külön kell kiosztani azok között, akik megkapják az AIP kiadványt:
a) Repülőtér/Helikopter Repülőtér Térkép - ICAO;
b) Repülőtéri Földi Mozgások Térképe;
c) Repülőtéri Akadályok Térképe - ICAO A típus;
d) Repülőtéri Terep és Akadály Térkép – ICAO (Elektronikus);
e) Légijármű Parkolási/Beállítási Térkép - ICAO;
f) Körzeti Térkép - ICAO;
g) Minimális Tengerszint Feletti Magasság ATC Légtérellenőrzési Radar Térkép – ICAO
h) Műszeres Megközelítési Térkép - ICAO;
i) Precíziós Megközelítés Térkép - ICAO;
j) Szabványos Érkezési Útvonalak Térképe - Műszeres /STAR/ - ICAO;
k) Szabványos Indulási Útvonalak Térképe - Műszeres /SID/ - ICAO;
l) Látvamegközelítési Térkép - ICAO;
Megjegyzés. – Az AIP-ben egy oldalzseb használható, benne a Repülőtéri Terep és Akadály Térkép – ICAO (Elektronikus formában), megfelelő elektronikus adathordozón.
4.1.4. Ha alkalmasak rá, térképeket, térképvázlatokat, vagy diagramokat kell alkalmazni arra, hogy

kiegészítsék, vagy helyettesítsék a Légiforgalmi Tájékoztató Kiadvány (AIP) táblázatait, vagy szövegét.
Megjegyzés.- Értelemszerűen, a 4. Annex (Légiforgalmi Térképek) előírásai szerint készített térképeket lehet felhasználni az előző követelmény kielégítésére. A Légiforgalmi Tájékoztató Kiadványokban található index térképek és diagramok pontos leírására vonatkozó segédanyag a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében található (Aeronautical Information Services Manual - Doc 8126).

4.2. Általános előírások

4.2.1. Minden Légiforgalmi Tájékoztató Kiadványnak önállónak kell lennie, és külön tartalomjegyzékkel kell rendelkeznie.
Megjegyzés.- Ha egy AIP-nek - a nagy terjedelem okán, vagy kényelmi szempontok miatt - szükségessé válik két, vagy több részben, vagy kötetben történő megjelentetése, ezek mindegyikében jelezni kell azt, hogy a fennmaradó információk a másik rész(ek)ben, vagy kötet(ek)ben találhatók.
4.2.1.1. Valamennyi AIP esetén el kell kerülni az információk ismétlését, úgy az AIP-n belül, úgy más forrásokból is.
4.2.1.2. Amikor két, vagy több Állam közösen, egyesített AIP kiadványt ad ki, akkor ezt a borítón és a tartalomjegyzékben is egyértelműen fel kell tüntetni.
4.2.2. **Ajánlás.-** *Az AIP-t lehetőség szerint cserelapos formában kell kiadni, kivéve, ha rövid időközönként az egész kiadványt újra kiadják.*
4.2.3. Minden Légiforgalmi Tájékoztató Kiadványt el kell látni időpont megjelölésével. Ha a Légiforgalmi Tájékoztató Kiadványt cserelapos formátumban adták ki, akkor minden oldalon szerepelnie kell az időpontnak. A dátum, amely tartalmazza a napot, a hónapot (névvel) és az évet, vagy a kiadás időpontja, vagy az információ hatálybalépésének időpontja legyen.
4.2.4. A Légiforgalmi Tájékoztató Kiadvány sorozat összes oldalának, aktuális dátumát tartalmazó ellenőrzőjegyzékét gyakori időközönként, ismételten ki kell adni, ezzel segítve a felhasználót, hogy a Kiadványt naprakészen tarthassa. Az oldalszámot/a táblázat/a térkép megnevezését és az ellenőrző jegyzék kiadási dátumát magán az ellenőrző jegyzéken is fel kell tüntetni.
4.2.5. Minden bekötött, könyv formátumban kiadott Légiforgalmi Tájékoztató Kiadványt, valamint a cserelapos formátumban kiadott Légiforgalmi Tájékoztató Kiadvány minden oldalát úgy kell feliratozni, hogy az egyértelműen jelezze:
a) A Légiforgalmi Tájékoztató Kiadvány azonosítását;
b) a lefedett, érintett területet, és ahol szükséges, annak felosztásait;
c) a kiadó Állam és az előállító szervezet (hatóság) megnevezését;
d) oldalszámokat/táblázat/térkép megnevezéseket;
e) a megbízhatóság fokát, ha a tájékoztatás bizonytalan.
4.2.6. **Ajánlás.-** *A lapok mérete lehetőség szerint ne haladja meg a 210x297 mm-es (szabványos A4-es) méretet, azonban nagyobb lapokat is fel lehet használni, feltéve, ha azokat ilyen méretre hajtják össze.*
4.2.7. Az AIP összes változását, vagy egy újra kiadott oldalon szereplő új tájékoztatást egyértelmű jelöléssel, vagy magyarázó jegyzettel kell meg jelölni.
4.2.8. Az AIP üzemeltetési szempontból jelentős változtatásait az AIRAC (*Aeronautical Information Regulation and Control Cycle* – Légiforgalmi Tájékoztató Közlemények Meghatározott Kiadási Rendje) eljárásaival összhangban kell kiadni, valamint ezt egyértelműen jelezni kell az AIRAC betűszóval.
4.2.9. Az AIP-t olyan rendszeres időközönként kell módosítani, vagy újra kiadni, mely ahhoz lehet szükséges, hogy megőrizzék naprakész állapotát. A kézi módosítások, vagy magyarázó jegyzetek alkalmazásának számát a minimálisra kell visszaszorítani. A módosítás szokásos, elfogadott módszerének a cserélhető lapot kell használni.
4.2.9.1. A 4.2.9. pontban említett rendszeres időközöket az AIP 1. Részében - (GEN - Általános rész) kell közölni.
*Megjegyzés.- Az AIP Módosítások kiadási időpontjai közötti időintervallumok megállapítására vonatkozó útmutató anyag a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (*Aeronautical Information Services Manual - *Doc 8126) található.*

4.3. Az AIP Módosításaira (*Amendments*) érvényes előírások

4.3.1. Az AIP- tartós jellegű változásait AIP Módosítások formájában kell közzétenni.
4.3.2. Minden AIP Módosítást sorszámmal kell ellátni, melyek folytatólagosak legyenek.
4.3.3. Az AIP Módosítás minden lapját, beleértve a borítót is, el kell látni a kiadás dátumával.
4.3.4. AZ AIRAC (Légiforgalmi Tájékoztató Közlemények Meghatározott Kiadási Rendje) AIP Módosítás minden lapján, beleértve a borítólapot is, fel kell tüntetni a hatálybalépés dátumát.
4.3.5. Amikor egy AIP Módosítást kiadnak, annak utalást kell tartalmaznia az Integrált Légiforgalmi Tájékoztatási Csomag azon elemeinek sorszámára (ha vannak ilyenek), melyeket beépítettek a Módosításba.
4.3.6. Az AIP Módosítás borítóján röviden jelezni kell a módosítás által érintett témákat.
4.3.7. Ha egy AIP Módosítás nem kerül közzétételre a meghatározott időintervallumban, vagy a tervezett kiadási időpontban, akkor egy NIL tájékoztatást kell összeállítani és szétosztani az érvényben lévő NOTAM-okról készített, nyomtatott formájú, nyílt szövegű havi NOTAM összesítőben az 5.2.13.3. pont előírásai szerint.

4.4. Az AIP Kiegészítésekre (*Supplements*) érvényes előírások

4.4.1. A hosszú ideig érvényben (három hónapig, vagy tovább) maradó ideiglenes változásokat, valamint a rövid ideig érvényes tájékoztatásokat, melyek terjedelmes szöveges részt és/vagy ábrákat tartalmaznak, AIP Kiegészítések formájában kell közzétenni.
*Megjegyzés: - Az AIP Kiegészítések használatára vonatkozó útmutató anyag, valamint a Kiegészítések ilyen használatára példák a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (*Aeronautical Information Services Manual - *Doc 8126) találhatók.*
4.4.2. Minden AIP Kiegészítést sorszámmal kell ellátni, melyek folytatólagosak és az adott naptári évre vonatkoznak.
4.4.3. Az AIP Kiegészítés lapjait addig kell az AIP-ben tartani, amíg a teljes tartalmuk, vagy annak egy része érvényben van.
4.4.4. Amikor egy NOTAM helyettesítésére egy AIP kiegészítést küldenek, akkor annak a NOTAM sorszámára vonatkozóan utalást kell tartalmaznia.
4.4.5. Az érvényben lévő AIP Kiegészítésekről legalább havi gyakorisággal ellenőrző jegyzéket kell kiadni. Ezt a tájékoztatást az 5.2.13.3. pont előírásai szerint, az érvényben lévő NOTAM-okról készülő nyomtatott formájú, nyílt szövegű havi NOTAM összesítő útján kell közzétenni.
4.4.6. **Ajánlás.-** *Az AIP Kiegészítés lapjait a jól láthatóság kedvéért, lehetőség szerint, feltűnő sárgára színezzék.*
4.4.7. **Ajánlás.-** *Az AIP Kiegészítések lapjait lehetőleg az első helyen kell tartani az AIP részekben.*

4.5. Szétosztás

Az AIP-t, az AIP Módosításokat és az AIP Kiegészítéseket a lehető leggyorsabb, leghatékonyabb módon kell szétosztani.

5. FEJEZET - NOTAM

5.2.5. A NOTAM összeállítója minden NOTAM számára meg kell, hogy határozzon egy sorfolytonos azonosítót, amely egy betűből és egy négyjegyű számból áll, amit egy törtvonal és az év jelzésére 2 további számjegy követ. A négyjegyű számoknak folytatólagosnak kell lenniük, és a naptári éven kell alapulniuk.
Megjegyzés.- A NOTAM sorozatok azonosítására az ABC betűit használhatják, A-tól Z-ig, az S és a T betű kivételével.
5.2.6. Ha egy NOTAM-ban hibák fordulnak elő, egy új sorszámmal azonosított NOTAM-ot kell kiadni, hogy a hibás NOTAM-ot lecserélje.
5.2.7. Amikor kiadnak egy olyan NOTAM-ot, amely töröl, vagy lecserél egy korábban kiadott NOTAM-

ot, akkor a korábbi NOTAM sorozatát és számát meg kell adni. Mindkét NOTAM sorozatának, helységnév azonosítójának és tárgyának azonosnak kell lennie. Egy NOTAM-mal csak egyetlen egy NOTAM-ot lehet törölni, vagy lecserélni.
5.2.8. Minden egyes NOTAM csak egyetlen tárggyal, és annak egyetlen jellemzőjével foglalkozhat.
Megjegyzés.- A NOTAM-ok Kiválasztási Feltételeivel egyetértésben, a NOTAM tárgya és a tárgy jellemzőinek kombinációjára vonatkozó útmutató anyag a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Aeronautical Information Services Manual - Doc 8126) *található.*
5.2.9. Minden egyes NOTAM-nak a lehető legrövidebbnek kell lennie, és úgy kell összeszerkeszteni, hogy jelentése, más okmányokra való hivatkozás nélkül is világos legyen.
5.2.10. Minden egyes NOTAM-ot önálló távközlési közleményként kell továbbítani.
5.2.11. Egy NOTAM, amely állandó, vagy hosszan tartó ideiglenes információkat tartalmaz, megfelelő AIP, vagy AIP Melléklet, Kiegészítés referenciákat, hivatkozásokat kell, hogy tartalmazzon.
5.2.12. A NOTAM-ok szövegében található helységnév azonosító kódoknak meg kell egyezniük azokkal, melyek a *Helységnév Azonosító Kódok* kiadványban (Location Indicators – *DOC 7910*) szerepelnek.
5.2.12.1. Semmi esetre sem szabad ezen azonosítók rövidített változatát használni.
5.2.12.2. Amennyiben egy helységnek nincs kijelölt ICAO helységnév azonosítója, akkor a helység nevét a 3.6.2 pontban előírt helyesírási követelményeknek megfelelően leírva kell a nyílt szövegbe beilleszteni.
5.2.13. Az érvényes NOTAM-okról legalább havonta egyszer egy ellenőrzőjegyzéket kell kiadni NOTAM formájában, a Légiforgalmi Állandóhelyű Szolgálaton keresztül (*Aeronautical Fixed Service - AFS*), a 6. Függelékben meghatározott NOTAM formátumot használva. Minden NOTAM sorozathoz egy NOTAM-ot kell kiadni.
5.2.13.1. A NOTAM ellenőrzőjegyzéknek hivatkoznia kell a legújabb AIP Módosításokra, AIP Mellékletekre, Kiegészítésekre és legalább a nemzetközi szétosztású AIC-ékre (*Aeronautical Information Circulars* - Légiforgalmi Tájékoztató Körlevelekre).
5.2.13.2. A NOTAM ellenőrzőjegyzéket ugyanazon címekre kell kiosztani, mint akik azt a tájékoztatás sorozatot kapták, amire az ellenőrzőjegyzék vonatkozik és ezt a tájékoztatást egyértelműen ellenőrzőjegyzéknek kell nevezni.
5.2.13.3. A lehető legkisebb késéssel havonta kinyomtatott nyílt szövegű összesítőt kell készíteni az érvényben lévő NOTAM-okról, melynek tartalmaznia kell az utolsó kiadott AIP Módosításokat, az AIC-k megjelölését, az AIP Mellékletek, Kiegészítések ellenőrző jegyzékét, majd ezt az összesítőt a lehető leggyorsabb eszközt felhasználva el kell juttatni azokhoz, akik az Integrált Légiforgalmi Tájékoztató Csomagot megkapják.

5.3. Szétosztás

5.3.1. A NOTAM-okat kérés alapján kell kiosztani.
5.3.2. A NOTAM-ot az ICAO távközlési eljárások idevonatkozó előírásainak megfelelően kell összeállítani.
5.3.2.1. Amikor csak lehetséges, a NOTAM-ok szétosztásához a Légiforgalmi Állandóhelyű Szolgálatot (*AFS - Aeronautical Fixed Service*) kell alkalmazni.
5.3.2.2. Ha a NOTAM-ok cseréje az 5.3.4. pont alapján nem a Légiforgalmi Állandóhelyű Szolgálat (AFS) segítségével történik, akkor a szöveget megelőzően a NOTAM kiadás dátumát és időpontját hat számjegyből álló dátum/idő csoporttal kell jelölni, és használni kell a kiadó azonosítóját.
5.3.3. A kibocsátó Államnak kell kiválasztania azokat a NOTAM-okat, melyeket nemzetközi szétosztásra szánnak.
5.3.3.1. **Ajánlás.-** *Amennyiben megvalósítható, lehetőleg szelektív kiosztási listákat kell alkalmazni.*
Megjegyzés.- Ezek a listák a tájékoztatások felesleges szétosztásának megelőzésére szolgálnak. Az erre vonatkozó útmutató anyag a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Aeronautical Information Services Manual - *Doc 8126*) *található.*
5.3.4. A NOTAM-ok nemzetközi cseréje csak az érintett nemzetközi NOTAM irodák közötti kölcsönös megegyezés alapján történhet. Az ASHTAM (lásd 5.2.4.) nemzetközi cseréjébe, valamint azokban az Államokban, ahol a vulkánok aktivitásával kapcsolatos tájékoztatások szétosztására továbbra is a

NOTAM közleményt használják, a NOTAM közlemények nemzetközi cseréjébe be kell vonni a Vulkáni Hamufelhők Tanácsadói Központjait (*Vulcanic Ash Advisory Centre*s), a regionális léginavigációs egyezmény alapján az AFS műholdas elosztó rendszerek működéséhez kijelölt központokat (műholdas elosztó rendszer a léginavigációhoz (SADIS) és a nemzetközi műholdas kommunikációs rendszerhez (ISCS) kapcsolódó információ számára), valamint figyelembe kell vennie a nagy hatósugarú üzemeltetés követelményeit is.
Megjegyzés.- A repülőterek / helikopter repülőterek közötti közvetlen SNOWTAM (lásd a 2. Függeléket) cserére egyezményeket lehet kötni.
5.3.4.1. A nemzetközi NOTAM irodák között az ilyen NOTAM cseréket, amennyire csak gyakorlatilag lehetséges, a tájékoztatást fogadó érintett Államok követelményeire kell korlátozni, legalább a nemzetközi és a belföldi járatok számára készített külön sorozatok biztosításával.
5.3.4.2. Az 5.3.4. pontban leírt követelményeknek megfelelően, amikor csak lehetséges, az 5. Függelékkel összhangban, a Légiforgalmi Állandóhelyű Szolgálat segítségével (AFS) továbbított NOTAM közleményekhez egy előre meghatározott szétosztási rendszert kell használni.

6. FEJEZET - A LÉGIFORGALMI TÁJÉKOZTATÓ KÖZLEMÉNYEK MEGHATÁROZOTT KIADÁSI RENDJE (AIRAC)

6.1. Általános előírások

6.1.1. A 4. Függelék - 1. részében felsorolt körülményekre vonatkozó tájékoztatásokat az AIRAC meghatározott rendje szerint kell szétosztani, azaz az alapok létrehozását, a visszavonást és a jelentős módosításokat a hatálybalépési időpontok szokásos 28 naponkénti sorozata szerint kell végrehajtani, az 1998. január 29-ei naptól kezdődően. Az ilyen módon közölt információkat, tájékoztatásokat a hatálybalépés utáni további 28 napig nem változtathatják meg, kivéve, ha a közölt körülmény ideiglenes jellegű és így nem tart a teljes időszak végéig.
Megjegyzés.- Az AIRAC rendszerrel kapcsolatosan alkalmazható eljárásokra vonatkozó útmutató anyag a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Aeronautical Information Services Manual - Doc 8126) *található.*
6.1.2. **Ajánlás.-** *Lehetőleg az AIRAC szabályozott rendszerét kell használni a 4. Függelék 2. Részében felsorolt körülmények bevezetésével, megszüntetésével és előre megfontolt jelentős változtatásával kapcsolatos tájékoztatások kiadására is.*
6.1.3. Ha az AIRAC időpontjára a kiadandó tájékoztatást még nem nyújtották be, egy NIL értesítést kell összeállítani és NOTAM, vagy más alkalmas eszköz útján szétosztani, legalább egy ciklussal korábban, mint amelyre az AIRAC hatálybalépési dátuma vonatkozik.
6.1.4. Az AIRAC hatálybalépési dátumától eltérő bevezetési dátumokat nem szabad használni az olyan előre tervezett, üzemeltetést jelentősen érintő változások esetén, melyek térképészeti munkákat igényelnek, és/vagy melyek navigációs adatbázisokat aktualizálnak.
6.1.5. **Ajánlás.-** *Az AIRAC rendszer szerinti jelentős változások bevezetésének hatálybalépési dátumaként az AIRAC ciklusban lehetőleg kerülendő a december 21-e és január 17-e közötti időpontok használata, ezeket a napokat is beleértve.*

6.2. Tájékoztatások biztosítása papír másolat formájában

6.2.1. Az AIRAC rendszer szerint szétosztott tájékoztatásokat minden esetben meg kell jelentetni papír másolat formájában és azt az AIS-nek (Légiforgalmi Tájékoztató Szolgálat) legalább 42 nappal a hatálybalépés dátuma előtt ki kell adnia abból a célból, hogy a tájékoztatás a hatálybalépési dátum előtt legalább 28 nappal korábban eljusson a címzettekhez.
6.2.2. **Ajánlás.-** *Amikor jelentősebb változásokat terveznek és ahol az előzetes értesítés kívánatos lehet és használható, a kiadás dátuma lehetőség szerint legalább 56 nappal előzze meg a hatálybalépés dátumát.*
Megjegyzés. – Azzal kapcsolatos útmutató anyag, hogy mi tartozik a jelentősebb változás alá, a

Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Aeronautical Information Services Manual - Doc 8126) *található.*

6.3. Tájékoztatások biztosítása elektronikus formátumban

6.3.1. Azoknak az Államoknak, melyek létrehoztak egy légiforgalmi adatbázist, amikor annak tartalmát a 4. Függelék - 1. Részben felsorolt körülményekre vonatkozóan frissítik, garantálniuk kell, hogy az adatok hatálybalépési időpontjai megegyezzenek azon AIRAC hatálybalépési időpontokkal, melyeket a papír másolat formájában biztosított tájékoztatások számára használtak fel.
6.3.2. A 4. Függelék - 1. Részben felsorolt körülményekre vonatkozó, elektronikus formátumban nyújtott tájékoztatásokat az AIS-nek (Légiforgalmi Tájékoztató Szolgálatnak) oly módon kell kiadnia/hozzáférhetővé tennie, hogy a tájékoztatás az AIRAC hatálybalépési dátuma előtt legalább 28 nappal korábban eljusson a címzettekhez.
6.3.3. **Ajánlás.-** *Amikor jelentősebb változásokat terveznek és ahol az előzetes értesítés kívánatos lehet és használható, az elektronikus formátumban nyújtott tájékoztatásokat, lehetőség szerint, a hatálybalépési dátumot megelőzően legalább 56 nappal korábban kell kiadni/hozzáférhetővé tenni.*
Megjegyzés. – Azzal kapcsolatos útmutató anyag, hogy mi tartozik a jelentősebb változás alá, a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Aeronautical Information Services Manual - Doc 8126) *található.*

