3.2.2

„B” táblázat: Az ADR anyagainak és tárgyainak betűrendes felsorolása

Ez a tárgymutató a 3.2.1 szakasz „A” táblázatban UN szám szerinti sorrendben felsorolt anyagokat és tárgyakat tartalmazza betűrendes felsorolásban. A táblázat nem szerves része az ADR-nek. A táblázatot nem terjesztették be sem a Belső Szállítási Bizottság Veszélyes Áru Szállítási Munkacsoportjához ellenőrzés és jóváhagyás céljából, sem az ADR Szerződő Felekhez hivatalos jóváhagyás céljából. A táblázatot az „A” és „B” Mellékletben való eligazodás megkönnyítésére az ENSZ Európai Gazdasági Bizottsága Titkársága állította össze kellő gondossággal, azonban a táblázat használata nem helyettesíti a Mellékletek áttanulmányozását és az azokban foglalt előírások betartását, mivel ellentmondás esetén a Mellékletekben foglaltak a mérvadók. Joghatállyal csak az ADR és Mellékletei rendelkeznek.

- Megjegyzés: 1.** *A betűrendes sorrend céljából a következő információ nincs figyelembe véve, még ha az a helyes szállítás név részét képezi is: számok, görög betűk, rövidítések, mint „szek”, „terc”, és betűk, mint „N” (nitrogén), „n” (normál), „o” (orto), „m” (meta), „p” (para) és „m.n.n.” (másként meg nem nevezett).*
2. *Az anyagok és tárgyak nagybetűvel írt neve a helyes szállítási megnevezést (lásd a 3.1.2 szakaszt) jelenti, a keresetőség érdekében azonban esetenként a szavak sorrendje fel van cserélve. A helyes szállítási megnevezésre minden esetben a 3.2 fejezet „A” táblázat megnevezései a mértékadóak.*
3. *A anyagok és tárgyak nagybetűvel írt nevét követő „lásd” szó alternatív helyes szállítási megnevezést vagy egy helyes szállítási megnevezés részét jelöli (kivéve a PCB-knél) (lásd a 3.1.2.1 bekezdést).*
4. *Ha egy kisbetűvel írt nevet a „lásd” szó követ, az azt jelenti, hogy a név nem egy helyes szállítási megnevezés, csupán szinonima.*
5. *Ahol a tétel részben nagybetűvel, részben kisbetűvel van írva, a kisbetűs szöveg nem része a helyes szállítási megnevezésnek (lásd a 3.1.2.1 bekezdést).*
6. *Az okmányokban és a küldeménydarabok jelölésénél a helyes szállítási megnevezés az esettől függően egyes számban vagy többes számban használható (lásd a 3.1.2.3 bekezdést).*
7. *A helyes szállítási megnevezés pontos meghatározására lásd a 3.1.2 szakaszt.*

3.3 FEJEZET

EGYES ANYAGOKRA VAGY TÁRGYAKRA VONATKOZÓ KÜLÖNLEGES ELŐÍRÁSOK

3.3.1

Amennyiben a 3.2 fejezet „A” táblázatának 6 oszlopában egy anyagra vagy tárgyra különleges előírás vonatkozik, ezen különleges előírás jelentése és követelményei a következők:

- 16** Az új vagy régebben létező robbanóanyagok vagy robbanótárgyak mintái – az illetékes hatóságok által előírt módon (lásd a 2.2.1.1.3 pontot) – vizsgálati, besorolási, kutatási és fejlesztési vagy minőségellenőrzési célból, vagy mint kereskedelmi minták szállíthatók. A nem nedvesített vagy nem deszenzibilizált robbanóanyag minták mennyisége az illetékes hatóságok előírásai szerinti kis küldeménydarabokban 10 kg-ra van korlátozva. A nedvesített vagy deszenzibilizált robbanóanyag minták mennyisége 25 kg-ra van korlátozva.
- 23** Bár ez az anyag a gyúlékonyság veszélyével bír, ez csak zárt térben bekövetkező rendkívüli tűz esetén jelent tényleges veszélyt.
- 32** Ez az anyag semmilyen más formában nem tartozik az ADR előírásainak hatálya alá.
- 37** Ez az anyag bevont formában nem tartozik az ADR előírásainak hatálya alá.
- 38** Ez az anyag 0,1 tömeg%-nál nem több kalcium-karbid tartalommal nem tartozik az ADR előírásainak hatálya alá.
- 39** Ez az anyag 30 tömeg% alatti vagy legalább 90 tömeg% szilícium tartalommal nem tartozik az ADR előírásainak hatálya alá.
- 43** Ha peszticidként adják fel, akkor ezeket az anyagokat a megfelelő peszticid tétel alatt és a peszticidekre vonatkozó előírások (lásd a 2.2.61.1.10 – 2.2.61.1.11.2 pontot) szerint kell szállítani.
- 45** Azok az antimon-oxidok és antimon-szulfidok, amelyek arzéntartalma összes tömegükhöz viszonyítva a 0,5%-ot nem haladja meg, nem tartoznak az ADR előírásainak hatálya alá.
- 47** A ferri-cianidok és ferro-cianidok nem tartoznak az ADR előírásainak hatálya alá.
- 48** Ezt az anyagot tilos szállítani, ha 20%-nál több hidrogén-cianidot tartalmaz.
- 59** Ezek az anyagok nem tartoznak az ADR előírásainak hatálya alá, ha legfeljebb 50% magnéziumot tartalmaznak.
- 60** Amennyiben a koncentráció meghaladja a 72%-ot, az anyag nem szállítható.
- 61** A műszaki névnek, aminek a helyes szállítási megnevezést kell kiegészítenie, az elfogadott ISO névnek, (lásd az ISO 1750:1981 „Peszticidek és más agrokemikáliák – szokásos elnevezések” c. szabványt módosított formában) vagy „A WHO ajánlása a peszticidek veszély szerinti osztályozására és az osztályozás irányelvei” („The WHO Recommended Classification of Pesticides by Hazard and Guidelines to Classification”) c. kiadványban felsorolt névnek, illetve a hatóanyag nevének kell lennie (lásd a 3.1.2.8.1 és a 3.1.2.8.1.1 pontot is).

- 62** Ez az anyag nem tartozik az ADR előírásainak hatálya alá, ha nem tartalmaz 4%-nál több nátrium-hidroxidot.
- 65** A hidrogén-peroxid vizes oldatok 8%-nál kisebb hidrogén-peroxid tartalommal nem tartoznak az ADR előírásainak hatálya alá.
- 103** Az ammónium-nitritek, valamint a szervesetlen nitritek keverékei ammóniumsóval nem szállíthatók.
- 105** Az UN 2556 vagy UN 2557 leírásának megfelelő nitrocellulóz a 4.1 osztályba sorolható.
- 113** A vegyileg nem állandó keverékek nem szállíthatók.
- 119** Hűtőgépeknek számítanak azok a gépek vagy készülékek, amelyek belső tere élelmi-szerek és egyéb cikkek alacsony hőmérsékleten való tartására szolgál, valamint a légkondicionáló berendezések. Nem tartoznak az ADR előírásainak hatálya alá azok a hűtőgépek és hűtőgép részegységek, amelyek a 2 osztály 2.2.2.1.3 pont szerinti A vagy O csoportjába tartozó gázból 12 kg-nál kevesebbet, illetve 12 l-nél kevesebb ammóniaoldatot (UN 2672) tartalmaznak.
- 122** A járulékos veszélyeket, az esetleges szabályozási és vészhőmérsékletet és az UN számot (generikus tételt) a jelenleg besorolt szerves peroxid készítményekhez a 2.2.52.4 bekezdés tartalmazza.
- 123** (fenntartva)
- 127** Egyéb inert anyag vagy inert anyag keverék használható, amennyiben ez az inert anyag azonos flegmatizáló tulajdonságokkal rendelkezik.
- 131** A flegmatizált anyagnak lényegesen érzéketlenebbnek kell lennie, mint a száraz PETN.
- 135** A diklór-izocianursav dihidratált nátrium-sója nem tartozik az ADR előírásainak hatálya alá.
- 138** A p-bróm-benzil-cianid nem tartozik az ADR előírásainak hatálya alá.
- 141** Azok az anyagok, amelyeket megfelelő hőkezelésnek vetettek alá, és ezáltal nem jelentenek veszélyt a szállítás alatt, nem tartoznak az ADR előírásainak hatálya alá.
- 142** A legfeljebb 1,5% olaj-, és legfeljebb 11% nedvességtartalmú, oldószerrel extrahált szójaliszt, amely gyakorlatilag nem tartalmaz gyúlékony oldószert, nem tartozik az ADR előírásainak hatálya alá.
- 144** A legfeljebb 24 tf.% alkoholt tartalmazó vizes oldat nem tartozik az ADR előírásainak hatálya alá.
- 145** A III csomagolási csoportba tartozó alkoholos italok legfeljebb 250 liter űrtartalmú tartályokban szállítva nem tartoznak az ADR előírásainak hatálya alá.
- 152** Ezen anyag besorolása a szemcsemérettől és a csomagolástól függően változik, de a határokat kísérletileg még nem állapították meg. A megfelelő besorolást a 2.2.1 szakasz előírásai szerint kell elvégezni.
- 153** Ezt a tételt csak akkor lehet alkalmazni, ha a vizsgálatok alapján bizonyított, hogy az

anyagok vízzel érintkezve nem gyúlékonyak, nem mutatnak öngyulladás hajlamot és a fejlődött gázok keveréke sem gyúlékony.

162 (törölve)

163 A 3.2 fejezet „A” táblázatában név szerint említett anyag ilyen tételként nem szállítható. Az ilyen tételként szállított anyagok legfeljebb 20% olyan nitrocellulózt tartalmazhatnak, amely legfeljebb 12,6% nitrogént tartalmaz (száraz tömegre vetítve).

168 Azok az azbesztek, amelyek természetes vagy mesterséges kötőanyagba (pl. cement, műanyagok, aszfalt, gyanták vagy ásványérc) oly módon vannak beágyazva vagy azon rögzítve, hogy abból belélegezhető azbeszt szálak a szállítás során veszélyes mennyiségben nem szabadulhatnak ki, nem tartoznak az ADR előírásainak hatálya alá. Azok az azbesztet tartalmazó gyártmányok, amelyek ezt a feltételt nem elégítik ki, de úgy vannak csomagolva, hogy belélegezhető azbeszt szálak a szállítás során veszélyes mennyiségben nem szabadulhatnak ki, nem tartoznak az ADR előírásainak hatálya alá.

169 A ftálsavanhidrid szilárd állapotban és a tetrahidro-ftálsavanhidridek legfeljebb 0,05% maleinsavanhidriddel nem tartozik az ADR előírásainak hatálya alá. A legfeljebb 0,05% maleinsavanhidridet tartalmazó, olvasztott ftálsavanhidridet lobbanáspontján vagy annál magasabb hőmérsékleten az UN 3256 alá kell besorolni.

172 A járulékos veszéllyel rendelkező radioaktív anyagok esetén:

- a) a küldeménydarabokat el kell látni az anyagra jellemző minden járulékos veszélynek megfelelő veszélyességi bárcával; a járműveken és a konténereken pedig az ezeknek megfelelő nagybárcákat kell az 5.3.1 szakasz vonatkozó előírásai szerint elhelyezni;
- b) amennyiben szükséges, a radioaktív anyagot az I, a II vagy a III csomagolási csoporthoz a 2. részben a döntő járulékos veszélyre előírt csoportba sorolási kritériumok szerint kell hozzárendelni.

Az 5.4.1.2.5.1 b) pontban előírt leírásnak tartalmaznia kell a járulékos veszély leírását (pl. „Járlékos veszély: 3, 6.1”), azon összetevők megnevezését, amelyek ezen veszély(ek)e)t túlnyomórészt okozzák, és amennyiben van, a csomagolási csoportot is. A csomagolásra vonatkozóan lásd még a 4.1.9.1.5 pontot is.

177 A bárium-szulfát nem tartozik az ADR előírásainak hatálya alá.

178 Ezt a megnevezést csak a származási ország illetékes hatóságának engedélyével (lásd a 2.2.1.1.3 pontot) lehet használni, és csak akkor, ha egyéb alkalmas megnevezés nincs a 3.2 fejezet „A” táblázatában.

181 Az ilyen típusú anyagot tartalmazó küldeménydarabokat kiegészítésképpen el kell látni 1 számú veszélyességi bárcával (lásd az 5.2.2.2.2 pontot), kivéve, ha a származási ország illetékes hatósága engedélyezte ezen bárca elhagyását kifejezetten az alkalmazott csomagolásra, mivel a vizsgálatok eredményei bizonyították, hogy az anyag ebben a csomagolásban nem robbanásveszélyes (lásd az 5.2.2.1.9 pontot).

182 Az alkálifémek csoportját a lítium, a nátrium, a kálium, a rubídium és a cézium alkotja.

183 Az alkáliföldfémek csoportját a magnézium, a kalcium, a stroncium és a bárium alkotja.

- 186** Az ammónium-nitrát tartalom meghatározása során mindazon nitrát-ion mennyiséget, amellyel egyenértékű tömegű ammónium-ion van jelen a keverékben, ammónium-nitrátként kell számításba venni.
- 188** Nem tartoznak az ADR előírásainak hatálya alá azok a cellák és akkumulátorok, amelyek megfelelnek a következő előírásoknak:
- a) egy fémlítium- vagy lítiumötvözet-cella legfeljebb 1 g lítiumot tartalmaz, illetve lítiumion cella esetén a névleges kapacitás legfeljebb 20 Wh;
 - b) egy fémlítium- vagy lítiumötvözet-akkumulátor összesen legfeljebb 2 g lítiumot tartalmaz, illetve lítiumion akkumulátor esetén a névleges kapacitás legfeljebb 100 Wh. A 2009. január 1. előtt gyártottak kivételével, az ezen követelménynek megfelelő lítiumion akkumulátornak a külső házán fel kell tüntetni a névleges kapacitást (Wh-ban);
 - c) minden cella, ill. akkumulátor megfelel a 2.2.9.1.7 pont a) és e) alpontja előírásainak;
 - d) a cellákat, ill. akkumulátorokat, kivéve, ha készülékben vannak, a cellát, ill. akkumulátort teljesen magába foglaló belső csomagolásba kell helyezni. A cellákat, ill. akkumulátorokat a rövidzárlat ellen védeni kell. A védelemnek ki kell terjednie az ugyanabban a csomagolásban lévő vezetőképes anyaggal való érintkezésre is, mivel az is rövidzárlatot okozhat. A belső csomagolást a 4.1.1.1, a 4.1.1.2 és a 4.1.1.5 bekezdés előírásainak megfelelő, erős külső csomagolásba kell helyezni;
 - e) a készülékben lévő cellákat, ill. akkumulátorokat sérülés és rövidzárlat ellen védeni kell, és a készüléket olyan hatékony eszközzel kell ellátni, amely megakadályozza, hogy véletlenszerűen működésbe lépjen. Ezt a követelményt nem kell alkalmazni azokra az eszközökre, amelyek a szállítás során szándékosan működnek (rádiófrekvenciás azonosító (RFID) transzmitterek, órák, érzékelők, stb.) és amelyek nem képesek veszélyes hőfejlődést előidézni. Készülékben lévő akkumulátorok esetén a készüléket olyan erős külső csomagolóeszközbe kell csomagolni, amely a csomagolóeszköz ürtartalmának és rendeltetésének megfelelő szilárdságú, alkalmas anyagból és kialakítással készült, kivéve ha a készülék maga ugyanilyen védelmet nyújt a benne lévő akkumulátornak.
 - f) a készülékben (beleértve a nyomtatott áramköri lapot is) lévő gomb akkumulátort tartalmazó küldeménydarabok, valamint a legfeljebb négy, készülékben lévő cellát, vagy legfeljebb két, készülékben lévő akkumulátort tartalmazó küldeménydarabok kivételével a többi küldeménydarabot a következőképpen kell megjelölni:
 - i) fel kell rajta tüntetni, hogy „fémlítium”, ill. „lítiumion” cellát, ill. akkumulátort tartalmaz;
 - ii) fel kell rajta tüntetni, hogy a küldeménydarabot óvatosan kell kezelni és a küldeménydarab sérülése tűzveszélyt okoz;
 - iii) fel kell rajta tüntetni, hogy a küldeménydarab sérülése esetén különleges eljárásra (ellenőrzésre, átcsomagolásra) van szükség;
 - iv) fel kell rajta tüntetni a további információért hívható telefonszámot;
 - g) az f) pont szerinti jelöléssel ellátott küldeménydarabo(ka)t tartalmazó küldeményhez olyan okmányt kell mellékelni, amely a következőket tartalmazza:

- i) utalást arra, hogy a küldeménydarab „fémlítium”, ill. „lítiumion” cellát, ill. akkumulátort tartalmaz;
 - ii) utalást arra, hogy a küldeménydarabo(ka)t óvatosan kell kezelni és a küldeménydarab(ok) sérülése tűzveszélyt okoz;
 - iii) utalást arra, hogy a küldeménydarab sérülése esetén különleges eljárásra (ellenőrzésre, átcsomagolásra) van szükség;
 - iv) a további információért hívható telefonszámot;
- h) a készülékben lévő akkumulátorokat tartalmazók kivételével minden küldeménydarabnak alkalmasnak kell lennie, hogy elviselje az 1,2 m-ről bármilyen helyzetben végrehajtott ejtési próbát anélkül, hogy a benne levő cellák vagy akkumulátorok megsérüljenek, a tartalom olyan mértékben elmozdulna, ami az akkumulátorok (vagy a cellák) érintkezését eredményezi, ill. a tartalom kiszabadulna; és
- i) egy küldeménydarab bruttó tömege legfeljebb 30 kg lehet, kivéve, ha készülékben lévő vagy készülékkel egybeacsomagolt akkumulátorokat tartalmaz.

Az előzőekben, illetve bárhol az ADR-ben szereplő „lítiumtartalom” egy fémlítium vagy lítiumötvözet cella anódjában levő lítium tömegét jelenti.

A fémlítium és a lítiumion akkumulátorokra külön tételek vannak, hogy különböző módon lehessen szállítani, ill. eltérő vészhelyzeti eljárásokat lehessen alkalmazni.

- 190** Az aeroszol csomagolásokat az akaratlan működtetés ellen védelemmel kell ellátni. A legfeljebb 50 ml űrtartalmú aeroszolak, amelyek csak nem mérgező alkotórészeket tartalmaznak, nem tartoznak az ADR előírásainak hatálya alá.
- 191** A legfeljebb 50 ml űrtartalmú, kisméretű tartályok, amelyek csak nem mérgező alkotórészeket tartalmaznak, nem tartoznak az ADR előírásainak hatálya alá.
- 194** Az esetleges szabályozási és vészhőmérsékletek és az UN számok (generikus tételek) a jelenleg besorolt önreaktív anyagokhoz a 2.2.41.4 bekezdésben találhatók.
- 196** Azok a készítmények szállíthatók e tételként, amelyek a laboratóriumi vizsgálat során nem detonálnak kavitált állapotban, nem deflagrálnak, nem mutatnak semmiféle hatást zárt térben hevítve és nincs robbanóerejük. A készítménynek termikusan stabilnak kell lennie (öngyorsuló bomlási hőmérséklet 50 kg-os küldeménydarabban 60 °C vagy annál magasabb). Az e kritériumokat nem teljesítő készítményeket az 5.2 osztály előírásai szerint kell szállítani (lásd a 2.2.52.4 bekezdést).
- 198** A legfeljebb 20% nitrocellulóz tartalmú nitrocellulóz oldatok festékként, parfüm készítményként vagy nyomdafestékként szállíthatók (lásd UN 1210, UN 1263, UN 1266, UN 3066, UN 3469 és UN 3470).
- 199** Azok az ólomvegyületek, amelyek 0,07M sósavoldattal 1:1000 arányban vegyítve, 23°C ± 2 °C-on történő, egy órán keresztül tartó keveréssel legfeljebb 5%-ban oldhatók (lásd az ISO 3711:1990 „Ólom-kromát pigmentek és ólom-kromát/ólom-molibdát pigmentek – Meghatározások és vizsgálati módszerek” c. szabványt), oldhatatlannak tekinthetők és így nem tartoznak az ADR előírásainak hatálya alá, kivéve, ha valamely más osztály besorolási kritériumainak megfelelnek.
- 201** Az öngyújtóknak és öngyújtó utántöltőknek meg kell felelniük azon ország előírásainak, ahol megtöltötték. A véletlen működésbe lépés ellen védeni kell. A gáz folyadékfázisa 15 °C-on nem haladhatja meg a tartály űrtartalmának 85%-át. A

tartályoknak, beleértve a zárószerkezeteket, el kell viselniük a cseppfolyósított szénhidrogén-gáz által 55 °C-on kifejtett nyomás kétszeresével egyenlő belső nyomást. A szelepeket és a gyújtószerkezetet reteszeléssel, tapadószalagos lezárással vagy más alkalmas módon rögzíteni kell, vagy eleve úgy kell kialakítani, hogy a szállítás alatt ne léphessen működésbe, ill. a tartalom ne szabadulhasson ki. Az öngyújtók nem tartalmazhatnak 10 g-nál több cseppfolyósított szénhidrogén-gázt. Az öngyújtó utántöltők nem tartalmazhatnak 65 g-nál több cseppfolyósított szénhidrogén-gázt.

Megjegyzés: Az elkülönítve összegyűjtött hulladék öngyújtókra lásd a 3.3 fejezet 654 különleges előírását.

- 203** Ez a tétel nem használható az UN 2315 folyékony, poliklórozott bifenilekhez és az UN 3432 szilárd, poliklórozott bifenilekhez.
 - 204** (törölve)
 - 205** Ez a tétel nem használható az UN 3155 pentaklór-fenolhoz.
 - 207** A polimer gyöngyök és műanyag sajtolóanyagok lehetnek polisztirolból, poli(metil-metakrilát)-ból vagy más polimerből.
 - 208** A kalcium-nitrát műtrágyák kereskedelmi formái, amelyek főleg kettős sóból (kalcium-nitrátból és ammónium-nitrátból) állnak és nem tartalmaznak 10%-nál több ammónium-nitrátot, de legalább 12% kristályvíz tartalmúak, nem tartoznak az ADR előírásainak hatálya alá.
 - 210** A fertőző anyagokat tartalmazó növényi, állati vagy baktérium forrásokból származó toxinokat és a fertőző anyagokban levő toxinokat a 6.2 osztályba kell besorolni.
 - 215** Ez a tétel csak az olyan, technikailag tiszta anyagra, illetve belőle készült formulázásokra vonatkozik, amelyek ÖBH-ja (öngyorsuló bomlási hőmérséklete) meghaladja a 75 °C-ot. Nem vonatkozik tehát olyan formulázásokra, amelyek önreaktív anyagok. (Az önreaktív anyagokra lásd a 2.2.41.4 bekezdést.)
- A legfeljebb 35 tömeg% azo-dikarbonamidot és legalább 65 tömeg% inert anyagot tartalmazó homogén keverékek nem tartoznak az ADR előírásainak hatálya alá, kivéve, ha más osztály kritériumait is kielégítik.
- 216** Az ADR előírásainak hatálya alá nem tartozó szilárd anyagok és gyúlékony folyadékok keverékei e tétel alatt szállíthatók anélkül, hogy előzetesen a 4.1 osztály besorolási kritériumait alkalmazzák, amennyiben az anyag berakodása során, illetve a csomagolóeszköz, a jármű vagy a konténer lezárásakor szabad folyadék szemmel nem látható. Nem tartoznak az ADR hatálya alá azok a légmentesen zárt csomagolások, ill. tárgyak, melyek a II vagy a III csomagolási csoportba tartozó gyúlékony folyadékot tartalmaznak szilárd anyagban abszorbeálva, 10 ml-nél kisebb mennyiségben, ha a csomagolásban, ill. a tárgyban nincs szabad folyadéktartalom.
 - 217** Az ADR előírásainak hatálya alá nem tartozó szilárd anyagok és mérgező folyadékok keverékei e tétel alatt szállíthatók anélkül, hogy előzetesen a 6.1 osztály besorolási kritériumait alkalmazzák, amennyiben az anyag berakodása során, illetve a csomagolóeszköz, a jármű vagy a konténer lezárásakor szabad folyadék szemmel nem látható. Ez a tétel nem használható az I csomagolási csoportba tartozó folyadékot tartalmazó szilárd anyagokhoz.
 - 218** Az ADR előírásainak hatálya alá nem tartozó szilárd anyagok és maró folyadékok keverékei e tétel alatt szállíthatók anélkül, hogy előzetesen a 8 osztály besorolási

kritériumait alkalmazzák, amennyiben az anyag berakodása során, illetve a csomagolóeszköz, a jármű vagy a konténer lezárásakor szabad folyadék szemmel nem látható.

- 219** A 4.1.4.1 bekezdés P904 csomagolási utasítása szerint csomagolt és jelölt géntechnológiával módosított mikroorganizmusok (GMMO-k) és géntechnológiával módosított élő szervezetek (GMO-k) nem tartoznak az ADR más előírásainak hatálya alá.
- Ha a GMMO-k, ill. GMO-k kielégítik a 6.1 vagy a 6.2 osztályba sorolás kritériumait (lásd a 2.2.61.1 és a 2.2.62.1 bekezdést), akkor az ADR-nek a mérgező anyagok, ill. a fertőző anyagok szállítására vonatkozó előírásait kell alkalmazni.
- 220** Csak az oldat vagy keverék gyúlékony folyadék összetevőjének műszaki nevét kell a helyes szállítási megnevezés után zárójelben feltüntetni.
- 221** Az I csomagolási csoportba tartozó anyagokat nem lehet ebbe a tételbe felvenni.
- 224** Hacsak vizsgálatokkal nem lehet bizonyítani, hogy az érzékenység fagyasztott állapotban nem nagyobb, mint folyékony állapotban, a hajtóanyagnak normális szállítási feltételek között folyékony állapotban kell maradnia, és $-15\text{ }^{\circ}\text{C}$ feletti hőmérsékleten nem szabad megfagynia.
- 225** Az e tétel alá sorolt tűzoltókészülékek tartalmazhatnak beépített működtető töltetet (az 1.4C vagy 1.4S osztályozási kód alá tartozó munkavégző töltetet), anélkül, hogy a 2 osztály 2.2.2.1.3 pont szerinti A vagy O csoportjába történő besorolás megváltozna, feltéve, hogy a deflagráló robbanóanyag (hajtóanyag) összes mennyisége nem haladja meg tűzoltókészülékenként a 3,2 g-ot.
- 226** Ennek az anyagnak azok a formulázásai, amelyek legalább 30% nem illékony, nem gyúlékony flegmatizálószer tartalmaznak, nem tartoznak az ADR előírásainak hatálya alá.
- 227** Ha a flegmatizáláshoz vizet és szervesetlen, inert anyagot használnak, a karbamid-nitrát tartalom nem haladhatja meg a 75 tömeg%-ot, és a keverék a „Vizsgálatok és kritériumok kézikönyv” I. Rész szerinti 1 vizsgálati sorozat, a) próbája során nem lehet képes a detonálásra.
- 228** Azokat a keverékeket, amelyek a gyúlékony gázokra vonatkozó kritériumok (lásd a 2.2.2.1.5 pontot) szerint nem gyúlékonyak, az UN 3163 tételként kell szállítani.
- 230** A lítium-cellák és -akkumulátorok e tétel alatt akkor szállíthatók, ha kielégítik a 2.2.9.1.7 pont követelményeit.
- 235** Ez a tétel azokra a tárgyakra vonatkozik, amelyek az 1 osztályba tartozó robbanóanyagot tartalmaznak és emellett tartalmazhatnak egyéb osztályba tartozó veszélyes árut is, és amelyeket járművekben életmentő légszák gázgenerátorként, légszák modulként vagy biztonsági öv előfeszítőként használnak.
- 236** A poliészter gyanta készlet két komponensből áll: az alapanyagból (3 osztály, II vagy III csomagolási csoport) és az aktiváló anyagból (szerves peroxidokból). A szerves peroxidnak D, E vagy F típusúnak kell lennie és nem igényelhet hőmérséklet-szabályozást. A csomagolási csoportnak a 3 osztály feltételei szerint az alapanyagra meghatározva II-nek vagy III-nak kell lennie. A 3.2 fejezet „A” táblázatának 7a oszlopában látható mennyiségi határokat az alapanyagra kell alkalmazni.

- 237** A membránszűrők, beleértve a szállításhoz jelen lévő papír szeparátorokat, bevonó és hordozó anyagokat stb., nem lehetnek hajlamosak a detonáció továbbvitelére a „Vizsgálatok és kritériumok kézikönyv” I. Rész 1.a) vizsgálati sorozat szerinti bármely próba során.

Ezen kívül az illetékes hatóság megfelelő égési sebesség vizsgálatok eredményei alapján (figyelembe véve a „Vizsgálatok és kritériumok kézikönyv” III. Rész 33.2.1 bekezdésében található standard vizsgálatokat) meghatározhatja, hogy a nitro-cellulóz membránszűrők abban a formában, ahogyan szállítják, nem tartoznak a 4.1 osztályba tartozó gyúlékony szilárd anyagokra vonatkozó előírások hatálya alá.

- 238** a) Az akkumulátortelepek akkor tekinthetők kifolyásmentesnek, amennyiben képesek ellenállni a következők szerinti rezgés- és nyomáskülönbség-vizsgálatoknak az akkumulátorfolyadék kifolyása nélkül.

Rezgésvizsgálat: az akkumulátort mereven rögzíteni kell a rázóasztal lapjára és egyszerű harmonikus rezgőmozgásnak kell kitenni, amelynek amplitúdója 0,8 mm (1,6 mm maximális kitérés). A frekvenciát 1 Hz/min sebességgel kell változtatni 10 Hz és 55 Hz határok között. A teljes frekvenciamenetnek és a visszatérésnek 95 ± 5 perc alatt kell végbemennie minden egyes szerelési helyzetben (rezgési irány). Az akkumulátort három egymásra kölcsönösen merőleges helyzetben (beleértve a töltőnyílások és szellőzőnyílások, ha ilyenek vannak, fordított helyzetben történő vizsgálatát) azonos időtartamig kell vizsgálni.

Nyomáskülönbség vizsgálat: a rezgésvizsgálatot követően az akkumulátorokat 6 órán át $24\text{ °C} \pm 4\text{ °C}$ -on kell tárolni, miközben legalább 88 kPa nyomáskülönbségnek kell kitenni. Az akkumulátorokat három egymásra kölcsönösen merőleges irányban (beleértve a töltőnyílások és szellőzőnyílások, ha ilyenek vannak, fordított helyzetben történő vizsgálatát) minden egyes helyzetben legalább 6 órán át kell vizsgálni.

- b) A kifolyásmentes akkumulátortelepek nem tartoznak az ADR előírásainak hatálya alá abban az esetben, ha 55 °C -on az elektrolit nem folyik ki a sérült vagy repedt akkumulátorból, és nincs szabad folyadék, ami kifolyhatna, illetve a szállításra kész csomagolásban a sorkapcsok a rövidzárlat ellen védve vannak.

- 239** Az akkumulátorok vagy cellák nátriumon, kénen és nátrium vegyületeken (pl. nátrium-poliszulfidok és nátrium-tetrakloro-aluminát) kívül nem tartalmazhatnak más veszélyes anyagot. Az akkumulátorok vagy cellák olyan hőmérsékleten, amelynél a bennük levő elemi nátrium folyékonnyá válhat, csak a származási ország illetékes hatóságának jóváhagyásával és az általa meghatározott feltételek mellett adhatók fel szállításra. Ha a származási ország nem valamely ADR Szerződő Fél, akkor a küldemény által érintett első ADR Szerződő Fél illetékes hatóságának kell a jóváhagyást és a szállítási feltételeket elismernie.

A celláknak tömören zárt fémházakból kell állniuk, melyek a veszélyes anyagokat teljesen magukba zárják, és kialakításuk és zárásuk normális szállítási feltételek mellett megakadályozza ezen anyagok kiszabadulását.

Az akkumulátoroknak fémházba teljesen bezárt és rögzített cellákból kell állniuk, amelynél a ház kialakítása és zárása normális szállítási feltételek mellett megakadályozza a veszélyes anyagok kiszabadulását.

- 240** Lásd a 2.2.9.1.7 ponthoz fűzött utolsó megjegyzést.

- 241** A formulázást úgy kell készíteni, hogy a szállítás alatt homogén maradjon és ne váljon szét. Nem tartoznak az ADR előírásainak hatálya alá azok az alacsony nitro-

cellulóz tartalmú formulázások, amelyek a „Vizsgálatok és kritériumok kézikönyv” I. Rész 1.a), 2.b), illetve 2.c) vizsgálati sorozat szerint elvégzett, zárt térben való hevítés hatására történő detonálási, deflagrációs vagy robbanási tulajdonságok vizsgálata során nem mutatnak semmiféle veszélyes tulajdonságot, és a „Vizsgálatok és kritériumok kézikönyv” III. Rész 33.2.1.4 bekezdése szerinti N.1 vizsgálatban nem viselkednek gyúlékony szilárd anyagként (ehhez a vizsgálathoz a lemezes anyagot szükség esetén meg kell őrölni és szitálni, hogy szemcsemérete 1,25 mm-nél kisebb legyen).

- 242** A kén nem tartozik az ADR előírásainak hatálya alá, ha különleges alakúra van formázva (pl. szemcsés, granulált, pellet, pasztilla vagy pehely).
- 243** A szikragyújtású motorokhoz (pl. gépjárművekhez, helyhez kötött és egyéb motorokhoz) használt motorbenzint, benzint és gázolint e tétel alá kell besorolni, függetlenül az eltérő illékonyságuktól.
- 244** E tétel alá tartozik pl. az alumíniumhamu, alumíniumsalak, alumínium lefőlözés, elhasználdott katódok, elhasználdott üstbélések és alumíniumsó salak.
- 247** A 24 tf.%-nál több, de legfeljebb 70 tf.% alkoholtartalmú alkoholos italok, ha a gyártási eljárás részeként szállítják, a 4.1.1 szakasz általános előírásainak megfelelő, 250 liternél nagyobb, de legfeljebb 500 liter űrtartalmú fahordókban is szállíthatók a következő feltételek mellett:
- a) a fahordókat töltés előtt szemrevételezni és tömíteni kell;
 - b) megfelelő folyadékmentes teret kell hagyni (legalább 3%), lehetővé téve a folyadék tágulását;
 - c) a fahordókat a hordónyílással felfelé kell szállítani; és
 - d) a fahordókat „A Biztonságos Konténerekről szóló 1972. évi Nemzetközi Egyezmény” (CSC) módosított kiadása követelményeit kielégítő konténerekben kell szállítani. Minden fahordót hozzá igazított keretvázban kell rögzíteni és megfelelő módon ki kell ékelni, megakadályozva bármilyen irányú elmozdulást a szállítás alatt.
- 249** A korrózióval szemben stabilizált ferrocérium (tűzkő) legalább 10% vastartalommal nem tartozik az ADR előírásainak hatálya alá.
- 250** Ez a tétel csak az elemzési célokra szolgáló vegyianyag mintákhoz használható a „Vegyifegyverek kifejlesztésének, gyártásának, felhalmozásának és használatának tilalmáról, valamint megsemmisítéséről szóló Egyezmény” teljesítésével kapcsolatosan. Az anyagok szállítása ezen tétel alatt a Vegyifegyver Tilalmi Szervezet által meghatározott felügyeleti rendszabályokkal és biztonsági eljárások szerint végezhető.

A vegyianyag minta csak az illetékes hatóság vagy a Vegyifegyver Tilalmi Szervezet főigazgatójának előzetes engedélyével szállítható, amennyiben a minta kielégíti a következő feltételeket:

- a) az ICAO Műszaki Utasítások (ICAO-TI) 623 csomagolási utasítása szerint (lásd a Kiegészítés S-3-8 pontját) kell csomagolni, és
- b) a szállítás idején a fuvarokmányhoz kell csatolni a szállítást engedélyező okmány egy példányát, amely feltünteti a mennyiségi korlátozást és a csomagolási utasítást is.

- 251** Az UN 3316 vizsgálókészlet vagy elsősegély felszerelés tétel olyan dobozokra, kazettákra stb. vonatkozik, amelyek különböző vegyi anyagokat tartalmaznak kis mennyiségben, amelyeket például gyógyászati, analitikai, vizsgálati vagy javítási célra használnak. Az ilyen vizsgálókészletek és felszerelések nem tartalmazhatnak olyan anyagot, amelynél a 3.2 fejezet „A” táblázat 7a oszlopában „0” mennyiség szerepel.
- Az alkotórészek nem reagálhatnak egymással veszélyesen (lásd a „veszélyes reakciót” az 1.2.1 szakaszban). A veszélyes anyag összes mennyisége vizsgálókészletenként vagy felszerelésenként nem haladhatja meg az 1 litert vagy 1 kg-ot. A vizsgálókészlet vagy felszerelés egészét a benne levő anyagokhoz tartozó legszigorúbb csomagolási csoportba kell sorolni.
- Azok a vizsgálókészletek vagy felszerelések, amelyeket a járműveken elsősegély vagy helyi felhasználás céljából szállítanak, nem tartoznak az ADR előírásainak hatálya alá.
- A 3.4 fejezet szerint szállíthatók azok a vizsgálókészletek és elsősegély felszerelések, amelyeknél a belső csomagolásban a veszélyes áru mennyisége nem haladja meg azt a korlátozott mennyiségre vonatkozó határt, amely a 3.2 fejezet „A” táblázat 7a oszlopában az egyes anyagokra meg van határozva.
- 252** Az ammónim-nitrát vizes oldata legfeljebb 0,2% éghető anyag tartalommal és legfeljebb 80%-os koncentrációval nem tartoznak az ADR előírásainak hatálya alá, feltéve, hogy az ammónium-nitrát a szállítás alatt minden körülmények között oldatban marad.
- 266** Ez az anyag a megadottnál kevesebb alkohol-, víz- vagy flegmatizálószer-tartalommal csak az illetékes hatóság külön engedélyével szállítható (lásd a 2.2.1.1 bekezdést).
- 267** A klorátokat tartalmazó, C típusú robbantóanyagokat el kell különíteni az ammónium-nitrátot vagy más ammóniumsót tartalmazó robbanóanyagoktól.
- 270** Az 5.1 osztályba tartozó szerves, szilárd nitrátok azon vizes oldatai, amelyek koncentrációja nem haladja meg a szállítás alatt felléphető legkisebb hőmérséklethez tartozó telítési határ 80%-át, úgy tekinthetők, hogy nem rendelkeznek az 5.1 osztály kritériumaival.
- 271** Flegmatizálószerként laktóz, glukóz vagy hasonló anyagok használhatók, feltéve, hogy az anyag legalább 90 tömeg% flegmatizálószer-tartalmaz. Az illetékes hatóság a „Vizsgálatok és kritériumok kézikönyv” I. Rész 16. fejezet 6 vizsgálati sorozat c) próba alapján, amelyet legalább 3, szállításra előkészített csomagoláson hajtottak végre, engedélyezheti ezen keverék 4.1 osztályba történő besorolását. A legalább 98 tömeg% flegmatizálószer-tartalmú keverékek nem tartoznak az ADR előírásainak hatálya alá. A legalább 90 tömeg% flegmatizálószer-tartalmú keverékeket tartalmazó küldeménydarabokat nem kell 6.1 számú bárcával ellátni.
- 272** Ez az anyag a 4.1 osztály anyagaként csak az illetékes hatóság külön engedélyével szállítható (lásd UN 0143, ill. UN 0150).
- 273** Az önmelegedéssel szemben stabilizált manebet és maneb készítményeket nem kell a 4.2 osztályba sorolni, ha vizsgálatokkal bizonyítható, hogy az anyag 1 m³-es kockája nem mutat öngyulladás hajlamot és a hőmérséklet a minta közepén nem haladja meg a 200 °C-ot, ha a mintát 24 órán át legalább 75 °C ± 2 °C-on tartják.
- 274** A 3.1.2.8 bekezdés előírásait kell alkalmazni.

- 278** Ez az anyag csak akkor sorolható be és szállítható, ha az illetékes hatóság a szállításra előkészített csomagoláson végzett, a „Vizsgálatok és kritériumok kézikönyv” I. Rész 2 vizsgálati sorozat és a 6 vizsgálati sorozat c) próba eredménye alapján (lásd a 2.2.1.1 bekezdést) engedélyezte. A csomagolási csoportot a 2.2.3 szakasz kritériumai és a 6 vizsgálati sorozat c) próbához használt csomagolóeszköz típusa alapján kell az illetékes hatóságnak meghatároznia.
- 279** Az anyag besorolása vagy csomagolási csoporthoz rendelése sokkal inkább az embereken szerzett tapasztalatokon, semmint az ADR-ben található besorolási kritériumok szigorú alkalmazása alapján történt.
- 280** E tétel alá tartoznak azok a járművekben használt életmentő légszák gázgenerátorok, légszák modulok és biztonsági öv előfeszítők, amelyek az 1 osztályba vagy más osztály(ok)ba tartozó veszélyes árut tartalmaznak, ha alkatrész-egységként szállítják és ha a szállításra kész csomagolásban a „Vizsgálatok és kritériumok kézikönyv” I. Rész 6.c) vizsgálati sorozat szerint bevizsgálták és ennek során nem robbantak fel, burkolatuk vagy a nyomástartó tartály nem tört szét és nem következett be veszélyes kivetődés vagy hőhatás, ami jelentősen akadályozná a tűzoltást vagy más vészhelyzeti intézkedés végrehajtását a közvetlen környezetben.
- 282** (törölve)
- 283** A lengéscsillapítóként szolgáló, gázt tartalmazó tárgyak, beleértve az ütközési energia elnyelésére használt eszközöket és a légrugókat, nem tartoznak az ADR előírásainak hatálya alá, feltéve, hogy:
- a) a gáztér űrtartalma legfeljebb 1,6 liter és a töltési nyomás legfeljebb 280 bar, úgy, hogy az űrtartalom (liter) és a töltési nyomás (bar) szorzata legfeljebb 80 (azaz 0,5 literes gáztér és 160 bar töltési nyomás, 1 literes gáztér és 80 bar töltési nyomás, 1,6 literes gáztér és 50 bar töltési nyomás, 0,28 literes gáztér és 280 bar töltési nyomás);
 - b) a legkisebb repesztőnyomás a legfeljebb 0,5 literes gázterű gyártmányoknál a 20 °C-hoz tartozó töltési nyomás 4-szerese, a 0,5 literesnél nagyobb gázterű gyártmányoknál a 20 °C-hoz tartozó töltési nyomás 5-szöröse;
 - c) olyan anyagból készültek, amelyből törés esetén nem képződnek szilánkok;
 - d) az illetékes hatóság által elfogadott minőségbiztosítási rendszernek megfelelően gyártották;
 - e) a gyártási típus tűzállósági vizsgálata bizonyítja, hogy az olvadásbiztosíték vagy a belső nyomást csökkentő biztonsági szelep által olyan mértékben csökken a szerkezetben a nyomás, hogy az nem törik el, illetve nem vetődik ki.
- A járművek üzemelése során használt felszerelésekre lásd az 1.1.3.2 d) pontot.
- 284** A gyújtó hatású anyagot tartalmazó kémiai oxigénfejlesztőknek a következő feltételeknek kell megfelelniük:
- a) az oxigénfejlesztő, ha robbanóanyagot működtető szerkezetet tartalmaz, csak akkor szállítható ezen tétel alatt, ha a 2.2.1.1.1 b) ponthoz fűzött megjegyzés értelmében nem tartozik az 1 osztályba;
 - b) a csomagolás nélküli oxigénfejlesztőnek a tartalom kiszivárgása, illetve a szerkezet működésbe lépése nélkül ki kell állnia az 1,8 m-ről végrehajtott ejtőpróbát, melynél az ütközőlap merev, rugalmatlan, sík és vízszintes, és az ejtés

olyan helyzetben történik, ami a legnagyobb valószínűséggel eredményez sérülést; és

- c) a működtető szerkezettel ellátott oxigénfejlesztőknél a működtető szerkezetnek legalább két olyan hatásos eszközzel kell rendelkeznie, ami megakadályozza a szerkezet nem szándékos működésbe lépését.

286 Az e tétel alá tartozó nitrocellulóz membránszűrők nem tartoznak az ADR előírásainak hatálya alá, ha egyenként valamely tárgyban vagy lezárt csomagban vannak és tömegük legfeljebb 0,5 g.

288 Ezek az anyagok csak akkor sorolhatók be és szállíthatók, ha az illetékes hatóság a szállításra előkészített csomagoláson végzett, a „Vizsgálatok és kritériumok kézikönyv” I. Rész 2 vizsgálati sorozat és a 6 vizsgálati sorozat c) próba eredménye alapján (lásd 2.2.1.1 bekezdést) engedélyezte.

289 A közúti járműbe, vasúti kocsiba, vízi vagy légi járművekbe szerelt vagy komplett alkatrészekben (kormányoszlop, ajtópanel, ülés stb.) lévő légszák gázgenerátorok, légszák modulok és biztonsági öv előfeszítők nem tartoznak az ADR előírásainak hatálya alá.

290 Ha ez az anyag valamely más osztály(ok) 2. részben szereplő meghatározásának és kritériumainak is megfelel, akkor a következők szerint kell besorolni:

- a) Ha az anyag megfelel a 3.5 fejezetben az engedményes mennyiségű veszélyes árukra meghatározott kritériumoknak, akkor a csomagolóeszköznek meg kell felelnie a 3.5.2 szakasz előírásainak és a 3.5.3 szakasz vizsgálati követelményeinek. A radioaktív anyagra engedményes küldeménydarabban az 1.7.1.5 bekezdés szerint vonatkozó összes többi követelményt be kell tartani, a többi osztálytól függetlenül.
- b) Ha a mennyiség meghaladja a 3.5.1.2 bekezdésben meghatározott határokat, akkor az anyagot a döntő járulékos veszély szerint kell besorolni. Az áru megnevezésének a fuvarokmányban a döntő veszély szerinti osztályban a megfelelő UN számból és helyes szállítási megnevezésből kell állnia, amit ki kell egészíteni a radioaktív engedményes küldeménydarabra vonatkozó, a 3.2 fejezet „A” táblázatának 2 oszlopában szereplő névvel. Az anyagot az erre az UN számra vonatkozó előírások szerint kell szállítani. A fuvarokmányban feltüntetendő adatokra példa a következő:

„UN 1993 Gyúlékony folyékony anyag, m.n.n. (etanol és toluol keveréke), Radioaktív anyag engedményes küldeménydarabban – korlátozott anyag-mennyiség, 3, PG II”.

Ezenkívül a 2.2.7.2.4.1 pont követelményeit is be kell tartani.

- c) A b) pontnak megfelelően besorolt anyagokra nem érvényesek a korlátozott mennyiségben csomagolt veszélyes áruk szállítására a 3.4 fejezetben lévő előírások.
- d) Ha az anyag megfelel valamely különleges előírásnak, amely a másik osztályra vonatkozó, összes veszélyes áru előírás alól mentesíti, akkor a 7 osztálynak megfelelő UN számhoz kell sorolni, és az 1.7.1.5 bekezdés minden követelményét be kell tartani.

291 A gyúlékony cseppfolyósított gáznak a hűtőgép szerkezeti elemein belül kell lennie. Ezeket a szerkezeti elemeket a hűtőgép üzemi nyomásának legalább háromszorosára

kell méretezni. A hűtőgépet úgy kell méretezni és kialakítani, hogy a cseppfolyósított gázt megtartsa, és normál szállítási feltételek mellett kizárja a nyomástartó szerkezeti elemek törésének vagy repedésének veszélyét. A 12 kg-nál kevesebb gázt tartalmazó hűtőgépek és hűtőgép részegységek nem tartoznak az ADR előírásainak hatálya alá.

292 (törölve)

293 A gyufákra a következő meghatározások vonatkoznak:

- a) a „vihargyufa” olyan gyufa, amelynek feje dörzsölésre érzékeny gyújtóeleggyel és pirotechnikai anyaggal van impregnálva, ami kis lánggal vagy láng nélkül, de intenzív hőfejlődéssel ég;
- b) a „biztonsági gyufa” olyan gyufa, amely dobozban van, illetve levél vagy kártya formájú és csak preparált felületen való dörzsöléssel gyújtható meg;
- c) a „mindenütt gyulladó gyufa” olyan gyufa, amely bármely szilárd felületen való dörzsöléssel meggyújtható;
- d) A „Vesta-viasz gyufa” olyan gyufa, amely akár preparált felületen, akár szilárd felületen való dörzsöléssel meggyújtható.

295 Ha az egységrakomány el van látva jelöléssel és bárcákkal, az egyes akkumulátorokat nem kell külön jelölni és bárcázni.

296 Ide tartoznak a mentőeszközök, pl. mentőtutajok, egyéni mentőeszközök és önfelfűvő csúszdák. Az UN 2990 tétel alá az önfelfűvő mentőeszközök, míg az UN 3072 tétel alá a nem önfelfűvő mentőeszközök tartoznak. A mentőeszközök tartalmazhatnak:

- a) jelzőtesteket (1 osztály), mint pl. füstjelzők vagy fényjelzők olyan csomagolásban, ami megakadályozza, hogy nem szándékosan működésbe lépjenek;
- b) csak az UN 2990 tétel esetén az önfelfűvő szerkezet aktiválásához az 1.4 alosztály S összeférhetőségi csoportjába tartozó munkavégző tölteteket, amennyiben a robbanóanyag mennyisége készülékenként nem haladja meg a 3,2 g-ot;
- c) a 2 osztály 2.2.2.1.3 pont szerinti A vagy O csoportjába tartozó sűrített vagy cseppfolyósított gázokat;
- d) elektromos akkumulátorokat (8 osztály) és lítium-akkumulátorokat (9 osztály);
- e) elsősegély felszerelést vagy javítókészleteket kis mennyiségű veszélyes anyag (pl. a 3, 4.1, 5.2, 8 és 9 osztály anyagai) tartalommal; vagy
- f) „mindenütt gyulladó gyufát” olyan csomagolásban, ami megakadályozza, hogy nem szándékosan működésbe lépjen.

Azok a mentőeszközök, amelyek legfeljebb 40 kg összes bruttó tömegű erős, merev külső csomagolóeszközben vannak és a 2 osztály A vagy O csoportjába tartozó sűrített vagy cseppfolyósított gázt tartalmaznak – amely kizárólag az eszköz aktiválásának céljára szolgál – legfeljebb 120 ml befogadóképességű tartályokban, de ezen kívül egyéb veszélyes árut nem tartalmaznak, nem tartoznak az ADR előírásainak hatálya alá.

298 (törölve)

- 300** A halliszt, halhulladék és a krill-liszt nem rakható be, ha hőmérséklete a berakodáskor nagyobb, mint a 35 °C és a környezeti hőmérsékletet 5 °C-kal meghaladó hőmérséklet közül a magasabbik.
- 302** A gázosítószer hatása alatt álló áruszállító egységek, amelyek más veszélyes árut nem tartalmaznak, csak az 5.5.2 szakasz előírásainak hatálya alá tartoznak.
- 303** Ezeket a tartályokat a bennük levő gáznak, ill. gázkeveréknek a 2.2.2 szakasz előírásai szerint meghatározott osztályozási kódjához kell besorolni.
- 304** Ez a tétel csak a nem aktivált akkumulátorok szállításához használható, amelyek száraz kálium-hidroxidot tartalmaznak és amelyeket felhasználás előtt az egyes cellákhoz megfelelő mennyiségű víz hozzáadásával aktiválni szükséges.
- 305** Ezek az anyagok nem tartoznak az ADR előírásainak hatálya alá, ha koncentrációjuk legfeljebb 50 mg/kg.
- 306** Ez a tétel csak olyan anyagokhoz használható, amelyek az 1 osztály 1 és 2 vizsgálati sorozata szerint (lásd „Vizsgálatok és kritériumok kézikönyv”, I. Rész) vizsgálva nem mutatnak az 1 osztályra jellemző robbanási tulajdonságot.
- 307** Ez a tétel csak olyan egynemű keverékekhez használható, amelyek fő alkotórésze az ammónium-nitrát, a következő összetétel határokkal:
- a) legalább 90% ammónium-nitrát legfeljebb 0,2% összes éghető anyag tartalommal (beleértve a szerves anyagokat szénegyenértékre számítva) és esetleges olyan adalékokkal, amelyek szervesetlenek és az ammónium-nitráttal szemben semlegesek; vagy
 - b) 90%-nál kevesebb, de 70%-nál több ammónium-nitrát egyéb szervesetlen anyagokkal, vagy 80%-nál több, de 90%-nál kevesebb ammónium-nitrát kalcium-karbonáttal és/vagy dolomittal és/vagy ásványi kalcium-szulfáttal keverve, és legfeljebb 0,4% összes éghető anyag tartalommal (beleértve a szerves anyagokat szénegyenértékre számítva); vagy
 - c) nitrogén típusú, ammónium-nitrát alapú műtrágya, amely ammónium-nitrát és ammónium-szulfát keverékéből áll 45%-nál több, de 70%-nál kevesebb ammónium-nitrát tartalommal és legfeljebb 0,4% összes éghető anyag tartalommal (beleértve a szerves anyagokat szénegyenértékre számítva), oly módon, hogy ammónium-nitrát és ammónium-szulfát tartalom együtt meghaladja a 70%-ot.
- 309** Ezt a tételt a főleg ammónium-nitrát és tüzelőanyag keverékéből álló, érzékenyítés nélküli emulziókra, szuszpenziókra és gélekre kell alkalmazni, amelyek csak a felhasználás előtti további feldolgozás után válnak E típusú robbantóanyaggá.

Az emulzió jellegzetes összetétele: 60...85% ammónium-nitrát; 5...30% víz; 2...8% tüzelőanyag; 0,5...4% emulgáló szer; 0...10% oldható égésgátló, valamint nyomjelző adalék. Az ammónium-nitrát egy részét más szervesetlen nitrátok helyettesíthetik.

A szuszpenzió és a gél jellegzetes összetétele: 60...85% ammónium-nitrát; 0...5% nátrium- vagy kálium-perklorát; 0...17% hexamin-nitrát vagy monometilamin-nitrát; 5...30% víz; 2...15% tüzelőanyag; 0,5...4% sűrítőanyag; 0...10% oldható égésgátló, valamint nyomjelző adalék. Az ammónium-nitrát egy részét más szervesetlen nitrátok helyettesíthetik.

Az anyagoknak ki kell állniuk a „Vizsgálatok és kritériumok kézikönyv” I. rész, 18. szakasz 8 vizsgálati sorozatot és a besorolást az illetékes hatóságnak jóvá kell hagynia.

- 310** A „Vizsgálatok és kritériumok kézikönyv” 38.3 fejezetében található vizsgálati követelményeket nem kell alkalmazni a legfeljebb 100 cellából vagy akkumulátorból álló gyártási sorozatokra, ill. a cellák és akkumulátorok gyártási mintáira, ha vizsgálat céljából szállítják és:
- a) a cellák és akkumulátorok fém-, műanyag- vagy rétegelt falemez hordó vagy fém-, műanyag- vagy faláda külső csomagolásban vannak és a csomagoló-eszköz teljesíti az I csomagolási csoport kritériumait; és
 - b) a külső csomagoláson belül minden cella és akkumulátor egyedileg belső csomagolásban van és nem éghető, nem vezetőképes párnázóanyaggal van körülvéve.
- 311** Az anyagok csak akkor szállíthatók ezen tétel alatt, ha azt az illetékes hatóság a „Vizsgálatok és kritériumok kézikönyv” I. rész szerinti, megfelelő vizsgálatok alapján engedélyezte. A csomagolásnak biztosítania kell, hogy a hígítószer százalékos mennyisége a szállítás alatt soha ne csökkenjen az illetékes hatóság engedélyében meghatározott érték alá.
- 312** (fenntartva)
- 313** (törölve)
- 314**
- a) Ezek az anyagok magasabb hőmérsékleteken hajlamosak az exoterm bomlásra. A bomlást hő vagy szennyeződések [pl. fémporok (vas, mangán, kobalt, magnézium) és keverékeik] is kiválthatják;
 - b) A szállítás alatt ezeket az anyagokat árnyékolással a közvetlen napsugárzástól és mindenfajta hőforrástól védeni kell és megfelelően szellőzött helyre kell elhelyezni.
- 315** Ez a tétel nem használható azokra a 6.1 osztályba tartozó anyagokra, amelyek mérgezőképessége belélegzés esetén a 2.2.61.1.8 pontban leírtak szerint az I csomagolási csoportnak felel meg.
- 316** Ezt a tételt csak a száraz kalcium-hipokloritra lehet alkalmazni, ha nem-morzsolódó tabletta formában szállítják.
- 317** A „hasadó-engedményes” megnevezés csak a 6.4.11.2 bekezdésnek megfelelő küldeménydarabokra használható.
- 318** Az okmányokban a helyes szállítási megnevezést ki kell egészíteni a műszaki megnevezéssel (lásd a 3.1.2.8 bekezdést). Ha a szállítandó fertőző anyag ismeretlen, de vélhetően kielégíti az „A” kategóriába való felvétel és az UN 2814 vagy az UN 2900 alá történő besorolás kritériumait, a fuvarokmányba a helyes szállítási megnevezést követően zárójelbe téve a „**feltehetően „A” kategóriájú fertőző anyag**” bejegyzést kell tenni.
- 319** A P650 csomagolási utasítás szerint csomagolt és jelöléssel ellátott anyagok nem tartoznak az ADR többi előírásainak hatálya alá.
- 320** (törölve)

- 321** Ezt a tároló rendszert mindig úgy kell tekinteni, hogy hidrogént tartalmaz.
- 322** Ezt az árut a III csomagolási csoportba lehet sorolni, ha nem-morzsolódó tabletta formában szállítják.
- 323** (fenntartva)
- 324** A 99%-os vagy az alatti koncentrációjú anyagot stabilizálni kell.
- 325** Ha az anyag nem hasadó vagy hasadó-engedményes urán-hexafluorid, akkor az UN 2978 tételhez kell sorolni.
- 326** Ha az anyag hasadó urán-hexafluorid, akkor az UN 2977 tételhez kell sorolni.
- 327** Ez a tétel alkalmazható az 5.4.1.1.3 pont szerint feladott, hulladékká vált aeroszol csomagolások újrahasznosítás vagy ártalmatlanítás céljából történő szállításakor is. Ilyen esetben az aeroszol csomagolást nem kell az akaratlan működtetés elleni védelemmel ellátni, feltéve, hogy megtették a szükséges óvintézkedéseket a veszélyes nyomásnövekedés, ill. veszélyes atmoszféra kialakulásának megakadályozására. Azokat az aeroszolókat, amelyek nem szivárognak, ill. nincsenek nagyon deformálódva, a P207 csomagolási utasításnak és a PP87 különleges csomagolási előírásnak megfelelően kell csomagolni, vagy az LP02 csomagolási utasításnak és az L2 különleges csomagolási előírásnak megfelelően. A szivárgó vagy erősen deformálódott aeroszol csomagolásokat kármentő csomagolásban kell szállítani, megfelelő óvintézkedésekkel biztosítva, hogy nem lép fel veszélyes nyomásnövekedés.

Megjegyzés: *Nem szállíthatók a hulladék aeroszol csomagolások zárt konténerben, ha tengeri úton szállítják tovább.*

- 328** Ez a tétel az üzemanyagcella kazettákra vonatkozik, beleértve a készülékben lévőket, ill. készülékkel egybecsomagoltakat is. Készülékben lévő üzemanyagcella kazettának minősül az olyan kazetta, amely az üzemanyagcella-rendszerbe van illesztve vagy annak szerves részét képezi. Az üzemanyagcella kazetta olyan tárgy, amelyben az üzemanyag van, ami az adagolást vezérlő szelep(ek)en keresztül jut az üzemanyagcellába. Az üzemanyagcella kazettákat, beleértve a készülékben lévőket is, úgy kell megtervezni és gyártani, hogy szokásos szállítási körülmények között az üzemanyag szivárgását megelőzzék.

A folyékony üzemanyagú üzemanyagcella kazetta gyártási típusának szivárgás nélkül ki kell állnia a 100 kPa túlnyomással végzett belső nyomásállósági próbát.

A fémhidridben lévő hidrogén tartalmú üzemanyagcella kazetták kivételével, amelyeknek a 339 különleges előírásnak kell megfelelniük, minden üzemanyagcella kazetta gyártási típusra bizonyítani kell, hogy a tartalom szivárgása nélkül kiállja az olyan ejtőpróbát, mely során 1,2 m magasról merev felületre ejtik abban a helyzetben, amely a legnagyobb valószínűséggel eredményezi a tárolórendszer sérülését.

Ha az üzemanyagcella-rendszerben fémlítium vagy lítiumion akkumulátorok vannak, akkor a szállítmányt e tétel alatt kell feladni és a megfelelő UN 3091 fémlítium akkumulátorok készülékben, ill. UN 3481 lítiumion akkumulátorok készülékben tétel alatt.

- 329** (fenntartva)
- 330** (törölve)

- 331** (fenntartva)
- 332** A magnézium-nitrát-hexahidrát nem tartozik az ADR előírásainak hatálya alá.
- 333** A szikragyújtású motorokhoz (pl. gépjárművekhez, helyhez kötött és egyéb motorokhoz) használt etanol és benzin, motorbenzin vagy gazolin keveréket e tétel alá kell besorolni, függetlenül az eltérő illékonyságuktól.
- 334** Az üzemanyagcella kazetta aktiválószer is tartalmazhat, feltéve, hogy két, egymástól független szerkezettel van ellátva, amely megakadályozza, hogy a szállítás során az aktiválószer és az üzemanyag véletlenszerűen keveredjen.
- 335** Az ADR előírásainak hatálya alá nem tartozó szilárd anyagok és a környezetre veszélyes folyékony vagy szilárd anyagok keverékeit az UN 3077 tétel alá kell sorolni és e tétel alatt szállíthatók, amennyiben az anyag berakodása során, illetve a csomagolóeszköz, a jármű vagy a konténer lezárásakor szabad folyadék szemmel nem látható. Az ömlesztett szállításra használt jármű felépítményének, ill. konténernek szivárgásmentesnek kell lennie. Ha a keverék berakodása során, ill. a csomagolóeszköz, a jármű vagy a konténer lezárásakor szabad folyadék látható, a keveréket az UN 3082 tétel alá kell sorolni. Nem tartoznak az ADR előírásainak hatálya alá az olyan lezárt csomagok vagy tárgyak, amelyekben legfeljebb 10 ml, környezetre veszélyes folyékony anyag van szilárd anyagban elnyelve és a csomag vagy a tárgy nem tartalmaz szabad folyadékot, és azok, amelyekben legfeljebb 10 g környezetre veszélyes szilárd anyag van.
- 336** Egy nem gyúlékony, szilárd *LSA-II* vagy *LSA-III* anyagot tartalmazó küldeménydarab légi szállítás esetén nem tartalmazhat 3000A₂-nél nagyobb aktivitást.
- 337** A *B(U)* és a *B(M)* típusú küldeménydarabok légi szállítás esetén nem tartalmazhatnak nagyobb aktivitást, mint:
- a) kis mértékben diszpergálódó radioaktív anyagok esetén: a küldeménydarab-mintára engedélyezett aktivitás, a küldeménydarab-minta engedélyben meghatározottak szerint;
 - b) különleges formájú radioaktív anyag esetén: a 3000A₁, ill. a 100 000A₂ közül a kisebb érték; vagy
 - c) minden más radioaktív anyag esetén: a 3000A₂ érték.
- 338** Az e tétel alatt szállított, gyúlékony, cseppfolyósított gázt tartalmazó üzemanyagcella kazettát úgy kell kialakítani, hogy
- a) repedés, ill. szivárgás nélkül el tudja viselni a tartalom 55 °C-on fennálló egyensúlyi nyomásának legalább kétszeresével egyenlő nyomást;
 - b) legfeljebb 200 ml gyúlékony, cseppfolyósított gázt tartalmazzon, melynek gőznyomása 55 °C-on legfeljebb 1000 kPa; és
 - c) kiállja a 6.2.6.3.1 pontban leírt, forró vizes fürdőben végzett próbát.
- 339** Az e tétel alatt szállított, fémhidridben lévő hidrogén tartalmú üzemanyagcella kazetta víztérfogata legfeljebb 120 ml lehet.

Az üzemanyagcella kazettában a nyomás 55 °C-on nem lehet 5 MPa-nál nagyobb. A gyártási típusnak repedés, ill. szivárgás nélkül el kell tudnia viselni a kazetta 55 °C-ra vonatkozó tervezési nyomásának kétszerese és a kazetta 55 °C-ra vonatkozó ter-

vezési nyomása plusz 200 kPa nyomás értékek közül a nagyobbbat. Az e próba során alkalmazott nyomás felel meg az ejtőpróbánál és a hidrogén töltési – ürítési sorozat vizsgálatnál a „burkolat legkisebb repesztőnyomása”-ként említett nyomásnak.

Az üzemanyagcella kazettát a gyártó által meghatározott eljárással kell tölteni. Minden üzemanyagcella kazettához a gyártónak a következő információt kell megadnia:

- a) az üzemanyagcella kazetta első töltése, ill. újratöltése előtt végrehajtandó vizsgálati eljárást;
- b) a betartandó biztonsági óvintézkedéseket és a lehetséges veszélyek ismertetését;
- c) azt a módszert, amellyel a névleges töltési kapacitás meghatározható;
- d) a nyomástartomány legkisebb és legnagyobb értékét;
- e) a hőmérséklettartomány legkisebb és legnagyobb értékét; és
- f) az első töltés, ill. az újratöltés során betartandó minden egyéb követelményt, beleértve az első töltéshez, ill. az újratöltéshez használandó eszköz típusát is.

Az üzemanyagcella kazettákat úgy kell megtervezni és gyártani, hogy szokásos szállítási körülmények között az üzemanyag ne szivároghasson. Minden üzemanyagcella kazetta gyártási típusnak, beleértve az üzemanyagcella részét képező kazettákat is, sikeresen ki kell állnia a a következő vizsgálatokat:

Ejtőpróba

1,8 m magasról merev felületre történő ejtés négy, különböző helyzetben:

- a) függőleges helyzetben arra a végére, ahol a zárószelep van;
- b) függőleges helyzetben arra a végére, amelyik a zárószeleppel szemben van;
- c) vízszintes helyzetben egy 38 mm átmérőjű, a hegyével felfelé álló acéltüskére; és
- d) 45°-os szögben arra a végére, ahol a zárószelep van.

Minden lehetséges szivárgási helyet szappanoldattal vagy más, egyenértékű módszerrel vizsgálva a névleges töltési nyomásig feltöltött kazetta nem szivároghat. Ezután az üzemanyagcella kazettát hidrosztatikus nyomással szét kell ronsolni. Az észlelt repesztőnyomásnak nagyobbnak kell lennie, mint a burkolat legkisebb repesztőnyomásának a 85%-a.

Tűzállósági próba

Az üzemanyagcella kazettát a névleges kapacitásáig fel kell tölteni hidrogénnel, és olyan tűz hatásának kell kitenni, amely teljesen elborítja. Az üzemanyagcella kazetta gyártási típus (amelyen lehet szellőzőberendezés is) akkor állta ki sikeresen a tűzállósági próbát, ha:

- a) a kazetta roncsolódása nélkül a belső nyomás (túlnyomás) lecsökken nullára; vagy
- b) a kazetta legalább 20 percig roncsolódás nélkül viseli el a tüzet.

Hidrogén töltési – ürítési sorozat vizsgálat

A vizsgálat célja annak igazolása, hogy az üzemanyagcella kazetta tervezési feszültség határokat a használat során nem lépik túl.

Az üzemanyagcella kazettát sorozatosan fel kell tölteni a névleges hidrogén kapacitás legfeljebb 5%-áról legalább 95%-ára, és visszaüríteni legfeljebb 5%-ára. A töltést a névleges töltési nyomással kell végezni, a hőmérsékletet az üzemi hőmérséklet tartományon belül kell tartani. A vizsgálati sorozatnak legalább 100 ciklusból kell állnia.

A vizsgálat sorozat után az üzemanyagcella kazettát fel kell tölteni és meg kell mérni a kazetta által kiszorított víz térfogatát. A kazetta gyártási típus akkor állta ki sikeresen a hidrogén töltési – ürítési sorozat vizsgálatot, ha a vizsgálaton átesett kazetta által kiszorított víz térfogata nem több, mint az olyan, nem vizsgált kazetta által kiszorított víz térfogata, amely 95% névleges kapacitásig van töltve, és a burkolat legkisebb repesztőnyomásának a 75%-át kitevő nyomás alá van helyezve.

Gyártásközi tömörségi próba

Minden üzemanyagcella kazettát a névleges töltési nyomásán, $15\text{ °C} \pm 5\text{ °C}$ -on tömörségi próbának kell alávetni. Minden lehetséges szivárgási helyet szappanoldattal vagy más, egyenértékű módszerrel vizsgálva a kazetta nem szivároghat.

Minden üzemanyagcella kazettán tartósan fel kell tüntetni a következőket:

- a) a névleges töltési nyomást MPa-ban;
- b) az üzemanyagcella kazetta gyártási sorozatszámát vagy egyedi azonosító számát; és
- c) a legnagyobb használati élettartam alapján meghatározott lejáratí időpontot (az évet négy számjeggyel és a hónapot két számjeggyel megadva).

340 A 3.5 fejezet szerint szállíthatók azok a vizsgálókészletek, elsősegély felszerelések és poliészter gyanta készletek, amelyeknél a belső csomagolásban a veszélyes anyag mennyisége nem haladja meg a 3.2 fejezet „A” táblázat 7b oszlopában az erre az anyagra meghatározott, engedményes mennyiségre vonatkozó határt. Az ilyen készletekben lehetnek 5.2 osztályba tartozó anyagok is, és bár az 5.2 osztály anyagai a 3.2 fejezet „A” táblázat 7b oszlopában nincs engedményes mennyiség engedélyezve, ilyen esetben az E2 kód vonatkozik rájuk (lásd a 3.5.1.2 bekezdést).

341 (fenntartva)

342 A kizárólag sterilizáló berendezésekben felhasználni szándékozott belső üvegtartályok (pl. ampullák vagy kapszulák), ha belső csomagolásuként 30 ml-nél kevesebb és külső csomagolásuként legfeljebb 300 ml etilén-oxidot tartalmaznak, a 3.5 fejezet előírásai szerint szállíthatók, függetlenül attól, hogy a 3.2 fejezet „A” táblázat 7b oszlopában E0 van feltüntetve, amennyiben

- a) töltés után minden belső üvegtartály tömörségét vizsgálattal megállapították úgy, hogy az üvegtartályokat olyan hőmérsékletű és olyan időtartamú forró fürdőbe helyezik, ami elegendő annak biztosítására, hogy a belső nyomás elérje az etilén-oxid 55 °C -on fennálló gőznyomását. Azok az üvegtartályok, melyek ezen vizsgálat alatt szivárognak, deformálódnak vagy más hiányosságot mutatnak, nem szállíthatók ezen különleges előírás alapján;

- b) a 3.5.2 szakasz szerint előírt csomagolóeszközön kívül minden belső üvegtartály lehegesztett műanyag tasakba van helyezve, amely összeférhető az etilén-oxiddal és a belső üvegtartály szivárgása vagy törése esetén képes a tartalom megtartására; és
 - c) minden üvegtartály védve van a csomagolóeszköz sérülése (pl. roncsolódása) esetén a műanyag tasak kilyukadását megakadályozó eszközzel (pl. burkolattal vagy párnázattal).
- 343** Ez a tétel az olyan nyersolajra vonatkozik, amely akkora koncentrációban tartalmaz hidrogén-szulfidot, hogy a nyersolajból felszabaduló gőzök belélegzés esetén veszélyt jelenthetnek. A csomagolási csoportot a gyúlékonyság és a belélegzési veszély alapján kell hozzárendelni, a képviselt veszély mértéke szerint.
- 344** A 6.2.6 szakasz előírásait be kell tartani.
- 345** Ez a gáz olyan, legfeljebb 1 l űrtartalmú nyitott mélyhűtő tartályban, amely kettős falú és a külső és a belső fal közötti tér légmentes (vákuumszigetelésű), nem tartozik az ADR hatálya alá, amennyiben a tartályokat az ütések elleni védelem céljából megfelelő párnázóanyaggal vagy abszorbeáló anyaggal ellátott külső csomagolásban szállítják.
- 346** Azok a nyitott mélyhűtő tartályok, amelyek megfelelnek a 4.1.4 szakasz P203 csomagolási utasítása követelményeinek és a porózus anyagban teljesen abszorbeált UN 1977 mélyhűtött, cseppfolyósított nitrogénen kívül nem tartalmaznak más veszélyes árut, nem tartoznak az ADR semmilyen más előírásának hatálya alá.
- 347** Ez a tétel csak akkor használható, ha a Vizsgálatok és kritériumok kézikönyv I. Rész 6 d) vizsgálati sorozat eredményei bizonyítják, hogy a működésből eredő mindenfajta veszélyes hatás a küldeménydarabon belül marad.
- 348** A 2011. december 31-e után gyártott akkumulátorok külső házán fel kell tüntetni a wattóra kapacitást.
- 349** A hipokloritok keverékei ammóniumsóval nem szállíthatók. Az UN 1791 hipoklorit oldat a 8 osztály anyaga.
- 350** Az ammónium-bromát és vizes oldatai, valamint a bromátok keverékei ammóniumsóval nem szállíthatók.
- 351** Az ammónium-klorát és vizes oldatai, valamint a klorátok keverékei ammóniumsóval nem szállíthatók.
- 352** Az ammónium-klorit és vizes oldatai, valamint a kloritok keverékei ammóniumsóval nem szállíthatók.
- 353** Az ammónium-permanganát és vizes oldatai, valamint a permanganátok keverékei ammóniumsóval nem szállíthatók.
- 354** Ez az anyag belélegezve mérgező.
- 355** Az ezen tétel alatt szállított vészhelyzeti felhasználásra szolgáló oxigénpalackok tartalmazhatnak egybeszerelt működtető tölteteket (az 1.4 alosztály C vagy S összeférhetőségi csoportjába tartozó munkavégző tölteteket) anélkül, hogy ezáltal a 2 osztályba való besorolásuk megváltozna, amennyiben a deflagráló (hajtó) robbanóanyag összmenyisége nem haladja meg oxigénpalackonként a 3,2 g-ot. A szállításra előkészített, egybeszerelt működtető töltetet tartalmazó palackokat a nem

szándékos működésbe lépés megakadályozására hatékony eszközzel kell ellátni.

- 356** A közúti járműbe, vasúti kocsiba, vízi vagy légi járművekbe vagy komplett alkatrészekbe szerelt vagy közúti járműbe, vasúti kocsiba, vízi vagy légi járművekbe történő beépítésre szolgáló fémhidrid tároló rendszereket a szállításra történő elfogadás előtt a gyártó ország¹⁾ illetékes hatóságának jóvá kell hagynia. A fuvarokmányoknak utalást kell tartalmaznia arra, hogy a küldeménydarabot a gyártó ország¹⁾ illetékes hatósága jóváhagyta vagy minden küldeményhez mellékelni kell a gyártó ország¹⁾ illetékes hatósága engedélyének másolatát.
- 357** A olyan nyersolajat, amely akkora koncentrációban tartalmaz hidrogén-szulfidot, hogy a nyersolajból felszabaduló gőzök belélegzés esetén veszélyt jelenthetnek, az UN 3494 kén-hidrogénes kőolaj, gyúlékony, mérgező tétel alatt kell szállítani.
- 358** A nitroglicerint alkoholos oldatban 1%-nál több, de legfeljebb 5% nitroglicerintartalommal a 3 osztályba, az UN 3064 tétel alá sorolható, amennyiben a 4.1.4.1 bekezdés P300 csomagolási utasítás minden követelményének megfelel.
- 359** A nitroglicerint alkoholos oldatban 1%-nál több, de legfeljebb 5% nitroglicerintartalommal az 1 osztályba, az UN 0144 tétel alá kell besorolni, amennyiben nem felel meg a 4.1.4.1 bekezdés P300 csomagolási utasítás minden követelményének.
- 360** A kizárólag fémlítium vagy lítiumion akkumulátorral hajtott járműveket az UN 3171 akkumulátorral hajtott jármű tétel alá kell sorolni.
- 361** Ez a tétel a 0,3 Wh-nál nagyobb energiatároló-kapacitású, kétrétegű elektromos kondenzátorokra vonatkozik. A legfeljebb 0,3 Wh energiatároló-kapacitású kondenzátorok nem tartoznak az ADR hatálya alá. Az energiatároló-kapacitás a kondenzátor által tárolt, a névleges feszültségből és a névleges kapacitásból számított energiát jelenti. Minden, e tétel alá tartozó kondenzátornak (azoknak is, amelyek olyan elektrolitot tartalmaznak, amely az ADR egyetlen osztálya kritériumainak sem felel meg) a következő feltételeknek kell megfelelnie:
- a) a készülékbe be nem épített kondenzátorokat töltetlen állapotban kell szállítani. A készülékbe beépített kondenzátorokat vagy töltetlenül vagy pedig rövidzárlat ellen védett állapotban kell szállítani;
 - b) minden kondenzátort a szállítás során lehetséges rövidzárlat veszélye ellen a következőképpen kell védeni:
 - i) ha egy kondenzátor vagy egy modulban lévő mindegyik kondenzátor energiatároló-kapacitása legfeljebb 10 Wh, akkor a kondenzátornak, ill. a modulnak rövidzárlat ellen védettnek kell lennie, vagy a fegyverzeteit fémszalaggal kell összekötni; és
 - ii) ha egy kondenzátor vagy egy modulban lévő kondenzátor energiatároló-kapacitása nagyobb, mint 10 Wh, akkor a kondenzátor, ill. a modul fegyverzeteit fémszalaggal kell összekötni;
 - c) a veszélyes árut tartalmazó kondenzátort 95 kPa nyomáskülönbség elviselésére kell méretezni;
 - d) a kondenzátort úgy kell méretezni és kialakítani, hogy a használat közben esetleg kialakuló nyomást biztonságosan lecsökkentse szellőzőnyíláson vagy a kondenzátor burkolatán lévő gyengítési ponton keresztül. A szellőzés közben

1) Ha a gyártó ország nem valamely ADR Szerződő Fél, akkor a jóváhagyást valamely ADR Szerződő Fél illetékes hatóságának kell elismernie.

kiáramló minden folyékony anyagnak a csomagolóeszközön vagy a készüléken belül kell maradnia, amelybe a kondenzátort beépítették; és

e) a kondenzátoron fel kell tüntetni az energiatároló-kapacitást (Wh-ban).

Azok a kondenzátorok, ill. készülékbe beépített kondenzátorok, amelyek olyan elektrolitot tartalmaznak, amely az ADR egyetlen osztálya kritériumainak sem felel meg, nem tartoznak az ADR többi előírásának hatálya alá.

Azok a kondenzátorok, amelyek energiatároló-kapacitása legfeljebb 10 Wh, és amelyek olyan elektrolitot tartalmaznak, amely az ADR valamely osztálya kritériumainak megfelel, nem tartoznak az ADR többi előírásának hatálya alá, amennyiben csomagolás nélkül képesek kiállni az 1,2 m-ről, rugalmatlan felületre végrehajtott ejtőpróbát a tartalom vesztesége nélkül.

Azok a kondenzátorok, amelyek energiatároló-kapacitása nagyobb, mint 10 Wh és nincsenek készülékbe építve, és amelyek olyan elektrolitot tartalmaznak, amely az ADR valamely osztálya kritériumainak megfelel, az ADR hatálya alá tartoznak.

Azok a készülékbe beépített kondenzátorok, amelyek olyan elektrolitot tartalmaznak, amely az ADR valamely osztálya kritériumainak megfelel, nem tartoznak az ADR többi előírásának hatálya alá, amennyiben a készülék a rendeltetésének megfelelő szilárdságú, alkalmas anyagból és kialakítással készült, erős külső csomagolóeszközbe van csomagolva oly módon, hogy képes megakadályozni, hogy a kondenzátor a szállítás közben véletlenül működésbe lépjen. A kondenzátort tartalmazó nagyméretű, robusztus készülékek csomagolás nélkül vagy raklapon is feladhatók, amennyiben a kondenzátoroknak a készülék, amelyben vannak, azonos védelmet nyújt.

Megjegyzés: az olyan kondenzátorok, amelyek kialakításuknál fogva fenntartják a kapocs-feszültséget (pl. aszimmetrikus kondenzátorok) nem tartoznak e tétel alá.

362 (fenntartva)

363 Ez a tétel azokra a folyékony tüzelőanyagokra is vonatkozik, amelyek nem tartoznak az 1.1.3.3 bekezdés a) és b) pontjai szerinti mentesség alá, ha gépek vagy berendezések (pl. generátor, kompresszor, fűtőberendezés, stb.) eredetileg is elválaszthatatlan részét képező egységében (tartályában) a 3.2 fejezet „A” táblázat 7a oszlopában meghatározott mennyiségen felüli mennyiségben vannak. Ezek nem tartoznak az ADR előírásainak hatálya alá, ha a következők teljesülnek:

- a) a tartály megfelel a gyártó ország illetékes hatósága gyártási követelményeinek²⁾;
- b) a veszélyes árut tartalmazó tartály minden szelepe és nyílása (pl. a szellőző berendezése) a szállítás alatt zárva van;
- c) a gép, ill. a berendezés úgy helyezkedik el, hogy megakadályozza a veszélyes áru nem szándékos kifolyását, és olyan eszközzel van rögzítve, ami meggátol minden olyan elmozdulást a szállítás alatt, ami megváltoztatná a gép, ill. a berendezés elhelyezkedését vagy megrongálná azt.
- d) ha a tartály 60 liternél nagyobb, de legfeljebb 450 liter befogadóképességű,

2) Pl. megfelel Az Európai Parlament és a Tanács 2006/42/EK irányelve (2006. május 17.) a gépekről és a 95/16/EK irányelv módosításáról (lásd az EU Hivatalos Lapja, L 157. szám, 2006. 06.09., 0024 – 0086 o.) vonatkozó előírásainak

akkor a gép, ill. a berendezés az egyik külső oldalán az 5.2.2 szakasz szerint bárcával van ellátva, ha 450 liternél nagyobb, de legfeljebb 1500 liter befogadóképességű, akkor mind a négy külső oldalán el van látva az 5.2.2 szakasz szerint bárcával;

- e) ha a tartály 1500 liternél nagyobb, akkor a gép, ill. a berendezés mind a négy külső oldalán az 5.3.1.1.1 pont szerint nagybárcával van ellátva, az 5.4.1 szakasz követelményeit betartják és a fuvarokmány a következő bejegyzést tartalmazza: „**A 363 különleges előírás szerinti szállítás**”.

- 364** Ez a tárgy csak akkor szállítható a 3.4 fejezet előírásai szerint, ha a küldeménydarab szállításra kész állapotban képes kiállni a „Vizsgálatok és kritériumok kézikönyv” I. Rész 6. vizsgálati sorozat d) próbáját, ahogy azt az illetékes hatóság meghatározza.
- 365** A higanyt tartalmazó készülékekre és egyéb gyártmányokra lásd az UN 3506 tételt.
- 366** A legfeljebb 1 kg higanyt tartalmazó készülékek és egyéb gyártmányok nem tartoznak az ADR előírásainak hatálya alá.
- 367 –**
499 (fenntartva)
- 500** (törölve)
- 501** Az olvasztott naftalinra lásd az UN 2304 tételt.
- 502** Az UN 2006 nitrocellulóz alapú, önmelegedő műanyag, m.n.n. és az UN 2002 celluloid hulladék a 4.2 osztály anyaga.
- 503** A fehérfoszforra olvasztott formában lásd az UN 2447 számot.
- 504** Az UN 1847 hidratált kálium-szulfid legalább 30% kristályvíz-tartalommal, az UN 1849 hidratált nátrium-szulfid legalább 30% kristályvíz-tartalommal és az UN 2949 hidratált nátrium-hidrogén-szulfid legalább 25% kristályvíz-tartalommal a 8 osztály anyaga.
- 505** Az UN 2004 magnézium-diamid a 4.2 osztály anyaga.
- 506** Az alkálifémek és alkáliföldfémek piroforos formában a 4.2 osztály anyagai. Az UN 1869 magnézium vagy magnézium ötvözetek 50%-nál több magnézium tartalommal, szemcse, forgács vagy szalagok formájában a 4.1 osztály anyagai.
- 507** Az UN 3048 alumínium-foszfid peszticid mérgező, gyúlékony gázok fejlődését gátló adalékokkal a 6.1 osztály anyaga.
- 508** Az UN 1871 titán-hidrid és az UN 1437 cirkónium-hidrid a 4.1 osztály anyaga. Az UN 2870 alumínium-bór-hidrid a 4.2 osztály anyaga.
- 509** Az UN 1908 klorit oldat a 8 osztály anyaga.
- 510** Az UN 1755 krómsav oldat a 8 osztály anyaga.
- 511** Az UN 1625 higany(II)-nitrát, az UN 1627 higany(I)-nitrát, az UN 2727 tallium-nitrát a 6.1 osztály anyaga. A szilárd tórium-nitrát, az uranil-nitrát-hexahidrát oldat és a szilárd uranil-nitrát a 7 osztály anyaga.

- 512** Az UN 1730 folyékony antimon-pentaklorid, az UN 1731 antimon-pentaklorid oldat, az UN 1732 antimon-pentafluorid és az UN 1733 antimon-triklorid a 8 osztály anyaga.
- 513** Az UN 0224 bárium-azid, száraz vagy 50 tömeg%-nál kevesebb vízzel nedvesített az 1 osztály anyaga. Az UN 1571 legalább 50% vízzel nedvesített bárium-azid a 4.1 osztály anyaga. Az UN 1854 piroforos bárium ötvözetek a 4.2 osztály anyagai. Az UN 1445 szilárd bárium-klorát, az UN 1446 bárium-nitrát, az UN 1447 szilárd bárium-perklorát, az UN 1448 bárium-permanganát, az UN 1449 bárium-peroxid, az UN 2719 bárium-bromát, az UN 2741 bárium-hipoklorit 22%-nál több aktív klórtartalommal, az UN 3405 bárium-klorát oldat és az UN 3406 bárium-perklorát oldat az 5.1 osztály anyaga. Az UN 1565 bárium-cianid és az UN 1884 bárium-oxid a 6.1 osztály anyaga.
- 514** Az UN 2464 berillium-nitrát az 5.1 osztály anyaga.
- 515** Az UN 1581 klórpikrin és metil-bromid keveréke és az UN 1582 klórpikrin és metil-klorid keveréke a 2 osztály anyaga.
- 516** Az UN 1912 metil-klorid és diklór-metán keveréke a 2 osztály anyaga.
- 517** Az UN 1690 szilárd nátrium-fluorid, az UN 1812 szilárd kálium-fluorid, az UN 2505 ammónium-fluorid, az UN 2674 nátrium-fluoro-szilikát, az UN 2856 fluoro-szilikátok, m.n.n., az UN 3415 nátrium-fluorid oldat és az UN 3422 kálium-fluorid oldat a 6.1 osztály anyagai.
- 518** Az UN 1463 vízmentes króm-trioxid (szilárd krómsav) az 5.1 osztály anyaga.
- 519** Az UN 1048 vízmentes hidrogén-bromid a 2 osztály anyaga.
- 520** Az UN 1050 vízmentes hidrogén-klorid a 2 osztály anyaga.
- 521** A szilárd kloritok és hipokloritok az 5.1 osztály anyagai.
- 522** Az UN 1873 perklórsav vizes oldat 50 tömeg%-nál több, de legfeljebb 72 tömeg% tiszta savtartalommal az 5.1 osztály anyaga. A perklórsav vizes oldat 72 tömeg%-nál több tiszta savtartalommal és a perklórsav keverékei vízen kívül más folyadékkal szállításra nem fogadhatók el.
- 523** Az UN 1382 vízmentes kálium-szulfid és az UN 1385 vízmentes nátrium-szulfid, valamint hidrátjaik 30%-nál kevesebb kristályvíz-tartalommal, valamint az UN 2318 nátrium-hidrogén-szulfid 25%-nál kevesebb kristályvíz-tartalommal a 4.2 osztály anyaga.
- 524** Az UN 2858 kész cirkónium termékek 18 µm vagy annál nagyobb vastagsággal a 4.1 osztály anyagai.
- 525** A szervesen cianidok oldatait 30%-nál több összes cianid-ion koncentrációval az I csomagolási csoportba, 3%-nál több, de legfeljebb 30% összes cianid-ion koncentrációval a II csomagolási csoportba, 0,3%-nál több, de legfeljebb 3% összes cianid-ion koncentrációval a III csomagolási csoportba kell besorolni.
- 526** Az UN 2000 celluloid a 4.1 osztály anyaga.
- 528** Az UN 1353 gyengén nitrált cellulózzal impregnált szálak vagy szövetek, amelyek nem önmelegedőek, a 4.1 osztály anyagai.

- 529** Az UN 0135 higany-fulminát legalább 20 tömeg% vízzel (vagy víz és alkohol keverékével) nedvesítve az 1 osztály anyaga. A higany(I)-klorid (kalomel) a 9 osztály anyaga (UN 3077).
- 530** Az UN 3293 hidrazin vizes oldat legfeljebb 37 tömeg% hidrazintartalommal a 6.1 osztály anyaga.
- 531** A 23 °C-nál alacsonyabb lobbanáspontú, 55%-nál nagyobb nitrocellulóz-tartalmú keverékek bármilyen nitrogéntartalommal vagy legfeljebb 55% olyan nitrocellulóz-tartalommal, amelynek nitrogéntartalma meghaladja a 12,6%-ot (száraz anyagra vetítve) az 1 osztály anyagai (lásd UN 0340 vagy UN 0342) vagy a 4.1 osztály anyagai.
- 532** Az UN 2672 ammónia oldat 10%-nál több, de legfeljebb 35% ammónia-tartalommal a 8 osztály anyaga.
- 533** Az UN 1198 gyúlékony formaldehid oldatok a 3 osztály anyagai. A 25%-nál kevesebb formaldehid-tartalmú, nem gyúlékony formaldehid oldatok nem tartoznak az ADR előírásainak hatálya alá.
- 534** A benzint (gazolint), bár bizonyos klimatikus viszonyok mellett 50 °C hőmérsékleten 110 kPa-nál (1,10 bar-nál) nagyobb gőznyomása lehet anélkül, hogy meghaladná a 150 kPa-t (1,50 bar-t), mégis olyan anyagnak kell tekinteni, amelynek gőznyomása 50 °C-on nem haladja meg a 110 kPa-t (1,10 bar-t).
- 535** Az UN 1469 ólom-nitrát, az UN 1470 szilárd ólom-perklorát és az UN 3408 ólom-perklorát oldat az 5.1 osztály anyaga.
- 536** A szilárd naftalinra lásd az UN 1334 számot.
- 537** Az UN 2869 nem piroforos titán-triklorid keverék a 8 osztály anyaga.
- 538** A szilárd kénre lásd az UN 1350 számot.
- 539** Az izocianát oldatok, amelyek lobbanáspontja 23 °C vagy annál magasabb, a 6.1 osztály anyagai.
- 540** A legalább 25% víztartalommal nedvesített UN 1326 hafniumpor, UN 1352 titánpor és UN 1358 cirkóniumpor a 4.1 osztály anyaga.
- 541** A megadott határnál kisebb víz-, alkohol- vagy lágyítótartalmú nitrocellulóz keverékek az 1 osztály anyagai.
- 542** A tremolitot és/vagy aktinolitot tartalmazó zsírkő ezen tétel alá tartozik.
- 543** Az UN 1005 vízmentes ammónia, az UN 3318 vizes ammónia oldat 50%-nál több ammóniatartalommal és az UN 2073 vizes ammónia oldat 35%-nál több, de legfeljebb 50% ammóniatartalommal a 2 osztály anyaga. A legfeljebb 10% ammóniát tartalmazó ammóniaoldatok nem tartoznak az ADR előírásainak hatálya alá.
- 544** Az UN 1032 vízmentes dimetil-amin, az UN 1036 etil-amin, az UN 1061 vízmentes metil-amin és az UN 1083 vízmentes trimetil-amin a 2 osztály anyaga.
- 545** Az UN 0401 dipikril-szulfid 10 tömeg%-nál kevesebb vízzel nedvesítve az 1 osztály anyaga.

- 546** A 18 µm-nél vékonyabb, UN 2009 száraz cirkónium lemez, szalag vagy huzal a 4.2 osztály anyaga. A legalább 254 µm vastagságú száraz cirkónium lemez, szalag vagy huzal nem tartozik az ADR előírásainak hatálya alá.
- 547** Az UN 2210 maneb vagy UN 2210 maneb készítmények önmelegedő formában a 4.2 osztály anyagai.
- 548** Azok a klór-szilánok, amelyek vízzel érintkezve gyúlékony gázokat fejlesztenek, a 4.3 osztály anyagai.
- 549** Azok a klór-szilánok, amelyek lobbanáspontja 23 °C alatti, és vízzel érintkezve nem fejlesztenek gyúlékony gázokat, a 3 osztály anyagai. Azok a klór-szilánok, amelyek lobbanáspontja 23 °C vagy ennél magasabb, és vízzel érintkezve nem fejlesztenek gyúlékony gázokat, a 8 osztály anyagai.
- 550** Az UN 1333 cérium lemezek, rudak, öntecsek a 4.1 osztály anyagai.
- 551** Ezen izocianátok oldatai, ha lobbanáspontjuk 23 °C alatt van, a 3 osztály anyagai.
- 552** A fémek és fémötvözetek por vagy egyéb gyúlékony formában, ha öngyulladásra hajlamosak, a 4.2 osztály anyagai. A fémek és fémötvözetek por vagy egyéb gyúlékony formában, ha vízzel érintkezve gyúlékony gázokat fejlesztenek, a 4.3 osztály anyagai.
- 553** A hidrogén-peroxid és a peroxi-ecetsav ezen keveréke a laboratóriumi vizsgálat során (lásd a „Vizsgálatok és kritériumok kézikönyv” II. Rész 20. fejezetét) nem detonálhat kavított állapotban, egyáltalán nem deflagrálnak, nem mutathat semmiféle hatást zárt térben hevítve és nem lehet robbanóereje. A formulázásnak termikusan stabilnak kell lennie (öngyorsuló bomlási hőmérséklet 60 °C vagy annál magasabb 50 kg-os küldeménydarabnál), és az érzéketlenítéshez a peroxi-ecetsavval összeférhető folyadékot kell használni. Az ezen kritériumokat nem teljesítő formulázásokat az 5.2 osztály anyagának kell tekinteni [lásd a „Vizsgálatok és kritériumok kézikönyv” II. Rész 20.4.3.g) pontját].
- 554** Azok a fém-hidridek, amelyek vízzel érintkezve gyúlékony gázokat fejlesztenek, a 4.3 osztály anyagai. Az UN 2870 alumínium-bór-hidrid vagy UN 2870 alumínium-bór-hidrid készülékekben a 4.2 osztály anyaga.
- 555** Azok a nem mérgező fémporok és finom porok, amelyek öngyulladásra nem hajlamos formában vannak, de amelyek vízzel érintkezve gyúlékony gázokat fejlesztenek, a 4.3 osztály anyagai.
- 556** Azok a szerves fémvegyületek és oldataik, amelyek öngyulladásra hajlamosak, a 4.2 osztály anyagai. A szerves fémvegyületeket olyan koncentrációban tartalmazó gyúlékony oldatok, amelyek vízzel érintkezve sem gyúlékony gázokat nem fejlesztenek veszélyes mennyiségben, sem öngyulladásra nem hajlamosak, a 3 osztály anyagai.
- 557** A fémporok és finom porok piroforos állapotban 4.2 osztály anyagai.
- 558** A fémek és fémötvözetek piroforos állapotban a 4.2 osztály anyagai. Azok a fémek és fémötvözetek, amelyek a vízzel érintkezve nem fejlesztenek gyúlékony gázokat és nem piroforosak, vagy nem önmelegedők, de amelyek könnyen meggyulladnak, a 4.1 osztály anyagai.
- 559** (törölve)

- 560** A magas hőmérsékletű folyékony anyag, m.n.n. (beleértve az olvasztott fémeket, sókat stb.) 100 °C-on vagy annál magasabb hőmérsékleten, de lobbanásponttal rendelkező anyag esetében a lobbanáspont alatti hőmérsékleten a 9 osztály anyaga (UN 3257).
- 561** A túlnyomórészt maró tulajdonságokkal bíró klór-formiátok a 8 osztály anyagai.
- 562** Az öngyulladó szerves fémvegyületek a 4.2 osztály anyagai. A vízzel reaktív, gyúlékony szerves fémvegyületek a 4.3 osztály anyagai.
- 563** Az UN 1905 szelénsav a 8 osztály anyaga.
- 564** Az UN 2443 vanádium-oxi-triklorid, az UN 2444 vanádium-tetraklorid és az UN 2475 vanádium-triklorid a 8 osztály anyaga.
- 565** Azokat az állatok vagy emberek gyógykezeléséből vagy biológiai kísérletekből származó nem specifikált hulladékokat, amelyeknél kicsi annak a valószínűsége, hogy a 6.2 osztály anyagait tartalmazzák, ezen tétel alá kell sorolni. Azok az előzőleg fertőző anyagokat tartalmazó kórházi hulladékok vagy biológiai kísérletekből származó hulladékok, amelyek fertőtlenítve vannak, nem tartoznak a 6.2 osztály előírásainak hatálya alá.
- 566** Az UN 2030 hidrazin vizes oldat 37 tömeg%-nál több hidrazintartalommal a 8 osztály anyaga.
- 567** (törölve)
- 568** A megállapított határnál kisebb víztartalmú bárium-azid az 1 osztály UN 0224 szám anyaga.
- 569 –**
579 (fenntartva)
- 580** A tartányjárműveket, a különleges járműveket és az ömlesztett szállításra szolgáló, különlegesen felszerelt járműveket el kell látni mindkét oldalukon és hátul az 5.3.3 szakasz szerinti jelöléssel. Tankkonténerek, mobil tartányok, különleges konténerek és az ömlesztett szállításra szolgáló, különlegesen felszerelt konténerek esetében ezt a jelölést mind a négy oldalon el kell helyezni.
- 581** Ez a tétel a metil-acetilén és propadién szénhidrogénnel való keverékeire terjed ki, amely mint a
- P1 keverék legfeljebb 63 tf.% metil-acetilént és propadiént és legfeljebb 24 tf.% propánt és propilént tartalmaz, és a telített C₄-szénhidrogén részaránya legalább 14 tf.%; és mint a
- P2 keverék legfeljebb 48 tf.% metil-acetilént és propadiént és legfeljebb 50 tf.% propánt és propilént tartalmaz, és a telített C₄-szénhidrogén részaránya legalább 5 tf.%; valamint kiterjed a
- propadién keverékeire 1...4% metil-acetilénnel.
- A fuvarokmányra vonatkozó követelmények (lásd az 5.4.1.1 bekezdést) szempontjából megfelelő a „P1 keverék” vagy a „P2 keverék” kifejezés használata a műszaki megnevezés helyett.
- 582** Ez a tétel többek között az R... jelű gázok keverékeire terjed ki, mint az:

F1 keverék, amelynek gőznyomása 70 °C-on legfeljebb 1,3 MPa (13 bar) és sűrűsége 50 °C-on a diklór-fluor-metánénál (1,30 kg/l) nem kisebb;

F2 keverék, amelynek gőznyomása 70 °C-on legfeljebb 1,9 MPa (19 bar) és sűrűsége 50 °C-on a diklór-difluor-metánénál (1,21 kg/l) nem kisebb;

F3 keverék, amelynek gőznyomása 70 °C-on legfeljebb 3 MPa (30 bar) és sűrűsége 50 °C-on a klór-difluor-metánénál (1,09 kg/l) nem kisebb;

Megjegyzés: *A triklór-monofluor-metán (R 11 hűtőgáz), az 1,1,2-triklór-1,2,2-trifluor-etán (R 113 hűtőgáz), az 1,1,1-triklór-2,2,2-trifluor-etán (R 113a hűtőgáz), az 1-klór-1,2,2-trifluor-etán (R 133 hűtőgáz) és az 1-klór-1,1,2-trifluor-etán (R 133b hűtőgáz) nem a 2 osztály anyaga, az F1, F2, F3 keverékekben azonban előfordulhatnak.*

A fuvarokmányra vonatkozó követelmények (lásd az 5.4.1.1 bekezdést) szempontjából megfelelő az „F1 keverék”, „F2 keverék” vagy „F3 keverék” kifejezés használata a műszaki megnevezés helyett.

583 Ez a tétel többek között olyan keverékekre terjed ki, mint az:

A gázkeverék, amelynek gőznyomása 70 °C-on legfeljebb 1,1 MPa (11 bar) és sűrűsége 50 °C-on legalább 0,525 kg/l;

A01 gázkeverék, amelynek gőznyomása 70 °C-on legfeljebb 1,6 MPa (16 bar) és sűrűsége 50 °C-on legalább 0,516 kg/l;

A02 gázkeverék, amelynek gőznyomása 70 °C-on legfeljebb 1,6 MPa (16 bar) és sűrűsége 50 °C-on legalább 0,505 kg/l;

A0 gázkeverék, amelynek gőznyomása 70 °C-on legfeljebb 1,6 MPa (16 bar) és sűrűsége 50 °C-on legalább 0,495 kg/l;

A1 gázkeverék, amelynek gőznyomása 70 °C-on legfeljebb 2,1 MPa (21 bar) és sűrűsége 50 °C-on legalább 0,485 kg/l;

B1 gázkeverék, amelynek gőznyomása 70 °C-on legfeljebb 2,6 MPa (26 bar), és sűrűsége 50 °C-on legalább 0,474 kg/l;

B2 gázkeverék, amelynek gőznyomása 70 °C-on legfeljebb 2,6 MPa (26 bar) és sűrűsége 50 °C-on legalább 0,463 kg/l;

B gázkeverék, amelynek gőznyomása 70 °C-on legfeljebb 2,6 MPa (26 bar) és sűrűsége 50 °C-on legalább 0,450 kg/l;

C gázkeverék, amelynek gőznyomása 70 °C-on legfeljebb 3,1 MPa (31 bar) és sűrűsége 50 °C-on legalább 0,440 kg/l.

A fuvarokmányra vonatkozó követelmények (lásd az 5.4.1.1 bekezdést) szempontjából megfelelő a következő kifejezések használata a műszaki megnevezés helyett:

- „A keverék” vagy „bután”;
- „A01 keverék” vagy „bután”;
- „A02 keverék” vagy „bután”;
- „A0 keverék” vagy „bután”;
- „A1 keverék”;
- „B1 keverék”;
- „B2 keverék”;
- „B keverék”;

– „C keverék” vagy „propán”.

Tartányban történő szállítás esetén a bután vagy propán kereskedelmi név csak kiegészítésként használható.

- 584** Ez a gáz nem esik az ADR előírásainak hatálya alá, ha:
- legfeljebb 0,5% gáz halmazállapotú levegőt tartalmaz;
 - fémkapszulákban (szifonpatronok, habszifon patronok) van, amelyek mentesek a szilárdságukat gyengítő hibáktól;
 - a kapszula zárásának szivárgásmentessége garantált;
 - egy kapszula legfeljebb 25 g ilyen gázt tartalmaz;
 - egy kapszula legfeljebb 0,75 g ilyen gázt tartalmaz 1 cm³ térfogatra vonatkoztatva.
- 585** A cinóber nem tartozik az ADR előírásainak hatálya alá.
- 586** A hafnium-, titán- és cirkóniumporok szemmel látható vízfelesleget kell tartalmaznia. Azok a mechanikailag előállított, nedvesített hafnium-, titán- és cirkóniumporok, melyek részecskemérete legalább 53 µm, és azok a kémiai előállítottak, melyek részecskemérete legalább 840 µm, nem tartoznak az ADR hatálya alá.
- 587** A bárium-sztearát és a bárium-titanát nem tartozik az ADR előírásainak hatálya alá.
- 588** Az alumínium-bromid és az alumínium-klorid szilárd, hidratált formái nem tartoznak az ADR előírásainak hatálya alá.
- 589** (törölve)
- 590** A vas(III)-klorid-hexahidrát nem tartozik az ADR előírásainak hatálya alá.
- 591** A legfeljebb 3% szabad kénsavat tartalmazó ólom-szulfát nem tartozik az ADR előírásainak hatálya alá.
- 592** Azok az üres, tisztítatlan csomagolóeszközök (beleértve az üres IBC-eket és nagycsomagolásokat is), üres tartányjárművek, üres leszerelhető tartányok, üres mobil tartányok, üres tankkonténerek és üres kiskonténerek, amelyek ezt az anyagot tartalmazták, nem tartoznak az ADR előírásainak hatálya alá.
- 593** Az 5.5.3 szakaszban meghatározottak kivételével, ez a gáz nem tartozik az ADR előírásainak hatálya alá, amennyiben pl. gyógyászati vagy biológiai minták hűtésére szolgál és a 4.1.4.1 bekezdés P203 csomagolási utasítás 6) pont nyitott mélyhűtő tartályokra vonatkozó előírásainak megfelelő, kettős falú tartályban van.
- 594** A következő tárgyak, amelyeket a gyártó ország előírásai szerint állítottak elő és töltöttek meg, erős külső csomagolásba helyezve nem tartoznak az ADR előírásainak hatálya alá:
- UN 1044 tűzoltókészülékek, a nem szándékos működtetés elleni védelemmel ellátva;
 - UN 3164 pneumatikus vagy hidraulikus nyomás alatti tárgyak, amelyek az erőátvitelük, alaktartásuk vagy konstrukciójuk révén a belső gáz nyomásánál nagyobb nyomás elviselésére vannak méretezve.
- 596** Az olyan kadmumpigmentek, mint a kadmium-szulfidok, a kadmium-szulfoszelenidek és a hosszabb láncú zsírsavak kadmiumsói (pl. kadmium-sztearát) nem tartoznak az ADR előírásainak hatálya alá.
- 597** Az ecetsav oldatok legfeljebb 10 tömeg% tiszta savtartalommal nem tartoznak az

ADR előírásainak hatálya alá.

598 A következő tárgyak nem tartoznak az ADR előírásainak hatálya alá:

a) Új akkumulátortelepek abban az esetben, ha:

- úgy vannak rögzítve, hogy nem tudnak elcsúszni, leesni vagy megrongálódni;
- el vannak látva kitámasztó eszközzel vagy megfelelően vannak halmazolva, pl. rakodólapon;
- nincs a külsejükön veszélyes sav vagy lúg maradvány;
- rövidzárlat ellen védve vannak.

b) Használt akkumulátortelepek abban az esetben, ha:

- házuk sértetlen;
- úgy vannak rögzítve, hogy nem tudnak szivárogni, elcsúszni, leesni vagy megrongálódni, pl. rakodólapon vannak rögzítve;
- nincs a külsejükön veszélyes sav vagy lúg maradvány;
- rövidzárlat ellen védve vannak.

„Használt akkumulátortelep”-eken azokat az akkumulátortelepeket kell érteni, amelyeket élettartamuk leteltével újrafeldolgozás céljából szállítanak.

599 (törölve)

600 Az olvasztott és megszilárdult vanádium-pentoxid nem tartozik az ADR előírásainak hatálya alá.

601 A felhasználásra kész gyógyszerészeti termékek (gyógyszerek), amelyeket személyes vagy háztartási felhasználás vagy kiskereskedelmi értékesítés céljára gyártanak és erre szolgáló csomagolásban vannak, nem tartoznak az ADR előírásainak hatálya alá.

602 Azok a foszfor-szulfidok, amelyek fehér- és sárgafoszfortól nem mentesek, nem szállíthatók.

603 Az UN 1051 vagy UN 1614 tétel leírásának nem megfelelő vízmentes hidrogén-cianid nem szállítható. A hidrogén-cianid (cián-hidrogénsav) 3% alatti víztartalommal akkor stabil, ha a pH érték $2,5 \pm 0,5$ és a folyadék átlátszó és színtelen.

604 –

606 (törölve)

607 A kálium-nitrát és nátrium-nitrit keverékei valamely ammóniumsóval nem szállíthatók.

608 (törölve)

609 Az éghető szennyeződésektől nem mentes tetranitro-metán nem szállítható.

610 Ez az anyag 45%-nál nagyobb hidrogén-cianid tartalommal nem szállítható.

611 Az ammónium-nitrát 0,2%-nál több éghető anyag tartalommal (beleértve bármilyen szerves anyagot szénegyenértékre átszámítva) nem szállítható, hacsak nem valamely 1 osztályba tartozó anyag vagy tárgy alkotórésze.

- 612 (fenntartva)
- 613 A klórsav oldatok 10% feletti klórsav-tartalommal és a klórsav keverékek vízen kívül bármilyen más folyadékkal nem szállíthatók.
- 614 A 2,3,7,8-tetraklór-dibenzo-1,4-dioxin (TCDD) olyan koncentrációban, amely a 2.2.61.1 bekezdésben foglalt feltételek alapján nagyon mérgező, nem szállítható.
- 615 (fenntartva)
- 616 A 40%-nál nagyobb folyékony salétromsav-észter tartalmú anyagoknak ki kell elégíteni a 2.3.1 szakasz szerinti kiizzadási próba feltételeit.
- 617 A robbantóanyag típusán kívül az adott robbantóanyag kereskedelmi nevét is fel kell tüntetni a küldeménydarabon.
- 618 Az 1,2-butadiénnel töltött tartályokban a gázfázis oxigénkoncentrációja legfeljebb 50 ml/m³ lehet.
- 619–
- 622 (fenntartva)
- 623 Az UN 1829 kén-trioxidot inhibitor hozzáadásával stabilizálni kell. A 99,95%-os vagy annál nagyobb tisztaságú kén-trioxid stabilizálás nélkül is szállítható tartányban, feltéve, hogy a hőmérsékletét 32,5 °C-on vagy a fölött tartják. Ezen anyag inhibitor nélkül tartányban legalább 32,5 °C hőmérsékleten való szállításánál a fuvarokmányban szerepelni kell a „**Szállítás alatt a termék minimális hőmérséklete 32,5 °C**” szövegnek.
- 625 Az ilyen tárgyakat tartalmazó küldeménydarabokon jól olvasható módon fel kell tüntetni az „**UN 1950 AEROSZOLOK**” feliratot.
- 626 –
- 627 (fenntartva)
- 632 Öngyulladónak (piroforosnak) tekintendő.
- 633 Ezt az anyagot tartalmazó küldeménydarabokat és kiskonténereket el kell látni a következő felirattal: „**Gyújtóforrástól távol tartandó**”. Ezt a feliratot a feladási ország valamelyik hivatalos nyelvén és ha ez nem angol, francia vagy német, akkor ezenkívül angolul, franciául vagy németül kell szövegezni, hacsak a szállításban érintett országok közötti megállapodások másként nem rendelkeznek.
- 634 (törölve)
- 635 Az ezen tárgyakat tartalmazó küldeménydarabokat csak akkor kell 9 számú bárcával ellátni, ha a tárgy a csomagolásba, rekeszbe vagy más eszközbe úgy van teljesen bezárva, hogy a tárgy gyors azonosítása nem lehetséges.
- 636 a) A készülékekben levő cellák a szállítás alatt nem sühetnek ki olyan mértékben, hogy a kapocsfeszültség nyitott áramkörben 2 V alá, vagy a nem kisütött cella feszültségének kétharmada alá csökkenjen aszerint, hogy ezen két feszültség közül melyik az alacsonyabb.
- b) Abban az esetben, ha az összegyűjtött és ártalmatlanításra szánt, egyenként legfeljebb 500 gr bruttó tömegű lítium-cellákat és akkumulátorokat – akár

készülékben vannak, akár nem –, másféle (nemlítium-) cellákkal és akkumulátorokkal együtt szállításra adnak fel, a köztes feldolgozó létesítményig az ADR többi előírását nem kell betartani, ha kielégítik a következő feltételeket:

- i) a P903b csomagolási utasítás előírásait betartják;
- ii) minőségbiztosítási programot alkalmaznak annak biztosítására, hogy a lítium-cellák, ill. akkumulátorok összes mennyisége nem haladja meg a szállítóegységenkénti 333 kg-ot;
- iii) a küldeménydarabokat el kell látni „**Használt lítium-cellák**” felirattal.

637 A géntechnológiával módosított mikroorganizmusok és a géntechnológiával módosított élő szervezetek azok, amelyek bár nem veszélyesek az emberekre vagy állatokra, de amelyek képesek az állatokat, növényeket, mikrobiológiai anyagokat és az ökoszisztémát oly módon megváltoztatni, ami a természetben nem következhet be. Azok a géntechnológiával módosított mikroorganizmusok és géntechnológiával módosított élő szervezetek, amelyek felhasználását a származási, a tranzit és a célország illetékes hatóságai engedélyezték³⁾, nem tartoznak az ADR előírásainak hatálya alá. Gerinces vagy gerinctelen élő állatok ezen UN szám alá besorolt anyagok szállítására nem használhatók, hacsak az anyag más módon nem szállítható. A gyorsan romló anyagokállításánál megfelelő információt kell nyújtani, pl.: „+2/+4 °C-on tartandó” vagy „fagyasztva szállítandó” vagy „tilos fagyasztani”.

638 Ezek az anyagok önreaktív anyagokkal rokon anyagok (lásd a 2.2.41.1.19 pontot).

639 Lásd a 2.2.2.3 bekezdés, 2F osztályozási kód, UN 1965, 2. megjegyzést.

640 A 3.2 fejezet „A” táblázat 2 oszlopában említett fizikai és műszaki jellemzők különböző tartánykódokat határoznak meg ugyanazon csomagolási csoportba tartozó anyagok ADR-tartányokban történőállításához.

A tartányban szállított termék ezen fizikai és műszaki jellemzőinek megállapításához kizárólag ADR-tartányok esetén a következő bejegyzéssel kell a fuvarokmányban feltüntetendő adatokat kiegészíteni:

„**640X különleges előírás**”, ahol „X” a 3.2 fejezet „A” táblázat 6 oszlopában a 640 különleges előírás után szereplő nagybetű.

Ez a bejegyzés azonban elhagyható olyan típusú tartányban történőállítás esetén, amely legalább az adott UN szám adott csomagolási csoportjához tartozó legszigorúbb követelményeknek felel meg.

642 Az ENSZ Minta Szabályzat ezen tételét csak az 1.1.4.2 bekezdés szerinti esetben lehet a szabad ammónia tartalmú ammónia műtrágya oldatállításához használni.

643 Az aszfaltkeverékek nem tartoznak a 9 osztály előírásainak hatálya alá.

644 Ez az anyag csak akkor szállítható, ha

- a szállított anyag 10%-os vizes oldatában mért pH érték 5 és 7 között van;
- az oldat nem tartalmaz sem 0,2%-nál több éghető anyagot, sem klórvegyületet olyan mennyiségben, hogy a klórtartalom meghaladja a 0,02%-ot.

3) Lásd részletesen a géntechnológiával módosított szervezeteknek a környezetben történő szándékos kibocsátásáról és a 90/220/EGK Tanácsi Irányelv hatályon kívül helyezéséről szóló 2001/18/EK Európai Parlamenti és Tanácsi Irányelv (az EK Hivatalos Lapja, L 106. szám, 2001.04.17., 8 – 14 o.) C részét, amely tartalmazza az Európai Közösség engedélyezési eljárásait. Magyarországon lásd az 1998. évi XXVII. tv-t a géntechnológiai tevékenységről, ill. a végrehajtására kiadott rendeleteket.

- 645** A 3.2 fejezet „A” táblázat 3b oszlopban található osztályozási kódot csak valamely ADR Szerződő Fél illetékes hatóságának a szállítás előtti jóváhagyásával lehet alkalmazni. A jóváhagyást írásba foglalt besorolás jóváhagyási igazolásként kell kiadni [lásd az 5.4.1.2.1 pont g) alpontját], és egyedi hivatkozási számmal kell ellátni. Ha az alosztályt a 2.2.1.1.7.2 pontban ismertetett eljárással határozzák meg, az illetékes hatóság előírhatja, hogy a besorolást a „Vizsgálatok és kritériumok kézikönyv” I. Rész 16 fejezet 6 vizsgálati sorozat próbái során nyert adatok alapján ellenőrizték.
- 646** A gözzel aktivált szén nem tartozik az ADR előírásainak hatálya alá.
- 647** A legfeljebb 25% tisztasav tartalmú (biológiai erjesztésű) ételecet és (étkezési) ecetsav oldat csak a következő előírások hatálya alá tartozik:
- a) a csomagolóeszközöket (IBC-eket, nagycsomagolásokat) és a tartányokat rozsdamentes acélból vagy műanyagból kell gyártani, ami tartósan ellenáll az ételecet, ill. ecetsav oldat korróziós hatásának;
 - b) a csomagolóeszközöket (IBC-eket, nagycsomagolásokat) és a tartányokat évente legalább egyszer a tulajdonosnak szemrevételezéssel meg kell vizsgálnia. A vizsgálat eredményét írásban kell rögzíteni és legalább egy évig meg kell őrizni. A sérült csomagolóeszközöket (IBC-eket, nagycsomagolásokat) és tartányokat nem szabad megtölteni;
 - c) a csomagolóeszközöket (IBC-eket, nagycsomagolásokat) és a tartányokat úgy kell megtölteni, hogy a termék ne csepegjen és ne tapadjon a külső felületükre.
 - d) a tömítéseknek és zárószervezeteknek ételecettel, ill. ecetsav oldattal szemben ellenállónak kell lenniük. A csomagolóeszközöket (IBC-eket, nagy-csomagolásokat) és a tartányokat, a csomagolónak, ill. töltőnek légmentesen kell lezárnia úgy, hogy normális szállítási feltételek mellett ne következhesen be szivárgás;
 - e) használhatók a 4.1.1.1, 4.1.1.2, 4.1.1.4, 4.1.1.5, 4.1.1.6, 4.1.1.7 és 4.1.1.8 bekezdés általános csomagolási előírásainak megfelelő kombinált csomagolások üveg vagy műanyag belső csomagolóeszközökkel (lásd a 4.1.4.1 bekezdésben a P001 csomagolási utasítást).

Az ADR egyéb előírásait nem kell betartani.

- 648** Az ezzel a peszticiddel impregnált tárgyak, pl. papírtányérok, papírszalagok, vattagolyók, műanyag lapok, légmentesen zárt burkolatban nem tartoznak az ADR előírásainak hatálya alá.
- 649** (törölve)
- 650** A festékek csomagolóeszközeiből, beszáradt vagy folyékony festék maradványokból álló hulladék a II csomagolási csoport feltételei szerint szállítható. Az UN 1263 tétel II csomagolási csoportjára vonatkozó előírásokon kívül ez a hulladék a következők szerint is csomagolható és szállítható:
- a) a hulladék a 4.1.4.1 bekezdés P002 csomagolási utasítása, ill. a 4.1.4.2 bekezdés IBC06 csomagolási utasítása szerint is csomagolható;
 - b) a hulladék teljes falú egyesítőcsomagolásba helyezett 13H3, 13H4 vagy 13H5 típusú hajlékony falú IBC-be is csomagolható;
 - c) az a), ill. a b) pont alatt jelzett csomagolóeszközöket, ill. IBC-eket a 6.1, ill. a 6.5 fejezet előírásai szerint a II csomagolási csoportra, szilárd anyagra elég

vizsgálni.

A vizsgálatokat a hulladékot reprezentáló mintával megtöltött, szállításra előkészített csomagolóeszközzel, ill. IBC-vel kell elvégezni;

- d) megengedett az ömlesztett szállítás teljes falú, ponyvás járműben, teljes falú, zárt konténerben vagy teljes falú, ponyvás nagykonténerben is. A jármű felépítményének, ill. a konténernek szivárgásmentesnek kell lennie, vagy pl. alkalmas és elég erős béléssel szivárgásmentessé kell tenni;
- e) ha a hulladékot e különleges előírás feltételei szerint szállítják, az árut az 5.4.1.1.3 pont értelmében a következő szöveggel kell a fuvarokmányba bejegyezni:

„UN 1263 HULLADÉK FESTÉK, 3, II(D/E)”, vagy

„UN 1263 HULLADÉK FESTÉK, 3, PG II, (D/E)”.

651 A V2 különleges előírás 1) bekezdését nem kell alkalmazni, ha a szállítóegységen a nettó robbanóanyag-mennyiség legfeljebb 4000 kg, feltéve, hogy a nettó robbanóanyag-mennyiség járművenként is csak legfeljebb 3000 kg.

652 Azok az üzemanyag tartályok, amelyeket hőlégballonokhoz, ill. meleglevegős lég-hajókhoz használnak és amelyeket ausztenites (korrózióálló) acélból, ferrites és ausztenites acélból (duplex acélból) vagy hegesztett titánból a nemzeti légügyi előírások szerint gyártottak és hagytak jóvá és 2004. július 1-je előtt helyeztek üzembe (az üzembe helyezés előtti vizsgálat 2004. július 1-je előtt történt) és nem felelnek meg a 6.2 fejezet követelményeinek, a következő feltételekkel szállíthatók közúton:

- a) a 6.2.1 szakasz általános előírásait be kell tartani;
- b) a tartály tervezését és gyártását – a légialkalmasság szempontjából – a nemzeti légiközlekedési hatóság jóváhagyta;
- c) a 6.2.3.1.2 pont előírásaitól eltérően a tervezési nyomást a +40 °C-os csökkentett maximális környezeti hőmérsékletből kell levezetni, mely esetben:
 - i) a 6.2.5.1 bekezdés előírásaitól eltérően a tartályt kereskedelmi tisztaságú, hengerelt és hőkezelt titánból is lehet gyártani, a következő minimum követelmények betartásával: $R_m > 450$ MPa, $\epsilon_A > 20\%$ (ϵ_A = szakadási nyúlás);
 - ii) ausztenites (korrózióálló) acélból, ferrites és ausztenites acélból (duplex acélból) készült tartályok is használhatók a szavatolt minimális folyáshatár (R_e) legfeljebb 85%-át kitevő feszültségszintig a +40 °C-os csökkentett maximális környezeti hőmérsékletből levezetett tervezési nyomás mellett;
 - iii) a tartályt 26 bar névleges nyitónyomású nyomáscsökkentő szerkezettel kell ellátni; a tartály próbanyomása legalább 30 bar legyen;
- d) ha a c) pontban említett eltérési lehetőséget nem alkalmazzák, akkor a tartályt 65 °C referencia hőmérsékletre kell tervezni és olyan nyomáscsökkentő szerkezettel kell ellátni, amelynek névleges nyitónyomását azon ország illetékes hatóságának kell meghatároznia, amelyben használni fogják;
- e) a tartály törzsét legalább 25 mm vastagságú, szilárd habból vagy ahhoz hasonló anyagból készült, vízálló külső védőréteggel kell ellátni;

- f) szállítás közben a tartálynak rekeszben vagy külön védőeszközben szilárdan rögzítve kell lenni;
- g) a tartályon jól látható feliratot kell elhelyezni, miszerint a tartály csak hőléggallonokhoz, ill. meleglevegős léghajókhoz használható;
- h) a tartály használati ideje (az üzembe helyezés előtti vizsgálatától számítva) legfeljebb 25 év lehet.

653 Ez a gáz olyan palackokban szállítva, amelyeknél a próbanyomás és az űrtartalom szorzata legfeljebb 15,2 MPa.liter (152 bar.liter), nem tartozik az ADR többi előírásának hatálya alá, a következő feltételekkel:

- a palackok gyártására és vizsgálatára vonatkozó előírásokat betartják;
- a palackok olyan külső csomagolóeszközben vannak, amely legalább a 4. Rész kombinált csomagolásokra vonatkozó követelményeinek megfelel; a 4.1.1.1, a 4.1.1.2 és a 4.1.1.5 – 4.1.1.7 bekezdés általános csomagolási előírásait be kell tartani;
- a palackokat nem csomagolják egybe más veszélyes áruval;
- egy küldeménydarab össztömege legfeljebb 30 kg;
- minden küldeménydarabon jól látható módon és tartósan fel van tüntetve sűrített argon esetén az UN 1006, szén-dioxid esetén az UN 1013, sűrített hélium esetén az UN 1046, ill. sűrített nitrogén esetén az UN 1066 jelölés. Ezt a jelölést egy vonallal körberajzolt, legalább 100 x 100 mm nagyságú, csúcsára állított négyzetben kell feltüntetni.

654 Ez a tétel alkalmazható az 5.4.1.1.3 pont szerint feladott, elkülönítve összegyűjtött hulladék öngyújtók ártalmatlanítás céljából történő szállításakor is. Ilyen esetben nem kell az akaratlan működtetés ellen védeni, feltéve, hogy megtették a szükséges óvintézkedéseket a veszélyes nyomásnövekedés, ill. veszélyes atmoszféra kialakulásának megakadályozására. Azokat az öngyújtókat, amelyek nem szivárognak, ill. nincsenek nagyon deformálódva, a P003 csomagolási utasításnak megfelelően kell csomagolni, és ezenkívül a következő előírásokat kell betartani:

- csak legfeljebb 60 l űrtartalmú, merev falú csomagolóeszközök használhatók;
- a gyulladás elkerülése érdekében a csomagolóeszközt vízzel vagy más, alkalmas védőközeggel kell feltölteni;
- normális szállítási körülmények között a védőközegnek el kell lepnie az öngyújtók gyújtószerkezetét;
- a csomagolóeszközöket megfelelően szellőztetni kell, hogy gyúlékony atmoszféra, ill. nyomás kialakulását megelőzzék;
- a küldeménydarabok csak jól szellőző vagy nyitott járművel, ill. konténerben vihetők.

A szivárgó vagy erősen deformálódott öngyújtókat kármentő csomagolásban kell szállítani, megfelelő óvintézkedésekkel biztosítva, hogy nem lép fel veszélyes nyomásnövekedés.

Megjegyzés: *A hulladék öngyújtókra nem kell alkalmazni sem a 201 különleges előírást, sem a 4.1.4.1 bekezdés P002 csomagolási utasításának PP84 és RR5 különleges csomagolási előírását.*

655 Azok a légzőkészülékekhez használt palackok és zárószerkezetük, amelyeket a 97/23/EK irányelv⁴⁾ szerint terveztek, gyártottak, hagytak jóvá és láttak el jelöléssel, anélkül szállíthatók, hogy megfelelnek a 6.2 fejezetnek, amennyiben alávetik a 6.2.1.6.1 pont szerinti vizsgálatoknak és a vizsgálatok időköze nem haladja meg a 4.1.4.1 bekezdés P200 csomagolási utasításában meghatározott időközt. A folyadék-

4) Az Európai Parlament és a Tanács 97/23/EK irányelve (1997. május 29.) a nyomástartó berendezésekre vonatkozó tagállami jogszabályok közelítéséről (PED) (lásd az EK Hivatalos lapja L 181. 1997. 7. 9., p. 1 - 55.)

nyomás-próbánál alkalmazandó nyomás a palackon a 97/23/EK irányelv szerint feltüntetett nyomás.

656 (törölve)

657 Ez a tétel csak technikailag tiszta anyagokra alkalmazható. Az LPG összetevők keverékeire lásd az UN 1965 vagy UN 1075 tételt a 2.2.2.3 bekezdés 2. megjegyzése értelmében.

658 Az EN ISO 9994:2006 + A1:2008 „Öngyújtók – Biztonsági előírások” szabványnak megfelelő UN 1057 öngyújtók, valamint az UN 1057 öngyújtó utántöltők csak a 3.4.1 szakasz a) – h) pontjai, a 3.4.2 szakasz (kivéve, ha a bruttó össztömeg 30 kg), a 3.4.3 szakasz (kivéve, ha a bruttó össztömeg 20 kg), a 3.4.11 és a 3.4.12 szakasz előírásainak betartásával is szállíthatók, feltéve, hogy megfelelnek a következő feltételeknek:

- a) egyetlen küldeménydarab bruttó össztömege sem több, mint 10 kg;
- b) az ilyen küldeménydarabokból legfeljebb 100 kg bruttó össztömeget szállítanak egy járművön; és
- c) minden külső csomagolóeszközön jól látható módon és tartósan fel van tüntetve az „**UN 1057 ÖNGYÚJTÓK**”, ill. az „**UN 1057 ÖNGYÚJTÓ UTÁNTÖLTŐK**” felirat

659 E tétel alatt nem szállíthatók azok az anyagok, amelyekhez a 3.2 fejezet „A” táblázat 9a, ill. 11 oszlopában a PP86, ill. a TP7 különleges előírás van hozzárendelve és ezért a gőztérből a levegőt ki kell szorítani, hanem csak a 3.2 fejezet „A” táblázatban feltüntetett, az anyagnak megfelelő UN tétel alatt.

Megjegyzés: Lásd még a 2.2.2.1.7 pontot is.

660 Az ilyen gázt tartalmazó, gépjárművekbe való beépítésre tervezett gáznemű tüzelőanyag tartály rendszer szállítására a 4.1.4.1 bekezdés, az 5.2, az 5.4 és a 6.2 fejezet előírásait nem kell alkalmazni, feltéve, hogy megfelelnek a következő feltételeknek:

- a) A gáznemű tüzelőanyag tartály rendszernek meg kell felelnie az ENSZ-EGB 67. sz. előírás 2. felülvizsgált szövegváltozat⁵⁾, az ENSZ-EGB 110. sz. előírás 1. felülvizsgált szövegváltozat⁶⁾ vagy az ENSZ-EGB 115. sz. előírás⁷⁾ vagy a 79/2009/EK rendelet⁸⁾ 406/2010/EU rendelettel⁹⁾ együtt alkalmazott követelményeinek.
- b) A gáznemű tüzelőanyag tartály rendszernek szivárgásmentesnek kell lennie, és nem lehet rajta olyan külső sérülés, amely a biztonságát befolyásolná.

-
- 5) ENSZ-EGB 67. sz. előírás (Egységes feltételek: I. Meghajtó rendszerükben folyékony szénhidrogén gázt használó gépjárművek különleges berendezéseinek jóváhagyására; II. Meghajtó rendszerükben folyékony szénhidrogén gáz használatára szolgáló különleges berendezésekkel felszerelt jármű jóváhagyására ilyen berendezés beépítése szempontjából)
 - 6) ENSZ-EGB 110. sz. előírás (Egységes előírások I. sűrített földgázt (CNG) használó gépjárművek meghajtó rendszerének különleges berendezéseihez; II. sűrített földgázt (CNG) használó jóváhagyott különleges berendezés-típusok beszereléséhez járművek meghajtó rendszerébe jóváhagyásához)
 - 7) ENSZ-EGB 115. sz. előírás (Egységes feltételek: I. Meghajtó rendszerükben LPG használatához gépjárművekre utólag felszerelt különleges LPG (folyékony olajgáz) rendszerek; II. Meghajtó rendszerükben CNG használatához gépjárművekre utólag felszerelt különleges CNG (sűrített földgáz) rendszerekjóváhagyásához)
 - 8) Az Európai Parlament és a Tanács 79/2009/EK rendelete (2009. január 14.) a hidrogénüzemű gépjárművek típusjóváhagyásáról és a 2007/46/EK irányelv módosításáról
 - 9) A Bizottság 406/2010/EU rendelete (2010. április 26.) a hidrogénüzemű gépjárművek típusjóváhagyásáról szóló 79/2009/EK európai parlamenti és tanácsi rendelet végrehajtásáról

Megjegyzés 1. A kritériumok megtalálhatók az ISO 11623:2002 Szállítható gázpalackok. Kompozit palackok időszakos ellenőrzése és vizsgálata c. szabványban (vagy az ISO DIS 19078 Gázpalackok felszerelésének vizsgálata, és a nagynyomású palackok újraminősítése a föld-gáz hajtóanyagú gépjárműveken való földgáz tárolásra c. szabványban).

2. Ha a gáznemű tüzelőanyag tartály rendszer szivárog, vagy túl van töltve, vagy olyan sérülés van rajta, amely a biztonságát befolyásolná, akkor az ADR-nek megfelelő kármentő nyomástartó tartályban kell szállítani..
- c) Ha a gáznemű tüzelőanyag tartály rendszerbe két vagy több szelep van egymás után beépítve, két szeleplek úgy kell zárva lennie, hogy normális szállítási körülmények között gáztömör legyen. Ha csak egy szelep van, vagy csak egy működik megfelelően, a biztonsági szelep nyílásán kívül minden más nyílásnak úgy kell zárva lennie, hogy normális szállítási körülmények között gáztömör legyen.
- d) A gáznemű tüzelőanyag tartály rendszert oly módon kell szállítani, hogy normális szállítási körülmények között a nyomáscsökkentő szelepek ne tömődjenek el, ill. ne akadjanak fel, a szelepek és a gáznemű tüzelőanyag tartály rendszer egyéb, nyomás alatt lévő részei ne sérüljenek meg, és a gáz nem szándékosan ne szabaduljon ki. A gáznemű tüzelőanyag tartály rendszert oly módon kell rögzíteni, hogy ne csússzon, ne guruljon el, és függőleges irányba se mozduljon el.
- e) A gáznemű tüzelőanyag tartály rendszernek meg kell felelnie a 4.1.6.8 bekezdés a), b), c), d) vagy e) pontja előírásainak.
- f) Az 5.2 fejezet jelölésre és bárcázásra vonatkozó előírásait be kell tartani, kivéve ha az gáznemű tüzelőanyag tartály rendszert kezelőeszközben szállítják. Ez esetben viszont a jelölést és a bárcákat a kezelőeszközt kell feltenni.
- g) Okmányok

Az e különleges előírás szerint szállított küldeményeket fuvarokmánynak kell kísérnie, aminek legalább a következőket kell tartalmaznia:

- i) a gáznemű tüzelőanyag tartály rendszerben lévő gáz UN számát, ami elé az „UN” betűket kell írni;
- ii) a gáz helyes szállítási megnevezését;
- iii) a bárca számát;
- iv) gáznemű tüzelőanyag tartály rendszerek darabszámát;
- v) cseppfolyósított gáz esetén az egyes gáznemű tüzelőanyag tartály rendszerekben lévő gáz nettó mennyiségét kg-ban, sűrített gáz esetén a az egyes gáznemű tüzelőanyag tartály rendszerek névleges űrtartalmát literben, ami után fel kell tüntetni a névleges üzemi nyomást;
- vi) a feladó és a címzett nevét és címét.

Az i) – v) pontokban szereplő adatokat a következő módok valamelyikén kell feltüntetni:

1. példa: UN 1971 földgáz, sűrített, 2.1, 1 gáznemű tüzelőanyag tartály rendszer, összesen 50 literes, 200 bar.
2. példa: UN 1965 szénhidrogén-gáz keverék, cseppfolyósított, m.n.n., 2.1, 3 gáznemű tüzelőanyag tartály rendszer, egyenként 15 kg nettó

tömegű gáz.

Megjegyzés: Az ADR összes többi előírását is be kell tartani.

- 661** Az olyan sérült lítium akkumulátorok, amelyeket nem a 636 különleges előírás szerint összegyűjtve és ártalmatlanításra adnak fel, csak valamely ADR Szerződő Fél illetékes hatósága által meghatározott kiegészítő feltételekkel szállíthatók. Ez a hatóság elismerheti olyan ország illetékes hatóságának a jóváhagyását is, amely nem szerződő fele az ADR-nek, feltéve, hogy a jóváhagyást az ADR, ill. a RID által előírt eljárás szerint adták ki.

Csak olyan csomagolási módszerek használhatók, amelyet az illetékes hatóság erre az áruja jóváhagyott.

Az illetékes hatóság szigorúbb szállítási kategóriát vagy alagútkorlátozási kódot is előírhat, amit az illetékes hatóság jóváhagyásában fel kell tüntetni.

Minden ilyen szállítmányt kísérnie kell az illetékes hatóság jóváhagyása másolatának, vagy a fuvarokmányban hivatkozni kell az illetékes hatóság jóváhagyására.

