- *for UN No. 1078 refrigerant gas, n.o.s.: mixture F1, mixture F2, mixture F3;*
- *for UN No. 1060 methylacetylene and propadiene mixtures, stabilized: mixture P1, mixture P2;*
- *for UN No. 1965 hydrocarbon gas mixture, liquefied, n.o.s.: mixture A or butane, mixture A01 or butane, mixture A02 or butane, mixture A0 or butane, mixture A1, mixture B1, mixture B2, mixture B, mixture C or propane;*
- *for UN No. 1010 Butadienes, stabilized: 1,2-Butadiene, stabilized, 1,3-Butadiene, stabilized.*

vehicle registration code (VRI Code)² of the country of origin of design and either the name of the manufacturer or other identification of the packaging specified by the competent authority of the country of origin of design.

5.2.1.7.5 Each package which conforms to a design approved by the competent authority shall be legibly and durably marked on the outside of the packaging with:

- (a) the identification mark allocated to that design by the competent authority;
- (b) a serial number to uniquely identify each packaging which conforms to that design;
- (c) in the case of a Type B(U) or Type B(M) package design, with "TYPE B(U)" or "TYPE B(M)"; and
- (d) in the case of a Type C package design, with "TYPE C".

5.2.1.7.6 Each package which conforms to a Type B(U), Type B(M) or Type C package design shall have the outside of the outermost receptacle which is resistant to the effects of fire and water plainly marked by embossing, stamping or other means resistant to the effects of fire and water with the trefoil symbol shown in the figure below.

Basic trefoil symbol with proportions based on a central circle of radius X .
The minimum allowable size of X shall be 4 mm.

² Distinguishing sign for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

5.2.1.7.7 Where LSA-I or SCO-I material is contained in receptacles or wrapping materials and is carried under exclusive use as permitted by 4.1.9.2.3, the outer surface of these receptacles or wrapping materials may bear the marking "RADIOACTIVE LSA-I" or "RADIOACTIVE SCO-I", as appropriate.

5.2.1.7.8 In all cases of international carriage of packages requiring competent authority design or shipment approval, for which different approval types apply in the different countries concerned by the shipment, marking shall be in accordance with the certificate of the country of origin of the design.

5.2.1.8 *Special marking provisions for environmentally hazardous substances*

5.2.1.8.1 Packages containing environmentally hazardous substances meeting the criteria of 2.2.9.1.10 shall be durably marked with the environmentally hazardous substance mark shown in 5.2.1.8.3 with the exception of single packagings and combination packagings where such single packagings or inner packagings of such combination packagings have:

- a quantity of 5 l or less for liquids; or
- a net mass of 5 kg or less for solids.

5.2.1.8.2 The environmentally hazardous substance mark shall be located adjacent to the markings required by 5.2.1.1. The requirements of 5.2.1.2 and 5.2.1.4 shall be met.

5.2.1.8.3 The environmentally hazardous substance mark shall be as shown below. The dimensions shall be 100 mm × 100 mm, except in the case of packages of such dimensions that they can only bear smaller marks.

Symbol (fish and tree): black on white or suitable contrasting background

NOTE: The labelling provisions of 5.2.2 apply in addition to any requirement for packages to bear the environmentally hazardous substance mark.

5.2.1.9 *Orientation arrows*

5.2.1.9.1 Except as provided in 5.2.1.9.2:

- Combination packagings having inner packagings containing liquids;
- Single packagings fitted with vents; and
- Cryogenic receptacles intended for the carriage of refrigerated liquefied gases,

shall be legibly marked with package orientation arrows which are similar to the illustration shown below or with those meeting the specifications of ISO 780:1997. The orientation arrows shall appear on two opposite vertical sides of the package with the arrows pointing in the correct upright direction. They shall be rectangular and of a size that is clearly visible

commensurate with the size of the package. Depicting a rectangular border around the arrows is optional.

Two black or red arrows on white or suitable contrasting background.
The rectangular border is optional.

5.2.1.9.2 Orientation arrows are not required on:

- (a) Outer packagings containing pressure receptacles except cryogenic receptacles;
- (b) Outer packagings containing dangerous goods in inner packagings each containing not more than 120 ml, with sufficient absorbent material between the inner and outer packagings to completely absorb the liquid contents;
- (c) Outer packagings containing Class 6.2 infectious substances in primary receptacles each containing not more than 50 ml;
- (d) Type IP-2, type IP-3, type A, type B(U), type B(M) or type C packages containing Class 7 radioactive material;
- (e) Outer packagings containing articles which are leak-tight in all orientations (e.g. alcohol or mercury in thermometers, aerosols, etc.); or
- (f) Outer packagings containing dangerous goods in hermetically sealed inner packagings each containing not more than 500 ml.

5.2.1.9.3 Arrows for purposes other than indicating proper package orientation shall not be displayed on a package marked in accordance with this sub-section.

5.2.2 Labelling of packages

5.2.2.1 Labelling provisions

5.2.2.1.1 For each article or substance listed in Table A of Chapter 3.2, the labels shown in Column (5) shall be affixed unless otherwise provided for by a special provision in Column (6).

5.2.2.1.2 Indelible danger markings corresponding exactly to the prescribed models may be used instead of labels.

5.2.2.1.3 to 5.2.2.1.5 (Reserved)

5.2.2.1.6 Except as provided in 5.2.2.2.1.2, each label shall:

- (a) be affixed to the same surface of the package, if the dimensions of the package allow; for packages of Class 1 and 7, near the mark indicating the proper shipping name;
- (b) be so placed on the package that it is not covered or obscured by any part or attachment to the packaging or any other label or marking; and
- (c) be displayed next to each other when more than one label is required.

Where a package is of such an irregular shape or small size that a label cannot be satisfactorily affixed, the label may be attached to the package by a securely affixed tag or other suitable means.

5.2.2.1.7 Intermediate bulk containers of more than 450 litres capacity and large packagings shall be labelled on two opposite sides.

5.2.2.1.8 (*Reserved*)

5.2.2.1.9 *Special provisions for the labelling of self-reactive substances and organic peroxides*

- (a) The label conforming to model No. 4.1 also implies that the product may be flammable and hence no label conforming to model No. 3 is required. In addition, a label conforming to model No. 1 shall be applied for self-reactive substances Type B, unless the competent authority has permitted this label to be dispensed with for a specific packaging because test data have proven that the self-reactive substance in such a packaging does not exhibit explosive behaviour.
- (b) The label conforming to model No. 5.2 also implies that the product may be flammable and hence no label conforming to model No. 3 is required. In addition, the following labels shall be applied:
 - (i) A label conforming to model No. 1 for organic peroxides type B, unless the competent authority has permitted this label to be dispensed with for a specific packaging because test data have proven that the organic peroxide in such a packaging does not exhibit explosive behaviour;
 - (ii) A label conforming to model No. 8 is required when Packing Group I or II criteria of Class 8 are met.

For self-reactive substances and organic peroxides mentioned by name, the labels to be affixed are indicated in the list found in 2.2.41.4 and 2.2.52.4 respectively.

5.2.2.1.10 *Special provisions for the labelling of infectious substances packages*

In addition to the label conforming to model No. 6.2, infectious substances packages shall bear any other label required by the nature of the contents.

5.2.2.1.11 *Special provisions for the labelling of radioactive material*

5.2.2.1.11.1 Except when enlarged labels are used in accordance with 5.3.1.1.3, each package, overpack and container containing radioactive material shall bear at least two labels which conform to the models Nos. 7A, 7B, and 7C as appropriate according to the category (see 5.1.5.3.4) of that package, overpack or container. Labels shall be affixed to two opposite sides on the outside of the package or on the outside of all four sides of the container. Each overpack containing radioactive material shall bear at least two labels on opposite sides of the outside of the overpack. In addition, each package, overpack and container containing fissile

material, other than fissile material excepted under 6.4.11.2 shall bear labels which conform to model No.7E; such labels, where applicable shall be affixed adjacent to the labels for radioactive material. Labels shall not cover the markings specified in 5.2.1. Any labels which do not relate to the contents shall be removed or covered.

5.2.2.1.11.2 Each label conforming to models Nos.7A, 7B, and 7C shall be completed with the following information.

(a) *Contents:*

- (i) except for LSA-I material, the name(s) of the radionuclide(s) as taken from Table 2.2.7.2.2.1, using the symbols prescribed therein. For mixtures of radionuclides, the most restrictive nuclides shall be listed to the extent the space on the line permits. The group of LSA or SCO shall be shown following the name(s) of the radionuclide(s). The terms "LSA-II", "LSA-III", "SCO-I" and "SCO-II" shall be used for this purpose;
- (ii) for LSA-I material, only the term "LSA-I" is necessary; the name of the radionuclide is not necessary;
- (b) *Activity:* The maximum activity of the radioactive contents during carriage expressed in becquerels (Bq) with the appropriate SI prefix symbol (see 1.2.2.1). For fissile material, the mass of fissile material (or mass of each fissile nuclide for mixtures when appropriate) in grams (g), or multiples thereof, may be used in place of activity;
- (c) For overpacks and containers the "contents" and "activity" entries on the label shall bear the information required in (a) and (b) above, respectively, totalled together for the entire contents of the overpack or container except that on labels for overpacks or containers containing mixed loads of packages containing different radionuclides, such entries may read "See Transport Documents";
- (d) *Transport index:* The number determined in accordance with 5.1.5.3.1 and 5.1.5.3.2 (no transport index entry is required for category I-WHITE).

5.2.2.1.11.3 Each label conforming to the model No. 7E shall be completed with the criticality safety index (CSI) as stated in the certificate of approval for special arrangement or the certificate of approval for the package design issued by the competent authority.

5.2.2.1.11.4 For overpacks and containers, the criticality safety index (CSI) on the label shall bear the information required in 5.2.2.1.11.3 totalled together for the fissile contents of the overpack or container.

5.2.2.1.11.5 In all cases of international carriage of packages requiring competent authority design or shipment approval, for which different approval types apply in the different countries concerned by the shipment, labelling shall be in accordance with the certificate of the country of origin of design.

5.2.2.2 Provisions for labels

5.2.2.2.1 Labels shall satisfy the provisions below and conform, in terms of colour, symbols and general format, to the models shown in 5.2.2.2.2. Corresponding models required for other modes of transport, with minor variations which do not affect the obvious meaning of the label, are also acceptable.

NOTE: Where appropriate, labels in 5.2.2.2.2 are shown with a dotted outer boundary as provided for in 5.2.2.2.1.1. This is not required when the label is applied on a background of contrasting colour.

5.2.2.2.1.1 Labels shall be in the form of a square set at an angle of 45° (diamond-shaped) with minimum dimensions of 100 mm by 100 mm. They shall have a line 5 mm inside the edge and running parallel with it. In the upper half of a label the line shall have the same colour as the symbol and in the lower half it shall have the same colour as the figure in the bottom corner. Labels shall be displayed on a background of contrasting colour, or shall have either a dotted or solid outer boundary line. If the size of the package so requires, the dimensions of the labels may be reduced, provided that they remain clearly visible.

5.2.2.2.1.2 Cylinders for Class 2 may, on account of their shape, orientation and securing mechanisms for carriage, bear labels representative of those specified in this section and the environmentally hazardous substance mark when appropriate, which have been reduced in size, according to the dimensions outlined in ISO 7225:2005, "*Gas cylinders - Precautionary labels*", for display on the non-cylindrical part (shoulder) of such cylinders.

Notwithstanding the provisions of 5.2.2.1.6, labels and the environmentally hazardous substance mark (see 5.2.1.8.3) may overlap to the extent provided for by ISO 7225:2005. However, in all cases, the primary risk label and the figures appearing on any label shall remain fully visible and the symbols recognizable.

Empty uncleaned pressure receptacles for gases of Class 2 may be carried with obsolete or damaged labels for the purposes of refilling or inspection as appropriate and the application of a new label in conformity with current regulations or for the disposal of the pressure receptacle.

5.2.2.2.1.3 With the exception of labels for Divisions 1.4, 1.5 and 1.6 of Class 1, the upper half of the label shall contain the pictorial symbol and the lower half shall contain:

- (a) For Classes 1, 2, 3, 5.1, 5.2, 7, 8 and 9, the class number;
- (b) For Classes 4.1, 4.2 and 4.3, the figure "4";
- (c) For Classes 6.1 and 6.2, the figure "6".

The labels may include text such as the UN number or words describing the hazard (e.g. "flammable") in accordance with 5.2.2.2.1.5 provided the text does not obscure or detract from the other required label elements.

5.2.2.2.1.4 In addition, except for Divisions 1.4, 1.5 and 1.6, labels for Class 1 shall show in the lower half, above the class number, the division number and the compatibility group letter for the substance or article. Labels for Divisions 1.4, 1.5 and 1.6 shall show in the upper half the division number, and in the lower half the class number and the compatibility group letter.

5.2.2.2.1.5 On labels other than those for material of Class 7, the optional insertion of any text (other than the class number) in the space below the symbol shall be confined to particulars indicating the nature of the risk and precautions to be taken in handling.

5.2.2.2.1.6 The symbols, text and numbers shall be clearly legible and indelible and shall be shown in black on all labels except for:

- (a) the Class 8 label, where the text (if any) and class number shall appear in white;
- (b) labels with entirely green, red or blue backgrounds where they may be shown in white;
- (c) the Class 5.2 label, where the symbol may be shown in white; and

- (d) labels conforming to model No. 2.1 displayed on cylinders and gas cartridges for gases of UN Nos. 1011, 1075, 1965 and 1978, where they may be shown in the background colour of the receptacle if adequate contrast is provided.

5.2.2.2.1.7 All labels shall be able to withstand open weather exposure without a substantial reduction in effectiveness.

5.2.2.2.2 Specimen labels

CLASS 1 HAZARD

Explosive substances or articles

(No. 1)

Divisions 1.1, 1.2 and 1.3

Symbol (exploding bomb): black; Background: orange; Figure '1' in bottom corner

(No. 1.4)

Division 1.4

(No. 1.5)

Division 1.5

(No. 1.6)

Division 1.6

Background: orange; Figures: black; Numerals shall be about 30 mm in height and be about 5 mm thick (for a label measuring 100 mm x 100 mm); Figure '1' in bottom corner

** Place for division - to be left blank if explosive is the subsidiary risk

* Place for compatibility group - to be left blank if explosive is the subsidiary risk

CLASS 2 HAZARD

Gases

(No. 2.1)

Flammable gases

Symbol (flame): black or white;
(except as provided for in 5.2.2.2.1.6 (d))
Background: red; Figure '2' in bottom corner

(No. 2.2)

Non flammable, non-toxic gases
Symbol (gas cylinder): black or white;
Background: green; Figure '2' in bottom corner

CLASS 3 HAZARD

Flammable liquids

(No. 2.3)

Toxic gases

Symbol (skull and crossbones): black;
Background: white; Figure '2' in bottom corner

(No. 3)

Symbol (flame): black or white;
Background: red; Figure '3' in bottom corner

CLASS 4.1 HAZARD
Flammable solids, self-reactive
substances and solid desensitized
explosives

(No. 4.1)
Symbol (flame): black;
Background: white with
seven vertical red stripes;
Figure '4' in bottom corner

CLASS 4.2 HAZARD
Substances liable to
spontaneous combustion

(No. 4.2)
Symbol (flame): black;
Background: upper half white,
lower half red;
Figure '4' in bottom corner

CLASS 4.3 HAZARD
Substances which, in contact with water,
emit flammable gases

(No. 4.3)
Symbol (flame): black or white;
Background: blue;
Figure '4' in bottom corner

CLASS 5.1 HAZARD
Oxidizing substances

(No. 5.1)
Symbol (flame over circle): black;
Background: yellow;
Figure '5.1' in bottom corner

CLASS 5.2 HAZARD
Organic peroxides

(No. 5.2)
Symbol (flame): black or white;
Background: upper half red; lower half yellow;
Figure '5.2' in bottom corner

CLASS 6.1 HAZARD
Toxic substances

(No. 6.1)
Symbol (skull and crossbones): black;
Background: white; Figure '6' in bottom corner

CLASS 6.2 HAZARD
Infectious substances

(No. 6.2)
The lower half of the label may bear the inscriptions: 'INFECTIOUS SUBSTANCE'
and 'In the case of damage or leakage immediately notify Public Health Authority';
Symbol (three crescents superimposed on a circle) and inscriptions: black;
Background: white; Figure '6' in bottom corner

CLASS 7 HAZARD
Radioactive material

(No. 7A)

Category I - White
 Symbol (trefoil): black;
 Background: white;

Text (mandatory): black in lower half of label:

'RADIOACTIVE'
 'CONTENTS'
 'ACTIVITY'

One red bar shall
 follow the word 'RADIOACTIVE';
 Figure '7' in bottom corner.

(No. 7B)

Category II - Yellow

Symbol (trefoil): black;

Background: upper half yellow with white border, lower half white;

Text (mandatory): black in lower half of label:

'RADIOACTIVE'
 'CONTENTS'
 'ACTIVITY'

In a black outlined box: 'TRANSPORT INDEX';
 Two red vertical bars shall follow the word 'RADIOACTIVE';
 Figure '7' in bottom corner.

Category III - Yellow

Symbol (trefoil): black;

Background: upper half yellow with white border, lower half white;

Text (mandatory): black in lower half of label:

'RADIOACTIVE'
 'CONTENTS'
 'ACTIVITY'

In a black outlined box: 'TRANSPORT INDEX';
 Three red vertical bars shall follow the word 'RADIOACTIVE';
 Figure '7' in bottom corner.

(No. 7E)

Class 7 fissile material

Background: white;

Text (mandatory): black in upper half of label: 'FISSILE';

In a black outlined box in the lower half of the label:

'CRITICALITY SAFETY INDEX'

Figure '7' in bottom corner.

CLASS 8 HAZARD
Corrosive substances

(No. 8)

Symbol (liquids, spilling from two glass vessels
 and attacking a hand and a metal): black;

Background: upper half white;
 lower half black with white border;

Figure '8' in bottom corner

CLASS 9 HAZARD
Miscellaneous dangerous substances and articles

(No. 9)

Symbol (seven vertical stripes in upper half): black;
 Background: white;

Figure '9' underlined in bottom corner

CHAPTER 5.3

PLACARDING AND MARKING OF CONTAINERS, MEGCs, MEMUs, TANK-CONTAINERS, PORTABLE TANKS AND VEHICLES

NOTE: *For marking and placarding of containers, MEGCs, tank-containers and portable tanks for carriage in a transport chain including a maritime journey, see also 1.1.4.2.1. If the provisions of 1.1.4.2.1 (c) are applied, only 5.3.1.3 and 5.3.2.1.1 of this Chapter are applicable.*

5.3.1 Placarding

5.3.1.1 General provisions

5.3.1.1.1 As and when required in this section, placards shall be affixed to the exterior surface of containers, MEGCs, MEMUs, tank-containers, portable tanks and vehicles. Placards shall correspond to the labels required in Column (5) and, where appropriate, Column (6) of Table A of Chapter 3.2 for the dangerous goods contained in the container, MEGC, MEMU, tank-container, portable tank or vehicle and shall conform to the specifications given in 5.3.1.7. Placards shall be displayed on a background of contrasting colour, or shall have either a dotted or solid outer boundary line.

5.3.1.1.2 For Class 1, compatibility groups shall not be indicated on placards if the vehicle, container or special compartments of MEMUs are carrying substances or articles belonging to two or more compatibility groups. Vehicles, containers or special compartments of MEMUs carrying substances or articles of different divisions shall bear only placards conforming to the model of the most dangerous division in the order:

1.1 (most dangerous), 1.5, 1.2, 1.3, 1.6, 1.4 (least dangerous).

When 1.5 D substances are carried with substances or articles of Division 1.2, the vehicle or container shall be placarded as Division 1.1.

Placards are not required for the carriage of explosives of Division 1.4, compatibility group S.

5.3.1.1.3 For Class 7, the primary risk placard shall conform to model No. 7D as specified in 5.3.1.7.2. This placard is not required for vehicles or containers carrying excepted packages and for small containers.

Where both Class 7 labels and placards would be required to be affixed to vehicles, containers, MEGCs, tank-containers or portable tanks, an enlarged label corresponding to the label required may be displayed instead of placard No.7D to serve both purposes.

5.3.1.1.4 Containers, MEGCs, MEMUs, tank-containers, portable tanks or vehicles containing goods of more than one class need not bear a subsidiary risk placard if the hazard represented by that placard is already indicated by a primary or subsidiary risk placard.

5.3.1.1.5 Placards which do not relate to the dangerous goods being carried, or residues thereof, shall be removed or covered.

5.3.1.1.6 When the placarding is affixed to folding panels, they shall be designed and secured so that they cannot unfold or come loose from the holder during carriage (especially as a result of impacts or unintentional actions).

5.3.1.2 *Placarding of containers, MEGCs, tank-containers and portable tanks*

***NOTE:** This sub-section does not apply to swap bodies, except tank swap bodies or swap bodies carried in combined road/rail transport.*

The placards shall be affixed to both sides and at each end of the container, MEGC, tank-container or portable tank.

When the tank-container or portable tank has multiple compartments and carries two or more dangerous goods, the appropriate placards shall be displayed along each side at the position of the relevant compartments and one placard of each model shown on each side at both ends.

5.3.1.3 *Placarding of vehicles carrying containers, MEGCs, tank-containers or portable tanks*

***NOTE:** This sub-section does not apply to the placarding of vehicles carrying swap bodies other than tank swap bodies or than swap bodies carried in combined road/rail transport; for such vehicles, see 5.3.1.5.*

If the placards affixed to the containers, MEGCs, tank-containers or portable tanks are not visible from outside the carrying vehicles, the same placards shall also be affixed to both sides and at the rear of the vehicle. Otherwise, no placard need be affixed on the carrying vehicle.

5.3.1.4 *Placarding of vehicles for carriage in bulk, tank-vehicles, battery-vehicles, MEMUs and vehicles with demountable tanks*

5.3.1.4.1 Placards shall be affixed to both sides and at the rear of the vehicle.

When the tank-vehicle or the demountable tank carried on the vehicle has multiple compartments and carries two or more dangerous goods, the appropriate placards shall be displayed along each side at the position of the relevant compartments and one placard of each model shown on each side at the rear of the vehicle. However, in such case, if all compartments have to bear the same placards, these placards need be displayed only once along each side and at the rear of the vehicle.

Where more than one placard is required for the same compartment, these placards shall be displayed adjacent to each other.

***NOTE:** When, in the course of an ADR journey or at the end of an ADR journey, a tank semi-trailer is separated from its tractor to be loaded on board a ship or an inland navigation vessel, placards shall also be displayed at the front of the semi-trailer.*

5.3.1.4.2 MEMUs with tanks and bulk containers shall be placarded in accordance with 5.3.1.4.1 for the substances contained therein. For tanks with a capacity of less than 1 000 litres placards may be replaced by labels conforming to 5.2.2.2.

5.3.1.4.3 For MEMUs carrying packages containing substances or articles of Class 1 (other than of Division 1.4, Compatibility group S), placards shall be affixed to both sides and at the rear of the MEMU.

Special compartments for explosives shall be placarded in accordance with the provisions of 5.3.1.1.2. The last sentence of 5.3.1.1.2 does not apply.

5.3.1.5 *Placarding of vehicles carrying packages only*

NOTE: This sub-section applies also to vehicles carrying swap bodies loaded with packages, except for combined road/rail transport; for combined road/rail transport, see 5.3.1.2 and 5.3.1.3.

5.3.1.5.1 For vehicles carrying packages containing substances or articles of Class 1 (other than of Division 1.4, compatibility group S), placards shall be affixed to both sides and at the rear of the vehicle.

5.3.1.5.2 For vehicles carrying radioactive material of Class 7 in packagings or IBCs (other than excepted packages), placards shall be affixed to both sides and at the rear of the vehicle.

5.3.1.6 *Placarding of empty tank-vehicles, battery-vehicles, MEGCs, MEMUs, tank-containers, portable tanks and empty vehicles and containers for carriage in bulk*

5.3.1.6.1 Empty tank-vehicles, vehicles with demountable tanks, battery-vehicles, MEGCs, MEMUs, tank-containers and portable tanks uncleaned and not degassed, and empty vehicles and containers for carriage in bulk, uncleaned, shall continue to display the placards required for the previous load.

5.3.1.7 *Specifications for placards*

5.3.1.7.1 Except as provided in 5.3.1.7.2 for the Class 7 placard, a placard shall:

- (a) Be not less than 250 mm by 250 mm and have a line 12.5 mm inside the edge and running parallel with it. In the upper half the line shall have the same colour as the symbol and in the lower half it shall have the same colour as the figure in the bottom corner;
- (b) Correspond to the label required for the dangerous goods in question with respect to colour and symbol (see 5.2.2.2); and
- (c) Display the numbers (and for goods of Class 1, the compatibility group letter) prescribed for the dangerous goods in question in 5.2.2.2 for the corresponding label, in digits not less than 25 mm high.

5.3.1.7.2 The Class 7 placard shall be not less than 250 mm by 250 mm with a black line running 5 mm inside the edge and parallel with it and is otherwise as shown below (Model No. 7D). The number "7" shall not be less than 25 mm high. The background colour of the upper half of the placard shall be yellow and of the lower half white, the colour of the trefoil and the printing shall be black. The use of the word "RADIOACTIVE" in the bottom half is optional to allow the use of this placard to display the appropriate UN number for the consignment.

Placard for radioactive material of Class 7

(No.7D)

Symbol (trefoil): black; Background: upper half yellow with white border, lower half white;

The lower half shall show the word "RADIOACTIVE" or alternatively, the appropriate UN Number, and the figure "7" in the bottom corner.

- 5.3.1.7.3 For tanks with a capacity of not more than 3 m³ and for small containers, placards may be replaced by labels conforming to 5.2.2.2. If these labels are not visible from outside the carrying vehicle, placards according to 5.3.1.7.1 shall also be affixed to both sides and at the rear of the vehicle.
- 5.3.1.7.4 For Classes 1 and 7, if the size and construction of the vehicle are such that the available surface area is insufficient to affix the prescribed placards, their dimensions may be reduced to 100 mm on each side.

5.3.2 Orange-coloured plate marking

5.3.2.1 General orange-coloured plate marking provisions

- 5.3.2.1.1 Transport units carrying dangerous goods shall display two rectangular orange-coloured plates conforming to 5.3.2.2.1, set in a vertical plane. They shall be affixed one at the front and the other at the rear of the transport unit, both perpendicular to the longitudinal axis of the transport unit. They shall be clearly visible.

If a trailer containing dangerous goods is detached from its motor vehicle during carriage of dangerous goods, an orange-coloured plate shall remain affixed to the rear of the trailer.

- 5.3.2.1.2 When a hazard identification number is indicated in Column (20) of table A of Chapter 3.2, tank-vehicles, battery vehicles or transport units having one or more tanks carrying dangerous goods shall in addition display on the sides of each tank, each tank compartment or each element of battery vehicles, clearly visible and parallel to the longitudinal axis of the vehicle, orange-coloured plates identical with those prescribed in 5.3.2.1.1. These orange-coloured plates shall bear the hazard identification number and the UN number prescribed respectively in Columns (20) and (1) of table A of Chapter 3.2 for each of the substances carried in the tank, in a compartment of the tank or in an element of a battery vehicle. For MEMUs these requirements shall only apply to tanks with a capacity of 1 000 litres or more and bulk containers.

- 5.3.2.1.3 For tank-vehicles or transport units having one or more tanks carrying substances with UN Nos. 1202, 1203 or 1223, or aviation fuel classed under UN Nos. 1268 or 1863, but no other dangerous substance, the orange-coloured plates prescribed in 5.3.2.1.2 need not be affixed if the plates affixed to the front and rear in accordance with 5.3.2.1.1 bear the hazard identification number and the UN number prescribed for the most hazardous substance carried, i.e. the substance with the lowest flash-point.
- 5.3.2.1.4 When a hazard identification number is indicated in Column (20) of Table A of Chapter 3.2, transport units and containers carrying unpackaged solids or articles or packaged radioactive material with a single UN number required to be carried under exclusive use and no other dangerous goods shall in addition display on the sides of each transport unit or container, clearly visible and parallel to the longitudinal axis of the vehicle, orange-coloured plates identical with those prescribed in 5.3.2.1.1. These orange-coloured plates shall bear the hazard identification number and the UN number prescribed respectively in Columns (20) and (1) of table A of Chapter 3.2 for each of the substances carried in bulk in the transport unit or in the container or for the packaged radioactive material when required to be carried under exclusive use in the transport unit or in the container.
- 5.3.2.1.5 If the orange-coloured plates prescribed in 5.3.2.1.2 and 5.3.2.1.4 affixed to the containers, tank-containers, MEGCs or portable tanks are not clearly visible from outside the carrying vehicle, the same plates shall also be affixed to both sides of the vehicle.

***NOTE:** This paragraph need not be applied to the marking with orange coloured plates of closed and sheeted vehicles, carrying tanks with a maximum capacity of 3 000 litres.*

- 5.3.2.1.6 For transport units carrying only one dangerous substance and no non-dangerous substance, the orange-coloured plates prescribed in 5.3.2.1.2, 5.3.2.1.4 and 5.3.2.1.5 shall not be necessary provided that those displayed at the front and rear in accordance with 5.3.2.1.1 bear the hazard identification number and the UN number for that substance prescribed respectively in Columns (20) and (1) of Table A of Chapter 3.2.
- 5.3.2.1.7 The requirements of 5.3.2.1.1 to 5.3.2.1.5 are also applicable to empty fixed or demountable tanks, battery-vehicles, tank-containers, portable tanks and MEGCs, uncleaned, not degassed or not decontaminated, MEMUs, uncleaned as well as to empty vehicles and containers for carriage in bulk, uncleaned or not decontaminated.
- 5.3.2.1.8 Orange-coloured marking which does not relate to dangerous goods carried, or residues thereof, shall be removed or covered. If plates are covered, the covering shall be total and remain effective after 15 minutes' engulfment in fire.

5.3.2.2 Specifications for the orange-coloured plates

- 5.3.2.2.1 The orange-coloured plates shall be reflectorized and shall be of 40 cm base and of 30 cm high; they shall have a black border of 15 mm wide. The material used shall be weather-resistant and ensure durable marking. The plate shall not become detached from its mount in the event of 15 minutes' engulfment in fire. It shall remain affixed irrespective of the orientation of the vehicle. The orange-coloured plates may be separated in their middle with a black horizontal line of 15 mm thickness.

If the size and construction of the vehicle are such that the available surface area is insufficient to affix these orange-coloured plates, their dimensions may be reduced to 300 mm for the base, 120 mm for the height and 10 mm for the black border. In that case, for a packaged radioactive material carried under exclusive use, only the UN number is required, and the size of the digits stipulated in 5.3.2.2.2 may be reduced to 65 mm in height and 10 mm in stroke thickness.

For containers carrying dangerous solid substances in bulk and for tank-containers, MEGCs and portable tanks, the plates prescribed in 5.3.2.1.2, 5.3.2.1.4 and 5.3.2.1.5 may be replaced by a self-adhesive sheet, by paint or by any other equivalent process. This alternative marking shall conform to the specifications set in this sub-section except for the provisions concerning resistance to fire mentioned in 5.3.2.2.1 and 5.3.2.2.2.

NOTE: *The colour of the orange plates in conditions of normal use should have chromaticity co-ordinates lying within the area on the chromaticity diagram formed by joining the following co-ordinates:*

Chromaticity co-ordinates of points at the corners of the area on the chromaticity diagram				
x	0.52	0.52	0.578	0.618
y	0.38	0.40	0.422	0.38

*Luminance factor of reflectorized colour: $\beta > 0.12$.
Reference centre E, standard illuminant C, normal incidence 45°, viewed at 0°.
Co-efficient of reflex luminous intensity at an angle of illumination of 5°, viewed at 0.2°: not less than 20 candelas per lux per m².*

5.3.2.2.2 The hazard identification number and the UN number shall consist of black digits 100 mm high and of 15 mm stroke thickness. The hazard-identification number shall be inscribed in the upper part of the plate and the UN number in the lower part; they shall be separated by a horizontal black line, 15 mm in stroke width, extending from side to side of the plate at mid-height (see 5.3.2.2.3).The hazard identification number and the UN number shall be indelible and shall remain legible after 15 minute’ engulfment in fire. Interchangeable numbers and letters on plates presenting the hazard identification number and the UN number shall remain in place during carriage and irrespective of the orientation of the vehicle.

5.3.2.2.3 *Example of orange-coloured plate with hazard identification number and UN number*

Background orange.
Border, horizontal line and figures black, 15 mm thickness.

5.3.2.2.4 The permitted tolerances for dimensions specified in this sub-section are ± 10%.

- 5.3.2.2.5 When the orange-coloured plate is affixed to folding panels, they shall be designed and secured so that they cannot unfold or come loose from the holder during carriage (especially as a result of impacts or unintentional actions).

5.3.2.3 *Meaning of hazard identification numbers*

- 5.3.2.3.1 The hazard identification number consists of two or three figures. In general, the figures indicate the following hazards:

- | | |
|---|--|
| 2 | Emission of gas due to pressure or to chemical reaction |
| 3 | Flammability of liquids (vapours) and gases or self-heating liquid |
| 4 | Flammability of solids or self-heating solid |
| 5 | Oxidizing (fire-intensifying) effect |
| 6 | Toxicity or risk of infection |
| 7 | Radioactivity |
| 8 | Corrosivity |
| 9 | Risk of spontaneous violent reaction |

NOTE: *The risk of spontaneous violent reaction within the meaning of figure 9 include the possibility following from the nature of a substance of a risk of explosion, disintegration and polymerization reaction following the release of considerable heat or flammable and/or toxic gases.*

Doubling of a figure indicates an intensification of that particular hazard.

Where the hazard associated with a substance can be adequately indicated by a single figure, this is followed by zero.

The following combinations of figures, however, have a special meaning: 22, 323, 333, 362, 382, 423, 44, 446, 462, 482, 539, 606, 623, 642, 823, 842, 90 and 99, see 5.3.2.3.2 below.

If a hazard identification number is prefixed by the letter "X", this indicates that the substance will react dangerously with water. For such substances, water may only be used by approval of experts.

For substances of Class 1, the classification code in accordance with Column (3 b) of Table A of Chapter 3.2, shall be used as the hazard identification number. The classification code consists of:

- the division number in accordance with 2.2.1.1.5; and
- the compatibility group letter in accordance with 2.2.1.1.6.

- 5.3.2.3.2 The hazard identification numbers listed in Column (20) of table A of Chapter 3.2 have the following meanings:

- | | |
|-----|---|
| 20 | asphyxiant gas or gas with no subsidiary risk |
| 22 | refrigerated liquefied gas, asphyxiant |
| 223 | refrigerated liquefied gas, flammable |
| 225 | refrigerated liquefied gas, oxidizing (fire-intensifying) |
| 23 | flammable gas |
| 238 | gas, flammable corrosive |
| 239 | flammable gas, which can spontaneously lead to violent reaction |
| 25 | oxidizing (fire-intensifying) gas |
| 26 | toxic gas |
| 263 | toxic gas, flammable |
| 265 | toxic gas, oxidizing (fire-intensifying) |
| 268 | toxic gas, corrosive |
| 28 | gas, corrosive |

30	flammable liquid (flash-point between 23 °C and 60 °C, inclusive) or flammable liquid or solid in the molten state with a flash-point above 60 °C, heated to a temperature equal to or above its flash-point, or self-heating liquid
323	flammable liquid which reacts with water, emitting flammable gases
X323	flammable liquid which reacts dangerously with water, emitting flammable gases ¹
33	highly flammable liquid (flash-point below 23 °C)
333	pyrophoric liquid
X333	pyrophoric liquid which reacts dangerously with water ¹
336	highly flammable liquid, toxic
338	highly flammable liquid, corrosive
X338	highly flammable liquid, corrosive, which reacts dangerously with water ¹
339	highly flammable liquid which can spontaneously lead to violent reaction
36	flammable liquid (flash-point between 23 °C and 60 °C, inclusive), slightly toxic, or self-heating liquid, toxic
362	flammable liquid, toxic, which reacts with water, emitting flammable gases
X362	flammable liquid toxic, which reacts dangerously with water, emitting flammable gases ¹
368	flammable liquid, toxic, corrosive
38	flammable liquid (flash-point between 23 °C and 60 °C, inclusive), slightly corrosive or self-heating liquid, corrosive
382	flammable liquid, corrosive, which reacts with water, emitting flammable gases
X382	flammable liquid, corrosive, which reacts dangerously with water, emitting flammable gases ¹
39	flammable liquid, which can spontaneously lead to violent reaction
40	flammable solid, or self-reactive substance, or self-heating substance
423	solid which reacts with water, emitting flammable gases, or flammable solid which reacts with water, emitting flammable gases or self-heating solid which reacts with water, emitting flammable gases
X423	solid which reacts dangerously with water, emitting flammable gases, or flammable solid which reacts dangerously with water, emitting flammable gases, or self-heating solid which reacts dangerously with water, emitting flammable gases ¹
43	spontaneously flammable (pyrophoric) solid
X432	spontaneously flammable (pyrophoric) solid which reacts dangerously with water, emitting flammable gases ¹
44	flammable solid, in the molten state at an elevated temperature
446	flammable solid, toxic, in the molten state, at an elevated temperature
46	flammable or self-heating solid, toxic
462	toxic solid which reacts with water, emitting flammable gases
X462	solid which reacts dangerously with water, emitting toxic gases ¹
48	flammable or self-heating solid, corrosive
482	corrosive solid which reacts with water, emitting flammable gases
X482	solid which reacts dangerously with water, emitting corrosive gases ¹
50	oxidizing (fire-intensifying) substance
539	flammable organic peroxide
55	strongly oxidizing (fire-intensifying) substance
556	strongly oxidizing (fire-intensifying) substance, toxic
558	strongly oxidizing (fire-intensifying) substance, corrosive

¹ Water not to be used except by approval of experts.

559	strongly oxidizing (fire-intensifying) substance, which can spontaneously lead to violent reaction
56	oxidizing substance (fire-intensifying), toxic
568	oxidizing substance (fire-intensifying), toxic, corrosive
58	oxidizing substance (fire-intensifying), corrosive
59	oxidizing substance (fire-intensifying) which can spontaneously lead to violent reaction
60	toxic or slightly toxic substance
606	infectious substance
623	toxic liquid, which reacts with water, emitting flammable gases
63	toxic substance, flammable (flash-point between 23 °C and 60 °C, inclusive)
638	toxic substance, flammable (flash-point between 23 °C and 60 °C, inclusive), corrosive
639	toxic substance, flammable (flash-point not above 60 °C) which can spontaneously lead to violent reaction
64	toxic solid, flammable or self-heating
642	toxic solid, which reacts with water, emitting flammable gases
65	toxic substance, oxidizing (fire-intensifying)
66	highly toxic substance
663	highly toxic substance, flammable (flash-point not above 60 °C)
664	highly toxic solid, flammable or self-heating
665	highly toxic substance, oxidizing (fire-intensifying)
668	highly toxic substance, corrosive
X668	highly toxic substance, corrosive, which reacts dangerously with water ¹
669	highly toxic substance which can spontaneously lead to violent reaction
68	toxic substance, corrosive
69	toxic or slightly toxic substance, which can spontaneously lead to violent reaction
70	radioactive material
78	radioactive material, corrosive
80	corrosive or slightly corrosive substance
X80	corrosive or slightly corrosive substance, which reacts dangerously with water ¹
823	corrosive liquid which reacts with water, emitting flammable gases
83	corrosive or slightly corrosive substance, flammable (flash-point between 23 °C and 60 °C, inclusive)
X83	corrosive or slightly corrosive substance, flammable, (flash-point between 23 °C and 60 °C, inclusive), which reacts dangerously with water ¹
839	corrosive or slightly corrosive substance, flammable (flash-point between 23 °C and 60 °C inclusive) which can spontaneously lead to violent reaction
X839	corrosive or slightly corrosive substance, flammable (flash-point between 23 °C and 60 °C inclusive), which can spontaneously lead to violent reaction and which reacts dangerously with water ¹
84	corrosive solid, flammable or self-heating
842	corrosive solid which reacts with water, emitting flammable gases
85	corrosive or slightly corrosive substance, oxidizing (fire-intensifying)
856	corrosive or slightly corrosive substance, oxidizing (fire-intensifying) and toxic
86	corrosive or slightly corrosive substance, toxic
88	highly corrosive substance
X88	highly corrosive substance, which reacts dangerously with water ¹
883	highly corrosive substance, flammable (flash-point between 23 °C and 60 °C inclusive)
884	highly corrosive solid, flammable or self-heating

¹ Water not to be used except by approval of experts.

885	highly corrosive substance, oxidizing (fire-intensifying)
886	highly corrosive substance, toxic
X886	highly corrosive substance, toxic, which reacts dangerously with water ¹
89	corrosive or slightly corrosive substance, which can spontaneously lead to violent reaction
90	environmentally hazardous substance; miscellaneous dangerous substances
99	miscellaneous dangerous substance carried at an elevated temperature.

5.3.3 Mark for elevated temperature substances

Tank-vehicles, tank-containers, portable tanks, special vehicles or containers or especially equipped vehicles or containers for which a mark for elevated temperature substances is required according to special provision 580 in Column (6) of Table A of Chapter 3.2 shall bear on both sides and at the rear for vehicles, and on both sides and at each end for containers, tank-containers and portable tanks, a triangular shaped mark with sides of at least 250 mm, to be shown in red, as reproduced below.

5.3.4 (Reserved)

5.3.5 (Reserved)

5.3.6 Environmentally hazardous substance mark

When a placard is required to be displayed in accordance with the provisions of section 5.3.1, containers, MEGCs, tank-containers, portable tanks and vehicles containing environmentally hazardous substances meeting the criteria of 2.2.9.1.10 shall be marked with the environmentally hazardous substance mark shown in 5.2.1.8.3. The provisions of section 5.3.1 concerning placards shall apply mutatis mutandis to the mark.

¹ Water not to be used except by approval of experts.

CHAPTER 5.4

DOCUMENTATION

5.4.0 General

- 5.4.0.1 Unless otherwise specified, any carriage of goods governed by ADR shall be accompanied by the documentation prescribed in this Chapter, as appropriate.

NOTE: For the list of documentation to be carried on board transport units, see 8.1.2.

- 5.4.0.2 The use of electronic data processing (EDP) or electronic data interchange (EDI) techniques as an aid to or instead of paper documentation is permitted, provided that the procedures used for the capture, storage and processing of electronics data meet the legal requirements as regards the evidential value and availability of data during transport in a manner at least equivalent to that of paper documentation.
- 5.4.0.3 When the dangerous goods transport information is given to the carrier by EDP or EDI techniques, the consignor shall be able to give the information to the carrier as a paper document, with the information in the sequence required by this Chapter.

5.4.1 Dangerous goods transport document and related information

5.4.1.1 General information required in the transport document

- 5.4.1.1.1 The transport document(s) shall contain the following information for each dangerous substance, material or article offered for carriage:

- (a) the UN number preceded by the letters "UN";
- (b) the proper shipping name supplemented, when applicable (see 3.1.2.8.1) with the technical name in brackets (see 3.1.2.8.1.1), as determined in accordance with 3.1.2;
- (c) - for substances and articles of Class 1: the classification code given in Column (3b) of Table A in Chapter 3.2.

When, in Column (5) of Table A in Chapter 3.2, label model numbers other than 1, 1.4, 1.5 and 1.6 are given, these label model numbers, in brackets, shall follow the classification code;

- for radioactive material of Class 7: the Class number: "7";

NOTE: For radioactive material with a subsidiary risk, see also special provision 172 in Chapter 3.3.

- for substances and articles of other classes: the label model numbers given in Column (5) of Table A in Chapter 3.2 or applicable according to a special provision referred to in Column (6). When more than one label model numbers are given, the numbers following the first one shall be given in brackets. For substances and articles for which no label model is given in Column (5) of Table A in Chapter 3.2, their class according to Column (3a) shall be given instead;

- (d) where assigned, the packing group for the substance which may be preceded by the letters "PG" (e.g. "PG II"), or the initials corresponding to the words "Packing Group" in the languages used according to 5.4.1.4.1;

NOTE: For radioactive material of Class 7 with subsidiary risks, see special provision 172 (b) in Chapter 3.3.

- (e) the number and a description of the packages when applicable. UN packaging codes may only be used to supplement the description of the kind of package (e.g. one box (4G));

NOTE: The number, type and capacity of each inner packaging within the outer packaging of a combination packaging is not required to be indicated.

- (f) the total quantity of each item of dangerous goods bearing a different UN number, proper shipping name or, when applicable, packing group (as a volume or as a gross mass, or as a net mass as appropriate);

NOTE 1: In the case of intended application of 1.1.3.6, the total quantity of dangerous goods for each transport category shall be indicated in the transport document in accordance with 1.1.3.6.3.

NOTE 2: For dangerous goods in machinery or equipment specified in this Annex, the quantity indicated shall be the total quantity of dangerous goods contained therein in kilograms or litres as appropriate.

- (g) the name and address of the consignor;
- (h) the name and address of the consignee(s). With the agreement of the competent authorities of the countries concerned by the carriage, when dangerous goods are carried to be delivered to multiple consignees who cannot be identified at the start of the carriage, the words "Delivery Sale" may be given instead;
- (i) a declaration as required by the terms of any special agreement;
- (j) *(Reserved)*
- (k) where assigned, the tunnel restriction code given in Column (15) of Table A of Chapter 3.2, in capitals within parenthesis. The tunnel restriction code need not be added in the transport document where the carriage is known beforehand not to pass through a tunnel with restrictions for carriage of dangerous goods.

The location and order in which the elements of information required appear in the transport document is left optional, except that (a), (b), (c), (d) and (k) shall be shown in the order listed above (i.e. (a), (b), (c), (d), (k)) with no information interspersed, except as provided in ADR.

Examples of such permitted dangerous goods descriptions are:

**"UN 1098 ALLYL ALCOHOL, 6.1 (3), I, (C/D)" or
"UN 1098, ALLYL ALCOHOL, 6.1 (3), PG I, (C/D)"**

5.4.1.1.2 The information required on a transport document shall be legible.

Although upper case is used in Chapter 3.1 and in Table A in Chapter 3.2 to indicate the elements which shall be part of the proper shipping name, and although upper and lower case are used in this Chapter to indicate the information required in the transport document, except for the provisions in 5.4.1.1.1 (k), the use of upper or of lower case for entering the information in the transport document is left optional.

5.4.1.1.3 *Special provisions for wastes*

If waste containing dangerous goods (other than radioactive wastes) is being carried, the proper shipping name shall be preceded by the word "**WASTE**", unless this term is part of the proper shipping name, e.g.:

"**UN 1230 WASTE METHANOL, 3 (6.1), II, (D/E)**", or

"**UN 1230 WASTE METHANOL, 3 (6.1), PG II, (D/E)**", or

"**UN 1993 WASTE FLAMMABLE LIQUID, N.O.S. (toluene and ethyl alcohol), 3, II, (D/E)**", or

"**UN 1993 WASTE FLAMMABLE LIQUID, N.O.S. (toluene and ethyl alcohol), 3, PG II, (D/E)**".

If the provision for waste as set out in 2.1.3.5.5 is applied, the following shall be added to the proper shipping name:

"**WASTE IN ACCORDANCE WITH 2.1.3.5.5**" (e.g. "UN 3264, CORROSIVE LIQUID, ACIDIC, INORGANIC, N.O.S., 8, II, (E), **WASTE IN ACCORDANCE WITH 2.1.3.5.5**").

The technical name, as prescribed in Chapter 3.3, special provision 274, need not be added.

5.4.1.1.4 *(Deleted)*

5.4.1.1.5 *Special provisions for salvage packagings and salvage pressure receptacles*

When dangerous goods are carried in a salvage packaging or salvage pressure receptacle, the words "**SALVAGE PACKAGING**" or "**SALVAGE PRESSURE RECEPTACLE**" shall be added after the description of the goods in the transport document.

5.4.1.1.6 *Special provision for empty means of containment, uncleaned*

5.4.1.1.6.1 For empty means of containment, uncleaned, which contain the residue of dangerous goods of classes other than Class 7, the words "EMPTY, UNCLEARED" or "RESIDUE, LAST CONTAINED" shall be indicated before or after the dangerous goods description specified in 5.4.1.1.1 (a) to (d) and (k). Moreover, 5.4.1.1.1 (f) does not apply.

5.4.1.1.6.2 The special provision of 5.4.1.1.6.1 may be replaced with the provisions of 5.4.1.1.6.2.1, 5.4.1.1.6.2.2 or 5.4.1.1.6.2.3, as appropriate.

5.4.1.1.6.2.1 For empty packagings, uncleaned, which contain the residue of dangerous goods of classes other than Class 7, including empty uncleaned receptacles for gases with a capacity of not more than 1 000 litres, the particulars according to 5.4.1.1.1 (a), (b), (c), (d), (e) and (f) are replaced with "EMPTY PACKAGING", "EMPTY RECEPTACLE", "EMPTY IBC" or "EMPTY LARGE PACKAGING", as appropriate, followed by the information of the goods last loaded, as described in 5.4.1.1.1 (c).

See example as follows: "EMPTY PACKAGING, 6.1 (3)".

In addition, in such a case, if the dangerous goods last loaded are goods of Class 2, the information prescribed in 5.4.1.1.1 (c) may be replaced by the number of the class "2".

- 5.4.1.1.6.2.2 For empty means of containment other than packagings, uncleaned, which contain the residue of dangerous goods of classes other than Class 7 and for empty uncleaned receptacles for gases with a capacity of more than 1 000 litres, the particulars according to 5.4.1.1.1 (a) to (d) and (k) are preceded by "EMPTY TANK-VEHICLE", "EMPTY DEMOUNTABLE TANK", "EMPTY TANK-CONTAINER", "EMPTY PORTABLE TANK", "EMPTY BATTERY-VEHICLE", "EMPTY MEGC", "EMPTY MEMU", "EMPTY VEHICLE", "EMPTY CONTAINER" or "EMPTY RECEPTACLE", as appropriate, followed by the words "LAST LOAD:". Moreover, paragraph 5.4.1.1.1 (f) does not apply.

See examples as follows:

"EMPTY TANK-VEHICLE, LAST LOAD: UN 1098 ALLYL ALCOHOL, 6.1 (3), I, (C/D)" or

"EMPTY TANK-VEHICLE, LAST LOAD: UN 1098 ALLYL ALCOHOL, 6.1 (3), PG I, (C/D)".

- 5.4.1.1.6.2.3 When empty means of containment, uncleaned, which contain the residue of dangerous goods of classes other than Class 7, are returned to the consignor, the transport documents prepared for the full-capacity carriage of these goods may also be used. In such cases, the indication of the quantity is to be eliminated (by effacing it, striking it out or any other means) and replaced by the words "EMPTY, UNCLEARED RETURN".

- 5.4.1.1.6.3 (a) If empty tanks, battery- vehicles and MEGCs, uncleaned, are carried to the nearest place where cleaning or repair can be carried out in accordance with the provisions of 4.3.2.4.3, the following additional entry shall be made in the transport document: **"Carriage in accordance with 4.3.2.4.3"**.
- (b) If empty vehicles and containers, uncleaned, are carried to the nearest place where cleaning or repair can be carried out in accordance with the provisions of 7.5.8.1, the following additional entry shall be made in the transport document: **"Carriage in accordance with 7.5.8.1"**.

- 5.4.1.1.6.4 For the carriage of fixed tanks (tank vehicles), demountable tanks, battery-vehicles, tank-containers and MEGCs under the conditions of 4.3.2.4.4, the following entry shall be included in the transport document: "Carriage in accordance with 4.3.2.4.4".

- 5.4.1.1.7 *Special provisions for carriage in a transport chain including maritime or air carriage*

For carriage in accordance with 1.1.4.2.1, a statement shall be included in the transport document, as follows: **"Carriage in accordance with 1.1.4.2.1"**.

- 5.4.1.1.8 (Reserved)

- 5.4.1.1.9 (Reserved)

- 5.4.1.1.10 (Deleted)

- 5.4.1.1.11 *Special provisions for the carriage of IBCs or portable tanks after the date of expiry of the last periodic test or inspection*
- For carriage in accordance with 4.1.2.2 (b), 6.7.2.19.6 (b), 6.7.3.15.6 (b) or 6.7.4.14.6 (b), a statement to this effect shall be included in the transport document, as follows: "**Carriage in accordance with 4.1.2.2 (b)**", "**Carriage in accordance with 6.7.2.19.6 (b)**", "**Carriage in accordance with 6.7.3.15.6 (b)**" or "**Carriage in accordance with 6.7.4.14.6 (b)**" as appropriate.
- 5.4.1.1.12 *(Reserved)*
- 5.4.1.1.13 *Special provisions for carriage in multi-compartment tank-vehicles or transport units with more than one tank*
- When by derogation from 5.3.2.1.2 a multi-compartment tank-vehicle or a transport unit with more than one tank is marked in accordance with 5.3.2.1.3, the substances contained in each tank or in each compartment of a tank shall be specified in the transport document.
- 5.4.1.1.14 *Special provisions for the carriage of substances carried under elevated temperature*
- If the proper shipping name of a substance which is carried or offered for carriage in a liquid state at a temperature equal to or exceeding 100 °C, or in a solid state at a temperature equal to or exceeding 240 °C, does not convey the elevated temperature condition (for example, by using the term "MOLTEN" or "ELEVATED TEMPERATURE" as part of the proper shipping name), the word "**HOT**" shall immediately precede the proper shipping name.
- 5.4.1.1.15 *Special provisions for the carriage of substances stabilized by temperature control*
- If the word "STABILIZED" is part of the proper shipping name (see also 3.1.2.6), when stabilization is by means of temperature control, the control and emergency temperatures (see 2.2.41.1.17) shall be indicated in the transport document, as follows:
- "Control temperature:°C Emergency temperature: °C"**
- 5.4.1.1.16 *Information required in accordance with special provision 640 in Chapter 3.3*
- Where it is required by special provision 640 of Chapter 3.3, the transport document shall bear the inscription "**Special provision 640X**" where "X" is the capital letter appearing after the pertinent reference to special provision 640 in column (6) of Table A of Chapter 3.2.
- 5.4.1.1.17 *Special provisions for the carriage of solids in bulk containers conforming to 6.11.4*
- When solid substances are carried in bulk containers conforming to 6.11.4, the following statement shall be shown on the transport document (see NOTE at the beginning of 6.11.4):
- "Bulk container BK(x) approved by the competent authority of..."**
- 5.4.1.1.18 *Special provisions for carriage of environmentally hazardous substances (aquatic environment)*
- When a substance belonging to one of classes 1 to 9 meets the classification criteria of 2.2.9.1.10, the transport document shall bear the additional inscription "ENVIRONMENTALLY HAZARDOUS" or "MARINE POLLUTANT/ENVIRONMENTALLY HAZARDOUS". This additional requirement does not apply to UN Nos. 3077 and 3082 or for the exceptions listed in 5.2.1.8.1.
- The inscription "MARINE POLLUTANT" (according to 5.4.1.4.3 of the IMDG Code) is acceptable for carriage in a transport chain including maritime carriage.

5.4.1.2 *Additional or special information required for certain classes*

5.4.1.2.1 *Special provisions for Class 1*

- (a) The transport document shall indicate, in addition to the requirements in 5.4.1.1.1 (f):
- the total net mass, in kg, of explosive contents ¹ for each substance or article bearing a different UN number;
 - the total net mass, in kg, of explosive contents ¹ for all substances and articles covered by the transport document;
- (b) For mixed packing of two different goods, the description of the goods in the transport document shall include the UN numbers and names printed in capitals in Columns (1) and (2) of Table A of Chapter 3.2 of both substances or articles. If more than two different goods are contained in the same package in conformity with the mixed packing provisions given in 4.1.10 special provisions MP1, MP2 and MP20 to MP24, the transport document shall indicate under the description of the goods the UN numbers of all the substances and articles contained in the package, in the form, **"Goods of UN Nos..."**;
- (c) For the carriage of substances and articles assigned to an n.o.s. entry or the entry "0190 SAMPLES, EXPLOSIVE" or packed conforming to packing instruction P101 of 4.1.4.1, a copy of the competent authority approval with the conditions of carriage shall be attached to the transport document. It shall be drafted in an official language of the forwarding country and also, if that language is not English, French or German, in English, French or German unless agreements, if any, concluded between the countries concerned in the transport operation provide otherwise;
- (d) If packages containing substances and articles of compatibility groups B and D are loaded together in the same vehicle in accordance with the requirements of 7.5.2.2, a copy of the competent authority approval of the protective compartment or containment system in accordance with 7.5.2.2, note ^a under the table, shall be attached to the transport document. It shall be drafted in an official language of the forwarding country and also, if that language is not English, French or German, in English, French or German unless agreements, if any, concluded between the countries concerned in the transport operation provide otherwise;
- (e) When explosive substances or articles are carried in packagings conforming to packing instruction P101, the transport document shall bear the inscription **"Packaging approved by the competent authority of ..."** (see 4.1.4.1, packing instruction P101);
- (f) *(Reserved)*
- (g) When fireworks of UN Nos. 0333, 0334, 0335, 0336 and 0337 are carried, the transport document shall bear the inscription:

"Classification of fireworks by the competent authority of XX with the firework reference XX/YYZZZZ".

The classification approval certificate need not be carried with the consignment, but shall be made available by the consignor to the carrier or the competent authorities for control purposes. The classification approval certificate or a copy of it shall be in an official language of the forwarding country, and also, if that language is not German, English or French, in German, English or French.

¹ For articles, "explosive contents" means the explosive substance contained in the article.

NOTE 1: The commercial or technical name of the goods may be entered additionally to the proper shipping name in the transport document.

NOTE 2: The classification reference(s) shall consist of the ADR Contracting Party in which the classification code according to special provision 645 of 3.3.1 was approved, indicated by the distinguishing sign for motor vehicles in international traffic (XX)², the competent authority identification (YY) and a unique serial reference (ZZZZ). Examples of such classification references are:

GB/HSE123456
D/BAM1234.

5.4.1.2.2 Additional provisions for Class 2

- (a) For the carriage of mixtures (see 2.2.2.1.1) in tanks (dismountable tanks, fixed tanks, portable tanks, tank-containers or elements of battery-vehicles or of MEGCs), the composition of the mixture as a percentage of the volume or as a percentage of the mass shall be given. Constituents below 1% need not be indicated (see also 3.1.2.8.1.2). The composition of the mixture need not be given when the technical names authorized by special provisions 581, 582 or 583 are used to supplement the proper shipping name;
- (b) For the carriage of cylinders, tubes, pressure drums, cryogenic receptacles and bundles of cylinders under the conditions of 4.1.6.10, the following entry shall be included in the transport document: **"Carriage in accordance with 4.1.6.10"**.

5.4.1.2.3 Additional provisions for self-reactive substances of Class 4.1 and organic peroxides of Class 5.2

5.4.1.2.3.1 For self-reactive substances of Class 4.1 and for organic peroxides of Class 5.2 that require temperature control during carriage (for self-reactive substances see 2.2.41.1.17; for organic peroxides, see 2.2.52.1.15 to 2.2.52.1.17), the control and emergency temperatures shall be indicated in the transport document, as follows:

"Control temperature: ... °C Emergency temperature: ... °C".

5.4.1.2.3.2 When for certain self-reactive substances of Class 4.1 and certain organic peroxides of Class 5.2 the competent authority has permitted the label conforming to model No.1 to be dispensed with for a specific packaging (see 5.2.2.1.9), a statement to this effect shall be included in the transport document, as follows:

"The label conforming to model No. 1 is not required".

5.4.1.2.3.3 When organic peroxides and self-reactive substances are carried under conditions where approval is required (for organic peroxides see 2.2.52.1.8, 4.1.7.2.2 and special provision TA2 of 6.8.4; for self-reactive substances see 2.2.41.1.13 and 4.1.7.2.2, a statement to this effect shall be included in the transport document, e.g. **"Carriage in accordance with 2.2.52.1.8"**.

² Distinguishing sign for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

A copy of the competent authority approval with the conditions of carriage shall be attached to the transport document. It shall be drafted in an official language of the forwarding country and also, if that language is not English, French or German, in English, French or German unless agreements, if any, concluded between the countries concerned in the transport operation provide otherwise.

5.4.1.2.3.4 When a sample of an organic peroxide (see 2.2.52.1.9) or a self-reactive substance (see 2.2.41.1.15) is carried, a statement to this effect shall be included in the transport document, e.g. **"Carriage in accordance with 2.2.52.1.9"**.

5.4.1.2.3.5 When self-reactive substances type G (see Manual of Tests and Criteria, Part II, paragraph 20.4.2 (g)) are carried, the following statement may be given in the transport document: **"Not a self-reactive substance of Class 4.1"**.

When organic peroxides type G (see Manual of Tests and Criteria, Part II, paragraph 20.4.3 (g)) are carried, the following statement may be given in the transport document: **"Not a substance of Class 5.2"**.

5.4.1.2.4 *Additional provisions for Class 6.2*

In addition to the information concerning the consignee (see 5.4.1.1.1 (h)), the name and telephone number of a responsible person shall be indicated.

5.4.1.2.5 *Additional provisions for Class 7*

5.4.1.2.5.1 The following information shall be inserted in the transport document for each consignment of Class 7 material, as applicable, in the order given and immediately after the information required under 5.4.1.1.1 (a) to (c) and (k):

- (a) The name or symbol of each radionuclide or, for mixtures of radionuclides, an appropriate general description or a list of the most restrictive nuclides;
- (b) A description of the physical and chemical form of the material, or a notation that the material is special form radioactive material or low dispersible radioactive material. A generic chemical description is acceptable for chemical form. For radioactive material with a subsidiary risk, see last sentence of special provision 172 of Chapter 3.3;
- (c) The maximum activity of the radioactive contents during carriage expressed in becquerels (Bq) with an appropriate SI prefix symbol (see 1.2.2.1). For fissile material, the mass of fissile material (or mass of each fissile nuclide for mixtures when appropriate) in grams (g), or appropriate multiples thereof, may be used in place of activity;
- (d) The category of the package, i.e. I-WHITE, II-YELLOW, III-YELLOW;
- (e) The transport index (categories II-YELLOW and III-YELLOW only);
- (f) For consignments including fissile material other than consignments excepted under 6.4.11.2, the criticality safety index;
- (g) The identification mark for each competent authority approval certificate (special form radioactive material, low dispersible radioactive material, special arrangement, package design, or shipment) applicable to the consignment;
- (h) For consignments of more than one package, the information required in 5.4.1.1.1 and in (a) to (g) above shall be given for each package. For packages in an overpack, container, or vehicle, a detailed statement of the contents of each package within the overpack, container, or vehicle and, where appropriate, of each overpack, container, or

vehicle shall be included. If packages are to be removed from the overpack, container, or vehicle at a point of intermediate unloading, appropriate transport documents shall be made available;

- (i) Where a consignment is required to be shipped under exclusive use, the statement "**EXCLUSIVE USE SHIPMENT**"; and
- (j) For LSA-II and LSA-III substances, SCO-I and SCO-II, the total activity of the consignment as a multiple of A_2 . For radioactive material for which the A_2 value is unlimited, the multiple of A_2 shall be zero.

5.4.1.2.5.2 The consignor shall provide in the transport documents a statement regarding actions, if any, that are required to be taken by the carrier. The statement shall be in the languages deemed necessary by the carrier or the authorities concerned, and shall include at least the following information:

- (a) Supplementary requirements for loading, stowage, carriage, handling and unloading of the package, overpack or container including any special stowage provisions for the safe dissipation of heat (see special provision CV33 (3.2) of 7.5.11), or a statement that no such requirements are necessary;
- (b) Restrictions on the mode of carriage or vehicle and any necessary routeing instructions;
- (c) Emergency arrangements appropriate to the consignment.

5.4.1.2.5.3 In all cases of international carriage of packages requiring competent authority design or shipment approval, for which different approval types apply in the different countries concerned by the shipment, the UN number and proper shipping name required in 5.4.1.1.1 shall be in accordance with the certificate of the country of origin of design.

5.4.1.2.5.4 The applicable competent authority certificates need not necessarily accompany the consignment. The consignor shall make them available to the carrier(s) before loading and unloading.

5.4.1.3 *(Reserved)*

5.4.1.4 ***Format and language***

5.4.1.4.1 The document containing the information in 5.4.1.1 and 5.4.1.2 may be that already required by other regulations in force for carriage by another mode of carriage. In case of multiple consignees, the name and address of the consignees and the quantities delivered enabling the nature and quantities carried to be evaluated at any time, may be entered in other documents which are to be used or in any other documents made mandatory according to other specific regulations and which shall be on board the vehicle.

The particulars to be entered in the document shall be drafted in an official language of the forwarding country, and also, if that language is not English, French, or German, in English, French or German, unless international road carriage tariffs, if any, or agreements concluded between the countries concerned in the transport operation, provide otherwise.

5.4.1.4.2 If by reason of the size of the load, a consignment cannot be loaded in its entirety on a single transport unit, at least as many separate documents, or copies of the single document, shall be made out as transport units loaded. Furthermore, in all cases, separate transport documents shall be made out for consignments or parts of consignments which may not be loaded together on the same vehicle by reason of the prohibitions set forth in 7.5.2.

The information relative to the hazards of the goods to be carried (as indicated in 5.4.1.1) may be incorporated in, or combined with, an existing transport or cargo handling document.

The layout of the information in the document (or the order of transmission of the corresponding data by electronic data processing (EDP) or electronic data interchange (EDI) techniques) shall be as provided in 5.4.1.1.1.

When an existing transport document or cargo handling document cannot be used for the purposes of dangerous goods documentation for multimodal transport, the use of documents corresponding to the example shown in 5.4.5 is considered advisable³.

5.4.1.5 *Non-dangerous goods*

When goods mentioned by name in Table A of Chapter 3.2, are not subject to ADR because they are considered as non-dangerous according to Part 2, the consignor may enter in the transport document a statement to that effect, e.g.: "**Not goods of Class ...**"

***NOTE:** This provision may be used in particular when the consignor considers that, due to the chemical nature of the goods (e.g. solutions and mixtures) carried or to the fact that such goods are deemed dangerous for other regulatory purposes the consignment might be subject to control during the journey.*

³ If used, the relevant recommendations of the UNECE United Nations Centre for Trade Facilitation and Electronic Business (UN/CEFACT) may be consulted, in particular Recommendation No. 1 (United Nations Layout Key for Trade Documents) (ECE/TRADE/137, edition 81.3), UN Layout Key for Trade Documents - Guidelines for Applications (ECE/TRADE/270, edition 2002), Recommendation No. 11 (Documentary Aspects of the International Transport of Dangerous Goods) (ECE/TRADE/204, edition 96.1 – currently under revision) and Recommendation No. 22 (Layout Key for Standard Consignment Instructions) (ECE/TRADE/168, edition 1989). Refer also to the UN/CEFACT Summary of Trade Facilitation Recommendations (ECE/TRADE/346, edition 2006) and the United Nations Trade Data Elements Directory (UNTDDED) (ECE/TRADE/362, edition 2005).

5.4.2 Large container or vehicle packing certificate

If the carriage of dangerous goods in a large container precedes a voyage by sea, a container packing certificate conforming to section 5.4.2 of the IMDG Code⁴ shall be provided with the transport document⁵.

The functions of the transport document required under 5.4.1 and of the container packing certificate as provided above may be incorporated into a single document; if not, these documents shall be attached one to the other. If these functions are incorporated into a single document, the inclusion in the transport document of a statement that the loading of the container has been carried out in accordance with the applicable modal regulations together with the identification of the person responsible for the container packing certificate shall be sufficient.

NOTE: *The container packing certificate is not required for portable tanks, tank-containers and MEGCs.*

⁴ Guidelines for use in practice and in training for loading goods in transport units have also been drawn up by the International Maritime Organization (IMO), the International Labour Organization (ILO) and the United Nations Economic Commission for Europe (UNECE) and have been published by IMO ("IMO/ILO/UNECE Guidelines for Packing of Cargo Transport Units (CTUs)").

⁵ Section 5.4.2 of the IMDG Code requires the following:

"5.4.2 Container/vehicle packing certificate

5.4.2.1 When dangerous goods are packed or loaded into any container or vehicle, those responsible for packing the container or vehicle shall provide a "container/vehicle packing certificate" specifying the container/vehicle identification number(s) and certifying that the operation has been carried out in accordance with the following conditions:

- .1 The container/vehicle was clean, dry and apparently fit to receive the goods;
- .2 Packages, which need to be segregated in accordance with applicable segregation requirements, have not been packed together onto or in the container/vehicle [unless approved by the competent authority concerned in accordance with 7.2.2.3 (of the IMDG Code)];
- .3 All packages have been externally inspected for damage, and only sound packages have been loaded;
- .4 Drums have been stowed in an upright position, unless otherwise authorized by the competent authority, and all goods have been properly loaded, and, where necessary, adequately braced with securing material to suit the mode(s) of transport for the intended journey;
- .5 Goods loaded in bulk have been evenly distributed within the container/vehicle;
- .6 For consignments including goods of class 1, other than division 1.4, the container/vehicle is structurally serviceable in conformity with 7.4.6 (of the IMDG Code);
- .7 The container/vehicle and packages are properly marked, labelled, and placarded, as appropriate;
- .8 When solid carbon dioxide (CO₂-dry ice) is used for cooling purposes, the container/vehicle is externally marked or labelled in a conspicuous place, such as, at the door end, with the words: "DANGEROUS CO₂ GAS (DRY ICE) INSIDE. VENTILATE THOROUGHLY BEFORE ENTERING"; and
- .9 A dangerous goods transport document, as indicated in 5.4.1 (of the IMDG Code) has been received for each dangerous goods consignment loaded in the container/vehicle.

NOTE: *The container/vehicle packing certificate is not required for tanks*

5.4.2.2 The information required in the dangerous goods transport document and the container/vehicle packing certificate may be incorporated into a single document; if not, these documents shall be attached one to the other. If the information is incorporated into a single document, the document shall include a signed declaration such as "It is declared that the packing of the goods into the container/vehicle has been carried out in accordance with the applicable provisions". This declaration shall be dated and the person signing this declaration shall be identified on the document. Facsimile signatures are acceptable where applicable laws and regulations recognize the legal validity of facsimile signatures.

5.4.2.3 If the container/vehicle packing certificate is presented to the carrier by means of EDP or EDI transmission techniques, the signature(s) may be electronic signature(s) or may be replaced by the name(s) (in capitals) of the person authorized to sign.

5.4.2.4 When the container/vehicle packing certificate is given to a carrier by EDP or EDI techniques and subsequently the dangerous goods are transferred to a carrier that requires a paper dangerous goods transport document, the carrier shall ensure that the paper document indicates "Original received electronically" and the name of the signatory shall be shown in capital letters.

5.4.3 Instructions in writing

- 5.4.3.1 As an aid during an accident emergency situation that may occur or arise during carriage, instructions in writing in the form specified in 5.4.3.4 shall be carried in the vehicle crew's cab and shall be readily available.
- 5.4.3.2 These instructions shall be provided by the carrier to the vehicle crew in language(s) that each member can read and understand before the commencement of the journey. The carrier shall ensure that each member of the vehicle crew concerned understands and is capable of carrying out the instructions properly.
- 5.4.3.3 Before the start of the journey, the members of the vehicle crew shall inform themselves of the dangerous goods loaded and consult the instructions in writing for details on actions to be taken in the event of an accident or emergency.
- 5.4.3.4 The instructions in writing shall correspond to the following four page model as regards its form and contents.

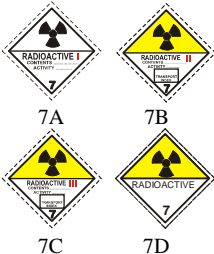

INSTRUCTIONS IN WRITING ACCORDING TO ADR

Actions in the event of an accident or emergency

In the event of an accident or emergency that may occur or arise during carriage, the members of the vehicle crew shall take the following actions where safe and practicable to do so:

- Apply the braking system, stop the engine and isolate the battery by activating the master switch where available;
- Avoid sources of ignition, in particular, do not smoke or switch on any electrical equipment;
- Inform the appropriate emergency services, giving as much information about the incident or accident and substances involved as possible;
- Put on the warning vest and place the self-standing warning signs as appropriate;
- Keep the transport documents readily available for responders on arrival;
- Do not walk into or touch spilled substances and avoid inhalation of fumes, smoke, dusts and vapours by staying up wind;
- Where appropriate and safe to do so, use the fire extinguishers to put out small/initial fires in tyres, brakes and engine compartments;
- Fires in load compartments shall not be tackled by members of the vehicle crew;
- Where appropriate and safe to do so, use on-board equipment to prevent leakages into the aquatic environment or the sewage system and to contain spillages;
- Move away from the vicinity of the accident or emergency, advise other persons to move away and follow the advice of the emergency services;
- Remove any contaminated clothing and used contaminated protective equipment and dispose of it safely.

Additional guidance to members of the vehicle crew on the hazard characteristics of dangerous goods by class and on actions subject to prevailing circumstances		
Danger labels and placards	Hazard characteristics	Additional guidance
(1)	(2)	(3)
Explosive substances and articles  1 1.5 1.6	May have a range of properties and effects such as mass detonation; projection of fragments; intense fire/heat flux; formation of bright light, loud noise or smoke. Sensitive to shocks and/or impacts and/or heat.	Take cover but stay away from windows.
Explosive substances and articles  1.4	Slight risk of explosion and fire.	Take cover.
Flammable gases  2.1	Risk of fire. Risk of explosion. May be under pressure. Risk of asphyxiation. May cause burns and/or frostbite. Containments may explode when heated.	Take cover. Keep out of low areas.
Non-flammable, non-toxic gases  2.2	Risk of asphyxiation. May be under pressure. May cause frostbite. Containments may explode when heated.	Take cover. Keep out of low areas.
Toxic gases  2.3	Risk of intoxication. May be under pressure. May cause burns and/or frostbite. Containments may explode when heated.	Use emergency escape mask. Take cover. Keep out of low areas.
Flammable liquids  3	Risk of fire. Risk of explosion. Containments may explode when heated.	Take cover. Keep out of low areas.
Flammable solids, self-reactive substances and solid desensitized explosives  4.1	Risk of fire. Flammable or combustible, may be ignited by heat, sparks or flames. May contain self-reactive substances that are liable to exothermic decomposition in the case of heat supply, contact with other substances (such as acids, heavy-metal compounds or amines), friction or shock. This may result in the evolution of harmful and flammable gases or vapours or self-ignition. Containments may explode when heated. Risk of explosion of desensitized explosives after loss of desensitizer.	
Substances liable to spontaneous combustion  4.2	Risk of fire by spontaneous combustion if packages are damaged or contents are spilled. May react vigorously with water	
Substances which, in contact with water, emit flammable gases  4.3	Risk of fire and explosion in contact with water.	Spilled substances should be kept dry by covering the spillages.

Danger labels and placards	Hazard characteristics	Additional guidance
(1)	(2)	(3)
Oxidizing substances  5.1	Risk of vigorous reaction, ignition and explosion in contact with combustible or flammable substances.	Avoid mixing with flammable or combustible substances (e.g. sawdust).
Organic peroxides  5.2	Risk of exothermic decomposition at elevated temperatures, contact with other substances (such as acids, heavy-metal compounds or amines), friction or shock. This may result in the evolution of harmful and flammable gases or vapours or self-ignition.	Avoid mixing with flammable or combustible substances (e.g. sawdust).
Toxic substances  6.1	Risk of intoxication by inhalation, skin contact or ingestion. Risk to the aquatic environment or the sewerage system.	Use emergency escape mask.
Infectious substances  6.2	Risk of infection. May cause serious disease in humans or animals. Risk to the aquatic environment or the sewerage system.	
Radioactive material  7A 7B 7C 7D	Risk of intake and external radiation.	Limit time of exposure.
Fissile material  7E	Risk of nuclear chain reaction.	
Corrosive substances  8	Risk of burns by corrosion. May react vigorously with each other, with water and with other substances. Spilled substance may evolve corrosive vapours. Risk to the aquatic environment or the sewerage system.	
Miscellaneous dangerous substances and articles  9	Risk of burns. Risk of fire. Risk of explosion. Risk to the aquatic environment or the sewerage system.	

NOTE 1: For dangerous goods with multiple risks and for mixed loads, each applicable entry shall be observed.

NOTE 2: Additional guidance shown above may be adapted to reflect the classes of dangerous goods to be carried and their means of transport.

Additional guidance to members of the vehicle crew on the hazard characteristics of dangerous goods, indicated by marks, and on actions subject to prevailing circumstances		
Mark	Hazard characteristics	Additional guidance
(1)	(2)	(3)
 Environmentally hazardous substances	Risk to the aquatic environment or the sewerage system	
 Elevated temperature substances	Risk of burns by heat.	Avoid contact with hot parts of the transport unit and the spilled substance.

Equipment for personal and general protection
to carry out general actions and hazard specific emergency actions
to be carried on board the vehicle in accordance with section 8.1.5 of ADR

The following equipment shall be carried on board the transport unit:

- for each vehicle, a wheel chock of a size suited to the maximum mass of the vehicle and to the diameter of the wheel;
- two self-standing warning signs;
- eye rinsing liquid^a; and

for each member of the vehicle crew

- a warning vest (e.g. as described in the EN 471 standard);
- portable lighting apparatus;
- a pair of protective gloves; and
- eye protection (e.g. protective goggles).

Additional equipment required for certain classes:

- an emergency escape mask^b for each member of the vehicle crew shall be carried on board the vehicle for danger label numbers 2.3 or 6.1;
- a shovel^c;
- a drain seal^c;
- a collecting container^c.

^a Not required for danger label numbers 1, 1.4, 1.5, 1.6, 2.1, 2.2 and 2.3.

^b For example an emergency escape mask with a combined gas/dust filter of the A1B1E1K1-P1 or A2B2E2K2-P2 type which is similar to that described in the EN 141 standard.

^c Only required for solids and liquids with danger label numbers 3, 4.1, 4.3, 8 or 9.

5.4.4 Retention of dangerous goods transport information

5.4.4.1 The consignor and the carrier shall retain a copy of the dangerous goods transport document and additional information and documentation as specified in ADR, for a minimum period of three months.

5.4.4.2 When the documents are kept electronically or in a computer system, the consignor and the carrier shall be able to reproduce them in a printed form.

5.4.5 Example of a multimodal dangerous goods form

Example of a form which may be used as a combined dangerous goods declaration and container packing certificate for multimodal carriage of dangerous goods.

MULTIMODAL DANGEROUS GOODS FORM

* FOR DANGEROUS GOODS; you must specify: UN no., proper shipping name, hazard class, packing group (where assigned) and any other element of information required under applicable national and international regulations

1. Shipper / Consignor /Sender		2. Transport document number					
		3. Page 1 of Pages		4. Shipper's reference			
		5. Freight Forwarder's reference					
6. Consignee		7. Carrier (to be completed by the carrier)					
		SHIPPER'S DECLARATION I hereby declare that the contents of this consignment are fully and accurately described below by the proper shipping name, and are classified, packaged, marked and labeled /placarded and are in all respects in proper condition for transport according to the applicable international and national governmental regulations.					
8. This shipment is within the limitations prescribed for: (Delete non-applicable) <div style="display: flex; justify-content: space-around;"> PASSENGER AND CARGO AIRCRAFT CARGO AIRCRAFT ONLY </div>		9. Additional handling information					
10. Vessel / flight no. and date	11. Port / place of loading						
12. Port / place of discharge	13. Destination

CHAPTER 5.5

SPECIAL PROVISIONS

5.5.1 *(Deleted)*

5.5.2 Special provisions applicable to fumigated cargo transport units (UN 3359)

5.5.2.1 *General*

5.5.2.1.1 Fumigated cargo transport units (UN 3359) containing no other dangerous goods are not subject to any provisions of ADR other than those of this section.

NOTE: For the purposes of this Chapter, cargo transport unit means a vehicle, a container, a tank-container, a portable tank or a MEGC.

5.5.2.1.2 When the fumigated cargo transport unit is loaded with dangerous goods in addition to the fumigant, any provision of ADR relevant to these goods (including placarding, marking and documentation) applies in addition to the provisions of this section.

5.5.2.1.3 Only cargo transport units that can be closed in such a way that the escape of gas is reduced to a minimum shall be used for the carriage of cargo under fumigation.

5.5.2.2 *Training*

Persons engaged in the handling of fumigated cargo transport units shall be trained commensurate with their responsibilities.

5.5.2.3 *Marking and placarding*

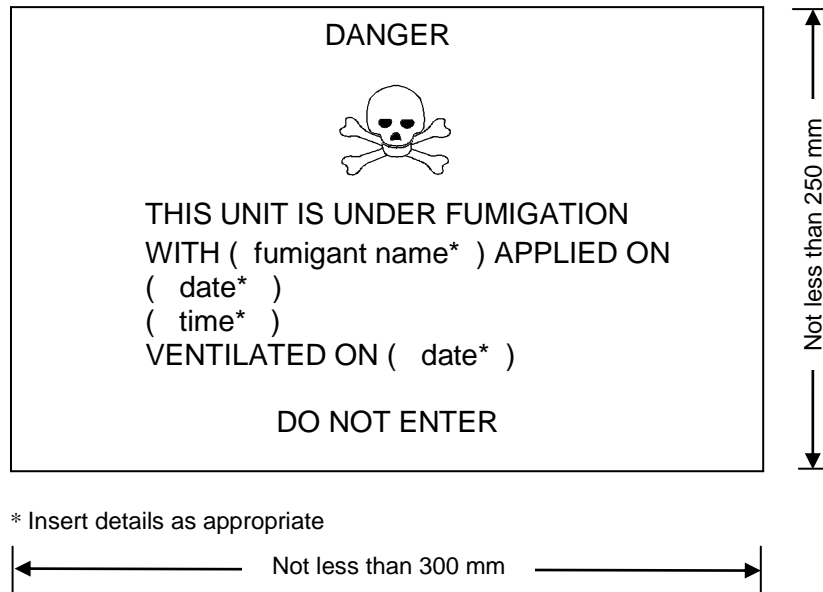

5.5.2.3.1 A fumigated cargo transport unit shall be marked with a warning mark, as specified in 5.5.2.3.2, affixed at each access point in a location where it will be easily seen by persons opening or entering the cargo transport unit. This mark shall remain on the cargo transport unit until the following provisions are met:

(a) The fumigated cargo transport unit has been ventilated to remove harmful concentrations of fumigant gas; and

(b) The fumigated goods or materials have been unloaded.

5.5.2.3.2 The fumigation warning mark shall be rectangular and shall not be less than 300 mm wide and 250 mm high. The markings shall be in black print on a white background with lettering not less than 25 mm high. An illustration of this mark is given in the figure below.

Fumigation warning mark

5.5.2.3.3 If the fumigated cargo transport unit has been completely ventilated either by opening the doors of the unit or by mechanical ventilation after fumigation, the date of ventilation shall be marked on the fumigation warning mark.

5.5.2.3.4 When the fumigated cargo transport unit has been ventilated and unloaded, the fumigation warning mark shall be removed.

5.5.2.3.5 Placards conforming to model No. 9 (see 5.2.2.2.2) shall not be affixed to a fumigated cargo transport unit except as required for other Class 9 substances or articles packed therein.

5.5.2.4 *Documentation*

5.5.2.4.1 Documents associated with the carriage of cargo transport units that have been fumigated and have not been completely ventilated before carriage shall include the following information:

- "UN 3359, fumigated cargo transport unit, 9", or "UN 3359, fumigated cargo transport unit, Class 9";
- The date and time of fumigation; and
- The type and amount of the fumigant used.

These particulars shall be drafted in an official language of the forwarding country and also, if the language is not English, French or German, in English, French or German, unless agreements, if any, concluded between the countries concerned in the transport operation provide otherwise.

5.5.2.4.2 The documents may be in any form, provided they contain the information required in 5.5.2.4.1. This information shall be easy to identify, legible and durable.

5.5.2.4.3 Instructions for disposal of any residual fumigant including fumigation devices (if used) shall be provided.

5.5.2.4.4 A document is not required when the fumigated cargo transport unit has been completely ventilated and the date of ventilation has been marked on the warning mark (see 5.5.2.3.3 and 5.5.2.3.4).

- 5.5.3 Special provisions applicable to packages and vehicles and containers containing substances presenting a risk of asphyxiation when used for cooling or conditioning purposes (such as dry ice (UN 1845) or nitrogen, refrigerated liquid (UN 1977) or argon, refrigerated liquid (UN 1951))**
- 5.5.3.1 Scope**
- 5.5.3.1.1 This section is not applicable to substances which may be used for cooling or conditioning purposes when carried as a consignment of dangerous goods. When they are carried as a consignment, these substances shall be carried under the relevant entry of Table A in Chapter 3.2 in accordance with the associated conditions of carriage.
- 5.5.3.1.2 This section is not applicable to gases in cooling cycles.
- 5.5.3.1.3 Dangerous goods used for cooling or conditioning tanks or MEGCs during carriage are not subject to this section.
- 5.5.3.2 General**
- 5.5.3.2.1 Vehicles and containers containing substances used for cooling or conditioning purposes (other than fumigation) during carriage are not subject to any provisions of ADR other than those of this section.
- 5.5.3.2.2 When dangerous goods are loaded in cooled or conditioned vehicles and containers any provisions of ADR relevant to these dangerous goods apply in addition to the provisions of this section.
- 5.5.3.2.3 (Reserved)
- 5.5.3.2.4 Persons engaged in the handling or carriage of cooled or conditioned vehicles and containers shall be trained commensurate with their responsibilities.
- 5.5.3.3 Packages containing a coolant or conditioner**
- 5.5.3.3.1 Packaged dangerous goods requiring cooling or conditioning assigned to packing instructions P203, P620, P650, P800, P901 or P904 of 4.1.4.1 shall meet the appropriate requirements of that packing instruction.
- 5.5.3.3.2 For packaged dangerous goods requiring cooling or conditioning assigned to other packing instructions, the packages shall be capable of withstanding very low temperatures and shall not be affected or significantly weakened by the coolant or conditioner. Packages shall be designed and constructed to permit the release of gas to prevent a build-up of pressure that could rupture the packaging. The dangerous goods shall be packed in such a way as to prevent movement after the dissipation of any coolant or conditioner.
- 5.5.3.3.3 Packages containing a coolant or conditioner shall be carried in well ventilated vehicles and containers.
- 5.5.3.4 Marking of packages containing a coolant or conditioner**
- 5.5.3.4.1 Packages containing dangerous goods used for cooling or conditioning shall be marked with the name indicated in Column (2) of Table A of Chapter 3.2 of these dangerous goods followed by the words "AS COOLANT" or "AS CONDITIONER" as appropriate in an official language of the country of origin and also, if that language is not English, French or German, in English, French or German, unless agreements concluded between the countries concerned in the transport operation provide otherwise.

5.5.3.4.2 The markings shall be durable, legible and placed in such a location and of such a size relative to the package as to be readily visible.

5.5.3.5 *Vehicles and containers containing unpackaged dry ice*

5.5.3.5.1 If dry ice in unpackaged form is used, it shall not come into direct contact with the metal structure of a vehicle or container to avoid embrittlement of the metal. Measures shall be taken to provide adequate insulation between the dry ice and the vehicle or container by providing a minimum of 30 mm separation (e.g. by using suitable low heat conducting materials such as timber planks, pallets etc).

5.5.3.5.2 Where dry ice is placed around packages, measures shall be taken to ensure that packages remain in the original position during carriage after the dry ice has dissipated.

5.5.3.6 *Marking of vehicles and containers*

5.5.3.6.1 Vehicles and containers containing dangerous goods used for cooling or conditioning shall be marked with a warning mark, as specified in 5.5.3.6.2 affixed at each access point in a location where it will be easily seen by persons opening or entering the vehicle or container. This mark shall remain on the vehicle or container until the following provisions are met:

- (a) The vehicle or container has been ventilated to remove harmful concentrations of coolant or conditioner; and
- (b) The cooled or conditioned goods have been unloaded.

5.5.3.6.2 The warning mark shall be rectangular and shall not be less than 150 mm wide and 250 mm high. The warning mark shall include:

- (a) The word "WARNING" in red or white with lettering not less than 25 mm high in an official language of the country of origin and also, if that language is not English, French or German, in English, French or German, unless agreements concluded between the countries concerned in the transport operation provide otherwise; and
- (b) The name indicated in Column (2) of Table A of Chapter 3.2 followed by the words "AS COOLANT" or "AS CONDITIONER" as appropriate, shown below the symbol in black letters on a white background with lettering not less than 25 mm high in an official language of the country of origin and also, if that language is not English, French or German, in English, French or German, unless agreements concluded between the countries concerned in the transport operation provide otherwise.

For example: CARBON DIOXIDE, SOLID, AS COOLANT.

An illustration of this mark is given below.

* Insert the name indicated in Column (2) of Table A of Chapter 3.2 followed by the words "AS COOLANT" or "AS CONDITIONER" as appropriate.

5.5.3.7 *Documentation*

5.5.3.7.1 Documents (such as a bill of lading, cargo manifest or CMR/CIM consignment note) associated with the carriage of vehicles or containers that have been cooled or conditioned and have not been completely ventilated before carriage shall include the following information:

- (a) The UN number preceded by the letters "UN"; and
- (b) The name indicated in Column (2) of Table A of Chapter 3.2 followed by the words "AS COOLANT" or "AS CONDITIONER" as appropriate in an official language of the country of origin and also, if that language is not English, French or German, in English, French or German, unless agreements, if any, concluded between the countries concerned in the transport operation provide otherwise.

For example: UN 1845, CARBON DIOXIDE, SOLID, AS COOLANT.

5.5.3.7.2 The transport document may be in any form, provided it contains the information required in 5.5.3.7.1. This information shall be easy to identify, legible and durable.

PART 6

**Requirements for the construction
and testing of packagings,
intermediate bulk containers (IBCs),
large packagings, tanks and bulk containers**

CHAPTER 6.1

REQUIREMENTS FOR THE CONSTRUCTION AND TESTING OF PACKAGINGS

6.1.1 General

6.1.1.1 The requirements of this Chapter do not apply to:

- (a) Packages containing radioactive material of Class 7, unless otherwise provided (see 4.1.9);
- (b) Packages containing infectious substances of Class 6.2, unless otherwise provided (see Chapter 6.3, Note and packing instruction P621 of 4.1.4.1);
- (c) Pressure receptacles containing gases of Class 2;
- (d) Packages whose net mass exceeds 400 kg;
- (e) Packagings with a capacity exceeding 450 litres.

6.1.1.2 The requirements for packagings in 6.1.4 are based on packagings currently used. In order to take into account progress in science and technology, there is no objection to the use of packagings having specifications different from those in 6.1.4, provided that they are equally effective, acceptable to the competent authority and able successfully to withstand the tests described in 6.1.1.3 and 6.1.5. Methods of testing other than those described in this Chapter are acceptable, provided they are equivalent, and are recognized by the competent authority.

6.1.1.3 Every packaging intended to contain liquids shall successfully undergo a suitable leakproofness test, and be capable of meeting the appropriate test level indicated in 6.1.5.4.3:

- (a) Before it is first used for carriage;
- (b) After remanufacturing or reconditioning, before it is re-used for carriage;

For this test, packagings need not have their own closures fitted.

The inner receptacle of composite packagings may be tested without the outer packaging provided the test results are not affected.

This test is not necessary for:

- Inner packagings of combination packagings;
- Inner receptacles of composite packagings (glass, porcelain or stoneware), marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii);
- Light gauge metal packagings, marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii).

6.1.1.4 Packagings shall be manufactured, reconditioned and tested under a quality assurance programme which satisfies the competent authority in order to ensure that each packaging meets the requirements of this Chapter.

NOTE: ISO 16106:2006 "Packaging – Transport packages for dangerous goods – Dangerous goods packagings, intermediate bulk containers (IBCs) and large packagings – Guidelines for the application of ISO 9001" provides acceptable guidance on procedures which may be followed.

6.1.1.5 Manufacturers and subsequent distributors of packagings shall provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that packages as presented for carriage are capable of passing the applicable performance tests of this Chapter.

6.1.2 Code for designating types of packagings

6.1.2.1 The code consists of:

- (a) An Arabic numeral indicating the kind of packaging, e.g. drum, jerrican, etc., followed by;
- (b) A capital letter(s) in Latin characters indicating the nature of the material, e.g. steel, wood, etc., followed where necessary by;
- (c) An Arabic numeral indicating the category of packaging within the kind to which the packaging belongs.

6.1.2.2 In the case of composite packagings, two capital letters in Latin characters are used in sequence in the second position of the code. The first indicates the material of the inner receptacle and the second that of the outer packaging.

6.1.2.3 In the case of combination packagings only the code number for the outer packaging is used.

6.1.2.4 The letters "T", "V" or "W" may follow the packaging code. The letter "T" signifies a salvage packaging conforming to the requirements of 6.1.5.1.11. The letter "V" signifies a special packaging conforming to the requirements of 6.1.5.1.7. The letter "W" signifies that the packaging, although of the same type indicated by the code, is manufactured to a specification different to that in 6.1.4 and is considered equivalent under the requirements of 6.1.1.2.

6.1.2.5 The following numerals shall be used for the kinds of packaging:

- 1. Drum
- 2. (Reserved)
- 3. Jerrican
- 4. Box
- 5. Bag
- 6. Composite packaging
- 7. (Reserved)
- 0. Light gauge metal packagings

6.1.2.6 The following capital letters shall be used for the types of material:

- A. Steel (all types and surface treatments)
- B. Aluminium
- C. Natural wood
- D. Plywood
- F. Reconstituted wood
- G. Fibreboard
- H. Plastics material
- L. Textile
- M. Paper, multiwall
- N. Metal (other than steel or aluminium)
- P. Glass, porcelain or stoneware

NOTE: Plastics material is taken to include other polymeric materials such as rubber.

6.1.2.7

The following table indicates the codes to be used for designating types of packagings depending on the kind of packagings, the material used for their construction and their category; it also refers to the sub-sections to be consulted for the appropriate requirements:

Kind	Material	Category	Code	Sub-section
1. Drums	A. Steel	non-removable head	1A1	6.1.4.1
		removable head	1A2	
	B. Aluminium	non-removable head	1B1	6.1.4.2
		removable head	1B2	
	D. Plywood		1D	6.1.4.5
	G. Fibre		1G	6.1.4.7
	H. Plastics	non-removable head	1H1	6.1.4.8
		removable head	1H2	
	N. Metal, other than steel or aluminium	non-removable head	1N1	6.1.4.3
removable head		1N2		
2. (Reserved)				
3. Jerricans	A. Steel	non-removable head	3A1	6.1.4.4
		removable head	3A2	
	B. Aluminium	non-removable head	3B1	6.1.4.4
		removable head	3B2	
	H. Plastics	non-removable head	3H1	6.1.4.8
		removable head	3H2	
4. Boxes	A. Steel		4A	6.1.4.14
	B. Aluminium		4B	6.1.4.14
	C. Natural wood	ordinary	4C1	6.1.4.9
		with sift-proof walls	4C2	
	D. Plywood		4D	6.1.4.10
	F. Reconstituted wood		4F	6.1.4.11
	G. Fibreboard		4G	6.1.4.12
	H. Plastics	expanded	4H1	6.1.4.13
		solid	4H2	
N. Metal, other than steel or aluminium		4N	6.1.4.14	
5. Bags	H. Woven plastics	without inner liner or coating	5H1	6.1.4.16
		sift-proof	5H2	
		water resistant	5H3	
	H. Plastics film		5H4	6.1.4.17
	L. Textile	without inner liner or coating	5L1	6.1.4.15
		sift-proof	5L2	
		water resistant	5L3	
	M. Paper	multiwall	5M1	6.1.4.18
		multiwall, water resistant	5M2	

Kind	Material	Category	Code	Sub-section
6. Composite packagings	H. Plastics receptacle	with outer steel drum	6HA1	6.1.4.19
		with outer steel crate or box	6HA2	
		with outer aluminium drum	6HB1	
		with outer aluminium crate or box	6HB2	
		with outer wooden box	6HC	
		with outer plywood drum	6HD1	
		with outer plywood box	6HD2	
		with outer fibre drum	6HG1	
		with outer fibreboard box	6HG2	
		with outer plastics drum	6HH1	
		with outer solid plastics box	6HH2	
	P. Glass, porcelain or stoneware receptacle	with outer steel drum	6PA1	6.1.4.20
		with outer steel crate or box	6PA2	
		with outer aluminium drum	6PB1	
		with outer aluminium crate or box	6PB2	
		with outer wooden box	6PC	
		with outer plywood drum	6PD1	
		with outer wickerwork hamper	6PD2	
		with outer fibre drum	6PG1	
		with outer fibreboard box	6PG2	
		with outer expanded plastics packaging	6PH1	
		with outer solid plastics packaging	6PH2	
7. (Reserved)				
0. Light gauge metal packagings	A. Steel	non-removable head	0A1	6.1.4.22
		removable head	0A2	

6.1.3 Marking

NOTE 1: The marking indicates that the packaging which bears it corresponds to a successfully tested design type and that it complies with the requirements of this Chapter which are related to the manufacture, but not to the use, of the packaging. In itself, therefore, the mark does not necessarily confirm that the packaging may be used for any substance: generally the type of packaging (e.g. steel drum), its maximum capacity and/or mass, and any special requirements are specified for each substance in Table A of Chapter 3.2.

NOTE 2: The marking is intended to be of assistance to packaging manufacturers, reconditioners, packaging users, carriers and regulatory authorities. In relation to the use of a new packaging, the original marking is a means for its manufacturer(s) to identify the type and to indicate those performance test regulations that have been met.

NOTE 3: The marking does not always provide full details of the test levels, etc., and these may need to be taken further into account, e.g. by reference to a test certificate, to test reports or to a register of successfully tested packagings. For example, a packaging having

an X or Y marking may be used for substances to which a packing group having a lesser degree of danger has been assigned with the relevant maximum permissible value of the relative density¹ determined by taking into account the factor 1.5 or 2.25 indicated in the packaging test requirements in 6.1.5 as appropriate, i.e. packing group I packaging tested for products of relative density 1.2 could be used as a packing group II packaging for products of relative density 1.8 or a packing group III packaging for products of relative density 2.7, provided of course that all the performance criteria can still be met with the higher relative density product.

- 6.1.3.1 Each packaging intended for use according to the ADR shall bear markings which are durable, legible and placed in a location and of such a size relative to the packaging as to be readily visible. For packages with a gross mass of more than 30 kg, the markings or a duplicate thereof shall appear on the top or on a side of the packaging. Letters, numerals and symbols shall be at least 12 mm high, except for packagings of 30 litres or 30 kg capacity or less, when they shall be at least 6 mm in height and for packagings of 5 litres or 5 kg or less when they shall be of an appropriate size.

The marking shall show:

- (a) (i) The United Nations packaging symbol  ;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7². This symbol shall not be used for packagings which comply with the simplified conditions of 6.1.1.3, 6.1.5.3.1 (e), 6.1.5.3.5 (c), 6.1.5.4, 6.1.5.5.1 and 6.1.5.6 (see also (ii) below). For embossed metal packagings, the capital letters "UN" may be applied instead of the symbol; or

- (ii) The symbol "RID/ADR" for composite packagings (glass, porcelain or stoneware) and light gauge metal packagings conforming to simplified conditions (see 6.1.1.3, 6.1.5.3.1 (e), 6.1.5.3.5 (c), 6.1.5.4, 6.1.5.5.1 and 6.1.5.6);

NOTE: Packagings bearing this symbol are approved for rail, road and inland waterways transport operations which are subject to the provisions of RID, ADR and ADN respectively. They are not necessarily accepted for carriage by other modes of transport or for transport operations by road, rail or inland waterways which are governed by other regulations.

- (b) The code designating the type of packaging according to 6.1.2;
- (c) A code in two parts:
- (i) a letter designating the packing group(s) for which the design type has been successfully tested:
- X for packing groups I, II and III;
Y for packing groups II and III;
Z for packing group III only;

¹ Relative density (d) is considered to be synonymous with Specific Gravity (SG) and is used throughout this text.

² This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

- (ii) the relative density, rounded off to the first decimal, for which the design type has been tested for packagings without inner packagings intended to contain liquids; this may be omitted when the relative density does not exceed 1.2. For packagings intended to contain solids or inner packagings, the maximum gross mass in kilograms.

For light-gauge metal packagings, marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii) intended to contain liquids having a viscosity at 23 °C exceeding 200 mm²/s, the maximum gross mass in kg;

- (d) Either the letter "S" denoting that the packaging is intended for the carriage of solids or inner packagings or, for packagings (other than combination packagings) intended to contain liquids, the hydraulic test pressure which the packaging was shown to withstand in kPa rounded down to the nearest 10 kPa.

For light-gauge metal packagings, marked with the symbol "RID/ADR, according to 6.1.3.1(a) (ii) intended to contain liquids having a viscosity at 23 °C exceeding 200 mm²/s, the letter "S";

- (e) The last two digits of the year during which the packaging was manufactured. Packagings of types 1H and 3H shall also be appropriately marked with the month of manufacture; this may be marked on the packaging in a different place from the remainder of the marking. An appropriate method is:

- (f) The State authorizing the allocation of the mark, indicated by the distinguishing sign for motor vehicles in international traffic³;
- (g) The name of the manufacturer or other identification of the packaging specified by the competent authority.

6.1.3.2

In addition to the durable markings prescribed in 6.1.3.1, every new metal drum of a capacity greater than 100 litres shall bear the marks described in 6.1.3.1 (a) to (e) on the bottom, with an indication of the nominal thickness of at least the metal used in the body (in mm, to 0.1 mm), in permanent form (e.g. embossed). When the nominal thickness of either head of a metal drum is thinner than that of the body, the nominal thickness of the top head, body, and bottom head shall be marked on the bottom in permanent form (e.g. embossed), for example "1.0-1.2-1.0" or "0.9-1.0-1.0". Nominal thickness of metal shall be determined according to the appropriate ISO standard, for example ISO 3574:1999 for steel. The marks indicated in 6.1.3.1 (f) and (g) shall not be applied in a permanent form except as provided in 6.1.3.5.

³ Distinguishing sign for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

- 6.1.3.3 Every packaging other than those referred to in 6.1.3.2 liable to undergo a reconditioning process shall bear the marks indicated in 6.1.3.1 (a) to (e) in a permanent form. Marks are permanent if they are able to withstand the reconditioning process (e.g. embossed). For packagings other than metal drums of a capacity greater than 100 litres, these permanent marks may replace the corresponding durable markings prescribed in 6.1.3.1.
- 6.1.3.4 For remanufactured metal drums, if there is no change to the packaging type and no replacement or removal of integral structural components, the required markings need not be permanent. Every other remanufactured metal drum shall bear the markings in 6.1.3.1 (a) to (e) in a permanent form (e.g. embossed) on the top head or side.
- 6.1.3.5 Metal drums made from materials (e.g. stainless steel) designed to be reused repeatedly may bear the markings indicated in 6.1.3.1 (f) and (g) in a permanent form (e.g. embossed).
- 6.1.3.6 The marking in accordance with 6.1.3.1 is valid for only one design type or series of design types. Different surface treatments may fall within the same design type.
- A "series of design types" means packagings of the same structural design, wall thickness, material and cross-section, which differ only in their lesser design heights from the design type approved.
- The closures of receptacles shall be identifiable as those referred to in the test report.
- 6.1.3.7 Marking shall be applied in the sequence of the sub-paragraphs in 6.1.3.1; each element of the marking required in these sub-paragraphs and when appropriate sub-paragraphs (h) to (j) of 6.1.3.8 shall be clearly separated, e.g. by a slash or space, so as to be easily identifiable. For examples, see 6.1.3.11.
- Any additional markings authorized by a competent authority shall still enable the parts of the mark to be correctly identified with reference to 6.1.3.1.
- 6.1.3.8 After reconditioning a packaging, the reconditioner shall apply to it a durable marking showing, in the following sequence:
- (h) The State in which the reconditioning was carried out, indicated by the distinguishing sign for motor vehicles in international traffic³;
 - (i) The name of the reconditioner or other identification of the packaging specified by the competent authority;
 - (j) The year of reconditioning; the letter "R"; and, for every packaging successfully passing the leakproofness test in 6.1.1.3, the additional letter "L".
- 6.1.3.9 When, after reconditioning, the markings required by 6.1.3.1 (a) to (d) no longer appear on the top head or the side of a metal drum, the reconditioner also shall apply them in a durable form followed by 6.1.3.8 (h), (i) and (j). These markings shall not identify a greater performance capability than that for which the original design type had been tested and marked.
- 6.1.3.10 Packagings manufactured with recycled plastics material as defined in 1.2.1 shall be marked "REC". This mark shall be placed near the mark prescribed in 6.1.3.1.

³ *Distinguishing sign for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).*

6.1.3.11 *Examples of markings for NEW packagings*

	4G/Y145/S/02 NL/VL823	as in 6.1.3.1 (a) (i), (b), (c), (d) and (e) as in 6.1.3.1 (f) and (g)	For a new fibreboard box
	1A1/Y1.4/150/98 NL/VL824	as in 6.1.3.1 (a) (i), (b), (c), (d) and (e) as in 6.1.3.1 (f) and (g)	For a new steel drum to contain liquids
	1A2/Y150/S/01 NL/VL825	as in 6.1.3.1 (a) (i), (b), (c), (d) and (e) as in 6.1.3.1 (f) and (g)	For a new steel drum to contain solids, or inner packagings
	4HW/Y136/S/98 NL/VL826	as in 6.1.3.1 (a) (i), (b), (c), (d) and (e) as in 6.1.3.1 (f) and (g)	For a new plastics box of equivalent specification
	1A2/Y/100/01 USA/MM5	as in 6.1.3.1 (a) (i), (b), (c), (d) and (e) as in 6.1.3.1 (f) and (g)	For a remanufactured steel drum to contain liquids
	RID/ADR/0A1/Y100/89 NL/VL123	as in 6.1.3.1 (a) (ii), (b), (c), (d) and (e) as in 6.1.3.1 (f) and (g)	For a new light gauge metal packaging, non-removable head
	RID/ADR/0A2/Y20/S/04 NL/VL124	as in 6.1.3.1 (a) (ii), (b), (c), (d) and (e) as in 6.1.3.1 (f) and (g)	For a new light gauge metal packaging, removable head, intended to contain solids, or liquids with a viscosity at 23 °C exceeding 200 mm ² /s.

6.1.3.12 *Examples of markings for RECONDITIONED packagings*

	1A1/Y1.4/150/97 NL/RB/01 RL	as in 6.1.3.1 (a) (i), (b), (c), (d) and (e) as in 6.1.3.8 (h), (i) and (j)
	1A2/Y150/S/99 USA/RB/00 R	as in 6.1.3.1 (a) (i), (b), (c), (d) and (e) as in 6.1.3.8 (h), (i) and (j)

6.1.3.13 *Example of marking for SALVAGE packagings*

	1A2T/Y300/S/01 USA/abc	as in 6.1.3.1 (a) (i), (b), (c), (d) and (e) as in 6.1.3.1 (f) and (g)
---	---------------------------	---

NOTE: The markings, for which examples are given in 6.1.3.11, 6.1.3.12 and 6.1.3.13 may be applied in a single line or in multiple lines provided the correct sequence is respected.

6.1.3.14 *Certification*

By affixing marking in accordance with 6.1.3.1, it is certified that mass-produced packagings correspond to the approved design type and that the requirements referred to in the approval have been met.

6.1.4 **Requirements for packagings**

6.1.4.0 *General requirements*

Any permeation of the substance contained in the packaging shall not constitute a danger under normal conditions of carriage.

6.1.4.1 *Steel drums*

- 1A1 non-removable head
- 1A2 removable head

- 6.1.4.1.1 Body and heads shall be constructed of steel sheet of a suitable type and of adequate thickness in relation to the capacity of the drum and to its intended use.

***NOTE:** In the case of carbon steel drums, "suitable" steels are identified in ISO 3573:1999 "Hot rolled carbon steel sheet of commercial and drawing qualities" and ISO 3574:1999 "Cold-reduced carbon steel sheet of commercial and drawing qualities". For carbon steel drums below 100 litres "suitable" steels in addition to the above standards are also identified in ISO 11949:1995 "Cold-reduced electrolytic tinplate", ISO 11950:1995 "Cold-reduced electrolytic chromium/chromium oxide-coated steel" and ISO 11951:1995 "Cold-reduced blackplate in coil form for the production of tinplate or electrolytic chromium/chromium-oxide coated steel".*

- 6.1.4.1.2 Body seams shall be welded on drums intended to contain more than 40 litres of liquid. Body seams shall be mechanically seamed or welded on drums intended to contain solids or 40 litres or less of liquids.

- 6.1.4.1.3 Chimes shall be mechanically seamed or welded. Separate reinforcing rings may be applied.

- 6.1.4.1.4 The body of a drum of a capacity greater than 60 litres shall, in general, have at least two expanded rolling hoops or, alternatively, at least two separate rolling hoops. If there are separate rolling hoops they shall be fitted tightly on the body and so secured that they cannot shift. Rolling hoops shall not be spot welded.

- 6.1.4.1.5 Openings for filling, emptying and venting in the bodies or heads of non-removable head (1A1) drums shall not exceed 7 cm in diameter. Drums with larger openings are considered to be of the removable head type (1A2). Closures for openings in the bodies and heads of drums shall be so designed and applied that they will remain secure and leakproof under normal conditions of carriage. Closure flanges may be mechanically seamed or welded in place. Gaskets or other sealing elements shall be used with closures, unless the closure is inherently leakproof.

- 6.1.4.1.6 Closure devices for removable head (1A2) drums shall be so designed and applied that they will remain secure and drums will remain leakproof under normal conditions of carriage. Gaskets or other sealing elements shall be used with all removable heads.

- 6.1.4.1.7 If materials used for body, heads, closures and fittings are not in themselves compatible with the contents to be carried, suitable internal protective coatings or treatments shall be applied. These coatings or treatments shall retain their protective properties under normal conditions of carriage.

- 6.1.4.1.8 Maximum capacity of drum: 450 litres.

- 6.1.4.1.9 Maximum net mass: 400 kg.

6.1.4.2 *Aluminium drums*

- 1B1 non-removable head
- 1B2 removable head

- 6.1.4.2.1 Body and heads shall be constructed of aluminium at least 99% pure or of an aluminium base alloy. Material shall be of a suitable type and of adequate thickness in relation to the capacity of the drum and to its intended use.

- 6.1.4.2.2 All seams shall be welded. Chime seams, if any, shall be reinforced by the application of separate reinforcing rings.
- 6.1.4.2.3 The body of a drum of a capacity greater than 60 litres shall, in general, have at least two expanded rolling hoops or, alternatively, at least two separate rolling hoops. If there are separate rolling hoops they shall be fitted tightly on the body and so secured that they cannot shift. Rolling hoops shall not be spot welded.
- 6.1.4.2.4 Openings for filling, emptying and venting in the bodies or heads of non-removable head (1B1) drums shall not exceed 7 cm in diameter. Drums with larger openings are considered to be of the removable head type (1B2). Closures for openings in the bodies and heads of drums shall be so designed and applied that they will remain secure and leakproof under normal conditions of carriage. Closure flanges shall be welded in place so that the weld provides a leakproof seam. Gaskets or other sealing elements shall be used with closures, unless the closure is inherently leakproof.
- 6.1.4.2.5 Closure devices for removable head (1B2) drums shall be so designed and applied that they will remain secure and drums will remain leakproof under normal conditions of carriage. Gaskets or other sealing elements shall be used with all removable heads.
- 6.1.4.2.6 Maximum capacity of drum: 450 litres.
- 6.1.4.2.7 Maximum net mass: 400 kg.
- 6.1.4.3 *Drums of metal other than aluminium or steel***
- 1N1 non-removable head
1N2 removable head
- 6.1.4.3.1 The body and heads shall be constructed of a metal or of a metal alloy other than steel or aluminium. Material shall be of a suitable type and of adequate thickness in relation to the capacity of the drum and to its intended use.
- 6.1.4.3.2 Chime seams, if any, shall be reinforced by the application of separate reinforcing rings. All seams, if any, shall be joined (welded, soldered, etc.) in accordance with the technical state of the art for the used metal or metal alloy.
- 6.1.4.3.3 The body of a drum of a capacity greater than 60 litres shall, in general, have at least two expanded rolling hoops or, alternatively, at least two separate rolling hoops. If there are separate rolling hoops they shall be fitted tightly on the body and so secured that they cannot shift. Rolling hoops shall not be spot welded.
- 6.1.4.3.4 Openings for filling, emptying and venting in the bodies or heads of non-removable head (1N1) drums shall not exceed 7 cm in diameter. Drums with larger openings are considered to be of the removable head type (1N2). Closures for openings in the bodies and heads of drums shall be so designed and applied that they will remain secure and leakproof under normal conditions of carriage. Closure flanges shall be joined in place (welded, soldered, etc.) in accordance with the technical state of the art for the used metal or metal alloy so that the seam join is leakproof. Gaskets or other sealing elements shall be used with closures, unless the closure is inherently leakproof.
- 6.1.4.3.5 Closure devices for removable head (1N2) drums shall be so designed and applied that they will remain secure and drums will remain leakproof under normal conditions of carriage. Gaskets or other sealing elements shall be used with all removable heads.

6.1.4.3.6 Maximum capacity of drum: 450 litres.

6.1.4.3.7 Maximum net mass: 400 kg.

6.1.4.4 *Steel or aluminium jerricans*

3A1 steel, non-removable head

3A2 steel, removable head

3B1 aluminium, non-removable head

3B2 aluminium, removable head

6.1.4.4.1 Body and heads shall be constructed of steel sheet, of aluminium at least 99% pure or of an aluminium base alloy. Material shall be of a suitable type and of adequate thickness in relation to the capacity of the jerrican and to its intended use.

6.1.4.4.2 Chimes of steel jerricans shall be mechanically seamed or welded. Body seams of steel jerricans intended to contain more than 40 litres of liquid shall be welded. Body seams of steel jerricans intended to contain 40 litres or less shall be mechanically seamed or welded. For aluminium jerricans, all seams shall be welded. Chime seams, if any, shall be reinforced by the application of a separate reinforcing ring.

6.1.4.4.3 Openings in non-removable head jerricans (3A1 and 3B1) shall not exceed 7 cm in diameter. Jerricans with larger openings are considered to be of the removable head type (3A2 and 3B2). Closures shall be so designed that they will remain secure and leakproof under normal conditions of carriage. Gaskets or other sealing elements shall be used with closures, unless the closure is inherently leakproof.

6.1.4.4.4 If materials used for body, heads, closures and fittings are not in themselves compatible with the contents to be carried, suitable internal protective coatings or treatments shall be applied. These coatings or treatments shall retain their protective properties under normal conditions of carriage.

6.1.4.4.5 Maximum capacity of jerrican: 60 litres.

6.1.4.4.6 Maximum net mass: 120 kg.

6.1.4.5 *Plywood drums*

1D

6.1.4.5.1 The wood used shall be well seasoned, commercially dry and free from any defect likely to lessen the effectiveness of the drum for the purpose intended. If a material other than plywood is used for the manufacture of the heads, it shall be of a quality equivalent to the plywood.

6.1.4.5.2 At least two-ply plywood shall be used for the body and at least three-ply plywood for the heads; the plies shall be firmly glued together by a water resistant adhesive with their grain crosswise.

6.1.4.5.3 The body and heads of the drum and their joints shall be of a design appropriate to the capacity of the drum and to its intended use.

6.1.4.5.4 In order to prevent sifting of the contents, lids shall be lined with kraft paper or some other equivalent material which shall be securely fastened to the lid and extend to the outside along its full circumference.

6.1.4.5.5 Maximum capacity of drum: 250 litres.

- 6.1.4.5.6 Maximum net mass: 400 kg.
- 6.1.4.6** *(Deleted)*
- 6.1.4.7** *Fibre drums*
- 1G
- 6.1.4.7.1 The body of the drum shall consist of multiple plies of heavy paper or fibreboard (without corrugations) firmly glued or laminated together and may include one or more protective layers of bitumen, waxed kraft paper, metal foil, plastics material, etc.
- 6.1.4.7.2 Heads shall be of natural wood, fibreboard, metal, plywood, plastics or other suitable material and may include one or more protective layers of bitumen, waxed kraft paper, metal foil, plastics material, etc.
- 6.1.4.7.3 The body and heads of the drum and their joins shall be of a design appropriate to the capacity of the drum and to its intended use.
- 6.1.4.7.4 The assembled packaging shall be sufficiently water resistant so as not to delaminate under normal conditions of carriage.
- 6.1.4.7.5 Maximum capacity of drum: 450 litres.
- 6.1.4.7.6 Maximum net mass: 400 kg.
- 6.1.4.8** *Plastics drums and jerricans*
- 1H1 drums, non-removable head
 1H2 drums, removable head
 3H1 jerricans, non-removable head
 3H2 jerricans, removable head
- 6.1.4.8.1 The packaging shall be manufactured from suitable plastics material and be of adequate strength in relation to its capacity and intended use. Except for recycled plastics material as defined in 1.2.1, no used material other than production residues or regrind from the same manufacturing process may be used. The packaging shall be adequately resistant to ageing and to degradation caused either by the substance contained or by ultra-violet radiation. Any permeation of the substance contained in the package, or recycled plastics material used to produce new packaging, shall not constitute a danger under normal conditions of carriage.
- 6.1.4.8.2 If protection against ultra-violet radiation is required, it shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the packaging. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, retesting may be waived if the carbon black content does not exceed 2% by mass or if the pigment content does not exceed 3% by mass; the content of inhibitors of ultra-violet radiation is not limited.
- 6.1.4.8.3 Additives serving purposes other than protection against ultra-violet radiation may be included in the composition of the plastics material provided that they do not adversely affect the chemical and physical properties of the material of the packaging. In such circumstances, retesting may be waived.
- 6.1.4.8.4 The wall thickness at every point of the packaging shall be appropriate to its capacity and intended use, taking into account the stresses to which each point is liable to be exposed.

- 6.1.4.8.5 Openings for filling, emptying and venting in the bodies or heads of non-removable head drums (1H1) and jerricans (3H1) shall not exceed 7 cm in diameter. Drums and jerricans with larger openings are considered to be of the removable head type (1H2 and 3H2). Closures for openings in the bodies or heads of drums and jerricans shall be so designed and applied that they will remain secure and leakproof under normal conditions of carriage. Gaskets or other sealing elements shall be used with closures unless the closure is inherently leakproof.
- 6.1.4.8.6 Closure devices for removable head drums and jerricans (1H2 and 3H2) shall be so designed and applied that they will remain secure and leakproof under normal conditions of carriage. Gaskets shall be used with all removable heads unless the drum or jerrican design is such that, where the removable head is properly secured, the drum or jerrican is inherently leakproof.
- 6.1.4.8.7 The maximum permissible permeability for flammable liquids shall be 0.008 g/l.h at 23 °C (see 6.1.5.7).
- 6.1.4.8.8 Where recycled plastics material is used for production of new packaging, the specific properties of the recycled material shall be assured and documented regularly as part of a quality assurance programme recognised by the competent authority. The quality assurance programme shall include a record of proper pre-sorting and verification that each batch of recycled plastics material has the proper melt flow rate, density, and tensile yield strength, consistent with that of the design type manufactured from such recycled material. This necessarily includes knowledge about the packaging material from which the recycled plastics have been derived, as well as the awareness of the prior contents of those packagings if those prior contents might reduce the capability of new packaging produced using that material. In addition, the packaging manufacturer's quality assurance programme under 6.1.1.4 shall include performance of the mechanical design type test in 6.1.5 on packagings manufactured from each batch of recycled plastics material. In this testing, stacking performance may be verified by appropriate dynamic compression testing rather than static load testing.
- NOTE:** ISO 16103:2005 – "Packaging – Transport packaging for dangerous goods - Recycled plastics material" provides additional guidance on procedures to be followed in approving the use of recycled plastics material.
- 6.1.4.8.9 Maximum capacity of drums and jerricans: 1H1, 1H2: 450 litres
3H1, 3H2: 60 litres.
- 6.1.4.8.10 Maximum net mass: 1H1, 1H2: 400 kg
3H1, 3H2: 120 kg.
- 6.1.4.9 Boxes of natural wood**
- 4C1 ordinary
4C2 with sift-proof walls
- 6.1.4.9.1 The wood used shall be well seasoned, commercially dry and free from defects that would materially lessen the strength of any part of the box. The strength of the material used and the method of construction shall be appropriate to the capacity and intended use of the box. The tops and bottoms may be made of water resistant reconstituted wood such as hardboard, particle board or other suitable type.
- 6.1.4.9.2 Fastenings shall be resistant to vibration experienced under normal conditions of carriage. End grain nailing shall be avoided whenever practicable. Joins which are likely to be highly stressed shall be made using clenched or annular ring nails or equivalent fastenings.

- 6.1.4.9.3 Box 4C2: each part shall consist of one piece or be equivalent thereto. Parts are considered equivalent to one piece when one of the following methods of glued assembly is used: Lindermann joint, tongue and groove joint, ship lap or rabbet joint or butt joint with at least two corrugated metal fasteners at each joint.
- 6.1.4.9.4 Maximum net mass: 400 kg.
- 6.1.4.10 *Plywood boxes***
- 4D
- 6.1.4.10.1 Plywood used shall be at least 3-ply. It shall be made from well seasoned rotary cut, sliced or sawn veneer, commercially dry and free from defects that would materially lessen the strength of the box. The strength of the material used and the method of construction shall be appropriate to the capacity and intended use of the box. All adjacent plies shall be glued with water resistant adhesive. Other suitable materials may be used together with plywood in the construction of boxes. Boxes shall be firmly nailed or secured to corner posts or ends or be assembled by equally suitable devices.
- 6.1.4.10.2 Maximum net mass: 400 kg.
- 6.1.4.11 *Reconstituted wood boxes***
- 4F
- 6.1.4.11.1 The walls of boxes shall be made of water resistant reconstituted wood such as hardboard, particle board or other suitable type. The strength of the material used and the method of construction shall be appropriate to the capacity of the boxes and to their intended use.
- 6.1.4.11.2 Other parts of the boxes may be made of other suitable material.
- 6.1.4.11.3 Boxes shall be securely assembled by means of suitable devices.
- 6.1.4.11.4 Maximum net mass: 400 kg.
- 6.1.4.12 *Fibreboard boxes***
- 4G
- 6.1.4.12.1 Strong and good quality solid or double-faced corrugated fibreboard (single or multiwall) shall be used, appropriate to the capacity of the box and to its intended use. The water resistance of the outer surface shall be such that the increase in mass, as determined in a test carried out over a period of 30 minutes by the Cobb method of determining water absorption, is not greater than 155 g/m² - see ISO 535:1991. It shall have proper bending qualities. Fibreboard shall be cut, creased without scoring, and slotted so as to permit assembly without cracking, surface breaks or undue bending. The fluting of corrugated fibreboard shall be firmly glued to the facings.
- 6.1.4.12.2 The ends of boxes may have a wooden frame or be entirely of wood or other suitable material. Reinforcements of wooden battens or other suitable material may be used.
- 6.1.4.12.3 Manufacturing joints in the body of boxes shall be taped, lapped and glued, or lapped and stitched with metal staples. Lapped joints shall have an appropriate overlap.
- 6.1.4.12.4 Where closing is effected by gluing or taping, a water resistant adhesive shall be used.
- 6.1.4.12.5 Boxes shall be designed so as to provide a good fit to the contents.

6.1.4.12.6 Maximum net mass: 400 kg.

6.1.4.13 *Plastics boxes*

4H1 expanded plastics boxes

4H2 solid plastics boxes

6.1.4.13.1 The box shall be manufactured from suitable plastics material and be of adequate strength in relation to its capacity and intended use. The box shall be adequately resistant to ageing and to degradation caused either by the substance contained or by ultra-violet radiation.

6.1.4.13.2 An expanded plastics box shall comprise two parts made of a moulded expanded plastics material, a bottom section containing cavities for the inner packagings and a top section covering and interlocking with the bottom section. The top and bottom sections shall be designed so that the inner packagings fit snugly. The closure cap for any inner packaging shall not be in contact with the inside of the top section of this box.

6.1.4.13.3 For dispatch, an expanded plastics box shall be closed with a self-adhesive tape having sufficient tensile strength to prevent the box from opening. The adhesive tape shall be weather resistant and its adhesive compatible with the expanded plastics material of the box. Other closing devices at least equally effective may be used.

6.1.4.13.4 For solid plastics boxes, protection against ultra-violet radiation, if required, shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the box. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, retesting may be waived if the carbon black content does not exceed 2% by mass or if the pigment content does not exceed 3% by mass; the content of inhibitors of ultra-violet radiation is not limited.

6.1.4.13.5 Additives serving purposes other than protection against ultra-violet radiation may be included in the composition of the plastics material provided that they do not adversely affect the chemical or physical properties of the material of the box. In such circumstances, retesting may be waived.

6.1.4.13.6 Solid plastics boxes shall have closure devices made of a suitable material of adequate strength and so designed as to prevent the box from unintentional opening.

6.1.4.13.7 Where recycled plastics material is used for production of new packaging, the specific properties of the recycled material shall be assured and documented regularly as part of a quality assurance programme recognised by the competent authority. The quality assurance programme shall include a record of proper pre-sorting and verification that each batch of recycled plastics material has the proper melt flow rate, density, and tensile yield strength, consistent with that of the design type manufactured from such recycled material. This necessarily includes knowledge about the packaging material from which the recycled plastics have been derived, as well as the awareness of the prior contents of those packagings if those prior contents might reduce the capability of new packaging produced using that material. In addition, the packaging manufacturer's quality assurance programme under 6.1.1.4 shall include performance of the mechanical design type test in 6.1.5 on packagings manufactured from each batch of recycled plastics material. In this testing, stacking performance may be verified by appropriate dynamic compression testing rather than static load testing.

6.1.4.13.8 Maximum net mass 4H1: 60 kg
4H2: 400 kg.

6.1.4.14 ***Steel, aluminium or other metal boxes***

- 4A steel boxes
- 4B aluminium boxes
- 4N metal, other than steel or aluminium, boxes

6.1.4.14.1 The strength of the metal and the construction of the box shall be appropriate to the capacity of the box and to its intended use.

6.1.4.14.2 Boxes shall be lined with fibreboard or felt packing pieces or shall have an inner liner or coating of suitable material, as required. If a double seamed metal liner is used, steps shall be taken to prevent the ingress of substances, particularly explosives, into the recesses of the seams.

6.1.4.14.3 Closures may be of any suitable type; they shall remain secured under normal conditions of carriage.

6.1.4.14.4 Maximum net mass: 400 kg.

6.1.4.15 ***Textile bags***

- 5L1 without inner liner or coating
- 5L2 sift-proof
- 5L3 water resistant

6.1.4.15.1 The textiles used shall be of good quality. The strength of the fabric and the construction of the bag shall be appropriate to the capacity of the bag and to its intended use.

6.1.4.15.2 Bags, sift-proof, 5L2: the bag shall be made sift-proof, for example by the use of:

- (a) paper bonded to the inner surface of the bag by a water resistant adhesive such as bitumen; or
- (b) plastics film bonded to the inner surface of the bag; or
- (c) one or more inner liners made of paper or plastics material.

6.1.4.15.3 Bags, water resistant, 5L3: to prevent the entry of moisture the bag shall be made waterproof, for example by the use of:

- (a) separate inner liners of water resistant paper (e.g. waxed kraft paper, tarred paper or plastics-coated kraft paper); or
- (b) plastics film bonded to the inner surface of the bag; or
- (c) one or more inner liners made of plastics material.

6.1.4.15.4 Maximum net mass: 50 kg.

6.1.4.16 ***Woven plastics bags***

- 5H1 without inner liner or coating
- 5H2 sift-proof
- 5H3 water resistant

- 6.1.4.16.1 Bags shall be made from stretched tapes or monofilaments of a suitable plastics material. The strength of the material used and the construction of the bag shall be appropriate to the capacity of the bag and to its intended use.
- 6.1.4.16.2 If the fabric is woven flat, the bags shall be made by sewing or some other method ensuring closure of the bottom and one side. If the fabric is tubular, the bag shall be closed by sewing, weaving or some other equally strong method of closure.
- 6.1.4.16.3 Bags, sift-proof, 5H2: the bag shall be made sift-proof, for example by means of:
- (a) paper or a plastics film bonded to the inner surface of the bag; or
 - (b) one or more separate inner liners made of paper or plastics material.
- 6.1.4.16.4 Bags, water resistant, 5H3: to prevent the entry of moisture, the bag shall be made waterproof, for example by means of:
- (a) separate inner liners of water resistant paper (e.g. waxed kraft paper, double-tarred kraft paper or plastics-coated kraft paper); or
 - (b) plastics film bonded to the inner or outer surface of the bag; or
 - (c) one or more inner plastics liners.
- 6.1.4.16.5 Maximum net mass: 50 kg.
- 6.1.4.17 *Plastics film bags***
- 5H4
- 6.1.4.17.1 Bags shall be made of a suitable plastics material. The strength of the material used and the construction of the bag shall be appropriate to the capacity of the bag and to its intended use. Joins and closures shall withstand pressures and impacts liable to occur under normal conditions of carriage.
- 6.1.4.17.2 Maximum net mass: 50 kg.
- 6.1.4.18 *Paper bags***
- 5M1 multiwall
5M2 multiwall, water resistant
- 6.1.4.18.1 Bags shall be made of a suitable kraft paper or of an equivalent paper with at least three plies, the middle ply of which may be net-cloth and adhesive bonding to the outer paper plies. The strength of the paper and the construction of the bags shall be appropriate to the capacity of the bag and to its intended use. Joins and closures shall be sift-proof.
- 6.1.4.18.2 Bags 5M2: to prevent the entry of moisture, a bag of four plies or more shall be made waterproof by the use of either a water resistant ply as one of the two outermost plies or a water resistant barrier made of a suitable protective material between the two outermost plies; a bag of three plies shall be made waterproof by the use of a water resistant ply as the outermost ply. Where there is a danger of the substance contained reacting with moisture or where it is packed damp, a waterproof ply or barrier, such as double-tarred kraft paper, plastics-coated kraft paper, plastics film bonded to the inner surface of the bag, or one or more inner plastics liners, shall also be placed next to the substance. Joins and closures shall be waterproof.

6.1.4.18.3 Maximum net mass: 50 kg.

6.1.4.19 ***Composite packagings (plastics material)***

6HA1	plastics receptacle with outer steel drum
6HA2	plastics receptacle with outer steel crate or box
6HB1	plastics receptacle with outer aluminium drum
6HB2	plastics receptacle with outer aluminium crate or box
6HC	plastics receptacle with outer wooden box
6HD1	plastics receptacle with outer plywood drum
6HD2	plastics receptacle with outer plywood box
6HG1	plastics receptacle with outer fibre drum
6HG2	plastics receptacle with outer fibreboard box
6HH1	plastics receptacle with outer plastics drum
6HH2	plastics receptacle with outer solid plastics box

6.1.4.19.1 *Inner receptacle*

6.1.4.19.1.1 The requirements of 6.1.4.8.1 and 6.1.4.8.4 to 6.1.4.8.7 apply to plastics inner receptacles.

6.1.4.19.1.2 The plastics inner receptacle shall fit snugly inside the outer packaging, which shall be free of any projection that might abrade the plastics material.

6.1.4.19.1.3 Maximum capacity of inner receptacle:

6HA1, 6HB1, 6HD1, 6HG1, 6HH1:	250 litres
6HA2, 6HB2, 6HC, 6HD2, 6HG2, 6HH2:	60 litres.

6.1.4.19.1.4 Maximum net mass:

6HA1, 6HB1, 6HD1, 6HG1, 6HH1:	400 kg
6HA2, 6HB2, 6HC, 6HD2, 6HG2, 6HH2:	75 kg.

6.1.4.19.2 *Outer packaging*

6.1.4.19.2.1 Plastics receptacle with outer steel or aluminium drum 6HA1 or 6HB1; the relevant requirements of 6.1.4.1 or 6.1.4.2, as appropriate, apply to the construction of the outer packaging.

6.1.4.19.2.2 Plastics receptacle with outer steel or aluminium crate or box 6HA2 or 6HB2; the relevant requirements of 6.1.4.14 apply to the construction of the outer packaging.

6.1.4.19.2.3 Plastics receptacle with outer wooden box 6HC; the relevant requirements of 6.1.4.9 apply to the construction of the outer packaging.

6.1.4.19.2.4 Plastics receptacle with outer plywood drum 6HD1; the relevant requirements of 6.1.4.5 apply to the construction of the outer packaging.

6.1.4.19.2.5 Plastics receptacle with outer plywood box 6HD2; the relevant requirements of 6.1.4.10 apply to the construction of the outer packaging.

6.1.4.19.2.6 Plastics receptacle with outer fibre drum 6HG1; the requirements of 6.1.4.7.1 to 6.1.4.7.4 apply to the construction of the outer packaging.

6.1.4.19.2.7 Plastics receptacle with outer fibreboard box 6HG2; the relevant requirements of 6.1.4.12 apply to the construction of the outer packaging.

- 6.1.4.19.2.8 Plastics receptacle with outer plastics drum 6HH1; the requirements of 6.1.4.8.1 to 6.1.4.8.6 apply to the construction of the outer packaging.
- 6.1.4.19.2.9 Plastics receptacles with outer solid plastics box (including corrugated plastics material) 6HH2; the requirements of 6.1.4.13.1 and 6.1.4.13.4 to 6.1.4.13.6 apply to the construction of the outer packaging.
- 6.1.4.20** *Composite packagings (glass, porcelain or stoneware)*
- 6PA1 receptacle with outer steel drum
- 6PA2 receptacle with outer steel crate or box
- 6PB1 receptacle with outer aluminium drum
- 6PB2 receptacle with outer aluminium crate or box
- 6PC receptacle with outer wooden box
- 6PD1 receptacle with outer plywood drum
- 6PD2 receptacle with outer wickerwork hamper
- 6PG1 receptacle with outer fibre drum
- 6PG2 receptacle with outer fibreboard box
- 6PH1 receptacle with outer expanded plastics packaging
- 6PH2 receptacle with outer solid plastics packaging
- 6.1.4.20.1 *Inner receptacle*
- 6.1.4.20.1.1 Receptacles shall be of a suitable form (cylindrical or pear-shaped) and be made of good quality material free from any defect that could impair their strength. The walls shall be sufficiently thick at every point and free from internal stresses.
- 6.1.4.20.1.2 Screw-threaded plastics closures, ground glass stoppers or closures at least equally effective shall be used as closures for receptacles. Any part of the closure likely to come into contact with the contents of the receptacle shall be resistant to those contents. Care shall be taken to ensure that the closures are so fitted as to be leakproof and are suitably secured to prevent any loosening during carriage. If vented closures are necessary, they shall comply with 4.1.1.8.
- 6.1.4.20.1.3 The receptacle shall be firmly secured in the outer packaging by means of cushioning and/or absorbent materials.
- 6.1.4.20.1.4 Maximum capacity of receptacle: 60 litres.
- 6.1.4.20.1.5 Maximum net mass: 75 kg.
- 6.1.4.20.2 *Outer packaging*
- 6.1.4.20.2.1 Receptacle with outer steel drum 6PA1; the relevant requirements of 6.1.4.1 apply to the construction of the outer packaging. The removable lid required for this type of packaging may nevertheless be in the form of a cap.
- 6.1.4.20.2.2 Receptacle with outer steel crate or box 6PA2; the relevant requirements of 6.1.4.14 apply to the construction of the outer packaging. For cylindrical receptacles the outer packaging shall, when upright, rise above the receptacle and its closure. If the crate surrounds a pear-shaped receptacle and is of matching shape, the outer packaging shall be fitted with a protective cover (cap).
- 6.1.4.20.2.3 Receptacle with outer aluminium drum 6PB1; the relevant requirements of 6.1.4.2 apply to the construction of the outer packaging.

- 6.1.4.20.2.4 Receptacle with outer aluminium crate or box 6PB2; the relevant requirements of 6.1.4.14 apply to the construction of the outer packaging.
- 6.1.4.20.2.5 Receptacle with outer wooden box 6PC; the relevant requirements of 6.1.4.9 apply to the construction of the outer packaging.
- 6.1.4.20.2.6 Receptacle with outer plywood drum 6PD1; the relevant requirements of 6.1.4.5 apply to the construction of the outer packaging.
- 6.1.4.20.2.7 Receptacle with outer wickerwork hamper 6PD2. The wickerwork hamper shall be properly made with material of good quality. It shall be fitted with a protective cover (cap) so as to prevent damage to the receptacle.
- 6.1.4.20.2.8 Receptacle with outer fibre drum 6PG1; the relevant requirements of 6.1.4.7.1 to 6.1.4.7.4 apply to the construction of the outer packaging.
- 6.1.4.20.2.9 Receptacle with outer fibreboard box 6PG2; the relevant requirements of 6.1.4.12 apply to the construction of the outer packaging.
- 6.1.4.20.2.10 Receptacle with outer expanded plastics or solid plastics packaging (6PH1 or 6PH2); the materials of both outer packagings shall meet the relevant requirements of 6.1.4.13. Outer solid plastics packaging shall be manufactured from high density polyethylene or some other comparable plastics material. The removable lid for this type of packaging may nevertheless be in the form of a cap.

6.1.4.21 *Combination packagings*

The relevant requirements of section 6.1.4 for the outer packagings to be used, are applicable.

***NOTE:** For the inner and outer packagings to be used, see the relevant packing instructions in Chapter 4.1.*

6.1.4.22 *Light gauge metal packagings*

- 0A1 non-removable-head
- 0A2 removable-head

- 6.1.4.22.1 The sheet metal for the body and ends shall be of suitable steel, and of a gauge appropriate to the capacity and intended use of the packaging.
- 6.1.4.22.2 The joints shall be welded, at least double-seamed by welting or produced by a method ensuring a similar degree of strength and leakproofness.
- 6.1.4.22.3 Inner coatings of zinc, tin, lacquer, etc. shall be tough and shall adhere to the steel at every point, including the closures.
- 6.1.4.22.4 Openings for filling, emptying and venting in the bodies or heads of non-removable head (0A1) packagings shall not exceed 7 cm in diameter. Packagings with larger openings shall be considered to be of the removable-head type (0A2).
- 6.1.4.22.5 The closures of non-removable-head packagings (0A1) shall either be of the screw-threaded type or be capable of being secured by a screwable device or a device at least equally effective. The closures of removable-head packagings (0A2) shall be so designed and fitted that they stay firmly closed and the packagings remain leakproof in normal conditions of carriage.

6.1.4.22.6 Maximum capacity of packagings: 40 litres.

6.1.4.22.7 Maximum net mass: 50 kg.

6.1.5 Test requirements for packagings

6.1.5.1 *Performance and frequency of tests*

6.1.5.1.1 The design type of each packaging shall be tested as provided in 6.1.5 in accordance with procedures established by the competent authority allowing the allocation of the mark and shall be approved by this competent authority.

6.1.5.1.2 Each packaging design type shall successfully pass the tests prescribed in this Chapter before being used. A packaging design type is defined by the design, size, material and thickness, manner of construction and packing, but may include various surface treatments. It also includes packagings which differ from the design type only in their lesser design height.

6.1.5.1.3 Tests shall be repeated on production samples at intervals established by the competent authority. For such tests on paper or fibreboard packagings, preparation at ambient conditions is considered equivalent to the requirements of 6.1.5.2.3.

6.1.5.1.4 Tests shall also be repeated after each modification which alters the design, material or manner of construction of a packaging.

6.1.5.1.5 The competent authority may permit the selective testing of packagings that differ only in minor respects from a tested type, e.g. smaller sizes of inner packagings or inner packagings of lower net mass; and packagings such as drums, bags and boxes which are produced with small reductions in external dimension(s).

6.1.5.1.6 (*Reserved*)

NOTE: For the conditions for assembling different inner packagings in an outer packaging and permissible variations in inner packagings, see 4.1.1.5.1.

6.1.5.1.7 Articles or inner packagings of any type for solids or liquids may be assembled and carried without testing in an outer packaging under the following conditions:

- (a) The outer packaging shall have been successfully tested in accordance with 6.1.5.3 with fragile (e.g. glass) inner packagings containing liquids using the packing group I drop height;
- (b) The total combined gross mass of inner packagings shall not exceed one half the gross mass of inner packagings used for the drop test in (a) above;
- (c) The thickness of cushioning material between inner packagings and between inner packagings and the outside of the packaging shall not be reduced below the corresponding thicknesses in the originally tested packaging; and if a single inner packaging was used in the original test, the thicknesses of cushioning between inner packagings shall not be less than the thickness of cushioning between the outside of the packaging and the inner packaging in the original test. If either fewer or smaller inner packagings are used (as compared to the inner packagings used in the drop test), sufficient additional cushioning material shall be used to take up void spaces;
- (d) The outer packaging shall have passed successfully the stacking test in 6.1.5.6 while empty. The total mass of identical packages shall be based on the combined mass of inner packagings used for the drop test in (a) above;

- (e) Inner packagings containing liquids shall be completely surrounded with a sufficient quantity of absorbent material to absorb the entire liquid contents of the inner packagings;
- (f) If the outer packaging is intended to contain inner packagings for liquids and is not leakproof, or is intended to contain inner packagings for solids and is not siftproof, a means of containing any liquid or solid contents in the event of leakage shall be provided in the form of a leakproof liner, plastics bag or other equally efficient means of containment. For packagings containing liquids, the absorbent material required in (e) above shall be placed inside the means of containing the liquid contents;
- (g) Packagings shall be marked in accordance with 6.1.3 as having been tested to packing group I performance for combination packagings. The marked gross mass in kilograms shall be the sum of the mass of the outer packaging plus one half of the mass of the inner packaging(s) as used for the drop test referred to in (a) above. Such a package mark shall also contain a letter "V" as described in 6.1.2.4.

6.1.5.1.8 The competent authority may at any time require proof, by tests in accordance with this section, that serially-produced packagings meet the requirements of the design type tests. For verification purposes records of such tests shall be maintained.

6.1.5.1.9 If an inner treatment or coating is required for safety reasons, it shall retain its protective properties even after the tests.

6.1.5.1.10 Provided the validity of the test results is not affected and with the approval of the competent authority, several tests may be made on one sample.

6.1.5.1.11 *Salvage packagings*

Salvage packagings (see 1.2.1) shall be tested and marked in accordance with the requirements applicable to packing group II packagings intended for the carriage of solids or inner packagings, except as follows:

- (a) The test substance used in performing the tests shall be water, and the packagings shall be filled to not less than 98% of their maximum capacity. It is permissible to use additives, such as bags of lead shot, to achieve the requisite total package mass so long as they are placed so that the test results are not affected. Alternatively, in performing the drop test, the drop height may be varied in accordance with 6.1.5.3.5 (b);
- (b) Packagings shall, in addition, have been successfully subjected to the leakproofness test at 30 kPa, with the results of this test reflected in the test report required by 6.1.5.8; and
- (c) Packagings shall be marked with the letter "T" as described in 6.1.2.4.

6.1.5.2 *Preparation of packagings for testing*

6.1.5.2.1 Tests shall be carried out on packagings prepared as for carriage including, with respect to combination packagings, the inner packagings used. Inner or single receptacles or packagings other than bags shall be filled to not less than 98% of their maximum capacity for liquids or 95% for solids. Bags shall be filled to the maximum mass at which they may be used. For combination packagings where the inner packaging is designed to carry liquids and solids, separate testing is required for both liquid and solid contents. The substances or articles to be carried in the packagings may be replaced by other substances or articles except where this would invalidate the results of the tests. For solids, when another substance is used it shall have the same physical characteristics (mass, grain size, etc.) as the substance to be carried. It is permissible to use additives, such as bags of lead shot, to achieve the requisite total package mass, so long as they are placed so that the test results are not affected.

6.1.5.2.2 In the drop tests for liquids, when another substance is used, it shall be of similar relative density and viscosity to those of the substance being carried. Water may also be used for the liquid drop test under the conditions in 6.1.5.3.5.

6.1.5.2.3 Paper or fibreboard packagings shall be conditioned for at least 24 hours in an atmosphere having a controlled temperature and relative humidity (r.h.). There are three options, one of which shall be chosen. The preferred atmosphere is 23 ± 2 °C and $50\% \pm 2\%$ r.h. The two other options are 20 ± 2 °C and $65\% \pm 2\%$ r.h. or 27 ± 2 °C and $65\% \pm 2\%$ r.h.

***NOTE:** Average values shall fall within these limits. Short-term fluctuations and measurement limitations may cause individual measurements to vary by up to $\pm 5\%$ relative humidity without significant impairment of test reproducibility.*

6.1.5.2.4 (Reserved)

6.1.5.2.5 To check that their chemical compatibility with the liquids is sufficient, plastics drums and jerricans in accordance with 6.1.4.8 and if necessary composite packagings (plastics material) in accordance with 6.1.4.19 shall be subjected to storage at ambient temperature for six months, during which time the test samples shall be kept filled with the goods they are intended to carry.

For the first and last 24 hours of storage, the test samples shall be placed with the closure downwards. However, packagings fitted with a vent shall be so placed on each occasion for five minutes only. After this storage the test samples shall undergo the tests prescribed in 6.1.5.3 to 6.1.5.6.

When it is known that the strength properties of the plastics material of the inner receptacles of composite packagings (plastics material) are not significantly altered by the action of the filling substance, it shall not be necessary to check that the chemical compatibility is sufficient.

A significant alteration in strength properties means:

- (a) distinct embrittlement; or
- (b) a considerable decrease in elasticity, unless related to a not less than proportionate increase in the elongation under load.

Where the behaviour of the plastics material has been established by other means, the above compatibility test may be dispensed with. Such procedures shall be at least equivalent to the above compatibility test and be recognized by the competent authority.

***NOTE:** For plastics drums and jerricans and composite packagings (plastics material) made of polyethylene, see also 6.1.5.2.6 below.*

6.1.5.2.6 For polyethylene drums and jerricans in accordance with 6.1.4.8 and if necessary, polyethylene composite packagings in accordance with 6.1.4.19, chemical compatibility with filling liquids assimilated in accordance with 4.1.1.21 may be verified as follows with standard liquids (see 6.1.6).

The standard liquids are representative for the processes of deterioration on polyethylene, as there are softening through swelling, cracking under stress, molecular degradation and combinations thereof. The sufficient chemical compatibility of the packagings may be verified by storage of the required test samples for three weeks at 40 °C with the appropriate standard liquid(s); where this standard liquid is water, storage in accordance with this procedure is not required. Storage is not required either for test samples which are used for the stacking test in case of the standard liquids "wetting solution" and "acetic acid".

For the first and last 24 hours of storage, the test samples shall be placed with the closure downwards. However, packagings fitted with a vent shall be so placed on each occasion for five minutes only. After this storage, the test samples shall undergo the tests prescribed in 6.1.5.3 to 6.1.5.6.

The compatibility test for tert-Butyl hydroperoxide with more than 40% peroxide content and peroxyacetic acids of Class 5.2 shall not be carried out using standard liquids. For these substances, sufficient chemical compatibility of the test samples shall be verified during a storage period of six months at ambient temperature with the substances they are intended to carry.

Results of the procedure in accordance with this paragraph from polyethylene packagings can be approved for an equal design type, the internal surface of which is fluorinated.

6.1.5.2.7 For packagings made of polyethylene, as specified in 6.1.5.2.6, which have passed the test in 6.1.5.2.6, filling substances other than those assimilated in accordance with 4.1.1.21 may also be approved. Such approval shall be based on laboratory tests verifying that the effect of such filling substances on the test specimens is less than that of the appropriate standard liquid(s) taking into account the relevant processes of deterioration. The same conditions as those set out in 4.1.1.21.2 shall apply with respect to relative density and vapour pressure.

6.1.5.2.8 Provided that the strength properties of the plastics inner packagings of a combination packaging are not significantly altered by the action of the filling substance, proof of chemical compatibility is not necessary. A significant alteration in strength properties means:

- (a) distinct embrittlement;
- (b) a considerable decrease in elasticity, unless related to a not less than proportionate increase in elastic elongation.

6.1.5.3 *Drop test*⁴

6.1.5.3.1 *Number of test samples (per design type and manufacturer) and drop orientation*

For other than flat drops the centre of gravity shall be vertically over the point of impact.

Where more than one orientation is possible for a given drop test, the orientation most likely to result in failure of the packaging shall be used.

Packaging	No. of test samples	Drop orientation
(a) Steel drums Aluminium drums Drums of metal other than steel or aluminium Steel jerricans Aluminium jerricans Plywood drums Fibre drums Plastics drums and jerricans Composite packagings which are in the shape of a drum Light gauge metal packagings	Six (three for each drop)	First drop (using three samples): the packaging shall strike the target diagonally on the chime or, if the packaging has no chime, on a circumferential seam or an edge. Second drop (using the other three samples): the packaging shall strike the target on the weakest part not tested by the first drop, for example a closure or, for some cylindrical drums, the welded longitudinal seam of the drum body

⁴ See ISO Standard 2248.

Packaging	No. of test samples	Drop orientation
(b) Boxes of natural wood Plywood boxes Reconstituted wood boxes Fibreboard boxes Plastics boxes Steel or aluminium boxes Composite packagings which are in the shape of a box	Five (one for each drop)	First drop: flat on the bottom Second drop: flat on the top Third drop: flat on the long side Fourth drop: flat on the short side Fifth drop: on a corner
(c) Bags - single-ply with a side seam	Three (three drops per bag)	First drop: flat on a wide face Second drop: flat on a narrow face Third drop: on an end of the bag
(d) Bags - single-ply without a side seam, or multi-ply	Three (two drops per bag)	First drop: flat on a wide face Second drop: on an end of the bag
(e) Composite packagings (glass, stoneware or porcelain), marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii) and which are in the shape of a drum or box	Three (one for each drop)	Diagonally on the bottom chime, or, if there is no chime, on a circumferential seam or the bottom edge

6.1.5.3.2 *Special preparation of test samples for the drop test*

The temperature of the test sample and its contents shall be reduced to –18 °C or lower for the following packagings:

- (a) Plastics drums (see 6.1.4.8);
- (b) Plastics jerricans (see 6.1.4.8);
- (c) Plastics boxes other than expanded plastics boxes (see 6.1.4.13);
- (d) Composite packagings (plastics material) (see 6.1.4.19); and
- (e) Combination packagings with plastics inner packagings, other than plastics bags intended to contain solids or articles.

Where test samples are prepared in this way, the conditioning in 6.1.5.2.3 may be waived. Test liquids shall be kept in the liquid state by the addition of anti-freeze if necessary.

6.1.5.3.3 Removable head packagings for liquids shall not be dropped until at least 24 hours after filling and closing to allow for any possible gasket relaxation.

6.1.5.3.4 *Target*

The target shall be a non-resilient and horizontal surface and shall be:

- Integral and massive enough to be immovable;
- Flat with a surface kept free from local defects capable of influencing the test results;
- Rigid enough to be non-deformable under test conditions and not liable to become damaged by the tests; and
- Sufficiently large to ensure that the test package falls entirely upon the surface.

6.1.5.3.5

Drop height

For solids and liquids, if the test is performed with the solid or liquid to be carried or with another substance having essentially the same physical characteristics:

Packing Group I	Packing Group II	Packing Group III
1.8 m	1.2 m	0.8 m

For liquids in single packagings and for inner packagings of combination packagings, if the test is performed with water:

NOTE: The term water includes water/antifreeze solutions with a minimum specific gravity of 0.95 for testing at - 18 °C.

- (a) where the substances to be carried have a relative density not exceeding 1.2:

Packing Group I	Packing Group II	Packing Group III
1.8 m	1.2 m	0.8 m

- (b) where the substances to be carried have a relative density exceeding 1.2, the drop height shall be calculated on the basis of the relative density (d) of the substance to be carried, rounded up to the first decimal, as follows:

Packing Group I	Packing Group II	Packing Group III
$d \times 1.5$ (m)	$d \times 1.0$ (m)	$d \times 0.67$ (m)

- (c) for light-gauge metal packagings, marked with symbol "RID/ADR" according to 6.1.3.1(a) (ii) intended for the carriage of substances having a viscosity at 23 °C greater than 200 mm²/s (corresponding to a flow time of 30 seconds with an ISO flow cup having a jet orifice of 6 mm diameter in accordance with ISO Standard 2431:1993)

- (i) if the relative density does not exceed 1.2:

Packing group II	Packing group III
0.6 m	0.4 m

- (ii) where the substances to be carried have a relative density (d) exceeding 1.2 the drop height shall be calculated on the basis of the relative density (d) of the substance to be carried, rounded up to the first decimal place, as follows:

Packing group II	Packing group III
$d \times 0.5$ m	$d \times 0.33$ m

6.1.5.3.6

Criteria for passing the test

6.1.5.3.6.1

Each packaging containing liquid shall be leakproof when equilibrium has been reached between the internal and external pressures, however for inner packagings of combination packagings and except for inner receptacles of composite packagings (glass, porcelain or stoneware), marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii) it is not necessary that the pressures be equalized.

6.1.5.3.6.2

Where a packaging for solids undergoes a drop test and its upper face strikes the target, the test sample passes the test if the entire contents are retained by an inner packaging or inner

receptacle (e.g. a plastics bag), even if the closure while retaining its containment function, is no longer sift-proof.

- 6.1.5.3.6.3 The packaging or outer packaging of a composite or combination packaging shall not exhibit any damage liable to affect safety during carriage. Inner receptacles, inner packagings, or articles shall remain completely within the outer packaging and there shall be no leakage of the filling substance from the inner receptacle(s) or inner packaging(s).
- 6.1.5.3.6.4 Neither the outermost ply of a bag nor an outer packaging may exhibit any damage liable to affect safety during carriage.
- 6.1.5.3.6.5 A slight discharge from the closure(s) upon impact is not considered to be a failure of the packaging provided that no further leakage occurs.
- 6.1.5.3.6.6 No rupture is permitted in packagings for goods of Class 1 which would permit the spillage of loose explosive substances or articles from the outer packaging.

6.1.5.4 ***Leakproofness test***

The leakproofness test shall be performed on all design types of packagings intended to contain liquids; however, this test is not required for

- inner packagings of combination packagings;
- inner receptacles of composite packagings (glass, porcelain or stoneware), marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii);
- light gauge metal packagings, marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii) intended for substances with a viscosity at 23 °C exceeding 200 mm²/s.

- 6.1.5.4.1 *Number of test samples:* three test samples per design type and manufacturer.
- 6.1.5.4.2 *Special preparation of test samples for the test:* either vented closures shall be replaced by similar non-vented closures or the vent shall be sealed.
- 6.1.5.4.3 *Test method and pressure to be applied:* the packagings including their closures shall be restrained under water for 5 minutes while an internal air pressure is applied, the method of restraint shall not affect the results of the test.

The air pressure (gauge) to be applied shall be:

Packing Group I	Packing Group II	Packing Group III
Not less than 30 kPa (0.3 bar)	Not less than 20 kPa (0.2 bar)	Not less than 20 kPa (0.2 bar)

Other methods at least equally effective may be used.

- 6.1.5.4.4 *Criterion for passing the test:* there shall be no leakage.

6.1.5.5 *Internal pressure (hydraulic) test*

6.1.5.5.1 *Packagings to be tested*

The internal pressure (hydraulic) test shall be carried out on all design types of metal, plastics and composite packagings intended to contain liquids. This test is not required for:

- Inner packagings of combination packagings;
- Inner receptacles of composite packagings (glass, porcelain or stoneware), marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii);
- Light gauge metal packagings, marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii) intended for substances with a viscosity at 23 °C exceeding 200 mm²/s.

6.1.5.5.2 *Number of test samples:* three test samples per design type and manufacturer.

6.1.5.5.3 *Special preparation of packagings for testing:* either vented closures shall be replaced by similar non-vented closures or the vent shall be sealed.

6.1.5.5.4 *Test method and pressure to be applied:* metal packagings and composite packagings (glass, porcelain or stoneware), including their closures, shall be subjected to the test pressure for 5 minutes. Plastics packagings and composite packagings (plastics material) including their closures shall be subjected to the test pressure for 30 minutes. This pressure is the one to be included in the marking required by 6.1.3.1 (d). The manner in which the packagings are supported shall not invalidate the test. The test pressure shall be applied continuously and evenly; it shall be kept constant throughout the test period. The hydraulic pressure (gauge) applied, as determined by any one of the following methods, shall be:

- (a) not less than the total gauge pressure measured in the packaging (i.e. the vapour pressure of the filling liquid and the partial pressure of the air or other inert gases, minus 100 kPa) at 55 °C, multiplied by a safety factor of 1.5; this total gauge pressure shall be determined on the basis of a maximum degree of filling in accordance with 4.1.1.4 and a filling temperature of 15 °C; or
- (b) not less than 1.75 times the vapour pressure at 50 °C of the liquid to be carried, minus 100 kPa but with a minimum test pressure of 100 kPa; or
- (c) not less than 1.5 times the vapour pressure at 55 °C of the liquid to be carried, minus 100 kPa but with a minimum test pressure of 100 kPa.

6.1.5.5.5 In addition, packagings intended to contain liquids of packing group I shall be tested to a minimum test pressure of 250 kPa (gauge) for a test period of 5 or 30 minutes depending upon the material of construction of the packaging.

6.1.5.5.6 *Criterion for passing the test:* no packaging may leak.

6.1.5.6 *Stacking test*

All design types of packagings other than bags, and other than non-stackable composite packagings (glass, porcelain, or stoneware) marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii), shall be subjected to a stacking test.

6.1.5.6.1 *Number of test samples:* three test samples per design type and manufacturer.

6.1.5.6.2 *Test method:* the test sample shall be subjected to a force applied to the top surface of the test sample equivalent to the total weight of identical packages which might be stacked on it during carriage; where the contents of the test sample are liquids with relative density different from that of the liquid to be carried, the force shall be calculated in relation to the latter. The minimum height of the stack including the test sample shall be 3 metres. The duration of the test shall be 24 hours except that plastics drums, jerricans, and composite packagings 6HH1 and 6HH2 intended for liquids shall be subjected to the stacking test for a period of 28 days at a temperature of not less than 40 °C.

For the test in accordance with 6.1.5.2.5, the original filling substance shall be used. For the test in accordance with 6.1.5.2.6, a stacking test shall be carried out with a standard liquid.

6.1.5.6.3 *Criteria for passing the test:* no test sample shall leak. In composite packagings or combination packagings, there shall be no leakage of the filling substance from the inner receptacle or inner packaging. No test sample shall show any deterioration which could adversely affect transport safety or any distortion liable to reduce its strength or cause instability in stacks of packages. Plastics packagings shall be cooled to ambient temperature before the assessment.

6.1.5.7 ***Supplementary permeability test for plastics drums and jerricans in accordance with 6.1.4.8 and for composite packagings (plastics material) in accordance with 6.1.4.19 intended for the carriage of liquids having a flash-point ≤ 60 °C, other than 6HA1 packagings***

Polyethylene packagings need be subjected to this test only if they are to be approved for the carriage of benzene, toluene, xylene or mixtures and preparations containing those substances.

6.1.5.7.1 *Number of test samples:* three packagings per design type and manufacturer.

6.1.5.7.2 *Special preparation of the test sample for the test:* the test samples are to be pre-stored with the original filling substance in accordance with 6.1.5.2.5, or, for polyethylene packagings, with the standard liquid mixture of hydrocarbons (white spirit) in accordance with 6.1.5.2.6.

6.1.5.7.3 *Test method:* the test samples filled with the substance for which the packaging is to be approved shall be weighed before and after storage for 28 days at 23 °C and 50% relative atmospheric humidity. For polyethylene packagings, the test may be carried out with the standard liquid mixture of hydrocarbons (white spirit) in place of benzene, toluene or xylene.

6.1.5.7.4 *Criterion for passing the test:* permeability shall not exceed 0.008 g/l.h.

6.1.5.8 ***Test Report***

6.1.5.8.1 A test report containing at least the following particulars shall be drawn up and shall be available to the users of the packaging:

1. Name and address of the test facility;
2. Name and address of applicant (where appropriate);
3. A unique test report identification;
4. Date of the test report;
5. Manufacturer of the packaging;
6. Description of the packaging design type (e.g. dimensions, materials, closures, thickness, etc.), including method of manufacture (e.g. blow moulding) and which may include drawing(s) and/or photograph(s);

7. Maximum capacity;
8. Characteristics of test contents, e.g. viscosity and relative density for liquids and particle size for solids;
9. Test descriptions and results;
10. The test report shall be signed with the name and status of the signatory.

6.1.5.8.2 The test report shall contain statements that the packaging prepared as for carriage was tested in accordance with the appropriate requirements of this section and that the use of other packaging methods or components may render it invalid. A copy of the test report shall be available to the competent authority.

6.1.6 **Standard liquids for verifying the chemical compatibility testing of polyethylene packagings, including IBCs, in accordance with 6.1.5.2.6 and 6.5.6.3.5, respectively**

6.1.6.1 The following standard liquids shall be used for this plastics material.

- (a) **Wetting Solution** for substances causing severe cracking in polyethylene under stress, in particular for all solutions and preparations containing wetting agents.

An aqueous solution of 1% of alkyl benzene sulphonate, or an aqueous solution of 5% nonylphenol ethoxylate which has been preliminary stored for at least 14 days at a temperature of 40 °C before being used for the first time for the tests, shall be used. The surface tension of this solution shall be 31 to 35 mN/m at 23 °C. The stacking test shall be carried out on the basis of a relative density of not less than 1.20.

A compatibility test with acetic acid is not required if adequate chemical compatibility is proved with a wetting solution.

For filling substances causing cracking in polyethylene under stress which is resistant to the wetting solution, adequate chemical compatibility may be proved after preliminary storing for three weeks at 40 °C in accordance with 6.1.5.2.6, but with the original filling matter;

- (b) **Acetic acid** for substances and preparations causing cracking in polyethylene under stress, in particular for monocarboxylic acids and monovalent alcohols.

Acetic acid in 98 to 100% concentration shall be used.
Relative density = 1.05.

The stacking test shall be carried out on the basis of a relative density not less than 1.1.

In the case of filling substances causing polyethylene to swell more than acetic acid and to such an extent that the polyethylene mass is increased by up to 4%, adequate chemical compatibility may be proved after preliminary storing for three weeks at 40 °C, in accordance with 6.1.5.2.6 but with the original filling matter;

- (c) **Normal butyl acetate/normal butyl acetate-saturated wetting solution** for substances and preparations causing polyethylene to swell to such an extent that the polyethylene mass is increased by about 4% and at the same time causing cracking under stress, in particular for phyto-sanitary products, liquid paints and esters. Normal butyl acetate in 98 to 100% concentration shall be used for preliminary storage in accordance with 6.1.5.2.6.

For the stacking test in accordance with 6.1.5.6, a test liquid consisting of a 1 to 10% aqueous wetting solution mixed with 2% normal butyl acetate conforming to (a) above shall be used.

The stacking test shall be carried out on the basis of a relative density not less than 1.0.

In the case of filling substances causing polyethylene to swell more than normal butyl acetate and to such an extent that the polyethylene mass is increased by up to 7.5%, adequate chemical compatibility may be proved after preliminary storing for three weeks at 40 °C, in accordance with 6.1.5.2.6 but with the original filling matter;

- (d) **Mixture of hydrocarbons (white spirit)** for substances and preparations causing polyethylene to swell, in particular for hydrocarbons, esters and ketones.

A mixture of hydrocarbons having a boiling range 160 °C to 220 °C, relative density 0.78-0.80, flash-point > 50 °C and an aromatic content 16% to 21% shall be used.

The stacking test shall be carried out on the basis of a relative density not less than 1.0.

In the case of filling substances causing polyethylene to swell to such an extent that the polyethylene mass is increased by more than 7.5%, adequate chemical compatibility may be proved after preliminary storing for three weeks at 40 °C, in accordance with 6.1.5.2.6 but with the original filling matter;

- (e) **Nitric acid** for all substances and preparations having an oxidizing effect on polyethylene and causing molecular degradation identical to or less than 55% nitric acid.

Nitric acid in a concentration of not less than 55% shall be used.

The stacking test shall be carried out on the basis of a relative density of not less than 1.4.

In the case of filling substances more strongly oxidizing than 55% nitric acid or causing degradation of the molecular mass proceed in accordance with 6.1.5.2.5.

The period of use shall be determined in such cases by observing the degree of damage (e.g. two years for nitric acid in not less than 55% concentration);

- (f) **Water** for substances which do not attack polyethylene in any of the cases referred to under (a) to (e), in particular for inorganic acids and lyes, aqueous saline solutions, polyvalent alcohols and organic substances in aqueous solution.

The stacking test shall be carried out on the basis of a relative density of not less than 1.2.

A design type test with water is not required if adequate chemical compatibility is proved with wetting solution or nitric acid.

CHAPTER 6.2

REQUIREMENTS FOR THE CONSTRUCTION AND TESTING OF PRESSURE RECEPTACLES, AEROSOL DISPENSERS, SMALL RECEPTACLES CONTAINING GAS (GAS CARTRIDGES) AND FUEL CELL CARTRIDGES CONTAINING LIQUEFIED FLAMMABLE GAS

NOTE: *Aerosol dispensers, small receptacles containing gas (gas cartridges) and fuel cell cartridges containing liquefied flammable gas are not subject to the requirements of 6.2.1 to 6.2.5.*

6.2.1 General requirements

6.2.1.1 Design and construction

6.2.1.1.1 Pressure receptacles and their closures shall be designed, manufactured, tested and equipped in such a way as to withstand all conditions, including fatigue, to which they will be subjected during normal conditions of carriage and use.

6.2.1.1.2 *(Reserved)*

6.2.1.1.3 In no case shall the minimum wall thickness be less than that specified in the design and construction technical standards.

6.2.1.1.4 For welded pressure receptacles, only metals of weldable quality shall be used.

6.2.1.1.5 The test pressure of cylinders, tubes, pressure drums and bundles of cylinders shall be in accordance with packing instruction P200 of 4.1.4.1, or, for a chemical under pressure, with packing instruction P206 of 4.1.4.1. The test pressure for closed cryogenic receptacles shall be in accordance with packing instruction P203 of 4.1.4.1. The test pressure of a metal hydride storage system shall be in accordance with packing instruction P205 of 4.1.4.1.

6.2.1.1.6 Pressure receptacles assembled in bundles shall be structurally supported and held together as a unit. Pressure receptacles shall be secured in a manner that prevents movement in relation to the structural assembly and movement that would result in the concentration of harmful local stresses. Manifold assemblies (e.g. manifold, valves, and pressure gauges) shall be designed and constructed such that they are protected from impact damage and forces normally encountered in carriage. Manifolds shall have at least the same test pressure as the cylinders. For toxic liquefied gases, each pressure receptacle shall have an isolation valve to ensure that each pressure receptacle can be filled separately and that no interchange of pressure receptacle contents can occur during carriage.

NOTE: *Toxic liquefied gases have the classification codes 2T, 2TF, 2TC, 2TO, 2TFC or 2TOC.*

6.2.1.1.7 Contact between dissimilar metals which could result in damage by galvanic action shall be avoided.

6.2.1.1.8 *Additional requirements for the construction of closed cryogenic receptacles for refrigerated liquefied gases*

- 6.2.1.1.8.1 The mechanical properties of the metal used shall be established for each pressure receptacle, including the impact strength and the bending coefficient.

NOTE: *With regard to the impact strength, sub-section 6.8.5.3 gives details of test requirements which may be used.*

- 6.2.1.1.8.2 The pressure receptacles shall be thermally insulated. The thermal insulation shall be protected against impact by means of a jacket. If the space between the pressure receptacle and the jacket is evacuated of air (vacuum-insulation), the jacket shall be designed to withstand without permanent deformation an external pressure of at least 100 kPa (1 bar) calculated in accordance with a recognised technical code or a calculated critical collapsing pressure of not less than 200 kPa (2 bar) gauge pressure. If the jacket is so closed as to be gas-tight (e.g. in the case of vacuum-insulation), a device shall be provided to prevent any dangerous pressure from developing in the insulating layer in the event of inadequate gas-tightness of the pressure receptacle or its fittings. The device shall prevent moisture from penetrating into the insulation.

- 6.2.1.1.8.3 Closed cryogenic receptacles intended for the carriage of refrigerated liquefied gases having a boiling point below -182°C at atmospheric pressure shall not include materials which may react with oxygen or oxygen enriched atmospheres in a dangerous manner, when located in parts of the thermal insulation where there is a risk of contact with oxygen or with oxygen enriched liquid.

- 6.2.1.1.8.4 Closed cryogenic receptacles shall be designed and constructed with suitable lifting and securing arrangements.

- 6.2.1.1.9 *Additional requirements for the construction of pressure receptacles for acetylene*

Pressure receptacles for UN 1001 acetylene, dissolved, and UN 3374 acetylene, solvent free, shall be filled with a porous material, uniformly distributed, of a type that conforms to the requirements and testing specified by the competent authority and which:

- (a) Is compatible with the pressure receptacle and does not form harmful or dangerous compounds either with the acetylene or with the solvent in the case of UN 1001; and
- (b) Is capable of preventing the spread of decomposition of the acetylene in the porous material.

In the case of UN 1001, the solvent shall be compatible with the pressure receptacle.

6.2.1.2 *Materials*

- 6.2.1.2.1 Construction materials of pressure receptacles and their closures which are in direct contact with dangerous goods shall not be affected or weakened by the dangerous goods intended to be carried and shall not cause a dangerous effect e.g. catalysing a reaction or reacting with the dangerous goods.

- 6.2.1.2.2 Pressure receptacles and their closures shall be made of the materials specified in the design and construction technical standards and the applicable packing instruction for the substances intended for carriage in the pressure receptacle. The materials shall be resistant to brittle fracture and to stress corrosion cracking as indicated in the design and construction technical standards.

6.2.1.3 *Service equipment*

- 6.2.1.3.1 Valves, piping and other fittings subjected to pressure, excluding pressure relief devices, shall be designed and constructed so that the burst pressure is at least 1.5 times the test pressure of the pressure receptacle.
- 6.2.1.3.2 Service equipment shall be configured or designed to prevent damage that could result in the release of the pressure receptacle contents during normal conditions of handling and carriage. Manifold piping leading to shut-off valves shall be sufficiently flexible to protect the valves and the piping from shearing or releasing the pressure receptacle contents. The filling and discharge valves and any protective caps shall be capable of being secured against unintended opening. Valves shall be protected as specified in 4.1.6.8.
- 6.2.1.3.3 Pressure receptacles which are not capable of being handled manually or rolled, shall be fitted with devices (skids, rings, straps) ensuring that they can be safely handled by mechanical means and so arranged as not to impair the strength of, nor cause undue stresses in, the pressure receptacle.
- 6.2.1.3.4 Individual pressure receptacles shall be equipped with pressure relief devices as specified in packing provision P200 (2) or P205 of 4.1.4.1 or in 6.2.1.3.6.4 and 6.2.1.3.6.5. Pressure-relief devices shall be designed to prevent the entry of foreign matter, the leakage of gas and the development of any dangerous excess pressure. When fitted, pressure relief devices on manifolded horizontal pressure receptacles filled with flammable gas shall be arranged to discharge freely to the open air in such a manner as to prevent any impingement of escaping gas upon the pressure receptacle itself under normal conditions of carriage.
- 6.2.1.3.5 Pressure receptacles whose filling is measured by volume shall be provided with a level indicator.
- 6.2.1.3.6 *Additional requirements for closed cryogenic receptacles*
- 6.2.1.3.6.1 Each filling and discharge opening in a closed cryogenic receptacle used for the carriage of flammable refrigerated liquefied gases shall be fitted with at least two mutually independent shut-off devices in series, the first being a stop-valve, the second being a cap or equivalent device.
- 6.2.1.3.6.2 For sections of piping which can be closed at both ends and where liquid product can be trapped, a method of automatic pressure-relief shall be provided to prevent excess pressure build-up within the piping.
- 6.2.1.3.6.3 Each connection on a closed cryogenic receptacle shall be clearly marked to indicate its function (e.g. vapour or liquid phase).
- 6.2.1.3.6.4 Pressure-relief devices
- 6.2.1.3.6.4.1 Every closed cryogenic receptacle shall be provided with at least one pressure-relief device. The pressure-relief device shall be of the type that will resist dynamic forces including surge.
- 6.2.1.3.6.4.2 Closed cryogenic receptacles may, in addition, have a frangible disc in parallel with the spring loaded device(s) in order to meet the requirements of 6.2.1.3.6.5.
- 6.2.1.3.6.4.3 Connections to pressure-relief devices shall be of sufficient size to enable the required discharge to pass unrestricted to the pressure-relief device.
- 6.2.1.3.6.4.4 All pressure-relief device inlets shall under maximum filling conditions be situated in the vapour space of the closed cryogenic receptacle and the devices shall be so arranged as to ensure that the escaping vapour is discharged unrestrictedly.

6.2.1.3.6.5 Capacity and setting of pressure-relief devices

NOTE: *In relation to pressure-relief devices of closed cryogenic receptacles, maximum allowable working pressure (MAWP) means the maximum effective gauge pressure permissible at the top of a loaded closed cryogenic receptacle in its operating position including the highest effective pressure during filling and discharge.*

- 6.2.1.3.6.5.1 The pressure-relief device shall open automatically at a pressure not less than the MAWP and be fully open at a pressure equal to 110% of the MAWP. It shall, after discharge, close at a pressure not lower than 10% below the pressure at which discharge starts and shall remain closed at all lower pressures.
- 6.2.1.3.6.5.2 Frangible discs shall be set to rupture at a nominal pressure which is the lower of either the test pressure or 150% of the MAWP.
- 6.2.1.3.6.5.3 In the case of the loss of vacuum in a vacuum-insulated closed cryogenic receptacle the combined capacity of all pressure-relief devices installed shall be sufficient so that the pressure (including accumulation) inside the closed cryogenic receptacle does not exceed 120% of the MAWP.
- 6.2.1.3.6.5.4 The required capacity of the pressure-relief devices shall be calculated in accordance with an established technical code recognized by the competent authority¹.

6.2.1.4 *Approval of pressure receptacles*

- 6.2.1.4.1 The conformity of pressure receptacles shall be assessed at time of manufacture as required by the competent authority. Pressure receptacles shall be inspected, tested and approved by an inspection body. The technical documentation shall include full specifications on design and construction, and full documentation on the manufacturing and testing.
- 6.2.1.4.2 Quality assurance systems shall conform to the requirements of the competent authority.

6.2.1.5 *Initial inspection and test*

- 6.2.1.5.1 New pressure receptacles, other than closed cryogenic receptacles and metal hydride storage systems, shall be subjected to testing and inspection during and after manufacture in accordance with the applicable design standards including the following:

On an adequate sample of pressure receptacles:

- (a) Testing of the mechanical characteristics of the material of construction;
- (b) Verification of the minimum wall thickness;
- (c) Verification of the homogeneity of the material for each manufacturing batch;
- (d) Inspection of the external and internal conditions of the pressure receptacles;
- (e) Inspection of the neck threads;
- (f) Verification of the conformance with the design standard;

¹ See for example CGA Publications S-1.2-2003 "Pressure Relief Device Standards-Part 2-Cargo and Portable Tanks for Compressed Gases" and S-1.1-2003 "Pressure Relief Device Standards-Part 1-Cylinders for Compressed Gases".

For all pressure receptacles:

- (g) A hydraulic pressure test. Pressure receptacles shall withstand the test pressure without expansion greater than that allowed in the design specification;

NOTE: *With the agreement of the competent authority, the hydraulic pressure test may be replaced by a test using a gas, where such an operation does not entail any danger.*

- (h) Inspection and assessment of manufacturing defects and either repairing them or rendering the pressure receptacles unserviceable. In the case of welded pressure receptacles, particular attention shall be paid to the quality of the welds;
- (i) An inspection of the markings on the pressure receptacles;
- (j) In addition, pressure receptacles intended for the carriage of UN No. 1001 acetylene, dissolved, and UN No. 3374 acetylene, solvent free, shall be inspected to ensure proper installation and condition of the porous material and, if applicable, the quantity of solvent.

6.2.1.5.2 On an adequate sample of closed cryogenic receptacles, the inspections and tests specified in 6.2.1.5.1 (a), (b), (d) and (f) shall be performed. In addition, welds shall be inspected by radiographic, ultrasonic or another suitable non-destructive test method on a sample of closed cryogenic receptacles according to the applicable design and construction standard. This weld inspection does not apply to the jacket.

Additionally, all closed cryogenic receptacles shall undergo the initial inspections and tests specified in 6.2.1.5.1 (g), (h) and (i), as well as a leakproofness test and a test of the satisfactory operation of the service equipment after assembly.

6.2.1.5.3 For metal hydride storage systems, it shall be verified that the inspections and tests specified in 6.2.1.5.1 (a), (b), (c), (d), (e) if applicable, (f), (g), (h) and (i) have been performed on an adequate sample of the receptacles used in the metal hydride storage system. In addition, on an adequate sample of metal hydride storage systems, the inspections and tests specified in 6.2.1.5.1 (c) and (f) shall be performed, as well as 6.2.1.5.1 (e), if applicable, and inspection of the external conditions of the metal hydride storage system.

Additionally, all metal hydride storage systems shall undergo the initial inspections and tests specified in 6.2.1.5.1 (h) and (i), as well as a leakproofness test and a test of the satisfactory operation of the service equipment.

6.2.1.6 ***Periodic inspection and test***

6.2.1.6.1 Refillable pressure receptacles, other than cryogenic receptacles, shall be subjected to periodic inspections and tests by a body authorised by the competent authority, in accordance with the following:

- (a) Check of the external conditions of the pressure receptacle and verification of the equipment and the external markings;
- (b) Check of the internal conditions of the pressure receptacle (e.g. internal inspection, verification of minimum wall thickness);
- (c) Checking of the threads if there is evidence of corrosion or if the fittings are removed;
- (d) A hydraulic pressure test and, if necessary, verification of the characteristics of the material by suitable tests;

- (e) Check of service equipment, other accessories and pressure-relief devices, if to be reintroduced into service.

NOTE 1: *With the agreement of the competent authority, the hydraulic pressure test may be replaced by a test using a gas, where such an operation does not entail any danger.*

NOTE 2: *With the agreement of the competent authority, the hydraulic pressure test of cylinders or tubes may be replaced by an equivalent method based on acoustic emission testing or a combination of acoustic emission testing and ultrasonic examination. ISO 16148:2006 may be used as a guide for acoustic emission testing procedures.*

NOTE 3: *The hydraulic pressure test may be replaced by ultrasonic examination carried out in accordance with ISO 10461:2005+A1:2006 for seamless aluminium alloy gas cylinders and in accordance with ISO 6406:2005 for seamless steel gas cylinders.*

NOTE 4: *For the periodic inspection and test frequencies, see packing instruction P200 of 4.1.4.1 or, for a chemical under pressure, packing instruction P206 of 4.1.4.1.*

- 6.2.1.6.2 Pressure receptacles intended for the carriage of UN No. 1001 acetylene, dissolved and UN No. 3374 acetylene, solvent free, shall be examined only as specified in 6.2.1.6.1 (a), (c) and (e). In addition the condition of the porous material (e.g. cracks, top clearance, loosening, settlement) shall be examined.

- 6.2.1.6.3 Pressure relief valves for closed cryogenic receptacles shall be subject to periodic inspections and tests.

6.2.1.7 *Requirements for manufacturers*

- 6.2.1.7.1 The manufacturer shall be technically able and shall possess all resources required for the satisfactory manufacture of pressure receptacles; this relates in particular to qualified personnel:

- (a) To supervise the entire manufacturing process;
- (b) To carry out joining of materials; and
- (c) To carry out the relevant tests.

- 6.2.1.7.2 The proficiency test of a manufacturer shall in all instances be carried out by an inspection body approved by the competent authority of the country of approval.

6.2.1.8 *Requirements for inspection bodies*

- 6.2.1.8.1 Inspection bodies shall be independent from manufacturing enterprises and competent to perform the tests, inspections and approvals required.

6.2.2 **Requirements for UN pressure receptacles**

In addition to the general requirements of section 6.2.1, UN pressure receptacles shall comply with the requirements of this section, including the standards, as applicable.

6.2.2.1 *Design, construction and initial inspection and test*

6.2.2.1.1 The following standards apply for the design, construction, and initial inspection and test of UN cylinders, except that inspection requirements related to the conformity assessment system and approval shall be in accordance with 6.2.2.5:

ISO 9809-1:1999	Gas cylinders – Refillable seamless steel gas cylinders – Design, construction and testing – Part 1: Quenched and tempered steel cylinders with tensile strength less than 1 100 MPa <i>NOTE: The note concerning the F factor in section 7.3 of this standard shall not be applied for UN cylinders.</i>
ISO 9809-2:2000	Gas cylinders – Refillable seamless steel gas cylinders – Design, construction and testing – Part 2: Quenched and tempered steel cylinders with tensile strength greater than or equal to 1 100 MPa
ISO 9809-3:2000	Gas cylinders – Refillable seamless steel gas cylinders – Design, construction and testing – Part 3: Normalized steel cylinders
ISO 7866:1999	Gas cylinders – Refillable seamless aluminium alloy gas cylinders – Design, construction and testing <i>NOTE: The note concerning the F factor in section 7.2 of this standard shall not be applied for UN cylinders. Aluminium alloy 6351A – T6 or equivalent shall not be authorised.</i>
ISO 4706:2008	Gas cylinders – Refillable welded steel cylinders – Test pressure 60 bar and below
ISO 18172-1:2007	Gas cylinders – Refillable welded stainless steel cylinders – Part 1: Test pressure 6 MPa and below
ISO 20703:2006	Gas cylinders – Refillable welded aluminium-alloy cylinders – Design, construction and testing
ISO 11118:1999	Gas cylinders – Non-refillable metallic gas cylinders – Specification and test methods
ISO 11119-1:2002	Gas cylinders of composite construction – Specification and test methods – Part 1: Hoop wrapped composite gas cylinders
ISO 11119-2:2002	Gas cylinders of composite construction – Specification and test methods – Part 2: Fully wrapped fibre reinforced composite gas cylinders with load-sharing metal liners
ISO 11119-3:2002	Gas cylinders of composite construction – Specification and test methods – Part 3: Fully wrapped fibre reinforced composite gas cylinders with non-load-sharing metallic or non-metallic liners

NOTE 1: In the above referenced standards composite cylinders shall be designed for unlimited service life.

NOTE 2: After the first 15 years of service, composite cylinders manufactured according to these standards, may be approved for extended service by the competent authority which was responsible for the original approval of the cylinders and which will base its decision on the test information supplied by the manufacturer or owner or user.

6.2.2.1.2 The following standard apply for the design, construction, and initial inspection and test of UN tubes, except that inspection requirements related to the conformity assessment system and approval shall be in accordance with 6.2.2.5:

ISO 11120:1999	Gas cylinders – Refillable seamless steel tubes for compressed gas transport, of water capacity between 150 l and 3 000 l – Design, construction and testing <i>NOTE: The note concerning the F factor in section 7.1 of this standard shall not be applied for UN tubes.</i>
----------------	--

- 6.2.2.1.3 The following standards apply for the design, construction and initial inspection and test of UN acetylene cylinders, except that inspection requirements related to the conformity assessment system and approval shall be in accordance with 6.2.2.5:

For the cylinder shell:

ISO 9809-1:1999	Gas cylinders – Refillable seamless steel gas cylinders – Design, construction and testing – Part 1: Quenched and tempered steel cylinders with tensile strength less than 1 100 MPa <i>NOTE: The note concerning the F factor in section 7.3 of this standard shall not be applied for UN cylinders.</i>
ISO 9809-3:2000	Gas cylinders – Refillable seamless steel gas cylinders – Design, construction and testing – Part 3: Normalized steel cylinders

For the porous material in the cylinder:

ISO 3807-1:2000	Cylinders for acetylene – Basic requirements – Part 1: Cylinders without fusible plugs
ISO 3807-2:2000	Cylinders for acetylene – Basic requirements – Part 2: Cylinders with fusible plugs

- 6.2.2.1.4 The following standard apply for the design, construction, and initial inspection and test of UN cryogenic receptacles, except that inspection requirements related to the conformity assessment system and approval shall be in accordance with 6.2.2.5:

ISO 21029-1:2004	Cryogenic vessels – Transportable vacuum insulated vessels of not more than 1 000 l volume – Part 1: Design, fabrication, inspection and tests
------------------	--

- 6.2.2.1.5 The following standard applies for the design, construction, and initial inspection and test of UN metal hydride storage systems, except that inspection requirements related to the conformity assessment system and approval shall be in accordance with 6.2.2.5:

ISO 16111:2008	Transportable gas storage devices – Hydrogen absorbed in reversible metal hydride
----------------	---

6.2.2.2 **Materials**

In addition to the material requirements specified in the pressure receptacle design and construction standards, and any restrictions specified in the applicable packing instruction for the gas(es) to be carried (e.g. packing instruction P200 or P205 of 4.1.4.1), the following standards apply to material compatibility:

ISO 11114-1:1997	Transportable gas cylinders – Compatibility of cylinder and valve materials with gas contents – Part 1: Metallic materials
ISO 11114-2:2000	Transportable gas cylinders – Compatibility of cylinder and valve materials with gas contents – Part 2: Non-metallic materials

NOTE: The limitations imposed in ISO 11114-1 on high strength steel alloys at ultimate tensile strength levels up to 1 100 MPa do not apply to UN No. 2203 silane.

6.2.2.3 *Service equipment*

The following standards apply to closures and their protection:

ISO 11117:2008 + Cor 1:2009	Gas cylinders – Valve protection caps and valve guards – Design, construction and tests NOTE: Construction according to ISO 11117:1998 may continue until 31 December 2014.
ISO 10297:2006	Transportable gas cylinders – Cylinder valves – Specification and type testing NOTE: The EN version of this ISO standard fulfils the requirements and may also be used.
ISO 13340:2001	Transportable gas cylinders – Cylinder valves for non-refillable cylinders – Specification and prototype testing

For UN metal hydride storage systems, the requirements specified in the following standard apply to closures and their protection:

ISO 16111:2008	Transportable gas storage devices – Hydrogen absorbed in reversible metal hydride
----------------	---

6.2.2.4 *Periodic inspection and test*

The following standards apply to the periodic inspection and testing of UN cylinders and UN metal hydride storage systems:

ISO 6406:2005	Periodic inspection and testing of seamless steel gas cylinders
ISO 10460:2005	Gas cylinders – Welded carbon-steel gas cylinders – Periodic inspection and testing NOTE: The repair of welds described in clause 12.1 of this standard shall not be permitted. Repairs described in clause 12.2 require the approval of the competent authority which approved the periodic inspection and test body in accordance with 6.2.2.6.
ISO 10461:2005 + A1:2006	Seamless aluminium-alloy gas cylinders – Periodic inspection and testing
ISO 10462:2005	Gas cylinders – Transportable cylinders for dissolved acetylene – Periodic inspection and maintenance
ISO 11623:2002	Transportable gas cylinders – Periodic inspection and testing of composite gas cylinders
ISO 16111:2008	Transportable gas storage devices – Hydrogen absorbed in reversible metal hydride

6.2.2.5 *Conformity assessment system and approval for manufacture of pressure receptacles*

6.2.2.5.1 *Definitions*

For the purposes of this sub-section:

Conformity assessment system means a system for competent authority approval of a manufacturer, by pressure receptacle design type approval, approval of manufacturer's quality system and approval of inspection bodies;

Design type means a pressure receptacle design as specified by a particular pressure receptacle standard;

Verify means confirm by examination or provision of objective evidence that specified requirements have been fulfilled.

6.2.2.5.2 *General requirements*

Competent authority

- 6.2.2.5.2.1 The competent authority that approves the pressure receptacle shall approve the conformity assessment system for the purpose of ensuring that pressure receptacles conform to the requirements of ADR. In instances where the competent authority that approves a pressure receptacle is not the competent authority in the country of manufacture, the marks of the approval country and the country of manufacture shall be indicated in the pressure receptacle marking (see 6.2.2.7 and 6.2.2.8).

The competent authority of the country of approval shall supply, upon request, evidence demonstrating compliance to this conformity assessment system to its counterpart in a country of use.

- 6.2.2.5.2.2 The competent authority may delegate its functions in this conformity assessment system in whole or in part.

- 6.2.2.5.2.3 The competent authority shall ensure that a current list of approved inspection bodies and their identity marks and approved manufacturers and their identity marks is available.

Inspection body

- 6.2.2.5.2.4 The inspection body shall be approved by the competent authority for the inspection of pressure receptacles and shall:

- (a) Have a staff with an organizational structure, capable, trained, competent, and skilled, to satisfactorily perform its technical functions;
- (b) Have access to suitable and adequate facilities and equipment;
- (c) Operate in an impartial manner and be free from any influence which could prevent it from doing so;
- (d) Ensure commercial confidentiality of the commercial and proprietary activities of the manufacturer and other bodies;
- (e) Maintain clear demarcation between actual inspection body functions and unrelated functions;
- (f) Operate a documented quality system;
- (g) Ensure that the tests and inspections specified in the relevant pressure receptacle standard and ADR are performed; and
- (h) Maintain an effective and appropriate report and record system in accordance with 6.2.2.5.6.

- 6.2.2.5.2.5 The inspection body shall perform design type approval, pressure receptacle production testing and inspection, and certification to verify conformity with the relevant pressure receptacle standard (see 6.2.2.5.4 and 6.2.2.5.5).

Manufacturer

6.2.2.5.2.6 The manufacturer shall:

- (a) Operate a documented quality system in accordance with 6.2.2.5.3;
- (b) Apply for design type approvals in accordance with 6.2.2.5.4;
- (c) Select an inspection body from the list of approved inspection bodies maintained by the competent authority in the country of approval; and
- (d) Maintain records in accordance with 6.2.2.5.6.

Testing laboratory

6.2.2.5.2.7 The testing laboratory shall have:

- (a) Staff with an organizational structure, sufficient in number, competence, and skill; and
- (b) Suitable and adequate facilities and equipment to perform the tests required by the manufacturing standard to the satisfaction of the inspection body.

6.2.2.5.3 *Manufacturer's quality system*

6.2.2.5.3.1 The quality system shall contain all the elements, requirements, and provisions adopted by the manufacturer. It shall be documented in a systematic and orderly manner in the form of written policies, procedures and instructions.

The contents shall in particular include adequate descriptions of:

- (a) The organizational structure and responsibilities of personnel with regard to design and product quality;
- (b) The design control and design verification techniques, processes, and procedures that will be used when designing the pressure receptacles;
- (c) The relevant pressure receptacle manufacturing, quality control, quality assurance and process operation instructions that will be used;
- (d) Quality records, such as inspection reports, test data and calibration data;
- (e) Management reviews to ensure the effective operation of the quality system arising from the audits in accordance with 6.2.2.5.3.2;
- (f) The process describing how customer requirements are met;
- (g) The process for control of documents and their revision;
- (h) The means for control of non-conforming pressure receptacles, purchased components, in-process and final materials; and
- (i) Training programmes and qualification procedures for relevant personnel.

6.2.2.5.3.2 Audit of the quality system

The quality system shall be initially assessed to determine whether it meets the requirements in 6.2.2.5.3.1 to the satisfaction of the competent authority.

The manufacturer shall be notified of the results of the audit. The notification shall contain the conclusions of the audit and any corrective actions required.

Periodic audits shall be carried out, to the satisfaction of the competent authority, to ensure that the manufacturer maintains and applies the quality system. Reports of the periodic audits shall be provided to the manufacturer.

6.2.2.5.3.3 Maintenance of the quality system

The manufacturer shall maintain the quality system as approved in order that it remains adequate and efficient.

The manufacturer shall notify the competent authority that approved the quality system, of any intended changes. The proposed changes shall be evaluated in order to determine whether the amended quality system will still satisfy the requirements in 6.2.2.5.3.1.

6.2.2.5.4 Approval process

Initial design type approval

6.2.2.5.4.1 The initial design type approval shall consist of approval of the manufacturer's quality system and approval of the pressure receptacle design to be produced. An application for an initial design type approval shall meet the requirements of 6.2.2.5.4.2 to 6.2.2.5.4.6 and 6.2.2.5.4.9.