7. FEJEZET - LÉGIFORGALMI TÁJÉKOZTATÓ KÖRLEVELEK (AIC)

7.1. A körlevelek összeállítása

7.1.1. Egy AIC-t kell kiadni, amikor egy olyan légiforgalmi tájékoztatás közzététele szükséges, ami nem minősül:
a) a 4.1. pont előírásai értelmében olyannak, hogy azt egy Légiforgalmi Tájékoztató Kiadványban (AIP) kellene kiadni; vagy
b) az 5.1. pont előírásai értelmében olyannak, hogy azt egy NOTAM-ban kellene kiadni.
7.1.1.1. Egy AIC-t kell kiadni, amikor az alábbiak közzététele kívánatos:
a) jogszabályokkal, rendelkezésekkel, eljárásokkal és berendezésekkel kapcsolatos bármely fontosabb változás hosszú távú előrejelzése;
b) pusztán csak magyarázó, vagy tanácsadó jellegű tájékoztatások, melyek hatással lehetnek a repülés biztonságára;
c) műszaki, jogi, vagy tisztán adminisztratív ügyekre vonatkozó magyarázó, vagy tanácsadó jellegű tájékoztatások, vagy értesítések;
Ezeknek tartalmaznia kell az alábbiakat:
1. a biztosított léginavigációs eljárások, szolgálatok és berendezések fontos változásainak előrejelzését;
2. az új navigációs rendszerek létesítésének előrejelzését;
3. légijármű baleset/esemény kivizsgálása során feltárt olyan fontos tájékoztatásokat, amelyek összefüggnek a repülés biztonságával;
4. tájékoztatásokat a nemzetközi polgári légiközlekedés jogellenes beavatkozás elleni védelmével összefüggő szabályozásokról, rendelkezésekről;
5. tanácsokat a légijármű-vezetőket különösen érintő orvosi kérdésekkel kapcsolatban;
6. a pilóták részére olyan figyelmeztetéseket, hogy hogyan kerüljék el az egészségükre leselkedő veszélyeket;
7. bizonyos időjárási rendellenességeknek a légijárművek üzemeltetésére gyakorolt hatását;
8. tájékoztatást az újabb veszélyekről, melyek a légijármű kiszolgálási módszereket, tevékenységeket érintik;
9. korlátozás alá eső árucikkek légi szállítására vonatkozó rendszabályokat;

10. utalást a nemzeti törvényalkotás követelményeire és bekövetkezett változások közzétételére;
11. a hajózószemélyzet szakszolgálati képesítésével kapcsolatos megállapodásokat, egyezményeket;
12. a légiközlekedésben foglalkoztatott személyek képzését, oktatását;
13. a nemzeti törvényhozás követelményeinek alkalmazását, vagy az azok alóli mentességet;
14. meghatározott, bizonyos típusú berendezések használatára és karbantartására vonatkozó tanácsokat;
15. a légiforgalmi térképek új, vagy átdolgozott kiadásának pillanatnyi, vagy tervezett elérhetőségét;
16. kommunikációs berendezések szállítását a fedélzeten;
17. a zajcsökkentési eljárásokra vonatkozó magyarázó tájékoztatásokat;
18. kiválasztott légialkalmassági irányelveket;
19. NOTAM sorozatokban, vagy szétosztásukban bekövetkezett változásokat, az AIP új kiadásait, vagy az AIP tartalmának, jogkörének, vagy formátumának jelentősebb változásait;
20. előzetes tájékoztatást a hóeltakarítási tervről (lásd 7.1.1.2. pontot);
21. hasonló jellegű, egyéb tájékoztatásokat.

Megjegyzés.- Egy AIC kiadása nem mentesít a 4. és 5. Fejezetben ismertetett kötelezettségek alól.

7.1.1.2. Az 1. Függelék AD 1.2.2. pontja szerint kiadott hóeltakarítási tervet idényjellegű tájékoztatásokkal kell kiegészíteni, és még jóval valamennyi téli időszak kezdete előtt kell kiadni - nem később, mint egy hónappal a téli körülmények szokásos beállta előtt. A hóeltakarítási tervnek az alábbi tájékoztatásokat kell tartalmaznia:

a) azoknak a repülőtereknek/helikopter repülőtereknek a jegyzékét, amelyeken az elkövetkező téli időszakban várhatóan hóeltakarítást fognak végezni;

1) a futópálya- és gurulóút-rendszereknek megfelelően; vagy[24]*

2) a tervezett hóeltakarítást, a futópálya rendszertől eltérően (futópályák hosszúsága, szélessége és száma, az érintett gurulóutak és forgalmi előterek, vagy ezek részei);[25]*

b) [26]*tájékoztatást bármely kijelölt központról, amelyet kijelöltek, hogy koordinálja a hóeltakarítás menetének pillanatnyi állapotával, a futópályák, gurulóutak és forgalmi előterek pillanatnyi állapotával kapcsolatos tájékoztatásokat.

c) a repülőterek/helikopter repülőterek felosztását SNOWTAM kiosztási listákra, hogy elejét vegyék a túlzott mértékű, felesleges SNOWTAM kiosztást.

d) [27]*szükség szerint az érvényes hóeltakarítási terv kisebb módosításairól szóló információt.

e) [28]*a hóeltakarítás eszközeinek részletes leírását tartalmazó jegyzékét;

f) [29]*egy listát arról, hogy mit tekintenek majd a hópad legkisebb jelentendő magasságának, minden repülőtéren/helikopter repülőtéren, ahol a jelentést el fogják kezdeni.

7.2. Általános előírások

7.2.1. Az AIC-t nyomtatott formában kell kiadni.

Megjegyzés.- A kiadott anyag szöveget és ábrákat egyaránt tartalmazhat.

7.2.1.1. A kiadó Államnak kell kiválasztania azt az AIC-t, melyet nemzetközi szétosztásra szánnak.

7.2.1.2. Minden AIC-nek egy sorszámot kell adni, mely sorszámoknak folytatólagosaknak kell lenniük, és a naptári éven kell alapuljanak.

7.2.1.3. Ha az AIC-ket több, mint egy sorozatban osztják szét, minden sorozatot egyedi betűjelzéssel kell ellátni.

7.2.1.4**. Ajánlás.-** *Ahol az érvényben lévő AIC-k nagy száma elegendő ahhoz, hogy az azonosításra ilyen formában kerüljön sor, az egyes AIC témakörök tárgy szerinti megkülönböztetésére és azonosítására lehetőség szerint szín szerinti kódolást kell alkalmazni.*

Megjegyzés.- Az AIC- k tárgy szerinti szín-kódolására vonatkozó tájékoztató anyag a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Aeronautical Information Services Manual - *Doc 8126*) *található.*

7.2.2. Legalább évente egyszer, az AIC-kkel azonos címekre történő kiosztással, ellenőrző jegyzéket kell kiadni az érvényben lévő AIC-kről.

7.3. Szétosztás, kiosztás

A nemzetközi szétosztásra szánt AIC-k számára az Államoknak ugyanazt a kiosztást kell biztosítaniuk, mint az AIP-jük esetén.

8. FEJEZET - A REPÜLÉS ELŐTTI ÉS REPÜLÉS UTÁNI TÁJÉKOZTATÁS / ADATOK

8.1. Repülés előtti tájékoztatás

8.1.1. Minden olyan repülőtéren/helikopter repülőtéren, amelyet rendes körülmények között nemzetközi légiforgalom üzemeltetésére vesznek igénybe, a repülés biztonsága, rendszeressége és hatékonysága szempontjából lényeges, és az adott repülőtérről/helikopter repülőtérről kiinduló repülési útvonalszakaszokra vonatkozó légiforgalmi tájékoztatásokat a repülési tevékenységeket végző személyzet rendelkezésére kell bocsátani, beleértve a hajózó személyzeteket és a repülés előtti tájékoztatásokért felelős szolgálatokat is.

8.1.2. A 8.1.1. pontban említett repülőtereken/helikopter repülőtereken a repülés előtti tervezés céljaira biztosított légiforgalmi tájékoztatásoknak magukba kell foglalniuk az alábbi lényeges összetevőket:

a) az Integrált Légiforgalmi Tájékoztató Csomag elemeit;

b) térképeket és navigációs térképvázlatokat.

Megjegyzés: - Az a) és b) pontokban felsorolt dokumentációt korlátozhatják a nemzeti kiadványokra és amikor ez megoldható, a közvetlenül szomszédos Államok kiadványaira, feltéve, hogy a légiforgalmi tájékoztatások teljes könyvtára rendelkezésre áll egy központi helyen, valamint, hogy a közvetlen kommunikáció eszközei használhatók a repülőtér AIS egysége és ezen könyvtár között.

8.1.2.1. Kiegészítő naprakész tájékoztatásokat kell biztosítani az indulási repülőtérre vonatkozóan az alábbiakról:

a) építési, vagy karbantartási munkálatok a munkaterületen, vagy közvetlenül a munkaterület mellett;

b) a munkaterület bármely egyenetlen része, függetlenül attól, hogy megjelölték, vagy nem, pl. ilyenek a futópályák és gurulóutak felszínének töredezett részei;

c) hó, jég és víz jelenléte és vastagsága a futópályán és a gurulóutakon, beleértve hatását a felület fékhatására;

d) összefújt, vagy felhalmozódott hó a futópályákon és gurulóutakon, vagy mellettük;

e) parkoló légijármű, vagy más akadályok a gurulóutakon, vagy közvetlenül mellettük;

f) más ideiglenes veszély jelenléte;

g) madarak jelenléte, amely potenciális veszélyt jelent a légijárművek üzemeltetésére;

h) a repülőtér fényrendszere egy részének, vagy egészének meghibásodása, vagy szabálytalan működése, beleértve a bevezető -, a küszöb -, a futópálya -, a gurulóút -, akadály - és a munkaterületek használaton kívüli részeit jelölő fényeket, valamint a repülőtér energiaellátását.

i) az ILS (markerekkel együtt), MLS, az alap GNSS, SBAS (Satellite Based Augmentation Systems - Műholdas Alapú, Megnövelt Területen Működő Szolgáltatás), GBAS (Ground Based Augmentation System - Földi Telepítésű Kiterjesztő Rendszer), SRE, PAR, DME, SSR, VOR, NDB berendezések, VHF légiforgalmi mozgószolgálati csatornák, RVR észlelő rendszerek és a másodlagos energia rendszer meghibásodása, vagy szabálytalan működése és üzemeltetési státuszának változása; és

j) humanitárius segélyezési feladatok, küldetések jelenléte és műveletei, mint amilyeneket az ENSZ védnöksége alatt folytatnak, az alkalmazott eljárásokkal és/vagy az okozott korlátozásokkal együtt.

8.1.3. Az érvényes NOTAM-ok és más sürgős jellegű tájékoztatások ismételt összefoglalását nyílt szöveges repülés előtti tájékoztató bulletin (PIB) formájában kell hozzáférhetővé tenni a repülő személyzet számára.

Megjegyzés.- a PIB (Pre-flight Information Bulletins - Repülés Előtti Tájékoztató Bulletin) összeállítására vonatkozó útmutató anyag a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Aeronautical Information Services Manual - *Doc 8126*) *található.*

8.2. Automatizált légiforgalmi tájékoztató rendszerek

8.2.1. Ott, ahol a polgári légügyi hatóság, vagy az az ügynökség, melyre a 3.1.1. c) pontban leírtaknak megfelelően a szolgáltatás felügyeletét átruházták, automatizált repülés előtti légiforgalmi tájékoztató rendszereket használ, hogy segítségével a légiforgalmi tájékoztatásokat/léginavigációs adatokat hozzáférhetővé tegyék az üzemeltetést végző személyzet részére, beleértve a hajózó-személyzet tagjait is, a repülésük előtti önálló eligazítás, repülés tervezés és a repülés tájékoztató szolgálat céljaira, a rendelkezésre bocsátott tájékoztatások/adatok meg kell feleljenek a 8.1.2. és 8.1.3. pontban leírt rendelkezéseknek.

8.2.2. **Ajánlás.-** *A repülés előtti automatizált légiforgalmi tájékoztató rendszereket, melyek az üzemeltetést végző személyzet részére, beleértve a hajózó-személyzet tagjait, és más érintett légiforgalmi személyzeteket is, egy összehangolt, közös hozzáférési lehetőséget biztosítanak a légiforgalmi tájékoztatásokhoz - a 8.2.1. pontban leírtaknak megfelelően - valamint a meteorológiai tájékoztatásokhoz - a* Meteorológiai Szolgálat a Nemzetközi Légiközlekedés Számára *– 3. Annex – 9.5.1. pontja alapján - lehetőség szerint a polgári légügyi hatóság, vagy az az ügynökség - melyre a 3.1.1. c) pontban leírtaknak megfelelően a szolgáltatás felügyeletét átruházták - és az illetékes meteorológiai hatóság között kötött egyezményben foglaltak szerint kell felállítani.*

8.2.3. Ahol repülés előtti automatizált légiforgalmi tájékoztató rendszereket használnak összehangolt, közös hozzáférési lehetőségként az üzemeltetést végző személyzet részére, beleértve a hajózó-személyzet tagjait, és más érintett légiforgalmi személyzeteket is, a légiforgalmi tájékoztatásokhoz/adatokhoz, valamint a meteorológiai tájékoztatásokhoz, a polgári légügyi hatóság, vagy az az ügynökség, melyre a 3.1.1. c) pontban leírtaknak megfelelően a szolgáltatás felügyeletét átruházták, továbbra is felelősséggel tartozik az ilyen rendszerek segítségével biztosított légiforgalmi tájékoztatások/adatok minőségéért és időszerűségéért.

Megjegyzés – Az érintett meteorológiai hatóság tartozik felelősséggel az ilyen rendszerek segítségével biztosított meteorológiai tájékoztatások minőségéért, a 3. Annex – 9.5.1. pontja alapján.

8.2.4. Egy automatizált légiforgalmi tájékoztató rendszer repülés előtti saját-eligazítási eszközeinek szükség szerint hozzáférést kell biztosítaniuk a légiforgalmi tájékoztató szolgálatokkal történő konzultáció lehetőségéhez telefon, vagy más alkalmas telekommunikációs eszköz segítségével az üzemeltetést végző személyzet részére, beleértve a hajózószemélyzet tagjait is és más érintett légiforgalmi személyzeteket is. Az ilyen eszközök ember/gép közötti kapcsolatot megvalósító műszaki megoldásainak könnyű, segítségről is gondoskodó hozzáférést kell biztosítaniuk minden vonatkozó tájékoztatáshoz/adathoz.

8.2.5. **Ajánlás.-** *A repülés előtti saját-eligazítás, repülés tervezés és repülés tájékoztató szolgálat céljaira légiforgalmi tájékoztatásokat/adatokat biztosító automatizált légiforgalmi tájékoztató rendszereknek lehetőség szerint:*

a) gondoskodniuk kell a rendszer adatbázisának folyamatos és megfelelő időben történő frissítéséről és a tárolt légiforgalmi tájékoztatások érvényességének és minőségének figyelemmel kiséréséről;

b) lehetővé kell tegyék az üzemeltetést végző személyzet részére, beleértve a hajózó-személyzet tagjait és más érintett légiforgalmi személyzeteket és légiforgalmi felhasználókat is, hogy megfelelő telekommunikációs eszközökön keresztül hozzáférjenek a rendszerhez;

c) biztosítaniuk kell, hogy a megtekintett légiforgalmi tájékoztatások/adatok szükség szerint papírmásolat formájában is rendelkezésre álljanak;

d) olyan hozzáférési és lekérdezési eljárásokat kell használniuk, melyek rövidített nyílt szövegen és ICAO helységnév-azonosítókon alapulnak, értelemszerűen, vagy egy menüvezérelt felhasználói felületen, vagy más alkalmazható struktúrán keresztül, ahogy abban a polgári légügyi hatóság és az érintett üzemeltetők megegyeztek; és

e) egy tájékoztatást igénylő felhasználói kérés esetén gyors válaszadásról kell gondoskodniuk.

Megjegyzés.- Az ICAO rövidítések és kódok, valamint helységnév-azonosítók a Légiforgalmi Szolgálatok Eljárásai – ICAO Rövidítések és Kódok *(Procedures for Air Navigation Services – ICAO abbreviations and Codes - PANS-ABC, Doc 8400), illetve a* Helységnév-azonosítók *(Locations Indicators - Doc 7910) alapján kerülnek megadásra.*

8.3. Repülés utáni tájékoztatás

8.3.1 Az Államoknak biztosítaniuk kell, hogy intézkedéseket tegyenek a repülőtereken/helikopter repülőtereken, a légijárművek személyzetétől kapott, a léginavigációs berendezések állapotáról és működéséről szóló tájékoztatások átvételére, valamint gondoskodniuk kell arról, hogy az ilyen tájékoztatások a légiforgalmi tájékoztató szolgálat rendelkezésére álljanak olyan szétosztás céljára, ahogy azt a körülmények szükségessé teszik.
8.3.2. Az Államoknak biztosítaniuk kell, hogy intézkedéseket tegyenek a repülőtereken/helikopter repülőtereken a légijárművek személyzetétől kapott, az általuk megfigyelt madarak jelenlétéről szóló információ átvételére, valamint gondoskodniuk kell arról, hogy az ilyen tájékoztatások a légiforgalmi tájékoztató szolgálat rendelkezésére álljanak olyan szétosztás céljára, ahogy azt a körülmények szükségessé teszik.
Megjegyzés.- Lásd a 14. Annex – I. Kötet – 9. Fejezet – 9.4. bekezdését!

1. FÜGGELÉK - A LÉGIFORGALMI TÁJÉKOZTATÓ KIADVÁNY (AIP) TARTALMA

(lásd a 4. Fejezetet)

1. RÉSZ - ÁLTALÁNOS TUDNIVALÓK (GEN)

Abban az esetben, ha egy AIP egynél több kötetben készül el, és kerül kibocsátásra, valamint mindegyik kötethez külön módosító és kiegészítő szolgáltatás tartozik, akkor minden egyes kötetnek tartalmaznia kell egy külön bevezetést (előszót), az AIP Módosítások (*Amendments*) jegyzékét, az AIP Mellékletek, Kiegészítések (*Supplements*) jegyzékét, az AIP lapok ellenőrző jegyzékét és a legutóbbi, kézzel bevezetett érvényes módosítások listáját.

GEN 0.1. - Előszó

A Légiforgalmi Tájékoztató Kiadvány (AIP) rövid leírása, mely tartalmazza:
1) a kiadó hatóság nevét;
2) az alkalmazható ICAO dokumentumokat;
3) az AIP felépítését és a rendszeres módosítások meghatározott időszakait; és
4) az AIP-ben lévő hibák, vagy hiányosságok észlelése esetén értesítendő szolgálat megnevezését.

GEN 0.2. - Az AIP Módosítások Nyilvántartása

Módosítások *(Ammendments)* nyilvántartása
Az AIP Módosítások és az AIRAC AIP Módosítások (melyeket az AIRAC rendszer szabályai szerint adtak ki) nyilvántartása a következőket tartalmazza:
1) a módosítás számát;
2) a kiadás dátumát;
3) a beillesztés dátumát (az AIRAC AIP Módosítás esetén a hatálybalépés dátuma); és
4) annak a tisztviselőnek a kézjegye, aki beillesztette a Módosítást.

GEN 0.3. - Az AIP Kiegészítések, Mellékletek Nyilvántartása

Mellékletek (*Supplements*) Nyilvántartása
A kiadott AIP Kiegészítések, Mellékletek jegyzéke a következőket tartalmazza:
1) a Kiegészítés, Melléklet számát;
2) a Kiegészítés, Melléklet tárgyát;
3) az érintett AIP bekezdés(eke)t, fejezeteket;
4) az érvényesség időtartamát; és
5) érvénytelenítési bejegyzést.

GEN 0.4. - Az AIP oldalak Ellenőrzőjegyzéke

Az AIP lapok Ellenőrzőjegyzéke a következőket tartalmazza:
1) oldalszám / térkép megnevezését; és
2) a légiforgalmi tájékoztatás közzétételének, vagy hatálybalépésének dátumát (nap, hónap – névvel megadva, és az év).

GEN 0.5. - Az AIP kézi módosításainak nyilvántartása

Az AIP-be kézzel bevezetett érvényes módosítások nyilvántartása a következőket tartalmazza:
1) az érintett AIP oldal(aka)t;
2) a módosítás szövegét; és
3) annak az AIP Módosításnak a számát, amely értelmében a kézzel végzett módosítást bevezették.

GEN 0.6. - Az 1. Rész tartalomjegyzéke

A 1. Általános részben – (GEN) található fejezetek és alfejezetek listája.
Megjegyzés: - Az alfejezeteket ABC sorrendben is fel lehet sorolni.

GEN 1. - NEMZETI ELŐÍRÁSOK ÉS KÖVETELMÉNYEK

GEN 1.1. - Kijelölt hatóságok

A nemzetközi légiforgalom érdekében dolgozó, annak támogatásában érintett, kijelölt hatóságok (polgári repülési, meteorológiai, vámügyi, bevándorlási, egészségügyi, útvonal - és repülőtéri / helikopter repülőtéri díjakkal, mezőgazdasági karantén ügyekkel foglalkozó, valamint légijármű-baleseteket kivizsgáló) címei, melyek minden egyes hatóságról az alábbiakat tartalmazzák:
1) kijelölt hatóságot;
2) a hatóság nevét;
3) a hatóság postai címét;
4) a telefonszámát;
5) a telefax számát;
6) a telex számát; és
7) a légiforgalmi állandóhelyű szolgálat (AFS) címét.