Ha valamely ADR Szerződő Fél illetékes hatósága ezen különleges előírás szerinti jóváhagyást ad ki, erről értesítenie kell az UNECE Titkárságát, hogy az UNECE Titkárság ezt az információt a honlapján közzétegye.

Megjegyzés: A jóváhagyás kiadásakor figyelembe kell venni az Egyesült Nemzetek ajánlásait a sérült lítium akkumulátorok szállításának műszaki követelményeire vonatkozóan.

Sérült lítium akkumulátoron különösen a következők értendők:

- a gyártó által biztonsági okból sérültnek minősített akkumulátorok;
- olyan akkumulátorok, amelyek háza sérült vagy jelentős mértékben deformálódott;
- szivárgó vagy kinyílt akkumulátorok;
- a vizsgálat helyére történő szállítás előtt nem megállapítható hibával rendelkező akkumulátorok.

3.4 FEJEZET

KORLÁTOZOTT MENNYISÉGBEN CSOMAGOLT VESZÉLYES ÁRUK

- 3.4.1** Ez a fejezet bizonyos osztályok korlátozott mennyiségben csomagolt veszélyes áruinak szállítására vonatkozó előírásokat tartalmaz. A belső csomagolásonként vagy tárgyanként megengedett mennyiségi határokat az egyes anyagokra a 3.2 fejezet „A táblázat” 7a oszlopa tartalmazza. Ezen kívül azoknál a tételeknél, amelyek e fejezet szerint nem szállíthatók, ebben az oszlopban a „0” mennyiség van feltüntetve. Az ezen fejezet előírásait kielégítő, korlátozott mennyiségben csomagolt veszélyes áruk nem tartoznak az ADR más előírásainak hatálya alá, kivéve
- a) az 1. Rész 1.1, 1.2, 1.3, 1.4, 1.5, 1.6, 1.8, 1.9 fejezete;
 - b) a 2. Rész;
 - c) a 3. Rész 3.1, 3.2, 3.3 fejezete (kivéve a 61, 178, 181, 220, 274, 625, 633 és 650 e) különleges előírást);
 - d) a 4. Rész 4.1.1.1, 4.1.1.2, 4.1.1.4 – 4.1.1.8 bekezdése;
 - e) az 5. Rész 5.1.2.1 a) i) és b) pontja, az 5.1.2.2, 5.1.2.3, 5.2.1.9 bekezdése és az 5.4.2 szakasza;
 - f) a 6. Rész 6.1.4 szakasz gyártási előírásai, a 6.2.5.1 és 6.2.6.1 – 6.2.6.3 bekezdés;
 - g) a 7. Rész 7.1 fejezete és a 7.2.1, 7.2.2, 7.5.1 (kivéve a 7.5.1.4 bekezdést), 7.5.2.4 bekezdése, 7.5.7, 7.5.8 és 7.5.9 szakasza; és
 - h) a 8. Rész 8.6.3.3 bekezdése és a 8.6.4 szakasz
- vonatkozó előírásait.
- 3.4.2** A veszélyes árukat alkalmas külső csomagolásba helyezett belső csomagolásba kell csomagolni. Köztes csomagolások is használhatók. Ezen kívül az 1.4 alosztály S összeférhetőségi csoportjába tartozó tárgyak esetén a 4.1.5 szakasz minden előírását be kell tartani. Nem szükséges belső csomagolás használata tárgyak szállításához, pl. az aeroszolokhoz vagy a „gázzal töltött kisméretű tartályok”-hoz. A küldeménydarab össztömege nem haladhatja meg a 30 kg-ot.
- 3.4.3** Az e fejezet szerint szállított veszélyes árukat tartalmazó tárgyakhoz – kivéve az 1.4 alosztály S összeférhetőségi csoportjába tartozó tárgyakat –, ill. belső csomagolásokhoz olyan zsugorfóliás vagy nyújtható fóliás alátétálcás külső csomagolások is használhatók, amelyek megfelelnek a 4.1.1.1, a 4.1.1.2 és a 4.1.1.4 – 4.1.1.8 bekezdés előírásainak. A törékeny vagy könnyen kilyukadó belső csomagolásokat, pl. az üvegből, porcelánból, kőagyagból vagy bizonyos műanyagokból lévőket a 4.1.1.1, a 4.1.1.2 és a 4.1.1.4 – 4.1.1.8 bekezdés előírásainak megfelelő, alkalmas köztes csomagolásba kell helyezni és úgy kell tervezni, hogy megfeleljenek a 6.1.4 szakasz gyártási előírásainak. A küldeménydarab össztömege nem haladhatja meg a 20 kg-ot.
- 3.4.4** A 8 osztály II csomagolási csoportjába tartozó folyékony anyagokat tartalmazó üveg, porcelán és kőagyag belső csomagolásokat összeférhető anyagú és merev köztes csomagolásba kell helyezni.
- 3.4.5** (fenntartva)
- 3.4.6** (fenntartva)

3.4.7

A korlátozott mennyiségű veszélyes árut tartalmazó küldeménydarabokat (kivéve, ha légi úton szállítják) a következő jelöléssel kell ellátni:

A jelölésnek jól láthatónak és olvashatónak kell lennie, felismerhetősége az időjárás hatására lényegesen nem csökkenhet. Az alsó és a felső rész, valamint a keretező vonalak feketék. A középső rész fehér vagy lehet a kellően elütő színű háttér. A mérete legalább 100 x 100 mm, a csúcsára állított négyzetet keretező vonalak vastagsága legalább 2 mm. Ha a küldeménydarab mérete úgy kívánja, a jelölés mérete 50 x 50 mm-ig csökkenthető, feltéve, hogy jól látható marad.

3.4.8

Az ICAO Műszaki Utasítások a Veszélyes Áruk Biztonságos Légi Szállítására 3. Rész, 4. fejezet előírásai szerint légi szállításra feladott, veszélyes árut tartalmazó küldeménydarabokat a következő jelöléssel kell ellátni:

A jelölésnek jól láthatónak és olvashatónak kell lennie, felismerhetősége az időjárás hatására lényegesen nem csökkenhet. Az alsó és a felső rész, valamint a keretező vonalak feketék. A középső rész fehér vagy lehet a kellően elütő színű háttér. A mérete legalább 100 x 100 mm, a csúcsára állított négyzetet keretező vonalak vastagsága legalább 2 mm. Az „Y” jelképet a jelölés közepére kell elhelyezni és jól láthatónak kell lennie. Ha a küldeménydarab mérete úgy kívánja, a jelölés mérete 50 x 50 mm-ig csökkenthető, feltéve, hogy jól látható marad

3.4.9

A 3.4.8 szakasz szerinti jelöléssel ellátott, veszélyes árut tartalmazó küldeménydarabokat úgy lehet tekinteni, hogy megfelelnek e fejezet 3.4.1 – 3.4.4 szakasza előírásainak és nem kell ellátni a 3.4.7 szakasz szerinti jelöléssel.

3.4.10

(fenntartva)

3.4.11

Ha korlátozott mennyiségű veszélyes árut tartalmazó küldeménydarabokat egyesítő-csomagolásba helyeznek, az 5.1.2 szakasz előírásait be kell tartani. Ezen kívül az egyesítő-csomagolást el kell látni az e fejezet szerinti jelöléssel, kivéve, ha az egyesítő-csomagolásban levő minden veszélyes árura jellemző jelölések láthatóak. Az 5.1.2.1 a) ii) pont és az 5.1.2.4 bekezdés rendelkezéseit csak akkor kell alkalmazni, ha az egyesítő-csomagolás olyan más veszélyes árut is tartalmaz, amelyek nem korlátozott mennyiségben vannak csomagolva és csak ezen más veszélyes árukra vonatkozóan.

3.4.12

A korlátozott mennyiségben csomagolt veszélyes áru feladása előtt a feladónak – igazolható

formában – közölnie kell a szállítóval a továbbítandó ilyen áru összegzett bruttó tömegét.

3.4.13

- a) A korlátozott mennyiségben csomagolt veszélyes árut szállító, 12 tonnánál nagyobb megengedett legnagyobb össztömegű szállítóegységet az elején és a hátulján a 3.4.15 szakasz szerint jelöléssel kell ellátni, kivéve, ha a szállítóegység olyan veszélyes árut is tartalmaz, amelyre az 5.3.2 szakasz szerint narancssárga tábla van előírva. Ez utóbbi esetben az előírt narancssárga táblás jelölés elegendő a szállítóegységre, vagy az 5.3.2 szakasz szerinti narancssárga tábla és a 3.4.15 szakasz szerint jelölés együtt is alkalmazható.
- b) A 12 tonnánál nagyobb megengedett legnagyobb össztömegű szállítóegységen levő, korlátozott mennyiségben csomagolt veszélyes árut szállító konténert mind a négy oldalán a 3.4.15 szakasz szerint jelöléssel kell ellátni, kivéve, ha a konténer olyan veszélyes árut is tartalmaz, amelyre az 5.3.1 szakasz szerint nagybárca van előírva. Ez utóbbi esetben az előírt nagybárca elegendő a konténerre, vagy az 5.3.1 szakasz szerinti nagybárca és a 3.4.15 szakasz szerint jelölés együtt is alkalmazható.

A szállítóegységet nem kell megjelölni, kivéve, ha a konténeren levő jelölés a szállítóegységen kívülről nem látható. Ez esetben a szállítóegység elejére és hátuljára ugyanolyan jelölést kell elhelyezni.

3.4.14

A 3.4.13 szakaszban előírt jelölés elhagyható, ha a korlátozott mennyiségben csomagolt veszélyes árut tartalmazó küldeménydarabok összes bruttó tömege egy szállítóegységen legfeljebb 8 tonna.

3.4.15

A jelölésnek meg kell felelnie a 3.4.7 szakasz előírásainak, azzal az eltéréssel, hogy mérete legalább 250 × 250 mm.

3.5 FEJEZET

ENGEDMÉNYES MENNYISÉGBEN CSOMAGOLT VESZÉLYES ÁRUK

3.5.1 Engedményes mennyiségek

3.5.1.1 Bizonyos osztályok engedményes mennyiségű veszélyes áruira (a tárgyak kivételével) – amennyiben megfelelnek ezen fejezet előírásainak – az ADR összes többi előírása közül csak a következőket kell betartani:

- a) az 1.3 fejezet képzési követelményeit;
- b) a 2. rész osztályozási (besorolási) eljárását és a csomagolási csoporthoz való hozzárendelés kritériumait;
- c) a 4.1.1.1, a 4.1.1.2, a 4.1.1.4 és a 4.1.1.6 bekezdés csomagolási előírásait.

Megjegyzés: *Radioaktív anyagok esetén az 1.7.1.5 bekezdésben található, az engedményes küldeménydarabban lévő radioaktív anyagokra vonatkozó követelmények érvényesek.*

3.5.1.2 Az ezen fejezet előírásai szerint engedményes mennyiségben szállítható veszélyes áruknál a 3.2 fejezet „A” táblázat 7b oszlopában egy betűből és számból álló kód van feltüntetve a következők szerint:

Kód	Legnagyobb nettó mennyiség belső csomagolásonként (szilárd anyagra g-ban, folyékony anyagra és gázra ml-ben)	Legnagyobb nettó mennyiség külső csomagolásonként (szilárd anyagra g-ban, folyékony anyagra és gázra ml-ben, egybecsomagolás esetén a g-ban és a ml-ben kifejezett mennyiség összege)
E0	engedményes mennyiségként nem engedélyezett	
E1	30	1000
E2	30	500
E3	30	300
E4	1	500
E5	1	300

Gázok esetén a belső csomagolásra megadott mennyiség a belső tartály víztérfogatát jelenti, a külső csomagolásra megadott mennyiség az egy külső csomagolásban lévő összes belső csomagolás együttes víztérfogatát jelenti.

3.5.1.3 Ha olyan veszélyes árukat csomagolnak egybe engedményes mennyiségben, amelyekhez különböző kódok tartoznak, a külső csomagolásonkénti legnagyobb mennyiségre a (leg)kisebb értéket kell betartani.

3.5.1.4 Azokra az engedményes mennyiségű veszélyes árukra, amelyekhez az E1, E2, E4 vagy E5 kód van hozzárendelve, amennyiben gázok és folyadékok esetén a belső csomagolások legfeljebb 1 ml, szilárd anyag esetén legfeljebb 1 g nettó veszélyes anyag mennyiséget tartalmaznak, valamint a külső csomagolás gázok és folyadékok esetén legfeljebb 100 ml, szilárd anyag esetén legfeljebb 100 g nettó veszélyes anyag mennyiséget tartalmaz, csak a következőket kell betartani:

- a) az 3.5.2 szakasz előírásait, azzal a kivétellel, hogy nem szükséges köztes csomagolás, ha a belső csomagolások párnázóanyag között, biztonságos külső csomagolásban vannak oly módon elhelyezve, hogy szokásos szállítási körülménynek között ne törhessenek el, ne lyukadhassanak ki, ill. tartalmuk ne szivároghasson ki. Folyékony anyagok esetén a külső csomagolásnak a belső csomagolóeszközök teljes tartalmának felszívására elegendő nedvszívó anyagot kell tartalmaznia; és
- b) az 3.5.3 szakasz előírásait.

3.5.2 Csomagolóeszközök

Az engedélyes mennyiségben szállított veszélyes áruk csomagolóeszközeinek a következőknek kell megfelelniük:

- a) Minden esetben kell belső csomagolóeszközt alkalmazni. A belső csomagolóeszköz lehet műanyagból (amely, ha folyékony anyaghoz használják legalább 0,2 mm vastagságú legyen), üvegből, porcelánból, kőből, kerámiából vagy fémből (lásd a 4.1.1.2 bekezdést is). A belső csomagolóeszközök zárószerkezetét zárt helyzetében rögzíteni kell huzallal, ragasztószalaggal vagy más hatásos eszközzel, az öntött csavarmentes nyakú tartályokat folyadéktömör menetes kupakkal kell ellátni. A zárószerkezetnek a tartalommal szemben ellenállónak kell lennie. ;
- b) Minden belső csomagolóeszközt párnázóanyag közé, közbenső csomagolásba kell biztonságosan elhelyezni oly módon, hogy szokásos szállítási körülménynek között ne törhessenek el, ne lyukadhassanak ki, ill. tartalmuk ne szivároghasson ki. Törés vagy szivárgás esetén a közbenső csomagolásnak a teljes tartalmat meg kell tartania, függetlenül attól, hogy a küldeménydarab milyen helyzetben van. Folyékony anyagok esetén a közbenső csomagolásnak a belső csomagolóeszköz teljes tartalmának felszívására elegendő nedvszívó anyagot kell tartalmaznia. Ilyen esetben a nedvszívó anyag párnázóanyagként is szolgálhat. A veszélyes anyag nem léphet veszélyes reakcióba sem a párnázóanyaggal, sem a nedvszívó anyaggal, sem a csomagolóeszköz anyagával, ill. nem gyengítheti épségüket vagy védő tulajdonságaikat.;
- c) A közbenső csomagolást erős, merev falú (fa, papírlemez vagy ugyanennyire erős más anyagból készült) külső csomagolóeszközbe kell biztonságosan elhelyezni.;
- d) Minden küldeménydarab típusnak meg kell felelnie a 3.5.3 szakasz előírásainak.;
- e) A küldeménydaraboknak olyan méretűnek kell lenniük, hogy elegendő hely legyen a szükséges jelöléseknek.;
- f) Egyesítőcsomagolások is alkalmazhatók, amelyekbe veszélyes árut, ill. az ADR hatálya alá nem tartozó árut tartalmazó küldeménydarabok is elhelyezhetők.

3.5.3 A küldeménydarabok vizsgálata

3.5.3.1

A szállításra előkészített, teljes küldeménydarabnak alkalmasnak kell lennie a következőkben felsorolt vizsgálatok elviselésére, bármely belső csomagolóeszköz törése vagy szivárgása, ill. a hatásosság jelentős csökkenése nélkül. A belső csomagolóeszközöket szilárd anyag esetén ürtartalmuk legalább 95%-áig, folyékony anyag esetén ürtartalmuk legalább 98%-áig kell megtölteni, és az alkalmasságot kellően dokumentált vizsgálatokkal kell bizonyítani.

- a) Ejtés merev, rugalmatlan, sík és vízszintes felületre, 1,8 m magasságból:
 - i) ha a minta doboz (láda) formájú, akkor mindegyik, a következő helyzetekben kell

leejteni:

- laposan a fenéklapra;
 - laposan a tetőlapra;
 - laposan a leghosszabb oldallapra;
 - laposan a legrövidebb oldallapra;
 - valamelyik sarokra;
- ii) ha a minta hordó formájú, akkor mindegyik, a következő helyzetekben kell leejteni:
- átlósan a tetőlap peremére úgy, hogy a tömegközéppont függőlegesen a felütkezési pont fölött legyen;
 - átlósan a fenék peremére;
 - laposan a palástra;

Megjegyzés: *Az egyes ejtéseket teljesen azonos küldeménydarabok más-más példányán is végre lehet hajtani.*

- b) 24 órán keresztül akkora erőnek kell a tetőlapra hatnia, amely megegyezik a mintadarabbal együtt 3 m magasságig halmazolt, teljesen azonos küldeménydarabok összes tömegének.

3.5.3.2

A vizsgálat céljára a szállítandó anyagot helyettesíteni lehet más anyaggal, feltéve, hogy ez a vizsgálat eredményét nem hamisítja meg. Ha szilárd anyagok esetén más anyagot használnak, annak ugyanolyan fizikai jellemzőkkel (tömeg, szemcseméret, stb.) kell rendelkeznie, mint a szállítandó anyagnak. Folyékony anyagok esetén, ha az ejtőpróbánál más anyagot használnak, annak a szállítandó anyaggal azonos relatív sűrűségűnek és viszkozitásúnak kell lennie.

3.5.4

A küldeménydarabok jelölése

3.5.4.1

Az engedményes mennyiségű veszélyes árut tartalmazó, e fejezet szerint előkészített küldeménydarabokat a 3.5.4.2 bekezdés szerinti, jól látható és tartós jelöléssel kell ellátni. A jelölésen fel kell tüntetni a küldeménydarabban lévő mindegyik veszélyes árura vonatkozóan a 3.2 fejezet „A” táblázat 5 oszlopában feltüntetett első (vagy egyetlen) bárca számát. Ha a küldeménydarabon a feladó vagy a címzett neve nincs máshol feltüntetve, akkor azt is e jelölésen belül kell feltüntetni.

3.5.4.2

A jelölésnek legalább 100 x 100 mm nagyságúnak kell lennie.

„Engedményes mennyiség” jelölés

A vonalkázás és a jelkép azonos színű (vörös vagy fekete), fehér vagy más, kellően elütő színű alapon.

- * *Itt kell feltüntetni a 3.2 fejezet „A” táblázat 5 oszlopában feltüntetett első (vagy egyetlen) bárca számát.*
- ** *Itt kell feltüntetni a feladó vagy a címzett nevét, ha a küldeménydarabon nincs máshol feltüntetve.*

3.5.4.3 Az engedményes mennyiségű veszélyes árut tartalmazó egyesítőcsomagolásokat is el kell látni a 3.5.4.1 bekezdésben előírt jelöléssel, kivéve, ha az egyesítőcsomagolásban levő küldeménydarabok jelölése kívülről jól látható.

3.5.5 A járművön, ill. konténerben lévő küldeménydarabok száma

Egy járművön, ill. konténerben nem lehet 1000-nél több küldeménydarab.

3.5.6 Okmányok

Ha az engedményes mennyiségű veszélyes áruhoz tartozik (egy vagy több) kísérő-okmány (ügymint hajóraklevél, légi fuvarlevél, CMR vagy CIM fuvarlevél), akkor legalább az egyik okmányba be kell írni a „**veszélyes áru engedményes mennyiségben**” bejegyzést és a küldeménydarabok számát.

4. RÉSZ

A CSOMAGOLÁSRA ÉS A TARTÁNYOKRA VONATKOZÓ ELŐÍRÁSOK

4.1 FEJEZET

A CSOMAGOLÓESZKÖZÖK, A NAGYMÉRETŰ CSOMAGOLÓ ESZKÖZÖK (IBC-k) ÉS A NAGYCSOMAGOLÁSOK HASZNÁLATA

4.1.1 A veszélyes áruk csomagolóeszközbe, IBC-be és nagycsomagolásba történő csomagolására vonatkozó általános előírások

Megjegyzés: A 2, a 6.2 és a 7 osztály anyagainak csomagolására ezen szakasz általános előírásait csak úgy kell alkalmazni, ahogy a 4.1.8.2 bekezdés (a 6.2 osztályra), a 4.1.9.1.5 pont (a 7 osztályra), valamint a 4.1.4 szakasz alkalmazandó csomagolási utasításai (P201 és LP02 a 2 osztályra, ill. P620, P621, IBC620 és LP621 a 6.2 osztályra) ezt előírják.

4.1.1.1 A veszélyes árut olyan, jó minőségű csomagolóeszközbe (IBC-be, nagycsomagolásba), kell csomagolni, amely elég erős ahhoz, hogy ellenálljon azoknak az igénybevételeknek, ütődéseknek, amelyeknek rendes körülmények között a szállítás során, a szállítóeszközök közötti átrakás, a szállítóeszközből a raktárba való berakodás során ki van téve, illetve amelyek akkor léphetnek fel, amikor további kézi vagy gépi árukezelés céljából a rakodólapról vagy az egyesítőcsomagolásból eltávolítják. A csomagolóeszközöket (IBC-eket, nagycsomagolásokat), úgy kell gyártani és lezárni, hogy a szállításra kész küldeménydaraboknál elkerülhető legyen a tartalom bármilyen szivárgása vagy kiszóródása. Ez a szokásos szállítási körülmények között különösen a rezgésekből, illetve a hőmérséklet, a páratartalom vagy a nyomás változásából adódhat (pl. a tengerszint feletti magasság változásának eredményeként). A csomagolóeszközöket (az IBC-eket és a nagycsomagolásokat) a gyártó előírásai szerint kell lezárni. Veszélyes anyagnak nem szabad a csomagolóeszköz (IBC, nagycsomagolás) külsejére tapadnia. Ezek az előírások egyaránt érvényesek az új, az ismételten felhasznált, az átalakított, ill. a felújított csomagolóeszközökre, az új, az ismételten felhasznált, a javított, ill. az átalakított IBC-kre, valamint az új, az ismételten felhasznált, ill. az átalakított nagycsomagolásokra.

4.1.1.2 A csomagolóeszközök (IBC-k, nagycsomagolások) veszélyes áruval közvetlenül érintkező

- a) részeit a veszélyes áru nem támadhatja meg, sem lényegesen nem gyengítheti,
- b) ezek a részek nem okozhatnak veszélyes hatást, pl. reakció katalizálását vagy a veszélyes áruval való reakciót, és
- c) nem engedhetik a veszélyes árut áthatolni, ami a szokásos szállítási körülmények között veszélyt okozhat.

Szükség esetén a csomagolóeszközt (IBC-t, nagycsomagolást) belső bevonattal vagy felületkezeléssel kell ellátni.

Megjegyzés: A polietilénből gyártott műanyag csomagolóeszközök (IBC-k) kémiai összeférhetőségére lásd a 4.1.1.21 bekezdést.

4.1.1.3 A belső csomagolóeszközök kivételével minden csomagolóeszköznek (IBC-nek, nagycsomagolásnak) meg kell felelnie a 6.1.5, 6.3.5, 6.5.6, ill. 6.6.5 szakaszban (ill. az ADR-ben máshol) levő előírások szerint vizsgált gyártási típusnak. Azokat a csomagolóeszközöket, amelyeknél nincs szükség tömörségi vizsgálatra, a 6.1.1.3 bekezdés tartalmazza.

4.1.1.4 Ha a csomagolóeszközt (IBC-t, nagycsomagolást) folyadékkal töltik meg, folyadékmentes szabad teret kell hagyni ahhoz, hogy a folyadéknak a szállítás közben elért hőmérsékletek hatására bekövetkező tágulása esetén se a folyadék ki ne szivároгjon, se a csomagolóeszköz ne szenvedjen tartós alakváltozást. Hacsak nincsenek különleges követelmények előírva, a folyadékok 55 °C hőmérsékleten nem tölthetők ki teljesen a csomagolóeszközt. Ugyanakkor egy IBC-nél elegendő szabad teret kell hagyni, hogy 50 °C átlagos anyaghőmérséklet esetén a víztöltet kapacitásának legfeljebb 98 %-áig legyen megtöltve. Ha másként nincs előírva, a

15 °C töltési hőmérsékletre vonatkoztatott legnagyobb töltési fokot a következők szerint kell meghatározni:

a)	Az anyag forráspontja (forrás kezdőpontja), °C	< 60	≥ 60 < 100	≥ 100 < 200	≥ 200 < 300	≥ 300
	A töltési fok a csomagolóeszköz űrtartalmának %-a	90	92	94	96	98

vagy

- b) a töltési fok = a csomagolóeszköz űrtartalmának $\frac{98}{1 + \alpha(50 - t_F)}$ %-a.

A képletben α a folyadék átlagos köbös hőtágulási együtthatója 15 °C és 50 °C között, vagyis 35 °C-os maximális hőmérséklet-változásra a következő képlettel számítható:

$$\alpha = \frac{d_{15} - d_{50}}{35 \times d_{50}}, \text{ ahol}$$

d_{15} és d_{50} a folyadék relatív sűrűsége¹⁾ 15 °C-on, ill. 50 °C-on;

t_F a folyadék középhőmérséklete a töltés során.

4.1.1.5

A belső csomagolásokat a külső csomagolásban úgy kell elhelyezni, hogy a szokásos szállítási feltételek között ne törhessenek el, ne lyukadhassanak ki, és tartalmuk ne szóródhasson vagy folyhasson szét a külső csomagolásban. A folyékony anyagot tartalmazó belső csomagolásokat a zárószerkezetükkel felfelé, a külső csomagoláson lévő, az 5.2.1.9 bekezdésben előírt, az álló helyzetet jelző nyilaknak megfelelően kell a külső csomagolásban elhelyezni. A törékeny vagy könnyen átlukasztható belső csomagolásokat, mint az üveg, porcelán, kőagyag vagy bizonyos műanyag csomagolásokat a külső csomagolásban megfelelő tömítőanyag közé kell beágyazni. A tartalom elfolyásának nem szabad a tömítőanyag és a külső csomagolás védő tulajdonságait lényegesen gyengíteni.

4.1.1.5.1

Amennyiben egy kombinált csomagolás, ill. nagycsomagolás külső csomagolóeszközét különböző típusú belső csomagolóeszközökkel sikeresen bevizsgálták, ebbe a külső csomagolóeszközbe, ill. nagycsomagolásba a különböző belső csomagolóeszközök tetszőleges kombinációban behelyezhetők. Ezenkívül, a csomagolás további vizsgálata nélkül használhatók a következő belső csomagolóeszköz változatok, ha azonos követelményszintnek felelnek meg:

- a) Azonos méretű vagy kisebb belső csomagolóeszközök használhatók, amennyiben:
 - i) a belső csomagolóeszközök hasonló kialakításúak, mint a bevizsgált belső csomagolóeszközök (pl. alak – hengeres, szögletes stb.);
 - ii) a belső csomagolóeszközök szerkezeti anyaga (üveg, műanyag, fém stb.) az eredetileg bevizsgált belső csomagolóeszközökkel azonos vagy nagyobb mértékben ellenálló az ütődéseknél és halmazoláskor fellépő erőkkel szemben;
 - iii) a belső csomagolóeszközök nyílásai azonos vagy kisebb átmérőjűek és zárásuk hasonló kialakítású (pl. csavarmenetes kupak, bepattanó fedél stb.);
 - iv) elegendő mennyiségű párnázóanyagot használnak a hézagok kitöltésére és a belső csomagolóeszközök jelentősebb elmozdulásának megakadályozására; és
 - v) a belső csomagolóeszközök ugyanolyan helyzetben vannak a külső csomagolóeszközbe elhelyezve, mint a bevizsgált csomagolóeszközök.
- b) Azokból a belső csomagolóeszközökből, amelyekkel bevizsgálták, vagy az előző a) pontban leírt eltérő belső csomagolóeszközökből kevesebb is használható, amennyiben elegendő mennyiségű párnázóanyagot használnak a hézagok kitöltésére és a belső csomagolóeszközök jelentősebb elmozdulásának megakadályozására.

1) A relatív sűrűség (d) kifejezés a „sűrűség” szinonimájának tekintendő, ez a fejezet végig ilyen értelemben használja.

- 4.1.1.6** A veszélyes árukat nem szabad más veszélyes áruval vagy egyéb árukkal ugyanazon külső csomagolásba vagy nagycsomagolásba egybe csomagolni, ha egymással veszélyesen reagálnak és
- égést és/vagy jelentős hőfejlődést;
 - gyúlékony, fojtó hatású, gyújtó hatású vagy mérgező gázok fejlődését;
 - maró anyagok képződését; vagy
 - vegyileg nem állandó anyagok képződését okozzák.
- Megjegyzés:** Az egybecsomagolásra vonatkozó különleges előírásokat lásd a 4.1.10 szakaszban.
- 4.1.1.7** Nedvesített vagy hígított anyagokat tartalmazó csomagolások zárószervezetének olyannak kell lennie, hogy a folyadék (víz, oldószer vagy flegmatizálószer) részaránya szállítás közben ne csökkenjen az előírt határérték alá.
- 4.1.1.7.1** Amennyiben egy IBC-n egymás mögött két vagy több zárószervezet van beépítve, először a szállított anyaghoz legközelebb esőt kell elzárni.
- 4.1.1.8** Abban az esetben, ha a küldeménydarabban lévő anyag a hőmérséklet emelkedése vagy más ok miatt gázt bocsát ki, és ennek következtében a küldeménydarabban túlnyomás fejlődhet ki, a csomagolóeszközt, ill. az IBC-t szellőző-szerkezettel lehet ellátni, feltéve, hogy a kibocsátott gáz sem gyúlékonysága, sem mérgező tulajdonsága, vagy például a kiszabaduló mennyisége következtében nem okoz veszélyt.
- Ha a veszélyes túlnyomás az anyag normális bomlása miatt léphet fel, szellőző-szerkezetet kell alkalmazni. A szellőző-szerkezetet úgy kell kialakítani, hogy a folyadék szivárgása és idegen anyagok behatolása normális szállítási körülmények között elkerülhető legyen, feltéve, hogy a csomagolóeszköz, ill. az IBC a szállításnak megfelelő helyzetben van.
- Megjegyzés:** A légi szállítás esetén a küldeménydarabok nem láthatók el szellőző-szerkezettel.
- 4.1.1.8.1** Folyékony anyag csak olyan belső csomagolóeszközbe tölthető, amely megfelelő mértékben ellenáll azon belső nyomásnak, amely benne a normális szállítási körülmények között kialakulhat.
- 4.1.1.9** Az új, ismételten használt vagy átalakított csomagolóeszközöknek (IBC-knek, nagycsomagolásoknak), ill. a felújított csomagolóeszközöknek és a javított, ill. rendszeresen karbantartott IBC-knek ki kell tudniuk állni a 6.1.5, 6.3.5, 6.5.6, ill. 6.6.5 szakaszban előírt próbákat. Töltés és szállításra feladás előtt minden csomagolóeszköznél meg kell győződni arról, hogy az mentes rozsdától, szennyeződéstől vagy egyéb sérüléstől, minden IBC-nél ellenőrizni kell, hogy a kezelésre szolgáló szerelvényei megfelelően működnek. Az olyan csomagolóeszközt, amelynek ellenállóképessége a jóváhagyott gyártási típushoz viszonyítva gyengült, nem szabad tovább használni, ill. fel kell újítani oly módon, hogy képes legyen a gyártási típusvizsgálatok elviselésére. Az olyan IBC-t, amelynek ellenállóképessége a jóváhagyott gyártási típushoz viszonyítva gyengült, nem szabad tovább használni, ill. úgy kell megjavítani vagy rendszeres karbantartás keretében kijavítani, hogy képes legyen a gyártási típusvizsgálatok elviselésére.
- 4.1.1.10** Folyékony anyag csak olyan csomagolóeszközbe, IBC-be tölthető, amely megfelelő mértékben ellenáll azon belső nyomásnak, amely benne a normális szállítási körülmények között kialakulhat. Az olyan csomagolóeszközöket és IBC-eket, amelyeken a 6.1.3.1 d), ill. a 6.5.2.2.1 pont szerint a nyomáspróbánál alkalmazott próbanyomás értéke fel van tüntetve, csak olyan folyékony anyagokkal szabad megtölteni, melynek gőznyomása:
- akkora, hogy a csomagolóeszközben, IBC-ben 55 °C hőmérsékleten a teljes túlnyomás (vagyis a tartalmazott anyag gőznyomásának és a levegő vagy más inert gáz parciális nyomásának összegéből 100 kPa-t levonva) a 4.1.1.4 bekezdésben foglaltaknak megfelelő legnagyobb töltési fok és 15 °C töltési hőmérséklet alapján meghatározva

nem haladja meg a feltüntetett próbanyomás érték 2/3-át; vagy

b) 50 °C-on kisebb, mint a feltüntetett próbanyomás és 100 kPa összegének 4/7-e; vagy

c) 55 °C-on kisebb, mint a feltüntetett próbanyomás és 100 kPa összegének 2/3-a.

A folyékony anyagok szállítására szolgáló IBC-eket nem szabad olyan folyékony anyagok szállítására használni, amelyek gőznyomása 50 °C-on meghaladja a 110 kPa-t (1,1 bar-t) vagy 55 °C-on meghaladja a 130 kPa-t (1,3 bar-t).

A 4.1.1.10 c) pont szerint számított, feltüntetendő próbanyomás példái csomagolóeszközökre és IBC-kre:

UN szám	Megnevezés	Osztály	Csomagolási csoport	V_{p55} (kPa)	$V_{p55} \times 1,5$ (kPa)	$(V_{p55} \times 1,5)$ mínusz 100 (kPa)	A 6.1.5.5.4 c) pont szerint szükséges legkisebb próbanyomás (túlnyomás) (kPa)	A csomagolóeszközön feltüntetendő legkisebb próbanyomás (túlnyomás) (kPa)
2056	Tetrahidro-furán	3	II	70	105	5	100	100
2247	n-Dekán	3	III	1,4	2,1	-97,9	100	100
1593	Diklór-metán	6.1	III	164	246	146	146	150
1155	Dietil-éter	3	I	199	299	199	199	250

Megjegyzés: 1. Tiszta folyadékokra az 55 °C-on fennálló gőznyomás (V_{p55}) gyakran megtalálható a műszaki táblázatokban.

2. A táblázat csak a 4.1.1.10 c) pont használatára vonatkozik, ami azt jelenti, hogy a feltüntetendő próbanyomásnak meg kell haladnia az 55 °C-on fennálló gőznyomás 1,5-szerese mínusz 100 kPa értéket. Amennyiben például az n-dekánra a próbanyomást a 6.1.5.5.4 a) pont szerint határozzuk meg, a feltüntetendő legkisebb próbanyomás kisebb lehet.

3. A dietil-éterre a megkívánt legkisebb próbanyomás a 6.1.5.5.5 pont szerint 250 kPa.

4.1.1.11 Azokra az üres csomagolóeszközökre, (IBC-kre, nagycsomagolásokra), amelyek veszélyes anyagot tartalmaztak, ugyanazok a követelmények vonatkoznak, mintha töltve lennének, kivéve, ha megfelelő intézkedéseket tettek az összes veszély megszüntetésére.

4.1.1.12 A folyékony anyagokhoz szánt minden, a 6.1 fejezetben meghatározott csomagolóeszköznek sikeresen ki kell állnia a megfelelő tömörségi próbát, és a 6.1.5.4.3 pont szerinti megfelelő vizsgálati szintet teljesítenie kell a következők szerint

a) a szállításához történő első használat előtt;

b) a csomagolóeszköz felújítása vagy átalakítása után, mielőtt szállításához újból felhasználnák.

Ehhez a vizsgálathoz a csomagolóeszközt nem kell saját zárószerkezetével ellátni. Az összetett csomagolás belső tartálya a külső csomagolás nélkül is vizsgálható, ha ez a vizsgálati eredményeket nem befolyásolja.

Erre a vizsgálatra nincs szükség:

- a kombinált csomagolások és nagycsomagolások belső csomagolásainál;
- a 6.1.3.1.a) ii) pont szerint „RID/ADR” jellel ellátott összetett (üveg, porcelán és köbgyag) csomagolások belső tartályainál; és
- a 6.1.3.1.a) ii) pont szerint „RID/ADR” jellel ellátott finomlemez csomagolásoknál.

4.1.1.13 Az olyan szilárd anyagokhoz, amelyek a szállítás alatt előforduló hőmérsékleteken folyékonnyá válhatnak, csak olyan csomagolóeszközök, IBC-k használhatók, amelyek alkalmasak az anyag folyékony állapotban való megtartására.

4.1.1.14 A porszerű vagy szemcsés anyagokhoz használt csomagolóeszközöknek, IBC-knek, portömörnek kell lenniük vagy béléssel kell rendelkezniük.

- 4.1.1.15** Műanyag hordók és kannák, merev falú műanyag IBC-k és műanyag belső tartállyal rendelkező összetett IBC-k esetén, hacsak az illetékes hatóság másként nem engedélyezte, a veszélyes áruk szállításához történő használat engedélyezett időtartama a tartályok gyártási időpontjától számított öt év, kivéve, ha a szállítandó anyag természetére való tekintettel rövidebb használati időtartamot írtak elő.
- 4.1.1.16** Ha hűtésre jeget használnak, az nem befolyásolhatja a csomagolóeszköz épségét.
- 4.1.1.17** Az ADR szerinti szállításra felhasználhatók azok a 6.1.3 szakasz, a 6.2.2.7, a 6.2.2.8 bekezdés, a 6.3.1, a 6.5.2, ill. a 6.6.3 szakasz szerinti jelöléssel ellátott olyan csomagolóeszközök (IBC-k és nagycsomagolások) is, amelyeket olyan országban hagytak jóvá, amely nem ADR Szerződő Fél.
- 4.1.1.18** ***Robbanóanyagok, önreaktív anyagok és szerves peroxidok***
- Ha az ADR-ben nincs ellentétes előírás, az 1 osztály anyagaihoz, a 4.1 osztály önkreatív anyagaihoz és az 5.2 osztály szerves peroxidjaihoz használt csomagolóeszközöknek (IBC-k-nek és nagycsomagolásoknak) a közepes veszélyre vonatkozó előírásoknak (II csomagolási csoport) kell megfelelniük.
- 4.1.1.19** ***A kármentő csomagolások használata***
- 4.1.1.19.1** A veszélyes árut tartalmazó sérült, meghibásodott, tömítetlen vagy nem az előírások szerinti küldeménydarab vagy a kiszóródott vagy kifolyt veszélyes áru a 6.1.5.1.11 pont szerinti kármentő csomagolásban szállítható. Ez nem zárja ki a 4.1.1.19.2 és a 4.1.1.19.3 pont feltételeit kielégítő, megfelelő típusú és vizsgálati szintű, nagyobb méretű csomagolóeszköz alkalmazását.
- 4.1.1.19.2** Megfelelő intézkedéseket kell tenni, hogy a kármentő csomagolásokon belül a sérült vagy tömítetlenné vált küldeménydarabok túlzott mozgása ne következhesen be; amennyiben a kármentő csomagolás folyékony anyagot tartalmaz, kielégítő mennyiségű nedvszívó anyagot kell alkalmazni, hogy szabad folyadék megjelenése kizárható legyen.
- 4.1.1.19.3** Meg kell tenni a szükséges intézkedéseket annak biztosítására, hogy veszélyes nyomásnövekedés ne léphessen fel.
- 4.1.1.20** ***A kármentő nyomástartó tartály használata***
- 4.1.1.20.1** A sérült, meghibásodott, tömítetlen vagy az előírásoknak nem megfelelő nyomástartó tartály esetén a 6.2.3.11 bekezdés szerinti kármentő nyomástartó tartály használható.
- Megjegyzés:*** A kármentő nyomástartó tartály az 5.1.2 szakasz szerint egyesítőcsomagolásként is használható. Ha egyesítőcsomagolásként használják, akkor az 5.2.1.3 bekezdés helyett az 5.1.2.1 bekezdés szerint kell megjelölni.
- 4.1.1.20.2** A nyomástartó tartályt megfelelő méretű kármentő nyomástartó tartályba kell tenni. Több nyomástartó tartály csak akkor helyezhető ugyanabba a kármentő nyomástartó tartályba, ha tartalmuk ismert és nem reagálnak egymással veszélyesen (lásd a 4.1.1.6 bekezdést). Megfelelő intézkedéseket kell tenni, hogy a nyomástartó tartályok mozgása ne következhesen be a kármentő nyomástartó tartályban, pl. elkülönítéssel, rögzítéssel vagy párnázással.
- 4.1.1.20.3** Egy nyomástartó tartály csak akkor helyezhető kármentő nyomástartó tartályba, ha:
- a kármentő nyomástartó tartály megfelel a 6.2.3.11 bekezdésnek és a jóváhagyás másolata rendelkezésre áll;
 - a veszélyes áru nem befolyásolhatja károsan, ill. nem gyengítheti a kármentő nyomástartó tartály azon részeit, amelyek a veszélyes áruval közvetlenül érintkeznek vagy érintkezhetnek, és nem okozhat káros hatást (pl. reakció katalizálása vagy a veszélyes áruval való reakcióba lépés); és
 - a berakott nyomástartó tartály(ok) nyomása és ürtartalma legfeljebb akkora lehet, hogyha a teljes tartalmuk a kármentő nyomástartó tartály kerül, a kármentő nyomástar-

tó tartályban a nyomás 65°C –on nem haladja meg a kármentő nyomástartó tartály próbanyomását (gázok esetén lásd a 4.1.4.1 bekezdés P200 csomagolási utasítása 3) bekezdését). Figyelembe kell venni, hogy a kármentő nyomástartó tartály hasznosítható víztérfogata csökken pl. a berakott eszközök vagy a párnázóanyag miatt.

4.1.1.20.4 A kármentő nyomástartó tartályon fel kell tüntetni a szállításakor benne lévő nyomástartó tartály(ok)ban lévő veszélyes árura vonatkozó, az 5.2 fejezetben a küldeménydarabokra előírt helyes szállítási megnevezést, UN számot, ami elé az „UN” betűket kell írni, valamint bárcákat.

4.1.1.20.5 A kármentő nyomástartó tartályokat minden használat után ki kell tisztítani, gáztalanítani, és szemrevételezéssel kívül-belül meg kell vizsgálni. A 6.2.3.5 bekezdés szerint legalább ötévente időszakos vizsgálatnak kell alávetni.

4.1.1.21 ***Műanyag csomagolóeszközök, ill. IBC-k kémiai összeférhetőségének bizonyítása a töltőanyag standardfolyadékkal történő helyettesítésével***

4.1.1.21.1 *Alkalmazási terület*

A 6.1.5.2.6 pontban meghatározott, polietilénből készült csomagolóeszközöknek és a 6.5.6.3.5 pontban meghatározott, polietilénből készült IBC-knek a töltőanyagokkal való kémiai összeférhetősége a 4.1.1.21.3 – 4.1.1.21.5 pont szerinti eljárással, a 4.1.1.21.6 táblázatban lévő felsorolás alkalmazásával standardfolyadékkal való helyettesítéssel bizonyítható, feltéve, hogy az adott gyártási típust a 6.1.5, ill. a 6.5.6 szakasz szerint (figyelembevéve a 6.1.6 szakaszt is) a standardfolyadékkal vizsgálták, és a 4.1.1.21.2 pont feltételeit betartják. Ha ezen szakasz szerint helyettesítés nem lehetséges, a kémiai összeférhetőséget csomagolóeszközök esetén a 6.1.5.2.5 pont szerinti gyártási típus vizsgálattal vagy a 6.1.5.2.7 pont szerinti laboratóriumi vizsgálatokkal, ill. IBC-k esetén a 6.5.6.3.3 pont szerinti gyártási típus vizsgálattal vagy a 6.5.6.3.6 pont szerinti laboratóriumi vizsgálatokkal kell bizonyítani.

***Megjegyzés:** E szakasz előírásaitól függetlenül a csomagolóeszközök és IBC-k használata egy meghatározott töltőanyaghoz a 3.2 fejezet „A” táblázatában és a 4.1 fejezet csomagolási utasításaiban található korlátozások hatálya alá esik.*

4.1.1.21.2 *Feltételek*

A töltőanyag relatív sűrűsége nem haladhatja meg a helyettesítő standardfolyadékkal végrehajtott, a 6.1.5.3.5, ill. a 6.5.6.9.4 pont szerinti sikeres ejtőpróbánál az ejtési magasság meghatározásához használt és a 6.1.5.6, ill. – ha szükséges – a 6.5.6.6 bekezdés szerinti sikeres halmazolási próba során a terhelés meghatározásához használt sűrűség értéket. A töltőanyag gőznyomása 50 °C vagy 55 °C hőmérsékleten nem haladhatja meg a helyettesítő standardfolyadékkal végrehajtott, a 6.1.5.5.4 vagy a 6.5.6.8.4.2 pont szerinti sikeres folyadéknomás-próbánál alkalmazott nyomás meghatározásához használt gőznyomás értéket. Abban az esetben, ha a töltőanyag valamely standardfolyadék-kombinációval helyettesíthető, a töltőanyag ugyanazon jellemzői nem haladhatják meg az alkalmazott ejtési magasságból, a halmazoláshoz használt terhelés tömegéből és a folyadéknomás-próbánál alkalmazott nyomásból adódó legkisebb értékeket.

***Példa:** az UN 1736 benzoil-klorid helyettesíthető a „szénhidrogén-keverék és nedvesítőszer oldat” standardfolyadék-kombinációval. A benzoil-klorid gőznyomása 50 °C-on 0,34 kPa és relatív sűrűsége kb. 1,2. A műanyag hordók és kannák gyártási típus vizsgálatát gyakran az előírt legalacsonyabb vizsgálati szinten végzik. A gyakorlatban ez azt jelenti, hogy a halmazolási próbát rendszerint csak a „szénhidrogén-keverék” 1,0 relatív sűrűségének és a „nedvesítőszer oldat” 1,2 relatív sűrűségének megfelelő halmazolási terheléssel végzik (a standardfolyadékok fogalom meghatározását lásd a 6.1.6 szakaszban). Ennek következtében az ily módon vizsgált gyártási típus benzoil-kloriddal való kémiai összeférhetősége nem bizonyított, mivel „szénhidrogén keverék” standardfolyadékkal vizsgálva a gyártási típus vizsgálati szintje nem megfelelő. (Mivel az esetek többségében a folyadéknomás-próba során alkalmazott nyomás legalább 100 kPa, ez a szint a 4.1.1.10 bekezdés szerint a benzoil-*

klorid gőznyomásához megfelelő.)

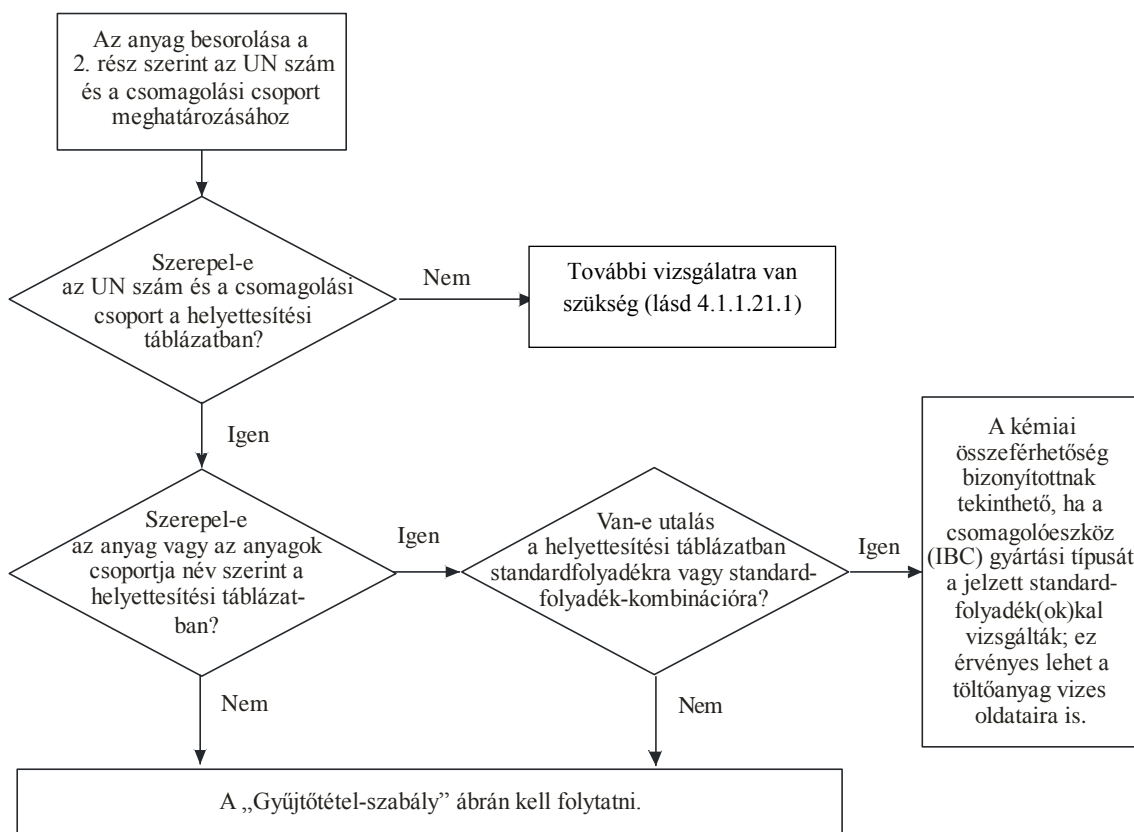

A helyettesítési eljárást a töltőanyagoknak (ami lehet oldat, keverék vagy készítmény is) minden összetevőjére (pl. a tisztító- és fertőtlenítőszerekben levő nedvesítőszerekre) alkalmazni kell, függetlenül attól, hogy veszélyesek vagy nem.

4.1.1.21.3

A helyettesítési eljárás

A töltőanyagot a 4.1.1.21.6 táblázatban felsorolt valamely anyaghoz, ill. anyagcsoporthoz a következő lépések szerint kell hozzárendelni (lásd még a 4.1.1.21.1 ábrát):

- Be kell sorolni a töltőanyagot a 2. rész eljárásai és kritériumai alapján (meg kell határozni az UN számot és a csomagolási csoportot);
- Meg kell keresni az UN számot a 4.1.1.21.6 pont helyettesítési táblázat 1 oszlopában;
- Ha az adott UN számhoz több tétel tartozik, akkor a csomagolási csoportnak, a koncentrációnak, a lobbanáspontnak, a nem veszélyes összetevőknek stb. megfelelő tételt a 2a, 2b és 4 oszlopban található információk segítségével kell kiválasztani. Ha ez nem lehetséges, akkor a kémiai összeférhetőséget csomagolóeszközök esetén a 6.1.5.2.5 vagy a 6.1.5.2.7, ill. IBC-k esetén a 6.5.6.3.3 vagy a 6.5.6.3.6 pont szerint kell bizonyítani (vizes oldatokra azonban lásd a 4.1.1.21.4 pontot);
- Ha a töltőanyag a) pont szerint meghatározott UN száma és csomagolási csoportja nem szerepel a helyettesítési táblázatban, a kémiai összeférhetőséget csomagolóeszközök esetén a 6.1.5.2.5 vagy a 6.1.5.2.7, ill. IBC-k esetén a 6.5.6.3.3 vagy a 6.5.6.3.6 pont szerint kell bizonyítani;
- Ha a kiválasztott sorban az 5 oszlopban „Gyűjtőtétel-szabály” bejegyzés szerepel, a továbbiakban a 4.1.1.21.5 pontban leírt szabályt kell követni;
- A töltőanyag kémiai összeférhetősége bizonyítottnak tekinthető, ha a 4.1.1.21.1 és 4.1.1.21.2 pont előírásait figyelembe vették, az 5 oszlopban standardfolyadék vagy standardfolyadék-kombináció van feltüntetve, és a gyártási típust erre (ezekre) a standardfolyadék(ok)ra jóváhagyták.

4.1.1.21.1 ábra: A töltőanyagok helyettesítése standardfolyadékokkal

4.1.1.21.4 Vizes oldatok

A 4.1.1.21.3 pont szerint standardfolyadék(ok)kal helyettesíthető anyagok, ill. anyagcsoportok vizes oldatai a következő feltételek teljesülése esetén ugyanazon standardfolyadék(ok)kal helyettesíthetők:

- a) a vizes oldat a 2.1.3.3 bekezdés kritériumai alapján ugyanazon UN szám alá sorolható, mint a táblázatban szereplő anyag;
- b) a vizes oldat nincs külön név szerint említve a 4.1.1.21.6 pont helyettesítési táblázatában; és
- c) nem következik be kémiai reakció a veszélyes anyag és az oldószerként használt víz között.

Példa: UN 1120 terc-butanol vizes oldatok:

- A tiszta terc-butanol a helyettesítési táblázat szerint az „ecetsav” standardfolyadékhoz van hozzárendelve.
- A terc-butanol vizes oldatai a 2.1.3.3 bekezdés szerint az UN 1120 BUTANOLOK tétel alá sorolhatók, mivel a terc-butanol vizes oldatai az osztály, a csomagolási csoport(ok) és a halmazállapot tekintetében nem különböznek a tiszta anyagra vonatkozó tételektől. Ezen kívül az UN 1120 BUTANOLOK tétel nincs kifejezetten a tiszta anyagra korlátozva, és ezen anyagok vizes oldatai nincsenek sem a 3.2 fejezet „A” táblázatában, sem a helyettesítési táblázatban külön név szerint említve.
- Az UN 1120 BUTANOLOK a normális szállítási körülmények között vízzel nem reagálnak.

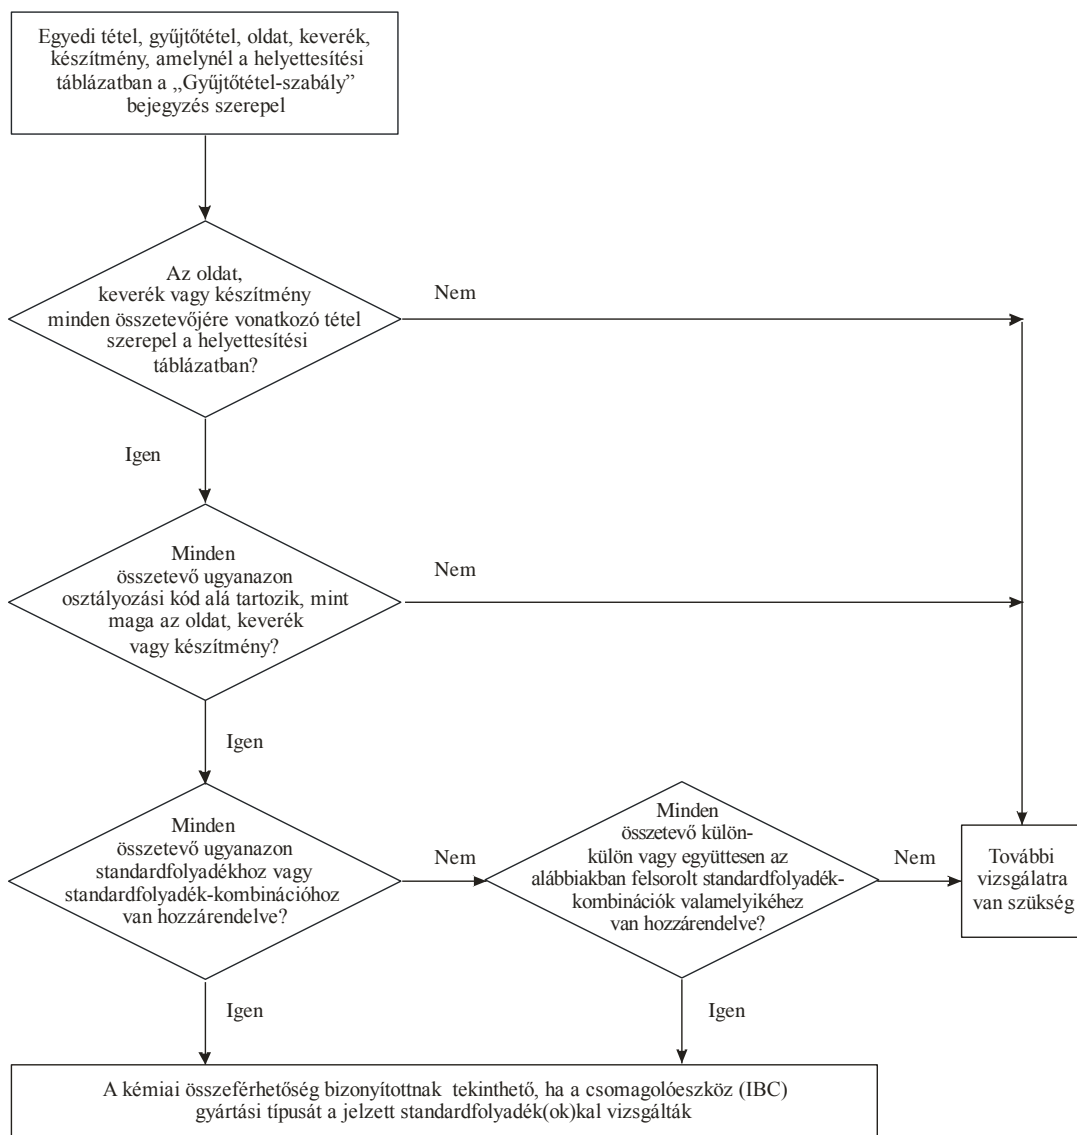

Ezért az UN 1120 terc-butanol vizes oldatok az „ecetsav” standardfolyadékkal helyettesíthetők.

4.1.1.21.5 Gyűjtőtétel-szabály

Olyan töltőanyagok esetében, amelyeknél az 5 oszlopban „Gyűjtőtétel-szabály” bejegyzés szerepel, a hozzárendeléshez a következő lépéseket kell tenni, ill. a következő feltételeket kell teljesíteni (lásd még a 4.1.1.21.2 ábrát):

- a) Végre kell hajtani a 4.1.1.21.3 pont szerinti hozzárendelési eljárást az oldat, keverék vagy készítmény minden összetevőjére, figyelembe véve a 4.1.1.21.2 pont feltételeit. Generikus tételek esetén figyelmen kívül hagyhatók azok az összetevők, amelyekről ismert, hogy nincs károsító hatásuk a nagy sűrűségű polietilénre (pl. az UN 1263 FESTÉK-ben vagy FESTÉK SEGÉDANYAG-ban levő szilárd pigmentek).
- b) Az oldat, keverék vagy készítmény nem helyettesíthető standardfolyadékkal, ha:
 - i) egy vagy több veszélyes összetevő UN száma és csomagolási csoportja nem szerepel a helyettesítési táblázatban; vagy
 - ii) egy vagy több összetevőnél a helyettesítési táblázat 5 oszlopában a „Gyűjtőtétel-szabály” bejegyzés található; vagy
 - iii) az anyag egy vagy több veszélyes összetevőjének osztályozási kódja eltér az oldat, keverék vagy készítmény osztályozási kódjától (az UN 2059 GYÚLÉKONY NITROCELLULÓZ OLDAT kivételével).
- c) Ha a helyettesítési táblázatban minden veszélyes összetevő szerepel, és osztályozási kódjuk megegyezik magának az oldatnak, keveréknek, ill. készítménynek az osztályozási kódjával, és minden veszélyes összetevő ugyanazon standardfolyadékhoz vagy standardfolyadék-kombinációhoz van hozzárendelve az 5 oszlopban, akkor az oldat, keverék, ill. készítmény kémiai összeférhetősége bizonyítottnak tekinthető, ha a 4.1.1.21.1 és a 4.1.1.21.2 pont előírásait figyelembe vették.

- d) Ha a helyettesítési táblázatban minden veszélyes összetevő szerepel, és osztályozási kódjuk megegyezik magának az oldatnak, keveréknek, ill. készítménynek az osztályozási kódjával, de az 5 oszlopban eltérő standardfolyadékok találhatók, akkor az oldat, keverék, ill. készítmény kémiai összeférhetősége csak a következő standardfolyadék-kombináció esetén tekinthető bizonyítottnak, ha a 4.1.1.21.1 és a 4.1.1.21.2 pont előírásait figyelembe vették:
- i) víz/55%-os salétromsav; a C1 osztályozási kód alá tartozó szerves savak kivételével, amelyek a „víz” standardfolyadékkal helyettesíthetők;
 - ii) víz/nedvesítőszer oldat;
 - iii) víz/ecetsav;
 - iv) víz/szénhidrogén-keverék;
 - v) víz/n-butil-acetát – n-butil-acetáttal telített nedvesítőszer oldat.
- e) E szabály értelmében tehát a kémiai összeférhetőség nem tekinthető bizonyítottnak a d) pontban leírtaktól eltérő standardfolyadék-kombinációkra, ill. a b) pontban leírt esetekben. Ilyen esetekben a kémiai összeférhetőséget más módon kell bizonyítani [lásd a 4.1.1.21.3 d) pontot].

Elfogadott standardfolyadék-kombinációk:

- víz/salétromsav (55%), kivéve a C1 osztályozási kód alá tartozó szerves savakat, amelyek a „víz” standardfolyadékhoz vannak hozzárendelve;
- víz/nedvesítőszer oldat;
- víz/ecetsav;
- víz/szénhidrogén-keverék;
- víz/n-butil-acetát – n-butil-acetáttal telített nedvesítőszer oldat.

4.1.1.21.2 ábra: Gyűjtőtétel szabály

1 példa: UN 1940 TIOGLIKOLSAV (50%) és UN 2531 METAKRILSAV, STABILIZÁLT (50%) keveréke; a keverék besorolása: UN 3265 MARÓ, FOLYÉKONY, SAVAS SZERVES ANYAG, M.N.N.

- Mind az összetevők, mind a keverék UN száma szerepel a helyettesítési táblázatban;
- Az összetevők és a keverék osztályozási kódja azonos: C3;
- Az UN 1940 TIOGLIKOLSAV az „ecetsav”, az UN 2531 METAKRILSAV, STABILIZÁLT pedig az „n-butil-acetát / n-butil-acetáttal telített nedvesítőszer oldat” standardfolyadékkal helyettesíthető. A d) pont értelmében ez nem egy elfogadott standardfolyadék-kombináció. A keverék kémiai összeférhetőségét más módon kell bizonyítani.

2 példa: UN 1793 FOSZFORSÁV-MONOIZOPROPIL-ÉSZTER (50%) és UN 1803 FOLYÉKONY FENOLSZULFONSAV (50%) keveréke; a keverék besorolása: UN 3265 MARÓ, FOLYÉKONY, SAVAS SZERVES ANYAG, M.N.N.

- Mind az összetevők, mind a keverék UN száma szerepel a helyettesítési táblázatban;
- Az összetevők és a keverék osztályozási kódja azonos: C3;
- Az UN 1793 FOSZFORSÁV-MONOIZOPROPIL-ÉSZTER a „nedvesítőszerszolgát”, az UN 1803 FOLYÉKONY FENOLSZULFONSÁV a „víz” standardfolyadékkal helyettesíthető. A d) pont értelmében ez egy elfogadott standardfolyadék-kombináció. Ennek következtében a kémiai összeférhetőség bizonyítottnak tekinthető, ha a csomagolóeszköz gyártási típusát a „nedvesítőszerszolgát” és a „víz” standardfolyadékokra jóváhagyták.

4.1.1.21.6 Helyettesítési táblázat

A következő helyettesítési táblázatban a veszélyes anyagok az UN szám szerinti sorrendben szerepelnek. Minden sorban alapvetően egyetlen egyedi vagy gyűjtötétel szerepel, amelyhez egy adott UN szám tartozik. Azonban ugyanaz az UN szám több, egymást követő sorban is előfordulhat, ha az adott UN számhoz tartozó anyagok eltérő megnevezéssel (pl. egy anyagcsoport önálló izomerjei), különböző kémiai tulajdonságokkal, különböző fizikai tulajdonságokkal és/vagy különböző szállítási feltételekkel rendelkeznek. Ilyen esetekben az adott csomagolási csoporton belül az egyedi vagy gyűjtötétel az egymást követő sorok közül az utolsó.

A 4.1.1.21.6 táblázat 1 – 4. oszlopa, a 3.2 fejezet „A” táblázatához hasonló szerkezetet követve, használható az anyag azonosítására e bekezdés céljából. Az utolsó oszlop tartalmazza a standardfolyadék(ka)t, amellyel (amelyekkel) az anyag helyettesíthető.

Magyarázó megjegyzések az egyes oszlopokhoz:

1 oszlop UN szám

Itt vannak feltüntetve:

- az egyedi UN számok, amelyek konkrétan egy-egy veszélyes anyaghoz vannak hozzárendelve, illetve
- a gyűjtötételek UN számai, amelyhez a név szerint nem említett veszélyes anyagokat a 2. rész osztályozási kritériumai (a „döntési fák”) szerint hozzá kell rendelni.

2a oszlop Helyes szállítási megnevezés vagy műszaki megnevezés

Itt van feltüntetve az anyag megnevezése, az egyedi tétel megnevezése, ami különböző izomereket is tartalmazhat, ill. maga a gyűjtőmegnevezés.

A feltüntetett megnevezés eltérhet a használandó helyes szállítási megnevezéstől.

2b oszlop Leírás

Itt van feltüntetve a tételt magyarázó szöveg olyan esetekben, amikor az anyag besorolása, szállítási feltételei és/vagy kémiai összeférhetősége eltérő.

3a oszlop Osztály

Itt van feltüntetve az osztály, amelynek fogalomkörébe a veszélyes anyag tartozik. Az osztály számának hozzárendelése a 2. rész eljárásai és kritériumai szerint történik.

3b oszlop Osztályozási kód

Itt van feltüntetve a veszélyes anyag osztályozási kódja, aminek hozzá-

rendelése a 2. rész eljárásai és kritériumai szerint történik.

4 oszlop

Csomagolási csoport

Itt van feltüntetve a veszélyes anyaghoz a 2. rész szerinti eljárások és kritériumok alapján hozzárendelt csomagolási csoport száma (I, II vagy III). Bizonyos anyagok nincsenek csomagolási csoporthoz rendelve.

5 oszlop

Standardfolyadék

Itt van feltüntetve vagy egy standardfolyadék, ill. egy standardfolyadék-kombináció, amellyel az anyag helyettesíthető, vagy a gyűjtőtétel-szabályra való hivatkozás, amelyet a 4.1.1.21.5 pont tartalmaz.

4.1.1.21.6 táblázat: Helyettesítési táblázat

UN szám	Helyes szállítási megnevezés vagy műszaki megnevezés 3.1.2	Leírás 3.1.2	Osztály 2.2	Osztályo- zási kód 2.2	Csoma- golási csoport 2.1.1.3	Standardfolyadék
(1)	(2a)	(2b)	(3a)	(3b)	(4)	(5)
1090	Aceton		3	F1	II	Szénhidrogén-keverék Megjegyzés: csak akkor alkalmazható, ha a csomagolóeszköz a töltőanyagot csak elfogadható mértékben ereszti át
1093	Akrilnitril, stabilizált		3	FT1	I	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1104	Amil-acetátok	tiszta izomerek és izomerek keveréke	3	F1	III	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1105	Pentanolok	tiszta izomerek és izomerek keveréke	3	F1	II/III	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1106	Amil-aminok	tiszta izomerek és izomerek keveréke	3	FC	II/III	Szénhidrogén-keverék és nedvesítőszer oldat
1109	Amil-formiátok	tiszta izomerek és izomerek keveréke	3	F1	III	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1120	Butanolok	tiszta izomerek és izomerek keveréke	3	F1	II/III	Ecetsav
1123	Butil-acetátok	tiszta izomerek és izomerek keveréke	3	F1	II/III	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1125	n-Butil-amin		3	FC	II	Szénhidrogén-keverék és nedvesítőszer oldat
1128	n-Butil-formiát		3	F1	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1129	Butiraldehid		3	F1	II	Szénhidrogén-keverék
1133	Ragasztók	gyúlékony folyadék tartalommal	3	F1	I/II/III	Gyűjtőtétel-szabály
1139	Bevonó oldat	beleértve az ipari vagy más célokra használt felületkezelő vagy bevonóanyagokat, pl. alapozó festékeket jármű karosszériához, hordóbélelő anyagokat	3	F1	I/II/III	Gyűjtőtétel-szabály
1145	Ciklohexán		3	F1	II	Szénhidrogén-keverék
1146	Ciklopentán		3	F1	II	Szénhidrogén-keverék
1153	Etilénglikol-dietil- éter		3	F1	III	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat és szénhidrogén-keverék

UN szám	Helyes szállítási megnevezés vagy műszaki megnevezés 3.1.2	Leírás 3.1.2	Osztály 2.2	Osztályo- zási kód 2.2	Csoma- golási csoport 2.1.1.3	Standardfolyadék
1154	Dietil-amin		3	FC	II	Szénhidrogén-keverék és nedvesítőszer oldat
1158	Diizopropil-amin		3	FC	II	Szénhidrogén-keverék és nedvesítőszer oldat
1160	Dimetil-amin vizes oldat		3	FC	II	Szénhidrogén-keverék és nedvesítőszer oldat
1165	Dioxán		3	F1	II	Szénhidrogén-keverék
1169	Folyékony aromás kivonatok		3	F1	II/III	Gyűjtötétel-szabály
1170	Etanol vagy Etanol oldat	vizes oldat	3	F1	II/III	Ecetsav
1171	Etilénglikol-monoetil- éter		3	F1	III	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat és szénhidrogén-keverék
1172	Etilénglikol-monoetil- éter-acetát		3	F1	III	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat és szénhidrogén-keverék
1173	Etil-acetát		3	F1	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1177	2-Etil-butil-acetát		3	F1	III	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1178	2-Etil-butiraldehid		3	F1	II	Szénhidrogén-keverék
1180	Etil-butirát		3	F1	III	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1188	Etilénglikol-mono- metil-éter		3	F1	III	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat és szénhidrogén-keverék
1189	Etilénglikol-mono- metil-éter-acetát		3	F1	III	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat és szénhidrogén-keverék
1190	Etil-formiát		3	F1	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1191	Oktilaldehidek	tiszta izomerek és izomerek keveréke	3	F1	III	Szénhidrogén-keverék
1192	Etil-laktát		3	F1	III	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1195	Etil-propionát		3	F1	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1197	Folyékony ízanyag kivonatok		3	F1	II/III	Gyűjtötétel-szabály
1198	Gyúlékony formaldehid oldat	vizes oldat, lobbanáspont 23 °C és 60 °C között	3	FC	III	Ecetsav
1202	Dízelolaj	amely megfelel az EN 590:2004 szabványnak vagy lobbanáspontja legfeljebb 100 °C	3	F1	III	Szénhidrogén-keverék
1202	Gázolaj	lobbanáspont legfeljebb 100 °C	3	F1	III	Szénhidrogén-keverék
1202	Könnyű fűtőolaj	extra könnyű	3	F1	III	Szénhidrogén-keverék
1202	Könnyű fűtőolaj	amely megfelel az EN 590:2004 szabványnak vagy lobbanáspontja legfeljebb 100 °C	3	F1	III	Szénhidrogén-keverék

UN szám	Helyes szállítási megnevezés vagy műszaki megnevezés 3.1.2	Leírás 3.1.2	Osztály 2.2	Osztályo- zási kód 2.2	Csoma- golási csoport 2.1.1.3	Standardfolyadék
1203	Motorbenzin vagy Benzin vagy Gazolin		3	F1	II	Szénhidrogén-keverék
1206	Heptánok	tiszta izomerek és izomerek keveréke	3	F1	II	Szénhidrogén-keverék
1207	Hexaldehid	n-hexaldehid	3	F1	III	Szénhidrogén-keverék
1208	Hexánok	tiszta izomerek és izomerek keveréke	3	F1	II	Szénhidrogén-keverék
1210	Nyomdafesték vagy Nyomdafesték segédanyag	gyúlékony, beleértve a festékhígítókat és oldószereket	3	F1	I/II/III	Gyűjtötétel-szabály
1212	Izobutanol		3	F1	III	Ecetsav
1213	Izobutil-acetát		3	F1	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1214	Izobutil-amin		3	FC	II	Szénhidrogén-keverék és nedvesítőszer oldat
1216	Izookténok	tiszta izomerek és izomerek keveréke	3	F1	II	Szénhidrogén-keverék
1219	Izopropanol		3	F1	II	Ecetsav
1220	Izopropil-acetát		3	F1	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1221	Izopropil-amin		3	FC	I	Szénhidrogén-keverék és nedvesítőszer oldat
1223	Kerozin		3	F1	III	Szénhidrogén-keverék
1224	3,3-Dimetil-2-butanon		3	F1	II	Szénhidrogén-keverék
1224	Folyékony ketonok, m.n.n.		3	F1	II/III	Gyűjtötétel-szabály
1230	Metanol		3	FT1	II	Ecetsav
1231	Metil-acetát		3	F1	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1233	Metil-amil-acetát		3	F1	III	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1235	Metil-amin vizes oldat		3	FC	II	Szénhidrogén-keverék és nedvesítőszer oldat
1237	Metil-butirát		3	F1	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1247	Metil-metakrilát monomer, stabilizált		3	F1	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1248	Metil-propionát		3	F1	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1262	Oktánok	tiszta izomerek és izomerek keveréke	3	F1	II	Szénhidrogén-keverék
1263	Festék vagy Festék segédanyag	beleértve a festéket, lakkot, zománcot, sellakot, kencét, polírozót, folyékony töl- tőanyagot és folyékony lakkbázist, ill. beleértve a festékhígítókat és oldószereket	3	F1	I/II/III	Gyűjtötétel-szabály
1265	Pentánok	n-pentán	3	F1	II	Szénhidrogén-keverék
1266	Parfüm készítmények	gyúlékony oldószerekkel	3	F1	II/III	Gyűjtötétel-szabály
1268	Kőszénkátrány nafta	gőznyomás 50 °C-on legfeljebb 110 kPa	3	F1	II	Szénhidrogén-keverék

UN szám	Helyes szállítási megnevezés vagy műszaki megnevezés 3.1.2	Leírás 3.1.2	Osztály 2.2	Osztályo- zási kód 2.2	Csoma- golási csoport 2.1.1.3	Standardfolyadék
1268	Nyersolaj (petróleum) párlatok, m.n.n. vagy Nyersolaj (petróleum) termékek, m.n.n.		3	F1	I/II/III	Gyűjtőtétel-szabály
1274	n-Propanol		3	F1	II/III	Ecetsav
1275	Propionaldehid		3	F1	II	Szénhidrogén-keverék
1276	n-Propil-acetát		3	F1	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1277	Propil-amin	n-Propil-amin	3	FC	II	Szénhidrogén-keverék és nedvesítőszer oldat
1281	Propil-formiátok	tiszta izomerek és izomerek keveréke	3	F1	II	n-Butil-acetát/ n-butil-acetát- telített nedvesítőszer oldat
1282	Piridin		3	F1	II	Szénhidrogén-keverék
1286	Gyantaolaj		3	F1	II/III	Gyűjtőtétel-szabály
1287	Gumioldat		3	F1	II/III	Gyűjtőtétel-szabály
1296	Trietil-amin		3	FC	II	Szénhidrogén-keverék és nedvesítőszer oldat
1297	Trimetil-amin vizes oldat	legfeljebb 50 tömeg% trimetil-amin tartalommal	3	FC	I/II/III	Szénhidrogén-keverék és nedvesítőszer oldat
1301	Vinil-acetát, stabilizált		3	F1	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1306	Folyékony fakonzerváló anyagok		3	F1	II/III	Gyűjtőtétel-szabály
1547	Anilin		6.1	T1	II	Ecetsav
1590	Folyékony diklór- anilinek	tiszta izomerek és izomerek keveréke	6.1	T1	II	Ecetsav
1602	Folyékony, mérgező színezék, m.n.n. vagy Folyékony, mérgező színezék intermedier, m.n.n.		6.1	T1	I/II/III	Gyűjtőtétel-szabály
1604	Etilén-diamin		8	CF1	II	Szénhidrogén-keverék és nedvesítőszer oldat
1715	Ecetsavanhidrid		8	CF1	II	Ecetsav
1717	Acetil-klorid		3	FC	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1718	Foszforsav-mono- butil-észter		8	C3	III	Nedvesítőszer oldat
1719	Hidrogén-szulfid	vizes oldat	8	C5	III	Ecetsav
1719	Maró, lúgos folyékony anyag, m.n.n.	szervetlen	8	C5	II/III	Gyűjtőtétel-szabály
1730	Folyékony antimon- pentaklorid	vegytiszta	8	C1	II	Víz
1736	Benzoil-klorid		8	C3	II	Szénhidrogén-keverék és nedvesítőszer oldat
1750	Klór-ecetsav oldat	vizes oldat	6.1	TC1	II	Ecetsav
1750	Klór-ecetsav oldat	mono- és diklór-ecetsav keverékei	6.1	TC1	II	Ecetsav
1752	Klór-acetil-klorid		6.1	TC1	I	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat

UN szám	Helyes szállítási megnevezés vagy műszaki megnevezés 3.1.2	Leírás 3.1.2	Osztály 2.2	Osztályo- zási kód 2.2	Csoma- golási csoport 2.1.1.3	Standardfolyadék
1755	Krómsav oldat	vizes oldat legfeljebb 30% krómsavtarta- lommal	8	C1	II/III	Salétromsav
1760	Ciánamid	vizes oldat legfeljebb 50% ciánamid tartalommal	8	C9	II	Víz
1760	O,O-Dietil-ditiofosz- forsav		8	C9	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1760	O,O-Diizopropil- ditiofoszforsav		8	C9	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1760	O,O-Di-n-propil- ditiofoszforsav		8	C9	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1760	Maró folyadék, m.n.n.	lobbanáspont 60 °C felett	8	C9	I/II/III	Gyűjtőtétel-szabály
1761	Etilén-diamin-réz oldat	vizes oldat	8	CT1	II/III	Szénhidrogén-keverék és nedvesítőszer oldat
1764	Diklór-ecetsav		8	C3	II	Ecetsav
1775	Fluoro-bórsav	vizes oldat legfeljebb 50% fluoro-bórsav tartalommal	8	C1	II	Víz
1778	Fluoro-kovasav		8	C1	II	Víz
1779	Hangyasav	85 tömeg%-nál több savtartalommal	8	C3	II	Ecetsav
1783	Hexametilén-diamin oldat	vizes oldat	8	C7	II/III	Szénhidrogén-keverék és nedvesítőszer oldat
1787	Jód-hidrogénsav	vizes oldat	8	C1	II/III	Víz
1788	Bróm-hidrogénsav	vizes oldat	8	C1	II/III	Víz
1789	Klór-hidrogénsav (sósav)	legfeljebb 38%-os vizes oldat	8	C1	II/III	Víz
1790	Fluor-hidrogénsav	legfeljebb 60% hidrogén-fluorid tartalommal	8	CT1	II	Víz megengedett használati idő: legfeljebb 2 év
1791	Hipoklorit oldat	vizes oldat, a kereskedelemben szokásos nedvesítőszer tartalommal	8	C9	II/III	Salétromsav és nedvesítőszer oldat*
1791	Hipoklorit oldat	vizes oldat	8	C9	II/III	Salétromsav*
* Az UN 1791-hez: A próbát csak szellőző-szerkezettel szabad végrehajtani. Ha a próbánál standardfolyadékként salétromsavat használnak, a szellőző-szerkezetnek és a tömítésnek savállóknak kell lennie. Ha a próbát magával a hipoklorit oldattal hajtják végre, ugyanolyan típusú, hipokloritnak ellenálló, de salétromsavval szemben nem ellenálló szellőző-szerkezetek és tömítések (pl. szilikongumiból készültek) is használhatók.						
1793	Foszforsav-mono- izopropil-észter		8	C3	III	Nedvesítőszer oldat
1802	Perklórsav	vizes oldat legfeljebb 50 tömeg% savtartalommal	8	CO1	II	Víz
1803	Folyékony fenolszulfonsav	izomerek keveréke	8	C3	II	Víz
1805	Foszforsav oldat		8	C1	III	Víz
1814	Kálium-hidroxid oldat (kálilúg)	vizes oldat	8	C5	II/III	Víz
1824	Nátrium-hidroxid oldat (nátronlúg)	vizes oldat	8	C5	II/III	Víz
1830	Kénsav	51%-nál több savtartalommal	8	C1	II	Víz
1832	Kimerült kénsav	vegyileg állandó	8	C1	II	Víz
1833	Kénessav		8	C1	II	Víz

UN szám	Helyes szállítási megnevezés vagy műszaki megnevezés 3.1.2	Leírás 3.1.2	Osztály 2.2	Osztályo- zási kód 2.2	Csoma- golási csoport 2.1.1.3	Standardfolyadék
1835	Tetrametil-ammoni- um-hidroxid, oldat	vizes oldat, lobbanáspont 60 °C felett	8	C7	II	Víz
1840	Cink-klorid oldat	vizes oldat	8	C1	III	Víz
1848	Propionsav	legalább 10 tömeg%, de 90 tömeg%-nál kevesebb savtartalommal	8	C3	III	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1862	Etil-krotonát		3	F1	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1863	Tüzelőanyag repülőgép turbínamotorhoz		3	F1	I/II/III	Szénhidrogén-keverék
1866	Gyanta oldat	gyúlékony	3	F1	I/II/III	Gyűjtötétel-szabály
1902	Foszforsav-diizooktil- észter		8	C3	III	Nedvesítőszer oldat
1906	Hulladék kénsav		8	C1	II	Salétromsav
1908	Klorit oldat	vizes oldat	8	C9	II/III	Ecetsav
1914	Butil-propionátok		3	F1	III	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1915	Ciklohexanon		3	F1	III	Szénhidrogén-keverék
1917	Etil-akrilát, stabilizált		3	F1	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1919	Metil-akrilát, stabilizált		3	F1	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1920	Nonánok	tiszta izomerek és izomerek keveréke, lobbanáspont 23 °C és 60 °C között	3	F1	III	Szénhidrogén-keverék
1935	Cianid oldat, m.n.n.	szervetlen	6.1	T4	I/II/III	Víz
1940	Tioglikolsav		8	C3	II	Ecetsav
1986	Gyúlékony, mérgező alkoholok, m.n.n.		3	FT1	I/II/III	Gyűjtötétel-szabály
1987	Ciklohexanol	technikai tisztaságú	3	F1	III	Ecetsav
1987	Alkoholok, m.n.n.		3	F1	II/III	Gyűjtötétel-szabály
1988	Gyúlékony, mérgező aldehidek, m.n.n.		3	FT1	I/II/III	Gyűjtötétel-szabály
1989	Aldehidek, m.n.n.		3	F1	I/II/III	Gyűjtötétel-szabály
1992	2,6-cisz-Dimetil- morfolin		3	FT1	III	Szénhidrogén-keverék
1992	Gyúlékony, mérgező, folyékony anyag, m.n.n.		3	FT1	I/II/III	Gyűjtötétel-szabály
1993	Propionsav- vinilészter		3	F1	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1993	(1-Metoxi-2-propil)- acetát		3	F1	III	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
1993	Gyúlékony folyékony anyag, m.n.n.		3	F1	I/II/III	Gyűjtötétel-szabály
2014	Hidrogén-peroxid vizes oldat	legalább 20%, de legfeljebb 60% hidrogén-peroxid tartalommal, szükség szerint stabilizálva	5.1	OC1	II	Salétromsav
2022	Krezilsav	krezolokat, xilenolokat és metil-fenolokat tartalmazó vizes oldat	6.1	TC1	II	Ecetsav

UN szám	Helyes szállítási megnevezés vagy műszaki megnevezés 3.1.2	Leírás 3.1.2	Osztály 2.2	Osztályo- zási kód 2.2	Csoma- golási csoport 2.1.1.3	Standardfolyadék
2030	Hidrazin vizes oldat	legalább 37 tömeg%, de legfeljebb 64 tömeg% hidrazintartalommal	8	CT1	II	Víz
2030	Hidrazin-hidrát	vizes oldat 64% hidrazintartalommal	8	CT1	II	Víz
2031	Salétromsav	a vörösen füstölő salétromsav kivételével, legfeljebb 55% salétromsav- tartalommal	8	CO1	II	Salétromsav
2045	Izobutiraldehid (izobutilaldehid)		3	F1	II	Szénhidrogén-keverék
2050	Diizobutilén izomerek keveréke		3	F1	II	Szénhidrogén-keverék
2053	Metil-izobutil- karbinol (metil-amil- alkohol)		3	F1	III	Ecetsav
2054	Morfolin		8	CF1	I	Szénhidrogén-keverék
2057	Tripilén (propilén-trimer)		3	F1	II/III	Szénhidrogén-keverék
2058	Valeraldehid	tiszta izomerek és izomerek keveréke	3	F1	II	Szénhidrogén-keverék
2059	Gyúlékony nitro- cellulóz oldat		3	D	I/II/III	Gyűjtötétel-szabály Az általános eljárástól eltérően az F1 osztályozási kód alá tartozó oldószerekre is ez a szabály alkalmazható
2075	Vízmentes klorál, stabilizált		6.1	T1	II	Nedvesítőszer oldat
2076	Folyékony krezolok	tiszta izomerek és izomerek keverék	6.1	TC1	II	Ecetsav
2078	Toluilén-diizocianát	folyékony	6.1	T1	II	n-Butil-acetát/ n-butil-acetáttal telített nedvesítőszer oldat
2079	Dietilén-triamin		8	C7	II	Szénhidrogén-keverék
2209	Formaldehid oldat	vizes oldat 37% formaldehidarta- lommal, metanol- tartalom: 8-10%	8	C9	III	Ecetsav
2209	Formaldehid oldat	vizes oldat, legalább 25% formaldehid- tartalommal	8	C9	III	Víz

4.1.2 Kiegészítő általános előírások az IBC-k használatára

4.1.2.1

Amennyiben az IBC-t 60 °C vagy alacsonyabb (zárttéri) lobbanáspontú folyékony anyagok vagy porrobbanásra hajlamos porok szállítására használják, intézkedéseket kell hozni, hogy a töltés és ürítés során a veszélyes elektrosztatikus feltöltődést elkerüljék.

4.1.2.2

Minden fém, merev falú műanyag és összetett IBC-t a 6.5.4.4, ill. a 6.5.4.5 bekezdés szerint vizsgálatnak kell alávetni:

- üzembehelyezés előtt;
- az üzembehelyezést követően legfeljebb két és fél, ill. öt éves időközönként;
- javítás és átalakítás után, mielőtt szállításhoz újból felhasználnák.

Az IBC-k az utolsó időszakos vizsgálat, ill. felülvizsgálat érvényességének letelte után nem tölthetők meg és nem adhatók át szállításra. Az utolsó időszakos vizsgálat vagy felülvizsgálat érvényességének letelte előtt megtöltött IBC az utolsó időszakos vizsgálat vagy felülvizsgálat érvényességének letelte után legfeljebb három hónapig szállítható. Ezen kívül az IBC az utolsó időszakos vizsgálat vagy felülvizsgálat érvényességének letelte után is szállítható:

- a) kiürítés után, de tisztítás előtt az újratöltés előtt szükséges vizsgálat vagy felülvizsgálat elvégzésének céljából; és
- b) a veszélyes anyag ártalmatlanításra (megfelelő elhelyezésére) vagy visszaforgatásra történő visszaszállítása céljából az időszakos vizsgálat vagy felülvizsgálat érvényességének lejártá után legfeljebb hat hónapig, hacsak az illetékes hatóság másként nem rendelkezik.

Megjegyzés: A fuvarokmányba teendő bejegyzésre lásd az 5.4.1.1.11 pontot.

4.1.2.3

A 31HZ2 típusú IBC-ket legalább a külső burkolat ürtartalmának 80%-ig kell megtölteni.

4.1.2.4

Ha egy fém, merev falú műanyag, hajlékony falú, ill. összetett IBC rendszeres karbantartását nem az IBC tulajdonosa végzi, akinek bejegyzési állama és neve, ill. engedélyezett jele az IBC-n tartósan fel van tüntetve, akkor az IBC-n a gyártó által felvitt UN típusjelölés közelében tartósan fel kell tüntetni a következőket:

- a) annak az államnak a jelét, ahol a rendszeres karbantartást végzik; és
- b) a rendszeres karbantartást végző nevét, ill. engedélyezett jelét.

4.1.3

A csomagolási utasításokra vonatkozó általános előírások

4.1.3.1

Az 1 – 9 osztály veszélyes áruira vonatkozó csomagolási utasításokat a 4.1.4 szakasz tartalmazza. A csomagolási utasítások a csomagolóeszközök fajtája szerint három bekezdésre vannak felosztva:

- | | |
|--------------------|---|
| a 4.1.4.1 bekezdés | a csomagolóeszközökre vonatkozik (az IBC-k és a nagy-csomagolások kivételével): ezek az utasítások „P” betűvel kezdődő kóddal vannak ellátva, a csak RID és ADR szerinti csomagolóeszközökre vonatkozó utasítások kódja „R” betűvel kezdődik; |
| a 4.1.4.2 bekezdés | az IBC-kre vonatkozik: ezek az utasítások „IBC” betűkkel kezdődő kóddal vannak ellátva; |
| a 4.1.4.3 bekezdés | a nagycsomagolásokra vonatkozik: ezek az utasítások „LP” betűkkel kezdődő kóddal vannak ellátva. |

A csomagolási utasítások általában azt is megadják, hogy a 4.1.1, 4.1.2 vagy 4.1.3 szakasz általános előírásait be kell tartani, ill. előírhatják, hogy a 4.1.5, 4.1.6, 4.1.7, 4.1.8 vagy 4.1.9 szakasz különleges előírásait is teljesíteni kell. A csomagolási utasításokban egyes anyagokra és tárgyakra különleges csomagolási előírások is szerepelhetnek, ezeket szintén számokból és betűkből álló kódok jelölik a következők szerint:

- | | |
|------|---|
| „PP” | az IBC-k és a nagycsomagolások kivételével minden más csomagolóeszközre, vagy |
| „RR” | csak a RID és az ADR szerinti szállításnál érvényes különleges előírásokra; |
| „B” | az IBC-kre, vagy |

„BB” csak a RID és az ADR szerinti szállításnál érvényes különleges előírásokra;

„L” a nagycsomagolásokra.

Ellenkező előírás hiányában minden csomagolóeszköznek meg kell felelnie a 6. rész vonatkozó előírásainak. A csomagolási utasítások általában nem nyújtanak információt az összeférhetőségről, így a felhasználó nem választhatja meg a csomagolóeszközt anélkül, hogy ellenőrizné a (csomagolandó) anyag összeférhetőségét a kiválasztott csomagolóanyaggal (pl. a legtöbb fluoridhoz az üvegtartályok nem megfelelőek). Ahol a csomagolási utasítás szerint üvegtartály megengedett, ott porcelán és kőagyag csomagolóeszközök ugyan-csak használhatók.

4.1.3.2 Az egyes anyagokra és tárgyakra alkalmazandó csomagolási utasítás(oka)t a 3.2 fejezet „A” táblázatának 8 oszlopa tartalmazza. A meghatározott anyagokra vagy tárgyakra vonatkozó különleges csomagolási előírásokat és az egybecsomagolási előírásokat (lásd a 4.1.10 szakaszt) a 9a és 9b oszlop tartalmazza.

4.1.3.3 A csomagolási utasítások tartalmazzák a használható önálló és kombinált csomagolóeszközöket. A kombinált csomagolásra megadják a használható külső csomagolóeszközt, belső csomagolóeszközt, és ahol szükséges, a belső és a külső csomagolóeszközben megengedett legnagyobb mennyiséget. A legnagyobb nettó tömeg és legnagyobb ürtartalom meghatározását lásd az 1.2.1 szakaszban.

4.1.3.4 Amennyiben a szállított anyag a szállítás alatt hajlamos folyékonnyá válni, a következő csomagolóeszközök nem használhatók:

A csomagolóeszközök közül:

Hordók: 1D és 1G

Ládák: 4A, 4B, 4C1, 4C2, 4D, 4F, 4G, 4H1 és 4H2

Zsákok: 5L1, 5L2, 5L3, 5H1, 5H2, 5H3, 5H4, 5M1 és 5M2

Összetett csomagolóeszközök: 6HC, 6HD2, 6HG1, 6HG2, 6HD1, 6PC, 6PD1, 6PD2, 6PG1, 6PG2 és 6PH1

A nagycsomagolások közül:

Hajlékony falú műanyag: 51H (külső csomagolóeszköz)

Az IBC-k közül:

Az I csomagolási csoport anyagaihoz: egyik IBC típus sem

A II és a III csomagolási csoport anyagaihoz:

Fa: 11C, 11D és 11F

Papírlemez: 11G

Hajlékony falú: 13H1, 13H2, 13H3, 13H4, 13H5, 13L1, 13L2, 13L3, 13L4, 13M1 és 13M2

Összetett: 11HZ2 és 21HZ2.

Ezen bekezdés tekintetében a 45 °C vagy annál alacsonyabb olvadáspontú anyagokat és keverékeket kell olyan szilárd anyagoknak tekinteni, amelyek a szállítás alatt hajlamosak folyékonnyá válni.

4.1.3.5 Ha ebben a fejezetben a csomagolási utasítások megengedik egy adott kódjelű (pl. 4G; 1A2) csomagolóeszköz használatát, akkor az azonos kódjelű és a 6. rész előírásai szerint „V”, „U” vagy „W” betűvel jelölt (pl. 4GV, 4GU vagy 4GW; 1A2V, 1A2U vagy 1A2W) csomagolóeszközök is használhatók, ugyanazokkal a feltételekkel és korlátozásokkal, amelyeket a csomagolási utasítás az adott kódjelű csomagolóeszközhöz előír. Például a 4GV kódjelű kombinált csomagolás minden esetben használható, amikor 4G kódjelű van megengedve, feltéve, hogy betartják a vonatkozó csomagolási utasítás előírásait a belső csomagolóeszközhöz és a mennyiség korlátozására.

4.1.3.6 Folyékony és szilárd anyagok szállítására szolgáló nyomástartó tartályok

4.1.3.6.1 Hacsak az ADR-ben másként nincs előírva, minden folyékony és szilárd anyag szállítására használhatók azok a nyomástartó tartályok, amelyek

- a) megfelelnek 6.2 fejezet vonatkozó követelményeinek; ill.
- b) a tervezésre, szerkezetre, gyártásra, vizsgálatra vonatkozóan a gyártás országában alkalmazott nemzeti vagy nemzetközi szabványoknak megfelelnek, feltéve, hogy a 4.1.3.6 bekezdés előírásait is betartják, valamint a fémből készült palackok, nagy-palackok, gázhordók, palackkötegek és kármentő nyomástartó tartályok kialakítása olyan, hogy a repesztő- és a próbanyomás hányadosa legalább
 - i) 1,50 az újratölthető nyomástartó tartályoknál, ill.
 - ii) 2,00 a nem újratölthető nyomástartó tartályoknál,

kivéve a robbanóanyagokat, a termikusan nem állandó anyagokat, a szerves peroxidokat, az önreaktív anyagokat, az olyan anyagokat, amelyeknél kémiai reakció révén jelentős nyomás alakulhat ki és a radioaktív anyagokat (hacsak a 4.1.9 szakasz nem engedélyezi).

Ez a pont nem vonatkozik a 4.1.4.1 bekezdés P200 csomagolási utasításának 3. táblázatában említett anyagokra.

4.1.3.6.2 Minden nyomástartó tartály gyártási típust a gyártási ország illetékes hatóságának jóvá kell hagynia vagy a 6.2 fejezet szerint kell jóváhagyni.

4.1.3.6.3 Hacsak másként nincs előírva, csak olyan nyomástartó tartály használható, amelynek próbanyomása legalább 0,6 MPa.

4.1.3.6.4 Hacsak másként nincs előírva, a nyomástartó tartályt veszlefüvő szerkezettel lehet ellátni, amely úgy van méretezve, hogy túltöltés vagy tűz esetén megakadályozza a tartály szétrobbanását.

A nyomástartó tartály szelepeit úgy kell tervezni és gyártani, hogy eredendően képesek legyenek a sérülések elviselésére anélkül, hogy a tartalom kiszabadulna, vagy a 4.1.6.8 bekezdés a) – e) pontjaiban felsorolt módszerek valamelyikének alkalmazásával védeni kell az olyan sérülésekkel szemben, amelyek a nyomástartó tartály tartalmának véletlen kiszabadulásához vezetnének.

4.1.3.6.5 A nyomástartó tartályt 50 °C-on legfeljebb ürtartalmának 95%-áig szabad megtölteni. Elegendő folyadékmentes szabad teret kell hagyni ahhoz, hogy 55 °C hőmérsékleten a folyadék ne töltse ki teljesen a nyomástartó tartályt.

4.1.3.6.6 Hacsak másként nincs előírva, a nyomástartó tartályt 5 évenként időszakos vizsgálatnak kell alávetni. Az időszakos vizsgálatnak a következőkből kell állnia: külső vizsgálatból, belső vizsgálatból vagy az illetékes hatóság által jóváhagyott más módszerrel végzett vizsgálatból, nyomáspróbából vagy az illetékes hatóság által engedélyezett azonos hatékonyságú, roncsolásmentes vizsgálatból, beleértve a tartozékok vizsgálatát is (pl. a szelepek, veszlefüvő szerkezetek, ill. olvadó betétek tömörségének vizsgálatát). A nyomástartó tartály az időszakos vizsgálat esedékessége után még szállítható, azonban megtölteni már nem szabad. A nyomástartó tartály javítását a 4.1.6.11 bekezdés követelményei szerint kell végezni.

4.1.3.6.7 A csomagolónak (töltőnek) töltés előtt meg kell vizsgálnia a nyomástartó tartályt, meg kell győződnie arról, hogy a nyomástartó tartály a szállítandó anyagra engedélyezve van és az ADR előírásait betartották. A zárószelepet töltés után le kell zárni, és a szállítás alatt zárva kell maradnia. A feladónak ellenőriznie kell a zárószerkezetek és a szerelvények tömítettségét.

4.1.3.6.8 Újratölthető nyomástartó tartályt csak ugyanolyan anyaggal szabad megtölteni, mint ami előzőleg volt benne, kivéve, ha a töltet megváltoztatásához szükséges műveleteket végrehajtották.

4.1.3.6.9 A 6.2 fejezet előírásainak megfelelő nyomástartó tartályok kivételével a 4.1.3.6 bekezdés szerinti, folyékony és szilárd anyagok szállítására szolgáló nyomástartó tartályokat a gyártási

ország illetékes hatóságának előírásai szerint kell jelöléssel ellátni.

4.1.3.7 A vonatkozó csomagolási utasításban kifejezetten nem engedélyezett csomagolóeszköz vagy IBC csak akkor használható valamely anyag vagy tárgy szállítására, ha a Szerződő Felek az 1.5.1 szakasz szerinti ideiglenes eltérésben erről kifejezetten megállapodtak.

4.1.3.8 *Nem az 1 osztályba tartozó csomagolatlan tárgyak*

4.1.3.8.1 Ha egy nagyméretű, robusztus tárgy nem csomagolható a 6.1 vagy a 6.6 fejezet csomagolási előírásainak megfelelően és üres, tisztítatlan állapotban, csomagolás nélkül kell szállítani, akkor az ilyen szállítást a származási ország²⁾ illetékes hatósága engedélyezheti. Az engedélyezéshez az illetékes hatóságnak a következőket kell figyelembe vennie:

- a) a nagyméretű, robusztus tárgynak elég erősnek kell lenni ahhoz, hogy ellenálljon azoknak az igénybevételeknek, ütődéseknek, amelyeknek rendes körülmények között a szállítás során, a szállítóeszközök közötti átrakás, a szállítóeszközből a raktárba való berakodás során ki van téve, illetve amelyek akkor léphetnek fel, amikor további kézi vagy gépi árukezelés céljából a rakodólapról eltávolítják;
- b) minden zárószerkezetnek és nyílásnak zárva kell lennie, hogy ne következessen be a tartalom szabadba jutása, ami normális szállítási körülmények között különösen a rezgésekből, illetve a hőmérséklet, a páratartalom vagy a nyomás változásából adódhat (pl. a tengerszint feletti magasság változásának eredményeként). Veszélyes anyagnak nem szabad a nagyméretű, robusztus tárgy külsejére tapadnia;
- c) a nagyméretű, robusztus tárgyak veszélyes áruval közvetlenül érintkező
 - i) részeit a veszélyes áru nem támadhatja meg, sem lényegesen nem gyengítheti, és
 - ii) ezek a részek nem okozhatnak veszélyes hatást, pl. reakció katalizálását vagy a veszélyes áruval való reakciót;
- d) a folyadékot tartalmazó, nagyméretű, robusztus tárgyakat úgy kell berakni és rögzíteni, hogy a szállítás alatt sem a tartalom kiszabadulása, sem a tárgyak maradandó alakváltozása ne következessen be;
- e) a nagyméretű, robusztus tárgyakat úgy kell rögzíteni a rekeszben, keretben, egyéb kezelőeszközben vagy magában a szállítóeszközben vagy konténerben, hogy normális szállítási feltételek esetén ne lazulhassanak ki.

4.1.3.8.2 Az illetékes hatóság által a 4.1.3.8.1 pont szerint engedélyezett, csomagolás nélküli tárgyak az 5. rész feladási eljárásainak hatálya alá tartoznak. Ezenkívül az ilyen tárgyak feladójának gondoskodnia kell arról, hogy az engedély a fuvarokmányhoz legyen csatolva.

Megjegyzés: *A nagyméretű, robusztus tárgyak közé tartoznak pl. a hajlékony falú tüzelőanyagtartályok, a katonai berendezések, a gépek és készülékek, amelyek a 3.4.1 szakasz szerinti korlátozott mennyiségnél nagyobb mennyiségű veszélyes árut tartalmaznak.*

4.1.4 **A csomagolási utasítások felsorolása**

Megjegyzés: *Bár a következő csomagolási utasítások számozási rendszere megegyezik az IMDG Kódex és az ENSZ Minta Szabályzat által használt rendszerrel, a felhasználóknak tekintettel kell lenniük arra, hogy bizonyos részletek az ADR esetében eltérőek lehetnek.*

4.1.4.1 *A csomagolóeszközök (kivéve az IBC-ket és a nagycsomagolásokat) használatára vonatkozó csomagolási utasítások*

2) Ha a származási ország nem valamely ADR Szerződő Fél, akkor a jóváhagyást a küldeménygel érintett első ADR Szerződő Fél illetékes hatóságának kell elismernie.

Nyomástartó tartályok , feltéve, hogy a 4.1.3.6 bekezdés általános előírásait betartják.				
Különleges csomagolási előírások: PP6 (törölve) PP7 Az UN 2000 alá tartozó celluloid lapokat teljes rakományként, fedett járműben vagy zárt konténerben csomagolás nélkül is lehet szállítani rakodólapon rakva, műanyag fóliával burkolva és megfelelő módon, pl. acél pántszalaggal rögzítve. Egy rakodólap nem lehet 1000 kg-nál nagyobb tömegű. PP8 Az UN 2002 anyagaihoz a csomagolóeszközöket úgy kell kialakítani, hogy a megnövekedett belső nyomás következtében ne következhesen be robbanás. Palackok, nagypalackok és gáz-hordók ezekhez az anyagokhoz nem használhatók. PP9 Az UN 3175, 3243 és 3244 anyagaihoz a csomagolóeszköznek olyan gyártási típusnak kell megfelelnie, amely sikeresen kiállta a tömörségi próbát a II csomagolási csoport igénybevételi szintjén. Az UN 3175 esetén nincs szükség a tömörségi próbára, ha a folyadék a zárt zsákokban levő szilárd anyagban teljesen abszorbeálva van.				

P002 (folyt.)	CSOMAGOLÁSI UTASÍTÁS (szilárd anyagokhoz)	P002 (folyt.)
Különleges csomagolási előírások (folyt.):		
PP11	Az UN 1309, III csomagolási csoport és UN 1362 anyagaihoz 5H1, 5L1 és 5M1 jelű zsákok használhatók, ha műanyag zsákokba vannak helyezve és rakodólapon zsugor- vagy nyújtható fóliával vannak burkolva.	
PP12	Az UN 1361, 2213 és 3077 anyagaihoz 5H1, 5L1 és 5M1 jelű zsákok is használhatók, ha a szállítás fedett járműben vagy zárt konténerben történik.	
PP13	Az UN 2870 alá sorolt tárgyakhoz csak az I csomagolási csoport igénybevételi szintjét kielégítő kombinált csomagolások használhatók.	
PP14	Az UN 2211, 2698 és 3314 anyagaihoz használt csomagolóeszközöket nem kell alávetni a 6.1 fejezet igénybevételi próbáinak.	
PP15	Az UN 1324 és 2623 anyagaihoz használt csomagolóeszközöknek ki kell elégíteniük a III csomagolási csoport igénybevételi szintjét.	
PP20	Az UN 2217 anyagaihoz bármilyen portömör és tépésálló anyagú tartály is használható.	
PP30	Az UN 2471 anyagaihoz papír vagy papírlemez belső csomagolóeszközök nem használhatók.	
PP34	Az UN 2969 anyagaihoz (egész ricinusmag esetén) 5H1, 5L1 vagy 5M1 jelű zsákok is használhatók.	
PP37	Az UN 2590 és 2212 anyagaihoz 5M1 jelű zsákok is használhatók. Minden zsákot fedett járműben vagy zárt konténerben kell szállítani, vagy zárt, merevfalú egyesítőcsomagolásba kell helyezni.	
PP38	Az UN 1309, II csomagolási csoport anyagaihoz zsákok csak fedett járműben vagy zárt konténerben való szállításnál használhatók.	
PP84	Az UN 1057 tárgyaihoz a II csomagolási csoport igénybevételi szintjét kielégítő, merev külső csomagolóeszközöket kell használni. A csomagolóeszközöket úgy kell tervezni, gyártani és használni, hogy ne következhesen be elmozdulás, az eszközök nem szándékos begyűjtása vagy gyúlékony gáz, ill. folyadék kibocsátása.	
Megjegyzés: Az elkülönítve összegyűjtött hulladék öngyújtókra lásd a 3.3 fejezet 654 különleges előírását.		
Csak a RID és az ADR szerinti szállításnál érvényes különleges csomagolási előírás:		
RR5	Az UN 1057 tárgyait tartalmazó küldeménydaraboknak a PP84 különleges csomagolási előírástól eltérően csak a 4.1.1.1, a 4.1.1.2 és a 4.1.1.5 – 4.1.1.7 bekezdés általános előírásainak kell megfelelniük, ha bruttó tömegük legfeljebb 10 kg.	
Megjegyzés: Az elkülönítve összegyűjtött hulladék öngyújtókra lásd a 3.3 fejezet 654 különleges előírását.		

P003	CSOMAGOLÁSI UTASÍTÁS	P003
<p>A veszélyes árut alkalmas külső csomagolóeszközbe kell helyezni. A csomagolóeszköznek meg kell felelnie a 4.1.1.1, a 4.1.1.2, a 4.1.1.4, a 4.1.1.8 bekezdés és a 4.1.3 szakasz előírásainak és úgy kell tervezni, hogy kielégítsék a 6.1.4 szakasz gyártásra vonatkozó követelményeit. A befogadóképességnek és a tervezett felhasználásnak megfelelő kialakítású, megfelelő szilárdságú és alkalmas anyagból készített külső csomagolóeszközt kell használni. Ha ezt a csomagolási utasítást tárgyak szállításánál vagy kombinált csomagolások belső csomagolásainál alkalmazzák, a csomagolóeszközt úgy kell tervezni és gyártani, hogy normális szállítási feltételek között a tárgyak nem szándékos működésbe lépését megakadályozza.</p>		
Különleges csomagolási előírások:		
PP16	<p>Az UN 2800-hoz: a telepeket védeni kell a csomagoláson belüli rövidzárlattal szemben és erős külső csomagolásokba kell biztonságosan csomagolni.</p> <p>Megjegyzés: 1. <i>A kifolyásmentes, nedves akkumulátortelepeket, amelyek mechanikai vagy elektromos készülékek beépített alkatrészei és azok működéséhez szükségesek, a készülék akkumulátortartójában szilárdan kell rögzíteni, és oly módon kell védeni, hogy sérülés és rövidzárlat ne következhesen be.</i></p> <p>2. <i>A használt telepekre (UN 2800) lásd a P801a utasítást.</i></p>	
PP17	<p>Az UN 2037 tételnél egy küldeménydarab nettó tömege papírlemez csomagolóeszköz esetén legfeljebb 55 kg, egyéb csomagolóeszköz esetén legfeljebb 125 kg lehet.</p>	
PP19	<p>Az UN 1364 és 1365 anyagai bálákban is szállíthatók.</p>	
PP20	<p>Az UN 1363, 1386, 1408 és 2793 anyagaihoz bármilyen portömör és tépésálló anyagból gyártott tartály is használható.</p>	
PP32	<p>Az UN 2857 és 3358 tárgyai csomagolatlanul, rekeszekben vagy megfelelő egyesítőcsomagolásban is szállíthatók.</p>	
PP87	<p>(törölve)</p>	
PP88	<p>(törölve)</p>	
PP90	<p>Az UN 3506 tételnél a higannyal szemben ellenálló, erős, szivárgásmentes és döfésálló anyagból készített bélést vagy belső zsákot kell használni, amely megakadályozza az anyag kiszabadulását a csomagolóeszközből, függetlenül a küldeménydarab helyzetétől;</p>	
Csak a RID és az ADR szerinti szállításhoz érvényes különleges csomagolási előírás:		
RR6	<p>Az UN 2037 tétel teljes rakományként való szállítása esetén a fémből készült tárgyakat a következőképpen is lehet csomagolni:</p> <p>a tárgyakat alátétre helyezve, alkalmas műanyag fóliával burkolva – amely a megfelelő helyzetben rögzíti – egységekké kell összefogni. Ezeket az egységeket rakodólapon egymásra kell helyezni, és megfelelően rögzíteni kell.</p>	

P004	CSOMAGOLÁSI UTASÍTÁS	P004
Ezt a csomagolási utasítást az UN 3473, 3476, 3477, 3478 és 3479 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók:		
1)	<p>Üzemanyagcella kazettákra, feltéve, hogy a 4.1.1.1, a 4.1.1.2, a 4.1.1.3, a 4.1.1.6 bekezdés és a 4.1.3 szakasz általános előírásait betartják:</p> <p>Hordók (1A2, 1B2, 1N2, 1H2, 1D, 1G);</p> <p>Ládák (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2);</p> <p>Kannák (3A2, 3B2, 3H2).</p> <p>A csomagolóeszközöknek a II csomagolási csoport igénybevételi szintjének kell megfelelniük.</p>	
2)	<p>Készülékkel egybecsomagolt üzemanyagcella kazettákra: erős, külső csomagolóeszközök, amelyek amegfelelnek a 4.1.1.1, a 4.1.1.2., a 4.1.1.6 bekezdés és a 4.1.3 szakasz általános előírásainak.</p> <p>Ha az üzemanyagcella kazettát a készülékkel egybecsomagolják, akkor a kazettát vagy belső csomagolásba kell tenni, vagy a külső csomagolásba olyan párnázóanyag vagy osztóbetétek közé helyezni, amely(ek) megvédi(k) a kazettát a sérüléstől, amit a tartalom elmozdulása vagy a külső csomagolásban való elhelyezkedése okozhat.</p> <p>A készüléket rögzíteni kell, nehogy a külső csomagolásban elmozdulhasson.</p> <p>A „készülék” kifejezés e csomagolási utasítás értelmében azt az berendezést jelenti, amelynek működéséhez szükségesek azok az üzemanyagcella kazetták, amelyekkel egybe vannak csomagolva.</p>	
3)	<p>Készülékben lévő üzemanyagcella kazettákra: erős, külső csomagolóeszközök, amelyek megfelelnek a 4.1.1.1, a 4.1.1.2., a 4.1.1.6 bekezdés és a 4.1.3 szakasz általános előírásainak.</p> <p>Az üzemanyagcella kazettát tartalmazó, nagyméretű, robusztus készülékek (lásd a 4.1.3.8 bekezdést) csomagolás nélkül is szállíthatók.</p> <p>A készülékben lévő üzemanyagcella kazettákat rövidzárral ellen védeni kell, és az egész rendszert védeni kell, nehogy véletlenszerűen működésbe lépjen.</p>	

P010		CSOMAGOLÁSI UTASÍTÁS		P010
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják.				
Kombinált csomagolások:			Legnagyobb nettó tömeg

Hordók acél, nem levehető tetővel (1A1)			450 l	
Kannák acél, nem levehető tetővel (3A1)			60 l	
Összetett csomagolóeszközök műanyagtartály külső acélhordóval (6HA1)			250 l	
Acél nyomástartó tartályok , feltéve, hogy a 4.1.3.6 bekezdés általános előírásait betartják.				

P099	CSOMAGOLÁSI UTASÍTÁS	P099
Csak az illetékes hatóság által, ezen árukhoz jóváhagyott csomagolóeszközök használhatók. Az illetékes hatóság jóváhagyásának másolatát a küldeményhez mellékelni kell, vagy a fuvarokmányban utalni kell arra, hogy a csomagolóeszközt az illetékes hatóság jóváhagyta.		

P101	CSOMAGOLÁSI UTASÍTÁS	P101
Csak a származási ország illetékes hatósága által engedélyezett csomagolóeszközök használhatók. Ha a származási ország nem ADR Szerződő Fél, akkor a csomagolóeszközt a küldemény által érintett első ADR Szerződő Fél illetékes hatóságának jóvá kell hagynia. A nemzetközi forgalomban részt vevő gépjárművek államjelzését azon országra nézve, amelynek hatósága intézkedik, a fuvarokmányban fel kell tüntetni a következők szerint: „... illetékes hatósága által engedélyezett csomagolás” [lásd az 5.4.1.2.1 e) pontot].

Kiegészítő követelmény: A csomagolóeszköznek portömörnek kell lennie.		
Különleges csomagolási előírások: PP49 Az UN 0094 és 0305 esetében egy belső csomagolásba legfeljebb 50 g anyag csomagolható. PP50 Az UN 0027 esetében belső csomagolások nem szükségesek, ha külső csomagolásként hordót használnak. PP51 Az UN 0028-hoz belső csomagolásként nátronpapír vagy viaszolt papír burkolatok is használhatók.		

P114a CSOMAGOLÁSI UTASÍTÁS P114a (nedvesített szilárd anyagokhoz)		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök
Zsákok műanyagból textilszövetből műanyagszövetből Tartályok fémről műanyagból fából	Zsákok műanyagból műanyag bevonatú vagy bélésű textilszövetből Tartályok fémről műanyagból Megosztó válaszfalak fából	Ládák acélládák (4A) fém (acélt és alumíniumot kivéve) (4N) közönséges faládák (4C1) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) papírlemez ládák (4G) tömör műanyag ládák (4H2) Hordók acélhordók (1A1, 1A2) alumíniumhordók (1B1, 1B2) egyéb fém hordók (1N1, 1N2) rétegelt falemez hordók (1D) papírlemez hordók (1G) műanyag hordók (1H1, 1H2)
Kiegészítő követelmény: Nem szükséges köztes csomagolás, ha külső csomagolásként folyadéktömör, levehető tetejű hordót használnak.		
Különleges csomagolási előírások: PP26 Az UN 0077, 0132, 0234, 0235 és 0236-hoz használt csomagolóeszközök nem tartalmazhatnak ólmot. PP43 Az UN 0342 esetében nem szükséges belső csomagolás, ha külső csomagolásként fémhordót (1A1, 1A2, 1B1, 1B2, 1N1 vagy 1N2) vagy műanyag hordót (1H1 vagy 1H2) használnak.		

P114b		CSOMAGOLÁSI UTASÍTÁS (száraz szilárd anyagokhoz)	P114b
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.			
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök	
Zsákok nátrónpapírból műanyagból portömör textilszövetből portömör műanyagszövetből Tartályok papírlemezből fémből papírból műanyagból portömör műanyagszövetből fából	Nem szükséges	Ládák közönséges faládák (4C1) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) papírlemez ládák (4G) Hordók acélhordók (1A1, 1A2) alumíniumhordók (1B1, 1B2) egyéb fém hordók (1N1, 1N2) rétegelt falemez hordók (1D) papírlemez hordók (1G) műanyag hordók (1H1, 1H2)	
Különleges csomagolási előírások:			
PP26	Az UN 0077, 0132, 0234, 0235 és 0236-hoz használt csomagolóeszközök nem tartalmazhatnak ólmot.		
PP48	Az UN 0508 és az UN 0509 anyagaihoz fém csomagolóeszköz nem használható.		
PP50	Az UN 0160, UN 0161 és UN 0508 anyagaihoz nem szükségesek belső csomagolóeszközök, ha külső csomagolásként hordókat használnak.		
PP52	Ha az UN 0160 és UN 0161 anyagaihoz külső csomagolásként fémhordót (1A1, 1A2, 1B1, 1B2, 1N1 vagy 1N2) használnak, a fém csomagolóeszközöket úgy kell kialakítani, hogy a belső nyomás belső vagy külső okokból történő növekedése ne okozzon robbanásvesztélyt.		

<div>P115</div> <div>CSOMAGOLÁSI UTASÍTÁS</div> <div>P115</div>		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök
Tartályok műanyagból fából	Zsákok műanyagból fém tartályokban Hordók fémről Tartályok fából	Ládák közönséges faládák (4C1) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) Hordók acélhordók (1A1, 1A2) alumíniumhordók (1B1, 1B2) egyéb fém hordók (1N1, 1N2) rétegelt falemez hordók (1D) papírlemez hordók (1G) műanyag hordók (1H1, 1H2)
Különleges csomagolási előírások: PP45 Az UN 0144-hez nem szükséges köztes csomagolás. PP53 Ha az UN 0075, 0143, 0495 és 0497 anyagaihoz külső csomagolásként ládákat használnak, akkor a belső csomagolásokat kúpos, csavarmenetes kupakkal kell zárni és térfogatuk egyenként nem haladhatja meg az 5 litert. A belső csomagolásokat körül kell venni nem éghető, abszorbeáló párnázóanyaggal. Az abszorbeáló párnázóanyag mennyiségének elegendőnek kell lennie a folyadéktartalmak felszívásához. A fémtartályokat párnázattal kell egymástól elválasztani. Ha a külső csomagolás láda, a hajtóanyag nettó mennyisége egy küldeménydarabban legfeljebb 30 kg lehet. PP54 Ha az UN 0075, 0143, 0495 és 0497 anyagaihoz külső csomagolásként hordókat használnak és a köztes csomagolás hordó, ezt olyan mennyiségű nem éghető párnázóanyaggal kell körülvenni, ami elegendő a folyadéktartalmak abszorbeálásához. A belső és a köztes csomagolóeszközök helyett fémhordóban levő műanyag tartályból álló összetett csomagolóeszköz is használható. A hajtóanyag nettó mennyisége egy küldeménydarabban nem haladhatja meg a 120 litert. PP55 Az UN 0144 anyagaihoz abszorbeáló párnázóanyagot kell behelyezni. PP56 Az UN 0144 anyagaihoz belső csomagolásként fém tartályok is használhatók. PP57 Az UN 0075, 0143, 0495 és 0497 anyagaihoz köztes csomagolásként zsákokat kell használni ha külső csomagolásként ládákat használnak. PP58 Az UN 0075, 0143, 0495 és 0497 anyagaihoz köztes csomagolásként hordót kell használni, ha külső csomagolásként hordókat használnak. PP59 Az UN 0144 anyagaihoz külső csomagolásként papírlemez ládák (4G) is használhatók. PP60 Az UN 0144 anyagaihoz alumíniumhordók (1B1 és 1B2), valamint fém hordók (acélt és alumíniumot kivéve) (1N1 és 1N2) nem használhatók.

A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök
Nem szükséges	Nem szükséges	Ládák acélládák (4A) alumíniumládák (4B) egyéb fém ládák (4N) közönséges faládák (4C1) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) papírlemez ládák (4G) habosított műanyag ládák (4H1) tömör műanyag ládák (4H2) Hordók acélhordók (1A1, 1A2) alumíniumhordók (1B1, 1B2) egyéb fém hordók (1N1, 1N2) rétegelt falemez hordók (1D) papírlemez hordók (1G) műanyag hordók (1H1, 1H2)
Különleges csomagolási előírások: PP67 A következőket kell alkalmazni az UN 0006, 0009, 0010, 0015, 0016, 0018, 0019, 0034, 0035, 0038, 0039, 0048, 0056, 0137, 0138, 0168, 0169, 0171, 0181, 0182, 0183, 0186, 0221, 0243, 0244, 0245, 0246, 0254, 0280, 0281, 0286, 0287, 0297, 0299, 0300, 0301, 0303, 0321, 0328, 0329, 0344, 0345, 0346, 0347, 0362, 0363, 0370, 0412, 0424, 0425, 0434, 0435, 0436, 0437, 0438, 0451, 0488 és 0502 tárgyaihoz: A rendszerint katonai célú, nagyméretű, robusztus robbanótárgyak gyújtószerkezeteik nélkül vagy gyújtószerkezettel, de legalább két hatékony védőszerkezettel csomagolatlanul szállíthatók. Ha az ilyen tárgyak hajtótöltetet tartalmaznak vagy önhajtók, akkor gyújtórendszereiket védeni kell a normális szállítási feltételek melletti működésbe lépéssel szemben. Ha a csomagolatlan tárgy a 4. vizsgálati sorozatban negatív eredményt ad, ez jelzi, hogy az csomagolás nélküli szállításra figyelembe vehető. Az ilyen csomagolatlan tárgyak csúszótalpakra erősíthetők vagy keretekbe vagy más alkalmas anyagmozgató eszközbe helyezhetők.		

P131 CSOMAGOLÁSI UTASÍTÁS P131		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök
Zsákok papírból műanyagból Tartályok papírlémezről fémről műanyagból fából Orsók	Nem szükséges	Ládák acélládák (4A) alumíniumládák (4B) egyéb fém ládák (4N) közönséges faládák (4C1) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) papírlémez ládák (4G) Hordók acélhordók (1A1, 1A2) alumíniumhordók (1B1, 1B2) egyéb fém hordók (1N1, 1N2) rétegelt falemez hordók (1D) papírlémez hordók (1G) műanyag hordók (1H1, 1H2)
Különleges csomagolási előírás: PP68 Az UN 0029, 0267 és 0455 esetében belső csomagolásként zsákok és orsók nem használhatók.		

P132a CSOMAGOLÁSI UTASÍTÁS P132a		
(zárt fém, műanyag vagy papírlémez házból álló tárgyakhoz, amelyek detonáló robbanóanyagot tartalmaznak vagy műanyag kötésű detonáló robbanóanyagokból készült tárgyakhoz)		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök
Nem szükséges	Nem szükséges	Ládák acélládák (4A) alumíniumládák (4B) egyéb fém ládák (4N) közönséges faládák (4C1) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) papírlémez ládák (4G) tömör műanyag ládák (4H2)

P132b CSOMAGOLÁSI UTASÍTÁS P132b		
(zárt ház nélküli tárgyakhoz)		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök
Tartályok papírlamezből fémből műanyagból fából Burkolatok papírból műanyagból	Nem szükséges	Ládák acélládák (4A) alumíniumládák (4B) egyéb fém ládák (4N) közönséges faládák (4C1) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) papírlamez ládák (4G) tömör műanyag ládák (4H2)

P133 CSOMAGOLÁSI UTASÍTÁS P133		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök
Tartályok papírlamezből fémből műanyagból fából Tálcák megosztó válaszfalakkal papírlamezből műanyagból fából	Tartályok papírlamezből fémből műanyagból fából	Ládák acélládák (4A) alumíniumládák (4B) egyéb fém ládák (4N) közönséges faládák (4C1) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) papírlamez ládák (4G) tömör műanyag ládák (4H2)
Kiegészítő követelmény: Tartályok köztes csomagolásként csak akkor szükségesek, ha a belső csomagolóeszközök tálcák.		
Különleges csomagolási előírás: PP69 Az UN 0043, 0212, 0225, 0268 és 0306-hoz belső csomagolóeszközként tálcák nem használhatók.		

P134 CSOMAGOLÁSI UTASÍTÁS P134		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök
Zsákok vízálló Tartályok papírlémezről fémről műanyagból fából Burkolatok hullámpapírlémezről Hüvelyek papírlémezről	Nem szükséges	Ládák acélládák (4A) alumíniumládák (4B) egyéb fém ládák (4N) közönséges faládák (4C1) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) papírlémez ládák (4G) habosított műanyag ládák (4H1) tömör műanyag ládák (4H2) Hordók acélhordók (1A1, 1A2) alumíniumhordók (1B1, 1B2) egyéb fém hordók (1N1, 1N2) rétegelt falemez hordók (1D) papírlémez hordók (1G) műanyag hordók (1H1, 1H2)

P135 CSOMAGOLÁSI UTASÍTÁS P135		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök
Zsákok papírból műanyagból Tartályok papírlémezről fémről műanyagból fából Burkolatok papírból műanyagból	Nem szükséges	Ládák acélládák (4A) alumíniumládák (4B) egyéb fém ládák (4N) közönséges faládák (4C1) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) papírlémez ládák (4G) habosított műanyag ládák (4H1) tömör műanyag ládák (4H2) Hordók acélhordók (1A1, 1A2) alumíniumhordók (1B1, 1B2) egyéb fém hordók (1N1, 1N2) rétegelt falemez hordók (1D) papírlémez hordók (1G) műanyag hordók (1H1, 1H2)

A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök és kialakítások
Zsákok műanyagból textilszövetből Ládák papírlamezből műanyagból fából Megosztó válaszfalak a külső csomagolásban	Nem szükséges	Ládák acélládák (4A) alumíniumládák (4B) egyéb fém ládák (4N) közönséges faládák (4C1) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) papírlamez ládák (4G) tömör műanyag ládák (4H2) Hordók acélhordók (1A1, 1A2) alumíniumhordók (1B1, 1B2) egyéb fém hordók (1N1, 1N2) rétegelt falemez hordók (1D) papírlamez hordók (1G) műanyag hordók (1H1, 1H2)

<div>P137</div> <div>CSOMAGOLÁSI UTASÍTÁS</div> <div>P137</div>		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök
Zsákok műanyagból Ládák papírlamezből fából Hüvelyek papírlamezből fémből műanyagból Megosztó válaszfalak a külső csomagolásban	Nem szükséges	Ládák acélládák (4A) alumíniumládák (4B) egyéb fém ládák (4N) közönséges faládák (4C1) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) papírlamez ládák (4G) Hordók acélhordók (1A1, 1A2) alumíniumhordók (1B1, 1B2) egyéb fém hordók (1N1, 1N2) rétegelt falemez hordók (1D) papírlamez hordók (1G) műanyag hordók (1H1, 1H2)
Különleges csomagolási előírás: PP70 Ha az UN 0059, 0439, 0440 és 0441 formázott tölteteket egyenként csomagolják, a kúpos üregnek lefelé kell néznie és a küldeménydarabot el kell látni a „FÖLFELE” jelöléssel. Ha a formázott tölteteket páronként csomagolják, a kúpos üregeknek befelé kell nézniük, hogy véletlen beindulás esetén a jet-hatás minimális legyen.		

P138 CSOMAGOLÁSI UTASÍTÁS P138		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök
Zsákok műanyagból	Nem szükséges	Ládák acélládák (4A) alumíniumládák (4B) egyéb fém ládák (4N) közönséges faládák (4C1) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) papírlemez ládák (4G) tömör műanyag ládák (4H2) Hordók acélhordók (1A1, 1A2) alumíniumhordók (1B1, 1B2) egyéb fém hordók (1N1, 1N2) rétegelt falemez hordók (1D) papírlemez hordók (1G) műanyag hordók (1H1, 1H2)
Kiegészítő követelmény: Ha a tárgyak végei zártak, belső csomagolóeszközök nem szükségesek.		

P139 CSOMAGOLÁSI UTASÍTÁS P139		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök
Zsákok műanyagból Tartályok papírlemezből fémből műanyagból fából Orsók Burkolatok papírból műanyagból	Nem szükséges	Ládák acélládák (4A) alumíniumládák (4B) egyéb fém ládák (4N) közönséges faládák (4C1) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) papírlemez ládák (4G) tömör műanyag ládák (4H2) Hordók acélhordók (1A1, 1A2) alumíniumhordók (1B1, 1B2) egyéb fém hordók (1N1, 1N2) rétegelt falemez hordók (1D) papírlemez hordók (1G) műanyag hordók (1H1, 1H2)
Különleges csomagolási előírások: PP71 Az UN 0065, 0102, 0104, 0289 és 0290 estében a robbanózsínórok végeit le kell zárni, pl. szorosan záró dugóval, úgy, hogy a robbanóanyag ne szabadulhasson ki. A hajlékony robbanózsínórok végeit szorosan le kell kötni. PP72 Az UN 0065 és 0289 esetében nem szükségesek belső csomagolóeszközök, ha azok tekercselve vannak.		

<div>P140</div> <div>CSOMAGOLÁSI UTASÍTÁS</div> <div>P140</div>		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök
Zsákok műanyagból Orsók Burkolatok nátronpapírból műanyagból Tartályok fából	Nem szükséges	Ládák acélládák (4A) alumíniumládák (4B) egyéb fém ládák (4N) közönséges faládák (4C1) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) papírlemez ládák (4G) tömör műanyag ládák (4H2) Hordók acélhordók (1A1, 1A2) alumíniumhordók (1B1, 1B2) egyéb fém hordók (1N1, 1N2) rétegelt falemez hordók (1D) papírlemez hordók (1G) műanyag hordók (1H1, 1H2)
Különleges csomagolási előírások: PP73 Az UN 0105 esetében nem szükségesek belső csomagolóeszközök, ha a tárgyak végei zártak. PP74 Az UN 0101 esetében a csomagolóeszköznek portömörnek kell lennie, kivéve, ha a gyújtó papírhüvellyel van burkolva és a hüvely mindkét vége el van látva levehető sapkával. PP75 Az UN 0101 tárgyaihoz acél, alumínium és egyéb fém ládák és hordók nem használhatók.		

<div>P141</div> <div>CSOMAGOLÁSI UTASÍTÁS</div> <div>P141</div>		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök
Tartályok papírlemezből fémből műanyagból fából Tálcák megosztó válaszfalakkal műanyagból fából Megosztó válaszfalak a külső csomagolásban	Nem szükséges	Ládák acélládák (4A) alumíniumládák (4B) egyéb fém ládák (4N) közönséges faládák (4C1) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) papírlemez ládák (4G) tömör műanyag ládák (4H2) Hordók acélhordók (1A1, 1A2) alumíniumhordók (1B1, 1B2) egyéb fém hordók (1N1, 1N2) rétegelt falemez hordók (1D) papírlemez hordók (1G) műanyag hordók (1H1, 1H2)

A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök
Zsákok papírból műanyagból Tartályok papírlémezről fémből műanyagból fából Burkolatok papírból Tálcák megosztó válaszfalakkal műanyagból	Nem szükséges	Ládák acélládák (4A) alumíniumládák (4B) egyéb fém ládák (4N) közönséges faládák (4C1) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) papírlémez ládák (4G) tömör műanyag ládák (4H2) Hordók acélhordók (1A1, 1A2) alumíniumhordók (1B1, 1B2) egyéb fém hordók (1N1, 1N2) rétegelt falemez hordók (1D) papírlémez hordók (1G) műanyag hordók (1H1, 1H2)

<div>P143</div> <div>CSOMAGOLÁSI UTASÍTÁS</div> <div>P143</div>		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök
Zsákok nátronpapírból műanyagból textilszövetből gumibevonatú textilszövetből Tartályok papírlémezről fémből műanyagból fából Tálcák megosztó válaszfalakkal műanyagból fából	Nem szükséges	Ládák acélládák (4A) alumíniumládák (4B) alumíniumládák (4B) egyéb fém ládák (4N) portömör faládák (4C2) rétegelt falemez ládák (4D) farostlemez ládák (4F) papírlémez ládák (4G) tömör műanyag ládák (4H2) Hordók acélhordók (1A1, 1A2) alumíniumhordók (1B1, 1B2) egyéb fém hordók (1N1, 1N2) rétegelt falemez hordók (1D) papírlémez hordók (1G) műanyag hordók (1H1, 1H2)
Kiegészítő követelmény: A fenti belső és külső csomagolóeszközök helyett összetett csomagolóeszköz (6HH2) (műanyag tartály külső tömör műanyag ládával) is használható.		
Különleges csomagolási előírás: PP76 Ha az UN 0271, 0272, 0415 vagy 0491-hez fém csomagolóeszközöket használnak, a fém csomagolóeszközöket úgy kell kialakítani, hogy a belső nyomás belső vagy külső okokból történő növekedése ne okozzon robbanásveszélyt.		

P144	CSOMAGOLÁSI UTASÍTÁS	P144
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.		
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső csomagolóeszközök
Tartályok papírlémezről fémről műanyagból fából Megosztó válaszfalak a külső csomagolásban	Nem szükséges	Ládák acélládák (4A) alumíniumládák (4B) egyéb fém ládák (4N) közönséges faládák (4C1) fém-béléssel rétegelt falemez ládák (4D) fém-béléssel farostlemez ládák (4F) fém-béléssel habosított műanyag ládák (4H1) tömör műanyag ládák (4H2) Hordók acélhordók (1A1, 1A2) alumíniumhordók (1B1, 1B2) egyéb fém hordók (1N1, 1N2) műanyag hordók (1H1, 1H2)
Különleges csomagolási előírás: PP77 Az UN 0248 és 0249-hez használt csomagolásokat védeni kell a víz behatolásával szemben. Ha a vízzel aktiválható szerkezeteket csomagolatlanul szállítják, azokat legalább két, független védőszerkezettel kell ellátni, ami megakadályozza a víz behatolását.		