6.2.2.5.4.2 A manufacturer desiring to produce pressure receptacles in accordance with a pressure receptacle standard and ADR shall apply for, obtain, and retain a design type approval certificate issued by the competent authority in the country of approval for at least one pressure receptacle design type in accordance with the procedure given in 6.2.2.5.4.9. This certificate shall, on request, be submitted to the competent authority of the country of use.

6.2.2.5.4.3 An application shall be made for each manufacturing facility and shall include:

- (a) The name and registered address of the manufacturer and in addition, if the application is submitted by an authorised representative, its name and address;
- (b) The address of the manufacturing facility (if different from the above);
- (c) The name and title of the person(s) responsible for the quality system;
- (d) The designation of the pressure receptacle and the relevant pressure receptacle standard;
- (e) Details of any refusal of approval of a similar application by any other competent authority;
- (f) The identity of the inspection body for design type approval;
- (g) Documentation on the manufacturing facility as specified under 6.2.2.5.3.1; and
- (h) The technical documentation required for design type approval, which shall enable verification of the conformity of the pressure receptacles with the requirements of

the relevant pressure receptacle design standard. The technical documentation shall cover the design and method of manufacture and shall contain, as far as is relevant for assessment, at least the following:

- (i) pressure receptacle design standard, design and manufacturing drawings, showing components and subassemblies, if any;
- (ii) descriptions and explanations necessary for the understanding of the drawings and intended use of the pressure receptacles;
- (iii) a list of the standards necessary to fully define the manufacturing process;
- (iv) design calculations and material specifications; and
- (v) design type approval test reports, describing the results of examinations and tests carried out in accordance with 6.2.2.5.4.9.

6.2.2.5.4.4 An initial audit in accordance with 6.2.2.5.3.2 shall be performed to the satisfaction of the competent authority.

6.2.2.5.4.5 If the manufacturer is denied approval, the competent authority shall provide written detailed reasons for such denial.

6.2.2.5.4.6 Following approval, changes to the information submitted under 6.2.2.5.4.3 relating to the initial approval shall be provided to the competent authority.

Subsequent design type approvals

6.2.2.5.4.7 An application for a subsequent design type approval shall meet the requirements of 6.2.2.5.4.8 and 6.2.2.5.4.9, provided a manufacturer is in the possession of an initial design type approval. In such a case, the manufacturer's quality system according to 6.2.2.5.3 shall have been approved during the initial design type approval and shall be applicable for the new design.

6.2.2.5.4.8 The application shall include:

- (a) The name and address of the manufacturer and in addition, if the application is submitted by an authorised representative, its name and address;
- (b) Details of any refusal of approval of a similar application by any other competent authority;
- (c) Evidence that initial design type approval has been granted; and
- (d) The technical documentation, as described in 6.2.2.5.4.3 (h).

Procedure for design type approval

6.2.2.5.4.9 The inspection body shall:

- (a) Examine the technical documentation to verify that:
 - (i) the design is in accordance with the relevant provisions of the standard, and
 - (ii) the prototype lot has been manufactured in conformity with the technical documentation and is representative of the design;

- (b) Verify that the production inspections have been carried out as required in accordance with 6.2.2.5.5;
- (c) Select pressure receptacles from a prototype production lot and supervise the tests of these pressure receptacles as required for design type approval;
- (d) Perform or have performed the examinations and tests specified in the pressure receptacle standard to determine that:
 - (i) the standard has been applied and fulfilled, and
 - (ii) the procedures adopted by the manufacturer meet the requirements of the standard; and
- (e) Ensure that the various type approval examinations and tests are correctly and competently carried out.

After prototype testing has been carried out with satisfactory results and all applicable requirements of 6.2.2.5.4 have been satisfied, a design type approval certificate shall be issued, which shall include the name and address of the manufacturer, results and conclusions of the examination, and the necessary data for identification of the design type.

If the manufacturer is denied a design type approval, the competent authority shall provide written detailed reasons for such denial.

6.2.2.5.4.10 Modifications to approved design types

The manufacturer shall either:

- (a) Inform the issuing competent authority of modifications to the approved design type, where such modifications do not constitute a new design, as specified in the pressure receptacle standard; or
- (b) Request a subsequent design type approval where such modifications constitute a new design according to the relevant pressure receptacle standard. This additional approval shall be given in the form of an amendment to the original design type approval certificate.

6.2.2.5.4.11 Upon request, the competent authority shall communicate to any other competent authority, information concerning design type approval, modifications of approvals and withdrawn approvals.

6.2.2.5.5 *Production inspection and certification*

General requirements

An inspection body, or its delegate, shall carry out the inspection and certification of each pressure receptacle. The inspection body selected by the manufacturer for inspection and testing during production may be different from the inspection body used for the design type approval testing.

Where it can be demonstrated to the satisfaction of the inspection body that the manufacturer has trained competent inspectors, independent of the manufacturing operations, inspection may be performed by those inspectors. In such a case, the manufacturer shall maintain training records of the inspectors.

The inspection body shall verify that the inspections by the manufacturer, and tests performed on those pressure receptacles, fully conform to the standard and the requirements

of ADR. Should non-conformance in conjunction with this inspection and testing be determined, the permission to have inspection performed by the manufacturer's inspectors may be withdrawn.

The manufacturer shall, after approval by the inspection body, make a declaration of conformity with the certified design type. The application of the pressure receptacle certification marking shall be considered a declaration that the pressure receptacle complies with the applicable pressure receptacle standards and the requirements of this conformity assessment system and ADR. The inspection body shall affix or delegate the manufacturer to affix the pressure receptacle certification marking and the registered mark of the inspection body to each approved pressure receptacle.

A certificate of compliance, signed by the inspection body and the manufacturer, shall be issued before the pressure receptacles are filled.

6.2.2.5.6 *Records*

Design type approval and certificate of compliance records shall be retained by the manufacturer and the inspection body for not less than 20 years.

6.2.2.6 *Approval system for periodic inspection and test of pressure receptacles*

6.2.2.6.1 *Definition*

For the purposes of this section:

Approval system means a system for competent authority approval of a body performing periodic inspection and test of pressure receptacles (hereinafter referred to as "periodic inspection and test body"), including approval of that body's quality system.

6.2.2.6.2 *General requirements*

Competent authority

6.2.2.6.2.1 The competent authority shall establish an approval system for the purpose of ensuring that the periodic inspection and test of pressure receptacles conform to the requirements of ADR. In instances where the competent authority that approves a body performing periodic inspection and test of a pressure receptacle is not the competent authority of the country approving the manufacture of the pressure receptacle, the marks of the approval country of periodic inspection and test shall be indicated in the pressure receptacle marking (see 6.2.2.7).

The competent authority of the country of approval for the periodic inspection and test shall supply, upon request, evidence demonstrating compliance to this approval system including the records of the periodic inspection and test to its counterpart in a country of use.

The competent authority of the country of approval may terminate the approval certificate referred to in 6.2.2.6.4.1, upon evidence demonstrating non-compliance with the approval system.

6.2.2.6.2.2 The competent authority may delegate its functions in this approval system, in whole or in part.

6.2.2.6.2.3 The competent authority shall ensure that a current list of approved periodic inspection and test bodies and their identity marks is available.

Periodic inspection and test body

6.2.2.6.2.4 The periodic inspection and test body shall be approved by the competent authority and shall:

- (a) Have a staff with an organizational structure, capable, trained, competent, and skilled, to satisfactorily perform its technical functions;
- (b) Have access to suitable and adequate facilities and equipment;
- (c) Operate in an impartial manner and be free from any influence which could prevent it from doing so;
- (d) Ensure commercial confidentiality;
- (e) Maintain clear demarcation between actual periodic inspection and test body functions and unrelated functions;
- (f) Operate a documented quality system accordance with 6.2.2.6.3;
- (g) Apply for approval in accordance with 6.2.2.6.4;
- (h) Ensure that the periodic inspections and tests are performed in accordance with 6.2.2.6.5; and
- (i) Maintain an effective and appropriate report and record system in accordance with 6.2.2.6.6.

6.2.2.6.3 *Quality system and audit of the periodic inspection and test body*

6.2.2.6.3.1 Quality system

The quality system shall contain all the elements, requirements, and provisions adopted by the periodic inspection and test body. It shall be documented in a systematic and orderly manner in the form of written policies, procedures, and instructions.

The quality system shall include:

- (a) A description of the organizational structure and responsibilities;
- (b) The relevant inspection and test, quality control, quality assurance, and process operation instructions that will be used;
- (c) Quality records, such as inspection reports, test data, calibration data and certificates;
- (d) Management reviews to ensure the effective operation of the quality system arising from the audits performed in accordance with 6.2.2.6.3.2;
- (e) A process for control of documents and their revision;
- (f) A means for control of non-conforming pressure receptacles; and
- (g) Training programmes and qualification procedures for relevant personnel.

6.2.2.6.3.2 Audit

The periodic inspection and test body and its quality system shall be audited in order to determine whether it meets the requirements of ADR to the satisfaction of the competent authority.

An audit shall be conducted as part of the initial approval process (see 6.2.2.6.4.3). An audit may be required as part of the process to modify an approval (see 6.2.2.6.4.6).

Periodic audits shall be conducted, to the satisfaction of the competent authority, to ensure that the periodic inspection and test body continues to meet the requirements of ADR.

The periodic inspection and test body shall be notified of the results of any audit. The notification shall contain the conclusions of the audit and any corrective actions required.

6.2.2.6.3.3 Maintenance of the quality system

The periodic inspection and test body shall maintain the quality system as approved in order that it remains adequate and efficient.

The periodic inspection and test body shall notify the competent authority that approved the quality system, of any intended changes, in accordance with the process for modification of an approval in 6.2.2.6.4.6.

6.2.2.6.4 *Approval process for periodic inspection and test bodies*

Initial approval

6.2.2.6.4.1 A body desiring to perform periodic inspection and test of pressure receptacles in accordance with a pressure receptacle standard and ADR shall apply for, obtain, and retain an approval certificate issued by the competent authority.

This written approval shall, on request, be submitted to the competent authority of a country of use.

6.2.2.6.4.2 An application shall be made for each periodic inspection and test body and shall include:

- (a) The name and address of the periodic inspection and test body and, if the application is submitted by an authorised representative, its name and address;
- (b) The address of each facility performing periodic inspection and test;
- (c) The name and title of the person(s) responsible for the quality system;
- (d) The designation of the pressure receptacles, the periodic inspection and test methods, and the relevant pressure receptacle standards met by the quality system;
- (e) Documentation on each facility, the equipment, and the quality system as specified under 6.2.2.6.3.1;
- (f) The qualifications and training records of the periodic inspection and test personnel; and
- (g) Details of any refusal of approval of a similar application by any other competent authority.

6.2.2.6.4.3 The competent authority shall:

- (a) Examine the documentation to verify that the procedures are in accordance with the requirements of the relevant pressure receptacle standards and ADR; and
- (b) Conduct an audit in accordance with 6.2.2.6.3.2 to verify that the inspections and tests are carried out as required by the relevant pressure receptacle standards and ADR, to the satisfaction of the competent authority.

6.2.2.6.4.4 After the audit has been carried out with satisfactory results and all applicable requirements of 6.2.2.6.4 have been satisfied, an approval certificate shall be issued. It shall include the name of the periodic inspection and test body, the registered mark, the address of each facility, and the necessary data for identification of its approved activities (e.g. designation of pressure receptacles, periodic inspection and test method and pressure receptacle standards).

6.2.2.6.4.5 If the periodic inspection and test body is denied approval, the competent authority shall provide written detailed reasons for such denial.

Modifications to periodic inspection and test body approvals

6.2.2.6.4.6 Following approval, the periodic inspection and test body shall notify the issuing competent authority of any modifications to the information submitted under 6.2.2.6.4.2 relating to the initial approval.

The modifications shall be evaluated in order to determine whether the requirements of the relevant pressure receptacle standards and ADR will be satisfied. An audit in accordance with 6.2.2.6.3.2 may be required. The competent authority shall accept or reject these modifications in writing, and an amended approval certificate shall be issued as necessary.

6.2.2.6.4.7 Upon request, the competent authority shall communicate to any other competent authority, information concerning initial approvals, modifications of approvals, and withdrawn approvals.

6.2.2.6.5 *Periodic inspection and test and certification*

The application of the periodic inspection and test marking to a pressure receptacle shall be considered a declaration that the pressure receptacle complies with the applicable pressure receptacle standards and the requirements of ADR. The periodic inspection and test body shall affix the periodic inspection and test marking, including its registered mark, to each approved pressure receptacle (see 6.2.2.7.7).

A record certifying that a pressure receptacle has passed the periodic inspection and test shall be issued by the periodic inspection and test body, before the pressure receptacle is filled.

6.2.2.6.6 *Records*

The periodic inspection and test body shall retain records of pressure receptacle periodic inspection and tests (both passed and failed) including the location of the test facility, for not less than 15 years.

The owner of the pressure receptacle shall retain an identical record until the next periodic inspection and test unless the pressure receptacle is permanently removed from service.

6.2.2.7 *Marking of refillable UN pressure receptacles*

NOTE: Marking requirements for UN metal hydride storage systems are given in 6.2.2.9.

6.2.2.7.1 Refillable UN pressure receptacles shall be marked clearly and legibly with certification, operational and manufacturing marks. These marks shall be permanently affixed (e.g. stamped, engraved, or etched) on the pressure receptacle. The marks shall be on the shoulder, top end or neck of the pressure receptacle or on a permanently affixed component of the pressure receptacle (e.g. welded collar or corrosion resistant plate welded on the outer jacket of a closed cryogenic receptacle). Except for the UN packaging symbol, the minimum size of the marks shall be 5 mm for pressure receptacles with a diameter greater than or

equal to 140 mm and 2.5 mm for pressure receptacles with a diameter less than 140 mm. The minimum size of the UN packaging symbol shall be 10 mm for pressure receptacles with a diameter greater than or equal to 140 mm and 5 mm for pressure receptacles with a diameter less than 140 mm.

6.2.2.7.2 The following certification marks shall be applied:

- (a) The United Nations packaging symbol

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7². This symbol shall not be used for pressure receptacles which only conform to the requirements of 6.2.3 to 6.2.5 (see 6.2.3.9).

- (b) The technical standard (e.g. ISO 9809-1) used for design, manufacture and testing;
- (c) The character(s) identifying the country of approval as indicated by the distinguishing signs for motor vehicles in international traffic³;

NOTE: *The country of approval shall be understood to be the country that approved the body which inspected the individual receptacle at time of manufacture.*

- (d) The identity mark or stamp of the inspection body that is registered with the competent authority of the country authorizing the marking;
- (e) The date of the initial inspection, the year (four digits) followed by the month (two digits) separated by a slash (i.e. "/");

6.2.2.7.3 The following operational marks shall be applied:

- (f) The test pressure in bar, preceded by the letters "PH" and followed by the letters "BAR";
- (g) The mass of the empty pressure receptacle including all permanently attached integral parts (e.g. neck ring, foot ring, etc.) in kilograms, followed by the letters "KG". This mass shall not include the mass of valve, valve cap or valve guard, any coating or porous material for acetylene. The mass shall be expressed to three significant figures rounded up to the last digit. For cylinders of less than 1 kg, the mass shall be expressed to two significant figures rounded up to the last digit. In the case of pressure receptacles for UN No. 1001 acetylene, dissolved and UN No. 3374 acetylene, solvent free, at least one decimal shall be shown after the decimal point and two digits for pressure receptacles of less than 1 kg;
- (h) The minimum guaranteed wall thickness of the pressure receptacle in millimetres followed by the letters "MM". This mark is not required for pressure receptacles with a water capacity less than or equal to 1 litre or for composite cylinders or for closed cryogenic receptacles;
- (i) In the case of pressure receptacles for compressed gases, UN No. 1001 acetylene, dissolved, and UN No. 3374 acetylene, solvent free, the working pressure in bar,

² This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

³ Distinguishing signs for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

preceded by the letters "PW". In the case of closed cryogenic receptacles, the maximum allowable working pressure preceded by the letters "MAWP";

- (j) In the case of pressure receptacles for liquefied gases and refrigerated liquefied gases, the water capacity in litres expressed to three significant figures rounded down to the last digit, followed by the letter "L". If the value of the minimum or nominal water capacity is an integer, the figures after the decimal point may be neglected;
- (k) In the case of pressure receptacles for UN No. 1001 acetylene, dissolved, the total of the mass of the empty receptacle, the fittings and accessories not removed during filling, any coating, the porous material, the solvent and the saturation gas expressed to three significant figures rounded down to the last digit followed by the letters "KG". At least one decimal shall be shown after the decimal point. For pressure receptacles of less than 1 kg, the mass shall be expressed to two significant figures rounded down to the last digit;
- (l) In the case of pressure receptacles for UN No. 3374 acetylene, solvent free, the total of the mass of the empty receptacle, the fittings and accessories not removed during filling, any coating and the porous material expressed to three significant figures rounded down to the last digit followed by the letters "KG". At least one decimal shall be shown after the decimal point. For pressure receptacles of less than 1 kg, the mass shall be expressed to two significant figures rounded down to the last digit;

6.2.2.7.4 The following manufacturing marks shall be applied:

- (m) Identification of the cylinder thread (e.g. 25E). This mark is not required for closed cryogenic receptacles;
- (n) The manufacturer's mark registered by the competent authority. When the country of manufacture is not the same as the country of approval, then the manufacturer's mark shall be preceded by the character(s) identifying the country of manufacture as indicated by the distinguishing signs for motor vehicles in international traffic³. The country mark and the manufacturer's mark shall be separated by a space or slash;
- (o) The serial number assigned by the manufacturer;
- (p) In the case of steel pressure receptacles and composite pressure receptacles with steel liner intended for the carriage of gases with a risk of hydrogen embrittlement, the letter "H" showing compatibility of the steel (see ISO 11114-1:1997).

6.2.2.7.5 The above marks shall be placed in three groups:

- Manufacturing marks shall be the top grouping and shall appear consecutively in the sequence given in 6.2.2.7.4.
- The operational marks in 6.2.2.7.3 shall be the middle grouping and the test pressure (f) shall be immediately preceded by the working pressure (i) when the latter is required.
- Certification marks shall be the bottom grouping and shall appear in the sequence given in 6.2.2.7.2.

³ *Distinguishing signs for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).*

(a)	(b)	(c)	(d)	(e)
u n	ISO 9809-1	F	IB	2000/12

6.2.2.7.7 In addition to the preceding marks, each refillable pressure receptacle that meets the periodic inspection and test requirements of 6.2.2.4 shall be marked indicating:

- The above marks shall appear consecutively in the sequence given.

6.2.2.7.9 For bundles of cylinders, pressure receptacle marking requirements shall only apply to the individual cylinders of a bundle and not to any assembly structure.

6.2.2.8.1 Non-refillable UN pressure receptacles shall be marked clearly and legibly with certification and gas or pressure receptacle specific marks. These marks shall be permanently affixed (e.g. stencilled, stamped, engraved, or etched) on the pressure receptacle. Except when stencilled, the marks shall be on the shoulder, top end or neck of the pressure receptacle or on a permanently affixed component of the pressure receptacle (e.g. welded collar). Except

- 995 -

for the UN packaging symbol and the "DO NOT REFILL" mark, the minimum size of the marks shall be 5 mm for pressure receptacles with a diameter greater than or equal to 140 mm and 2.5 mm for pressure receptacles with a diameter less than 140 mm. The minimum size of the UN packaging symbol shall be 10 mm for pressure receptacles with a diameter greater than or equal to 140 mm and 5 mm for pressure receptacles with a diameter less than 140 mm. The minimum size of the "DO NOT REFILL" mark shall be 5 mm.

6.2.2.8.2 The marks listed in 6.2.2.7.2 to 6.2.2.7.4 shall be applied with the exception of (g), (h) and (m). The serial number (o) may be replaced by the batch number. In addition, the words "DO NOT REFILL" in letters of at least 5 mm in height are required.

6.2.2.8.3 The requirements of 6.2.2.7.5 shall apply.

NOTE: *Non-refillable pressure receptacles may, on account of their size, substitute this marking by a label.*

6.2.2.8.4 Other marks are allowed provided they are made in low stress areas other than the side wall and are not of a size and depth that will create harmful stress concentrations. Such marks shall not conflict with required marks.

6.2.2.9 Marking of UN metal hydride storage systems

6.2.2.9.1 UN metal hydride storage systems shall be marked clearly and legibly with the marks listed below. These marks shall be permanently affixed (e.g. stamped, engraved, or etched) on the metal hydride storage system. The marks shall be on the shoulder, top end or neck of the metal hydride storage system or on a permanently affixed component of the metal hydride storage system. Except for the United Nations packaging symbol, the minimum size of the marks shall be 5 mm for metal hydride storage systems with a smallest overall dimension greater than or equal to 140 mm and 2.5 mm for metal hydride storage systems with a smallest overall dimension less than 140 mm. The minimum size of the United Nations packaging symbol shall be 10 mm for metal hydride storage systems with a smallest overall dimension greater than or equal to 140 mm and 5 mm for metal hydride storage systems with a smallest overall dimension less than 140 mm.

6.2.2.9.2 The following marks shall be applied:

(a) The United Nations packaging symbol

;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7²;

(b) "ISO 16111" (the technical standard used for design, manufacture and testing);

(c) The character(s) identifying the country of approval as indicated by the distinguishing signs of motor vehicles in international traffic³;

NOTE: *The country of approval shall be understood to be the country that approved the body which inspected the individual receptacle at the time of manufacture.*

² This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

³ Distinguishing signs for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

- (d) The identity mark or stamp of the inspection body that is registered with the competent authority of the country authorizing the marking;
- (e) The date of the initial inspection, the year (four digits) followed by the month (two digits) separated by a slash (i.e. "/");
- (f) The test pressure of the receptacle in bar, preceded by the letters "PH" and followed by the letters "BAR";
- (g) The rated charging pressure of the metal hydride storage system in bar, preceded by the letters "RCP" and followed by the letters "BAR";
- (h) The manufacturer's mark registered by the competent authority. When the country of manufacture is not the same as the country of approval, then the manufacturer's mark shall be preceded by the character(s) identifying the country of manufacture as indicated by the distinguishing signs of motor vehicles in international traffic³. The country mark and the manufacturer's mark shall be separated by a space or slash;
- (i) The serial number assigned by the manufacturer;
- (j) In the case of steel receptacles and composite receptacles with steel liner, the letter "H" showing compatibility of the steel (see ISO 11114-1:1997); and,
- (k) In the case of metal hydride storage systems having limited life, the date of expiry, denoted by the letters "FINAL" followed by the year (four digits) followed by the month (two digits) separated by a slash (i.e. "/").

The certification marks specified in (a) to (e) above shall appear consecutively in the sequence given. The test pressure (f) shall be immediately preceded by the rated charging pressure (g). The manufacturing marks specified in (h) to (k) above shall appear consecutively in the sequence given.

6.2.2.9.3 Other marks are allowed in areas other than the side wall, provided they are made in low stress areas and are not of a size and depth that will create harmful stress concentrations. Such marks shall not conflict with required marks.

6.2.2.9.4 In addition to the preceding marks, each metal hydride storage system that meets the periodic inspection and test requirements of 6.2.2.4 shall be marked indicating:

- (a) The character(s) identifying the country authorizing the body performing the periodic inspection and test, as indicated by the distinguishing sign of motor vehicles in international traffic³. This marking is not required if this body is approved by the competent authority of the country approving manufacture;
- (b) The registered mark of the body authorised by the competent authority for performing periodic inspection and test;
- (c) The date of the periodic inspection and test, the year (two digits) followed by the month (two digits) separated by a slash (i.e. "/"). Four digits may be used to indicate the year.

The above marks shall appear consecutively in the sequence given.

³ *Distinguishing signs for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).*

6.2.2.10 *Equivalent procedures for conformity assessment and periodic inspection and test*

For UN pressure receptacles the requirements of 6.2.2.5 and 6.2.2.6 are considered to have been complied with when the following procedures are applied:

Procedure	Relevant body
Type approval (1.8.7.2)	Xa
Supervision of manufacture (1.8.7.3)	Xa or IS
Initial inspection and tests (1.8.7.4)	Xa or IS
Periodic inspection (1.8.7.5)	Xa or Xb or IS

Xa means the competent authority, its delegate or inspection body conforming to 1.8.6.2, 1.8.6.4, 1.8.6.5 and 1.8.6.8 and accredited according to EN ISO/IEC 17020:2004 type A.

Xb means inspection body conforming to 1.8.6.2, 1.8.6.4, 1.8.6.5 and 1.8.6.8 and accredited according to EN ISO/IEC 17020:2004 type B.

IS means an in-house inspection service of the applicant under the surveillance of an inspection body conforming to 1.8.6.2, 1.8.6.4, 1.8.6.5 and 1.8.6.8 and accredited according to EN ISO/IEC 17020:2004 type A. The in-house inspection service shall be independent from design process, manufacturing operations, repair and maintenance.

6.2.3 **General requirements for non-UN pressure receptacles**

6.2.3.1 *Design and construction*

6.2.3.1.1 Pressure receptacles and their closures not designed, constructed, inspected, tested and approved according to the requirements of 6.2.2 shall be designed, constructed, inspected, tested and approved in accordance with the general requirements of 6.2.1 as supplemented or modified by the requirements of this section and those of 6.2.4 or 6.2.5.

6.2.3.1.2 Whenever possible the wall thickness shall be determined by calculation, accompanied, if needed, by experimental stress analysis. Otherwise the wall thickness may be determined by experimental means.

Appropriate design calculations for the pressure envelope and supporting components shall be used to ensure the safety of the pressure receptacles concerned.

The minimum wall thickness to withstand pressure shall be calculated in particular with regard to:

- The calculation pressures, which shall not be less than the test pressure;
- The calculation temperatures allowing for appropriate safety margins;
- The maximum stresses and peak stress concentrations where necessary;
- Factors inherent to the properties of the material.

6.2.3.1.3 For welded pressure receptacles, only metals of weldable quality whose adequate impact strength at an ambient temperature of –20 °C can be guaranteed shall be used.

6.2.3.1.4 For closed cryogenic receptacles, the impact strength to be established as required by 6.2.1.1.8.1 shall be tested as laid down in 6.8.5.3.

6.2.3.2 *(Reserved)*

6.2.3.3 ***Service equipment***

6.2.3.3.1 Service equipment shall comply with 6.2.1.3.

6.2.3.3.2 *Openings*

Pressure drums may be provided with openings for filling and discharge and with other openings intended for level gauges, pressure gauges or relief devices. The number of openings shall be kept to a minimum consistent with safe operations. Pressure drums may also be provided with an inspection opening, which shall be closed by an effective closure.

6.2.3.3.3 *Fittings*

- (a) If cylinders are fitted with a device to prevent rolling, this device shall not be integral with the valve cap;
- (b) Pressure drums which are capable of being rolled shall be equipped with rolling hoops or be otherwise protected against damage due to rolling (e.g. by corrosion resistant metal sprayed on to the pressure receptacle surface);
- (c) Bundles of cylinders shall be fitted with appropriate devices ensuring that they can be handled and carried safely;
- (d) If level gauges, pressure gauges or relief devices are installed, they shall be protected in the same way as is required for valves in 4.1.6.8.

6.2.3.4 ***Initial inspection and test***

6.2.3.4.1 New pressure receptacles shall be subjected to testing and inspection during and after manufacture in accordance with the requirements of 6.2.1.5.

6.2.3.4.2 *Specific provisions applying to aluminium alloy pressure receptacles*

- (a) In addition to the initial inspection required by 6.2.1.5.1, it is necessary to test for possible intercrystalline corrosion of the inside wall of the pressure receptacles where use is made of an aluminium alloy containing copper, or where use is made of an aluminium alloy containing magnesium and manganese and the magnesium content is greater than 3.5% or the manganese content lower than 0.5%;
- (b) In the case of an aluminium/copper alloy the test shall be carried out by the manufacturer at the time of approval of a new alloy by the competent authority; it shall thereafter be repeated in the course of production, for each pour of the alloy;
- (c) In the case of an aluminium/magnesium alloy the test shall be carried out by the manufacturer at the time of approval of a new alloy and of the manufacturing process by the competent authority. The test shall be repeated whenever a change is made in the composition of the alloy or in the manufacturing process.

6.2.3.5 *Periodic inspection and test*

6.2.3.5.1 Periodic inspection and test shall be in accordance with 6.2.1.6.1.

NOTE: *With the agreement of the competent authority of the country that issued the type approval, the hydraulic pressure test of each welded steel cylinder intended for the carriage of gases of UN No. 1965, hydrocarbon gas mixture liquefied, n.o.s., with a capacity below 6.5 l may be replaced by another test ensuring an equivalent level of safety.*

6.2.3.5.2 *(Deleted)*

6.2.3.6 *Approval of pressure receptacles*

6.2.3.6.1 The procedures for conformity assessment and periodic inspection of section 1.8.7 shall be performed by the relevant body according to the following table.

Procedure	Relevant body
Type approval (1.8.7.2)	Xa
Supervision of manufacture (1.8.7.3)	Xa or IS
Initial inspection and tests (1.8.7.4)	Xa or IS
Periodic inspection (1.8.7.5)	Xa or Xb or IS

For refillable pressure receptacles, the conformity assessment of valves and other demountable accessories having a direct safety function may be carried out separately from the receptacles and the conformity assessment procedure shall be at least as stringent as that undergone by the pressure receptacle to which they are fitted.

Xa means the competent authority, its delegate or inspection body conforming to 1.8.6.2, 1.8.6.4, 1.8.6.5 and 1.8.6.8 and accredited according to EN ISO/IEC 17020:2004 type A.

Xb means inspection body conforming to 1.8.6.2, 1.8.6.4, 1.8.6.5 and 1.8.6.8 and accredited according to EN ISO/IEC 17020:2004 type B.

IS means an in-house inspection service of the applicant under the surveillance of an inspection body conforming to 1.8.6.2, 1.8.6.4, 1.8.6.5 and 1.8.6.8 and accredited according to EN ISO/IEC 17020:2004 type A. The in-house inspection service shall be independent from design process, manufacturing operations, repair and maintenance.

6.2.3.6.2 If the country of approval is not a Contracting Party to ADR, the competent authority mentioned in 6.2.1.7.2 shall be the competent authority of a Contracting Party to ADR.

6.2.3.7 *Requirements for manufacturers*

6.2.3.7.1 The relevant requirements of 1.8.7 shall be met.

6.2.3.8 *Requirements for inspection bodies*

The requirements of 1.8.6 shall be met.

6.2.3.9 *Marking of refillable pressure receptacles*

6.2.3.9.1 Markings shall be in accordance with sub-section 6.2.2.7 with the following variations.

6.2.3.9.2 The United Nations packaging symbol specified in 6.2.2.7.2 (a) shall not be applied.

- 6.2.3.9.3 The requirements of 6.2.2.7.3 (j) shall be replaced by the following:
- (j) The water capacity of the pressure receptacle in litres followed by the letter "L". In the case of pressure receptacles for liquefied gases the water capacity in litres shall be expressed to three significant figures rounded down to the last digit. If the value of the minimum or nominal water capacity is an integer, the figures after the decimal point may be neglected.
- 6.2.3.9.4 The marks specified in 6.2.2.7.3 (g) and (h) and 6.2.2.7.4 (m) are not required for pressure receptacles for UN No. 1965 hydrocarbon gas mixture, liquefied, n.o.s.
- 6.2.3.9.5 When marking the date required by 6.2.2.7.7 (c), the month need not be indicated for gases for which the interval between periodic inspections is 10 years or more (see packing instructions P200 and P203 of 4.1.4.1).
- 6.2.3.9.6 The marks in accordance with 6.2.2.7.7 may be engraved on a ring of an appropriate material affixed to the cylinder when the valve is installed and which is removable only by disconnecting the valve from the cylinder.
- 6.2.3.9.7 *Marking of bundles of cylinders*
- 6.2.3.9.7.1 Individual cylinders in a bundle of cylinders shall be marked in accordance with 6.2.3.9.
- 6.2.3.9.7.2 A plate permanently attached to the frame of the bundle shall bear the following markings:
- (a) The certification marks specified in 6.2.2.7.2 (b), (c), (d) and (e);
 - (b) The operational marks specified in 6.2.2.7.3 (f), (i), (j) and the gross mass which shall include the mass of the frame of the bundle and all permanently attached parts (cylinders, manifold, fittings and valves). Bundles intended for the carriage of UN No. 1001 acetylene, dissolved and UN No. 3374 acetylene, solvent free shall bear the tare mass as specified in paragraph (a) (6) of clause 5.4 of EN 12755:2000; and
 - (c) The manufacturing marks specified in 6.2.2.7.4 (n), (o) and, where applicable, (p).
- 6.2.3.9.7.3 The marks shall be placed in three groups:
- (a) The manufacturing marks shall be the top grouping and shall appear consecutively in the sequence given in 6.2.3.9.7.2 (c);
 - (b) The operational marks in 6.2.3.9.7.2 (b) shall be the middle grouping and the operational mark specified in 6.2.2.7.3 (f) shall be immediately preceded by the operational mark specified in 6.2.2.7.3 (i) when the latter is required;
 - (c) Certification marks shall be the bottom grouping and shall appear in the sequence given in 6.2.3.9.7.2 (a).
- 6.2.3.10 *Marking of non-refillable pressure receptacles***
- 6.2.3.10.1 Markings shall be in accordance with 6.2.2.8, except that the United Nations packaging symbol specified in 6.2.2.7.2 (a) shall not be applied.

6.2.3.11 *Salvage pressure receptacles*

- 6.2.3.11.1 To permit the safe handling and disposal of the pressure receptacles carried within the salvage pressure receptacle, the design may include equipment not otherwise used for cylinders or pressure drums such as flat heads, quick opening devices and openings in the cylindrical part.
- 6.2.3.11.2 Instructions on the safe handling and use of the salvage pressure receptacle shall be clearly shown in the documentation for the application to the competent authority of the country of approval and shall form part of the approval certificate. In the approval certificate, the pressure receptacles authorized to be carried in a salvage pressure receptacle shall be indicated. A list of the materials of construction of all parts likely to be in contact with the dangerous goods shall also be included.
- 6.2.3.11.3 A copy of the approval certificate shall be delivered by the manufacturer to the owner of a salvage pressure receptacle.
- 6.2.3.11.4 The marking of salvage pressure receptacles according to 6.2.3 shall be determined by the competent authority of the country of approval taking into account suitable marking provisions of 6.2.3.9 as appropriate. The marking shall include the water capacity and test pressure of the salvage pressure receptacle.

6.2.4 **Requirements for non-UN pressure receptacles designed, constructed and tested according to referenced standards**

NOTE: Persons or bodies identified in standards as having responsibilities in accordance with ADR shall meet the requirements of ADR.

6.2.4.1 *Design, construction and initial inspection and test*

The standards referenced in the table below shall be applied for the issue of type approvals as indicated in column (4) to meet the requirements of Chapter 6.2 referred to in column (3). The requirements of Chapter 6.2 referred to in column (3) shall prevail in all cases. Column (5) gives the latest date when existing type approvals shall be withdrawn according to 1.8.7.2.4; if no date is shown the type approval remains valid until it expires.

Since 1 January 2009 the use of the referenced standards has been mandatory. Exceptions are dealt with in 6.2.5.

If more than one standard is referenced for the application of the same requirements, only one of them shall be applied, but in full unless otherwise specified in the table below.

EN ISO 15995:2010	Gas cylinders – Specifications and testing of LPG cylinder valves – Manually operated (ISO 15995:2006)	6.2.3.1 and 6.2.3.3	Until further notice	
EN 13153:2001	Specifications and testing of LPG – Cylinder valves – Manually operated	6.2.3.1 and 6.2.3.3	Between 1 January 2005 and 31 December 2010	
EN 13153:2001 + A1:2003	Specifications and testing of LPG – Cylinder valves – Manually operated	6.2.3.1 and 6.2.3.3	Between 1 January 2009 and 31 December 2014	
EN ISO 13340:2001	Transportable gas cylinders – Cylinder valves for non-refillable cylinders – Specification and prototype testing	6.2.3.1 and 6.2.3.3	Until further notice	

6.2.4.2 *Periodic inspection and test*

The standards referenced in the table below shall be applied for the periodic inspection and test of pressure receptacles as indicated in column (3) to meet the requirements of 6.2.3.5 which shall prevail in all cases.

The use of a referenced standard is mandatory.

When a pressure receptacle is constructed in accordance with the provisions of 6.2.5 the procedure for periodic inspection if specified in the type approval shall be followed.

If more than one standard is referenced for the application of the same requirements, only one of them shall be applied, but in full unless otherwise specified in the table below.

Reference	Title of document	Applicable
(1)	(2)	(3)
<i>for periodic inspection and test</i>		
EN 1251-3:2000	Cryogenic vessels – Transportable, vacuum insulated, of not more than 1 000 litres volume – Part 3: Operational requirements	Until further notice
EN 1968:2002 + A1:2005 (except Annex B)	Transportable gas cylinders – Periodic inspection and testing of seamless steel gas cylinders	Until further notice
EN 1802:2002 (except Annex B)	Transportable gas cylinders – Periodic inspection and testing of seamless aluminium alloy gas cylinders	Until further notice
EN 12863:2002 + A1:2005	Transportable gas cylinders – Periodic inspection and maintenance of dissolved acetylene cylinders NOTE: <i>In this standard "initial inspection" is to be understood as the "first periodic inspection" after final approval of a new acetylene cylinder.</i>	Until further notice
EN 1803:2002 (except Annex B)	Transportable gas cylinders – Periodic inspection and testing of welded steel gas cylinders	Until further notice
EN ISO 11623:2002 (except clause 4)	Transportable gas cylinders – Periodic inspection and testing of composite gas cylinders	Until further notice
EN 14189:2003	Transportable gas cylinders – Inspection and maintenance of cylinder valves at time of periodic inspection of gas cylinders	Until 31 December 2014
EN ISO 22434:2012	Transportable gas cylinders – Inspection and maintenance of cylinder valves (ISO 22434:2006)	Mandatorily from 1 January 2015
EN 14876:2007	Transportable gas cylinders – Periodic inspection and testing of welded steel pressure drums	Until further notice
EN 14912:2005	LPG equipment and accessories – Inspection and maintenance of LPG cylinder valves at time of periodic inspection of cylinders	Until further notice
EN 1440:2008 + A1:2012 (except Annexes G and H)	LPG equipment and accessories – Periodic inspection of transportable refillable LPG cylinders	Mandatorily from 1 January 2015

6.2.5 **Requirements for non-UN pressure receptacles not designed, constructed and tested according to referenced standards**

To reflect scientific and technical progress or where no standard is referenced in 6.2.2 or 6.2.4, or to deal with specific aspects not addressed in a standard referenced in 6.2.2 or 6.2.4, the competent authority may recognize the use of a technical code providing the same level of safety.

In the type approval the issuing body shall specify the procedure for periodic inspections if the standards referenced in 6.2.2 or 6.2.4 are not applicable or shall not be applied.

The competent authority shall transmit to the secretariat of UNECE a list of the technical codes that it recognises. The list should include the following details: name and date of the code, purpose of the code and details of where it may be obtained. The secretariat shall make this information publicly available on its website.

A standard which has been adopted for reference in a future edition of the ADR may be approved by the competent authority for use without notifying the secretariat of UNECE.

The requirements of 6.2.1, 6.2.3 and the following requirements however shall be met.

NOTE: For this section, the references to technical standards in 6.2.1 shall be considered as references to technical codes.

6.2.5.1 Materials

The following provisions contain examples of materials that may be used to comply with the requirements for materials in 6.2.1.2:

- (a) Carbon steel for compressed, liquefied, refrigerated liquefied gases and dissolved gases as well as for substances not in Class 2 listed in Table 3 of packing instruction P200 of 4.1.4.1;
- (b) Alloy steel (special steels), nickel, nickel alloy (such as monel) for compressed, liquefied, refrigerated liquefied gases and dissolved gases as well as for substances not in Class 2 listed in Table 3 of packing instruction P200 of 4.1.4.1;
- (c) Copper for:
 - (i) gases of classification codes 1A, 1O, 1F and 1TF, whose filling pressure referred to a temperature of 15 °C does not exceed 2 MPa (20 bar);
 - (ii) gases of classification code 2A and also UN No. 1033 dimethyl ether; UN No. 1037 ethyl chloride; UN No. 1063 methyl chloride; UN No. 1079 sulphur dioxide; UN No. 1085 vinyl bromide; UN No. 1086 vinyl chloride; and UN No. 3300 ethylene oxide and carbon dioxide mixture with more than 87% ethylene oxide;
 - (iii) gases of classification codes 3A, 3O and 3F;
- (d) Aluminium alloy: see special requirement "a" of packing instruction P200 (10) of 4.1.4.1;
- (e) Composite material for compressed, liquefied, refrigerated liquefied gases and dissolved gases;
- (f) Synthetic materials for refrigerated liquefied gases; and
- (g) Glass for the refrigerated liquefied gases of classification code 3A other than UN No. 2187 carbon dioxide, refrigerated, liquid or mixtures thereof, and gases of classification code 3O.

6.2.5.2 Service equipment

(Reserved)

6.2.5.3 *Metal cylinders, tubes, pressure drums and bundles of cylinders*

At the test pressure, the stress in the metal at the most severely stressed point of the pressure receptacle shall not exceed 77% of the guaranteed minimum yield stress (Re).

"Yield stress" means the stress at which a permanent elongation of 2 per thousand (i.e. 0.2%) or, for austenitic steels, 1% of the gauge length on the test-piece, has been produced.

NOTE: In the case of sheet-metal the axis of the tensile test-piece shall be at right angles to the direction of rolling. The permanent elongation at fracture, shall be measured on a test-piece of circular cross-section in which the gauge length "l" is equal to five times the diameter "d" ($l = 5d$); if test pieces of rectangular cross-section are used, the gauge length "l" shall be calculated by the formula:

$$l = 5.65 \sqrt{F_0}$$

where F_0 indicates the initial cross-sectional area of the test-piece.

Pressure receptacles and their closures shall be made of suitable materials which shall be resistant to brittle fracture and to stress corrosion cracking between $-20\text{ }^{\circ}\text{C}$ and $+50\text{ }^{\circ}\text{C}$.

Welds shall be skilfully made and shall afford the fullest safety.

6.2.5.4 *Additional provisions relating to aluminium-alloy pressure receptacles for compressed gases, liquefied gases, dissolved gases and non pressurized gases subject to special requirements (gas samples) as well as articles containing gas under pressure other than aerosol dispensers and small receptacles containing gas (gas cartridges)*

6.2.5.4.1 The materials of aluminium-alloy pressure receptacles which are to be accepted shall satisfy the following requirements:

	A	B	C	D
Tensile strength, Rm, in MPa (= N/mm ²)	49 to 186	196 to 372	196 to 372	343 to 490
Yield stress, Re, in MPa (= N/mm ²) (permanent set $\lambda = 0.2\%$)	10 to 167	59 to 314	137 to 334	206 to 412
Permanent elongation at fracture ($l = 5d$) in per cent	12 to 40	12 to 30	12 to 30	11 to 16
Bend test (diameter of former $d = n \times e$, where e is the thickness of the test piece)	n=5(Rm \leq 98) n=6(Rm $>$ 98)	n=6(Rm \leq 325) n=7(Rm $>$ 325)	n=6(Rm \leq 325) n=7(Rm $>$ 325)	n=7(Rm \leq 392) n=8(Rm $>$ 392)
Aluminium Association Series Number ^a	1 000	5 000	6 000	2 000

^a See "Aluminium Standards and Data", Fifth edition, January 1976, published by the Aluminium Association, 750 Third Avenue, New York.

The actual properties will depend on the composition of the alloy concerned and on the final treatment of the pressure receptacle, but whatever alloy is used the thickness of the pressure receptacle shall be calculated by one of the following formulae:

$$e = \frac{P_{\text{MPa}} D}{\frac{2Re}{1.3} + P_{\text{MPa}}} \quad \text{or} \quad e = \frac{P_{\text{bar}} D}{\frac{20Re}{1.3} + P_{\text{bar}}}$$

where

e	=	minimum thickness of pressure receptacle wall, in mm
P_{MPa}	=	test pressure, in MPa
P_{bar}	=	test pressure, in bar
D	=	nominal external diameter of the pressure receptacle, in mm and
Re	=	guaranteed minimum proof stress with 0.2% proof stress, in MPa (= N/mm ²)

In addition, the value of the minimum guaranteed proof stress (Re) introduced into the formula is in no case to be greater than 0.85 times the guaranteed minimum tensile strength (R_m), whatever the type of alloy used.

NOTE 1: *The above characteristics are based on previous experience with the following materials used for pressure receptacles:*

Column A: Aluminium, unalloyed, 99.5% pure;

Column B: Alloys of aluminium and magnesium;

Column C: Alloys of aluminium, silicon and magnesium, such as ISO/R209-Al-Si-Mg (Aluminium Association 6351);

Column D: Alloys of aluminium, copper and magnesium.

NOTE 2: *The permanent elongation at fracture is measured by means of test-pieces of circular cross-section in which the gauge length "l" is equal to five times the diameter "d" ($l = 5d$); if test-pieces of rectangular section are used the gauge length shall be calculated by the formula:*

$$l = 5.65 \sqrt{F_o}$$

where F_o is the initial cross-section area of the test-piece.

NOTE 3: (a) *The bend test (see diagram) shall be carried out on specimens obtained by cutting into two equal parts of width $3e$, but in no case less than 25 mm, an annular section of a cylinder. The specimens shall not be machined elsewhere than on the edges;*

(b) *The bend test shall be carried out between a mandrel of diameter (d) and two circular supports separated by a distance of $(d + 3e)$. During the test the inner faces shall be separated by a distance not greater than the diameter of the mandrel;*

(c) *The specimen shall not exhibit cracks when it has been bent inwards around the mandrel until the inner faces are separated by a distance not greater than the diameter of the mandrel;*

(d) *The ratio (n) between the diameter of the mandrel and the thickness of the specimen shall conform to the values given in the table.*

Diagram of bend test

6.2.5.4.2 A lower minimum elongation value is acceptable on condition that an additional test approved by the competent authority of the country in which the pressure receptacles are made proves that safety of carriage is ensured to the same extent as in the case of pressure receptacles constructed to comply with the characteristics given in the table in 6.2.5.4.1 (see also EN 1975:1999 + A1:2003).

6.2.5.4.3 The wall thickness of the pressure receptacles at the thinnest point shall be the following:

- where the diameter of the pressure receptacle is less than 50 mm: not less than 1.5 mm;
- where the diameter of the pressure receptacle is from 50 to 150 mm: not less than 2 mm; and
- where the diameter of the pressure receptacle is more than 150 mm: not less than 3 mm.

6.2.5.4.4 The ends of the pressure receptacles shall have a semicircular, elliptical or "basket-handle" section; they shall afford the same degree of safety as the body of the pressure receptacle.

6.2.5.5 *Pressure receptacles in composite materials*

For composite cylinders, tubes, pressure drums and bundles of cylinders which make use of composite materials, the construction shall be such that a minimum burst ratio (burst pressure divided by test pressure) is:

- 1.67 for hoop wrapped pressure receptacles;
- 2.00 for fully wrapped pressure receptacles.

6.2.5.6 *Closed cryogenic receptacles*

The following requirements apply to the construction of closed cryogenic receptacles for refrigerated liquefied gases:

6.2.5.6.1 If non-metallic materials are used, they shall resist brittle fracture at the lowest working temperature of the pressure receptacle and its fittings.

6.2.5.6.2 The pressure relief devices shall be so constructed as to work perfectly even at their lowest working temperature. Their reliability of functioning at that temperature shall be established and checked by testing each device or a sample of devices of the same type of construction.

- 6.2.5.6.3 The vents and pressure relief devices of pressure receptacles shall be so designed as to prevent the liquid from splashing out.
- 6.2.6 General requirements for aerosol dispensers, small receptacles containing gas (gas cartridges) and fuel cell cartridges containing liquefied flammable gas**
- 6.2.6.1 *Design and construction***
- 6.2.6.1.1 Aerosol dispensers (UN No.1950 aerosols) containing only a gas or a mixture of gases, and small receptacles containing gas (gas cartridges) (UN No. 2037), shall be made of metal. This requirement shall not apply to aerosols and small receptacles containing gas (gas cartridges) with a maximum capacity of 100 ml for UN No. 1011 butane. Other aerosol dispensers (UN No.1950 aerosols) shall be made of metal, synthetic material or glass. Receptacles made of metal and having an outside diameter of not less than 40 mm shall have a concave bottom.
- 6.2.6.1.2 The capacity of receptacles made of metal shall not exceed 1 000 ml; that of receptacles made of synthetic material or of glass shall not exceed 500 ml.
- 6.2.6.1.3 Each model of receptacles (aerosol dispensers or cartridges) shall, before being put into service, satisfy a hydraulic pressure test carried out in conformity with 6.2.6.2.
- 6.2.6.1.4 The release valves and dispersal devices of aerosol dispensers (UN No.1950 aerosols) and the valves of UN No. 2037 small receptacles containing gas (gas cartridges) shall ensure that the receptacles are so closed as to be leakproof and shall be protected against accidental opening. Valves and dispersal devices which close only by the action of the internal pressure are not to be accepted.
- 6.2.6.1.5 The internal pressure at 50 °C shall exceed neither two-thirds of the test pressure nor 1.32 MPa (13.2 bar). Aerosol dispensers and small receptacles containing gas (gas cartridges) shall be so filled that at 50°C the liquid phase does not exceed 95% of their capacity.
- 6.2.6.2 *Hydraulic pressure test***
- 6.2.6.2.1 The internal pressure to be applied (test pressure) shall be 1.5 times the internal pressure at 50 °C, with a minimum pressure of 1 MPa (10 bar).
- 6.2.6.2.2 The hydraulic pressure tests shall be carried out on at least five empty receptacles of each model:
- (a) until the prescribed test pressure is reached, by which time no leakage or visible permanent deformation shall have occurred; and
 - (b) until leakage or bursting occurs; the dished end, if any, shall yield first and the receptacle shall not leak or burst until a pressure 1.2 times the test pressure has been reached or passed.
- 6.2.6.3 *Tightness (leakproofness) test***
- 6.2.6.3.1 *Small receptacles containing gas (gas cartridges) and fuel cell cartridges containing liquefied flammable gas*
- 6.2.6.3.1.1 Each receptacle or fuel cell cartridge shall satisfy a tightness (leakproofness) test in a hot-water bath.

- 6.2.6.3.1.2 The temperature of the bath and the duration of the test shall be such that the internal pressure of each receptacle or fuel cell cartridge reaches at least 90% of the internal pressure that would be reached at 55 °C. However, if the contents are sensitive to heat or if the receptacles or fuel cell cartridges are made of a plastics material which softens at this temperature, the temperature of the bath shall be from 20 °C to 30 °C. In addition, one receptacle or fuel cell cartridge out of every 2000 shall be tested at 55 °C.
- 6.2.6.3.1.3 No leakage or permanent deformation of a receptacle or fuel cell cartridge shall occur, except that a plastics receptacle or fuel cell cartridge may be deformed through softening provided that it does not leak.
- 6.2.6.3.2 *Aerosol dispensers*
- Each filled aerosol dispenser shall be subjected to a test performed in a hot water bath or an approved water bath alternative.
- 6.2.6.3.2.1 Hot water bath test
- 6.2.6.3.2.1.1 The temperature of the water bath and the duration of the test shall be such that the internal pressure reaches that which would be reached at 55 °C (50 °C if the liquid phase does not exceed 95% of the capacity of the aerosol dispenser at 50 °C). If the contents are sensitive to heat or if the aerosol dispensers are made of plastics material which softens at this test temperature, the temperature of the bath shall be set at between 20 °C and 30 °C but, in addition, one aerosol dispenser in 2 000 shall be tested at the higher temperature.
- 6.2.6.3.2.1.2 No leakage or permanent deformation of an aerosol dispenser may occur, except that a plastics aerosol dispenser may be deformed through softening provided that it does not leak.
- 6.2.6.3.2.2 Alternative methods
- With the approval of the competent authority alternative methods which provide an equivalent level of safety may be used provided that the requirements of 6.2.6.3.2.2.1, 6.2.6.3.2.2.2 and 6.2.6.3.2.2.3 are met.
- 6.2.6.3.2.2.1 Quality system
- Aerosol dispenser fillers and component manufacturers shall have a quality system. The quality system shall implement procedures to ensure that all aerosol dispensers that leak or that are deformed are rejected and not offered for carriage.
- The quality system shall include:
- (a) A description of the organizational structure and responsibilities;
 - (b) The relevant inspection and test, quality control, quality assurance, and process operation instructions that will be used;
 - (c) Quality records, such as inspection reports, test data, calibration data and certificates;
 - (d) Management reviews to ensure the effective operation of the quality system;
 - (e) A process for control of documents and their revision;
 - (f) A means for control of non-conforming aerosol dispensers;
 - (g) Training programmes and qualification procedures for relevant personnel; and

- (h) Procedures to ensure that there is no damage to the final product.

An initial audit and periodic audits shall be conducted to the satisfaction of the competent authority. These audits shall ensure the approved system is and remains adequate and efficient. Any proposed changes to the approved system shall be notified to the competent authority in advance.

6.2.6.3.2.2.2 Pressure and leak testing of aerosol dispensers before filling

Every empty aerosol dispenser shall be subjected to a pressure equal to or in excess of the maximum expected in the filled aerosol dispensers at 55 °C (50 °C if the liquid phase does not exceed 95% of the capacity of the receptacle at 50 °C). This shall be at least two-thirds of the design pressure of the aerosol dispenser. If any aerosol dispenser shows evidence of leakage at a rate equal to or greater than 3.3×10^{-2} mbar.l.s⁻¹ at the test pressure, distortion or other defect, it shall be rejected.

6.2.6.3.2.2.3 Testing of the aerosol dispensers after filling

Prior to filling the filler shall ensure that the crimping equipment is set appropriately and the specified propellant is used.

Each filled aerosol dispenser shall be weighed and leak tested. The leak detection equipment shall be sufficiently sensitive to detect at least a leak rate of 2.0×10^{-3} mbar.l.s⁻¹ at 20 °C.

Any filled aerosol dispenser which shows evidence of leakage, deformation or excessive weight shall be rejected.

6.2.6.3.3 With the approval of the competent authority, aerosols and receptacles, small, are not subject to 6.2.6.3.1 and 6.2.6.3.2, if they are required to be sterile but may be adversely affected by water bath testing, provided:

- (a) They contain a non-flammable gas and either
 - (i) contain other substances that are constituent parts of pharmaceutical products for medical, veterinary or similar purposes;
 - (ii) contain other substances used in the production process for pharmaceutical products; or
 - (iii) are used in medical, veterinary or similar applications;
- (b) An equivalent level of safety is achieved by the manufacturer's use of alternative methods for leak detection and pressure resistance, such as helium detection and water bathing a statistical sample of at least 1 in 2000 from each production batch; and
- (c) For pharmaceutical products according to (a) (i) and (iii) above, they are manufactured under the authority of a national health administration. If required by the competent authority, the principles of Good Manufacturing Practice (GMP) established by the World Health Organization (WHO)⁴ shall be followed.

⁴ WHO Publication: "Quality assurance of pharmaceuticals. A compendium of guidelines and related materials. Volume 2: Good manufacturing practices and inspection".

6.2.6.4 *Reference to standards*

The requirements of this section are deemed to be met if the following standards are complied with:

- for aerosol dispensers (UN No. 1950 aerosols): Annex to Council Directive 75/324/EEC⁵ as amended and applicable at the date of manufacture;
- for UN No. 2037, small receptacles containing gas (gas cartridges) containing UN No. 1965, hydrocarbon gas mixture n.o.s, liquefied: EN 417:2012 Non-refillable metallic gas cartridges for liquefied petroleum gases, with or without a valve, for use with portable appliances - Construction, inspection, testing and marking.

⁵ Council Directive 75/324/EEC of 20 May 1975 on the approximation of the laws of the Member States relating to aerosol dispensers, published in the Official Journal of the European Communities No. L 147 of 9.06.1975.

CHAPTER 6.3

REQUIREMENTS FOR THE CONSTRUCTION AND TESTING OF PACKAGINGS FOR CLASS 6.2 INFECTIOUS SUBSTANCES OF CATEGORY A

NOTE: *The requirements of this Chapter don't apply to packagings used for the carriage of Class 6.2 substances according to packing instruction P621 of 4.1.4.1.*

6.3.1 General

6.3.1.1 The requirements of this Chapter apply to packagings intended for the carriage of infectious substances of Category A.

6.3.2 Requirements for packagings

6.3.2.1 The requirements for packagings in this section are based on packagings, as specified in 6.1.4, currently used. In order to take into account progress in science and technology, there is no objection to the use of packagings having specifications different from those in this Chapter provided that they are equally effective, acceptable to the competent authority and able successfully to withstand the tests described in 6.3.5. Methods of testing other than those described in ADR are acceptable provided they are equivalent, and are recognized by the competent authority.

6.3.2.2 Packagings shall be manufactured and tested under a quality assurance programme which satisfies the competent authority in order to ensure that each packaging meets the requirements of this Chapter.

NOTE: *ISO 16106:2006 "Packaging – Transport packages for dangerous goods – Dangerous goods packagings, intermediate bulk containers (IBCs) and large packagings – Guidelines for the application of ISO 9001" provides acceptable guidance on procedures which may be followed.*

6.3.2.3 Manufacturers and subsequent distributors of packagings shall provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that packages as presented for carriage are capable of passing the applicable performance tests of this Chapter.

6.3.3 Code for designating types of packagings

6.3.3.1 The codes for designating types of packagings are set out in 6.1.2.7.

6.3.3.2 The letters "U" or "W" may follow the packaging code. The letter "U" signifies a special packaging conforming to the requirements of 6.3.5.1.6. The letter "W" signifies that the packaging, although, of the same type indicated by the code is manufactured to a specification different from that in 6.1.4 and is considered equivalent under the requirements of 6.3.2.1.

6.3.4 Marking

NOTE 1: *The marking indicates that the packaging which bears it corresponds to a successfully tested design type and that it complies with the requirements of this Chapter which are related to the manufacture, but not to the use, of the packaging.*

NOTE 2: *The marking is intended to be of assistance to packaging manufacturers, reconditioners, packaging users, carriers and regulatory authorities.*

NOTE 3: *The marking does not always provide full details of the test levels, etc., and these may need to be taken further into account, e.g. by reference to a test certificate, to test reports or to a register of successfully tested packagings.*

6.3.4.1 Each packaging intended for use according to ADR shall bear markings which are durable, legible and placed in a location and of such a size relative to the packaging as to be readily visible. For packages with a gross mass of more than 30 kg, the markings or a duplicate thereof shall appear on the top or on a side of the packaging. Letters, numerals and symbols shall be at least 12 mm high, except for packagings of 30 litres or 30 kg capacity or less, when they shall be at least 6 mm in height and for packagings of 5 litres or 5 kg or less when they shall be of an appropriate size.

6.3.4.2 A packaging that meets the requirements of this section and of 6.3.5 shall be marked with:

(a) The United Nations packaging symbol

;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7¹;

- (b) The code designating the type of packaging according to the requirements of 6.1.2;
- (c) The text "CLASS 6.2";
- (d) The last two digits of the year of manufacture of the packaging;
- (e) The state authorizing the allocation of the mark, indicated by the distinguishing sign for motor vehicles in international traffic²;
- (f) The name of the manufacturer or other identification of the packaging specified by the competent authority;
- (g) For packagings meeting the requirements of 6.3.5.1.6, the letter "U", inserted immediately following the marking required in (b) above.

6.3.4.3 Marking shall be applied in the sequence shown in 6.3.4.2 (a) to (g); each element of the marking required in these sub-paragraphs shall be clearly separated, e.g. by a slash or space, so as to be easily identifiable. For examples, see 6.3.4.4.

¹ This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

² Distinguishing sign for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

Any additional markings authorized by a competent authority shall still enable the parts of the mark to be correctly identified with reference to 6.3.4.1.

6.3.4.4 *Example of marking*

4G/CLASS 6.2/06
S/SP-9989-ERIKSSON

as in 6.3.4.2 (a), (b), (c) and (d)
as in 6.3.4.2 (e) and (f)

6.3.5 **Test requirements for packagings**

6.3.5.1 *Performance and frequency of tests*

- 6.3.5.1.1 The design type of each packaging shall be tested as provided in this section in accordance with procedures established by the competent authority allowing the allocation of the mark and shall be approved by this competent authority.
- 6.3.5.1.2 Each packaging design type shall successfully pass the tests prescribed in this Chapter before being used. A packaging design type is defined by the design, size, material and thickness, manner of construction and packing, but may include various surface treatments. It also includes packagings which differ from the design type only in their lesser design height.
- 6.3.5.1.3 Tests shall be repeated on production samples at intervals established by the competent authority.
- 6.3.5.1.4 Tests shall also be repeated after each modification which alters the design, material or manner of construction of a packaging.
- 6.3.5.1.5 The competent authority may permit the selective testing of packagings that differ only in minor respects from a tested type, e.g. smaller sizes or lower net mass of primary receptacles; and packagings such as drums and boxes which are produced with small reductions in external dimension(s).
- 6.3.5.1.6 Primary receptacles of any type may be assembled within a secondary packaging and carried without testing in the rigid outer packaging under the following conditions:
- (a) The rigid outer packaging shall have been successfully tested in accordance with 6.3.5.2.2 with fragile (e.g. glass) primary receptacles;
 - (b) The total combined gross mass of primary receptacles shall not exceed one half the gross mass of primary receptacles used for the drop test in (a) above;
 - (c) The thickness of cushioning between primary receptacles and between primary receptacles and the outside of the secondary packaging shall not be reduced below the corresponding thicknesses in the originally tested packaging; and if a single primary receptacle was used in the original test, the thickness of cushioning between primary receptacles shall not be less than the thickness of cushioning between the outside of the secondary packaging and the primary receptacle in the original test. When either fewer or smaller primary receptacles are used (as compared to the primary receptacles used in the drop test), sufficient additional cushioning material shall be used to take up the void spaces;
 - (d) The rigid outer packaging shall have successfully passed the stacking test in 6.1.5.6 while empty. The total mass of identical packages shall be based on the combined mass of packagings used in the drop test in (a) above;

- (e) For primary receptacles containing liquids, an adequate quantity of absorbent material to absorb the entire liquid content of the primary receptacles shall be present;
- (f) If the rigid outer packaging is intended to contain primary receptacles for liquids and is not leakproof, or is intended to contain primary receptacles for solids and is not siftproof, a means of containing any liquid or solid contents in the event of leakage shall be provided in the form of a leakproof liner, plastics bag or other equally effective means of containment;
- (g) In addition to the markings prescribed in 6.3.4.2 (a) to (f), packagings shall be marked in accordance with 6.3.4.2 (g).

6.3.5.1.7 The competent authority may at any time require proof, by tests in accordance with this section, that serially-produced packagings meet the requirements of the design type tests.

6.3.5.1.8 Provided the validity of the test results is not affected and with the approval of the competent authority, several tests may be made on one sample.

6.3.5.2 *Preparation of packagings for testing*

6.3.5.2.1 Samples of each packaging shall be prepared as for carriage, except that a liquid or solid infectious substance shall be replaced by water or, where conditioning at –18 °C is specified, by water/antifreeze. Each primary receptacle shall be filled to not less than 98% of its capacity.

NOTE: The term water includes water/antifreeze solution with a minimum specific gravity of 0.95 for testing at – 18 °C.

6.3.5.2.2 Tests and number of samples required

Tests required for packaging types

Type of packaging ^a			Tests required					
Rigid outer packaging	Primary receptacle		Water spray	Cold conditioning	Drop	Additional drop	Puncture	Stack 6.1.5.6
	Plastics	Other	6.3.5.3.6.1	6.3.5.3.6.2	6.3.5.3	6.3.5.3.6.3	6.3.5.4	
			No. of samples	No. of samples	No. of samples	No. of samples	No. of samples	No. of samples
Fibreboard box	x		5	5	10	Required on one sample when the packaging is intended to contain dry ice.	2	Required on three samples when testing a "U"-marked packaging as defined in 6.3.5.1.6 for specific provisions.
		x	5	0	5		2	
Fibreboard drum	x		3	3	6		2	
		x	3	0	3		2	
Plastics box	x		0	5	5		2	
		x	0	5	5		2	
Plastics drum/jerrican	x		0	3	3		2	
		x	0	3	3		2	
Boxes of other material	x		0	5	5		2	
		x	0	0	5		2	
Drums/jerricans of other material	x		0	3	3		2	
		x	0	0	3		2	

^a "Type of packaging" categorizes packagings for test purposes according to the kind of packaging and its material characteristics.

NOTE 1: *In instances where a primary receptacle is made of two or more materials, the material most liable to damage determines the appropriate test.*

NOTE 2: *The material of the secondary packagings are not taken into consideration when selecting the test or conditioning for the test.*

Explanation for use of the table:

If the packaging to be tested consists of a fibreboard outer box with a plastics primary receptacle, five samples must undergo the water spray test (see 6.3.5.3.6.1) prior to dropping and another five must be conditioned to – 18 °C (see 6.3.5.3.6.2) prior to dropping. If the packaging is to contain dry ice then one further single sample shall be dropped five times after conditioning in accordance with 6.3.5.3.6.3.

Packagings prepared as for carriage shall be subjected to the tests in 6.3.5.3 and 6.3.5.4. For outer packagings, the headings in the table relate to fibreboard or similar materials whose performance may be rapidly affected by moisture; plastics which may embrittle at low temperature; and other materials such as metal whose performance is not affected by moisture or temperature.

6.3.5.3 ***Drop test***

6.3.5.3.1 Samples shall be subjected to free-fall drops from a height of 9 m onto a non-resilient, horizontal, flat, massive and rigid surface in conformity with 6.1.5.3.4.

6.3.5.3.2 Where the samples are in the shape of a box, five shall be dropped one in each of the following orientations:

- (a) flat on the base;
- (b) flat on the top;
- (c) flat on the longest side;
- (d) flat on the shortest side;
- (e) on a corner.

6.3.5.3.3 Where the samples are in the shape of a drum, three shall be dropped one in each of the following orientations:

- (a) diagonally on the top chime, with the centre of gravity directly above the point of impact;
- (b) diagonally on the base chime;
- (c) flat on the side.

6.3.5.3.4 While the sample shall be released in the required orientation, it is accepted that for aerodynamic reasons the impact may not take place in that orientation.

6.3.5.3.5 Following the appropriate drop sequence, there shall be no leakage from the primary receptacle(s) which shall remain protected by cushioning/absorbent material in the secondary packaging.

6.3.5.3.6 *Special preparation of test sample for the drop test*

6.3.5.3.6.1 Fibreboard - Water spray test

Fibreboard outer packagings: The sample shall be subjected to a water spray that simulates exposure to rainfall of approximately 5 cm per hour for at least one hour. It shall then be subjected to the test described in 6.3.5.3.1.

6.3.5.3.6.2 Plastics material – Cold conditioning

Plastics primary receptacles or outer packagings: The temperature of the test sample and its contents shall be reduced to – 18 °C or lower for a period of at least 24 hours and within 15 minutes of removal from that atmosphere the test sample shall be subjected to the test described in 6.3.5.3.1. Where the sample contains dry ice, the conditioning period shall be reduced to 4 hours.

6.3.5.3.6.3 Packagings intended to contain dry ice – Additional drop test

Where the packaging is intended to contain dry ice, a test additional to that specified in 6.3.5.3.1 and, when appropriate, in 6.3.5.3.6.1 or 6.3.5.3.6.2 shall be carried out. One sample shall be stored so that all the dry ice dissipates and then that sample shall be dropped in one of the orientations described in 6.3.5.3.2 which shall be that most likely to result in failure of the packaging.

6.3.5.4 *Puncture test*

6.3.5.4.1 *Packagings with a gross mass of 7 kg or less*

Samples shall be placed on a level hard surface. A cylindrical steel rod with a mass of at least 7 kg, a diameter of 38 mm and whose impact end edges have a radius not exceeding 6 mm (see Figure 6.3.5.4.2), shall be dropped in a vertical free fall from a height of 1 m, measured from the impact end to the impact surface of the sample. One sample shall be placed on its base. A second sample shall be placed in an orientation perpendicular to that used for the first. In each instance the steel rod shall be aimed to impact the primary receptacle. Following each impact, penetration of the secondary packaging is acceptable, provided that there is no leakage from the primary receptacle(s).

6.3.5.4.2 *Packagings with a gross mass exceeding 7 kg*

Samples shall be dropped on to the end of a cylindrical steel rod. The rod shall be set vertically in a level hard surface. It shall have a diameter of 38 mm and the edges of the upper end a radius not exceeding 6 mm (see Figure 6.3.5.4.2). The rod shall protrude from the surface a distance at least equal to that between the centre of the primary receptacle(s) and the outer surface of the outer packaging with a minimum of 200 mm. One sample shall be dropped with its top face lowermost in a vertical free fall from a height of 1 m, measured from the top of the steel rod. A second sample shall be dropped from the same height in an orientation perpendicular to that used for the first. In each instance, the packaging shall be so orientated that the steel rod would be capable of penetrating the primary receptacle(s). Following each impact, penetration of the secondary packaging is acceptable provided that there is no leakage from the primary receptacle(s).

Figure 6.3.5.4.2

6.3.5.5 ***Test report***

6.3.5.5.1 A written test report containing at least the following particulars shall be drawn up and shall be available to the users of the packaging:

1. Name and address of the test facility;
2. Name and address of applicant (where appropriate);
3. A unique test report identification;
4. Date of the test and of the report;
5. Manufacturer of the packaging;
6. Description of the packaging design type (e.g. dimensions, materials, closures, thickness, etc.), including method of manufacture (e.g. blow moulding) and which may include drawing(s) and/or photograph(s);
7. Maximum capacity;
8. Test contents;
9. Test descriptions and results;
10. The test report shall be signed with the name and status of the signatory.

6.3.5.5.2 The test report shall contain statements that the packaging prepared as for carriage was tested in accordance with the appropriate requirements of this Chapter and that the use of other packaging methods or components may render it invalid. A copy of the test report shall be available to the competent authority.

CHAPTER 6.4

REQUIREMENTS FOR THE CONSTRUCTION, TESTING AND APPROVAL OF PACKAGES AND MATERIAL OF CLASS 7

6.4.1 *(Reserved)*

6.4.2 **General requirements**

- 6.4.2.1 The package shall be so designed in relation to its mass, volume and shape that it can be easily and safely carried. In addition, the package shall be so designed that it can be properly secured in or on the vehicle during carriage.
- 6.4.2.2 The design shall be such that any lifting attachments on the package will not fail when used in the intended manner and that, if failure of the attachments should occur, the ability of the package to meet other requirements of this Annex would not be impaired. The design shall take account of appropriate safety factors to cover snatch lifting.
- 6.4.2.3 Attachments and any other features on the outer surface of the package which could be used to lift it shall be designed either to support its mass in accordance with the requirements of 6.4.2.2 or shall be removable or otherwise rendered incapable of being used during carriage.
- 6.4.2.4 As far as practicable, the packaging shall be so designed and finished that the external surfaces are free from protruding features and can be easily decontaminated.
- 6.4.2.5 As far as practicable, the outer layer of the package shall be so designed as to prevent the collection and the retention of water.
- 6.4.2.6 Any features added to the package at the time of carriage which are not part of the package shall not reduce its safety.
- 6.4.2.7 The package shall be capable of withstanding the effects of any acceleration, vibration or vibration resonance which may arise under routine conditions of carriage without any deterioration in the effectiveness of the closing devices on the various receptacles or in the integrity of the package as a whole. In particular, nuts, bolts and other securing devices shall be so designed as to prevent them from becoming loose or being released unintentionally, even after repeated use.
- 6.4.2.8 The materials of the packaging and any components or structures shall be physically and chemically compatible with each other and with the radioactive contents. Account shall be taken of their behaviour under irradiation.
- 6.4.2.9 All valves through which the radioactive contents could escape shall be protected against unauthorized operation.
- 6.4.2.10 The design of the package shall take into account ambient temperatures and pressures that are likely to be encountered in routine conditions of carriage.
- 6.4.2.11 For radioactive material having other dangerous properties the package design shall take into account those properties; see 2.1.3.5.3 and 4.1.9.1.5.

6.4.2.12 Manufacturers and subsequent distributors of packagings shall provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that packages as presented for carriage are capable of passing the applicable performance tests of this Chapter.

6.4.3 *(Reserved)*

6.4.4 Requirements for excepted packages

An excepted package shall be designed to meet the requirements specified in 6.4.2.

6.4.5 Requirements for Industrial packages

6.4.5.1 Types IP-1, IP-2, and IP-3 packages shall meet the requirements specified in 6.4.2 and 6.4.7.2.

6.4.5.2 A Type IP-2 package shall, if it were subjected to the tests specified in 6.4.15.4 and 6.4.15.5, prevent:

- (a) Loss or dispersal of the radioactive contents; and
- (b) More than a 20% increase in the maximum radiation level at any external surface of the package.

6.4.5.3 A Type IP-3 package shall meet all the requirements specified in 6.4.7.2 to 6.4.7.15.

6.4.5.4 *Alternative requirements for Types IP-2 and IP-3 packages*

6.4.5.4.1 Packages may be used as Type IP-2 package provided that:

- (a) They satisfy the requirements of 6.4.5.1;
- (b) They are designed to satisfy the requirements prescribed for packing group I or II in Chapter 6.1; and
- (c) When subjected to the tests required for packing groups I or II in Chapter 6.1, they would prevent:
 - (i) Loss or dispersal of the radioactive contents; and
 - (ii) More than a 20% increase in the maximum radiation level at any external surface of the package.

6.4.5.4.2 Portable tanks may also be used as Types IP-2 or IP-3 packages, provided that:

- (a) They satisfy the requirements of 6.4.5.1;
- (b) They are designed to satisfy the requirements prescribed in Chapter 6.7 and are capable of withstanding a test pressure of 265 kPa; and
- (c) They are designed so that any additional shielding which is provided shall be capable of withstanding the static and dynamic stresses resulting from handling and routine conditions of carriage and of preventing more than a 20% increase in the maximum radiation level at any external surface of the portable tanks.

- 6.4.5.4.3 Tanks, other than portable tanks, may also be used as Types IP-2 or IP-3 packages for carrying LSA-I and LSA-II liquids and gases as prescribed in Table 4.1.9.2.4, provided that:
- (a) They satisfy the requirements of 6.4.5.1;
 - (b) They are designed to satisfy the requirements prescribed in Chapter 6.8; and
 - (c) They are designed so that any additional shielding which is provided shall be capable of withstanding the static and dynamic stresses resulting from handling and routine conditions of carriage and of preventing more than a 20% increase in the maximum radiation level at any external surface of the tanks.
- 6.4.5.4.4 Containers with the characteristics of a permanent enclosure may also be used as Types IP-2 or IP-3 packages, provided that:
- (a) The radioactive contents are restricted to solid materials;
 - (b) They satisfy the requirements of 6.4.5.1; and
 - (c) They are designed to conform to ISO 1496-1:1990: "Series 1 Containers - Specifications and Testing - Part 1: General Cargo Containers" and subsequent amendments 1:1993, 2:1998, 3:2005, 4:2006 and 5:2006, excluding dimensions and ratings. They shall be designed such that if subjected to the tests prescribed in that document and the accelerations occurring during routine conditions of carriage they would prevent:
 - (i) loss or dispersal of the radioactive contents; and
 - (ii) more than a 20% increase in the maximum radiation level at any external surface of the containers.
- 6.4.5.4.5 Metal intermediate bulk containers may also be used as Types IP-2 or IP-3 packages provided that:
- (a) They satisfy the requirements of 6.4.5.1; and
 - (b) They are designed to satisfy the requirements prescribed in Chapter 6.5 for packing group I or II, and if they were subjected to the tests prescribed in that Chapter, but with the drop test conducted in the most damaging orientation, they would prevent:
 - (i) loss or dispersal of the radioactive contents; and
 - (ii) more than a 20% increase in the maximum radiation level at any external surface of the intermediate bulk container.

6.4.6 Requirements for packages containing uranium hexafluoride

- 6.4.6.1 Packages designed to contain uranium hexafluoride shall meet the requirements prescribed elsewhere in ADR which pertain to the radioactive and fissile properties of the material. Except as allowed in 6.4.6.4, uranium hexafluoride in quantities of 0.1 kg or more shall also be packaged and carried in accordance with the provisions of ISO 7195:2005 "Nuclear Energy – Packaging of uranium hexafluoride (UF₆) for transport", and the requirements of 6.4.6.2 and 6.4.6.3.
- 6.4.6.2 Each package designed to contain 0.1 kg or more of uranium hexafluoride shall be designed so that it would meet the following requirements:

- (a) Withstand without leakage and without unacceptable stress, as specified in ISO 7195:2005, the structural test as specified in 6.4.21.5;
- (b) Withstand without loss or dispersal of the uranium hexafluoride the free drop test specified in 6.4.15.4; and
- (c) Withstand without rupture of the containment system the thermal test specified in 6.4.17.3.

6.4.6.3 Packages designed to contain 0.1 kg or more of uranium hexafluoride shall not be provided with pressure relief devices.

6.4.6.4 Subject to the approval of the competent authority, packages designed to contain 0.1 kg or more of uranium hexafluoride may be carried if:

- (a) The packages are designed to international or national standards other than ISO 7195:2005 provided an equivalent level of safety is maintained;
- (b) The packages are designed to withstand without leakage and without unacceptable stress a test pressure of less than 2.76 MPa as specified in 6.4.21.5; or
- (c) For packages designed to contain 9 000 kg or more of uranium hexafluoride, the packages do not meet the requirement of 6.4.6.2 (c).

In all other respects the requirements specified in 6.4.6.1 to 6.4.6.3 shall be satisfied.

6.4.7 Requirements for Type A packages

6.4.7.1 Type A packages shall be designed to meet the general requirements of 6.4.2 and of 6.4.7.2 to 6.4.7.17.

6.4.7.2 The smallest overall external dimension of the package shall not be less than 10 cm.

6.4.7.3 The outside of the package shall incorporate a feature such as a seal, which is not readily breakable and which, while intact, will be evidence that it has not been opened.

6.4.7.4 Any tie-down attachments on the package shall be so designed that, under normal and accident conditions of carriage, the forces in those attachments shall not impair the ability of the package to meet the requirements of ADR.

6.4.7.5 The design of the package shall take into account temperatures ranging from -40°C to +70°C for the components of the packaging. Attention shall be given to freezing temperatures for liquids and to the potential degradation of packaging materials within the given temperature range.

6.4.7.6 The design and manufacturing techniques shall be in accordance with national or international standards, or other requirements, acceptable to the competent authority.

6.4.7.7 The design shall include a containment system securely closed by a positive fastening device which cannot be opened unintentionally or by a pressure which may arise within the package.

6.4.7.8 Special form radioactive material may be considered as a component of the containment system.

- 6.4.7.9 If the containment system forms a separate unit of the package, it shall be capable of being securely closed by a positive fastening device which is independent of any other part of the packaging.
- 6.4.7.10 The design of any component of the containment system shall take into account, where applicable, the radiolytic decomposition of liquids and other vulnerable materials and the generation of gas by chemical reaction and radiolysis.
- 6.4.7.11 The containment system shall retain its radioactive contents under a reduction of ambient pressure to 60 kPa.
- 6.4.7.12 All valves, other than pressure relief valves, shall be provided with an enclosure to retain any leakage from the valve.
- 6.4.7.13 A radiation shield which encloses a component of the package specified as a part of the containment system shall be so designed as to prevent the unintentional release of that component from the shield. Where the radiation shield and such component within it form a separate unit, the radiation shield shall be capable of being securely closed by a positive fastening device which is independent of any other packaging structure.
- 6.4.7.14 A package shall be so designed that if it were subjected to the tests specified in 6.4.15, it would prevent:
- (a) Loss or dispersal of the radioactive contents; and
 - (b) More than a 20% increase in the maximum radiation level at any external surface of the package.
- 6.4.7.15 The design of a package intended for liquid radioactive material shall make provision for ullage to accommodate variations in the temperature of the contents, dynamic effects and filling dynamics.

Type A packages to contain liquids

- 6.4.7.16 A Type A package designed to contain liquid radioactive material shall, in addition:
- (a) Be adequate to meet the conditions specified in 6.4.7.14 (a) above if the package is subjected to the tests specified in 6.4.16; and
 - (b) Either
 - (i) be provided with sufficient absorbent material to absorb twice the volume of the liquid contents. Such absorbent material shall be suitably positioned so as to contact the liquid in the event of leakage; or
 - (ii) be provided with a containment system composed of primary inner and secondary outer containment components designed to enclose the liquid contents completely and ensure their retention, within the secondary outer containment components, even if the primary inner components leak.

Type A packages to contain gas

- 6.4.7.17 A package designed for gases shall prevent loss or dispersal of the radioactive contents if the package were subjected to the tests specified in 6.4.16. A Type A package designed for tritium gas or for noble gases shall be excepted from this requirement.

6.4.8 Requirements for Type B(U) packages

- 6.4.8.1 Type B(U) packages shall be designed to meet the requirements specified in 6.4.2, and of 6.4.7.2 to 6.4.7.15, except as specified in 6.4.7.14 (a), and, in addition, the requirements specified in 6.4.8.2 to 6.4.8.15.
- 6.4.8.2 A package shall be so designed that, under the ambient conditions specified in 6.4.8.5 and 6.4.8.6 heat generated within the package by the radioactive contents shall not, under normal conditions of carriage, as demonstrated by the tests in 6.4.15, adversely affect the package in such a way that it would fail to meet the applicable requirements for containment and shielding if left unattended for a period of one week. Particular attention shall be paid to the effects of heat, which may:
- (a) Alter the arrangement, the geometrical form or the physical state of the radioactive contents or, if the radioactive material is enclosed in a can or receptacle (for example, clad fuel elements), cause the can, receptacle or radioactive material to deform or melt; or
 - (b) Lessen the efficiency of the packaging through differential thermal expansion or cracking or melting of the radiation shielding material; or
 - (c) In combination with moisture, accelerate corrosion.
- 6.4.8.3 A package shall be so designed that, under the ambient condition specified in 6.4.8.5 and in the absence of insolation, the temperature of the accessible surfaces of a package shall not exceed 50 °C, unless the package is carried under exclusive use.
- 6.4.8.4 The maximum temperature of any surface readily accessible during carriage of a package under exclusive use shall not exceed 85 °C in the absence of insolation under the ambient conditions specified in 6.4.8.5. Account may be taken of barriers or screens intended to give protection to persons without the need for the barriers or screens being subject to any test.
- 6.4.8.5 The ambient temperature shall be assumed to be 38 °C.
- 6.4.8.6 The solar insolation conditions shall be assumed to be as specified in Table 6.4.8.6.

Table 6.4.8.6: Insolation data

Case	Form and location of surface	Insolation for 12 hours per day (W/m ²)
1	Flat surfaces carried horizontally-downward facing	0
2	Flat surfaces carried horizontally-upward facing	800
3	Surfaces carried vertically	200 ^a
4	Other downward facing (not horizontal) surfaces	200 ^a
5	All other surfaces	400 ^a

^a Alternatively, a sine function may be used, with an absorption coefficient adopted and the effects of possible reflection from neighbouring objects neglected.

- 6.4.8.7 A package which includes thermal protection for the purpose of satisfying the requirements of the thermal test specified in 6.4.17.3 shall be so designed that such protection will remain effective if the package is subjected to the tests specified in 6.4.15 and 6.4.17.2 (a) and (b) or 6.4.17.2 (b) and (c), as appropriate. Any such protection on the exterior of the package shall not be rendered ineffective by ripping, cutting, skidding, abrasion or rough handling.

- 6.4.8.8 A package shall be so designed that, if it were subjected to:
- (a) The tests specified in 6.4.15, it would restrict the loss of radioactive contents to not more than 10^{-6} A₂ per hour; and
 - (b) The tests specified in 6.4.17.1, 6.4.17.2 (b), 6.4.17.3, and 6.4.17.4 and the tests in
 - (i) 6.4.17.2 (c), when the package has a mass not greater than 500 kg, an overall density not greater than 1 000 kg/m³ based on the external dimensions, and radioactive contents greater than 1 000 A₂ not as special form radioactive material, or
 - (ii) 6.4.17.2 (a), for all other packages,
- it would meet the following requirements:
- retain sufficient shielding to ensure that the radiation level at 1 m from the surface of the package would not exceed 10 mSv/h with the maximum radioactive contents which the package is designed to contain; and
 - restrict the accumulated loss of radioactive contents in a period of one week to not more than 10 A₂ for krypton-85 and not more than A₂ for all other radionuclides.
- Where mixtures of different radionuclides are present, the provisions of 2.2.7.2.2.4 to 2.2.7.2.2.6 shall apply except that for krypton-85 an effective A₂(i) value equal to 10 A₂ may be used. For case (a) above, the assessment shall take into account the external contamination limits of 4.1.9.1.2.
- 6.4.8.9 A package for radioactive contents with activity greater than 10^5 A₂ shall be so designed that if it were subjected to the enhanced water immersion test specified in 6.4.18, there would be no rupture of the containment system.
- 6.4.8.10 Compliance with the permitted activity release limits shall depend neither upon filters nor upon a mechanical cooling system.
- 6.4.8.11 A package shall not include a pressure relief system from the containment system which would allow the release of radioactive material to the environment under the conditions of the tests specified in 6.4.15 and 6.4.17.
- 6.4.8.12 A package shall be so designed that if it were at the maximum normal operating pressure and it were subjected to the tests specified in 6.4.15 and 6.4.17, the level of strains in the containment system would not attain values which would adversely affect the package in such a way that it would fail to meet the applicable requirements.
- 6.4.8.13 A package shall not have a maximum normal operating pressure in excess of a gauge pressure of 700 kPa.
- 6.4.8.14 A package containing low dispersible radioactive material shall be so designed that any features added to the low dispersible radioactive material that are not part of it, or any internal components of the packaging shall not adversely affect the performance of the low dispersible radioactive material.
- 6.4.8.15 A package shall be designed for an ambient temperature range from -40 °C to +38 °C.

6.4.9 Requirements for Type B(M) packages

- 6.4.9.1 Type B(M) packages shall meet the requirements for Type B(U) packages specified in 6.4.8.1, except that for packages to be carried solely within a specified country or solely between specified countries, conditions other than those given in 6.4.7.5, 6.4.8.4, 6.4.8.5, 6.4.8.6, and 6.4.8.9 to 6.4.8.15 above may be assumed with the approval of the competent authorities of these countries. Notwithstanding, the requirements for Type B(U) packages specified in 6.4.8.9 to 6.4.8.15 shall be met as far as practicable.
- 6.4.9.2 Intermittent venting of Type B(M) packages may be permitted during carriage, provided that the operational controls for venting are acceptable to the relevant competent authorities.

6.4.10 Requirements for Type C packages

- 6.4.10.1 Type C packages shall be designed to meet the requirements specified in 6.4.2 and of 6.4.7.2 to 6.4.7.15, except as specified in 6.4.7.14 (a), and of the requirements specified in 6.4.8.2 to 6.4.8.6, 6.4.8.10 to 6.4.8.15, and, in addition, of 6.4.10.2 to 6.4.10.4.
- 6.4.10.2 A package shall be capable of meeting the assessment criteria prescribed for tests in 6.4.8.8 (b) and 6.4.8.12 after burial in an environment defined by a thermal conductivity of $0.33 \text{ W.m}^{-1}.\text{K}^{-1}$ and a temperature of 38°C in the steady state. Initial conditions for the assessment shall assume that any thermal insulation of the package remains intact, the package is at the maximum normal operating pressure and the ambient temperature is 38°C .
- 6.4.10.3 A package shall be so designed that, if it were at the maximum normal operating pressure and subjected to:
- (a) The tests specified in 6.4.15, it would restrict the loss of radioactive contents to not more than $10^{-6} A_2$ per hour; and
 - (b) The test sequences in 6.4.20.1, it would meet the following requirements:
 - (i) retain sufficient shielding to ensure that the radiation level at 1 m from the surface of the package would not exceed 10 mSv/h with the maximum radioactive contents which the package is designed to contain; and
 - (ii) restrict the accumulated loss of radioactive contents in a period of 1 week to not more than $10 A_2$ for krypton-85 and not more than A_2 for all other radionuclides.

Where mixtures of different radionuclides are present, the provisions of 2.2.7.2.2.4 to 2.2.7.2.2.6 shall apply except that for krypton-85 an effective $A_2(i)$ value equal to $10 A_2$ may be used. For case (a) above, the assessment shall take into account the external contamination limits of 4.1.9.1.2.

- 6.4.10.4 A package shall be so designed that there will be no rupture of the containment system following performance of the enhanced water immersion test specified in 6.4.18.

6.4.11 Requirements for packages containing fissile material

6.4.11.1 Fissile material shall be carried so as to:

- (a) Maintain sub-criticality during normal and accident conditions of carriage; in particular, the following contingencies shall be considered:
 - (i) water leaking into or out of packages;
 - (ii) the loss of efficiency of built-in neutron absorbers or moderators;
 - (iii) rearrangement of the contents either within the package or as a result of loss from the package;
 - (iv) reduction of spaces within or between packages;
 - (v) packages becoming immersed in water or buried in snow; and
 - (vi) temperature changes; and
- (b) Meet the requirements:
 - (i) of 6.4.7.2 for packages containing fissile material;
 - (ii) prescribed elsewhere in ADR which pertain to the radioactive properties of the material; and
 - (iii) specified in 6.4.11.3 to 6.4.11.12, unless excepted by 6.4.11.2.

6.4.11.2 Fissile material meeting one of the provisions (a) to (d) of 2.2.7.2.3.5 is excepted from the requirement to be carried in packages that comply with 6.4.11.3 to 6.4.11.12 as well as the other requirements of ADR that apply to fissile material. Only one type of exception is allowed per consignment.

6.4.11.3 Where the chemical or physical form, isotopic composition, mass or concentration, moderation ratio or density, or geometric configuration is not known, the assessments of 6.4.11.7 to 6.4.11.12 shall be performed assuming that each parameter that is not known has the value which gives the maximum neutron multiplication consistent with the known conditions and parameters in these assessments.

6.4.11.4 For irradiated nuclear fuel the assessments of 6.4.11.7 to 6.4.11.12 shall be based on an isotopic composition demonstrated to provide:

- (a) The maximum neutron multiplication during the irradiation history; or
- (b) A conservative estimate of the neutron multiplication for the package assessments. After irradiation but prior to shipment, a measurement shall be performed to confirm the conservatism of the isotopic composition.

6.4.11.5 The package, after being subjected to the tests specified in 6.4.15, shall:

- (a) Preserve the minimum overall outside dimensions of the package to at least 10 cm; and
- (b) Prevent the entry of a 10 cm cube.

- 6.4.11.6 The package shall be designed for an ambient temperature range of -40°C to + 38°C unless the competent authority specifies otherwise in the certificate of approval for the package design.
- 6.4.11.7 For a package in isolation, it shall be assumed that water can leak into or out of all void spaces of the package, including those within the containment system. However, if the design incorporates special features to prevent such leakage of water into or out of certain void spaces, even as a result of error, absence of leakage may be assumed in respect of those void spaces. Special features shall include the following:
- (a) Multiple high standard water barriers, not less than two of which would remain watertight if the package were subject to the tests prescribed in 6.4.11.12 (b), a high degree of quality control in the manufacture, maintenance and repair of packagings and tests to demonstrate the closure of each package before each shipment; or
 - (b) For packages containing uranium hexafluoride only, with maximum enrichment of 5 mass percent uranium-235:
 - (i) packages where, following the tests prescribed in 6.4.11.12 (b), there is no physical contact between the valve and any other component of the packaging other than at its original point of attachment and where, in addition, following the test prescribed in 6.4.17.3 the valves remain leaktight; and
 - (ii) a high degree of quality control in the manufacture, maintenance and repair of packagings coupled with tests to demonstrate closure of each package before each shipment.
- 6.4.11.8 It shall be assumed that the confinement system shall be closely reflected by at least 20 cm of water or such greater reflection as may additionally be provided by the surrounding material of the packaging. However, when it can be demonstrated that the confinement system remains within the packaging following the tests prescribed in 6.4.11.12 (b), close reflection of the package by at least 20 cm of water may be assumed in 6.4.11.9 (c).
- 6.4.11.9 The package shall be subcritical under the conditions of 6.4.11.7 and 6.4.11.8 with the package conditions that result in the maximum neutron multiplication consistent with:
- (a) Routine conditions of carriage (incident free);
 - (b) The tests specified in 6.4.11.11 (b);
 - (c) The tests specified in 6.4.11.12 (b).
- 6.4.11.10 *(Reserved)*
- 6.4.11.11 For normal conditions of carriage a number "N" shall be derived, such that five times "N" packages shall be subcritical for the arrangement and package conditions that provide the maximum neutron multiplication consistent with the following:
- (a) There shall not be anything between the packages, and the package arrangement shall be reflected on all sides by at least 20 cm of water; and
 - (b) The state of the packages shall be their assessed or demonstrated condition if they had been subjected to the tests specified in 6.4.15.

- 6.4.11.12 For accident conditions of carriage a number "N" shall be derived, such that two times "N" packages shall be subcritical for the arrangement and package conditions that provide the maximum neutron multiplication consistent with the following:
- (a) Hydrogenous moderation between packages, and the package arrangement reflected on all sides by at least 20 cm of water; and
 - (b) The tests specified in 6.4.15 followed by whichever of the following is the more limiting:
 - (i) the tests specified in 6.4.17.2 (b) and, either 6.4.17.2 (c) for packages having a mass not greater than 500 kg and an overall density not greater than 1 000 kg/m³ based on the external dimensions, or 6.4.17.2 (a) for all other packages; followed by the test specified in 6.4.17.3 and completed by the tests specified in 6.4.19.1 to 6.4.19.3; or
 - (ii) the test specified in 6.4.17.4; and
 - (c) Where any part of the fissile material escapes from the containment system following the tests specified in 6.4.11.12 (b), it shall be assumed that fissile material escapes from each package in the array and all of the fissile material shall be arranged in the configuration and moderation that results in the maximum neutron multiplication with close reflection by at least 20 cm of water.
- 6.4.11.13 The criticality safety index (CSI) for packages containing fissile material shall be obtained by dividing the number 50 by the smaller of the two values of N derived in 6.4.11.11 and 6.4.11.12 (i.e. $CSI = 50/N$). The value of the criticality safety index may be zero, provided that an unlimited number of packages is subcritical (i.e. N is effectively equal to infinity in both cases).

6.4.12 Test procedures and demonstration of compliance

- 6.4.12.1 Demonstration of compliance with the performance standards required in 2.2.7.2.3.1.3, 2.2.7.2.3.1.4, 2.2.7.2.3.3.1, 2.2.7.2.3.3.2, 2.2.7.2.3.4.1, 2.2.7.2.3.4.2, and 6.4.2 to 6.4.11 must be accomplished by any of the methods listed below or by a combination thereof:
- (a) Performance of tests with specimens representing LSA-III material, or special form radioactive material, or low dispersible radioactive material or with prototypes or samples of the packaging, where the contents of the specimen or the packaging for the tests shall simulate as closely as practicable the expected range of radioactive contents and the specimen or packaging to be tested shall be prepared as presented for carriage;
 - (b) Reference to previous satisfactory demonstrations of a sufficiently similar nature;
 - (c) Performance of tests with models of appropriate scale incorporating those features which are significant with respect to the item under investigation when engineering experience has shown results of such tests to be suitable for design purposes. When a scale model is used, the need for adjusting certain test parameters, such as penetrator diameter or compressive load, shall be taken into account;
 - (d) Calculation, or reasoned argument, when the calculation procedures and parameters are generally agreed to be reliable or conservative.

6.4.12.2 After the specimen, prototype or sample has been subjected to the tests, appropriate methods of assessment shall be used to assure that the requirements for the test procedures have been fulfilled in compliance with the performance and acceptance standards prescribed in 2.2.7.2.3.1.3, 2.2.7.2.3.1.4, 2.2.7.2.3.3.1, 2.2.7.2.3.3.2, 2.2.7.2.3.4.1, 2.2.7.2.3.4.2, and 6.4.2 to 6.4.11.

6.4.12.3 All specimens shall be inspected before testing in order to identify and record faults or damage including the following:

- (a) Divergence from the design;
- (b) Defects in manufacture;
- (c) Corrosion or other deterioration; and
- (d) Distortion of features.

The containment system of the package shall be clearly specified. The external features of the specimen shall be clearly identified so that reference may be made simply and clearly to any part of such specimen.

6.4.13 Testing the integrity of the containment system and shielding and evaluating criticality safety

After each of the applicable tests specified in 6.4.15 to 6.4.21:

- (a) Faults and damage shall be identified and recorded;
- (b) It shall be determined whether the integrity of the containment system and shielding has been retained to the extent required in 6.4.2 to 6.4.11 for the package under test; and
- (c) For packages containing fissile material, it shall be determined whether the assumptions and conditions used in the assessments required by 6.4.11.1 to 6.4.11.13 for one or more packages are valid.

6.4.14 Target for drop tests

The target for the drop tests specified in 2.2.7.2.3.3.5 (a), 6.4.15.4, 6.4.16 (a), 6.4.17.2 and 6.4.20.2 shall be a flat, horizontal surface of such a character that any increase in its resistance to displacement or deformation upon impact by the specimen would not significantly increase the damage to the specimen.

6.4.15 Tests for demonstrating ability to withstand normal conditions of carriage

6.4.15.1 The tests are: the water spray test, the free drop test, the stacking test and the penetration test. Specimens of the package shall be subjected to the free drop test, the stacking test and the penetration test, preceded in each case by the water spray test. One specimen may be used for all the tests, provided that the requirements of 6.4.15.2 are fulfilled.

6.4.15.2 The time interval between the conclusion of the water spray test and the succeeding test shall be such that the water has soaked in to the maximum extent, without appreciable drying of the exterior of the specimen. In the absence of any evidence to the contrary, this interval shall be taken to be two hours if the water spray is applied from four directions

simultaneously. No time interval shall elapse, however, if the water spray is applied from each of the four directions consecutively.

6.4.15.3 Water spray test: The specimen shall be subjected to a water spray test that simulates exposure to rainfall of approximately 5 cm per hour for at least one hour.

6.4.15.4 Free drop test: The specimen shall drop onto the target so as to suffer maximum damage in respect of the safety features to be tested.

- (a) The height of drop measured from the lowest point of the specimen to the upper surface of the target shall be not less than the distance specified in Table 6.4.15.4 for the applicable mass. The target shall be as defined in 6.4.14;
- (b) For rectangular fibreboard or wood packages not exceeding a mass of 50 kg, a separate specimen shall be subjected to a free drop onto each corner from a height of 0.3 m;
- (c) For cylindrical fibreboard packages not exceeding a mass of 100 kg, a separate specimen shall be subjected to a free drop onto each of the quarters of each rim from a height of 0.3 m.

Table 6.4.15.4: Free drop distance for testing packages to normal conditions of carriage

Package mass (kg)	Free drop distance (m)
Package mass < 5 000	1.2
5 000 ≤ Package mass < 10 000	0.9
10 000 ≤ Package mass < 15 000	0.6
15 000 ≤ Package mass	0.3

6.4.15.5 Stacking test: Unless the shape of the packaging effectively prevents stacking, the specimen shall be subjected, for a period of 24 h, to a compressive load equal to the greater of the following:

- (a) A total weight equal to 5 times the maximum weight of the package; and
- (b) The equivalent of 13 kPa multiplied by the vertically projected area of the package.

The load shall be applied uniformly to two opposite sides of the specimen, one of which shall be the base on which the package would typically rest.

6.4.15.6 Penetration test: The specimen shall be placed on a rigid, flat, horizontal surface which will not move significantly while the test is being carried out.

- (a) A bar of 3.2 cm in diameter with a hemispherical end and a mass of 6 kg shall be dropped and directed to fall, with its longitudinal axis vertical, onto the centre of the weakest part of the specimen, so that, if it penetrates sufficiently far, it will hit the containment system. The bar shall not be significantly deformed by the test performance;
- (b) The height of drop of the bar measured from its lower end to the intended point of impact on the upper surface of the specimen shall be 1 m.

6.4.16**Additional tests for Type A packages designed for liquids and gases**

A specimen or separate specimens shall be subjected to each of the following tests unless it can be demonstrated that one test is more severe for the specimen in question than the other, in which case one specimen shall be subjected to the more severe test.

- (a) Free drop test: The specimen shall drop onto the target so as to suffer the maximum damage in respect of containment. The height of the drop measured from the lowest part of the specimen to the upper surface of the target shall be 9 m. The target shall be as defined in 6.4.14;
- (b) Penetration test: The specimen shall be subjected to the test specified in 6.4.15.6 except that the height of drop shall be increased to 1.7 m from the 1 m specified in 6.4.15.6 (b).

6.4.17**Tests for demonstrating ability to withstand accident conditions in carriage****6.4.17.1**

The specimen shall be subjected to the cumulative effects of the tests specified in 6.4.17.2 and 6.4.17.3, in that order. Following these tests, either this specimen or a separate specimen shall be subjected to the effect(s) of the water immersion test(s) as specified in 6.4.17.4 and, if applicable, 6.4.18.

6.4.17.2

Mechanical test: The mechanical test consists of three different drop tests. Each specimen shall be subjected to the applicable drops as specified in 6.4.8.8 or 6.4.11.12. The order in which the specimen is subjected to the drops shall be such that, on completion of the mechanical test, the specimen shall have suffered such damage as will lead to the maximum damage in the thermal test which follows.

- (a) For drop I, the specimen shall drop onto the target so as to suffer the maximum damage, and the height of the drop measured from the lowest point of the specimen to the upper surface of the target shall be 9 m. The target shall be as defined in 6.4.14;
- (b) For drop II, the specimen shall drop so as to suffer the maximum damage onto a bar rigidly mounted perpendicularly on the target. The height of the drop measured from the intended point of impact of the specimen to the upper surface of the bar shall be 1 m. The bar shall be of solid mild steel of circular section, $(15.0 \text{ cm} \pm 0.5 \text{ cm})$ in diameter and 20 cm long unless a longer bar would cause greater damage, in which case a bar of sufficient length to cause maximum damage shall be used. The upper end of the bar shall be flat and horizontal with its edge rounded off to a radius of not more than 6 mm. The target on which the bar is mounted shall be as described in 6.4.14;
- (c) For drop III, the specimen shall be subjected to a dynamic crush test by positioning the specimen on the target so as to suffer maximum damage by the drop of a 500 kg mass from 9 m onto the specimen. The mass shall consist of a solid mild steel plate 1 m by 1 m and shall fall in a horizontal attitude. The height of the drop shall be measured from the underside of the plate to the highest point of the specimen. The target on which the specimen rests shall be as defined in 6.4.14.

6.4.17.3

Thermal test: The specimen shall be in thermal equilibrium under conditions of an ambient temperature of 38 °C, subject to the solar insolation conditions specified in Table 6.4.8.6 and subject to the design maximum rate of internal heat generation within the package from the radioactive contents. Alternatively, any of these parameters are allowed to have different values prior to and during the test, providing due account is taken of them in the subsequent assessment of package response.

The thermal test shall then consist of:

- (a) Exposure of a specimen for a period of 30 minutes to a thermal environment which provides a heat flux at least equivalent to that of a hydrocarbon fuel/air fire in sufficiently quiescent ambient conditions to give a minimum average flame emissivity coefficient of 0.9 and an average temperature of at least 800 °C, fully engulfing the specimen, with a surface absorptivity coefficient of 0.8 or that value which the package may be demonstrated to possess if exposed to the fire specified, followed by;
- (b) Exposure of the specimen to an ambient temperature of 38 °C, subject to the solar insolation conditions specified in Table 6.4.8.6 and subject to the design maximum rate of internal heat generation within the package by the radioactive contents for a sufficient period to ensure that temperatures in the specimen are everywhere decreasing and/or are approaching initial steady state conditions. Alternatively, any of these parameters are allowed to have different values following cessation of heating, providing due account is taken of them in the subsequent assessment of package response.

During and following the test the specimen shall not be artificially cooled and any combustion of materials of the specimen shall be permitted to proceed naturally.

6.4.17.4 Water immersion test: The specimen shall be immersed under a head of water of at least 15 m for a period of not less than eight hours in the attitude which will lead to maximum damage. For demonstration purposes, an external gauge pressure of at least 150 kPa shall be considered to meet these conditions.

6.4.18 Enhanced water immersion test for Type B(U) and Type B(M) packages containing more than 10^5 A₂ and Type C packages

Enhanced water immersion test: The specimen shall be immersed under a head of water of at least 200 m for a period of not less than one hour. For demonstration purposes, an external gauge pressure of at least 2 MPa shall be considered to meet these conditions.

6.4.19 Water leakage test for packages containing fissile material

6.4.19.1 Packages for which water in-leakage or out-leakage to the extent which results in greatest reactivity has been assumed for purposes of assessment under 6.4.11.7 to 6.4.11.12 shall be excepted from the test.

6.4.19.2 Before the specimen is subjected to the water leakage test specified below, it shall be subjected to the tests in 6.4.17.2 (b), and either 6.4.17.2 (a) or (c) as required by 6.4.11.12, and the test specified in 6.4.17.3.

6.4.19.3 The specimen shall be immersed under a head of water of at least 0.9 m for a period of not less than 8 hours and in the attitude for which maximum leakage is expected.

6.4.20 Tests for Type C packages

6.4.20.1 Specimens shall be subjected to the effects of each of the following test sequences in the orders specified:

- (a) The tests specified in 6.4.17.2 (a), 6.4.17.2 (c), 6.4.20.2 and 6.4.20.3; and
- (b) The test specified in 6.4.20.4.

Separate specimens are allowed to be used for each of the sequences (a) and (b).

- 6.4.20.2 Puncture/tearing test: The specimen shall be subjected to the damaging effects of a solid probe made of mild steel. The orientation of the probe to the surface of the specimen shall be as to cause maximum damage at the conclusion of the test sequence specified in 6.4.20.1 (a).
- (a) The specimen, representing a package having a mass less than 250 kg, shall be placed on a target and subjected to a probe having a mass of 250 kg falling from a height of 3 m above the intended impact point. For this test the probe shall be a 20 cm diameter cylindrical bar with the striking end forming a frustum of a right circular cone with the following dimensions: 30 cm height and 2.5 cm in diameter at the top with its edge rounded off to a radius of not more than 6 mm. The target on which the specimen is placed shall be as specified in 6.4.14;
 - (b) For packages having a mass of 250 kg or more, the base of the probe shall be placed on a target and the specimen dropped onto the probe. The height of the drop, measured from the point of impact with the specimen to the upper surface of the probe shall be 3 m. For this test the probe shall have the same properties and dimensions as specified in (a) above, except that the length and mass of the probe shall be such as to incur maximum damage to the specimen. The target on which the base of the probe is placed shall be as specified in 6.4.14.
- 6.4.20.3 Enhanced thermal test: The conditions for this test shall be as specified in 6.4.17.3, except that the exposure to the thermal environment shall be for a period of 60 minutes.
- 6.4.20.4 Impact test: The specimen shall be subject to an impact on a target at a velocity of not less than 90 m/s, at such an orientation as to suffer maximum damage. The target shall be as defined in 6.4.14, except that the target surface may be at any orientation as long as the surface is normal to the specimen path.
- 6.4.21 Inspections for packagings designed to contain 0.1 kg or more of uranium hexafluoride**
- 6.4.21.1 Every manufactured packaging and its service and structural equipment shall, either jointly or separately, undergo an inspection initially before being put into service and periodically thereafter. These inspections shall be performed and certified by agreement with the competent authority.
- 6.4.21.2 The initial inspection shall consist of a check of the design characteristics, a structural test, a leakproofness test, a water capacity test and a check of satisfactory operation of the service equipment.
- 6.4.21.3 The periodic inspections shall consist of a visual examination, a structural test, a leakproofness test and a check of satisfactory operation of the service equipment. The maximum intervals for periodic inspections shall be five years. Packagings which have not been inspected within this five-year period shall be examined before carriage in accordance with a programme approved by the competent authority. They shall not be refilled before completion of the full programme for periodic inspections.
- 6.4.21.4 The check of design characteristics shall demonstrate compliance with the design type specifications and the manufacturing programme.
- 6.4.21.5 For the initial structural test, packagings designed to contain 0.1 kg or more of uranium hexafluoride shall be tested hydraulically at an internal pressure of at least 1.38 MPa but, when the test pressure is less than 2.76 MPa, the design shall require multilateral approval. For retesting packagings, any other equivalent non-destructive testing may be applied subject to multilateral approval.

- 6.4.21.6 The leakproofness test shall be performed in accordance with a procedure which is capable of indicating leakages in the containment system with a sensitivity of 0.1 Pa.l/s (10^{-6} bar.l/s).
- 6.4.21.7 The water capacity of the packagings shall be established with an accuracy of $\pm 0.25\%$ at a reference temperature of 15 °C. The volume shall be stated on the plate described in 6.4.21.8.
- 6.4.21.8 A plate made of non-corroding metal shall be durably attached to every packaging in a readily accessible place. The method of attaching the plate must not impair the strength of the packaging. The following particulars, at least, shall be marked on the plate by stamping or by any other equivalent method:
- Approval number;
 - Manufacturer's serial number;
 - Maximum working pressure (gauge pressure);
 - Test pressure (gauge pressure);
 - Contents: uranium hexafluoride;
 - Capacity in litres;
 - Maximum permissible filling mass of uranium hexafluoride;
 - Tare mass;
 - Date (month, year) of the initial test and the most recent periodic test;
 - Stamp of the expert who performed the tests.

6.4.22 Approvals of package designs and materials

- 6.4.22.1 The approval of designs for packages containing 0.1 kg or more of uranium hexafluoride requires that:
- (a) Each design that meets the requirements of 6.4.6.4 shall require multilateral approval;
 - (b) Each design that meets the requirements of 6.4.6.1 to 6.4.6.3 shall require unilateral approval by the competent authority of the country of origin of the design, unless multilateral approval is otherwise required by ADR.
- 6.4.22.2 Each Type B(U) and Type C package design shall require unilateral approval, except that:
- (a) A package design for fissile material, which is also subject to 6.4.22.4, 6.4.23.7, and 5.1.5.2.1 shall require multilateral approval; and
 - (b) A Type B(U) package design for low dispersible radioactive material shall require multilateral approval.
- 6.4.22.3 Each Type B(M) package design, including those for fissile material which are also subject to the requirements of 6.4.22.4, 6.4.23.7, and 5.1.5.2.1 and those for low dispersible radioactive material, shall require multilateral approval.
- 6.4.22.4 Each package design for fissile material which is not excepted according to 6.4.11.2 from the requirements that apply specifically to packages containing fissile material shall require multilateral approval.
- 6.4.22.5 The design for special form radioactive material shall require unilateral approval. The design for low dispersible radioactive material shall require multilateral approval (see also 6.4.23.8).

- 6.4.22.6 Any design that requires unilateral approval originating in a country Contracting Party to ADR shall be approved by the competent authority of this country; if the country where the package has been designed is not a Contracting Party to ADR, carriage is possible on condition that:
- (a) A certificate has been supplied by this country, proving that the package design satisfies the technical requirements of ADR, and that this certificate is countersigned by the competent authority of the first country Contracting Party to ADR reached by the consignment;
 - (b) If no certificate and no existing package design approval by a country Contracting Party to ADR has been supplied, the package design is approved by the competent authority of the first country Contracting Party to ADR reached by the consignment.

6.4.22.7 For designs approved under the transitional measures see 1.6.6.

6.4.23 Applications and approvals for radioactive material carriage

6.4.23.1 *(Reserved)*

6.4.23.2 An application for shipment approval shall include:

- (a) The period of time, related to the shipment, for which the approval is sought;
- (b) The actual radioactive contents, the expected modes of carriage, the type of vehicle, and the probable or proposed route; and
- (c) The details of how the precautions and administrative or operational controls, referred to in the package design approval certificates issued under 5.1.5.2.1, are to be put into effect.

6.4.23.3 An application for approval of shipments under special arrangement shall include all the information necessary to satisfy the competent authority that the overall level of safety in carriage is at least equivalent to that which would be provided if all the applicable requirements of ADR had been met.

The application shall also include:

- (a) A statement of the respects in which, and of the reasons why, the shipment cannot be made in full accordance with the applicable requirements of ADR; and
- (b) A statement of any special precautions or special administrative or operational controls which are to be employed during carriage to compensate for the failure to meet the applicable requirements of ADR.

6.4.23.4 An application for approval of Type B(U) or Type C package design shall include:

- (a) A detailed description of the proposed radioactive contents with reference to their physical and chemical states and the nature of the radiation emitted;
- (b) A detailed statement of the design, including complete engineering drawings and schedules of materials and methods of manufacture;
- (c) A statement of the tests which have been done and their results, or evidence based on calculative methods or other evidence that the design is adequate to meet the applicable requirements;

- (d) The proposed operating and maintenance instructions for the use of the packaging;
- (e) If the package is designed to have a maximum normal operating pressure in excess of 100 kPa gauge, a specification of the materials of manufacture of the containment system, the samples to be taken, and the tests to be made;
- (f) Where the proposed radioactive contents are irradiated fuel, a statement and a justification of any assumption in the safety analysis relating to the characteristics of the fuel and a description of any pre-shipment measurement as required by 6.4.11.4 (b);
- (g) Any special stowage provisions necessary to ensure the safe dissipation of heat from the package considering the various modes of carriage to be used and type of vehicle or container;
- (h) A reproducible illustration, not larger than 21 cm by 30 cm, showing the make-up of the package; and
- (i) A specification of the applicable quality assurance programme as required in 1.7.3.

6.4.23.5 An application for approval of a Type B(M) package design shall include, in addition to the general information required for package approval in 6.4.23.4 for Type B(U) packages:

- (a) A list of the requirements specified in 6.4.7.5, 6.4.8.4, 6.4.8.5, 6.4.8.6 and 6.4.8.9 to 6.4.8.15 with which the package does not conform;
- (b) Any proposed supplementary operational controls to be applied during carriage not regularly provided for in this Annex, but which are necessary to ensure the safety of the package or to compensate for the deficiencies listed in (a) above;
- (c) A statement relative to any restrictions on the mode of carriage and to any special loading, carriage, unloading or handling procedures; and
- (d) The range of ambient conditions (temperature, solar radiation) which are expected to be encountered during carriage and which have been taken into account in the design.

6.4.23.6 The application for approval of designs for packages containing 0.1 kg or more of uranium hexafluoride shall include all information necessary to satisfy the competent authority that the design meets the applicable requirements of 6.4.6.1, and a description of the applicable quality assurance programme as required in 1.7.3.

6.4.23.7 An application for a fissile package approval shall include all information necessary to satisfy the competent authority that the design meets the applicable requirements of 6.4.11.1, and a specification of the applicable quality assurance programme as required by 1.7.3.

6.4.23.8 An application for approval of design for special form radioactive material and design for low dispersible radioactive material shall include:

- (a) A detailed description of the radioactive material or, if a capsule, the contents; particular reference shall be made to both physical and chemical states;
- (b) A detailed statement of the design of any capsule to be used;
- (c) A statement of the tests which have been done and their results, or evidence based on calculative methods to show that the radioactive material is capable of meeting the performance standards, or other evidence that the special form radioactive material or low dispersible radioactive material meets the applicable requirements of ADR;

- (d) A specification of the applicable quality assurance programme as required in 1.7.3; and
- (e) Any proposed pre-shipment actions for use in the consignment of special form radioactive material or low dispersible radioactive material.

6.4.23.9

Each approval certificate issued by a competent authority shall be assigned an identification mark. The identification mark shall be of the following generalized type:

VRI/Number/Type Code

- (a) Except as provided in 6.4.23.10 (b), VRI represents the international vehicle registration identification code of the country issuing the certificate¹;
- (b) The number shall be assigned by the competent authority, and shall be unique and specific with regard to the particular design or shipment. The shipment approval identification mark shall be clearly related to the design approval identification mark;
- (c) The following type codes shall be used in the order listed to indicate the types of approval certificates issued:

AF	Type A package design for fissile material
B(U)	Type B(U) package design [B(U) F if for fissile material]
B(M)	Type B(M) package design [B(M) F if for fissile material]
C	Type C package design (CF if for fissile material)
IF	Industrial package design for fissile material
S	Special form radioactive material
LD	Low dispersible radioactive material
T	Shipment
X	Special arrangement

In the case of package designs for non-fissile or fissile excepted uranium hexafluoride, where none of the above codes apply, then the following type codes shall be used:

H(U)	Unilateral approval
H(M)	Multilateral approval;

- (d) For package design and special form radioactive material approval certificates, other than those issued under the transitional provisions of 1.6.6.2 and 1.6.6.3, and for low dispersible radioactive material approval certificates, the symbols "-96" shall be added to the type code.

6.4.23.10

These type codes shall be applied as follows:

- (a) Each certificate and each package shall bear the appropriate identification mark, comprising the symbols prescribed in 6.4.23.9 (a), (b), (c) and (d) above, except that, for packages, only the applicable design type codes including, if applicable, the symbols "-96", shall appear following the second stroke, that is, the "T" or "X" shall not appear in the identification marking on the package. Where the design approval and shipment approval are combined, the applicable type codes do not need to be repeated. For example:

A/132/B(M)F-96: A Type B(M) package design approved for fissile material, requiring multilateral approval, for which the competent authority of Austria has assigned the design number 132 (to be

¹ See the Vienna Convention on Road Traffic (1968).

marked on both the package and on the package design approval certificate);

A/132/B(M)F-96T: The shipment approval issued for a package bearing the identification mark elaborated above (to be marked on the certificate only);

A/137/X: A special arrangement approval issued by the competent authority of Austria, to which the number 137 has been assigned (to be marked on the certificate only);

A/139/IF-96: An industrial package design for fissile material approved by the competent authority of Austria, to which package design number 139 has been assigned (to be marked on both the package and on the package design approval certificate); and

A/145/H(U)-96: A package design for fissile excepted uranium hexafluoride approved by the competent authority of Austria, to which package design number 145 has been assigned (to be marked on both the package and on the package design approval certificate);

- (b) Where multilateral approval is effected by validation according to 6.4.23.16, only the identification mark issued by the country of origin of the design or shipment shall be used. Where multilateral approval is effected by issue of certificates by successive countries, each certificate shall bear the appropriate identification mark and the package whose design was so approved shall bear all appropriate identification marks. For example:

A/132/B(M)F-96
CH/28/B(M)F-96

would be the identification mark of a package which was originally approved by Austria and was subsequently approved, by separate certificate, by Switzerland. Additional identification marks would be tabulated in a similar manner on the package;

- (c) The revision of a certificate shall be indicated by a parenthetical expression following the identification mark on the certificate. For example, A/132/B(M)F-96 (Rev.2) would indicate revision 2 of the Austrian package design approval certificate; or A/132/B(M)F-96 (Rev.0) would indicate the original issuance of the Austrian package design approval certificate. For original issuances, the parenthetical entry is optional and other words such as "original issuance" may also be used in place of "Rev.0". Certificate revision numbers may only be issued by the country issuing the original approval certificate;
- (d) Additional symbols (as may be necessitated by national regulations) may be added in brackets to the end of the identification mark; for example, A/132/B(M)F-96(SP503);
- (e) It is not necessary to alter the identification mark on the packaging each time that a revision to the design certificate is made. Such re-marking shall be required only in those cases where the revision to the package design certificate involves a change in the letter type codes for the package design following the second stroke.

- 6.4.23.11 Each approval certificate issued by a competent authority for special form radioactive material or low dispersible radioactive material shall include the following information:
- (a) Type of certificate;
 - (b) The competent authority identification mark;
 - (c) The issue date and an expiry date;
 - (d) List of applicable national and international regulations, including the edition of the IAEA Regulations for the Safe Transport of Radioactive Material under which the special form radioactive material or low dispersible radioactive material is approved;
 - (e) The identification of the special form radioactive material or low dispersible radioactive material;
 - (f) A description of the special form radioactive material or low dispersible radioactive material;
 - (g) Design specifications for the special form radioactive material or low dispersible radioactive material which may include references to drawings;
 - (h) A specification of the radioactive contents which includes the activities involved and which may include the physical and chemical form;
 - (i) A specification of the applicable quality assurance programme as required in 1.7.3;
 - (j) Reference to information provided by the applicant relating to specific actions to be taken prior to shipment;
 - (k) If deemed appropriate by the competent authority, reference to the identity of the applicant;
 - (l) Signature and identification of the certifying official.
- 6.4.23.12 Each approval certificate issued by a competent authority for a special arrangement shall include the following information:
- (a) Type of certificate;
 - (b) The competent authority identification mark;
 - (c) The issue date and an expiry date;
 - (d) Mode(s) of carriage;
 - (e) Any restrictions on the modes of carriage, type of vehicle, container, and any necessary routeing instructions;
 - (f) List of applicable national and international regulations, including the edition of the IAEA Regulations for the Safe Transport of Radioactive Material under which the special arrangement is approved;
 - (g) The following statement:

"This certificate does not relieve the consignor from compliance with any requirement of the government of any country through or into which the package will be carried.";

- (h) References to certificates for alternative radioactive contents, other competent authority validation, or additional technical data or information, as deemed appropriate by the competent authority;
- (i) Description of the packaging by a reference to the drawings or a specification of the design. If deemed appropriate by the competent authority, a reproducible illustration, not larger than 21 cm by 30 cm, showing the make-up of the package shall also be provided, accompanied by a brief description of the packaging, including materials of manufacture, gross mass, general outside dimensions and appearance;
- (j) A specification of the authorized radioactive contents, including any restrictions on the radioactive contents which might not be obvious from the nature of the packaging. This shall include the physical and chemical forms, the activities involved (including those of the various isotopes, if appropriate), amounts in grams (for fissile material or for each fissile nuclide when appropriate), and whether special form radioactive material or low dispersible radioactive material, if applicable;
- (k) Additionally, for packages containing fissile material:
 - (i) a detailed description of the authorized radioactive contents;
 - (ii) the value of the criticality safety index;
 - (iii) reference to the documentation that demonstrates the criticality safety of the contents;
 - (iv) any special features, on the basis of which the absence of water from certain void spaces has been assumed in the criticality assessment;
 - (v) any allowance (based on 6.4.11.4 (b)) for a change in neutron multiplication assumed in the criticality assessment as a result of actual irradiation experience; and
 - (vi) the ambient temperature range for which the special arrangement has been approved;
- (l) A detailed listing of any supplementary operational controls required for preparation, loading, carriage, unloading and handling of the consignment, including any special stowage provisions for the safe dissipation of heat;
- (m) If deemed appropriate by the competent authority, reasons for the special arrangement;
- (n) Description of the compensatory measures to be applied as a result of the shipment being under special arrangement;
- (o) Reference to information provided by the applicant relating to the use of the packaging or specific actions to be taken prior to the shipment;
- (p) A statement regarding the ambient conditions assumed for purposes of design if these are not in accordance with those specified in 6.4.8.5, 6.4.8.6, and 6.4.8.15, as applicable;
- (q) Any emergency arrangements deemed necessary by the competent authority;
- (r) A specification of the applicable quality assurance programme as required in 1.7.3;

- (s) If deemed appropriate by the competent authority, reference to the identity of the applicant and to the identity of the carrier;
- (t) Signature and identification of the certifying official.

6.4.23.13 Each approval certificate for a shipment issued by a competent authority shall include the following information:

- (a) Type of certificate;
- (b) The competent authority identification mark(s);
- (c) The issue date and an expiry date;
- (d) List of applicable national and international regulations, including the edition of the IAEA Regulations for the Safe Transport of Radioactive Material under which the shipment is approved;
- (e) Any restrictions on the modes of carriage, type of vehicle, container, and any necessary routeing instructions;
- (f) The following statement:
"This certificate does not relieve the consignor from compliance with any requirement of the government of any country through or into which the package will be carried.";
- (g) A detailed listing of any supplementary operational controls required for preparation, loading, carriage, unloading and handling of the consignment, including any special stowage provisions for the safe dissipation of heat or maintenance of criticality safety;
- (h) Reference to information provided by the applicant relating to specific actions to be taken prior to shipment;
- (i) Reference to the applicable design approval certificate(s);
- (j) A specification of the actual radioactive contents, including any restrictions on the radioactive contents which might not be obvious from the nature of the packaging. This shall include the physical and chemical forms, the total activities involved (including those of the various isotopes, if appropriate), amounts in grams (for fissile material or for each fissile nuclide when appropriate), and whether special form radioactive material or low dispersible radioactive material, if applicable;
- (k) Any emergency arrangements deemed necessary by the competent authority;
- (l) A specification of the applicable quality assurance programme as required in 1.7.3;
- (m) If deemed appropriate by the competent authority, reference to the identity of the applicant;
- (n) Signature and identification of the certifying official.

6.4.23.14 Each approval certificate of the design of a package issued by a competent authority shall include the following information:

- (a) Type of certificate;
- (b) The competent authority identification mark;

- (c) The issue date and an expiry date;
- (d) Any restriction on the modes of carriage, if appropriate;
- (e) List of applicable national and international regulations, including the edition of the IAEA Regulations for the Safe Transport of Radioactive Material under which the design is approved;
- (f) The following statement;

"This certificate does not relieve the consignor from compliance with any requirement of the government of any country through or into which the package will be carried.";
- (g) References to certificates for alternative radioactive contents, other competent authority validation, or additional technical data or information, as deemed appropriate by the competent authority;
- (h) A statement authorizing shipment where shipment approval is required under 5.1.5.1.2, if deemed appropriate;
- (i) Identification of the packaging;
- (j) Description of the packaging by a reference to the drawings or specification of the design. If deemed appropriate by the competent authority, a reproducible illustration, not larger than 21 cm by 30 cm, showing the make-up of the package shall also be provided, accompanied by a brief description of the packaging, including materials of manufacture, gross mass, general outside dimensions and appearance;
- (k) Specification of the design by reference to the drawings;
- (l) A specification of the authorized radioactive content, including any restrictions on the radioactive contents which might not be obvious from the nature of the packaging. This shall include the physical and chemical forms, the activities involved (including those of the various isotopes, if appropriate), amounts in grams (for fissile material or for each fissile nuclide when appropriate), and whether special form radioactive material or low dispersible radioactive material, if applicable;
- (m) A description of the containment system;
- (n) Additionally, for packages containing fissile material:
 - (i) a detailed description of the authorized radioactive contents;
 - (ii) a description of the confinement system;
 - (iii) the value of the criticality safety index;
 - (iv) reference to the documentation that demonstrates the criticality safety of the contents;
 - (v) any special features, on the basis of which the absence of water from certain void spaces has been assumed in the criticality assessment;
 - (vi) any allowance (based on 6.4.11.4 (b)) for a change in neutron multiplication assumed in the criticality assessment as a result of actual irradiation experience; and
 - (vii) the ambient temperature range for which the package design has been approved;

- (o) For Type B(M) packages, a statement specifying those requirements of 6.4.7.5, 6.4.8.4, 6.4.8.5, 6.4.8.6 and 6.4.8.9 to 6.4.8.15 with which the package does not conform and any amplifying information which may be useful to other competent authorities;
- (p) For packages containing more than 0.1 kg of uranium hexafluoride, a statement specifying those prescriptions of 6.4.6.4 which apply if any and any amplifying information which may be useful to other competent authorities;
- (q) A detailed listing of any supplementary operational controls required for preparation, loading, carriage, unloading and handling of the consignment, including any special stowage provisions for the safe dissipation of heat;
- (r) Reference to information provided by the applicant relating to the use of the packaging or specific actions to be taken prior to shipment;
- (s) A statement regarding the ambient conditions assumed for purposes of design if these are not in accordance with those specified in 6.4.8.5, 6.4.8.6 and 6.4.8.15, as applicable;
- (t) A specification of the applicable quality assurance programme as required in 1.7.3;
- (u) Any emergency arrangements deemed necessary by the competent authority;
- (v) If deemed appropriate by the competent authority, reference to the identity of the applicant;
- (w) Signature and identification of the certifying official.

6.4.23.15 The competent authority shall be informed of the serial number of each packaging manufactured to a design approved by them under 1.6.6.2.1, 1.6.6.2.2, 6.4.22.2, 6.4.22.3 and 6.4.22.4.

6.4.23.16 Multilateral approval may be by validation of the original certificate issued by the competent authority of the country of origin of the design or shipment. Such validation may take the form of an endorsement on the original certificate or the issuance of a separate endorsement, annex, supplement, etc., by the competent authority of the country through or into which the shipment is made.

CHAPTER 6.5

REQUIREMENTS FOR THE CONSTRUCTION AND TESTING OF INTERMEDIATE BULK CONTAINERS (IBCs)

6.5.1 General requirements

6.5.1.1 Scope

6.5.1.1.1 The requirements of this Chapter apply to intermediate bulk containers (IBCs) the use of which is expressly authorized for the carriage of certain dangerous goods according to the packing instructions indicated in Column (8) of Table A in Chapter 3.2. Portable tanks and tank-containers which meet the requirements of Chapter 6.7 or 6.8 respectively are not considered to be IBCs. IBCs which meet the requirements of this Chapter are not considered to be containers for the purposes of ADR. The letters IBC only will be used in the rest of the text to refer to intermediate bulk containers.

6.5.1.1.2 Exceptionally, IBCs and their service equipment not conforming strictly to the requirements herein, but having acceptable alternatives, may be considered by the competent authority for approval. In addition, in order to take into account progress in science and technology, the use of alternative arrangements which offer at least equivalent safety in use in respect of compatibility with the properties of the substances carried and equivalent or superior resistance to impact, loading and fire, may be considered by the competent authority.

6.5.1.1.3 The construction, equipment, testing, marking and operation of IBCs shall be subject to acceptance by the competent authority of the country in which the IBCs are approved.

***NOTE:** Parties performing inspections and tests in other countries, after the IBC has been put into service, need not be accepted by the competent authority of the country in which the IBC has been approved, but the inspections and tests have to be performed according to the rules specified in the IBC's approval.*

6.5.1.1.4 Manufacturers and subsequent distributors of IBCs shall provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that IBCs as presented for carriage are capable of passing the applicable performance tests of this Chapter.

6.5.1.2 (Reserved)

6.5.1.3 (Reserved)

6.5.1.4 Designatory code system for IBCs

6.5.1.4.1 The code shall consist of two Arabic numerals as specified in (a), followed by a capital letter(s) specified in (b), followed, when specified in an individual section, by an Arabic numeral indicating the category of IBC.

(a)	Type	For solids, filled or discharged		For liquids
		by gravity	under pressure of more than 10 kPa (0.1 bar)	
	Rigid	11	21	31
	Flexible	13	-	-

(b) Materials

- A. Steel (all types and surface treatments)
- B. Aluminium
- C. Natural wood
- D. Plywood
- F. Reconstituted wood
- G. Fibreboard
- H. Plastics material
- L. Textile
- M. Paper, multiwall
- N. Metal (other than steel or aluminium).

6.5.1.4.2 For composite IBCs, two capital letters in Latin characters shall be used in sequence in the second position of the code. The first shall indicate the material of the inner receptacle of the IBC and the second that of the outer packaging of the IBC.

6.5.1.4.3 The following types and codes of IBC are assigned:

Material	Category	Code	Sub-section
Metal			
A. Steel	for solids, filled or discharged by gravity	11A	6.5.5.1
	for solids, filled or discharged under pressure	21A	
	for liquids	31A	
B. Aluminium	for solids, filled or discharged by gravity	11B	
	for solids, filled or discharged under pressure	21B	
	for liquids	31B	
N. Other than steel or aluminium	for solids, filled or discharged by gravity	11N	
	for solids, filled or discharged under pressure	21N	
	for liquids	31N	
Flexible			
H. Plastics	woven plastics without coating or liner	13H1	6.5.5.2
	woven plastics, coated	13H2	
	woven plastics with liner	13H3	
	woven plastics, coated and with liner	13H4	
	plastics film	13H5	
L. Textile	without coating or liner	13L1	
	coated	13L2	
	with liner	13L3	
	coated and with liner	13L4	
M. Paper	multiwall	13M1	
	multiwall, water resistant	13M2	
H. Rigid plastics	for solids, filled or discharged by gravity, fitted with structural equipment	11H1	6.5.5.3
	for solids, filled or discharged by gravity, freestanding	11H2	
	for solids, filled or discharged under pressure, fitted with structural equipment	21H1	
	for solids, filled or discharged under pressure, freestanding	21H2	
	for liquids, fitted with structural equipment	31H1	
	for liquids, freestanding	31H2	

Material	Category	Code	Sub-section
HZ. Composite with plastics inner receptacle ^a	for solids, filled or discharged by gravity, with rigid plastics inner receptacle	11HZ1	6.5.5.4
	for solids, filled or discharged by gravity, with flexible plastics inner receptacle	11HZ2	
	for solids, filled or discharged under pressure, with rigid plastics inner receptacle	21HZ1	
	for solids, filled or discharged under pressure, with flexible plastics inner receptacle	21HZ2	
	for liquids, with rigid plastics inner receptacle	31HZ1	
	for liquids, with flexible plastics inner receptacle	31HZ2	
G. Fibreboard	for solids, filled or discharged by gravity	11G	6.5.5.5
Wooden			
C. Natural wood	for solids, filled or discharged by gravity with inner liner	11C	6.5.5.6
D. Plywood	for solids, filled or discharged by gravity, with inner liner	11D	
F. Reconstituted wood	for solids, filled or discharged by gravity, with inner liner	11F	

^a The code shall be completed by replacing the letter Z by a capital letter in accordance with 6.5.1.4.1 (b) to indicate the nature of the material used for the outer casing.

6.5.1.4.4 The letter "W" may follow the IBC code. The letter "W" signifies that the IBC, although of the same type indicated by the code, is manufactured to a specification different from those in 6.5.5 and is considered equivalent in accordance with the requirements in 6.5.1.1.2.

6.5.2 Marking

6.5.2.1 Primary marking

6.5.2.1.1 Each IBC manufactured and intended for use according to ADR shall bear markings which are durable, legible and placed in a location so as to be readily visible. Letters, numerals and symbols shall be at least 12 mm high and shall show:

(a) The United Nations packaging symbol

;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7¹. For metal IBCs on which the marking is stamped or embossed, the capital letters "UN" may be applied instead of the symbol;

(b) The code designating the type of IBC according to 6.5.1.4;

(c) A capital letter designating the packing group(s) for which the design type has been approved:

(i) X for packing groups I, II and III (IBCs for solids only);

(ii) Y for packing groups II and III;

¹ This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

- (iii) Z for packing group III only;
- (d) The month and year (last two digits) of manufacture;
- (e) The State authorizing the allocation of the mark; indicated by the distinguishing sign for motor vehicles in international traffic²;
- (f) The name or symbol of the manufacturer and other identification of the IBC as specified by the competent authority;
- (g) The stacking test load in kg. For IBCs not designed for stacking, the figure "0" shall be shown;
- (h) The maximum permissible gross mass in kg.

The primary marking required above shall be applied in the sequence of the subparagraphs below. The marking required by 6.5.2.2 and any further marking authorized by a competent authority shall still enable the parts of the mark to be correctly identified.

Each element of the marking applied in accordance with (a) to (h) and with 6.5.2.2 shall be clearly separated, e.g. by a slash or space, so as to be easily identifiable.

6.5.2.1.2 *Examples of markings for various types of IBC in accordance with 6.5.2.1.1 (a) to (h) above:*

	11A/Y/02 99 NL/Mulder 007 5500/1500	For a metal IBC for solids discharged by gravity and made from steel/for packing groups II and III/ manufactured in February 1999/authorized by the Netherlands/manufactured by Mulder and of a design type to which the competent authority has allocated serial number 007/the stacking test load in kg/the maximum permissible gross mass in kg.
	13H3/Z/03 01 F/Meunier 1713 0/1500	For a flexible IBC for solids discharged for instance by gravity and made from woven plastics with a liner/not designed to be stacked.
	31H1/Y/04 99 GB/9099 10800/1200	For a rigid plastics IBC for liquids made from plastics with structural equipment withstanding the stack load.
	31HA1/Y/05 01 D/Muller 1683 10800/1200	For a composite IBC for liquids with a rigid plastics inner receptacle and a steel outer casing.
	11C/X/01 02 S/Aurigny 9876 3000/910	For a wooden IBC for solids with an inner liner authorized for packing groups I, II and III solids.

² *Distinguishing sign for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).*

6.5.2.2 Additional marking

6.5.2.2.1 Each IBC shall bear the markings required in 6.5.2.1 and, in addition, the following information which may appear on a corrosion-resistant plate permanently attached in a place readily accessible for inspection:

Additional marking	Category of IBC				
	Metal	Rigid plastics	Composite	Fibreboard	Wooden
Capacity in litres ^a at 20 °C	X	X	X		
Tare mass in kg ^a	X	X	X	X	X
Test (gauge) pressure, in kPa or bar ^a , if applicable		X	X		
Maximum filling / discharge pressure in kPa or bar ^a , if applicable	X	X	X		
Body material and its minimum thickness in mm	X				
Date of last leakproofness test, if applicable (month and year)	X	X	X		
Date of last inspection (month and year)	X	X	X		
Serial number of the manufacturer	X				
Maximum permitted stacking load ^b	X	X	X	X	X

^a The unit used shall be indicated.

^b See 6.5.2.2.2. This additional marking shall apply to all IBCs manufactured, repaired or remanufactured as from 1 January 2011 (see also 1.6.1.15).

6.5.2.2.2 The maximum permitted stacking load applicable when the IBC is in use shall be displayed on a symbol as follows:

The symbol shall be not less than 100 mm × 100 mm, be durable and clearly visible. The letters and numbers indicating the mass shall be at least 12 mm high.

The mass marked above the symbol shall not exceed the load imposed during the design type test (see 6.5.6.6.4) divided by 1.8.

NOTE: The provisions of 6.5.2.2.2 shall apply to all IBCs manufactured, repaired or remanufactured as from 1 January 2011 (see also 1.6.1.15).

- 6.5.2.2.3 In addition to the markings required in 6.5.2.1, flexible IBCs may bear a pictogram indicating recommended lifting methods.
- 6.5.2.2.4 The inner receptacle of composite IBCs manufactured after 1 January 2011 shall bear the markings indicated in 6.5.2.1.1 (b), (c), (d) where this date is that of the manufacture of the plastics inner receptacle, (e) and (f). The UN packaging symbol shall not be applied. The marking shall be applied in the sequence shown in 6.5.2.1.1. It shall be durable, legible and placed in a location so as to be readily visible when the inner receptacle is placed in the outer casing.

The date of the manufacture of the plastics inner receptacle may alternatively be marked on the inner receptacle adjacent to the remainder of the marking. An example of an appropriate marking method is:

- 6.5.2.2.5 Where a composite IBCs is designed in such a manner that the outer casing is intended to be dismantled for carriage when empty (such as for return of the IBC for reuse to the original consignor), each of the parts intended to be detached when so dismantled shall be marked with the month and year of manufacture and the name or symbol of the manufacturer and other identification of the IBC as specified by the competent authority (see 6.5.2.1.1 (f)).

6.5.2.3 *Conformity to design type*

The marking indicates that IBCs correspond to a successfully tested design type and that the requirements referred to in the certificate have been met.

6.5.2.4 *Marking of remanufactured composite IBCs (31HZ1)*

The marking specified in 6.5.2.1.1 and 6.5.2.2 shall be removed from the original IBC or made permanently illegible and new markings shall be applied to an IBC remanufactured in accordance with ADR.

6.5.3 Construction requirements

6.5.3.1 *General requirements*

- 6.5.3.1.1 IBCs shall be resistant to or adequately protected from deterioration due to the external environment.
- 6.5.3.1.2 IBCs shall be so constructed and closed that none of the contents can escape under normal conditions of carriage including the effect of vibration, or by changes in temperature, humidity or pressure.
- 6.5.3.1.3 IBCs and their closures shall be constructed of materials compatible with their contents, or be protected internally, so that they are not liable:
- (a) To be attacked by the contents so as to make their use dangerous;
 - (b) To cause the contents to react or decompose, or form harmful or dangerous compounds with the IBCs.

- 6.5.3.1.4 Gaskets, where used, shall be made of materials not subject to attack by the contents of the IBCs.
- 6.5.3.1.5 All service equipment shall be so positioned or protected as to minimize the risk of escape of the contents owing to damage during handling and carriage.
- 6.5.3.1.6 IBCs, their attachments and their service and structural equipment shall be designed to withstand, without loss of contents, the internal pressure of the contents and the stresses of normal handling and carriage. IBCs intended for stacking shall be designed for stacking. Any lifting or securing features of IBCs shall be of sufficient strength to withstand the normal conditions of handling and carriage without gross distortion or failure and shall be so positioned that no undue stress is caused in any part of the IBC.
- 6.5.3.1.7 Where an IBC consists of a body within a framework it shall be so constructed that:
- (a) The body does not chafe or rub against the framework so as to cause material damage to the body;
 - (b) The body is retained within the framework at all times;
 - (c) The items of equipment are fixed in such a way that they cannot be damaged if the connections between body and frame allow relative expansion or movement.
- 6.5.3.1.8 Where a bottom discharge valve is fitted, it shall be capable of being made secure in the closed position and the whole discharge system shall be suitably protected from damage. Valves having lever closures shall be able to be secured against accidental opening and the open or closed position shall be readily apparent. For IBCs containing liquids, a secondary means of sealing the discharge aperture shall also be provided, e.g. a blank flange or equivalent device.

6.5.4 Testing, certification and inspection

- 6.5.4.1 *Quality assurance:* the IBCs shall be manufactured, remanufactured, repaired and tested under a quality assurance programme which satisfies the competent authority, in order to ensure that each manufactured, remanufactured or repaired IBC meets the requirements of this Chapter.

NOTE: ISO 16106:2006 "Packaging – Transport packages for dangerous goods – Dangerous goods packagings, intermediate bulk containers (IBCs) and large packagings – Guidelines for the application of ISO 9001" provides acceptable guidance on procedures which may be followed.

- 6.5.4.2 *Test requirements:* IBCs shall be subject to design type tests and, if applicable, to initial and periodic inspections and tests in accordance with 6.5.4.4.
- 6.5.4.3 *Certification:* in respect of each design type of IBC a certificate and mark (as in 6.5.2) shall be issued attesting that the design type, including its equipment, meets the test requirements.

6.5.4.4 Inspection and testing

NOTE: See also 6.5.4.5 for tests and inspections on repaired IBCs.

6.5.4.4.1 Every metal, rigid plastics and composite IBC shall be inspected to the satisfaction of the competent authority:

(a) Before it is put into service (including after remanufactured), and thereafter at intervals not exceeding five years, with regard to:

- (i) conformity to design type including marking;
- (ii) internal and external condition;
- (iii) proper functioning of service equipment.

Thermal insulation, if any, need be removed only to the extent necessary for a proper examination of the body of the IBC.

- (b) At intervals of not more than two and a half years, with regard to:
- (i) external condition;
 - (ii) proper functioning of service equipment.

Thermal insulation, if any, need be removed only to the extent necessary for a proper examination of the body of the IBC.

Each IBC shall correspond in all respects to its design type.

6.5.4.4.2 Every metal, rigid plastics and composite IBC for liquids, or for solids which are filled or discharged under pressure, shall undergo a suitable leakproofness test at least equally effective as the test prescribed in 6.5.6.7.3 and be capable of meeting the test level indicated in 6.5.6.7.3:

- (a) Before it is first used for carriage;
- (b) At intervals of not more than two and a half years.

For this test the IBC shall be fitted with the primary bottom closure. The inner receptacle of a composite IBC may be tested without the outer casing, provided that the test results are not affected.

6.5.4.4.3 A report of each inspection and test shall be kept by the owner of the IBC at least until the next inspection or test. The report shall include the results of the inspection and test and shall identify the party performing the inspection and test (see also the marking requirements in 6.5.2.2.1).

6.5.4.4.4 The competent authority may at any time require proof, by tests in accordance with this Chapter, that IBCs meet the requirements of the design type tests.

6.5.4.5 *Repaired IBCs*

6.5.4.5.1 When an IBC is impaired as a result of impact (e.g. accident) or any other cause, it shall be repaired or otherwise maintained (see definition of "*Routine maintenance of IBCs*" in 1.2.1), so as to conform to the design type. The bodies of rigid plastics IBCs and the inner receptacles of composite IBCs that are impaired shall be replaced.

- 6.5.4.5.2 In addition to any other testing and inspection requirements in ADR, an IBC shall be subjected to the full testing and inspection requirements set out in 6.5.4.4, and the required reports shall be prepared, whenever it is repaired.
- 6.5.4.5.3 The Party performing the tests and inspections after the repair shall durably mark the IBC near the manufacturer's UN design type marking to show:
- (a) The State in which the tests and inspections were carried out;
 - (b) The name or authorized symbol of the party performing the tests and inspections; and
 - (c) The date (month, year) of the tests and inspections.
- 6.5.4.5.4 Test and inspections performed in accordance with 6.5.4.5.2 may be considered to satisfy the requirements for the two and a half and five year periodic tests and inspections.

6.5.5 Specific requirements for IBCs

6.5.5.1 *Specific requirements for metal IBCs*

- 6.5.5.1.1 These requirements apply to metal IBCs intended for the carriage of solids and liquids. There are three categories of metal IBCs:
- (a) Those for solids which are filled or discharged by gravity (11A, 11B, 11N);
 - (b) Those for solids which are filled or discharged at a gauge pressure greater than 10 kPa (0.1 bar) (21A, 21B, 21N); and
 - (c) Those for liquids (31A, 31B, 31N).
- 6.5.5.1.2 Bodies shall be made of suitable ductile metal in which the weldability has been fully demonstrated. Welds shall be skilfully made and afford complete safety. Low-temperature performance of the material shall be taken into account when appropriate.
- 6.5.5.1.3 Care shall be taken to avoid damage by galvanic action due to the juxtaposition of dissimilar metals.
- 6.5.5.1.4 Aluminium IBCs intended for the carriage of flammable liquids shall have no movable parts, such as covers, closures, etc., made of unprotected steel liable to rust, which might cause a dangerous reaction by coming into frictional or percussive contact with the aluminium.
- 6.5.5.1.5 Metal IBCs shall be made of metals which meet the following requirements:
- (a) for steel the elongation at fracture, in %, shall not be less than $\frac{10000}{R_m}$ with an absolute minimum of 20%;

where R_m = guaranteed minimum tensile strength of the steel to be used, in N/mm²;
 - (b) for aluminium and its alloy the elongation at fracture, in %, shall not be less than $\frac{10000}{6R_m}$ with an absolute minimum of 8%.
- Specimens used to determine the elongation at fracture shall be taken transversely to the direction of rolling and be so secured that:

$$L_o = 5d \quad \text{or}$$

$$L_o = 5.65\sqrt{A}$$

where: L_o = gauge length of the specimen before the test

d = diameter

A = cross-sectional area of test specimen.

6.5.5.1.6 Minimum wall thickness:

- (a) for a reference steel having a product of $R_m \times A_o = 10\,000$, the wall thickness shall not be less than:

Capacity (C) in litres	Wall thickness (T) in mm			
	Types 11A, 11B, 11N		Types 21A, 21B, 21N, 31A, 31B, 31N	
	Unprotected	Protected	Unprotected	Protected
$C \leq 1000$	2.0	1.5	2.5	2.0
$1000 < C \leq 2000$	$T = C/2000 + 1.5$	$T = C/2000 + 1.0$	$T = C/2000 + 2.0$	$T = C/2000 + 1.5$
$2000 < C \leq 3000$	$T = C/2000 + 1.5$	$T = C/2000 + 1.0$	$T = C/1000 + 1.0$	$T = C/2000 + 1.5$

where: A_o = minimum elongation (as a percentage) of the reference steel to be used on fracture under tensile stress (see 6.5.5.1.5);

- (b) for metals other than the reference steel described in (a), the minimum wall thickness is given by the following equivalence formula:

$$e_1 = \frac{21.4 \times e_0}{\sqrt[3]{R_{m1} \times A_1}}$$

where: e_1 = required equivalent wall thickness of the metal to be used (in mm);

e_0 = required minimum wall thickness for the reference steel (in mm);

R_{m1} = guaranteed minimum tensile strength of the metal to be used (in N/mm^2) (see (c));

A_1 = minimum elongation (as a percentage) of the metal to be used on fracture under tensile stress (see 6.5.5.1.5).

However, in no case shall the wall thickness be less than 1.5 mm.

- (c) For purposes of the calculation described in (b), the guaranteed minimum tensile strength of the metal to be used (R_{m1}) shall be the minimum value according to national or international material standards. However, for austenitic steels, the specified value for R_m according to the material standards may be increased by up to 15% when a greater value is attested in the material inspection certificate. When no material standard exists for the material in question, the value of R_m shall be the minimum value attested in the material inspection certificate.

6.5.5.1.7 Pressure-relief requirements: IBCs for liquids shall be capable of releasing a sufficient amount of vapour in the event of fire engulfment to ensure that no rupture of the body will occur. This can be achieved by conventional pressure relief devices or by other constructional means. The start-to-discharge pressure shall not be higher than 65 kPa

(0.65 bar) and no lower than the total gauge pressure experienced in the IBC (i.e. the vapour pressure of the filling substance plus the partial pressure of the air or other inert gases, minus 100 kPa (1 bar)) at 55 °C, determined on the basis of a maximum degree of filling as defined in 4.1.1.4. The required relief devices shall be fitted in the vapour space.

6.5.5.2 *Specific requirements for flexible IBCs*

6.5.5.2.1 These requirements apply to flexible IBCs of the following types:

13H1	woven plastics without coating or liner
13H2	woven plastics, coated
13H3	woven plastics with liner
13H4	woven plastics, coated and with liner
13H5	plastics film
13L1	textile without coating or liner
13L2	textile, coated
13L3	textile with liner
13L4	textile, coated and with liner
13M1	paper, multiwall
13M2	paper, multiwall, water resistant

Flexible IBCs are intended for the carriage of solids only.

6.5.5.2.2 Bodies shall be manufactured from suitable materials. The strength of the material and the construction of the flexible IBC shall be appropriate to its capacity and its intended use.

6.5.5.2.3 All materials used in the construction of flexible IBCs of types 13M1 and 13M2 shall, after complete immersion in water for not less than 24 hours, retain at least 85% of the tensile strength as measured originally on the material conditioned to equilibrium at 67% relative humidity or less.

6.5.5.2.4 Seams shall be formed by stitching, heat sealing, gluing or any equivalent method. All stitched seam-ends shall be secured.

6.5.5.2.5 Flexible IBCs shall provide adequate resistance to ageing and to degradation caused by ultraviolet radiation or the climatic conditions, or by the substance contained, thereby rendering them appropriate to their intended use.

6.5.5.2.6 For flexible plastics IBCs where protection against ultraviolet radiation is required, it shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the body. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, re-testing may be waived if changes in the carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.

6.5.5.2.7 Additives may be incorporated into the material of the body to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.

6.5.5.2.8 No material recovered from used receptacles shall be used in the manufacture of IBC bodies. Production residues or scrap from the same manufacturing process may, however, be used. Component parts such as fittings and pallet bases may also be used provided such components have not in any way been damaged in previous use.

6.5.5.2.9 When filled, the ratio of height to width shall be not more than 2:1.

6.5.5.2.10 The liner shall be made of a suitable material. The strength of the material used and the construction of the liner shall be appropriate to the capacity of the IBC and the intended use. Joints and closures shall be siftproof and capable of withstanding pressures and impacts liable to occur under normal conditions of handling and carriage.

6.5.5.3 *Specific requirements for rigid plastics IBCs*

6.5.5.3.1 These requirements apply to rigid plastics IBCs for the carriage of solids or liquids. Rigid plastics IBCs are of the following types:

- 11H1 fitted with structural equipment designed to withstand the whole load when IBCs are stacked, for solids which are filled or discharged by gravity
- 11H2 freestanding, for solids which are filled or discharged by gravity
- 21H1 fitted with structural equipment designed to withstand the whole load when IBCs are stacked, for solids which are filled or discharged under pressure
- 21H2 freestanding, for solids which are filled or discharged under pressure
- 31H1 fitted with structural equipment designed to withstand the whole load when IBCs are stacked, for liquids
- 31H2 freestanding, for liquids.

6.5.5.3.2 The body shall be manufactured from suitable plastics material of known specifications and be of adequate strength in relation to its capacity and its intended use. The material shall be adequately resistant to ageing and to degradation caused by the substance contained or, where relevant, by ultraviolet radiation. Low temperature performance shall be taken into account when appropriate. Any permeation of the substance contained shall not constitute a danger under normal conditions of carriage.

6.5.5.3.3 Where protection against ultraviolet radiation is required, it shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the body. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, re-testing may be waived if changes in the carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.

6.5.5.3.4 Additives may be incorporated in the material of the body to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.

6.5.5.3.5 No used material other than production residues or regrind from the same manufacturing process may be used in the manufacture of rigid plastics IBCs.

6.5.5.4 *Specific requirements for composite IBCs with plastics inner receptacles*

6.5.5.4.1 These requirements apply to composite IBCs for the carriage of solids and liquids of the following types:

- 11HZ1 Composite IBCs with a rigid plastics inner receptacle, for solids filled or discharged by gravity
- 11HZ2 Composite IBCs with a flexible plastics inner receptacle, for solids filled or discharged by gravity
- 21HZ1 Composite IBCs with a rigid plastics inner receptacle, for solids filled or discharged under pressure
- 21HZ2 Composite IBCs with a flexible plastics inner receptacle, for solids filled or discharged under pressure
- 31HZ1 Composite IBCs with a rigid plastics inner receptacle, for liquids
- 31HZ2 Composite IBCs with a flexible plastics inner receptacle, for liquids.

This code shall be completed by replacing the letter Z by a capital letter in accordance with 6.5.1.4.1 (b) to indicate the nature of the material used for the outer casing.

- 6.5.5.4.2 The inner receptacle is not intended to perform a containment function without its outer casing. A "rigid" inner receptacle is a receptacle which retains its general shape when empty without closures in place and without benefit of the outer casing. Any inner receptacle that is not "rigid" is considered to be "flexible".
- 6.5.5.4.3 The outer casing normally consists of rigid material formed so as to protect the inner receptacle from physical damage during handling and carriage but is not intended to perform the containment function. It includes the base pallet where appropriate.
- 6.5.5.4.4 A composite IBC with a fully enclosing outer casing shall be so designed that the integrity of the inner receptacle may be readily assessed following the leakproofness and hydraulic pressure tests.
- 6.5.5.4.5 IBCs of type 31HZ2 shall be limited to a capacity of not more than 1 250 litres.
- 6.5.5.4.6 The inner receptacle shall be manufactured from suitable plastics material of known specifications and be of adequate strength in relation to its capacity and its intended use. The material shall be adequately resistant to ageing and to degradation caused by the substance contained or, where relevant, by ultraviolet radiation. Low temperature performance shall be taken into account when appropriate. Any permeation of the substance contained shall not constitute a danger under normal conditions of carriage.
- 6.5.5.4.7 Where protection against ultraviolet radiation is required, it shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the inner receptacle. Where use is made of carbon black, pigments or inhibitors, other than those used in the manufacture of the tested design type, retesting may be waived if changes in carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.
- 6.5.5.4.8 Additives may be incorporated in the material of the inner receptacle to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.
- 6.5.5.4.9 No used material other than production residues or regrind from the same manufacturing process may be used in the manufacture of inner receptacles.
- 6.5.5.4.10 The inner receptacle of IBCs type 31HZ2 shall consist of at least three plies of film.
- 6.5.5.4.11 The strength of the material and the construction of the outer casing shall be appropriate to the capacity of the composite IBC and its intended use.
- 6.5.5.4.12 The outer casing shall be free of any projection that might damage the inner receptacle.
- 6.5.5.4.13 Metal outer casings shall be constructed of a suitable metal of adequate thickness.
- 6.5.5.4.14 Outer casings of natural wood shall be of well seasoned wood, commercially dry and free from defects that would materially lessen the strength of any part of the casing. The tops and bottoms may be made of water resistant reconstituted wood such as hardboard, particle board or other suitable type.
- 6.5.5.4.15 Outer casings of plywood shall be made of well seasoned rotary cut, sliced or sawn veneer, commercially dry and free from defects that would materially lessen the strength of the casing. All adjacent plies shall be glued with water resistant adhesive. Other suitable

materials may be used with plywood for the construction of casings. Casings shall be firmly nailed or secured to corner posts or ends or be assembled by equally suitable devices.

- 6.5.5.4.16 The walls of outer casings of reconstituted wood shall be made of water resistant reconstituted wood such as hardboard, particle board or other suitable type. Other parts of the casings may be made of other suitable material.
- 6.5.5.4.17 For fibreboard outer casings, strong and good quality solid or double-faced corrugated fibreboard (single or multiwall) shall be used appropriate to the capacity of the casing and to its intended use. The water resistance of the outer surface shall be such that the increase in mass, as determined in a test carried out over 30 minutes by the Cobb method of determining water absorption, is not greater than 155 g/m² (see ISO 535:1991). It shall have proper bending qualities. Fibreboard shall be cut, creased without scoring, and slotted so as to permit assembly without cracking, surface breaks or undue bending. The fluting of corrugated fibreboard shall be firmly glued to the facings.
- 6.5.5.4.18 The ends of fibreboard outer casings may have a wooden frame or be entirely of wood. Reinforcements of wooden battens may be used.
- 6.5.5.4.19 Manufacturing joins in the fibreboard outer casing shall be taped, lapped and glued, or lapped and stitched with metal staples. Lapped joins shall have an appropriate overlap. Where closing is effected by gluing or taping, a water resistant adhesive shall be used.
- 6.5.5.4.20 Where the outer casing is of plastics material, the relevant requirements of 6.5.5.4.6 to 6.5.5.4.9 apply, on the understanding that, in this case, the requirements applicable to the inner receptacle are applicable to the outer casing of composite IBCs.
- 6.5.5.4.21 The outer casing of an IBC type 31HZ2 shall enclose the inner receptacle on all sides.
- 6.5.5.4.22 Any integral pallet base forming part of an IBC or any detachable pallet shall be suitable for mechanical handling with the IBC filled to its maximum permissible gross mass.
- 6.5.5.4.23 The pallet or integral base shall be designed so as to avoid any protrusion of the base of the IBC that might be liable to damage in handling.
- 6.5.5.4.24 The outer casing shall be secured to any detachable pallet to ensure stability in handling and carriage. Where a detachable pallet is used, its top surface shall be free from sharp protrusions that might damage the IBC.
- 6.5.5.4.25 Strengthening devices such as timber supports to increase stacking performance may be used but shall be external to the inner receptacle.
- 6.5.5.4.26 Where IBCs are intended for stacking, the bearing surface shall be such as to distribute the load in a safe manner. Such IBCs shall be designed so that the load is not supported by the inner receptacle.

6.5.5.5 *Specific requirements for fibreboard IBCs*

- 6.5.5.5.1 These requirements apply to fibreboard IBCs for the carriage of solids which are filled or discharged by gravity. Fibreboard IBCs are of the following type: 11G.
- 6.5.5.5.2 Fibreboard IBCs shall not incorporate top lifting devices.
- 6.5.5.5.3 The body shall be made of strong and good quality solid or double-faced corrugated fibreboard (single or multiwall), appropriate to the capacity of the IBC and to its intended use. The water resistance of the outer surface shall be such that the increase in mass, as determined in a test carried out over a period of 30 minutes by the Cobb method of

determining water absorption, is not greater than 155 g/m² (see ISO 535:1991). It shall have proper bending qualities. Fibreboard shall be cut, creased without scoring, and slotted so as to permit assembly without cracking, surface breaks or undue bending. The fluting or corrugated fibreboard shall be firmly glued to the facings.

- 6.5.5.5.4 The walls, including top and bottom, shall have a minimum puncture resistance of 15 J measured according to ISO 3036:1975.
- 6.5.5.5.5 Manufacturing joins in the body of IBCs shall be made with an appropriate overlap and shall be taped, glued, stitched with metal staples or fastened by other means at least equally effective. Where joins are effected by gluing or taping, a water resistant adhesive shall be used. Metal staples shall pass completely through all pieces to be fastened and be formed or protected so that any inner liner cannot be abraded or punctured by them.
- 6.5.5.5.6 The liner shall be made of a suitable material. The strength of the material used and the construction of the liner shall be appropriate to the capacity of the IBC and the intended use. Joins and closures shall be siftproof and capable of withstanding pressures and impacts liable to occur under normal conditions of handling and carriage.
- 6.5.5.5.7 Any integral pallet base forming part of an IBC or any detachable pallet shall be suitable for mechanical handling with the IBC filled to its maximum permissible gross mass.
- 6.5.5.5.8 The pallet or integral base shall be designed so as to avoid any protrusion of the base of the IBC that might be liable to damage in handling.
- 6.5.5.5.9 The body shall be secured to any detachable pallet to ensure stability in handling and carriage. Where a detachable pallet is used, its top surface shall be free from sharp protrusions that might damage the IBC.
- 6.5.5.5.10 Strengthening devices such as timber supports to increase stacking performance may be used but shall be external to the liner.
- 6.5.5.5.11 Where IBCs are intended for stacking, the bearing surface shall be such as to distribute the load in a safe manner.

6.5.5.6 *Specific requirements for wooden IBCs*

- 6.5.5.6.1 These requirements apply to wooden IBCs for the carriage of solids which are filled or discharged by gravity. Wooden IBCs are of the following types:
 - 11C Natural wood with inner liner
 - 11D Plywood with inner liner
 - 11F Reconstituted wood with inner liner.
- 6.5.5.6.2 Wooden IBCs shall not incorporate top lifting devices.
- 6.5.5.6.3 The strength of the materials used and the method of construction of the body shall be appropriate to the capacity and intended use of the IBC.
- 6.5.5.6.4 Natural wood shall be well seasoned, commercially dry and free from defects that would materially lessen the strength of any part of the IBC. Each part of the IBC shall consist of one piece or be equivalent thereto. Parts are considered equivalent to one piece when a suitable method of glued assembly is used (as for instance Lindermann joint, tongue and groove joint, ship lap or rabbet joint); or butt joint with at least two corrugated metal fasteners at each joint, or when other methods at least equally effective are used.

- 6.5.5.6.5 Bodies of plywood shall be at least 3-ply. They shall be made of well seasoned rotary cut, sliced or sawn veneer, commercially dry and free from defects that would materially lessen the strength of the body. All adjacent plies shall be glued with water resistant adhesive. Other suitable materials may be used with plywood for the construction of the body.
- 6.5.5.6.6 Bodies of reconstituted wood shall be made of water resistant reconstituted wood such as hardboard, particle board or other suitable type.
- 6.5.5.6.7 IBCs shall be firmly nailed or secured to corner posts or ends or be assembled by equally suitable devices.
- 6.5.5.6.8 The liner shall be made of a suitable material. The strength of the material used and the construction of the liner shall be appropriate to the capacity of the IBC and the intended use. Joins and closures shall be siftproof and capable of withstanding pressures and impacts liable to occur under normal conditions of handling and carriage.
- 6.5.5.6.9 Any integral pallet base forming part of an IBC or any detachable pallet shall be suitable for mechanical handling with the IBC filled to its maximum permissible gross mass.
- 6.5.5.6.10 The pallet or integral base shall be designed so as to avoid any protrusion of the base of the IBC that might be liable to damage in handling.
- 6.5.5.6.11 The body shall be secured to any detachable pallet to ensure stability in handling and carriage. Where a detachable pallet is used, its top surface shall be free from sharp protrusions that might damage the IBC.
- 6.5.5.6.12 Strengthening devices such as timber supports to increase stacking performance may be used but shall be external to the liner.
- 6.5.5.6.13 Where IBCs are intended for stacking, the bearing surface shall be such as to distribute the load in a safe manner.

6.5.6 Test requirements for IBCs

6.5.6.1 *Performance and frequency of tests*

- 6.5.6.1.1 Each IBC design type shall successfully pass the tests prescribed in this Chapter before being used and being approved by the competent authority allowing the allocation of the mark. An IBC design type is defined by the design, size, material and thickness, manner of construction and means of filling and discharging but may include various surface treatments. It also includes IBCs which differ from the design type only in their lesser external dimensions.
- 6.5.6.1.2 Tests shall be carried out on IBCs prepared for carriage. IBCs shall be filled as indicated in the relevant sections. The substances to be carried in the IBCs may be replaced by other substances except where this would invalidate the results of the tests. For solids, when another substance is used it shall have the same physical characteristics (mass, grain size, etc.) as the substance to be carried. It is permissible to use additives, such as bags of lead shot, to achieve the requisite total package mass, so long as they are placed so that the test results are not affected.

6.5.6.2 *Design type tests*

- 6.5.6.2.1 One IBC of each design type, size, wall thickness and manner of construction shall be submitted to the tests listed in the order shown in 6.5.6.3.7 and as set out in 6.5.6.4 to 6.5.6.13. These design type tests shall be carried out as required by the competent authority.

- 6.5.6.2.2 To prove sufficient chemical compatibility with the contained goods or standard liquids in accordance with 6.5.6.3.3 or 6.5.6.3.5 for rigid plastics IBCs of type 31H2 and for composite IBCs of types 31HH1 and 31HH2, a second IBC can be used when the IBCs are designed to be stacked. In such case both IBCs shall be subjected to a preliminary storage.
- 6.5.6.2.3 The competent authority may permit the selective testing of IBCs which differ only in minor respects from a tested type, e.g. with small reductions in external dimensions.
- 6.5.6.2.4 If detachable pallets are used in the tests, the test report issued in accordance with 6.5.6.14 shall include a technical description of the pallets used.

6.5.6.3 *Preparation of IBCs for testing*

- 6.5.6.3.1 Paper and fibreboard IBCs and composite IBCs with fibreboard outer casings shall be conditioned for at least 24 hours in an atmosphere having a controlled temperature and relative humidity (r.h.). There are three options, one of which shall be chosen. The preferred atmosphere is 23 ± 2 °C and $50\% \pm 2\%$ r.h. The two other options are 20 ± 2 °C and $65\% \pm 2\%$ r.h.; or 27 ± 2 °C and $65\% \pm 2\%$ r.h.

***NOTE:** Average values shall fall within these limits. Short-term fluctuations and measurement limitations may cause individual measurements to vary by up to $\pm 5\%$ relative humidity without significant impairment of test reproducibility.*

- 6.5.6.3.2 Additional steps shall be taken to ascertain that the plastics material used in the manufacture of rigid plastics IBCs (types 31H1 and 31H2) and composite IBCs (types 31HZ1 and 31HZ2) complies respectively with the requirements in 6.5.5.3.2 to 6.5.5.3.4 and 6.5.5.4.6 to 6.5.5.4.9.
- 6.5.6.3.3 To prove there is sufficient chemical compatibility with the contained goods, the sample IBC shall be subjected to a preliminary storage for six months, during which the samples shall remain filled with the substances they are intended to contain or with substances which are known to have at least as severe a stress-cracking, weakening or molecular degradation influence on the plastics materials in question, and after which the samples shall be submitted to the applicable tests listed in the table in 6.5.6.3.7.
- 6.5.6.3.4 Where the satisfactory behaviour of the plastics material has been established by other means, the above compatibility test may be dispensed with. Such procedures shall be at least equivalent to the above compatibility test and recognized by the competent authority.
- 6.5.6.3.5 For polyethylene rigid plastics IBCs (types 31H1 and 31H2) in accordance with 6.5.5.3 and composite IBCs with polyethylene inner receptacle (types 31HZ1 and 31HZ2) in accordance with 6.5.5.4, chemical compatibility with filling liquids assimilated in accordance with 4.1.1.21 may be verified as follows with standard liquids (see 6.1.6).

The standard liquids are representative for the processes of deterioration on polyethylene, as there are softening through swelling, cracking under stress, molecular degradation and combinations thereof.

The sufficient chemical compatibility of the IBCs may be verified by storage of the required test samples for three weeks at 40 °C with the appropriate standard liquid(s); where this standard liquid is water, storage in accordance with this procedure is not required. Storage is not required either for test samples which are used for the stacking test in case of the standard liquids wetting solution and acetic acid. After this storage, the test samples shall undergo the tests prescribed in 6.5.6.4 to 6.5.6.9.

The compatibility test for tert-Butyl hydroperoxide with more than 40% peroxide content and peroxyacetic acids of Class 5.2 shall not be carried out using standard liquids. For these

substances, sufficient chemical compatibility of the test samples shall be verified during a storage period of six months at ambient temperature with the substances they are intended to carry.

Results of the procedure in accordance with this paragraph from polyethylene IBCs can be approved for an equal design type, the internal surface of which is fluorinated.

6.5.6.3.6 For IBC design types, made of polyethylene, as specified in 6.5.6.3.5, which have passed the test in 6.5.6.3.5, the chemical compatibility with filling substances may also be verified by laboratory tests proving that the effect of such filling substances on the test specimens is less than that of the appropriate standard liquid(s) taking into account the relevant processes of deterioration. The same conditions as those set out in 4.1.1.21.2 shall apply with respect to relative density and vapour pressure.

6.5.6.3.7 *Design type tests required and sequential order*

Type of IBC	Vibration ^f	Bottom lift	Top lift ^a	Stacking ^b	Leak-proofness	Hydraulic pressure	Drop	Tear	Topple	Righting ^c
Metal:										
11A, 11B, 11N	-	1st ^a	2nd	3rd	-	-	4th ^e	-	-	-
21A, 21B, 21N	-	1st ^a	2nd	3rd	4th	5th	6th ^e	-	-	-
31A, 31B, 31N	1st	2nd ^a	3rd	4th	5th	6th	7th ^e	-	-	-
Flexible ^d	-	-	x ^c	x	-	-	x	x	x	x
Rigid plastics:										
11H1, 11H2	-	1st ^a	2nd	3rd	-	-	4th	-	-	-
21H1, 21H2	-	1st ^a	2nd	3rd	4th	5th	6th	-	-	-
31H1, 31H2	1st	2nd ^a	3rd	4th ^g	5th	6th	7th	-	-	-
Composite:										
11HZ1, 11HZ2	-	1st ^a	2nd	3rd	-	-	4th ^e	-	-	-
21HZ1, 21HZ2	-	1st ^a	2nd	3rd	4th	5th	6th ^e	-	-	-
31HZ1, 31HZ2	1st	2nd ^a	3rd	4th ^g	5th	6th	7th ^e	-	-	-
Fibreboard	-	1st	-	2nd	-	-	3rd	-	-	-
Wooden	-	1st	-	2nd	-	-	3rd	-	-	-

^a When IBCs are designed for this method of handling.

^b When IBCs are designed to be stacked.

^c When IBCs are designed to be lifted from the top or the side.

^d Required test indicated by x; an IBC which has passed one test may be used for other tests, in any order.

^e Another IBC of the same design may be used for the drop test.

^f Another IBC of the same design may be used for the vibration test.

^g The second IBC in accordance with 6.5.6.2.2 can be used out of the sequential order direct after the preliminary storage.

6.5.6.4 *Bottom lift test*

6.5.6.4.1 *Applicability*

For all fibreboard and wooden IBCs, and for all types of IBC which are fitted with means of lifting from the base, as a design type test.

6.5.6.4.2 *Preparation of the IBC for test*

The IBC shall be filled. A load shall be added and evenly distributed. The mass of the filled IBC and the load shall be 1.25 times the maximum permissible gross mass.

6.5.6.4.3 *Method of testing*

The IBC shall be raised and lowered twice by a lift truck with the forks centrally positioned and spaced at three quarters of the dimension of the side of entry (unless the points of entry are fixed). The forks shall penetrate to three quarters of the direction of entry. The test shall be repeated from each possible direction of entry.

6.5.6.4.4 *Criteria for passing the test*

No permanent deformation which renders the IBC, including the base pallet, if any, unsafe for carriage and no loss of contents.

6.5.6.5 *Top lift test*

6.5.6.5.1 *Applicability*

For all types of IBC which are designed to be lifted from the top and for flexible IBCs designed to be lifted from the top or the side, as a design type test.

6.5.6.5.2 *Preparation of the IBC for test*

Metal, rigid plastics and composite IBCs shall be filled. A load shall be added and evenly distributed. The mass of the filled IBC and the load shall be twice the maximum permissible gross mass. Flexible IBCs shall be filled with a representative material and then shall be loaded to six times their maximum permissible gross mass, the load being evenly distributed.

6.5.6.5.3 *Methods of testing*

Metal and flexible IBCs shall be lifted in the manner for which they are designed until clear of the floor and maintained in that position for a period of five minutes.

Rigid plastics and composite IBCs shall be lifted:

- (a) by each pair of diagonally opposite lifting devices, so that the hoisting forces are applied vertically, for a period of five minutes; and
- (b) by each pair of diagonally opposite lifting devices, so that the hoisting forces are applied toward the centre at 45° to the vertical, for a period of five minutes.

6.5.6.5.4 Other methods of top lift testing and preparation at least equally effective may be used for flexible IBCs.

6.5.6.5.5 *Criteria for passing the test*

- (a) Metal, rigid plastics and composite IBCs: the IBC remains safe for normal conditions of carriage, there is no observable permanent deformation of the IBC, including the base pallet, if any, and no loss of contents;
- (b) Flexible IBCs: no damage to the IBC or its lifting devices which renders the IBC unsafe for carriage or handling and no loss of contents.

6.5.6.6 *Stacking test*

6.5.6.6.1 *Applicability*

For all types of IBC which are designed to be stacked on each other, as a design type test.

6.5.6.6.2 *Preparation of the IBC for test*

The IBC shall be filled to its maximum permissible gross mass. If the specific gravity of the product being used for testing makes this impracticable, the IBC shall additionally be loaded so that it is tested at its maximum permissible gross mass the load being evenly distributed.

6.5.6.6.3 *Method of testing*

- (a) The IBC shall be placed on its base on level hard ground and subjected to a uniformly distributed superimposed test load (see 6.5.6.6.4). For rigid plastics IBCs of type 31H2 and composite IBCs of types 31HH1 and 31HH2, a stacking test shall be carried out with the original filling substance or a standard liquid (see 6.1.6) in accordance with 6.5.6.3.3 or 6.5.6.3.5 using the second IBC in accordance with 6.5.6.2.2 after the preliminary storage. IBCs shall be subjected to the test load for a period of at least:
 - (i) 5 minutes, for metal IBCs;
 - (ii) 28 days at 40 °C, for rigid plastics IBCs of types 11H2, 21H2 and 31H2 and for composite IBCs with outer casings of plastics material which bear the stacking load (i.e., types 11HH1, 11HH2, 21HH1, 21HH2, 31HH1 and 31HH2);
 - (iii) 24 hours, for all other types of IBCs;
- (b) The load shall be applied by one of the following methods:
 - (i) one or more IBCs of the same type filled to the maximum permissible gross mass stacked on the test IBC;
 - (ii) appropriate weights loaded on to either a flat plate or a reproduction of the base of the IBC, which is stacked on the test IBC.

6.5.6.6.4 *Calculation of superimposed test load*

The load to be placed on the IBC shall be 1.8 times the combined maximum permissible gross mass of the number of similar IBCs that may be stacked on top of the IBC during carriage.

6.5.6.6.5 *Criteria for passing the test*

- (a) All types of IBCs other than flexible IBCs: no permanent deformation which renders the IBC including the base pallet, if any, unsafe for carriage and no loss of contents;
- (b) Flexible IBCs: no deterioration of the body which renders the IBC unsafe for carriage and no loss of contents.

6.5.6.7 *Leakproofness test*

6.5.6.7.1 *Applicability*

For those types of IBC used for liquids or for solids filled or discharged under pressure, as a design type test and periodic test.

6.5.6.7.2 *Preparation of the IBC for test*

The test shall be carried out before the fitting of any thermal insulation equipment. Vented closures shall either be replaced by similar non-vented closures or the vent shall be sealed.

6.5.6.7.3 *Method of testing and pressure to be applied*

The test shall be carried out for a period of at least 10 minutes using air at a gauge pressure of not less than 20 kPa (0.2 bar). The air tightness of the IBC shall be determined by a suitable method such as by air-pressure differential test or by immersing the IBC in water or, for metal IBCs, by coating the seams and joints with a soap solution. In the case of immersing a correction factor shall be applied for the hydrostatic pressure.

6.5.6.7.4 *Criterion for passing the test*

No leakage of air.

6.5.6.8 *Internal pressure (hydraulic) test*

6.5.6.8.1 *Applicability*

For those types of IBCs used for liquids or for solids filled or discharged under pressure, as a design type test.

6.5.6.8.2 *Preparation of the IBC for test*

The test shall be carried out before the fitting of any thermal insulation equipment. Pressure-relief devices shall be removed and their apertures plugged, or shall be rendered inoperative.

6.5.6.8.3 *Method of testing*

The test shall be carried out for a period of at least 10 minutes applying a hydraulic pressure not less than that indicated in 6.5.6.8.4. The IBCs shall not be mechanically restrained during the test.

6.5.6.8.4 *Pressures to be applied*

6.5.6.8.4.1 Metal IBCs:

- (a) For IBCs of types 21A, 21B and 21N, for packing group I solids, a 250 kPa (2.5 bar) gauge pressure;
- (b) For IBCs of types 21A, 21B, 21N, 31A, 31B and 31N, for packing groups II or III substances, a 200 kPa (2 bar) gauge pressure;
- (c) In addition, for IBCs of types 31A, 31B and 31N, a 65kPa (0.65 bar) gauge pressure. This test shall be performed before the 200 kPa (2 bar) test.

6.5.6.8.4.2 Rigid plastics and composite IBCs:

- (a) For IBCs of types 21H1, 21H2, 21HZ1 and 21HZ2: 75 kPa (0.75 bar) (gauge);
- (b) For IBCs of types 31H1, 31H2, 31HZ1 and 31HZ2: whichever is the greater of two values, the first as determined by one of the following methods:
 - (i) the total gauge pressure measured in the IBC (i.e. the vapour pressure of the filling substance and the partial pressure of the air or other inert gases, minus 100 kPa) at 55 °C multiplied by a safety factor of 1.5; this total gauge pressure shall be determined on the basis of a maximum degree of filling in accordance with 4.1.1.4 and a filling temperature of 15 °C;

- (ii) 1.75 times the vapour pressure at 50 °C of the substance to be carried minus 100 kPa, but with a minimum test pressure of 100 kPa;
- (iii) 1.5 times the vapour pressure at 55 °C of the substance to be carried minus 100 kPa, but with a minimum test pressure of 100 kPa;

and the second as determined by the following method:

- (iv) twice the static pressure of the substance to be carried, with a minimum of twice the static pressure of water;

6.5.6.8.5 *Criteria for passing the test(s):*

- (a) For IBCs of types 21A, 21B, 21N, 31A, 31B and 31N, when subjected to the test pressure specified in 6.5.6.8.4.1 (a) or (b): no leakage;
- (b) For IBCs of types 31A, 31B and 31N, when subjected to the test pressure specified in 6.5.6.8.4.1 (c): no permanent deformation which renders the IBC unsafe for carriage and no leakage;
- (c) For rigid plastics and composite IBCs: no permanent deformation which would render the IBC unsafe for carriage and no leakage.

6.5.6.9 *Drop test*

6.5.6.9.1 *Applicability*

For all types of IBCs, as a design type test.

6.5.6.9.2 *Preparation of the IBC for test*

- (a) Metal IBCs: the IBC shall be filled to not less than 95% of its maximum capacity for solids or 98% of its maximum capacity for liquids. Pressure-relief devices shall be removed and their apertures plugged, or shall be rendered inoperative;
- (b) Flexible IBCs: the IBC shall be filled to the maximum permissible gross mass, the contents being evenly distributed;
- (c) Rigid plastics and composite IBCs: the IBC shall be filled to not less than 95% of its maximum capacity for solids or 98% of its maximum capacity for liquids. Arrangements provided for pressure relief may be removed and plugged or rendered inoperative. Testing of IBCs shall be carried out when the temperature of the test sample and its contents has been reduced to minus 18 °C or lower. Where test samples of composite IBCs are prepared in this way the conditioning specified in 6.5.6.3.1 may be waived. Test liquids shall be kept in the liquid state, if necessary by the addition of anti-freeze. This conditioning may be disregarded if the materials in question are of sufficient ductility and tensile strength at low temperatures;
- (d) Fibreboard and wooden IBCs: The IBC shall be filled to not less than 95% of its maximum capacity.

6.5.6.9.3 *Method of testing*

The IBC shall be dropped on its base onto a non-resilient, horizontal, flat, massive and rigid surface in conformity with the requirements of 6.1.5.3.4, in such a manner as to ensure that the point of impact is that part of the base of the IBC considered to be the most vulnerable. IBCs of 0.45 m³ or less capacity shall also be dropped:

- (a) Metal IBCs: on the most vulnerable part other than the part of the base tested in the first drop;
- (b) Flexible IBCs: on the most vulnerable side;
- (c) Rigid plastics, composite, fibreboard and wooden IBCs: flat on a side, flat on the top and on a corner.

The same or different IBCs may be used for each drop.

6.5.6.9.4 *Drop height*

For solids and liquids, if the test is performed with the solid or liquid to be carried or with another substance having essentially the same physical characteristics:

Packing group I	Packing group II	Packing group III
1.8 m	1.2 m	0.8 m

For liquids if the test is performed with water:

- (a) Where the substances to be carried have a relative density not exceeding 1.2:

Packing group II	Packing group III
1.2 m	0.8 m

- (b) Where the substances to be carried have a relative density exceeding 1.2, the drop heights shall be calculated on the basis of the relative density (d) of the substance to be carried rounded up to the first decimal as follows:

Packing group II	Packing group III
$d \times 1.0 \text{ m}$	$d \times 0.67 \text{ m}$

6.5.6.9.5 *Criteria for passing the test(s):*

- (a) Metal IBCs: no loss of contents;
- (b) Flexible IBCs: no loss of contents. A slight discharge, e.g. from closures or stitch holes, upon impact shall not be considered to be a failure of the IBC provided that no further leakage occurs after the IBC has been raised clear of the ground;
- (c) Rigid plastics, composite, fibreboard and wooden IBCs: no loss of contents. A slight discharge from a closure upon impact shall not be considered to be a failure of the IBC provided that no further leakage occurs;
- (d) All IBCs: no damage which renders the IBC unsafe to be carried for salvage or for disposal, and no loss of contents. In addition, the IBC shall be capable of being lifted by an appropriate means until clear of the floor for five minutes.

NOTE: The criteria in (d) apply to design types for IBCs manufactured as from 1 January 2011.

6.5.6.10 *Tear test*

6.5.6.10.1 *Applicability*

For all types of flexible IBCs, as a design type test.

6.5.6.10.2 *Preparation of the IBC for test*

The IBC shall be filled to not less than 95% of its capacity and to its maximum permissible gross mass, the contents being evenly distributed.

6.5.6.10.3 *Method of testing*

Once the IBC is placed on the ground, a 100 mm knife score, completely penetrating the wall of a wide face, is made at a 45° angle to the principal axis of the IBC, halfway between the bottom surface and the top level of the contents. The IBC shall then be subjected to a uniformly distributed superimposed load equivalent to twice the maximum permissible gross mass. The load shall be applied for at least five minutes. An IBC which is designed to be lifted from the top or the side shall then, after removal of the superimposed load, be lifted clear of the floor and maintained in that position for a period of five minutes.

6.5.6.10.4 *Criteria for passing the test*

The cut shall not propagate more than 25% of its original length.

6.5.6.11 *Topple test*

6.5.6.11.1 *Applicability*

For all types of flexible IBC, as a design type test.

6.5.6.11.2 *Preparation of the IBC for test*

The IBC shall be filled to not less than 95% of its capacity and to its maximum permissible gross mass, the contents being evenly distributed.

6.5.6.11.3 *Method of testing*

The IBC shall be caused to topple on to any part of its top on to a rigid, non-resilient, smooth, flat and horizontal surface.

6.5.6.11.4 *Topple height*

Packing group I	Packing group II	Packing group III
1.8 m	1.2 m	0.8 m

6.5.6.11.5 *Criteria for passing the test*

No loss of contents. A slight discharge, e.g. from closures or stitch holes, upon impact shall not be considered to be a failure of the IBC provided that no further leakage occurs.

6.5.6.12 *Righting test*

6.5.6.12.1 *Applicability*

For all flexible IBCs designed to be lifted from the top or side, as a design type test.

6.5.6.12.2 *Preparation of the IBC for test*

The IBC shall be filled to not less than 95% of its capacity and to its maximum permissible gross mass, the contents being evenly distributed.

6.5.6.12.3 *Method of testing*

The IBC, lying on its side, shall be lifted at a speed of at least 0.1 m/s to upright position, clear of the floor, by one lifting device or by two lifting devices when four are provided.

6.5.6.12.4 *Criteria for passing the test*

No damage to the IBC or its lifting devices which renders the IBC unsafe for carriage or handling.

6.5.6.13 *Vibration test*

6.5.6.13.1 *Applicability*

For all IBCs used for liquids, as a design type test.

NOTE: This test applies to design types for IBCs manufactured after 31 December 2010 (see also 1.6.1.14).

6.5.6.13.2 *Preparation of the IBC for test*

A sample IBC shall be selected at random and shall be fitted and closed as for carriage. The IBC shall be filled with water to not less than 98% of its maximum capacity.

6.5.6.13.3 *Test method and duration*

6.5.6.13.3.1 The IBC shall be placed in the center of the test machine platform with a vertical sinusoidal, double amplitude (peak-to peak displacement) of 25 mm \pm 5%. If necessary, restraining devices shall be attached to the platform to prevent the specimen from moving horizontally off the platform without restricting vertical movement.

6.5.6.13.3.2 The test shall be conducted for one hour at a frequency that causes part of the base of the IBC to be momentarily raised from the vibrating platform for part of each cycle to such a degree that a metal shim can be completely inserted intermittently at, at least, one point between the base of the IBC and the test platform. The frequency may need to be adjusted after the initial set point to prevent the packaging from going into resonance. Nevertheless, the test frequency shall continue to allow placement of the metal shim under the IBC as described in this paragraph. The continuing ability to insert the metal shim is essential to passing the test. The metal shim used for this test shall be at least 1.6 mm thick, 50 mm wide, and be of sufficient length to be inserted between the IBC and the test platform a minimum of 100 mm to perform the test.

6.5.6.13.4 *Criteria for passing the test*

No leakage or rupture shall be observed. In addition, no breakage or failure of structural components, such as broken welds or failed fastenings, shall be observed.

6.5.6.14 *Test report*

6.5.6.14.1 A test report containing at least the following particulars shall be drawn up and shall be made available to the users of the IBC:

1. Name and address of the test facility;
2. Name and address of applicant (where appropriate);
3. A unique test report identification;
4. Date of the test report;
5. Manufacturer of the IBC;

6. Description of the IBC design type (e.g. dimensions, materials, closures, thickness, etc.) including method of manufacture (e.g. blow moulding) and which may include drawing(s) and/or photograph(s);
7. Maximum capacity;
8. Characteristics of test contents, e.g. viscosity and relative density for liquids and particle size for solids;
9. Test descriptions and results;
10. The test report shall be signed with the name and status of the signatory.

6.5.6.14.2 The test report shall contain statements that the IBC prepared as for carriage was tested in accordance with the appropriate requirements of this Chapter and that the use of other packaging methods or components may render it invalid. A copy of the test report shall be available to the competent authority.

CHAPTER 6.6

REQUIREMENTS FOR THE CONSTRUCTION AND TESTING OF LARGE PACKAGINGS

6.6.1 General

6.6.1.1 The requirements of this Chapter do not apply to:

- packagings for Class 2, except large packagings for articles, including aerosols;
- packagings for Class 6.2, except large packagings for clinical waste of UN No. 3291;
- Class 7 packages containing radioactive material.

6.6.1.2 Large packagings shall be manufactured, tested and remanufactured under a quality assurance programme which satisfies the competent authority in order to ensure that each manufactured or remanufactured large packaging meets the requirements of this Chapter.

NOTE: ISO 16106:2006 "Packaging – Transport packages for dangerous goods – Dangerous goods packagings, intermediate bulk containers (IBCs) and large packagings – Guidelines for the application of ISO 9001" provides acceptable guidance on procedures which may be followed.

6.6.1.3 The specific requirements for large packagings in 6.6.4 are based on large packagings currently used. In order to take into account progress in science and technology, there is no objection to the use of large packagings having specifications different from those in 6.6.4 provided they are equally effective, acceptable to the competent authority and able successfully to withstand the tests described in 6.6.5. Methods of testing other than those described in ADR are acceptable provided they are equivalent and are recognized by the competent authority.

6.6.1.4 Manufacturers and subsequent distributors of packagings shall provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that packages as presented for carriage are capable of passing the applicable performance tests of this Chapter.

6.6.2 Code for designating types of large packagings

6.6.2.1 The code used for large packagings consist of:

- (a) Two Arabic numerals:
 - 50 for rigid large packagings; or
 - 51 for flexible large packagings; and
- (b) A capital letter in Latin character indicating the nature of the material, e.g. wood, steel etc. The capital letters used shall be those shown in 6.1.2.6.

6.6.2.2 The letter "W" may follow the Large Packaging code. The letter "W" signifies that the large packaging, although of the same type indicated by the code, is manufactured to a specification different from those in 6.6.4 and is considered equivalent in accordance with the requirements in 6.6.1.3.

6.6.3 Marking

6.6.3.1 Primary marking

Each large packaging manufactured and intended for use in accordance with the provisions of ADR shall bear markings which are durable, legible and placed in a location so as to be readily visible. Letters, numerals and symbols shall be at least 12 mm high and shall show:

- (a) The United Nations packaging symbol

;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7¹. For metal large packagings on which the marking is stamped or embossed, the capital letters "UN" may be applied instead of the symbol;

- (b) The number "50" designating a large rigid packaging or "51" for flexible large packagings, followed by the material type in accordance with 6.5.1.4.1 (b);
- (c) A capital letter designating the packing group(s) for which the design type has been approved:
- X for packing groups I, II and III
Y for packing groups II and III
Z for packing group III only;
- (d) The month and year (last two digits) of manufacture;
- (e) The State authorizing the allocation of the mark; indicated by the distinguishing sign for motor vehicles in international traffic²;
- (f) The name or symbol of the manufacturer and other identification of the large packagings as specified by the competent authority;
- (g) The stacking test load in kg. For large packagings not designed for stacking the figure "0" shall be shown;
- (h) The maximum permissible gross mass in kilograms.

The primary marking required above shall be applied in the sequence of the sub-paragraphs.

Each element of the marking applied in accordance with (a) to (h) shall be clearly separated, e.g. by a slash or space, so as to be easily identifiable.

¹ This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

² Distinguishing sign for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

6.6.3.2

Examples of the marking:

50A/X/05 01/N/PQRS
2500/1000

For a large steel packaging suitable for stacking;
stacking load: 2 500 kg; maximum gross mass:
1 000 kg.

50H/Y/04 02/D/ABCD 987
0/800

For a large plastics packaging not suitable for
stacking; maximum gross mass: 800 kg.

51H/Z/06 01/S/1999
0/500

For a large flexible packaging not suitable for
stacking; maximum gross mass: 500 kg.

6.6.3.3

The maximum permitted stacking load applicable when the large packaging is in use shall be displayed on a symbol as follows:

Large packaging capable of being stacked

Large packaging NOT capable of being stacked

The symbol shall be not less than 100 mm × 100 mm, be durable and clearly visible. The letters and numbers indicating the mass shall be at least 12 mm high.

The mass marked above the symbol shall not exceed the load imposed during the design type test (see 6.6.5.3.3.4) divided by 1.8.

6.6.4

Specific requirements for large packagings

6.6.4.1

Specific requirements for metal large packagings

- 50A steel
- 50B aluminium
- 50N metal (other than steel or aluminium)

6.6.4.1.1

The large packaging shall be made of suitable ductile metal in which the weldability has been fully demonstrated. Welds shall be skilfully made and afford complete safety. Low-temperature performance shall be taken into account when appropriate.

6.6.4.1.2

Care shall be taken to avoid damage by galvanic action due to the juxtaposition of dissimilar metals.

6.6.4.2

Specific requirements for flexible material large packagings

- 51H flexible plastics
- 51M flexible paper

6.6.4.2.1

The large packaging shall be manufactured from suitable materials. The strength of the material and the construction of the flexible large packagings shall be appropriate to its capacity and its intended use.