GEN 1.2. - Légijárművek beléptetése, tranzitálása és kiléptetése

A nemzetközi légiforgalomban résztvevő légijárművek beléptetésével, tranzitálásával és kiléptetésével kapcsolatos előzetes bejelentés és engedélykérés szabályai és követelményei.

GEN 1.3. - Utasok és légijármű személyzetek beléptetése, tranzitálása és kiléptetése

A nem bevándorló utasok és a személyzetek beléptetésével, tranzitálásával és kiléptetésével kapcsolatos rendszabályok (beleértve a vám-, bevándorlási- és karantén szabályokat, valamint az előzetes bejelentés és engedélykérés követelményeit).

GEN 1.4. - Áruszállítmány beléptetése, tranzitálása és kiléptetése

Az áruszállítmányok beléptetésével, tranzitálásával és kiléptetésével kapcsolatos rendszabályok (beleértve a vámszabályokat, valamint az előzetes bejelentés és engedélykérés követelményeit).
Megjegyzés: - a GEN 3.6. (Kutatás és mentés) fejezetben találhatóak részletesen a kutatás, mentés, mentési munkálatok, kivizsgálás, javítás és az eltűnt, vagy sérült repülőgépekkel kapcsolatos mentési munkálatok céljára belépni, vagy indulni szándékozók támogatására szolgáló intézkedések.

GEN 1.5. - Légijármű műszerek, berendezések és repülési dokumentumok.

A légijárművek műszerezettségének, berendezéseinek és repülési dokumentumainak rövid leírása, az alábbiakat beleértve:
1) Műszerezettség, berendezések (ide tartoznak a légijármű kommunikációs és navigációs berendezései), valamint a repülési okmányok, melyeket egy légijármű fedélzetén kell tartani, beleértve minden további szükséges speciális követelményt, az Annex 6 - I. Rész - 6. és 7. Fejezeteiben pontosan meghatározottakon felül; és
2) Vészrádió, Vészjeladó Rádióállomás (Emergency Locator Transmitter – ELT), jelzőkészülékek és életmentő berendezések, ahogy az Annex 6 - I. Részének - 6.6. pontja és II. Részének - 6.4. pontja tartalmazza ezeket, ha így határoztak a körzeti légiforgalmi értekezleteken a kijelölt szárazföldi területek fölött közlekedő járatok vonatkozásában.

GEN 1.6. - A légiközlekedésre vonatkozó nemzeti jogszabályok és a nemzetközi megállapodások/egyezmények összefoglalása

A légiközlekedésre kihatással bíró nemzeti jogszabályok címeinek, megnevezéseinek és hivatkozásainak listája, valamint ahol alkalmazható összegzésük, együttesen az állam által ratifikált nemzetközi megállapodások / egyezmények, szerződések listájával.

GEN 1.7. - Eltérések az ICAO Szabványoktól, Gyakorlati Ajánlásoktól és Eljárásoktól

Az Állam nemzeti jogszabályai és gyakorlata, valamint a vonatkozó ICAO rendelkezések között mutatkozó jelentős eltérések listája, beleértve az alábbiakat:
1) az érintett jogszabály /az Annex és a kiadás száma, paragrafus/; és
2) az eltérés, részletes szöveggel.
Ebben az alfejezetben az összes jelentős eltérést fel kell sorolni. Szám szerinti sorrendben kell felsorolni az összes Annex-et még akkor is, ha valamely Annex-el kapcsolatban nincs eltérés – ebben az esetben NIL jelzésről kell gondoskodni. A körzeti kiegészítő eljárásoktól /SUPPS/ való nemzeti eltéréseket, vagy az alkalmazásuktól való eltérés mértékét, közvetlenül azt az Annex-et követően kell közzétenni, mellyel a kiegészítő eljárás összefügg.

GEN 2. - TÁBLÁZATOK ÉS KÓDOK

GEN 2.1. – Mérési rendszer, légijárművek jelzései, ünnepnapok

GEN 2.1.1 – Mértékegységek
Az alkalmazott mértékegységek leírása, beleértve a mértékegységek táblázatát.
GEN 2.1.2. – Időbeli referencia rendszer
Az alkalmazott időbeli vonatkozási rendszer leírása (naptár és időrendszer), valamint annak jelzése, hogy alkalmaznak-e, vagy sem nyári időszámítást a nappali órák számának növelésére, és annak feltüntetése, hogy az időbeli referencia rendszert milyen módon mutatták be az AIP anyagaiban.
GEN 2.1.3. – Vízszintes referencia rendszer
A felhasznált vízszintes (geodéziai) vonatkozási rendszer rövid leírása, beleértve az alábbiakat:
1) a referencia rendszer megnevezése/meghatározása;
2) a projekció azonosítása;
3) a felhasznált ellipszoid azonosítása;
4) a felhasznált alapadat (*datum*) azonosítása
5) az alkalmazás területe(i); és
6) ha alkalmazható, akkor magyarázat azoknak a koordinátáknak csillaggal való jelölésére, melyek nem elégítik ki a 11. Annex, és 14. Annex pontossági követelményeit.
GEN 2.1.4 – Függőleges referencia rendszer

A használatban lévő függőleges referencia rendszer rövid leírása, beleértve a következőket:
1) a referencia rendszer megnevezése/meghatározása;
2) a felhasznált geoid (földalak) modell meghatározása, mellékelve azokat a paramétereket, amelyek a felhasznált modell és az EGM-96 közötti magassági transzformációhoz szükségesek; és
3) magyarázat, amennyiben alkalmazható, azoknak a tengerszint feletti magasság / geoid egyenetlenségek csillaggal való jelölésére, melyek nem elégítik ki a 14. Annex pontossági követelményeit.
GEN 2.1.5. - Légijárművek nemzeti hovatartozásának és lajstromozásának jelzései
A légijármű nemzeti hovatartozásának és lajstromozásának az adott Állam által elfogadott jelzései.
GEN 2.1.6. - Hivatalos Ünnepnapok
A hivatalos munkaszüneti napok listája, valamint annak feltüntetése, hogy ez mely szolgálatokat érinti.

GEN 2.2. – Az AIS kiadványokban használt rövidítések

Az Állam által kiadott Légiforgalmi Tájékoztató Kiadványokban és a szétosztásra kerülő légiforgalmi tájékoztatásokban/adatokban használt rövidítésekből ABC sorrendben összeállított lista, a jelentésükkel, megfelelő magyarázatokkal ellátva azokkal a nemzeti rövidítésekkel, amelyek eltérnek a "Légiforgalmi Szolgálatok Eljárásai – ICAO Rövidítések és Kódok *(Procedures for Air Navigation Services – ICAO abbreviations and Codes - PANS-ABC, Doc 8400)*" című kiadványban leírtaktól.
Megjegyzés.- Ezt ki lehet még egészíteni egy ABC sorrendbe szedett meghatározások listájával / szakkifejezések magyarázatos szójegyzékével.

GEN 2.3. – A térképeken használt jelek

A térképeken használt jelek listája, azon térkép-sorozatok alapján sorba rendezve, amelyeken a jeleket alkalmazták.

GEN 2.4. - Helységnév azonosítók

A légiforgalmi állandóhelyű állomások helymeghatározására kijelölt helységnév-azonosítók ABC sorrendbe szedett listája kódolás és dekódolás céljára. Biztosítani kell a Légiforgalmi Állandóhelyű Szolgálattal /AFS-el/ összeköttetésben nem álló helységnév-azonosítókra való hivatkozást.

GEN 2.5. – Rádiónavigációs berendezések felsorolása

A rádiónavigációs berendezések ABC sorrendbe szedett listája, mely az alábbiakat tartalmazza:
1) azonosító;
2) az állomás neve;
3) a létesítmény/berendezés típusa;
4) hogy a berendezés milyen célokat szolgál: útvonal (E), repülőtér (A), vagy mindkettő (AE).

GEN 2.6. – Átszámítási táblázatok

Átszámításra használt táblázatok az alábbi mértékegységek között:
1) tengeri mérföldről kilométerre, és viszont;
2) lábról méterre, és viszont;
3) decimális ívpercek és ívmásodpercek, oda-vissza;
4) más átszámítási táblázatok, értelemszerűen.

GEN 2.7. – Napkelte / napnyugta táblázatok

A napkelte/napnyugta táblázatokban megadott időpontok meghatározására felhasznált kritériumok rövid, vázlatos leírása, azoknak a helyeknek ABC sorrendbe szedett listájával, melyekre az időpontokat megadták a táblázatban, hivatkozással a vonatkozó oldalakra, valamint a kiválasztott állomások/helyek

számára a napkelte/napnyugta táblázatok, beleértve:
1) az állomás nevét;
2) az ICAO helységnév azonosítót;
3) a földrajzi koordinátákat fokokban és percekben megadva;
4) az(ok) a dátum(ok), amely(ek)re az időpontokat megadták;
5) a hajnali polgári szürkület kezdetének időpontja;
6) a napkelte időpontja;
7) a napnyugta időpontja; és
8) az esti polgári szürkület végének időpontja;

GEN 3. – SZOLGÁLATOK

GEN 3.1. – Légiforgalmi Tájékoztató Szolgálat

GEN 3.1.1. – Felelős, illetékes szolgálat
A rendelkezésre bocsátott Légiforgalmi Tájékoztató Szolgálat (AIS) és a főbb összetevőinek leírása, beleértve:
1) a szolgálat/egység nevét;
2) postai címét;
3) telefonszámát;
4) telefax-számát;
5) telex-számát;
6) AFS címét;
7) azoknak az ICAO dokumentumoknak a megnevezését, melyekre a szolgálat munkáját alapozták, és utalást arra az AIP részre, ahol, ha vannak, felsorolták az eltéréseket; és
8) annak jelzése, ha a szolgálat nem folyamatos (H24) üzemű;
GEN 3.1.2. Illetékesség, hatáskör
A Légiforgalmi Tájékoztató Szolgálat illetékessége, hatásköre.
GEN 3.1.3 – Légiforgalmi Kiadványok
Az Integrált Légiforgalmi Tájékoztatási Csomag (*Integrated Aeronautical Information Package*) elemeinek leírása, beleértve az alábbiakat:
1) AIP és a hozzá kapcsolódó módosító (*amendment*) szolgálat;
2) AIP Kiegészítések (*Supplements*);
3) AIC (Légiforgalmi Tájékoztató Körlevél - *Aeronautical Information Circular*);
4) NOTAM és repülés előtti tájékoztató bulletin (PIB – *Pre-flight Information Bulletins*);
5) az érvényben lévő NOTAM-ok ellenőrző listái és összesítései;
6) hogyan lehet ezeket beszerezni.
Amikor egy AIC-t használnak arra, hogy a kiadványok árát közzétegyék, akkor ezt az AIP ezen fejezetében kell jelezni.
GEN 3.1.4. - AIRAC (A Légiforgalmi Tájékoztató Közlemények Meghatározott Kiadási Rendje – *Aeronautical Information Regulation and Control*) rendszer
Az adott AIRAC rendszer rövid leírása, mellékelve egy táblázatot a jelenlegi és a közeljövőre vonatkozó AIRAC kiadási dátumokkal.
GEN 3.1.5. - Repülés előtti tájékoztató szolgálat a repülőtereken / helikopter repülőtereken
Azoknak a repülőtereknek / helikopter repülőtereknek a listája, amelyeken a repülés előtti tájékoztatás rutinszerűen rendelkezésre áll, beleértve az alábbi lényeges dolgok feltüntetését:
1) az Integrált Légiforgalmi Tájékoztató Csomag rendelkezésre álló elemei;
2) a rendelkezésre álló térképek és részletes navigációs térképek; és
3) az ilyen jellegű adatok általános érvényességi területe.
GEN 3.1.6. - Elektronikus terep és akadály adat
Az elektronikus terep és akadály adat beszerzésének részletei, tartalmazva a következőket:
1) a felelős személy, szolgálat, vagy szervezet nevét;

2) a felelős személy, szolgálat, vagy szervezet postai címét és internet (e-mail) címét;
3) a felelős személy, szolgálat, vagy szervezet telefax számát;
4) a felelős személy, szolgálat, vagy szervezet elérhetőségi telefonszámát;
5) a szolgálat elérhetőségének idejét (idő tartam, beleértve az időzónát, amikor a kapcsolatot fel lehet venni);
6) folyamatos (on-line) tájékoztatás, ami felhasználható a személy, a szolgálat, vagy a szervezet felé történő kapcsolatfelvételre; és
7) kiegészítő információ, ha szükséges, annak érdekében, hogy hogyan és mikor lehet a személlyel, a szolgálattal, vagy a szervezettel a kapcsolatot felvenni.

GEN 3.2. – Légiforgalmi térképek

GEN 3.2.1. – Felelős szolgálat(ok)
A légiforgalmi térképek előállításáért felelős szolgálat(ok) leírása, beleértve:
1) a szolgálat nevét;
2) postai címét;
3) telefonszámát;
4) telefax-számát;
5) telex-számát;
6) az AFS-címét;
7) azoknak az ICAO dokumentumoknak a megnevezését, melyekre a szolgálat munkáját alapozták és utalást arra az AIP részre, ahol, ha vannak, felsorolták az eltéréseket; és
8) annak jelzése, ha a szolgálat nem folyamatos (H24) üzemű;
GEN 3.2.2. – A térképek naprakészen tartása, karbantartása
Rövid leírása annak, hogy a navigációs térképeket hogyan vizsgálják felül, és hogyan módosítják.
GEN 3.2.3. – A beszerzés lehetőségei
Részletes ismertetése annak, hogy a térképeket hogyan lehet beszerezni, mely az alábbiakat tartalmazza:
1) a szolgálat(ok)at / az árusítással megbízott szervezet(ek)et;
2) postai címeket;
3) telefonszámot;
4) telefax-számot;
5) telex-számot; és
6) AFS címet.
GEN 3.2.4. – A rendelkezésre álló légiforgalmi térkép sorozatok
A rendelkezésre álló légiforgalmi térkép sorozatok listája, továbbá minden egyes sorozat általános leírása és a lehetséges felhasználás megjelölése.
GEN 3.2.5. – A rendelkezésre álló légiforgalmi térképek listája
A rendelkezésre álló légiforgalmi térképek listája, mely az alábbiakat tartalmazza:
1) a térképsorozat címe;
2) a térképsorozat léptéke;
3) egy sorozat minden egyes térképének, vagy a sorozat minden egyes lapjának az elnevezése és/vagy a száma;
4) az ár, laponként számítva; és
5) a legutóbbi módosítás dátuma.
GEN 3.2.6. – A World Aeronautical Chart (WAC) – A Léginavigációs Világtérkép indextérképe ICAO – 1 : 1 000 000 léptékben
Ez egy indextérkép, mely egy Állam által kiadott WAC 1 : 1 000 000 térkép fedésterületét és lapjainak beosztását, tördelését mutatja be.
Ha ICAO – 1: 500 000-es Léginavigációs Térképet adnak ki a WAC –1 : 1 000 000-as helyett, akkor az ICAO – 1: 500 000-es Léginavigációs Térkép fedésterületét és lapjainak beosztását, tördelését kell az indextérképen bemutatni.

GEN 3.2.7. – Topográfiai térképek
Annak részletes ismertetése, hogy hogyan lehet hozzájutni a topográfiai térképekhez. A következőket tartalmazza:
1) a szolgálat(ok)/szervezet(ek) megnevezését;
2) postai címet;
3) telefonszámot;
4) telefax számot;
5) telex számot; és
6) AFS címet.
GEN 3.2.8. – Az AIP-ben nem szereplő navigációs térképek javítása
Az AIP-ben nem szerepeltetett navigációs térképeken végrehajtott javítások felsorolása, vagy annak közlése, hogy hol lehet az ilyen információkat beszerezni.

GEN 3.3. – ATS - Légiforgalmi Szolgálatok

GEN 3.3.1. – Felelős szolgálat
A légiforgalmi szolgálat és annak nagyobb részeinek leírása, beleértve:
1) a szolgálat megnevezését;
2) postai címét;
3) telefonszámát;
4) telefax-számát;
5) telex-számát;
6) AFS-címét;
7) azoknak az ICAO dokumentumoknak a megnevezését, melyekre a szolgálat munkáját alapozták, és utalást arra az AIP részre, ahol, ha vannak, felsorolták az eltéréseket; és
8) annak jelzése, ha a szolgálat nem folyamatos (H24) üzemű;
GEN 3.3.2. – Illetékesség, hatáskör
A légiforgalmi szolgálatok illetékességének, hatáskörének rövid leírása, amiért a szolgálatokat létesítették.
GEN 3.3.3. – A szolgálatok típusai
A biztosított légiforgalmi szolgálatok főbb típusainak rövid leírása.
GEN 3.3.4. – A járatók (üzemeltetők) és az ATS közötti koordinálás
Általános feltételek, melyek mellett a járatók (üzemeltetők) és az ATS szolgálatok közötti koordináció létrejön.
GEN 3.3.5. – Minimális tengerszint feletti repülési magasságok
A minimális tengerszint feletti repülési magasságok meghatározásához használt kritériumok.
GEN 3.3.6. – ATS egységek címjegyzéke
Az ATS egységek és címük listája ABC sorrendbe szedve, mely az alábbiakat tartalmazza:
1) az egység megnevezését;
2) postai címét;
3) telefonszámát;
4) telefax-számát;
5) telex-számát; és
6) AFS-címét;

GEN 3.4. – Hírközlési Szolgálatok

GEN 3.4.1. – Illetékes szolgálat
A hírközlési és a navigációs berendezések biztosításáért felelős szolgálat leírása, beleértve az alábbiakat:
1) a szolgálat megnevezését;
2) postai címet;
3) telefonszámot;
4) telefax-számot;

5) telex-számot;
6) AFS- címet;
7) azoknak az ICAO dokumentumoknak a megnevezését, melyekre a szolgálat munkáját alapozták, és utalást arra az AIP részre, ahol, ha vannak, felsorolták az eltéréseket; és
8) annak jelzése, ha a szolgálat nem folyamatos (H24) üzemű;
GEN 3.4.2. – Illetékesség, hatáskör
Annak a hatáskörnek a rövid leírása, melynek számára a Hírközlési Szolgálatot biztosítják.
GEN 3.4.3. – A szolgálatok típusai
A szolgálat és szolgáltatások, berendezések főbb típusainak rövid leírása, beleértve:
1) rádiónavigációs szolgálatokat;
2) hang alapú és/vagy adatkapcsolati szolgálatot;
3) rádióadó / sugárzó szolgálatot;
4) a felhasznált nyelve(ke)t; és
5) annak közlését, hogy hol szerezhető be részletes információ.
GEN 3.4.4. – Követelmények és feltételek
Azoknak a követelményeknek és feltételeknek a rövid leírása, melyek alapján a hírközlési szolgálat rendelkezésre áll.