P200	CSOMAGOLÁSI UTASÍTÁS	P200
<p>A csomagolóeszköz típusa Palack, nagypalack, gázhordó és palackköteg. Palackok, nagypalackok, gázhordók és palackkötegek használhatók, feltéve, hogy a 4.1.6 szakasz különleges csomagolási előírásait és a következő 1) – 11) bekezdés előírásait betartják.</p> <p>Általános előírások</p> <ol style="list-style-type: none"> 1) A tartályokat úgy kell lezárni és tömíteni, hogy megakadályozzák a gáz kiszabadulását. 2) A táblázatok szerint 200 ml/m³ (ppm) vagy annál kisebb LC₅₀ értékkel rendelkező mérgező anyagokat tartalmazó nyomástartó tartályokon nem lehet semmiféle nyomáscsökkentő szerkezet. Az UN 1013 szén-dioxid és az UN 1070 dinitrogén-oxid szállítására használt UN nyomástartó tartályokat nyomáscsökkentő szerkezettel kell ellátni. 3) A következő három táblázat a sűrített gázokra (1 táblázat), a cseppfolyósított és oldott gázokra (2 táblázat) és a nem a 2 osztályba tartozó anyagokra (3 táblázat) vonatkozik. A táblázatokban a következők szerepelnek: <ol style="list-style-type: none"> a) az anyag UN száma, megnevezése és leírása, valamint osztályozási kódja; b) mérgező anyagok esetén az LC₅₀ érték; c) az anyaghoz használható nyomástartó tartály típusa, amit „X” betű jelöl; d) a nyomástartó tartályok időszakos vizsgálatának legnagyobb időköze; <p>Megjegyzés: A kompozit anyagok felhasználásával készült nyomástartó tartályokra az időszakos vizsgálat gyakoriságát annak az illetékes hatóságnak, ill. az általa kijelölt szervezetnek kell meghatároznia, amely a típusjóváhagyást kiadta.</p> <ol style="list-style-type: none"> e) a nyomástartó tartályok legkisebb próbanyomása; f) sűrített gázok tartályainál a legnagyobb üzemi nyomás vagy cseppfolyósított, ill. oldott gázok tartályainál a legnagyobb töltési fok(ok); g) az egyes anyagokra vonatkozó különleges csomagolási előírások. <p>Próbanyomás, töltési fok és töltési előírások</p> <ol style="list-style-type: none"> 4) Az előírt legkisebb próbanyomás 1 MPa (10 bar); 5) A nyomástartó tartályokat semmilyen esetben sem szabad a következő követelmények által meghatározott határoknál nagyobb mértékben megtölteni: <ol style="list-style-type: none"> a) Sűrített gázok esetén az üzemi nyomás nem lehet nagyobb, mint a nyomástartó tartály próbanyomásának kétharmada. Az üzemi nyomás felső határára az „o” különleges csomagolási előírás további korlátozást tartalmaz. A belső nyomás 65 °C-on semmilyen esetben sem haladhatja meg a próbanyomást. b) Nagy nyomáson cseppfolyósított gázok esetén a töltési foknak akkorának kell lennie, hogy az állandósult nyomás 65 °C-on ne haladja meg a nyomástartó tartály próbanyomását. A táblázatban megadottól eltérő próbanyomás és töltési fok is alkalmazható, kivéve ott, ahol az „o” különleges csomagolási előírás szerepel, akkor ha <ol style="list-style-type: none"> i) az „r” különleges csomagolási előírás teljesül, ha az elő van írva; vagy ii) minden más esetben az előző követelmény teljesül. <p>Azoknál a nagy nyomáson cseppfolyósított gázoknál és gázkeverékeknél, amelyekre vonatkozóan nem áll rendelkezésre adat, a legnagyobb töltési fokot (TF) a következő képlettel kell meghatározni:</p> $TF = 8,5 \cdot 10^{-4} \cdot d_g \cdot P_e$ <p>ahol</p> <p>TF = a megengedett legnagyobb töltési fok</p> <p>d_g = a gáz sűrűsége (15 °C-on és 1 bar nyomáson) (kg/m³-ben)</p> <p>P_e = a legkisebb próbanyomás (bar-ban).</p> <p>Ha a gáz sűrűsége nem ismert, a töltési fokot a következő képlettel kell meghatározni:</p> $TF = \frac{P_e \cdot MM \cdot 10^{-3}}{R \cdot 338}$ <p>ahol</p> <p>TF = megengedett legnagyobb töltési fok</p> <p>P_e = a legkisebb próbanyomás (bar-ban)</p> <p>MM = a gáz molekulatömege (g/mol-ban)</p> <p>R = 8,31451 · 10⁻² bar · l · mol⁻¹ · K⁻¹ (gázállandó).</p> <p>Gázkeverékeknél az egyes alkotórészek térfogat arányának figyelembevételével kapott átlagos molekulatömeget kell alkalmazni.</p> 		

P200 (folyt.)	CSOMAGOLÁSI UTASÍTÁS	P200 (folyt.)
	<p>c) Kis nyomáson cseppfolyósított gázoknál a töltési fok (az ürtartalom-literenkénti legnagyobb töltőtömeg) a folyadékfázis 50 °C-on fennálló sűrűségének 0,95-szorosa, ezenkívül a folyadékfázis 60 °C alatt nem töltheti ki teljesen a tartályt. A próbanyomásnak legalább akkorának kell lennie, mint a folyékony anyag 65 °C-on fennálló gőznyomása (abszolút nyomás) mínusz 100 kPa (1 bar).</p> <p>Azoknál a kis nyomáson cseppfolyósított gázoknál és gázkeverékeknél, amelyekre vonatkozóan nem áll rendelkezésre adat, a legnagyobb töltési fokot a következő képlettel kell meghatározni:</p> $TF = (0,0032 \cdot BP - 0,24) \cdot d_l$ <p>ahol</p> <p>TF = a megengedett legnagyobb töltési fok</p> <p>BP = a forráspont (Kelvin fokban)</p> <p>d_l = a folyékony anyag sűrűsége a forrásponton (kg/l-ben).</p> <p>d) Az UN 1001 oldott acetilénre és az UN 3374 oldószermentes acetilénre lásd a 10) bekezdésben a „p” különleges csomagolási előírást.</p> <p>6) Eltérő próbanyomás és töltési fok is alkalmazható, amennyiben az előző 4) és 5) bekezdésben leírt általános követelményeket kielégítik.</p> <p>7) a) A nyomástartó tartályok töltése csak különleges felszereltségű helyeken, szakképzett személyzettel és megfelelő eljárással végezhető.</p> <p>Az eljárásnak ki kell terjednie annak ellenőrzésére, hogy</p> <ul style="list-style-type: none"> – a tartály és szerelvényei megfelelnek a vonatkozó szabályzatoknak; – a szállítandó termékkel összeférhetők; – nincs biztonságot befolyásoló sérülésük; – a töltési fokot, ill. a töltési nyomást betartották; – a feliratok és a jelölések szabályszerűek. <p>b) A palackokba töltendő LPG-nek jó minőségűnek kell lennie; ez teljesítettnek tekinthető, ha a betöltendő LPG megfelel az ISO 9162:1989 szabványban meghatározott, korrózióra vonatkozó határoknak.</p>	
	<p>Időszakos vizsgálat</p> <p>8) Az újratölthető, nyomástartó tartályokat a 6.2.1.6, ill. a 6.2.3.5 bekezdés előírásai szerint kell időszakos vizsgálatnak alávetni.</p> <p>9) Ha valamely anyagra a következő táblázatokban nincs különleges előírás feltüntetve, az időszakos vizsgálatot a következők szerint kell végrehajtani:</p> <p>a) az 1T, 1TF, 1TO, 1TC, 1TFC, 1TOC, 2T, 2TO, 2TF, 2TC, 2TFC, 2TOC, 4A, 4F és 4TC osztályozási kód alá tartozó gázok szállítására szolgáló nyomástartó tartályok esetében 5 évenként;</p> <p>b) a többi osztály anyagainak szállítására szolgáló nyomástartó tartályok esetében 5 évenként;</p> <p>c) az 1A, 1O, 1F, 2A, 2O és 2F osztályozási kód alá tartozó gázok szállítására szolgáló nyomástartó tartályok esetében 10 évenként.</p> <p>E bekezdéstől eltérően a kompozit anyagok felhasználásával készült, nyomástartó tartályok (nyomástartó kompozit tartályok) időszakos vizsgálatát azon illetékes hatóság, ill. az általa kijelölt szervezet által meghatározott időszakonként kell elvégezni, amely a típusjóváhagyást kiadta.</p>	
	<p>Különleges csomagolási előírások</p> <p>10) <i>Az anyagok összeférhetősége</i></p> <p>a: Alumíniumötvözetből készült nyomástartó tartály nem használható.</p> <p>b: Rézből készült szelepek nem használhatók.</p> <p>c: A tartalommal érintkezésbe kerülő fémrészek legfeljebb 65% rezet tartalmazhatnak.</p> <p>d: Acélból készült nyomástartó tartályok csak akkor használhatók, ha a 6.2.2.7.4 pont szerint „H” betű fel van rajtuk tüntetve.</p> <p><i>A 200 ml/m³-nél (ppm-nél) kisebb LC₅₀ értékű anyagokra vonatkozó követelmények</i></p> <p>k: A szelepnnyílásokat nyomástartó, gázzáró dugóval vagy sapkával kell ellátni, amelynek menete illeszkedik a szelepnnyílás menetéhez és ami olyan anyagból készült, amit a nyomástartó tartály tartalma nem támad meg.</p> <p>Egy palackkötegen belül minden palackot saját zárószeleppel kell ellátni, amelyet a szállítás alatt zárva kell tartani. Töltés után a gyűjtőcsövet légteleníteni kell, át kell öblíteni</p>	

P200 (folyt.)	CSOMAGOLÁSI UTASÍTÁS	P200 (folyt.)
	<p>és le kell zárni.</p> <p>Az UN 1045 sűrített fluort tartalmazó palackkötegek palackjainál nem szükséges minden palackot leválasztó szeleppel ellátni, ehelyett elegendő a legfeljebb 150 l összes víztérfogatú palack-csoportokra leválasztó szelepet tenni.</p> <p>A palackoknál, ill. a palackkötegek egyes palackjainál a próbanyomásnak legalább 200 bar-nak kell lennie, és a legkisebb falvastagság alumínium ötvözet esetén 3,5 mm, acél esetén 2 mm lehet. Azok az egyedi palackok, amelyek nem felelnek meg ezeknek a követelményeknek, csak olyan merev, külső csomagolóeszközben szállíthatók, amely az I csomagolási csoport követelményeit kielégíti és kellően megvédi a palackot és szerelvényeit. A gázhordók legkisebb falvastagságát az illetékes hatóságnak kell meghatároznia.</p> <p>A nyomástartó tartályon nem lehet nyomáscsökkentő szerkezet.</p> <p>A palackoknak, ill. a palackkötegek egyes palackjainak a víztérfogata legfeljebb 85 liter lehet.</p> <p>A szelepeknek képesnek kell lenniük a nyomástartó tartály próbanyomásának elviselésére és kúpos menetes csatlakozással vagy az ISO 10692-2:2001 szabvány követelményeit kielégítő más módon közvetlenül a nyomástartó tartályhoz kell csatlakozniuk..</p> <p>A szelepeknek vagy nem perforált membránnal kialakított, tömítés nélküli típusúnak kell lenniük vagy olyannak, ami megakadályozza a tömítésen keresztüli vagy a tömítés melletti szivárgást.</p> <p>Kapszulákban történő szállítás nem engedélyezett.</p> <p>Töltés után minden nyomástartó tartály tömörségét ellenőrizni kell.</p> <p><i>Egyes gázokra vonatkozó előírások</i></p> <p>l: Az UN 1040 etilén-oxid légmentesen zárt üveg vagy fém belső csomagolásokban is szállítható, amelyek párnázóanyag között, az I csomagolási csoportnak megfelelő papírlemez, fa- vagy fémládában vannak. A megengedett legnagyobb mennyiség üveg belső csomagolás esetén 30 g, fém belső csomagolás esetén 200 g. Töltés után minden belső csomagolás tömörségét forróvizet fürdőbe mártva olyan hőmérsékleten és időtartamig kell vizsgálni, ami elegendő ahhoz, hogy a belső nyomás elérje az etilén-oxid 55 °C-on fennálló gőznyomását. Egy külső csomagolásban a legnagyobb nettó tömeg legfeljebb 2,5 kg lehet.</p> <p>m: A nyomástartó tartályokat úgy kell megtölteni, hogy az üzemi nyomás ne haladja meg az 5 bar-t.</p> <p>n: A palackok, ill. a palackköteg egyes palackjai legfeljebb 5 kg gázt tartalmazhatnak. Ha az UN 1045 sűrített fluort tartalmazó palackköteg a „k” különleges csomagolási előírás szerint palack-csoportokra van osztva, egy csoport legfeljebb 5 kg gázt tartalmazhat.</p> <p>o: Az üzemi nyomás, ill. a töltési fok semmi esetre sem haladhatja meg a táblázatban feltüntetett értéket.</p> <p>p: UN 1001 oldott acetilén és az UN 3374 oldószermentes acetilén esetén a palackokat homogén, monolit, porózus anyaggal kell kitölteni; az üzemi nyomás és az acetilén mennyisége nem haladhatja meg a jóváhagyásban meghatározott vagy az ISO 3807-1:2000, ill. az ISO 3807-2:2000 szabványban szereplő értéket.</p> <p>UN 1001 oldott acetilén esetén a palacknak a jóváhagyásban meghatározott mennyiségű acetont vagy más alkalmas oldószert kell tartalmaznia (lásd az ISO 3807-1:2000, ill. az ISO 3807-2:2000 szabványt); a nyomáscsökkentő szerkezettel ellátott és az összekapcsolt palackokat függőleges helyzetben kell szállítani.</p> <p>Alternatívaként az UN 1001 oldott acetilénhez használt olyan palack, amely nem UN nyomástartó tartály, nem monolit, porózus anyaggal is megtölthető; az üzemi nyomás, az acetilén és az oldószer mennyisége nem haladhatja meg az engedélyben előírt értéket. A palack időszakos vizsgálatának időköze legfeljebb öt év lehet.</p> <p>Az 52 bar próbanyomást csak az ISO 3807-2:2000 szabványnak megfelelő palackokra kell alkalmazni.</p> <p>q: A piroforos gázokhoz és az 1%-nál több piroforos alkotórészt tartalmazó, gyúlékony gázkeverékekhez használt nyomástartó tartályok szelepníllásait nyomástartó, gázzáró dugóval vagy sapkával kell ellátni, ami olyan anyagból készült, amit a nyomástartó tartály tartalma nem támad meg. Ha a nyomástartó tartályok palackköteget képeznek, minden egyes tartályt saját szeleppel kell ellátni, amit a szállítás alatt zárva kell tartani, és a gyűjtőcső vezeték</p>	

P200 (folyt.)	CSOMAGOLÁSI UTASÍTÁS	P200 (folyt.)
	<p>kimenő szelepnnyílásait nyomástartó, gázzáró dugóval vagy sapkával kell ellátni. A gázzáró dugó vagy sapka menetének illeszkednie kell a szelepnnyílás menetéhez. Kapszulákban történő szállítás nem engedélyezett.</p>	
r:	A gáz töltési fokát úgy kell korlátozni, hogy a nyomás a gáz teljes elbomlása esetén sem lehet nagyobb, mint a nyomástartó tartály próbanyomásának kétharmada.	
ra:	<p>Ez a gáz következő feltételek mellett kapszulákba is tölthető:</p> <ol style="list-style-type: none"> a gáz mennyisége nem haladhatja meg a 150 g-ot kapszulánként; a kapszuláknak mentesnek kell lenniük az olyan hibáktól, amelyek ellenállóképességüket csökkenthetnék; a zárás tömörségét kiegészítő szerkezettel (kupakkal, sapkával, lehegesztéssel, lekötéssel stb.) kell biztosítani, ami alkalmas a zárórendszer szállítás alatti tömítetlenné válásának megakadályozására; a kapszulákat kielégítő szilárdságú külső csomagolásba kell helyezni. Egy küldeménydarab tömege nem lehet 75 kg-nál nagyobb. 	
s:	<p>Az alumíniumötvözet nyomástartó tartályokat:</p> <ul style="list-style-type: none"> csak réz vagy rozsdamentes acél szelepekkel szabad ellátni; és a szénhidrogén szennyeződéstől meg kell tisztítani és nem lehetnek olajjal szennyezettek. Az UN nyomástartó tartályokat az ISO 11621:1997 szerint kell kitisztítani. 	
ta:	<p>Az UN 1965 számú anyagok szállítására használt, hegesztett acélpalackokra eltérő feltételek alkalmazhatók</p> <ol style="list-style-type: none"> azon országok illetékes hatóságának egyetértésével, ahol a szállítás történik; és az illetékes hatóság által elismert belföldi műszaki szabályzat vagy nemzeti szabvány előírásainak megfelelően. <p>Ha a töltési feltételek eltérőek a P200 5) bekezdésben meghatározottaktól, a fuvarokmányba a következő bejegyzést kell tenni: „A P200 csomagolási utasítás „ta” különleges előírása szerinti szállítás” és fel kell tüntetni a töltési fok számításához használt referencia hőmérsékletet.</p>	
	<p>Időszakos vizsgálat</p>	
u:	<p>Az alumíniumötvözet nyomástartó tartályoknál az időszakos vizsgálatok időköze 10 évre növelhető. Ez az eltérés az UN nyomástartó tartályokra csak akkor alkalmazható, ha az ötvözetet, amelyből a nyomástartó tartály készült, alávetették az ISO 7866:1999 szabvány szerinti feszültségkorróziós vizsgálatnak.</p>	
v:	<p>1) Az időszakos vizsgálatok időköze acélpalackok esetén, az UN 1011, 1075, 1965, 1969, ill. 1978 tételekhez használt utántölthető, hegesztett acélpalackok kivételével, 15 évre növelhető:</p> <ol style="list-style-type: none"> azon ország(ok) illetékes hatóságának (hatóságainak) egyetértésével, amely(ek)ben az időszakos vizsgálatokat végzik és a szállítás történik, és az illetékes hatóság által elismert műszaki szabályzat vagy szabvány előírásainak megfelelően. <p>2) Az UN 1011, 1075, 1965, 1969, ill. 1978 tételekhez használt utántölthető, hegesztett acélpalackok esetén az időköz 15 évre növelhető, ha ezen csomagolási utasítás 12) bekezdésének előírásait alkalmazzák</p>	
	<p><i>Az m.n.n. tételekre és a keverékekre vonatkozó követelmények</i></p>	
z:	<p>A nyomástartó tartály és szerelvényei anyagának a tartalommal összeférhetőnek kell lennie és nem képezhet azzal ártalmas vagy veszélyes vegyületeket.</p> <p>A próbanyomást és a töltési fokot az 5) bekezdés vonatkozó követelményei szerint kell kiszámítani.</p> <p>A 200 ml/m³ vagy annál kisebb LC₅₀ értékkel bíró mérgező gázokra és gázkeverékekre a „k” különleges előírás követelményeit kell betartani, az ilyen gázok szállítása nagypalackban, gázhordóban, ill. MEG-konténerben nem engedélyezett, kivéve az UN 1975 nirogén-monoxid és dinitrogén-tetroxid keverékét, amely gázhordóban szállítható.</p> <p>A piroforos gázokhoz vagy 1%-nál több piroforos vegyületet tartalmazó gyúlékony gázkeverékekhez használt nyomástartó tartályoknak a „q” különleges csomagolási előírás követelményeinek kell megfelelniük.</p> <p>Meg kell tenni a szükséges intézkedéseket a szállítás alatt a veszélyes reakciók (pl. polime-</p>	

P200 (folyt.)	CSOMAGOLÁSI UTASÍTÁS		P200 (folyt.)
<p>rizáció, bomlás) elkerülésére. Szükség esetén stabilizátorokat vagy inhibitorokat kell a gázhoz adni.</p> <p>Az UN 1911 diboránt tartalmazó keverékeket olyan nyomásig kell betölteni, hogy ha a diborán teljes bomlása bekövetkezik, a nyomás ne múlja felül a nyomástartó tartály próbanyomásának kétharmadát.</p> <p>Az UN 2192 germánt tartalmazó keverékek (kivéve a legfeljebb 35% germántartalmú, hidrogént vagy nitrogént tartalmazó keverékeket, valamint a legfeljebb 28% germántartalmú, héliumot vagy argont tartalmazó keverékeket) csak addig szabad tölteni, hogy a nyomás a germán teljes elbomlása esetén se legyen nagyobb, mint a nyomástartó tartály próbanyomásának kétharmada.</p> <p><i>A nem a 2 osztályba tartozó anyagokra vonatkozó követelmények</i></p> <p>ab: A nyomástartó tartályoknak a következő feltételeket kell kielégíteniük:</p> <ul style="list-style-type: none">i) a nyomáspróba alkalmával a nyomástartó tartály belsejét és a szerelvényeket is meg kell vizsgálni;ii) a tartály korrózióállóságát két évente alkalmas (pl. ultrahangos) készülékkel meg kell vizsgálni és ellenőrizni kell a szerelvények állapotát;iii) a falvastagság nem lehet 3 mm-nél kisebb. <p>ac: A vizsgálatokat az illetékes hatóság által elismert szakértő felügyelete mellett kell végezni.</p> <p>ad: A nyomástartó tartályoknak a következő feltételeket kell kielégíteniük:</p> <ul style="list-style-type: none">i) a nyomástartó tartályokat legalább 2,1 MPa (21 bar) (túlnyomás) tervezési nyomásra kell méretezni;ii) az újratölthető tartályokon feltüntetendő jelölésen kívül a nyomástartó tartályokon jól látható és tartós módon fel kell tüntetni a következőket:<ul style="list-style-type: none">– az anyag UN számát és helyes szállítási megnevezését a 3.1.2 szakasz szerint;– a töltet engedélyezett legnagyobb tömegét és a tartály tara tömegét, beleértve a töltés alatt rajta levő szerelvényeket, vagy a bruttó tömeget. <p>11) Ezen csomagolási utasítás követelményei a következő szabványok értelemszerű alkalmazása esetén teljesítettnek tekinthetők:</p>

12)	<p>Az utántölthető, hegesztett acélpalackok időszakos vizsgálatára a 10) bekezdés „v” különleges csomagolási előírás 2) pontja szerinti 15 éves időköz akkor alkalmazható, ha a következő előírásokat betartják.</p> <ol style="list-style-type: none"> 1. Általános előírások <ol style="list-style-type: none"> 1.1 Ezen szakasz alkalmazásához az illetékes hatóság nem ruházhatja át feladatait és köteleseit Xb szervezetre (B típusú vizsgáló szervezetre) vagy IS szervezetre (üzemi vizsgáló szervezetre). 1.2 A palackok tulajdonosának kérelmeznie kell az illetékes hatóságtól a 15 éves időköz engedélyezését, és bizonyítania kell, hogy a 2., 3. és 4. pont előírásait beartotta. 1.3 Az 1999. január 1-je óta gyártott palackokat a következő szabványok szerint gyártották: <ul style="list-style-type: none"> – EN 1442; vagy – EN 13322-1; vagy – a Tanács 84/527/EGK^{a)} Irányelve Mellékletének 1 – 3 része ahogy azt az ADR 6.2.4 szakasz táblázata előírja. Az illetékes nemzeti hatóság által elfogadott műszaki szabályzat alapján az ADR-nek megfelelően 2009. január 1-je előtt gyártott többi palacknál is elfogadható a 15 éves időköz, ha azok az alkalmazás időpontjában érvényes ADR előírásaival azonos mértékben biztonságosak. 1.4 A tulajdonosnak dokumentált bizonyítékot kell benyújtania az illetékes hatóságnak, bemutatva, hogy a palackok megfelelnek az 1.3 pont előírásainak. Az illetékes hatóságnak ellenőriznie kell ezen feltételek teljesülését. 1.5 Az illetékes hatóságnak ellenőriznie kell, hogy a 2. és 3. pont előírásait teljesítették és helyesen alkalmazták. Ha minden előírás teljesült, engedélyeznie kell a palackokra a 15 éves vizsgálati időközt. Ebben az engedélyben egyértelműen azonosítani kell a palackok típusát (amint az a típusjövahagyásban meg van határozva) vagy a palackcsoportot (lásd a megjegyzést). Az engedélyt át kell adni a tulajdonosnak; az illetékes hatóságnak az engedély másolatát meg kell őriznie. A tulajdonosnak a dokumentumokat mindaddig meg kell őriznie, amíg a palackokra a 15 éves időszak engedélyezett. <p>Megjegyzés: <i>A palackcsoportot a gyártási időpont alapján azok a palackok alkotják, amelyeket egy időintervallumon belül gyártottak, amely alatt az ADR és az illetékes hatóság által elfogadott műszaki szabályzat alkalmazható előírásai műszaki tartalmuk tekintetében nem változtak meg. Például: azok az azonos konstrukciójú és űrtartalmú palackok, amelyeket az ADR 1985. január 1-je és 1988. december 31-e között érvényes előírásai és az illetékes hatóság által elfogadott műszaki szabályzat ugyanezen időszakban alkalmazható előírásai szerint gyártottak, ezen pont előírásai értelmében egy csoportot alkotnak.</i></p> <ol style="list-style-type: none"> 1.6 A illetékes hatóságnak megfelelő időközönként, de legalább három évenként, ill. ha az eljárásban változás következett be, ellenőriznie kell, hogy a palack tulajdonosa megfelel-e az ADR előírásoknak és a kiadott engedélynek. 2. Üzemeltetési előírások <ol style="list-style-type: none"> 2.1 Azok a palackok, amelyeknek az időszakos vizsgálatára 15 éves időköz engedélyezett, csak olyan töltőüzemben tölthetők, amely dokumentált minőségbiztosítási rendszert alkalmaz annak biztosítására, hogy ezen csomagolási utasítás 7) bekezdésének minden előírását és az EN 1439:2008 szabvány előírásait és felelősségi követelményeit helyesen alkalmazzák és betartják. 2.2 Az illetékes hatóságnak megfelelő időközönként, de legalább három évenként, ill. ha az eljárásban változás következett be, ellenőriznie kell, hogy ezeket a követelményeket kielégítik. 	

a) Az 1984. szeptember 17-i Tanácsi Irányelv a tagállamoknak a hegesztett kivitelű ötvözetlen acél gázpalackokra vonatkozó jogszabályi közelítéséről (az EK Hivatalos Lapja, L 300, 1984.11.19.)

P200 (folyt.)	CSOMAGOLÁSI UTASÍTÁS	P200 (folyt.)
2.3	A tulajdonosnak dokumentált bizonyítékot kell az illetékes hatóság rendelkezésére bocsátania arra nézve, hogy a töltőüzem megfelel a 2.1 pont előírásainak.	
2.4	Ha a töltőüzem egy másik ADR Szerződő Fél területén van, a tulajdonosnak további dokumentált bizonyítékot kell adnia arra nézve, hogy a töltőüzemet a másik ADR Szerződő Fél illetékes hatósága megfelelő módon ellenőrzi.	
2.5	A belső korrózió megelőzésére a palackokba csak jó minőségű gázok tölthetők, amelyeknél nagyon csekély a szennyeződés valószínűsége. Ez a követelmény teljesítettnek tekinthető, ha a gáz megfelel az ISO 9162:1989 szabványban meghatározott, a korrózióra vonatkozó határoknak.	
3.	Előírások a minősítésre és az időszakos vizsgálatra	
3.1	A meglévő típusú vagy csoportba tartozó palackokat, amelyekre a 15 éves időköz engedélyezett és amelyekre a 15 éves időközt alkalmazzák is, a 6.2.3.5 bekezdés szerinti időszakos vizsgálatnak kell alávetni.	
	<i>Megjegyzés: A palackok csoportjának meghatározására lásd az 1.5 alponthoz fűzött megjegyzést.</i>	
3.2	Ha egy a 15 éves időközű palack az időszakos vizsgálat során nem viseli el a hidraulikus nyomáspróbát (pl. felhasad vagy szivárog), a tulajdonosnak meg kell vizsgálnia és jegyzőkönyvben kell rögzítenie a meghibásodás okát és hogy más palackok (pl. ugyanazon típusú vagy csoportba tartozó) is érintettek-e. Utóbbi esetben a tulajdonosnak erről tájékoztatnia kell az illetékes hatóságot. Az illetékes hatóságnak azután döntenie kell a megfelelő intézkedésekről, és erről minden ADR Szerződő Fél illetékes hatóságát értesítenie kell.	
3.3	Ha az alkalmazott szabványban (lásd az 1.3 pontot) meghatározott belső korróziót tapasztalnak, a palackot ki kell vonni a használatból és nem adható további időköz sem a töltésre, sem a szállításra.	
3.4	A 15 éves időközű palackok csak az EN 13152:2001 + A1:2003 vagy az EN 13153:2001 + A1:2003 szabvány szerint legalább 15 éves használatra tervezett és gyártott szelepekkel láthatók el. Az időszakos vizsgálat után a palackokat új szelepekkel kell ellátni, kivéve, hogy az EN 14912:2005 szabvány szerint felújított vagy bevizsgált kézi működtetésű szelepek ismételten visszahelyezhetők, ha további 15 év használatra alkalmasak. A felújítást vagy vizsgálatot csak a szelepek gyártója vagy műszaki útmutatása alapján az ilyen munkára minősített és dokumentált minőségbiztosítási rendszert működtető vállalkozás végezheti.	
4.	Jelölés	
	Azokat a palackokat, amelyeknek az időszakos vizsgálatára e bekezdés szerint 15 éves időköz engedélyezett, kiegészítésként jól látható módon és olvashatóan el kell látni a „P15Y” jelöléssel. Ezt a jelölést el kell távolítani, ha a palackokra a továbbiakban nem engedélyezett a 15 éves időköz.	
	<i>Megjegyzés: Ezt a jelölést nem kell felvinni az 1.6.2.9, az 1.6.2.10 átmeneti előírások, ill. az ezen csomagolási utasítás 10) bekezdés „v” különleges csomagolási előírása 1) pontja hatálya alá tartozó palackokra.</i>

P201	CSOMAGOLÁSI UTASÍTÁS	P201
Ezt az utasítást az UN 3167, 3168 és 3169 tétel anyagaira kell alkalmazni.		
A következő csomagolóeszközök használhatók:		
1) Az illetékes hatóság által jóváhagyott gyártási, vizsgálati és töltési előírásoknak megfelelő palackok és gáztartályok;		
2) A következő kombinált csomagolások, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:		
Külső csomagolóeszközök:		
Hordók (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G);		
Ládák (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2);		
Kannák (3A1, 3A2, 3B1, 3B2, 3H1, 3H2);		
Belső csomagolóeszközök:		
a) nem mérgező gázokhoz: légmentesen zárt üveg vagy fém belső csomagolóeszköz; küldeménydarabonként legfeljebb 5 liter ürtartalomig;		
b) mérgező gázokhoz: légmentesen zárt üveg vagy fém belső csomagolóeszköz; küldeménydarabonként legfeljebb 1 liter ürtartalomig.		
A csomagolóeszközöknek a III csomagolási csoport igénybevételi szintjének kell megfelelniük.		

P202	CSOMAGOLÁSI UTASÍTÁS	P202
(fenntartva)		

P203	CSOMAGOLÁSI UTASÍTÁS	P203
Ezt az utasítást a 2 osztály mélyhűtött, cseppfolyósított gázaira kell alkalmazni.		
Előírások a zárt mélyhűtő tartályokra		
1)	A 4.1.6 szakasz különleges csomagolási előírásait be kell tartani.	
2)	A 6.2 fejezet előírásait be kell tartani..	
3)	A zárt mélyhűtő tartályokat úgy kell szigetelni, hogy felületükön ne képződjön dér.	
4)	Próbanyomás A mélyhűtött, cseppfolyósított anyagokat olyan zárt mélyhűtő tartályba kell tölteni, amelynek legkisebb próbanyomása a következő: a) vákuumszigeteléssel ellátott zárt mélyhűtő tartály esetén a próbanyomás nem lehet kisebb, mint a megtöltött tartály legnagyobb belső nyomása – figyelembe véve a töltés, ill. az ürítés során kialakuló nyomást – és 100 kPa (1 bar) nyomás összegének 1,3-szerese; b) egyéb zárt mélyhűtő tartály esetén a próbanyomás nem lehet kisebb, mint a megtöltött tartály legnagyobb belső nyomásának – figyelembe véve a töltés, ill. az ürítés során kialakuló nyomást – 1,3-szerese;	
5)	Töltési fok Nem gyúlékony, nem mérgező (3A és 3O osztályozási kódú) mélyhűtött, cseppfolyósított gázok esetén a folyékony fázis térfogata a töltési hőmérsékleten és 100 kPa (1 bar) nyomáson ne haladja meg a nyomástartó tartály víztérfogatának 98%-át. Gyúlékony (3F osztályozási kódú) mélyhűtött, cseppfolyósított gázoknál a töltési fokot úgy kell meghatározni, hogy a tartalom olyan hőmérsékletre történő felmelegedése estén, amelyen a gőznyomás megegyezik a biztonsági szelep nyitónyomásával, a folyékony fázis térfogata ne haladja meg a nyomástartó tartály víztérfogatának 98%-át ezen a hőmérsékleten.	
6)	Nyomáscsökkentő szerkezetek A zárt mélyhűtő tartályokat el kell látni legalább egy nyomáscsökkentő szerkezettel.	
7)	Összeférhetőség Az illesztések tömítéséhez, ill. a zárószerkezetek karbantartásához felhasznált anyagoknak összeférhetőeknek kell lenniük a tartalommal. Gyújtó hatású (3O osztályozási kódú) gázok szállítására szolgáló tartályoknál ezek az anyagok nem reagálhatnak veszélyesen a gázokkal .	
8)	Időszakos vizsgálat A nyomáscsökkentő szelepek 6.2.1.6.3 pont szerinti időszakos vizsgálatát legalább 5 évente el kell végezni.	
Előírások a nyitott mélyhűtő tartályokra:		
Nyitott mélyhűtő tartályokban csak a 3A osztályozási kód alá tartozó következő nem gyújtóhatású, mélyhűtött, cseppfolyósított gázok szállíthatók: UN 1913, 1951, 1963, 1970, 1977, 2591, 3136 és 3158. A nyitott mélyhűtő tartályokat úgy kell kialakítani, hogy megfeleljenek a következő követelményeknek.		
1)	A tartályokat úgy kell tervezni, gyártani, vizsgálni és felszerelni, hogy ellenálljanak azoknak a körülményeknek, beleértve a kifáradást is, amelyeknek a normális használati és szokásos szállítási feltételek között ki vannak téve.	
2)	Az ürtartalom nem haladhatja meg a 450 litert.	
3)	A tartályok kettős falúnak kell lennie, ahol a külső és a belső fal közötti tér légmentes (vákuumszigetelés). A szigetelésnek meg kell akadályoznia a tartály külső felületén a dér lecsapódását.	
4)	A gyártási anyagoknak a felhasználási hőmérsékleten megfelelő mechanikai tulajdonságokkal kell rendelkezniük.	
5)	Az anyagok, amelyek a veszélyes áruval közvetlenül érintkeznek, csak olyanok lehetnek, amelyeket a szállítandó veszélyes áru nem támad meg, ill. nem gyengít, és amelyek nem fejtenek ki veszélyes hatást, pl. reakció katalizálást vagy a veszélyes áruval való reakciót.	
6)	A kettős falú üvegtartályokat alkalmas párnázóanyaggal vagy nedvszívó anyaggal körülvéve külső csomagolásba kell helyezni, amely képes a szokásos szállítási körülmények között fellépő lökéseknek és nyomásoknak ellenállni.	
7)	A tartályokat úgy kell kialakítani, hogy a szállítás alatt álló helyzetben maradjanak, pl. olyan alapjuk legyen, amelynek legkisebb vízszintes irányú mérete nagyobb, mint a teljesen megtöltött tartály tömegközéppont magassága, vagy legyenek tartókeretbe rögzítve.	
8)	A tartályok nyílásait gázáteresztő szerkezettel kell ellátni, ami a folyadék kifröccsenését megakadályozza és olyan kialakítású, hogy a szállítás során a helyén marad.	

P203 (folyt.)	CSOMAGOLÁSI UTASÍTÁS	P203 (folyt.)
9)	<p>A nyitott mélyhűtő tartályokat a következő tartósan, pl. beütéssel, véséssel vagy maratással felvitt jelölésekkel kell ellátni:</p> <ul style="list-style-type: none"> – a gyártó neve és címe; – a típus száma vagy neve – a sorozatszám vagy tételszám; – azon gázok UN száma és helyes szállítási megnevezése, amelyekhez a tartály felhasználható; – a tartály űrtartalma literben. 	

P204	CSOMAGOLÁSI UTASÍTÁS	P204
	(törölve)	

P205	CSOMAGOLÁSI UTASÍTÁS	P205
	<p>Ezt a csomagolási utasítást az UN 3468 tételre kell alkalmazni</p> <ol style="list-style-type: none"> 1) A fémhidrid tárolórendszereknél a 4.1.6 szakasz különleges csomagolási előírásait be kell tartani 2) Ez a csomagolási utasítás csak a legfeljebb 150 liter víztérfogatú és legfeljebb 25 MPa kifejtett nyomást elviselő nyomástartó tartályokra vonatkozik. 3) A 6.2 fejezetnek a gázt tartalmazó nyomástartó tartályok gyártására és vizsgálatára vonatkozó előírásainak megfelelő fémhidrid tárolórendszerek kizárólag hidrogén szállítására engedélyezettek. 4) Ha acél nyomástartó tartályokat vagy acélbélésű kompozit nyomástartó tartályokat használnak, ezek csak olyanok lehetnek, amelyen a 6.2.2.9.2 j) pont szerint „H” jel van. 5) A fémhidrid tárolórendszereknek meg kell felelniük az ISO 16111:2008 (Szállítható gáztároló eszközök – Reverzibilis fémhidridben abszorbeált hidrogén) szabványban meghatározott üzemelési feltételeknek, tervezési kritériumoknak, névleges kapacitásnak, típusvizsgálatoknak, gyártási tétel vizsgálatoknak, rutin vizsgálatoknak, próbanyomásnak, névleges töltőnyomásnak és a nyomáscsökkentő szerkezetekre vonatkozó előírásoknak, valamint megfelelőségüket és jóváhagyásukat a 6.2.2.5 bekezdés szerint kell értékelni. 6) A fémhidrid tárolórendszereket legfeljebb akkora nyomással szabad hidrogénnal feltölteni, mint a névleges töltőnyomás, amely az ISO 16111:2008 szabvány szerint a rendszer tartós jelölésén fel van tüntetve. 7) A fémhidrid tárolórendszereknél az időszakos vizsgálatra vonatkozó előírásoknak meg kell felelniük az ISO 16111:2008 szabványnak, az időszakos vizsgálatokat a 6.2.2.6 bekezdés szerint kell végrehajtani, időközük legfeljebb öt év lehet. 	

P206	CSOMAGOLÁSI UTASÍTÁS	P206
Ezt a csomagolási utasítást az UN 3500, 3501, 3502, 3503, 3504 és 3505 tételre kell alkalmazni.		
Hacsak az ADR-ben nincs másként előírva, a 6.2 fejezet vonatkozó követelményeinek megfelelő palackok és gázhordók használhatók.		
1) A 4.1.6 szakasz különleges csomagolási előírásait be kell tartani. 2) Az időszakos vizsgálatok legnagyobb időköze 5 év lehet. 3) A palackokat és a gázhordókat úgy kell megtölteni, hogy a nem-gáz fázis 50 °C-on ne haladja meg víztérfogatuk 95%-át, és 60 °C-on se legyenek teljesen megtöltve. Töltött állapotban, 65 °C-on a belső nyomás nem lehet nagyobb, mint a palack vagy a gázhordó próbanyomása. A palackban vagy gázhordóban levő minden anyag gőznyomását és hőtágulását figyelembe kell venni. 4) A legkisebb próbanyomásnak meg kell egyeznie a P200 csomagolási utasításban a hajtóanyagra megadott próbanyomással, de nem lehet 20 bar-nál kevesebb.		
Kiegészítő követelmény: A palackokat és a gázhordókat nem szabad úgy szállításra feladni, ha porlasztó szerkezettel, pl. tömlővel és szórófejjel vannak összekötve.		
Különleges csomagolási előírás: PP89 Az UN 3501, 3502, 3503, 3504 és 3505 tételekhez használt nem újratölthető palackok literben kifejezett víztérfogata – a 4.1.6.9 bekezdés b) pontjától eltérően – az 1000 l és a bar-ban kifejezett próbanyomás hányadosánál nem lehet nagyobb, feltéve, hogy a gyártási előírások szerinti ürtartalom és nyomás korlátozás megfelel az ISO 11118:1999 szabványnak, ami szerint az ürtartalom legfeljebb 50 l lehet.		

P207	CSOMAGOLÁSI UTASÍTÁS	P207
Ezt a csomagolási utasítást az UN 1950 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:		
a) Hordók (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G); Ládák (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2); A csomagolóeszközöknek a II csomagolási csoport igénybevételi szintjének kell megfelelniük. b) Merev külső csomagolóeszközök a következő legnagyobb nettó tömeggel: papírlemezből 55 kg egyéb anyagból (nem papírlemezből) 125 kg A 4.1.1.3 bekezdés előírásait nem kell betartani.		
A csomagolóeszközöket úgy kell tervezni és gyártani, hogy normális szállítási feltételek között az aeroszolok elmozdulását és nem szándékos működésbe lépését megakadályozza.		
Különleges csomagolási előírások: PP87 A 327 különleges előírás szerint szállított, UN 1950 hulladék aeroszol csomagolások esetén a csomagolóeszközt a szállítás alatt esetleg szabaddá váló folyadék visszatartására alkalmas eszközzel (pl. nedvszívóanyaggal) kell ellátni. A csomagolóeszközt megfelelően szellőztetni kell, hogy nyomásnövekedés vagy gyúlékony légkör ne alakulhasson ki.		
Csak a RID és az ADR szerinti szállításhoz érvényes különleges csomagolási előírás: RR6 Az UN 1950 tétel teljes rakományként való szállítása esetén a fémből készült tárgyakat a következőképpen is lehet csomagolni: a tárgyakat alátétre helyezve, alkalmas műanyag fóliával burkolva – amely a megfelelő helyzetben rögzíti – egységekké kell összefogni. Ezeket az egységeket rakodólapon egymásra kell helyezni, és megfelelően rögzíteni kell.		

P208	CSOMAGOLÁSI UTASÍTÁS	P208
Ezt a csomagolási utasítást az UN 3150 kisméretű eszközök szénhidrogén-gáz töltettel vagy szénhidrogén-gáz utántöltő patronok kisméretű eszközökhöz tételhez kell alkalmazni.		
1)	A 4.1.6 szakasz vonatkozó különleges csomagolási utasításait be kell tartani.	
2)	A tárgyaknak meg kell felelniük azon ország előírásainak, ahol töltötték.	
3)	Ezeket az eszközöket és utántöltő patronokat a 6.1.4 szakasz szerinti külső csomagolásokba kell helyezni, amelyeket a 6.1 fejezet szerint a II csomagolási csoportra vizsgáltak és hagytak jóvá.	

P300	CSOMAGOLÁSI UTASÍTÁS	P300
Ezt a csomagolási utasítást az UN 3064 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják: Egyenként legfeljebb 1 liter űrtartalmú belső fémdobozokból és külső faladából (4C1, 4C2, 4D vagy 4F) álló kombinált csomagolások, amelyek legfeljebb 5 liter oldatot tartalmaznak.		
Kiegészítő követelmények:		
1.	A fémdobozokat teljesen körül kell venni nedvszívó párnázóanyaggal.	
2.	A faladákat teljesen ki kell bélelni a víz és a nitroglicerín áthatolásával szemben ellenálló, alkalmas anyaggal.	

P301	CSOMAGOLÁSI UTASÍTÁS	P301
Ezt a csomagolási utasítást az UN 3165 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:		
1)	<p>Csőből gyártott és hegesztett fenekekkel kialakított nyomásálló alumíniumtartály</p> <p>A tartályon belül a folyadék megtartó résznek legfeljebb 46 liter térfogattal rendelkező, hegesztett alumínium (monoblokk) belső tartályból kell állnia.</p> <p>A külső tartály legkisebb tervezési nyomásának 1275 kPa-nak, legkisebb repesztőnyomásának 2755 kPa-nak kell lennie.</p> <p>Minden egyes tartályt a gyártás során és a szállítás előtt szivárgás szempontjából meg kell vizsgálni és szivárgásmentesnek kell lennie.</p> <p>A komplett egységet nem éghető párnázóanyag, pl. csillám közé erős, szorosan zárt külső fém csomagolóeszközbe kell biztonságosan csomagolni, amely megfelelően védi az összes szerelvényt.</p> <p>Az egységenkénti és küldeménydarabonkénti folyadékmennyiség legfeljebb 42 liter lehet.</p>	
2)	<p>Nyomásálló alumíniumtartály</p> <p>A tartályon belül a folyadék megtartó résznek legfeljebb 46 liter térfogattal rendelkező, fűvott műanyag belső tartályból kell állnia.</p> <p>A nyomásálló tartály legkisebb tervezési nyomásának 2860 kPa-nak, legkisebb repesztőnyomásának 5170 kPa-nak kell lennie.</p> <p>Minden egyes tartályt a gyártás során és a szállítás előtt szivárgás szempontjából meg kell vizsgálni és szivárgásmentesnek kell lennie.</p> <p>A komplett egységet nem éghető párnázóanyag, pl. csillám közé erős, szorosan zárt külső fém csomagolóeszközbe kell biztonságosan csomagolni, amely megfelelően védi az összes szerelvényt.</p> <p>Az egységenkénti és küldeménydarabonkénti folyadék mennyiség legfeljebb 42 liter lehet.</p>	

P302	CSOMAGOLÁSI UTASÍTÁS	P302
Ezt a csomagolási utasítást az UN 3269 tételre kell alkalmazni.		
A következő kombinált csomagolások használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:		
Külső csomagolóeszközök:		
Hordók (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G);		
Ládák (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2);		
Kannák (3A1, 3A2, 3B1, 3B2, 3H1, 3H2);		
Belső csomagolóeszközök:		
Az aktiváló anyag (szerves peroxid) mennyisége belső csomagolásonként folyékony anyag esetén legfeljebb 125 ml, szilárd anyag esetén legfeljebb 500 g lehet.		
Az alapanyagot és az aktiváló anyagot külön-külön kell belső csomagolásokba helyezni.		
A komponensek ugyanabba a külső csomagolásba helyezhetők, amennyiben kifolyás esetén nem reagálnak egymással veszélyesen.		
A csomagolóeszközöknek az alapanyagra vonatkozóan a 3 osztály kritériumai szerint a II vagy a III csomagolási csoport igénybevételi szintjének kell megfelelniük.		

P400	CSOMAGOLÁSI UTASÍTÁS	P400
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:		
1) Nyomástartó tartályok, feltéve, hogy a 4.1.3.6 bekezdés általános előírásait betartják. Csak acélból készült tartályok használhatók, amelyeket üzembe helyezés előtt és azután 10 évente időszakosan legalább 1 MPa (10 bar) nyomással (túlnyomással) kell vizsgálni. Szállítás alatt a folyadéknak inert gázréteg alatt kell lennie, amelynek túlnyomása nem lehet 20 kPa-nál (0,2 bar-nál) kevesebb.		
2) Olyan ládák (4A, 4B, 4N, 4C1, 4C2, 4D, 4F vagy 4G), hordók (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1D vagy 1G) vagy kannák (3A1, 3A2, 3B1 vagy 3B2), amelyekben légmentesen zárt fémdobozokba helyezett, legfeljebb 1 liter űrtartalmú, tömítéssel rendelkező, menetes zárószerkezettel ellátott üveg vagy fém belső csomagolóeszközök vannak. A belső csomagolóeszközt minden oldalról száraz, nem éghető, nedvszívó anyaggal kell párnázni, amely párnázóanyagnak elegendőnek kell lennie a teljes tartalom felszívására. A belső csomagolóeszközöket legfeljebb űrtartalmuk 90%-áig szabad megtölteni. A külső csomagolóeszköz legfeljebb 125 kg nettó tömeget tartalmazhat.		
3) Legfeljebb 150 kg nettó tömeget tartalmazó acél, alumínium vagy egyéb fémhordók (1A1, 1A2, 1B1, 1B2, 1N1 vagy 1N2), kannák (3A1, 3A2, 3B1 vagy 3B2) vagy ládák (4A, 4B vagy 4N), amelyekben tömítéssel rendelkező, menetes zárószerkezettel ellátott, legfeljebb 4 liter űrtartalmú, légmentesen zárt belső fémdobozok vannak. A belső csomagolóeszközt minden oldalról száraz, nem éghető, nedvszívó anyaggal kell párnázni, amely párnázóanyagnak elegendőnek kell lennie a teljes tartalom felszívására. A belső csomagolóeszközök rétegeit a párnázóanyagon kívül megosztó betétekkel is el kell választani. A belső csomagolóeszközöket legfeljebb űrtartalmuk 90%-áig szabad megtölteni.		
Különleges csomagolási előírás:		
PP86	Az UN 3392 és 3394 anyagai esetében a gőztérből a levegőt nitrogénnel ki kell szorítani vagy más módon el kell távolítani.	

P401	CSOMAGOLÁSI UTASÍTÁS	P401
<p>A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:</p> <ol style="list-style-type: none"> 1) Nyomástartó tartályok, feltéve, hogy a 4.1.3.6 bekezdés általános előírásait betartják. Csak acélból készült tartályok használhatók, amelyeket üzembe helyezés előtt és azután 10 évente időszakosan legalább 0,6 MPa (6 bar) nyomással (túlnyomással) kell vizsgálni. Szállítás alatt a folyadéknak inert gázzal kell lennie, amelynek túlnyomása nem lehet 20 kPa-nál (0,2 bar-nál) kevesebb. 2) Kombinált csomagolások Külső csomagolóeszközök: Hordók (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G); Ládák (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2); Kannák (3A1, 3A2, 3B1, 3B2, 3H1, 3H2); Belső csomagolóeszközök: üvegből, fémből vagy műanyagból, menetes zárószerkezettel, legfeljebb 1 l ürtartalommal. Minden belső csomagolást a teljes tartalom felszívására elegendő mennyiségű inert párnázó- és felszívóanyaggal kell körülvenni. <p>A külső csomagolás legnagyobb nettó tömege legfeljebb 30 kg lehet.</p>		
<p>Csak a RID és az ADR szerinti szállításnál érvényes különleges csomagolási előírás:</p> <p>RR7 Az UN 1183, 1242, 1295 és 2988 tételekhez: a nyomástartó tartályokat öt évente kell vizsgálni..</p>		

P402	CSOMAGOLÁSI UTASÍTÁS	P402
<p>A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:</p> <ol style="list-style-type: none"> 1) Nyomástartó tartályok, feltéve, hogy a 4.1.3.6 bekezdés általános előírásait betartják. P404	CSOMAGOLÁSI UTASÍTÁS	P404
Ezt a csomagolási utasítást az UN 1383, 1854, 1855, 2008, 2441, 2545, 2546, 2846, 2881, 3200, 3391 és 3393 alá tartozó piroforos szilárd anyagokra kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:		
1) Kombinált csomagolások külső csomagolóeszközök: (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F vagy 4H2) belső csomagolóeszközök: Fém csomagolóeszközök legfeljebb 15 kg nettó tömeggel. A belső csomagolóeszközöknek légmentesen zártaknak és menetes zárószervezetűeknek kell lenniük. 2) Fém csomagolások: (1A1, 1A2, 1B1, 1N1, 1N2, 3A1, 3A2, 3B1 és 3B2) legnagyobb nettó tömeg: 150 kg. 3) Összetett csomagolások: műanyag tartály acél vagy alumínium hordóval (6HA1 vagy 6HB1) legnagyobb nettó tömeg: 150 kg.		
Nyomástartó tartályok , feltéve, hogy a 4.1.3.6 bekezdés általános előírásait betartják.		
Különleges csomagolási előírás:		
PP86	Az UN 3391 és 3393 anyagai esetében a gőztérből a levegőt nitrogénnel ki kell szorítani vagy más módon el kell távolítani.	

P405	CSOMAGOLÁSI UTASÍTÁS	P405
Ezt a csomagolási utasítást az UN 1381 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:		
1) Az UN 1381 nedves foszforhoz: a) Kombinált csomagolások külső csomagolóeszközök: (4A, 4B, 4N, 4C1, 4C2, 4D vagy 4F) legnagyobb nettó tömeg: 75 kg belső csomagolóeszközök: i) légmentesen zárt fémdobozok, legfeljebb 15 kg nettó tömeggel; vagy ii) üveg belső csomagolóeszközök, amelyeket minden oldalról száraz, nem éghető, nedvszívó anyaggal kell párnázni, amely párnázóanyagnak elegendőnek kell lennie a teljes tartalom felszívására, legfeljebb 2 kg nettó tömeggel; vagy b) Hordók (1A1, 1A2, 1B1, 1B2, 1N1 vagy 1N2) legnagyobb nettó tömeg: 400 kg Kannák (3A1 vagy 3B1) legnagyobb nettó tömeg: 120 kg. A csomagolóeszközöknek képesnek kell lenniük a 6.1.5.4 bekezdésben meghatározott tömörségi próba elviselésére a II csomagolási csoport igénybevételi szintjén.		
2) Az UN 1381 száraz foszforhoz: a) Ha a foszfor olvasztott, hordók (1A2, 1B2 vagy 1N2) legfeljebb 400 kg nettó tömeggel; vagy b) Lövedékekben vagy kemény burkolatú tárgyakban, ha az 1 osztályba tartozó alkatrészek nélkül szállítják: az illetékes hatóság által előírt csomagolóeszköz.		

P406	CSOMAGOLÁSI UTASÍTÁS	P406
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják.		
1)	Kombinált csomagolások Külső csomagolások: (4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2, 1G, 1D, 1H1, 1H2, 3H1 vagy 3H2) Belső csomagolások: vízálló csomagolások.	
2)	Műanyag, rétegelt falemez vagy papírlemez hordók (1H2, 1D vagy 1G) vagy ládák (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G és 4H2) vízálló belső zsákkal, műanyag fólia béléssel vagy vízálló bevonattal.	
3)	Fémhordók (1A1, 1A2, 1B1, 1B2, 1N1 vagy 1N2), műanyaghordók (1H1 vagy 1H2), fémkannák (3A1, 3A2, 3B1 vagy 3B2), műanyagkannák (3H1 vagy 3H2), műanyagtartály külső acél- vagy alumíniumhordóval (6HA1 vagy 6HB1), műanyagtartály külső papírlemez, műanyag- vagy rétegelt falemez hordóval (6HG1, 6HH1 vagy 6HD1), műanyagtartály külső acél- vagy alumíniumládával vagy -rekesszel, vagy külső fa-, rétegelt falemez, papírlemez vagy tömör műanyag ládával (6HA2, 6HB2, 6HC, 6HD2, 6HG2 vagy 6HH2).	
Kiegészítő követelmények:		
1.	A csomagolóeszközt úgy kell kialakítani, hogy a víz-, alkohol-, ill. flegmatizálószer-tartalom ne csökkenhessen.	
2.	A csomagolóeszközt úgy kell kialakítani és lezárni, hogy robbanásveszélyes túlnyomás vagy 300 kPa-t (3 bar-t) meghaladó nyomásnövekedés ne következzen be.	
Különleges csomagolási előírások:		
PP24	Az UN 2852, 3364, 3365, 3366, 3367, 3368 és 3369 anyagainak mennyisége küldeménydarabonként legfeljebb 500 g lehet.	
PP25	Az UN 1347-hez: küldeménydarabonként 15 kg-ot meghaladó mennyiségben nem szállítható.	
PP26	Az UN 1310, 1320, 1321, 1322, 1344, 1347, 1348, 1349, 1517, 2907, 3317 és 3376-hoz: a csomagolóeszközöknek ólom-mentesnek kell lenniük.	
PP48	Az UN 3474 anyaghoz fém csomagolóeszköz nem használható.	
PP78	Az UN 3370 anyaga küldeménydarabonként legfeljebb 11,5 kg mennyiségben szállítható.	
PP80	Az UN 2907 anyagához használt csomagolóeszközöknek a II csomagolási csoport igénybevételi szintjének kell megfelelniük. Az I csomagolási csoport kritériumait teljesítő csomagolóeszközök nem használhatók.	

P407	CSOMAGOLÁSI UTASÍTÁS	P407
Ezt a csomagolási utasítást az UN 1331, 1944, 1945 és 2254 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:		
Külső csomagolóeszközök:		
Hordók (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G);		
Ládák (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2);		
Kannák (3A1, 3A2, 3B1, 3B2, 3H1, 3H2);		
Belső csomagolóeszközök:		
A gyufákat biztonságosan lezárt belső csomagolásba szorosan kell becsomagolni, hogy normális szállítási feltételek mellett véletlenszerűen ne gyulladhasson meg.		
A küldeménydarab legnagyobb bruttó tömege nem haladhatja meg a 45 kg-ot, kivéve a papírlemez ládát, ami nem lehet 30 kg-nál nehezebb.		
A csomagolóeszközöknek a III csomagolási csoport igénybevételi szintjének kell megfelelniük.		
Különleges csomagolási előírás:		
PP27	Az UN 1331-hez: A mindenütt gyulladó gyufát tilos egyéb veszélyes anyagokkal ugyanazon külső csomagolásba egybe csomagolni, kivéve a biztonsági gyufát és „Vesta”-viasz gyufát, amelyeket különálló belső csomagolásokba kell csomagolni. Egy belső csomagolás legfeljebb 700 mindenütt gyulladó gyufát tartalmazhat.	

P408	CSOMAGOLÁSI UTASÍTÁS	P408
Ezt a csomagolási utasítást az UN 3292 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:		
1) Cellákhoz: Hordók (1A2, 1B2, 1N2, 1H2, 1D, 1G); Ládák (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2); Kannák (3A2, 3B2, 3H2); Elegendő párnázóanyag szükséges, hogy a szállítás alatt ne következhesen be a cellák egymással vagy a külső csomagolás belső felületével való érintkezése, sem pedig a celláknak a külső csomagoláson belüli veszélyes elmozdulása. A csomagolóeszközöknek a II csomagolási csoport igénybevételi szintjének kell megfelelniük.		
2) Az akkumulátorokat csomagolás nélkül vagy védőcsomagolásban (pl. teljesen zárt csomagolásban vagy farekeszben) is lehet szállítani. Az akkumulátorok sorkapcsait sem a többi akkumulátor, sem egyéb, az akkumulátorral egybecsomagolt anyag nem terhelheti a tömegével. A csomagolóeszközökre a 4.1.1.3 bekezdés előírásait nem kell betartani.		
Kiegészítő követelmény:		
A cellákat és az akkumulátorokat a rövidzárlattal szemben védeni kell, ill. oly módon kell elkülöníteni, hogy ne következhesen be rövidzárlat.		

P409	CSOMAGOLÁSI UTASÍTÁS	P409
Ezt a csomagolási utasítást az UN 2956, 3242 és 3251 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:		
1) Papírlemez hordó (1G), amely ellátható béléssel vagy bevonattal; legnagyobb nettó tömeg: 50 kg 2) Kombinált csomagolások: Papírlemez láda (4G) egy belső műanyag fólia zsákkal; legnagyobb nettó tömeg: 50 kg 3) Kombinált csomagolások: Papírlemez láda (4G) vagy papírlemez hordó (1G) legfeljebb 5 kg tartalmú belső műanyag zsákokkal; legnagyobb nettó tömeg: 25kg

	75 kg	75 kg	
	75 kg	75 kg	
Nyomástartó tartályok , feltéve, hogy a 4.1.3.6 bekezdés általános előírásait betartják.			
Különleges csomagolási előírások:			
PP39	Az UN 1378-hoz: a fém csomagolóeszközöket szellőző-szerkezettel kell ellátni.		
PP40	Az UN 1326, 1352, 1358, 1395, 1396, 1436, 1437, 1871, 2805 és 3182, II csomagolási csoport anyagaihoz zsákok nem használhatók.		
PP83	Az UN 2813 anyagai esetében a szállításhoz a vízálló tasakokba legfeljebb 20 g hőfejlesztésre szolgáló anyag csomagolható. Minden vízálló tasakot műanyag zsákba kell behegeszteni és köztes csomagolásba kell helyezni. A külső csomagolás legfeljebb 400 g anyagot tartalmazhat. A csomagolásban nem lehet víz vagy olyan folyékony anyag, amely a vízzel reaktív anyaggal reakcióba léphet.		

- c) Ezek a csomagolások nem használhatók, ha a szállított anyag a szállítás alatt folyékonnyá válhat.
- d) Ezek a csomagolások a II csomagolási csoportba tartozó anyagokhoz csak akkor használhatók, ha fedett járműben vagy zárt konténerben szállítják.

P411	CSOMAGOLÁSI UTASÍTÁS	P411
Ezt a csomagolási utasítást az UN 3270 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják: Hordók (1A2, 1B2, 1N2, 1H2, 1D, 1G); Ládák (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2); Kannák (3A2, 3B2, 3H2), feltéve, hogy a megnövekedett belső nyomás következtében robbanás nem lehetséges. A legnagyobb nettó tömeg nem haladhatja meg a 30 kg-ot.		

P500	CSOMAGOLÁSI UTASÍTÁS	P500
Ezt a csomagolási utasítást az UN 3356 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják: Hordók (1A2, 1B2, 1N2, 1H2, 1D, 1G); Ládák (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2); Kannák (3A2, 3B2, 3H2), A csomagolóeszközöknek a II csomagolási csoport követelményeinek kell megfelelniük.		

P500 (folyt.)	CSOMAGOLÁSI UTASÍTÁS	P500 (folyt.)
Az oxigénfejlesztőket olyan küldeménydarabban kell szállítani, amely abban az esetben, ha a küldeménydarabban lévő valamelyik oxigénfejlesztő működésbe lép, megfelel a következő követelményeknek:		
a)	a küldeménydarabban lévő többi oxigénfejlesztő nem lép működésbe;	
b)	a csomagolóeszköz anyaga nem gyullad meg; és	
c)	a küldeménydarab külső felületének a hőmérséklete nem haladja meg a 100 °C-ot.	

P501		CSOMAGOLÁSI UTASÍTÁS		P501	
Ezt a csomagolási utasítást az UN 2015 tételre kell alkalmazni.

P520		CSOMAGOLÁSI UTASÍTÁS							P520
Ezt a csomagolási utasítást az 5.2 osztály szerves peroxidjaira és a 4.1 osztály önreaktív anyagaira kell alkalmazni.									
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.7.1 bekezdés különleges előírásait betartják: A csomagolási módszerek OP1-OP8 jelöléssel vannak ellátva. A jelenleg besorolt egyes szerves peroxidokhoz és önreaktív anyagokhoz alkalmas csomagolási módszereket a 2.2.41.4 és 2.2.52.4 bekezdés sorolja fel. Az egyes csomagolási módszerekhez meghatározott mennyiségek a küldeménydarabonként engedélyezett legnagyobb mennyiségeket jelentik. A következő csomagolások használhatók:									
1) Kombinált csomagolások külső ládával (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1 és 4H2), hordóval (1A1, 1A2, 1B1, 1B2, 1G, 1H1, 1H2 és 1D) vagy kannával (3A1, 3A2, 3B1, 3B2, 3H1 és 3H2); 2) Önálló csomagolóeszközök, amelyek hordók (1A1, 1A2, 1B1, 1B2, 1G, 1H1, 1H2 és 1D) vagy kannák (3A1, 3A2, 3B1, 3B2, 3H1 és 3H2); 3) Összetett csomagolóeszközök műanyag belső tartállyal (6HA1, 6HA2, 6HB1, 6HB2, 6HC, 6HD1, 6HD2, 6HG1, 6HG2, 6HH1 és 6HH2).									
Engedélyezett legnagyobb mennyiség csomagolásonként/küldeménydarabonként ^{a)} az OP1 – OP8 csomagolási módszerhez									
<div>Legnagyobb mennyiség</div> <div>Csomagolási módszer</div>		OP1	OP2 ^{a)}	OP3	OP4 ^{a)}	OP5	OP6	OP7	OP8
Legnagyobb tömeg (kg) szilárd anyagra és kombinált csomagolásra (szilárd és folyékony anyag esetén)		0,5	0,5/10	5	5/25	25	50	50	400 ^{b)}
Legnagyobb tartalom literben folyadékra ^{c)}		0,5	–	5	–	30	60	60	225 ^{d)}
a) Ha két adat van megadva, az első a belső csomagolásonkénti legnagyobb nettó tömegre, míg a második a teljes küldeménydarab legnagyobb nettó tömegére vonatkozik.									
b) 60 kg kannákra; 200 kg ládákra és 400 kg szilárd anyagokra összetett csomagolásokban, ha a külső csomagolás láda (4C1, 4C2, 4D, 4F, 4G, 4H1 és 4H2) és a belső csomagolások legfeljebb 25 kg nettó tömegű műanyag vagy papírlemez csomagolóeszközök.									
c) A viszkózus anyagokat úgy kell kezelni mint a szilárd anyagokat, ha az 1.2.1 szakaszban a folyékony anyagokra adott meghatározásnak nem felelnek meg.									
d) 60 liter kannákra.									
Kiegészítő követelmények:									
1. Fém csomagolóeszközök, akár a kombinált csomagolások belső csomagolóeszközeként, akár az összetett vagy kombinált csomagolások külső csomagolóeszközeként csak az OP7 és OP8 módszernél használhatók.									
2. A kombinált csomagolásokban üvegtartályok szilárd anyagok esetén csak legfeljebb 0,5 kg-os, folyékony anyagok esetén csak legfeljebb 0,5 l-es belső csomagolóeszközként használhatók.									
3. A kombinált csomagolásoknál a párnázóanyag nem lehet könnyen gyulladó.									
4. A „ROBBANÓ” járulékos veszély bárcával (5.2.2.2.2 pont, 1 sz. bárca) ellátandó szerves peroxidot vagy önreaktív anyagot tartalmazó küldeménydarabnak meg kell felelnie a 4.1.5.10 és a 4.1.5.11 bekezdésben található előírásoknak									
Különleges csomagolási előírások:									
PP21 Az UN 3221, 3222, 3223, 3224, 3231, 3232, 3233 és 3234 alá tartozó, egyes B vagy C típusú önreaktív anyagokra az OP5 vagy OP6 csomagolási módszernél engedélyezetttnél kisebb csomagolásokat kell használni (lásd a 4.1.7 szakaszt és a 2.2.41.4 bekezdést).									
PP22 Az UN 3241 2-bróm-2-nitro-1,3-propándiol-t az OP6 csomagolási módszer szerint kell csomagolni.									

P600	CSOMAGOLÁSI UTASÍTÁS	P600
<p>Ezt a csomagolási utasítást az UN 1700, 2016 és 2017 tételre kell alkalmazni.</p> <p>A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:</p> <p>Külső csomagolóeszközök: (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H2), amelyek a II csomagolási csoport igénybevételi szintjét elégitik ki. A tárgyakat egyedileg kell csomagolni és egymástól elválasztani válaszfalak, osztóbetékek, belső csomagolások vagy párnázóanyag segítségével, hogy normális szállítási feltételek között a tárgyak nem szándékos működésbe lépését megakadályozzák. Legnagyobb nettó tömeg: 75 kg.</p>		

P601	CSOMAGOLÁSI UTASÍTÁS	P601
<p>A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják és a csomagolóeszközöket légmentesen lezárják:</p>		
<p>1) Olyan, legfeljebb 15 kg bruttó tömegű kombinált csomagolás, amely a következőkből áll:</p> <ul style="list-style-type: none"> – legfeljebb 1 liter mennyiséget tartalmazó, üveg belső csomagolóeszköz(ök), amelyek legfeljebb ürtartalmuk 90%-áig vannak megtöltve, és amelyek zárását valamilyen alkalmas eszközzel zárt helyzetében rögzíteni kell, ami megakadályozza a zárószervezet kinyílását vagy lazulását a szállítás alatt fellépő ütések vagy rezgések hatására, ezek a belső csomagolóeszközök egyenként – fémtartályba helyezve, az üveg belső csomagolóeszköz(ök) teljes tartalmának felszívására elegendő nedvszívó anyaggal és inert párnázóanyaggal körülvéve, a fémtartályok pedig – 1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G vagy 4H2 jelű külső csomagolóeszközbe téve. <p>2) Olyan, legfeljebb 75 kg bruttó tömegű kombinált csomagolás, amelyben a legfeljebb 5 liter ürtartalmú, fém belső csomagolóeszközök egyenként a teljes tartalmuk felszívására elegendő nedvszívó anyaggal és inert párnázóanyaggal körülvéve 1A1, 1A2, , 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G vagy 4H2 jelű külső csomagolóeszközben vannak. A belső csomagolóeszközöket legfeljebb ürtartalmuk 90%-áig szabad megtölteni. A belső csomagoló-eszközök zárását valamilyen alkalmas eszközzel zárt helyzetében rögzíteni kell, ami megakadályozza a zárószervezet kinyílását vagy lazulását a szállítás alatt fellépő ütések vagy rezgések hatására.</p> <p>3) Olyan csomagolás, amelynek:</p> <ul style="list-style-type: none"> – külső csomagolóeszköze <ul style="list-style-type: none"> olyan acél- vagy műanyag hordó (1A1, 1A2, 1H1, ill. 1H2 jelű), amelyet vagy mint szilárd, ill. folyékony anyag szállítására használt önálló csomagolóeszközt, vagy mint belső csomagolások befogadására szolgáló csomagolóeszközt vizsgáltak a 6.1.5 szakasz vizsgálati követelményei szerint a szállításra összeállított küldeménydarab tömegének megfelelő tömeggel, és ennek megfelelően van jelöléssel ellátva; – belső csomagolóeszköze <ul style="list-style-type: none"> olyan hordó vagy összetett csomagolás (1A1, 1B1, 1N1, 1H1 vagy 6HA1), amely kielégíti a 6.1 fejezet önálló csomagolóeszközökre vonatkozó előírásait, és megfelel a következő feltételeknek: <ul style="list-style-type: none"> a) a folyadéknymás próbát legalább 0,3 MPa (3 bar) nyomással (túlnyomással) kell végrehajtani; b) a típusvizsgálat során és a minden egyes csomagolóeszközön elvégzendő tömörségi próbát 30 kPa (0,3 bar) próbanyomással kell végrehajtani; c) a külső hordótól lökésállapítóként inert párnázóanyaggal kell elválasztani, amelynek a belső csomagolóeszközt minden oldalról körül kell vennie; d) ürtartalma nem haladhatja meg a 125 litert; és e) a zárószervezetnek csavarmentes kupaknak kell lennie, <ul style="list-style-type: none"> i) amelyet valamilyen alkalmas eszközzel zárt helyzetében rögzíteni kell, ami megakadályozza a zárószervezet kinyílását vagy lazulását a szállítás alatt fellépő ütések vagy rezgések hatására; és ii) amely légmentesen záró tömítőbetéttel van ellátva; 		

P601 (folyt.)	CSOMAGOLÁSI UTASÍTÁS	P601 (folyt.)
	<p>f) a külső és belső csomagolóeszközöket legalább 2,5 évenként a b) pont szerint tömörségi próbának kell alávetni;</p> <p>g) a teljes csomagolóeszközt legalább 3 évenként szemrevételezéssel meg kell vizsgálni az illetékes hatóság számára kielégítő módon.</p> <p>h) a belső és a külső csomagolóeszközökön jól olvashatóan és tartósan fel kell tüntetni:</p> <p>i) az első alkalommal végzett vizsgálat és az utolsó időszakos vizsgálat időpontját (hónap, év);</p> <p>ii) a vizsgálatot és szemrevételezést végző szakértő bélyegzőlenyomatát.</p> <p>4) Nyomástartó tartályok, feltéve, hogy a 4.1.3.6 bekezdés általános előírásait betartják. A nyomástartó tartályokat üzembe helyezés előtt és azután 10 évente időszakosan legalább 1 MPa (10 bar) nyomással (túlnyomással) kell vizsgálni. A nyomástartó tartályon semmilyen nyomáscsökkentő szerkezet nem lehet. Minden nyomástartó tartályt, amely olyan folyadékot tartalmaz, amelynek LC₅₀ értéke belélegzés esetén 200 ml/m³ (ppm) vagy annál kisebb, olyan záródugóval vagy zárószeleppel kell lezárni, amely megfelel a következő előírásoknak:</p> <p>a) a záródugónak, ill. zárószelepnek kúpos csavarmenettel közvetlenül a nyomástartó tartályhoz kell csatlakoznia, és a nyomástartó tartály próbanyomását sérülés és szivárgás nélkül ki kell állnia;</p> <p>b) a zárószelepnek tömítés nélküli, nem-perforált membrános szelepnek kell lennie, kivéve a maró anyagoknál, ahol lehet tömítéssel ellátott szelep is, ha olyan elrendezéssel van gáztömörré téve, ahol a szeleptesthez vagy a nyomástartó tartályhoz rögzített tömítő sapka és a tömítőgyűrű megakadályozza, hogy a tömítésen keresztül vagy amellet szivároгjon az anyag;</p> <p>c) a zárószelep kimenetét menetes sapkával vagy menetes tömör dugóval és inert tömítőanyaggal kell lezárni;</p> <p>d) A nyomástartó tartály szerkezeti anyagának, a szelepek, a dugók, a kimeneti sapkák, a kitt és a tömítések anyagának egymással és a tartalommal összeférhetőnek kell lennie. Az olyan nyomástartó tartályt, amelynek bármely pontján kisebb a falvastagsága, mint 2,0 mm, illetve az olyat, amelynek a szelepe nincs megfelelő védelemmel ellátva, külső csomagolóeszközbe helyezve kell szállítani. A nyomástartó tartályokat nem szabad sem összekapcsolni, sem gyűjtőcsővel ellátni.</p>	
Különleges csomagolási előírás:		
PP82	(törölve)	
Csak a RID és az ADR szerinti szállításnál érvényes különleges csomagolási előírás:		
RR3	(törölve)	
RR7	Az UN 1251 tételhez: a nyomástartó tartályokat öt évente kell vizsgálni.	
RR10	AZ UN 1614 anyagot, ha inert porózus anyagba teljesen abszorbeálva van, legfeljebb 7,5 liter űrtartalmú fém tartályokba kell csomagolni, amelyeket oly módon kell faládákba helyezni, hogy ne érintkezhessenek egymással. A tartályokat teljesen ki kell tölteni porózus anyaggal, amelynek olyannak kell lennie, hogy még hosszabb használat után vagy rázkódások esetén se tömörüljön össze és ne képződjene benne veszélyes üregek még 50 °C hőmérséklet esetén sem.	

P602	CSOMAGOLÁSI UTASÍTÁS	P602
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják és a csomagolóeszközöket légmentesen lezárják:		
1)	<p>Olyan, legfeljebb 15 kg bruttó tömegű kombinált csomagolás, amely a következőkből áll:</p> <ul style="list-style-type: none"> – legfeljebb 1 liter mennyiséget tartalmazó, üveg belső csomagolóeszköz(ök), amelyek legfeljebb ürtartalmuk 90%-áig vannak megtöltve, és amelyek zárását valamilyen alkalmas eszközzel zárt helyzetében rögzíteni kell, ami megakadályozza a zárószerkezet kinyílását vagy lazulását a szállítás alatt fellépő ütések vagy rezgések hatására, ezek a belső csomagolóeszközök egyenként – fémtartályba helyezve, a teljes tartalmuk felszívására elegendő nedvszívó anyaggal és inert párnázóanyaggal körülvéve, a fémtartályok pedig – 1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G vagy 4H2 jelű külső csomagolóeszközbe téve. 	
2)	<p>Olyan, legfeljebb 75 kg bruttó tömegű kombinált csomagolás, amelyben a fém belső csomagolóeszközök egyenként a teljes tartalmuk felszívására elegendő nedvszívó anyaggal és inert párnázóanyaggal körülvéve 1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G vagy 4H2 jelű külső csomagolóeszközben van. A belső csomagolóeszközöket legfeljebb ürtartalmuk 90%-áig szabad megtölteni. A belső csomagolóeszközök zárását valamilyen alkalmas eszközzel zárt helyzetében rögzíteni kell, ami megakadályozza a zárószerkezet kinyílását vagy lazulását a szállítás alatt fellépő ütések vagy rezgések hatására. A belső csomagolóeszközök ürtartalma nem haladhatja meg az 5 litert.</p>	
3)	<p>Hordók és összetett csomagolóeszközök (1A1, 1B1, 1N1, 1H1, 6HA1 vagy 6HH1) feltéve, ha megfelelnek következő feltételeknek:</p> <ol style="list-style-type: none"> a folyadéknymás próbát legalább 0,3 MPa (3 bar) nyomással (túlnyomás) kell végrehajtani; a típusvizsgálat során és a minden egyes csomagolóeszközön elvégzendő tömörségi próbát 30 kPa próbanyomással kell végrehajtani; a zárószerkezetnek csavarmentes kupaknak kell lennie, <ol style="list-style-type: none"> amelyet valamilyen alkalmas eszközzel zárt helyzetében rögzíteni kell, ami megakadályozza a zárószerkezet kinyílását vagy lazulását a szállítás alatt fellépő ütések vagy rezgések hatására; és amely légmentesen záró tömítőbetéttel van ellátva. 	
4)	<p>Nyomástartó tartályok, feltéve, hogy a 4.1.3.6 bekezdés általános előírásait betartják. A nyomástartó tartályokat üzembe helyezés előtt és azután 10 évente időszakosan legalább 1 MPa (10 bar) nyomással (túlnyomással) kell vizsgálni. A nyomástartó tartályon semmilyen nyomáscsökkentő szerkezet nem lehet. Minden nyomástartó tartályt, amely olyan folyadékot tartalmaz, amelynek LC₅₀ értéke belélegzés esetén 200 ml/m³ (ppm) vagy annál kisebb, olyan zárodugóval vagy zárószeleppel kell lezárni, amely megfelel a következő előírásoknak:</p> <ol style="list-style-type: none"> a zárodugónak, ill. zárószelepnek kúpos csavarmentesül közvetlenül a nyomástartó tartályhoz kell csatlakoznia, és a nyomástartó tartály próbanyomását sérülés és szivárgás nélkül ki kell állnia; a zárószelepnek tömítés nélküli, nem-perforált membrános szelepnek kell lennie, kivéve a maró anyagoknál, ahol lehet tömítéssel ellátott szelep is, ha olyan elrendezéssel van gáztömörré téve, ahol a szeleptesthez vagy a nyomástartó tartályhoz rögzített tömítő sapka és a tömítőgyűrű megakadályozza, hogy a tömítésen keresztül vagy amellet szivárogon az anyag; a zárószelep kimenetét menetes sapkával vagy menetes tömör dugóval és inert tömítőanyaggal kell lezárni; a nyomástartó tartály szerkezeti anyagának, a szelepek, a dugók, a kimeneti sapkák, a kett és a tömítések anyagának egymással és a tartalommal összeférhetőnek kell lennie. <p>Az olyan nyomástartó tartályt, amelynek bármely pontján kisebb a falvastagsága, mint 2,0 mm, illetve az olyat, amelynek a szelepe nincs megfelelő védelemmel ellátva, külső csomagolóeszközbe helyezve kell szállítani. A nyomástartó tartályokat nem szabad sem összekapcsolni, sem gyűjtőcsővel ellátni.</p>	

P620	CSOMAGOLÁSI UTASÍTÁS	P620
Ezt a csomagolási utasítást az UN 2814 és 2900 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.8 szakasz különleges előírásait betartják:		
A 6.3 fejezet követelményeit kielégítő és annak megfelelően jóváhagyott csomagolóeszközök, amelyek a következőkből állnak:		
a) belső csomagolóeszköz, amely a következőket tartalmazza: <ul style="list-style-type: none"> i) folyadéktömör elsődleges tartály(oka)t; ii) folyadéktömör másodlagos csomagolást; iii) nem szilárd fertőző anyagok esetén az elsődleges tartály és a másodlagos csomagolás közé helyezett nedvszívó anyagot, amely elegendő mennyiségű az elsődleges tartályok teljes tartalmának felszívására; amennyiben több elsődleges tartály van elhelyezve egyetlen másodlagos csomagolásban, úgy ezeket egyenként be kell burkolni vagy úgy kell elválasztani egymástól, hogy ne érintkezhessenek egymással; b) merev falú külső csomagolóeszköz: <ul style="list-style-type: none"> hordók (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G); ládák (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2); kannák (3A1, 3A2, 3B1, 3B2, 3H1, 3H2); A legkisebb külső méret nem lehet 100 mm-nél kisebb.		
Kiegészítő követelmények:		
1. A fertőző anyagokat tartalmazó belső csomagolóeszközöket tilos más típusú árukkal közös külső csomagolásba együvé csomagolni. A küldeménydarabokat az 1.2.1 és az 5.1.2 szakasz előírásai szerinti egyesítőcsomagolásba lehet tenni, amelyben szárazjég is elhelyezhető.		
2. A kivételes küldemények kivételével, mint pl. egész szervek, amelyek különleges csomagolást igényelnek, a következő kiegészítő követelményeket kell betartani: <ul style="list-style-type: none"> a) Ha az anyagot szobahőmérsékleten vagy magasabb hőmérsékleten adják fel szállításra: Az elsődleges tartályokat fémből, üvegből vagy műanyagból kell készíteni. Ezeket szivárgásmentes tömitést eredményező, biztosított zárásmóddal kell zárni, mint pl. hőzárás, szoknyával ellátott dugó vagy ráperemezhető fémzár. Amennyiben csavarmentes fedelet használnak, hatékony eszközzel, pl. ragasztószalaggal, parafinozott zárószalaggal vagy gyárilag kialakított zárószerezettel rögzíteni kell; b) Ha az anyagot hűtve vagy fagyasztva adják fel szállításra: Jeget, szárazjeget vagy egyéb hűtőközeget kell a másodlagos csomagolás(ok) köré helyezni vagy alternatívaként a 6.3.3 szakasz szerint jelölt, komplett küldeménydarab(oka)t tartalmazó egyesítőcsomagolásba helyezni. Belső távtartókat kell alkalmazni a másodlagos csomagolás(ok) vagy a küldeménydarabok rögzítésére, hogy azok a jég vagy a szárazjég eltűnése után eredeti helyzetükben maradjanak. Amennyiben jeget használnak, a külső csomagolásnak, ill. az egyesítőcsomagolásnak folyadéktömörnek kell lennie. Szárazjég használata esetén a külső csomagolásnak, ill. az egyesítőcsomagolásnak lehetővé kell tennie a szén-dioxid gáz eltávozását. Az elsődleges tartálynak és a másodlagos csomagolásnak meg kell őriznie integritását az alkalmazott hűtőközeg hőmérsékletén; c) Ha az anyagot cseppfolyósított nitrogénben adják fel szállításra: Az elsődleges tartályokat olyan műanyagból kell készíteni, amely ellenáll a nagyon alacsony hőmérsékletnek. A másodlagos csomagolásnak is ellen kell állnia a nagyon alacsony hőmérsékletnek és a legtöbb esetben egyedileg kell illeszkednie a belső tartályhoz. A cseppfolyósított nitrogén szállítására vonatkozó követelményeket ugyancsak be kell tartani. Az elsődleges tartálynak és a másodlagos csomagolásnak meg kell őriznie integritását a cseppfolyósított nitrogén hőmérsékletén; d) A liofilizált anyagok elsődleges tartályokban is szállíthatók, amelyek lánggal leforrasztott üvegampullák vagy fémzárral ellátott, gumidugós üvegcsék. 		
3. Függetlenül a szállítás során előírányzott hőmérséklettől a fertőző anyagok csomagolására használt elsődleges vagy másodlagos csomagolásnak szivárgás nélkül ellen kell állnia legalább 95 kPa nyomáskülönbséget létrehozó belső nyomásnak és a -40 °C és +55 °C közötti hőmérsékletnek.		

P620 (folyt.)	CSOMAGOLÁSI UTASÍTÁS	P620 (folyt.)
4.	A 6.2 osztályba tartozó fertőző anyaggal azonos csomagolóeszközbe nem csomagolható egyéb veszélyes áru, kivéve, ha a fertőző anyag életképességének fenntartásához, stabilizálásához, degenerálódásának megakadályozásához vagy az általa képviselt veszély hatástalanításához szükséges. Egy fertőző anyagot tartalmazó elsődleges tartályba legfeljebb 30 ml mennyiséget szabad a 3, a 8, ill. a 9 osztályba tartozó veszélyes áruból csomagolni. A 3, a 8, ill. a 9 osztály ezen kis mennyiségű veszélyes áruai nem tartoznak az ADR többi előírásának hatálya alá, ha ezen csomagolási utasítás szerint vannak csomagolva.	
5.	A származási ország ^{a)} illetékes hatósága az állati eredetű anyagok szállításához más csomagolóeszközt is engedélyezhet a 4.1.8.7 bekezdés szerint.	

a) *Ha a származási ország nem valamely ADR Szerződő Fél, a küldemény által érintett első ADR Szerződő Fél illetékes hatósága*

P621	CSOMAGOLÁSI UTASÍTÁS	P621
Ezt a csomagolási utasítást az UN 3291 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1.15 kivételével a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják.		
1)	Amennyiben a csomagolóeszköz elegendő nedvszívó anyagot tartalmaz a teljes folyadék mennyiség felszívására és képes a folyadék megtartására: hordók (1A2, 1B2, 1N2, 1H2, 1D, 1G); ládák (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2); kannák (3A2, 3B2, 3H2). A csomagolóeszközöknek szilárd anyagokra vonatkozóan a II csomagolási csoport követelményeinek kell megfelelniük..	
2)	Nagyobb mennyiségű folyadékot tartalmazó küldeménydarabok esetén: hordók (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G); kannák (3A1, 3A2, 3B1, 3B2, 3H1, 3H2); összetett csomagolóeszközök (6HA1, 6HB1, 6HG1, 6HH1, 6HD1, 6HA2, 6HB2, 6HC, HD2, 6HG2, 6HH2, 6PA1, 6PB1, 6PG1, 6PD1, 6PH1, 6PH2, 6PA2, 6PB2, 6PC, 6PG2 vagy PD2). A csomagolóeszközöknek folyékony anyagokra vonatkozóan a II csomagolási csoport követelményeinek kell megfelelniük.	
Kiegészítő követelmények: Az éles tárgyakat, pl. törött üvegeket, tüket tartalmazó csomagolóeszközöknek dőfésállónak kell lenniük, és meg kell tartaniuk a folyékony anyagokat a 6.1 fejezet szerinti vizsgálati körülmények között.		

P650	CSOMAGOLÁSI UTASÍTÁS	P650
Ezt a csomagolási utasítást az UN 3373 tételre kell alkalmazni.		
1)	A csomagolásnak jó minőségűnek és elég erősnek kell lennie ahhoz, hogy ellenálljon azoknak az igénybevételeknek, ütődéseknek, amelyeknek rendes körülmények között a szállítás során, a járművek, ill. konténerek közötti átrakás, a járművekből, ill. konténerekből a raktárba való berakodás során ki van téve, illetve amelyek akkor léphetnek fel, amikor további kézi vagy gépi árukezelés céljából a rakodólapról vagy az egyesítőcsomagolásból eltávolítják. A csomagolóeszközöket úgy kell gyártani és lezárni, hogy elkerülhető legyen a tartalom bármilyen szivárgása vagy kiszóródása. Ez a szokásos szállítási körülmények között különösen a rezgésekből, illetve a hőmérséklet, a páratartalom vagy a nyomás változásából adódhat.	
2)	A csomagolásnak legalább három részből kell állnia:	
	a) elsődleges tartály;	
	b) másodlagos csomagolás; és	
	c) külső csomagolás,	
	a másodlagos és a külső csomagolás közül az egyiknek merev falúnak kell lennie.	
3)	Az elsődleges tartályokat úgy kell a másodlagos csomagolásba helyezni, hogy normális szállítási feltételek esetén ne törhessenek el, ne lyukadhassanak ki és tartalmuk ne szivároгjon a másodlagos csomagolóeszközbe. A másodlagos csomagolásokat megfelelő párnázóanyaggal kell a külső csomagolásban rögzíteni. A tartalom esetleges kiszabadulása nem csökkentheti lényegesen sem a párnázóanyag, sem a külső csomagolóeszköz védő tulajdonságait.	
4)	A szállításhoz a következő jelölést kell a külső csomagolás külső felületén elütő színű háttérre, jól látható és tartós módon felvinni. A jelölésnek egy legalább 50 x 50 mm nagyságú, csúcsára állított négyzet (rombusz) alakúnak kell lennie, a vonal vastagságának legalább 2 mm-nek, a betűk és számok magasságának legalább 6 mm-nek kell lennie. A külső csomagoláson közvetlenül a rombusz alakú jelölés mellett, legalább 6 mm magasságú betűkkel fel kell tüntetni a helyes szállítási megnevezést: „B” KATEGÓRIÁJÚ BIOLÓGIAI ANYAG.	
<div></div>		
5)	A külső csomagolás legalább egy oldalfelületének legalább 100 x 100 mm méretűnek kell lennie.	
6)	A kész küldeménydarabnak képesnek kell lennie a 6.3.5.3 bekezdés szerinti, 1,2 m ejtési magassággal végrehajtott ejtőpróba elviselésére, amint azt a 6.3.5.2 bekezdés meghatározza. A megfelelő ejtési sorozat után semmi nem szabadulhat ki az elsődleges tartály(ok)ból a másodlagos csomagolásba, az elsődleges tartály(oka)t a nedvszívó anyagnak – ha az elő van írva – továbbra is védenie kell.	
7)	Folyékony anyagokhoz:	
	a) Az elsődleges tartály(ok)nak szivárgásmentesnek kell lennie (lenniük);	
	b) A másodlagos csomagolásnak szivárgásmentesnek kell lennie;	
	c) Ha több törékeny elsődleges tartályt helyeznek közös másodlagos csomagolásba, akkor azokat vagy egyedileg be kell burkolni vagy úgy kell elválasztani, hogy ne érintkezhessenek egymással.	
	d) Az elsődleges tartály(ok) és a másodlagos csomagolás közé nedvszívó anyagot kell helyezni. A nedvszívó anyagnak elegendőnek kell lennie az elsődleges tartály(ok) teljes tartalmának felszívására, és a folyékony anyag esetleges kiszabadulása nem eredményezheti sem a párnázóanyag, sem a külső csomagolás sérülését;	
	e) Az elsődleges tartálynak vagy a másodlagos csomagolásnak szivárgás nélkül el kell viselnie a legalább 95 kPa (0,95 bar) nyomáskülönbséget eredményező belső nyomást.	

P650 (folyt.)	CSOMAGOLÁSI UTASÍTÁS	P650 (folyt.)
8)	<p><i>Szilárd anyagokhoz:</i></p> <p>a) Az elsődleges tartály(ok)nak portömörnek kell lenniük;</p> <p>b) A másodlagos csomagolásnak portömörnek kell lennie;</p> <p>c) Ha több törékeny elsődleges tartályt helyeznek közös másodlagos csomagolásba, akkor azokat vagy egyedileg be kell burkolni vagy úgy kell elválasztani, hogy ne érintkezhessenek egymással.</p> <p>d) Amennyiben nem zárható ki, hogy a szállítás alatt az elsődleges tartályban visszamaradt folyadék lehet jelen, akkor nedvszívó anyagot tartalmazó, folyékony anyaghoz alkalmas csomagolást kell használni.</p>	
9)	<p><i>Mélyhűtött vagy fagyasztott minták: Jég, szárazjég és cseppfolyósított nitrogén használata</i></p> <p>a) Ha hűtőközegként szárazjeget vagy cseppfolyósított nitrogént használnak, az 5.5.3 szakasz előírásait kell betartani. Ha jeget használnak, azt a másodlagos csomagolás(ok) köré, a külső csomagolásba vagy az egyesítőcsomagolásba kell helyezni. A másodlagos csomagolás(ok) eredeti helyzetben való rögzítésére belső távtartókat kell alkalmazni. Amennyiben jeget használnak, a külső csomagolásnak, ill. az egyesítőcsomagolásnak folyadéktömörnek kell lennie.</p> <p>b) Az elsődleges tartálynak és a másodlagos csomagolásnak meg kell őriznie integritását az alkalmazott hűtőközeg hőmérsékletén, valamint a hűtés megszűnése esetén előálló hőmérsékleteken és nyomásokon is;</p>	
10)	Ha a küldeménydarabok egyesítőcsomagolásban vannak, az ezen csomagolási utasítás szerinti küldeménydarab-jelölésnek jól láthatónak kell lennie, vagy az egyesítőcsomagolás külső felületén meg kell ismételni.	
11)	Amennyiben az UN 3373 alá besorolt, fertőző anyagokat ezen csomagolási utasítás szerint csomagolják, az ADR más előírásait nem kell betartani.	
12)	A csomagolóeszköz gyártójának, ill. forgalomba hozójának egyértelmű utasítást kell adnia a küldeménydarabot előkészítő feladó, ill. személy (pl. beteg) számára arról, hogyan kell megtölteni és lezárni, annak érdekében, hogy a küldeménydarabot a szállításhoz megfelelően lehessen előkészíteni.	
13)	A 6.2 osztályba tartozó fertőző anyaggal azonos csomagolóeszközbe nem csomagolható egyéb veszélyes áru, kivéve, ha a fertőző anyag életképességének fenntartásához, stabilizálásához, degenerálódásának megakadályozásához vagy az általa képviselt veszély hatástalanításához szükséges. Egy fertőző anyagot tartalmazó elsődleges tartályba legfeljebb 30 ml mennyiséget szabad a 3, a 8, ill. a 9 osztályba tartozó veszélyes áruból csomagolni. Ha ilyen kis mennyiségű veszélyes árut ezen csomagolási utasítás szerint csomagolnak egybe fertőző anyaggal, az ADR más előírásait nem kell betartani.	
14)	Ha az anyag kiszivárgott és a járműben vagy a konténerben kifolyt, ill. szétszóródott, az mindaddig nem használható tovább, amíg alaposan ki nem tisztították és szükség esetén nem fertőtlenítették. Az ugyanabban a járműben vagy konténerben szállított minden más árut is meg kell vizsgálni az esetleges szennyeződés szempontjából.	
Kiegészítő követelmény:		
A származási ország ^{a)} illetékes hatósága az állati eredetű anyagok szállításához más csomagolóeszközt is engedélyezhet a 4.1.8.7 bekezdés szerint.		
a)	Ha a származási ország nem valamely ADR Szerződő Fél, a küldemény által érintett első ADR Szerződő Fél illetékes hatósága	

P800	CSOMAGOLÁSI UTASÍTÁS	P800
Ezt a csomagolási utasítást az UN 2803 és 2809 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:		
1) Nyomástartó tartályok, feltéve, hogy a 4.1.3.6 bekezdés általános előírásait betartják; vagy 2) Menetes zárású acél palackok vagy flakonok legfeljebb 3 liter űrtartalomig; vagy 3) Kombinált csomagolások, amelyek megfelelnek a következő követelményeknek: <ul style="list-style-type: none"> a) a folyadékot tartalmazó belső csomagolóeszköz üveg, fém vagy merev műanyag lehet, egyenként legfeljebb 15 kg nettó tömeggel; b) a belső csomagolóeszközöket elegendő mennyiségű párnázóanyag közé kell csomagolni a törés megakadályozására; c) vagy a belső vagy a külső csomagolóeszközöket el kell látni a tartalmazott anyaggal szemben ellenálló, erős, szivárgásmentes és dőfésálló anyagból készített béléssel vagy belső zsákkal, amely teljesen körül veszi, és megakadályozza az anyag kiszabadulását a csomagolóeszközből, függetlenül a küldeménydarab helyzetétől; d) a következő külső csomagolóeszközök és legnagyobb nettó tömegek alkalmazhatók: 		
Külső csomagolóeszközök:		Legnagyobb nettó tömeg
Hordók		
acélhordók (1A1, 1A2)		400 kg
fémhordók (acélt és alumíniumot kivéve) (1N1, 1N2)		400 kg
műanyaghordók (1H1, 1H2)		400 kg
rétegelt falemez hordók (1D)		400 kg
papírlemez hordók (1G)		400 kg
Ládák		
acélládák (4A)		400 kg
fémládák (acélt és alumíniumot kivéve) (4N)		400 kg
közönséges faládák (4C1)		250 kg
portömör faládák (4C2)		250 kg
rétegelt falemez ládák (4D)		250 kg
farostlemez ládák (4F)		125 kg
papírlemez ládák (4G)		125 kg
habosított műanyag ládák (4H1)		60 kg
tömör műanyag ládák (4H2)		125 kg
Különleges csomagolási előírás:		
PP41 Az UN 2803-hoz: ha a galliumot alacsony hőmérsékleten kell szállítani, hogy teljesen szilárd állapotban maradjon, a fenti csomagolásokat erős, vízálló külső csomagolásba lehet helyezni, amely szárazjeget vagy más hűtőszert tartalmaz. Ha hűtőközeget használnak, a gallium csomagolásához használt minden anyagnak kémiaiilag és fizikailag ellenállónak kell lennie a hűtőközeggel szemben, és ütésállónak kell lennie az alkalmazott hűtőközeg alacsony hőmérsékletén. Ha szárazjeget használnak, a külső csomagolásnak lehetővé kell tennie a széndioxid gáz távozását.		

P801	CSOMAGOLÁSI UTASÍTÁS	P801
Ezt a csomagolási utasítást az UN 2794, 2795 és 3028 tétel alá sorolt új vagy használt akkumulátor-telepekre kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1.3 bekezdés kivételével a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:		
1) Merev falú külső csomagolások; 2) Farekeszek; 3) Rakodólapok.		
Kiegészítő követelmények:		
1. Az akkumulátorokat védeni kell a rövidzárlattal szemben. 2. Az egymásra halmazolt akkumulátorokat megfelelő módon rögzíteni kell és az egyes sorokat nem vezető anyagból készült réteggel kell elválasztani. 3. Az akkumulátorok sorkapcsait a felette levő tárgyak tömegükkel nem terhelhetik. 4. Az akkumulátorokat úgy kell csomagolni vagy rögzíteni, hogy megakadályozzák nem szándékos elmozdulásukat. Amennyiben párnázóanyagot alkalmaznak, annak inertnek kell lennie.		

P801a	CSOMAGOLÁSI UTASÍTÁS	P801a
Ezt a csomagolási utasítást az UN 2794, 2795, 2800 és 3028 tétel alá sorolt használt akkumulátor-telepekre kell alkalmazni.		
Legfeljebb 1 m ³ befogadóképességű, rozsdamentes acélból vagy tömör műanyagból készült akkumulátor ládák használhatók, ha a következő feltételeket betartják:		
1) az akkumulátor ládáknak a szállított akkumulátortelegekben levő maró anyaggal szemben ellenállónak kell lenniük; 2) normális szállítási körülmények között az akkumulátor ládákból semmiféle maró anyag nem szivároghat ki, illetve a ládába más anyag (pl. víz) nem kerülhet be. A szállított akkumulátor-telepek által tartalmazott maró anyagból semmilyen maradék nem tapadhat a ládák külsejére; 3) az akkumulátortelegeket a ládába csak a ládák falmagasságáig szabad rakni; 4) nem szabad a ládába sem olyan más veszélyes árut, sem olyan különböző anyagokat tartalmazó akkumulátortelegeket tenni, amelyek egymással veszélyes reakcióba léphetnek; 5) az akkumulátor ládákat vagy <ul style="list-style-type: none"> a) le kell fedni; vagy b) fedett vagy ponyvás járműben, ill. zárt vagy ponyvás konténerben kell szállítani. 		

P802	CSOMAGOLÁSI UTASÍTÁS	P802
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:		
1)	Kombinált csomagolások:	
	külső csomagolóeszköz:	1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G vagy 4H2
	legnagyobb nettó tömeg:	75 kg
	belső csomagolóeszközök:	üveg vagy műanyag
	legnagyobb űrtartalom:	10 liter;
2)	Kombinált csomagolások:	
	külső csomagolóeszköz:	1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G vagy 4H2
	legnagyobb nettó tömeg:	125 kg
	belső csomagolóeszközök:	fém;
	legnagyobb űrtartalom:	40 liter;
3)	Összetett csomagolóeszközök:	üveg tartályok külső acél-, alumínium-, rétegelt falemez vagy tömör műanyag hordóval (6PA1, 6PB1, 6PD1, vagy 6PH2), vagy külső acél- vagy alumíniumládával vagy -rekesszel vagy külső faládával vagy külső vesszőkosárral (6PA2, 6PB2, 6PC vagy 6PD2)
	legnagyobb űrtartalom:	60 liter;
4)	Acélhordó (1A1) legfeljebb 250 liter űrtartalommal;	
5)	Nyomástartó tartályok, feltéve, hogy a 4.1.3.6 bekezdés általános előírásait betartják.	

P803	CSOMAGOLÁSI UTASÍTÁS	P803
Ezt a csomagolási utasítást az UN 2028 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:		
1)	Hordók (1A2, 1B2, 1N2, 1H2, 1D, 1G);	
2)	Ládák (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H2);	
	Legnagyobb nettó tömeg: 75 kg.	
A tárgyakat egyenként kell csomagolni és egymástól el kell választani megosztó válaszfalak, osztóbetétek, belső csomagolások vagy párnázóanyag használatával, hogy normális szállítási feltételek között a tárgyak nem szándékos működésbe lépését megakadályozzák.		

P804	CSOMAGOLÁSI UTASÍTÁS	P804
Ezt a csomagolási utasítást az UN 1744 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják és a csomagolóeszközöket légmentesen lezárják:		
1)	<p>Olyan, legfeljebb 25 kg bruttó tömegű kombinált csomagolás, amely a következőkből áll:</p> <ul style="list-style-type: none"> – legfeljebb 1,3 liter űrtartalmú, üveg belső csomagolóeszköz(ök), amelyek legfeljebb űrtartalmuk 90%-áig vannak megtöltve, és amelyek zárását valamilyen alkalmas eszközzel zárt helyzetében rögzíteni kell, ami megakadályozza a zárószerkezet kinyílását vagy lazulását a szállítás alatt fellépő ütések vagy rezgések hatására, ezek a belső csomagolóeszközök egyenként – fém vagy merev falú műanyag tartályba helyezve, az üveg belső csomagolóeszköz(ök) teljes tartalmának felszívására elegendő nedvszívó anyaggal és inert párnázóanyaggal körülvéve, a fém, ill. műanyag tartályok pedig – 1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G vagy 4H2 jelű külső csomagolóeszközbe téve. 	
2)	<p>Olyan, legfeljebb 75 kg bruttó tömegű kombinált csomagolás, amelyben a legfeljebb 5 liter űrtartalmú, fém vagy poli(vinilidén-fluorid) (PVDF) belső csomagolóeszközök egyenként a teljes tartalmuk felszívására elegendő nedvszívó anyaggal és inert párnázóanyaggal körülvéve 1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G vagy 4H2 jelű külső csomagolóeszköz-ben vannak. A belső csomagolóeszközöket legfeljebb űrtartalmuk 90%-áig szabad megtölteni. A belső csomagolóeszközök zárását valamilyen alkalmas eszközzel zárt helyzetében rögzíteni kell, ami megakadályozza a zárószerkezet kinyílását vagy lazulását a szállítás alatt fellépő ütések vagy rezgések hatására.</p>	
3)	<p>Olyan csomagolás, amelynek:</p> <ul style="list-style-type: none"> – külső csomagolóeszköze <ul style="list-style-type: none"> olyan acél- vagy műanyagbordó (1A1, 1A2, 1H1, ill. 1H2 jelű) amelyet vagy mint szilárd, ill. folyékony anyag szállítására használt önálló csomagolóeszközt, vagy mint belső csomagolások befogadására szolgáló csomagolóeszközt vizsgáltak a 6.1.5 szakasz vizsgálati követelményei szerint a szállításra összeállított küldeménydarab tömegének megfelelő tömeggel, és ennek megfelelően van jelöléssel ellátva; – belső csomagolóeszköze <ul style="list-style-type: none"> olyan hordó vagy összetett csomagolás (1A1, 1B1, 1N1, 1H1 vagy 6HA1), amely kielégíti a 6.1 fejezet önálló csomagolóeszközökre vonatkozó előírásait, és megfelel a következő feltételeknek: <ul style="list-style-type: none"> a) a folyadéknomás próbát legalább 300 kPa (3 bar) nyomással (túlnyomással) kell végrehajtani; b) a típusvizsgálat során és a minden egyes csomagolóeszközön elvégzendő tömörségi próbát 30 kPa (0,3 bar) próbanyomással kell végrehajtani; c) a külső hordótól lökéscsillapítóként inert párnázóanyaggal kell elválasztani, amelynek a belső csomagolóeszközt minden oldalról körül kell vennie; d) űrtartalma nem haladhatja meg a 125 litert; e) a zárószerkezetnek csavarmenetes kupaknak kell lennie, <ul style="list-style-type: none"> i) amelyet valamilyen alkalmas eszközzel zárt helyzetében rögzíteni kell, ami megakadályozza a zárószerkezet kinyílását vagy lazulását a szállítás alatt fellépő ütések vagy rezgések hatására; ii) amely légmentesen záró tömítőbetéttel van ellátva; f) a külső és belső csomagolóeszközöket legalább 2,5 évenként belső vizsgálatnak és a b) pont szerint tömörségi próbának kell alávetni; és g) a belső és a külső csomagolóeszközökön jól olvashatóan és tartósan fel kell tüntetni: <ul style="list-style-type: none"> i) az első alkalommal végzett vizsgálat és az utolsó időszakos vizsgálat és a belső csomagolóeszköz vizsgálatának időpontját (hónap, év) és; 	

P804 (folyt.)	CSOMAGOLÁSI UTASÍTÁS	P804 (folyt.)
4)	<p>ii) a vizsgálatot végző szakértő nevét vagy engedélyezett jelét.</p> <p>Nyomástartó tartályok, feltéve, hogy a 4.1.3.6 bekezdés általános előírásait betartják.</p> <p>a) A nyomástartó tartályokat üzembe helyezés előtt és azután 10 évente időszakosan legalább 1 MPa (10 bar) nyomással (túlnyomással) kell vizsgálni;</p> <p>b) A nyomástartó tartályokat legalább 2,5 évenként belső vizsgálatnak és tömörségi próbának kell alávetni;</p> <p>c) A nyomástartó tartályokon semmilyen nyomáscsökkentő szerkezet nem lehet;</p> <p>d) Mindegyik nyomástartó tartályt egy másodlagos zárószerkezettel ellátott dugóval vagy szeleppel (szelepekkel) kell lezárni;</p> <p>e) A nyomástartó tartály szerkezeti anyagának, a szelepek, a dugók, a kimeneti sapkák, a kitt és a tömítések anyagának egymással és a tartalommal összeférhetőnek kell lennie.</p>	

P900	CSOMAGOLÁSI UTASÍTÁS	P900
	(fenntartva)	

P901	CSOMAGOLÁSI UTASÍTÁS	P901
	Ezt a csomagolási utasítást az UN 3316 tételre kell alkalmazni.	
	<p>A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:</p> <p>Hordók (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G);</p> <p>Ládák (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2);</p> <p>Kannák (3A1, 3A2, 3B1, 3B2, 3H1, 3H2).</p> <p>A csomagolóeszközöknek a vizsgálókészlet, ill. elsősegély felszerelés egészéhez hozzárendelt csomagolási csoport igénybevételi szintjének kell megfelelniük (lásd a 3.3.1 szakasz 251 különleges előírását).</p> <p>A veszélyes áru legnagyobb mennyisége külső csomagolásként legfeljebb 10 kg lehet, nem számítva a hűtőközegként használt szilárd szén-dioxid (szárazjég) tömegét.</p> <p>Kiegészítő követelmények:</p> <p>A készletben, ill. felszerelésben levő veszélyes anyagokat olyan belső csomagolóeszközökbe kell elhelyezni, amelyek tartalma nem haladja meg a 250 ml-t vagy 250 g-ot, és védeni kell a vizsgálókészletekben vagy elsősegély felszerelésekben található más anyagoktól.</p>	

P902	CSOMAGOLÁSI UTASÍTÁS	P902
	Ezt a csomagolási utasítást az UN 3268 tételre kell alkalmazni.	
	<p>Csomagolt tárgyak:</p> <p>A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:</p> <p>Hordók (1A2, 1B2, 1N2, 1H2, 1D, 1G);</p> <p>Ládák (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2);</p> <p>Kannák (3A2, 3B2, 3H2);</p> <p>A csomagolóeszközöknek a III csomagolási csoport igénybevételi szintjének kell megfelelniük.</p> <p>A csomagolóeszközöket úgy kell tervezni és gyártani, hogy normális szállítási feltételek között a tárgyak elmozdulását és nem szándékos működésbe lépését megakadályozzák.</p> <p>Csomagolatlan tárgyak:</p> <p>Ezek a tárgyak a gyártási helyről a szerelési helyre e célra készült szállítóeszközben, járművön, ill. konténerben csomagolatlanul is szállíthatók.</p> <p>Kiegészítő követelmény:</p> <p>A nyomástartó tartályoknak meg kell felelniük az illetékes hatóság által a nyomástartó tartályban levő anyag(ok)ra előírt követelményeknek.</p>	

P903	CSOMAGOLÁSI UTASÍTÁS	P903
Ezt a csomagolási utasítást az UN 3090, 3091, 3480 és 3481 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:		
<p>1) Cellákhoz és akkumulátorokhoz:</p> <p style="padding-left: 40px;">Hordók (1A2, 1B2, 1N2, 1H2, 1D, 1G);</p> <p style="padding-left: 40px;">Ládák (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2);</p> <p style="padding-left: 40px;">Kannák (3A2, 3B2, 3H2);</p> <p>A cellákat és az akkumulátorokat úgy kell a csomagolóeszközbe helyezni, hogy védve legyenek az olyan sérülésektől, amit a cella, ill. az akkumulátor csomagolásban való elmozdulása vagy elhelyezkedése okozhat.</p> <p>A csomagolóeszközöknek a II csomagolási csoport igénybevételi szintjének kell megfelelniük.</p>		
<p>2) Az erős, ütésálló házzal rendelkező, 12 kg vagy annál nagyobb bruttó tömegű cellákhoz és akkumulátorokhoz, valamint az ilyen cellákból és akkumulátorokból álló szerelvényekhez ezen kívül:</p> <p>a) erős külső csomagolás;</p> <p>b) védőburkolat (pl. teljesen zárt vagy rácsos farekesz); vagy</p> <p>c) rakodólap vagy egyéb kezelőeszköz.</p> <p>A cellák és az akkumulátorok rögzítésének meg kell akadályoznia nem szándékos elmozdulásukat, és a sorkapcsokat a felettük levő tárgyak tömegükkel nem terhelhetik.</p> <p>A csomagolóeszközökre a 4.1.1.3 bekezdés előírásait nem kell betartani.</p>		
<p>3) Készülékkel egybecsomagolt cellákhoz és akkumulátorokhoz:</p> <p>Ezen csomagolási utasítás 1) bekezdése követelményeinek megfelelő csomagolóeszköz, amelyet a készülékkel egy külső csomagolóeszközbe helyeznek; vagy</p> <p>A cellákat, ill. akkumulátorokat teljesen beburkoló csomagolóeszköz, amelyet a készülékkel együtt az ezen csomagolási utasítás 1) bekezdése követelményeinek megfelelő külső csomagolóeszközbe helyeznek.</p> <p>A készüléket rögzíteni kell, nehogy a külső csomagolásban elmozdulhasson.</p> <p>A „készülék” kifejezés e csomagolási utasítás értelmében azt a berendezést jelenti, amelynek működéséhez szükségesek azok a fémlítium- vagy lítiumion cellák, ill. akkumulátorok, amelyekkel egybe vannak csomagolva.</p>		
<p>4) Készülékben lévő cellákhoz és akkumulátorokhoz:</p> <p>Erős külső csomagolóeszköz, amely ürtartalmának és rendeltetésének megfelelő szilárdságú, alkalmas anyagból és kialakítással készült úgy, hogy képes megakadályozni, hogy a cella, ill. akkumulátor a szállítás közben véletlenül működésbe lépjen.</p> <p>A csomagolóeszközökre a 4.1.1.3 bekezdés előírásait nem kell betartani.</p> <p>A nagyméretű készülékek csomagolás nélkül vagy raklapon is feladhatók, amennyiben a cellának, ill. akkumulátoroknak a készülék, amelyben vannak, azonos védelmet nyújt.</p> <p>Rádiófrekvenciás azonosítók (RFID), órák, hőmérséklet regisztrálók, amelyek nem képesek veszélyes hőfejlődést előidézni, erős külső csomagolásban akkor is szállíthatók, ha a szállítás során szándékosan működnek.</p>		
<p>Kiegészítő követelmény:</p> <p>A cellákat és az akkumulátorokat védeni kell a rövidzárlattal szemben.</p>		

P903a	CSOMAGOLÁSI UTASÍTÁS	P903a
Ezt a csomagolási utasítást az UN 3090, 3091, 3480 és 3481 tétel alá tartozó használt cellákra és akkumulátorokra kell alkalmazni.		
<p>A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:</p> <p>A II csomagolási csoport igénybevételi szintjének megfelelő csomagolóeszközök.</p> <p>Nem jóváhagyott csomagolóeszközök is használhatók, de csak akkor, ha</p> <ul style="list-style-type: none"> – kielégítik a 4.1.1.3 bekezdés kivételével a 4.1.1 és a 4.1.3 szakasz általános előírásait; – a cellák és az akkumulátorok elhelyezése és halmazolása kizárja a rövidzárlat veszélyét; – a küldeménydarab tömege nem haladja meg a 30 kg-ot. 		
<p>Kiegészítő követelmény:</p> <p>Az akkumulátorokat védeni kell a rövidzárlattal szemben.</p>		

P903b	CSOMAGOLÁSI UTASÍTÁS	P903b
Ezt a csomagolási utasítást az UN 3090, 3091, 3480 és 3481 tétel alá tartozó használt cellákra és akkumulátorokra kell alkalmazni.		
<p>Az ártalmatlanítás céljából összegyűjtött, egyenként legfeljebb 500 g bruttó tömegű, használt lítium-cellák és -akkumulátorok akár másféle (nemlítium-) cellákkal és akkumulátorokkal együtt, akár magukban szállíthatók egyedi védelem nélkül a következő feltételekkel:</p> <ol style="list-style-type: none"> 1) olyan 1H2 jelű hordókban vagy 4H2 jelű ládákban, amelyek szilárd anyagokra a II csomagolási csoport igénybevételi szintjének felelnek meg; 2) olyan 1A2 jelű hordókban vagy 4A jelű ládákban, amelyek szilárd anyagokra a II csomagolási csoport igénybevételi szintjének felelnek meg, és olyan polietilén zsákkal vannak ellátva, amelyek: <ul style="list-style-type: none"> – tépőszilárdsága legalább 480 g a zsák hossz- és keresztirányában (gyártásirányban és arra merőlegesen); – vastagsága legalább 500 µ, fajlagos elektromos ellenállása nagyobb 10 Mohm-nál és a vízfeltevő képessége 24 óra alatt, 25 °C-on kisebb 0,01%-nál; – zártnak kell lennie és amely – csak egyszer használható; 3) 30 kg-nál kisebb bruttó tömegű gyűjtő tálcákon, amelyek nemvezető anyagból vannak és a 4.1.1.1, a 4.1.1.2 és a 4.1.1.5 – 4.1.1.8 bekezdések előírásainak megfelelnek. 		
<p>Kiegészítő követelmények:</p> <p>A csomagolásban fennmaradó üres teret megfelelő párnázóanyaggal kell kitölteni. A párnázóanyag elhagyható, ha a polietilén zsák a csomagolóeszközt teljesen kitölti és a zsák zárva van.</p> <p>A légmentesen zárt csomagolásokat a 4.1.1.8 bekezdés szerint szellőző-szerkezetekkel kell ellátni. A szellőzőszerkezetet úgy kell kialakítani, hogy a gázok által kifejtett túlnyomás ne haladja meg a 10 kPa-t.</p>		

P904	CSOMAGOLÁSI UTASÍTÁS	P904
Ezt a csomagolási utasítást az UN 3245 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók:		
<p>1) A 4.1.1.1, a 4.1.1.2, a 4.1.1.4, a 4.1.1.8 bekezdés és a 4.1.3 szakasz előírásainak megfelelő csomagolóeszközök, amelyek úgy vannak tervezve, hogy kielégítik a 6.1.4 szakasz gyártásra vonatkozó követelményeit. A befogadóképességnek és a tervezett felhasználásnak megfelelő kialakítású, megfelelő szilárdságú és alkalmas anyagból készített külső csomagolóeszközt kell használni. Ha ezt a csomagolási utasítást kombinált csomagolások belső csomagolásainak szállításánál alkalmazzák, a csomagolóeszközt úgy kell tervezni és gyártani, hogy normális szállítási feltételek között a nem szándékos kiszabadulását megakadályozza.</p> <p>2) Olyan csomagolóeszközök, amelyeknek nem kell megfelelniük a 6. rész csomagolás vizsgálati előírásainak, de megfelelnek a következőknek:</p> <p>a) belső csomagolás, amely a következőkből áll:</p> <p>i) elsődleges tartály(ok)ból és másodlagos csomagolásból, az elsődleges tartály(ok)nak és a másodlagos csomagolásnak folyékony anyagok esetén szivárgásmentesnek, szilárd anyagok esetén portömörnek kell lenniük;</p> <p>ii) folyékony anyagok esetén: az elsődleges tartály(ok) és a másodlagos csomagolás közé helyezett nedvszívó anyagból, amely elegendő mennyiségű az elsődleges tartály(ok) teljes tartalmának felszívására, és a folyékony anyag esetleges kiszabadulása nem eredményezheti sem a párnázóanyag, sem a külső csomagolás sérülését;</p> <p>iii) ha több törékeny elsődleges tartályt helyeznek közös másodlagos csomagolásba, akkor azokat vagy egyedileg be kell burkolni vagy úgy kell elválasztani, hogy ne érintkezhessenek egymással;</p>		
<p>A szállításhoz a következő jelölést kell a külső csomagolás külső felületén elütő színű háttérre, jól látható és tartós módon felvinni. A jelölésnek 45°-kal elforgatott-négyzet (rombusz) alakúnak kell lennie, amelynek oldalhosszúsága legalább 50 mm, a vonal vastagságának legalább 2 mm-nek, a betűk és számok magasságának legalább 6 mm-nek kell lennie.</p>		
		
Kiegészítő követelmény:		
<p>Jég, szárazjég és cseppfolyósított nitrogén</p> <p>Ha hűtőközegként szárazjeget vagy cseppfolyósított nitrogént használnak, az 5.5.3 szakasz előírásait kell betartani. Ha jeget használnak, azt a másodlagos csomagolás(ok) köré, a külső csomagolásba vagy az egyesítőcsomagolásba kell helyezni. A másodlagos csomagolás(ok) eredeti helyzetben való rögzítésére belső távtartókat kell alkalmazni. Amennyiben jeget használnak, a külső csomagolásnak, ill. az egyesítőcsomagolásnak folyadéktömörnek kell lennie.</p>		

P905	CSOMAGOLÁSI UTASÍTÁS	P905
Ezt a csomagolási utasítást UN 2990 és 3072 tételre kell alkalmazni.		
Bármilyen alkalmas csomagolás engedélyezett, amennyiben a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják, azzal az eltéréssel, hogy a csomagolóeszközöknek nem kell megfelelniük a 6. rész csomagolás vizsgálati előírásainak.		
Ha a mentőeszköz kialakítása olyan, hogy egy merev, időjárásálló, külső burkolatban van, vagy az a részét képezi (mint pl. a mentőcsónakoknál), akkor csomagolás nélkül is szállítható.		
Kiegészítő követelmények:		
<ol style="list-style-type: none"> A eszközökön belül levő, veszélyes anyagot vagy tárgyat tartalmazó tartozékokat úgy kell rögzíteni, hogy nem szándékos elmozdulás ne következhesen be, és ezen kívül: <ol style="list-style-type: none"> az 1 osztályba tartozó jelzőtesteket műanyag vagy papírlemez belső csomagolóeszközökbe kell tenni; a nem gyúlékony, nem mérgező gázokat az illetékes hatóság előírásai szerinti palackba kell tölteni; az elektromos akkumulátort (8 osztály) és a lítium akkumulátort (9 osztály) le kell kapcsolni vagy elektromosan szigetelni kell és rögzíteni kell a folyadék kifolyásának megakadályozására; és a kis mennyiségű egyéb veszélyes anyagot (például a 3, a 4.1 és az 5.2 osztályba tartozókat) erős belső csomagolóeszközbe kell csomagolni. A szállításra való előkészítés és a csomagolás során intézkedéseket kell fogantatosítani az eszköz nem szándékos felfűvódásának megakadályozására. 		

P906	CSOMAGOLÁSI UTASÍTÁS	P906
Ezt a csomagolási utasítást az UN 2315, 3151, 3152 és 3432 tételre kell alkalmazni.		
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják:		
<ol style="list-style-type: none"> PCB-t, polihalogénezett bifenileket vagy terfenileket tartalmazó vagy azzal szennyezett folyékony és szilárd anyagokhoz a P001, ill. a P002 szerinti csomagolóeszközök. Transzformátorokhoz, kondenzátorokhoz és egyéb berendezésekhez szivárgásmentes csomagoló-eszközök, amelyek képesek a berendezésben levő folyékony PCB-k, polihalogénezett bifenilek vagy terfenilek legalább 1,25-szorosának befogadására. A csomagolóeszközben megfelelő mennyiségű inert anyagnak kell lennie, amely a berendezésben levő folyékony anyag legalább 1,1-szeresét képes felszívni. Általában a transzformátorokat és kondenzátorokat olyan szivárgásmentes fém csomagolóeszközökben kell szállítani, amelyek képesek a transzformátorokon és kondenzátorokon túl a bennük levő folyékony anyag legalább 1,25-szorosának befogadására. 		
Az előzőeken kívül azok a folyékony és szilárd anyagok, amelyek nem a P001 és a P002 utasítás szerint vannak csomagolva, ill. a csomagolatlan transzformátorok és kondenzátorok olyan szállítóegységben is szállíthatók, amely legalább 800 mm magas, szivárgásmentes fémtálcával van ellátva, amely kielégítő mennyiségű nedvszívó anyagot tartalmaz az esetleges folyadék legalább 1,1-szeresének felszívására.		
Kiegészítő követelmény:		
Megfelelő intézkedéseket kell tenni a transzformátorok és kondenzátorok lezárására, hogy megakadályozzák a szivárgást normális szállítási körülmények között.		

R001	CSOMAGOLÁSI UTASÍTÁS			R001
A következő csomagolóeszközök használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják.				
Finomlemez csomagolóeszközök		Legnagyobb úrtartalom/legnagyobb nettó tömeg		
	I csomagolási csoport	II csomagolási csoport	III csomagolási csoport	
acél, nem levehető tetővel (0A1)	Nem használható	40 l / 50kg	40 l / 50kg	
acél, levehető tetővel (0A2) ^{a)}	Nem használható	40 l / 50kg	40 l / 50kg	
a) Az UN 1261 nitro-metánhoz nem használható.				

Megjegyzés: 1. Ez az utasítás folyékony és szilárd anyagokhoz is használható, feltéve, hogy a csomagolóeszköz gyártási típusát ennek megfelelően vizsgálták, ill. látták el jelöléssel.

2. A 3 osztály, II csomagolási csoportjába tartozó anyagok közül ezek a csomagoló-eszközök csak olyan anyagokhoz használhatók, amelyek nem rendelkeznek járulékos veszéllyel és gőznyomásuk nem haladja meg 50 °C-on a 110 kPa-t, valamint az enyhén mérgező peszticidekhez.

4.1.4.2 Az IBC-k használatára vonatkozó csomagolási utasítások

IBC01	CSOMAGOLÁSI UTASÍTÁS	IBC01
A következő IBC-k használhatók, feltéve, hogy a 4.1.1, 4.1.2 és 4.1.3 szakasz általános előírásait betartják: Fém IBC-k (31A, 31B és 31N).		
Csak a RID és az ADR szerinti szállításnál érvényes különleges csomagolási előírás:		
BB1	Az UN 3130-hoz: a tartályok nyílásait két, egymás mögött elhelyezett szerkezettel tömören le kell zárni, melyek közül az egyiknek csavarmentesnek vagy azonos értékű módon rögzítettnek kell lennie.	

IBC02	CSOMAGOLÁSI UTASÍTÁS	IBC02
A következő IBC-k használhatók, feltéve, hogy a 4.1.1, 4.1.2 és 4.1.3 szakasz általános előírásait betartják:		
1) Fém IBC-k (31A, 31B és 31N);		
2) Merev falú műanyag IBC-k (31H1 és 31H2);		
3) Összetett IBC-k (31HZ1).		
Különleges csomagolási előírások:		
B5	Az UN 1791, 2014, 2984 és 3149-hez: az IBC-ket olyan szerkezettel kell ellátni, amely lehetővé teszi a szállítás alatti szellőzést. A szellőző-szerkezet bemenetének a legnagyobb töltési fok mellett is az IBC gőzterében kell maradnia a szállítás alatt.	
B7	Az UN 1222 és 1865-höz: 450 liternél nagyobb úrtartalmú IBC-k nem használhatók, mivel az anyag nagy mennyiségben szállítva robbanásveszélyes lehet.	
B8	Ez az anyag tiszta formában nem szállítható IBC-ben, mivel ismeretes, hogy gőznyomása 50 °C-on nagyobb 110 kPa-nál, ill. 55 °C-on nagyobb 130 kPa-nál.	
B15	Az 55%-nál több tiszta savat tartalmazó UN 2031 salétromsav oldat szállítására használt merev falú műanyag IBC-k és merev falú műanyag belső tartállyal rendelkező összetett IBC-k megengedett használati időtartama a gyártásuk időpontjától számított 2 év.	
Csak a RID és az ADR szerinti szállításnál érvényes különleges csomagolási előírás:		
BB2	Az UN 1203-hoz: az 534 különleges előírástól (lásd a 3.3.1 szakaszt) eltérően IBC csak akkor használható, ha a tényleges gőznyomás 50 °C-on legfeljebb 110 kPa, ill. 55 °C-on legfeljebb 130 kPa.	

IBC03	CSOMAGOLÁSI UTASÍTÁS	IBC03
A következő IBC-k használhatók, feltéve, hogy a 4.1.1, 4.1.2 és 4.1.3 szakasz általános előírásait betartják:		
1) Fém IBC-k (31A, 31B és 31N); 2) Merev falú műanyag IBC-k (31H1 és 31H2); 3) Összetett IBC-k (31HZ1, 31HA2, 31HB2, 31HN2, 31HD2 és 31HH2).		
Különleges csomagolási előírás:		
B8	Ez az anyag tiszta formában nem szállítható IBC-ben, mivel ismeretes, hogy gőznyomása 50 °C-on nagyobb 110 kPa-nál, ill. 55 °C-on nagyobb 130 kPa-nál.	

IBC04	CSOMAGOLÁSI UTASÍTÁS	IBC04
A következő IBC-k használhatók, feltéve, hogy a 4.1.1, 4.1.2 és 4.1.3 szakasz általános előírásait betartják:		
Fém IBC-k (11A, 11B, 11N, 21A, 21B és 21N).		

IBC05	CSOMAGOLÁSI UTASÍTÁS	IBC05
A következő IBC-k használhatók, feltéve, hogy a 4.1.1, 4.1.2 és 4.1.3 szakasz általános előírásait betartják:		
1) Fém IBC-k (11A, 11B, 11N, 21A, 21B és 21N); 2) Merev falú műanyag IBC-k (11H1, 11H2, 21H1 és 21H2); 3) Összetett IBC-k (11HZ1 és 21HZ1).		

IBC06	CSOMAGOLÁSI UTASÍTÁS	IBC06
A következő IBC-k használhatók, feltéve, hogy a 4.1.1, 4.1.2 és 4.1.3 szakasz általános előírásait betartják:		
1) Fém IBC-k (11A, 11B, 11N, 21A, 21B és 21N); 2) Merev falú műanyag IBC-k (11H1, 11H2, 21H1 és 21H2); 3) Összetett IBC-k (11HZ1, 11HZ2, 21HZ1 és 21HZ2).		
Kiegészítő követelmény:		
Ha a szilárd anyag a szállítás alatt folyékonnyá válhat, lásd a 4.1.3.4 bekezdést.		
Különleges csomagolási előírás:		
B12	Az UN 2907-hez: az IBC-knek a II csomagolási csoport igénybevételi szintjének kell megfelelniük. Az I csomagolási csoport igénybevételi szintjének megfelelő IBC-k nem használhatók.	

IBC07	CSOMAGOLÁSI UTASÍTÁS	IBC07
A következő IBC-k használhatók, feltéve, hogy a 4.1.1, 4.1.2 és 4.1.3 szakasz általános előírásait betartják:		
1) Fém IBC-k (11A, 11B, 11N, 21A, 21B és 21N); 2) Merev falú műanyag IBC-k (11H1, 11H2, 21H1 és 21H2); 3) Összetett IBC-k (11HZ1, 11HZ2, 21HZ1 és 21HZ2); 4) Fa IBC-k (11C, 11D és 11F).		
Kiegészítő követelmények:		
1. Ha a szilárd anyag a szállítás alatt folyékonnyá válhat, lásd a 4.1.3.4 bekezdést. 2. A fa IBC-k bélésének portömörnek kell lennie.		

IBC08	CSOMAGOLÁSI UTASÍTÁS	IBC08
A következő IBC-k használhatók, feltéve, hogy a 4.1.1, 4.1.2 és 4.1.3 szakasz általános előírásait betartják:		
1) Fém IBC-k (11A, 11B, 11N, 21A, 21B és 21N); 2) Merev falú műanyag IBC-k (11H1, 11H2, 21H1 és 21H2); 3) Összetett IBC-k (11HZ1, 11HZ2, 21HZ1 és 21HZ2); 4) Papírlemez IBC-k (11G); 5) Fa IBC-k (11C, 11D és 11F); 6) Hajlékony falú IBC-k (13H1, 13H2, 13H3, 13H4, 13H5, 13L1, 13L2, 13L3, 13L4, 13M1 és 13M2).		
Kiegészítő követelmény:		
Ha a szilárd anyag a szállítás alatt folyékonyra válhat, lásd a 4.1.3.4 bekezdést.		
Különleges csomagolási előírások:		
B3	A hajlékony falú IBC-knek portömörnek és vízállónak kell lenniük, vagy el kell látni portömör és vízálló béléssel.	
B4	A hajlékony falú, a papírlemez és a fa IBC-knek portömörnek és vízállónak kell lenniük, vagy el kell látni portömör és vízálló béléssel.	
B6	Az UN 1363, 1364, 1365, 1386, 1408, 1841, 2211, 2217, 2793 és 3314 tételekhez: az IBC-knek nem kell kielégíteniük a 6.5 fejezetnek az IBC-k vizsgálatára vonatkozó követelményeit.	
B13	<i>Megjegyzés: Az UN 1748, 2208, 2880, 3485, 3486 és 3487 anyagai az IMDG Kódex szerint IBC-ben tengeren nem szállíthatók.</i>	

IBC99	CSOMAGOLÁSI UTASÍTÁS	IBC99
Csak az illetékes hatóság által, ezen árukhoz jóváhagyott IBC-k használhatók. Az illetékes hatóság jóváhagyásának másolatát a küldeményhez mellékelni kell, vagy a fuvarokmányban utalni kell arra, hogy a csomagolóeszközt az illetékes hatóság jóváhagyta.		

IBC100	CSOMAGOLÁSI UTASÍTÁS	IBC100
Ezt a csomagolási utasítást az UN 0082, 0241, 0331 és 0332 tételre kell alkalmazni.		
A következő IBC-k használhatók, feltéve, hogy a 4.1.1, 4.1.2 és 4.1.3 szakasz általános előírásait, valamint a 4.1.5 szakasz különleges előírásait betartják:		
1) Fém IBC-k (11A, 11B, 11N, 21A, 21B, 21N, 31A, 31B és 31N); 2) Hajlékony falú IBC-k (13H2, 13H3, 13H4, 13L2, 13L3, 13L4 és 13M2); 3) Merev falú műanyag IBC-k (11H1, 11H2, 21H1, 21H2, 31H1 és 31H2); 4) Összetett IBC-k (11HZ1, 11HZ2, 21HZ1, 21HZ2, 31HZ1 és 31HZ2).		
Kiegészítő követelmények:		
1. IBC-k csak a szabadon folyó anyagokhoz használhatók. 2. Hajlékony falú IBC-k csak szilárd anyagokhoz használhatók.		
Különleges csomagolási előírások:		
B9	Az UN 0082-höz: ez a csomagolási utasítás csak akkor alkalmazható, ha az anyag ammónium-nitrát vagy más szervesetlen nitrátok egyéb éghető anyagokkal alkotott keveréke, amelyek nem robbanó alkotórészek. Az ilyen robbanóanyagok nem tartalmazhatnak nitroglicerint, hasonló folyékony szerves nitrátokat vagy klorátokat. Fém IBC-k nem használhatók.	
B10	Az UN 0241-hez: ez a csomagolási utasítás csak olyan anyaghoz használható, amely fő alkotórészként vizet és nagy mennyiségben ammónium-nitrátot vagy más oxidálószer tartalmaz, amely részben vagy teljes egészében oldott állapotban van. A további alkotórészek lehetnek szénhidrogének vagy alumíniumpor, de nem tartalmazhat nitrovegyületeket, pl. trinitro-toluolt. Fém IBC-k nem használhatók.	

IBC520		CSOMAGOLÁSI UTASÍTÁS			IBC520	
Ezt a csomagolási utasítást az F típusú szerves peroxidokra és önreaktív anyagokra kell alkalmazni.						
A következőkben felsorolt IBC-kben a felsorolt készítmények szállíthatók, amennyiben a 4.1.1, a 4.1.2 és a 4.1.3 szakasz általános előírásait és a 4.1.7.2 bekezdés különleges előírásait betartják:						
Az alábbi felsorolásban nem szereplő készítményekhez csak az illetékes hatóság által engedélyezett IBC-k használhatók (lásd a 4.1.7.2.2 pontot).

Kiegészítő követelmények:

1. Az IBC-ket olyan szerkezettel kell ellátni, amely lehetővé teszi a szállítás alatti szellőzést. A szellőző-szerkezet bemenetének a legnagyobb töltési fok mellett is az IBC gőzterében kell maradnia a szállítás alatt.
2. A fém IBC-k vagy teljes falú fémburkolattal rendelkező összetett IBC-k robbanásszerű felhasadásának elkerülésére a vészlefüvő-szerkezetnek olyannak kell lennie, hogy az összes bomlástermék és gőz eltávozhasson, ami az öngyorsuló bomlás során fejlődik, vagy akkor, ha legalább egy óráig olyan láng veszi körül, amely a 4.2.1.13.8 pont szerinti képlettel jellemezhető. Az ebben a csomagolási utasításban megadott szabályozási és vészhőmérsékleteket szigetelés nélküli IBC-re állapították meg. Szerves peroxidok e csomagolási utasítás szerinti IBC-ben való feladásakor a feladónak biztosítania kell, hogy az IBC megfelel a következő előírásoknak:
 - a) az IBC-n alkalmazott nyomáscsökkentő- és vészlefüvő szerkezetek kialakításánál megfelelően figyelembe vették a szerves peroxid öngyorsuló bomlását és a tűz hatását; és
 - b) a megadott szabályozási és vészhőmérséklet – a használandó IBC kialakítását (pl. szigetelését is) figyelembe véve – megfelelő.

IBC620	CSOMAGOLÁSI UTASÍTÁS	IBC620
Ezt az utasítást az UN 3291 tételre kell alkalmazni.		
A következő IBC-k használhatók, feltéve, hogy a 4.1.1.15 bekezdés kivételével a 4.1.1, 4.1.2 és 4.1.3 szakasz általános előírásait betartják: A II csomagolási csoport teljesítőképességi szintjének megfelelő merev falú, szivárgásmentes IBC-k.		
Kiegészítő követelmények:		
<ol style="list-style-type: none"> 1. Elegendő mennyiségű nedvszívó anyagnak kell lenni az IBC-ben levő folyadék teljes mennyiségének felszívásához. 2. Az IBC-nek alkalmasnak kell lennie a folyékony anyag megtartására. 3. Az éles tárgyakat, pl. törött üvegeket, tüket tartalmazó IBC-nek dőfésállónak kell lennie. 		