- 6.6.4.2.2 All materials used in the construction of flexible large packagings of types 51M shall, after complete immersion in water for not less than 24 hours, retain at least 85% of the tensile strength as measured originally on the material conditioned to equilibrium at 67% relative humidity or less.
- 6.6.4.2.3 Seams shall be formed by stitching, heat sealing, glueing or any equivalent method. All stitched seam-ends shall be secured.
- 6.6.4.2.4 Flexible large packagings shall provide adequate resistance to ageing and to degradation caused by ultraviolet radiation or the climatic conditions, or by the substance contained, thereby rendering them appropriate to their intended use.
- 6.6.4.2.5 For plastics flexible large packagings where protection against ultraviolet radiation is required, it shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the large packaging. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, re-testing may be waived if changes in the carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.
- 6.6.4.2.6 Additives may be incorporated into the material of the large packaging to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.
- 6.6.4.2.7 When filled, the ratio of height to width shall be not more than 2:1.

6.6.4.3 ***Specific requirements for plastics large packagings***

50H rigid plastics

- 6.6.4.3.1 The large packaging shall be manufactured from suitable plastics material of known specifications and be of adequate strength in relation to its capacity and its intended use. The material shall be adequately resistant to ageing and to degradation caused by the substance contained or, where relevant, by ultraviolet radiation. Low temperature performance shall be taken into account when appropriate. Any permeation of the substance contained shall not constitute a danger under normal conditions of carriage.
- 6.6.4.3.2 Where protection against ultraviolet radiation is required, it shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the outer packaging. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, re-testing may be waived if changes in the carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.
- 6.6.4.3.3 Additives may be incorporated in the material of the large packaging to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.

6.6.4.4 ***Specific requirements for fibreboard large packagings***

50G rigid fibreboard

- 6.6.4.4.1 Strong and good quality solid or double-faced corrugated fibreboard (single or multiwall) shall be used, appropriate to the capacity of the large packagings and to their intended use. The water resistance of the outer surface shall be such that the increase in mass, as determined in a test carried out over a period of 30 minutes by the Cobb method of

determining water absorption, is not greater than 155 g/m² - see ISO 535:1991. It shall have proper bending qualities. Fibreboard shall be cut, creased without scoring, and slotted so as to permit assembly without cracking, surface breaks or undue bending. The fluting or corrugated fibreboard shall be firmly glued to the facings.

- 6.6.4.4.2 The walls, including top and bottom, shall have a minimum puncture resistance of 15 J measured according to ISO 3036:1975.
- 6.6.4.4.3 Manufacturing joins in the outer packaging of large packagings shall be made with an appropriate overlap and shall be taped, glued, stitched with metal staples or fastened by other means at least equally effective. Where joins are effected by gluing or taping, a water resistant adhesive shall be used. Metal staples shall pass completely through all pieces to be fastened and be formed or protected so that any inner liner cannot be abraded or punctured by them.
- 6.6.4.4.4 Any integral pallet base forming part of a large packaging or any detachable pallet shall be suitable for mechanical handling with the large packaging filled to its maximum permissible gross mass.
- 6.6.4.4.5 The pallet or integral base shall be designed so as to avoid any protrusion of the base of the large packaging that might be liable to damage in handling.
- 6.6.4.4.6 The body shall be secured to any detachable pallet to ensure stability in handling and carriage. Where a detachable pallet is used, its top surface shall be free from sharp protrusions that might damage the large packaging.
- 6.6.4.4.7 Strengthening devices such as timber supports to increase stacking performance may be used but shall be external to the liner.
- 6.6.4.4.8 Where large packagings are intended for stacking, the bearing surface shall be such as to distribute the load in a safe manner.

6.6.4.5 *Specific requirements for wooden large packagings*

50C natural wood
50D plywood
50F reconstituted wood

- 6.6.4.5.1 The strength of the materials used and the method of construction shall be appropriate to the capacity and intended use of the large packagings.
- 6.6.4.5.2 Natural wood shall be well seasoned, commercially dry and free from defects that would materially lessen the strength of any part of the large packagings. Each part of the large packagings shall consist of one piece or be equivalent thereto. Parts are considered equivalent to one piece when a suitable method of glued assembly is used as for instance Lindermann joint, tongue and groove joint, ship lap or rabbet joint; or butt joint with at least two corrugated metal fasteners at each joint, or when other methods at least equally effective are used.
- 6.6.4.5.3 Large packagings of plywood shall be at least 3-ply. They shall be made of well seasoned rotary cut, sliced or sawn veneer, commercially dry and free from defects that would materially lessen the strength of the large packaging. All adjacent plies shall be glued with water resistant adhesive. Other suitable materials may be used with plywood for the construction of the large packaging.
- 6.6.4.5.4 Large packagings of reconstituted wood shall be made of water resistant reconstituted wood such as hardboard, particle board or other suitable type.

- 6.6.4.5.5 Large packagings shall be firmly nailed or secured to corner posts or ends or be assembled by equally suitable devices.
- 6.6.4.5.6 Any integral pallet base forming part of a large packaging or any detachable pallet shall be suitable for mechanical handling with the large packaging filled to its maximum permissible gross mass.
- 6.6.4.5.7 The pallet or integral base shall be designed so as to avoid any protrusion of the base of the large packaging that might be liable to damage in handling.
- 6.6.4.5.8 The body shall be secured to any detachable pallet to ensure stability in handling and carriage. Where a detachable pallet is used, its top surface shall be free from sharp protrusions that might damage the large packaging.
- 6.6.4.5.9 Strengthening devices such as timber supports to increase stacking performance may be used but shall be external to the liner.
- 6.6.4.5.10 Where large packagings are intended for stacking, the bearing surface shall be such as to distribute the load in a safe manner.

6.6.5 Test requirements for large packagings

6.6.5.1 *Performance and frequency of test*

- 6.6.5.1.1 The design type of each large packaging shall be tested as provided in 6.6.5.3 in accordance with procedures established by the competent authority allowing the allocation of the mark and shall be approved by this competent authority.
- 6.6.5.1.2 Each large packaging design type shall successfully pass the tests prescribed in this Chapter before being used. A large packaging design type is defined by the design, size, material and thickness, manner of construction and packing, but may include various surface treatments. It also includes large packagings which differ from the design type only in their lesser design height.
- 6.6.5.1.3 Tests shall be repeated on production samples at intervals established by the competent authority. For such tests on fibreboard large packagings, preparation at ambient conditions is considered equivalent to the provisions of 6.6.5.2.4.
- 6.6.5.1.4 Tests shall also be repeated after each modification which alters the design, material or manner of construction of large packagings.
- 6.6.5.1.5 The competent authority may permit the selective testing of large packagings that differ only in minor respects from a tested type, e.g. smaller sizes of inner packagings or inner packagings of lower net mass; and large packagings which are produced with small reductions in external dimension(s).
- 6.6.5.1.6 (*Reserved*)

NOTE: *For the conditions for assembling different inner packagings in a large packaging and permissible variations in inner packagings, see 4.1.1.5.1.*
- 6.6.5.1.7 The competent authority may at any time require proof, by tests in accordance with this section, that serially-produced large packagings meet the requirements of the design type tests.
- 6.6.5.1.8 Provided the validity of the test results is not affected and with the approval of the competent authority, several tests may be made on one sample.

6.6.5.2 *Preparation for testing*

6.6.5.2.1 Tests shall be carried out on large packagings prepared as for carriage including the inner packagings or articles used. Inner packagings shall be filled to not less than 98% of their maximum capacity for liquids or 95% for solids. For large packagings where the inner packagings are designed to carry liquids and solids, separate testing is required for both liquid and solid contents. The substances in the inner packagings or the articles to be carried in the large packagings may be replaced by other material or articles except where this would invalidate the results of the tests. When other inner packagings or articles are used they shall have the same physical characteristics (mass, etc) as the inner packagings or articles to be carried. It is permissible to use additives, such as bags of lead shot, to achieve the requisite total package mass, so long as they are placed so that the test results are not affected.

6.6.5.2.2 In the drop tests for liquids, when another substance is used, it shall be of similar relative density and viscosity to those of the substance being carried. Water may also be used for the liquid drop test under the conditions in 6.6.5.3.4.4.

6.6.5.2.3 Large packagings made of plastics materials and large packagings containing inner packagings of plastic materials - other than bags intended to contain solids or articles - shall be drop tested when the temperature of the test sample and its contents has been reduced to -18 °C or lower. This conditioning may be disregarded if the materials in question are of sufficient ductility and tensile strength at low temperatures. Where test sample are prepared in this way, the conditioning in 6.6.5.2.4 may be waived. Test liquids shall be kept in the liquid state by the addition of anti-freeze if necessary.

6.6.5.2.4 Large packagings of fibreboard shall be conditioned for at least 24 hours in an atmosphere having a controlled temperature and relative humidity (r.h.). There are three options, one of which shall be chosen.

The preferred atmosphere is 23 °C ± 2 °C and 50% ± 2% r.h. The two other options are: 20 °C ± 2 °C and 65% ± 2% r.h.; or 27 °C ± 2 °C and 65% ± 2% r.h.

***NOTE:** Average values shall fall within these limits. Short term fluctuations and measurement limitations may cause individual measurements to vary by up to ± 5% relative humidity without significant impairment of test reproducibility.*

6.6.5.3 *Test requirements*

6.6.5.3.1 *Bottom lift test*

6.6.5.3.1.1 Applicability

For all types of large packagings which are fitted with means of lifting from the base, as a design type test.

6.6.5.3.1.2 Preparation of large packaging for test

The large packaging shall be loaded to 1.25 times its maximum permissible gross mass, the load being evenly distributed.

6.6.5.3.1.3 Method of testing

The large packaging shall be raised and lowered twice by a lift truck with the forks centrally positioned and spaced at three quarters of the dimension of the side of entry (unless the points of entry are fixed). The forks shall penetrate to three quarters of the direction of entry. The test shall be repeated from each possible direction of entry.

- 6.6.5.3.1.4 Criteria for passing the test
- No permanent deformation which renders the large packaging unsafe for carriage and no loss of contents.
- 6.6.5.3.2 *Top lift test*
- 6.6.5.3.2.1 Applicability
- For types of large packagings which are intended to be lifted from the top and fitted with means of lifting, as a design type test.
- 6.6.5.3.2.2 Preparation of large packaging for test
- The large packaging shall be loaded to twice its maximum permissible gross mass. A flexible large packaging shall be loaded to six times its maximum permissible gross mass, the load being evenly distributed.
- 6.6.5.3.2.3 Method of testing
- The large packaging shall be lifted in the manner for which it is designed until clear of the floor and maintained in that position for a period of five minutes.
- 6.6.5.3.2.4 *Criteria for passing the test*
- (a) Metal and rigid plastics large packagings: no permanent deformation which renders the large packaging, including the base pallet, if any, unsafe for carriage and no loss of contents;
 - (b) Flexible large packagings: no damage to the large packaging or its lifting devices which renders the large packaging unsafe for carriage or handling and no loss of contents.
- 6.6.5.3.3 *Stacking test*
- 6.6.5.3.3.1 Applicability
- For all types of large packagings which are designed to be stacked on each other, as a design type test.
- 6.6.5.3.3.2 Preparation of large packaging for test
- The large packaging shall be filled to its maximum permissible gross mass.
- 6.6.5.3.3.3 Method of testing
- The large packaging shall be placed on its base on level hard ground and subjected to a uniformly distributed superimposed test load (see 6.6.5.3.3.4) for a period of at least five minutes, large packagings of wood, fibreboard and plastics materials for a period of 24 h.
- 6.6.5.3.3.4 Calculation of superimposed test load
- The load to be placed on the large packagings shall be 1.8 times the combined maximum permissible gross mass of the number of similar large packagings that may be stacked on top of the large packagings during carriage.

6.6.5.3.3.5 Criteria for passing the test

- (a) All types of large packagings other than flexible large packagings: no permanent deformation which renders the large packaging including the base pallet, if any, unsafe for carriage and no loss of contents;
- (b) Flexible large packagings: no deterioration of the body which renders the large packaging unsafe for carriage and no loss of contents.

6.6.5.3.4 Drop test

6.6.5.3.4.1 Applicability

For all types of large packagings as a design type test.

6.6.5.3.4.2 Preparation of large packaging for testing

The large packaging shall be filled in accordance with 6.6.5.2.1

6.6.5.3.4.3 Method of testing

The large packaging shall be dropped onto a non resilient, horizontal, flat, massive and rigid surface in conformity with the requirements of 6.1.5.3.4, in such a manner as to ensure that the point of impact is that part of the base of the large packaging considered to be the most vulnerable.

6.6.5.3.4.4 Drop height

NOTE: Large packagings for substances and articles of Class 1 shall be tested at the packing group II performance level.

- 6.6.5.3.4.4.1 For inner packagings containing solid or liquid substances or articles, if the test is performed with the solid, liquid or articles to be carried, or with another substance or article having essentially the same characteristics:

Packing group I	Packing group II	Packing group III
1.8 m	1.2 m	0.8 m

- 6.6.5.3.4.4.2 For inner packagings containing liquids if the test is performed with water:

- (a) Where the substances to be carried have a relative density not exceeding 1.2:

Packing group I	Packing group II	Packing group III
1.8 m	1.2 m	0.8 m

- (b) Where the substances to be carried have a relative density exceeding 1.2, the drop height shall be calculated on the basis of the relative density (d) of the substance to be carried, rounded up to the first decimal, as follows:

Packing group I	Packing group II	Packing group III
$d \times 1.5$ (m)	$d \times 1.0$ (m)	$d \times 0.67$ (m)

- 6.6.5.3.4.5 Criteria for passing the test
- 6.6.5.3.4.5.1 The large packaging shall not exhibit any damage liable to affect safety during carriage. There shall be no leakage of the filling substance from inner packaging(s) or article(s).
- 6.6.5.3.4.5.2 No rupture is permitted in large packagings for articles of Class 1 which would permit the spillage of loose explosive substances or articles from the large packaging.
- 6.6.5.3.4.5.3 Where a large packaging undergoes a drop test, the sample passes the test if the entire contents are retained even if the closure is no longer sift-proof.
- 6.6.5.4 *Certification and test report***
- 6.6.5.4.1 In respect of each design type of large packaging a certificate and mark (as in 6.6.3) shall be issued attesting that the design type including its equipment meets the test requirements.
- 6.6.5.4.2 A test report containing at least the following particulars shall be drawn up and shall be made available to the users of the large packaging:
1. Name and address of the test facility;
 2. Name and address of applicant (where appropriate);
 3. A unique test report identification;
 4. Date of the test report;
 5. Manufacturer of the large packaging;
 6. Description of the large packaging design type (e.g. dimensions, materials, closures, thickness, etc) and/or photograph(s);
 7. Maximum capacity/maximum permissible gross mass;
 8. Characteristics of test contents, e.g. types and descriptions of inner packagings or articles used;
 9. Test descriptions and results;
 10. The test report shall be signed with the name and status of the signatory.
- 6.6.5.4.3 The test report shall contain statements that the large packaging prepared as for carriage was tested in accordance with the appropriate provisions of this Chapter and that the use of other packaging methods or components may render it invalid. A copy of the test report shall be available to the competent authority.

CHAPTER 6.7

REQUIREMENTS FOR THE DESIGN, CONSTRUCTION, INSPECTION AND TESTING OF PORTABLE TANKS AND UN MULTIPLE-ELEMENT GAS CONTAINERS (MEGCs)

NOTE: *For fixed tanks (tank-vehicles), demountable tanks and tank-containers and tank swap bodies, with shells made of metallic materials, and battery-vehicles and multiple element gas containers (MEGCs) other than UN MEGCs, see Chapter 6.8; for fibre-reinforced plastics tanks, see Chapter 6.9; for vacuum operated waste tanks, see Chapter 6.10.*

6.7.1 Application and general requirements

6.7.1.1 The requirements of this Chapter apply to portable tanks intended for the carriage of dangerous goods, and to MEGCs intended for the carriage of non-refrigerated gases of Class 2, by all modes of carriage. In addition to the requirements of this Chapter, unless otherwise specified, the applicable requirements of the International Convention for Safe Containers (CSC) 1972, as amended, shall be fulfilled by any multimodal portable tank or MEGC which meets the definition of a "container" within the terms of that Convention. Additional requirements may apply to offshore portable tanks or MEGCs that are handled in open seas.

6.7.1.2 In recognition of scientific and technological advances, the technical requirements of this Chapter may be varied by alternative arrangements. These alternative arrangements shall offer a level of safety not less than that given by the requirements of this Chapter with respect to the compatibility with substances carried and the ability of the portable tank or MEGC to withstand impact, loading and fire conditions. For international carriage, alternative arrangement portable tanks or MEGCs shall be approved by the applicable competent authorities.

6.7.1.3 When a substance is not assigned a portable tank instruction (T1 to T23, T50 or T75) in Column (10) of Table A of in Chapter 3.2, interim approval for carriage may be issued by the competent authority of the country of origin. The approval shall be included in the documentation of the consignment and contain as a minimum the information normally provided in the portable tank instructions and the conditions under which the substance shall be carried.

6.7.2 Requirements for the design, construction, inspection and testing of portable tanks intended for the carriage of substances of Class 1 and Classes 3 to 9

6.7.2.1 Definitions

For the purposes of this section:

Alternative arrangement means an approval granted by the competent authority for a portable tank or MEGC that has been designed, constructed or tested to technical requirements or testing methods other than those specified in this Chapter:

Portable tank means a multimodal tank used for the carriage of substances of Class 1 and Classes 3 to 9. The portable tank includes a shell fitted with service equipment and structural equipment necessary for the carriage of dangerous substances. The portable tank shall be capable of being filled and discharged without the removal of its structural equipment. It shall possess stabilizing members external to the shell, and shall be capable of being lifted when full. It shall be designed primarily to be loaded onto a vehicle, wagon or sea-going or inland navigation vessel and shall be equipped with skids, mountings or accessories to

facilitate mechanical handling. Tank-vehicles, tank-wagons, non-metallic tanks and intermediate bulk containers (IBCs) are not considered to fall within the definition for portable tanks;

Shell means the part of the portable tank which retains the substance intended for carriage (tank proper), including openings and their closures, but does not include service equipment or external structural equipment;

Service equipment means measuring instruments and filling, discharge, venting, safety, heating, cooling and insulating devices;

Structural equipment means the reinforcing, fastening, protective and stabilizing members external to the shell;

Maximum allowable working pressure (MAWP) means a pressure that shall be not less than the highest of the following pressures measured at the top of the shell while in operating position:

- (a) The maximum effective gauge pressure allowed in the shell during filling or discharge; or
- (b) The maximum effective gauge pressure to which the shell is designed which shall be not less than the sum of:
 - (i) the absolute vapour pressure (in bar) of the substance at 65 °C, minus 1 bar; and
 - (ii) the partial pressure (in bar) of air or other gases in the ullage space being determined by a maximum ullage temperature of 65 °C and a liquid expansion due to an increase in mean bulk temperature of $t_r - t_f$ (t_f = filling temperature, usually 15 °C; t_r = maximum mean bulk temperature, 50 °C);

Design pressure means the pressure to be used in calculations required by a recognized pressure vessel code. The design pressure shall be not less than the highest of the following pressures:

- (a) The maximum effective gauge pressure allowed in the shell during filling or discharge; or
- (b) The sum of:
 - (i) the absolute vapour pressure (in bar) of the substance at 65 °C, minus 1 bar;
 - (ii) the partial pressure (in bar) of air or other gases in the ullage space being determined by a maximum ullage temperature of 65 °C and a liquid expansion due to an increase in mean bulk temperature of $t_r - t_f$ (t_f = filling temperature usually 15 °C; t_r = maximum mean bulk temperature, 50 °C); and
 - (iii) a head pressure determined on the basis of the static forces specified in 6.7.2.2.12, but not less than 0.35 bar; or
- (c) Two thirds of the minimum test pressure specified in the applicable portable tank instruction in 4.2.5.2.6;

Test pressure means the maximum gauge pressure at the top of the shell during the hydraulic pressure test equal to not less than 1.5 times the design pressure. The minimum test pressure for portable tanks intended for specific substances is specified in the applicable portable tank instruction in 4.2.5.2.6;

Leakproofness test means a test using gas subjecting the shell and its service equipment to an effective internal pressure of not less than 25% of the MAWP;

Maximum permissible gross mass (MPGM) means the sum of the tare mass of the portable tank and the heaviest load authorized for carriage;

Reference steel means a steel with a tensile strength of 370 N/mm² and an elongation at fracture of 27%;

Mild steel means a steel with a guaranteed minimum tensile strength of 360 N/mm² to 440 N/mm² and a guaranteed minimum elongation at fracture conforming to 6.7.2.3.3.3;

Design temperature range for the shell shall be -40 °C to 50 °C for substances carried under ambient conditions. For the other substances handled under elevated temperature conditions the design temperature shall be not less than the maximum temperature of the substance during filling, discharge or carriage. More severe design temperatures shall be considered for portable tanks subjected to severe climatic conditions;

Fine grain steel means steel which has a ferritic grain size of 6 or finer when determined in accordance with ASTM E 112-96 or as defined in EN 10028-3, Part 3;

Fusible element means a non-reclosable pressure relief device that is thermally actuated;

Offshore portable tank means a portable tank specially designed for repeated use for carriage to, from and between offshore facilities. An offshore portable tank is designed and constructed in accordance with the guidelines for the approval of containers handled in open seas specified by the International Maritime Organization in document MSC/Circ.860.

6.7.2.2 General design and construction requirements

- 6.7.2.2.1 Shells shall be designed and constructed in accordance with the requirements of a pressure vessel code recognized by the competent authority. Shells shall be made of metallic materials suitable for forming. The materials shall in principle conform to national or international material standards. For welded shells only a material whose weldability has been fully demonstrated shall be used. Welds shall be skilfully made and afford complete safety. When the manufacturing process or the materials make it necessary, the shells shall be suitably heat-treated to guarantee adequate toughness in the weld and in the heat affected zones. In choosing the material, the design temperature range shall be taken into account with respect to risk of brittle fracture, to stress corrosion cracking and to resistance to impact. When fine grain steel is used, the guaranteed value of the yield strength shall be not more than 460 N/mm² and the guaranteed value of the upper limit of the tensile strength shall be not more than 725 N/mm² according to the material specification. Aluminium may only be used as a construction material when indicated in a portable tank special provision assigned to a specific substance in Column (11) of Table A of Chapter 3.2 or when approved by the competent authority. When aluminium is authorized, it shall be insulated to prevent significant loss of physical properties when subjected to a heat load of 110 kW/m² for a period of not less than 30 minutes. The insulation shall remain effective at all temperatures less than 649 °C and shall be jacketed with a material with a melting point of not less than 700 °C. Portable tank materials shall be suitable for the external environment in which they may be carried.

- 6.7.2.2.2 Portable tank shells, fittings, and pipework shall be constructed from materials which are:
- (a) Substantially immune to attack by the substance(s) intended to be carried; or
 - (b) Properly passivated or neutralized by chemical reaction; or
 - (c) Lined with corrosion-resistant material directly bonded to the shell or attached by equivalent means.
- 6.7.2.2.3 Gaskets shall be made of materials not subject to attack by the substance(s) intended to be carried.
- 6.7.2.2.4 When shells are lined, the lining shall be substantially immune to attack by the substance(s) intended to be carried, homogeneous, non porous, free from perforations, sufficiently elastic and compatible with the thermal expansion characteristics of the shell. The lining of every shell, shell fittings and piping shall be continuous, and shall extend around the face of any flange. Where external fittings are welded to the tank, the lining shall be continuous through the fitting and around the face of external flanges.
- 6.7.2.2.5 Joints and seams in the lining shall be made by fusing the material together or by other equally effective means.
- 6.7.2.2.6 Contact between dissimilar metals which could result in damage by galvanic action shall be avoided.
- 6.7.2.2.7 The materials of the portable tank, including any devices, gaskets, linings and accessories, shall not adversely affect the substance(s) intended to be carried in the portable tank.
- 6.7.2.2.8 Portable tanks shall be designed and constructed with supports to provide a secure base during carriage and with suitable lifting and tie-down attachments.
- 6.7.2.2.9 Portable tanks shall be designed to withstand, without loss of contents, at least the internal pressure due to the contents, and the static, dynamic and thermal loads during normal conditions of handling and carriage. The design shall demonstrate that the effects of fatigue, caused by repeated application of these loads through the expected life of the portable tank, have been taken into account.
- 6.7.2.2.10 A shell which is to be equipped with a vacuum-relief device shall be designed to withstand, without permanent deformation, an external pressure of not less than 0.21 bar above the internal pressure. The vacuum-relief device shall be set to relieve at a vacuum setting not greater than minus (-) 0.21 bar unless the shell is designed for a higher external over pressure, in which case the vacuum-relief pressure of the device to be fitted shall be not greater than the tank design vacuum pressure. A shell used for the carriage of solid substances (powdery or granular) of packing groups II or III only, which do not liquefy during carriage, may be designed for a lower external pressure, subject to the approval of the competent authority. In this case, the vacuum valve shall be set to relieve at this lower pressure. A shell that is not to be fitted with a vacuum-relief device shall be designed to withstand, without permanent deformation an external pressure of not less than 0.4 bar above the internal pressure.
- 6.7.2.2.11 Vacuum-relief devices used on portable tanks intended for the carriage of substances meeting the flash-point criteria of Class 3, including elevated temperature substances carried at or above their flash-point, shall prevent the immediate passage of flame into the shell, or the portable tank shall have a shell capable of withstanding, without leakage an internal explosion resulting from the passage of flame into the shell.

- 6.7.2.2.12 Portable tanks and their fastenings shall, under the maximum permissible load, be capable of absorbing the following separately applied static forces:
- (a) In the direction of travel: twice the MPGM multiplied by the acceleration due to gravity (g)¹;
 - (b) Horizontally at right angles to the direction of travel: the MPGM (when the direction of travel is not clearly determined, the forces shall be equal to twice the MPGM) multiplied by the acceleration due to gravity (g)¹;
 - (c) Vertically upwards: the MPGM multiplied by the acceleration due to gravity (g)¹; and
 - (d) Vertically downwards: twice the MPGM (total loading including the effect of gravity) multiplied by the acceleration due to gravity (g)¹.
- 6.7.2.2.13 Under each of the forces in 6.7.2.2.12, the safety factor to be observed shall be as follows:
- (a) For metals having a clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed yield strength; or
 - (b) For metals with no clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength and, for austenitic steels, the 1% proof strength.
- 6.7.2.2.14 The values of yield strength or proof strength shall be the values according to national or international material standards. When austenitic steels are used, the specified minimum values of yield strength or proof strength according to the material standards may be increased by up to 15% when these greater values are attested in the material inspection certificate. When no material standard exists for the metal in question, the value of yield strength or proof strength used shall be approved by the competent authority.
- 6.7.2.2.15 Portable tanks shall be capable of being electrically earthed when intended for the carriage of substances meeting the flash-point criteria of Class 3 including elevated temperature substances carried at or above their flash-point. Measures shall be taken to prevent dangerous electrostatic discharge.
- 6.7.2.2.16 When required for certain substances by the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 or by a portable tank special provision indicated in Column (11) of Table A of Chapter 3.2 and described in 4.2.5.3, portable tanks shall be provided with additional protection, which may take the form of additional shell thickness or a higher test pressure, the additional shell thickness or higher test pressure being determined in the light of the inherent risks associated with the carriage of the substances concerned.
- 6.7.2.3 *Design criteria***
- 6.7.2.3.1 Shells shall be of a design capable of being stress-analysed mathematically or experimentally by resistance strain gauges, or by other methods approved by the competent authority.
- 6.7.2.3.2 Shells shall be designed and constructed to withstand a hydraulic test pressure not less than 1.5 times the design pressure. Specific requirements are laid down for certain substances in the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 or by a portable tank special provision indicated in Column (11) of Table A of Chapter 3.2 and described in 4.2.5.3. Attention is drawn to the minimum shell thickness requirements specified in 6.7.2.4.1 to 6.7.2.4.10.

¹ For calculation purposes $g = 9.81 \text{ m/s}^2$.

6.7.2.3.3 For metals exhibiting a clearly defined yield point or characterized by a guaranteed proof strength (0.2% proof strength, generally, or 1% proof strength for austenitic steels) the primary membrane stress σ (sigma) in the shell shall not exceed 0.75 Re or 0.50 Rm, whichever is lower, at the test pressure, where:

Re = yield strength in N/mm², or 0.2% proof strength or, for austenitic steels, 1% proof strength;

Rm = minimum tensile strength in N/mm².

6.7.2.3.3.1 The values of Re and Rm to be used shall be the specified minimum values according to national or international material standards. When austenitic steels are used, the specified minimum values for Re and Rm according to the material standards may be increased by up to 15% when greater values are attested in the material inspection certificate. When no material standard exists for the metal in question, the values of Re and Rm used shall be approved by the competent authority or its authorized body.

6.7.2.3.3.2 Steels which have a Re/Rm ratio of more than 0.85 are not allowed for the construction of welded shells. The values of Re and Rm to be used in determining this ratio shall be the values specified in the material inspection certificate.

6.7.2.3.3.3 Steels used in the construction of shells shall have an elongation at fracture, in %, of not less than 10 000/Rm with an absolute minimum of 16% for fine grain steels and 20% for other steels. Aluminium and aluminium alloys used in the construction of shells shall have an elongation at fracture, in %, of not less than 10 000/6Rm with an absolute minimum of 12%.

6.7.2.3.3.4 For the purpose of determining actual values for materials, it shall be noted that for sheet metal, the axis of the tensile test specimen shall be at right angles (transversely) to the direction of rolling. The permanent elongation at fracture shall be measured on test specimens of rectangular cross sections in accordance with ISO 6892:1998 using a 50 mm gauge length.

6.7.2.4 *Minimum shell thickness*

6.7.2.4.1 The minimum shell thickness shall be the greater thickness based on:

- (a) The minimum thickness determined in accordance with the requirements of 6.7.2.4.2 to 6.7.2.4.10;
- (b) The minimum thickness determined in accordance with the recognized pressure vessel code including the requirements in 6.7.2.3; and
- (c) The minimum thickness specified in the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 or by a portable tank special provision indicated in Column (11) of Table A of Chapter 3.2 and described in 4.2.5.3.

6.7.2.4.2 The cylindrical portions, ends (heads) and manhole covers of shells not more than 1.80 m in diameter shall be not less than 5 mm thick in the reference steel or of equivalent thickness in the metal to be used. Shells more than 1.80 m in diameter shall be not less than 6 mm thick in the reference steel or of equivalent thickness in the metal to be used, except that for powdered or granular solid substances of packing group II or III the minimum thickness requirement may be reduced to not less than 5 mm thick in the reference steel or of equivalent thickness in the metal to be used.

6.7.2.4.3 When additional protection against shell damage is provided, portable tanks with test pressures less than 2.65 bar may have the minimum shell thickness reduced, in proportion to the protection provided, as approved by the competent authority. However, shells not more

than 1.80 m in diameter shall be not less than 3 mm thick in the reference steel or of equivalent thickness in the metal to be used. Shells more than 1.80 m in diameter shall be not less than 4 mm thick in the reference steel or of equivalent thickness in the metal to be used.

6.7.2.4.4 The cylindrical portions, ends (heads) and manhole covers of all shells shall be not less than 3 mm thick regardless of the material of construction.

6.7.2.4.5 The additional protection referred to in 6.7.2.4.3 may be provided by overall external structural protection, such as suitable "sandwich" construction with the outer sheathing (jacket) secured to the shell, double wall construction or by enclosing the shell in a complete framework with longitudinal and transverse structural members.

6.7.2.4.6 The equivalent thickness of a metal other than the thickness prescribed for the reference steel in 6.7.2.4.2 shall be determined using the following formula:

$$e_1 = \frac{21.4e_0}{\sqrt[3]{Rm_1 \times A_1}}$$

where:

e_1 = required equivalent thickness (in mm) of the metal to be used;

e_0 = minimum thickness (in mm) of the reference steel specified in the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 or by a portable tank special provision indicated in Column (11) of Table A of Chapter 3.2 and described in 4.2.5.3;

Rm_1 = guaranteed minimum tensile strength (in N/mm²) of the metal to be used (see 6.7.2.3.3);

A_1 = guaranteed minimum elongation at fracture (in %) of the metal to be used according to national or international standards.

6.7.2.4.7 When in the applicable portable tank instruction in 4.2.5.2.6, a minimum thickness of 8 mm or 10 mm is specified, it shall be noted that these thicknesses are based on the properties of the reference steel and a shell diameter of 1.80 m. When a metal other than mild steel (see 6.7.2.1) is used or the shell has a diameter of more than 1.80 m, the thickness shall be determined using the following formula:

$$e_1 = \frac{21.4e_0 d_1}{1,8 \sqrt[3]{Rm_1 \times A_1}}$$

where:

e_1 = required equivalent thickness (in mm) of the metal to be used;

e_0 = minimum thickness (in mm) of the reference steel specified in the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 or by a portable tank special provision indicated in Column (11) of Table A of Chapter 3.2 and described in 4.2.5.3;

d_1 = diameter of the shell (in m), but not less than 1.80 m;

Rm_1 = guaranteed minimum tensile strength (in N/mm²) of the metal to be used (see 6.7.2.3.3);

A_1 = guaranteed minimum elongation at fracture (in %) of the metal to be used according to national or international standards.

6.7.2.4.8 In no case shall the wall thickness be less than that prescribed in 6.7.2.4.2, 6.7.2.4.3 and 6.7.2.4.4. All parts of the shell shall have a minimum thickness as determined by 6.7.2.4.2 to 6.7.2.4.4. This thickness shall be exclusive of any corrosion allowance.

- 6.7.2.4.9 When mild steel is used (see 6.7.2.1), calculation using the formula in 6.7.2.4.6 is not required.
- 6.7.2.4.10 There shall be no sudden change of plate thickness at the attachment of the ends (heads) to the cylindrical portion of the shell.
- 6.7.2.5 *Service equipment***
- 6.7.2.5.1 Service equipment shall be so arranged as to be protected against the risk of being wrenched off or damaged during handling and carriage. When the connection between the frame and the shell allows relative movement between the sub-assemblies, the equipment shall be so fastened as to permit such movement without risk of damage to working parts. The external discharge fittings (pipe sockets, shut-off devices), the internal stop-valve and its seating shall be protected against the danger of being wrenched off by external forces (for example using shear sections). The filling and discharge devices (including flanges or threaded plugs) and any protective caps shall be capable of being secured against unintended opening.
- 6.7.2.5.2 All openings in the shell, intended for filling or discharging the portable tank shall be fitted with a manually operated stop-valve located as close to the shell as reasonably practicable. Other openings, except for openings leading to venting or pressure-relief devices, shall be equipped with either a stop-valve or another suitable means of closure located as close to the shell as reasonably practicable.
- 6.7.2.5.3 All portable tanks shall be fitted with a manhole or other inspection openings of a suitable size to allow for internal inspection and adequate access for maintenance and repair of the interior. Compartmented portable tanks shall have a manhole or other inspection openings for each compartment.
- 6.7.2.5.4 As far as reasonably practicable, external fittings shall be grouped together. For insulated portable tanks, top fittings shall be surrounded by a spill collection reservoir with suitable drains.
- 6.7.2.5.5 Each connection to a portable tank shall be clearly marked to indicate its function.
- 6.7.2.5.6 Each stop-valve or other means of closure shall be designed and constructed to a rated pressure not less than the MAWP of the shell taking into account the temperatures expected during carriage. All stop-valves with screwed spindles shall close by a clockwise motion of the handwheel. For other stop-valves the position (open and closed) and direction of closure shall be clearly indicated. All stop-valves shall be designed to prevent unintentional opening.
- 6.7.2.5.7 No moving parts, such as covers, components of closures, etc., shall be made of unprotected corrodible steel when they are liable to come into frictional or percussive contact with aluminium portable tanks intended for the carriage of substances meeting the flash-point criteria of Class 3 including elevated temperature substances carried at or above their flash-point.
- 6.7.2.5.8 Piping shall be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration. All piping shall be of a suitable metallic material. Welded pipe joints shall be used wherever possible.
- 6.7.2.5.9 Joints in copper tubing shall be brazed or have an equally strong metal union. The melting point of brazing materials shall be no lower than 525 °C. The joints shall not decrease the strength of the tubing as may happen when cutting threads.
- 6.7.2.5.10 The burst pressure of all piping and pipe fittings shall be not less than the highest of four times the MAWP of the shell or four times the pressure to which it may be subjected in service by the action of a pump or other device (except pressure-relief devices).

6.7.2.5.11 Ductile metals shall be used in the construction of valves and accessories.

6.7.2.6 *Bottom openings*

6.7.2.6.1 Certain substances shall not be carried in portable tanks with bottom openings. When the applicable portable tank instruction identified in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 indicates that bottom openings are prohibited there shall be no openings below the liquid level of the shell when it is filled to its maximum permissible filling limit. When an existing opening is closed it shall be accomplished by internally and externally welding one plate to the shell.

6.7.2.6.2 Bottom discharge outlets for portable tanks carrying certain solid, crystallizable or highly viscous substances shall be equipped with not less than two serially fitted and mutually independent shut-off devices. The design of the equipment shall be to the satisfaction of the competent authority or its authorized body and shall include:

- (a) An external stop-valve, fitted as close to the shell as reasonably practicable, and so designed as to prevent any unintended opening through impact or other inadvertent act; and
- (b) A liquid tight closure at the end of the discharge pipe, which may be a bolted blank flange or a screw cap.

6.7.2.6.3 Every bottom discharge outlet, except as provided in 6.7.2.6.2, shall be equipped with three serially fitted and mutually independent shut-off devices. The design of the equipment shall be to the satisfaction of the competent authority or its authorized body and include:

- (a) A self-closing internal stop-valve, that is a stop-valve within the shell or within a welded flange or its companion flange, such that:
 - (i) The control devices for the operation of the valve are designed so as to prevent any unintended opening through impact or other inadvertent act;
 - (ii) The valve may be operable from above or below;
 - (iii) If possible, the setting of the valve (open or closed) shall be capable of being verified from the ground;
 - (iv) Except for portable tanks having a capacity of not more than 1 000 litres, it shall be possible to close the valve from an accessible position of the portable tank that is remote from the valve itself; and
 - (v) The valve shall continue to be effective in the event of damage to the external device for controlling the operation of the valve;
- (b) An external stop-valve fitted as close to the shell as reasonably practicable; and
- (c) A liquid tight closure at the end of the discharge pipe, which may be a bolted blank flange or a screw cap.

6.7.2.6.4 For a lined shell, the internal stop-valve required by 6.7.2.6.3 (a) may be replaced by an additional external stop-valve. The manufacturer shall satisfy the requirements of the competent authority or its authorized body.

6.7.2.7 *Safety-relief devices*

6.7.2.7.1 All portable tanks shall be fitted with at least one pressure-relief device. All relief devices shall be designed, constructed and marked to the satisfaction of the competent authority or its authorized body.

6.7.2.8 *Pressure-relief devices*

- 6.7.2.8.1 Every portable tank with a capacity not less than 1 900 litres and every independent compartment of a portable tank with a similar capacity, shall be provided with one or more pressure-relief devices of the spring-loaded type and may in addition have a frangible disc or fusible element in parallel with the spring-loaded devices except when prohibited by reference to 6.7.2.8.3 in the applicable portable tank instruction in 4.2.5.2.6. The pressure-relief devices shall have sufficient capacity to prevent rupture of the shell due to over pressurization or vacuum resulting from filling, discharging, or from heating of the contents.
- 6.7.2.8.2 Pressure-relief devices shall be designed to prevent the entry of foreign matter, the leakage of liquid and the development of any dangerous excess pressure.
- 6.7.2.8.3 When required for certain substances by the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6, portable tanks shall have a pressure-relief device approved by the competent authority. Unless a portable tank in dedicated service is fitted with an approved relief device constructed of materials compatible with the substance carried, the relief device shall comprise a frangible disc preceding a spring-loaded pressure-relief device. When a frangible disc is inserted in series with the required pressure-relief device, the space between the frangible disc and the pressure-relief device shall be provided with a pressure gauge or suitable tell-tale indicator for the detection of disc rupture, pinholing, or leakage which could cause a malfunction of the pressure-relief system. The frangible disc shall rupture at a nominal pressure 10% above the start to discharge pressure of the relief device.
- 6.7.2.8.4 Every portable tank with a capacity less than 1 900 litres shall be fitted with a pressure-relief device which may be a frangible disc when this disc complies with the requirements of 6.7.2.11.1. When no spring-loaded pressure-relief device is used, the frangible disc shall be set to rupture at a nominal pressure equal to the test pressure. In addition, fusible elements conforming to 6.7.2.10.1 may also be used.
- 6.7.2.8.5 When the shell is fitted for pressure discharge, the inlet line shall be provided with a suitable pressure-relief device set to operate at a pressure not higher than the MAWP of the shell, and a stop-valve shall be fitted as close to the shell as reasonably practicable.

6.7.2.9 *Setting of pressure-relief devices*

- 6.7.2.9.1 It shall be noted that the pressure-relief devices shall operate only in conditions of excessive rise in temperature, since the shell shall not be subject to undue fluctuations of pressure during normal conditions of carriage (see 6.7.2.12.2).
- 6.7.2.9.2 The required pressure-relief device shall be set to start-to-discharge at a nominal pressure of five-sixths of the test pressure for shells having a test pressure of not more than 4.5 bar and 110% of two-thirds of the test pressure for shells having a test pressure of more than 4.5 bar. After discharge the device shall close at a pressure not more than 10% below the pressure at which the discharge starts. The device shall remain closed at all lower pressures. This requirement does not prevent the use of vacuum-relief or combination pressure-relief and vacuum-relief devices.

6.7.2.10 *Fusible elements*

- 6.7.2.10.1 Fusible elements shall operate at a temperature between 100 °C and 149 °C on condition that the pressure in the shell at the fusing temperature will be not more than the test pressure. They shall be placed at the top of the shell with their inlets in the vapour space and when used for transport safety purposes, they shall not be shielded from external heat. Fusible elements shall not be used on portable tanks with a test pressure which exceeds 2.65 bar

unless specified by special provision TP36 in Column (11) of Table A of Chapter 3.2. Fusible elements used on portable tanks intended for the carriage of elevated temperature substances shall be designed to operate at a temperature higher than the maximum temperature that will be experienced during carriage and shall be to the satisfaction of the competent authority or its authorized body.

6.7.2.11 *Frangible discs*

- 6.7.2.11.1 Except as specified in 6.7.2.8.3, frangible discs shall be set to rupture at a nominal pressure equal to the test pressure throughout the design temperature range. Particular attention shall be given to the requirements of 6.7.2.5.1 and 6.7.2.8.3 if frangible discs are used.
- 6.7.2.11.2 Frangible discs shall be appropriate for the vacuum pressures which may be produced in the portable tank.

6.7.2.12 *Capacity of pressure-relief devices*

- 6.7.2.12.1 The spring-loaded pressure-relief device required by 6.7.2.8.1 shall have a minimum cross sectional flow area equivalent to an orifice of 31.75 mm diameter. Vacuum-relief devices, when used, shall have a cross sectional flow area not less than 284 mm².
- 6.7.2.12.2 The combined delivery capacity of the pressure relief system (taking into account the reduction of the flow when the portable tank is fitted with frangible-discs preceding spring-loaded pressure-relief devices or when the spring-loaded pressure-relief devices are provided with a device to prevent the passage of the flame), in condition of complete fire engulfment of the portable tank shall be sufficient to limit the pressure in the shell to 20% above the start-to-discharge pressure of the pressure limiting device. Emergency pressure-relief devices may be used to achieve the full relief capacity prescribed. These devices may be fusible, spring loaded or frangible disc components, or a combination of spring-loaded and frangible disc devices. The total required capacity of the relief devices may be determined using the formula in 6.7.2.12.2.1 or the table in 6.7.2.12.2.3.
- 6.7.2.12.2.1 To determine the total required capacity of the relief devices, which shall be regarded as being the sum of the individual capacities of all the contributing devices, the following formula shall be used:

$$Q = 12.4 \frac{FA^{0.82}}{LC} \sqrt{\frac{ZT}{M}}$$

where:

Q = minimum required rate of discharge in cubic metres of air per second (m³/s) at standard conditions: 1 bar and 0 °C (273 K);

F = is a coefficient with the following value:

for uninsulated shells: F = 1;

for insulated shells: F = U(649 - t)/13.6 but in no case is less than 0.25

where:

U = thermal conductance of the insulation, in kW.m⁻². K⁻¹, at 38 °C;

t = actual temperature of the substance during filling (in °C); when this temperature is unknown, let t = 15 °C;

The value of F given above for insulated shells may be taken provided that the insulation is in accordance with 6.7.2.12.2.4;

- A = total external surface area of shell in m²;
- Z = the gas compressibility factor in the accumulating condition (when this factor is unknown, let Z=1.0);
- T = absolute temperature in Kelvin (°C + 273) above the pressure-relief devices in the accumulating condition;
- L = the latent heat of vaporization of the liquid, in kJ/kg, in the accumulating condition;
- M = molecular mass of the discharged gas;
- C = a constant which is derived from one of the following formulae as a function of the ratio k of specific heats:

$$k = \frac{c_p}{c_v}$$

where:

c_p is the specific heat at constant pressure; and
 c_v is the specific heat at constant volume.

When $k > 1$:

$$C = \sqrt{k \left(\frac{2}{k+1} \right)^{\frac{k+1}{k-1}}}$$

When $k = 1$ or k is unknown:

$$C = \frac{1}{\sqrt{e}} = 0.607$$

where e is the mathematical constant 2.7183

C may also be taken from the following table:

k	C	k	C	k	C
1.00	0.607	1.26	0.660	1.52	0.704
1.02	0.611	1.28	0.664	1.54	0.707
1.04	0.615	1.30	0.667	1.56	0.710
1.06	0.620	1.32	0.671	1.58	0.713
1.08	0.624	1.34	0.674	1.60	0.716
1.10	0.628	1.36	0.678	1.62	0.719
1.12	0.633	1.38	0.681	1.64	0.722
1.14	0.637	1.40	0.685	1.66	0.725
1.16	0.641	1.42	0.688	1.68	0.728
1.18	0.645	1.44	0.691	1.70	0.731
1.20	0.649	1.46	0.695	2.00	0.770
1.22	0.652	1.48	0.698	2.20	0.793
1.24	0.656	1.50	0.701		

6.7.2.12.2.2 As an alternative to the formula above, shells designed for the carriage of liquids may have their relief devices sized in accordance with the table in 6.7.2.12.2.3. This table assumes an insulation value of $F = 1$ and shall be adjusted accordingly when the shell is insulated. Other values used in determining this table are:

$$\begin{array}{ll} M = 86.7 & T = 394 \text{ K} \\ L = 334.94 \text{ kJ/kg} & C = 0.607 \\ Z = 1 & \end{array}$$

6.7.2.12.2.3 Minimum required rate of discharge, Q , in cubic metres per air per second at 1 bar and 0 °C (273 K)

A Exposed area (square metres)	Q (cubic metres of air per second)	A Exposed area (square metres)	Q (cubic metres of air per second)
2	0.230	37.5	2.539
3	0.320	40	2.677
4	0.405	42.5	2.814
5	0.487	45	2.949
6	0.565	47.5	3.082
7	0.641	50	3.215

30	2.115	90	5.206
32.5	2.258	95	5.442
35	2.400	100	5.676

6.7.2.12.2.4 Insulation systems, used for the purpose of reducing venting capacity, shall be approved by the competent authority or its authorized body. In all cases, insulation systems approved for this purpose shall:

- (a) Remain effective at all temperatures up to 649 °C; and
- (b) Be jacketed with a material having a melting point of 700 °C or greater.

6.7.2.13 *Marking of pressure-relief devices*

6.7.2.13.1 Every pressure-relief device shall be clearly and permanently marked with the following particulars:

- (a) The pressure (in bar or kPa) or temperature (in °C) at which it is set to discharge;
- (b) The allowable tolerance at the discharge pressure for spring-loaded devices;
- (c) The reference temperature corresponding to the rated pressure for frangible discs;

- (d) The allowable temperature tolerance for fusible elements; and
- (e) The rated flow capacity of the spring-loaded pressure relief devices, frangible discs or fusible elements in standard cubic metres of air per second (m³/s);
- (f) The cross sectional flow areas of the spring loaded pressure-relief devices, frangible discs and fusible elements in mm².

When practicable, the following information shall also be shown:

- (g) The manufacturer's name and relevant catalogue number of the device.

6.7.2.13.2 The rated flow capacity marked on the spring-loaded pressure-relief devices shall be determined according to ISO 4126-1:2004 and ISO 4126-7:2004.

6.7.2.14 *Connections to pressure-relief devices*

6.7.2.14.1 Connections to pressure-relief devices shall be of sufficient size to enable the required discharge to pass unrestricted to the safety device. No stop-valve shall be installed between the shell and the pressure-relief devices except where duplicate devices are provided for maintenance or other reasons and the stop-valves serving the devices actually in use are locked open or the stop-valves are interlocked so that at least one of the duplicate devices is always in use. There shall be no obstruction in an opening leading to a vent or pressure-relief device which might restrict or cut-off the flow from the shell to that device. Vents or pipes from the pressure-relief device outlets, when used, shall deliver the relieved vapour or liquid to the atmosphere in conditions of minimum back-pressure on the relieving devices.

6.7.2.15 *Siting of pressure-relief devices*

6.7.2.15.1 Each pressure-relief device inlet shall be situated on top of the shell in a position as near the longitudinal and transverse centre of the shell as reasonably practicable. All pressure-relief device inlets shall under maximum filling conditions be situated in the vapour space of the shell and the devices shall be so arranged as to ensure the escaping vapour is discharged unrestrictedly. For flammable substances, the escaping vapour shall be directed away from the shell in such a manner that it cannot impinge upon the shell. Protective devices which deflect the flow of vapour are permissible provided the required relief-device capacity is not reduced.

6.7.2.15.2 Arrangements shall be made to prevent access to the pressure-relief devices by unauthorized persons and to protect the devices from damage caused by the portable tank overturning.

6.7.2.16 *Gauging devices*

6.7.2.16.1 Glass level-gauges and gauges made of other fragile material, which are in direct communication with the contents of the tank shall not be used.

6.7.2.17 *Portable tank supports, frameworks, lifting and tie-down attachments*

6.7.2.17.1 Portable tanks shall be designed and constructed with a support structure to provide a secure base during carriage. The forces specified in 6.7.2.2.12 and the safety factor specified in 6.7.2.2.13 shall be considered in this aspect of the design. Skids, frameworks, cradles or other similar structures are acceptable.

6.7.2.17.2 The combined stresses caused by portable tank mountings (e.g. cradles, framework, etc.) and portable tank lifting and tie-down attachments shall not cause excessive stress in any portion of the shell. Permanent lifting and tie-down attachments shall be fitted to all portable tanks.

Preferably they shall be fitted to the portable tank supports but may be secured to reinforcing plates located on the shell at the points of support.

6.7.2.17.3 In the design of supports and frameworks the effects of environmental corrosion shall be taken into account.

6.7.2.17.4 Forklift pockets shall be capable of being closed off. The means of closing forklift pockets shall be a permanent part of the framework or permanently attached to the framework. Single compartment portable tanks with a length less than 3.65 m need not have closed off forklift pockets provided that:

- (a) The shell including all the fittings are well protected from being hit by the forklift blades; and
- (b) The distance between the centres of the forklift pockets is at least half of the maximum length of the portable tank.

6.7.2.17.5 When portable tanks are not protected during carriage, according to 4.2.1.2, the shells and service equipment shall be protected against damage to the shell and service equipment resulting from lateral or longitudinal impact or overturning. External fittings shall be protected so as to preclude the release of the shell contents upon impact or overturning of the portable tank on its fittings. Examples of protection include:

- (a) Protection against lateral impact which may consist of longitudinal bars protecting the shell on both sides at the level of the median line;
- (b) Protection of the portable tank against overturning which may consist of reinforcement rings or bars fixed across the frame;
- (c) Protection against rear impact which may consist of a bumper or frame;
- (d) Protection of the shell against damage from impact or overturning by use of an ISO frame in accordance with ISO 1496-3:1995.

6.7.2.18 *Design approval*

6.7.2.18.1 The competent authority or its authorized body shall issue a design approval certificate for any new design of a portable tank. This certificate shall attest that a portable tank has been surveyed by that authority, is suitable for its intended purpose and meets the requirements of this Chapter and where appropriate, the provisions for substances provided in Chapter 4.2 and in Table A of Chapter 3.2. When a series of portable tanks are manufactured without change in the design, the certificate shall be valid for the entire series. The certificate shall refer to the prototype test report, the substances or group of substances allowed to be carried, the materials of construction of the shell and lining (when applicable) and an approval number. The approval number shall consist of the distinguishing sign or mark of the State in whose territory the approval was granted, i.e. the distinguishing sign for use in international traffic as prescribed by the Convention on Road Traffic, Vienna 1968, and a registration number. Any alternative arrangements according to 6.7.1.2 shall be indicated on the certificate. A design approval may serve for the approval of smaller portable tanks made of materials of the same kind and thickness, by the same fabrication techniques and with identical supports, equivalent closures and other appurtenances.

6.7.2.18.2 The prototype test report for the design approval shall include at least the following:

- (a) The results of the applicable framework test specified in ISO 1496-3:1995;
- (b) The results of the initial inspection and test according to 6.7.2.19.3; and
- (c) The results of the impact test in 6.7.2.19.1, when applicable.

6.7.2.19 *Inspection and testing*

- 6.7.2.19.1 Portable tanks meeting the definition of container in the International Convention for Safe Containers (CSC), 1972, as amended, shall not be used unless they are successfully qualified by subjecting a representative prototype of each design to the Dynamic, Longitudinal Impact Test prescribed in the Manual of Tests and Criteria, Part IV, Section 41.
- 6.7.2.19.2 The shell and items of equipment of each portable tank shall be inspected and tested before being put into service for the first time (initial inspection and test) and thereafter at not more than five-year intervals (5 year periodic inspection and test) with an intermediate periodic inspection and test (2.5 year periodic inspection and test) midway between the 5 year periodic inspections and tests. The 2.5 year inspection and test may be performed within 3 months of the specified date. An exceptional inspection and test shall be performed regardless of the date of the last periodic inspection and test when necessary according to 6.7.2.19.7.
- 6.7.2.19.3 The initial inspection and test of a portable tank shall include a check of the design characteristics, an internal and external examination of the portable tank and its fittings with due regard to the substances to be carried, and a pressure test. Before the portable tank is placed into service, a leakproofness test and a check of the satisfactory operation of all service equipment shall also be performed. When the shell and its fittings have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.
- 6.7.2.19.4 The 5-year periodic inspection and test shall include an internal and external examination and, as a general rule, a hydraulic pressure test. Sheathing, thermal insulation and the like shall be removed only to the extent required for reliable appraisal of the condition of the portable tank. When the shell and equipment have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.
- 6.7.2.19.5 The intermediate 2.5 year periodic inspection and test shall at least include an internal and external examination of the portable tank and its fittings with due regard to the substances intended to be carried, a leakproofness test and a check of the satisfactory operation of all service equipment. Sheathing, thermal insulation and the like shall be removed only to the extent required for reliable appraisal of the condition of the portable tank. For portable tanks intended for the carriage of a single substance, the 2.5 year internal examination may be waived or substituted by other test methods or inspection procedures specified by the competent authority or its authorized body.
- 6.7.2.19.6 A portable tank may not be filled and offered for carriage after the date of expiry of the last 5 year or 2.5 year periodic inspection and test as required by 6.7.2.19.2. However, a portable tank filled prior to the date of expiry of the last periodic inspection and test may be carried for a period not to exceed three months beyond the date of expiry of the last periodic test or inspection. In addition, a portable tank may be carried after the date of expiry of the last periodic test and inspection:
- (a) After emptying but before cleaning, for purposes of performing the next required test or inspection prior to refilling; and
 - (b) Unless otherwise approved by the competent authority, for a period not to exceed six months beyond the date of expiry of the last periodic test or inspection, in order to allow the return of dangerous goods for proper disposal or recycling. Reference to this exemption shall be mentioned in the transport document.

- 6.7.2.19.7 The exceptional inspection and test is necessary when the portable tank shows evidence of damaged or corroded areas, or leakage, or other conditions that indicate a deficiency that could affect the integrity of the portable tank. The extent of the exceptional inspection and test shall depend on the amount of damage or deterioration of the portable tank. It shall include at least the 2.5 year inspection and test according to 6.7.2.19.5.
- 6.7.2.19.8 The internal and external examinations shall ensure that:
- (a) The shell is inspected for pitting, corrosion, or abrasions, dents, distortions, defects in welds or any other conditions, including leakage, that might render the portable tank unsafe for carriage;
 - (b) The piping, valves, heating/cooling system, and gaskets are inspected for corroded areas, defects, or any other conditions, including leakage, that might render the portable tank unsafe for filling, discharge or carriage;
 - (c) Devices for tightening manhole covers are operative and there is no leakage at manhole covers or gaskets;
 - (d) Missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
 - (e) All emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves shall be operated to demonstrate proper operation;
 - (f) Linings, if any, are inspected in accordance with criteria outlined by the lining manufacturer;
 - (g) Required markings on the portable tank are legible and in accordance with the applicable requirements; and
 - (h) The framework, supports and arrangements for lifting the portable tank are in a satisfactory condition.
- 6.7.2.19.9 The inspections and tests in 6.7.2.19.1, 6.7.2.19.3, 6.7.2.19.4, 6.7.2.19.5 and 6.7.2.19.7 shall be performed or witnessed by an expert approved by the competent authority or its authorized body. When the pressure test is a part of the inspection and test, the test pressure shall be the one indicated on the data plate of the portable tank. While under pressure, the portable tank shall be inspected for any leaks in the shell, piping or equipment.
- 6.7.2.19.10 In all cases when cutting, burning or welding operations on the shell have been effected, that work shall be to the approval of the competent authority or its authorized body taking into account the pressure vessel code used for the construction of the shell. A pressure test to the original test pressure shall be performed after the work is completed.
- 6.7.2.19.11 When evidence of any unsafe condition is discovered, the portable tank shall not be returned to service until it has been corrected and the test is repeated and passed. .

6.7.2.20 Marking

6.7.2.20.1 Every portable tank shall be fitted with a corrosion resistant metal plate permanently attached to the portable tank in a conspicuous place readily accessible for inspection. When for reasons of portable tank arrangements the plate cannot be permanently attached to the shell, the shell shall be marked with at least the information required by the pressure vessel code. As a minimum, at least the following information shall be marked on the plate by stamping or by any other similar method:

- (a) Owner information
 - (i) Owner's registration number;
- (b) Manufacturing information
 - (i) Country of manufacture;
 - (ii) Year of manufacture;
 - (iii) Manufacturer's name or mark;
 - (iv) Manufacturer's serial number;
- (c) Approval information

- (i) The United Nations packaging symbol

;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7²;

- (ii) Approval country;
 - (iii) Authorized body for the design approval;
 - (iv) Design approval number;
 - (v) Letters 'AA', if the design was approved under alternative arrangements (see 6.7.1.2);
 - (vi) Pressure vessel code to which the shell is designed;
- (d) Pressures
 - (i) MAWP (in bar gauge or kPa gauge)³;
 - (ii) Test pressure (in bar gauge or kPa gauge)³;
 - (iii) Initial pressure test date (month and year);
 - (iv) Identification mark of the initial pressure test witness;
 - (v) External design pressure⁴ (in bar gauge or kPa gauge)³;
 - (vi) MAWP for heating/cooling system (in bar gauge or kPa gauge)³ (when applicable);

² This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

³ The unit used shall be indicated.

⁴ See 6.7.2.2.10.

- (e) Temperatures
 - (i) Design temperature range (in °C)³;
- (f) Materials
 - (i) Shell material(s) and material standard reference(s);
 - (ii) Equivalent thickness in reference steel (in mm)³;
 - (iii) Lining material (when applicable);
- (g) Capacity
 - (i) Tank water capacity at 20 °C (in litres)³;
 This indication is to be followed by the symbol "S" when the shell is divided by surge plates into sections of not more than 7 500 litres capacity;
 - (ii) Water capacity of each compartment at 20 °C (in litres)³ (when applicable, for multi-compartment tanks).
 This indication is to be followed by the symbol "S" when the compartment is divided by surge plates into sections of not more than 7 500 litres capacity;
- (h) Periodic inspections and tests
 - (i) Type of the most recent periodic test (2.5-year, 5-year or exceptional);
 - (ii) Date of the most recent periodic test (month and year);
 - (iii) Test pressure (in bar gauge or kPa gauge)³ of the most recent periodic test (if applicable);
 - (iv) Identification mark of the authorized body who performed or witnessed the most recent test.

³

The unit used shall be indicated.

6.7.2.20.2 The following particulars shall be marked either on the portable tank itself or on a metal plate firmly secured to the portable tank:

Name of the operator

Maximum permissible gross mass (MPGM) _____ kg

Unladen (tare) mass _____ kg

Portable tank instruction in accordance with 4.2.5.2.6

NOTE: For the identification of the substances being carried, see also Part 5.

6.7.2.20.3 If a portable tank is designed and approved for handling in open seas, the words "OFFSHORE PORTABLE TANK" shall be marked on the identification plate.

6.7.3 Requirements for the design, construction, inspection and testing of portable tanks intended for the carriage of non-refrigerated liquefied gases

NOTE: These requirements also apply to portable tanks intended for the carriage of chemicals under pressure (UN Nos. 3500, 3501, 3502, 3503, 3504 and 3505).

6.7.3.1 Definitions

For the purposes of this section:

Alternative arrangement means an approval granted by the competent authority for a portable tank or MEGC that has been designed, constructed or tested to technical requirements or testing methods other than those specified in this Chapter;

Portable tank means a multimodal tank having a capacity of more than 450 litres used for the carriage of non-refrigerated liquefied gases of Class 2. The portable tank includes a shell fitted with service equipment and structural equipment necessary for the carriage of gases. The portable tank shall be capable of being filled and discharged without the removal of its structural equipment. It shall possess stabilizing members external to the shell, and shall be capable of being lifted when full. It shall be designed primarily to be loaded onto a vehicle, wagon or sea-going or inland navigation vessel and shall be equipped with skids, mountings or accessories to facilitate mechanical handling. Tank-vehicles, tank-wagons, non-metallic tanks, intermediate bulk containers (IBCs), gas cylinders and large receptacles are not considered to fall within the definition for portable tanks;

Shell means the part of the portable tank which retains the non-refrigerated liquefied gas intended for carriage (tank proper), including openings and their closures, but does not include service equipment or external structural equipment;

Service equipment means measuring instruments and filling, discharge, venting, safety and insulating devices;

Structural equipment means the reinforcing, fastening, protective and stabilizing members external to the shell;

Maximum allowable working pressure (MAWP) means a pressure that shall be not less than the highest of the following pressures measured at the top of the shell while in operating position, but in no case less than 7 bar:

- (a) The maximum effective gauge pressure allowed in the shell during filling or discharge; or
- (b) The maximum effective gauge pressure to which the shell is designed, which shall be:
 - (i) for a non-refrigerated liquefied gas listed in the portable tank instruction T50 in 4.2.5.2.6, the MAWP (in bar) given in T50 portable tank instruction for that gas;
 - (ii) for other non-refrigerated liquefied gases, not less than the sum of:
 - the absolute vapour pressure (in bar) of the non-refrigerated liquefied gas at the design reference temperature minus 1 bar; and
 - the partial pressure (in bar) of air or other gases in the ullage space being determined by the design reference temperature and the liquid phase expansion due to an increase of the mean bulk temperature of $t_f - t_r$ (t_f = filling temperature, usually 15 °C, t_r = maximum mean bulk temperature, 50 °C);

- (iii) for chemicals under pressure, the MAWP (in bar) given in T50 portable tank instruction for the liquefied gas portion of the propellants listed in T50 in 4.2.5.2.6;

Design pressure means the pressure to be used in calculations required by a recognized pressure vessel code. The design pressure shall be not less than the highest of the following pressures:

- (a) The maximum effective gauge pressure allowed in the shell during filling or discharge; or
- (b) The sum of:
 - (i) the maximum effective gauge pressure to which the shell is designed as defined in (b) of the MAWP definition (see above); and
 - (ii) a head pressure determined on the basis of the static forces specified in 6.7.3.2.9, but not less than 0.35 bar;

Test pressure means the maximum gauge pressure at the top of the shell during the pressure test;

Leakproofness test means a test using gas subjecting the shell and its service equipment to an effective internal pressure of not less than 25% of the MAWP;

Maximum permissible gross mass (MPGM) means the sum of the tare mass of the portable tank and the heaviest load authorized for carriage;

Reference steel means a steel with a tensile strength of 370 N/mm^2 and an elongation at fracture of 27%;

Mild steel means a steel with a guaranteed minimum tensile strength of 360 N/mm^2 to 440 N/mm^2 and a guaranteed minimum elongation at fracture conforming to 6.7.3.3.3;

Design temperature range for the shell shall be -40°C to 50°C for non-refrigerated liquefied gases carried under ambient conditions. More severe design temperatures shall be considered for portable tanks subjected to severe climatic conditions;

Design reference temperature means the temperature at which the vapour pressure of the contents is determined for the purpose of calculating the MAWP. The design reference temperature shall be less than the critical temperature of the non-refrigerated liquefied gas or liquefied gas propellants of chemicals under pressure intended to be carried to ensure that the gas at all times is liquefied. This value for each portable tank type is as follows:

- (a) Shell with a diameter of 1.5 metres or less: 65°C ;
- (b) Shell with a diameter of more than 1.5 metres:
 - (i) without insulation or sun shield: 60°C ;
 - (ii) with sun shield (see 6.7.3.2.12): 55°C ; and
 - (iii) with insulation (see 6.7.3.2.12) : 50°C ;

Filling density means the average mass of non-refrigerated liquefied gas per litre of shell capacity (kg/l). The filling density is given in portable tank instruction T50 in 4.2.5.2.6.

6.7.3.2 *General design and construction requirements*

- 6.7.3.2.1 Shells shall be designed and constructed in accordance with the requirements of a pressure vessel code recognized by the competent authority. Shells shall be made of steel suitable for forming. The materials shall in principle conform to national or international material standards. For welded shells, only a material whose weldability has been fully demonstrated shall be used. Welds shall be skilfully made and afford complete safety. When the manufacturing process or the materials make it necessary, the shells shall be suitably heat-treated to guarantee adequate toughness in the weld and in the heat affected zones. In choosing the material the design temperature range shall be taken into account with respect to risk of brittle fracture, to stress corrosion cracking and to resistance to impact. When fine grain steel is used, the guaranteed value of the yield strength shall be not more than 460 N/mm² and the guaranteed value of the upper limit of the tensile strength shall be not more than 725 N/mm² according to the material specification. Portable tank materials shall be suitable for the external environment in which they may be carried.
- 6.7.3.2.2 Portable tank shells, fittings and pipework shall be constructed of materials which are:
- (a) Substantially immune to attack by the non-refrigerated liquefied gas(es) intended to be carried; or
 - (b) Properly passivated or neutralized by chemical reaction.
- 6.7.3.2.3 Gaskets shall be made of materials compatible with the non-refrigerated liquefied gas(es) intended to be carried.
- 6.7.3.2.4 Contact between dissimilar metals which could result in damage by galvanic action shall be avoided.
- 6.7.3.2.5 The materials of the portable tank, including any devices, gaskets, and accessories, shall not adversely affect the non-refrigerated liquefied gas(es) intended for carriage in the portable tank.
- 6.7.3.2.6 Portable tanks shall be designed and constructed with supports to provide a secure base during carriage and with suitable lifting and tie-down attachments.
- 6.7.3.2.7 Portable tanks shall be designed to withstand, without loss of contents, at least the internal pressure due to the contents, and the static, dynamic and thermal loads during normal conditions of handling and carriage. The design shall demonstrate that the effects of fatigue, caused by repeated application of these loads through the expected life of the portable tank, have been taken into account.
- 6.7.3.2.8 Shells shall be designed to withstand an external pressure of at least 0.4 bar (gauge pressure) above the internal pressure without permanent deformation. When the shell is to be subjected to a significant vacuum before filling or during discharge it shall be designed to withstand an external pressure of at least 0.9 bar (gauge pressure) above the internal pressure and shall be proven at that pressure.
- 6.7.3.2.9 Portable tanks and their fastenings shall, under the maximum permissible load, be capable of absorbing the following separately applied static forces:
- (a) In the direction of travel: twice the MPGM multiplied by the acceleration due to gravity (g)¹;

¹ For calculation purposes $g = 9.81 \text{ m/s}^2$.

- (b) Horizontally at right angles to the direction of travel: the MPGM (when the direction of travel is not clearly determined, the forces shall be equal to twice the MPGM) multiplied by the acceleration due to gravity (g)¹;
- (c) Vertically upwards: the MPGM multiplied by the acceleration due to gravity (g)¹; and
- (d) Vertically downwards: twice the MPGM (total loading including the effect of gravity) multiplied by the acceleration due to gravity (g)¹.

6.7.3.2.10 Under each of the forces in 6.7.3.2.9, the safety factor to be observed shall be as follows:

- (a) For steels having a clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed yield strength; or
- (b) For steels with no clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength and, for austenitic steels, the 1% proof strength.

6.7.3.2.11 The values of yield strength or proof strength shall be the values according to national or international material standards. When austenitic steels are used, the specified minimum values of yield strength and proof strength according to the material standards may be increased by up to 15% when these greater values are attested in the material inspection certificate. When no material standard exists for the steel in question, the value of yield strength or proof strength used shall be approved by the competent authority.

6.7.3.2.12 When the shells intended for the carriage of non-refrigerated liquefied gases are equipped with thermal insulation, the thermal insulation systems shall satisfy the following requirements:

- (a) It shall consist of a shield covering not less than the upper third but not more than the upper half of the surface of the shell and separated from the shell by an air space about 40 mm across;
- (b) It shall consist of a complete cladding of adequate thickness of insulating materials protected so as to prevent the ingress of moisture and damage under normal conditions of carriage and so as to provide a thermal conductance of not more than $0.67 \text{ (W.m}^{-2}\text{.K}^{-1}\text{)}$;
- (c) When the protective covering is so closed as to be gas-tight, a device shall be provided to prevent any dangerous pressure from developing in the insulating layer in the event of inadequate gas tightness of the shell or of its items of equipment; and
- (d) The thermal insulation shall not inhibit access to the fittings and discharge devices.

6.7.3.2.13 Portable tanks intended for the carriage of flammable non-refrigerated liquefied gases shall be capable of being electrically earthed.

6.7.3.3 *Design criteria*

6.7.3.3.1 Shells shall be of a circular cross-section.

6.7.3.3.2 Shells shall be designed and constructed to withstand a test pressure not less than 1.3 times the design pressure. The shell design shall take into account the minimum MAWP values provided in portable tank instruction T50 in 4.2.5.2.6 for each non-refrigerated liquefied gas intended for carriage. Attention is drawn to the minimum shell thickness requirements for these shells specified in 6.7.3.4.

6.7.3.3.3 For steels exhibiting a clearly defined yield point or characterized by a guaranteed proof strength (0.2% proof strength, generally, or 1% proof strength for austenitic steels) the

primary membrane stress σ (sigma) in the shell shall not exceed 0.75 Re or 0.50 Rm, whichever is lower, at the test pressure, where:

Re = yield strength in N/mm², or 0.2% proof strength or, for austenitic steels, 1% proof stress;

Rm = minimum tensile strength in N/mm².

6.7.3.3.3.1 The values of Re and Rm to be used shall be the specified minimum values according to national or international material standards. When austenitic steels are used, the specified minimum values for Re and Rm according to the material standards may be increased by up to 15% when these greater values are attested in the material inspection certificate. When no material standard exists for the steel in question, the values of Re and Rm used shall be approved by the competent authority or its authorized body.

6.7.3.3.3.2 Steels which have a Re/Rm ratio of more than 0.85 are not allowed for the construction of welded shells. The values of Re and Rm to be used in determining this ratio shall be the values specified in the material inspection certificate.

6.7.3.3.3.3 Steels used in the construction of shells shall have an elongation at fracture, in %, of not less than 10 000/Rm with an absolute minimum of 16% for fine grain steels and 20% for other steels.

6.7.3.3.3.4 For the purpose of determining actual values for materials, it shall be noted that for sheet metal, the axis of the tensile test specimen shall be at right angles (transversely) to the direction of rolling. The permanent elongation at fracture shall be measured on test specimens of rectangular cross sections in accordance with ISO 6892:1998 using a 50 mm gauge length.

6.7.3.4 Minimum shell thickness

6.7.3.4.1 The minimum shell thickness shall be the greater thickness based on:

- (a) The minimum thickness determined in accordance with the requirements in 6.7.3.4; and
- (b) The minimum thickness determined in accordance with the recognized pressure vessel code including the requirements in 6.7.3.3.

6.7.3.4.2 The cylindrical portions, ends (heads) and manhole covers of shells of not more than 1.80 m in diameter shall be not less than 5 mm thick in the reference steel or of equivalent thickness in the steel to be used. Shells of more than 1.80 m in diameter shall be not less than 6 mm thick in the reference steel or of equivalent thickness in the steel to be used.

6.7.3.4.3 The cylindrical portions, ends (heads) and manhole covers of all shells shall be not less than 4 mm thick regardless of the material of construction.

6.7.3.4.4 The equivalent thickness of a steel other than the thickness prescribed for the reference steel in 6.7.3.4.2 shall be determined using the following formula:

$$e_1 = \frac{21,4e_0}{\sqrt[3]{Rm_1 \times A_1}}$$

where:

e_1 = required equivalent thickness (in mm) of the steel to be used;

e_0 = minimum thickness (in mm) for the reference steel specified in 6.7.3.4.2;

- R_{m1} = guaranteed minimum tensile strength (in N/mm^2) of the steel to be used (see 6.7.3.3.3);
- A_1 = guaranteed minimum elongation at fracture (in %) of the steel to be used according to national or international standards.

6.7.3.4.5 In no case shall the wall thickness be less than that prescribed in 6.7.3.4.1 to 6.7.3.4.3. All parts of the shell shall have a minimum thickness as determined by 6.7.3.4.1 to 6.7.3.4.3. This thickness shall be exclusive of any corrosion allowance.

6.7.3.4.6 When mild steel is used (see 6.7.3.1), calculation using the formula in 6.7.3.4.4 is not required.

6.7.3.4.7 There shall be no sudden change of plate thickness at the attachment of the ends (heads) to the cylindrical portion of the shell.

6.7.3.5 Service equipment

6.7.3.5.1 Service equipment shall be so arranged as to be protected against the risk of being wrenched off or damaged during handling and carriage. When the connection between the frame and the shell allows relative movement between the sub-assemblies, the equipment shall be so fastened as to permit such movement without risk of damage to working parts. The external discharge fittings (pipe sockets, shut-off devices), the internal stop-valve and its seating shall be protected against the danger of being wrenched off by external forces (for example using shear sections). The filling and discharge devices (including flanges or threaded plugs) and any protective caps shall be capable of being secured against unintended opening.

6.7.3.5.2 All openings with a diameter of more than 1.5 mm in shells of portable tanks, except openings for pressure-relief devices, inspection openings and closed bleed holes, shall be fitted with at least three mutually independent shut-off devices in series, the first being an internal stop-valve, excess flow valve or equivalent device, the second being an external stop-valve and the third being a blank flange or equivalent device.

6.7.3.5.2.1 When a portable tank is fitted with an excess flow valve, the excess flow valve shall be so fitted that its seating is inside the shell or inside a welded flange or, when fitted externally, its mountings shall be designed so that in the event of impact its effectiveness shall be maintained. The excess flow valves shall be selected and fitted so as to close automatically when the rated flow specified by the manufacturer is reached. Connections and accessories leading to or from such a valve shall have a capacity for a flow more than the rated flow of the excess flow valve.

6.7.3.5.3 For filling and discharge openings, the first shut-off device shall be an internal stop-valve and the second shall be a stop-valve placed in an accessible position on each discharge and filling pipe.

6.7.3.5.4 For filling and discharge bottom openings of portable tanks intended for the carriage of flammable and/or toxic non-refrigerated liquefied gases or chemicals under pressure the internal stop-valve shall be a quick closing safety device which closes automatically in the event of unintended movement of the portable tank during filling or discharge or fire engulfment. Except for portable tanks having a capacity of not more than 1 000 litres, it shall be possible to operate this device by remote control.

6.7.3.5.5 In addition to filling, discharge and gas pressure equalizing orifices, shells may have openings in which gauges, thermometers and manometers can be fitted. Connections for such instruments shall be made by suitable welded nozzles or pockets and not be screwed connections through the shell.

- 6.7.3.5.6 All portable tanks shall be fitted with manholes or other inspection openings of suitable size to allow for internal inspection and adequate access for maintenance and repair of the interior.
- 6.7.3.5.7 External fittings shall be grouped together so far as reasonably practicable.
- 6.7.3.5.8 Each connection on a portable tank shall be clearly marked to indicate its function.
- 6.7.3.5.9 Each stop-valve or other means of closure shall be designed and constructed to a rated pressure not less than the MAWP of the shell taking into account the temperatures expected during carriage. All stop-valves with a screwed spindle shall close by a clockwise motion of the handwheel. For other stop-valves the position (open and closed) and direction of closure shall be clearly indicated. All stop-valves shall be designed to prevent unintentional opening.
- 6.7.3.5.10 Piping shall be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration. All piping shall be of suitable metallic material. Welded pipe joints shall be used wherever possible.
- 6.7.3.5.11 Joints in copper tubing shall be brazed or have an equally strong metal union. The melting point of brazing materials shall be no lower than 525 °C. The joints shall not decrease the strength of tubing as may happen when cutting threads.
- 6.7.3.5.12 The burst pressure of all piping and pipe fittings shall be not less than the highest of four times the MAWP of the shell or four times the pressure to which it may be subjected in service by the action of a pump or other device (except pressure-relief devices).
- 6.7.3.5.13 Ductile metals shall be used in the construction of valves and accessories.

6.7.3.6 *Bottom openings*

- 6.7.3.6.1 Certain non-refrigerated liquefied gases shall not be carried in portable tanks with bottom openings when portable tank instruction T50 in 4.2.5.2.6 indicates that bottom openings are not allowed. There shall be no openings below the liquid level of the shell when it is filled to its maximum permissible filling limit.

6.7.3.7 *Pressure-relief devices*

- 6.7.3.7.1 Portable tanks shall be provided with one or more spring-loaded pressure-relief devices. The pressure-relief devices shall open automatically at a pressure not less than the MAWP and be fully open at a pressure equal to 110% of the MAWP. These devices shall, after discharge, close at a pressure not lower than 10% below the pressure at which discharge starts and shall remain closed at all lower pressures. The pressure-relief devices shall be of a type that will resist dynamic forces including liquid surge. Frangible discs not in series with a spring-loaded pressure-relief device are not permitted.
- 6.7.3.7.2 Pressure-relief devices shall be designed to prevent the entry of foreign matter, the leakage of gas and the development of any dangerous excess pressure.
- 6.7.3.7.3 Portable tanks intended for the carriage of certain non-refrigerated liquefied gases identified in portable tank instruction T50 in 4.2.5.2.6 shall have a pressure-relief device approved by the competent authority. Unless a portable tank in dedicated service is fitted with an approved relief device constructed of materials compatible with the load, such device shall comprise a frangible disc preceding a spring-loaded device. The space between the frangible disc and the device shall be provided with a pressure gauge or a suitable tell-tale indicator. This arrangement permits the detection of disc rupture, pinholing or leakage which could cause a malfunction of the pressure-relief device. The frangible discs shall rupture at a nominal pressure 10% above the start-to-discharge pressure of the relief device.

6.7.3.7.4 In the case of multi-purpose portable tanks, the pressure-relief devices shall open at a pressure indicated in 6.7.3.7.1 for the gas having the highest maximum allowable pressure of the gases allowed to be carried in the portable tank.

6.7.3.8 Capacity of relief devices

6.7.3.8.1 The combined delivery capacity of the relief devices shall be sufficient that, in the event of total fire engulfment, the pressure (including accumulation) inside the shell does not exceed 120% of the MAWP. Spring-loaded relief devices shall be used to achieve the full relief capacity prescribed. In the case of multi-purpose tanks, the combined delivery capacity of the pressure-relief devices shall be taken for the gas which requires the highest delivery capacity of the gases allowed to be carried in portable tanks.

6.7.3.8.1.1 To determine the total required capacity of the relief devices, which shall be regarded as being the sum of the individual capacities of the several devices, the following formula⁵ shall be used:

$$Q = 12.4 \frac{FA^{0.82}}{LC} \sqrt{\frac{ZT}{M}}$$

where:

Q = minimum required rate of discharge in cubic metres of air per second (m³/s) at standard conditions: 1 bar and 0 °C (273 K);

F = is a coefficient with the following value:

for uninsulated shells: F = 1;

for insulated shells: F = U(649-t)/13.6 but in no case is less than 0.25

where:

U = thermal conductance of the insulation, in Kw.m⁻².K⁻¹, at 38 °C;

t = actual temperature of the non-refrigerated liquefied gas during filling (°C); when this temperature is unknown, let t=15 °C;

The value of F given above for insulated shells may be taken provided that the insulation is in accordance with 6.7.3.8.1.2;

where:

A = total external surface area of shell in square metres;

Z = the gas compressibility factor in the accumulating condition (when this factor is unknown, let Z=1.0);

T = absolute temperature in Kelvin (°C + 273) above the pressure relief devices in the accumulating condition;

⁵ This formula applies only to non-refrigerated liquefied gases which have critical temperatures well above the temperature at the accumulating condition. For gases which have critical temperatures near or below the temperature at the accumulating condition, the calculation of the pressure-relief device delivery capacity shall consider further thermodynamic properties of the gas (see for example CGA S-1.2-2003 "Pressure Relief Device Standards - Part 2 - Cargo and Portable Tanks for Compressed Gases").

L = the latent heat of vaporization of the liquid, in kJ/kg, in the accumulating condition;

M = molecular mass of the discharged gas;

C = a constant which is derived from one of the following formulae as a function of the ratio k of specific heats

$$k = \frac{c_p}{c_v}$$

where

c_p is the specific heat at constant pressure; and

c_v is the specific heat at constant volume.

when $k > 1$:

$$C = \sqrt{k \left(\frac{2}{k+1} \right)^{\frac{k+1}{k-1}}}$$

when $k = 1$ or k is unknown:

$$C = \frac{1}{\sqrt{e}} = 0.607$$

where e is the mathematical constant 2.7183

C may also be taken from the following table:

k	C	k	C	k	C
1.00	0.607	1.26	0.660	1.52	0.704
1.02	0.611	1.28	0.664	1.54	0.707
1.04	0.615	1.30	0.667	1.56	0.710
1.06	0.620	1.32	0.671	1.58	0.713
1.08	0.624	1.34	0.674	1.60	0.716
1.10	0.628	1.36	0.678	1.62	0.719
1.12	0.633	1.38	0.681	1.64	0.722
1.14	0.637	1.40	0.685	1.66	0.725
1.16	0.641	1.42	0.688	1.68	0.728
1.18	0.645	1.44	0.691	1.70	0.731
1.20	0.649	1.46	0.695	2.00	0.770
1.22	0.652	1.48	0.698	2.20	0.793
1.24	0.656	1.50	0.701		

6.7.3.8.1.2 Insulation systems, used for the purpose of reducing the venting capacity, shall be approved by the competent authority or its authorized body. In all cases, insulation systems approved for this purpose shall:

- (a) Remain effective at all temperatures up to 649 °C; and
- (b) Be jacketed with a material having a melting point of 700 °C or greater.

6.7.3.9 *Marking of pressure-relief devices*

6.7.3.9.1 Every pressure-relief device shall be plainly and permanently marked with the following particulars:

- (a) The pressure (in bar or kPa) at which it is set to discharge;
- (b) The allowable tolerance at the discharge pressure for spring-loaded devices;
- (c) The reference temperature corresponding to the rated pressure for frangible discs; and
- (d) The rated flow capacity of the device in standard cubic metres of air per second (m³/s).
- (e) The cross sectional flow areas of the spring loaded pressure-relief devices and frangible discs in mm².

When practicable, the following information shall also be shown:

- (f) The manufacturer's name and relevant catalogue number of the device.

6.7.3.9.2 The rated flow capacity marked on the pressure-relief devices shall be determined according to ISO 4126-1:2004 and ISO 4126-7:2004.

6.7.3.10 *Connections to pressure-relief devices*

6.7.3.10.1 Connections to pressure-relief devices shall be of sufficient size to enable the required discharge to pass unrestricted to the safety device. No stop-valve shall be installed between the shell and the pressure-relief devices except when duplicate devices are provided for maintenance or other reasons and the stop-valves serving the devices actually in use are locked open or the stop-valves are interlocked so that at least one of the duplicate devices is always operable and capable of meeting the requirements of 6.7.3.8. There shall be no obstruction in an opening leading to a vent or pressure-relief device which might restrict or cut-off the flow from the shell to that device. Vents from the pressure-relief devices, when used, shall deliver the relieved vapour or liquid to the atmosphere in conditions of minimum back-pressure on the relieving device.

6.7.3.11 *Siting of pressure-relief devices*

6.7.3.11.1 Each pressure-relief device inlet shall be situated on top of the shell in a position as near the longitudinal and transverse centre of the shell as reasonably practicable. All pressure relief device inlets shall under maximum filling conditions be situated in the vapour space of the shell and the devices shall be so arranged as to ensure that the escaping vapour is discharged unrestrictedly. For flammable non-refrigerated liquefied gases, the escaping vapour shall be directed away from the shell in such a manner that it cannot impinge upon the shell. Protective devices which deflect the flow of vapour are permissible provided the required relief-device capacity is not reduced.

6.7.3.11.2 Arrangements shall be made to prevent access to the pressure-relief devices by unauthorized persons and to protect the devices from damage caused by the portable tank overturning.

6.7.3.12 *Gauging devices*

6.7.3.12.1 Unless a portable tank is intended to be filled by weight it shall be equipped with one or more gauging devices. Glass level-gauges and gauges made of other fragile material, which are in direct communication with the contents of the shell shall not be used.

6.7.3.13 *Portable tank supports, frameworks, lifting and tie-down attachments*

- 6.7.3.13.1 Portable tanks shall be designed and constructed with a support structure to provide a secure base during carriage. The forces specified in 6.7.3.2.9 and the safety factor specified in 6.7.3.2.10 shall be considered in this aspect of the design. Skids, frameworks, cradles or other similar structures are acceptable.
- 6.7.3.13.2 The combined stresses caused by portable tank mountings (e.g. cradles, frameworks, etc.) and portable tank lifting and tie-down attachments shall not cause excessive stress in any portion of the shell. Permanent lifting and tie-down attachments shall be fitted to all portable tanks. Preferably they shall be fitted to the portable tank supports but may be secured to reinforcing plates located on the shell at the points of support.
- 6.7.3.13.3 In the design of supports and frameworks the effects of environmental corrosion shall be taken into account.
- 6.7.3.13.4 Forklift pockets shall be capable of being closed off. The means of closing forklift pockets shall be a permanent part of the framework or permanently attached to the framework. Single compartment portable tanks with a length less than 3.65 m need not have closed off forklift pockets provided that:
- (a) The shell and all the fittings are well protected from being hit by the forklift blades; and
 - (b) The distance between the centres of the forklift pockets is at least half of the maximum length of the portable tank.
- 6.7.3.13.5 When portable tanks are not protected during carriage, according to 4.2.2.3, the shells and service equipment shall be protected against damage to the shell and service equipment resulting from lateral or longitudinal impact or overturning. External fittings shall be protected so as to preclude the release of the shell contents upon impact or overturning of the portable tank on its fittings. Examples of protection include:
- (a) Protection against lateral impact which may consist of longitudinal bars protecting the shell on both sides at the level of the median line;
 - (b) Protection of the portable tank against overturning which may consist of reinforcement rings or bars fixed across the frame;
 - (c) Protection against rear impact which may consist of a bumper or frame;
 - (d) Protection of the shell against damage from impact or overturning by use of an ISO frame in accordance with ISO 1496-3:1995.

6.7.3.14 *Design approval*

- 6.7.3.14.1 The competent authority or its authorized body shall issue a design approval certificate for any new design of a portable tank. This certificate shall attest that a portable tank has been surveyed by that authority, is suitable for its intended purpose and meets the requirements of this Chapter and where appropriate the provisions for gases provided in portable tank instruction T50 in 4.2.5.2.6. When a series of portable tanks are manufactured without change in the design, the certificate shall be valid for the entire series. The certificate shall refer to the prototype test report, the gases allowed to be carried, the materials of construction of the shell and an approval number. The approval number shall consist of the distinguishing sign or mark of the State in whose territory the approval was granted, i.e. the distinguishing sign for use in international traffic, as prescribed by the Convention on Road Traffic, Vienna 1968, and a registration number. Any alternative arrangements according to 6.7.1.2 shall be indicated on the certificate. A design approval may serve for the approval

of smaller portable tanks made of materials of the same kind and thickness, by the same fabrication techniques and with identical supports, equivalent closures and other appurtenances.

6.7.3.14.2 The prototype test report for the design approval shall include at least the following:

- (a) The results of the applicable framework test specified in ISO 1496-3:1995;
- (b) The results of the initial inspection and test in 6.7.3.15.3; and
- (c) The results of the impact test in 6.7.3.15.1, when applicable.

6.7.3.15 *Inspection and testing*

6.7.3.15.1 Portable tanks meeting the definition of container in the International Convention for Safe Containers (CSC), 1972, as amended, shall not be used unless they are successfully qualified by subjecting a representative prototype of each design to the Dynamic, Longitudinal Impact Test prescribed in the Manual of Tests and Criteria, Part IV, Section 41.

6.7.3.15.2 The shell and items of equipment of each portable tank shall be inspected and tested before being put into service for the first time (initial inspection and test) and thereafter at not more than five-year intervals (5 year periodic inspection and test) with an intermediate periodic inspection and test (2.5 year periodic inspection and test) midway between the 5 year periodic inspections and tests. The 2.5 year inspection and test may be performed within 3 months of the specified date. An exceptional inspection and test shall be performed regardless of the last periodic inspection and test when necessary according to 6.7.3.15.7.

6.7.3.15.3 The initial inspection and test of a portable tank shall include a check of the design characteristics, an internal and external examination of the portable tank and its fittings with due regard to the non-refrigerated liquefied gases to be carried, and a pressure test referring to the test pressures according to 6.7.3.3.2. The pressure test may be performed as a hydraulic test or by using another liquid or gas with the agreement of the competent authority or its authorized body. Before the portable tank is placed into service, a leakproofness test and a test of the satisfactory operation of all service equipment shall also be performed. When the shell and its fittings have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test. All welds subject to full stress level in the shell shall be inspected during the initial test by radiographic, ultrasonic, or another suitable non-destructive test method. This does not apply to the jacket.

6.7.3.15.4 The 5 year periodic inspection and test shall include an internal and external examination and, as a general rule, a hydraulic pressure test. Sheathing, thermal insulation and the like shall be removed only to the extent required for reliable appraisal of the condition of the portable tank. When the shell and equipment have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.

6.7.3.15.5 The intermediate 2.5 year periodic inspection and test shall at least include an internal and external examination of the portable tank and its fittings with due regard to the non-refrigerated liquefied gases intended to be carried, a leakproofness test and a check of the satisfactory operation of all service equipment. Sheathing thermal insulation and the like shall be removed only to the extent required for reliable appraisal of the condition of the portable tank. For portable tanks intended for the carriage of a single non-refrigerated liquefied gas, the 2.5 year internal examination may be waived or substituted by other test methods or inspection procedures specified by the competent authority or its authorized body.

6.7.3.15.6 A portable tank may not be filled and offered for carriage after the date of expiry of the last 5 year or 2.5 year periodic inspection and test as required by 6.7.3.15.2. However a portable tank filled prior to the date of expiry of the last periodic inspection and test may be

carried for a period not to exceed three months beyond the date of expiry of the last periodic test or inspection. In addition, a portable tank may be carried after the date of expiry of the last periodic test and inspection:

- (a) After emptying but before cleaning, for purposes of performing the next required test or inspection prior to refilling; and
- (b) Unless otherwise approved by the competent authority, for a period not to exceed six months beyond the date of expiry of the last periodic test or inspection, in order to allow the return of dangerous goods for proper disposal or recycling. Reference to this exemption shall be mentioned in the transport document.

6.7.3.15.7 The exceptional inspection and test is necessary when the portable tank shows evidence of damaged or corroded areas, or leakage, or other conditions that indicate a deficiency that could affect the integrity of the portable tank. The extent of the exceptional inspection and test shall depend on the amount of damage or deterioration of the portable tank. It shall include at least the 2.5 year inspection and test according to 6.7.3.15.5.

6.7.3.15.8 The internal and external examinations shall ensure that:

- (a) The shell is inspected for pitting, corrosion, or abrasions, dents, distortions, defects in welds or any other conditions, including leakage, that might render the portable tank unsafe for carriage;
- (b) The piping, valves, and gaskets are inspected for corroded areas, defects, or any other conditions, including leakage, that might render the portable tank unsafe for filling, discharge or carriage;
- (c) Devices for tightening manhole covers are operative and there is no leakage at manhole covers or gaskets;
- (d) Missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
- (e) All emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves shall be operated to demonstrate proper operation;
- (f) Required markings on the portable tank are legible and in accordance with the applicable requirements; and
- (g) The framework, the supports and the arrangements for lifting the portable tank are in satisfactory condition.

6.7.3.15.9 The inspections and tests in 6.7.3.15.1, 6.7.3.15.3, 6.7.3.15.4, 6.7.3.15.5 and 6.7.3.15.7 shall be performed or witnessed by an expert approved by the competent authority or its authorized body. When the pressure test is a part of the inspection and test, the test pressure shall be the one indicated on the data plate of the portable tank. While under pressure, the portable tank shall be inspected for any leaks in the shell, piping or equipment.

6.7.3.15.10 In all cases when cutting, burning or welding operations on the shell have been effected, that work shall be to the approval of the competent authority or its authorized body taking into account the pressure vessel code used for the construction of the shell. A pressure test to the original test pressure shall be performed after the work is completed.

6.7.3.15.11 When evidence of any unsafe condition is discovered, the portable tank shall not be returned to service until it has been corrected and the pressure test is repeated and passed.

6.7.3.16 *Marking*

6.7.3.16.1 Every portable tank shall be fitted with a corrosion resistant metal plate permanently attached to the portable tank in a conspicuous place readily accessible for inspection. When for reasons of portable tank arrangements the plate cannot be permanently attached to the shell, the shell shall be marked with at least the information required by the pressure vessel code. As a minimum, at least the following information shall be marked on the plate by stamping or by any other similar method:

- (a) Owner information
 - (i) Owner's registration number;
- (b) Manufacturing information
 - (i) Country of manufacture;
 - (ii) Year of manufacture;
 - (iii) Manufacturer's name or mark;
 - (iv) Manufacturer's serial number;
- (c) Approval information

- (i) The United Nations packaging symbol

;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7²;

- (ii) Approval country;
 - (iii) Authorized body for the design approval;
 - (iv) Design approval number;
 - (v) Letters 'AA', if the design was approved under alternative arrangements (see 6.7.1.2);
 - (vi) Pressure vessel code to which the shell is designed;
- (d) Pressures
 - (i) MAWP (in bar gauge or kPa gauge)³;
 - (ii) Test pressure (in bar gauge or kPa gauge)³;
 - (iii) Initial pressure test date (month and year);
 - (iv) Identification mark of the initial pressure test witness;
 - (v) External design pressure⁶ (in bar gauge or kPa gauge)³;
- (e) Temperatures
 - (i) Design temperature range (in °C)³;
 - (ii) Design reference temperature (in °C)³;
- (f) Materials

² This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

³ The unit used shall be indicated.

⁶ See 6.7.3.2.8.

- (i) Shell material(s) and material standard reference(s);
- (ii) Equivalent thickness in reference steel (in mm)³;
- (g) Capacity
 - (i) Tank water capacity at 20 °C (in litres)³;
- (h) Periodic inspections and tests
 - (i) Type of the most recent periodic test (2.5-year, 5-year or exceptional);
 - (ii) Date of the most recent periodic test (month and year);
 - (iii) Test pressure (in bar gauge or kPa gauge)³ of the most recent periodic test (if applicable);
 - (iv) Identification mark of the authorized body who performed or witnessed the most recent test.

6.7.3.16.2 The following information shall be marked either on the portable tank itself or on a metal plate firmly secured to the portable tank:

Name of the operator

Name of non-refrigerated liquefied gas(es) permitted for carriage

Maximum permissible load mass for each non-refrigerated liquefied gas permitted _____kg

Maximum permissible gross mass (MPGM)_____kg

Unladen (tare) mass_____kg

Portable tank instruction in accordance with 4.2.5.2.6

NOTE: For the identification of the non-refrigerated liquefied gases being carried, see also Part 5.

6.7.3.16.3 If a portable tank is designed and approved for handling in open seas, the words "OFFSHORE PORTABLE TANK" shall be marked on the identification plate.

6.7.4 Requirements for the design, construction, inspection and testing of portable tanks intended for the carriage of refrigerated liquefied gases

6.7.4.1 Definitions

For the purposes of this section:

Alternative arrangement means an approval granted by the competent authority for a portable tank or MEGC that has been designed, constructed or tested to technical requirements or testing methods other than those specified in this Chapter;

Portable tank means a thermally insulated multimodal tank having a capacity of more than 450 litres fitted with service equipment and structural equipment necessary for the carriage of refrigerated liquefied gases. The portable tank shall be capable of being filled and discharged without the removal of its structural equipment. It shall possess stabilizing members external to the tank, and shall be capable of being lifted when full. It shall be designed primarily to be loaded onto a vehicle, wagon or sea-going or inland navigation vessel and shall be equipped with skids, mountings or accessories to facilitate mechanical handling. Tank-vehicles, tank-wagons, non-metallic tanks, intermediate bulk containers (IBCs), gas cylinders and large receptacles are not considered to fall within the definition for portable tanks;

Tank means a construction which normally consists of either :

- (a) A jacket and one or more inner shells where the space between the shell(s) and the jacket is exhausted of air (vacuum insulation) and may incorporate a thermal insulation system; or
- (b) A jacket and an inner shell with an intermediate layer of solid thermally insulating material (e.g. solid foam);

Shell means the part of the portable tank which retains the refrigerated liquefied gas intended for carriage, including openings and their closures, but does not include service equipment or external structural equipment;

Jacket means the outer insulation cover or cladding which may be part of the insulation system;

Service equipment means measuring instruments and filling, discharge, venting, safety, pressurizing, cooling and thermal insulation devices;

Structural equipment means the reinforcing, fastening, protective and stabilizing members external to the shell;

Maximum allowable working pressure (MAWP) means the maximum effective gauge pressure permissible at the top of the shell of a loaded portable tank in its operating position including the highest effective pressure during filling and discharge;

Test pressure means the maximum gauge pressure at the top of the shell during the pressure test;

Leakproofness test means a test using gas subjecting the shell and its service equipment, to an effective internal pressure not less than 90% of the MAWP;

Maximum permissible gross mass (MPGM) means the sum of the tare mass of the portable tank and the heaviest load authorized for carriage;

Holding time means the time that will elapse from the establishment of the initial filling condition until the pressure has risen due to heat influx to the lowest set pressure of the pressure limiting device(s);

Reference steel means a steel with a tensile strength of 370 N/mm² and an elongation at fracture of 27%;

Minimum design temperature means the temperature which is used for the design and construction of the shell not higher than the lowest (coldest) temperature (service temperature) of the contents during normal conditions of filling, discharge and carriage.

6.7.4.2 General design and construction requirements

- 6.7.4.2.1 Shells shall be designed and constructed in accordance with the requirements of a pressure vessel code recognized by the competent authority. Shells and jackets shall be made of metallic materials suitable for forming. Jackets shall be made of steel. Non-metallic materials may be used for the attachments and supports between the shell and jacket, provided their material properties at the minimum design temperature are proven to be sufficient. The materials shall in principle conform to national or international material standards. For welded shells and jackets only materials whose weldability has been fully demonstrated shall be used. Welds shall be skilfully made and afford complete safety. When the manufacturing process or the materials make it necessary, the shell shall be suitably heat treated to guarantee adequate toughness in the weld and in the heat affected zones. In choosing the material, the minimum design temperature shall be taken into account with respect to risk of brittle fracture, to hydrogen embrittlement, to stress corrosion cracking and to resistance to impact. When fine grain steel is used, the guaranteed value of the yield strength shall be not more than 460 N/mm² and the guaranteed value of the upper limit of the tensile strength shall be not more than 725 N/mm² in accordance with the material specifications. Portable tank materials shall be suitable for the external environment in which they may be carried.
- 6.7.4.2.2 Any part of a portable tank, including fittings, gaskets and pipe-work, which can be expected normally to come into contact with the refrigerated liquefied gas carried shall be compatible with that refrigerated liquefied gas.
- 6.7.4.2.3 Contact between dissimilar metals which could result in damage by galvanic action shall be avoided.
- 6.7.4.2.4 The thermal insulation system shall include a complete covering of the shell(s) with effective insulating materials. External insulation shall be protected by a jacket so as to prevent the ingress of moisture and other damage under normal carriage conditions.

- 6.7.4.2.5 When a jacket is so closed as to be gas-tight, a device shall be provided to prevent any dangerous pressure from developing in the insulation space.
- 6.7.4.2.6 Portable tanks intended for the carriage of refrigerated liquefied gases having a boiling point below minus (-) 182 °C at atmospheric pressure shall not include materials which may react with oxygen or oxygen enriched atmospheres in a dangerous manner, when located in parts of the thermal insulation when there is a risk of contact with oxygen or with oxygen enriched fluid.
- 6.7.4.2.7 Insulating materials shall not deteriorate unduly in service.
- 6.7.4.2.8 A reference holding time shall be determined for each refrigerated liquefied gas intended for carriage in a portable tank.
- 6.7.4.2.8.1 The reference holding time shall be determined by a method recognized by the competent authority on the basis of the following:
- (a) The effectiveness of the insulation system, determined in accordance with 6.7.4.2.8.2;
 - (b) The lowest set pressure of the pressure limiting device(s);
 - (c) The initial filling conditions;
 - (d) An assumed ambient temperature of 30 °C;
 - (e) The physical properties of the individual refrigerated liquefied gas intended to be carried.
- 6.7.4.2.8.2 The effectiveness of the insulation system (heat influx in watts) shall be determined by type testing the portable tank in accordance with a procedure recognized by the competent authority. This test shall consist of either:
- (a) A constant pressure test (for example at atmospheric pressure) when the loss of refrigerated liquefied gas is measured over a period of time; or
 - (b) A closed system test when the rise in pressure in the shell is measured over a period of time.
- When performing the constant pressure test, variations in atmospheric pressure shall be taken into account. When performing either tests corrections shall be made for any variation of the ambient temperature from the assumed ambient temperature reference value of 30 °C.
- NOTE:** For the determination of the actual holding time before each journey, refer to 4.2.3.7.
- 6.7.4.2.9 The jacket of a vacuum-insulated double-wall tank shall have either an external design pressure not less than 100 kPa (1 bar) (gauge pressure) calculated in accordance with a recognized technical code or a calculated critical collapsing pressure of not less than 200 kPa (2 bar) (gauge pressure). Internal and external reinforcements may be included in calculating the ability of the jacket to resist the external pressure.
- 6.7.4.2.10 Portable tanks shall be designed and constructed with supports to provide a secure base during carriage and with suitable lifting and tie-down attachments.
- 6.7.4.2.11 Portable tanks shall be designed to withstand, without loss of contents, at least the internal pressure due to the contents, and the static, dynamic and thermal loads during normal conditions of handling and carriage. The design shall demonstrate that the effects of fatigue,

caused by repeated application of these loads through the expected life of the portable tank, have been taken into account.

6.7.4.2.12 Portable tanks and their fastenings under the maximum permissible load shall be capable of absorbing the following separately applied static forces:

- (a) In the direction of travel: twice the MPGM multiplied by the acceleration due to gravity (g)¹;
- (b) Horizontally at right angles to the direction of travel: the MPGM (when the direction of travel is not clearly determined, the forces shall be equal to twice the MPGM) multiplied by the acceleration due to gravity (g)¹;
- (c) Vertically upwards: the MPGM multiplied by the acceleration due to gravity (g)¹; and
- (d) Vertically downwards: twice the MPGM (total loading including the effect of gravity) multiplied by the acceleration due to gravity (g)¹.

6.7.4.2.13 Under each of the forces in 6.7.4.2.12, the safety factor to be observed shall be as follows:

- (a) For materials having a clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed yield strength; and
- (b) For materials with no clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength or, in case of austenitic steels, the 1% proof strength.

6.7.4.2.14 The values of yield strength or proof strength shall be the values according to national or international material standards. When austenitic steels are used, the specified minimum values according to the material standards may be increased by up to 15% when greater values are attested in the material inspection certificate. When no material standard exists for the metal in question, or when non-metallic materials are used the values of yield strength or proof strength shall be approved by the competent authority.

6.7.4.2.15 Portable tanks intended for the carriage of flammable refrigerated liquefied gases shall be capable of being electrically earthed.

6.7.4.3 *Design criteria*

6.7.4.3.1 Shells shall be of a circular cross section.

6.7.4.3.2 Shells shall be designed and constructed to withstand a test pressure not less than 1.3 times the MAWP. For shells with vacuum insulation the test pressure shall not be less than 1.3 times the sum of the MAWP and 100 kPa (1 bar). In no case shall the test pressure be less than 300 kPa (3 bar) (gauge pressure). Attention is drawn to the minimum shell thickness requirements, specified in 6.7.4.4.2 to 6.7.4.4.7.

6.7.4.3.3 For metals exhibiting a clearly defined yield point or characterized by a guaranteed proof strength (0.2% proof strength, generally, or 1% proof strength for austenitic steels) the primary membrane stress σ (sigma) in the shell shall not exceed 0.75 Re or 0.50 Rm, whichever is lower, at the test pressure, where:

Re = yield strength in N/mm², or 0.2% proof strength or, for austenitic steels, 1% proof strength;

¹ For calculation purposes $g = 9.81 \text{ m/s}^2$.

Rm = minimum tensile strength in N/mm².

- 6.7.4.3.3.1 The values of Re and Rm to be used shall be the specified minimum values according to national or international material standards. When austenitic steels are used, the specified minimum values for Re and Rm according to the material standards may be increased by up to 15% when greater values are attested in the material inspection certificate. When no material standard exists for the metal in question, the values of Re and Rm used shall be approved by the competent authority or its authorized body.
- 6.7.4.3.3.2 Steels which have a Re/Rm ratio of more than 0.85 are not allowed for the construction of welded shells. The values of Re and Rm to be used in determining this ratio shall be the values specified in the material inspection certificate.
- 6.7.4.3.3.3 Steels used in the construction of shells shall have an elongation at fracture, in %, of not less than 10 000/Rm with an absolute minimum of 16% for fine grain steels and 20% for other steels. Aluminium and aluminium alloys used in the construction of shells shall have an elongation at fracture, in %, of not less than 10 000/6Rm with an absolute minimum of 12%.
- 6.7.4.3.3.4 For the purpose of determining actual values for materials, it shall be noted that for sheet metal, the axis of the tensile test specimen shall be at right angles (transversely) to the direction of rolling. The permanent elongation at fracture shall be measured on test specimens of rectangular cross sections in accordance with ISO 6892:1988 using a 50 mm gauge length.

6.7.4.4 *Minimum shell thickness*

- 6.7.4.4.1 The minimum shell thickness shall be the greater thickness based on:
- (a) The minimum thickness determined in accordance with the requirements in 6.7.4.4.2 to 6.7.4.4.7; or
 - (b) The minimum thickness determined in accordance with the recognized pressure vessel code including the requirements in 6.7.4.3.
- 6.7.4.4.2 Shells of not more than 1.80 m in diameter shall be not less than 5 mm thick in the reference steel or of equivalent thickness in the metal to be used. Shells of more than 1.80 m in diameter shall be not less than 6 mm thick in the reference steel or of equivalent thickness in the metal to be used.
- 6.7.4.4.3 Shells of vacuum-insulated tanks of not more than 1.80 m in diameter shall be not less than 3 mm thick in the reference steel or of equivalent thickness in the metal to be used. Such shells of more than 1.80 m in diameter shall be not less than 4 mm thick in the reference steel or of equivalent thickness in the metal to be used.
- 6.7.4.4.4 For vacuum-insulated tanks, the aggregate thickness of the jacket and the shell shall correspond to the minimum thickness prescribed in 6.7.4.4.2, the thickness of the shell itself being not less than the minimum thickness prescribed in 6.7.4.4.3.
- 6.7.4.4.5 Shells shall be not less than 3 mm thick regardless of the material of construction.
- 6.7.4.4.6 The equivalent thickness of a metal other than the thickness prescribed for the reference steel in 6.7.4.4.2 and 6.7.4.4.3 shall be determined using the following formula:

$$e_1 = \frac{21.4e_o}{\sqrt[3]{Rm_1 \times A_1}}$$

where:

- e_1 = required equivalent thickness (in mm) of the metal to be used;
- e_0 = minimum thickness (in mm) of the reference steel specified in 6.7.4.4.2 and 6.7.4.4.3;
- R_{m1} = guaranteed minimum tensile strength (in N/mm²) of the metal to be used (see 6.7.4.3.3);
- A_1 = guaranteed minimum elongation at fracture (in %) of the metal to be used according to national or international standards.

6.7.4.4.7 In no case shall the wall thickness be less than that prescribed in 6.7.4.4.1 to 6.7.4.4.5. All parts of the shell shall have a minimum thickness as determined by 6.7.4.4.1 to 6.7.4.4.6. This thickness shall be exclusive of any corrosion allowance.

6.7.4.4.8 There shall be no sudden change of plate thickness at the attachment of the ends (heads) to the cylindrical portion of the shell.

6.7.4.5 Service equipment

6.7.4.5.1 Service equipment shall be so arranged as to be protected against the risk of being wrenched off or damaged during handling and carriage. When the connection between the frame and the tank or the jacket and the shell allows relative movement, the equipment shall be so fastened as to permit such movement without risk of damage to working parts. The external discharge fittings (pipe sockets, shut-off devices), the stop-valve and its seating shall be protected against the danger of being wrenched off by external forces (for example using shear sections). The filling and discharge devices (including flanges or threaded plugs) and any protective caps shall be capable of being secured against unintended opening.

6.7.4.5.2 Each filling and discharge opening in portable tanks used for the carriage of flammable refrigerated liquefied gases shall be fitted with at least three mutually independent shut-off devices in series, the first being a stop-valve situated as close as reasonably practicable to the jacket, the second being a stop-valve and the third being a blank flange or equivalent device. The shut-off device closest to the jacket shall be a quick closing device, which closes automatically in the event of unintended movement of the portable tank during filling or discharge or fire engulfment. This device shall also be possible to operate by remote control.

6.7.4.5.3 Each filling and discharge opening in portable tanks used for the carriage of non-flammable refrigerated liquefied gases shall be fitted with at least two mutually independent shut-off devices in series, the first being a stop-valve situated as close as reasonably practicable to the jacket, the second a blank flange or equivalent device.

6.7.4.5.4 For sections of piping which can be closed at both ends and where liquid product can be trapped, a method of automatic pressure relief shall be provided to prevent excess pressure build-up within the piping.

6.7.4.5.5 Vacuum insulated tanks need not have an opening for inspection.

6.7.4.5.6 External fittings shall be grouped together so far as reasonably practicable.

6.7.4.5.7 Each connection on a portable tank shall be clearly marked to indicate its function.

6.7.4.5.8 Each stop-valve or other means of closure shall be designed and constructed to a rated pressure not less than the MAWP of the shell taking into account the temperature expected during carriage. All stop-valves with a screwed spindle shall be closed by a clockwise

motion of the handwheel. In the case of other stop-valves the position (open and closed) and direction of closure shall be clearly indicated. All stop-valves shall be designed to prevent unintentional opening.

- 6.7.4.5.9 When pressure-building units are used, the liquid and vapour connections to that unit shall be provided with a valve as close to the jacket as reasonably practicable to prevent the loss of contents in case of damage to the pressure-building unit.
- 6.7.4.5.10 Piping shall be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration. All piping shall be of a suitable material. To prevent leakage due to fire, only steel piping and welded joints shall be used between the jacket and the connection to the first closure of any outlet. The method of attaching the closure to this connection shall be to the satisfaction of the competent authority or its authorized body. Elsewhere pipe joints shall be welded when necessary.
- 6.7.4.5.11 Joints in copper tubing shall be brazed or have an equally strong metal union. The melting point of brazing materials shall be no lower than 525 °C. The joints shall not decrease the strength of the tubing as may happen when cutting threads.
- 6.7.4.5.12 The materials of construction of valves and accessories shall have satisfactory properties at the lowest operating temperature of the portable tank.
- 6.7.4.5.13 The burst pressure of all piping and pipe fittings shall be not less than the highest of four times the MAWP of the shell or four times the pressure to which it may be subjected in service by the action of a pump or other device (except pressure-relief devices).

6.7.4.6 *Pressure-relief devices*

- 6.7.4.6.1 Every shell shall be provided with not less than two independent spring-loaded pressure-relief devices. The pressure-relief devices shall open automatically at a pressure not less than the MAWP and be fully open a pressure equal to 110% of the MAWP. These devices shall, after discharge, close at a pressure not lower than 10% below the pressure at which discharge starts and shall remain closed at all lower pressures. The pressure-relief devices shall be of the type that will resist dynamic forces including surge.
- 6.7.4.6.2 Shells for non-flammable refrigerated liquefied gases and hydrogen may in addition have frangible discs in parallel with the spring-loaded devices as specified in 6.7.4.7.2 and 6.7.4.7.3.
- 6.7.4.6.3 Pressure-relief devices shall be designed to prevent the entry of foreign matter, the leakage of gas and the development of any dangerous excess pressure.
- 6.7.4.6.4 Pressure-relief devices shall be approved by the competent authority or its authorized body.

6.7.4.7 *Capacity and setting of pressure-relief devices*

- 6.7.4.7.1 In the case of the loss of vacuum in a vacuum-insulated tank or of loss of 20% of the insulation of a tank insulated with solid materials, the combined capacity of all pressure-relief devices installed shall be sufficient so that the pressure (including accumulation) inside the shell does not exceed 120% of the MAWP.
- 6.7.4.7.2 For non-flammable refrigerated liquefied gases (except oxygen) and hydrogen, this capacity may be achieved by the use of frangible discs in parallel with the required safety-relief devices. Frangible discs shall rupture at nominal pressure equal to the test pressure of the shell.

6.7.4.7.3 Under the circumstances described in 6.7.4.7.1 and 6.7.4.7.2 together with complete fire engulfment the combined capacity of all pressure-relief devices installed shall be sufficient to limit the pressure in the shell to the test pressure.

6.7.4.7.4 The required capacity of the relief devices shall be calculated in accordance with a well-established technical code recognized by the competent authority⁷.

6.7.4.8 *Marking of pressure-relief devices*

6.7.4.8.1 Every pressure-relief device shall be plainly and permanently marked with the following particulars:

- (a) The pressure (in bar or kPa) at which it is set to discharge;
- (b) The allowable tolerance at the discharge pressure for spring-loaded devices;
- (c) The reference temperature corresponding to the rated pressure for frangible discs; and
- (d) The rated flow capacity of the device in standard cubic meters of air per second (m³/s).
- (e) The cross sectional flow areas of the spring loaded pressure-relief devices and frangible discs in mm².

When practicable, the following information shall also be shown:

- (f) The manufacturer's name and relevant catalogue number of the device.

6.7.4.8.2 The rated flow capacity marked on the pressure-relief devices shall be determined according to ISO 4126-1:2004 and ISO 4126-7:2004.

6.7.4.9 *Connections to pressure-relief devices*

6.7.4.9.1 Connections to pressure-relief devices shall be of sufficient size to enable the required discharge to pass unrestricted to the safety device. No stop-valve shall be installed between the shell and the pressure-relief devices except when duplicate devices are provided for maintenance or other reasons and the stop-valves serving the devices actually in use are locked open or the stop-valves are interlocked so that the requirements of 6.7.4.7 are always fulfilled. There shall be no obstruction in an opening leading to a vent or pressure-relief device which might restrict or cut-off the flow from the shell to that device. Pipework to vent the vapour or liquid from the outlet of the pressure-relief devices, when used, shall deliver the relieved vapour or liquid to the atmosphere in conditions of minimum back-pressure on the relieving device.

6.7.4.10 *Siting of pressure-relief devices*

6.7.4.10.1 Each pressure-relief device inlet shall be situated on top of the shell in a position as near the longitudinal and transverse centre of the shell as reasonably practicable. All pressure-relief device inlets shall under maximum filling conditions be situated in the vapour space of the shell and the devices shall be so arranged as to ensure that the escaping vapour is discharged unrestrictedly. For refrigerated liquefied gases, the escaping vapour shall be directed away from the tank and in such a manner that it cannot impinge upon the tank. Protective devices which deflect the flow of vapour are permissible provided the required relief-device capacity is not reduced.

⁷ See for example CGA S-1.2-2003 "Pressure Relief Device Standards - Part 2 - Cargo and Portable Tanks for Compressed Gases".

- 6.7.4.10.2 Arrangements shall be made to prevent access to the devices by unauthorized persons and to protect the devices from damage caused by the portable tank overturning.
- 6.7.4.11 *Gauging devices***
- 6.7.4.11.1 Unless a portable tank is intended to be filled by weight, it shall be equipped with one or more gauging devices. Glass level-gauges and gauges made of other fragile material, which are in direct communication with the contents of the shell shall not be used.
- 6.7.4.11.2 A connection for a vacuum gauge shall be provided in the jacket of a vacuum-insulated portable tank.
- 6.7.4.12 *Portable tank supports, frameworks, lifting and tie-down attachments***
- 6.7.4.12.1 Portable tanks shall be designed and constructed with a support structure to provide a secure base during carriage. The forces specified in 6.7.4.2.12 and the safety factor specified in 6.7.4.2.13 shall be considered in this aspect of the design. Skids, frameworks, cradles or other similar structures are acceptable.
- 6.7.4.12.2 The combined stresses caused by portable tank mountings (e.g. cradles, frameworks, etc.) and portable tank lifting and tie-down attachments shall not cause excessive stress in any portion of the tank. Permanent lifting and tie-down attachments shall be fitted to all portable tanks. Preferably they shall be fitted to the portable tank supports but may be secured to reinforcing plates located on the tank at the points of support.
- 6.7.4.12.3 In the design of supports and frameworks the effects of environmental corrosion shall be taken into account.
- 6.7.4.12.4 Forklift pockets shall be capable of being closed off. The means of closing forklift pockets shall be a permanent part of the framework or permanently attached to the framework. Single compartment portable tanks with a length less than 3.65 m need not have closed off forklift pockets provided that:
- (a) The tank and all the fittings are well protected from being hit by the forklift blades; and
 - (b) The distance between the centres of the forklift pockets is at least half of the maximum length of the portable tank.
- 6.7.4.12.5 When portable tanks are not protected during carriage, according to 4.2.3.3, the shells and service equipment shall be protected against damage to the shell and service equipment resulting from lateral or longitudinal impact or overturning. External fittings shall be protected so as to preclude the release of the shell contents upon impact or overturning of the portable tank on its fittings. Examples of protection include:
- (a) Protection against lateral impact which may consist of longitudinal bars protecting the shell on both sides at the level of the median line;
 - (b) Protection of the portable tank against overturning which may consist of reinforcement rings or bars fixed across the frame;
 - (c) Protection against rear impact which may consist of a bumper or frame;
 - (d) Protection of the shell against damage from impact or overturning by use of an ISO frame in accordance with ISO 1496-3:1995;
 - (e) Protection of the portable tank from impact or overturning by a vacuum insulation jacket.

6.7.4.13 *Design approval*

- 6.7.4.13.1 The competent authority or its authorized body shall issue a design approval certificate for any new design of a portable tank. This certificate shall attest that a portable tank has been surveyed by that authority, is suitable for its intended purpose and meets the requirements of this Chapter. When a series of portable tanks are manufactured without change in the design, the certificate shall be valid for the entire series. The certificate shall refer to the prototype test report, the refrigerated liquefied gases allowed to be carried, the materials of construction of the shell and jacket and an approval number. The approval number shall consist of the distinguishing sign or mark of the State in whose territory the approval was granted, i.e. the distinguishing sign for use in international traffic, as prescribed by the Convention on Road Traffic, Vienna 1968, and a registration number. Any alternative arrangements according to 6.7.1.2 shall be indicated on the certificate. A design approval may serve for the approval of smaller portable tanks made of materials of the same kind and thickness, by the same fabrication techniques and with identical supports, equivalent closures and other appurtenances.
- 6.7.4.13.2 The prototype test report for the design approval shall include at least the following:
- (a) The results of the applicable frame-work test specified in ISO 1496-3:1995;
 - (b) The results of the initial inspection and test in 6.7.4.14.3; and
 - (c) The results of the impact test in 6.7.4.14.1, when applicable.

6.7.4.14 *Inspection and testing*

- 6.7.4.14.1 Portable tanks meeting the definition of container in the International Convention for Safe Containers (CSC), 1972, as amended, shall not be used unless they are successfully qualified by subjecting a representative prototype of each design to the Dynamic, Longitudinal Impact Test prescribed in the Manual of Tests and Criteria, Part IV, Section 41.
- 6.7.4.14.2 The tank and items of equipment of each portable tank shall be inspected and tested before being put into service for the first time (initial inspection and test) and thereafter at not more than five-year intervals (5 year periodic inspection and test) with an intermediate periodic inspection and test (2.5 year periodic inspection and test) midway between the 5 year periodic inspections and tests. The 2.5 year inspection and test may be performed within 3 months of the specified date. An exceptional inspection and test shall be performed regardless of the last periodic inspection and test when necessary according to 6.7.4.14.7.
- 6.7.4.14.3 The initial inspection and test of a portable tank shall include a check of the design characteristics, an internal and external examination of the portable tank shell and its fittings with due regard to the refrigerated liquefied gases to be carried, and a pressure test referring to the test pressures according to 6.7.4.3.2. The pressure test may be performed as a hydraulic test or by using another liquid or gas with the agreement of the competent authority or its authorized body. Before the portable tank is placed into service, a leakproofness test and a check of the satisfactory operation of all service equipment shall also be performed. When the shell and its fittings have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test. All welds subject to full stress level shall be inspected during the initial test by radiographic, ultrasonic, or another suitable non-destructive test method. This does not apply to the jacket.
- 6.7.4.14.4 The 5 and 2.5 year periodic inspections and tests shall include an external examination of the portable tank and its fittings with due regard to the refrigerated liquefied gases carried, a leakproofness test, a check of the satisfactory operation of all service equipment and a vacuum reading, when applicable. In the case of non-vacuum insulated tanks, the jacket and

insulation shall be removed during the 2.5 year and the 5 year periodic inspections and tests but only to the extent necessary for a reliable appraisal.

6.7.4.14.5 *(Deleted)*

6.7.4.14.6 A portable tank may not be filled and offered for carriage after the date of expiry of the last 5 year or 2.5 year periodic inspection and test as required by 6.7.4.14.2. However a portable tank filled prior to the date of expiry of the last periodic inspection and test may be carried for a period not to exceed three months beyond the date of expiry of the last periodic test or inspection. In addition, a portable tank may be carried after the date of expiry of the last periodic test and inspection:

- (a) After emptying but before cleaning, for purposes of performing the next required test or inspection prior to refilling; and
- (b) Unless otherwise approved by the competent authority, for a period not to exceed six months beyond the date of expiry of the last periodic test or inspection, in order to allow the return of dangerous goods for proper disposal or recycling. Reference to this exemption shall be mentioned in the transport document.

6.7.4.14.7 The exceptional inspection and test is necessary when the portable tank shows evidence of damaged or corroded areas, leakage, or any other conditions that indicate a deficiency that could affect the integrity of the portable tank. The extent of the exceptional inspection and test shall depend on the amount of damage or deterioration of the portable tank. It shall include at least the 2.5 year inspection and test according to 6.7.4.14.4.

6.7.4.14.8 The internal examination during the initial inspection and test shall ensure that the shell is inspected for pitting, corrosion, or abrasions, dents, distortions, defects in welds or any other conditions, that might render the portable tank unsafe for carriage.

6.7.4.14.9 The external examination shall ensure that:

- (a) The external piping, valves, pressurizing/cooling systems when applicable and gaskets are inspected for corroded areas, defects, or any other conditions, including leakage, that might render the portable tank unsafe for filling, discharge or carriage;
- (b) There is no leakage at any manhole covers or gaskets;
- (c) Missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
- (d) All emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves shall be operated to demonstrate proper operation;
- (e) Required markings on the portable tank are legible and in accordance with the applicable requirements; and
- (f) The framework, the supports and the arrangements for lifting the portable tank are in satisfactory condition.

6.7.4.14.10 The inspections and tests in 6.7.4.14.1, 6.7.4.14.3, 6.7.4.14.4, 6.7.4.14.5 and 6.7.4.14.7 shall be performed or witnessed by an expert approved by the competent authority or its authorized body. When the pressure test is a part of the inspection and test, the test pressure shall be the one indicated on the data plate of the portable tank. While under pressure, the portable tank shall be inspected for any leaks in the shell, piping or equipment.

6.7.4.14.11 In all cases when cutting, burning or welding operations on the shell of a portable tank have been effected, that work shall be to the approval of the competent authority or its authorized body taking into account the pressure vessel code used for the construction of the shell. A pressure test to the original test pressure shall be performed after the work is completed.

6.7.4.14.12 When evidence of any unsafe condition is discovered, the portable tank shall not be returned to service until it has been corrected and the test is repeated and passed.

6.7.4.15 Marking

6.7.4.15.1 Every portable tank shall be fitted with a corrosion resistant metal plate permanently attached to the portable tank in a conspicuous place readily accessible for inspection. When for reasons of portable tank arrangements the plate cannot be permanently attached to the shell, the shell shall be marked with at least the information required by the pressure vessel code. As a minimum, at least the following information shall be marked on the plate by stamping or by any other similar method:

- (a) Owner information
 - (i) Owner's registration number;
- (b) Manufacturing information
 - (i) Country of manufacture;
 - (ii) Year of manufacture;
 - (iii) Manufacturer's name or mark;
 - (iv) Manufacturer's serial number;
- (c) Approval information
 - (i) The United Nations packaging symbol  ;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7²;

- (ii) Approval country;
 - (iii) Authorized body for the design approval;
 - (iv) Design approval number;
 - (v) Letters 'AA', if the design was approved under alternative arrangements (see 6.7.1.2);
 - (vi) Pressure vessel code to which the shell is designed;
- (d) Pressures
 - (i) MAWP (in bar gauge or kPa gauge)³;
 - (ii) Test pressure (in bar gauge or kPa gauge)³;
 - (iii) Initial pressure test date (month and year);
 - (iv) Identification mark of the initial pressure test witness;

² This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

³ The unit used shall be indicated.

- (e) Temperatures
 - (i) Minimum design temperature (in °C)³;
- (f) Materials
 - (i) Shell material(s) and material standard reference(s);
 - (ii) Equivalent thickness in reference steel (in mm)³;
- (g) Capacity
 - (i) Tank water capacity at 20 °C (in litres)³;
- (h) Insulation
 - (i) Either "Thermally insulated" or "Vacuum insulated" (as applicable);
 - (ii) Effectiveness of the insulation system (heat influx) (in Watts)³;
- (i) Holding times – for each refrigerated liquefied gas permitted to be carried in the portable tank
 - (i) Name, in full, of the refrigerated liquefied gas;
 - (ii) Reference holding time (in days or hours)³;
 - (iii) Initial pressure (in bar gauge or kPa gauge)³;
 - (iv) Degree of filling (in kg)³;
- (j) Periodic inspections and tests
 - (i) Type of the most recent periodic test (2.5-year, 5-year or exceptional);
 - (ii) Date of the most recent periodic test (month and year);
 - (iii) Identification mark of the authorized body who performed or witnessed the most recent test.

³

The unit used shall be indicated.

6.7.4.15.2 The following particulars shall be durably marked either on the portable tank itself or on a metal plate firmly secured to the portable tank.

Name of the owner and the operator

Name of the refrigerated liquefied gas being carried (and minimum mean bulk temperature)

Maximum permissible gross mass (MPGM)_____kg

Unladen (tare) mass_____kg

Actual holding time for gas being carried _____days (or hours)

Portable tank instruction in accordance with 4.2.5.2.6

NOTE: For the identification of the refrigerated liquefied gas(es) being carried, see also Part 5.

6.7.4.15.3 If a portable tank is designed and approved for handling in open seas, the words "OFFSHORE PORTABLE TANK" shall be marked on the identification plate.

6.7.5 Requirements for the design, construction, inspection and testing of UN multiple-element gas containers (MEGCs) intended for the carriage of non-refrigerated gases

6.7.5.1 Definitions

For the purposes of this section:

Alternative arrangement means an approval granted by the competent authority for a portable tank or MEGC that has been designed, constructed or tested to technical requirements or testing methods other than those specified in this Chapter;

Elements are cylinders, tubes or bundles of cylinders;

Leakproofness test means a test using gas subjecting the elements and the service equipment of the MEGC to an effective internal pressure of not less than 20% of the test pressure;

Manifold means an assembly of piping and valves connecting the filling and/or discharge openings of the elements;

Maximum permissible gross mass (MPGM) means the sum of the tare mass of the MEGC and the heaviest load authorized for carriage;

UN Multiple-element gas containers (MEGCs) are multimodal assemblies of cylinders, tubes and bundles of cylinders which are interconnected by a manifold and which are assembled within a framework. The MEGC includes service equipment and structural equipment necessary for the carriage of gases;

Service equipment means measuring instruments and filling, discharge, venting and safety devices;

Structural equipment means the reinforcing, fastening, protective and stabilizing members external to the elements.

6.7.5.2 General design and construction requirements

6.7.5.2.1 The MEGC shall be capable of being filled and discharged without the removal of its structural equipment. It shall possess stabilizing members external to the elements to provide structural integrity for handling and carriage. MEGCs shall be designed and constructed with supports to provide a secure base during carriage and with lifting and tie-down attachments which are adequate for lifting the MEGC including when filled to its maximum permissible gross mass. The MEGC shall be designed to be loaded onto a vehicle, wagon or sea-going or inland navigation vessel and shall be equipped with skids, mountings or accessories to facilitate mechanical handling.

6.7.5.2.2 MEGCs shall be designed, manufactured and equipped in such a way as to withstand all conditions to which they will be subjected during normal conditions of handling and carriage. The design shall take into account the effects of dynamic loading and fatigue.

6.7.5.2.3 Elements of an MEGC shall be made of seamless steel and be constructed and tested according to 6.2.1 and 6.2.2. All of the elements in an MEGC shall be of the same design type.

6.7.5.2.4 Elements of MEGCs, fittings and pipework shall be:

- (a) Compatible with the substances intended to be carried (see ISO 11114-1:1997 and ISO 11114-2:2000); or

(b) Properly passivated or neutralized by chemical reaction.

- 6.7.5.2.5 Contact between dissimilar metals which could result in damage by galvanic action shall be avoided.
- 6.7.5.2.6 The materials of the MEGC, including any devices, gaskets, and accessories, shall not adversely affect the gas(es) intended for carriage in the MEGC.
- 6.7.5.2.7 MEGCs shall be designed to withstand, without loss of contents, at least the internal pressure due to the contents, and the static, dynamic and thermal loads during normal conditions of handling and carriage. The design shall demonstrate that the effects of fatigue, caused by repeated application of these loads through the expected life of the multiple-element gas container, have been taken into account.
- 6.7.5.2.8 MEGCs and their fastenings shall, under the maximum permissible load, be capable of withstanding the following separately applied static forces:
- (a) In the direction of travel: twice the MPGM multiplied by the acceleration due to gravity (g)¹;
 - (b) Horizontally at right angles to the direction of travel: the MPGM (when the direction of travel is not clearly determined, the forces shall be equal to twice the MPGM) multiplied by the acceleration due to gravity (g)¹;
 - (c) Vertically upwards: the MPGM multiplied by the acceleration due to gravity (g)¹; and
 - (d) Vertically downwards: twice the MPGM (total loading including the effect of gravity) multiplied by the acceleration due to gravity (g)¹.
- 6.7.5.2.9 Under the forces defined in 6.7.5.2.8, the stress at the most severely stressed point of the elements shall not exceed the values given in either the relevant standards of 6.2.2.1 or, if the elements are not designed, constructed and tested according to those standards, in the technical code or standard recognised or approved by the competent authority of the country of use (see 6.2.5).
- 6.7.5.2.10 Under each of the forces in 6.7.5.2.8, the safety factor for the framework and fastenings to be observed shall be as follows:
- (a) for steels having a clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed yield strength; or
 - (b) for steels with no clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength and, for austenitic steels, the 1% proof strength.
- 6.7.5.2.11 MEGCs intended for the carriage of flammable gases shall be capable of being electrically earthed.
- 6.7.5.2.12 The elements shall be secured in a manner that prevents undesired movement in relation to the structure and the concentration of harmful localized stresses.

¹ For calculation purposes $g = 9.81 \text{ m/s}^2$.

6.7.5.3 *Service equipment*

- 6.7.5.3.1 Service equipment shall be configured or designed to prevent damage that could result in the release of the pressure receptacle contents during normal conditions of handling and carriage. When the connection between the frame and the elements allows relative movement between the sub-assemblies, the equipment shall be so fastened as to permit such movement without damage to working parts. The manifolds, the discharge fittings (pipe sockets, shut-off devices), and the stop-valves shall be protected from being wrenched off by external forces. Manifold piping leading to shut-off valves shall be sufficiently flexible to protect the valves and the piping from shearing, or releasing the pressure receptacle contents. The filling and discharge devices (including flanges or threaded plugs) and any protective caps shall be capable of being secured against unintended opening.
- 6.7.5.3.2 Each element intended for the carriage of toxic gases (gases of groups T, TF, TC, TO, TFC and TOC) shall be fitted with a valve. The manifold for liquefied toxic gases (gases of classification codes 2T, 2TF, 2TC, 2TO, 2TFC and 2TOC) shall be so designed that the elements can be filled separately and be kept isolated by a valve capable of being sealed. For the carriage of flammable gases (gases of group F), the elements shall be divided into groups of not more than 3 000 litres each isolated by a valve.
- 6.7.5.3.3 For filling and discharge openings of the MEGC, two valves in series shall be placed in an accessible position on each discharge and filling pipe. One of the valves may be a non-return valve. The filling and discharge devices may be fitted to a manifold. For sections of piping which can be closed at both ends and where a liquid product can be trapped, a pressure-relief valve shall be provided to prevent excessive pressure build-up. The main isolation valves on an MEGC shall be clearly marked to indicate their directions of closure. Each stop-valve or other means of closure shall be designed and constructed to withstand a pressure equal to or greater than 1.5 times the test pressure of the MEGC. All stop-valves with screwed spindles shall close by a clockwise motion of the handwheel. For other stop-valves, the position (open and closed) and direction of closure shall be clearly indicated. All stop-valves shall be designed and positioned to prevent unintentional opening. Ductile metals shall be used in the construction of valves or accessories.
- 6.7.5.3.4 Piping shall be designed, constructed and installed so as to avoid damage due to expansion and contraction, mechanical shock and vibration. Joints in tubing shall be brazed or have an equally strong metal union. The melting point of brazing materials shall be no lower than 525 °C. The rated pressure of the service equipment and of the manifold shall be not less than two thirds of the test pressure of the elements.

6.7.5.4 *Pressure-relief devices*

- 6.7.5.4.1 The elements of MEGCs used for the carriage of UN No. 1013 carbon dioxide and UN No. 1070 nitrous oxide shall be divided into groups of not more than 3 000 litres each isolated by a valve. Each group shall be fitted with one or more pressure relief devices. If so required by the competent authority of the country of use, MEGCs for other gases shall be fitted with pressure relief devices as specified by that competent authority.
- 6.7.5.4.2 When pressure relief devices are fitted, every element or group of elements of an MEGC that can be isolated shall then be fitted with one or more pressure relief devices. Pressure relief devices shall be of a type that will resist dynamic forces including liquid surge and shall be designed to prevent the entry of foreign matter, the leakage of gas and the development of any dangerous excess pressure.

6.7.5.4.3 MEGCs used for the carriage of certain non-refrigerated gases identified in portable tank instruction T50 in 4.2.5.2.6 may have a pressure-relief device as required by the competent authority of the country of use. Unless an MEGC in dedicated service is fitted with an approved pressure relief device constructed of materials compatible with the gas carried, such a device shall comprise a frangible disc preceding a spring-loaded device. The space between the frangible disc and the spring-loaded device may be equipped with a pressure gauge or a suitable telltale indicator. This arrangement permits the detection of disc rupture, pinholing or leakage which could cause a malfunction of the pressure relief device. The frangible disc shall rupture at a nominal pressure 10% above the start-to-discharge pressure of the spring-loaded device.

6.7.5.4.4 In the case of multi-purpose MEGCs used for the carriage of low-pressure liquefied gases, the pressure-relief devices shall open at a pressure as specified in 6.7.3.7.1 for the gas having the highest maximum allowable working pressure of the gases allowed to be carried in the MEGC.

6.7.5.5 *Capacity of pressure relief devices*

6.7.5.5.1 The combined delivery capacity of the pressure relief devices when fitted shall be sufficient that, in the event of total fire engulfment of the MEGC, the pressure (including accumulation) inside the elements does not exceed 120% of the set pressure of the pressure relief device. The formula provided in CGA S-1.2-2003 "Pressure Relief Device Standards - Part 2 - Cargo and Portable Tanks for Compressed Gases" shall be used to determine the minimum total flow capacity for the system of pressure relief devices. CGA S-1.1-2003 "Pressure Relief Device Standards - Part 1 - Cylinders for Compressed Gases" may be used to determine the relief capacity of individual elements. Spring-loaded pressure relief devices may be used to achieve the full relief capacity prescribed in the case of low pressure liquefied gases. In the case of multi-purpose MEGCs, the combined delivery capacity of the pressure-relief devices shall be taken for the gas which requires the highest delivery capacity of the gases allowed to be carried in the MEGC.

6.7.5.5.2 To determine the total required capacity of the pressure relief devices installed on the elements for the carriage of liquefied gases, the thermodynamic properties of the gas shall be considered (see, for example, CGA S-1.2-2003 "Pressure Relief Device Standards - Part 2 - Cargo and Portable Tanks for Compressed Gases" for low pressure liquefied gases and CGA S-1.1-2003 "Pressure Relief Device Standards - Part 1 - Cylinders for Compressed Gases" for high pressure liquefied gases).

6.7.5.6 *Marking of pressure-relief devices*

6.7.5.6.1 Pressure relief devices shall be clearly and permanently marked with the following:

- (a) The manufacturer's name and relevant catalogue number;
- (b) The set pressure and/or the set temperature;
- (c) The date of the last test.
- (d) The cross sectional flow areas of the spring loaded pressure-relief devices and frangible discs in mm².

6.7.5.6.2 The rated flow capacity marked on spring loaded pressure relief devices for low pressure liquefied gases shall be determined according to ISO 4126-1:2004 and ISO 4126-7:2004.

6.7.5.7 *Connections to pressure-relief devices*

- 6.7.5.7.1 Connections to pressure-relief devices shall be of sufficient size to enable the required discharge to pass unrestricted to the pressure relief device. No stop-valve shall be installed between the element and the pressure-relief devices, except when duplicate devices are provided for maintenance or other reasons, and the stop-valves serving the devices actually in use are locked open, or the stop-valves are interlocked so that at least one of the duplicate devices is always operable and capable of meeting the requirements of 6.7.5.5. There shall be no obstruction in an opening leading to or leaving from a vent or pressure-relief device which might restrict or cut-off the flow from the element to that device. The opening through all piping and fittings shall have at least the same flow area as the inlet of the pressure relief device to which it is connected. The nominal size of the discharge piping shall be at least as large as that of the pressure relief device outlet. Vents from the pressure-relief devices, when used, shall deliver the relieved vapour or liquid to the atmosphere in conditions of minimum back-pressure on the relieving device.

6.7.5.8 *Siting of pressure-relief devices*

- 6.7.5.8.1 Each pressure relief device shall, under maximum filling conditions, be in communication with the vapour space of the elements for the carriage of liquefied gases. The devices, when fitted, shall be so arranged as to ensure that the escaping vapour is discharged upwards and unrestrictedly as to prevent any impingement of escaping gas or liquid upon the MEGC, its elements or personnel. For flammable, pyrophoric and oxidizing gases, the escaping gas shall be directed away from the element in such a manner that it cannot impinge upon the other elements. Heat resistant protective devices which deflect the flow of gas are permissible provided the required pressure relief device capacity is not reduced.
- 6.7.5.8.2 Arrangements shall be made to prevent access to the pressure-relief devices by unauthorized persons and to protect the devices from damage caused by the MEGC overturning.

6.7.5.9 *Gauging devices*

- 6.7.5.9.1 When an MEGC is intended to be filled by mass, it shall be equipped with one or more gauging devices. Level-gauges made of glass or other fragile material shall not be used.

6.7.5.10 *MEGC supports, frameworks, lifting and tie-down attachments*

- 6.7.5.10.1 MEGCs shall be designed and constructed with a support structure to provide a secure base during carriage. The forces specified in 6.7.5.2.8 and the safety factor specified in 6.7.5.2.10 shall be considered in this aspect of the design. Skids, frameworks, cradles or other similar structures are acceptable.
- 6.7.5.10.2 The combined stresses caused by element mountings (e.g. cradles, frameworks, etc.) and MEGC lifting and tie-down attachments shall not cause excessive stress in any element. Permanent lifting and tie-down attachments shall be fitted to all MEGCs. In no case shall mountings or attachments be welded onto the elements.
- 6.7.5.10.3 In the design of supports and frameworks, the effects of environmental corrosion shall be taken into account.
- 6.7.5.10.4 When MEGCs are not protected during carriage, according to 4.2.4.3, the elements and service equipment shall be protected against damage resulting from lateral or longitudinal impact or overturning. External fittings shall be protected so as to preclude the release of the elements' contents upon impact or overturning of the MEGC on its fittings. Particular attention shall be paid to the protection of the manifold. Examples of protection include:
- (a) Protection against lateral impact which may consist of longitudinal bars;

- (b) Protection against overturning which may consist of reinforcement rings or bars fixed across the frame;
- (c) Protection against rear impact which may consist of a bumper or frame;
- (d) Protection of the elements and service equipment against damage from impact or overturning by use of an ISO frame in accordance with the relevant provisions of ISO 1496-3:1995.

6.7.5.11 *Design approval*

6.7.5.11.1 The competent authority or its authorized body shall issue a design approval certificate for any new design of an MEGC. This certificate shall attest that the MEGC has been surveyed by that authority, is suitable for its intended purpose and meets the requirements of this Chapter, the applicable provisions for gases of Chapter 4.1 and of packing instruction P200. When a series of MEGCs are manufactured without change in the design, the certificate shall be valid for the entire series. The certificate shall refer to the prototype test report, the materials of construction of the manifold, the standards to which the elements are made and an approval number. The approval number shall consist of the distinguishing sign or mark of the country granting the approval, i.e. the distinguishing sign for use in international traffic, as prescribed by the Convention on Road Traffic, Vienna 1968, and a registration number. Any alternative arrangements according to 6.7.1.2 shall be indicated on the certificate. A design approval may serve for the approval of smaller MEGCs made of materials of the same type and thickness, by the same fabrication techniques and with identical supports, equivalent closures and other appurtenances.

6.7.5.11.2 The prototype test report for the design approval shall include at least the following:

- (a) The results of the applicable framework test specified in ISO1496-3:1995;
- (b) The results of the initial inspection and test specified in 6.7.5.12.3;
- (c) The results of the impact test specified in 6.7.5.12.1; and
- (d) Certification documents verifying that the cylinders and tubes comply with the applicable standards.

6.7.5.12 *Inspection and testing*

6.7.5.12.1 MEGCs meeting the definition of container in the International Convention for Safe Containers (CSC), 1972, as amended, shall not be used unless they are successfully qualified by subjecting a representative prototype of each design to the Dynamic, Longitudinal Impact Test prescribed in the Manual of Tests and Criteria, Part IV, Section 41.

6.7.5.12.2 The elements and items of equipment of each MEGC shall be inspected and tested before being put into service for the first time (initial inspection and test). Thereafter, MEGCs shall be inspected at no more than five-year intervals (5 year periodic inspection). An exceptional inspection and test shall be performed, regardless of the last periodic inspection and test, when necessary according to 6.7.5.12.5.

6.7.5.12.3 The initial inspection and test of an MEGC shall include a check of the design characteristics, an external examination of the MEGC and its fittings with due regard to the gases to be carried, and a pressure test performed at the test pressures according to packing instruction P200 of 4.1.4.1. The pressure test of the manifold may be performed as a hydraulic test or by using another liquid or gas with the agreement of the competent authority or its authorized body. Before the MEGC is placed into service, a leakproofness test and a test of the satisfactory operation of all service equipment shall also be performed.

When the elements and their fittings have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.

- 6.7.5.12.4 The 5-year periodic inspection and test shall include an external examination of the structure, the elements and the service equipment in accordance with 6.7.5.12.6. The elements and the piping shall be tested at the periodicity specified in packing instruction P200 and in accordance with the provisions described in 6.2.1.6. When the elements and equipment have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.
- 6.7.5.12.5 An exceptional inspection and test is necessary when the MEGC shows evidence of damaged or corroded areas, leakage, or other conditions that indicate a deficiency that could affect the integrity of the MEGC. The extent of the exceptional inspection and test shall depend on the amount of damage or deterioration of the MEGC. It shall include at least the examinations required under 6.7.5.12.6.
- 6.7.5.12.6 The examinations shall ensure that:
- (a) The elements are inspected externally for pitting, corrosion, abrasions, dents, distortions, defects in welds or any other conditions, including leakage, that might render the MEGC unsafe for carriage;
 - (b) The piping, valves, and gaskets are inspected for corroded areas, defects, and other conditions, including leakage, that might render the MEGC unsafe for filling, discharge or carriage;
 - (c) Missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
 - (d) All emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves shall be operated to demonstrate proper operation;
 - (e) Required markings on the MEGC are legible and in accordance with the applicable requirements; and
 - (f) The framework, the supports and the arrangements for lifting the MEGC are in satisfactory condition.
- 6.7.5.12.7 The inspections and tests in 6.7.5.12.1, 6.7.5.12.3, 6.7.5.12.4 and 6.7.5.12.5 shall be performed or witnessed by a body authorized by the competent authority. When the pressure test is a part of the inspection and test, the test pressure shall be the one indicated on the data plate of the MEGC. While under pressure, the MEGC shall be inspected for any leaks in the elements, piping or equipment.
- 6.7.5.12.8 When evidence of any unsafe condition is discovered, the MEGC shall not be returned to service until it has been corrected and the applicable tests and verifications are passed.

6.7.5.13 ***Marking***

- 6.7.5.13.1 Every MEGC shall be fitted with a corrosion resistant metal plate permanently attached to the MEGC in a conspicuous place readily accessible for inspection. The metal plate shall not be affixed to the elements. The elements shall be marked in accordance with Chapter 6.2. As a minimum, at least the following information shall be marked on the plate by stamping or by any other similar method:
- (a) Owner information
 - (i) Owner's registration number;

- (b) Manufacturing information
 - (i) Country of manufacture;
 - (ii) Year of manufacture;
 - (iii) Manufacturer's name or mark;
 - (iv) Manufacturer's serial number;

(c) Approval information

- (i) The United Nations packaging symbol  ;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7²;

- (ii) Approval country;
 - (iii) Authorized body for the design approval;
 - (iv) Design approval number;
 - (v) Letters 'AA', if the design was approved under alternative arrangements (see 6.7.1.2);
- (d) Pressures
 - (i) Test pressure (in bar gauge)³;
 - (ii) Initial pressure test date (month and year);
 - (iii) Identification mark of the initial pressure test witness;
- (e) Temperatures
 - (i) Design temperature range (in °C)³;
- (f) Elements / Capacity
 - (i) Number of elements;
 - (ii) Total water capacity (in litres)³;
- (g) Periodic inspections and tests
 - (i) Type of the most recent periodic test (5-year or exceptional);
 - (ii) Date of the most recent periodic test (month and year);
 - (iii) Identification mark of the authorized body who performed or witnessed the most recent test.

² This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

³ The unit used shall be indicated.

Unladen (tare) mass _____ kg

CHAPTER 6.8

REQUIREMENTS FOR THE CONSTRUCTION, EQUIPMENT, TYPE APPROVAL, INSPECTIONS AND TESTS, AND MARKING OF FIXED TANKS (TANK-VEHICLES), DEMOUNTABLE TANKS AND TANK-CONTAINERS AND TANK SWAP BODIES, WITH SHELLS MADE OF METALLIC MATERIALS, AND BATTERY-VEHICLES AND MULTIPLE ELEMENT GAS CONTAINERS (MEGCs)

NOTE: *For portable tanks and UN multiple-element gas containers (MEGCs) see Chapter 6.7, for fibre-reinforced plastics tanks see Chapter 6.9, for vacuum operated waste tanks see Chapter 6.10.*

6.8.1 Scope

6.8.1.1 The requirements across the whole width of the page apply both to fixed tanks (tank-vehicles), to demountable tanks and battery-vehicles, and to tank-containers, tank swap bodies and MEGCs. Those contained in a single column apply only:

- to fixed tanks (tank-vehicles), to demountable tanks and battery-vehicles (left hand column);
- to tank-containers, tank swap bodies and MEGCs (right hand column).

6.8.1.2 These requirements shall apply to

fixed tanks (tank-vehicles), demountable tanks and battery-vehicles	tank-containers, tank swap bodies and MEGCs
---	---

used for the carriage of gaseous, liquid, powdery or granular substances.

6.8.1.3 Section 6.8.2 sets out the requirements applicable to fixed tanks (tank-vehicles), to demountable tanks, tank-containers, tank swap bodies intended for the carriage of substances of all classes and battery-vehicles and MEGCs for gases of Class 2. Sections 6.8.3 to 6.8.5 contain special requirements supplementing or modifying the requirements of section 6.8.2.

6.8.1.4 For provisions concerning use of these tanks, see Chapter 4.3.

6.8.2 Requirements applicable to all classes

6.8.2.1 Construction

Basic principles

6.8.2.1.1 Shells, their attachments and their service and structural equipment shall be designed to withstand without loss of contents (other than quantities of gas escaping through any degassing vents):

- static and dynamic stresses in normal conditions of carriage as defined in 6.8.2.1.2 and 6.8.2.1.13;
- prescribed minimum stresses as defined in 6.8.2.1.15.

6.8.2.1.2	<p>The tanks and their fastenings shall be capable of absorbing, under the maximum permissible load, the forces exerted by:</p> <ul style="list-style-type: none"> - in the direction of travel: twice the total mass; - at right angles to the direction of travel: the total mass; - vertically upwards: the total mass; - vertically downwards: twice the total mass. 	<p>Tank-containers and their fastenings shall, under the maximum permissible load be capable of absorbing the forces equal to those exerted by:</p> <ul style="list-style-type: none"> - in the direction of travel: twice the total mass; - horizontally at right angles to the direction of travel: the total mass; (where the direction of travel is not clearly determined, twice the total mass in each direction); - vertically upwards: the total mass; - vertically downwards: twice the total mass.
6.8.2.1.3	<p>The walls of the shells shall have at least the thickness specified in</p> <p>6.8.2.1.17 to 6.8.2.1.21 6.8.2.1.17 to 6.8.2.1.20.</p>	
6.8.2.1.4	<p>Shells shall be designed and constructed in accordance with the requirements of standards listed in 6.8.2.6 or of a technical code recognized by the competent authority, in accordance with 6.8.2.7, in which the material is chosen and the shell thickness determined taking into account maximum and minimum filling and working temperatures, but the following minimum requirements of 6.8.2.1.6 to 6.8.2.1.26 shall be met.</p>	
6.8.2.1.5	<p>Tanks intended to contain certain dangerous substances shall be provided with additional protection. This may take the form of additional thickness of the shell (increased calculation pressure) determined in the light of the dangers inherent in the substances concerned or of a protective device (see the special provisions of 6.8.4).</p>	
6.8.2.1.6	<p>Welds shall be skilfully made and shall afford the fullest safety. The execution and checking of welds shall comply with the requirements of 6.8.2.1.23.</p>	
6.8.2.1.7	<p>Measures shall be taken to protect shells against the risk of deformation as a result of a negative internal pressure. Shells, other than shells according to 6.8.2.2.6, designed to be equipped with vacuum valves shall be able to withstand, without permanent deformation, an external pressure of not less than 21 kPa (0.21 bar) above the internal pressure. Shells used for the carriage of solid substances (powdery or granular) of packing groups II or III only, which do not liquefy during carriage, may be designed for a lower external pressure but not less than 5 kPa (0.05 bar). The vacuum valves shall be set to relieve at a vacuum setting not greater than the tank's design vacuum pressure. Shells, which are not designed to be equipped with a vacuum valve shall be able to withstand, without permanent deformation an external pressure of not less than 40 kPa (0.4 bar) above the internal pressure.</p>	
	<p><i>Materials for shells</i></p>	
6.8.2.1.8	<p>Shells shall be made of suitable metallic materials which, unless other temperature ranges are prescribed in the various classes, shall be resistant to brittle fracture and to stress corrosion cracking between -20 °C and +50 °C.</p>	
6.8.2.1.9	<p>The materials of shells or of their protective linings which are in contact with the contents shall not contain substances liable to react dangerously (see "Dangerous reaction" in 1.2.1) with the contents, to form dangerous compounds, or substantially to weaken the material.</p>	

If contact between the substance carried and the material used for the construction of the shell entails a progressive decrease in the shell thickness, this thickness shall be increased at manufacture by an appropriate amount. This additional thickness to allow for corrosion shall not be taken into consideration in calculating the shell thickness.

- 6.8.2.1.10 For welded shells only materials of faultless weldability whose adequate impact strength at an ambient temperature of $-20\text{ }^{\circ}\text{C}$ can be guaranteed, particularly in the weld seams and the zones adjacent thereto, shall be used.

If fine-grained steel is used, the guaranteed value of the yield strength R_e shall not exceed 460 N/mm^2 and the guaranteed value of the upper limit of tensile strength R_m shall not exceed 725 N/mm^2 , in accordance with the specifications of the material.

- 6.8.2.1.11 Ratios of R_e/R_m exceeding 0.85 are not allowed for steels used in the construction of welded tanks.

R_e = apparent yield strength for steels having a clearly-defined yield point or
guaranteed 0.2% proof strength for steels with no clearly-defined yield point
(1% for austenitic steels)

R_m = tensile strength.

The values specified in the inspection certificate for the material shall be taken as a basis in determining this ratio in each case.

- 6.8.2.1.12 For steel, the elongation at fracture, in % shall be not less than

$$\frac{10000}{\text{determined tensile strength in N/mm}^2}$$

but in any case for fine-grained steels it shall be not less than 16% and not less than 20% for other steels.

For aluminium alloys the elongation at fracture shall be not less than 12%¹.

Calculation of the shell thickness

- 6.8.2.1.13 The pressure on which the shell thickness is based shall not be less than the calculation pressure, but the stresses referred to in 6.8.2.1.1 shall also be taken into account, and, if necessary, the following stresses:

In the case of vehicles in which the tank constitutes a stressed self-supporting member, the shell shall be designed to withstand the stresses thus imposed in addition to stresses from other sources.

¹ In the case of sheet metal the axis of the tensile test-piece shall be at right angles to the direction of rolling. The permanent elongation at fracture shall be measured on test-pieces of circular cross-section in which the gauge length l is equal to five times the diameter d ($l = 5d$); if test-pieces of rectangular section are used, the gauge length shall be calculated by the formula

$$l = 5,65 \sqrt{F_0},$$

where F_0 indicates the initial cross-section area of the test-piece.

Under these stresses, the stress at the most severely stressed point of the shell and its fastenings shall not exceed the value σ defined in 6.8.2.1.16.

Under each of these stresses the safety factors to be observed shall be the following:

- for metals having a clearly-defined yield point: a safety factor of 1.5 in relation to the apparent yield strength; or
- for metals with no clearly-defined yield point: a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength (1% maximum elongation for austenitic steels).

6.8.2.1.14 The calculation pressure is in the second part of the code (see 4.3.4.1) according to Column (12) of Table A of Chapter 3.2.

When "G" appears, the following requirements shall apply:

- (a) Gravity-discharge shells intended for the carriage of substances having a vapour pressure not exceeding 110 kPa (1.1 bar) (absolute pressure) at 50 °C shall be designed for a calculation pressure of twice the static pressure of the substance to be carried but not less than twice the static pressure of water;
- (b) Pressure-filled or pressure-discharge shells intended for the carriage of substances having a vapour pressure not exceeding 110 kPa (1.1 bar) (absolute pressure) at 50 °C shall be designed for a calculation pressure equal to 1.3 times the filling or discharge pressure;

When the numerical value of the minimum calculation pressure is given (gauge pressure) the shell shall be designed for this pressure which shall not be less than 1.3 times the filling or discharge pressure. The following minimum requirements shall apply in these cases:

- (c) Shells intended for the carriage of substances having a vapour pressure of more than 110 kPa (1.1 bar) at 50 °C and a boiling point of more than 35 °C shall, whatever their filling or discharge system, be designed for a calculation pressure of not less than 150 kPa (1.5 bar) gauge pressure or 1.3 times the filling or discharge pressure, whichever is the higher;
- (d) Shells intended for the carriage of substances having a boiling point of not more than 35 °C shall, whatever their filling or discharge system, be designed for a calculation pressure equal to 1.3 times the filling or discharge pressure but not less than 0.4 MPa (4 bar) (gauge pressure).

6.8.2.1.15 At the test pressure, the stress σ at the most severely stressed point of the shell shall not exceed the material-dependent limits prescribed below. Allowance shall be made for any weakening due to the welds.

6.8.2.1.16 For all metals and alloys, the stress σ at the test pressure shall be lower than the smaller of the values given by the following formulae:

$$\sigma \leq 0.75 Re \text{ or } \sigma \leq 0.5 Rm$$

where

Re = apparent yield strength for steels having a clearly-defined yield point; or
guaranteed 0.2% proof strength for steels with no clearly-defined yield point
(1% for austenitic steels)

Rm = tensile strength.

The values of Re and Rm to be used shall be specified minimum values according to material standards. If no material standard exists for the metal or alloy in question, the values of Re and Rm used shall be approved by the competent authority or by a body designated by that authority.

When austenitic steels are used, the specified minimum values according to the material standards may be exceeded by up to 15% if these higher values are attested in the inspection certificate. The minimum values shall, however, not be exceeded when the formula given in 6.8.2.1.18 is applied.

Minimum shell thickness

6.8.2.1.17 The shell thickness shall not be less than the greater of the values determined by the following formulae:

$$e = \frac{P_T D}{2 \sigma \lambda} \qquad e = \frac{P_C D}{2 \sigma}$$

where:

- e = minimum shell thickness in mm
- P_T = test pressure in MPa
- P_C = calculation pressure in MPa as specified in 6.8.2.1.14
- D = internal diameter of shell in mm
- σ = permissible stress, as defined in 6.8.2.1.16, in N/mm²
- λ = a coefficient not exceeding 1, allowing for any weakening due to welds, and linked to the inspection methods defined in 6.8.2.1.23.

The thickness shall in no case be less than that defined in

6.8.2.1.18 to 6.8.2.1.21. | 6.8.2.1.18 to 6.8.2.1.20.

<p>6.8.2.1.18 Shells of circular cross-section² not more than 1.80 m in diameter other than those referred to in 6.8.2.1.21, shall not be less than 5 mm thick if of mild steel³, or of equivalent thickness if of another metal.</p> <p>Where the diameter is more than 1.80 m, this thickness shall be increased to 6 mm except in the case of shells intended for the carriage of powdery or granular substances, if the shell is of mild steel³, or to an equivalent thickness if of another metal.</p>	<p>Shells shall be not less than 5 mm thick if of mild steel³ (in conformity with the requirements of 6.8.2.1.11 and 6.8.2.1.12) or of equivalent thickness if of another metal.</p> <p>Where the diameter is more than 1.80 m, this thickness shall be increased to 6 mm except in the case of tanks intended for the carriage of powdery or granular substances, if the shell is of mild steel³ or to an equivalent thickness if of another metal.</p> <p>Whatever the metal used, the shell thickness shall in no case be less than 3 mm.</p>
--	--

² For shells not of a circular cross-section, for example box-shaped or elliptical shells, the indicated diameters shall correspond to those calculated on the basis of a circular cross-section of the same area. For such shapes of cross-section the radius of convexity of the shell wall shall not exceed 2 000 mm at the sides or 3 000 mm at the top and bottom.

³ For the definitions of "mild steel" and "reference steel" see 1.2.1. "Mild steel" in this case also covers a steel referred to in EN material standards as "mild steel", with a minimum tensile strength between 360 N/mm² and 490 N/mm² and a minimum elongation at fracture conforming to 6.8.2.1.12.

"Equivalent thickness" means the thickness obtained by the following formula⁴:

$$e_1 = \frac{464e_0}{\sqrt[3]{(R_{m1}A_1)^2}}$$

6.8.2.1.19

Where protection of the tank against damage through lateral impact or overturning is provided according to 6.8.2.1.20, the competent authority may allow the aforesaid minimum thicknesses to be reduced in proportion to the protection provided; however, the said thicknesses shall not be less than 3 mm in the case of mild steel³, or than an equivalent thickness in the case of other materials, for shells not more than 1.80 m in diameter. For shells with a diameter exceeding 1.80 m the aforesaid minimum thickness shall be increased to 4 mm in the case of mild steel³ and to an equivalent thickness in the case of other metals.

Equivalent thickness means the thickness given by the formula in 6.8.2.1.18.

Except in cases for which 6.8.2.1.21 provide, the thickness of shells with protection against damage in accordance with 6.8.2.1.20 (a) or (b) shall not be less than the values given in the table below.

Where protection of the tank against damage is provided according to 6.8.2.1.20, the competent authority may allow the aforesaid minimum thicknesses to be reduced in proportion to the protection provided; however, the said thicknesses shall be not less than 3 mm in the case of mild steel³, or than an equivalent thickness in the case of other materials, for shells not more than 1.80 m in diameter. For shells of a diameter exceeding 1.80 m this minimum thickness shall be increased to 4 mm in the case of mild steel³, and to an equivalent thickness in the case of other metals.

Equivalent thickness means the thickness given by the formula in 6.8.2.1.18.

The thickness of shells with protection against damage in accordance with 6.8.2.1.20 shall not be less than the values given in the table below.

	Diameter of shell	≤ 1.80 m	> 1.80 m
Minimum thickness of shells	Austenitic stainless steels	2.5 mm	3 mm
	Austenitic-ferritic stainless steels	3 mm	3.5 mm
	Other steels	3 mm	4 mm
	Aluminium alloys	4 mm	5 mm
	Pure aluminium of 99.80%	6 mm	8 mm

³ For the definitions of "mild steel" and "reference steel" see 1.2.1. "Mild steel" in this case also covers a steel referred to in EN material standards as "mild steel", with a minimum tensile strength between 360 N/mm² and 490 N/mm² and a minimum elongation at fracture conforming to 6.8.2.1.12.

⁴ This formula is derived from the general formula:

$$e_1 = e_0 \sqrt[3]{\left(\frac{R_{m0}A_0}{R_{m1}A_1}\right)^2}$$

where

- e_1 = minimum shell thickness for the metal chosen, in mm;
- e_0 = minimum shell thickness for mild steel, in mm, according to 6.8.2.1.18 and 6.8.2.1.19;
- R_{m0} = 370 (tensile strength for reference steel, see definition 1.2.1, in N/mm²);
- A_0 = 27 (elongation at fracture for reference steel, in %);
- R_{m1} = minimum tensile strength of the metal chosen, in N/mm²; and
- A_1 = minimum elongation at fracture of the metal chosen under tensile stress, in %.

6.8.2.1.20	<p>For tanks built after 1 January 1990, there is protection against damage as referred to in 6.8.2.1.19 when the following measures or equivalent⁵ measures are adopted:</p> <p>(a) For tanks intended for the carriage of powdery or granular substances, the protection against damage shall satisfy the competent authority.</p> <p>(b) For tanks intended for the carriage of other substances, there is protection against damage when:</p> <p>1. For shells with a circular or elliptical cross-section having a maximum radius of curvature of 2 m, the shell is equipped with strengthening members comprising partitions, surge-plates or external or internal rings, so placed that at least one of the following conditions is met:</p> <ul style="list-style-type: none"> - Distance between two adjacent strengthening elements of not more than 1.75 m. - Volume contained between two partitions or surge-plates of not more than 7 500 l. <p>The vertical cross-section of a ring, with the associated coupling, shall have a section modulus of at least 10 cm³.</p> <p>External rings shall not have projecting edges with a radius of less than 2.5 mm.</p> <p>Partitions and surge-plates shall conform to the requirements of 6.8.2.1.22.</p> <p>The thickness of the partitions and surge-plates shall in no case be less than that of the shell.</p> <p>2. For tanks made with double walls, the space between being evacuated of air, the aggregate thickness of the outer metal wall and the shell wall corresponds to the wall thickness prescribed in 6.8.2.1.18, and the thickness of the wall of the shell itself is not less than the minimum thickness prescribed in 6.8.2.1.19.</p>	<p>The protection referred to in 6.8.2.1.19 may consist of:</p> <ul style="list-style-type: none"> - overall external structural protection as in "sandwich" construction where the sheathing is secured to the shell; or - a structure in which the shell is supported by a complete skeleton including longitudinal and transverse structural members; or - double-wall construction. <p>Where the tanks are made with double walls, the space between being evacuated of air, the aggregate thickness of the outer metal wall and the shell wall shall correspond to the minimum wall thickness prescribed in 6.8.2.1.18, the thickness of the wall of the shell itself being not less than the minimum thickness prescribed in 6.8.2.1.19.</p> <p>Where tanks are made with double walls with an intermediate layer of solid materials at least 50 mm thick, the outer wall shall have a thickness of not less than 0.5 mm if it is made of mild steel³ or at least 2 mm if it is made of a plastics material reinforced with glass fibre. Solid foam with an impact absorption capacity such as that, for example, of polyurethane foam, may be used as the intermediate layer of solid material.</p>
------------	--	--

³ For the definitions of "mild steel" and "reference steel" see 1.2.1. "Mild steel" in this case also covers a steel referred to in EN material standards as "mild steel", with a minimum tensile strength between 360 N/mm² and 490 N/mm² and a minimum elongation at fracture conforming to 6.8.2.1.12.

⁵ Equivalent measures means measures given in standards referenced in 6.8.2.6.

3. For tanks made with double walls having an intermediate layer of solid materials at least 50 mm thick, the outer wall has a thickness of at least 0.5 mm of mild steel³ or at least 2 mm of a plastics material reinforced with glass fibre. Solid foam (with an impact absorption capacity like that, for example, of polyurethane foam) may be used as the intermediate layer of solid material.
4. Shells of forms other than in 1, especially box-shaped shells, are provided, all round the mid-point of their vertical height and over at least 30% of their height with a protection designed in such a way as to offer specific resilience at least equal to that of a shell constructed in mild steel³ of a thickness of 5 mm (for a shell diameter not exceeding 1.80 m) or 6 mm (for a shell diameter exceeding 1.80 m). The protection shall be applied in a durable manner to the shell.

This requirement shall be considered to have been met without further proof of the specific resilience when the protection involves the welding of a plate of the same material as the shell to the area to be strengthened, so that the minimum wall thickness is in accordance with 6.8.2.1.18.

This protection is dependent upon the possible stresses exerted on mild steel³ shells in the event of an accident, where the ends and walls have a thickness of at least 5 mm for a diameter not exceeding 1.80 m or at least 6 mm for a diameter exceeding 1.80 m. If another metal is used, the equivalent thickness shall be obtained in accordance with the formula in 6.8.2.1.18.

³

For the definitions of "mild steel" and "reference steel" see 1.2.1. "Mild steel" in this case also covers a steel referred to in EN material standards as "mild steel", with a minimum tensile strength between 360 N/mm² and 490 N/mm² and a minimum elongation at fracture conforming to 6.8.2.1.12.

For demountable tanks this protection is not required when they are protected on all sides by the drop sides of the carrying vehicle.

6.8.2.1.21 The thickness of shells designed in accordance with 6.8.2.1.14 (a) which either are of not more than 5 000 litres capacity or are divided into leakproof compartments of not more than 5 000 litres unit capacity may be adjusted to a level which, unless prescribed otherwise in 6.8.3 or 6.8.4, shall however not be less than the appropriate value shown in the following table:

Maximum radius of curvature of shell (m)	Capacity of shell or shell compartment (m ³)	Minimum thickness (mm)
		Mild steel
≤ 2	≤ 5.0	3
2 - 3	≤ 3.5	3
	> 3.5 but ≤ 5.0	4

Where a metal other than mild steel³ is used, the thickness shall be determined by the equivalence formula given in 6.8.2.1.18 and shall not be less than the values given in the following table:

	Maximum radius of curvature of shell (m)	≤ 2	2-3	2-3
	Capacity of shell or shell compartment (m ³)	≤ 5.0	≤ 3.5	> 3.5 but ≤ 5.0
Minimum thickness of shell	Austenitic stainless steels	2.5 mm	2.5 mm	3 mm
	Other steels	3 mm	3 mm	4 mm
	Aluminium alloys	4 mm	4 mm	5 mm
	Pure aluminium at 99.80%	6 mm	6 mm	8 mm

The thickness of the partitions and surge-plates shall in no case be less than that of the shell.

³ For the definitions of "mild steel" and "reference steel" see 1.2.1. "Mild steel" in this case also covers a steel referred to in EN material standards as "mild steel", with a minimum tensile strength between 360 N/mm² and 490 N/mm² and a minimum elongation at fracture conforming to 6.8.2.1.12.

- 6.8.2.1.22 Surge-plates and partitions shall be dished, with a depth of dish of not less than 10 cm, or shall be corrugated, profiled or otherwise reinforced to give equivalent strength. The area of the surge plate shall be at least 70% of the cross-sectional area of the tank in which the surge-plate is fitted.

Welding and inspection of welds

- 6.8.2.1.23 The manufacturer's qualification for performing welding operations shall be one recognized by the competent authority. Welding shall be performed by skilled welders using a welding process whose effectiveness (including any heat treatments required) has been demonstrated by test. Non-destructive tests shall be carried out by radiography or by ultrasound and must confirm that the quality of the welding is appropriate to the stresses.

The following checks shall be carried out in accordance with the value of the coefficient λ used in determining the thickness of the shell in 6.8.2.1.17:

- $\lambda = 0.8$: the weld beads shall so far as possible be inspected visually on both faces and shall be subjected to a non-destructive spot check. All weld "Tee" junctions with the total length of weld examined to be not less than 10% of the sum of the length of all longitudinal, circumferential and radial (in the tank ends) welds shall be tested;
- $\lambda = 0.9$: all longitudinal beads throughout their length, all connections, 25% of circular beads, and welds for the assembly of large-diameter items of equipment shall be subjected to non-destructive checks. Beads shall be checked visually on both sides as far as possible;
- $\lambda = 1$: all beads shall be subjected to non-destructive checks and shall so far as possible be inspected visually on both sides. A weld test-piece shall be taken.

Where the competent authority has doubts regarding the quality of weld beads, it may require additional checks.

Other construction requirements

- 6.8.2.1.24 The protective lining shall be so designed that its leakproofness remains intact, whatever the deformation liable to occur in normal conditions of carriage (see 6.8.2.1.2).
- 6.8.2.1.25 The thermal insulation shall be so designed as not to hinder access to, or the operation of, filling and discharge devices and safety valves.
- 6.8.2.1.26 If shells intended for the carriage of flammable liquids having a flash-point of not more than 60 °C are fitted with non-metallic protective linings (inner layers), the shells and the protective linings shall be so designed that no danger of ignition from electrostatic charges can occur.

6.8.2.1.27	<p>Shells intended for the carriage of liquids having a flash-point of not more than 60 °C or for the carriage of flammable gases, or of UN No.1361 carbon or UN No.1361 carbon black, packing group II, shall be linked to the chassis by means of at least one good electrical connection. Any metal contact capable of causing electrochemical corrosion shall be avoided. Shells shall be provided with at least one earth fitting clearly marked with the symbol "  ", capable of being electrically connected.</p>	<p>All parts of a tank-container intended for the carriage of liquids having a flash-point of not more than 60 °C, flammable gases, or UN No.1361 carbon or UN No.1361 carbon black, packing group II, shall be capable of being electrically earthed. Any metal contact capable of causing electrochemical corrosion shall be avoided.</p>
6.8.2.1.28	<p><i>Protection of fittings mounted on the upper part of the tank</i></p> <p>The fittings and accessories mounted on the upper part of the tank shall be protected against damage caused by overturning. This protection may take the form of strengthening rings, protective canopies or transverse or longitudinal members so shaped that effective protection is given.</p>	
6.8.2.2	<i>Items of equipment</i>	
6.8.2.2.1	<p>Suitable non-metallic materials may be used to manufacture service and structural equipment.</p> <p>The items of equipment shall be so arranged as to be protected against the risk of being wrenched off or damaged during carriage or handling. They shall exhibit a suitable degree of safety comparable to that of the shells themselves, and shall in particular:</p> <ul style="list-style-type: none"> - be compatible with the substances carried; and - meet the requirements of 6.8.2.1.1. <p>Piping shall be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration.</p>	
	<p>As many operating parts as possible shall be served by the smallest possible number of openings in the shell. The leakproofness of the service equipment including the closure (cover) of the inspection openings shall be ensured even in the event of overturning of the tank, taking into account the forces generated by an impact (such as acceleration and dynamic pressure). Limited release of the tank contents due to a pressure peak during the impact is however allowed.</p>	<p>The leakproofness of the service equipment shall be ensured even in the event of the overturning of the tank-container.</p>
	<p>The gaskets shall be made of a material compatible with the substance carried and shall be replaced as soon as their effectiveness is impaired, for example as a result of ageing.</p> <p>Gaskets ensuring the leakproofness of fittings requiring manipulation during normal use of tanks shall be so designed and arranged that manipulation of the fittings incorporating them does not damage them.</p>	

6.8.2.2.2

Each bottom-filling or bottom-discharge opening in tanks which are referred to, in Column (12) of Table A of Chapter 3.2, with a tank code including the letter "A" in its third part (see 4.3.4.1.1) shall be equipped with at least two mutually independent closures, mounted in series, comprising

- an external stop-valve with piping made of a malleable metal material and
- a closing device at the end of each pipe which may be a screw-threaded plug, a blank flange or an equivalent device. This closing device shall be sufficiently tight so that the substance is contained without loss. Measures shall be taken to enable the safe release of pressure in the discharge pipe before the closing device is completely removed.

Each bottom-filling or bottom-discharge opening in tanks which are referred to, in Column (12) of Table A of Chapter 3.2, with a tank code including the letter "B" in its third part (see 4.3.3.1.1 or 4.3.4.1.1) shall be equipped with at least three mutually independent closures, mounted in series, comprising

- an internal stop-valve, i.e. a stop-valve mounted inside the shell or in a welded flange or companion flange;
- an external stop-valve or an equivalent device⁶

one at the end of each pipe | as near as possible to the shell

and

- a closing device at the end of each pipe which may be a screw-threaded plug, a blank flange or an equivalent device. This closing device shall be sufficiently tight so that the substance is contained without loss. Measures shall be taken to enable the safe release of pressure in the discharge pipe before the closing device is completely removed.

However, in the case of tanks intended for the carriage of certain crystallizable or highly viscous substances and shells fitted with an ebonite or thermoplastic coating, the internal stop-valve may be replaced by an external stop-valve provided with additional protection.

The internal stop-valve shall be operable either from above or from below. Its setting - open or closed - shall so far as possible in each case be capable of being verified from the ground. Internal stop-valve control devices shall be so designed as to prevent any unintended opening through impact or an inadvertent act.

The internal shut-off device shall continue to be effective in the event of damage to the external control device.

In order to avoid any loss of contents in the event of damage to the external fittings (pipes, lateral shut-off devices), the internal stop-valve and its seating shall be protected against the danger of being wrenched off by external stresses or shall be so designed as to resist them. The filling and discharge devices (including flanges or threaded plugs) and protective caps (if any) shall be capable of being secured against any unintended opening.

The position and/or direction of closure of shut-off devices shall be clearly apparent.

All openings of tanks which are referred to in Column (12) of Table A of Chapter 3.2, by a tank code including letter "C" or "D" in its third part (see 4.3.3.1.1 and 4.3.4.1.1) shall be

⁶ In the case of tank-containers of less than 1 m³ capacity, the external stop-valve or other equivalent device may be replaced by a blank flange.

situated above the surface level of the liquid. These tanks shall have no pipes or pipe connections below the surface level of the liquid. The cleaning openings (fist-holes) are, however, permitted in the lower part of the shell for tanks referred to by a tank code including letter "C" in its third part. This opening shall be capable of being sealed by a flange so closed as to be leakproof and whose design shall be approved by the competent authority or by a body designated by that authority.

- 6.8.2.2.3 Tanks that are not hermetically closed may be fitted with vacuum valves to avoid an unacceptable negative internal pressure; these vacuum-relief valves shall be set to relieve at a vacuum setting not greater than the vacuum pressure for which the tank has been designed (see 6.8.2.1.7). Hermetically closed tanks shall not be fitted with vacuum valves. However, tanks of the tank code SGAH, S4AH or L4BH, fitted with vacuum valves which open at a negative pressure of not less than 21 kPa (0.21 bar) shall be considered as being hermetically closed. For tanks intended for the carriage of solid substances (powdery or granular) of packing groups II or III only, which do not liquefy during transport, the negative pressure may be reduced to not less than 5 kPa (0.05 bar).

Vacuum valves and breather devices (see 6.8.2.2.6) used on tanks intended for the carriage of substances meeting the flash-point criteria of Class 3, shall prevent the immediate passage of flame into the shell by means of a suitable protective device, or the shell of the tank shall be capable of withstanding, without leakage, an explosion resulting from the passage of the flame.

If the protective device consists of a suitable flame trap or flame arrester, it shall be positioned as close as possible to the shell or the shell compartment. For multi-compartment tanks, each compartment shall be protected separately.

- 6.8.2.2.4 The shell or each of its compartments shall be provided with an opening large enough to permit inspection.

- 6.8.2.2.5 *(Reserved)*

- 6.8.2.2.6 Tanks intended for the carriage of liquids having a vapour pressure of not more than 110 kPa (1.1 bar) (absolute) at 50 °C shall have a breather device and a safety device to prevent the contents from spilling out if the tank overturns; otherwise they shall conform to 6.8.2.2.7 or 6.8.2.2.8.

- 6.8.2.2.7 Tanks intended for the carriage of liquids having a vapour pressure of more than 110 kPa (1.1 bar) at 50 °C and a boiling point of more than 35 °C shall have a safety valve set at not less than 150 kPa (1.5 bar) (gauge pressure) and which shall be fully open at a pressure not exceeding the test pressure; otherwise they shall conform to 6.8.2.2.8.

- 6.8.2.2.8 Tanks intended for the carriage of liquids having a boiling point of not more than 35 °C shall have a safety valve set at not less than 300 kPa (3 bar) gauge pressure and which shall be fully open at a pressure not exceeding the test pressure; otherwise they shall be hermetically closed⁷.

- 6.8.2.2.9 Movable parts such as covers, closures, etc., which are liable to come into frictional or percussive contact with aluminium shells intended for the carriage of flammable liquids having a flash-point of not more than 60 °C or for the carriage of flammable gases shall not be made of unprotected corrodible steel.

⁷ For the definition of "hermetically closed tank" see 1.2.1.

- 6.8.2.2.10 If tanks required to be hermetically closed are equipped with safety valves, these shall be preceded by a bursting disc and the following conditions shall be observed:

The arrangement of the bursting disc and safety valve shall be such as to satisfy the competent authority. A pressure gauge or another suitable indicator shall be provided in the space between the bursting disc and the safety valve, to enable detection of any rupture, perforation or leakage of the disc which may disrupt the action of the safety valve.

6.8.2.3 *Type approval*

- 6.8.2.3.1 The competent authority or a body designated by that authority shall issue in respect of each new type of tank-vehicle, demountable tank, tank-container, tank swap body, battery-vehicle or MEGC a certificate attesting that the type, including fastenings, which it has inspected is suitable for the purpose for which it is intended and meets the construction requirements of 6.8.2.1, the equipment requirements of 6.8.2.2 and the special conditions for the classes of substances carried.

The certificate shall show:

- the results of the test;
- an approval number for the type;

The approval number shall consist of the distinguishing sign⁸ of the State in whose territory the approval was granted and a registration number.

- the tank code in accordance with 4.3.3.1.1 or 4.3.4.1.1;
- the alphanumerical codes of special provisions of construction (TC), equipment (TE) and type approval (TA) of 6.8.4 which are shown in column (13) of Table A of Chapter 3.2 for those substances for the carriage of which the tank has been approved;
- if required, the substances and/or group of substances for the carriage of which the tank has been approved. These shall be shown with their chemical name or the corresponding collective entry (see 2.1.1.2), together with their classification (class, classification code and packing group). With the exception of substances of Class 2 and those listed in 4.3.4.1.3, the listing of approved substances may be dispensed with. In such cases, groups of substances permitted on the basis of the tank code shown in the rationalised approach in 4.3.4.1.2 shall be accepted for carriage taking into account any relevant special provision.

The substances referred to in the certificate or the groups of substances approved according to the rationalised approach shall, in general, be compatible with the characteristics of the tank. A reservation shall be included in the certificate if it was not possible to investigate this compatibility exhaustively when the type approval was issued.

A copy of the certificate shall be attached to the tank record of each tank, battery-vehicle or MEGC constructed (see 4.3.2.1.7).

The competent authority or a body designated by that authority shall at the request of the applicant carry out a separate type approval of valves and other service equipment for

⁸ *Distinguishing sign for use in international traffic prescribed by the Convention on Road Traffic (Vienna, 1968).*

which a standard is listed in the table in 6.8.2.6.1, in accordance with that standard. This separate type approval shall be taken into account when issuing the certificate for the tank, if the test results are presented and the valves and other service equipment are fit for the intended use.

- 6.8.2.3.2 If the tanks, battery-vehicles or MEGCs are manufactured in series without modification this approval shall be valid for the tanks, battery-vehicles or MEGCs manufactured in series or according to the prototype.

A type approval may however serve for the approval of tanks with limited variations of the design that either reduce the loads and stresses on the tanks (e.g. reduced pressure, reduced mass, reduced volume) or increase the safety of the structure (e.g. increased shell thickness, more surge-plates, decreased diameter of openings). The limited variations shall be clearly described in the type approval certificate.

- 6.8.2.3.3 The following requirements apply to tanks for which special provision TA4 of 6.8.4 (and therefore 1.8.7.2.4) does not apply.

The type approval shall be valid for a maximum of ten years. If within that period the relevant technical requirements of ADR (including referenced standards) have changed so that the approved type is no longer in conformity with them, the competent authority or the body designated by that authority which issued the type approval shall withdraw it and inform the holder of the type approval.

NOTE: For the ultimate dates for withdrawal of existing type approvals, see column (5) of the tables in 6.8.2.6 or 6.8.3.6 as appropriate.

If a type approval has expired or has been withdrawn, the manufacture of the tanks, battery-vehicles or MEGCs according to that type approval is no longer authorised.

In such a case, the relevant provisions concerning the use, periodic inspection and intermediate inspection of tanks, battery-vehicles or MEGCs contained in the type approval which has expired or has been withdrawn shall continue to apply to these tanks, battery-vehicles or MEGCs constructed before the expiry or the withdrawal if they may continue to be used.

They may continue to be used as long as they remain in conformity with the requirements of ADR. If they are no longer in conformity with the requirements of ADR they may continue to be used only if such use is permitted by relevant transitional measures in Chapter 1.6.

Type approvals may be renewed by a complete review and assessment for conformity with the provisions of ADR applicable at the date of renewal. Renewal is not permitted after a type approval has been withdrawn. Interim amendments of an existing type approval not affecting conformity (see 6.8.2.3.2) do not extend or modify the original validity of the certificate.

NOTE: The review and assessment of conformity can be done by a body other than the one which issued the original type approval.

The issuing body shall keep all documents for the type approval for the whole period of validity including its renewals if granted.

If the designation of the issuing body is revoked or restricted, or when the body has ceased activity, the competent authority shall take appropriate steps to ensure that the files are either processed by another body or kept available.

- 6.8.2.3.4 In the case of a modification of a tank with a valid, expired or withdrawn type approval, the testing, inspection and approval are limited to the parts of the tank that have been modified.

The modification shall meet the provisions of ADR applicable at the time of the modification. For all parts of the tank not affected by the modification, the documentation of the initial type approval remains valid.

A modification may apply to one or more tanks covered by a type approval.

A certificate approving the modification shall be issued by the competent authority of any Contracting Party to ADR or by a body designated by this authority and shall be kept as part of the tank record.

Each application for an approval certificate for a modification shall be lodged with a single competent authority or body designated by this authority.

6.8.2.4 ***Inspections and tests***

6.8.2.4.1 Shells and their equipment shall either together or separately undergo an initial inspection before being put into service. This inspection shall include:

- a check of conformity to the approved type;
- a check of the design characteristics⁹
- an examination of the internal and external conditions;
- a hydraulic pressure test¹⁰ at the test pressure indicated on the plate prescribed in 6.8.2.5.1; and
- a leakproofness test and a check of satisfactory operation of the equipment.

Except in the case of Class 2, the test pressure for the hydraulic pressure test depends on the calculation pressure and shall be at least equal to the pressure indicated below:

Calculation pressure (bar)	Test pressure (bar)
G ¹¹	G ¹¹
1.5	1.5
2.65	2.65
4	4
10	4
15	4
21	10 (4 ¹²)

The minimum test pressures for Class 2 are given in the table of gases and gas mixtures in 4.3.3.2.5.

The hydraulic pressure test shall be carried out on the shell as a whole and separately on each compartment of compartmented shells.

⁹ The check of the design characteristics shall also include, for shells requiring a test pressure of 1 MPa (10 bar) or higher, the taking of weld test-pieces (work samples) in accordance with 6.8.2.1.23 and the tests prescribed in 6.8.5.

¹⁰ In special cases and with the agreement of the expert approved by the competent authority, the hydraulic pressure test may be replaced by a pressure test using another liquid or gas, where such an operation does not present any danger.

¹¹ G = minimum calculation pressure according to the general requirements of 6.8.2.1.14 (see 4.3.4.1).

¹² Minimum test pressure for UN No. 1744 bromine or UN No. 1744 bromine solution.

The test shall be carried out on each compartment at a pressure at least equal to 1.3 times the maximum working pressure.

The hydraulic pressure test shall be carried out before the installation of a thermal insulation as may be necessary.

If the shells and their equipment are tested separately, they shall be jointly subjected to a leakproofness test after assembly in accordance with 6.8.2.4.3.

The leakproofness test shall be carried out separately on each compartment of compartmented shells.

6.8.2.4.2 Shells and their equipment shall undergo periodic inspections no later than every six years. | five years.

These periodic inspections shall include:

- An external and internal examination;
- A leakproofness test in accordance with 6.8.2.4.3 of the shell with its equipment and check of the satisfactory operation of all the equipment;
- As a general rule, a hydraulic pressure test¹⁰ (for the test pressure for the shells and compartments if applicable, see 6.8.2.4.1).

Sheathing for thermal or other insulation shall be removed only to the extent required for reliable appraisal of the characteristics of the shell.

In the case of tanks intended for the carriage of powdery or granular substances, and with the agreement of the expert approved by the competent authority, the periodic hydraulic pressure tests may be omitted and replaced by leakproofness tests in accordance with 6.8.2.4.3, at an effective internal pressure at least equal to the maximum working pressure.

6.8.2.4.3 Shells and their equipment shall undergo intermediate inspections at least every three years | two and a half years

after the initial inspection and each periodic inspection. These intermediate inspections may be performed within three months before or after the specified date.

However, the intermediate inspection may be performed at any time before the specified date.

If an intermediate inspection is performed more than three months before the due date, another intermediate inspection shall be performed at the latest

three years | two and a half years
after this date.

¹⁰ In special cases and with the agreement of the expert approved by the competent authority, the hydraulic pressure test may be replaced by a pressure test using another liquid or gas, where such an operation does not present any danger.

These intermediate inspections shall include a leakproofness test of the shell with its equipment and check of the satisfactory operation of all the equipment. For this purpose the tank shall be subjected to an effective internal pressure at least equal to the maximum working pressure. For tanks intended for the carriage of liquids or solids in the granular or powdery state, when a gas is used for the leakproofness test it shall be carried out at a pressure at least equal to 25% of the maximum working pressure. In all cases, it shall not be less than 20 kPa (0.2 bar) (gauge pressure).

For tanks equipped with breather devices and a safety device to prevent the contents spilling out if the tank overturns, the pressure test shall be equal to the static pressure of the filling substance.

The leakproofness test shall be carried out separately on each compartment of compartmented shells.

6.8.2.4.4 When the safety of the tank or of its equipment may have been impaired as a result of repairs, alterations or accident, an exceptional check shall be carried out. If an exceptional check fulfilling the requirements of 6.8.2.4.2 has been performed, then the exceptional check may be considered to be a periodic inspection. If an exceptional check fulfilling the requirements of 6.8.2.4.3 has been performed then the exceptional check may be considered to be an intermediate inspection.

6.8.2.4.5 The tests, inspections and checks in accordance with 6.8.2.4.1 to 6.8.2.4.4 shall be carried out by the expert approved by the competent authority. Certificates shall be issued showing the results of these operations, even in the case of negative results. These certificates shall refer to the list of the substances permitted for carriage in this tank or to the tank code and the alphanumeric codes of special provisions in accordance with 6.8.2.3.

A copy of these certificates shall be attached to the tank record of each tank, battery-vehicle or MEGC tested (see 4.3.2.1.7).

6.8.2.5 Marking

6.8.2.5.1 Every tank shall be fitted with a corrosion-resistant metal plate permanently attached to the tank in a place readily accessible for inspection. The following particulars at least shall be marked on the plate by stamping or by any other similar method. These particulars may be engraved directly on the walls of the shell itself, if the walls are so reinforced that the strength of the shell is not impaired¹³:

- approval number;
- manufacturer's name or mark;
- manufacturer's serial number;
- year of manufacture;
- test pressure (gauge pressure);
- external design pressure (see 6.8.2.1.7);
- capacity of the shell – in the case of multiple-compartment shells, the capacity of each compartment –, followed by the symbol "S" when the shells or the compartments of more than 7 500 litres are divided by surge plates into sections of not more than 7 500 litres capacity;
- design temperature (only if above +50 °C or below -20 °C);

¹³ Add the units of measurement after the numerical values.

- date and type of the most recent test: "month, year" followed by a "P" when the test is the initial test or a periodic test in accordance with 6.8.2.4.1 and 6.8.2.4.2, or "month, year" followed by an "L" when the test is an intermediate leakproofness test in accordance with 6.8.2.4.3;
- stamp of the expert who carried out the tests;
- material of the shell and reference to materials standards, if available and, where appropriate, the protective lining;
- test pressure on the shell as a whole and test pressure by compartment in MPa or bar (gauge pressure) where the pressure by compartment is less than the pressure on the shell.

In addition, the maximum working pressure allowed shall be inscribed on pressure-filled or pressure-discharge tanks.

6.8.2.5.2	The following particulars shall be inscribed on the tank-vehicle (on the tank itself or on plates) ¹³ :	The following particulars shall be inscribed on the tank-container (on the tank itself or on plates) ¹³ :
	<ul style="list-style-type: none"> - name of owner or operator; - unladen mass of the tank-vehicle; and - maximum permissible mass of the tank-vehicle. 	<ul style="list-style-type: none"> - names of owner and of operator; - capacity of the shell; - tare; - maximum permissible gross mass;
	The following particulars shall be inscribed on a demountable tank (on the tank itself or on plates) ¹³ :	
	<ul style="list-style-type: none"> - name of owner or operator; - "demountable tank"; - tare of the tank; - maximum permissible gross mass of the tank; - for the substances according to 4.3.4.1.3, the proper shipping name of the substance(s) accepted for carriage; - tank code according to 4.3.4.1.1; and - for substances other than those according to 4.3.4.1.3, the alphanumeric codes of all special provisions TC and TE which are shown in column (13) of Table A of Chapter 3.2 for the substances to be carried in the tank. 	<ul style="list-style-type: none"> - for the substances according to 4.3.4.1.3, the proper shipping name of the substance(s) accepted for carriage; - tank code according to 4.3.4.1.1; and - for substances other than those according to 4.3.4.1.3, the alphanumeric codes of all special provisions TC and TE which are shown in column (13) of Table A of Chapter 3.2 for the substances to be carried in the tank.