GEN 3.5. – Meteorológiai szolgálatok

GEN 3.5.1. – Illetékes szolgálat
A meteorológiai szolgálat biztosításáért felelős meteorológiai szolgálat rövid leírása, beleértve az alábbiakat:
1) a szolgálat megnevezését;
2) postai címét;
3) telefonszámát;
4) telefax-számát;
5) telex-számát;
6) AFS-címét;
7) azoknak az ICAO dokumentumoknak a megnevezését, melyekre a szolgálat munkáját alapozták, és utalást arra az AIP részre, ahol, ha vannak, felsorolták az eltéréseket; és
8) annak jelzése, ha a szolgálat nem folyamatos (H24) üzemű;
GEN 3.5.2. – Illetékesség, hatáskör
Annak a körzetnek és/vagy útvonalaknak a rövid leírása, melyek számára a meteorológiai szolgálatot biztosítják.
GEN 3.5.3. – Meteorológiai megfigyelések és jelentések
A nemzetközi légiforgalom számára biztosított meteorológia megfigyelések és jelentések részletes leírása, beleértve az alábbiakat:
1) az állomás neve és ICAO helységnév azonosítója;
2) a megfigyelés típusa és gyakorisága, az automatikus megfigyelő berendezés megnevezésével együtt;
3) a meteorológiai jelentések típusai (pl. METAR) és a "trend" típusú leszállási előrejelzés hozzáférhetősége;
4) A talaj menti szél, a látástávolság, a futópálya menti látástávolság, a felhőalap, a hőmérséklet és ahol alkalmazható a szélnyírás (pl. *anemometer* /szélsebességmérő/ a futópályák kereszteződésében, *transmissometer* /látástávolság-mérő/ a földetérési pont közelében, stb.) megfigyelésére, észlelésére és jelentésére használt megfigyelési rendszer meghatározott típusa és a megfigyelési pontok száma;
5) a szolgálat üzemideje; és
6) a rendelkezésre álló légiforgalmi klimatológiai tájékoztatások megjelölése.
GEN 3.5.4. A szolgálatok típusai
A biztosított szolgálatok, szolgáltatások főbb típusainak rövid leírása, részletesen ismertetve az eligazítást, a szaktanácsadást (konzultációt), a meteorológiai információk bemutatását, az üzemeltetők és a hajózó

személyzetek számára rendelkezésre álló repülési dokumentációt, valamint azokat a módszereket és eszközöket, amelyeket a meteorológiai információ szolgáltatására alkalmaznak és használnak.
GEN 3.5.5. – A járatóktól (üzemeltetőktől) megkövetelt értesítések
Az a minimális mennyiségű előzetes értesítés, bejelentés, amit a meteorológiai hatóság megkíván az üzemeltetőktől az eligazítás, a szaktanácsadás (konzultáció) és a repülési dokumentáció tekintetében, és egyéb olyan meteorológiai információ, amit megkövetelnek, vagy kicserélnek.
GEN 3.5.6. – Légijárművektől származó jelentések
Szükség szerint a meteorológiai hatóság követelményei a légijárművekről származó jelentések összeállításáról és továbbításáról.
GEN 3.5.7. – VOLMET szolgálat
A VOLMET szolgáltatás leírása, az alábbiakat beleértve:
1) az adó állomás neve:
2) hívójel, vagy azonosító és a rádióadásban használt rövidítések;
3) az sugárzásra használt frekvencia, vagy frekvenciák;
4) az adási időszakok;
5) üzemidő;
6) azoknak a repülőtereknek/helikopter repülőtereknek a listája, amelyek számára a jelentéseket és/vagy előrejelzéseket kiadják; és
7) a kiadott jelentések, előrejelzések, valamint a SIGMET tájékoztatások és a megjegyzések.
GEN 3.5.8. – SIGMET és AIRMET szolgálat
A légiforgalmi szolgálattal ellátott Repüléstájékoztató Körzeten, vagy irányítói körzeten belül biztosított meteorológiai megfigyelések leírása, beleértve a meteorológiai megfigyelő állomások listáját, az alábbiakkal:
1) meteorológiai megfigyelő állomás neve és ICAO helységnév azonosítója;
2) üzemidő;
3) a kiszolgált Repüléstájékoztató Körzet(ek), vagy irányítói körzet(ek);
4) a kiadott SIGMET tájékoztatások érvényességi időszakai;
5) a SIGMET tájékoztatással kapcsolatban alkalmazott meghatározott eljárások (pl. vulkáni hamu, trópusi ciklon);
6) az AIRMET tájékoztatás eljárásai (a vonatkozó körzeti légiforgalmi egyezményekkel, megállapodásokkal összhangban);
7) a SIGMET és AIRMET tájékoztatásokkal ellátott légiforgalmi szolgálati egység(ek); és
8) kiegészítő információk (pl. a szolgáltatás bármilyen jellegű korlátozását illetően, stb.).
3.5.9. – Egyéb automatizált meteorológiai szolgáltatások
A rendelkezésre álló, meteorológiai információkat biztosító, automatizált szolgáltatások leírása (pl. telefon és/vagy számítógépes modem útján elérhető automatizált repülés előtti tájékoztató szolgáltatás), amely az alábbiakat tartalmazza:
1) a szolgálat nevét;
2) a rendelkezésre álló tájékoztatásokat;
3) az érintett körzeteket, útvonalakat és repülőtereket; és
4) telefon-, telex - és fax számo(ka)t.

GEN 3.6. – Kutatás és mentés

GEN 3.6.1. – Illetékes szolgálat(ok)
A kutatás és mentés (SAR – *Search and Rescue*) biztosításáért felelős szolgálat(ok) rövid leírása, amely tartalmazza az alábbiakat:
1) a szolgálat/egység nevét;
2) postai címet;
3) telefonszámot;
4) telefax számot;

5) telex számot;
6) AFS címet; és
7) azoknak az ICAO dokumentumoknak a megnevezését, melyekre a szolgálat munkáját alapozták, és utalást arra az AIP részre, ahol, ha vannak, felsorolták az eltéréseket;
GEN 3.6.2. – Illetékesség, hatáskör
Annak az illetékességi területnek a rövid leírása, amelyen belül kutató és mentő szolgálatot biztosítanak.
GEN 3.6.3. – A szolgálat típusai
Ahol alkalmazható, a biztosított szolgálat és szolgáltatások, eszközök rövid leírása és földrajzi ábrázolása, beleértve annak jelzését, hogy a SAR szolgálat légi fedésterülete hol függ a légijárművek jelentős mértékű letelepítésétől.
GEN 3.6.4. – SAR megállapodások, egyezmények
A pillanatnyilag érvényben lévő SAR megállapodások, egyezmények rövid leírása, beleértve azokat az előkészületeket, melyeket, akár csak a felszállást követő közvetlen bejelentéssel, vagy a repülési terv benyújtása után, más Államok légijárművei kutatás, mentés, anyagi javak mentése, elveszett, vagy megsérült légijárművel kapcsolatos javítás, vagy anyagi javak, rakomány mentése céljából történő belépésének és indulásának elősegítésére tettek.
GEN 3.6.5. – A felhasználhatóság feltételei
A kutatással és mentéssel kapcsolatos előkészületek, intézkedések rövid leírása. Tartalmazza azokat az általános feltételeket, melyek alapján a szolgálat és eszközei a nemzetközi légiforgalom számára hozzáférhető. Tartalmazza annak jelzését is, hogy vajon a kutatás, mentés részére rendelkezésre bocsátott eszközök, szolgáltatások a SAR feladatokra és szerepekre specializáltak, vagy egyébként más célra használatosak, de kiképzéssel és megfelelő eszközök, felszerelés segítségével alkalmassá tették SAR célokra is, vagy csak alkalomszerűen állnak rendelkezésre és nem képezték ki, vagy készítették fel az adott SAR munkára.
GEN 3.6.6. – Alkalmazott eljárások és jelzések
A mentésben résztvevő légijármű által alkalmazott eljárások és jelzések rövid leírása és egy táblázat, amely a túlélők által használandó jelzéseket mutatja be.

GEN4. – REPÜLŐTEREK / HELIKOPTER REPÜLŐTEREK ÉS LÉGINAVIGÁCIÓS SZOLGÁLATOK HASZNÁLATI DÍJAI

Ha ebben a fejezetben nem szerepelnek részletesen, akkor itt adhatják meg, hogy hol található a pillanatnyi díjak részletes ismertetése.

GEN 4.1. – R epülőtereken / helikopter repülőtereken fizetendő díjak

A nemzetközi forgalomban használható repülőtereken / helikopter repülőtereken alkalmazható díjak típusainak rövid leírása, beleértve az alábbiakat:
1) *a légijármű leszállását;*
2) *légijármű parkolását, hangárban történő elhelyezését és hosszú ideig tartó tárolását;*
3) *utasokkal kapcsolatos szolgáltatások díjait;*
4) *a biztonsággal kapcsolatos díjakat;*
5) *zajjal kapcsolatos díjakat;*
6) *egyéb díjakat (vám, egészségügy, bevándorlás, stb.);*
7) *kivételeket / engedményeket; és*
8) *fizetési módozatokat.*

GEN 4.2. – A léginavigációs / légiforgalmi szolgálatokért fizetendő díjak

A nemzetközi használatra biztosított léginavigációs / légiforgalmi szolgálatokért kiróható díjak rövid leírása, beleértve az alábbiakat:
1) *a bevezető irányítást;*
2) *az útvonalon biztosított léginavigációs / légiforgalmi szolgálatokat;*

3) *a léginavigációs / légiforgalmi szolgálatok költség alapját, valamint a kivételeket / engedményeket; és*
4) *a fizetési módozatokat.*

2. RÉSZ - ENR (EN-ROUTE) ÚTVONALREPÜLÉS

Abban az esetben, ha egy AIP egynél több kötetben készül el, és kerül kibocsátásra, valamint mindegyik kötethez külön módosító és kiegészítő szolgáltatás tartozik, akkor minden egyes kötetnek tartalmaznia kell egy külön bevezető részt (előszót), az AIP Módosítások (*Amendments*) jegyzékét, az AIP Kiegészítések (*Supplements*) jegyzékét, az AIP lapok ellenőrző jegyzékét és a legutóbbi, kézzel bevezetett érvényes módosítások listáját. Abban az esetben, ha az AIP-t egyetlen kötetben adták ki, a "Nem alkalmazható" jelzéssel kell ellátni az előbb felsorolt összes alfejezetet.
A megfelelő alfejezetben jelezni kell, ha a nemzeti szabályozás, valamint az ICAO SARP-ok (Nemzetközi Szabványok és Gyakorlati Ajánlások) és eljárások között eltérés áll fenn, és hogy ezek részletes ismertetése a GEN 1.7 részben található.

ENR 0.6. - A 2. Rész tartalomjegyzéke

A 2. Részben (*En-route* - Útvonalrepülés) található fejezetek és alfejezetek jegyzéke.
Megjegyzés: - Az alfejezetek felsorolását ABC sorrendben is meg lehet adni.

ENR 1. - ÁLTALÁNOS SZABÁLYOK ÉS ELJÁRÁSOK

ENR 1.1. - Általános szabályok

Az általános szabályok közzétételét úgy követelik meg, ahogy azt az Államon belül alkalmazzák.

ENR 1.2. – VFR – Látvarepülési Szabályok

A Látvarepülési Szabályok közzétételét úgy követelik meg, ahogy azt az Államon belül alkalmazzák.

ENR 1.3. – IFR – Műszerrepülési Szabályok

A Műszerrepülési Szabályok közzétételét úgy követelik meg, ahogy azt az Államon belül alkalmazzák.

ENR 1.4. – ATS légterek osztályozása

Az ATS légtér osztályok leírása, a 11. Annex, 4. Függelékében található ATS légtér osztályba-sorolási táblázat formájában, megfelelő módon megjelölve azokat a légtér osztályokat, melyeket az Állam nem használt fel.

ENR 1.5. – Várakozási, megközelítési (érkezési) és indulási eljárások

ENR 1.5.1. – Általános szabályok
Azokat a kritériumokat kell ebben a pontban nyilvánosságra hozni, melyekre a várakozási, megközelítési (érkezési) és indulási eljárásokat kidolgozták. Ha ezek eltérnek az ICAO által előírtaktól, akkor táblázatos formában kell közzétenni a felhasznált kritériumokat.
ENR 1.5.2. – Érkező légijárművek
Azoknak az eljárásoknak (hagyományos, vagy területi navigációs, vagy mindkettő) a közzétételét követelik meg az érkező légijárművek számára, melyek közösek az azonos típusú légtérbe belépő, vagy az abban a légtérben repülő légijárművek számára. Ha eltérő eljárásokat alkalmaznak a Közelkörzetben, ezt a tényt jelezni kell, utalással arra, hogy az adott eljárásokat hol lehet megtalálni.
ENR 1.5.3. – Induló légijárművek
Az induló légijárművek számára azoknak az eljárásoknak (hagyományos, vagy területi navigációs, vagy

mindkettő) a közzétételét követelik meg, melyek közösek bármely repülőtérről / helikopter repülőtérről felszálló légijármű számára.

ENR 1.6. – ATS légtérellenőrző / Radar szolgálatok és eljárások

ENR 1.6.1 – Elsődleges radar
Az elsődleges radar szolgálatok és eljárások leírása, beleértve az alábbiakat:
1) kiegészítő, pótlólagos szolgálatok;
2) a radar irányító szolgálat alkalmazása;
3) radar - és rádióhiba esetén alkalmazandó eljárások;
4) hang alapú és CPDLC pozíció jelentési követelmények; és
5) a radar fedésterületének grafikus ábrázolása.
ENR 1.6.2. – Másodlagos Légtérellenőrző Radar (SSR)
A Másodlagos Légtérellenőrző Radar üzemeltetési eljárásainak részletes leírása, az alábbiakat beleértve:
1) kényszerhelyzeti eljárások;
2) rádióhiba és jogellenes beavatkozás esetén követendő eljárások;
3) a másodlagos kód kijelölésének rendszere;
4) hang alapú és CPDLC pozíció jelentési követelmények; és
5) az SSR radar fedésterületének grafikus ábrázolása;
Megjegyzés.- A Másodlagos Ellenőrző Radar eljárások leírása különös fontossággal bír azokon a területeken, vagy útvonalakon, ahol az elfogás lehetősége fennáll.
ENR 1.6.3. – Automatikus függőségen alapuló légtérellenőrzés – sugárzásos (ADS-B)
Az Automatikus függőségen alapuló légtérellenőrzés – sugárzásos (ADS-B) üzemeltetési eljárásainak részletes leírása, az alábbiakat beleértve:
1) kényszerhelyzeti eljárások;
2) rádióhiba és jogellenes beavatkozás esetén követendő eljárások;
3) légijármű azonosításának követelményei;
4) hang alapú és CPDLC pozíció jelentési követelmények; és
5) az ADS-B fedésterületének grafikus ábrázolása;
Megjegyzés.- Az ADS-B eljárások leírása különös fontossággal bír azokon a területeken, vagy útvonalakon, ahol az elfogás lehetősége fennáll.

ENR 1.7. – Magasságmérő beállítási eljárások

Megkövetelik az alkalmazott magasságmérő beállítási eljárások közzétételét, az alábbiakat beleértve:
1) rövid bevezetés azoknak az ICAO dokumentumoknak a bemutatásával, melyekre az eljárásokat alapozták, valamint az ICAO előírásaitól való eltérések, ha vannak ilyenek;
2) alapvető magasságmérő beállítási eljárások;
3) magasságmérő beállítási körzet(ek) leírása;
4) A járatók (üzemeltetők) (beleértve a pilóták) által alkalmazható eljárások; és
5) az utazómagasságok táblázata;

ENR 1.8. – Regionális kiegészítő eljárások

Megkövetelik a teljes illetékességi területet érintő körzeti kiegészítő eljárások (SUPPS) közzétételét, kiegészítve a pontosan bemutatott nemzeti eltérésekkel, ha vannak ilyenek.

ENR 1.9. – Légiforgalmi áramlásszervezés

A Légiforgalmi áramlásszervezés (ATFM) rendszerének rövid ismertetése, az alábbiakat beleértve:
1) Az ATFM felépítése, a szolgálat illetékességi területe, a biztosított szolgálatok, az egység(ek) helye és az üzemidejük;

2) az áramlásszervezésben használatos üzenetek típusai, valamint a formátumok leírása; és
3) az induló légijárművek számára alkalmazandó eljárások, az alábbiakat tartalmazva:
  a) az alkalmazott ATFM intézkedésekkel kapcsolatos információ biztosításáért felelős szolgálat;
  b) repülési tervvel kapcsolatos követelmények; és
  c) résidő kiosztás.

ENR 1.10. – Repülés tervezés

Megkövetelik a repülés tervezési szakaszához kapcsolódó minden olyan megszorítás, korlátozás, vagy tanácsadó információ közzétételét, amely a felhasználó segítségére lehet a tervezett repülés bejelentésében, beleértve az alábbiakat:
1) a repülési terv benyújtásának eljárásai;
2) az ismétlődő repülési terv rendszere; és
3) a benyújtott repülési tervben szereplő adatok megváltoztatása.

ENR 1.11. – A repülési terv közlemények címzése

Megkövetelik a repülési tervekben alkalmazható címek közzétételét táblázatos formában, bemutatva az alábbiakat:
1) a repülés kategóriája (IFR, VFR, vagy mindkettő);
2) útvonal (a FIR-be, vagy a FIR-en keresztül és/vagy a TMA-ba, vagy azon keresztül);
3) közlemény címe;

ENR 1.12. – Polgári légijárművek elfogása

Megkövetelik az alkalmazandó elfogási eljárások és vizuális jelzések maradéktalan közzétételét, valamint egyértelműen jelezni kell, hogy alkalmazzák-e az ICAO rendelkezéseket, ha nem, akkor az eltéréseket részletesen be kell mutassák.

ENR 1.13. – Jogellenes beavatkozás

Megkövetelik a jogellenes beavatkozás esetén alkalmazandó, megfelelő eljárások közzétételét.

ENR 1.14. – Légiforgalmi váratlan események

A légiforgalmi események jelentési rendszerének leírása, mely az alábbiakat tartalmazza:
1) a légiforgalmi események részletes leírása;
2) a "Légiforgalmi események jelentésére használt formanyomtatvány", ("*Air Traffic Incident Reporting Form*") használata;
3) az események jelentésének eljárásai (beleértve a repülés közbeni eljárásokat is); valamint
4) a jelentés célját és a formanyomtatvány kezelését.

ENR 2. – A LÉGIFORGALMI SZOLGÁLATOK LÉGTEREI

ENR 2.1. – FIR, UIR, TMA

A repüléstájékoztató körzetek (*FIR - Flight Information Region*), magaslégtéri repüléstájékoztató körzetek (*UIR - Upper Flight Information Region*), közelkörzetek (*TMA - Terminal Control Area*) részletes leírása, beleértve az alábbiakat:
1) a FIR/UIR neve, oldalhatárainak földrajzi koordináta pontjai fokokban, percekben, a TMA oldalhatárai fokokban, percekben és másodpercekben megadva, függőleges határaik és a légterek osztályba sorolása;
2) a szolgálatot biztosító egység azonosítása;
3) az egységet kiszolgáló légiforgalmi állomás hívójele, a használatos nyelv(ek), a terület és a feltételek

pontos meghatározása, hogy mikor és hol használandó, ha alkalmazható;
4) a frekvenciák, kiegészítve a konkrét célok megjelölésével; és
5) megjegyzések.
A katonai légitámaszpontok körül található, az AIP-ben egyébként más módon le nem írt repülőtéri irányítói körzeteket (*Control Zone*) ebben az alfejezetben kell megadni. Azokon a területeken, ahol a 2. Annex a repülési tervekkel, a kétirányú összeköttetéssel és a helyzetjelentéssel kapcsolatos követelményei az összes járatra vonatkoznak, annak érdekében, hogy kiküszöböljék, vagy csökkentsék az elfogások szükségességét, és/vagy ahol az elfogás lehetősége fennáll és szükséges a folyamatos figyelés a 121.5 MHz kényszerhelyzeti frekvencián, akkor ezt a tényt a vonatkozó terület(ek)ről, vagy azoknak részé(i)ről itt kell közölni.
Azon kijelölt területek részletes leírása, amelyek felett szükséges egy kényszerhelyzeti Vészjeladó Rádióállomás megléte a fedélzeten (*ELT - Emergency Locator Transmitter*), és ahol a légijárművek személyzeteinek folyamatosan figyelniük kell a 121.5 MHz kényszerhelyzeti URH frekvencián, kivéve azokat az időszakokat, amikor a légijármű személyzete más URH csatornákon kommunikál, vagy amikor a fedélzeti berendezésekre érvényes korlátozások, vagy a pilótafülkében elvégzendő feladatok nem teszik lehetővé a két csatorna egyidejű figyelését.
Megjegyzés.- A repülőterek / helikopter repülőterek körüli más légtér-típusok leírása, mint amilyenek a repülőtéri irányító körzetek és a repülőtéri forgalmi körzetek, a vonatkozó repülőtéri, vagy helikopter repülőtéri fejezetben található.

ENR 2.2. – Egyéb, szabályozott légterek

Ahol ilyeneket létesítettek, a szabályozott légtér egyéb típusainak részletes leírása, valamint a légtér osztályozása.

ENR 3. - ATS ÚTVONALAK

Megjegyzés 1.- A rádióirányszögeket, az útirányszögeket és a radiálokat általában a mágneses északhoz viszonyítva adják meg. Az egyenlítőtől távolabb található területek esetében, ahol az illetékes hatóság megállapítása szerint a mágneses északhoz való viszonyítás gyakorlatilag nem alkalmazható, más alkalmas vonatkozatást, pl. a földrajzi északot, vagy a koordináta-háló szerinti északi irányt lehet használni.
Megjegyzés 2.- Két rádiónavigációs berendezés közötti távolság felénél kijelölt, vagy olyan útvonal esetében, amelynek iránya a navigációs berendezések között módosul, a két radiál kereszteződésénél kijelölt átkapcsolási pontot nem kell feltüntetni minden egyes útvonalszakasz vonatkozásában, amennyiben ezen pontok létezését általános formában közlik.

ENR 3.1. – Alacsony légtéri ATS útvonalak

Az alacsony légtéri ATS útvonalak részletes leírása, beleértve az alábbiakat:
1) az útvonal megjelölése, a meghatározott útvonalszakaszo/ko/n alkalmazható Megkövetelt Navigációs Teljesítőképesség (RNP – *Required Navigation Performance*) típus(ok), az útvonalat meghatározó valamennyi fontos pont neve, kódolt megjelölése vagy név-kódja, és földrajzi koordinátái fokokban, percekben és másodpercekben megadva, beleértve a "kötelező" és "kérésre közlendő" jelentőpontokat is;
2) útirányszögek, vagy VOR radiálok, kerekítve a legközelebbi fokra, geodetikus távolságok (*geodesic distance*)[30]* a legközelebbi 1/10 kilométerre, vagy tengeri mérföldre kerekítve, minden egymást követő kijelölt fontos pont között, valamint a VOR radiálok esetén az átkapcsolási pontok között;
3) felső és alsó határok, vagy a minimális tengerszint feletti repülési magasságok kerekítve a következő felette lévő 50 méterre, vagy 100 lábra, valamint a légtér osztályba-sorolása;
4) oldalhatárok és a legkisebb akadálymentes magasságok;
5) az utazó magasságok (repülési szintek) iránya; és
6) megjegyzések, beleértve az irányító egység megjelölését, valamint üzemi frekvenciáját.
Megjegyzés.- a 11. Annex, 1. Függelékével összefüggésben és repüléstervezési célokra, a meghatározott

RNP (Megkövetelt Navigációs Teljesítőképesség) típust nem tekintik az útvonal megnevezés szerves részének.