4.1.4.3

A nagycsomagolások használatára vonatkozó csomagolási utasítások

LP01		CSOMAGOLÁSI UTASÍTÁS (folyékony anyaghoz)			LP01
A következő nagycsomagolások használhatók, feltéve, hogy a 4.1.1 és 4.1.3 szakasz általános előírásait betartják.					
Belső csomagolóeszközök		Külső nagycsomagolások	I csomagolási csoport	II csomagolási csoport	III csomagolási csoport
Üveg	10 l	Acél (50A)	Nem használható	Nem használható	Legnagyobb úrtartalom 3 m ³
Műanyag	30 l	Alumínium (50B)			
Fém	40 l	Fém (acélt és alumíniumot kivéve) (50N)			
		Merev falú műanyag (50H)			
		Közönséges fa (50C)			
		Rétegelt falemez (50D)			
		Farostlemez (50F)			
		Merev falú papírlemez (50G)			

LP02		CSOMAGOLÁSI UTASÍTÁS (szilárd anyaghoz)			LP02
A következő nagycsomagolások használhatók, feltéve, hogy a 4.1.1 és 4.1.3 szakasz általános előírásait betartják:					
Belső csomagolóeszközök		Külső nagycsomagolások	I csomagolási csoport	II csomagolási csoport	III csomagolási csoport
Üveg	10 kg	Acél (50A)	Nem használható	Nem használható	Legnagyobb úrtartalom 3 m ³
Műanyag ^{b)}	50 kg	Alumínium (50B)			
Fém	50 kg	Fém (acélt és alumíniumot kivéve) (50N)			
Papír ^{a), b)}	50 kg	Merev falú műanyag (50H)			
Papírlémez ^{a), b)}	50 kg	Közönséges fa (50C)

		Merev falú papírlémez (50G)			
		Hajlékony falú műanyag (51H) ^{c)}			
Különleges csomagolási előírások:					
L2	Az UN 1950 aeroszolokhoz használt nagycsomagolásoknak a III csomagolási csoport követelményeinek kell megfelelniük. A 327 különleges előírás szerint szállított, hulladékká vált aeroszolokhoz használt nagycsomagolásokat ezen kívül olyan eszközzel (pl. nedvszívó anyaggal) kell ellátni, ami a szállítás alatt esetleg szabaddá váló folyadékot képes visszatartani.				
L3	Megjegyzés: Az UN 2208 és 3486 tétel anyagai tengeren nem szállíthatók nagycsomagolásban.				

a) Ez a csomagolóeszköz nem használható, ha a szállított anyag a szállítás alatt folyékonyvá válhat.

b) A csomagolóeszköznek portömörnek kell lennie.

c) Csak hajlékony falú belső csomagolásokhoz használható.

LP99	CSOMAGOLÁSI UTASÍTÁS	LP99
Csak az illetékes hatóság által, ezen árukhoz jóváhagyott csomagolóeszközök használhatók (lásd a 4.1.3.7 bekezdést). Az illetékes hatóság jóváhagyásának másolatát a küldeményhez mellékelni kell, vagy a fuvarokmányban utalni kell arra, hogy a csomagolóeszközt az illetékes hatóság jóváhagyta.		

LP101	CSOMAGOLÁSI UTASÍTÁS		LP101
A következő nagycsomagolások használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.			
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső nagycsomagolások	
Nem szükséges	Nem szükséges	Acél (50A) Alumínium (50B) Fém (acélt és alumíniumot kivéve) (50N) Merev falú műanyag (50H) Közönséges fa (50C) Rétegelt falemez (50D) Farostlemez (50F) Merev falú papírlemez (50G)	
Különleges csomagolási előírás:			
L1 Az UN 0006, 0009, 0010, 0015, 0016, 0018, 0019, 0034, 0035, 0038, 0039, 0048, 0056, 0137, 0138, 0168, 0169, 0171, 0181, 0182, 0183, 0186, 0221, 0243, 0244, 0245, 0246, 0254, 0280, 0281, 0286, 0287, 0297, 0299, 0300, 0301, 0303, 0321, 0328, 0329, 0344, 0345, 0346, 0347, 0362, 0363, 0370, 0412, 0424, 0425, 0434, 0435, 0436, 0437, 0438, 0451, 0488 és 0502 számhoz: A rendszerint katonai célú, nagyméretű, robusztus robbanótárgyak gyújtószerkezeteik nélkül vagy gyújtószerkezettel, de legalább két hatékony védőszerkezettel csomagolatlanul szállíthatók. Ha az ilyen tárgyak hajtótöltetet tartalmaznak vagy önhajtók, akkor gyújtórendszereiket védeni kell a normális szállítási feltételek melletti működésbe lépéssel szemben. Ha a csomagolatlan tárgy a 4 vizsgálati sorozatban negatív eredményt ad, ez jelzi, hogy az csomagolás nélküli szállításra figyelembe vehető. Az ilyen csomagolatlan tárgyak csúszótálcákra erősíthetők vagy keretekbe vagy más alkalmas anyagmozgató eszközbe helyezhetők.			

LP102	CSOMAGOLÁSI UTASÍTÁS		LP102
A következő nagycsomagolások használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait és a 4.1.5 szakasz különleges előírásait betartják.			
Belső csomagolóeszközök	Köztes csomagolóeszközök	Külső nagycsomagolások

LP621	CSOMAGOLÁSI UTASÍTÁS	LP621
Ezt a csomagolási utasítást az UN 3291 tételre kell alkalmazni.		
A következő nagycsomagolások használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános csomagolási előírásait betartják:		
1) Belső csomagolóeszközökbe helyezett kórházi hulladékhoz: a 6.6 fejezet előírásait szilárd anyagokra, a II csomagolási csoportra kielégítő merev falú, szivárgásmentes nagycsomagolások, amennyiben elegendő nedvszívó anyagot tartalmaznak a teljes folyadékmennyiség felszívására és folyadék megtartására alkalmas nagycsomagolások. 2) Nagyobb mennyiségű folyadékot tartalmazó küldeménydarabokhoz: a 6.6 fejezet előírásait folyékony anyagokra a II csomagolási csoportra kielégítő nagycsomagolások.		
Kiegészítő követelmény: Az éles tárgyakat, pl. törött üvegeket, tüket tartalmazó nagycsomagolásoknak döfésállóknak kell lenniük, és meg kell tartaniuk a folyékony anyagokat a 6.6 fejezet szerinti vizsgálati körülmények között.		

LP902	CSOMAGOLÁSI UTASÍTÁS	LP902
Ezt a csomagolási utasítást az UN 3268 tételre kell alkalmazni.		
Csomagolt tárgyak A következő nagycsomagolások használhatók, feltéve, hogy a 4.1.1 és a 4.1.3 szakasz általános előírásait betartják: A III csomagolási csoport igénybevételi szintjének megfelelő csomagolóeszközök. A csomagolóeszközöket úgy kell tervezni és gyártani, hogy normális szállítási feltételek között a tárgyak elmozdulását és nem szándékos működésbe lépését megakadályozzák.		
Csomagolatlan tárgyak Ezek a tárgyak a gyártási helyről a szerelési helyre e célra készült szállítóeszközben, járművön, ill. konténerben csomagolatlanul is szállíthatók.		
Kiegészítő követelmény: Az esetleges nyomástartó tartályoknak meg kell felelniük az illetékes hatóságnak a nyomástartó tartályban levő anyag(ok)ra vonatkozó követelményeinek.		

4.1.4.4 (törölve)

4.1.5 Különleges csomagolási előírások az 1 osztály áruhoz

4.1.5.1 A 4.1.1 szakasz általános előírásait be kell tartani.

4.1.5.2 Az 1 osztály áruhoz használt minden csomagolóeszközt úgy kell tervezni és kivitelezni, hogy

- a robbanóanyagok és robbanótárgyak védve legyenek, ne szabadulhassanak ki, és normális szállítási feltételek között, beleértve a várható hőmérséklet-, páratartalom- vagy nyomásváltozásokat, a nem szándékos begyújtás vagy beindulás veszélye ne növekedjen;
- a teljes küldeménydarab normális szállítási feltételek mellett biztonságosan kezelhető legyen; és
- a küldeménydarabok ellenálljanak azon halmazolási terhelésnek, aminek a szállítás során várhatóan ki lehetnek téve, úgy, hogy ne növekedjen a robbanóanyag által képviselt veszély, a csomagolások árumegtartó funkciója ne szenvedjen kárt és ne deformálódjanak olyan mértékben vagy módon, ami azután csökkenti szilárdságukat vagy a halmaz instabilitását okozná.

4.1.5.3 Minden robbanóanyagot és robbanótárgyat feladásra kész állapotban a 2.2.1 szakaszban leírt eljárás szerint be kell sorolni.

4.1.5.4 Az 1 osztály áruit a 3.2 fejezet „A” táblázat 8 oszlopában található csomagolási utasítások szerint kell csomagolni, amelyek a 4.1.4 szakaszban vannak részletezve.

- 4.1.5.5** Hacsak az ADR-ben nincs más előírva, a csomagolóeszközöknek, IBC-knek és nagy-csomagolásoknak a 6.1, a 6.5, ill. a 6.6 fejezet követelményeinek kell megfelelniük és e fejezetek vizsgálati követelményeit a II csomagolási csoport szintjén kell kielégíteniük.
- 4.1.5.6** A folyékony robbanóanyagokat tartalmazó csomagolóeszközök zárószerkezeteinek a szivárgás elkerülésére kettős tömítésűnek kell lenniük.
- 4.1.5.7** A fémhordók zárószerkezetét megfelelő tömítéssel kell ellátni; ha a zárószerkezet csavarmentes kialakítású, a robbanóanyagnak nem szabad a csavarmenetbe bejutnia.
- 4.1.5.8** A vízzeloldható robbanóanyagokhoz használt csomagolóeszközöknek vízállónak kell lenniük. Az érzéketlenített vagy flegmatizált anyagokhoz használt csomagolóeszközöknek a koncentráció változásának megakadályozására a szállítás alatt zárva kell lenniük.
- 4.1.5.9** Amennyiben a küldeménydarab vízzel töltött kettős burkolatot tartalmaz, és a víz a szállítás alatt megfagyhat, a vízhez a fagyás megakadályozására elegendő mennyiségű fagyásgátló szert kell adni. Olyan fagyásgátló nem használható, amely eredendő gyúlékonysága révén tűzveszélyt okozhat.
- 4.1.5.10** Szegek, kapcsok és más fém zárószerkezetek, amelyek nincsenek védőbevonattal ellátva, nem hatolhatnak be a külső csomagolás belsejébe, hacsak a belső csomagolás nem védi kellőképpen a robbanóanyagokat és robbanótárgyakat a fémmel való érintkezéstől.
- 4.1.5.11** A belső csomagolásoknak, távtartóknak, párnázó- (tömítő-) anyagoknak, valamint a robbanóanyagok vagy robbanótárgyak elrendezésének a küldeménydarabokban olyannak kell lennie, ami megakadályozza hogy a robbanóanyag szabaddá váljon a külső csomagolás belsejében normális szállítási feltételek mellett. Meg kell akadályozni, hogy a tárgyak fém alkatrészei a fém csomagolóeszközökkel érintkezésbe kerülhessenek. A robbanóanyagot tartalmazó olyan tárgyakat, amelyek nincsenek külső burkolatba helyezve, el kell választani egymástól, hogy megakadályozzuk a sűrűlődni és a felütközést. Erre a célra a belső vagy a külső csomagolást megosztó párnázó válaszfalak, fészkek vagy tartályok használhatók.
- 4.1.5.12** A csomagolóeszközöket a küldeménydarabban levő robbanóanyagokkal összeférhető és azokkal szemben áthatolhatatlan anyagból kell készíteni, úgy, hogy sem a robbanóanyagok és a csomagolóanyagok közötti kölcsönhatás, sem szivárgás ne következhesen be, aminek eredményeként a robbanóanyag szállítása a továbbiakban nem lenne biztonságos vagy a veszélyességi osztálya vagy összeférhetőségi csoportja megváltozna.
- 4.1.5.13** Meg kell akadályozni a robbanóanyagok behatolását a korcolt fém csomagolóeszközök illesztéseibe.
- 4.1.5.14** A műanyag csomagolóeszközök nem lehetnek hajlamosak olyan mértékű statikus elektromosság gerjesztésére vagy felhalmozására, aminek a kisülése a becsomagolt robbanóanyag begyújtását vagy a robbanótárgy működésbe lépését okozhatja.
- 4.1.5.15** A rendszerint katonai célú, nagyméretű, robusztus robbanótárgyak, gyújtószerkezeteik nélkül, vagy gyújtószerkezettel, de legalább két hatékony védőszerkezettel, csomagolatlanul szállíthatók. Ha az ilyen tárgyak hajtótöltetet tartalmaznak vagy önhajtók, akkor gyújtórendszeiket védeni kell a normális szállítási feltételek melletti működésbelépéssel szemben. Ha a csomagolatlan tárgy a 4. vizsgálati sorozatban negatív eredményt ad, ez jelzi, hogy az csomagolás nélküli szállításra figyelembe vehető. Az ilyen csomagolatlan tárgyak csúszótálcákra erősíthetők vagy keretekbe vagy más alkalmas kezelő-, tárolóeszközbe vagy indítóállványba helyezhetők oly módon, hogy normális szállítási körülmények között ne lazulhassanak ki. Amennyiben ezeket a nagyméretű robbanótárgyakat az üzembiztonsági és alkalmassági vizsgálataik keretében olyan vizsgálatoknak is alávetik, amelyek megfelelnek az ADR céljainak, és e vizsgálatokat sikerrel kiállják, az illetékes hatóság engedélyezheti ezen tárgyak ADR szerinti szállítását.
- 4.1.5.16** A robbanóanyagokat nem szabad olyan belső vagy külső csomagolóeszközökbe csomagolni, amelyeknél a külső és belső nyomás között termikus vagy más hatások eredményeként létrejövő különbségek a küldeménydarab robbanását vagy törését okozhatják.
- 4.1.5.17** Amennyiben a szabadon levő robbanóanyag vagy a zárt ház nélküli vagy csak részben tokozott tárgy robbanóanyaga fém csomagolóeszközök (1A1, 1A2, 1B1, 1B2, 4A, 4B és

fém tartályok) belső felületével érintkezhet, a fém csomagolóeszközt el kell látni belső bevonattal vagy béléssel (lásd a 4.1.1.2 bekezdést).

4.1.5.18 A P101 csomagolási utasítás bármely robbanóanyaghoz használható, amennyiben a csomagolóeszközt az illetékes hatóság engedélyezte, függetlenül attól, hogy a csomagolóeszköz megfelel-e a 3.2 fejezet „A” táblázat 8 oszlopában feltüntetett csomagolási utasításnak.

4.1.6 Különleges csomagolási előírások a 2 osztály, ill. a többi osztály olyan áruira, amelyekre a P200 csomagolási utasítás vonatkozik

4.1.6.1 Ez a szakasz a 2 osztály gázainak, ill. más osztályok P200 csomagolási utasítás alá tartozó anyagainak (pl. UN 1051 hidrogén-cianid, stabilizált) a szállításához használt nyomástartó tartályok és nyitott mélyhűtő tartályok használatára vonatkozó általános követelményeket tartalmazza. A nyomástartó tartályokat úgy kell gyártani és lezárni, hogy elkerülhető legyen a tartalom bármilyen szivárgása. Ez a szokásos szállítási körülmények között különösen a rezgésekből, illetve a hőmérséklet, a páratartalom vagy a nyomás változásából adódhat (pl. a tengerszint feletti magasság változásának eredményeként).

4.1.6.2 A nyomástartó tartályok és a nyitott mélyhűtő tartályok veszélyes áruval közvetlenül érintkező részeit a veszélyes áru nem támadhatja meg, sem lényegesen nem gyengítheti, és ezek a részek nem okozhatnak veszélyes hatást (pl. reakció katalizálását vagy a veszélyes áruval való reakciót) (lásd a szakasz végén a szabványok táblázatát is).

4.1.6.3 Egy adott gázhoz vagy gázkeverékhez a nyomástartó tartályt, annak zárószerkezetét, ill. a nyitott mélyhűtő tartályt úgy kell megválasztani, hogy megfeleljen a 6.2.1.2 bekezdés és a 4.1.4.1 bekezdés vonatkozó csomagolási utasítása követelményeinek. Ezt a bekezdést azokra a nyomástartó tartályokra is alkalmazni kell, amelyek MEG-konténerek, ill. battériás járművek elemeit képezik.

4.1.6.4 Az újrátölthető nyomástartó tartályokat a használat megváltoztatása esetén a biztonságos üzemeltetéshez szükséges mértékben ki kell üríteni, ki kell tisztítani, ill. gáztalanítani kell (lásd a szakasz végén a szabványok táblázatát is). Ezenkívül azok a nyomástartó tartályok, amelyek előzőleg 8 osztályba tartozó maró anyagot, vagy más osztályokba tartozó, maró járulékos veszéllyel rendelkező anyagot tartalmaztak, a 2 osztály anyagaihoz csak akkor használhatók, ha elvégezték a 6.2.1.6, ill. 6.2.3.5 bekezdésben meghatározott, szükséges vizsgálatokat.

4.1.6.5 Töltés előtt a csomagolónak meg kell vizsgálnia a nyomástartó tartályt, ill. a nyitott mélyhűtő tartályt és meg kell győződnie arról, hogy a nyomástartó tartály, ill. a nyitott mélyhűtő tartály a szállítandó anyaghoz, nyomás alatti vegyszereknél a hajtóanyaghoz engedélyezett és megfelel a követelményeknek. Töltés után a zárószелеpeket el kell zárni és a szállítás alatt zárva kell tartani. A feladónak ellenőriznie kell, hogy a zárószerkezet és a szerelvények nem szivárognak-e.

Megjegyzés: *A palackkötegben levő egyedi palackok zárószелеpei a szállítás alatt nyitva lehetnek, kivéve ha a szállított anyagra a P200 csomagolási utasításban a „k” vagy „q” különleges csomagolási előírás vonatkozik.*

4.1.6.6 A nyomástartó tartályokat, ill. a nyitott mélyhűtő tartályokat a betöltendő anyagra vonatkozó csomagolási utasításban meghatározott üzemi nyomás, töltési fok és töltési előírások betartásával kell megtölteni. A bomlásra hajlamos gázokat és gázkeverékeket olyan nyomásig kell tölteni, hogy a nyomástartó tartályban a nyomás a gáz teljes mennyiségének elbomlása esetén se haladja meg az üzemi nyomást. A palackkötegek palackjait nem szabad a kötegben levő legkisebb üzemi nyomású palack üzemi nyomása fölé tölteni.

4.1.6.7 A nyomástartó tartályoknak és zárószerkezeteiknek meg kell felelniük a 6.2 fejezetben részletezett tervezési, gyártási, ellenőrzési és vizsgálati követelményeknek. Ha külső csomagolás van előírva, abban a nyomástartó tartályokat, ill. a nyitott mélyhűtő tartályokat szilárdan rögzíteni kell. Ha a vonatkozó csomagolási utasításban nincs más előírva, a belső csomagolásokat egyesével vagy csoportosan lehet a külső csomagolásba helyezni.

- 4.1.6.8** A szelepeket úgy kell tervezni és gyártani, hogy azok eredendően képesek legyenek a sérülések elviselésére anélkül, hogy a tartalom kiszabadulna, vagy a következő módszerek valamelyikének alkalmazásával védeni kell az olyan sérülésekkel szemben, amelyek a nyomástartó tartály tartalmának véletlen kiszabadulásához vezetnének (lásd a szakasz végén a szabványok táblázatát is):
- a) a zárószelepek a tartálynyak belsejében vannak elhelyezve és menetes dugóval vagy sapkával vannak védve;
 - b) a zárószelepek védőkupakkal vannak ellátva. A védőkupakot megfelelő keresztmetszetű szellőzőlyukakkal kell ellátni, hogy a zárószelep szivárgása esetén a gáz eltávozhasson;
 - c) a zárószelepek védőkarimával vagy más védőszerkezettel vannak ellátva;
 - d) a nyomástartó tartályokat védőkeretekben szállítják (pl. palackkötegben vannak); vagy
 - e) a nyomástartó tartályokat védőládákban szállítják. Az UN nyomástartó tartályok esetén a szállításra kész csomagolásnak olyannak kell lennie, hogy a 6.1.5.3 bekezdés szerinti ejtési próba során az I csomagolási csoport szintjén megfeleljen.
- 4.1.6.9** A nem újratölthető, nyomástartó tartályok esetén:
- a) a tartályokat külső csomagolásban, például ládában, rekeszben vagy zsugorfóliával, ill. nyújtható fóliával burkolt alátétálcás csomagolásban kell szállítani;
 - b) a gyúlékony vagy mérgező gázzal töltött tartályok víztérfogata legfeljebb 1,25 liter lehet;
 - c) ezek a tartályok nem használhatók olyan mérgező gázokhoz, amelyek LC_{50} értéke 200 ml/m^3 vagy annál kisebb; és
 - d) a tartályok használatba vétel után nem javíthatók.
- 4.1.6.10** A mélyhűtő tartályok kivételével az újratölthető tartályokat a 6.2.1.6, ill. nem-UN nyomástartó tartályokat a 6.2.3.5.1 pont, ill. a P200 vagy a P205, ill. P206 csomagolási utasítás előírásai szerint időszakos vizsgálatnak kell alávetni. A zárt mélyhűtő tartályok nyomáscsökkentő szelepeit a 6.2.1.6.3 pont és a P203 csomagolási utasítás előírásai szerint időszakos vizsgálatnak kell alávetni. A nyomástartó tartályok az időszakos vizsgálat határidejének letelte után nem tölthetők meg, de a vizsgálat végrehajtása vagy ártalmatlanítás céljából az időszakos vizsgálat végrehajtására meghatározott határidő letelte után is szállíthatók, beleértve az átmeneti szállítási műveleteket.
- 4.1.6.11** A javításokat a vonatkozó tervezési és gyártási szabványok gyártási és vizsgálati követelményei szerint kell végezni, és csak akkor végezhetők, ha a 6.2 fejezetben felsorolt, az időszakos vizsgálatra vonatkozó szabványok erre utalnak. A nyomástartó tartályok, kivéve a zárt mélyhűtő tartályok burkolatát, nem javíthatók a következő hibák esetén:
- a) hegesztési repedések és egyéb hegesztési hibák;
 - b) repedések a tartályfalban;
 - c) szivárgások vagy a tartályfal, tető vagy fenék anyagának hibái.
- 4.1.6.12** A nyomástartó tartály nem tölthető meg:
- a) ha olyan mértékben sérült, hogy ez befolyásolhatja a nyomástartó tartály vagy üzemi szerelvényei épségét; és
 - b) amíg a nyomástartó tartályt és üzemi szerelvényeit meg nem vizsgálták és meg nem állapították, hogy jó üzemi állapotban vannak; és
 - c) ha a tanúsításra, az időszakos vizsgálatra, ill. a töltésre vonatkozó jelölés olvashatatlan.
- 4.1.6.13** A megtöltött nyomástartó tartály nem adható fel szállításra:
- a) ha szivároog;
 - b) ha olyan mértékben sérült, hogy ez befolyásolhatja a nyomástartó tartály vagy üzemi

szerelvényei épségét; és

- c) amíg a nyomástartó tartályt és üzemi szerelvényeit meg nem vizsgálták és meg nem állapították, hogy jó üzemi állapotban vannak; és
- d) ha a tanúsításra, az időszakos vizsgálatra, ill. a töltésre vonatkozó jelölés olvashatatlan.

4.1.6.14

A tulajdonosnak az illetékes hatóság megalapozott kérésére a nyomástartó tartályok megfelelőségének bizonyításához szükséges minden információt az illetékes hatóság által jól érthető nyelven meg kell adnia. A tulajdonát képező nyomástartó tartályok nem megfelelőségének kiküszöbölésére vonatkozó minden intézkedésben együtt kell működnie a hatósággal, annak felkérésére.

4.1.6.15

Az UN nyomástartó tartályokra a következőkben felsorolt ISO szabványokat kell alkalmazni. Egyéb nyomástartó tartályok esetén a 4.1.6 szakasz előírásai a következő szabványok értelemszerű alkalmazása esetén teljesítettnek tekinthetők:

A vonatkozó bekezdés	Hivatkozás	A dokumentum címe
4.1.6.2	EN ISO 11114-1:1997	Szállítható gázpalackok. Gázpalack és palackszelep szerkezeti anyagainak megfelelősége a gáztöltetnek. 1. Rész: Fémek
	EN ISO 11114-2:2000	Szállítható gázpalackok. Gázpalack és palackszelep szerkezeti anyagainak megfelelősége a gáztöltetnek. 2. Rész: Nemfémes anyagok
4.1.6.4	ISO 11621:1997	Gázpalackok. Eljárás a gáztöltet megváltoztatására Megjegyzés: Az ISO szabvány EN változata megfelel ezeknek a követelményeknek, ezért szintén alkalmazható.
4.1.6.8 Eredendően védett szelepek	ISO 10297:2006 A Melléklet	Gázpalackok – Újratölthető gázpalack szelepek – Meghatározások és típusvizsgálat Megjegyzés: Az ISO szabvány EN változata megfelel ezeknek a követelményeknek, ezért szintén alkalmazható.
	EN 13152:2001+ A1:2003	Cseppfolyósított szénhidrogéngáz palackja szelepeinek előírásai és vizsgálata. Önelzáró szelepek
	EN 13153:2001+ A1:2003	Cseppfolyósított szénhidrogéngáz palackja szelepeinek előírásai és vizsgálata. Kézi működtetésű szelepek
4.1.6.8 b) és c)	ISO 11117:1998 vagy ISO 11117:2008 + Cor. 1:2009	Gázpalackok – Szelep védőkupakok és védőszerkezetek ipari és orvosi gázok palackjaihoz – Méretezés, gyártás és vizsgálatok
	EN 962:1996 + A2:2000	Szállítható gázpalackok. Ipari és egészségügyi gázpalackok szelepvédő sapkái és kosarai. Kialakítás, kivitelezés és vizsgálatok
	ISO 16111:2008	Szállítható gáztároló eszközök – Reverzibilis fémhidridben abszorbeált hidrogén

4.1.7

Különleges csomagolási előírások a szerves peroxidokhoz (5.2 osztály) és az önreaktív anyagokhoz (4.1 osztály)

4.1.7.0.1

A szerves peroxidok esetén a tartályokat „hatékonyan le kell zárni”. Ha a küldeménydarabban gázfejlődés miatt jelentős belső nyomás alakulhat ki, szellőző-szerkezet használható, ha a fejlődő gáz nem okoz veszélyt, egyébként a töltési fokot kell korlátozni. A szellőző-szerkezetet úgy kell kialakítani, hogy a küldeménydarab függőleges helyzetében folyadék ne szabadulhasson ki, ill. szennyeződés ne juthasson be. A külső csomagolást, ha

van, úgy kell kialakítani, hogy ne zavarja a szellőző-szerkezet működését.

4.1.7.1 *A csomagolóeszközök használata (az IBC-k kivételével)*

4.1.7.1.1 A szerves peroxidokhoz és az önreaktív anyagokhoz használt csomagolóeszközöknek a 6.1 fejezet követelményeinek kell megfelelniük és annak vizsgálati követelményeit a II csomagolási csoport szintjén kell kielégíteniük.

4.1.7.1.2 A szerves peroxidok és az önreaktív anyagok csomagolási módszereit, amelyek OP1 – OP8 jelöléssel vannak ellátva, a P520 csomagolási utasítás sorolja fel. Az egyes csomagolási módszereknél meghatározott mennyiségek a küldeménydarabonként engedélyezett legnagyobb mennyiséget jelentik.

4.1.7.1.3 A jelenleg besorolt szerves peroxidokhoz és önreaktív anyagokhoz alkalmas csomagolási módszereket a 2.2.41.4 és a 2.2.52.4 bekezdés sorolja fel.

4.1.7.1.4 Az új szerves peroxidoknál, az új önreaktív anyagoknál, ill. a jelenleg besorolt szerves peroxidok vagy önreaktív anyagok új készítményeinél a megfelelő csomagolási módszer hozzárendelése céljából a következő eljárást kell alkalmazni:

- a) A B típusú szerves peroxidhoz, ill. B típusú önreaktív anyaghoz:
az OP5 csomagolási módszert kell hozzárendelni, amennyiben a szerves peroxid (ill. az önreaktív anyag) a csomagolási módszer által engedélyezett valamelyik csomagolásban a Vizsgálatok és Kritériumok kézikönyv 20.4.3 b) bekezdés (ill. a 20.4.2 b) bekezdés) szerinti feltételeket kielégíti. Ha a szerves peroxid (ill. az önreaktív anyag) ezeket a feltételeket csak kisebb csomagolásban elégíti ki, mint ami az OP5 csomagolási módszernél meg van határozva (azaz az OP1 – OP4 módszernél felsorolt valamelyik csomagolásban), akkor az alacsonyabb OP számú, megfelelő csomagolási módszert kell hozzárendelni;
- b) A C típusú szerves peroxidhoz, ill. C típusú önreaktív anyaghoz:
az OP6 csomagolási módszert kell hozzárendelni, amennyiben a szerves peroxid (ill. az önreaktív anyag) a csomagolási módszer által engedélyezett valamelyik csomagolásban a „Vizsgálatok és Kritériumok kézikönyv” 20.4.3 c) bekezdés (ill. a 20.4.2 c) bekezdés) szerinti feltételeket kielégíti. Ha a szerves peroxid (ill. az önreaktív anyag) ezeket a feltételeket csak kisebb csomagolásban elégíti ki, mint ami az OP6 csomagolási módszernél meg van határozva, akkor az alacsonyabb OP számú, megfelelő csomagolási módszert kell hozzárendelni;
- c) A D típusú szerves peroxidhoz, ill. D típusú önreaktív anyaghoz:
az OP7 csomagolási módszert kell hozzárendelni;
- d) Az E típusú szerves peroxidhoz, ill. E típusú önreaktív anyaghoz:
az OP8 csomagolási módszert kell hozzárendelni;
- e) Az F típusú szerves peroxidhoz, ill. F típusú önreaktív anyaghoz:
az OP8 csomagolási módszert kell hozzárendelni.

4.1.7.2 *Az IBC-k használata*

4.1.7.2.1 A már besorolt szerves peroxidok közül az IBC520 csomagolási utasításban felsoroltak szállíthatók IBC-ben, az ott feltüntetettek szerint. Az IBC-knek a 6.5 fejezet követelményeinek kell megfelelniük és annak vizsgálati követelményeit a II csomagolási csoport szintjén kell kielégíteniük.

4.1.7.2.2 Egyéb, F típusú szerves peroxidok és önreaktív anyagok a származási ország illetékes hatósága által meghatározott feltételek mellett szállíthatók IBC-kben, ha a megfelelő vizsgálatok alapján az illetékes hatóság meggyőződött arról, hogy az ilyen szállítás biztonságosan végrehajtható. A vizsgálatoknak a következőkre szükséges kiterjedniük:

- a) annak bizonyítására, hogy a szerves peroxid (ill. az önreaktív anyag) megfelel a Vizsgálatok és Kritériumok kézikönyv 20.4.3 f) bekezdésben, illetve a 20.4.2 f)

bekezdésben megadott besorolási elveknek, lásd a kézikönyv 20.1 b) ábrájának az F kimeneti kockáját;

- b) minden olyan anyaggal az összeférhetőség bizonyítására, amely az anyaggal a szállítás alatt normál esetben érintkezésbe kerülhet;
- c) az anyagnak a szóban forgó IBC-ben való szállításával kapcsolatos szabályozási és vészhőmérséklete, ha ilyenek alkalmazandók, meghatározására az ÖBH-ből való levezetéssel;
- d) szükség esetén a nyomáscsökkentő és a vészlefúvó szerkezetek konstrukciójára; és
- e) az esetlegesen szükséges különleges előírások meghatározására.

Ha a származási ország nem valamely ADR Szerződő Fél, akkor a besorolást és szállítási feltételeket a küldemény által érintett első ADR Szerződő Fél illetékes hatóságának kell elismernie.

4.1.7.2.3 A figyelembe veendő vészhelyzetek az anyag öngyorsuló bomlása és amikor a láng a tartályt teljesen körülveszi. A fém vagy külső fémburkolatú, összetett IBC robbanásszerű felrepedésének elkerülésére a vészlefúvó szerkezetnek lehetővé kell tennie minden bomlás-termék és gőz eltávolítását, amely az öngyorsuló bomlás során, ill. akkor fejlődik, ha legalább egy óráig olyan láng veszi körül, amely a 4.2.1.13.8 pontban megadott képlettel jellemezhető.

4.1.8 Különleges csomagolási előírások a fertőző anyagokhoz (6.2 osztály)

4.1.8.1 A fertőző anyagok feladójának biztosítania kell, hogy a küldeménydarabok oly módon legyenek előkészítve, hogy rendeltetési helyükre jó állapotban érkezzenek meg, és a szállítás alatt se személyekre, se állatokra ne jelentsenek veszélyt.

4.1.8.2 A fertőző anyagokat tartalmazó küldeménydarabokra az 1.2.1 szakasz meghatározásai és a 4.1.1.1 – 4.1.1.17 bekezdés általános előírásai vonatkoznak, a 4.1.1.3, a 4.1.1.9 – 4.1.1.12 és a 4.1.1.15 bekezdés kivételével. A folyékony anyagokat azonban csak olyan csomagoló-eszközbe szabad tölteni, amely megfelelő mértékben ellenáll a normális szállítási körülmények között kialakuló belső nyomásnak.

4.1.8.3 A másodlagos csomagolás és a külső csomagolás közé el kell helyezni a tartalom tételes jegyzékét. Ha a szállítandó fertőző anyag ismeretlen, de feltehetően megfelel az „A” kategóriába történő besorolás feltételeinek, akkor a külső csomagolásba helyezett jegyzéken a helyes szállítási megnevezést követően, zárójelbe téve a „**feltehetően „A” kategóriájú fertőző anyag**” szöveget kell feltüntetni.

4.1.8.4 Mielőtt egy üres csomagolóeszközt a feladóhoz visszaküldenek vagy máshová szállítanak, azt ki kell tisztítani, ill. fertőtleníteni, hogy minden veszélyt kiküszöböljenek, és a rajta levő bárcákat, ill. jelöléseket, amelyek arra utalnak, hogy fertőző anyagot tartalmazott, el kell távolítani, vagy felismerhetetlenné kell tenni.

4.1.8.5 Azonos minőség esetén a másodlagos csomagoláson belül az elsődleges tartályoknál a következő változatok engedélyezettek a teljes csomagolás további vizsgálata nélkül:

- a) A vizsgált elsődleges tartállyal azonos méretű vagy kisebb elsődleges tartályok használhatók, amennyiben:
 - i) az elsődleges tartályok hasonló kialakításúak, mint a bevizsgált elsődleges tartályok (pl. hengeres, szögletes);
 - ii) az elsődleges tartályok szerkezeti anyaga (pl. üveg, műanyag, fém) az eredetileg bevizsgált elsődleges tartályokkal azonos vagy nagyobb mértékben ellenáll az ütődéseknél és a halmazoláskor fellépő erőkkel szemben;
 - iii) az elsődleges tartály nyílásai azonos vagy kisebb átmérőjűek és zárásuk hasonló kialakítású (pl. csavarmenetes kupak, bepattanó fedél stb.);
 - iv) elegendő mennyiségű párnázóanyagot használnak a hézagok kitöltésére és az

elsődleges tartályok jelentősebb elmozdulásának megakadályozására; és

v) az elsődleges tartályok ugyanolyan helyzetben vannak a másodlagos csomagolásban elhelyezve, mint a bevizsgált küldeménydarabban.

b) Azokból az elsődleges tartályokból, amelyekkel bevizsgálták, vagy az előző a) pontban leírt elsődleges tartályokból kevesebb is használható, amennyiben elegendő mennyiségű párnázóanyagot használnak a hézagok kitöltésére és az elsődleges tartályok jelentősebb elmozdulásának megakadályozására.

4.1.8.6 A 4.1.8.1 – 4.1.8.5 bekezdések csak az „A” kategóriájú fertőző anyagokra (UN 2814 és UN 2900) vonatkoznak, nem kell alkalmazni sem az UN 3373 „B” kategóriájú biológiai anyagra (lásd a 4.1.4.1 bekezdés P650 csomagolási utasítását), sem az UN 3291 nem specifikált kórházi hulladék, m.n.n. vagy (bio)gyógyászati hulladék, m.n.n. vagy szabályozott gyógyászati hulladék, m.n.n. tétel esetén.

4.1.8.7 Az állati eredetű anyagok szállítása esetén a vonatkozó csomagolási utasítás által az anyagra, ill. tárgyra kifejezetten engedélyezett csomagolóeszközön (IBC-n) kívül csak olyan csomagolóeszköz (IBC) használható, amelyet a származási ország³⁾ illetékes hatósága külön erre jóváhagyott, feltéve, ha:

- a) ez az alternatív csomagolóeszköz megfelel e Rész általános követelményeinek;
- b) ez az alternatív csomagolóeszköz megfelel a 6. Rész követelményeinek is, ha a 3.2 fejezet „A” táblázat 8 oszlopában feltüntetett csomagolási utasítás ezt előírja;
- c) származási ország³⁾ illetékes hatósága megállapítja, hogy ez az alternatív csomagolóeszköz legalább olyan szintű biztonságot nyújt, mintha az anyag a 3.2 fejezet „A” táblázat 8 oszlopában feltüntetett csomagolási utasítás által előírt módszer szerint lenne csomagolva;
- d) az illetékes hatóság jóváhagyásának másolata a küldeményhez mellékelve van, vagy a fuvarokmányban utalás van arra, hogy az alternatív csomagolóeszközt az illetékes hatóság jóváhagyta.

4.1.9 Különleges csomagolási előírások a 7 osztályhoz

4.1.9.1 Általános előírások

4.1.9.1.1 A radioaktív anyagnak, a csomagolóeszközöknek és a küldeménydaraboknak a 6.4 fejezet követelményeinek kell megfelelniük. Az egy küldeménydarabban levő radioaktív anyag mennyisége nem haladhatja meg a 2.2.7.2.2, a 2.2.7.2.4.1, a 2.2.7.2.4.4, a 2.2.7.2.4.5, a 2.2.7.2.4.6 pontban, a 3.3 fejezet 336 különleges előírásában és a 4.1.9.3 bekezdésben meghatározott határokat. Az ADR-ben szereplő, radioaktív anyagot tartalmazó küldeménydarabok fajtái a következők:

- a) engedményes küldeménydarab (lásd az 1.7.1.5 bekezdést);
- b) 1 típusú ipari küldeménydarab (*IP-1* típusú küldeménydarab);
- c) 2 típusú ipari küldeménydarab (*IP-2* típusú küldeménydarab);
- d) 3 típusú ipari küldeménydarab (*IP-3* típusú küldeménydarab);
- e) *A* típusú küldeménydarab;
- f) *B(U)* típusú küldeménydarab;
- g) *B(M)* típusú küldeménydarab;
- h) *C* típusú küldeménydarab.

A hasadóanyagot vagy urán-hexafluoridot tartalmazó küldeménydarabok további

3) Ha a származási ország nem valamely ADR Szerződő Fél, a küldemény által érintett első ADR Szerződő Fél illetékes hatósága

követelmények tárgyát képezik.

4.1.9.1.2

A küldeménydarabok külső felületén a nem tapadó radioaktív szennyezettséget a lehető legalacsonyabb értéken kell tartani, és normális szállítási körülmények között nem haladhatja meg a következő értékeket:

- a) 4 Bq/cm² béta-, gamma -, valamint csekély toxicitású alfa-sugárzók esetén; és
- b) 0,4 Bq/cm² minden más alfa-sugárzó esetén.

Ezeket a határokat a felület bármely 300 cm²-nyi részén képzett átlagra alkalmazni kell.

4.1.9.1.3

Egy küldeménydarab – az engedményes küldeménydarab kivételével – a radioaktív anyag alkalmazásához szükséges tárgyakon kívül mást nem tartalmazhat. E tárgyak és a küldeménydarab közötti kölcsönhatás a gyártási típusra vonatkozó szállítási feltételek között nem csökkentheti a küldeménydarab biztonságát.

4.1.9.1.4

A 7.5.11 szakasz CV33 különleges előírásában meghatározottak kivételével az egyesítő csomagolások, a konténerek, a tartányok, az IBC-k és a járművek belső és külső felületén a nem tapadó szennyezettség szintje nem haladhatja meg a 4.1.9.1.2 pontban meghatározott határértékeket.

4.1.9.1.5

Az egyéb veszélyes tulajdonságokkal is rendelkező radioaktív anyagok küldeménydarab-mintájánál ezeket a tulajdonságokat is figyelembe kell venni. Azokat a járulékos veszéllyel bíró radioaktív anyagokat, amelyek olyan küldeménydarabban vannak, melyhez nem szükséges az illetékes hatóság jóváhagyása, a 6. rész megfelelő fejezetének követelményeit mindenben kielégítő és az adott járulékos veszélyre a 4.1, a 4.2, ill. a 4.3 fejezet vonatkozó követelményeinek megfelelő csomagolóeszközökben, IBC-kben, tartányokban vagy ömlesztettáru konténerben kell szállítani.

4.1.9.1.6

Minden küldeménydarab első szállítása előtt a következő követelményeknek kell eleget tenni:

- a) Amennyiben a biztonsági tartály tervezési nyomása meghaladja a 35 kPa (túlnyomás) értéket, akkor biztosítani kell, hogy minden küldeménydarab a biztonsági tartály ezen nyomás alatti sértetlenségére vonatkozóan a jóváhagyott minta követelményeinek megfelelően.
- b) Minden *B(U)*, *B(M)* és *C* típusú küldeménydarab és minden hasadóanyagot tartalmazó küldeménydarab esetén biztosítani kell, hogy az árnyékolás és a biztonsági tartály hatékonysága, valamint – szükség esetén – a hőátadási tulajdonságok és a megtartó rendszer hatékonysága azon határok között legyen, amely a jóváhagyott mintára alkalmazandó vagy meg van határozva.
- c) Minden hasadóanyagot tartalmazó küldeménydarab esetében, amelynél a 6.4.11.1 bekezdés előírásainak betartása érdekében a neutronmérgek a küldeménydarabok kifejezett alkotórészét képezik, ellenőrizni kell ezen neutronmérgek jelenlétét és eloszlását.

4.1.9.1.7

Minden küldeménydarab minden egyes szállítása előtt a következő követelményeket kell teljesíteni:

- a) Minden küldeménydarabnál biztosítani kell, hogy az összes vonatkozó ADR előírást és követelményt betartsák.
- b) Biztosítani kell, hogy a teheremelő berendezések, amelyek a 6.4.2.2 bekezdés feltételeinek nem felelnek meg, el legyenek távolítva vagy a küldeménydarabok emelésére más módon alkalmatlanná legyenek téve a 6.4.2.3 bekezdés szerint.
- c) Minden olyan küldeménydarab esetében, amelyhez az illetékes hatóság engedélyre van szüksége, biztosítani kell az engedélyben megállapított minden feltétel betartását.
- d) Minden *B(U)*, *B(M)* és *C* típusú küldeménydarabot mindaddig vissza kell tartani, amíg az egyensúlyi állapot megközelítőleg be nem következett, úgy, hogy a hőmérsékletre és a nyomásra vonatkozó előírt szállítási feltételeknek való megfelelés bizonyítható legyen, kivéve, ha e feltételek alól az egyoldalú engedély felmentést adott.

- e) Minden $B(U)$, $B(M)$ és C típusú küldeménydarabnál vizsgálattal vagy alkalmas próbával kell biztosítani, hogy a biztonsági tartály minden zárószerkezete, szelepe vagy más nyílása, amelyen keresztül a radioaktív anyag a szabadba juthat, szabályosan zárt, és adott esetben oly módon tömített, mint az a 6.4.8.8 és 6.4.10.3 bekezdésnek való megfelelés bizonyításánál elő van írva.
- f) Minden különleges formájú radioaktív anyagnál biztosítani kell, hogy az engedélyben meghatározott követelményeket és az ADR vonatkozó követelményeit betartsák.
- g) A hasadóanyagot tartalmazó küldeménydaraboknál a 6.4.11.4 b) pontban meghatározott mérést, valamint a 6.4.11.7 bekezdésben előírt, a küldeménydarab zártságának bizonyítására szolgáló vizsgálatokat el kell végezni, amennyiben vonatkozik rájuk.
- h) Minden kis mértékben diszpergálódó radioaktív anyagnál biztosítani kell, hogy a küldeménydarab-minta engedélyében meghatározott követelményeket és az ADR vonatkozó követelményeit betartsák.

4.1.9.1.8 A feladónak a küldeménydarab helyes zárására és a szállításhoz való egyéb előkészítésére vonatkozó utasítások egy példányával is rendelkeznie kell, mielőtt a szállítás az engedély-okiratok előírásai alapján megtörténne.

4.1.9.1.9 A kizárólagos használat mellett szállított küldemények kivételével egyetlen küldeménydarab vagy egyesítőcsomagolás szállítási mutatószáma (TI) sem haladhatja meg a 10-et, és egyetlen küldeménydarab vagy egyesítőcsomagolás kritikussági biztonsági mutatószáma (CSI) sem haladhatja meg az 50-et.

4.1.9.1.10 A kizárólagos használat mellett és az 7.5.11 szakasz, CV33 előírás 3.5) a) pontjában meghatározott feltételek szerint szállított küldeménydarabok és egyesítőcsomagolások kivételével a maximális sugárzási szint egy küldeménydarab vagy egyesítőcsomagolás külső felületének egyetlen pontján sem haladhatja meg a 2 mSv/h értéket.

4.1.9.1.11 A maximális sugárzási szint egy kizárólagos használat mellett szállított küldeménydarab vagy egyesítőcsomagolás külső felületének egyetlen pontján sem haladhatja meg a 10 mSv/h értéket.

4.1.9.2 *Az LSA anyagok és SCO tárgyak szállítására és a szállítás ellenőrzésére vonatkozó követelmények*

4.1.9.2.1 Az LSA anyagok vagy SCO tárgyak mennyiségét egyetlen $IP-1$ típusú, $IP-2$ típusú vagy $IP-3$ típusú küldeménydarabban, vagy az adott esettől függően tárgyban vagy tárgyak összességében oly módon kell korlátozni, hogy a külső sugárzási szint a nem árnyékolt anyagtól vagy tárgytól vagy tárgyak összességétől 3 m távolságban ne haladja meg a 10 mSv/h értéket.

4.1.9.2.2 Azoknak az LSA anyagoknak és SCO tárgyaknak, amelyek hasadóanyagok vagy azt tartalmaznak, a 6.4.11.1 bekezdés és a 7.5.11 szakasz CV33 különleges előírás 4.1) és 4.2) pontja vonatkozó előírásainak kell megfelelniük.

4.1.9.2.3 Az LSA anyagok és SCO tárgyak az LSA-I és SCO-I csoportokban a következő feltételek mellett csomagolatlanul szállíthatók:

- a) minden csomagolatlan anyagot, az olyan érceket kivéve, amelyek kizárólag a természetben előforduló radionuklidokat tartalmaznak, úgy kell szállítani, hogy a normális szállítási körülmények között sem a tartalom elvesztése a járműből, sem az árnyékolás csökkenése ne következzen be;
- b) minden járműnek kizárólagos használat alatt kell állni, hacsak azzal nem kizárólagosan olyan SCO-I tárgyat szállítanak, amelyeken a szennyezettség a hozzáférhető és a nem hozzáférhető felületeken nem nagyobb mint a 2.2.7.1.2 pontban a „szennyezettség” meghatározásánál megadott, alkalmazandó érték tízszerese; és
- c) amennyiben az SCO-I tárgyaknál feltételezhető, hogy a nem hozzáférhető felületeken a 2.2.7.2.3.2 a) i) pontban meghatározott értéknél nagyobb mértékű nem tapadó szennye-

zettség van jelen, akkor intézkedni kell, hogy a radioaktív anyag a járműbe ne szabadulhasson ki.

4.1.9.2.4

Az *LSA* anyagokat és *SCO* tárgyakat, hacsak a 4.1.9.2.3 pontban nincs más előírva, a következő táblázat szerint kell csomagolni.

Követelmények az ipari küldeménydarabokra *LSA* anyagokhoz és *SCO* tárgyakhoz

Radioaktív tartalom	Ipari küldeménydarab típus	
	Kizárólagos használat esetén	Nem kizárólagos használat esetén
<i>LSA-I</i>		
Szilárd ^{a)}	<i>IP-1</i> típus	<i>IP-1</i> típus
Folyékony	<i>IP-1</i> típus	<i>IP-2</i> típus
<i>LSA-II</i>		
Szilárd	<i>IP-2</i> típus	<i>IP-2</i> típus
Folyékony és gáz alakú	<i>IP-2</i> típus	<i>IP-3</i> típus
<i>LSA-III</i>	<i>IP-2</i> típus	<i>IP-3</i> típus
<i>SCO-I</i> ^{a)}	<i>IP-1</i> típus	<i>IP-1</i> típus
<i>SCO-II</i>	<i>IP-2</i> típus	<i>IP-2</i> típus

a) A 4.1.9.2.3 pontban meghatározott körülmények között az *LSA-I* anyagok és *SCO-I* tárgyak csomagolatlanul szállíthatók.

4.1.9.3

Hasadóanyagot tartalmazó küldeménydarabok

A 2.2.7.2.3.5 pont alapján nem valamely hasadóanyag tételhez sorolt küldeménydarabok kivételével a hasadóanyagot tartalmazó küldeménydarabok nem tartalmazhatnak:

- a küldeménydarab-mintára engedélyezettől nagyobb tömegű hasadóanyagot (vagy keverékeknél hasadó nuklidokat);
- olyan radionuklidokat vagy hasadóanyagokat, amelyek a küldeménydarab-mintára nincsenek engedélyezve; ill.
- olyan anyagokat, amelyek alakjukban, fizikai vagy kémiai állapotukban vagy térbeli elrendeződésükben a küldeménydarab-minta engedélyezett tartalmától eltérnek,

amint az a küldeménydarab-minta engedélyben meg van határozva.

4.1.10

Különleges előírások az egybecsomagolásra

4.1.10.1

Amennyiben e fejezet előírásai szerint az egybecsomagolás engedélyezett, a különféle veszélyes áruk vagy veszélyes áruk és más áruk a 6.1.4.21 bekezdésnek megfelelő kombinált csomagolásba egybecsomagolhatók, amennyiben nem reagálnak egymással veszélyesen és e fejezet minden más vonatkozó előírását kielégítik.

Megjegyzés: 1. Lásd még a 4.1.1.5 és a 4.1.1.6 bekezdést is.

2. A 7 osztály anyagaira lásd a 4.1.9 szakaszt.

4.1.10.2

A csak az 1 osztály anyagait vagy csak a 7 osztály anyagait tartalmazó küldeménydarabok kivételével, ha külső csomagolásként papírlemez ládát vagy faládát használnak, a különböző árukat egybecsomagolva tartalmazó küldeménydarabok tömege nem haladhatja meg a 100 kg-ot.

4.1.10.3

Az azonos osztályba és azonos osztályozási kód alá tartozó anyagok egybecsomagolhatók, kivéve, ha a 4.1.10.4 bekezdés vonatkozó különleges előírásában másként szerepel.

4.1.10.4

Amennyiben a 3.2 fejezet „A” táblázat 9b oszlopában egy adott tételnél fel van tüntetve, az adott tétel alá tartozó áruk más árukkal ugyanazon küldeménydarabba történő egybecsomagolására a következő különleges előírásokat kell alkalmazni.

MP1 Csak ugyanolyan típusú és összeférhetőségi csoportú áruval csomagolható egybe.

MP2 Más árukkal nem csomagolható egybe.

- MP3** Az UN 1873 és az UN 1802 anyagainak egybecsomagolása engedélyezett.
- MP4** Nem csomagolható egybe sem más osztályok áruival, sem pedig olyan árukkal, melyek nem esnek az ADR hatálya alá. Azonban, ha ez a szerves peroxid valamely 3 osztály anyagához térhálósító vagy keményítő rendszerként szolgál, az egybecsomagolás a 3 osztály ezen anyagával engedélyezett.
- MP5** Az UN 2814 és az UN 2900 anyaga a P620 csomagolási utasításnak megfelelő kombinált csomagolásba egybecsomagolható. Nem csomagolhatók viszont egybe más árukkal, kivéve a P650 csomagolási utasításnak megfelelően csomagolt UN 3373 „B” kategóriájú biológiai anyagot és a hűtőközegként hozzáadott anyagokat, pl. jeget, szárazjeget vagy cseppfolyósított nitrogént.
- MP6** Nem csomagolható egybe más árukkal. Ez nem vonatkozik a hűtőközegként hozzáadott anyagokra, pl. jégre, szárazjégre vagy cseppfolyósított nitrogénre.
- MP7** Belső csomagolásonként legfeljebb 5 liter mennyiségben a 6.1.4.21 bekezdésnek megfelelő kombinált csomagolásba egybecsomagolható
- az ugyanazon osztály más osztályozási kódja alá tartozó árukkal, ha az egybecsomagolás azokra is megengedett; vagy
 - az ADR hatálya alá nem tartozó árukkal,
- amennyiben nem reagálnak egymással veszélyesen.
- MP8** Belső csomagolásonként legfeljebb 3 liter mennyiségben a 6.1.4.21 bekezdésnek megfelelő kombinált csomagolásba egybecsomagolható
- az ugyanazon osztály más osztályozási kódja alá tartozó árukkal, ha az egybecsomagolás azokra is megengedett; vagy
 - az ADR hatálya alá nem tartozó árukkal
- amennyiben nem reagálnak egymással veszélyesen.
- MP9** A 6.1.4.21 bekezdés szerinti kombinált csomagolás külső csomagolásába egybecsomagolható
- a 2 osztály más áruival;
 - más osztályok áruival, ha az egybecsomagolás azokra is megengedett; vagy
 - az ADR hatálya alá nem tartozó árukkal,
- amennyiben nem reagálnak egymással veszélyesen.
- MP10** Belső csomagolásonként legfeljebb 5 kg mennyiségben a 6.1.4.21 bekezdésnek megfelelő kombinált csomagolásba egybecsomagolható
- az ugyanazon osztály más osztályozási kódja alá tartozó árukkal, vagy más osztályok áruival, ha az egybecsomagolás azokra is megengedett; vagy
 - az ADR hatálya alá nem tartozó árukkal,
- amennyiben nem reagálnak egymással veszélyesen.
- MP11** Belső csomagolásonként legfeljebb 5 kg mennyiségben a 6.1.4.21 bekezdésnek megfelelő kombinált csomagolásba egybecsomagolható
- az ugyanazon osztály más osztályozási kódja alá tartozó árukkal, vagy más osztályok áruival (az 5.1 osztály I vagy II csomagolási csoportjának anyagainak kivételével), ha az egybecsomagolás azokra is megengedett; vagy

- az ADR hatálya alá nem tartozó árukkal,

amennyiben nem reagálnak egymással veszélyesen.

MP12 Belső csomagolásonként legfeljebb 5 kg mennyiségben a 6.1.4.21 bekezdésnek megfelelő kombinált csomagolásba egybecsomagolható

- az ugyanazon osztály más osztályozási kódja alá tartozó árukkal, vagy más osztályok áruival (az 5.1 osztály I vagy II csomagolási csoportjának anyagainak kivételével), ha az egybecsomagolás azokra is megengedett; vagy
- az ADR hatálya alá nem tartozó árukkal,

amennyiben nem reagálnak egymással veszélyesen.

A küldeménydarabok nem lehetnek 45 kg-nál nehezebbek. Azonban, ha a külső csomagolásként papírlemez ládákat használnak, egy küldeménydarab nem lehet 27 kg-nál nehezebb.

MP13 Belső csomagolásonként és küldeménydarabonként legfeljebb 3 kg mennyiségben a 6.1.4.21 bekezdésnek megfelelő kombinált csomagolásba egybecsomagolható

- az ugyanazon osztály más osztályozási kódja alá tartozó árukkal, vagy más osztályok áruival, ha az egybecsomagolás azokra is megengedett; vagy
- az ADR hatálya alá nem tartozó árukkal,

amennyiben nem reagálnak egymással veszélyesen.

MP14 Belső csomagolásonként legfeljebb 6 kg mennyiségben a 6.1.4.21 bekezdésnek megfelelő kombinált csomagolásba egybecsomagolható

- az ugyanazon osztály más osztályozási kódja alá tartozó árukkal, vagy más osztályok áruival, ha az egybecsomagolás azokra is megengedett; vagy
- az ADR hatálya alá nem tartozó árukkal,

amennyiben nem reagálnak egymással veszélyesen.

MP15 Belső csomagolásonként legfeljebb 3 liter mennyiségben a 6.1.4.21 bekezdésnek megfelelő kombinált csomagolásba egybecsomagolható

- az ugyanazon osztály más osztályozási kódja alá tartozó árukkal, vagy más osztályok áruival, ha az egybecsomagolás azokra is megengedett; vagy
- az ADR hatálya alá nem tartozó árukkal,

amennyiben nem reagálnak egymással veszélyesen.

MP16 Belső csomagolásonként és küldeménydarabonként legfeljebb 3 liter mennyiségben a 6.1.4.21 bekezdésnek megfelelő kombinált csomagolásba egybecsomagolható

- az ugyanazon osztály más osztályozási kódja alá tartozó árukkal, vagy más osztályok áruival, ha az egybecsomagolás azokra is megengedett; vagy
- az ADR hatálya alá nem tartozó árukkal,

amennyiben nem reagálnak egymással veszélyesen.

MP17 Belső csomagolásonként legfeljebb 0,5 liter és küldeménydarabonként legfeljebb 1 liter mennyiségben a 6.1.4.21 bekezdésnek megfelelő kombinált csomagolásba egybecsomagolható

- a 7 osztály kivételével más osztályok áruival, ha az egybecsomagolás azokra

is megengedett; vagy

- az ADR hatálya alá nem tartozó árukkal,

amennyiben nem reagálnak egymással veszélyesen.

MP18 Belső csomagolásonként legfeljebb 0,5 kg és küldeménydarabonként legfeljebb 1 kg mennyiségben a 6.1.4.21 bekezdésnek megfelelő kombinált csomagolásba egybecsomagolható

- a 7 osztály kivételével más osztályok áruival, ha az egybecsomagolás azokra is megengedett; vagy
- az ADR hatálya alá nem tartozó árukkal,

amennyiben nem reagálnak egymással veszélyesen.

MP19 Belső csomagolásonként legfeljebb 5 liter mennyiségben a 6.1.4.21 bekezdésnek megfelelő kombinált csomagolásba egybecsomagolható

- az ugyanazon osztály más osztályozási kódja alá tartozó árukkal, vagy más osztályok áruival, ha az egybecsomagolás azokra is megengedett; vagy
- az ADR hatálya alá nem tartozó árukkal,

amennyiben nem reagálnak egymással veszélyesen.

MP20 Egybecsomagolható az azonos UN szám alá tartozó anyagokkal.

Nem csomagolható egybe az 1 osztály más UN szám alá tartozó anyagaival és tárgyaival, kivéve, ha az MP24 különleges előírás megengedi.

Nem csomagolható egybe más osztályok áruival és az ADR hatálya alá nem tartozó árukkal.

MP21 Egybecsomagolható az azonos UN szám alá tartozó tárgyakkal.

Nem csomagolható egybe az 1 osztály más UN szám alá tartozó áruival, kivéve

- a) saját gyújtószerkezetüket, amennyiben
 - i) a gyújtószerkezet normális szállítási feltételek mellett nem lép működésbe; vagy
 - ii) a gyújtószerkezet legalább két olyan hatékony biztonsági szerkezettel van ellátva, amely a gyújtószerkezet nem szándékos működésbe lépése esetén a tárgy robbanását megakadályozza; vagy
 - iii) gyújtószerkezet, amely nincs felszerelve legalább két hatékony biztonsági szerkezettel (pl. a B összeférhetőségi csoportba sorolt gyújtószerkezet), de a származási ország⁴⁾ illetékes hatóságának véleménye szerint a gyújtószerkezet nem szándékos működésbe lépése normális szállítási körülmények között nem vonja maga után a tárgy felrobbanását;
- b) a C, a D és az E összeférhetőségi csoport tárgyait.

Nem szabad egybecsomagolni más osztályok áruival és olyan árukkal, amelyek nem tartoznak az ADR előírásainak hatálya alá.

4) Ha a származási ország nem valamely ADR Szerződő Fél, akkor a jóváhagyást a küldeménnyel érintett első ADR Szerződő Fél illetékes hatóságának kell elismernie.

Ha az árukat e különleges előírás szerint egybecsomagolják, tekintetbe kell venni a küldeménydarabok besorolásának esetleges módosítását a 2.2.1.1 bekezdés alapján. Az áru bejegyzésére a fuvarokmányba lásd az 5.4.1.2.1 b) pontot.

MP22 Egybecsomagolható az azonos UN szám alá tartozó tárgyakkal.

Nem csomagolható egybe az 1 osztály más UN szám alá tartozó tárgyaival, kivéve

- a) a saját gyújtószerkezetüket, feltéve, hogy a gyújtószerkezet normális szállítási feltételek mellett nem lép működésbe;
- b) a C, a D és az E összeférhetőségi csoport tárgyait;
- c) ha az MP24 különleges előírás megengedi.

Nem csomagolható egybe más osztályok áruival és olyan árukkal, amelyek nem tartoznak az ADR előírásainak hatálya alá.

Ha az árukat e különleges előírás szerint egybecsomagolják, tekintetbe kell venni a küldeménydarabok besorolásának esetleges módosítását a 2.2.1.1 bekezdés alapján. Az áru bejegyzésére a fuvarokmányba lásd az 5.4.1.2.1 b) pontot.

MP23 Egybecsomagolható az azonos UN szám alá tartozó tárgyakkal.

Nem csomagolható egybe az 1 osztály más UN szám alá tartozó tárgyaival, kivéve

- a) a saját gyújtószerkezetüket, feltéve, hogy a gyújtószerkezet normális szállítási feltételek mellett nem lép működésbe;
- b) ha az MP24 különleges előírás megengedi.

Nem csomagolható egybe más osztályok áruival és olyan árukkal, amelyek nem tartoznak az ADR előírásainak hatálya alá.

Ha az árukat e különleges előírás szerint egybecsomagolják, tekintetbe kell venni a küldeménydarabok besorolásának esetleges módosítását a 2.2.1.1 bekezdés alapján. Az áru bejegyzésére a fuvarokmányba lásd az 5.4.1.2.1 b) pontot.

MP24 Egybecsomagolható a következő táblázatban található UN számok alá tartozó árukkal a következő feltételekkel:

- amennyiben a táblázatban A betű van feltüntetve, az árukat az ezen UN számok alá tartozó árukkal mindenféle tömegkorlátozás nélkül egy küldeménydarabbá szabad egyesíteni;
- amennyiben a táblázatban B betű van feltüntetve, az árukat az ezen UN számok alá tartozó árukkal legfeljebb 50 kg robbanóanyag össztömegig szabad egyesíteni.

Ha az árukat e különleges előírás szerint egybecsomagolják, tekintetbe kell venni a küldeménydarabok besorolásának esetleges módosítását a 2.2.1.1 bekezdés alapján. Az áru bejegyzésére a fuvarokmányba lásd az 5.4.1.2.1 b) pontot.

4.2 FEJEZET

A MOBIL TARTÁNYOK ÉS AZ UN TÖBBELEMES GÁZKONTÉNEREK (UN MEG-KONTÉNEREK) HASZNÁLATA

- Megjegyzés: 1.** *A fémből gyártott, rögzített tartányok (tartányjárművek), leszerelhető tartányok, tankkonténerek és tartányos cserefelépítmények, továbbá battériás járművek és többelemes gázkonténerek (MEG-konténerek) használatára lásd a 4.3 fejezetet; a szálvázaz műanyag tartányok használatára lásd a 4.4 fejezetet; a hulladékok szállítására szolgáló, vákuummal üzemelő tartányok használatára lásd a 4.5 fejezetet.*
- 2.** *Az ADR szerinti szállításra felhasználhatók azok a 6.7 fejezet szerinti jelöléssel ellátott mobil tartányok és UN MEG-konténerek is, amelyeket olyan országban hagytak jóvá, amely nem Szerződő Fél.*

- 4.2.1** **Általános előírások a mobil tartányok használatára az 1 és a 3 – 9 osztály anyagainak szállításához**
- 4.2.1.1** Ez a szakasz az 1, 3, 4.1, 4.2, 4.3, 5.1, 5.2, 6.1, 6.2, 7, 8 és 9 osztályba tartozó veszélyes áruk szállítására szolgáló mobil tartányok használatára vonatkozó általános előírásokat tartalmazza. Ezen általános előírásokon kívül a mobil tartányoknak a tervezés, gyártás és vizsgálat tekintetében meg kell felelniük a 6.7.2 szakaszban részletezett előírásoknak. Az anyagokat olyan mobil tartányban kell szállítani, amely megfelel a 3.2 fejezet „A” táblázat 10 oszlopában hivatkozott és a 4.2.5.2.6 pontban meghatározott (T1 – T23) mobil tartány utasításnak, és a 3.2 fejezet „A” táblázat 11 oszlopában az egyes anyagokhoz hozzárendelt és a 4.2.5.3 bekezdésben meghatározott mobil tartány különleges előírásoknak.
- 4.2.1.2** A mobil tartányokat alkalmas módon védeni kell a szállítás során a hosszirányú és keresztirányú lökésekkel vagy felborulásból adódóan a tartányt, ill. üzemi szerelvényeit érő sérülésekkel szemben. Amennyiben a tartány és az üzemi szerelvények úgy vannak kialakítva, hogy a lökéseknek és a felborulásnak ellenállnak, akkor nem szükséges ily módon védeni. A tartányok védelmének példái a 6.7.2.17.5 pontban találhatók.
- 4.2.1.3** Bizonyos anyagok vegyileg nem állandóak. Ezek csak akkor fogadhatók el szállításra, ha megtették a szükséges intézkedéseket a szállítás alatti veszélyes bomlásuk, átalakulásuk vagy polimerizálódásuk megakadályozására. E célból különösen arról kell gondoskodni, hogy a mobil tartányok ne tartalmazzanak olyan anyagokat, amelyek az ilyen reakciókat elősegíthetik.
- 4.2.1.4** A tartány külső falának (kivéve a nyílásokat és zárószerveket) vagy a hőszigetelésének hőmérséklete a szállítás során nem emelkedhet 70 °C fölé. Szükség esetén a tartánynak hőszigeteltnek kell lennie.
- 4.2.1.5** Az üres, tisztítatlan és nem gáztalanított mobil tartányoknak ugyanolyan előírásoknak kell megfelelniük, mint az előzőleg szállított anyaggal megtöltött mobil tartányoknak.
- 4.2.1.6** Különböző anyagok nem szállíthatók szomszédos tartánykamrákban, ha azok veszélyesen reagálhatnak egymással (lásd a „veszélyes reakció” fogalmát az 1.2.1 szakaszban).
- 4.2.1.7** Az illetékes hatóság vagy az általa felhatalmazott szerv által a mobil tartányra kiadott gyártási típus jóváhagyási bizonyítványt, vizsgálati jegyzőkönyvet és az üzembe helyezés előtti és időszakos vizsgálatok eredményeit tartalmazó bizonyítványokat mind ennek a hatóságnak vagy szervnek, mind a tulajdonosnak meg kell őriznie. A tulajdonosnak ezeket az okmányokat bármely illetékes hatóság kérésére be kell tudni mutatnia.
- 4.2.1.8** Ha a szállított anyag(ok) neve nincs feltüntetve a 6.7.2.20.2 pontban meghatározott fém-táblán, a 6.7.2.18.1 pontban előírt bizonyítvány másolatát az illetékes hatóság vagy általa felhatalmazott szerv kérésére a feladó, a címzett vagy az ügynöke útján késedelem nélkül be kell mutatni.

4.2.1.9 Töltési fok

4.2.1.9.1 Töltés előtt a feladónak biztosítani kell, hogy megfelelő mobil tartányt használjanak, és hogy a mobil tartányba ne töltsenek olyan anyagot, amely a tartány, a tömítések, az üzemi szerelvények vagy a védőbevonatok anyagával érintkezve veszélyesen reagálhat, veszélyes anyagokat képezhet vagy anyagukat jelentősen gyengítheti. A feladónak szükség esetén konzultálnia kell az anyag gyártójával és az illetékes hatósággal, hogy tájékozódjon az anyagnak a mobil tartány anyagával való összeférhetőségéről.

4.2.1.9.1.1 A mobil tartányokat nem szabad a 4.2.1.9.2 – 4.2.1.9.6 pontban meghatározott mértéket meghaladóan megtölteni. A 4.2.1.9.2, a 4.2.1.9.3 vagy a 4.2.1.9.5.1 pont érvényességét az egyes anyagokra a 4.2.5.2.6 pontban, ill. a 4.2.5.3 bekezdésben és a 3.2 fejezet „A” táblázat 10, ill. 11 oszlopában található mobil tartány utasítások és különleges előírások határozzák meg.

4.2.1.9.2 A legnagyobb töltési fok (%-ban) általános esetre a következő képlettel határozható meg:

$$\text{a töltési fok} = \frac{97}{1 + \alpha(t_r - t_f)}.$$

4.2.1.9.3 A 6.1 és a 8 osztály I vagy II csomagolási csoportba tartozó folyékony anyagai esetén, és az olyan folyékony anyagok esetén, amelyek telített gőznyomása 65 °C-on meghaladja a 175 kPa-t (1,75 bar-t), a legnagyobb töltési fokot (%-ban) a következő képlettel kell meghatározni:

$$\text{a töltési fok} = \frac{95}{1 + \alpha(t_r - t_f)}.$$

4.2.1.9.4 Ezekben a képletekben α a folyékony anyag átlagos köbös hőtágulási együtthatóját jelenti a folyékony anyag töltés alatti átlagos hőmérséklete (t_f) és az anyag szállítás alatti legnagyobb átlagos hőmérséklete (t_r) között (mindkettő °C-ban). Azoknál a folyékony anyagoknál, amelyeket környezeti hőmérsékleten szállítanak, α a következő képlettel számítható ki:

$$\alpha = \frac{d_{15} - d_{50}}{35d_{50}},$$

ahol d_{15} és d_{50} a folyékony anyag sűrűsége 15 °C-on, ill. 50 °C-on.

4.2.1.9.4.1 A folyékony anyag legnagyobb átlagos hőmérsékletét (t_r) 50 °C-nak kell venni, kivéve az olyan mérsékelt vagy szélsőséges éghajlati körülmények közötti szállításokat, amelyekre az érintett illetékes hatóságok az adott esetnek megfelelően alacsonyabb hőmérsékletet is elfogadhatnak, vagy magasabb hőmérsékletet írhatnak elő.

4.2.1.9.5 A 4.2.1.9.2 – 4.2.1.9.4.1 pont előírásait nem kell alkalmazni az olyan mobil tartányokra, amelyek tartalmát a szállítás alatt 50 °C felett tartják (pl. fűtőberendezéssel). A fűtőberendezéssel ellátott mobil tartányokat el kell látni hőmérséklet-szabályozóval annak biztosítására, hogy a tartány a szállítás időtartama alatt végig legfeljebb 95%-ig legyen megtöltve.

4.2.1.9.5.1 Az olvadáspontjuk feletti hőmérsékleten szállított szilárd anyagok és a magas hőmérsékletű folyékony anyagok esetén a legnagyobb töltési fokot (%-ban) a következő képlettel kell meghatározni:

$$\text{a töltési fok} = 95 \frac{d_r}{d_f},$$

ahol d_f és d_r a folyékony anyag sűrűsége a folyékony anyag töltés alatti átlagos hőmérsékletén, illetve szállítás alatti legnagyobb átlagos hőmérsékletén.

4.2.1.9.6 A mobil tartány nem adható át szállításra:

a) ha a töltési fok a 2680 mm²/s-nál kisebb viszkozitású folyékony anyagok esetén 20 °C-

on, ill. melegített anyagoknál a legmagasabb szállítási hőmérsékleten nagyobb, mint 20%, de legfeljebb 80%, kivéve, ha a mobil tartány válaszfalakkal vagy hullámtörő lemezekkel legfeljebb 7500 liter befogadóképességű rekeszekre van osztva;

- b) ha az előzőleg szállított áru maradéka a tartány külsejére vagy az üzemi szerelvényekre tapadt;
- c) ha szivárog vagy olyan mértékben sérült, hogy ez befolyásolhatja a mobil tartány vagy emelő- vagy rögzítőszerkezetének épségét; és
- d) amíg az üzemi szerelvényeket meg nem vizsgálták és meg nem állapították, hogy jó üzemi állapotban vannak.

4.2.1.9.7 A mobil tartány emelővilla zsebeinek megtöltött tartánynál zárva kell lenniük. Ez az előírás nem vonatkozik azokra a mobil tartányokra, amelyeknek emelővilla zsebeit a 6.7.2.17.4 pont szerint nem kell zárószerkezettel ellátni.

4.2.1.10 *Kiegészítő előírások a 3 osztály anyagainak mobil tartányban történő szállítására*

4.2.1.10.1 A gyúlékony folyékony anyagok szállítására szánt minden mobil tartánynak zártnak kell lennie és a 6.7.2.8 – 6.7.2.15 bekezdés szerinti nyomáscsökkentő szerkezetekkel kell rendelkeznie.

4.2.1.10.1.1 A csak szárazföldi használatra szánt mobil tartányoknál nyitott szellőző-berendezések is használhatók, ha a 4.3 fejezet megengedi.

4.2.1.11 *Kiegészítő előírások a 4.1 osztály anyagainak (az önreaktív anyagok kivételével), a 4.2 és a 4.3 osztály anyagainak mobil tartányban történő szállítására*

(fenntartva)

Megjegyzés: A 4.1 osztály önreaktív anyagaira lásd a 4.2.1.13.1 pontot.

4.2.1.12 *Kiegészítő előírások az 5.1 osztály anyagainak mobil tartányban történő szállítására*

(fenntartva)

4.2.1.13 *Kiegészítő előírások az 5.2 osztály anyagainak és a 4.1 osztály önreaktív anyagainak mobil tartányban történő szállítására*

4.2.1.13.1 Minden anyagnak bevizsgálnak kell lenni és a vizsgálati jegyzőkönyvet jóváhagyásra be kell nyújtani a származási ország illetékes hatóságához. Erről értesítést kell küldeni a rendeltetési ország illetékes hatóságához. Az értesítésnek tartalmaznia kell a vonatkozó szállítási feltételeket és a jegyzőkönyvet a vizsgálati eredményekkel. A végrehajtott vizsgálatoknak a következőket kell lehetővé tenniük:

- a) annak bizonyítását, hogy a szállított anyag összeférhető minden olyan anyaggal, amellyel normál esetben a szállítás során érintkezésbe kerül;
- b) hogy megfelelő adatok álljanak rendelkezésre ahhoz, hogy a mobil tartány szerkezeti jellemzőit figyelembe véve a nyomáscsökkentő szelepek és vészlefüvő szerkezetek tervezhetők legyenek.

Az anyag biztonságos szállításához szükséges mindenféle különleges előírást egyértelműen be kell írni a jegyzőkönyvbe.

4.2.1.13.2 Az 55 °C vagy annál magasabb öngyorsuló bomlási hőmérséklettel (ÖBH) rendelkező F típusú szerves peroxidok és F típusú önreaktív anyagok szállítására használt mobil tartányokra a következő követelményeket kell alkalmazni. Ellentmondás esetén ezeket az előírásokat kell érvényesíteni a 6.7.2 szakaszban előírtakkal szemben. A figyelembe veendő vészhelyzetek az anyag öngyorsuló bomlása és a 4.2.1.13.8 pontban leírt eset, amikor a láng a tartányt teljesen körülveszi.

- 4.2.1.13.3** A kiegészítő előírásokat az 55 °C-nál alacsonyabb ÖBH-val rendelkező szerves peroxidok és önreaktív anyagok mobil tartányban történő szállításához a származási ország illetékes hatóságának kell meghatározni. Erről értesítést kell küldeni a rendeltetési ország illetékes hatóságához.
- 4.2.1.13.4** A mobil tartányt legalább 0,4 MPa (4 bar) próbanyomásra kell méretezni.
- 4.2.1.13.5** A mobil tartányt hőmérséklet-érzékelő szerkezetekkel kell ellátni.
- 4.2.1.13.6** A mobil tartányt nyomáscsökkentő szelepekkel és vészlefúvó szerkezetekkel kell ellátni. Vákuumszelepek is használhatók. A nyomáscsökkentő szelepeknek az anyag tulajdonságai és a mobil tartány szerkezeti jellemzői alapján meghatározott nyomáson kell működésbe lépniük. A tartányon olvadóbetétek nem engedélyezettek.
- 4.2.1.13.7** A nyomáscsökkentő szerkezeteknek rugóterhelésű szelepekből kell állniuk, amelyeket úgy kell beállítani, hogy megakadályozzák a tartányban az 50 °C hőmérsékleten felszabaduló bomlástermékek és gőzök jelentős felhalmozódását. A nyomáscsökkentő szelepek áteresztési keresztmetszetét és nyitónyomását a 4.2.1.13.1 pontban előírt vizsgálatok eredményei alapján kell meghatározni. A nyitónyomás azonban semmilyen esetben sem lehet olyan, hogy a mobil tartány felborulása esetén a szelep(ke)n keresztül folyadék távozhasson.
- 4.2.1.13.8** A vészlefúvó szerkezetek rugóterhelésűek vagy hasadótárcsás típusúak vagy a kettő kombinációi egyaránt lehetnek, és lehetővé kell tenniük minden bomlástermék és gőz eltávolítását, amely az öngyorsuló bomlás alatt fejlődik, vagy akkor, ha legalább egy óráig olyan láng veszi körül, amely a következő képlettel jellemezhető:

$$q = 70961 \cdot F \cdot A^{0,82},$$

ahol:

q = hőfelvétel [W]

A = nedvesített felület [m²]

F = szigetelési együttható [-]

$F = 1$ nem szigetelt tartány esetén, vagy

$$F = \frac{U(923 - T)}{47032} \text{ szigetelt tartány esetén}$$

ahol:

U = K/L = a szigetelő réteg hőátadási együtthatója [W·m⁻²·K⁻¹]

K = a szigetelő réteg hővezetési együtthatója [W·m⁻¹·K⁻¹]

L = a szigetelőréteg vastagsága [m]

T = az anyag hőmérséklete lefúváskor [K]

A vészlefúvó szerkezet(ek) nyitónyomásának nagyobbak kell lennie, mint a 4.2.1.13.7 pontban meghatározott nyomás, és azt a 4.2.1.13.1 pontban meghatározott vizsgálatok eredményei alapján kell meghatározni. A vészlefúvó szerkezeteket úgy kell méretezni, hogy a tartányban a legnagyobb nyomás soha ne haladja meg a tartány próbanyomását.

Megjegyzés: A vészlefúvó szerkezet méretezésére a „Vizsgálatok és kritériumok kézikönyv” 5. Függelékében található példa.

- 4.2.1.13.9** Szigeteléssel ellátott mobil tartányoknál a vészlefúvó szerkezet(ek) teljesítményét és beállítását a felület 1%-át kitevő szigetelés veszteséget feltételezve kell meghatározni.
- 4.2.1.13.10** A vákuumszelepeket és a rugóterhelésű szelepeket lángáthatolást gátló szerkezettel kell ellátni. A lefúvási teljesítmény lángáthatolást gátló szerkezet által okozott csökkenését

figyelembe kell venni.

- 4.2.1.13.11** Az üzemi szerelvényeket, pl. szelepeket és külső csővezetékeket úgy kell kialakítani, hogy a mobil tartány megtöltése után ne maradjon bennük anyag.
- 4.2.1.13.12** A mobil tartányokat szigeteléssel vagy a napsugárzás elleni védőlemezzel lehet ellátni. Ha a mobil tartányban levő anyag ÖBH értéke 55 °C vagy annál alacsonyabb, vagy ha a mobil tartány alumíniumból készült, akkor a mobil tartányt teljes szigeteléssel kell ellátni. A külső felületet fehérre kell festeni vagy világos színű, metál fényezésűnek kell lennie.
- 4.2.1.13.13** A töltési fok 15 °C-on nem haladhatja meg a 90%-ot.
- 4.2.1.13.14** A 6.7.2.20.2 pontban előírt jelölésnek tartalmaznia kell az UN számot és a műszaki megnevezést az anyag engedélyezett koncentrációjával együtt.
- 4.2.1.13.15** Csak a 4.2.5.2.6 pontban a T23 mobil tartány utasításban külön felsorolt szerves peroxidok és önreaktív anyagok szállíthatók mobil tartányban.
- 4.2.1.14** ***Kiegészítő előírások a 6.1 osztály anyagainak mobil tartányban történő szállítására***
(fenntartva)
- 4.2.1.15** ***Kiegészítő előírások a 6.2 osztály anyagainak mobil tartányban történő szállítására***
(fenntartva)
- 4.2.1.16** ***Kiegészítő előírások a 7 osztály anyagainak mobil tartányban történő szállítására***
- 4.2.1.16.1** A radioaktív anyagok szállítására használt mobil tartányokat tilos más áruk szállítására használni.
- 4.2.1.16.2** A mobil tartányok töltési foka nem haladhatja meg a 90%-ot, illetve az illetékes hatóság által engedélyezett más értéket.
- 4.2.1.17** ***Kiegészítő előírások a 8 osztály anyagainak mobil tartányban történő szállítására***
- 4.2.1.17.1** A 8 osztály anyagainak szállításához használt mobil tartányok nyomáscsökkentő szerkezeteit legalább évente felül kell vizsgálni.
- 4.2.1.18** ***Kiegészítő előírások a 9 osztály anyagainak mobil tartányokban történő szállítására***
(fenntartva)
- 4.2.1.19** ***Kiegészítő előírások a szilárd anyagok olvadáspontjuk feletti hőmérsékleten történő szállítására***
- 4.2.1.19.1** Azok az olvadáspontjuk feletti hőmérsékleten szállított (vagy szállításra feladott) szilárd anyagok, amelyekhez a 3.2 fejezet „A” táblázat 10 oszlopában nincs mobil tartány utasítás hozzárendelve, ill. a hozzárendelt mobil tartány utasítás nem vonatkozik az olvadáspont feletti hőmérsékleten történő szállításra, csak akkor szállíthatók mobil tartányban, ha a szilárd anyag a 4.1, 4.2, 4.3, 5.1, 6.1, 8 vagy 9 osztályba tartozik, a II vagy III csomagolási csoporthoz van hozzárendelve és a 6.1, ill. a 8 osztály veszélyén kívül más járulékos veszélye nincs.
- 4.2.1.19.2** Hacsak a 3.2 fejezet „A” táblázatában nincs másként előírva, a szilárd anyagok olvadáspontjuk feletti hőmérsékleten történő szállítására használt mobil tartányoknak a III csomagolási csoportba tartozó szilárd anyagok esetén a T4 mobil tartány utasítás előírásainak, ill. a II csomagolási csoportba tartozó szilárd anyagok esetén a T7 mobil tartány utasítás előírásainak kell megfelelniük. A 4.2.5.2.5 pont értelmében azonos vagy nagyobb biztonsági szintet kielégítő, más mobil tartány is választható. A legnagyobb töltési fokot (%-ban) a 4.2.1.9.5 pont szerint kell meghatározni (TP3 különleges előírás).

- 4.2.2** **Általános előírások a mobil tartányok használatára a nem mélyhűtött, cseppfolyósított gázok és nyomás alatti vegyszerek szállításához**
- 4.2.2.1** Ez a szakasz azokat az általános előírásokat tartalmazza, amelyeket a mobil tartányok nem mélyhűtött, cseppfolyósított gázok és a nyomás alatti vegyszerek szállításához történő használatánál kell alkalmazni.
- 4.2.2.2** A mobil tartányoknak a 6.7.3 szakaszban részletezett tervezési, gyártási és vizsgálati követelményeknek kell megfelelniük. A nem mélyhűtött, cseppfolyósított gázokat és a nyomás alatti vegyszereket a 4.2.5.2.6 pontban található T50 mobil tartány utasításnak és a 3.2 fejezet „A” táblázat 11 oszlopában az adott gázra vonatkozó, a 4.2.5.3 bekezdésben található mobil tartány különleges előírásoknak megfelelő mobil tartányokban kell szállítani.
- 4.2.2.3** A mobil tartányokat alkalmas módon védeni kell a szállítás során a hosszirányú és keresztirányú lökésekből vagy felborulásból adódóan a tartányt, ill. üzemi szerelvényeit érő sérülésekkel szemben. Amennyiben a tartány és az üzemi szerelvények úgy vannak kialakítva, hogy a lökéseknek és a felborulásnak ellenállnak, akkor nem szükséges ily módon védeni. A tartányok védelmének példái a 6.7.3.13.5 pontban találhatók.
- 4.2.2.4** Bizonyos nem mélyhűtött, cseppfolyósított gázok vegyileg nem állandóak. Ezek csak akkor fogadhatók el szállításra, ha megtették a szükséges intézkedéseket a szállítás alatti veszélyes bomlásuk, átalakulásuk vagy polimerizálódásuk megakadályozására. E célból különösen arról kell gondoskodni, hogy a mobil tartányok ne tartalmazzanak olyan nem mélyhűtött, cseppfolyósított gázokat, amelyek az ilyen reakciókat elősegíthetik.
- 4.2.2.5** Ha a szállított gáz(ok) neve nincs feltüntetve a 6.7.3.16.2 pontban meghatározott fémtáblán, a 6.7.3.14.1 pontban előírt bizonyítvány másolatát az illetékes hatóság vagy általa felhatalmazott szerv kérésére a feladó, a címzett vagy az ügynöke útján késedelem nélkül be kell mutatni.
- 4.2.2.6** Az üres, tisztítatlan és nem gáztalanított mobil tartányoknak ugyanolyan előírásoknak kell megfelelniük, mint az előzőleg szállított nem mélyhűtött, cseppfolyósított gázzal megtöltött mobil tartányoknak.
- 4.2.2.7** ***Töltés***
- 4.2.2.7.1** Töltés előtt a mobil tartányt ellenőrizni kell annak biztosítására, hogy a szállítandó nem mélyhűtött, cseppfolyósított gázra, ill. a nyomás alatti vegyszer hajtóanyagára engedélyezett legyen és nem töltenek bele olyan nem mélyhűtött, cseppfolyósított gázt, ill. a nyomás alatti vegyszert, amely a tartány, a tömítések, az üzemi szerelvények vagy a védőbevonatok anyagával érintkezve veszélyesen reagálhat, veszélyes anyagokat képezhet vagy anyagukat jelentősen gyengítheti. Töltés alatt a nem mélyhűtött, cseppfolyósított gáz, ill. a nyomás alatti vegyszer hajtóanyaga hőmérsékletének a méretezési hőmérséklet tartomány határain belül kell lennie.
- 4.2.2.7.2** A nem mélyhűtött, cseppfolyósított gáz ürtartalom literenkénti legnagyobb mennyisége (kg/l) a tartányban nem lehet nagyobb, mint a nem mélyhűtött, cseppfolyósított gáz 50 °C-on fennálló sűrűségének 0,95-szorosa. Ezen kívül a tartány 60 °C-on nem lehet a folyadékkal teljesen tele.
- 4.2.2.7.3** A mobil tartányok nem tölthetők meg az engedélyezett legnagyobb bruttó tömeget és az egyes szállítandó gázokra engedélyezett legnagyobb töltőtömeget meghaladó mértékben.
- 4.2.2.8** A mobil tartány nem adható át szállításra:
- a) ha a belsejében levő folyadékmentes tér akkora, hogy a mobil tartányon belül a folyadék hullámozása megengedhetetlen hidraulikus erőket keltene;
 - b) ha szivárog;
 - c) ha olyan mértékben sérült, hogy ez befolyásolhatja a mobil tartány vagy emelő- vagy rögzítőszerkezeteinek épségét; és
 - d) amíg az üzemi szerelvényeket meg nem vizsgálták és meg nem állapították, hogy jó üzemi állapotban vannak.

- 4.2.2.9** A mobil tartány emelővilla zsebeinek megtöltött tartánynál zárva kell lenniük. Ez az előírás nem vonatkozik azokra a mobil tartányokra, amelyeknek emelővilla zsebeit a 6.7.3.13.4 pont szerint nem kell zárószerkezettel ellátni.
- 4.2.3** **Általános előírások a mobil tartányok használatára a mélyhűtött, cseppfolyósított gázok szállításához**
- 4.2.3.1** Ez a szakasz azokat az általános előírásokat tartalmazza, amelyeket a mobil tartányok mélyhűtött, cseppfolyósított gázok szállításához történő használatánál kell alkalmazni.
- 4.2.3.2** A mobil tartányoknak a 6.7.4 szakaszban részletezett tervezési, gyártási és vizsgálati követelményeknek kell megfelelniük. A mélyhűtött, cseppfolyósított gázokat a 4.2.5.2.6 pontban található T75 mobil tartány utasításának és a 3.2 fejezet „A” táblázat 11 oszlopában az adott anyagra vonatkozó, a 4.2.5.3 bekezdésben található mobil tartány különleges előírásoknak megfelelő mobil tartányokban kell szállítani.
- 4.2.3.3** A mobil tartányokat alkalmas módon védeni kell a szállítás során a hosszirányú és keresztirányú lökésekkel vagy felborulásból adódóan a tartányt, ill. üzemi szerelvényeit érő sérülésekkel szemben. Amennyiben a tartány és az üzemi szerelvények úgy vannak kialakítva, hogy a lökéseknek és a felborulásnak ellenállnak, akkor nem szükséges ily módon védeni. A tartányok védelmének példái a 6.7.4.12.5 pontban találhatók.
- 4.2.3.4** Ha a szállított gáz(ok) neve nincs feltüntetve a 6.7.4.15.2 pontban meghatározott fém táblán, a 6.7.4.13.1 pontban előírt bizonyítvány másolatát az illetékes hatóság vagy általa felhatalmazott szerv kérésére a feladó, a címzett vagy az ügynöke útján késedelem nélkül be kell mutatni.
- 4.2.3.5** Az üres, tisztítatlan és nem gáztalanított mobil tartányoknak ugyanolyan előírásoknak kell megfelelniük, mint az előzőleg szállított mélyhűtött, cseppfolyósított gázzal megtöltött mobil tartányoknak.
- 4.2.3.6** **Töltés**
- 4.2.3.6.1** Töltés előtt a mobil tartányt ellenőrizni kell annak biztosítására, hogy a szállítandó mélyhűtött, cseppfolyósított gázra engedélyezett legyen és nem töltenek bele olyan mélyhűtött, cseppfolyósított gázt, amely a tartány, a tömítések, az üzemi szerelvények vagy a védőbevonatok anyagával érintkezve veszélyesen reagálhat, veszélyes anyagokat képezhet vagy anyagukat jelentősen gyengítheti. Töltés alatt a mélyhűtött, cseppfolyósított gáz hőmérsékletének a méretezési hőmérséklet tartomány határain belül kell lennie.
- 4.2.3.6.2** A kezdeti töltési fok becsléséhez figyelembe kell venni a tervezett szállításhoz szükséges megtartási időt, beszámítva a lehetséges késéseket. A 4.2.3.6.3 és a 4.2.3.6.4 pontban előírtak kivételével a tartány kezdeti töltési fokának akkorának kell lennie, hogy ha a tartalom – a hélium kivételével – olyan hőmérsékletet érne el, amelyen a gőznyomás egyenlő a megengedett legnagyobb üzemi nyomással, a folyadék által elfoglalt térfogat nem lenne nagyobb 98%-nál.
- 4.2.3.6.3** A hélium szállítására szolgáló tartányokat legfeljebb a nyomáscsökkentő szelep bemenetéig szabad megtölteni.
- 4.2.3.6.4** Az illetékes hatóság nagyobb kezdeti töltési fokot engedélyezhet, amennyiben a szállítás várható időtartama lényegesen rövidebb, mint a megtartási idő.
- 4.2.3.7** **Tényleges megtartási idő**
- 4.2.3.7.1** A tényleges megtartási időt minden egyes szállításra ki kell számítani az illetékes hatóság által elismert eljárás szerint a következők alapján:
- a szállítandó mélyhűtött, cseppfolyósított gázra vonatkozó referencia megtartási idő (lásd a 6.7.4.2.8.1 pontot) (a 6.7.4.15.1 pont szerinti táblán feltüntetve);
 - a tényleges töltési sűrűség;

- c) a tényleges töltési nyomás;
- d) a nyomáshatároló eszköz(ök) legkisebb nyitónyomása.

4.2.3.7.2 A tényleges megtartási időt vagy magán a mobil tartányon vagy a mobil tartányra tartósan rögzített fémtáblán kell feltüntetni a 6.7.4.15.2 pont szerint.

4.2.3.8 A mobil tartány nem adható át szállításra:

- a) ha a belsejében levő folyadékmentes tér akkora, hogy a mobil tartányon belül a folyadék hullámzása megengedhetetlen hidraulikus erőket keltene;
- b) ha szivárog;
- c) ha olyan mértékben sérült, hogy ez befolyásolhatja a mobil tartány vagy emelő- vagy rögzítő szerkezeteinek épségét;
- d) amíg az üzemi szerelvényeket meg nem vizsgálták és meg nem állapították, hogy jó üzemi állapotban vannak;
- e) amíg a tényleges megtartási időt a szállított mélyhűtött, cseppfolyósított gázra meg nem a határozták a 4.2.3.7 bekezdés szerint, és a mobil tartányt a 6.7.4.15.2 pont szerinti jelöléssel el nem látták; és
- f) ha a szállítás időtartama, figyelembe véve a lehetséges késéseket is, meghaladja a tényleges megtartási időt.

4.2.3.9 A mobil tartány emelővilla zsebeinek megtöltött tartánynál zárva kell lenniük. Ez az előírás nem vonatkozik azokra a mobil tartányokra, amelyeknek emelővilla zsebeit a 6.7.4.12.4 pont szerint nem kell zárószerkezettel ellátni.

4.2.4 Általános előírások az UN többelemes gázkonténerek (UN MEG-konténerek) használatára

4.2.4.1 Ez a szakasz a nem mélyhűtött gázok szállítására szolgáló, a 6.7.5 szakasz szerinti többelemes gázkonténerek (MEG-konténerek) használatára vonatkozó általános előírásokat tartalmazza.

4.2.4.2 A MEG-konténereknek a 6.7.5 szakaszban részletezett tervezési, gyártási és vizsgálati követelményeknek kell megfelelniük. A MEG-konténerek elemeit a 4.1.4.1 bekezdés P200 csomagolási utasításában és a 6.2.1.6 bekezdésben található előírások szerint kell időszakos vizsgálatnak alávetni.

4.2.4.3 A MEG-konténereket alkalmas módon védeni kell a szállítás során a hosszirányú és keresztirányú lökésekből vagy felborulásból adódóan az elemeket, ill. üzemi szerelvényeket érő sérülésekkel szemben. Amennyiben az elemek és az üzemi szerelvények úgy vannak kialakítva, hogy a lökéseknek és a felborulásnak ellenállnak, akkor nem szükséges ily módon védeni. Az ilyen védelemre példák a 6.7.5.10.4 pontban találhatók.

4.2.4.4 A MEG-konténerek időszakos vizsgálatára vonatkozó előírásokat a 6.7.5.12 bekezdés tartalmazza. A MEG-konténer, ill. elemei az időszakos vizsgálat határideje után nem tölthetők meg, de a MEG-konténer a határidő eltelte után is szállítható.

4.2.4.5 Töltés

4.2.4.5.1 Töltés előtt a MEG-konténert ellenőrizni kell annak biztosítására, hogy a szállítandó gázra engedélyezett legyen és az ADR vonatkozó előírásait betartották.

4.2.4.5.2 A MEG-konténer elemeit a 4.1.4.1 bekezdés P200 csomagolási utasításában az adott gázra meghatározott üzemi nyomás, töltési fok és töltési előírások betartásával kell megtölteni. Ha egy MEG-konténert vagy elemeit egy csoportját nem elemenként, hanem egységként töltenek meg, akkor semmilyen esetben sem szabad a legkisebb üzemi nyomású elem üzemi nyomása fölé tölteni.

4.2.4.5.3 A MEG-konténereket nem szabad a megengedett legnagyobb bruttó tömegüket meghaladó mértékben megtölteni.

- 4.2.4.5.4** A leválasztó szelepeket a töltés után el kell zárni és a szállítás alatt zárva kell maradniuk. Mérgező (a T, TF, TC, TO, TFC és TOC csoportba tartozó) gázok csak olyan MEG-konténerben szállíthatók, amely elemei leválasztó szeleppel vannak ellátva.
- 4.2.4.5.5** A töltőnyílás(oka)t dugóval vagy sapkával kell lezárni. A zárószerkezetek és a szerelvények tömítettségét a töltőnek a töltés után ellenőriznie kell.
- 4.2.4.5.6** A MEG-konténer nem adható át töltésre:
- ha olyan mértékben sérült, hogy ez befolyásolhatja a nyomástartó tartályok, az üzemi vagy a szerkezeti szerelvények épségét;
 - amíg a nyomástartó tartályokat, az üzemi és a szerkezeti szerelvényeket meg nem vizsgálták és meg nem állapították, hogy jó üzemi állapotban vannak; és
 - ha a tanúsításra, az időszakos vizsgálatra, ill. a töltésre vonatkozó jelölés olvashatatlan.
- 4.2.4.6** A megtöltött MEG-konténer nem adható át szállításra:
- ha szivárog;
 - ha olyan mértékben sérült, hogy ez befolyásolhatja a nyomástartó tartályok, az üzemi vagy a szerkezeti szerelvények épségét;
 - amíg a nyomástartó tartályokat, az üzemi és a szerkezeti szerelvényeket meg nem vizsgálták és meg nem állapították, hogy jó üzemi állapotban vannak; és
 - ha a tanúsításra, az időszakos vizsgálatra, ill. a töltésre vonatkozó jelölés olvashatatlan.
- 4.2.4.7** Az üres, tisztítatlan és nem gáztalanított MEG-konténernek ugyanazon követelményeknek kell megfelelnie, mint az előzőleg szállított anyaggal megtöltött MEG-konténernek.

4.2.5 Mobil tartány utasítások és különleges előírások

4.2.5.1 Általános előírások

- 4.2.5.1.1** Ez a szakasz a mobil tartányban szállítható veszélyes árukhoz tartozó mobil tartány utasításokat és különleges előírásokat tartalmazza. Minden mobil tartány utasítást egy betűből és számokból álló kód jelöl (pl. T1). A mobil tartányban szállítható anyagokhoz az alkalmazandó mobil tartány utasítást a 3.2 fejezet „A” táblázat 10 oszlopa tünteti fel. Ha a 10 oszlopban az adott anyagra nincs mobil tartány utasítás feltüntetve, akkor ez az anyag nem szállítható mobil tartányban, kivéve, ha azt az illetékes hatóság a 6.7.1.3 bekezdés szerint engedélyezte. A mobil tartány különleges előírások a 3.2 fejezet „A” táblázat 11 oszlopában találhatók. Minden mobil tartány különleges előírást egy betűkből és számokból álló kód jelöl (pl. TP1). A mobil tartány különleges előírásokat a 4.2.5.3 bekezdés tartalmazza.

Megjegyzés: A MEG-konténerben történő szállításra engedélyezett gázoknál a 3.2 fejezet „A” táblázat 10 oszlopában „(M)” jelölés található.

4.2.5.2 Mobil tartány utasítások

- 4.2.5.2.1** A mobil tartány utasításokat az 1 – 9 osztály veszélyes anyagaihoz kell alkalmazni. A mobil tartány utasítás az adott anyaghoz használható mobil tartányra vonatkozó előírásokról ad tájékoztatást. Ezeket az előírásokat az e fejezet és a 6.7 fejezet általános követelményei kiegészítéseképpen kell betartani.
- 4.2.5.2.2** Az 1 és a 3 – 9 osztály anyagaihoz a mobil tartány utasítások tartalmazzák az alkalmazandó legkisebb próbanyomást, a tartány legkisebb falvastagságát (referencia acélra), az alsó nyílásokra és a nyomás csökkentésre vonatkozó követelményeket. A T23 mobil tartány utasításban szerepel azoknak a 4.1 osztályba tartozó önreaktív anyagoknak és az 5.2 osztályba tartozó szerves peroxidoknak a felsorolása, amelyek mobil tartányban szállíthatók.
- 4.2.5.2.3** A nem mélyhűtött, cseppfolyósított gázokra a T50 mobil tartány utasítás vonatkozik. A T50 utasítás a mobil tartányban szállítható, nem mélyhűtött, cseppfolyósított gázokra tartalmazza

a megengedett legnagyobb üzemi nyomást, a folyadékszint alatt levő nyílásokra és a nyomás csökkentésére vonatkozó követelményeket és a legnagyobb töltési sűrűséget.

4.2.5.2.4 A mélyhűtött, cseppfolyósított gázokra a T75 mobil tartány utasítás vonatkozik.

4.2.5.2.5 *A megfelelő mobil tartány utasítás meghatározása*

Egy adott veszélyes árura a 3.2 fejezet „A” táblázat 10 oszlopában előírt mobil tartány utasítás szerintin kívül olyan mobil tartányok is használhatók, amelyeknek a legkisebb próbanyomása nagyobb, vagy nagyobb a falvastagsága, ill. az alsó nyílásokra és a nyomáscsökkentő berendezésekre szigorúbb előírások vonatkoznak. Az adott anyag szállításához megfelelő mobil tartány határozható meg a következők szerint.

4.2.5.2.6 *Mobil tartány utasítások*

A mobil tartány utasítások az egyes anyagok szállításához használt mobil tartányra vonatkozó követelményeket határozzák meg. A T1 – T22 mobil tartány utasítás meghatározza az alkalmazandó legkisebb próbanyomást, a legkisebb falvastagságot (referencia acélra mm-ben), a nyomás csökkentésre és az alsó nyílásokra vonatkozó követelményeket.

T1 – T22		MOBIL TARTÁNY UTASÍTÁSOK		T1 – T22
Ezek a mobil tartány utasítások a 3 – 9 osztály folyékony és szilárd anyagaira vonatkoznak. A 4.2.1 szakasz általános előírásait és a 6.7.2 szakasz követelményeit be kell tartani.				
Mobil tartány utasítás	Legkisebb próbanyomás (bar)	Legkisebb falvastagság (referencia acélra mm-ben) (lásd 6.7.2.4)	A nyomás csökkentésre vonatkozó követelmények ^{a)} (lásd 6.7.2.8)	Az alsó nyílásokra vonatkozó követelmények ^{b)} (lásd 6.7.2.6)

T22	10	10 mm	Lásd 6.7.2.8.3	Nem engedélyezett

a) A rovatokban szereplő „Normál” szó arra utal, hogy a 6.7.2.8 bekezdés minden követelményét teljesíteni kell, a 6.7.2.8.3 pont kivételével.

b) Ha ebben az oszlopban „Nem engedélyezett” van feltüntetve, akkor alsó nyílások nem engedélyezettek, ha a szállítandó anyag folyékony (lásd a 6.7.2.6.1 pontot). Ha a szállítandó anyag normális szállítás körülmények között fellépő minden hőmérsékleten szilárd, akkor a 6.7.2.6.2 pont követelményeinek megfelelő alsó nyílások engedélyezettek.

T23		MOBIL TARTÁNY UTASÍTÁS					T23	
Ez a mobil tartány utasítás a 4.1 osztály önreaktív anyagai és az 5.2 osztály szerves peroxidjaira vonatkozik. A 4.2.1 szakasz általános előírásait és a 6.7.2 szakasz követelményeit teljesíteni kell. A 4.1 osztály önreaktív anyagai és az 5.2 osztály peroxidjaira a 4.2.1.13 bekezdés vonatkozó kiegészítő előírásait ugyancsak be kell tartani.

- a) A „kis méretű tartány” átmérője legfeljebb 1,5 m;
a „hőszigetelés nélküli tartány” átmérője 1,5 m-nél nagyobb és nincs hőszigeteléssel vagy napsugárzás elleni védőlemezzel ellátva (lásd 6.7.3.2.12);
a „napsugárzás elleni védőlemezzel ellátott tartány” átmérője 1,5 m-nél nagyobb és napsugárzás elleni védőlemezzel van ellátva (lásd 6.7.3.2.12);
a „szigetelt tartány” átmérője 1,5 m-nél nagyobb és szigeteléssel van ellátva (lásd 6.7.3.2.12);
(A „tervezési referencia hőmérséklet” meghatározására lásd a 6.7.3.1 bekezdést.)
- b) A nyomás csökkentésre vonatkozó követelmények oszlopban a „Normál” szó azt jelenti, hogy a 6.7.3.7.3 pontban előírt hasadótárcsa nem szükséges.
- c) Az UN 3500, 3501, 3502, 3503, 3504 és 3505 tételnél a %-os töltési fokot kell figyelembe venni a legnagyobb töltési fok helyett.

T75	MOBIL TARTÁNY UTASÍTÁS	T75
Ez a mobil tartány utasítás a mélyhűtött, cseppfolyósított gázokra vonatkozik. A 4.2.3 szakasz általános előírásait és a 6.7.4 szakasz követelményeit be kell tartani.		

4.2.5.3 Mobil tartány különleges előírások

Egyes anyagokra mobil tartány különleges előírások vonatkoznak, amelyek azokat az előírásokat jelzik, amelyek kiegészítik vagy módosítják a mobil tartány utasításokban, ill. a 6.7 fejezetben rögzített követelményeket. A mobil tartány különleges előírások TP betűkkel kezdődő kóddal (az angol „tank provision” kifejezés rövidítése) vannak jelölve és a 3.2 fejezet „A” táblázat 11 oszlopában vannak feltüntetve az egyes anyagokhoz. A következő felsorolás tartalmazza a mobil tartány különleges előírásokat:

TP1 A 4.2.1.9.2 pontban előírt töltési fokot be kell tartani

$$(\text{töltési fok} = \frac{97}{1 + \alpha(t_r - t_f)}).$$

TP2 A 4.2.1.9.3 pontban előírt töltési fokot be kell tartani

$$(\text{töltési fok} = \frac{95}{1 + \alpha(t_r - t_f)}).$$

- TP3** Az olvadáspontjuk feletti hőmérsékleten szállított szilárd anyagok és a magas hőmérsékletű folyékony anyagok esetén a legnagyobb töltési fokot (%-ban) a 4.2.1.9.5 pont szerint kell meghatározni (töltési fok = $95 \frac{d_r}{d_f}$).
- TP4** A mobil tartány töltési foka nem haladhatja meg a 90%-ot, ill. az illetékes hatóság által engedélyezett más értéket (lásd a 4.2.1.16.2 pontot).
- TP5** A 4.2.3.6 bekezdésben előírt töltési fokot be kell tartani.
- TP6** Annak érdekében, hogy a tartány felrepedését minden körülmények között megakadályozzák (beleértve azt az esetet is, ha a láng teljesen körülveszi), a tartányt olyan nyomáscsökkentő szerkezettel kell ellátni, amely megfelel a tartány befogadóképességének és a szállított anyag természetének. A szerkezetnek az anyaggal összeférhetőnek kell lennie.
- TP7** A gőztérből a levegőt nitrogénnel vagy más módon ki kell űzni.
- TP8** A mobil tartány próbanyomását 1,5 bar-ra lehet csökkenteni, ha a szállított anyag lobbanáspontja nagyobb mint 0 °C.
- TP9** Az ezen tétel alá tartozó anyag csak az illetékes hatóság engedélyével szállítható mobil tartányban.
- TP10** Legalább 5 mm vastag ólom bélés szükséges, amelyet évente kell vizsgálni vagy az illetékes hatóság által engedélyezett más alkalmas bélés anyag.
- TP11** (fenntartva)
- TP12** (törölve)
- TP13** (fenntartva)
- TP14** (fenntartva)
- TP15** (fenntartva)
- TP16** A tartányt különleges szerkezettel kell ellátni vákuum és túlnyomás megakadályozására normális szállítási feltételek mellett. Ezt az illetékes hatóságnak engedélyeznie kell. A nyomás csökkentésre vonatkozó követelmények megegyeznek a 6.7.2.8.3 pontban leírtakkal a termék nyomáscsökkentő szelepből történő ki-kristályosodásának megakadályozására.
- TP17** A tartány hőszigeteléséhez csak szervesetlen, nem éghető anyagok használhatók.
- TP18** A hőmérsékletet 18 °C és 40 °C között kell tartani. A megszilárdult metakrilsavat tartalmazó mobil tartányt a szállítás alatt nem szabad visszamelegíteni.
- TP19** A számított falvastagságot 3 mm-rel kell növelni. A falvastagságokat ultrahanggal kell ellenőrizni az időszakos folyadéknyomás-próbák között félidőben.
- TP20** Ez az anyag csak szigetelt tartányban, nitrogén alatt szállítható.
- TP21** A falvastagság nem lehet 8 mm-nél kisebb. A tartányokat legalább 2,5 évenként hidraulikus nyomáspróbának és belső vizsgálatnak kell alávetni.
- TP22** A csatlakozásokhoz vagy egyéb eszközökhöz használt kenőanyagoknak az oxigénnel összeférhetőeknek kell lenniük.

- TP23** A szállítás csak az illetékes hatóság által előírt különleges feltételek mellett engedélyezett.
- TP24** A mobil tartány ellátható a legnagyobb töltési fok mellett is a tartány gőzterében maradó eszközzel a szállított anyag lassú bomlása következtében kialakuló túlnyomás megakadályozására. Ennek az eszköznek meg kell akadályoznia felborulás esetén a folyadék túlzott mértékű kifolyását vagy idegen anyagoknak a tartányba való bejutását. Ezt az eszközt az illetékes hatóságnak vagy az általa felhatalmazott szervnek engedélyeznie kell.
- TP25** A 99,95%-os vagy nagyobb tisztaságú kén-trioxid inhibitor nélkül is szállítható mobil tartányban, ha a hőmérsékletet 32,5 °C-on vagy magasabb értéken tartják.
- TP26** Felmelegített állapotban történő szállításnál a fűtőberendezésnek a tartány külsején kell lennie. Az UN 3176 tétel esetén ezt az előírást csak akkor kell figyelembe venni, ha az anyag a vízzel veszélyesen reagál.
- TP27** 4 bar legkisebb próbanyomású mobil tartány is használható, ha bizonyítható, hogy a 6.7.2.1 bekezdésben a próbanyomásra vonatkozó fogalommeghatározás alapján 4 bar vagy annál kisebb próbanyomás is elfogadható.
- TP28** 2,65 bar legkisebb próbanyomású mobil tartány is használható, ha bizonyítható, hogy a 6.7.2.1 bekezdésben a próbanyomásra vonatkozó fogalommeghatározás alapján 2,65 bar vagy annál kisebb próbanyomás is elfogadható.
- TP29** 1,5 bar legkisebb próbanyomású mobil tartány is használható, ha bizonyítható, hogy a 6.7.2.1 bekezdésben a próbanyomásra vonatkozó fogalommeghatározás alapján 1,5 bar vagy annál kisebb próbanyomás is elfogadható.
- TP30** Ezt az anyagot szigetelt tartányban kell szállítani.
- TP31** Ez az anyag csak szilárd állapotban szállítható tartányban.
- TP32** Az UN 0331, 0332 és 3375 anyagokhoz mobil tartányok csak a következő feltételek teljesülése esetén használhatók:
- a) A sürgősségi fojtás elkerülésére a fémből gyártott mobil tartányokat nyomáscsökkentő szerkezettel kell ellátni, ami lehet rugóterhelésű szelep, hasadótárcsa vagy olvadóbetét. Az a nyomás, amelynél a nyomáscsökkentő szerkezet működésbe lép, nem lehet 2,65 bar-nál nagyobb az olyan mobil tartányoknál, amelyek legkisebb próbanyomása 4 bar-nál nagyobb.
 - b) A tartányban történő szállításra való alkalmasságot bizonyítani kell. Ennek meghatározására alkalmas módszer pl. a 8 vizsgálati sorozat 8.d) próbája (lásd „Vizsgálatok és kritériumok kézikönyv”, I rész, 18.7 pont).
 - c) Az anyag nem hagyható a tartányban olyan hosszú ideig, ami károsodást okozhat. Megfelelő intézkedéseket kell tenni, hogy az anyag a tartányban ne tömörödjön össze és ne ülepedjen le (pl. tisztítás stb.).
- TP33** Az ehhez az anyaghoz tartozó mobil tartány utasítás a szemcsés és porszerű anyagokra, valamint az olyan szilárd anyagokra vonatkozik, amelyeket olvadáspontjuk feletti hőmérsékleten töltenek és ürítenek, de lehűtve, szilárd anyagként szállítanak. Az olvadáspontjuk feletti hőmérsékleten szállított szilárd anyagokra lásd a 4.2.1.19 bekezdést.
- TP34** A mobil tartányt nem kell a 6.7.4.14.1 pont szerinti ütközési próbának kitenni, ha a mobil tartányon a 6.7.4.15.1 pontban meghatározott táblán és ezenkívül a tartány

oldalán, a külső burkolaton, legalább 10 cm-es betűkkel fel van tüntetve a „VASÚTON NEM SZÁLLÍTHATÓ” felirat.

- TP35** A 2008. december 31-ig érvényes ADR szerinti T14 mobil tartány utasítás 2014. december 31-ig tovább alkalmazható.
- TP36** A mobil tartányokon a gőztérben olvadóbetétek is használhatók.
- TP37** A T14 mobil tartány utasítás 2016. december 31-ig tovább alkalmazható, kivéve, hogy ezen időpontig:
- a) az UN 1810, 2474 és 2668 számú anyagokra a T7 mobil tartány utasítás alkalmazható;
 - b) az UN 2486 számú anyagra a T8 mobil tartány utasítás alkalmazható; és
 - c) az UN 1838 számú anyagra a T10 mobil tartány utasítás alkalmazható.
- TP38** A 2012. december 31-ig érvényes ADR előírásai szerinti T9 mobil tartány utasítás 2018. december 31-ig tovább alkalmazható.
- TP39** A 2012. december 31-ig érvényes ADR előírásai szerinti T4 mobil tartány utasítás 2018. december 31-ig tovább alkalmazható.
- TP40** A mobil tartány csatlakoztatott porlasztó szerkezettel nem szállítható.

4.3 FEJEZET

A FÉMBŐL GYÁRTOTT, RÖGZÍTETT TARTÁNYOK (TARTÁNYJÁRMŰVEK), LESZERELHETŐ TARTÁNYOK, TANKKONTÉNEREK ÉS TARTÁNYOS CSEREFELÉPÍTMÉNYEK, VALAMINT BATTÉRIÁS JÁRMŰVEK ÉS TÖBBELEMES GÁZKONTÉNEREK (MEG-KONTÉNEREK) HASZNÁLATA

Megjegyzés: *A mobil tartányok és az UN többelemes gázkonténerek (UN MEG-konténerek) használatára lásd a 4.2 fejezetet; a szálvázaz műanyag tartányok használatára lásd a 4.4 fejezetet; a hulladékok szállítására szolgáló, vákuummal üzemelő tartányok használatára lásd a 4.5 fejezetet.*

4.3.1 Alkalmazási terület

4.3.1.1 Az oldal teljes szélességében nyomtatott követelményeket a rögzített tartányokra (tartányjárművekre), a leszerelhető tartányokra, a battériás járművekre, a tankkonténerekre, a tartányos cserefelépítményekre és a MEG-konténerekre egyaránt alkalmazni kell. Az egyetlen oszlopban nyomtatott követelményeket csak

- a rögzített tartányokra (tartányjárművekre), a leszerelhető tartányokra és a battériás járművekre (bal oldali oszlop); ill.
- a tankkonténerekre, a tartányos cserefelépítményekre és a MEG-konténerekre (jobb oldali oszlop)

kell alkalmazni.

4.3.1.2 Ezeket a követelményeket a gáz alakú, a folyékony, a porszerű vagy szemcsés anyagok szállításához használt

rögzített tartányokra (tartányjárművekre), leszerelhető tartányokra és battériás jármű- vekre	tankkonténerekre, tartányos cserefelépítmé- nyekre és MEG-konténerekre
---	---

kell alkalmazni.

4.3.1.3 A 4.3.2 szakasz tartalmazza az összes osztály anyagainak szállítására szolgáló rögzített tartányok (tartányjárművek), leszerelhető tartányok, tankkonténerek és tartányos cserefelépítmények és a 2 osztály gázainak szállítására szolgáló battériás járművek és MEG-konténerek használatára vonatkozó előírásokat. A 4.3.3 és a 4.3.4 szakasz a használatra vonatkozó különleges előírásokat tartalmazza, amelyek kiegészítik vagy módosítják a 4.3.2 szakasz előírásait.

4.3.1.4 A gyártásra, a szerelvényekre, a típusjóváhagyásra, a vizsgálatokra és a jelölésre vonatkozó követelményeket lásd a 6.8 fejezetben.

4.3.1.5 A jelen fejezet alkalmazását illető átmeneti előírásokat az

1.6.3	1.6.4
-------	-------

szakasz tartalmazza.

4.3.2 Az összes osztályra vonatkozó követelmények

4.3.2.1 *Használat*

4.3.2.1.1 Az ADR hatálya alá tartozó valamely anyag csak akkor szállítható rögzített tartányban (tartányjárműben), leszerelhető tartányban, battériás járműben, tankkonténerben, tartányos cserefelépítményben vagy MEG-konténerben, ha a 3.2 fejezet „A” táblázat 12 oszlopában a

4.3.3.1.1 vagy a 4.3.4.1.1 pont szerinti valamely tartánykódra hivatkozás szerepel.

4.3.2.1.2 Az előírt tartány, battériás jármű és MEG-konténer típus a 3.2 fejezet „A” táblázat 12 oszlopában egy kód formájában van megadva. Az itt megjelenő azonosító kód meghatározott sorrendben betűkből, ill. betűkből és számokból áll. A négy részes kód magyarázata a 4.3.3.1.1 pontban található, ha a szállítandó anyag a 2 osztályba tartozik, illetve a 4.3.4.1.1 pontban, ha a szállítandó anyag az 1, vagy a 3 – 9 osztályba⁵⁾ tartozik.

4.3.2.1.3 A 4.3.2.1.2 pont szerint előírt tartány típus az a típus, amely a legkevésbé szigorú gyártási követelményeknek felel meg, amelyek a szóban forgó anyag esetében még elfogadhatók. Ha ebben a fejezetben vagy a 6.8 fejezetben nincs más előírva, lehetséges olyan tartány használata is, amelynek kódja nagyobb tervezési nyomást ír elő, ill. a töltő és ürítő nyílásokra vagy a biztonsági szelepekre, szerkezetekre szigorúbb előírást tartalmaz (a 2 osztályra vonatkozóan lásd a 4.3.3.1.1, a 3 – 9 osztályra a 4.3.4.1.1 pontot).

4.3.2.1.4 Bizonyos anyagok esetében a tartányokra, a battériás járművekre, ill. MEG-konténerekre kiegészítő előírások is vonatkoznak, amelyeket a 3.2 fejezet „A” táblázat 13 oszlopa különleges előírások formájában tartalmaz.

4.3.2.1.5 A tartányokat, a battériás járműveket és a MEG-konténereket csak olyan veszélyes anyagokkal szabad megtölteni, amelyekre a 6.8.2.3.1 pont szerint engedélyezve vannak, és amelyek a tartány anyagával, a tömítésekkel, a szerelvényekkel és a védőbevonattal érintkezve nem léphetnek veszélyes reakcióba (a veszélyes reakciókat lásd az 1.2.1 szakaszban), nem hozhatnak létre veszélyes terméket, vagy nem gyöngíthetik jelentősen a tartány anyagát⁶⁾.

4.3.2.1.6 A veszélyes anyagokhoz használt tartányokban nem szabad élelmiszereket szállítani, kivéve, ha a közegészségügyi szempontból káros következmények megelőzéséhez szükséges intézkedéseket megtették.

4.3.2.1.7 A tartány-vizsgálati könyvet (gépkönyvet) a tulajdonosnak vagy az üzemben tartónak kell őriznie, és a könyv dokumentumait az illetékes hatóság kérésére be kell tudnia mutatni. A tartány-vizsgálati könyvet (gépkönyvet) a tartány teljes élettartama alatt vezetni kell, és a tartány használatból való kivonása után még 15 hónapig meg kell őrizni.

Ha a tartány élettartama alatt bármikor megváltozik a tulajdonos vagy az üzemben tartó, a tartány-vizsgálati könyvet (gépkönyvet) az új tulajdonosnak, ill. üzemben tartónak át kell adni.

A tartány időszakos, ill. soron kívüli vizsgálatok a 6.8.2.4.5 és a 6.8.3.4.16 pontok szerinti próbákat, ellenőrzéseket vagy vizsgálatokat végző szakértő rendelkezésére kell bocsátani a tartány-vizsgálati könyv, ill. minden szükséges dokumentum másolatát.

4.3.2.2 *Töltési fok*

4.3.2.2.1 Folyékony anyagok környezeti hőmérsékleten való szállítására használt tartányoknál a következő töltési fokokat nem szabad túllépni:

- a) egyéb veszélyeket (pl. mérgezést, marást) nem jelentő gyúlékony anyagok esetén légző-berendezéssel vagy biztonsági szeleppel felszerelt tartányoknál (akkor is, ha a szelep előtt hasadótárcsa van):

$$\text{a töltési fok} = \text{a befogadóképesség} \cdot \frac{100}{1 + \alpha(50 - t_F)} \% - a;$$

- b) mérgező vagy maró anyagok esetén (akár gyúlékonyak, akár nem) légző-berendezéssel vagy biztonsági szeleppel felszerelt tartányoknál (akkor is, ha a szelep előtt hasadótárcsa van):

5) Kivételt képeznek az 1, az 5.2 és a 7 osztály anyagainak szállítására szolgáló tartányok (lásd a 4.3.4.1.3 pontot).

6) Szükség esetén az anyag gyártójával és az illetékes hatósággal kell konzultálni annak megítéléséhez, hogy az anyag a tartány, a battériás jármű vagy a MEG-konténer anyagával összeférhető-e.

$$\text{a töltési fok} = \text{a befogadóképesség} \frac{98}{1 + \alpha(50 - t_F)} \% \text{-a;}$$

- c) gyúlékony anyagok és az enyhén mérgező vagy gyengén maró anyagok esetén (akár gyúlékonyak, akár nem) légmentesen zárt, biztonsági szelep nélküli tartányoknál:

$$\text{a töltési fok} = \text{a befogadóképesség} \frac{97}{1 + \alpha(50 - t_F)} \% \text{-a;}$$

- d) nagyon mérgező vagy mérgező, erősen maró vagy maró anyagok esetén (akár gyúlékonyak, akár nem) légmentesen zárt, biztonsági szelep nélküli tartányoknál:

$$\text{a töltési fok} = \text{a befogadóképesség} \frac{95}{1 + \alpha(50 - t_F)} \% \text{-a.}$$

4.3.2.2.2

Ezekben a képletekben α a folyadék átlagos köbös hőtágulási együtthatóját jelenti 15 °C és 50 °C között, azaz 35 °C legnagyobb hőmérséklet-változásra. Az α -t a következő képlet szerint kell kiszámítani:

$$\alpha = \frac{d_{15} - d_{50}}{35d_{50}}.$$

Az előző képletekben

d_{15} és d_{50} a folyadék sűrűsége 15°C-on, ill. 50°C-on;

t_F a folyadék átlagos hőmérséklete a töltés alatt.

4.3.2.2.3

A 4.3.2.2.1 a) – d) pontban előírtak nem vonatkoznak az olyan tartányokra, amelyek a szállított anyagot a szállítás során fűtőberendezéssel 50 °C fölötti hőmérsékleten tartják. Ilyen esetben a szállítás megkezdésekor a töltési fokot úgy kell megválasztani, ill. a hőmérsékletet úgy kell szabályozni, hogy a tartány a szállítás időtartama alatt végig legfeljebb 95%-ig legyen megtöltve, és a szállítás során a hőmérséklet ne emelkedjen a töltési hőmérséklet fölé.

4.3.2.2.4

Amennyiben a folyékony állapotú anyagok, a cseppfolyósított, ill. a mélyhűtött, cseppfolyósított gázok szállítására használt tartány nincs válaszfalakkal vagy hullámtörő lemezekkel legfeljebb 7500 liter űrtartalmú rekeszekre osztva, a töltési foknak a befogadóképesség legalább 80%-ának vagy legfeljebb 20%-ának kell lennie.

Ez az előírás nem vonatkozik:

- azokra a folyékony anyagokra, amelyeknek a kinematikai viszkozitása 20 °C-on legalább 2680 mm²/s;
- azokra az olvadékokra, amelyeknek a kinematikai viszkozitása a töltési hőmérsékleten legalább 2680 mm²/s;
- az UN 1963 mélyhűtött, cseppfolyósított héliumra és az UN 1966 mélyhűtött, cseppfolyósított hidrogénre.

4.3.2.3

Üzemeltetés

4.3.2.3.1

A tartány falvastagságának a teljes használati időtartam alatt nem szabad

a 6.8.2.1.17 – 6.8.2.1.21 | a 6.8.2.1.17 – 6.8.2.1.20
pontban előírt legkisebb érték alá csökkennie.

4.3.2.3.2

(fenntartva)

A tankkonténereket, ill. MEG-konténereket a szállítás során a szállító járművön úgy kell rögzíteni, hogy az oldalról és a hátulról jövő lökések vagy felborulás ellen megfelelő módon biztosítva legyenek⁷⁾ a szállító jármű vagy a tankkonténer, ill. MEG-konténer berendezései által. Ha a tankkonténerek, ill. MEG-konténerek, beleértve az üzemi szerelvényeket is, úgy vannak kialakítva, hogy a lökéseknek és a felborulásnak ellenállnak, akkor nem szükséges azokat ilyen módon biztosítani.

4.3.2.3.3

Megfelelő intézkedéseket kell tenni a gázok és gőzök veszélyes mennyiségben történő kiszabadulásának megakadályozására a tartányok, battériás járművek, ill. MEG-konténerek töltése és ürítése alatt. A tartányt, battériás járművet és MEG-konténert úgy kell lezárni, hogy tartalma ellenőrizhetetlenül ne juthasson a szabadba. Az alsó ürítésű tartány nyílásait csavarmentes dugóval, vakkarimával vagy más, ugyanilyen hatékonyságú szerkezettel kell lezárni. A töltőnek a töltés után biztosítani kell, hogy a tartány, battériás jármű és MEG-konténer zárószervezetei zártak és tömítettek legyenek, ugyanez vonatkozik a merülőcső tetején levő zárószervezetekre is.

4.3.2.3.4

Abban az esetben, ha több, egymás mögött elhelyezett zárószervezet van, legelőször a betöltött anyaghoz legközelebb esőt kell elzárni.

4.3.2.3.5

A szállítás alatt a tartány külsején nem lehet a betöltött anyagból semmilyen veszélyes maradék.

4.3.2.3.6

Egymással veszélyesen reagáló anyagokat nem szabad a tartányok szomszédos kamráiban szállítani.

Szállíthatók azonban egymással veszélyesen reagáló anyagok a tartányok szomszédos kamráiban akkor, ha ezeket a kamrákat a tartányfallal azonos vagy nagyobb vastagságú fal választja el egymástól, illetve, ha a rakott kamrákat üres tér vagy üres kamra választja el.

4.3.2.4

Üres, tisztítatlan tartányok, battériás járművek és MEG-konténerek

Megjegyzés: Az üres, tisztítatlan tartányokra, battériás járművekre és MEG-konténerekre a 4.3.5 szakasz TU1, TU2, TU4, TU16 és TU35 különleges előírás vonatkozik.

4.3.2.4.1

A szállítás alatt a tartány külsején nem maradhat a betöltött anyagból semmilyen veszélyes maradék.

4.3.2.4.2

Az üres, tisztítatlan tartányokat, battériás járműveket, ill. MEG-konténereket csak úgy szabad szállításra felvenni, ha ugyanúgy vannak lezárva és ugyanolyan tömítettek, mintha töltve lennének.

4.3.2.4.3

Ha az üres, tisztítatlan tartányok, battériás járművek és MEG-konténerek nincsenek ugyanúgy lezárva és nem ugyanolyan tömítettek, mintha töltve lennének és ezért nem felelnek meg az ADR előírásainak, a megfelelő biztonságot szem előtt tartva, a legközelebbi alkalmas helyre szállíthatók, ahol a tisztítás vagy javítás elvégezhető.

A biztonság megfelelőnek tekinthető, ha megtették a szükséges intézkedéseket ahhoz, hogy az ADR előírásainak megfelelő biztonságot érjenek el, és a veszélyes áruk ellenőrzés nélkül ne jussanak a szabadba.

7) A tartány védelmének példái:

- az oldalirányú védelem állhat pl. hosszanti tartórudakból, amelyek a tartány két hosszanti oldala középvonában vannak;
- a felborulás elleni védelem állhat pl. erősítőgyűrűkből vagy a keretre erősített keresztrudakból;
- a hátulról jövő lökések elleni védelem lehet pl. lökhárító vagy ütközőkeret.

4.3.2.4.4 Az üres, tisztítatlan rögzített tartányok (tartányjárművek), leszerelhető tartányok, battériás járművek, tankkonténerek, tartányos cserefelépítmények és MEG-konténerek a 6.8.2.4.2 és a 6.8.2.4.3 pontban meghatározott időköz eltelte után is szállíthatók a vizsgálat végrehajtása céljából.

4.3.3 A 2 osztályra vonatkozó különleges előírások

4.3.3.1 Kódok és tartány rangsor

4.3.3.1.1 A tartányok, battériás járművek és MEG-konténerek kódja

A 3.2 fejezet „A” táblázat 12 oszlopában szereplő kódok (tartánykódok) négy részének jelentése a következő:

Rész	Leírás	Tartánykód
1	A tartány, battériás jármű vagy MEG-konténer típusa	C = sűrített gázok szállítására szolgáló tartány, battériás jármű vagy MEG-konténer P = cseppfolyósított gázok vagy oldott gázok szállítására szolgáló tartány, battériás jármű vagy MEG-konténer R = mélyhűtött, cseppfolyósított gázok szállítására szolgáló tartány
2	Tervezési nyomás	* = a 4.3.3.2.5 táblázat szerinti legkisebb próbanyomás értéke (bar-ban), vagy 22 = a legkisebb tervezési nyomás (bar-ban)
3	Nyílások (lásd a 6.8.2.2 és a 6.8.3.2 bekezdést)	B = háromszoros zárószervezetű alsó töltő- vagy ürítőnyílással ellátott tartány; vagy olyan battériás jármű, ill. MEG-konténer, amelynek nyílásai a folyadék szint alatt vannak vagy amely sűrített gázok szállítására szolgál C = háromszoros zárószervezetű felső töltő- vagy ürítőnyílással ellátott tartány, amelynél a folyadékszint alatt csak tisztító-nyílások vannak D = háromszoros zárószervezetű felső töltő- vagy ürítőnyílással ellátott tartány; vagy olyan battériás jármű, ill. MEG-konténer, amelynél a folyadékszint alatt nincsenek nyílások
4	Biztonsági szelepek, ill. szerkezetek	N = a 6.8.3.2.9, ill. a 6.8.3.2.11 és a 6.8.3.2.12 vagy a 6.8.3.2.10 pont szerinti biztonsági szeleppel ellátott tartány, battériás jármű, ill. MEG-konténer, amely nem légmentesen zárt H = légmentesen zárt (lásd az 1.2.1 szakaszt) tartány, battériás jármű, ill. MEG-konténer

Megjegyzés: 1. A 3.2 fejezet „A” táblázat 13 oszlopában bizonyos gázokra feltüntetett TU17 különleges előírás azt jelzi, hogy a gáz csak olyan battériás járműben vagy MEG-konténerben szállítható, amelynek elemei tartályok.

2. A 3.2 fejezet „A” táblázat 13 oszlopában bizonyos gázokra feltüntetett TU40 különleges előírás azt jelzi, hogy a gáz csak olyan battériás járműben vagy MEG-konténerben szállítható, amelynek elemei varrat nélküli tartályok.

3. A magán a tartányon vagy a táblán feltüntetett nyomás nem lehet kisebb, mint a „*”-nak megfelelő érték vagy a legkisebb tervezési nyomás.

4.3.3.1.2 Tartányrangsor

Tartánykód	A tartánykódhoz engedélyezett anyagok szállítására használható, további tartányok kódjai
C*BN	C#BN, C#CN, C#DN, C#BH, C#CH, C#DH
C*BH	C#BH, C#CH, C#DH
C*CN	C#CN, C#DN, C#CH, C#DH

C*CH	C#CH, C#DH
C*DN	C#DN, C#DH
C*DH	C#DH
P*BN	P#BN, P#CN, P#DN, P#BH, P#CH, P#DH
P*BH	P#BH, P#CH, P#DH
P*CN	P#CN, P#DN, P#CH, P#DH
P*CH	P#CH, P#DH
P*DN	P#DN, P#DH
P*DH	P#DH
R*BN	R#BN, R#CN, R#DN
R*CN	R#CN, R#DN
R*DN	R#DN

A #-jellel jelölt helyen szereplő számnak legalább egyenlőnek kell lennie a *-gal jelölt helyen szereplő számmal.

Megjegyzés: Ez a rangsor nem veszi figyelembe az egyes tételekre vonatkozó esetleges különleges előírásokat (lásd a 4.3.5 és a 6.8.4 szakaszt).

4.3.3.2 Töltési feltételek és próbanyomások

4.3.3.2.1 A sűrített gázok szállítására használt tartányoknál a próbanyomásnak az üzemi nyomás 1,5-szeresének kell lennie, az üzemi nyomás alatt az 1.2.1 szakaszban a nyomástartó tartály üzemi nyomására adott meghatározás szerinti nyomás értendő.

4.3.3.2.2 A próbanyomást

- a nagy nyomáson cseppfolyósított gázok; és
- az oldott gázok

szállítására használt tartányoknál a úgy kell meghatározni, hogy a tartányt a legnagyobb töltési fokra megtöltve az anyag nyomása hőszigetelt tartány esetében 55 °C-on, illetve hőszigetelés nélküli tartány esetében 65 °C-on ne haladja meg a próbanyomást.

4.3.3.2.3 A kis nyomáson cseppfolyósított gázok szállítására használt tartányoknál a próbanyomás:

- a) hőszigetelt tartány esetén legalább a folyadéknak 60 °C-hoz tartozó, 0,1 MPa-lal (1 bar-ral) csökkentett gőznyomása, de legalább 1 MPa (10 bar);
- b) hőszigetelés nélküli tartány esetén legalább a folyadéknak 65 °C-hoz tartozó, 0,1 MPa-lal (1 bar-ral) csökkentett gőznyomása, de legalább 1 MPa (10 bar).

A legnagyobb töltési fok meghatározásához az űrtartalom literenként engedélyezett legnagyobb töltési tömeget a következők szerint kell kiszámítani:

az űrtartalom literenként engedélyezett legnagyobb töltési tömeg = a folyadékfázis 50 °C-on fennálló sűrűsége (kg/l-ben) x 0,95.

Ezenkívül a gőzfázis 60 °C alatt nem tűnhet el.

Ha a tartány átmérője legfeljebb 1,5 m, a próbanyomásra és a legnagyobb töltési fokra a 4.1.4.1 bekezdés P200 csomagolási utasítása szerinti értékek érvényesek.

4.3.3.2.4 A mélyhűtött, cseppfolyósított gázok szállítására használt tartányok esetén a próbanyomás nem lehet kisebb, mint a tartányon feltüntetett legnagyobb megengedett üzemi nyomás 1,3-szerese, de legalább 300 kPa (3 bar) nyomás (túlnyomás); a vákuumszigetelésű tartányok próbanyomása nem lehet kisebb, mint a legnagyobb megengedett üzemi nyomás és 100 kPa (1 bar) összegének 1,3-szerese.

4.3.3.2.5 A rögzített tartányban (tartányjárműben), leszerelhető tartányban, battériás járműben, tankkonténerben és MEG-konténerben szállítható gázok és gázkeverékek táblázata a tartány legkisebb próbanyomásának, valamint adott esetben a töltési fokának megadásával

Az m.n.n. tételek alá sorolt gázoknál és gázkeverékeknél a próbanyomásra és a legnagyobb

töltési fokra vonatkozó értékeket az illetékes hatóság által elismert szakértőnek kell meghatároznia.

Ha a sűrített vagy nagy nyomáson cseppfolyósított gázok szállítására szolgáló tartányokat a táblázatban megadottnál kisebb próbanyomásnak vetik alá, és a tartányok hőszigeteléssel vannak ellátva, az illetékes hatóság által elismert szakértő csökkentheti az engedélyezett legnagyobb töltési tömeget, amennyiben az anyag nyomása a tartányban 55 °C-on nem haladja meg a tartányon feltüntetett próbanyomást.

a) Akkor engedélyezett, ha LC₅₀ értéke 200 ppm vagy annál nagyobb.

b) Piroforosnak tekintendő.