6.8.2.6 ***Requirements for tanks which are designed, constructed and tested according to referenced standards***

NOTE: Persons or bodies identified in standards as having responsibilities in accordance with ADR shall meet the requirements of ADR.

¹³ Add the units of measurement after the numerical values.

6.8.2.6.1 Design and construction

The standards referenced in the table below shall be applied for the issue of type approvals as indicated in column (4) to meet the requirements of Chapter 6.8 referred to in column (3). The requirements of Chapter 6.8 referred to in column (3) shall prevail in all cases. Column (5) gives the latest date when existing type approvals shall be withdrawn according to 1.8.7.2.4 or 6.8.2.3.3; if no date is shown the type approval remains valid until it expires.

Since 1 January 2009 the use of the referenced standards has been mandatory. Exceptions are dealt with in 6.8.2.7 and 6.8.3.7.

If more than one standard is referenced for the application of the same requirements, only one of them shall be applied, but in full unless otherwise specified in the table below.

6.8.2.6.2 *Inspection and test*

The standard referenced in the table below shall be applied for the inspection and test of tanks as indicated in column (4) to meet the requirements of Chapter 6.8 referred to in column (3) which shall prevail in all cases.

The use of a referenced standard is mandatory.

Reference	Title of document	Applicable sub-sections and paragraphs	Applicable
(1)	(2)	(3)	(4)
EN 12972:2007	Tanks for transport of dangerous goods – Testing, inspection and marking of metallic tanks	6.8.2.4 6.8.3.4	Until further notice

6.8.2.7 *Requirements for tanks which are not designed, constructed and tested according to referenced standards*

To reflect scientific and technical progress or where no standard is referenced in 6.8.2.6 or to deal with specific aspects not addressed in a standard referenced in 6.8.2.6, the competent authority may recognize the use of a technical code providing the same level of safety. Tanks shall, however, comply with the minimum requirements of 6.8.2.

The competent authority shall transmit to the secretariat of UNECE a list of the technical codes that it recognises. The list should include the following details: name and date of the code, purpose of the code and details of where it may be obtained. The secretariat shall make this information publicly available on its website.

A standard which has been adopted for reference in a future edition of the ADR may be approved by the competent authority for use without notifying the UNECE secretariat.

For testing, inspection and marking, the applicable standard referenced in 6.8.2.6 may also be used.

6.8.3 **Special requirements applicable to Class 2**

6.8.3.1 *Construction of shells*

6.8.3.1.1 Shells intended for the carriage of compressed or liquefied gases or dissolved gases shall be made of steel. In the case of weldless shells, by derogation from 6.8.2.1.12 a minimum elongation at fracture of 14% and also a stress σ lower than or equal to limits hereafter given according to the material may be accepted:

- (a) When the ratio R_e/R_m (of the minimum guaranteed characteristics after heat treatment) is higher than 0.66 without exceeding 0.85:

$$\sigma \leq 0.75 R_e;$$

- (b) When the ratio R_e/R_m (of the minimum guaranteed characteristics after heat treatment) is higher than 0.85:

$$\sigma \leq 0.5 R_m.$$

6.8.3.1.2 The requirements of 6.8.5 apply to the materials and construction of welded shells.

6.8.3.1.3 (*Reserved*)

Construction of battery-vehicles and MEGCs

6.8.3.1.4 Cylinders, tubes, pressure drums and bundles of cylinders, as elements of a battery-vehicle or MEGC, shall be constructed in accordance with Chapter 6.2.

NOTE 1: *Bundles of cylinders which are not elements of a battery-vehicle or of a MEGC shall be subject to the requirements of Chapter 6.2.*

NOTE 2: *Tanks as elements of battery-vehicles and MEGCs shall be constructed in accordance with 6.8.2.1 and 6.8.3.1.*

NOTE 3: *Demountable tanks¹⁴ are not to be considered elements of battery-vehicles or MEGCs.*

6.8.3.1.5 Elements and their fastenings shall be capable of absorbing under the maximum permissible load the forces defined in 6.8.2.1.2. Under each force the stress at the most severely stressed point of the element and its fastenings shall not exceed the value defined in 6.2.5.3 for cylinders, tubes, pressure drums and bundles of cylinders and for tanks the value of σ defined in 6.8.2.1.16.

6.8.3.2 *Items of equipment*

6.8.3.2.1 The discharge pipes of tanks shall be capable of being closed by blank flanges or some other equally reliable device. For tanks intended for the carriage of refrigerated liquefied gases, these blank flanges or other equally reliable devices may be fitted with pressure-release openings of a maximum diameter of 1.5 mm.

6.8.3.2.2 Shells intended for the carriage of liquefied gases may be provided with, in addition to the openings prescribed in 6.8.2.2.2 and 6.8.2.2.4, openings for the fitting of gauges, thermometers, manometers and with bleed holes, as required for their operation and safety.

6.8.3.2.3 The internal stop-valve of all filling and all discharge openings of tanks

| with a capacity greater than 1 m³

intended for the carriage of liquefied flammable or toxic gases shall be instant-closing and shall close automatically in the event of an unintended movement of the tank or in the event of fire. It shall also be possible to operate the internal stop-valve by remote control.

However on tanks intended for the carriage of liquefied non-toxic flammable gases, the internal stop-valve with remote control may be replaced by a non-return valve for filling openings into the vapour

¹⁴ For the definition of "demountable tank" see 1.2.1.

phase of the tank only. The non-return valve shall be positioned internally in the tank, be spring loaded so that the valve is closed if the pressure in the filling line is equal to or lower than the pressure in the tank and be equipped with appropriate sealing¹⁵.

- 6.8.3.2.4 All openings, other than those accommodating safety valves and closed bleed holes, of tanks intended for the carriage of liquefied flammable and/or toxic gases shall, if their nominal diameter is more than 1.5 mm, shall be equipped with an internal shut-off device.
- 6.8.3.2.5 Notwithstanding the requirements of 6.8.2.2.2, 6.8.3.2.3 and 6.8.3.2.4, tanks intended for the carriage of refrigerated liquefied gases may be equipped with external devices in place of internal devices if the external devices afford protection against external damage at least equivalent to that afforded by the wall of the shell.
- 6.8.3.2.6 If the tanks are equipped with gauges in direct contact with the substance carried, the gauges shall not be made of a transparent material. If there are thermometers, they shall not project directly into the gas or liquid through the shell.
- 6.8.3.2.7 Filling and discharge openings situated in the upper part of tanks shall be equipped with, in addition to what is prescribed in 6.8.3.2.3, a second, external, closing device. This device shall be capable of being closed by a blank flange or some other equally reliable device.
- 6.8.3.2.8 Safety valves shall meet the requirements of 6.8.3.2.9 to 6.8.3.2.12 below:
- 6.8.3.2.9 Tanks intended for the carriage of compressed or liquefied gases or dissolved gases, may be fitted with spring-loaded safety valves. These valves shall be capable of opening automatically under a pressure between 0.9 and 1.0 times the test pressure of the tank to which they are fitted. They shall be of such a type as to resist dynamic stresses, including liquid surge. The use of dead weight or counter weight valves is prohibited. The required capacity of the safety valves shall be calculated in accordance with the formula contained in 6.7.3.8.1.1.
- 6.8.3.2.10 Where tanks are intended for carriage by sea, the requirements of 6.8.3.2.9 shall not prohibit the fitting of safety valves conforming to the IMDG Code.
- 6.8.3.2.11 Tanks intended for the carriage of refrigerated liquefied gases shall be equipped with two or more independent safety valves capable of opening at the maximum working pressure indicated on the tank. Two of these safety valves shall be individually sized to allow the gases formed by evaporation during normal operation to escape from the tank in such a way that the pressure does not at any time exceed by more than 10% the working pressure indicated on the tank.

One of the safety valves may be replaced by a bursting disc which shall be such as to burst at the test pressure.

In the event of loss of the vacuum in a double-walled tank, or of destruction of 20% of the insulation of a single-walled tank, the combination of the pressure relief devices shall permit an outflow such that the pressure in the shell cannot exceed the test pressure. The provisions of 6.8.2.1.7 shall not apply to vacuum-insulated tanks.

¹⁵ *The use of metal to metal sealing is not permitted.*

6.8.3.2.12 These pressure relief devices of tanks intended for the carriage of refrigerated liquefied gases shall be so designed as to function faultlessly even at their lowest working temperature. The reliability of their operation at that temperature shall be established and checked either by testing each device or by testing a specimen device of each design-type.

6.8.3.2.13 The valves of demountable tanks that can be rolled shall be provided with protective caps.

Thermal insulation

6.8.3.2.14 If tanks intended for the carriage of liquefied gases are equipped with thermal insulation, such insulation shall consist of either:

- a sun shield covering not less than the upper third but not more than the upper half of the tank surface and separated from the shell by an air space at least 4 cm across; or
- a complete cladding, of adequate thickness, of insulating materials.

6.8.3.2.15 Tanks intended for the carriage of refrigerated liquefied gases shall be thermally insulated. Thermal insulation shall be ensured by means of a continuous sheathing. If the space between the shell and the sheathing is under vacuum (vacuum insulation), the protective sheathing shall be so designed as to withstand without deformation an external pressure of at least 100 kPa (1 bar) (gauge pressure). By derogation from the definition of "calculation pressure" in 1.2.1, external and internal reinforcing devices may be taken into account in the calculations. If the sheathing is so closed as to be gas-tight, a device shall be provided to prevent any dangerous pressure from developing in the insulating layer in the event of inadequate gas-tightness of the shell or of its items of equipment. The device shall prevent the infiltration of moisture into the heat-insulating sheath.

6.8.3.2.16 Tanks intended for the carriage of liquefied gases having a boiling point below -182° C at atmospheric pressure shall not include any combustible material either in the thermal insulation or in the means of attachment.

The means of attachment for vacuum insulated tanks may, with the approval of the competent authority, contain plastics substances between the shell and the sheathing.

6.8.3.2.17 By derogation from the requirements of 6.8.2.2.4 shells intended for the carriage of refrigerated liquefied gases need not have an inspection opening.

Items of equipment for battery-vehicles and MEGCs

6.8.3.2.18 Service and structural equipment shall be configured or designed to prevent damage that could result in the release of the pressure receptacle contents during normal conditions of handling and carriage. When the connection between the frame of the battery-vehicle or MEGC and the elements allows relative movement between the sub-assemblies, the equipment shall be so fastened as to permit such movement without damage to working parts. Manifold piping leading to shut-off valves shall be sufficiently flexible to protect the valves and the piping from shearing, or releasing the pressure receptacle contents. The filling and discharge devices (including flanges or threaded plugs) and any protective caps shall be capable of being secured against unintended opening.

6.8.3.2.19 In order to avoid any loss of content in the event of damage, the manifolds, the discharge fittings (pipe sockets, shut-off devices), and the stop-valves shall be protected or arranged from being wrenched off by external forces or designed to withstand them.

6.8.3.2.20 The manifold shall be designed for service in a temperature range of -20° C to +50° C.

The manifold shall be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration. All piping shall be of suitable metallic material. Welded pipe joints shall be used wherever possible.

Joints in copper tubing shall be brazed or have an equally strong metal union. The melting point of brazing materials shall be no lower than 525°C. The joints shall not decrease the strength of tubing as may happen when cutting threads.

- 6.8.3.2.21 Except for UN No.1001 acetylene, dissolved, the permissible maximum stress σ of the manifolding arrangement at the test pressure of the receptacles shall not exceed 75% of the guaranteed yield strength of the material.

The necessary wall thickness of the manifolding arrangement for the carriage of UN No.1001 acetylene, dissolved shall be calculated according to an approved code of practice.

NOTE: For the yield strength, see 6.8.2.1.11.

The basic requirements of this paragraph shall be deemed to have been complied with if the following standards are applied: (*Reserved*).

- 6.8.3.2.22 By derogation from the requirements of 6.8.3.2.3, 6.8.3.2.4 and 6.8.3.2.7, for cylinders, tubes, pressure drums and bundles of cylinders (frames) forming a battery-vehicle or MEGC, the required closing devices may be provided for within the manifolding arrangement.
- 6.8.3.2.23 If one of the elements is equipped with a safety valve and shut-off devices are provided between the elements, every element shall be so equipped.
- 6.8.3.2.24 The filling and discharge devices may be affixed to a manifold.
- 6.8.3.2.25 Each element, including each individual cylinder of a bundle, intended for the carriage of toxic gases, shall be capable of being isolated by a shut-off valve.
- 6.8.3.2.26 Battery-vehicles or MEGCs intended for the carriage of toxic gases shall not have safety valves, unless the safety valves are preceded by a bursting disc. In the latter case, the arrangement of the bursting disc and safety valve shall be satisfactory to the competent authority.
- 6.8.3.2.27 When battery-vehicles or MEGCs are intended for carriage by sea, the requirements of 6.8.3.2.26 shall not prohibit the fitting of safety valves conforming to the IMDG Code.
- 6.8.3.2.28 Receptacles which are elements of a battery-vehicle or MEGC intended for the carriage of flammable gases shall be combined in groups of not more than 5 000 litres which are capable of being isolated by a shut-off valve.

Each element of a battery-vehicle or MEGC intended for the carriage of flammable gases, when consisting of tanks conforming to this Chapter, shall be capable of being isolated by a shut-off valve.

6.8.3.3 ***Type approval***

No special requirements.

6.8.3.4 *Inspections and tests*

- 6.8.3.4.1 The materials of every welded shell with the exception of cylinders, tubes, pressure drums and cylinders as part of bundles of cylinders which are elements of a battery-vehicle or of a MEGC shall be tested according to the method described in 6.8.5.
- 6.8.3.4.2 The basic requirements for the test pressure are given in 4.3.3.2.1 to 4.3.3.2.4 and the minimum test pressures are given in the table of gases and gas mixtures in 4.3.3.2.5.
- 6.8.3.4.3 The first hydraulic pressure test shall be carried out before thermal insulation is placed in position. When the shell, its fittings, piping and items of equipment have been tested separately, the tank shall be subjected to a leakproofness test after assembly.
- 6.8.3.4.4 The capacity of each shell intended for the carriage of compressed gases filled by mass, liquefied gases or dissolved gases shall be determined, under the supervision of an expert approved by the competent authority, by weighing or volumetric measurement of the quantity of water which fills the shell; the measurement of shell capacity shall be accurate to within 1%. Determination by a calculation based on the dimensions of the shell is not permitted. The maximum filling masses allowed in accordance with packing instruction P200 or P203 in 4.1.4.1 as well as 4.3.3.2.2 and 4.3.3.2.3 shall be prescribed by an approved expert.
- 6.8.3.4.5 Checking of the welds shall be carried out in accordance with the $\lambda=1$ requirements of 6.8.2.1.23.
- 6.8.3.4.6 By derogation from the requirements of 6.8.2.4.2, the periodic inspections shall take place:
- | | | |
|---|--|---|
| at least after six years | | at least after eight years |
| of service and thereafter at least every 12 years in the case of tanks intended for the carriage of refrigerated liquefied gases. | | |
| The intermediate inspections according to 6.8.2.4.3 shall be carried out at least six years after each periodic inspection. | | A leakproofness test or an intermediate inspection according to 6.8.2.4.3 may be performed, at the request of the competent authority, between any two successive periodic inspections. |
- 6.8.3.4.7 In the case of vacuum-insulated tanks, the hydraulic-pressure test and the check of the internal condition may, with the consent of the approved expert, be replaced by a leakproofness test and measurement of the vacuum.
- 6.8.3.4.8 If, at the time of periodic inspections, openings have been made in shells intended for the carriage of refrigerated liquefied gases, the method by which they are hermetically closed before the shells are returned to service shall be approved by the approved expert and shall ensure the integrity of the shell.
- 6.8.3.4.9 Leakproofness tests of tanks intended for the carriage of gases shall be performed at a pressure of not less than:
- For compressed gases, liquefied gases and dissolved gases: 20% of the test pressure;
 - For refrigerated liquefied gases: 90% of the maximum working pressure.

Inspections and tests for battery-vehicles and MEGCs

6.8.3.4.10 The elements and items of equipment of each battery-vehicle or MEGC shall be inspected and tested either together or separately before being put into service for the first time (initial inspection and test). Thereafter battery-vehicles or MEGCs the elements of which are receptacles shall be inspected at not more than five-year intervals. Battery-vehicles and MEGCs the elements of which are tanks shall be inspected according to 6.8.3.4.6. An exceptional inspection and test shall be performed regardless of the last periodic inspection and test when necessary according to 6.8.3.4.14.

6.8.3.4.11 The initial inspection shall include:

- a check of conformity to the approved type;
- a check of the design characteristics;
- an examination of the internal and external conditions;
- a hydraulic pressure test¹⁰ at the test pressure indicated on the plate prescribed in 6.8.3.5.10;
- a leakproofness test at the maximum working pressure; and
- a check of satisfactory operation of the equipment.

When the elements and their fittings have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.

6.8.3.4.12 Cylinders, tubes and pressure drums and cylinders as part of bundles of cylinders shall be tested according to packing instruction P200 or P203 in 4.1.4.1.

The test pressure of the manifold of the battery-vehicle or MEGC shall be the same as that of the elements of the battery-vehicle or MEGC. The pressure test of the manifold may be performed as a hydraulic test or by using another liquid or gas with the agreement of the competent authority or its authorised body. By derogation from this requirement, the test pressure for the manifold of battery-vehicle or MEGC shall not be less than 300 bar for UN No. 1001 acetylene, dissolved.

6.8.3.4.13 The periodic inspection shall include a leakproofness test at the maximum working pressure and an external examination of the structure, the elements and the service equipment without disassembling. The elements and the piping shall be tested at the periodicity defined in packing instruction P200 of 4.1.4.1 and in accordance with the requirements of 6.2.1.6 and 6.2.3.5 respectively. When the elements and equipment have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.

6.8.3.4.14 An exceptional inspection and test is necessary when the battery-vehicle or MEGC shows evidence of damaged or corroded areas, or leakage, or any other conditions, that indicate a deficiency that could affect the integrity of the battery-vehicle or MEGC. The extent of the exceptional inspection and test and, if deemed necessary, the disassembling of elements shall depend on the amount of damage or deterioration of the battery-vehicle or MEGC. It shall include at least the examinations required under 6.8.3.4.15.

¹⁰ *In special cases and with the agreement of the expert approved by the competent authority, the hydraulic pressure test may be replaced by a pressure test using another liquid or gas, where such an operation does not present any danger.*

6.8.3.4.15 The examinations shall ensure that:

- (a) The elements are inspected externally for pitting, corrosion, or abrasions, dents, distortions, defects in welds or any other conditions, including leakage, that might render the battery-vehicles or MEGCs unsafe for transport;
- (b) The piping, valves, and gaskets are inspected for corroded areas, defects, and other conditions, including leakage, that might render battery-vehicles or MEGCs unsafe for filling, discharge or transport;
- (c) Missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
- (d) All emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves shall be operated to demonstrate proper operation;
- (e) Required markings on the battery-vehicles or MEGCs are legible and in accordance with the applicable requirements; and
- (f) Any framework, supports and arrangements for lifting the battery-vehicles or MEGCs are in satisfactory condition.

6.8.3.4.16 The tests, inspections and checks in accordance with 6.8.3.4.10 to 6.8.3.4.15 shall be carried out by the expert approved by the competent authority. Certificates shall be issued showing the results of these operations, even in the case of negative results.

These certificates shall refer to the list of the substances permitted for carriage in this battery-vehicle or MEGC in accordance with 6.8.2.3.1.

A copy of these certificates shall be attached to the tank record of each tank, battery-vehicle or MEGC tested (see 4.3.2.1.7).

6.8.3.5 Marking

6.8.3.5.1 The following additional particulars shall be marked by stamping or by any other similar method on the plate prescribed in 6.8.2.5.1, or directly on the walls of the shell itself if the walls are so reinforced that the strength of the tank is not impaired.

6.8.3.5.2 On tanks intended for the carriage of only one substance:

- the proper shipping name of the gas and, in addition for gases classified under an n.o.s. entry, the technical name¹⁶;

¹⁶ Instead of the proper shipping name or, if applicable, of the proper shipping name of the n.o.s. entry followed by the technical name, the use of the following names is permitted:

- for UN No. 1078 refrigerant gas, n.o.s.: mixture F1, mixture F2, mixture F3;
- for UN No. 1060 methylacetylene and propadiene mixtures, stabilized: mixture P1, mixture P2;
- for UN No. 1965 hydrocarbon gas mixture, liquefied, n.o.s.: mixture A, mixture A01, mixture A02, mixture A0, mixture A1, mixture B1, mixture B2, mixture B, mixture C. The names customary in the trade and mentioned in 2.2.2.3, Classification code 2F, UN No. 1965, Note 1 may be used only as a complement;
- for UN No. 1010 Butadienes, stabilized: 1,2-Butadiene, stabilized, 1,3-Butadiene, stabilized.

This indication shall be supplemented:

- in the case of tanks intended for the carriage of compressed gases filled by volume (pressure), by an indication of the maximum filling pressure at 15 °C permitted for the tank; and
- in the case of tanks intended for the carriage of compressed gases filled by mass, and of liquefied gases, refrigerated liquefied gases or dissolved gases by an indication of the maximum permissible load mass in kg and of the filling temperature if below -20 °C.

6.8.3.5.3 On multipurpose tanks:

- the proper shipping names of the gases and, in addition for gases classified under an n.o.s. entry, the technical name of the gases¹⁶ for whose carriage the tank is approved.

These particulars shall be supplemented by an indication of the maximum permissible load mass in kg for each gas.

6.8.3.5.4 On tanks intended for the carriage of refrigerated liquefied gases:

- the maximum working pressure allowed.

6.8.3.5.5 On tanks equipped with thermal insulation:

- the inscription "thermally insulated" or "thermally insulated by vacuum".

6.8.3.5.6	In addition to the particulars prescribed in 6.8.2.5.2, the following shall be inscribed on the tank-vehicle (on the tank itself or on plates) ¹³ :	In addition to the particulars prescribed in 6.8.2.5.2, the following shall be inscribed on the tank-container (on the tank itself or on plates) ¹³ :
-----------	--	--

- | | | |
|-----|---|---|
| (a) | - | the tank code according to the certificate (see 6.8.2.3.1) with the actual test pressure of the tank; |
| | - | the inscription: "minimum filling temperature allowed: ..."; |
| (b) | | where the tank is intended for the carriage of one substance only: |
| | - | the proper shipping name of the gas and, in addition for gases classified under an n.o.s. entry, the technical name ¹⁶ ; |
| | - | for compressed gases which are filled by mass, and for liquefied gases, refrigerated liquefied gases or dissolved gases, the maximum permissible load mass in kg; |

¹³ Add the units of measurement after the numerical values.

¹⁶ Instead of the proper shipping name or, if applicable, of the proper shipping name of the n.o.s. entry followed by the technical name, the use of the following names is permitted:

- for UN No. 1078 refrigerant gas, n.o.s.: mixture F1, mixture F2, mixture F3;
- for UN No. 1060 methylacetylene and propadiene mixtures, stabilized: mixture P1, mixture P2;
- for UN No. 1965 hydrocarbon gas mixture, liquefied, n.o.s.: mixture A, mixture A01, mixture A02, mixture A0, mixture A1, mixture B1, mixture B2, mixture B, mixture C. The names customary in the trade and mentioned in 2.2.2.3, Classification code 2F, UN No. 1965, Note 1 may be used only as a complement;
- for UN No. 1010 Butadienes, stabilized: 1,2-Butadiene, stabilized, 1,3-Butadiene, stabilized.

- (c) where the tank is a multipurpose tank:
 - the proper shipping name of the gas and, for gases classified under an n.o.s. entry, the technical name¹⁶ of all gases to whose carriage the tank is assigned with an indication of the maximum permissible load mass in kg for each of them;
- (d) where the shell is equipped with thermal insulation:
 - the inscription "thermally insulated" (or "thermally insulated by vacuum"), in an official language of the country of registration and also, if that language is not English, French or German, in English, French or German, unless any agreements concluded between the countries concerned in the transport operation provide otherwise.

6.8.3.5.7 (Reserved)

6.8.3.5.8 These particulars shall not be required in the case of a vehicle carrying demountable tanks. |

6.8.3.5.9 (Reserved)

Marking of battery-vehicles and MEGCs

- 6.8.3.5.10 Every battery-vehicle and every MEGC shall be fitted with a corrosion-resistant metal plate permanently attached in a place readily accessible for inspection. The following particulars at least shall be marked on the plate by stamping or by any other similar method¹³
- approval number;
 - manufacturer's name or mark;
 - manufacturer's serial number;
 - year of manufacture;
 - test pressure (gauge pressure)
 - design temperature (only if above +50 °C or below -20 °C);
 - date (month and year) of initial test and most recent periodic test in accordance with 6.8.3.4.10 to 6.8.3.4.13;
 - stamp of the expert who carried out the tests.

¹³ Add the units of measurement after the numerical values.

¹⁶ Instead of the proper shipping name or, if applicable, of the proper shipping name of the n.o.s. entry followed by the technical name, the use of the following names is permitted:

- for UN No. 1078 refrigerant gas, n.o.s.: mixture F1, mixture F2, mixture F3;
- for UN No. 1060 methylacetylene and propadiene mixtures, stabilized: mixture P1, mixture P2;
- for UN No. 1965 hydrocarbon gas mixture, liquefied, n.o.s.: mixture A, mixture A01, mixture A02, mixture A0, mixture A1, mixture B1, mixture B2, mixture B, mixture C. The names customary in the trade and mentioned in 2.2.2.3, Classification code 2F, UN No. 1965, Note 1 may be used only as a complement;
- for UN No. 1010 Butadienes, stabilized: 1,2-Butadiene, stabilized, 1,3-Butadiene, stabilized.

6.8.3.5.11	<p>The following particulars shall be inscribed on the battery-vehicle itself or on a plate¹³:</p> <ul style="list-style-type: none"> - names of owner or of operator; - number of elements; - total capacity of the elements; <p>and for battery-vehicles filled by mass:</p> <ul style="list-style-type: none"> - unladen mass; - maximum permissible mass. 	<p>The following particulars shall be inscribed either on the MEGC itself or on a plate¹³:</p> <ul style="list-style-type: none"> - names of owner and of operator; - number of elements; - total capacity of the elements; - maximum permissible laden mass; - the tank code according to the certificate of approval (see 6.8.2.3.1) with the actual test pressure of the MEGC; - the proper shipping name of the gases, and in addition, for gases classified under an n.o.s. entry, the technical name¹⁶ of the gases for whose carriage the MEGC is used; <p>and for MEGCs filled by mass:</p> <ul style="list-style-type: none"> - tare.
------------	---	---

- 6.8.3.5.12 The frame of a battery-vehicle or MEGC shall bear near the filling point a plate specifying:
- the maximum filling pressure¹³ at 15 °C allowed for elements intended for compressed gases;
 - the proper shipping name of the gas in accordance with Chapter 3.2 and, in addition for gases classified under an n.o.s. entry, the technical name¹⁶;
- and, in addition, in the case of liquefied gases:
- the permissible maximum load per element¹³.

6.8.3.5.13 Cylinders, tubes and pressure drums, and cylinders as part of bundles of cylinders, shall be marked according to 6.2.2.7. These receptacles need not be labelled individually with the danger labels as required in Chapter 5.2.

Battery-vehicles and MEGCs shall be placarded and marked according to Chapter 5.3.

¹³ Add the units of measurements after the numerical values.

¹⁶ Instead of the proper shipping name or, if applicable, of the proper shipping name of the n.o.s. entry followed by the technical name, the use of the following names is permitted:

- for UN No. 1078 refrigerant gas, n.o.s.: mixture F1, mixture F2, mixture F3;
- for UN No. 1060 methylacetylene and propadiene mixtures, stabilized: mixture P1, mixture P2;
- for UN No. 1965 hydrocarbon gas mixture, liquefied, n.o.s.: mixture A, mixture A01, mixture A02, mixture A0, mixture A1, mixture B1, mixture B2, mixture B, mixture C. The names customary in the trade and mentioned in 2.2.2.3, Classification code 2F, UN No. 1965, Note 1 may be used only as a complement;
- for UN No. 1010 Butadienes, stabilized: 1,2-Butadiene, stabilized, 1,3-Butadiene, stabilized.

6.8.3.6 *Requirements for battery-vehicles and MEGCs which are designed, constructed and tested according to referenced standards*

NOTE: Persons or bodies identified in standards as having responsibilities in accordance with ADR shall meet the requirements of ADR.

The standard referenced in the table below shall be applied for the issue of type approvals as indicated in column (4) to meet the requirements of Chapter 6.8 referred to in column (3). The requirements of Chapter 6.8 referred to in column (3) shall prevail in all cases. Column (5) gives the latest date when existing type approvals shall be withdrawn according to 1.8.7.2.4; if no date is shown the type approval remains valid until it expires.

Since 1 January 2009 the use of the referenced standards has been mandatory. Exceptions are dealt with in 6.8.3.7

If more than one standard is referenced for the application of the same requirements, only one of them shall be applied, but in full unless otherwise specified in the table below.

Reference	Title of document	Applicable sub-sections and paragraphs	Applicable for new type approvals or for renewals	Latest date for withdrawal of existing type approvals
(1)	(2)	(3)	(4)	(5)
EN 13807:2003	Transportable gas cylinders – Battery vehicles – Design, manufacture, identification and testing	6.8.3.1.4 and 6.8.3.1.5, 6.8.3.2.18 to 6.8.3.2.26, 6.8.3.4.10 to 6.8.3.4.12 and 6.8.3.5.10 to 6.8.3.5.13	Until further notice	

6.8.3.7 *Requirements for battery-vehicles and MEGCs which are not designed, constructed and tested according to referenced standards*

To reflect scientific and technical progress or where no standard is referenced in 6.8.3.6 or to deal with specific aspects not addressed in a standard referenced in 6.8.3.6, the competent authority may recognize the use of a technical code providing the same level of safety. Battery-vehicles and MEGCs shall, however, comply with the minimum requirements of 6.8.3.

In the type approval the issuing body shall specify the procedure for periodic inspections if the standards referenced in 6.2.2, 6.2.4 or 6.8.2.6 are not applicable or shall not be applied.

The competent authority shall transmit to the secretariat of UNECE a list of the technical codes that it recognises. The list should include the following details: name and date of the code, purpose of the code and details of where it may be obtained. The secretariat shall make this information publicly available on its website.

A standard which has been adopted for reference in a future edition of the ADR may be approved by the competent authority for use without notifying the UNECE secretariat.

6.8.4

Special provisions

NOTE 1: For liquids having a flash-point of not more than 60 °C and for flammable gases, see also 6.8.2.1.26, 6.8.2.1.27 and 6.8.2.2.9.

NOTE 2: For requirements for tanks subjected to a pressure test of not less than 1 MPa (10 bar) or for tanks intended for the carriage of refrigerated liquefied gases, see 6.8.5.

When they are shown under an entry in Column (13) of Table A of Chapter 3.2, the following special provisions apply:

(a) Construction (TC)

TC1 The requirements of 6.8.5 are applicable to the materials and construction of these shells.

TC2 Shells, and their items of equipment, shall be made of aluminium not less than 99.5% pure or of suitable steel not liable to cause hydrogen peroxide to decompose. Where shells are made of aluminium not less than 99.5% pure, the wall thickness need not exceed 15 mm, even where calculation in accordance with 6.8.2.1.17 gives a higher value.

TC3 The shells shall be made of austenitic steel.

TC4 Shells shall be provided with an enamel or equivalent protective lining if the material of the shell is attacked by UN No. 3250 chloroacetic acid.

TC5 Shells shall be provided with a lead lining not less than 5 mm thick or an equivalent lining.

TC6 Where the use of aluminium is necessary for tanks, such tanks shall be made of aluminium not less than 99.5% pure; the wall thickness need not exceed 15 mm even where calculation in accordance with 6.8.2.1.17 gives a higher value.

TC7 The effective minimum thickness of the shell shall not be less than 3 mm.

TC8 The shells shall be made of aluminium or aluminium alloy.

(b) Items of equipment (TE)

TE1 (Deleted)

TE2 (Deleted)

TE3 Tanks shall in addition meet the following requirements. The heating device shall not penetrate into, but shall be exterior to the shell. However, a pipe used for extracting the phosphorus may be equipped with a heating jacket. The device heating the jacket shall be so regulated as to prevent the temperature of the phosphorus from exceeding the filling temperature of the shell. Other piping shall enter the shell in its upper part; openings shall be situated above the highest permissible level of the phosphorus and be capable of being completely enclosed under lockable caps. The tank shall be equipped with a gauging system for verifying the level of the phosphorus and, if water is used as a protective agent, with a fixed gauge mark showing the highest permissible level of the water.

TE4 Shells shall be equipped with thermal insulation made of materials which are not readily flammable.

- TE5** If shells are equipped with thermal insulation, such insulation shall be made of materials which are not readily flammable.
- TE6** Tanks may be equipped with a device of a design which precludes its obstruction by the substance carried and which prevents leakage and the build-up of excess overpressure or underpressure inside the shell.
- TE7** The shell-discharge system shall be equipped with two mutually independent shut-off devices mounted in series, the first taking the form of a quick-closing internal stop-valve of an approved type and the second that of an external stop-valve, one at each end of the discharge pipe. A blank flange, or another device providing the same measure of security, shall also be fitted at the outlet of each external stop-valve. The internal stop-valve shall be such that if the pipe is wrenched off the stop-valve will remain integral with the shell and in the closed position.
- TE8** The connections to the external pipe-sockets of tanks shall be made of materials not liable to cause decomposition of hydrogen peroxide.
- TE9** Tanks shall be fitted in their upper part with a shut-off device preventing any build-up of excess pressure inside the shell due to the decomposition of the substances carried, any leakage of liquid, and any entry of foreign matter into the shell.
- TE10** The shut-off devices of tanks shall be so designed as to preclude obstruction of the devices by the solidified substance during carriage. Where tanks are sheathed in thermally-insulating material, the material shall be of an inorganic nature and entirely free from combustible matter.
- TE11** Shells and their service equipment shall be so designed as to prevent the entry of foreign matter, leakage of liquid or any building up of dangerous excess pressure inside the shell due to the decomposition of the substances carried. A safety valve preventing the entry of foreign matter also fulfils this provision.
- TE12** Tanks shall be equipped with thermal insulation complying with the requirements of 6.8.3.2.14. If the SADT of the organic peroxide in the tank is 55 °C or less, or the tank is constructed of aluminium, the shell shall be completely insulated. The sun shield and any part of the tank not covered by it, or the outer sheathing of a complete lagging, shall be painted white or finished in bright metal. The paint shall be cleaned before each transport journey and renewed in case of yellowing or deterioration. The thermal insulation shall be free from combustible matter. Tanks shall be fitted with temperature sensing devices.

Tanks shall be fitted with safety valves and emergency pressure-relief devices. Vacuum-relief devices may also be used. Emergency pressure-relief devices shall operate at pressures determined according to both the properties of the organic peroxide and the construction characteristics of the tank. Fusible elements shall not be permitted in the body of the shell.

Tanks shall be fitted with spring-loaded safety valves to prevent significant pressure build-up within the shell of the decomposition products and vapours released at a temperature of 50 °C. The capacity and start-to-discharge pressure of the safety-valve(s) shall be based on the results of the tests specified in special provision TA2. The start-to-discharge pressure shall however in no case be such that liquid could escape from the valve(s) if the tank were overturned.

The emergency-relief devices may be of the spring-loaded or frangible types designed to vent all the decomposition products and vapours evolved during a period of not less than one hour of complete fire-engulfment as calculated by the following formula:

$$q = 70961 \times F \times A^{0.82}$$

where:

q = heat absorption [W]

A = wetted area [m²]

F = insulation factor

F = 1 for non-insulated tanks, or

$$F = \frac{U(923 - T_{PO})}{47032} \text{ for insulated tanks}$$

where:

K = heat conductivity of insulation layer [W·m⁻¹·K⁻¹]

L = thickness of insulation layer [m]

U = K/L = heat transfer coefficient of the insulation [W·m⁻²·K⁻¹]

T_{PO} = temperature of peroxide at relieving conditions [K]

The start-to-discharge pressure of the emergency-relief device(s) shall be higher than that above specified and based on the results of the tests referred to in special provision TA2. The emergency-relief devices shall be dimensioned in such a way that the maximum pressure in the tank never exceeds the test pressure of the tank.

NOTE: An example of a method to determine the size of emergency-relief devices is given in Appendix 5 of the Manual of Tests and Criteria.

For tanks equipped with thermal insulation consisting of a complete cladding, the capacity and setting of the emergency-relief device(s) shall be determined assuming a loss of insulation from 1% of the surface area.

Vacuum-relief devices and spring-loaded safety valves of tanks shall be provided with flame arresters unless the substances to be carried and their decomposition products are non-combustible. Due attention shall be paid to the reduction of the relief capacity caused by the flame arrester.

TE13 Tanks shall be thermally insulated and fitted with a heating device on the outside.

TE14 Tanks shall be equipped with thermal insulation. The thermal insulation directly in contact with the shell shall have an ignition temperature at least 50 °C higher than the maximum temperature for which the tank was designed.

TE15 (Deleted)

TE16 (Reserved)

TE17 (Reserved)

TE18 Tanks intended for the carriage of substances filled at a temperature higher than 190 °C shall be equipped with deflectors placed at right angles to the upper filling openings, so as to avoid a sudden localized increase in wall temperature during filling.

TE19 Fittings and accessories mounted in the upper part of the tank shall be either:

- inserted in a recessed housing; or
- equipped with an internal safety valve; or
- shielded by a cap, or by transverse and/or longitudinal members, or by other equally effective devices, so profiled that in the event of overturning the fittings and accessories will not be damaged.

Fittings and accessories mounted in the lower part of the tank:

Pipe-sockets, lateral shut-off devices, and all discharge devices shall either be recessed by at least 200 mm from the extreme outer edge of the tank or be protected by a rail having a coefficient of inertia of not less than 20 cm^3 transversally to the direction of travel; their ground clearance shall be not less than 300 mm with the tank full.

Fittings and accessories mounted on the rear face of the tank shall be protected by the bumper prescribed in 9.7.6. Their height above the ground shall be such that they are adequately protected by the bumper

TE20 Notwithstanding the other tank-codes which are permitted in the hierarchy of tanks of the rationalized approach in 4.3.4.1.2, tanks shall be equipped with a safety valve.

TE21 The closures shall be protected with lockable caps.

TE22 (*Reserved*)

TE23 Tanks shall be equipped with a device of a design which precludes its obstruction by the substance carried and which prevents leakage and the build-up of excess overpressure or underpressure inside the shell.

TE24 If tanks, intended for the carriage and handling of bitumen, are equipped with a spray bar at the end of the discharge pipe, the closing device, as required by 6.8.2.2.2, may be replaced by a shut-off valve, situated on the discharge pipe and preceding the spray bar.

TE25 (*Reserved*)

(c) **Type approval (TA)**

TA1 Tanks shall not be approved for the carriage of organic substances.

TA2 This substance may be carried in fixed or demountable tanks or tank-containers under the conditions laid down by the competent authority of the country of origin, if, on the basis of the tests mentioned below, the competent authority is satisfied that such a transport operation can be carried out safely. If the country of origin is not party to ADR, these conditions shall be recognized by the competent authority of the first ADR country reached by the consignment.

For the type approval tests shall be undertaken:

- to prove the compatibility of all materials normally in contact with the substance during carriage;
- to provide data to facilitate the design of the emergency pressure-relief devices and safety valves taking into account the design characteristics of the tank; and
- to establish any special requirements necessary for the safe carriage of the substance.

The test results shall be included in the report for the type approval.

TA3 This substance may be carried only in tanks with the tank code LGAV or SGAV; the hierarchy in 4.3.4.1.2 is not applicable.

TA4 The conformity assessment procedures of section 1.8.7 shall be applied by the competent authority, its delegate or inspection body conforming to 1.8.6.2, 1.8.6.4, 1.8.6.5 and 1.8.6.8 and accredited to EN ISO/IEC 17020:2004 type A.

TA5 This substance may be carried only in tanks with the tank code S2.65AN(+); the hierarchy in 4.3.4.1.2 is not applicable.

(d) Tests (TT)

TT1 Tanks of pure aluminium need to be subjected to the initial and periodic hydraulic pressure tests at a pressure of only 250 kPa (2.5 bar) (gauge pressure).

TT2 The condition of the lining of shells shall be inspected every year by an expert approved by the competent authority, who shall inspect the inside of the shell.

TT3 By derogation from the requirements of 6.8.2.4.2, periodic inspections shall take place at least every eight years and shall include a thickness check using suitable instruments. For such tanks, the leakproofness test and check for which provision is made in 6.8.2.4.3 shall be carried out at least every four years.

TT4 *(Reserved)*

TT5 The hydraulic pressure tests shall take place at least every
3 years. | 2½ years.

TT6 The periodic tests, including the hydraulic pressure test, shall be carried out at least every 3 years. |

TT7 Notwithstanding the requirements of 6.8.2.4.2, the periodic internal inspection may be replaced by a programme approved by the competent authority.

TT8 Tanks on which the proper shipping name required for the entry UN 1005 AMMONIA, ANHYDROUS is marked in accordance with 6.8.3.5.1 to 6.8.3.5.3 and

constructed of fine-grained steel with a yield strength of more than 400 N/mm² in accordance with the material standard, shall be subjected at each periodic test according to 6.8.2.4.2, to magnetic particle inspections to detect surface cracking.

For the lower part of each shell at least 20% of the length of each circumferential and longitudinal weld shall, together with all nozzle welds and any repair or ground areas, be inspected.

If the marking of the substance on the tank or tank plate is removed, a magnetic particle inspection shall be carried out and these actions recorded in the inspection certificate attached to the tank record.

Such magnetic particle inspections shall be carried out by a competent person qualified for this method according to EN 473 (Non-destructive testing – Qualification and certification of NDT personnel – General principles).

TT9 For inspections and tests (including supervision of the manufacture) the procedures of section 1.8.7 shall be applied by the competent authority, its delegate or inspection body conforming to 1.8.6.2, 1.8.6.4, 1.8.6.5 and 1.8.6.8 and accredited according to EN ISO/IEC 17020:2004 type A.

TT10 The periodic inspections according to 6.8.2.4.2 shall take place:

at least every three years. | at least every two and a half years.

(e) Marking (TM)

***NOTE:** These particulars shall be in an official language of the country of approval, and also, if that language is not English, French or German, in English, French or German, unless any agreements concluded between the countries concerned in the transport operation provide otherwise.*

TM1 Tanks shall bear in addition to the particulars prescribed in 6.8.2.5.2, the words: **"Do not open during carriage. Liable to spontaneous combustion"** (see also the Note above).

TM2 Tanks shall bear in addition to the particulars prescribed in 6.8.2.5.2, the words: **"Do not open during carriage. Gives off flammable gases on contact with water"** (see also the Note above).

TM3 Tanks shall also bear, on the plate prescribed in 6.8.2.5.1, the proper shipping names of the approved substances and the maximum permissible load of the tank in kg.

TM4 For tanks the following additional particulars shall be marked by stamping or by any other similar method on the plate prescribed in 6.8.2.5.2 or directly on the shell itself, if the walls are so reinforced that the strength of the tank is not impaired: the chemical name with the approved concentration of the substance concerned.

TM5 Tanks shall bear, in addition to the particulars referred to in 6.8.2.5.1 the date (month, year) of the most recent inspection of the internal condition of the shell.

TM6 *(Reserved)*

TM7 The trefoil symbol, as described in 5.2.1.7.6, shall be marked by stamping or any other equivalent method on the plate described in 6.8.2.5.1. This trefoil may be engraved directly on the walls of the shell itself, if the walls are so reinforced that the strength of the shell is not impaired.

6.8.5 Requirements concerning the materials and construction of fixed welded tanks, demountable welded tanks, and welded shells of tank-containers for which a test pressure of not less than 1 MPa (10 bar) is required, and of fixed welded tanks, demountable welded tanks and welded shells of tank-containers intended for the carriage of refrigerated liquefied gases of Class 2

6.8.5.1 *Materials and shells*

- 6.8.5.1.1 (a) Shells intended for the carriage of :
- compressed, liquefied gases or dissolved gases of Class 2;
 - UN Nos. 1380, 2845, 2870, 3194 and 3391 to 3394 of Class 4.2; and
 - UN No. 1052 hydrogen fluoride, anhydrous and UN No.1790 hydrofluoric acid with more than 85% hydrogen fluoride of Class 8

shall be made of steel;

- (b) Shells constructed of fine-grained steels for the carriage of:
- corrosive gases of Class 2 and UN No. 2073 ammonia solution; and
 - UN No. 1052 hydrogen fluoride, anhydrous and UN No.1790 hydrofluoric acid with more than 85% hydrogen fluoride of Class 8

shall be heat-treated for thermal stress relief;

- (c) Shells intended for the carriage of refrigerated liquefied gases of Class 2, shall be made of steel, aluminium, aluminium alloy, copper or copper alloy (e.g. brass). However, shells made of copper or copper alloy shall be allowed only for gases containing no acetylene; ethylene, however, may contain not more than 0.005% acetylene;
- (d) Only materials appropriate to the lowest and highest working temperatures of the shells and of their fittings and accessories may be used.

6.8.5.1.2 The following materials shall be allowed for the manufacture of shells:

- (a) Steels not subject to brittle fracture at the lowest working temperature (see 6.8.5.2.1):
- mild steels (except for refrigerated liquefied gases of Class 2);
 - fine-grained steels, down to a temperature of -60 °C;
 - nickel steels (with a nickel content of 0.5 to 9%), down to a temperature of -196 °C, depending on the nickel content;
 - austenitic chrome-nickel steels, down to a temperature of -270 °C;
- (b) Aluminium not less than 99.5% pure or aluminium alloys (see 6.8.5.2.2);
- (c) Deoxidized copper not less than 99.9% pure, or copper alloys having a copper content of over 56% (see 6.8.5.2.3).

- 6.8.5.1.3 (a) Shells made of steel, aluminium or aluminium alloys shall be either seamless or welded;

- (b) Shells made of austenitic steel, copper or copper alloy may be hard-soldered.

6.8.5.1.4 The fittings and accessories may either be screwed to the shells or be secured thereto as follows:

- (a) Shells made of steel, aluminium or aluminium alloy: by welding;
- (b) Shells made of austenitic steel, of copper or of copper alloy: by welding or hard-soldering.

6.8.5.1.5 The construction of shells and their attachment to the vehicle, to the underframe or in the container frame shall be such as to preclude with certainty any such reduction in the temperature of the load-bearing components as would be likely to render them brittle. The means of attachment of shells shall themselves be so designed that even when the shell is at its lowest working temperature they still possess the necessary mechanical properties.

6.8.5.2 Test requirements

6.8.5.2.1 Steel shells

The materials used for the manufacture of shells and the weld beads shall, at their lowest working temperature, but at least at -20 °C, meet at least the following requirements as to impact strength:

- The tests shall be carried out with test-pieces having a V-shaped notch;
- The minimum impact strength (see 6.8.5.3.1 to 6.8.5.3.3) for test-pieces with the longitudinal axis at right angles to the direction of rolling and a V-shaped notch (conforming to ISO R 148) perpendicular to the plate surface, shall be 34 J/cm² for mild steel (which, because of existing ISO standards, may be tested with test-pieces having the longitudinal axis in the direction of rolling); fine-grained steel; ferritic alloy steel Ni < 5%, ferritic alloy steel 5% ≤ Ni ≤ 9%; or austenitic Cr - Ni steel;
- In the case of austenitic steels, only the weld bead need be subjected to an impact-strength test;
- For working temperatures below -196°C the impact-strength test is not performed at the lowest working temperature, but at -196 °C.

6.8.5.2.2 Shells made of aluminium or aluminium alloy

The seams of shells shall meet the requirements laid down by the competent authority.

6.8.5.2.3 Shells made of copper or copper alloy

It is not necessary to carry out tests to determine whether the impact strength is adequate.

6.8.5.3 Impact-strength tests

6.8.5.3.1 For sheets less than 10 mm but not less than 5 mm thick, test-pieces having a cross-section of 10 mm × e mm, where "e" represents the thickness of the sheet, shall be used. Machining to 7.5 mm or 5 mm is permitted if it is necessary. The minimum value of 34 J/cm² shall be required in every case.

NOTE: No impact-strength test shall be carried out on sheets less than 5 mm thick, or on their weld seams.

6.8.5.3.2

- (a) For the purpose of testing sheets, the impact strength shall be determined on three test-pieces. Test-pieces shall be taken at right angles to the direction of rolling; however, for mild steel they may be taken in the direction of rolling.
- (b) For testing weld seams the test-pieces shall be taken as follows:

when $e \leq 10$ mm:

three test-pieces with the notch at the centre of the weld;

three test-pieces with the notch in the centre of the heat affected zone (the V-notch to cross the fusion boundary at the centre of the specimen);

when $10 \text{ mm} < e \leq 20 \text{ mm}$:

three test-pieces from the centre of the weld;

three test-pieces from the heat affected zone (the V-notch to cross the fusion boundary at the centre of the specimen);

when $e > 20 \text{ mm}$

two sets of three test-pieces, one set on the upper face, one set on the lower face at each of the points indicated below (the V-notch to cross the fusion boundary at the centre of the specimen for those taken from the heat affected zone)

- 6.8.5.3.3 (a) For sheets, the average of the three tests shall meet the minimum value of 34 J/cm^2 indicated in 6.8.5.2.1; not more than one of the individual values may be below the minimum value and then not below 24 J/cm^2 ;
- (b) For welds, the average value obtained from the three test-pieces taken at the centre of the weld shall not be below the minimum value of 34 J/cm^2 ; not more than one of the individual values may be below the minimum value and then not below 24 J/cm^2 ;
- (c) For the heat affected zone (the V-notch to cross the fusion boundary at the centre of the specimen) the value obtained from not more than one of the three test-pieces may be below the minimum value of 34 J/cm^2 , though not below 24 J/cm^2 .

6.8.5.3.4 If the requirements prescribed in 6.8.5.3.3 are not met, one retest only may be done if:

- (a) the average value of the first three tests is below the minimum value of 34 J/cm^2 ; or
- (b) more than one of the individual values is less than the minimum value of 34 J/cm^2 but not below 24 J/cm^2 .

6.8.5.3.5 In a repeated impact test on sheets or welds, none of the individual values may be below 34 J/cm^2 . The average value of all the results of the original test and of the retest should be equal to or more than the minimum of 34 J/cm^2 .

On a repeated impact strength test on the heat-affected zone, none of the individual values may be below 34 J/cm^2 .

6.8.5.4 *Reference to standards*

The requirements of 6.8.5.2 and 6.8.5.3 shall be deemed to have been complied with if the following relevant standards have been applied:

EN 1252-1:1998 Cryogenic vessels - Materials - Part 1: Toughness requirements for temperature below - 80 °C.

EN 1252-2:2001 Cryogenic vessels - Materials - Part 2: Toughness requirements for temperature between - 80 °C and - 20 °C.

CHAPTER 6.9

REQUIREMENTS FOR THE DESIGN, CONSTRUCTION, EQUIPMENT, TYPE APPROVAL, TESTING AND MARKING OF FIBRE-REINFORCED PLASTICS (FRP) FIXED TANKS (TANK-VEHICLES), DEMOUNTABLE TANKS, TANK-CONTAINERS AND TANK SWAP BODIES

NOTE: *For portable tanks and UN multiple-element gas containers (MEGCs) see Chapter 6.7; for fixed tanks (tank-vehicles), demountable tanks and tank-containers and tank swap bodies, with shells made of metallic materials, and battery-vehicles and multiple element gas containers (MEGCs) other than UN MEGCs see Chapter 6.8; for vacuum operated waste tanks see Chapter 6.10.*

6.9.1 General

- 6.9.1.1 FRP tanks shall be designed, manufactured and tested in accordance with a quality assurance programme recognized by the competent authority; in particular, lamination work and welding of thermoplastic liners shall only be carried out by qualified personnel in accordance with a procedure recognized by the competent authority.
- 6.9.1.2 For the design and testing of FRP tanks, the provisions of 6.8.2.1.1, 6.8.2.1.7, 6.8.2.1.13, 6.8.2.1.14 (a) and (b), 6.8.2.1.25, 6.8.2.1.27, 6.8.2.1.28 and 6.8.2.2.3 shall also apply.
- 6.9.1.3 Heating elements shall not be used for FRP tanks.
- 6.9.1.4 For the stability of tank-vehicles, the requirements of 9.7.5.1 shall apply.

6.9.2 Construction

- 6.9.2.1 Shells shall be made of suitable materials, which shall be compatible with the substances to be carried in a service temperature range of between -40°C and +50°C, unless temperature ranges are specified for specific climatic conditions by the competent authority of the country where the transport operation is performed.
- 6.9.2.2 Shells shall consist of the following three elements :
- internal liner,
 - structural layer,
 - external layer.
- 6.9.2.2.1 The internal liner is the inner shell wall zone designed as the primary barrier to provide for the long-term chemical resistance in relation to the substances to be carried, to prevent any dangerous reaction with the contents or the formation of dangerous compounds and any substantial weakening of the structural layer owing to the diffusion of products through the internal liner.

The internal liner may either be a FRP liner or a thermoplastic liner.

- 6.9.2.2.2 FRP liners shall consist of:
- (a) surface layer ("gel-coat"): adequate resin rich surface layer, reinforced with a veil, compatible with the resin and contents. This layer shall have a fibre mass content of not more than 30% and have a thickness between 0.25 and 0.60 mm;
 - (b) strengthening layer(s): layer or several layers with a minimum thickness of 2 mm, containing a minimum of 900 g/m² of glass mat or chopped fibres with a mass content in glass of not less than 30% unless equivalent safety is demonstrated for a lower glass content.
- 6.9.2.2.3 Thermoplastic liners shall consist of thermoplastic sheet material as referred to in 6.9.2.3.4, welded together in the required shape, to which the structural layers are bonded. Durable bonding between liners and the structural layer shall be achieved by the use of an appropriate adhesive.
- NOTE:** For the carriage of flammable liquids the internal layer may require additional measures in accordance with 6.9.2.14, in order to prevent the accumulation of electrical charges.
- 6.9.2.2.4 The structural layer of the shell is the zone specially designed according to 6.9.2.4 to 6.9.2.6 to withstand the mechanical stresses. This part normally consists of several fibre reinforced layers in determined orientations.
- 6.9.2.2.5 The external layer is the part of the shell which is directly exposed to the atmosphere. It shall consist of a resin rich layer with a thickness of at least 0.2 mm. For a thickness larger than 0.5 mm, a mat shall be used. This layer shall have a mass content in glass of less than 30% and shall be capable of withstanding exterior conditions, in particular the occasional contact with the substance to be carried. The resin shall contain fillers or additives to provide protection against deterioration of the structural layer of the shell by ultra-violet radiation.
- 6.9.2.3 Raw materials**
- 6.9.2.3.1 All materials used for the manufacture of FRP tanks shall be of known origin and specifications.
- 6.9.2.3.2 *Resins*
- The processing of the resin mixture shall be carried out in strict compliance with the recommendations of the supplier. This concerns mainly the use of hardeners, initiators and accelerators. These resins can be:
- unsaturated polyester resins;
 - vinyl ester resins;
 - epoxy resins;
 - phenolic resins.
- The heat distortion temperature (HDT) of the resin, determined in accordance with ISO 75-1:1993 shall be at least 20°C higher than the maximum service temperature of the tank, but shall in any case not be lower than 70 °C.

6.9.2.3.3 *Reinforcement fibres*

The reinforcement material of the structural layers shall be a suitable grade of fibres such as glass fibres of type E or ECR according to ISO 2078:1993. For the internal surface liner, glass fibres of type C according to ISO 2078:1993 may be used. Thermoplastic veils may only be used for the internal liner when their compatibility with the intended contents has been demonstrated.

6.9.2.3.4 *Thermoplastic liner material*

Thermoplastic liners, such as unplasticized polyvinyl chloride (PVC-U), polypropylene (PP), polyvinylidene fluoride (PVDF), polytetrafluoroethylene (PTFE), etc. may be used as lining materials.

6.9.2.3.5 *Additives*

Additives necessary for the treatment of the resin, such as catalysts, accelerators, hardeners and thixotropic substances as well as materials used to improve the tank, such as fillers, colours, pigments etc. shall not cause weakening of the material, taking into account lifetime and temperature expectancy of the design.

6.9.2.4 Shells, their attachments and their service and structural equipment shall be designed to withstand without loss of contents (other than quantities of gas escaping through any degassing vents) during the design lifetime:

- the static and dynamic loads in normal conditions of carriage;
- the prescribed minimum loads as defined in 6.9.2.5 to 6.9.2.10.

6.9.2.5 At the pressures as indicated in 6.8.2.1.14 (a) and (b), and under the static gravity forces caused by the contents with maximum density specified for the design and at maximum filling degree, the design stress σ in longitudinal and circumferential direction of any layer of the shell shall not exceed the following value:

$$\sigma \leq \frac{R_m}{K}$$

where:

R_m = the value of tensile strength given by taking the mean value of the test results minus twice the standard deviation of the test results. The tests shall be carried out, in accordance with the requirements of EN 61:1977, on not less than six samples representative of the design type and construction method;

K = $S \times K_0 \times K_1 \times K_2 \times K_3$

where

K shall have a minimum value of 4, and

S = the safety coefficient. For the general design, if the tanks are referred to in Column (12) of Table A of Chapter 3.2 by a tank code including the letter "G" in its second part (see 4.3.4.1.1), the value for S shall be equal to or more than 1.5. For tanks intended for the carriage of substances which require an increased safety level, i.e. if the tanks are referred to in Column (12) of Table A of Chapter 3.2 by a tank code including the number "4" in its second part (see 4.3.4.1.1), the value of S shall be multiplied by a factor of two, unless the shell is provided

with protection against damage consisting of a complete metal skeleton including longitudinal and transverse structural members;

K_0 = a factor related to the deterioration in the material properties due to creep and ageing and as a result of the chemical action of the substances to be carried. It shall be determined by the formula:

$$K_0 = \frac{1}{\alpha\beta}$$

where " α " is the creep factor and " β " is the ageing factor determined in accordance with EN 978:1997 after performance of the test according to EN 977:1997. Alternatively, a conservative value of $K_0 = 2$ may be applied. In order to determine α and β the initial deflection shall correspond to 2σ ;

K_1 = a factor related to the service temperature and the thermal properties of the resin, determined by the following equation, with a minimum value of 1:

$$K_1 = 1.25 - 0.0125 (\text{HDT} - 70)$$

where HDT is the heat distortion temperature of the resin, in °C;

K_2 = a factor related to the fatigue of the material; the value of $K_2 = 1.75$ shall be used unless otherwise agreed with the competent authority. For the dynamic design as outlined in 6.9.2.6 the value of $K_2 = 1.1$ shall be used;

K_3 = a factor related to curing and has the following values:

- 1.1 where curing is carried out in accordance with an approved and documented process;
- 1.5 in other cases.

6.9.2.6 At the dynamic stresses, as indicated in 6.8.2.1.2 the design stress shall not exceed the value specified in 6.9.2.5, divided by the factor α .

6.9.2.7 At any of the stresses as defined in 6.9.2.5 and 6.9.2.6, the resulting elongation in any direction shall not exceed 0.2% or one tenth of the elongation at fracture of the resin, whichever is lower.

6.9.2.8 At the specified test pressure, which shall not be less than the relevant calculation pressure as specified in 6.8.2.1.14 (a) and (b) the maximum strain in the shell shall not be greater than the elongation at fracture of the resin.

6.9.2.9 The shell shall be capable of withstanding the ball drop test according to 6.9.4.3.3 without any visible internal or external defects.

6.9.2.10 The overlay laminates used in the joints, including the end joints, the joints of the surge plates and the partitions with the shell shall be capable of withstanding the static and dynamic stresses mentioned above. In order to avoid concentrations of stresses in the overlay lamination, the applied taper shall not be steeper than 1:6.

The shear strength between the overlay laminate and the tank components to which it is bonded shall not be less than:

$$\tau = \frac{Q}{l} \leq \frac{\tau_R}{K}$$

where:

τ_R is the bending shear strength according to EN ISO 14125:1998 (three points method) with a minimum of $\tau_R = 10 \text{ N/mm}^2$, if no measured values are available;

Q is the load per unit width that the joint shall carry under the static and dynamic loads;

K is the factor calculated in accordance with 6.9.2.5 for the static and dynamic stresses;

l is the length of the overlay laminate.

6.9.2.11 Openings in the shell shall be reinforced to provide at least the same safety factors against the static and dynamic stresses as specified in 6.9.2.5 and 6.9.2.6 as that for the shell itself. The number of openings shall be minimized. The axis ratio of oval-shaped openings shall be not more than 2.

6.9.2.12 For the design of flanges and pipework attached to the shell, handling forces and the fastening of bolts shall also be taken into account.

6.9.2.13 The tank shall be designed to withstand, without significant leakage, the effects of a full engulfment in fire for 30 minutes as specified by the test requirements in 6.9.4.3.4. Testing may be waived with the agreement of the competent authority, where sufficient proof can be provided by tests with comparable tank designs.

6.9.2.14 *Special requirements for the carriage of substances with a flash-point of not more than 60 °C*

FRP tanks used for the carriage of substances with a flash-point of not more than 60°C shall be constructed so as to ensure the elimination of static electricity from the various component parts so as to avoid the accumulation of dangerous charges.

6.9.2.14.1 The electrical surface resistance of the inside and outside of the shell as established by measurements shall not be higher than 10^9 ohms. This may be achieved by the use of additives in the resin or interlaminar conducting sheets, such as metal or carbon network.

6.9.2.14.2 The discharge resistance to earth as established by measurements shall not be higher than 10^7 ohms.

6.9.2.14.3 All components of the shell shall be electrically connected to each other and to the metal parts of the service and structural equipment of the tank and to the vehicle. The electrical resistance between components and equipment in contact with each other shall not exceed 10 ohms.

6.9.2.14.4 The electrical surface-resistance and discharge resistance shall be measured initially on each manufactured tank or a specimen of the shell in accordance with a procedure recognized by the competent authority.

6.9.2.14.5 The discharge resistance to earth of each tank shall be measured as part of the periodic inspection in accordance with a procedure recognized by the competent authority.

6.9.3 Items of equipment

- 6.9.3.1 The requirements of 6.8.2.2.1, 6.8.2.2.2 and 6.8.2.2.4 to 6.8.2.2.8 shall apply.
- 6.9.3.2 In addition, when they are shown under an entry in Column (13) of Table A of Chapter 3.2, the special provisions of 6.8.4 (b) (TE) shall also apply.

6.9.4 Type testing and approval

- 6.9.4.1 For any design of a FRP tank type, its materials and a representative prototype shall be subjected to the design type testing as outlined below.

6.9.4.2 Material testing

- 6.9.4.2.1 The elongation at fracture according to EN ISO 527-5:1997 and the heat distortion temperature according to ISO 75-1:1993 shall be determined for the resins to be used.
- 6.9.4.2.2 The following characteristics shall be determined for samples cut out of the shell. Samples manufactured in parallel may only be used, if it is not possible to use cutouts from the shell. Prior to testing, any liner shall be removed.

The tests shall cover:

- Thickness of the laminates of the central shell wall and the ends;
 - Mass content and composition of glass, orientation and arrangement of reinforcement layers;
 - Tensile strength, elongation at fracture and modulus of elasticity according to EN ISO 527-5:1997 in the direction of stresses. In addition, the elongation at fracture of the resin shall be established by means of ultrasound;
 - Bending strength and deflection established by the bending creep test according to ISO 14125:1998 for a period of 1000 hours using a sample with a minimum width of 50 mm and a support distance of at least 20 times the wall thickness. In addition, the creep factor α and the ageing factor β shall be determined by this test and according to EN 978:1997.
- 6.9.4.2.3 The interlaminar shear strength of the joints shall be measured by testing representative samples in the tensile test according to EN ISO 14130:1997.
- 6.9.4.2.4 The chemical compatibility of the shell with the substances to be carried shall be demonstrated by one of the following methods with the agreement of the competent authority. This demonstration shall account for all aspects of the compatibility of the materials of the shell and its equipment with the substances to be carried, including chemical deterioration of the shell, initiation of critical reactions of the contents and dangerous reactions between both.
- In order to establish any deterioration of the shell, representative samples taken from the shell, including any internal liners with welds, shall be subjected to the chemical compatibility test according to EN 977:1997 for a period of 1 000 hours at 50°C. Compared with a virgin sample, the loss of strength and elasticity modulus measured by the bending test according to EN 978:1997 shall not exceed 25%. Cracks, bubbles, pitting effects as well as separation of layers and liners and roughness shall not be acceptable.

- Certified and documented data of positive experiences on the compatibility of the filling substances in question with the materials of the shell with which they come into contact at given temperatures, times and any other relevant service conditions.
- Technical data published in relevant literature, standards or other sources, acceptable to the competent authority.

6.9.4.3 *Type testing*

A representative prototype tank shall be subjected to tests as specified below. For this purpose service equipment may be replaced by other items if necessary.

- 6.9.4.3.1 The prototype shall be inspected for compliance with the design type specification. This shall include an internal and external visual inspection and measurement of the main dimensions.
- 6.9.4.3.2 The prototype, equipped with strain gauges at all locations where a comparison with the design calculation is required, shall be subjected to the following loads and the strains shall be recorded:
- Filled with water to the maximum filling degree. The measuring results shall be used to calibrate the design calculation according to 6.9.2.5;
 - Filled with water to the maximum filling degree and subjected to accelerations in all three directions by means of driving and braking exercises with the prototype attached to a vehicle. For comparison with the design calculation according to 6.9.2.6 the strains recorded shall be extrapolated in relation to the quotient of the accelerations required in 6.8.2.1.2 and measured;
 - Filled with water and subjected to the specified test pressure. Under this load, the shell shall exhibit no visual damage or leakage.
- 6.9.4.3.3 The prototype shall be subjected to the ball drop test according to EN 976-1:1997, No. 6.6. No visible damage inside or outside the tank shall occur.
- 6.9.4.3.4 The prototype with its service and structural equipment in place and filled to 80% of its maximum capacity with water, shall be exposed to a full engulfment in fire for 30 minutes, caused by an open heating oil pool fire or any other type of fire with the same effect. The dimensions of the pool shall exceed those of the tank by at least 50 cm to each side and the distance between fuel level and tank shall be between 50 cm and 80 cm. The rest of the tank below liquid level, including openings and closures, shall remain leakproof except for drips.

6.9.4.4 *Type approval*

- 6.9.4.4.1 The competent authority or a body designated by that authority shall issue in respect of each new type of tank an approval attesting that the design is suitable for the purpose for which it is intended and meets the construction and equipment requirements of this chapter as well as the special provisions applicable to the substances to be carried.
- 6.9.4.4.2 The approval shall be based on the calculation and the test report, including all material and prototype test results and its comparison with the design calculation, and shall refer to the design type specification and the quality assurance programme.
- 6.9.4.4.3 The approval shall include the substances or group of substances for which compatibility with the shell is provided. Their chemical names or the corresponding collective entry (see 2.1.1.2), and their class and classification code shall be indicated.

6.9.4.4.4 In addition, it shall include design and threshold values (such as life-time, service temperature range, working and test pressures, material data) specified and all precautions to be taken for the manufacture, testing, type approval, marking and use of any tank, manufactured in accordance with the approved design type.

6.9.5 Inspections

6.9.5.1 For every tank, manufactured in conformity with the approved design, material tests and inspections shall be performed as specified below.

6.9.5.1.1 The material tests according to 6.9.4.2.2, except for the tensile test and for a reduction of the testing time for the bending creep test to 100 hours shall be performed with samples taken from the shell. Samples manufactured in parallel may only be used, if no cutouts from the shell are possible. The approved design values shall be met.

6.9.5.1.2 Shells and their equipment shall either together or separately undergo an initial inspection before being put into service. This inspection shall include:

- a check of conformity to the approved design;
- a check of the design characteristics;
- an internal and external examination;
- a hydraulic pressure test at the test pressure indicated on the plate prescribed in 6.8.2.5.1;
- a check of operation of the equipment;
- a leakproofness test, if the shell and its equipment have been pressure tested separately.

6.9.5.2 For the periodic inspection of tanks the requirements of 6.8.2.4.2 to 6.8.2.4.4 shall apply. In addition, the inspection in accordance with 6.8.2.4.3 shall include an examination of the internal condition of the shell.

6.9.5.3 The inspections and tests in accordance with 6.9.5.1 and 6.9.5.2 shall be carried out by the expert approved by the competent authority. Certificates shall be issued showing the results of these operations. These certificates shall refer to the list of the substances permitted for carriage in this shell in accordance with 6.9.4.4.

6.9.6 Marking

6.9.6.1 The requirements of 6.8.2.5 shall apply to the marking of FRP tanks, with the following amendments:

- the tank plate may also be laminated to the shell or be made of suitable plastics materials;
- the design temperature range shall always be marked.

6.9.6.2 In addition, when they are shown under an entry in Column (13) of Table A of Chapter 3.2, the special provisions of 6.8.4 (e) (TM) shall also apply.

CHAPTER 6.10

REQUIREMENTS FOR THE CONSTRUCTION, EQUIPMENT, TYPE APPROVAL, INSPECTION AND MARKING OF VACUUM-OPERATED WASTE TANKS

NOTE 1: *For portable tanks and UN multiple-element gas containers (MEGCs) see Chapter 6.7; for fixed tanks (tank-vehicles), demountable tanks and tank containers and tank swap bodies, with shells made of metallic materials, and battery-vehicles and multiple element gas containers (MEGCs) other than UN MEGCs see Chapter 6.8; for fibre-reinforced plastic tanks see Chapter 6.9.*

NOTE 2: *This Chapter applies to fixed tanks, demountable tanks, tank-containers and tank swap bodies.*

6.10.1 General

6.10.1.1 Definition

NOTE: *A tank which fully complies with the requirements of Chapter 6.8 is not considered to be a "vacuum-operated waste tank".*

6.10.1.1.1 The term "*protected area*" means the areas located as follows:

- (a) The lower part of the tank in a zone which extends over a 60° angle on either side of the lower generating line;
- (b) The top part of the tank in a zone which extends over a 30° angle on either side of the top generating line;
- (c) On the end front of the tank on motor vehicles;
- (d) On the rear end of the tank inside the protection volume formed by the device stipulated in 9.7.6.

6.10.1.2 Scope

6.10.1.2.1 The special requirements of 6.10.2 to 6.10.4 complete or modify Chapter 6.8 and are applied to vacuum-operated waste tanks.

Vacuum-operated waste tanks may be equipped with openable ends, if the requirements of Chapter 4.3 allow bottom discharge of the substances to be carried (indicated by letters "A" or "B" in Part 3 of the tank code given in Column (12) of Table A of Chapter 3.2, in accordance with 4.3.4.1.1).

Vacuum-operated waste tanks shall comply with all requirements of Chapter 6.8, with the exception of requirements overtaken by a special provision in this Chapter. However the requirements of 6.8.2.1.19, 6.8.2.1.20, and 6.8.2.1.21 shall not apply.

6.10.2 Construction

6.10.2.1 Tanks shall be designed for a calculation pressure equal to 1.3 times the filling or discharge pressure but not less than 400 kPa (4 bar) (gauge pressure). For the carriage of substances for which a higher calculation pressure of the tank is specified in Chapter 6.8, this higher pressure shall apply.

6.10.2.2 Tanks shall be designed to withstand a negative internal pressure of 100 kPa (1 bar).

6.10.3 Items of equipment

- 6.10.3.1 The items of equipment shall be so arranged as to be protected against the risk of being wrenched off or damaged during carriage or handling. This requirement can be fulfilled by placing the items of equipment in a so called "protected area" (see 6.10.1.1.1).
- 6.10.3.2 The bottom discharge of shells may be constituted by external piping with a stop-valve fitted as close to the shell as practicable and a second closure which may be a blank flange or other equivalent device.
- 6.10.3.3 The position and closing direction of the stop-valve(s) connected to the shell, or to any compartment in the case of compartmented shells, shall be unambiguous, and be able to be checked from the ground.
- 6.10.3.4 In order to avoid any loss of contents in the event of damage to the external filling and discharge fittings (pipes, lateral shut-off devices), the internal stop-valve, or the first external stop-valve (where applicable), and its seatings shall be protected against the danger of being wrenched off by external stresses or shall be so designed as to withstand them. The filling and discharge devices (including flanges or threaded plugs) and protective caps (if any) shall be capable of being secured against any unintended opening.
- 6.10.3.5 The tanks may be equipped with openable ends. Openable ends shall comply with the following conditions:
- (a) The ends shall be designed to be secured leaktight when closed;
 - (b) Unintentional opening shall not be possible;
 - (c) Where the opening mechanism is power operated the end shall remain securely closed in the event of a power failure;
 - (d) A safety or breakseal device shall be incorporated to ensure that the openable end cannot be opened when there is still a residual over pressure in the tank. This requirement does not apply to openable ends which are power-operated, where the movement is positively controlled. In this case the controls shall be of the dead-man type and be so positioned that the operator can observe the movement of the openable end at all times and is not endangered during opening and closing of the openable end; and
 - (e) Provisions shall be made to protect the openable end and prevent it from being forced open during a roll-over of the vehicle, tank-container or tank swap body.
- 6.10.3.6 Vacuum-operated waste tanks which are fitted with an internal piston to assist in the cleaning of the tank or discharging shall be provided with stop-devices to prevent the piston in every operational position being ejected from the tank when a force equivalent to the maximum working pressure of the tank is applied to the piston. The maximum working pressure for tanks or compartments with pneumatic operated piston shall not exceed 100 kPa (1.0 bar). The internal piston shall be constructed in a manner and of materials which will not cause an ignition source when the piston is moved.
- The internal piston may be used as a compartment provided it is secured in position. Where any of the means by which the internal piston is secured is external to the tank, it shall be placed in a position not liable to accidental damage.

6.10.3.7 The tanks may be equipped with suction booms if:

- (a) The boom is fitted with an internal or external stop-valve fixed directly to the shell, or directly to a bend that is welded to the shell; a rotation crown wheel can be fitted between the shell or the bend and the external stop valve, if this rotation crown wheel is located in the protected area and the stop-valve control device is protected with a housing or cover against the danger of being wrenched off by external loads;
- (b) The stop-valve mentioned in (a) is so arranged that carriage with the valve in an open position is prevented; and
- (c) The boom is constructed in such a way that the tank will not leak as a result of accidental impact on the boom.

6.10.3.8 The tanks shall be fitted with the following additional service equipment:

- (a) The outlet of a pump/exhauster unit shall be so arranged as to ensure that any flammable or toxic vapours are diverted to a place where they will not cause a danger;
- (b) A device to prevent immediate passage of flame shall be fitted to both the inlet and outlet of a vacuum pump/exhauster unit which may create sparks and which is fitted on a tank used for the carriage of flammable wastes;
- (c) Pumps which can deliver a positive pressure shall have a safety device fitted in the pipework which can be pressurised. The safety device shall be set to discharge at a pressure not exceeding the maximum working pressure of the tank;
- (d) A stop-valve shall be fitted between the shell, or the outlet of the overfill prevention device fitted to the shell, and the pipework connecting the shell to the pump/exhauster unit;
- (e) The tank shall be fitted with a suitable pressure/vacuum manometer which shall be mounted in a position where it can be easily read by the person operating the pump/exhauster unit. A distinguishing line shall be marked on the scale to indicate the maximum working pressure of the tank;
- (f) The tank, or in case of compartmented tanks, every compartment, shall be equipped with a level indicating device. Sight glasses may be used as level indicating devices provided:
 - (i) they form a part of the tank wall and have a resistance to the pressure comparable to that of the tank; or they are fitted external to the tank;
 - (ii) the top and bottom connections to the tank are equipped with shut-off valves fixed directly to the shell and so arranged that carriage with the valves in an open position is prevented;
 - (iii) are suitable for operation at the maximum working pressure of the tank; and
 - (iv) are placed in a position where they will not be liable to accidental damage.

6.10.3.9 The shells of vacuum-operated waste tanks shall be fitted with a safety valve preceded by a bursting disc.

The valve shall be capable of opening automatically at a pressure between 0.9 and 1.0 times the test pressure of the tank to which it is fitted. The use of dead weight or counterweight valves is prohibited.

The bursting disc shall burst at the earliest when the initial opening pressure of the valve is reached and at the latest when this pressure reaches the test pressure of the tank to which it is fitted.

Safety devices shall be of such a type as to resist dynamic stresses, including liquid surge.

The space between the bursting disc and the safety valve shall be provided with a pressure gauge or suitable tell-tale indicator for the detection of disc rupture, pinholing or leakage which could cause a malfunction of the safety valve.

6.10.4 Inspection

Vacuum-operated waste tanks shall be subject every three years for fixed tanks or demountable tanks and at least every two and a half years for tank-containers and tank swap bodies to an examination of the internal condition, in addition to the tests according to 6.8.2.4.3.

CHAPTER 6.11

REQUIREMENTS FOR THE DESIGN, CONSTRUCTION, INSPECTION AND TESTING OF BULK CONTAINERS

6.11.1 Definitions

For the purposes of this section:

Closed bulk container means a totally closed bulk container having a rigid roof, sidewalls, end walls and floor (including hopper-type bottoms). The term includes bulk containers with an opening roof, side or end wall that can be closed during carriage. Closed bulk containers may be equipped with openings to allow for the exchange of vapours and gases with air and which prevent under normal conditions of carriage the release of solid contents as well as the penetration of rain and splash water;

Sheeted bulk container means an open top bulk container with rigid bottom (including hopper-type bottom), side and end walls and a non-rigid covering;

6.11.2 Application and general requirements

6.11.2.1 Bulk containers and their service and structural equipment shall be designed and constructed to withstand, without loss of contents, the internal pressure of the contents and the stresses of normal handling and carriage.

6.11.2.2 Where a discharge valve is fitted, it shall be capable of being made secure in the closed position and the whole discharge system shall be suitably protected from damage. Valves having lever closures shall be able to be secured against unintended opening and the open or closed position shall be readily apparent.

6.11.2.3 Code for designating types of bulk container

The following table indicates the codes to be used for designating types of bulk containers:

Types of bulk containers	Code
Sheeted bulk container	BK1
Closed bulk container	BK2

6.11.2.4 In order to take account of progress in science and technology, the use of alternative arrangements which offer at least equivalent safety as provided by the requirements of this chapter may be considered by the competent authority.

6.11.3 Requirements for the design, construction, inspection and testing of containers conforming to the CSC used as BK1 or BK2 bulk containers

6.11.3.1 Design and construction requirements

6.11.3.1.1 The general design and construction requirements of this sub-section are deemed to be met if the bulk container complies with the requirements of ISO 1496-4:1991 "Series 1 Freight containers- Specification and testing – Part 4: Non pressurized containers for dry bulk" and the container is siftproof.

- 6.11.3.1.2 Containers designed and tested in accordance with ISO 1496-1:1990 "Series 1 Freight containers- Specification and testing - Part 1: General cargo containers for general purposes" shall be equipped with operational equipment which is, including its connection to the container, designed to strengthen the end walls and to improve the longitudinal restraint as necessary to comply with the test requirements of ISO 1496-4:1991 as relevant.
- 6.11.3.1.3 Bulk containers shall be siftproof. Where a liner is used to make the container siftproof it shall be made of a suitable material. The strength of material used for, and the construction of, the liner shall be appropriate to the capacity of the container and its intended use. Joins and closures of the liner shall withstand pressures and impacts liable to occur under normal conditions of handling and carriage. For ventilated bulk containers any liner shall not impair the operation of ventilating devices.
- 6.11.3.1.4 The operational equipment of bulk containers designed to be emptied by tilting shall be capable of withstanding the total filling mass in the tilted orientation.
- 6.11.3.1.5 Any movable roof or side or end wall or roof section shall be fitted with locking devices with securing devices designed to show the locked state to an observer at ground level.
- 6.11.3.2 *Service equipment***
- 6.11.3.2.1 Filling and discharge devices shall be so constructed and arranged as to be protected against the risk of being wrenched off or damaged during carriage and handling. The filling and discharge devices shall be capable of being secured against unintended opening. The open and closed position and direction of closure shall be clearly indicated.
- 6.11.3.2.2 Seals of openings shall be so arranged as to avoid any damage by the operation, filling and emptying of the bulk container.
- 6.11.3.2.3 Where ventilation is required bulk containers shall be equipped with means of air exchange, either by natural convection, e.g. by openings, or active elements, e.g. fans. The ventilation shall be designed to prevent negative pressures in the container at all times. Ventilating elements of bulk containers for the carriage of flammable substances or substances emitting flammable gases or vapours shall be designed so as not to be a source of ignition.
- 6.11.3.3 *Inspection and testing***
- 6.11.3.3.1 Containers used, maintained and qualified as bulk containers in accordance with the requirements of this section shall be tested and approved in accordance with the CSC.
- 6.11.3.3.2 Containers used and qualified as bulk containers shall be inspected periodically according to the CSC.
- 6.11.3.4 *Marking***
- 6.11.3.4.1 Containers used as bulk containers shall be marked with a Safety Approval Plate in accordance with the CSC.

6.11.4 Requirements for the design, construction and approval of BK1 or BK2 bulk containers other than containers conforming to the CSC

NOTE: When containers conforming to the provisions of this section are used for the carriage of solids in bulk, the following statement shall be shown on the transport document:

"Bulk container BK(x) approved by the competent authority of". (see 5.4.1.1.17)".

- 6.11.4.1 Bulk containers covered in this section include skips, offshore bulk containers, bulk bins, swap bodies, trough shaped containers, roller containers, and load compartments of vehicles.
- NOTE:** These bulk containers also include containers conforming to the UIC leaflets 591 and 592-2 to 592-4 as mentioned in 7.1.3 which do not conform to the CSC.*
- 6.11.4.2 These bulk containers shall be designed and constructed so as to be strong enough to withstand the shocks and loadings normally encountered during carriage including, as applicable, transshipment between modes of transport.
- 6.11.4.3 *(Reserved)*
- 6.11.4.4 These bulk containers shall be approved by the competent authority and the approval shall include the code for designating types of bulk containers in accordance with 6.11.2.3 and the requirements for inspection and testing as appropriate.
- 6.11.4.5 Where it is necessary to use a liner in order to retain the dangerous goods it shall meet the provisions of 6.11.3.1.3.

CHAPTER 6.12

REQUIREMENTS FOR THE CONSTRUCTION, EQUIPMENT, TYPE APPROVAL, INSPECTIONS AND TESTS, AND MARKING OF TANKS, BULK CONTAINERS AND SPECIAL COMPARTMENTS FOR EXPLOSIVES OF MOBILE EXPLOSIVES MANUFACTURING UNITS (MEMUs)

NOTE 1: *For portable tanks, see Chapter 6.7; for fixed tanks (tank-vehicles), demountable tanks, tank-containers and tank swap bodies, with shells made of metallic materials, see Chapter 6.8; for fibre-reinforced plastics tanks see Chapter 6.9; for vacuum operated waste tanks see Chapter 6.10; for bulk containers see Chapter 6.11.*

NOTE 2: *This Chapter applies to fixed tanks, demountable tanks, tank-containers, tank swap bodies, which do not comply with all requirements of the Chapters mentioned in Note 1 as well as bulk containers and special compartments for explosives.*

6.12.1 Scope

The requirements of this Chapter are applicable to tanks, bulk containers and special compartments intended for the carriage of dangerous goods on MEMUs.

6.12.2 General provisions

6.12.2.1 Tanks shall meet the requirements of Chapter 6.8, notwithstanding the minimum capacity defined in section 1.2.1 for fixed tanks, as modified by the special provisions of this Chapter.

6.12.2.2 Bulk containers intended for the carriage of dangerous goods on MEMUs shall comply with the requirements for bulk containers of type BK2.

6.12.2.3 Where a single tank or bulk container contains more than one substance each substance shall be separated by at least two walls with drained air space between.

6.12.3 Tanks

6.12.3.1 Tanks with a capacity of 1 000 litres or more

6.12.3.1.1 These tanks shall meet the requirements of section 6.8.2.

6.12.3.1.2 For UN Nos. 1942 and 3375, the tank shall meet the requirements of Chapters 4.3 and 6.8 concerning breather devices and, in addition, shall have bursting discs or other suitable means of emergency pressure relief, approved by the competent authority of the country of use.

6.12.3.1.3 For shells not of a circular cross-section, for example box-shaped or elliptical shells, which cannot be calculated according to 6.8.2.1.4 and standards or technical code mentioned therein, the ability to withstand the permissible stress may be demonstrated by a pressure test specified by the competent authority.

These tanks shall meet the requirements of sub-section 6.8.2.1 other than 6.8.2.1.3, 6.8.2.1.4 and 6.8.2.1.13 to 6.8.2.1.22.

The thickness of these shells shall not be less than the values given in the table below:

Material	Minimum thickness
Stainless austenitic steels	2.5 mm
Other steels	3 mm
Aluminium alloys	4 mm
Pure aluminium of 99.80%	6 mm

Protection of the tank against damage through lateral impact or overturning shall be provided. Protection shall be provided according to 6.8.2.1.20 or the competent authority shall approve alternative protection measures.

- 6.12.3.1.4 By derogation from the requirements of 6.8.2.5.2 tanks do not need to be marked with the tank code and the special provisions, as applicable.

6.12.3.2 Tanks with a capacity of less than 1 000 litres

- 6.12.3.2.1 The construction of these tanks shall meet the requirements of sub-section 6.8.2.1 other than 6.8.2.1.3, 6.8.2.1.4, 6.8.2.1.6, 6.8.2.1.10 to 6.8.2.1.23 and 6.8.2.1.28.

- 6.12.3.2.2 The equipment of these tanks shall meet the requirements of 6.8.2.2.1. For UN Nos. 1942 and 3375, the tank shall meet the requirements of Chapters 4.3 and 6.8 concerning breather devices and, in addition, shall have bursting discs or other suitable means of emergency pressure relief, approved by the competent authority of the country of use.

- 6.12.3.2.3 The thickness of these shells shall not be less than the values given in the table below:

Material	Minimum thickness
Stainless austenitic steels	2.5 mm
Other steels	3 mm
Aluminium alloys	4 mm
Pure aluminium of 99.80%	6 mm

- 6.12.3.2.4 Tanks may have constructional parts that are without a radius of convexity. Alternative supportive measures may be curved walls, corrugated walls or ribs. In at least one direction the distance between parallel supports on each side of the tank shall not be greater than 100 times the wall thickness.

- 6.12.3.2.5 Welds shall be skilfully made and shall afford the fullest safety. Welding shall be performed by skilled welders using a welding process whose effectiveness (including any heat treatments required) has been demonstrated by test.

- 6.12.3.2.6 The requirements of 6.8.2.4 do not apply. However, the initial and periodic inspections of these tanks shall be carried out under the responsibility of the user or owner of the MEMU. Shells and their equipment shall be subject to visual examination of their external and internal condition and a leakproofness test to the satisfaction of the competent authority at least every three years.

- 6.12.3.2.7 The requirements for type approval of 6.8.2.3 and for marking of 6.8.2.5 do not apply.

6.12.4 Items of equipment

- 6.12.4.1 Tanks with bottom discharge for UN 1942 and UN 3375 shall have at least two closures. One of these closures may be the product mixing or discharge pump or auger.
- 6.12.4.2 Any piping after the first closure shall be of a fusible material (i.e. rubber hose) or have fusible elements.
- 6.12.4.3 In order to avoid any loss of contents in the event of damage to the external pumps and discharge fittings (pipes), the first closure and its seatings shall be protected against the danger of being wrenched off by external stresses or shall be so designed as to withstand them. The filling and discharge devices (including flanges or threaded plugs) and protective caps (if any) shall be capable of being secured against any unintended opening.
- 6.12.4.4 Breather devices in accordance with 6.8.2.2.6 on tanks for UN 3375 may be substituted by "goose necks". Such equipment shall be protected against the danger of being wrenched off by external stresses or shall be so designed as to withstand them.

6.12.5 Special compartments for explosives

Compartments for packages of explosives containing detonators and/or detonator assemblies and those containing substances or articles of compatibility group D shall be designed to provide effective segregation such that there is no danger of transmission of detonation from the detonators and/or detonator assemblies to the substances or articles of compatibility group D. Segregation shall be achieved by the use of separate compartments or by placing one of the two types of explosive in a special containment system. Either method of segregation shall be approved by the competent authority. If the material used for the compartment is metal, the complete inside of the compartment shall be covered with materials providing suitable fire resistance. The explosives compartments shall be located where they are protected from impact and from damage on rough terrain and dangerous interaction with other dangerous goods on board and from ignition sources on the vehicle e.g. exhausts etc.

NOTE: *Materials classified as class B-s3-d2 according to standard EN 13501-1:2002 are deemed to fulfil the fire resistance requirement.*

PART 7

Provisions concerning the conditions of carriage, loading, unloading and handling

CHAPTER 7.1

GENERAL PROVISIONS

- 7.1.1 The carriage of dangerous goods is subject to the mandatory use of a particular type of transport equipment in accordance with the provisions of this Chapter and Chapter 7.2 for carriage in packages, Chapter 7.3 for carriage in bulk and Chapter 7.4 for carriage in tanks. In addition, the provisions of Chapter 7.5 concerning loading, unloading and handling shall be observed.

Columns (16), (17) and (18) of Table A of Chapter 3.2 show the particular provisions of this Part that apply to specific dangerous goods.

- 7.1.2 In addition to the provisions of this Part, vehicles used for the carriage of dangerous goods shall, as regards their design, construction and, if appropriate, their approval, conform to the relevant requirements of Part 9.

- 7.1.3 Large containers, portable tanks and tank-containers which meet the definition of "container" given in the CSC (1972), as amended, or in UIC leaflets 591 (status at 01.10.2007, 3rd edition), 592-2 (status at 01.10.2004, 6th edition), 592-3 (status at 01.01.1998, 2nd edition) and 592-4 (status at 01.05.2007, 3rd edition) may not be used to carry dangerous goods unless the large container or the frame of the portable tank or tank-container satisfies the provisions of the CSC or of UIC leaflets 591 and 592-2 to 592-4.

- 7.1.4 A large container may be presented for carriage only if it is structurally serviceable.

"Structurally serviceable" means that the container is free from major defects in its structural components, e.g. top and bottom side rails, doorsill and header, floor cross members, corner posts, and corner fittings. "Major defects" are dents or bends in structural members greater than 19 mm in depth, regardless of length; cracks or breaks in structural members; more than one splice or an improper splice (e.g. a lapped splice) in top or bottom end rails or door headers or more than two splices in any one top or bottom side rail or any splice in a door sill or corner post; door hinges and hardware that are seized, twisted, broken, missing or otherwise inoperative; non-closing gaskets and seals; any distortion of the overall configuration sufficient to prevent proper alignment of handling equipment, mounting and securing on a chassis or vehicle.

In addition, deterioration in any component of the container, such as rusted metal in side walls or disintegrated fibreglass is unacceptable, regardless of the material of construction. Normal wear, including oxidization (rust), slight dents and scratches and other damage that do not affect serviceability or weather-tightness are, however, acceptable.

Prior to loading the container shall also be checked to ensure that it is free from any residue of a previous load and that the interior floor and walls are free from protrusions.

- 7.1.5 Large containers shall meet the requirements concerning the body of the vehicle laid down in this Part and, if appropriate, those laid down in Part 9 for the load in question; the body of the vehicle need not then satisfy those provisions.

However, large containers carried on vehicles whose platforms have insulation and heat-resistant qualities which satisfy those requirements need not then satisfy the said requirements.

This provision also applies to small containers for the carriage of explosive substances and articles of Class 1.

- 7.1.6 Subject to the provisions of the last part of the first sentence of 7.1.5, the fact that dangerous goods are contained in one or more containers shall not affect the conditions to be met by the vehicle by reason of the nature and quantities of the dangerous goods carried.

CHAPTER 7.2

PROVISIONS CONCERNING CARRIAGE IN PACKAGES

- 7.2.1 Unless otherwise provided in 7.2.2 to 7.2.4, packages may be loaded:
- (a) in closed vehicles or in closed containers; or
 - (b) in sheeted vehicles or in sheeted containers; or
 - (c) in open vehicles or in open containers.
- 7.2.2 Packages comprising packagings made of materials sensitive to moisture shall be loaded on to closed or on to sheeted vehicles or into closed or sheeted containers.
- 7.2.3 *(Reserved)*
- 7.2.4 When they are shown under an entry in Column (16) of Table A of Chapter 3.2, the following special provisions apply:
- V1 Packages shall be loaded on to closed or sheeted vehicles or into closed or sheeted containers.
 - V2
 - (1) Packages shall only be loaded on to EX/II or EX/III vehicles which satisfy the relevant requirements of Part 9. The choice of vehicle depends on the quantity to be carried, which is limited per transport unit in accordance with the provisions concerning loading (see 7.5.5.2).
 - (2) Trailers, except semi-trailers, which satisfy the requirements for EX/II or EX/III vehicles may be drawn by motor vehicles which do not satisfy those requirements.
- For carriage in containers, see also 7.1.3 to 7.1.6.
- Where substances or articles of Class 1 in quantities requiring a transport unit made up of EX/III vehicle(s) are being carried in containers to or from harbour areas, rail terminals or airports of arrival or departure as part of a multimodal journey, a transport unit made up of EX/II vehicle(s) may be used instead, provided that the containers being carried comply with the appropriate requirements of the IMDG Code, the RID or the ICAO Technical Instructions.
- V3 For free-flowing powdery substances and for fireworks the floor of a container shall have a non-metallic surface or covering.
 - V4 *(Reserved)*
 - V5 Packages may not be carried in small containers.
 - V6 Flexible IBCs shall be carried in closed vehicles or in closed containers, in sheeted vehicles or in sheeted containers. The sheet shall be of an impermeable and non-combustible material.
 - V7 *(Reserved)*

- V8 (1) Substances stabilized by temperature control shall be forwarded in such manner that the control temperatures indicated in 2.2.41.1.17 and 2.2.41.4 or in 2.2.52.1.16 and 2.2.52.4, as appropriate, are never exceeded.
- (2) The means of temperature control chosen for the transport operation depends on a number of factors such as:
- the control temperature(s) of the substance(s) to be carried;
 - the difference between the control temperature and the expected ambient temperature;
 - the effectiveness of the thermal insulation;
 - the duration of the transport operation; and
 - the safety margin to be allowed for delays en route.
- (3) Suitable methods to prevent the control temperature from being exceeded are listed below, in ascending order of effectiveness:
- R1 Thermal insulation, provided that the initial temperature of the substance(s) is sufficiently below the control temperature;
- R2 Thermal insulation and coolant system, provided that:
- an adequate quantity of non-flammable coolant (e.g. liquid nitrogen or solid carbon dioxide), allowing a reasonable margin for possible delay, is carried or a means of replenishment is assured;
 - liquid oxygen or air is not used as coolant;
 - there is a uniform cooling effect even when most of the coolant has been consumed; and
 - the need to ventilate the transport unit before entering is clearly indicated by a warning on the door(s);
- R3 Thermal insulation and single mechanical refrigeration, provided that for substances with a flash-point lower than the sum of the emergency temperature plus 5 °C explosion-proof electrical fittings, EEx IIB T3, are used within the cooling compartment to prevent ignition of flammable vapours from the substances;
- R4 Thermal insulation and combined mechanical refrigeration system and coolant system, provided that:
- the two systems are independent of one another; and
 - the requirements of methods R2 and R3 above are met;
- R5 Thermal insulation and dual mechanical refrigeration system, provided that:
- apart from the integral power supply unit, the two systems are independent of one another;

- each system alone is capable of maintaining adequate temperature control; and
 - for substances with a flash-point lower than the sum of the emergency temperature plus 5 °C explosion-proof electrical fittings, EEx IIB T3, are used within the cooling compartment to prevent ignition of flammable vapours from the substances.
- (4) Methods R4 and R5 may be used for all organic peroxides and self-reactive substances.

Method R3 may be used for organic peroxides and self-reactive substances of Types C, D, E and F and, when the maximum ambient temperature to be expected during carriage does not exceed the control temperature by more than 10 °C, for organic peroxides and self-reactive substances of Type B.

Method R2 may be used for organic peroxides and self-reactive substances of Types C, D, E and F when the maximum ambient temperature to be expected during carriage does not exceed the control temperature by more than 30 °C.

Method R1 may be used for organic peroxides and self-reactive substances of Types C, D, E and F when the maximum ambient temperature to be expected during carriage is at least 10 °C below the control temperature.

- (5) Where substances are required to be carried in insulated, refrigerated or mechanically-refrigerated vehicles or containers, these vehicles or containers shall satisfy the requirements of Chapter 9.6.
- (6) If substances are contained in protective packagings filled with a coolant, they shall be loaded in closed or sheeted vehicles or closed or sheeted containers. If the vehicles or containers used are closed they shall be adequately ventilated. Sheeted vehicles and containers shall be fitted with sideboards and a tailboard. The sheets of these vehicles and containers shall be of an impermeable and non-combustible material.
- (7) Any control and temperature sensing devices in the refrigeration system shall be readily accessible and all electrical connections shall be weatherproof. The temperature of the air inside the transport unit shall be measured by two independent sensors and the output shall be recorded so that any change in temperature is readily detectable. When substances having a control temperature of less than +25 °C are carried, the transport unit shall be equipped with visible and audible alarms, powered independently of the refrigeration system and set to operate at or below the control temperature.
- (8) A back-up refrigeration system or spare parts shall be available.

NOTE: This provision V8 does not apply to substances referred to in 3.1.2.6 when substances are stabilized by the addition of chemical inhibitors such that the SADT is greater than 50 °C. In this latter case, temperature control may be required under conditions of carriage where the temperature may exceed 55 °C.

V9 (Reserved)

V10 IBCs shall be carried in closed or sheeted vehicles or closed or sheeted containers.

V11 IBCs other than metal or rigid plastics IBCs shall be carried in closed or sheeted vehicles or closed or sheeted containers.

- V12 IBCs of type 31HZ2 (31HA2, 31HB2, 31HN2, 31HD2 and 31HH2) shall be carried in closed vehicles or containers.
- V13 When packed in 5H1, 5L1 or 5 M1 bags, shall be carried in closed vehicles or containers.
- V14 Aerosols carried for the purposes of reprocessing or disposal under special provision 327 in Chapter 3.3 shall only be carried in ventilated or open vehicles or containers.

CHAPTER 7.3

PROVISIONS CONCERNING CARRIAGE IN BULK

7.3.1 General provisions

7.3.1.1 Goods may not be carried in bulk in bulk containers, containers or vehicles unless:

- (a) either a special provision, identified by the code BK, explicitly authorizing this mode of carriage is indicated in column (10) of Table A of Chapter 3.2 and the relevant conditions of 7.3.2 are satisfied in addition to those of this section; or
- (b) a special provision, identified by the code VV, explicitly authorizing this mode of carriage is indicated in column (17) of Table A of Chapter 3.2 and the conditions of this special provision, as laid down in 7.3.3 are satisfied in addition to those of this section.

Nevertheless, empty packagings, uncleaned, may be carried in bulk if this mode of carriage is not explicitly prohibited by other provisions of ADR.

NOTE: For carriage in tanks, see Chapters 4.2 and 4.3.

7.3.1.2 Substances which may become liquid at temperatures likely to be encountered during carriage, are not permitted for carriage in bulk.

7.3.1.3 Bulk containers, containers or bodies of vehicles shall be siftproof and shall be so closed that none of the contents can escape under normal conditions of carriage including the effect of vibration, or by changes of temperature, humidity or pressure.

7.3.1.4 Bulk solids shall be loaded and evenly distributed in a manner that minimises movement that could result in damage to the bulk container, container or vehicle or leakage of the dangerous goods.

7.3.1.5 Where venting devices are fitted they shall be kept clear and operable.

7.3.1.6 Bulk solids shall not react dangerously with the material of the bulk container, container, vehicle, gaskets, equipment including lids and tarpaulins and with protective coatings which are in contact with the contents or significantly weaken them. Bulk containers, containers or vehicles shall be so constructed or adapted that the goods cannot penetrate between wooden floor coverings or come into contact with those parts of the bulk container, container or vehicle that may be affected by the materials or residues thereof.

7.3.1.7 Before being filled and handed over for carriage, each bulk container, container or vehicle shall be inspected and cleaned to ensure that it does not contain any residue on the interior or exterior of the bulk container, container or vehicle that could:

- cause a dangerous reaction with the substance intended for carriage;
- detrimentally affect the structural integrity of the bulk container, container or vehicle; or
- affect the dangerous goods retention capabilities of the bulk container, container or vehicle.

7.3.1.8 During carriage, no dangerous residues shall adhere to the outer surfaces of bulk containers, containers or of the bodies of vehicles.

- 7.3.1.9 If several closure systems are fitted in series, the system which is located nearest to the substance to be carried shall be closed first before filling.
- 7.3.1.10 Empty bulk containers, containers or vehicles which have carried a dangerous solid substance in bulk shall be treated in the same manner as is required by ADR for a filled bulk container, container or vehicle, unless adequate measures have been taken to nullify any hazard.
- 7.3.1.11 If bulk containers, containers or vehicles are used for the carriage in bulk of goods liable to cause a dust explosion, or evolve flammable vapours (e. g. for certain wastes) measures shall be taken to exclude sources of ignition and prevent dangerous electrostatic discharge during carriage, filling or discharge of the substance.
- 7.3.1.12 Substances, for example wastes, which may react dangerously with one another and substances of different classes and goods not subject to ADR, which are liable to react dangerously with one another shall not be mixed together in the same bulk container, container or vehicle. Dangerous reactions are:
- (a) Combustion and/or evolution of considerable heat;
 - (b) Emission of flammable and/or toxic gases;
 - (c) Formation of corrosive liquids; or
 - (d) Formation of unstable substances.
- 7.3.1.13 Before a bulk container, container or vehicle is filled it shall be visually examined to ensure it is structurally serviceable, its interior walls, ceiling and floors are free from protrusions or damage and that any inner liners or substance retaining equipment are free from rips, tears or any damage that would compromise its cargo retention capabilities. Structurally serviceable means the bulk container, container or vehicle does not have major defects in its structural components, such as top and bottom side rails, top and bottom end rails, door sill and header, floor cross members, corner posts, and corner fittings in a bulk container or container. Major defects include:
- (a) Bends, cracks or breaks in the structural or supporting members that affect the integrity of the bulk container, container or of the body of the vehicle;
 - (b) More than one splice or an improper splice (such as a lapped splice) in top or bottom end rails or door headers;
 - (c) More than two splices in any one top or bottom side rail;
 - (d) Any splice in a door sill or corner post;
 - (e) Door hinges and hardware that are seized, twisted, broken, missing, or otherwise inoperative;
 - (f) Gaskets and seals that do not seal;
 - (g) Any distortion of the overall configuration of a bulk container or container great enough to prevent proper alignment of handling equipment, mounting and securing on a chassis or vehicle;
 - (h) Any damage to lifting attachments or handling equipment interface features; or
 - (i) Any damage to service or operational equipment.

- 7.3.2 Additional provisions for the carriage in bulk when the provisions of 7.3.1.1 (a) are applied**
- 7.3.2.1 The codes BK1 and BK2 in column (10) of Table A of Chapter 3.2 have the following meanings:
- BK1: Carriage in bulk in sheeted bulk containers is permitted;
BK2: Carriage in bulk in closed bulk containers is permitted.
- 7.3.2.2 The bulk container used shall conform to the requirements of Chapter 6.11.
- 7.3.2.3 Goods of Class 4.2**
- The total mass carried in a bulk container shall be such that its spontaneous ignition temperature is greater than 55 °C.
- 7.3.2.4 Goods of Class 4.3**
- These goods shall be carried in bulk containers (code BK2) which are waterproof.
- 7.3.2.5 Goods of Class 5.1**
- Bulk containers shall be so constructed or adapted that the goods cannot come into contact with wood or any other incompatible material.
- 7.3.2.6 Goods of Class 6.2**
- 7.3.2.6.1 Animal material containing infectious substances (UN Nos. 2814, 2900 and 3373) is authorized for carriage in bulk containers provided the following conditions are met:
- (a) Sheeted bulk containers BK1 are permitted provided that they are not filled to maximum capacity to avoid substances coming into contact with the sheeting. Closed bulk containers BK2 are also permitted;
 - (b) Closed and sheeted bulk containers, and their openings, shall be leak-proof by design or by the fitting of a suitable liner;
 - (c) The animal material shall be thoroughly treated with an appropriate disinfectant before loading prior to carriage;
 - (d) Sheeted bulk containers shall be covered by an additional top liner weighted down by absorbent material treated with an appropriate disinfectant;
 - (e) Closed or sheeted bulk containers shall not be re-used until after they have been thoroughly cleaned and disinfected.
- NOTE:** Additional provisions may be required by appropriate national health authorities.
- 7.3.2.6.2 Wastes of Class 6.2 (UN 3291)
- (a) (Reserved);
 - (b) Closed bulk containers and their openings shall be leakproof by design. These bulk containers shall have non porous interior surfaces and shall be free from cracks or other features which could damage packagings inside, impede disinfection or permit inadvertent release;

- (c) Wastes of UN No. 3291 shall be contained within the closed bulk container in UN type tested and approved sealed leakproof plastics bags tested for solids of packing group II and marked in accordance with 6.1.3.1. Such plastics bags shall be capable of passing the tests for tear and impact resistance according to ISO 7765-1:1988 "Plastics film and sheeting - Determination of impact resistance by the free-falling dart method - Part 1: Staircase methods" and ISO 6383-2:1983 "Plastics - Film and sheeting - Determination of tear resistance. Part 2: Elmendorf method". Each bag shall have an impact resistance of at least 165 g and a tear resistance of at least 480 g in both parallel and perpendicular planes with respect to the length of the bag. The maximum net mass of each plastics bag shall be 30 kg;
- (d) Single articles exceeding 30 kg such as soiled mattresses may be carried without the need for a plastics bag when authorized by the competent authority;
- (e) Wastes of UN No. 3291 which contain liquids shall only be carried in plastics bags containing sufficient absorbent material to absorb the entire amount of liquid without it spilling in the bulk container;
- (f) Wastes of UN No. 3291 containing sharp objects shall only be carried in UN type tested and approved rigid packagings meeting the provisions of packing instructions P621, IBC620 or LP621;
- (g) Rigid packagings specified in packing instructions P621, IBC620 or LP621 may also be used. They shall be properly secured to prevent damage during normal conditions of carriage. Wastes carried in rigid packagings and plastics bags together in the same closed bulk container shall be adequately segregated from each other, e.g. by suitable rigid barriers or dividers, mesh nets or otherwise securing, such that they prevent damage to the packagings during normal conditions of carriage;
- (h) Wastes of UN No. 3291 in plastics bags shall not be compressed in a closed bulk container in such a way that bags may be rendered no longer leakproof;
- (i) The closed bulk container shall be inspected for leakage or spillage after each journey. If any wastes of UN No. 3291 have leaked or been spilled in the closed bulk container, it shall not be re-used until after it has been thoroughly cleaned and, if necessary, disinfected or decontaminated with an appropriate agent. No other goods shall be carried together with UN No. 3291 other than medical or veterinary wastes. Any such other wastes carried in the same closed bulk container shall be inspected for possible contamination.

7.3.2.7 *Material of Class 7*

For the carriage of unpackaged radioactive material, see 4.1.9.2.3.

7.3.2.8 *Goods of Class 8*

These goods shall be carried in bulk containers which are watertight.

7.3.3 **Special provisions for the carriage in bulk when the provisions of 7.3.1.1 (b) are applied**

When they are shown under an entry in Column (17) of Table A of Chapter 3.2, the following special provisions apply:

- VV1 Carriage in bulk in closed or sheeted vehicles, in closed containers or in large sheeted containers is permitted.

- VV2 Carriage in bulk is permitted in closed vehicles with a metal body, closed metal containers and in sheeted vehicles and sheeted large containers covered with a non-combustible sheet and having a metal body or having floor and walls protected from the load.
- VV3 Carriage in bulk is permitted in sheeted vehicles and sheeted large containers with adequate ventilation.
- VV4 Carriage in bulk is permitted in closed or sheeted vehicles with a metal body, and in closed metal containers or in sheeted large metal containers.
For UN Nos. 2008, 2009, 2210, 2545, 2546, 2881, 3189 and 3190, only carriage in bulk of solid waste is permitted.
- VV5 Carriage in bulk is permitted in specially equipped vehicles and containers.
The openings used for loading and unloading shall be capable of being closed hermetically.
- VV6 *(Reserved)*
- VV7 Carriage in bulk in closed or sheeted vehicles, in closed containers or in large sheeted containers is permitted only if the substance is in pieces.
- VV8 Carriage in bulk is permitted, as a full load, in closed vehicles, closed containers or sheeted vehicles or large containers covered with an impermeable, non-combustible sheet.
Vehicles and containers shall be so constructed either that the substances contained cannot come into contact with wood or any other combustible material, or that the entire surface of the floor and walls, if made of wood or another combustible material has been provided with an impermeable surfacing resistant to combustion or has been coated with sodium silicate or a similar substance.
- VV9 Carriage in bulk is permitted, as a full load, in sheeted vehicles, closed containers or in sheeted large containers with complete walls.
For substances of Class 8, the body of the vehicle or container shall be equipped with a suitable and sufficiently stout inner lining.
- VV10 Carriage in bulk is permitted, as a full load, in sheeted vehicles, closed containers or sheeted large containers with complete walls.
The body of vehicles or containers shall be leakproof or rendered leakproof, for example by means of a suitable and sufficiently stout inner lining.
- VV11 Carriage in bulk is permitted in specially equipped vehicles and containers in a manner which avoids risks to humans, animals and the environment, e.g. by loading the wastes in bags or by airtight connections.
- VV12 Substances for which carriage in tank-vehicles, in portable tanks or in tank-containers is unsuitable because of the high temperature and density of the substance may be carried in special vehicles or containers in accordance with standards specified by the competent authority of the country of origin. If the country of origin is not a contracting party to ADR, the conditions laid down shall be recognized by the competent authority of the first country contracting party to ADR reached by the consignment.
- VV13 Carriage in bulk is permitted in specially equipped vehicles or containers in accordance with standards specified by the competent authority of the country of

origin. If the country of origin is not a contracting party to ADR, the conditions laid down shall be recognized by the competent authority of the first country contracting party to ADR reached by the consignment.

VV14 (1) Used batteries may be carried in bulk in specially equipped vehicles or containers. Large plastics containers shall not be permitted. Small plastics containers shall be capable of withstanding, when fully loaded, a drop from a height of 0.8 m onto a hard surface at -18 °C, without breakage.

(2) The load compartments of vehicles or containers shall be of steel resistant to the corrosive substances contained in the batteries. Less resistant steels may be used when there is a sufficiently great wall thickness or a plastics lining/layer resistant to the corrosive substances.

The design of the load compartments of vehicles or containers shall take account of any residual currents and impact from the batteries.

***NOTE:** Steel exhibiting a maximum rate of progressive reduction of 0.1 mm per year under the effects of the corrosive substances may be considered as resistant.*

(3) It shall be ensured by means of constructional measures that there will be no leakage of corrosive substances from the load compartments of vehicles or containers during carriage. Open load compartments shall be covered. The cover shall be resistant to the corrosive substances.

(4) Before loading, the load compartments of vehicles or containers, including their equipment, shall be inspected for damage. Vehicles or containers with damaged load compartments shall not be loaded.

The load compartments of vehicles or containers shall not be loaded above the top of their walls.

(5) No batteries containing different substances and no other goods liable to react dangerously with each other shall be present in the load compartments of vehicles or containers (see "*Dangerous reaction*" in 1.2.1).

During carriage no dangerous residue of the corrosive substances contained in the batteries shall adhere to the outer surface of the load compartments of vehicles or containers.

VV15 Carriage in bulk is permitted in closed or sheeted vehicles, closed containers or sheeted large containers with complete walls for solids (substances or mixtures, such as preparations or wastes) containing on an average not more than 1 000 mg/kg of substance to which this UN No is assigned. At no point of the load shall the concentration of this substance or these substances be higher than 10 000 mg/kg.

The bodies of vehicles or containers shall be leakproof or rendered leakproof, for example by means of a suitable and sufficiently stout inner lining.

VV16 Carriage in bulk is permitted in accordance with the provisions of 4.1.9.2.3.

VV17 Carriage in bulk of SCO-I is permitted in accordance with the provisions of 4.1.9.2.3.

CHAPTER 7.4

PROVISIONS CONCERNING CARRIAGE IN TANKS

- 7.4.1 Dangerous goods may not be carried in tanks unless a code is indicated in Columns (10) or (12) of Table A of Chapter 3.2 or unless a competent authority approval is granted as detailed in 6.7.1.3. The carriage shall be in accordance with the provisions of Chapters 4.2, 4.3, 4.4 or 4.5 as applicable. The vehicles, whether they be rigid vehicles, drawing vehicles, trailers or semi-trailers, shall satisfy the relevant requirements of Chapters 9.1, 9.2 and 9.7.2 concerning the vehicle to be used, as indicated in Column (14) of Table A in Chapter 3.2.
- 7.4.2 The vehicles designated by the codes EX/III, FL, OX or AT in 9.1.1.2 shall be used as follows:
- Where an EX/III vehicle is prescribed, only an EX/III vehicle may be used;
 - Where a FL vehicle is prescribed, only an FL vehicle may be used;
 - Where a OX vehicle is prescribed, only an OX vehicle may be used;
 - Where a AT vehicle is prescribed, AT, FL and OX vehicles may be used.

CHAPTER 7.5

PROVISIONS CONCERNING LOADING, UNLOADING AND HANDLING

7.5.1 General provisions concerning loading, unloading and handling

NOTE: Within the meaning of this section, placing a container, bulk-container, tank-container or portable tank onto a vehicle is considered as loading, and removing it is considered as unloading.

7.5.1.1 The vehicle and its driver, as well as the large container(s), bulk-container(s), tank-container(s) or portable tank(s) if any, shall comply with the regulatory provisions (especially those concerning safety, security, cleanliness and satisfactory operation of the equipment used in loading and unloading) upon arrival at the loading and unloading sites, which include container terminals.

7.5.1.2 Unless otherwise specified in ADR, the loading shall not be carried out if:

- (a) an examination of the documents; or
- (b) a visual inspection of the vehicle or of the large container(s), bulk-container(s), tank-container(s) or portable tank(s) if any, as well as of their equipment used in loading and unloading,

shows that the vehicle, the driver, a large container, a bulk-container, a tank-container, a portable tank or their equipment do not comply with the regulatory provisions. The interior and exterior of a vehicle or container shall be inspected prior to loading to ensure that there is no damage that could affect its integrity or that of the packages to be loaded in it.

7.5.1.3 Unless otherwise specified in ADR, the unloading shall not be carried out, if the above-mentioned inspections reveal deficiencies that might affect the safety or the security of the unloading.

7.5.1.4 In accordance with the special provisions of 7.3.3 or 7.5.11, in conformity with Columns (17) and (18) of Table A of Chapter 3.2, certain dangerous goods shall only be forwarded as a "full load" (see definition in 1.2.1). In such a case, the competent authorities may require the vehicle or large container used for such carriage to be loaded at only one point and unloaded at only one point.

7.5.1.5 When orientation arrows are required packages and overpacks shall be oriented in accordance with such markings.

NOTE: Liquid dangerous goods shall be loaded below dry dangerous goods whenever practicable.

7.5.2 Mixed loading prohibition

7.5.2.1 Packages bearing different danger labels shall not be loaded together in the same vehicle or container unless mixed loading is permitted according to the following Table based on the danger labels they bear.

NOTE: In accordance with 5.4.1.4.2, separate transport documents shall be drawn up for consignments that cannot be loaded together in the same vehicle or container.

Labels Nos.	1	1.4	1.5	1.6	2.1, 2.2, 2.3	3	4.1	4.1 + 1	4.2	4.3	5.1	5.2	5.2 + 1	6.1	6.2	7 A, B, C	8	9

X Mixed loading permitted.

a Mixed loading permitted with 1.4S substances and articles.

b Mixed loading permitted between goods of Class 1 and life-saving appliances of Class 9 (UN Nos. 2990, 3072 and 3268).

c Mixed loading permitted between air bag inflators, or air bag modules, or seat-belt pretensioners of Division 1.4, compatibility group G, (UN No. 0503) and air bag inflators or air bag modules or seat-belt pretensioners of Class 9 (UN No. 3268).

d Mixed loading permitted between blasting explosives (except UN No. 0083 explosive, blasting, type C) and ammonium nitrate (UN Nos. 1942 and 2067) and alkali metal nitrates and alkaline earth metal nitrates provided the aggregate is treated as blasting explosives under Class 1 for the purposes of placarding, segregation, stowage and maximum permissible load. Alkali metal nitrates include caesium nitrate (UN 1451), lithium nitrate (UN 2722), potassium nitrate (UN 1486), rubidium nitrate (UN 1477) and sodium nitrate (UN 1498). Alkaline earth metal nitrates include barium nitrate (UN 1446), beryllium nitrate (UN 2464), calcium nitrate (UN 1454), magnesium nitrate (UN 1474) and strontium nitrate (UN 1507).

7.5.2.2

Packages containing substances or articles of Class 1, bearing a label conforming to models Nos. 1, 1.4, 1.5 or 1.6 which are assigned to different compatibility groups shall not be loaded together in the same vehicle or container, unless mixed loading is permitted in accordance with the following Table for the corresponding compatibility groups.

Compatibility Group	A	B	C	D	E	F	G	H	J	L	N	S
A	X											
B		X		^a								X
C			X	X	X		X				^{b c}	X
D		^a	X	X	X		X				^{b c}	X
E			X	X	X		X				^{b c}	X
F						X						X
G			X	X	X		X					X
H								X				X
J									X			X
L										^d		
N			^{b c}	^{b c}	^{b c}						^b	X
S		X	X	X	X	X	X	X	X		X	X

X *Mixed loading permitted.*

^a *Packages containing articles of compatibility group B and those containing substances or articles of compatibility group D may be loaded together on one vehicle or in one container provided they are effectively segregated such that there is no danger of transmission of detonation from the articles of compatibility group B to the substances or articles of compatibility group D. Segregation shall be achieved by the use of separate compartments or by placing one of the two types of explosive in a special containment system. Either method of segregation shall be approved by the competent authority.*

^b *Different types of articles of division 1.6, compatibility group N, may be carried together as articles of division 1.6, compatibility group N, only when it is proven by testing or analogy that there is no additional risk of sympathetic detonation between the articles. Otherwise they should be treated as hazard division 1.1.*

^c *When articles of compatibility group N are carried with substances or articles of compatibility groups C, D or E, the articles of compatibility group N should be considered as having the characteristics of compatibility group D.*

^d *Packages containing substances and articles of Compatibility Group L may be loaded together on one vehicle or in one container with packages containing the same type of substances and articles of that compatibility group.*

7.5.2.3 For the purpose of the application of the prohibitions of mixed loading on one vehicle, no account shall be taken of substances contained in closed containers with complete sides. Nevertheless, the mixed loading prohibitions laid down in 7.5.2.1 concerning mixed loading of packages bearing labels conforming to models Nos. 1, 1.4, 1.5 or 1.6 with other packages, and in 7.5.2.2 concerning mixed loading of explosives of different compatibility groups shall also apply between dangerous goods contained in a container and the other dangerous goods loaded on the same vehicle, whether or not the latter goods are enclosed in one or more other containers.

7.5.2.4 Mixed loading of dangerous goods packed in limited quantities with any type of explosive substances and articles, except those of Division 1.4 and UN Nos. 0161 and 0499, is prohibited.

7.5.3 *(Reserved)*

7.5.4 **Precautions with respect to foodstuffs, other articles of consumption and animal feeds**

If special provision CV28 is indicated for a substance or article in Column (18) of Table A of Chapter 3.2, precautions with respect to foodstuffs, other articles of consumption and animal feeds shall be taken as follows.

Packages as well as uncleaned empty packagings, including large packagings and intermediate bulk containers (IBCs), bearing labels conforming to models Nos. 6.1 or 6.2 and those bearing labels conforming to model No. 9 containing goods of UN Nos. 2212, 2315, 2590, 3151, 3152 or 3245, shall not be stacked on or loaded in immediate proximity to packages known to contain foodstuffs, other articles of consumption or animal feeds in vehicles, in containers and at places of loading, unloading or transhipment.

When these packages, bearing the said labels, are loaded in immediate proximity of packages known to contain foodstuffs, other articles of consumption or animal feeds, they shall be kept apart from the latter:

- (a) By complete partitions which should be as high as the packages bearing the said labels;
- (b) By packages not bearing labels conforming to models Nos. 6.1, 6.2 or 9 or packages bearing labels conforming to model No.9 but not containing goods of UN Nos. 2212, 2315, 2590, 3151, 3152 or 3245; or
- (c) By a space of at least 0.8 m;

unless the packages bearing the said labels are provided with an additional packaging or are completely covered (e.g. by a sheeting, a fibreboard cover or other measures).

7.5.5 **Limitation of the quantities carried**

7.5.5.1 If the provisions below, or the additional provisions of 7.5.11 to be applied according to Column (18) of Table A of Chapter 3.2 require a limitation of the quantity of specific goods that can be carried, the fact that dangerous goods are contained in one or more containers shall not affect the mass limitations per transport unit laid down by these provisions.

7.5.5.2 *Limitations with respect to explosive substances and articles*

7.5.5.2.1 *Substances and quantities carried*

The total net mass in kg of explosive substance (or in the case of explosive articles, the total net mass of explosive substance contained in all the articles combined) which may be carried on one transport unit shall be limited as indicated in the table below (see also 7.5.2.2 as regards the prohibition of mixed loading):

Maximum permissible net mass in kg of explosive in Class 1 goods per transport unit

Transport Unit	Division	1.1		1.2	1.3	1.4		1.5 and 1.6	Empty uncleaned packagings
	Compatibility group	1.1A	Other than 1.1A			Other than 1.4S	1.4S		
EX/II ^a		6.25	1 000	3 000	5 000	15 000	Unlimited	5 000	Unlimited
EX/III ^a		18.75	16 000	16 000	16 000	16 000	Unlimited	16 000	Unlimited

^a For the description of EX/II and EX/III vehicles see Part 9.

7.5.5.2.2 Where substances and articles of different divisions of Class 1 are loaded on one transport unit in conformity with the prohibitions of mixed loading contained in 7.5.2.2, the load as a whole shall be treated as if it belonged to the most dangerous division (in the order 1.1, 1.5, 1.2, 1.3, 1.6, 1.4). However, the net mass of explosives of compatibility group S shall not count towards the limitation of quantities carried.

Where substances classified as 1.5D are carried on one transport unit together with substances or articles of division 1.2, the entire load shall be treated for carriage as if it belonged to division 1.1.

7.5.5.2.3 *Carriage of explosives on MEMUs*

Carriage of explosives on MEMUs is only permitted subject to the following conditions:

- The competent authority shall authorize the transport operation within its territory;
- The type and quantity of packaged explosives carried shall be limited to those necessary for the quantity of material to be manufactured on the MEMU, and in any case shall not exceed:
 - 200 kg of explosives of compatibility group D; and
 - a total of 400 units of detonators or detonator assemblies, or a mixture of both, unless otherwise approved by the competent authority;
- Packaged explosives shall only be carried in compartments that meet the requirements of 6.12.5;
- No other dangerous goods may be carried in the same compartment as the packaged explosives;
- Packaged explosives shall only be loaded onto the MEMU once the loading of other dangerous goods has been completed and immediately prior to carriage;
- When mixed loading is permitted between explosives and substances of Class 5.1 (UN 1942 and UN 3375) the aggregate is treated as blasting explosives under Class 1 for the purposes of segregation, stowage and maximum permissible load.

- 7.5.5.3 The maximum quantity of organic peroxides of Class 5.2 and self-reactive substances of Class 4.1 of Types B, C, D, E or F is limited to 20 000 kg per transport unit.
- 7.5.6 *(Reserved)*
- 7.5.7 **Handling and stowage**
- 7.5.7.1 Where appropriate the vehicle or container shall be fitted with devices to facilitate securing and handling of the dangerous goods. Packages containing dangerous substances and unpackaged dangerous articles shall be secured by suitable means capable of restraining the goods (such as fastening straps, sliding slatboards, adjustable brackets) in the vehicle or container in a manner that will prevent any movement during carriage which would change the orientation of the packages or cause them to be damaged. When dangerous goods are carried with other goods (e.g. heavy machinery or crates), all goods shall be securely fixed or packed in the vehicles or containers so as to prevent the release of dangerous goods. Movement of packages may also be prevented by filling any voids by the use of dunnage or by blocking and bracing. Where restraints such as banding or straps are used, these shall not be over-tightened to cause damage or deformation of the package¹. The requirements of this paragraph are deemed to be complied with if the cargo is secured in accordance with standard EN 12195-1:2010.
- 7.5.7.2 Packages shall not be stacked unless designed for that purpose. Where different design types of packages that have been designed for stacking are to be loaded together, consideration shall be given to their compatibility for stacking with each other. Where necessary, stacked packages shall be prevented from damaging the package below by the use of load-bearing devices.
- 7.5.7.3 During loading and unloading, packages containing dangerous goods shall be protected from being damaged.
- NOTE:** Particular attention shall be paid to the handling of packages during their preparation for carriage, the type of vehicle or container on which they are to be carried and to the method of loading or unloading, so that accidental damage is not caused through dragging or mishandling the packages.*
- 7.5.7.4 The provisions of 7.5.7.1 also apply to the loading, stowage and unloading of containers, tank-containers, portable tanks and MEGCs on to and from vehicles.
- 7.5.7.5 Members of the vehicle crew may not open a package containing dangerous goods.

¹ Guidance on the stowage of dangerous goods can be found in the European Best Practice Guidelines on Cargo Securing for Road Transport published by the European Commission. Other guidance is also available from competent authorities and industry bodies.

7.5.8 Cleaning after unloading

7.5.8.1 If, when a vehicle or container which has contained packaged dangerous goods is unloaded, some of the contents are found to have escaped, the vehicle or container shall be cleaned as soon as possible and in any case before reloading.

If it is not possible to do the cleaning locally, the vehicle or container shall be carried, with due regard to adequate safety, to the nearest suitable place where cleaning can be carried out.

Carriage is adequately safe if suitable measures have been taken to prevent the uncontrolled release of the dangerous goods that have escaped.

7.5.8.2 Vehicles or containers which have been loaded with dangerous goods in bulk shall be properly cleaned before reloading unless the new load consists of the same dangerous goods as the preceding load.

7.5.9 Prohibition of smoking

Smoking shall be prohibited during handling operations in the vicinity of vehicles or containers and inside the vehicles or containers.

7.5.10 Precautions against electrostatic charges

In the case of flammable gases, or liquids with a flash-point of 60 °C or below, or UN No. 1361, carbon or carbon black, packing group II, a good electrical connection from the chassis of the vehicle, the portable tank or the tank-container to earth shall be established before tanks are filled or emptied. In addition, the rate of filling shall be limited.

7.5.11 Additional provisions applicable to certain classes or specific goods

In addition to the provisions of sections 7.5.1 to 7.5.10, the following provisions shall apply when they are shown under an entry indicated in Column (18) of Table A of Chapter 3.2.

- CV1 (1) The following operations are prohibited:
- (a) Loading or unloading goods in a public place in a built-up area without special permission from the competent authorities;
 - (b) Loading or unloading goods in a public place elsewhere than in a built-up area without prior notice thereof having been given to the competent authorities, unless these operations are urgently necessary for reasons of safety.
- (2) If, for any reason, handling operations have to be carried out in a public place, then substances and articles of different kinds shall be separated according to the labels.
- CV2 (1) Before loading, the loading surface of the vehicle or container shall be thoroughly cleaned.
- (2) The use of fire or naked flame shall be prohibited on vehicles and containers carrying goods, in their vicinity and during the loading and unloading of these goods.

- CV3 See 7.5.5.2.
- CV4 Substances and articles of compatibility group L shall only be carried as a full load.
- CV5 to
CV8 (*Reserved*)
- CV9 Packages shall not be thrown or subjected to impact.
- Receptacles shall be so stowed in the vehicle or container that they cannot overturn or fall.
- CV10 Cylinders as defined in 1.2.1, shall be laid parallel to or at right angles to the longitudinal axis of the vehicle or container; however, those situated near the forward transverse wall shall be laid at right angles to the said axis.
- Short cylinders of large diameter (about 30 cm and over) may be stowed longitudinally with their valve-protecting devices directed towards the middle of the vehicle or container.
- Cylinders which are sufficiently stable or are carried in suitable devices effectively preventing them from overturning may be placed upright.
- Cylinders which are laid flat shall be securely and appropriately wedged, attached or secured so that they cannot shift.
- CV11 Receptacles shall always be placed in the position for which they were designed and be protected against any possibility of being damaged by other packages.
- CV12 When pallets loaded with articles are stacked, each tier of pallets shall be evenly distributed over the lower tier, if necessary by the interposition of a material of adequate strength.
- CV13 If any substances have leaked and been spilled in a vehicle or container, it may not be re-used until after it has been thoroughly cleaned and, if necessary, disinfected or decontaminated. Any other goods and articles carried in the same vehicle or container shall be examined for possible contamination.
- CV14 Goods shall be shielded from direct sunlight and heat during carriage.
- Packages shall be stored only in cool, well-ventilated places away from heat sources.
- CV15 See 7.5.5.3.
- CV16 to
CV19 (*Reserved*)
- CV20 The provisions of Chapter 5.3 and special provisions V1 and V8(5) and (6) of Chapter 7.2 shall not apply provided that the substance is packaged in accordance with packing method OP1 or OP2 of packing instruction P520 in 4.1.4.1, as required, and the total quantity of substances to which this derogation applies per transport unit is limited to 10 kg.
- CV21 The transport unit shall be thoroughly inspected prior to loading.
- Before carriage, the carrier shall be informed:

- about the operation of the refrigeration system, including a list of the suppliers of coolant available en route;
- procedures to be followed in the event of loss of temperature control.

In the case of temperature control in accordance with methods R2 or R4 of special provision V8(3) of Chapter 7.2, a sufficient quantity of non-flammable refrigerant (e.g. liquid nitrogen or dry ice), including a reasonable margin for possible delays, shall be carried unless a means of replenishment is assured.

Packages shall be so stowed as to be readily accessible.

The specified control temperature shall be maintained during the whole transport operation, including loading and unloading, as well as any intermediate stops.

CV22 Packages shall be loaded so that a free circulation of air within the loading space provides a uniform temperature of the load. If the contents of one vehicle or large container exceed 5 000 kg of flammable solids and/or organic peroxides, the load shall be divided into stacks of not more than 5 000 kg separated by air spaces of at least 0.05 m.

CV23 When handling packages, special measures shall be taken to ensure that they do not come into contact with water.

CV24 Before loading, vehicles and containers shall be thoroughly cleaned and in particular be free of any combustible debris (straw, hay, paper, etc.).

The use of readily flammable materials for stowing packages is prohibited.

CV25 (1) Packages shall be so stowed that they are readily accessible.

(2) When packages are to be carried at an ambient temperature of not more than 15 °C or refrigerated, the temperature shall be maintained when unloading or during storage.

(3) Packages shall be stored only in cool places away from sources of heat.

CV26 The wooden parts of a vehicle or container which have come into contact with these substances shall be removed and burnt.

CV27 (1) Packages shall be so stowed that they are readily accessible.

(2) When packages are to be carried refrigerated, the functioning of the cooling chain shall be ensured when unloading or during storage.

(3) Packages shall only be stored in cool places away from sources of heat.

CV28 See 7.5.4.

CV29 to
CV32 (*Reserved*)

CV33 **NOTE 1:** "Critical group" means a group of members of the public which is reasonably homogeneous with respect to its exposure for a given radiation source and given exposure pathway and is typical of individual receiving the highest effective dose by the given exposure pathway from the given source.

NOTE 2: "Members of the public" means in a general sense, any individuals in the population except when subject to occupational or medical exposure.

NOTE 3: "Workers" are any persons who work, whether full time, part-time or temporarily, for an employer and who have recognised rights and duties in relation to occupational radiation protection.

(1) Segregation

(1.1) Packages, overpacks, containers and tanks containing radioactive material and unpacked radioactive material shall be segregated during carriage:

(a) from workers in regularly occupied working areas:

(i) in accordance with Table A below; or

(ii) by distances calculated using a dose criterion of 5 mSv in a year and conservative model parameters;

NOTE: Workers subject to individual monitoring for the purposes of radiation protection shall not be considered for the purposes of segregation.

(b) from members of the critical group of the public, in areas where the public has regular access:

(i) in accordance with Table A below; or

(ii) by distances calculated using a dose criterion of 1 mSv in a year and conservative model parameters;

(c) from undeveloped photographic film and mailbags:

(i) in accordance with Table B below; or

(ii) by distances calculated using a radiation exposure criterion for undeveloped photographic film due to the transport of radioactive material for 0.1 mSv per consignment of such film; and

NOTE: Mailbags shall be assumed to contain undeveloped film and plates and therefore be separated from radioactive material in the same way.

(d) from other dangerous goods in accordance with 7.5.2.

Table A: Minimum distances between packages of category II-YELLOW or of category III-YELLOW and persons

Sum of transport indexes not more than	Exposure time per year (hours)			
	Areas where members of the public have regular access		Regularly occupied working areas	
	50	250	50	250
	Segregation distance in metres, no shielding material intervening, from:			
2	1	3	0.5	1
4	1.5	4	0.5	1.5
8	2.5	6	1.0	2.5
12	3	7.5	1.0	3
20	4	9.5	1.5	4
30	5	12	2	5
40	5.5	13.5	2.5	5.5
50	6.5	15.5	3	6.5

Table B: Minimum distances between packages of category II-YELLOW or of category III-YELLOW and packages bearing the word "FOTO", or mailbags

Total number of packages not more than		Sum of transport indexes not more than	Journey or storage duration, in hours							
Category			1	2	4	10	24	48	120	240
III-yellow	II-yellow		Minimum distances in metres							
		0.2	0.5	0.5	0.5	0.5	1	1	2	3
		0.5	0.5	0.5	0.5	1	1	2	3	5
	1	1	0.5	0.5	1	1	2	3	5	7
	2	2	0.5	1	1	1.5	3	4	7	9
	4	4	1	1	1.5	3	4	6	9	13
	8	8	1	1.5	2	4	6	8	13	18
1	10	10	1	2	3	4	7	9	14	20
2	20	20	1.5	3	4	6	9	13	20	30
3	30	30	2	3	5	7	11	16	25	35
4	40	40	3	4	5	8	13	18	30	40
5	50	50	3	4	6	9	14	20	32	45

(1.2) Category II-YELLOW or III-YELLOW packages or overpacks shall not be carried in compartments occupied by passengers, except those exclusively reserved for couriers specially authorized to accompany such packages or overpacks.

(1.3) No persons other than members of the vehicle crew shall be permitted in vehicles carrying packages, overpacks or containers bearing category II-YELLOW or III-YELLOW labels.

(2) *Activity limits*

The total activity in a vehicle, for carriage of LSA material or SCO in Industrial Packages Type 1 (Type IP-1), Type 2 (Type IP-2), Type 3 (Type IP-3) or unpackaged, shall not exceed the limits shown in Table C below.

Table C: Vehicle activity limits for LSA material and SCO in industrial packages or unpackaged

Nature of material or object	Activity limit for vehicle
LSA-I	No limit
LSA-II and LSA-III non-combustible solids	No limit
LSA-II and LSA-III combustible solids, and all liquids and gases	100 A ₂
SCO	100 A ₂

(3) *Stowage during carriage and storage in transit*

(3.1) Consignments shall be securely stowed.

(3.2) Provided that its average surface heat flux does not exceed 15 W/m² and that the immediately surrounding cargo is not in bags, a package or overpack may be carried or stored among packaged general cargo without any special stowage provisions except as may be specifically required by the competent authority in an applicable approval certificate.

(3.3) Loading of containers and accumulation of packages, overpacks and containers shall be controlled as follows:

- (a) Except under the condition of exclusive use, and for consignments of LSA-I material, the total number of packages, overpacks and containers aboard a single vehicle shall be so limited that the total sum of the transport indexes aboard the vehicle does not exceed the values shown in Table D below;
- (b) The radiation level under routine conditions of carriage shall not exceed 2 mSv/h at any point on, and 0.1 mSv/h at 2 m from, the external surface of the vehicle, except for consignments carried under exclusive use, for which the radiation limits around the vehicle are set forth in (3.5) (b) and (c);
- (c) The total sum of the criticality safety indexes in a container and aboard a vehicle shall not exceed the values shown in Table E below.

Table D: Transport Index limits for containers and vehicles not under exclusive use

Type of container or vehicle	Limit on total sum of transport indexes in a container or aboard a vehicle
Small container	50
Large container	50
Vehicle	50

Table E: Criticality Safety Index for containers and vehicles containing fissile material

Type of container or vehicle	Limit on total sum of criticality safety indexes	
	Not under exclusive use	Under exclusive use
Small container	50	n.a.
Large container	50	100
Vehicle	50	100

(3.4) Any package or overpack having either a transport index greater than 10, or any consignment having a criticality safety index greater than 50, shall be carried only under exclusive use.

(3.5) For consignments under exclusive use, the radiation level shall not exceed:

(a) 10 mSv/h at any point on the external surface of any package or overpack, and may only exceed 2 mSv/h provided that:

(i) the vehicle is equipped with an enclosure which, during routine conditions of carriage, prevents the access of unauthorized persons to the interior of the enclosure;

(ii) provisions are made to secure the package or overpack so that its position within the vehicle enclosure remains fixed during routine conditions of carriage, and

(iii) there is no loading or unloading during the shipment;

(b) 2 mSv/h at any point on the outer surfaces of the vehicle, including the upper and lower surfaces, or, in the case of an open vehicle, at any point on the vertical planes projected from the outer edges of the vehicle, on the upper surface of the load, and on the lower external surface of the vehicle; and

(c) 0.1 mSv/h at any point 2 m from the vertical planes represented by the outer lateral surfaces of the vehicle, or, if the load is carried in an open vehicle, at any point 2 m from the vertical planes projected from the outer edges of the vehicle.

(4) *Segregation of packages containing fissile material during carriage and storage in transit*

(4.1) Any group of packages, overpacks, and containers containing fissile material stored in transit in any one storage area shall be so limited that the total sum of the CSIs in the group does not exceed 50. Each group shall be stored so as to maintain a spacing of at least 6 m from other such groups.

(4.2) Where the total sum of the criticality safety indexes on board a vehicle or in a container exceeds 50, as permitted in Table E above, storage shall be such as to maintain a spacing of at least 6 m from other groups of packages, overpacks or containers containing fissile material or other vehicles carrying radioactive material.

(5) *Damaged or leaking packages, contaminated packagings*

- (5.1) If it is evident that a package is damaged or leaking, or if it is suspected that the package may have leaked or been damaged, access to the package shall be restricted and a qualified person shall, as soon as possible, assess the extent of contamination and the resultant radiation level of the package. The scope of the assessment shall include the package, the vehicle, the adjacent loading and unloading areas, and, if necessary, all other material which has been carried in the vehicle. When necessary, additional steps for the protection of persons property and the environment, in accordance with provisions established by the competent authority, shall be taken to overcome and minimize the consequences of such leakage or damage.
- (5.2) Packages damaged or leaking radioactive contents in excess of allowable limits for normal conditions of carriage may be removed to an acceptable interim location under supervision, but shall not be forwarded until repaired or reconditioned and decontaminated.
- (5.3) A vehicle and equipment used regularly for the carriage of radioactive material shall be periodically checked to determine the level of contamination. The frequency of such checks shall be related to the likelihood of contamination and the extent to which radioactive material is carried.
- (5.4) Except as provided in paragraph (5.5), any vehicle, or equipment or part thereof which has become contaminated above the limits specified in 4.1.9.1.2 in the course of carriage of radioactive material, or which shows a radiation level in excess of 5 $\mu\text{Sv/h}$ at the surface, shall be decontaminated as soon as possible by a qualified person and shall not be re-used unless the non-fixed contamination does not exceed the limits specified in 4.1.9.1.2, and the radiation level resulting from the fixed contamination on surfaces after decontamination is less than 5 $\mu\text{Sv/h}$ at the surface.
- (5.5) A container, tank, intermediate bulk container or vehicle dedicated to the carriage of unpackaged radioactive material under exclusive use shall be excepted from the requirements of the previous paragraph (5.4) and in 4.1.9.1.4 solely with regard to its internal surfaces and only for as long as it remains under that specific exclusive use.

(6) *Other provisions*

Where a consignment is undeliverable, the consignment shall be placed in a safe location and the competent authority shall be informed as soon as possible and a request made for instructions on further action.

- CV34 Prior to carriage of pressure receptacles it shall be ensured that the pressure has not risen due to potential hydrogen generation.
- CV35 If bags are used as single packagings, they shall be adequately separated to allow for the dissipation of heat.
- CV36 Packages shall preferably be loaded in open or ventilated vehicles or open or ventilated containers. If this is not feasible and packages are carried in other closed vehicles or containers, the cargo doors of the vehicles or containers shall be marked with the following in letters not less than 25 mm high:

"WARNING
NO VENTILATION
OPEN WITH CAUTION"

This shall be in a language considered appropriate by the consignor.

ANNEX B

PROVISIONS CONCERNING TRANSPORT EQUIPMENT AND TRANSPORT OPERATIONS

PART 8

Requirements for vehicle crews, equipment, operation and documentation

CHAPTER 8.1

GENERAL REQUIREMENTS CONCERNING TRANSPORT UNITS AND EQUIPMENT ON BOARD

8.1.1 Transport units

A transport unit loaded with dangerous goods may in no case include more than one trailer (or semi-trailer).

8.1.2 Documents to be carried on the transport unit

8.1.2.1 In addition to the documents required under other regulations, the following documents shall be carried on the transport unit:

- (a) The transport documents prescribed in 5.4.1, covering all the dangerous goods carried and, when appropriate, the large container or vehicle packing certificate prescribed in 5.4.2;
- (b) The instructions in writing prescribed in 5.4.3;
- (c) *(Reserved)*;
- (d) Means of identification, which include a photograph, for each member of the vehicle crew, in accordance with 1.10.1.4.

8.1.2.2 Where the provisions of ADR require the following documents to be drawn up, they shall likewise be carried on the transport unit:

- (a) The certificate of approval referred to in 9.1.3 for each transport unit or element thereof;
- (b) The driver's training certificate prescribed in 8.2.1;
- (c) A copy of the competent authority approval, when required in 5.4.1.2.1 (c) or (d) or 5.4.1.2.3.3.

8.1.2.3 The instructions in writing prescribed in 5.4.3 shall be kept readily available.

8.1.2.4 *(Deleted)*

8.1.3 Placarding and marking

Transport units carrying dangerous goods shall be placarded and marked in conformity with Chapter 5.3.

8.1.4 Fire-fighting equipment

- 8.1.4.1 The following table shows the minimum provisions for portable fire extinguishers for the inflammability Classes¹ A, B and C that apply to transport units carrying dangerous goods except for those referred to in 8.1.4.2:

(1) Transport unit maximum permissible mass	(2) Minimum number of fire extinguishers	(3) Minimum total capacity per transport unit	(4) Extinguisher suitable for engine or cab fire. At least one with a minimum capacity of:	(5) Additional extinguisher(s) requirement. At least one extinguisher shall have a minimum capacity of:
≤ 3.5 tonnes	2	4 kg	2 kg	2 kg
> 3.5 tonnes ≤ 7.5 tonnes	2	8 kg	2 kg	6 kg
>7.5 tonnes	2	12 kg	2 kg	6 kg
The capacities are for dry powder devices (or an equivalent capacity for any other suitable extinguishing agent).				

- 8.1.4.2 Transport units carrying dangerous goods in accordance with 1.1.3.6 shall be equipped with one portable fire extinguisher for the inflammability classes¹ A, B and C, with a minimum capacity of 2 kg dry powder (or an equivalent capacity for any other suitable extinguishing agent).

- 8.1.4.3 The portable fire extinguishers shall be suitable for use on a vehicle and shall comply with the relevant requirements of EN 3 Portable fire extinguishers, Part 7 (EN 3-7:2004 + A1:2007).

If the vehicle is equipped with a fixed fire extinguisher, automatic or easily brought into action for fighting a fire in the engine, the portable extinguisher need not be suitable for fighting a fire in the engine. The extinguishing agents shall be such that they are not liable to release toxic gases into the driver's cab or under the influence of the heat of the fire.

- 8.1.4.4 The portable fire extinguishers conforming to the provisions of 8.1.4.1 or 8.1.4.2 shall be fitted with a seal verifying that they have not been used.

In addition, they shall bear a mark of compliance with a standard recognized by a competent authority and an inscription at least indicating the date (month, year) of the next recurrent inspection or of the maximum permissible period of use, as applicable.

The fire extinguishers shall be subjected to periodic inspections in accordance with authorized national standards in order to guarantee their functional safety.

- 8.1.4.5 The fire extinguishers shall be installed on the transport units in a way that they are easily accessible to the vehicle crew. The installation shall be carried out in such a way that the fire extinguishers shall be protected against effects of the weather so that their operational safety is not affected.

¹ For the definition of the inflammability classes, see Standard EN 2:1992 Classification of fires.

8.1.5 Miscellaneous equipment and equipment for personal protection

8.1.5.1 Each transport unit carrying dangerous goods shall be provided with items of equipment for general and personal protection in accordance with 8.1.5.2. The items of equipment shall be selected in accordance with the danger label number of the goods loaded. The label numbers can be identified through the transport document.

8.1.5.2 The following equipment shall be carried on board the transport unit:

- For each vehicle, a wheel chock of a size suited to the maximum mass of the vehicle and to the diameter of the wheel;
- Two self-standing warning signs;
- Eye rinsing liquid²; and

for each member of the vehicle crew

- A warning vest (e.g. as described in the EN 471 standard);
- Portable lighting apparatus conforming to the provisions of 8.3.4;
- A pair of protective gloves; and
- Eye protection (e.g. protective goggles).

8.1.5.3 Additional equipment required for certain classes:

- An emergency escape mask³ for each member of the vehicle crew shall be carried on board the vehicle for danger label numbers 2.3 or 6.1;
- A shovel⁴;
- A drain seal⁴;
- A collecting container⁴.

² Not required for danger label numbers 1, 1.4, 1.5, 1.6, 2.1, 2.2 and 2.3.

³ For example an emergency escape mask with a combined gas/dust filter of the A1B1E1K1-P1 or A2B2E2K2-P2 type which is similar to that described in the EN 141 standard.

⁴ Only required for solids and liquids with danger label numbers 3, 4.1, 4.3, 8 or 9.

CHAPTER 8.2

REQUIREMENTS CONCERNING THE TRAINING OF THE VEHICLE CREW

8.2.1 Scope and general requirements concerning the training of drivers

- 8.2.1.1 Drivers of vehicles carrying dangerous goods shall hold a certificate issued by the competent authority stating that they have participated in a training course and passed an examination on the particular requirements that have to be met during carriage of dangerous goods.
- 8.2.1.2 Drivers of vehicles carrying dangerous goods shall attend a basic training course. Training shall be given in the form of a course approved by the competent authority. Its main objectives are to make drivers aware of hazards arising in the carriage of dangerous goods and to give them basic information indispensable for minimizing the likelihood of an incident taking place and, if it does, to enable them to take measures which may prove necessary for their own safety and that of the public and the environment, for limiting the effects of an incident. This training, which shall include individual practical exercises, shall act as the basis of training for all categories of drivers covering at least the subjects defined in 8.2.2.3.2. The competent authority may approve basic training courses limited to specific dangerous goods or to a specific class or classes. These restricted basic training courses shall not be provided for drivers of vehicles referred to in 8.2.1.4.
- 8.2.1.3 Drivers of vehicles or MEMUs carrying dangerous goods in fixed tanks or demountable tanks with a capacity exceeding 1 m³, drivers of battery-vehicles with a total capacity exceeding 1 m³ and drivers of vehicles or MEMUs carrying dangerous goods in tank-containers, portable tanks or MEGCs with an individual capacity exceeding 3 m³ on a transport unit, shall attend a specialization training course for carriage in tanks covering at least the subjects defined in 8.2.2.3.3. The competent authority may approve tank specialization training courses limited to specific dangerous goods or to a specific class or classes. These restricted tank specialization training courses shall not be provided for drivers of vehicles referred to in 8.2.1.4.
- 8.2.1.4 Drivers of vehicles carrying substances or articles of Class 1, other than substances and articles of Division 1.4, compatibility group S (see S1 in Chapter 8.5), drivers of MEMU carrying mixed loads of substances or articles of Class 1 and substances of Class 5.1 (see 7.5.5.2.3) and drivers of vehicles carrying certain radioactive material (see S11 and S12 in Chapter 8.5) shall attend specialization training courses covering at least the subjects defined in 8.2.2.3.4 or 8.2.2.3.5.
- 8.2.1.5 All training courses, practical exercises, examinations and the role of competent authorities shall comply with the provisions of 8.2.2.
- 8.2.1.6 All training certificates conforming to the requirements of this section and issued in accordance with 8.2.2.8 by the competent authority of a Contracting Party shall be accepted during their period of validity by the competent authorities of other Contracting Parties.

8.2.2 Special requirements concerning the training of drivers

- 8.2.2.1 The necessary knowledge and skills shall be imparted by training covering theoretical courses and practical exercises. The knowledge shall be tested in an examination.
- 8.2.2.2 The training body shall ensure that the training instructors have a good knowledge of, and take into consideration, recent developments in regulations and training requirements relating to the carriage of dangerous goods. The training shall be practice-related. The training programme shall conform with the approval referred to in 8.2.2.6, on the subjects set

out in 8.2.2.3.2 to 8.2.2.3.5. The training shall also include individual practical exercises (see 8.2.2.3.8).

8.2.2.3 *Structure of training*

8.2.2.3.1 Training shall be given in the form of a basic training course and, when applicable, specialization training courses. Basic training courses and specialization training courses may be given in the form of comprehensive training courses, conducted integrally, on the same occasion and by the same training body.

8.2.2.3.2 Subjects to be covered by the basic training course shall be, at least:

- (a) General requirements governing the carriage of dangerous goods;
- (b) Main types of hazard;
- (c) Information on environmental protection in the control of the transfer of wastes;
- (d) Preventive and safety measures appropriate to the various types of hazard;
- (e) What to do after an accident (first aid, road safety, basic knowledge about the use of protective equipment, instructions in writing, etc.);
- (f) Marking, labelling, placarding and orange-coloured plate marking;
- (g) What a driver should and should not do during the carriage of dangerous goods;
- (h) Purpose and the method of operation of technical equipment on vehicles;
- (i) Prohibitions on mixed loading in the same vehicle or container;
- (j) Precautions to be taken during loading and unloading of dangerous goods;
- (k) General information concerning civil liability;
- (l) Information on multimodal transport operations;
- (m) Handling and stowage of packages;
- (n) Traffic restrictions in tunnels and instructions on behaviour in tunnels (prevention of incidents, safety, action in the event of fire or other emergencies, etc.);
- (o) Security awareness.

8.2.2.3.3 Subjects to be covered by the specialization training course for carriage in tanks shall be, at least:

- (a) Behaviour of vehicles on the road, including movements of the load;
- (b) Specific requirements of the vehicles;
- (c) General theoretical knowledge of the various and different filling and discharge systems;
- (d) Specific additional provisions applicable to the use of those vehicles (certificates of approval, approval marking, placarding and orange-coloured plate marking, etc.).

- 8.2.2.3.4 Subjects to be covered by the specialization training course for the carriage of substances and articles of Class 1 shall be, at least:
- (a) Specific hazards related to explosive and pyrotechnical substances and articles;
 - (b) Specific requirements concerning mixed loading of substances and articles of Class 1.
- 8.2.2.3.5 Subjects to be covered by the specialization training course for the carriage of radioactive material of Class 7 shall be, at least:
- (a) Specific hazards related to ionizing radiation;
 - (b) Specific requirements concerning packing, handling, mixed loading and stowage of radioactive material;
 - (c) Special measures to be taken in the event of an accident involving radioactive material.
- 8.2.2.3.6 Teaching units are intended to last 45 minutes.
- 8.2.2.3.7 Normally, not more than eight teaching units are permitted on each training day.
- 8.2.2.3.8 The individual practical exercises shall take place in connection with the theoretical training, and shall at least cover first aid, fire-fighting and what to do in case of an incident or accident.
- 8.2.2.4 *Initial training programme***
- 8.2.2.4.1 The minimum duration of the theoretical element of each initial training course or part of the comprehensive training course shall be as follows:
- | | |
|---|-------------------|
| Basic training course | 18 teaching units |
| Specialization training course for carriage in tanks | 12 teaching units |
| Specialization training course for carriage of substances and articles of Class 1 | 8 teaching units |
| Specialization training course for carriage of radioactive material of Class 7 | 8 teaching units |
- For the basic training course and the specialization training course for carriage in tanks, additional teaching units are required for practical exercises referred to in 8.2.2.3.8 which will vary depending on the number of drivers under instruction.
- 8.2.2.4.2 The total duration of the comprehensive training course may be determined by the competent authority, who shall maintain the duration of the basic training course and the specialization training course for tanks, but may supplement it with shortened specialization training courses for Classes 1 and 7.
- 8.2.2.5 *Refresher training programme***
- 8.2.2.5.1 Refresher training undertaken at regular intervals serves the purpose of bringing the drivers' knowledge up to date; it shall cover new technical, legal and substance-related developments.
- 8.2.2.5.2 The duration of the refresher training including individual practical exercises shall be of at least two days for comprehensive training courses, or at least one half the duration allocated

to the corresponding initial basic or initial specialization training courses as specified in 8.2.2.4.1 for individual training courses.

8.2.2.5.3 A driver may replace a refresher training course and examination with the corresponding initial training course and examination.

8.2.2.6 *Approval of training*

8.2.2.6.1 The training courses shall be subject to approval by the competent authority.

8.2.2.6.2 Approval shall only be given with regard to applications submitted in writing.

8.2.2.6.3 The following documents shall be attached to the application for approval:

- (a) A detailed training programme specifying the subjects taught and indicating the time schedule and planned teaching methods;
- (b) Qualifications and fields of activities of the teaching personnel;
- (c) Information on the premises where the courses take place and on the teaching materials as well as on the facilities for the practical exercises;
- (d) Conditions of participation in the courses, such as number of participants.

8.2.2.6.4 The competent authority shall organize the supervision of training and examinations.

8.2.2.6.5 Approval shall be granted in writing by the competent authority subject to the following conditions:

- (a) The training shall be given in conformity with the application documents;
- (b) The competent authority shall be granted the right to send authorized persons to be present at the training courses and examinations;
- (c) The competent authority shall be advised in time of the dates and the places of the individual training courses;
- (d) The approval may be withdrawn if the conditions of approval are not complied with.

8.2.2.6.6 The approval document shall indicate whether the courses concerned are basic or specialization training courses, initial or refresher training courses, and whether they are limited to specific dangerous goods or a specific class or classes.

8.2.2.6.7 If the training body, after a training course has been given approval, intends to make any alterations with respect to such details as were relevant to the approval, it shall seek permission in advance from the competent authority. This applies in particular to changes concerning the training programme.

8.2.2.7 *Examinations*

8.2.2.7.1 *Examinations for the basic training course*

8.2.2.7.1.1 After completion of the basic training, including the practical exercises, an examination shall be held on the corresponding basic training course.

- 8.2.2.7.1.2 In the examination, the candidate has to prove that he has the knowledge, insight and skill for the practice of professional driver of vehicles carrying dangerous goods as provided in the basic training course.
- 8.2.2.7.1.3 For this purpose the competent authority shall prepare a catalogue of questions which refer to the items summarized in 8.2.2.3.2. Questions in the examination shall be drawn from this catalogue. The candidates shall not have any knowledge of the questions selected from the catalogue prior to the examination.
- 8.2.2.7.1.4 A single examination for comprehensive training courses may be held.
- 8.2.2.7.1.5 Each competent authority shall supervise the modalities of the examination.
- 8.2.2.7.1.6 The examination shall take the form of a written examination or a combination of a written and oral examination. Each candidate shall be asked at least 25 written questions for the basic training course. If the examination follows a refresher training course, at least 15 written questions shall be asked. The duration of these examinations shall be at least 45 and 30 minutes respectively. The questions may be of a varying degree of difficulty and be allocated a different weighting.
- 8.2.2.7.2 *Examinations for specialization training courses for carriage in tanks or carriage of substances and articles of Class 1 or radioactive material of Class 7*
- 8.2.2.7.2.1 After having sat the examination on the basic training course and after having attended the specialization training course for carriage in tanks or carriage of substances and articles of Class 1 or radioactive material of Class 7, the candidate shall be allowed to take part in the examination corresponding to the training.
- 8.2.2.7.2.2 This examination shall be held and supervised on the same basis as in 8.2.2.7.1. The catalogue of questions shall refer to the items summarized in 8.2.2.3.3, 8.2.2.3.4 or 8.2.2.3.5, as appropriate.
- 8.2.2.7.2.3 With respect to each specialization training examination, at least 15 written questions shall be asked. If the examination follows a refresher training course, at least 10 written questions shall be asked. The duration of these examinations shall be at least 30 and 20 minutes respectively.
- 8.2.2.7.2.4 If an examination is based on a restricted basic training course, this limits the examination of the specialization training course to the same scope.
- 8.2.2.8 *Certificate of driver's training***
- 8.2.2.8.1 The certificate referred to in 8.2.1.1 shall be issued:
- (a) After completion of a basic training course, provided the candidate has successfully passed the examination in accordance with 8.2.2.7.1;
 - (b) If applicable, after completion of a specialization training course for carriage in tanks or carriage of substances and articles of Class 1 or radioactive material of Class 7, or after having acquired the knowledge referred to in special provisions S1 and S11 in Chapter 8.5, provided the candidate has successfully passed an examination in accordance with 8.2.2.7.2;
 - (c) If applicable, after completion of a restricted basic or restricted tank specialization training course, provided the candidate has successfully passed the examination in accordance with 8.2.2.7.1 or 8.2.2.7.2. The certificate issued shall clearly indicate its limited scope of validity to the relevant dangerous goods or class(es).

8.2.2.8.2 The date of validity of a driver training certificate shall be five years from the date the driver passes an initial basic or initial comprehensive training examination.

The certificate shall be renewed if the driver furnishes proof of participation in refresher training in accordance with 8.2.2.5 and has passed an examination in accordance with 8.2.2.7 in the following cases:

- (a) In the twelve months before the date of expiry of the certificate. The competent authority shall issue a new certificate, valid for five years, the period of validity of which shall begin with the date of expiry of the previous certificate;
- (b) Prior to the twelve months before the date of expiry of the certificate. The competent authority shall issue a new certificate, valid for five years, the period of validity of which shall begin from the date on which the refresher examination was passed.

Where a driver extends the scope of his certificate during its period of validity, by meeting the requirements of 8.2.2.8.1 (b) and (c), the period of validity of a new certificate shall remain that of the previous certificate. When a driver has passed a specialization training examination, the specialization shall be valid until the date of expiry of the certificate.

8.2.2.8.3 The certificate shall have the layout of the model shown in 8.2.2.8.5. Its dimensions shall be in accordance with ISO 7810:2003 ID-1 and it shall be made of plastic. The colour shall be white with black lettering. It shall include an additional security feature such as a hologram, UV printing or guilloche patterns.

8.2.2.8.4 The certificate shall be prepared in the language(s) or one of the languages of the country of the competent authority which issued the certificate. If none of these languages is English, French or German, the title of the certificate, the title of item 8 and the titles on the back shall also be drawn up in English, French or German.

** Distinguishing sign used on vehicles in international traffic (for Parties to the 1968 Convention on Road Traffic or the 1949 Convention on Road Traffic, as notified to the Secretary General of the United Nations in accordance with respectively article 45(4) or annex 4 of these conventions).

8.2.3 **Training of persons other than the drivers holding a certificate in accordance with 8.2.1, involved in the carriage of dangerous goods by road**

Persons whose duties concern the carriage of dangerous goods by road shall have received training in the requirements governing the carriage of such goods appropriate to their responsibilities and duties according to Chapter 1.3. This requirement shall apply to individuals such as personnel who are employed by the road vehicle operator or the consignor, personnel who load or unload dangerous goods, personnel in freight forwarding or shipping agencies and drivers of vehicles other than drivers holding a certificate in accordance with 8.2.1, involved in the carriage of dangerous goods by road.

CHAPTER 8.3

MISCELLANEOUS REQUIREMENTS TO BE COMPLIED WITH BY THE VEHICLE CREW

8.3.1 Passengers

Apart from members of the vehicle crew, no passengers may be carried in transport units carrying dangerous goods.

8.3.2 Use of fire-fighting appliances

Members of the vehicle crew shall know how to use the fire-fighting appliances.

8.3.3 Prohibition on opening packages

A driver or a driver's assistant may not open a package containing dangerous goods.

8.3.4 Portable lighting apparatus

The portable lighting apparatus used shall not exhibit any metal surface liable to produce sparks.

8.3.5 Prohibition on smoking

Smoking shall be prohibited during handling operations in the vicinity of vehicles and inside the vehicles.

8.3.6 Running the engine during loading or unloading

Except where the engine has to be used to drive the pumps or other appliances for loading or unloading the vehicle and the laws of the country in which the vehicle is operating permit such use, the engine shall be shut off during loading and unloading operations.

8.3.7 Use of the parking brakes and wheel chocks

No vehicles carrying dangerous goods may be parked without the parking brakes being applied. Trailers without braking devices shall be restrained from moving by applying at least one wheel chock as described in 8.1.5.2.

8.3.8 Use of cables

In the case of a transport unit equipped with an anti-lock braking system, consisting of a motor vehicle and an O₃ or O₄ trailer, the connections referred to in paragraph 9.2.2.6.3 shall be connecting the towing vehicle and the trailer at all times during carriage.

CHAPTER 8.4

REQUIREMENTS CONCERNING THE SUPERVISION OF VEHICLES

8.4.1 Vehicles carrying dangerous goods in the quantities shown in special provisions S1 (6) and S14 to S24 of Chapter 8.5 for a given substance according to Column (19) of Table A of Chapter 3.2 shall be supervised or alternatively may be parked, unsupervised, in a secure depot or secure factory premises. If such facilities are not available, the vehicle, after having been properly secured, may be parked in an isolated position meeting the requirements of (a), (b) or (c) below:

- (a) A vehicle park supervised by an attendant who has been notified of the nature of the load and the whereabouts of the driver;
- (b) A public or private vehicle park where the vehicle is not likely to suffer damage from other vehicles; or
- (c) A suitable open space separated from the public highway and from dwellings, where the public does not normally pass or assemble.

The parking facilities permitted in (b) shall be used only if those described in (a) are not available, and those described in (c) may be used only if facilities described in (a) and (b) are not available.

8.4.2 Loaded MEMUs shall be supervised or alternatively may be parked, unsupervised, in a secure depot or secure factory premises. Empty uncleaned MEMUs are exempted from this requirement.

CHAPTER 8.5

ADDITIONAL REQUIREMENTS RELATING TO PARTICULAR CLASSES OR SUBSTANCES

In addition to the requirements of Chapters 8.1 to 8.4, when reference is made to them in Column (19) of Table A of Chapter 3.2, the following requirements shall apply to the carriage of the substances or articles concerned. In the event of conflict with the requirements of Chapters 8.1 to 8.4, the requirements of this Chapter shall take precedence.

S1: Requirements concerning the carriage of explosive substances and articles (Class 1)

(1) *Special training of drivers*

If, according to other regulations applicable in the country of a Contracting Party, a driver has followed equivalent training under a different regime or for a different purpose, covering the subjects defined in 8.2.2.3.4, the specialization training course may be totally or partially dispensed with.

(2) *Approved official*

If the national regulations so provide, the competent authority of a country contracting party to ADR may require an approved official to be carried in the vehicle at the carrier's expense.

(3) *Prohibition of smoking, fire and naked flame*

Smoking, the use of fire or of naked flames shall be prohibited on vehicles carrying substances and articles of Class 1, in their vicinity and during the loading and unloading of these substances and articles.

(4) *Places of loading and unloading*

- (a) Loading or unloading of substances and articles of Class 1 shall not take place in a public place in a built-up area without special permission from the competent authorities;
- (b) Loading or unloading of substances and articles of Class 1 in a public space elsewhere than in a built-up area without prior notice thereof having been given to the competent authorities shall be prohibited, unless operations are urgently necessary for reasons of safety;
- (c) If, for any reason, handling operations have to be carried out in a public place, then substances and articles of different kinds shall be separated according to the labels;
- (d) When vehicles carrying substances and articles of Class 1 are obliged to stop for loading or unloading operations in a public place, a distance of at least 50 m shall be maintained between the stationary vehicles.

(5) *Convoys*

- (a) When vehicles carrying substances and articles of Class 1 travel in convoy, a distance of not less than 50 m shall be maintained between each transport unit and the next;

- (b) The competent authority may lay down rules for the order or composition of convoys.

(6) *Supervision of vehicles*

The requirements of Chapter 8.4 shall be applicable only when substances and articles of Class 1 having a total net mass of explosive substance above the limits set below are carried in a vehicle:

Division 1.1:	0 kg
Division 1.2:	0 kg
Division 1.3, compatibility group C:	0 kg
Division 1.3, other than compatibility group C:	50 kg
Division 1.4, other than those listed below:	50 kg
Division 1.5:	0 kg
Division 1.6:	50 kg
Substances and articles of Division 1.4 belonging to UN numbers 0104, 0237, 0255, 0267, 0289, 0361, 0365, 0366, 0440, 0441, 0455, 0456 and 0500:	0 kg

For mixed loads the lowest limit applicable to any of the substances or articles carried shall be used for the load as a whole.

In addition, these substances and articles shall be supervised at all times in order to prevent any malicious act and to alert the driver and the competent authorities in the event of loss or fire.

Empty uncleaned packagings are exempted.

(7) *Locking of vehicles*

Doors and rigid covers in the load compartments of EX/II vehicles and all openings in the load compartments of EX/III vehicles carrying substances and articles of Class 1 shall be locked during transport, except for the periods of loading and unloading.

S2: Additional requirements concerning the carriage of flammable liquids or gases

(1) *Portable lighting apparatus*

The load compartment of closed vehicles carrying liquids having a flash-point of not more than 60 °C or flammable substances or articles of Class 2, shall not be entered by persons carrying portable lighting apparatus other than those so designed and constructed that they cannot ignite any flammable vapours or gases which may have penetrated into the interior of the vehicle.

(2) *Operation of combustion heaters during loading or unloading*

The operation of combustion heaters of vehicles of type FL (see Part 9) is forbidden during loading and unloading and at loading sites.

(3) *Precautions against electrostatic charges*

In the case of vehicles of type FL (see Part 9), a good electrical connection from the vehicle chassis to earth shall be established before tanks are filled or emptied. In addition, the rate of filling shall be limited.

S3: Special provisions concerning the carriage of infectious substances

The requirements of the table columns (2), (3) and (5) in 8.1.4.1 and 8.3.4 shall not apply.

S4: Additional requirements concerning carriage under controlled temperatures

Maintenance of the prescribed temperature is essential for safe carriage. In general, there shall be:

- thorough inspection of the transport unit prior to loading;
- instructions to the carrier about the operation of the refrigeration system, including a list of the suppliers of coolant available en route;
- procedures to be followed in the event of loss of control;
- regular monitoring of operating temperatures; and
- availability of a back-up refrigeration system or spare parts.

The temperature of the air space within the transport unit shall be measured by two independent sensors and the output shall be so recorded that temperature changes are readily detectable.

The temperature shall be checked every four to six hours and logged.

If the control temperature is exceeded during carriage, an alert procedure shall be initiated involving any necessary repairs to the refrigeration equipment or an increase in the cooling capacity (e.g. by adding liquid or solid coolant). There shall also be frequent checking of the temperature and preparations for implementation of the emergency procedures. If the emergency temperature (see also 2.2.41.1.17 and 2.2.52.1.15 to 2.2.52.1.18) is reached, the emergency procedures shall be set in operation.

***NOTE:** This provision S4 does not apply to substances referred to in 3.1.2.6 when substances are stabilized by the addition of chemical inhibitors such that the SADT is greater than 50 °C. In this latter case, temperature control may be required under conditions of carriage where the temperature may exceed 55 °C.*

S5: Special provisions common to the carriage of radioactive material of Class 7 in excepted packages (UN Nos. 2908, 2909, 2910 and 2911) only

The requirements of the instructions in writing of 8.1.2.1 (b) and of 8.2.1, 8.3.1 and 8.3.4 shall not apply.

S6: Special provisions common to the carriage of radioactive material of Class 7 other than in excepted packages

The provisions of 8.3.1 shall not apply to vehicles carrying only packages, overpacks or containers bearing category I-WHITE labels.

The provisions of 8.3.4 shall not apply provided there is no subsidiary risk.

Other additional requirements or special provisions

S7: *(Deleted)*

- S8:** When a transport unit is loaded with more than 2 000 kg of these substances, stops for service requirements shall as far as possible not be made near inhabited places or frequented places. A longer stop near such places is permissible only with the consent of the competent authorities.
- S9:** During the carriage of these substances, stops for service requirements shall as far as possible not be made near inhabited places or frequented places. A longer stop near such places is permissible only with the consent of the competent authorities.
- S10:** During the period April to October, when a vehicle is stationary, the packages shall, if the legislation of the country in which the vehicle is halted so requires, be effectively protected against the action of the sun, e.g. by means of sheets placed not less than 20 cm above the load.
- S11:** If, according to other regulations applicable in the country of a Contracting Party, a driver has followed equivalent training under a different regime or for a different purpose covering the subjects defined in 8.2.2.3.5, the specialization training course may be totally or partially dispensed with.
- S12:** If the total number of packages containing radioactive material carried does not exceed 10, and the sum of the transport indices does not exceed 3, the requirement in 8.2.1.4 concerning specialization training course for drivers of vehicles carrying radioactive material need not be applied. However, drivers shall then receive appropriate training, commensurate with and appropriate to their duties, which provides them with an awareness of the radiation hazards involved in the carriage of radioactive material. Such awareness training shall be confirmed by a certificate provided by their employer.
- S13:** When a consignment cannot be delivered, it shall be placed in a safe place; the competent authority should be informed as soon as possible and requested for instructions on how to proceed.
- S14:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply for vehicles carrying any amount of these substances.
- S15:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply for vehicles carrying any amount of these substances. However, the provisions of Chapter 8.4 need not be applied when the loaded compartment is locked or the packages carried are otherwise protected against any illicit unloading.
- S16:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply when the total mass of these substances in the vehicle exceeds 500 kg.
- In addition, vehicles carrying more than 500 kg of these substances shall be subject at all times to supervision to prevent any malicious act and to alert the driver and competent authorities in the event of loss or fire.
- S17:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply when the total mass of these substances in the vehicle exceeds 1 000 kg.
- S18:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply when the total mass of such substances in the vehicle exceeds 2 000 kg.
- S19:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply when the total mass of such substances in the vehicle exceeds 5 000 kg.

- S20:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply when the total mass or volume of these substances in the vehicle exceeds 10 000 kg as packaged goods or 3 000 litres in tanks.
- S21:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply to all material, in whatever mass. In addition, these goods shall be subject at all times to supervision to prevent any malicious act and to alert the driver and the competent authorities in the event of loss or fire. However, the provisions of Chapter 8.4 need not be applied where:
- (a) The loaded compartment is locked or the packages carried are otherwise protected against illicit unloading; and
 - (b) The dose rate does not exceed 5µSv/h at any accessible point on the outer surface of the vehicle.
- S22:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply when the total mass or volume of these substances in the vehicle exceeds 5 000 kg as packaged goods or 3 000 litres in tanks.
- S23:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply when this substance is carried in bulk or in tanks and when the total mass or volume in the vehicle exceeds 3 000 kg or 3 000 litres, as applicable.
- S24:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply when the total mass of these substances in the vehicle exceeds 100 kg.

CHAPTER 8.6

ROAD TUNNEL RESTRICTIONS FOR THE PASSAGE OF VEHICLES CARRYING DANGEROUS GOODS

8.6.1 General provisions

The provisions of this Chapter apply when the passage of vehicles through road tunnels is restricted in accordance with 1.9.5.

8.6.2 Road signs or signals governing the passage of vehicles carrying dangerous goods

The tunnel category, assigned in accordance with 1.9.5.1 by the competent authority to a given road tunnel for the purpose of restricting the passage of transport units carrying dangerous goods, shall be indicated as follows by means of road signs and signals:

Sign and signal	Tunnel category
No sign	Tunnel category A
Sign with an additional panel bearing a letter B	Tunnel category B
Sign with an additional panel bearing a letter C	Tunnel category C
Sign with an additional panel bearing a letter D	Tunnel category D
Sign with an additional panel bearing a letter E	Tunnel category E

8.6.3 Tunnel restriction codes

8.6.3.1 The restrictions for the transport of specific dangerous goods through tunnels are based on the tunnel restriction code of these goods, indicated in Column (15) of Table A of Chapter 3.2. The tunnel restriction codes are put between brackets at the bottom of the cell. When ‘(—)’ is indicated instead of one of the tunnel restriction codes, the dangerous goods are not subject to any tunnel restriction; for the dangerous goods assigned to UN Nos. 2919 and 3331, restrictions to the passage through tunnels may, however, be part of the special arrangement approved by the competent authority(ies) on the basis of 1.7.4.2.

8.6.3.2 When a transport unit contains dangerous goods to which different tunnel restriction codes have been assigned, the most restrictive of these tunnel restriction codes shall be assigned to the whole load.

8.6.3.3 Dangerous goods carried in accordance with 1.1.3 are not subject to the tunnel restrictions and shall not be taken into account when determining the tunnel restriction code to be assigned to the whole load of a transport unit, except if the transport unit is required to be marked in accordance with 3.4.13 subject to 3.4.14¹

8.6.4 Restrictions for the passage of transport units carrying dangerous goods through tunnels

The restrictions for passage through tunnels shall apply:

¹ or in accordance with 3.4.10 subject to 3.4.11 of ADR as applicable until 31 December 2010 if the transitional measures of 1.6.1.20 are applied.

- to transport units for which marking is required by 3.4.13 subject to 3.4.14¹, through tunnels of category E; and
- to transport units for which an orange-coloured plate marking is required according to 5.3.2, in accordance with the table below once the tunnel restriction code to be assigned to the whole load of the transport unit has been determined.

Tunnel restriction code of the whole load	Restriction
B	Passage forbidden through tunnels of category B, C, D and E
B1000C	Carriage where the total net explosive mass per transport unit <ul style="list-style-type: none"> - exceeds 1000 kg: Passage forbidden through tunnels of category B, C, D and E; - does not exceed 1000 kg: Passage forbidden through tunnels of category C, D and E
B/D	Tank carriage: Passage forbidden through tunnels of category B, C, D and E; Other carriage: Passage forbidden through tunnels of category D and E
B/E	Tank carriage: Passage forbidden through tunnels of category B, C, D and E; Other carriage: Passage forbidden through tunnels of category E
C	Passage forbidden through tunnels of category C, D and E
C5000D	Carriage where the total net explosive mass per transport unit <ul style="list-style-type: none"> - exceeds 5000 kg: Passage forbidden through tunnels of category C, D and E; - does not exceed 5000 kg: Passage forbidden through tunnels of category D and E
C/D	Tank carriage: Passage forbidden through tunnels of category C, D and E; Other carriage: Passage forbidden through tunnels of category D and E
C/E	Tank carriage: Passage forbidden through tunnels of category C, D and E; Other carriage: Passage forbidden through tunnels of category E
D	Passage forbidden through tunnels of category D and E
D/E	Bulk or tank carriage: Passage forbidden through tunnels of category D and E; Other carriage: Passage forbidden through tunnels of category E
E	Passage forbidden through tunnels of category E
-	Passage allowed through all tunnels (For UN Nos. 2919 and 3331, see also 8.6.3.1).

NOTE 1: For example, the passage of a transport unit carrying UN 0161, powder, smokeless, classification code 1.3C, tunnel restriction code C5000D, in a quantity representing a total net explosive mass of 3000 kg is forbidden in tunnels of categories D and E.

NOTE 2: Dangerous goods packed in limited quantities carried in containers or transport units marked in accordance with the IMDG Code are not subject to the restrictions for passage through tunnels of category E when the total gross mass of the packages containing dangerous goods packed in limited quantities does not exceed 8 tonnes per transport unit.

¹ or in accordance with 3.4.10 subject to 3.4.11 of ADR as applicable until 31 December 2010 if the transitional measures of 1.6.1.20 are applied.

PART 9

Requirements concerning the construction and approval of vehicles

CHAPTER 9.1

SCOPE, DEFINITIONS AND REQUIREMENTS FOR THE APPROVAL OF VEHICLES

9.1.1 Scope and definitions

9.1.1.1 Scope

The requirements of Part 9 shall apply to vehicles of categories N and O, as defined in Annex 7 of the Consolidated Resolution on the Construction of Vehicles (R.E.3)¹, intended for the carriage of dangerous goods.

These requirements refer to vehicles, as regards their construction, type approval, ADR approval and annual technical inspection.

9.1.1.2 Definitions

For the purposes of Part 9:

"Vehicle" means any vehicle, whether complete, incomplete or completed, intended for the carriage of dangerous goods by road;

"EX/II vehicle" or *"EX/III vehicle"* means a vehicle intended for the carriage of explosive substances and articles (Class 1);

"FL vehicle" means:

- (a) A vehicle intended for the carriage of liquids having a flash-point of not more than 60°C (with the exception of diesel fuel complying with standard EN 590:2004, gas oil, and heating oil (light) - UN No. 1202 - with a flash-point as specified in standard EN 590:2004) in fixed tanks or demountable tanks with a capacity exceeding 1 m³ or in tank-containers or portable tanks with an individual capacity exceeding 3 m³; or
- (b) A vehicle intended for the carriage of flammable gases in fixed tanks or demountable tanks with a capacity exceeding 1 m³ or in tank-containers, portable tanks or MEGCs with an individual capacity exceeding 3 m³; or,
- (c) A battery-vehicle with a total capacity exceeding 1 m³ intended for the carriage of flammable gases;

"OX vehicle" means a vehicle intended for the carriage of hydrogen peroxide, stabilized or hydrogen peroxide, aqueous solution stabilized with more than 60% hydrogen peroxide (Class 5.1, UN No. 2015) in fixed tanks or demountable tanks with a capacity exceeding 1 m³ or in tank-containers or portable tanks with an individual capacity exceeding 3 m³;

"AT vehicle" means:

- (a) A vehicle, other than EX/III, FL or OX vehicle or than a MEMU, intended for the carriage of dangerous goods in fixed tanks or demountable tanks with a capacity exceeding 1 m³ or in tank-containers, portable tanks or MEGCs with an individual capacity exceeding 3 m³; or

¹ Document of the UNECE, TRANS/WP.29/78/Rev.1, as amended.

(b) A battery-vehicle with a total capacity exceeding 1 m³ other than a FL vehicle;

"*MEMU*" means a vehicle meeting the definition of mobile explosives manufacturing unit in 1.2.1.

"*Complete vehicle*" means any vehicle which does not need any further completion (e.g. one stage built vans, lorries, tractors, trailers);

"*Incomplete vehicle*" means any vehicle which still needs completion in at least one further stage (e.g. chassis-cab, trailer chassis);

"*Completed vehicle*" means any vehicle which is the result of a multi-stage process (e.g. chassis or chassis-cab fitted with a bodywork);

"*Type-approved vehicle*" means any vehicle which has been approved in accordance with ECE Regulation No. 105² or Directive 98/91/EC³;

"*ADR approval*" means certification by a competent authority of a Contracting Party that a single vehicle intended for the carriage of dangerous goods satisfies the relevant technical requirements of this Part as an EX/II, EX/III, FL, OX, or AT vehicle or as a MEMU.

9.1.2 Approval of EX/II, EX/III, FL, OX and AT vehicles and MEMUs

NOTE: *No special certificates of approval shall be required for vehicles other than EX/II, EX/III, FL, OX and AT vehicles and MEMUs, apart from those required by the general safety regulations normally applicable to vehicles in the country of origin.*

9.1.2.1 General

EX/II, EX/III, FL, OX and AT vehicles and MEMUs shall comply with the relevant requirements of this Part.

Every complete or completed vehicle shall be subjected to a first inspection by the competent authority in accordance with the administrative requirements of this Chapter to verify conformity with the relevant technical requirements of Chapters 9.2 to 9.8.

The competent authority may waive the first inspection for a tractor for a semi trailer type-approved in accordance with 9.1.2.2 for which the manufacturer, his duly accredited representative or a body recognised by the competent authority has issued a declaration of conformity with the requirements of Chapter 9.2.

The conformity of the vehicle shall be certified by the issue of a certificate of approval in accordance with 9.1.3.

When vehicles are required to be fitted with an endurance braking system, the manufacturer of the vehicle or his duly accredited representative shall issue a declaration of conformity with the relevant prescriptions of Annex 5 of ECE Regulation No. 13⁴. This declaration shall be presented at the first technical inspection.

² ECE Regulation No. 105 (Uniform provisions concerning the approval of vehicles intended for the carriage of dangerous goods with regard to their specific constructional features).

³ Directive 98/91/EC of the European Parliament and of the Council of 14 December 1998 relating to motor vehicles and their trailers intended for the transport of dangerous goods by road and amending Directive 70/156/EEC relating to the type approval of motor vehicles and their trailers (Official Journal of the European Communities No. L 011 of 16.01.1999, p. 0025 – 0036).

⁴ ECE Regulation No. 13 (Uniform provisions concerning the approval of vehicles of categories M, N and O with regards to braking).

9.1.2.2 *Requirements for type-approved vehicles*

At the request of the vehicle manufacturer or his duly accredited representative, vehicles subject to ADR approval according to 9.1.2.1 may be type-approved by a competent authority. The relevant technical requirements of Chapter 9.2 shall be considered to be fulfilled if a type approval certificate has been issued by a competent authority in accordance with ECE Regulation No. 105² or Directive 98/91/EC³ provided that the technical requirements of the said Regulation or the said Directive correspond to those of Chapter 9.2 of this Part and provided that no modification of the vehicle alters its validity. In the case of MEMUs, the type approval mark affixed in accordance with ECE Regulation No. 105 may identify the vehicle as either MEMU or EX/III. MEMUs need only be identified as such on the certificate of approval issued in accordance with 9.1.3.

This type approval, granted by one Contracting Party, shall be accepted by the other Contracting Parties as ensuring the conformity of the vehicle when the single vehicle is submitted for inspection for ADR approval.

At the inspection for ADR approval, only those parts of the type-approved incomplete vehicle which have been added or modified in the process of completion shall be inspected for compliance with the applicable requirements of Chapter 9.2.

9.1.2.3 *Annual technical inspection*

EX/II, EX/III, FL, OX and AT vehicles and MEMUs shall be subject to an annual technical inspection in their country of registration to make sure that they conform to the relevant requirements of this Part, and to the general safety regulations (concerning brakes, lighting, etc.) in force in their country of registration.

The conformity of the vehicle shall be certified either by the extension of validity of the certificate of approval or by the issue of a new certificate of approval in accordance with 9.1.3.

9.1.3 **Certificate of approval**

9.1.3.1 Conformity of EX/II, EX/III, FL, OX and AT vehicles and MEMUs with the requirements of this Part is subject to a certificate of approval (certificate of ADR approval) issued by the competent authority of the country of registration for each vehicle whose inspection yields satisfactory results or has resulted in the issue of a declaration of conformity with the requirements of Chapter 9.2 in accordance with 9.1.2.1.

9.1.3.2 A certificate of approval issued by the competent authority of one Contracting Party for a vehicle registered in the territory of that Contracting Party shall be accepted, so long as its validity continues, by the competent authorities of the other Contracting Parties.

9.1.3.3 The certificate of approval shall have the same layout as the model shown in 9.1.3.5. Its dimensions shall be 210 mm × 297 mm (format A4). Both front and back may be used. The colour shall be white, with a pink diagonal stripe.

² ECE Regulation No 105 (Uniform provisions concerning the approval of vehicles intended for the carriage of dangerous goods with regard to their specific construction features).

³ Directive 98/91/EC of the European Parliament and of the Council of 14 December 1998 relating to motor vehicles and their trailers intended for the transport of dangerous goods by road and amending Directive 70/156/EEC relating to the type approval of motor vehicles and their trailers (Official Journal of the European Communities No L011 of 16.01.1999, p. 0025-0036).

It shall be drawn up in the language or one of the languages of the country issuing it. If that language is not English, French or German, the title of the certificate of approval and any remarks under No. 11 shall also be drawn up in English, French or German.

The certificate of approval for a vacuum-operated waste tank-vehicle shall bear the following remark: "vacuum-operated waste tank-vehicle".

9.1.3.4

The validity of a certificate of approval shall expire not later than one year after the date of the technical inspection of the vehicle preceding the issue of the certificate. The next approval term shall, however, be related to the last nominal expiry date, if the technical inspection is performed within one month before or after that date.

However, in the case of tanks subject to compulsory periodic inspection this provision shall not mean that tightness (leakproofness) tests, hydraulic pressure tests or internal inspections of tanks have to be carried out at intervals shorter than those laid down in Chapters 6.8 and 6.9.

Model for certificate of approval for vehicles carrying certain dangerous goods

<p align="center">CERTIFICATE OF APPROVAL FOR VEHICLES CARRYING CERTAIN DANGEROUS GOODS</p>					
<p>This certificate testifies that the vehicle specified below fulfils the conditions prescribed by the European Agreement concerning the International Carriage of Dangerous Goods by Road (ADR).</p>					
1. Certificate No.:	2. Vehicle manufacturer:	3. Vehicle Identification No.:	4. Registration number (if any):		
5. Name and business address of carrier, operator or owner:					
6. Description of vehicle: ¹					
7. Vehicle designation(s) according to 9.1.1.2 of ADR: ²					
EX/II	EX/III	FL	OX	AT	MEMU
8. Endurance braking system: ³					
<input type="checkbox"/> Not applicable <input type="checkbox"/> The effectiveness according to 9.2.3.1.2 of ADR is sufficient for a total mass of the transport unit of ____t ⁴					
9. Description of the fixed tank(s)/battery-vehicle (if any):					
9.1 Manufacturer of the tank:					
9.2 Approval number of the tank/battery-vehicle:					
9.3 Tank manufacturer's serial number/Identification of elements of battery-vehicle:					
9.4 Year of manufacture:					
9.5 Tank code according to 4.3.3.1 or 4.3.4.1 of ADR:					
9.6 Special provisions TC and TE according to 6.8.4 of ADR (if applicable) ⁶ :					
10. Dangerous goods authorised for carriage:					
The vehicle fulfils the conditions required for the carriage of dangerous goods assigned to the vehicle designation(s) in No. 7.					
10.1 In the case of an EX/II <input type="checkbox"/> goods of Class 1 including compatibility group J or EX/III vehicle ³ <input type="checkbox"/> <input type="checkbox"/> goods of Class 1 excluding compatibility group J					
10.2 In the case of a tank-vehicle/battery-vehicle ³					
<input type="checkbox"/> only the substances permitted under the tank code and any special provisions specified in No. 9 may be carried ⁵ or <input type="checkbox"/> only the following substances (Class, UN number, and if necessary packing group and proper shipping name) may be carried:					
Only substances which are not liable to react dangerously with the materials of the shell, gaskets, equipment and protective linings (if applicable) may be carried.					
11. Remarks:					
12. Valid until:			Stamp of issuing service		
			Place, Date, Signature		

¹ According to the definitions for power-driven vehicles and for trailers of categories N and O as defined in Annex 7 of the Consolidated Resolution on the Construction of Vehicles (R.E.3) or in Directive 97/27/EC.

² Strike out what is not appropriate.

³ Mark the appropriate.

⁴ Enter appropriate value. A value of 44t will not limit the "registration / in-service maximum permissible mass" indicated in the registration document(s).

⁵ Substances assigned to the tank code specified in No. 9 or to another tank code permitted under the hierarchy in 4.3.3.1.2 or 4.3.4.1.2, taking account of the special provision(s), if any.

⁶ Not required when the authorized substances are listed in No. 10.2.

13. Extensions of validity	
Validity extended until	Stamp of issuing service, place, date, signature:

NOTE: This certificate shall be returned to the issuing service when the vehicle is taken out of service; if the vehicle is transferred to another carrier, operator or owner, as specified in No. 5; on expiry of the validity of the certificate; and if there is a material change in one or more essential characteristics of the vehicle.

CHAPTER 9.2

REQUIREMENTS CONCERNING THE CONSTRUCTION OF VEHICLES

9.2.1 Compliance with the requirements of this Chapter

9.2.1.1 EX/II, EX/III, FL, OX and AT vehicles shall comply with the requirements of this Chapter, according to the table below.

For vehicles other than of EX/II, EX/III, FL, OX and AT:

- the requirements of 9.2.3.1.1 (Braking equipment in accordance with ECE Regulation No. 13 or Directive 71/320/EEC) are applicable to all vehicles first registered (or which entered into service if the registration is not mandatory) after 30 June 1997;
- the requirements of 9.2.5 (Speed limitation device in accordance with ECE Regulation No. 89 or Directive 92/24/EEC) are applicable to all motor vehicles with a maximum mass exceeding 12 tonnes first registered after 31 December 1987 and all motor vehicles with a maximum mass exceeding 3.5 tonnes but not more than 12 tonnes first registered after 31 December 2007.

9.2.1.2 MEMUs shall comply with the requirements of this Chapter applicable to EX/III-vehicles.

9.2.2 Electrical equipment

9.2.2.1 General provisions

The electrical installation as a whole shall meet the provisions of 9.2.2.2 to 9.2.2.6 in accordance with the table of 9.2.1.

9.2.2.2 Wiring

9.2.2.2.1 The size of conductors shall be large enough to avoid overheating. Conductors shall be adequately insulated. All circuits shall be protected by fuses or automatic circuit breakers, except for the following:

- from the battery to the cold start and stopping systems of the engine;
- from the battery to the alternator;
- from the alternator to the fuse or circuit breaker box;
- from the battery to the starter motor;
- from the battery to the power control housing of the endurance braking system (see 9.2.3.1.2), if this system is electrical or electromagnetic;
- from the battery to the electrical lifting mechanism for lifting the bogie axle.

The above unprotected circuits shall be as short as possible.

9.2.2.2.2 Cables shall be securely fastened and positioned in such a way that the conductors are adequately protected against mechanical and thermal stresses.

9.2.2.3 Battery master switch

9.2.2.3.1 A switch for breaking the electrical circuits shall be placed as close to the battery as practicable. If a single pole switch is used it shall be placed in the supply lead and not in the earth lead.

9.2.2.3.2 A control device to facilitate the disconnecting and reconnecting functions of the switch shall be installed in the driver's cab. It shall be readily accessible to the driver and be distinctively marked. It shall be protected against inadvertent operation by either adding a protective cover, by using a dual movement control device or by other suitable means. Additional control devices may be installed provided they are distinctively marked and protected against inadvertent operation. If the control device(s) are electrically operated, the circuits of the control device(s) are subject to the requirements of 9.2.2.5.

9.2.2.3.3 The switch shall have a casing with protection degree IP 65 in accordance with IEC Standard 60529.

9.2.2.3.4 The cable connections on the switch shall have protection degree IP 54. However, this does not apply if these connections are contained in a housing which may be the battery box. In this case it is sufficient to insulate the connections against short circuits, for example with a rubber cap.

9.2.2.4 *Batteries*

The battery terminals shall be electrically insulated or covered by an insulating battery box cover. If the batteries are not located under the engine bonnet, they shall be fitted in a vented box.