ENR 3.2. – Felső légtéri ATS útvonalak

A felső légtéri ATS útvonalak részletes leírása, beleértve az alábbiakat:
1) az útvonal megjelölése, a meghatározott útvonalszakaszo/ko/n alkalmazható Megkövetelt Navigációs Teljesítőképesség (RNP – *Required Navigation Performance*) típus(ok), az útvonalat meghatározó valamennyi fontos pont neve, kódolt megjelölése vagy név-kódja, és földrajzi koordinátái fokokban, percekben és másodpercekben megadva, beleértve a "kötelező" és "kérésre közlendő" jelentőpontokat is;
2) útirányszögek, vagy VOR radiálok, kerekítve a legközelebbi fokra, geodetikus távolságok (*geodesic distance*)[31]* a legközelebbi 1/10 kilométerre, vagy tengeri mérföldre kerekítve, minden egymást követő kijelölt fontos pont között, valamint a VOR radiálok esetén az átkapcsolási pontok között;
3) felső és alsó határok, valamint a légtér osztályba-sorolása;
4) oldalhatárok;
5) az utazó magasságok (repülési szintek) iránya; és
6) megjegyzések, beleértve az irányító egység megjelölését, valamint üzemi frekvenciáját és ha rendelkezésre áll, a bejelentkezési címét.
Megjegyzés.- a 11. Annex, 1. Függelékével összefüggésben és repüléstervezési célokra, a meghatározott RNP (Megkövetelt Navigációs Teljesítőképesség) típust nem tekintik az útvonal megnevezés szerves részének.

ENR 3.3. – Területi navigációs útvonalak

A területi navigációs útvonalak (RNAV) részletes leírása, beleértve az alábbiakat:
1) az útvonal megjelölése, a meghatározott útvonalszakaszo/ko/n alkalmazható Megkövetelt Navigációs Teljesítőképesség (RNP – *Required Navigation Performance*) típus(ok), az útvonalat meghatározó valamennyi fontos pont neve, kódolt megjelölése, vagy név-kódja és földrajzi koordinátái fokokban, percekben és másodpercekben megadva, beleértve a "kötelező" és "kérésre közlendő" jelentőpontokat is;
2) egy VOR/DME területi navigációs útvonalakat kitűző, meghatározó útvonalpontok tekintetében, kiegészítésképpen:
a) a referencia VOR/DME állomás azonosítója;
b) irányszöge a legközelebbi fokra kerekítve, valamint a referencia VOR/DME-től való távolsága a legközelebbi 1/10 kilométerre, vagy tengeri mérföldre kerekítve, ha az útvonalpont nem ugyanabban a pontban található; és
c) a DME adó-antennájának tengerszint feletti magassága a legközelebbi 30 méterre (100 lábra) kerekítve;
3) geodetikus távolságok (*geodesic distance*)[32]* a legközelebbi 1/10 kilométerre, vagy tengeri mérföldre kerekítve, a meghatározott végpontok, valamint az összes egymást követő kijelölt fontos pont között;
4) felső és alsó határok és légtér osztályba-sorolása;
5) az utazó magasságok (repülési szintek) iránya; és
6) megjegyzések, beleértve az irányító egység megjelölését, valamint üzemi frekvenciáját és ha rendelkezésre áll, a bejelentkezési címét.
Megjegyzés.- a 11. Annex, 1. Függelékével összefüggésben és repüléstervezési célokra, a meghatározott RNP (Megkövetelt Navigációs Teljesítőképesség) típust nem tekintik az útvonal megnevezés szerves részének.

ENR 3.4. – Helikopter útvonalak

A helikopter útvonalak részletes leírása, beleértve a következőket:
1) az útvonal megjelölése, a meghatározott útvonalszakaszo/ko/n alkalmazható Megkövetelt Navigációs Teljesítőképesség (RNP – *Required Navigation Performance*) típus(ok), az útvonalat meghatározó

valamennyi fontos pont neve, kódolt megjelölése, vagy név-kódja és földrajzi koordinátái fokokban, percekben és másodpercekben megadva, beleértve a "kötelező" és "kérésre közlendő" jelentőpontokat is;
2) útirányszögek, vagy VOR radiálok, kerekítve a legközelebbi fokra, geodetikus távolságok (*geodesic distance*) a legközelebbi 1/10 kilométerre, vagy tengeri mérföldre kerekítve, minden egymást követő kijelölt fontos pont között, valamint a VOR radiálok esetén az átkapcsolási pontok között;
3) felső és alsó határok, valamint a légtér osztályba-sorolása;
4) a minimális tengerszint feletti repülési magasságok (*minimum flight altitudes*), kerekítve a legközelebbi magasabb 50[33]** méterre vagy 100 lábra; és
(**valószínűleg az 50 méter hibás adat, a 100 lábból csak 30 méter következne!! - Fordító)
5) megjegyzések, beleértve az irányító egység megjelölését, valamint üzemi frekvenciáját.
Megjegyzés.- az Annex 11, 1. Függelékével összefüggésben és repüléstervezési célokra, a meghatározott RNP (Megkövetelt Navigációs Teljesítőképesség) típust nem tekintik az útvonal megnevezés szerves részének.

ENR 3.5. – Egyéb útvonalak

Megkövetelik azoknak a pontosan kijelölt útvonalaknak a leírását, melyek használata kötelező a meghatározott légtér(ek)en belül.
Megjegyzés: - Az érkezési, átrepülő és indulási útvonalakat, melyeket a repülőterekről / helikopter repülőterekről induló, érkező forgalom eljárásaival kapcsolatosan határoztak meg, nem ebben a részben kell meghatározni, mivel ezek a 3. Rész - Repülőterek idevágó szakaszában lettek részletezve.

ENR 3.6. – Várakozás az útvonalon

Az útvonalon való várakozási eljárások részletes leírását követelik meg, mely az alábbiakat tartalmazza:
1) a várakozási eljárás azonosítása (ha van ilyen) és a várakozási pont (navigációs berendezés), vagy útvonalpont földrajzi koordinátákkal, fokban, percben és másodpercben megadva;
2) a rárepülés útiránya;
3) az eljárás fordulóinak iránya;
4) maximális műszer szerinti repülési sebesség (IAS);
5) a várakozásra használható minimális és maximális repülési szintek;
6) a kirepülés ideje/távolsága; és
7) az irányító egység megjelölését, valamint üzemi frekvenciáját.
Megjegyzés.- a várakozási eljárásokkal kapcsolatos akadálymentességi kritériumokat a "Léginavigációs Szolgálatok Eljárásai, a Légijárművek Üzemeltetése (PANS - OPS, Doc 8168), I. és II. Kötete tartalmazza.

ENR 4. - RÁDIÓNAVIGÁCIÓS SEGÉDESZKÖZÖK / RENDSZEREK

ENR 4.1. - Rádiónavigációs Segédeszközök - Útvonalrepülés

Az útvonalrepülés céljára létesített, rádiónavigációs szolgálatot biztosító állomások listája, az állomások neve szerint betűrendbe szedve, az alábbiakat beleértve:
1) az állomás neve és a mágneses elhajlás a legközelebbi fokra kerekítve, valamint a VOR-ok számára a VOR berendezés deklinációja (*Station declination)*[34]* a legközelebbi fokra kerekítve, melyet a berendezés műszaki beállításakor használnak;
2) azonosító;
3) az összes elem frekvenciája/csatornája;
4) üzemeltetési ideje;
5) a sugárzásra használt antenna telepítési helyének földrajzi koordinátái fokokban, percekben és másodpercekben megadva;
6) a DME adó antennájának tengerszint feletti magassága, kerekítve a legközelebbi 30 méterre (100 lábra); és

7) megjegyzések.
Ha a berendezést üzemeltető hatóság nem ugyanaz, mint a kijelölt állami képviselet, akkor az üzemeltetést végző hatóság nevét a megjegyzés rovatban kell feltüntetni. A berendezés hatótávolságát a megjegyzés rovatban kell jelezni.

ENR 4.2. – Különleges navigációs rendszerek.

A különleges navigációs rendszerekkel kapcsolatban lévő állomások leírása (DECCA, LORAN, stb.), az alábbiakat beleértve:
1) az állomás, vagy állomáslánc neve;
2) a rendelkezésre álló szolgálat típusa (vezérlő jel, segéd jel, szín);
3) frekvencia (csatornaszám, alap impulzus gyakoriság, ismétlődési sebesség, ahogy alkalmazható);
4) üzemidő;
5) az adóállomás telepítési helyének földrajzi koordinátái fokokban, percekben és másodpercekben megadva; és
6) megjegyzések.
Ha a berendezést üzemeltető hatóság nem ugyanaz, mint a kijelölt állami képviselet, akkor az üzemeltetést végző hatóság nevét a megjegyzés rovatban kell feltüntetni. A berendezés hatótávolságát a megjegyzés rovatban kell jelezni.

ENR 4.3 – GNSS – Globális navigációs műholdrendszer

A navigációs szolgáltatást biztosító, útvonalrepülés céljára létesített Globális Navigációs Műholdrendszer (GNSS) elemeinek listája és meghatározása, az elemek neve alapján betűrendbe szedve, az alábbiakat tartalmazza:
1) A GNSS elem (GPS, GLONASS, EGNOS, MSAS, WAAS, stb.) neve;
2) frekvencia (frekvenciák), értelemszerűen;
3) a névleges szolgálati terület és a lefedési terület földrajzi koordinátái fokokban, percekben és másodpercekben megadva; és
4) megjegyzések.
Ha a berendezést üzemeltető hatóság nem ugyanaz, mint a kijelölt állami képviselet, akkor az üzemeltetést végző hatóság nevét a megjegyzés rovatban kell feltüntetni.

ENR 4.4. – Fontos Pontok Név-kódjának kijelölése

A nem rádiónavigációs berendezések telepítési helyével kijelölt fontos pontok számára létrehozott név - kód elnevezések (5 betűs, kiejthető név-kódok) betűrendbe rendezett listája, beleértve:
1) név-kód elnevezés;
2) a pozíció földrajzi koordinátái fokokban, percekben és másodpercekben megadva; és
3) utalás azokra az ATS, vagy egyéb útvonalakra, amelyeken az adott pont elhelyezkedik.

ENR 4.5. – Légiforgalmi földi fények – útvonalon

Az Állam által fontosnak minősített földrajzi pontot jelölő léginavigációs földi fények, és más fényjeladók listája, az alábbiakat beleértve:
1) nagyobb, vagy kisebb város neve, vagy a fényjeladó egyéb azonosítója;
2) a fényjeladó típusa, és a fényintenzitás 1000 candelában ("cd" – gyertya) kifejezve;
3) a jelzés karakterisztikája;
4) üzemideje; és
5) megjegyzések.

ENR 5. – NAVIGÁCIÓS FIGYELMEZTETÉSEK

ENR 5.1. – Tiltott, korlátozott és veszélyes légterek

A tiltott, korlátozott és veszélyes légterek leírása, ahol lehetséges grafikus ábrázolással kiegészítve, olyan információkkal, melyek létesítésükkel és a működtetésükkel kapcsolatosak, az alábbiakat tartalmazza:
1) a légtér azonosítója, neve, valamint a légtér oldalhatárainak földrajzi koordinátái fokokban, percekben és másodpercekben, amennyiben az irányítói körzeteken / repülőtéri irányítói körzeteken belül található, valamint fokokban és percekben, amennyiben kívül helyezkedik el;
2) a felső és alsó határok; valamint
3) megjegyzések, beleértve az aktivitás idejét.
A megjegyzés rovatban jelezni kell a korlátozás típusát, vagy a veszély természetét és az elfogás kockázatát, amennyiben megsértenék ezt a légteret.

ENR 5.2. – Katonai gyakorló és kiképzési légterek, területek, valamint a Légvédelmi Azonosítási Körzet (*ADIZ – Air Defence Identification Zone*)

A létesített katonai kiképzési területek és a rendszeres időközönként végrehajtott katonai gyakorlatok, valamint a létesített Légvédelmi Azonosítási Körzet (ADIZ) részletes leírása, ahol alkalmazható grafikus ábrázolással kiegészítve, az alábbiakat beleértve:
1) oldalhatárainak földrajzi koordinátái fokokban, percekben és másodpercekben, amennyiben az irányítói körzeteken / repülőtéri irányítói körzeteken belül, fokokban és percekben amennyiben azokon kívül helyezkedik el;
2) a felső és alsó határai, valamint a működtetés bejelentésének rendszere és eszközei, azokkal az információkkal együtt, melyek a polgári repülésre vonatkoznak, valamint az alkalmazható ADIZ (*Légvédelmi Azonosítási Körzet – Air Defence Identification Zone*) eljárások;
3) megjegyzések, beleértve a működtetés idejét, valamint az elfogás kockázatát, amennyiben megsértenék a ADIZ légterét (*Légvédelmi Azonosítási Körzet – Air Defence Identification Zone*).

ENR 5.3. – Egyéb veszélyes jellegű tevékenységek és más potenciális veszélyek

ENR 5.3.1. – Egyéb veszélyes jellegű tevékenységek
A repülésekre esetleg hatással lévő tevékenységek leírása, ahol lehetséges térképvázlatokkal kiegészítve, az alábbiakat beleértve:
1) a terület középpontjának földrajzi koordinátái fokokban és percekben, valamint kiterjedése;
2) függőleges határok;
3) tanácsadói intézkedések;
4) az információk biztosításáért felelős hatóság; és
5) megjegyzések, beleértve az aktivitás idejét.
ENR 5.3.2. – Egyéb potenciális veszélyek
A repülésekre esetleg hatással lévő potenciális veszélyek (pl. működő vulkáni tevékenység, nukleáris erőművek, stb.) részletes leírása, ahol lehetséges navigációs térképpel kiegészítve, az alábbiakat beleértve:
1) a potenciális veszély helyének földrajzi koordinátái fokokban és percekben;
2) függőleges határok;
3) tanácsadói intézkedések;
4) az információk biztosításáért felelős hatóság; és
5) megjegyzések.

ENR 5.4. – Légiforgalmi akadályok

Az 1-es számú Területen (az Állam teljes területén) a légiközlekedést befolyásoló akadályok listája, a következőket beleértve:
1) az akadály azonosítóját, vagy megnevezését;
2) az akadály típusát;

3) az akadály helyzetét, fokokban, percekben és másodpercekben megadott földrajzi koordinátákkal;
4) az akadály tengerszint feletti magasságát, valamint függőleges kiterjedését a legközelebbi méterre, vagy lábra;
5) az akadály fényeinek (ha van ilyen) típusa és színe; és
6) ha alkalmazható, akkor annak jelzése, hogy az akadályok listája hozzáférhető elektronikus formában és egy hivatkozás a GEN 3.1.6 pontra;
Megjegyzés 1.- Egy akadály, aminek a magassága a föld felett 100 m, vagy több, akadálynak számít az 1-es számú Területen.
Megjegyzés 2.- Az 1-es számú Területen az akadályok helyzetének (földrajzi hosszúság és szélesség), valamint tengerszint feletti magasságának / függőleges kiterjedésének meghatározását és jelentését (a terepen végzett munka pontosságát és az adatok integritását) szabályzó részletes előírások, értelemszerűen, a 11. Annex, 5. Függelék, 1. és 2. Táblázatában találhatóak.

ENR 5.5 – Légi sport és szabadidős tevékenységek

Az intenzív légi sport és szabadidős tevékenységek rövid leírása, végrehajtásuk feltételeivel, körülményeivel, ahol alkalmazható, kiegészítve ezek grafikus ábrázolásával, beleértve az alábbiakat:
1) az azonosítója, neve és oldalhatárainak földrajzi koordinátái fokokban, percekben és másodpercekben, amennyiben az irányítói körzeteken / repülőtéri irányítói körzeteken belül található, fokokban és percekben, amennyiben azokon kívül helyezkedik el;
2) függőleges határai;
3) az üzemeltető/felhasználó telefonszáma; és
4) megjegyzések, beleértve aktivitás idejét.
Megjegyzés: - Ez a paragrafus további különböző fejezetekre bontható, minden egyes különböző tevékenységi osztály számára, minden esetben feltüntetve a részleteket.

ENR 5.6. – Madárvándorlás és az érzékeny faunával rendelkező területek

A madarak vándorlásával összefüggő mozgások leírása, beleértve ezek útvonalát is, a madarak állandó pihenőhelyeit, valamint a védelemre szoruló, érzékeny faunával rendelkező területeket is, ahol ez megvalósítható, navigációs térképekkel is kiegészítve.

ENR 6. – ÚTVONAL-TÉRKÉPEK
Ennek a szakasznak kell tartalmaznia az ICAO – Útvonal–térképeket, valamint az indextérképeket.

3. RÉSZ – AERODROMES (AD) – REPÜLŐTEREK
Abban az esetben, ha egy AIP egynél több kötetben készül el és kerül kibocsátásra, valamint mindegyik kötethez külön módosító és kiegészítő szolgáltatás tartozik, akkor minden egyes kötetnek tartalmaznia kell egy külön bevezető részt (előszót), az AIP Módosítások (*Amendments*) jegyzékét, az AIP Kiegészítések (*Supplements*) jegyzékét, az AIP lapok ellenőrző jegyzékét és a legutóbbi, kézzel bevezetett érvényes módosítások listáját. Abban az esetben, ha az AIP-t egyetlen kötetben adták ki, a "Nem alkalmazható" jelzéssel kell ellátni az előbb felsorolt összes alfejezetet.
AD 0.6. – A 3. Rész tartalomjegyzéke
A 3. Részben (Aerodromes /AD – Repülőterek/) található fejezetek és alfejezetek felsorolása.
Megjegyzés: - az alfejezeteket betűrendbe szedve is meg lehet adni.

AD 1. – REPÜLŐTEREK / HELIKOPTER REPÜLŐTEREK – BEVEZETÉS

AD 1.1. – Repülőterek / Helikopter Repülőterek hozzáférhetősége

A repülőterek és helikopter repülőterek vonatkozásában az Állam által kijelölt felelős hatóság rövid leírása, beleértve az alábbiakat:
1) azokat az általános feltételeket, melyek alapján a repülőtér / helikopter repülőtér rendelkezésre áll,

használható;
2) azoknak az ICAO dokumentumoknak a megnevezését, melyekre a szolgálatok munkáját alapozták, és utalást arra az AIP részre, ahol felsorolták az eltéréseket, ha vannak ilyenek;
3) azokat a szabályokat, ha vannak ilyenek, melyek alapján a katonai légitámaszpontokat polgári célra igénybe lehet venni;
4) azokat az általános feltételeket, ha vannak ilyenek, melyek alapján a repülőterek CAT II / III szerinti üzemelésére a "Rossz látási körülmények eljárásai" alkalmazhatóak;
5) a fékhatás mérésére használt eszközök és az a futópályán mérhető súrlódási együttható érték, amely alatt az Állam a futópályát csúszósnak fogja nyilvánítani, ha a felülete nedves; és
6) egyéb, hasonló természetű információk.

AD 1.2. – Műszaki mentő és tűzoltó szolgálatok, valamint a hóeltakarítási terv

AD 1.2.1. – Műszaki mentő és tűzoltó szolgálatok
A nyilvánosan rendelkezésre álló (közhasznú) repülőtereken / helikopter repülőtereken a mentő és tűzoltó szolgálatok létesítését meghatározó szabályok rövid leírása, valamint az Állam által megállapított mentő és tűzoltó kategóriák ismertetése.
AD 1.2.2. - Hóeltakarítási terv
Az általános hóeltakarítási terv szempontjainak rövid leírása azon közhasznú repülőterek / helikopter repülőterek számára, ahol rendszerint előfordulhat havazás, az alábbiakat beleértve:
1) a téli szolgáltatásokat végző szervezet;
2) a mozgási területek felügyelete;
3) mérési módszerek és az elvégzett mérések;
4) a mozgási területek használhatóságának megőrzése érdekében tett intézkedések;
5) a jelentések rendszere és eszközei;
6) a futópálya zárás esetei; és
7) a hóval kapcsolatos körülményekről szóló információk szétosztása.
Megjegyzés.- ahol a repülőtereken / helikopter repülőtereken eltérő hóeltakarítási-terv szempontokat alkalmaznak, ott ennek megfelelően lehet felosztani ezt az alfejezetet.

AD 1.3. – Repülőterek / helikopter repülőterek jegyzéke

Az Állam területén található repülőterek és helikopter repülőterek grafikus ábrázolással kiegészített listája, az alábbiakat beleértve:
1) a repülőtér / helikopter repülőtér neve és ICAO által kiosztott helységnév azonosítója;
2) milyen típusú forgalom számára engedik meg a repülőtér / helikopter repülőtér használatát (nemzetközi / belföldi, IFR / VFR, menetrend szerinti / menetrenden kívüli, magán); és
3) hivatkozás az AIP – 3. Részének azon alfejezetére, melyben a repülőterek / helikopter repülőterek részletes adatai megtalálhatóak.

AD 1.4. – A repülőterek / helikopter repülőterek csoportosítása

A repülőterek / helikopter repülőterek csoportosításában az Állam által használt követelmények rövid leírása tájékoztatások elkészítése/ szétosztása/biztosítása céljából (pl. nemzetközi/belföldi; elsődleges/ másodlagos; nagyobb/egyéb; polgári/katonai; stb.).