4.3.3.3 *Üzemeltetés*

4.3.3.3.1 Ha a tartányt, battériás járművet, ill. MEG-konténert különböző gázokhoz engedélyezték, a gáztöltet megváltoztatása során a biztonságos üzemeltetéshez szükséges mértékben ki kell üríteni, tisztítani, ill. gáztalanítani.

4.3.3.3.2 A tartányon, battériás járművön, ill. MEG-konténeren a szállításra való átadásakor csak a betöltött vagy az éppen lefejtett gázra vonatkozó, a 6.8.3.5.6 pont szerinti érvényes adatoknak szabad láthatóknak lenniük, a többi gázra vonatkozó minden adatot le kell takarni.

4.3.3.3.3 Egy battériás jármű, ill. MEG-konténer minden eleme csak ugyanazt a gázt tartalmazhatja.

4.3.3.3.4 A kis nyomáson cseppfolyósított gázok szállítására használt tartányokat megfelelő intézkedésekkel (pl. az elegendő belső nyomás fenntartása céljából nitrogénnel vagy más inert gázzal való feltöltéssel) védeni kell a deformáció veszélyétől, ha a külső túlnyomás (pl. az alacsony környezeti hőmérséklet miatt) nagyobb lehet, mint a tartány külső túlnyomással szembeni ellenállóképessége.

4.3.3.4 (fenntartva)

4.3.4 **A 3 – 9 osztályra vonatkozó előírások**

4.3.4.1 ***Kódok, a csoportos hozzárendelés és a tartány rangsor***

4.3.4.1.1 *A tartányok kódja*

A 3.2 fejezet „A” táblázatának 12 oszlopában szereplő kódok (tartánykódok) négy részének jelentése a következő:

Rész	Leírás	Tartánykód
1	A tartány típusa	L = folyékony állapotban levő anyagok (folyékony anyagok vagy olvasztott állapotban szállításra átadott szilárd anyagok) szállítására szolgáló tartány; S = szilárd állapotban levő anyagok (porszerű vagy szemcsés anyagok) szállítására szolgáló tartány
2	Tervezési nyomás	G = a legkisebb tervezési nyomás a 6.8.2.1.14 pont általános követelményei szerint; vagy 1.5; 2.65; 4; 10; 15 vagy 21 = a legkisebb tervezési nyomás barban (lásd a 6.8.2.1.14 pontot)
3	Nyílások (lásd a 6.8.2.2.2 pontot)	A = kétszeres zárószerkezetű, alsó töltő-, ill. ürítőnyílással ellátott tartány B = háromszoros zárószerkezetű, alsó töltő-, ill. ürítőnyílással ellátott tartány C = felső töltő-, ill. ürítőnyílással ellátott tartány, amelynél a folyadékszint alatt csak tisztítónyílások vannak D = felső töltő-, ill. ürítőnyílással ellátott tartány, amelynél a folyadékszint alatt nincsenek nyílások
4	Biztonsági szelepek, ill. szerkezetek	V = a 6.8.2.2.6 pont szerinti légző-berendezéssel ellátott, de lángáthatolást gátló szerkezet nélküli tartány; vagy nem robbanási nyomás álló tartány F = a 6.8.2.2.6 pont szerinti légző-berendezéssel ellátott tartány lángáthatolást gátló szerkezettel; vagy robbanási nyomás álló tartány N = a 6.8.2.2.6 pont szerinti légző-berendezés nélküli tartány, amely nincs légmentesen zárva H = légmentesen zárt tartány (lásd az 1.2.1 szakaszt)

4.3.4.1.2

Az ADR-tartányok kódjának anyagcsoportokhoz történő hozzárendelése és a tartányok rangsora

Megjegyzés: Bizonyos anyagok és anyag csoportok a csoportos hozzárendelésben nem szerepelnek, ezekre lásd a 4.3.4.1.3 pontot.

Tartányrangsor

Olyan tartányok is használhatók, amelyeknek tartánykódja sem ebben a táblázatban, sem a 3.2 fejezet „A” táblázatában nincsen feltüntetve, azzal a feltétellel, hogy a kód minden eleme, az 1 – 4 részben található betűk, ill. számok legalább azonos biztonsági szintnek felelnek meg, mint a 3.2 fejezet „A” táblázatában feltüntetett kód megfelelő elemei. A biztonsági szintek növekvő sorrendben a következők:

1 rész: Tartány típus

$S \rightarrow L$

2 rész: Tervezési nyomás

$G \rightarrow 1.5 \rightarrow 2.65 \rightarrow 4 \rightarrow 10 \rightarrow 15 \rightarrow 21 \text{ bar}$

3. rész: Nyílások

$A \rightarrow B \rightarrow C \rightarrow D$

4 rész: Biztonsági szelepek, ill. szerkezetek

$V \rightarrow F \rightarrow N \rightarrow H$

Például:

- az L10CN kóddal ellátott tartány használható olyan anyagokhoz is, amelyekhez az L4BN kód van hozzárendelve;
- az L4BN kóddal ellátott tartány használható olyan anyagokhoz is, amelyekhez az SGAN kód van hozzárendelve.

Megjegyzés: *A rangsor nem veszi figyelembe az egyes tételekre vonatkozó esetleges különleges előírásokat (lásd a 4.3.5 és a 6.8.4 szakaszt).*

4.3.4.1.3

A következő anyagokra és anyagsoportokra, amelyeknél a 3.2 fejezet „A” táblázat 12 oszlopában a tartánykód után (+) jel látható, különleges előírások vonatkoznak. Ebben az esetben a tartányok alternatív használata más anyagokhoz és anyagsoportokhoz csak akkor engedélyezett, ha az a típusjóváhagyási bizonyítványban szerepel. Figyelembe véve a 3.2 fejezet „A” táblázat 13 oszlopában található különleges előírásokat, a 4.3.4.1.2 pont végén található előírások szerinti, magasabb értékű tartányok alkalmazhatók.

Ezekre a tartányokra a követelményeket a következő tartánykódok adják meg, kiegészítve a vonatkozó különleges előírásokkal, amelyeket a 3.2 fejezet „A” táblázat 13 oszlopa tartalmaz.

a) 1 osztály

1.5 alosztály, UN 0331 B típusú robbantóanyag: S2.65AN kód

b) 4.1 osztály:

UN 2448 olvasztott kén: LGBV kód;

c) 4.2 osztály:

UN 1381 fehér- vagy sárgafoszfor szárazon vagy víz alatt vagy oldatban és UN 2447 olvasztott fehérfoszfor: L10DH kód;

d) 4.3 osztály:

UN 1389 folyékony alkálifém amalgám, UN 1391 alkálifém diszperzió vagy UN 1391 alkáliföldfém diszperzió, UN 1392 folyékony alkáliföldfém-amalgám, UN 1415 lítium, UN 1420 folyékony káliumfém-ötvözetek, UN 1421 folyékony alkálifém-ötvözetek, m.n.n., UN 1422 folyékony kálium-nátrium-ötvözetek, UN 1428 nátrium, UN 2257 kálium, UN 3401 szilárd alkálifém-amalgám, UN 3402 szilárd alkáliföldfém-amalgám, UN 3403 szilárd káliumfém-ötvözetek és UN 3404 szilárd kálium-nátrium-ötvözetek és UN 3482 gyúlékony alkálifém diszperzió vagy UN 3482 gyúlékony alkáliföldfém diszperzió: L10BN kód;

UN 1407 cézium és UN 1423 rubídium: L10CH kód;

UN 1402 kalcium-karbid, I csomagolási csoport: S2.65AN kód

e) 5.1 osztály:

UN 1873 perklórsav 50 tömeg%-nál több, de legfeljebb 72 tömeg% savtartalommal: L4DN kód;

UN 2015 hidrogén-peroxid vizes oldat, stabilizált, 70%-nál több hidrogén-peroxid

tartalommal: L4DV kód;

UN 2015 hidrogén-peroxid vizes oldat, stabilizált, 60%-nál több, de legfeljebb 70% hidrogén-peroxid tartalommal: L4BV kód;

UN 2014 hidrogén-peroxid vizes oldat 20%-nál több, de legfeljebb 60% hidrogén-peroxid tartalommal és UN 3149 hidrogén-peroxid és peroxi-ecetsav keverék, stabilizált: L4BV kód;

UN 2426 folyékony ammónium-nitrát, forró, tömény oldat, 80%-nál több, de legfeljebb 93% koncentrációval: L4BV kód;

UN 3375 ammónium-nitrát emulzió, szuszpenzió vagy gél, folyékony: LGAV kód;

UN 3375 ammónium-nitrát emulzió, szuszpenzió vagy gél, szilárd: SGAV kód;

f) 5.2 osztály:

UN 3109 F típusú, folyékony szerves peroxid és UN 3119 F típusú, folyékony szerves peroxid hőmérséklet-szabályozással: L4BN kód;

UN 3110 F típusú, szilárd szerves peroxid és UN 3120 F típusú, szilárd szerves peroxid hőmérséklet-szabályozással: S4AN kód;

g) 6.1 osztály:

UN 1613 hidrogén-cianid vizes oldat (cián-hidrogénsav vizes oldat) és UN 3294 hidrogén-cianid alkoholos oldat: L15DH kód;

h) 7 osztály:

minden anyagra: különleges tartány;

Minimális követelmény

folyékony anyagokra: L2.65CN kód;

szilárd anyagokra: S2.65AN kód.

E bekezdés általános előírásaitól függetlenül a radioaktív anyagokhoz használt tartányok más áruk szállítására is használhatók, ha az 5.1.3.2 bekezdés előírásait betartják.

i) 8 osztály:

UN 1052 hidrogén-fluorid, vízmentes és UN 1790 fluor-hidrogénsav, 85%-nál több hidrogén-fluorid tartalommal: L21DH kód;

UN 1744 bróm vagy UN 1744 bróm oldat: L21DH kód ;

UN 1791 hipoklorit oldat és UN 1908 klorit oldat: L4BV kód.

4.3.4.1.4

Azokat a folyékony hulladékok szállítására szolgáló, a 6.10 fejezet követelményeinek megfelelő tartányokat, amelyek a 6.10.3.2 bekezdés szerint két zárószervezettel rendelkeznek, az L4AH tartánycódhoz kell rendelni. Ha a tartány szerelvényezése olyan, hogy váltakozva lehet benne folyékony és szilárd anyagot szállítani, akkor az L4AH+S4AH kódkombinációhoz kell rendelni.

4.3.4.2

Általános előírások

4.3.4.2.1

Forró anyag betöltése esetén a tartány külső falának vagy hőszigetelésének hőmérséklete a szállítás során nem emelkedhet 70 °C fölé.

4.3.4.2.2

Az egy szállítóegység független, de egymással összeköttetésben álló tartányait összekötő csöveknek a szállítás alatt üresnek kell lenniük. Azokat a hajlékony töltő- és ürítőcsöveket, amelyek nem állnak állandó összeköttetésben a tartánnyal, üres állapotban kell szállítani.

(fenntartva)

4.3.4.2.3

(fenntartva)

4.3.5

Különleges előírások

Ha a 3.2 fejezet „A” táblázat 13 oszlopában erre vonatkozó bejegyzés található, a következő különleges előírásokat kell alkalmazni:

- TU1** A tartányt tilos addig szállításra átadni, amíg az anyag nem szilárdult meg teljesen és nincs inert gázzal fedve. Az üres, tisztítatlan tartányt, amely ezt az anyagot tartalmazta, inert gázzal kell megtölteni.
- TU2** Az anyagot inert gázzal kell fedni. Az üres, tisztítatlan tartányt, amely ezt az anyagot tartalmazta, inert gázzal kell megtölteni.
- TU3** A tartány belsejét és az anyagokkal érintkezésbe kerülő minden alkatrészét tisztán kell tartani. A szivattyúkhoz, szelepekhez és egyéb készülékekhez a betöltött termékkel veszélyesen reagáló kenőanyag nem használható.
- TU4** A szállítás alatt az anyagnak inert gázréteg alatt kell lennie, amelynek túlnyomása nem lehet 50 kPa-nál (0,5 bar-nál) kevesebb.
- Az üres, tisztítatlan tartányt, amely ezt az anyagot tartalmazta, szállításra történő átadáskor legalább 50 kPa (0,5 bar) túlnyomáson inert gázzal kell megtölteni.
- TU5** (fenntartva)
- TU6** Nem engedélyezett a szállítás tartányban, battériás járműben és MEG-konténerben, ha $LC_{50} < 200$ ppm.
- TU7** Az illesztések tömítéséhez vagy a zárószerkezetek karbantartásához használt anyagoknak a tartalommal összeférhetőnek kell lenniük.
- TU8** Alumíniumötvözet tartány csak akkor használható a szállításhoz, ha a tartányt kizárólag erre használják, és az acetaldehid savmentes.
- TU9** Az UN 1203 motorbenzin vagy benzin vagy gazolin 50 °C-on 110 kPa-nál (1,1 bar-nál) nagyobb, de legfeljebb 150 kPa (1,5 bar) gőznyomással a 6.8.2.1.14 a) pont szerint tervezett és a 6.8.2.2.6 pont szerinti szerelvényekkel ellátott tartányban is szállítható.
- TU10** (fenntartva)
- TU11** Töltés alatt ezen anyag hőmérséklete nem haladhatja meg a 60 °C-ot. A töltési hőmérséklet legfeljebb 80 °C is lehet akkor, ha a töltés során nem képződnek izzó részek és a következő feltételeket teljesítik. Töltés után a tartányt a tömörség ellenőrzésére nyomás alá kell helyezni (pl. sűrített levegővel). Biztosítani kell, hogy a szállítás alatt a túlnyomás fennmaradjon. Ürités előtt ellenőrizni kell, hogy a belső nyomás meghaladja-e az atmoszférikus nyomást. Ellenkező esetben ürítés előtt a tartányba inert gázt kell vezetni.
- TU12** A betöltendő anyag változása esetén ezen anyag szállítása előtt és után a tartányt és szerelvényeit minden maradéktól gondosan meg kell tisztítani.
- TU13** A tartánynak a töltéskor szennyeződésektől mentesnek kell lennie. Az üzemi szerelvényeit, pl. szelepeket és külső csővezetéseket, töltés és ürítés után ki kell üríteni.
- TU14** A tartány zárószerkezeteinek védősapkáját a szállítás alatt rögzíteni kell.
- TU15** A tartányt nem szabad élelmiszerek, fogyasztási cikkek vagy takarmány szállítására használni.

- TU16** Az üres, tisztítatlan tartányt úgy szabad a szállításra átadni, ha vagy
- nitrogénnel van megtöltve; vagy
 - befogadóképességének legalább 96%-áig, de legfeljebb 98%-áig vízzel van megtöltve. Október 1-je és március 31-e között a víznek elegendő mennyiségű fagyásgátló szert kell tartalmaznia, ami megakadályozza a víz megfagyását a szállítás során. A fagyásgátló anyag nem fejthet ki korróziós hatást és nem lehet hajlamos a foszforral való reakcióra.
- TU17** Csak olyan battériás járműben vagy MEG-konténerben szállítható, amelynek elemei tartályok.
- TU18** A töltési fokot úgy kell meghatározni, hogy azon a hőmérsékleten, amelyen az anyag gőznyomása megegyezik a biztonsági szelep nyitónyomásával, a folyadék térfogata ne haladja meg a tartány befogadóképességének 95%-át. A 4.3.2.3.4 pont előírásait nem kell alkalmazni.
- TU19** A tartány a töltési hőmérsékleten és a töltési nyomáson 98%-ig tölthető meg. A 4.3.2.3.4 pont előírásait nem kell alkalmazni.
- TU20** (fenntartva)
- TU21** Az anyagot, ha védőközegként víz használatos, a töltés időpontjában legalább 12 cm vízzréggel kell fedni, a töltési fok 60 °C-on nem haladhatja meg a 98%-ot. Ha védőközegként nitrogén használatos, a töltési fok 60 °C-on nem haladhatja meg a 96%-ot. A fennmaradó teret nitrogénnel kell megtölteni oly módon, hogy még lehűlés után se csökkenjen a nyomás az atmoszférikus nyomás alá. A tartányt légmentesen kell lezárni, hogy gázszivárgás ne következzen be.
- TU22** A tartányt legfeljebb befogadóképességének 90%-áig szabad megtölteni; folyékony anyagok esetén 50 °C átlagos folyadék hőmérsékleten azonban 5% szabad térnek kell maradnia.
- TU23** A töltési fok nem haladhatja meg ürtartalom-literenként a 0,93 kg-ot, ha a töltés tömegre történik. Ha a töltés térfogatra történik, a töltési fok nem haladhatja meg a tartány befogadóképességének 85%-át.
- TU24** A töltési fok nem haladhatja meg ürtartalom-literenként a 0,95 kg-ot, ha a töltés tömegre történik. Ha a töltés térfogatra történik, a töltési fok nem haladhatja meg a tartány befogadóképességének 85%-át.
- TU25** A töltési fok nem haladhatja meg ürtartalom-literenként az 1,14 kg-ot, ha a töltés tömegre történik. Ha a töltés térfogatra történik, a töltési fok nem haladhatja meg a tartány befogadóképességének 85%-át.
- TU26** A töltési fok nem haladhatja meg a tartány befogadóképességének 85%-át.
- TU27** A tartányt legfeljebb befogadóképességének 98%-áig szabad megtölteni.
- TU28** A tartányt 15 °C hivatkozási hőmérsékleten legfeljebb a befogadóképességének 95%-áig szabad megtölteni.
- TU29** A tartányt legfeljebb befogadóképességének 97%-áig szabad megtölteni, és a legnagyobb hőmérséklet a töltés után nem haladhatja meg a 140 °C-ot.
- TU30** A tartányt a tartány típusjövahagyására vonatkozó vizsgálati jegyzőkönyvben meghatározott mértékig, de legfeljebb befogadóképességének 90%-áig szabad megtölteni.

- TU31** A tartányt nem szabad űrtartalom-literenként 1 kg-nál nagyobb mértékben megtölteni.
- TU32** A tartányt legfeljebb befogadóképességének 88%-áig szabad megtölteni.
- TU33** A tartányt legalább befogadóképességének 88%-áig, de legfeljebb 92%-áig vagy űrtartalom-literenként 2,86 kg-mal szabad megtölteni.
- TU34** A tartányt űrtartalom-literenként legfeljebb 0,84 kg anyaggal szabad megtölteni.
- TU35** Az üres, tisztítatlan rögzített tartány (tartányjármű), üres, tisztítatlan leszerelhető tartány és üres, tisztítatlan tankkonténer, amelyben ez az anyag volt, nem esik az ADR előírásainak hatálya alá, ha a veszélyek elhárítására megfelelő intézkedéseket tettek.
- TU36** A 4.3.2.2 bekezdés szerinti töltési fok 15 °C hivatkozási hőmérsékleten nem haladhatja meg a tartány befogadóképességének 93%-át.
- TU37** Tartányokban csak olyan kórokozókat tartalmazó anyagok szállíthatók, amelyek általában nem képviselnek jelentős veszélyt, és bár kitétel esetén súlyos fertőzést okozhatnak, erre hatékony megelőzési és kezelési módszer áll rendelkezésre, és a fertőzés továbbterjedésének veszélye korlátozott (azaz mérsékelt egyéni és csekély közösségi veszélyt jelentenek).
- TU38** (fenntartva)
- TU39** Az anyag tartányban történő szállításra való alkalmasságát bizonyítani kell. Az alkalmasság értékelési módszert az illetékes hatóságnak jóvá kell hagynia. Ilyen módszer pl. a 8 vizsgálati sorozatban a 8.d) próba (lásd „Vizsgálatok és kritériumok kézikönyv”, I. rész, 18.7 fejezet).
- Az anyag nem hagyható a tartányban olyan hosszú ideig, ami károsodást okozhat. Megfelelő intézkedéseket kell tenni, hogy az anyag a tartányban ne tömörödjön össze és ne ülepedjen le (pl. tisztítás stb.).
- TU40** Csak varrat nélküli tartályokból álló battériás járműben, ill. MEG-konténerben szállítható.
- TU41** Az anyag tartányban történő szállításra való alkalmasságát bizonyítani kell minden olyan ország illetékes hatósága számára elfogadható módon, amelybe vagy amelyen keresztül a szállítás történik. Az alkalmasság értékelési módszert valamely ADR Szerződő Fél illetékes hatóságának jóvá kell hagynia. Ez a hatóság elismerheti olyan ország illetékes hatóságának a jóváhagyását is, amely nem szerződő fele az ADR-nek, feltéve, hogy a jóváhagyást a RID, az ADR, az ADN vagy az IMDG-kódex által előírt eljárás szerint adták ki.
- Az anyag nem hagyható a tartányban olyan hosszú ideig, ami károsodást okozhat. Megfelelő intézkedéseket kell tenni, hogy az anyag a tartányban ne tömörödjön össze és ne ülepedjen le (pl. tisztítás stb.).

4.4 FEJEZET

A SZÁLVÁZAS MŰANYAGBÓL GYÁRTOTT TARTÁNYOK, RÖGZÍTETT TARTÁNYOK (TARTÁNYJÁRMŰVEK), LESZERELHETŐ TARTÁNYOK, TANKKONTÉNEREK ÉS TARTÁNYOS CSEREFELÉPÍTMÉNYEK HASZNÁLATA

Megjegyzés: *A mobil tartányok és az UN többelemes gázkonténerek (UN MEG-konténerek) használatára lásd a 4.2 fejezetet; a fémből gyártott, rögzített tartányok (tartányjárművek), leszerelhető tartányok, tankkonténerek és tartányos cserefelépítmények, továbbá battériás járművek és többelemes gázkonténerek (MEG-konténerek) – az UN MEG-konténerek kivételével – használatára lásd a 4.3 fejezetet; a hulladékok szállítására szolgáló, vákuummal üzemelő tartányok használatára lásd a 4.5 fejezetet.*

4.4.1 Általános előírások

Veszélyes anyagok csak akkor szállíthatók szálvázaz műanyag tartányban, ha kielégítik a következő feltételeket:

- a) az anyag a 3, 5.1, 6.1, 6.2, 8 vagy 9 osztályba tartozik;
- b) az anyag gőznyomása (abszolút nyomás) 50 °C-on nem haladja meg a 110 kPa-t (1,1 bar-t);
- c) az anyag szállítása fémből készült tartányban a 4.3.2.1.1 pont szerint engedélyezett;
- d) az erre az anyagra a 3.2 fejezet „A” táblázat 12 oszlopában található tartánykód második részében meghatározott tervezési nyomás nem haladja meg a 400 kPa-t (4 bar-t) (lásd még a 4.3.4.1.1 pontot is); és
- e) a tartány kielégíti a 6.9 fejezetnek az adott anyag szállítására vonatkozó előírásait.

4.4.2 Üzemeltetés

4.4.2.1 A 4.3.2.1.5 – 4.3.2.2.4, a 4.3.2.3.3 – 4.3.2.3.6, a 4.3.2.4.1, a 4.3.2.4.2 pont, a 4.3.4.1 és a 4.3.4.2 bekezdés előírásait kell alkalmazni.

4.4.2.2 A szállított anyag hőmérséklete nem haladhatja meg töltéskor a tartány üzemi hőmérsékletét, ami a 6.9.6 szakaszban hivatkozott tartány táblán van feltüntetve.

4.4.2.3 A 3.2 fejezet „A” táblázat 13 oszlopában a fémből készült tartányban történő szállításra vonatkozó, a 4.3.5 szakaszban található különleges (TU) előírásokat a szálvázaz műanyag tartányban történő szállításra is alkalmazni kell.

4.5 FEJEZET

A HULLADÉKOK SZÁLLÍTÁSÁRA SZOLGÁLÓ, VÁKUUMMAL ÜZEMELŐ TARTÁNYOK HASZNÁLATA

Megjegyzés: *A mobil tartányok és az UN többelemes gázkonténerek (UN MEG-konténerek) használatára lásd a 4.2 fejezetet; a fémből gyártott, rögzített tartányok (tartány-járművek), leszerelhető tartányok, tankkonténerek és tartányos cserefelépítmények, továbbá battériás járművek és többelemes gázkonténerek (MEG-konténerek) – az UN MEG-konténerek kivételével – használatára lásd a 4.3 fejezetet; a szálvázaz műanyag tartányok használatára lásd a 4.4 fejezetet.*

4.5.1 Használat

4.5.1.1 A 3, 4.1, 5.1, 6.1, 6.2, 8 és 9 osztály anyagait tartalmazó hulladékok a 6.10 fejezet szerinti, hulladékok szállítására szolgáló, vákuummal üzemelő tartányban is szállíthatók, ha rögzített tartányban, leszerelhető tartányban, tankkonténerben vagy tartányos cserefelépítményben való szállításuk a 4.3 fejezet szerint engedélyezett. Azok az anyagok, amelyeknél a 3.2 fejezet „A” táblázat 12 oszlopában az L4BH tartánykód található, ill. amelyekhez 4.3.4.1.2 pont tartány rangsora szerint L4BH kóddal rendelkező tartányok is használhatók, hulladékok szállítására szolgáló, vákuummal üzemelő olyan tartányokban is szállíthatók, amelyek tartánykódjának harmadik részében „A” vagy „B” betű szerepel (ami a 9.1.3.5 pont szerinti tartányjármű jóváhagyási igazolás 9.5 pontjában fel van tüntetve).

4.5.2 Üzemeltetés

4.5.2.1 A hulladékok szállítására szolgáló, vákuummal üzemelő tartányokra – a 4.3.2.2.4 és a 4.3.2.3.3 pont kivételével – a 4.3 fejezet előírásait kell alkalmazni, kiegészítve a 4.5.2.2 – 4.5.2.4 bekezdés előírásaival.

4.5.2.2 Az olyan folyékony anyagokat, amelyek lobbanáspontjuk alapján megfelelnek a 3 osztály kritériumainak, olyan töltőcsövön kell a hulladékok szállítására szolgáló, vákuummal üzemelő tartányba tölteni, hogy a beömlés a tartány alsó részén történjen. Gondoskodni kell arról, hogy a porlasztás a legkisebb legyen.

4.5.2.3 A 23 °C-nál alacsonyabb lobbanáspontú gyúlékony folyadékok levegőnyomással történő ürítésénél a legnagyobb megengedett nyomás 100 kPa (1 bar).

4.5.2.4 Ha a hulladékok szállítására szolgáló, vákuummal üzemelő tartányban dugattyú van, az csak akkor szolgálhat válaszfalként is, ha a válaszfal (dugattyú) két oldalán olyan anyagok vannak, amelyek nem lépnek egymással veszélyes reakcióba (lásd a 4.3.2.3.6 pontot).

4.6 FEJEZET

(fenntartva)

4.7 FEJEZET

A ROBBANÓANYAG ELŐÁLLÍTÓ MOBIL EGYSÉGEK (MEMU-k) HASZNÁLATA

Megjegyzés: 1. A csomagolóeszközök használatára lásd a 4.1 fejezetet; a mobil tartányok használatára lásd a 4.2 fejezetet; a fémből gyártott, rögzített tartányok (tartányjárművek), leszerelhető tartányok, tankkonténerek és tartányos cserefelépítmények használatára lásd a 4.3 fejezetet; a szálvázazás műanyag tartányok használatára lásd a 4.4 fejezetet; a hulladékok szállítására szolgáló, vákuummal üzemelő tartányok használatára lásd a 4.5 fejezetet.

2. A gyártásra, a szerelvényekre, a típusjóváhagyásra, a vizsgálatokra és a jelölésre vonatkozó követelményekre lásd a 6.7, a 6.8, a 6.9, a 6.11 és a 6.12 fejezetet.

4.7.1 Használat

4.7.1.1 A 6.12 fejezet szerinti MEMU-val a 3, az 5.1, a 6.1 és a 8 osztály anyagai szállíthatók mobil tartányban, ha a 4.2 fejezet szerint megengedett; rögzített tartányban, leszerelhető tartányban, tankkonténerben és tartányos cserefelépítményben, ha a 4.3 fejezet szerint megengedett; szálvázazás műanyag tartányban, ha a 4.4 fejezet szerint megengedett; ill. ömlesztettáru-konténerben, ha a 7.3 fejezet szerint megengedett.

4.7.1.2 Az 1 osztályba tartozó robbanóanyagok és –tárgyak az illetékes hatóság engedélyével (lásd a 7.5.5.2.3 pontot) küldeménydarabokban is szállíthatók a 6.12.5 szakasz szerinti különleges rakterekben, amennyiben a csomagolóeszköz a 4.1 fejezet szerint, a szállítás a 7.2 és a 7.5 fejezet szerint megengedett.

4.7.2 Üzemeltetés

4.7.2.1 A 6.12 fejezet szerinti tartányok üzemeltetésére a következő előírások vonatkoznak:

- a) MEMU-val történő szállítás esetén az 1000 liter vagy annál nagyobb befogadóképességű tartányokra a 4.2 fejezet, a 4.3 fejezet (kivéve a 4.3.1.4 bekezdést, a 4.3.2.3.1 pontot, a 4.3.3 és a 4.3.4 szakaszt), ill. a 4.4 fejezet előírásai, valamint a következő 4.7.2.2, 4.7.2.3 és 4.7.2.4 bekezdés előírásai;
- b) MEMU-val történő szállítás esetén az 1000 liternél kisebb befogadóképességű tartányokra a 4.2 fejezet, a 4.3 fejezet (kivéve a 4.3.1.4 és a 4.3.2.1 bekezdést, a 4.3.2.3.1 pontot, a 4.3.3 és a 4.3.4 szakaszt), ill. a 4.4 fejezet előírásai, valamint a következő 4.7.2.2, 4.7.2.3 és 4.7.2.4 bekezdés előírásai.

4.7.2.2 A tartány falvastagságának a teljes használati időtartam alatt nem szabad a vonatkozó gyártási előírásokban előírt legkisebb érték alá csökkenie.

4.7.2.3 Szállítás közben a hajlékony ürítőcsőnek, akár állandó összeköttetésben van a tartánnyal, akár nem, valamint a betöltési nyílásnak a kevert (és érzékenyített) robbanóanyagtól mentesnek kell lennie.

4.7.2.4 Amennyiben tartányban való szállításra a 3.2 fejezet „A” táblázat 13 oszlopában fel van tüntetve 4.3.5 szakasz szerinti különleges előírás (TU), úgy azt is be kell tartani.

4.7.2.5 Az üzemeltetőnek gondoskodnia kell róla, hogy a 9.8.8 szakaszban említett zárok a szállítás alatt zárva legyenek.

5. RÉSZ

FELADÁSI ELJÁRÁSOK

5.1 FEJEZET

ÁLTALÁNOS ELŐÍRÁSOK

5.1.1 Alkalmazási terület és általános előírások

Ez a fejezet a veszélyes áru küldemények jelölésére, bárcázására és okmányolására, valamint ahol szükséges, a küldemény engedélyezésére és az előzetes értesítésre vonatkozik.

5.1.2 Az egyesítőcsomagolások használata

5.1.2.1

a) Az egyesítőcsomagoláson fel kell tüntetni

- i) az „EGYESÍTŐCSOMAGOLÁS” feliratot, és
- ii) a benne levő minden veszélyes áru UN számát fel kell tüntetni, – amely elé az „UN” betűket kell írni, – ahogy azt az 5.2.1.1 és 5.2.1.2 bekezdés a küldeménydarabokra előírja, és el kell helyezni rajta a benne levő küldeménydarabokra az 5.2.2 szakaszban előírt bárcákat, valamint a „környezetre veszélyes anyag” jelölést, ha az 5.2.1.8 bekezdés szerint az a küldeménydarabra szükséges,

kivéve, ha az egyesítőcsomagolásban levő minden veszélyes árufajta UN száma és bárcája, ill. a „környezetre veszélyes anyag” jelölés látható, hacsak az 5.2.2.1.11 pont mást nem ír elő. Ha különböző küldeménydarabokra ugyanolyan UN szám, bárca, ill. a „környezetre veszélyes anyag” jelölés szükséges, akkor azt az egyesítőcsomagoláson csak egyszer kell feltüntetni, ill. elhelyezni.

Az „EGYESÍTŐCSOMAGOLÁS” feliratot jól láthatóan, olvashatóan, a kiindulási ország valamelyik hivatalos nyelvén kell feltüntetni, és ezenkívül, ha ez a nyelv nem az angol, a francia vagy a német, akkor angol, francia vagy német nyelven is fel kell tüntetni, kivéve, ha a szállításban érintett országok közötti megállapodások mást írnak elő.

b) A következő esetekben az egyesítőcsomagolások két, egymással szemben levő oldalára az 5.2.1.9 bekezdésben ábrázolt, az álló helyzetet jelző nyilakat is el kell helyezni:

- i) azokra az egyesítőcsomagolásokra, amelyekben olyan küldeménydarabok vannak, amelyeket az 5.2.1.9.1 pont szerint e jelöléssel el kell ellátni, kivéve, ha a jelölés kívülről látható; és
- ii) azokra az egyesítőcsomagolásokra, amelyekben folyékony anyagot tartalmazó olyan küldeménydarabok vannak, amelyeket az 5.2.1.9.2 pont szerint e jelöléssel nem kell ellátni, kivéve, ha a csomagolóeszközök zárószerkezete az egyesítőcsomagoláson keresztül látható.

5.1.2.2 Minden veszélyes árut tartalmazó küldeménydarabnak, amely az egyesítőcsomagolásban van, meg kell felelnie az ADR összes vonatkozó előírásának. Az egyes csomagolások funkcióját az egyesítőcsomagolás nem befolyásolhatja.

5.1.2.3 Az olyan küldeménydarabot, amelyen az 5.2.1.9 bekezdés szerinti, álló helyzetet jelző nyilak vannak, a jelölésnek megfelelő helyzetben kell egyesítőcsomagolásba, ill. nagycsomagolásba helyezni.

5.1.2.4 Az együvé rakási tilalmak az egyesítőcsomagolásokra is vonatkoznak.

5.1.3 Üres, tisztítatlan, csomagolóeszközök (beleértve az IBC-ket és a nagycsomagolásokat), tartányok, MEMU-k, ömlesztett árut szállító járművek és konténerek

5.1.3.1 Az üres, tisztítatlan csomagolóeszközöket (beleértve az IBC-ket és a nagycsomagolásokat), tartányokat (beleértve a tartányjárműveket, battériás járműveket, leszerelhető tartányokat, mobil tartányokat, tankkonténereket, MEG-konténereket és MEMU-kat), az ömlesztett áru

szállításához használt járműveket és konténereket, amelyek a 7 osztály kivételével a többi osztály veszélyes áruit tartalmazták, ugyanúgy kell jelölni és bárcázni, mint töltött állapotban.

Megjegyzés: Az okmányokra lásd az 5.4 fejezetet.

5.1.3.2 A radioaktív anyagok szállítására használt csomagolóeszközöket, IBC-eket és tartányokat nem szabad más áruk tárolására vagy szállítására használni, kivéve, ha annyira vannak sugárzásmentesítve, hogy a sugárzási szint béta-, gamma-sugárzók és csekély toxicitású alfa-sugárzók esetén legfeljebb $0,4 \text{ Bq/cm}^2$, ill. minden más alfa-sugárzó esetén legfeljebb $0,04 \text{ Bq/cm}^2$.

5.1.4 Egybecsomagolás

Amennyiben két vagy több veszélyes árut ugyanazon külső csomagolásba egybecsomagolnak, a küldeménydarabot el kell látni minden egyes árura a megfelelő jelöléssel és veszélyességi bárcákkal. Ha a különböző árukra ugyanolyan veszélyességi bárca szükséges, akkor abból csak egyet kell elhelyezni.

5.1.5 Általános előírások a 7 osztályra

5.1.5.1 Szállítási engedély és értesítés

5.1.5.1.1 Általános előírás

A 6.4 fejezetben leírt küldeménydarab-minta engedélyen kívül meghatározott körülmények között többoldalú szállítási engedélyre is szükség van (lásd az 5.1.5.1.2 és 5.1.5.1.3 pontot), ill. az illetékes hatóságok értesítése is szükséges (lásd az 5.1.5.1.4 pontot).

5.1.5.1.2 Szállítási engedély

Többoldalú engedély szükséges:

- a) a 6.4.7.5 bekezdés előírásainak nem megfelelő vagy ellenőrzött időszakos szellőztetésre kialakított $B(M)$ típusú küldeménydarabok szállításához;
- b) az olyan $B(M)$ típusú küldeménydarabok szállításához, amelyek radioaktív tartalmának aktivitása nagyobb, mint a $3000A_1$, ill. a $3000A_2$ és az 1000 TBq közül a kisebb érték;
- c) olyan küldeménydarabok szállításához, amelyek hasadóanyagot tartalmaznak, ha az egyes küldeménydarabok kritikusági biztonsági mutatószámának összege egy járművön vagy egy konténerben meghaladja az 50-et;

azzal a kivétellel, hogy az illetékes hatóság engedélyezheti a szállítást saját országának területén keresztül vagy területére szállítási engedély nélkül is a minta általa kiadott engedélyében (lásd az 5.1.5.2.1 pontot) szereplő különleges előírással.

5.1.5.1.3 Szállítási engedély külön megegyezés alapján

Az illetékes hatóság jóváhagyhat olyan előírásokat, amelyek szerint az ADR vonatkozó követelményeinek nem mindenben megfelelő küldeményt külön megegyezéssel szállíthatnak (lásd az 1.7.4 szakaszt).

5.1.5.1.4 Értesítések

Az illetékes hatóságokat a következő esetekben kell értesíteni:

- a) Az olyan küldeménydarab első szállítása előtt, amelyhez az illetékes hatóság engedélye szükséges, a feladónak biztosítani kell, hogy a küldeménydarab gyártási típusához szükséges minden vonatkozó engedélyezési okirat egy példánya a szállítás kiindulási országa és mindazon országok illetékes hatóságai számára rendelkezésre álljon, amelyeken keresztül vagy amelybe a küldeményt szállítják. A feladónak nem szükséges

ezen illetékes hatóságok elismerésére várakozni, és az illetékes hatóságok sem kötelesek az engedélyezési okiratok átvételét elismerni.

- b) Minden
 - i) C típusú küldeménydarab szállításánál olyan radioaktív anyag tartalommal, amelynek aktivitása a $3000A_1$, ill. a $3000A_2$ és az 1000 TBq értékek közül a kisebbiknél nagyobb;
 - ii) $B(U)$ típusú küldeménydarab szállításánál olyan radioaktív anyag tartalommal, amelynek aktivitása a $3000A_1$, ill. a $3000A_2$ és az 1000 TBq értékek közül a kisebbiknél nagyobb;
 - iii) $B(M)$ típusú küldeménydarab szállításánál;
 - iv) külön megegyezés alapján végzett szállításnál;
a feladónak a szállítás kiindulási országa és mindazon országok illetékes hatóságait értesíteni kell, amelyeken keresztül vagy amelybe a küldeményt szállítják. Ennek az értesítésnek a szállítást megelőzően minden illetékes hatóság birtokában kell lenni, lehetőleg legalább hét nappal a szállítás megkezdése előtt.
- c) A feladónak nem kell külön értesítést feladni, ha a szükséges információkat a szállítási engedély iránti kérelem tartalmazza.
- d) A feladási értesítésnek a következőket kell tartalmaznia:
 - i) elegendő adatot, amely lehetővé teszi a küldeménydarab vagy küldeménydarabok azonosítását, beleértve minden vonatkozó engedélyezési okirat számot és azonosító jelzést;
 - ii) a feladási időpontra, a várható megérkezési időpontra és a tervezett szállítási útvonalra vonatkozó adatokat;
 - iii) a radioaktív anyag(ok) vagy nuklid(ok) nevét;
 - iv) a radioaktív anyag fizikai és kémiai állapotának leírását, vagy annak közlését, hogy különleges formájú vagy kis mértékben diszpergálódó radioaktív anyagról van-e szó; és
 - v) a radioaktív tartalom szállítás alatti legnagyobb aktivitását becquerelben (Bq) a hozzátartozó SI-prefixum jelével együtt (lásd az 1.2.2.1 bekezdést). Hasadóanyagoknál az aktivitás helyett a hasadóanyag (vagy keverékeknél az egyes hasadónuklidok) mennyisége is megadható grammal (g) vagy annak többszörösében.

5.1.5.2 *Az illetékes hatóságok engedélye*

5.1.5.2.1 Az illetékes hatóságok engedélye szükséges a következőkre:

- a) a gyártási mintára;
 - i) különleges formájú radioaktív anyagokra;
 - ii) kis mértékben diszpergálódó radioaktív anyagokra;
 - iii) $0,1\text{ kg}$ vagy annál több urán-hexafluoridot tartalmazó küldeménydarabokra;
 - iv) hasadó anyagot tartalmazó minden küldeménydarabra, kivéve, ha a 6.4.11.2 bekezdés alapján mentesítve vannak;
 - v) $B(U)$ típusú és $B(M)$ típusú küldeménydarabokra;
 - vi) C típusú küldeménydarabokra;
- b) a külön megegyezésre;
- c) bizonyos szállításokra (lásd az 5.1.5.1.2 pontot).

Az engedélyokirat tanúsítja, hogy a vonatkozó követelményeket betartották; a küldeménydarab-minta engedélyben a mintához azonosító számot kell rendelni.

A küldeménydarab-mintára és a szállításra vonatkozó engedélyek közös engedélyokiratba foglalhatók egybe.

Az engedélyokiratoknak és az engedély iránti kérelmeknek meg kell felelniük a 6.4.23 szakasz előírásainak.

5.1.5.2.2 A feladónak rendelkeznie kell minden szükséges engedélyokirat egy példányával.

5.1.5.2.3 Olyan küldeménydarab-minták esetében, amelyekhez nem szükséges az illetékes hatóság engedélye, a feladónak az illetékes hatóság általi ellenőrzéshez – kérésre – rendelkezésre kell bocsátania azokat a dokumentumokat, amelyek bizonyítják, hogy a küldeménydarab-minta minden rá vonatkozó előírásnak megfelel.

5.1.5.3 *A szállítási mutatószám (TI) és a kritikussági biztonsági mutatószám (CSI) meghatározása*

5.1.5.3.1 A szállítási mutatószám (TI) egy küldeménydarabra, egyesítőcsomagolásra, konténerre, csomagolatlan LSA-I anyagra vagy csomagolatlan SCO-I tárgyra a következő eljárás alapján meghatározott szám:

- a) Meg kell határozni a legnagyobb sugárzási szintet millisievert per órában (mSv/h) a küldeménydarab, egyesítőcsomagolás, konténer, csomagolatlan LSA-I anyag vagy csomagolatlan SCO-I tárgy külső felületétől 1 m távolságban. Az így kapott értéket meg kell szorozni 100-zal, a kapott érték a szállítási mutatószám. Urán- és tórium-érceknél és ezek koncentrációjainál legnagyobb sugárzási szintként a külső felületről 1 m távolságban bármely ponton a következő értékek vehetők:

urán- és tóriumércekre és fizikai koncentrációikra 0,4 mSv/h;

kémiai tóriumkoncentrációkra 0,3 mSv/h;

kémiai uránkoncentrációkra, az urán-hexafluorid kivételével 0,02 mSv/h.

- b) A tartányokra, konténerekre, csomagolatlan LSA-I anyagokra és csomagolatlan SCO-I tárgyakra az a) pont szerint kapott értéket a 5.1.5.3.1 táblázatban található megfelelő tényezővel meg kell szorozni.

- c) Az a) és b) pontok szerint kapott értékeket egy tizedesjegyre fel kell kerekíteni (pl.: 1,13-ot 1,2-re), kivétel a 0,05 vagy ennél kisebb érték, ami nullának vehető.

5.1.5.3.1 táblázat – Szorzótényezők a tartányokhoz, a konténerekhez, a csomagolatlan LSA-I anyagokhoz és SCO-I tárgyakhoz

A rakomány mérete ^{a)}	Szorótényező
rakomány méret $\leq 1 \text{ m}^2$	1
$1 \text{ m}^2 < \text{rakomány méret} \leq 5 \text{ m}^2$	2
$5 \text{ m}^2 < \text{rakomány méret} \leq 20 \text{ m}^2$	3
$20 \text{ m}^2 < \text{rakomány méret}$	10

a) A rakomány legnagyobb keresztmetszeti területe.

5.1.5.3.2 A szállítási mutatószámot az egyes egyesítőcsomagolásokra, konténerekre és járművekre vagy a bennük levő küldeménydarabok TI értékének összegzésével vagy a sugárzási szint közvetlen mérésével kell meghatározni, kivéve a nem alaktartó egyesítőcsomagolásokat, amelyekre a szállítási mutatószám csak az összes küldeménydarab TI értékének összegezésével határozható meg.

5.1.5.3.3 A kritikussági biztonsági mutatószámot minden egyesítőcsomagolásra, ill. konténerre a benne levő küldeménydarabok CSI értékének összegzésével kell meghatározni. Ugyanígy kell meghatározni egy küldemény vagy egy jármű összegzett CSI értékét.

5.1.5.3.4 A küldeménydarabokat és az egyesítőcsomagolásokat az 5.1.5.3.4 táblázatban meghatározott

feltételek és a következő előírások szerint az I-FEHÉR, a II-SÁRGA vagy a III-SÁRGA kategóriába kell besorolni:

- A küldeménydaraboknál és egyesítőcsomagolásoknál a megfelelő kategória meghatározásánál figyelembe kell venni a szállítási mutatószámot (*TI*) és a felületen mért sugárzási szintet. Amennyiben a szállítási mutatószám (*TI*) kielégíti valamelyik kategória feltételeit, de a felületen mért sugárzási szint egy másik kategóriának felel meg, a küldeménydarabot, ill. egyesítőcsomagolást a két kategória közül a magasabba kell besorolni. Ebben az összefüggésben a I-FEHÉR kategória tekintendő legalacsonyabbnak.
- A szállítási mutatószámot (*TI*) az 5.1.5.3.1 és az 5.1.5.3.2 pont szerint kell meghatározni.
- Amennyiben a felületen mért sugárzási szint nagyobb, mint 2 mSv/h, a küldeménydarabot, ill. egyesítőcsomagolást kizárólagos használat mellett és a 7.5.11 szakasz, CV33 előírás 1.3) és 3.5) a) pontja szerinti előírásoknak megfelelően kell szállítani.
- Azt a küldeménydarabot, amelyet külön megegyezés alapján szállítanak, a III-SÁRGA kategóriába kell besorolni, kivéve, ha az 5.1.5.3.5 pont előírásait alkalmazzák.
- Azt az egyesítőcsomagolást, amely külön megegyezés alapján szállított küldeménydarabokat tartalmaz, a III-SÁRGA kategóriába kell besorolni, kivéve, ha az 5.1.5.3.5 pont előírásait alkalmazzák.

5.1.5.3.4 táblázat – A küldeménydarabok és egyesítőcsomagolások kategóriái

Feltételek		
Szállítási mutatószám (<i>TI</i>)	A felületen mért legnagyobb sugárzási szint a küldeménydarabokon	Kategória
0 ^{a)}	Legfeljebb 0,005 mSv/h	I-FEHÉR
Nagyobb, mint 0, de legfeljebb 1 ^{a)}	Nagyobb, mint 0,005 mSv/h, de legfeljebb 0,5 mSv/h	II-SÁRGA
Nagyobb, mint 1, de legfeljebb 10	Nagyobb, mint 0,5 mSv/h, de legfeljebb 2 mSv/h	III-SÁRGA
Nagyobb, mint 10	Nagyobb, mint 2 mSv/h, de legfeljebb 10 mSv/h	III-SÁRGA ^{b)}

a) Amennyiben a mért szállítási mutatószám (*TI*) nem nagyobb, mint 0,05, a szállítási mutatószám (*TI*) az 5.1.5.3.1 c) pont alapján nullának vehető.

b) Kizárólagos használat mellett kell szállítani.

5.1.5.3.5

Az illetékes hatóság gyártási minta engedélyéhez, ill. szállítási engedélyéhez kötött küldeménydarabok bármely nemzetközi szállítása esetén, ha a szállításban érintett országokban különböző engedélytípusok szükségesek, a jelölést a gyártási minta származási országában kiadott engedélynek megfelelően kell végrehajtani.

5.1.5.4

Különleges előírások az engedményes küldeménydarabokra

5.1.5.4.1

Az engedményes küldeménydarabokon a csomagolás külsején jól olvashatóan és tartósan fel kell tüntetni:

- az UN számot, amely elé az „UN” rövidítést kell írni;
- a feladó vagy a címzett, vagy mindkettő azonosító adatait;
- a megengedett bruttó tömeget, ha az meghaladja az 50 kg-ot.

5.1.5.4.2

Az 5.4 fejezet okmányokra vonatkozó előírásait a radioaktív anyagok engedményes küldeménydarabjaira nem kell alkalmazni, kivéve, hogy az UN számot, amely elé az „UN” rövidítést kell írni, valamint a feladó és a címzett nevét és címét a fuvarokmányban, pl. a hajó-raklevélben, a légi fuvarlevélben vagy a CMR vagy CIM fuvarlevélben fel kell tüntetni.

5.1.5.5

Az engedélyekre és előzetes értesítésre vonatkozó előírások összefoglalása

- Megjegyzés:** 1. Az olyan küldeménydarab első szállítása előtt, amelyhez az illetékes hatóság küldeménydarab-minta engedélye szükséges, a feladónak biztosítania kell, hogy a küldeménydarab-minta engedélynek egy példánya minden érintett ország illetékes hatóságának rendelkezésre álljon [lásd az 5.1.5.1.4 a) pontot].
2. Értesítés akkor szükséges, ha a tartalom meghaladja a 3000A₁, ill. a 3000A₂ vagy az 1000 TBq értéket [lásd az 5.1.5.1.4 b) pontot].
3. A szállításhoz többoldali engedély szükséges, ha a tartalom meghaladja a 3000A₁, ill. a 3000A₂ vagy az 1000 TBq értéket, vagy ha ellenőrzött időszaks szellőztetés szükséges (lásd az 5.1.5.1 bekezdést).
4. Az engedélyezésére és az előzetes értesítésre lásd az anyag szállítására alkalmazott küldeménydarabra vonatkozó előírásokat.

Tárgy	UN szám	Az illetékes hatóságok engedélye szükséges-e		A származási ország és az érintett országok ^{a)} illetékes hatóságainak értesítése szükséges-e a feladó által minden szállítás előtt	Hivatkozás

- b) Amennyiben a radioaktív tartalom olyan hasadóanyagokból áll, amelyek a hasadóanyagokat tartalmazó küldeménydarabokra vonatkozó előírások alól nem mentesülnek, akkor a hasadóanyagokat tartalmazó küldeménydarabokra vonatkozó előírások érvényesek (lásd a 6.4.11 szakaszt).
- c) A hasadóanyagokra vonatkozó küldeménydarab-minták esetén a táblázat valamely más pontja szerint is szükség lehet engedélyre.
- d) Szállítási engedélyre azonban a táblázat valamely más pontja szerint is szükség lehet.

5.2 FEJEZET

JELÖLÉS ÉS BÁRCÁZÁS

5.2.1 A küldeménydarabok jelölése

Megjegyzés: A csomagolóeszközök, nagycsomagolások, gáztartályok és IBC-k gyártásával, vizsgálatával és engedélyezésével kapcsolatos jelölésekre lásd a 6. részt.

5.2.1.1 Hacsak az ADR-ben nincs másként előírva, minden küldeménydarabon jól látható módon és tartósan fel kell tüntetni a benne levő veszélyes áru UN számát, amely elé az „UN” betűket kell írni. A 30 liternél nagyobb űrtartalmú, ill. a 30 kg-nál nagyobb nettó tömegű küldeménydarabokon, valamint a 60 liternél nagyobb víztérfogatú palackokon az UN számnak és az „UN” betűknek legalább 12 mm magasnak kell lennie. A legfeljebb 30 liter űrtartalmú, ill. a legfeljebb 30 kg nettó tömegű küldeménydarabokon, valamint a legfeljebb 60 liter víztérfogatú palackokon legalább 6 mm magasnak kell lenniük, kivéve a legfeljebb 5 literes vagy 5 kg-os küldeménydarabokat, amelyek alkalmas méretűnek kell lenniük. Csomagolatlan tárgyak esetén a feliratot magán a tárgyon, vagy a kereten, a kezelő-, tárolóeszközön vagy indítóállványon kell feltüntetni.

5.2.1.2 Minden e fejezetben előírt jelölésnek

- a) jól láthatónak és olvashatónak kell lennie; és
- b) jól láthatósága az időjárás hatására lényegesen nem csökkenhet.

5.2.1.3 A kármentő csomagolásokat és a kármentő nyomástartó tartályokat kiegészítésként a „KÁRMENTŐ” felirattal kell ellátni.

5.2.1.4 A 450 liternél nagyobb űrtartalmú IBC-eket és a nagycsomagolásokat két, egymással szemben levő oldalukon kell megjelölni.

5.2.1.5 *Kiegészítő előírások az 1 osztály áruira*

Az 1 osztály árukat tartalmazó küldeménydarabokon kiegészítésként fel kell tüntetni a 3.1.2 szakasz szerinti helyes szállítási megnevezést. Ezt a jelölést jól olvasható módon és marandóan a kiindulási ország valamely hivatalos nyelvén kell feltüntetni, és ha ez a nyelv nem az angol, a francia vagy a német, akkor vagy angolul, vagy franciául, vagy németül is fel kell tüntetni, kivéve, ha a szállításban érintett országok közötti megállapodások mást írnak elő.

5.2.1.6 Kiegészítő előírások a 2 osztály gázaira

Az újrátölthető tartályokon jól olvashatóan és tartósan fel kell írni a következőket:

- a) a gáz vagy gázkeverék UN számát és a 3.1.2 szakasz szerinti helyes szállítási megnevezését;

Az m.n.n. tételek alá sorolt gázok esetében csak az UN számot és a gáz műszaki megnevezését¹⁾ kell megadni;

Gázkeverékek esetében nem szükséges két olyan alkotórésznél többet megnevezni, amely a keverék veszélyessége tekintetében mértékadó;

- b) az olyan sűrített gázoknál, amelyeket tömegre töltenek, és a cseppfolyósított gázoknál:

1) A műszaki megnevezés helyett a következő megnevezések is engedélyezettek:

- az UN 1078 hűtőgáz, m.n.n. esetében: F1 keverék, F2 keverék, F3 keverék;
- az UN 1060 metil-acetilén és propadién keverék, stabilizált esetén: P1 keverék, P2 keverék;
- az UN 1965 szénhidrogén-gáz keverék, cseppfolyósított, m.n.n. esetén: A keverék vagy bután, A01 keverék vagy bután, A02 keverék vagy bután, A0 keverék vagy bután, A1 keverék, B1 keverék, B2 keverék, B keverék, C keverék vagy propán;
- az UN 1010 butadiének, stabilizált esetén: 1,2-butadién, stabilizált, 1,3-butadién, stabilizált.

vagy a töltet engedélyezett legnagyobb tömegét és a tartály saját tömegét, beleértve a szerelvényeket és tartozékokat is, amelyek a töltés alatt a tartályon vannak, vagy a bruttó tömeget;

c) a következő időszakos vizsgálat időpontját (év).

Ezeket az adatokat vagy a tartályra erősített tartós adattáblára vagy címkére kell beütni vagy felírni, vagy jól tapadó és jól olvasható módon, pl. festéssel vagy más azonos értékű eljárással magára a tartályra kell felírni.

Megjegyzés: 1. Lásd még a 6.2.2.7 bekezdést.

2. A nem újratölthető tartályokra lásd a 6.2.2.8 bekezdést.

5.2.1.7 Különleges előírások a 7 osztály radioaktív anyagainak jelölésére

5.2.1.7.1 Minden küldeménydarabon a csomagolás külső oldalán jól olvashatóan és tartósan fel kell tüntetni a feladó vagy a címzett, vagy mindkettő azonosító adatait.

5.2.1.7.2 Minden küldeménydarabon, az engedményes küldeménydarabok kivételével, a csomagolás külső oldalára jól olvashatóan és tartósan rá kell írni az áru UN számát, amely elé az „UN” rövidítést kell írni és helyes szállítási megnevezését. Az engedményes küldeménydarabokat az 5.1.5.4.1 pont előírásai szerint kell megjelölni.

5.2.1.7.3 Az 50 kg bruttó tömegnél nehezebb küldeménydarabokon a csomagolás külső oldalán jól olvashatóan és tartósan fel kell tüntetni az engedélyezett bruttó tömeget.

5.2.1.7.4 Minden küldeménydarabon, amely:

- a) valamely *IP-1* típusú, *IP-2* típusú vagy *IP-3* típusú küldeménydarab-mintának felel meg, a csomagolás külső oldalán jól olvashatóan és tartósan fel kell tüntetni az „IP-1 TÍPUS”, „IP-2 TÍPUS”, ill. „IP-3 TÍPUS” feliratot;
- b) valamely *A* típusú küldeménydarab-mintának felel meg, a csomagolás külső oldalán jól olvashatóan és tartósan fel kell tüntetni az „A TÍPUS” feliratot;
- c) valamely *IP-2* típusú, *IP-3* típusú, illetve *A* típusú küldeménydarab-mintának felel meg, a csomagolás külső oldalán jól olvashatóan és tartósan fel kell tüntetni a minta származási országának államjelzését²⁾ és vagy a gyártó nevét vagy a küldeménydarab egyéb azonosítóját, melyet a minta származási országának illetékes hatósága határozott meg.

5.2.1.7.5 Minden küldeménydarabon, amely megfelel az illetékes hatóság által jóváhagyott valamely mintának, a csomagolás külső oldalán jól olvashatóan és tartósan fel kell tüntetni:

- a) az erre a mintára az illetékes hatóság által kiadott azonosító jelet;
- b) a sorozatszámot, amely lehetővé teszi minden egyes, a mintának megfelelő csomagolás egyértelmű azonosítását;
- c) *B(U)* vagy *B(M)* típusú küldeménydarab-minta esetén a „B(U) TÍPUS” vagy „B(M) TÍPUS” feliratot; és
- d) *C* típusú küldeménydarab-minta esetén a „C TÍPUS” feliratot.

2) A Közúti Közlekedésről szóló Bécsi Egyezmény (1968) által előírt, a nemzetközi forgalomban résztvevő gépjárművek államjelzése.

5.2.1.7.6

Minden $B(U)$, $B(M)$ vagy C típusú mintának megfelelő küldeménydarabot el kell látni a legkülső tűz- és vízálló tartály külső oldalán beütéssel, domborítással vagy más eljárással tűz- és vízálló módon felvitt következő sugárveszély szimbólummal:

Sugárveszély szimbólum
X sugarú belső körre vonatkozó arányokkal.
Az X megengedett legkisebb mérete 4 mm.

5.2.1.7.7

Ha az $LSA-I$ anyag vagy $SCO-I$ tárgy tartályban, ill. burkolóanyagban van és a 4.1.9.2.3 pont szerint kizárólagos használat mellett szállítják, a tartály, ill. a burkolóanyag külső felületére felírható a „RADIOACTIVE LSA-I”, illetve a „RADIOACTIVE SCO-I” felirat.

5.2.1.7.8

Az illetékes hatóság gyártási minta engedélyéhez, ill. szállítási engedélyéhez kötött küldeménydarabok bármely nemzetközi szállítása esetén, ha a szállításban érintett országokban különböző engedélytípusok szükségesek, a jelölést a gyártási minta származási országában kiadott engedélynek megfelelően kell végrehajtani.

5.2.1.8

A környezetre veszélyes anyagok különleges jelölése

5.2.1.8.1

Azokon a küldeménydarabokon, amelyek a 2.2.9.1.10 pont kritériumai szerint környezetre veszélyes anyagot tartalmaznak, tartósan fel kell tüntetni az 5.2.1.8.3 pont szerinti, „környezetre veszélyes anyag” jelölést, kivéve az önálló csomagolóeszközöket, ill. a kombinált csomagolásokat, ha az önálló csomagolóeszköz, ill. a kombinált csomagolás bármely belső csomagolóeszköze

- legfeljebb 5 liter folyékony anyagot; vagy
- legfeljebb 5 kg szilárd anyagot

tartalmaz.

5.2.1.8.2

A „környezetre veszélyes anyag” jelölést az 5.2.1.1 bekezdésben előírt jelölés közelében kell elhelyezni. Az 5.2.1.2 és az 5.2.1.4 bekezdés előírásait is be kell tartani.

5.2.1.8.3

A „környezetre veszélyes anyag” jelölés a következő ábrán látható. A jelölésnek 100 x 100 mm nagyságúnak kell lennie, kivéve, ha a küldeménydarab méretei miatt csak kisebb jelölés fér el.

Jelkép (hal és fa): fekete; fehér vagy más, kellően elütő színű alapon.

Megjegyzés: Ezen kívül a „környezetre veszélyes anyag” jelölés küldeménydarabon való elhelyezésére az 5.2.2 szakasz bárcázásra vonatkozó előírásait is alkalmazni kell.

5.2.1.9

Az álló helyzetet jelző nyilak

5.2.1.9.1

Az 5.2.1.9.2 pontban említett esetek kivételével

- azokat a kombinált csomagolásokat, amelyekben a belső csomagolásban folyékony anyag van;
- a szellőző szerkezettel ellátott önálló csomagolóeszközöket, és
- a mélyhűtött, cseppfolyósított gázok szállítására szolgáló mélyhűtő tartályokat

a következő ábrához hasonló vagy az ISO 780:1997 szabványban szereplő leírásnak megfelelő, a küldeménydarab álló helyzetét jelző nyilakkal jól látható módon meg kell jelölni. Az álló helyzetet jelző nyilakat a küldeménydarab két, egymással szemben lévő függőleges oldalára kell feltenni úgy, hogy a nyilak függőlegesen a helyes irányba mutassanak. A jelölésnek négyszögletes alakúnak és a küldeménydarab méretéhez képest jól látható nagyságúnak kell lennie. A nyilak körüli négyszögletes keret feltüntetése tetszőleges.

Két, felfelé mutató fekete vagy vörös nyíl fehér vagy más, kellően elütő színű alapon.

A négyszögletes keret feltüntetése tetszőleges.

5.2.1.9.2

Az álló helyzetet jelző nyilakat nem szükséges feltenni

- a nyomástartó tartályokat – kivéve a mélyhűtő tartályokat – tartalmazó külső csomagolásokra;
- azokra a külső csomagolásokra, amelyekben legfeljebb 120 ml-es belső csomagolás(ok)ban van a veszélyes áru, és a belső és a külső csomagolóeszköz között a teljes

folyékony anyag mennyiség felszívására elegendő felszívóképes anyag van;

- c) azokra a külső csomagolásokra, amelyekben a 6.2 osztályba tartozó fertőző anyag van legfeljebb 50 ml-es elsődleges tartály(ok)ban;
- d) a 7 osztályba tartozó radioaktív anyagot tartalmazó *IP-2*, *IP-3*, *A*, *B(U)*, *B(M)* és *C* típusú küldeménydarabokra;
- e) azokra a külső csomagolásokra, amelyekben olyan tárgyak vannak, amelyek bármely irányban elhelyezve szivárgásmentesek (pl. alkoholos vagy higanyos hőmérő, aeroszol stb.); és
- f) azokra a külső csomagolásokra, amelyekben a veszélyes áru egyenként legfeljebb 500 ml tartalmú, légmentesen lezárt belső csomagolóeszközökben van.

5.2.1.9.3 Az e bekezdés szerint megjelölt küldeménydarabokon nyilak csak a küldeménydarab helyzetének jelzése céljából alkalmazhatók.

5.2.2 A küldeménydarabok bárcázása

5.2.2.1 Bárcázási előírások

5.2.2.1.1 A 3.2 fejezet „A” táblázatában felsorolt minden anyagnál vagy tárgynál az 5 oszlopban megadott bárcá(ka)t kell elhelyezni, kivéve, ha a 6 oszlopban valamely különleges előírás másként rendelkezik.

5.2.2.1.2 Az előírt mintáknak pontosan megfelelő, letörölhetetlen veszélyességi jelölések is alkalmazhatók a veszélyességi bárcák helyett.

**5.2.2.1.3 –
5.2.2.1.5**

(fenntartva)

5.2.2.1.6 Az 5.2.2.2.1.2 pontban előírtak kivételével minden bárcát

- a) a küldeménydarab egyazon felületére kell elhelyezni, ha ezt a küldeménydarab méretei lehetővé teszik; az 1 és a 7 osztály anyagait tartalmazó küldeménydaraboknál a helyes szállítási megnevezés közelében;
- b) úgy kell a küldeménydarabra elhelyezni, hogy sem a csomagolás valamely része, vagy tartozéka, sem másik bárca vagy jelölés ne takarja vagy ne fedje el;
- c) egymás mellé kell elhelyezni, ha egynél több bárca van előírva.

Ha a küldeménydarab alakja szabálytalan vagy a küldeménydarab túl kicsi ahhoz, hogy a bárca megfelelően elhelyezhető legyen, a bárca egy biztonságosan rögzített függőcímkére is ragasztható, vagy más alkalmas módon a küldeménydarabhoz erősíthető.

5.2.2.1.7 A 450 liternél nagyobb űrtartalmú IBC-eket és a nagycsomagolásokat két, egymással szemben levő oldalukon kell bárcával ellátni.

5.2.2.1.8 (fenntartva)

5.2.2.1.9 Különleges előírások az önreaktív anyagok és a szerves peroxidok bárcázására

- a) Mivel a 4.1 számú bárca arra is utal, hogy a termék gyúlékony lehet, ezért 3 számú bárca nem szükséges. A B típusú önreaktív anyagok esetében kiegészítésképpen 1 számú bárcát is el kell helyezni, kivéve, ha az illetékes hatóság engedélyezte ezen bárca elhagyását kifejezetten az alkalmazott csomagolásra, mivel a vizsgálatok eredményei bizonyították, hogy az önreaktív anyag ebben a csomagolásban nem robbanásveszélyes;
- b) Mivel az 5.2 számú bárca arra is utal, hogy a termék gyúlékony lehet, ezért 3 számú - bárca nem szükséges. Kiegészítésképpen a következő bárcákat kell elhelyezni:

- i) a B típusú szerves peroxidok esetében kiegészítésképpen 1 számú bárcát is el kell helyezni, kivéve, ha az illetékes hatóság engedélyezte ezen bárca elhagyását kifejezetten az alkalmazott csomagolásra, mivel a vizsgálatok eredményei bizonyították, hogy a szerves peroxid ebben a csomagolásban nem robbanásveszélyes;
- ii) 8 számú veszélyességi bárcát, ha a szerves peroxid a 8 osztály I vagy II csomagolási csoportja kritériumainak megfelel.

A név szerint említett önreaktív anyagokhoz és szerves peroxidokhoz az elhelyezendő bárcákat a 2.2.41.4 illetve a 2.2.52.4 bekezdés felsorolása tartalmazza.

5.2.2.1.10 *Különleges előírások a fertőző anyagokat tartalmazó küldeménydarabok bárcázására*

A fertőző anyagokat tartalmazó küldeménydarabokon a 6.2 számú bárcán kívül mindazon veszélyességi bárcákat el kell helyezni, amelyek a tartalom tulajdonságai miatt szükségesek.

5.2.2.1.11 *Különleges előírások a radioaktív anyagok bárcázására*

5.2.2.1.11.1 Kivéve, ha az 5.3.1.1.3 pontban előírtak szerint felnagyított bárcákat alkalmaznak, minden radioaktív anyagot tartalmazó küldeménydarabra, konténerre és egyesítőcsomagolásra legalább két, a kategóriájának megfelelő (lásd az 5.1.5.3.4 pontot) 7A, 7B vagy 7C számú bárcát kell elhelyezni. A bárcákat a küldeménydarabok külsejének két, egymással szemben levő oldalára, ill. a nagykonténer mind a négy oldalára kell elhelyezni. Minden, radioaktív anyagot tartalmazó egyesítőcsomagolást legalább két, egymással szemben levő külső oldalán kell bárcával megjelölni. Ezenkívül minden hasadóanyagot tartalmazó küldeménydarabra, egyesítőcsomagolásra és konténerre, kivéve a 6.4.11.2 bekezdés szerinti mentesített hasadóanyagokat tartalmazókat, a 7E számú bárcákat is el kell helyezni; ezeket a bárcákat közvetlenül a radioaktív anyagra utaló bárcák mellé kell helyezni. A bárcák nem takarhatják az 5.2.1 szakaszban meghatározott jelöléseket. Azokat a bárcákat, amelyek nem felelnek meg a tartalomnak, el kell távolítani vagy le kell takarni.

5.2.2.1.11.2 A 7A, 7B és 7C számú minta szerinti bárcákon a következő információkat kell feltüntetni:

- a) Tartalom:
 - i) Az *LSA-I* anyagokat kivéve a radionuklidok nevét a 2.2.7.2.2.1 pont táblázata szerint, az ott található jellel. A radionuklid keverékekre a sugárzás szempontjából meghatározó nuklidokat kell megnevezni, amennyire a rovatban rendelkezésre álló hely ezt megengedi. Az *LSA-* vagy *SCO-*csoportot a radionuklid neve után kell írni. Ehhez az „*LSA-II*”, „*LSA-III*”, „*SCO-I*” és „*SCO-II*” kifejezéseket kell használni.
 - ii) *LSA-I* anyagokhoz elegendő az „*LSA-I*” megjelölés, a radionuklid nevét nem kötelező feltüntetni.
- b) Aktivitás:

A radioaktív tartalom szállítás alatti legnagyobb aktivitását becquerelben (Bq) kell megadni a hozzátartozó SI-prefixum jelével együtt (lásd az 1.2.2.1 bekezdést). Hasadóanyagoknál az aktivitás helyett a hasadóanyag (vagy keverékeknél az egyes hasadó-nuklidok) mennyisége is megadható grammban (g) vagy annak többszörösében.
- c) Egyesítőcsomagolásoknál és konténereknél a „tartalom”-ra és az „aktivitás”-ra vonatkozó beírás a bárcákon az előző a) és b) pont alatt előírt adatoknak megfelelően történjen, az egyesítőcsomagolások vagy konténerek teljes tartalmára vonatkoztatva. Ez nem vonatkozik azon egyesítőcsomagolások vagy konténerek bárcáira, amelyek különböző radionuklidokat tartalmazó küldeménydarabokat tartalmaznak együvé rakva; ilyen esetekben a „Lásd a fuvarokmányt” beírást lehet alkalmazni.
- d) Szállítási mutatószám:

Az 5.1.5.3.1 és az 5.1.5.3.2 pont alapján meghatározott számot (az I-FEHÉR kategóriára nézve a szállítási mutatószám feltüntetése nem szükséges).

- 5.2.2.1.11.3** Minden 7E számú bárcán fel kell tüntetni a kritikussági biztonsági mutatószámot (*CSI-t*), amint az a külön megegyezés vagy a küldeménydarab-minta engedély okiratában szerepel, amelyet az illetékes hatóság adott ki.
- 5.2.2.1.11.4** Egyesítőcsomagolások és konténerek esetén az 5.2.2.1.11.3 pontban előírt kritikussági biztonsági mutatószámot (*CSI-t*) a bárcán az egyesítőcsomagolás, ill. a konténer teljes hasadó-anyag tartalmára összesítve kell feltüntetni.
- 5.2.2.1.11.5** Az illetékes hatóság gyártási minta engedélyéhez, ill. szállítási engedélyéhez kötött küldeménydarabok bármely nemzetközi szállítása esetén, ha a szállításban érintett országokban különböző engedélytípusok szükségesek, a bárcákat a gyártási minta származási országában kiadott engedélynek megfelelően kell elhelyezni.

5.2.2.2 Előírások a bárcákra

- 5.2.2.2.1** A bárcáknak a szín, a jelkép és a forma tekintetében az 5.2.2.2.2 pontban látható bárcákkal kell megegyezniük és a következő előírásoknak kell megfelelniük. Elfogadhatók azonban a többi közlekedési alágazatra előírt hasonló bárcák is, amelyeken csak olyan, apró eltérések vannak, amelyek a bárca nyilvánvaló jelentését nem befolyásolják.

***Megjegyzés:** Az 5.2.2.2.2 pontban – ahol indokolt – a bárcák az 5.2.2.2.1.1 pontban előírtak szerint szaggatott külső határvonallal vannak ábrázolva. Ez nem szükséges akkor, ha a bárca elütő színű háttéren van.*

- 5.2.2.2.1.1** A bárcák csúcsára állított négyzet (rombusz) alakúak, legalább 100 x 100 mm nagyságúak. A szélekkel párhuzamosan, azoktól 5 mm távolságra egy vonal fut körbe. A vonal a bárca felső felén a jelképpel azonos színű, az alsó felén az alsó sarokban feltüntetett számmal azonos színű. A bárcákat elütő színű háttérre kell feltenni vagy pedig a külső szélét szaggatott vagy folytonos határvonallal kell jelölni. Ha a küldeménydarab mérete úgy kívánja, a bárcák méretei csökkenthetők, feltéve, hogy jól láthatók maradnak.

- 5.2.2.2.1.2** A 2 osztály gázait tartalmazó palackokhoz alakjuk, helyzetük és a szállításhoz szükséges rögzítés módja miatt az e szakaszban előírtak szerinti bárcák, ill. az esetleg szükséges „környezetre veszélyes anyag” jelölés az ISO 7225:2005 (Gázpalackok - Figyelmeztető bárcák) szabvány szerinti, csökkentett méretben is használhatók, hogy a gázpalackok nem hengeres részére (vállrészére) elhelyezhetők legyenek.

Az 5.2.2.1.6 pont előírásaitól eltérően a bárcák és a „környezetre veszélyes anyag” jelölés (lásd az 5.2.1.8.3 pontot) az ISO 7225:2005 szabvány szerinti mértékben fedhetik egymást. A főveszélyre utaló bárcának és az összes bárcán levő számnak mindig, teljes mértékben láthatónak, ill. a jelképeknek felismerhetőnek kell lenniük.

A 2 osztály gázaihoz használt, üres, tisztítatlan nyomástartó tartályok újratöltés, vizsgálat, az érvényes előírásoknak megfelelő, új bárcával való ellátás vagy a nyomástartó tartály ártalmatlanítása céljából úgy is szállíthatók, ha elavult vagy sérült bárcákkal vannak jelölve.

- 5.2.2.2.1.3** Az 1 osztály 1.4, 1.5 és 1.6 alosztályának bárcája kivételével a bárcák felső felén a jelkép, az alsó felén a következők vannak feltüntetve:

- az 1, a 2, a 3, az 5.1, az 5.2, a 7, a 8 és a 9 osztály bárcáinál az osztály száma;
- a 4.1, a 4.2 és a 4.3 osztály bárcáinál a „4” számjegy;
- a 6.1 és a 6.2 osztály bárcáinál a „6” számjegy.

A bárcákon az 5.2.2.2.1.5 pont szerint szöveg is feltüntethető, pl. az UN szám, vagy a veszély jellegét leíró szavak (pl. „gyúlékony”), feltéve, hogy a szöveg nem takarja el, ill. nem zavarja a bárcára előírt egyéb elemeket.

- 5.2.2.2.1.4** Ezen kívül az 1 osztály bárcáinak – az 1.4, 1.5 és 1.6 alosztály kivételével – az alsó felén az anyagra vagy tárgyra vonatkozó alosztály száma és összeférhetőségi csoport betűje van az osztály száma fölött. Az 1.4, 1.5 és 1.6 alosztály bárcáinak felső felén az alosztály száma, az alsó felén az osztály száma és az összeférhetőségi csoport betűje van.

- 5.2.2.2.1.5** A bárcákon – a 7 osztály anyagaira utaló bárcák kivételével – a jelkép alatti üres részen az osztály számán kívüli egyéb szöveg is feltüntethető, de csak ha a veszély természetére vagy kezelési óvintézkedésre utal.
- 5.2.2.2.1.6** A jelképeknek, szövegeknek és számoknak jól olvashatónak és tartósnak és minden bárcán fekete színűnek kell lenniük, kivéve:
- a 8 osztály bárcáját, ahol a szöveget (ha van) és az osztály számát fehérrel kell felírni;
 - a teljesen zöld, vörös vagy kék háttérű bárcákat, ahol fehér színűek is lehetnek;
 - az 5.2 osztály bárcáját, ahol a jelkép fehér is lehet; és
 - az UN 1011, 1075, 1965 és 1978 számú anyagokat tartalmazó palackokon és gázpatronokon elhelyezett 2.1 számú bárcát, ahol megegyezhet a tartály színével, ha az kellően elüt a bárca háttérétől.
- 5.2.2.2.1.7** A bárcák felismerhetősége az időjárás hatására lényegesen nem csökkenhet.
- 5.2.2.2.2** *Bárca minták*

1 osztály veszélye
Robbanóanyagok és -tárgyak

(1 sz. bárca)
1.1, 1.2 és 1.3 alosztály
A jelkép (felrobbanó bomba): fekete;
a háttér: narancssárga;
'1' számjegy az alsó sarokban

(1.4 sz. bárca)
1.4 alosztály

(1.5 sz. bárca)
1.5 alosztály

(1.6 sz. bárca)
1.6 alosztály

A háttér: narancssárga; a számok: feketék;
a számjegyek kb. 30 mm magasak és kb. 5 mm vastagságúak (100 x 100 mm-es bárcáknál);
'1' számjegy az alsó sarokban

- ** Az alosztály számának helye – üresen kell hagyni, ha a robbanásveszély járulékos veszély.
- * Az összeférhetőségi csoport helye – üresen kell hagyni, ha a robbanásveszély járulékos veszély

2 osztály veszélye
Gázok

(2.1 sz. bárca)

Gyúlékony gázok

A jelkép (láng): fekete vagy fehér
(kivéve, ha az 5.2.2.2.1.6 d) pont szerinti);
a háttér: vörös;
'2' számjegy az alsó sarokban

(2.2 sz. bárca)

Nem gyúlékony, nem mérgező gázok

A jelkép (gázpalack): fekete vagy fehér;
a háttér: zöld;
'2' számjegy az alsó sarokban

(2.3 sz. bárca)

Mérgező gázok

A jelkép (halálfej): fekete;
a háttér: fehér;
'2' számjegy az alsó sarokban

3 osztály veszélye
Gyúlékony folyékony anyagok

(3 sz. bárca)

A jelkép (láng): fekete vagy fehér;
a háttér: vörös;
'3' számjegy az alsó sarokban

4.1 osztály veszélye
Gyúlékony szilárd anyagok,
önreaktív anyagok és
szilárd, érzéketlenített
robbanóanyagok

(4.1 sz. bárca)
 A jelkép (láng): fekete;
 a háttér: fehér
 hét függőleges vörös csíkkal;
 '4' számjegy az alsó
 sarokban

4.2 osztály veszélye
Öngyulladásra hajlamos
anyagok

(4.2 sz. bárca)
 A jelkép (láng): fekete;
 a háttér: felső fél fehér,
 alsó fél vörös;
 '4' számjegy az alsó
 sarokban

4.3 osztály veszélye
Vízzel érintkezve gyúlékony gázokat
fejlesztő anyagok

(4.3 sz. bárca)
 A jelkép (láng): fekete vagy fehér;
 a háttér: kék;
 '4' számjegy az alsó sarokban

5.1 osztály veszélye
Gyújtó hatású (oxidáló) anyagok

(5.1 sz. bárca)
 A jelkép (kör feletti láng): fekete;
 a háttér sárga;
 '5.1' számjegyek az alsó sarokban

5.2 osztály veszélye
Szerves peroxidok

(5.2 sz. bárca)
 A jelkép (láng): fekete vagy fehér;
 a háttér: felső fél vörös, alsó fél sárga;
 '5.2' számjegyek az alsó sarokban

6.1 osztály veszélye
Mérgező anyagok

(6.1 sz. bárca)
 A jelkép (halálfej): fekete;
 a háttér: fehér;
 '6' számjegy az alsó sarokban

6.2 osztály veszélye Fertőző anyagok

(6.2 sz. bárca)

A bárca alsó felén feltüntethető
a „FERTŐZŐ ANYAG” és a

„Sérülés vagy szabaddá válás esetén azonnal értesíteni kell az egészségügyi hatóságokat” felirat.

A jelkép (kör, amelyen három félhold van) és a felirat: fekete;

a háttér: fehér;

‘6’ számjegy az alsó sarokban

7 osztály veszélye Radioaktív anyagok

(7A sz. bárca)

I – FEHÉR kategória

A jelkép (stilizált lóhere): fekete;
a háttér: fehér.

Kötelező szöveg a bárca

alsó felén: fekete

‘RADIOACTIVE’,

‘CONTENTS’,

‘ACTIVITY’;

a ‘RADIOACTIVE’ szó után

egy függőleges vörös csík;

‘7’ számjegy az alsó sarokban

(7B sz. bárca)

II – SÁRGA kategória

A jelkép (stilizált lóhere): fekete;

a háttér: felső fél sárga, fehér
szegéllyel, alsó fél fehér.

Kötelező szöveg a bárca alsó

felén: fekete

‘RADIOACTIVE’,

‘CONTENTS’,

‘ACTIVITY’.

Fekete keretben:

‘TRANSPORT INDEX’;

a ‘RADIOACTIVE’ szó után

két függőleges vörös csík;

‘7’ számjegy az alsó sarokban

(7C sz. bárca)

III – SÁRGA kategória

A jelkép (stilizált lóhere): fekete;

a háttér: felső fél sárga, fehér
szegéllyel, alsó fél fehér.

Kötelező szöveg a bárca

alsó felén: fekete

‘RADIOACTIVE’,

‘CONTENTS’,

‘ACTIVITY’.

Fekete keretben:

‘TRANSPORT INDEX’;

a ‘RADIOACTIVE’ szó után

három függőleges vörös csík;

‘7’ számjegy az alsó sarokban

(7E sz. bárca)

7 osztályba tartozó hasadóanyag

A háttér: fehér.

Kötelező szöveg: fekete - a bárca felső felén: ‘FISSILE’,

a bárca alsó felén fekete keretben: ‘CRITICALITY SAFETY INDEX’;

‘7’ számjegy az alsó sarokban

8 osztály veszélye
Maró anyagok

(8 sz. bárca)

A jelkép (két üveg kémcsőből csepegő,
egy kezét és egy fémdarabot megtámadó
folyadék): fekete;

a háttér: felső fél fehér,
alsó fél fekete, fehér szegéllyel;

‘8’ számjegy az alsó sarokban

9 osztály veszélye
Különféle veszélyes anyagok és tárgyak

(9 sz. bárca)

A jelkép (hét függőleges csík a
felső részen): fekete;

a háttér: fehér;

‘9’ számjegy aláhúzva az alsó sarokban

5.3 FEJEZET

A KONTÉNEREK, MEG-KONTÉNEREK, MEMU-k TANKKONTÉNEREK, MOBIL TARTÁNYOK ÉS JÁRMŰVEK NAGYBÁRCÁVAL ÉS NARANCSSÁRGA TÁBLÁVAL VALÓ MEGJELÖLÉSE

Megjegyzés: *A konténerek, MEG-konténerek, tankkonténerek és mobil tartányok jelölésére és nagybárcával való ellátására tengeri szállítást is magában foglaló szállítási láncban lásd az 1.1.4.2.1 pontot. Ha az 1.1.4.2.1 c) pont előírásait alkalmazzzák, akkor csak a jelen fejezet 5.3.1.3 bekezdését és 5.3.2.1.1 pontját kell alkalmazni.*

5.3.1 Nagybárcák elhelyezése

5.3.1.1 Általános előírások

5.3.1.1.1 Amikor és ahogyan ebben a szakaszban elő van írva, a konténerek, MEG-konténerek, MEMU-k, tankkonténerek, mobil tartányok és járművek külső felületére nagybárcákat kell erősíteni. A nagybárcáknak meg kell egyezniük a konténerben, MEG-konténerben, MEMU-ban, tankkonténerben, mobil tartányban vagy a járműben levő árura, a 3.2 fejezet „A” táblázat 5, esetleg 6 oszlopában előírt bárcákkal, és meg kell felelniük az 5.3.1.7 bekezdésben található leírásnak. A nagybárcákat elütő színű háttérre kell feltenni vagy pedig a külső szélét szaggatott vagy folytonos határvonallal kell jelölni.

5.3.1.1.2 Az 1 osztálynál az összeférhetőségi csoportot nem kell a nagybárcákon feltüntetni, ha a jármű, a konténer vagy a MEMU különleges raktere több összeférhetőségi csoport anyagait szállítja. A különböző alosztályokba tartozó anyagokat vagy tárgyakat szállító járművet, konténert, ill. a MEMU különleges rakterét csak a legveszélyesebb alosztály szerinti nagybárcával kell ellátni a következő sorrendnek megfelelően:

1.1 (legveszélyesebb), 1.5, 1.2, 1.3, 1.6, 1.4 (legkevésbé veszélyes).

Amennyiben az 1.5D osztályozási kód alá tartozó anyagokat az 1.2 alosztály anyagaival vagy tárgyaival együtt szállítják, úgy a járművet, ill. a konténert az 1.1 alosztálynak megfelelően kell nagybárcával ellátni. Az 1.4 alosztály S összeférhetőségi csoportjába tartozó robbanóanyagok és -tárgyak szállítása esetén nincs szükség nagybárcára.

5.3.1.1.3 A 7 osztálynál a fő veszélyre utaló nagybárcának meg kell egyeznie az 5.3.1.7.2 pontban leírt 7D mintával. Erre a nagybárcára nincs szükség azoknál a járműveknél és konténereknél, amelyekben engedményes küldeménydarabokat szállítanak, és a kiskonténereknél. Amennyiben a járműre, konténerre, MEG-konténerre, tankkonténerre vagy mobil tartányra a 7 osztály veszélyességi bárcája és nagybárca is elő van írva, akkor a 7D számú nagybárca helyett az előírt veszélyességi bárca felnagyított változata is elhelyezhető, amely mindkét célnak megfelel.

5.3.1.1.4 A több osztályba tartozó árukat tartalmazó konténerekre, MEG-konténerekre, MEMU-kra, tankkonténerekre, mobil tartányokra vagy járművekre nem szükséges a járulékos veszélyre utaló nagybárca elhelyezése, ha az ezen nagybárcának megfelelő veszélyt már egy fő vagy járulékos veszélyre utaló nagybárca jelöli.

5.3.1.1.5 Azokat a nagybárcákat, amelyek nem a szállított veszélyes árukra vagy azok maradékára utalnak, el kell távolítani vagy le kell takarni.

5.3.1.1.6 Ha a nagybárca összehajtható tartóra van rögzítve, akkor azt úgy kell kialakítani és rögzíteni, hogy aállítás közben ne csukódjon be, ill. ne nyíljon ki és ne lazuljon meg (különösen ütközés vagy véletlen folytán).

5.3.1.2 *Konténerek, MEG-konténerek, tankkonténerek és mobil tartányok nagybárcával való megjelölése*

Megjegyzés: *Ez a bekezdés nem vonatkozik a cserefelépítményekre, kivéve a tartányos cserefelépítményeket és a kombinált közúti/vasúti szállításban használt cserefelépítményeket.*

A nagybárcákat a konténerek, MEG-konténerek, mobil tartányok és tankkonténerek mindkét oldalára és mindkét végére el kell helyezni.

Ha egy többkamrás tankkonténer, ill. többkamrás mobil tartány két- vagy többfajta veszélyes árut tartalmaz, a tartánykamrában levő anyagra utaló nagybárcá(ka)t mindkét oldalon a megfelelő tartánykamránál kell elhelyezni, a tankkonténer, ill. a mobil tartány két végére pedig az oldalt levő mindegyik fajta bárcából egyet-egyet kell elhelyezni.

5.3.1.3 *A konténereket, MEG-konténereket, tankkonténereket és mobil tartányokat szállító járművek nagybárcával való megjelölése*

Megjegyzés: *Ez a bekezdés nem vonatkozik a tartányos cserefelépítményeken és kombinált közúti/vasúti szállításban használt cserefelépítményeken kívül más cserefelépítményeket szállító járművek nagybárcával való megjelölésére; az ilyen járművekre lásd az 5.3.1.5 bekezdést.*

Ha a szállító járművön levő konténerekre, MEG-konténerekre, tankkonténerekre vagy mobil tartányokra erősített nagybárcák kívülről nem láthatók, akkor ugyanolyan nagybárcákat kell elhelyezni a járművek mindkét oldalára és hátuljára. Egyébként a járműveket nem kell nagybárcával megjelölni.

5.3.1.4 *Ömlesztett árut szállító járművek, tartányjárművek, battériás járművek, MEMU-k és leszerelhető tartányos járművek nagybárcával való megjelölése*

5.3.1.4.1 A nagybárcákat a jármű mindkét oldalára és hátuljára el kell helyezni.

Ha egy többkamrás tartányjármű, ill. a járművön levő többkamrás leszerelhető tartány két- vagy többfajta veszélyes árut tartalmaz, a tartánykamrában levő anyagra utaló nagybárcá(ka)t mindkét oldalon a megfelelő tartánykamránál kell elhelyezni, a jármű hátulján pedig az oldalt levő mindegyik fajta nagybárcából egyet-egyet kell elhelyezni. Ha viszont minden tartánykamrán ugyanolyan nagybárcáknak kell lenniük, akkor ezekből a jármű mindkét oldalára és hátuljára csak egyet kell elhelyezni.

Ha ugyanahhoz a tartánykamrához több nagybárca van előírva, akkor a nagybárcákat egymás mellé kell elhelyezni.

Megjegyzés: *Ha egy ADR szerinti szállítás során vagy végén a tartányos félpótkocsit tengerjáró hajóra vagy belvízi hajóra rakásakor lekapcsolják a vontató járműről, akkor a nagybárcákat a félpótkocsi elejére is el kell helyezni.*

5.3.1.4.2 A tartánnyal vagy ömlesztettáru-konténerrel rendelkező MEMU-t a bennük lévő anyagra vonatkozóan az 5.3.1.4.1 pont szerint kell nagybárcával ellátni. Ha a tartány 1000 liternél kisebb befogadóképességű, a nagybárcák az 5.2.2.2 szerinti bárcákkal helyettesíthetők.

5.3.1.4.3 Az 1.4. osztály S összeférhetőségi csoportjába tartozók kivételével az 1. osztály anyagait és tárgyait tartalmazó küldeménydarabokat szállító MEMU-knál a nagybárcákat a MEMU mindkét oldalára és hátuljára kell elhelyezni.

A robbanóanyag szállítására szolgáló különleges rakteret az 5.3.1.1.2 pont szerint kell nagybárcával ellátni. Az 5.3.1.1.2 pont utolsó mondata azonban erre az esetre nem érvényes.

5.3.1.5 *A kizárólag küldeménydarabokat szállító járművek nagybárcával való megjelölése*

Megjegyzés: Ez a bekezdés a küldeménydarabokat tartalmazó cserefelépítményeket szállító járművekre is vonatkozik, kivéve a kombinált közúti/vasúti szállítás esetét, amire lásd az 5.3.1.2 és az 5.3.1.3 bekezdést.

5.3.1.5.1 Az 1.4 alosztály S összeférhetőségi csoportjába tartozók kivételével az 1 osztály anyagait és tárgyait tartalmazó küldeménydarabokat szállító járműveknél a nagybárcákat a járművek mindkét oldalára és hátuljára kell elhelyezni.

5.3.1.5.2 A 7 osztály radioaktív anyagait csomagolóeszközökben vagy IBC-kben (az engedélyes küldeménydarabok kivételével) szállító járműveknél a nagybárcákat a járművek mindkét oldalára és hátuljára kell elhelyezni.

5.3.1.6 *Üres tartányjárművek, battériás járművek, MEG-konténerek, MEMU-k, tankkonténerek, mobil tartányok és előzőleg ömlesztett szállításra használt, üres járművek és konténerek nagybárcával való megjelölése*

5.3.1.6.1 Az üres, tisztítatlan és nem gáztalanított tartányjárműveken, leszerelhető tartányos járműveken, battériás járműveken, MEG-konténereken, MEMU-kon, tankkonténereken, mobil tartányokon és az ömlesztett szállításra használt, üres, tisztítatlan járműveken és konténereken az előző rakomány esetében előírt nagybárcáknak kell lenniük.

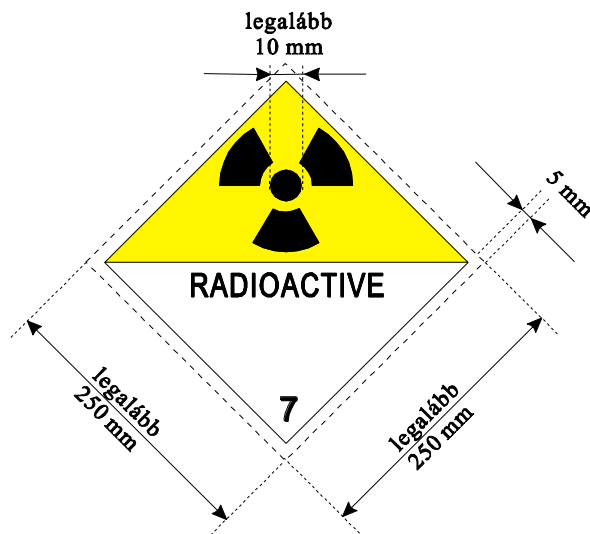

5.3.1.7 *A nagybárcák leírása*

5.3.1.7.1 A nagybárcáknak – az 5.3.1.7.2 pontban a 7 osztály nagybárcáira előírtak kivételével – a következőknek kell megfelelniük:

- a) a méretük legalább 250 x 250 mm, a szélekkel párhuzamosan, azoktól 12,5 mm-re egy vonal fut körbe, ami a nagybarca felső felén a jelképpel azonos színű, az alsó felén az alsó sarokban feltüntetett számmal azonos színű;
- b) a színnek és a jelképnek meg kell egyeznie az adott veszélyes árura előírt bárcával (lásd az 5.2.2.2 bekezdést); és
- c) tartalmazniuk kell az adott veszélyes árura az 5.2.2.2 bekezdésben a megfelelő bárcára előírt számokat (és az 1 osztályba tartozó áruknál az összeférhetőségi csoport betűjét) legalább 25 mm magas írásjegyekkel.

5.3.1.7.2 A 7 osztályra utaló nagybárcák mérete legalább 250 x 250 mm, a szélekkel párhuzamosan, azoktól 5 mm-re fekete vonal fut körbe, egyébként a következő ábrának megfelelő kivittel (7D sz.). A '7' számjegy nem lehet 25 mm-nél kisebb. A nagybarca felső fele sárga, az alsó fele fehér, a stilizált lóhere és a feliratok feketék. Az alsó felén a „RADIOACTIVE” szó feltüntetése tetszőleges, azért, hogy a nagybárcán a küldemény UN száma feltüntethető legyen.

7D sz. nagybárca a 7 osztály radioaktív anyagaihoz

Jelkép (stilizált lóhere): fekete; háttér: felső fél sárga, fehér szegéllyel, alsó fél fehér;
Az alsó félen a „RADIOACTIVE” szó látható, vagy a megfelelő UN szám, és az alsó sarokban a ‘7’ számjegy.

5.3.1.7.3 A legfeljebb 3 m³ befogadóképességű tartányoknál és a kiskonténereknél a nagybárcák helyettesíthetők az 5.2.2.2 bekezdésnek megfelelő bárcákkal. Ha ezek a bárcák a szállító járművön kívülről nem láthatók, akkor az 5.3.1.7.1 pont szerinti nagybárcákat kell elhelyezni a jármű mindkét oldalára és hátuljára.

5.3.1.7.4 Az 1 és a 7 osztály esetében, ha a jármű mérete és kialakítása olyan, hogy a rendelkezésre álló felület nem elegendő az előírt nagybárcák elhelyezéséhez, ezek mérete 100 mm oldalhosszúságig csökkenthető.

5.3.2 Narancssárga tábla

5.3.2.1 A narancssárga táblára vonatkozó általános előírások

5.3.2.1.1 A veszélyes árut szállító szállítóegységekre két, függőleges síkban elhelyezett, narancssárga, téglalap alakú táblát kell elhelyezni, amelyek megfelelnek az 5.3.2.2.1 pontnak. Az egyik táblát a szállítóegység elejére, a másikat a hátuljára, a jármű hossz tengelyére merőlegesen kell rögzíteni. A tábláknak jól láthatóknak kell lenniük.

Ha veszélyes áru szállítás során a veszélyes árut tartalmazó pótkocsit lekapcsolják a vontató járműről, a pótkocsi hátulján fent kell hagyni a narancssárga táblát.

5.3.2.1.2 Ha a 3.2 fejezet „A” táblázatának 20 oszlopában van feltüntetve veszélyt jelölő szám, akkor a tartányjárműveken, battériás járműveken és szállítóegységeken, amelyek egy vagy több tartányukban veszélyes árut szállítanak, ezenkívül mindegyik tartány, mindegyik tartánykamra vagy a battériás jármű mindegyik elemének mindkét oldalán jól látható módon, a jármű hossz tengelyével párhuzamosan az 5.3.2.1.1 pontban előírtakkal azonos narancssárga táblákat kell elhelyezni. Ezek a narancssárga táblák fel kell tüntetni az abban a tartányban, tartánykamrában, ill. battériás jármű elemében szállított anyagra a 3.2 fejezet „A” táblázat 20 oszlopában előírt veszélyt jelölő és 1 oszlopában előírt UN számot. Ezeket a követelményeket MEMU-knál csak az 1000 liter vagy annál nagyobb befogadó-képességű tartányokra és az ömlesztettáru-konténerekre kell alkalmazni.

5.3.2.1.3 Az olyan tartányjárműveknél és szállítóegységeknél, amelyek egy vagy több tartányukban az UN 1202, 1203 vagy 1223 szám alá tartozó anyagokat, ill. az UN 1268 vagy 1863 alá tartozó repülőgép turbinamotorokhoz való tüzelőanyagot szállítanak, de más veszélyes

anyagot nem, az 5.3.2.1.2 pontban előírt narancssárga táblákat nem szükséges elhelyezni, ha az 5.3.2.1.1 pont szerint elől és hátul elhelyezett táblákon a szállított legveszélyesebb anyagra, azaz a legalacsonyabb lobbanáspontú anyagra vonatkozó veszélyt jelölő szám és UN szám fel van tüntetve.

5.3.2.1.4 Ha a 3.2 fejezet „A” táblázatának 20 oszlopában van feltüntetve veszélyt jelölő szám, a csomagolás nélküli szilárd anyagokat, ill. tárgyakat, vagy az egyetlen UN szám alá tartozó, kizárólagos használat mellett szállítandó radioaktív anyagot küldeménydarabokban szállító, de más veszélyes árut nem tartalmazó szállítóegységeket és konténereket az egyes szállítóegységek vagy konténerek oldalain jól látható módon, a jármű hossz tengelyével párhuzamosan az 5.3.2.1.1 pontban előírtakkal azonos narancssárga táblákkal kell ellátni. Ezek a táblákon fel kell tüntetni a szállítóegységben vagy a konténerben ömlesztve szállított minden egyes anyagra vagy a szállítóegységben vagy a konténerben lévő kizárólagos használat mellett szállítandó, küldeménydarabos radioaktív anyagra a 3.2 fejezet „A” táblázat 20 oszlopában előírt veszélyt jelölő és 1 oszlopában előírt UN számot.

5.3.2.1.5 Ha a szállító járművön levő konténerre, MEG-konténerre, tankkonténerre vagy mobil tartányra erősített, az 5.3.2.1.2, ill. az 5.3.2.1.4 pontban előírt narancssárga táblák kívülről nem láthatók tisztán, akkor ugyanolyan táblákat kell elhelyezni a jármű mindkét oldalára.

***Megjegyzés:** Ezt a pontot nem kell alkalmazni azoknak a fedett, ill. ponyvás járműveknek a narancssárga táblával való megjelölésére, amelyek legfeljebb 3000 liter befogadóképességű tartány(oka)t szállítanak.*

5.3.2.1.6 Az olyan szállítóegységen, amelyben csak egy veszélyes anyagot szállítanak és azon kívül még nem-veszélyes anyagot sem, az 5.3.2.1.2, az 5.3.2.1.4 és az 5.3.2.1.5 pontban előírt narancssárga táblákra nincs szükség, ha az 5.3.2.1.1 pont szerinti, elől és hátul elhelyezett táblákon a szállított anyagra a 3.2 fejezet „A” táblázat 20 oszlopában előírt veszélyt jelölő és 1 oszlopában előírt UN szám fel van tüntetve.

5.3.2.1.7 Az 5.3.2.1.1 – 5.3.2.1.5 pont előírásai érvényesek az üres, tisztítatlan és nem gáztalanított, ill. nem fertőtlenített rögzített vagy leszerelhető tartányokra, tankkonténerekre, MEG-konténerekre, mobil tartányokra és battériás járművekre, üres, tisztítatlan MEMUK-ra, valamint az ömlesztett áru szállítására használt, üres, tisztítatlan vagy nem fertőtlenített járművekre és konténerekre is.

5.3.2.1.8 A nem a szállított veszélyes árura vagy árumaradékra utaló narancssárga táblát el kell távolítani vagy le kell takarni. Ha a táblákat letakarják, a letakarásnak teljesnek kell lennie, és 15 percig tartó égés után is takarnia kell a táblát.

5.3.2.2 A narancssárga tábla leírása

5.3.2.2.1 A narancssárga táblának fényvisszaverőnek kell lennie, az alapja 40 cm, a magassága 30 cm legyen. A táblán 15 mm széles fekete szegélynek kell lennie. A táblát az időjárás viszontagságainak ellenálló és a jelölés tartósságát biztosító anyagból kell készíteni. A tábla 15 percig tartó égés esetén sem válhat le a tartójáról. A táblának rögzítve kell maradnia, bármilyen helyzetben van is a jármű.. A narancssárga tábla közepén egy 15 mm széles, vízszintes, fekete vonallal megosztható.

Ha a jármű mérete és kialakítása olyan, hogy a rendelkezésre álló felület nem elegendő a narancssárga tábla rögzítéséhez, annak mérete 300 mm szélességig és 120 mm magasságig, a fekete keret 10 mm szélességig csökkenthető. Ebben az esetben radioaktív anyag küldeménydarabokban, kizárólagos használat mellett történő szállításánál csak az UN számot kell feltüntetni, a számok 5.3.2.2.2 pontban előírt magassága 65 mm-ig, vonalvastagsága 10 mm-ig csökkenthető.

A szilárd veszélyes anyag ömlesztett szállítására használt konténereknél, a tank-konténereknél, a MEG-konténereknél és a mobil tartányoknál az 5.3.2.1.2, az 5.3.2.1.4 és az 5.3.2.1.5 pontban előírt táblákat öntapadó fóliával, festéssel vagy bármely más, egyenértékű megoldással lehet helyettesíteni.

Ennek az alternatív jelölésnek meg kell felelnie az ebben a bekezdésben felsorolt feltételeknek, kivéve az 5.3.2.2.1 és az 5.3.2.2.2 pontban említett, tűzállóságra vonatkozó előírásokat.

Megjegyzés: A narancssárga tábla színárnyalatának normál használati körülmények között a színdiagramon a következő koordináták összekötésével kapott területre eső szíenkoordinátákkal kell rendelkeznie:

A terület sarokpontjainak szíenkoordinátái a színdiagramon				
x	0,52	0,52	0,578	0,618
y	0,38	0,40	0,422	0,38

Fényerő tényező a fényvisszaverő színnél: $\beta > 0,12$.

Referencia középpont E, C normálfény típus, normál beesési szög 45° , 0° irányából mérve.

A visszavert fényerősségi együttható 5° -os beesési szögnél $0,2^\circ$ -nál mérve legalább $20 \text{ kandela}/(\text{lux} \cdot \text{m}^2)$.

5.3.2.2.2

A veszélyt jelölő és az UN számoknak 100 mm magas és 15 mm vonalvastagságú fekete számjegyekből kell állniuk. A veszélyt jelölő számnak a tábla felső részén, az UN számnak a tábla alsó részén kell lennie, a két számot a tábla fél magasságában 15 mm széles, fekete, vízszintes vonallal kell a tábla teljes szélességében elválasztani (lásd az 5.3.2.2.3 pontot). A veszélyt jelölő és az UN számoknak kitörölhetetlennek kell lenniük, és 15 percig tartó égés után is olvashatóknak kell maradniuk. Ha a táblán a veszélyt jelölő és az UN számok cserélhetőek, a cserélhető számoknak, betűknek a szállítás során nem szabad elmozdulniuk, bármilyen helyzetben van is a jármű.

5.3.2.2.3

A veszélyt jelölő és az UN számot feltüntető narancssárga tábla mintája

Veszélyt jelölő szám (2 vagy három számjegy, adott esetben előtte egy X betű; lásd az 5.3.2.3 bekezdést)

UN szám (4 számjegy)

A háttér narancssárga. A keret, a vízszintes vonal és a számjegyek feketék, 15 mm vastagok

5.3.2.2.4

Az ebben a bekezdésben megadott méretek megengedett tűrése $\pm 10\%$.

5.3.2.2.5

Ha a narancssárga tábla összehajtható tartóra van rögzítve, akkor azt úgy kell kialakítani és rögzíteni, hogy a szállítás közben ne csukódjon be, ill. ne nyíljon ki és ne lazuljon meg (különösen ütközés vagy véletlen folytán).

5.3.2.3

A veszélyt jelölő számok jelentése

5.3.2.3.1

A veszélyt jelölő szám két vagy három számjegyből áll. A számok általában a következő veszélyekre utalnak:

- 2 nyomás vagy vegyi reakció révén gáz kiszabadulása
- 3 folyékony anyagok (gőzök) és gázok gyúlékonysága vagy önmelegedő folyékony anyag
- 4 szilárd anyagok gyúlékonysága vagy önmelegedő szilárd anyag
- 5 gyújtó (égést tápláló) hatás
- 6 mérgezőképesség vagy fertőzésveszély
- 7 radioaktivitás

- 8 maró hatás
9 spontán heves reakció veszélye.

Megjegyzés: A 9 számjegy alkalmazásának szempontjából a spontán heves reakció veszélye kiterjed az anyag természetéből adódó robbanásveszélyre, bomlási vagy polimerizációs reakció lehetőségére és az ezzel együtt járó jelentős hő vagy gyúlékony és/vagy mérgező gázok fejlődésére.

Valamely számjegy megkettőzése az illető veszély fokozott mértékére utal.

Ha valamely anyag veszélyessége egyetlen számjeggyel megjelölhető, akkor ezt a számjegyet második számként egy nulla követi.

A következő számjegy kombinációknak azonban különleges jelentésük van: 22, 323, 333, 362, 382, 423, 44, 446, 462, 482, 539, 606, 623, 642, 823, 842, 90 és 99, lásd a következő 5.3.2.3.2 pontot.

Ha a veszélyt jelölő szám előtt „X” betű áll, ez azt jelzi, hogy az anyag a vízzel veszélyesen reagál. Ilyen anyagoknál víz csak szakértő jóváhagyásával használható.

Az 1 osztály anyagaihoz és tárgyaihoz veszélyt jelölő számként a 3.2 fejezet „A” táblázat 3b oszlopa szerinti osztályozási kódot kell használni. Az osztályozási kód

- a 2.2.1.1.5 pont szerinti alosztály számából; és
- a 2.2.1.1.6 pont szerinti összeférhetőségi csoport betűjéből áll.

5.3.2.3.2

A 3.2 fejezet „A” táblázatának 20 oszlopában feltüntetett veszélyt jelölő számok jelentése a következő:

- 20 fojtó hatású gáz vagy más járulékos veszéllyel nem járó gáz
22 mélyhűtött, cseppfolyósított, fojtó gáz
223 mélyhűtött, cseppfolyósított, gyúlékony gáz
225 mélyhűtött, cseppfolyósított, gyújtó hatású (égést tápláló) gáz
23 gyúlékony gáz
238 gyúlékony, maró gáz
239 gyúlékony gáz, amely spontán heves reakciót okozhat
25 gyújtó hatású (égést tápláló) gáz
26 mérgező gáz
28 maró gáz
263 mérgező, gyúlékony gáz
265 mérgező, gyújtó hatású (égést tápláló) gáz
268 mérgező, maró gáz
30 – gyúlékony (lobbanáspont 23...60 °C) folyékony anyag; vagy
– 60 °C feletti lobbanáspontú gyúlékony folyékony anyag vagy olvasztott szilárd anyag lobbanáspontjával egyenlő vagy annál magasabb hőmérsékleten; vagy
– önmelegedő folyékony anyag
323 gyúlékony folyékony anyag amely vízzel reagálva gyúlékony gázokat fejleszt
X323 gyúlékony folyékony anyag, amely vízzel veszélyesen reagálva* gyúlékony gázokat fejleszt
33 könnyen gyúló (lobbanáspont 23 °C alatt) folyékony anyag
333 piroforos folyékony anyag
X333 piroforos folyékony anyag, amely a vízzel veszélyesen reagál*
336 könnyen gyúló, mérgező folyékony anyag
338 könnyen gyúló, maró folyékony anyag
X338 könnyen gyúló, maró folyékony anyag, amely a vízzel veszélyesen reagál*
339 könnyen gyúló folyékony anyag, amely spontán heves reakciót okozhat
36 gyúlékony (lobbanáspont 23...60 °C), enyhén mérgező folyékony anyag vagy

- önmelegedő, mérgező folyékony anyag
- 362 gyúlékony, mérgező folyékony anyag, amely vízzel reagálva gyúlékony gázokat fejleszt
- X362 gyúlékony, mérgező folyékony anyag, amely vízzel veszélyesen reagálva* gyúlékony gázokat fejleszt
- 368 gyúlékony, mérgező, maró folyékony anyag
- 38 gyúlékony (lobbanáspont 23...60 °C) folyékony anyag, amely gyengén maró vagy önmelegedő, maró folyékony anyag
- 382 gyúlékony folyékony, maró anyag, amely vízzel reagálva gyúlékony gázokat fejleszt
- X382 gyúlékony folyékony, maró anyag, amely vízzel veszélyesen reagálva* gyúlékony gázokat fejleszt
- 39 gyúlékony folyékony anyag, amely spontán heves reakciót okozhat
- 40 gyúlékony szilárd anyag, vagy önmelegedő anyag, vagy önreaktív anyag
- 423 szilárd anyag, amely vízzel reagálva gyúlékony gázokat fejleszt, vagy gyúlékony szilárd anyag, amely vízzel reagálva gyúlékony gázokat fejleszt, vagy önmelegedő szilárd anyag, amely vízzel reagálva gyúlékony gázokat fejleszt
- X423 szilárd anyag, amely vízzel veszélyesen reagálva* gyúlékony gázokat fejleszt, vagy gyúlékony szilárd anyag, amely vízzel veszélyesen reagálva* gyúlékony gázokat fejleszt, vagy önmelegedő szilárd anyag, amely vízzel veszélyesen reagálva* gyúlékony gázokat fejleszt
- 43 öngyulladó (piroforos) szilárd anyag
- X432 öngyulladó (piroforos) szilárd anyag, amely vízzel veszélyesen reagálva* gyúlékony gázokat fejleszt
- 44 gyúlékony szilárd anyag, amely magasabb hőmérsékleten olvasztott állapotban van
- 446 gyúlékony, mérgező szilárd anyag, amely magasabb hőmérsékleten olvasztott állapotban van
- 46 gyúlékony vagy önmelegedő, mérgező szilárd anyag
- 462 mérgező szilárd anyag, amely vízzel reagálva gyúlékony gázokat fejleszt
- X462 szilárd anyag, amely vízzel veszélyesen reagálva* mérgező gázokat fejleszt
- 48 gyúlékony vagy önmelegedő, maró szilárd anyag
- 482 maró szilárd anyag, amely vízzel reagálva gyúlékony gázokat fejleszt
- X482 szilárd anyag, amely vízzel veszélyesen reagálva* maró gázokat fejleszt
- 50 gyújtó hatású (égést tápláló) anyag
- 539 gyúlékony szerves peroxid
- 55 erősen gyújtó hatású (égést tápláló) anyag
- 556 erősen gyújtó hatású (égést tápláló), mérgező anyag
- 558 erősen gyújtó hatású (égést tápláló), maró anyag
- 559 erősen gyújtó hatású (égést tápláló) anyag, amely spontán heves reakciót okozhat
- 56 gyújtó hatású (égést tápláló), mérgező anyag
- 568 gyújtó hatású (égést tápláló), mérgező, maró anyag
- 58 gyújtó hatású (égést tápláló), maró anyag
- 59 gyújtó hatású (égést tápláló) anyag, amely spontán heves reakciót okozhat
- 60 mérgező vagy enyhén mérgező anyag
- 606 fertőző anyag
- 623 mérgező folyékony anyag, amely vízzel reagálva gyúlékony gázokat fejleszt
- 63 mérgező, gyúlékony (lobbanáspont 23...60 °C) folyékony anyag
- 638 mérgező, gyúlékony (lobbanáspont 23...60 °C), maró folyékony anyag
- 639 mérgező, gyúlékony (lobbanáspont legfeljebb 60 °C) folyékony anyag, amely spontán heves reakciót okozhat
- 64 mérgező, gyúlékony vagy önmelegedő szilárd anyag
- 642 mérgező szilárd anyag, amely vízzel reagálva gyúlékony gázokat fejleszt
- 65 mérgező, gyújtó hatású (égést tápláló) anyag
- 66 nagyon mérgező anyag

663	nagyon mérgező, gyúlékony (lobbanáspont legfeljebb 60 °C) folyékony anyag
664	nagyon mérgező, gyúlékony vagy önmelegedő szilárd anyag
665	nagyon mérgező, gyújtó hatású (égést tápláló) anyag
668	nagyon mérgező, maró anyag
X668	nagyon mérgező, maró anyag, amely vízzel veszélyesen reagál*
669	nagyon mérgező anyag, amely spontán heves reakciót okozhat
68	mérgező, maró anyag
69	mérgező vagy enyhén mérgező anyag, amely spontán heves reakciót okozhat
70	radioaktív anyag
78	radioaktív, maró anyag
80	maró vagy gyengén maró anyag
X80	maró vagy gyengén maró anyag, amely vízzel veszélyesen reagál*
823	maró folyékony anyag, amely vízzel reagálva gyúlékony gázokat fejleszt
83	maró vagy gyengén maró, gyúlékony (lobbanáspont 23...60 °C) folyékony anyag
X83	maró vagy gyengén maró, gyúlékony (lobbanáspont 23...60 °C) folyékony anyag, amely vízzel veszélyesen reagál*
839	maró vagy gyengén maró, gyúlékony (lobbanáspont 23...60 °C) folyékony anyag, amely spontán heves reakciót okozhat
X839	maró vagy gyengén maró, gyúlékony (lobbanáspont 23...60 °C) folyékony anyag, amely spontán heves reakciót okozhat és vízzel veszélyesen reagál*
84	maró, gyúlékony vagy önmelegedő szilárd anyag
842	maró szilárd anyag, amely vízzel reagálva gyúlékony gázokat fejleszt
85	maró vagy gyengén maró, gyújtó hatású (égést tápláló) anyag
856	maró vagy gyengén maró, gyújtó hatású (égést tápláló), mérgező anyag
86	maró vagy gyengén maró, mérgező anyag
88	erősen maró anyag
X88	erősen maró anyag, amely a vízzel veszélyesen reagál*
883	erősen maró, gyúlékony (lobbanáspont 23...60 °C) folyékony anyag
884	gyúlékony vagy önmelegedő, erősen maró, szilárd anyag
885	erősen maró és gyújtó hatású (égést tápláló) anyag
886	erősen maró és mérgező anyag
X886	erősen maró és mérgező anyag, amely vízzel veszélyesen reagál*
89	maró vagy gyengén maró anyag, amely spontán heves reakciót okozhat
90	környezetre veszélyes anyag vagy különféle veszélyes anyagok
99	különféle veszélyes anyagok magas hőmérsékleten szállítva

* Víz csak szakértő jóváhagyásával használható.

5.3.3 Magas hőmérsékletű anyagok jelölése

Azokat a tartányjárműveket, tankkonténereket, mobil tartányokat, különleges járműveket és konténereket, ill. különlegesen felszerelt járműveket és konténereket, amelyeknél a 3.2 fejezet „A” táblázat 6 oszlopában az 580 különleges előírás szerint a magas hőmérsékletű anyag jelölése szükséges, a járművek mindkét oldalán és hátulján és a konténerek, tankkonténerek és mobil tartányok mindkét oldalán és mindkét végén a következő ábra szerinti háromszög alakú, vörös színű jelöléssel kell ellátni, amelynek oldalhosszúsága legalább 250 mm.

5.3.4 (fenntartva)

5.3.5 (fenntartva)

5.3.6 A környezetre veszélyes anyagok különleges jelölése

Ha az 5.3.1 szakasz előírásai szerint nagybárcát kell alkalmazni, a 2.2.9.1.10 pont kritériumai szerint környezetre veszélyes anyagot tartalmazó konténereket, MEG-konténereket, tankkonténereket, mobil tartányokat és járműveket az 5.2.1.8.3 pont szerinti, „környezetre veszélyes anyag” jelöléssel is el kell látni. Az 5.3.1 szakasz nagybárcákra vonatkozó előírásait erre a jelölésre értelemszerűen alkalmazni kell.

5.4 FEJEZET

OKMÁNYOK

5.4.0 Általános előírások

5.4.0.1 Eltérő előírás hiányában az ADR által szabályozott minden szállításnál az árut az ebben a fejezetben előírt okmányoknak kell kísérniük.

Megjegyzés: A szállítóegységen tartandó okmányok felsorolására lásd a 8.1.2 szakaszt.

5.4.0.2 Elektronikus adatfeldolgozási (EDP) vagy elektronikus adatátviteli (EDI) technikák használata az írásos dokumentáció kiegészítéseként vagy helyette megengedett, amennyiben az elektronikus adatok fogadására, tárolására és feldolgozására használt eljárások a bizonyító erőre és a szállítás alatti hozzáférhetőségre vonatkozó jogi követelményeknek legalább annyira megfelelnek, mint az írásos dokumentáció.

5.4.0.3 Ha a veszélyes áru szállítási információt a szállítónak, fuvarozónak EDP vagy EDI technikával adják át, a feladónak az információt, az ezen fejezetben meghatározott sorrendben feltüntetve, írásban (papíron) is át kell tudnia adni a szállítónak, fuvarozónak.

5.4.1 Veszélyes áru szállítási okmányok és az azokkal összefüggő információk

5.4.1.1 Általános információk, amelyeket a fuvarokmányoknak tartalmaznia kell

5.4.1.1.1 A fuvarokmány(ok)nak minden szállítandó anyagra vagy tárgyra vonatkozóan a következő információkat kell tartalmazniuk:

- a) az UN számot, amely elé az „UN” betűket kell írni;
- b) a helyes szállítási megnevezést, amint azt a 3.1.2 szakasz meghatározza, szükség esetén (lásd a 3.1.2.8.1 pontot) a zárójelbe tett műszaki megnevezéssel kiegészítve (lásd a 3.1.2.8.1.1 pontot);
- c) – az 1 osztály anyagai és tárgyai esetén a 3.2 fejezet „A” táblázat 3b oszlopában található osztályozási kódot.

Ha a 3.2 fejezet „A” táblázat 5 oszlopában az 1, 1.4, 1.5, ill. 1.6 számú bárcán kívül más bárca száma is fel van tüntetve, akkor az osztályozási kód után zárójelben azt a bárcaszámot is fel kell tüntetni;

- a 7 osztály radioaktív anyagai esetén az osztály számát: „7”;

Megjegyzés: A járulékos veszélyekkel rendelkező radioaktív anyagokra lásd a 3.3 fejezetben a 172 különleges előírást.

- a többi osztály anyagai és tárgyai esetén a 3.2 fejezet „A” táblázat 5 oszlopában feltüntetett, ill. 6 oszlopában feltüntetett különleges előírás alapján szükséges bárca számát. Ha egynél több bárca van megadva, akkor az elsőt követő többi bárca számát zárójelbe kell tenni. Olyan anyagok és tárgyak esetén, amelyeknél a 3.2 fejezet „A” táblázat 5 oszlopában nincs bárca szám feltüntetve, e helyett a 3a oszlopban feltüntetett osztály számát;

- d) ahol van, az anyagra vonatkozó csomagolási csoportot, ami elé a „PG” betűk (pl. „PG II”) vagy az 5.4.1.4.1 pont szerinti nyelven a „csomagolási csoport” kezdőbetűi írhatók;

Megjegyzés: A 7 osztály járulékos veszélyekkel rendelkező radioaktív anyagaira lásd a 3.3 fejezetben a 172 különleges előírás b) bekezdését.

- e) küldeménydarabok szállítása esetén a küldeménydarabok számát és fajtáját. A csoma-

golóeszköz UN kódjelét csak a küldeménydarab-fajta leírásának kiegészítése-ként lehet használni [pl. egy láda (4G)];

Megjegyzés: *Nem kell feltüntetni a kombinált csomagolás külső csomagolásában lévő belső csomagolóeszközök számát, típusát és befogadóképességét.*

- f) a veszélyes árukénti összes mennyiséget (térfogatban, bruttó vagy nettó tömegben) az azonos UN számhoz, helyes szállítási megnevezéshez és – ha van – csomagolási csoporthoz tartozó áruként;

Megjegyzés: *1. Amennyiben az 1.1.3.6 bekezdést kívánják alkalmazni, a szállított veszélyes áru összmenységét szállítási kategóriánként kell megadni a fuvarokmányban az 1.1.3.6.3 pont szerint.*

2. Az e Mellékletben szereplő gépek és készülékek esetén a bennük lévő veszélyes áru összes mennyiségét kell feltüntetni, literben vagy kg-ban.

- g) a feladó nevét és címét;
- h) a címzett(ek) nevét és címét. Ehelyett, ha a veszélyes árut több, olyan címzetthez szállítják, akik a szállítás megkezdésekor még nem ismertek, a szállításban érintett országok illetékes hatóságainak hozzájárulásával a „**járműről történő értesítés**” szavakat lehet beírni;
- i) az esetleges külön megállapodás rendelkezéseinek megfelelő nyilatkozatot.
- j) (fenntartva)
- k) a 3.2 fejezet „A” táblázat 15 oszlopában feltüntetett alagútkorlátozási kódot – ha van – nagybetűvel, zárójelben feltüntetve. Az alagútkorlátozási kódot nem kell a fuvarokmányban feltüntetni, ha előzetesen ismert, hogy a szállítás nem halad át olyan alagúton, amelyben a veszélyes áru szállítására korlátozás van.

Az egyes információk helye és sorrendje a fuvarokmányban tetszőleges, kivéve, hogy az a), b), c), d) és k) pont szerinti adatokat ebben a sorrendben [azaz a), b), c), d), k) sorrendben] kell beírni, minden más információ közbeszúrása nélkül, kivéve, amit az ADR előír. Ilyen megengedett veszélyes áru leírás például

„UN 1098 ALLIL- ALKOHOL, 6.1 (3), I, (C/D)” vagy

„UN 1098 ALLIL- ALKOHOL, 6.1 (3), PG I, (C/D)”.

5.4.1.1.2

A fuvarokmányban az előírt információknak jól olvashatónak kell lenniük.

Bár a 3.1 fejezetben és a 3.2 fejezet „A” táblázatában a helyes szállítási megnevezés részét képező elemek nagybetűvel vannak feltüntetve, ill. ebben a fejezetben a fuvarokmányban feltüntetendő információk vegyesen kis- és nagybetűvel vannak írva, az információt a fuvarokmányba kis- vagy nagybetűvel egyaránt be lehet írni, kivéve az 5.4.1.1.1 k) pontban előírtakat.

5.4.1.1.3

Hulladékokra vonatkozó különleges előírások

Amennyiben veszélyes árut tartalmazó hulladékot szállítanak (a radioaktív hulladékok kivételével), a helyes szállítási megnevezés elé kell írni a „HULLADÉK” szót, kivéve, ha ez része a helyes szállítási megnevezésnek, pl.:

„UN 1230 HULLADÉK METANOL, 3 (6.1), II, (D/E)” vagy

„UN 1230 HULLADÉK METANOL, 3 (6.1), PG II, (D/E)” vagy

„UN 1993 HULLADÉK GYÚLÉKONY FOLYÉKONY ANYAG, M.N.N. (toluol és etil-alkohol), 3, II, (D/E)” vagy

„UN 1993 HULLADÉK GYÚLÉKONY FOLYÉKONY ANYAG, M.N.N. (toluol és etil-alkohol), 3, PG II, (D/E)”.

Ha a hulladékra a 2.1.3.5.5 pont előírásait alkalmazzák, akkor a helyes szállítási megnevezést a következőkkel kell kiegészíteni:

„A 2.1.3.5.5 PONT SZERINTI HULLADÉK”

(pl.: „UN 3264 MARÓ, FOLYÉKONY, SAVAS, SZERVETLEN ANYAG, M.N.N. 8, II, (E), A 2.1.3.5.5 PONT SZERINTI HULLADÉK”).

Ilyen esetben a 3.3 fejezet 274 különleges előírása által előírt műszaki megnevezést nem kell beírni.

5.4.1.1.4 (törölve)

5.4.1.1.5 *A kármentő csomagolásokra és kármentő nyomástartó tartályokra vonatkozó különleges előírások*

Ha veszélyes árut kármentő csomagolásban vagy kármentő nyomástartó tartályban szállítanak, a fuvarokmányba az áru megnevezése után a „KÁRMENTŐ CSOMAGOLÁS”, ill. „KÁRMENTŐ NYOMÁSTARTÓ TARTÁLY” bejegyzést kell tenni.

5.4.1.1.6 *Az üres, tisztítatlan eszközökre vonatkozó különleges előírások*

5.4.1.1.6.1 A 7 osztály kivételével a többi osztály veszélyes áruinak maradékát tartalmazó, üres, tisztítatlan eszközök esetében a fuvarokmányban az 5.4.1.1.1 a) – d) és k) pontban előírt veszélyes áru leírás előtt vagy után az „ÜRES, TISZTÍTATLAN” vagy az „UTOLSÓ RAKOMÁNY MARADÉKA” szavakat kell feltüntetni. Emellett az 5.4.1.1.1 f) pont előírásait nem kell alkalmazni.

5.4.1.1.6.2 Az 5.4.1.1.6.1 pont különleges előírása helyett az 5.4.1.1.6.2.1, az 5.4.1.1.6.2.2, ill. az 5.4.1.1.6.2.3 pont előírásai értelemszerűen alkalmazhatók.

5.4.1.1.6.2.1 A 7 osztály kivételével a többi osztály veszélyes áruinak maradékát tartalmazó, üres, tisztítatlan csomagolóeszközök esetében, beleértve a legfeljebb 1000 l űrtartalmú, üres, tisztítatlan gáztartályokat is, a fuvarokmányban az 5.4.1.1.1 a), b) c) d), e) és f) pont szerinti adatok helyett értelemszerűen az „ÜRES CSOMAGOLÓESZKÖZ”, „ÜRES TARTÁLY”, „ÜRES IBC”, ill. „ÜRES NAGYCSOMAGOLÁS” bejegyzés valamelyike szerepel, amit az utolsó berakott árura az 5.4.1.1.1 c) pontban meghatározott információ követ. Lásd a következő példát:

„ÜRES CSOMAGOLÓESZKÖZ, 6.1 (3)”.

Ha az utolsó berakott veszélyes áru a 2 osztályba tartozó áru volt, akkor az 5.4.1.1.1 c) pontban meghatározott információ helyett az osztály száma: „2” is bejegyezhető.

5.4.1.1.6.2.2 A 7 osztály kivételével a többi osztály veszélyes áruinak maradékát tartalmazó, üres, tisztítatlan eszközök – a csomagolóeszközök kivételével –, és az 1000 l-nél nagyobb űrtartalmú, üres, tisztítatlan gáztartályok esetében a fuvarokmányban az 5.4.1.1.1 a) – d) és a k) pont szerinti adatok előtt értelemszerűen az „ÜRES TARTÁNYJÁRMŰ”, „ÜRES LESZERELHETŐ TARTÁNY”, „ÜRES TANKKONTÉNER”, „ÜRES MOBIL TARTÁNY”, „ÜRES BATTÉRIÁS JÁRMŰ”, „ÜRES MEG-KONTÉNER”, „ÜRES MEMU”, „ÜRES JÁRMŰ”, „ÜRES KONTÉNER”, ill. „ÜRES TARTÁLY” bejegyzés valamelyike szerepel, amit az „UTOLSÓ RAKOMÁNY:” szavak követnek. Emellett az 5.4.1.1.1. f) pont előírásait nem kell alkalmazni. Lásd a következő példát:

„ÜRES TARTÁNYJÁRMŰ, UTOLSÓ RAKOMÁNY: UN 1098 ALLIL-ALKOHOL, 6.1 (3), I, (C/D)” vagy

„ÜRES TARTÁNYJÁRMŰ, UTOLSÓ RAKOMÁNY: UN 1098 ALLIL-ALKOHOL, 6.1 (3), PG I, (C/D)”.

5.4.1.1.6.2.3 A 7 osztály kivételével a többi osztály veszélyes áruinak maradékát tartalmazó, üres, tisztítatlan eszközöknek a feladóhoz történő visszaszállítása esetén az a fuvarokmány is használható, amellyel a veszélyes árut szállították. Ilyen esetben a mennyiség feltüntetését érvényteleníteni kell (áthúzással, törléssel vagy más módon) és helyette az „**üres, tiszt-**

títtatlan vissza” szavakat kell be írni.

- 5.4.1.1.6.3** a) Ha az üres, tisztítatlan tartányokat, battériás járműveket vagy MEG-konténereket a 4.3.2.4.3 pont szerint a legközelebbi olyan helyre szállítják, ahol a tisztítás vagy javítás elvégezhető, a következő kiegészítő bejegyzést kell a fuvarokmányba tenni: „**A 4.3.2.4.3 pont szerinti szállítás**”.
- b) Ha az üres, tisztítatlan járműveket vagy konténereket a 7.5.8.1 bekezdés szerint a legközelebbi olyan helyre szállítják, ahol a tisztítás vagy javítás elvégezhető, a következő kiegészítő bejegyzést kell a fuvarokmányba tenni: „**A 7.5.8.1 bekezdés szerinti szállítás**”.
- 5.4.1.1.6.4** Ha rögzített tartányokat (tartányjárműveket), leszerelhető tartányokat, battériás járműveket, tankkonténereket vagy MEG-konténereket a 4.3.2.4.4 pont szerint szállítanak, a következő kiegészítő bejegyzést kell a fuvarokmányba tenni: „**A 4.3.2.4.4 pont szerinti szállítás**”.
- 5.4.1.1.7** *A tengeri vagy légi szállítást is magában foglaló szállítási láncra vonatkozó különleges előírások*
- Az 1.1.4.2.1 pont szerinti szállításnál a következő bejegyzést kell a fuvarokmányba tenni:
„**Az 1.1.4.2.1 pont szerinti szállítás**”.
- 5.4.1.1.8–**
5.4.1.1.9 (fenntartva)
- 5.4.1.1.10** (törölve)
- 5.4.1.1.11** *Az IBC-k és mobil tartányok utolsó időszakos vizsgálat érvényességének lejárt utáni szállítására vonatkozó különleges előírások*
- A 4.1.2.2 bekezdés b) pontja, a 6.7.2.19.6 pont b) alpontja, a 6.7.3.15.6 pont b) alpontja és a 6.7.4.14.6 pont b) alpontja szerinti szállításnál ezt a tényt a fuvarokmányban a következő formában kell feltüntetni : „**A 4.1.2.2 b) pont szerinti szállítás**”; „**A 6.7.2.19.6 b) pont szerinti szállítás**”; „**A 6.7.3.15.6 b) pont szerinti szállítás**”; „**A 6.7.4.14.6 b) pont szerinti szállítás**”.
- 5.4.1.1.12** (fenntartva)
- 5.4.1.1.13** *A többkamrás tartányjárművekben vagy egynél több tartánnyal rendelkező szállítóegységekben történő szállításra vonatkozó különleges előírások*
- Ha egy többkamrás tartányjárművet vagy egynél több tartánnyal rendelkező szállítóegységet az 5.3.2.1.2 ponttól eltérően az 5.3.2.1.3 pont szerinti jelöléssel látnak el, akkor a fuvarokmányban minden egyes tartányban vagy a tartány minden egyes kamrájában levő anyagot külön fel kell tüntetni.
- 5.4.1.1.14** *A magas hőmérsékleten szállított anyagokra vonatkozó különleges előírások*
- Ha egy folyékony anyagot 100 °C-on vagy annál magasabb hőmérsékleten, ill. egy szilárd anyagot 240 °C-on vagy annál magasabb hőmérsékleten szállítanak vagy adnak fel szállításra és a helyes szállítási megnevezés nem utal a magas hőmérsékletre (pl. a helyes szállítási megnevezésben nem szerepel az „OLVASZTOTT” vagy „MAGAS HŐMÉRSEKLETŰ” kifejezés), akkor a helyes szállítási megnevezés elé közvetlenül a „**FORRÓ**” szót kell írni.
- 5.4.1.1.15** *A hőmérséklet-szabályozással stabilizált anyagok szállítására vonatkozó különleges előírások*
- Ha a „STABILIZÁLT” kifejezés a helyes szállítási megnevezés része (lásd a 3.1.2.6 bekezdést is), és a stabilizálás hőmérséklet-szabályozással történik, a fuvarokmányban fel kell tüntetni a szabályozási és a vészhőmérsékletet (lásd a 2.2.41.1.17 pontot) a következők szerint:
- „**Szabályozási hőmérséklet: ... °C, vészhőmérséklet: ... °C**”.

- 5.4.1.1.16** *A 3.3 fejezet 640 különleges utasítása szerint szükséges információ feltüntetése*
- Ha a 3.3 fejezet 640 különleges előírása megköveteli, a fuvarokmányba a „**640X különleges előírás**” bejegyzést kell tenni, ahol „X” a 3.2 fejezet „A” táblázat 6 oszlopában a 640 különleges előírás után szereplő nagybetű.
- 5.4.1.1.17** *A szilárd anyagoknak a 6.11.4 szakasz szerinti ömlesztettáru-konténerben történő szállítására vonatkozó különleges előírások*
- Ha szilárd anyagot a 6.11.4 szakasz szerinti ömlesztettáru-konténerben szállítanak, a fuvarokmányba a következő bejegyzést kell tenni (lásd a 6.11.4 szakasz címéhez fűzött megjegyzést):
- „... **illetékes hatósága által jóváhagyott BK(x) ömlesztettáru-konténer**”.
- 5.4.1.1.18** *A (vízi) környezetre veszélyes anyagok szállítására vonatkozó különleges előírások*
- Ha valamely, 1 – 9 osztályba tartozó anyag a 2.2.9.1.10 pont osztályozási kritériumainak is megfelel, a fuvarokmányban kiegészítésképpen fel kell tüntetni a „**KÖRNYEZETRE VESZÉLYES**” vagy a „**TENGERSZENNYEZŐ / KÖRNYEZETRE VESZÉLYES**” bejegyzést. Ezt a kiegészítő előírást nem kell alkalmazni az UN 3077 és az UN 3082 anyagaira, ill. az 5.2.1.8.1 pontban felsorolt kivételekre.
- Tengeri szállítást is magában foglaló szállítási láncban történő szállítás esetén (az IMDG Kódex 5.4.1.4.3 pontja szerinti) „**TENGERSZENNYEZŐ**” bejegyzés is elfogadható.
- 5.4.1.2** *Az egyes osztályoknál szükséges különleges vagy kiegészítő információk*
- 5.4.1.2.1** *Különleges előírások az 1 osztályra*
- Az 5.4.1.1.1. f) pontban előírtakon kívül a következőket kell a fuvarokmányban feltüntetni:
 - az összes robbanóanyag-tartalom³⁾ nettó tömegét (kg-ban) az eltérő UN számú anyagoként vagy tárgyaként;
 - az összes robbanóanyag-tartalom³⁾ nettó tömegét (kg-ban) a fuvarokmányban szereplő összes anyagra vagy tárgyra.
 - Két különböző áru egybecsomagolása esetén a fuvarokmányba az áru megjelöléseként mindkét anyag vagy tárgy 3.2 fejezet „A” táblázat 1, illetve 2 oszlopában szereplő UN számát és nagybetűvel szedett helyes szállítási megnevezését be kell írni. Amennyiben a 4.1.10 szakasz MP1, MP2, MP20 – MP24 egybecsomagolásra vonatkozó különleges előírása szerint kettőnél több különböző áru van egy küldeménydarabbá egyesítve, úgy a fuvarokmányban az áru megnevezése alatt a küldeménydarabban levő minden anyag és tárgy UN számát „**UN... számú áru**” formában kell feltüntetni.
 - A valamely m.n.n. tétel vagy az „UN 0190 ROBBANÓANYAG MINTA” alá besorolt, illetve az 4.1.4.1 bekezdés P101 csomagolási utasítása szerint csomagolt anyagok és tárgyak szállításánál a fuvarokmányhoz mellékelni kell az illetékes hatóság engedélyének egy példányát a szállítási feltételekkel. Ezt a feladási ország valamely hivatalos nyelvén és ezenkívül, ha ez a nyelv nem az angol, a francia, vagy a német, akkor angol, francia vagy német nyelven kell szövegezni, kivéve, ha a szállítás által érintett országok közötti megállapodások, ha ilyenek vannak, másként rendelkeznek.
 - Ha a B és a D összeférhetőségi csoport anyagait és tárgyait tartalmazó küldeménydarabokat a 7.5.2.2 bekezdés előírásai szerint ugyanabba a járműbe együvé rakják, a 7.5.2.2 bekezdés táblázatához fűzött a) lábjegyzet szerinti elválasztott rekeszekre vagy különleges védőburkolat-rendszerre vonatkozóan az illetékes hatóság jóváhagyásának

3) Tárgyak esetében a robbanóanyag-tartalom a tárgyban levő robbanóanyagot jelenti.

másolatát a fuvarokmányhoz kell csatolni. Ezt a feladási ország valamelyik hivatalos nyelvén és ezenkívül, ha ez a nyelv nem az angol, a francia vagy a német, akkor angol, francia vagy német nyelven kell szövegezni, kivéve, ha a szállítás által érintett országok közötti megállapodások, ha ilyenek vannak, másként rendelkeznek.