9.2.2.5 *Permanently energized circuits*

- 9.2.2.5.1 (a) Those parts of the electrical installation including the leads which shall remain energized when the battery master switch is open, shall be suitable for use in hazardous areas. Such equipment shall meet the general requirements of IEC 60079, parts 0 and 14¹ and the additional requirements applicable from IEC 60079, parts 1, 2, 5, 6, 7, 11, 15 or 18²;

- (b) For the application of IEC 60079 part 14¹, the following classification shall be used:

Permanently energized electrical equipment including the leads which is not subject to 9.2.2.3 and 9.2.2.4 shall meet the requirements for Zone 1 for electrical equipment in general or meet the requirements for Zone 2 for electrical equipment situated in the driver's cab. The requirements for explosion group IIC, temperature class T6 shall be met.

However, for permanently energized electrical equipment installed in an environment where the temperature caused by non-electrical equipment situated in that environment exceeds the T6 temperature limit, the temperature classification of the permanently energized electrical equipment shall be at least that of the T4 temperature class.

- (c) The supply leads for permanently energised equipment shall either comply with the provisions of IEC 60079, part 7 ("Increased safety") and be protected by a fuse or automatic circuit breaker placed as close to the source of power as practicable or, in the case of "intrinsically safe equipment", they shall be protected by a safety barrier placed as close to the source of power as practicable.

- 9.2.2.5.2 Bypass connections to the battery master switch for electrical equipment which must remain energized when the battery master switch is open shall be protected against overheating by suitable means, such as a fuse, a circuit breaker or a safety barrier (current limiter).

9.2.2.6 *Provisions concerning that part of the electrical installation situated to the rear of the driver's cab*

The whole installation shall be so designed, constructed and protected such that it cannot provoke any ignition or short-circuit under normal conditions of use of vehicles and that these risks can be minimized in the event of an impact or deformation. In particular:

9.2.2.6.1 *Wiring*

The wiring located to the rear of the driver's cab shall be protected against impact, abrasion and chafing during normal vehicle operation. Examples of appropriate protection are given in figures 1, 2, 3 and 4 below. However, the sensor cables of anti-lock braking devices do not need additional protection.

¹ The requirements of IEC 60079 part 14 do not take precedence over the requirement of this Part.

² As an alternative, the general requirements of EN 50014 and the additional requirements of EN 50016, 50017, 50018, 50019, 50020, 50021 or 50028 may be used

Figure N°1

Figure N°2

Figure N°3

Figure N°4

9.2.2.6.2 *Lighting*

Lamp bulbs with a screw cap shall not be used.

9.2.2.6.3 *Electrical connections*

Electrical connections between motor vehicles and trailers shall have a protection degree IP54 in accordance with IEC 60529 and be designed to prevent accidental disconnection. Connectors shall be in conformity with ISO 12098:2004³, ISO 7638:2003³ and EN 15207:2006 as appropriate.

9.2.3 **Braking equipment**

9.2.3.1 *General provisions*

9.2.3.1.1 Motor vehicles and trailers intended for use as transport units for dangerous goods shall fulfil all relevant technical requirements of ECE Regulation No.13⁴ or Directive 71/320/EEC⁵, as amended, in accordance with the dates of application specified therein.

9.2.3.1.2 EX/III, FL, OX and AT vehicles shall fulfil the requirements of ECE Regulation No.13⁴, Annex 5.

9.2.3.2 *(Deleted)*

9.2.4 **Prevention of fire risks**

9.2.4.1 *General provisions*

The following technical provisions shall apply in accordance with the table of 9.2.1.

9.2.4.2 *Vehicle cab*

Unless the driver's cab is made of materials which are not readily flammable, a shield made of metal or other suitable material of the same width as the tank shall be fitted at the rear of the cab. Any windows in the rear of the cab or in the shield shall be hermetically closed and made of fire-resistant safety glass with fire-resistant frames. Furthermore, there shall be a clear space of not less than 15 cm between the tank and the cab or the shield.

9.2.4.3 *Fuel tanks*

The fuel tanks for supplying the engine of the vehicle shall meet the following requirements:

- (a) In the event of any leakage, the fuel shall drain to the ground without coming into contact with hot parts of the vehicle or the load;
- (b) Fuel tanks containing petrol shall be equipped with an effective flame trap at the filler opening or with a closure enabling the opening to be kept hermetically sealed.

³ ISO 4009, referred to in this standard, need not be applied.

⁴ ECE Regulation No. 13 (Uniform provisions concerning the approval of vehicles of categories M, N and O with regard to braking).

⁵ Directive 71/320/EEC (originally published in the Official Journal of the European Communities No. L202 of 6.9.1971).

9.2.4.4 *Engine*

The engine propelling the vehicle shall be so equipped and situated to avoid any danger to the load through heating or ignition. In the case of EX/II and EX/III vehicles the engine shall be of compression-ignition construction.

9.2.4.5 *Exhaust system*

The exhaust system (including the exhaust pipes) shall be so directed or protected to avoid any danger to the load through heating or ignition. Parts of the exhaust system situated directly below the fuel tank (diesel) shall have a clearance of at least 100 mm or be protected by a thermal shield.

9.2.4.6 *Vehicle endurance braking*

Vehicles equipped with endurance braking systems emitting high temperatures placed behind the rear wall of the driver's cab shall be equipped with a thermal shield securely fixed and located between this system and the tank or load so as to avoid any heating, even local, of the tank wall or the load.

In addition, the thermal shield shall protect the braking system against any outflow or leakage, even accidental, of the load. For instance, a protection including a twin-shell shield shall be considered satisfactory.

9.2.4.7 *Combustion heaters*

9.2.4.7.1 Combustion heaters shall comply with the relevant technical requirements of ECE Regulation No. 122⁶, as amended, or of Directive 2001/56/EC⁷, as amended, in accordance with the dates of application specified therein and the provisions of 9.2.4.7.2 to 9.2.4.7.6 applicable according to the table in 9.2.1.

9.2.4.7.2 The combustion heaters and their exhaust gas routing shall be designed, located, protected or covered so as to prevent any unacceptable risk of heating or ignition of the load. This requirement shall be considered as fulfilled if the fuel tank and the exhaust system of the appliance conform to provisions similar to those prescribed for fuel tanks and exhaust systems of vehicles in 9.2.4.3 and 9.2.4.5 respectively.

9.2.4.7.3 The combustion heaters shall be put out of operation by at least the following methods:

- (a) Intentional manual switching off from the driver's cab;
- (b) Stopping of the vehicle engine; in this case the heating device may be restarted manually by the driver;
- (c) Start up of a feed pump on the motor vehicle for the dangerous goods carried.

9.2.4.7.4 Afterrunning is permitted after the combustion heaters have been put out of operation. For the methods of 9.2.4.7.3 (b) and (c) the supply of combustion air shall be interrupted by suitable measures after an afterrunning cycle of not more than 40 seconds. Only heaters shall be used for which proof has been furnished that the heat exchanger is resistant to the reduced afterrunning cycle of 40 seconds for the time of their normal use.

⁶ ECE Regulation No. 122 (Regulation with regard the type approval of a heating system and of a vehicle with regard to its heating system).

⁷ Directive 2001/56/EC of the European Parliament and of the Council of 27 September 2001 relating to heating systems for motor vehicles and their trailers (initially published in the Official Journal of the European Communities No. L292 of 9 November 2001).

9.2.4.7.5 The combustion heater shall be switched on manually. Programming devices shall be prohibited.

9.2.4.7.6 Combustion heaters with gaseous fuels are not permitted.

9.2.5 Speed limitation device

Motor vehicles (rigid vehicles and tractors for semi-trailers) with a maximum mass exceeding 3.5 tonnes, shall be equipped with a speed limitation device according to the technical requirements of ECE Regulation No. 89⁸, as amended. The device shall be set in such a way that the speed cannot exceed 90 km/h, bearing in mind the technological tolerance of the device.

9.2.6 Coupling devices of trailers

Coupling devices of trailers shall comply with the technical requirements of ECE Regulation No. 55⁹ or Directive 94/20/EC¹⁰, as amended, in accordance with the dates of application specified therein.

⁸ ECE Regulation No. 89: uniform provisions concerning the approval of:

- I. Vehicles with regard to limitation of their maximum speed;
- II. Vehicles with regard to the installation of a speed limitation device (SLD) of an approved type;
- III. Speed limitation devices (SLD).

As an alternative, the corresponding provisions of directive 92/24/EEC of the Council of 31 March 1992 (originally published in the Official Journal of the European Communities No. L 129 of 14.05.1992), as amended, may apply provided that they have been amended in accordance with the latest amended form of ECE Regulation No. 89 applicable at the time of the vehicle approval.

⁹ ECE Regulation No. 55 (Uniform provisions concerning the approval of mechanical coupling components of combinations of vehicles).

¹⁰ Directive 94/20/EC of the European parliament and of the Council of 30 of May 1994 (originally published in the Official Journal of the European Communities No. L 195 of 29.07.1994).

CHAPTER 9.3

ADDITIONAL REQUIREMENTS CONCERNING COMPLETE OR COMPLETED EX/II OR EX/III VEHICLES INTENDED FOR THE CARRIAGE OF EXPLOSIVE SUBSTANCES AND ARTICLES (CLASS 1) IN PACKAGES

9.3.1 Materials to be used in the construction of vehicle bodies

No materials likely to form dangerous compounds with the explosive substances carried shall be used in the construction of the body.

9.3.2 Combustion heaters

9.3.2.1 Combustion heaters may only be installed on EX/II and EX/III vehicles for heating of the driver's cab or the engine.

9.3.2.2 Combustion heaters shall meet the requirements of 9.2.4.7.1, 9.2.4.7.2, 9.2.4.7.5 and 9.2.4.7.6.

9.3.2.3 The switch of the combustion heater may be installed outside the driver's cab.

It is not necessary to prove that the heat exchanger is resistant to the reduced afterrunning cycle.

9.3.2.4 No combustion heaters or fuel tanks, power sources, combustion air or heating air intakes as well as exhaust tube outlets required for the operation of the combustion heater shall be installed in the load compartment.

9.3.3 EX/II vehicles

The vehicles shall be designed, constructed and equipped so that the explosives are protected from external hazards and the weather. They shall be either closed or sheeted. Sheeting shall be resistant to tearing and be of impermeable material, not readily flammable¹. It shall be tautened so as to cover the loading area on all sides.

All openings in the load compartment of closed vehicles shall have lockable, close-fitting doors or rigid covers. The driver's compartment shall be separated from the load compartment by a continuous wall.

9.3.4 EX/III vehicles

9.3.4.1 The vehicles shall be designed, constructed and equipped so that the explosives are protected from external hazards and the weather. These vehicles shall be closed. The driver's compartment shall be separated from the load compartment by a continuous wall. The loading surface shall be continuous. Load restraint anchorage points may be installed. All joints shall be sealed. All openings shall be capable of being locked. They shall be so constructed and placed as to overlap at the joints.

¹ In the case of flammability, this requirement will be deemed to be met if, in accordance with the procedure specified in ISO standard 3795:1989 'Road vehicles, and tractors and machinery for agriculture and forestry - Determination of burning behaviour of interior materials', samples of the sheeting have a burn rate not exceeding 100 mm/min.

- 9.3.4.2 The body shall be made from heat and flame resistant materials with a minimum thickness of 10 mm. Materials classified as Class B-s3-d2 according to standard EN 13501-1: 2002 are deemed to fulfil this requirement.

If the material used for the body is metal, the complete inside of the body shall be covered with materials fulfilling the same requirement.

9.3.5 Engine and load compartment

The engine propelling an EX/II or EX/III vehicle shall be placed forward of the front wall of the load compartment; it may nevertheless be placed under the load compartment, provided this is done in such a way that any excess heat does not constitute a hazard to the load by raising the temperature on the inner surface of the load compartment above 80 °C.

9.3.6 External heat sources and load compartment

The exhaust system of EX/II and EX/III vehicles or others parts of these complete or completed vehicles shall be so constructed and situated that any excess heat shall not constitute a hazard to the load by raising the temperature on the inner surface of the load compartment above 80 °C.

9.3.7 Electrical equipment

- 9.3.7.1 The rated voltage of the electrical system shall not exceed 24V.

- 9.3.7.2 Any lighting in the load compartment of EX/II vehicles shall be on the ceiling and covered, i.e. with no exposed wiring or bulb.

In the case of Compatibility Group J, the electrical installation shall be at least IP65 (e.g. flame-proof Eex d). Any electrical equipment accessible from the inside of the load compartment shall be sufficiently protected from mechanical impact from the inside.

- 9.3.7.3 The electrical installation on EX/III vehicles shall meet the relevant requirements of 9.2.2.2, 9.2.2.3, 9.2.2.4, 9.2.2.5.2 and 9.2.2.6.

The electrical installation in the load compartment shall be dust-protected (at least IP54 or equivalent) or, in the case of Compatibility Group J, at least IP65 (e.g. flame-proof Eex d).

CHAPTER 9.4

ADDITIONAL REQUIREMENTS CONCERNING THE CONSTRUCTION OF THE BODIES OF COMPLETE OR COMPLETED VEHICLES INTENDED FOR THE CARRIAGE OF DANGEROUS GOODS IN PACKAGES (OTHER THAN EX/II AND EX/III VEHICLES)

- 9.4.1 Combustion heaters shall meet the following requirements:
- (a) The switch may be installed outside the driver's cab;
 - (b) The device may be switched off from outside the load compartment; and
 - (c) It is not necessary to prove that the heat exchanger is resistant to the reduced afterrunning cycle.
- 9.4.2 If the vehicle is intended for the carriage of dangerous goods for which a label conforming to models Nos. 1, 1.4, 1.5, 1.6, 3, 4.1, 4.3, 5.1 or 5.2 is prescribed, no fuel tanks, power sources, combustion air or heating air intakes as well as exhaust tube outlets required for the operation of the combustion heater shall be installed in the load compartment. It shall be ensured that the heating air outlet cannot be blocked by cargo. The temperature to which packages are heated shall not exceed 50° C. Heating devices installed inside the load compartments shall be designed so as to prevent the ignition of an explosive atmosphere under operating conditions.
- 9.4.3 Additional requirements concerning the construction of the bodies of vehicles intended for the carriage of given dangerous goods or specific packagings may be included in Part 7, Chapter 7.2 in accordance with the indications in Column (16) of Table A of Chapter 3.2, for a given substance.

CHAPTER 9.5

ADDITIONAL REQUIREMENTS CONCERNING THE CONSTRUCTION OF THE BODIES OF COMPLETE OR COMPLETED VEHICLES INTENDED FOR THE CARRIAGE OF DANGEROUS SOLIDS IN BULK

- 9.5.1 Combustion heaters shall meet the following requirements:
- (a) The switch may be installed outside the driver's cab;
 - (b) The device may be switched off from outside the load compartment; and
 - (c) It is not necessary to prove that the heat exchanger is resistant to the reduced afterrunning cycle.
- 9.5.2 If the vehicle is intended for the carriage of dangerous goods for which a label conforming to models Nos. 4.1, 4.3 or 5.1 is prescribed, no fuel tanks, power sources, combustion air or heating air intakes as well as exhaust tube outlets required for the operation of the combustion heater shall be installed in the load compartment. It shall be ensured that the heating air outlet cannot be blocked by cargo. The temperature to which the load is heated shall not exceed 50 °C. Heating devices installed inside the load compartments shall be designed so as to prevent the ignition of an explosive atmosphere under operating conditions.
- 9.5.3 The bodies of vehicles intended for the carriage of dangerous solids in bulk shall meet the requirements of Chapter 6.11 and 7.3, as appropriate, including those of 7.3.2 or 7.3.3 which may be applicable in accordance with the indications in columns (10) or (17) respectively of Table A of Chapter 3.2 for a given substance.

CHAPTER 9.6

ADDITIONAL REQUIREMENTS CONCERNING COMPLETE OR COMPLETED VEHICLES INTENDED FOR THE CARRIAGE OF TEMPERATURE CONTROLLED SUBSTANCES

- 9.6.1 Insulated, refrigerated and mechanically-refrigerated vehicles intended for the carriage of temperature controlled substances shall conform to the following conditions:
- (a) the vehicle shall be such and so equipped as regards its insulation and means of refrigeration, that the control temperature prescribed in 2.2.41.1.17 and 2.2.52.1.16 and in 2.2.41.4 and 2.2.52.4 for the substance to be carried is not exceeded. The overall heat transfer coefficient shall be not more than $0.4 \text{ W/m}^2\text{K}$;
 - (b) the vehicle shall be so equipped that vapours from the substances or the coolant carried cannot penetrate into the driver's cab;
 - (c) a suitable device shall be provided enabling the temperature prevailing in the loading space to be determined at any time from the cab;
 - (d) the loading space shall be provided with vents or ventilating valves if there is any risk of a dangerous excess pressure arising therein. Care shall be taken where necessary to ensure that refrigeration is not impaired by the vents or ventilating valves;
 - (e) the refrigerant shall not be flammable; and
 - (f) the refrigerating appliance of a mechanically refrigerated vehicle shall be capable of operating independently of the engine used to propel the vehicle.
- 9.6.2 Suitable methods (see V8(3)) to prevent the control temperature from being exceeded are listed in Chapter 7.2 (R1 to R5). Depending on the method used, additional provisions concerning the construction of vehicle bodies may be included in Chapter 7.2.

CHAPTER 9.7

ADDITIONAL REQUIREMENTS CONCERNING FIXED TANKS (TANK-VEHICLES), BATTERY-VEHICLES AND COMPLETE OR COMPLETED VEHICLES USED FOR THE CARRIAGE OF DANGEROUS GOODS IN DEMOUNTABLE TANKS WITH A CAPACITY GREATER THAN 1 M³ OR IN TANK-CONTAINERS, PORTABLE TANKS OR MEGCs OF A CAPACITY GREATER THAN 3 M³ (EX/III, FL, OX AND AT VEHICLES)

9.7.1 General provisions

- 9.7.1.1 In addition to the vehicle proper, or the units of running gear used in its stead, a tank-vehicle comprises one or more shells, their items of equipment and the fittings for attaching them to the vehicle or to the running-gear units.
- 9.7.1.2 Once the demountable tank has been attached to the carrier vehicle, the entire unit shall meet the requirements prescribed for tank-vehicles.

9.7.2 Requirements concerning tanks

- 9.7.2.1 Fixed tanks or demountable tanks made of metal shall meet the relevant requirements of Chapter 6.8.
- 9.7.2.2 Elements of battery-vehicles and of MEGCs shall meet the relevant requirements of Chapter 6.2 in the case of cylinders, tubes, pressure drums and bundles of cylinders and the requirements of Chapter 6.8 in the case of tanks.
- 9.7.2.3 Tank-containers made of metal shall meet the requirements of Chapter 6.8, portable tanks shall meet the requirements of Chapter 6.7 or, if applicable, those of the IMDG Code (see 1.1.4.2).
- 9.7.2.4 Tanks made of fibre-reinforced plastics material shall meet the requirements of Chapter 6.9.
- 9.7.2.5 Vacuum-operated waste tanks shall meet the requirements of Chapter 6.10.

9.7.3 Fastenings

Fastenings shall be designed to withstand static and dynamic stresses in normal conditions of carriage, and minimum stresses as defined in 6.8.2.1.2, 6.8.2.1.11 to 6.8.2.1.15 and 6.8.2.1.16 in the case of tank-vehicles, battery-vehicles, and vehicles carrying demountable tanks.

9.7.4 Earthing of FL vehicles

Tanks made of metal or of fibre-reinforced plastics material of FL tank-vehicles and battery elements of FL battery-vehicles shall be linked to the chassis by means of at least one good electrical connection. Any metal contact capable of causing electrochemical corrosion shall be avoided.

NOTE: See also 6.9.1.2 and 6.9.2.14.3.

9.7.5 Stability of tank-vehicles

9.7.5.1 The overall width of the ground-level bearing surface (distance between the outer points of contact with the ground of the right-hand tyre and the left-hand tyre of the same axle) shall be at least equal to 90% of the height of the centre of gravity of the laden tank-vehicle. In an articulated vehicle the mass on the axles of the load-carrying unit of the laden semi-trailer shall not exceed 60% of the nominal total laden mass of the complete articulated vehicle.

9.7.5.2 In addition, tank-vehicles with fixed tanks with a capacity of more than 3 m³ intended for the carriage of dangerous goods in the liquid or molten state tested with a pressure of less than 4 bar, shall comply with the technical requirements of ECE Regulation No. 111¹ for lateral stability, as amended, in accordance with the dates of application specified therein. The requirements are applicable to tank-vehicles which are first registered as from 1 July 2003.

9.7.6 Rear protection of vehicles

A bumper sufficiently resistant to rear impact shall be fitted over the full width of the tank at the rear of the vehicle. There shall be a clearance of at least 100 mm between the rear wall of the tank and the rear of the bumper (this clearance being measured from the rearmost point of the tank wall or from projecting fittings or accessories in contact with the substance being carried). Vehicles with a tilting shell for the carriage of powdery or granular substances and a vacuum-operated waste tank with a tilting shell with rear discharge do not require a bumper if the rear fittings of the shell are provided with a means of protection which protects the shell in the same way as a bumper.

***NOTE 1:** This provision does not apply to vehicles used for the carriage of dangerous goods in tank-containers, MEGCs or portable tanks.*

***NOTE 2:** For the protection of tanks against damage by lateral impact or overturning, see 6.8.2.1.20 and 6.8.2.1.21 or, for portable tanks, 6.7.2.4.3 and 6.7.2.4.5.*

9.7.7 Combustion heaters

9.7.7.1 Combustion heaters shall meet the requirements of 9.2.4.7.1, 9.2.4.7.2, 9.2.4.7.5 and the following:

- (a) The switch may be installed outside the driver's cab;
- (b) The device may be switched off from outside the load compartment; and
- (c) It is not necessary to prove that the heat exchanger is resistant to the reduced afterrunning cycle.

In addition for FL vehicles, they shall meet the requirements of 9.2.4.7.3 and 9.2.4.7.4.

9.7.7.2 If the vehicle is intended for the carriage of dangerous goods for which a label conforming to models Nos. 1.5, 3, 4.1, 4.3, 5.1 or 5.2 is prescribed, no fuel tanks, power sources, combustion air or heating air intakes as well as exhaust tube outlets required for the operation of the combustion heater shall be installed in the load compartment. It shall be ensured that the heating air outlet cannot be blocked by cargo. The temperature to which the load is heated shall not exceed 50 °C. Heating devices installed inside the load compartments shall be designed so as to prevent the ignition of an explosive atmosphere under operating conditions.

¹ ECE Regulation No. 111: Uniform provisions concerning the approval of tank-vehicles of categories N and O with regard to rollover stability.

9.7.8 Electrical equipment

- 9.7.8.1 The electrical installation on FL vehicles for which an approval according to 9.1.2 is required shall meet the requirements of 9.2.2.2, 9.2.2.3, 9.2.2.4, 9.2.2.5.1 and 9.2.2.6.

However additions to or modifications of the electrical installations of the vehicle shall meet the requirements for the electrical apparatus of the relevant group and temperature class according to the substances to be carried.

NOTE: For transitional provisions, see also 1.6.5.

- 9.7.8.2 Electrical equipment on FL vehicles, situated in areas where an explosive atmosphere is, or may be expected to be, present in such quantities as to require special precautions, shall be suitable for use in a hazardous area. Such equipment shall meet the general requirements of IEC 60079 parts 0 and 14 and the additional requirements applicable from IEC 60079 parts 1, 2, 5, 6, 7, 11 or 18². The requirements for the electrical apparatus of the relevant group and temperature class according to the substances to be carried shall be met.

For the application of IEC 60079 part 14², the following classification shall be used:

ZONE 0

Inside tank compartments, fittings for filling and discharge and vapour recovery lines.

ZONE 1

Inside cabinets for equipment used for filling and discharge and within 0.5 m of venting devices and pressure relief safety valves.

- 9.7.8.3 Permanently energized electrical equipment, including the leads, which is situated outside Zones 0 and 1 shall meet the requirements for Zone 1 for electrical equipment in general or meet the requirements for Zone 2 according to IEC 60079 part 14² for electrical equipment situated in the driver's cab. The requirements for the relevant group of electrical apparatus according to the substances to be carried shall be met.

9.7.9 Additional safety requirements concerning EX/III vehicles

- 9.7.9.1 EX/III vehicles shall be equipped with automatic fire extinguisher systems for the engine compartment.
- 9.7.9.2 Protection of the load by metal thermal shields against tyre fire shall be provided.

² As an alternative, the general requirements of EN 50014 and the additional requirements of EN 50015, 50016, 50017, 50018, 50019, 50020 or 50028 may be used.

CHAPTER 9.8

ADDITIONAL REQUIREMENTS CONCERNING COMPLETE AND COMPLETED MEMUs

9.8.1 General provisions

In addition to the vehicle proper, or the units of running gear used in its stead, a MEMU comprises one or more tanks and bulk containers, their items of equipment and the fittings for attaching them to the vehicle or to the running-gear units.

9.8.2 Requirements concerning tanks and bulk containers

Tanks, bulk containers and special compartments for packages of explosives of MEMUs shall meet the requirements of Chapter 6.12.

9.8.3 Earthing of MEMUs

Tanks, bulk containers and special compartments for packages of explosives made of metal or of fibre-reinforced plastics material shall be linked to the chassis by means of at least one good electrical connection. Any metal contact capable of causing electro-chemical corrosion or reacting with the dangerous goods carried in the tanks and bulk containers shall be avoided.

9.8.4 Stability of MEMUs

The overall width of the ground-level bearing surface (distance between the outer points of contact with the ground of the right-hand tyre and the left-hand tyre of the same axle) shall be at least equal to 90% of the height of the centre of gravity of the laden vehicle. In an articulated vehicle the mass on the axles of the load-carrying unit of the laden semi-trailer shall not exceed 60% of the nominal total laden mass of the complete articulated vehicle.

9.8.5 Rear protection of MEMUs

A bumper sufficiently resistant to rear impact shall be fitted over the full width of the tank at the rear of the vehicle. There shall be a clearance of at least 100 mm between the rear wall of the tank and the rear of the bumper (this clearance being measured from the rearmost point of the tank wall or from protecting fittings or accessories in contact with the substance being carried). Vehicles with a tilting shell with rear discharge do not require a bumper if the rear fittings of the shell are provided with a means of protection which protects the shell in the same way as a bumper.

***NOTE:** This provision does not apply to MEMUs where the tanks are protected adequately against rear impact by other means, e.g. machinery or piping not containing dangerous goods.*

9.8.6 Combustion heaters

9.8.6.1 Combustion heaters shall meet the requirements of 9.2.4.7.1, 9.2.4.7.2, 9.2.4.7.5, 9.2.4.7.6 and the following:

- (a) the switch may be installed outside the driver's cab;
- (b) the device shall be switched off from outside the MEMU compartment; and
- (c) it is not necessary to prove that the heat exchanger is resistant to the reduced afterrunning cycle.

9.8.6.2 No fuel tanks, power sources, combustion air or heating air intakes as well as exhaust tube outlets required for the operation of the combustion heater shall be installed in the load compartments containing tanks. It shall be ensured that the heating air outlet cannot be blocked. The temperature to which any equipment is heated shall not exceed 50 °C. Heating devices installed inside the compartments shall be designed so as to prevent the ignition of any explosive atmosphere under operating conditions.

9.8.7 Additional safety requirements

9.8.7.1 MEMUs shall be equipped with automatic fire extinguisher systems for the engine compartment.

9.8.7.2 Protection of the load by metal thermal shields against tyre fire shall be provided.

9.8.8 Additional security requirements

Process equipment and special compartments in MEMUs shall be fitted with locks.

A VESZÉLYES ÁRUK NEMZETKÖZI KÖZÚTI

SZÁLLÍTÁSÁRÓL SZÓLÓ

EURÓPAI MEGÁLLAPODÁS

(ADR)

„A” ÉS „B” MELLÉKLETE

2013.

„A” MELLÉKLET

ÁLTALÁNOS ELŐÍRÁSOK ÉS
A VESZÉLYES ANYAGOKRA ÉS TÁRGYAKRA
VONATKOZÓ ELŐÍRÁSOK

1. RÉSZ

ÁLTALÁNOS ELŐÍRÁSOK

1.1 FEJEZET

HATÁLY ÉS ALKALMAZÁSI TERÜLET

1.1.1 Szerkezet

Az ADR „A” és „B” Melléklete kilenc részre van osztva. Az „A” Melléklet az 1 – 7. részből, a „B” Melléklet a 8. és 9. részből áll. Minden rész fejezetekből áll és minden fejezet szakaszt és bekezdéseket tartalmaz. Az egyes részekben belül a rész sorszáma kapcsolódik az egyes fejezetek, szakaszok és bekezdések sorszámaához; például a 4. rész, 2 fejezet, 1 szakaszának számozása: „4.2.1”.

1.1.2 Hatály

1.1.2.1 Az ADR 2. cikk értelmében az „A” Melléklet a következőket határozza meg:

- a) azokat a veszélyes árukat, amelyek a nemzetközi szállításból ki vannak zárva;
- b) azokat a veszélyes árukat, amelyek nemzetközi szállítása engedélyezett és a szállításhoz előírt feltételeket (beleértve a mentességeket), különösen:
 - az áruk besorolását (osztályozását), beleértve a besorolási kritériumokat és a vonatkozó vizsgálati módszereket;
 - a csomagolóeszközök használatát (beleértve az egybecsomagolást);
 - a tartányok használatát (beleértve a töltést);
 - a feladási eljárásokat (beleértve a küldeménydarabok jelölését és bárcázását, a szállítóeszközök táblázását és jelölését, valamint a szükséges okmányokat és információkat);
 - a csomagolóeszközök és tartányok gyártására, vizsgálatára és jóváhagyására vonatkozó előírásokat;
 - a szállítóeszközök használatát (beleértve a berakást, az együvé rakást és a kirakást).

1.1.2.2 Az „A” Melléklet bizonyos előírásai az ADR 2. cikkével összhangban, a „B” Mellékletre, ill. az „A” és a „B” Mellékletre egyaránt vonatkoznak, a következők szerint:

1.1.1 Szerkezet

1.1.2.3 (A „B” Melléklet hatálya)

1.1.2.4

1.1.3.1 A szállítás jellegéből adódó mentességek

1.1.3.6 Az egy szállítóegységben szállított mennyiségből adódó mentességek

1.1.4 Más szabályzatok alkalmazhatósága

1.1.4.5 Nem közúti szállítás

1.2 Meghatározások és mértékegységek

1.3 A veszélyes áruk szállításában résztvevő személyek képzése

1.4 A résztvevők biztonsággal kapcsolatos kötelezettsége

1.5 Eltérések

1.6 Átmeneti előírások

1.8 A biztonsági követelmények betartását biztosító ellenőrzések, ill. a biztonságot elősegítő, egyéb intézkedések

1.9 A szállítás korlátozása az illetékes hatóságok által

1.10 Közbiztonsági előírások

3.1 Általános előírások

3.2 A veszélyes áruk felsorolása táblázat 1, 2, 14, 15 és 19 oszlopa (a 8. és a 9. rész előírásainak alkalmazása az egyes anyagokra és tárgyakra).

- 1.1.2.3** Az ADR 2. cikk értelmében a „B” Melléklet a veszélyes árukat szállító járművek szerkezetére, felszerelésére és üzemeltetésére vonatkozó feltételeket határozza meg, így:
- a jármű személyzetére, felszerelésére, üzemeltetésére és az okmányokra vonatkozó követelményeket;
 - a járművek szerkezetére és jóváhagyására vonatkozó követelményeket.
- 1.1.2.4** Az ADR 1. cikk c) pontjában a „jármű” kifejezés nem jelent szükségszerűen egy és ugyanazon járművet. Nemzetközi egy szállítás akkor is, ha több különböző járművel végézik, feltéve, hogy a szállítást a fuvarokmányban megjelölt feladó és a címzett között, legalább két ADR Szerződő Fél területén végzik.

1.1.3 Mentességek

1.1.3.1 *A szállítás jellegéből adódó mentességek*

Az ADR előírásait nem kell alkalmazni:

- a) a magánszemélyek által történő veszélyes áru szállításra, amennyiben az áru kiskereskedelmi csomagolásban van és személyes vagy háztartási használatra, továbbá szabadidő vagy sport célokra szolgál, feltéve, hogy a veszélyes áru normális szállítási feltételek melletti kiszabadulásának megakadályozására szükséges intézkedéseket megtették. Amennyiben ez az áru magánszemély által vagy magánszemély részére megtöltött, újratölthető tartályokban szállított gyúlékony folyékony anyag, akkor az összmenyiség egy tartályban legfeljebb 60 liter, egy szállítóegységen legfeljebb 240 liter lehet. Az IBC, a nagycsomagolás, ill. a tartály nem tekinthető kiskereskedelmi csomagolásnak;
- b) az ebben a mellékletben nem szereplő gépek és készülékek szállítására, amelyek szerkezetükben vagy működtető elemeikben veszélyes árut tartalmaznak, feltéve, hogy a veszélyes áru normális szállítási feltételek melletti kiszabadulásának megakadályozására szükséges intézkedéseket megtették;
- c) a vállalatok (vállalkozások) olyan szállításaira, ami fő tevékenységüket kiegészíti, mint például a mély- és magasépítési munkaterületek ellátása, vagy méréssel, javítással és karbantartással kapcsolatos szállítások, ill. visszaszállítások csomagolóeszközként legfeljebb 450 liter mennyiségű veszélyes áru esetén és az 1.1.3.6 bekezdésben meghatározott mennyiségi határokon belül. Meg kell tenni a szükséges intézkedéseket a veszélyes áru normális szállítási feltételek melletti kiszabadulásának megakadályozására. Ez a fajta mentesség nem alkalmazható a 7 osztályra. Ugyancsak nem alkalmazható ez a mentesség a vállalatok (vállalkozások) által anyagbeszerzés, külső vagy belső anyagelosztás céljából végzett szállításokra;
- d) a veszélyhelyzet elhárításában illetékes hatóságok által vagy felügyeletük mellett végzett szállításokra, amennyiben a szállítás a veszélyhelyzet elhárítása érdekében szükséges, különösen:
 - a veszélyes árut tartalmazó, balesetet szenvedett, sérült vagy meghibásodott járműveket szállító járművek által végzett szállításokra; és
 - a rendkívüli eseményben vagy balesetben érintett veszélyes áru összegyűjtésére és a legközelebbi megfelelő, biztonságos helyre történő elszállítására;
- e) emberi életek mentését vagy a környezet védelmét szolgáló, veszélyhelyzetben történő szállításokra, amennyiben teljesen biztonságos végrehajtásukhoz minden intézkedést megtettek;
- f) üres, tisztítatlan, telepített tárolótartályok, amelyekben a 2 osztály A, O vagy F csoportjába tartozó gázok, a 3 vagy a 9 osztály II vagy III csomagolási csoportjába tartozó anyagok vagy a 6.1 osztály II vagy III csomagolási csoportjába tartozó peszticidek voltak, azzal a feltétellel, hogy:
 - minden rajtuk lévő nyílás – az esetleges nyomáscsökkentő szerkezetek nyílásainak kivételével – légmentesen le van zárva;
 - megtették a szükséges intézkedéseket annak érdekében, hogy szokásos szállítási körülmények között a tartalom ne szivároгjon ki; és

- a rakomány úgy van rögzítve rekeszben, kalodában vagy egyéb kezelőeszközben, ill. magán a járművön vagy a konténerben, hogy szokásos szállítási körülmények között ne lazuljon ki, ill. ne mozduljon el.

Ez a mentesség nem vonatkozik az olyan telepített tárolótartályokra, amelyekben érzékenyített robbanóanyag vagy az ADR által a szállításból kizárt anyag volt.

Megjegyzés: A radioaktív anyagokra lásd még az 1.7.1.4 bekezdést is.

1.1.3.2 *A gázok szállítására vonatkozó mentességek*

Az ADR előírásait nem kell alkalmazni, ha a szállított anyagok (tárgyak) a következők:

- a szállítást végző jármű tartályaiban levő gázok, amelyek a jármű meghajtására vagy bármely berendezésének (pl. hűtőkészülék) működtetésére szolgálnak;
- a szállított járművek tüzelőanyag tartályában levő gázok. A zárószelepnek a tartály és a motor között zárva kell lennie és az elektromos érintkezőket meg kell szakítani;
- a 2.2.2.1 bekezdés szerinti A és O csoport gázai, ha a gáz nyomása a tartályban vagy tartányban 20 °C-on nem haladja meg a 200 kPa-t (2 bar-t) és a gáz nem cseppfolyósított, ill. nem mélyhűtött cseppfolyósított gáz. Ide tartozik mindenfajta tartály és tartány, pl. a gépek és berendezések részeit képezők is;
- a jármű üzemelése során használt felszerelésekben (pl. tűzoltó készülékben) lévő gázok, beleértve a tartalék alkatrészekben (pl. felfújt gumiabroncsban) lévő gázokat is. Ez a mentesség arra az esetre is vonatkozik, ha felfújt gumiabroncsokat rakományként szállítanak;
- a járművek különleges készülékeiben (hűtőkészülék, halszállító tartályok, fűtőkészülék stb.) levő gázok, amelyek a szállítás során ezek működtetéséhez szükségesek, valamint az ilyen készülékek tartalék tartályai és üres, tisztítatlan cseretartályai, amelyeket ugyanazon szállítóegységben szállítanak;
- az élelmiszerekben (ideértve a szénsavas italokat is) levő gázok, az UN 1950 tétel alá tartozók kivételével;
- sport céljára használt labdákban lévő gázok; és
- a fényforrásokban lévő gázok, feltéve, hogy a fényforrások úgy vannak csomagolva, hogy esetleges törésük esetén a kilövellési hatás a küldeménydarab belsejére korlátozódik.

1.1.3.3 *Folyékony tüzelőanyagok szállítására vonatkozó mentességek*

Az ADR előírásait nem kell alkalmazni, ha a szállított anyagok a következők:

- a szállítási tevékenységet végző jármű tüzelőanyag tartályaiban lévő és a jármű meghajtására vagy bármely berendezésének működtetésére szolgáló tüzelőanyag.

Ez esetben a tüzelőanyag vagy olyan, a jármű motorjához és/vagy a segéd-berendezéshez közvetlenül csatlakoztatott, rögzített tüzelőanyag tartályban szállítható, amely megfelel a hatósági előírásoknak, vagy hordozható tüzelőanyag tartályban (pl. kannában) szállítható.

A rögzített tartályok együttes térfogata nem haladhatja meg szállítóegységként az 1500 litert és a pótkocsira szerelt tartály térfogata nem haladhatja meg az 500 litert. Szállítóegységként legfeljebb 60 liter szállítható hordozható tüzelőanyag tartályokban. Ezek a korlátozások nem vonatkoznak a segélyszolgálatok által üzemeltetett járművekre;

- a rakományként szállított járművek, szállítóeszközök (pl. csónakok) tartályaiban levő tüzelőanyagok, amelyek meghajtásukra vagy bármely berendezésük működtetésére szolgál. A motor vagy a berendezés és a tüzelőanyag tartály között található csapot a szállítás közben zárva kell tartani, kivéve, ha a berendezésnek működőképesnek kell maradnia. Szükség esetén ezeket a járműveket, szállítóeszközöket állítva kell berakni és feldőlés ellen biztosítani kell.

- 1.1.3.4** *A különleges előírások szerinti és a korlátozott, ill. engedményes mennyiségben csomagolt veszélyes áruk szállítására vonatkozó mentességek*
- Megjegyzés:* A radioaktív anyagokra lásd az 1.7.1.4 bekezdést.
- 1.1.3.4.1** A 3.3 fejezet bizonyos különleges előírásai egyes veszélyes anyagok szállítását részben vagy teljesen felmentik az ADR előírásai alól. Ez a mentesség akkor alkalmazható, ha a különleges előírásra hivatkozás található a 3.2 fejezet „A” táblázat 6 oszlopában a szóban forgó veszélyes árua vonatkozóan.
- 1.1.3.4.2** Bizonyos veszélyes áruk ugyancsak mentességet élvezhetnek, amennyiben a 3.4 fejezet feltételeit kielégítik.
- 1.1.3.4.3** Bizonyos veszélyes áruk ugyancsak mentességet élvezhetnek, amennyiben a 3.5 fejezet feltételeit kielégítik.
- 1.1.3.5** *Az üres, tisztítatlan csomagolóeszközökre vonatkozó mentességek*
- Az üres, tisztítatlan csomagolóeszközök (beleértve az üres IBC-eket és nagycsomagolásokat), amelyekben a 2, a 3, a 4.1, az 5.1, a 6.1, a 8 és a 9 osztály anyagai voltak, nem esnek az ADR előírásainak hatálya alá, ha a lehetséges veszély elhárítására megfelelő intézkedéseket tettek. A veszély akkor tekinthető elhárítottnak, ha megtették a megfelelő intézkedéseket az 1 – 9 osztály bármelyikére jellemző veszély elhárítására.
- 1.1.3.6** *Az egy szállítóegységben szállított mennyiségből adódó mentességek*
- 1.1.3.6.1** Ezen bekezdés alkalmazása céljából a veszélyes áruk a „0”, „1”, „2”, „3” vagy „4” szállítási kategóriához vannak hozzárendelve, amint az a 3.2 fejezet „A” táblázat 15 oszlopában jelezve van. A „0” szállítási kategóriába tartozó anyagokat tartalmazott üres, tisztítatlan csomagolóeszközök ugyancsak a „0” szállítási kategóriába tartoznak. A nem a „0” szállítási kategóriába tartozó anyagokat tartalmazott üres, tisztítatlan csomagolóeszközök a „4” szállítási kategóriába tartoznak.
- 1.1.3.6.2** Ha az egy szállítóegységben szállított veszélyes áruk mennyisége nem haladja meg az adott szállítási kategóriára az 1.1.3.6.3 pont táblázatának 3 oszlopában jelzett értéket (ha az egy szállítóegységben szállított veszélyes áruk ugyanabba a szállítási kategóriába tartoznak) vagy az 1.1.3.6.4 pont szerint számított értéket (ha az egy szállítóegységben szállított veszélyes áruk különböző szállítási kategóriába tartoznak), akkor ezek az áruk küldeménydarabokban egy szállítóegységben szállíthatók a következő előírások alkalmazása nélkül:
- 1. 10 fejezet, kivéve az 1 osztály UN 0029, 0030, 0059, 0065, 0073, 0104, 0237, 0255, 0267, 0288, 0289, 0290, 0360, 0361, 0364, 0365, 0366, 0439, 0440, 0441, 0455, 0456 és 0500 tételei alá tartozó robbanó tárgyakat, valamint a 7 osztály UN 2910 és 2911 tételei alá tartozó engedményes küldeménydarabokat, amennyiben az aktivitási szintjük meghaladja az A_2 értéket;
 - 5.3 fejezet;
 - 5.4.3 szakasz;
 - 7.2 fejezet, kivéve a 7.2.4 szakasz V5 és V8 előírását;
 - a 7.5.11 szakasz CV1 előírása;
 - 8. rész, kivéve
 - 8.1.2.1 a),
 - 8.1.4.2 – 8.1.4.5,
 - 8.2.3,
 - 8.3.3, 8.3.4, 8.3.5,
 - 8.4 fejezet,
 - 8.5 fejezet S1 3) és 6),
 - S2 1),
 - S4,
 - S14 – S21 és
 - S24 előírása;
 - 9. rész.

1.1.3.6.3

Ha a szállítóegységben szállított veszélyes áruk ugyanabba a kategóriába tartoznak, a szállítóegységenkénti legnagyobb össz mennyiség a következő táblázat 3 oszlopában található.

Szállítási kategória	Anyag vagy tárgy csomagolási csoport vagy osztályozási kód/csoport vagy UN szám	Legnagyobb össz mennyiség szállító- egységenként
(1)	(2)	(3)
0	<p>1 osztály: 1.1A, 1.1L, 1.2L, 1.3L és UN 0190</p> <p>3 osztály: UN 3343</p> <p>4.2 osztály: az I csomagolási csoportba tartozó anyagok</p> <p>4.3 osztály: UN 1183, 1242, 1295, 1340, 1390, 1403, 1928, 2813, 2965, 2968, 2988, 3129, 3130, 3131, 3134, 3148, 3396, 3398, 3399</p> <p>5.1 osztály: UN 2426</p> <p>6.1 osztály: UN 1051, 1600, 1613, 1614, 2312, 3250, 3294</p> <p>6.2 osztály: UN 2814, 2900</p> <p>7 osztály: UN 2912 – 2919, 2977, 2978, 3321 – 3333</p> <p>8 osztály: UN 2215 (maleinsavanhidrid, olvasztott)</p> <p>9 osztály: UN 2315, 3151, 3152, 3432 és az ilyen anyagokat vagy keverékeket tartalmazó készülékek</p> <p>és az UN 2908 alá tartozók kivételével azok az üres, tisztítatlan csomagolóeszközök, amelyek az ebbe a szállítási kategóriába tartozó anyagokat tartalmazzák.</p>	0
1	<p>Az I csomagolási csoportba tartozó anyagok és tárgyak, amelyek nem szerepelnek a 0 szállítási kategóriában és a következő osztályok anyagai és tárgyai:</p> <p>1 osztály: 1.1B – 1.1J^{a)}, 1.2B – 1.2J, 1.3C, 1.3G, 1.3H, 1.3J, 1.5D^{a)}</p> <p>2 osztály: T, TC^{a)}, TO, TF, TOC^{a)} és TFC csoport aeroszolok: C, CO, FC, T, TF, TC, TO, TFC és TOC csoport nyomás alatti vegyszerek: UN 3502, 3503, 3504 és 3505</p> <p>4.1 osztály: UN 3221 – 3224 és UN 3231 – 3240</p> <p>5.2 osztály: UN 3101 – 3104 és UN 3111 – 3120</p>	20
2	<p>A II csomagolási csoportba tartozó anyagok és tárgyak, amelyek nem szerepelnek a 0, az 1 vagy a 4 szállítási kategóriában és a következő osztályok anyagai és tárgyai:</p> <p>1 osztály: 1.4B – 1.4G és 1.6N</p> <p>2 osztály: F csoport aeroszolok: F csoport nyomás alatti vegyszerek: UN 3501</p> <p>4.1 osztály: UN 3225 – 3230</p> <p>5.2 osztály: UN 3105 – 3110</p> <p>6.1 osztály: III csomagolási csoportba tartozó anyagok és tárgyak</p> <p>9 osztály: UN 3245</p>	333
3	<p>A III csomagolási csoportba tartozó anyagok és tárgyak, amelyek nem szerepelnek a 0, a 2 vagy a 4 szállítási kategóriában és a következő osztályok anyagai és tárgyai:</p>	1000

Szállítási kategória	Anyag vagy tárgy csomagolási csoport vagy osztályozási kód/csoport vagy UN szám	Legnagyobb összmenyiség szállító- egységenként
(1)	(2)	(3)
3 (folyt.)	2 osztály: A és O csoport aeroszolok: A és O csoport nyomás alatti vegyszerek: UN 3500 3 osztály: UN 3473 4.3 UN 3476 8 osztály: UN 2794, 2795, 2800, 3028 és 3477 9 osztály: UN 2990, 3072	
4	1 osztály: 1.4S 4.1 osztály: UN 1331, 1345, 1944, 1945, 2254, 2623 4.2 osztály: UN 1361 és 1362 III csomagolási csoport 7 osztály: UN 2908 – 2911 9 osztály: UN 3268 és 3499 valamint azok az üres, tisztítatlan csomagolóeszközök, amelyek a 0 szállítási kategóriába tartozókon kívüli, többi anyagot tartalmazták.	Korlátlan

a) Az UN 0081, 0082, 0084, 0241, 0331, 0332, 0482, 1005 és 1017 számú anyagnál a legnagyobb összmenyiség szállítóegységenként 50 kg.

Az előző táblázatban a „legnagyobb összmenyiség szállítóegységenként” jelentése a következő:

- tárgyakkal a bruttó tömeg kg-ban (az 1 osztályba tartozó tárgyakkal a robbanóanyag nettó tömege kg-ban; az ebben a mellékletben szereplő gépekben és készülékekben lévő veszélyes áru esetén, a bennük lévő veszélyes áru összmenyisége kg-ban vagy literben);
- szilárd anyagoknál, cseppfolyósított gázoknál, mélyhűtött, cseppfolyósított gázoknál és oldott gázoknál a nettó tömeg kg-ban;
- folyékony anyagoknál és sűrített gázoknál a tartály névleges űrtartalma literben (lásd a meghatározást az 1.2.1 szakaszban).

1.1.3.6.4

Ha különböző szállítási kategóriába tartozó veszélyes árukat szállítanak egy szállítóegységben, akkor:

- az „1” szállítási kategóriába tartozó anyagok és tárgyak mennyisége 50-nel szorozva,
- az „1” szállítási kategóriába tartozó, az 1.1.3.6.3 pont táblázatához fűzött a) megjegyzés szerinti anyagok és tárgyak mennyisége 20-szal szorozva,
- a „2” szállítási kategóriába tartozó anyagok és tárgyak mennyisége 3-mal szorozva, és
- a „3” szállítási kategóriába tartozó anyagok és tárgyak mennyisége

együttesen nem haladhatja meg az 1000-t.

1.1.3.6.5

E bekezdés alkalmazásánál nem kell figyelembe venni azokat a veszélyes árukat, amelyek az 1.1.3.2 – 1.1.3.5 bekezdés szerint mentességet élveznek.

1.1.3.7

Lítium akkumulátorok szállítására vonatkozó mentességek

Az ADR előírásait nem kell alkalmazni:

- a szállítást végző járműben alkalmazott lítium akkumulátorokra, amelyek a jármű meghajtására vagy bármely berendezésének működtetésére szolgálnak;
- a szállítás során használt (vagy használni szándékozott) eszközökben (pl. laptopban) lévő lítium akkumulátorokra, amelyek ezen eszközök működtetésére szolgálnak.

1.1.3.8

(fenntartva)

1.1.3.9 *A szállítás során hűtés vagy kondicionálás céljára használt veszélyes árukra vonatkozó mentességek*

Amikor a jármű vagy a konténer hűtése vagy kondicionálása céljából olyan veszélyes árut használnak, mely csak fojtó tulajdonságú (a környezetben rendes körülmények között jelen levő oxigént hígítja vagy kiszorítja), arra csak az 5.5.3 szakasz előírásait kell betartani.

1.1.4 **Más szabályzatok alkalmazhatósága**

1.1.4.1 (fenntartva)

1.1.4.2 *Tengeri vagy légi szállítást is magában foglaló szállítási lánc*

1.1.4.2.1 Az olyan küldeménydarabokat, konténereket, mobil tartányokat és tankkonténereket, amelyek nem felelnek meg teljesen az ADR-nek a csomagolásra, az egybecsomagolásra, a küldeménydarabok jelölésére és bárcázására, a nagybárcák és narancssárga táblák alkalmazására vonatkozó előírásainak, de megfelelnek az IMDG kódex vagy az ICAO Műszaki Utasítások előírásainak, a tengeri vagy légi szállítást is magában foglaló szállítási láncban történő továbbításra a következő feltételekkel fel lehet venni:

- a) Ha a küldeménydarabok nincsenek az ADR-nek megfelelően bárcázva és jelölve, akkor az IMDG Kódex vagy az ICAO Műszaki Utasítások szerinti veszélyességi bárcá(k)nak és jelölésnek kell rajtuk lenni.
- b) Az egy küldeménydarabba történő egybecsomagolásra az IMDG Kódex vagy az ICAO Műszaki Utasítások előírásait kell alkalmazni.
- c) A tengeri szállítást is magában foglaló szállítási láncban történő továbbításnál, ha a konténerek, mobil tartányok vagy tankkonténerek nincsenek az e Melléklet 5.3 fejezete szerint jelölve és nagybárcával ellátva, akkor az IMDG Kódex 5.3 fejezete szerinti jelölésnek és nagybárcá(k)nak kell rajtuk lenni. Ilyen esetekben magának a járműnek a jelölésére csak az e Melléklet 5.3.2.1.1 pontjának előírásait kell alkalmazni. Üres, tisztítatlan mobil tartányokat és tankkonténereket ezen előírás szerint egészen a tisztítóállomásig lehet szállítani (szállítási láncban történő továbbítást követően).

Ez a könnyítés nem vonatkozik azokra az árukra, amelyek az ADR 1 – 9 osztályába tartozó veszélyes áruk, azonban az IMDG Kódex vagy az ICAO Műszaki Utasítások előírásai szerint nem veszélyesek.

1.1.4.2.2 Azok a szállítóegységek, amelyek az 1.1.4.2.1 c) pontban említett konténert, mobil tartányt vagy tankkonténert szállító járművön kívüli egyéb jármű(vek)ből állnak és nincsenek az ADR 5.3.1 szakasza szerint nagybárcával ellátva, de az IMDG Kódex 5.3 fejezete szerint meg vannak jelölve és el vannak látva nagybárcával, akkor vehetők fel tengeri szállítást is magában foglaló szállítási láncban történő továbbításra, ha az ADR 5.3.2 szakaszának narancssárga táblával való megjelölésre vonatkozó előírásait betartják.

1.1.4.2.3 A tengeri vagy légi szállítást is magában foglaló szállítási lánc esetén az 5.4.1 és az 5.4.2 szakaszban előírt okmányok és információk, illetve a 3.3 fejezet szerinti különleges előírásokban megkövetelt információk helyettesíthetők az IMDG Kódexben, ill. az ICAO Műszaki Utasításokban előírt fuvarokmánnyal, illetve információkkal, feltéve, hogy az ADR által előírt kiegészítő információk szerepelnek benne.

Megjegyzés: Az 1.1.4.2.1 pont szerinti szállításra lásd az 5.4.1.1.7 pontot is. Konténerben történő szállításra lásd az 5.4.2 szakaszt is.

1.1.4.3 *A tengeri szállításra jóváhagyott IMO típusú mobil tartányok használata*

Azok az IMO-típusú mobil tartányok (1, 2, 5 és 7 típusú IMO tartányok), amelyek nem felelnek meg a 6.7 vagy a 6.8 fejezet követelményeinek, de amelyeket 2003. január. 1-jé előtt, az IMDG Kódex (29-98 módosítás) előírásai szerint gyártottak és hagytak jóvá, tovább

használhatók, feltéve, hogy kielégítik az IMDG Kódex¹⁾ vonatkozó időszakos vizsgálati és próbakövetelményeit. Ezen kívül meg kell felelniük a 3.2 fejezet „A” táblázatának 10 és 11 oszlopában szereplő követelményeknek és az ADR 4.2 fejezet előírásainak. Lásd még az IMDG Kódex 4.2.0.1 bekezdését is.

1.1.4.4 (fenntartva)

1.1.4.5 *Nem közúti szállítás*

1.1.4.5.1 Ha az ADR előírásainak hatálya alá tartozó szállítást végző járművet útvonalának egy részén nem közúti szállítással továbbítják, akkor ezen az útvonalrészén csak azok a belföldi vagy nemzetközi szabályok alkalmazhatók, amelyek a veszélyes áruknak az útvonal szóban forgó részén a közúti jármű továbbítására használt szállítási móddal való szállítását esetleg szabályozzák.

1.1.4.5.2 Az előző 1.1.4.5.1 pontban hivatkozott esetben az érintett Szerződő Felek megállapodhatnak az ADR alkalmazásában a szállítás azon szakaszára, amely során a járművet nem közúton továbbítják, szükség esetén kiegészítve további követelményekkel, kivéve, ha az érintett ADR Szerződő Felek közötti ezen megállapodások ellentétesek a veszélyes áruknak az útvonal szóban forgó szakaszán a közúti jármű továbbítására alkalmazott szállítási módra vonatkozó nemzetközi konvenciók, pl. az Életbiztonság a tengeren tárgyú nemzetközi egyezmény (SOLAS) előírásaival, amelynek ezen ADR Szerződő Felek ugyancsak szerződő felei lehetnek.

Ezeket a megállapodásokat a kezdeményező Szerződő Félnek be kell terjesztenie az Egyesült Nemzetek Európai Gazdasági Bizottsága Titkárságának, amely a Szerződő Feleket értesíti.

1.1.4.5.3 Abban az esetben, ha az ADR előírásainak hatálya alá eső szállítás a közúti útvonal egészén vagy egy részén olyan nemzetközi egyezmény előírásainak hatálya alá is esik, amely a veszélyes áruknak nem közúton való szállítását szabályozza, de hatálya egyes, gépjárművel végzett szolgáltatásokra is kiterjed, erre az útszakaszra egyidejűleg érvényesek ennek a nemzetközi egyezménynek az előírásai és az ADR azon előírásai, amelyek az említett egyezménnyel nem összeférhetetlenek. Az ADR egyéb előírásai a szóban forgó útszakaszra nem érvényesek.

1.1.5 Szabványok alkalmazása

Ha valamely szabvány alkalmazása kötelező, de a szabvány és az ADR előírásai között ellentmondás van, ilyenkor az ADR előírásait kell elsődlegesnek tekinteni.

1) A Nemzetközi Tengerészeti Szervezet (IMO) a DSC.1/Circ.12 számú körlevéllel (ill. helyesbítéseivel) kiadta „A meglévő IMO-típusú mobil tartányok és közúti tartányjárművek veszélyes áruk szállítására történő további használatára vonatkozó útmutatót” („Guidance on the Continued Use of Existing IMO Type Portable Tanks and Road Tank Vehicles for the Transport of Dangerous Goods”), amelynek szövege megtalálható az IMO honlapján: www.imo.org.

1.2 FEJEZET

MEGHATÁROZÁSOK ÉS MÉRTÉKEGYSÉGEK

1.2.1 Meghatározások

Megjegyzés: Ez a szakasz minden általános és különleges meghatározást tartalmaz.

Az ADR alkalmazásában:

A

ADN: a Veszélyes Áruk Nemzetközi Belvízi Szállításáról szóló Európai Megállapodás;

Aeroszol vagy **aeroszol csomagolás:** a 6.2.6 szakasz követelményeit kielégítő, fémből, üvegből vagy műanyagból készült, nem utántölthető tartály, amely sűrített, cseppfolyósított vagy nyomás alatt oldott gázt tartalmaz valamilyen folyékony, pépszerű vagy por alakú anyaggal együtt vagy akár nélküle, olyan adagoló szerkezettel, amely lehetővé teszi a tartalomnak gázban szuszpendált szilárd vagy folyékony részecskék, hab, paszta, por formájában, folyadék vagy gáz alakban való kibocsátását;

Állandósult nyomás: a nyomástartó tartály tartalmának nyomása a termikus és diffúziós egyensúly elérése után;

Állati eredetű anyagok: az állati tetemek, állati testrészek és az állati eredetű takarmány;

„Amely országba vagy amely országon keresztül” (a 7 osztály anyagainak szállításánál): az az ország, amelybe vagy amelyen keresztül a küldeményt szállítják, e fogalom kifejezetten kizárja azt az országot, amely fölött a küldeményt légi úton szállítják, feltéve, hogy nincs tervezett leszállás abban az országban;

Áruszállító egység: a jármű, a konténer, a tankkonténer, a mobil tartány és a MEG-konténer;

Megjegyzés: Ez a fogalom meghatározás csak a 3.3 fejezet 302 különleges előírására és az 5.5.2 szakaszra vonatkozik.

ASTM: American Society for Testing and Materials (Amerikai Anyagvizsgálati Társaság), (ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA, 19428-2959, United States of America);

Átalakított csomagolóeszköz: különösen

- a) az olyan fémhordók,
 - i) amelyeket nem UN típusból alakítottak át a 6.1 fejezet előírásainak megfelelő, UN típusúvá; vagy
 - ii) amelyeket a 6.1 fejezetnek megfelelő valamely UN típusból egy másik UN típusúvá alakítottak át; vagy
 - iii) amelyek valamely lényeges szerkezeti elemét (pl. a nem levehető tetőt) kicserélték;
- b) az olyan műanyag hordók,
 - i) amelyeket egyik UN típusból egy másik UN típusúvá alakítottak át (pl. 1H1-ből 1H2-vé); vagy
 - ii) amelyek valamely lényeges szerkezeti elemét kicserélték.

Az átalakított hordókra a 6.1 fejezet ugyanazon követelményei vonatkoznak, mint amelyeket az azonos típusú, új hordókra kell alkalmazni;

Átalakított IBC: lásd **nagyméretű csomagolóeszköz (IBC)**;

Átalakított nagycsomagolás: lásd **nagycsomagolás**;

B

Battériás jármű: olyan jármű, amelynek egymással gyűjtőcsővel összekötött és tartósan ehhez a járműhöz rögzített elemei vannak. A következő elemek tekinthetők a battériás jármű elemeinek: palackok, nagypalackok, gázhordók, palackkötegek és a 2.2.2.1.1 pontban meghatározott gázok szállítására készült, 450 liternél nagyobb befogadóképességű tartányok;

Bélés: olyan különálló tömlő vagy zsák, beleértve nyílásainak zárószerkezeteit, amelyet a csomagolóeszközbe (nagycsomagolásba, IBC-be) helyeztek el, de nem alkotja annak szerves részét;

Belső csomagolóeszköz: olyan csomagolóeszköz, amelyet a szállításhoz külső csomagolással kell ellátni;

Belső tartály: olyan tartály, amelyet külső csomagolással kell ellátni ahhoz, hogy befogadó funkcióját betöltse;

Berakó: az a vállalkozás, amelyik:

- a) a küldeménydarabos veszélyes árut, kiskonténert vagy mobil tartányt a járműre, a járműbe vagy konténerbe berakja; vagy
- b) a konténert, ömlesztettáru-konténert, MEG-konténert, tankkonténert vagy mobil tartányt a járműre rakja;

Biztonsági szelep: nyomáskülönbség hatására automatikusan működésbe lépő, rugóterhelésű szerkezet, amelynek feladata a nem megengedett belső nyomás kialakulásának megakadályozása a tartányban;

Biztonsági tartály (a 7 osztály anyagainak szállításánál): a csomagolási elemeknek a tervező által meghatározott együttese, amelynek feladata a radioaktív anyagok kiszabadulásának megakadályozása a szállítás során;

C

CGA: Compressed Gas Association (Sűrített Gáz Egyesület), (CGA, 4221 Walney Road, 5th Floor, Chantilly VA 20151-2923, United States of America);

CIM: a Nemzetközi Vasúti Árufuvarozási Szerződésre vonatkozó Egységes Szabályok [a Nemzetközi Vasúti Fuvarozási Egyezmény (COTIF) B Függeléke] módosított kiadása;

Címzett: a fuvarozási szerződés szerinti címzett. Ha a címzett a fuvarozási szerződésre vonatkozó előírásokkal összhangban harmadik személyt jelöl meg, az ADR értelmében ezt a személyt kell címzettnek tekinteni. Ha a szállítási műveletet fuvarozási szerződés nélkül végzik, az a vállalkozás tekintendő címzettnek, amely megérkezéskor a veszélyes árut átveszi;

CMR: a Nemzetközi Közúti Árufuvarozási Szerződésről szóló Egyezmény (Genf, 1956. május 19.) módosított kiadása;

Criticality safety index (CSI): lásd *kritikussági biztonsági mutatószám (CSI)*

CSC Egyezmény: „A Biztonságos Konténerekről szóló 1972. évi Nemzetközi Egyezmény” módosított kiadása, kiadja a Nemzetközi Tengerészeti Szervezet (IMO), London (Magyarországon kihirdette a 2003. évi LXIV. törvény);

Cs

Cseppfolyósított petróleumgáz (LPG): egy vagy több, könnyű szénhidrogénből álló, kis nyomáson cseppfolyósított gáz, amely csak az UN 1011, 1075, 1965, 1969 vagy 1978 tételhez van sorolva és amely főként propánt, propilént, butánt, bután izomereket, butént tartalmaz, valamint nyomokban más szénhidrogén gázokat;

Megjegyzés: 1. A gyúlékony gázok más UN tételekhez vannak sorolva és nem tekinthetők LPG-nek.

2. Az UN 1075 tétel tekintetében lásd a 2.2.2.3 bekezdés táblázatában a 2F osztályozási kódon belül az UN 1965 tételhez tartozó 2. megjegyzést.

Cserefelépítmény: lásd *konténer*;

Csomagolási csoport: olyan csoport, melyhez csomagolás céljából egyes anyagok veszélyességük mértéke szerint rendelhetők hozzá. A csomagolási csoportok a következőket jelentik (bővebb magyarázat a 2. részben található):

- I csomagolási csoport: nagyon veszélyes anyagok;
II csomagolási csoport: közepesen veszélyes anyagok;
III csomagolási csoport: kevésbé veszélyes anyagok;

Megjegyzés: Bizonyos, veszélyes anyagokat tartalmazó tárgyak is valamely csomagolási csoporthoz vannak hozzárendelve.

Csomagoló: az a vállalkozás, amely a veszélyes árut csomagolóeszközbe, nagycsomagolásba vagy IBC-be teszi, ill. szükség esetén előkészíti a küldeménydarabokat a szállításhoz;

Csomagolóeszköz (csomagolás): egy vagy több tartály és minden egyéb szerkezeti elem vagy anyag, amely szükséges ahhoz, hogy a tartály betölthesse befogadó és egyéb biztonsági funkcióját (lásd még *átalakított csomagolóeszköz, belső csomagolóeszköz, felújított csomagolóeszköz, finomlemez csomagolóeszköz, IBC, ismételten felhasznált csomagolóeszköz, kármentő csomagolás, kombinált csomagolás, köztes csomagolóeszköz, külső csomagolóeszköz, nagycsomagolás, összetett (műanyag) csomagolóeszköz, összetett (üveg, porcelán, kőagyag) csomagolóeszköz és portömör csomagolóeszköz*);

E

Égéshő felhasználásával működő fűtőberendezés: olyan fűtőberendezés, amely valamilyen folyékony vagy gáznemű tüzelőanyaggal működik a motortól függetlenül, ehhez a jármű meghajtására szolgáló motor hulladékhője nem használható;

Egyesítőcsomagolás: olyan – a 7 osztály esetében egyetlen feladó által használt – burkolat, amit egy vagy több küldeménydarab egységbe fogására használnak a szállítás alatti könnyebb kezelés és rakodás céljából.

Egyesítőcsomagolás például:

- a) a rakományképző eszköz, pl. rakodólap, amelyre több küldeménydarabot raknak vagy halmazolnak és műanyag pántszalaggal, zsugor- vagy nyújtható fóliával vagy más alkalmas módon rögzítenek; vagy
- b) a külső védőcsomagolás, mint pl. láda vagy rekesz;

EK Irányelv: az Európai Közösség illetékes intézményei által hozott olyan előírás, amely az elérendő eredmény tekintetében kötelező mindazokra a tagállamokra, amelyek címzettjei az irányelvnek, de a végrehajtás formáját és módszerét a nemzeti hatóságok választhatják meg;

EN (szabvány)*: Az Európai Szabványügyi Bizottság (CEN) által kiadott európai szabvány (CEN, Avenue Marnix 17, B-1000 Brussels);

Engedély:

Egyoldalú engedély (a 7 osztály anyagainak szállításánál): a mintadarab olyan engedélye, amelyet csak a mintadarab származási országa illetékes hatóságnak kell megadnia. Amennyiben a származási ország nem valamely ADR Szerződő Fél, akkor a küldemény által érintett első ADR Szerződő Fél illetékes hatóságának kell

* A magyar szöveg a szabványok címét a Magyar Szabványügyi Testület szabványkatalógusában szereplő fordításban közli. A szabványok szóhasználatát esetenként jelentősen eltérhet az ADR szóhasználatától.

ezt az engedélyt elismernie (lásd a 6.4.22.6 bekezdést).

Többoldalú engedély (a 7 osztály anyagainak szállításánál): az olyan engedély, amelyet a mintadarabnak, ill. a szállításnak a származási, ill. kiindulási országa illetékes hatósága ad, és mindazon országok illetékes hatósága, amely országba vagy amely országon keresztül a küldeményt szállítják

ENSZ-EGB előírás: „A közúti járművekre, a közúti járművekbe szerelhető alkatrészekre, ill. a közúti járműveknél használatos tartozékokra vonatkozó egységes műszaki előírások elfogadásáról és az ezen előírások alapján kibocsátott jóváhagyások kölcsönös elismerésének feltételeiről” szóló Egyezmény (1958. évi Egyezmény módosított formában) mellékletét képező előírás (Magyarországon kihirdette az 1960. évi 21. tvr.);

ENSZ Minta Szabályzat: az ENSZ „Ajánlások a veszélyes áruk szállítására – Minta szabályzat” kiadvány tizenhetedik javított kiadása (ST/SG/AC.10/1/Rev.17);

F

Fa IBC: merev vagy összeecsukható fa testből és bélésből (de nem belső csomagolásból), továbbá szerkezeti és üzemi szerelvényekből álló IBC;

Fahordó: fából kör keresztmetszettel, domború paláستal készült csomagolóeszköz, dongákból és fenekekből összeállítva és abroncsokkal ellátva;

Fedett jármű: olyan jármű, amelynek karosszériája lezárható szekrényből áll;

Feladó: az a vállalkozás, amely a veszélyes árut a saját nevében vagy harmadik fél megbízásából feladja. Ha a szállítási műveletet fuvarozási szerződés alapján végzik, a feladó a fuvarozási szerződés szerinti feladót jelenti;

Felújított csomagolóeszköz: különösen

- a) az olyan fémhordók, amelyeket
 - i) az eredeti szerkezeti anyagig megtisztítottak, eltávolítva minden korábbi tartalmat, a belső és külső korróziós nyomokat és a külső bevonatokat és bárcákat;
 - ii) visszaállítottak eredeti alakjukra és körvonalukra, peremeiket (ha vannak) kiegyengették és tömítették és minden, nem beépített tömítésüket kicserélték;
 - iii) tisztítás után, de festés előtt megvizsgálták, és kiselejtezték azokat, amelyeken látható kitörések, az anyagvastagság jelentős csökkenése, fémkifáradás, sérült menetek vagy záróelemek, vagy egyéb jelentős hiányosságok tapasztalhatók;
- b) az olyan műanyag hordók és kannák,
 - i) amelyeket az eredeti szerkezeti anyagig megtisztítottak, eltávolítva minden korábbi tartalmat, külső bevonatot és bárcát;
 - ii) amelyek minden, nem beépített tömítését kicserélték; és
 - iii) amelyeket tisztítás után megvizsgálták, és kiselejtezték azokat, amelyeken látható kopások, törések, repedések, sérült menetek vagy záróelemek, vagy egyéb jelentős hiányosságok tapasztalhatók;

Fémhidrid tároló rendszer: önálló, teljes hidrogén tároló rendszer, amely a tartályból, a fémhidridből, a nyomáscsökkentő szerkezetből, a zárószelepből, az üzemi szerelvényekből és belső szerkezeti elemekből áll, és amely kizárólag hidrogén szállítására szolgál;

Fém IBC: fém-testből, valamint a megfelelő üzemi és szerkezeti szerelvényekből álló IBC;

Finomlemez csomagolóeszköz: olyan kör, ellipszis, négyszög vagy sokszög keresztmetszetű (vagy kúp alakú), valamint kúpos nyakú vagy vödör alakú, önzott acéllemezből vagy finomlemezből 0,5 mm-nél kisebb falvastagsággal, lapos vagy domború fenékkal, egy vagy több töltőnyílással készült csomagolóeszköz, amely nem esik a hordóra vagy kannára vonatkozó meghatározás alá;

Folyékony anyag: olyan anyag, amelynek gőznyomása 50 °C-on legfeljebb 300 kPa (3 bar)

és 101,3 kPa nyomáson 20 °C-on nem teljesen gáz alakú, és

- a) olvadáspontja vagy olvadás kezdőpontja 101,3 kPa nyomáson legfeljebb 20 °C; vagy
- b) az ASTM D 4359-90 vizsgálati módszerrel meghatározva folyékony; vagy
- c) a 2.3.4 szakaszban leírt folyékonyság meghatározási vizsgálat (penetrométer eljárás) kritériumai szerint nem pasztaszerű;

Megjegyzés: A „folyékony állapotban történő szállítás” a tartányokra vonatkozó előírások tekintetében:

- az előző meghatározás szerint folyékony anyag szállítása, vagy
- olyan szilárd anyag szállítása, amelyet olvasztott állapotban adnak át a szállításra.

G

Gáz: olyan anyag, amelynek

- a) gőznyomása 50 °C-on meghaladja a 300 kPa-t (3 bar-t); vagy
- b) 20 °C-on és 101,3 kPa normál nyomáson teljesen gáz alakú;

Gázhordó: szállításra használt, hegesztett, nyomástartó tartály legalább 150 liter, de legfeljebb 1000 liter űrtartalommal (pl. hengeres tartály gördítőabroncsokkal; csúszótalpakra erősített, gömb alakú tartály);

Gázpatron: lásd *gázzal töltött kis méretű tartály*;

Gázzal töltött kis méretű tartály (gázpatron): a 6.2.6 szakasz vonatkozó követelményeit kielégítő, nem utántölthető tartály, amely túlnyomás alatti gázt vagy gázkeveréket tartalmaz, és szeleppel is ellátható;

GHS: a „Vegyí anyagok osztályozásának és címkézésének egyetemes harmonizált rendszere” negyedik módosítása, amelyet az ENSZ ST/SG/AC.10/30/Rev.4 jelű kiadványa tartalmaz;

Gy

Gyúlékony alkotórész (aeroszoloznál): a „Vizsgálatok és kritériumok kézikönyv”, III. rész 31.1.3 szakaszához fűzött 1 – 3. megjegyzésben meghatározott gyúlékony folyékony anyag, gyúlékony szilárd anyag, ill. gyúlékony gáz és gázkeverék. Ez a meghatározás nem terjed ki a piroforos, az önmelegedő és a vízzel reaktív anyagokra. A kémiai égéshőt a következő módszerek valamelyikével kell meghatározni: ASTM D 240, ISO/FDIS 13943: 1999 (E/F) 86.1 – 86.3, ill. NFPA 30B;

Gyűjtőmegnevezés: az anyagok vagy tárgyak meghatározott csoportját jelentő tétel (lásd a 2.1.1.2 bekezdés B., C. és D. pontját);

H

Hajlékony falú IBC: fóliából, szövetből vagy más hajlékony anyagból vagy ilyen anyagok kombinációjából készült csomagolóeszköz-testből álló IBC, szükség esetén belső bevonattal vagy béléssel, a megfelelő üzemi és kezelő szerelvényekkel felszerelve;

Hajlékony falú IBC rendszeres karbantartása: lásd *nagyméretű csomagolóeszköz (IBC)*;

Hordó: fémből, papírlémezből, műanyagból, rétegelt falemezből vagy más alkalmas anyagból készült, henger alakú csomagolóeszköz, sík vagy domború fenékkal. Ez a meghatározás magában foglalja az egyéb alakú csomagolóeszközöket is, pl. kúpos nyakú, kör keresztmetszetű tartályokat vagy vödröket. A fahordók és a kannák nem tartoznak ezen meghatározás alá;

Hulladék: olyan anyag, oldat, keverék és tárgy, amelyet általában közvetlenül nem lehet felhasználni, de amelyet újrahasznosítási eljárás, lerakóhelyen való tárolás, égetéssel vagy

más módon történő ártalmatlanítás céljából szállítanak;

Hulladék szállítására szolgáló, vákuummal üzemelő tartány: olyan rögzített tartány, leszerelhető tartány, tankkonténer vagy tartányos cserefelépítmény, amelyet elsődlegesen veszélyes hulladékok szállítására használnak, és a hulladékok töltését, ill. ürítését szolgáló speciális kialakítása, ill. felszerelése megfelel a 6.10 fejezet előírásainak. Az olyan tartány, amely mindenben megfelel a 6.7 vagy a 6.8 fejezet előírásainak, nem minősül „hulladék szállítására szolgáló, vákuummal üzemelő tartány”-nak;

I

IAEA: Nemzetközi Atomenergia Ügynökség (NAÜ), (IAEA, P.O.Box 100, A-1400 Wien);

IBC: lásd *nagyméretű csomagolóeszköz*;

ICAO: International Civil Aviation Organization (Nemzetközi Polgári Repülési Szervezet), (ICAO, 999 University Street, Montreal, Quebec H3C 5H7, Canada);

ICAO Műszaki Utasítások: a Nemzetközi Polgári Repülésről szóló Chicagói Egyezmény 18. Függelékét kiegészítő, a Veszélyes Áruk Légi Szállításának Biztonságát Szolgáló Műszaki Utasítások, amelyet a Nemzetközi Polgári Repülési Szervezet (ICAO, Montreal) ad ki (Magyarországon kihirdette a 2009. évi LXXXVIII. törvény);

Illetékes hatóság: az a hatóság vagy hatóságok vagy egyéb szervezet vagy szervezetek, amelye(ke)t az egyes országokban, az egyes esetekre a belföldi jogszabályok szerint kijelölnek;

IMDG Kódex: az „Életbiztonság a tengeren” tárgyú nemzetközi egyezmény (SOLAS egyezmény), 1974, A rész, VII. fejezetének végrehajtására szolgáló Veszélyes Áruk Nemzetközi Tengerészeti Kódexe, amelyet a Nemzetközi Tengerészeti Szervezet (IMO, London), ad ki. (Magyarországon kihirdette a 2001. évi XI. törvény);

IMO: International Maritime Organization (Nemzetközi Tengerészeti Szervezet), (IMO, 4 Albert Embankment, London SE1 7SR, United Kingdom);

Ismételten felhasznált csomagolóeszköz: olyan csomagolóeszköz, amelyet megvizsgáltak és minden olyan sérüléstől mentesnek találtak, amely befolyásolná a teljesítőképességi vizsgálatok elviselését; a fogalom kiterjed azokra a csomagolóeszközökre is, amelyeket azonos vagy hasonló összeférhetőségű termékkel töltöttek meg ismételten és a termék feladója által ellenőrzött elosztási láncban szállítanak;

Ismételten felhasznált nagycsomagolás: lásd *nagycsomagolás*;

ISO (szabvány): a Nemzetközi Szabványügyi Szervezet (ISO) (1, rue de Varembé – CH-1204 Geneva 20) által kiadott nemzetközi szabvány;

J

Jármű: lásd *battériás jármű, fedett jármű, nyitott jármű, ponyvás jármű és tartányjármű*;

Járműszemélyzet tagja: a járművezető és minden olyan személy, aki biztonsági, közbiztonsági, oktatási vagy üzemi okból kíséri a járművezetőt;

Javított IBC: lásd *nagyméretű csomagolóeszköz (IBC)*;

K

Kanna: fémből vagy műanyagból készült, négy- vagy sokszög keresztmetszetű, egy- vagy többnyílású csomagolóeszköz;

Kármentő csomagolás: olyan különleges csomagolóeszköz, amelybe sérült, meghibásodott, szivárgó vagy nem megfelelő veszélyes áru küldeménydarabot vagy kiszóródott, kifolyt

veszélyes árut lehet elhelyezni újrahasznosítás vagy ártalmatlanítás céljából történő szállításhoz;

Kármentő nyomástartó tartály: olyan 1000 liter víztérfogatot meg nem haladó befogadó-képességű nyomástartó tartály, amelybe sérült, meghibásodott, szivárgó vagy nem megfelelő nyomástartó tartály(oka)t lehet elhelyezni pl. újrahasznosítás vagy ártalmatlanítás céljából történő szállításhoz;

Kérelmező: megfelelőség-értékelés vonatkozásában a gyártó vagy valamely Szerződő Fél országában felhatalmazott képviselője. Időszakos, közbenső és soron kívüli vizsgálat vonatkozásában a kérelmező a vizsgálóhely, az üzemben tartó vagy valamely Szerződő Fél országában felhatalmazott képviselőjük;

Megjegyzés: *Megfelelőség-értékelési kérelmet kivételes esetben harmadik fél (pl. az 1.2.1 szakasz meghatározása szerinti tankkonténer üzemben tartó) is benyújthat.*

Kezelő szerelvény (hajlékony falú IBC-knél): az IBC testéhez erősített vagy az IBC test folytatásaként kialakított fül, hurok, szem vagy keret;

Kirakó: az a vállalkozás, amelyik:

- a) a konténert, ömlesztettáru-konténert, MEG-konténert, tankkonténert vagy mobil tartányt a járműről lerakja; vagy
- b) a küldeménydarabos veszélyes árut, kiskonténert vagy mobil tartányt a járműről lerakja, a járműből vagy konténerből kirakja; vagy
- c) a veszélyes árut tartányból (tartányjárműből, leszerelhető tartányból, mobil tartányból vagy tankkonténerből), battériás járműből, MEMU-ból vagy MEG-konténerből lefejt, ill. az ömlesztett veszélyes árut a járműből, nagykonténerből, kiskonténerből vagy ömlesztettáru-konténerből kirakja;

Kiskonténer: lásd *konténer*;

Kizárólagos használat (a 7 osztály anyagainak szállításánál): a jármű vagy a nagykonténer egyetlen feladó általi használata, amikor is a szállítás előtt, alatt és után az összes be- és kirakási műveletet a feladó vagy a címzett utasítása szerint végzik;

Kombinált csomagolás: szállítási csomagolóeszköz-kombináció, amely egy vagy több belső csomagolóeszközből áll, amelye(ke)t külső csomagolóeszközbe helyeztek el a 4.1.1.5 bekezdésnek megfelelően;

Megjegyzés: *A „kombinált csomagolás” „belső elemét” mindig „belső csomagolás”-nak nevezik és nem „belső tartály”-nak. Az üvegpalack jó példa az ilyen „belső csomagolás”-ra.*

Konténer: olyan szállítóeszköz (daruzható, emelhető vagy más hasonló szerkezet), amely

- tartós jellegű és ennek megfelelően elég szilárd ahhoz, hogy ismételten felhasználható legyen;
- kifejezetten úgy van kialakítva, hogy megkönnyítse az áruknak egy vagy több szállítóeszközzel – a rakomány megbontása nélkül – történő szállítását;
- a rakodást és a különböző szállítóeszközök közötti gyors átrakást lehetővé tevő elemekkel van ellátva;
- kialakításánál fogva az áru egyszerűen berakható és kirakható;
- a radioaktív anyagok szállítására használt konténerek kivételével befogadóképessége legalább 1 m³.

Ezen kívül:

A **kiskonténer** olyan konténer, amelynek vagy külső méretei (hosszúsága, szélessége, magassága) 1,5 m-nél kisebbek vagy befogadóképessége legfeljebb 3 m³;

A nagykonténer

- a) olyan konténer, amely nem felel meg a kiskonténer meghatározásának;
- b) „A Biztonságos Konténerekről szóló 1972. évi Nemzetközi Egyezmény (CSC)” értelmében:
olyan méretű konténer, amelynek az alsó négy sarokkal behatárolt területe
 - i) legalább 14 m² (150 négyzetláb); vagy
 - ii) legalább 7 m² (75 négyzetláb), ha felső sarokelemekkel rendelkezik;

A **nyitott konténer** nyitott tetejű konténer vagy szállítólap alapú konténer;

A **ponyvás konténer** a berakott áru védelme érdekében ponyvával ellátott nyitott konténer;

A **zárt konténer** teljesen zárt, szilárd tetejű, oldalfalú, végfalú és padlójú konténer. Ide tartozik az a nyitható tetejű konténer is, amelynek teteje a szállítás alatt zárva tartható;

A **cserefelépítmény** olyan konténer, amely az EN 283 Európai Szabvány (1991. évi kiadás) szerint a következő jellemzőkkel bír:

- szilárdság szempontjából csak szárazföldi (vasúti és közúti) és ro-ro-hajón történő szállításra van méretezve;
- nem halmazolható;
- a közúti járművekről a jármű rakfelületén levő berendezéssel saját támasztólábaira lerakható, ill. visszarakható;

Megjegyzés: A „konténer” fogalom nem terjed ki a hagyományos csomagoló-eszközökre, IBC-kre, tankkonténerekre és járművekre. Radioaktív anyagok szállításánál azonban a konténerek csomagolóeszközként használhatók.

Köztes csomagolóeszköz: olyan csomagolóeszköz, amelyet a belső csomagolások vagy tárgyak és a külső csomagolás közé helyeznek;

Kritikus hőmérséklet: az a hőmérséklet, amely felett az anyag nem létezhet folyékony halmazállapotban;

Kritikussági biztonsági mutatószám (CSI) hasadóanyagot tartalmazó küldeménydarabhoz, egyesítőcsomagoláshoz vagy konténerhez (a 7 osztály anyagainak szállításánál): olyan szám, amelyet a hasadó anyagot tartalmazó küldeménydarabok, egyesítőcsomagolások vagy konténerek együttesének ellenőrzésére használnak;

Küldemény: olyan veszélyes áru küldeménydarab(ok) vagy rakomány, amelyet a feladó szállításra átad;

Küldeménydarab: a csomagolási művelet végterméke, amely a feladásra kész csomagoló-eszközből, nagycsomagolásból vagy IBC-ből és tartalmából áll. A fogalom kiterjed a gázok szállítására használt, ezen fejezet szerinti tartályokra, valamint az olyan tárgyakra is, amelyek méretük, tömegük vagy kialakításuk folytán csomagolás nélkül vagy rekeszben (csúszótalpon), kosárban vagy rakodóeszközben szállíthatók. A radioaktív anyagok szállítását kivéve, nem terjed ki e fogalom azokra az árukra, amelyeket ömlesztve szállítanak, sem a tartányban szállított anyagokra;

Megjegyzés: A radioaktív anyagokra lásd a 2.2.7.2 bekezdést, a 4.1.9.1.1 pontot és a 6.4 fejezetet.

Küldeménydarab tömege: ellenkező meghatározás hiányában a küldeménydarab bruttó tömege. Az áru szállításához használt konténer és tartány tömege a bruttó tömegbe nem számít bele;

Külső csomagolóeszköz: az összetett csomagolás vagy kombinált csomagolás külső védelme felszívó anyaggal, tömítőanyaggal és minden egyéb elemmel, ami szükséges a belső

tartályok vagy belső csomagolóeszközök befogadásához és védelméhez;

L

Láda: fémről, fából, rétegelt falemezből, farostlemezből, papírlemezből, műanyagból vagy más alkalmas anyagból készült, négyyszögletes vagy sokszög alakú oldalakkal rendelkező teljes falú csomagolóeszköz. Kis nyílások olyan célokra, mint a könnyebb megfogás vagy felnyitás vagy a besorolási követelmények kielégítése, engedélyezettek, amennyiben ezek nem befolyásolják a csomagolóeszköz integritását a szállítás alatt;

Légmentesen zárt tartány: folyékony anyagok szállítására szolgáló, legalább 4 bar nyomásra méretezett tartány, vagy szilárd (porszerű vagy szemcsés) anyagok szállítására szolgáló tartány – a tervezési nyomásától függetlenül –, amelynek nyílásai légmentesen zárva vannak, és:

- nincs rajta se biztonsági szelep, se hasadótárcsa vagy más hasonló biztonsági berendezés, se vákuumszelep; vagy
- nincs rajta se biztonsági szelep, se hasadótárcsa vagy más hasonló biztonsági berendezés, de van rajta a 6.8.2.2.3 pont előírásának megfelelő vákuumszelep; vagy
- van rajta biztonsági szelep, ami előtt a 6.8.2.2.10 pont szerint hasadótárcsa van, de nincs rajta vákuumszelep; vagy
- van rajta biztonsági szelep, ami előtt a 6.8.2.2.10 pont szerint hasadótárcsa van, és van rajta a 6.8.2.2.3 pont előírásának megfelelő vákuumszelep is;

Legnagyobb nettó tömeg: egyetlen csomagolás tartalmának legnagyobb tiszta tömege, vagy belső csomagolások és ezek tartalmának legnagyobb együttes tömege kg-ban;

Legnagyobb normál üzemi nyomás (a 7 osztály anyagainak szállításánál): a közepes tengerszint feletti levegőnyomást meghaladó azon legnagyobb nyomás, amely a biztonsági tartály belsejében a szállítás során fennálló környezeti feltételeknek megfelelő hőmérsékleti és napsugárzási viszonyok mellett, szellőztetés, segédrendszer általi külső hűtés vagy szállítás közbeni üzemi ellenőrzés nélkül egy év alatt kialakulhat;

Legnagyobb űrtartalom: a tartály vagy csomagolóeszköz (beleértve az IBC-t és a nagycsomagolást is) legnagyobb befogadóképessége m³-ben vagy literben;

Legnagyobb üzemi nyomás (túlnyomás): a következő három érték közül a legnagyobb:

- a) a tartályban a töltés során megengedett legnagyobb tényleges nyomás (legnagyobb megengedett töltési nyomás);
- b) a tartályban az ürítés során megengedett legnagyobb tényleges nyomás (legnagyobb megengedett ürítési nyomás); és
- c) az a tényleges túlnyomás, amelyet a tartályra annak tartalma (beleértve azokat az idegen gázokat is, amelyeket tartalmazhat) a legnagyobb üzemi hőmérsékleten fejt ki.

Hacsak a 4.3 fejezetben levő különleges előírások másként nem rendelkeznek, az üzemi nyomás (túlnyomás) számszerű értéke nem lehet kisebb, mint a tartalom gőznyomása (abszolút nyomása) 50 °C-on.

A biztonsági szelepekkel (hasadótárcsával vagy anélkül) felszerelt tartályok esetén azonban a legnagyobb üzemi nyomásnak (túlnyomásnak) a biztonsági szelepekre előírt nyitónyomással kell egyenlőnek lennie. Ez a követelmény nem vonatkozik a 2 osztály sűrített, cseppfolyósított és oldott gázainak szállítására szolgáló tartályokra. (lásd még *próbanyomás*, *tervezési nyomás*, *töltési nyomás* és *ürítési nyomás*);

Megjegyzés: 1. A mobil tartályokra lásd a 6.7 fejezetet.

2. A zárt mélyhűtő tartályokra lásd a 6.2.1.3.6.5 ponthoz fűzött megjegyzést.

Leszerelhető tartály: olyan, 450 liternél nagyobb befogadóképességű tartály, de nem rögzített tartály, nem mobil tartály, nem tankkonténer és nem battériás jármű vagy MEG-konténer eleme, amelyet nem úgy alakítottak ki, hogy az árut a rakomány megbontása nélkül

lehessen szállítani, és amelyet rendes körülmények között csak üres állapotban lehet emelni;

Lobbanáspont: egy folyékony anyag azon legalacsonyabb hőmérséklete, amelynél gőzei a levegővel gyúlékony keveréket alkotnak;

LPG: lásd *cseppfolyósított petróleumgáz (LPG)*;

M

Megengedett legnagyobb bruttó tömeg:

- (IBC-knél) az IBC, az üzemi és a szerkezeti szerelvények tömegének, valamint a legnagyobb nettó rakomány tömegének az összege;
- (tartányoknál) a tartány saját tömege és a szállításra megengedett legnagyobb rakomány össztömege;

Megjegyzés: A mobil tartányokra lásd a 6.7 fejezetet.

Megfelelőség biztosítása (radioaktív anyagoknál): az illetékes hatóság által alkalmazott rendszeres intézkedési program, amelynek célja annak biztosítása, hogy az ADR követelményei a gyakorlatban megvalósuljanak;

Megfelelőség-értékelés: egy termék megfelelőségének ellenőrzése az 1.8.6 és az 1.8.7 szakasznak a típusjóváhagyásra, a gyártás felügyeletére és az üzembe helyezés előtti vizsgálatra vonatkozó előírásai szerint;

MEG-konténer: lásd *többeleemes gázkonténer*;

Megtartó rendszer (a 7 osztály anyagainak szállításánál): a hasadóanyagnak és a csomagolási elemeknek a tervező által meghatározott és az illetékes hatóság által jóváhagyott együttese, amelynek feladata a kritikussági biztonság fenntartása;

Mélyhűtő tartály: szállításra használt, hőszigetelt, nyomástartó tartály mélyhűtött, cseppfolyósított gázokhoz, legfeljebb 1000 liter ürtartalommal (lásd még *nyitott mélyhűtő tartály*);

MEMU: lásd *robbanóanyag előállító mobil egység*;

Merev falú belső tartály (összetett IBC-knél): olyan tartály, amely üres állapotban, a zárószerkezet helyre tétele és a külső burkolat segítségével is megtartja szokásos alakját. Minden belső tartályt, amely nem „merev falú”, „hajlékony falú”-nak kell tekinteni;

Merev falú IBC rendszeres karbantartása: nagyméretű csomagolóeszköz (IBC);

Merev falú műanyag IBC: merev műanyag testből álló IBC, amely vázszerkezettel rendelkezhet, és a megfelelő üzemi szerelvényekkel látható el;

Minőségbiztosítás: bármely szervezet vagy szerv által alkalmazott rendszeres ellenőrzési és felügyeleti program, amelynek célja annak biztosítása, hogy az ADR biztonsági előírásai a gyakorlatban megvalósuljanak;

Minta (a 7 osztály anyagainak szállításánál): valamely különleges formájú radioaktív anyag, kis mértékben diszpergálódó radioaktív anyag, küldeménydarab vagy csomagolás leírása, ami lehetővé teszi az ilyen tárgy pontos azonosítását. A leíráshoz adatlapok, szerkezeti rajzok, az előírásokkal való egyezőséget tanúsító jelentések és más mértékadó dokumentumok tartozhatnak;

m.n.n. (másként meg nem nevezett) tétel: olyan gyűjtőmegnevezés, amelyhez olyan anyagok, keverékek, oldatok vagy tárgyak rendelkeznek, amelyek

- nincsenek a 3.2 fejezet „A” táblázatában név szerint megemlítve; és
- az m.n.n. tétel megnevezésének, osztályának, osztályozási kódjának és csomagolási csoportjának megfelelő kémiai, fizikai és/vagy veszélyes tulajdonságokkal rendelkeznek;

Mobil tartány: a 6.7 fejezetben, ill. az IMDG Kódexben található meghatározás szerinti, multimodális tartány, amelyhez a 3.2 fejezet „A” táblázat 10 oszlopában mobil tartány utasítás (T-jel) van feltüntetve; amennyiben a 2.2.2.1.1 pontban meghatározott gázok szállítására használják, 450 liternél nagyobb befogadóképességű;

Mobil tartány üzemben tartója: lásd *tankkonténer vagy mobil tartány üzemben tartója*;

Műanyagszövet (hajlékony falú IBC-knél): alkalmas műanyagból álló nyújtott szalagokból vagy monoszálakból készült anyag;

Műszaki megnevezés: elfogadott kémiai – adott esetben biológiai – megnevezés, vagy a tudományos és műszaki kézikönyvekben, folyóiratokban és egyéb szakirodalomban jelenleg használt, egyéb megnevezés (lásd a 3.1.2.8.1.1 pontot);

N

Nagycsomagolás: olyan csomagolóeszköz, amelynél a belső csomagolások vagy tárgyak egy külső csomagolóeszközbe vannak helyezve és

- a) gépi mozgatásra alkalmas kivitelű;
- b) amelynek befogadóképessége meghaladja a 400 kg nettó tömeget, ill. a 450 litert, de legfeljebb 3 m³;

Az **átalakított nagycsomagolás** olyan fém vagy merev falú műanyag nagycsomagolás,

- a) amelyet nem UN típusúból alakítottak át UN típusúvá; vagy
- b) amelyet valamely UN típusúból egy másik UN típusúvá alakítottak át.

Az átalakított nagycsomagolásokra az ADR ugyanazon követelményei vonatkoznak, mint amelyeket az azonos típusú, új nagycsomagolásokra kell alkalmazni (lásd még a gyártási típus meghatározását a 6.6.5.1.2 pontban).

Az **ismételten felhasznált nagycsomagolás** újratöltésre szánt nagycsomagolás, amelyet megvizsgáltak és minden olyan sérüléstől mentesnek találtak, amely befolyásolná a teljesítőképességi vizsgálatok elviselését; a fogalom kiterjed azokra a nagycsomagolásokra is, amelyeket azonos vagy hasonló összeférhetőségű termékkel töltenek meg ismételten és a termék feladója által ellenőrzött elosztási láncban szállítanak;

Nagykonténer: lásd *konténer*;

Nagyméretű csomagolóeszköz (IBC): a 6.1 fejezetben nem említett, merev vagy hajlékony falú, szállítható csomagolóeszköz, amelynek

- a) űrtartalma
 - i) nem haladja meg a 3 m³-t a II és a III csomagolási csoportba tartozó, szilárd és folyékony anyagok esetében;
 - ii) nem haladja meg az 1,5 m³-t az I csomagolási csoportba tartozó, szilárd anyagok esetében, ha azok hajlékony falú, merev falú műanyag, összetett, papírlemez vagy fa IBC-kbe vannak csomagolva;
 - iii) nem haladja meg a 3 m³-t az I csomagolási csoportba tartozó, szilárd anyagok esetében, ha azok fém IBC-kbe vannak csomagolva;
 - iv) nem haladja meg a 3 m³-t a 7 osztály radioaktív anyagai esetében;
- b) gépi mozgatásra alkalmas kivitelű;
- c) a szállítás és kezelés során fellépő erőhatásoknak oly módon áll ellen, mint azt a 6.5 fejezet szerinti próbák meghatározzák (lásd még *fa IBC*, *fém IBC*, *hajlékony falú IBC*, *merev falú műanyag IBC*, *összetett IBC műanyag belső tartállyal és papírlemez IBC*).

Megjegyzés: 1. A 6.7 fejezet előírásainak megfelelő mobil tartányok, ill. a 6.8 fejezet előírásainak megfelelő tankkonténerek nem tekinthetők IBC-knek.

2. A 6.5 fejezet előírásainak megfelelő IBC-k az ADR értelmében nem tekinthetők konténereknek.

Az **átalakított IBC** olyan fém, merev falú műanyag vagy összetett IBC,

- a) amelyet nem UN típusból alakítottak át UN típusúvá; vagy
- b) amelyet valamely UN típusból egy másik UN típusúvá alakítottak át.

Az átalakított IBC-kre az ADR ugyanazon követelményei vonatkoznak, mint amelyeket az azonos típusú, új IBC-kre kell alkalmazni (lásd még a gyártási típus meghatározását a 6.5.6.1.1 pontban).

A **javított IBC** olyan fém, merev falú műanyag vagy összetett IBC, amely ütdés vagy bármilyen más ok (pl. korrózió, ridegedés, a gyártási típushoz képest gyengült ellenállóképesség) miatt kijavítottak, hogy megegyezzen a gyártási típussal és képes legyen a gyártási típus vizsgálatok elviselésére. Az összetett IBC-k merev falú műanyag belső tartályának a cseréje ugyanazon gyártó eredeti gyártási típusa szerinti belső tartályra az ADR értelmében az IBC javításának minősül. A merev falú IBC-k rendszeres karbantartása azonban nem minősül javításnak. A merev falú műanyag IBC testeken és az összetett IBC-k belső tartályán nem végezhető javítás. A hajlékony falú IBC-k csak az illetékes hatóság engedélyével javíthatók;

A **hajlékony falú IBC rendszeres karbantartása** a hajlékony falú, műanyag vagy textilszövet IBC-ken a következő, rendszeresen elvégzett munkákat jelenti:

- a) tisztítás; vagy
- b) az IBC szerves részét nem képező alkotóelemek, pl. különálló bélések és zárószalagok cseréje a gyártó eredeti előírásainak megfelelővel;

amennyiben ez az IBC árumegtartó funkcióját nem befolyásolja kedvezőtlenül, ill. az IBC gyártási típusát nem változtatja meg;

A **merev falú IBC rendszeres karbantartása** a fém, merev falú műanyag és összetett IBC-ken a következő, rendszeresen elvégzett munkákat jelenti:

- a) tisztítás;
- b) a zárószervezetek (beleértve a hozzátartozó tömítéseket) vagy az üzemi szerelvények eltávolítása és visszahelyezése vagy a gyártó eredeti előírásainak megfelelővel való cseréje, feltéve, hogy az IBC tömörségét ellenőrzik; vagy
- c) a veszélyes áru megtartására vagy az ürítési nyomás fenntartására közvetlenül nem szolgáló szerkezeti szerelvények kijavítása (pl. a tartólábak, emelő tartozékok helyreigazítása), hogy megegyezzenek a gyártási típussal, amennyiben ez az IBC megtartó funkcióját nem befolyásolja;

Nagypalack (a 2 osztályban): varrat nélküli, szállításra használt, nyomástartó tartály 150 liternél nagyobb, de legfeljebb 3000 liter űrtartalommal;

Nettó robbanóanyag tömeg (NEM): a robbanó anyag csomagolóeszköz, burkolat, ház, stb. nélküli össztömege. (A *nettó robbanóanyag mennyiség (NEQ)*, a *nettó robbanóanyag tartalom (NEC)* vagy a *nettó robbanóanyag súly (NEW)* gyakran ugyanebben az értelemben használatos);

Ny

Nyitott jármű: olyan jármű, amelynek rakfelülete csupasz, vagy csak oldalfalakkal és hátsó fallal van ellátva;

Nyitott konténer: lásd *konténer*;

Nyitott mélyhűtő tartály: szállításra használt, hőszigetelt tartály mélyhűtött, cseppfolyósított gázokhoz, amelyet a mélyhűtött, cseppfolyósított gáz folyamatos szellőztetésével atmoszferikus nyomáson tartanak;

Nyomástartó tartály: gyűjtőfogalom, amelyhez a palackok, a nagypalackok, a gázhordók, a zárt mélyhűtő tartályok, a fémhidrid-tárolórendszerek, a palackkötegek és kármentő nyomástartó tartályok tartoznak;

O

„Offshore” ömlesztettáru-konténer: olyan többször használható ömlesztettáru-konténer, amelyet speciálisan nyílt tengeri létesítményekhez, létesítményektől, ill. létesítmények közötti szállításra terveztek. Az „offshore” ömlesztettáru-konténert a nyílt tengeren kezelt „offshore” konténerekre vonatkozó jóváhagyási útmutató szerint kell tervezni és gyártani, amit a Nemzetközi Tengerészeti Szervezet (IMO) MSC/Circ.860 dokumentuma tartalmaz;

Orsó (az 1 osztályban): műanyagból, fából, papírlemezből, fémből vagy egyéb alkalmas anyagból készített eszköz központi tengellyel és a tengely mindkét végén oldalsó tárcsával vagy anélkül. Az anyagok és tárgyak a tengely köré tekerceselhetők és azokat az oldalsó tárcsák tarthatják meg;

Ö

ÖBH: lásd *öngyorsuló bomlási hőmérséklet*;

Ömlesztettáru-konténer: olyan megtartó rendszer (beleértve mindenfajta bélést és bevonatot), amely a vele közvetlenül érintkező szilárd anyag szállítására szolgál. A csomagolóeszközök, IBC-k, nagycsomagolások és tartányok nem tartoznak ide.

Az ömlesztettáru-konténer

- tartós jellegű és ennek megfelelően elég szilárd ahhoz, hogy ismételten felhasználható legyen;
- kifejezetten úgy van kialakítva, hogy megkönnyítse az áruknak egy vagy több szállító eszközzel – a rakomány megbontása nélkül – történő szállítását;
- a könnyű kezelhetőséget lehetővé tevő elemekkel van ellátva;
- befogadóképessége legalább 1,0 m³.

Ömlesztettáru-konténer lehet pl. konténer, „offshore” ömlesztettáru-konténer, billenő-puttony, ömlesztettáru-siló, cserefelépítmény, konténerteknő, görgős konténer, a jármű rakodótere;

Ömlesztett szállítás: csomagolatlan szilárd anyagok vagy tárgyak szállítása járműveken vagy konténerekben. A fogalom nem vonatkozik sem a csomagolt árukra (küldeménydarabokra), sem a tartányokban szállított anyagokra;

Öngyorsuló bomlási hőmérséklet (ÖBH): az a legalacsonyabb hőmérséklet, amelynél a szállítás során használt csomagolásban levő anyagnál az öngyorsuló bomlás bekövetkezhet. Az ÖBH meghatározására vonatkozó követelményeket és a zárt térben történő hevítés hatását a Vizsgálatok és kritériumok kézikönyv II. része tartalmazza. [Az öngyorsuló bomlási hőmérséklet (ÖBH) a francia température de decomposition auto-accélération (TDAA), ill. az angol self-accelerating decomposition temperature (SADT) magyar megfelelője.];

Összetett IBC műanyag belső tartállyal: olyan IBC, amely merev külső burkolatot képező vázszerkezetből áll, amely a műanyag belső tartályt, valamint a megfelelő üzemi és szerkezeti szerelvényeket veszi körül. Kialakítása olyan, hogy a belső tartály és a külső burkolat összeszerelve szétválaszthatatlan egységet képez és így töltik, tárolják, szállítják vagy ürítik;

Megjegyzés: A „műanyag” az összetett IBC-knél a belső tartállyal kapcsolatosan használva az egyéb polimer anyagokat, mint pl. a gumit is jelenti.

Összetett (műanyag) csomagolóeszköz: belső műanyag tartályból és külső (fém, papírlemez, rétegelt falemez stb.) csomagolásból álló csomagolóeszköz. Ez a csomagolóeszköz, ha egyszer már összeállították, szétválaszthatatlan marad, így töltik, raktározzák, szállítják és ürítik;

Megjegyzés: Lásd az összetett (üveg, porcelán, kőagyag) csomagolóeszközhöz fűzött megjegyzést.

Összetett (üveg, porcelán, kőagyag) csomagolóeszköz: belső üveg, porcelán- vagy kőagyag tartályból és külső (fém, fa, papírlemez, műanyag, habosított műanyag stb.) csomagolásból áll. Ez a csomagolóeszköz, ha egyszer összeállították, szétválaszthatatlan marad, így töltik, raktározzák, szállítják és ürítik;

Megjegyzés: Egy „összetett csomagolóeszköz” „belső elemét” a szokásos körülmények között „belső tartálynak” nevezik. Például egy 6HA1 típusú összetett (műanyag) csomagolóeszköz „belső eleme” egy ilyen fajta „belső tartály”, mivel ezt a szokásos körülmények között nem arra alakították ki, hogy „külső csomagolás” nélkül „befogadó” funkciót lásson el, és így nem „belső csomagolásról” van szó.

P

Palack: legfeljebb 150 liter űrtartalmú, szállításra használt, nyomástartó tartály (lásd még *palackköteg*);

Palackköteg: szállításra használt, szerkezeti egységbe épített palackok, amelyek egymással gyűjtőcsővel vannak összekötve és szilárdan egymáshoz vannak erősítve. A palackok együttes űrtartalma legfeljebb 3000 liter lehet, a 2 osztály mérgező (a 2.2.2.1.3 pont szerint T betűvel kezdődő csoportba tartozó) gázainak szállítására használt palackkötegek űrtartalma azonban legfeljebb 1000 liter lehet;

Papírlemez IBC: papírlemez testből különálló fenékkal és tetővel vagy anélkül, szükség esetén béléssel (de nem belső csomagolással), és megfelelő szerkezeti és üzemi szerelvényekből álló IBC;

Ponyvás jármű: a felrakott áru védelme érdekében ponyvával ellátott nyitott jármű;

Ponyvás konténer: lásd *konténer*;

Portömör csomagolóeszköz: olyan csomagolóeszköz, amely nem engedi át a szilárd tartalmat, beleértve a szállítás alatt keletkező finom szilárd anyagot is;

Próbanyomás: az üzembe helyezés előtti, ill. az időszakos vizsgálat alkalmával végzett nyomáspróba során kifejtett nyomás (lásd még *legnagyobb üzemi nyomás (túlnyomás)*, *tervezési nyomás*, *töltési nyomás* és *ürítési nyomás*);

Megjegyzés: A mobil tartányokra lásd a 6.7 fejezetet.

R

Radioaktív tartalom (a 7 osztály anyagainak szállításánál): a csomagolásban együtt levő radioaktív anyag bármely szennyezett vagy felaktivált szilárd vagy folyékony anyaggal és gázzal;

Referencia acél: a 370 N/mm² szakítószilárdságú és 27% szakadási nyúlású acél;

Rekesz: rácsos kialakítású (nem teljes falú) külső csomagolóeszköz;

RID: a Veszélyes Áruk Nemzetközi Vasúti Fuvarozásáról szóló Szabályzat (RID), amely a Nemzetközi Vasúti Fuvarozási Egyezmény (COTIF) C Függeléke;

Robbanóanyag előállító mobil egység (MEMU): olyan egység (vagy olyan egységgel felszerelt jármű), amely arra szolgál, hogy nem robbanóanyagok közé tartozó veszélyes árukból robbanóanyagot állítsanak vele elő és azt közvetlenül a felhasználás helyére (a robbantólyukba) juttassák. Az egység különféle tartányokat, ömlesztettáru-konténereket, a munkafolyamathoz tartozó felszereléseket, valamint szivattyúkat, keverő és adagoló berendezést, ill. egyéb szükséges felszerelést tartalmazhat. A MEMU-nak lehet olyan különleges raktere is, amelyben robbanóanyagot tartalmazó küldeménydarabok vannak;

Megjegyzés: *Annak ellenére, hogy a MEMU meghatározásában szerepel az, hogy robbanóanyagot állítanak elő vele és azt közvetlenül a felhasználás helyére juttatják, a MEMU-ra vonatkozó követelmények csak a vele való szállításra vonatkoznak és nem az említett tevékenységekre.*

Rögzített tartány: szerkezeti tartósan a járműre szerelt, legalább 1000 liter befogadóképességű tartány (a jármű ily módon tartányjárművé válik) vagy egy ilyen jármű alvázának elválaszthatatlan részét képező tartány;

S

Sugárzási szint (a 7 osztály anyagainak szállításánál): a megfelelő sugárzásra vonatkozó dózis-teljesítmény millisievert per óra egységben megadva;

Sz

Szabályozási hőmérséklet: az a legmagasabb hőmérséklet, amelyen a szerves peroxid vagy az önreaktív anyag biztonságosan szállítható;

Szállítás: a veszélyes áru helyváltoztatása, beleértve a közlekedési okokból történő megállásokat, ill. minden olyan, közlekedési szempontból szükségessé vált időszakot a helyváltoztatás előtt, alatt és után, amely alatt a veszélyes áru a járműben, tartányban vagy konténerben van.

Ez a fogalom kiterjed a veszélyes áruk átmeneti tárolására is a közlekedési ágak, ill. a közlekedési eszközök cseréjénél (átrakásnál), azzal a feltétellel, hogy az áru átvételének és kiszolgáltatásának helyét feltűntető fuvarokmányt kérésre bemutatják, ill. a küldeménydarabokat vagy a tartányokat nem nyitják fel, kivéve, ha az illetékes hatóságok ellenőrzik;

Szállítási mutatószám (Transport index, TI) küldeménydarabhoz, egyesítőcsomagoláshoz, konténerhez vagy csomagolatlan LSA-I vagy SCO-I küldeményhez (a 7 osztály anyagainak szállításánál): olyan szám, amelyet a besugárzás ellenőrzésére használnak;

Szállító: az a vállalkozás, amely a szállítási műveletet végrehajtja, akár fuvarozási szerződés alapján, akár anélkül;

Szállítóegység: olyan gépjármű, amelyhez nincs pótkocsi kapcsolva, vagy gépjárműből és a hozzákapcsolt pótkocsiból álló járműszerelvény;

Szállítóeszköz (közúti vagy vasúti szállításnál): jármű vagy vasúti kocsi;

Szerkezeti acél: a 360...440 N/mm² közötti legkisebb szakítószilárdságú acél;

Megjegyzés: *A mobil tartányokra lásd a 6.7 fejezetet.*

Szerkezeti szerelvény:

- tartányjármű vagy leszerelhető tartány esetében a tartány külső vagy belső erősítő- és rögzítő-, védő- vagy stabilizáló-elemei;
- tankkonténer esetében a tartány külső vagy belső erősítő- és rögzítő-, védő- vagy stabilizáló-elemei;
- battériás jármű vagy MEG-konténer elemei esetében a tartány vagy a tartály külső vagy belső erősítő- és rögzítő-, védő- vagy stabilizáló-elemei;
- hajlékony falú IBC-ket kivéve, minden más IBC típusnál a test erősítő-, rögzítő-, kezelő-, védő- vagy stabilizáló-elemei (beleértve a belső műanyag tartállyal rendelkező összetett IBC-k esetében a rakodólap alapot is);

Megjegyzés: *A mobil tartányokra lásd a 6.7 fejezetet.*

Szilárd anyag:

- a) amelynek olvadáspontja vagy olvadás kezdőpontja 101,3 kPa nyomáson 20 °C-nál magasabb; vagy
- b) az ASTM D 4359-90 vizsgálati módszerrel meghatározva nem folyékony, vagy a 2.3.4 szakaszban leírt folyékonyság meghatározási vizsgálat (penetrométer eljárás) kritériumai szerint pasztaszerű;

T

Tálca (az 1 osztályban): fém, műanyag, papírlemez vagy más alkalmas anyagú lemez, amelyet a belső, a köztes vagy a külső csomagolásba helyeznek és azokba szorosan illeszkedik. A tálca felülete lehet alakos, hogy a csomagolások vagy tárgyak beültethetők, szilárdan rögzíthetők és egymástól elválaszthatók legyenek;

Tankkonténer: gáz alakú, folyékony, porszerű vagy szemcsés anyagok szállítására használt, a konténer meghatározásnak megfelelő szállítóeszköz, amely a tartányból és szerelvényeiből áll, beleértve azokat a szerelvényeket is, amelyek lehetővé teszik a tankkonténer helyváltoztatását egyensúlyhelyezete jelentős megváltoztatása nélkül; amennyiben a 2.2.2.1.1 pontban meghatározott gázok szállítására használják, 450 liternél nagyobb befogadóképességű;

Megjegyzés: A 6.5 fejezet előírásainak megfelelő IBC-k nem tekinthetők tankkonténereknek.

Tankkonténer vagy mobil tartány üzemben tartója: az a vállalkozás, amelynek a nevében a tankkonténert vagy a mobil tartányt nyilvántartásba vették;

Tartály (az 1 osztályban): köztes vagy belső csomagolásként használt láda, palack, hordó, kanna, doboz és hüvely, beleértve mindenféle zárószervezetüket;

Tartály: anyagok vagy tárgyak befogadására vagy tartására alkalmas befogadóedény, beleértve mindenfajta zárószervezetét is. Ez a meghatározás a tartányokra nem vonatkozik (lásd még *belső tartály*, *gázpatron*, *mélyhűtő tartály*, *merev belső tartály* és *nyomástartó tartály*);

Tartály névleges űrtartalma: a tartályban található veszélyes áru literben kifejezett névleges térfogata. A sűrített gázok tartályainál ez megegyezik a víztöltet térfogatával;

Tartány: maga a tartányköpeny, beleértve annak üzemi és szerkezeti szerelvényeit. Ahol a tartány szó önmagában szerepel, tankkonténert, mobil tartányt, leszerelhető tartányt vagy rögzített tartányt jelent az ebben a részben szereplő meghatározás szerint, ill. olyan tartányt, amely a battériás jármű vagy a MEG-konténer elemét képezi (lásd még leszerelhető tartány, MEG-konténer, mobil tartány és rögzített tartány);

Megjegyzés: A mobil tartányokra lásd a 6.7.4.1 bekezdést.

Tartány, ill. tartánykamra befogadóképessége (űrtartalma): a tartány, ill. tartánykamra teljes belső térfogata, literben vagy m³-ben kifejezve. Ha a tartányt, ill. tartánykamrát az alakja vagy a szerkezeti kialakítása miatt nem lehet teljesen feltölteni, akkor a töltési fok meghatározásánál és a tartány jelölésénél a csökkentett befogadóképességet kell alapul venni;

Tartányjármű: a folyadékok, gáz halmazállapotú, porszerű vagy szemcsés anyagok szállítására használt, egy vagy több rögzített tartánnyal felszerelt jármű. A tartányjármű magán a járművön vagy az azt helyettesítő futómű-elemeknél kívül egy vagy több tartányból, szerelvényeiből és a tartányokat a járműhöz vagy a futómű-elemekhez csatlakoztató alkatrészekből áll;

Tartányköpeny: az anyagot tartalmazó burkolat (beleértve a nyílásokat és zárószervezteket);

- Megjegyzés:** 1. Ez a meghatározás nem vonatkozik a tartályokra.
2. A mobil tartályokra lásd a 6.7 fejezetet.

Tartányos cserefelépítmény: a tartányos cserefelépítmény tankkonténernek tekintendő;

Tartány-vizsgálati könyv (gépkönyv): olyan dokumentáció, amely tartalmazza a tartányra, battériás járműre, ill. MEG-konténerre vonatkozóan az összes fontos műszaki adatot, mint például a 6.8.2.3, a 6.8.2.4 és a 6.8.3.4 bekezdésben említett bizonyítványokat, ill. tanúsítványokat;

Teljes rakomány: egyetlen feladótól származó rakomány, amely részére egy jármű vagy nagykonténer kizárólagos használatra van fenntartva, és amelynek be- és kirakását a feladó vagy a címzett utasításai szerint végzik;

Megjegyzés: A 7 osztálynál a megfelelő kifejezés a kizárólagos használat.

Tervezési nyomás: a próbanyomással legalább egyenlő elméleti nyomás, amely a szállított anyag veszélyességi foka szerint kisebb vagy nagyobb mértékben meghaladhatja az üzemi nyomást. A tervezési nyomás csak a tartány falvastagságának meghatározására való a külső és belső erősítőelemek figyelembevétele nélkül (lásd még *legnagyobb üzemi nyomás (túlnyomás)*, *próbanyomás*, *töltési nyomás* és *ürítési nyomás*);

Megjegyzés: A mobil tartályokra lásd a 6.7 fejezetet.

Test (az összetett IBC-ket kivéve minden más IBC típusnál): maga a tartály, beleértve a nyílásokat és azok zárószerveit, de kizárva az üzemi szerelvényeket;

Többelemes gázkonténer (MEG-konténer): olyan szállítóeszköz, amelynek egymással gyűjtőcsővel összekötött és vázra szerelt elemei vannak. A következő elemek tekinthetők a többelemes gázkonténer elemeinek: palackok, nagypalackok, gázhordók, palackkötegek és a 2.2.2.1.1 pontban meghatározott gázok szállítására készült, 450 liternél nagyobb befogadóképességű tartályok;

Megjegyzés: Az UN MEG-konténerekre lásd a 6.7 fejezetet.

Töltési fok: a gáz tömegének és a felhasználásra kész nyomástartó tartályt teljesen kitöltő víz tömegének aránya 15 °C-on;

Töltési nyomás: az a legnagyobb nyomás, amely a tartányban a nyomás alatti töltéskor ténylegesen fellép (lásd még *legnagyobb üzemi nyomás (túlnyomás)*, *próbanyomás*, *tervezési nyomás* és *ürítési nyomás*);

Töltő: az a vállalkozás, amely a veszélyes árut tartányba (tartányjárműbe, leszerelhető tartányba, mobil tartányba vagy tankkonténerbe), battériás járműbe vagy MEG-konténerbe tölti, ill. az ömlesztett veszélyes árut járműbe, nagykonténerbe vagy kiskonténerbe rakja;

Tömörségi próba: tartányok, csomagolóeszközök vagy IBC-k, szerelvények és zárószervek szivárgásmentességének meghatározására szolgáló vizsgálat;

Megjegyzés: A mobil tartályokra lásd a 6.7 fejezetet.

Transport index (TI): lásd *szállítási mutatószám (TI)*

Túlnyomásos gázpatron: lásd *aeroszol vagy aeroszol csomagolás*;

U

UIC: Union Internationale des Chemins de Fer (Nemzetközi Vasútegylet), (UIC, 16 rue Jean Rey, F-75015 Paris, France);

UNECE: United Nations Economic Commission for Europe (ENSZ Európai Gazdasági Bizottság), (UNECE, Palais des Nations, 8-14 avenue de la Paix, CH-1211 Geneva 10, Switzerland);

UN szám (azonosító szám): az anyagok és tárgyak négyjegyű azonosító száma, amely az „ENSZ Minta Szabályzat”-ból származik;

Ü

Üritési nyomás: az a legnagyobb nyomás, amely a tartányban a nyomás alatti ürítéskor ténylegesen fellép (lásd még *legnagyobb üzemi nyomás (túlnyomás)*, *próbanyomás*, *tervezési nyomás* és *töltési nyomás*);

Üzemanyagcella: olyan elektrokémiai eszköz, amely az üzemanyag kémiai energiáját elektromos energiává, hővé és reakciótermékké alakítja át;

Üzemanyagcellás motor: berendezések meghajtására szolgáló eszköz, amely az üzemanyag-cellából, annak üzemanyag ellátójából – függetlenül attól, hogy az vele egybe épített vagy különálló –, valamint a funkciója ellátásához szükséges tartozékokból áll;

Üzemi nyomás: a sűrített gáz állandósult nyomása a megtöltött nyomástartó tartályban 15 °C referencia hőmérsékleten;

Megjegyzés: Tartányokra lásd a legnagyobb üzemi nyomás (túlnyomás) fogalmát.

Üzemi szerelvények:

- a) tartányoknál a töltő- és ürítő-, a szellőző-, a biztonsági, a fűtő- és hőszigetelő berendezések, valamint a mérőeszközök;
- b) battériás jármű vagy MEG-konténer elemeinél a töltő-, ürítő- és biztonsági berendezések, az összekötő csövek, valamint a mérőeszközök;
- c) IBCk-nél a töltő- és ürítő-, a nyomáscsökkentő-, szellőző-, a fűtő- és hőszigetelő-berendezések, valamint a mérőeszközök;

Megjegyzés: A mobil tartányokra lásd a 6.7 fejezetet.

V

Vákuum-szelep: nyomáskülönbség hatására automatikusan működésbe lépő, rugóterhelésű szerkezet, amelynek feladata a nem megengedett vákuum kialakulásának megakadályozása a tartányban;

Vállalat: lásd *vállalkozás*;

Vállalkozás: a természetes személy vagy jogi személy, függetlenül attól, hogy folytat-e jövedelemszerző tevékenységet; a jogi személyiség nélküli társaság vagy személyek társulása, függetlenül attól, hogy folytat-e jövedelemszerző tevékenységet; a hivatalos testületet, függetlenül attól, hogy rendelkezik-e jogi személyiséggel, vagy hogy jogi személyiséggel rendelkező hatóságtól függ-e;

Védett IBC (fém IBC-nél): az ütközéssel szembeni kiegészítő védelemmel ellátott IBC, ez a védelem lehet pl. többrétegű (szendvicsszerkezetű) vagy kettős falú konstrukció vagy fémrácsos vázszerkezet;

Veszélyes áruk: olyan anyagok és tárgyak, amelyek szállítását az ADR tiltja vagy csak feltételekkel engedi meg;

Veszélyes reakció:

- a) égés és/vagy jelentős hőfejlődés;
- b) gyúlékony, fojtó hatású, gyújtó hatású (oxidáló) és/vagy mérgező gázok fejlődése;
- c) maró anyagok képződése;
- d) vegyileg nem állandó anyagok képződése; vagy

e) veszélyes nyomásnövekedés (csak tartányoknál);

Vész hőmérséklet: az a hőmérséklet, amelynél a hőmérséklet-szabályozás megszűnése esetén a vészhelyzeti eljárásokat alkalmazni kell;

Visszaforgatott műanyag: használt ipari csomagolóeszközökből visszanyert anyag, melyet új csomagolóeszközzé való feldolgozásához megtisztítanak és előkészítenek;

Vizsgálatok és kritériumok kézikönyv: az ENSZ „Ajánlások a veszélyes áruk szállítására, Vizsgálatok és kritériumok kézikönyv” ötödik javított kiadása (az ST/SG/AC.10/11/Rev.5/Amend.1 dokumentummal módosított ST/SG/AC.10/11/Rev.5 dokumentum);

Vizsgáló szervezet: az illetékes hatóság által elismert, független vizsgáló szervezet;

Z

Záró szerkezet: a tartály nyílását záró szerkezet;

Zárt konténer: lásd *konténer*;

Zs

Zsák: papírból, műanyag fóliából, textilből, szövött anyagból vagy más alkalmas anyagból készült hajlékony csomagolóeszköz.

1.2.2 Mértékegységek

1.2.2.1 Az ADR-ben a következő mértékegységek^{a)} alkalmazhatók

Fizikai mennyiség	SI-egység ^{b)}		Egyéb engedélyezett mértékegység		A mértékegységek közötti arány
	neve	jele	neve	jele	
Hosszúság	méter	m	–	–	
Terület, felület	négyszetméter	m ²	–	–	
Térfogat	köbméter	m ³	liter	l ^{c)}	1 l = 10 ⁻³ m ³
Idő	másodperc	s	perc óra nap	min h d	1 min = 60 s 1 h = 3600 s 1 d = 86 400 s
Tömeg	kilogramm	kg	gramm tonna	g t	1 g = 10 ⁻³ kg 1 t = 10 ³ kg
Sűrűség	–	kg/m ³	–	kg/l	1 kg/l = 10 ³ kg/m ³
Hőmérséklet	kelvin	K	Celsius-fok	°C	0 °C = 273,15 K
Hőmérséklet-különbség	kelvin	K	Celsius-fok	°C	1 °C = 1 K
Erő	newton	N	–	–	1 N = 1 kg·m/s ²
Nyomás	Pascal	Pa	bar	bar	1 bar = 10 ⁵ Pa 1 Pa = 1 N/m ²
Mechanikai feszültség	–	N/m ²	–	N/mm ²	1 N/mm ² = 1 MPa
Munka Energia Hőmennyiség	joule	J	kilowattóra elektronvolt	kWh eV	1 kWh = 3,6 MJ 1 J = 1 N·m = 1 W·s 1 eV = 0,1602·10 ⁻¹⁸ J
Teljesítmény					
Kinematikai viszkozitás					
Dinamikai viszkozitás	–	Pa·s	–	mPa·s	1 mPa·s = 10 ⁻³ Pa·s
Aktivitás	becquerel	Bq	–	–	–
Dózisegyenérték	sievert	Sv	–	–	–

a) A korábbi, már nem törvényes mértékegységekkel adott mennyiség értékek törvényes mértékegységű értékre való átszámításához a következő kerekített értékeket kell alkalmazni:

Erő:

$$1 \text{ kg} = 9,807 \text{ N}$$

$$1 \text{ N} = 0,102 \text{ kg}$$

Nyomás:

$$1 \text{ Pa} = 1 \text{ N/m}^2 = 10^{-5} \text{ bar} = 1,02 \cdot 10^{-5} \text{ kg/cm}^2 = 0,75 \cdot 10^{-2} \text{ Torr}$$

$$1 \text{ bar} = 10^5 \text{ Pa} = 1,02 \text{ kg/cm}^2 = 750 \text{ Torr}$$

$$1 \text{ kg/cm}^2 = 9,807 \cdot 10^4 \text{ Pa} = 0,9807 \text{ bar} = 736 \text{ Torr}$$

$$1 \text{ Torr} = 1,33 \cdot 10^2 \text{ Pa} = 1,33 \cdot 10^{-3} \text{ bar} = 1,36 \cdot 10^{-3} \text{ kg/cm}^2$$

Munka, energia, hőmennyiség:

$$1 \text{ J} = 1 \text{ N} \cdot \text{m} = 0,278 \cdot 10^{-6} \text{ kWh} = 1,102 \text{ kg} \cdot \text{m} = 0,239 \cdot 10^{-3} \text{ kcal}$$

$$1 \text{ kWh} = 3,6 \cdot 10^6 \text{ J} = 367 \cdot 10^3 \text{ kg} \cdot \text{m} = 860 \text{ kcal}$$

$$1 \text{ kg} \cdot \text{m} = 9,807 \text{ J} = 2,72 \cdot 10^{-6} \text{ kWh} = 2,34 \cdot 10^{-3} \text{ kcal}$$

$$1 \text{ kcal} = 4,19 \cdot 10^3 \text{ J} = 1,16 \cdot 10^{-3} \text{ kWh} = 427 \text{ kg} \cdot \text{m}$$

Teljesítmény:

$$1 \text{ W} = 0,102 \text{ kg} \cdot \text{m/s} = 0,86 \text{ kcal/h}$$

$$1 \text{ kg} \cdot \text{m/s} = 9,807 \text{ W} = 8,43 \text{ kcal/h}$$

$$1 \text{ kcal/h} = 1,16 \text{ W} = 0,119 \text{ kg} \cdot \text{m/s}$$

Kinematikai viszkozitás:

$$1 \text{ m}^2/\text{s} = 10^4 \text{ St (stokes)}$$

$$1 \text{ St} = 10^{-4} \text{ m}^2/\text{s}$$

Dinamikai viszkozitás:

$$1 \text{ Pa} \cdot \text{s} = 1 \text{ N} \cdot \text{s/m}^2 = 10 \text{ P (poise)} = 0,102 \text{ kg} \cdot \text{s/m}^2$$

$$1 \text{ P} = 0,1 \text{ Pa} \cdot \text{s} = 0,1 \text{ N} \cdot \text{s/m}^2 = 1,02 \cdot 10^{-2} \text{ kg} \cdot \text{s/m}^2$$

$$1 \text{ kg} \cdot \text{s/m}^2 = 9,807 \text{ Pa} \cdot \text{s} = 9,807 \text{ N} \cdot \text{s/m}^2 = 98,07 \text{ P}$$

b) A Nemzetközi mértékegységrendszer (SI) az Általános Súly- és Mértékügyi Értekezlet határozatainak eredménye (Cím: Pavillon de Breteuil, Parc de St-Cloud, F-92 310 Sèvres).

c) Írógép használata esetén a literre vonatkozó „l” rövidítés mellett az „L” rövidítés is megengedett.

A mértékegységek többszöröseit és törtrészeit a mértékegységek jele elé tett, egy szorzót jelentő, következő prefixumok (SI-prefixumok) egyikével lehet képezni.

Szorzó		A prefixum		
		neve	A prefixum jele	
1 000 000 000 000 000 000 =	10^{18}	trillió	exa	E
1 000 000 000 000 000 =	10^{15}	billiárd	peta	P
1 000 000 000 000 =	10^{12}	billió	tera	T
1 000 000 000 =	10^9	milliárd	giga	G
1 000 000 =	10^6	millió	mega	M
1 000 =	10^3	ezer	kilo	k
100 =	10^2	száz	hekto	h
10 =	10^1	tíz	deka	da
0,1 =	10^{-1}	tized	deci	d
0,01 =	10^{-2}	század	centi	c
0,001 =	10^{-3}	ezred	milli	m
0,000 001 =	10^{-6}	milliomod	mikro	μ
0,000 000 001 =	10^{-9}	milliárdod	nano	n
0,000 000 000 001 =	10^{-12}	billiomod	piko	p
0,000 000 000 000 001 =	10^{-15}	billiárdod	femto	f
0,000 000 000 000 000 001 =	10^{-18}	trilliomod	atto	a

1.2.2.2

Kifejezett ellentétes meghatározás hiányában a „%” az ADR-ben a következőket jelenti:

- szilárd vagy folyékony anyagok keveréke, valamint oldatok és folyadékokkal átitatott szilárd anyagok esetén a keverék, az oldat vagy az átitatott anyag teljes tömegére vonatkoztatott tömeg%-ot;
- sűrített gázkeverékek esetén: ha a töltés nyomásra történik, a térfogatarányt a gázkeverék teljes térfogatának százalékában megadva; vagy ha a töltés tömegre történik, a tömegarányt a gázkeverék teljes tömegének százalékában megadva;
- cseppfolyósított gázkeverék, valamint oldott gázkeverék esetén: a tömegarányt a gázkeverék teljes tömegének százalékában megadva.

1.2.2.3

A tartályokra vonatkozó mindenféle nyomás (pl. próbanyomás, belső nyomás, a biztonsági szelepek nyitónyomása) mindig túlnyomásban van megadva (a légköri nyomáshoz viszonyított túlnyomásban); ezzel szemben a gőznyomás mindig abszolút nyomásban van kifejezve.

1.2.2.4

Ha az ADR töltési fokot ír elő tartályokra vagy tartányokra, ez mindig 15 °C anyag-hőmérsékletre vonatkozik, kivéve, ha más hőmérséklet van megjelölve.

1.3 FEJEZET

A VESZÉLYES ÁRUK SZÁLLÍTÁSÁBAN RÉSZTVEVŐ SZEMÉLYEK KÉPZÉSE

1.3.1 Hatály és alkalmazási terület

Az 1.4 fejezetben hivatkozott résztvevők által alkalmazott, a veszélyes áruk szállításával kapcsolatos munkakört ellátó személyeknek feladatukhoz és felelősségükhöz igazodó képzésben kell részesülniük a veszélyes áruk szállítására vonatkozó előírásokból. Az 1.3.2 szakasz szerinti képzést az alkalmazottaknak még a felelősség elvállalása előtt kell megkapniuk; olyan munkakör, amelyre a szükséges képzés még nem történt meg, csak képzett személy közvetlen felügyelete mellett látható el. A veszélyes árukkal kapcsolatos közbiztonsági előírásokról szóló 1.10 fejezet képzési követelményeit is figyelembe kell venni.

Megjegyzés: 1. A biztonsági tanácsadó képzésére e szakasz helyett lásd az 1.8.3 szakaszt .
2. A járművezető képzésére e szakasz helyett lásd a 8.2 fejezetet.
3. A 7 osztályra vonatkozó képzésre lásd az 1.7.2.5 bekezdést is.

1.3.2 A képzés jellege

Az érintett személyek feladatához és felelősségéhez igazodva a következő képzés szükséges:

1.3.2.1 Általános tájékoztató oktatás

A személyzetnek ismernie kell a veszélyes áruk szállítására vonatkozó általános előírásokat.

1.3.2.2 Munkakörre (feladatra) szakosított oktatás

A személyzetet feladatával és felelősségével arányban álló részletességgel ki kell oktatni a veszélyes áruk szállítására vonatkozó szabályzatok előírásaira.

Ha a veszélyes árut multimodális szállítással továbbítják, a személyzetnek a többi szállítási módra vonatkozó előírásokat is ismernie kell.

1.3.2.3 Biztonsági képzés

A személyzetet ki kell oktatni a veszélyes áruk által képviselt veszélyekről és kockázatról azzal arányban, hogy a veszélyes áruk szállításakor, be- vagy kirakásakor bekövetkező bal-eset esetén mekkora a sérülés veszélye, ill. mennyire van kitéve a veszélyes áru hatásának.

Az oktatás célja, hogy a személyzet tudatában legyen a biztonságos árukezelés szabályainak és a veszélyhelyzet elhárítására teendő intézkedéseknek.

1.3.2.4 A képzést ismeretfelújító oktatás keretében rendszeresen ki kell egészíteni az előírásokban történt változásokkal.

1.3.3 Dokumentálás

Az e fejezet szerinti oktatásra vonatkozó iratokat a munkáltatónak meg kell őriznie és kérés esetén a munkavállaló vagy az illetékes hatóság számára hozzáférhetővé kell tenni. Az iratokat a munkáltatónak az illetékes hatóság által meghatározott időtartamig kell megőriznie. Az oktatásra vonatkozó iratokat új munkakör betöltése esetén ellenőrizni kell.

1.4 FEJEZET

A RÉSZTVEVŐK BIZTONSÁGGAL KAPCSOLATOS KÖTELEZETTSÉGEI

1.4.1 Általános biztonsági előírások

1.4.1.1 A veszélyes áru szállításában résztvevőknek az előrelátható veszély természetének és mértékének megfelelő intézkedéseket kell tenniük, hogy elkerüljék a sérüléseket és károkat, ill. a lehető legkisebbre csökkentsék a következményeket. Az ADR előírásait azonban mindenképpen be kell tartani.

1.4.1.2 Amennyiben olyan közvetlen veszély áll fenn, ami a közbiztonságot veszélyezteti, a résztvevőknek azonnal értesíteniük kell a veszélyhelyzet elhárító szolgálatokat, és rendelkezésükre kell bocsátaniuk azokat az információkat, amelyeket beavatkozásukhoz igényelnek.

1.4.1.3 Az ADR a különböző résztvevőkre háruló kötelezettségeket részletesebben is megadhatja.

Ha egy Szerződő Fél véleménye szerint nem jár a biztonság csökkenésével, a valamely résztvevőre háruló kötelezettségeket belföldi jogszabályaiban átháríthatja egy vagy több másik résztvevőre, feltéve, hogy az 1.4.2 és az 1.4.3 szakaszban felsorolt kötelezettségeknek eleget tesznek. Ezekről az eltérésekről a Szerződő Félnek értesítenie kell az ENSZ Európai Gazdasági Bizottság Titkárságát, amely a Szerződő Felek tudomására hozza.

Az 1.2.1, az 1.4.2 és az 1.4.3 szakasznak a résztvevők és kötelezettségeik meghatározására vonatkozó előírásai nem érintik a belföldi jog jogkövetkezményekre (büntetőjogi, kártérítési felelősség stb.) vonatkozó azon előírásait, amelyek abból fakadnak, hogy a kérdéses résztvevő pl. természetes vagy jogi személy, önálló vállalkozó, munkaadó vagy alkalmazott.

1.4.2 A fő résztvevők kötelezettsége

Megjegyzés: *1. Az e szakaszban meghatározott biztonsági kötelezettséggel rendelkező résztvevők közül egy és ugyanazon vállalkozás több résztvevő is lehet. Ugyanígy az egy résztvevőre háruló tevékenységek és az ezekhez tartozó biztonsági kötelezettségek több vállalkozásra is hárulhatnak.*

2. A radioaktív anyagokra lásd még az 1.7.6 szakaszt is.

1.4.2.1 Feladó

1.4.2.1.1 A veszélyes áru feladója csak olyan küldeményt adhat át szállításra, amely megfelel az ADR előírásainak. A feladóra – az 1.4.1 szakasz figyelembevételével – különösen a következő kötelezettségek hárulnak:

- a) meg kell győződnie arról, hogy a veszélyes áru az ADR-rel összhangban van besorolva és az ADR szerint szállítható;
- b) nyomon követhető módon el kell látnia a szállítót információval és adatokkal, ill. szükség esetén az előírt fuvarokmányokkal és kísérő okmányokkal (jóváhagyások, engedélyek, bejelentések, bizonyítványok stb.), különös tekintettel az 5.4 fejezet és a 3. részben levő táblázatok előírásaira;
- c) csak olyan csomagolóeszközöket, nagycsomagolásokat, IBC-eket és tartányokat (tartány-járműveket, leszerelhető tartányokat, battériás járműveket, MEG-konténereket, mobil tartányokat és tankkonténereket) szabad használnia, amelyek jóvá vannak hagyva és az adott anyag szállítására alkalmasak, ill. el vannak látva az ADR által előírt jelölésekkel;
- d) be kell tartania a feladás módjára és a szállítási korlátozásokra vonatkozó előírásokat;
- e) biztosítani kell, hogy még az üres, tisztítatlan és nem gáztalanított tartányok (tartány-járművek, leszerelhető tartányok, battériás járművek, MEG-konténerek, mobil tartányok és tankkonténerek) ill. az üres, tisztítatlan járművek, valamint az ömlesztett áruhoz

használt nagy- és kiskonténerek is el legyenek látva a megfelelő jelölésekkel és veszélyességi bárcákkal, továbbá az üres, tisztítatlan tartányok ugyanolyan tömören le legyenek zárva, mint megtöltött állapotban.

1.4.2.1.2 Ha a feladó más résztvevők (csomagoló, berakó, töltő stb.) szolgáltatásait veszi igénybe, megfelelő intézkedéseket kell foganatosítani annak biztosítására, hogy a küldemény megfeleljen az ADR előírásainak. Az 1.4.2.1.1 a), b), c) és e) pont esetében azonban a feladó megbízhat a többi résztvevőtől kapott adatokban és információkban.

1.4.2.1.3 Ha a feladó harmadik fél nevében vagy megbízásából jár el, ez utóbbinak a feladót írásban kell tájékoztatnia arról, hogy veszélyes áruval van szó, és rendelkezésére kell bocsátania minden információt és okmányt, amire a feladónak szüksége van kötelezettségei teljesítéséhez.

1.4.2.2 Szállító (fuvarozó)

1.4.2.2.1 A szállítóra (fuvarozóra) – az 1.4.1 szakasz figyelembevételével – különösen a következő kötelezettségek hárulnak:

- a) meg kell győződnie arról, hogy a szállítandó veszélyes áru az ADR szerint szállítható;
- b) meg kell győződnie arról, hogy a feladó a szállítandó veszélyes árura vonatkozó, az ADR által előírt minden információt a szállítás előtt megadott; az előírt okmányok a szállítóegységen vannak; vagy ha elektronikus adatfeldolgozási (EDP) vagy elektronikus adatátviteli (EDI) technikát használnak írásos dokumentáció helyett, az adatok szállítás alatt oly módon hozzáférhetőek, ami legalább egyenértékű az írásos dokumentációval;
- c) szemrevételezéssel meg kell győződnie arról, hogy sem a járműnek, sem a rakománynak nincs nyilvánvaló hiányossága, nem szivárog, nincs rajta repedés, szükséges berendezései nem hiányoznak stb.;
- d) meg kell győződnie arról, hogy a tartányjármű, battériás jármű, leszerelhető tartány, mobil tartány, tankkonténer vagy MEG-konténer soronkövetkező vizsgálatának határideje még nem járt le;

***Megjegyzés:** A tartányok, a battériás járművek és a MEG-konténerek ezen határidő lejárta után is szállíthatók a 4.1.6.10 bekezdés (nyomástartó tartályokból álló battériás járművek és MEG-konténerek esetén), a 4.2.4.4 bekezdés, a 4.3.2.4.4, a 6.7.2.19.6, a 6.7.3.15.6 és a 6.7.4.14.6 pontok feltételei szerint.*

- e) ellenőriznie kell, hogy a járművek ne legyenek túlterhelve;
- f) meg kell győződnie arról, hogy a járműre előírt nagybárcák és jelölések el vannak helyezve;
- g) meg kell győződnie arról, hogy a járművezető számára az írásbeli utasításban előírt eszközök a járművön vannak.

Az előzőeket – értelemszerűen – a fuvarokmány, ill. a kísérő okmányok alapján, a jármű vagy a konténer, vagy adott esetben a rakomány szemrevételezésével kell végrehajtani.

1.4.2.2.2 Az 1.4.2.2.1 a), b), e) és f) pont esetében azonban a szállító (fuvarozó) megbízhat a többi résztvevőtől kapott információkban és adatokban.

1.4.2.2.3 Ha a szállító (fuvarozó) az 1.4.2.2.1 pont alapján az ADR előírásainak megsértését tapasztalja, akkor a küldeményt mindaddig nem továbbíthatja, amíg az előírások nem teljesülnek.

1.4.2.2.4 Ha a szállítás során olyan szabálytalanságot észlel, amely a szállítás biztonságát veszélyeztet, a küldemény továbbítását – a közlekedés és a küldemény biztonsága, ill. a közbiztonság figyelembevételével – a lehető leghamarabb meg kell szakítani. A szállítás csak akkor folytatható, ha a küldemény megfelel az előírásoknak. Az útvonal hátralevő része

szerint illetékes hatóság(ok) azonban engedélyt adhat(nak) a szállítás folytatására.

Amennyiben a szabálytalanság nem szüntethető meg, ill. a szállítás folytatására engedélyt nem adtak, az illetékes hatóságoknak a szükséges hatósági eszközökkel támogatniuk kell a szállítót (fuvarozót). Ugyanez vonatkozik arra az esetre, ha a fuvarozó tájékoztatja hatóságot, hogy a feladó nem közölte vele az áru veszélyességét, és a fuvarozási szerződésekre vonatkozó jogszabályok alapján az árut lerakni, megsemmisíteni vagy ártalmatlanná tenni kívánja.

1.4.2.2.5 (fenntartva)

1.4.2.3 *Címzett*

1.4.2.3.1 A címzett kötelezettsége az áru átvétele – kivéve, ha az átvétel megtagadására kellő indokkal rendelkezik –, ill. kirakás után ellenőrizni, hogy az őt érintő ADR előírásokat betartották.

1.4.2.3.2 Ha egy konténer esetében az ellenőrzés során az ADR előírásainak megsértését tapasztalják, a címzett csak azután adhatja vissza a konténert a szállítónak (fuvarozónak), miután a szabálytalanságot megszüntették.

1.4.2.3.3 Ha a címzett más résztvevők (kirakó, tisztító, fertőtlenítő helyek stb.) szolgáltatásait is igénybe veszi, akkor megfelelő intézkedéseket kell fogantatnia annak biztosítására, hogy az ADR 1.4.2.3.1 és 1.4.2.3.2 pontja előírásainak megfeleljenek.

1.4.3 *A többi résztvevő kötelezettségei*

A többi résztvevőt, ill. kötelezettségeiket a következő – nem teljes körű – felsorolás tartalmazza. A többi résztvevő kötelezettségei az előző 1.4.1 szakaszból következnek, amennyiben tudatában vannak vagy tudatában kell lenniük, hogy feladataikat az ADR hatálya alá eső szállítási tevékenység részeként végzik.

1.4.3.1 *Berakó*

1.4.3.1.1 A berakóra – az 1.4.1 szakasz figyelembevételével – különösen a következő kötelezettségek hárulnak:

- a) csak akkor adhatja át az árut a szállítónak (fuvarozónak), ha az az ADR szerint szállítható;
- b) amikor becsomagolt veszélyes árut vagy üres, tisztítatlan csomagolóeszközt ad át szállításra, ellenőriznie kell a csomagolóeszközök sértetlenségét. Nem adhat át olyan küldeménydarabot, amelynek csomagolóeszköze sérült – különösen, ha az nem tömített, szivárog vagy fennáll a veszélyes áru kifolyásának veszélye –, amíg a sérülést ki nem javították; ugyanez vonatkozik az üres, tisztítatlan csomagolóeszközökre is;
- c) amikor veszélyes árut rak járműre, nagykonténerbe vagy kiskonténerbe, be kell tartania a rakodásra és árukezelésre vonatkozó különleges előírásokat;
- d) miután a veszélyes árut konténerbe rakta, be kell tartania a veszély jelölésére vonatkozó, 5.3 fejezet szerinti követelményeket;
- e) amikor a küldeménydarabokat berakja, be kell tartania az együvé rakásra vonatkozó tiltásokat, figyelembe véve a járművön vagy nagykonténerben levő, korábban berakott veszélyes árukat, valamint az élelmiszerektől, egyéb fogyasztási cikkektől és takarmánytól való elkülönítésre vonatkozó előírásokat.

1.4.3.1.2 Az 1.4.3.1.1. a), d) és e) pont esetében azonban a berakó megbízhat a többi résztvevőtől kapott információkban és adatokban.

1.4.3.2 Csomagoló

A csomagolóra – az 1.4.1 szakasz figyelembevételével – különösen a következő kötelezettségek hárulnak:

- a) be kell tartania a csomagolási és az egybecsomagolási feltételekre vonatkozó előírásokat;
- b) amikor egy küldeménydarabot szállításra előkészít, be kell tartania a küldeménydarabok jelölésére és bárcázására vonatkozó előírásokat.

1.4.3.3 Töltő

A töltőre – az 1.4.1 szakasz figyelembevételével – különösen a következő kötelezettségek hárulnak:

- a) a tartány megtöltése előtt meg kell győződnie arról, hogy a tartány és szerelvényei kielégítő műszaki állapotban vannak;
- b) meg kell győződnie arról, hogy a tartányjármű, battériás jármű, leszerelhető tartány, mobil tartány, tankkonténer vagy MEG-konténer időszakos vizsgálatának érvényességi ideje még nem járt le;
- c) tartányba csak olyan veszélyes árut tölthet, amelynek szállítására az adott tartány engedélyezve van;
- d) a tartányok töltése során be kell tartania a szomszédos tartány-kamrákban levő veszélyes árukra vonatkozó előírásokat;
- e) a töltés során be kell tartania a betöltendő anyagra engedélyezett legnagyobb töltési fokot vagy űrtartalom literenkénti legnagyobb töltési tömeget;
- f) a tartány megtöltése után ellenőriznie kell, hogy minden zárószerkezet zárt helyzetben van és nincs szivárgás;
- g) biztosítania kell, hogy az általa megtöltött tartány külsején ne maradjon a betöltött anyagból semmilyen veszélyes maradék;
- h) a veszélyes áru szállításra történő előkészítése során biztosítania kell, hogy a narancs-sárga táblák, a bárcák, a nagybárcák, valamint a „magas hőmérsékletű anyag” és a „környezetre veszélyes anyag” jelölés az előírás szerint el legyenek helyezve a tartányokon, a járműveken és az ömlesztett árut tartalmazó kis- és nagykonténereken;
- i) (fenntartva)
- j) meg kell győződnie arról, hogy ömlesztett áru járműbe, ill. konténerbe rakodása során a 7.3 fejezet vonatkozó előírásait betartják.

1.4.3.4 Tankkonténer vagy mobil tartány üzemben tartója

A tankkonténer vagy mobil tartány üzemben tartójára – az 1.4.1 szakasz figyelembevételével – különösen a következő kötelezettségek hárulnak:

- a) biztosítania kell, hogy a gyártásra, a szerelvényekre, a vizsgálatokra és a jelölésre vonatkozó követelményeknek megfeleljenek;
- b) biztosítania kell, hogy a tartányt és szerelvényeit oly módon tartsák karban, ami biztosítja, hogy rendes üzemeltetési körülmények között a tankkonténer vagy a mobil tartány a következő időszakos vizsgálatig kielégíti az ADR előírásait;
- c) soron kívüli ellenőrzést kell végeztetnie, ha a tartány vagy szerelvényei biztonságát javítás, átalakítás vagy baleset csökkentheti.

1.4.3.5 –

1.4.3.6 (fenntartva)

1.4.3.7 Kirakó

Megjegyzés: *E bekezdés értelmében kirakásnak minősül a lerakás, kirakás, lefejtés (kiürítés), amint azt az 1.2.1 szakasz „kirakó” fogalom meghatározása tartalmazza.*

1.4.3.7.1

A kirakóra – az 1.4.1 szakasz figyelembevételével – különösen a következő kötelezettségek hárulnak

- a) a fuvarokmányban és a küldeménydarabon, konténeren, tartányon, MEMU-n, MEG-konténeren, ill. járművön levő információk összehasonlításával meg kell győződnie arról, hogy a megfelelő árut rakják ki;
- b) kirakás előtt és alatt ellenőriznie kell, hogy a csomagolóeszközök, a tartány, a jármű vagy a konténer nem sérült-e olyan mértékben, ami akadályozná a kirakási műveletet. Ilyen esetben meg kell győződnie arról, hogy csak a megfelelő intézkedések végrehajtása után rakodnak ki;
- c) a kirakásra vonatkozó minden előírást be kell tartania;
- d) a tartány, a jármű vagy a konténer kirakása után azonnal
 - i) el kell távolítani minden veszélyes maradékot, ami a kirakási művelet során a tartány, a jármű vagy a konténer külsejére tapadt;
 - ii) gondoskodnia kell a szelepek és a vizsgálónyílások fedelének zárásáról;
- e) biztosítani kell, hogy a járművek, ill. a konténerek előírt tisztítása és fertőtlenítése megtörténjen; és
- f) gondoskodni kell arról, hogy miután a konténert teljes mértékben kirakták, kitisztították, ill. fertőtlenítették, ne legyenek rajta tovább láthatóak az 5.3 fejezet szerinti veszélyességi jelölések.

1.4.3.7.2

Ha a kirakó más résztvevők (tisztító, fertőtlenítő helyek stb.) szolgáltatásait is igénybe veszi, akkor megfelelő intézkedéseket kell fogantatni annak biztosítására, hogy az ADR előírásainak megfeleljenek.

1.5 FEJEZET

ELTÉRÉSEK

1.5.1 Ideiglenes eltérések

- 1.5.1.1** Az ADR Megállapodás 4. cikk 3. pontja alapján a Szerződő Felek illetékes hatóságai közvetlenül egymás között megállapodhatnak abban, hogy területeiken bizonyos szállításokat ideiglenesen az ADR előírásaitól eltérően engedélyeznek, feltéve, hogy ez a biztonságot nem veszélyezteti. Annak a hatóságnak, amely az ideiglenes eltérést kezdeményezte, erről az eltérésről értesítenie kell az ENSZ Európai Gazdasági Bizottság Titkárságát, amely ezután erről a Szerződő Feleket értesíti.*

***Megjegyzés:** Az 1.7.4 szakasz szerinti „külön megegyezés” nem tekinthető az ezen fejezet szerinti ideiglenes eltérésnek.*

- 1.5.1.2** Az ideiglenes eltérés érvényességének időtartama nem lehet öt évnél hosszabb az életbe lépésétől számítva. Az ideiglenes eltérés automatikusan megszűnik az ADR megfelelő módosításának életbelépési dátumától kezdve.

- 1.5.1.3** Az ideiglenes eltérések alapján végzett szállítási tevékenység az ADR értelmében szállítási tevékenységnek minősül.

- 1.5.2** (fenntartva)

* A titkárság megjegyzése: Az ezen szakasz alapján elfogadott ideiglenes eltérések az ENSZ Európai Gazdasági Bizottsága honlapján (<http://www.unece.org/trans/danger/danger.htm>) megtekinthetők.

1.6 FEJEZET

ÁTMENETI ELŐÍRÁSOK

1.6.1 Általános előírások

- 1.6.1.1** Az ADR anyagai és tárgyai – más előírás hiányában – 2013. június 30-ig az ADR 2012. december 31-ig érvényes előírásai szerint is szállíthatók.
- 1.6.1.2** (törölve)
- 1.6.1.3** Azok az 1 osztályba tartozó anyagok és tárgyak, amelyek valamely Szerződő Fél fegyveres erőihez tartoznak és amelyeket 1990. január 1-je előtt az ADR akkor érvényes előírásainak megfelelően csomagoltak, 1990. január 1-je után is szállíthatók, amennyiben a csomagolások sértetlenek és a fuvarokmányba tett bejegyzés szerint ezek 1990. január 1-je előtt csomagolt katonai áruk. Az erre az osztályra 1990. január 1-jétől érvényes egyéb előírásokat be kell tartani.
- 1.6.1.4** Azok az 1 osztályba tartozó anyagok és tárgyak, amelyeket 1990. január 1-je és 1996. december 31-e között az ADR ezen időszakban érvényes előírásainak megfelelően csomagoltak, 1997. január 1-je után is szállíthatók, amennyiben a csomagolások sértetlenek és a fuvarokmányba tett bejegyzés szerint ezek az 1 osztályba tartozó olyan áruk, amelyeket 1990. január 1-je és 1996. december 31-e között csomagoltak.
- 1.6.1.5** (fenntartva)
- 1.6.1.6** Azok az IBC-k, amelyeket 2003. január 1-je előtt az ADR 2001. június 30-ig érvényes 3612 szélzetszáma (1) bekezdése szerint gyártottak, de a 6.5.2.1.1 pont szerinti betűk, számok és jelek magassága nem felel meg a 2001. július 1-től érvényes előírásoknak, továbbra is használhatók.
- 1.6.1.7** Azok a típusjóvá hagyások, amelyeket a nagy vagy közepes molekulatömegű polietilénből gyártott hordókra, kannákra, ill. összetett csomagolóeszközökre a 6.1.5.2.6 pont 2004. december 31-ig érvényes előírásai alapján 2005. július 1-je előtt adtak ki, de nem felelnek meg a 4.1.1.21 bekezdés követelményeinek, 2009. december 31-ig érvényesek. Az e típusjóvá hagyások alapján gyártott és jelöléssel ellátott csomagolóeszközök a 4.1.1.15 bekezdésben meghatározott felhasználási időtartamuk leteltéig használhatók.
- 1.6.1.8** Az 5.3.2.2 bekezdés 2004. december 31-ig érvényes követelményeinek megfelelő narancssárga táblák továbbra is használhatók, feltéve, hogy az 5.3.2.2.1 és az 5.3.2.2.2 pont azon követelményeit, amelyek szerint a táblának, a számoknak és a betűknek rögzítve kell maradniuk, bármilyen helyzetben van is a jármű, betartják.
- 1.6.1.9** (törölve)
- 1.6.1.10** Azok a 2003. július 1-je előtt gyártott lítium-cellák, ill. akkumulátorok, amelyeket a 2002. december 31-ig érvényes előírások szerint bevizsgáltak, de a 2003. január 1-jétől érvényes előírások szerint nem vizsgáltak, valamint az ilyen lítium-cellákat, ill. akkumulátorokat tartalmazó készülékek 2013. június 30-ig szállíthatók, ha egyébként minden más előírásnak megfelelnek.
- 1.6.1.11** Azok a típusjóvá hagyások, amelyeket 2007. július 1-e előtt, a 6.1.6.1 bekezdés a) pontjának 2006. december 31-ig érvényes követelményei alapján adtak ki nagy és közepes molekulatömegű polietilénből gyártott hordókra, kannákra, összetett csomagolóeszközökre, ill. nagy molekulatömegű polietilénből gyártott IBC-kre, de amelyek nem felelnek meg a 6.1.6.1 bekezdés a) pont 2007. január 1-től érvényes követelményeinek, továbbra is érvényesek.
- 1.6.1.12 –**
1.6.1.13 (törölve)

- 1.6.1.14** Azok az IBC-k, amelyeket 2011. január 1-je előtt olyan gyártási típus alapján gyártottak, amelyen nem végezték el a 6.5.6.13 bekezdés szerinti rázóvizsgálatot, vagy amelyeknek az ejtési próba időpontjában nem kellett kielégíteni a 6.5.6.9.5 d) pont kritériumait, továbbra is használhatók.
- 1.6.1.15** A 2011. január 1-je előtt gyártott, átalakított, ill. javított IBC-ken nem szükséges feltüntetni a 6.5.2.2.2 pont szerinti legnagyobb megengedett halmazolási terhelést. Az ilyen IBC-k a 6.5.2.2.2 pont szerinti jelölés nélkül 2010. december 31-e után is használhatók, de ha ezen időpont után az IBC-t átalakítják vagy javítják, akkor el kell látni a 6.5.2.2.2 pont szerinti jelöléssel.
- 1.6.1.16** A tenyészet esetén „A” kategóriába sorolandó (lásd a 2.2.62.1.12.2 pontot) kórokozók kivételével, a „B” kategóriájú kórokozóval fertőzött állati eredetű anyagok 2014. december 31-ig az illetékes hatóság által meghatározott előírások²⁾ szerint szállíthatók.
- 1.6.1.17 –
1.6.1.18** (törölve)
- 1.6.1.19** A környezetre veszélyes anyagok besorolására a 2.2.9.1.10.3 és a 2.2.9.1.10.4 pontok 2010. december 31-ig érvényes előírásai 2013. december 31-ig alkalmazhatók.
- 1.6.1.20** A 3.4 fejezet 2011. január 1-től érvényes előírásaival ellentétben a korlátozott mennyiségben csomagolt veszélyes áruk (kivéve azokat, amelyekhez a 3.2 fejezet „A” táblázat 7a oszlopában „0” érték van hozzárendelve) 2015. június 30-ig a 3.4 fejezet 2010. december 31-ig érvényes előírásai szerint szállíthatók. A 3.4.12 – 3.4.15 szakaszok 2011. január 1-től érvényes előírásai azonban 2011. január 1-től ebben az esetben is alkalmazhatók. A 3.4.13 szakasz b) pontja utolsó mondatának alkalmazása során, ha a szállított konténer a 3.4.12 szakasz 2010. december 31-ig érvényes előírásai szerint van megjelölve, a szállítóegység a 3.4.15 szakasz 2011. január 1-től érvényes előírásai szerinti jelöléssel is ellátható.
- 1.6.1.21** A Szerződő Felek által 2012. december 31-ig kibocsátott, a 2010. december 31-ig érvényes mintának megfelelő járművezető oktatási bizonyítványok a 8.2.2.8.5 pont előírásainak megfelelő bizonyítványok helyett az öt éves érvényességük lejártáig tovább használhatók.
- 1.6.1.22** A 2011. július 1-je előtt gyártott összetett IBC-k belső tartályai, amelyek a 6.5.2.2.4 pont 2010. december 31-ig érvényes előírásai szerint vannak jelölve, továbbra is használhatók.
- 1.6.1.23** A 2011. július 1-je előtt, a 8.1.4.3 bekezdés 2010. december 31-ig érvényes előírásai szerint gyártott tűzoltó készülékek továbbra is használhatók.
- 1.6.1.24** A 2014. január 1-je előtt gyártott lítium cellák és akkumulátorok, amelyeket a 2012. december 31-ig érvényes követelmények szerint bevizsgáltak, de amelyeket a 2013. január 1-jétől érvényes követelmények szerint nem vizsgáltak, valamint az ilyen lítium cellákat és akkumulátorokat tartalmazó készülékek, amennyiben az összes többi vonatkozó követelményt teljesítik, továbbra is szállíthatók.
- 1.6.1.25** Azok a küldeménydarabok és egyesítő csomagolások, amelyeken az UN számot a 2012. december 31-ig érvényes ADR előírásai szerint tüntették fel, és nem felelnek meg az 5.2.1.1 bekezdésnek az UN szám és az „UN” betűk nagyságára vonatkozó, 2013. január 1-jétől érvényes követelményeinek, 2013. december 31-ig tovább használhatók. A legfeljebb 60 liter víztérfogatú palackok azonban a következő időszakos vizsgálatig, de legfeljebb 2018. június 30-ig használhatók.
- 1.6.1.26** A 2014. január 1-je előtt gyártott vagy átalakított nagycsomagolások, amelyek nem felelnek meg a 6.6.3.1 bekezdésnek a betűk, számok és jelképek magasságra vonatkozó, 2013. január 1-jétől érvényes követelményeinek, továbbra is használhatók. Azokon a nagycsomago-

2) Fertőzött állati tetemekre vonatkozó előírások találhatók pl. az Európai Parlament és a Tanács 1774/2002/EK (2002. október 3.) rendeletében a nem emberi fogyasztásra szánt állati melléktermékekre vonatkozó egészségügyi előírások megállapításáról (az EK Hivatalos Lapja L 273 szám, 2002. 10. 10., 1. oldal)

lásokon, amelyeket 2015. január 15. előtt gyártottak vagy alakítottak át, nem szükséges a 6.6.3.3 bekezdés szerinti, megengedett legnagyobb halmazolási terhelési jelölést feltüntetni. Az ilyen, a 6.6.3.3 bekezdés szerint nem jelölt nagycsomagolásokat 2014. december 31. után is lehet használni, de ha ezen időpont után átalakítják, a 6.6.3.3 bekezdés szerint jelölni kell.

- 1.6.1.27** A 2013. július 1-je előtt gyártott, berendezések vagy gépek szerves részét képező, UN 1202, 1203, 1223, 1863 vagy 3475 tétel alá tartozó folyékony tüzelőanyagot tartalmazó tároló edények, amelyek nem felelnek meg a 3.3 fejezet 2013. január 1-jétől érvényes 363 különleges előírása a) pontja követelményeinek, továbbra is használhatók.
- 1.6.2** **Nyomástartó tartályok és a 2 osztály anyagaihoz használt tartályok**
- 1.6.2.1** Azok az 1997. január 1-je előtt gyártott tartályok, amelyek az ADR 1997. január 1-jétől érvényes előírásainak nem felelnek meg, de amelyek szállítása az ADR 1996. december 31-ig érvényes előírásai szerint engedélyezett volt, ezen időpont után is szállíthatók, amennyiben a P200 és a P203 csomagolási utasításban előírt időszakos vizsgálatok alapján megfelelnek.
- 1.6.2.2** (törölve)
- 1.6.2.3** A 2003. január 1-je előtt gyártott tartályok 2003. január 1-je után is viselhetik azokat a jelöléseket, amelyek a 2002. december 31-ig érvényes követelményeknek felelnek meg.
- 1.6.2.4** Továbbra is használhatók az olyan műszaki szabályzat szerint, korábban tervezett és gyártott nyomástartó tartályok, amelyet az illetékes hatóság a 6.2.5 szakasz értelmében már nem ismerhet el.
- 1.6.2.5** Továbbra is használhatók azok a nyomástartó tartályok, ill. zárószerkezeteik, amelyeket olyan, a gyártásukkor érvényes szabványok szerint terveztek és gyártottak (lásd a 6.2.4 szakaszt), amelyek az ADR akkor érvényes előírásai szerint alkalmazhatók voltak, kivéve, ha ezt valamely különleges átmeneti előírás korlátozza.
- 1.6.2.6** Azok a nem a 2 osztályba tartozó anyagokhoz használt nyomástartó tartályok, amelyeket a 4.1.4.4 bekezdés 2008. december 31-ig érvényes előírásai szerint, 2009. július 1-je előtt gyártottak, és amelyek nem felelnek meg a 4.1.3.6 bekezdés 2009. január 1-től érvényes előírásainak, továbbra is használhatók, amennyiben a 4.1.4.4 bekezdés 2008. december 31-ig érvényes többi előírását is betartják.
- 1.6.2.7** (törölve)
- 1.6.2.8** (törölve)
- 1.6.2.9** A 4.1.4.1 bekezdés P200 csomagolási utasítás 10) pont v különleges előírása 2010. december 31-ig érvényes követelményeit az ADR Szerződő Felek a 2015. január 1-je előtt gyártott palackokra alkalmazhatják.
- 1.6.2.10** Az UN 1011, 1075, 1965, 1969, ill. 1978 tétel alá tartozó gázok szállítására szolgáló, újratölthető hegesztett acélpalackok, amelyekre a 4.1.4.1 bekezdés P200 csomagolási utasítás 2010. december 31-ig érvényes 10) pont v különleges előírása szerint a szállító ország(ok) illetékes hatóságai 15 évenkénti időszakos vizsgálatot engedélyeztek, továbbra is ezen előírások szerint vethetők alá időszakos vizsgálatnak.
- 1.6.2.11** Azokat a 2013. január 1-je előtt gyártott és szállításra előkészített gázpatronokat, amelyek megfelelőség-értékelésére az 1.8.6, 1.8.7, ill. 1.8.8 szakasz előírásait nem alkalmazták, ezen időpont után is szállíthatók, amennyiben az ADR minden más, vonatkozó előírását betartják.
- 1.6.2.12** A kármentő nyomástartó tartályok 2013. december 31-ig a nemzeti előírások alapján is gyárthatók és hagyhatók jóvá. A 2014. január 1-je előtt, nemzeti előírások szerint gyártott és jóváhagyott kármentő nyomástartó tartályok a használat szerinti ország(ok) illetékes hatóságainak jóváhagyásával továbbra is használhatók.

1.6.3 Rögzített tartányok (tartányjárművek), leszerelhető tartányok és battériás járművek

- 1.6.3.1** Azok a rögzített tartányok (tartányjárművek), leszerelhető tartányok és battériás járművek, amelyeket az 1978. október 1-jétől alkalmazandó előírások életbelépése előtt gyártottak, továbbra is használhatók, ha a tartány szerelvényei kielégítik a 6.8 fejezet követelményeit. A tartányok falvastagságát – a 2 osztály mélyhűtött, cseppfolyósított gázainak szállítására használt tartányok kivételével – szerkezeti acélból gyártott tartánynál legalább 0,4 MPa (4 bar) tervezési nyomásra (túlnyomásra), alumíniumból és alumínium-ötvözetből gyártott tartánynál legalább 200 kPa (2 bar) tervezési nyomásra (túlnyomásra) kell méretezni. Nem kör keresztmetszetű tartányoknál a számítás alapjául szolgáló átmérőt olyan körből kell meghatározni, amelynek területe egyenlő a tartány tényleges keresztmetszeti területével.
- 1.6.3.2** Az időszakos vizsgálatokat az átmeneti előírások szerint tovább használt rögzített tartányok (tartányjárművek), leszerelhető tartányok és battériás járművek esetén a 6.8.2.4 és a 6.8.3.4 bekezdés előírásai és az egyes osztályokra vonatkozó különleges előírások szerint kell végrehajtani. Hacsak a korábbiakban nagyobb próbanyomás nem volt előírva, az alumíniumból és alumínium-ötvözetből gyártott tartányoknál elegendő a 200 kPa (2 bar) próbanyomás (túlnyomás).
- 1.6.3.3** Azok a rögzített tartányok (tartányjárművek), leszerelhető tartányok és battériás járművek, amelyek az 1.6.3.1 és az 1.6.3.2 bekezdés szerinti átmeneti előírásoknak megfelelnek, 1993. szeptember 30-ig tovább használhatók olyan veszélyes áruk szállítására, amelyekre eredetileg engedélyezték. Ez az átmeneti időszak nem érvényes a 2 osztályba tartozó anyagok szállítására használt rögzített tartányokra (tartányjárművekre), leszerelhető tartányokra és battériás járművekre, sem az olyan rögzített tartányokra (tartányjárművekre), leszerelhető tartányokra és battériás járművekre, amelyeknek falvastagsága és szerelvényei megfelelnek a 6.8 fejezet előírásainak.
- 1.6.3.4**
- a) Azok az 1985. május 1-je előtt, az ADR 1978. október 1-je és 1985. április 30-a között érvényes előírásai szerint gyártott rögzített tartányok (tartányjárművek), leszerelhető tartányok és battériás járművek, amelyek nem felelnek meg az 1985. május 1-jétől érvényes előírásoknak, ezt az időpontot követően továbbra is használhatók.
 - b) Azok a rögzített tartányok (tartányjárművek), leszerelhető tartányok és battériás járművek, amelyeket az 1985. május 1-je és az 1988. január 1-jétől alkalmazandó előírások életbelépése közötti időben, az akkor érvényes ADR előírások szerint gyártottak, továbbra is használhatók.
- 1.6.3.5** Azok az 1993. január 1-je előtt, az 1992. december 31-ig érvényes előírások szerint gyártott rögzített tartányok (tartányjárművek), leszerelhető tartányok és battériás járművek, amelyek nem felelnek meg az 1993. január 1-jétől érvényes előírásoknak, továbbra is használhatók.
- 1.6.3.6**
- a) Azoknak a rögzített tartányoknak (tartányjárműveknek), leszerelhető tartányoknak és battériás járműveknek, amelyeket 1978. január 1-je és 1984. december 31-e között gyártottak, amennyiben 2004. december 31-e után is használják, meg kell felelniük az 1990. január 1-jétől érvényes 211 127 szélzetszám (5) bekezdésének a falvastagság és a sérülések elleni védelem tekintetében.
 - b) Azoknak a rögzített tartányoknak (tartányjárműveknek), leszerelhető tartányoknak és battériás járműveknek, amelyeket 1985. január 1-je és 1989. december 31-e között gyártottak, amennyiben 2010. december 31-e után is használják, meg kell felelniük az 1990. január 1-jétől érvényes 211 127 szélzetszám (5) bekezdésének a falvastagság és a sérülések elleni védelem tekintetében.
- 1.6.3.7** Azok az 1999. január 1-je előtt, az 1998. december 31-ig érvényes előírások szerint gyártott rögzített tartányok (tartányjárművek), leszerelhető tartányok és battériás járművek, amelyek nem felelnek meg az 1999. január 1-jétől érvényes előírásoknak, továbbra is használhatók.
- 1.6.3.8** Amikor az ADR módosítása következtében egyes gázok helyes szállítási megnevezése módosul, a táblán, ill. a tartányon (lásd a 6.8.3.5.2, ill. a 6.8.3.5.3 pontot) nem szükséges a

megnevezést módosítani, amennyiben a gáz(ok) megnevezését a rögzített tartányon (tartányjárművön), leszerelhető tartányon, battériás járművön vagy a rajtuk levő táblán [lásd a 6.8.3.5.6 b) és c) pontot] a következő időszakos vizsgálat során módosítják.

**1.6.3.9 -
1.6.3.10**

(fenntartva)

1.6.3.11

Azok az 1997. január 1-je előtt, az 1996. december 31-ig érvényes előírások szerint gyártott rögzített tartányok (tartányjárművek) és leszerelhető tartányok, amelyek nem felelnek meg a 211 332 és a 211 333 szélzetszám 1997. január 1-jétől érvényes előírásainak, továbbra is használhatók.

1.6.3.12

(fenntartva)

1.6.3.13

(törölve)

1.6.3.14

(fenntartva)

1.6.3.15

(törölve)

1.6.3.16

Azoknál a 2007. január 1-je előtt gyártott rögzített tartányoknál (tartányjárműveknél), leszerelhető tartányoknál és battériás járműveknél, amelyek nem felelnek meg a 4.3.2 szakasz, a 6.8.2.3, a 6.8.2.4 és a 6.8.3.4 bekezdés tartány-vizsgálati könyvre (gépkönyvre) vonatkozó előírásainak, a tartány-vizsgálati könyvhöz (gépkönyvhöz) szükséges dokumentumokat legkésőbb a következő időszakos vizsgálat időpontjától kezdődően kell megőrizni.

1.6.3.17

Azok a 2007. július 1-je előtt, a 2006. december 31-ig érvényes előírások szerint gyártott rögzített tartányok (tartányjárművek) és leszerelhető tartányok, amelyek a 3 osztály I csomagolási csoportjába tartozó, 50 °C-on legfeljebb 175 kPa (1,75 bar) gőznyomású (abszolút nyomás) anyagok szállítására szolgálnak és a 2006. december 31-ig érvényes előírások szerint L1.5BN tartánykód volt hozzájuk rendelve, az említett anyagok szállítására 2018. december 31-ig tovább használhatók.

1.6.3.18

Azok a 2003. január 1-je előtt, a 2001. június 30-ig érvényes előírások szerint gyártott rögzített tartányok (tartányjárművek), leszerelhető tartányok, és battériás járművek, amelyek nem felelnek meg a 2001. július 1-jétől érvényes előírásoknak, továbbra is használhatók, amennyiben a megfelelő tartánykódhoz való hozzárendelésük megtörtént.

1.6.3.19

Azok a 2003. január 1-je előtt, a 6.8.2.1.21 pont 2002. december 31-ig érvényes előírásai szerint gyártott rögzített tartányok (tartányjárművek) és leszerelhető tartányok, amelyek nem felelnek meg a 2003. január 1-jétől érvényes előírásoknak, továbbra is használhatók.

1.6.3.20

Azok a 2003. július 1-je előtt, a 2002. december 31-ig érvényes előírások szerint gyártott rögzített tartányok (tartányjárművek) és leszerelhető tartányok, amelyek nem felelnek meg a 6.8.2.1.7 pont 2003. január 1-jétől érvényes követelményeinek és a 6.8.4 szakasz b) pont TE15 különleges előírása 2003. január 1-jétől 2006. december 31-ig érvényes követelményeinek, továbbra is használhatók.

1.6.3.21

(törölve)

**1.6.3.22 –
1.6.3.24**

(fenntartva)

1.6.3.25

(törölve)

1.6.3.26

Azok a 2007. január 1-je előtt, a 2006. december 31-ig érvényes előírások szerint gyártott rögzített tartányok (tartányjárművek) és leszerelhető tartányok, amelyek nem felelnek meg a külső tervezési nyomás feltüntetésére vonatkozóan a 6.8.2.5.1 pont 2007. január 1-től érvényes előírásainak, továbbra is használhatók.

- 1.6.3.27 –**
1.6.3.29 (fenntartva)
- 1.6.3.30** Azok a 2005. július 1-je előtt, a 2004. december 31-ig érvényes előírások szerint gyártott, hulladékok szállítására szolgáló, vákuummal üzemelő rögzített tartányok (tartányjárművek) és leszerelhető tartányok, amelyek nem felelnek meg a 6.10.3.9 bekezdés 2005. január 1-jétől érvényes előírásainak, továbbra is használhatók.
- 1.6.3.31** Továbbra is használhatók azok a rögzített tartányok (tartányjárművek), leszerelhető tartányok és battériás jármű elemeit képező tartányok, amelyeket olyan, a gyártásukkor érvényes műszaki szabályzat szerint terveztek és gyártottak, amelyet a 6.8.2.7 bekezdés akkor érvényes előírásai szerint az illetékes hatóság elismert.
- 1.6.3.32** Továbbra is használhatók azok a rögzített tartányok (tartányjárművek) és leszerelhető tartányok, amelyeket 2007. július 1-je előtt, a 2006. december 31-ig érvényes előírások szerint gyártottak, és amelyek a 2006. december 31-ig érvényes 6.8.2.6 bekezdés táblázatában hivatkozott EN 13317:2002 szabvány szerinti (beleértve a szabvány 2007. január 1-jétől már nem elfogadott B Melléklete B.2 táblázatát és ábráját is) búvónyílásfedéllel vannak ellátva, vagy amelyeken a búvónyílásfedél anyaga nem felel meg az EN 13094:2004 szabvány 5.2 paragrafusának követelményeinek.
- 1.6.3.33** Ha egy rögzített tartány (tartányjármű) vagy leszerelhető tartány már 2009. január 1-je előtt válaszfalakkal vagy hullámtörő lemezekkel legfeljebb 7500 liter űrtartalmú rekeszekre volt osztva, a 6.8.2.5.1 pontban előírt adatok között az űrtartalom adatát nem kell kiegészíteni az „S” szimbólummal mindaddig, amíg a 6.8.2.4.2 pont szerinti, következő időszakos vizsgálatot el nem végzik.
- 1.6.3.34** Azoknál a cseppfolyósított, ill. mélyhűtött, cseppfolyósított gázok szállítására szolgáló rögzített tartányoknál (tartányjárműveknél) és leszerelhető tartányoknál, amelyek megfelelnek az ADR gyártási követelményeinek, de amelyeket 2009. július 1-je előtt válaszfalakkal vagy hullámtörő lemezekkel 7500 liternél nagyobb űrtartalmú rekeszekre osztottak, a töltési fok – a 4.3.2.2.4 pont előírásától eltérően – a befogadóképesség 20%-ánál nagyobb és 80%-ánál kisebb is lehet.
- 1.6.3.35** (törölve)
- 1.6.3.36** Azok a 2011. július 1-je előtt gyártott, cseppfolyósított, nem mérgező, gyúlékony gázok szállítására szolgáló rögzített tartányok (tartányjárművek), amelyek belső zárószerkezet helyett visszacsapó szeleppel vannak ellátva és nem felelnek meg a 6.8.3.2.3 bekezdés előírásainak, továbbra is használhatók.
- 1.6.3.37** (törölve)
- 1.6.3.38** Továbbra is használhatók azok a rögzített tartányok (tartányjárművek), leszerelhető tartányok és battériás járművek, amelyeket olyan, a gyártásukkor érvényes szabványok szerint terveztek és gyártottak (lásd a 6.8.2.6 és a 6.8.3.6 bekezdést), amelyek az ADR akkor érvényes előírásai szerint alkalmazhatók voltak, kivéve, ha ezt valamely különleges átmeneti előírás korlátozza.
- 1.6.3.39** Azok a 2011. július 1-je előtt, a 6.8.2.3.3 bekezdés 2010. december 31-ig érvényes előírásai szerint gyártott rögzített tartányok (tartányjárművek) és leszerelhető tartányok, amelyek a lángzár, ill. lángáthatolást gátló szerkezet helyzete tekintetében nem felelnek meg a 6.8.2.2.3 pont harmadik bekezdése előírásainak, továbbra is használhatók.
- 1.6.3.40** A 2011. július 1-je előtt gyártott, az UN 1092, 1238, 1239, 1244, 1251, 1510, 1580, 1810, 1834, 1838, 2474, 2486, 2668, 3381, 3383, 3385, 3387 és 3389 tétel alá tartozó, belélegezve mérgező anyagokhoz használt rögzített tartányokra (tartányjárművekre) és leszerelhető tartányokra a 3.2 fejezet „A” táblázat 2010. december 31-ig érvényes 12 oszlopában szereplő

tartánykód a 2016. december 31-ig tovább használható.

- 1.6.3.41** A 2013. július 1-je előtt, a 2012. december 31-ig érvényes követelmények szerint gyártott rögzített tartányok (tartányjárművek) és leszerelhető tartányok, amelyek nem felelnek meg a 6.8.2.5.2, ill. a 6.8.3.5.6 pont 2013. január 1-jétől érvényes jelölési előírásainak, a 2013. július 1-je utáni következő időszakos vizsgálatig a 2012. december 31-ig érvényes követelmények szerinti jelölést is viselhetik.
- 1.6.3.42** Az UN 2381 tételnél a 2012. december 31-ig érvényes 3.2 fejezet „A” táblázat 12 oszlopában feltüntetett tartánykód a 2013. július 1-je előtt gyártott rögzített tartányoknál (tartányjárműveknél) és leszerelhető tartányoknál 2018. december 31-ig tovább alkalmazható.
- 1.6.3.43** Azok a 2012. január 1-je előtt, a 2012. december 31-ig érvényes előírások szerint gyártott rögzített tartányok (tartányjárművek) és leszerelhető tartányok, amelyek nem felelnek meg a 6.8.2.6 bekezdés EN 14432:2006 és EN 14433:2006 szabványokra vonatkozó 2011. január 1-től érvényes követelményeinek, továbbra is használhatók.

**1.6.3.44 –
1.6.3.49**

(fenntartva)

1.6.3.50 *Szálvázaz műanyag tartányok*

Azok a szálvázaz műanyag tartányok, amelyeket 2002. július 1-je előtt gyártottak a B.1c Függelék 2001. június 30-ig érvényes előírásai alapján, a 2001. július 1-je előtt jóváhagyott gyártási típusnak megfelelően, élettartamuk végéig tovább használhatók, amennyiben a 2001. június 30-ig érvényes minden előírásnak megfeleltek és folyamatosan megfelelnek.

A 2001. június 30-ig érvényes előírások szerint azonban új gyártási típus 2001. július 1-je után nem hagyható jóvá.

1.6.4 **Tankkonténerek, mobil tartányok és MEG-konténerek**

- 1.6.4.1** Azok a tankkonténerek, amelyeket 1988. január 1-je előtt, az 1987. december 31-ig érvényes előírások szerint gyártottak, és nem felelnek meg az 1988. január 1-jétől érvényes előírásoknak, továbbra is használhatók.
- 1.6.4.2** Azok a tankkonténerek, amelyeket 1993. január 1-je előtt, az 1992. december 31-ig érvényes előírások szerint gyártottak, és nem felelnek meg az 1993. január 1-jétől érvényes előírásoknak, továbbra is használhatók.
- 1.6.4.3** Azok az 1999. január 1-je előtt, az 1998. december 31-ig érvényes előírások szerint gyártott tankkonténerek, amelyek nem felelnek meg az 1999. január 1-jétől érvényes előírásoknak, továbbra is használhatók.
- 1.6.4.4** (fenntartva)
- 1.6.4.5** Amikor az ADR módosítása következtében egyes gázok helyes szállítási megnevezése módosul, a táblán, ill. a tartányon (lásd a 6.8.3.5.2 és a 6.8.3.5.3 pontot) nem szükséges a megnevezést módosítani, amennyiben a gáz(ok) megnevezését a tankkonténeren, a MEG-konténeren vagy a rajtuk levő táblán [lásd a 6.8.3.5.6 b) és c) pontot] a következő időszakos vizsgálat során módosítják.
- 1.6.4.6** Azok a 2007. január 1-je előtt, a 2006. december 31-ig érvényes előírások szerint gyártott tankkonténerek, amelyek nem felelnek meg a külső tervezési nyomás feltüntetésére vonatkozóan a 6.8.2.5.1 pont 2007. január 1-jétől érvényes előírásainak, továbbra is használhatók.
- 1.6.4.7** Azok az 1997. január 1-je előtt, az 1996. december 31-ig érvényes előírások szerint gyártott

tankkonténerek, amelyek nem felelnek meg a 212 332 és a 212 333 szélzetszám 1997. január 1-jétől érvényes előírásainak, továbbra is használhatók.

1.6.4.8 (fenntartva)

1.6.4.9 Továbbra is használhatók azok a tankkonténerek és MEG-konténerek, amelyeket olyan, a gyártásukkor érvényes műszaki szabályzat szerint terveztek és gyártottak, amelyet a 6.8.2.7 bekezdés akkor érvényes előírásai szerint az illetékes hatóság elismert.

1.6.4.10 (törölve)

1.6.4.11 (fenntartva)

1.6.4.12 Azok a 2003. január 1-je előtt, a 2001. június 30-ig érvényes előírások szerint gyártott tankkonténerek és a MEG-konténerek, amelyek nem felelnek meg a 2001. július 1-jétől érvényes előírásoknak, tovább használhatók.

A megfelelő tartánykódot és – ha van – a 6.8.4 szakasz szerinti különleges előírások TC és TE betűkből és számokból álló kódjait ezeken is fel kell tüntetni.

1.6.4.13 Azok a 2003. július 1-je előtt, a 2002. december 31-ig érvényes előírások szerint gyártott tankkonténerek, amelyek nem felelnek meg a 6.8.2.1.7 pont 2003. január 1-jétől érvényes követelményeinek és a 6.8.4 szakasz b) pont TE15 különleges előírása 2003. január 1-jétől 2006. december 31-ig érvényes követelményeinek, továbbra is használhatók.

1.6.4.14 (fenntartva)

1.6.4.15 A vizsgálat fajtáját („P”, ill. „L”) a 6.8.2.5.1 pont szerinti tartánytáblán a 2007. január 1-je után végrehajtott első vizsgálatig nem szükséges feltüntetni.

1.6.4.16 (törölve)

1.6.4.17 (törölve)

1.6.4.18 Azoknál a 2007. január 1-je előtt gyártott tankkonténereknél és MEG-konténereknél, amelyek nem felelnek meg a 4.3.2 szakasz, a 6.8.2.3, a 6.8.2.4 és a 6.8.3.4 bekezdés tartányvizsgálati könyvre (gépkönyvre) vonatkozó előírásainak, a tartányvizsgálati könyvhöz (gépkönyvhöz) szükséges dokumentumokat legkésőbb a következő időszakos vizsgálat időpontjától kezdődően kell megőrizni.

1.6.4.19 Azok a 2007. július 1-je előtt, a 2006. december 31-ig érvényes előírások szerint gyártott tankkonténerek, amelyek a 3 osztály I csomagolási csoportjába tartozó, 50 °C-on legfeljebb 175 kPa (1,75 bar) gőznyomású (abszolút nyomás) anyagok szállítására szolgálnak és a 2006. december 31-ig érvényes előírások szerint L1.5BN tartánykód volt hozzájuk rendelve, az említett anyagok szállítására 2016. december 31-ig tovább használhatók.

1.6.4.20 Azok a 2005. január 1-je előtt, a 2004. december 31-ig érvényes előírások szerint gyártott, hulladékok szállítására szolgáló, vákuummal üzemelő tankkonténerek, amelyek nem felelnek meg a 6.10.3.9 bekezdés 2005. január 1-jétől érvényes előírásainak, továbbra is használhatók.

**1.6.4.21 –
1.6.4.29** (fenntartva)

1.6.4.30 A 2007. január 1-től érvényes tervezési előírásoknak nem megfelelő, de 2008. január 1-je előtt kiadott gyártási típus bizonyítvány szerint gyártott mobil tartányok, ill. UN MEG-konténerek továbbra is használhatók.

1.6.4.31 Azokhoz az anyagokhoz, amelyekhez a 3.2 fejezet „A” táblázat 11 oszlopában TP35 különleges előírás van hozzárendelve, a 2008. december 31-ig érvényes ADR-ben előírt T14 mobil tartány utasítás 2014. december 31-ig tovább alkalmazható.

- 1.6.4.32** Ha egy tankkonténer tartánya már 2009. január 1-je előtt válaszfalakkal vagy hullámtörő lemezekkel legfeljebb 7500 liter űrtartalmú rekeszekre volt osztva, a 6.8.2.5.1 pont által előírt adatok között az űrtartalom adatát nem kell kiegészíteni az „S” szimbólummal mindaddig, amíg a 6.8.2.4.2 pont szerinti, következő időszakos vizsgálatot el nem végzik.
- 1.6.4.33** Azoknál a cseppfolyósított, ill. mélyhűtött, cseppfolyósított gázok szállítására szolgáló tankkonténereknél, amelyek megfelelnek az ADR gyártási követelményeinek, de amelyeket 2009. július 1-je előtt válaszfalakkal vagy hullámtörő lemezekkel 7500 liternél nagyobb űrtartalmú rekeszekre osztottak, a töltési fok – a 4.3.2.2.4 pont előírásától eltérően – a befogadóképesség 20%-ánál nagyobb és 80%-ánál kisebb is lehet.
- 1.6.4.34** (törölve)
- 1.6.4.35** (törölve)
- 1.6.4.36** Azokhoz az anyagokhoz, amelyekhez a 3.2 fejezet „A” táblázat 11 oszlopában TP37 különleges előírás van hozzárendelve, a 2010. december 31-ig érvényes ADR-ben előírt mobil tartány utasítás 2016. december 31-ig tovább alkalmazható.
- 1.6.4.37** Azok a 2012. január 1-je előtt gyártott mobil tartányok és MEG-konténerek, amelyek jelölése a 6.7.2.20.1, 6.7.3.16.1, 6.7.4.15.1, ill. 6.7.5.13.1 pont 2010. december 31-ig érvényes előírásainak megfelel, továbbra is használhatók, ha az ADR 2011. január 1-től érvényes, minden más követelményének megfelelnek, beleértve, a 6.7.2.20.1 g) pont szerint a tartánytáblán az „S” szimbólum feltüntetésére vonatkozó előírást, amennyiben a tartány, ill. tartánykamra hullámtörő lemezekkel legfeljebb 7500 l űrtartalmú rekeszekre van osztva. Ha a tartány, ill. tartánykamra már 2012. január 1-je előtt legfeljebb 7500 l űrtartalmú rekeszekre volt osztva, akkor a 6.7.2.19.5 pont szerinti legközelebbi időszakos vizsgálatig nem szükséges a feltüntetett tartány, ill. tartánykamra űrtartalmát az „S” szimbólummal kiegészíteni.
- 1.6.4.38** A 2014. január 1-je előtt gyártott mobil tartányokon a 6.7.2.20.2, a 6.7.3.16.2. és a 6.7.4.15.2 pont előírásától eltérően a mobil tartány utasítást a következő időszakos vizsgálatig nem szükséges feltüntetni.
- 1.6.4.39** Továbbra is használhatók azok a tankkonténerek és MEG-konténerek, amelyeket olyan, a gyártásukkor érvényes szabványok szerint terveztek és gyártottak (lásd a 6.8.2.6 és a 6.8.3.6 bekezdést), amelyek az ADR akkor érvényes előírásai szerint alkalmazhatók voltak, kivéve, ha ezt valamely különleges átmeneti előírás
- 1.6.4.40** Azok a 2011. július 1-je előtt, a 6.8.2.3.3 bekezdés 2010. december 31-ig érvényes előírásai szerint gyártott tankkonténerek, amelyek a lángzár, ill. lángáthatolásgátló szerkezet helyzete tekintetében nem felelnek meg a 6.8.2.2.3 pont harmadik albekezdése előírásainak, továbbra is használhatók.
- 1.6.4.41** A 2011. július 1-je előtt gyártott, az UN 1092, 1238, 1239, 1244, 1251, 1510, 1580, 1810, 1834, 1838, 2474, 2486, 2668, 3381, 3383, 3385, 3387 és 3389 tétel alá tartozó, belélegezve mérgező anyagokhoz használt tankkonténerekre a 3.2 fejezet „A” táblázat 2010. december 31-ig érvényes 12 oszlopában szereplő tartánykód a 2016. december 31-ig tovább használható.
- 1.6.4.42** A 2013. július 1-je előtt, a 2012. december 31-ig érvényes követelmények szerint gyártott tankkonténerek, amelyek nem felelnek meg a 6.8.2.5.2, ill. a 6.8.3.5.6 pont 2013. január 1-jétől érvényes jelölési előírásainak, a 2013. július 1-je utáni következő időszakos vizsgálatig a 2012. december 31-ig érvényes követelmények szerinti jelölést is viselhetik.
- 1.6.4.43** A 2014. január 1-je előtt gyártott mobil tartányoknak és MEG-konténereknek a nyomás-csökkentő szerkezetek jelölése vonatkozásában nem kell megfelelniük a 6.7.2.13.1 pont f) alpontjának, a 6.7.3.9.1 pont e) alpontjának, a 6.7.4.8.1 pont e) alpontjának és a 6.7.5.6.1 pont d) alpontjának.