AD 2. – REPÜLŐTEREK

*Megjegyzés: - A leírásokban a **** behelyettesítendő a vonatkozó ICAO helységnév azonosító kóddal.*

**** AD 2.1. – A repülőtér helységnév azonosító kódja és neve

Megkövetelik a repülőtér számára kiosztott ICAO helységnév azonosító kódjának és nevének közzétételét.

Egy ICAO helységnév azonosító kód szerves részét kell képezze az AD 2. fejezet minden alfejezetében alkalmazandó hivatkozási rendszernek.

**** AD 2.2. – A repülőtér földrajzi és adminisztratív adatai

Itt követelik meg a repülőtér földrajzi és közigazgatási, adminisztratív adatainak közzétételét, az alábbiakat beleértve:
1) a repülőtér vonatkozási pontja (földrajzi koordinátái fokokban, percekben és másodpercekben) és elhelyezkedése;
2) a repülőtér vonatkozási pontjának iránya és távolsága a repülőtér által kiszolgált település (nagyváros, város) központjától;
3) a repülőtér tengerszint feletti magassága, kerekítve a legközelebbi méterre, vagy lábra, valamint a referencia hőmérséklet;
4) a Geoid (földalak) hullámossága, egyenetlensége (*Geoid undulation*) a repülőtér tengerszint feletti vonatkozási pontján, a legközelebbi méterre, vagy lábra kerekítve;
5) mágneses elhajlás a legközelebbi fokra kerekítve, az adat keletkezésének időpontja, az éves változása;
6) a repülőtéri igazgatóság, hatóság megnevezése, címe, telefax és telex számai és AFS címe;
7) milyen típusú forgalom számára engedik meg a repülőtér használatát (IFR / VFR); és
8) megjegyzések.

**** AD 2.3. – Üzemidő

A repülőtéren található szolgálatok üzemidejének részletes leírása, beleértve az alábbiakat:
1) repülőtéri igazgatóság;
2) vámhivatal és bevándorlási hivatal;
3) egészségügyi és közegészségügyi szolgálat;
4) AIS (*Aeronautical Information Services* - Légiforgalmi Tájékoztató Szolgálat) eligazító irodája;
5) ATS (*Air Traffic Services* – Légiforgalmi Szolgálatok) bejelentő irodája (*ARO – ATS reporting office*);
6) MET (repülés meteorológia) eligazító iroda;
7) légiforgalmi szolgálatok;
8) üzemanyag szolgáltatások;
9) földi kiszolgálás, utaskezelés;
10) biztonsági szolgálatok;
11) jégtelenítés; és
12) megjegyzések.

**** AD 2.4. – Földi kiszolgálás és eszközei

A repülőtéren a rendelkezésre álló földi kiszolgálás és a földi kiszolgálás eszközeinek részletes leírása, beleértve az alábbiakat:
1) a teherárú, rakomány kezelésére szolgáló létesítmények, eszközök, szolgáltatások;
2) a rendelkezésre álló üzemanyag és olajfajták;
3) az üzemanyag ellátás létesítményei, berendezései és kapacitásuk;
4) jégtelenítő létesítmények, berendezések, szolgáltatás;
5) hangár férőhelyek légijárművek átmeneti tárolására;
6) javítási szolgáltatások az átmenetileg itt tartózkodó légijárművek számára; és
7) megjegyzések.

**** AD 2.5. - Az utasok kiszolgálása és létesítményei

A repülőtéren az utasok rendelkezésére álló létesítmények, berendezések, utas-kiszolgálás rövid leírása, az alábbiakat beleértve:

1) *szálloda (szállodák) a repülőtéren, vagy annak közvetlen környezetében;*
2) *étterem (éttermek) a repülőtéren, vagy annak közvetlen környezetében;*
3) *közlekedési, szállítási lehetőségek;*
4) egészségügyi létesítmények;
5) *bankok, postahivatalok a repülőtéren, vagy annak közvetlen környezetében;*
6) *idegenforgalmi iroda;* és
7) megjegyzések.

****** AD 2.6. – Mentési és tűzoltó szolgálatok**

A repülőtéren rendelkezésre álló (műszaki) mentési és tűzoltó szolgálatok és berendezések, felszerelések részletes leírása, beleértve az alábbiakat:
1) a repülőtér tűzoltási kategóriája;
2) a műszaki mentés berendezései;
3) *a mozgásképtelenné vált légijárművek eltávolításának képessége, lehetősége;* és
4) megjegyzések.

****** AD 2.7. – Idényjellegű, időszakos használhatóság – hóeltakarítás**

A repülőtér mozgási területein a hóeltakarításra használt berendezéseknek, valamint a hóeltakarítás meghatározott elsőbbségi rendjének részletes leírása, az alábbiakat beleértve:
1) a hóeltakarításra használt eszköz(ök) típusa(i);
2) a hóeltakarítás sorrendje, elsőbbsége; és
3) megjegyzések.

****** AD 2.8. – Előterek, gurulóutak és az ellenőrző helyek / pontok adatai**

Az előterek, gurulóutak és a kijelölt ellenőrző pontok helyének/pozíciójának fizikai jellemzőivel kapcsolatos részletek, az alábbiakat beleértve:
1) a forgalmi előterek burkolata és teherbírása;
2) a gurulóutak szélessége, burkolata, és teherbírása;
3) a magasságmérő ellenőrzésére kijelölt pontok helyzetének meghatározása és a tengerszint feletti magassága, kerekítve a legközelebbi méterre, vagy lábra;
4) VOR ellenőrzésre kijelölt pontok helymeghatározása;
5) az INS (*Inertial Reference System* - Inerciális Referencia Rendszer) ellenőrzésére kijelölt pontok helyzetének meghatározása fokokban, percekben, másodpercekben és 1/100 másodpercekben; és
6) megjegyzések.
Ha az ellenőrző helyek / pontok szerepelnek egy repülőtér térképen, akkor erről információt kell biztosítani ebben az alfejezetben.

****** AD 2.9. – A földi mozgásokat irányító és ellenőrző rendszer, valamint a jelölések**

A gurulásokat irányító és ellenőrző rendszer, valamint a futópálya és gurulóút jelölések rövid leírása, az alábbiakat beleértve:
1) a légijármű állóhely azonosító jeleinek, a gurulóút nyomvonalaknak és a légijármű állóhelyeken található látás szerinti beállító / utas-beszállító hídhoz vezető rendszernek (*visual docking/parking guidance system*) a használata;
2) futópálya és gurulóút jelölések és fények;
3) megállító keresztfénysorok (ha vannak ilyenek); és
4) megjegyzések.

**** AD 2.10. – Repülőtéri akadályok

Az akadályok részletes ismertetése, az alábbiakat beleértve:
1) akadályok a 2-es számú Területen:
a) az akadály azonosítása, vagy neve;
b) az akadály típusa;
c) az akadály pozíciójának földrajzi koordinátái fokokban, percekben, másodpercekben és 1/10 másodpercekben;
d) az akadály tengerszint feletti magassága és függőleges kiterjedése a legközelebbi méterre, vagy lábra kerekítve;
e) az akadály jelölése, és az akadályfények típusa, színe (ha van);
f) ha alkalmazható, akkor annak jelzése, hogy az akadályok listája hozzáférhető elektronikus formában és egy hivatkozás a GEN 3.1.6 pontra; és
g) NIL jelölés, ha alkalmazható.
Megjegyzés 1.- A 10. Fejezet 10.2.2 pontja tartalmazza a 2-es számú Terület meghatározását, míg a 8. Függelék, A8-2 ábrája grafikus formában szemlélteti az akadály adatok gyűjtésére használandó felületeket, valamint a 2-es számú Területen az akadályok azonosításának kritériumait.
Megjegyzés 2.- Az 2-es számú Területen az akadályok helyzetének (földrajzi hosszúság és szélesség), valamint tengerszint feletti magasságának / függőleges kiterjedésének meghatározását és jelentését (a terepen végzett munka pontosságát és az adatok integritását) szabályzó részletes előírások, értelemszerűen, a 11. Annex, 5. Függelék, 1. és 2. Táblázatában találhatóak, valamint a 14. Annex, I. Kötet, 5. Függelék, A5-1 és A5-2 Táblázatában.
2) akadályok a 3-as számú Területen:
a) az akadály azonosítása, vagy neve;
b) az akadály típusa;
c) az akadály pozíciójának földrajzi koordinátái fokokban, percekben, másodpercekben és 1/10 másodpercekben;
d) az akadály tengerszint feletti magassága és függőleges kiterjedése a legközelebbi méterre, vagy lábra kerekítve;
e) az akadály jelölése és az akadályfények típusa, színe (ha van);
f) ha alkalmazható, akkor annak jelzése, hogy az akadályok listája hozzáférhető elektronikus formában és egy hivatkozás a GEN 3.1.6 pontra; és
g) NIL jelölés, ha helyénvaló.
Megjegyzés 1.- A 10. Fejezet 10.2.3 pontja tartalmazza a 3-as számú Terület meghatározását, míg a 8. Függelék, A8-3 ábrája grafikus formában szemlélteti az akadály adatok gyűjtésére használandó felületeket, valamint az akadályok azonosításának kritériumait a 3-es számú Területen.
Megjegyzés 2.- A 3-as számú Területen az akadályok helyzetének (földrajzi hosszúság és szélesség), valamint tengerszint feletti magasságának / függőleges kiterjedésének meghatározását és jelentését (a terepen végzett munka pontosságát és az adatok integritását) szabályzó részletes előírások a 14. Annex, I. Kötet, 5. Függelék, A5-1 és A5-2 Táblázatában találhatók, értelemszerűen.

**** AD 2.11. - A biztosított meteorológiai tájékoztatás

A repülőtéren biztosított meteorológiai tájékoztatások részletes leírása, valamint annak jelzése, hogy melyik meteorológiai iroda felelős a felsorolt szolgáltatások biztosításáért, beleértve a következőket:
1) a kapcsolódó meteorológiai iroda megnevezése;
2) üzemidő és ahol ez alkalmazható, az ezen az időszakon túl felelős meteorológiai irodának a megnevezése;
3) a TAF-ok összeállításáért felelős iroda megnevezése, érvényességi időszakai és az előrejelzések kiadásának idő-intervallumai;
4) a repülőtér számára rendelkezésre álló trend típusú előrejelzések és a kiadásának idő-intervallumai;

5) információk arról, hogy az eligazításokat és/vagy konzultációkat milyen módon biztosítják;
6) a biztosított repülési dokumentáció típusai és a repülési dokumentációban használt nyelv(ek);
7) az eligazítás, vagy konzultáció idején bemutatott, vagy rendelkezésre álló térképek és egyéb információ;
8) olyan kiegészítő berendezések, melyek segítségével a meteorológiai körülményekről információkat biztosíthatnak, ilyenek lehetnek a meteorológiai radar és vevő a meteorológiai műhold által biztosított képi ábrázolások számára;
9) a meteorológiai információval ellátott Légiforgalmi Szolgálati Egység(ek) (*Air Traffic Services Unit(s)*); és
10) további információk (pl. a szolgálat bármilyen fajta korlátozásáról, stb.).

**** AD 2.12. – A futópálya fizikai jellemzői

Minden egyes futópálya esetén a futópálya fizikai jellemzőinek részletes leírása, beleértve a következőket:
1) megnevezések;
2) földrajzi irányszögek 1/100 fokra kerekítve;
3) a futópálya méretei a legközelebbi méterre, vagy lábra kerekítve;
4) minden egyes futópálya és a hozzájuk tartozó végbiztonsági sávok burkolatának, valamint felületének teherbírása (PCN és a hozzákapcsolódó adatok);
5) minden egyes futópálya küszöbének és pályavégének földrajzi koordinátái fokokban, percekben, másodpercekben és 1/100 másodpercekben megadva, valamint a Földalak (*Geoid*) hullámossága, egyenetlensége (*Geoid undulation*), melyet a legközelebbi 1/2 méterre, vagy lábra kerekítenek, minden egyes küszöb esetén;
6) tengerszint feletti magassága:
· a nem precíziós futópályák küszöbének a legközelebbi méterre, vagy lábra kerekítve; és a precíziós futópályák küszöbének és a földetérési zóna legmagasabban fekvő pontjának, a legközelebbi 1/2 méterre, vagy lábra kerekítve;
7) minden egyes futópálya és hozzájuk tartozó végbiztonsági sávok lejtési viszonyai;
8) a végbiztonsági sáv (*stopway*) mérete a legközelebbi méterre, vagy lábra kerekítve (ha van ilyen);
9) az akadálymentes, felszállási biztonsági sáv (*clearway*) mérete (ha van ilyen) kerekítve a legközelebbi méterre, vagy lábra;
10) a leszállósávok (*strips*) méretei;
11) akadályoktól mentes zóna megléte; és
12) megjegyzések.

**** AD 2.13. – Közzétett távolságok

A közzétett, meghatározott távolságok kerekítve a legközelebbi méterre, vagy lábra minden egyes futópályának minden egyes felszálló irányára, beleértve az alábbiakat;
1) futópálya megnevezése;
2) TORA – az igénybe vehető nekifutási távolság;
3) TODA – az igénybe vehető felszállási távolság;
4) ASDA – az igénybe vehető gyorsítási-megállási távolság;
5) LDA – az igénybe vehető leszállási távolság; és
6) megjegyzések.
Ha egy futópálya valamelyik iránya nem használható felszállásra, leszállásra, vagy mindkettőre, mert azt üzemeltetési szempontból megtiltották, akkor ezt közzé kell tenni, és a "Nem Használható" (*Not Usable*) szavakat, vagy a "NU" rövidítést kell alkalmazni. (Annex 14, 1. Kötet, "A" Melléklet, 3. Szakasz).

**** AD 2.14. – Bevezető és futópálya fények

A bevezető és a futópálya fények részletes leírása, beleértve az alábbiakat:

1) a futópálya megnevezését;
2) a bevezető fényrendszer típusát, hosszúságát és intenzitását;
3) a futópálya küszöb fényeit, színüket és a szárny-fénysorokat (*VASIS*-ból);
4) a VASIS (*visual approach slope indicator system* - optikai siklópálya rendszer) típusát;
5) a futópálya földetérési zóna (*touchdown zone*) fényeinek a hosszúságát;
6) a futópálya középvonal fények (*centre line lights*) hosszúságát, a két lámpatest közötti távolságot, színüket és intenzitásukat;
7) a futópálya szegélyfények (*edge lights*) hosszúságát, a két lámpatest közötti távolságot, színüket és intenzitásukat;
8) a futópálya záró-fények és szárny-fénysorok (*wing bars)* színét;
9) a végbiztonsági sáv (*stopway*) fényeinek hosszát és színét; és
10) megjegyzéseket.

****** AD 2.15. – Egyéb fények, tartalék energia ellátás**

Az egyéb repülőtéri fények, tartalék energia ellátás részletes leírása, az alábbiakat beleértve:
1) a repülőtéri fényjeladó / azonosító fényjeladó (ha van ilyen) telepítési helye, karakterisztikája, és üzemeltetési ideje;
2) a szélsebesség mérő / leszállási irány kijelző telepítési helye és megvilágítása (ha van ilyen);
3) a gurulóutak szegély- és középvonal fényei;
4) tartalék, másodlagos áramellátás beleértve az átkapcsolási időt is; és
5) megjegyzések.

****** AD 2.16. – Helikopter leszálló terület**

A repülőtéren a helikopterek leszállására biztosított terület részletes leírása, az alábbiakat beleértve:
1) a földetérési és elemelkedési (*TLOF*) terület, vagy a végső megközelítési és felszállási (*FATO*) terület mindegyik küszöbe mértani középpontjának (ahol alkalmazható) földrajzi koordinátái fokokban, percekben, másodpercekben és 1/100 másodpercekben, valamint a (*Geoid*) Földalak hullámossága, egyenetlensége (*Geoid undulation*) a legközelebbi 1/2 méterre, vagy lábra kerekítve;
2) TLOF és/vagy FATO terület tengerszint feletti magassága;
· nem precíziós bevezetések esetén a legközelebbi méterre, vagy lábra kerekítve; és
· precíziós bevezetések esetén a legközelebbi 1/2 méterre, vagy lábra kerekítve;
3) a TLOF és FATO területek mérete a legközelebbi méterre, vagy lábra kerekítve, a burkolat típusa, teherbíró-képessége, felületi nyomószilárdsága és jelzései;
4) a FATO földrajzi irányszöge, 1/100 fokra kerekítve;
5) a rendelkezésre álló, közzétett, meghatározott távolságok a legközelebbi méterre, vagy lábra kerekítve;
6) bevezető és FATO fények; és
7) megjegyzések;

****** AD 2.17. – A Légiforgalmi Szolgálatok légtere**

A repülőtéren kialakított Légiforgalmi Szolgálatok (ATS) légterének részletes leírása, beleértve az alábbiakat:
1) a légtér megnevezését és oldalhatárainak földrajzi koordinátáit fokokban, percekben és másodpercekben megadva;
2) függőleges határait;
3) a légtér osztályba sorolását;
4) a szolgálatot biztosító ATS egység hívójelét és a használható nyelvet (nyelveket);
5) az átváltási magasságot; és
6) megjegyzéseket.

****** AD 2.18. – A Légiforgalmi Szolgálatok hírközlési berendezései**

A repülőtéren kialakított Légiforgalmi Szolgálatok hírközlési berendezéseinek részletes leírása, az alábbiakat beleértve:
1) a szolgálat megnevezése;
2) hívójele;
3) frekvenciája (frekvenciái);
4) bejelentkezési címe, értelemszerűen;
5) üzemidő; és
6) megjegyzések.

****** AD 2.l9. – Rádió-navigációs és leszállító berendezések**

A repülőtéren a műszeres megközelítéssel és a közelkörzeti eljárásokkal kapcsolatos rádiónavigációs és leszállító berendezések részletes bemutatása, az alábbiakat beleértve:
1) a berendezés típusa, és a mágneses elhajlás a legközelebbi fokra kerekítve, értelemszerűen, és a támogatott ILS/MLS, alap GNSS, SBAS, és GBAS üzemeltetés, valamint a VOR/ILS/MLS számára a telepítési hely mágneses deklinációja (*Station declination*) is, a legközelebbi fokra kerekítve, melyet a berendezés műszaki beállítására használnak fel;
2) azonosítója, ha szükséges;
3) frekvenciája (frekvenciái), értelemszerűen;
4) üzemideje, értelemszerűen;
5) az adásra használt antenna telepítési helyének földrajzi koordinátái fokokban, percekben, másodpercekben és 1/10 másodpercekben megadva, értelemszerűen;
6) a DME berendezés adó-antennájának tengerszint feletti magassága, kerekítve a legközelebbi 30 méterre (100 lábra), valamint a DME/P antenna esetén a legközelebbi 3 méterre (10 lábra); és
7) megjegyzések.
Abban az esetben, amikor ugyanazt a berendezést használják útvonalrepülési és repülőtéri célokra is, akkor a leírását meg kell adni az ENR 4. fejezetben is. Ha a Földi Bázisú (telepítésű) Kiterjesztő Rendszer (GBAS - *Ground Based Augmentation System*) több, mint egy repülőteret szolgál ki, akkor a berendezés leírását valamennyi repülőtérnél biztosítani kell. Amennyiben a berendezést üzemeltető hatóság nem ugyanaz, mint a kijelölt állami szervezet, akkor az üzemeltető hatóság nevét a megjegyzés rovatban fel kell tüntetni. A berendezés hatótávolságát jelezni kell a megjegyzés rovatban.

****** AD 2.20. - A forgalmat érintő helyi előírások, rendelkezések**

A repülőtér forgalmára vonatkozó előírások részletes leírása, beleértve a guruló légijárművek szabványos gurulási nyomvonalát, beállítási, parkolási előírásokat, oktató és kiképző repüléseket, valamint a hasonló, de kizárt, visszautasított repülési eljárásokat.

****** AD 2.21. - Zajcsökkentő eljárások**

A repülőtéren alkalmazott zajcsökkentő eljárások részletes leírása.

****** AD 2.22. - Repülési eljárások**

A repülőtéren, a légtérszervezés alapján kialakított feltételek és repülési eljárások részletes leírása, beleértve a radar és/vagy ADS-B eljárásokat is. Ha ki van alakítva, a repülőtéren a rossz látási körülmények eljárásainak részletes bemutatása, az alábbiakat beleértve:
1) a rossz látási körülmények között használatra engedélyezett futópálya, futópályák és a hozzá tartozó berendezés;
2) meghatározott meteorológiai viszonyok, amiknél a rossz látási körülmények eljárásait bevezetik,

használják és befejezik; és
3) a rossz látási körülményeknél használatos földi jelölések / fényrendszer ismertetése.

**** AD 2.23. - Kiegészítő információk

A repülőtérre vonatkozó kiegészítő információk, olyanok, mint például a repülőtéren található madárcsoportok, kiegészítve a pihenőhely és táplálkozási hely közötti jelentős napi mozgások feltüntetésével, amennyire csak lehetséges.