- e) Ha a robbanóanyagokat vagy robbanótárgyakat a P101 csomagolási utasítás szerinti csomagolásban szállítják, a fuvarokmányba a következő bejegyzést kell tenni: „... **illetékes hatósága által engedélyezett csomagolás**” (lásd a 4.1.4.1 bekezdés P101 csomagolási utasítását).
- f) (fenntartva).
- g) Az UN 0333, 0334, 0335, 0336 és 0337 alá tartozó tűzijáték testek szállításánál a fuvarokmányba a következő bejegyzést kell tenni: „**A tűzijátéktesteket XX illetékes hatósága sorolta be X/YYZZZZ hivatkozási számon**”

A besorolás jóváhagyási igazolást nem szükséges a szállítmánnyal együtt vinni, de a feladónak ellenőrzés céljából a szállító, fuvarozó, ill. az illetékes hatóságok számára hozzáférhetővé kell tennie. A besorolás jóváhagyási igazolást vagy annak másolatát a feladási ország valamelyik hivatalos nyelvén, és ha ez a nyelv nem az angol, a francia, vagy a német, akkor ezenkívül angolul, franciául vagy németül kell szövegezni.

Megjegyzés: *1. A helyes szállítási megnevezés kiegészítéseként a fuvarokmányban az áru kereskedelmi vagy műszaki megnevezése is megadható.*

2. A besorolás hivatkozási száma az osztályozási kódot a 3.3.1 szakasz 645 különleges előírása szerint jóváhagyó ADR Szerződő Félnek a nemzetközi forgalomban résztvevő gépjárművekre előírt államjelzéséből (XX⁴⁾) az illetékes hatóság azonosítójából (YY) és az egyedi sorozatszámából (ZZZZ) áll. A besorolási hivatkozásra példák a következők:

*GB/HSE123456
D/BAM1234*

5.4.1.2.2 *Kiegészítő előírások a 2 osztályra*

- a) A keverékek (lásd a 2.2.2.1.1 pontot) rögzített és leszerelhető tartányokban, mobil tartányokban, tankkonténerekben, battériás jármű vagy MEG-konténerek elemeiben történő szállításánál a keverék összetételét térf%-ban vagy tömeg%-ban meg kell adni. Az 1%-nál kevesebb alkotórészeket nem kell feltüntetni (lásd még a 3.1.2.8.1.2 pontot is). Nem szükséges megadni a keverék összetételét, ha az 581, 582 vagy 583 különleges előírás által engedélyezett műszaki megnevezést használják a helyes szállítási megnevezés kiegészítéseként.
- b) Palackok, nagypalackok, gázhordók, mélyhűtő tartályok és palackkötegek 4.1.6.10 bekezdés feltételei szerinti szállításánál a fuvarokmányba a következő bejegyzést kell tenni:
„A 4.1.6.10 bekezdés szerinti szállítás”.

5.4.1.2.3 *Kiegészítő előírások a 4.1 osztály önreaktív anyagaina és az 5.2 osztály szerves peroxidjaira*

- 5.4.1.2.3.1** A 4.1 osztály önreaktív anyagainál és az 5.2 osztály szerves peroxidjainál, amelyek a szállítás alatt hőmérséklet-szabályozást igényelnek (önreaktív anyagokra lásd a 2.2.41.1.17 pontot; szerves peroxidokra lásd a 2.2.52.1.15 - 2.2.52.1.17 pontot), a szabályozási és a vész-hőmérsékleteket fel kell tüntetni a fuvarokmányban a következők szerint:
„Szabályozási hőmérséklet: ... °C, Vészhőmérséklet: ... °C”.

4) A Közúti Közlekedésről szóló Bécsi Egyezmény (1968) által előírt, a nemzetközi forgalomban résztvevő gépjárművek államjelzése.

- 5.4.1.2.3.2** A 4.1 osztály egyes önreaktív anyagaihoz és az 5.2 osztály egyes szerves peroxidjaihoz, amelyeknél meghatározott csomagolás esetén az illetékes hatóság engedélye alapján 1 számú bárca nem szükséges (lásd az 5.2.2.1.9 pontot), a fuvarokmányba a következő bejegyzést kell tenni:
„1 számú veszélyességi bárca nem szükséges”.
- 5.4.1.2.3.3** Ha az önreaktív anyagokat és a szerves peroxidokat olyan feltételek mellett szállítják, amelyekhez jóváhagyás szükséges (az önreaktív anyagokra lásd a 2.2.41.1.13 és a 4.1.7.2.2 pontot; a szerves peroxidokra lásd a 2.2.52.1.8 és a 4.1.7.2.2 pontot, valamint a 6.8.4 szakasz TA2 különleges előírását), a fuvarokmányba erre utaló bejegyzést kell tenni, pl.:
„A 2.2.52.1.8 pont szerinti szállítás”.
 Az illetékes hatóság szállítási feltételeket tartalmazó jóváhagyásának másolatát a fuvarokmányhoz kell csatolni. Ezt a feladási ország valamelyik hivatalos nyelvén és ezenkívül, ha ez a nyelv nem az angol, a francia vagy a német, akkor angol, francia vagy német nyelven kell szövegezni, kivéve, ha a szállítás által érintett országok közötti megállapodások, ha ilyenek vannak, másként rendelkeznek.
- 5.4.1.2.3.4** Szerves peroxid minta (lásd a 2.2.52.1.9 pontot) vagy önreaktív anyag minta (lásd a 2.2.41.1.15 pontot) szállításánál erre a tényre utaló nyilatkozatot kell a fuvarokmányba bejegyezni, pl.:
„A 2.2.52.1.9 pont szerinti szállítás”.
- 5.4.1.2.3.5** G típusú önreaktív anyag szállításánál [lásd a „Vizsgálatok és kritériumok kézikönyv” II. Rész, 20.4.2.g) bekezdését] a következő nyilatkozat tehető a fuvarokmányba:
„Nem a 4.1 osztály önreaktív anyaga”.
 G típusú szerves peroxid szállításánál [lásd a „Vizsgálatok és kritériumok kézikönyv” II. Rész, 20.4.3.g) bekezdését] a következő nyilatkozat tehető a fuvarokmányba:
„Nem az 5.2 osztály anyaga”.
- 5.4.1.2.4** *Kiegészítő előírások a 6.2 osztályra*
 A címzettre vonatkozó információ [lásd az 5.4.1.1.1 h) pontot] kívül egy felelős személy nevét és telefonszámát is meg kell adni.
- 5.4.1.2.5** *Kiegészítő előírások a 7 osztályra*
- 5.4.1.2.5.1** Minden, a 7 osztály anyagát tartalmazó küldemény esetében a fuvarokmányban – értelemszerűen – a következő információt kell a megadott sorrendben, közvetlenül az 5.4.1.1.1 a) – c) és k) pontban előírt információkat követően feltüntetni:
- az egyes radionuklidok nevét vagy jelét, vagy radionuklidok keveréke esetében a megfelelő általános leírást vagy a sugárzás szempontjából meghatározó nuklidok felsorolását;
 - az anyagok fizikai és kémiai állapotának leírását vagy annak közlését, hogy különleges formájú radioaktív anyagról vagy kis mértékben diszpergálódó radioaktív anyagról van szó. A kémiai alakot illetően a fajtamegnevezés elegendő. A járulékos veszéllyel rendelkező radioaktív anyagra lásd a 3.3 fejezet 172 különleges előírása utolsó mondatát;
 - a radioaktív tartalom maximális aktivitását a szállítás során becquerelben (Bq) a megfelelő SI-prefixum jelével együtt (lásd az 1.2.2.1 bekezdést). Hasadóanyagoknál az aktivitás helyett a hasadóanyag (vagy keverékeknél az egyes hasadónuklidok) mennyisége is megadható grammban (g) vagy annak többszörösében;
 - a küldeménydarab kategóriáját, azaz I-FEHÉR, II-SÁRGA, III-SÁRGA;
 - a szállítási mutatószámot (csak a II-SÁRGA és a III-SÁRGA kategóriánál);

- f) hasadóanyagot tartalmazó küldeménynél, kivéve a 6.4.11.2 bekezdés értelmében engedélyes küldeményeket, a kritikussági biztonsági mutatószámot;
- g) amennyiben a feladáshoz szükséges, akkor az illetékes hatóság minden engedélyének (különleges formájú radioaktív anyagokra, kis mértékben diszpergálódó radioaktív anyagokra, külön megegyezésre, küldeménydarab-mintára vagy szállításra vonatkozó engedélyek) jelölő számát;
- h) az olyan küldeményeknél, amelyek egynél több küldeménydarabból állnak, az 5.4.1.1.1 pontban és az előző a) – g) pontban előírt információkat minden egyes küldeménydarabra meg kell adni. Részletesen meg kell adni az egyesítő-csomagolásban, konténerben, ill. járműben levő minden egyes küldeménydarab, ill. minden egyes egyesítő-csomagolás, konténer, ill. jármű tartalmát. Amennyiben az egyesítő-csomagolásból, konténerből, ill. járműből egyes küldeménydarabokat útközben kiraknak, a hozzájuk tartozó fuvarokmányokat mellékelni kell;
- i) amennyiben egy küldeményt kizárólagos használat mellett szállítanak, kiegészítésképpen a „**szállítás kizárólagos használat mellett**” megjegyzést;
- j) *LSA-II* vagy *LSA-III* anyagoknál és *SCO-I* vagy *SCO-II* tárgyakkal a küldeménydarab összes aktivitását az A_2 -érték többszörösében. Az olyan radioaktív anyagnál, amelyre az A_2 -érték nincs korlátozva, az A_2 -érték többszörösét nullának kell venni.

5.4.1.2.5.2

A feladónak a fuvarokmányban nyilatkoznia kell azokról az intézkedésekről, amelyeket esetleg a fuvarozónak kell megtennie. Ezt a nyilatkozatot olyan nyelven kell szövegezni, amelyet a fuvarozó vagy az illetékes hatóság szükségesnek tart, és a nyilatkozatnak legalább a következő információkat kell tartalmaznia:

- a) kiegészítő követelményeket a küldeménydarabok, egyesítő-csomagolások, konténerek, tartányok berakása, tárolása, szállítása, kezelése, kirakása során, beleértve a hőelvezetésre vonatkozó különleges tárolási előírásokat [lásd a 7.5.11 szakasz CV33 3.2) különleges előírását] vagy utalást, amelynek értelmében ilyen intézkedések nem szükségesek;
- b) a szállítási módra vagy a járműre vonatkozó korlátozásokat, és a szállítási útvonalra vonatkozó szükséges adatokat;
- c) a küldeményre vonatkozó veszélyhelyzeti utasításokat.

5.4.1.2.5.3

Az illetékes hatóság gyártási minta engedélyéhez, ill. szállítási engedélyéhez kötött küldeménydarabok bármely nemzetközi szállítása esetén, ha a szállításban érintett országokban különböző engedélytípusok szükségesek, az 5.4.1.1.1 pontban előírt UN számot és helyes szállítási megnevezést a gyártási minta származási országában kiadott engedélynek megfelelően kell megadni.

5.4.1.2.5.4

Az illetékes hatóság engedélyét nem kell feltétlenül a küldeményhez mellékelni. A feladónak azonban berakás és kirakás előtt a fuvarozó rendelkezésére kell bocsátania.

5.4.1.3

(fenntartva)

5.4.1.4

Az okmányok nyelvezete és formája

5.4.1.4.1

Más szállítási módra érvényes egyéb előírások által megkövetelt okmány is elfogadható, ha az 5.4.1.1 és az 5.4.1.2 bekezdésben előírt adatokat tartalmazza. Több címzett esetén a címzettek nevét, címét és a továbbított mennyiségeket a jármű vezetőfülkéjében tartandó más, használatos vagy speciális szabályzatok által megkövetelt okmányokba is be lehet jegyezni, ha ez lehetővé teszi a szállított áruk természetének és mennyiségének megállapítását bármely időpontban.

A fuvarokmányba bevezetendő bejegyzéseket a feladási ország valamelyik hivatalos nyelvén, és ezenkívül, ha ez a nyelv nem az angol, a francia vagy a német, akkor angol,

francia vagy német nyelven kell szövegezni, kivéve, ha a közúti szállításra vonatkozó nemzetközi díjszabások, ha vannak ilyenek, vagy a szállítás által érintett országok közötti megállapodások másként rendelkeznek.

5.4.1.4.2

Ha valamely rakomány a nagysága következtében egy szállítóegységbe teljes egészében nem rakható be, legalább annyi külön fuvarokmányt vagy egyetlen fuvarokmánynak annyi másolatát kell kiállítani, ahány szállítóegységbe rakták a rakományt. Ezenfelül minden esetben külön fuvarokmányt kell kiállítani azokra a küldeményekre vagy küldeményrészekre, amelyeket a 7.5.2 szakasz tiltó rendelkezései miatt nem szabad ugyanazon járműbe együvé rakni.

A szállítandó áru veszélyeire vonatkozó információkat (mint azt az 5.4.1.1 bekezdés tartalmazza) egyéb szokásos fuvarokmányba vagy árukísérő okmányba is be lehet jegyezni, vagy ezekkel kombinálni lehet. Az információ elrendezésének az okmányban (vagy elektronikus adatfeldolgozási (EDP) vagy elektronikus adatátviteli (EDI) technikák esetén a megfelelő adatok átviteli sorrendjének) meg kell felelnie az 5.4.1.1.1 pontban előírtaknak.

Ha a szokásos fuvarokmány vagy árukísérő okmány nem használható multimodális szállításnál veszélyes áru okmányként, akkor célszerű az 5.4.5 szakaszban példaként bemutatott okmány használata⁵⁾.

5.4.1.5

Nem veszélyes áruk

Ha a 3.2 fejezet „A” táblázatában név szerint említett áru nem esik az ADR hatálya alá, mivel a 2. rész értelmében nem tekinthető veszélyesnek, a feladó bejegyezheti a fuvarokmányba: „**Nem a(z) ... osztályba tartozó áru**”.

Megjegyzés: *Ez az előírás különösen akkor alkalmazható, ha a feladó úgy gondolja, hogy a szállítmányt útközben ellenőrizhetik a szállított áru (pl. oldat vagy keverék) kémiai tulajdonságai miatt, vagy amiatt, hogy az áru egyéb szabályok szerint veszélyesnek minősül.*

5) Amennyiben ezt használják, az ENSZ EGB-hez (UNECE) tartozó Elektronikus Kereskedelmi és Kereskedelem könnyítési Központ (UN/CEFACT) vonatkozó ajánlásai alkalmazhatók, különösen az 1. sz. Ajánlás (ENSZ kereskedelmi okmányok mintája) (ECE/TRADE/137, 81.3 kiadás), Az ENSZ kereskedelmi okmányok mintája – Alkalmazási útmutató (ECE/TRADE/270, 2002. évi kiadás) a 11. sz. Ajánlás (a veszélyes áruk nemzetközi szállítási okmányai) (ECE/TRADE/204, 96.1 kiadás – átdolgozás alatt) és a 22. sz. Ajánlás (A standard küldemény utasítások mintája) (ECE/TRADE/168, 1989. évi kiadás). Lásd még az UN/CEFACT A kereskedelem megkönnyítésére vonatkozó ajánlások összefoglalóját (ECE/TRADE/346, 2006. évi kiadás) és a ENSZ Kereskedelmi adat elemek jegyzékét (UNTDED) (ECE/TRADE/362, 2005. évi kiadás).

5.4.2 Nagykonténer, ill. jármű megrakási bizonyítvány

Ha a veszélyes áru nagykonténerben történő szállítását tengeri szállítás követi, a fuvarokmányhoz csatolni kell az IMDG Kódex⁶⁾ 5.4.2 szakasza szerinti konténer megrakási bizonyítványt⁷⁾.

Az 5.4.1 szakaszban előírt fuvarokmány és az előzőekben említett konténer megrakási bizonyítvány funkcióit egyetlen okmány is betöltheti. Ha több okmány van, egymáshoz kell azokat csatolni. Ha ezeket a funkciókat egyetlen okmány látja el, elegendő a fuvarokmányba tett azon nyilatkozat, hogy a konténer megrakása az alkalmazható alágazati előírások szerint történt, valamint a konténer megrakási bizonyítványért felelős személy megnevezése.

Megjegyzés: Mobil tartányokhoz, tankkonténerekhez és MEG- konténerekhez nem szükséges konténer megrakási bizonyítvány.

-
- 6) Az áruk szállítóegységbe történő rakodásához gyakorlati és oktatási irányelveket a Nemzetközi Tengerészeti Szervezet (IMO), a Nemzetközi Munkaügyi Szervezet (ILO) és az ENSZ Európai Gazdasági Bizottsága (UNECE) is kialakított, amelyeket az IMO jelentetett meg – (IMO/ILO/UNECE Guidelines for packing of cargo transport units (CTUs)).

- 7) Az IMDG Kódex 5.4.2 szakasza a következőket írja elő:

„5.4.2 Konténer/jármű megrakási bizonyítvány

5.4.2.1 Ha a veszélyes árut bármilyen konténerbe vagy járműbe rakják, a konténer vagy a jármű berakásáért felelősnek "konténer/jármű megrakási bizonyítvány"-t kell kiállítania, amely tartalmazza a konténer/jármű azonosító számát (számait) és tanúsítja, hogy az eljárást a következő feltételek szerint hajtották végre:

- .1 A konténer/jármű tiszta, száraz és az áru befogadására alkalmas volt;
- .2 Az együvé rakási szabályok szerint együvé nem rakható küldeménydarabokat nem rakták ugyanabba a konténerbe, járműbe, ill. járműre (kivéve, ha az érintett illetékes hatóság az (IMDG Kódex) 7.2.2.3 bekezdése alapján azt engedélyezte);
- .3 Minden küldeménydarabot külsőleg megvizsgáltak sérülés szempontjából, és csak hibátlan küldeménydarabokat raktak be;
- .4 A hordókat állítva rakták be, kivéve, ha az illetékes hatóság másként engedélyezte, és minden árut megfelelően raktak be, ill. szükség esetén a tervezett szállítás mód(ok)nak megfelelően rögzítő-eszközökkel rögzítettek;
- .5 Ha a veszélyes árut ömlesztve szállítják, az ömlesztve berakott áru egyenletesen el van terítve a konténerben/járműben;
- .6 Ha a küldemény az 1.4 alosztály kivételével 1 osztályba tartozó árut is tartalmaz, a konténer/jármű (az IMDG Kódex) 7.4.6 bekezdése értelmében szerkezetileg megfelelő;
- .7 A konténer/jármű és a benne levő küldeménydarabok megfelelően vannak feliratozva, bárcázva és nagybárcával jelölve;
- .8 Ha hűtés céljára szilárd szén-dioxidot (CO₂ - szárazjeget) használnak, a konténer/jármű szembetűnő helyen, pl. az ajtó felőli végén kívülről meg van jelölve vagy bárcázva a következő felirattal: „VESZÉLYES CO₂ GÁZT (SZÁRAZJEGET) TARTALMAZ, BELÉPÉS ELŐTT ALAPOSAN KI KELL SZELLŐZTETNI”; és
- .9 Az (IMDG Kódex) 5.4.1 szakaszában előírt veszélyes áru fuvarokmányokat a konténerbe/járműbe rakott minden egyes veszélyes áru küldeményre átadták.

Megjegyzés: A konténer/jármű megrakási bizonyítvány tartányokhoz nem szükséges.

5.4.2.2 A fuvarokmányban és a konténer/jármű megrakási bizonyítványban feltüntetendő információkat egyetlen okmányban is fel lehet tüntetni; ellenkező esetben az okmányokat egymáshoz kell csatolni. Ha az információkat egyetlen okmány tartalmazza, akkor az okmányban aláírt nyilatkozatnak kell szerepelni, miszerint „Kijelentem, hogy az áruk berakása a konténerbe/járműbe az alkalmazandó előírások szerint történt”. A nyilatkozatot dátummal kell ellátni és az okmányban az aláíró személyét is fel kell tüntetni. Sokszorosított (facsimile) aláírás is elfogadható, ha a vonatkozó jogszabályok, illetve előírások jogilag érvényesnek ismerik el sokszorosított aláírást.

5.4.2.3 Ha a konténer/jármű megrakási bizonyítványt a fuvarozó részére EDP vagy EDI technikák használatával adják, az aláírás(ok) elektronikus(ak) is lehet(nek) vagy az aláírás helyett megfelelő az aláírásra jogosult személy(ek) neve, nagybetűkkel írva.

5.4.2.4 Ha a fuvarozónak a konténer/jármű megrakási bizonyítványt EDP vagy EDI technikák használatával adják és az árut később olyan fuvarozónak adják át, akinek a fuvarokmányokra írásban (papíron) van szüksége, az (első) fuvarozónak gondoskodnia kell arról, hogy az okmányon feltüntessék az „eredetileg elektronikusan érkezett” bejegyzést és az aláíró nevét nagybetűkkel írva.”

5.4.3 Írásbeli utasítás

- 5.4.3.1** A szállítás során – esetlegesen – bekövetkező baleset vagy más veszélyhelyzet esetén szükséges teendőkhöz segítségként az 5.4.3.4 bekezdésben meghatározott formájú írásbeli utasítást kell a jármű vezetőfülkéjében, könnyen elérhető helyen tartani.
- 5.4.3.2** Az írásbeli utasítást a szállítónak (fuvarozónak) még az indulás előtt kell biztosítani a járműszemélyzet számára. Az írásbeli utasítást a jármű személyzet minden tagja részére olyan nyelven kell készíteni, amelyet ért és amelyen olvasni tud. A szállítónak (fuvarozónak) gondoskodnia kell arról, hogy az érintett személyzet minden tagja megértse az utasítást és az abban foglaltakat megfelelően végre tudja hajtani.
- 5.4.3.3** Indulás előtt a jármű személyzetének tájékozódnia kell a berakott veszélyes árurol és tanulmányoznia kell az írásbeli utasítást, hogy tudja, mi a teendője baleset vagy más veszélyhelyzet esetén.
- 5.4.3.4** Az írásbeli utasításnak a következő, négyoldalas mintának kell tartalmilag és formailag teljes mértékben megfelelnie.

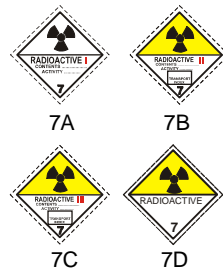

ADR SZERINTI ÍRÁSBELI UTASÍTÁS

Teendők baleset vagy más veszélyhelyzet esetén

A jármű személyzetének a szállítás során – esetlegesen – bekövetkező baleset vagy más veszélyhelyzet esetén – ha lehetséges és biztonságosan végrehajtható – a következőket kell tennie:

- Álljon meg a járművel, állítsa le a motort, ha van akkumulátortelep-főkapcsoló, áramtalanítson!
- Kerüljön minden gyújtóforrást, főleg ne dohányozzon és ne kapcsoljon be semmilyen elektromos berendezést!
- Értesítse a megfelelő beavatkozó, kárelhárító szolgálato(ka)t, adjon meg minden lehetséges felvilágosítást a balesetről, illetve a rendkívüli eseményről és az érintett veszélyes anyagról!
- Vegye fel a fényvisszaverő mellényt (ruházatot), és a megfelelő helyre állítsa fel a figyelmeztető jelzőket!
- Készítse elő a fuvarokmány(oka)t, hogy a beavatkozóknak azonnal átadhassa, ha megérkeznek!
- A kifolyt, kiszóródott anyagba ne lépjen bele és ne nyúljon hozzá, tartózkodjon a szél felőli oldalon, hogy a füstöt, a port, a gőzt vagy a párát nehogy belélegezze!
- Ha a gumibroncsnál, a fékberendezésnél vagy a motortérben kezdődő, kis mértékű tüzet észlel, kísérelje meg eloltani a tűzoltó készülékkel, de csak ha biztonságosan meg tudja tenni!
- A rakománytérben keletkező tűz oltását a jármű személyzetének tilos megkísérelnie!
- Ha biztonságosan megoldható, a járművön található eszközökkel próbálja megakadályozni, hogy az anyag a felszíni vizekbe, a talajba vagy a csatorna-hálózatba szivároгjon, illetve a kiömlött, kiszóródott anyagot próbálja felfogni!
- Húzódjon távolabbra a baleset vagy veszély helyszínétől, figyelmeztessen másokat is, hogy maradjanak távol, kövesse a beavatkozó, kárelhárító szolgálat(ok) utasításait, illetve tanácsait!
- Ha szennyeződött a ruhája, vegye le, és a szennyeződött védőeszközökkel együtt biztonságosan helyezze el!

Kiegészítő útmutatás a járműszemélyzet részére a veszélyes anyagok veszélyeinek jellemzőiről osztályonként, az adott körülményektől függő teendőkről		
Veszélyességi bárca, nagybárca	A veszély jellemzői	Kiegészítő útmutatás
(1)	(2)	(3)
Robbanóanyagok és -tárgyak   1 1.5 1.6	Többféle tulajdonság és hatás lehetséges, például: az egész tömeg felrobbanása; repeszdarabok kivetődése, szétröpülése; erőteljes égés vagy hőfejlődés; erős fény- vagy hanghatás; füst képződés. Rázkódásra, ütődésre, hőre érzékeny.	Húzódjon fedezékbe, de ablak közelébe ne menjen!
Robbanóanyagok és -tárgyak  1.4	Csekély tűz- és robbanásveszély.	Húzódjon fedezékbe!
Gyúlékony gázok   2.1	Tűzveszély. Robbanásveszély. A szállító edényzetben nagy nyomás lehet. Fulladás veszélye. Égési, fagyási sérülést okozhat. Hő hatására a szállító edényzet szétröbbranhat.	Húzódjon fedezékbe! Kerülje a mélyebben fekvő területeket!
Nem gyúlékony, nem mérgező gázok   2.2	Fulladás veszélye. A szállító edényzetben nagy nyomás lehet. Fagyási sérülést okozhat. Hő hatására a szállító edényzet szétröbbranhat.	Húzódjon fedezékbe! Kerülje a mélyebben fekvő területeket!
Mérgező gázok  2.3	Mérgezésveszély. A szállító edényzetben nagy nyomás lehet. Égési, fagyási sérülést okozhat. Hő hatására a szállító edényzet szétröbbranhat.	Használjon légzésvédő maszkot, (menekülőkármzsát)! Húzódjon fedezékbe! Kerülje a mélyebben fekvő területeket!
Gyúlékony folyékony anyagok   3	Tűzveszély. Robbanásveszély. Hő hatására a szállító edényzet szétröbbranhat.	Húzódjon fedezékbe! Kerülje a mélyebben fekvő területeket!
Gyúlékony szilárd anyagok, önreaktív anyagok és szilárd, érzéketlenített robbanóanyagok  4.1	Tűzveszély. Gyúlékony vagy éghető; hő, szikra vagy láng hatására meggyulladhat. Önreaktív anyagot tartalmazhat, ami hőfejlődéssel járó bomlásra hajlamos: hő hatására, vagy más anyagokkal (pl. savakkal, nehézfém vegyületekkel, aminosavakkal) érintkezve, vagy súrlódás vagy rázkódás hatására. Ilyenkor egészségre ártalmas vagy gyúlékony gázok, gőzök keletkezhetnek, illetve öngyulladás is bekövetkezhet. Hő hatására a szállító edényzet szétröbbranhat. Az érzéketlenített robbanóanyag felrobbanhat, ha csökken az érzéketlenítőszer mennyisége.	
Öngyulladásra hajlamos anyagok  4.2	Öngyulladás miatt tűzveszély áll fenn, ha a szállító edényzet megsérül vagy ha a tartalma kiömlik. Vízzel hevesen reagálhat.	
Vízzel érintkezve gyúlékony gázokat fejlesztő anyagok   4.3	Ha vízzel érintkezik, tűz- és robbanásveszélyes.	A kiömlött, kiszóródott anyagot óvni kell a nedvességtől, le kell takarni!

Veszélyességi bárca, nagybárca	A veszély jellemzői	Kiegészítő útmutatás
(1)	(2)	(3)
<p>Gyújtó hatású (oxidáló) anyagok</p>  <p>5.1</p>	<p>Ha gyúlékony vagy éghető anyaggal érintkezik, heves reakció, gyulladás és robbanás veszélye.</p>	<p>Ne keveredjen gyúlékony vagy éghető anyaggal (pl. fűrészporral)!</p>
<p>Szerves peroxidok</p>  <p>5.2</p>	<p>Hőfejlődéssel járó bomlás veszélye áll fenn: magas hőmérsékleten, vagy más anyagokkal (pl. savakkal, nehézfém vegyületekkel, aminosavakkal) érintkezve, vagy sűrűsödés vagy rázkódás hatására.</p> <p>Ilyenkor egészségre ártalmas vagy gyúlékony gázok, gőzök keletkezhetnek, illetve öngyulladás is bekövetkezhet.</p>	<p>Ne keveredjen gyúlékony vagy éghető anyaggal (pl. fűrészporral)!</p>
<p>Mérgező anyagok</p>  <p>6.1</p>	<p>Belégzés, lenyelés vagy bőrrel való érintkezés esetén mérgezés veszélye.</p> <p>Veszélyezteteti a vízi környezetet (a felszíni vizeket, a talajt) és a csatornahálózatot.</p>	<p>Használjon légzésvédő maszkot, (menekülőkármzsát)!</p>
<p>Fertőző anyagok</p>  <p>6.2</p>	<p>Fertőzés veszélye.</p> <p>Súlyos emberi vagy állati megbetegedést okozhat.</p> <p>Veszélyezteteti a vízi környezetet (a felszíni vizeket, a talajt) és a csatornahálózatot.</p>	
<p>Radioaktív anyagok</p>  <p>7A 7B 7C 7D</p>	<p>Külső és belső sugárterhelés veszélye.</p>	<p>A lehető legrövidebb ideig tartózkodjon a sugárzó anyagot tartalmazó rakomány közelében!</p>
<p>Hasadó anyagok</p>  <p>7E</p>	<p>Nukleáris láncreakció bekövetkezésének veszélye.</p>	
<p>Maró anyagok</p>  <p>8</p>	<p>A maró hatás miatt égési sérülést okozhat.</p> <p>Az ilyen anyagok egymással, vízzel vagy más anyagokkal hevesen reagálhatnak.</p> <p>A kiömlött anyag maró gőzöket fejleszthet.</p> <p>Veszélyezteteti a vízi környezetet (a felszíni vizeket, a talajt) és a csatornahálózatot.</p>	
<p>Különböző veszélyes anyagok és tárgyak</p>  <p>9</p>	<p>Égési sérülést okozhat.</p> <p>Tűzveszély.</p> <p>Robbanásveszély.</p> <p>Veszélyezteteti a vízi környezetet (a felszíni vizeket, a talajt) és a csatornahálózatot.</p>	

1. megjegyzés: Ha többféle veszélye van az anyagnak, vagy többféle anyag van a rakományban az összes rájuk vonatkozó leírást figyelembe kell venni.

2. megjegyzés: A táblázatban feltüntetett kiegészítő útmutatás a szállított anyag osztályának és a szállítóeszköznek megfelelően adaptálható.

Kiegészítő útmutatás a járműszemélyzet részére a veszélyes anyagok veszélyeinek jellemzőiről az alkalmazott jelölések szerint, az adott körülményektől függő teendőkről		
Jelölés	A veszély jellemzői	Kiegészítő útmutatás
(1)	(2)	(3)
 Környezetre veszélyes anyag	Veszélyezteteti a vízi környezetet (a felszíni vizeket, a talajt) és a csatornahálózatot.	
 Magas hőmérsékletű anyag	A magas hő égési sérülést okozhat.	Ne érjen hozzá a szállítóegység forró részeihez és a kiömlött anyaghoz!

Személyi védőeszközök és egyéb felszerelések
az általános tennivalók és az egyes veszélyek fennállása esetén teendők végrehajtásához, melyeket az ADR 8.1.5 szakasza szerint a szállítóegységen kell tartani

A következő felszerelést mindig a szállítóegységen kell tartani:

- minden járműre egy, a jármű legnagyobb megengedett össztömegének és a kerekek átmérőjének megfelelő méretű kerék kitámasztó éket;
- két, önmagában megálló figyelmeztető jelzőt;
- szemöblítő folyadékot^{a)}; valamint

a járműszemélyzet minden tagja részére:

- fényvisszaverő mellényt (ruházatot) (pl. az EN 471 szabványnak megfelelőt vagy azzal egyenértékűt);
- hordozható világítókészüléket;
- egy pár védőkesztyűt; valamint
- a szem védelmére alkalmas eszközt (pl. védőszemüveget).

Bizonyos osztályokhoz a következő kiegészítő felszerelés szükséges:

- a 2.3 vagy a 6.1 veszélyességi bárca, illetve nagybárca használata esetén a járműszemélyzet minden tagja részére légzésvédő maszk^{b)} (menekülő-kámzsa);
- lapát^{c)};
- csatornanyílás lefedésére alkalmas eszköz^{c)};
- gyűjtőedény^{c)}.

- a) Nem szükséges, ha csak az 1, 1.4, 1.5, 1.6, 2.1, 2.2 vagy 2.3 számú veszélyességi bárca, illetve nagybárca van a küldeményen.
- b) Például az EN 141 szabványnak megfelelő vagy azzal egyenértékű, A1B1E1K1-P1 vagy A2B2E2K2-P2 típusú, kombinált (gáz és részecske) szűrővel ellátott légzésvédő maszk (menekülőkámzsa).
- c) Csak szilárd és folyékony anyagoknál szükséges, ha a 3, 4.1, 4.3, 8 vagy 9 veszélyességi bárca, illetve nagybárca van a küldeményen.

5.4.4 A veszélyes áru szállítási információk megőrzése

5.4.4.1 A feladónak és a szállítónak, fuvarozónak az ADR-ben meghatározott veszélyes áru fuvarokmányt, kiegészítő információkat és okmányokat legalább három hónapig meg kell őrizniük

5.4.4.2 Ha az okmányokat elektronikusan vagy számítógéprendszerben tárolják, a feladónak és a szállítónak, fuvarozónak ki kell tudni nyomtatni.

5.4.5 Multimodális veszélyes áru nyomtatvány minta

Nyomtatvány minta, amely a veszélyes áruk multimodális szállításánál egyesített veszélyes áru nyilatkozatként és konténer megrakási bizonyítványként használható.

5.5.2.1.1 A gázosítószer hatása alatt álló áruszállító egységre (UN 3359), ha nem tartalmaz más veszélyes árut, csak az ADR e szakaszának előírásait kell alkalmazni.

Megjegyzés: E fejezet alkalmazásában áruszállító egység a jármű, a konténer, a tank-konténer, a mobil tartány és a MEG-konténer.

5.5.2.1.2 Ha egy gázosítószer hatása alatt álló áruszállító egységbe a gázosítószereken kívül más veszélyes árut is raknak, az erre az áruval vonatkozó minden ADR előírást (beleértve a nagybárcák használatára, a jelölésre és az okmányokra vonatkozókat is) be kell tartani e szakasz előírásain kívül.

5.5.2.1.3 Gázosítószer hatása alatt álló áru szállítására csak olyan áruszállító egység használható, amelyet úgy lehet lezárni, hogy a gáz kiszabadulása minimálisra csökken.

5.5.2.2 *Oktatás*

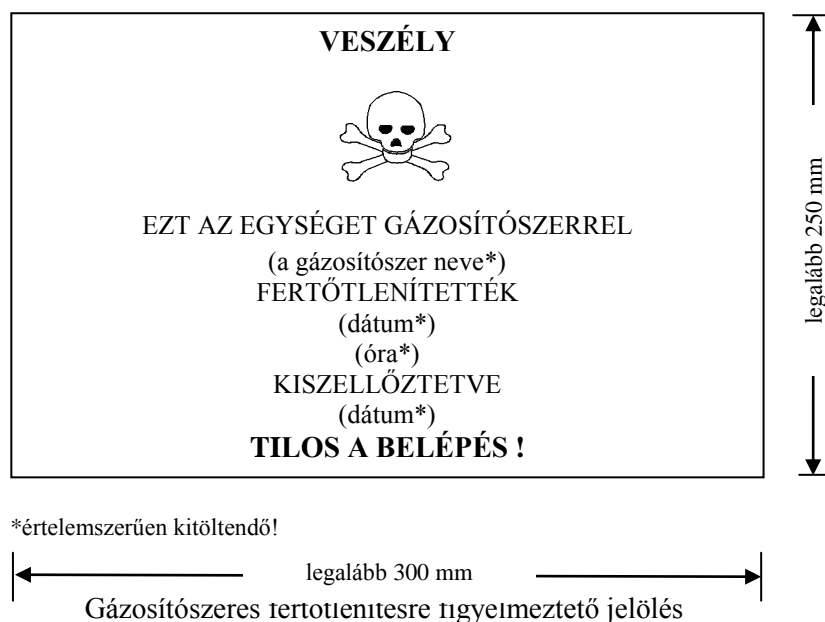

A gázosítószer hatása alatt álló áruszállító egységek kezelésével foglalkozó személyeket felelősségükkel arányban álló oktatásban kell részesíteni.

5.5.2.3 *Jelölés és nagybárcák alkalmazása*

5.5.2.3.1 A gázosítószer hatása alatt álló áruszállító egység minden hozzáférési pontjánál az 5.5.2.3.2 pontban meghatározott figyelmeztető jelölést kell elhelyezni, olyan helyzetben, hogy azt az áruszállító egységet kinyitó vagy a belsejébe belépő személy jól láthatja. A jelölésnek mindaddig rajta kell maradnia az áruszállító egységen, amíg a következő előírások nem teljesülnek:

- a) gázosítószer hatása alatt álló áruszállító egységet addig szellőztették, hogy már nincs benne gázosítószer ártalmas koncentrációban; és
- b) a gázosítószerezrel kezelt árut, ill. anyagot kirakodták.

5.5.2.3.2 A gázosítószerez fertőtlenítésre figyelmeztető jelölésnek téglalap alakúnak kell lennie és szélessége 300 mm-nél, magassága 250 mm-nél nem lehet kisebb. A jelölést fehér háttérre feketével kell felvinni, a betűk magassága nem lehet 25 mm-nél kisebb. A jelölést a következő ábra mutatja be.

- 5.5.2.3.3** Ha a gázosítószer hatása alatt álló áruszállító egységet a gázosítószeres kezelés után teljesen kiszellőztették akár az ajtók kinyitásával, akár gépi szellőztetéssel, a szellőztetés dátumát fel kell tüntetni a gázosítószeres fertőtlenítésre figyelmeztető jelölésen.
- 5.5.2.3.4** Ha a gázosítószer hatása alatt álló áruszállító egységet kiszellőztették és kirakták, a gázosítószeres fertőtlenítésre figyelmeztető jelölést el kell távolítani.
- 5.5.2.3.5** A gázosítószer hatása alatt álló áruszállító egységre csak akkor szabad 9 számú nagybárcát (lásd az 5.2.2.2.2 pontot) helyezni, ha az a benne lévő, valamely más, 9 osztályba tartozó anyag vagy tárgy miatt szükséges.
- 5.5.2.4** ***Okmányok***
- 5.5.2.4.1** A szállítás előtt nem teljesen kiszellőztetett, gázosítószer hatása alatt álló áruszállító egység szállítására vonatkozó okmánynak a következőket kell tartalmaznia.
- „UN 3359 gázosítószerrel kezelt egység, 9” vagy „UN 3359 gázosítószerrel kezelt egység, 9 osztály”;
 - a gázosítószeres kezelés dátumát és időpontját;
 - a használt gázosítószer típusát és mennyiségét.
- Ezeket az adatokat a feladási ország valamelyik hivatalos nyelvén és ha ez a nyelv nem az angol, a német vagy a francia, akkor angol, német vagy francia nyelven is fel kell tüntetni, kivéve, ha a szállítás által érintett országok közötti megállapodások, ha ilyenek vannak, másként rendelkeznek.
- 5.5.2.4.2** Az okmány bármilyen formájú lehet, feltéve, hogy könnyen azonosítható, jól olvasható és tartós módon tartalmazza az 5.5.2.4.1 pont szerinti adatokat.
- 5.5.2.4.3** Az esetleges visszamaradó gázosítószer és a gázosítóeszköz (ha ilyen van) ártalmatlanítására vonatkozóan utasításokat kell adni.
- 5.5.2.4.4** Nem szükséges okmány, ha a gázosítószer hatása alatt álló áruszállító egységet teljesen kiszellőztették és a szellőztetés dátumát a gázosítószeres fertőtlenítésre figyelmeztető jelölésen feltüntették. (Lásd az 5.5.2.3.3 és az 5.5.2.3.4 pontot.)

- 5.5.3 Különleges előírások az olyan küldeménydarabokra, járművekre és konténerekre, amelyekben hűtés vagy kondicionálás céljára használva fojtó hatású anyagok vannak (pl. szárazjég – UN 1845; mélyhűtött, cseppfolyósított nitrogén – UN 1977; mélyhűtött, cseppfolyósított argon – UN 1951)**
- 5.5.3.1 *Alkalmazási terület***
- 5.5.3.1.1** Nem vonatkozik ez a szakasz arra az esetre, ha a hűtésre vagy kondicionálásra használható anyagokat, mint veszélyes áru küldeményt szállítják, amikor is az anyagot a 3.2 fejezet „A” táblázat megfelelő tétele alatt, a hozzá tartozó szállítási feltételekkel kell szállítani.
- 5.5.3.1.2** Nem vonatkozik ez a szakasz a hűtőkörökben lévő gázokra.
- 5.5.3.1.3** A tartányok és MEG-konténerek hűtésére vagy kondicionálására használt veszélyes áruk nem tartoznak e szakasz előírásainak hatálya alá.
- 5.5.3.2 *Általános előírások***
- 5.5.3.2.1** A szállítás közbeni hűtésre vagy kondicionálásra szolgáló anyagokat (kivéve a gázosítószereket) tartalmazó járművek és konténerek e szakasz előírásain kívül nem tartoznak az ADR más előírásainak hatálya alá.
- 5.5.3.2.2** Ha a hűtött vagy kondicionált járműbe vagy konténerbe veszélyes árut raknak, e szakasz előírásain kívül a berakott anyagra vonatkozó ADR előírásokat is be kell tartani.
- 5.5.3.2.3** (fenntartva)
- 5.5.3.2.4** A hűtött vagy kondicionált járművek vagy konténerek kezelésével vagy szállításával foglalkozó személyeket felelőségükkel arányban álló oktatásban kell részesíteni.
- 5.5.3.3 *Hűtő vagy kondicionáló közeget tartalmazó küldeménydarabok***
- 5.5.3.3.1** Azokra a hűtést vagy kondicionálást igénylő anyagokra, amelyekhez a P203, P620, P650, P800, P901 és P904 csomagolási utasítás van rendelve, az adott csomagolási utasítás előírásait kell betartani.
- 5.5.3.3.2** Azoknál a hűtést vagy kondicionálást igénylő anyagoknál, amelyekhez más csomagolási utasítás van rendelve, a küldeménydarabnak alkalmasnak kell lennie a nagyon alacsony hőmérsékletek elviselésére, és a hűtő, ill. kondicionáló közeg nem támadhatja meg, sem lényegesen nem gyengítheti. A küldeménydarabot úgy kell tervezni és kialakítani, hogy lehetőség legyen a gáz távozására, és így megakadályozza a nyomás növekedést, ami a csomagolóeszköz törését okozná. A veszélyes árut úgy kell becsomagolni, hogy a hűtő, ill. kondicionáló közeg átalakulása után se mozduljon el.
- 5.5.3.3.3** A hűtő, ill. kondicionáló közeget tartalmazó küldeménydarabokat jól szellőző járműben, ill. konténerben szállíthatók.
- 5.5.3.4 *Hűtő vagy kondicionáló közeget tartalmazó küldeménydarabok jelölése***
- 5.5.3.4.1** Azokon a küldeménydarabokon, amelyek hűtő, ill. kondicionáló közegként használt veszélyes árut tartalmaznak, e veszélyes áru 3.2 fejezet „A” táblázat (2) oszlopában szereplő megnevezését, valamint utána a „HŰTŐKÖZEGKÉNT”, ill. „KONDITIONÁLÓ KÖZEGKÉNT” szavakat kell feltüntetni a feladási ország valamelyik hivatalos nyelvén, és ha ez nem angol, francia vagy német, akkor ezenkívül angolul, franciául vagy németül is, hacsak a szállításban érintett országok közötti megállapodások másként nem rendelkeznek.

5.5.3.4.2 A jelölésnek jól olvashatónak és tartósnak kell lennie, valamint úgy kell elhelyezni és a küldeménydarab méretéhez viszonyítva akkorának kell lennie, hogy jól látható legyen.

5.5.3.5 *Csomagolás nélküli szárazjeget tartalmazó járművek és konténerek*

5.5.3.5.1 Ha csomagolás nélküli szárazjeget használnak, nem érintkezhet közvetlenül a jármű, ill. a konténer fém szerkezeti elemeivel, hogy elkerüljék a fém ridegedését. A szárazjég és a jármű, ill. a konténer közötti megfelelő szigetelés céljából legalább 30 mm távolságot kell biztosítani (pl. rossz hővezető képességű anyag, deszka, raklap, stb. alkalmazásával).

5.5.3.5.2 Ha a szárazjeget küldeménydarab köré rakják, biztosítani kell, hogy a szállítás során a küldeménydarab a szárazjég átalakulása után is az eredeti helyzetében maradjon.

5.5.3.6 *A járművek és konténerek jelölése*

5.5.3.6.1 Azokon a járműveken és konténereken, amelyek hűtő, ill. kondicionáló közegként használt veszélyes árut tartalmaznak minden hozzáférési pontjuknál az 5.5.3.6.2 pontban meghatározott figyelmeztető jelölést kell elhelyezni, olyan helyzetben, hogy azt a járművet, ill. konténert kinyitó vagy a belsejébe belépő személy jól láthatja. A jelölésnek mindaddig rajta kell maradnia a járművön, ill. konténeren, amíg a következő előírások nem teljesülnek:

- a) a járművet, ill. konténert addig szellőztették, hogy már nincs benne hűtő, ill. kondicionáló közeg ártalmas koncentrációban; és
- b) a hűtött vagy kondicionált árut kirakodták.

5.5.3.6.2 A figyelmeztető jelölésnek téglalap alakúnak kell lennie és szélessége 150 mm-nél, magassága 250 mm-nél nem lehet kisebb. A jelölésen a következőknek kell szerepelnie:

- a) a „FIGYELEM” szónak, legalább 25 mm magasságú, piros vagy fehér betűkkel a feladási ország valamelyik hivatalos nyelvén, és ha ez nem angol, francia vagy német, akkor ezenkívül angolul, franciául vagy németül is, hacsak a szállításban érintett országok közötti megállapodások másként nem rendelkeznek; és
- b) a jelkép alatt, fehér alapon, legalább 25 mm magasságú fekete betűkkel a 3.2 fejezet „A” táblázat (2) oszlopában szereplő megnevezésének, valamint utána a „HŰTŐ-KÖZEGKÉNT”, ill. „KONDICIONÁLÓ KÖZEGKÉNT” szavaknak a feladási ország valamelyik hivatalos nyelvén, és ha ez nem angol, francia vagy német, akkor ezenkívül angolul, franciául vagy németül is, hacsak a szállításban érintett országok közötti megállapodások másként nem rendelkeznek.

Például: SZÉN-DIOXID, SZILÁRD, HŰTŐKÖZEGKÉNT

A jelölés a következő ábrán látható:

* Ide kell írni a 3.2 fejezet „A” táblázat (2) oszlopában szereplő megnevezést, valamint utána a „HŰTŐKÖZEGKÉNT”, ill. „KONDITIONÁLÓ KÖZEGKÉNT” szavakat.

5.5.3.7 *Okmányok*

5.5.3.7.1 A előzőleg hűtött vagy kondicionált és a szállítás előtt nem teljesen kiszellőztetett járművek és konténerek szállítására vonatkozó okmányoknak (pl. hajóraklevél, rakományjegyzék, CMR vagy CIM fuvarlevél) a következőket kell tartalmazniuk:

- a) az UN számot, ami elé az „UN” betűket kell írni; és
- b) a 3.2 fejezet „A” táblázat (2) oszlopában szereplő megnevezést, valamint utána a „HŰTŐKÖZEGKÉNT”, ill. „KONDITIONÁLÓ KÖZEGKÉNT” szavakat a feladási ország valamelyik hivatalos nyelvén, és ha ez nem angol, francia vagy német, akkor ezen kívül angolul, franciául vagy németül is, hacsak a szállításban érintett országok közötti megállapodások másként nem rendelkeznek.

Például: UN 1845, SZÉN-DIOXID, SZILÁRD, HŰTŐKÖZEGKÉNT

5.5.3.7.2 A fuvarokmány bármilyen formájú lehet, feltéve, hogy könnyen azonosítható, jól olvasható és tartós módon tartalmazza az 5.5.3.7.1 pont szerinti adatokat.

6. RÉSZ

**A CSOMAGOLÓESZKÖZÖK, A NAGYMÉRETŰ
CSOMAGOLÓESZKÖZÖK (IBC-k),
A NAGYCSOMAGOLÁSOK, A TARTÁNYOK ÉS
AZ ÖMLESZTETTÁRU-KONTÉNEREK
GYÁRTÁSÁRA ÉS VIZSGÁLATÁRA
VONATKOZÓ ELŐÍRÁSOK**

6.1 FEJEZET

A CSOMAGOLÓESZKÖZÖK GYÁRTÁSÁRA ÉS VIZSGÁLATÁRA VONATKOZÓ ELŐÍRÁSOK

6.1.1 Általános előírások

6.1.1.1 Ezen fejezet követelményeit nem kell alkalmazni:

- a) a 7 osztály radioaktív anyagait tartalmazó küldeménydarabokra, hacsak nincs más előírva (lásd a 4.1.9 szakaszt);
- b) a 6.2 osztály fertőző anyagait tartalmazó küldeménydarabokra, hacsak nincs más előírva (lásd a 6.3 fejezethez fűzött megjegyzést és a 4.1.4.1 bekezdés P621 csomagolási utasítását);
- c) a 2 osztály gázait tartalmazó nyomástartó tartályokra;
- d) azokra a küldeménydarabokra, amelyek nettó tömege meghaladja a 400 kg-ot;
- e) azokra a csomagolóeszközökre, amelyek űrtartalma meghaladja a 450 litert.

6.1.1.2 A 6.1.4 szakaszban levő csomagolási előírások a jelenleg használt csomagolásokon alapulnak. A tudományos és műszaki haladás figyelembevételének érdekében a 6.1.4 szakaszban található csomagolóeszközöktől eltérő jellemzőjű csomagolóeszközök is használhatók, amennyiben ezek ugyanolyan hatékonyságúak, az illetékes hatóság által elfogadhatók és képesek sikeresen elviselni a 6.1.1.3 bekezdésben és a 6.1.5 szakaszban leírt próbákat. Az ebben a fejezetben leírtaktól eltérő vizsgálati módszerek is használhatók, amennyiben egyenértékűek és az illetékes hatóság elfogadja.

6.1.1.3 A folyékony anyagokhoz szánt minden csomagolóeszköznek sikeresen ki kell állnia a megfelelő tömörségi próbát, és a 6.1.5.4.3 pont szerinti megfelelő vizsgálati szintet teljesítenie kell a következők szerint:

- a) a szállításhoz történő első használat előtt;
- b) felújítás vagy átalakítás után, mielőtt szállításhoz újból felhasználnák.

Ehhez a vizsgálathoz a csomagolóeszközt nem kell saját zárószerkezetével ellátni.

Az összetett csomagolóeszköz belső tartálya a külső csomagolóeszköz nélkül is vizsgálható, ha ez a vizsgálati eredményeket nem befolyásolja.

Erre a vizsgálatra nincs szükség:

- a kombinált csomagolások belső csomagolásainál;
- a 6.1.3.1 a) ii) pont szerint „RID/ADR” jellel ellátott, összetett (üveg, porcelán és kőanyag) csomagolóeszközök belső tartályainál;
- a 6.1.3.1 a) ii) pont szerint „RID/ADR” jellel ellátott, finomlemez csomagolóeszközöknél.

6.1.1.4 A csomagolóeszközöket az illetékes hatóság szerint megfelelő minőségbiztosítási program alapján kell gyártani, felújítani és vizsgálni annak biztosítására, hogy minden egyes csomagolóeszköz kielégítse a jelen fejezet követelményeit.

Megjegyzés: Az alkalmazható eljárás(ok)ra megfelelő útmutatást ad az ISO 16106:2006 szabvány: „Csomagolás. Veszélyes áruk szállítási csomagolása. Veszélyes áruk csomagolásai, közepes méretű szállítótartályok (IBC-k) és nagyméretű csomagolások. Útmutató az ISO 9001 alkalmazásához”.

6.1.1.5 A csomagolóeszköz gyártójának és forgalmazójának információt kell nyújtania a követendő eljárásokra és a zárószerkezetek (beleértve a szükséges tömítéseket) típusára és méreteire és minden más alkatrészre, ami annak biztosításához szükséges, hogy a szállításra előkészített

küldeménydarab képes legyen az e fejezet vonatkozó igénybevételi próbáinak elviselésére.

6.1.2 A csomagolóeszközök típusát jelölő kód

6.1.2.1 A kód a következő elemekből áll:

- a) egy arab számjegy, amely a csomagolóeszköz fajtáját jelzi, pl. hordó, kanna stb.; ezt követi:
- b) egy vagy több latin nagybetű, amely az anyagot jelzi, pl. acél, fa stb.; ezt követi szükség esetén:
- c) egy arab számjegy, amely a csomagolóeszköz kategóriáját jelzi azon a típuson belül, amelyhez tartozik.

6.1.2.2 Összetett csomagolóeszközök esetén a kódban a második helyen két latin nagybetűt kell használni. Az első jelzi a belső tartály anyagát, míg a második a külső csomagolóeszközét.

6.1.2.3 Kombinált csomagolások esetén csak a külső csomagolóeszköz kódszámát kell használni.

6.1.2.4 A csomagolási kódot egy „T”, „V” vagy „W” betű követheti. A „T” betű a 6.1.5.1.11 pont előírásainak megfelelő kármentő csomagolásra utal. A „V” betű a 6.1.5.1.7 pont előírásainak megfelelő különleges csomagolóeszközre utal. A „W” betű azt jelenti, hogy a csomagolóeszköz, bár a kód által jelzett típus alá tartozik, de a 6.1.4 szakaszban előírtaktól eltérően gyártották, és a 6.1.1.2 bekezdés előírásai értelmében egyenértékűnek tekinthető.

6.1.2.5 A következő számjegyek jelzik a csomagolóeszköz fajtáját:

- 1 Hordó
- 2 (fenntartva)
- 3 Kanna
- 4 Láda
- 5 Zsák
- 6 Összetett csomagolóeszköz
- 7 (fenntartva)
- 0 Finomlemez csomagolóeszközök

6.1.2.6 A következő nagybetűk jelzik az anyagot:

- A Acél (bármilyen minőségű vagy felületkezelésű)
- B Alumínium
- C Fa
- D Rétegelt falemez
- F Farostlemez
- G Papírlemez
- H Műanyag
- L Textil
- M Papír, többrétegű
- N Fém (acélt és alumíniumot kivéve)
- P Üveg, porcelán vagy kőagyag.

Megjegyzés: A „műanyag” az egyéb polimer anyagokat, mint pl. a gumit is jelenti.

6.1.2.7

A következő táblázat tartalmazza azokat a kódokat, amelyek az egyes csomagolóeszköz típusok jelölésére szolgálnak, a csomagolóeszköz fajtája, a gyártáshoz használt anyag és a kategória függvényében; utalás található a bekezdésre is, amelyben a megfelelő előírások találhatók:

Fajta	Anyag	Kategória	Kódjel	Bekezdés
1 Hordó	A Acél	nem levehető tetővel	1A1	6.1.4.1
		levehető tetővel	1A2	
	B Alumínium	nem levehető tetővel	1B1	6.1.4.2
		levehető tetővel	1B2	
	D Rétegelt falemez		1D	6.1.4.5

		külső tömör műanyag csomagolóeszközzel	6PH2	6.1.4.20
7 (fenntartva)				
0 Finomlemez csomagolóeszköz	A Acél	nem levehető tetővel	0A1	6.1.4.22
		levehető tetővel	0A2	

6.1.3 Jelölés

Megjegyzés: 1. A jelölés arra utal, hogy a csomagolóeszköz, amelyen a jelölés van, megfelel a sikeresen bevizsgált gyártási típusnak és megfelel a jelen fejezet előírásainak, amelyek a csomagolóeszköz gyártására, nem pedig annak használatára vonatkoznak. Ezért a jelölés önmagában nem szükségszerűen igazolja, hogy a csomagolóeszköz valamely anyaghoz használható; általában az egyes anyagokra nézve a csomagolóeszköz fajtája (pl. acélhordó), legnagyobb úrtartalma és/vagy tömege és az esetleges különleges előírások a 3.2 fejezet „A” táblázatában vannak meghatározva.

2. A jelölésnek az a célja, hogy megkönnyítse a csomagolóeszköz gyártók, felhívók és felhasználók, a szállítást/fuvarozást végzők és a szabályozó hatóságok feladatainak teljesítését. Valamely új csomagolóeszköz használatánál az eredeti jelölés eszköz a gyártó(k) részéről a típus azonosítására és a kiállt teljesítményvizsgálatok feltüntetésére.

3. A jelölés nem mindig ad teljes felvilágosítást a vizsgálati szintekről és egyéb részletekről, holott szükséges lehet ezek figyelembe vétele is, ezeknek a vizsgálati jegyzőkönyvben, jelentésekben vagy a vizsgálatokat sikeresen kiállt csomagolóeszközök nyilvántartásában kell utána nézni. Pl. egy X vagy Y jelű csomagolóeszköz nagyobb relatív sűrűség (d)¹⁾, de kisebb veszélyességi csomagolási csoportba sorolt anyaghoz is használható, ha a legnagyobb megengedhető relatív sűrűségnél figyelembe veszik a csomagolóeszközök vizsgálatára vonatkozó 6.1.5 szakasz előírásai között jelzett 1,5-es és 2,25-os tényezőt. Tehát egy I csomagolási csoportban 1,2

1) A relatív sűrűség (d) kifejezés a „sűrűség” szinonimájának tekinthető, a szövegezés végig ilyen értelemben használja.

relatív sűrűségű anyagra vizsgált csomagolóeszköz használható II csomagolási csoportba tartozó, 1,8 relatív sűrűségű anyaghoz, illetve III csomagolási csoportba tartozó, 2,7 relatív sűrűségű anyaghoz, feltéve, hogy minden kritérium teljesül a nagyobb sűrűségű anyaggal is.

6.1.3.1

Minden csomagolóeszközön, amelyet az ADR szerinti használatra szánnak, rajta kell lenni a jelölésnek, amely tartós, jól látható, olyan helyen van és a csomagolóeszközhöz képest olyan méretű, hogy könnyen olvasható legyen. A 30 kg bruttó tömeget meghaladó küldemény-daraboknál a jelölést vagy annak megismétlését a csomagolóeszköz tetejére vagy egyik oldalára kell felvinni. A betűknek, számoknak és szimbólumoknak legalább 12 mm magasnak kell lenniük, kivéve a 30 liter vagy 30 kg, ill. annál kisebb csomagolóeszközöket, amelyeken legalább 6 mm magasnak kell lenniük és az 5 liter vagy 5 kg, ill. annál kisebb csomagolóeszközöket, ahol megfelelő méretűnek kell lenniük.

A jelölés a következőből áll:

- a) i) az Egyesült Nemzetek jele a csomagolóeszközön:

Ezt a jelet csak annak tanúsítására szabad használni, hogy a csomagolóeszköz, a mobil tartány, ill. a MEG-konténer megfelel a 6.1, a 6.2, a 6.3, a 6.5, a 6.6, ill. a 6.7²⁾ fejezetben található vonatkozó előírásoknak. Ez a jel nem használható azokon a csomagolóeszközökön, amelyek a 6.1.1.3, 6.1.5.3.1 e), 6.1.5.3.5 c), 6.1.5.4, 6.1.5.5.1 és 6.1.5.6 bekezdés, ill. pont egyszerűsített feltételeinek felelnek meg [lásd a következő ii) alpontot is]. Amennyiben a jelölést beütéssel viszik fel a fém csomagolóeszközökre, e jel helyett az „UN” nagybetűk is használhatók;

- ii) „RID/ADR” jel az összetett (üveg, porcelán vagy kőagyag) csomagoló-eszközökön és finomlemez csomagolóeszközökön, amelyek egyszerűsített feltételeknek felelnek meg [lásd a 6.1.1.3, 6.1.5.3.1 e), 6.1.5.3.5 c), 6.1.5.4, 6.1.5.5.1 és 6.1.5.6 bekezdést, ill. pontot];

Megjegyzés: Az ilyen jellel ellátott csomagolóeszközök a RID, az ADR, ill. az ADN hatálya alá tartozó, vasúti, közúti, ill. belvízi szállításra vannak jóváhagyva. Használatuk a többi közlekedési alágazatra, ill. a más szabályzatok hatálya alá tartozó vasúti, közúti, ill. belvízi szállításra nem feltétlenül megengedett.

- b) a csomagolóeszköz típusát a 6.1.2 szakasz szerint jelölő kód;

- c) két részből álló kódszám:

- i) egy betű a csomagolási csoport(ok) jelölésére, amely(ek)re a gyártási típus kiállta a vizsgálatot:

X az I, a II és a III csomagolási csoporthoz;

Y a II és a III csomagolási csoporthoz;

Z csak a III csomagolási csoporthoz;

- ii) belső csomagolóeszköz nélküli csomagolóeszközökön, amelyek folyékony anyagok szállítására szolgálnak és a folyadéknomás-próbát sikeresen kiállták, a relatív sűrűség megjelölése egy tizedesre kerekítve, amelyre a gyártási típust vizsgálták; ez a jelölés elhagyható, ha ez a relatív sűrűség 1,2-nél nem nagyobb. Szilárd anyagok szállítására szolgáló csomagolóeszközökön vagy belső csomagolóeszközöket tartalmazó csomagolóeszközökön a legnagyobb össztömeg megjelölése kg-ban;

finomlemez csomagolóeszközöknél, amelyek a 6.1.3.1 a) ii) pont szerint „RID/ADR” jellel vannak ellátva és 23 °C-on 200 mm²/s-nál nagyobb viszkozitású anyagok befogadására szolgálnak, a legnagyobb össztömeg megjelölése kg-

2) Ezt a jelet használják annak tanúsítására is, hogy az olyan hajlékony ömlesztettáru-konténerek, amelyeket más közlekedési alágazatra hagytak jóvá, megfelelnek az ENSZ Minta Szabályzat 6.8 fejezete követelményeinek.

ban;

- d) vagy egy „S” betű, ha a csomagolóeszköz szilárd anyagok szállítására vagy belső csomagolások befogadására szolgál,
- vagy folyékony anyagok szállítására használt olyan csomagolóeszköze (kivéve a kombinált csomagolást), amely a folyadéknomás-próbát sikeresen kiállta, a próbanyomás értéke kPa-ban, a legközelebbi 10 kPa-ra lefelé kerekítve;
- finomlemez csomagolóeszközöknél, amelyek a 6.1.3.1 a) ii) pont szerint „RID/ADR” jellel vannak ellátva és 23 °C-on 200 mm²/s-nál nagyobb viszkozitású anyagok befogadására szolgálnak, egy „S” betű;
- e) a csomagolóeszköz gyártási éve (az utolsó két számjegy). Az 1H és 3H típusú csomagolóeszközökön ezenkívül a gyártási hónap is, amelyet a többi megjelöléstől eltérő helyen is fel lehet tüntetni. Erre a célra használható a következő jel:

- f) annak az államnak a jele, amely a jelölés alkalmazását engedélyezte a nemzetközi forgalomban résztvevő gépjárművek államjelzésével³⁾;
- g) a gyártó neve vagy a csomagolóeszköznek az illetékes hatóság által megállapított egyéb azonosító jele.

6.1.3.2

A 6.1.3.1 bekezdésben előírt tartós jelöléseken kívül minden, 100 liternél nagyobb űrtartalmú, új fémhordót el kell látni a fenékén a 6.1.3.1 a) – e) pont alatti jelölésekkel, feltüntetve legalább a palásthoz használt fém legkisebb névleges vastagságát is (mm-ben, 0,1 mm pontossággal) maradandóan (pl. beütéssel). Ha a fémhordó tetejének vagy fenékének névleges vastagsága kisebb, mint a palásté, akkor a tető, a palást és a fenék névleges vastagságát kell a fenéken maradandóan feltüntetni (pl. beütéssel), pl. „1.0-1.2-1.0” vagy „0.9-1.0-1.0”. A fém névleges vastagságát a megfelelő ISO szabvány (pl. ISO 3574:1999 acélra) szerint kell meghatározni. A 6.1.3.1 f) és g) pont alatti jelöléseket nem szabad maradandóan felvinni, kivéve, ha a 6.1.3.5 bekezdésben másként van előírva.

6.1.3.3

Minden felújítható csomagolóeszköze, a 6.1.3.2 bekezdésben említettek kivételével, a 6.1.3.1 a) – e) bekezdésben meghatározott jelölést maradandóan kell felvinni. A jelölés akkor maradandó, ha képes elviselni a felújítási eljárást (pl. beütéssel felvitt jelölés). A 100 liternél nagyobb űrtartalmú fémhordók kivételével a többi csomagolóeszközöknél ez a maradandó jelölés helyettesítheti a 6.1.3.1 bekezdésben előírt tartós jelöléseket.

6.1.3.4

Az átalakított hordóknál, ha a csomagolóeszköz típusa nem változik és nem történik lényeges szerkezeti elem csere vagy eltávolítás, az előírt jelölésnek nem kell maradandónak lennie (pl. beütötnék). Minden más átalakított fémhordót el kell látni a tetején vagy az oldalán maradandóan (pl. beütéssel) a 6.1.3.1 a) – e) pont szerinti jelölésekkel.

6.1.3.5

Az ismételt újrahasználatra szánt anyagból (pl. rozsdamentes acélból) gyártott fémhordókon a 6.1.3.1 f) és g) pont szerinti jelölések maradandóan (pl. beütéssel) is felvihetők.

6.1.3.6

A 6.1.3.1 bekezdés szerinti jelölés csak egy gyártási típusra vagy típusorozatra érvényes. Különböző felületi kezelésű csomagolóeszközök ugyanazon gyártási típus alá tartozhatnak.

Gyártási típus sorozaton azonos szerkezetű, azonos falvastagságú, azonos anyagból gyártott

3) A közúti közlekedésről szóló Bécsi Egyezmény (Bécs, 1968) által előírt államjelzés a nemzetközi forgalomban résztvevő gépjárművekre.

és azonos keresztmetszetű csomagolóeszközöket kell érteni, amelyek a jóváhagyott gyártási típustól csak annyiban térnek el, hogy szerkezeti magasságuk kisebb.

A tartályok zárószervezetének olyannak kell lennie, hogy azt a vizsgálati jelentésben említettekkel azonosítani lehessen.

6.1.3.7 A jelölést a 6.1.3.1 bekezdés pontjai szerinti sorrendben kell felvinni; az ezekben a pontokban és adott esetben a 6.1.3.8 bekezdés h) – j) pontjában előírt jelölés elemeket egyértelműen el kell választani egymástól, pl. ferde vonallal vagy szóközzel, hogy könnyen azonosíthatók legyenek. Példaként lásd a 6.1.3.11 bekezdést.

Az illetékes hatóság által engedélyezett kiegészítő jelölések nem zavarhatják a 6.1.3.1 bekezdés szerinti jelölés részek pontos azonosíthatóságát.

6.1.3.8 Aki a csomagolóeszközt felújítja, köteles a felújítás után a csomagolóeszközre olyan jelet elhelyezni, amely sorrendben a következőket jelzi:

- h) az állam, amelyben a felújítást végezték, a nemzetközi forgalomban résztvevő gépjárművek államjelzésével³⁾;
- i) a felújítást végző neve vagy a csomagolóeszköz más azonosítója, amelyet az illetékes hatóság határozott meg;
- j) a felújítás éve, „R” betű és minden olyan csomagolóeszközre, amely sikeresen kiállta a 6.1.1.3 bekezdés szerinti tömörségi próbát, kiegészítésként az „L” betű.

6.1.3.9 Ha a felújítás után a 6.1.3.1 a) – d) pontban előírt jelölések a fémhordó tetején vagy oldalán nem lennének láthatóak, a felújítást végzőnek azokat tartós formában fel kell vinni és azokat követően a 6.1.3.8 h), i) és j) pont szerinti jelöléseket is el kell helyezni. Ezek a jelölések nem utalhatnak nagyobb teljesítőképességre, mint amelyre az eredeti típusmintát bevizsgálták és jelölték.

6.1.3.10 Az 1.2.1 szakaszban meghatározott, visszaforgatott műanyagból gyártott csomagolóeszközöket „REC” jelöléssel kell ellátni. Ezt a jelölést a 6.1.3.1 bekezdésben előírt jelölések közelében kell elhelyezni.

6.1.3.11 *Példák az új csomagolóeszközök jelölésére*

	4G/Y145/S/02 NL/VL823	6.1.3.1 a) i), b), c), d) és e) szerint 6.1.3.1 f) és g) szerint	Új papírlemez ládára
	1A1/Y1.4/150/98 NL/VL824	6.1.3.1 a) i), b), c), d) és e) szerint 6.1.3.1 f) és g) szerint	Folyékony anyagok szállítására szolgáló új acélhordóra
	1A2/Y150/S/01 NL/VL825	6.1.3.1 a) i), b), c), d) és e) szerint 6.1.3.1 f) és g) szerint	Szilárd anyagok szállítására vagy belső csomagolóeszközök befogadására szolgáló új acélhordóra
	4HW/Y136/S/98 NL/VL826	6.1.3.1 a) i), b), c), d) és e) szerint 6.1.3.1 f) és g) szerint	Egyenértékű specifikációjú új műanyag ládára
	1A2/Y/100/01 USA/MM5	6.1.3.1 a) i), b), c), d) és e) szerint 6.1.3.1 f) és g) szerint	Folyékony anyagok szállítására szolgáló, átalakított acélhordóra
	RID/ADR/0A1/100/89 NL/VL123	6.1.3.1 a) ii), b), c), d) és e) szerint 6.1.3.1 f) és g) szerint	Új finomlemez csomagolóeszközre nem levehető tetővel
	RID/ADR/0A2/Y20/S/04 NL/VL124	6.1.3.1 a) ii), b), c), d) és e) szerint 6.1.3.1 f) és g) szerint	Új finomlemez csomagolóeszközre levehető tetővel szilárd anyagokhoz vagy olyan folyékony anyagokhoz, amelyek viszkozitása 23 °C-on legalább 200 mm ² /s.

6.1.3.12 *Példák a felújított csomagolóeszközök jelölésére*

	1A1/Y1.4/150/97 NL/RB/01 RL	6.1.3.1 a) i), b), c), d) és e) szerint 6.1.3.8 h), i) és j) szerint

6.1.3.13 *Példák a kármentő csomagolások jelölésére*

	1A2T/Y300/S/01 USA/abc	6.1.3.1 a) i), b), c), d) és e) szerint 6.1.3.1 f) és g) szerint
---	---------------------------	---

Megjegyzés: A jelölések, amelyekre a 6.1.3.11, a 6.1.3.12 és a 6.1.3.13 bekezdésben példák találhatók elhelyezhetők egyetlen sorban vagy több sorban, amennyiben a helyes sorrendet betartják.

6.1.3.14 *Tanúsítvány*

A 6.1.3.1 bekezdés szerinti jelölés tanúsítja, hogy a sorozatban gyártott csomagolóeszközök megfelelnek a jóváhagyott gyártási típusnak, és a jóváhagyásban szereplő feltételeket kielégítik.

6.1.4 **A csomagolóeszközökre vonatkozó követelmények**

6.1.4.0 *Általános követelmények*

A csomagolóeszközben lévő anyag áthatolása nem okozhat veszélyt szokásos szállítási körülmények között.

6.1.4.1 *Acélhordó*

- 1A1 kódjelű acélhordó nem levehető tetővel
- 1A2 kódjelű acélhordó levehető tetővel

6.1.4.1.1 A palástot és a fenekeket megfelelő minőségű és a hordó űrtartalmának és rendeltetésének megfelelő vastagságú acéllemezről kell gyártani.

Megjegyzés: Szénacél hordók esetén „megfelelő” acél minőségek az ISO 3573:1999 („Melegen hengerelt, ötvözetlen lágyacél szalagok és lemezek”) és az ISO 3574:1999 („Hidegen hengerelt, ötvözetlen lágyacél szalagok és lemezek”) szabványban vannak megadva.

100 l-nél kisebb űrtartalmú, szénacél hordók esetén „megfelelő” acél minőségek az előzőeken kívül az ISO 1149:1995 („Elektrolitikusan ónozott, hidegen hengerelt finomlemez”) és az ISO 11950:1995 („Elektrolitikus króm/króm-oxid bevonatú, hidegen hengerelt finomlemez”) és az ISO 11951:1995 („Hidegen hengerelt finomlemez tekercs formában ónozott vagy elektrolitikus króm/króm-oxid bevonatú acéllemez előállításához”) szabványban vannak megadva.

6.1.4.1.2 A 40 liternél nagyobb mennyiségű folyadék befogadására használt hordók palástját hegesztéssel kell egyesíteni. A szilárd anyagok vagy legfeljebb 40 liter folyadék befogadására használt hordók palástját korcolással vagy hegesztéssel kell egyesíteni.

6.1.4.1.3 A fenekeket és a palástot ráperemezéssel vagy hegesztéssel kell egyesíteni. Különálló erősítő gyűrűk is alkalmazhatók.

6.1.4.1.4 A 60 liternél nagyobb űrtartalmú hordók palástján általában legalább két, hengerléssel kiképzett gördítőbordának kell lenni, vagy ehelyett legalább két, különálló gördítőabroncsot

kell alkalmazni. Ha a hordók gördítőabroncsokkal készülnek, azokat szorosan kell a palást-hoz illeszteni, és úgy kell rögzíteni, hogy ne mozdulhassanak el. A gördítőabroncsokat nem szabad ponthegeztéssel felerősíteni.

6.1.4.1.5 A nem levehető tetejű hordók (1A1) palástján és tetején a töltő-, ürítő- és szellőzőnyílások átmérője nem haladhatja meg a 7 cm-t. Az ennél nagyobb nyílású hordókat levehető tetejűnek (1A2) kell tekinteni. A hordók palástján és tetején levő zárószerveket úgy kell kialakítani és rögzíteni, hogy normális szállítási körülmények között jól zárjanak és szivárgásmentesek maradjanak. A zárószerveket karimáit lehet mechanikusan felerősíteni vagy a helyükre lehet hegeszteni. A zárószerveket tömítőgyűrűvel vagy egyéb tömítő elemmel kell ellátni, kivéve, ha a zárószervezet eleve szivárgásmentes.

6.1.4.1.6 A levehető tetejű hordók (1A2) zárószerveket úgy kell kialakítani és rögzíteni, hogy normális szállítási körülmények között jól zárjon, és a hordó szivárgásmentes maradjon. A levehető tetőket tömítőgyűrűvel vagy egyéb tömítő elemmel kell ellátni.

6.1.4.1.7 Amennyiben a palásthöz, a fenekekhez, a zárószervekhez és a szerelvényekhez használt anyagok önmagukban nem összeférhetők a szállítandó anyaggal, alkalmas belső védő-bevonatot vagy felületkezelést kell alkalmazni. A bevonatnak, ill. kezeléseknak védő tulajdonságait normális szállítási körülmények között meg kell őriznie.

6.1.4.1.8 A hordók legnagyobb űrtartalma 450 liter.

6.1.4.1.9 A legnagyobb nettó tömeg 400 kg.

6.1.4.2 *Alumíniumhordó*

1B1 kódjelű alumíniumhordó nem levehető tetővel

1B2 kódjelű alumíniumhordó levehető tetővel

6.1.4.2.1 A palástot és a fenekeket 99%-os tisztaságú alumíniumból vagy alumíniumötvözetből kell gyártani. Az anyagnak megfelelő minőségűnek és a hordó űrtartalmának és rendeltetésének megfelelő vastagságúnak kell lennie.

6.1.4.2.2 Minden egyesítést hegesztéssel kell kialakítani. Ha van peremvarrat, azt külön erősítő gyűrű felhelyezésével kell megerősíteni.

6.1.4.2.3 A 60 liternél nagyobb űrtartalmú hordók palástján általában legalább két, hengerléssel kiképzett gördítőbordának kell lenni, vagy ehelyett legalább két, különálló gördítőabroncsot kell alkalmazni. Ha a hordók gördítőabroncsokkal készülnek, azokat szorosan kell a palásthöz illeszteni, és úgy kell rögzíteni, hogy ne mozdulhassanak el. A gördítőabroncsokat nem szabad ponthegeztéssel felerősíteni.

6.1.4.2.4 A nem levehető tetejű hordók (1B1) palástján és tetején a töltő-, ürítő- és szellőzőnyílások átmérője nem haladhatja meg a 7 cm-t. Az ennél nagyobb nyílású hordókat levehető tetejűnek (1B2) kell tekinteni. A hordók palástján és tetején levő zárószerveket úgy kell kialakítani és rögzíteni, hogy normális szállítási körülmények között jól zárjanak és szivárgásmentesek maradjanak. A zárószerveket karimáit lehet mechanikusan felerősíteni vagy a helyükre lehet hegeszteni. A zárószerveket tömítőgyűrűvel vagy egyéb tömítő elemmel kell ellátni, kivéve, ha a zárószervezet eleve szivárgásmentes.

6.1.4.2.5 A levehető tetejű hordók (1B2) zárószerveket úgy kell kialakítani és rögzíteni, hogy normális szállítási körülmények között jól zárjon, és a hordó szivárgásmentes maradjon. A levehető tetőket tömítőgyűrűvel vagy egyéb tömítő elemmel kell ellátni.

6.1.4.2.6 A hordók legnagyobb űrtartalma 450 liter.

6.1.4.2.7 A legnagyobb nettó tömeg 400 kg.

6.1.4.3 *Fémhordó (acélt és alumíniumot kivéve)*

1N1 kódjelű fémhordó nem levehető tetővel

1N2 kódjelű fémhordó levehető tetővel

6.1.4.3.1 A palástot és a fenekeket fémből vagy fém-ötvözetből kell gyártani, acélt és alumíniumot kivéve. Az anyagnak megfelelő minőségűnek és a hordó űrtartalmának és rendeltetésének megfelelő vastagságúnak kell lennie.

6.1.4.3.2 Ha van peremvarrat, azt külön erősítő gyűrű felhelyezésével kell megerősíteni. Minden egyesítést, (ha létezik) a felhasznált fémre vagy fém-ötvözetre jellemző műszaki gyakorlatnak megfelelően kell kialakítani (hegesztéssel, forrasztással stb.).

6.1.4.3.3 A 60 liternél nagyobb űrtartalmú hordók palástján általában legalább két, hengerléssel kiképzett gördítőbordának kell lenni, vagy ehelyett legalább két, különálló gördítőabroncsot kell alkalmazni. Ha a hordók gördítőabroncsokkal készülnek, azokat szorosan kell a palásthöz illeszteni, és úgy kell rögzíteni, hogy ne mozdulhassanak el. A gördítőabroncsokat nem szabad ponthegeztéssel felerősíteni.

6.1.4.3.4 A nem levehető tetejű hordók (1N1) palástján és tetején a töltő-, ürítő- és szellőzőnyílások átmérője nem haladhatja meg a 7 cm-t. Az ennél nagyobb nyílású hordókat levehető tetejűnek (1N2) kell tekinteni. A hordók palástján és tetején levő zárószervezeteket úgy kell kialakítani és rögzíteni, hogy normális szállítási körülmények között jól zárjanak és szivárgásmentesek maradjanak. A zárószervezetek karimáit a felhasznált fémre vagy fém-ötvözetre jellemző műszaki gyakorlatnak megfelelően (hegesztéssel, forrasztással stb.) oly módon kell a helyükre erősíteni, hogy az egyesítő varrat szivárgásmentes legyen. A zárószervezeteket tömítőgyűrűvel vagy egyéb tömítő elemmel kell ellátni, kivéve, ha a zárószervezet eleve szivárgásmentes.

6.1.4.3.5 A levehető tetejű hordók (1N2) zárószervezetét úgy kell kialakítani és rögzíteni, hogy normális szállítási körülmények között jól zárjon, és a hordó szivárgásmentes maradjon. A levehető tetőket tömítőgyűrűvel vagy egyéb tömítő elemmel kell ellátni.

6.1.4.3.6 A hordók legnagyobb űrtartalma 450 liter.

6.1.4.3.7 A legnagyobb nettó tömeg 400 kg.

6.1.4.4 *Acél-, ill. alumíniumkanna*

3A1 kódjelű acélkanna nem levehető tetővel

3A2 kódjelű acélkanna levehető tetővel

3B1 kódjelű alumíniumkanna nem levehető tetővel

3B2 kódjelű alumíniumkanna levehető tetővel

6.1.4.4.1 A palástot és a fenekeket acéllemezéből, ill. legalább 99%-os tisztaságú alumíniumból vagy alumíniumötvözetből kell gyártani. Az anyagnak megfelelő minőségűnek és a kanna űrtartalmának és rendeltetésének megfelelő vastagságúnak kell lennie.

6.1.4.4.2 Az acélkannáknál a fenekeket és a palástot ráperemezéssel vagy hegesztéssel kell egyesíteni. A 40 liternél több folyadék befogadására használt acélkannák palástját hegesztéssel kell egyesíteni. A legfeljebb 40 liter folyadék szállítására használt kannák palástját korcolással vagy hegesztéssel kell egyesíteni. Az alumíniumkannáknál minden egyesítést hegesztéssel kell kialakítani. Ha van peremvarrat, azt külön erősítő gyűrű felhelyezésével kell megerősíteni.

6.1.4.4.3 A nem levehető tetejű kannák (3A1 és 3B1) nyílásainak átmérője nem lehet 7 cm-nél nagyobb. Az ennél nagyobb nyílású kannát levehető tetejűnek (3A2 és 3B2) kell tekinteni. A zárószervezeteket úgy kell kialakítani és rögzíteni, hogy normális szállítási körülmények között jól zárjanak és szivárgásmentesek maradjanak. A zárószervezeteket tömítőgyűrűvel

vagy egyéb tömítő elemmel kell ellátni, kivéve, ha a zárószerkezet eleve szivárgásmentes.

6.1.4.4.4 Amennyiben a palásthoz, a fenekekhez, zárószerkezetekhez és szerelvényekhez használt anyagok önmagukban nem összeférhetők a szállítandó anyaggal, alkalmas belső védőbevonatot vagy felületkezelést kell alkalmazni. A bevonatnak, ill. kezelésnek védő tulajdonságait normális szállítási körülmények között meg kell őriznie.

6.1.4.4.5 A kannák legnagyobb űrtartalma 60 liter.

6.1.4.4.6 A legnagyobb nettó tömeg 120 kg.

6.1.4.5 ***Rétegelt falemez hordó***

1D kódjelű rétegelt falemez hordó

6.1.4.5.1 A felhasznált fának jól kiérleltnek, a kereskedelemben szokásos mértékben száraznak és minden olyan hibától mentesnek kell lennie, amely ártana a hordó rendeltetésszerű használatra való megfelelőségének. Amennyiben a fenekek gyártásához a rétegelt falemeztől eltérő anyagot használnak, ennek a rétegelt falemezzel azonos minőségűnek kell lennie.

6.1.4.5.2 A felhasznált rétegelt falemeznek legalább kétrétegűnek kell lennie a hordó palástjánál és legalább háromrétegűnek a fenekeknél. A rétegeket erezzel egymásra merőlegesen vízálló ragasztóval kell szilárdan összeragasztani.

6.1.4.5.3 A palástot és a fenekeket a hordó űrtartalmának és rendeltetésének megfelelően kell kialakítani.

6.1.4.5.4 Az anyag kiszóródásának elkerülése érdekében a fedeleket nátronpapírral vagy más, egyenértékű anyaggal kell bélelni, amit a fedélhez szilárdan rögzíteni kell, és amelynek a fedél egész kerülete mentén túl kell nyúlnia.

6.1.4.5.5 A hordók legnagyobb űrtartalma 250 liter.

6.1.4.5.6 A legnagyobb nettó tömeg 400 kg.

6.1.4.6 (törölve)

6.1.4.7 ***Papírlemez hordó***

1G kódjelű papírlemez hordó

6.1.4.7.1 A hordó palástját több réteg vastag papírból, vagy szilárdan összeragasztott, vagy rétegelt papírlemezből (nem hullámpapírlemezből) kell készíteni, amelyen egy vagy több bitumen, paraffinozott nátronpapír, fémfólia vagy műanyag stb. védőréteg lehet.

6.1.4.7.2 A fenekeket fából, papírlemezből, fémből, rétegelt falemezből, műanyagból vagy más alkalmas anyagból kell gyártani, és egy vagy több bitumen, paraffinozott nátronpapír, fémfólia, műanyag stb. védőréteggel lehet bevonni.

6.1.4.7.3 A hordó palástját, fenekeit és illesztéseit a hordó űrtartalmának és rendeltetésének megfelelően kell kialakítani.

6.1.4.7.4 Az összeszerelt csomagolóeszköznek vízzel szemben kielégítő módon ellenállónak kell lennie, hogy a rétegek normális szállítási körülmények között szét ne váljanak.

6.1.4.7.5 A hordó legnagyobb űrtartalma 450 liter.

6.1.4.7.6 A legnagyobb nettó tömeg 400 kg.

6.1.4.8 *Műanyag hordó és kanna*

- 1H1 kódjelű műanyag hordó nem levehető tetővel
- 1H2 kódjelű műanyag hordó levehető tetővel
- 3H1 kódjelű műanyag kanna nem levehető tetővel
- 3H2 kódjelű műanyag kanna levehető tetővel

6.1.4.8.1 A csomagolóeszközt megfelelő műanyagból kell gyártani, űrtartalmának és rendeltetésének megfelelő szilárdsággal kell rendelkeznie. Az 1.2.1 szakasz szerinti visszaforgatott műanyagok kivételével a gyártáshoz az ugyanazon sorozatból eredő gyártási maradékon vagy hulladékon kívül más használt anyagot nem szabad felhasználni. A csomagolóeszköznek megfelelően ellenállónak kell lennie az öregedéssel szemben, ill. a betöltött anyag vagy az ultraibolya sugárzás gyengítő hatásával szemben. A szállított anyag esetleges átszivárgása még az új csomagolóeszköz gyártásához felhasznált visszaforgatott műanyag esetében sem okozhat veszélyt normális szállítási körülmények között.

6.1.4.8.2 Ha szükség van ultraibolya-sugárzás elleni védelemre, ezt korom vagy más, megfelelő pigment vagy inhibitor hozzáadásával kell biztosítani. Ezeknek az adalékanyagoknak összeférhetőnek kell lenniük a tartalommal, és hatékonyságukat a csomagolóeszköz teljes használati időtartama alatt meg kell őrizniük. Amennyiben a jóváhagyott gyártási minta elkészítése során használttól eltérő kormot, pigmentet vagy inhibitort használnak, a vizsgálatok megismétlésétől el lehet tekinteni, ha a koromtartalom nem haladja meg a 2 tömeg%-ot vagy a pigmenttartalom a 3 tömeg%-ot; az ultraibolya-sugárzás elleni védelem inhibitor-tartalma nincs korlátozva.

6.1.4.8.3 Az ultraibolya-sugárzás elleni védelem kivül más okból használt adalékanyagok is lehetnek a műanyagban, feltéve, hogy nem változtatják meg a csomagolóeszköz anyagának kémiai és fizikai tulajdonságait. Ilyen esetben a vizsgálatok megismétlésétől el lehet tekinteni.

6.1.4.8.4 A falvastagságnak a csomagolóeszköz minden részén az űrtartalomnak és a rendeltetésnek megfelelőnek kell lennie, figyelembe véve azokat az erőhatásokat is, amelyeknek az egyes részek ki lehetnek téve.

6.1.4.8.5 A nem levehető tetejű hordók (1H1) és kannák (3H1) palástján és tetején a töltő-, ürítő- és szellőzőnyílások átmérője nem haladhatja meg a 7 cm-t. Az ennél nagyobb nyílású hordókat és kannákat levehető tetejűnek (1H2 és 3H2) kell tekinteni. A hordók és kannák palástján, ill. tetején levő zárószerveket úgy kell kialakítani és rögzíteni, hogy normális szállítási körülmények között jól zárjanak és szivárgásmentesek maradjanak. A zárószerveket tömítőgyűrűvel vagy egyéb tömítő elemmel kell ellátni, kivéve, ha a zárószervezet eleve szivárgásmentes.

6.1.4.8.6 A levehető tetejű hordók és kannák (1H2 és 3H2) zárószerveit úgy kell kialakítani és rögzíteni, hogy normális szállítási körülmények között jól zárjanak, és szivárgásmentesek maradjanak. Minden levehető tetőnél tömítőgyűrűt kell alkalmazni, kivéve, ha a hordó, ill. kanna kialakítása olyan, hogy a levehető tető helyes rögzítése esetén a hordó, ill. kanna eleve szivárgásmentes.

6.1.4.8.7 A gyúlékony folyadékok esetében megengedett legnagyobb áteresztőképesség 23 °C-on 0,008 g/(l·h) (lásd a 6.1.5.7 bekezdést).

6.1.4.8.8 Amennyiben új csomagolóeszközök gyártásához visszaforgatott műanyagot használnak, a visszaforgatott műanyag jellemzőit az illetékes hatóság által jóváhagyott minőségbiztosítási program keretében szavatolni és rendszeresen dokumentálni kell. A minőségbiztosítási programnak ki kell terjednie a megfelelő előválogatás regisztrálására és annak felülvizsgálatára, hogy a visszaforgatott műanyag minden egyes tétele megfelelő olvadási tulajdonságokkal, sűrűséggel és folyáshatárral bír, ami megegyezik az ugyanilyen visszaforgatott műanyagból készült gyártási típusával. Ez szükségszerűen magában foglalja annak ismeretét, hogy milyen csomagolóeszközből származik a visszaforgatott anyag, illetve, ha a csomagolóeszközbe előzően csomagolt anyag csökkentheti a visszaforgatott anyagból

gyártott új csomagolóeszköz alkalmasságát, akkor annak ismeretét is. Ezen túlmenően a csomagolóeszköz gyártó 6.1.1.4 bekezdés szerinti minőségbiztosítási programjának ki kell terjednie a 6.1.5 szakasz szerinti mechanikai gyártási típus vizsgálat végrehajtására minden egyes tétel visszaforgatott műanyagból gyártott csomagolóeszköz esetében. Ennek során a halmazolhatóság vizsgálatára a statikus terhelés helyett megfelelő dinamikus nyomáspróba is alkalmazható.

Megjegyzés: A „Csomagolás. Veszélyes áruk szállítási csomagolása. Anyagában hasznosított (visszaforgatott) műanyag” c. ISO 16103:2005 szabvány további útmutatást ad a visszaforgatott műanyagok használatának engedélyezési eljárására.

- | | | | |
|-------------------|---|--|-------------------------|
| 6.1.4.8.9 | A hordók és kannák legnagyobb űrtartalma: | az 1H1 és az 1H2 kódjelűé
a 3H1 és a 3H2 kódjelűé | 450 liter,
60 liter. |
| 6.1.4.8.10 | A legnagyobb nettó tömeg: | az 1H1 és az 1H2 kódjelűé
a 3H1 és a 3H2 kódjelűé | 400 kg,
120 kg. |
- 6.1.4.9 *Faláda***
- 4C1 kódjelű közönséges faláda
4C2 kódjelű faláda portömör falakkal
- 6.1.4.9.1** A felhasznált fának jól kiérleltnek, a kereskedelemben szokásos mértékben száraznak és minden olyan hiányosságtól mentesnek kell lennie, ami jelentősen csökkenthetné a láda bármelyik szerkezeti elemének ellenálló képességét. A felhasznált anyag szilárdságának és a láda szerkezetének meg kell felelnie a láda űrtartalmának és rendeltetésének. A tetőt és a feneket vízálló, fűrészárut helyettesítő anyagból, pl. farostlemezről, faforgácslemezről vagy más hasonló alkalmas anyagból is lehet gyártani.
- 6.1.4.9.2** Az összeerősítéseknek ellen kell állni a rezgéseknek normális szállítási feltételek között. A deszkavégeken a rostirányú szögezést, ahol csak lehetséges, kerülni kell. A nagy igénybevételnek kitett egyesítéseket visszahajtásos szegezéssel, gyűrűs szeggel vagy azonos hatékonyságú módon kell kialakítani.
- 6.1.4.9.3** 4C2 típusú láda esetén a láda minden elemét egyetlen darabból vagy ezzel egyenértékű módon kell gyártani. Az egyetlen darabból álló elemmel egyenértékűnek számítanak azok az elemek, amelyeket a következő módszerek egyike szerint ragasztással állítottak össze: Lindermann-illesztés (fecskefarok), hornyolás, átlapolás vagy tompaillesztés, minden csatlakozásnál legalább két, hullámosított fém rögzítőelemmel.
- 6.1.4.9.4** A legnagyobb nettó tömeg 400 kg.
- 6.1.4.10 *Rétegelt falemez láda***
- 4D kódjelű rétegelt falemez láda
- 6.1.4.10.1** A felhasznált rétegelt falemeznek legalább háromrétegűnek kell lennie. Jól kiérlelt, hámozott, késelt vagy fűrészelt furnérból kell gyártani, amely a kereskedelemben szokásos mértékben száraz és minden olyan hibától mentes legyen, ami a láda szilárdságát csökkenthetné. A felhasznált anyag szilárdságát és a gyártás módját a láda űrtartalmának és rendeltetésének megfelelően kell megválasztani. Minden réteget vízálló ragasztóval kell összeragasztani. Más alkalmas anyagok is használhatók rétegelt falemezzel együtt a ládák gyártásához. A ládák lapjait a sarkoknál vagy illesztéseknél szilárdan össze kell szegezni vagy kapcsolni, vagy más, ugyancsak alkalmas eszközzel össze kell erősíteni.
- 6.1.4.10.2** A legnagyobb nettó tömeg 400 kg.

6.1.4.11 Farostlemez láda

4F kódjelű farostlemez láda

6.1.4.11.1 A ládák falait vízálló farostlemezről kell gyártani, pl. kemény farostlemezről, faforgácslemezről vagy más megfelelő típusból. A felhasznált anyag szilárdságát és a gyártás módját a láda úrtartalmának és rendeltetésének megfelelően kell megválasztani.

6.1.4.11.2 A láda egyéb részeit más alkalmas anyagból is lehet gyártani.

6.1.4.11.3 A ládákat megfelelő eszközökkel szilárdan össze kell erősíteni.

6.1.4.11.4 A legnagyobb nettó tömeg 400 kg.

6.1.4.12 Papírlémez láda

4G kódjelű papírlémez láda

6.1.4.12.1 A ládát úrtartalmának és rendeltetésének megfelelő papírlémezből vagy kettős fedőrétegű (egy vagy több hullámosított réteggel) hullámpapírlémezből kell készíteni. A külső felületnek annyira kell vízállónak lennie, hogy a Cobb-módszer (az ISO 535:1991 sz. szabvány) szerinti harmincperces vízfelvételi vizsgálat során mért tömegnövekedése ne haladja meg a 155 g/m² értéket. A papírlémeznek megfelelő hajlítószilárdságúnak kell lennie és úgy kell kiszabni, átmetszés nélkül völgyelni és réselni, hogy a felállítás során ne törjön meg, felülete ne szakadjon be, és a ládának egyáltalán nem szabad kihasasodnia. A hullámosított réteget a fedőrétegekkel szilárdan kell összeragasztani.

6.1.4.12.2 A ládák homlokoldalai lehetnek fakeretűek vagy teljesen fából vagy más alkalmas anyagból is készíthetők. Erősítésként faléceket vagy más alkalmas anyagot lehet használni.

6.1.4.12.3 A ládák palástegyesítéseit ragasztószalaggal, vagy átlapolással és ragasztással vagy kapcsolással kell rögzíteni. Az átlapolt egyesítéseknél az átlapolásnak megfelelő méretűnek kell lennie.

6.1.4.12.4 Ha a zárást ragasztószalaggal vagy ragasztással végzik, a ragasztónak vízállónak kell lennie.

6.1.4.12.5 A láda méretei illeszkedjenek a tartalomhoz.

6.1.4.12.6 A legnagyobb nettó tömege 400 kg.

6.1.4.13 Műanyag láda

4H1 kódjelű habosított műanyag láda

4H2 kódjelű tömör műanyag láda

6.1.4.13.1 A ládát alkalmas műanyagból kell gyártani, úrtartalmának és rendeltetésének megfelelően szilárdnak kell lennie. Kielégítően ellenálló legyen az öregedéssel, a szállított anyag, illetve az ultraibolya-sugárzás okozta fokozatos gyengüléssel szemben.

6.1.4.13.2 A habosított műanyag ládának két részből kell állnia, az alsó részből, amely a belső csomagolás befogadására alkalmas fészkekből áll és a felső részből, amely az alsó részt lefedi és abba illeszkedik. Az alsó és felső részt oly módon kell kialakítani, hogy a belső csomagolóeszközök szorosan beleilleszkedjenek. A belső csomagolóeszközök zárószerveinek nem szabad érintkezniük a láda felső részének belső felületével.

6.1.4.13.3 Feladáshoz a habosított műanyag ládákat öntapadó szalaggal kell lezárni, amelynek elegendő szakítószilárdságúnak kell lennie ahhoz, hogy megakadályozza a láda kinyílását. Az öntapadó szalagnak ellenállónak kell lenni az időjárási hatásokkal szemben, és ragasztóanyagának összeférhetőnek kell lennie a láda habosított műanyagával. Egyéb zárószervek is használhatók, feltéve, hogy legalább azonos hatékonyságúak.

- 6.1.4.13.4** A tömör műanyag ládánál az ultraibolya-sugárzás elleni védelmet, ha szükséges, korommal vagy más pigmenttel vagy alkalmas inhibitorokkal kell biztosítani. Ezeknek az adalékanyagoknak összeférhetőeknek kell lenniük a tartalommal, és hatékonyságukat a láda teljes használati ideje alatt meg kell őrizniük. Ha más kormot, pigmentet vagy inhibitorokat használnak, mint amilyeneket a jóváhagyott gyártási minta elkészítésekor használtak, a vizsgálatok megismétlésétől el lehet tekinteni, ha a koromtartalom nem haladja meg a 2 tömeg%-ot vagy a pigmenttartalom a 3 tömeg%-ot; az ultraibolya-sugárzás elleni védelemre használt inhibitor százalékos aránya nincs korlátozva.
- 6.1.4.13.5** Az ultraibolya-sugárzás elleni védelmen kívül más okból használt adalékanyagok is lehetnek a műanyagban, feltéve, hogy nem változtatják meg a csomagolóeszköz anyagának kémiai és fizikai tulajdonságait. Ilyen esetben a vizsgálatok megismétlésétől el lehet tekinteni.
- 6.1.4.13.6** A tömör műanyag ládákat megfelelő szilárdságú, alkalmas anyagból készített záró-szerkezettel kell ellátni, amelyet úgy kell kialakítani, hogy a nem szándékos kinyitás megelőzhető legyen.
- 6.1.4.13.7** Amennyiben új csomagolóeszközök gyártásához visszaforgatott műanyagot használnak, a visszaforgatott műanyag jellemzőit az illetékes hatóság által jóváhagyott minőségbiztosítási program keretében szavatolni és rendszeresen dokumentálni kell. A minőségbiztosítási programnak ki kell terjednie a megfelelő előválogatás regisztrálására és annak felülvizsgálatára, hogy a visszaforgatott műanyag minden egyes tétele megfelelő olvadási tulajdonságokkal, sűrűséggel és folyáshatással bír, ami megegyezik az ugyanilyen visszaforgatott műanyagból készült gyártási típusával. Ez szükségszerűen magában foglalja annak ismeretét, hogy milyen csomagolóeszközből származik a visszaforgatott anyag, illetve, ha a csomagolóeszközbe előzően csomagolt anyag csökkentheti a visszaforgatott anyagból gyártott új csomagolóeszköz alkalmasságát, akkor annak ismeretét is. Ezen túlmenően a csomagolóeszköz gyártó 6.1.1.4 bekezdés szerinti minőségbiztosítási programjának ki kell terjednie a 6.1.5 szakasz szerinti mechanikai gyártási típus vizsgálat végrehajtására minden egyes tétel visszaforgatott műanyagból gyártott csomagolóeszköz esetében. Ennek során a halmazolhatóság vizsgálatára a statikus terhelés helyett megfelelő dinamikus nyomáspróba is alkalmazható.
- 6.1.4.13.8** A legnagyobb nettó tömeg:
- | | |
|-------------|---------|
| 4H1 kódjelű | 60 kg; |
| 4H2 kódjelű | 400 kg. |
- 6.1.4.14** *Acél-, alumínium- és egyéb fém láda*
- 4A kódjelű acélláda
- 4B kódjelű alumíniumláda
- 4N kódjelű fém láda (acélt és alumíniumot kivéve)
- 6.1.4.14.1** A fém szilárdságának és a láda szerkezetének a láda úrtartalmához és rendeltetéséhez kell igazodnia.
- 6.1.4.14.2** A ládákat szükség esetén papírlemez vagy nemez párnázattal kell bélelni, vagy alkalmas anyagból készült béléssel vagy bevonattal kell ellátni. Amennyiben kettős korcolású fémbélést használnak, gondoskodni kell annak megakadályozásáról, hogy az illesztések hézagaiba anyag hatolhasson be, különösen robbanóanyag esetén.
- 6.1.4.14.3** A zárószervezetek bármilyen alkalmas típusúak lehetnek, normális szállítási körülmények között jól kell zárniuk.
- 6.1.4.14.4** A legnagyobb nettó tömeg 400 kg.
- 6.1.4.15** *Textilzsák*
- 5L1 kódjelű, belső zsák vagy bevonat nélküli textilzsák
- 5L2 kódjelű portömör textilzsák

5L3 kódjelű vízálló textilzsák

6.1.4.15.1 A felhasznált textíliának jó minőségűnek kell lennie. A textília szilárdsága és a zsák kidolgozása feleljen meg a zsák ürtartalmának és rendeltetésének.

6.1.4.15.2 Portömör zsák (5L2): a zsákot pl. a következő módok valamelyikével kell portömörré tenni:

- a) a zsák belső felületére vízálló ragasztóval, pl. bitumennel ragasztott papírral; vagy
- b) a zsák belső felületére ragasztott műanyag fóliával; vagy
- c) egy vagy több papír vagy műanyag belső zsákkal.

6.1.4.15.3 Vízálló zsák (5L3): a nedvesség behatolásának megakadályozására a zsákot pl. a következő módok valamelyikével kell vízállóvá kell tenni:

- a) különálló, vízálló papír (pl. viasszal átitatott nátronpapír, bitumenes papír vagy műanyaggal bevont nátronpapír) belső zsákkal; vagy
- b) a zsák belső felületére ragasztott műanyagfóliával; vagy
- c) egy vagy több műanyag belső zsákkal.

6.1.4.15.4 A legnagyobb nettó tömeg 50 kg.

6.1.4.16 *Műanyagszövet zsák*

5H1 kódjelű, belső zsák vagy bevonat nélküli műanyagszövet zsák

5H2 kódjelű portömör műanyagszövet zsák

5H3 kódjelű vízálló műanyagszövet zsák

6.1.4.16.1 A zsákot alkalmas, húzással nyújtott műanyag szalagokból vagy műanyag elemi szálakból kell gyártani. A felhasznált anyag szilárdsága és a zsák kidolgozása feleljen meg a zsák ürtartalmának és rendeltetésének.

6.1.4.16.2 Ha a zsákot síkszövetből készítik, az oldalát és alját varrással vagy más módon kell összeerősíteni. Ha a zsákot cső alakú műanyagszövetből készítik, az alját össze kell varrni, szőni vagy egyéb, azonos szilárdságot nyújtó módon össze kell erősíteni.

6.1.4.16.3 Portömör zsák (5H2): a zsákot pl. a következő módok valamelyikével kell portömörré tenni:

- a) a zsák belső felületére ragasztott papírral vagy műanyagfóliával; vagy
- b) egy vagy több, különálló papír vagy műanyag belső zsákkal.

6.1.4.16.4 Vízálló zsák (5H3): a nedvesség behatolásának megakadályozására a zsákot pl. a következő módok valamelyikével kell vízállóvá tenni:

- a) különálló, vízálló papír (pl. viasszal átitatott nátronpapír, bitumenes papír vagy műanyaggal bevont nátronpapír) belső zsákkal; vagy
- b) a zsák belső felületére ragasztott műanyagfóliával; vagy
- c) egy vagy több műanyag belső zsákkal.

6.1.4.16.5 A legnagyobb nettó tömeg 50 kg.

6.1.4.17 *Műanyagfólia zsák*

5H4 kódjelű műanyagfólia zsák

6.1.4.17.1 A zsákot megfelelő műanyagból kell gyártani. A felhasznált műanyag szilárdsága és a zsák kivitele feleljen meg a zsák ürtartalmának és rendeltetésének. A varratoknak a normális szállítási feltételek között fellépő nyomásnak és ütődéseknek ellen kell állniuk.

- 6.1.4.17.2** A legnagyobb nettó tömeg 50 kg.
- 6.1.4.18** ***Papírsák***
- 5M1 kódjelű, többrétegű papírsák
- 5M2 kódjelű, többrétegű, vízálló papírsák
- 6.1.4.18.1** A zsákot alkalmas nátronpapírból vagy azonos minőségű papírból, legalább három rétegre kell kialakítani, ahol a középső réteg hálósövet is lehet, ami a külső papír réteghez hozzá van ragasztva. A papír szilárdságának és a zsák kidolgozásának meg kell felelnie a zsák úrtartalmának és rendeltetésének. A varratoknak és zárásoknak portömörnek kell lenniük.
- 6.1.4.18.2** 5M2 kódjelű papírsák: A nedvesség behatolásának megakadályozására a négy vagy többrétegű zsákot oly módon kell vízállóvá tenni, hogy külső két réteg egyikét vízálló anyagból készítik vagy megfelelő védő anyagból készített vízzáró réteget helyeznek a két legkülső réteg közé; a háromrétegű zsákot oly módon kell vízállóvá tenni, hogy legkülső réteggént vízálló anyagot használnak. Amennyiben fennáll annak a veszélye, hogy a betöltött anyag a nedvességgel reakcióba lép, vagy az anyagot nedvesen csomagolják, vízálló réteget vagy víz átnemeresztő anyagot, például mindkét oldalán kátránnyal bevont nátronpapírt, műanyag bevonatú nátronpapírt, a zsák belső felületéhez ragasztott műanyagfóliát, vagy egy vagy több műanyag belső bélést kell az anyaggal érintkező módon legbelülre elhelyezni. A varratoknak és zárásoknak vízállónak kell lenniük.
- 6.1.4.18.3** A legnagyobb nettó tömeg 50 kg.
- 6.1.4.19** ***Összetett (műanyag) csomagolóeszköz***
- 6HA1 kódjelű műanyag tartály külső acélhordóval
- 6HA2 kódjelű műanyag tartály külső acélládával vagy –rekesszel
- 6HB1 kódjelű műanyag tartály külső alumíniumhordóval
- 6HB2 kódjelű műanyag tartály külső alumíniumládával vagy –rekesszel
- 6HC kódjelű műanyag tartály külső faládával
- 6HD1 kódjelű műanyag tartály külső rétegelt falemez hordóval
- 6HD2 kódjelű műanyag tartály külső rétegelt falemez ládával
- 6HG1 kódjelű műanyag tartály külső papírlemez hordóval
- 6HG2 kódjelű műanyag tartály külső papírlemez ládával
- 6HH1 kódjelű műanyag tartály külső műanyag hordóval
- 6HH2 kódjelű műanyag tartály külső tömör műanyag ládával
- 6.1.4.19.1** Belső tartály
- 6.1.4.19.1.1** A műanyag belső tartálynak meg kell felelnie 6.1.4.8.1 és a 6.1.4.8.4 – 6.1.4.8.7 pont előírásainak.
- 6.1.4.19.1.2** A műanyag belső tartálynak hézag nélkül kell beleilleszkednie a külső csomagolóeszközbe, amelyen nem lehetnek olyan felületi érdességek, amelyek a műanyag kidörzsölését okozhatják.
- 6.1.4.19.1.3** A belső tartály legnagyobb úrtartalma: 6HA1, 6HB1, 6HD1, 6HG1 és 6HH1 250 liter,
6HA2, 6HB2, 6HC, 6HD2, 6HG2 és 6HH2 60 liter.
- 6.1.4.19.1.4** A legnagyobb nettó tömeg: 6HA1, 6HB1, 6HD1, 6HG1 és 6HH1 400 kg,
6HA2, 6HB2, 6HC, 6HD2, 6HG2 és 6HH2 75 kg.
- 6.1.4.19.2** Külső csomagolóeszköz
- 6.1.4.19.2.1** Műanyag tartály külső acél – vagy alumíniumhordóval (6HA1 vagy 6HB1). A külső csoma-

golóeszköz kialakításának meg kell felelnie a 6.1.4.1, ill. a 6.1.4.2 bekezdés előírásainak.

- 6.1.4.19.2.2** Műanyag tartály külső acél vagy alumínium rekesszel vagy ládával (6HA2 vagy 6HB2). A külső csomagolóeszköz kialakításának meg kell felelnie a 6.1.4.14 bekezdés előírásainak.
- 6.1.4.19.2.3** Műanyag tartály külső falárával (6HC). A külső csomagolóeszköz kialakításának meg kell felelnie a 6.1.4.9 bekezdés előírásainak.
- 6.1.4.19.2.4** Műanyag tartály külső rétegelt falemez hordóval (6HD1). A külső csomagolóeszköz kialakításának meg kell felelnie a 6.1.4.5 bekezdés előírásainak.
- 6.1.4.19.2.5** Műanyag tartály külső rétegelt falemez ládával (6HD2). A külső csomagolóeszköz kialakításának meg kell felelnie a 6.1.4.10 bekezdés előírásainak.
- 6.1.4.19.2.6** Műanyag tartály külső papírlemez hordóval (6HG1). A külső csomagolóeszköz kialakításának meg kell felelnie a 6.1.4.7.1 – 6.1.4.7.4 pont előírásainak.
- 6.1.4.19.2.7** Műanyag tartály külső papírlemez ládával (6HG2). A külső csomagolóeszköz kialakításának meg kell felelnie a 6.1.4.12 bekezdés előírásainak.
- 6.1.4.19.2.8** Műanyag tartály külső műanyag hordóval (6HH1). A külső csomagolóeszköz kialakításának meg kell felelnie a 6.1.4.8.1 – 6.1.4.8.6 pont előírásainak.
- 6.1.4.19.2.9** Műanyag tartály külső tömör műanyag ládával (beleértve a műanyag hullámlemez) (6HH2). A külső csomagolóeszköz kialakításának meg kell felelnie a 6.1.4.13.1 és a 6.1.4.13.4 – 6.1.4.13.6 pont előírásainak.

6.1.4.20 ***Összetett (üveg, porcelán, kőagyag) csomagolóeszköz***

- 6PA1 kódjelű tartály külső acélhordóval
- 6PA2 kódjelű tartály külső acéllárával vagy -rekesszel
- 6PB1 kódjelű tartály külső alumíniumhordóval
- 6PB2 kódjelű tartály külső alumíniumlárával vagy -rekesszel
- 6PC kódjelű tartály külső falárával
- 6PD1 kódjelű tartály külső rétegelt falemez hordóval
- 6PD2 kódjelű tartály külső vesszőkosárral
- 6PG1 kódjelű tartály külső papírlemez hordóval
- 6PG2 kódjelű tartály külső papírlemez lárával
- 6PH1 kódjelű tartály külső habosított műanyag csomagolóeszközzel
- 6PH2 kódjelű tartály külső tömör műanyag csomagolóeszközzel

6.1.4.20.1 Belső tartály

- 6.1.4.20.1.1** A tartályoknak megfelelő alakúaknak kell lenniük (henger vagy körte alakú), és azokat jó minőségű, minden olyan hibától mentes anyagból kell gyártani, amely szilárdságukat csökkenthetné. A falaknak minden ponton elég vastagnak és belső feszültségektől mentesnek kell lenniük.
- 6.1.4.20.1.2** A tartályok zárószervezeteként használhatók csavarmentes műanyag zárószervezetek, csiszolt üveg dugók vagy legalább ugyanilyen hatékonyságú zárószervezetek. A zárószervezet minden olyan részének, amely a tartály tartalmával érintkezésbe juthat, a tartalommal szemben ellenállónak kell lennie. Ügyelni kell arra, hogy a zárószervezeteket úgy szereljék fel, hogy azok szivárgásmentesek legyenek, és hogy úgy legyenek lezárva, hogy szállítás közben minden lazulás elkerülhető legyen. Ha szellőző-szerkezettel ellátott zárószervezetre van szükség, a 4.1.1.8 bekezdés előírásait kell betartani.
- 6.1.4.20.1.3** A tartályokat párnázóanyagok és/vagy felszívóképes anyagok használatával szilárdan be kell

ágyazni a külső csomagolásba.

- 6.1.4.20.1.4** A tartály legnagyobb űrtartalma 60 liter.
- 6.1.4.20.1.5** A legnagyobb nettó tömeg 75 kg.
- 6.1.4.20.2** Külső csomagolóeszköz
- 6.1.4.20.2.1** Tartály külső acélhordóval (6PA1). A külső csomagolóeszköz kialakításának meg kell felelnie a 6.1.4.1 bekezdés előírásainak. Az e csomagolástípushoz szükséges levehető tető süveg alakú is lehet.
- 6.1.4.20.2.2** Tartály külső acélládával vagy -rekesszel (6PA2). A külső csomagolóeszköz kialakításának meg kell felelnie a 6.1.4.14 bekezdés előírásainak. Hengeres tartályoknál függőleges helyzetben a külső védőcsomagolásnak felfelé túl kell nyúlni a tartályon és annak zárószerkezetén. Amennyiben a rekesz körte alakú tartályt vesz körül és annak alakjához illeszkedik, a külső védőcsomagolást védőtetővel (süveggel) kell ellátni.
- 6.1.4.20.2.3** Tartály külső alumíniumhordóval (6PB1). A külső csomagolóeszköz kialakításának meg kell felelnie a 6.1.4.2 bekezdés előírásainak.
- 6.1.4.20.2.4** Tartály külső alumíniumládával vagy -rekesszel (6PB2). A külső csomagolóeszköz kialakításának meg kell felelnie a 6.1.4.14 bekezdés előírásainak.
- 6.1.4.20.2.5** Tartály külső faládával (6PC). A külső csomagolóeszköz kialakításának meg kell felelnie a 6.1.4.9 bekezdés előírásainak.
- 6.1.4.20.2.6** Tartály külső rétegelt falemez hordóval (6PD1). A külső csomagolóeszköz kialakításának meg kell felelnie a 6.1.4.5 bekezdés előírásainak.
- 6.1.4.20.2.7** Tartály külső vesszőkosárral (6PD2). A vesszőkosarat jó minőségű anyagból, megfelelően kell elkészíteni. Védőtetővel (süveggel) úgy kell felszerelni, hogy a tartály sérülése elkerülhető legyen.
- 6.1.4.20.2.8** Tartály külső papírlemez hordóval (6PG1). A külső csomagolóeszköz kialakításának meg kell felelnie a 6.1.4.7.1 – 6.1.4.7.4 bekezdés előírásainak.
- 6.1.4.20.2.9** Tartály külső papírlemez ládával (6PG2). A külső csomagolóeszköz kialakításának meg kell felelnie a 6.1.4.12 bekezdés előírásainak.
- 6.1.4.20.2.10** Tartály külső habosított műanyag vagy tömör műanyag csomagolóeszközzel (6PH1 vagy 6PH2). E két külső csomagolóeszköz anyagának meg kell felelnie a 6.1.4.13 bekezdés előírásainak. A tömör műanyag csomagolóeszközt nagy sűrűségű polietilénből vagy más, ehhez hasonló műanyagból kell készíteni. Az e csomagolási típushoz tartozó levehető tető süveg alakú is lehet.

6.1.4.21 ***Kombinált csomagolások***

Csak a 6.1.4 szakasz megfelelő, a külső csomagolóeszközre vonatkozó előírásait kell figyelembe venni.

***Megjegyzés:** Az alkalmazandó külső és belső csomagolóeszközökre lásd a 4.1 fejezetben a megfelelő csomagolási utasításokat.*

6.1.4.22 ***Finomlemez csomagolóeszköz***

0A1 kódjelű finomlemez csomagolóeszköz nem levehető tetővel

0A2 kódjelű finomlemez csomagolóeszköz levehető tetővel

- 6.1.4.22.1** A palásthöz és a fenekekhez megfelelő acélból készített lemezt kell használni és a lemez vastagságának meg kell felelnie a csomagolás űrtartalmának és rendeltetésének.

- 6.1.4.22.2** Az illesztéseket hegeszteni kell, vagy legalább kettős korcolással vagy hasonló szilárdságot és tömítettséget adó eljárással kell kialakítani.
- 6.1.4.22.3** A belső bevonatoknak, pl. cink-, ón-, zománc- vagy hasonló bevonatoknak ellenállóknak kell lenniük, és minden pontban, beleértve a zárószerkezetet is, az acélhoz kell tapadniuk.
- 6.1.4.22.4** A nem levehető tetejű csomagolóeszközök (0A1) palástján és fenekein a töltő-, ürítő- és szellőzőnyílások átmérője nem haladhatja meg a 7 cm-t. A nagyobb nyílású csomagolóeszközöket levehető tetejűnek (0A2) kell tekinteni.
- 6.1.4.22.5** A nem levehető tetejű csomagolóeszközök (0A1) zárószerkezetének csavarmenetesnek kell lennie, vagy olyannak, amely csavarmenetes szerkezettel vagy más, legalább azonos hatékonyságú szerkezettel zárható. A levehető tetejű csomagolóeszközök (0A2) zárószerkezetét úgy kell kialakítani és rögzíteni, hogy normális szállítási körülmények között jól zárjanak, ill. a hordók és kannák szivárgásmentesek maradjanak.
- 6.1.4.22.6** A csomagolóeszköz legnagyobb űrtartalma 40 liter.
- 6.1.4.22.7** A legnagyobb nettó tömeg 50 kg.
- 6.1.5** **Előírások a csomagolóeszközök vizsgálatára**
- 6.1.5.1** *A vizsgálatok végrehajtása és gyakorisága*
- 6.1.5.1.1** Minden egyes csomagolóeszköz gyártási típusát a jelölés felvitelét engedélyező illetékes hatóság által meghatározott eljárás szerint, a 6.1.5 szakaszban előírt vizsgálatoknak kell alávetni, és ugyanennek az illetékes hatóságnak jóvá kell hagyni.
- 6.1.5.1.2** A csomagolóeszközök gyártási típusának sikeresen ki kell állnia az e fejezetben előírt vizsgálatokat, mielőtt az adott típusú csomagolóeszközt használatba vennék. A csomagolóeszköz gyártási típusát a tervezési méret, az anyag és falvastagság, a gyártási és összeállítási mód határozza meg, de beleérthetők a különféle felületkezelések. Egy gyártási típus tartalmazza azokat a csomagolóeszközöket is, amelyek a gyártási típustól csupán kisebb szerkezeti magasságukban térnek el.
- 6.1.5.1.3** A vizsgálatokat a gyártásból vett mintákon az illetékes hatóság által meghatározott időközönként meg kell ismételni. Az ilyen vizsgálatoknál papír vagy papírlemez csomagolóeszközök esetén a szobahőmérsékleten való előkészítés a 6.1.5.2.3 pont követelményeivel egyenértékűnek tekintendő.
- 6.1.5.1.4** A vizsgálatokat minden olyan módosítás után is meg kell ismételni, ami megváltoztatja a csomagolóeszköz szerkezetét, anyagát vagy gyártási módját.
- 6.1.5.1.5** Az illetékes hatóság engedélyezheti azon csomagolóeszközök szelektív vizsgálatát, amelyek csak kismértékben térnek el a már bevizsgálttól, pl. kisebb méretű belső csomagolásokat vagy kisebb nettó tömegű belső csomagolásokat tartalmaznak; vagy olyan hordók, zsákok és ládák, melyek a külső méret(ek)et tekintve valamivel kisebbek.
- 6.1.5.1.6** (fenntartva)
- Megjegyzés:** *Különböző típusú belső csomagolóeszközök egy külső csomagolóeszközbe való helyezésére, ill. a belső csomagolóeszköz változatokra vonatkozóan lásd a 4.1.1.5.1 pontot.*
- 6.1.5.1.7** Bármilyen, akár folyadékot, akár szilárd anyagot tartalmazó belső csomagolóeszközök, ill. tárgyak egy külső csomagolóeszközbe berakva szállíthatók anélkül, hogy a külső csomagolóeszközzel együtt vizsgálták volna, feltéve, ha:
- a) a külső csomagolóeszköz folyékony anyagot tartalmazó, törékeny (pl. üveg) belső

csomagolóeszközökkel a 6.1.5.3 bekezdés szerinti ejtőpróbát az I csomagolási csoportnak megfelelő ejtési magassággal sikeresen kiállta;

- b) a belső csomagolóeszközök együttes össztömege nem haladhatja meg az előző a) pontban leírt ejtőpróbánál alkalmazott belső csomagolóeszközök össztömegének a felét;
- c) a belső csomagolóeszközök között, ill. a belső csomagolóeszközök és a csomagolás külseje között a párnázóanyag vastagsága nem lehet kisebb az eredetileg vizsgált csomagolásban alkalmazott vastagságnál; ha az eredeti vizsgálatnál csak egy belső csomagolóeszköz volt, akkor a belső csomagolóeszközök közötti párnázóanyag vastagsága az eredeti vizsgálatnál a belső csomagolóeszköz és a csomagolás külseje közötti vastagságnál nem lehet kisebb. Ha az ejtőpróbánál alkalmazott belső csomagolóeszköz(ök)nél kevesebb vagy kisebb belső csomagolóeszköz(öke)t használnak, akkor az ebből adódó hézagokat ki kell tölteni elegendő mennyiségű párnázóanyaggal;
- d) a külső csomagolóeszköz – üres állapotban vizsgálva – sikeresen kiállta a 6.1.5.6 bekezdésben leírt halmazolási próbát. Az „azonos küldeménydarabok össztömegét” az előző a) pontban az ejtőpróbánál alkalmazott belső csomagolóeszközök össztömege alapján kell meghatározni;
- e) a folyadékot tartalmazó belső csomagolóeszközöket teljesen körül kell venni felszívóképes anyaggal, amely a belső csomagolóeszközök teljes folyadéktartalmának felszívására elegendő mennyiségű;
- f) ha a külső csomagolóeszközt folyadékot tartalmazó belső csomagolóeszközökhöz használják és nem szivárgásmentes, ill. szilárd anyagot tartalmazó belső csomagolóeszközökhöz használják és nem portömör, akkor szivárgásmentes bélés, műanyag zsák vagy egyéb azonos hatékonyságú eszköz alkalmazásával biztosítani kell, hogy a folyadékot, ill. szilárd anyagot szivárgás esetén is megtartsa. Folyadékot tartalmazó csomagolóeszközöknél az előző e) pont szerinti felszívóképes anyagot a folyadékot tartalmazó belső csomagolóeszközöket befogadó eszköz belsejébe kell helyezni.
- g) a csomagolóeszközt a 6.1.3 szakasz szerint úgy kell jelölni, mint az I csomagolási csoportra vizsgált kombinált csomagolásokat. A feltüntetett „legnagyobb össztömeg kg-ban” a külső csomagolóeszköz tömegének és az előző a) pont szerinti ejtőpróba-hoz használt belső csomagolóeszközök fele össztömegének összege legyen. A csomagolóeszköz jelölésében a „V” betűt is fel kell tüntetni, mint azt a 6.1.2.4 bekezdés előírja.

6.1.5.1.8 Az illetékes hatóság bármikor előírhatja, hogy a jelen szakasz előírásainak megfelelő próbákkal igazolják, hogy a sorozatban gyártott csomagolóeszközök megfelelnek a gyártási típus követelményeinek. A vizsgálatok jegyzőkönyvét ellenőrzés céljából meg kell őrizni.

6.1.5.1.9 Amennyiben biztonsági okokból valamilyen belső felületkezelés vagy bevonat szükséges, annak védő tulajdonságait a vizsgálatok után is meg kell őriznie.

6.1.5.1.10 Amennyiben a vizsgálat eredményeinek érvényességét nem befolyásolja és az illetékes hatóság hozzájárul, ugyanazon a mintadarabon több vizsgálat is végezhető.

6.1.5.1.11 *Kármentő csomagolások*

A kármentő csomagolásokat (lásd az 1.2.1 szakaszt) a szilárd anyagok vagy belső csomagolások szállítására használt, II csomagolási csoportba tartozó csomagolóeszközökre vonatkozó előírások szerint kell vizsgálni és jelölni, a következő eltérésekkel:

- a) a vizsgálatok végrehajtásához töltőanyagként vizet kell használni és a csomagolóeszközöket ürtartalmuk legalább 98%-áig kell megtölteni. Abból a célból, hogy elérjék a küldeménydarab megkövetelt össztömegét, kiegészítő terhek is használhatók, pl. ólomszemcsét tartalmazó zsákok, feltéve, hogy ezeket oly módon helyezik el, hogy nem hamisítják meg a próbák eredményét. Ennek alternatívájaként az ejtőpróba végrehajtásánál az ejtési magasság a 6.1.5.3.5 b) ponttal összhangban változtatható;

- b) ezenkívül a csomagolóeszközöknek sikeresen ki kell állniuk a 30 kPa-lal végrehajtott tömörségi próbát, a próba eredményét a 6.1.5.8 bekezdésben előírt vizsgálati jegyzőkönyvben rögzíteni kell; és
- c) a csomagolóeszközöket „T” betűvel kell jelölni, mint azt a 6.1.2.4 bekezdés előírja.

6.1.5.2 *A csomagolóeszközök előkészítése a próbákhoz*

6.1.5.2.1 A próbákat szállításra kész csomagolásokon kell végrehajtani, beleértve a kombinált csomagolások esetén azok belső csomagolásait. A belső csomagolóeszközöket, a tartályokat, az önálló csomagolóeszközöket, a zsákok kivételével, folyadékok esetén ürtartalmuk legalább 98%-áig, szilárd anyag esetén legalább 95%-áig kell megtölteni. A zsákokat az engedélyezett legnagyobb tömegig kell megtölteni. A kombinált csomagolásoknál, ahol a belső csomagolóeszközök folyadékokat és szilárd anyagokat egyaránt tartalmaznak, külön vizsgálat szükséges a folyadék és külön a szilárd anyag tartalomra. A szállítandó anyag helyettesíthető más anyaggal, kivéve, ha ez meghamisítaná a próbák eredményét. Szilárd anyag esetén a helyettesítő anyagnak ugyanolyan fizikai jellemzői legyenek (tömeg, szemcseméret stb.), mint a szállítandó anyagnak. Abból a célból, hogy elérjék a küldeménydarab megkövetelt össztömegét, kiegészítő terhek is használhatók, pl. ólomszemcsét tartalmazó zsákok, feltéve, hogy ezeket oly módon helyezik el, hogy nem hamisítják meg a próbák eredményét.

6.1.5.2.2 Folyadékokra vonatkozó ejtőpróbáknál ha más anyagot használnak, ennek a szállítandó anyaggal azonos relatív sűrűségűnek és viszkozitásúnak kell lennie. A 6.1.5.3.5 pontban meghatározott feltételek között végzett ejtőpróbákhoz víz is használható.

6.1.5.2.3 A papírból vagy papírlémezről készült csomagolóeszközöket legalább 24 órán át szabályozott hőmérsékletű és relatív páratartalmú levegőn kell tartani. Három megoldás közül lehet választani. Az ajánlott érték $23\text{ °C} \pm 2\text{ °C}$ hőmérséklet és $50\% \pm 2\%$ relatív páratartalom. A másik két lehetőség: $20\text{ °C} \pm 2\text{ °C}$ hőmérséklet és $65\% \pm 2\%$ relatív páratartalom, illetve $27\text{ °C} \pm 2\text{ °C}$ hőmérséklet és $65\% \pm 2\%$ relatív páratartalom.

***Megjegyzés:** Az átlagértékeknek e határok közé kell esni. A rövid idejű ingadozások és a mérési korlátok az egyedi mérésektől legfeljebb $\pm 5\%$ relatív páratartalom eltérést eredményezhetnek a vizsgálatok reprodukálhatóságának észrevehető csökkenése nélkül.*

6.1.5.2.4 (fenntartva)

6.1.5.2.5 A 6.1.4.8 bekezdés szerinti műanyag hordókat, kannákat és – ha szükséges – a 6.1.4.19 bekezdés szerinti összetett (műanyag) csomagolóeszközöket abból a célból, hogy kipróbálják, hogy kémiai összeférhetőségük a folyadékokkal kielégítő-e, szobahőmérsékleten hat hónapig kell tárolni, ez idő alatt a mintadaraboknak azokkal az árukkal kell megtöltve lenniük, amelyeket szállítani kívánnak bennük.

A tárolás első és utolsó 24 órája alatt a mintadarabokat zárószerkezetükkel lefelé kell állítani. A szellőző-szerkezettel ellátott csomagolóeszközöket azonban egy-egy alkalommal csak öt percig kell ilyen helyzetben tartani. A tárolást követően a mintadarabokat a 6.1.5.3 – 6.1.5.6 bekezdésben előírt próbáknak kell alávetni.

Az összetett (műanyag) csomagolóeszközök belső tartályai esetén nem szükséges a kémiai összeférhetőséget bizonyítani, ha ismeretes, hogy a műanyag szilárdsági jellemzői a töltőanyag hatására lényegesen nem változnak meg.

A szilárdsági jellemzők lényeges változásán a következőket kell érteni:

- a) jelentős ridegedést; vagy
- b) a szakítószilárdság jelentős csökkenését, hacsak ez nem jár a szakadási nyúlás legalább arányos növekedésével.

Ha a műanyag viselkedését más módszerekkel megállapították, az előző összeférhetőségi

vizsgálatától el lehet tekinteni. Az ilyen eljárásoknak azonban legalábbis azonos értékűnek kell lennie az előző összeférhetőségi vizsgálattal és azokat az illetékes hatóságnak el kell ismernie.

Megjegyzés: *Az olyan műanyag hordókra és kannákra, valamint az összetett (műanyag) csomagolóeszközökre vonatkozóan, amelyek polietilénből készülnek, lásd a 6.1.5.2.6 pontot is.*

6.1.5.2.6

A 6.1.4.8 bekezdés szerinti, polietilénből készült hordóknál és kannáknál, valamint – ha szükséges – a 6.1.4.19 bekezdés szerinti, polietilénből készült összetett (műanyag) csomagolóeszközöknél a töltőanyaggal való kémiai összeférhetőség a 4.1.1.21 bekezdés alapján hozzárendelt standardfolyadék(ok)kal is bizonyítható a következők szerint (lásd a 6.1.6 szakaszt is).

A standardfolyadékok a polietilénnél fellépő károsító folyamatok (így a lágyulás duzzadás révén, a feszültségkorrózió, a molekula degradációs reakciók és ezek kombinációi) szempontjából reprezentálják a szállítandó anyagot. E csomagolóeszközök kielégítő kémiai összeférhetősége bizonyítható háromhetes 40 °C-on végzett tárolással a megfelelő standardfolyadékkal feltöltve; az ezen eljárással végzett tárolásra nincs szükség, ha standardfolyadékként víz van megadva. Ugyancsak nem szükséges tárolni a halmazolási próbához használt mintadarabokat, ha standardfolyadékként nedvesítőszer oldat vagy ecetsav van megadva.

A tárolás első és utolsó 24 órája alatt a mintadarabokat zárószerkezetükkel lefelé kell állítani. A szellőző-szerkezettel ellátott csomagolóeszközöket azonban egy-egy alkalommal csak öt percig kell ilyen helyzetben tartani. A tárolás után a mintadarabokat a 6.1.5.3 – 6.1.5.6 bekezdésben előírt próbáknak kell alávetni.

Az 5.2 osztályba tartozó, 40%-nál nagyobb peroxid-tartalmú terc-butil-hidroperoxid és a peroxi-ecetsavak esetében az összeférhetőségi vizsgálat standardfolyadékkal nem végezhető el. Ezeknél az anyagoknál a kielégítő kémiai összeférhetőség bizonyításához a mintadarabot a szállítani kívánt anyaggal megtöltve hat hónapon keresztül kell szobahőmérsékleten tárolni.

A polietilénből készült csomagolóeszközökre e pont szerinti eljárás alapján kapott eredmények azokra a hasonló gyártási típusokra is elfogadhatók, amelyek belső felülete fluorozott.

6.1.5.2.7

A 6.1.5.2.6 pont szerinti polietilénből készült csomagolóeszközök, ha kiállták a 6.1.5.2.6 pont szerinti próbát, más töltőanyagokra is jóváhagyhatók, mint amelyeket 4.1.1.21 bekezdés szerint helyettesítettek. Ennek a jóváhagyásnak laboratóriumi vizsgálatokon kell alapulnia, amelyeknek igazolniuk kell, hogy ezeknek az anyagoknak a hatása a mintadarabokra – a figyelembe veendő károsodási folyamatok szempontjából – gyengébb, mint a standardfolyadék(ok)é. A relatív sűrűsége és a göznyomásra az előző 4.1.1.21.2 pont feltételei érvényesek.