- 1.6.4.44** Azokhoz az anyagokhoz, amelyekhez a 3.2 fejezet „A” táblázat 11 oszlopában TP38 vagy TP39 különleges utasítás van hozzárendelve, a 2012. december 31-ig érvényes ADR-ben előírt mobiltartány utasítás 2018. december 31-ig tovább alkalmazható.
- 1.6.4.45** Az UN 2381 tételnél, a 2012. december 31-ig érvényes 3.2 fejezet „A” táblázat 12 oszlopában feltüntetett tartánycód a 2013. július 1-je előtt gyártott tankkonténereknél 2018. december 31-ig tovább alkalmazható.
- 1.6.4.46** Azok a 2012. január 1-je előtt, a 2012. december 31-ig érvényes előírások szerint gyártott tankkonténerek, amelyek nem felelnek meg a 6.8.2.6 bekezdés EN 14432:2006 és EN 14433:2006 szabványokra vonatkozó 2011. január 1-től érvényes követelményeinek, továbbra is használhatók.
- 1.6.5 Járművek**
- 1.6.5.1 – 1.6.5.2** (fenntartva)
- 1.6.5.3** (törölve)
- 1.6.5.4** Az EX/II, EX/III, FL, OX és AT járművek szerkezetére a 9. rész 2012. december 31-ig érvényes előírásai 2014. március 31-ig alkalmazhatók.
- 1.6.5.5** Azok a 2003. január 1-je előtt forgalomba helyezett (vagy használatba vett) járművek, amelyeknek az elektromos berendezései nem felelnek meg a 9.2.2, a 9.3.7 vagy a 9.7.8 szakasz követelményeinek, de megfelelnek a 2001. június 30-ig érvényes előírásoknak, továbbra is használhatók.
- 1.6.5.6** (törölve)
- 1.6.5.7** Azok a kész (teljes) és befejezett járművek, amelyeket 2002. december 31-e előtt az ENSZ-EGB 105. sz. előírása³⁾ 01. módosítása, ill. a 98/91/EK irányelv⁴⁾ megfelelő előírásai szerint láttak el típusjóváhagyással, és nem felelnek meg a 9.2 fejezet előírásainak, de megfelelnek az alapjármű szerkezetére 2001. június 30-ig érvényes B.2 Függelék 220 100 – 220 540 szélzetszáma előírásainak, amennyiben 2003. július 1-je előtt helyezik először forgalomba, továbbra is jóváhagyhatók, ill. használhatók.
- 1.6.5.8** Azok az EX/II és EX/III járművek, amelyeket első alkalommal 2005. július 1-je előtt hagytak jóvá, és megfelelnek a 9. rész 2004. december 31-ig érvényes előírásainak, de nem felelnek meg a 2005. január 1-jétől érvényes követelményeknek, továbbra is használhatók.
- 1.6.5.9** Azok a 2004. július 1-je előtt először forgalomba helyezett (vagy használatba vett, ahol a forgalomba helyezés nem kötelező), veszélyes áruk folyékony vagy olvasztott állapotban történő szállítására szolgáló, 3 m³-nél nagyobb befogadóképességű, rögzített tartányt hordozó járművek (tartányjárművek), amelyeknél a tartány próbanyomása 4 bar-nál kisebb, és nem felelnek meg a 9.7.5.2 bekezdés előírásainak, továbbra is használhatók.
- 1.6.5.10** A 9.1.3.5 bekezdés 2006. december 31-ig érvényes előírásainak, valamint a 2007. január 1-től 2008. december 31-ig érvényes előírásainak megfelelő formájú jóváhagyási igazolások továbbra is használhatók.
- 1.6.5.11** Azok a 2009. július 1-je előtt, a nemzeti előírások szerint gyártott és jóváhagyott MEMU-k, amelyek nem felelnek meg a gyártásra és a jóváhagyásra vonatkozó, 2009. január 1-től érvényes követelményeknek, tovább használhatók azon ország(ok)ban, amely(ek)nek illetékes hatósága(i) engedélyezi(k).

3) ENSZ-EGB 105. sz. előírás (Egységes feltételek a veszélyes áruk szállítására szánt járművek jóváhagyására a különleges szerkezeti jellemzők szempontjából).

4) Az Európai Parlament és a Tanács 1998. december 14-i 98/91/EK irányelve a veszélyes áruk közúti szállítására szánt gépjárművekről és pótkocsijaikról, valamint a gépjárművek és pótkocsijaik típusjóváhagyására vonatkozó 70/156/EGK irányelv módosításáról (lásd az EK Hivatalos Lapja L011 sz., 1999.01.16., 25-36 o.).

- 1.6.5.12** Azok a 2012. április 1-je előtt forgalomba helyezett vagy használatba vett EX/III és FL járművek, amelyek villamos csatlakozásai nem felelnek meg a 9.2.2.6.3 pont követelményeinek, de megfelelnek a 2010. december 31-ig alkalmazható követelményeknek, továbbra is használhatók.
- 1.6.5.13** Azok az 1995. július 1-je előtt először forgalomba helyezett (vagy használatba vett, ha a forgalomba helyezés nem volt kötelező) pótkocsik, amelyek az ENSZ-EGB 13. sz. előírás 06 módosítási sorozatának megfelelő blokkolásgátló fékrendszerrel vannak ellátva, de nem felelnek meg az A kategória műszaki követelményeinek, továbbra is használhatók.
- 1.6.5.14** A 2013. július 1-je előtt, a 2012. december 31-ig érvényes ADR előírásai szerint jóváhagyott MEMU-k, amelyek nem felelnek meg a 6.12.3.1.2, ill. a 6.12.3.2.2 pont 2013. január 1-jétől érvényes követelményeinek, továbbra is használhatók.
- 1.6.6** **7 osztály**
- 1.6.6.1** ***Küldeménydarabok, amelyekhez a Nemzetközi Atomenergia Ügynökség 6. sz. Biztonsági sorozat 1985. évi és 1985. évi (1990-ben) módosított kiadása szerint nem szükséges a küldeménydarab-minta illetékes hatóság általi engedélyezése***
- Azok az engedélyezett küldeménydarabok, IP-1, IP-2 és IP-3 típusú ipari küldeménydarabok és A típusú küldeménydarabok, amelyekhez nem volt szükséges a küldeménydarab-minta illetékes hatóság általi engedélyezése és kielégítik a Nemzetközi Atomenergia Ügynökség „Előírások a radioaktív anyagok biztonságos szállítására” (NAÜ 6. sz. Biztonsági sorozat) 1985. évi vagy 1985. évi (1990-ben) módosított kiadásának követelményeit, továbbra is használhatók, azzal a kikötéssel, hogy az 1.7.3 szakasz szerinti kötelező minőségbiztosítási programra, ill. a 2.2.7.2.2, 2.2.7.2.4.1, 2.2.7.2.4.4, 2.2.7.2.4.5, 2.2.7.2.4.6 pontban, a 3.3 fejezet 336 különleges előírásában és a 4.1.9.3 bekezdésben az aktivitási határértékekre és anyagkorlátozásra vonatkozó előírásokat be kell tartani.
- A 2003. december 31-e után gyártott vagy átalakított csomagolóeszközöknek (kivéve hogyha az átalakítás a biztonságot növeli) meg kell felelniük az érvényben lévő ADR előírásoknak. A Nemzetközi Atomenergia Ügynökség „Előírások a radioaktív anyagok biztonságos szállítására” (NAÜ 6. sz. Biztonsági sorozat) 1985. évi vagy 1985. évi (1990-ben) módosított kiadása szerint legkésőbb 2003. december 31-ig szállításra előkészített küldeménydarabok továbbra is szállíthatók. Az ezen időpont után szállításra előkészített küldeménydaraboknak meg kell felelniük az érvényben lévő ADR előírásoknak.
- 1.6.6.2** ***Küldeménydarabok, amelyeket a Nemzetközi Atomenergia Ügynökség 6. sz. Biztonsági sorozat 1973. évi, 1973. évi módosított, 1985. évi és 1985. évi (1990-ben) módosított kiadásának előírásai szerint engedélyeztek***
- 1.6.6.2.1** A Nemzetközi Atomenergia Ügynökség 6. sz. Biztonsági sorozat 1973. évi vagy 1973. évi módosított kiadásának előírásai szerint az illetékes hatóság által engedélyezett küldeménydarab mintának megfelelően gyártott csomagolóeszközök továbbra is használhatóak azzal a kikötéssel, hogy a küldeménydarab minta többoldalú engedélyezése szükséges, valamint az 1.7.3 szakaszban a kötelező minőségbiztosítási programra, ill. a 2.2.7.2.2, 2.2.7.2.4.1, 2.2.7.2.4.4, 2.2.7.2.4.5, 2.2.7.2.4.6 pontban, a 3.3 fejezet 337 különleges előírásában és a 4.1.9.3 bekezdésben az aktivitási határértékekre és anyagkorlátozásra vonatkozó előírásokat be kell tartani. Új gyártás beindítása nem engedélyezhető. A csomagolóeszköz minta vagy az engedélyezett radioaktív tartalom fajtájának vagy mennyiségének olyan változtatása, amely az illetékes hatóság szerint a biztonságot lényegesen befolyásolná, meg kell feleljen az érvényben lévő ADR előírásainak. Minden egyes csomagolóeszközhöz az 5.2.1.7.5 pont szerinti sorozatszámot hozzá kell rendelni és a csomagolóeszköz külsején fel kell tüntetni.
- 1.6.6.2.2** A Nemzetközi Atomenergia Ügynökség 6. sz. Biztonsági sorozat 1985. évi vagy 1985. évi (1990-ben) módosított kiadásának előírásai szerint az illetékes hatóság által engedélyezett küldeménydarab-mintának megfelelően gyártott csomagolóeszközök tovább használhatóak,

azzal a kikötéssel, hogy a küldeménydarab-minta többoldalú engedélyezése szükséges, valamint az 1.7.3 szakaszban a kötelező minőségbiztosítási programra, ill. a 2.2.7.2.2, 2.2.7.2.4.1, 2.2.7.2.4.4, 2.2.7.2.4.5, 2.2.7.2.4.6 pontban, a 3.3 fejezet 337 különleges előírásában és a 4.1.9.3 bekezdésben az aktivitási határértékekre és anyag korlátozásra vonatkozó előírásokat be kell tartani. A csomagolóeszköz minta vagy az engedélyezett radioaktív tartalom fajtájának vagy mennyiségének olyan változtatása, amely az illetékes hatóság szerint a biztonságot lényegesen befolyásolná, meg kell feleljen az érvényben lévő ADR előírásainak. Minden csomagolóeszköznek, amelynek gyártása 2006. december 31-e után kezdődik, meg kell felelnie az érvényben lévő ADR előírásoknak.

1.6.6.3

Különleges formájú radioaktív anyagok, amelyeket a Nemzetközi Atomenergia Ügynökség 6. sz. Biztonsági sorozat 1973. évi, 1973. évi módosított, 1985. évi vagy 1985. évi (1990-ben) módosított kiadásának előírásai szerint engedélyeztek

Az olyan minta szerint gyártott különleges formájú radioaktív anyag, amelyre az illetékes hatóság a Nemzetközi Atomenergia Ügynökség 6. sz. Biztonsági sorozat 1973. évi, 1973. évi módosított, 1985. évi vagy 1985. évi (1990-ben) módosított kiadásának előírásai szerint adott ki egyoldalú engedélyt, tovább használható, ha az megfelel az 1.7.3 szakasz vonatkozó előírásai szerinti kötelező minőségbiztosítási programnak. Minden különleges formájú radioaktív anyagnak, amelyet 2003. december 31-e után gyártanak, meg kell felelnie az érvényben lévő ADR előírásoknak.

1.7 FEJEZET

ÁLTALÁNOS ELŐÍRÁSOK A 7 OSZTÁLYRA

1.7.1 Hatály és alkalmazási terület

Megjegyzés: 1. *A radioaktív anyagok szállítása során bekövetkező baleset vagy rendkívüli esemény esetén az emberek, az anyagi javak és a környezet védelme érdekében az illetékes nemzeti, ill. nemzetközi hatóságok által megállapított veszélyhelyzeti előírásokat kell betartani. Az ilyen előírásokhoz útmutatás található a „Planning and Preparing for Emergency Response to Transport Accidents Involving Radioactive Material”, Safety Standard Series No. TS-G-1.2 (ST-3), IAEA, Vienna (2002) kiadványban.*

2. *A veszélyhelyzeti beavatkozásnál figyelembe kell venni, hogy a baleset során a küldemény tartalma és a környezet között bekövetkező reakció folytán egyéb veszélyes anyagok is képződhetnek.*

1.7.1.1 Az ADR olyan szabályokat állapít meg, amelyek által a radioaktív anyagok szállításával kapcsolatos sugárzásból, kritikusságból vagy hőhatásból eredően a személyeket, javakat vagy környezetet érő veszélyek megfelelően kezelhetők. Ezek a szabályok az Nemzetközi Atomenergia Ügynökség „Előírások a radioaktív anyagok biztonságos szállítására”, 2009. évi kiadás, Biztonsági Szabványok Sorozat, TS-R-1 kiadványon alapulnak (Bécs, 2009.). A magyarázatok az IAEA „Advisory Material for the IAEA Regulations for the Safe Transport of Radioactive Materials (2005.évi kiadás)”, Safety Standard Series No. TS-G-1.1 (Rev. 1), IAEA Vienna, (2008) kiadványban találhatók.

1.7.1.2 Az ADR célja olyan követelmények kialakítása, amelyek betartása garantálja a biztonságot, a személyek, a javak és a környezet védelmét a sugárzás hatásaival szemben a radioaktív anyagok szállítása során. Ez a védelem azáltal érhető el, hogy követelményeket támaszt:

- a) a radioaktív tartalom megtartására;
- b) a külső sugárzási szint korlátozására;
- c) a kritikusság megelőzésére; és
- d) a hőhatás okozta károk megelőzésére.

Ezek a követelmények elsősorban azáltal teljesülnek, hogy a járművek és a küldeménydarabok tartalmának határértékei, ill. a küldeménydarab minták minőségi követelményei a radioaktív tartalom veszélyességének függvényében különböző fokozatokra vannak meghatározva. Másodsorban a küldeménydarabokra, kezelésükre, a csomagolóeszköz karbantartására vonatkozó, a radioaktív tartalom fajtáját figyelembe vevő követelmények meghatározásával és végül az adminisztratív ellenőrzések előírásával, – vagy ahol szükséges – az illetékes hatóság általi jóváhagyás megkövetelésével.

1.7.1.3 Az ADR előírásait a radioaktív anyagok közúti szállítására kell alkalmazni, beleértve a radioaktív anyagok használatával együtt járó szállításokat is. A „szállítás” magában foglal a radioaktív anyag mozgatásával kapcsolatos minden tevékenységet, a csomagolóeszköz tervezését, gyártását, karbantartását és javítását, a radioaktív rakomány előkészítését, feladását, berakását, szállítását (beleértve a közbelső tárolását), kirakását és átvételét a rendeltetési helyen. Az ADR által a minőségi követelmények meghatározásánál alkalmazott különböző fokozatok három általános súlyossági szinttel jellemezhetők:

- a) szokásos szállítási körülmények (rendkívüli esemény nélkül);
- b) kisebb balesetek fellépése során fennálló szállítási körülmények;
- c) a szállítás során bekövetkező baleseti körülmények.

1.7.1.4 Az ADR előírásait nem kell alkalmazni, ha a szállított anyagok (tárgyak) a következők:

- a) a szállítóeszköz szerves részét képező radioaktív anyagok;
- b) valamely létesítményen belül mozgatott radioaktív anyagok, amelyek a létesítményben

érvényben levő, megfelelő biztonsági előírások hatálya alá esnek, és ez a mozgítás nem vesz igénybe közutat vagy vasutat;

- c) a személyekbe vagy élő állatokba diagnosztikai vagy kezelési célra bevitt vagy beültetett radioaktív anyagok;
- d) a fogyasztási cikkekben levő, hatóságilag engedélyezett radioaktív anyagok, azok végső felhasználónak történt eladását követően;
- e) a természetben előforduló radionuklidokat tartalmazó természetes anyagok és ércek, amelyek vagy természetes állapotukban vannak, vagy a radionuklidok kinyerésén kívüli egyéb célból vannak feldolgozva, és amelyeket nem szándékoznak feldolgozni a radionuklidok felhasználása céljából, amennyiben az anyag aktivitás koncentrációja nem nagyobb, mint a 2.2.7.2.2.1 b) pontban meghatározott vagy a 2.2.7.2.2.2 – 2.2.7.2.2.6 pont szerint számított érték 10-szerese;
- f) nem radioaktív szilárd tárgyak, amelyek felületükön sehol nem tartalmaznak a 2.2.7.1.2 pontban a „szennyezettség” meghatározásánál megadott határoknál nagyobb mennyiségben radioaktív anyagokat.

1.7.1.5 *Az engedményes küldeménydarabok szállítására vonatkozó különleges előírások*

1.7.1.5.1 A 2.2.7.2.4.1 pont szerinti engedményes küldeménydarabokra, amelyek korlátozott mennyiségű radioaktív anyagot, készüléket, gyártmányt és üres csomagolóeszközöket tartalmazhatnak, az 5 – 7. részek előírásai közül csak a következőket kell betartani:

- a) az 5.1.2 szakaszban, az 5.1.3.2 bekezdésben, az 5.1.4 szakaszban, az 5.1.5.4 és az 5.2.1.9 bekezdésben és a 7.5.11 szakasz CV33 előírás 5.2) pontjában meghatározott előírásokat;
- b) a 6.4.4 szakaszban az engedményes küldeménydarabokra meghatározott követelményeket;
- c) ha az engedményes küldeménydarab hasadóanyagot tartalmaz, akkor a 2.2.7.2.3.5 pontban szereplő, hasadóanyag mentesítési feltételek egyikének meg kell felelnie és a 6.4.7.2 bekezdés követelményét be kell tartani.

1.7.1.5.2 Az ADR összes többi részének vonatkozó előírását az engedményes küldeménydarabokra be kell tartani.

1.7.2 **Sugárvédelmi program**

1.7.2.1 A radioaktív anyagok szállításához sugárvédelmi program szükséges, amely a sugárvédelmi követelmények kellő figyelembevételét célzó intézkedéseket tartalmaz.

1.7.2.2 A személyek sugárterhelése nem haladhatja meg az erre meghatározott dóziskorlátokat. A védelmet és biztonságot optimalni kell annak érdekében, hogy az egyéni dózisok nagysága, a sugárzásnak kitett személyek száma és a sugárterhelés valószínűsége az ésszerűen elérhető legalacsonyabb szinten maradjon. Az optimaláláskor tekintettel kell lenni a gazdasági és társadalmi tényezőkre, azzal, hogy az egyéni dózisok megállapításánál figyelembe kell venni a dózismegszorításokat. Rendszerszemléletű megközelítést kell alkalmazni, amely figyelembe veszi a szállítás és az egyéb tevékenységek kapcsolatát.

1.7.2.3 A programban alkalmazott intézkedések jellegét és mértékét a sugárterhelés nagyságához és valószínűségéhez kell igazítani. A programnak tartalmaznia kell az 1.7.2.2, az 1.7.2.4 és az 1.7.2.5 bekezdés és a 7.5.11 szakasz CV33 előírás 1.1) pontja követelményeit. A program dokumentumait ellenőrzés céljából, kérésre az illetékes hatóság rendelkezésére kell bocsátani.

1.7.2.4 Amennyiben a szállítási tevékenység során a foglalkozási sugárterhelésből eredő effektív dózis:

- a) valószínűleg évi 1 és 6 mSv között van, akkor a munkahely sugárellenőrzésén vagy az

egyéni sugárterhelés ellenőrzésén alapuló dózis értékelési programot kell működtetni;

- b) valószínűleg meghaladja az évi 6 mSv-et, akkor egyéni sugárterhelési ellenőrzést kell végezni.

Az egyéni sugárterhelési ellenőrzések, ill. a munkahely sugárellenőrzésének adatairól megfelelő nyilvántartást kell vezetni.

Megjegyzés: Amennyiben a szállítási tevékenység során a foglalkozási sugárterhelésből eredő effektív dózis nagy valószínűséggel nem haladja meg az évi 1 mSv-et, akkor nincs szükség sem különleges munkarendre, sem részletes megfigyelésre, sem dózisértékelési programra, ill. egyéni nyilvántartás vezetésére.

1.7.2.5

A dolgozóknak (lásd a 7.5.11 szakasz CV33 előírása 3. megjegyzését) sugárvédelemből megfelelő képzettséggel kell rendelkezniük, amely kiterjed az őket érő foglalkozási sugárterhelés, ill. a tevékenységük folytán esetleg másokat érő sugárterhelés korlátozása érdekében betartandó óvintézkedésekre.

1.7.3

Minőségbiztosítás

Az ADR előírásainak való megfelelés biztositása érdekében a különleges formájú radioaktív anyagok, a kis mértékben diszpergálódó radioaktív anyagok és a küldemény-darabok tervezésére, gyártására, vizsgálatára, dokumentációjára, használatára, karbantartására, felügyeletére, valamint a szállításra és a szállítás közbeni átmeneti tárolásra az illetékes hatóság által elfogadott, nemzetközi, nemzeti vagy egyéb szabványokon alapuló minőségbiztosítási programot kell kialakítani és működtetni. Annak a tanúsítványnak, hogy a gyártási mintára vonatkozó követelményeket teljes mértékben teljesítették, az illetékes hatóság rendelkezésére kell állnia. A gyártónak, a feladónak és a felhasználónak – kérésre – az illetékes hatóság számára rendelkezésre kell bocsátania a gyártás vagy a használat ellenőrzéséhez szükséges berendezéseket és minden illetékes hatóság számára bizonyítani kell, hogy

- a) az alkalmazott gyártási eljárások és a felhasznált anyagok összhangban vannak az engedélyezett mintadarab specifikációival; és
- b) minden csomagolóeszközt rendszeresen megvizsgálják és – szükség esetén – oly módon állítanak helyre és tartanak jó állapotban, hogy azok az ismételt felhasználás után is megfeleljenek a vonatkozó előírásoknak és specifikációknak.

Amennyiben az illetékes hatóság engedélye szükséges, ezen engedély kiadása a minőségbiztosítási program alkalmasságának függvénye.

1.7.4

Külön megegyezés

1.7.4.1

A külön megegyezés az illetékes hatóság által jóváhagyott előírásokat jelenti, amelyek betartásával az ADR radioaktív anyagokra vonatkozó követelményeinek nem mindenben megfelelő küldemény szállítható.

Megjegyzés: A külön megegyezés nem tekinthető az 1.5.1 szakasz szerinti ideiglenes eltérésnek.

1.7.4.2

Azok a küldemények, amelyeknél a 7 osztályra vonatkozó valamely előírást nem lehet betartani, csak külön megegyezés alapján szállíthatók. Az illetékes hatóság akkor engedélyezheti egy küldemény vagy egy előre tervezett küldemény sorozat külön megegyezés alapján történő szállítását, ha megbizonyosodott arról, hogy az ADR előírásait valóban nem lehet betartani és az ADR által megkövetelt biztonsági szintet más eszközökkel el lehet érni. A teljes szállítási biztonságnak legalább olyan szintűnek kell lennie, mintha minden vonatkozó előírást betartottak volna. Az ilyen típusú nemzetközi küldeményekhez többoldalú engedélyre van szükség.

1.7.5 Egyéb veszélyes tulajdonságokkal bíró radioaktív anyag

A radioaktív és hasadó tulajdonságokon kívül a küldeménydarab tartalmának minden járulékos veszélyét, így a robbanásveszélyt, gyúlékonyságot, piroforosságot, vegyi mérgező-képességet és maró hatást ugyancsak figyelembe kell venni az okmányokban, a csomagolásnál, a bárcázásnál, a feliratozásnál, a nagybárcák elhelyezésénél, az átmeneti tárolásnál, az elkülönítésnél és a szállításnál, hogy az ADR veszélyes árukra vonatkozó minden előírása teljesüljön.

1.7.6 Hiányosságok

1.7.6.1 Az ADR-ben előírt, a sugárzási szintre, ill. a szennyezettségre vonatkozó határértékek túllépése esetén:

- a) erről a hiányosságról értesítenie kell a feladót
 - i) a szállítónak, ha ezt a szállítás alatt észleli; ill.
 - ii) a címzettnek, ha átvételkor észleli;
- b) a szállítónak, a feladónak, ill. a címzettnek:
 - i) azonnal intézkednie kell az ebből eredő következmények elhárítására;
 - ii) ki kell vizsgálnia az okokat, körülményeket és következményeket;
 - iii) megfelelő intézkedéseket kell tennie azoknak az okoknak és körülményeknek a kiküszöbölésére, amelyek ehhez a hiányossághoz vezettek, és meg kell akadályoznia a hasonló körülmények ismételt előfordulását; és
 - iv) az illetékes hatóság(ka)t tájékoztatnia kell a hiányosság okairól és a végrehajtott vagy végrehajtandó elhárító, ill. megelőző tevékenységről; és
- c) a hiányosságról a feladót, ill. az illetékes hatóság(ka)t lehetőleg minél hamarabb kell tájékoztatni, de ha besugárzás szempontjából veszélyhelyzet alakult ki vagy van kialakulóban, azonnal tájékoztatni kell őket.

1.8 FEJEZET

BIZTONSÁGI KÖVETELMÉNYEK BETARTÁSÁT BIZTOSÍTÓ ELLENŐRZÉSEK, ILL. A BIZTONSÁGOT ELŐSEGÍTŐ EGYÉB INTÉZKEDÉSEK

1.8.1 A veszélyes áruk hatósági ellenőrzése

1.8.1.1 A Szerződő Felek illetékes hatóságai illetékességi területükön bármikor ellenőrizhetik, hogy a veszélyes áru szállítással kapcsolatos előírásokat, beleértve a közbiztonsági intézkedésekre vonatkozókat is az 1.10.1.5 bekezdés szerint, betartják-e.

Az ellenőrzést azonban úgy kell végezni, hogy az ne veszélyeztessen sem személyeket, sem javakat, sem a környezetet, ill. ne zavarja jelentősen a közúti közlekedést.

1.8.1.2 A veszélyes áruk szállításában résztvevőknek (lásd 1.4 fejezet) az ellenőrzéshez szükséges minden, saját feladataikra vonatkozó információt haladéktalanul az illetékes hatóság vagy képviselője rendelkezésére kell bocsátaniuk.

1.8.1.3 A veszélyes áruk szállításában résztvevő vállalkozások (lásd 1.4 fejezet) telephelyén történő ellenőrzés céljából az illetékes hatóságok helyszíni vizsgálatot is tarthatnak, megnézhetik a szükséges okmányokat, a veszélyes áruból, ill. a csomagolóeszközből vizsgálat céljából mintát vehetnek, feltéve, hogy mindezzel nem veszélyeztetik a biztonságot. A veszélyes áruk szállításában résztvevőknek (lásd 1.4 fejezet) ellenőrzés céljára a járműveket, a jármű alkatrészeket, a felszereléseket és a berendezéseket is hozzáférhetővé kell tenni, amennyiben az lehetséges, ill. ésszerű. Amennyiben a hatóság szükségesnek ítéli, kijelölhet valakit a vállalkozástól, hogy elkísérje az illetékes hatóság képviselőjét.

1.8.1.4 Amennyiben az illetékes hatóságok azt tapasztalják, hogy az ADR előírásait nem tartották be, megtilthatják a küldemény feladását vagy megszakíthatják a szállítást, amíg a tapasztalt hiányosságokat ki nem küszöbölik, ill. más, megfelelő intézkedést is hozhatnak. A jármű feltartóztatása történhet a helyszínen vagy – biztonsági okokból – a hatóságok által kiválasztott más helyen. Ezek az intézkedések azonban nem zavarhatják jelentősen a közúti közlekedést.

1.8.2 Hivatali együttműködés

1.8.2.1 A Szerződő Felek hivatalainak együtt kell működniük az ADR végrehajtásában.

1.8.2.2 Ha egy Szerződő Fél megállapítja, hogy területén a veszélyes áruk szállításának biztonságát egy olyan vállalkozás nagyon súlyos vagy ismételt szabálytalansága veszélyezteti, amelynek székhelye egy másik Szerződő Fél területén van, az ilyen szabálytalanságról értesítenie kell a másik Szerződő Fél illetékes hatóságát. Azon Szerződő Fél illetékes hatóságai, amelynek területén a súlyos vagy ismételt szabálytalanságot megállapították, felkérhetik azon Szerződő Fél illetékes hatóságait, amelyben a vállalkozás székhelye van, hogy hozzanak megfelelő intézkedéseket a szabálytalanság elkövetője vagy elkövetői ellen. A személyekre vonatkozó adatok nem adhatók át, kivéve, ha a súlyos vagy ismételt szabálytalanság miatti büntetőeljáráshoz van rá szükség.

1.8.2.3 Az értesített illetékes hatóságoknak a vállalkozással szemben hozott intézkedéseikről – ha ilyenre szükség volt – értesíteniük kell azon Szerződő Fél illetékes hatóságait, amelyben a szabálytalanságot megállapították.

1.8.3 Biztonsági tanácsadó

1.8.3.1 Minden vállalkozásnak, amely veszélyes árut közúton szállít, fuvaroz vagy ahhoz kapcsolódó csomagolást, berakást, töltést vagy kirakást végez, egy vagy több veszélyes áru szállítási biztonsági tanácsadót kell kineveznie, aki azért felelős, hogy segítse megelőzni, hogy e tevékenységek veszélyeztessék az embereket, az anyagi javakat vagy a környezetet.

- 1.8.3.2** A Szerződő Felek illetékes hatóságai rendelkezhetnek úgy, hogy ezeket a követelményeket nem kell alkalmazni azon vállalkozások esetében:
- amelyek tevékenysége olyan mennyiségekre terjed ki, melyek szállítóegységenként nem haladják meg az 1.1.3.6 és az 1.7.1.4 bekezdésben, valamint a 3.3, 3.4 és 3.5 fejezetben meghatározott értékeket; vagy
 - amelyek fő vagy kiegészítő tevékenységi körébe nem tartozik a veszélyes áru szállítás, ill. az ezzel kapcsolatos be- és kirakás, de esetenként részt vesznek olyan veszélyes áruk belföldi szállításában vagy az ehhez kapcsolódó be- és kirakásában, amelyek csak kisebb veszélyt vagy környezeti kockázatot jelentenek.
- 1.8.3.3** A tanácsadó fő feladata, hogy a vállalkozás vezetőjének felelőssége mellett minden lehetséges módon és ténykedéssel elősegítse, hogy a vállalkozás az érintett tevékenységét a hatályos szabályoknak megfelelően és a lehető legbiztonságosabb módon végezze.
- A tanácsadónak a vállalkozás tevékenységére vonatkozóan a következők a feladatai:
- annak figyelemmel kísérése, hogy betartják-e a veszélyes áruk szállítását szabályozó előírásokat;
 - tanácsadás a vállalkozás számára a veszélyes áruk szállítását illetően;
 - éves jelentés készítése a vállalkozás vezetősége, vagy adott esetben a helyi hatóság számára a vállalkozás veszélyes áruk szállításával kapcsolatos tevékenységéről. Az éves jelentéseket öt évig meg kell őrizni, és a hatóság kérésére be kell mutatni.
- A tanácsadónak ezen kívül kötelessége figyelemmel kísérni a vállalkozás érintett tevékenységére vonatkozóan a következők gyakorlati végrehajtását és az ezzel kapcsolatos eljárásokat:
- a szállítandó veszélyes áruk azonosítására vonatkozó szabályok betartását;
 - azt, hogy a vállalkozás figyelembe veszi-e a szállítójárművek vásárlásánál a szállítandó veszélyes áruval kapcsolatos különleges követelményeket;
 - a veszélyes áruk szállítására, be- és kirakására használt felszerelések ellenőrzésére szolgáló eljárásokat;
 - a vállalkozás alkalmazottainak megfelelő képzését, beleértve az előírások változásainak nyomon követését, és a képzésről szóló jelentések, okmányok őrzését, nyilvántartását;
 - a szállítás vagy a be- és kirakás biztonságát veszélyeztető baleset vagy rendkívüli esemény esetén a megfelelő veszély-elhárítási eljárások alkalmazását;
 - a szállítás vagy a be- és kirakás alatt észlelt súlyos balesetek, rendkívüli események vagy súlyos szabálytalanságok okának felderítését, vagy amennyiben szükséges, jelentés készítését;
 - a balesetek, rendkívüli események vagy súlyos szabálytalanságok ismétlődésének megakadályozását célzó megfelelő eljárások alkalmazását;
 - az alvállalkozók vagy harmadik felek kiválasztásakor és igénybevételekor a veszélyes áruk szállításával kapcsolatos jogi előírások és különleges követelmények figyelembe vételét;
 - annak ellenőrzését, hogy a veszélyes áruk szállításában, be- és kirakásában résztvevő alkalmazottak részletes technológiai utasítást és oktatást kapnak;
 - a veszélyes áruk szállításakor, be- és kirakásakor fennálló veszélyek tudatosítását szolgáló intézkedések meghozatalát;
 - olyan ellenőrzési eljárások fogantatását, melyek azt hivatottak biztosítani, hogy a járműveken a kötelező okmányok és biztonsági felszerelések a szabályoknak megfelelő formában megtalálhatók;
 - olyan ellenőrzési eljárások fogantatását, melyek a be- és kirakással kapcsolatos szabályok betartását biztosítják;
 - az 1.10.3.2 bekezdésben meghatározott közbiztonsági terv meglétét.
- 1.8.3.4** A tanácsadó lehet a vállalkozás vezetője is, a vállalkozásban más feladatkört is ellátó személy vagy a vállalkozás közvetlen alkalmazásában nem álló személy, amennyiben alkalmas a tanácsadó feladatainak ellátására.
- 1.8.3.5** Minden érintett vállalkozásnak az illetékes hatóság vagy az egyes Szerződő Felek által e

célra kijelölt testület kérésére közölnie kell, hogy ki a tanácsadója.

- 1.8.3.6** Ha egy szállítás, ill. az áruk be- vagy kirakása közben bekövetkezett baleset személyeket, anyagi javakat vagy a környezetet érinti, vagy bennük kárt okoz, az érintett vállalkozás tanácsadójának a lényeges információk összegyűjtése után baleseti jelentést kell készítenie a vállalkozás vezetősége vagy adott esetben a helyi hatóság részére. Ez a jelentés azonban nem helyettesíti a vállalkozás vezetésének jelentését, amely bármilyen más nemzetközi vagy belföldi szabályozás alapján szükséges.
- 1.8.3.7** A tanácsadónak a közúti szállításra érvényes bizonyítvánnyal kell rendelkeznie. A bizonyítványt az illetékes hatóságnak vagy az egyes Szerződő Felek által e célra kijelölt testületnek kell kiadnia.
- 1.8.3.8** A bizonyítvány megszerzéséhez a jelöltnek képzésben kell részt vennie, és a Szerződő Fél illetékes hatósága által jóváhagyott vizsgát kell tennie.
- 1.8.3.9** A képzés fő célja, hogy a jelölt megfelelő tudást szerezzen a veszélyes áruk szállításában rejlő veszélyekről, az adott szállítási módra vonatkozó jogszabályokról, rendeletekről és hatósági előírásokról, valamint az 1.8.3.3 bekezdés szerinti feladatokról.
- 1.8.3.10** A vizsgát az illetékes hatóságnak vagy az általa kinevezett vizsgáztató szervezetnek kell megszerveznie. Képzőszerv nem lehet vizsgáztató szervezet.
- A vizsgáztató szervezetet írásban kell kinevezni. A kinevezést, amely korlátozott időtartamú is lehet, a következő kritériumok alapján kell kiadni:
- a vizsgáztató szervezet szakmai alkalmassága;
 - a vizsgáztató szervezet által javasolt vizsgáztatási forma részletes leírása;
 - a vizsgáztatás pártatlanságának biztosítására vonatkozó intézkedések;
 - a szervezet függetlensége bármely, biztonsági tanácsadót alkalmazó természetes vagy jogi személytől.
- 1.8.3.11** A vizsga célja meggyőződni arról, hogy a jelölt az 1.8.3.7 bekezdésben előírt bizonyítvány megszerzéséhez elegendő szintű tudással rendelkezik-e a tanácsadóra háruló, az 1.8.3.3 bekezdésben felsorolt feladatok ellátásához. A vizsgának a következő témákra kell kiterjednie:
- a) A veszélyes árukkal kapcsolatos balesetek lehetséges következményeinek és a balesetek fő okainak ismerete;
 - b) A belföldi jog, a nemzetközi megállapodások és egyezmények előírásai, különös tekintettel az alábbiakra:
 - a veszélyes áruk besorolása (az oldatok és keverékek besorolási eljárása, az anyag-felsorolás felépítése, a veszélyes áru osztályok és az osztályba sorolás elvei, a szállított veszélyes áruk jellemzői, fizikai, kémiai és toxikológiai (mérgező) tulajdonságai);
 - általános csomagolási előírások, a tartányokra és tankkonténerekre vonatkozó előírások (típusok, kódolás, jelölés, szerkezeti felépítés, első alkalommal végzett és időszakos vizsgálatok);
 - feliratok és jelölések, veszélyességi bárcával és narancssárga táblával való jelölés (a küldeménydarabok jelölése és bárcázása, a nagybárcák és a narancssárga táblák elhelyezése és eltávolítása);
 - bejegyzések a fuvarokmányokba (szükséges információk);
 - a szállítás lebonyolítása és a feladási korlátozások (teljes rakomány, ömlesztett szállítás, szállítás IBC-kben, szállítás konténerekben, szállítás rögzített és leszerelhető tartányokban);
 - utasok szállítása;
 - együvé rakási tilalmak és elővigyázatossági intézkedések az együvé rakáskor;
 - az áruk elkülönítése;
 - a szállított mennyiség korlátozása és a mentesített mennyiségek;
 - árukezelés és elhelyezés (be- és kirakás, töltési fok, átmeneti tárolás és

- elkülönítés);
- berakás előtti és kirakás utáni tisztítás, ill. gáztalanítás;
- személyzet, szakképzés;
- jármű okmányok (fuvarokmány, írásbeli utasítás, jármű jóváhagyási igazolás, a járművezető oktatási bizonyítványa, az eltérésekről szóló megállapodások okmányai, egyéb okmányok);
- írásbeli utasítás (az utasítás végrehajtása és a jármű személyzet egyéni védőfelszerelései);
- a járművek felügyeletére vonatkozó előírások (várakozás);
- forgalmi szabályok és korlátozások;
- környezetszennyező anyagok működés közbeni kibocsátása vagy véletlen kifolyása;
- a szállítóeszközökre vonatkozó követelmények.

1.8.3.12 *A vizsga*

1.8.3.12.1 A vizsgának írásbelinek kell lennie, ami kiegészíthető szóbeli vizsgával is.

1.8.3.12.2 A nemzetközi és a belföldi szabályzatokon kívül egyéb segédanyagot az írásbeli vizsgán nem szabad használni.

1.8.3.12.3 Elektronikus eszközöket csak akkor szabad használni, ha a vizsgáztató szervezet bocsátja rendelkezésre. Az elektronikus eszköz csak olyan lehet, amelybe a vizsgázó nem tud további adatokat bevinni, csak a feltett kérdésre tud válaszolni.

1.8.3.12.4 Az írásbeli vizsgának két részből kell állnia:

- a) A jelöltnek egy kérdőívet kell kapnia. A kérdőívnek legalább 20 kiegészítendő kérdést kell tartalmaznia, amelyek legalább az 1.8.3.11 bekezdésben felsorolt témákra terjednek ki. Felelet-választós kérdéseket is lehet alkalmazni, ez esetben két felelet-választós kérdés egyenértékű egy kiegészítendő kérdéssel.

A témák között különös figyelmet kell szentelni a következőknek:

- általános megelőző és biztonsági intézkedések;
- a veszélyes áruk besorolása;
- általános csomagolási előírások, beleértve a tartányokra, a tankkonténerekre és a tartányjárművekre vonatkozó előírásokat;
- a veszély jelölése és a veszélyességi bárcák;
- a fuvarokmányban levő bejegyzések;
- árukezelés és rakodás;
- a személyzet szakképzése;
- a jármű okmányai és bizonyítványok;
- írásbeli utasítás;
- a szállítóeszközökre és felszerelésükre vonatkozó előírások.

- b) A jelöltnek egy esettanulmányt is ki kell dolgoznia a tanácsadó 1.8.3.3 bekezdésben felsorolt feladataira vonatkozóan, amivel bizonyítja, hogy képes a tanácsadó feladatainak ellátására.

1.8.3.13 A Szerződő Felek rendelkezhetnek úgy, hogy azok a jelöltek, akik olyan vállalkozásnál kívánnak dolgozni, amely bizonyos veszélyes áruk szállítására szakosodott, csak az e tevékenységgel kapcsolatos témákból vizsgázzanak. Ezek a veszélyes árucsoportok a következők lehetnek:

- 1 osztály;
- 2 osztály;
- 7 osztály;
- 3, 4.1, 4.2, 4.3, 5.1, 5.2, 6.1, 6.2, 8 és 9 osztály;
- az UN 1202, 1203, 1223, 3475 számú anyagok, és az UN 1268 és 1863 alá tartozó repülőgép tüzelőanyagok.

Az 1.8.3.7 bekezdésben előírt bizonyítványból egyértelműen ki kell tűnnie, hogy csak azokra, az e bekezdésben foglalt árucsoport(ok)ra érvényes, amelyekből a jelölt az 1.8.3.12 bekezdés szerinti követelményeknek megfelelően vizsgát tett.

Azok a veszélyes áru szállítási biztonsági tanácsadói bizonyítványok, amelyeket 2009. január 1-je előtt bocsátottak ki és az UN 1202, 1203 és 1223 számú anyagokra érvényesek, az UN 3475 számú anyagra, valamint az UN 1268 és 1863 alá tartozó repülőgép tüzelőanyagokra is érvényesek.

1.8.3.14 Az illetékes hatóságnak vagy a vizsgáztató szervezetnek a vizsgakérdésekből gyűjteményt kell készítenie.

1.8.3.15 Az 1.8.3.7 bekezdésben előírt bizonyítványt az 1.8.3.18 bekezdés szerinti formában kell kiállítani. A bizonyítványt minden Szerződő Fél köteles elismerni.

1.8.3.16 *A bizonyítvány érvényessége és megújítása*

1.8.3.16.1 A bizonyítvány öt évig érvényes. A bizonyítvány érvényességi idejét meg kell hosszabbítani, esetenként az érvényességének lejártától számított öt évvel, ha tulajdonosa a bizonyítvány érvényességének lejártá előtti egy éven belül sikeres vizsgát tett. A vizsgáztatást az illetékes hatóságnak jóvá kell hagynia.

1.8.3.16.2 A vizsga célja meggyőződni arról, hogy a bizonyítvány tulajdonosa rendelkezik-e az 1.8.3.3 bekezdésben felsorolt feladatok ellátásához szükséges ismeretekkel. A szükséges ismeretek az 1.8.3.11 b) pontban vannak felsorolva, amely ismereteknek ki kell terjedniük a bizonyítvány kiadása (legutóbbi meghosszabbítása) óta eltelt időben az előírásokban bekövetkezett változásokra is. A vizsgát az 1.8.3.10 és 1.8.3.12 – 1.8.3.14 bekezdésben előírtak szerint kell szervezni és felügyelni. A bizonyítvány tulajdonosának azonban nem kell az 1.8.3.12.4 b) pontban említett esettanulmányt kidolgoznia.

1.8.3.17 (törölve)

1.8.3.18 *A bizonyítvány formája*

A veszélyes áru szállítási biztonsági tanácsadó képzésének bizonyítványa

Dátum: Aláírás:

1.8.4 **Az illetékes hatóságok és az általuk kijelölt szervezetek jegyzéke**

A Szerződő Feleknek közölniük kell az ENSZ Európai Gazdasági Bizottság Titkárságával azoknak a hatóságoknak, ill. az általuk kijelölt szervezeteknek a címét, amelyek az ADR végrehajtására vonatkozó belföldi jogszabályaik szerint illetékesek. Minden esetben meg kell adni az ADR azon előírásait, amelyre vonatkozóan illetékesek, ill. azt a címet, amelyre a kérelmeket be lehet nyújtani.

Az ENSZ EGB Titkárságának a kapott információk alapján jegyzéket kell összeállítania és azt napra kész állapotban kell tartania. A jegyzéket és módosításait meg kell küldenie a Szerződő Feleknek.

1.8.5 **A veszélyes árukkal kapcsolatos eseményekről szóló jelentés**

1.8.5.1 Amennyiben a veszélyes áru szállítása, berakása, töltése vagy kirakása során valamely Szerződő Fél területén jelentős baleset vagy káresemény következett be, a szállítónak, a fuvarozónak, a berakónak, a töltőnek, ill. a címzettnek meg kell győződnie arról, hogy az eseménytől számított legfeljebb egy hónapon belül az érintett Szerződő Fél illetékes hatósága számára az 1.8.5.4 bekezdésben szereplő minta szerinti jelentés készül.

1.8.5.2 A Szerződő Félek ezután szükség esetén jelentést kell készítenie az ENSZ Európai Gazdasági Bizottság Titkársága számára a többi Szerződő Fél informálása céljából.

1.8.5.3 Az 1.8.5.1 bekezdés szerinti jelentést akkor kell elkészíteni, ha a következő események közül egy vagy több bekövetkezett: a veszélyes áru kiszabadult vagy kiszabadulásának közvetlen veszélye állt fenn, személyi sérülés, anyagi kár vagy a környezet károsodása következett be, vagy a hatóságok beavatkoztak. Ennek megítélésénél a következő kritériumokat kell alkalmazni:

A „személyi sérülés” olyan esemény, amelyben a szállított veszélyes áruval közvetlenül

kapcsolatba hozható sérülés vagy haláleset következik be, és a sérülés:

- a) intenzív orvosi kezelést igényel,
- b) legalább egy napos kórházi tartózkodást igényel, vagy
- c) legalább három, egymást követő napig munkaképtelenséget okoz.

A „veszélyes áru kiszabadulás”

- a) a 0 vagy az 1 szállítási kategóriába tartozó veszélyes árunak legalább 50 kg vagy 50 l mennyiségben,
- b) a 2 szállítási kategóriába tartozó veszélyes árunak legalább 333 kg vagy 333 l mennyiségben, vagy
- c) a 3 vagy a 4 szállítási kategóriába tartozó veszélyes árunak legalább 1000 kg vagy 1000 l mennyiségben

történő szabaddá válása.

A „veszélyes áru kiszabadulás” kritériuma akkor is teljesül, ha a veszélyes áru kiszabadulásának közvetlen veszélye állt fenn az előzőekben említett mennyiségekben. Ezt rendszerint akkor kell feltételezni, ha a szerkezeti sérülés következtében a csomagolóeszköz nem alkalmas a további szállításra, vagy ha bármilyen más okból a megfelelő biztonsági szint már nem áll fenn (pl. a tartányok vagy konténerek deformálódása, a tartány felborulása vagy a közvetlen közelben levő tűz miatt).

A 6.2 osztály veszélyes áruai esetén a jelentési kötelezettség a mennyiségtől függetlenül fennáll.

Ha az eset a 7 osztály anyagával történik, a „veszélyes áru kiszabadulás” kritériumai a következők:

- a) radioaktív anyag bármilyen kiszabadulása a küldeménydarabból;
- b) olyan sugárterhelés bekövetkezése, amely meghaladja a dolgozók és a lakosság ionizáló sugárzással szembeni védelmét szabályozó előírások határértékeit (NAÜ 115. sz. Biztonsági Sorozat, II. Rész – „Nemzetközi alapvető biztonsági szabványok az ionizáló sugárzással szembeni védelemre és a sugárforrások biztonságára”); vagy
- c) ha okkal feltételezhető, hogy a küldeménydarab valamelyik biztonsági funkciójának (megtartás, árnyékolás, hővédelem vagy kritikusság) jelentős csökkenése következett be, ami a küldeménydarabot alkalmatlanná teszi a további szállításra kiegészítő biztonsági intézkedések nélkül.

Megjegyzés: Azon küldeményekre, amelyek nem szolgáltatathatók ki, lásd a 7.5.11 szakasz CV33 előírás 6) bekezdését.

Az „anyagi kár” vagy a „környezet károsodása” a veszélyes áru kiszabadulását jelenti, függetlenül annak mennyiségétől, ha a kár becsült értéke meghaladja az 50 000 eurót. A veszélyes árut tartalmazó szállítóeszközben és a közlekedési infrastruktúrában keletkezett kárt ebből a szempontból figyelmen kívül kell hagyni.

A „hatósági beavatkozás” a hatóságok vagy kárelhárító szolgálatok közvetlen beavatkozása a veszélyes áruval kapcsolatos eseménybe, és személyek legalább három órára történő evakuálása vagy közforgalmú közlekedési útvonalak (utak, vasútvonalak) legalább három órára történő lezárása a veszélyes áru által okozott veszélyhelyzet miatt.

Szükség esetén az illetékes hatóság további, érdemi információt kérhet.

1.8.5.4

A veszélyes áruk szállítása során bekövetkezett eseményekről készítendő jelentés mintája

**A veszélyes áruk szállítása során bekövetkezett eseményekről készítendő jelentés a
RID/ADR 1.8.5 szakasza szerint**

- 1.8.6** **Az 1.8.7 szakaszban leírt megfelelésértékelés, időszakos, közbenső és soron kívüli vizsgálatok hatósági felügyelete**
- 1.8.6.1** ***A vizsgáló szervezet jóváhagyása***
- Az illetékes hatóság az 1.8.7 szakaszban meghatározott megfelelésértékelés, időszakos, közbenső és soron kívüli vizsgálat, valamint az üzemi vizsgálóhely felügyelete céljából vizsgáló szervezeteket hagyhat jóvá.
- 1.8.6.2** ***Az illetékes hatóság, a megbízottja és a vizsgáló szervezet hivatali kötelessége***
- 1.8.6.2.1** Az illetékes hatóságnak, a megbízottjának, ill. a vizsgáló szervezetnek a feladattal arányban álló módon, szükségtelen igénybevétel nélkül kell a megfelelésértékelést, az időszakos, a közbenső és a soron kívüli vizsgálatot elvégeznie. Az illetékes hatóságnak, a megbízottjának, ill. a vizsgáló szervezetnek figyelembe kell vennie az érintett vállalkozás méretét, szakterületét és szerkezetét, valamint a technológia viszonylagos bonyolultságát és a gyártás sorozat jellegét.
- 1.8.6.2.2** Az illetékes hatóságnak, a megbízottjának, ill. a vizsgáló szervezetnek azonban olyan szigorúsággal kell eljárnia és azt a biztonsági szintet kell betartania, amelynek a szállítható nyomástartó berendezésnek meg kell felelnie a 4., ill. a 6. Rész előírásai szerint.
- 1.8.6.2.3** Ha az illetékes hatóság, ill. megbízottja vagy a vizsgáló szervezet azt tapasztalja, hogy a 4., ill. a 6. rész követelményeit a gyártó nem tartotta be, sem típusjóváhagyási bizonyítványt, sem megfelelési tanúsítványt nem állíthat ki, valamint köteleznie kell a gyártót, hogy a kijavításhoz szükséges intézkedéseket megtegye.
- 1.8.6.3** ***Tájékoztatási kötelezettség***
- Az ADR Szerződő Feleinek közzé kell tenniük azokat a nemzeti eljárásaikat, amelyeket a vizsgáló szervezetek értékelésére, kijelölésére és felügyeletére alkalmaznak, valamint az ezen információban bekövetkezett változásokat.
- 1.8.6.4** ***Egyes vizsgálati feladatok átruházása***
- Megjegyzés:*** Az 1.8.6.4 bekezdés nem vonatkozik az 1.8.7.6 bekezdés szerinti üzemi vizsgálóhelyekre.
- 1.8.6.4.1** Ha a megfelelésértékeléssel, az időszakos, a közbenső vagy a soron kívüli vizsgálatokkal kapcsolatos egyes feladatok elvégzésére a vizsgáló szervezet más szervezet (pl. alvállalkozó, leányvállalat) szolgáltatásait veszi igénybe, a vizsgáló szervezet akkreditációjának erre a szervezetre is ki kell terjednie, vagy ezt a szervezetet külön akkreditálni kell. A vizsgáló szervezetnek biztosítani kell, hogy ez a szervezet a ráruházott feladatok elvégzéséhez megállapított követelményeknek ugyanolyan szakképzettséggel és ugyanolyan biztonsággal megfelel, mint ahogy az a vizsgáló szervezetre elő van írva (lásd az 1.8.6.8 bekezdést), valamint felügyelni is kell ezt a szervezetet. Ezen intézkedéseiről a vizsgáló szervezetnek értesítenie kell az illetékes hatóságot.
- 1.8.6.4.2** A vizsgáló szervezet teljes felelősséggel tartozik az ilyen szervezet által elvégzett feladatért, bárhol is végezzék a feladatot.
- 1.8.6.4.3** A megfelelésértékelést, időszakos, közbenső vagy soron kívüli vizsgálatot teljes egészében nem ruházhatja át a vizsgáló szervezet. Az értékelést és a bizonyítvány, tanúsítvány kiállítását csak a vizsgáló szervezet maga végezheti.
- 1.8.6.4.4** A feladatok átruházása nem történhet a kérelmező beleegyezése nélkül.
- 1.8.6.4.5** Az előzőekben említett szervezetek minősítésével, ill. az általuk végzett munka értékelésével kapcsolatos dokumentumokat a vizsgáló szervezetnek az illetékes hatóság rendelkezésére kell bocsátania.

1.8.6.5

A vizsgáló szervezetekre háruló tájékoztatási kötelezettség

Minden vizsgáló szervezetnek tájékoztatnia kell a jóváhagyó hatóságát a következőkről:

- a) a típusjóváhagyási bizonyítvánnyal kapcsolatos minden elutasításról, korlátozásról, felfüggesztésről és visszavonásról, kivéve azokat az eseteket, amelyekre az 1.8.7.2.4 pont előírásai vonatkoznak;
- b) minden olyan körülményről, amely az illetékes hatóság által kiadott jóváhagyás érvényességi területét vagy feltételeit befolyásolja;
- c) az elvégzett megfelelőség-értékelési tevékenységre vonatkozó minden információ kérésről, amelyet az 1.8.1 szakasz vagy az 1.8.6.6 bekezdés alapján az ellenőrző, felügyelő illetékes hatóságtól kapott;
- d) a hatóság kérésére a jóváhagyása érvényességi területén végzett megfelelőség-értékelési tevékenységéről, és minden egyéb tevékenységéről, beleértve a feladatok átruházását is.

1.8.6.6

Az illetékes hatóságnak gondoskodnia kell a vizsgáló szervezet felügyeletéről, és ha azt állapítja meg, hogy a jóváhagyott szervezet nem felel meg a jóváhagyásban vagy az 1.8.6.8 bekezdésben foglaltaknak, vagy nem követi az ADR előírásaiban meghatározott eljárásokat, a jóváhagyást vissza kell vonnia vagy korlátoznia kell az érvényességét.

1.8.6.7

Ha egy vizsgáló szervezet jóváhagyását visszavonták vagy az érvényességét korlátozták, vagy a vizsgáló szervezet felhagyott a tevékenységgel, az illetékes hatóságnak meg kell tennie a szükséges lépéseket, hogy az iratokat vagy egy másik vizsgáló szervezet kezelje vagy biztosítani kell, hogy az iratok továbbra is hozzáférhetők legyenek.

1.8.6.8

A vizsgáló szervezetnek:

- a) szervezetbe integrált, alkalmas, hozzáértő, szakképzett és gyakorlott személyzettel kell rendelkeznie, hogy műszaki feladatait megfelelő módon végezhesse;
- b) alkalmas és elegendő berendezésnek és felszerelésnek kell rendelkezésére állnia;
- c) részrehajlás nélkül kell működnie, és minden olyan hatástól mentesnek kell lennie, ami ebben akadályozhatná;
- d) a gyártók és más szervezetek kereskedelmi és tulajdonjogi védelmet élvező tevékenységeit üzleti titokként kell kezelnie;
- e) egyértelműen el kell különítenie a vizsgáló szervezeti funkcióit és az ezzel nem kapcsolatos tevékenységet;
- f) dokumentált minőségbiztosítási rendszerrel kell rendelkeznie;
- g) biztosítania kell, hogy a vonatkozó szabványokban és az ADR-ben szereplő vizsgálatokat elvégezzék; és
- h) az 1.8.7 és az 1.8.8 szakaszban foglaltak szerinti célszerű és megfelelő jegyzőkönyvvezési és okirat nyilvántartási rendszert kell működtetni.

A vizsgáló szervezetet az EN ISO/IEC 17020:2004 szabvány szerint akkreditálni is kell, a 6.2.2.10, a 6.2.3.6 bekezdés és a 6.8.4 szakasz TA4 és TT9 különleges előírásának megfelelően.

Az új tevékenységet kezdő vizsgáló szervezetet ideiglenesen is jóvá lehet hagyni. Az ideiglenes kijelölés előtt az illetékes hatóságnak meg kell győződnie arról, hogy a vizsgáló szervezet megfelel az EN ISO/IEC 17020:2004 szabvány követelményeinek. Annak érdekében, hogy a vizsgáló szervezet tovább folytathassa ezt az új tevékenységet, a tevékenység első évében akkreditálni kell.

1.8.7 A megfelelés-értékelésre és az időszakos vizsgálatokra vonatkozó előírások

Megjegyzés: E szakasz alkalmazásában az „illetékes szervezet” az a szervezet, amelyet az UN nyomástartó tartályok tanúsítására a 6.2.2.10 bekezdés, a nem UN nyomástartó tartályok jóváhagyására a 6.2.3.6 bekezdés, valamint a 6.8.4 szakasz TA4 és TT9 különleges előírása határoz meg.

1.8.7.1 Általános előírások

1.8.7.1.1 Az 1.8.7 szakasz szerinti eljárásokat a nem UN nyomástartó tartályok engedélyezése során a 6.2.3.6 bekezdés, a tartályok, a battériás járművek és a MEG-konténerek jóváhagyása során a 6.8.4 szakasz TA4 és TT9 különleges előírása szerint kell alkalmazni.

Az 1.8.7 szakasz szerinti eljárásokat az UN nyomástartó tartályok tanúsítása során a 6.2.2.10 bekezdés táblázata szerint lehet alkalmazni.

1.8.7.1.2 A kérelmező

- a) az 1.8.7.2 bekezdés szerinti típusjóváhagyás;
- b) az 1.8.7.3 bekezdés szerinti gyártás felügyelet és az 1.8.7.4 bekezdés szerinti üzembe helyezés előtti vizsgálat;
- c) az 1.8.7.5 bekezdés szerinti időszakos, közbenső és soron kívüli vizsgálat

iránti kérelmét a saját választása szerinti, egyetlen illetékes hatósághoz, ill. megbízottjához vagy egyetlen jóváhagyott vizsgáló szervezethez nyújthatja be.

1.8.7.1.3 A kérelemnek a következőket kell tartalmaznia:

- a) a kérelmező nevét és székhelyét;
- b) megfelelés-értékelés esetén, ha a kérelmező nem azonos a gyártóval, akkor a gyártó nevét és székhelyét;
- c) írásos nyilatkozatot arról, hogy másik illetékes hatósághoz, ill. megbízottjához vagy más vizsgáló szervezethez nem nyújtottak be ugyanilyen kérelmet;
- d) az 1.8.7.7 bekezdésben leírt műszaki dokumentációt;
- e) nyilatkozatot arról, hogy az illetékes hatóságnak, ill. megbízottjának vagy a vizsgáló szervezetnek vizsgálati célból szabad belépést biztosít a gyártó-, vizsgáló- és tárolóhelyekre és rendelkezésére bocsát minden szükséges információt.

1.8.7.1.4 Ha a kérelmező az illetékes hatóság, ill. az általa megbízott vizsgáló szervezet részére meggyőzően bizonyítani tudja, hogy megfelel az 1.8.7.6 bekezdésben foglaltaknak, akkor üzemi vizsgálóhelyet létesíthet azokra a vizsgálatokra (vagy azok egy részére), amelyekre a 6.2.2.10, ill. a 6.2.3.6 bekezdés megengedi.

1.8.7.1.5 A gyártónak, ill. a típusjóváhagyás kérelmezőjének, ha az nem azonos a gyártóval, valamint a bizonyítványt, ill. tanúsítványt kiállító vizsgáló szervezetnek az adott típusú termékek utolsó gyártási időpontjától számított legalább 20 évig meg kell őriznie a típusjóváhagyási bizonyítványokat és a megfelelési tanúsítványokat, beleértve a műszaki dokumentációt is.

1.8.7.1.6 Ha a gyártó vagy a tulajdonos fel kíván hagyni a tevékenységével, a dokumentációt el kell küldenie az illetékes hatóságnak. A dokumentációt az 1.8.7.1.5 bekezdésben említett időtartam fennmaradó része alatt az illetékes hatóságnak kell megőriznie.

1.8.7.2 Típusjóváhagyás

A típusjóváhagyás a nyomástartó tartályoknak, tartályoknak, battériás járműveknek, ill. MEG-konténereknek a jóváhagyás érvényességi időtartamán belüli gyártására jogosít.

1.8.7.2.1

A kérelmezőnek

- a) nyomástartó tartályok esetén: a gyártani tervezett nyomástartó tartály mintadarabját az illetékes szervezet rendelkezésére kell bocsátania. Az illetékes szervezet további mintadarabokat is kérhet, ha a vizsgálati program úgy kívánja;
- b) tartályok, battériás járművek és MEG-konténerek esetén: a prototípust hozzáférhetővé kell tennie a típusvizsgálat elvégzése céljából.

1.8.7.2.2

Az illetékes szervezetnek

- a) meg kell vizsgálnia az 1.8.7.7.1 pont szerinti műszaki dokumentációt, hogy ellenőrizze, hogy a típus megfelel a vonatkozó ADR előírásoknak, a prototípust vagy prototípus sorozatot a műszaki dokumentáció szerint gyártották és reprezentálja a típust;
- b) el kell végeznie a vizsgálatokat, ill. az ADR-ben előírt próbák elvégzésénél jelen kell lennie, annak megállapítására, hogy az előírásokat alkalmazták és betartották, valamint a gyártó által alkalmazott eljárások megfelelnek a követelményeknek;
- c) felül kell vizsgálnia az (alap)anyag gyártó(k) által kiadott bizonylatokat az ADR vonatkozó előírásai alapján;
- d) jóvá kell hagynia a szerkezeti elemek állandó kötéseinek kialakítására szolgáló eljárásokat, ill. ellenőriznie kell, hogy már jóváhagyták-e, valamint azt, hogy a szerkezeti elemek állandó kötését és a roncsolásmentes vizsgálatokat arra jogosult (képzett, ill. minősített) alkalmazottak végzik-e;
- e) meg kell állapodnia a kérelmezővel abban, hogy hol és milyen vizsgáló berendezésekkel hajtják végre a vizsgálatokat és a szükséges próbákat.

Az illetékes szervezetnek a kérelmező számára típusvizsgálati jegyzőkönyvet kell kiállítania.

1.8.7.2.3

Az illetékes hatóságnak, ill. megbízottjának vagy a vizsgáló szervezetnek típusjóváadási bizonyítványt kell kiállítania a kérelmező részére, ha a típus megfelel az összes vonatkozó előírásnak.

A bizonyítványban fel kell tüntetni:

- a) a kiállító nevét és székhelyét;
- b) a gyártó és a kérelmező – ha az nem azonos gyártóval – nevét és székhelyét;
- c) arra való utalást, hogy a típusvizsgálat során az ADR melyik változatát és mely szabványokat alkalmazták;
- d) a vizsgálatokból származó követelményeket;
- e) a megfelelő szabványokban meghatározott, a típus, ill. a típusváltozat azonosításához szükséges adatokat;
- f) a típusvizsgálati jegyzőkönyv(ek)re való hivatkozást; és
- g) a típusjóváadás érvényességének leghosszabb időtartamát.

A bizonyítványhoz mellékelni kell a műszaki dokumentáció vonatkozó részeinek felsorolását (lásd az 1.8.7.7.1 pontot).

1.8.7.2.4

A típusjóváadás legfeljebb tíz évig lehet érvényes. Ha ezen időtartam alatt az ADR vonatkozó műszaki követelményei (beleértve a hivatkozott szabványokat is) úgy változnak meg, hogy a jóváhagyott típus már nem felel meg a követelményeknek, a típusjóváadást kiadó illetékes szervezetnek vissza kell azt vonnia és erről értesítenie kell a típusjóváadás tulajdonosát.

Megjegyzés: A meglévő típusjóváadások legkésőbbi visszavonási időpontjára lásd a 6.2.4 szakaszt, a 6.8.2.6, ill. 6.8.3.6 bekezdésben lévő táblázatok (5) oszlopát.

Ha egy típusjóváadás lejárt vagy visszavonták, akkor e típusjóváadás alapján nyomástartó tartály, tartány, battériás jármű, ill. MEG-konténer tovább nem gyártható.

Ilyen esetekben, ha a típusjóváahagyás lejárt, ill. visszavonása előtt gyártott nyomástartó tartályok, tartányok, battériás-járművek, ill. MEG-konténerek a típusjóváahagyás lejárt, ill. visszavonása után még tovább használhatók, akkor a használatukra, időszakos és közbenső vizsgálatukra a lejárt, ill. visszavont típusjóváahagyás vonatkozó előírásait kell alkalmazni.

Addig használhatók tovább, amíg megfelelnek az ADR követelményeinek. Ha már nem felelnek meg az ADR követelményeinek, csak abban az esetben használhatók tovább, ha azt az 1.6 fejezet vonatkozó átmeneti előírása megengedi.

A típusjóváahagyás megújítható, miután a megújítás idején érvényes ADR előírásoknak való megfelelés-értékelése és teljes felülvizsgálata megtörtént. Visszavont típusjóváahagyás már nem újítható meg. Meglévő típusjóváahagyás időközi kisebb módosítása (pl. nyomástartó tartálynál kiegészítés eltérő méretű vagy űrtartalmú termékre úgy, hogy az nem befolyásolja a megfelelést, vagy tartányra lásd a 6.8.3.2.3 pontot) nem hosszabbítja meg és nem módosítja a bizonyítvány eredeti érvényességét.

Megjegyzés: *A felülvizsgálatot és a megfelelés-értékelést az eredeti típusjóváahagyást kiadó szervezettől eltérő szervezet is végezheti.*

A típusjóváahagyást kiadó szervezetnek a típusjóváahagyáshoz szükséges összes dokumentumot (lásd az 1.8.7.7.1 pontot) meg kell őriznie az érvényessége teljes időtartama alatt, beleértve az esetleges megújítást is.

1.8.7.2.5

Az érvényes, lejárt vagy visszavont jóváahagyással rendelkező nyomástartó tartály, tartány, battériás jármű, ill. MEG-konténer átalakítása esetén a vizsgálatok és a jóváahagyás a nyomástartó tartály, tartány, battériás jármű, ill. MEG-konténer azon elemeire korlátozódik, amelyet átalakítottak. Az átalakításnak az átalakítás időpontjában érvényes ADR előírásainak kell megfelelnie. A nyomástartó tartály, tartány, battériás jármű, ill. MEG-konténer átalakítás által nem érintett minden elemére az első típusjóváahagyási dokumentáció továbbra is érvényes.

Az átalakítás érinthet egy vagy több nyomástartó tartályt, tartányt, battériás járművet, ill. MEG-konténert is, amelyre a típusjóváahagyás vonatkozik.

Az átalakítást jóváahagyó bizonyítványt valamely ADR Szerződő Fél illetékes hatóságának vagy az általa kijelölt szervezetnek kell kiállítania a kérelmező számára. Tartányok, battériás járművek, ill. a MEG-konténerek esetén egy másolatot a tartány-vizsgálati könyvhöz (gépkönyvhöz) kell csatolni.

Az átalakításra vonatkozó jóváahagyási bizonyítvány iránti minden kérelmet egyetlen illetékes hatósághoz vagy az általa kijelölt szervezethez kell benyújtani.

1.8.7.3

A gyártás felügyelete

1.8.7.3.1

Annak biztosítására, hogy a terméket a típusjóváahagyás előírásai szerint gyártják, az illetékes szervezetnek felügyelnie kell a gyártási folyamatot.

1.8.7.3.2

A kérelmezőnek minden szükséges intézkedést meg kell tennie annak biztosítására, hogy a gyártási folyamat megfelel a vonatkozó ADR előírásoknak, valamint a típusjóváahagyási bizonyítvány, ill. mellékletei előírásainak.

1.8.7.3.3

Az illetékes szervezetnek:

- a) ellenőriznie kell az 1.8.7.7.2 pontban leírt műszaki dokumentációnak való megfelelést;
- b) ellenőriznie kell, hogy a gyártási folyamatban olyan termékek készülnek, amelyek a rájuk vonatkozó követelményeknek és dokumentációnak megfelelnek;
- c) ellenőriznie kell az anyagok nyomonkövethetőségét, valamint a specifikációk alapján az (alap)anyag bizonylatokat;
- d) ellenőriznie kell, hogy a szerkezeti elemek állandó kötését és a roncsolásmentes vizsgálatokat arra jogosult (képzett, ill. minősített) alkalmazottak végzik-e;

- e) meg kell állapodnia a kérelmezővel a helyszínben, ahol a vizsgálatokat és a szükséges próbákat elvégzik; és
- f) az ellenőrzés eredményét jegyzőkönyvbe kell foglalnia.

1.8.7.4 *Az üzembe helyezés előtti vizsgálat*

1.8.7.4.1 A kérelmezőnek

- a) az ADR-ben előírt jelölést fel kell vinnie; és
- b) az illetékes szervezet rendelkezésére kell bocsátania az 1.8.7.7 bekezdésben leírt műszaki dokumentációt.

1.8.7.4.2 Az illetékes szervezetnek:

- a) el kell végeznie a szükséges vizsgálatokat és méréseket, annak ellenőrzésére, hogy a terméket a típusjóváhagyásnak és a vonatkozó előírásoknak megfelelően gyártották;
- b) az üzemi szerelvények gyártói által rendelkezésre bocsátott tanúsítványok alapján ellenőriznie kell az üzemi szerelvényeket;
- c) az elvégzett vizsgálatokra, ellenőrzésekre, valamint az átvizsgált műszaki dokumentációra vonatkozóan az üzembe helyezés előtti vizsgálatról jegyzőkönyvet kell kiállítania a kérelmező számára;
- d) ha a gyártás megfelel az előírásoknak, akkor a gyártás megfelelőségére vonatkozó írásbeli tanúsítványt kell kiállítania, és el kell látnia az illetékes szervezet jelével; és
- e) ellenőriznie kell, hogy a típusjóváhagyás az ADR típusjóváhagyásra vonatkozó előírásainak (beleértve a hivatkozott szabványokat is) megváltozása után továbbra is érvényes-e.

A d) pont szerinti tanúsítvány és a c) pont szerinti jegyzőkönyv több, azonos típusú tételre is vonatkozhat (csoportos tanúsítvány vagy csoportos jegyzőkönyv).

1.8.7.4.3 A bizonyítványban legalább a következőket kell feltüntetni:

- a) az illetékes szervezet nevét és székhelyét;
- b) a gyártó nevét és székhelyét, és ha nem a gyártó a kérelmező, akkor a kérelmező nevét és székhelyét is;
- c) arra való utalást, hogy az üzembe helyezés előtti vizsgálat során az ADR melyik változatát és mely szabványokat alkalmaztak;
- d) a vizsgálatok eredményét;
- e) a vizsgált termék(ek) azonosításához szükséges adatokat, de legalább a sorozatszámot, ill. nem újrátölthető palackoknál a gyártási tétel számát, és
- f) a típusjóváhagyás számát.

1.8.7.5 *Időszakos, közbenső és soronkívüli vizsgálatok*

1.8.7.5.1 Az illetékes szervezetnek:

- a) el kell végeznie az azonosítást és ellenőriznie kell a dokumentációnak való megfelelőséget;
- b) végre kell hajtania a vizsgálatokat és jelen kell lennie a próbáknál, hogy ellenőrizze, hogy a követelményeket betartották;
- c) a vizsgálatokról és a próbákról jegyzőkönyvet kell kiállítania, a jegyzőkönyv több tételre is vonatkozhat; és
- d) biztosítani kell, hogy az előírt jelölést felvigyék.

1.8.7.5.2 A nyomástartó tartályok időszakos vizsgálati jegyzőkönyvét a kérelmezőnek legalább a

következő időszakos vizsgálat időpontjáig meg kell őriznie.

Megjegyzés: *Tartányokra lásd a 4.3.2.1.7 pont tartány-vizsgálati könyvre (gépkönyvre) vonatkozó előírásait.*

1.8.7.6 A kérelmező üzemi vizsgálóhelyének felügyelete

1.8.7.6.1 A kérelmezőnek

- a) az üzemi vizsgálóhelyet az 1.8.7.7.5 pont szerint dokumentált, a vizsgálatokra vonatkozó minőségbiztosítási rendszer szerint kell kialakítani és felügyelni;
- b) teljesítenie kell a jóváhagyott minőségbiztosítási rendszerből eredő kötelezettségeit, és biztosítani kell, hogy a minőségbiztosítási rendszer megfelelő és hatékony maradjon;
- c) az üzemi vizsgálatra képzett és hozzáértő személyzetet kell kijelölnie;
- d) ahol szükséges, el kell helyezni a vizsgáló szervezet jelét.

1.8.7.6.2 A vizsgáló szervezetnek kezdeti auditálást kell végeznie, és ha ez kielégítő, legfeljebb három évig tartó időszakra szóló engedélyt kell kiadnia. Ennek során a következő előírásokat kell betartani:

- a) az audittal igazolni kell, hogy a termék vizsgálata az ADR követelményei szerint történik;
- b) a vizsgáló szervezet felhatalmazhatja a kérelmező üzemi vizsgálóhelyét, hogy a vizsgáló szervezet jelét elhelyezze minden ellenőrzött termékre;
- c) az engedély a lejárt előtti utolsó évben végzett, kielégítő eredménnyel járó audit után megújítható. Az új érvényességi időszak az előző engedély lejárataától számít;
- d) a vizsgáló szervezet auditorainak kellő szakértelemmel kell rendelkezniük ahhoz, hogy elvégezzék azon termékek megfelelőség-értékelését, amelyre a minőségbiztosítási rendszer kiterjed.

1.8.7.6.3 Az engedély érvényességi ideje alatt a vizsgáló szervezetnek időszakos felülvizsgálatokat kell tartania, hogy megbizonyosodjék, hogy a kérelmező továbbra is fenntartja és alkalmazza a minőségbiztosítási rendszert. Ennek során a következő előírásokat kell betartani:

- a) egy 12 hónapos időszakon belül legalább két felülvizsgálatot kell tartani;
- b) a vizsgáló szervezet további szemléket, képzést, műszaki változtatásokat, vagy a minőségbiztosítási rendszer módosítását írhatja elő, ill. a kérelmező által végezhető vizsgálatok körét korlátozhatja vagy megtilthatja.
- c) a vizsgáló szervezetnek a minőségbiztosítási rendszerben bekövetkezett minden változást értékelnie kell, és meg kell vizsgálnia, hogy a megváltozott minőségbiztosítási rendszer megfelel-e a kezdeti audit követelményeinek vagy teljes újraértékelés szükséges;
- d) a vizsgáló szervezet auditorainak kellő szakértelemmel kell rendelkezniük ahhoz, hogy elvégezzék azon termékek megfelelőség-értékelését, amelyre a minőségbiztosítási rendszer kiterjed; és
- e) a vizsgáló szervezetnek a szemléről, ill. felülvizsgálatról, és ha próbákat végeztek, azok eredményéről jegyzőkönyvet kell készítenie a kérelmező számára.

1.8.7.6.4 A vizsgáló szervezetnek gondoskodnia kell arról, hogy amennyiben a vonatkozó követelményeknek nem felelnek meg, a kijavításhoz szükséges intézkedések megtörténjenek. Ha a kijavításhoz szükséges intézkedések mégsem történnek meg kellő időben, az üzemi vizsgálóhely tevékenységére vonatkozó engedélyt a vizsgáló szervezet visszavonhatja vagy felfüggesztheti. A visszavonásról, ill. felfüggesztésről értesíteni kell az illetékes hatóságot. A vizsgáló szervezet döntésének részletes indokait a kérelmező számára jegyzőkönyvbe kell foglalni.

1.8.7.7 Dokumentáció

A műszaki dokumentációnak alkalmasnak kell lennie arra, hogy belőle a vonatkozó követelményeknek való megfelelés megállapítható legyen.

1.8.7.7.1 A típusjóváhagyáshoz szükséges dokumentumok

A kérelmezőnek – értelemszerűen – a következő dokumentumokat kell rendelkezésre bocsátania:

- a) a tervezésnél és a gyártásnál alkalmazott szabványok jegyzékét;
- b) a típus és a típusvariánsok leírását ;
- c) a 3.2 fejezet „A” táblázat vonatkozó oszlopában található utasításokat vagy a csak bizonyos anyagok szállítására szolgáló termékeknél az anyagok felsorolását;
- d) az általános összeállítási rajzo(ka)t;
- e) a megfelelés-értékeléséhez szükséges részletrajzokat, amelyeken fel vannak tüntetve a számításokhoz használt méretek, a szerkezeti és az üzemi szerelvények, a jelölések és/vagy bárcák;
- f) a számításokat, az eredményeket és következtetéseket;
- g) az üzemi szerelvények jegyzékét a műszaki adataikkal, a biztonsági szerkezetekre vonatkozó információt a lefűvási teljesítmény számításával;
- h) a szabványok által a szerkezeti elemek, azok részei, a bevonatok, burkolatok, a szerkezeti és az üzemi szerelvények gyártásához előírt anyagok jegyzékét, a megfelelő anyagspecifikációkat vagy az ADR-nek való megfelelést igazoló nyilatkozatot;
- i) az állandó kötések kialakítására szolgáló jóváhagyott eljárásokat;
- j) a hőkezelési eljárás(ok) leírását; és
- k) a típusjóváhagyásra és a gyártásra a szabványokban, ill. az ADR-ben felsorolt minden vonatkozó vizsgálat végrehajtásának módját, leírását és jegyzőkönyveit.

1.8.7.7.2 A gyártás felügyeletéhez szükséges dokumentumok

A kérelmezőnek – értelemszerűen – a következő dokumentumokat kell rendelkezésre bocsátania:

- a) az 1.8.7.7.1 pontban felsorolt dokumentumokat;
- b) a típusjóváhagyási bizonyítvány másolatát;
- c) a gyártási és a vizsgálati eljárások dokumentációját;
- d) a gyártási naplót;
- e) állandó kötések kivitelező alkalmazottak jogosultságát;
- f) a roncsolásmentes vizsgálatokat végző alkalmazottak jogosultságát;
- g) a roncsolásos és a roncsolásmentes vizsgálatok jegyzőkönyveit;
- h) a hőkezelési eljárás(ok) jegyzőkönyveit; és
- i) a hitelesítési jegyzőkönyveket.

1.8.7.7.3 Az üzembe helyezés előtti vizsgálatokhoz szükséges dokumentumok

A kérelmezőnek – értelemszerűen – a következők dokumentumokat kell rendelkezésre bocsátania:

- a) az 1.8.7.7.1 és az 1.8.7.7.2 pontban felsorolt dokumentumokat;
- b) a termék és alkatrészeinek anyagbizonylatait;
- c) az üzemi szerelvények anyagbizonylatait és a megfelelési nyilatkozatokat;

- d) megfelelőségi nyilatkozatot, beleértve a termék és a típusbizonyítványban szereplő típusvariánsok leírását.

1.8.7.7.4 *Az időszakos, a közbenő és a soron kívüli vizsgálatokhoz szükséges dokumentumok*

A kérelmezőnek – értelemszerűen – a következők dokumentumokat kell rendelkezésre bocsátania:

- a) nyomástartó tartályoknál, ha a gyártásra és az időszakos vizsgálatokra vonatkozó szabványok előírják, a különleges követelményekre vonatkozó dokumentációt;
- b) tartályoknál:
 - i) tartály-vizsgálati könyvet (gépkönyvet); és
 - ii) az 1.8.7.7.1 – 1.8.7.7.3 pontban említett, egy vagy több dokumentumot.

1.8.7.7.5 *Az üzemi vizsgálóhely értékeléséhez szükséges dokumentumok*

Az üzemi vizsgálóhely kérelmezőjének – értelemszerűen – a minőségbiztosítási rendszer következő dokumentumait kell rendelkezésre bocsátania:

- a) a szervezeti felépítést és a felelőségek megoszlását;
- b) a vizsgálatokra, a minőségellenőrzésre, a minőségbiztosításra és a munkafolyamatokra vonatkozó, megfelelő utasításokat, és a rendszeresen végzendő tevékenységeket;
- c) a minőségügyi nyilvántartást, pl. a vizsgálati jegyzőkönyveket, a vizsgálati eredményeket és hitelesítési adatokat, ill. tanúsítványokat;
- d) a vezetői felülvizsgálatokat az 1.8.7.6 bekezdés szerinti auditálás alapján a minőségbiztosítási rendszer hatékony működésének biztosításához;
- e) a vevők igényeinek kielégítését és a jogszabályok követelményeinek betartását szolgáló eljárások leírását;
- f) a dokumentáció ellenőrzési és karbantartási eljárását;
- g) nem megfelelő termékekkel kapcsolatos eljárást;
- h) az érintett személyekre vonatkozó képzési programot és minősítési eljárást.

1.8.7.8 *A szabvány szerint gyártott, jóváhagyott és vizsgált termékek*

Az 1.8.7.7 bekezdés követelményei a következő szabványok alkalmazása esetén teljesítettnek tekinthetők.

A vonatkozó bekezdés, ill. pont	Hivatkozás	A dokumentum címe
1.8.7.7.1 – 1.8.7.7.4	EN 12972:2007	Veszélyes anyagok szállítótartályai. A fém szállítótartályok vizsgálata, ellenőrzése és megjelölése

1.8.8 **Eljárás a gázpatronok megfelelőségének értékeléséhez**

A gázpatronok megfelelőség-értékelése során a következő eljárások egyikét kell alkalmazni:

- a) az 1.8.7 szakaszban leírt eljárást – az 1.8.7.5 bekezdés kivételével – a nem UN nyomástartó tartályokra; vagy
- b) az 1.8.8.1 – 1.8.8.7 bekezdésben leírt eljárást.

1.8.8.1 *Általános előírások*

1.8.8.1.1 A gyártást valamely Xa szervezetnek kell felügyelni és a 6.2.6 szakasz szerinti vizsgálatokat szükség szerint vagy Xa szervezetnek vagy ezen Xa szervezet által jóváhagyott IS szerve-

zetnek kell végrehajtania; az Xa és IS szervezet meghatározása a 6.2.3.6.1 pontban található. A megfelelőség-értékelést valamely ADR Szerződő Fél illetékes hatóságának, a megbízottjának vagy az általa jóváhagyott vizsgáló szervezetnek kell végrehajtania.

1.8.8.1.2 Az 1.8.8 szakasz alkalmazása esetén kérelmezőnek igazolnia, biztosítania kell, valamint nyilatkoznia kell arról, hogy a gázpatronok 6.2.6 szakasz rendelkezéseinek és az ADR minden további vonatkozó előírásának való megfelelőségéért kizárólagos felelősséggel tartozik.

1.8.8.1.3 A kérelmezőnek

- a) el kell végeznie az 1.8.8.2 bekezdés szerinti típusvizsgálatokat minden egyes gázpatron típusra (beleértve a felhasználandó anyagokat és az adott típus változatait, pl. térfogat, nyomás, tervrajz, záró- és adagolószerkezet);
- b) a tervezésre, gyártásra, ellenőrzésre és vizsgálatra az 1.8.8.3 bekezdés szerint jóváhagyott minőségbiztosítási rendszert kell működtetnie;
- c) a 6.2.6 szakaszban előírt vizsgálatokhoz az 1.8.8.4 bekezdés szerint jóváhagyott vizsgálati rendszert kell fenntartania;
- d) kérelmet kell benyújtania a Szerződő Fél valamely, választása szerinti Xa szervezetéhez a gyártás felügyeletére és a vizsgálatokra vonatkozó minőségbiztosítási rendszere jóváhagyására; ha a kérelmező székhelye nem valamely Szerződő Fél területén van, akkor egy Szerződő Fél területére irányuló szállítás előtt valamely Szerződő Fél Xa szervezetéhez kell a kérelmet benyújtania;
- e) ha a gázpatron végső összeszerelése a kérelmező által gyártott alkatrészekből egy vagy több más vállalkozó által történik, akkor írásos útmutatást kell adnia arra, hogyan kell a gázpatronokat összeszerelni és megtölteni, hogy megfeleljenek a típusvizsgálati bizonyítvány előírásainak.

1.8.8.1.4 Ha a kérelmező és a gázpatront a kérelmező útmutatása szerint összeszerelő és/vagy töltő vállalkozások az Xa szervezet számára elfogadható módon bizonyítani tudják, hogy megfelelnek az 1.8.7.6 bekezdésnek – kivéve az 1.8.7.6.1 d) és az 1.8.7.6.2 b) pontot –, akkor kialakíthatnak üzemi vizsgálóhelyet, amely a 6.2.6 szakaszban meghatározott vizsgálatokat vagy azok egy részét elvégezheti.

1.8.8.2 *Gyártási típusvizsgálat*

1.8.8.2.1 Kérelmezőnek minden egyes gázpatron típusra műszaki dokumentációt kell összeállítania, feltüntetve az alkalmazott műszaki szabvány(oka)t is. Ha olyan szabvány alkalmazását választotta, amelyre nincs hivatkozás a 6.2.6 szakaszban, az alkalmazott szabványt csatolnia kell a dokumentációhoz.

1.8.8.2.2 Kérelmezőnek őriznie kell a műszaki dokumentációt és az adott típus mintadarabjait a gyártás során és azután az adott típusvizsgálati tanúsítvány szerinti gyártás befejezésétől számított legalább öt évig, hogy az Xa szervezet rendelkezésére tudja bocsátani.

1.8.8.2.3 Kérelmezőnek gondos vizsgálat után típusvizsgálati bizonyítványt kell kiállítania, amely legfeljebb tíz évig érvényes; ezt az igazolást csatolnia kell a dokumentációhoz. A tanúsítvány felhatalmazza a kérelmezőt az adott típusú gázpatronok gyártására ezen időszak alatt.

1.8.8.2.4 Ha ezen időtartam alatt az ADR vonatkozó műszaki követelményei (beleértve a hivatkozott szabványokat is) úgy változnak meg, hogy a gyártási típus már nem felel meg a követelményeknek, a kérelmezőnek a típusvizsgálati bizonyítványát vissza kell vonnia és erről tájékoztatnia kell az Xa szervezetet.

1.8.8.2.5 Kérelmező a bizonyítvány gondos és teljes felülvizsgálata után legfeljebb újabb 10 évre újra kiadhatja azt.

1.8.8.3 *A gyártás felügyelete*

1.8.8.3.1 A típusvizsgálati eljárás és a gyártási folyamat Xa szervezet általi felügyeletet igényel annak biztosítására, hogy a kérelmező által jóváhagyott típus és az előállított termék megfelel a típusbizonyítvány előírásainak és az ADR vonatkozó előírásainak. Ha az 1.8.8.1.3 e) pontot alkalmazzák, az összeszerelő és töltő vállalkozást be kell vonni ebbe az eljárásba.

1.8.8.3.2 Kérelmezőnek meg kell tennie a szükséges intézkedéseket annak biztosítására, hogy a gyártási folyamat megfelel az ADR vonatkozó előírásainak, a típusbizonyítványának és mellékleteinek. Ha az 1.8.8.1.3 e) pontot alkalmazzák, az összeszerelő és töltő vállalkozást be kell vonni ebbe az eljárásba.

1.8.8.3.3 Az Xa szervezetnek

- a) ellenőriznie kell a kérelmező típusvizsgálatának megfelelőségét, valamint a gázpatronok típusának az 1.8.8.2 pontban meghatározott műszaki dokumentációnak való megfelelőségét;
- b) ellenőriznie kell, hogy a gyártási folyamat végtermékei megfelelnek a rájuk vonatkozó követelményeknek és dokumentációnak; ha a gázpatront a kérelmező által gyártott alkatrészekből egy vagy több más vállalkozó szereli össze, az Xa szervezetnek ellenőriznie kell azt is, hogy a gázpatronok végső összeszerelés és töltés után teljes összhangban vannak minden vonatkozó előírással és a kérelmező útmutatóját helyesen alkalmazzák;
- c) ellenőriznie kell, hogy az egyes részek állandó kötését és a vizsgálatokat arra jogosult (képzett, ill. minősített) alkalmazottak végzik-e;
- d) az ellenőrzés eredményeit jegyzőkönyvbe kell foglalnia.

1.8.8.3.4 Ha az Xa szervezet azt tapasztalja, hogy a kérelmező típusbizonyítványa vagy a gyártási eljárás nem megfelelő, gondoskodnia kell arról, hogy a kijavításhoz szükséges intézkedések megtörténjenek vagy a kérelmező vonja vissza a bizonyítványt.

1.8.8.4 *Tömörégi próba*

1.8.8.4.1 A kérelmezőnek és a kérelmező útmutatása alapján a gázpatronok végső összeszerelését és töltését végző vállalkozásoknak

- a) el kell végezniük a 6.2.6 szakasz szerinti próbákat;
- b) a próbák eredményit rögzíteniük kell;
- c) kizárólag azokra a gázpatronokra, amelyek teljes mértékben megfelelnek a típusvizsgálati előírásoknak és az ADR vonatkozó előírásainak és sikeresen kiállták a 6.2.6 szakaszban előírt próbákat, ki kell állítaniuk a megfelelőségi tanúsítványt;
- d) az Xa szervezet általi véletlenszerű ellenőrzés céljából meg kell őrizniük az 1.8.8.7 bekezdés szerinti dokumentációt a gyártás során és a jóváhagyott típushoz tartozó gázpatronok utolsó gyártását követően legalább öt évig;
- e) el kell helyezniük a gázpatron típusát, a kérelmezőt és a gyártás időpontját vagy a sorozatszámot azonosító tartós és olvasható jelölést; ha a korlátozottan rendelkezésre álló hely miatt a jelölés nem helyezhető el teljes egészében a gázpatron palástján, akkor ezeket az információkat a gázpatronhoz erősített vagy a gázpatronnal együtt egy belső csomagolásba helyezett tartós címkén kell feltüntetni.

1.8.8.4.2 Az Xa szervezetnek

- a) a szükséges vizsgálatokat véletlenszerű időközönként, de valamely gázpatron típus gyártásának megkezdése után rövid időn belül és azután három évenként legalább egyszer el kell végeznie annak ellenőrzésére, hogy a kérelmező gyártási típusvizsgálatához alkalmazott eljárása valamint a gyártás és a termék vizsgálata a gyártási típus bizonyítvány és a vonatkozó előírások szerint történik;

- b) ellenőriznie kell a kérelmező által kiadott bizonyítványokat;
- c) el kell végeznie a 6.2.6 szakaszban előírt vizsgálatokat vagy jóvá kell hagynia a vizsgálati programot és az e vizsgálatokat végző üzemi vizsgálóhelyet.

1.8.8.4.3 A bizonyítványnak legalább a következőket kell tartalmaznia:

- a) a kérelmező és – ha a végső összeszerelő nem azonos a kérelmezővel – a kérelmező írásos utasításai szerint a végső összeszerelést végző vállalkozás(ok) nevét és székhelyét;
- b) arra való utalást, hogy a gyártás és a vizsgálat során az ADR melyik változatát és mely szabványokat alkalmaztak;
- c) a vizsgálatok eredményeit;
- d) az 1.8.8.4.1. c) pont szerinti jelölés adatait.

1.8.8.5 (fenntartva)

1.8.8.6 *Az üzemi vizsgálóhely felügyelete*

Ha a kérelmező vagy a gázpatronokat összeszerelő és/vagy töltő vállalkozás üzemi vizsgálóhellyel rendelkezik, az 1.8.7.6 bekezdés előírásait – az 1.8.7.6.1 d) és az 1.8.7.6.2 b) pont kivételével – kell alkalmazni. A gázpatronok összeszerelését és/vagy töltését végző vállalkozásnak a kérelmezőre vonatkozó előírásoknak kell megfelelnie.

1.8.8.7 *Dokumentáció*

Az 1.8.7.7.1, az 1.8.7.7.2, az 1.8.7.7.3 és az 1.8.7.7.5 pont előírásait kell alkalmazni.

1.9 FEJEZET

A SZÁLLÍTÁS KORLÁTOZÁSA AZ ILLETÉKES HATÓSÁGOK ÁLTAL

- 1.9.1** Az ADR 4. Cikk 1. pontja szerint a Szerződő Felek a szállítás biztonságán kívüli egyéb okokból szabályozhatják vagy megtilthatják a veszélyes áruk területükre történő belépését. Ezeket a szabályokat vagy tilalmakat megfelelő módon nyilvánosságra kell hozni.
- 1.9.2** Az 1.9.3 szakaszban meghatározottak szerint azokban a kérdésekben, amelyekről az ADR nem rendelkezik, a Szerződő Felek hozhatnak bizonyos kiegészítő előírásokat a területükön veszélyes áruk nemzetközi közúti szállítását végző járművekre, feltéve hogy ezek az előírások nem állnak ellentétben a Megállapodás 2. cikkének 2. pontjával, a belföldi jogrend részét képezik, és egyaránt érvényesek a Szerződő Fél területén veszélyes áruk belföldi közúti szállítását végző járművekre is.
- 1.9.3** Az 1.9.2 szakasz hatálya alá eső kiegészítő előírások a következők:
- a) kiegészítő biztonsági követelmények vagy korlátozások olyan járművekre, amelyek bizonyos építményeket, pl. hidakat, ill. kombinált forgalmi módokat, kompot, vonatot, valamint kikötőt vagy egyéb közlekedési terminált használnak;
 - b) a járművek előírt útvonalon való közlekedésének követelménye annak érdekében, hogy a kereskedelmi vagy lakott területeket, a környezetvédelmi szempontból érzékeny területeket, veszélyes berendezéseket tartalmazó ipari övezeteket, ill. a különleges fizikai veszélyt jelentő utakat elkerüljék;
 - c) a veszélyes árut szállító járművek útvonalának vagy várakozásának kényszerhelyzetben történő korlátozása szélsőséges időjárási viszonyok, földrengés, baleset, sztrájk, állampolgári zavargások vagy háborús cselekmények esetén;
 - d) a veszélyes áruk szállításának forgalmi korlátozása az év vagy a hét bizonyos napjain.
- 1.9.4** Annak a Szerződő Félnek az illetékes hatósága, amely területén az előző 1.9.3 szakasz a) és d) pontja alá eső kiegészítő előírásokat alkalmaz, köteles erről az ENSZ Európai Gazdasági Bizottság Titkárságát értesíteni, amely azután tájékoztatja az összes Szerződő Felet.⁵⁾
- 1.9.5** **Alagút korlátozások**
- Megjegyzés:** A járművek közúti alagútban való közlekedésével kapcsolatos korlátozó előírásokat lásd a 8.6 fejezetben is.*
- 1.9.5.1** ***Általános előírások***
- A veszélyes árut szállító járművek alagútban való közlekedésének korlátozásához az illetékes hatóságnak a közúti alagutakat az 1.9.5.2.2 pontban meghatározott valamely alagút kategóriához kell rendelnie. A hozzárendelésnél figyelembe kell venni az alagút jellemzőit, az alkalmas, másik útvonal vagy szállítási mód lehetőségére is kiterjedő kockázatbecslés eredményét és a forgalomszervezési megfontolásokat. Egy alagút egynél több kategóriához is hozzárendelhető, pl.: napszaktól vagy a hét bizonyos napjaitól, stb. függően.
- 1.9.5.2** ***Kategorizálás***
- 1.9.5.2.1** A kategorizálásnak azon a feltételezésen kell alapulnia, hogy az alagútban három olyan fő veszély létezik, amely számos áldozatot követelő vagy az alagút építményének, szerkezetének súlyos károsodását előidéző balesetet okozhat:
- a) robbanás;

5) A veszélyes áruk közúti szállításában rejlő kockázatok elemzéséhez általános útmutató található az UNECE Titkárságának honlapján (<http://www.unece.org/trans/danger/danger.htm>).

- b) mérgező gázok vagy illékony mérgező folyadékok kiszabadulása;
- c) tűz.

1.9.5.2.2

Az öt alagút kategória a következő:

„A” alagút kategória

Nincs korlátozás a veszélyes áruk szállítására.

„B” alagút kategória

Korlátozás azon veszélyes árukra, melyek hatalmas robbanást okozhatnak.

A következő veszélyes áruk tekinthetők ilyennek⁶⁾:

1 osztály:	A és L összeférhetőségi csoport;
3 osztály:	D osztályozási kód (UN 1204, 2059, 3064, 3343, 3357 és 3379);
4.1 osztály:	D és DT osztályozási kód; és B típusú önreaktív anyagok (UN 3221, 3222, 3231 és 3232);
5.2 osztály:	B típusú szerves peroxidok (UN 3101, 3102, 3111 és 3112).
Ha a szállítóegységben a nettó robbanóanyag összes tömege több mint 1000 kg:	
1 osztály:	1.1, 1.2 és 1.5 alosztály (kivéve az A és L összeférhetőségi csoportot).
Tartányos szállítás esetén:	
2 osztály:	F, TF és TFC csoportok;
4.2 osztály:	I csomagolási csoport;
4.3 osztály:	I csomagolási csoport;
5.1 osztály:	I csomagolási csoport;
6.1 osztály:	UN 1510

„C” alagút kategória

Korlátozás azon veszélyes árukra, melyek hatalmas vagy nagy robbanást okozhatnak vagy nagy mennyiségű mérgezőanyag kiszabadulásával járhatnak.

A következő veszélyes áruk tekinthetők ilyennek⁶⁾:

- a „B” kategóriájú alagútban korlátozott veszélyes áruk, és
- a következő veszélyes áruk:

1 osztály:	1.1, 1.2 és 1.5 alosztály (kivéve az A és L összeférhetőségi csoportot); és 1.3 alosztály (H és J összeférhetőségi csoport);
7 osztály:	UN 2977 és 2978.
Ha a szállítóegységben a nettó robbanóanyag összes tömege több mint 5000 kg:	
1 osztály:	1.3 alosztály (C és G összeférhetőségi csoport).
Tartányos szállítás esetén:	
2 osztály:	2A, 2O, 3A és 3O osztályozási kód, és csak T betűt vagy TC, TO, TOC betűcsoportot tartalmazó osztályozási kód;
3 osztály:	FC, FT1, FT2 és FTC osztályozási kód: I csomagolási csoport;
6.1 osztály:	I csomagolási csoport, kivéve UN 1510;
8 osztály:	CT1, CFT és COT osztályozási kód: I csomagolási csoport.

6) A hozzárendelés az anyagban rejlő veszélyes tulajdonságokon, a csomagolás típusán és a szállított mennyiségen alapul.

„D” alagút kategória

Korlátozás azon veszélyes árukra, melyek hatalmas vagy nagy robbanást okozhatnak, nagy mennyiségű mérgezőanyag kiszabadulásával járhatnak, ill. nagy tüzet okozhatnak.

A következő veszélyes áruk tekinthetők ilyennek⁶⁾:

- a „C” kategóriájú alagútban korlátozott veszélyes áruk, és
- a következő veszélyes áruk:

1 osztály:	1.3 alosztály (C és G összeférhetőségi csoport);
2 osztály:	F, FC, T, TF, TC, TO, TFC és TOC csoportok;
4.1 osztály:	C, D, E és F típusú önreaktív anyagok; és UN 2956, 3241, 3242 és 3251;
5.2 osztály:	C, D, E és F típusú szerves peroxidok;
6.1 osztály:	TF1, TFC és TFW osztályozási kód: I csomagolási csoport; és a belélegezve mérgező anyagok, amelyekre a 3.2 fejezet „A” táblázat 6 oszlopában a 354 különleges előírás van feltüntetve; és az UN 3381 – 3390 tételek alá tartozó, belélegezve mérgező anyagok;
8 osztály:	CT1, CFT és COT osztályozási kód: I csomagolási csoport;
9 osztály:	M9 és M10 osztályozási kód.
Tartányos és ömlesztett szállítás esetén:	
3 osztály:	
4.2 osztály:	II csomagolási csoport;
4.3 osztály:	II csomagolási csoport;
6.1 osztály:	II csomagolási csoport; és TF2 osztályozási kód: III csomagolási csoport;
8 osztály:	CF1, CFT és CW1 osztályozási kód: I csomagolási csoport; és CF1 és CFT osztályozási kód: II csomagolási csoport
9 osztály:	M2 és M3 osztályozási kód.

„E” alagút kategória

Korlátozás minden veszélyes árura (kivéve: UN 2919, 3291, 3331, 3359 és 3373), valamint minden olyan veszélyes árura, amelyet a 3.4 fejezet előírásai szerint szállítanak, amennyiben az összes bruttó tömeg szállítóegységenként 8 tonnánál nagyobb.

Megjegyzés: Az UN 2919 és 3331 tétel alá tartozó veszélyes árukra azonban az illetékes hatóság(ok) által jóváhagyott, az 1.7.4.2 bekezdés szerinti külön megegyezés tartalmazhat alagút korlátozást.

1.9.5.3 A közúti jelzésekre és a korlátozások bejelentésére vonatkozó előírások

1.9.5.3.1 A Szerződő Feleknek jelzőtáblák és jelzések alkalmazásával fel kell tüntetni az alagút tilalmakat és az elkerülő utakat.

1.9.5.3.2 E célból a Bécsi Közúti Jelzési Egyezmény* (Bécs, 1968) valamint az Egyezményt kiegészítő Európai Megállapodás (Genf, 1971) és módosításai szerinti C,3^h és D,10^a, 10^b és 10^c jelzőtáblák, valamint jelzések használhatók, az ENSZ Gazdasági Bizottság Belső Szállítási Bizottság Közúti Közlekedési Munkacsoportjának a közúti jelzésekről szóló Közös Határozatok (R.E.2) értelmezése szerint.

1.9.5.3.3 A jelzőtáblák nemzetközi érthetőségének megkönnyítése érdekében a Bécsi Egyezményben meghatározott jelzésrendszer az egyes jelzőtábla-osztályokra jellemző formákon és színeken,

* Magyarországon lásd a 2004. évi XCI. törvényt.

és ahol csak lehetséges, inkább jelképek mintsem feliratok alkalmazásán alapul. Amikor a Szerződő Felek szükségesnek vélik az előírt jelzőtáblák vagy jelképek módosítását, ezeknek a módosításoknak nem szabad a lényeges jellemzőkön változtatniuk. Ha a Szerződő Felek nem alkalmazzák a Bécsi Egyezményt, az előírt jelzőtáblák és jelképek módosíthatók, feltéve, hogy a módosítások nem változtatják meg azok alapvető célját.

- 1.9.5.3.4** A veszélyes árut szállító járművek közötti alagútban való behajtásának megtiltására szolgáló közötti jelzéseket olyan helyen kell kihelyezni, ahol elkerülő út választása lehetséges.
- 1.9.5.3.5** Ahol az alagútba való behajtás korlátozott vagy elkerülő út van előírva, a jelzőtáblára kiegészítő táblát kell kihelyezni a következők szerint:
- nincs jelzőtábla: nincs korlátozás;
 - jelzőtábla, „B” betűt tartalmazó kiegészítő táblával: azokra a járművekre érvényes, amelyek a „B” kategóriás alagutakban nem engedélyezett veszélyes árut szállítanak;
 - jelzőtábla, „C” betűt tartalmazó kiegészítő táblával: azokra a járművekre érvényes, amelyek a „C” kategóriás alagutakban nem engedélyezett veszélyes árut szállítanak;
 - jelzőtábla, „D” betűt tartalmazó kiegészítő táblával: azokra a járművekre érvényes, amelyek a „D” kategóriás alagutakban nem engedélyezett veszélyes árut szállítanak;
 - jelzőtábla, „E” betűt tartalmazó kiegészítő táblával: azokra a járművekre érvényes, amelyek az „E” kategóriás alagutakban nem engedélyezett veszélyes árut szállítanak.
- 1.9.5.3.6** Az alagút korlátozás azokra a szállítóegységekre vonatkozik, amelyekre az 5.3.2 szakasz szerint narancssárga tábla van előírva, ezen kívül az „E” alagút kategóriánál azokra a szállítóegységekre, valamint az olyan konténereket szállító szállítóegységekre, amelyekre a 3.4.13 szakasz szerint jelölés van előírva.
- Az alagút korlátozást nem kell betartani, ha a veszélyes árut az 1.1.3 szakasz szerint szállítják, kivéve, ha az ilyen árukat szállító járműveket a 3.4.13 szakasz előírásai alapján – figyelembe véve a 3.4.14 szakaszt is – meg kell jelölni⁷⁾.
- 1.9.5.3.7** A korlátozásokat hivatalos úton közzé kell tenni, és a nyilvánosság számára hozzáférhetővé kell tenni. A Szerződő Feleknek értesíteniük kell az UNECE Titkárságát az ilyen korlátozásokról, a Titkárság a kapott információt a honlapján nyilvánosan hozzáférhetővé teszi.
- 1.9.5.3.8** Ha a Szerződő Felek a kockázatok csökkentése céljából az alagutakban közlekedő bizonyos járművekre vagy minden járműre vonatkozóan különleges intézkedéseket alkalmaznak – mint például a behajtás előtti bejelentkezés vagy a konvojban való áthaladás kísérő járművel –, ezeket a különleges intézkedéseket hivatalos úton közzé kell tenni, és a nyilvánosság számára hozzáférhetővé kell tenni.

7) vagy a 2010. december 31-ig érvényes ADR 3.4.10 szakasz előírásai alapján alapján – figyelembe véve a 3.4.11 szakaszt is –, amennyiben az 1.6.1.20 bekezdés átmeneti előírását alkalmazzák.

1.10 FEJEZET

KÖZBIZTONSÁGI ELŐÍRÁSOK

Megjegyzés: *E fejezet alkalmazásában a „közbiztonság” alatt értendők azok a rendszabályok és óvintézkedések, amelyek célja, hogy a lehető legkevesebbre csökkentsék a veszélyes áruk eltulajdonítását, ill. a velük való visszaéléseket, amelyek az embereket, az anyagi javakat vagy a környezetet veszélyeztethetik.*

1.10.1 Általános előírások

- 1.10.1.1 Mindenkinnek, aki a veszélyes áru szállításával kapcsolatba kerül, felelősségéhez mérten figyelembe kell vennie az ebben a fejezetben meghatározott közbiztonsági követelményeket.
- 1.10.1.2 Veszélyes áru szállításával csak megfelelően azonosított szállító, fuvarozó bízható meg.
- 1.10.1.3 Az átmeneti tárolóhelyeken, ill. terminálokon, jármű telephelyeken, kikötőkön és rendező-pályaúdvárokon belül a veszélyes áruk szállítása során átmeneti tárolásra használt területeket megfelelően biztosítani kell, jól meg kell világítani, és ha lehetséges és indokolt, az illetéktelenek elől el kell zárni.
- 1.10.1.4 Veszélyes áruk szállítása során a járműszemélyzet minden tagjának fényképes személyazonosító okmányt kell magánál tartania.
- 1.10.1.5 Az 1.8.1 szakasz és a 7.5.1.1 bekezdés szerinti biztonsági ellenőrzéseknek ki kell terjedniük a megfelelő közbiztonsági intézkedésekre is.
- 1.10.1.6 Az illetékes hatóság vagy az általa elismert szerv által kiállított, a 8.2.1 szakaszban meghatározott, érvényes járművezetői oktatási bizonyítványokról az illetékes hatóságnak naprakész nyilvántartást kell vezetnie.

1.10.2 Közbiztonsági képzés

- 1.10.2.1 Az 1.3 fejezetben meghatározott képzésnek és ismeretfelújító oktatásnak a közbiztonsági szempontok tudatosítására is ki kell terjedniük. A közbiztonsággal kapcsolatos ismeretfelújító oktatást nem kell feltétlenül a szabályozásban bekövetkezett változások oktatásával összekapcsolni.
- 1.10.2.2 A közbiztonsági szempontok tudatosítása során foglalkozni kell a közbiztonsági kockázat jellegével, a közbiztonsági kockázat felismerésével, a kockázatkezelés és -csökkentés módszereivel és a közbiztonság megsértése esetén teendő intézkedésekkel. Ha közbiztonsági terv szükséges, foglalkozni kell annak tudatosításával is, a résztvevők felelősségének és feladatainak, ill. a közbiztonsági terv végrehajtásában való részvételüknek arányában.
- 1.10.2.3 Még a veszélyes áru szállításával kapcsolatos munkakör betöltése előtt kell az érintetteknek ilyen képzésben részesülniük, ill. ellenőrizni kell, hogy ilyen képzésben részesültek-e, és a képzést rendszeres időközönként ismeretfelújító oktatással kell kiegészíteni.
- 1.10.2.4 Minden közbiztonsági képzésre vonatkozó iratot a munkáltatónak meg kell őriznie és kérés esetén a munkavállaló vagy az illetékes hatóság számára hozzáférhetővé kell tennie. Az iratokat a munkáltatónak az illetékes hatóság által meghatározott időtartamig kell megőriznie.

1.10.3 A nagy közbiztonsági kockázattal járó veszélyes árukra vonatkozó előírások

1.10.3.1 A nagy közbiztonsági kockázattal járó veszélyes áruk meghatározása

- 1.10.3.1.1 A nagy közbiztonsági kockázattal járó veszélyes áruk azok, amelyekkel terrorista cselekmények során vissza lehet élni, ami súlyos következményekkel járhat, pl. tömeges balesetet vagy tömegpusztítást idézhet elő, vagy – különösen a 7 osztály estében – súlyos társadalmi-gazdasági zavart okozhat.

1.10.3.1.2 A nagy közbiztonsági kockázattal járó veszélyes áruk (a 7 osztályba tartozók kivételével) a következő 1.10.3.1.2 táblázatban felsorolt és a megadottnál nagyobb mennyiségben szállított áruk.

1.10.3.1.2 táblázat: A nagy közbiztonsági kockázattal járó veszélyes áruk felsorolása

Osz- tály	Alosz- tály	Anyag vagy tárgy	Mennyiség		
			Tartányban (l) ^{c)}	Ömlesztve (kg) ^{d)}	Küldemény- darabban (kg)
1	1.1	Robbanóanyagok és -tárgyak	a)	a)	0
	1.2	Robbanóanyagok és -tárgyak	a)	a)	0
	1.3	C összeférhetőségi csoportba tartozó robbanóanyagok és -tárgyak	a)	a)	0
	1.4	UN 0104, 0237, 0255, 0267, 0289, 0361, 0365, 0366, 0440, 0441, 0455, 0456 és 0500 alá tartozó robbanótárgyak	a)	a)	0
	1.5	Robbanóanyagok	0	a)	0
2		Gyúlékony gázok (a csak F betűt tartalmazó osztályozási kódok)	3000	a)	b)
		Mérgező gázok (T, TF, TC, TO, TFC vagy TOC betű(ke)t tartalmazó osztályozási kódok), az aeroszolok kivételével	0	a)	0
3		I és II csomagolási csoportba tartozó gyúlékony folyékony anyagok	3000	a)	b)
		Érzéketlenített robbanóanyagok	0	a)	0
4.1		Érzéketlenített robbanóanyagok	a)	a)	0
4.2		I csomagolási csoportba tartozó anyagok	3000	a)	b)
4.3		I csomagolási csoportba tartozó anyagok	3000	a)	b)
5.1		I csomagolási csoportba tartozó, gyújtó hatású, folyékony anyagok	3000	a)	b)
		Perklorátok, ammónium-nitrát, ammónium-nitrát műtrágyák és ammónium-nitrát emulziók, szuszpenziók vagy gélek	3000	3000	b)
6.1		I csomagolási csoportba tartozó mérgező anyagok	0	a)	0
6.2		„A” kategóriába tartozó fertőző anyagok (UN 2814 és 2900, az állati eredetű anyagok kivételével)	a)	0	0
8		I csomagolási csoportba tartozó maró anyagok	3000	a)	b)

a) Tárgytalan.

b) Az 1.10.3 szakasz előírásait nem kell alkalmazni, akármennyi is a szállított mennyiség.

c) Az ebben az oszlopban megadott értékeket csak akkor kell alkalmazni, ha a 3.2 fejezet „A” táblázat 10 vagy 12 oszlopa szerint a tartányban való szállítás megengedett. Azokra az anyagokra vonatkozóan, amelyek tartányban való szállítása nem megengedett, ezen oszlop utasítása tárgytalan.

d) Az ebben az oszlopban megadott értékeket csak akkor kell alkalmazni, ha a 3.2 fejezet „A” táblázat 10 vagy 17 oszlopa szerint az ömlesztett szállítás megengedett. Azokra az anyagokra vonatkozóan, amelyek ömlesztett szállítása nem megengedett, ezen oszlop utasítása tárgytalan.

- 1.10.3.1.3** A 7 osztályba tartozó veszélyes áruk közül nagy közbiztonsági kockázattal járó radioaktív anyagok azok, amelyeknél egy küldeménydarab aktivitása eléri vagy meghaladja a $3000A_2$ szállítási közbiztonsági küszöbértéket (lásd a 2.2.7.2.2.1 pontot is), kivéve a következő radionuklidokat, amelyekre a szállítási közbiztonsági küszöbértéket az 1.10.3.1.3 táblázat tartalmazza.

1.10.3.1.3 táblázat: Egyes radionuklidokra vonatkozó szállítási közbiztonsági küszöbérték

Elem	Radionuklid	Szállítási közbiztonsági küszöbérték (TBq)
Americium	Am-241	0,6
Arany	Au-198	2
Kadmium	Cd-109	200
Kalifornium	Cf-252	0,2
Kúrrium	Cm-244	0,5
Kobalt	Co-57	7
Kobalt	Co-60	0,3
Cézium	Cs-137	1
Vas	Fe-55	8000
Germánium	Ge-68	7
Gadolínium	Gd-153	10
Iridium	Ir-192	0,8
Nikkel	Ni-63	600
Palládium	Pd-103	900
Prométium	Pm-147	400
Polónium	Po-210	0,6
Plutónium	Pu-238	0,6
Plutónium	Pu-239	0,6
Rádium	Ra-226	0,4
Ruténium	Ru-106	3
Szelén	Se-75	2
Stroncium	Sr-90	10
Tallium	Tl-204	200
Túlium	Tm-170	200
Itterbium	Yb-169	3

- 1.10.3.1.4** Radionuklid keverékeknél annak megállapítása, hogy vajon a szállítási közbiztonsági küszöbértéket elérték vagy túlhaladták-e, számítással történhet úgy, hogy a jelen lévő minden egyes radionuklidra összegezni kell a radionuklid aktivitása és a rá vonatkozó szállítási közbiztonsági küszöbérték hányadosát. Amennyiben ez az összeg kisebb 1-nél, úgy a keverék radioaktivitási küszöbértékét nem érték el, ill. nem haladták túl.

A számítás a következő képlettel végezhető:

$$\sum_i \frac{A_i}{T_i} < 1$$

ahol:

A_i = a küldeménydarabban jelen lévő i -edik radionuklid aktivitása (TBq)

T_i = az i -edik radionuklid szállítási közbiztonsági küszöbértéke (TBq).

- 1.10.3.1.5** Amikor a radioaktív anyag más osztályok járulékos veszélyeivel is bír, az 1.10.3.1.2 táblázat kritériumait is figyelembe kell venni (lásd még az 1.7.5 szakaszt).
- 1.10.3.2** *Közbiztonsági terv*
- 1.10.3.2.1** A nagy közbiztonsági kockázattal járó veszélyes áruk (lásd az 1.10.3.1.2 táblázatot) és a nagy közbiztonsági kockázattal járó radioaktív anyagok (lásd az 1.10.3.1.3 pontot) szállításában részt vevő, az 1.4.2 és az 1.4.3 szakaszban meghatározott szállítóknak, fuvarozóknak, feladóknak és többi résztvevőnek olyan közbiztonsági tervet kell készíteniük, bevezetniük és annak megfelelően eljárniuk, amely legalább az 1.10.3.2.2 pontban meghatározott elemeket tartalmazza.
- 1.10.3.2.2** A közbiztonsági tervnek legalább a következő elemekből kell állnia:
- a közbiztonsági rendszabályokért és óvintézkedésekért viselt felelősség részletes megosztása megfelelő hatáskörrel és képesítéssel rendelkező személyek között;
 - az érintett veszélyes áruk, ill. veszélyes áru fajták nyilvántartása;
 - a folyamatban levő tevékenységek felülvizsgálata és a közbiztonsági kockázat értékelése, beleértve a szállítási műveletek szükség szerinti megszakítását, a veszélyes áruk járművön, tartányban vagy konténerben tartását a szállítás előtt, alatt és után, ill. a veszélyes áruk átmeneti tárolását az intermodális szállítás vagy az egységek közötti átrakás során;
 - a résztvevők felelősségével és feladatával arányban álló intézkedések egyértelmű meghatározása, amelyeket a közbiztonsági kockázat csökkentéséhez meg kell tenni, beleértve:
 - a képzést;
 - a közbiztonsági eljárásokat (pl. teendők súlyos fenyegetettség esetén; új, ill. áthelyezett alkalmazottak ellenőrzése stb.);
 - az üzemi eljárásokat [pl. útvonalak kiválasztása/használata, ahol ismeretes; hozzáférés a veszélyes árukhoz az átmeneti tárolóhelyeken (mint azt a c) pont meghatározza); érzékeny infrastruktúra közelsége stb.];
 - a közbiztonsági kockázat csökkentéséhez használandó eszközöket és forrásokat;
 - hatékony, naprakész eljárások a közbiztonsági fenyegetettség, a közbiztonság megsértése, ill. a közbiztonságot érintő rendkívüli események kezelésére és jelentésére;
 - a közbiztonsági terv értékelésére, ellenőrzésére, valamint a rendszeres felülvizsgálatára és korszerűsítésére vonatkozó eljárás;
 - a közbiztonsági tervben szereplő szállítási információk fizikai védelmének biztosítására szolgáló intézkedések;
 - intézkedések annak biztosítására, hogy a közbiztonsági tervben szereplő szállítási információkhoz csak az érdekeltek juthassanak hozzá. Ezek az intézkedések azonban nem akadályozhatják az ADR-ben máshol előírt információk megadását.
- Megjegyzés:** *A szállítónak, fuvarozónak, a feladónak és a címzettnek együtt kell működniük egymással és az illetékes hatóságokkal* a fenyegetésre vonatkozó információk kicserélésében, a megfelelő közbiztonsági intézkedések alkalmazásában és a közbiztonságot érintő rendkívüli események kezelésében.*
- 1.10.3.3** Olyan készüléket, berendezést kell alkalmazni, ill. olyan intézkedést kell fogantatni, amely megakadályozza, hogy a nagy közbiztonsági kockázattal járó veszélyes árut (lásd az 1.10.3.1.2 táblázatot) és a nagy közbiztonsági kockázattal járó radioaktív anyagot (lásd az 1.10.3.1.3 pontot) szállító járművet, ill. rakományát eltulajdonítsák, és biztosítani kell, hogy ezek az eszközök mindig jól működjenek. Az óvintézkedések azonban nem akadályozhatják a vészhelyzet elhárítását.

* Magyarországon lásd a 30/2011. (IX. 22.) BM rendeletet.

Megjegyzés: *A nagy közbiztonsági kockázattal járó veszélyes áruk (lásd az 1.10.3.1.2 táblázatot) és a nagy közbiztonsági kockázattal járó radioaktív anyagot (lásd az 1.10.3.1.3 pontot) mozgásának ellenőrzésére a közlekedési telemetriai vagy egyéb nyomkövető módszereket kell alkalmazni, amennyiben arra alkalmasak és a hozzá szükséges eszközök rendelkezésre állnak, ill. fel vannak szerelve.*

- 1.10.4** Az 1.1.3.6 bekezdés előírásainak értelmében nem kell betartani az 1.10.1, az 1.10.2, az 1.10.3 szakasz és a 8.1.2.1 d) pont követelményeit, ha a küldeménydarabokban szállított mennyiség egy szállítóegységben nem haladja meg az 1.1.3.6.3 pontban meghatározott mennyiséget, kivéve az UN 0029, 0030, 0059, 0065, 0073, 0104, 0237, 0255, 0267, 0288, 0289, 0290, 0360, 0361, 0364, 0365, 0366, 0439, 0440, 0441, 0455, 0456 és 0500 számú tárgyakat, valamint kivéve az UN 2910 és 2911 számú anyagokat, amennyiben az aktivitás szint meghaladja az A_2 értéket (lásd az 1.1.3.6.2 pont első francia bekezdését). Ezen kívül az 1.10.1, az 1.10.2, az 1.10.3 szakasz és a 8.1.2.1 d) pont követelményeit akkor sem kell betartani, ha az előző mondatban említett szállítóegységenkénti mennyiséget tartányban vagy ömlesztve szállítják. Ezenkívül nem kell betartani e fejezet előírásait az UN 2912 KIS FAJLAGOS AKTÍVITÁSÚ RADIOAKTÍV ANYAG (LSA-I) és az UN 2913 RADIO-AKTÍV ANYAG, SZENNYEZETT FELÜLETŰ TÁRGYAK (SCO-I) szállításakor sem.
- 1.10.5** Radioaktív anyagok esetén e fejezet előírásai teljesítettnek tekinthetők, ha betartják a Nukleáris anyagok fizikai védelméről szóló Egyezmény⁸⁾ valamint az IAEA „Nukleáris anyagok és nukleáris létesítmények fizikai védelme” c. kiadvány⁹⁾ előírásait.

9) INFCIRC/225/Rev.4 (helyesbített kiadás), IAEA, Vienna (1999).

2. RÉSZ

OSZTÁLYOZÁS

2.1 FEJEZET

ÁLTALÁNOS ELŐÍRÁSOK

2.1.1 Bevezetés

2.1.1.1 Az ADR szerint a veszélyes áruk osztályai a következők:

1 osztály	Robbanóanyagok és –tárgyak
2 osztály	Gázok
3 osztály	Gyúlékony folyékony anyagok
4.1 osztály	Gyúlékony szilárd anyagok, önreaktív anyagok és érzéketlenített, szilárd robbanóanyagok
4.2 osztály	Öngyulladásra hajlamos anyagok
4.3 osztály	Vízzel érintkezve gyúlékony gázokat fejlesztő anyagok
5.1 osztály	Gyújtó hatású (oxidáló) anyagok
5.2 osztály	Szerves peroxidok
6.1 osztály	Mérgező anyagok
6.2 osztály	Fertőző anyagok
7 osztály	Radioaktív anyagok
8 osztály	Maró anyagok
9 osztály	Különféle veszélyes anyagok és tárgyak.

2.1.1.2 Az osztályokban minden tételhez UN szám van hozzárendelve. A következő tétel típusok használhatósak:

- A. Egyedi tételek: egy-egy pontosan meghatározott anyagra vagy tárgyra vonatkozó tételek, beleértve az olyan tételeket is, amelyek egy anyag izomerjeire vonatkoznak, pl.:
- UN 1090 ACETON
UN 1104 AMIL-ACETÁTOK
UN 1194 ETIL-NITRIT OLDAT
- B. Generikus tételek: anyagok vagy tárgyak pontosan meghatározott csoportjára vonatkozó tételek, amelyek azonban nem m.n.n. tételek, pl.:
- UN 1133 RAGASZTÓK
UN 1266 PARFÜM KÉSZÍTMÉNYEK
UN 2757 SZILÁRD, MÉRGEZŐ KARBAMÁT PESZTICID
UN 3101 B TÍPUSÚ, FOLYÉKONY SZERVES PEROXID
- C. Speciális m.n.n. tételek: meghatározott kémiai vagy műszaki tulajdonságokkal bíró, „másként meg nem nevezett” anyagok vagy tárgyak csoportjára vonatkozó tételek, pl.:
- UN 1477 SZERVETLEN NITRÁTOK, M.N.N.
UN 1987 ALKOHOLOK, M.N.N.
- D. Általános m.n.n. tételek: egy vagy több veszélyes tulajdonsággal bíró, „másként meg nem nevezett” anyagok vagy tárgyak csoportjára vonatkozó tételek, pl.:
- UN 1325 GYÚLÉKONY, SZERVES, SZILÁRD ANYAG, M.N.N.
UN 1993 GYÚLÉKONY FOLYÉKONY ANYAG, M.N.N.

A B., a C. és a D. pontban meghatározott tételeket gyűjtőmegnevezésnek nevezzük.

2.1.1.3 Csomagolási szempontból az anyagok – az 1, a 2, az 5.2, a 6.2 és a 7 osztály anyagai, valamint a 4.1 osztály önreaktív anyagai kivételével – az általuk képviselt veszély mértéke szerint csomagolási csoportokhoz vannak hozzárendelve:

- | | |
|-------------------------|--------------------------------|
| I csomagolási csoport | – nagyon veszélyes anyagok; |
| II csomagolási csoport | – közepesen veszélyes anyagok; |
| III csomagolási csoport | – kevésbé veszélyes anyagok. |

A csomagolási csoporto(ka)t, amely(ek)hez egy anyag hozzá van rendelve, a 3.2 fejezet „A” táblázata tartalmazza.

2.1.2 Az osztályozás alapelvei

2.1.2.1 Az egyes osztályok fogalmkörébe tartozó anyagok meghatározása az adott osztály 2.2.x.1 bekezdése szerinti tulajdonságaikon alapul. A veszélyes áruk hozzárendelése valamely osztályhoz és csomagolási csoporthoz az ugyanezen 2.2.x.1 bekezdésben szereplő kritériumok alapján történik. Egy vagy több járulékos veszély hozzárendelése a veszélyes anyagokhoz és tárgyakhoz az ezen veszélyeknek megfelelő osztály vagy osztályok 2.2.x.1 bekezdésében található kritériumai alapján történik.

2.1.2.2 Minden veszélyes áru tétel a 3.2 fejezet „A” táblázatában van felsorolva az UN számok sorrendjében. Ez a táblázat tartalmazza a felsorolt árukra vonatkozó, lényeges információkat, így a megnevezést, az osztályt, a csomagolási csoporto(ka)t, a szükséges veszélyességi bárcá(ka)t, a csomagolási és szállítási előírásokat.

***Megjegyzés:** A tételek betűrendes jegyzékét a 3.2 fejezet „B” táblázata tartalmazza, amely nem képezi az ADR hivatalos részét.*

2.1.2.3 Az anyag olyan technikai szennyeződések (pl. a gyártási folyamatból) vagy a stabilitásához vagy egyéb célból szükséges adalékanyagot is tartalmazhat, amely nem befolyásolja a besorolását. Az olyan anyagot azonban, amely név szerint meg van említve, vagyis amely a 3.2 fejezet „A” táblázatában egyedi tételként van feltüntetve, és olyan technikai szennyeződések vagy a stabilitásához vagy egyéb célból szükséges adalékanyagot tartalmaz, amely befolyásolja a besorolását, oldatnak vagy keveréknek kell tekinteni (lásd a 2.1.3.3 bekezdést).

2.1.2.4 Az egyes osztályok 2.2.x.2 bekezdésében felsorolt vagy meghatározott veszélyes áruk a szállításból ki vannak zárva.

2.1.2.5 A név szerint nem említett árukat, vagyis azokat, amelyek sem egyedi tételként nem szerepelnek a 3.2 fejezet „A” táblázatában, sem az előzőekben említett 2.2.x.2 bekezdésekben nincsenek felsorolva vagy meghatározva, a 2.1.3 szakaszban lévő eljárás szerint kell a megfelelő osztályba sorolni. Ezen kívül meg kell határozni az esetleges járulékos veszélyt, illetve a csomagolási csoportot. Az osztály és az esetleges járulékos veszély, illetve csomagolási csoport eldöntése után a megfelelő UN számot kell meghatározni. A megfelelő gyűjtőmegnevezés (UN szám) kiválasztásának paramétereit az osztályok végén, a 2.2.x.3 bekezdésekben levő döntési fák (gyűjtőmegnevezések felsorolása) jelzik. Az anyag vagy tárgy tulajdonságait lefedő gyűjtőmegnevezések közül minden esetben a legjellegzetesebbet kell választani a 2.1.1.2 bekezdés B., C. és D. pontja szerinti rangsor alapján. Akkor és csak akkor sorolható egy anyag vagy tárgy a 2.1.1.2 bekezdés szerinti valamely D. típusú tételhez, ha sem B., sem C. típusú tételhez nem sorolható.

2.1.2.6 A 2.3 fejezet vizsgálati eljárásai és az osztályok 2.2.x.1 bekezdésében meghatározott kritériumok alapján – amennyiben ezek között szerepel ez a lehetőség – az is megállapítható, hogy egyes osztályokban valamely anyag, keverék vagy oldat nem rendelkezik az adott

osztály kritériumaival, annak ellenére, hogy a 3.2 fejezet „A” táblázatában név szerint szerepel. Ilyen esetben ez az anyag, keverék vagy oldat nem tekintendő az adott osztályhoz tartozónak.

2.1.2.7 A besorolás szempontjából a 101,3 kPa nyomáson 20 °C vagy ez alatti olvadáspontú vagy olvadás kezdőpontú anyagokat kell folyékónynak tekinteni. Azokat a viszkózus anyagokat, amelyeknél határozott olvadáspont nem állapítható meg, az ASTM D 4359-90 szabvány szerinti vizsgálati eljárásnak vagy a 2.3.4 szakaszban leírt folyékonyság meghatározási vizsgálatnak (penetrométer eljárásnak) kell alávetni.

2.1.3 A név szerint nem említett anyagok, oldatok és keverékek (készítmények és hulladékok) besorolása

2.1.3.1 A név szerint nem említett anyagokat, oldatokat és keverékeket az egyes osztályok 2.2.x.1 bekezdésében található kritériumok alapján, az általuk képviselt veszély mértéke szerint kell besorolni. Az anyag által képviselt veszély(eke)t annak fizikai, kémiai jellemzői és fiziológiai tulajdonságai alapján kell meghatározni. Ezeket a jellemzőket és tulajdonságokat kell akkor is figyelembe venni, ha a tapasztalatok szigorúbb hozzárendeléshez vezetnek.

2.1.3.2 Azokat az anyagokat, amelyek nincsenek a 3.2 fejezet „A” táblázatában név szerint feltüntetve és csak egyetlen veszélyt képviselnek, a megfelelő osztályba, az adott osztály 2.2.x.3 bekezdésében felsorolt valamely gyűjtőmegnevezés alá kell besorolni.

2.1.3.3 Azokat az ADR osztályozási kritériumait kielégítő oldatokat és keverékeket, amelyek túlnyomórészt valamely egyedi tételhez tartozó, a 3.2 fejezet „A” táblázatában név szerint felsorolt anyagból és egy vagy több, az ADR hatálya alá nem tartozó anyagból és/vagy elenyésző mennyiségben egy vagy több, a 3.2 fejezet „A” táblázatában név szerint felsorolt anyagból állnak, ahhoz az UN tételhez és helyes szállítási megnevezéshez kell sorolni, amelyhez a túlnyomó részt kitevő anyag tartozik, kivéve, ha:

- a) az oldat vagy a keverék név szerint fel van sorolva a 3.2 fejezet „A” táblázatában;
- b) a 3.2 fejezet „A” táblázatában név szerint felsorolt anyag neve és leírása kifejezetten utal arra, hogy az csak a tiszta anyagra vonatkozik;
- c) az oldat vagy a keverék osztálya, osztályozási kódja, csomagolási csoportja vagy fizikai állapota különbözik a 3.2 fejezet „A” táblázatában név szerint felsorolt anyagtól; vagy
- d) az oldat vagy a keverék veszélyes tulajdonságai és jellemzői miatt más veszélyhelyzeti intézkedés szükséges, mint a 3.2 fejezet „A” táblázatában név szerint felsorolt anyagnál.

Az a) pont kivételével a többi esetben az oldatot vagy a keveréket, a megfelelő osztályban név szerint nem említett anyagként, az adott osztály 2.2.x.3 bekezdésében felsorolt valamely gyűjtőmegnevezés alá kell besorolni, figyelembe véve az oldat vagy keverék által esetleg képviselt járulékos veszély(eke)t. Ha azonban az oldat vagy a keverék egyik osztály kritériumaival sem rendelkezik, akkor nem tartozik az ADR hatálya alá.

2.1.3.4 A 2.1.3.4.1 és a 2.1.3.4.2 pontban említett tételek bármelyikének anyagát tartalmazó oldatokat és keverékeket e pontok előírásai szerint kell besorolni.

2.1.3.4.1 A következő, név szerint feltüntetett anyagok bármelyikét tartalmazó oldatokat és keverékeket ugyanazon tétel alá kell besorolni, mint ahová maga az anyag tartozik, kivéve, ha a 2.1.3.5.3 pontban említett tulajdonságokkal rendelkeznek:

– 3 osztály

UN 1921 PROPILÉN-IMIN, STABILIZÁLT;

UN 3064 NITROGLICERIN ALKOHOLOS OLDATBAN, 1%-nál több, de legfeljebb 5% nitroglicerín tartalommal

– 6.1 osztály

UN 1051 HIDROGÉN-CIANID, STABILIZÁLT, 3%-nál kevesebb víztartalommal;

UN 1185 ETILÉN-IMIN, STABILIZÁLT;

UN 1259 NIKKEL-TETRAKARBONIL;

UN 1613 HIDROGÉN-CIANID VIZES OLDAT (CIÁN-HIDROGÉNSAV VIZES OLDAT) legfeljebb 20% hidrogén-cianid tartalommal;

UN 1614 HIDROGÉN-CIANID, STABILIZÁLT, 3%-nál kevesebb víztartalommal és inert porózus anyagban abszorbeálva;

UN 1994 VAS-PENTAKARBONIL;

UN 2480 METIL-IZOCIANÁT;

UN 2481 ETIL-IZOCIANÁT;

UN 3294 HIDROGÉN-CIANID ALKOHOLOS OLDAT legfeljebb 45% hidrogén-cianid tartalommal

– 8 osztály

UN 1052 HIDROGÉN-FLUORID, VÍZMENTES;

UN 1744 BRÓM vagy UN 1744 BRÓM OLDAT;

UN 1790 FLUOR-HIDROGÉNSAV 85%-nál több hidrogén-fluorid tartalommal;

UN 2576 OLVASZTOTT FOSZFOR-OXI-BROMID

2.1.3.4.2

A 9 osztályba tartozó

UN 2315 FOLYÉKONY POLIKLÓROZOTT BIFENILEK;

UN 3151 FOLYÉKONY POLIHALOGÉNEZETT BIFENILEK;

UN 3151 FOLYÉKONY POLIHALOGÉNEZETT TERFENILEK;

UN 3152 SZILÁRD POLIHALOGÉNEZETT BIFENILEK

UN 3152 SZILÁRD POLIHALOGÉNEZETT TERFENILEK; vagy

UN 3432 SZILÁRD POLIKLÓROZOTT BIFENILEK

tételek bármelyikének anyagát tartalmazó oldatokat és keverékeket mindig a 9 osztály ugyanazon tétele alá kell besorolni, amennyiben:

- a 3, a 4.1, a 4.2, a 4.3, az 5.1, a 6.1, ill. a 8 osztály III csomagolási csoportjaiba tartozó anyagokon kívül további veszélyes alkotórészt nem tartalmaznak; és
- nem rendelkeznek a 2.1.3.5.3 pontban említett veszélyes tulajdonságokkal.

2.1.3.5

Azokat az anyagokat, amelyek a 3.2 fejezet „A” táblázatában nincsenek név szerint feltüntetve, de egynél több veszélyes tulajdonsággal rendelkeznek, valamint azokat az ADR osztályozási kritériumait kielégítő oldatokat és keverékeket, amelyekben többféle veszélyes anyag van, a veszélyes tulajdonságaik alapján a megfelelő osztályba, valamely gyűjtőmegnevezéshez (lásd a 2.1.2.5 bekezdést) és csomagolási csoporthoz kell sorolni. A veszélyes tulajdonságokon alapuló besorolást a következő módon kell végrehajtani:

2.1.3.5.1

A fizikai, kémiai jellemzőket és a fiziológiai tulajdonságokat méréssel vagy számítással kell meghatározni, az anyagot, oldatot vagy keveréket az egyes osztályok 2.2.x.1 bekezdésében meghatározott kritériumok szerint kell besorolni.

- 2.1.3.5.2** Amennyiben ez a meghatározás aránytalanul nagy költséggel és munkaráfordítással járna (pl. bizonyos hulladékoknál), akkor az oldatokat és keverékeket a döntő veszélyt képviselő összetevő osztályába kell besorolni.
- 2.1.3.5.3** Ha egy anyag, oldat vagy keverék veszélyességi jellemzői a következőkben felsorolt osztályok vagy anyagscsoportok közül egynél többnek is megfelelnek, akkor ezt az anyagot, oldatot vagy keveréket a döntő veszélynek megfelelő osztályba vagy anyagscsoportba kell besorolni, a következő elsőbbségi sorrend alapján:
- a) a 7 osztály anyagai (kivéve a radioaktív anyagokat engedményes küldeménydarabokban, amelyekre a 3.3 fejezet 290 különleges utasítása vonatkozik, ahol az egyéb veszélyességi tulajdonságok elsőbbséget élveznek);
 - b) az 1 osztály anyagai;
 - c) a 2 osztály anyagai;
 - d) a 3 osztály érzéketlenített, folyékony robbanóanyagai;
 - e) a 4.1 osztály önreaktív anyagai és érzéketlenített, szilárd robbanóanyagai;
 - f) a 4.2 osztály piroforos anyagai;
 - g) az 5.2 osztály anyagai;
 - h) a 6.1 osztály anyagai, amelyek belélegzési mérgezőképességük alapján az I csomagolási csoportba tartoznak [A 8 osztályba sorolás kritériumait kielégítő anyagokat, amennyiben por és köd belélegzési mérgezőképességük (LC_{50}) az I csomagolási csoport tartományába esik, de lenyelés vagy bőrön át való felszívódás esetén a mérgezőképességük csak a III csomagolási csoport tartományába esik vagy annál kevésbé mérgezőek, a 8 osztályba kell sorolni.];
 - i) a 6.2 osztály fertőző anyagai.
- 2.1.3.5.4** Ha egy anyag veszélyes tulajdonságai az előző 2.1.3.5.3 pontban fel nem sorolt több osztályhoz vagy anyagscsoporthoz tartoznak, az anyagot ugyanilyen eljárással kell besorolni, de a megfelelő osztályt a 2.1.3.10 bekezdésben levő, a veszélyességi rangsort tartalmazó táblázat alapján kell megválasztani.
- 2.1.3.5.5** Ha a szállítandó anyag olyan hulladék, melynek pontos összetétele nem ismert, a 2.1.3.5.2 pont szerint az UN tételhez és csomagolási csoporthoz való hozzárendelését a feladó ismeretei alapján rendelkezésre álló adatok (beleértve a hatályos biztonsági és környezetvédelmi jogszabályok¹⁾ által megkövetelt biztonsági és műszaki adatokat) alapján is el lehet végezni.

Kétség esetén a legnagyobb veszélyességi szintet kell alkalmazni.

Amennyiben a hulladék összetételére vonatkozó ismeretek és az azonosított összetevők fizikai és kémiai tulajdonságai alapján bizonyítható, hogy a hulladék tulajdonságai nem felelnek meg az I csomagolási csoportba való soroláshoz szükséges tulajdonságoknak, a hulladékot további vizsgálat nélkül a II csomagolási csoportba lehet sorolni, a legalkalmasabb m.n.n tételen belül. Viszont, ha ismert, hogy a hulladék csak környezetre veszélyes tulajdonságokkal rendelkezik, az UN 3077, ill. az UN 3082 tétel alá, a III csomagolási cso-

1) Ilyen jogszabályok például: a Bizottság 2000/532/EK határozata (2000. május 3.) a hulladékjegyzéknek a hulladékokról szóló 75/442/EGK tanácsi irányelv [felváltotta a 2006/12/EK parlamenti és tanácsi irányelv (az EU Hivatalos Lapja L 114 szám, 2006. 04. 27., 9. oldal)] 1. cikkének a) pontja értelmében történő meghatározásáról szóló 94/3/EK határozat, valamint a veszélyes hulladékok jegyzékének a veszélyes hulladékokról szóló 91/689/EGK tanácsi irányelv 1. cikkének (4) bekezdése értelmében történő meghatározásáról szóló 94/904/EK tanácsi határozat felváltásáról (az EK Hivatalos Lapja, L 226 szám, 2000. 09. 06., 3. o.). Magyarországon lásd még 2000. évi XLIII. tv-t a hulladékgazdálkodásról és a 16/2001. (VII. 18.) KöM rendeletet a hulladékok jegyzékéről.

portba lehet sorolni.

Ez az eljárás nem alkalmazható azokra a hulladékokra, amelyek a 2.1.3.5.3 pont alatt említett anyagokat, vagy a 4.3 osztály anyagait, vagy a 2.1.3.7 bekezdésben említett esetben szereplő anyagokat, vagy olyan anyagokat tartalmaznak, amelyek a 2.2.x.2 bekezdések szerint a szállításból ki vannak zárva.

- 2.1.3.6** Mindig a legjellegzetesebb, ráillő gyűjtőmegnevezést (lásd a 2.1.2.5 bekezdést) kell használni, azaz általános m.n.n. tétel csak akkor használható, ha generikus tétel vagy speciális m.n.n. tétel nem használható.
- 2.1.3.7** A gyújtó hatású anyagok oldatai és keverékei, ill. a járulékos gyújtóhatással bíró anyagok robbanásveszélyesek is lehetnek. Ebben az esetben csak akkor szállíthatók, ha megfelelnek az 1 osztály feltételeinek.
- 2.1.3.8** Az UN 3077 és az UN 3082 tétel alá soroltak kivételével azokat az 1 – 6.2, 8 és 9 osztályba tartozó anyagokat, amelyek megfelelnek a 2.2.9.1.10 pont kritériumainak, az 1 – 6.2, 8 és 9 osztályra jellemző veszélyeken túlmenően környezetre veszélyesnek is kell tekinteni. A többi anyagot, amely megfelel a 2.2.9.1.10 pont kritériumainak, de egyetlen más osztály kritériumának sem felel meg, az UN 3077, ill. az UN 3082 tétel alá kell sorolni.
- 2.1.3.9** A Veszélyes hulladékok országhatárokat átlépő szállításának ellenőrzéséről és ártalmatlanításáról szóló Bázeli Egyezmény* hatálya alá tartozó azon hulladékok is szállíthatók az UN 3077, ill. az UN 3082 tétel alatt, amelyek nem felelnek meg az 1 – 9 osztályba sorolás kritériumainak.

* Magyarországon kihirdette a 101/1996.(VII.12.) Korm. rendelet.

Megjegyzés: 1. Példa a táblázat használatára:

Egyedi anyag besorolása

A besorolandó anyag leírása:

A 3 osztály II csomagolási csoportjának, valamint a 8 osztály I csomagolási csoportjának kritériumait kielégítő, név szerint nem említett amin.

Eljárás:

A 3, II sornak a 8, I oszloppal való keresztezésénél 8, I található. Ezért ezt az ament a 8 osztályba a következők alá kell besorolni:

UN 2734 FOLYÉKONY, MARÓ, GYÚLÉKONY AMINOK, M.N.N. vagy UN 2734 FOLYÉKONY, MARÓ, GYÚLÉKONY POLIAMINOK, M.N.N., I csomagolási csoport.

Keverék besorolása

A besorolandó keverék leírása:

A 3 osztály III csomagolási csoportjába tartozó gyúlékony folyékony anyagból, a 6.1 osztály II csomagolási csoportjába tartozó mérgező anyagból és a 8 osztály I csomagolási csoportjába tartozó maró anyagból álló keverék.

Eljárás:

A 3, III sornak a 6.1, II oszloppal való keresztezésénél 6.1, II található.

A 6.1, II sornak a 8, I oszloppal való keresztezésénél folyadékra 8, I található.

Ezt a közelebből nem meghatározott keveréket tehát a 8 osztályba, a következő tétel alá kell besorolni: UN 2922 MÉRGEZŐ, MARÓ FOLYÉKONY ANYAG, M.N.N., I csomagolási csoport.

2. Példák a keverékek és oldatok osztályba és csomagolási csoportba történő besorolására:

A 6.1 osztály II csomagolási csoportjába tartozó fenolt a 3 osztály II csomagolási csoportjába tartozó benzolban oldva a 3 osztály II csomagolási csoportjába kell besorolni; ezt az oldatot a fenol mérgező volta miatt a 3 osztály II csomagolási csoportjába, az UN 1992 GYÚLÉKONY, MÉRGEZŐ, FOLYÉKONY ANYAG, M.N.N. tétel alá kell besorolni.

A 6.1 osztály II csomagolási csoportjába tartozó nátrium-arzenát és a 8 osztály II csomagolási csoportjába tartozó nátrium-hidroxid szilárd keverékét a 6.1 osztály II csomagolási csoportjába, az UN 3290 MARÓ, SZERVETLEN, MÉRGEZŐ SZILÁRD ANYAG, M.N.N. tétel alá kell besorolni.

A 4.1 osztály III csomagolási csoportjába tartozó nyers vagy finomított naftalint a 3 osztály II csomagolási csoportjába tartozó benzinben oldva a 3 osztály II csomagolási csoportjába, az UN 3295 FOLYÉKONY SZÉNHIDROGÉNEK, M.N.N. tétel alá kell besorolni.

A 3 osztály III csomagolási csoportjába tartozó szénhidrogének és a 9 osztály II csomagolási csoportjába tartozó poliklórozott bifenilek (PCB-k) keverékeit a 9 osztály II csomagolási csoportjába, az UN 2315 FOLYÉKONY POLIKLÓROZOTT BIFENILEK vagy az UN 3432 SZILÁRD POLIKLÓROZOTT BIFENILEK tétel alá kell besorolni.

A 3 osztályba tartozó propilén-imin és a 9 osztály II csomagolási csoportjába tartozó poliklórozott bifenilek (PCB-k) keverékét a 3 osztályba, az UN 1921 PROPILÉN-IMIN, STABILIZÁLT tétel alá kell besorolni.

2.1.4 Minták besorolása

2.1.4.1 Amennyiben egy anyag osztálya bizonytalan, ezért további vizsgálat céljából szállítják, akkor ideiglenes osztályt, helyes szállítási megnevezést és UN számot kell hozzárendelni a feladónak az anyagra vonatkozó ismeretei és

- a) a 2.2 fejezet osztályozási kritériumai; és
- b) e fejezet előírásai alapján.

A választott helyes szállítási megnevezéshez tartozó legszigorúbb csomagolási csoportot kell alkalmazni.

Ha ezt az előírást használjuk, a helyes szállítási megnevezést ki kell egészíteni a „minta” szóval (pl. UN 1993 gyúlékony folyékony anyag, m.n.n., minta). Abban az esetben, ha egy bizonyos besorolási kritériumoknak megfelelő anyagmintára létezik speciális helyes szállítási megnevezés (pl. UN 3167 túlnyomás nélküli, gyúlékony gázminta, m.n.n.), akkor ezt kell használni. Ha a minta szállításához m.n.n. tételt használnak, a helyes szállítási megnevezést nem kell kiegészíteni a műszaki megnevezéssel, amint azt a 3.3 fejezet 274 különleges előírása megköveteli.

2.1.4.2 Az anyag mintákat az ideiglenesen hozzárendelt helyes szállítási megnevezéshez tartozó előírások szerint kell szállítani, amennyiben:

- a) az anyag nem tekinthető a 2.2 fejezet 2.2.x.2 bekezdései vagy a 3.2 fejezet alapján a szállításból kizárt anyagnak;
- b) az anyag nem tekinthető az 1 osztály kritériumait kielégítő anyagnak, ill. fertőző vagy radioaktív anyagnak;
- c) ha az anyag önreaktív anyag, illetve szerves peroxid, akkor megfelel a 2.2.41.1.15 pont, ill. a 2.2.52.1.9 pont előírásainak;
- d) az anyagot kombinált csomagolásban szállítják, és a nettó tömege nem haladja meg a 2,5 kg-ot küldeménydarabonként;
- e) a minta nincs más áruval egybecsomagolva.

2.2 FEJEZET

AZ EGYES OSZTÁLYOKRA VONATKOZÓ ELŐÍRÁSOK

2.2.1 1 osztály Robbanóanyagok és -tárgyak

2.2.1.1 Kritériumok

2.2.1.1.1 Az 1 osztály fogalmkörébe tartozó anyagok:

- a) *Robbanóanyagok*: szilárd vagy folyékony halmazállapotú anyagok vagy keverékeik, amelyek kémiai reakció révén képesek arra, hogy olyan sebességgel fejlesszenek gázt, ami elegendő hőmérsékletű és akkora nyomáshullámot hoz létre, hogy a környezetében károsodást idéz elő.

Pirotechnikai anyagok: anyagok vagy keverékeik, amelyeknek az a rendeltetése, hogy robbanás nélküli, önfenntartó exoterm kémiai reakció révén hőt fejlesszenek, fényt keltsenek, hanghatást váltsanak ki, gázt vagy füstöt fejlesszenek, vagy e hatások valamilyen kombinációját fejtsek ki.

Megjegyzés: 1. Azok az anyagok, amelyek önmagukban véve nem robbanóanyagok, de amelyek robbanásveszélyes gáz-, gőz- vagy porkeverékeket képezhetnek, nem tartoznak az 1 osztály anyagai közé.

2. Szintén nem tartoznak az 1 osztályba azok a víz- és alkoholtartalmú robbanóanyagok, amelyek víz-, ill. alkoholtartalma a megadott határértékeket meghaladja és azok, amelyek plasztifikáló anyagot tartalmaznak – ezek a robbanóanyagok a 3 vagy a 4.1 osztályba vannak besorolva –, valamint azok a robbanóanyagok, amelyek a bennük rejlő alapvető veszély miatt az 5.2 osztályba vannak besorolva.

- b) *Robbanótárgyak*: olyan tárgyak, amelyek egy vagy több robbanóanyagot vagy pirotechnikai anyagokat tartalmaznak.

Megjegyzés: Nem tartoznak az 1 osztály előírásainak hatálya alá azok a szerkezetek, amelyek olyan jellegű vagy olyan kis mennyiségű robbanó vagy pirotechnikai anyagokat tartalmaznak, amelyek szállítás közbeni véletlenszerű vagy gondatlanság miatt bekövetkező meggyulladás vagy beindulása csak olyan reakciót idéz elő, amely nem jár kívülről észlelhető repeszhatással, tűzzel, köd-, füst- vagy hőfejlődéssel vagy erős hanghatással.

- c) Azok az előzőekben nem említett anyagok és tárgyak, amelyek arra a célra készültek, hogy gyakorlati hatásukat robbanás vagy pirotechnikai jelenség formájában fejtsek ki.

Az 1 osztály alkalmazásában a következő meghatározás érvényes:

Flegmatizált: valamely robbanóanyaghoz olyan anyag (vagy flegmatizálószer) van hozzákeverve, amely a biztonság növelésére szolgál a kezelés és szállítás során. A flegmatizálószer érzéketlenné vagy kevésbé érzékennyé teszi a robbanóanyagot a következőkkel szemben: hő, lökés, ütés, dörzsölés vagy súrlódás. A jellegzetes flegmatizálószer közé tartoznak, de nem korlátozódnak ezekre: viasz, papír, víz, polimerek (pl. klór-fluor-polimerek), alkohol és olajok (pl. vazelin és paraffin).

2.2.1.1.2 Minden anyagot vagy tárgyat, amelynek robbanó tulajdonsága van vagy robbanó tulajdonsága lehet, az 1 osztályba való besorolás szempontjából meg kell vizsgálni a „Vizsgálatok és kritériumok kézikönyv” I. Részében meghatározott vizsgálatok, próbák és kritériumok szerint.

Az 1 osztályba sorolt valamely anyag vagy tárgy csak akkor szállítható, ha a 3.2 fejezet „A”

táblázatában található valamely megnevezéshez vagy m.n.n. tételhez hozzá lett rendelve, és a „Vizsgálatok és kritériumok kézikönyv” feltételeinek megfelelő.

2.2.1.1.3

Az 1 osztály anyagait és tárgyait a 3.2 fejezet „A” táblázata szerint valamely UN szám és megnevezés vagy m.n.n. tétel alá kell besorolni. A 3.2 fejezet „A” táblázatában található megnevezésének értelmezése a 2.2.1.4 bekezdésben található szójegyzéken alapul.

Az új vagy már régebben létező robbanóanyagok vagy robbanótárgyak mintái – az indító robbanóanyagok kivételével –, amelyeket többek között kísérleti, besorolási, kutatási és fejlesztési vagy minőségellenőrzési célból, vagy mint kereskedelmi mintát szállítanak, az „UN 0190 ROBBANÓANYAG MINTA” tételhez is besorolhatók.

A 3.2 fejezet „A” táblázatában név szerint nem említett robbanóanyagoknak és -tárgyaknak az 1 osztály valamely m.n.n. tételéhez vagy az „UN 0190 ROBBANÓANYAG MINTA” tételéhez való hozzárendelését, valamint bizonyos meghatározott anyagok besorolását, amelyek szállítása a 3.2 fejezet „A” táblázat 6 oszlopában szereplő különleges előírás alapján az illetékes hatóság külön engedélyéhez van kötve, a származási ország illetékes hatóságának kell elvégeznie. Ezen anyagok és tárgyak szállítási feltételeit szintén írásban kell az illetékes hatóságnak engedélyeznie. Ha a származási ország nem ADR Szerződő Fél, akkor a besorolást és a szállítási feltételeket a küldemény által érintett első ADR Szerződő Fél illetékes hatóságának kell elismernie.

2.2.1.1.4

Az 1 osztály anyagait és tárgyait a 2.2.1.1.5 pont szerinti valamelyik alosztályhoz és a 2.2.1.1.6 pont szerinti valamelyik összeférhetőségi csoporthoz kell hozzárendelni. Az alosztályt a 2.3.0 és 2.3.1 szakaszban leírt vizsgálatok eredményei alapján kell meghatározni, felhasználva a 2.2.1.1.5 pont definícióit. Az összeférhetőségi csoportot a 2.2.1.1.6 pont definíciói alapján kell meghatározni. Az alosztály sorszáma és az összeférhetőségi csoport betűjele együtt alkotják az osztályozási kódot.

2.2.1.1.5

Az alosztályok meghatározása

- | | |
|---------------|--|
| 1.1 alosztály | Olyan anyagok és tárgyak, amelyeknél fennáll a teljes tömeg felrobbanásának veszélye. (A teljes tömeg felrobbanása olyan robbanás, ami gyakorlatilag egyidejűleg csaknem az egész rakománytömeget érinti.) |
| 1.2 alosztály | Olyan anyagok és tárgyak, amelyek a kivetés veszélyével járnak, de az egész tömeg felrobbanásának veszélyével nem. |
| 1.3 alosztály | Olyan anyagok és tárgyak, amelyek tűzveszélyesek és robbanás vagy kivetés vagy ezek együttes fellépésének csekély veszélyével járnak, de az egész mennyiség felrobbanásának veszélye nélkül,
<div style="margin-left: 20px;"><div>a) így azok az anyagok, amelyek égése jelentős sugárzó hőt eredményez; vagy</div><div>b) amelyek egymásután úgy égnek el, hogy csak kismértékű robbanással vagy kivetéssel, vagy ezek egyidejű fellépésével járnak.</div></div> |
| 1.4 alosztály | Olyan anyagok és tárgyak, amelyek csak csekély robbanásveszélyt jelentenek szállítás közbeni meggyulladásuk vagy beindulásuk esetén. A hatások lényegében a küldeménydarabra korlátozódnak, és általában nem következik be jelentősebb méretű repeszdarabok keletkezése vagy a repeszdarabok nagyobb távolságra való szétröpülése. Kívülről ható tűz nem vonja maga után a küldeménydarab teljes tartalmának gyakorlatilag azonnali felrobbanását. |
| 1.5 alosztály | Rendkívül kis mértékben érzékeny, tömegrobbanás veszélyét magukba rejtő anyagok, amelyek érzéketlensége olyan, hogy normális szállítási körülmények között beindulásuk vagy égésük robbanásba való átmenetének valószínűsége rendkívül csekély. Minimális követelmény ezen anyagokra nézve, hogy a külső tűz hatásának vizsgálata során nem szabad felrobbanniuk. |
| 1.6 alosztály | Rendkívül érzéketlen tárgyak, amelyeknél nem áll fenn a teljes tömeg felrobbanásának veszélye. Az ilyen tárgyak csak rendkívül érzéketlen anya- |

gokat tartalmaznak, és bizonyítottan elhanyagolható a véletlen iniciálásuk vagy beindulásuk valószínűsége.

Megjegyzés: Az 1.6 alosztály tárgyaitól kiinduló veszély egyetlen tárgy felrobbanására korlátozódik.

2.2.1.1.6 Az anyagok és tárgyak összeférhetőségi csoportjainak meghatározása

- A Primer robbanóanyag.
- B Primer robbanóanyaggal töltött tárgy kettőnél kevesebb hatékony biztonsági szerkezettel. Egyes tárgyak, így a detonátorok robbantáshoz, detonátor-szerkezetek robbantáshoz és gyutacsszelencék ide tartoznak, bár ezek nem tartalmaznak primer robbanóanyagot.
- C Tolóhatású robbanóanyag vagy egyéb másodlagos deflagráló robbanóanyag vagy ilyen robbanóanyaggal töltött tárgy.
- D Szekunder detonáló robbanóanyag vagy feketelőpor vagy szekunder detonáló robbanóanyagot tartalmazó tárgy, minden esetben gyújtóeszköz és hajtótöltet nélkül, vagy primer robbanóanyagot tartalmazó tárgy legalább két hatékony biztonsági szerkezettel.
- E Szekunder detonáló robbanóanyagot tartalmazó tárgy indítószerkezet nélkül, de hajtótöltettel (gyúlékony folyadékot, gél vagy hipergolokat tartalmazó töltetek kivételével).
- F Szekunder detonáló robbanóanyagot tartalmazó tárgy saját indítószerkezettel, hajtótöltettel (gyúlékony folyadékot, gél vagy hipergolokat tartalmazó töltetek kivételével) vagy hajtótöltet nélkül.
- G Pirotechnikai anyag vagy pirotechnikai anyagot tartalmazó tárgy vagy olyan tárgy, amely egyben robbanóanyagot és gyújtó-, világító-, könnyfakasztó- vagy ködképzőanyagot is tartalmaz (a vízzel aktiválható tárgyak, valamint a fehérfoszfort, foszfidokat, piroforos anyagot, gyúlékony folyadékot, gél vagy hipergolokat tartalmazó tárgyak kivételével).
- H Robbanóanyagot és fehérfoszfort együtt tartalmazó tárgy.
- J Robbanóanyagot és gyúlékony folyadékot vagy gél együtt tartalmazó tárgy.
- K Robbanóanyagot és mérgező vegyianyagot együtt tartalmazó tárgy.
- L Olyan robbanóanyag vagy robbanóanyagot tartalmazó tárgy, amely különleges kockázattal jár (pl. víz hatására történő aktiválódás miatt vagy hipergolok, foszfidok vagy piroforos anyag jelenléte miatt) és így minden egyes típus elkülönítése szükséges.
- N Csak rendkívül érzéketlen anyagokat tartalmazó tárgyak.
- S Olyan anyag vagy tárgy, amely úgy van csomagolva vagy kialakítva, hogy a nem szándékos reakció révén bekövetkező minden hatás a küldeménydarab belsejére korlátozódik, kivéve, ha tűz esetén maga a küldeménydarab károsodik. Ebben az esetben a robbanási és kivetési hatásoknak olyan mértékűre kell korlátozódniuk, hogy ne akadályozzák a tűz leküzdését vagy más rendkívüli intézkedések végrehajtását a küldeménydarab közvetlen közelében.

Megjegyzés: 1. Valamely anyag vagy tárgy meghatározott csomagolásban csak egyetlen összeférhetőségi csoportba sorolható. Mivel az S összeférhetőségi csoport feltételei tapasztalati jellegűek, az ezen csoportba való sorolás szükség-szerűen osztályozási kód hozzárendelésére szolgál próbához kötött.

2. A D és az E összeférhetőségi csoportok tárgyait el lehet látni, vagy egybe lehet csomagolni saját gyújtószerkezetükkel azzal a feltétellel, hogy ezeknek az eszközöknek legalább két olyan hatásos biztonsági szerkezetük van, amelyek megakadályozzák a robbanás bekövetkeztét a gyújtó-szerkezet nem szándékos aktiválódása esetén. Az ilyen tárgyak és küldeménydarabok a D vagy az E összeférhetőségi csoportba tartoznak.

3. A D és az E összeférhetőségi csoportok tárgyait egybe lehet csomagolni olyan saját indítószervezetükkel, amelyeknek nincs két hatásos biztonsági szerkezetük (azaz olyan indítószervezetek, amelyek a B összeférhetőségi csoportba tartoznak), feltéve, hogy a 4.1.10 szakasz MP21 egybecsomagolási előírásainak megfelelnek. Az ilyen küldeménydarabok a D vagy az E összeférhetőségi csoportba tartoznak.
4. A tárgyakat el lehet látni vagy egybe lehet csomagolni saját gyújtószervezetükkel, feltéve, hogy a gyújtószervezetek normális szállítási körülmények között nem tudnak működésbe lépni.
5. A C, a D és az E összeférhetőségi csoportba tartozó tárgyakat egybe lehet csomagolni. Az ilyen küldeménydarabokat az E összeférhetőségi csoporthoz kell hozzárendelni.

2.2.1.1.7 A tűzijáték testek alosztályba sorolása

2.2.1.1.7.1 A tűzijáték testeket rendes körülmények között a „Vizsgálatok és kritériumok kézikönyv” I. Rész 16. fejezet 6. vizsgálati sorozat próbái során nyert adatok alapján kell az 1.1, az 1.2, az 1.3 vagy az 1.4 alosztályba sorolni. Mivel azonban ezeknek a termékeknek a választéka rendkívül nagy, viszont a vizsgáló berendezések korlátozottan állnak rendelkezésre, az alosztályt a 2.2.1.1.7.2 pontban ismertetett eljárással is meg lehet határozni.

2.2.1.1.7.2 A tűzijáték testeket az UN 0333, az UN 0334, az UN 0335 és az UN 0336 tételek alá a 6 vizsgálati sorozat próbáinak elvégzése nélkül, hasonlóság alapján is be lehet sorolni, a 2.2.1.1.7.5 pontban található, „tűzijáték testek vizsgálat hiányában történő besorolásának táblázata” szerint, az illetékes hatóság egyetértése esetén. A táblázatban nem szereplő tételeket a 6 vizsgálati sorozat próbái során nyert adatok alapján kell besorolni.

Megjegyzés: 1. A 2.2.1.1.7.5 pont táblázatának első oszlopát csak akkor lehet más típusú tűzijáték testtel kiegészíteni, ha a teljes vizsgálat eredményeit már benyújtották az ENSZ Veszélyes áru szállítási szakértő albizottságnak (UN Sub-Committee of Experts on the Transport of Dangerous Goods).

2. Ha a 2.2.1.1.7.5 pont táblázatának negyedik oszlopában meghatározott tűzijáték testekre vonatkozóan valamely illetékes hatóságtól származó vizsgálati eredmények megerősítik a 2.2.1.1.7.5 pont táblázatának ötödik oszlopában szereplő besorolást vagy annak ellentmondanak, erről az ENSZ Veszélyes áru szállítási szakértő albizottságát (UN Sub-Committee of Experts on the Transport of Dangerous Goods) értesíteni kell.

2.2.1.1.7.3 Ha különböző alosztályokba tartozó tűzijáték testeket csomagolnak egy küldeménydarabba, azt a küldeménydarabban levő legveszélyesebb alosztály alapján kell besorolni, kivéve, ha a 6 vizsgálati sorozat próbái más eredményre vezetnek.

2.2.1.1.7.4 A 2.2.1.1.7.5 pont táblázatában lévő besorolás csak olyan tárgyakra érvényes, amelyek (4G kódjelű) papírlemez ládában vannak.

2.2.1.1.7.5 Tűzijáték testek vizsgálat hiányában történő besorolásának táblázata²⁾

- Megjegyzés:**
1. Ellentétes meghatározás hiányában a táblázatban a százalékra történő hivatkozás az összes pirotechnikai anyag tömegére vonatkozik (pl. rakéta motorok, lökö töltet, bontó töltet és effekt anyag).
 2. A „villanó elegy” a táblázatban olyan pirotechnikai anyagra utal, amely a tűzijáték testben por formában vagy töltetegységként van jelen, és amelyet levegőben durranó effekt keltéséhez, bontó töltethez vagy lököttöltethez használnak, kivéve, ha a „Vizsgálatok és kritériumok kézikönyv” 7. Függeléke szerinti „HLS Villanó elegy vizsgálat” bizonyít-

2) A táblázat azokat a tűzijáték test besorolásokat tartalmazza, amelyeket a 6 vizsgálati sorozat hiányában is lehet alkalmazni (lásd a 2.2.1.1.7.2 pontot).

ja, hogy a nyomásnövekedéshez szükséges idő 0,5 g pirotechnikai anyag esetén 8 ms-nál több.

3. A mm-ben kifejezett méretek a következőket jelentik:

- gömb és etázs bombáknál a bomba gömbjének átmérője;*
- hengeres bombánál a bombának a hossza;*
- csőben lévő bombánál, római gyertyánál, egylövéses római gyertyánál, vagy mozsárnál a tűzijáték testet tartalmazó cső belső átmérője;*
- hengeres mozsárnál a mozsárhoz használni kívánt cső belső átmérője.*

Típus	Tartalom/szinonima	Meghatározás	Részletes leírás	Besorolás
Gömb és hengeres alakú tűzijáték bombák	<i>Gömb-bombák:</i> csillagos bombák, nappali bombák, több effektus bombák, vízre ugró bombák, ejtőernyős bombák, füst bombák; <i>durranós/villanós bombák:</i> jelző-, durranó-, fűtő-, villanóbombák	Csőből való kilövésre tervezett eszköz lökőtöltettel vagy anélkül, késleltetővel és bontó töltettel, pirotechnikai töltetegységekkel vagy laza pirotechnikai anyaggal	Mindenféle durranós bomba	1.1G
			Csillagos bomba: ≥ 180 mm	1.1G
			Csillagos bombák: < 180 mm, $> 25\%$ laza por formájú villanó eleggyel és/vagy durranó effekttel	1.1G
			Csillagos bombák: < 180 mm, $\leq 25\%$ laza por formájú villanó eleggyel és/vagy durranó effekttel	1.3G
			Csillagos bombák: ≤ 50 mm vagy ≤ 60 g pirotechnikai anyaggal, $\leq 2\%$ laza por formájú villanó eleggyel és/vagy durranó effekttel	1.4G
	Etázs bombák	Két vagy több gömb-bombából egybe rögzített, azonos lökőtöltettel, de elválasztott külső késleltetővel rendelkező eszköz	A besorolást a legveszélyesebb gömb-bomba határozza meg.	
	Előre töltött csövek, csőben lévő bombák	Kilövésre tervezett, a csőbe előre telepített gömb- vagy hengeres bomba	Mindenféle durranós bomba	1.1G
			Csillagos bombák: ≥ 180 mm	1.1G
			Csillagos bombák: $> 25\%$ laza por formájú villanó eleggyel és/vagy durranó effekttel	1.1G
			Csillagos bombák: > 50 mm és < 180 mm	1.2G
			Csillagos bombák: ≤ 50 mm vagy ≤ 60 g pirotechnikai anyaggal, $\leq 25\%$ laza por formájú villanó eleggyel és/vagy durranó effekttel	1.3G
	Bombák a bombában (gömb) (a „bombák a bombában” esetén a százalékra történő hivatkozás a tűzijáték test teljes tömegére vonatkozik)	Csőből való kilövésre tervezett eszköz lökőtöltet nélkül, késleltetővel és bontó töltettel, amely durranós bombákat és inert anyagokat tartalmaz	> 120 mm	1.1G
		Csőből való kilövésre tervezett eszköz lökőtöltet nélkül, késleltetővel és bontó töltettel, amely töltetegységenként ≤ 25 g villanó elegyet tartalmazó durranós bombákat tartalmaz, valamint $\leq 33\%$ villanó elegyet és $\geq 60\%$ inert anyagot	≤ 120 mm	1.3G
		Csőből való kilövésre tervezett eszköz lökőtöltet nélkül, késleltetővel és bontó töltettel, amely csillagos bombákat és/vagy pirotechnikai töltetegységeket tartalmaz	> 300 mm	1.1G

Típus	Tartalom/szinonima	Meghatározás	Részletes leírás	Besorolás
		Csőből való kilövésre tervezett eszköz lököttöltet nélkül, késleltetővel és bontó töltettel, amely ≤ 70 mm csillagos bombákat és/vagy pirotechnikai töltetegységeket tartalmaz, valamint $\leq 25\%$ villanó elegyet és $\leq 60\%$ pirotechnikai anyagot	> 200 mm és ≤ 300 mm	1.3G
		Csőből való kilövésre tervezett eszköz lököttöltettel, késleltetővel és bontó töltettel, amely ≤ 70 mm csillagos bombákat és/vagy pirotechnikai töltetegységeket tartalmaz, valamint $\leq 25\%$ villanó elegyet és $\leq 60\%$ pirotechnikai anyagot	≤ 200 mm	1.3G
Telepek/ Kombinációk	Telepek, finálé telepek, bombetta telepek	Több, megszerelt elem, amely egyforma vagy különböző, de az ebben a táblázatban felsorolt valamely tűzijáték testnek megfelelő típusú tűzijáték testet tartalmaz, egy vagy két indítási ponttal	A besorolást a legveszélyesebb tűzijáték test típus határozza meg.	
Római gyertyák	Római gyertyák	Olyan pirotechnikai töltetegységek sorozatát tartalmazó cső, amelyek változó pirotechnikai anyagot, lököttölteteket és késleltetőket tartalmaznak	≥ 50 mm belső átmérővel, villanó eleggyel, vagy < 50 mm belső átmérővel és $> 25\%$ villanó eleggyel	1.1G
			≥ 50 mm belső átmérővel, villanó elegy nélkül	1.2G
			< 50 mm belső átmérővel és $\leq 25\%$ villanó eleggyel	1.3G
			≤ 30 mm belső átmérővel, minden pirotechnikai töltetegység ≤ 25 g és $\leq 5\%$ villanó eleggyel	1.4G
Egylövéses római gyertyák	Egylövéses római gyertyák, kis, előre töltött csövek	Olyan pirotechnikai töltetegységet tartalmazó cső, amely pirotechnikai anyagot, lököttöltetet tartalmaz, késleltetővel vagy anélkül	≤ 30 mm belső átmérővel és > 25 g pirotechnikai töltetegységgel vagy $> 5\%$ és $\leq 25\%$ villanó eleggyel	1.3G
			≤ 30 mm belső átmérővel, ≤ 25 g pirotechnikai töltetegységgel és $\leq 5\%$ villanó eleggyel	1.4G
Rakéták	Jelző rakéták, fűtőülő rakéták, nem pálcás rakéták	Levegőben való repülésre tervezett, pirotechnikai anyagot és/vagy pirotechnikai töltetegységet tartalmazó cső, vezető pálcával/pálcákkal vagy más, repülés stabilizáló eszközzel felszerelve	Csak villanó elegy tartalommal	1.1G
			A pirotechnikai anyag tartalomából a villanó elegy tartalom $> 25\%$	1.1G
			> 20 g pirotechnikai anyag tartalommal és $\leq 25\%$ villanó elegy tartalommal	1.3G
			≤ 20 g pirotechnikai anyag tartalommal, fekete lőpor bontó töltettel és durranó betétenként $\leq 0,13$ g, de összesen ≤ 1 g villanó eleggyel	1.4G

Típus	Tartalom/szinonima	Meghatározás	Részletes leírás	Besorolás
Tűzijáték mozsár	Tűzijáték mozsár, cső nélküli mozsár	Földre való állításra vagy földbe való rögzítésre tervezett, lökőtöltetet és pirotechnikai töltetegységet tartalmazó cső. A fő effekt az összes pirotechnikai töltetegység egy kifújásban való kilövése által a levegőben nagymértékben szétterjedő vizuális és/vagy hang effekt létrehozása; vagy: Vetőcsőben való elhelyezésre és mozsárként való működésre tervezett, szövet vagy papír zacskó, ill. szövet vagy papír henger, ami lökőtöltetet és pirotechnikai töltetegységeket tartalmaz.	> 25% laza por formájú villanó eleggyel és/vagy durranó effekttel	1.1G
			≥ 180 mm, $\leq 25\%$ laza por formájú villanó eleggyel és/vagy durranó effekttel	1.1G
			< 180 mm, $\leq 25\%$ laza por formájú villanó eleggyel és/vagy durranó effekttel	1.3G
			≤ 150 g pirotechnikai anyag $\leq 5\%$ laza por formájú villanó eleggyel és/vagy durranó effekttel. Minden töltetegység ≤ 25 g, minden durranó effekt < 2 g; minden fűtőlő, ha van ≤ 3 g	1.4G
Szikraszökőkút	Vulkánok, szikraszóró petárdák, vízesés, bengálégők, bengáli tüzek, hengeres szikraszökőkutak, világító/színes fáklyák	Nem fém burkolatú, préselt vagy szilárd, szikrát vagy lángot produkáló pirotechnikai anyagot tartalmazó eszköz	≥ 1 kg pirotechnikai anyaggal	1.3G
			< 1 kg pirotechnikai anyaggal	1.4G
Csillagszóró	Kézi csillagszóró, nem kézi csillagszóró	Merev drót részlegesen (az egyik végén) bevonva lassan égő pirotechnikai anyaggal, gyújtó véggel vagy anélkül	Perklorát alapú csillagszóró: darabonként > 5 g vagy csomagonként > 10 darab	1.3G
			Perklorát alapú csillagszóró: darabonként ≤ 5 g és csomagonként ≤ 10 darab; Nitrát alapú csillagszóró: darabonként ≤ 30 g	1.4G
Bengálgyufa	Bengálfáklya, vihargyufa	Kézben való tartásra tervezett, nem fém rúd részlegesen (az egyik végén) bevonva lassan égő pirotechnikai anyaggal	Perklorát alapú eszköz: darabonként > 5 g vagy csomagonként > 10 darab	1.3G
			Perklorát alapú eszköz: darabonként ≤ 5 g és csomagonként ≤ 10 darab; Nitrát alapú eszköz: darabonként ≤ 30 g	1.4G
Kis veszélyességű tűzijáték testek és újdonságok	Asztali bombák, recsegő szemcsék, füstök, ködök, pirotechnikai szerpentinek (<i>angolul: party poppers</i>), durranó egérkék (<i>angolul: throwdowns, snaps</i>)	Nagyon korlátozott látvány és hang kibocsátásra tervezett eszközök, amelyek kis mennyiségben tartalmaznak pirotechnikai anyagot és/vagy robbanó összetevőt	A „ <i>throwdowns</i> ” és a „ <i>snaps</i> ” tartalmazhat legfeljebb 1,6 mg ezüst fulminátot; A „ <i>snaps</i> ” és a „ <i>party poppers</i> ” tartalmazhat legfeljebb 16 mg kálium-klorát és vörös foszfor keveréket; A többi eszköz tartalmazhat legfeljebb 5 g pirotechnikai anyagot, de villanóelegyet nem.	1.4G

Típus	Tartalom/szinonima	Meghatározás	Részletes leírás	Besorolás
Forgók	Légi forgók, lepkék, földi forgók	Szikrát vagy gázt termelő pirotechnikai anyagot tartalmazó nem fém cső vagy csövek zajkeltő (fütyülő) eleggyel vagy a nélkül, szárnyakkal vagy szárnyak nélkül	Eszközönként > 20 g pirotechnikai anyaggal, amely ≤ 3% villanó elegyet, mint durranó effektet tartalmaz, vagy ≤ 5 g fütyülő elegyet tartalmaz	1.3G
			Eszközönként ≤ 20 g pirotechnikai anyaggal, amely ≤ 3% villanó elegyet, mint durranó effektet tartalmaz, vagy ≤ 5 g fütyülő elegyet tartalmaz	1.4G
Forgók	Katalin-kerék, szász-kerék	Pirotechnikai anyagot tartalmazó, megszerelt hajtóművek csatlakozó eszközzel úgy felszerelve, hogy el tudjon forogni	≥ 1 kg összes pirotechnikai anyaggal, durranó effekt nélkül, minden fütyülő (ha van) ≤ 25 g és a fütyülő elegy kerekenként ≤ 50 g	1.3G
			< 1 kg összes pirotechnikai anyaggal, durranó effekt nélkül, minden fütyülő (ha van) ≤ 5 g és a fütyülő elegy kerekenként ≤ 10 g	1.4G
Légi forgók	Repülő szász-kerék, UFO-k, korona	Hajtótöltetet és szikrát, lángot termelő és/vagy zajkeltő pirotechnikai anyagokat tartalmazó csövek. A csövek tartó-gyűrűre vannak rögzítve.	Az összes pirotechnikai anyag > 200 g vagy a pirotechnikai anyag hajtóművenként > 60 g, ≤ 3% villanó elegyet, mint durranó effektet tartalmaz, minden fütyülő (ha van) ≤ 25 g és a fütyülő elegy forgónként ≤ 50 g	1.3G
			Az összes pirotechnikai anyag ≤ 200 g és a pirotechnikai anyag hajtóművenként ≤ 60 g, ≤ 3% villanó elegyet, mint durranó effektet tartalmaz minden fütyülő (ha van) ≤ 5 g és a fütyülő elegy forgónként ≤ 10 g	1.4G
Vegyes csomag	Vegyes tűzijátékok	Az ebben a táblázatban felsorolt tűzijáték testeknek megfelelő típusú, többféle tűzijáték testek egy csomagban	A besorolást a legveszélyesebb tűzijáték test típus határozza meg.	
Petárda füzér	Petárda füzér	Megszerelt (papírból vagy kartonpapírból készült) csövek gyújtószállal összekötve, minden cső hangeffekt keltésére szolgál	Minden cső ≤ 140 mg villanó eleggyel vagy ≤ 1 g fekete löporral	1.4G
Petárda	Petárda	Nem fém csőben elhelyezett villanó elegy, amely hangeffekt keltésére szolgál	eszközönként > 2 g villanó eleggyel	1.1G
			eszközönként ≤ 2 g és belső csomagolásonként ≤ 10 g villanó eleggyel	1.3G
			eszközönként ≤ 1 g és belső csomagolásonként ≤ 10 g villanó eleggyel, vagy eszközönként ≤ 10 g fekete löporral	1.4G

2.2.1.1.8 *Kizárás az 1 osztályból*

2.2.1.1.8.1 Valamely anyag vagy tárgy a vizsgálati eredmények és az 1 osztály meghatározása alapján bármely ADR Szerződő Fél illetékes hatóságának jóváhagyásával kizárható az 1 osztályból. Ez a hatóság elismerheti olyan ország illetékes hatóságának a jóváhagyását is, amely nem szerződő fele az ADR-nek, feltéve, hogy a jóváhagyást a RID, az ADR, az ADN, az IMDG-kódex vagy az ICAO Műszaki Utasítások által előírt eljárás szerint adták ki.

2.2.1.1.8.2 Az illetékes hatóság 2.2.1.1.8.1 pont szerinti jóváhagyásával akkor zárható ki egy tárgy az 1 osztályból, ha három tárgy csomagolás nélkül vizsgálva, mindegyik a saját indító- vagy gyújtószerkezetével, vagy külső eszközzel a rendeletetésének megfelelően aktiválva, megfelel a következő kritériumoknak:

- a) egyetlen külső felületen sem lehet a hőmérséklet 65°C-nál magasabb, de legfeljebb 200°C-os pillanatnyi hőmérséklet csúcs elfogadható;
- b) sem a külső ház nem repedhet fel vagy nem robbanhat szét, sem pedig a tárgy, ill. leváló darabjai semelyik irányban nem mozdulhatnak el 1 m-nél nagyobb távolságra;

***Megjegyzés:** Amennyiben külső tűz befolyásolhatja a tárgy épségét, akkor ezeket az ismérveket az ISO 12097-3 szabvány szerinti tűzállósági vizsgálattal kell vizsgálni.*

- c) 1 m távolságban 135 dB(C)-nél nagyobb hanghatás csúcs nem érzékelhető;
- d) nem keletkezik semmiféle felvillanó fény vagy láng, ami a tárggyal érintkező, $80 \pm 10 \text{ g/m}^2$ -es papírlapot meg tudná gyújtani;
- e) nem képződik olyan mennyiségű füst, gőz vagy köd, ami egy megfelelően méretezett elszívóval ellátott, egy köbméteres kamrában a szemközti falak középpontjában elhelyezett, állandó fényforrástól egy méter távolságban, hitelesített fénymérővel (lux mérővel) vagy radiométerrel mérve a láthatóságot 50%-nál nagyobb mértékben csökkenti. Az ISO 5659-1 szabvány szerinti optikai sűrűség mérésre vonatkozó általános útmutató és az ISO 5659-2 szabvány 7.5 pontja szerinti fotometrikus rendszerre vonatkozó általános útmutató használható, vagy hasonló, ugyanezen célra szolgáló optikai sűrűség mérési eljárások is alkalmazhatók. A fénymérő hátát és oldalait alkalmas burkolattal kell körülvenni, hogy a nem közvetlenül a fényforrásból származó, szórt vagy kiszűrődő fény hatását minimumra csökkentse;

***Megjegyzés: 1.** Ha az a), b), c) és d) pontok szerinti vizsgálatnál egyáltalán nem vagy csak nagyon kevés füst figyelhető meg, az e) pontban leírt vizsgálatról el lehet tekinteni.*

***2.** A 2.2.1.1.8.1 pont szerinti illetékes hatóság előírhatja, hogy a tárgyat a csomagolásában vizsgálják, ha megállapítást nyert, hogy a szállításra kész csomagolásban nagyobb veszélyt jelenthet.*

2.2.1.2 *A szállításból kizárt anyagok és tárgyak*

2.2.1.2.1 Azok a robbanóanyagok, amelyek a „Vizsgálatok és kritériumok kézikönyv”, I. Rész kritériumai szerint nagymértékben robbanásérzékenyek, vagy amelyeknél spontán reakció léphet fel, valamint azok a robbanóanyagok és -tárgyak, amelyek nem sorolhatók a 3.2 fejezet „A” táblázatának valamely megnevezése vagy m.n.n. tétele alá, a szállításból ki vannak zárva.

2.2.1.2.2 A K összeférhetőségi csoport tárgyai a szállításból ki vannak zárva (1.2K – UN 0020 és 1.3K – UN 0021).

2.2.1.3

a) EVI = explosive, very insensitive (angol rövidítés)

b) EEI = explosive, extremely insensitive (angol rövidítés)

2.2.1.4 A megnevezések szójegyzéke

Megjegyzés: 1. A szójegyzékben található meghatározások nem helyettesíthetik sem a vizsgálati eljárásokat, sem az 1 osztályba tartozó valamely anyag vagy tárgy veszélyesség szempontjából való osztályozását. A termékeknek a megfelelő alosztályhoz való hozzárendelését és annak eldöntését, hogy az S összeférhetőségi csoporthoz kell-e sorolni, a „Vizsgálatok és kritériumok kézikönyv” I. Része szerint végzett vizsgálat, vagy már megvizsgált és a „Vizsgálatok és kritériumok kézikönyv” eljárása alapján besorolt, hasonló termékek analógiája alapján kell elvégezni.

2. A nevek után álló számok a megfelelő UN számra utalnak (3.2 fejezet „A” táblázat 1 oszlop). Az osztályozási kódra lásd a 2.2.1.1.4 pontot.

AKNÁK robbanótöltettel: UN 0136, 0294

Ezek a tárgyak detonáló robbanóanyaggal töltött fém vagy kombinált anyagú tartályból állnak olyan gyújtószerkezettel, amely nincs ellátva két vagy több hatékony biztonsági szerkezettel. A tárgyak arra szolgálnak, hogy hajók, járművek vagy emberek elhaladásakor lépjenek működésbe. Ide tartoznak ún. „Bangalori torpedók” is.

AKNÁK robbanótöltettel: UN 0137, 0138

Ezek a tárgyak detonáló robbanóanyaggal töltött fém vagy kombinált anyagú tartályból állnak, gyújtószerkezet nélkül vagy olyan gyújtószerkezettel, amely legalább két hatékony biztonsági szerkezettel van ellátva. A tárgyak arra szolgálnak, hogy hajók, járművek vagy emberek elhaladásakor lépjenek működésbe. Ide tartoznak ún. „Bangalori torpedók” is.

A TÍPUSÚ ROBBANTÓANYAG: UN 0081

Ezek az anyagok folyékony szerves nitrátokat, pl. nitroglicerint vagy ilyen anyagokból álló olyan keveréket tartalmaznak, melyekben a következő alkotórészek közül egy vagy több található: nitrocellulóz; ammónium-nitrát vagy más szervetlen nitrátok; aromás nitro-vegyületek vagy éghető anyagok, pl. faliszt vagy alumíniumpor. Ezenkívül tartalmazhatnak inert alkotórészeket, pl. kovaföldet vagy kis mennyiségű adalékanyagokat, pl. színezékeket vagy stabilizátorokat is. A robbantóanyagok porszerű, zselatinszerű vagy elastikus konzisztenciájúak legyenek. Ide tartoznak a dinamitok, a robbanó zselatinok és a plasztikus dinamitok.

BOMBÁK GYÚLÉKONY FOLYADÉK TARTALOMMAL, robbanótöltettel: UN 0399, 0400

Ezek olyan tárgyak, amelyeket légi járművekről dobnak le, és gyúlékony folyadékat tartalmazó tartályból és robbanóanyag-töltetből állnak.

BOMBÁK robbanótöltettel: UN 0033, 0291

Robbanóanyagot tartalmazó tárgyak, amelyeket légi járművekről dobnak le. Olyan gyújtószerkezetet tartalmaznak, amely nincs ellátva két vagy több hatékony biztonsági szerkezettel.

BOMBÁK robbanótöltettel: UN 0034; 0035

Ezek olyan robbanóanyagot tartalmazó tárgyak, amelyeket légi járművekről dobnak le. Vagy nem tartalmaznak gyújtószerkezetet vagy olyan gyújtószerkezetük van, amely legalább két hatékony biztonsági szerkezettel van ellátva.

BOMBÁK VILLANÓFÉNY TÖLTETTEL: UN 0037

Ezek olyan, robbanóanyagot tartalmazó tárgyak, amelyeket légi járművekről dobnak le, hogy rövid ideig ható, intenzív fényforrásul szolgáljanak fényképészeti célokra. Detonáló robbanóanyag-töltetet tartalmaznak olyan gyújtószerkezettel, amely nincs ellátva két vagy több hatékony biztonsági szerkezettel.

BOMBÁK VILLANÓFÉNY TÖLTETTEL: UN 0038

Ezek olyan, robbanóanyagot tartalmazó tárgyak, amelyeket légi járművekről dobnak le, hogy rövid ideig ható, intenzív fényforrásul szolgáljanak fényképészeti célokra. Detonáló robbanóanyag-töltetet tartalmaznak gyújtószerkezet nélkül, vagy gyújtószerkezettel, amely legalább két hatékony biztonsági szerkezettel van ellátva.

BOMBÁK VILLANÓFÉNY TÖLTETTEL: UN 0039, 0299

Ezek olyan robbanóanyagot tartalmazó tárgyak, amelyeket légi járművekről dobnak le, hogy rövid ideig ható, intenzív fényforrásul szolgáljanak fényképészeti célokra. Villanóanyag-töltetet tartalmaznak.

B TÍPUSÚ ROBBANTÓANYAG: UN 0082, 0331

Ezek az anyagok, amelyek vagy

- a) ammónium-nitrát vagy más szervesetlen nitrát robbanóanyagokkal, pl. trinitro-toluollal (TNT-vel), alkotott keverékből állnak, amelyek más anyagokat is, pl. falisztet és alumíniumport is tartalmazhatnak; vagy
- b) ammónium-nitrátból vagy más szervesetlen nitrátból és más éghető, nem robbanó anyagok keverékből állnak.

Mindkét esetben a robbantóanyagok tartalmazhatnak inert alkotórészeket, pl. kovaföldet és kis mennyiségű adalékanyagokat, pl. színezékeket vagy stabilizátorokat. Ezek a robbantóanyagok nem tartalmazhatnak sem nitroglicerint vagy hasonló folyékony szerves nitrátokat, sem pedig klorátokat.

C TÍPUSÚ ROBBANTÓANYAG: UN 0083

Ezek az anyagok kálium- vagy nátrium-klorát vagy kálium-, nátrium- vagy ammónium-perklorát és szerves nitrovegyületek vagy éghető anyagok, pl. faliszt, alumíniumpor vagy szénhidrogén keverékből állnak. Ezenkívül inert alkotórészeket, pl. kovaföldet és kis mennyiségű adalékanyagokat, pl. színezékeket vagy stabilizátorokat, is tartalmazhatnak. Ezek a robbantóanyagok nem tartalmazhatnak nitroglicerint vagy hasonló folyékony szerves nitrátokat.

DETONÁTORSZERKEZETEK, NEMVILLAMOSAK, robbantáshoz: UN 0360, 0361, 0500

Nemvillamos indítók, amelyek gyújtózsínórral, ütőgyújtóval, robbanózsínórral vagy gyújtócsővel vannak összekötve, és amelyeket ezekkel hoznak működésbe, késleltetővel ellátva, vagy anélkül. Ide értendők a relével szerelt robbanózsínók is.

D TÍPUSÚ ROBBANTÓANYAG: UN 0084

Ezek az anyagok szerves nitrovegyületek és éghető anyagok, pl. faliszt, szénhidrogének és -alumíniumpor keverékéből állnak. Ezenkívül inert alkotórészeket, pl. kovaföldet és kis mennyiségű adalékanyagokat, pl. színezékeket vagy stabilizátorokat is tartalmazhatnak. Ezek a robbantóanyagok nem tartalmazhatnak sem nitroglicerint vagy hasonló folyékony szerves nitrátokat, sem klorátokat, sem pedig ammónium-nitrátot. Ide tartoznak általában a plasztik robbantóanyagok.

E TÍPUSÚ ROBBANTÓANYAG: UN 0241, 0332

Ezek az anyagok vízből mint fő alkotórészből és nagy mennyiségű olyan ammónium-nitrátból vagy más oxidálószerből állnak, amelyek teljes egészében vagy részben oldott állapotban vannak. A további alkotórészek lehetnek nitrovegyületek, pl. trinitro-toluol, szénhidrogének vagy alumíniumpor. Ezenkívül inert alkotórészeket, pl. kovaföldet és kis mennyiségű adalékanyagokat, pl. színezékeket vagy stabilizátorokat is tartalmazhatnak. Ide tartoznak az emulziós robbantóanyagok, a robbantósuszpenziók és a „vízgél”.

FEKETE LŐPOR (PUSKAPOR), szemcsés vagy por alakú: UN 0027

Ez az anyag faszénből vagy más szénfajtából és kálium-nitrátból vagy nátrium-nitrátból, kénnel vagy anélkül alkotott belsőseges keverék.

FEKETE LŐPOR (PUSKAPOR), SAJTOLT vagy
FEKETE LŐPOR (PUSKAPOR), PELLETT: UN 0028

Ez a termék formázott fekete lőporból áll.

FORMÁZOTT TÖLTETEK detonátor nélkül: UN 0059, 0439, 0440, 0441

Ezek a tárgyak gyújtószer nélküli detonáló robbanóanyagból álló töltetet tartalmaznak. A robbanóanyag-töltet üreges kialakítású, ami szilárd anyaggal van kitöltve. A tárgyak arra szolgálnak, hogy erős romboló hatást fejtsenek ki.

FÜSTJELZŐK: UN 0196, 0197, 0313, 0487, 0507

Ezek a tárgyak pirotechnikai anyagot tartalmaznak, amely füstöt fejleszt. Ezenkívül tartalmazhatnak hallható hang keltésére szolgáló szerkezetet is.

FÜSTKÉPZŐ LŐSZER, FEHÉRFOSZFOR TARTALMÚ, robbanó-, kidobó- vagy hajtótöltettel: UN 0245, 0246

Olyan lőszer, amelyek füstképző anyagként fehérfoszfort tartalmaznak. A következő alkotórészekből is tartalmaznak egyet vagy többet: hajtótöltet gyutaccsal és indítótöltettel; gyújtók robbanó- vagy kidobótöltettel. E fogalom kódgránátokat is tartalmaz.