**** AD 2.24. - A repülőtérrel kapcsolatos navigációs térképek

Itt követelik meg a repülőtérre vonatkozó térképek közzétételét, az alábbi sorrendben:
1) Repülőtér / Helikopter repülőtér Térkép – ICAO;
2) Légijármű Parkolási / Beállítási Térkép – ICAO;
3) Repülőtéri Földi Mozgások Térképe – ICAO;
4) Repülőtéri Akadály térkép – ICAO A típusú (minden egyes futópályára);
5) Repülőtéri Domborzati és Akadály Térkép – ICAO (Elektronikus formában);
6) Precíziós Megközelítési Domborzati Térkép – ICAO - (Precíziós megközelítés Cat II. és Cat III. üzemre alkalmas futópályákra);
7) Körzeti Térkép – ICAO (indulási és tranzit útvonalakhoz);
8) Szabványos Indulási Útvonalak Térképe – Műszeres (*SID*) – ICAO;
9) Körzeti Térkép – ICAO (érkezési és tranzit útvonalakhoz);
10) Szabványos Érkezési Útvonalak Térképe – Műszeres (*STAR*) – ICAO;
11) A Radarvektorálásnál használható Minimális Tengerszint feletti Magasságok Térképe – ICAO;
12) Műszeres Megközelítési Térkép – ICAO (minden egyes futópályára és eljárás típusra);
13) Látvarepülési Megközelítési Térkép – ICAO; és
14) A repülőtér közvetlen környezetében található madárkolóniák, élőhelyek.
Ha a térképek közül valamelyiket nem adják ki, akkor erre a tényre utalni kell a GEN 3.2 (Léginavigációs térképek) szakaszban.
Megjegyzés. – Az AIP-ben egy oldalzseb használható a Repülőtéri Domborzati és Akadály Térkép – ICAO (Elektronikus formában) (Aerodrome Terrain and Obstacle Chart – ICAO [Electronic]) *egy megfelelő elektronikus adathordozón történő tárolására.*

AD 3. – HELIKOPTER REPÜLŐTEREK

Amikor egy repülőtéren helikopterek leszállására szolgáló területet biztosítanak, akkor az ezzel összefüggő adatokat a "**** AD 2.16." pont alatt kell felsorolni.
*Megjegyzés: - **** behelyettesítendő a vonatkozó ICAO helységnév azonosítóval.*

**** AD 3.1. – A helikopter repülőtér helységnév azonosítója és neve

Itt követelik meg a helikopter repülőtér helységnév azonosítójának és nevének közzétételét. Egy ICAO helységnév azonosító szerves részét kell képezze az AD 3. fejezet minden alfejezetében alkalmazandó hivatkozási rendszernek.

**** AD 3.2. – A helikopter repülőtér földrajzi és üzemeltetői adatai

Megkövetelik a helikopter repülőtér földrajzi és adminisztratív adatainak közzétételét, az alábbiakat beleértve:
1) a helikopter repülőtér vonatkozási pontja (a földrajzi koordináták fokokban, percekben és másodpercekben) és elhelyezkedése;
2) a helikopter repülőtér vonatkozási pontjának iránya és távolsága a helikopter repülőtér által kiszolgált település (nagyváros, város) központjától;
3) a repülőtér tengerszint feletti magassága kerekítve a legközelebbi méterre, vagy lábra, valamint a

referencia hőmérséklet;
4) a Földalak (*Geoid*) hullámossága, egyenetlensége (*Geoid undulation*) a helikopter repülőtér tengerszint feletti magasságának helyén a legközelebbi méterre, vagy lábra kerekítve;
5) mágneses elhajlás a legközelebbi fokra kerekítve, az adat keletkezésének időpontja, és az éves változás;
6) a helikopter repülőtéri igazgatóság megnevezése, címe, telefax és telex számai és AFS (Légiforgalmi Állandóhelyű Szolgálat) címe;
7) milyen típusú forgalom számára engedik meg a helikopter repülőtér használatát (IFR / VFR); és
8) megjegyzések.

****** AD 3.3. – Üzemidő**

A helikopter repülőtéren található alábbi szolgálatok üzemidejének részletes leírása:
1) helikopter repülőtér igazgatóság;
2) a vámhivatal és a bevándorlási hivatal;
3) az egészségügyi és a közegészségügyi szolgálat;
4) AIS (*Aeronautical Information Services* - Légiforgalmi Tájékoztató Szolgálat) eligazító irodája
5) ATS (*Air Traffic Services* - Légiforgalmi Szolgálatok) bejelentő irodája (*ARO – ATS reporting office*);
6) MET (repülés meteorológia) eligazító iroda;
7) légiforgalmi szolgálatok (*Air Traffic Services*);
8) üzemanyag szolgáltatás;
9) földi kiszolgálás;
10) biztonsági szolgálatok;
11) jégtelenítés; és
12) megjegyzések.

****** AD 3.4. – Földi kiszolgálás és eszközei**

A helikopter repülőtéren rendelkezésre álló földi kiszolgálás és a földi kiszolgálás eszközeinek részletes leírása, beleértve az alábbiakat:
1) a teherárú kezelésére szolgáló létesítmények, eszközök, szolgáltatások;
2) a rendelkezésre álló üzemanyag és olajfajták;
3) az üzemanyag ellátás létesítményei, berendezései és kapacitásuk;
4) jégtelenítő létesítmények, berendezések, szolgáltatás;
5) hangár férőhelyek helikopterek átmeneti tárolására;
6) javítási szolgáltatások az átmenetileg itt tartózkodó helikopterek számára; és
7) megjegyzések.

****** AD 3.5. – Az utasok kiszolgálása és létesítményei**

A helikopter repülőtéren az utasok rendelkezésre álló létesítmények, berendezések, utas-kiszolgálás rövid leírása, az alábbiakat beleértve:
1) *szálloda (szállodák) a helikopter repülőtéren, vagy közvetlen környezetében;*
2) *étterem (éttermek) a helikopter repülőtéren, vagy közvetlen környezetében;*
3) *közlekedési, szállítási lehetőségek;*
4) egészségügyi létesítmények;
5) *bankok, postahivatalok a helikopter repülőtéren, vagy annak közvetlen környezetében;*
6) *idegenforgalmi iroda;* és
7) megjegyzések.

****** AD 3.6 – Mentő és tűzoltó szolgálatok**

A helikopter repülőtéren rendelkezésre álló (műszaki) mentési és tűzoltó szolgálatok és berendezések,

felszerelések részletes leírása, beleértve az alábbiakat:
1) a helikopter repülőtér tűzoltási kategóriája;
2) a műszaki mentés berendezései;
3) *a mozgásképtelenné vált helikopterek eltávolításának képessége, lehetősége;* és
4) megjegyzések.

****** AD 3.7. – Idényjellegű, időszakos használhatóság - hóeltakarítás**

A helikopter repülőtér mozgási területein a hóeltakarításra használt berendezéseknek, valamint a hóeltakarítás meghatározott elsőbbségi rendjének részletes leírása, az alábbiakat beleértve:
1) a hóeltakarításra használt eszköz(ök) típusa(i);
2) a hóeltakarítás sorrendje, elsőbbsége; és
3) megjegyzések.

****** AD 3.8. – Előterek, gurulóutak és ellenőrző helyek / pontok adatai**

Az előterek, gurulóutak és kijelölt ellenőrző pontok helyének/pozíciójának fizikai jellemzőivel kapcsolatos részletek, az alábbiakat beleértve:
1) a forgalmi előterek és a helikopter állóhelyek burkolata és teherbírása;
2) a helikopterek földi gurulására használatos gurulóutak szélessége, burkolatának kivitele, teherbírása és megnevezése;
3) a helikopter légi gurulóutak, valamint a légi tranzit útvonalak szélessége és jelölése;
4) a magasságmérő ellenőrzésére kijelölt pontok helyzetének meghatározása és a tengerszint feletti magassága, kerekítve a legközelebbi méterre, vagy lábra;
5) VOR ellenőrzésre kijelölt pontok helymeghatározása;
6) az INS (*Inertial Reference System* - Inerciális Referencia Rendszer) ellenőrzésére kijelölt pontok helyzetének meghatározása fokokban, percekben, másodpercekben és 1/100 másodpercekben; és
7) megjegyzések.
Ha az ellenőrző helyek / pontok szerepelnek egy helikopter repülőtér navigációs térképén, akkor erről a tényről információt kell biztosítani ebben az alfejezetben.

****** AD 3.9. – Jelölések és jelzések**

A végső megközelítési – és felszállási terület, valamint a gurulóutak jelöléseinek és jelzéseinek rövid leírása, az alábbiakat beleértve:
1) A végső megközelítési - és felszállási terület jelölései;
2) gurulóutak jelölései, légi gurulóutak jelzései, valamint a légi tranzit útvonalak jelzései; és
3) megjegyzések.

****** AD 3.10. – A helikopter repülőtéren található akadályok**

Az akadályok részletes ismertetése, az alábbiakat beleértve:
1) akadályok a 2-es számú Területen:
a) az akadály azonosítása, vagy neve;
b) az akadály típusa;
c) az akadály pozíciójának földrajzi koordinátái fokokban, percekben, másodpercekben és 1/10 másodpercekben;
d) az akadály tengerszint feletti magassága, és függőleges kiterjedése a legközelebbi méterre, vagy lábra kerekítve;
e) az akadály jelölése, és az akadályfények típusa, színe (ha van);
f) ha alkalmazható, akkor annak jelzése, hogy az akadályok listája hozzáférhető elektronikus formában és egy hivatkozás a GEN 3.1.6 pontra; és

g) NIL jelölés, ha alkalmazható.
Megjegyzés 1.- A 10. Fejezet 10.2.2 pontja tartalmazza a 2-es számú Terület meghatározását, míg a 8. Függelék, A8-2 ábrája grafikus formában szemlélteti az akadály adatok gyűjtésére használandó felületeket, valamint a 2-es számú Területen az akadályok azonosításának kritériumait.
Megjegyzés 2.- Az 2-es számú Területen az akadályok helyzetének (földrajzi hosszúság és szélesség), valamint tengerszint feletti magasságának / függőleges kiterjedésének meghatározását és jelentését (a terepen végzett munka pontosságát és az adatok integritását) szabályzó részletes előírások, értelemszerűen, a 11. Annex, 5. Függelék, 1. és 2. Táblázatában találhatóak, valamint a 14. Annex, II. Kötet, 1. Függelék, 1. és 2. Táblázatában.
2) akadályok a 3-as számú Területen:
a) az akadály azonosítása, vagy neve;
b) az akadály típusa;
c) az akadály pozíciójának földrajzi koordinátái fokokban, percekben, másodpercekben és 1/10 másodpercekben;
d) az akadály tengerszint feletti magassága, és függőleges kiterjedése a legközelebbi méterre, vagy lábra kerekítve;
e) az akadály jelölése, és az akadályfények típusa, színe (ha van);
f) ha alkalmazható, akkor annak jelzése, hogy az akadályok listája hozzáférhető elektronikus formában és egy hivatkozás a GEN 3.1.6 pontra; és
g) NIL jelölés, ha helyénvaló.
Megjegyzés 1.- A 10. Fejezet 10.2.3 pontja tartalmazza a 3-as számú Terület meghatározását, míg a 8. Függelék, A8-3 ábrája grafikus formában szemlélteti az akadály adatok gyűjtésére használandó felületeket, valamint az akadályok azonosításának kritériumait a 3-es számú Területen.
Megjegyzés 2.- Az 3-as számú Területen az akadályok helyzetének (földrajzi hosszúság és szélesség), valamint tengerszint feletti magasságának / függőleges kiterjedésének meghatározását és jelentését (a terepen végzett munka pontosságát és az adatok integritását) szabályzó részletes előírások, értelemszerűen, a 14. Annex, II. Kötet, 1. Függelék, 1. és 2. Táblázatában találhatók.

****** AD 3.11 – A biztosított meteorológiai tájékoztatás**

A helikopter repülőtéren biztosított meteorológiai tájékoztatások részletes leírása, valamint annak jelzése, hogy melyik meteorológiai iroda felelős a felsorolt szolgáltatások biztosításáért, beleértve a következőket:
1) a kapcsolódó meteorológiai iroda megnevezése;
2) üzemidő, és ahol ez alkalmazható, az ezen az időszakon túl felelős meteorológiai irodának a megnevezése;
3) a TAF-ok összeállításáért felelős iroda megnevezése és az előrejelzések érvényességi időszakai;
4) a helikopter repülőtér számára rendelkezésre álló trend típusú előrejelzések és a kiadásának időintervallumai;
5) információk arról, hogy az eligazításokat és/vagy konzultációkat milyen módon biztosítják;
6) a biztosított repülési dokumentáció típusai és a repülési dokumentációban használt nyelv(ek);
7) az eligazítás, vagy konzultáció idején bemutatott, vagy rendelkezésre álló térképek és egyéb információ;
8) olyan kiegészítő berendezések, melyek segítségével a meteorológiai körülményekről információkat biztosíthatnak, ilyenek lehetnek a meteorológiai radar és vevő a meteorológiai műhold által biztosított képi ábrázolásokhoz;
9) a meteorológiai információval ellátott Légiforgalmi Szolgálati Egység(ek) (*Air Traffic Services Unit(s)*); és
10) további információk (pl. a szolgálat bármilyen fajta korlátozásáról, stb.).

****** AD 3.12. – A helikopter repülőtér adatai**

A helikopter repülőtér méreteinek és kapcsolódó adatainak részletes leírása, az alábbiakat beleértve:

1) a helikopter repülőtér típusa – talajszinten, kiemelkedésen, vagy külön az erre a célra készített emelvényen (*helideck*);
2) földetérési és elemelkedési (TLOF – *touchdown and lift-off*) terület méretei a legközelebbi méterre, vagy lábra kerekítve;
3) a végső megközelítési és felszállási terület (FATO – *final approach and take-off*) földrajzi irányszöge 1/100 fokra kerekítve;
4) a végső megközelítési és felszállási terület (FATO) terület mérete a legközelebbi méterre, vagy lábra kerekítve és a burkolat típusa;
5) a földetérési és elemelkedési (TLOF) terület burkolatának teherbíró képessége és felületi nyomószilárdsága tonnákban (1 000 kg)
6) a földetérési és elemelkedési (*TLOF*) terület, vagy a végső megközelítési és felszállási (*FATO*) terület mindegyik küszöbe mértani középpontjának (ahol alkalmazható) földrajzi koordinátái fokokban, percekben, másodpercekben és 1/100 másodpercekben, valamint a (*Geoid*) Földalak hullámossága, egyenetlensége (*Geoid undulation*) a legközelebbi 1/2 méterre, vagy lábra kerekítve;
7) a TLOF és/vagy FATO terület lejtése és tengerszint feletti magassága:
· a nem precíziós bevezetések esetén a legközelebbi méterre, vagy lábra kerekítve; és
· a precíziós bevezetések esetén a legközelebbi 1/2 méterre, vagy lábra kerekítve;
8) a biztonsági terület méretei;
9) a helikopter felszállási biztonsági, akadálymentességi sáv mérete a legközelebbi méterre, vagy lábra kerekítve;
10) az akadálymentességi szektor megléte, és
11) megjegyzések.

**** AD 3.13. – Közzétett távolságok

A közzétett, meghatározott távolságok kerekítve a legközelebbi méterre, vagy lábra, ahol ez a helikopter repülőtérre alkalmazható, beleértve az alábbiakat:
1) TODA – az igénybe vehető felszállási távolság;
2) a megszakított felszállásra igénybe vehető távolság;
3) LDA – az igénybe vehető leszállási távolság; és
4) megjegyzések;

**** AD 3.14. – Bevezető és FATO fények

A bevezető és a FATO fények részletes leírása, beleértve az alábbiakat:
1) a bevezető, megközelítési fényrendszer típusa, hosszúsága és intenzitása;
2) a VASIS (*Visual Approach Slope Indicator System* - Optikai Siklópálya Jelző Rendszer) típusa;
3) a végső megközelítési és felszállási (FATO) terület fényeinek elhelyezkedése és jellemzői;
4) a bevezetési pont fényeinek (a FATO-n található, háromszöggel jelölt felület) elhelyezkedése és jellemzői;
5) a földetérési és elemelkedési (TLOF) terület fényrendszerének elhelyezkedése és jellemzői; és
6) megjegyzések.

**** AD 3.15. – Egyéb fények, tartalék energia ellátás

Az egyéb fények, és a tartalék energia ellátás részletes leírása, az alábbiakat beleértve:
1) a helikopter repülőtéri fényjeladó / azonosító fényjeladó telepítési helye, jellemzői, és üzemideje;
2) a szélsebesség kijelző (WDI – *Wind Direction Indicator*) telepítési helye és megvilágítása;
3) a gurulóutak szegély - és középvonal fényei;
4) a tartalék áramellátás beleértve az átkapcsolási időt is; és
5) megjegyzések.

**** AD 3.16. – A Légiforgalmi Szolgálatok légtere

A helikopter repülőtéren kialakított Légiforgalmi Szolgálatok (ATS) légterének részletes leírása, beleértve az alábbiakat:
1) a légtér megnevezését és oldalhatárainak földrajzi koordinátáit fokokban, percekben és másodpercekben megadva;
2) függőleges határait;
3) a légtér osztályba sorolását;
4) a szolgálatot biztosító ATS egység hívójelét és a használható nyelvet (nyelveket);
5) az átváltási magasságot; és
6) megjegyzéseket.

**** AD 3.17. – A Légiforgalmi Szolgálatok hírközlési berendezései

A helikopter repülőtéren kialakított Légiforgalmi Szolgálatok hírközlési berendezéseinek részletes leírása, az alábbiakat beleértve:
1) a szolgálat megnevezése;
2) hívójele;
3) frekvenciája (frekvenciái);
4) üzemidő; és
5) megjegyzések.

**** AD 3.18. – Rádió-navigációs és leszállító berendezések

A helikopter repülőtéren a műszeres megközelítéssel és a közelkörzeti eljárásokkal összefüggő rádiónavigációs és leszállító berendezések részletes leírása, az alábbiakat beleértve:
1) a berendezés típusa és a mágneses elhajlás (*VOR* számára a telepítési hely mágneses deklinációja /*Station declination*/, melyet a berendezés műszaki beállítására használnak fel) a legközelebbi fokra kerekítve, valamint a ILS, MLS, alap GNSS, SBAS és GBAS üzemeltetés típusai;
2) azonosító, ha szükséges;
3) frekvencia (frekvenciák), értelemszerűen;
4) üzemideje, értelemszerűen;
5) az adásra használt antenna telepítési helyének földrajzi koordinátái fokokban, percekben, másodpercekben és 1/10 másodpercekben megadva, értelemszerűen;
6) a DME berendezés adó-antennájának tengerszint feletti magassága, kerekítve a legközelebbi 30 méterre (100 lábra), valamint a DME/P antennáé a legközelebbi 3 méterre (10 lábra); és
7) megjegyzések.
Abban az esetben, amikor ugyanazt a berendezést használják útvonalrepülési és helikopter repülőtéri célokra is, akkor ennek leírását meg kell adni az ENR 4. fejezetben is. Ha a Földi Bázisú (telepítésű) Kiterjesztő Rendszer (GBAS - *Ground Based Augmentation System*) több, mint egy helikopter repülőteret szolgál ki, akkor a berendezés leírását valamennyi repülőtérnél biztosítani kell. Amennyiben a berendezést üzemeltető hatóság nem ugyanaz, mint a kijelölt állami szervezet, akkor az üzemeltető hatóság nevét a megjegyzés rovatban fel kell tüntetni. A berendezés hatótávolságát jelezni kell a megjegyzés rovatban.

**** AD 3.19. – A forgalmat érintő helyi előírások, rendelkezések

A helikopter repülőtér forgalmára vonatkozó előírások részletes leírása, beleértve a guruló helikopterek szabvány gurulási nyomvonalát, beállítási, parkolási előírásokat, oktató és kiképző repüléseket, valamint a hasonló, de kizárt, visszautasított repülési eljárásokat.

**** AD 3.20. – Zajcsökkentő eljárások

A helikopter repülőtéren alkalmazott zajcsökkentő eljárások részletes leírása.

**** AD 3.21 – Repülési eljárások

A helikopter repülőtéren, a légtérszervezés alapján kialakított feltételek és a kijelölt repülési eljárások, beleértve a radar és / vagy ADS-B eljárásokat is. Ha ki van alakítva, a repülőtéren a rossz látási körülmények eljárásainak részletes bemutatása, az alábbiakat beleértve:
1) a rossz látási körülmények között használatra engedélyezett földetérési és elemelkedési terület(ek) (TLOF – touchdown and lift-off area(s)) és a hozzá tartozó berendezés;
2) meghatározott meteorológiai viszonyok, amiknél a rossz látási körülmények eljárásait bevezetik, használják és befejezik; és
3) a rossz látási körülményeknél használatos földi jelölések / fényrendszer ismertetése.

**** AD 3.22 – Kiegészítő információk

A helikopter repülőtérre vonatkozó kiegészítő információk, olyanok, mint például a repülőtéren található madárcsoportok, kiegészítve a pihenőhely és táplálkozási hely közötti jelentős napi mozgások feltüntetésével, amennyire csak lehetséges.

**** AD 3.23 – A helikopter repülőtérrel kapcsolatos térképek

Itt követelik meg a helikopter repülőtérre vonatkozó térképek közzétételét, az alábbi sorrendben:
1) Repülőtér / Helikopter repülőtér Térkép – ICAO;
2) Körzeti Térkép – ICAO (indulási és tranzit útvonalak);
3) Szabványos Indulási Útvonalak Térképe – Műszeres (*SID*) – ICAO;
4) Körzeti Térkép – ICAO (érkezési és tranzit útvonalak);
5) Szabványos Érkezési Útvonalak Térképe – Műszeres (*STAR*) – ICAO;
6) A Radarvektorálásnál használható Minimális Tengerszint feletti Magasságok Térképe – ICAO;
7) Műszeres Megközelítési Térkép – ICAO (minden egyes eljárás típusra);
8) Látvarepülési Megközelítési Térkép – ICAO; és
9) A helikopter repülőtér közvetlen környezetében található madárkolóniák.
Ha a térképek közül valamelyiket nem adják ki, akkor erre a tényre utalni kell a GEN 3.2 (Léginavigációs térképek) szakaszban.