6.1.5.2.8

A kombinált csomagolások műanyag belső csomagolóeszközein nem szükséges a kémiai összeférhetőséget bizonyítani, ha ismeretes, hogy a műanyag szilárdsági jellemzői a betöltött anyag hatására lényegesen nem változnak.

A szilárdsági jellemzők lényeges változásán a következőket kell érteni:

- a) a jelentős ridegedést; vagy
- b) a rugalmasság jelentős csökkenését, hacsak ez nem jár a szakadási nyúlás legalább arányos növekedésével.

6.1.5.3

Ejtőpróba⁴⁾

6.1.5.3.1

A próbadarabok száma (gyártási típusonként és gyártónként) és a próbadarab helyzete az ejtőpróbához

4) Lásd az ISO 2248 szabványt.

A lapra való ejtéstől eltérő ejtőpróbáknál a tömegközéppontnak függőlegesen a felütközési pont fölött kell lennie.

Amennyiben egynél több helyzet lehetséges egy adott ejtőpróbánál, azt a helyzetet kell választani, ami a legnagyobb valószínűséggel eredményezi a csomagolóeszköz sérülését.

Csomagolóeszköz	A próbadarabok száma	A próbadarabok helyzete az ejtőpróba
a) Acélhordó Alumíniumhordó Fémhordó (acélt és alumíniumot kivéve) Acélkanna Alumíniumkanna Rétegelt falemez hordó Papírlemez hordó Műanyag hordó és kanna Hordó alakú összetett csomagolóeszköz Finomlemez csomagolóeszköz	hat (ejtőpróbanként három)	<i>első próba</i> (három próbadarabbal): a csomagolásokat átlósan a fenék korcolására, vagy ha ilyen nincs, a körvarratra vagy az élre kell ejteni <i>második próba</i> (három másik próbadarabbal): a csomagolásokat a leggyengébb pontra kell ejteni, amely az első ejtés során nem került vizsgálatra, pl. az egyik záróelemre vagy egyes hengeres hordóknál a hordópalást hosszirányú hegesztési varratára
b) Faláda Rétegelt falemez láda Farostlemez láda Papírlemez láda Műanyag láda Acél- vagy alumíniumláda Láda alakú összetett csomagolóeszköz	öt (ejtőpróbanként egy)	<i>első próba</i> : a fenéklapra <i>második próba</i> : a tetőlapra <i>harmadik próba</i> : a hosszabbik oldallapra <i>negyedik próba</i> : a rövidebbik oldallapra <i>ötödik próba</i> : az egyik sarokra
c) Zsák – egyrétegű, oldalvarrattal	három (három ejtés zsákonként)	<i>első próba</i> : a zsák egyik széles oldallapjára <i>második próba</i> : a zsák egyik keskeny oldallapjára <i>harmadik próba</i> : a zsák végére
d) Zsák – egyrétegű, oldalvarrat nélkül, vagy többretegű	három (két ejtés zsákonként)	<i>első próba</i> : a zsák egyik széles oldallapjára <i>második próba</i> : a zsák végére
e) Hordó vagy láda alakú összetett (üveg, porcelán, kőagyag) csomagolóeszköz, amely a 6.1.3.1 a) ii) pont szerint „RID/ADR” jellel van ellátva	három (ejtőpróbanként egy)	átlós irányban a fenék peremére, ha ilyen nincs, a körvarratra vagy a fenékélre

6.1.5.3.2

A próbadarabok különleges előkészítése az ejtőpróba

A próbadarab és tartalmának hőmérsékletét –18 °C-ra vagy az alá kell csökkenteni a következő csomagolásoknál:

- műanyag hordók (lásd a 6.1.4.8 bekezdést);
- műanyag kannák (lásd a 6.1.4.8 bekezdést);
- műanyag ládák a habosított műanyag ládák kivételével (lásd a 6.1.4.13 bekezdést);
- összetett (műanyag) csomagolóeszközök (lásd a 6.1.4.19 bekezdést); és
- kombinált csomagolások műanyag belső csomagolóeszközökkel, a szilárd anyagokhoz vagy tárgyakhoz használt műanyag zsákok kivételével.

Ha a próbadarabokat így módon készítették elő, a 6.1.5.2.3 pontban előírt kondicionálás elhagyható. A próbához használt folyadékokat szükség esetén fagyásgátló hozzáadásával kell folyékony állapotban tartani.

6.1.5.3.3 A folyékony anyagokhoz használt, levehető tetejű csomagolóeszköznél csak a megtöltés és lezárás után 24 óra múlva szabad az ejtőpróbát elvégezni, tekintettel a tömítés esetleges rugalmas alakváltozására.

6.1.5.3.4 *Ütközőlap*

Az ütközőlap legyen rugalmatlan és vízszintes felületű, valamint:

- egy darabból álló és elég masszív, hogy ne mozdulhasson el;
- sima felületű, amely mentes minden olyan helyi hibától, amely befolyásolhatná a vizsgálat eredményét;
- elég szilárd, hogy a vizsgálati körülmények között ne deformálódjon és ne sérülhessen meg a vizsgálat hatására;
- elég nagy, hogy a vizsgált küldeménydarab teljes egészében a felületére essék.

6.1.5.3.5 *Ejtési magasság*

Szilárd és folyékony anyagoknál, ha a próbát a szállítandó szilárd vagy folyékony anyaggal vagy lényegében azonos fizikai jellemzőkkel bíró egyéb anyaggal végzik:

I csomagolási csoport	II csomagolási csoport	III csomagolási csoport
1,8 m	1,2 m	0,8 m

Önálló csomagolóeszközökben vagy kombinált csomagolások belső csomagolóeszközeiben levő folyékony anyagok esetén, ha a próbát vízzel hajtják végre:

Megjegyzés: A víz alatt értendők a -18 °C -on végzett vizsgálathoz használt, legalább 0,95 relatív sűrűségű víz/fagyásgátló oldatok is.

- a) olyan szállítandó anyagoknál, amelyeknek relatív sűrűsége nem haladja meg az 1,2 értéket:

I csomagolási csoport	II csomagolási csoport	III csomagolási csoport
1,8 m	1,2 m	0,8 m

- b) olyan szállítandó anyagok esetén, amelyeknek relatív sűrűsége meghaladja az 1,2 értéket, az ejtési magasságot a szállítandó anyag relatív sűrűségéből a következő módon kell kiszámítani (egy tizedesre felkerekítve):

I csomagolási csoport	II csomagolási csoport	III csomagolási csoport
relatív sűrűség $\times 1,5$ (m)	relatív sűrűség $\times 1,0$ (m)	relatív sűrűség $\times 0,67$ (m)

- c) olyan anyagok szállítására használt és a 6.1.3.1 a) ii) pont szerint „RID/ADR” jellel ellátott finomlemez csomagolóeszközök esetében, amelyeknek viszkozitása 23 °C -on $200\text{ mm}^2/\text{s}$ -nál nagyobb (ez megfelel az ISO 2431:1993 szabvány szerinti 6 mm átmérőjű kifolyónyílású szabványos pohárból 30 s kifolyási időnek):

- i) ha a relatív sűrűség nem haladja meg az 1,2 értéket:

II csomagolási csoport	III csomagolási csoport
0,6 m	0,4 m

- ii) ha a szállítandó anyag relatív sűrűsége meghaladja az 1,2 értéket, az ejtési magasságot a szállítandó anyag relatív sűrűségéből a következő módon kell kiszámítani (egy tizedesre felkerekítve):

II csomagolási csoport	III csomagolási csoport
relatív sűrűség $\times 0,5$ m	relatív sűrűség $\times 0,33$ m

6.1.5.3.6 *Elfogadási feltétel*

6.1.5.3.6.1 Minden folyadékot tartalmazó csomagolásnak tömítettnek kell maradnia, miután a belső és a külső nyomás között az egyensúly létrejött; a 6.1.3.1 a) ii) pont szerint „RID/ADR” jellel ellátott, összetett (üveg, porcelán és kőagyag) csomagolóeszközöknél és a kombinált csomagolások belső csomagolásainál nincs szükség arra, hogy a nyomások kiegyenlítődjenek.

6.1.5.3.6.2 Ha szilárd anyagok szállítására használt csomagolóeszközt ejtőpróbának vetnek alá úgy, hogy az ütközőlapra a felső rész ütközik fel, és a tartalmat a belső csomagolóeszköz vagy belső tartály (pl. műanyag zsák) teljes egészében megtartotta, a próbadarab kiállta a próbát, még akkor is, ha a zárószerkezet már nem portömör, de megtartó funkcióját megőrizte.

6.1.5.3.6.3 A csomagolóeszközön, ill. az összetett csomagolóeszköz vagy a kombinált csomagolás külső csomagolóeszközén nem szabad olyan sérülésnek mutatkoznia, amely befolyásolná a szállítás biztonságát. A belső tartályoknak, a belső csomagolóeszközöknek, ill. a tárgyaknak teljesen a külső csomagolóeszközben kell maradniuk, és a belső tartály(ok)ból, ill. csomagolóeszköz(ök)ből a töltőanyag nem szivároghat vagy szóródhat ki.

6.1.5.3.6.4 A zsákok külső rétegén, ill. a külső csomagolóeszközön nem szabad olyan sérülésnek mutatkoznia, amely befolyásolná a szállítás biztonságát.

6.1.5.3.6.5 Felütközésnél a zárószerkezeteknél keletkezett nagyon csekély veszteség nem tekinthető a csomagolás hiányosságának, feltéve, hogy további elfolyás nincs.

6.1.5.3.6.6 Az 1 osztályba tartozó áruk csomagolásán semmiféle olyan repedés nem engedhető meg, amely miatt az robbanóanyagok vagy -tárgyak a külső csomagolóeszközből kijuthatnának.

6.1.5.4 *Tömörégi próba*

Tömörégi próbát kell végrehajtani minden, folyékony anyag szállítására szánt csomagolás típuson, kivéve:

- a kombinált csomagolások belső csomagolásait;
- a 6.1.3.1 a) ii) pont szerint „RID/ADR” jellel ellátott és összetett (üveg, porcelán és kőagyag) csomagolóeszközök belső tartályait;
- az olyan finomlemez csomagolóeszközöket, amelyek 23 °C-on 200 mm²/s-nál nagyobb viszkozitású anyagok csomagolására valók és a 6.1.3.1 a) ii) pont szerint „RID/ADR” jellel vannak ellátva.

6.1.5.4.1 *A próbadarabok száma:* gyártási mintánként és gyártónként három próbadarab.

6.1.5.4.2 *A próbadarabok különleges előkészítése a próbához:* a szellőző-szerkezettel ellátott zárószerkezetet hasonló, de szellőző-szerkezet nélkülire kell kicserélni, vagy a szellőző-szerkezetet le kell zárni.

6.1.5.4.3 *Vizsgálati módszer és alkalmazandó nyomás:* a csomagolóeszközöket, beleértve a zárószerkezeteket is, víz alatt kell tartani 5 percen át, mialatt a belső levegőnyomás hat rájuk; a rögzítési módszernek nem szabad a próba eredményét befolyásolnia.

Az alkalmazandó levegőnyomás (túlnyomás):

I csomagolási csoport	II csomagolási csoport	III csomagolási csoport
legalább 30 kPa (0,3 bar)	legalább 20 kPa (0,2 bar)	legalább 20 kPa (0,2 bar)

Alkalmazhatók más, legalább azonos hatékonyságú eljárások is.

6.1.5.4.4 *Elfogadási feltétel:* nem következhet be semmiféle szivárgás.

6.1.5.5 *Belsőnyomás-állósági próba (folyadéknyomás-próba)*

6.1.5.5.1 *A vizsgálandó csomagolóeszközök*

A folyadéknomás-próbát folyadék befogadására használt, minden fémből és műanyagból készült és összetett csomagolóeszköz típusán el kell végezni. Nincs szükség nyomáspróbára:

- a kombinált csomagolások belső csomagolásain;
- a 6.1.3.1 a) ii) pont szerint „RID/ADR” jellel ellátott összetett (üveg, porcelán és kőagyag) csomagolóeszközök belső tartályain; és
- az olyan finomlemez csomagolóeszközökön, amelyek 23 °C-on 200 mm²/s-nál nagyobb viszkozitású anyagok csomagolására valók és a 6.1.3.1 a) ii) pont szerint „RID/ADR” jellel vannak ellátva.

6.1.5.5.2 *A próbadarabok száma:* gyártási mintánként és gyártónként három próbadarab.

6.1.5.5.3 *A próbadarabok különleges előkészítése a próbához:* a szellőző-szerkezettel ellátott záró-szerkezetet hasonló, de szellőző-szerkezet nélkülire kell kicserélni, vagy a szellőző-szerkezeteket le kell zárni.

6.1.5.5.4 *Vizsgálati módszer és alkalmazandó nyomás:* a fém csomagolóeszközöket és az összetett (üveg, kőagyag, porcelán) csomagolóeszközöket, beleértve záró-szerkezeteiket is, 5 percig kell a próbanyomásnak kitenni. A műanyag csomagolóeszközöket és az összetett (műanyag) csomagolóeszközöket, beleértve záró-szerkezeteiket is, 30 percig kell a próbanyomásnak kitenni. Ez az a próbanyomás, amit a jelölésben a 6.1.3.1 d) pont szerint fel kell tüntetni. A csomagolóeszköz megtámasztásának módja nem hamisíthatja meg a próba eredményeit. A nyomást folyamatosan és egyenletesen kell növelni. A próbanyomást a próba teljes időtartama alatt állandó értéken kell tartani. Az alkalmazott folyadéknymást (túlnymást) a következő módszerek egyikével kell meghatározni. A próbanyomás nem lehet kisebb, mint:

- a) a csomagolásban 55 °C-on mért teljes túlnyomás (vagyis a betöltött folyadék gőznyomásának és a levegő vagy más inert gázok parciális nyomásának összegéből levonva 100 kPa-t) szorozva 1,5 biztonsági tényezővel; e teljes túlnyomás meghatározásához a 4.1.1.4 bekezdés szerinti maximális töltési fokot és 15 °C töltési hőmérsékletet kell alapul venni; vagy
- b) a betöltött folyadék 50 °C-on mért gőznyomásának 1,75-szorosából levonva 100 kPa-t, de legalább 100 kPa túlnyomás; vagy
- c) a betöltött folyadék 55 °C-on mért gőznyomásának 1,5-szereséből levonva 100 kPa-t, de legalább 100 kPa túlnyomás.

6.1.5.5.5 Ezenkívül az I csomagolási csoportba tartozó folyadékokhoz szánt csomagolóeszközöket a csomagolóeszköz szerkezeti anyagától függően 5 percig vagy 30 percig legalább 250 kPa próbanyomással (túlnomással) kell vizsgálni.

6.1.5.5.6 *Elfogadási feltétel:* egyetlen csomagolóeszköz sem szivároghat.

6.1.5.6 *Halmazolási próba*

A halmazolási próbát minden csomagolástípuson el kell végezni, kivéve a zsákokat és a 6.1.3.1 a) ii) pont szerint „RID/ADR” jellel ellátott, nem halmazolható, összetett (üveg, porcelán és kőagyag) csomagolóeszközöket.

6.1.5.6.1 *A próbadarabok száma:* gyártási mintánként és gyártónként három próbadarab.

6.1.5.6.2 *Vizsgálati módszer:* a próbadarabot ki kell tenni a csomagolóeszköz felső felületére ható, az azonos küldeménydarabok össztömegével megegyező erőnek, melyek a szállítás során arra halmazolhatók; amennyiben a próbadarab tartalma olyan folyadék, amelynek relatív sűrűsége eltér a szállítandó folyadék sűrűségétől, az erőt ez utóbbira vonatkoztatva kell kiszámítani. A legkisebb halmazolási magasság, beleértve a próbadarabot is, 3 méter. A próba időtartama 24 óra, kivéve a folyadékokhoz szánt műanyag hordókat, kannákat és a 6HH1 és 6HH2 összetett csomagolóeszközöket, amelyeket 28 nap időtartamon át kell legalább 40 °C hőmérsékleten halmazolási próbának alávetni.

A 6.1.5.2.5 pont szerinti vizsgálatához az eredeti töltőanyagot kell használni. A 6.1.5.2.6 pont

szerinti vizsgálatnál a halmazolási próbát standardfolyadékkal kell végrehajtani.

- 6.1.5.6.3** *Elfogadási feltétel:* A csomagolóeszköz nem szivároghat. Összetett csomagolóeszközök, ill. kombinált csomagolások esetén a belső tartályban, ill. a belső csomagolásban található anyagból semennyinek sem szabad kifolynia. Egyetlen próbadarabon sem szabad olyan sérülésnek lennie, amely veszélyeztetheti a szállítás során a biztonságot, sem pedig olyan alakváltozásoknak, amelyek csökkenthetik a szilárdságot vagy a stabilitás hiányát vonhatják maguk után, ha a küldeménydarabokat egymásra rakják. A műanyag csomagolóeszközöket a próba értékelése előtt környezeti hőmérsékletre kell hűteni.
- 6.1.5.7** *Kiegészítő áteresztőképességi (szivárgási) próba a 60 °C vagy annál kisebb lobbaspontú folyadékok szállítására használt, a 6.1.4.8 bekezdés szerinti műanyag hordókra és kannákra, és a 6.1.4.19 bekezdés szerinti összetett (műanyag) csomagolóeszközökre, kivéve a 6HA1 kódjelű csomagolóeszközöket*

A polietilénből gyártott csomagolóeszközökön ezt a próbát csak akkor kell végrehajtani, ha benzol, toluol, xilol vagy ezeket az anyagokat tartalmazó keverékek vagy készítmények szállítására kell jóváhagyni.

- 6.1.5.7.1** *A próbadarabok száma:* Gyártási típusonként és gyártónként három próbadarab.
- 6.1.5.7.2** *A próbadarabok különleges előkészítése a próbákhoz:* A próbadarabokat előzetesen, vagy a 6.1.5.2.5 pont szerint eredeti töltőanyaggal, vagy polietilénből gyártott csomagolóeszközöknél a 6.1.5.2.6 pont szerint szénhidrogén-keverék (white spirit) standardfolyadékkal megtöltve kell tárolni.
- 6.1.5.7.3** *Vizsgálati eljárás:* A jóváhagyandó anyaggal megtöltött próbadarabokat 50%-os relatív páratartalom mellett és 23 °C-on 28 napig tartó tárolás előtt és után le kell mérni. A polietilénből gyártott csomagolásoknál a próbát szénhidrogén-keverék (white spirit) standardfolyadékkal is el lehet végezni benzol, toluol vagy xilol helyett.
- 6.1.5.7.4** *Elfogadási feltétel:* A folyadékáteresztés (szivárgás) nem haladhatja meg a 0,008 g/(l·h) értéket.

6.1.5.8 *Vizsgálati jegyzőkönyv*

- 6.1.5.8.1** A vizsgálatokról legalább a következő adatokat tartalmazó jegyzőkönyvet kell készíteni, amit a csomagolóeszköz felhasználói számára hozzáférhetővé kell tenni:
1. A vizsgálatot végző szervezet neve és címe;
 2. A vizsgálatot kérő neve és címe (ha szükséges);
 3. A vizsgálati jegyzőkönyv egyedi azonosítója;
 4. A vizsgálati jegyzőkönyv kelte;
 5. A csomagolóeszköz gyártója;
 6. A csomagolóeszköz típus leírása (pl. méretek, anyagok, zárószerkezetek, falvastagság stb.), beleértve a gyártási módszert (pl. üreges test fűvás), ami rajzzal (rajzokkal) és/vagy fényképpel (fényképekkel) kiegészíthető;
 7. Legnagyobb űrtartalom;
 8. A vizsgálat alatti tartalom jellemzői, pl. folyadékoknál a viszkozitás és a relatív sűrűség és szilárd anyagoknál a szemcseméret;
 9. A vizsgálatok leírása és eredményei;
 10. A vizsgálati jegyzőkönyvet alá kell írni, az aláíró nevét és beosztását fel kell tüntetni.

6.1.5.8.2 A vizsgálati jegyzőkönyvnek megállapítást kell tartalmaznia arra nézve, hogy a szállításra előkészített csomagolás ezen fejezet megfelelő rendelkezéseivel összhangban került vizsgálatra és más csomagolási módszerek vagy alkotórészek használata azt érvénytelenné teheti. A vizsgálati jegyzőkönyv egy példányát az illetékes hatóság rendelkezésére kell bocsátani.

6.1.6 Standardfolyadékok polietilénből gyártott csomagolóeszközök (IBC-k) kémiai összeférhetőségének a 6.1.5.2.6, ill. a 6.5.6.3.5 pont szerinti vizsgálatához

6.1.6.1 Az ilyen műanyaghoz a következő standardfolyadékokat kell használni:

- a) Nedvesítőszer oldatot olyan anyagoknál, amelyeknek a polietilénre erős, feszültség-korróziót kiváltó hatásuk van, különösen az összes, nedvesítőszeret tartalmazó oldatnál és készítménynél.

Alkil-benzol-szulfonát 1%-os vizes oldatát vagy nonil-fenol-etoxilát 5%-os vizes oldatát kell használni, amelyet a vizsgálatokhoz történő első felhasználás előtt legalább 14 napig 40 °C-on előtárolásnak kell alávetni. Az oldat felületi feszültségének 23 °C-on 31...35 mN/m-nek kell lennie.

A halmazolási próbánál legalább 1,2 relatív sűrűség-értéket kell alapul venni.

Amennyiben a nedvesítőszer oldattal való kielégítő kémiai összeférhetőség bizonyított, akkor ecetsavval nem kell összeférhetőségi vizsgálatot végezni.

Olyan töltőanyagok esetén, amelyeknek a polietilénre a nedvesítőszer oldatnál erősebb feszültségkorróziót kiváltó hatásuk van, a kielégítő kémiai összeférhetőséget a 6.1.5.2.6 pont szerinti, 40 °C-on végzett, háromhetes előtárolással, de az eredeti töltőanyaggal lehet vizsgálni.

- b) Ecetsavat olyan anyagoknál és készítményeknél, amelyeknek a polietilénre feszültségkorróziót kiváltó hatásuk van, különösen a monokarbonsavaknál és egyértékű alkoholoknál.

98...100%-os koncentrációjú ecetsavat kell használni, amelynek relatív sűrűsége 1,05.

A halmazolási próbánál legalább 1,1 relatív sűrűség-értéket kell alapul venni.

Olyan töltőanyagok esetén, amelyek a polietilént az ecetsavnál nagyobb mértékben és legfeljebb 4% tömegnövekedést kitevő mértékben duzzasztják, a kielégítő kémiai összeférhetőséget a 6.1.5.2.6 pont szerinti 40 °C-on végzett háromhetes előtárolással, de az eredeti töltőanyaggal lehet vizsgálni.

- c) Normál-butil-acetátot/n-butil-acetáttal telített nedvesítőszer oldatot olyan anyagoknál és készítményeknél, amelyek a polietilént legfeljebb 4% tömegnövekedést kitevő mértékben duzzasztják, és egyidejűleg feszültségkorróziót okoznak, különösen növényvédő szereknél, folyékony festékeknél és észtereknél. A 6.1.5.2.6 pont szerinti előtároláshoz 98...100%-os koncentrációjú n-butil-acetátot kell használni.

A 6.1.5.6 bekezdés szerinti halmazolási próbához az előző a) pont szerinti 1...10% vizes nedvesítőszer oldatot és 2% n-butil-acetátot tartalmazó vizsgálfolyadékot kell használni.

A halmazolási próbánál legalább 1,0 relatív sűrűség-értéket kell alapul venni.

Olyan töltőanyagok esetén, amelyek a polietilént az n-butil-acetátnál nagyobb mértékben és legfeljebb 7,5% tömegnövekedést kitevő mértékben duzzasztják, a kielégítő kémiai összeférhetőséget a 6.1.5.2.6 pont szerinti 40 °C-on végzett háromhetes előtárolással, de az eredeti töltőanyaggal lehet vizsgálni.

- d) Szénhidrogén-keveréket (white spirit) a polietilénre duzzasztó hatást kifejtő anyagoknál és készítményeknél, különösen szénhidrogénekkel, észterekkel és ketonokkal.

A szénhidrogén-keverék forrás tartományának 160...220 °C közöttinek, relatív sűrűségének 0,78...0,80 közöttinek, lobbanáspontjának 50 °C fölöttinek és aromás szén-

hidrogén-tartalmának 16...21%-nak kell lenni.

A halmazolási próbánál legalább 1,0 relatív sűrűség-értéket kell alapul venni.

Olyan töltőanyagok esetén, amelyek a polietilént 7,5%-nál nagyobb tömegnövekedést kitevő mértékben duzzasztják, a kielégítő kémiai összeférhetőséget a 6.1.5.2.6 pont szerinti 40 °C-on végzett háromhetes előtárolás után, de az eredeti töltőanyaggal lehet vizsgálni.

- e) Salétromsavat minden olyan anyagnál és készítménynél, amelynek a polietilénre gyakorolt oxidáló hatása és molekulatömeg-csökkentése azonos vagy kisebb mértékű, mint az 55%-os salétromsavé.

A salétromsavat legalább 55%-os koncentrációban kell alkalmazni.

A halmazolási próbánál legalább 1,4 relatív sűrűség-értéket kell alapul venni.

Olyan töltőanyagok esetén, amelyek oxidáló hatása vagy molekulatömeg-csökkentése nagyobb mértékű, mint az 55%-os salétromsavé, a 6.1.5.2.5 pont szerint kell eljárni.

Az ilyen esetekben a felhasználhatóság időtartamát a károsodás mértékének megfigyelése alapján kell meghatározni (pl. legalább 55%-os töménységű salétromsavnál 2 év).

- f) Vizet azoknál az anyagoknál, amelyek az a) – e) pontban jelzett esetektől eltérően nem támadják meg a polietilént, különösen szerves savaknál és lúgoknál, vizes sóoldatoknál, többértékű alkoholoknál és vízben oldott szerves anyagok esetében. A halmazolási próbánál legalább 1,2 relatív sűrűség-értéket kell alapul venni. Ha a megfelelő kémiai összeférhetőség nedvesítőszer oldattal vagy salétromsavval bizonyított, a gyártási típust nem szükséges vízzel vizsgálni.

6.2 FEJEZET

A NYOMÁSTARTÓ TARTÁLYOK, AZ AEROSZOLOK, A GÁZZAL TÖLTÖTT, KISMÉRETŰ TARTÁLYOK (GÁZPATRONOK) ÉS A GYÚLÉKONY, CSEPPFOLYÓSÍTOTT GÁZT TARTALMAZÓ ÜZEMANYAGCELLA KAZETTÁK GYÁRTÁSÁRA ÉS VIZSGÁLATÁRA VONATKOZÓ KÖVETELMÉNYEK

Megjegyzés: Az aeroszokok, a gázzal töltött kisméretű tartályok (gázpatronok) és a gyúlékony, cseppfolyósított gázt tartalmazó üzemanyagcella kazetták nem tartoznak a 6.2.1 – 6.2.5 szakaszok hatálya alá.

6.2.1 Általános követelmények

6.2.1.1 Tervezés és gyártás

6.2.1.1.1 A nyomástartó tartályokat és zárószervezetüket úgy kell méretezni, gyártani, bevizsgálni és felszerelni, hogy a normális szállítási feltételek mellett és normális használatot feltételezve minden fellépő igénybevételt, beleértve a kifáradást is, elviseljenek.

6.2.1.1.2 (fenntartva)

6.2.1.1.3 A legkisebb falvastagság semmilyen esetben sem lehet kisebb a tervezésre és gyártásra vonatkozó műszaki szabványokban meghatározott értéknél.

6.2.1.1.4 Hegesztett nyomástartó tartályokhoz csak hibátlanul hegeszthető anyagok használhatók fel.

6.2.1.1.5 A palackok, nagypalackok, gázhordók és palackkötegek próbanyomásának a 4.1.4.1 bekezdés P200 csomagolási utasításában, a nyomás alatti vegyszerekénél a 4.1.4.1 bekezdés P206 csomagolási utasításában előírtaknak kell lennie. A zárt mélyhűtő tartályoknál a próbanyomásnak a 4.1.4.1 bekezdés P203 csomagolási utasításában előírtaknak kell lennie. A fémhidrid tárolórendszer próbanyomásának a 4.1.4.1 bekezdés P205 csomagolási utasításában előírtaknak kell lennie.

6.2.1.1.6 A köteget alkotó nyomástartó tartályokat szerkezeti szerelvényekkel kell egységbe építeni. A nyomástartó tartályokat úgy kell rögzíteni, hogy se a szerkezeti szerelvényekhez képest ne mozdulhassanak el, se oly módon, ami veszélyes helyi feszültség halmozódást okozna. A csőrendszert (pl. gyűjtőcsöveket, szelepeket, nyomásmérőket) úgy kell méretezni és kialakítani, hogy az ütközések okozta sérülésekkel és a szállítás során felépő szokásos erőhatásokkal szemben védve legyenek. A gyűjtőcső próbanyomásának legalább akkorának kell lennie, mint a palackokénak. A cseppfolyósított, mérgező gázok esetén mindegyik nyomástartó tartálynak elválasztó szeleppel kell rendelkeznie, ami biztosítja, hogy minden egyes nyomástartó tartály külön tölthető legyen és a szállítás alatt tartalmuk egymással ne cserélődhessen ki.

Megjegyzés: A cseppfolyósított, mérgező gázok a 2T, 2TF, 2TC, 2TO, 2TFC, ill. 2TOC osztályozási kód alá tartoznak.

6.2.1.1.7 Kerülni kell a különböző fémek érintkezését, ami a galvanikus hatás folytán károsodást okozhat.

6.2.1.1.8 A mélyhűtött, cseppfolyósított gázokhoz használt zárt mélyhűtő tartályok gyártására vonatkozó kiegészítő követelmények

6.2.1.1.8.1 Minden egyes nyomástartó tartályra meg kell állapítani a felhasznált fém mechanikai

tulajdonságait, beleértve az ütőszilárdságot és a hajlítási együtthatót.

Megjegyzés: Az ütőszilárdságra (a fajlagos ütőmunkára) vonatkozóan a 6.8.5.3 bekezdés részletezi az alkalmazható vizsgálati követelményeket.

- 6.2.1.1.8.2** A nyomástartó tartályokat hőszigetelni kell. A hőszigetelést az ütések ellen burkolattal kell védeni. Ha a nyomástartó tartály és a burkolat közötti tér légüres (vákuumszigetelés), a védőburkolatot úgy kell méretezni, hogy egy elismert műszaki szabályzat szerint számítva legalább 100 kPa (1 bar) külső nyomásnak vagy legalább 200 kPa (2 bar) (túlnyomás) számított kritikus felszakítási nyomásnak álljon ellen maradandó alakváltozás nélkül. Ha a burkolat gáztömören zár (pl. vákuumszigetelés esetén), megfelelő szerkezettel kell megakadályozni, hogy a nyomástartó tartályon vagy szerelvényein bekövetkező tömítetlenség esetén a szigetelőrétegben veszélyes nyomás keletkezzék. A berendezésnek meg kell akadályoznia, hogy a szigetelésbe nedvesség hatoljon be.
- 6.2.1.1.8.3** Azok a zárt mélyhűtő tartályok, amelyek atmoszférikus nyomáson -182 °C alatti forráspontú, mélyhűtött, cseppfolyósított gázok szállítására szolgálnak, nem tartalmazhatnak olyan anyagokat, amelyek az oxigénnel vagy az oxigénben dús környezettel veszélyes módon reagálhatnak, ha a hőszigetelés olyan részén helyezkednek el, ahol fennáll annak a veszélye, hogy oxigénnel vagy oxigénben dús környezettel érintkeznek.
- 6.2.1.1.8.4** A zárt mélyhűtő tartályokat megfelelő emelő és rögzítő szerkezetekkel kell tervezni és ellátni.
- 6.2.1.1.9** *Az acetilénhez használt nyomástartó tartályok gyártására vonatkozó kiegészítő követelmények*
- Az UN 1001 oldott acetilénhez és az UN 3374 oldószermentes acetilénhez használt nyomástartó tartályokat olyan, egyenletesen elosztott, porózus anyaggal kell kitölteni, amely megfelel az illetékes hatóság által meghatározott követelményeknek és vizsgálatoknak, és amely:
- a) összeférhető a nyomástartó tartállyal, és sem az acetilénnel, sem az oldószerrel (az UN 1001 oldott acetilén esetén) nem alkot káros vagy veszélyes vegyületet;
 - b) képes megakadályozni az acetilén bomlásának terjedését a porózus anyagban.
- Az UN 1001 oldott acetilén esetén az oldószernek összeférhetőnek kell lennie a nyomástartó tartállyal.
- 6.2.1.2** *Szerkezeti anyagok*
- 6.2.1.2.1** A nyomástartó tartályok és zárószervezetük anyaga, amely a veszélyes áruval közvetlenül érintkezik csak olyan lehet, amelyet a szállítandó veszélyes áru nem támad meg, ill. nem gyengít, és amely nem fejt ki veszélyes hatást, pl. reakció katalizálást vagy a veszélyes áruval való reakciót.
- 6.2.1.2.2** A nyomástartó tartályokat és zárószervezetüket a tervezésre és gyártásra vonatkozó műszaki szabványokban és a nyomástartó tartályban szállítandó veszélyes anyagra vonatkozó csomagolási utasításban meghatározott anyagból kell gyártani. Az anyagnak a tervezésre és gyártásra vonatkozó műszaki szabványban meghatározottak szerint ellenállónak kell lennie a ridegtöréssel és a feszültség alatti korróziós repedezéssel szemben.
- 6.2.1.3** *Üzemi szerelvények*
- 6.2.1.3.1** A nyomásnak kitett szelepeket, csővezetékeket és más szerelvényeket – a nyomáscsökkentő szerkezetek kivételével – úgy kell tervezni és gyártani, hogy a repesztőnyomásuk a nyomástartó tartály próbanyomásának legalább 1,5-szerese legyen.
- 6.2.1.3.2** Az üzemi szerelvényeket úgy kell kialakítani vagy elrendezni, hogy normális szállítási és

kezelési körülmények között ne sérülhessenek úgy meg, hogy a nyomástartó tartály tartalma a szabadba jusson. A nyomáscsökkentő szelepekhez vezető gyűjtőcső vezetéknek elegendően hajlékonynak kell lennie, hogy ne következhesen be a szelepek és a csővezeték nyíródása és a nyomástartó tartály tartalmának kiszabadulása. A töltő- és ürítő szelepeknek és a védőkupakoknak a nem szándékos nyitással szemben védhetőnek kell lenniük. A szelepeket a 4.1.6.8 bekezdésben előírt módon védeni kell.

- 6.2.1.3.3** A kézzel nem mozgatható, ill. nem gördíthető nyomástartó tartályokat olyan szerkezettel (pl. csúszótalppal, emelőfülekkel, kampókkal) kell ellátni, amely lehetővé teszi gépi berendezéssel való biztonságos kezelésüket, és ezt úgy kell tartályra felszerelni, hogy ne okozzák sem a nyomástartó tartály gyengülését, sem pedig meg nem engedhető igénybevételét.
- 6.2.1.3.4** Az önálló nyomástartó tartályokat a 4.1.4.1 bekezdés P200 csomagolási utasítása 2) bekezdése vagy a P205 csomagolási utasítás, ill. a 6.2.1.3.6.4 és a 6.2.1.3.6.5 pontok szerint kell nyomáscsökkentő szerkezettel ellátni. A nyomáscsökkentő szerkezeteket úgy kell kialakítani, hogy megakadályozzák az idegen anyagoknak a tartályba való bejutását, a gáz kiszivárgását és mindenféle veszélyes túlnyomás kialakulását. A nyomáscsökkentő szerkezeteket a gyúlékony gázzal töltött, gyűjtőcsővel összekapcsolt, vízszintes helyzetű nyomástartó tartályokon úgy kell elhelyezni, hogy a lefűvás a szabad levegőbe akadálytalanul történhessen, és normális szállítási körülmények mellett a kiszabaduló gáz ne ütközzön magának a nyomástartó tartálynak.
- 6.2.1.3.5** A térfogatra töltött nyomástartó tartályokat szintjelzővel kell ellátni.
- 6.2.1.3.6** *A zárt mélyhűtő tartályokra vonatkozó kiegészítő követelmények*
- 6.2.1.3.6.1** A gyúlékony mélyhűtött, cseppfolyósított gázok szállítására szolgáló zárt mélyhűtő tartályok minden töltő- és ürítőnyílását legalább két, egymás mögött elhelyezett, egymástól független zárószerkezettel kell ellátni, ahol az első egy zárószelep, a második pedig egy sapka vagy azzal egyenértékű, más szerkezet.
- 6.2.1.3.6.2** Azokon a csővezeték szakaszokon, amelyek mindkét végükön zárhatóak, és azokon a részekon, ahol folyékony anyag maradhat vissza, a csővezetékben a túlzott nyomás kialakulásának elkerülésére automatikus nyomáscsökkentő rendszert kell alkalmazni.
- 6.2.1.3.6.3** A zárt mélyhűtő tartályoknál minden csatlakozáson jól látható módon fel kell tüntetni a rendeltetését (pl. gőzfázis, folyadékfázis).
- 6.2.1.3.6.4** Nyomáscsökkentő szerkezetek
- 6.2.1.3.6.4.1** A zárt mélyhűtő tartályokat legalább egy nyomáscsökkentő szerkezettel kell ellátni. A nyomáscsökkentő szerkezetnek olyan típusúnak kell lennie, ami ellenáll a dinamikus hatásoknak, beleértve a folyadék hullámozását is.
- 6.2.1.3.6.4.2** A zárt mélyhűtő tartályok ezenkívül a 6.2.1.3.6.5 pont követelményeinek kielégítésére a rugóterhelésű szerkezettel (szerkezetekkel) párhuzamosan hasadótárcsával is elláthatók.
- 6.2.1.3.6.4.3** A nyomáscsökkentő szerkezet csatlakozásának akkora keresztmetszetűnek kell lennie, amekkora lehetővé teszi, hogy a szükséges ürítési mennyiség akadálytalanul eljuthasson a nyomáscsökkentő szerkezethez.
- 6.2.1.3.6.4.4** Minden nyomáscsökkentő szerkezet bemenetnek a megengedett legnagyobb töltési fok mellett is a zárt mélyhűtő tartály gőzterében kell lennie és a szerkezetet úgy kell kialakítani, hogy biztosítva legyen a gőz akadálytalan távozása.
- 6.2.1.3.6.5** A nyomáscsökkentő szerkezetek teljesítménye és beállítása

Megjegyzés: *A zárt mélyhűtő tartályok nyomáscsökkentő szerkezetei szempontjából a megengedett legnagyobb üzemi nyomás a megtöltött, zárt mélyhűtő tartály tetején, üzemi helyzetben megengedett legnagyobb tényleges túlnyomás, beleértve a töltés és ürítés során fellépő legnagyobb tényleges nyomást.*

- 6.2.1.3.6.5.1** A nyomáscsökkentő szerkezetnek legalább a megengedett legnagyobb üzemi nyomáson automatikusan ki kell nyílnia, és a megengedett legnagyobb üzemi nyomás 110%-ának megfelelő nyomáson teljesen nyitva kell lennie. Lefűvás után a szerkezetnek a nyitónyomásánál legfeljebb 10%-kal alacsonyabb nyomáson záródnia kell és minden, ennél alacsonyabb nyomáson zárva kell maradnia.
- 6.2.1.3.6.5.2** A hasadótárcsákat olyan névleges nyomásra kell beállítani, ami a próbanyomás és a megengedett legnagyobb üzemi nyomás 150%-ának megfelelő nyomás közül az alacsonyabb értékkel egyenlő.
- 6.2.1.3.6.5.3** A vákuumszigetelt, zárt mélyhűtő tartályoknál a vákuum csökkenése esetén a beépített nyomáscsökkentő szerkezetek összes lefűvási teljesítményének elégnie kell lennie ahhoz, hogy a nyomás (beszámítva a nyomás növekedését) a zárt mélyhűtő tartályban ne lépje túl a megengedett legnagyobb üzemi nyomás 120%-át.
- 6.2.1.3.6.5.4** A nyomáscsökkentő szerkezetek szükséges teljesítményét az illetékes hatóság által elismert műszaki szabályzat¹⁾ szerint kell meghatározni.
- 6.2.1.4** *A nyomástartó tartályok engedélyezése*
- 6.2.1.4.1** A nyomástartó tartályok megfelelőségét a gyártásukkor kell értékelni az illetékes hatóság által előírt módon. A nyomástartó tartályokat egy vizsgáló szervezetnek kell megvizsgálnia és engedélyeznie. A műszaki dokumentációnak a tervezés és a gyártás részletes leírását, valamint a gyártás és a vizsgálat teljes dokumentációját tartalmaznia kell.
- 6.2.1.4.2** A minőségbiztosítási rendszernek meg kell felelnie az illetékes hatóság előírásainak.
- 6.2.1.5** *Üzembe helyezés előtti vizsgálat*
- 6.2.1.5.1** Az új nyomástartó tartályokat – a zárt mélyhűtő tartályok és a fémhidrid tárolórendszerek kivételével – a gyártás során és az üzembe helyezés előtt a vonatkozó tervezési szabványoknak megfelelően vizsgálatnak kell alávetni, amelynek a következőkre kell kiterjednie:
- Elegendő számú nyomástartó tartály mintadarabon:
- a) a szerkezeti anyag mechanikai jellemzőinek vizsgálatára;
 - b) a legkisebb falvastagság ellenőrzésére;
 - c) a szerkezeti anyag minden egyes gyártási sorozaton belüli azonosságának (minőségének) ellenőrzésére;
 - d) a nyomástartó tartály külső és belső állapotának vizsgálatára;
 - e) a nyakmenet vizsgálatára;
 - f) a tervezési szabványoknak való megfelelőség ellenőrzésére.
- Minden egyes nyomástartó tartályon:
- g) folyadéknomás-próbára. A nyomástartó tartálynak a tervezési előírásokban meghatározottnál nagyobb tágulás bekövetkezése nélkül kell elviselnie a próbanyomást;
- Megjegyzés:** *Az illetékes hatóság hozzájárulása esetén a folyadéknomás-próba gázzal végzett vizsgálattal helyettesíthető, ha az ilyen eljárás nem okoz semmiféle veszélyt.*
- h) a gyártási hibák vizsgálatára és értékelésére. A hibákat ki kell javítani vagy a nyomástartó tartályt használatra alkalmatlanná kell tenni. Hegesztett nyomástartó tartályok

1) Lásd például a CGA S-1.2-2003 „Pressure Relief Device Standards – Part 2 – Cargo and Portable Tanks for Compressed Gases” (Nyomáscsökkentő szerkezet szabványok – 2. rész – Árutartályok és mobil tartályok sűrített gázokhoz) és az S-1.1-2003 „Pressure Relief Device Standards – Part 1 – Cylinders for Compressed Gases” (Nyomáscsökkentő szerkezet szabványok – 1. rész – Sűrített gáz palackok) kiadványt.

esetén különös figyelmet kell fordítani a hegesztés minőségére;

- i) a nyomástartó tartályon levő jelölések vizsgálatára;
- j) ezen kívül az UN 1001 oldott acetilén és az UN 3374 oldószermentes acetilén szállítására használt nyomástartó tartályoknál ellenőrizni kell a porózus anyag megfelelő alkalmazását és állapotát, ill. ha van, az oldószer mennyiségét.

6.2.1.5.2

A zárt mélyhűtő tartályok egy megfelelő mintadarabján el kell végezni a 6.2.1.5.1 a), b), d) és f) pontban meghatározott vizsgálatokat. Ezen kívül a zárt mélyhűtő tartályok mintadarabján a vonatkozó tervezési és gyártási előírások szerint radiográfiás, ultrahangos vagy más alkalmas, roncsolásmentes vizsgálati módszerrel meg kell vizsgálni a hegesztéseket. A burkolat hegesztését nem kell így vizsgálni.

Ezen kívül minden zárt mélyhűtő tartályt alá kell vetni az üzembe helyezés előtti vizsgálatnak és a 6.2.1.5.1 g), h) és i) pontban meghatározott vizsgálatoknak, valamint tömörségi próbának és összeszerelés után ellenőrizni kell az üzemi szerelvények kielégítő működését.

6.2.1.5.3

A fémhidrid tárolórendszerекnél ellenőrizni kell, hogy a fémhidrid tárolórendszerben használt tartályok egy megfelelő mintadarabján elvégezték a 6.2.1.5.1 a), b), c), d), e) (ha alkalmazható rá), f), g), h) és i) pontban meghatározott vizsgálatokat. Ezen kívül a fémhidrid tárolórendszerek egy megfelelő mintadarabján el kell végezni a 6.2.1.5.1 c) és f) pontban, valamint, ha alkalmazható rá, a 6.2.1.5.1 e) pontban meghatározott vizsgálatokat és a fémhidrid tárolórendszer külső állapotát is meg kell vizsgálni.

Ezen kívül minden fémhidrid tárolórendszert alá kell vetni az üzembe helyezés előtti vizsgálatnak és a 6.2.1.5.1 h) és i) pontban meghatározott vizsgálatoknak, valamint tömörségi próbának és ellenőrizni kell az üzemi szerelvények kielégítő működését..

6.2.1.6

Időszakos vizsgálat

6.2.1.6.1

Az újratölthető nyomástartó tartályokat – a mélyhűtő tartályok kivételével – az illetékes hatósága által felhatalmazott szervezet által időszakos vizsgálatnak kell alávetni, amelynek a következőkre kell kiterjednie:

- a nyomástartó tartály külső állapotának vizsgálatára, valamint a szerelvények és a külső jelölések ellenőrzésére;
- a nyomástartó tartály belső állapotának vizsgálatára (pl. a belső vizsgálattal, a legkisebb falvastagság ellenőrzésével);
- a menetek vizsgálatára, ha korrózió jelei mutatkoznak vagy ha a szerelvényeket eltávolították;
- folyadéknomás-próbára és szükség esetén alkalmas vizsgálati eljárással az anyagjellemzők ellenőrzésére;
- az üzemi szerelvények, az egyéb tartozékok és a nyomáscsökkentő szerkezetek ellenőrzésére, amennyiben azokat újra üzembe helyezik.

Megjegyzés: 1. Az illetékes hatóság hozzájárulása esetén a folyadéknomás-próba helyettesíthető gázzal végzett vizsgálattal, ha az ilyen eljárás nem okoz semmiféle veszélyt.

2. Az illetékes hatóság hozzájárulása esetén a palackok, ill. nagypalackok folyadéknymás-próbája akusztikus emissziós vizsgálaton vagy az akusztikus emissziós és az ultrahangos vizsgálat kombinációján alapuló, egyenértékű vizsgálattal helyettesíthető. Az akusztikus emissziós vizsgálathoz útmutatóként az ISO 16148:2006 szabvány alkalmazható.

3. A folyadékyomás-próba varrat nélküli alumíniumötvözet gázpalackoknál az ISO 10461:2005 + A1:2006 szabvány, ill. varrat nélküli acél gázpalackoknál az ISO 6406:2005 szabvány szerint végzett ultrahangos

vizsgálattal helyettesíthető.

4. Az időszakos vizsgálatok gyakoriságára vonatkozóan lásd a 4.1.4.1 bekezdés P200, a nyomás alatti vegyszereknél a 4.1.4.1 bekezdés P206 csomagolási utasítását, .

6.2.1.6.2 Az UN 1001 oldott acetilén és az UN 3374 oldószermentes acetilén szállítására használt nyomástartó tartályoknál csak a 6.2.1.6.1 a), c) és e) pontok szerinti vizsgálatot kell elvégezni. Ezenkívül a porózus anyag állapotát (pl. repedezettség, felső szabad tér, lazulás, összeesés) is kell vizsgálni.

6.2.1.6.3 A zárt mélyhűtő tartályok nyomáscsökkentő szelepeit időszakos vizsgálatnak kell alávetni.

6.2.1.7 *A gyártóra vonatkozó előírások*

6.2.1.7.1 A gyártónak műszakilag alkalmasnak kell lennie a nyomástartó tartályok megfelelő színvonalú előállítására és rendelkeznie kell minden, ehhez szükséges erőforrással, különösen megfelelő képzettségű alkalmazottakkal:

- a) a gyártási folyamat átfogó felügyeletére;
- b) az anyagok illesztésének kivitelezésére;
- c) a megfelelő vizsgálatok végrehajtására.

6.2.1.7.2 A gyártó alkalmasságának értékelését minden esetben a jóváhagyó ország illetékes hatósága által jóváhagyott vizsgáló szervezetnek kell végeznie.

6.2.1.8 *A vizsgáló szervezetekre vonatkozó előírások*

6.2.1.8.1 A vizsgáló szervezeteknek a gyártó vállalatoktól függetlennek kell lenniük és kellő szakértelemmel kell rendelkezniük a szükséges vizsgálatok, ellenőrzések elvégzéséhez, ill. a jóváhagyásokhoz.

6.2.2 *Az UN nyomástartó tartályokra vonatkozó követelmények*

Az UN nyomástartó tartályoknak a 6.2.1 szakasz általános követelményein kívül e szakasz előírásainak is meg kell felelniük, beleértve az esetleges szabványokat.

6.2.2.1 *Tervezés, gyártás és üzembe helyezés előtti vizsgálat*

6.2.2.1.1 Az UN palackok tervezéséhez, gyártásához és üzembe helyezés előtti vizsgálatához a következő szabványokat kell alkalmazni, a megfelelőség-értékelési rendszerrel és a jóváhagyással kapcsolatos vizsgálati követelményeknek azonban a 6.2.2.5 bekezdéssel összhangban kell lenniük:

ISO 9809-1:1999	Gázpalackok – Újratölthető, varrat nélküli acél gázpalackok – Tervezés, gyártás és vizsgálat – 1. rész: Edzett és temperált palackok 1100 MPa-nál kisebb szakítószilárdságú acélból. Megjegyzés: A szabvány 7.3 szakaszában az <i>F</i> tényezőre vonatkozó megjegyzés az UN palackokra nem vonatkozik.
ISO 9809-2:2000	Gázpalackok – Újratölthető, varrat nélküli acél gázpalackok – Tervezés, gyártás és vizsgálat – 2. rész: Edzett és temperált palackok 1100 MPa vagy annál nagyobb szakítószilárdságú acélból.
ISO 9809-3:2000	Gázpalackok – Újratölthető, varrat nélküli acél gázpalackok – Tervezés, gyártás és vizsgálat – 3. rész: Normalizált acélpalackok.
ISO 7866:1999	Gázpalackok – Újratölthető, varrat nélküli alumíniumötvözet gázpalackok – Tervezés, gyártás és vizsgálat

	Megjegyzés: A szabvány 7.2 szakaszában az F tényezőre vonatkozó megjegyzés az UN palackokra nem vonatkozik. 6351A-T6 vagy azzal egyenértékű alumíniumötvözet nem megengedett.
ISO 4706:2008	Gázpalackok – Újratölthető, hegesztett acél gázpalackok : Próbanyomás legfeljebb 60 bar
ISO 18172-1:2007	Gázpalackok – Újratölthető, hegesztett rozsdamentes acél gázpalackok – 1. rész: Próbanyomás legfeljebb 6 MPa
ISO 20703:2006	Gázpalackok – Újratölthető, hegesztett alumíniumötvözet gázpalackok – Tervezés, gyártás és vizsgálat
ISO 11118:1999	Gázpalackok – Nem újratölthető fém gázpalackok – Meghatározások és vizsgálati módszerek.
ISO 11119-1:2002	Kompozit gázpalackok - Előírások és vizsgálati módszerek – 1. rész: Köpenyrészen bevont kompozit gázpalackok
ISO 11119-2:2002	Kompozit gázpalackok - Előírások és vizsgálati módszerek – 2. rész: Teljes felületen bevont szálvázas kompozit gázpalackok teherviselő fém béléstesttel
ISO 11119-3:2002	Kompozit gázpalackok - Előírások és vizsgálati módszerek – 3. rész: Teljes felületen bevont szálvázas kompozit gázpalackok nem-teherviselő fém vagy nemfém béléstesttel

Megjegyzés: 1. Az előzőekben hivatkozott szabványok szerint a kompozit palackokat korlátlan élettartamra kell tervezni.

2. Az első 15 évi használat után az e szabványok szerint gyártott kompozit palackok használatát a palackokat eredetileg jóváhagyó illetékes hatóság a gyártó, a tulajdonos vagy a felhasználó által közölt vizsgálati adatokra alapozva korlátlan időre kiterjesztheti.

6.2.2.1.2

Az UN nagypalackok tervezéséhez, gyártásához és üzembe helyezés előtti vizsgálatához következő szabványokat kell alkalmazni, a megfelelőség-értékelési rendszerrel és a jóváhagyással kapcsolatos vizsgálati követelményeknek azonban a 6.2.2.5 bekezdéssel összhangban kell lenniük:

ISO 11120:1999	Gázpalackok. A 150 l – 3000 l űrtartalmú, újratölthető, varrat nélküli acél nagypalackok sűrített gáz szállítására. Kialakítás, kivitelezés és vizsgálat Megjegyzés: A szabvány 7.1 szakaszában az F tényezőre vonatkozó megjegyzés az UN nagypalackokra nem vonatkozik.
----------------	--

6.2.2.1.3

Az UN acetilén palackok tervezéséhez, gyártásához és üzembe helyezés előtti vizsgálatához a következő szabványokat kell alkalmazni, a megfelelőség-értékelési rendszerrel és a jóváhagyással kapcsolatos vizsgálati követelményeknek azonban a 6.2.2.5 bekezdéssel összhangban kell lenniük:

A palackra:

ISO 9809-1:1999	Gázpalackok – Újratölthető, varrat nélküli acél gázpalackok – Tervezés, gyártás és vizsgálat – 1. rész: Edzett és temperált palackok 1100 MPa-nál kisebb szakítószilárdságú acélból. Megjegyzés: A szabvány 7.3 szakaszában az F tényezőre vonatkozó megjegyzés az UN palackokra nem vonatkozik.
ISO 9809-3:2000	Gázpalackok – Újratölthető, varrat nélküli acél gázpalackok – Tervezés, gyártás és vizsgálat – 3. rész: Normalizált acélpalackok.

A palackban levő porózus anyagra:

ISO 3807-1:2000	Acetilén palackok – Alapkövetelmények – 1. rész: Palackok kiolvadó dugó nélkül
ISO 3807-2:2000	Acetilén palackok – Alapkövetelmények – 2. rész: Palackok kiolvadó dugóval

6.2.2.1.4

Az UN mélyhűtő tartályok tervezésére, gyártására és üzembe helyezés előtti vizsgálatára a következő szabványt kell alkalmazni, a megfelelőség-értékelési rendszerrel és a jóváhagyással kapcsolatos vizsgálati követelményeknek azonban a 6.2.2.5 bekezdéssel összhangban kell lenniük.

ISO 21029-1:2004	Mélyhűtő tartályok – Szállítható, vákuumszigetelt tartályok legfeljebb 1000 liter űrtartalommal – 1. Rész: Tervezés, gyártás és vizsgálat
------------------	---

6.2.1.1.5

Az UN fémhidrid tárolórendszerek tervezésére, gyártására és üzembe helyezés előtti vizsgálatára a következő szabványt kell alkalmazni, a megfelelőség-értékelési rendszerrel és a jóváhagyással kapcsolatos vizsgálati követelményeknek azonban a 6.2.2.5 bekezdéssel összhangban kell lenniük

ISO 16111:2008	Szállítható gáztároló eszközök. – Reverzibilis fémhidridben abszorbeált hidrogén
----------------	--

6.2.2.2

Szerkezeti anyagok

A nyomástartó tartályok tervezési és gyártási szabványaiában az anyagokra meghatározott követelményeken és a szállítandó gáz(ok)ra vonatkozó csomagolási utasításokban (pl. a 4.1.4.1 bekezdés P200 vagy P205 csomagolási utasításában) meghatározott korlátozásokon kívül az anyagok összeférhetőségére a következő szabványokat kell alkalmazni:

ISO 11114-1:1997	Szállítható gázpalackok. Gázpalack és palackszelep szerkezeti anyagainak megfelelősége a gáztöltetnek. 1. rész: Fémek
ISO 11114-2:2000	Szállítható gázpalackok. Gázpalack és palackszelep szerkezeti anyagainak megfelelősége a gáztöltetnek. 2. rész: Nemfémes anyagok

Megjegyzés: Az ISO 11114-1 szabványban a nagy szilárdságú acélötvözeteknél a legnagyobb szakítószilárdsága vonatkozó 1100 MPa érték nem vonatkozik az UN 2203 szilícium-hidrogén (szilán) esetére.

6.2.2.3

Üzemi szerelvények

A zárószerkezetekre és védelmükre a következő szabványokat kell alkalmazni:

ISO 11117:2008 + Cor. 1:2009	Gázpalackok – Szelepvédő kupakok és szelepvédelmek – Tervezés, gyártás és vizsgálat Megjegyzés: Az ISO 11117:1998 szabvány szerinti konstrukciók 2014. december 31-ig alkalmazható.
ISO 10297:2006	Szállítható gázpalackok – Palackszelepek – Műszaki követelmények és típusvizsgálat Megjegyzés: Az ISO szabvány EN változata is alkalmazható, mivel megfelel a követelményeknek.
ISO 13340:2001	Szállítható gázpalackok – Palackszelepek nem újratölthető gázpalackokhoz – Műszaki követelmények és típusvizsgálat

Az UN fémhidrid tárolórendszerek esetén a zárószerkezetekre és azok védelmére a következő szabványt kell alkalmazni:

ISO 16111:2008	Szállítható gáztároló eszközök – Reverzibilis fémhidridben abszorbeált hidrogén
----------------	---

6.2.2.4

Időszakos vizsgálat

Az UN palackok és UN fémhidrid tárolórendszerek időszakos vizsgálatához a következő szabványokat kell alkalmazni:

ISO 6406:2005	Varrat nélküli acél gázpalackok időszakos vizsgálata
ISO 10460:2005	Gázpalackok – Hegesztett szénacél gázpalackok – Időszakos vizsgálat <i>Megjegyzés: A hegesztéseknek a szabvány 12.1 pontjában leírt javítása nem megengedett. A 12.2 pontban leírt javításhoz annak az illetékes hatóságnak a jóváhagyása szükséges, amelyik a 6.2.2.6 bekezdés szerint az időszakos vizsgálatot végző szervezetet jóváhagyta.</i>
ISO 10461:2005 +A1:2006	Varrat nélküli alumínium-ötvözet gázpalackok – Időszakos vizsgálat
ISO 10462: 2005	Gázpalackok – Szállítható palackok oldott acetilénhez – Időszakos vizsgálat és karbantartás
ISO 11623:2002	Szállítható gázpalackok – Kompozit gázpalackok időszakos vizsgálata
ISO 16111:2008	Szállítható gáztároló eszközök. – Reverzibilis fémhidridben abszorbeált hidrogén

6.2.2.5 *A nyomástartó tartályok megfelelőség-értékelési rendszere és gyártásának jóváhagyása*

6.2.2.5.1 *Meghatározások*

Ezen bekezdés alkalmazásában:

A *megfelelőség-értékelési rendszer* a gyártó illetékes hatóság általi engedélyezésére szolgáló, a nyomástartó tartály típusjóváhagyására, a gyártó minőségbiztosítási rendszerének jóváhagyására és a vizsgáló szervezetek jóváhagyására kiterjedő rendszer;

A *gyártási típus* valamely nyomástartó tartályra vonatkozó szabványban meghatározott nyomástartó tartály típus;

Az *ellenőrzés* meghatározott követelmények teljesítésének megállapítása vizsgálattal vagy objektív bizonyítékok felhasználásával.

6.2.2.5.2 *Általános követelmények*

Illetékes hatóság

6.2.2.5.2.1

A nyomástartó tartályt jóváhagyó illetékes hatóságnak jóvá kell hagynia a megfelelőség-értékelési rendszert, annak érdekében, hogy a nyomástartó tartályok megfeleljenek az ADR előírásainak. Ha egy nyomástartó tartályt jóváhagyó illetékes hatóság nem a gyártó országának illetékes hatósága, akkor a nyomástartó tartályon fel kell tüntetni mind a gyártó országának, mind a jóváhagyó országnak a jelét (lásd a 6.2.2.7 és a 6.2.2.8 bekezdést).

A jóváhagyó ország illetékes hatóságának azon ország megfelelő hatósága kérésre, amelyben a nyomástartó tartályt használják, bizonyítania kell, hogy megfelel a megfelelőség-értékelési rendszernek.

6.2.2.5.2.2

Az illetékes hatóság feladatait a megfelelőség-értékelési rendszerben részben vagy egészben átruházhatja.

6.2.2.5.2.3

Az illetékes hatóságnak biztosítania kell, hogy a jóváhagyott vizsgáló szervezetek és azonosító jelölésük, továbbá az engedélyezett gyártók és azonosító jelölésük érvényes jegyzéke rendelkezésre álljon.

Vizsgáló szervezet

6.2.2.5.2.4

A vizsgáló szervezetnek az illetékes hatóság jóváhagyásával kell rendelkeznie a nyomástartó tartályok vizsgálatára és a következő feltételeknek kell megfelelnie:

- szervezetbe integrált, alkalmas, hozzáértő, szakképzett és gyakorlott személyzettel kell rendelkeznie, hogy műszaki feladatait megfelelő módon végezhesse;
- alkalmas és elegendő berendezésnek és felszerelésnek kell rendelkezésére állnia;

- c) részrehajlás nélkül kell működnie, és minden olyan hatástól mentesnek kell lennie, ami ebben akadályozhatná;
- d) a gyártók és más szervezetek kereskedelmi és tulajdonjogi védelmet élvező tevékenységeit üzleti titokként kell kezelnie;
- e) egyértelműen el kell különítenie a vizsgáló szervezeti funkcióit és az ezzel nem kapcsolatos tevékenységet;
- f) dokumentált minőségbiztosítási rendszert kell működtetnie;
- g) biztosítani kell, hogy a nyomástartó tartályokra vonatkozó szabványokban és az ADR-ben szereplő vizsgálatokat elvégezzék; és
- h) a 6.2.2.5.6 pontban foglaltak szerinti célszerű és megfelelő jegyzőkönyvezési és okirat nyilvántartási rendszert kell működtetnie.

6.2.2.5.2.5 A nyomástartó tartályra vonatkozó szabványnak való megfelelés biztosításához a vizsgáló szervezetnek jóvá kell hagynia a gyártási típust, meg kell vizsgálnia és felügyelnie kell a nyomástartó tartály gyártását és ezekről tanúsítványt kell kiállítani (lásd a 6.2.2.5.4 és a 6.2.2.5.5 pontot).

Gyártó

6.2.2.5.2.6 A gyártónak

- a) a 6.2.2.5.3 pont szerinti, dokumentált minőségbiztosítási rendszert kell működtetnie;
- b) a típusjóvá hagyást a 6.2.2.5.4 pont szerint kell megkérnie;
- c) a jóváhagyó országban az illetékes hatóság által vezetett, jóváhagyott vizsgáló szervezetek jegyzékéből ki kell választania egy vizsgáló szervezetet; és
- d) az okiratokat a 6.2.2.5.6 pont szerint kell megőriznie.

Vizsgáló laboratórium

6.2.2.5.2.7 A vizsgáló laboratóriumnak:

- a) szervezetbe integrált, szakképzett és gyakorlott, kellő számú személyzettel kell rendelkeznie; és
- b) alkalmas és elegendő berendezésnek és felszerelésnek kell rendelkezésére állnia, hogy a gyártási szabványokban előírt vizsgálatokat a vizsgáló szervezet számára elfogadható módon elvégezhesse.

6.2.2.5.3 *A gyártó minőségbiztosítási rendszere*

6.2.2.5.3.1 A minőségbiztosítási rendszernek a gyártó által alkalmazott minden elemre, követelményre és előírásra ki kell terjednie. Ezt szisztematikusan és rendezett módon kell dokumentálni írásban rögzített alapelvek, eljárások és utasítások formájában.

Különösen a következők megfelelő leírását kell tartalmaznia:

- a) a szervezeti felépítés, a tervezéssel és termék minőségével kapcsolatos személyi felelősség;
- b) a nyomástartó tartályok tervezése és tervezés-ellenőrzése során alkalmazott technikák, módszerek és eljárások;
- c) a nyomástartó tartályok gyártására, minőségellenőrzésére, minőségbiztosítására és gyártási folyamatára vonatkozó, megfelelő utasítások;
- d) minőségellenőrzési nyilvántartás, pl. vizsgálati jegyzőkönyvek, vizsgálati eredmények és hitelesítési adatok;
- e) vezetői felülvizsgálatok a 6.2.2.5.3.2 pont szerinti auditálás alapján a minőségbiztosítási rendszer hatékony működésének biztosításához;

- f) a vevő igényeinek kielégítését szolgáló eljárások leírása;
- g) a dokumentáció ellenőrzési és karbantartási eljárása;
- h) a nem megfelelő minőségű nyomástartó tartályok, vásárolt alkatrészek, félkész és késztermékek ellenőrzésének, kiszűrésének módja; és
- i) az érintett személyekre vonatkozó képzési program és minősítési eljárás.

6.2.2.5.3.2 A minőségbiztosítási rendszer auditálása

A minőségbiztosítási rendszert először ki kell értékelni annak eldöntéséhez, hogy a 6.2.2.5.3.1 pontban felsorolt követelményeknek az illetékes hatóság számára elfogadható módon megfelel-e.

A gyártót értesíteni kell az auditálás eredményéről. Az értesítésnek tartalmaznia kell az auditálás következtetéseit és az esetleg szükséges javításokat.

Az illetékes hatóság számára elfogadható módon időszakos auditálást kell végezni, annak biztosítására, hogy a minőségbiztosítási rendszert a gyártó fenntartja és alkalmazza. Az időszakos auditálás jegyzőkönyvét a gyártónak át kell adni.

6.2.2.5.3.3 A minőségbiztosítási rendszer fenntartása

A gyártónak a minőségbiztosítási rendszert a jóváhagyott állapotban fenn kell tartania, hogy megfelelő és hatékony legyen.

A gyártónak a minőségbiztosítási rendszert jóváhagyó illetékes hatóságot minden tervezett változásról értesítenie kell. A javasolt változtatásokat értékelni kell annak eldöntésére, hogy a módosított minőségbiztosítási rendszer továbbra is megfelel-e a 6.2.2.5.3.1 pont előírásainak.

6.2.2.5.4 *Jóváhagyási eljárás*

Első típusjóváhagyás

6.2.2.5.4.1 Az első típusjóváhagyás a gyártó minőségbiztosítási rendszerének jóváhagyásából és a gyártandó nyomástartó tartály típusjóváhagyásából áll. Az első típusjóváhagyás iránti kérelemnek a 6.2.2.5.4.2 – 6.2.2.5.4.6 és a 6.2.2.5.4.9 pont előírásainak kell megfelelnie.

6.2.2.5.4.2 Ha egy gyártó valamely nyomástartó tartályra vonatkozó szabvány és az ADR előírásai szerinti nyomástartó tartályt kíván gyártani, akkor rendelkeznie kell a jóváhagyás országának illetékes hatósága által a 6.2.2.5.4.9 pontban leírt eljárás szerint kiadott gyártási típusbizonyítvánnyal legalább egy nyomástartó tartály típusra. A bizonyítvány megszerzéséhez kérelmet kell benyújtania, és a kapott bizonyítványt meg kell őriznie. Ha annak az országnak az illetékes hatósága kéri, amelyben a tartályt használják, akkor a bizonyítványt a rendelkezésére kell bocsátani.

6.2.2.5.4.3 Minden gyártó üzemre külön kérelmet kell benyújtani, aminek a következőket kell tartalmaznia:

- a) a gyártó nevét és székhelyét, és ezenkívül, ha a kérelmet meghatalmazott képviselő nyújtja be, annak nevét és címét;
- b) a gyártó üzem címét (ha az előzőektől eltér);
- c) a minőségbiztosítási rendszerért felelős személy(ek) nevét és beosztását;
- d) a nyomástartó tartály rendeltetését és a nyomástartó tartályra vonatkozó szabványt;
- e) ha egy hasonló kérelmet egy másik illetékes hatóság már elutasított, akkor az elutasítás részleteit;
- f) a gyártási típust jóváhagyó vizsgáló szervezet megnevezését;
- g) a gyártó üzemre a 6.2.2.5.3.1 pontban meghatározott dokumentációt; és
- h) a típusjóváhagyáshoz szükséges műszaki dokumentációt, ami lehetővé teszi annak megállapítását, hogy a nyomástartó tartály a vonatkozó gyártási szabvány előírásainak

megfelel-e. A műszaki dokumentációnak a tervezésre és a gyártási eljárásokra kell kiterjednie, és az értékeléshez szükséges mértékben legalább a következőket kell tartalmaznia:

- i) a nyomástartó tartályra vonatkozó gyártási szabványt, az esetleges alkatrészeket és szerkezeti részegységeket ábrázoló tervrajzokat;
- ii) a tervrajzok és a nyomástartó tartály tervezett használatának megértéséhez szükséges leírásokat és magyarázatokat;
- iii) a gyártási eljárás pontos meghatározásához szükséges szabványok felsorolását;
- iv) a tervezési számításokat és a felhasznált anyagok műszaki jellemzőit; és
- v) a típusjóváahagyás vizsgálati jegyzőkönyvét, amely tartalmazza a 6.2.2.5.4.9 pont szerint végrehajtott vizsgálatok eredményeit.

6.2.2.5.4.4 A 6.2.2.5.3.2 pont szerinti első auditálást az illetékes hatóság számára elfogadható módon kell végezni.

6.2.2.5.4.5 Ha az illetékes hatóság nem adja meg a jóváahagyást a gyártónak, az elutasítást írásban részletesen meg kell indokolnia.

6.2.2.5.4.6 A jóváahagyást követően az első típusjóváahagyási kérelemhez a 6.2.2.5.4.3 pont szerint benyújtott adatokban bekövetkező változásokat az illetékes hatósággal közölni kell.

További típusjóváahagyások

6.2.2.5.4.7 A további típusjóváahagyás iránti kérelemnek a 6.2.2.5.4.8 és a 6.2.2.5.4.9 pont előírásainak kell megfelelnie, feltéve, hogy a gyártó rendelkezik első típusjóváahagyással. Ilyen esetben a gyártó 6.2.2.5.3 pont szerinti minőségbiztosítási rendszerének, amelyet az első típusjóváahagyás során kellett jóváahagyni, az új gyártási típusra is alkalmazhatónak kell lennie.

6.2.2.5.4.8 A kérelemnek a következőket kell tartalmaznia:

- a) a gyártó nevét és székhelyét, és ezenkívül, ha a kérelmet meghatalmazott képviselő nyújtja be, annak nevét és címét;
- b) ha egy hasonló kérelmet egy másik illetékes hatóság már elutasított, akkor az elutasítás részleteit;
- c) annak bizonyítékát, hogy rendelkezik az első típusjóváahagyással; és
- d) a 6.2.2.5.4.3 h) pontban leírt műszaki dokumentációt.

A gyártási típusjóváahagyás eljárása

6.2.2.5.4.9 A vizsgáló szervezetnek:

- a) meg kell vizsgálnia a műszaki dokumentációt annak ellenőrzésére, hogy:
 - i) a típus megfelel-e a szabványok vonatkozó előírásainak, és
 - ii) a minta sorozatot a műszaki dokumentációnak megfelelően gyártották-e és az a gyártási típust megfelelően képviseli-e;
- b) ellenőriznie kell, hogy a 6.2.2.5.5 pont szerinti gyártásellenőrzéseket elvégezték-e;
- c) a minta sorozatból ki kell választania azokat a nyomástartó tartályokat, amelyeken azután a típusjóváahagyásban előírt vizsgálatok elvégzését felügyelnie kell;
- d) végre kell hajtania vagy hajtatnia a nyomástartó tartályra vonatkozó szabványban meghatározott vizsgálatokat annak eldöntéséhez, hogy:
 - i) a szabványt alkalmazták-e és betartották-e, és
 - ii) a gyártó által alkalmazott eljárások kielégítik-e a szabvány követelményeit; és
- e) biztosítania kell, hogy a különböző típusjóváahagyási vizsgálatokat pontosan és szak-

szerűen végezzék el.

Miután a gyártási típus vizsgálata kielégítő eredménnyel zárult, és a 6.2.2.5.4 pont minden vonatkozó követelménye teljesült, típusjóváahagyási bizonyítványt kell kiállítani, amelyben fel kell tüntetni a gyártó nevét és székhelyét, a vizsgálatok eredményeit és következtetéseit, és a gyártási típus azonosításához szükséges adatokat.

Ha az illetékes hatóság nem adja meg a típusjóváahagyást a gyártónak, az elutasítást írásban kell részletesen megindokolnia.

6.2.2.5.4.10 A jóváhagyott gyártási típus módosítása

A gyártónak

- a) vagy értesítenie kell a jóváhagyott típus módosításáról a jóváahagyást kiadó illetékes hatóságot, ha ez a módosítás a nyomástartó tartályra vonatkozó szabvány értelmében nem eredményez új gyártási típust;
- b) vagy további típusjóváahagyást kell kérnie, ha a módosítás a nyomástartó tartályra vonatkozó szabvány értelmében új gyártási típust eredményez. A kiegészítő jóváahagyást az eredeti típusjóváahagyási bizonyítvány módosításaként kell kiadni.

6.2.2.5.4.11 Bármely másik illetékes hatóság kérésére az illetékes hatóságnak tájékoztatást kell adnia a típusjóváahagyásokról, a jóváahagyások módosításáról és a jóváahagyások visszavonásáról.

6.2.2.5.5 Gyártásellenőrzés és tanúsítás

Általános követelmények

Minden egyes nyomástartó tartályt egy vizsgáló szervezetnek vagy megbízottjának kell megvizsgálnia és tanúsítania. A gyártó a gyártás során történő ellenőrzéshez másik vizsgáló szervezetet is választhat, mint amelyik a gyártási típus vizsgálatokat végzi.

Ha a vizsgáló szervezet által elfogadható módon be tudja bizonyítani a gyártó, hogy rendelkezik gyártási műveletektől független, szakképzett, hozzáértő ellenőrökkel, akkor a vizsgálatokat ezek az ellenőrök is elvégezhetik. Ilyen esetben a gyártónak meg kell őriznie az ellenőrök képzésére vonatkozó dokumentációt.

A vizsgáló szervezetnek ellenőriznie kell, hogy a nyomástartó tartályokon a gyártó által végzett ellenőrzések és vizsgálatok teljes mértékben megfelelnek-e a szabványnak és az ADR követelményeinek. Ha a vizsgáló szervezet azt állapítja meg, hogy az ellenőrzést, ill. a vizsgálatokat nem megfelelően hajtották végre, akkor a gyártó ellenőrei által végzendő vizsgálatokra vonatkozó engedélyt visszavonhatja.

A vizsgáló szervezet jóváahagyása után a gyártónak nyilatkozatot kell adnia, hogy a tartály megegyezik a jóváhagyott gyártási típussal. A nyomástartó tartály jóváahagyási jelölésének felvitelét úgy kell tekinteni, mint annak igazolását, hogy a nyomástartó tartály megfelel a nyomástartó tartályra vonatkozó szabványoknak, valamint az ezen megfelelés-értékelési rendszer és az ADR előírásainak. A vizsgáló szervezetnek vagy a vizsgáló szervezet felhatalmazása alapján a gyártónak minden egyes jóváhagyott nyomástartó tartályon el kell helyeznie a jóváahagyási jelölést és a vizsgáló szervezet nyilvántartási jelét.

A nyomástartó tartály megtöltése előtt a megfelelőségről tanúsítványt kell kiállítani, amit a gyártónak és a vizsgáló szervezetnek alá kell írnia.

6.2.2.5.6 *Okiratok*

A gyártási típus bizonyítványokat és a megfelelőségi tanúsítványokat a gyártónak és a vizsgáló szervezetnek legalább 20 évig meg kell őriznie.

6.2.2.6 A nyomástartó tartályok időszakos vizsgálatának jóváahagyási rendszere

6.2.2.6.1 *Meghatározások*

Ezen bekezdés alkalmazásában:

A *jóváahagyási rendszer* a nyomástartó tartályok időszakos vizsgálatát végző szervezet

(továbbiakban: időszakos vizsgálatot végző szervezet) illetékes hatóság általi jóváhagyásának rendszere, beleértve az ilyen szervezet minőségbiztosítási rendszerének jóváhagyását is.

6.2.2.6.2 *Általános követelmények*

Illetékes hatóság

6.2.2.6.2.1 Az illetékes hatóságnak jóváhagyási rendszert kell kialakítania annak érdekében, hogy a nyomástartó tartályok időszakos vizsgálata megfeleljen az ADR előírásainak. Ha a nyomástartó tartályok időszakos vizsgálatát végző szervezetet jóváhagyó illetékes hatóság nem a nyomástartó tartály gyártását jóváhagyó ország illetékes hatósága, akkor a nyomástartó tartályon fel kell tüntetni az időszakos vizsgálatot jóváhagyó országnak a jelét is (lásd a 6.2.2.7 bekezdést).

Az időszakos vizsgálatot jóváhagyó ország illetékes hatóságának azon ország megfelelő hatósága kérésére, amelyben a nyomástartó tartályt használják, bizonyítania kell, hogy megfelel ennek a jóváhagyási rendszernek, ill. rendelkezésére kell bocsátania az időszakos vizsgálatok során készült dokumentumokat.

A jóváhagyó ország illetékes hatósága a jóváhagyási rendszernek való nem megfelelésre utaló bizonyítékok alapján visszavonhatja a 6.2.2.6.4.1 pont szerinti jóváhagyási bizonyítványt.

6.2.2.6.2.2 Az illetékes hatóság feladatait ezen jóváhagyási rendszerben részben vagy egészben átruházhatja.

6.2.2.6.2.3 Az illetékes hatóságnak biztosítania kell, hogy az időszakos vizsgálat végzésére jóváhagyott szervezetek és azonosító jelölésük érvényes jegyzéke rendelkezésre álljon.

Időszakos vizsgálatot végző szervezet

6.2.2.6.2.4 Az időszakos vizsgálatot végző szervezetet az illetékes hatóságnak kell jóváhagynia és a következő feltételeknek kell megfelelnie:

- a) szervezetbe integrált, alkalmas, hozzáértő, szakképzett és gyakorlott személyzettel kell rendelkeznie, hogy műszaki feladatait megfelelő módon végezhesse;
- b) alkalmas és elegendő berendezésnek és felszerelésnek kell rendelkezésére állnia;
- c) részrehajlás nélkül kell működnie, és minden olyan hatástól mentesnek kell lennie, ami ebben akadályozhatná;
- d) biztosítania kell az információk üzleti titokként való kezelését;
- e) egyértelműen el kell különítenie az időszakos vizsgálatok végzésének szervezeti funkcióit és az ezzel nem kapcsolatos tevékenységet;
- f) a 6.2.2.6.3 pont szerinti, dokumentált minőségbiztosítási rendszert kell működtetnie;
- g) a 6.2.2.6.4 pontban foglaltak szerint kell a jóváhagyás iránt folyamodnia;
- h) biztosítania kell, hogy az időszakos vizsgálatok a 6.2.2.6.5 pont szerint történjenek; és
- i) a 6.2.2.6.6 pontban foglaltak szerinti célszerű és megfelelő jegyzőkönyvezési és okirat nyilvántartási rendszert kell működtetnie.

6.2.2.6.3 *Az időszakos vizsgálatot végző szervezet minőségbiztosítási rendszere és auditálása*

6.2.2.6.3.1 *Minőségbiztosítási rendszer*

A minőségbiztosítási rendszernek az időszakos vizsgálatot végző szervezet által alkalmazott minden elemre, követelményre és előírásra ki kell terjednie. Ezt szisztematikusan és rendezett módon kell dokumentálni írásban rögzített alapelvek, eljárások és utasítások formájában.

A minőségbiztosítási rendszernek a következőket kell tartalmaznia:

- a) a szervezeti felépítés és a felelősségek megosztásának leírása;
- b) a vizsgálatra, minőségellenőrzésre, minőségbiztosításra és eljárás végrehajtásra vonatkozó, megfelelő utasítások;
- c) minőségellenőrzési nyilvántartás, pl. vizsgálati jegyzőkönyvek, vizsgálati eredmények, hitelesítési adatok és bizonyítványok;
- d) vezetői felülvizsgálatok a 6.2.2.6.3.2 pont szerinti auditálás alapján a minőségbiztosítási rendszer hatékony működésének biztosításához;
- e) a dokumentáció ellenőrzési és karbantartási eljárása;
- f) a nem megfelelő minőségű nyomástartó tartályok ellenőrzésének, kiszűrésének módja; és
- g) az érintett személyekre vonatkozó képzési program és minősítési eljárás.

6.2.2.6.3.2 *Auditálás*

Az időszakos vizsgálatot végző szervezetet és minőségbiztosítási rendszerét ki kell értékelni annak eldöntéséhez, hogy az ADR követelményeinek az illetékes hatóság számára elfogadható módon megfelel-e.

Az auditálást az első jóváhagyási eljárás (lásd a 6.2.2.6.4.3 pontot) részeként kell elvégezni. Auditálásra lehet szükség a jóváhagyás módosítása során is (lásd a 6.2.2.6.4.6 pontot).

Az illetékes hatóság számára elfogadható módon időszakos auditálást kell végezni annak biztosítására, hogy az időszakos vizsgálatot végző szervezet továbbra is megfeleljen az ADR követelményeinek.

Az időszakos vizsgálatot végző szervezetet értesíteni kell az auditálás eredményéről. Az értesítésnek tartalmaznia kell az auditálás következtetéseit és az esetleg szükséges javításokat.

6.2.2.6.3.3 *A minőségbiztosítási rendszer fenntartása*

Az időszakos vizsgálatot végző szervezetnek a minőségbiztosítási rendszert a jóváhagyott állapotban fenn kell tartania, hogy folyamatosan megfelelő és hatékony legyen.

Az időszakos vizsgálatot végző szervezetnek a minőségbiztosítási rendszert jóváhagyó illetékes hatóságot a 6.2.2.6.4.6 pont szerinti jóváhagyás módosítási eljárás értelmében minden tervezett változásról értesítenie kell.

6.2.2.6.4 *Az időszakos vizsgálatot végző szervezetek jóváhagyásának eljárása*

Első jóváhagyás

6.2.2.6.4.1 Ha egy szervezet valamely nyomástartó tartályra vonatkozó szabvány és az ADR előírásai szerinti nyomástartó tartály időszakos vizsgálatát kívánja végezni, akkor rendelkeznie kell az illetékes hatóság által kiadott jóváhagyási bizonyítvánnyal, annak megszerzéséhez kérelmet kell benyújtania, és a kapott bizonyítványt meg kell őriznie.

Ha annak az országnak az illetékes hatósága kéri, amelyben a tartályt használják, akkor az írásbeli jóváhagyást a rendelkezésére kell bocsátani.

6.2.2.6.4.2 Minden időszakos vizsgálatot végző szervezetre külön kérelmet kell benyújtani, aminek a következőket kell tartalmaznia:

- a) az időszakos vizsgálatot végző szervezet nevét és székhelyét, és ezenkívül, ha a kérelmet meghatalmazott képviselő nyújtja be, annak nevét és címét;
- b) minden időszakos vizsgálatot végző telephely címét;
- c) a minőségbiztosítási rendszerért felelős személy(ek) nevét és beosztását;
- d) a nyomástartó tartály rendeltetését, az időszakos vizsgálatok végzésének módját és a nyomástartó tartályra vonatkozó szabványt, amelyeket a minőségbiztosítási rendszerben figyelembe vettek;
- e) minden telephelyre, a berendezésekre és a minőségbiztosítási rendszerre a 6.2.2.6.3.1

- pontban meghatározott dokumentációt;
- f) az időszakos vizsgálatot végző személyzet képzésére és minősítésére vonatkozó dokumentációt; és
 - g) ha egy hasonló kérelmet egy másik illetékes hatóság már elutasított, akkor az elutasítás részleteit.

6.2.2.6.4.3 Az illetékes hatóságnak:

- a) meg kell vizsgálnia a műszaki dokumentációt annak ellenőrzésére, hogy megfelel-e a vonatkozó nyomástartó tartály szabványok és az ADR előírásainak; és
- b) el kell végeznie a 6.2.2.6.3.2 pont szerinti auditálást annak ellenőrzésére, hogy a vizsgálatokat a vonatkozó nyomástartó szabványok és az ADR előírásainak megfelelően, az illetékes hatóság által elfogadott módon végzik.

6.2.2.6.4.4 Miután az auditálás kielégítő eredménnyel zárult, és a 6.2.2.6.4 pont minden vonatkozó követelménye teljesült, jóváhagyási bizonyítványt kell kiállítani, amelyben fel kell tüntetni az időszakos vizsgálatot végző szervezet nevét, nyilvántartási jelét, minden telephely címét és a jóváhagyott tevékenység azonosításához szükséges adatokat (pl. a nyomástartó tartályok rendeltetését, az időszakos vizsgálati módszereket és a nyomástartó tartály szabványokat).

6.2.2.6.4.5 Ha az illetékes hatóság nem adja meg a jóváhagyást az időszakos vizsgálatot végző szervezetnek, az elutasítást írásban részletesen meg kell indokolnia.

Az időszakos vizsgálatot végző szervezet jóváhagyásának módosítása

6.2.2.6.4.6 A jóváhagyást követően az időszakos vizsgálatot végző szervezetnek közölnie kell a jóváhagyást kiadó illetékes hatósággal az első jóváhagyási kérelemhez a 6.2.2.6.4.2 pont szerint benyújtott adatokban bekövetkező változásokat. A változásokat értékelni kell annak meghatározására, hogy kielégítik-e a vonatkozó nyomástartó tartály szabványok és az ADR előírásait. Ennek során szükség lehet a 6.2.2.6.3.2 pont szerinti auditálásra. Az illetékes hatóságnak ezen változásokat írásban kell elfogadnia vagy elutasítania, és szükség esetén módosított jóváhagyási bizonyítványt kell kiadnia.

6.2.2.6.4.7 Bármely másik illetékes hatóság kérésére az illetékes hatóságnak tájékoztatást kell adnia az első jóváhagyásokról, a jóváhagyások módosításáról és a jóváhagyások visszavonásáról.

6.2.2.6.5 *Időszakos vizsgálat és tanúsítás*

Az időszakos vizsgálati jelölés felvitelét egy nyomástartó tartályra úgy kell tekinteni, mint annak igazolását, hogy a nyomástartó tartály megfelel a nyomástartó tartályra vonatkozó szabványoknak és az ADR előírásainak. Az időszakos vizsgálatot végző szervezetnek minden jóváhagyott nyomástartó tartályon el kell helyeznie az időszakos vizsgálati jelölést és saját nyilvántartási jelét (lásd a 6.2.2.7.7 pontot).

A nyomástartó tartály megtöltése előtt az időszakos vizsgálatot végző szervezetnek tanúsítványt kell kiállítania arról, hogy a nyomástartó tartály az időszakos vizsgálaton megfelelt.

6.2.2.6.6 *Okiratok*

A nyomástartó tartályok időszakos vizsgálatára vonatkozó tanúsítványokat (megfelelőség és nem megfelelőség esetén egyaránt), beleértve a vizsgáló berendezések helyét, az időszakos vizsgálatot végző szervezetnek a legalább 15 évig meg kell őriznie.

A nyomástartó tartály tulajdonosának a tanúsítványt a következő időszakos vizsgálatig kell megőriznie, kivéve, ha a nyomástartó tartályt a használatból véglegesen kivonják.

6.2.2.7 *Az újratölthető, UN nyomástartó tartályok jelölése*

Megjegyzés: Az UN fémhidrid tárolórendszerek jelölésére vonatkozó előírásokat a 6.2.2.9 bekezdés tartalmazza.

6.2.2.7.1

Az újratölthető, UN nyomástartó tartályokon jól olvashatóan és maradandóan fel kell tüntetni a jóváhagyási jelölést, valamint az üzemi és a gyártási jelölést. A jelöléseket tartósan (pl. beütéssel, bevéséssel vagy maratással) kell a nyomástartó tartályon elhelyezni. A jelölések a nyomástartó tartály vállrészén, a tetején vagy a nyakrészén, vagy a nyomástartó tartályhoz tartósan hozzáerősített alkatrészen (pl. hegesztett galléron vagy a zárt mélyhűtő tartály külső burkolatára hegesztett korrózióálló táblán) helyezhetők el. Az „UN” csomagolóeszköz jelölés kivételével a jelölések legkisebb mérete a 140 mm vagy annál nagyobb átmérőjű nyomástartó tartályok esetén 5 mm, ill. a 140 mm-nél kisebb átmérőjű nyomástartó tartályok esetén 2,5 mm. Az „UN” csomagolóeszköz jelölés legkisebb mérete a 140 mm vagy annál nagyobb átmérőjű nyomástartó tartályok esetén 10 mm, ill. a 140 mm-nél kisebb átmérőjű nyomástartó tartályok esetén 5 mm.

6.2.2.7.2

A következő jóváhagyási jelöléseket kell feltüntetni:

- a) az Egyesült Nemzetek jelét a csomagolóeszközön:  ;
- Ezt a jelet csak annak tanúsítására szabad használni, hogy a csomagolóeszköz, a mobil tartály, ill. a MEG-konténer megfelel a 6.1, a 6.2, a 6.3, a 6.5, a 6.6, ill. a 6.7²⁾ fejezetben található vonatkozó előírásoknak. Ez a jel nem használható azokon a nyomástartó tartályokon, amelyek csak a 6.2.3 – 6.2.5 szakaszok követelményeinek felelnek meg (lásd a 6.2.3.9 bekezdést);
- b) a tervezéshez, a gyártáshoz és a vizsgálathoz használt műszaki szabványok számát (pl. ISO 9809-1);
- c) a jóváhagyó állam jelét a nemzetközi forgalomban résztvevő gépjárművek államjelzésével³⁾;
- Megjegyzés:** *A jóváhagyó államnak azt az államot kell tekinteni, amely azt a szervezetet hagyta jóvá, amelyik az adott nyomástartó tartályt a gyártás során vizsgálta.*
- d) a jelölést engedélyező ország illetékes hatósága által bejegyzett vizsgáló szervezet azonosító jelét vagy bélyegzőjét;
- e) az üzembe helyezés előtti vizsgálat végrehajtásának évét (négy számjeggyel), ferde vonallal elválasztva a hónapot (két számjeggyel) (pl. 2005/03).

6.2.2.7.3

A következő üzemi jelöléseket kell feltüntetni:

- f) a próbanyomást bar-ban kifejezve, ami elé a „PH” betűket kell írni, a nyomásérték után a „BAR” mértékegységet is ki kell írni;
- g) az üres nyomástartó tartály tömegét, beleértve minden tartósan felszerelt szerkezeti alkatrészt (pl. nyakgyűrűt, talpgyűrűt stb.) kilogrammban kifejezve, ami után a „KG” mértékegységet is ki kell írni. Ez a tömeg nem tartalmazza a szelep, a szelepszapka vagy a szelepvédő, az esetleges bevonat tömegét, sem acetilénél a porózus anyag tömegét. A tömeget az utolsó jegyre felfelé kerekített három értékes számjegyre kell megadni. Az 1 kg-nál könnyebb palackok esetén az üres tömeget az utolsó jegyre felfelé kerekített két értékes számjegyre kell megadni. Az UN 1001 oldott acetilén és az UN 3374 oldószermentes acetilén esetén legalább egy tizedesjegyet, az 1 kg-nál könnyebb nyomástartó tartályoknál legalább két tizedesjegyet kell feltüntetni;
- h) a nyomástartó tartály szavatolt legkisebb falvastagságát mm-ben kifejezve, ami után a „MM” mértékegységet is ki kell írni. Ez a jelölés nem szükséges 1 l víztérfogatú nyomástartó tartályokra, a kompozit palackokra és a zárt mélyhűtő tartályokra;

2) Ezt a jelet használják annak tanúsítására is, hogy az olyan hajlékony ömlesztettáru-konténerek, amelyeket más közlekedési alágazatra hagytak jóvá, megfelelnek az ENSZ Minta Szabályzat 6.8 fejezete követelményeinek.

3) A közúti közlekedésről szóló Bécsi Egyezmény (Bécs, 1968) által előírt államjelzés a nemzetközi forgalomban résztvevő gépjárművekre.

- i) a sűrített gázokhoz, az UN 1001 oldott acetilénhez és az UN 3374 oldószermentes acetilénhez használt nyomástartó tartályokon az üzemi nyomást bar-ban kifejezve, ami elé a „PW” rövidítést kell írni; zárt mélyhűtő tartályok esetén a megengedett legnagyobb üzemi nyomást, ami elé az „MAWP” rövidítést kell írni;
- j) a cseppfolyósított gázokhoz és a mélyhűtött, cseppfolyósított gázokhoz használt nyomástartó tartályokon a víztérfogatot literben kifejezve, az utolsó jegyre lefelé kerekített három értékes számjegyre, ami után az „L” mértékegységet is ki kell írni. Ha a legkisebb vagy névleges víztérfogat egész szám, a tizedesvessző utáni számjegyek elhagyhatók;
- k) az UN 1001 oldott acetilénhez használt nyomástartó tartályokon az üres tartály, a töltés alatt is rajta levő szerelvények és alkatrészek, az esetleges bevonat, valamint a porózus anyag, az oldószer és a telítési gáz tömegének összegét kg-ban kifejezve, az utolsó jegyre lefelé kerekített három értékes számjegyre, ami után a „KG” mértékegységet is ki kell írni. Legalább egy tizedesjegyet fel kell tüntetni, az 1 kg-nál könnyebb nyomástartó tartályoknál a tömeget az utolsó jegyre lefelé kerekített két értékes számjegyre kell megadni;
- l) az UN 3374 oldószermentes acetilénhez használt nyomástartó tartályokon az üres tartály, a töltés alatt is rajta levő szerelvények és alkatrészek, az esetleges bevonat, valamint a porózus anyag tömegének összegét kg-ban kifejezve, az utolsó jegyre lefelé kerekített három értékes számjegyre, ami után a „KG” mértékegységet is ki kell írni. Legalább egy tizedesjegyet fel kell tüntetni, az 1 kg-nál könnyebb nyomástartó tartályoknál a tömeget az utolsó jegyre lefelé kerekített két értékes számjegyre kell megadni.

6.2.2.7.4 A következő gyártási jelöléseket kell feltüntetni:

- m) a palack menet azonosítását (pl. 25E). Ez a jelölés nem szükséges a zárt mélyhűtő tartályokra;
- n) a gyártó illetékes hatóság által bejegyzett jelét. Ha nem ugyanabban az országban gyártják, mint ahol jóváhagyják, akkor a gyártó jele elé a gyártási ország jelét kell írni a nemzetközi forgalomban résztvevő gépjárművek államjelzésével⁴⁾. Az ország jelét és a gyártó jelét szóközzel vagy ferde vonallal kell elválasztani;
- o) a gyártó által kiadott sorozatszámot;
- p) a hidrogénes elridegedés veszélyével járó gázok szállítására szolgáló, acélból készült nyomástartó tartályok és acél béléssel ellátott, kompozit nyomástartó tartályok esetén az acél összeférhetőségét jelölő „H” betűt (lásd az ISO 11114-1:1997 szabványt).

6.2.2.7.5 Az előzőekben felsorolt jelöléseket három csoportba kell elrendezni:

- a felső csoportban a gyártási jelöléseket kell feltüntetni a 6.2.2.7.4 pontban megadott sorrendben, egymás után;
- a középső csoportban a 6.2.2.7.3 pontban felsorolt üzemi jelöléseket kell feltüntetni, és ha az üzemi nyomás (i) feltüntetése is szükséges, akkor azt közvetlenül a próbanyomás (f) előtt kell feltüntetni;
- az alsó csoportban a jóváhagyási jelöléseket kell feltüntetni a 6.2.2.7.2 pontban megadott sorrendben.

Példa a palack jelölésére:

4) A közúti közlekedésről szóló Bécsi Egyezmény (Bécs, 1968) által előírt államjelzés a nemzetközi forgalomban résztvevő gépjárművekre.

(m)	(n)	(o)	(p)	
25E	D MF	765432	H	
(i)	(f)	(g)	(j)	(h)
PW200	PH300BAR	62.1KG	50L	5.8MM
(a)	(b)	(c)	(d)	(e)
	ISO 9809-1	F	IB	2000/12

6.2.2.7.6 Az oldalfalon kívüli helyeken egyéb jelölések is elhelyezhetők, amennyiben kis feszültségnek kitett helyre viszik fel és méretük, ill. mélységük nem eredményez veszélyes feszültség halmozódást. Zárt mélyhűtő tartályok esetén ezek a jelölések a külső burkolatra erősített különálló táblán is feltüntethetők. Ezek a jelölések azonban nem lehetnek az előírt jelölésekkel ellentétesek.

6.2.2.7.7 Az előző jelöléseken kívül azokat az újratölthető, nyomástartó tartályokat, amelyek kielégíti a 6.2.2.4 bekezdés időszakos vizsgálati követelményeit, a következő jelölésekkel kell ellátni:

- az időszakos vizsgálatot végző szervezetet felhatalmazó országot azonosító betű(k), a nemzetközi forgalomban résztvevő gépjárművek államjelzésével⁵⁾. Ez a jelölés nem szükséges, ha ezt a szervezetet a gyártást engedélyező ország illetékes hatósága hatalmazta fel;
- az illetékes hatóság által az időszakos vizsgálat elvégzésére felhatalmazott szervezet nyilvántartási jele;
- az időszakos vizsgálat végrehajtásának évét (két számjeggyel), és ferde vonallal elválasztva a hónapot (két számjeggyel) (pl. 05/12). Az év jelölésére négy számjegy is használható (pl. 2005/12).

Ezeket a jelöléseket a megadott sorrendben egymás után kell feltüntetni.

6.2.2.7.8 Acetilén palackoknál az illetékes hatóság hozzájárulásával az utolsó időszakos vizsgálat dátuma és a vizsgálatot végző szervezet bélyegzője a palackhoz erősített olyan gallérra is beüthető, amelyet a szelep rögzít a palackra. A gallért úgy kell kialakítani, hogy az csak a szelepnek a palackról való leszerelésével legyen eltávolítható.

6.2.2.7.9 Palackkötegek esetén a nyomástartó tartályok jelölési előírásait csak a köteget alkotó egyes palackokra, nem pedig az összeszerelt szerkezetre kell alkalmazni.

6.2.2.8 *A nem újratölthető, UN nyomástartó tartályok jelölése*

6.2.2.8.1 A nem újratölthető, UN nyomástartó tartályokat jól olvashatóan és maradandóan el kell látni a jóváhagyási jelöléssel, valamint a gázra és a nyomástartó tartályra vonatkozó különleges jelöléssel. A jelöléseket tartósan (pl. betűsablonnal, beütéssel, bevéséssel vagy maratással) kell a nyomástartó tartályon elhelyezni. A jelölések – a betűsablonnal felvitt jelölés kivételével – elhelyezhetők a nyomástartó tartály vállrészén, a tetején vagy a nyakrészén, vagy a nyomástartó tartályhoz tartósan hozzáerősített alkatrészen (pl. hegesztett galléron). Az „UN” csomagolóeszköz jelölésén és a „TILOS ÚJRATÖLTENI” feliraton kívül a többi jelölés legkisebb mérete a 140 mm vagy annál nagyobb átmérőjű nyomástartó tartályok esetén 5 mm, ill. a 140 mm-nél kisebb átmérőjű nyomástartó tartályok esetén 2,5 mm.

Az „UN” csomagolóeszköz jelölés legkisebb mérete a 140 mm vagy annál nagyobb átmérőjű

5) A közúti közlekedésről szóló Bécsi Egyezmény (Bécs, 1968) által előírt államjelzés a nemzetközi forgalomban résztvevő gépjárművekre.

nyomástartó tartályok esetén 10 mm, ill. a 140 mm-nél kisebb átmérőjű nyomástartó tartályok esetén 5 mm.

A „TILOS ÚJRATÖLTENI” felirat mérete legalább 5 mm.

6.2.2.8.2 A 6.2.2.7.2 – 6.2.2.7.4 pontokban felsorolt jelöléseket kell alkalmazni a g), h) és m) pont kivételével. Az o) pont szerinti sorozatszám helyett fel lehet tüntetni a gyártási tétel számát. Ezen kívül a „TILOS ÚJRATÖLTENI” feliratot is el kell helyezni legalább 5 mm magas betűkkel írva.

6.2.2.8.3 A 6.2.2.7.5 pont követelményeit be kell tartani.

Megjegyzés: *A nem újratölthető, nyomástartó tartályokon, méreteikre tekintettel, a jelölés bárcával is helyettesíthető.*

6.2.2.8.4 Az oldalfalon kívüli helyeken egyéb jelölések is elhelyezhetők, amennyiben kis feszültségnek kitett helyre viszik fel és méretük, ill. mélységük nem eredményez veszélyes feszültség halmozódást. Ezek a jelölések azonban nem lehetnek az előírt jelölésekkel ellentétesek.

6.2.2.9 *Az UN fémhidrid tárolórendszerek jelölése*

6.2.2.9.1 Az UN fémhidrid tárolórendszereken jól olvashatóan és maradandóan fel kell tüntetni a következő jelöléseket. A jelöléseket tartósan (pl. beütéssel, bevéséssel vagy maratással) kell a fémhidrid tárolórendszeren elhelyezni. A jelölések a fémhidrid tárolórendszer vállrészén, a tetején vagy a nyakrészén, vagy a fémhidrid tárolórendszerhez tartósan hozzáerősített alkatrészeken helyezhetők el. Az „UN” csomagolóeszköz jelölés kivételével a jelölések legkisebb mérete a 140 mm vagy annál nagyobb átmérőjű fémhidrid tárolórendszerek esetén 5 mm, ill. a 140 mm-nél kisebb átmérőjű fémhidrid tárolórendszerek esetén 2,5 mm. Az „UN” csomagolóeszköz jelölés legkisebb mérete a 140 mm vagy annál nagyobb átmérőjű fémhidrid tárolórendszerek esetén 10 mm, ill. a 140 mm-nél kisebb átmérőjű fémhidrid tárolórendszerek esetén 5 mm.

6.2.2.9.2 A következő jelöléseket kell feltüntetni:

- a) az Egyesült Nemzetek jelét a csomagolóeszközön:  .
- Ezt a jelet csak annak tanúsítására szabad használni, hogy a csomagolóeszköz, a mobil tartány, ill. a MEG-konténer megfelel a 6.1, a 6.2, a 6.3, a 6.5, a 6.6, ill. a 6.7⁶⁾ fejezet vonatkozó előírásainak;
- b) az „ISO 16111” feliratot (a tervezéshez, a gyártáshoz és a vizsgálathoz használt műszaki szabvány);
- c) a jóváhagyó állam jelét a nemzetközi forgalomban résztvevő gépjárművek államjelzésével⁷⁾;
- Megjegyzés:** *Jóváhagyó államnak azt az államot kell tekinteni, amely azt a szervezetet hagyta jóvá, amelyik az adott nyomástartó tartályt a gyártás során vizsgálta.*
- d) a jelölést engedélyező állam illetékes hatósága által bejegyzett vizsgáló szervezet azonosító jelét vagy bélyegzőjét;
- e) az üzembe helyezés előtti vizsgálat végrehajtásának évét (négy számjeggyel), ferde

6) Ezt a jelet használják annak tanúsítására is, hogy az olyan hajlékony ömlesztettáru-konténerek, amelyeket más közlekedési alágazatra hagytak jóvá, megfelelnek az ENSZ Minta Szabályzat 6.8 fejezete követelményeinek.

7) A közúti közlekedésről szóló Bécsi Egyezmény (Bécs, 1968) által előírt államjelzés a nemzetközi forgalomban résztvevő gépjárművekre.

vonallal elválasztva a hónapot (két számjeggyel) (pl. 2011/03);

- f) a próbanyomást bar-ban kifejezve, ami elé a „PH” betűket kell írni, a nyomásérték után a „BAR” mértékegységet is ki kell írni;
- g) a névleges töltőnyomást bar-ban kifejezve, ami elé az „RCP” betűket kell írni, a nyomásérték után a „BAR” mértékegységet is ki kell írni;
- h) a gyártó illetékes hatóság által bejegyzett jelét. Ha nem ugyanabban az országban gyártják, mint ahol jóváhagyják, akkor a gyártó jele elé a gyártási ország jelét kell írni a nemzetközi forgalomban résztvevő gépjárművek államjelzésével⁷⁾. Az ország jelét és a gyártó jelét szóközzel vagy ferde vonallal kell elválasztani;
- i) a gyártó által kiadott sorozatszámot;
- j) acél tartályok és acél béléssel ellátott, kompozit tartályok esetén az acél összeférhetőségét jelölő „H” betűt (lásd az ISO 11114-1:1997 szabványt); és
- k) korlátozott élettartamú fémhidrid tárolórendszerek esetén a felhasználhatóság lejárátát jelölő „FINAL” feliratot, amit az év (négy számjeggyel) és ferde vonallal elválasztva a hónap (két számjeggyel) követ (pl. 2012/03).

Az előző a) – e) pont szerinti jóváhagyási jelöléseket a megadott sorrendben kell feltüntetni. A névleges töltőnyomást (g) közvetlenül a próbanyomás (f) előtt kell feltüntetni. A h) – k) pont szerinti gyártási jelöléseket a megadott sorrendben kell felvinni.

6.2.2.9.3

Az oldalfalon kívüli helyeken egyéb jelölések is elhelyezhetők, amennyiben kis feszültségnek kitett helyre viszik fel és méretük, ill. mélységük nem eredményez veszélyes feszültség halmozódást. Ezek a jelölések azonban nem lehetnek az előírt jelölésekkel ellentétesek.

6.2.2.9.4

Az előző jelöléseken kívül azt a fémhidrid tárolórendszert, amely kielégíti a 6.2.2.4 bekezdés szerinti időszakos vizsgálat követelményeit, a következő jelölésekkel kell ellátni:

- a) az időszakos vizsgálatot végző szervezetet jóváhagyó országot azonosító betű(k) a nemzetközi forgalomban résztvevő gépjárművek államjelzésével⁷⁾. Ez a jelölés nem szükséges, ha ezt a szervezetet a gyártást engedélyező ország illetékes hatósága hagyta jóvá;
- b) az illetékes hatóság által az időszakos vizsgálat elvégzésére jóváhagyott szervezet nyilvántartási jele;
- c) az időszakos vizsgálat végrehajtásának évét (két számjeggyel), és ferde vonallal elválasztva a hónapot (két számjeggyel) (pl. 15/12). Az év jelölésére négy számjegy is használható (pl. 2015/12).

Ezeket a jelöléseket a megadott sorrendben egymás után kell feltüntetni.

6.2.2.10

A megfelelés-értékelésre és az időszakos vizsgálatra vonatkozó egyenértékű eljárás

A következő eljárások alkalmazása esetén a 6.2.2.5 és a 6.2.2.6 bekezdés követelményei az UN nyomástartó tartályokra teljesítettnek tekinthetők:

Eljárás	Illetékes szervezet
Típusjóváhagyás (1.8.7.2)	Xa
A gyártás felügyelete (1.8.7.3)	Xa vagy IS
Üzembe helyezés előtti vizsgálat (1.8.7.4)	Xa vagy IS
Időszakos vizsgálat (1.8.7.5)	Xa vagy Xb vagy IS

Xa illetékes hatóságot, ill. megbízottját vagy az 1.8.6.2, az 1.8.6.4, az 1.8.6.5 és az 1.8.6.8 bekezdésnek megfelelő és az EN ISO/IEC 17020:2004 szabvány szerint akkreditált, A típusú vizsgáló szervezetet jelent.

Xb az 1.8.6.2, az 1.8.6.4, az 1.8.6.5 és az 1.8.6.8 bekezdésnek megfelelő és az EN ISO/IEC 17020:2004 szabvány szerint akkreditált, B típusú vizsgáló szervezetet jelent.

IS a kérelmezőnek az 1.8.6.2, az 1.8.6.4, az 1.8.6.5 és az 1.8.6.8 bekezdésnek megfelelő és az EN ISO/IEC 17020:2004 szabvány szerint akkreditált, A típusú vizsgáló szervezet által felügyelt üzemi vizsgálóhelyét jelenti. Az üzemi vizsgálóhelynek függetlennek kell lennie a tervezési, gyártási, javítási és karbantartási tevékenységektől.

6.2.3 A nem-UN nyomástartó tartályokra vonatkozó általános követelmények

6.2.3.1 Tervezés és gyártás

6.2.3.1.1 Ha egy nyomástartó tartályt, ill. zárószerkezetét nem a 6.2.2 szakasz követelményei szerint terveznek, gyártanak, vizsgálnak és hagynak jóvá, akkor a 6.2.1 szakasz általános követelményei (e szakasz követelményei szerint módosítva vagy kiegészítve) és a 6.2.4, ill. 6.2.5 szakasz követelményei szerint kell tervezni, gyártani, vizsgálni és jóváhagyni.

6.2.3.1.2 Hacsak lehetséges, a falvastagságot számítással kell meghatározni, szükség esetén kísérleti szilárdsági vizsgálattal összekapcsolva. Egyéb esetben a falvastagság kísérleti úton is meghatározható.

A külső falnál és a teherviselő részeknél alkalmas szilárdsági számításokat kell végezni a nyomástartó tartályok biztonságának eléréséhez.

A nyomás elviseléséhez szükséges legkisebb falvastagságot számítással kell meghatározni, különösen figyelembe véve:

- a tervezési nyomást, ami nem lehet a próbanyomásnál kisebb;
- a tervezési hőmérsékletet, elfogadható biztonsági tényező figyelembevételével;
- a legnagyobb feszültséget és szükség esetén a feszültség halmozódásokat;
- az anyag tulajdonságaival összefüggő egyéb tényezőket.

6.2.3.1.3 Hegesztett nyomástartó tartályokhoz csak olyan hibátlanul hegeszthető anyagok használhatók fel, amelyek ütőszilárdsága -20 °C környezeti hőmérsékleten szavatolható.

6.2.3.1.4 Zárt mélyhűtő tartályoknál a 6.2.1.1.8.1 pont szerint megállapítandó ütőszilárdságot a 6.8.5.3 bekezdés szerint kell vizsgálni.

6.2.3.2 (fenntartva)

6.2.3.3 Üzemi szerelvények

6.2.3.3.1 Az üzemi szerelvényeknek a 6.2.1.3 bekezdés előírásainak kell megfelelniük.

6.2.3.3.2 Nyílások

A gázhordókon töltő- és ürítőnyílások, valamint a szintjelző, nyomásmérő vagy nyomáscsökkentő szerkezet csatlakoztatásához további nyílások is lehetnek. A biztonságos üzemeltetés érdekében a nyílások száma a lehető legkevesebb legyen. A gázhordók vizsgálónyílással is elláthatók, amelyet hatékony zárószerkezettel kell zárni.

6.2.3.3.3 Szerelvények

- a) Ha a palack gördítést akadályozó szerkezettel van ellátva, ezt a szerkezetet nem szabad a szelepvédő sapkával egybeépíteni.
- b) A gördíthető gázhordókat gördítőabronccsal kell ellátni vagy más módon kell védeni a gördülés során bekövetkező sérülésektől (pl. korrózióálló fémbevonat felszórásával a nyomástartó tartály külső felületére).
- c) A palackköteget olyan szerkezettel kell ellátni, amely biztonságos kezelésüket és

szállításukat lehetővé teszi.

- d) Ha szintjelző, nyomásmérő vagy nyomáscsökkentő szerkezet van felszerelve, akkor ezeket a 4.1.6.8 bekezdésben a szelepekre előírt módon kell védeni.

6.2.3.4 *Üzembe helyezés előtti vizsgálat*

6.2.3.4.1 Az új nyomástartó tartályokat a gyártás során és az üzembe helyezés előtt a 6.2.1.5 bekezdés követelményei szerint kell vizsgálni.

6.2.3.4.2 *Az alumínium-ötvözet nyomástartó tartályokra vonatkozó különleges előírások*

- a) A 6.2.1.5.1 pontban előírt vizsgálatokon kívül vizsgálni kell a nyomástartó tartályfal belsejének kristályközi korróziójának lehetőségét, amennyiben réztartalmú alumínium-ötvözetet vagy olyan magnézium- vagy mangántartalmú alumínium-ötvözetet használnak, amelynek magnéziumtartalma meghaladja a 3,5%-ot, vagy mangántartalma 0,5%-nál kevesebb.
- b) Az alumínium-réz ötvözet vizsgálatát a gyártónak az új ötvözetnek az illetékes hatóság részéről történő engedélyezése alkalmával kell végrehajtania, és ezt követően a gyártás során minden öntésnél meg kell ismételnie.
- c) Az alumínium-magnézium ötvözet vizsgálatát a gyártónak az új ötvözetnek és a gyártási eljárásnak az illetékes hatóság által történő engedélyezése alkalmával kell végrehajtania. Az ötvözet összetételében vagy a gyártási eljárásban bekövetkezett változás esetén a vizsgálatot meg kell ismételni.

6.2.3.5 *Időszakos vizsgálat*

6.2.3.5.1 Az időszakos vizsgálatokat a 6.2.1.6.1 pont szerint kell végrehajtani.

Megjegyzés: A típusjóváhagyást kiadó ország illetékes hatósága hozzájárulása esetén az UN 1965 szénhidrogén-gáz keverék, cseppfolyósított, m.n.n. szállítására szolgáló, 6,5 l-nél kisebb űrtartalmú, hegesztett acélpalackok folyadékn nyomáspróbája egyenértékű vizsgálati módszerrel helyettesíthető.

6.2.3.5.2 (törölve)

6.2.3.6 *A nyomástartó tartályok engedélyezése*

6.2.3.6.1 Az 1.8.7 szakasz szerinti megfelelőség-értékelési eljárást és időszakos vizsgálatokat a következő táblázat szerinti illetékes szervezetnek kell végeznie:

Eljárás	Illetékes szervezet
Típusjóváhagyás (1.8.7.2)	Xa
A gyártás felügyelete (1.8.7.3)	Xa vagy IS
Üzembe helyezés előtti vizsgálat (1.8.7.4)	Xa vagy IS
Időszakos vizsgálat (1.8.7.5)	Xa vagy Xb vagy IS

Az újratölthető nyomástartó tartályok szelepeinek és a közvetlen biztonsági funkcióval rendelkező egyéb, leszerelhető tartozékainak megfelelőség-értékelését a tartálytól függetlenül is el lehet végezni, de a megfelelőség-értékelési eljárásnak legalább olyan szigorúnak kell lennie, mint amelyet a nyomástartó tartályra alkalmaztak, amelyre a tartozékokat szerelik.

Xa illetékes hatóságot, ill. megbízottját vagy az 1.8.6.2, az 1.8.6.4, az 1.8.6.5 és az 1.8.6.8 bekezdésnek megfelelő és az EN ISO/IEC 17020:2004 szabvány szerint akkreditált, A típusú vizsgáló szervezetet jelent.

Xb az 1.8.6.2, az 1.8.6.4, az 1.8.6.5 és az 1.8.6.8 bekezdésnek megfelelő és az EN ISO/IEC 17020:2004 szabvány szerint akkreditált, B típusú vizsgáló szervezetet jelent.

IS a kérelmezőnek az 1.8.6.2, az 1.8.6.4, az 1.8.6.5 és az 1.8.6.8 bekezdésnek megfelelő és az EN ISO/IEC 17020:2004 szabvány szerint akkreditált, A típusú vizsgáló szervezet által felügyelt üzemi vizsgálóhelyét jelenti. Az üzemi vizsgálóhelynek függetlennek kell lennie a tervezési, gyártási, javítási és karbantartási tevékenységektől.

6.2.3.6.2 Ha a jóváhagyó ország nem valamely ADR Szerződő Fél, akkor a 6.2.1.7.2 pontban említett illetékes hatóság valamely ADR Szerződő Fél illetékes hatósága.

6.2.3.7 *A gyártóra vonatkozó előírások*

6.2.3.7.1 Az 1.8.7 szakasz vonatkozó követelményeit kell betartani.

6.2.3.8 *A vizsgáló szervezetekre vonatkozó előírások*

Az 1.8.6 szakasz követelményeit kell betartani.

6.2.3.9 *Az újratölthető nyomástartó tartályok jelölése*

6.2.3.9.1 A jelölésre a 6.2.2.7 bekezdés előírásait kell betartani, a következő eltérésekkel.

6.2.3.9.2 A 6.2.2.7.2 a) pontban meghatározott, Egyesült Nemzetek jelét nem szabad használni.

6.2.3.9.3 A 6.2.2.7.3 j) pont helyett a következőt kell alkalmazni:

j) a víztérfogatot literben kifejezve, ami után az „L” mértékegységet is ki kell írni. A cseppfolyósított gázokhoz használt nyomástartó tartályokon a literben kifejezett víztérfogatot az utolsó jegyre lefelé kerekített három értékes számjegyre kell megadni. Ha a legkisebb vagy névleges víztérfogat egész szám, a tizedesvessző utáni számjegyek elhagyhatók.

6.2.3.9.4 A 6.2.2.7.3 g) és h) pont, valamint a 6.2.2.7.4 m) pont szerinti jelölés nem szükséges az UN 1965 szénhidrogén-gáz keverék, cseppfolyósított, m.n.n. gázokhoz használt nyomástartó tartályokra.

6.2.3.9.5 Ha a 6.2.2.7.7 c) pont szerint kell dátumot feltüntetni, a hónap feltüntetése nem szükséges azoknál a gázoknál, amelyekre a vizsgálati időköz 10 év vagy annál nagyobb (lásd a 4.1.4.1 bekezdés P200 és P203 csomagolási utasítását).

6.2.3.9.6 A 6.2.2.7.7 pont szerinti jelölés a palackhoz erősített olyan, alkalmas anyagból készült gallérra is beüthető, amelyet a szelepnek a palackra való felszerelésekor rögzítenek, és amely gallér csak a szelepnek a palackról való leszerelése után távolítható el.

6.2.3.9.7 *A palackkötegek jelölése*

6.2.3.9.7.1 A palackköteg egyedi palackjait a 6.2.3.9 bekezdés szerint kell megjelölni.

6.2.3.9.7.2 A palackköteg keretére tartósan felerősített táblára a következő jelölést kell felvinni:

- a) a 6.2.2.7.2 pont b), c), d) és e) alpontja szerinti jóváhagyási jelöléseket;
- b) a 6.2.2.7.3 pont f), i) és j) alpontja szerinti üzemi jelöléseket, és a bruttó tömeget, aminek tartalmaznia kell a palackköteg keret és minden tartósan hozzáerősített rész (palackok, csővezetékek, szerelvények és szelepek) tömegét is. Az UN 1001 oldott acetilénhez és az UN 3374 oldószermentes acetilénhez használt palackkötegeken szerepelnie kell a saját tömegnek is, ahogy azt az EN 12755:2000 szabvány 5.4 bekezdés 6 a) pontja előírja; és
- c) a 6.2.2.7.4 pont n), o) és – ahol értelmezhető – p) alpontja szerinti gyártási jelöléseket.

6.2.3.9.7.3.1 A jelöléseket három csoportba kell elrendezni:

- a) a felső csoportban a gyártási jelöléseket kell feltüntetni a 6.2.3.9.7.2 pont c) alpontjában

megadott sorrendben, egymás után;

- b) a középső csoportban a 6.2.3.9.7.2 pont b) alpontjában felsorolt üzemi jelöléseket kell feltüntetni, és ha a 6.2.2.7.3 pont i) alpont szerinti üzemi jelölés feltüntetése is szükséges, akkor azt közvetlenül a 6.2.2.7.3 pont f) alpont szerinti üzemi jelölés előtt kell feltüntetni;
- c) az alsó csoportban a jóváhagyási jelöléseket kell feltüntetni a 6.2.3.9.7.2 pont a) alpontjában megadott sorrendben.

6.2.3.10 *A nem újratölthető nyomástartó tartályok jelölése*

- 6.2.3.10.1** A jelölésre a 6.2.2.8 bekezdés előírásait kell betartani, azzal az eltéréssel, hogy a 6.2.2.7.2 a) pontban meghatározott, Egyesült Nemzetek jelét nem szabad használni.

6.2.3.11 *Kármentő nyomástartó tartályok*

- 6.2.3.11.1** A kármentő nyomástartó tartályban szállított nyomástartó tartály biztonságos kezelése és ártalmatlanítása céljából a kármentő nyomástartó tartálynak lehet olyan kialakítása és szerelvényei, amelyet egyébként gázpalackoknál, ill. gázhordóknál nem alkalmaznak, pl. lapos fenekek, gyorsnyitású szerkezetek vagy nyílások a paláston.

- 6.2.3.11.2** A kármentő nyomástartó tartály biztonságos kezelésére és használatára vonatkozó utasításokat a jóváhagyó ország illetékes hatóságához benyújtott kérelemben egyértelműen szerepeltetni kell, és a jóváhagyás részét kell képeznie. A jóváhagyásban fel kell tüntetni, hogy milyen nyomástartó tartályok szállíthatók a kármentő nyomástartó tartályban, valamint fel kell sorolni minden olyan rész gyártási anyagát, amelyek érintkezésbe kerülhetnek a veszélyes áruval.

- 6.2.3.11.3** A gyártónak a jóváhagyás másolatát át kell adni kármentő nyomástartó tartály tulajdonosának.

- 6.2.3.11.4** A kármentő nyomástartó tartály 6.2.3 szakasz szerinti jelölését a jóváhagyó ország illetékes hatósága határozza meg, figyelembe véve a 6.2.3.9 bekezdés alkalmazható jelölési előírásait. A jelölésnek tartalmaznia kell a kármentő nyomástartó tartály víztérfogatót és próbanyomását is.

6.2.4 *A hivatkozott szabványok szerint tervezett, gyártott és vizsgált nem UN nyomástartó tartályok*

Megjegyzés: *A szabványokban megnevezett azon személyeknek, ill. szervezeteknek, akikre az ADR szerint felelősség hárul, meg kell felelniük az ADR követelményeinek.*

6.2.4.1 *Tervezés, gyártás és üzembe helyezés előtti vizsgálat*

A következő táblázatban hivatkozott szabványokat a 6.2 fejezetnek a táblázat (3) oszlopában hivatkozott követelményeinek való megfelelés céljából a típusjóváhagyás kiadásánál a táblázat (4) oszlopa szerint kell alkalmazni. A 6.2 fejezetnek a táblázat (3) oszlopában hivatkozott követelményei azonban minden esetben elsőbbséget élveznek. Az (5) oszlopban van megadva az a legkésőbbi időpont, ameddig a meglévő típusjóváhagyásokat az 1.8.7.2.4 pont szerint vissza kell vonni; ha itt nincs időpont megadva, akkor a típusjóváhagyás az eredeti lejártáig érvényes.

A hivatkozott szabványok alkalmazása 2009. január 1-je óta kötelező. A kivételek a 6.2.5 szakaszban találhatók.

Ha ugyanarra a követelményre vonatkozóan több szabványra is van hivatkozás, akkor csak az egyiket kell alkalmazni, de azt teljes egészében, kivéve, ha a következő táblázatban másként van megadva.

6.2.4.2 Időszakos vizsgálat

A 6.2.3.5 bekezdés előírásainak való megfelelés céljából a nyomástartó tartályok időszakos vizsgálatára a következő táblázatban hivatkozott szabványokat kell alkalmazni, ahogy azt a (3) oszlop előírja, 6.2.3.5 bekezdés előírásai azonban minden esetben elsőbbséget élveznek.

Hivatkozott szabvány alkalmazása kötelező.

Ha a nyomástartó tartályt a 6.2.5 szakasz előírásai szerint gyártották és a típusjóváhagyásban meg van határozva az időszakos vizsgálatra vonatkozó eljárás, akkor azt kell követni.

Ha ugyanarra a követelményre vonatkozóan több szabványra is van hivatkozás, akkor csak az egyiket kell alkalmazni, de azt teljes egészében, kivéve, ha a következő táblázatban másként van megadva.

6.2.5

A nem a hivatkozott szabványok szerint tervezett, gyártott és vizsgált nyomástartó tartályokra vonatkozó követelmények

Az illetékes hatóság elismerhet olyan, azonos biztonsági szintet eredményező műszaki szabályzatot, amely célja a tudományos és műszaki haladás követése, vagy amely olyan szakterületre vonatkozik, amelyre a 6.2.2, ill. a 6.2.4 szakaszban nem szerepel szabvány, ill. olyan részterületet érint, amellyel a 6.2.2, ill. a 6.2.4 szakaszban szereplő szabvány nem foglalkozik.

A típusjóváhagyásban a kibocsátó szervezetnek meg kell határoznia az időszakos vizsgálatra vonatkozó eljárást, ha arra vonatkozóan a 6.2.2, ill. a 6.2.4 szakaszban nincs szabvány hivatkozás, vagy a hivatkozott szabványok nem alkalmazhatók.

Az elismert szabályzatok jegyzékét az illetékes hatóságnak meg kell küldenie az UNECE Titkárságának. A jegyzéknek tartalmaznia kell szabályzat(ok) címét, dátumát, tárgyát és elérhetőségének részleteit. A Titkárság a jegyzékeket a honlapján nyilvánosságra hozza.

Az illetékes hatóság az UNECE Titkárság értesítése nélkül is engedélyezheti olyan szabvány használatát, amelyet már elfogadtak, hogy az ADR valamely későbbi kiadása hivatkozzon rá.

A 6.2.1 és a 6.2.3 szakasz követelményeit és a következő követelményeket azonban ki kell elégíteni.

Megjegyzés: *E szakasz vonatkozásában a 6.2.1 szakaszban hivatkozott műszaki szabvány alatt a műszaki szabályzat értendő.*

6.2.5.1

Szerkezeti anyagok

A következő előírásokban példák találhatók a felhasználható anyagokra, amelyek kielégítik a 6.2.1.2 bekezdés szerkezeti anyagokra vonatkozó követelményeit:

- a) szénacél a sűrített, a cseppfolyósított, a mélyhűtött, cseppfolyósított gázokhoz, az oldott gázokhoz, valamint a nem a 2 osztályba tartozó anyagokhoz, amelyeket a 4.1.4.1 bekezdés P200 csomagolási utasítás 3 táblázata sorol fel;
- b) ötvöztetett acél (különleges acél), nikkel és nikkelötvözet (pl. monel) a sűrített, a cseppfolyósított, a mélyhűtött, cseppfolyósított gázokhoz, az oldott gázokhoz, valamint a nem a 2 osztályba tartozó anyagokhoz, amelyeket a 4.1.4.1 bekezdés P200 csomagolási utasítás 3 táblázata sorol fel;

- c) réz:
- i) az 1A, az 1O, az 1F és az 1TF osztályozási kód alá tartozó gázokhoz, ha töltési nyomásuk 15 °C-ra vonatkoztatva nem haladja meg a 2 MPa-t (20 bar-t);
 - ii) a 2A osztályozási kód gázaihoz és ezenkívül az UN 1033 dimetil-éterhez, az UN 1037 etil-kloridhoz, az UN 1063 metil-kloridhoz, az UN 1079 kén-dioxidhoz, az UN 1085 vinil-bromidhoz, az UN 1086 vinil-kloridhoz, valamint az UN 3300 etilén-oxid és szén-dioxid keverékhez 87%-nál nagyobb etilén-oxid tartalommal;
 - iii) a 3A, a 3O és a 3F osztályozási kód alá tartozó gázokhoz;
- d) alumíniumötvözet: lásd a 4.1.4.1 bekezdésben a P200 csomagolási utasítás 10) bekezdésének „a” különleges előírását;
- e) kompozit anyagok a sűrített, a cseppfolyósított, a mélyhűtött, cseppfolyósított gázokhoz, valamint az oldott gázokhoz;
- f) műanyagok a mélyhűtött, cseppfolyósított gázokhoz; és
- g) üveg a 3A osztályozási kód gázaihoz, az UN 2187 szén-dioxid, mélyhűtött, cseppfolyósított, ill. szén-dioxid keverékek, mélyhűtött, cseppfolyósított gázok kivételével, valamint a 3O osztályozási kód gázaihoz.

6.2.5.2 Üzemi szerelvények

(fenntartva)

6.2.5.3 Fémből készült palackok, nagypalackok, gázhordók és palackkötegek

A próbanyomás hatására a fémbe keletkező feszültség a tartály leginkább igénybe vett helyén nem haladhatja meg az R_e szavatolt legkisebb folyáshatár 77%-át.

Folyáshatáron azt a feszültséget kell érteni, amelynek hatására a próbatest mérési jelei között 2 ezrelékes (0,2%-os), illetve ausztenites acélokban 1%-os maradó nyúlás jön létre.

Megjegyzés: A fémlemezről készült szakítópróbatess tengelyének merőlegesnek kell lennie a hengerlés irányára. A szakadási nyúlás méréséhez olyan kör keresztmetszetű szakítópálcát kell használni, amelyen a két jel közötti „l” távolság a „d” átmérő ötszöröse ($l = 5d$). Négyzet keresztmetszetű szakítópálca esetén a jelek közötti távolságot a következő képlettel kell számítani:

$$l = 5,65 \sqrt{F_0}$$
ahol F_0 a szakítópálca eredeti keresztmetszeti területe.

A nyomástartó tartályokat és zárószervezetüket olyan alkalmas anyagból kell gyártani, amely –20 °C és +50 °C között ellenáll a ridegtörésnek és a feszültség alatti korróziós repedezésnek.

A hegesztéseket szakszerűen kell elkészíteni, és teljesen biztonságosnak kell lenniük.

6.2.5.4 Kiegészítő előírások azokra az alumíniumötvözet nyomástartó tartályokra, amelyeket sűrített gázokhoz, cseppfolyósított gázokhoz, oldott gázokhoz, gázmintákhoz (olyan túlnyomás nélküli gázokhoz, amelyekre különleges előírások érvényesek), valamint (az aeroszolok és a gázpatronok kivételével) a túlnyomás alatti gázt tartalmazó tárgyakhoz használnak

6.2.5.4.1 Az alumíniumötvözetből készült nyomástartó tartályok anyagának az alábbi követelményeknek kell megfelelnie:

	A	B	C	D
Szakítószilárdság, R_m , MPa (N/mm ²)	49 – 186	196 – 372	196 – 372	343 – 490
Folyáshatár, R_e , MPa (N/mm ²) ($l = 0,2\%$ maradandó nyúlásnál)	10 – 167	59 – 314	137 – 334	206 – 412
Szakadási nyúlás ($l = 5d$) %-ban	12 – 40	12 – 30	12 – 30	11 – 16

	A	B	C	D
Hajlítási próba (a hajlítótüske átmérője $d = n \cdot e$, ahol e a mintalemez vastagsága)	$n=5$ ($R_m \leq 98$) $n=6$ ($R_m > 98$)	$n=6$ ($R_m \leq 325$) $n=7$ ($R_m > 325$)	$n=6$ ($R_m \leq 325$) $n=7$ ($R_m > 325$)	$n=7$ ($R_m \leq 392$) $n=8$ ($R_m > 392$)
Aluminium Association sorozatszám ^{a)}	1 000	5 000	6 000	2 000

a) Lásd az „Aluminium Standards and Data” 5. kiadását, 1976. január, közzétette az Aluminium Association, 750, 3rd Avenue, New York.

A tényleges tulajdonságok az adott ötvözet összetételétől és a nyomástartó tartály végleges megmunkálásától függenek, azonban bármilyen ötvözetet is használjanak, a falvastagságot a következő képletek egyikével kell kiszámítani:

$$e = \frac{P_{MPa} D}{\frac{2R_e}{1,3} + P_{MPa}} \quad \text{vagy} \quad e = \frac{P_{bar} D}{\frac{20R_e}{1,3} + P_{bar}}$$

ahol

e = nyomástartó tartály legkisebb falvastagsága, mm;

P_{MPa} = a próbanyomás, MPa;

P_{bar} = a próbanyomás, bar;

D = a tartály névleges külső átmérője, mm;

R_e = a szavatolt minimális folyáshatár, MPa (= N/mm²) 0,2%-os maradó nyúlásnál.

Az előző képletekben szereplő szavatolt minimális folyáshatár (R_e) nem lehet nagyobb, mint a szavatolt minimális szakítószilárdság (R_m) 0,85-szorosa bármilyen alumíniumötvözet esetén.

Megjegyzés: 1. A táblázatban felsorolt minőségi adatok azokon a tapasztalatokon alapulnak, amelyeket eddig a nyomástartó tartályok gyártásához használt következő anyagokkal szereztek:

A oszlop: nem ötvözött, 99,5% tisztaságú alumínium;

B oszlop: alumínium- és magnéziumötvözetek;

C oszlop: alumínium-szilícium-magnézium ötvözetek, pl.: ISO/R209-Al-Si-Mg (Aluminium Association 6351)

D oszlop: alumínium-réz-magnézium ötvözetek.

2. A szakadási nyúlást kör keresztmetszetű szakítópálcán méri, amelyen a két jel közötti „l” távolság a „d” átmérő ötszöröse ($l=5d$). Négyyszög keresztmetszetű szakítópálcák esetén a jelek közötti távolságot a következő képlettel kell kiszámítani: $l = 5,65\sqrt{F_0}$

ahol F_0 a szakítópálca kezdeti keresztmetszete.

3. a) A hajlítási próbát (lásd az ábrát) olyan próbatesteken kell végrehajtani, amelyeket a palástból két egyforma $3e$, de legalább 25 mm széles körgyűrű kivágásával nyernek. A próbatesteknek csak a széleken szabad megmunkáltaknak lenniük.

b) A hajlítási próbát egy d átmérőjű tuskével és két támasztó hengerrel kell végrehajtani, amelyek egymástól $d+3e$ távolságra vannak. A próba során a belső felületeknek nem szabad egymástól nagyobb távolságra eltávolodni, mint a tüske átmérője.

c) A próbatesteken nem szabad repedéseknek mutatkozniuk, ha a tüske körül egészen addig behajlanak, ameddig a belső felületük közti távolság nem haladja meg a tüske átmérőjét.

d) A tűske átmérője és a próbatest vastagsága közötti n aránynak meg kell felelnie a táblázatban meghatározott értéknek.

A hajlítási próba vázlata

- 6.2.5.4.2** Kisebb minimális nyúlásérték azzal a feltétellel engedhető meg, hogy olyan kiegészítő vizsgálati eljárással, amelyet a nyomástartó tartály gyártási országának illetékes hatósága engedélyez, bizonyítják, hogy a tartály a szállítás tekintetében ugyanazt a biztonságot nyújtja, mint azok a tartályok, amelyeket 6.2.5.4.1 pont táblázatának értékei szerint gyártottak (lásd az EN 1975:1999 +A1:2003 szabványt is).
- 6.2.5.4.3** A nyomástartó tartályok falának a legvékonyabb részen a következő vastagságúnak kell lennie:
- d) legalább 1,5 mm, ha a nyomástartó tartály átmérője 50 mm-nél kisebb;
 - e) legalább 2 mm, ha a nyomástartó tartály átmérője 50 mm és 150 mm között van;
 - f) legalább 3 mm, ha a nyomástartó tartály átmérője 150 mm-nél nagyobb.
- 6.2.5.4.4** A tartályfenekek keresztmetszetének félkör, ellipszis vagy kosárív alakúnak kell lennie, és a nyomástartó tartály palástjával azonos biztonságot kell nyújtania.
- 6.2.5.5** **Kompozit nyomástartó tartályok**
- A kompozit palackoknál, nagypalackoknál, gázhordóknál és kompozit anyagok felhasználásával készült palackkötegeknél a kialakításnak olyannak kell lennie, hogy a repesztő- és a próbanyomás hányadosa legalább a következő legyen:
- g) köpenyrészen bevont nyomástartó tartályoknál 1,67;
 - h) a teljes felületen bevont nyomástartó tartályoknál 2,00.
- 6.2.5.6** **Zárt mélyhűtő tartályok**
- A mélyhűtött, cseppfolyósított gázokhoz használt zárt mélyhűtő tartályok kialakítására a következő követelményeket kell alkalmazni:
- 6.2.5.6.1** Nemfémek használata esetén a nyomástartó tartálynak és szerelvényeinek a legkisebb üzemi hőmérsékleten a ridegtöréssel szemben ellenállónak kell lennie.
- 6.2.5.6.2** A nyomáscsökkentő szerkezeteket úgy kell kialakítani, hogy még a legkisebb üzemi hőmérsékleten is kifogástalanul működjenek. Az ilyen hőmérsékleten való megbízható működést vagy minden egyes szerkezeten, vagy ugyanilyen típusú szerkezetekből vett mintán végzett próbával kell megállapítani, ill. ellenőrizni.
- 6.2.5.6.3** A nyomástartó tartályok nyílásait és nyomáscsökkentő szerkezeteit úgy kell kialakítani, hogy azok a folyadék kifröccsenését megakadályozzák.