FÜSTKÉPZŐ LŐSZER, robbanó-, kidobó- vagy hajtótöltettel vagy anélkül: UN 0015, 0016, 0303

Olyan lőszer, amelyek füstképző anyagokat, pl. klór-szulfonsav keveréket vagy titán-tetrakloridot, vagy hexaklór-etán vagy vörösfoszfor alapú füstképző pirotechnikai keveréket tartalmaznak. Amennyiben a füstképző anyag maga nem robbanóanyag, akkor a lőszer a következő alkotórészekből is tartalmaz egyet vagy többet: hajtótöltet gyutaccsal és gyújtótöltettel; gyújtók robbanó- vagy kidobótöltettel. E fogalom kódgránátokat is tartalmaz.

Megjegyzés: A FÜSTJELZŐK nem tartoznak ide. Ezek a jelen szójegyzékben külön vannak feltüntetve.

FÜST NÉLKÜLI LŐPOR: UN 0160, 0161, 0509

Nitrocellulóz alapon felépített anyag, amelyet lőporként használnak. A fogalom alá tartozik az egybázisú, füst nélküli lőpor [nitrocellulóz (NC) önállóan], a kétbázisú, füst nélküli lőpor [pl. az NC nitroglicerinnel (NG-vel)] és a hárombázisú, füst nélküli lőpor (pl. az NC/NG/nitroguanidin).

***Megjegyzés:** Az öntött, sajtolt és töltetzacskóban levő, füst nélküli lőpor a HAJTÓ-TÖLTETEK vagy a KIDOBÓTÖLTETEK LÖVEGEKHEZ címszó alá tartozik.*

GOLYÓS PERFORÁTORTÖLTÉNY OLAJKUTAK FÚRÁSÁHOZ: UN 0277, 0278

Ezek a tárgyak vékony papírlemezről, fémből vagy más anyagból készített házból állnak és füst nélküli lőport tartalmaznak. Arra valók, hogy edzett lövedéket löjjenek ki és ezzel az olaj-fürölük béléscsővét átlukasszák.

***Megjegyzés:** A FORMÁZOTT TÖLTETEK nem tartoznak ide. Ezek a jelen szójegyzékben külön szerepelnek.*

GRÁNÁTOK, kézi-, vagy fegyvergránátok robbanótöltettel: UN 0284, 0285

Ezek a tárgyak kézből történő hajításra vagy fegyverből való kilövésre szolgálnak. Vagy nem tartalmaznak gyújtószerkezetet, vagy olyan gyújtószerkezetet tartalmaznak, amely legalább két hatékony biztonsági szerkezettel van ellátva.

GRÁNÁTOK, kézi-, vagy fegyvergránátok robbanótöltettel: UN 0292, 0293

Ezek a tárgyak kézből történő hajításra vagy fegyverből való kilövésre szolgálnak. Olyan gyújtószerkezetet tartalmaznak, amely nincs ellátva két vagy több hatékony biztonsági szerkezettel.

GYAKORLÓGRÁNÁTOK, kézi- vagy fegyvergránátok: UN 0110, 0318, 0372, 0452

Ezek a tárgyak nem tartalmaznak fő robbanótöltetet. Kézből történő hajításra vagy fegyverből való kilövésre szolgálnak. Tartalmaznak gyújtószerkezetet és tartalmazhatnak jelzőtöltetet.

GYAKORLÓLŐSZER: UN 0362, 0488

Olyan lőszer, amely nem tartalmaz fő robbanótöltetet, de tartalmaz szétvető- vagy kidobótöltetet. A lőszer rendszerint gyutacsot és hajtótöltetet is tartalmaz.

***Megjegyzés:** A GYAKORLÓGRÁNÁTOK nem tartoznak ezen fogalom alá. Ezek a jelen szójegyzékben önállóan szerepelnek.*

GYÚJTÁSERŐSÍTŐK DETONÁTORRAL: UN 0225, 0268

A tárgyak detonáló robbanóanyagot és gyújtószert tartalmaznak, és a detonátor vagy robbanózsínór gyújtóimpulzusának erősítésére szolgálnak.

GYÚJTÁSERŐSÍTŐK detonátor nélkül: UN 0042, 0283

Ezek a tárgyak gyújtószert nélküli detonáló robbanóanyagot tartalmaznak és a detonátor vagy robbanózsínór gyújtóimpulzusának erősítésére szolgálnak.

GYÚJTÓK: UN 0121, 0314, 0315, 0325, 0454

Ezek a tárgyak egy vagy több robbanóanyagot tartalmaznak. Rendeltetésük a robbantó- vagy gyújtóláncban a deflagráció kiváltása. A tárgyak vegyi, villamos vagy mechanikus úton hozhatók működésbe.

***Megjegyzés:** A következő tárgyak nem tartoznak e fogalom alá: GYÚJTÓZSINÓR; GYÚJTÓZSINÓR-GYÚJTÓK; GYUTACS-CSÖVEK, GYUTACSSZELENCÉK; GYUTACSKAPSZULÁK; INDÍTÓGYÚJTÓK; PILLANAT-*

GYÚJTÓ, NEM ROBBANÓ; ROBBANÓZSINÓR. Ezek a jelen szó-jegyzékben külön szerepelnek.

GYÚJTÓZSINÓR: UN 0066

Ez a tárgy vagy fekete lőporral vagy más, gyorsan égő pirotechnikai keverékkel bevont textilszálakból készül, amely szálak hajlékony tömlőben vannak, vagy fekete lőpor bélből áll, amely hajlékony szövött textilburkolattal van körülvéve. A gyújtózsínór teljes hosszúsága mentén előrehaladó nyílt lánggal ég, és a gyújtás átvitelére használatos valamely gyújtókészüléktől töltetre vagy gyújtószerkezetre.

GYÚJTÓZSINÓR, BIZTONSÁGI: UN 0105

Ez a tárgy finom szemcsés fekete lőpor belet tartalmaz, amely hajlékony textilszövetből álló egy- vagy többretegű külső burkolattal van ellátva. A zsinór meggyújtás után mindenféle robbanó hatás nélkül meghatározott sebességgel végigég.

GYÚJTÓZSINÓR-GYÚJTÓK, cső formájú fémköpennyel: UN 0103

Ez a tárgy deflagráló robbanóanyag-béllel ellátott fémcső.

GYÚJTÓZSINÓR-GYÚJTÓK: UN 0131

Különböző felépítésű tárgyak, amelyek a biztonsági gyújtózsínór begyűjtására szolgálnak. Dörzsöléssel, ütéssel vagy villamos úton lépnek működésbe.

GYUTACSCSÖVEK, GYUTACSSZELENCÉK: UN 0319, 0320, 0376

Primer robbanóanyagból és deflagráló robbanóanyagból, pl. fekete lőporból, álló kiegészítő töltetet tartalmazó tárgyak. A lövegekhez való lövedék hüvelyében levő töltet indításához használják.

GYUTACSKAPSZULÁK: UN 0044, 0377, 0378

Ütésre könnyen robbanó, kis mennyiségű primer robbanóanyag keveréket tartalmazó fém- vagy műanyag gyutacskapszula. Ezek a tárgyak kézfegyver töltényekben indítóelemként és lövegeknél ütőgyutacsként használatosak.

GYUTACSOK LŐSZEREKHEZ: UN 0073, 0364, 0365, 0366

Ezek a tárgyak kis fém- vagy műanyagcsőből állnak, és robbanóanyagot, pl. ólom-azidot, PETN-t vagy robbanóanyagok kombinációját tartalmazzák. A gyújtólánc indítására valók.

GYUTACSOK, NEMVILLAMOSAK, robbantáshoz: UN 0029, 0267, 0455

Ezek a tárgyak az ipari robbantóanyagok indítására valók késleltető szerkezettel vagy anélkül. A nemvillamos gyutacsokat ütőgyújtóval, gyújtócsővel, gyújtózsínórral, egyéb robbantóeszközzel, vagy hajlékony robbanózsínórral hozzák működésbe. Ide tartoznak a robbanózsínór nélküli kapcsolók is.

GYUTACSOK, VILLAMOSAK, robbantáshoz: UN 0030, 0255, 0456

Ezek a tárgyak az ipari robbantóanyagok indítására szolgálnak, késleltető szerkezettel vagy anélkül. A villamos gyutacsokat villamos árammal hozzák működésbe.

HAJTÓANYAG, FOLYÉKONY: UN 0495, 0497

Deflagráló, folyékony robbanóanyag tárgyak mozgatóására.

HAJTÓANYAG, SZILÁRD: UN 0498, 0499, 0501

Deflagráló, szilárd robbanóanyag tárgyak mozgatóására.

HAJTÓTÖLTETEK: UN 0271, 0272, 0415, 0491

Ezek a tárgyak tetszőleges fizikai formájú hajtótöltetből állnak burkolattal vagy anélkül és

mint rakétamotorok alkotórészeként vagy a lövedék lassulásának csökkentésére szolgálnak.

HEXOTONAL: UN 0393

Ez az anyag ciklotrimetilén-trinitramin (RDX), trinitro-toluol (TNT) és alumínium belsőséges keverékéből áll.

HEXOLIT (HEXOTOL), száraz vagy 15 tömeg%-nál kevesebb vízzel nedvesített: UN 0118

Ez az anyag ciklotrimetilén-trinitramin (RDX) és trinitro-toluol (TNT) belsőséges keverékéből áll. Ide tartozik a „Composition B” is.

INDÍTÓGYÚJTÓK: UN 0316, 0317, 0368

Ezek a tárgyak primer robbanóanyagot tartalmaznak, és lőszerekben a deflagráció kiváltására valók. A deflagráció kiváltására mechanikai, villamos, kémiai vagy hidrosztatikus úton aktiválható szerkezetet tartalmaznak. Rendszerint biztonsági szerkezettel rendelkeznek.

JELZŐPATRONOK: UN 0054, 0312, 0405

Ezek a tárgyak arra valók, hogy színes fényjeleket vagy más jeleket adjanak jelzőpisztolyból vagy egyéb eszközből kilőve.

JELZŐTESTEK, KÉZI: UN 0191, 0373

Ezek hordozható tárgyak, amelyek pirotechnikai anyagot tartalmaznak, és látható jelző vagy figyelmeztető hatást keltenek. Ide tartoznak a kisméretű földi világítótestek, pl. autópálya fáklyák, vasúti fáklyák vagy kis vízi fáklyák.

KÁBELVÁGÓ SZERKEZET ROBBANÓANYAGGAL: UN 0070

Ez a tárgy egy késszerű szerkezetből áll, amelyet deflagráló robbanóanyagból álló kis töltet egy ellendarabhoz sajtol.

KÉZIFEGYVER TÖLTÉNYEK: UN 0012, 0339, 0417

Olyan lőszer, amelyek központi vagy peremgyújtású töltényhüvelyből állnak, valamint kidobótöltetet és szilárd lövedéket tartalmaznak. Legfeljebb 19,1 mm kaliberű fegyverekhez valók. Ide tartoznak a tetszőleges kaliberű sörétpatronok.

Megjegyzés: Nem tartoznak ide a VAKTÖLTÉNYEK KÉZI-FEGYVEREKHEZ, amelyek külön vannak feltüntetve, és egyes katonai kézfegyvertöltények, amelyek a TÖLTÉNYEK FEGYVEREKHEZ INERT LÖVEDÉKKEL fogalomba tartoznak.

KIDOBÓTÖLTETEK LÖVEGEKHEZ: UN 0242, 0279, 0414

Löveg-lőszerkezetekhez külön betöltendő kidobótöltetek bármilyen fizikai formában.

KIOLDÓSZERKEZETEK, ROBBANÓANYAG TARTALMÚAK: UN 0173

Ezek a tárgyak kis robbanótöltetből, gyújtószerkezetből és rudazatból vagy összekötő darabból állnak. Arra valók, hogy a rudazat vagy összekötő darab átszakításával a szerkezeteket gyorsan szétkapcsolják.

KÖTÉLVETŐ RAKÉTÁK: UN 0238, 0240, 0453

Ezek a tárgyak rakétahajtóműből állnak, és arra valók, hogy kötelet húzzanak magukkal.

KÖZETREPESZTŐ TORPEDÓK, detonátor nélkül, olajkutak fúrásához: UN 0099

Ezek a tárgyak gyújtószer nélküli detonáló robbanóanyagot tartalmazó házából állnak. A fúrólyuk környezetében a közet repesztésére használják, hogy a kőolaj kilépését a közetből megkönnyítsék.

LÉGZSÁK GÁZGENERÁTOR vagy **LÉGZSÁK MODUL** vagy **BIZTONSÁGI ÖV ELŐFESZÍTŐ**: UN 0503

Pirotechnikai anyagot tartalmazó tárgyak, amelyeket gépjárműben életmentő légzsákként vagy biztonsági övként használnak.

LŐPORBRIKETT (LŐPORPASZTA), legalább 17 tömeg% alkohollal **NEDVESÍTETT**: UN 0433

LŐPORBRIKETT (LŐPORPASZTA), legalább 25 tömeg% vízzel **NEDVESÍTETT**: UN 0159

Nitrocellulózsból álló anyag, amely legfeljebb 60 tömeg% nitroglicerinnel, más folyékony szerves nitráttal vagy ezek keverékével van impregnálva.

LŐSZER, GYÚJTÓ HATÁSÚ, gyúlékony folyadék vagy gél tartalommal, robbanó-, kidobó- vagy hajtótöltettel: UN 0247

Olyan lőszer, amelyek folyékony vagy gélyszerű gyújtóanyagot tartalmaznak. Amennyiben a gyújtóanyag maga nem robbanóanyag, akkor a lőszer a következő alkotórészekből is tartalmaz egyet vagy többet: hajtótöltet gyutaccsal és indítótöltettel; gyújtók robbanó- vagy kidobótöltettel.

LŐSZER, GYÚJTÓ HATÁSÚ, robbanó-, kidobó- vagy hajtótöltettel vagy anélkül: UN 0009, 0010, 0300

Olyan lőszer, amelyek gyújtó hatású anyagot tartalmaznak. Amennyiben a gyújtóanyag maga nem robbanóanyag, akkor a lőszer a következő alkotórészekből is tartalmaz egyet vagy többet: hajtótöltet gyutaccsal és indítótöltettel; gyújtók robbanó- vagy kidobótöltettel.

LŐSZER, GYÚJTÓ HATÁSÚ, FEHÉRFOSZFOR TARTALMÚ, robbanó-, kidobó- vagy hajtótöltettel: UN 0243, 0244

Olyan lőszer, amelyek gyújtóanyagként fehérfoszfort tartalmaznak. A következő alkotórészekből is tartalmaznak egyet vagy többet: hajtótöltet gyutaccsal és indítótöltettel; gyújtók robbanó- vagy kidobótöltettel.

LŐSZER, KÖNNYEZTETŐ HATÁSÚ, robbanó-, kidobó- vagy hajtótöltettel: UN 0018, 0019, 0301

Olyan lőszer, amelyek könnyeztető anyagot tartalmaznak. A következő alkotórészekből is tartalmaznak egyet vagy többet: pirotechnikai anyag; hajtótöltet gyutaccsal és indítótöltettel; gyújtók robbanó- vagy kidobótöltettel.

LŐSZER, VILÁGÍTÓ HATÁSÚ, robbanó-, kidobó- vagy hajtótöltettel vagy anélkül: UN 0171, 0254, 0297

Olyan lőszer, amelyek intenzív fényforrásként szolgálhatnak valamely terület megvilágítására. A fogalom tartalmazza a világítógránátokat és világítólövedékeket, valamint a világítóbombákat és a célmegjelölő bombákat is.

***Megjegyzés:** A következő tárgyak nem tartoznak e fogalomkörbe: JELZŐPATRONOK; JELZŐTESTEK, KÉZI; VÉSZJELZŐK, tengeri; VILÁGÍTÓTESTEK, FÖLDI; VILÁGÍTÓTESTEK, LÉGI. Ezek a jelen szójegyzékben külön vannak feltüntetve.*

LÖVEDÉKEK, inert, nyomjelzőszerrel: UN 0345, 0424, 0425

Olyan tárgyak, mint pl. a gránátok vagy golyók, amelyeket ágyúból vagy más lövegből, puskákból vagy más kézfegyverből lőnek ki.

LÖVEDÉKEK robbanó- vagy kidobótöltettel: UN 0346, 0347

Olyan tárgyak, mint pl. a gránátok vagy golyók, amelyeket ágyúból vagy más lövegből lőnek ki. Ezek a tárgyak vagy nem tartalmaznak gyújtószeret vagy olyan gyújtószeret tartalmaznak,

amely legalább két hatékony biztonsági szerkezettel van ellátva. Színjelzésre vagy más inert anyag szétszórására valók.

LÖVEDÉKEK robbanó- vagy kidobótöltettel: UN 0426, 0427

Olyan tárgyak, mint pl. a gránátok vagy golyók, amelyeket ágyúból vagy más lövegből lőnek ki. Ezek a tárgyak olyan gyújtószert tartalmaznak, amely nincs ellátva legalább két hatékony biztonsági szerkezettel. Színjelzésre vagy más inert anyag szétszórására valók.

LÖVEDÉKEK robbanó- vagy kidobótöltettel: UN 0434, 0435

Olyan tárgyak, mint pl. a gránátok vagy golyók, amelyeket ágyúból vagy más lövegből, puskból vagy más kézfegyverből lőnek ki. Színjelzésre vagy más inert anyag szétszórására valók.

LÖVEDÉKEK robbanótöltettel: UN 0167, 0324

Olyan tárgyak, mint pl. a gránátok vagy golyók, amelyeket ágyúból vagy más lövegből lőnek ki. Ezek a tárgyak olyan gyújtószert tartalmaznak, amely nincs ellátva legalább két hatékony biztonsági szerkezettel.

LÖVEDÉKEK robbanótöltettel: UN 0168, 0169, 0344

Olyan tárgyak, mint pl. a gránátok vagy golyók, amelyeket ágyúból vagy más lövegből lőnek ki. Ezek a tárgyak vagy nem tartalmaznak gyújtószert vagy olyan gyújtószert tartalmaznak, amely legalább két hatékony biztonsági szerkezettel van ellátva.

MUNKAVÉGZŐ TÖLTETEK: UN 0275, 0276, 0323, 0381

Ezek a tárgyak arra valók, hogy mechanikai hatásokat váltsanak ki. Deflagráció robbanó-anyagból álló töltetet és gyújtót tartalmazó házból állnak. A deflagrációs termékek robbanási gázai tárgyakat fújnak fel, egyenes vonalú vagy forgó mozgást hoznak létre, vagy megszakítókat, szelepeket vagy kapcsolókat működtetnek, rögzítőelemeket löknek ki, vagy oltószerkezeteket aktiválnak.

NAGYON ÉRZÉKETLEN ROBBANÓANYAGOK (EVI ANYAGOK), M.N.N.: UN 0482

Olyan anyagok, amelyek tömegrobbanási veszélyt képviselnek ugyan, de annyira érzéketlenek, hogy igen csekély az iniciálás vagy az égésből a detonálásba való átmenet veszélye a normális szállítási feltételek között, és amelyek kiállták az 5. vizsgálati sorozatot.

NYOMJELZŐK LŐSZEREKHEZ: UN 0212, 0306

Ezek olyan zárt tárgyak, amelyek pirotechnikai anyagot tartalmaznak és arra szolgálnak, hogy a lövedékek röppályáját láthatóvá tegyék.

OKTOLIT (OKTOL), száraz vagy 15 tömeg%-nál kevesebb vízzel nedvesített: UN 0266

Ez az anyag ciklotetrametilén-tetranitramin (HMX) és trinitro-toluol (TNT) belsőséges keverékéből áll.

OKTONAL: UN 0496

Ez az anyag ciklotetrametilén-tetranitramin (HMX), trinitro-toluol (TNT) és alumínium belsőséges keverékéből áll.

PENTOLIT, száraz vagy 15 tömeg%-nál kevesebb vízzel nedvesített: UN 0151

Ez az anyag pentaeritrit-tetranitrát (PETN) és trinitro-toluol (TNT) belsőséges keverékéből áll.

PERFORÁTOR PUSKÁK, TÖLTETTEL, detonátor nélkül, olajkutak fúrásához: UN 0124, 0494

Ezek a tárgyak acélcsőből vagy fémszalagból állnak, amelyben formázott töltetek vannak. A

tölteteket robbanózsínórok kötik össze. Nem tartalmazznak indítószervezetet.

PILLANATGYÚJTÓ, NEM ROBBANÓ: UN 0101

Ezek a tárgyak pamutszálakból állnak, amelyek fekete löporral vannak impregnálva (gyújtószál). Nyílt lánggal égnék és tűzijáték testek stb. gyújtóláncaiban kerülnek alkalmazásra.

PIROFOROS TÁRGYAK: UN 0380

Ezek a tárgyak piroforos (levegő hatására öngyulladásra hajlamos) anyagot és valamilyen robbanóanyagot vagy robbanó alkotórészt tartalmazznak. Nem tartoznak e fogalom alá a fehérfoszfor tartalmú tárgyak.

PIROTECHNIKAI TÁRGYAK műszaki célokra: UN 0428, 0429, 0430, 0431, 0432

Olyan tárgyak, amelyek pirotechnikai anyagot tartalmazznak, és műszaki célokra használatosak, pl. hőfejlesztésre, gázfejlesztésre vagy színházi hatások elérésére.

Megjegyzés: A következő tárgyak nem tartoznak e fogalomkörbe: FÜSTJELZŐK; JELZÓPATRONOK; JELZŐTESTEK, KÉZI; KÁBELVÁGÓ SZERKEZET ROBBANÓANYAGGAL; KIOLDÓSZERKEZETEK, ROBBANÓANYAG TARTALMÚAK; mindenféle lőszer; ROBBANÓSZEGECSEK; TŰZIJÁTÉK TESTEK; VASÚTI DURRANTYÚK; VÉSZJELZŐK, tengeri; VILÁGÍTÓTESTEK, FÖLDI; VILÁGÍTÓTESTEK, LÉGI. Ezek a jelen szójegyzékben külön vannak feltüntetve.

PRÓBALŐSZER: UN 0363

Olyan lőszer, amely pirotechnikai anyagot tartalmaz, és új lőszer, fegyverrész vagy fegyverrendszer működőképességének és hatásosságának vizsgálatára való.

RAKÉTAHAJTÓMŰVEK: UN 0186, 0280, 0281

Ezek a tárgyak toló hatású töltetből (rendszerint szilárd hajtóanyagból) állnak, amely egy vagy több fűvókával ellátott hengerben található. Rakéták vagy irányítható lövedékek hajtására valók.

RAKÉTAHAJTÓMŰVEK FOLYÉKONY HAJTÓANYAGGAL: UN 0395, 0396

Ezek a tárgyak egy vagy több fűvókát tartalmazó hengerből állnak, amely folyékony hajtóanyagot tartalmaz. A tárgyak rakéták vagy irányítható lövedékek hajtására valók.

RAKÉTAHAJTÓMŰVEK HIPERGOL FOLYADÉKOKKAL, kidobótöltettel vagy anélkül: UN 0250, 0322

Ezek a tárgyak hipergol hajtóanyagból állnak, amely egy vagy több fűvókával ellátott hengerben található. Rakéták vagy irányítható lövedékek hajtására valók.

RAKÉTÁK FOLYÉKONY HAJTÓANYAGGAL, robbanótöltettel: UN 0397, 0398

Ezek a tárgyak folyékony hajtóanyaggal töltött, egy vagy több fűvókával ellátott hengerből és támadófejből állnak. Ide tartoznak irányítható lövedékek is.

RAKÉTÁK inert fejjel: UN 0183, 0502

Ezek a tárgyak rakétahajtóműből és inert fejből állnak. Ide tartoznak irányítható lövedékek is.

RAKÉTÁK kidobótöltettel: UN 0436, 0437, 0438

A tárgyak rakétahajtóműből és kidobótöltetből állnak, a hasznos teher rakétafejből való kidobására szolgálnak. Ide tartoznak irányítható lövedékek is.

RAKÉTÁK robbanótöltettel: UN 0180, 0295

Ezek a tárgyak rakétahajtóműből és támadófejből állnak. Olyan gyújtószerkezetet tartalmaznak, amely nincs ellátva legalább két hatékony biztonsági szerkezettel. Ide tartoznak az irányítható lövedékek is.

RAKÉTÁK robbanótöltettel: UN 0181, 0182

Ezek a tárgyak rakétahajtóműből és támadófejből állnak. Vagy nem tartalmaznak gyújtószerkezetet vagy olyan gyújtószerkezetet tartalmaznak, amely legalább két hatékony biztonsági szerkezettel van ellátva. Ide tartoznak irányítható lövedékek is.

RENDKÍVÜL ÉRZÉKETLEN ROBBANÓTÁRGYAK (EEI TÁRGYAK): UN 0486

Olyan tárgyak, amelyek csak rendkívül érzéketlen anyagokat tartalmaznak és véletlen beindulási vagy detonálás továbbviteli-hajlamuk normális szállítási feltételek között elhanyagolható és kiállták a 7. vizsgálati sorozatot.

ROBBANÓANYAG MINTÁK, az indító robbanóanyagok kivételével: UN 0190

Új vagy régebben létező robbanóanyagok vagy robbanótárgyak, amelyek nincsenek besorolva a 3.2 fejezet „A” táblázatának egyetlen megnevezése alá sem, és az illetékes hatóság előírásai szerint általában kis mennyiségben kerülnek szállításra, többek között kísérleti, besorolási, kutatási és fejlesztési vagy minőségellenőrzési célból, vagy mint kereskedelmi minták.

Megjegyzés: Azok a robbanóanyagok és robbanótárgyak, amelyek a 3.2 fejezet „A” táblázatának valamely más megnevezése alá vannak besorolva, nem esnek ezen fogalom alá.

ROBBANÓGYÚJTÓK: UN 0106, 0107, 0257, 0367

Ezek a tárgyak robbanóelemeket tartalmaznak, amelyek a lőszerekben a detonáció kiváltására szolgálnak. A detonáció kiváltására mechanikai, villamos, kémiai vagy hidrosztatikus úton aktiválható szerkezetet tartalmaznak. Rendszerint biztonsági szerkezet is be van építve.

ROBBANÓGYÚJTÓK biztonsági szerkezettel: UN 0408, 0409, 0410

Ezek a tárgyak robbanó elemeket tartalmaznak, amelyek a lőszerekben a detonáció kiváltására szolgálnak. A detonáció kiváltására mechanikai, villamos, kémiai vagy hidrosztatikus úton aktiválható szerkezetet tartalmaznak. A robbanógyújtókban legalább két hatékony biztonsági szerkezetnek is kell lennie.

ROBBANÓLÁNC ALKOTÓRÉSZEI, M.N.N.: UN 0382, 0383, 0384, 0461

Tárgyak, amelyek a detonáció vagy deflagráció továbbvitelére szolgálnak a robbanólánc mentén.

ROBBANÓSZEGECSEK: UN 0174

Ezek a tárgyak fémsegecsek, belül levő kis robbanóanyag-töltettel.

ROBBANÓSZONDÁK: UN 0204, 0296

Ezek a tárgyak detonáló robbanóanyag-töltetből állnak. Olyan gyújtószerkezetet tartalmaznak, amely nincs ellátva (legalább két) hatékony biztonsági szerkezettel. Hajókról dobják a vízbe, és meghatározott vízmélységben vagy a tengerfenékre érve robbannak.

ROBBANÓSZONDÁK: UN 0374, 0375

Ezek a tárgyak detonáló robbanóanyag-töltetből állnak. Vagy nem tartalmaznak gyújtószerkezetet vagy olyan gyújtószerkezetet tartalmaznak, amely legalább két hatékony biztonsági szerkezettel van ellátva. Hajókról dobják a vízbe, és meghatározott vízmélységben vagy a tengerfenékre érve robbannak.

ROBBANÓTÖLTETEK: UN 0048

Ezek a tárgyak papírlémezről, műanyagból, fémből vagy más anyagból készített házból állnak és detonáló robbanóanyag-töltetet tartalmaznak. Vagy nem tartalmaznak gyújtószerkezetet vagy olyan gyújtószerkezetet tartalmaznak, amely legalább két hatékony biztonsági szerkezettel van ellátva.

***Megjegyzés:** A következő tárgyak nem tartoznak e fogalomkörbe: AKNÁK; BOMBÁK; LÖVEDÉKEK. Ezek a jelen szójegyzékben külön vannak feltüntetve.*

ROBBANÓTÖLTETEK, IPARIÁK, detonátor nélkül: UN 0442, 0443, 0444, 0445

Ezek a tárgyak gyújtószerkezet nélküli detonáló robbanóanyag-töltetből állnak. Robbantásos hegesztéshez, robbantásos illesztéshez, robbantásos sajtoláshoz vagy más fémmegmunkálási eljáráshoz használatosak.

ROBBANÓTÖLTETEK, KIEGÉSZÍTŐK: UN 0060

Ezek a tárgyak kisméretű, eltávolítható erősítőtöltetek, amelyet a lövedékek üregébe az indítógyújtó és a fő robbanótöltet közé helyeznek el.

ROBBANÓTÖLTETEK, MŰANYAG KÖTÉSŰEK: UN 0457, 0458, 0459, 0460

Ezek a tárgyak műanyag kötésű detonáló robbanóanyag-töltetből állnak. Burkolat nélküli speciális alakúak, és nem tartalmaznak gyújtószerkezetet. Lőszerek, pl. támadófejek alkotórészeként használatosak.

ROBBANÓZSINÓR, fémköpenyes: UN 0102, 0290

Ez a tárgy lágy fémcsőben lévő detonáló robbanóanyag-bélből áll, védőbevonattal ellátva vagy anélkül.

ROBBANÓZSINÓR, hajlékony: UN 0065, 0289

Ez a tárgy detonáló robbanóanyag-bélből áll, textilszállal körbefonva, műanyagból vagy más anyagból álló burkolattal ellátva. A burkolat nem szükséges, ha a textilonat portömör.

ROBBANÓZSINÓR, KISHATÁSÚ, fémköpennyel: UN 0104

Ez a tárgy lágy fémcsőben lévő detonáló robbanóanyag-bélből áll, védőbevonattal ellátva vagy anélkül. A robbanóanyag mennyisége olyan csekély, hogy kifelé csak kis hatás lép fel.

ROBBANTÓTÖLTETEK, PROFILOZOTT, HAJLÉKONY, VONAL ALAKÚ: UN 0237, 0288

Ezek a tárgyak detonáló robbanóanyagból készült V alakú bélből állnak hajlékony köpenybe burkolva.

SZÉTVETŐK, robbanótöltettel: UN 0043

Ezek a tárgyak kis robbanótöltetek. Lövedékek vagy más lőszerek szétrobbantására valók, hogy azok tartalma szétszóródjon.

TÁMADÓFEJEK RAKÉTÁKHOZ robbanó- vagy kidobótöltettel: UN 0370

Ezek a tárgyak inert hasznos teherből és detonáló vagy deflagrááló robbanóanyagot tartalmazó kis töltetből állnak. Vagy nem tartalmaznak gyújtószerkezetet vagy olyan gyújtószerkezetet tartalmaznak, amely legalább két hatékony biztonsági szerkezettel van ellátva. Rakétákba vannak beszerelve az inert anyag szétszórása céljából. Ide tartoznak irányított lövedékek támadófejei is.

TÁMADÓFEJEK RAKÉTÁKHOZ robbanó- vagy kidobótöltettel: UN 0371

Ezek a tárgyak inert hasznos teherből és detonáló vagy deflagrááló robbanóanyagot tartalmazó kis töltetből állnak. Olyan gyújtószerkezetet tartalmaznak, amely nincs ellátva (két vagy több) hatékony biztonsági szerkezettel. Rakétákba vannak beszerelve az inert anyag

szétszórása céljából. Ide tartoznak irányított lövedékek támadófejei is.

TÁMADÓFEJEK RAKÉTÁKHOZ robbanótöltettel: UN 0286, 0287

Ezek a tárgyak detonáló robbanóanyagból állnak, amely vagy nem tartalmaz gyújtószerkezetet, vagy olyan gyújtószerkezetet tartalmaz, amely legalább két hatékony biztonsági szerkezettel van ellátva. Rakétákba vannak beszerelve. Ide tartoznak az irányított lövedékek támadófejei is.

TÁMADÓFEJEK RAKÉTÁKHOZ robbanótöltettel: UN 0369

Ezek a tárgyak detonáló robbanóanyagból állnak, amely olyan gyújtószerkezetet tartalmaz, ami nincs ellátva (két vagy több) hatékony biztonsági szerkezettel. Rakétákba vannak beszerelve. Ide tartoznak az irányított lövedékek támadófejei is.

TÁMADÓFEJEK TORPEDÓKHOZ robbanótöltettel: UN 0221

Ezek a tárgyak detonáló robbanóanyagból állnak. Vagy nem tartalmaznak gyújtószerkezetet, vagy olyan gyújtószerkezetet tartalmaznak, amely legalább két hatékony biztonsági szerkezettel van ellátva. Torpedókba vannak beszerelve.

TORPEDÓK FOLYÉKONY HAJTÓANYAGGAL, inert fejjel: UN 0450

Ezek a tárgyak folyékony robbanóanyagot tartalmazó hajtórendszerből, amely a torpedót a víz alatt mozgatja, és inert fejből állnak.

TORPEDÓK FOLYÉKONY HAJTÓANYAGGAL, robbanótöltettel vagy anélkül: UN 0449

Ezek a tárgyak vagy folyékony robbanóanyagot tartalmazó hajtórendszerből állnak, amely a támadófejjel ellátott vagy anélküli torpedót a víz alatt mozgatja, vagy folyékony nem robbanó anyagot tartalmazó hajtórendszerből állnak, amely a támadófejjel ellátott torpedót a víz alatt mozgatja.

TORPEDÓK robbanótöltettel: UN 0329

Ezek a tárgyak támadófejből és folyékony robbanóanyagot tartalmazó hajtórendszerből állnak, amely a torpedót a víz alatt mozgatja. A támadófej vagy nem tartalmaz gyújtószerkezetet vagy olyan gyújtószerkezetet tartalmaz, amely legalább két hatékony biztonsági szerkezettel van ellátva.

TORPEDÓK robbanótöltettel: UN 0330

Ezek a tárgyak támadófejből és folyékony robbanóanyagot vagy nem robbanó anyagot tartalmazó hajtórendszerből állnak, amely a torpedót a víz alatt mozgatja. A támadófej olyan gyújtószerkezetet tartalmaz, amely nincs ellátva két vagy több hatékony biztonsági szerkezettel.

TORPEDÓK robbanótöltettel: UN 0451

Ezek a tárgyak támadófejből és folyékony, nem robbanó hajtórendszerből állnak, amely a torpedót a víz alatt mozgatja. A támadófej vagy nem tartalmaz gyújtószerkezetet vagy olyan gyújtószerkezetet tartalmaz, amely legalább két hatékony biztonsági szerkezettel van ellátva.

TÖLTÉNYEK FEGYVEREKHEZ INERT LÖVEDÉKKEL: UN 0012, 0328, 0339, 0417

Olyan lőszer, amely robbanótöltet nélküli lövedékből és kidobótöltetből áll gyutaccsal vagy gyutacs nélkül. A lőszer nyomjelzőszert tartalmazhat, feltéve, hogy a fő veszélyt a kidobótöltet képezi.

TÖLTÉNYEK FEGYVEREKHEZ robbanólövedékekkel: UN 0005, 0007, 0348

Olyan lőszer, amely robbanótöltetet tartalmazó lövedékből és kidobótöltetből áll gyutaccsal vagy gyutacs nélkül. A lövedék olyan gyújtószerkezetet tartalmaz, amely nincs ellátva

(legalább két) hatékony biztonsági szerkezettel. Ide tartoznak összeszerelt lőszer, félig összeszerelt lőszer és különálló darabokból álló löveg lőszer, amennyiben egybe vannak csomagolva.

TÖLTÉNYEK FEGYVEREKHEZ robbanólövedékkel: UN 0006, 0321, 0412

Olyan lőszer, amely robbanótöltetet tartalmazó lövedékből és kidobótöltetből áll gyutaccsal vagy gyutacs nélkül. A lövedék vagy nem tartalmaz gyújtószerkezetet vagy olyan gyújtószerkezetet tartalmaz, amely legalább két hatékony biztonsági szerkezettel van ellátva. Ide tartoznak összeszerelt lőszer, félig összeszerelt lőszer és különálló darabokból álló löveg lőszer, amennyiben egybe vannak csomagolva.

TÖLTÉNYHÜVELYEK, ÜRESEK, ÉGHETŐK, GYUTACS NÉLKÜL: UN 0446, 0447

Ezek a tárgyak részben vagy teljes egészében nitrocellulózsból gyártott töltényhüvelyek.

TÖLTÉNYHÜVELYEK, ÜRESEK, GYUTACCSAL: UN 0055; 0379

Ezek a tárgyak fémből, műanyagból vagy más, nem éghető anyagból készülnek. Egyetlen robbanó alkotórészük a gyutacs.

TRITONAL: UN 0390

Ez az anyag trinitro-toluol (TNT) és alumínium keverékéből áll.

TÚZIJÁTÉK TESTEK: UN 0333, 0334, 0335, 0336, 0337

Olyan pirotechnikai tárgyak, amelyek szórakoztatási célokra használatosak.

VAKTÖLTÉNYEK FEGYVEREKHEZ: UN 0014, 0326, 0327, 0338, 0413

Olyan lőszer, amely zárt töltényhüvelyből áll központi vagy peremgyújtással és feketelőpor- vagy füst nélküli löportöltetet tartalmaz. A töltényhüvely nem tartalmaz lövedéket. Erős durranás keltésére valók, valamint gyakorláshoz, díszlövéshez, kidobótöltetként és indítópisztolyokhoz stb. használatosak. Ide tartoznak a gyakorló lőszer is.

VAKTÖLTÉNYEK KÉZIFEGYVEREKHEZ: UN 0014, 0327, 0338

Olyan lőszer, amely zárt töltényhüvelyből áll központi vagy peremgyújtással és feketelőpor- vagy füst nélküli löportöltetet tartalmaz. A töltényhüvely nem tartalmaz lövedéket. Legfeljebb 19,1 mm kaliberű fegyverekhez valók és erős durranás keltésére szolgálnak és gyakorláshoz, díszlövéshez, kidobótöltetként és indítópisztolyokhoz stb. használatosak.

VAKTÖLTÉNYEK SZERSZÁMOKHOZ: UN 0014

Szerszámokban használt olyan tárgy, amely zárt töltényhüvelyből áll központi vagy peremgyújtással, feketelőpor- vagy füst nélküli löpor töltettel vagy anélkül, de lövedék nélkül.

VASÚTI DURRANTYÚK: UN 0192, 0193, 0492, 0493

Ezek a tárgyak pirotechnikai anyagot tartalmaznak, amely a tárgy összetörésekor erős hanghatással felrobban. Vasúti sínre helyezik.

VÉSZJELZŐK, tengeri: UN 0194, 0195, 0505, 0506

Ezek a tárgyak pirotechnikai anyagot tartalmaznak és arra valók, hogy durranás, láng, füst vagy ezek kombinációja formájában jelzést adjanak.

VILÁGÍTÓTESTEK, FÖLDI: UN 0092, 0418, 0419

Ezek a tárgyak pirotechnikai anyagot tartalmaznak, és a földön megvilágításra, jelzésre, megjelölésre vagy figyelmeztetésre használatosak.

VILÁGÍTÓTESTEK, LÉGI: UN 0093, 0403, 0404, 0420, 0421

Ezek a tárgyak pirotechnikai anyagot tartalmaznak és légi járműről ledobva megvilágításra,

jelzésre, megjelölésre vagy figyelmeztetésre szolgálnak.

VILLANÓFÉNY-PATRONOK: UN 0049, 0050

Ezek a tárgyak házból, gyújtóelemből és villanópor-készletből állnak. Minden alkotórész egyetlen, kilövésre kész tárggyá van egyesítve.

VILLANÓFÉNYPOR: UN 0094, 0305

Olyan pirotechnikai anyag, amely meggyújtáskor intenzív fényt kelt.

VÍZIBOMBÁK: UN 0056

Ezek a tárgyak detonáló robbanóanyagot tartalmazó hordóból, dobból vagy lövedékből állnak, amely vagy nem tartalmaz gyújtószerkezetet, vagy olyan gyújtószerkezetet tartalmaz, amely legalább két hatékony biztonsági szerkezettel van ellátva. Víz alatti robbanás előidézésére valók.

VÍZZEL AKTIVÁLHATÓ SZERKEZETEK robbanó-, kidobó- vagy hajtótöltettel:
UN 0248, 0249

Olyan tárgyak, amelyek működése tartalmuk vízzel való fizikai-kémiai reakciójától függ.

2.2.2 2 osztály Gázok

2.2.2.1 Kritériumok

2.2.2.1.1 A 2 osztály fogalma a tiszta gázokra, a gázkeverékekre, egy vagy több gáz keverékére egy vagy több más anyaggal, valamint az ilyen anyagokat tartalmazó tárgyakra terjed ki.

A gázok olyan anyagok, amelyek

- a) gőznyomása 50 °C-on meghaladja a 300 kPa-t (3 bar-t); vagy
- b) 20 °C-on és 101,3 kPa normál nyomáson teljesen gáz alakúak.

Megjegyzés: 1. Az UN 1052 vízmentes hidrogén-fluorid azonban a 8 osztály anyaga.

2. Valamely tiszta gáz tartalmazhat egyéb alkotórészeket is a gyártási folyamatból adódóan vagy hozzáadott anyagokat a termék stabilitásának megőrzésére, amennyiben ezen alkotórészek koncentrációja nem módosítja a gáz besorolását vagy a szállítási feltételeket, mint pl. a töltési fokot, a töltőnyomást, a próbanyomást.

3. A 2.2.2.3 bekezdés m.n.n. tételei tiszta gázokra és gázkeverékekre egyaránt vonatkoznak.

2.2.2.1.2 A 2 osztály anyagai és tárgyai a következők szerint vannak csoportosítva:

1. Sűrített gáz: olyan gáz, amely a szállításra szánt csomagolásban túlnyomás alatt -50 °C-on teljesen gáz halmazállapotú; ebbe a kategóriába tartozik minden gáz, amelynek kritikus hőmérséklete -50 °C vagy annál alacsonyabb
2. Cseppfolyósított gáz: olyan gáz, amely a szállításra szánt csomagolásban túlnyomás alatt -50 °C felett részben folyékony állapotban van. Meg kell különböztetni a következőket:
 - nagy nyomáson cseppfolyósított gáz: olyan gáz, amelynek kritikus hőmérséklete -50 °C-nál magasabb, de legfeljebb +65 °C;
 - kis nyomáson cseppfolyósított gáz: olyan gáz, amelynek kritikus hőmérséklete +65 °C-nál magasabb
3. Mélyhűtött, cseppfolyósított gáz: olyan gáz, amely a szállításra szánt csomagolásban alacsony hőmérséklete folytán részben folyékony állapotban van
4. Oldott gáz: olyan gáz, amely a szállításra szánt csomagolásban túlnyomás alatt folyadék fázisú oldószerben van oldva
5. Aeroszol csomagolások és gázzal töltött kisméretű tartályok (gázpatronok)
6. Túlnyomás alatti gázt tartalmazó egyéb tárgyak
7. Túlnyomás nélküli gázok, amelyekre különleges előírások érvényesek (gázminták)
8. Nyomás alatti vegyszerek: folyadék, paszta vagy por nyomás alatt, olyan hajtóanyaggal, amely megfelel a sűrített vagy cseppfolyósított gáz definíciójának, vagy ilyen gázok keveréke.

2.2.2.1.3 A 2 osztály anyagai és tárgyai (az aeroszolak és a nyomás alatti vegyszerek kivételével) veszélyes tulajdonságaik alapján a következő csoportok valamelyikéhez vannak hozzárendelve:

A fojtó

O	gyújtó hatású
F	gyúlékony
T	mérgező
TF	mérgező, gyúlékony
TC	mérgező, maró
TO	mérgező, gyújtó hatású
TFC	mérgező, gyúlékony, maró
TOC	mérgező, gyújtó hatású, maró.

Ha a gázok vagy gázkeverékek veszélyes tulajdonságai a kritériumok alapján egynél több csoporthoz tartoznak, a T betűvel jelölt csoportok minden más csoportot megelőznek. Az F betűvel jelölt csoportok megelőzik az A vagy O betűvel jelölteket.

Megjegyzés: 1. Az ENSZ Minta Szabályzatban, az IMDG kódexben és az ICAO Műszaki Utasításokban a gázokat az általuk képviselt fő veszély alapján a következő három alosztály egyikébe sorolják:

- 2.1 alosztály: gyúlékony gázok (megfelel az F betűvel jelölt csoportokba tartozó gázoknak);
- 2.2 alosztály: nem gyúlékony, nem mérgező gázok (megfelel az A vagy az O betűvel jelölt csoportokba tartozó gázoknak);
- 2.3 alosztály: mérgező gázok (megfelel a T betűvel jelölt, azaz T, TF, TC, TO, TFC és TOC csoportba tartozó gázoknak).

2. A gázzal töltött kisméretű tartályokat (UN 2037) a tartalom veszélyessége alapján az A - TOC csoport valamelyikéhez kell hozzárendelni. Az aeroszolokra (UN 1950) lásd a 2.2.2.1.6 pontot. A nyomás alatti vegyszerekre (UN 3500 – 3505) lásd a 2.2.2.1.7 pontot.

3. A maró hatású gázok mérgezőnek is tekintendők és ezért a TC, a TFC vagy a TOC csoportba vannak sorolva.

2.2.2.1.4 Ha a 2 osztálynak a 3.2 fejezet „A” táblázatában név szerint említett valamely keveréke a 2.2.2.1.2 és a 2.2.2.1.5 pontban felsorolt kritériumoktól eltérőket elégít ki, akkor ezt a keveréket ezen kritériumok szerint kell besorolni és a megfelelő m.n.n. tételhez hozzárendelni.

2.2.2.1.5 A 2 osztály azon anyagait és tárgyait (az aeroszolok és a nyomás alatti vegyszerek kivételével), amelyek a 3.2 fejezet „A” táblázatában nincsenek név szerint feltüntetve a 2.2.2.1.2 és a 2.2.2.1.3 pont szerint a 2.2.2.3 bekezdésben felsorolt valamely gyújtó-megnevezés alá kell besorolni. A kritériumok a következők:

Fojtó gázok

Olyan nem gyúlékony, nem gyújtó hatású és nem mérgező gázok, amelyek a légkörben rendes körülmények között jelen levő oxigént hígítják vagy kiszorítják.

Gyúlékony gázok

Olyan gázok, amelyek 20 °C-on és 101,3 kPa normál nyomáson

- a) a levegővel alkotott, legfeljebb 13 térf.% gázt tartalmazó keverék formájában gyúlékonyak (alsó robbanási határjuk legfeljebb 13%); vagy
- b) az alsó robbanási határuktól függetlenül a levegővel legalább 12 százalékpont terjedelmű robbanási tartománnyal bírnak.

A gyúlékonyságot vizsgálatokkal vagy számítással kell meghatározni az ISO által elfogadott módszerek (lásd az ISO 10156:2010 szabványt) szerint.

Ha nem áll elegendő adat rendelkezésre ezen módszerek használatához, a származási ország illetékes hatósága által elismert más, azonos értékű vizsgálati eljárások is alkalmazhatók.

Ha a származási ország nem valamely ADR Szerződő Fél, akkor ezeket a módszereket a küldemény által érintett első ADR Szerződő Fél illetékes hatóságának kell elismernie.

Gyújtó hatású (oxidáló) gázok

Olyan gázok, amelyek általában oxigén leadásával tüzet okozhatnak, vagy más anyagok égését a levegőnél nagyobb mértékben elősegíthetik. Ezek olyan tiszta gázok vagy gázkeverékek, amelyek oxidáló képessége az ISO 10156:2010 szabvány szerinti módszerrel meghatározva nagyobb, mint 23,5%.

Mérgező gázok

Megjegyzés: Azokat a gázokat, amelyek részben vagy teljes egészében a maró hatásuk következtében elégítik ki a mérgezőképesség kritériumait, mérgező gázokként kell besorolni. A maró hatás, mint lehetséges járulékos veszély kritériumait lásd a „maró gázok” címszó alatt is.

Olyan gázok,

- amelyekről ismert, hogy az emberi egészséget veszélyeztető mértékben mérgezők vagy marók; vagy
- amelyekről feltételezhető, hogy az emberre nézve mérgezők vagy marók, mivel a 2.2.61.1 bekezdés szerint vizsgálva az akut mérgezési LC_{50} értékük legfeljebb 5000 ml/m³ (ppm).

A gázkeverékek (beleértve a más osztályba tartozó anyagok gőzeit) esetében a következő képlet használható:

$$a \text{ mérgező (keverék) } LC_{50} \text{ értéke} = \frac{1}{\sum_{i=1}^n \frac{f_i}{T_i}}$$

ahol

f_i = a keverék i -edik alkotórészének molaránya

T_i = a keverék i -edik alkotórészének toxicitási mutatója. A T_i -érték egyenlő a 4.1.4.1 bekezdés P200 csomagolási utasítása szerinti LC_{50} értékkel. Amennyiben az LC_{50} érték nem szerepel a 4.1.4.1 bekezdés P200 csomagolási utasításában, a szakirodalomban található LC_{50} értéket kell használni. Ha az LC_{50} érték ismeretlen, a toxicitási mutatót a hasonló fiziológiai és kémiai hatásokkal rendelkező anyagok legalacsonyabb LC_{50} értéke alapján kell meghatározni, vagy – ha ez az egyetlen gyakorlati lehetőség – kísérleteket kell végezni.

Maró gázok

Azokat a gázokat és gázkeverékeket, amelyek teljes egészében a maró hatásuk következtében elégítik ki a mérgezőképesség kritériumait, mint maró járulékos veszéllyel bíró mérgező gázokat kell besorolni.

Egy olyan gázkeveréknek, amely a maró és mérgező hatás kombinálódása folytán mérgezőnek tekintendő, akkor van maró járulékos veszélye, ha emberen szerzett tapasztalatok alapján ismert, hogy roncsolja a bőrt, a szemet vagy a nyálkahártyát, vagy ha a keverék maró alkotórészeinek LC_{50} értéke a következő képlettel számítva legfeljebb 5000 ml/m³ (ppm):

$$a \text{ maró (keverék) } LC_{50} \text{ értéke} = \frac{1}{\sum_{i=1}^n \frac{f_{C_i}}{T_{C_i}}}$$

ahol

f_{C_i} = a keverék i -edik alkotórészének molaránya

T_{C_i} = a keverék i -edik maró alkotórészének toxicitási mutatója. A T_{C_i} -érték egyenlő a 4.1.4.1 bekezdés P200 csomagolási utasítása szerinti LC_{50} értékkel. Amennyiben az

LC_{50} érték nem szerepel a 4.1.4.1 bekezdés P200 csomagolási utasításában, a szakirodalomban található LC_{50} értéket kell használni. Ha az LC_{50} érték ismeretlen, a toxicitási mutatót a hasonló fiziológiai és kémiai hatásokkal rendelkező anyagok legalacsonyabb LC_{50} értéke alapján kell meghatározni, vagy – ha ez az egyetlen gyakorlati lehetőség – kísérleteket kell végezni.

2.2.2.1.6 Aeroszolok

Az aeroszolok (UN 1950) veszélyes tulajdonságaik alapján a következő csoportok valamelyikéhez vannak hozzárendelve:

- A fojtó
- O gyújtó hatású
- F gyúlékony
- T mérgező
- C maró
- CO maró, gyújtó hatású
- FC gyúlékony, maró
- TF mérgező, gyúlékony
- TC mérgező, maró
- TO mérgező, gyújtó hatású
- TFC mérgező, gyúlékony, maró
- TOC mérgező, gyújtó hatású, maró.

A csoporthoz rendelés az aeroszol csomagolás tartalmának tulajdonságaitól függ.

Megjegyzés: *Aeroszol csomagolások hajtóanyagaként nem használhatók a 2.2.2.1.5 pont kritériumai szerint mérgező gázok, ill. a 4.1.4.1 bekezdés P200 csomagolási utasítás 2. táblázat c) lábjegyzete által „piroforosnak tekintendő” gázok. Azok az aeroszolok, amelyek tartalma mérgezőképesség vagy maró hatás tekintetében a I csomagolási csoportnak felel meg, a szállításból ki vannak zárva (lásd még a 2.2.2.2.2 pontot is).*

A kritériumok a következők:

- a) az A csoporthoz kell hozzárendelni, ha a tartalom a következő b) – f) pont szerinti, egyetlen más csoport kritériumainak sem felel meg;
- b) az O csoporthoz kell hozzárendelni, ha az aeroszol a 2.2.2.1.5 pont szerint gyújtó hatású (oxidáló) gázt tartalmaz;
- c) az F csoporthoz kell hozzárendelni, ha a tartalom 85 tömeg% vagy annál több gyúlékony alkotórészt tartalmaz és a kémiai égéshő 30 kJ/g vagy annál nagyobb;
nem kell az F csoporthoz hozzárendelni, ha a tartalom 1 tömeg% vagy annál kevesebb gyúlékony alkotórészt tartalmaz és a kémiai égéshő 20 kJ/g-nál kisebb;
egyéb esetekben az aeroszol gyúlékonyságát a „Vizsgálatok és kritériumok kézikönyv”, III. rész 31. fejezetében leírt vizsgálatokkal kell meghatározni. A vizsgálat szerint „rendkívül gyúlékony”, ill. „gyúlékony” aeroszolókat az F csoporthoz kell hozzárendelni.

Megjegyzés: *A gyúlékony alkotórészek a „Vizsgálatok és kritériumok kézikönyv”, III. rész 31.1.3 szakaszához fűzött 1 – 3. megjegyzésben meghatározott gyúlékony fo-*

lyékony anyagok, gyúlékony szilárd anyagok, ill. gyúlékony gázok és gázkeverékek. Ez a meghatározás nem terjed ki a piroforos, az önmelegedő és a vízzel reaktív anyagokra. A kémiai égéshőt a következő módszerek valamelyikével kell meghatározni: ASTM D 240, ISO/FDIS 13943: 1999 (E/F) 86.1 – 86.3, ill. NFPA 30B.

- d) a T csoporthoz kell hozzárendelni, ha a tartalom, az aeroszol csomagolás hajtóanyagát kivéve, a 6.1 osztály II vagy III csomagolási csoportjába tartozik;
- e) a C csoporthoz kell hozzárendelni, ha a tartalom, az aeroszol csomagolás hajtóanyagát kivéve, kielégíti a 8 osztály II vagy III csomagolási csoportjának kritériumait;
- f) ha az O, F, T és C csoport közül egynél több kritériuma teljesül, akkor az esettől függően a CO, FC, TF, TC TO, TFC vagy TOC csoporthoz kell hozzárendelni.

2.2.2.1.7

Nyomás alatti vegyszerek

A nyomás alatti vegyszerek (UN 3500 - 3505) veszélyes tulajdonságaik alapján a következő csoportok valamelyikéhez vannak hozzárendelve:

- A fojtó
- F gyúlékony
- T mérgező
- C maró
- FC gyúlékony, maró
- TF mérgező, gyúlékony

A csoporthoz rendelés a különböző halmazállapotú összetevők:

- a hajtóanyag;
- a folyadék; ill
- a szilárd anyag

veszélyes tulajdonságaitól függ.

Megjegyzés: 1. *Nyomás alatti vegyszerek hajtóanyagaként nem használhatók a 2.2.2.1.5 pont kritériumai szerint mérgező vagy gyújtó hatású gázok, ill. a 4.1.4.1 bekezdés P200 csomagolási utasítás 2. táblázat c) lábjegyzete által „piroforosnak tekintendő” gázok.*

2. *Azok a nyomás alatti vegyszerek, amelyek tartalma mérgezőképesség vagy maró hatás tekintetében a I csomagolási csoportnak felel meg, vagy amelyek tartalma mérgezőképesség és maró hatás tekintetében is a II vagy a III csomagolási csoportnak felel meg, ezen UN tétel alatt a szállításból ki vannak zárva.*

3. *Azok a nyomás alatti vegyszerek, amelyek tartalma kielégíti az 1 osztály, a 3 osztályba tartozó folyékony, érzéketlenített robbanóanyagok, a 4.1 osztályba tartozó önreaktív anyagok és szilárd, érzéketlenített robbanóanyagok, a 4.2, a 4.3, az 5.1, az 5.2, a 6.2 vagy a 7 osztály kritériumait ezen UN tétel alatt nem szállíthatók*

4. *Az aeroszol csomagolásban lévő nyomás alatti vegyszereket az UN 1950 tétel alatt kell szállítani.*

A kritériumok a következők:

- a) az A csoporthoz kell hozzárendelni, ha a tartalom a következő b) – e) pont szerinti,

egyetlen más csoport kritériumainak sem felel meg;

- b) az F csoporthoz kell hozzárendelni, ha valamelyik összetevőt, ami lehet tiszta anyag vagy keverék is, gyúlékonynak kell besorolni. Gyúlékony összetevők azok a gyúlékony folyadékok vagy folyékony keverékek, gyúlékony szilárd anyagok vagy szilárd keverékek, gyúlékony gázok vagy gázkeverékek, amelyek megfelelnek a következő kritériumoknak:
 - i) gyúlékony folyadék az, amelynek lobbanáspontja legfeljebb 93 °C;
 - ii) gyúlékony szilárd anyag az, amely megfelel a 2.2.41.1 bekezdés kritériumainak;
 - iii) gyúlékony gáz az, amely megfelel a 2.2.2.1.5 pont kritériumainak;
- c) a T csoporthoz kell hozzárendelni, ha a tartalom, a hajtóanyagot kivéve, a 6.1 osztály II vagy III csomagolási csoportjába tartozik;
- d) a C csoporthoz kell hozzárendelni, ha a tartalom, a hajtóanyagot kivéve, kielégíti a 8 osztály II vagy III csomagolási csoportjába tartozik;
- e) ha a tartalom az F, a T és a C csoport közül kettőnek a kritériumának is megfelel, akkor – értelemszerűen – az FC, ill. a TF csoporthoz kell hozzárendelni.

2.2.2.2 A szállításból kizárt gázok

2.2.2.2.1 A 2 osztály vegyileg nem állandó anyagai csak akkor adhatók át szállításra, ha megtették a szükséges intézkedéseket a normális szállítási körülmények között a veszélyes reakció, mint pl. bomlás, szétválás vagy polimerizálódás mindenfajta lehetőségének megakadályozására. E célból különösen arról kell gondoskodni, hogy a tartályok és tartányok ne tartalmazzanak olyan anyagokat, amelyek ezeket a reakciókat elősegíthetik.

2.2.2.2.2 A következő anyagok és keverékek a szállításból ki vannak zárva:

- UN 2186 hidrogén-klorid, mélyhűtött, cseppfolyósított;
- UN 2421 nitrogén-trioxid;
- UN 2455 metil-nitrit;
- azok a mélyhűtött, cseppfolyósított gázok, amelyek nem sorolhatók a 3A, 3O vagy 3F osztályozási kód alá;
- azok az oldott gázok, amelyek nem sorolhatók az UN 1001, 2073 vagy 3318 alá;
- azok az aeroszolok, amelyek hajtógázként olyan gázt tartalmaznak, amely a 2.2.2.1.5 pont kritériuma szerint mérgező, vagy a 4.1.4.1 bekezdés P200 csomagolási utasítás kritériuma szerint piroforos;
- azok az aeroszolok, amelyek tartalma a mérgezőképesség vagy maró hatás tekintetében az I csomagolási csoportnak felel meg (lásd a 2.2.61 és a 2.2.8 szakaszt);
- azok a nagyon mérgező gázzal (LC_{50} 200 ppm-nél kisebb) vagy olyan gázzal töltött kisméretű tartályok (gázpatronok), amely gáz a 4.1.4.1 bekezdés P200 csomagolási utasítás kritériuma szerint piroforos.

2.2.2.3 A gyűjtőmegnevezések felsorolása

Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése
<i>Sűrített gázok</i>		
1A	1956	SŰRÍTETT GÁZ, M.N.N.
1O	3156	SŰRÍTETT GÁZ, GYÚJTÓ HATÁSÚ, M.N.N.
1F	1964	SZÉNHIDROGÉN-GÁZ KEVERÉK, SŰRÍTETT, M.N.N.
	1954	SŰRÍTETT GÁZ, GYÚLÉKONY, M.N.N.
1T	1955	SŰRÍTETT GÁZ, MÉRGEZŐ, M.N.N.
1TF	1953	SŰRÍTETT GÁZ, MÉRGEZŐ, GYÚLÉKONY, M.N.N.
1TC	3304	SŰRÍTETT GÁZ, MÉRGEZŐ, MARÓ, M.N.N.
1TO	3303	SŰRÍTETT GÁZ, MÉRGEZŐ, GYÚJTÓ HATÁSÚ, M.N.N.
1TFC	3305	SŰRÍTETT GÁZ, MÉRGEZŐ, GYÚLÉKONY, MARÓ, M.N.N.
1TOC	3306	SŰRÍTETT GÁZ, MÉRGEZŐ, GYÚJTÓ HATÁSÚ, MARÓ, M.N.N.
<i>Cseppfolyósított gázok</i>		
2A	1058	CSEPPFOLYÓSÍTOTT GÁZ, nem gyúlékony, nitrogén, szén-dioxid vagy levegő alatt
	1078	HŰTŐGÁZ, M.N.N. mint pl. az R ... jelű gázok keveréke, azaz: F1 keverék, amelynek gőznyomása 70 °C-on 1,3 MPa-nál (13 bar) nem nagyobb, és sűrűsége 50 °C-on a diklór-fluor-metánénál (1,30 kg/l) nem kisebb; F2 keverék, amelynek gőznyomása 70 °C-on 1,9 MPa-nál (19 bar) nem nagyobb, és sűrűsége 50 °C-on a diklór-difluor-metánénál (1,21 kg/l) nem kisebb; F3 keverék, amelynek gőznyomása 70 °C-on 3 MPa-nál (30 bar) nem nagyobb, és sűrűsége 50 °C-on a klór-difluor-metánénál (1,09 kg/l) nem kisebb. Megjegyzés: A triklór-monofluor-metán (R 11 hűtőgáz), az 1,1,2-triklór-1,2,2-trifluor-etán (R 113 hűtőgáz), az 1,1,1-triklór-2,2,2-trifluor-etán (R 113a hűtőgáz), az 1-klór-1,2,2-trifluor-etán (R 133 hűtőgáz) és az 1-klór-1,1,2-trifluor-etán (R 133b hűtőgáz) nem a 2 osztály anyaga, az F1, F2, F3 keverékekben azonban előfordulhatnak.
	1968	ROVARIRTÓ GÁZ, M.N.N.
	3163	CSEPPFOLYÓSÍTOTT GÁZ, M.N.N.
2O	3157	CSEPPFOLYÓSÍTOTT GÁZ, GYÚJTÓ HATÁSÚ, M.N.N.
2F	1010	BUTADIÉNEK ÉS SZÉNHIDROGÉN KEVERÉKE, STABILIZÁLT, amelynek gőznyomása 70 °C-on nem haladja meg az 1,1 MPa-t (11 bar-t) és sűrűsége 50 °C-on legalább 0,525 kg/l Megjegyzés: A stabilizált butadiének is az UN 1010 alá vannak besorolva, lásd a 3.2 fejezet „A” táblázatát.
	1060	METIL-ACETILÉN ÉS PROPADIÉN KEVERÉK, STABILIZÁLT mint a metil-acetilén és propadién keveréke szénhidrogénnel, azaz: P1 keverék legfeljebb 63 térf.% metil-acetilén és propadién, és legfeljebb 24 térf.% propán és propén tartalommal, a telített C ₄ -szénhidrogén részarányának legalább 14 térf.%-nak kell lennie; és P2 keverék legfeljebb 48 térf.% metil-acetilén és propadién, és legfeljebb 50 térf.% propán és propén tartalommal, a telített C ₄ -szénhidrogén részarányának legalább 5 térf.%-nak kell lennie; valamint propadién keverékei 1...4% metil-acetilénnel.

Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése
2F (folyt.)	1965	SZÉNHIDROGÉN-GÁZ KEVERÉK, CSEPPFOLYÓSÍTOTT, M.N.N. keverékek, mint: A gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg az 1,1 MPa-t (11 bar-t), és sűrűsége 50 °C-on 0,525 kg/l-nél nem kisebb A01 gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg az 1,6 MPa-t (16 bar-t), és sűrűsége 50 °C-on 0,516 kg/l-nél nem kisebb A02 gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg az 1,6 MPa-t (16 bar-t), és sűrűsége 50 °C-on 0,505 kg/l-nél nem kisebb A0 gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg az 1,6 MPa-t (16 bar-t), és sűrűsége 50 °C-on 0,495 kg/l-nél nem kisebb A1 gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg a 2,1 MPa-t (21 bar-t), és sűrűsége 50 °C-on 0,485 kg/l-nél nem kisebb B1 gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg a 2,6 MPa-t (26 bar-t), és sűrűsége 50 °C-on 0,474 kg/l-nél nem kisebb B2 gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg a 2,6 MPa-t (26 bar-t), és sűrűsége 50 °C-on 0,463 kg/l-nél nem kisebb B gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg a 2,6 MPa-t (26 bar-t), és sűrűsége 50 °C-on 0,450 kg/l-nél nem kisebb C gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg a 3,1 MPa-t (31 bar-t), és sűrűsége 50 °C-on 0,440 kg/l-nél nem kisebb. Megjegyzés: 1. Az előbbi gázkeverékek megnevezésére a kereskedelemben szokásos következő elnevezések is használhatók: A, A01, A02 és A0 keverék esetén BUTÁN, C gázkeverék esetén PROPÁN. 2. A tengeri vagy légi szállítást megelőző és követő szállításkor az UN 1965 SZÉNHIDROGÉN-GÁZ KEVERÉK, CSEPPFOLYÓSÍTOTT, M.N.N. helyett választható az UN 1075 PETRÓLEUMGÁZ, CSEPPFOLYÓSÍTOTT tétel is.

2.2.3 3 osztály Gyúlékony folyékony anyagok

2.2.3.1 Kritériumok

2.2.3.1.1 A 3 osztály fogalmköre olyan anyagokra és ezen osztály anyagait tartalmazó tárgyakra terjed ki, amelyek

- az 1.2.1 szakaszban a „folyékony anyag” meghatározás a) bekezdése szerint folyékonyak;
- gőznyomásuk 50 °C hőmérsékleten legfeljebb 300 kPa (3 bar) és 20 °C hőmérsékleten, 101,3 kPa normál nyomáson nem teljesen gáz alakúak;
- lobbanáspontjuk legfeljebb 60 °C (a vizsgálatra lásd a 2.3.3.1 bekezdést).

A 3 osztály fogalmköre kiterjed az olyan gyúlékony folyékony anyagokra és olvasztott szilárd anyagokra is, amelyek lobbanáspontja meghaladja a 60 °C-ot és amelyeket lobbanáspontjukkal megegyező vagy annál magasabb hőmérsékletre melegítve szállítanak vagy adnak át szállításra. Ezek az anyagok az UN 3256 tétel alá vannak besorolva.

A 3 osztály fogalmköre kiterjed a folyékony, érzéketlenített robbanóanyagokra is. A folyékony, érzéketlenített robbanóanyagok olyan robbanóanyagok, amelyek vízben vagy más folyadékban vannak oldva vagy szuszpendálva azért, hogy homogén folyékony keveréket képezve robbanó tulajdonságaikat elnyomják. A 3.2 fejezet „A” táblázatában ilyen tétel az UN 1204, 2059, 3064, 3343, 3357 és 3379.

Megjegyzés: 1. *Nem tartoznak a 3 osztályba azok a 35 °C feletti lobbanáspontú anyagok, amelyek a „Vizsgálatok és kritériumok kézikönyv” III. rész 32.2.5 bekezdés kritériumai alapján nem égést fenntartóak; ha azonban az ilyen anyagokat lobbanáspontjukkal megegyező vagy annál magasabb hőmérsékletre melegítve szállítják vagy adják át szállításra, akkor a 3 osztály anyagai.*

2. *Az előző 2.2.3.1.1 ponttól eltérően a dízelolajat, a gázolajat és a könnyű fűtőolajat, beleértve a szintetikusan előállított termékeket is, 60 °C feletti, de legfeljebb 100 °C lobbanásponttal a 3 osztály UN 1202 számú anyagának kell tekinteni.*

3. *Azok a folyékony anyagok, amelyek lobbanáspontja 23 °C alatt van és belélegzés esetén nagyon mérgezőek, valamint azok, amelyek lobbanáspontja 23 °C vagy annál magasabb és mérgezőek, a 6.1 osztály anyagai (lásd a 2.2.61.1 bekezdést).*

4. *Azok a peszticidként használt gyúlékony folyékony anyagok és készítmények, amelyek nagyon mérgezők, mérgezők vagy enyhén mérgezők és lobbanáspontjuk 23 °C vagy annál magasabb, a 6.1 osztály anyagai (lásd a 2.2.61.1 bekezdést).*

2.2.3.1.2 A 3 osztály anyagai és tárgyai a következők szerint vannak csoportosítva:

F Gyúlékony folyékony anyagok járulékos veszély nélkül és az ilyen anyagokat tartalmazó tárgyak:

F1 Gyúlékony folyékony anyagok 60 °C vagy annál alacsonyabb lobbanásponttal

F2 60 °C feletti lobbanáspontú folyékony anyagok, amelyeket lobbanáspontjukkal megegyező vagy annál magasabb hőmérsékletre melegítve szállítanak vagy adnak fel szállításra (magas hőmérsékletű anyagok)

F3 Gyúlékony folyékony anyagot tartalmazó tárgyak

FT Gyúlékony folyékony anyagok, amelyek mérgezők:

FT1 Gyúlékony folyékony anyagok, amelyek mérgezők

FT2 Peszticidek

FC Gyúlékony folyékony anyagok, amelyek marók

FTC Gyúlékony folyékony anyagok, amelyek mérgezők és marók

D Folyékony, érzéketlenített robbanóanyagok.

2.2.3.1.3

A 3 osztályba sorolt anyagokat és tárgyakat a 3.2 fejezet „A” táblázata sorolja fel. A 3.2 fejezet „A” táblázatában név szerint nem említett anyagokat a 2.2.3.3 bekezdés megfelelő tételéhez és a megfelelő csomagolási csoportba kell sorolni, ezen bekezdés előírásai szerint. A gyúlékony folyékony anyagokat a szállítás során általuk képviselt veszély mértéke alapján a következő csomagolási csoportok egyikéhez kell hozzárendelni:

	Lobbanáspont (zárttéri)	Forráskezdhet
I	–	$\leq 35\text{ °C}$
II ^{a)}	$< 23\text{ °C}$	$> 35\text{ °C}$
III ^{a)}	$\geq 23\text{ °C}$ és $\leq 60\text{ °C}$	$> 35\text{ °C}$

a) Lásd a 2.2.3.1.4 pontot is.*

Járlékos veszéllyel (veszélyekkel) rendelkező folyékony anyagok esetében az előző táblázat alapján meghatározott csomagolási csoportot és a járulékos veszély(ek) fokozata alapján adódó csomagolási csoportot is tekintetbe kell venni, ezek alapján az osztályt és a csomagolási csoportot a 2.1.3.10 bekezdés veszélyességi rangsor táblázata szerint kell meghatározni.

2.2.3.1.4

A folyékony vagy viszkózus keverékeket és készítményeket, beleértve a legfeljebb 20% nitrocellulóz tartalmú keverékeket is, amelyek nitrogéntartalma 12,6%-nál nem több (száraz tömegre vetítve), csak akkor lehet a III csomagolási csoportba sorolni, ha a következő követelményeket kielégítik:

- az oldószer-szétválási próba során a szétváló oldószer réteg magassága a minta teljes magasságának 3%-ánál kisebb (lásd a „Vizsgálatok és kritériumok kézikönyv” III. Rész, 32.5.1 bekezdését); és
- a viszkozitás³⁾ és a lobbanáspont a táblázatnak megfelelő:

Extrapolált kinematikai viszkozitás, ν (0-hoz közelítő nyírósebességnél, 23 °C-on), mm^2/s	A kifolyási idő, t ISO 2431:1993 szerint		Lobbanáspont, °C
	s	A kifolyónyílás átmérője, mm	
$20 < \nu \leq 80$	$20 < t \leq 60$	4	17 felett
$80 < \nu \leq 135$	$60 < t \leq 100$	4	10 felett
$135 < \nu \leq 220$	$20 < t \leq 32$	6	5 felett
$220 < \nu \leq 300$	$32 < t \leq 44$	6	–1 felett
$300 < \nu \leq 700$	$44 < t \leq 100$	6	–5 felett
$700 < \nu$	$100 < t$	6	–5 és alatta

Megjegyzés: A 20%-nál több, de legfeljebb 55% nitrocellulózt tartalmazó keverékek, amelynek nitrogéntartalma 12,6%-nál nem több (száraz anyagra vetítve), az UN 2059 szám alá tartoznak.

A 23 °C-nál alacsonyabb lobbanáspontú keverékek

– több mint 55% nitrocellulóz-tartalommal, bármilyen nitrogéntartalom

- 3) A viszkozitás meghatározása: Ha a szóban forgó anyag nemnewtoni folyadék, vagy a viszkozitás kifolyópohárral nem határozható meg, változó nyírósebességű viszkoziméterrel meg kell határozni az anyag dinamikai viszkozitását 23 °C-on, különböző nyírósebességekre, majd az így kapott, nyírósebességtől függő értékekből a 0 nyírósebességre kell extrapolálni. Az így kapott dinamikai viszkozitás és a sűrűség hányadosa adja a látszólagos kinematikai viszkozitást a 0-hoz közelítő nyírósebességnél.

esetén, vagy

- legfeljebb 55% nitrocellulóz-tartalommal és 12,6%-nál nagyobb nitrogén-tartalom esetén (száraz anyagra vetítve)

az 1 osztály (UN 0340 vagy 0342) vagy a 4.1 osztály (UN 2555, 2556 vagy 2557) anyagai.

2.2.3.1.5 A nem mérgező, nem maró és környezetre nem veszélyes oldatok és a homogén keverékek, amelyek lobbanáspontja 23 °C vagy ennél magasabb (viszkózus anyagok, mint pl. némely festékek és zománcok, kivéve a 20%-nál nagyobb nitrocellulóz tartalmú anyagokat), 450 litert meg nem haladó tartályokba csomagolva nem esnek az ADR előírásainak hatálya alá, ha oldószer-szétválási próba (lásd a „Vizsgálatok és kritériumok kézikönyv” III. rész 32.5.1 bekezdését) során a szétvált oldószer réteg magassága kisebb, mint a teljes mintamagasság 3%-a, és ha 23 °C-on az ISO 2431:1993 szabvány szerinti 6 mm átmérőjű kifolyónyílással ellátott kifolyópohárból a kifolyás időtartama:

- a) legalább 60 s, vagy
- b) legalább 40 s, és nem tartalmaz a 3 osztályba tartozó anyagokból 60%-nál többet.

2.2.3.1.6 Ha a 3 osztály anyagai valamilyen adalékanyag hozzáadása révén eltérő veszélyességi kategóriába kerülnek át, mint ahová a 3.2 fejezet „A” táblázatában név szerint említett anyagok tartoznak, ezeket a keverékeket vagy oldatokat azok alá a tételek alá kell besorolni, ahová tényleges veszélyességük mértéke alapján tartoznak.

Megjegyzés: Az oldatok és keverékek (készítmények és hulladékok) osztályozására lásd a 2.1.3 szakaszt is.

2.2.3.1.7 A 2.3.3.1 bekezdés és a 2.3.4 szakasz szerinti vizsgálati eljárások és a 2.2.3.1.1 pontban található kritériumok alapján az is meghatározható, hogy egy név szerint feltüntetett (vagy név szerint feltüntetett anyagot tartalmazó) oldat vagy keverék természete olyan, hogy az oldat vagy keverék nem esik ezen osztály előírásainak hatálya alá (lásd a 2.1.3 szakaszt is).

2.2.3.2 *A szállításból kizárt anyagok*

2.2.3.2.1 A 3 osztályba tartozó olyan anyagok, amelyek könnyen peroxidálódnak (mint az éter vagy bizonyos heterociklikus, oxigéntartalmú anyagok), nem fogadhatók el szállításra, ha peroxid-tartalmuk – hidrogén-peroxidra (H₂O₂-re) számítva – meghaladja a 0,3%-ot. A peroxid-tartalmat a 2.3.3.3 bekezdésben foglaltak szerint kell meghatározni.

2.2.3.2.2 A 3 osztály vegyileg nem állandó anyagai csak akkor adhatók át szállításra, ha megtették a szükséges intézkedéseket a szállítás alatt bekövetkező veszélyes bomlás vagy polimerizáció megakadályozására. Ezért különösen arról kell gondoskodni, hogy a tartályok és tartányok ne tartalmazzanak olyan anyagokat, amelyek az ilyen reakciókat elősegítik.

2.2.3.2.3 Azok a folyékony, érzéketlenített robbanóanyagok, amelyek a 3.2 fejezet „A” táblázatában nincsenek feltüntetve, a 3 osztály anyagaiként nem fogadhatók el szállításra.

2.2.3.3 A gyűjtőmegnevezések felsorolása

Járlékos - veszély	Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése
Gyúlékony, folyékony anyagok és az ilyen anyagokat tartalmazó tárgyak			
Járlékos veszély nélküli anyagok	F1	1133	RAGASZTÓK gyúlékony folyadék tartalommal
		1136	GYÚLÉKONY KŐSZÉNKÁTRÁNY PÁRLATOK
		1139	BEVONÓ OLDAT (beleértve az ipari vagy más célokra használt felületkezelő vagy bevonóanyagokat, pl. alapozó festékeket jármű karosszériához, hordóbélelő anyagokat)
		1169	FOLYÉKONY AROMÁS KIVONATOK

2.2.41 4.1 osztály Gyúlékony szilárd anyagok, önreaktív anyagok és szilárd, érzéketlenített robbanóanyagok

2.2.41.1 Kritériumok

2.2.41.1.1 A 4.1 osztály fogalmköre a gyúlékony anyagokra és tárgyra, az érzéketlenített robbanóanyagokra, amelyek az 1.2.1 szakaszban a „szilárd anyag” meghatározás a) bekezdése szerint szilárdak, valamint a szilárd vagy folyékony önreaktív anyagokra terjed ki.

A következők tartoznak a 4.1 osztályba:

- könnyen gyulladó szilárd anyagok és tárgyak (lásd a 2.2.41.1.3 – 2.2.41.1.8 pontot);
- szilárd és folyékony önreaktív anyagok (lásd a 2.2.41.1.9 – 2.2.41.1.17 pontot);
- szilárd, érzéketlenített robbanóanyagok (lásd a 2.2.41.1.18 pontot);
- önreaktív anyagokkal rokon anyagok (lásd a 2.2.41.1.19 pontot).

2.2.41.1.2 A 4.1 osztály anyagai és tárgyai a következők szerint vannak csoportosítva:

F Gyúlékony szilárd anyagok járulékos veszély nélkül:

F1 Szerves anyagok

F2 Szerves anyagok olvasztott állapotban

F3 Szervetlen anyagok

FO Gyúlékony szilárd anyagok, amelyek gyújtó hatásúak

FT Gyúlékony szilárd anyagok, amelyek mérgezőek:

FT1 Szerves, mérgező anyagok

FT2 Szervetlen, mérgező anyagok

FC Gyúlékony szilárd anyagok, amelyek maróak:

FC1 Szerves, maró anyagok

FC2 Szervetlen, maró anyagok

D Szilárd, érzéketlenített robbanóanyagok, járulékos veszély nélkül

DT Szilárd, érzéketlentett robbanóanyagok, amelyek mérgezőek

SR Önreaktív anyagok:

SR1 Önreaktív anyagok hőmérséklet-szabályozási igény nélkül

SR2 Önreaktív anyagok hőmérséklet-szabályozási igénnyel.

Gyúlékony szilárd anyagok

Meghatározások és tulajdonságok

2.2.41.1.3 A *gyúlékony szilárd anyagok* a könnyen gyulladó szilárd anyagok és azok, amelyek súrlódás révén tüzet okozhatnak.

A *könnyen gyulladó szilárd anyagok* porszerűek, szemcsésék vagy pasztaszerűek, és csak akkor veszélyesek, ha a gyújtóforrással, pl. égő gyufával való rövid érintkezéssel könnyen meggyújthatók és a láng gyorsan terjed. A veszélyt nemcsak a tűz jelentheti, hanem a mérgező égéstermékek is. A fémporok különösen azért veszélyesek, mert nehéz a tüzet eloltani, mivel a szokásos oltószerek, mint a szén-dioxid vagy a víz növelhetik a veszélyt.

2.2.41.1.4 A 4.1 osztály gyúlékony szilárd anyagai közé sorolt anyagokat és tárgyakat a 3.2 fejezet „A” táblázata sorolja fel. A 3.2 fejezet „A” táblázatában név szerint nem említett szerves anyagok és tárgyak besorolása a 2.1 fejezet előírásai szerint a 2.2.41.3 bekezdés megfelelő tétele alá tapasztalatok alapján vagy a „Vizsgálatok és kritériumok kézikönyv” III. rész 33.2.1 bekezdése szerinti vizsgálati eljárások eredményei alapján történhet. A 3.2 fejezet „A” táblázatában név szerint nem említett szervetlen anyagok besorolásának a „Vizsgálatok és kritériumok kézikönyv” III. rész 33.2.1 bekezdése szerinti vizsgálati eljárások eredményei alapján kell történnie; a tapasztalatokat is figyelembe kell azonban venni, ha azok szigorúbb hozzárendeléshez vezetnének.

2.2.41.1.5 A név szerint nem említett anyagoknak a „Vizsgálatok és kritériumok kézikönyv” III. rész 33.2.1 bekezdése szerinti vizsgálati eljárások eredményei alapján a 2.2.41.3 bekezdés valamely tétel alá történő besorolásánál a következő kritériumokat kell alkalmazni:

- a) A fémporok és a fémötvözet-porok kivételével a porszerű, szemcsés vagy pasztaszerű anyagokat akkor kell a 4.1 osztályba könnyen gyulladó anyagnak besorolni, ha azok gyújtóforrással (pl. égő gyufával) való rövid érintkezés hatására könnyen meggyulladnak, vagy ha meggyulladás esetén a láng gyorsan terjed, az égési idő 100 mm mérési távolságon kevesebb 45 s-nál vagy az égési sebesség nagyobb mint 2,2 mm/s.
- b) A fémporokat és a fémötvözet-porokat akkor kell a 4.1 osztályba sorolni, ha lánggal meggyújthatók és a reakció 10 percen belül a minta teljes hosszára kiterjed.

Azokat a szilárd anyagokat, amelyek súrlódás révén tüzet okozhatnak, valamely meglévő tételhez (pl. gyufához) való hasonlóság alapján, vagy valamely, ráillő különleges előírás alapján kell a 4.1 osztályba sorolni.

2.2.41.1.6 A „Vizsgálatok és kritériumok kézikönyv” III. rész 33.2.1 bekezdése szerinti vizsgálati eljárások, valamint a 2.2.41.1.4 és a 2.2.41.1.5 pontban található kritériumok alapján az is meghatározható, hogy egy név szerint feltüntetett anyag természete olyan, hogy az anyag nem esik ezen osztály előírásainak hatálya alá.

2.2.41.1.7 Ha a 4.1 osztály anyagai valamilyen adalékanyag hozzáadása révén eltérő veszélyességi kategóriába kerülnek át, mint ahová a 3.2 fejezet „A” táblázatában név szerint említett anyagok tartoznak, ezeket a keverékeket azok alá a tételek alá kell besorolni, ahová tényleges veszélyességük mértéke alapján tartoznak.

Megjegyzés: Az oldatok és keverékek (készítmények és hulladékok) besorolásához lásd a 2.1.3 szakaszt.

Csomagolási csoporthoz való hozzárendelés

2.2.41.1.8 A 3.2 fejezet „A” táblázatának egyes tételei alá sorolt gyúlékony szilárd anyagokat a „Vizsgálatok és kritériumok kézikönyv” III. rész 33.2.1 bekezdése szerinti vizsgálati eljárások alapján a II vagy a III csomagolási csoportba kell sorolni, a következő kritériumok szerint:

- a) A könnyen gyulladó szilárd anyagokat, amelyeknél a vizsgálat során az égési idő 100 mm mérési távolságon 45 s-nál kevesebb:
 - a II csomagolási csoportba kell sorolni akkor, ha a láng áthalad a nedvesített zónán;
 - a III csomagolási csoportba kell sorolni akkor, ha a nedvesített zóna legalább négy percre megállítja a láng terjedését.
- b) A fémporokat és fémötvözet-porokat:
 - a II csomagolási csoportba kell sorolni akkor, ha a vizsgálat során a reakció öt percen belül az egész mintára kiterjed;
 - a III csomagolási csoportba kell sorolni akkor, ha a vizsgálat során a reakció csak öt

percen túl terjed ki az egész mintára.

Azokat a szilárd anyagokat, amelyek sűrűlódás révén tüzet okozhatnak, valamely meglévő tételhez való hasonlóság, vagy valamely különleges előírás alapján kell valamely csomagolási csoporthoz hozzárendelni.

Önreaktív anyagok

Meghatározások

2.2.41.1.9

Az ADR alkalmazásában az önreaktív anyagok termikusan instabil anyagok, amelyek hajlamosak az erős exoterm bomlásra még oxigén (levegő) részvétele nélkül is. Nem tekinthetők a 4.1 osztály önreaktív anyagainak azok az anyagok, amelyek:

- a) az 1 osztály kritériumai szerint robbanóanyagok;
- b) az 5.1 osztály besorolási eljárása szerint gyújtó hatású anyagok (lásd a 2.2.51.1 bekezdést), kivéve a gyújtó hatású anyagok olyan keverékeit, amelyek 5% vagy annál több éghető szerves anyagot tartalmaznak, mivel ezeket a 2. megjegyzésben szereplő elv szerint kell besorolni;
- c) az 5.2 osztály kritériumai szerint szerves peroxidok (lásd a 2.2.52.1 bekezdést);
- d) bomláshője nem éri el a 300 J/g-ot; vagy
- e) öngyorsuló bomlási hőmérséklete (ÖBH) (lásd a 3. megjegyzést) 50 kg-os küldeménydarab esetén meghaladja a 75 °C-ot.

Megjegyzés: 1. *A bomláshő bármely nemzetközileg elfogadott módszerrel, pl. differenciál kaloriméteres (DSC) méréssel és adiabatikus kalorimetriával meghatározható.*

- 2.** *Az 5.1 osztály kritériumainak megfelelő gyújtó hatású anyagok keverékeit, amelyek 5% vagy annál több éghető szerves anyagot tartalmaznak, és amelyek nem elégítik ki az előző a), c), d) vagy e) pont kritériumait, az önreaktív anyagok besorolási eljárása szerint meg kell vizsgálni.*

Ha a keverék B – F típusú önreaktív anyag jellemzőivel rendelkezik, akkor a 4.1 osztályba kell sorolni.

Ha a keverék a „Vizsgálatok és kritériumok kézikönyv” II. Rész 20.40.3 g) bekezdése alapján G típusú anyag jellemzőivel rendelkezik, akkor az 5.1 osztály kritériumai szerint kell besorolni (lásd a 2.2.51.1 bekezdést).

- 3.** *Az öngyorsuló bomlási hőmérséklet (ÖBH) az a legalacsonyabb hőmérséklet, amelynél öngyorsuló bomlás mehet végbe az anyagban a szállításra használt csomagolásban. Az ÖBH meghatározására vonatkozó előírásokat a „Vizsgálatok és kritériumok kézikönyv” II. rész 20. fejezete és a 28.4 bekezdése tartalmazza.*

- 4.** *Bármely anyagot, ami az önreaktív anyag tulajdonságait mutatja, mint ilyent kell besorolni, még ha az anyag a 2.2.42.1.5 pont szerinti vizsgálatban a 4.2 osztályba történő besoroláshoz pozitív eredményt adott is.*

Tulajdonságok

2.2.41.1.10

Az önreaktív anyagok bomlása hővel, katalitikus szennyeződésekkel való érintkezéssel (pl. savak, nehézfém vegyületek, bázisok), sűrűlódással vagy ütéssel iniciálható. A bomlás sebessége a hőmérséklettel növekszik és az anyagtól függően változik. A bomlás, különösen ha nem történik meggyulladás, mérgező gázok vagy gőzök fejlődésével járhat. Egyes önreaktív anyagok hőmérséklet-szabályozást igényelnek. Egyes önreaktív anyagok, különösen zárt térben, robbanásszerűen elbomolhatnak. Ezek a jellemzők hígítók hozzáadásával vagy megfelelő csomagolások használatával módosíthatók. Némely önreaktív anyag élénken ég. Önreaktív anyagok például a következő típusú vegyületek:

alifás azovegyületek ($-C-N=N-C-$);
szerves azidok ($-C-N_3$);
diazónium sók ($-CN_2^+Z^-$);
N-nitrózo vegyületek ($-N-N=O$); és
aromás szulfohidrazidok ($-SO_2-NH-NH_2$).

Ez a felsorolás nem teljes, más reaktív csoportot tartalmazó anyagok és az anyagok egyes keverékei hasonló tulajdonságokkal rendelkezhetnek.

Besorolás

2.2.41.1.11 Az önreaktív anyagok a veszély mértéke alapján hét típusba vannak sorolva. Az önreaktív anyagok típusai az A típustól, amely abban a csomagolásban, amelyben bevizsgálásra került, nem szállítható, egészen a G típusig tartanak, amely nem esik a 4.1 osztály előírásainak hatálya alá. A B-től F-ig terjedő típusok alá való besorolás az egy csomagolásban engedélyezett legnagyobb mennyiségtől függ. Az anyagok besorolásához alkalmazandó elveket, besorolási eljárásokat, vizsgálati módszereket és kritériumokat, valamint a megfelelő vizsgálati jegyzőkönyvre példát a „Vizsgálatok és kritériumok kézikönyv” II. Rész tartalmazza.

2.2.41.1.12 A már besorolt és csomagolóeszközben való szállításra már engedélyezett önreaktív anyagokat a 2.2.41.4 bekezdés, az IBC-ben való szállításra már engedélyezett önreaktív anyagokat a 4.1.4.2 bekezdés IBC520 csomagolási utasítása, és a 4.2 fejezet szerint tartányban szállítható önreaktív anyagokat a 4.2.5.2 bekezdés T23 mobil tartány utasítása sorolja fel. Ezekben a felsorolásokban minden engedélyezett anyag a 3.2 fejezet „A” táblázatának valamely generikus tételéhez (UN 3221 – 3240) hozzá van rendelve, és meg vannak adva a szállítás szempontjából fontos információt jelentő járulékos veszélyek, ill. megjegyzések.

A gyűjtőmegnevezések meghatározzák:

- az önreaktív anyag típusát (B – F), lásd az előző 2.2.41.1.11 pontot;
- a fizikai állapotot (folyékony/szilárd); és
- a hőmérséklet-szabályozást (ha szükséges), lásd a következő 2.2.41.1.17 pontot.

A 2.2.41.4 bekezdésben felsorolt önreaktív anyagok besorolása technikailag tiszta anyagokon alapul (kivéve ahol 100%-nál kisebb koncentráció van megadva).

2.2.41.1.13 A 2.2.41.4 bekezdésben, a 4.1.4.2 bekezdés IBC520 csomagolási utasításában, ill. a 4.2.5.2 bekezdés T23 mobil tartány utasításában fel nem sorolt önreaktív anyagok besorolását és valamely gyűjtőmegnevezéshez való hozzárendelését a vizsgálati jegyzőkönyv alapján a származási ország illetékes hatóságának kell elvégeznie. A jóváhagyásnak tartalmaznia kell a besorolást és a szállítási feltételeket. Ha a származási ország nem valamely ADR Szerződő Fél, a besorolást és a szállítási feltételeket a küldemény által érintett első ADR Szerződő Fél illetékes hatóságának kell elismernie.

2.2.41.1.14 Egyes önreaktív anyagokhoz aktivátorok, pl. cinkvegyületek adhatók reaktivitásuk megváltoztatására. Az aktivátor típusától és koncentrációjától függően ez a termikus stabilitás csökkenéséhez és a robbanó tulajdonságok változásához vezethet. Ha ezen tulajdonságok bármelyike is megváltozik, az új készítményt a besorolási eljárás szerint újra kell értékelni.

2.2.41.1.15 A 2.2.41.4 bekezdésben fel nem sorolt önreaktív anyag vagy önreaktív anyag készítmény mintákat, amelyekre nézve nem áll rendelkezésre teljes körű vizsgálati eredmény és szállításuk további vizsgálatok vagy értékelés céljából történik, a C típusú önreaktív anyagokra vonatkozó, megfelelő tételhez kell hozzárendelni, feltéve, hogy a következő feltételeknek megfelelnek:

- a rendelkezésre álló adatokból kitűnik, hogy a minta nem veszélyesebb, mint egy B típusú önreaktív anyag;
- a minta az OP2 csomagolási módszernek megfelelően van csomagolva és mennyisége szállítóegységként nem haladja meg a 10 kg-ot;

- a rendelkezésre álló adatok jelzik, hogy a szabályozási hőmérséklet, ha ilyen van, elegendően alacsony minden veszélyes bomlás megakadályozására és elegendően magas minden veszélyes fázis-átalakulás megakadályozására.

Érzéketlenítés

2.2.41.1.16

A biztonságos szállítás céljából az önreaktív anyagokat számos esetben hígítók használatával érzéketlenítik. Amennyiben valamely anyag százalékos tartalma meg van határozva, ez a tartalom tömegére vonatkozik, egész számra kerekítve. Hígító használata esetén az önreaktív anyagot a szállítás során használt koncentrációjú és formájú hígító jelenléte mellett kell vizsgálni. Olyan hígítók, amelyek a küldeménydarabból való kifolyás esetén lehetővé teszik, hogy az önreaktív anyag veszélyes mértékben koncentrálódhasson, nem használhatók. A használt hígítónak az önreaktív anyaggal összeférhetőnek kel lennie. Ebben a tekintetben összeférhető hígítók azok a szilárd vagy folyékony anyagok, amelyek nem befolyásolják hátrányosan az önreaktív anyag termikus stabilitását és veszélytípusát. A folyékony hígítók forráspontja a hőmérséklet-szabályozást igénylő készítményekben lásd a 2.2.41.1.17 pontot) legalább 60 °C és lobbanáspontja legalább 5 °C legyen. A folyékony hígító forráspontjának legalább 50 °C-kal magasabbnak kell lennie, mint az önreaktív anyag szabályozási hőmérséklete.

Hőmérséklet szabályozási előírások

2.2.41.1.17

Egyes önreaktív anyagok csak hőmérséklet-szabályozás mellett szállíthatók. A szabályozási hőmérséklet az a maximális hőmérséklet, amelyen az önreaktív anyag biztonságosan szállítható. Feltételezett, hogy a szállítás során a küldeménydarab közvetlen környezetében a hőmérséklet 24 óránként csak rövid ideig magasabb 55 °C-nál. A hőmérséklet-szabályozás megszűnése esetén szükség lehet vészhelyzeti eljárások alkalmazására. A vészhőmérséklet az a hőmérséklet, amelynél az ilyen eljárásokat meg kell indítani. A szabályozási és vészhőmérsékleteket az öngyorsuló bomlási hőmérsékletből (ÖBH) vezetik le (lásd az 1. táblázatot). Az ÖBH-t azért kell meghatározni, hogy eldönthető legyen, vajon az anyagot alá kell-e vetni hőmérséklet-szabályozásnak a szállítás alatt. Az ÖBH meghatározására vonatkozó előírásokat a „Vizsgálatok és kritériumok kézikönyv” II. Rész 20. fejezete és 28.4 bekezdése tartalmazza.

1. táblázat: A szabályozási és a vészhőmérséklet meghatározása

A tartály típusa	ÖBH ^{a)}	Szabályozási hőmérséklet	Vészhőmérséklet
Önálló csomagoló-eszközök és IBC-k	20 °C vagy az alatt	20 °C-kal az ÖBH alatt	10 °C-kal az ÖBH alatt
	20 °C felett, 35 °C-ig	15 °C-kal az ÖBH alatt	10 °C-kal az ÖBH alatt
	35 °C felett	10 °C-kal az ÖBH alatt	5 °C-kal az ÖBH alatt
Tartályok	legfeljebb 50 °C	10 °C-kal az ÖBH alatt	5 °C-kal az ÖBH alatt

a) Az anyag ÖBH értéke a szállításra kész csomagolásban.

Azokat az önreaktív anyagokat, amelyek ÖBH értéke 55 °C-nál nem nagyobb, a szállítás alatt hőmérséklet-szabályozásnak kell alávetni. A szabályozási és vészhőmérsékletek, ahol vannak, a 2.2.41.4 bekezdésben vannak felsorolva. A tényleges szállítási hőmérséklet lehet alacsonyabb, mint a szabályozási hőmérséklet, de úgy kell megválasztani, hogy veszélyes fázis-átalakulás ne következhesen be.

Szilárd, érzéketlenített robbanóanyagok

2.2.41.1.18

A szilárd, érzéketlenített robbanóanyagok olyan anyagok, amelyeket vízzel vagy alkohollal nedvesítenek vagy más anyagokkal hígítanak azért, hogy robbanó tulajdonságaikat elnyomják. A 3.2 fejezet „A” táblázatában ilyen tétel az UN 1310, 1320, 1321, 1322, 1336, 1337, 1344, 1347, 1348, 1349, 1354, 1355, 1356, 1357, 1517, 1571, 2555, 2556, 2557, 2852, 2907, 3317, 3319, 3344, 3364, 3365, 3366, 3367, 3368, 3369, 3370, 3376, 3380 és 3474.

Önreaktív anyagokkal rokon anyagok

2.2.41.1.19

Azok az anyagok,

- a) amelyeket az 1 és 2 vizsgálati sorozat eredményei alapján ideiglenesen az 1 osztályba soroltak, de a 6. vizsgálati sorozat alapján mentesülnek az 1 osztály alól;
- b) amelyek nem a 4.1 osztály önreaktív anyagai; és
- c) amelyek nem az 5.1 vagy az 5.2 osztály anyagai;

szintén a 4.1 osztályba tartoznak. Ilyen tételek az UN 2956, 3241, 3242 és 3251.

2.2.41.2

A szállításból kizárt anyagok

2.2.41.2.1

A 4.1 osztályba tartozó, vegyileg nem állandó anyagok csak akkor adhatók át szállításra, ha megtették a szükséges intézkedéseket a szállítás alatt bekövetkező veszélyes bomlás vagy polimerizáció megakadályozására. Ezért különösen arról kell gondoskodni, hogy a tartályok és tartányok ne tartalmazzanak olyan anyagokat, amelyek az ilyen reakciókat elősegítik.

2.2.41.2.2

Az UN 3097 számú gyújtó hatású, gyúlékony, szilárd anyagok a szállításból ki vannak zárva, kivéve, ha megfelelnek az 1 osztály előírásainak (lásd a 2.1.3.7 bekezdést is).

2.2.41.2.3

A következő anyagok a szállításból ki vannak zárva:

- az A típusú önreaktív anyagok [lásd a „Vizsgálatok és kritériumok kézikönyv” II. rész, 20.4.2 a) bekezdését];
- a fehér- vagy sárgafoszfortól nem mentes foszfor-szulfidok;
- a 3.2 fejezet „A” táblázatában fel nem sorolt szilárd, érzéketlenített robbanóanyagok;
- a szervesetlen, gyúlékony anyagok olvasztott formában, kivéve az UN 2448 olvasztott ként.

2.2.41.3

A gyűjtőmegnevezések felsorolása

Járolékos veszély	Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése
Gyúlékony szilárd anyagok	járolékos veszély nélkül	szerves anyagok F1	3175 GYÚLÉKONY FOLYADÉK TARTALMÚ SZILÁRD ANYAGOK, M.N.N. 1353 GYENGÉN NITRÁLT NITROCELLULÓZZAL IMPREGNÁLT SZÁLAK, M.N.N. vagy

Megjegyzés:

- A fémek és fémötvözetek por vagy egyéb gyúlékony formában, ha öngyulladásra hajlamosak, a 4.2 osztály anyagai.*
- A fémek és fémötvözetek por vagy egyéb gyúlékony formában, ha vízzel érintkezve gyúlékony gázokat fejlesztenek, a 4.3 osztály anyagai.*
- Azok a fém-hidridek, amelyek vízzel érintkezve gyúlékony gázokat fejlesztenek, a 4.3 osztály anyagai. Az alumínium-bórhidrid vagy alumínium-bórhidrid készülékekben a 4.2 osztály UN 2870 alá tartozó anyag*

2.2.41.4 A már besorolt és csomagolóeszközben való szállításra engedélyezett önreaktív anyagok felsorolása

A „csomagolási módszer” oszlopban az „OP1” – „OP8” kód a 4.1.4.1 bekezdés P520 csomagolási utasítás csomagolási módszereire utal (lásd még a 4.1.7.1 bekezdést). A szállítandó önreaktív anyagnak meg kell felelnie a felsorolás szerinti besorolásnak és (az ÖBH-ből levezetett) szabályozási, ill. vészhőmérsékletnek. Az IBC-ben engedélyezett anyagokra lásd a 4.1.4.2 bekezdés IBC520 csomagolási utasítását, a 4.2 fejezet szerint tartányban engedélyezettekre lásd a 4.2.5.2 bekezdés T23 mobil tartány utasítását.

Megjegyzés: *Az ebben a táblázatban levő besorolás a technikailag tiszta anyagokon alapul (kivéve, ha a megadott koncentráció 100%-nál kisebb). Más koncentrációk esetében az anyag a „Vizsgálatok és kritériumok kézikönyv” II. Részében és a 2.2.41.1.17 pontban található eljárást követve ettől eltérően is besorolható.*

2.2.42 4.2 osztály Öngyulladásra hajlamos anyagok

2.2.42.1 *Kritériumok*

2.2.42.1.1 A 4.2 osztály fogalomköre a következőkre terjed ki:

- piroforos anyagokra, amelyek olyan anyagok (beleértve a folyékony vagy szilárd keverékeket és oldatokat), amelyek már kis mennyiségben is a levegővel érintkezve 5 percen belül meggyulladnak. A 4.2 osztály ezen anyagai a leginkább öngyulladásra hajlamosak; és
- önmelegedő anyagokra és tárgyakra, amelyek olyan anyagok és tárgyak (beleértve az oldatokat és keverékeket), amelyek a levegővel érintkezve energia közlés nélkül hajlamosak az önmelegedésre. Ezek az anyagok csak nagy mennyiségben (több kilogrammban), hosszabb idő után (órák vagy napok) gyulladnak meg.

2.2.42.1.2 A 4.2 osztály anyagai és tárgyai a következők szerint vannak csoportosítva:

S Öngyulladásra hajlamos anyagok járulékos veszély nélkül:

- S1 Szerves, folyékony anyagok
- S2 Szerves, szilárd anyagok
- S3 Szervetlen, folyékony anyagok
- S4 Szervetlen, szilárd anyagok
- S5 Szerves fémvegyületek

SW Öngyulladásra hajlamos anyagok, amelyek vízzel érintkezve gyúlékony gázokat fejlesztenek

SO Öngyulladásra hajlamos, gyújtó hatású anyagok

ST Öngyulladásra hajlamos, mérgező anyagok:

- ST1 Mérgező, szerves, folyékony anyagok
- ST2 Mérgező, szerves, szilárd anyagok
- ST3 Mérgező, szervetlen, folyékony anyagok
- ST4 Mérgező, szervetlen, szilárd anyagok

SC Öngyulladásra hajlamos, maró anyagok:

- SC1 Maró, szerves, folyékony anyagok
- SC2 Maró, szerves, szilárd anyagok
- SC3 Maró, szervetlen, folyékony anyagok
- SC4 Maró, szervetlen, szilárd anyagok.

Tulajdonságok

2.2.42.1.3 Egy anyag önmelegedése az a folyamat, amikor az anyag fokozatos reakciója oxigénnel (levegőn) hőfejlődéssel jár. Ha a hőfejlődés sebessége meghaladja a hővesztesség sebességét, az anyag hőmérséklete emelkedik, ami egy indukciós időtartam után öngyuladáshoz és égéshez vezethet.

2.2.42.1.4 A 4.2 osztályba sorolt anyagokat és tárgyakat a 3.2 fejezet „A” táblázata sorolja fel. A 3.2 fejezet „A” táblázatában név szerint nem említett anyagok és tárgyak besorolása a 2.1 fejezet előírásai szerint a 2.2.42.3 bekezdés megfelelő m.n.n. tétele alá, a tapasztalatok alapján vagy a „Vizsgálatok és kritériumok kézikönyv” III. Rész 33.3 bekezdése szerinti vizsgálati eljárások eredményei alapján történhet. A 4.2 osztály valamely általános m.n.n. tétele alá történő besorolásnak a „Vizsgálatok és kritériumok kézikönyv” III. Rész 33.3 bekezdése szerinti vizsgálati eljárások eredményei alapján kell történnie; a tapasztalatokat is figyelembe kell azonban venni, ha azok szigorúbb hozzárendeléshez vezetnének.

2.2.42.1.5 A név szerint nem említett anyagoknak vagy tárgyaknak a „Vizsgálatok és kritériumok kézikönyv” III. Rész 33.3 bekezdése szerinti vizsgálati eljárások eredményei alapján a 2.2.42.3 bekezdés valamely tétele alá történő besorolásánál a következő kritériumokat kell alkalmazni:

- a) az öngyulladásra hajlamos (piroforos) szilárd anyagokat akkor kell a 4.2 osztályba sorolni, ha 1 m magasságból leejtve vagy öt percen belül meggyulladnak;
- b) az öngyulladásra hajlamos (piroforos) folyékony anyagokat akkor kell a 4.2 osztályba sorolni, ha:
 - i) inert hordozóra kiöntve öt percen belül meggyulladnak, vagy
 - ii) az i) szerinti próbánál negatív eredményt adnak, de száraz, redőzött szűrőpapírra kiöntve (Whatman No. 3 szűrőpapír) öt percen belül meggyulladnak vagy a szűrőpapírt elszenesítik;
- c) azokat az anyagokat, amelyeknél egy 10 cm élhosszúságú kocka alakú mintában 140 °C vizsgálati hőmérsékleten 24 órán belül öngyulladás vagy a hőmérséklet 200 °C fölé emelkedése figyelhető meg, a 4.2 osztályba kell sorolni. Ez a kritérium a faszén öngyulladási hőmérsékletén alapul, ami 27 m³-es kockánál 50 °C. Azokat az anyagokat, amelyek öngyulladási hőmérséklete 27 m³ térfogatú kocka formában 50 °C-nál magasabb, nem szabad a 4.2 osztályba sorolni.

Megjegyzés: 1. Azok az anyagok, amelyeket legfeljebb 3 m³ térfogatú csomagolásokban szállítanak, nem tartoznak a 4.2 osztályba, ha 10 cm élhosszúságú kocka alakú mintában 120 °C vizsgálati hőmérsékleten 24 órán belül öngyulladás vagy a hőmérséklet 180 °C fölé emelkedése nem figyelhető meg.

2. Azok az anyagok, amelyeket legfeljebb 450 liter térfogatú csomagolásokban szállítanak, nem tartoznak a 4.2 osztályba, ha 10 cm élhosszúságú kocka alakú mintában 100 °C vizsgálati hőmérsékleten 24 órán belül öngyulladás vagy a hőmérséklet 160 °C fölé emelkedése nem figyelhető meg.

3. Mivel a járulékos veszélyekkel rendelkező szerves fémvegyületek tulajdonságaiktól függően a 4.2 vagy a 4.3 osztályba sorolhatók, ezekhez az anyagokhoz a 2.3.5 szakaszban különleges besorolási folyamatára található.

2.2.42.1.6 Ha a 4.2 osztály anyagai valamilyen adalékanyag hozzáadása révén eltérő veszélyességi kategóriába kerülnek át, mint ahová a 3.2 fejezet „A” táblázatában név szerint említett anyagok tartoznak, ezeket a keverékeket vagy oldatokat azok alá a tételek alá kell besorolni, ahová tényleges veszélyességük mértéke alapján tartoznak.

Megjegyzés: Az oldatok és keverékek (készítmények és hulladékok) besorolásához lásd a 2.1.3 szakaszt.

2.2.42.1.7 A „Vizsgálatok és kritériumok kézikönyv” III. Rész 33.3 bekezdése szerinti vizsgálati eljárások és a 2.2.42.1.5 pontban található kritériumok alapján az is meghatározható, hogy egy név szerint feltüntetett anyag természete olyan, hogy az anyag nem esik ezen osztály előírásainak hatálya alá.

Csomagolási csoporthoz való hozzárendelés

2.2.42.1.8

A 3.2 fejezet „A” táblázatának egyes tételei alá sorolt anyagokat és tárgyakat a „Vizsgálatok és kritériumok kézikönyv” III. rész 33.3 bekezdése szerinti vizsgálati eljárások alapján az I, a II vagy a III csomagolási csoportba kell sorolni a következő kritériumok szerint:

- a) az öngyulladásra hajlamos (piroforos) anyagokat az I csomagolási csoportba kell sorolni;
- b) azokat az önmelegedő anyagokat és tárgyakat, amelyeknél 2,5 cm élhosszúságú kocka alakú mintában 140 °C vizsgálati hőmérsékleten 24 órán belül öngyulladás vagy a hőmérséklet 200 °C fölé emelkedése figyelhető meg, a II csomagolási csoportba kell sorolni.

Azokat az anyagokat, amelyek öngyulladási hőmérséklete 450 liter térfogatban meghaladja az 50 °C-ot, nem kell a II csomagolási csoportba sorolni;

- c) azokat a gyengén önmelegedő anyagokat, amelyeknél 2,5 cm élhosszúságú kocka alakú mintában a b) pontban említett jelenségek nem figyelhetők meg az adott körülmények között, de amelyeknél 10 cm élhosszúságú kocka alakú mintában 140 °C vizsgálati hőmérsékleten 24 órán belül öngyulladás vagy a hőmérséklet 200 °C fölé emelkedése figyelhető meg, a III csomagolási csoportba kell sorolni.

2.2.42.2

A szállításból kizárt anyagok

A következő anyagok a szállításból ki vannak zárva:

- az UN 3255 terc-butil-hipoklorit; és
- az UN 3127 számú gyújtó hatású, önmelegedő, szilárd anyagok, kivéve, ha megfelelnek az 1 osztály előírásainak (lásd a 2.1.3.7 bekezdést).

2.2.42.3 A gyűjtőmegnevezések felsorolása

- a) Azok a nem mérgező fémporok és finom porok, amelyek öngyulladásra nem hajlamos formában vannak, de amelyek vízzel érintkezve gyúlékony gázokat fejlesztenek, a 4.3 osztály anyagai.

2.2.43 4.3 osztály Vízrel érintkezve gyúlékony gázokat fejlesztő anyagok

2.2.43.1 *Kritériumok*

2.2.43.1.1 A 4.3 osztály fogalomköre olyan anyagokra és olyan anyagokat tartalmazó tárgyakra terjed ki, amelyek vízzel reagálva a levegővel robbanó keverék alkotására hajlamos, gyúlékony gázokat fejlesztenek.

2.2.43.1.2 A 4.3 osztály anyagai és tárgyai a következők szerint vannak csoportosítva:

W Vízrel érintkezve gyúlékony gázokat fejlesztő anyagok járulékos veszély nélkül és az ilyen anyagokat tartalmazó tárgyak:

W1 Folyékony anyagok

W2 Szilárd anyagok

W3 Tárgyak

WF1 Vízrel érintkezve gyúlékony gázokat fejlesztő, folyékony, gyúlékony anyagok

WF2 Vízrel érintkezve gyúlékony gázokat fejlesztő, szilárd, gyúlékony anyagok

WS Vízrel érintkezve gyúlékony gázokat fejlesztő, önmelegedő, szilárd anyagok

WO Vízrel érintkezve gyúlékony gázokat fejlesztő, gyújtó hatású, szilárd anyagok

WT Vízrel érintkezve gyúlékony gázokat fejlesztő, mérgező anyagok:

WT1 Folyékony anyagok

WT2 Szilárd anyagok

WC Vízrel érintkezve gyúlékony gázokat fejlesztő, maró anyagok:

WC1 Folyékony anyagok

WC2 Szilárd anyagok

WFC Vízrel érintkezve gyúlékony gázokat fejlesztő, gyúlékony, maró anyagok.

Tulajdonságok

2.2.43.1.3 Bizonyos anyagok a vízzel érintkezve olyan gyúlékony gázokat fejleszthetnek, amelyek a levegővel robbanó elegyet alkothatnak. Az ilyen keverékek bármilyen közönséges gyújtóforrástól, pl. nyílt lángtól, szikrát vető kéziszerszámtól vagy védelem nélküli izzó-lámpától könnyen meggyulladhatnak. A keletkező lökéshullám és a láng veszélyeztetheti az embereket és a környezetet. A 2.2.43.1.4 pontban leírt vizsgálati módszer használatos annak meghatározására, hogy az anyag reakciója a vízzel nem jár-e veszélyes mennyiségű, esetleg gyúlékony gázok fejlődésével. Ezt a módszert piroforos anyagokhoz nem szabad használni.

Besorolás

2.2.43.1.4 A 4.3 osztályba sorolt anyagokat és tárgyakat a 3.2 fejezet „A” táblázata sorolja fel. A 3.2 fejezet „A” táblázatában név szerint nem említett anyagok és tárgyak besorolásának a 2.1 fejezet előírásai szerint a 2.2.43.3 bekezdés megfelelő tétele alá a „Vizsgálatok és kritériumok kézikönyv” III. rész 33.4 bekezdése szerinti vizsgálati eljárások eredményei alapján kell történnie; a tapasztalatokat is figyelembe kell azonban venni, ha azok szigorúbb besoroláshoz vezetnének.

2.2.43.1.5 A név szerint nem említett anyagoknak a „Vizsgálatok és kritériumok kézikönyv” III. Rész 33.4 bekezdése szerinti vizsgálati eljárások eredményei alapján a 2.2.43.3 bekezdés valamely tétele alá történő besorolásánál a következő kritériumokat kell alkalmazni:

Egy anyagot akkor kell a 4.3 osztályba sorolni, ha

- a) a vizsgálatok bármely szakaszában a fejlődött gáz magától meggyullad; vagy
- b) a gyúlékony gáz fejlődési sebessége a vizsgált anyag 1 kg-jára számítva meghaladja az 1 liter/óra értéket.

***Megjegyzés:** Mivel a járulékos veszélyekkel rendelkező szerves fémvegyületek tulajdonságaiktól függően a 4.2 vagy a 4.3 osztályba sorolhatók, ezekhez az anyagokhoz a 2.3.5 szakaszban különleges besorolási folyamatára található.*

2.2.43.1.6 Ha a 4.3 osztály anyagai valamilyen adalékanyag hozzáadása révén eltérő veszélyességi kategóriába kerülnek át, mint ahová a 3.2 fejezet „A” táblázatában név szerint említett anyagok tartoznak, ezeket a keverékeket vagy oldatokat azok alá a tételek alá kell besorolni, ahová tényleges veszélyességük mértéke alapján tartoznak.

***Megjegyzés:** Az oldatok és keverékek (készítmények és hulladékok) besorolásához lásd a 2.1.3 szakaszt.*

2.2.43.1.7 A „Vizsgálatok és kritériumok kézikönyv” III. Rész 33.4 bekezdése szerinti vizsgálati eljárások és a 2.2.43.1.5 pontban található kritériumok alapján az is meghatározható, hogy egy név szerint feltüntetett anyag természete olyan, az anyag nem esik ezen osztály előírásainak hatálya alá.

Csomagolási csoporthoz való hozzárendelés

2.2.43.1.8 A 3.2 fejezet „A” táblázatának egyes tételei alá sorolt anyagokat és tárgyakat a „Vizsgálatok és kritériumok kézikönyv” III. Rész 33.4 bekezdése szerinti vizsgálati eljárások alapján az I, a II vagy a III csomagolási csoportba kell sorolni a következő kritériumok szerint:

- a) Az I csomagolási csoportba akkor kell sorolni egy anyagot, ha szobahőmérsékleten a vízzel erősen reagál és a fejlődő gáz általában hajlamot mutat arra, hogy önmagától meggyulladjon, vagy szobahőmérsékleten olyan könnyen reagál a vízzel, hogy a gyúlékony gáz fejlődésének mértéke a vizsgált anyag 1 kg-jára számítva bármely egy perces időtartam alatt legalább 10 liter;
- b) A II csomagolási csoportba akkor kell sorolni egy anyagot, ha szobahőmérsékleten olyan könnyen reagál vízzel, hogy a gyúlékony gáz maximális fejlődési sebessége a vizsgált anyag 1 kg-jára számítva legalább 20 liter/óra és az I csomagolási csoport kritériumai nem teljesülnek;
- c) A III csomagolási csoportba akkor kell sorolni egy anyagot, ha szobahőmérsékleten olyan lassan reagál vízzel, hogy a gyúlékony gáz maximális fejlődési sebessége a vizsgált anyag 1 kg-jára számítva legalább 1 liter/óra és sem az I csomagolási csoport, sem a II csomagolási csoport kritériumai nem teljesülnek.

2.2.43.2 ***A szállításból kizárt anyagok***

Az UN 3133 alá sorolt vízzel reaktív, gyújtó hatású, szilárd anyagok a szállításból ki vannak zárva, kivéve ha megfelelnek az 1 osztály előírásainak (lásd a 2.1.3.7 bekezdést is).

2.2.43.3 A gyűjtőmegnevezések felsorolása

Ha szükséges, a 2.1.3.10 bekezdés veszélyességi rangsor táblázata alapján meghatározandó, másik osztályozási kód valamely gyűjtőmegnevezése alá kell sorolni.)

Megjegyzés:

- a) *Azok a fémek és fémötvözetek, amelyek a vízzel érintkezve nem fejlesztenek gyúlékony gázokat és nem piroforosak, vagy nem önmelegedők, de amelyek könnyen meggyúlnak, a 4.1 osztály anyagai. Az alkáliföldfémek és alkáliföldfém ötvözetek piroforos formában a 4.2 osztály anyagai. A fémporok és finom porok piroforos állapotban a 4.2 osztály anyagai. A fémek és fémötvözetek piroforos állapotban a 4.2 osztály anyagai. A foszfor vegyületei nehézfémekkel, pl. vassal, rézzel stb. nem esnek az ADR előírásainak hatálya alá.*
- b) *A fémek és fémötvözetek piroforos állapotban a 4.2 osztály anyagai.*
- c) *Azok a klór-szilánok, amelyek lobbanáspontja 23 °C alatti, és vízzel érintkezve nem fejlesztenek gyúlékony gázokat, a 3 osztály anyagai. Azok a klór-szilánok, amelyek lobbanáspontja 23 °C vagy ennél magasabb, és vízzel érintkezve nem fejlesztenek gyúlékony gázokat, a 8 osztály anyagai.*

2.2.51	5.1 osztály Gyújtó hatású (oxidáló) anyagok
2.2.51.1	Kritériumok
2.2.51.1.1	Az 5.1 osztály fogalmköre olyan anyagokra és olyan anyagokat tartalmazó tárgyra terjed ki, amelyek bár önmagukban nem szükségszerűen gyúlékonyak, általában oxigén leadásával tüzet okozhatnak vagy más anyagok égését elősegíthetik.
2.2.51.1.2	<p>Az 5.1 osztály anyagai és az ilyen anyagokat tartalmazó tárgyak a következők szerint vannak csoportosítva:</p> <ul style="list-style-type: none"> O Gyújtó hatású anyagok járulékos veszély nélkül vagy ilyen anyagokat tartalmazó tárgyak: <ul style="list-style-type: none"> O1 Folyékony anyagok O2 Szilárd anyagok O3 Tárgyak OF Gyújtó hatású szilárd, gyúlékony anyagok OS Gyújtó hatású szilárd, önmelegedő anyagok OW Gyújtó hatású szilárd anyagok, amelyek vízzel érintkezve gyúlékony gázokat fejlesztenek OT Gyújtó hatású, mérgező anyagok: <ul style="list-style-type: none"> OT1 Folyékony anyagok OT2 Szilárd anyagok OC Gyújtó hatású, maró anyagok: <ul style="list-style-type: none"> OC1 Folyékony anyagok OC2 Szilárd anyagok OTC Gyújtó hatású, mérgező, maró anyagok.
2.2.51.1.3	Az 5.1 osztályba sorolt anyagokat és tárgyakat a 3.2 fejezet „A” táblázata sorolja fel. A 3.2 fejezet „A” táblázatában név szerint nem említett anyagok és tárgyak besorolása a 2.1 fejezet szerint a 2.2.51.3 bekezdés megfelelő tétele alá a következő 2.2.51.1.6 – 2.2.51.1.9 pontok és a „Vizsgálatok és kritériumok kézikönyv” III. Rész 34.4 bekezdése szerinti kritériumok, módszerek és vizsgálati eljárások alapján történhet. Amennyiben a vizsgálati eredmények és az ismeretes tapasztalatok között eltérés van, a tapasztalat alapján való megítélést előnyben kell részesíteni a vizsgálati eredményekkel szemben.
2.2.51.1.4	<p>Ha az 5.1 osztály anyagai valamilyen anyag hozzáadása révén eltérő veszélyességi kategóriába kerülnek át, mint ahová a 3.2 fejezet „A” táblázatában név szerint említett anyagok tartoznak, ezeket a keverékeket azok alá a tételek alá kell besorolni, amelyekbe tényleges veszélyességük mértéke alapján tartoznak.</p> <p>Megjegyzés: <i>Az oldatok és keverékek (készítmények és hulladékok) besorolásához lásd a 2.1.3 szakaszt.</i></p>
2.2.51.1.5	A „Vizsgálatok és kritériumok kézikönyv” III. Rész 34.4 bekezdése szerinti vizsgálati eljárások és a 2.2.51.1.6 – 2.2.51.1.9 pontban található kritériumok alapján az is meghatározható, hogy egy név szerint feltüntetett anyag természete olyan, hogy az anyag nem esik ezen osztály előírásainak hatálya alá.

Gyújtó hatású szilárd anyagok

Besorolás

- 2.2.51.1.6** A 3.2 fejezet „A” táblázatában név szerint nem említett gyújtó hatású, szilárd anyagoknak a „Vizsgálatok és kritériumok kézikönyv” III. Rész 34.4.1 bekezdése szerinti vizsgálati eljárások alapján a 2.2.51.3 bekezdés valamely tétele alá történő besorolásánál a következő kritériumokat kell alkalmazni:

Egy szilárd anyagot akkor kell az 5.1 osztályba sorolni, ha cellulózzal 4:1 vagy 1:1 tömegarányban alkotott keveréke meggyullad vagy elég vagy az átlagos égési ideje azonos vagy rövidebb, mint a kálium-bromát/cellulóz 3:7 tömegarányú keverék átlagos égési ideje.

Csomagolási csoporthoz való hozzárendelés

- 2.2.51.1.7** A 3.2 fejezet „A” táblázatának egyes tételei alá sorolt gyújtó hatású, szilárd anyagokat a „Vizsgálatok és kritériumok kézikönyv” III. rész 34.4.1 bekezdése szerinti vizsgálati eljárások alapján az I, a II vagy a III csomagolási csoportba kell sorolni, a következő kritériumok szerint:
- a) az I csomagolási csoportba akkor kell sorolni az anyagot, ha cellulózzal 4:1 vagy 1:1 tömegarányban alkotott keverékének átlagos égési ideje rövidebb, mint a kálium-bromát/cellulóz 3:2 tömegarányú keverék átlagos égési ideje;
 - b) a II csomagolási csoportba akkor kell sorolni az anyagot, ha cellulózzal 4:1 vagy 1:1 tömegarányban alkotott keverékének átlagos égési ideje azonos vagy rövidebb, mint a kálium-bromát/cellulóz 2:3 tömegarányú keverék átlagos égési ideje és az I csomagolási csoport kritériumait nem elégíti ki;
 - c) a III csomagolási csoportba akkor kell sorolni az anyagot, ha cellulózzal 4:1 vagy 1:1 tömegarányban alkotott keverékének átlagos égési ideje azonos vagy rövidebb, mint a kálium-bromát/cellulóz 3:7 tömegarányú keverék átlagos égési ideje és sem az I, sem a II csomagolási csoport kritériumait nem elégíti ki.

Gyújtó hatású folyékony anyagok

Besorolás

- 2.2.51.1.8** A 3.2 fejezet „A” táblázatában név szerint nem említett gyújtó hatású, folyékony anyagoknak a „Vizsgálatok és kritériumok kézikönyv” III. rész 34.4.2 bekezdése szerinti vizsgálati eljárások alapján a 2.2.51.3 bekezdés valamely tétele alá történő besorolásánál a következő kritériumokat kell alkalmazni:

Egy folyékony anyagot akkor kell az 5.1 osztályba sorolni, ha cellulózzal 1:1 tömegarányban alkotott keveréke 2070 kPa vagy nagyobb nyomásnövekedést eredményez, és az átlagos nyomásnövekedési idő azonos vagy rövidebb, mint a 65%-os vizes salétromsav oldat/cellulóz 1:1 tömegarányú keveréke esetében.

Csomagolási csoporthoz való hozzárendelés

- 2.2.51.1.9** A 3.2 fejezet „A” táblázatának egyes tételei alá sorolt gyújtó hatású, folyékony anyagokat a „Vizsgálatok és kritériumok kézikönyv” III. rész 34.4.2 bekezdése szerinti vizsgálati eljárások alapján az I, a II vagy a III csomagolási csoportba kell sorolni, a következő kritériumok szerint:
- a) az I csomagolási csoportba akkor kell sorolni az anyagot, ha cellulózzal 1:1 tömegarányban alkotott keveréke önmagától meggyullad, vagy a nyomásnövekedési ideje rövidebb, mint az 50%-os perklórsav oldat/cellulóz 1:1 tömegarányú keveréké;
 - b) a II csomagolási csoportba akkor kell sorolni az anyagot, ha cellulózzal 1:1 tömegarányban alkotott keverékének nyomásnövekedési ideje azonos vagy rövidebb,

mint a 40%-os vizes nátrium-klorát oldat/cellulóz 1:1 tömegarányú keveréké és az I csomagolási csoport kritériumait nem elégíti ki;

- c) a III csomagolási csoportba akkor kell sorolni az anyagot, ha cellulózzal 1:1 tömegarányban alkotott keverékének nyomásnövekedési ideje azonos vagy rövidebb, mint a 65%-os vizes salétromsav oldat/cellulóz 1:1 tömegarányú keveréké és sem az I, sem a II csomagolási csoport kritériumait nem elégíti ki.

2.2.51.2 A szállításból kizárt anyagok

2.2.51.2.1 Az 5.1 osztály vegyileg nem állandó anyagai csak akkor adhatók át szállításra, ha megtették a szükséges intézkedéseket a szállítás alatt bekövetkező veszélyes bomlás vagy polimerizáció megakadályozására. Ezért különösen arról kell gondoskodni, hogy a tartályok és tartányok ne tartalmazzanak olyan anyagokat, amelyek az ilyen reakciókat elősegítik.

2.2.51.2.2 A következő anyagok a szállításból ki vannak zárva:

- az UN 3100 számú önmelegedő, gyújtó hatású szilárd anyagok, az UN 3121 számú vízzel reaktív, gyújtó hatású szilárd anyagok és az UN 3137 számú gyúlékony, gyújtó hatású szilárd anyagok, kivéve, ha megfelelnek az 1 osztály előírásainak (lásd a 2.1.3.7 bekezdést is);
- a nem stabilizált hidrogén-peroxid és a nem stabilizált hidrogén-peroxid vizes oldatok 60%-nál több hidrogén-peroxid tartalommal;
- az éghető szennyeződésektől nem mentes tetranitro-metán;
- perklórsav oldatok 72 tömeg%-nál nagyobb savtartalommal és a perklórsav keverékek vízen kívül bármilyen más folyadékkal;
- a klórsav oldatok 10% feletti klórsav-tartalommal és a klórsav keverékek vízen kívül bármilyen más folyadékkal;
- az ebbe az osztályba tartozó UN 1745 bróm-pentafluorid, 1746 bróm-trifluorid és 2495 jód-pentafluorid, valamint a 2 osztályba tartozó UN 1749 klór-trifluorid és 2548 klór-pentafluorid kivételével minden más halogénezett fluorvegyület;
- az ammónium-klorát és vizes oldatait, valamint a klorátok keverékei ammóniumsóval;
- az ammónium-klorit és vizes oldatait, valamint a kloritok keverékei ammóniumsóval;
- a hipokloritok keverékei ammóniumsóval;
- az ammónium-bromát és vizes oldatait, valamint a bromátok keverékei ammóniumsóval;
- az ammónium-permanganát és vizes oldatait, valamint a permanganátok keverékei ammóniumsóval;
- az ammónium-nitrát 0,2%-nál több éghető anyag tartalommal (beleértve bármilyen szerves anyagot szénegyenértékre átszámítva), hacsak nem valamely 1 osztályba tartozó anyag vagy tárgy alkotórésze;
- az ammónium-nitrát tartalmú műtrágyák, amelyek ammónium-nitrát tartalma (mindazon nitrát-ion mennyiséget, amellyel egyenértékű tömegű ammónium-ion van jelen a keverékben, ammónium-nitrátként kell számításba venni) vagy éghető anyag tartalma a 307 különleges előírásban megadott határokat meghaladja, kivéve az 1 osztályra vonatkozó feltételek melletti szállítást;
- az ammónium-nitrit és vizes oldatait, valamint a szervesetlen nitritek keverékei ammóniumsóval;
- a kálium-nitrát és nátrium-nitrit keverékei ammóniumsóval.

2.2.51.3 A gyűjtőmegnevezések felsorolása

2.2.52 5.2 osztály Szerves peroxidok

2.2.52.1 Kritériumok

2.2.52.1.1 Az 5.2 osztály fogalmköre a szerves peroxidokra és a szerves peroxid készítményekre terjed ki.

2.2.52.1.2 Az 5.2 osztály anyagai a következők szerint vannak csoportosítva:

P1 Szerves peroxidok hőmérséklet-szabályozás nélkül

P2 Szerves peroxidok hőmérséklet-szabályozással.

Fogalommeghatározás

2.2.52.1.3 A szerves peroxidok olyan szerves anyagok, amelyek a kétértékű –O–O– szerkezeti elemet tartalmazzák és amelyek a hidrogén-peroxid olyan származékainak tekinthetők, ahol egyik vagy mindkét hidrogén atomot szerves gyökök helyettesítenek.

Tulajdonságok

2.2.52.1.4 A szerves peroxidok normál vagy magasabb hőmérsékleten hajlamosak az exoterm bomlásra. A bomlás hőhatásra, szennyező anyagokkal (pl. savak, nehézfém vegyületek, aminok) való érintkezésre, sűrűlő vagy ütés hatására következhet be. A bomlási sebesség a hőmérséklettel növekszik és függ a szerves peroxid kikészítésétől. A bomlás során egészségre ártalmas vagy gyúlékony gázok vagy gőzök fejlődhetnek. Egyes szerves peroxidok esetében a hőmérsékletet a szállítás alatt szabályozni kell. Egyes szerves peroxidok robbanásszerű bomlást szenvedhetnek, különösen zárt térben. Ez a tulajdonság hígítók hozzáadásával vagy megfelelő csomagolás használatával megváltoztatható. Számos szerves peroxid erősen ég. El kell kerülni, hogy a szerves peroxid a szemmel érintkezésbe kerülhessen. Egyes szerves peroxidok már rövid érintkezés hatására a szaruhártya súlyos sérülését vagy a bőr felmaródását okozhatják.

Megjegyzés: A szerves peroxidok gyúlékonyságának meghatározására szolgáló vizsgálati módszereket a „Vizsgálatok és kritériumok kézikönyv” III. Rész 32.4 bekezdése tartalmazza. Mivel a szerves peroxidok hő hatására hevesen reagálhatnak, ajánlatos a lobbanáspont meghatározásához kis méretű mintát használni, pl. amilyen az ISO 3679:1983 szabványban szerepel.

Besorolás

2.2.52.1.5 Bármely szerves peroxidot az 5.2 osztályba sorolhatónak kell tekinteni, kivéve, ha:

- legfeljebb 1,0%, szerves peroxidból származó aktív oxigént és legfeljebb 1,0% hidrogén-peroxidot tartalmaz;
- legfeljebb 0,5%, szerves peroxidból származó aktív oxigént és 1,0%-nál több, de legfeljebb 7,0% hidrogén-peroxidot tartalmaznak.

Megjegyzés: Valamely szerves peroxidot tartalmazó készítmény aktív oxigéntartalma (%-ban) a $16 \times \sum(n_i \times c_i / m_i)$ képlettel határozható meg, ahol n_i = az i -edik szerves peroxid molekulánkénti peroxid-csoportjainak száma; c_i = az i -edik szerves peroxid koncentrációja (tömeg%); és m_i = az i -edik szerves peroxid molekulatömege.

2.2.52.1.6 A szerves peroxidok veszélyességük mértéke szerint hét típusba vannak sorolva. A típusok az A típustól, amely abban a csomagolásban, amelyben bevizsgálásra került, nem szállítható, egészen a G típusig tartanak, amely nem esik az 5.2 osztály előírásainak hatálya alá. A B-től

F-ig terjedő típusok alá való besorolás az egy csomagolásban engedélyezett legnagyobb mennyiségtől függ. A 2.2.52.4 bekezdésben fel nem sorolt anyagok besorolásának alapelveit a „Vizsgálatok és kritériumok kézikönyv” II. Rész tartalmazza.

2.2.52.1.7 A már besorolt és csomagolóeszközben való szállításra már engedélyezett szerves peroxidokat a 2.2.52.4 bekezdés, az IBC-ben való szállításra már engedélyezett szerves peroxidokat a 4.1.4.2 bekezdés IBC520 csomagolási utasítása, és a 4.2, ill. a 4.3 fejezet szerint tartányban szállítható szerves peroxidokat a 4.2.5.2 bekezdés T23 mobil tartány utasítása sorolja fel. Ezekben a felsorolásokban minden engedélyezett anyag a 3.2 fejezet „A” táblázatának valamely generikus tételéhez (UN 3101 – 3120) hozzá van rendelve, és meg vannak adva a szállítás szempontjából fontos információt jelentő járulékos veszélyek, ill. megjegyzések.

A generikus tételek meghatározzák:

- a szerves peroxidok típusait (B – F) (lásd a 2.2.52.1.6 pontot);
- a fizikai állapotot (folyékony/szilárd); és
- a hőmérséklet-szabályozást (ha szükséges), (lásd a 2.2.52.1.15 – 2.2.52.1.18 pontot).

A szerves peroxid készítmények keverékei a legveszélyesebb alkotórésznek megfelelő típusú szerves peroxidként sorolhatók be és az arra a típusra megadott szállítási feltételek mellett kell szállítani. Azonban, ha két termikusan stabil alkotórész termikusan kevésbé stabil keveréket képezhet, a keverék öngyorsuló bomlási hőmérsékletét meg kell határozni és szükség esetén a szabályozási és vész hőmérsékletet az ÖBH értékéből le kell vezetni a 2.2.52.1.16 pont szerint.

2.2.52.1.8 A 2.2.52.4 bekezdésben, a 4.1.4.2 bekezdés IBC520 csomagolási utasításában, ill. a 4.2.5.2 bekezdés T23 mobil tartány utasításában fel nem sorolt szerves peroxidok, szerves peroxid készítmények vagy keverékek besorolását és valamely gyűjtőmegnevezéshez történő hozzárendelését a származási ország illetékes hatóságának kell végeznie. A jóváhagyásnak tartalmaznia kell a besorolást és a vonatkozó szállítási feltételeket. Amennyiben a származási ország nem valamely ADR Szerződő Fél, úgy a besorolást és a szállítási feltételeket a küldemény által érintett első ADR Szerződő Fél illetékes hatóságának kell elismernie.

2.2.52.1.9 A 2.2.52.4 bekezdésben fel nem sorolt szerves peroxid vagy szerves peroxid készítmény mintákat, amelyekre nézve nem áll rendelkezésre teljes körű vizsgálati eredmény és szállításuk további vizsgálatok és értékelés céljából történik, a C típusú szerves peroxidokra vonatkozó, megfelelő tételhez kell hozzárendelni, feltéve, hogy megfelelnek a következő feltételeknek:

- a rendelkezésre álló adatokból kitűnik, hogy a minta nem veszélyesebb, mint egy B típusú szerves peroxid;
- a minta az OP2 csomagolási módszer szerint van csomagolva és mennyisége szállítóegységenként nem haladja meg a 10 kg-ot;
- a rendelkezésre álló adatok jelzik, hogy a szabályozási hőmérséklet, ha ilyen van, elegendően alacsony minden veszélyes bomlás megakadályozására és elegendően magas minden veszélyes fázis-átalakulás megakadályozására.

A szerves peroxidok érzéketlenítése

2.2.52.1.10 A biztonságos szállítás céljából a szerves peroxidokat számos esetben szerves folyadékokkal vagy szilárd anyagokkal, szervetlen szilárd anyagokkal vagy vízzel érzéketlenítik. Amennyiben valamely anyag százalékos tartalma meg van határozva, ez tömeg%-ot jelent, egész számra kerekítve. Általában az érzéketlenítést úgy kell végrehajtani, hogy kifolyás esetén a szerves peroxid veszélyes mértékű koncentrációja ne következhesen be.

2.2.52.1.11 Hacsak az egyes szerves peroxid készítményekre nincs más előírva, az érzéketlenítésre használt hígítóra a következő meghatározások érvényesek:

- az A típusú hígítók olyan szerves folyadékok, amelyek összeférhetőek a szóban forgó szerves peroxiddal és forráspontjuk legalább 150 °C. Az A típusú hígítók minden szerves peroxid érzéketlenítéséhez felhasználhatók;
- a B típusú hígítók szerves folyadékok, amelyek összeférhetőek a szerves peroxiddal és amelyek forráspontja 150 °C-nál kisebb, de legalább 60 °C és lobbanáspontja legalább 5 °C.

A B típusú hígítók minden szerves peroxid érzéketlenítésére használhatók, amennyiben a hígító forráspontja legalább 60 °C-kal magasabb, mint a szerves peroxid ÖBH értéke 50 kg-os küldeménydarabban.

2.2.52.1.12 Az A vagy B típusú hígítóktól eltérő típusú hígítók is használhatók a 2.2.52.4 bekezdésben felsorolt szerves peroxid készítményekhez, amennyiben azokkal összeférhetőek. Azonban az A vagy B típusú hígítók helyettesítése részben vagy teljes mértékben más, eltérő tulajdonságokkal bíró hígítókkal szükségessé teszi a készítmény ismételt minősítését az 5.2 osztályra vonatkozó normál besorolási eljárás szerint.

2.2.52.1.13 A víz csak olyan szerves peroxidokhoz használható érzéketlenítőszerként, amelyek a 2.2.52.4 bekezdésben fel vannak sorolva, vagy az illetékes hatóság 2.2.52.1.8 pont szerinti jóváhagyásában mint „víz hozzáadásával” vagy mint „stabil vizes diszperziók” vannak megemlítve. A 2.2.52.4 bekezdésben fel nem sorolt szerves peroxid mintákat vagy szerves peroxid készítmény mintákat is lehet vízzel érzéketleníteni, amennyiben a 2.2.52.1.9 pont előírásainak megfelelnek.

2.2.52.1.14 Szerves és szervetlen szilárd anyagokat csak akkor szabad a szerves peroxidok érzéketlenítésére használni, ha ezekkel összeférhetőek. A folyékony és a szilárd anyagok akkor tekinthetők összeférhetőnek, ha nem befolyásolják hátrányosan a szerves peroxid készítménynek sem termikus stabilitását, sem veszélyességét.

Hőmérséklet-szabályozás

2.2.52.1.15 Egyes szerves peroxidok csak hőmérséklet-szabályozás mellett szállíthatók. A szabályozási hőmérséklet az a maximális hőmérséklet, amelyen a szerves peroxid biztonságosan szállítható. Feltételezett, hogy a szállítás során a küldeménydarab közvetlen környezetében a hőmérséklet 24 óránként csak rövid ideig magasabb 55 °C-nál. A hőmérséklet-szabályozás megszűnése esetén szükség lehet vészhelyzeti eljárások alkalmazására. A vészhőmérséklet az a hőmérséklet, amelynél az ilyen eljárásokat meg kell indítani.

2.2.52.1.16 A szabályozási és a vészhőmérsékletet az öngyorsuló bomlási hőmérsékletből (ÖBH) vezetik le, ami az a legalacsonyabb hőmérséklet, amelynél a szállítás során használt csomagolásban levő anyagnál az öngyorsuló bomlás bekövetkezhet (lásd az 1. táblázatot). Az ÖBH-t azért kell meghatározni, hogy eldönthető legyen, vajon az anyagot alá kell-e vetni hőmérséklet-szabályozásnak a szállítás alatt. Az ÖBH meghatározására vonatkozó követelményeket a „Vizsgálatok és kritériumok kézikönyv” II. Rész 20. és 28.4 bekezdése tartalmazza.

1. táblázat: A szabályozási és a vészhőmérséklet meghatározása

A tartály típusa	ÖBH ^{a)}	Szabályozási hőmérséklet	Vészhőmérséklet
Önálló csomagolóeszközök és IBC-k	20 °C vagy az alatt	20 °C-kal az ÖBH alatt	10 °C-kal az ÖBH alatt
	20 °C felett, 35 °C-ig	15 °C-kal az ÖBH alatt	10 °C-kal az ÖBH alatt
	35 °C felett	10 °C-kal az ÖBH alatt	5 °C-kal az ÖBH alatt
Tartályok	legfeljebb 50 °C	10 °C-kal az ÖBH alatt	5 °C-kal az ÖBH alatt

a) Az anyag ÖBH értéke a szállításra kész csomagolásban.

2.2.52.1.17 A következő szerves peroxidokat kell a szállítás alatt hőmérséklet-szabályozásnak alávetni:

- a B és C típusú szerves peroxidokat ÖBH ≤ 50 °C értékkel;

- azokat a D típusú szerves peroxidokat, amelyek zárt térben hevítve közepes hatást mutatnak és ÖBH értékük $\leq 50\text{ }^{\circ}\text{C}$, vagy zárt térben hevítés során csekély vagy semmilyen hatást nem mutatnak és ÖBH értékük $\leq 45\text{ }^{\circ}\text{C}$; és
- az E és F típusú szerves peroxidokat ÖBH $\leq 45\text{ }^{\circ}\text{C}$ értékkel.

Megjegyzés: A zárt térben való hevítés hatásának meghatározására vonatkozó előírásokat a „Vizsgálatok és kritériumok kézikönyv” II. Rész 20. és 28.4 bekezdés tartalmazza.

2.2.52.1.18 A szabályozási és vészhőmérsékletet, ahol van, a 2.2.52.4 bekezdés sorolja fel. A tényleges szállítási hőmérséklet lehet alacsonyabb, mint a szabályozási hőmérséklet, de úgy kell beállítani, hogy veszélyes fázis-átalakulás ne következhesen be.

2.2.52.2 A szállításból kizárt anyagok

A következő szerves peroxidok az 5.2 osztály feltételei mellett a szállításból ki vannak zárva:

- A típusú szerves peroxidok [lásd a „Vizsgálatok és kritériumok kézikönyv” II. rész 20.4.3 a) pontját].

2.2.52.3 A gyűjtőmegnevezések felsorolása

2.2.52.4

A már besorolt és csomagolóeszközben való szállításra engedélyezett szerves peroxidok felsorolása

A „csomagolási módszer” oszlopban az „OP1” – „OP8” kód a 4.1.4.1 bekezdés P520 csomagolási utasítás csomagolási módszereire utal (lásd még a 4.1.7.1 bekezdést). A szállítandó szerves peroxidnak meg kell felelnie a felsorolás szerinti besorolásnak és (az ÖBH-ből levezetett) szabályozási, ill. vészhőmérsékletnek. Az IBC-ben engedélyezett anyagokra lásd a 4.1.4.2 bekezdés IBC520 csomagolási utasítását, a 4.2, ill. a 4.3 fejezet szerint tartányban engedélyezettekre lásd a 4.2.5.2 bekezdés T23 mobil tartány utasítását.

- 1) *B típusú hígító mindig kicserélhető A típusú hígítóra. A B típusú hígító forráspontjának legalább 60 °C-kal magasabbnak kell lennie, mint a szerves peroxid ÖBH értéke.*
- 2) *Szabad oxigéntartalom $\leq 4,7\%$.*
- 3) *„ROBBANÁSVESZÉLY” járulékos veszély bárca szükséges (1 sz. bárca, lásd az 5.2.2.2.2 pontot).*
- 4) *A hígító helyettesíthető di-terc-butil-peroxiddal.*
- 5) *Szabad oxigéntartalom $\leq 9\%$.*
- 6) *Legfeljebb 9% hidrogén-peroxiddal; szabad oxigéntartalom $\leq 10\%$.*
- 7) *Csak nemfémes csomagolóeszközök használhatók.*
- 8) *Szabad oxigéntartalom $> 10\%$ és $\leq 10,7\%$, vízzel vagy víz nélkül.*
- 9) *Szabad oxigéntartalom $\leq 10\%$, vízzel vagy víz nélkül.*
- 10) *Szabad oxigéntartalom $\leq 8,2\%$, vízzel vagy víz nélkül.*
- 11) *Lásd a 2.2.52.1.9 pontot.*
- 12) *Tartályonként 2000 kg-ig a nagy méretekben végzett vizsgálatok alapján az F TÍPUSÚ SZERVES PEROXID alá sorolva.*
- 13) *„MARÓ” járulékos veszély bárca szükséges (8 sz. bárca, lásd az 5.2.2.2.2 pontot).*
- 14) *Peroxi-ecetsav készítmények, amelyek a „Vizsgálatok és kritériumok kézikönyv” 20.4.3 d) pontjának megfelelnek.*
- 15) *Peroxi-ecetsav készítmények, amelyek a „Vizsgálatok és kritériumok kézikönyv” 20.4.3 e) pontjának megfelelnek.*
- 16) *Peroxi-ecetsav készítmények, amelyek a „Vizsgálatok és kritériumok kézikönyv” 20.4.3 f) pontjának megfelelnek.*
- 17) *Víz hozzáadásával a szerves peroxid termikus stabilitása csökken.*
- 18) *80% alatti koncentrációnál nincs szükség „MARÓ” járulékos veszély bárcára (8 sz. bárca, lásd az 5.2.2.2.2 pontot).*
- 19) *Keverékek hidrogén-peroxiddal, vízzel és savakkal.*
- 20) *A típusú hígítóval, vízzel vagy anélkül.*
- 21) *Legalább 25 tömeg% A típusú hígítóval és ezenkívül etil-benzollal.*
- 22) *Legalább 19 tömeg% A típusú hígítóval és ezenkívül metil-izobutil-ketonnal.*
- 23) *6%-nál kevesebb di-terc-butil-peroxiddal.*
- 24) *Legfeljebb 8% 1-izopropil-hidroperoxi-4-izopropil-hidroxi-benzollal.*
- 25) *B típusú hígító 110 °C-nál nagyobb forrásponttal.*
- 26) *0,5%-nál kisebb hidroperoxid tartalommal.*
- 27) *56% feletti koncentrációnál „MARÓ” járulékos veszély bárca szükséges (8 sz. bárca, lásd az 5.2.2.2.2 pontot).*
- 28) *Szabad aktív oxigéntartalom $\leq 7,6\%$, A típusú hígítóban, amelynek legalább 95%-a csak 200 °C...260 °C között párolog el.*
- 29) *Nem tartozik az ADR 5.2 osztályra vonatkozó előírásainak hatálya alá.*
- 30) *B típusú hígító 130 °C-nál nagyobb forrásponttal.*
- 31) *Aktív oxigéntartalom $\leq 6,7\%$.*

2.2.61 6.1 osztály Mérgező anyagok

2.2.61.1 *Kritériumok*

2.2.61.1.1 A 6.1 osztály fogalomköre azokra a mérgező anyagokra terjed ki, amelyekről tapasztalat alapján tudják vagy amelyekről állatokon végzett kísérletek alapján feltételezhető, hogy viszonylag csekély mennyiségben, egyszeri vagy rövid ideig tartó behatással, belélegzés, bőrrel való érintkezés vagy lenyelés útján károsíthatják az emberi egészséget vagy halált okozhatnak.

Megjegyzés: *A géntechnológiával módosított mikroorganizmusokat és élő szervezeteket, ha kielégítik ezen osztály kritériumait, ebbe az osztályba kell sorolni.*

2.2.61.1.2 A 6.1 osztály anyagai a következők szerint vannak csoportosítva:

T Mérgező anyagok járulékos veszély nélkül:

T1 Szerves folyékony anyagok

T2 Szerves szilárd anyagok

T3 Szerves fémvegyületek

T4 Szervetlen folyékony anyagok

T5 Szervetlen szilárd anyagok

T6 Peszticidként használt folyékony anyagok

T7 Peszticidként használt szilárd anyagok

T8 Minták

T9 Egyéb mérgező anyagok

TF Mérgező, gyúlékony anyagok:

TF1 Folyékony anyagok

TF2 Peszticidként használt folyékony anyagok

TF3 Szilárd anyagok

TS Mérgező, önmelegedő, szilárd anyagok

TW Mérgező anyagok, amelyek vízzel érintkezve gyúlékony gázokat fejlesztenek:

TW1 Folyékony anyagok

TW2 Szilárd anyagok

TO Mérgező, gyújtó hatású anyagok:

TO1 Folyékony anyagok

TO2 Szilárd anyagok

TC Mérgező, maró anyagok:

TC1 Szerves folyékony anyagok

TC2 Szerves szilárd anyagok

TC3 Szervetlen folyékony anyagok

TC4 Szervetlen szilárd anyagok

TFC Mérgező, gyúlékony, maró anyagok

TFW Mérgező, gyúlékony anyagok, amelyek vízzel érintkezve gyúlékony gázokat fejlesztenek.

Fogalommeghatározások

2.2.61.1.3 Az ADR alkalmazásában

A *heveny mérgezőképesség LD₅₀ (közepes halálos dózis) értéke lenyelés esetén* az anyag statisztikailag számított egyszeri dózisa, amely lenyelés esetén várhatóan a fiatal, felnőtt, fehér patkányok 50%-ánál okoz 14 napon belüli halált. Az LD₅₀ értéket a vizsgált anyag beadott mennyiségének a vizsgált állatok testtömegére vonatkoztatott arányával (mg/kg) fejezik ki.

A *heveny mérgezőképesség LD₅₀ értéke bőrön át való felszívódás esetén* az a dózis, amely ha fehér nyulak csupasz bőrével 24 órán át folyamatosan érintkezésbe került, nagy valószínűséggel 14 napon belül halált okoz a kísérleti állatok felénél. A kísérleti állatok számának elegendőnek kell lenni ahhoz, hogy az eredmény statisztikailag szignifikáns legyen és megfeleljen a jó gyógyszerészeti gyakorlatnak. Az eredményt testtömegre vonatkoztatva mg/kg-ban fejezik ki.

A *heveny mérgezőképesség LC₅₀ értéke belélegzés esetén* az a gőz, köd vagy por-koncentráció, amely egy órán át tartó folyamatos belélegzés esetén fiatal, felnőtt, hím és nőstény, fehér patkányok csoportjának egyaránt felénél nagy valószínűséggel 14 napon belüli halált okoz. Szilárd anyagot akkor kell így vizsgálni, ha az anyag összmenyiségének legalább 10 tömeg%-a belélegezhető por, azaz ezen részecskefrakció aerodinamikai átmérője 10 µm vagy ennél kisebb. Folyékony anyagot akkor kell így vizsgálni, ha a szállított anyag szivárgása esetén fennáll a ködképződés lehetősége. Mind szilárd, mind folyékony anyag esetén a belélegzési mérgezőképesség vizsgálatára előkészített minta több mint 90 tömeg%-ának az előzőekben meghatározott belélegezhető tartományban kell lennie. Az eredményt egységnyi térfogatú levegőre vonatkoztatva adják meg, por és köd esetén mg/liter-ben, gőz esetén milliliter/m³-ben (ppm-ben).

Besorolás és csomagolási csoporthoz való hozzárendelés

2.2.61.1.4 A 6.1 osztály anyagait a szállítás során általuk képviselt veszély mértéke szerint a következő három csomagolási csoport valamelyikéhez kell hozzárendelni:

- I csomagolási csoport: nagyon mérgező anyagok;
- II csomagolási csoport: mérgező anyagok;
- III csomagolási csoport: enyhén mérgező anyagok.

2.2.61.1.5 A 6.1 osztályba sorolt anyagokat, keverékeket, oldatokat és tárgyakat a 3.2 fejezet „A” táblázata sorolja fel. A 3.2 fejezet „A” táblázatában név szerint nem említett anyagokat, keverékeket és oldatokat a 2.1 fejezet szerinti a 2.2.61.3 bekezdés megfelelő tétele alá és a megfelelő csomagolási csoportba a 2.2.61.1.6 – 2.2.61.1.11 pontban található kritériumok alapján kell besorolni.

2.2.61.1.6 A mérgezési veszély megállapításához számításba kell venni az embereken bekövetkezett véletlen mérgezési esetek tapasztalatait, valamint az egyes anyagok különleges tulajdonságait, mint a folyékony halmazállapotot, nagymértékű illékonyságot, a bőrön át való felszívódás valószínűségét, különleges biológiai hatásokat.

2.2.61.1.7 Embereken történt megfigyelések hiányában a mérgezési veszélyt állatokon végzett kísérletekből származó, rendelkezésre álló adatok segítségével a következő táblázatnak megfelelően kell meghatározni:

	Csomagolási csoport	Mérgezőképesség lenyelés esetén, LD_{50} (mg/kg)	Mérgezőképesség bőrön át való felszívódás esetén, LD_{50} (mg/kg)	Mérgezőképesség por és köd belélegzése esetén, LC_{50} (mg/l)
Nagyon mérgező	I	$LD_{50} \leq 5$	$LD_{50} \leq 50$	$LC_{50} \leq 0,2$
Mérgező	II	$5 < LD_{50} \leq 50$	$50 < LD_{50} \leq 200$	$0,2 < LC_{50} \leq 2$
Enyhén mérgező	III ^{a)}	$50 < LD_{50} \leq 300$	$200 < LD_{50} \leq 1000$	$2 < LC_{50} \leq 4$

a) A könnygáz anyagokat a II csomagolási csoportba kell sorolni, még ha mérgezőképességük a III csomagolási csoport értékeinek felel is meg.

2.2.61.1.7.1 Ha egy anyag két vagy több mérgezési mód esetén különböző mérgezőképességű, a legnagyobb mérgezőképesség szerint kell besorolni.

2.2.61.1.7.2 A 8 osztály kritériumait kielégítő anyagok az I csomagolási csoportnak megfelelő por és köd belélegzési mérgezőképességgel (LC_{50}) csak akkor fogadhatók el a 6.1 osztályba történő besoroláshoz, ha lenyelés vagy bőrön át való felszívódás esetére vonatkozó mérgezőképességük alapján legalább az I vagy a II csomagolási csoportba tartoznak. Ellenkező esetben a 8 osztályba történő besorolást kell végezni, ha az lehetséges (lásd a 2.2.8.1.5 pontot).

2.2.61.1.7.3 Por és köd belélegzése esetén a mérgezőképesség kritériuma az 1 órán át tartó belélegzés LC_{50} adatain alapul. Ahol ezek az adatok rendelkezésre állnak, ezeket kell használni. Amennyiben csak a 4 órán át tartó belélegzés LC_{50} adatai állnak rendelkezésre, ezek négyszeresével lehet helyettesíteni az előző értéket, vagyis a 4 órás LC_{50} négyszerese egyenlőnek tekinthető az 1 órás LC_{50} -nel.

Mérgezőképesség gőz belélegzése esetén

2.2.61.1.8 A mérgező gőzöket kibocsátó folyadékokat a következő csoportok alá kell besorolni, ahol „V” jelenti a telített gőz koncentrációját (ml/m^3 levegő egységben) (illékonyság) 20 °C-on és normál atmoszferikus nyomáson.

A mérgező hatás fokozata	Csomagolási csoport	Feltétel
Nagyon mérgező	I	ha $V \geq 10LC_{50}$ és $LC_{50} \leq 1000 \text{ ml/m}^3$
Mérgező	II	ha $V \geq LC_{50}$ és $LC_{50} \leq 3000 \text{ ml/m}^3$ és az I csomagolási csoport kritériumai nem teljesülnek
Enyhén mérgező	III ^{a)}	ha $V \geq 0,2LC_{50}$ és $LC_{50} \leq 5000 \text{ ml/m}^3$ és sem az I, sem a II csomagolási csoport kritériumai nem teljesülnek

a) A könnygáz anyagokat a II csomagolási csoportba kell sorolni, még ha mérgezőképességük a III csomagolási csoport értékeinek felel is meg.

Gőz belélegzése esetén a mérgezőképesség kritériuma az 1 órán át tartó belélegzés LC_{50} adatain alapul. Ahol ezek az adatok rendelkezésre állnak, ezeket kell használni.

Amennyiben csak a 4 órán át tartó belélegzés LC_{50} adatai állnak rendelkezésre, ezek kétszeresével lehet helyettesíteni az előző értéket, vagyis a 4 órás LC_{50} kétszerese egyenlőnek tekinthető az 1 órás LC_{50} -nel.

**Mérgezőképesség a gőzök belélegzésekor
A csomagolási csoportok határvonalai**

Az ábra a besorolás megkönnyítésére grafikusán ábrázolja a mérgezési kritériumokat. Mivel a grafikus ábrázolás közelítő pontosságú, az egyes csomagolási csoportok határvonalára vagy azok közelébe eső anyagokat a számszerű kritériumok alapján kell ellenőrizni.

Folyékony anyagok keverékei

2.2.61.1.9 A folyékony anyagok olyan keverékeit, amelyek a belélegzési mérgezés veszélyével bírnak, a következő kritériumok szerint kell a veszélyességi kategóriák alá besorolni:

2.2.61.1.9.1 Ha a keveréket alkotó minden egyes mérgező anyagra az LC_{50} értéke ismeretes, a csomagolási csoportot a következők szerint kell meghatározni:

a) a keverék LC_{50} értékének kiszámítása:

$$LC_{50}(\text{keverék}) = \frac{1}{\sum_{i=1}^n \frac{f_i}{LC_{50i}}}, \text{ ahol}$$

f_i = a keverék i -edik alkotórészének mólaránya;

LC_{50i} = az i -edik alkotórész átlagos halálos koncentrációja ml/m³-ben;

b) az egyes alkotórészek illékonyságának kiszámítása:

$$V_i = P_i \times \frac{10^6}{101,3} \text{ ml/m}^3, \text{ ahol}$$

P_i = az i -edik alkotórész parciális nyomása kPa-ban 20 °C-on és normál atmoszférikus nyomáson;

c) az illékonysági arány kiszámítása LC_{50} -re:

$$R = \sum_{i=1}^n \frac{V_i}{LC_{50i}};$$

d) felhasználva az LC_{50} (keverék) és R kiszámított értékét, a keverékére meghatározható a csoport:

I csomagolási csoport	$R \geq 10$ és LC_{50} (keverék) $\leq 1000 \text{ ml/m}^3$;
II csomagolási csoport	$R \geq 1$ és LC_{50} (keverék) $\leq 3000 \text{ ml/m}^3$, ha a keverék az I csomagolási csoport kritériumainak nem felel meg;
III csomagolási csoport	$R \geq 1/5$ és LC_{50} (keverék) $\leq 5000 \text{ ml/m}^3$, ha a keverék sem az I, sem a II csomagolási csoport kritériumainak nem felel meg.

2.2.61.1.9.2 A mérgező alkotórészekre vonatkozó LC_{50} értékek hiányában a keverék a következő egyszerűsített mérgezési küszöb próbák alapján rendelhető valamely csoporthoz. Ha ilyen mérgezési küszöb vizsgálatokat használunk, meg kell határozni a leginkább korlátozó csoportot és ezt kell használni a keverék szállításához.

2.2.61.1.9.3 Valamely keverék csak akkor sorolható az I csomagolási csoportba, ha mindkét következő kritériumot teljesíti:

- A folyékony keverék mintáját elpárologtatjuk és levegővel hígítjuk 1000 ml/m^3 elpárologtatott keverék vizsgálati atmoszférát alakítva ki a levegőben. Tíz fehér patkányt (öt hímet és öt nőtényt) egy órán át kiteszünk a vizsgálati atmoszférának és tizennégy napon keresztül megfigyeljük azokat. Ha a tizennégy napos megfigyelési időszak alatt öt vagy több állat hullik el, a keverék feltételezetten 1000 ml/m^3 vagy ennél kisebb LC_{50} értékkel rendelkezik.
- A folyékony keverékkel egyensúlyban levő gőzmintát 9-szeres levegőtérfogattal hígítjuk a vizsgálati atmoszféra kialakításához. Tíz fehér patkányt (öt hímet és öt nőtényt) egy órán át kiteszünk a vizsgálati atmoszférának és tizennégy napon keresztül megfigyeljük azokat. Ha a tizennégy napos megfigyelési időszak alatt öt vagy több állat hullik el, a keverék feltételezetten a keverék LC_{50} értékének 10-szeresével egyenlő vagy nagyobb illékonysággal rendelkezik.

2.2.61.1.9.4 Valamely keverék csak akkor sorolható a II csomagolási csoportba, ha mindkét következő kritériumot teljesíti és a keverék nem elégíti ki az I csomagolási csoportra vonatkozó kritériumokat:

- A folyékony keverék mintáját elpárologtatjuk és levegővel hígítjuk 3000 ml/m^3 elpárologtatott keverék vizsgálati atmoszférát alakítva ki a levegőben. Tíz fehér patkányt (öt hímet és öt nőtényt) egy órán át kiteszünk a vizsgálati atmoszférának és tizennégy napon keresztül megfigyeljük azokat. Ha a tizennégy napos megfigyelési időszak alatt öt vagy több állat hullik el, a keverék feltételezetten 3000 ml/m^3 vagy ennél kisebb LC_{50} értékkel rendelkezik.
- A folyékony keverékkel egyensúlyban levő gőzmintát használjuk a vizsgálati atmoszféra kialakításához. Tíz fehér patkányt (öt hímet és öt nőtényt) egy órán át kiteszünk a vizsgálati atmoszférának és tizennégy napon keresztül megfigyeljük azokat. Ha a tizennégy napos megfigyelési időszak alatt öt vagy több állat hullik el, a keverék feltételezetten a keverék LC_{50} értékével egyenlő vagy nagyobb illékonysággal rendelkezik.

2.2.61.1.9.5 Valamely keverék csak akkor sorolható a III csomagolási csoportba, ha mindkét következő kritériumot teljesíti és a keverék nem elégíti ki sem az I, sem a II csomagolási csoportra vonatkozó kritériumokat:

- A folyékony keverék mintáját elpárologtatjuk és levegővel hígítjuk 5000 ml/m^3 elpárologtatott keverék vizsgálati atmoszférát alakítva ki a levegőben. Tíz fehér patkányt (öt hímet és öt nőtényt) egy órán át kiteszünk a vizsgálati atmoszférának és tizennégy napon keresztül megfigyeljük azokat. Ha a tizennégy napos megfigyelési időszak alatt öt vagy több állat hullik el, a keverék feltételezetten 5000 ml/m^3 vagy ennél kisebb LC_{50} értékkel rendelkezik.

- b) A folyékony keverék gőzkoncentrációját megmérjük és ha a gőzkoncentráció 1000 ml/m³-rel egyenlő vagy annál nagyobb, az illékonyság feltételezeten a keverék LC₅₀ értékének 1/5-ével egyenlő vagy annál nagyobb.

A keverékek lenyelési és bőrön keresztüli mérgezőképességének meghatározására szolgáló módszerek

2.2.61.1.10 A keverékek 6.1 osztályba történő besorolásához és a megfelelő csomagolási csoport meghatározásához a lenyelési és bőrön keresztüli mérgezőképesség alapján (lásd a 2.2.61.1.3 pontot) meg kell határozni a keverék heveny LD₅₀ értékét.

2.2.61.1.10.1 Ha a keverék csak egy hatóanyagot tartalmaz, és ennek az LD₅₀ értéke ismeretes, a szállítandó keverékre megbízható lenyelési vagy bőrön keresztüli heveny mérgezőképességi adatok hiányában a lenyelési LD₅₀ érték a következő képlettel határozható meg:

$$a \text{ készítmény } LD_{50} \text{ értéke} = \frac{a \text{ hatóanyag } LD_{50} \text{ értéke} \times 100}{a \text{ hatóanyag tömegszázaléka}}$$

2.2.61.1.10.2 Ha a keverék egynél több hatóanyagot tartalmaz, három módszer lehetséges a keverék lenyelési vagy bőrön keresztüli LD₅₀ értékének meghatározására. A legalkalmasabb módszer a szállítandó keverékre megbízható lenyelési vagy bőrön keresztüli mérgezőképességi adatok beszerzése. Ha megbízható, pontos adatok nem állnak rendelkezésre, akkor a következő módszerek valamelyike használható:

- a) A készítményt a keverék legveszélyesebb alkotórésze alapján soroljuk be, mintha ez az alkotórész olyan koncentrációban lenne jelen, mint az összes hatóanyag együttesen; vagy
- b) A következő képletet alkalmazzuk:

$$\frac{C_A}{T_A} + \frac{C_B}{T_B} + \dots + \frac{C_Z}{T_Z} = \frac{100}{T_M}$$

ahol:

C = a keverékben az A, B, ... Z alkotórész %-os koncentrációja;

T = az A, B, ... Z alkotórész lenyelési LD₅₀ értéke;

T_M = a keverék lenyelési LD₅₀ értéke.

Megjegyzés: Ez a képlet használható a bőrön keresztüli mérgezőképesség meghatározásához is, amennyiben ez az információ ugyanarra a fajra vonatkozóan minden alkotórészre rendelkezésre áll. E képlet használata nem veszi figyelembe az erősítő vagy védő hatásokat.

Peszticidek besorolása

2.2.61.1.11 Minden peszticid hatóanyagot és ezek készítményeit, amelyekre az LC₅₀ és/vagy az LD₅₀ érték ismeretes és amelyek a 6.1 osztályba vannak besorolva, a 2.2.61.1.6 – 2.2.61.1.9 pontban található kritériumok szerint kell a megfelelő csomagolási csoporthoz hozzárendelni. Azokat az anyagokat és készítményeket, amelyeknek járulékos veszélye van, a 2.1.3.10 bekezdésben található veszélyességi rangsor táblázat alapján kell besorolni és a megfelelő csomagolási csoporthoz hozzárendelni.

2.2.61.1.11.1 Ha a peszticid készítmény lenyelési vagy bőrön keresztüli mérgezőképesség LD₅₀ értéke nem ismeretes, de hatóanyagainak LD₅₀ értéke ismeretes, akkor a készítmény LD₅₀ értéke a 2.2.61.1.10 pontban leírt eljárás alkalmazásával határozható meg.

Megjegyzés: A használatos peszticidekre vonatkozóan LD₅₀ mérgezőképességi adatok találhatóak a „WHO Ajánlás a peszticidek osztályozására veszélyességük

alapján és az osztályozási irányelvek” kiadványban, amely az International Programme on Chemical Safety, World Health Organization (WHO), CH-1211 Geneva 27, Switzerland címen szerezhető be. Bár ez a dokumentum felhasználható a peszticidek LD₅₀ értékeinek forrásaként, ennek osztályozási rendszere nem használható a peszticidek szállítási besorolásához és a csomagolási csoportokhoz történő hozzárendeléséhez, azt az ADR előírásai szerint kell elvégezni.

2.2.61.1.11.2 A peszticid szállításánál használt helyes szállítási megnevezést a hatóanyag, a peszticid halmazállapota és a lehetséges járulékos veszélyek alapján kell megválasztani (lásd a 3.1.2 szakaszt).

2.2.61.1.12 Ha a 6.1 osztály anyagai valamilyen adalékanyag hozzáadása révén eltérő veszélyességi kategóriákba kerülnek át, mint ahová 3.2 fejezet „A” táblázatában név szerint említett anyagok, ezeket a keverékeket vagy oldatokat azok alá a tételek alá kell besorolni, ahová tényleges veszélyességük mértéke alapján tartoznak.

***Megjegyzés:** Az oldatok és keverékek (készítmények és hulladékok) besorolására lásd a 2.1.3 szakaszt is.*

2.2.61.1.13 A 2.2.61.1.6 – 2.2.61.1.11 pontban található kritériumok alapján az is meghatározható, hogy egy név szerint feltüntetett anyag vagy név szerint feltüntetett anyagot tartalmazó oldat vagy keverék természete olyan, hogy az oldat vagy keverék nem esik ezen osztály előírásainak hatálya alá.

2.2.61.1.14 Azok az anyagok, oldatok és keverékek – kivéve a peszticidként használt anyagokat és készítményeket –, amelyek a módosított 67/548/EGK⁴⁾ vagy az 1999/45/EK⁵⁾ Irányelv kritériumai alapján, ezen irányelvek szerint nem számítanak nagyon mérgezőnek, mérgezőnek vagy ártalmasnak, a 6.1 osztályba nem tartozó anyagoknak tekinthetők.

2.2.61.2 *A szállításból kizárt anyagok*

2.2.61.2.1 A 6.1 osztály vegyileg nem állandó anyagai csak akkor adhatók át szállításra, ha megtették a szükséges intézkedéseket, hogy megakadályozzák a szállítás alatti veszélyes bomlásukat vagy polimerizációjukat. Ennek elérésére különösen azt kell biztosítani, hogy a tartályok, ill. tartányok ne tartalmazzanak olyan anyago(ka)t, amelyek ilyen reakciókat okozhatnak.

2.2.61.2.2 A következő anyagok a szállításból ki vannak zárva:

- azok a vízmentes vagy oldatban levő hidrogén-cianidok, amelyek nem felelnek meg az UN 1051, 1613, 1614 vagy 3294 tétel leírásának;
- a fém-karbonilok, amelyek lobbanáspontja 23 °C alatt van, az UN 1259 nikkel-tetra-karbonil és az UN 1994 vas-pentakarbonil kivételével;
- a 2,3,7,8-tetraklór-dibenzo-p-dioxin (TCDD) olyan koncentrációban, amely a 2.2.61.1.7 pontban foglalt feltételek alapján nagyon mérgező;
- az UN 2249 diklór-dimetil-éter, szimmetrikus;
- a foszfid készítmények a mérgező, gyúlékony gázok fejlődését gátló adalékok nélkül.

4) Az Európai Közösségek Tanácsának 1967. június 27-i 67/548/EGK Irányelve a tagállamok veszélyes anyagok osztályozására, csomagolására és címkézésére vonatkozó jogszabályainak és közigazgatási előírásainak közelítéséről (lásd az EK Hivatalos Lapja, L 196. szám, 1967.08.16.).

5) Az Európai Parlament és a Tanács 1999. május 31-i 1999/45/EK Irányelve a tagállamok veszélyes készítmények osztályozására, csomagolására és címkézésére vonatkozó jogszabályainak és közigazgatási előírásainak közelítéséről (lásd az EK Hivatalos Lapja, L 200. szám, 1999.07.30., p. 1-68.).

vattacsomók, műanyag lapok stb. légmentesen zárt burkolatban nem tartoznak az ADR előírásainak hatálya alá.

- i) *Az ADR előírásainak hatálya alá nem tartozó szilárd anyagok és mérgező folyékony anyagok keverékei az UN 3243 tétel alatt szállíthatók anélkül, hogy a 6.1 osztály besorolási kritériumait alkalmazni kellene, amennyiben az anyag berakodása során, ill. a csomagolóeszköz, a konténer vagy a jármű lezárása során szabad folyadék szemmel nem látható. Minden csomagolóeszköznek meg kell felelni a gyártási mintának, ami sikeresen elviselte a II csomagolási csoportra vonatkozó tömörségi próbát. Ez a tétel nem használható az I csomagolási csoportba tartozó folyadékot tartalmazó szilárd anyagokhoz.*
- j) *A nagyon mérgező vagy mérgező, gyúlékony, folyékony anyagok 23 °C alatti lobbanásponttal – az UN 1051, 1092, 1098, 1143, 1163, 1182, 1185, 1238, 1239, 1244, 1251, 1259, 1613, 1614, 1695, 1994, 2334, 2382, 2407, 2438, 2480, 2482, 2484, 2485, 2606, 2929, 3279 és 3294 szám alá tartozó, belélegzés esetén nagyon mérgező anyagok kivételével – a 3 osztály anyagai.*
- k) *Azok a gyúlékony folyékony anyagok, amelyek enyhén mérgezőek, a peszticidként használt anyagok és készítmények kivételével, 23 °C és 60 °C közötti lobbanásponttal a 3 osztály anyagai.*
- l) *Az enyhén mérgező, gyújtó hatású anyagok az 5.1 osztály anyagai.*
- m) *Az enyhén mérgező és gyengén maró anyagok a 8 osztály anyagai.*
- n) *Az UN 1360, 1397, 1432, 1714, 2011 és 2013 szám alá besorolt fémfoszfidok a 4.3 osztály anyagai.*

2.2.62 6.2 osztály Fertőző anyagok

2.2.62.1 Kritériumok

2.2.62.1.1 A 6.2 osztály fogalmkörébe a fertőző anyagok tartoznak. Az ADR értelmében a fertőző anyagok olyan anyagok, amelyekről ismert vagy okkal feltételezhető, hogy kórokozókat tartalmaznak. A kórokozók olyan mikroorganizmusok (beleértve a baktériumokat, vírusokat, rickettsiákat, parazitákat, gombákat) és más hatóanyagok, pl. a prionok, amelyek képesek ember vagy állat megbetegedését okozni.

Megjegyzés: 1. A géntechnológiával módosított mikroorganizmusokat és élő szervezeteket, biológiai termékeket, diagnosztikai mintákat és fertőzött élő állatokat ebbe az osztályba kell besorolni, ha kielégítik ennek az osztálynak a feltételeit.

2. Azok a növényi, állati vagy baktérium forrásokból származó toxinok, amelyek nem tartalmaznak semmiféle fertőző anyagot vagy élő szervezetet, vagy nem fertőző anyagban vagy élő szervezetben vannak, a 6.1 osztály UN 3172 vagy UN 3462 szám alá tartozó anyagok.

2.2.62.1.2 A 6.2 osztály anyagai a következők szerint vannak csoportosítva:

- I1 Emberekre ártalmas, fertőző anyagok
- I2 Csak állatokra ártalmas, fertőző anyagok
- I3 Kórházi hulladék
- I4 Biológiai anyagok.

Fogalommeghatározások

2.2.62.1.3 Az ADR alkalmazásában:

Biológiai termékek azok a termékek, amelyeket élő szervezetekből az illetékes nemzeti közegészségügyi hatóságok előírásai szerint – szükség esetén az ilyen hatóságok speciális engedélyével – gyártanak és forgalmazznak, és a humán- vagy állatgyógyászatban megelőzésre, kezelésre vagy diagnosztizálásra vagy ezekkel kapcsolatos kutatásra, kísérleti vagy vizsgálati célokra szolgálnak. A teljesség igénye nélkül ide tartoznak a félkész vagy kész termékek, pl. a vakcinák.

A *tenyészet* olyan eljárás eredménye, amely által a kórokozókat szándékosan szaporítják. Ez a meghatározás nem terjed ki az e pontban meghatározott, betegtől származó mintára.

A *gyógyászati vagy kórházi hulladékok* az állatok vagy emberek gyógykezeléséből vagy biológiai kísérletekből származó hulladékok.

A *betegtől származó minta* olyan, közvetlenül emberből vagy állatból levett anyag, beleértve többek között a váladékot, székletet, vért és alkotóelemeit, szövetmintákat, testnedveket, keneteket, valamint testrészeket, amelyet kutatás, vizsgálat, kórmeghatározás, gyógykezelés vagy kórmegeelőzés céljából szállítanak.

Besorolás

2.2.62.1.4 A fertőző anyagokat a 6.2 osztályba, az UN 2814, az UN 2900, az UN 3291, ill. az UN 3373 tételekhez kell sorolni.

A fertőző anyagok a következő kategóriákra vannak felosztva:

2.2.62.1.4.1 „A” kategória: Olyan fertőző anyag, amelyet olyan formában szállítanak, hogy kitétel esetén képes – egyébként egészséges – emberben vagy állatban tartós egészségkárosodást, életveszélyes vagy halálos megbetegedést okozni. Az e

kritériumot kielégítő anyagokra* tájékoztató példák találhatók az ebben a bekezdésben levő táblázatban.

Megjegyzés: *Kitétel az, ha egy fertőző anyag a védőcsomagolásból kiszabadul és ennek eredményeként emberrel vagy állattal fizikai kapcsolatba kerül.*

- a) Azokat a fertőző anyagokat, amelyek ezeket a kritériumokat kielégítik és csak emberi, vagy emberi és állati megbetegedést okoznak, az UN 2814 tételhez kell besorolni. Azokat a fertőző anyagokat, amelyek csak állati megbetegedést okoznak, az UN 2900 tételhez kell besorolni;
- b) Az UN 2814, ill. az UN 2900 tételhez történő besorolást a páciens, ill. az állat ismert kórtörténetére, a helyi járvány körülményekre, a páciens, ill. az állat tüneteire vagy a páciens, ill. az állat egyedi körülményeinek szakszerű megítélésére kell alapozni.

Megjegyzés: 1. *Az UN 2814 tétel esetében a helyes szállítási megnevezés „EMBEREKRE ÁRTALMAS FERTŐZŐ ANYAG”. Az UN 2900 tétel esetében a helyes szállítási megnevezés „csak ÁLLATOKRA ÁRTALMAS FERTŐZŐ ANYAG”.*

2. *A következő táblázat felsorolása nem teljes. Azokat a fertőző anyagokat, beleértve az új vagy kialakult patogéneket, amelyek nem szerepelnek a táblázatban, de ugyanazon kritériumoknak megfelelnek, szintén az „A” kategóriába kell besorolni. Ezen kívül, ha egy anyag esetében kétséges, hogy kielégíti-e a kritériumokat, akkor az „A” kategóriába kell besorolni.*

3. *A következő táblázatban a dőlt betűvel szedett mikroorganizmusok baktériumok, mikoplazmák, rickettsiák vagy gombák.*

Tájékoztató példák az „A” kategóriába tartozó anyagokra, amelyek minden formájukban ebbe a kategóriába tartoznak – kivéve, ha másként van jelölve (lásd 2.2.62.1.4.1)

UN szám és megnevezés	Mikroorganizmus
UN 2900 Csak állatokra ártalmas fertőző anyag (folyt.)	Juhhimlő vírus (csak ha tenyészet) Kecskehimlő vírus (csak ha tenyészet) Sertés hólyaggyulladás vírus (csak ha tenyészet) Hólyagos szájgyulladás vírus (csak ha tenyészet)

a) A diagnosztikai és a klinikai célú tenyészeteket „B” kategóriájú fertőző anyagnak is be lehet sorolni.

2.2.62.1.4.2 „B” kategória: Olyan fertőző anyag, amely nem elégíti ki az „A” kategóriába történő besorolás kritériumait. A „B” kategóriába tartozó fertőző anyagokat az UN 3373 tételhez kell besorolni.

Megjegyzés: Az UN 3373 tétel esetében a helyes szállítási megnevezés: „B” KATEGÓRIÁJÚ BIOLÓGIAI ANYAG.

2.2.62.1.5 Kivételek

2.2.62.1.5.1 Azok az anyagok, amelyek nem tartalmaznak fertőző anyagokat, vagy amelyek nem valószínű, hogy emberi vagy állati megbetegedést okoznak, nem tartoznak az ADR előírásainak hatálya alá, ha egyetlen más osztályba sorolás feltételeit sem elégítik ki.

2.2.62.1.5.2 Az emberi vagy állati megbetegedést nem okozó mikroorganizmust tartalmazó anyagok nem tartoznak az ADR előírásainak hatálya alá, ha egyetlen más osztályba sorolás feltételeit sem elégítik ki.

2.2.62.1.5.3 Azok az anyagok, amelyekben a bennük lévő kórokozók olyan módon vannak semlegesítve vagy inaktíválva, hogy már nem jelentenek egészségi kockázatot, nem tartoznak az ADR előírásainak hatálya alá, ha egyetlen más osztályba sorolás feltételeit sem elégítik ki.

Megjegyzés: Azok a gyógyászati eszközök, amelyekből a szabad folyadékot eltávolították, úgy tekinthetők, hogy megfelelnek e pont előírásainak és nem tartoznak az ADR előírásainak hatálya alá.

2.2.62.1.5.4 Azok az anyagok (ideértve az élelmiszer- és a vízmintákat is), amelyekben a kórokozók koncentrációja természetesen előforduló szinten van és a fertőzési kockázatuk nem tekinthető jelentősnek, nem tartoznak az ADR előírásainak hatálya alá, ha egyetlen más osztályba sorolás feltételeit sem elégítik ki.

2.2.62.1.5.5 A felszívóanyagra csöppentett, megszáradt vér, a belső vérzés megállapítására szolgáló székletminta, a vérátömlesztés céljából vagy szervátültetéshez, ill. vérátömlesztéshez használt vérkészítmények előállítására céljából gyűjtött vér és vér alkotórészek, valamint a szervátültetésre szolgáló szövetek és szervek nem tartoznak az ADR előírásainak hatálya alá.

2.2.62.1.5.6 Azok az emberi, ill. állati minták, amelyeknél elenyésző annak a valószínűsége, hogy kórokozókat tartalmaznak, nem tartoznak az ADR előírásainak hatálya alá, ha olyan csomagolásban szállítják, amely megakadályozza, hogy kiszivároghassanak, és az **„emberi minta, az ADR/RID egyéb előírásainak betartása nélkül szállítható”,** ill. **„állati minta, az ADR/RID egyéb előírásainak betartása nélkül szállítható”** felirattal meg vannak jelölve.

A csomagolás akkor elégíti ki az előző követelményt, ha megfelel a következőknek:

- a) A csomagolásnak három részből kell állnia:
- i) szivárgásmentes elsődleges tartály(ok)ból;
 - ii) szivárgásmentes másodlagos csomagolásból; és
 - iii) olyan külső csomagolásból, amely úrtartalmának, tömegének és rendeltetésének

megfelelően erős, és legalább egy oldalfelületének mérete legalább 100 mm × 100 mm;

- b) Folyadékok esetén az elsődleges tartály(ok) és a másodlagos csomagolás közé az elsődleges tartály(ok) teljes tartalmának felszívására elegendő nedvszívó párnázóanyagot kell helyezni, hogy a folyékony anyag a szállítás során történő kiszabadulása vagy kiszivárgása esetén ne érhesse el a külső csomagolást, ill. ne okozza sem a párnázóanyag, sem a külső csomagolás sérülését;
- c) Amennyiben több törékeny elsődleges tartály van elhelyezve egyetlen másodlagos csomagolásban, úgy ezeket egyenként be kell burkolni vagy úgy kell elválasztani egymástól, hogy ne érintkezhessenek egymással.

Megjegyzés: 1. *Annak eldöntését, hogy valamely anyag ezen alpont alapján kivételnek számít-e a páciens, ill. az állat ismert kórtörténetének, tüneteinek, egyedi körülményeinek és a helyi járvány körülményeknek a szakszerű megítélésére kell alapozni. Az ezen alpont szerint szállítható minta lehet pl.*

- a koleszterinszint, vércukorszint, hormonszint, prosztata specifikus antitestek (PSA) meghatározására szolgáló vér- és vizeletminta;
- a nemfertőző emberi vagy állati betegségekben a szív-, máj-, vese-funkció vagy terápiás célú gyógyszer szint meghatározásához szükséges minta;
- a biztosítás kötésnél vagy foglalkoztatáskor szükséges, kábítószer vagy alkohol kimutatására szolgáló minta
- a terhesség kimutatására szolgáló minta;
- a rák kimutatása céljából vett szövettani minta; és
- emberben vagy állatban lévő antitestek kimutatására szolgáló minta fertőzésre utaló gyanú nélkül (pl. oltóanyaggal létrehozott immunitás értékelése, autoimmun betegségek kórmeghatározása, stb) .

2. *Légi szállítás esetén az e pont szerint kivételnek számító minták csomagolóeszközeinek meg kell felelniük az a) – c) pontok feltételeinek.*

2.2.62.1.5.7 Kivéve

- a) a kórházi hulladékokat (UN 3291);
- b) az olyan gyógyászati eszközöket és felszereléseket, amelyek „A” kategóriába tartozó fertőző anyagot tartalmaznak vagy azzal szennyezettek (UN 2814 , ill. UN 2900); és
- c) az olyan gyógyászati eszközöket és felszereléseket, amelyek valamely más osztály kritériumainak megfelelő veszélyes anyagot tartalmaznak vagy azzal szennyezettek,

azok a gyógyászati eszközök és felszerelések, amelyek fertőző anyagot tartalmazhatnak vagy azzal szennyeződhetnek, és amelyeket fertőtlenítés, tisztítás, sterilizálás, javítás vagy értékelés céljából szállítanak, nem tartoznak e bekezdésen kívül az ADR többi előírásainak hatálya alá, amennyiben olyan csomagolóeszközben vannak, amelyet úgy terveztek és gyártottak, hogy normális szállítási körülmények között nem törhet el, nem lyukadhat ki, és a tartalom nem szivároghat ki belőle. A csomagolóeszközt olyanra kell tervezni, hogy megfeleljen a 6.1.4, ill. a 6.6.4 szakasz konstrukciós követelményeinek.

A csomagolóeszköznek a 4.1.1.1 és a 4.1.1.2 bekezdés általános csomagolási előírásainak kell megfelelnie, és 1,2 m magasságból történő ejtés után is meg kell tudnia tartani a gyógyászati eszközt, ill. felszerelést.

A csomagolóeszközön fel kell tüntetni a „HASZNÁLT GYÓGYÁSZATI ESZKÖZ”, ill. a „HASZNÁLT GYÓGYÁSZATI FELSZERELÉS” feliratot. Ha egyesítőcsomagolást használnak, akkor azt ugyanígy meg kell jelölni, kivéve, ha jól látható a csomagolóeszközön lévő felirat.

2.2.62.1.6 –

2.2.62.1.8 (fenntartva)

2.2.62.1.9 *Biológiai termékek*

Az ADR alkalmazásában a biológiai termékek a következő csoportokra vannak osztva:

- a) olyan termékek, amelyeket az illetékes hatóságok követelményei szerint állítanak elő és csomagolnak be, és végső csomagolás (kiszerezés), illetve elosztás céljából szállítanak, hivatásos egészségügyi személyzet vagy magánszemély által történő egyéni gyógykezelés céljára. Az ebbe a csoportba tartozó anyagok nem tartoznak az ADR előírásainak hatálya alá;
- b) olyan termékek, amelyek nem elégítik ki előző a) pont kritériumait, és amelyekről ismert vagy okkal feltételezhető, hogy fertőző anyagot tartalmaznak, és az „A” vagy a „B” kategóriába való feltételeknek megfelelnek. Az ebbe a csoportba tartozó anyagokat az UN 2814, az UN 2900, ill. az UN 3373 tételhez kell besorolni.

Megjegyzés: *Egyes engedélyezett biológiai termékek csak a világ egyes részein képezhetnek biológiai veszélyt. Ilyen esetben az illetékes hatóság előírhatja, hogy ezek a biológiai termékek feleljenek meg a fertőző anyagokra vonatkozó követelményeknek vagy egyéb korlátozásokat foganatosíthat.*

2.2.62.1.10 *Géntechnológiával módosított mikroorganizmusok és élő szervezetek*

Azokat a géntechnológiával módosított mikroorganizmusokat, amelyek nem elégítik ki a fertőző anyagok meghatározását, a 2.2.9 szakasz szerint kell besorolni.

2.2.62.1.11 *Gyógyászati vagy kórházi hulladék*

2.2.62.1.11.1 Azokat a gyógyászati vagy kórházi hulladékokat, amelyek az „A” kategóriába tartozó fertőző anyagot tartalmaznak, az UN 2814, ill. az UN 2900 tételhez kell besorolni. Azokat a gyógyászati vagy kórházi hulladékokat, amelyek a „B” kategóriába tartozó fertőző anyagot tartalmaznak, az UN 3291 tételhez kell besorolni.

Megjegyzés: *Ezen előírások szerint kell besorolni a Bizottság 2000/532/EK⁶⁾ módosított határozata mellékletét képező hulladékjegyzék szerinti 18 01 03 számú (Emberek, illetve állatok egészségügyi ellátásból és/vagy az azzal kapcsolatos kutatásból származó hulladékok – szülészeti, illetve az emberi betegségek diagnosztizálásából, kezeléséből, illetve megelőzéséből származó hulladékok – egyéb hulladékok, amelyek gyűjtése és ártalmatlanítása speciális követelményekhez kötött a fertőzések elkerülése érdekében) és a 18 02 02 számú (Emberek, illetve állatok egészségügyi ellátásból és/vagy az azzal kapcsolatos kutatásból származó hulladékok – állatbetegségek kutatásából, diagnosztizálásából, kezeléséből, illetve megelőzéséből származó hulladékok – egyéb hulladékok, amelyek gyűjtése és ártalmatlanítása speciális követelményekhez kötött a fertőzések elkerülése érdekében) gyógyászati vagy klinikai hulladékokat a páciens, ill. az állat orvosi, ill. állatorvosi diagnózisa alapján.*

2.2.62.1.11.2 Azokat a gyógyászati vagy kórházi hulladékokat, amelyekről okkal feltételezhető, hogy csekély annak a valószínűsége, hogy fertőző anyago(ka)t tartalmaznak, az UN 3291 tételhez kell besorolni. A besoroláshoz a nemzetközi, regionális vagy belföldi hulladék jegyzékek is figyelembe vehetők.

Megjegyzés: *1. Az UN 3291 szám esetében a helyes szállítási megnevezés:*

6) A Bizottság 2000/532/EK határozata (2000. május 3.) a hulladékjegyzéknek a hulladékokról szóló 75/442/EGK tanácsi irányelv [felváltotta a 2006/12/EK parlamenti és tanácsi irányelv (az EU Hivatalos Lapja L 114 szám, 2006. 04. 27., 9. oldal)] 1. cikkének a) pontja értelmében történő meghatározásáról szóló 94/3/EK határozat, valamint a veszélyes hulladékok jegyzékének a veszélyes hulladékokról szóló 91/689/EGK tanácsi irányelv 1. cikkének (4) bekezdése értelmében történő meghatározásáról szóló 94/904/EK tanácsi határozat felváltásáról (az EK Hivatalos Lapja, L 226 szám, 2000. 09. 06., 3. o.) Magyarországon lásd még a 16/2001. (VII. 18.) KöM rendeletet a hulladékok jegyzékéről.

„NEM SPECIFIKÁLT KÓRHÁZI HULLADÉK M.N.N.” vagy „(BIO)GYÓGYÁSZATI HULLADÉK, M.N.N.” vagy „SZABÁLYOZOTT GYÓGYÁSZATI HULLADÉK, M.N.N.”

2. Az előző besorolási kritériumokkal ellentétben nem tartoznak az ADR hatálya alá a Bizottság 2000/532/EK⁶⁾ módosított határozata mellékletét képező hulladékjegyzék szerinti 18 01 04 számú (Ember, illetve állatok egészségügyi ellátásból és/vagy az azzal kapcsolatos kutatásból származó hulladékok – szülészeti, illetve az emberi betegségek diagnosztizálásából, kezeléséből, illetve megelőzéséből származó hulladékok – hulladékok, amelyek gyűjtése és ártalmatlanítása nem kötött speciális követelményekhez a fertőzések elkerülése érdekében) és a 18 02 03 számú (Ember, illetve állatok egészségügyi ellátásból és/vagy az azzal kapcsolatos kutatásból származó hulladékok – állatbetegségek kutatásából, diagnosztizálásából, kezeléséből, illetve megelőzéséből származó hulladékok – hulladékok, amelyek gyűjtése és ártalmatlanítása nem kötött speciális követelményekhez a fertőzések elkerülése érdekében) gyógyászati vagy klinikai hulladékok.