A tűzhányó aktivitás riasztási szintjét jelző színkód	A tűzhányó aktivitásának állapota
ZÖLD RIASZTÁS	A tűzhányó nem működik, normális állapotban van, vagy *egy magasabb riasztási szintről történő változás után*: úgy vélik, hogy a tűzhányó aktivitása szünetel, és a tűzhányó visszatért normális állapotába.
SÁRGA RIASZTÁS	A vulkán az ismert háttér szintek fölé nyugtalan állapotának jeleit eregeti, vagy *egy magasabb riasztási szintről történő változás után*: a tűzhányó aktivitása jelentősen csökkent, de folyamatosan megfigyelés alatt kell tartani a lehetséges újra kezdődő erősödés miatt.
NARANCS RIASZTÁS	A vulkán megnövekedett valószínűségű kitörésének súlyosbodó jeleit mutatja, vagy a vulkán kitörése folyamatban van kicsi, vagy semmilyen hamu kibocsátással *[határozzák meg a hamu nyúlvány magasságát, ha lehetséges]*.
VÖRÖS RIASZTÁS	A vulkán kitörése minden percben bekövetkezhet jelentős hamu kibocsátással az atmoszférába, vagy a vulkán kitörése folyamatban van jelentős hamu kibocsátással az atmoszférába *[határozzák meg a hamu nyúlvány magasságát, ha lehetséges]*.

Megjegyzés. – Az érintett Állam területén a Körzeti Irányító Központ számára az illetékes vulkanológiai szervezetnek kell biztosítania a tűzhányó aktivitás riasztási szintjét jelző színkódot, és a korábbi szintben beálló bármilyen változást, pl. "RED ALERT FOLLOWING YELLOW" , vagy "GREEN ALERT FOLLOWING ORANGE", azaz "VÖRÖS RIASZTÁS A SÁRGA UTÁN", *vagy* "ZÖLD RIASZTÁS A NARANCS UTÁN".

3.6. F adatelem - Ha az üzemeltetésre jelentős hatású vulkáni hamufelhőt jelentettek, jelezni kell a vulkáni hamufelhő vízszintes kiterjedését a földrajzi szélesség / hosszúság felhasználásával (teljes fokokban kifejezve), a hamufelhő alsó/felső szintjét a tengerszinthez viszonyítva (*altitude*) 1000 méterben (lábban), és/vagy a kibocsátó vulkánhoz viszonyított radiállal és távolsággal. A tájékoztatást kezdetben csupán a különleges légi-jelentésekre is alapozhatják, de az illetékes meteorológiai figyelő állomásoktól és/vagy a Vulkáni Hamufelhők Tanácsadói Központjaitól (*Volcanic Ash Advisory Centre/s/*) származó értesítések jó alapot szolgáltathatnak a későbbi részletesebb tájékoztatások számára.
3.7. G adatelem – az illetékes meteorológiai megfigyelő állomásoktól és/vagy a Vulkáni Hamufelhők Tanácsadói Központjától származó értesítésekre alapozva jelezni kell a vulkáni hamufelhő mozgásának várható irányát a kiválasztott repülési szinteken.
3.8. H adatelem – jelezni kell azokat a repülési útvonalakat és repülési útvonal szakaszokat, valamint repülési szinteket, amelyeket a természeti jelenség érint, vagy várhatóan érinteni fog.
3.9. I adatelem – jelezni kell a légtér, a repülési útvonalak, vagy útvonalszakaszok zárását, valamint a rendelkezésre álló elkerülő útvonalak lehetőségét.
3.10. J adatelem – az információforrás jelzése, például "különleges légi-jelentés" ("*special air-report*"), vagy "vulkanológiai szervezet" ("*vulcanological agency*"), stb. Az információ forrását minden esetben fel kell tüntetni, akár éppen kitört egy vulkán, vagy egy vulkáni hamufelhőt jelentettek, akár nem.
3.11. K adatelem – az előző pontokhoz kiegészítésképpen, nyílt szöveggel leírva, bármely üzemeltetési szempontból fontos, lényeges információ.

5) HATÁSKÖR, TÁRGYKÖR (*SCOPE*)

A = Repülőtér *(Aerodrome)*
E = Útvonal *(En-route)*
W = Navigációs figyelmeztetés *(Nav Warning)*
K = Ez a NOTAM egy ellenőrző jegyzék.
Megjegyzés.– A NOTAM tárgyától és tartalmától függően a hatáskör, tárgykör (SCOPE) minősítő mezőben összetett minősítők is lehetnek. A lehetséges kombinációk a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Aeronautical Information Services Manual - Doc 8126), *a NOTAM Kiválasztás Követelményeiben találhatóak.*
Ha a hatáskört AE-nek minősítik, akkor a repülőtér helységnév azonosítóját az A) adattételben kell jelenteni.

6) és 7) ALSÓ/FELSŐ HATÁR (*LOWER/UPPER*)

Az ALSÓ és FELSŐ határokat mindig ki kell tölteni és mindig repülési szintben (FL) kell megadni. Navigációs figyelmeztetések és légtér korlátozások esetén, a közölt értékeknek meg kell egyezniük az F) és a G) adatelemekben megadottakkal.
Ha az adatelem nem tartalmaz pontosan meghatározott magassági információt, "000"-t kell az ALSÓ értéknek, és "999"-et a FELSŐ értéknek beállítani, mint alapértelmezés szerinti értéket.

8) KOORDINÁTÁK, SUGÁR (*COORDINATES, RADIUS*)

A földrajzi szélesség és hosszúság 1 perc pontossággal megadva, valamint egy három számjeggyel meghatározott távolsági érték, mely tengeri mérföldben adja meg a hatókör sugarát, (például: 4700N01140E043). A koordináták egy kör közepét adják meg, megközelítő pontossággal, melynek sugara körülzárja a hatókör teljes területét és ha a NOTAM a teljes FIR/UIR-re vonatkozik, vagy több, mint egy FIR/UIR-re, akkor a rádiusz helyére a "999" alapértelmezés szerinti értéket kell beírni.

4. A) adatelem
Ide annak a repülőtérnek, vagy FIR-nek az ICAO helységnév azonosítóját kell beírni – ahogy azt a Helységnév Azonosítók *(Locations Indicators – ICAO Doc 7910)* című kiadvány tartalmazza – ahol a jelentésbe foglalt berendezés, légtér, vagy körülmény megtalálható. Amennyiben szükséges, nemcsak egy, hanem több FIR/UIR is megnevezhető. Amennyiben nem áll rendelkezésre megfelelő ICAO helységnév azonosító, akkor használja az ICAO által biztosított, az államot azonosító betűket, ahogy azt a Helységnév Azonosítók *(Locations Indicators – ICAO Doc 7910)* című kiadvány 2. Része tartalmazza, valamint "XX" betűket, majd a későbbiek során az E) adatelemben nyílt szöveggel kell megadni a nevet.
Ha a tájékoztatás GNSS-re vonatkozik, az adott GNSS egységnek kiosztott megfelelő ICAO telepítés azonosítót, vagy a GNSS összes egységére vonatkozó közös telepítés azonosítót kell beírni (kivéve GBAS).
Megjegyzés. - GNSS esetén a telepítés azonosítót fel lehet használni egy GNSS egység üzemkiesésének azonosítására (például, a KNMH egy GPS műhold üzemszünetét jelenti).
5. B) adatelem
A dátum/idő csoport céljára egy tíz számból álló adatcsoportot kell használni, UTC-ben megadva az évet, hónapot, napot, órát és perceket. Ez a bejegyzés annak a dátum/időpont-nak a jelzése, amikor a NOTAMN, NOTAMR, vagy NOTAMC hatályba lép.
6. C) adatelem
A NOTAMC kivételével, itt egy dátum/idő adatcsoportot kell alkalmazni, (ez egy tíz számból álló adatcsoport, amely UTC-ben adja meg az évet, hónapot, napot, órát és perceket), mely feltünteti az információ érvényességének idejét, kivéve, ha az információ állandó természetű, mely esetben az adatcsoport helyére a "PERM" rövidítést kell illeszteni. Ha az időzítési információ még bizonytalan, akkor az érvényesség idejét egy dátum/idő adatcsoport alkalmazásával csak hozzávetőlegesen kell megadni, melyet az "EST" rövidítés kövessen. Minden olyan NOTAM-ot, mely tartalmazza az "EST" rövidítést, a későbbiek folyamán törölni kell, vagy le kell cserélni egy másik NOTAM-mal, még a C) adatelemben meghatározott dátum/idő adatcsoporttal megadott időpont előtt.
7. D) adatelem
Ha a jelentett veszély, üzemeltetési állapot, vagy berendezésekre vonatkozó kikötések, feltételek a megadott idő- és dátum ütemezés szerinti időszakokban lesznek érvényben, a B) és C) adatelemben közölt dátum/idő adatcsoport által meghatározott időpontok között, akkor az ilyen információkat a D) adatelemben kell jelezni. Ha a D) adatelem hossza meghaladná a 200 karaktert, akkor meg kell fontolni annak lehetőségét, hogy az ilyen információról szóló tájékoztatást önálló NOTAM-ban adják ki.
Megjegyzés.– A D) adatelem tartalmának egyeztetett, harmonizált meghatározásával kapcsolatos útmutató anyag a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében (Aeronautical Information Services Manual – Doc 8126) található.
8. E) adatelem
A kifejtett, dekódolt NOTAM kódot kell használni, ahol szükséges, kiegészítve azt az ICAO rövidítésekkel, jelzésekkel, azonosítókkal, elnevezésekkel, hívójelekkel, frekvenciákkal, számokkal és nyílt szöveges információval. Amennyiben a NOTAM-ot nemzetközi terjesztésre szánják, a nyílt szöveges részeknek a szöveget angolul kell tartalmazniuk. Ennek a bejegyzésnek érthetőnek és tömörnek kell lennie, hogy megfelelő, alkalmas PIB bejegyzést (Repülés Előtti Hivatalos Közlemény - *Pre-Flight Information Bulletins*) biztosítson.
NOTAMC (*cancellation* - törlés, érvénytelenítés) esetén a tárgyra vonatkozóan utalást, valamint állapotáról jelentést kell tartalmaznia, hogy ezzel lehetővé tegye a gondos valószínűség ellenőrzést.
9. F) és G) adatelemek
Ezek az elemek általában a navigációs figyelmeztetések, vagy a légtér korlátozások esetén használhatóak, és rendszerint részét képzik a PIB (Repülés Előtti Bulletinek - *Pre-Flight Information Bulletins*) bejegyzéseknek. Be kell jegyezni a tevékenység, vagy korlátozás alsó és felső magassági határát, egyértelműen feltüntetve a referencia alapadatot és a mérés mértékegységét.
Megjegyzés.- A NOTAM-okra példákat a Légiforgalmi Tájékoztató Szolgálatok Kézikönyvében *(Aeronautical Information Services Manual – Doc 8126) és a* Légiforgalmi Szolgálatok Eljárásai – ICAO

Rövidítések és Kódok *kiadványban (Procedures for Air Navigation Services – ICAO abbreviations and Codes - PANS-ABC, Doc 8400) található.*

[34]ez megegyezik az adott VOR telepítési pontjának mágneses elhajlásával, mert a VOR berendezés nulla fokos radiálja a mágneses északi irányhoz van kalibrálva, kivéve Kanada északi területeit.

ANNEX 18.
Veszélyes áruk biztonságos légiszállítása

3. kiadás – 2001. július
9. módosítással

A Nemzetközi Polgári Repülésről szóló Egyezményhez
Ez a kiadás magában foglal a Tanács által 2001. március 8. előtt elfogadott minden módosítást és 2001. november 1-től a 18. Annex minden korábbi kiadásának helyébe lép.

A szabványok és az ajánlott gyakorlatok alkalmazási eljárásaira vonatkozó tájékoztatás az Előszóban és az egyes Fejezetek vonatkozó záradékaiban olvasható.

Nemzetközi Polgári Repülési Szervezet

ICAO

„A" Táblázat - a 18. Annex módosításai

Módosítás	*Forrása(i)*	*Tárgya(i)*	*Jóváhagyva* *Hatályba lép* *Alkalmazandó*
1. Kiadás	A Légi-navigációs Bizottság Tanulmánya		1981. jún. 26. 1983. jan. 1. 1984. jan. 1.
1.	A Veszélyes Anyagok Munkabizottság 6. ülése	Különféle módosítások az Egyesült Nemzetek szakértői bizottsága és az IAEA ajánlásai közötti egyezőség kialakítására	1982. nov.26. 1983. már.26. 1984. jan. 1.
2.	A Veszélyes Anyagok Munkabizottság 5., 6. és 7. ülése	A "Gyűjtő csomagolás" és az "egység rakodóeszköz" meghatározás pontosítása. A csomag és csomagolás meghatározások egységessé tétele az Egyesült Nemzetek Szakértői Bizottságának ajánlásaival. Újabb, a repülőtérre, vagy repülőtérről történő felszíni szállításra vonatkozó szakasz beiktatása. A „parancsnok pilóta tájékoztatása" követelmény módosítása, hogy jelezze, mikor kell e tájékoztatást biztosítani.	1983. jún. 1. 1983. okt. 1. 1984. jan. 1.
3.	A Veszélyes Anyagok Munkabizottság 8. ülése	A felmentés adhatóság körülményeinek tisztázása. A mérgező és fertőző anyagok állattól és élelmiszertől való elkülönítési követelményeinek tisztázása.	1985. márc. 25. 1985. júl. 29. 1986. jan. 1.
4. (2. Kiadás)	A Veszélyes Anyagok Munkabizottság 11. ülése	A 18. Annex rendelkezéseinek általános egyszerűsítése a technikai részletek eltávolítása révén. Különféle rendelkezések különféle módosítása.	1989. febr. 24. 1989. júl. 23. 1989. nov. 16.
5.	A Veszélyes Anyagok Munkabizottság 14. és 16. ülése	Az állami szere nyomatékosítása, miszerint felelős a Veszélyes Anyagok Biztonságos Légi-szállításának Technológiai Utasítása (Doc 9284) bármiféle	1999. márc. 10. 1999. júl. 19.

Módosítás	*Forrása(i)*	*Tárgya(i)*	*Jóváhagyva Hatályba lép Alkalmazandó*
		módosítása esetén az egyezés megvalósításáért. Az utas és a személyzet által vitt veszélyes anyagokra vonatkozó kivételek egyértelművé tétele.	1999. nov. 4.
6 (3. Kiadás)	A Veszélyes Anyagok Munkabizottság 17. ülése és a 6. Annex I. kötet 25. módosítása	a) a következő meghatározások módosítása: veszélyes anyag, személyzeti tag és parancsnok pilóta; b) Különleges körülmények között az átrepülendő államot felmentésadásra kötelező rendelkezések módosítása, elősegítendő a veszélyes anyag szállítást a területét átrepülő légi-járművön; c) a csomagolási rendelkezések összehangolása a Technológia Utasításban szereplőkkel; d) a veszélyes anyagok Technológiai Utasítás szerinti berakodásának és tárolásának követelményét lefedő rendelkezések beiktatása; e) rendelkezések módosítása az utas tájékoztatás teljes felelősségének az államra terhelése céljából; f) rendelkezések módosítása, biztosítandó, hogy a vészhelyzeti műveleti személyzet baleset, vagy esemény alkalmával késedelem nélkül kapjon tájékoztatást a légi-járművön rakományként szállított veszélyes anyagokról; g) rendelkezések módosítása a veszélyes anyagszállítás előírásait szándékosan megsértő szállítmányozókkal szemben teendő lépések tekintetében az államok közötti együttműködés fokozására; és h) vészhelyzetben a pilótát a fedélzeten lévő veszélyes anyagokról tájékoztatás adásra kötelező rendelkezések módosítása.	2001. márc. 7. 2001. júl. 16. 2001. nov. 1.
7	A Veszélyes Anyag Munkabizottság tizennyolcadik találkozója	a) az ICAO értesítése a veszélyes anyagért felelős nemzeti hatóságról b) veszélyes anyagra vonatkozó vészhelyzeti reagálási tájékoztatás biztosítása	2003. február 24. 2003. július 14. 2003. november 27.
8	A veszélyes Anyag Panel tizenkilencedik találkozója	a) a 9.6.1 pont finomítása világossá téve, hogy veszélyes anyag jelenlétéről csak akkor kell jelentést tenni, ha súlyos esemény történt, amelyben veszélyes anyag valószínűleg érintve volt; és b) Új, 13. Fejezet létrehozása előírva az államnak, hogy alakítson ki veszélyes anyagokkal kapcsolatos védelmi intézkedéseket.	2005. február 16. 2005. július 11. 2005. november 24.
9	A veszélyes Anyag Panel huszadik találkozója	A veszélyes anyaggal történt esemény és baleset kivizsgálással kapcsolatos (12. Fejezetben lévő) rendelkezések kiterjesztése a tévesen-, vagy be nem vallott veszélyes anyagok eseteire.	2007. február 19. 2007. július 16. 2008. november 20.

12. FEJEZET - VESZÉLYES ANYAGGAL TÖRTÉNT BALESET ÉS ESEMÉNY JELENTÉSE

12.1 Veszélyes anyagot érintő légi-jármű balesetek és repülőesemények ismételt előfordulásának megakadályozása érdekében a szerződő állam hozzon létre eljárásokat a felségterületén előfordult, más államból származó, vagy más államba tartó veszélyes anyag szállítását érintő légi-jármű balesetek, repülőesemények kivizsgálására és az ezzel kapcsolatos információk összeállítására. Az ilyen légi-jármű balesetről és repülőeseményről szóló jelentést a Technológiai Kézikönyv részletes előírásainak megfelelően kell elkészíteni.

12.2 **Ajánlás. –** Veszélyes anyagot érintő légi-jármű balesetek és repülőesemények ismételt előfordulásának megakadályozása érdekében a szerződő állam létesítsen eljárásokat a 12.1-ben nem szereplő egyéb ilyen, saját felségterületen előforduló baleset és repülőesemény kivizsgálására és az azzal kapcsolatos információk összeállítására. Az ilyen légi-jármű balesetekről és repülőeseményről szóló jelentést a Technológiai Kézikönyv részletes előírásainak megfelelően kell elkészíteni.

12.3 A légi rakományban lévő tévesen-, vagy be nem vallott veszélyes anyag estek ismételt előfordulásának megakadályozására a szerződő állam hozzon létre eljárásokat a felségterületén előfordult, más államból származó, vagy más államba tartó veszélyes anyag szállítását érintő esetek kivizsgálására és az ezzel kapcsolatos információk összeállítására. Az ilyen esetekről szóló jelentést a Technológiai Kézikönyv részletes előírásainak megfelelően kell elkészíteni.

12.4 **Ajánlás. –** A légi rakományban lévő tévesen-, vagy be nem vallott veszélyes anyag estek ismételt előfordulásának megakadályozására a szerződő állam létesítsen eljárásokat a 12.3-ban nem szereplő egyéb ilyen, saját felségterületen előforduló esetek kivizsgálására és az azzal kapcsolatos információk összeállítására. Az ilyen esetekről szóló jelentést a Technológiai Kézikönyv részletes előírásainak megfelelően kell elkészíteni.

A Magyar Közlönyt szerkeszti a Miniszterelnöki Hivatal, a Szerkesztőbizottság közreműködésével. A Szerkesztőbizottság elnöke: dr. Petrétei József. A szerkesztésért felelős: dr. Tordai Csaba. Budapest V., Kossuth tér 1–3.
Kiadja a Magyar Közlöny Lap- és Könyvkiadó. Felelős kiadó: dr. Kodela László elnök-vezérigazgató.
Budapest VIII., Somogyi Béla u. 6., www.mhk.hu. Telefon: 266-9290.
A papír alapon terjesztett Magyar Közlöny a kormányzati portálon közzétett hiteles elektronikus dokumentum oldalhű másolata.
A Határozatok Tára hivatalos lap tartalma a Magyar Közlöny IX. részében jelenik meg.

Előfizetésben megrendelhető a Magyar Közlöny Lap- és Könyvkiadónál
Budapest VIII., Somogyi Béla u. 6., 1394 Budapest 62. Pf. 357, vagy faxon 318-6668.
Előfizetésben terjeszti a Magyar Közlöny Lap- és Könyvkiadó a Magyar Posta Zrt. közreműködésével.
Telefon: 235-4554, 266-9290/240, 241 mellék. Terjesztés: tel.: 317-9999, 266-9290/245 mellék.
Példányonként megvásárolható a Budapest VIII., Somogyi Béla u. 6. szám alatti Közlönyboltban (tel.: 318-8411), illetve megrendelhető a kiadó ügyfélszolgálatán (fax: 318-6668, 338-4746, e-mail: kozlonybolt@mhk.hu) vagy a www.mhk.hu/kozlonybolt internetcímen.
2009. évi éves előfizetési díj: 151 452 Ft. Egy példány ára: 315 Ft 16 oldal terjedelemig, utána +8 oldalanként +270 Ft.