2.2.62.1.11.3 Azok a fertőtlenített gyógyászati vagy kórházi hulladékok, amelyek korábban fertőző anyago(ka)t tartalmaztak, nem tartoznak az ADR előírásainak hatálya alá, ha egyetlen más osztályba való besorolás kritériumát sem elérik ki.

2.2.62.1.11.4 Az UN 3291 szám alá besorolt gyógyászati vagy kórházi hulladékok a II csomagolási csoporthoz vannak hozzárendelve.

2.2.62.1.12 *Fertőzőtt állatok*

2.2.62.1.12.1 Élő állatok fertőző anyag szállítására nem használhatók, kivéve, ha az anyag más módon nem szállítható. Azokat az élő állatokat, amelyeket szándékosan megfertőztek vagy amelyekről ismert vagy gyanítható, hogy fertőző anyagot tartalmaznak, csak az illetékes hatóság által előírt feltételek⁷⁾ szerint lehet szállítani.

2.2.62.1.12.2 Az „A” kategóriájú kórokozókkal, ill. a csak tenyészet esetén „A” kategóriába sorolandó kórokozókkal fertőzőtt állati eredetű anyagokat az UN 2814, ill. az UN 2900 tétel alá kell sorolni. A „B” kategóriájú kórokozókkal – kivéve azokat a kórokozókat, amelyek tenyészet esetén „A” kategóriába sorolandók – fertőzőtt állati eredetű anyagokat az UN 3373 tétel alá kell sorolni.

2.2.62.2 *A szállításból kizárt anyagok*

Gerinces vagy gerinctelen élő állatok fertőző anyagok szállítására nem használhatók, hacsak az anyag más módon nem szállítható, ill. a szállítást az illetékes hatóság jóvá nem hagyta (lásd a 2.2.62.1.12.1 pontot).

7) Az élő állatok szállítását szabályozó előírásokat tartalmaz pl. a 91/628/EGK irányelv az állatok szállítás közbeni védelméről (az EK Hivatalos Lapja L 340. szám, 1991. 12. 11., 17. old.) és az Európa Tanács (Miniszeri Bizottság) Ajánlásai egyes állatfajok szállítására.

2.2.62.3 A gyűjtőmegnevezések felsorolása

	Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése
Fertőző anyagok			
Emberekre ártalmas anyagok	I1	2814	EMBEREKRE ÁRTALMAS FERTŐZŐ ANYAG
Csak állatokra ártalmas anyagok	I2	2900	csak ÁLLATOKRA ÁRTALMAS FERTŐZŐ ANYAG
Kórházi hulladék	I3	3291 3291 3291	NEM SPECIFIKÁLT KÓRHÁZI HULLADÉK, M.N.N. vagy (BIO)GYÓGYÁSZATI HULLADÉK, M.N.N. vagy SZABÁLYOZOTT GYÓGYÁSZATI HULLADÉK, M.N.N,
Biológiai anyagok	I4	3373	„B” KATEGÓRIÁJÚ BIOLÓGIAI ANYAG

2.2.7 7 osztály Radioaktív anyagok

2.2.7.1 Fogalommeghatározás

2.2.7.1.1 Radioaktív anyag minden olyan anyag, amely radionuklidokat tartalmaz és mind az aktivitás koncentráció, mind a küldemény teljes aktivitása nagyobb, mint a 2.2.7.2.2.1 – 2.2.7.2.2.6 pontban meghatározott érték.

2.2.7.1.2 Szennyezettség

Szennyezettségen értendő valamely radioaktív anyag jelenléte egy felületen 0,4 Bq/cm²-nél nagyobb mennyiségben béta-, gamma-sugárzók és csekély toxicitású alfa-sugárzók esetén, vagy 0,04 Bq/cm²-nél nagyobb mennyiségben minden más alfa-sugárzó esetén.

Nem tapadó szennyezettség az olyan szennyezettség, amely rendes kezelési feltételek között a felületről eltávolítható.

Tapadó szennyezettség a nem tapadó szennyezettség kivételével minden más szennyezettség.

2.2.7.1.3 Különleges fogalmak meghatározása

A_1 és A_2

A_1 -en a különleges formájú radioaktív anyagok azon aktivitása értendő, amely a 2.2.7.2.2.1 táblázatban fel van tüntetve vagy a 2.2.7.2.2.2 pont szerint van levezetve és az ADR előírásaihoz az aktivitás határok megállapítására használatos.

A_2 -n a különleges formájú radioaktív anyagoktól eltérő, más radioaktív anyagok azon aktivitása értendő, amely a 2.2.7.2.2.1 táblázatban fel van tüntetve vagy a 2.2.7.2.2.2 pont szerint van levezetve, és az ADR előírásaihoz az aktivitás határok megállapítására használatos.

A besugárzatlan tórium olyan tórium, amely 232-tórium grammonként legfeljebb 10^{-7} g 233-uránt tartalmaz.

A besugárzatlan urán olyan urán, amely 235-urán grammonként legfeljebb $2 \cdot 10^3$ Bq plutóniumot, 235-urán grammonként legfeljebb $9 \cdot 10^6$ Bq hasadási terméket és 235-urán grammonként legfeljebb $5 \cdot 10^{-3}$ g 236-uránt tartalmaz.

Csekély toxicitású alfa-sugárzók: természetes urán, szegényített urán, természetes tórium, 235-urán vagy 238-urán, 232-tórium, 228-tórium és 230-tórium, ha ezeket ércék vagy fizikai vagy kémiai koncentrátumok tartalmazzák; és a 10 napnál rövidebb felezési idejű alfa-sugárzók.

Hasadónuklidok: 233-urán, 235-urán, 239-plutónium és 241-plutónium.

Hasadóanyag a bármely hasadónuklidot tartalmazó anyag. Nem tartozik e meghatározás alá:

- a besugárzatlan természetes urán vagy szegényített urán, és
- az olyan természetes vagy szegényített urán, amit csak termikus reaktorokban sugároztak be.

Kis fajlagos aktivitású (LSA) anyag: Olyan radioaktív anyag, amelynek fajlagos aktivitása természeténél fogva korlátozott, vagy olyan radioaktív anyag, amelyre becsült közepes fajlagos aktivitás határérték vonatkozik. Az LSA anyagot körülvevő árnyékoló anyagot a becsült közepes fajlagos aktivitás meghatározásánál nem szabad figyelembe venni.

A kis mértékben diszpergálódó radioaktív anyag olyan szilárd radioaktív anyag vagy kapszulába zárt szilárd radioaktív anyag, amelynek diszpergálódási képessége korlátozott és nem por formájú.

Különleges formájú (special form) radioaktív anyag:

- a) szétterjedésre nem képes szilárd radioaktív anyagot; vagy
- b) radioaktív anyagot tartalmazó, tömören lezárt kapszulát jelent.

Low specific activity (LSA): lásd **kis fajlagos aktivitású (LSA) anyag**.

Egy **radionuklid fajlagos aktivitása** a nuklid egységnyi tömegére jutó aktivitás. Egy anyag fajlagos aktivitását úgy kell tekinteni, mint egy olyan anyagnak az egységnyi tömegére jutó aktivitását, amelyben a radionuklidok lényegében egyenletesen vannak eloszlalva.

Surface contaminated object (SCO): lásd **szennyezett felületű tárgy (SCO)**.

Szennyezett felületű tárgy (SCO): A szennyezett felületű tárgy (SCO) olyan szilárd tárgy, amely önmagában nem radioaktív, de amelynek felületén radioaktív anyag van eloszlalva (radioaktív anyaggal van szennyezve).

Az urán (természetes, szegényített, dúsított) a következőket jelenti:

A **természetes urán** olyan urán, amelyben az uránizotópok természetben előforduló eloszlásúak (kb. 99,28 tömeg% 238-urán és 0,72 tömeg% 235-urán). Ez lehet kémiaiilag elkülönített urán is.

A **szegényített urán** olyan urán, amelynek százalékos 235-urán tartalma kisebb, mint a természetes uráné.

A **dúsított urán** olyan urán, amelynek százalékos 235-urán tartalma nagyobb, mint 0,72%.

Mind a természetes, mind a dúsított, mind a szegényített uránban kis százalékban 234-urán is jelen van.

2.2.7.2 Besorolás

2.2.7.2.1 Általános előírások

2.2.7.2.1.1 A radioaktív anyagokat a 2.2.7.2.2 – 2.2.7.2.5 pontok előírásai szerint, a küldeménydarabban lévő radionuklidok aktivitás szintje és hasadó, ill. nem hasadó volta, a szállítandó küldeménydarab típusa, a küldeménydarab tartalmának természete, ill. formája, valamint a szállításra vonatkozó külön megegyezés figyelembevételével kell a 2.2.7.2.1.1 táblázatban meghatározott valamely UN számhoz rendelni.

2.2.7.2.1.1 táblázat – UN számhoz való hozzárendelés

Engedményes küldeménydarabok (1.7.1.5)	
UN 2908	RADIOAKTÍV ANYAG, ENGEDMÉNYES KÜLDEMÉNYDARABBAN – ÜRES CSOMAGOLÓESZKÖZ

2.2.7.2.2 Az aktivitás szintek meghatározása

2.2.7.2.2.1 Az egyedi radionuklidokra a 2.2.7.2.2.1 táblázat a következő alapértékeket tartalmazza:

- A_1 és A_2 TBq-ben;
- mentességi aktivitás koncentráció az anyagra Bq/g-ban; és
- mentességi aktivitás határ a küldeményre Bq-ben.

2.2.7.2.2.1 táblázat – Radionuklid alapértékek az egyes radionuklidokra

Radionuklid (rendszer)	A_1 (TBq)	A_2 (TBq)	Mentességi aktivitás koncentráció anyagra (Bq/g)	Mentességi aktivitás küldeményre (Bq)

- c) A mennyiség a bomlási sebesség mérésével vagy a forrástól előírt távolságban a sugárzási szint mérésével határozható meg.
- d) Ezek az értékek csak olyan uránvegyületekre vonatkoznak, amelyek kémiai alakja normális szállítási körülmények között és baleset esetén is UF_6 , UO_2F_2 vagy $UO_2(NO_3)_2$.
- e) Ezek az értékek csak olyan uránvegyületekre vonatkoznak, amelyek kémiai alakja normális szállítási körülmények között és baleset esetén is UO_3 , UF_4 , UCl_4 vagy hatvegyértékű uránvegyület.
- f) Ezek az értékek az előző d) és e) pont alatt meghatározottakon kívüli egyéb más uránvegyületekre vonatkoznak.
- g) Ezek az értékek csak a besugárzatlan uránra vonatkoznak.

2.2.7.2.2.2 Azokra az egyedi radionuklidokra, amelyek nincsenek a 2.2.7.2.2.1 táblázatban felsorolva, a 2.2.7.2.2.1 pont szerinti radionuklid alapértékek meghatározásához többoldalú engedély szükséges. A Nemzetközi Sugárvédelmi Bizottság (ICRP) ajánlása szerint, a tüdőabszorpciós típusnak megfelelő dózis tényezővel számított A_2 érték használata is megengedett, ha mind a normális szállítási körülmények között, mind a baleset esetén lévő kémiai alakokat figyelembe veszik. Alternatívaként a 2.2.7.2.2.2 táblázatban található radionuklid alapértékek az illetékes hatóság engedélye nélkül használhatók.

2.2.7.2.2.2 táblázat – Radionuklid alapértékek ismeretlen radionuklidokra vagy keverékekre

Radioaktív tartalom	A_1	A_2	Mentességi aktivitás koncentráció anyagra (Bq/g)	Mentességi aktivitás küldeményre (Bq)
	(TBq)	(TBq)		
Csak béta- vagy gamma-sugarakat kibocsátó nuklidok jelenléte ismert	1×10^{-1}	2×10^{-2}	1×10^1	1×10^4
Alfa-sugarakat kibocsátó nuklidok jelenléte ismert, de neutron sugárzóké nem	2×10^{-1}	9×10^{-5}	1×10^{-1}	1×10^3
Neutron sugárzó nuklidok jelenléte ismert vagy nem áll tényleges adat rendelkezésre	1×10^{-3}	9×10^{-5}	1×10^{-1}	1×10^3

2.2.7.2.2.3 A 2.2.7.2.2.1 táblázatban nem szereplő radionuklidokra az A_1 és A_2 számításakor az olyan radioaktív bomlási lánc, amelyben a radionuklidok a természetben előforduló arányban szerepelnek, és sem tíz napnál nagyobb, sem a kiindulási radionuklid felezési idejénél nagyobb felezési idejű leánynuklid nem szerepel, egy radionuklidnak tekintendő. Ekkor a figyelembe veendő aktivitás és az alkalmazandó A_1 vagy A_2 érték a kiindulási radionuklidra érvényes érték. Az olyan radioaktív bomlási láncban, amelyben a leánynuklidok felezési ideje nagyobb mint tíz nap, vagy nagyobb, mint a kiindulási radionuklid felezési ideje, a kiindulási nuklidot és az ilyen leánynuklidokat úgy kell kezelni, mint különböző nuklidok keverékét.

2.2.7.2.2.4 Radionuklid keverékekre a 2.2.7.2.2.1 pont szerinti radionuklid alapértékek a következők szerint határozhatók meg:

$$X_m = \frac{1}{\sum_i \frac{f(i)}{X(i)}}, \text{ ahol}$$

$f(i)$ – a keverékben az i -edik radionuklid aktivitásának vagy aktivitás koncentrációjának részaránya;

$X(i)$ – az i -edik radionuklidra vonatkozó A_1 vagy A_2 érték, ill. az anyagra vonatkozó mentességi aktivitás koncentráció vagy a küldeményre vonatkozó mentességi aktivitás érték;

X_m – keverék esetén a származtatott A_1 vagy A_2 érték, ill. az anyagra vonatkozó mentességi aktivitás koncentráció vagy a küldeményre vonatkozó mentességi aktivitás érték.

2.2.7.2.2.5 Amennyiben minden egyes radionuklid azonossága ismert, azonban néhány radionuklid aktivitása ismeretlen, a radionuklidok csoportokba foglalhatók. Az egyes radionuklid csoportokra azután a 2.2.7.2.2.4 és a 2.2.7.2.4.4 pont szerinti képlet alkalmazása során a megfelelő legkisebb vonatkozó radionuklid értéket lehet alkalmazni. A csoportba sorolás alapja az összes alfa-aktivitás és az összes béta/gamma-aktivitás lehet, amennyiben ezek ismeretesek, amikor is az alfa-sugárzókra illetve béta/gamma-sugárzókra a legkisebb radionuklid értéket kell alkalmazni.

2.2.7.2.2.6 Azokra az egyedi radionuklidokra vagy radionuklid-keverékekre, amelyeknél tényleges adatok nem állnak rendelkezésre, a 2.2.7.2.2.2 táblázat értékeit kell alkalmazni.

2.2.7.2.3 *Egyéb anyagjellemzők meghatározása*

2.2.7.2.3.1 Kis fajlagos aktivitású (LSA) anyag

2.2.7.2.3.1.1 (fenntartva)

2.2.7.2.3.1.2 Az LSA anyagok az alábbi három csoport egyikéhez tartoznak:

a) *LSA-I*

- i) urán- és tóriumérccek és ezen ércek koncentrációjai és természetes radionuklidokat tartalmazó egyéb ércek, amelyeket ezen radionuklidok felhasználására kívánnak feldolgozni;
- ii) természetes urán vagy szegényített urán, vagy természetes tórium, vagy ezek vegyületei vagy keverékei, amelyek nincsenek besugározva és szilárdak vagy folyékonyak;
- iii) radioaktív anyagok, amelyek A_2 értéke nincs korlátozva, kivéve a 2.2.7.2.3.5 pont szerint nem mentesített hasadóanyagokat; vagy

- iv) egyéb radioaktív anyag, amelyben az aktivitás egyenletesen oszlik meg és a becsült közepes fajlagos aktivitás nem haladja meg a 2.2.7.2.2.1 – 2.2.7.2.2.6 pontban az aktivitás koncentrációra meghatározott érték 30-szorosát, kivéve a 2.2.7.2.3.5 pont szerint nem mentesített hasadóanyagokat;

b) *LSA-II*

- i) a víz, legfeljebb 0,8 TBq/l trícium koncentrációval; vagy
- ii) egyéb anyagok, amelyekben az aktivitás egyenletesen oszlik meg, és amelyekben a becsült közepes fajlagos aktivitás szilárd anyagok és gázok esetében $10^{-4}A_2/g$ értéket, folyadékok esetében a $10^{-5}A_2/g$ értéket nem haladja meg;

c) *LSA-III*

A 2.2.7.2.3.1.3 pont szerinti szilárd anyagok (pl. szilárdított hulladékok vagy anyagok), a porok kivételével, amelyeknél

- i) a radioaktív anyagok szilárd anyagban vagy szilárd tárgyak együttesében vagy szilárd, tömör kötőanyagban (mint beton, bitumen, kerámia stb.) lényegében egyenletesen vannak elosztatva;
- ii) a radioaktív anyagok viszonylag oldhatatlanok, vagy azokat viszonylag oldhatatlan közeg tartalmazza úgy, hogy az egy küldeménydarabra jutó kilúgozódásból adódó radioaktív anyag veszteség a 7 napig tartó, vízben való áztatás során még a csomagolás elveszése esetén sem haladja meg a $0,1A_2$ értéket; és
- iii) a szilárd anyagok becsült közepes fajlagos aktivitása az árnyékolóanyagok figyelembevételével a $2 \cdot 10^{-3}A_2/g$ értéket nem haladja meg.

2.2.7.2.3.1.3 Az *LSA-III* anyagnak olyan szilárd anyagnak kell lennie, hogy ha egy küldeménydarab teljes tartalmát alávetnék a 2.2.7.2.3.1.4 pont szerinti vizsgálatnak, a vízben mérhető aktivitás a $0,1A_2$ értéket nem haladná meg.

2.2.7.2.3.1.4 Az *LSA-III* anyagot a következők szerint kell vizsgálni:

A küldeménydarab teljes tartalmát reprezentáló szilárd anyag mintát hét napig környezeti hőmérsékletű vízbe kell meríteni. A vizsgálathoz használt víz mennyisége annyi legyen, hogy a hétnapos vizsgálati idő végén megmaradó el nem nyelt és hatástalan szabad vízmennyiség a szilárd vizsgálati minta térfogatának legkevesebb 10%-a legyen. A víz kezdeti pH-értéke 6...8 között kell legyen, miközben vezetőképessége 20 °C-on legfeljebb 1 mS/m lehet. A vizsgált minta 7 napig tartó bemerülését követően kell megmérni a szabad vízmennyiség teljes aktivitását.

2.2.7.2.3.1.5 A 2.2.7.2.3.1.4 pontban meghatározott teljesítményszintnek való megfelelést a 6.4.12.1 és a 6.4.12.2 bekezdés szerint kell bizonyítani.

2.2.7.2.3.2 Szennyezett felületű tárgyak (*SCO*)

A szennyezett felületű tárgyak (*SCO*) a következő két csoport egyikébe tartoznak:

a) *SCO-I*: olyan szilárd tárgy, amelyen

- i) a nem tapadó radioaktív szennyezettség aktivitása a hozzáférhető felületek 300 cm^2 -nyi részén (vagy a teljes felületen, ha az kisebb 300 cm^2 -nél) meghatározva, nem haladja meg a 4 Bq/cm^2 értéket béta- és gamma-sugárzók, valamint csekély toxicitású alfa-sugárzók esetén, ill. a $0,4\text{ Bq/cm}^2$ értéket egyéb alfa-sugárzók esetén; és
- ii) a tapadó radioaktív szennyezettség aktivitása a hozzáférhető felületek 300 cm^2 -nyi részén (vagy a teljes felületen, ha az kisebb 300 cm^2 -nél) meghatározva, nem haladja meg a $4 \cdot 10^4\text{ Bq/cm}^2$ értéket béta- és gamma-sugárzók, valamint csekély

toxicitását alfa-sugárzók esetén, ill. a $4 \cdot 10^3$ Bq/cm² értéket egyéb alfa-sugárzók esetén; és

- iii) a nem tapadó és a tapadó radioaktív szennyezettség aktivitásának összege a nem hozzáférhető felületek 300 cm²-nyi részén (vagy a teljes felületen, ha az kisebb 300 cm²-nél) meghatározva, nem haladja meg a $4 \cdot 10^4$ Bq/cm² értéket béta- és gamma-sugárzók, valamint csekély toxicitását alfa-sugárzók esetén, ill. a $4 \cdot 10^3$ Bq/cm² értéket egyéb alfa-sugárzók esetén.
- b) *SCO-II*: olyan szilárd tárgy, amelynek felületén olyan tapadó vagy nem tapadó radioaktív szennyezettség található, amely az a) pontban az *SCO-I*-re vonatkozó határokat meghaladja, és amelyen
- i) a nem tapadó radioaktív szennyezettség aktivitása a hozzáférhető felületek 300 cm²-nyi részén (vagy a teljes felületen, ha az kisebb 300 cm²-nél) meghatározva, nem haladja meg a 400 Bq/cm² értéket béta- és gamma-sugárzók, valamint csekély toxicitását alfa-sugárzók esetén, ill. a 40 Bq/cm² értéket egyéb alfa-sugárzók esetén; és
 - ii) a tapadó radioaktív szennyezettség aktivitása a hozzáférhető felületek 300 cm²-nyi részén (vagy a teljes felületen, ha az kisebb 300 cm²-nél) meghatározva, nem haladja meg a $8 \cdot 10^5$ Bq/cm² értéket béta- és gamma-sugárzók, valamint csekély toxicitását alfa-sugárzók esetén, vagy a $8 \cdot 10^4$ Bq/cm² értéket egyéb alfa-sugárzók esetén; és
 - iii) a nem tapadó és a tapadó radioaktív szennyezettség aktivitásának összege a nem hozzáférhető felületek 300 cm²-nyi részén (vagy a teljes felületen, ha az kisebb 300 cm²-nél) meghatározva, nem haladja meg a $8 \cdot 10^5$ Bq/cm² értéket béta- és gamma-sugárzók, valamint csekély toxicitását alfa-sugárzók esetén, vagy a $8 \cdot 10^4$ Bq/cm² értéket egyéb alfa-sugárzók esetén.

2.2.7.2.3.3 A különleges formájú radioaktív anyag

2.2.7.2.3.3.1 A különleges formájú radioaktív anyag legalább egyik méretének el kell érnie az 5 mm-t. Ha egy tömören lezárt kapszula a különleges formájú radioaktív anyag részét képezi, azt úgy kell kialakítani, hogy csak a kapszula széttronsolásával lehessen kinyitni. A különleges formájú radioaktív anyag mintához egyoldalú engedély szükséges.

2.2.7.2.3.3.2 A különleges formájú anyagnak olyan természetűnek vagy olyan szerkezetűnek kell lenni, hogy ha alávetnék a 2.2.7.2.3.3.4 – 2.2.7.2.3.3.8 pontban meghatározott vizsgálatoknak, kielégítené a következő előírásokat:

- a) nem szakad fel vagy nem törik össze a 2.2.7.2.3.3.5 a), b), c), és a 2.2.7.2.3.3.6 a) pontban ismertetett ejtési, ütési és hajlítási vizsgálat hatására (amelyik alkalmazható);
- b) nem olvad meg és nem diszpergálódik a 2.2.7.2.3.3.5 d) vagy a 2.2.7.2.3.3.6 b) pont szerinti hőpróba hatására (ha az alkalmazható); és
- c) a vízben mérhető aktivitás a 2.2.7.2.3.3.7 és a 2.2.7.2.3.3.8 pont szerinti kioldhatóság-vizsgálat során nem haladja meg a 2 kBq értéket; vagy helyette a zárt sugárforrásoknál az ISO 9978:1992 „Sugárzás elleni védelem – Zárt radioaktív sugárforrások – Zártságvizsgálati eljárások” szabvány alapján, a zártság mértékének megállapítására végzendő térfogati szivárgást meghatározó vizsgálat hatására nem lépi túl az elfogadott küszöböt, amely az illetékes hatóság számára elfogadható.

2.2.7.2.3.3.3 A 2.2.7.2.3.3.2 pontban meghatározott teljesítményszintnek való megfelelést a 6.4.12.1 és a 6.4.12.2 bekezdés szerint kell bizonyítani.

2.2.7.2.3.3.4 A különleges formájú radioaktív anyagból álló vagy azt modellező mintadarabokat a 2.2.7.2.3.3.5 pontban meghatározott ejtési, ütési, hajlítási és hőpróbának vagy a 2.2.7.2.3.3.6 pontban engedélyezett alternatív próbáknak kell kitenni. Minden vizsgálatához használható

másik mintadarab. Mindegyik vizsgálat után egy kioldhatóság- vagy térfogatvesztés-vizsgálatot kell végezni a mintán olyan eljárással, amely legalább olyan pontos, mint a nem diszpergálódó szilárd anyagra a 2.2.7.2.3.3.7 pontban megadott, ill. kapszulázott (tokozott) anyagra a 2.2.7.2.3.3.8 pontban megadott próbák.

2.2.7.2.3.3.5 A megfelelő vizsgálati eljárások a következők:

- a) *Ejtési próba:* A mintát 9 m magasból ütközőlapra kell ejteni. Az ütközőlapnak a 6.4.14 szakaszban meghatározott kivitelűnek kell lennie.
- b) *Ütési próba:* A mintadarabot egy ólomlapra kell helyezni, amelyik sima, szilárd felületen nyugszik, és egy acélrúd lapos végével akkora ütest kell rámérni, amely 1,4 kg tömeg 1 m magasból való függőleges ráejtésének felel meg. A rúd végének 25 mm átmérőjűnek kell lennie, a szélét $3 \pm 0,3$ mm-es sugárral le kell kerekíteni. Az ólom 3,5...4,5 Vickers-keménységű és max. 25 mm vastagságú legyen; a felülete pedig nagyobb legyen, mint a próbatest által befedett felület. Minden ütéshez új ólomfelületet kell használni. A bélyeg (acélrúd) úgy üsse meg a mintát, hogy azon a legnagyobb sérülést okozza.
- c) *Hajlítási próba:* A próbát csak hosszú, vékony forrásokra kell alkalmazni, amelyeknek legkisebb hosszúsága 10 cm, és a hosszúságnak a legkisebb szélességhez viszonyított aránya legalább 10. A mintadarabot mereven, vízszintesen úgy kell befogni, hogy hosszúságának a fele nyúljon ki a befogásból. A mintadarabot úgy kell elhelyezni, hogy a mintadarab a legnagyobb sérülést szenvedje el, ha a szabad végét egy acélrúd lapos végével megütik. A rúdnak olyan erővel kell megütni a mintadarabot, hogy az egyenértékű legyen 1,4 kg tömeg 1 m-ről való függőleges ráejtésével. A rúd végének 25 mm átmérőjűnek kell lennie, a szélét $3 \pm 0,3$ mm-es sugárral le kell kerekíteni.
- d) *Hőpróba:* A mintadarabot levegőn 800 °C-ra kell felhevíteni, és tíz percen át ezen a hőmérsékleten tartani, majd hagyni kell kihűlni.

2.2.7.2.3.3.6 A zárt kapszulába tokozott radioaktív anyagból álló vagy azt modellező mintadarabokat a következők alól lehet mentesíteni:

- a) a 2.2.7.2.3.3.5 a) és b) pontban leírt próbák alól, feltéve, hogy a különleges formájú radioaktív anyag tömege:
 - i) 200 g-nál kevesebb, és az ISO 2919:1999 „Sugárvédelem. Zárt radioaktív sugárforrások. Általános követelmények és osztályozás” szabványban meghatározott 4. osztályszámozású ütségi próbát elvégezték; vagy
 - ii) 500 g-nál kevesebb, és az ISO 2919:1999 „Sugárvédelem. Zárt radioaktív sugárforrások. Általános követelmények és osztályozás” szabványban meghatározott 5. osztályszámozású ütségi próbát elvégezték; és
- b) a 2.2.7.2.3.3.5 d) pontban leírt próba alól, feltéve, hogy helyette az ISO 2919:1999 „Sugárvédelem. Zárt radioaktív sugárforrások. Általános követelmények és osztályozás” szabványban meghatározott 6. osztályszámozású hőmérsékletpróbát elvégezték.

2.2.7.2.3.3.7 A nem diszpergálódó, szilárd anyagokból álló vagy azt modellező mintadaraboknál kioldhatóság-vizsgálatot kell végezni a következők szerint:

- a) A mintadarabot hét napig környezeti hőmérsékletű vízbe kell meríteni. A vizsgálathoz felhasznált víz mennyiségének elégnek kell lenni ahhoz, hogy a hétnapos vizsgálati idő végén megmaradó, el nem nyelt és hatástalan szabad vízmennyiség a szilárd vizsgálati minta térfogatának legkevesebb 10%-a legyen. A víz kezdeti pH-értéke 6...8 között legyen, miközben vezetőképessége 20 °C-on legfeljebb 1 mS/m lehet.
- b) A vizet a mintadarabbal együtt 50 °C \pm 5 °C hőmérsékletre kell hevíteni, és négy órán

át ezen a hőmérsékleten kell tartani.

- c) Ezután a víz aktivitását meg kell határozni.
- d) Ezt követően a mintadarabot legalább hét napon át legalább 90% relatív nedvességtartalmú és 30 °C-os mozdulatlan levegőn kell tárolni.
- e) Ezután a mintadarabot az a) pontban leírtakhoz hasonlóan vízbe kell meríteni, a vizet a mintadarabbal együtt ismét $50\text{ °C} \pm 5\text{ °C}$ -ra fel kell melegíteni, és ezen a hőmérsékleten tartani négy órán át.
- f) Ezután a víz aktivitását meg kell határozni.

2.2.7.2.3.3.8 A zárt kapszulába tokozott radioaktív anyagból álló vagy azt modellező mintadarabokon a minősítéshez vagy kioldhatóság- vagy térfogatveszteség-vizsgálatot kell végezni a következők szerint:

- a) A kioldhatóság-vizsgálatnak a következő lépéseket kell tartalmazni:
 - i) A mintadarabot környezeti hőmérsékletű vízbe kell meríteni. A víz kezdeti pH-értéke 6-8 között legyen, miközben vezetőképessége 20 °C-on legfeljebb 1 mS/m lehet.
 - ii) A vizet a mintadarabbal együtt $50\text{ °C} \pm 5\text{ °C}$ hőmérsékletre kell hevíteni, és négy órán át ezen a hőmérsékleten tartani.
 - iii) Ezután meg kell határozni a víz aktivitását.
 - iv) Ezt követően a mintadarabot legalább hét napon át legalább 90% relatív páratartalmú és 30 °C-os mozdulatlan levegőn kell tárolni.
 - v) Az i), ii), iii) alatti műveletet meg kell ismételni.
- b) A másik lehetőség szerinti térfogatveszteség megállapításához az ISO 9978:1992 „Sugárzás elleni védelem – Zárt radioaktív sugárforrások – Zártságvizsgálati eljárások” szabványban ismertetett azon próbákat kell alkalmazni, amelyek az illetékes hatóság számára elfogadhatók.

2.2.7.2.3.4 Kis mértékben diszpergálódó radioaktív anyagok

2.2.7.2.3.4.1 A kis mértékben diszpergálódó radioaktív anyag mintájához többoldalú engedély szükséges. A kis mértékben diszpergálódó radioaktív anyagnak olyannak kell lennie, hogy a küldeménydarabban lévő összes radioaktív anyagra, figyelembe véve a 6.4.8.14 bekezdés előírásait, teljesüljenek a következő feltételek:

- a) a sugárzási szint a nem árnyékolt radioaktív anyagtól 3 m távolságban nem haladja meg a 10 mSv/h értéket;
- b) ha alávetnék a 6.4.20.3 és a 6.4.20.4 bekezdésben meghatározott próbáknak, a levegőbe történő gáz és legfeljebb 100 µm ekvivalens aerodinamikai átmérőjű részecské kibocsátás nem haladná meg a 100A₂ értéket. Mindegyik próbához külön mintadarabot lehet használni;
- c) ha alávetnék a 2.2.7.2.3.1.4 pontban meghatározott próbának, a vízben mérhető aktivitás nem haladná meg a 100A₂ értéket. A próba végrehajtásánál az előző b) pontban meghatározott próbák károsító hatását figyelembe kell venni.

2.2.7.2.3.4.2 A kis mértékben diszpergálódó radioaktív anyagokat a következők szerint kell vizsgálni:

A kis mértékben diszpergálódó radioaktív anyagból álló vagy azt modellező mintadarabokat a 6.4.20.3 bekezdésben meghatározott fokozott hőpróbának és a 6.4.20.4 bekezdésben meghatározott ütőpróbának kell alávetni. Mindegyik próbához külön mintadarabot lehet

használni. A mintadarabot minden próba után alá kell vetni a 2.2.7.2.3.1.4. pont szerinti kioldhatóság-vizsgálatnak. Minden próba után meg kell vizsgálni, hogy a 2.2.7.2.3.4.1 pont vonatkozó követelményei teljesülnek-e.

- 2.2.7.2.3.4.3** A 2.2.7.2.3.4.1 és a 2.2.7.2.3.4.2 pontokban előírt követelményeknek való megfelelést a 6.4.12.1 és a 6.4.12.2 bekezdés szerint kell bizonyítani.

2.2.7.2.3.5 Hasadóanyagok

A hasadó radionuklidot tartalmazó küldeménydarabot a 2.2.7.2.1.1 táblázat megfelelő tételéhez kell sorolni, amelynek leírása tartalmazza a „HASADÓ” vagy „hasadó-engedményes” kifejezést. A „hasadó-engedményes”-kénti besorolás csak akkor megengedett, ha az a következő a) – d) alpontok valamelyikének feltételei teljesülnek. Küldeményenként csak egyfajta mentesítés engedélyezhető (lásd a 6.4.7.2 bekezdést is).

- a) A küldeményenkénti tömeghatár, feltéve, hogy küldeménydarab legkisebb külső mérete legalább 10 cm:

$$\frac{\text{a 235 – urán tömege (g)}}{X} + \frac{\text{az egyéb hasadóanyag tömege (g)}}{Y} < 1,$$

ahol X és Y a 2.2.7.2.3.5 táblázatban meghatározott tömeghatár, feltéve, hogy:

- i) vagy az egyes küldeménydarabok legfeljebb 15 g hasadónuklidot tartalmaznak; csomagolatlan anyagnál a mennyiségi korlát a járműben vagy járművön szállított küldeményre vonatkozik;
- ii) vagy a hasadóanyag homogén hidrogéntartalmú oldat vagy keverék, amelyben a hasadónuklid és a hidrogén aránya 5 tömeg%-nál kisebb;
- iii) vagy az anyag bármely 10 liternyi térfogatában nincs 5 g-nál több hasadónuklid.

Berillium nem lehet jelen a 2.2.7.2.3.5 táblázatban a küldeményre megadott tömeghatárok 1%-át meghaladó mennyiségben, kivéve, ha az anyagban a berillium koncentrációja nem haladja meg az 1 g-ot, bármely 1000 g-ra vetítve.

Deutérium nem lehet jelen a 2.2.7.2.3.5 táblázatban a küldeményre megadott tömeghatárok 1%-át meghaladó mennyiségben, kivéve, ha a deutérium hidrogénben, legfeljebb a természetes koncentrációban fordul elő.

- b) Legfeljebb 1 tömeg% 235-urán tartalmú dúsított urán olyan összes plutónium- és 233-urán tartalommal, amely nem haladja meg a 235-urán tömegének 1%-át, amennyiben a hasadónuklidok az anyagban lényegében egyenletesen vannak eloszlva. Ezenkívül ha a 235-urán fém-, oxid- vagy karbid-formában van jelen nem alkot hat rácsszerű elrendeződést.
- c) Uranil-nitrát folyékony oldatait az urán tömegének legfeljebb 2%-át kitevő 235-urán dúsítással, olyan összes plutónium- és 233-urán tartalommal, amely a 235-urán tömegének 0,002%-át nem haladja meg; ezenkívül a nitrogén/urán atomarányának (N/U) legalább 2-nek kell lenni.
- d) Küldeményenként legfeljebb 1 kg plutónium, amely legfeljebb 20 tömeg% hasadónuklidokat tartalmaz. Az e mentesítés alá tartozó küldeményeket kizárólagos használat mellett kell szállítani

2.2.7.2.3.5 táblázat – Küldemény tömeghatárok a hasadóanyagot tartalmazó küldeménydarabokra vonatkozó előírások alóli mentességhez

Hasadóanyag	A vízzel azonos vagy annál kisebb átlagos hidrogén-sűrűségű anyagokkal kevert hasadóanyag tömeg (g)	A víznél nagyobb átlagos hidrogén-sűrűségű anyagokkal kevert hasadóanyag tömeg (g)
235-urán (X)	400	290
Egyéb hasadóanyag (Y)	250	180

2.2.7.2.4 *A küldeménydarabok és a csomagolatlan anyagok besorolása*

Egy küldeménydarab radioaktív anyag tartalma nem haladhatja meg a küldeménydarab típusra a következőkben meghatározott határértékeket.

2.2.7.2.4.1 Engedményes küldeménydarabok besorolása

2.2.7.2.4.1.1 Egy küldeménydarabot akkor lehet engedményes küldeménydarabnak besorolni, ha

- olyan üres csomagolóeszköz, amelyben radioaktív anyag volt;
- korlátozott mennyiségben tartalmaz készüléket vagy gyártmányt, ahogy azt a 2.2.7.2.4.1.2 táblázat meghatározza;
- természetes uránból, szegényített uránból vagy természetes tóriumból készült gyártmányt tartalmaz;
- korlátozott mennyiségű radioaktív anyagot tartalmaz, ahogy azt a 2.2.7.2.4.1.2 táblázat meghatározza.

2.2.7.2.4.1.2 Egy radioaktív anyagot tartalmazó küldeménydarabot akkor lehet engedményes küldeménydarabnak besorolni, ha a sugárzási szint a külső felületének egyetlen pontján sem haladja meg az 5 $\mu\text{Sv/h}$ értéket.

2.2.7.2.4.1.2 táblázat – Aktivitáshatárok engedményes küldeménydarabokra

A tartalom halmazállapota	Készülékek és gyártmányok		Anyagok
	Határérték tárgyanként ^{a)}	Határérték küldeménydarabonként ^{a)}	Határérték küldeménydarabonként ^{a)}
Szilárd anyagok különleges formájúak egyéb formájúak	$10^{-2} A_1$	A_1	$10^{-3} A_1$
	$10^{-2} A_2$	A_2	$10^{-3} A_2$
Folyékony anyagok	$10^{-3} A_2$	$10^{-1} A_2$	$10^{-4} A_2$
Gázok trícium különleges formájúak egyéb formájúak	$2 \times 10^{-2} A_2$	$2 \times 10^{-1} A_2$	$2 \times 10^{-2} A_2$
	$10^{-3} A_1$	$10^{-2} A_1$	$10^{-3} A_1$
	$10^{-3} A_2$	$10^{-2} A_2$	$10^{-3} A_2$

- a) A radionuklidokból álló keverékekre lásd a 2.2.7.2.2.4 – 2.2.7.2.2.6 pontot.

2.2.7.2.4.1.3 Azokat a radioaktív anyagokat, amelyeket bizonyos készülék vagy bizonyos gyártmány tartalmaz vagy amelyek e tárgyak alkotórészét képezik, csak akkor lehet az UN 2911 RADIOAKTÍV ANYAG, ENGEDMÉNYES KÜLDEMÉNYDARABBAN – KÉSZÜLÉKEK vagy GYÁRTMÁNYOK tétel alá sorolni, ha:

- a) a sugárzási szint a csomagolatlan készülék vagy gyártmány bármely pontjától 10 cm távolságban nem haladja meg a 0,1 mSv/h értéket, és
- b) minden készülék vagy gyártmány el van látva a „RADIOACTIVE” felirattal, kivéve:
 - i) a radiolumineszcens világító kijelzőjű órákat és készülékeket;
 - ii) azokat a fogyasztási cikkeket, amelyek vagy a 1.7.1.4 d) pont szerinti hatósági engedéllyel rendelkeznek, vagy amelyek aktivitása egyedileg nem haladja meg a 2.2.7.2.2.1 táblázatban a küldeményre vonatkozó mentességi aktivitás határát (5. oszlop), amennyiben az ilyen cikkeket olyan küldeménydarabban szállítják, amelynek valamely belső felülete el van látva a „RADIOACTIVE” felirattal úgy, hogy a küldeménydarab felnyitásakor a radioaktív anyag jelenlétére utaló figyelmeztetés láthatóvá válik; és
- c) az aktív anyagot a nem aktív komponensek teljesen bezárják (az olyan eszköz, amelynek kizárólagos funkciója a radioaktív anyag megtartása, nem tekinthető készüléknek vagy gyártmánynak); és
- d) a 2.2.7.2.4.1.2 táblázatnak a 2, ill. 3 oszlopában feltüntetett határértékek minden egyes tárgyra és minden egyes küldeménydarabra teljesülnek.

2.2.7.2.4.1.4 Azokat a radioaktív anyagokat, amelyek a 2.2.7.2.4.1.3 pontban meghatározottaktól eltérőek és aktivitásuk nem haladja meg a 2.2.7.2.4.1.2 táblázatnak a 4. oszlopában feltüntetett határértéket, akkor lehet az UN 2910 RADIOAKTÍV ANYAG, ENGEDMÉNYES KÜLDEMÉNYDARABBAN – KORLÁTOZOTT ANYAG-MENNYISÉG tétel alá sorolni, ha:

- a) a küldeménydarab azon feltételek között, amelyek a normális szállítás során valószínűleg fennállnak, a tartalmat megtartja, és
- b) a küldeménydarab valamely belső felülete el van látva a „RADIOACTIVE” felirattal, úgy, hogy a küldeménydarab felnyitásakor a radioaktív anyag jelenlétére utaló figyelmeztetés láthatóvá válik.

2.2.7.2.4.1.5 Valamely üres csomagolóeszközt, amely előzőleg radioaktív anyagot tartalmazott, csak akkor lehet az UN 2908 RADIOAKTÍV ANYAG, ENGEDMÉNYES KÜLDEMÉNYDARABBAN – ÜRES CSOMAGOLÓESZKÖZ tétel alá sorolni, ha:

- a) jól karbantartott és biztonságosan zárva van;
- b) a szerkezetében levő urán vagy tórium külső felülete fémből vagy más szilárd anyagból álló inaktív burkolattal van ellátva;
- c) a belső, nem tapadó szennyezettség szintje a felület bármely 300 cm²-nyi részén képzett átlagra nem haladja meg
 - i) a 400 Bq/cm²-t béta-, gamma -, valamint csekély toxicitású alfa-sugárzók esetén; ill.
 - ii) a 40 Bq/cm²-t minden más alfa-sugárzó esetén, és
- d) az 5.2.2.1.11.1 pont szerint elhelyezett esetleges bárcák nem láthatóak.

2.2.7.2.4.1.6 Az olyan gyártmányt, amelyben az egyetlen radioaktív anyag besugárzatlan természetes urán, besugárzatlan szegényített urán vagy besugárzatlan természetes tórium, csak akkor lehet az UN 2909 RADIOAKTÍV ANYAG, ENGEDMÉNYES KÜLDEMÉNYDARABBAN – TERMÉSZETES URÁNBÓL vagy SZEGÉNYÍTETT URÁNBÓL vagy TERMÉSZETES TÓRIUMBÓL KÉSZÜLT GYÁRTMÁNYOK tétel alá sorolni, ha az urán vagy a tórium külső felülete fémből vagy más szilárd anyagból álló inaktív burkolattal van ellátva.

2.2.7.2.4.2 Kis fajlagos aktivitású (*LSA*) anyagok besorolása

Egy radioaktív anyag csak akkor sorolható be *LSA* anyagként, ha a 2.2.7.1.3 pont szerinti *LSA* anyag meghatározásnak megfelel, és a 2.2.7.2.3.1 pont, a 4.1.9.2 bekezdés és a 7.5.11 szakasz CV33 különleges előírás 2) pont feltételei teljesülnek.

2.2.7.2.4.3 Szennyezett felületű (*SCO*) tárgyak besorolása

Egy radioaktív anyag csak akkor sorolható be *SCO* tárgyként, ha a 2.2.7.1.3 pont szerinti *SCO* tárgy meghatározásnak megfelel, és a 2.2.7.2.3.2 pont, a 4.1.9.2 bekezdés és a 7.5.11 szakasz CV33 különleges előírás 2) pont feltételei teljesülnek.

2.2.7.2.4.4 A típusú küldeménydarabok besorolása

Radioaktív anyagot tartalmazó küldeménydarabok akkor sorolhatók be *A* típusú küldeménydarabként, ha a következő feltételek teljesülnek:

Az *A* típusú küldeménydarabok nem tartalmazhatnak nagyobb aktivitást, mint a következő:

- a) különleges formájú radioaktív anyagból: A_1 ill.
- b) minden más radioaktív anyagból: A_2 .

Azoknál a radionuklid-keverékeknél, amelyeknél minden egyes radionuklid azonossága és aktivitása ismert, a következő feltételeket kell alkalmazni az *A* típusú küldeménydarabok radioaktív tartalmára:

$$\sum_i \frac{B(i)}{A_1(i)} + \sum_j \frac{C(j)}{A_2(j)} \leq 1, \text{ ahol}$$

$B(i)$ – a különleges formájú radioaktív anyagként jelen levő i -edik radionuklid aktivitása;

$A_1(i)$ – az i -edik radionuklid A_1 értéke;

$C(j)$ – a nem különleges formájú radioaktív anyagként jelen levő j -edik radionuklid aktivitása; és

$A_2(j)$ – a j -edik radionuklid A_2 értéke.

2.2.7.2.4.5 Urán-hexafluorid besorolása

Az urán-hexafluoridot csak az UN 2977 RADIOAKTÍV ANYAG, HASADÓ URÁN-HEXAFLUORID vagy az UN 2978 RADIOAKTÍV ANYAG, URÁN-HEXAFLUORID, nem hasadó vagy hasadó-engedményes tétel alá lehet sorolni.

2.2.7.2.4.5.1 Az urán-hexafluoridot tartalmazó küldeménydarabok:

- a) nem tartalmazhatnak a küldeménydarab-mintára engedélyezetttnél nagyobb tömegű urán-hexafluoridot;
- b) nem tartalmazhatnak annál nagyobb tömegű urán-hexafluoridot, mint ami 5%-nál kisebb üres teret eredményezne a küldeménydarabban azon a legnagyobb hőmérsékleten, amely arra az üzemi létesítményre van meghatározva, ahol a küldeménydarabot használni fogják; ill.
- c) csak szilárd urán-hexafluoridot tartalmazhatnak, és a szállításra való átadáskor a küldeménydarab belső nyomása nem lehet nagyobb az atmoszferikus nyomásnál.

2.2.7.2.4.6 $B(U)$, $B(M)$ és C típusú küldeménydarabok besorolása

2.2.7.2.4.6.1 A 2.2.7.2.4 pont (2.2.7.2.4.1 – 2.2.7.2.4.5 alpontok) szerint máshová nem sorolt küldeménydarabokat a származási ország illetékes hatósága által kiadott küldeménydarab-minta engedélynek megfelelően kell besorolni.

- 2.2.7.2.4.6.2** Egy küldeménydarab csak akkor sorolható be $B(U)$ típusú küldeménydarabként, ha nem tartalmaz:
- a) nagyobb aktivitást, mint a küldeménydarab-mintára engedélyezett;
 - b) más radionuklidokat, mint a küldeménydarab-mintára engedélyezett; vagy
 - c) olyan anyagokat, amelyek alakjukban, fizikai vagy kémiai állapotukban a küldeménydarab-minta engedélyezett tartalmától eltérnek,
- amint a küldeménydarab-minta engedélyben meg van határozva.
- 2.2.7.2.4.6.3** Egy küldeménydarab csak akkor sorolható be $B(M)$ típusú küldeménydarabként, ha nem tartalmaz:
- a) nagyobb aktivitást, mint a küldeménydarab-mintára engedélyezett;
 - b) más radionuklidokat, mint a küldeménydarab-mintára engedélyezett; vagy
 - c) olyan anyagokat, amelyek alakjukban, fizikai vagy kémiai állapotukban a küldeménydarab-minta engedélyezett tartalmától eltérnek,
- amint a küldeménydarab-minta engedélyben meg van határozva.
- 2.2.7.2.4.6.4** Egy küldeménydarab csak akkor sorolható be C típusú küldeménydarabként, ha nem tartalmaz
- a) nagyobb aktivitást, mint a küldeménydarab-mintára engedélyezett;
 - b) más radionuklidokat, mint a küldeménydarab-mintára engedélyezett; vagy
 - c) olyan anyagokat, amelyek alakjukban, fizikai vagy kémiai állapotukban a küldeménydarab-minta engedélyezett tartalmától eltérnek,
- amint a küldeménydarab-minta engedélyben meg van határozva.
- 2.2.7.2.5** *Külön megegyezés*
- Egy radioaktív anyag akkor sorolható be külön megegyezés alapján szállított anyagként, ha az 1.7.4 szakasz szerint kívánják szállítani.

2.2.8 8 osztály Maró anyagok

2.2.8.1 *Kritériumok*

2.2.8.1.1 A 8 osztály fogalomkörébe azok az anyagok tartoznak, amelyek vegyi reakciójukkal a velük érintkezésbe kerülő hámszövetet – a bőr hámrétegét vagy a nyálkahártyát – megtámadják, vagy elfolyás esetén képesek megrongálni vagy tönkretenni más árukat vagy a szállítóeszközöket. Ugyancsak ezen osztály fogalomkörébe tartoznak azok az anyagok, amelyek csak víz jelenlétében képeznek maró anyagot, vagy amelyek a levegő természetes nedvességének jelenlétében maró gőzöket vagy ködöket fejlesztenek.

2.2.8.1.2 A 8 osztály anyagai és tárgyai a következők szerint vannak csoportosítva:

C1 – C11 Maró anyagok járulékos veszély nélkül és az ilyen anyagokat tartalmazó tárgyak:

 C1 – C4 Savas anyagok:

 C1 Szervetlen, folyékony anyagok

 C2 Szervetlen, szilárd anyagok

 C3 Szerves, folyékony anyagok

 C4 Szerves, szilárd anyagok

 C5 – C8 Bázikus jellegű anyagok:

 C5 Szervetlen, folyékony anyagok

 C6 Szervetlen, szilárd anyagok

 C7 Szerves, folyékony anyagok

 C8 Szerves, szilárd anyagok

 C9 – C10 Egyéb maró anyagok:

 C9 Folyékony anyagok

 C10 Szilárd anyagok

 C11 Tárgyak

CF Maró, gyúlékony anyagok:

 CF1 Folyékony anyagok

 CF2 Szilárd anyagok

CS Maró, önmelegedő anyagok:

 CS1 Folyékony anyagok

 CS2 Szilárd anyagok

CW Maró, vízzel érintkezve gyúlékony gázokat fejlesztő anyagok:

 CW1 Folyékony anyagok

 CW2 Szilárd anyagok

CO Maró, gyújtó hatású anyagok:

 CO1 Folyékony anyagok

 CO2 Szilárd anyagok

CT Maró, mérgező anyagok és az ilyen anyagokat tartalmazó tárgyak:

CT1 Folyékony anyagok

CT2 Szilárd anyagok

CT3 Tárgyak

CFT Maró, gyúlékony, mérgező, folyékony anyagok

COT Maró, gyújtó hatású, mérgező anyagok.

Besorolás és a csomagolási csoportokhoz való hozzárendelés

2.2.8.1.3 A 8 osztály anyagait a szállítás során általuk képviselt veszély mértéke szerint a következő három csomagolási csoport valamelyikéhez kell hozzárendelni:

I csomagolási csoport: erősen maró anyagok

II csomagolási csoport: maró anyagok

III csomagolási csoport: gyengén maró anyagok.

2.2.8.1.4 A 8 osztályba sorolt anyagokat és tárgyakat a 3.2 fejezet „A” táblázata sorolja fel. Az anyagok hozzárendelése az I, a II és a III csomagolási csoporthoz tapasztalati alapon történt, figyelembe véve olyan kiegészítő tényezőket is, mint a belélegzési veszély (lásd a 2.2.8.1.5 pontot) és a vízzel való reakció (beleértve a veszélyes bomlástermékek képződését).

2.2.8.1.5 Azokat az anyagokat és készítményeket, amelyek kielégítik a 8 osztály feltételeit és az I csomagolási csoportnak megfelelő por és köd belélegzési mérgezőképességgel (LC_{50}) rendelkeznek, de a lenyelés vagy bőrön át való felszívódás esetén a mérgezőképességük a III csomagolási csoportnak megfelelő vagy annál kevésbé mérgezőek, a 8 osztályba kell sorolni.

2.2.8.1.6 A 3.2 fejezet „A” táblázatában név szerint nem említett anyagok, beleértve a keverékeket is, a 2.2.8.3 bekezdés megfelelő tétele alá és a megfelelő csomagolási csoporthoz a következő a) – c) pont kritériumai szerint, azon érintkezési időtartam alapján sorolhatók be, amely alatt az emberi bőr roncsolódása annak teljes vastagságában bekövetkezik.

A folyékony anyagoknál, ill. azoknál a szilárd anyagoknál, amelyek a szállítás alatt folyékonyra válhatnak, ha feltételezhető, hogy nem okoznak az emberi bőrön, annak teljes vastagságában roncsolódást, figyelembe kell venni a fémfelületekre gyakorolt korróziós hatás lehetőségét. A csomagolási csoportba sorolás során figyelembe kell venni az emberen bekövetkezett balesetknél szerzett tapasztalatokat. Az emberen szerzett tapasztalatok hiányában a csomagolási csoportba sorolást kísérletek adatai alapján kell végezni, összhangban az OECD 404⁸⁾ vagy 435⁹⁾ Vizsgálati útmutatóval. Egy anyag, amely az OECD 430¹⁰⁾ vagy 431¹¹⁾ Vizsgálati útmutató szerint meghatározva nem korrozív, további vizsgálat nélkül úgy tekinthető, hogy az ADR értelmében a bőrre nem maró hatású anyag:

a) azok az anyagok, amelyek a sértetlen bőrszövet teljes vastagságban bekövetkező roncsolódását okozzák legfeljebb 3 percig tartó érintkezés után 60 perces megfigyelési időtartamon belül, az I csomagolási csoport anyagai;

b) azok az anyagok, amelyek a sértetlen bőrszövet teljes vastagságban bekövetkező ron-

8) OECD Útmutató vegyi anyagok vizsgálatára, No. 404 „Akut dermális irritáció/korrózió”, 2002.

9) OECD Útmutató vegyi anyagok vizsgálatára, No. 435 „In vitro membrán gát vizsgálat a dermális korrózióra”, 2006.

10) OECD vegyi anyagok vizsgálatára, No. 430 „In vitro dermális korrózió: Transzkután elektromos ellenállás vizsgálat (TER)”, 2004.

11) OECD Útmutató vegyi anyagok vizsgálatára, No. 431 „In vitro bőr maró hatás: Humán bőr modell vizsgálat”, 2004.

csolódását okozzák 3 percnél hosszabb ideig, de legfeljebb 60 percig tartó érintkezés után 14 napos megfigyelési időtartamon belül, a II csomagolási csoport anyagai;

c) a következő anyagok a III csomagolási csoport anyagai:

- azok az anyagok, amelyek a sértetlen bőrszövet teljes vastagságban bekövetkező roncsolódását okozzák 60 percnél hosszabb ideig, de legfeljebb 4 óráig tartó érintkezés után 14 napos megfigyelési időtartamon belül; vagy
- azok az anyagok, amelyek nem okozzák a sértetlen bőrszövet teljes vastagságban bekövetkező roncsolódását, de a korróziósebesség – ha mindkét fémen vizsgálják – akár az acél, akár az alumínium felületen 55 °C vizsgálati hőmérsékleten meghaladja az évi 6,25 mm-t. Az acélon végzett vizsgálathoz S235JR+CR (1.0037, ill. St 37-2), S275J2G3+CR (1.0144, ill. St 44-3), ISO 3574, Unified Numbering System (UNS) G10200 vagy SAE 1020 minőségű acélt, az alumíniumon végzetthez nem eloxált 7075-T6 vagy AZ5GU-T6 minőségű alumíniumot kell használni. Elfogadott vizsgálat található a „Vizsgálatok és kritériumok kézikönyv”, III. rész 37. fejezetében.

Megjegyzés: Ha az első vizsgálat (akár acélon, akár alumíniumon végzik) azt mutatja, hogy a vizsgált anyag korróziós hatású, a második vizsgálatot a másik fémen nem szükséges végrehajtani.

2.2.8.1.6 táblázat: a 2.2.8.1.6 pont kritériumainak összefoglaló táblázata

Csomagolási csoport	Érintkezési idő	Megfigyelési időtartam	Hatás
I	≤ 3 perc	≤ 60 perc	a sértetlen bőrszövet teljes vastagságban roncsolódik
II	> 3 perc ≤ 1 óra	≤ 14 nap	a sértetlen bőrszövet teljes vastagságban roncsolódik
III	> 1 óra ≤ 4 óra	≤ 14 nap	a sértetlen bőrszövet teljes vastagságban roncsolódik
III	–	–	a korróziósebesség – ha mindkét fémen vizsgálják – akár az acél, akár az alumínium felületen 55 °C vizsgálati hőmérsékleten meghaladja az évi 6,25 mm-t

2.2.8.1.7

Ha a 8 osztály anyagai valamilyen anyag hozzáadása révén eltérő veszélyességi kategóriába kerülnek át, mint ahová a 3.2 fejezet „A” táblázatában név szerint említett anyagok tartoznak, ezeket a keverékeket azok alá a tételek alá kell besorolni, amelyekbe tényleges veszélyességük mértéke alapján tartoznak.

Megjegyzés: Az oldatok és keverékek (készítmények és hulladékok) besorolására lásd még a 2.1.3 szakaszt.

2.2.8.1.8

A 2.2.8.1.6 pontban található kritériumok alapján az is meghatározható, hogy egy név szerint feltüntetett vagy egy név szerint feltüntetett anyagot tartalmazó oldat vagy keverék természete olyan, az anyag nem esik ezen osztály előírásainak hatálya alá.

2.2.8.1.9

Azok az anyagok, oldatok és keverékek, amelyek

- a módosított 67/548/EGK¹²⁾ vagy az 1999/45/EK¹³⁾ Irányelv kritériumai alapján, ezen

12) Az Európai Közös Tanácsának 1967. június 27-i 67/548/EGK Irányelve a tagállamok veszélyes anyagok osztályozására, csomagolására és címkézésére vonatkozó jogszabályainak és közigazgatási előírásainak közelítéséről (Az EK Hivatalos Lapja, L 196. szám, 1967.08.16.).

irányelvek szerint nem számítanak marónak, és

- nem mutatnak maró hatást az acélon és az alumíniumon
- a 8 osztályba nem tartozó anyagoknak tekinthetők.

Megjegyzés: Az ENSZ Minta Szabályzatban felsorolt UN 1910 kalcium-oxid és UN 2812 nátrium-aluminát nem tartozik az ADR előírásainak hatálya alá.

2.2.8.2 A szállításból kizárt anyagok

2.2.8.2.1 A 8 osztály vegyileg nem állandó anyagai csak akkor adhatók át szállításra, ha megtették a szükséges intézkedéseket, hogy megakadályozzák a szállítás alatti veszélyes bomlásukat vagy polimerizációjukat. Ennek elérésére különösen azt kell biztosítani, hogy a tartályok, ill. tartányok ne tartalmazzanak olyan anyago(ka)t, amelyek ilyen reakciókat okozhatnak.

2.2.8.2.2 A következő anyagok a szállításból ki vannak zárva:

- UN 1798 királyvíz (salétromsav és sósav keveréke);
- a vegyileg nem állandó, kimerült kénsavkeverékek;
- a nem denitrált, vegyileg nem állandó nitrálósav keverékek és az elhasznált kénsav és salétromsav keverékek;
- perklórsav vizes oldata 72 tömeg%-nál több tiszta savtartalommal és a perklórsav keverékei vízen kívül más folyadékkal.

13) Az Európai Parlament és a Tanács 1999. május 31-i 1999/45/EK Irányelve a tagállamok veszélyes készítmények osztályozására, csomagolására és címkézésére vonatkozó jogszabályainak és közigazgatási előírásainak közeliítéséről (lásd az EK Hivatalos Lapja, L 200. szám, 1999.07.30., p. 1-68.).

2.2.8.3 A gyűjtőmegnevezések felsorolása

Járolékos veszély	Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése

Megjegyzés:

- Az ADR előírásainak hatálya alá nem tartozó szilárd anyagok és maró folyadékok keverékei az UN 3244 azonosító szám alatt szállíthatók anélkül, hogy a 8 osztály besorolási feltételeit alkalmazni kellene, amennyiben az anyag berakása során, ill. a csomagolóeszköz, a konténer vagy a jármű lezárásakor szabad folyadék szemmel nem látható. Minden egyes csomagolóeszköznek olyan gyártási típusnak kell megfelelni, ami sikeresen kiállta a II csomagolási csoportra előírt tömörségi próbát.
- Azok a klór-szilánok, amelyek vízzel vagy nedves levegővel érintkezve gyúlékony gázokat fejlesztenek, a 4.3 osztály anyagai.
- A túlnyomórészt mérgező tulajdonságokkal bíró klór-formiátok a 6.1 osztály anyagai.
- Azok a maró anyagok, amelyek a 2.2.61.1.4 – 2.2.61.1.9 pont szerint belégzésre nagyon mérgezők, a 6.1 osztály anyagai.
- az UN 2505 ammónium-fluorid, az UN 1812 szilárd kálium-fluorid, az UN 1690 szilárd nátrium-fluorid, az UN 2674 nátrium-fluoro-szilikát, az UN 2856 fluoro-szilikátok, m.n.n., az UN 3415 nátrium-fluorid oldat és az UN 3422 kálium-fluorid oldat a 6.1 osztály anyagai.

2.2.9 9 osztály Különféle veszélyes anyagok és tárgyak

2.2.9.1 *Kritériumok*

2.2.9.1.1 A 9 osztály címének fogalmkörébe azok az anyagok és tárgyak tartoznak, amelyek a szállítás során olyan veszélyt képviselnek, ami nem esik a többi osztály fogalmkörébe.

2.2.9.1.2 A 9 osztály anyagai és tárgyai a következők szerint vannak csoportosítva:

M1 Anyagok, amelyek finom poruk belélegzése esetén az egészséget veszélyeztethetik

M2 Anyagok és készülékek, amelyekből tűz esetén dioxinok képződhetnek

M3 Gyúlékony gőzöket fejlesztő anyagok

M4 Lítium akkumulátorok

M5 Biztonsági felszerelések

M6 – M8 Környezetre veszélyes anyagok:

M6 Vízi környezetre veszélyes, folyékony anyagok

M7 Vízi környezetre veszélyes, szilárd anyagok

M8 Géntechnológiával módosított mikroorganizmusok és élő szervezetek

M9 – M10 Magas hőmérsékletű anyagok:

M9 Folyékony anyagok

M10 Szilárd anyagok

M11 Egyéb anyagok, amelyek a szállítás alatt veszélyt jelentenek, de egyetlen más osztály meghatározásának sem felelnek meg.

Fogalommeghatározások és besorolás

2.2.9.1.3 A 9 osztályba sorolt anyagokat a 3.2 fejezet „A” táblázata sorolja fel. A 3.2 fejezet „A” táblázatában név szerint nem említett anyagok és tárgyak besorolását ezen táblázat, ill. a 2.2.9.3 bekezdés megfelelő tétele alá 2.2.9.1.4 – 2.2.9.1.14 pont szerint kell végezni.

Anyagok, amelyek finom poruk belélegzése esetén az egészséget veszélyeztethetik

2.2.9.1.4 Azon anyagok közé, amelyek finom poruk belélegzése esetén az egészséget veszélyeztethetik, az azbeszt és az azbesztet tartalmazó keverékek tartoznak.

Anyagok és készülékek, amelyekből tűz esetén dioxinok képződhetnek

2.2.9.1.5 Azon anyagok és készülékek közé, amelyekből tűz esetén dioxinok képződhetnek, a poliklórozott és polihalogénezett bifenilek és terfenilek (PCB-k és PCT-k), valamint az ezeket az anyagokat tartalmazó keverékek, továbbá az ilyen anyagokat vagy keverékeket tartalmazó készülékek, mint pl. transzformátorok, kondenzátorok tartoznak.

Megjegyzés: Az olyan keverékek, amelyek PCB- vagy PCT-tartalma nem haladja meg az 50 mg/kg értéket, nem tartoznak az ADR előírásainak hatálya alá.

Gyúlékony gőzöket fejlesztő anyagok

2.2.9.1.6 A gyúlékony gőzöket fejlesztő anyagok közé tartoznak azok a polimerek, amelyek legfeljebb 55 °C lobbaspontú gyúlékony folyadékot tartalmaznak.

2.2.9.1.7

A bármilyen formában lítiumot tartalmazó cellákat és akkumulátorokat, készülékben lévő cellákat és akkumulátorokat, ill. készülékkel egybecsomagolt cellákat és akkumulátorokat az UN 3090, 3091, 3480, ill. 3481 tétel alá kell sorolni, és akkor szállíthatók ezen tételek alatt ha megfelelnek a következő előírásoknak:

- a) minden cella, ill. akkumulátor olyan típusú, ami bizonyítottan megfelel a „Vizsgálatok és kritériumok kézikönyv” III. rész 38.3 bekezdés minden vizsgálati követelményének;

Megjegyzés: az akkumulátoroknak akkor is olyan típusúnak kell lenniük, ami bizonyítottan megfelel a „Vizsgálatok és kritériumok kézikönyv” III. rész 38.3 bekezdés minden vizsgálati követelményének, ha az akkumulátort alkotó cellák is ilyen típusúak.

- b) minden cellában, ill. akkumulátorban szellőztető szerkezet van beépítve, vagy úgy van kialakítva, hogy a normális szállítási körülmények között kizárja a hirtelen bekövetkező repedést;
- c) minden cella, ill. akkumulátor el van látva külső rövidzárlat ellen védő, hatékony eszközzel (pl. diódával, biztosítókkal, stb.);
- d) a cellákat vagy párhuzamosan kapcsolt cellasorokat tartalmazó minden akkumulátor el van látva olyan hatékony eszközzel, amely a veszélyes visszáram megakadályozásához szükséges;
- e) a cellákat és akkumulátorokat olyan minőségbiztosítási program szerint kell gyártani, amelynek a következőket kell tartalmaznia:
- i) a szervezeti felépítés leírását és a személyzet tervezéssel és termékminőséggel kapcsolatos felelősségének megoszlását;
 - ii) a vizsgálatokra, a minőségellenőrzésre, a minőségbiztosításra, a munkafolyamatokra vonatkozóan használandó utasításokat;
 - iii) a cellák gyártása során a belső rövidzárlat megelőzésére és észlelésére is kiterjedő folyamatirányítást;
 - iv) a minőségügyi nyilvántartást, mint pl. vizsgálati jegyzőkönyvek, vizsgálati eredmények és hitelesítési adatok, ill. tanúsítványok; ezeket az adatokat meg kell őrizni, és az illetékes hatóság kérésére be kell mutatni;
 - v) a vezetői felülvizsgálatokat a minőségbiztosítási rendszer hatékony működésének biztosításához;
 - vi) a dokumentáció ellenőrzési és karbantartási eljárását;
 - vii) az előző a) pontban említettek szerint vizsgált típusnak nem megfelelő cellák, ill. akkumulátorok ellenőrzésének módját;
 - viii) az érintett személyekre vonatkozó képzési programot és minősítési eljárást; és
 - ix) a végtermék sérülésmentességét biztosító eljárást.

Megjegyzés: Üzemi minőségbiztosítási programok is elfogadhatók. Harmadik felek tanúsítása nem szükséges, de az előző i) – ix) pontok szerinti eljárásoknak megfelelően dokumentáltnak és nyomon követhetőnek kell lenniük.

A 3.3 fejezet 188 különleges előírása követelményeinek megfelelő lítium akkumulátorok nem tartoznak az ADR előírásainak hatálya alá.

Megjegyzés: Az UN 3171 akkumulátorral hajtott jármű, ill. az UN 3171 akkumulátorral hajtott készülék tétel csak a nedves akkumulátorral, nátrium akkumulátorral,

fémlítium vagy lítiumion akkumulátorral hajtott járművekre, valamint a nedves akkumulátorral vagy nátrium akkumulátorral hajtott készülékekre vonatkozik, amelyeket úgy szállítanak, hogy az akkumulátorok be vannak szerelve.

E tétel alkalmazásában járműnek számít az egy vagy több személy, ill. áru szállítására szolgáló, önjáró szerkezet. Ilyen lehet pl. az elektromos autó, motorkerékpár, robogó, három- vagy négykerekű jármű, ill. motorkerékpár, e-kerékpár, kerekes szék, kerti traktor, csónak vagy légijármű.

Készüléknek számít pl. a fűnyírógép, tisztítógép, hajó vagy repülőgép modell. A fémlítium vagy lítiumion akkumulátorral hajtott készülékek az UN 3091 FÉM-LÍTIUM AKKUMULÁTOROK KÉSZÜLÉKBEN vagy UN 3091 FÉMLÍTIUM AKKUMULÁTOROK KÉSZÜLÉKKEL EGYBE-CSOMAGOLVA, ill. az UN 3481 LÍTIUMION AKKUMULÁTOROK KÉSZÜLÉKBEN vagy UN 3481 LÍTIUMION AKKUMULÁTOROK KÉSZÜLÉKKEL EGYBECSOMAGOLVA tételként szállíthatók.

A belsőégésű motorral és nedves akkumulátorral, nátrium akkumulátorral, fémlítium vagy lítiumion akkumulátorral hajtott elektromos hibrid járműveket amelyeket úgy szállítanak, hogy az akkumulátor(ok) be van(nak) szerelve, az UN 3166 gyúlékony gáz üzemű jármű, ill. az UN 3166 gyúlékony folyadék üzemű jármű tételhez kell sorolni. Az olyan járműveket, amelyekben üzemanyagcella van, az UN 3166 gyúlékony gáz üzemű üzemanyag-cellás jármű, ill. az UN 3166 gyúlékony folyadék üzemű üzemanyagcellás jármű tétel alá kell sorolni.

Biztonsági felszerelések

- 2.2.9.1.8** A biztonsági felszerelések közé tartoznak azok a mentőeszközök és gépjármű tartozékok, amelyek megfelelnek a 3.3 fejezet 235, ill. 296 különleges előírásában szereplő leírásnak.

Környezetre veszélyes anyagok

- 2.2.9.1.9** (törölve)

Vízi környezetet szennyező anyagok

- 2.2.9.1.10** Környezetre (vízi környezetre) veszélyes anyagok

- 2.2.9.1.10.1** Általános fogalommeghatározás

- 2.2.9.1.10.1.1** Környezetre veszélyes anyagok – többek között – a vízi környezetet szennyező folyékony vagy szilárd anyagok, valamint az ilyen anyagok oldatai és keverékei (készítmények és hulladékok).

A 2.2.9.1.10 pont alkalmazásában az „anyag” olyan természetes állapotban előforduló vagy gyártási folyamatból származó kémiai elem és vegyületei, amely a termék stabilitásának megőrzéséhez szükséges adalékanyagot és az alkalmazott eljárásból származó szennyezőt is tartalmazhat, de nem tartalmaz olyan oldószert, amely az anyag stabilitásának befolyásolása vagy összetételének megváltoztatása nélkül elkülöníthető.

- 2.2.9.1.10.1.2** A vízi környezet a vízben élő vízi szervezetek, ill. a vízi életközösség szempontjából értelmezendő, amelynek a vízi szervezetek a részét képezik.¹⁴⁾ Ezért a veszély azonosításának alapja az anyag, ill. keverék vízi toxicitása, ezt azonban módosíthatják a lebomlásra és a bioakkumulációra vonatkozó további adatok.

14) Ez nem vonatkozik az olyan vízszennyező anyagokra, amelyeknél a vízi környezeten túlmenő hatásokat, pl. az emberi egészségre gyakorolt hatást is szükséges lehet figyelembe venni.

2.2.9.1.10.1.3 A következő besorolási eljárás célja, hogy mindenfajta anyagra, ill. keverékre alkalmazni lehessen, tudatában kell lenni azonban, hogy bizonyos esetekben, pl. fémeknél vagy nehezen oldható szervesetlen vegyületeknél különleges útmutatás¹⁵⁾ szükséges.

2.2.9.1.10.1.4 Az ebben a szakaszban használt kifejezések és betűszavak jelentése a következő:

- *BCF*: biokoncentrációs tényező
- *BOI*: biokémiai oxigénigény
- *KOI*: kémiai oxigénigény
- *GLP*: helyes laboratóriumi gyakorlat
- *EC_x*: a válaszban x%-os változást okozó koncentráció;
- *EC₅₀*: az anyag tényleges koncentrációja, amely a legnagyobb válaszreakció 50%-át eredményezi;
- *ErC₅₀*: a szaporodási sebesség szempontjából meghatározott *EC₅₀* érték
- *K_{ow}*: oktanol/víz megoszlási együttható;
- *LC₅₀* (50%-os halálos koncentráció): az anyag azon koncentrációja a vízben, amely a kísérleti állatcsoport 50%-ának (felének) elhullását okozza;
- *L(E)C₅₀*: *LC₅₀* vagy *EC₅₀*;
- *NOEC* (No Observed Effect Concentration, nem észlelhető hatás koncentráció): észlelhető hatást még nem okozó koncentráció: az a vizsgálati koncentráció, amely közvetlenül a statisztikailag szignifikáns káros hatást okozó, legkisebb vizsgált koncentráció alatt van. A *NOEC*-nek a kontrolhoz viszonyítva nincs statisztikailag szignifikáns káros hatása;
- OECD Test Guidelines: a Gazdasági Együttműködési és Fejlesztési Szervezet (OECD) által kiadott vizsgálati irányelvek.

2.2.9.1.10.2 Fogalommeghatározás és az adatokra vonatkozó követelmények

2.2.9.1.10.2.1 A környezetre (vízi környezetre) veszélyes anyagok besorolásának alapvető elemei.

- a) akut vízi toxicitás;
- b) krónikus vízi toxicitás;
- c) a bioakkumulációs hajlam vagy a tényleges bioakkumuláció; és
- d) szerves vegyianyagok (biotikus vagy abiotikus) lebomlása.

2.2.9.1.10.2.2 A harmonizált nemzetközi vizsgálati módszerek alapján nyert adatok előnyösebbek, a gyakorlatban azonban a belföldi vizsgálati módszerek alapján nyert adatok is alkalmazhatók, ha egyenértékűnek tekinthetők. Általánosan elfogadott, hogy az édesvízi és a tengeri fajokra vonatkozó toxicitás azonosnak tekinthető és lehetőleg az OECD vizsgálati irányelvek vagy azzal egyenértékű módszerek alapján kell levezetni, a helyes laboratóriumi gyakorlat (*GLP*) alapelvei szerint. Ha így nyert adatok nincsenek, a besorolást a rendelkezésre álló legjobb adatok alapján kell elvégezni.

2.2.9.1.10.2.3 Az *akut vízi toxicitás* egy anyag azon belső tulajdonsága, hogy rövid távú vízi expozíció esetén károsan befolyásol egy adott élő szervezetet.

15) Megtalálható a GHS 10 Mellékletében.

Az akut (rövid távú) veszélyesség – besorolási szempontból – egy vegyianyag élő szervezetre vonatkozó akut toxicitása által okozott veszélyesség rövid időtartamú vízi expozíció során.

Az akut vízi toxicitást általában a halra vonatkozó 96 órás LC_{50} (OECD 203 vizsgálati irányelv vagy azzal egyenértékű módszer), a rákfajokra vonatkozó 48 órás LC_{50} (OECD 202 vizsgálati irányelv vagy azzal egyenértékű módszer) és/vagy az alga fajokra vonatkozó 72 vagy 96 órás EC_{50} (OECD 201 vizsgálati irányelv vagy azzal egyenértékű módszer) értékek felhasználásával kell meghatározni. Ezekkel a fajokkal bármely vízi szervezetek helyettesíthetők, ill. más fajokkal, pl. békalencsével (Lemna-val) nyert adatok is használhatók, ha a vizsgálati módszer megfelelő.

- 2.2.9.1.10.2.4** A krónikus vízi toxicitás egy anyag azon belső tulajdonsága, hogy káros hatást gyakorol a vízi szervezetekre a szervezet életciklusához viszonyítva meghatározott expozíciók során.

A hosszú távú veszélyesség – besorolási szempontból – egy vegyianyag krónikus toxicitása által okozott veszélyesség hosszú időtartamú vízi expozíciót követően.

A krónikus toxicitásra kevesebb adat áll rendelkezésre, mint az akut toxicitásra, és a vizsgálati eljárások is kevésbé egységesek. Az OECD 210 (hal korai életszakasz), 211 (vízibolha szaporodás) vizsgálati irányelv, valamint az OECD 201 (alga növekedés gátlása) vizsgálati irányelv alapján kapott adatok elfogadhatók. Egyéb, nemzetközileg elismert hiteles vizsgálatok is alkalmazhatók. A $NOEC$ értékeket vagy más, egyenértékű EC_x értéket kell használni.

- 2.2.9.1.10.2.5** A bioakkumuláció (biológiai felhalmozódás) az élő szervezetbe bármilyen expozíciós úton (azaz levegőből, vízből, üledékből, talajból, táplálékkal) bekerült anyagnak az átalakítás és kiválasztás után a szervezetben maradt nettó mennyiségét jelenti.

A bioakkumulációs hajlamot általában az oktanol/víz megoszlási együtthatóval kell meghatározni, amit az OECD 107 vagy 117 vizsgálati irányelv szerint meghatározott $\log K_{ow}$ -ban szoktak megadni. Ezzel ugyan jól jellemezhető a bioakkumulációs hajlam, de a kísérletileg meghatározott biokoncentrációs tényező (BCF) jobb eredményt ad, ezért ha lehetséges, ezt kell használni. A BCF -t az OECD 305 vizsgálati irányelv szerint kell meghatározni.

- 2.2.9.1.10.2.6** A lebomlás a szerves molekulák kisebb molekulákra, majd végül szén-dioxidra, vízre és sókra történő bomlása.

A környezetben való lebomlás lehet biotikus vagy abiotikus (pl. hidrolízis), ez a tény a kritériumokban figyelembe van véve. A könnyű biológiai lebonthatóság legegyszerűbben az OECD 301 vizsgálati irányelv (A–F) biológiai lebonthatósági vizsgálatával határozható meg. Ha egy anyag ezekben a vizsgálatokban közepes eredményt mutat, abból arra lehet következtetni, hogy a legtöbb környezetben gyorsan lebomlik. Tekintettel arra, hogy ezek a vizsgálatok édesvízre vonatkoznak, a tengeri környezetre alkalmasabb, OECD 306 vizsgálati irányelv alapján nyert eredményeket is figyelembe vették. Ha ilyen adat nem áll rendelkezésre, a gyors lebomlásra akkor lehet következtetni, ha az ötnapos BOI és a KOI hányadosa ($BOI_5/KOI \geq 0,5$).

A gyors lebonthatóság meghatározásánál az abiotikus lebomlás (pl. hidrolízis), az elsődleges biotikus és az elsődleges abiotikus lebomlás, nemvízes közegben való lebomlás és a környezetben való bizonyítottan gyors lebomlás, mind figyelembe vehető¹⁶⁾.

Egy anyag akkor tekintendő a környezetben gyorsan lebomlónak, ha a következő kritériumoknak megfelel:

- a) a 28 napos könnyű biológiai lebonthatósági vizsgálat során a következő lebomlási szinteket éri el:

16) Az adatok értelmezésére különleges útmutatás található a GHS 4.1 fejezetében és 9 Mellékletében.

- i) az oldott szerves széntartalom alapján vizsgálatnál: 70%-ot;
- ii) az oxigén fogyáson vagy a szén-dioxid képződésen alapuló vizsgálatnál: az elméleti maximumok 60%-át.

Ezeket az értékeket 10 napon belül kell elérni attól a naptól kezdve, amikor a biológiai lebomlás első alkalommal 10% felett volt, kivéve, ha az anyagot mint összetett, többkomponensű, szerkezetileg hasonló összetevőkkel rendelkező anyagot azonosították. Ebben az esetben ha kielégítő bizonyíték áll rendelkezésre, a 10 napon belüli bekövetkezési feltételtől el lehet tekinteni, és a 28 napos megfelelőségi szintet kell alkalmazni¹⁷⁾.

- b) ha csak a *BOI* és a *KOI* értékek állnak rendelkezésre: a $BOI_5/KOI \geq 0,5$; vagy
- c) egyéb, meggyőző tudományos bizonyíték van arra, hogy az anyag, ill. keverék a vízi környezetben, 28 napon belül 70% fölötti mértékben lebomlik (biotikus és/vagy abiotikus úton).

2.2.9.1.10.3 Az anyagok besorolási kategóriái és kritériumai

Egy anyagot akkor kell a „környezetre (vízi környezetre) veszélyes anyag”-nak besorolni, ha a 2.2.9.1.10.3.1 táblázatban az akut-1 kategóriára, a krónikus-1 kategóriára vagy a krónikus-2 kategóriára feltüntetett kritériumoknak megfelel. Ezek a kritériumok részletesen leírják a besorolási kategóriákat. A 2.2.9.1.10.3.2 táblázat pedig diagram formájában foglalja össze a kategóriákat.

2.2.9.1.10.3.1 táblázat: A vízi környezetre veszélyes anyagok kategóriái

(lásd az 1. megj.)

a) Akut (rövid távú) veszélyesség a vízi környezetre

Akut-1 kategória (lásd a 2. megj.)

96 órás LC_{50} (halra)	≤ 1 mg/l és/vagy
48 órás EC_{50} (rákokra)	≤ 1 mg/l és/vagy
72 vagy 96 órás ErC_{50} (algákra vagy egyéb vízinnövényekre)	≤ 1 mg/l (lásd a 3. megj.)

b) Hosszú távú veszélyesség a vízi környezetre (lásd a 2.2.9.1.10.3.1 ábrát is)

- i) Nem gyorsan lebomló anyagok (lásd a 4. megj.), amelyekre van megfelelő krónikus toxicitási adat

Krónikus-1 kategória (lásd a 2. megj.)

Krónikus $NOEC$ vagy EC_x (halra)	$\leq 0,1$ mg/l és/vagy
Krónikus $NOEC$ vagy EC_x (rákokra)	$\leq 0,1$ mg/l és/vagy
Krónikus $NOEC$ vagy EC_x (algákra vagy egyéb vízinnövényekre)	$\leq 0,1$ mg/l

Krónikus-2 kategória

Krónikus $NOEC$ vagy EC_x (halra)	≤ 1 mg/l és/vagy
Krónikus $NOEC$ vagy EC_x (rákokra)	≤ 1 mg/l és/vagy
Krónikus $NOEC$ vagy EC_x (algákra vagy egyéb vízinnövényekre)	≤ 1 mg/l

17) Lásd a GHS 4.1 fejezetét és a 9 melléklet A9.4.2.2.3 pontját.

ii) Gyorsan lebomló anyagok, amelyekre van megfelelő krónikus toxicitási adat

Krónikus-1 kategória (lásd a 2. megj.)

Krónikus NOEC vagy EC_x (halra)	$\leq 0,01$ mg/l és/vagy
Krónikus NOEC vagy EC_x (rákokra)	$\leq 0,01$ mg/l és/vagy
Krónikus NOEC vagy EC_x (algákra vagy egyéb vízinnövényekre)	$\leq 0,01$ mg/l

Krónikus-2 kategória

Krónikus NOEC vagy EC_x (halra)	$\leq 0,1$ mg/l és/vagy
Krónikus NOEC vagy EC_x (rákokra)	$\leq 0,1$ mg/l és/vagy
Krónikus NOEC vagy EC_x (algákra vagy egyéb vízinnövényekre)	$\leq 0,1$ mg/l

iii) Anyagok, amelyekre nincs megfelelő krónikus toxicitási adat

Krónikus-1 kategória (lásd a 2. megj.)

96 órás LC_{50} (halra)	≤ 1 mg/l és/vagy
48 órás EC_{50} (rákokra)	≤ 1 mg/l és/vagy
72 vagy 96 órás ErC_{50} (algákra vagy egyéb vízinnövényekre)	≤ 1 mg/l (lásd a 3. megj.)
és az anyag nem bomlik le gyorsan és/vagy a kísérletileg meghatározott $BCF \geq 500$ (vagy ennek hiányában a $\log K_{ow} \geq 4$) (lásd a 4. és az 5. megj.)	

Krónikus-2 kategória

96 órás LC_{50} (halra)	> 1 , de ≤ 10 mg/l és/vagy
48 órás EC_{50} (rákokra)	> 1 , de ≤ 10 mg/l és/vagy
72 vagy 96 órás ErC_{50} (algákra vagy egyéb vízinnövényekre)	> 1 , de ≤ 10 mg/l (l. 3. megj.)
és az anyag nem bomlik le gyorsan és/vagy a kísérletileg meghatározott $BCF \geq 500$ (vagy ennek hiányában a $\log K_{ow} \geq 4$) (lásd a 4. és az 5. megj.)	

Megjegyzés: 1. A halat, a rákokat és algákat helyettesítő fajok vizsgálgat, mint amelyek a táplálkozási szintek és a rendszertan széles skáláját ölelik fel, a vizsgálati módszerek nagymértékben szabványosítottak. Más élő szervezetekre vonatkozó adatok is figyelembe vehetők, de csak, ha azonos fajt képviselnek és a vizsgálatok kimenetei is mehegyeznek.

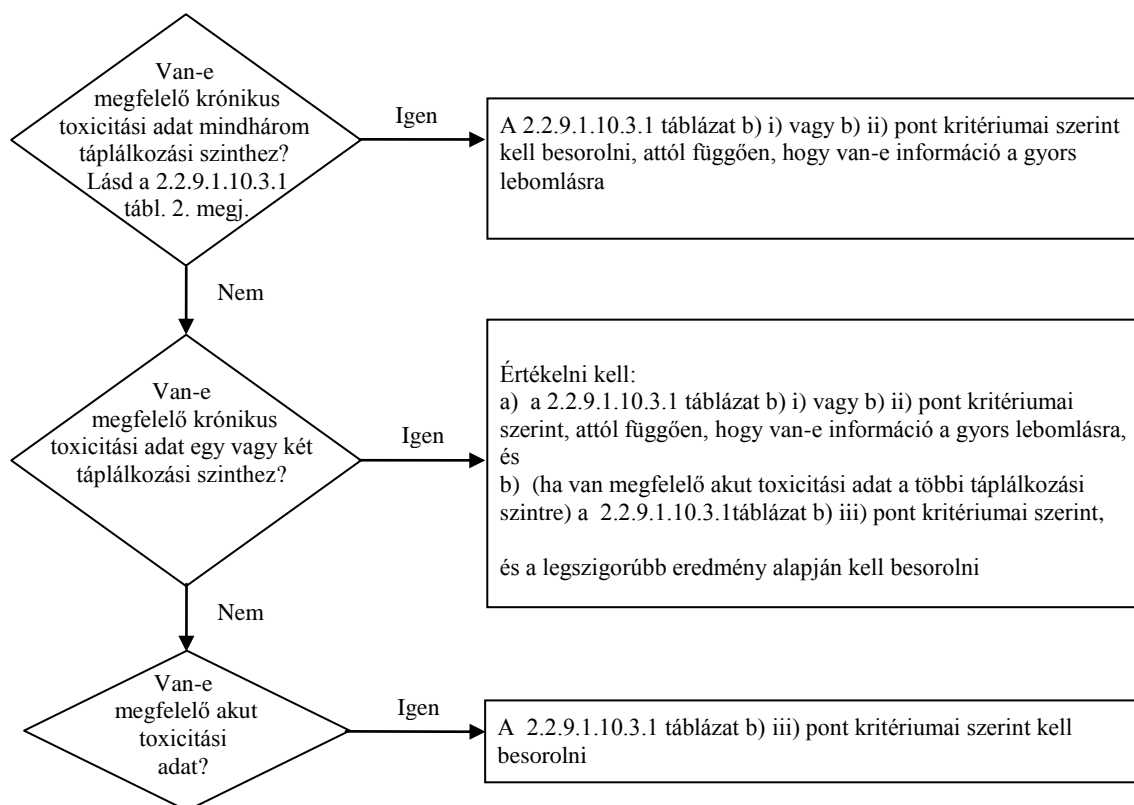

2. Az anyagok akut-1 és/vagy krónikus-1 kategóriába sorolása során az összegzési módszer alkalmazásához szükség van egyúttal jelezni a megfelelő M tényező értékét (lásd a 2.2.9.1.10.4.6.4 pontot).

3. Ha az algára vonatkozó ErC_{50} toxicitás [= EC_{50} (szaporodási ráta)] a következő legérzékenyebb faj értékének századrésznél kisebb és a besorolás eredménye kizárólag ezen a hatáson alapul, meg kell gondolni, hogy ez a toxicitás reprezentálja-e a vízi növényekre vonatkozó toxicitást. Ha bizonyítható, hogy nem ez az eset áll fenn, akkor szakértői értékelés alapján kell eldönteni, hogy a besorolást alkalmazzuk-e. A besorolásnak az ErC_{50} értéken kell alapulnia. Olyan esetekben, amikor az EC_{50} alapja nincs meghatározva és nem áll rendelkezésre ErC_{50} érték, a besorolást a rendelkezésre álló legkisebb EC_{50} alapján kell végezni.

4. A gyors lebonthatóság hiányának megállapítását vagy a könnyű biológiai lebonthatóság hiányára vagy a gyors lebomlás hiányának más bizonyítékára lehet alapozni. Ha a lebonthatóságra nincs használható adat (sem kísérletileg meghatározott, sem becsült) akkor az anyagot nem gyorsan lebomlónak kell tekinteni.

5. A kísérletileg meghatározott $BCF \geq 500$ értéken vagy ennek hiányában a $\log K_{ow} \geq 4$ értéken (ha a $\log K_{ow}$ érték megfelelő mutatója az anyag bioakkumulációs hajlamának) alapuló bioakkumulációs hajlam. A mért $\log K_{ow}$ értékeket előnyben kell részesíteni a becsült adatokkal szemben, valamint a mért BCF értékeket a $\log K_{ow}$ értékekkel szemben.

2.2.9.1.10.3.1. ábra: Kategóriák a vízi környezetre hosszú távon veszélyes anyagokhoz

2.2.9.1.10.3.2 A következő 2.2.9.1.10.3.2 táblázat besorolási rendszere az anyagok besorolási kritériumait foglalja össze.

2.2.9.1.10.3.2 táblázat A vízi környezetre veszélyes anyagok besorolási rendszere

Besorolási kategória			
Akut veszélyesség (lásd az 1. megj.)	Hosszú távú veszélyesség (lásd a 2. megj.)		
	Van megfelelő krónikus toxicitási adat		Nincs megfelelő krónikus toxicitási adat (lásd az 1. megj.)
	Nem gyorsan lebomló anyagok (lásd a 3. megj.)	Gyorsan lebomló anyagok (lásd a 3. megj.)	
Kategória: akut-1	Kategória: krónikus-1	Kategória: krónikus-1	Kategória: krónikus-1
$L(E)C_{50} \leq 1,00$	$NOEC$ vagy $EC_x \leq 0,1$	$NOEC$ vagy $EC_x \leq 0,01$	$L(E)C_{50} \leq 1,00$ és a gyors lebomlás hiánya és/vagy $BCF \geq 500$, vagy ennek hiányában $\log K_{ow} \geq 4$
	Kategória: krónikus-2	Kategória: krónikus-2	Kategória: krónikus-2
	$0,1 < NOEC$ vagy $EC_x \leq 1$	$0,01 < NOEC$ vagy $EC_x \leq 0,1$	$1,00 < L(E)C_{50} \leq 10,0$ és a gyors lebomlás hiánya és/vagy $BCF \geq 500$, vagy ennek hiányában $\log K_{ow} \geq 4$

- Megjegyzés:**
1. A halra, rákokra és/vagy algákra vagy más vízinövényekre meghatározott, (vagy kísérleti adatok hiányában a kvantitatív szerkezet-hatás összefüggés (QSAR¹⁸⁾) szerint becsült) mg/l-ben kifejezett $L(E)C_{50}$ értékeken alapuló akut toxicitási tartomány.
 2. Az anyagokat a különböző krónikus kategóriákba kell sorolni, kivéve, ha van megfelelő krónikus toxicitási adat mind a három táplálkozási szintre, amelyek meghaladják a vízben való oldhatóságot vagy az 1 mg/l értéket. (A „megfelelő” azt jelenti, hogy az adatok kielégítően lefedik a szóban forgó végpontokat. Általában ez mért vizsgálati adatokat jelent, de a felesleges vizsgálatok elkerülésére egyedi esetekben lehetnek becsült adatok is, pl. QSAR vagy nyilvánvaló esetben szakértői vélemény.)
 3. Halra vagy rákokra meghatározott, mg/l-ben kifejezett $NOEC$ vagy egyenértékű EC_x értékeken, vagy más, elismert jellemzőn alapuló krónikus toxicitási tartomány.

2.2.9.1.10.4 A keverékek besorolási kategóriái és kritériumai

2.2.9.1.10.4.1 A keverékek besorolási rendszeréhez tartoznak az anyagok besorolásához használt kategóriák, azaz az akut-1, a krónikus-1 és a krónikus-2 kategória. Annak érdekében, hogy a keverék vízi környezetre való veszélyességének besorolásához az összes rendelkezésre álló adatot felhasználjuk, a következő feltételezést használjuk:

A „lényeges összetevő” a keverékben legalább 0,1 tömeg%-ban jelenlévő akut-1 és/vagy krónikus-1 kategóriába tartozó összetevő és minden más, legalább 1 tömeg%-ban jelen levő összetevő, kivéve, ha feltételezhető, hogy valamelyik 0,1 tömeg%-nál kisebb koncentrációban jelenlévő összetevő is lényeges a keverék vízi környezetre való veszélyességének besorolásához (pl. nagyon mérgező összetevők esetében).

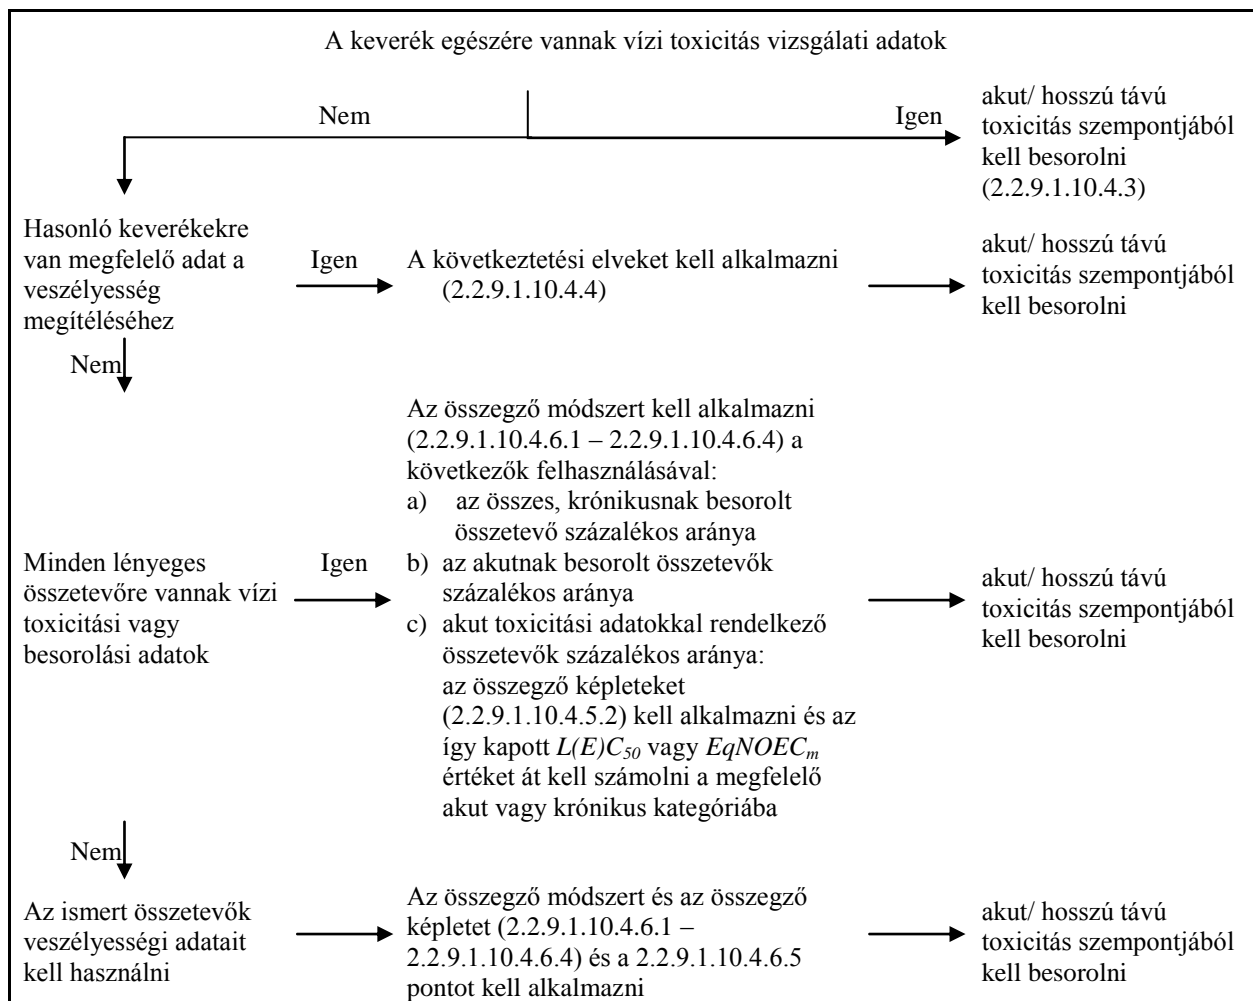

18) Különleges útmutatás található a GHS 4.1 fejezet 4.1.2.13 bekezdésében és 9. Melléklet A9.6 szakaszában.

2.2.9.1.10.4.2 A vízi környezetre való veszélyesség besorolásának menete lépcsőzetes, és attól függ, hogy milyen adatok állnak rendelkezésre az egész keverékre, ill. az összetevőire. A lépcsőzetes besorolás elemei a következők:

- a keverékkel végzett vizsgálaton alapuló besorolás;
- a következtetés elvén alapuló besorolás;
- „a besorolt összetevők összegzése” módszer és/vagy az „összegző képlet” használata.

A követendő eljárást a következő 2.2.9.1.10.4.2 ábra mutatja.

2.2.9.1.10.4.2 ábra: A keverékek akut és hosszú távú vízi környezeti veszélyességének lépcsőzetes besorolása

2.2.9.1.10.4.3 Keverékek besorolása abban az esetben, ha a keverék egészére vannak toxicitási adatok

2.2.9.1.10.4.3.1 Ha a keverék egészének vízi toxicitását megvizsgálták, akkor ezek az adatokat kell felhasználni a keverék besorolására az anyagokra elfogadott kritériumok szerint. A besorolást normál esetben a halra, a rákokra és az algákra vagy egyéb vízinövényekre kapott adatokra kell alapozni (lásd a 2.2.9.1.10.2.3 és a 2.2.9.2.10.2.4 pontot). Ha a keverék egészére nincs megfelelő akut vagy krónikus toxicitási adat, a következtetési elveket vagy az összegző módszert kell alkalmazni (lásd a 2.2.9.1.10.4.4 – 2.2.9.1.10.4.6 pontot).

2.2.9.1.10.4.3.2 A keverékek hosszú távú veszélyesség alapján történő besorolásához a lebomlásra és a egyes esetekben a bioakkumulációra vonatkozó további adatok szükségesek. A keverékek egészére nem léteznek lebomlásra és bioakkumulációra vonatkozó adatok. A lebomlásra és bioakkumulációra vonatkozó vizsgálatokat keverékekre nem alkalmazzák, mert rendszerint nehezen értelmezhetők, és a vizsgálatok csak egyedi anyagokra mértékadók.

2.2.9.1.10.4.3.3 Besorolás az akut-1 kategóriába

- a) ha a keverék egészére vannak megfelelő akut toxicitási vizsgálati adatok (LC_{50} vagy EC_{50}) és az $L(E)C_{50}$ értéke ≤ 1 mg/l:

a keveréket a 2.2.9.1.10.3.1 táblázat a) pontja szerint az akut-1 kategóriába kell besorolni;

- b) ha a keverék egészére vannak akut toxicitási vizsgálati adatok (LC_{50} vagy EC_{50}) és az $L(E)C_{50}$ értéke(k) >1 mg/l vagy nagyobb(ak), mint a vízben való oldhatóság értéke:

a keveréket az ADR értelmében nem kell akut veszélyességi kategóriába sorolni.

2.2.9.1.10.4.3.4 Besorolás a krónikus-1 és -2 kategóriába

- a) ha a keverék egészére vannak megfelelő krónikus toxicitási adatok (EC_x vagy $NOEC$), és a vizsgált keverék EC_x vagy $NOEC$ értéke ≤ 1 mg/l:

- i) a keveréket a 2.2.9.1.10.3.1 táblázat b) ii) pontja (gyorsan lebomló) szerint a krónikus-1 vagy -2 kategóriába kell besorolni, ha a rendelkezésre álló információk alapján arra lehet következtetni, hogy a keverék minden lényeges összetevője gyorsan lebomló;

- ii) minden más esetben a keveréket a 2.2.9.1.10.3.1 táblázat b) i) pontja (nem gyorsan lebomló) szerint a krónikus-1 vagy -2 kategóriába kell besorolni;

- b) ha a keverék egészére vannak megfelelő krónikus toxicitási adatok (EC_x vagy $NOEC$) és a vizsgált keverék EC_x vagy $NOEC$ értéke(i) >1 mg/l vagy nagyobb(ak), mint a vízben való oldhatóság értéke:

a keveréket az ADR értelmében nem kell hosszú távú veszélyességi kategóriába sorolni.

2.2.9.1.10.4.4 Keverékek besorolása, amelyeknél a keverék egészére nincsenek toxicitási adatok: a következtetés elvén alapuló besorolás

2.2.9.1.10.4.4.1 Ha magát a keveréket nem vizsgálták a vízi környezetre való veszélyességének megállapítására, viszont az egyes összetevőkre és hasonló, megvizsgált keverékekre elegendő adat áll rendelkezésre ahhoz, hogy a keverék veszélyességét megfelelően jellemezze, akkor ezeket az adatokat kell használni a következő, elfogadott következtetési szabályok szerint. Ez biztosítja, hogy a besorolási eljárás folyamán a rendelkezésre álló adatokat a lehető legnagyobb mértékben felhasználjuk a keverék veszélyességének jellemzésére, anélkül, hogy további állatkísérletekre volna szükség.

2.2.9.1.10.4.4.2 Hígítás

Abban az esetben, ha egy keveréket egy már besorolt másik keverék vagy anyag olyan hígítószerrel történő hígításával állítottak elő, amelynek a vízi környezetre való veszélyessége azonos vagy kisebb mértékű, mint a legkevésbé toxikus eredeti összetevőjének veszélyessége, és amely valószínűleg nem befolyásolja a többi összetevő vízi környezetre való veszélyességét, akkor a keveréket az eredeti keverékkel, ill. anyaggal azonosan kell besorolni. Alternatívaként a 2.2.9.1.10.4.5 pont szerinti eljárás is alkalmazható.

2.2.9.1.10.4.4.3 Gyártási tételek

Egy keverék valamely bevizsgált gyártási tételének a vízi környezetre való veszélyességi besorolása és ugyanakkor a kereskedelmi terméknek, ugyanazon gyártó által, vagy ugyanazon gyártó felügyelete mellett gyártott másik, nem bevizsgált gyártási tételének besorolása alapvetően azonosnak tekintendő, kivéve, ha okkal feltételezhető, hogy olyan jelentős változás következett be, amely a nem bevizsgált gyártási tételnek a vízi

környezetre való veszélyességi besorolását is megváltoztatta. Ez esetben új besorolási eljárás szükséges.

2.2.9.1.10.4.4.4 A legszigorúbb (krónikus-1 és akut-1) kategóriákba sorolt keverékek koncentrációjának növelése

Ha egy krónikus-1 és/vagy akut-1 kategóriába sorolt, bevizsgált keverékben a krónikus-1 és/vagy akut-1 kategóriába sorolt összetevők koncentrációját a továbbiakban növeljük, a nagyobb koncentrációjú nem bevizsgált keveréket – további vizsgálat nélkül – ugyanabba a kategóriába kell sorolni, mint az eredeti bevizsgált keveréket.

2.2.9.1.10.4.4.5 Egy toxikussági kategórián belüli interpoláció

Három, azonos összetevőket tartalmazó keverék (A, B és C) esetén, ha A keverék és B keverék bevizsgált és ugyanabba a kategóriába tartozik és a nem bevizsgált C keverék ugyanazokat a toxikológiai aktív összetevőket tartalmazza, mint az A és B keverék, de a toxikológiai aktív összetevők koncentrációja az A és B keverékben levő koncentrációk közé esik, akkor feltételezhető, hogy a C keverék ugyanabba a kategóriába tartozik, mint az A és a B keverék.

2.2.9.1.10.4.4.6 Alapvetően azonos keverékek

Ha adottak a következők:

- a) két keverék:
 - i) A + B;
 - ii) C + B,
- b) a B összetevő koncentrációja a két keverékben lényegében azonos;
- c) az A összetevő koncentrációja az i) pont szerinti keverékben azonos a C összetevő koncentrációjával az ii) pont szerinti keverékben;
- d) az A és C vízi környezetre való veszélyességi adatai ismertek és alapvetően azonosak, és nem valószínű, hogy a B összetevő vízi toxicitását befolyásolnák,
akkor ha az i), ill. az ii) pont szerinti keveréket vizsgálati adatok alapján már besorolták, a másik keverék ugyanabba a veszélyességi kategóriába sorolható.

2.2.9.1.10.4.5 Keverékek besorolása abban az esetben, ha a keverék mindegyik összetevőjére vagy csak néhányra vannak toxicitási adatok

2.2.9.1.10.4.5.1 A keverék besorolását a besorolt összetevők koncentrációjának összegzésére kell alapozni. Az „akut”, ill. „krónikus” kategóriába sorolt összetevők százalékos aránya az összevezető módszer kiinduló adata. Az összevezető módszer részletei a 2.2.9.1.10.4.6.1 – 2.2.9.1.10.4.6.4 pontokban találhatók.

2.2.9.1.10.4.5.2 Egy keverék lehet már besorolt (akut-1 és/vagy krónikus-1, krónikus-2) összetevők és olyan összetevők kombinációja, amelyekre vannak megfelelő toxicitási vizsgálati adatok. Ha a keverék egynél több összetevőjére van megfelelő toxicitási adat, akkor ezeknek az összetevőknek az együttes toxicitását a toxicitási adatok jellegétől függően a következő a), ill. b) összevezető képlettel kell kiszámolni:

- a) a vízi környezetre gyakorolt akut toxicitás alapján:

$$\frac{\sum C_i}{L(E)C_{50m}} = \sum_n \frac{C_i}{L(E)C_{50i}}$$

ahol:

- C_i = az i -edik összetevő koncentrációja (tömeg%);
 $L(E)C_{50i}$ = az i -edik összetevő LC_{50} vagy EC_{50} értéke (mg/l);
 n = az összetevők száma, $i = 1 - n$;
 $L(E)C_{50m}$ = a keverék azon részének $L(E)C_{50}$ értéke, amelyre van toxicitási adat.

A számított toxicitást kell felhasználni a keverék ezen részének az akut toxicitási veszélyességi kategóriába sorolásához, amit azután felhasználunk az összegzési módszerben.

- b) a vízi környezetre gyakorolt krónikus toxicitás alapján

$$\frac{\sum C_i + \sum C_j}{EqNOEC_m} = \sum_n \frac{C_i}{NOEC_i} + \sum_n \frac{C_j}{0,1 \times NOEC_j}$$

ahol

- C_i = a gyorsan lebomló összetevők közül az i -ediknek a koncentrációja (tömeg%);
 C_j = a nem gyorsan lebomló összetevők közül a j -ediknek a koncentrációja (tömeg%);
 $NOEC_i$ = a gyorsan lebomló összetevők közül az i -ediknek a $NOEC$ értéke (vagy más, elismert jellemző a krónikus toxicitásra), (mg/l);
 $NOEC_j$ = a nem gyorsan lebomló összetevők közül a j -ediknek a $NOEC$ értéke (vagy más, elismert jellemző a krónikus toxicitásra), (mg/l);
 n = az összetevők száma, i és $j = 1 \dots n$
 $EqNOEC_m$ = a keverék azon részének egyenértékű $NOEC$ értéke, amelyre van vizsgálati adat;

Az egyenértékű toxicitás így módon azt a tényt tükrözi, hogy a nem gyorsan lebomló anyagok eggyel szigorúbb veszélyességi kategóriába tartoznak mint a gyorsan lebomló anyagok.

A számított egyenértékű toxicitást kell felhasználni a keverék ezen részének az hosszú távú veszélyességi kategóriába sorolásához a gyorsan lebomló anyagokra vonatkozó kritériumok szerint [2.2.9.1.10.3.1 táblázat b) ii) pont], amit azután felhasználunk az összegzési módszerben.

- 2.2.9.1.10.4.5.3** Amikor a keverék egy részére az összegző képletet alkalmazzuk, előnyös, ha a keverék ezen része toxicitását az egyes összetevők azonos rendszertani csoportra (halra, rákra vagy algára) vonatkozó toxicitási értékeivel kiszámoljuk, és azután a kapott legnagyobb - toxicitási értéket (azaz a legkisebb értéket) használjuk (vagyis a három csoport közül a legérzékenyebbre vonatkozót). Ha azonban nincs minden összetevőre azonos rendszertani csoportra vonatkozó toxicitási adat, az egyes összetevőkre vonatkozóan a toxicitási adatot úgy kell kiválasztani, mint ahogy az anyagok besorolásánál kell a toxicitási adatot kiválasztani, vagyis a legnagyobb toxicitási értéket (a legérzékenyebb vizsgálati szervezetre vonatkozót) kell használni. Az így kiszámított akut és krónikus toxicitás érték figyelembevételével kell a keverék ezen részét az akut-1 és/vagy krónikus-1, ill. -2 kategóriába sorolni, ugyanazon kritériumok alapján, mint amelyek az anyagokra vonatkoznak.

- 2.2.9.1.10.4.5.4** Ha egy keveréket többféleképpen sorolnak be, a legszigorúbb eredményt adó módszert kell alkalmazni.

- 2.2.9.1.10.4.6** Összegző módszer

2.2.9.1.10.4.6.1 Besorolási eljárás

Általában a keverékeknek a szigorúbb besorolás megelőzi a kevésbé szigorút, például a krónikus-1 kategóriába való besorolás megelőzi a krónikus-2-be való sorolást. Ennek következtében, ha a besorolás eredménye krónikus-1 kategória, a besorolási eljárás befejeződik. Mivel a krónikus-1 kategóriánál nincs szigorúbb, ezért nem szükséges a besorolási eljárást folytatni.

2.2.9.1.10.4.6.2 Az akut-1 kategóriába való sorolás

2.2.9.1.10.4.6.2.1 Először az összes, akut-1 kategóriába sorolt összetevő koncentrációját (%-ban) összeadjuk. Ha ezen összeg 25% vagy annál nagyobb, az egész keveréket az akut-1 kategóriába kell sorolni. Ha a számítás eredménye az, hogy a keverék az akut-1 kategóriába tartozik, a besorolási eljárás befejeződik.

2.2.9.1.10.4.6.2.2 A keveréknek a besorolt összetevők koncentrációjának összegzésén alapuló, akut veszélyesség szerinti besorolása a 2.2.9.1.10.4.6.2.2 táblázatban van összefoglalva.

2.2.9.1.10.4.6.2.2 táblázat: A keverék akut veszély szerinti besorolása a besorolt összetevők koncentrációjának összegzése alapján

Az adott kategóriába besorolt összetevők koncentrációjának összege (%-ban)	A keverék besorolása
$\text{akut-1} \times M^{a)} \geq 25\%$	akut-1

a) Az *M* tényező magyarázatára lásd a 2.2.9.1.10.4.6.4 pontot.

2.2.9.1.10.4.6.3 A krónikus-1 és krónikus-2 kategóriába való sorolás

2.2.9.1.10.4.6.3.1 Először az összes, a krónikus-1 kategóriába sorolt összetevő koncentrációját (%-ban) összeadjuk. Ha ezen összeg 25% vagy annál nagyobb, az egész keveréket a krónikus-1 kategóriába kell sorolni. Ha a számítás eredménye az, hogy a keverék a krónikus-1 kategóriába tartozik, a besorolási eljárás befejeződik.

2.2.9.1.10.4.6.3.2 Ha a keverék nem tartozik a krónikus-1 kategóriába, akkor a krónikus-2 kategóriába való sorolás szempontjából kell vizsgálni. Akkor kell a keveréket a krónikus-2 kategóriába sorolni, ha a krónikus-1 kategóriába sorolt összetevők koncentrációja összegének (%-ban) 10-szerese és a krónikus-2 kategóriába sorolt összetevők koncentrációjának összege (%-ban) 25% vagy annál nagyobb. Ha a számítás eredménye az, hogy a keverék a krónikus-2 kategóriába tartozik, a besorolási eljárás befejeződik.

2.2.9.1.10.4.6.3.3 A keveréknek a besorolt összetevők összegzésén alapuló, hosszú távú veszélyesség szerinti besorolása a 2.2.9.1.10.4.6.3.3 táblázatban van összefoglalva.

2.2.9.1.10.4.6.3.3 táblázat: A keverék hosszú távú veszélyesség szerinti besorolása a besorolt összetevők összegzése alapján

Az adott kategóriába besorolt összetevők koncentráció összege (%-ban)	A keverék besorolása:
$\text{krónikus-1} \times M^{a)} \geq 25\%$	krónikus-1
$(M^{a)} \times 10 \times \text{krónikus-1}) + \text{krónikus-2} \geq 25\%$	krónikus-2

a) Az *M* tényező magyarázatára lásd a 2.2.9.1.10.4.6.4 pontot.

2.2.9.1.10.4.6.4 Nagyon mérgező összetevőket tartalmazó keverékek

Az olyan, akut-1 vagy krónikus-1 kategóriába sorolt összetevők, amelyek akut toxicitása jóval kisebb 1 mg/l-nél és/vagy krónikus toxicitása jóval kisebb, mint 0,1 mg/l (ha nem gyorsan lebomlók) vagy mint 0,01 mg/l (ha gyorsan lebomlók), befolyásolhatják az egész keverék toxicitását, ezért az összegző módszerben súlyozottan vannak figyelembe véve. Ha a keverékben van akut-1 vagy krónikus-1 kategóriába sorolt összetevő, a

2.2.9.1.10.4.6.2 és 2.2.9.1.10.4.6.3 pontban leírt lépcsőzetes eljárást kell alkalmazni, amelyben az összetevők százalékos arányának egyszerű összeadása helyett egy súlyozott összeget használunk, amely az akut-1 és krónikus-1 kategóriájú összetevők koncentrációjának és egy tényezőnek a szorzata. Ez azt jelenti, hogy a 2.2.9.1.10.4.6.2.2, ill. a 2.2.9.1.10.4.6.3.3 táblázatok bal oldali oszlopában az akut-1, ill. krónikus-1 kategóriájú összetevők koncentrációja a megfelelő tényezővel megszorozva szerepel. A szorzótényező az összetevők toxicitása alapján van meghatározva, és a következő 2.2.9.1.10.4.6.4 táblázatban szerepel. Ezért az akut-1 és/vagy krónikus-1 kategóriába sorolt összetevőket tartalmazó keverékek összegző módszerrel történő besorolásához ismerni kell az *M* tényező értékét. Ehelyett az összegző képlet is alkalmazható (lásd a 2.2.9.1.10.4.5.2 pontot), ha a keverékben lévő minden, nagyon mérgező összetevőre van toxicitási adat és elegendő bizonyíték van arra, hogy a többi összetevő (beleértve azokat is, amelyekre akut és/vagy krónikus toxicitási adatok nem állnak rendelkezésre), csak enyhén vagy egyáltalán nem mérgező, és nem befolyásolják jelentősen a keverék környezetre való veszélyességét.

2.2.9.1.10.4.6.4 táblázat: A keverékek nagyon mérgező összetevőikhez tartozó szorzótényezők

Akut toxicitás <i>L(E)C₅₀</i> érték	<i>M</i> tényező	Krónikus toxicitás <i>NOEC</i> érték	<i>M</i> tényező	
			Nem gyorsan lebomló összetevők	Gyorsan lebomló összetevők
$0,1 < L(E)C_{50} \leq 1$	1	$0,01 < NOEC \leq 0,1$	1	-
$0,01 < L(E)C_{50} \leq 0,1$	10	$0,001 < NOEC \leq 0,01$	10	1
$0,001 < L(E)C_{50} \leq 0,01$	100	$0,0001 < NOEC \leq 0,001$	100	10
$0,0001 < L(E)C_{50} \leq 0,001$	1000	$0,00001 < NOEC \leq 0,0001$	1000	100
$0,00001 < L(E)C_{50} \leq 0,0001$	10000	$0,000001 < NOEC \leq 0,00001$	10000	1000
(további tizedes intervallumonként folytatva)		(további tizedes intervallumonként folytatva)		

2.2.9.1.10.4.6.5 Keverék besorolása abban az esetben, ha nincs az összetevőkre használható információ

Abban az esetben, ha a keverék valamely lényeges összetevőjének akut és/vagy krónikus vízi toxicitására nincs használható adat, a keveréket nem lehet határozott veszélyességi kategóriába sorolni. Ebben az esetben a keveréket az ismert összetevők alapján kell besorolni, és ki kell egészíteni a következő megállapítással: „A keverék *x* %-a olyan összetevő(k)ból áll, amely(ek)nek vízi környezetre való veszélyessége nem ismert.”

2.2.9.1.10.5 Az 1272/2008/EK¹⁹⁾ rendelet szerint a környezetre (vízi környezetre) veszélyesnek besorolt anyagok és keverékek

Ha a 2.2.9.1.10.3 és a 2.2.9.1.10.4 pont szerinti besoroláshoz nem áll rendelkezésre adat, akkor az anyagot, ill. keveréket:

- a környezetre (vízi környezetre) veszélyesnek kell besorolni, ha a 1272/2008/EK¹⁹⁾ rendelet szerint a vízi akut-1, vízi krónikus-1 vagy vízi krónikus-2 kategóriába kell sorolni, vagy – ha az említett rendelet szerint még alkalmazandók, akkor – a 67/548/EGK irányelv²⁰⁾ vagy az 1999/45/EK irányelv²¹⁾ szerint R50; R50/53 vagy R51/53 kockázati mondatot kell hozzárendelni;
- úgy lehet tekinteni, hogy nem veszélyes a környezetre (vízi környezetre), ha az említett irányelvek, ill. rendelet szerint nem kell egyik, említett kockázati mondatot

19) Az Európai Parlament és a Tanács 2008. december 16-i 1272/2008/EK rendelete az anyagok és keverékek osztályozásáról, címkézéséről és csomagolásáról, a 67/548/EGK és az 1999/45/EK irányelv módosításáról és hatályon kívül helyezéséről, valamint az 1907/2006/EK rendelet módosításáról (az EU Hivatalos Lapja, L 353. szám, 2008.12.31.).

20) Az EK Hivatalos Lapja, L 196. szám, 1967.08.16., 1 - 5. o.).

21) Az Európai Parlament és a Tanács 1999. május 31-i 1999/45/EK Irányelve a tagállamok veszélyes készítmények osztályozására, csomagolására és címkézésére vonatkozó jogszabályainak és közigazgatási előírásainak közelítéséről (lásd az EK Hivatalos Lapja, L 200. szám, 1999.07.30.).

vagy kategóriát sem hozzárendelni.

- 2.2.9.1.10.6** A 2.2.9.1.10.3, a 2.2.9.1.10.4 és a 2.2.9.1.10.5 pont előírásai szerint a környezetre (vízi környezetre) veszélyesnek besorolt anyagok, ill. keverékek hozzárendelése

Azokat a környezetre (vízi környezetre) veszélyes anyagokat, ill. keverékeket, amelyek az ADR szerint nincsenek másként besorolva, a következő tételekhez kell hozzárendelni:

UN 3077 KÖRNYEZETRE VESZÉLYES SZILÁRD ANYAG, M.N.N., vagy

UN 3082 KÖRNYEZETRE VESZÉLYES FOLYÉKONY ANYAG, M.N.N.

Ezek a tételek a III csomagolási csoportba tartoznak.

Géntechnológiával módosított mikroorganizmusok és élő szervezetek

- 2.2.9.1.11** A géntechnológiával módosított mikroorganizmusok (GMMO-k) és élő szervezetek (GMO-k) olyan mikroorganizmusok és élő szervezetek, amelyek genetikai anyagát szándékosan, génszűrés beavatkozással úgy változtatták meg, ami a természetben nem fordul elő. Ezek a 9 osztályba, az UN 3245 tétel alá tartoznak, ha nem elégítik ki a mérgező anyagok vagy a fertőző anyagok meghatározását, de képesek az állatokat, növényeket vagy mikrobiológiai anyagokat oly módon megváltoztatni, ami a természetes reprodukció eredményeként rendszerint nem következik be.

Megjegyzés: 1. Azok a GMMO-k és GMO-k, amelyek fertőzőek, a 6.2 osztály UN 2814, UN 2900, ill. UN 3373 szám anyagai.

2. Azok a GMMO-k és GMO-k, amelyek felhasználását a származási, a tranzit és a célország illetékes hatóságai engedélyezték²²⁾, nem tartoznak az ADR előírásainak hatálya alá.

3. Élő állatok a 9 osztályba besorolt géntechnológiával módosított mikroorganizmusok szállítására nem használhatók, hacsak az anyag más módon nem szállítható. A géntechnológiával módosított élő állatokat a származási és a rendeltetési ország illetékes hatóságának előírásai és feltételei szerint kell szállítani.

- 2.2.9.1.12** (törölve)

Magas hőmérsékletű anyagok

- 2.2.9.1.13** A magas hőmérsékletű anyagok olyan anyagok, amelyeket folyékony állapotban 100 °C-on vagy annál magasabb hőmérsékleten, de amennyiben van lobbanáspontjuk, akkor a lobbanáspont alatti hőmérsékleten szállítanak vagy adnak át szállításra. Ide tartoznak azok a szilárd anyagok, amelyeket 240 °C-on vagy annál magasabb hőmérsékleten szállítanak vagy adnak át szállításra.

Megjegyzés: A magas hőmérsékletű anyagok csak akkor sorolhatók a 9 osztályba, ha egyetlen más osztály feltételeit sem elégítik ki.

Egyéb anyagok, amelyek a szállítás alatt veszélyt jelentenek, de egyetlen más osztály meghatározásának sem felelnek meg

- 2.2.9.1.14** A következő egyéb anyagok, amelyek egyetlen más osztály meghatározásának sem felelnek meg, a 9 osztályba vannak besorolva:

szilárd ammóniumvegyületek 60 °C alatti lobbanásponttal
csekély veszélyt képviselő ditionitok

22) Lásd részletesen a géntechnológiával módosított szervezeteknek a környezetben történő szándékos kibocsátásáról és a 90/220/EGK Tanácsi Irányelv hatályon kívül helyezéséről szóló 2001/18/EK Európai Parlamenti és Tanácsi Irányelv (az EK Hivatalos Lapja, L 106. szám, 2001.04.17., 8 – 14 o.) C részét, amely tartalmazza az Európai Közösség engedélyezési eljárásait. Magyarországon lásd az 1998. évi XXVII. tv-t a géntechnológiai tevékenységről, ill. a végrehajtására kiadott rendeleteket.

erősen illékony folyékony anyagok
ártalmas gőzöket kibocsátó anyagok
allergéneket tartalmazó anyagok
vizsgáló-készletek és elsősegély felszerelések
kétrétegű elektromos kondenzátorok (0,3 Wh-nál nagyobb energiatároló-kapacitással).

Megjegyzés: A következő anyagok és tárgyak, amelyeket az ENSZ Minta Szabályzat felsorol, nem esnek az ADR előírásainak hatálya alá: UN 1845 szilárd szén-dioxid (szárazjég)²³⁾, UN 2071 ammónium-nitrát alapú műtrágya, UN 2216 stabilizált halliszt (halhulladék), UN 2807 mágnesezett anyag, UN 3166 belsőégésű motor vagy UN 3166 gyúlékony gáz üzemű jármű vagy UN 3166 gyúlékony folyadék üzemű jármű vagy UN 3166 gyúlékony gáz üzemű üzemanyagcellás motor vagy UN 3166 gyúlékony folyadék üzemű üzemanyagcellás motor vagy UN 3166 gyúlékony gáz üzemű üzemanyagcellás jármű vagy UN 3166 gyúlékony folyadék üzemű üzemanyagcellás jármű, UN 3171 akkumulátorral hajtott jármű vagy UN 3171 akkumulátorral (nedves akkumulátorral) hajtott készülék (lásd még a 2.2.9.1.7 pont végén lévő megjegyzést), UN 3334 légi forgalomban szabályozott folyadék, m.n.n., UN 3335 légi forgalomban szabályozott szilárd anyag, m.n.n. és UN 3363 veszélyes áru készülékben vagy veszélyes áru berendezésben.

Csomagolási csoporthoz való hozzárendelés

2.2.9.1.15 A 9 osztály anyagai és tárgyai a veszélyességük mértéke alapján a következő csomagolási csoportok valamelyikéhez vannak hozzárendelve, ha a 3.2 fejezet „A” táblázat (4) oszlopában ez fel van tüntetve:

II csomagolási csoport: közepesen veszélyes anyagok
III csomagolási csoport: kevésbé veszélyes anyagok.

2.2.9.2 A szállításból kizárt anyagok és tárgyak

A következő anyagok és tárgyak a szállításból ki vannak zárva:

- azok a lítium akkumulátorok, amelyek nem felelnek meg a 3.3 fejezet 188, 230 vagy 636 különleges előírásának;
- azoknak a készülékeknek (pl. transzformátoroknak, kondenzátoroknak, hidraulikus berendezéseknek) az üres, tisztítatlan tartóedényei, amelyekben az UN 2315, 3151, 3152 vagy 3432 szám alá besorolt anyagok voltak.

23) A hűtőközegként használt UN 1845 szilárd szén-dioxidra (szárazjégre) lásd az 5.5.3 szakaszt.

2.2.9.3 A megnevezések felsorolása

		Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése
Különféle veszélyes anyagok és tárgyak				
Anyagok, amelyek finom poruk belélegzése esetén az egészséget veszélyeztetik		M1	2212	KÉK AZBESZT (krokidolit) vagy
			2212	BARNA AZBESZT (amozit)
			2590	FEHÉR AZBESZT (krizotil, aktinolit, antofillit, tremolit)
Anyagok és készülékek, amelyekből tűz esetén dioxinok képződhetnek		M2	2315	FOLYÉKONY POLIKLÓROZOTT BIFENILEK
			3151	FOLYÉKONY POLIHALOGÉNEZETT BIFENILEK vagy
			3151	FOLYÉKONY POLIHALOGÉNEZETT TERFENILEK
			3152	SZILÁRD POLIHALOGÉNEZETT BIFENILEK vagy
			3152	SZILÁRD POLIHALOGÉNEZETT TERFENILEK
Gyúlékony gőzöket fejlesztő anyagok		M3	3432	SZILÁRD POLIKLÓROZOTT BIFENILEK
			2211	HABOSÍTHATÓ POLIMER GYÖNGYÖK, amelyek gyúlékony gőzöket fejlesztenek
Lítium akkumulátorok		M4	3314	MŰANYAG SAJTOLÓANYAG gyúlékony gőzöket fejlesztő, massa, lemez vagy extrudált profil formában
			3090	FÉMLÍTIUM AKKUMULÁTOROK (beleértve a lítiumötvözet akkumulátorokat is)
			3091	FÉMLÍTIUM AKKUMULÁTOROK KÉSZÜLÉKBEN (beleértve a lítiumötvözet akkumulátorokat is) vagy
			3091	FÉMLÍTIUM AKKUMULÁTOROK KÉSZÜLÉKKEL EGYBECSOMAGOLVA (beleértve a lítiumötvözet akkumulátorokat is)
			3480	LÍTIUMION AKKUMULÁTOROK (beleértve a lítiumion polimer akkumulátorokat is)
Biztonsági felszerelések		M5	3481	LÍTIUMION AKKUMULÁTOROK KÉSZÜLÉKBEN (beleértve a lítiumion polimer akkumulátorokat is) vagy
			3481	LÍTIUMION AKKUMULÁTOROK KÉSZÜLÉKKEL EGYBECSOMAGOLVA (beleértve a lítiumion polimer akkumulátorokat is)
			2990	ÖNFELFÚVÓ MENTŐESZKÖZ
			3072	NEM ÖNFELFÚVÓ MENTŐESZKÖZ, mely tartozékként veszélyes anyagokat tartalmaz
			3268	LÉGZSÁK GÁZGENERÁTOR vagy
Környezetre veszélyes anyagok		M6	3268	LÉGZSÁK MODUL vagy
			3268	BIZTONSÁGI ÖV ELŐFESZÍTŐ
			3082	KÖRNYEZETRE VESZÉLYES, FOLYÉKONY ANYAG, M.N.N.
			3077	KÖRNYEZETRE VESZÉLYES, SZILÁRD ANYAG, M.N.N.
			3245	GÉNTÉCHNOLÓGIÁVAL MÓDOSÍTOTT MIKROORGANIZMUSOK vagy
	az élő vizeket szennyező folyékony anyagok	M6	3245	GÉNTÉCHNOLÓGIÁVAL MÓDOSÍTOTT ÉLŐ SZERVEZETEK
	az élő vizeket szennyező szilárd anyagok	M7		
	géntechológiával módosított mikro-organizmusok és élő szervezetek	M8		

2.2.9.3

A megnevezések felsorolása (folyt.)

		Osztály ozási kód	UN szám	Az anyag vagy tárgy megnevezése
Magas hőmérsékletű anyagok	folyékony anyagok	M9	3257	MAGAS HŐMÉRSÉKLETŰ FOLYÉKONY ANYAG, M.N.N. 100 °C-on vagy magasabb hőmérsékleten, lobbanásponttal rendelkező anyagoknál lobbanáspontjuk alatti hőmérsékleten (beleértve az olvasztott fémeket, olvasztott sókat, stb.)
	szilárd anyagok	M10	3258	MAGAS HŐMÉRSÉKLETŰ SZILÁRD ANYAG, M.N.N. 240 °C-on vagy magasabb hőmérsékleten
Egyéb anyagok és tárgyak, amelyek a szállítás alatt veszélyt jelentenek, de egyetlen más osztály meghatározásának sem felelnek meg		M11		<p>Itt nincs gyűjtőmegnevezés. Ezzel az osztályozási kóddal csak a 3.2 fejezet „A” táblázatában felsorolt anyagok tartoznak a 9 osztály előírásainak hatálya alá, ezek a következők:</p> <p>1841 ACETALDEHID-AMMÓNIA 1931 CINK-DITIONIT 1941 DIBRÓM-DIFLUOR-METÁN 1990 BENZALDEHID 2969 RICINUSMAG vagy 2969 RICINUSMAG LISZT vagy 2969 RICINUSMAG PEHELY vagy 2969 RICINUSMAG POGÁCSA 3316 VIZSGÁLÓKÉSZLET vagy 3316 ELSŐSEGÉLY FELSZERELÉS 3359 GÁZOSÍTÓSZER HATÁSA ALATT ÁLLÓ ÁRUSZÁLLÍTÓ EGYSÉG 3499 KONDENZÁTOR kétrétegű elektromos (0,3 Wh-nál nagyobb energiátároló-kapacitással)</p>

2.3 FEJEZET

VIZSGÁLATI ELJÁRÁSOK

2.3.0 Általános előírások

Hacsak a 2.2 fejezetben vagy ebben a fejezetben nincs másként előírva, a veszélyes áruk besorolásához azokat a vizsgálati módszereket kell használni, amelyek a „Vizsgálatok és kritériumok kézikönyv”-ben találhatók.

2.3.1 Kiizzadási vizsgálat az A típusú robbantóanyagokhoz

2.3.1.1 Az A típusú robbantóanyagokat (UN 0081), amennyiben folyékony salétromsav-észter tartalmuk a 40%-ot meghaladja, kiegészítésképpen a “Vizsgálatok és kritériumok kézikönyv”-ben meghatározott vizsgálatokon kívül a következő kiizzadási vizsgálatnak kell alávetni.

2.3.1.2 A robbantóanyagok kiizzadási vizsgálatának elvégzésére használt készülék (1 – 3. ábra) egy 40 mm magas, 15,7 mm belső átmérőjű üreges, talpas bronzhenger, amelynek talpa ugyanazon anyagból készült. A henger palástján 20 db 0,5 mm átmérőjű furat van (négy sorban öt-öt furat). Az 52 mm teljes hosszúságú, 48 mm hosszú, hengeres részű bronzdugattyú a függőleges helyzetű bronzhengerbe helyezhető; ez a 15,6 mm átmérőjű dugattyú 2220 g tömegű nehezékekkel van terhelve úgy, hogy a henger fenekére 120 kPa (1,2 bar) nyomás hat.

2.3.1.3 5...8 g robbantóanyagból 30 mm hosszú és 15 mm átmérőjű hengert kell készíteni, amelyet igen finom gézbe kell becsavarni és a hengerbe kell helyezni; ezután rá kell helyezni a dugattyút a teherrel oly módon, hogy a robbantóanyagra 120 kPa (1,2 bar) nyomás hasson. Mélni kell a hengeren levő furatokban az első olajos cseppecskék (nitroglicerín) megjelenéséig eltelt időt.

2.3.1.4 A robbantóanyag megfelelő, ha az első cseppek megjelenéséig több mint öt perc telik el, ha a vizsgálatot 15...25 °C hőmérsékleten végezték.

Robbantóanyagok kiizzadási vizsgálata

1. ábra: Harang alakú nehezék,
tömege 2220 g, alkalmas a bronz dugattyúra
történő ráhelyezésre

2. ábra: Hengeres bronzdugattyú,
méretek mm-ben

3. ábra: Talpas bronzhenger, egyik végén zárt:
felülnézet és oldalnézet metszettel,
méretek mm-ben

Jelölések az 1 – 3. ábrához:

- 1) négy sorban öt-öt furat, átmérő 0,5 mm
- 2) réz
- 3) ólomlemez, belül centrikus kúppal
- 4) négy, kb. 46 mm x 56 mm méretű nyílás a kerület mentén egyforma távolságokra.

2.3.2 A 4.1 osztály nitrocellulóz keverékeire vonatkozó feltételek

- 2.3.2.1** A nitrocellulóz 132 °C-on történő félórás melegítése során nem szabad hogy szemmel látható sárgásbarna nitrózus gázokat fejlesszen. A gyulladási hőmérsékletnek meg kell haladnia a 180 °C-ot. Lásd a következő 2.3.2.3 – 2.3.2.8, 2.3.2.9 a) és 2.3.2.10 bekezdést.
- 2.3.2.2** 3 g plasztifikált nitrocellulóz 132 °C-on való egyórás melegítése során nem szabad hogy szemmel látható sárgásbarna nitrózus gőzöket fejlesszen. A gyulladási hőmérsékletnek meg kell haladni a 170 °C-ot. Lásd a következő 2.3.2.3 – 2.3.2.8, 2.3.2.9 b) és 2.3.2.10 bekezdést.
- 2.3.2.3** Ha az egyes anyagok közötti szállításának megengedett voltára nézve véleménykülönbség merül fel, a következőkben részletezett vizsgálatokat kell elvégezni.
- 2.3.2.4** Amennyiben a kémiai állandóság vizsgálatára ebben a fejezetben nem szereplő, más vizsgálati módszert vagy eljárást alkalmaznak, ezeknek a módszereknek ugyanazt az eredményt kell adniuk, mintha a vizsgálatokat a következő módszerekkel végezték volna.
- 2.3.2.5** A hőállóság következőkben leírt meghatározása során a vizsgálandó anyagot tartalmazó szárítószekrény hőmérséklete az előírtól 2 °C-nál nagyobb mértékben nem térhet el; a vizsgálati időtartamot a 30 vagy 60 perces vizsgálatoknál legfeljebb kétperces eltéréssel be kell tartani. A szárítószekrényt úgy kell kialakítani, hogy a vizsgálatához előírt hőmérsékletet a minta behelyezése után legkésőbb öt perc múlva elérje.
- 2.3.2.6** A 2.3.2.9 és 2.3.2.10 bekezdés szerinti vizsgálatok előtt a mintákat legalább 15 órán át kell szárítani szobahőmérsékleten, kiizzított és granulált kalcium-kloriddal töltött vákuum-exszikkátorban. Ennek során a mintát vékony rétegben kell elteríteni, ezért a nem porszerű vagy nem szálas mintát apró darabokra kell vágdalni, le kell reszelni vagy össze kell törni. Az exszikkátorban a nyomásnak 6,5 kPa-nál (0,065 bar-nál) kisebbnek kell lennie.
- 2.3.2.7** Az előző 2.3.2.6 bekezdésben leírt feltételek melletti szárítás előtt a 2.3.2.2 bekezdés szerinti anyagokat jól szellőztetett szárítószekrényben előszárításnak kell alávetni 70 °C állandó hőmérsékleten mindaddig, amíg a 15 percen belül mért tömegcsökkenés nem haladja meg az eredeti tömeg 0,3%-át.
- 2.3.2.8** A 2.3.2.1 bekezdés szerinti gyengén nitrált nitrocellulózt előzetesen az előző 2.3.2.7 bekezdés szerinti feltételek mellett előszárításnak kell alávetni, ezután azt legalább 15 órán át exszikkátorban koncentrált kénsav fölött kell tartani.

2.3.2.9 Kémiai állandóság vizsgálata hőhatásra

a) Az előző 2.3.2.1 bekezdésben felsorolt anyagok vizsgálata:

i) Két kémcső mindegyikébe, amelyeknek

hosszúsága	350 mm,
belső átmérője	16 mm,
falvastagsága	1,5 mm,

kalcium-klorid fölött szárított 1 g anyagot kell tenni (szükség esetén az anyagot szárítás céljából 0,05 g-nyi darabkákra kell aprítani).

A két kémcsövet teljesen, de nem szorosan be kell fedni, ezután úgy kell az elektromos kemencébe helyezni, hogy azok legalább hosszúságuk 4/5 részében láthatók legyenek, és 30 percen át 132 °C állandó hőmérsékletnek legyenek kitéve. Meg kell figyelni, hogy ezen idő alatt képződnek-e sárgásbarna nitrózus gázok, amelyek különösen jól láthatók fehér háttér előtt.

- ii) Az anyagot kémiaiilag állandónak kell tekinteni, ha ilyen gázok nem jelennek meg.
- b) A plasztifikált nitrocellulóz vizsgálata (lásd a 2.3.2.2 bekezdést):
 - i) 3 g plasztifikált nitrocellulózt az a) pontban leírtakhoz hasonló kémcsövekbe teszünk, amelyeket azután 132 °C állandó hőmérsékletű szárítószekrénybe helyezzünk.
 - ii) A plasztifikált nitrocellulózt tartalmazó kémcsöveket egy órán át kell a szárítószekrényben tartani. Ezen idő alatt nem szabad, hogy sárgásbarna nitrózus gőzök váljanak láthatóvá. A megfigyelés és értékelés az a) pontban leírtakhoz hasonló.

2.3.2.10 A gyulladási hőmérséklet vizsgálata (lásd a 2.3.2.1 és a 2.3.2.2 bekezdést)

- a) A gyulladási hőmérséklet meghatározásához 0,2 g anyagot tartalmazó kémcsövet Wood-fém fürdőbe merítve kell hevíteni. A kémcsövet azután kell a fürdőbe meríteni, miután a fürdő elérte a 100 °C hőmérsékletet, a hőmérsékletet ezután percenként 5 °C-kal kell növelni.
- b) A kémcsöveknek a következő méretűeknek kell lenniük:

hosszúság	125 mm,
belső átmérő	15 mm,
falvastagság	0,5 mm.

 A kémcsöveket 20 mm mélyen kell a fürdőbe meríteni.
- c) A háromszor megismételt kísérlet során minden egyes alkalommal meg kell állapítani, hogy az anyag meggyulladása milyen hőmérsékleten következik be, illetve, hogy lassú vagy gyors égéssel, fellobbanással vagy robbanással.
- d) A három kísérlet során kapott legkisebb hőmérséklet az anyag gyulladási hőmérséklete.

2.3.3 A 3, a 6.1 és a 8 osztályba tartozó gyúlékony folyékony anyagok vizsgálata

2.3.3.1 A lobbanáspont meghatározása

2.3.3.1.1 A gyúlékony folyékony anyagok lobbanáspontjának meghatározásához a következő módszerek használhatók:

Nemzetközi szabványok

ISO 1516 (A lobban/nem lobban meghatározása – Zárt tégelyes egyensúlyi módszer)

ISO 1523 (A lobbanáspont meghatározása – Zárt tégelyes egyensúlyi módszer)

ISO 2719 (A lobbanáspont meghatározása – Pensky-Martens zárt tégelyes módszer)

ISO 13736 (A lobbanáspont meghatározása – Abel-féle zárt tégelyes módszer)

ISO 3679 (A lobbanáspont meghatározása – Zárt tégelyes, gyors egyensúlyi módszer)

ISO 3680 (A lobban/nem lobban meghatározása – Zárt tégelyes, gyors egyensúlyi módszer)

Nemzeti szabványok

American Society for Testing Materials International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, Pennsylvania, USA 19428-2959:

ASTM D3828-07a, Standard Test Methods for Flash Point by Small Scale Closed-Cup Tester

ASTM D56-05, Standard Test Method for Flash Point by Tag Closed-Cup Tester

ASTM D3278-96(2004)e1, Standard Test Methods for Flash Point of Liquids by Small Scale Closed-Cup Apparatus

ASTM D0093-08, Standard Test Methods for Flash Point by Pensky-Martens Closed-Cup Tester

State Committee of the Council of Ministers for Standardization, 113813, GSP, RUS-Moscow, M-49 Leninsky Prospect, 9:

GOST 12.1.044-84

2.3.3.1.2 A festékek, ragasztók és hasonló, oldószer tartalmú viszkózus termékek lobbanáspontjának meghatározására csak viszkózus folyadékok lobbanáspontjának meghatározására alkalmas készülékek és vizsgálati módszerek használhatók, tekintettel a következő szabványokra:

- a) az ISO 3679:1983 nemzetközi szabvány;
- b) az ISO 3680:1983 nemzetközi szabvány;
- c) az ISO 1523:1983 nemzetközi szabvány;
- d) az EN ISO 13736 és az EN ISO 2719 (B módszer) nemzetközi szabványok.

2.3.3.1.3 A 2.3.3.1.1 pontban felsorolt szabványokat csak az azokban meghatározott lobbanáspont tartományban lehet használni. A használandó szabvány kiválasztásánál figyelembe kell venni az anyag és a mintatartó közötti kémiai reakció lehetőségét. A készüléket a biztonsági előírások betartása mellett huzatmentes helyen kell felállítani. Biztonság okáért ajánlatos a szerves peroxidok és az önreaktív anyagok esetén (amelyek "energetikai" anyagoknak minősülnek), valamint a mérgező anyagok esetén olyan módszert választani, amelyhez csekély mintamennyiség – kb. 2 ml – szükséges.

2.3.3.1.4 Ha a nem-egyensúlyi módszerrel meghatározott lobbanáspont $23\text{ °C} \pm 2\text{ °C}$ vagy $60\text{ °C} \pm 2\text{ °C}$, az eredményt ugyanazon készüléket használva az egyensúlyi módszerrel meg kell erősíteni.

2.3.3.1.5 A gyúlékony folyadék besorolásakor felmerülő vita esetén a feladó által javasolt besorolást kell elfogadni, ha az illető folyadék lobbanáspontjának ellenőrző vizsgálata során az eredmény nem tér el 2 °C -nál nagyobb mértékben a 2.2.3.1 bekezdésben megadott értéktartároktól (23 °C , illetve 60 °C). Ha 2 °C -nál nagyobb az eltérés, még egy ellenőrző vizsgálatot kell végezni, és az ellenőrző vizsgálatok során kapott legkisebb értéket kell figyelembe venni.

2.3.3.2 A forráskezdet meghatározása

A gyúlékony folyékony anyagok forráskezdetének meghatározásához a következő módszerek használhatók:

Nemzetközi szabványok

ISO 3294 (Ásványolajtermékek. A forrásponttartomány meghatározása. Gázkromatográfias módszer)

ISO 4626 (Illékony szerves folyadékok – A nyersanyagként használt szerves oldószerek forrástartományának meghatározása)

ISO 3405 (Ásványolajtermékek. A desztillációs jellemzők meghatározása atmoszférikus nyomáson)

Nemzeti szabványok

American Society for Testing Materials International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, Pennsylvania, USA 19428-2959:

ASTM D86-07a, Standard Test Method for Distillation of Petroleum Products at Atmospheric Pressure

ASTM D1078-05, Standard Test Method for Distillation Range of Volatile Organic Liquids

További elfogadott módszerek

A 440/2008/EK Bizottsági rendelet²⁴⁾ Mellékletének A részében leírt A.2 módszer.

2.3.3.3 Vizsgálat a peroxid-tartalom meghatározására

Valamely folyadék peroxid-tartalmát a következő vizsgálati eljárással kell megállapítani:

A titrálendő folyadékból p mennyiséget (kb. 5 g-nyit 0,01 g pontossággal mérve) bele kell önteni egy Erlenmeyer-lombikba, ehhez hozzá kell adni 20 cm³ ecetsav-anhidridet, és kb. 1 g-nyi porrá tört szilárd kálium-jodidot, ezt összerázva tíz perc eltelte után három perc alatt kb. 60 °C-ra kell hevíteni. Miután öt percen át hűlni hagyták, 25 cm³ vizet kell hozzáadni. Félórai állás után a szabaddá vált jódot indikátor hozzáadása nélkül 0,1 normál nátrium-tioszulfát oldattal kell titrálni. A teljes elszíntelenedés jelzi a reakció végét. A tioszulfát oldatból szükséges térfogatot n -nel jelölve (cm³-ben), a folyadék peroxid-tartalma (H₂O₂-re vetítve) a

$$\frac{17n}{100p}$$

képletből adódik.

2.3.4 Vizsgálat a folyékonyság meghatározásához

A folyékony vagy viszkózus anyagok és keverékek, valamint a pasztaszerű anyagok folyékonyságának meghatározására a következő módszert kell alkalmazni:

2.3.4.1 Vizsgálókészülék

Kereskedelmi forgalomban kapható, ISO 2137:1985 szabvány szerinti penetrométer 47,5 ± 0,05 g-os vezetőrúddal; kúpos furatokkal ellátott 102,5 ± 0,05 g tömegű duralumíniumból készült szitatárcsával (lásd a 4. ábrát); és a minta befogadására alkalmas, 72...80 mm belső átmérőjű penetrációs tartállyal.

2.3.4.2 Vizsgálati eljárás

A mintát legkésőbb fél órával a mérés előtt a penetrációs tartályba öntjük. A tartályt a légmentes lezárás után a mérésig mozdulatlan állapotban kell tartani. A mintát a légmentesen lezárt penetrációs tartályban 35 °C ± 0,5 °C hőmérsékletre felmelegítjük és a penetrométer asztalára helyezzük közvetlenül a mérés előtt (legfeljebb 2 perccel előbb). Ezt követően a szitatárcsa S csúcsát a folyadék felületére helyezzük, és mérjük a behatolás mélységét az idő függvényében.

2.3.4.3 Az eredmények értékelése

Az anyag pasztaszerű, ha az S csúcsot a minta felületére helyezve a mérőórán leolvasott behatolás

a) 5 ± 0,1 s terhelési idő elteltével 15,0 ± 0,3 mm-nél kisebb, vagy

b) 5 ± 0,1 s terhelési idő elteltével 15,0 ± 0,3 mm-nél nagyobb, de újabb 55 ± 0,5 s idő

24) A Bizottság 440/2008/EK rendelete (2008. május 30.) a vegyi anyagok regisztrálásáról, értékeléséről, engedélyezéséről és korlátozásáról (REACH) szóló 1907/2006/EK európai parlamenti és a tanácsi rendelet értelmében alkalmazandó vizsgálati módszerek (lásd az EU Hivatalos Lapja, L 142. szám, 2008.05.31. p. 1-739. és L 143. szám, 2008.06.03., p 55.).

elteltével a további penetráció $5 \pm 0,5$ mm-nél kisebb.

Megjegyzés: Olyan minta esetében, amelynek folyáspontja van, gyakran nem lehet a penetrációs tartályban állandó szintű felületet létrehozni és ennek következtében nem lehet világosan megállapítani a mérés kezdeti feltételeit az S csúccsal való érintkezésbe hozatalkor. Ezenfelül bizonyos minták esetében a szitatárcsa ráhelyezése a felület rugalmas alakváltozását válthatja ki, ezáltal az első másodpercekben mélyebb behatolás látszatát kelti. Ezekben az esetekben alkalmas lehet az eredmények értékelését az előző b) pont szerint végezni.

4. ábra: Penetrométer

* A tűrés nélkül megadott méretek tűrése: $\pm 0,1$ mm

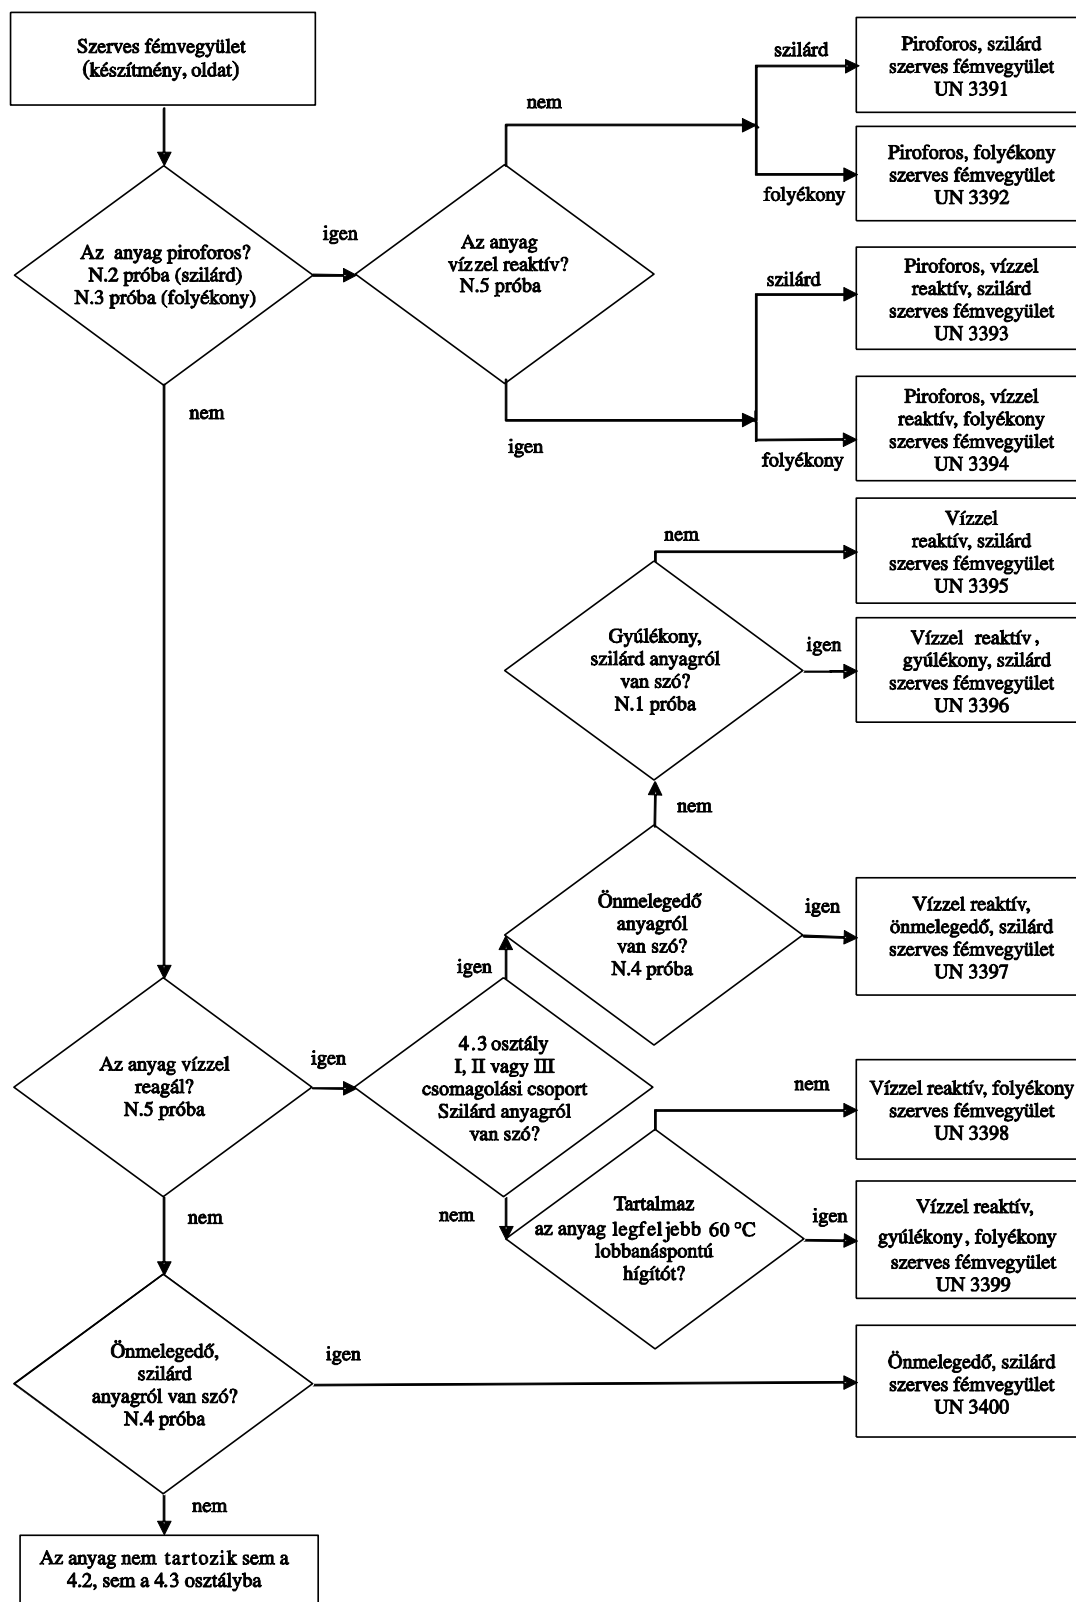

2.3.5

A szerves fémvegyületek besorolása a 4.2 és a 4.3 osztályba

A szerves fémvegyületek a „Vizsgálatok és kritériumok kézikönyv”, III. rész, 33 fejezet N.1 - N.5 vizsgálattal meghatározott tulajdonságaiktól függően a 2.3.5 folyamatábra alapján a 4.2, ill. a 4.3 osztályba sorolhatók.

- Megjegyzés:**
- 1. A járulékos veszélyekkel rendelkező szerves fémvegyületeket tulajdonságaiktól függően a veszélyességi rangsor táblázat (lásd a 2.1.3.10 bekezdést) figyelembe vételével adott esetben esetleg más osztályba kell besorolni.*
 - 2. A szerves fémvegyületeket olyan koncentrációban tartalmazó gyúlékony oldatok, amelyek vízzel érintkezve sem gyúlékony gázokat nem fejlesztenek veszélyes mennyiségben, sem öngyulladásra nem hajlamosak, a 3 osztály anyagai.*

2.3.5 ábra: Folyamatábra a szerves fémvegyületek besorolására a 4.2 és a 4.3 osztályba^{a, b)}

- a) Ha alkalmazható és a vizsgálat – figyelembe véve az anyag reakcióját – célszerűen végrehajtható, akkor a 6.1, ill. a 8 osztály szerinti tulajdonságokat a 2.1.3.10 bekezdés veszélyességi rangsor táblázata szerint kell számításba venni.
- b) Az N.1 - N.5 vizsgálati módszer leírását a „Vizsgálatok és kritériumok kézikönyv”, III. rész, 33. fejezet tartalmazza.

3. RÉSZ

A VESZÉLYES ÁRUK FELSOROLÁSA, KÜLÖNLEGES ELŐÍRÁSOK ÉS A KORLÁTOZOTT ÉS AZ ENGEDMÉNYES MENNYISÉGBEN CSOMAGOLT VESZÉLYES ÁRUKRA VONATKOZÓ MENTESSÉGEK

3.1 FEJEZET

ÁLTALÁNOS ELŐÍRÁSOK

3.1.1 Bevezetés

Az e rész táblázataiban található vagy hivatkozott előírásokon kívül minden rész, fejezet és/vagy szakasz általános követelményeit is be kell tartani. A táblázatok ezeket az általános követelményeket nem tartalmazzák. Ha egy általános követelmény valamely különleges előírásnak ellentmond, a különleges előírás a mértékadó.

3.1.2 Helyes szállítási megnevezés

Megjegyzés: *Minták szállításánál a helyes szállítási megnevezésre lásd a 2.1.4.1 bekezdést.*

3.1.2.1 A helyes szállítási megnevezés a 3.2 fejezet „A” táblázatában szereplő, az árut legpontosabban leíró tétel azon része, amely nagybetűvel van szedve (és minden szám, görög betű, „sec”, „terc”, „m”, „n”, „o”, „p” betűk, amelyek a megnevezés szerves részét képezik). A helyes szállítási megnevezés után zárójelben egy másik helyes szállítási megnevezés is lehet [pl. ETANOL (ETIL-ALKOHOL)]. A tétel kisbetűvel szedett része nem tekintendő a helyes szállítási megnevezés részének.

3.1.2.2 Amennyiben az „és” vagy a „vagy” kötőszavak kisbetűvel vannak írva, vagy ha az egyes megnevezések vesszővel vannak elválasztva, a tétel teljes helyes szállítási megnevezését nem szükséges feltüntetni a fuvarokmányban vagy a küldeménydarab feliratozásánál. Ez különösen akkor áll fenn, ha egyetlen UN szám alatt több különböző tétel kombinációja van felsorolva. Az alábbi példák mutatják az ilyen tételeknél a helyes szállítási megnevezés kiválasztását:

a) UN 1057 ÖNGYÚJTÓK vagy ÖNGYÚJTÓ UTÁNTÖLTŐK

A helyes szállítási megnevezés a következő lehetséges kombinációk közül a legalkalmasabb:

ÖNGYÚJTÓK
ÖNGYÚJTÓ UTÁNTÖLTŐK;

b) UN 2793 VASTARTALMÚ FORGÁCS FÚRÁSBÓL, KÖSZÖRÜLÉSBŐL, ESZTERGÁLÁSBÓL vagy DARABOLÁSBÓL önmelegedésre hajlamos formában.

A helyes szállítási megnevezés a következő kombinációk közül a legalkalmasabb:

VASTARTALMÚ FORGÁCS FÚRÁSBÓL
VASTARTALMÚ FORGÁCS KÖSZÖRÜLÉSBŐL
VASTARTALMÚ FORGÁCS ESZTERGÁLÁSBÓL
VASTARTALMÚ FORGÁCS DARABOLÁSBÓL.

3.1.2.3 A helyes szállítási megnevezés lehet egyes számban vagy többes számban, ahogy megfelelő. Ezen kívül amennyiben a helyes szállítási megnevezésben jelzős szerkezet van, az okmányokban és a küldeménydarabok feliratán a szórend – értelemszerűen – megváltoztatható. Például: a „dimetil-amin vizes oldata” helyett „vizes dimetil-amin oldat” is írható. Az 1 osztály áruinál a helyes szállítási megnevezést magában foglaló, további leírással kiegészített kereskedelmi vagy katonai nevek is használhatók.

3.1.2.4 Számos anyagra külön tétel van folyékony és szilárd állapotban (a folyékony és a szilárd meghatározását lásd az 1.2.1 szakaszban), ill. szilárd állapotban és oldat formájában. Ezek

eltérő UN számok alá tartoznak, amelyek nem feltétlenül egymás után következnek¹⁾.

3.1.2.5 Ha az 1.2.1 szakasz meghatározása szerint szilárd anyagot olvasztott állapotban adnak fel szállításra, akkor a helyes szállítási megnevezést ki kell egészíteni az „OLVASZTOTT” jelzővel, kivéve, ha ez a 3.2 fejezet „A” táblázatában levő megnevezésben nagybetűvel szedve szerepel (pl. OLVASZTOTT, SZILÁRD ALKIL-FENOL, M.N.N.).

3.1.2.6 Ha a 2.2.x.2 bekezdések szerint egy anyag stabilizálás nélkül a szállításból ki lenne zárva, mivel normális szállítási feltételek mellett veszélyes reakcióra hajlamos, a helyes szállítási megnevezést ki kell kiegészíteni a „STABILIZÁLT” kifejezéssel (pl.: „SZERVES, MÉRGEZŐ FOLYÉKONY ANYAG, M.N.N., STABILIZÁLT”), kivéve az önreaktív anyagokat, a szerves peroxidokat és azokat az anyagokat, amelyeknél a 3.2 fejezet „A” táblázat 2 oszlopában lévő megnevezésben a „STABILIZÁLT” szó nagybetűvel szedve szerepel.

Ha az ilyen anyagokat hőmérséklet-szabályozással stabilizálják, hogy mindenféle veszélyes túlnyomás kialakulását megakadályozzák, akkor:

- a) folyadékok esetében: ha az ÖBH 50 °C vagy annál kisebb, akkor a 2.2.41.1.17 pont előírásait, a 7.2 fejezet V8 különleges előírását, a 8.5 fejezet S4 különleges előírását és a 9.6 fejezet követelményeit kell betartani, IBC-ben és tartányban történő szállítás esetén az összes olyan előírást kell betartani, amely az UN 3239 anyagra vonatkozik (lásd különösen a 4.1.7.2 bekezdés IBC520 csomagolási utasítását és a 4.2.1.13 bekezdést);
- b) gázok esetében: a szállítási feltételeket az illetékes hatóságnak kell jóváhagynia.

3.1.2.7 A hidrátok a vízmentes anyagra vonatkozó helyes szállítási megnevezés alatt szállíthatók.

3.1.2.8 *Generikus vagy „másként meg nem nevezett” (m.n.n.) tételek*

3.1.2.8.1 Azokat az „m.n.n.” vagy „generikus” helyes szállítási megnevezéseket, amelyekhez a 3.2 fejezet „A” táblázat 6 oszlopában a 274 vagy a 318 különleges előírás van hozzárendelve, ki kell egészíteni az áru műszaki megnevezésével, kivéve, ha az áru ellenőrzött termék, aminek közzétételét belföldi jogszabály vagy nemzetközi egyezmény tiltja. Az 1 osztály robbanó-anyagai esetében a veszélyes áru megnevezése kiegészíthető további leírással, kereskedelmi vagy katonai névvel. A műszaki megnevezést közvetlenül a helyes szállítási megnevezés után, zárójelben kell feltüntetni. Ezekon kívül a megnevezéshez megfelelő kiegészítő leírás is fűzhető, mint pl. a „tartalmaz”, „tartalmazó”, „keverék”, „oldat” stb. szavak, ill. a technikai alkotórész százalékos aránya is megadható. Például „UN 1993 Gyúlékony folyékony anyag, m.n.n. (xilolt és benzolt tartalmaz), 3, II”.

3.1.2.8.1.1 A műszaki megnevezés lehet elfogadott kémiai vagy biológiai megnevezés, vagy a tudományos és műszaki kézikönyvekben, folyóiratokban és egyéb szakirodalomban jelenleg használt, egyéb megnevezés. Kereskedelmi nevek erre a célra nem használhatók. Peszticidek esetén az ISO által elfogadott megnevezés vagy „A WHO ajánlása a peszticidek veszély szerinti osztályozására és az osztályozás irányelvei” („The WHO Recommended Classification of Pesticides by Hazard and Guidelines to Classification”) c. kiadványban felsorolt nevek, illetve a hatóanyagok neve használható.

3.1.2.8.1.2 Ha egy veszélyes anyago(ka)t tartalmazó keverék olyan „m.n.n.” vagy „generikus” tételhez tartozik, amelynél a 3.2 fejezet „A” táblázat 6 oszlopában a 274 különleges előírás található, nem szükséges két olyan alkotórésznel többet megnevezni, amely a keverék veszélyessége tekintetében mérvadó. Ha az áru ellenőrzött termék, aminek közzétételét belföldi jogszabály vagy nemzetközi egyezmény tiltja, nem kell az alkotórészeket megnevezni. Ha a keveréket tartalmazó küldeménydarabon járulékos veszélyre utaló bárca van, a zárójelben levő két műszaki megnevezés egyikével azt az alkotórészt kell megnevezni, amelyik miatt a járulékos

1) A részleteket a betűrendes felsorolás tartalmazza (3.2 fejezet „B” táblázat), pl.
NITRO-XILOLOK, FOLYÉKONY 6.1 1665
NITRO-XILOLOK, SZILÁRD 6.1 3447

veszélyre utaló bárca szükséges. /*/-*/

Megjegyzés: Lásd az 5.4.1.2.2 pontot.

3.1.2.8.1.3

Az áru műszaki megnevezéssel kiegészített helyes szállítási megnevezésének megválasztását az ilyen tételeknél a következő példák mutatják:

UN 3394 PIROFOROS, VÍZZEL REAKTÍV, FOLYÉKONY, SZERVES FÉMVEGYÜLET (trimetil-gallium)

UN 2902 FOLYÉKONY, MÉRGEZŐ PESZTICID, M.N.N. (drazoxolon).

3.1.3

Oldatok és keverékek

Megjegyzés: Ha egy anyag a 3.2 fejezet „A” táblázatában név szerint meg van említve, akkor ezt az anyagot a szállítás során a 3.2 fejezet „A” táblázat 2 oszlopában található helyes szállítási megnevezéssel kell azonosítani. Az ilyen anyagok tartalmazhatnak olyan technikai szennyeződések (pl. a gyártási folyamatból) vagy a stabilitásukhoz vagy egyéb célból szükséges adalékanyagokat is, amelyek nem befolyásolják a besorolásukat. Az olyan anyagot azonban, amely név szerint meg van említve, és olyan technikai szennyeződések vagy a stabilitásához vagy egyéb célból szükséges adalékanyagokat tartalmaz, amelyek befolyásolják a besorolását, oldatnak vagy keveréknek kell tekinteni (lásd a 2.1.3.3 bekezdést).

3.1.3.1

Egy oldat vagy keverék akkor nem tartozik az ADR hatálya alá, ha az oldat vagy keverék jellemzői, tulajdonságai, fizikai formája, ill. állapota olyan, hogy egyetlen osztályba való sorolás kritériumainak sem felel meg, beleértve az embereken szerzett tapasztalatok kritériumait is.

3.1.3.2

Azt az ADR osztályozási kritériumainak megfelelő oldatot, ill. keveréket, amely túlnyomórészt egyetlen, a 3.2 fejezet „A” táblázatában név szerint felsorolt anyagból és egy vagy több, az ADR hatálya alá nem tartozó anyagból, vagy elenyésző mennyiségben egy vagy több, a 3.2 fejezet „A” táblázatában név szerint felsorolt anyagból áll, a 3.2 fejezet „A” táblázatában név szerint felsorolt, a túlnyomó részt kitevő anyag UN számához és helyes szállítási megnevezéséhez kell sorolni, kivéve, ha:

- az oldat vagy keverék név szerint fel van sorolva a 3.2 fejezet „A” táblázatában;
- a 3.2 fejezet „A” táblázatában név szerint felsorolt anyag neve és leírása kifejezetten utal arra, hogy az csak a tiszta anyagra vonatkozik;
- az oldat vagy a keverék osztálya, osztályozási kódja, csomagolási csoportja vagy fizikai állapota különbözik a 3.2 fejezet „A” táblázatában név szerint felsorolt anyagétól; vagy
- az oldat vagy a keverék veszélyes tulajdonságai és jellemzői miatt más veszélyhelyzeti intézkedés szükséges, mint a 3.2 fejezet „A” táblázatában név szerint felsorolt anyagnál.

Az olyan jelzővel, mint pl. „OLDAT” vagy „KEVERÉK” a helyes szállítási megnevezést megfelelően ki kell egészíteni, pl. „ACETON OLDAT”. Ezen kívül az oldat, ill. a keverék koncentrációja ugyancsak feltüntethető az oldat, ill. keverék alap megnevezése mellett, pl. „75%-os ACETON OLDAT”.

3.1.3.3

Azt az ADR osztályozási kritériumainak megfelelő oldatot, ill. keveréket, amely a 3.2 fejezet „A” táblázatában nincs név szerint feltüntetve, de két vagy több veszélyes anyagból tevődik össze, azon tétel alá kell besorolni, amelynek helyes szállítási megnevezése, leírása, osztálya, osztályozási kódja és csomagolási csoportja legpontosabban leírja az oldatot, ill. keveréket.

3.2 FEJEZET

A VESZÉLYES ÁRUK FELSOROLÁSA

3.2.1 Az „A” táblázat (A veszélyes áruk UN szám szerinti felsorolása) magyarázata

Az „A” táblázat egy-egy sora általában valamely konkrét UN szám alá tartozó összes anyagra vagy tárgyra vonatkozik. Ha azonban ugyanazon UN szám alá tartozó anyagok vagy tárgyak eltérő kémiai, fizikai tulajdonságokkal és/vagy szállítási feltételekkel rendelkeznek, az adott UN számra több, egymás utáni sor is vonatkozhat.

Az „A” táblázat oszlopai egy-egy meghatározott tárgykörre vonatkoznak, amint az a következő magyarázatban szerepel. Az oszlopok és sorok metszéspontja (rovat) tartalmazza az adott oszlopban szereplő tárgykört illetően az adott sor anyagára (anyagaira) vagy tárgyára (tárgyaira) vonatkozó információt:

- az első négy oszlop azonosítja az adott sorba tartozó anyago(ka)t vagy tárgya(ka)t (ebben a vonatkozásban kiegészítő információt adhatnak a 6 oszlopban található különleges előírások);
- a következő oszlopok a különleges előírásokat adják meg vagy szöveges, vagy kódolt formában. A kódok az itt következő magyarázatban feltüntetett részben, fejezetben, szakaszban és/vagy bekezdésben található részletes információra utalnak. Ha egy rovat üres, az azt jelenti, hogy vagy nincs különleges előírás és így csak az általános követelményeket kell alkalmazni, vagy a magyarázatban szereplő szállítási korlátozások érvényesek.

A rovatokban nincs utalás az általános követelményekre. Azt, hogy az általános követelmények melyik részben, fejezetben, szakaszban és/vagy bekezdésben találhatók, minden egyes oszlopra a következő magyarázat mutatja.

Magyarázó megjegyzések az egyes oszlopokhoz:

1 oszlop „UN szám”

Itt vannak feltüntetve:

- az egyedi UN számok, amelyek konkrétan egy-egy veszélyes anyaghoz vagy tárgyhoz vannak hozzárendelve, illetve
- a „generikus” vagy „m.n.n.” tételek UN száma, amelyhez a név szerint nem említett veszélyes anyagokat vagy tárgyakat a 2. rész osztályozási kritériumai (a „döntési fák”) szerint hozzá kell rendelni.

2 oszlop „Megnevezés és leírás”

Itt van feltüntetve – nagy betűvel szedve – az egyedi UN számmal rendelkező anyagok vagy tárgyak megnevezése, illetve a „generikus” vagy „m.n.n.” tételek megnevezése, amelyhez az anyagok vagy tárgyak a 2. rész osztályozási kritériumai (a „döntési fák”) szerint hozzá vannak rendelve. Ezt a megnevezést kell helyes szállítási megnevezésként, illetve annak részeként használni (a helyes szállítási megnevezésre vonatkozó további részletekre lásd a 3.1.2 szakaszt).

Ha egy anyag vagy tárgy besorolása és/vagy szállítási feltételei bizonyos körülmények között eltérőek lehetnek, a tétel értelmezéséhez a helyes szállítási megnevezés mellett – kisbetűvel szedve – további leírás is szerepel.

3a oszlop	<p>„Osztály”</p> <p>Itt van feltüntetve az osztály, amelynek fogalomkörébe a veszélyes anyag vagy tárgy tartozik. Az osztály számának hozzárendelése a 2. rész eljárásai és kritériumai szerint történik.</p>
3b oszlop	<p>„Osztályozási kód”</p> <p>Itt van feltüntetve a veszélyes anyag vagy tárgy osztályozási kódja.</p> <ul style="list-style-type: none"> – Az 1 osztály anyagai és tárgyai esetében a kód a 2.2.1.1.4 pont szerinti eljárások és kritériumok alapján hozzárendelt alosztály számából és összeférhetőségi csoport betűjéből áll. – A 2 osztály anyagai és tárgyai esetében a kód egy számból és a veszélyes tulajdonság szerinti csoport betűjéből (betűiből) áll, amelyek magyarázata a 2.2.2.1.2 és a 2.2.2.1.3 pontban található. – A 3, 4.1, 4.2, 4.3, 5.1, 5.2, 6.1, 6.2, 8 és 9 osztály anyagai és tárgyai esetében a kódok magyarázata a 2.2.x.1.2 pontban²⁾ található. – A 7 osztály anyagai és tárgyai esetében nincs osztályozási kód.
4 oszlop	<p>„Csomagolási csoport”</p> <p>Itt van feltüntetve az anyaghoz rendelt csomagolási csoport száma (I, II vagy III). A csomagolási csoportok a 2. rész szerinti eljárások és kritériumok alapján vannak hozzárendelve. Bizonyos anyagok és tárgyak nincsenek csomagolási csoporthoz rendelve.</p>
5 oszlop	<p>„Bárcák”</p> <p>Itt van feltüntetve azoknak a bárcáknak, nagybárcáknak a száma (lásd az 5.2.2.2 és az 5.3.1.7 bekezdést), amelyeket a küldeménydarabokon, konténereken, tankonténereken, mobil tartányokon, MEG-konténereken és járműveken kell elhelyezni. Azonban:</p> <ul style="list-style-type: none"> – a 7 osztály anyagai és tárgyai esetében a 7X a kategóriának megfelelően a 7A, 7B vagy 7C számú bárcát (lásd az 5.1.5.3.4 és az 5.2.2.1.11.1 pontot), vagy a 7D számú nagybárcát (lásd az 5.3.1.1.3 és az 5.3.1.7.2 pontot) jelenti. <p>A bárcákra, nagybárcákra vonatkozó általános előírásokat (azaz a bárcák darabszámát, elhelyezésüket) küldeménydarabok esetén az 5.2.2.1 bekezdés, konténerek, tankonténerek, mobil tartányok, MEG-konténerek és járművek esetében az 5.3.1 szakasz tartalmazza.</p> <p>Megjegyzés: A 6 oszlopban található különleges előírások módosíthatják az előző bárcázási előírásokat.</p>
6 oszlop	<p>„Különleges előírások”</p> <p>Itt van feltüntetve a betartandó különleges előírás(ok) száma. Ezek az előírások széles tárgykört fognak át, főleg az 1 – 5 oszlop tartalmához kapcsolódnak (pl. szállítási tilalmak, felmentések a követelmények alól, magyarázatok a veszélyes áruk bizonyos formáinak besorolásához és kiegészítő bárcázási vagy jelölési előírások) és a 3.3 fejezetben szám szerint vannak felsorolva. Ha a 6 oszlop üres, a szóban forgó veszélyes</p>

2) Ahol x = a veszélyes anyag vagy tárgy osztályának száma, a kétszámjegyű osztályoknál „pont” nélkül.

áru esetében az 1 – 5 oszlop tartalmára nem vonatkozik különleges előírás.

7a oszlop „Korlátozott mennyiség”

Itt van feltüntetve a belső csomagolásonkénti, ill. tárgyankénti legnagyobb mennyiség a veszélyes áru 3.4 fejezet szerinti, korlátozott mennyiségként történő szállításához.

7b oszlop „Engedményes mennyiség”

Itt egy betűből és számból álló kód van feltüntetve, amelynek jelentése a következő:

- az „E0” azt jelenti, hogy a veszélyes áru engedményes mennyiségben csomagolva sem mentesül az ADR előírásainak hatálya alól;
- minden más „E” kód azt jelenti, hogy az ADR előírásait nem kell alkalmazni, ha a 3.5 fejezetben előírt feltételek teljesülnek.

8 oszlop „Csomagolási utasítások”

Itt van feltüntetve az alkalmazandó csomagolási utasítás betűkből és számokból álló kódja:

- „P” betűvel kezdődő kód, amely a csomagolóeszközökre és a tartályokra (kivéve az IBC-eket és a nagycsomagolásokat) vonatkozó csomagolási utasításokra utal, ill. az „R” betűvel kezdődő kód, amely a finomlemez csomagolásokra vonatkozó csomagolási utasításokra utal. Ezek az utasítások a 4.1.4.1 bekezdésben szám szerinti sorrendben vannak feltüntetve, és azt határozzák meg, hogy milyen csomagolóeszközt vagy tartályt lehet használni. Ugyancsak utalnak arra, hogy a 4.1.1, 4.1.2 és 4.1.3 szakasz általános csomagolási előírásai közül és a 4.1.5, 4.1.6, 4.1.7, 4.1.8 és 4.1.9 szakasz különleges csomagolási előírásai közül melyeket kell betartani. Ha a 8 oszlopban nincs „P” vagy „R” betűvel kezdődő kód, a szóban forgó veszélyes áru nem szállítható csomagolóeszközben;
- „IBC” betűvel kezdődő kód, amely az IBC-kre vonatkozó csomagolási utasításokra utal. Ezek az utasítások a 4.1.4.2 bekezdésben szám szerinti sorrendben vannak feltüntetve, és azt határozzák meg, hogy milyen IBC-t lehet használni. Ugyancsak utalnak arra, hogy a 4.1.1, 4.1.2 és 4.1.3 szakasz általános csomagolási előírásai közül és a 4.1.5, 4.1.6, 4.1.7, 4.1.8 és 4.1.9 szakasz különleges csomagolási előírásai közül melyeket kell betartani. Ha a 8 oszlopban nincs „IBC” betűvel kezdődő kód, a szóban forgó veszélyes áru nem szállítható IBC-ben;
- „LP” betűvel kezdődő kód, amely a nagycsomagolásokra vonatkozó csomagolási utasításokra utal. Ezek az utasítások a 4.1.4.3 bekezdésben szám szerinti sorrendben vannak feltüntetve, és azt határozzák meg, hogy milyen nagycsomagolást lehet használni. Ugyancsak utalnak arra, hogy a 4.1.1, 4.1.2 és 4.1.3 szakasz általános csomagolási előírásai közül és a 4.1.5, 4.1.6, 4.1.7, 4.1.8 és 4.1.9 szakasz különleges csomagolási előírásai közül melyeket kell betartani. Ha a 8 oszlopban nincs „LP” betűvel kezdődő kód, a szóban forgó veszélyes áru nem szállítható nagycsomagolásban;

Megjegyzés: A 9a oszlopban található különleges csomagolási előírások módosíthatják az előző csomagolási utasításokat.

9a oszlop

„Különleges csomagolási előírások”

Itt van feltüntetve az alkalmazandó különleges csomagolási előírás betűkből és számokból álló kódja:

- „PP” vagy „RR” betűkkel kezdődő kód, amely a csomagolóeszközök és tartályok (kivéve az IBC-ket és nagycsomagolásokat) tekintetében kiegészítésképpen betartandó különleges csomagolási előírásokra utal. Ezek a különleges csomagolási előírások a 4.1.4.1 bekezdésben találhatók a megfelelő („P” vagy „R” betűvel kezdődő) csomagolási utasítások után, amelyekre a 8 oszlopban található hivatkozás. Ha a 9a oszlopban nincs „PP” vagy „RR” betűkkel kezdődő kód, a megfelelő csomagolási utasítás végén felsorolt különleges csomagolási előírások egyikét sem kell alkalmazni;
- „B” betűvel vagy „BB” betűkkel kezdődő kód, amely az IBC-k tekintetében kiegészítésképpen betartandó különleges csomagolási előírásokra utal. Ezek a különleges csomagolási előírások a 4.1.4.2 bekezdésben találhatók a megfelelő („IBC” betűkkel kezdődő) csomagolási utasítások után, amelyekre a 8 oszlopban található hivatkozás. Ha a 9a oszlopban nincs „B” betűvel vagy „BB” betűkkel kezdődő kód, a megfelelő csomagolási utasítás végén felsorolt különleges csomagolási előírások egyikét sem kell alkalmazni;
- „L” betűvel kezdődő kód, amely a nagycsomagolások tekintetében kiegészítésképpen betartandó különleges csomagolási előírásokra utal. Ezek a különleges csomagolási előírások a 4.1.4.3 bekezdésben találhatók a megfelelő („LP” betűkkel kezdődő) csomagolási utasítások után, amelyekre a 8 oszlopban található hivatkozás. Ha a 9a oszlopban nincs „L” betűvel kezdődő kód, a megfelelő csomagolási utasítás végén felsorolt különleges csomagolási előírások egyikét sem kell alkalmazni.

9b oszlop

„Egybecsomagolási előírások”

Itt van feltüntetve az alkalmazandó egybecsomagolási előírás „MP” betűkkel kezdődő kódja. Ezek az előírások szám szerinti sorrendben a 4.1.10 szakaszban vannak feltüntetve. Ha a 9b oszlop nem tartalmaz „MP” betűkkel kezdődő kódot, csak az általános követelményeket kell betartani (lásd a 4.1.1.5 és a 4.1.1.6 bekezdést).

10 oszlop

„Mobil tartány és ömlesztettáru-konténer utasítások”

Itt van feltüntetve a „mobil tartány utasítás” betűkből és számokból álló kódja, a 4.2.5.2.1 – 4.2.5.2.4 és a 4.2.5.2.6 pont szerint. Itt az a mobil tartány utasítás szerepel, amely a legkevésbé szigorú előírásokat takarja, amelyek betartásával az illető anyag mobil tartányban szállítható. A 4.2.5.2.5 pontban vannak azok a kódok, amelyek a többi mobil tartány utasítást jelölik, amelyek szerint az anyag ugyancsak szállítható. Ha nincs kód megadva, akkor a mobil tartányban történő szállítás nem engedélyezett, kivéve, ha azt az illetékes hatóság a 6.7.1.3 bekezdés szerint engedélyezte.

A mobil tartányok tervezésére, gyártására, szerelvényeire, típus-jóváhagyására, vizsgálatára és jelölésére vonatkozó általános követelményeket a 6.7 fejezet tartalmazza. A használatra (pl. a töltésre) vonatkozó általános követelmények a 4.2.1 – 4.2.4 szakaszban találhatók.

Az „(M)” jelölés azt jelenti, hogy az anyag UN MEG-konténerben is

szállítható.

Megjegyzés: A 11 oszlopban található különleges előírások módosíthatják az előző követelményeket.

Itt lehetnek feltüntetve a „BK” betűkkel kezdődő kódok is, amelyek a 6.11 fejezetben leírt ömlesztettáru-konténer típusokra utalnak, amelyeket a 7.3.1.1 a) pont és a 7.3.2 szakasz előírásai szerint lehet ömlesztett áru szállítására használni.

11 oszlop

„Különleges előírások a mobil tartányokra és az ömlesztettáru-konténerekre”

Itt van feltüntetve a mobil tartányokra vonatkozó, ugyancsak betartandó különleges előírások betűkből és számokból álló kódja. Ezek a „TP” betűkkel kezdődő kódok a mobil tartányok gyártására és használatára vonatkozó különleges előírásokra utalnak, és a 4.2.5.3 bekezdésben találhatók.

Megjegyzés: Az itt feltüntetett különleges előírások nemcsak a 10 oszlopban előírt mobil tartányokra vonatkoznak, hanem – amennyiben műszakilag értelmezhető – azokra a mobil tartányokra is, amelyek a 4.2.5.2.5 pont táblázata szerint szintén használhatók.

12 oszlop

„ADR-tartány tartánykódja”

Itt van feltüntetve a tartány típust leíró, betűkből és számokból álló kód a 2 osztály gázaira a 4.3.3.1.1 pont szerint, a 3 – 9 osztály anyagaira a 4.3.4.1.1 pont szerint. Itt az a tartány típus szerepel, amely a legkevésbé szigorú előírásokat takarja, amelyek betartásával az illető anyag ADR-tartányban szállítható. A 2 osztály gázaira a 4.3.3.1.2 pontban, a 3 – 9 osztály anyagaira a 4.3.4.1.2 pontban vannak azok a kódok, amelyek a többi tartány típust jelölik, amelyekben az anyag ugyancsak szállítható. Ha nincs kód megadva, az ADR-tartányban történő szállítás nem engedélyezett.

Amennyiben ebben az oszlopban szilárd anyagra (S) és folyékony anyagra (L) vonatkozó tartánykód is található, ez azt jelenti, hogy az anyag szilárd vagy folyékony (olvasztott) állapotban egyaránt feladható tartányban való szállításra. Ez az előírás általában a 20 °C...180 °C közötti olvadáspontú anyagokra vonatkozik.

Ha egy szilárd anyagnál csak folyékony anyagra vonatkozó tartánykód (L) van ebben az oszlopban feltüntetve, akkor ez az anyag tartányban csak folyékony (olvasztott) állapotban adható fel szállításra.

A gyártásra, szerelvényekre, típusjóváhagyásra, vizsgálatra és jelölésre vonatkozó általános követelmények, amelyeket a tartánykód nem tartalmaz, a 6.8.1, 6.8.2, 6.8.3 és 6.8.5 szakaszban találhatók. A használatra (pl. legnagyobb töltési fokra, legkisebb próbanyomásra) vonatkozó általános követelmények a 4.3.1 – 4.3.4 szakaszban találhatók.

A tartánykód utáni (M) jelölés azt jelenti, hogy az anyag battériás járműben és MEG-konténerben is szállítható.

A tartánykód utáni „(+)” jelölés azt jelenti, hogy a tartány alternatív használata csak akkor megengedett, ha ez a típusjóváhagyási bizonyítványban szerepel.

A szálvázás műanyag tartányokra lásd a 4.4.1 szakaszt és a 6.9 fejezetet; a hulladékok szállítására szolgáló, vákuummal üzemelő tartányokra lásd a 4.5.1 szakaszt és a 6.10 fejezetet.

Megjegyzés: A 13 oszlopban található különleges előírások módosíthatják az előző követelményeket.

13 oszlop

„Különleges előírások az ADR-tartányokra”

Itt vannak feltüntetve az ADR-tartányokra vonatkozó, ugyancsak betartandó különleges előírások betűkből és számokból álló kódjai:

- a „TU” betűkkel kezdődő kódok a tartányok használatára vonatkozó különleges előírásokra utalnak, és a 4.3.5 szakaszban találhatók;
- a „TC” betűkkel kezdődő kódok a tartányok gyártására vonatkozó különleges előírásokra utalnak, és a 6.8.4 a) bekezdésben találhatók;
- a „TE” betűkkel kezdődő kódok a tartányok szerelvényeire vonatkozó különleges előírásokra utalnak, és a 6.8.4 b) bekezdésben találhatók;
- a „TA” betűkkel kezdődő kódok a tartányok típusjövőhagyására vonatkozó különleges előírásokra utalnak, és a 6.8.4 c) bekezdésben találhatók;
- a „TT” betűkkel kezdődő kódok a tartányok vizsgálatára vonatkozó különleges előírásokra utalnak, és a 6.8.4 d) bekezdésben találhatók;
- a „TM” betűkkel kezdődő kódok a tartányok jelölésére vonatkozó különleges előírásokra utalnak, és a 6.8.4 e) bekezdésben találhatók.

Megjegyzés: Az itt feltüntetett különleges előírások nemcsak a 12 oszlopban előírt tartányokra vonatkoznak, hanem – amennyiben műszakilag értelmezhető – azokra a tartányokra is, amelyek a 4.3.3.1.2, ill. a 4.3.4.1.2 pontban lévő tartányrangsor alapján szintén használhatók.

14 oszlop

„Jármű a tartányos szállításához”

Itt van feltüntetve az a kód (lásd a 9.1.1 szakaszt) amely az anyag tartányos szállítására használható járművet (beleértve a pótkocsi, ill. félpótkocsi vontatóját is) jelöli, a 7.4.2 szakasz szerint. A járművek szerkezetére és jóváhagyására vonatkozó követelményeket a 9.1, a 9.2 és a 9.7 fejezet tartalmazza.

15 oszlop

„Szállítási kategória / (Alagútkorlátozási kód)”

A rovat felső sorában van feltüntetve a szállítási kategóriát jelölő szám, amelyhez az anyag vagy a tárgy hozzá van rendelve az egy szállítóegységben szállított mennyiségből adódó mentesség alkalmazásához (lásd az 1.1.3.6 bekezdést).

A rovat alsó sorában, zárójelben van feltüntetve az alagútkorlátozási kód, mely utal az anyagot vagy tárgyat szállító jármű közúti alagúton való átszállításánál alkalmazandó korlátozásra. Ezek a korlátozások a 8.6 fejezetben találhatók. A „(–)” jelölés azt jelenti, hogy a tételhez nincs alagútkorlátozási kód hozzárendelve.

16 oszlop	<p>„Különleges előírások a küldeménydarabok szállítására”</p> <p>Itt vannak feltüntetve a „V” betűből és számokból álló kódok, amelyek a küldeménydarabok szállítására vonatkozó, esetleges különleges előírásokra utalnak, és a 7.2.4 szakaszban vannak felsorolva. A küldeménydarabok szállítására vonatkozó általános előírásokat a 7.1 és a 7.2 fejezet tartalmazza.</p> <p>Megjegyzés: <i>Ezen kívül a berakásra, kirakásra és árukezelésre vonatkozó, a 18 oszlopban található különleges előírásokat is be kell tartani.</i></p>
17 oszlop	<p>„Különleges előírások az ömlesztett szállításra”</p> <p>Itt vannak feltüntetve a „VV” betűkből és számokból álló kódok, amelyek az ömlesztett szállításra vonatkozó különleges előírásokra utalnak, és a 7.3.3 szakaszban vannak felsorolva. Ha nincs kód megadva, az ömlesztett szállítás nem engedélyezett. Az ömlesztett szállításra vonatkozó általános előírásokat a 7.1 és a 7.3 fejezet tartalmazza.</p> <p>Megjegyzés: <i>Ezen kívül a berakásra, kirakásra és árukezelésre vonatkozó, a 18 oszlopban található különleges előírásokat is be kell tartani.</i></p>
18 oszlop	<p>„Különleges előírások a szállításra – Berakás, kirakás és árukezelés”</p> <p>Itt vannak feltüntetve a „CV” betűkből és számokból álló kódok, amelyek a berakásra, kirakásra és árukezelésre vonatkozó különleges előírásokra utalnak, és a 7.5.11 szakaszban vannak felsorolva. Ha nincs kód megadva, csak az általános követelményeket kell betartani (lásd a 7.5.1 – 7.5.10 szakaszt).</p>
19 oszlop	<p>„Különleges előírások a szállításra – A szállítás lebonyolítása”</p> <p>Itt vannak feltüntetve az „S” betűből és számokból álló kódok, amelyek a szállítás lebonyolítására vonatkozó különleges előírásokra utalnak, és a 8.5 fejezetben vannak felsorolva. Ezeket az előírásokat a 8.1 – 8.4 fejezet követelményein felül kell alkalmazni, azonban ha ellentétben állnak a 8.1 – 8.4 fejezet előírásaival, akkor az itt feltüntetett különleges előírások érvényesek.</p>
20 oszlop	<p>„Veszélyt jelölő szám”</p> <p>Itt van feltüntetve a két vagy három számjegyből (egyes esetekben előtte egy „X” betűből) álló veszélyt jelölő szám a 2 – 9 osztály anyagaira és tárgyaira, ill. az 1 osztály anyagaira és tárgyaira az osztályozási kód (lásd a 3b oszlopot). Az 5.3.2.1 bekezdésben leírt esetekben ezt a számot narancssárga tábla felső részén kell feltüntetni. A veszélyt jelölő számok jelentése az 5.3.2.3 bekezdésben található.</p>