- 6.2.6 Az aeroszolonkra, a gázzal töltött kisméretű tartályokra (gázpatronokra) és a gyúlékony cseppfolyósított gázt tartalmazó üzemanyagcella kazettákra vonatkozó általános követelmények**
- 6.2.6.1 Tervezés és gyártás**
- 6.2.6.1.1** A csak egyféle gázt vagy gázkeveréket tartalmazó UN 1950 aeroszolonkat, valamint UN 2037 gázzal töltött kisméretű tartályokat (gázpatronokat) fémből kell gyártani. Ezt a követelményt nem kell alkalmazni az UN 1011 butánt tartalmazó aeroszolonkra és gázzal töltött kisméretű tartályokra (gázpatronokra) 100 ml űrtartalomig. Az UN 1950 számú egyéb aeroszolonkat fémből, műanyagból vagy üvegből kell gyártani. A legalább 40 mm külső átmérőjű fémtartályok fenekének homorúnak kell lennie.
- 6.2.6.1.2** A fémtartályok űrtartalma 1000 ml-nél, a műanyag és üvegtartályoké 500 ml-nél nagyobb nem lehet.
- 6.2.6.1.3** Minden tartálymintadarabot (aeroszolonkat és gázpatronokat) üzembe helyezés előtt a 6.2.6.2 bekezdés szerinti folyadéknomás-próbának kell alávetni.
- 6.2.6.1.4** Az UN 1950 aeroszolon kibocsátószelepeinek és porlasztószerkezetének és az UN 2037 gázpatronok szelepeinek olyannak kell lennie, hogy a tartályok tömör zárását és véletlen kinyílása elleni védelmét biztosítsa. Olyan szelepek és porlasztószerkezetek, amelyek csak belső nyomásra zárnak, nem alkalmazhatók.
- 6.2.6.1.5** A belső nyomás 50 °C-on nem haladhatja meg sem a próbanyomás kétharmadát, sem az - 1,32 MPa-t (13,2 bar-t). Az aeroszolonkat és a kisméretű gáztartályokat (gázpatronokat) úgy kell megölteni, hogy a folyadék fázis 50 °C-on ne haladja meg űrtartalmuk 95%-át.
- 6.2.6.2 Folyadéknomás-próba**
- 6.2.6.2.1** A próba során alkalmazott belső nyomásnak (próbanyomásnak) az 50 °C-on fennálló belső nyomás 1,5 szeresének, de legalább 1 MPa-nak (10 bar-nak) kell lennie.
- 6.2.6.2.2** A folyadéknomás-próbát minden tartálytípusból legalább öt üres tartályon el kell végezni:
- a) az előírt próbanyomásig, amely mellett semmiféle szivárgásnak vagy maradandó alakváltozásnak nem szabad fellépnie;
 - b) szivárgás vagy szétrepedés bekövetkeztéig; amennyiben a tartály feneké homorú, annak kell először engednie (kidomborodnia), és a tartály csak akkor szivároghat vagy repedhet szét, ha a nyomás eléri vagy meghaladja a próbanyomás 1,2-szeresét.
- 6.2.6.3 Tömörségi (szivárgásmentességi) próba**
- 6.2.6.3.1 Gázzal töltött kisméretű tartályok (gázpatronok) és gyúlékony cseppfolyósított gázt tartalmazó üzemanyagcella kazetták**
- 6.2.6.3.1.1** Minden tartálynak, ill. üzemanyagcella kazettának ki kell állnia a forró vizes fürdőben végzett tömörségi (szivárgás-mentességi) próbát.
- 6.2.6.3.1.2** A fürdő hőmérsékletét és a próba időtartamát úgy kell megválasztani, hogy az egyes tartályok, ill. üzemanyagcella kazetták belsejében fellépő nyomás legalább 90 %-át elérje annak a nyomásnak, amely 55 °C hőmérsékleten kialakulna. Ha azonban a tartalom hőre érzékeny, vagy a tartály, ill. üzemanyagcella kazetta olyan műanyagból készült, amely az ily módon végrehajtott próba hőmérsékleténél meglágyulna, akkor a vizsgálatot 20...30 °C hőmérsékletű fürdőben kell végrehajtani. Ezenfelül minden 2000 darab közül egy darabon a vizsgálatot 55 °C-on kell végezni.
- 6.2.6.3.1.3** A vizsgálat során a tartályon, ill. üzemanyagcella kazettán semmiféle szivárgásnak vagy

maradandó alakváltozásnak nem szabad bekövetkeznie, kivéve a műanyag tartállynál, ill. üzemanyagcella kazettánál a lágyulás miatt bekövetkező alakváltozást, feltéve, hogy nem szivárog.

6.2.6.3.2 *Aeroszol csomagolások*

Minden aeroszol csomagolásnak ki kell állnia a forró vizes fürdőben végzett tömörségi (szivárgásmentességi) próbát, vagy egy jóváhagyott, egyéb vízfürdős vizsgálatot.

6.2.6.3.2.1 Forró vizes fürdőben végzett próba

6.2.6.3.2.1.1 A fürdő hőmérsékletét és a próba időtartamát úgy kell megválasztani, hogy a belső nyomás elérje azt a nyomást, amely 55 °C hőmérsékleten kialakulna (vagy amely 50 °C hőmérsékleten alakulna ki, ha a folyékony fázis 50 °C-on nem haladja meg az aeroszol csomagolás ürtartalmának 95%-át). Ha azonban a tartalom hőre érzékeny, vagy az aeroszol csomagolás olyan műanyagból készült, amely az ily módon végrehajtott próba hőmérsékleténél meglágyulna, akkor a vizsgálatot 20....30 °C hőmérsékletű fürdőben kell végrehajtani, de ezenfelül minden 2000 darab közül egy darabon a magasabb hőmérsékleten kell a vizsgálatot elvégezni

6.2.6.3.2.1.2 A vizsgálat során az aeroszol csomagoláson semmiféle szivárgásnak vagy maradandó alakváltozásnak nem szabad bekövetkeznie, kivéve a műanyag aeroszol csomagolásnál a lágyulás miatt bekövetkező alakváltozást, feltéve, hogy nem szivárog.

6.2.6.3.2.2 Egyéb módszerek

Az illetékes hatóság jóváhagyásával egyéb módszerek is használhatók, ha azonos biztonsági szintet eredményeznek, feltéve, hogy a 6.2.6.3.2.2.1, a 6.2.6.3.2.2.2 és a 6.2.6.3.2.2.3 pont követelményeit betartják.

6.2.6.3.2.2.1 Minőségbiztosítási rendszer

Az aeroszol csomagolások töltőjének és aeroszol csomagolások szerkezeti elemei gyártójának rendelkeznie kell minőségbiztosítási rendszerrel. A minőségbiztosítási rendszerben olyan eljárást kell fogatosítani, amely biztosítja, hogy minden aeroszol csomagolást, amely szivárog vagy alakváltozást szenvedett, selejtnak minősítsenek és nem adják fel szállításra.

A minőségbiztosítási rendszernek a következőket kell tartalmaznia:

- a szervezeti felépítés és a felelősségek megosztásának leírása;
- a vizsgálatra, minőségellenőrzésre, minőségbiztosításra és eljárás végrehajtásra vonatkozó, megfelelő utasítások;
- minőségellenőrzési nyilvántartás, pl. vizsgálati jegyzőkönyvek, vizsgálati eredmények, hitelesítési adatok és bizonyítványok;
- vezetői felülvizsgálatok a minőségbiztosítási rendszer hatékony működésének biztosításához;
- a dokumentáció ellenőrzési és karbantartási eljárása;
- a nem megfelelő minőségű aeroszol csomagolások ellenőrzésének, kiszűrésének módja;
- az érintett személyekre vonatkozó képzési program és minősítési eljárás; és
- a végtermék sérülésmentességét biztosító eljárás.

Az illetékes hatóság számára elfogadható módon első alkalommal és időszakosan auditálást kell végezni. Az auditálásnak biztosítania kell, hogy a jóváhagyott rendszer alkalmas és hatékony legyen és az is maradjon. Az illetékes hatóságot a jóváhagyott rendszert érintő minden javasolt változtatásról előzetesen értesíteni kell.

6.2.6.3.2.2.2 Az aeroszol csomagolás töltés előtti nyomás- és tömörségi próbája

Minden üres aeroszol csomagolást legalább akkora nyomásnak kell kitenni, mint az a

legnagyobb nyomás, amely a megtöltött aeroszol csomagolásban 55 °C-on várhatóan kialakul (vagy amely 50 °C hőmérsékleten alakulna ki, ha a folyékony fázis 50 °C-on nem haladja meg az aeroszol csomagolás úrtartalmának 95%-át). Ez a nyomás azonban nem lehet kisebb, mint az aeroszol csomagolás méretezési nyomásának kétharmada. Azt az aeroszol csomagolást, amely a próbanyomáson $3,3 \times 10^{-2}$ mbar·l·s⁻¹ mértékben vagy annál erősebben szivárog, eltorzul vagy más sérülést szenved, ki kell selejtezni.

6.2.6.3.2.3 Az aeroszol csomagolás töltés utáni vizsgálata

Töltés előtt a töltőnek biztosítania kell, hogy a peremező berendezés megfelelően legyen beállítva és az előírt hajtóanyagot használják.

Minden megtöltött aeroszol csomagolás tömegét meg kell mérni, ill. a tömörségét meg kell vizsgálni. A tömörség vizsgáló berendezésnek elegendő pontosságúnak kell lennie ahhoz, hogy legalább a 20 °C-on 2×10^{-3} mbar·l·s⁻¹ mértékű szivárgást tudja érzékelni.

Azt az aeroszol csomagolást, amely szivárog, eltorzult vagy túl van töltve, ki kell selejtezni.

6.2.6.3.3 Az illetékes hatóság hozzájárulásával mentesül a 6.2.6.3.1 és a 6.2.6.3.2 pont előírásai alól az olyan aeroszol és kisméretű tartály (gázpatron), amelynek sterilnek kell lennie, és amelyet a vízfürdős vizsgálat kedvezőtlenül befolyásolna, amennyiben:

- a) nem gyúlékony gázt tartalmaz és
 - i) olyan más anyagokat tartalmaz, amelyek gyógyászati, állatgyógyászati vagy hasonló célú gyógyszerészeti termék alkotórészei; vagy
 - ii) olyan más anyagokat tartalmaz, amelyeket a gyógyszerészeti termékek gyártási folyamatában használnak; vagy
 - iii) gyógyászati, állatgyógyászati vagy hasonló célokra használatosak;
- b) azonos biztonságot lehet elérni azzal, hogy a gyártó más tömörségi- illetve nyomás-próbát alkalmaz, mint pl. a hélium érzékelést és olyan vízfürdős vizsgálatot, amelyet minden gyártási tételből 2000 darabonként legalább egy darabot tartalmazó, véletlenszerűen kiválasztott mintán végeznek;
- c) az előző a) pont i) és iii) alpontja szerinti gyógyszerészeti termékeket az állami egészségügyi szervek engedélyével gyártották. Amennyiben az illetékes hatóság előírja, az Egészségügyi Világszervezet (WHO)⁸⁾ által kiadott helyes gyártási gyakorlatot (Good Manufacturing Practice – GMP) követik.

6.2.6.4 Hivatkozás a szabványokra

Ezen szakasz követelményei a következő szabványok alkalmazása esetén teljesítettnek tekinthetők:

- UN 1950 aeroszolakra: a gyártás időpontjában alkalmazandó, módosított 75/324/EGK⁹⁾ Tanácsi Irányelv melléklete;
- az UN 2037 gázzal töltött kisméretű tartályokra (gázpatronokra), amelyek UN 1965 szénhidrogén-gáz keverék, cseppfolyósított, m.n.n.-t tartalmaznak: EN 417:2012 „Nem újratölthető fém gázpatronok cseppfolyósított szénhidrogén gázokhoz, szeleppel vagy szelep nélkül, szállítható berendezésekhez – Gyártás, vizsgálat és jelölés” szabvány.

8) WHO kiadvány: „Gyógyszerészeti minőségbiztosítás. Irányelvek és hasonló dokumentumok gyűjteménye, 2. kötet: Helyes gyártási gyakorlat és vizsgálat” („Quality assurance of pharmaceuticals. A compendium of guidelines and related materials. Volume 2: Good manufacturing practices and inspection”)

9) A Tanács 1975. május 20-i 75/324/EGK Irányelve a tagállamok aeroszolakra vonatkozó jogszabályainak közelítéséről (Az EK Hivatalos Lapja, L 147 szám, 1975. 06.09.).

6.3 FEJEZET

A 6.2 OSZTÁLY „A” KATEGÓRIÁBA TARTOZÓ FERTŐZŐ ANYAGAIHOZ HASZNÁLT CSOMAGOLÓESZKÖZÖK GYÁRTÁSÁRA ÉS VIZSGÁLATÁRA VONATKOZÓ KÖVETELMÉNYEK

Megjegyzés: E fejezet követelményei nem vonatkoznak a 6.2 osztály anyagainak szállítására használt, a 4.1.4.1 bekezdés P621 csomagolási utasítása szerinti csomagolóeszközökre.

6.3.1 Általános előírások

6.3.1.1 E fejezet követelményei az „A” kategóriába tartozó fertőző anyagok szállítására használt csomagolóeszközökre vonatkoznak.

6.3.2 A csomagolóeszközökre vonatkozó követelmények

6.3.2.1 A csomagolóeszközökre vonatkozó követelmények – 6.1.4 szakaszban meghatározottak szerint – a jelenleg használt csomagolásokon alapulnak. A tudományos és műszaki haladás figyelembevételének érdekében az ezen fejezetben található csomagolóeszközöktől eltérő jellemzőjű csomagolóeszközök is használhatók, amennyiben ezek ugyanolyan hatékonyságúak, az illetékes hatóság által elfogadhatók és képesek sikeresen elviselni a 6.3.5 szakaszban leírt próbákat. Az ADR-ben leírtaktól eltérő vizsgálati módszerek is használhatók, amennyiben egyenértékűek és az illetékes hatóság elfogadja.

6.3.2.2 A csomagolóeszközöket az illetékes hatóság szerint megfelelő minőségbiztosítási program alapján kell gyártani és vizsgálni annak biztosítására, hogy minden egyes csomagolóeszköz kielégítse a jelen fejezet követelményeit.

Megjegyzés: Az alkalmazható eljárás(ok)ra megfelelő útmutatást ad az ISO 16106:2006 szabvány: „Csomagolás. Veszélyes áruk szállítási csomagolása. Veszélyes áruk csomagolásai, közepes méretű szállítótartályok (IBC-k) és nagyméretű csomagolások. Útmutató az ISO 9001 alkalmazásához”.

6.3.2.3 A csomagolóeszköz gyártójának és forgalmazójának információt kell nyújtania a követendő eljárásokra és a zárószervezetek (beleértve a szükséges tömítéseket) típusára és méreteire és minden más alkatrészre, ami annak biztosításához szükséges, hogy a szállításra előkészített küldeménydarab képes legyen az e fejezet vonatkozó igénybevételi próbáinak elviselésére.

6.3.3 A csomagolóeszközök típusát jelölő kód

6.3.3.1 A csomagolóeszközök típusát jelölő kódok a 6.1.2.7 bekezdésben találhatók.

6.3.3.2 A csomagolási kódot egy „U” vagy „W” betű követheti. Az „U” betű a 6.3.5.1.6 pont előírásainak megfelelő különleges csomagolóeszközre utal. A „W” betű azt jelenti, hogy a csomagolóeszköz, bár a kód által jelzett típus alá tartozik, de a 6.1.4 szakaszban előírtaktól eltérően gyártották, és a 6.3.2.1 bekezdés előírásai értelmében egyenértékűnek tekinthető.

6.3.4 Jelölés

Megjegyzés: 1. A jelölés arra utal, hogy a csomagolóeszköz, amelyen a jelölés van, megfelel a sikeresen bevizsgált gyártási típusnak és megfelel a jelen fejezet előírásainak, amelyek a csomagolóeszköz gyártására, nem pedig annak

használatára vonatkoznak.

- 2. A jelölésnek az a célja, hogy megkönnyítse a csomagolóeszköz gyártók, felújítók és felhasználók, a szállítást/fuvarozást végzők és a szabályozó hatóságok feladatainak teljesítését.*
- 3. A jelölés nem mindig ad teljes felvilágosítást a vizsgálati szintekről és egyéb részletekről, holott szükséges lehet ezek figyelembe vétele is, ezeknek a vizsgálati jegyzőkönyvben, jelentésekben vagy a vizsgálatokat sikeresen kiállt csomagolóeszközök nyilvántartásában kell utána nézni.*

6.3.4.1 Minden csomagolóeszközön, amelyet az ADR szerinti használatra szánunk, rajta kell lenni a jelölésnek, amely tartós, jól látható, olyan helyen van és a csomagolóeszközhöz képest olyan méretű, hogy könnyen olvasható legyen. A 30 kg bruttó tömeget meghaladó küldeménydaraboknál a jelölést vagy annak megismétlését a csomagolóeszköz tetejére vagy egyik oldalára kell felvinni. A betűknek, számoknak és szimbólumoknak legalább 12 mm magasnak kell lenniük, kivéve a 30 liter vagy 30 kg, ill. annál kisebb csomagolóeszközöket, amelyek legalább 6 mm magasnak kell lenniük és az 5 liter vagy 5 kg, ill. annál kisebb csomagolóeszközöket, ahol megfelelő méretűnek kell lenniük.

6.3.4.2 A jelen szakasz és a 6.3.5 szakasz követelményeit kielégítő csomagolóeszközöket a következő jelölésekkel kell ellátni:

- a) az Egyesült Nemzetek jele a csomagolóeszközön:  .
- Ezt a jelet csak annak tanúsítására szabad használni, hogy a csomagolóeszköz, a mobil tartány, ill. a MEG-konténer megfelel a 6.1, a 6.2, a 6.3, a 6.5, a 6.6 ill. a 6.7¹⁾ fejezetben található vonatkozó előírásoknak;
- b) a csomagolóeszköz típusát a 6.1.2 szakasz szerint jelölő kód;
- c) a „CLASS 6.2” szöveg;
- d) a gyártási év (az utolsó két számjegy);
- e) annak az államnak a jele, amely a jelölés alkalmazását engedélyezte, a nemzetközi forgalomban résztvevő gépjárművek államjelzésével²⁾;
- f) a gyártó neve vagy jele, vagy a csomagolóeszköznek az illetékes hatóság által megállapított egyéb azonosító jele;
- g) a 6.3.5.1.6 bekezdés követelményeit kielégítő csomagolóeszközöknél az előző b) pont szerint előírt jelölés után közvetlenül egy „U” betűt kell írni.

6.3.4.3 A jelölést a 6.3.4.2 bekezdés a) – g) pontjai szerinti sorrendben kell felvinni; az ezekben a pontokban előírt jelölés elemeket egyértelműen el kell választani egymástól, pl. ferde vonallal vagy szóközzel, hogy könnyen azonosíthatók legyenek. Példaként lásd a 6.3.4.4 bekezdést.

Az illetékes hatóság által engedélyezett kiegészítő jelölések nem zavarhatják a 6.3.4.1 bekezdés szerinti jelölés részek pontos azonosíthatóságát.

6.3.4.4 *Példa a csomagolóeszköz jelölésére*

4G/CLASS 6.2/06
S/SP-9989-ERIKSSON

a 6.3.4.2 a), b), c) és d) szerint
a 6.3.4.2 e) és f) szerint

1) Ezt a jelet használják annak tanúsítására is, hogy az olyan hajlékony ömlesztettáru-konténerek, amelyeket más közlekedési alágazatra hagytak jóvá, megfelelnek az ENSZ Minta Szabályzat 6.8 fejezete követelményeinek.

2) A közúti közlekedésről szóló Bécsi Egyezmény (Bécs, 1968) által előírt államjelzés a nemzetközi forgalomban résztvevő gépjárművekre.

6.3.5 A csomagolóeszközök vizsgálati követelményei

6.3.5.1 A vizsgálatok végrehajtása és gyakorisága

6.3.5.1.1 Minden egyes csomagolóeszköz gyártási típusát a jelölés felvitelét engedélyező illetékes hatóság által meghatározott eljárás szerint, az e szakaszban előírt vizsgálatoknak kell alávetni, és ugyanennek az illetékes hatóságnak jóvá kell hagyni.

6.3.5.1.2 A csomagolóeszközök gyártási típusának sikeresen ki kell állnia az e fejezetben előírt vizsgálatokat, mielőtt az adott típusú csomagolóeszközt használatba vennék. A csomagolóeszköz gyártási típusát a tervezési méret, az anyag és falvastagság, a gyártási és összeállítási mód határozza meg, de beleérthetők a különféle felületkezelések. Egy gyártási típus tartalmazza azokat a csomagolóeszközöket is, amelyek a gyártási típustól csupán kisebb szerkezeti magasságukban térnek el.

6.3.5.1.3 A vizsgálatokat a gyártásból vett mintákon az illetékes hatóság által meghatározott időközönként meg kell ismételni.

6.3.5.1.4 A vizsgálatokat minden olyan módosítás után is meg kell ismételni, ami megváltoztatja a csomagolóeszköz szerkezetét, anyagát vagy gyártási módját.

6.3.5.1.5 Az illetékes hatóság engedélyezheti azon csomagolóeszközök szelektív vizsgálatát, amelyek csak kismértékben térnek el egy bevizsgált típustól, pl. kisebb nettó tömegű elsődleges tartályokat tartalmaznak; vagy amelyek, pl. hordók és ládák esetén a külső méret(ek)et tekintve valamivel kisebbek.

6.3.5.1.6 Bármely típusú elsődleges tartály elhelyezhető és szállítható egy másodlagos csomagolásban anélkül, hogy a merev falú külső csomagolóeszközzel együtt vizsgálták volna, feltéve, ha:

- a) a merev falú külső csomagolóeszköz törékeny (pl. üveg) elsődleges tartályokkal a 6.3.5.2.2 bekezdés szerinti vizsgálatokat sikeresen kiállta;
- b) a elsődleges tartályok együttes össztömege nem haladhatja meg az előző a) pont szerinti ejtőpróbánál használt elsődleges tartályok össztömegének felét;
- c) az elsődleges tartályok között és az elsődleges tartályok és a másodlagos csomagolóeszközök külseje között a párnázóanyag vastagsága nem lehet kisebb az eredetileg vizsgált csomagolásban alkalmazott vastagságnál; ha az eredeti vizsgálatnál csak egy elsődleges tartály volt, akkor az elsődleges tartályok közötti párnázóanyag vastagsága az eredeti vizsgálatnál az elsődleges tartály és a másodlagos csomagolóeszköz külseje közötti vastagságnál nem lehet kisebb. Ha az ejtőpróbánál alkalmazott elsődleges tartályoknál kevesebb vagy kisebb elsődleges tartályokat használnak, akkor az ebből adódó hézagokat ki kell tölteni elegendő mennyiségű párnázóanyaggal;
- d) a merev falú külső csomagolóeszköz – üres állapotban vizsgálva – sikeresen kiállta a 6.1.5.6 bekezdésben leírt halmazolási próbát. Az „azonos küldeménydarabok össztömegét” az előző a) pontban az ejtőpróbánál alkalmazott csomagolóeszközök össztömege alapján kell meghatározni;
- e) a folyadékot tartalmazó elsődleges tartályokat teljesen körül kell venni felszívóképes anyaggal, amely a elsődleges tartályok teljes folyadéktartalmának felszívására elegendő mennyiségű;
- f) ha a merev falú külső csomagolóeszközt folyadékot tartalmazó elsődleges tartályokhoz használják és nem szivárgásmentes, ill. szilárd anyagot tartalmazó elsődleges tartályokhoz használják és nem portömör, akkor szivárgásmentes bélés, műanyag zsák vagy egyéb azonos hatékonyságú eszköz alkalmazásával biztosítani kell, hogy a folyadékot, ill. szilárd anyagot szivárgás esetén is megtartsa;
- g) a 6.3.4.2 a) – f) pontban előírt jelöléseken kívül a csomagolóeszközöket a 6.3.4.2 g) pont szerinti jelöléssel is el kell látni.

6.3.5.1.7 Az illetékes hatóság bármikor előírhatja, hogy a jelen szakasz előírásainak megfelelő próbákkal igazolják, hogy a sorozatban gyártott csomagolóeszközök megfelelnek a gyártási típus követelményeinek.

6.3.5.1.8 Amennyiben a vizsgálat eredményeit nem befolyásolja és az illetékes hatóság hozzájárul, ugyanazon a mintán több vizsgálat is végezhető.

6.3.5.2 *A csomagolóeszközök előkészítése a próbákhoz*

6.3.5.2.1 Minden csomagolóeszköz próbadarabját úgy kell előkészíteni, mint a szállításra, azzal a különbséggel, hogy a folyékony vagy szilárd fertőző anyagot vízzel vagy, ha $-18\text{ }^{\circ}\text{C}$ -on történő kondicionálás van előírva, víz/fagyásgátló keverékkel kell helyettesíteni. Minden elsődleges tartályt ürtartalmának legalább 98%-áig kell megtölteni.

Megjegyzés: *A víz alatt értendők a $-18\text{ }^{\circ}\text{C}$ -on végzett vizsgálatokhoz használt, legalább 0,95 relatív sűrűségű víz/fagyásgátló oldatok is.*

6.3.5.2.2 *Előírt vizsgálatok és próbadarabok száma*

A csomagolóeszköz típusa szerint előírt vizsgálatok

A csomagolóeszköz típusa ^{a)}			Előírt vizsgálatok

a) „A csomagolóeszköz típusa” a csomagolóeszközök csoportosítása a csomagolóeszköz fajtája és anyagának jellemzői szerint a vizsgálatok céljából

Megjegyzés: *1. Ha az elsődleges tartály két- vagy többféle anyagból készült, a megfelelő vizsgálatot a sérülékenyebb anyag határozza meg.*

2. A vizsgálat, ill. a vizsgálatokhoz szükséges kondicionálás kiválasztásánál a másodlagos csomagolóeszköz anyagát nem kell figyelembe venni.

A táblázat magyarázata

Ha a vizsgálandó csomagolóeszköz külső papírlemez láda műanyag elsődleges tartállyal, akkor az ejtés előtt öt próbadarabot kell vízpermet próbának (lásd a 6.3.5.3.6.1 pontot) alávetni, valamint ugyancsak az ejtés előtt másik öt darabot $-18\text{ }^{\circ}\text{C}$ -on kondicionálni kell (lásd a 6.3.5.3.6.2 pontot). Ha a csomagolóeszközben szárazjég használatos, további egy próbadarabot kell ötször leejteni a 6.3.5.3.6.3 pontban leírt kondicionálás után.

A szállításra előkészített csomagolóeszközöket a 6.3.5.3 és a 6.3.5.4 bekezdésben felsorolt vizsgálatoknak kell alávetni. A külső csomagolóeszközöknél a táblázat fejléce a következőkre vonatkozik:

- i) papírlmezre vagy hasonló anyagra, melynek szilárdságát a nedvesség gyorsan befolyásolhatja;
- j) műanyagra, ami alacsony hőmérsékleten rideggé válhat; és
- k) egyéb anyagra, mint pl. fémre, aminek minőségét a hőmérséklet és a nedvesség nem befolyásolja.

6.3.5.3 Ejtőpróba

6.3.5.3.1 A próbadarabokat szabadon le kell ejteni a 6.1.5.3.4 pont szerinti, rugalmatlan, vízszintes, sima, masszív és szilárd felületre 9 m magasságból.

6.3.5.3.2 Láda formájú minta esetén öt próbadarabot kell leejteni, mindegyiket a következő helyzetekben:

- a) laposan a fenéklapra,
- b) laposan a tetőlapra,
- c) laposan a leghosszabb oldallapra,
- d) laposan a legrövidebb oldallapra,
- e) valamelyik sarokra.

6.3.5.3.3 Hordó alakú minta esetén három próbadarabot kell leejteni, mindegyiket a következő helyzetekben:

- a) átlósan a felső peremre oly módon, hogy a tömegközéppont függőlegesen a felütközési pont felett legyen,
- b) átlósan a fenékperemre,
- c) laposan a palástra.

6.3.5.3.4 Bár a próbadarabot a megkívánt helyzetben kell elengedni, elfogadható, ha aerodinamikai okokból a felütközés nem ebben a helyzetben történik.

6.3.5.3.5 A megfelelő ejtési sorozatot követően az elsődleges tartály(ok)ból semmi sem szivároghat ki és azoknak a másodlagos csomagolásban a felszívóképes anyag által védve kell maradniuk.

6.3.5.3.6 A próbadarabok előkészítése az ejtőpróba

6.3.5.3.6.1 Vízpermet próba papírlmez esetén

Papírlmez külső csomagolóeszköz esetén: A próbadarabot legalább 1 órán át ki kell tenni vízpermetnek, ami kb. 5 cm/óra intenzitású esőnek felel meg. Ezután alá kell vetni a 6.3.5.3.1 pontban leírt próbának.

6.3.5.3.6.2 Alacsony hőmérsékletű kondicionálás műanyagok esetén 1

Műanyag elsődleges tartályok és külső csomagolóeszközök esetén: A próbadarabot és tartalmát -18°C -os vagy még alacsonyabb hőmérsékletű atmoszférában kell tartani legalább 24 órán át és azután az ezen atmoszférából való eltávolítást követően 15 percen belül alá kell vetni a 6.3.5.3.1 pontban leírt próbának. Ha a próbadarab szárazjeget tartalmaz, a kondicionálás időtartama 4 órára csökkenthető.

6.3.5.3.6.3 Kiegészítő ejtőpróba szárazjeget tartalmazó csomagolóeszközökre

Ha a csomagolóeszköznek szárazjeget kell tartalmaznia, a 6.3.5.3.1 és a 6.3.5.3.6.1, ill. 6.3.5.3.6.2 pontban előírt próbán kívül kiegészítő vizsgálatot kell végezni. Egy próbadarabot addig kell tárolni, amíg a szárazjég teljes mennyisége szublimál és azután a 6.3.5.3.2 pontban leírtak közül abban a helyzetben kell leejteni, amelyekben a legnagyobb valószínűséggel következik be a csomagolóeszköz sérülése.

6.3.5.4 *Átlyukasztási próba*

6.3.5.4.1 7 kg vagy annál kisebb bruttó tömegű küldeménydarabok

A próbadarabot vízszintes, kemény felületre kell állítani. Legalább 7 kg tömegű, 38 mm átmérőjű és a felütközési végén legfeljebb 6 mm-es sugárral lekerekített végű hengeres acélrudat (lásd a 6.3.5.4.2 ábrát) kell ráejteni függőlegesen szabadeséssel a próbadarab felütközési felületétől a rúd felütközési végéig mért 1 m magasságból. Az első próbadarabot fenéklapjára kell állítani. Egy második próbadarabot az első alkalommal választott helyzetre merőlegesen kell elhelyezni. Az acélrúddal minden esetben az elsődleges tartály ütését kell megelőzni. Az egyes ütések után a másodlagos csomagolásba való behatolás elfogadható, amennyiben az elsődleges tartály(ok)ból nem következett be szivárgás.

6.3.5.4.2 7 kg-nál nagyobb bruttó tömegű küldeménydarabok

A próbadarabokat egy hengeres acélrúd végére kell ejteni. A rudat függőlegesen egy vízszintes, kemény felületbe kell befogni. A rúd átmérőjének 38 mm-nek kell lenni és a felső végének lekerekítési sugara nem haladhatja meg a 6 mm-t (lásd a 6.3.5.4.2 ábrát). A rúdnak a felületből legalább annyira kell kiállnia, mint az elsődleges tartály(ok) közepe és a külső csomagolás legkülső felülete közötti távolság, de legalább 200 mm-re. Egy próbadarabot „fejjel lefelé” (vagyis olyan helyzetben, hogy a felső felülete van legalul) függőlegesen szabadeséssel a rúd felső végétől mért 1 m magasságból kell a rúdra ejteni. A második próbadarabot ugyanezen magasságból az első ejtésnél alkalmazott helyzethez képest merőlegesen kell ejteni. A küldeménydarabokat minden esetben úgy kell elhelyezni, hogy az acélrúd be tudjon hatolni az elsődleges tartály(ok)ba. Az egyes ütések után a másodlagos csomagolóeszköz átlyukadása elfogadható, ha az elsődleges tartály(ok)ból nem következik be szivárgás.

6.3.5.4.2 ábra

6.3.5.5 *Vizsgálati jegyzőkönyv*

6.3.5.5.1 A vizsgálatokról legalább a következő adatokat tartalmazó, jegyzőkönyvet kell írásba foglalni, amit a csomagolóeszköz felhasználói számára hozzáférhetővé kell tenni:

1. A vizsgálatot végző szerv neve és címe;
2. A vizsgálatot kérő neve és címe (ha szükséges);
3. A vizsgálati jegyzőkönyv egyedi azonosítója;
4. A vizsgálat ideje és a vizsgálati jegyzőkönyv kelte;

5. A csomagolóeszköz gyártója;
6. A csomagolóeszköz típus leírása (pl. méretek, anyagok, zárószerkezetek, falvastagság stb.), beleértve a gyártási módszert (pl. üreges test fűvás), ami rajzzal és/vagy fényképpel kiegészíthető;
7. Legnagyobb űrtartalom;
8. A vizsgálat alatti tartalom;
9. A vizsgálatok leírása és eredményei;
10. A vizsgálati jegyzőkönyvet alá kell írni, az aláíró nevét és beosztását fel kell tüntetni.

6.3.5.5.2

A vizsgálati jegyzőkönyvnek megállapítást kell tartalmaznia arra nézve, hogy a szállításra előkészített csomagolás ezen fejezet megfelelő rendelkezéseivel összhangban került vizsgálatra és más csomagolási módszerek vagy alkotórészek használata azt érvénytelenné teheti. A vizsgálati jegyzőkönyv egy példányát az illetékes hatóság rendelkezésére kell bocsátani.

6.4 FEJEZET

A 7 OSZTÁLY KÜLDEMÉNYDARABJAINAK ÉS ANYAGAINAK GYÁRTÁSÁRA, VIZSGÁLATÁRA ÉS JÓVÁHAGYÁSÁRA VONATKOZÓ KÖVETELMÉNYEK

- 6.4.1** (fenntartva)
- 6.4.2** **Általános követelmények**
- 6.4.2.1** A küldeménydarabot úgy kell megtervezni a tömegére, térfogatára és alakjára vonatkozólag, hogy könnyen és biztonságosan kezelhető és szállítható legyen, továbbá, hogy a szállítás alatt a szállítóeszközön vagy azon belül megfelelően rögzíteni lehessen.
- 6.4.2.2** A kivitelnek olyannak kell lennie, hogy a küldeménydarabon bármely emelő szerelvény rendeltetésszerű használat közben ne romoljon el, és ha a meghibásodás mégis bekövetkezik, az ne rontsa a küldeménydarabnak azt a képességét, hogy megfeleljen a többi ADR előírásnak. A kivitelnél figyelembe kell venni a hirtelen emelés miatt szükséges biztonsági tényezőket.
- 6.4.2.3** Az emelő szerelvényeket, ill. a küldeménydarab külső felületén lévő minden olyan tartozékot, amit a küldeménydarab emelésére lehet használni, úgy kell megtervezni, hogy azok vagy elbírják a küldeménydarab tömegét a 6.4.2.2 bekezdés előírásainak megfelelően, vagy eltávolíthatónak kell lenniük, vagy úgy kell kialakítani, hogy a szállítás idejére használatra alkalmatlanná lehessen tenni.
- 6.4.2.4** Amennyire csak lehetséges, a csomagolást úgy kell tervezni és elkészíteni, hogy a külső felületeken kiálló kiemelkedések ne legyenek, és könnyen lehessen a szennyezettségtől mentesíteni.
- 6.4.2.5** Amennyire lehetséges, a küldeménydarab külső burkolatát úgy kell tervezni, hogy az a vizet ne gyűjtse össze és ne tartsa meg.
- 6.4.2.6** Bármely, a szállítás idejére a küldeménydarabhoz mellékelt szerkezet, amely nem része a küldeménydarabnak, nem csökkentheti annak biztonságát.
- 6.4.2.7** A küldeménydarabnak a tartályok zárószerkezeteinek bármilyen meghibásodása vagy a küldeménydarab egészének sérülése nélkül ellen kell tudnia állni a normális szállítási feltételek között valószínűleg fellépő gyorsulási, rezgési vagy rezonancia hatásoknak. Különösen a csavarokat, csavaranyákat és más biztonsági szerkezeteket kell úgy tervezni, hogy többszöri, megismételt használat után is megelőzhető legyen lazulásuk vagy nem szándékos kinyílásuk.
- 6.4.2.8** A csomagolás anyagainak és bármely alkatrészének vagy szerkezetének fizikailag és kémiaiilag összeférhetőnek kell lennie egymással és a radioaktív tartalommal. Figyelembe kell venni viselkedésüket besugárzás hatására is.
- 6.4.2.9** Minden olyan szelepet, amelyen keresztül a radioaktív tartalom kiszabadulni képes, illetéktelen működtetéssel szemben védetté kell tenni.
- 6.4.2.10** A küldeménydarab tervezésekor figyelembe kell venni a normális szállítási feltételek mellett valószínűleg előforduló környezeti hőmérsékleteket és nyomásokat.
- 6.4.2.11** A más veszélyes tulajdonságokkal is rendelkező radioaktív anyagoknál a küldeménydarab tervezésekor ezeket a veszélyes tulajdonságokat számításba kell venni; lásd a 2.1.3.5.3 és a 4.1.9.1.5 pontot.

- 6.4.2.12** A csomagolóeszköz gyártójának és forgalmazójának információt kell nyújtania a követendő eljárásokra és a zárószervezetek (beleértve a szükséges tömítéseket) típusára és méreteire és minden más alkatrészre, ami annak biztosításához szükséges, hogy a szállításra előkészített küldeménydarab képes legyen az e fejezet vonatkozó igénybevételi próbáinak elviselésére.
- 6.4.3** (fenntartva)
- 6.4.4** **Az engedményes küldeménydarabokra vonatkozó követelmények**
- Az engedményes küldeménydarabnak a 6.4.2 szakaszban meghatározott követelményeket kell kielégíteniük.
- 6.4.5** **Az ipari küldeménydarabokra vonatkozó követelmények**
- 6.4.5.1** Az *IP-1*, *IP-2* és *IP-3* típusú küldeménydaraboknak a 6.4.2 szakasz és a 6.4.7.2 bekezdés követelményeit kell kielégíteniük.
- 6.4.5.2** Az *IP-2* típusú küldeménydarab esetében, ha alávetnék a 6.4.15.4 és a 6.4.15.5 bekezdésben meghatározott vizsgálatoknak, akkor nem következhet be:
- a) a radioaktív tartalom elvesztése vagy szétszóródása; és
 - b) a küldeménydarab bármely külső felületén a legnagyobb sugárzási szint 20%-nál nagyobb mértékű növekedése.
- 6.4.5.3** Az *IP-3* típusú küldeménydarabnak a 6.4.7.2 – 6.4.7.15 bekezdésben meghatározott minden követelményt ki kell elégítenie.
- 6.4.5.4** ***Alternatív követelmények az IP-2 és IP-3 típusú küldeménydarabokra***
- 6.4.5.4.1** Egy küldeménydarab *IP-2* típusú küldeménydarabként akkor használható, ha:
- a) eleget tesz a 6.4.5.1 bekezdés követelményeinek;
 - b) úgy tervezték, hogy megfeleljen a 6.1 fejezetben az I vagy II csomagolási csoportra előírt követelményeknek; és
 - c) ha alávetnék a 6.1 fejezetben a I vagy II csomagolási csoportra előírt vizsgálatoknak, akkor nem következne be:
 - i) a radioaktív tartalom elvesztése vagy szétszóródása; és
 - ii) a küldeménydarab bármely külső felületén a legnagyobb sugárzási szint 20%-nál nagyobb mértékű növekedése.
- 6.4.5.4.2** A mobil tartány *IP-2* vagy *IP-3* típusú küldeménydarabként is használható, ha:
- a) eleget tesz a 6.4.5.1 bekezdés követelményeinek;
 - b) úgy tervezték, hogy megfeleljen a 6.7 fejezetben előírt követelményeknek, és képes 265 kPa próbanyomás elviselésére; és
 - c) úgy tervezték, hogy bármilyen kiegészítő árnyékolással van is ellátva, a normális kezelési és szállítási feltételek között ellenáll a statikus és dinamikus hatásoknak, és nem következhet be a mobil tartány bármely külső felületén a legnagyobb sugárzási szint 20%-nál nagyobb mértékű növekedése.
- 6.4.5.4.3** A mobil tartányokon kívül más tartányokat is lehet *IP-2* vagy *IP-3* típusú küldeménydarabként a 4.1.9.2.4 táblázatban előírtak szerint *LSA-I* és *LSA-II* folyékony anyagok és gázok szállítására használni, ha:
- a) eleget tesz a 6.4.5.1 bekezdés követelményeinek;

- b) úgy tervezték, hogy megfeleljen a 6.8 fejezetben előírt követelményeknek; és
- c) úgy tervezték, hogy bármilyen kiegészítő árnyékolással van is ellátva, a normális kezelési és szállítási feltételek között ellenáll a statikus és dinamikus hatásoknak, és nem következhet be tartány bármely külső felületén a legnagyobb sugárzási szint 20%-nál nagyobb mértékű növekedése.

6.4.5.4.4

Tartósan zárt kialakítású konténerek is használhatók *IP-2* vagy *IP-3* típusú küldeménydarabként, ha:

- a) a radioaktív tartalom csak szilárd anyag;
- b) kielégítik a 6.4.5.1 bekezdés követelményeit; és
- c) tervezésük olyan, hogy megfeleljenek az ISO 1496-1:1990 „1. sorozat Teherkonténerek – Meghatározások és Vizsgálatok – 1. rész: Általános teherkonténerek” szabványban és annak 1:1993, 2:1998, 3:2005, 4:2006 és 5:2006 módosításában meghatározott követelményeknek, kivéve a méreteket és a terhelési határokat. Ezeket úgy kell tervezni, hogy ha alávetnék az ezen előírásban meghatározott próbáknak és a normális szállítási körülmények mellett előforduló gyorsulásoknak, nem következne be:
 - i) a radioaktív tartalom elvesztése vagy szétszóródása; és
 - ii) a konténer bármely külső felületén a legnagyobb sugárzási szint 20%-nál nagyobb mértékű növekedése.

6.4.5.4.5

A fém IBC-k is használhatók *IP-2* vagy *IP-3* típusú küldeménydarabként, ha:

- a) kielégítik 6.4.5.1 bekezdés előírásait; és
- b) a kivitelük megfelel a 6.5 fejezetben az I vagy II csomagolási csoportra vonatkozó követelményeknek és ha alávetnék a 6.5 fejezetben előírt vizsgálatoknak, de az ejtési próbát olyan helyzetben végeznék, hogy a legnagyobb sérülést szenvedje, nem következne be:
 - i) a radioaktív tartalom elvesztése vagy szétszóródása; és
 - ii) az IBC bármely külső felületén a legnagyobb sugárzási szint 20%-nál nagyobb mértékű növekedése.

6.4.6

Az urán-hexafluoridot tartalmazó küldeménydarabokra vonatkozó követelmények

6.4.6.1

Az urán-hexafluoridhoz tervezett küldeménydaraboknak ki kell elégíteniük az ADR máshol található azon előírásait, amelyek az anyag radioaktív és hasadó tulajdonságai miatt vonatkoznak rájuk. A 6.4.6.4 bekezdésben engedélyezett kivétellel a 0,1 kg vagy annál több urán-hexafluoridot az ISO 7195:2005 „Nukleáris energia – Az urán-hexafluorid (UF₆) csomagolása a szállításhoz” szabvány és a 6.4.6.2 és a 6.4.6.3 bekezdés előírásainak megfelelően kell csomagolni és szállítani.

6.4.6.2

Minden küldeménydarabot, amelyet 0,1 kg vagy annál több urán-hexafluorid tartalomra terveztek, úgy kell kialakítani, hogy kielégítse a következő előírásokat:

- a) az ISO 7195:2005 szabványban meghatározott szivárgás és elfogadhatatlan feszültség fellépése nélkül elviselje a 6.4.21.5 bekezdésben meghatározott szerkezeti vizsgálatot;
- b) az urán-hexafluorid elvesztése vagy kiszóródása nélkül elviselje 6.4.15.4 bekezdésben meghatározott szabadejtési próbát;
- c) a biztonsági tartály törése nélkül elviselje a 6.4.17.3 bekezdésben meghatározott hőpróbát.

6.4.6.3

A 0,1 kg vagy annál több urán-hexafluoridot tartalmazó küldeménydarabokat nem szabad nyomás csökkentő szerkezetekkel ellátni.

- 6.4.6.4** A 0,1 kg vagy annál több urán-hexafluorid tartalomra tervezett küldeménydarabok az illetékes hatóság engedélyével akkor is szállíthatók, ha:
- a) a küldeménydarabokat az ISO 7195:2005 szabványtól eltérő nemzeti vagy nemzetközi szabványok szerint tervezték, azonban a biztonság szintje azonos;
 - b) a küldeménydarabokat úgy tervezték, hogy szivárgás és elfogadhatatlan feszültség fellépése nélkül elviseljék a 2,76 MPa-nál kisebb próbanyomást, mint azt a 6.4.21.5 bekezdés előírja; vagy
 - c) a 9000 kg vagy ennél több urán-hexafluorid tartalomra tervezett küldeménydaraboknál a küldeménydarab nem elégti ki a 6.4.6.2 c) pont előírásait.
- Egyébként a 6.4.6.1 – 6.4.6.3 bekezdés követelményeit kell kielégíteni.

6.4.7 Az A típusú küldeménydarabokra vonatkozó követelmények

- 6.4.7.1** Az A típusú küldeménydarabok kivitelének olyannak kell lennie, hogy megfeleljen a 6.4.2 szakasz általános követelményeinek, valamint a 6.4.7.2 – 6.4.7.17 bekezdésben meghatározott követelményeknek.
- 6.4.7.2** A küldeménydarab legkisebb külső mérete nem lehet 10 cm-nél kisebb.
- 6.4.7.3** A küldeménydarab külső oldalán megfelelő szerkezetnek (pl. ólomzárnak) kell lennie, amely nem könnyen törhető össze, és amelynek sértetlen állapota bizonyítja, hogy a küldeménydarabot nem nyitották fel.
- 6.4.7.4** Minden rögzítő szerelvénynek a küldeménydarabon olyan kialakításúnak kell lennie, hogy a szerelvényekben ébredő erők se normális szállítási körülmények, se baleseti körülmények esetén ne okozzák azt, hogy a küldeménydarab a továbbiakban nem felel meg az ADR előírásainak.
- 6.4.7.5** A küldeménydarab tervezésekor $-40\text{ °C} \dots +70\text{ °C}$ hőmérséklet-tartományt kell alapul venni a csomagolás alkotóelemeihez. Figyelembe kell venni a folyadéktartalom fagyási hőmérsékletét és a csomagolás anyagainak e hőmérséklet-tartományban bekövetkező lehetséges károsodását.
- 6.4.7.6** A tervezési és a gyártási technikának meg kell felelnie a belföldi és a nemzetközi előírásoknak vagy más olyan követelményeknek, amelyek az illetékes hatóság számára elfogadhatóak.
- 6.4.7.7** A konstrukciónak tartalmaznia kell egy kényszerrögzítő szerkezettel biztonságosan lezárt biztonsági tartályt, amely nem tud véletlenül vagy a küldeménydarabban esetleg keletkező nyomás hatására kinyílni.
- 6.4.7.8** A különleges formájú radioaktív anyag úgy tekinthető, mint a biztonsági tartály egyik alkotóeleme.
- 6.4.7.9** Ha a biztonsági tartály a küldeménydarab egy önálló egységét képezi, annak alkalmasnak kell lennie arra, hogy a csomagolás bármely más részétől független kényszerrögzítő szerkezettel biztonságosan lezárható legyen.
- 6.4.7.10** A biztonsági tartály bármely alkatrészének tervezésekor, ahol szükséges, figyelembe kell venni a folyadékok és más megtámadható anyagok radiolítikus bomlását, valamint a kémiai reakció és radiolízis általi gázfeljődést.
- 6.4.7.11** A biztonsági tartálynak meg kell őriznie radioaktív tartalmát a környezeti nyomás 60 kPa-ig történő csökkenése során is.
- 6.4.7.12** Minden szelepet, amely nem nyomáscsökkentő szelep, burkolattal kell védeni, hogy a szelepből jövő bármely szivárgást megtartsa.

6.4.7.13 Azt a sugárnyékolást, amelyik egy olyan elemét veszi körül a küldeménydarabnak, amely a biztonsági tartály része, úgy kell tervezni, hogy megakadályozza ennek az elemnek nem szándékos kikerülését az árnyékolásból. Ahol a sugárnyékolás és benne az ilyen elem különálló szerkezetet képez, a sugárnyékolást el kell látni kényszerrögzítésű biztonságos zárószervezettel, amely független a csomagolás bármely más részétől.

6.4.7.14 A küldeménydarabot úgy kell kialakítani, hogy ha a 6.4.15 szakaszban meghatározott vizsgálatoknak alávetnék, nem következne be:

- a) a radioaktív tartalom elvesztése vagy szétszóródása; és
- b) a küldeménydarab bármely külső felületén a legnagyobb sugárzási szint 20%-nál nagyobb mértékű növekedése.

6.4.7.15 A folyékony radioaktív anyagokhoz használatos küldeménydarab tervezésénél biztosítani kell, hogy legyen elegendő üres tér a tartalom hőmérséklet-változásának és a töltés során fellépő, ill. az egyéb erőhatások kiegyenlítésére.

Folyékony anyagot tartalmazó A típusú küldeménydarab

6.4.7.16 A folyékony radioaktív anyagot tartalmazó A típusú küldeménydarabnak továbbá meg kell felelnie:

- a) az előző 6.4.7.14 a) pontban meghatározott követelményeknek, ha a küldeménydarabot alávetik a 6.4.16 szakaszban meghatározott vizsgálatoknak; és
- b) a következők egyikének:
 - i) annyi felszívóképes anyaggal kell ellátni, amennyi a folyadéktartalom kétszeresét képes felszívni. Az ilyen felszívóképes anyagot alkalmas módon kell elhelyezni, hogy szivárgás esetén a folyékony anyaggal érintkezni tudjon; vagy
 - ii) olyan biztonsági tartállyal kell ellátni, amely egy elsődleges, belső és egy másodlagos, külső visszatartó elemből készült, amely olyan kialakítású, hogy a folyadéktartalmat teljes mértékben magába zárja és biztosítja annak megtartását a másodlagos, külső részben abban az esetben, ha az elsődleges, belső alkatrész kilyukadna.

Gázokat tartalmazó A típusú küldeménydarab

6.4.7.17 Annak a küldeménydarabnak, amelyet gázok számára terveztek, meg kell akadályoznia a radioaktív tartalom elvesztését vagy szétterjedését, ha a küldeménydarabot alávetnék a 6.4.16 szakaszban meghatározott vizsgálatoknak. A trícium gáz vagy nemesgázok befogadására tervezett A típusú küldeménydarabot mentesíteni kell ez alól a követelmény alól.

6.4.8 A B(U) típusú küldeménydarabokra vonatkozó követelmények

6.4.8.1 A B(U) típusú küldeménydarabokat úgy kell tervezni, hogy kielégítsék a 6.4.2 szakaszban meghatározott követelményeket, továbbá a 6.4.7.2 – 6.4.7.15 bekezdés követelményeit, kivéve a 6.4.7.14 a) pontban meghatározottakat, és ezenkívül kielégítsék a 6.4.8.2 – 6.4.8.15 bekezdésben meghatározott követelményeket.

6.4.8.2 A küldeménydarabot úgy kell megtervezni, hogy a 6.4.8.5 és a 6.4.8.6 bekezdésben meghatározott környezeti feltételek mellett a radioaktív tartalom által a küldeménydarabon belül fejlesztett hő 6.4.15 szakasz szerinti normális szállítási feltételek között oly módon nem befolyásolhatja kedvezőtlenül a küldeménydarabot, hogy az a zártságra és sugárnyékolásra vonatkozó követelményeket ne teljesítse, ha a küldeménydarab egy hétig felügyelet nélkül marad. Különösen a hő hatására kell figyelmet fordítani, ami:

- a) megváltoztathatja a radioaktív tartalom elhelyezkedését, geometriai alakját vagy fizikai állapotát; vagy ha az anyag fémtokba vagy tartályba van zárva (pl. tokozott

fűtőelemek), előidézheti a fémtok, tartály vagy a radioaktív anyag deformációját vagy megolvadását; vagy

- b) csökkenti a csomagolás hatékonyságát a sugárárnyékoló anyag eltérő hőtágulása, repedése vagy megolvadása miatt; vagy
- c) nedvesség jelenlétében gyorsítja a korróziót.

6.4.8.3 A küldeménydarabot úgy kell tervezni, hogy a 6.4.8.5 bekezdésben meghatározott környezeti feltételek között és napbesugárzás nélkül a küldeménydarab hozzáférhető felületének hőmérséklete ne haladja meg az 50 °C-ot, kivéve, ha a küldeménydarabot kizárólagos használat mellett szállítják.

6.4.8.4 A kizárólagos használat mellett szállított küldeménydarab szállítás alatt könnyen hozzáférhető bármely felületének legmagasabb hőmérséklete napbesugárzás nélkül, a 6.4.8.5 bekezdésben meghatározott környezeti körülmények között nem haladhatja meg a 85 °C-ot. Figyelembe vehetők a személyek védelmét szolgáló védőfalak vagy árnyékolások is anélkül, hogy a védőfalat vagy az árnyékolást vizsgálatnak kellene alávetni.

6.4.8.5 A környezeti hőmérsékletet 38 °C-nak kell feltételezni.

6.4.8.6 A napbesugárzási körülményeket a 6.4.8.6 táblázatban meghatározottak szerint kell feltételezni.

6.4.8.6 táblázat Napbesugárzási adatok

Eset	A felület alakja és elhelyezkedése	Napi 12 óra napbesugárzás (W/m ²)
1	Szállítás közben vízszintesen elhelyezkedő és lefelé néző, sík felületek	0
2	Szállítás közben vízszintesen elhelyezkedő és felfelé néző, sík felületek	800
3	Szállítás közben függőlegesen elhelyezkedő felületek	200 ^{a)}
4	Egyéb (nem vízszintesen elhelyezkedő) lefelé néző felületek	200 ^{a)}
5	Minden más felület	400 ^{a)}

- a) Szükség esetén szinusz függvényt lehet használni egy felvett elnyelési együtthatóval, és a szomszédos tárgytól származó lehetséges reflexió hatásai elhanyagolhatók.

6.4.8.7 Az olyan hővédelemmel rendelkező küldeménydarabot, amely megfelel a 6.4.17.3 bekezdésben ismertetett hőpróba előírásainak, úgy kell kialakítani, hogy a hővédelem hatásos maradjon, ha a küldeménydarabot alávetik a 6.4.15 szakaszban meghatározott vizsgálatnak és a 6.4.17.2 a) és b), ill. a 6.4.17.2 b) és c) pontban meghatározott próbáknak, attól függően, melyik alkalmasabb. A küldeménydarab külsején levő ilyen védelem felszakítás, vágás, kaparás, dörzsölés vagy durva kezelés révén nem válhat hatástalanná.

6.4.8.8 A küldeménydarabot úgy kell megtervezni, hogy ha alávetnék:

- a) a 6.4.15 szakaszban meghatározott próbáknak, a radioaktív tartalom vesztesége nem lenne több, mint $10^{-6}A_2/h$; és
- b) a 6.4.17.1, a 6.4.17.2 b) a 6.4.17.3 és a 6.4.17.4 bekezdésben meghatározott vizsgálatoknak, és ezenkívül:
 - i) a 6.4.17.2 c) pontban meghatározott próbának, ha a küldeménydarab tömege nem több, mint 500 kg, külső méretei alapján átlagos sűrűsége nem nagyobb 1000 kg/m^3 -nél, és radioaktív tartalma – nem különleges formájú radioaktív anyagból – meghaladja az $1000A_2$ értéket; vagy
 - ii) a 6.4.17.2 a) pontban meghatározott próbának minden más küldeménydarab esetén,

akkor kielégítené a következő követelményeket:

- elegendő árnyékoló hatása maradna, amely biztosítja, hogy a sugárzási szint a küldeménydarab felületétől 1 m távolságban nem haladja meg a 10 mSv/h értéket a legnagyobb radioaktív tartalom esetén, amelynek befogadására a küldeménydarabot tervezték; és
- a radioaktív tartalom halmozott vesztesége egy hét alatt 85-kripton esetén nem lenne több, mint $10A_2$, ill. minden más radionuklidból A_2 .

Amikor különféle radionuklid keverékek vannak jelen, a 2.2.7.2.2.4 – 2.2.7.2.2.6 pont szerinti módszert kell alkalmazni, kivéve a 85-kripton esetében, ahol $A_2(i)$ tényleges értékének $10A_2$ használható. Az előző a) pont szerinti esetben számításba kell venni a 4.1.9.1.2 pont szerinti külső szennyezettségi határokat.

- 6.4.8.9** A 10^5A_2 -nél nagyobb aktivitású radioaktív tartalomra tervezett küldeménydarabokat úgy kell kialakítani, hogy ha alávetnék a 6.4.18 szakaszban ismertetett fokozott vízbe merítési próbának, a biztonsági tartály nem repedne meg.
- 6.4.8.10** Az aktivitás-kibocsátás engedélyezett határát a szűrőktől, ill. a mechanikus hűtőrendszertől függetlenül be kell tartani.
- 6.4.8.11** A küldeménydarabban a biztonsági tartályon nem lehet nyomás csökkentő szerkezet, amelyen keresztül a radioaktív tartalom a 6.4.15 és a 6.4.17 szakaszban meghatározott vizsgálatok körülményei között a környezetbe juthatna.
- 6.4.8.12** A küldeménydarabot úgy kell kialakítani, hogy ha a legnagyobb üzemi nyomáson alávetnék a 6.4.15 és a 6.4.17 szakaszban meghatározott vizsgálatoknak, a biztonsági tartályban a feszültség nem érne el olyan értéket, amely a küldeménydarabot olyan módon befolyásolná hátrányosan, hogy az nem tudná a vonatkozó követelményeket teljesíteni.
- 6.4.8.13** A küldeménydarab legnagyobb normális üzemi nyomása nem haladhatja meg a 700 kPa (túlnyomás) értéket.
- 6.4.8.14** A kis mértékben diszpergálódó radioaktív anyagot tartalmazó küldeménydarabot úgy kell kialakítani, hogy bármely, a kis mértékben diszpergálódó radioaktív anyaghoz hozzátett, de annak részét nem képező szerkezet, ill. a csomagolóeszköz bármely belső eleme ne befolyásolja kedvezőtlenül a kis mértékben diszpergálódó radioaktív anyag viselkedését.
- 6.4.8.15** A küldeménydarabot $-40...+38$ °C környezeti hőmérsékletre kell tervezni.

6.4.9 A $B(M)$ típusú küldeménydarabokra vonatkozó követelmények

- 6.4.9.1** A $B(M)$ típusú küldeménydaraboknak meg kell felelniük a 6.4.8.1 bekezdésben a $B(U)$ típusú küldeménydarabokra vonatkozó követelményeknek, azzal a kivétellel, hogy azoknál a küldeménydaraboknál, amelyeket kizárólag meghatározott országokba vagy meghatározott országok között szállítanak, az ezen országok illetékes hatóságainak engedélyével a 6.4.7.5, a 6.4.8.4, a 6.4.8.5, a 6.4.8.6 és a 6.4.8.9 – 6.4.8.15 bekezdésben megadottaktól eltérő körülmények feltételezhetők. A 6.4.8.9 – 6.4.8.15 bekezdésben a $B(U)$ típusú küldeménydarabokra meghatározott követelményeket azonban – amennyire csak lehetséges – be kell tartani.
- 6.4.9.2** A $B(M)$ típusú küldeménydarabok szállítás alatti szakaszos szellőztetése engedélyezhető, amennyiben a szellőztetés működésének ellenőrzési gyakorlata az érintett illetékes hatóság számára elfogadható.

6.4.10 A C típusú küldeménydarabokra vonatkozó követelmények

- 6.4.10.1** A C típusú küldeménydarabokat úgy kell kialakítani, hogy megfeleljenek a 6.4.2 szakaszban

meghatározott követelményeknek, a 6.4.7.2 – 6.4.7.15 bekezdés követelményeinek, kivéve a 6.4.7.14 a) pontot, a 6.4.8.2 – 6.4.8.6, a 6.4.8.10 – 6.4.8.15, továbbá a 6.4.10.2 – 6.4.10.4 bekezdésben meghatározott követelményeknek.

6.4.10.2 A küldeménydarabnak meg kell felelnie a 6.4.8.8 b) és a 6.4.8.12 bekezdésben szereplő vizsgálatokra előírt értékelési kritériumoknak $0,33 \text{ W} \cdot \text{m}^{-1} \cdot \text{K}^{-1}$ hővezetéssel és $38 \text{ }^{\circ}\text{C}$ hőmérséklettel jellemezhető környezetbe történő beágyazást követően, az egyensúly beállta után. Az értékelés során kiindulási körülményként azt kell feltételezni, hogy a küldeménydarab mindenféle hőszigetelése sértetlen marad, a küldeménydarab legnagyobb normál üzemi nyomáson van és a környezeti hőmérséklet $38 \text{ }^{\circ}\text{C}$.

6.4.10.3 A küldeménydarabot úgy kell kialakítani, hogy ha az a legnagyobb normál üzemi nyomáson lenne és alávetnék:

- a) a 6.4.15 szakaszban meghatározott próbáknak, akkor a radioaktív tartalom vesztesége legfeljebb $10^{-6} A_2/\text{h}$ lenne; és
- b) a 6.4.20.1 bekezdésben meghatározott próbának, kielégítené a következő követelményeket:
 - i) elegendő mértékű árnyékolása maradna ahhoz, hogy a sugárzási szint a küldeménydarab felületétől 1 m távolságban ne legyen több, mint 10 mSv/h a legnagyobb radioaktív tartalom esetében, aminek megtartására a küldeménydarabot tervezték; és
 - ii) a radioaktív tartalom halmozott vesztesége egy hét alatt 85-kripton esetén nem lenne több, mint $10 A_2$, illetve minden más radionuklid esetén A_2 .

Amikor különféle radionuklidok keverékei vannak jelen, a 2.2.7.2.2.4 – 2.2.7.2.2.6 pont előírásait kell alkalmazni, kivéve a 85-kripton esetében, ahol $A_2(i)$ értékűl $10 A_2$ használható. Az előző a) pont szerinti esetben számításba kell venni a 4.1.9.1.2 pont szerinti külső szennyezettségi határokat.

6.4.10.4 A küldeménydarabot úgy kell kialakítani, hogy a 6.4.18 szakaszban ismertetett fokozott vízbe merítési próba elvégzése után a biztonsági tartály ne repedjen meg.

6.4.11 A hasadóanyagot tartalmazó küldeménydarabokra vonatkozó követelmények

6.4.11.1 A hasadóanyagot úgy kell szállítani, hogy:

- a) a szubkritikus állapot fennmaradjon mind normális szállítási körülmények között, mind baleset esetén; különösen a következő eshetőségekre kell tekintettel lenni:
 - i) víz szivárgása a küldeménydarabba vagy a küldeménydarabból;
 - ii) a beépített neutronelnyelők vagy moderátorok hatékonyságának elvesztése;
 - iii) a radioaktív tartalom lehetséges átrendeződése vagy a küldeménydarabon belül, vagy a küldeménydarabból való kiszóródás eredményeként;
 - iv) a távolság csökkenése a küldeménydarabokon belül vagy a küldeménydarabok között;
 - v) a küldeménydarabok vízbe merülése vagy hóba temetődése; és
 - vi) a hőmérséklet-változások; és
- b) megfelelően:
 - i) a hasadóanyagot tartalmazó küldeménydarabokra a 6.4.7.2 bekezdés előírásainak;
 - ii) az ADR máshol található előírásainak, amelyek az anyag radioaktív tulajdonságai miatt vonatkoznak rájuk; és
 - iii) a 6.4.11.3 – 6.4.11.12 bekezdésben meghatározott követelményeknek, kivéve, ha a 6.4.11.2 bekezdés mentességet ad ezek alól.

- 6.4.11.2** A 2.2.7.2.3.5 pont a) – d) alpontja valamelyikének megfelelő hasadóanyagot nem szükséges olyan küldeménydarabokban szállítani, amely megfelel a 6.4.11.3 – 6.4.11.12 bekezdés előírásainak, ill. az ilyen hasadóanyag mentesül az ADR egyéb, hasadóanyagokra vonatkozó követelményei alól. Küldeményenként csak egy fajta mentesítés engedélyezhető.
- 6.4.11.3** Ha a kémiai vagy fizikai forma, az izotóp összetétel, a tömeg vagy koncentráció, a moderálási arány vagy sűrűség, vagy a geometriai elrendezés nem ismeretes, a 6.4.11.7 – 6.4.11.12 bekezdés szerinti értékelést kell elvégezni, feltételezve, hogy minden ismeretlen értékű paraméter értéke a legnagyobb neutron sokszorozódást adó érték, amely az ezen értékelésben ismert feltételeknek és paramétereknek felel meg.
- 6.4.11.4** A besugárzott nukleáris üzemanyag esetében a 6.4.11.7 – 6.4.11.12 bekezdés szerinti értékelésnek a demonstrált izotóp összetételen kell alapulnia, amely biztosítja:
- a) a besugárzás története során a legnagyobb neutronsokszorozódást; vagy
 - b) a küldeménydarab értékeléséhez a neutron sokszorozódás óvatos becslését. Besugárzás után, de a szállítást megelőzően mérést kell végezni az izotóp összetétel konzervatív voltának bizonyítására.
- 6.4.11.5** A küldeménydarabnak olyannak kell lennie, hogy miután alávetették a 6.4.15 szakaszban meghatározott vizsgálatnak,
- a) a küldeménydarab minden befoglaló (külső) mérete legalább 10 cm marad; és
 - b) egy 10 cm élhosszúságú kocka nem tud belehatolni.
- 6.4.11.6** A küldeménydarabot $-40\text{ }^{\circ}\text{C}$... $+38\text{ }^{\circ}\text{C}$ környezeti hőmérsékletre kell tervezni, kivéve, ha az illetékes hatóság mást ír elő a küldeménydarab-minta engedélyében.
- 6.4.11.7** Az egyenként szigetelt küldeménydaraboknál azt kell feltételezni, hogy víz tud be- vagy kiszivárogni a küldeménydarab valamennyi üreges részébe, beleértve a biztonsági tartályt. Azonban, ha a kialakítás olyan, hogy egyes üreges részekbe a víz be- vagy kiszivárgásának megakadályozására különleges megoldással rendelkezik – még akkor is, ha emberi tévedés történne –, az ilyen üreges részekre vonatkozóan feltételezni lehet a szivárgásmentességet. Különleges megoldások közé tartozik:
- a) többrétegű, megbízható vízszigetelés, amelyek közül legalább kettő hézagmentes maradna, ha a küldeménydarabot alávetnék a 6.4.11.12 b) pontban meghatározott vizsgálatoknak; szigorú minőségellenőrzés a küldeménydarabok gyártása, karbantartása és javítása során; és különleges vizsgálatok valamennyi küldeménydarab szállítás előtti zártságának kimutatására; vagy
 - b) csak a legfeljebb 5 tömeg% urán-235 dúsítású urán-hexafluoridot tartalmazó küldeménydarabokra:
 - i) a küldeménydaraboknál a 6.4.11.12 b) pontban előírt vizsgálatok után nincs fizikai érintkezés a szelep és a csomagolás bármely más része között, kivéve a csatlakozások eredeti pontjait, és ezenkívül a 6.4.17.3 bekezdésben előírt próba után a szelepek szivárgásmentesek maradnak; és
 - ii) a csomagolóeszközök gyártásánál, karbantartásánál és javításánál magas szintű minőségellenőrzés vizsgálatokkal összekapcsolva minden küldeménydarab tömörségének bizonyítására az egyes szállítások előtt.
- 6.4.11.8** Fel kell tételezni, hogy a megtartó rendszert a közvetlenül körülvevő legalább 20 cm-es vízréteg (vagy ezzel egyenértékű más anyag) által létrehozott reflexió vagy olyan nagyobb járulékos reflexió éri, amelyet a csomagolást körülvevő anyag biztosít. Azonban, ha bizonyítható, hogy a megtartó rendszer a 6.4.11.12 b) pontban leírt vizsgálatok után is a csomagolásban marad, a 6.4.11.9 c) pontban feltételezhető a küldeménydarab legalább 20 cm-es vízréteg általi közvetlen reflexiója.
- 6.4.11.9** A küldeménydarabnak szubkritikusnak kell lennie a 6.4.11.7 és a 6.4.11.8 bekezdés

körülményei között és a legnagyobb neutron sokszorozódást eredményező küldeménydarab feltételek mellett, ami felléphet

- a) normális szállítási feltételek között (esemény mentes);
- b) a 6.4.11.11 b) pontban előírt vizsgálatok során;
- c) a 6.4.11.12 b) pontban előírt vizsgálatok során.

6.4.11.10 (fenntartva)

6.4.11.11 A normális szállítási feltételekre egy N számot kell képezni oly módon, hogy az N küldeménydarab ötszöröse az elrendezésre és a küldeménydarab azon feltételeire nézve szubkritikus legyen, amelyek a legnagyobb neutronsokszorozódást eredményezik összhangban a következőkkel:

- a) nincs semmi a küldeménydarabok között és a küldeménydarabok halmazát minden oldalról legalább 20 cm-es reflektáló vízréteg veszi körül; és
- b) küldeménydarabok állapotának feltételezetten vagy demonstráltan olyannak kell lennie, mintha alávetették volna azokat a 6.4.15 szakaszban meghatározott próbáknak.

6.4.11.12 A szállítás baleseti feltételeire egy N számot kell képezni oly módon, hogy az N küldeménydarab kétszerese az elrendezésre és a küldeménydarab azon feltételeire nézve szubkritikus legyen, amelyek a legnagyobb neutronsokszorozódást eredményezik összhangban a következőkkel:

- a) hidrogéntartalmú moderátor van a küldeménydarabok között és a halmazt minden oldalról legalább 20 cm vastag reflektáló vízréteg veszi körül; és
- b) a 6.4.15 szakaszban meghatározott próbákkal, amelyeket a következők közül a jobban korlátozó követ:
 - i) a 6.4.17.2 b) pontban meghatározott próba és vagy a 6.4.17.2 c) pontban meghatározott próba, ha a küldeménydarab tömege nem több, mint 500 kg, külső méretei alapján átlagos sűrűsége nem nagyobb 1000 kg/m³-nél, vagy a 6.4.17.2 a) pontban meghatározott próba minden más küldeménydarab esetén; amit a 6.4.17.3 bekezdésben meghatározott próba követ és végül a 6.4.19.1 – 6.4.19.3 bekezdésben meghatározott próbákkal zárul a vizsgálat; vagy
 - ii) a 6.4.17.4 bekezdésben meghatározott próba; és
- c) Ha a hasadóanyag bármely része kiszabadul a biztonsági tartályból a 6.4.11.12 b) pontban leírt próba után, akkor fel kell tételezni, hogy a hasadóanyag az elrendezésben levő minden küldeménydarabból kiszabadul és minden hasadóanyagot olyan konfigurációban és moderációban kell elrendezni, ami a legnagyobb neutron sokszorozódást eredményezi a legalább 20 cm-es vízréteg szoros reflexiójának megfelelő mértékben.

6.4.11.13 A kritikussági biztonsági mutatószámot (CSI) a hasadó anyagot tartalmazó küldeménydarabokra úgy kell meghatározni, hogy 50-et el kell osztani a 6.4.11.11 és a 6.4.11.12 bekezdésben levezetett két N érték közül a kisebbel (azaz $CSI = 50/N$). A kritikussági biztonsági mutatószám lehet nulla, amennyiben a küldeménydarabok korlátlan száma kritikus alatti (szubkritikus) (azaz N mindkét esetben ténylegesen végtelen).

6.4.12 Vizsgálati eljárások és a megfelelés bizonyítása

6.4.12.1 A 2.2.7.2.3.1.3, a 2.2.7.2.3.1.4, a 2.2.7.2.3.3.1, a 2.2.7.2.3.3.2, a 2.2.7.2.3.4.1, a 2.2.7.2.3.4.2 pontban és a 6.4.2 – 6.4.11 szakaszban előírt követelményeknek való megfelelést a következőkben felsorolt eljárások bármelyikével vagy valamely kombinációjukkal kell bizonyítani:

- a) *LSA-III* anyag vagy különleges formájú radioaktív anyag vagy kis mértékben diszpergálódó radioaktív anyag esetén a mintán, a prototípuson vagy a gyártásból

kivett csomagoláson elvégzett vizsgálatokkal, amikor is a vizsgálatokhoz felhasznált mintadarab vagy csomagolás tartalmának, amennyire csak lehetséges hasonlítania kell a radioaktív tartalom várható összetételére, és a vizsgálandó mintadarabot vagy csomagolást úgy kell előkészíteni, ahogyan azt szállításra átadják.

- b) Megfelelő mértékben hasonló esetben korábban elvégzett bizonyítási eljárásra való hivatkozással.
- c) Olyan, alkalmas léptékű modelleken végzett vizsgálatokkal, amelyek tartalmazzák a vizsgált mintadarab lényeges jellemzőit, olyan esetekben, amikor a mérnöki tapasztalat szerint az ilyen vizsgálatok eredményei tervezési célokra alkalmasak. Amennyiben ilyen modellt használnak, bizonyos vizsgálati paramétereket, mint pl. az átdöfő rúd átmérőjét vagy a halmazolási terhelést, megfelelően módosítani kell.
- d) Számítással vagy ésszerű indokok alapján, amennyiben a számítási eljárások és a paraméterek általánosan elfogadottak, megbízhatók vagy hagyományosak.

6.4.12.2 Miután a mintadarab, prototípus vagy minta vizsgálata megtörtént, megfelelő értékelési módszert kell alkalmazni annak tanúsítására, hogy a 2.2.7.2.3.1.3, a 2.2.7.2.3.1.4, a 2.2.7.2.3.3.1, a 2.2.7.2.3.3.2, a 2.2.7.2.3.4.1, a 2.2.7.2.3.4.2 pont vizsgálatokra vonatkozó előírásait és a 6.4.2 – 6.4.11 szakasz követelményeit betartották.

6.4.12.3 Minden mintadarabot a próbák előtt azonosítás céljából meg kell vizsgálni, és a hiányosságokat vagy sérüléseket jegyzőkönyvezni kell a következők szerint:

- a) eltérés a gyártási mintától;
- b) gyártási hibák;
- c) korrózió vagy más elhasználódás; és
- d) külső alakváltozás.

A küldeménydarab biztonsági tartályának egyértelműen azonosíthatónak kell lennie. A mintadarab külső jellegzetességeinek egyértelműen azonosíthatónak kell lennie, hogy a mintadarab bármely részére egyszerűen és világosan hivatkozni lehessen.

6.4.13 A biztonsági tartály és a sugárárnyékolás sértetlenségének vizsgálata és a biztonsági kritikusság értékelése

A 6.4.15 – 6.4.21 szakaszban meghatározott minden egyes alkalmazható próba után:

- a) a hibákat és a sérülést azonosítani és jegyzőkönyvezni kell;
- b) meg kell határozni, hogy a biztonsági tartály és a sugárárnyékolás megőrizte-e zártágát a vizsgált küldeménydarabra vonatkozóan a 6.4.2 – 6.4.11 szakaszban előírt mértékben; és
- c) hasadóanyagot tartalmazó küldeménydaraboknál meg kell határozni, hogy a 6.4.11.1 – 6.4.11.13 bekezdésben előírt értékelésnél az egy vagy több küldeménydarabra alkalmazott feltételezések és körülmények érvényesek-e.

6.4.14 Ütközőlap ejtési vizsgálatokhoz

A 2.2.7.2.3.3.5 a), a 6.4.15.4, a 6.4.16 a), a 6.4.17.2 és a 6.4.20.2 bekezdésben meghatározott ejtési vizsgálatokhoz az ütközőlapnak olyan jellegű sima, vízszintes felületűnek kell lennie, hogy a mintadarab felütközése során létrejött elmozdulás vagy alakváltozás által okozott ellenállás növekedése ne növelje észrevehető módon a mintadarab károsodását.

6.4.15 Vizsgálat a normális szállítási körülmények elviselésének bemutatására

6.4.15.1 A vizsgálat vízpermet, szabadejtési, halmazolási és átdöfési próbából áll. A küldeménydarab mintadarabjait alá kell vetni a szabadejtési, halmazolási és átdöfési próbáknak, előtte

azonban minden esetben el kell végezni a vízpermet-próbát. Egy mintadarabot lehet használni az összes vizsgálathoz, feltéve, hogy a 6.4.15.2 bekezdés követelményei teljesülnek.

6.4.15.2 A vízpermet-próba és az utána következő vizsgálat közötti időtartamnak annyinak kell lennie, hogy a víz beszívódása a legnagyobb mértékű legyen a mintadarab külsejének észrevehető száradása nélkül. Ha semmi nem szól ellene, akkor ennek az időtartamnak két órának kell lennie, ha a vízpermet egyszerre négy irányból hat. Nem kell szünetet tartani, ha a vízpermet a négy irányból egymás után éri a mintadarabot.

6.4.15.3 *Vízpermetpróba:* A mintadarabot úgy kell alávetni a vízpermetpróbának, hogy az ki legyen téve legalább egy óra hosszat tartó, óránként mintegy 5 cm intenzitású esőnek megfelelő hatásnak.

6.4.15.4 *Szabadejtési próba:* a mintadarabot úgy kell az ütközőlapra ejteni, hogy a vizsgálandó – biztonsági szempontból legfontosabb – részeket a legnagyobb károsodás érje.

- A mintadarab legalsó pontjától az ütközőlap felső felületéig mért ejtési magasság nem lehet kevesebb, mint a 6.4.15.4 táblázatban a tömeg függvényében megadott távolság. Az ütközőlapnak olyannak kell lennie, ahogyan a 6.4.14 szakaszban meg van határozva.
- Az 50 kg-nál nem nagyobb tömegű, szögletes, papírlemez vagy fa küldeménydarabok egy külön példányát 0,3 m magasságból mindegyik sarkára le kell ejteni.
- A 100 kg-nál nem nagyobb tömegű hengeres papírlemez küldeménydarabok egy külön példányát 0,3 m magasságból mindkét végén a kör alakú perem minden egyes környezedére le kell ejteni.

6.4.15.4 táblázat Ejtési magasságok a küldeménydarabok normális szállítási körülményeinek vizsgálatához

A küldeménydarab tömege (kg)	Szabad ejtési magasság (m)
a küldeménydarab tömege < 5 000	1,2
5 000 ≤ a küldeménydarab tömege < 10 000	0,9
10 000 ≤ a küldeménydarab tömege < 15 000	0,6
15 000 ≤ a küldeménydarab tömege	0,3

6.4.15.5 *Halmazolási próba:* kivéve azokat az eseteket, amikor a csomagolás alakja a halmazolást nem teszi lehetővé, a mintadarabot 24 órán át olyan nyomóterhelés hatásának kell kitenni, amely a következők közül a nagyobb:

- akkora összes terhelés, amely a küldeménydarab legnagyobb tömege ötszörösének felel meg; és
- a küldeménydarab függőleges vetületi felülete szorozva 13 kPa-lal.

A terhelésnek egyenletesen kell a mintadarab két, egymással szemben levő oldalára hatnia, amelyek közül az egyik az alaplappal legyen, amelyen a küldeménydarab általában nyugszik.

6.4.15.6 *Átdőfési próba:* A mintadarabot kemény, sík, vízszintes lapra kell helyezni, amelynek nem szabad észrevehető módon elmozdulnia a próba végrehajtása során.

- A 3,2 cm-es átmérőjű hengeres, félgömbben végződő, 6 kg tömegű rudat hossz-tengelyével függőlegesen úgy kell a mintadarab leggyengébb részének közepére ejteni, hogy ha elég mélyen hatol be, éppen a biztonsági tartályt találja el. A próba végrehajtása során a rúd nem szenvedhet észrevehető alakváltozást.
- Az ejtési magasságnak a rúd alsó végétől a mintadarab felső felületén azon pontig, ahová az ejtés irányul, 1 m-nek kell lennie.

- 6.4.16 Folyadékok és gázok szállítására tervezett A típusú küldeménydarabok kiegészítő vizsgálata**
- Egyetlen vagy más-más mintadarabot kell a következő próbák mindegyikének alávetni, kivéve, ha a próbák valamelyike bizonyíthatóan szigorúbb a kérdéses mintadarabra, mint a többi. Ez utóbbi esetben egy mintadarabot kell a legszigorúbb próbának alávetni.
- Szabadejtési próba:** A mintadarabot úgy kell az ütközőlapra ejteni, hogy a védelmet a legnagyobb károsodás érje. Az ejtési magasságnak a mintadarab legalsó részétől az ütközőlap felső felületéig 9 m-nek kell lennie. Az ütközőlapnak olyannak kell lennie, ahogy a 6.4.14 szakaszban meg van határozva.
 - Átdőfési próba:** A mintadarabot alá kell vetni a 6.4.15.6 bekezdésben meghatározott próbának, azzal az eltéréssel, hogy az ejtési magasságot a 6.4.15.6 b) pontban meghatározott 1 m-ről 1,7 m-re kell növelni.
- 6.4.17 Vizsgálatok a szállítás közben bekövetkező balesetekkel szembeni ellenálló képesség bemutatására**
- 6.4.17.1** A mintadarabot a 6.4.17.2 és a 6.4.17.3 bekezdésben meghatározott próbák halmozott hatásának kell alávetni a felsorolás sorrendjében. A próbákat követően vagy ugyanezt vagy egy másik mintadarabot vízbe merítési próbá(k)nak kell alávetni a 6.4.17.4 bekezdésben és ha alkalmazható, a 6.4.18 szakaszban meghatározottak szerint.
- 6.4.17.2** **Mechanikai próba:** A mechanikai próba három különböző ejtési vizsgálatból áll. Minden mintadarabot a 6.4.8.8 vagy a 6.4.11.12 bekezdésben meghatározott ejtéseknek kell alávetni. Az ejtési próbák sorrendjét úgy kell megválasztani, hogy a mechanikai vizsgálat befejezése után a mintadarab károsodása az azt követő hőpróba során a legnagyobb mértékű legyen.
- Az 1. ejtés során a mintadarabot úgy kell az ütközőlapra ejteni, hogy az a legnagyobb sérülést szenvedje el, és az ejtési magasságnak a mintadarab legalsó pontjától az ütközőlap felső felületéig 9 m-nek kell lenni. Az ütközőlapnak olyannak kell lenni, ahogy a 6.4.14 szakaszban meg van határozva.
 - A 2. ejtés során a mintadarabot oly módon kell ejteni, hogy abban az ütközőlapra függőlegesen rögzített hegyes rúd a legnagyobb sérülést okozza. Az ejtési magasságnak a mintadarab ütközésre szánt pontja és a rúd felső felülete között 1 m-nek kell lennie. A rúdnak szerkezeti acélból készült, tömör hengeres testnek kell lennie, amelynek átmérője $15\text{ cm} \pm 0,5\text{ cm}$, és hosszúsága 20 cm, hacsak hosszabb rúd nem idézhet elő nagyobb károsodást. Ez esetben a legnagyobb károsodást okozó, elegendő hosszúságú rudat kell alkalmazni. A rúd felső végének sík, vízszintes felületűnek kell lennie, szélének lekerekítési sugara ne legyen több, mint 6 mm. Az ütközőlapnak, amelyből a rúd kiemelkedik, a 6.4.14 szakasz szerintinek kell lennie.
 - A 3. ejtés során a mintadarabot dinamikus összenyomási próbának kell alávetni; a mintadarabot ütközőlapra kell fektetni, és úgy kell ráejteni 9 m magasból 500 kg tömeget, hogy a mintadarab a legnagyobb károsodást szenvedje el. A tömegnek 1 m x 1 m-es szilárd szerkezeti acél lapnak kell lennie, és vízszintes helyzetben kell leesnie. Az ejtési magasságot a tömeg alsó lapja és a mintadarab legmagasabb pontja között kell mérni. Az ütközőlapnak, amelyen a mintadarab elhelyezkedik, a 6.4.14 szakasz szerintinek kell lennie.
- 6.4.17.3** **Hőpróba:** A mintadarabnak 38 °C-os környezeti hőmérsékleten termikus egyensúlyban kell lennie a 6.4.8.6 táblázatban meghatározott napbesugárzási körülmények és a radioaktív tartalomtól a küldeménydarab belsejében történő – a tervezésnél alapul vett – legnagyobb mértékű hőfejlődés feltételei mellett. Alternatívaként ezen paraméterek bármelyike eltérő értékű is lehet a próba előtt és alatt, amennyiben a küldeménydarab megfelelő reakciójának értékelése során ezt figyelembe veszik.
- A hőpróbának a következőkből kell állnia:
- a mintadarab teljes egészét 30 percig olyan termikus környezetbe kell helyezni, ami

legalább akkora hőfluxust biztosít, mint a szénhidrogén-levegő keverék lángja kellően nyugodt környezeti körülmények mellett, legalább 800 °C közepes láng hőmérséklet és legalább 0,9 közepes kisugárzási tényező esetén; a mintát teljesen lánggal körülvéve a felület abszorpciós tényezőjének vagy 0,8-nak vagy olyan értékűnek kell lennie, amelyet a küldeménydarab a meghatározott tűz hatására feltételezhetően mutatna; majd ezt követően

- b) a mintát elegendően hosszú ideig 38 °C-os környezeti hőmérsékletnek kell kitenni, a 6.4.8.6 táblázatban meghatározott napbesugárzási körülményeknek és a radioaktív tartalomtól a küldeménydarab belsejében történő legnagyobb mértékű hőfejlődés feltételei mellett, hogy a hőmérséklet a küldeménydarabban mindenütt csökkenjen és/vagy elérje a kezdeti állandósult körülményeket. Alternatívaként ezen paraméterek bármelyike eltérő értékű is lehet a próba előtt és alatt, amennyiben a küldeménydarab viselkedésének értékelése során ezt megfelelő módon figyelembe veszik.

A próba alatt és után a mintát nem kell mesterségesen hűteni és a minta anyagának esetleges égését hagyni kell természetes módon folytatódni.

6.4.17.4 *Vízbe merítési próba:* A mintadarabot legalább 15 m vízoszlop nyomásával azonos nyomású víz alatt kell tartani legalább nyolc órán keresztül olyan helyzetben, amelyik a legnagyobb sérüléshez vezet. Ilyen nyomásnak tekinthető a legalább 150 kPa külső nyomás (túlnyomás).

6.4.18 **Fokozott vízbe merítési próba a $10^5 A_2$ -nél nagyobb aktivitást tartalmazó $B(U)$ és $B(M)$ típusú küldeménydarabokra és C típusú küldeménydarabokra**

Fokozott vízbe merítési próba: A mintadarabot legalább 200 m vízoszlop nyomásával azonos nyomású vízben (víz alatt) kell tartani legalább egy órán keresztül. Ilyen nyomásnak tekinthető a legalább 2 MPa külső nyomás (túlnyomás).

6.4.19 **Hasadóanyagot tartalmazó küldeménydarabok vízszivárgás-próbája**

6.4.19.1 Az olyan küldeménydarabokat, amelyeknél a víz beszivárgást és kiszivárgást a legnagyobb reaktivitást eredményezőnek feltételezték a 6.4.11.7 – 6.4.11.12 bekezdés szerinti értékelés céljából, mentesíteni kell a próba alól.

6.4.19.2 Mielőtt a mintadarabot a következőkben ismertetett vízszivárgási próbának alávetnék, el kell végezni rajta a 6.4.17.2 b) pont szerinti próbát és a 6.4.17.2 a) vagy c) pont szerinti próbát, mint azt a 6.4.11.12 bekezdés előírja, továbbá a 6.4.17.3 bekezdésben előírt próbát.

6.4.19.3 A mintadarabot legalább 0,9 m vízoszlop nyomásával azonos víznyomás alatt kell tartani legalább nyolc órán keresztül olyan helyzetben, amelynél a legnagyobb szivárgás várható.

6.4.20 **A C típusú küldeménydarabok vizsgálata**

6.4.20.1 A küldeménydarabokat meghatározott sorrendben alá kell vetni a következő próbáknak:

- a) a 6.4.17.2 a), a 6.4.17.2 c), a 6.4.20.2 és a 6.4.20.3 bekezdésben előírt próbák; és
b) a 6.4.20.4 bekezdésben előírt próba.

Az a) és b) pont szerinti próbákat nem szükséges ugyanazon a mintadarabon végrehajtani.

6.4.20.2 *Átlyukasztási/felhasítási próba:* A mintát szerkezeti acélból készült, tömör acéltest károsító hatásának kell kitenni. Az acéltest helyzetének a minta felületéhez képest olyannak kell lennie, hogy a 6.4.20.1 a) pontban meghatározott vizsgálatssorozat eredményeként a legnagyobb sérülés következzen be.

- a) A 250 kg-nál kisebb tömegű küldeménydarabot képviselő mintát az ütközőlapra kell helyezni és ki kell tenni a kiválasztott ütközési pont felett 3 m magasból leeső 250 kg tömegű acéltest hatásának. Ennél a próbánál az acéltestnek 20 cm átmérőjű, 30 cm

hosszú hengeres rúdnak kell lennie, amelynek egyenes csomakúp alakú felütköző végénél az átmérő 2,5 cm, szélének lekerekítési sugara ne legyen több, mint 6 mm. Az ütközőlapnak, amelyre a mintát állítani kell, a 6.4.14 szakasz szerintinek kell lennie;

- b) 250 kg vagy nagyobb tömegű küldeménydarab esetén az acéltestet a felütköző végével felfelé az ütközőlapra kell állítani és a mintát kell ráejteni. Az ejtési magasságnak a minta felütközési pontjától az acéltest felső felületéig mérve 3 m-nek kell lennie. Ehhez a próbához az acéltestnek ugyanolyan jellemzőkkel és méretekkel kell bírnia, mint ahogy az előző a) bekezdésben meg van határozva, azzal az eltéréssel, hogy az acéltest hosszának és tömegének olyannak kell lennie, ami a minta legnagyobb mértékű sérülését okozza. Az ütközőlapnak, amelyre az acéltestet alapjával rá kell állítani, a 6.4.14 szakasz szerintinek kell lennie.

6.4.20.3 *Fokozott hőpróba:* a próbát a 6.4.17.3 bekezdésben meghatározott körülmények között kell végrehajtani, azzal az eltéréssel, hogy a mintadarabot a termikus környezetnek 60 perc időtartamra kell kitenni.

6.4.20.4 *Ütőpróba:* a mintát a legnagyobb sérülést okozó helyzetben legalább 90 m/s felütközési sebességgel kell az ütközőlapnak ütköztetni. Az ütközőlapnak a 6.4.14 szakasz szerintinek kell lennie azzal az eltéréssel, hogy az ütközőfelület bármilyen irányban elhelyezhető, ha merőleges a minta pályájára.

6.4.21 **A 0,1 kg vagy annál több urán-hexafluoridot tartalmazó csomagolóeszközök vizsgálata**

6.4.21.1 Minden csomagolóeszközt és üzemi, ill. szerkezeti szerelvényeit vagy együttesen vagy külön-külön első alkalommal az üzembe helyezés előtt és később időszakonként meg kell vizsgálni. Ezt a vizsgálatot az illetékes hatóság egyetértésével kell végrehajtani és tanúsítani.

6.4.21.2 Az üzembe helyezés előtti vizsgálat a gyártási típus vizsgálatából, szerkezetvizsgálatból, tömörségvizsgálatból, víztérfogat-meghatározásból és az üzemi szerelvények kielégítő működésének vizsgálatából áll.

6.4.21.3 Az időszakos vizsgálat szemrevételezésből, szerkezetvizsgálatból, tömörségvizsgálatból és az üzemi szerelvények kielégítő működésének vizsgálatából áll. Az időszakos vizsgálat határideje legfeljebb öt év. Azokat a csomagolóeszközöket, amelyek ezen ötéves időtartamon belül nem kerültek vizsgálatra, szállítás előtt az illetékes hatóság által jóváhagyott program szerint kell felülvizsgálni. Ezek csak az időszakos vizsgálatra vonatkozó teljes körű program végrehajtása után tölthetők meg ismét.

6.4.21.4 A gyártási típus vizsgálatnak bizonyítania kell a gyártási típus és a gyártási program előírásainak betartását.

6.4.21.5 A 0,1 kg vagy annál több urán-hexafluorid befogadására szolgáló csomagolóeszközöket legalább 1,38 MPa nyomással folyadéknomás-próbának kell alávetni, de ha a próbanyomás 2,76 MPa-nál kevesebb, a minta többoldalú jóváhagyást igényel. A csomagolóeszközök ismételt vizsgálatára más, azonos értékű, roncsolásmentes vizsgálat többoldalú jóváhagyás esetén alkalmazható.

6.4.21.6 A tömörségvizsgálatot olyan eljárással kell végezni, amely biztonsági tartálynál 0,1 Pa·l/s (10^{-6} bar·l/s) érzékenységgel képes a szivárgás megállapítására.

6.4.21.7 A csomagolóeszköz víztérfogatát 15 °C-ra vonatkoztatva $\pm 0,25\%$ pontossággal kell meghatározni. A térfogatot a 6.4.21.8 bekezdésben előírt táblán fel kell tüntetni.

6.4.21.8 Minden csomagolóeszközhöz nem korrodáló fémből készült táblát kell tartós módon egy könnyen hozzáférhető helyre erősíteni. A tábla felerősítésének módja nem befolyásolhatja a csomagolóeszköz szilárdságát. A táblára legalább a következő adatokat kell beütéssel vagy más hasonló eljárással felvinni:

- az engedély száma;

- a gyártó sorozatszám;
- legnagyobb üzemi nyomás (túlnyomás);
- próbanyomás (túlnyomás);
- tartalom: urán-hexafluorid;
- űrtartalom literben;
- az urán-hexafluorid töltet megengedett legnagyobb tömege;
- saját tömeg;
- az üzembe helyezés előtti vizsgálat és az utoljára végrehajtott időszakos vizsgálat időpontja (hónap, év);
- a vizsgálatot végző szakértő bélyegzőlenyomata.

6.4.22 A küldeménydarab minták és anyagok engedélyezése

6.4.22.1 A 0,1 kg vagy annál több urán-hexafluoridot tartalmazó küldeménydarabok mintáinak engedélyezésénél:

- a) minden mintához, amely kielégíti a 6.4.6.4 bekezdés követelményeit, többoldalú engedély szükséges;
- b) minden mintához, amely kielégíti a 6.4.6.1–6.4.6.3 bekezdés előírásait a minta származási országa illetékes hatóságának egyoldalú engedélye szükséges, kivéve, ha az ADR-ben egyébként többoldalú engedély van előírva.

6.4.22.2 Minden egyes $B(U)$ és C típusú küldeménydarab mintához egyoldalú engedély kell, kivéve:

- a) a hasadó anyag küldeménydarab mintáját, ami a 6.4.22.4, a 6.4.23.7 bekezdés és az 5.1.5.2.1 pont hatálya alá esik és amelyhez többoldalú engedély kell; és
- b) a kis mértékben diszpergálódó radioaktív anyag $B(U)$ típusú küldeménydarab mintáját, amelyhez többoldalú engedély kell.

6.4.22.3 Minden $B(M)$ típusú küldeménydarab mintához, beleértve a hasadó anyagot tartalmazót, amely a 6.4.22.4, a 6.4.23.7 bekezdés és az 5.1.5.2.1 pont hatálya alá is esik, és a kis mértékben diszpergálódó radioaktív anyagot tartalmazókat, többoldalú engedély szükséges.

6.4.22.4 Minden olyan hasadó anyagot tartalmazó küldeménydarab mintához, amely a 6.4.11.2 bekezdés szerint nincs mentesítve a hasadó anyagot tartalmazó küldeménydarabokra vonatkozó előírások alól, többoldalú engedély szükséges.

6.4.22.5 A különleges formájú radioaktív anyag mintájához egyoldalú engedély kell. A kis mértékben diszpergálódó radioaktív anyag mintájához többoldalú engedély szükséges (lásd a 6.4.23.8 bekezdést is).

6.4.22.6 Valamely ADR Szerződő Félől származó bármely mintát, amelyhez egyoldalú engedély kell, ezen állam illetékes hatóságának kell engedélyeznie. Amennyiben az az állam, amelyben a küldeménydarabot tervezték, nem ADR Szerződő Fél, a szállítás csak akkor engedélyezett, ha:

- a) ez az állam tanúsítványt állít ki, amely szerint a küldeménydarab minta megfelel az ADR műszaki előírásainak és ezt a tanúsítványt a küldemény által érintett első ADR Szerződő Fél illetékes hatósága elismeri;
- b) amennyiben nincs tanúsítvány, ill. a küldeménydarab minta ADR Szerződő Fél általi elismerése mellékelve, a küldeménydarab mintáját a küldemény által érintett első ADR Szerződő Fél illetékes hatóságai engedélyezik.

- 6.4.22.7** Az átmeneti előírások alapján engedélyezett mintákra lásd az 1.6.6 szakaszt.
- 6.4.23 Engedély iránti kérelmek és engedélyek a radioaktív anyagok szállításához**
- 6.4.23.1** (fenntartva)
- 6.4.23.2** A szállítási engedély iránti kérelemnek tartalmaznia kell:
- a) a szállítási időszakot, amelyre az engedélyt kéri;
 - b) a tényleges radioaktív tartalom adatait, a tervezett szállítási módokat, a járműtípust és a lehetséges vagy tervezett szállítási útvonalat; és
 - c) annak részletezését, hogy milyen módon hajtják végre a küldeménydarab-mintának az 5.1.5.2.1 pont szerint kiállított engedélyokiratában nevesített óvőrendszabályokat és adminisztratív vagy üzemi ellenőrzéseit.
- 6.4.23.3** A külön megegyezés alapján történő szállításra vonatkozó engedély iránti kérelemnek minden olyan információt tartalmaznia kell, ami szükséges az illetékes hatóság meggyőzésére, bizonyítva, hogy a szállítás során az általános biztonság legalább annak megfelel, amely fennállna akkor, ha az ADR minden vonatkozó előírását betartották volna.
- Az engedély iránti kérelemnek tartalmaznia kell:
- a) felvilágosítást arra, hogy a szállítást milyen vonatkozásban és milyen okokból nem lehet az ADR vonatkozó előírásaival teljes összhangban végrehajtani;
 - b) adatokat a különleges biztonsági előírásokra vagy különleges adminisztratív vagy üzemi ellenőrzésekre, amelyeket a szállítás során végre kell hajtani, hogy az ADR vonatkozó előírásaitól való eltéréseket ellensúlyozzák.
- 6.4.23.4** A *B(U)* típusú vagy *C* típusú küldeménydarab minta engedélyezése iránti kérelemnek tartalmaznia kell:
- a) a tervezett radioaktív tartalom részletes leírását, adatokat annak fizikai és kémiai állapotára és a kibocsátott sugárzás fajtájára;
 - b) a gyártási minta részletes leírását, beleértve a teljes körű szerkezeti rajzokat, anyagjegyzéket és az alkalmazandó gyártási eljárást;
 - c) jegyzőkönyvet a vizsgálatokról és azok eredményeiről, vagy számítási eljárásról vagy más bizonyítékot arra, hogy a minta a vonatkozó előírásoknak megfelel;
 - d) a javasolt üzemelési és karbantartási utasításokat a küldeménydarab használatához;
 - e) ha a küldeménydarab 100 kPa túlnyomásnál nagyobb legnagyobb normál üzemi nyomásra van kialakítva, az engedély iránti kérelemnek ki kell térni a biztonsági tartály gyártásához felhasznált anyagokra, azok specifikációira, a mintavételre és az elvégzendő vizsgálatokra;
 - f) ha a tervezett radioaktív tartalom besugárzott fűtőelem, a kérelmezőnek a biztonsági vizsgálatokban szereplő minden feltételezést, amely a fűtőelem tulajdonságaira vonatkozik, ki kell fejtenie és igazolnia kell, és le kell írnia az esetleges szállítást megelőző intézkedéseket, mint azt a 6.4.11.4 b) pont előírja;
 - g) minden különleges rakodási feltételt, amely a küldeménydarabból a biztonságos hőelvezetéshez szükséges, figyelembe véve az alkalmazásra kerülő különböző szállítási módokat, jármű- és konténertípusokat;
 - h) a küldeménydarabot ábrázoló, 21 x 30 cm-nél nem nagyobb, másolható képet, ami bemutatja a küldeménydarab összeállítását; és
 - i) az alkalmazott minőségbiztosítási program specifikációját, mint azt az 1.7.3 szakasz előírja.
- 6.4.23.5** A *B(M)* típusú küldeménydarab mintára vonatkozó engedély iránti kérelemnek a 6.4.23.4

bekezdésben a *B(U)* típusú küldeménydarabra előírt adatokon kívül kiegészítésképpen a következőket kell tartalmaznia:

- a) a 6.4.7.5, a 6.4.8.4, a 6.4.8.5, a 6.4.8.6 és a 6.4.8.9 – 6.4.8.15 bekezdésben meghatározott azon követelmények felsorolását, amelyeknek a küldeménydarab nem felel meg;
- b) a kiegészítésként tervezett üzemeltetési óvintézkedéseket, amelyeket a szállítás alatt kell végrehajtani, és amelyeket az ADR egyébként nem ír elő, de szükségesek ahhoz, hogy a küldeménydarab biztonsága megmaradjon vagy az előző a) pontban felsorolt hiányosságok ellensúlyozásához;
- c) a szállítási módokra vonatkozó bármilyen korlátozás bejelentését, és az esetleges különleges berakási, szállítási, kirakási vagy kezelési eljárásokat; és
- d) a szállítás alatt várhatóan fellépő különböző környezeti feltételeket (hőmérséklet, nap-sugárzás), amelyeket a tervezés során figyelembe vettek.

6.4.23.6 A 0,1 kg vagy annál több urán-hexafluoridot tartalmazó küldeménydarabok mintáira vonatkozó engedély kérelemnek tartalmaznia kell minden információt, amely az illetékes hatóságot meggyőzheti arról, hogy a minta megfelel a 6.4.6.1 bekezdés előírásainak és az alkalmazott minőségbiztosítási program leírását, mint azt az 1.7.3 szakasz előírja.

6.4.23.7 A hasadó anyagot tartalmazó küldeményre vonatkozó engedély kérelemnek tartalmaznia kell minden információt, amely az illetékes hatóságot meggyőzheti arról, hogy a minta megfelel a 6.4.11.1 bekezdés előírásainak és az alkalmazott minőségbiztosítási program leírását, mint azt az 1.7.3 szakasz előírja.

6.4.23.8 A különleges formájú radioaktív anyag és a kis mértékben diszpergálódó radioaktív anyag mintára vonatkozó engedély kérelemnek a következőket kell tartalmaznia:

- a) a radioaktív anyag, vagy ha kapszuláról van szó, a tartalom pontos leírását, különösen a fizikai és kémiai állapot megadásával;
- b) az alkalmazott kapszula gyártási típusának pontos leírását;
- c) jelentést az elvégzett vizsgálatokról és azok eredményeiről, vagy a számításokról, amelyek bizonyítják, hogy a radioaktív anyag megfelel az előírásoknak, vagy más bizonyítékot arra, hogy a különleges formájú radioaktív anyag vagy a kis mértékben diszpergálódó radioaktív anyag kielégíti az ADR vonatkozó előírásait;
- d) az alkalmazott minőségbiztosítási program leírását, mint azt az 1.7.3 szakasz előírja; és
- e) a különleges formájú radioaktív anyag vagy a kis mértékben diszpergálódó radioaktív anyag feladása során a szállítás előtt elvégezni javasolt teendőket.

6.4.23.9 Az illetékes hatóság által kiadott minden engedélyokiratot egy azonosító jelöléssel kell ellátni. Ennek a jelölésnek a következő általános alakúnak kell lennie:

Az állam jele/szám/típus kód:

- a) A 6.4.23.10 b) pontban előírtak kivételével annak az államnak a jele, amely az engedélyt kiadta a nemzetközi forgalomban résztvevő gépjárművek államjelzésének formájában¹⁾.
- b) A számot az illetékes hatóságnak kell kiadnia és ez meghatározott mintára vagy meghatározott szállításra vonatkozik. A szállítási engedélyhez kiadott jelölésnek egyértelműen kapcsolatban kell lenni a küldeménydarab-minta engedélyéhez kiadott azonosító jelöléssel.
- c) A következő kódokat az engedélyokirat típusának jelölésére a következők szerint kell alkalmazni:

AF A típusú küldeménydarab-minta hasadóanyagokhoz

1) Lásd a Közúti közlekedésről szóló Bécsi Egyezményt (Bécs, 1968).

<i>B(U)</i>	<i>B(U)</i> típusú küldeménydarab-minta [<i>B(U)F</i> hasadóanyaghoz]
<i>B(M)</i>	<i>B(M)</i> típusú küldeménydarab-minta [<i>B(M)F</i> hasadóanyaghoz]
<i>C</i>	<i>C</i> típusú küldeménydarab-minta [<i>CF</i> hasadóanyaghoz]
<i>IF</i>	Ipari küldeménydarabok hasadóanyagokhoz
<i>S</i>	Különleges formájú radioaktív anyagok
<i>LD</i>	Kis mértékben diszpergálódó radioaktív anyagok
<i>T</i>	Szállítás
<i>X</i>	Külön megegyezés.

Nemhasadó vagy hasadó-engedményes urán-hexafluoridra vonatkozó küldeménydarab-minta esetében, ha az előző kódokat nem használják, a következő kódokat kell használni:

<i>H(U)</i>	Egyoldalú engedély
<i>H(M)</i>	Többoldalú engedély.

- d) A küldeménydarab mintákra és a különleges formájú radioaktív anyagokra vonatkozó engedélyokiratokban, az 1.6.6.2 és az 1.6.6.3 bekezdés átmeneti előírásai szerinti kibocsátott engedélyek kivételével, és a kis mértékben diszpergálódó radioaktív anyagokra vonatkozó engedélyokiratokban a típus kódhoz a „-96” szimbólumot hozzá kell fűzni.

6.4.23.10

Ezeket a kódokat a következőképpen kell alkalmazni:

- a) Minden okiratot és minden küldeménydarabot el kell látni a megfelelő jelöléssel, amely a 6.4.23.9 a), b), c) és d) pontban előírt szimbólumokból áll, azzal a kivétellel, hogy küldeménydaraboknál csak a megfelelő gyártási típuskódot, adott esetben a „-96” szimbólumot is beleértve, kell a második ferde vonal után feltüntetni, azaz a T vagy X nem jelenik meg a küldeménydarab jelölésében. Amennyiben a küldeménydarab mintára és a szállításra vonatkozó engedélyek egyetlen okirattá vannak összefogva, a megfelelő kódokat nem kell megismételni. Például:

A/132/B(M)F-96: *B(M)* típusú küldeménydarab hasadóanyaghoz, amelyhez többoldalú engedély szükséges és amelyhez az illetékes ország, Ausztria hatósága a 132 azonosító jelölést adta ki (A küldeménydarabra fel kell vinni és a küldeménydarab-minta engedélyokiratába be kell írni);

A/132/B(M)F-96T: szállítási engedély az előzőekben megjelölt azonosítóval ellátott küldeménydarabra kiadva (Csak az engedélyokiratban kell feltüntetni);

A/137/X: külön megegyezés, melyet Ausztria illetékes hatósága fogadott el és a 137 azonosító jelöléssel látott el. (Csak az engedélyokiratban kell feltüntetni);

A/139/IF-96: hasadóanyagokat tartalmazó ipari küldeménydarab-minta, melyet Ausztria illetékes hatósága engedélyezett és a 139 azonosító jelöléssel látott el (mind a küldeménydarabon, mind a küldeménydarab minta engedélyében fel kell tüntetni); és

A/145/H(U)-96: küldeménydarab minta hasadó engedményes urán-hexafluoridra, amelyet Ausztria illetékes hatósága engedélyezett és a 145 azonosító jelöléssel látott el (mind a küldeménydarabon, mind a küldeménydarab minta engedélyében fel kell tüntetni).

- b) Amennyiben egy többoldalú engedély a 6.4.23.16 bekezdés szerint érvényességi záradékkal lett kiadva, csak azt a jelölést kell alkalmazni, amelyet a küldeménydarab-

minta származási vagy feladási országa adott ki. Amennyiben egy többoldalú engedélyt a különböző országokban egymásután kiállított engedélyokiratok révén adnak ki, akkor minden engedélyokiratban fel kell tüntetni a megfelelő azonosító jelölést és a küldeménydarabokat, amelynek gyártási típusa ebben a formában engedélyezve lett, el kell látni minden megfelelő azonosító jelöléssel.

Például a küldeménydarab

A/132/B(M)F-96

CH/28/B(M)F-96

jelölése osztrák eredetre utal, amelyet azután egy további engedélyokirat révén Svájc is engedélyezett. Az esetleges további jelöléseket a küldeménydarabon hasonló módon egymás alatt kell feltüntetni.

- c) Az engedélyokirat felülvizsgálatát a jelölés mellett közvetlenül zárójelben kell feltüntetni. Például az A/132/B(M)F-96(Rev.2) a küldeménydarabra vonatkozó osztrák engedélyokirat második felülvizsgálatát, vagy az A/132/B(M)F-96(Rev.0) a küldeménydarab osztrák engedélyének eredeti okiratát jelenti. Az első alkalommal történő kiadás zárójelben való feltüntetése fakultatív, a Rev.0 helyett más szavak is, pl. „eredeti kiadás” alkalmazhatók. Engedély felülvizsgálati számot csak az eredeti engedélyt kibocsátó ország adhat.
- d) A jelölés végéhez kiegészítő szimbólumok fűzhetők zárójelben (ha ezt az egyes országokban előírják), pl. A/132/B(M)F-96 (SP503).
- e) Nem szükséges, hogy a jelölést a csomagoláson az engedélyokirat minden felülvizsgálatakor megváltoztassák. Az ilyen jellegű jelölésváltoztatás csak akkor szükséges, ha az engedélyokirat felülvizsgálata a küldeménydarab-minta második ferde vonal utáni betű kódjának megváltozásával jár.

6.4.23.11

Az illetékes hatóság által a különleges formájú radioaktív anyagokra vagy kis mértékben diszpergálódó radioaktív anyagokra kiadott valamennyi engedélyokiratnak a következő információkat kell tartalmaznia:

- a) az igazolás fajtáját;
- b) az illetékes hatóság által kiadott azonosító jelét;
- c) a kiadás időpontját és az érvényesség időtartamát;
- d) az alkalmazott belföldi és nemzetközi szabályzatok felsorolását, beleértve a NAÜ „Szabályzat a radioaktív anyagok biztonságos szállítására” kiadványát, amelynek alapján a különleges formájú radioaktív anyagot vagy a kis mértékben diszpergálódó radioaktív anyagot engedélyezték;
- e) a különleges formájú radioaktív anyag vagy a kis mértékben diszpergálódó radioaktív anyag azonosítását;
- f) a különleges formájú radioaktív anyag vagy a kis mértékben diszpergálódó radioaktív anyag leírását;
- g) a különleges formájú radioaktív anyag vagy a kis mértékben diszpergálódó radioaktív anyag tervének részletes leírását, amely tartalmazhat rajzokra való hivatkozásokat;
- h) a radioaktív tartalom részletes leírását, amely tartalmazza a szóban forgó aktivitások értékét, és tartalmazhatja a fizikai és kémiai állapotának leírását;
- i) az alkalmazott minőségbiztosítási program részletes leírását, mint az az 1.7.3 szakaszban elő van írva;
- j) a kérelmező által szolgáltatandó, a szállítás előtt végrehajtandó különleges tevékenységekre vonatkozó információkra való hivatkozást;
- k) ha az illetékes hatóság szükségesnek tartja, hivatkozást a kérelmező kilétére;
- l) az igazolást kiállító hivatalnok nevét és aláírását.

6.4.23.12

Az illetékes hatóság által a külön megegyezésekről kiadott valamennyi jóváhagyási igazolásnak a következő információkat kell tartalmaznia:

- a) az igazolás fajtáját;
- b) az illetékes hatóság által kiadott azonosító jelet;
- c) a kiadás időpontját és az érvényesség időtartamát;
- d) a szállítási módo(ka)t;
- e) bármilyen korlátozást a szállítási módra, a szállító jármű, ill. a konténer típusára és szükség esetén az útvonalra vonatkozó utasításokat;
- f) az alkalmazott belföldi és nemzetközi szabályzatok felsorolását, beleértve a NAÜ „Szabályzat a radioaktív anyagok biztonságos szállítására” kiadványát, amelyek alapján a külön megegyezést jóváhagyták;
- g) a következő nyilatkozatot: „Ez az igazolás nem mentesíti a feladót azon előírások teljesítése alól, amelyet bármelyik ország kormánya hozott, amelyen keresztül vagy ahova a küldeménydarabot szállítják”;
- h) hivatkozást egy alternatív radioaktív tartalomra vonatkozó igazolásra, egy illetékes hatóság másik engedélyére, vagy kiegészítő műszaki adatokra vagy információra, ha ezt az illetékes hatóság szükségesnek tartja;
- i) a csomagolás leírását, hivatkozással a tervrajzokra vagy a tervek részletes ismertetésére. Ha az illetékes hatóság megfelelőnek tartja, a küldeménydarab összeállítását mutató, 21 cm x 30 cm-nél nem nagyobb tervrajz másolat csatolása is elfogadható a csomagolás rövid leírásának mellékelésével, amely tartalmazza a gyártási anyagokat, a bruttó tömeget, a főbb külső méreteket és a megjelenést;
- j) az engedélyezett radioaktív tartalom leírását, beleértve a radioaktív tartalom bármilyen korlátozását, amely a csomagolás természetéből nem magától értetődő. Ennek tartalmaznia kell a fizikai és a kémiai tulajdonságok leírását, a vele járó aktivitásokat (beleértve az izotópváltozatok ilyen tulajdonságait, ha ilyenek vannak), a mennyiségeket grammban (hasadóanyagoknál, ill. az egyes hasadónuklidoknál), és azt, hogy különleges formájú anyagról vagy kis mértékben diszpergálódó radioaktív anyagról van-e szó;
- k) a hasadóanyagok számára tervezett küldeménydaraboknál kiegészítésként:
 - i) az engedélyezett radioaktív tartalom részletes leírását;
 - ii) a kritikussági biztonsági mutatószám értékét;
 - iii) hivatkozást olyan dokumentációra, amely bizonyítja a tartalom kritikussági biztonságát;
 - iv) minden különleges sajátosságot, amelynek alapján a víz hiányát feltételezték üres terekben a kritikussági értékelés során;
 - v) a kritikussági értékelésnél figyelembe vett neutron sokszorozódás megengedett változtatását (a 6.4.11.4 b) pont szerint) a tényleges besugárzási tapasztalatok alapján;
 - vi) a környezeti hőmérséklet tartományt, amelyet a külön megegyezés tartalmaz;
- l) a járulékos üzemeltetési intézkedések pontos felsorolását, amelyeket a küldemény előkészítése, berakása, szállítása, kirakása és kezelése megkíván, beleértve a biztonságos hőelvezetésre vonatkozó minden különleges rakodási előírást;
- m) ha az illetékes hatóság szükségesnek tartja, a külön megegyezés indoklását;
- n) a külön megegyezés alapján történő szállítás miatti intézkedések leírását;
- o) hivatkozást azokra az információkra, amelyeket a kérelmező szolgáltatott a csomagolás használatára vonatkozóan vagy azokra a különleges intézkedésekre, amelyeket a szállítás megkezdése előtt el kell végezni;

- p) nyilatkozatot a tervezéskor feltételezett környezeti körülményekre vonatkozóan, ha azok nem felelnek meg a 6.4.8.5, a 6.4.8.6, illetve a 6.4.8.15 bekezdésben meghatározottaknak;
- q) minden vészhelyzeti intézkedést, amelyet az illetékes hatóság szükségesnek tart;
- r) az alkalmazott minőségbiztosítási program részletes leírását, amint az az 1.7.3 szakaszban elő van írva;
- s) ha az illetékes hatóság szükségesnek tartja, hivatkozást a kérelmező és a szállító kilétére;
- t) az igazolást kiállító hivatalnok nevét és aláírását.

6.4.23.13

Az illetékes hatóság által kiadott valamennyi, a szállításra vonatkozó jóváhagyási igazolásnak a következő információkat kell tartalmaznia:

- a) az igazolás fajtáját;
- b) az illetékes hatóság által kiadott azonosító jelet;
- c) a kiadás időpontját és az érvényesség időtartamát;
- d) az alkalmazott nemzeti és nemzetközi szabályzatok felsorolását, beleértve a NAÜ „Szabályzat a radioaktív anyagok biztonságos szállítására” kiadványát, amelyek alapján a szállítást jóváhagyták;
- e) bármilyen korlátozást a szállítási módra, a szállító jármű, ill. a konténer típusára és szükség esetén az útvonalra vonatkozó utasításokat;
- f) a következő nyilatkozatot: „Ez az igazolás nem mentesíti a feladót azon előírások teljesítése alól, amelyet bármelyik ország kormánya hozott, amelyen keresztül vagy ahova a küldeménydarabot szállítják”;
- g) a járulékos üzemeltetési intézkedések pontos felsorolását, amelyeket a küldemény előkészítése, berakása, szállítása, kirakása és kezelése megkíván, beleértve a biztonságos hőelvezetésre vonatkozó minden különleges rakodási előírást;
- h) a kérelmező által szolgáltatott információkra való hivatkozást a szállítás előtt végrehajtandó különleges tevékenységekre;
- i) hivatkozást a vonatkozó küldeménydarab minta engedélyokirat(ok)ra;
- j) a tényleges radioaktív tartalom leírását, beleértve a radioaktív tartalom bármilyen korlátozását, amely a csomagolás természetéből nem magától értetődő. Ennek tartalmaznia kell a fizikai és a kémiai tulajdonságok leírását, a vele járó aktivitásokat (beleértve az izotópváltozatok ilyen tulajdonságait, ha ilyenek vannak), a mennyiségeket grammban (hasadóanyagoknál, ill. az egyes hasadó nuklidoknál), és azt, hogy különleges formájú anyagról vagy kis mértékben diszpergálódó radioaktív anyagról van-e szó;
- k) minden vészhelyzeti intézkedést, amelyet az illetékes hatóság szükségesnek tart;
- l) az alkalmazott minőségbiztosítási program részletes leírását, amint az az 1.7.3 szakaszban elő van írva;
- m) ha az illetékes hatóság szükségesnek tartja, hivatkozást a kérelmező kilétére;
- n) az igazolást kiállító hivatalnok nevét és aláírását.

6.4.23.14

Az illetékes hatóság által a küldeménydarab-mintákra kiadott valamennyi jóváhagyási igazolásnak a következő információkat kell tartalmaznia:

- a) az igazolás fajtáját;
- b) az illetékes hatóság által kiadott azonosító jelet;
- c) a kiadás időpontját és az érvényesség időtartamát;
- d) a szállítási mód esetleges korlátozását;

- e) az alkalmazott belföldi és nemzetközi szabályzatok felsorolását, beleértve a NAÜ „Szabályzat a radioaktív anyagok biztonságos szállítására” kiadványát, amelyek alapján a mintát jóváhagyták;
- f) a következő nyilatkozatot: „Ez az engedély nem mentesíti a feladót azon előírások teljesítése alól, amelyet bármely ország kormánya hozott, amelyen keresztül vagy ahova a küldeménydarabot szállítják”;
- g) hivatkozást egy alternatív radioaktív tartalomra vonatkozó igazolásra, egy illetékes hatóság másik engedélyére, vagy kiegészítő műszaki adatokra vagy információra, ha ezt az illetékes hatóság szükségesnek tartja;
- h) nyilatkozatot a szállítás engedélyezéséről, ha az 5.1.5.1.2 pont szerint a szállításához engedélyre van szükség, és ha az ilyen nyilatkozat elegendő;
- i) a csomagolóeszköz azonosítóját;
- j) a csomagolás leírását, hivatkozással a rajzokra vagy a tervek részletes ismertetésére. Ha az illetékes hatóság szükségesnek tartja, a küldeménydarab összeállítását mutató, 21 cm x 30 cm-nél nem nagyobb tervrajz másolatot is csatolni kell a csomagolás rövid leírásának mellékelésével, amely tartalmazza a gyártási anyagokat, a bruttó tömeget, a főbb külső méreteket és a megjelenést;
- k) a minta ismertetését hivatkozással a rajzokra;
- l) az engedélyezett radioaktív tartalom leírását, beleértve a radioaktív tartalom bármilyen korlátozását, amely a csomagolás természetéből nem magától értetődő. Ennek tartalmaznia kell a fizikai és a kémiai tulajdonságok leírását, a vele járó aktivitásokat (beleértve az izotópváltozatok ilyen tulajdonságait, ha ilyenek vannak), a mennyiségeket grammal (hasadóanyagoknál, ill. az egyes hasadónuklidoknál), és azt, hogy különleges formájú anyagról vagy kis mértékben diszpergálódó radioaktív anyagról van-e szó;
- m) a biztonsági tartály leírását;
- n) a hasadóanyagokat tartalmazó küldeménydaraboknál kiegészítésként:
 - i) az engedélyezett radioaktív tartalom részletes leírását;
 - ii) a megtartó rendszer leírását;
 - iii) a kritikussági biztonsági mutatószám értékét;
 - iv) hivatkozást olyan dokumentációra, amely bizonyítja a tartalom kritikussági biztonságát;
 - v) minden különleges sajátosságot, amelynek alapján a víz hiányát feltételezték üres terekben a kritikussági értékelés során;
 - vi) a kritikussági értékelésnél figyelembe vett neutron sokszorozódás megengedett változtatását (a 6.4.11.4 b) pont szerint) a tényleges besugárzási tapasztalatok alapján;
 - vii) a környezeti hőmérséklet tartományt, amelyet a külön megegyezés tartalmaz;
- o) *B(M)* típusú küldeménydaraboknál a 6.4.7.5, 6.4.8.4, 6.4.8.5, 6.4.8.6 és 6.4.8.9 – 6.4.8.15 bekezdés azon előírásainak felsorolását, amelyeknek a küldeménydarab nem felel meg, és minden olyan kiegészítő információt, ami hasznos lehet más illetékes hatóságok számára;
- p) a 0,1 kg vagy annál több urán-hexafluoridot tartalmazó küldeménydaraboknál a 6.4.6.4 bekezdés rá vonatkozó előírásainak felsorolását (ha van ilyen), és minden olyan kiegészítő információt, ami hasznos lehet más illetékes hatóságok számára;
- q) a járulékos üzemeltetési intézkedések pontos felsorolását, amelyeket a küldemény előkészítése, berakása, szállítása, kirakása és kezelése megkíván, beleértve a biztonságos hőelvezetésre vonatkozó minden különleges rakodási előírást;

- r) hivatkozást azokra az információkra, amelyeket a kérelmező szolgáltatott a csomagoló-eszköz használatára vonatkozóan vagy azokra a különleges intézkedésekre, amelyeket a szállítás megkezdése előtt el kell végezni;
- s) nyilatkozatot a tervezéskor feltételezett környezeti feltételekre vonatkozóan, ha azok nem felelnek meg a 6.4.8.5, a 6.4.8.6, illetve a 6.4.8.15 bekezdésben meghatározottaknak;
- t) az alkalmazott minőségbiztosítási program részletes leírását, amint az az 1.7.3 szakaszban elő van írva;
- u) minden vészhelyzeti intézkedést, amelyet az illetékes hatóság szükségesnek tart;
- v) ha az illetékes hatóság szükségesnek tartja, hivatkozást a kérelmező kilétére;
- w) az igazolást kiállító hivatalnok nevét és aláírását.

6.4.23.15 Az illetékes hatóságot értesíteni kell az általa az 1.6.6.2.1, az 1.6.6.2.2 pont, a 6.4.22.2, a 6.4.22.3 és a 6.4.22.4 bekezdés szerint jóváhagyott minta alapján gyártott minden csomagolóeszköz sorszámáról.

6.4.23.16 A többoldalú engedélyek a minta származási országa vagy a feladási ország illetékes hatóságai által kiadott eredeti engedélyokiratok érvényességi záradékolásával is létrejöhetnek. Ilyen érvényességi záradékolás történhet az eredeti engedélyokiratra vonatkozó egyetértési észrevételezéssel vagy egy külön egyetértési okirat, melléklet, kiegészítés stb. készítésével azon ország illetékes hatósága által, amelyen keresztül vagy amelybe a szállítás történik.

6.5 FEJEZET

A NAGYMÉRETŰ CSOMAGOLÓESZKÖZÖK (IBC-k) GYÁRTÁSÁRA ÉS VIZSGÁLATÁRA VONATKOZÓ ELŐÍRÁSOK

6.5.1 Általános előírások

6.5.1.1 Az előírások hatálya

6.5.1.1.1 E fejezet előírásai azokra a nagyméretű csomagolóeszközökre (IBC-kre) vonatkoznak, amelyek használata bizonyos veszélyes anyagok szállításához a 3.2 fejezet „A” táblázat 8 oszlopában megadott csomagolási utasítások szerint engedélyezett. A 6.7, ill. a 6.8 fejezet követelményeit kielégítő mobil tartányok, ill. tankkonténerek nem tekinthetők IBC-nek. Az e fejezet követelményeit kielégítő IBC-k nem tekinthetők az ADR értelmében vett konténernek. A szöveg további részében a nagyméretű csomagolóeszközök megjelölésére csakis az IBC rövidítés szolgál.

6.5.1.1.2 Az illetékes hatóság kivételesen jóváhagyhat olyan IBC-t, ill. üzemi szerelvényeket, amelyek szigorúan véve nem felelnek meg az itt szereplő követelményeknek, de elfogadható változatot jelentenek. Ezenkívül a tudományos és műszaki haladás figyelembe vétele érdekében az illetékes hatóság ugyancsak elfogadhat olyan alternatív megoldásokat, amelyek a szállított anyaggal való összeférhetőség tekintetében legalább olyan biztonságosak, mint a meglévő gyakorlat, ill. az ütődésekkel, a rakodási igénybevételekkel és a tűzzel szembeni ellenállóképességük azonos vagy nagyobb.

6.5.1.1.3 Az IBC-k szerkezetéhez, szerelvényeihez, vizsgálatához, jelöléséhez és üzemeltetéséhez azon ország illetékes hatóságának a beleegyezése szükséges, amelyben az IBC-t jóváhagyták.

***Megjegyzés:** Nem kell az IBC-t jóváhagyó ország illetékes hatóságának a beleegyezése, ha a már üzembe helyezett IBC vizsgálatát végző szervezet más országban van, de a vizsgálatot az IBC jóváhagyásában meghatározott módon kell végezni.*

6.5.1.1.4 Az IBC gyártójának és forgalmazójának információt kell nyújtania a követendő eljárásokra és a zárószerkezetek (beleértve a szükséges tömítéseket) típusára és méreteire és minden más alkatrészre, ami annak biztosításához szükséges, hogy a szállításra előkészített IBC képes legyen az e fejezet vonatkozó igénybevételi próbáinak elviselésére.

6.5.1.2 (fenntartva)

6.5.1.3 (fenntartva)

6.5.1.4 Az IBC-k típusát jelölő kód

6.5.1.4.1 A kód a következőkből áll: két arab számjegyből, amint azt az a) pont meghatározza; ezt egy vagy több nagybetű követi a b) pont szerinti meghatározásnak megfelelően; ezt adott esetben egy arab számjegy követi, amely az IBC kategóriát jelöli.

a)

Típus	Szilárd anyagokhoz		Folyékony anyagokhoz
	gravitációs úton történő töltésnél és/vagy ürítésnél	10 kPa (0,1 bar) feletti nyomással történő töltésnél és/vagy ürítésnél	
Merev falú	11	21	31
Hajlékony falú	13	—	—

- b) Anyagok:
- A acél (bármilyen minőségű vagy felületkezelésű)
 - B alumínium
 - C fa
 - D rétegelt falemez
 - F farostlemez
 - G papírlémez
 - H műanyag
 - L textil
 - M papír, többrétegű
 - N fém (acélt és alumíniumot kivéve)

6.5.1.4.2 Összetett IBC-k esetén két latin nagybetűt kell egymás után használni a kód második helyén. Az első jelzi az IBC belső tartályának anyagát és a második az IBC külső csomagolóeszközének anyagát.

6.5.1.4.3 Az IBC-k típusai és kódjai a következők:

Anyag	Kategória	Kód	Bekezdés
Fém			6.5.5.1
A Acél	szilárd anyagokhoz gravitációs úton történő töltésnél és/vagy ürítésnél	11A	
	szilárd anyagokhoz nyomással történő töltésnél és/vagy ürítésnél	21A	
	folyadékokhoz	31A	
B Alumínium	szilárd anyagokhoz gravitációs úton történő töltésnél és/vagy ürítésnél	11B	
	szilárd anyagokhoz nyomással történő töltésnél és/vagy ürítésnél	21B	
	folyadékokhoz	31B	
N Fém (acélt és alumíniumot kivéve)	szilárd anyagokhoz gravitációs úton történő töltésnél és/vagy ürítésnél	11N	
	szilárd anyagokhoz nyomással történő töltésnél és/vagy ürítésnél	21N	
	folyadékokhoz	31N	
Hajlékony falú			6.5.5.2
H Műanyag	műanyagszövet belső bevonat vagy bélés nélkül	13H1	
	műanyagszövet belső bevonattal	13H2	
	műanyagszövet béléssel	13H3	
	műanyagszövet belső bevonattal és béléssel	13H4	
	műanyagfólia	13H5	
L Textilszövet	belső bevonat vagy bélés nélkül	13L1	
	belső bevonattal	13L2	
	béléssel	13L3	
	belső bevonattal és béléssel	13L4	
M Papír	többrétegű	13M1	
	többrétegű, vízálló	13M2	

Anyag	Kategória	Kód	Bekezdés
Merev falú			6.5.5.3
H műanyag	szilárd anyagokhoz gravitációs úton történő töltésnél és/vagy ürítésnél (vázszerkezettel)	11H1	
	szilárd anyagokhoz gravitációs úton történő töltésnél és/vagy ürítésnél (önhordó)	11H2	
	szilárd anyagokhoz nyomással történő töltésnél és/vagy ürítésnél (vázszerkezettel)	21H1	
	szilárd anyagokhoz nyomással történő töltésnél és/vagy ürítésnél (önhordó)	21H2	
	folyadékokhoz (vázszerkezettel)	31H1	
	folyadékokhoz (önhordó)	31H2	
Összetett			6.5.5.4
HZ ^{a)} műanyag belső tartállyal	szilárd anyagokhoz gravitációs úton történő töltésnél és/vagy ürítésnél, merev falú műanyag belső tartállyal	11HZ1	
	szilárd anyagokhoz gravitációs úton történő töltésnél és/vagy ürítésnél, hajlékony falú műanyag belső tartállyal	11HZ2	
	szilárd anyagokhoz nyomással történő töltésnél és/vagy ürítésnél, merev falú műanyag belső tartállyal	21HZ1	
	szilárd anyagokhoz nyomással történő töltésnél és/vagy ürítésnél, hajlékony falú műanyag belső tartállyal	21HZ2	
	folyadékokhoz, merev falú műanyag belső tartállyal	31HZ1	
	folyadékokhoz, hajlékony falú műanyag belső tartállyal	31HZ2	
Papírlemez			6.5.5.5
G Papírlemez	szilárd anyagokhoz gravitációs úton történő töltésnél és/vagy ürítésnél	11G	
Fa			6.5.5.6
C Közöséges fa	szilárd anyagokhoz gravitációs úton történő töltésnél és/vagy ürítésnél, béléssel	11C	
D Rétegelt falemez	szilárd anyagokhoz gravitációs úton történő töltésnél és/vagy ürítésnél béléssel	11D	
F Farostlemez	szilárd anyagokhoz gravitációs úton történő töltésnél és/vagy ürítésnél, béléssel	11F	

a) Ezt a kódot ki kell egészíteni, a Z betűt helyettesítve, a 6.5.1.4.1 b) pont szerinti nagybetűvel, amely a külső burkolathoz használt anyag fajtáját jelzi.

6.5.1.4.4

Egy „W” betű követheti az IBC kódot. A „W” betű jelzi, hogy az IBC, bár a kód által jelzett típus alá tartozik, de a 6.5.5 szakaszban előírtaktól eltérően gyártották és a 6.5.1.1.2 pont előírásai szerint azonos értékűnek tekinthető.

6.5.2

Jelölés

6.5.2.1

Alapjelölés

6.5.2.1.1

Minden, az ADR előírásai szerint gyártott és ADR szerinti felhasználásra szánt IBC-n jelölésnek kell lennie, amely tartós, jól olvasható és jól látható helyen van. A betűk, számok és jelek magasságának legalább 12 mm-nek kell lennie a következő tartalommal:

- a) az Egyesült Nemzetek jele a csomagolóeszközön:  .
- Ezt a jelet csak annak tanúsítására szabad használni, hogy a csomagolóeszköz, a mobil tartány, ill. a MEG-konténer megfelel a 6.1, a 6.2, a 6.3, a 6.5, a 6.6, ill. a 6.7¹⁾ fejezetben található vonatkozó előírásoknak. Amennyiben a jelölést beütéssel viszik fel a fém csomagolóeszközökre, e jel helyett az „UN” nagybetűk is használhatók;
- b) az IBC típusát a 6.5.1.4 bekezdés szerint jelölő kód;
- c) egy nagybetű, amely a csomagolási csoporto(ka)t jelöli, amely(ek)re a gyártási típust jóváhagyták:
- i) X az I, a II és a III csomagolási csoporthoz (csak szilárd anyagokhoz használatos IBC-k esetén);
 - ii) Y a II és a III csomagolási csoporthoz;
 - iii) Z csak a III csomagolási csoporthoz;
- d) a gyártás időpontja: hónap és az év utolsó két számjegye;
- e) annak az államnak a jele, amely a jelölés alkalmazását engedélyezte, a nemzetközi forgalomban résztvevő gépjárművek államjelzésével²⁾;
- f) a gyártó neve vagy jele és az IBC-nek az illetékes hatóság által megállapított egyéb azonosító jele;
- g) a halmazolási próba során alkalmazott terhelés kg-ban, a halmazolásra nem tervezett IBC-knél „0”-t kell feltüntetni;
- h) a megengedett legnagyobb bruttó tömeg kg-ban.

Az előírt alapjelölést az előző pontok sorrendjében kell felvinni. A 6.5.2.2 bekezdésben előírt és az illetékes hatóság által engedélyezett minden más jelölést úgy kell elhelyezni, hogy a jelölés különböző elemei pontosan felismerhetők legyenek.

Az előző a) – h) pontban és a 6.5.2.2 bekezdésben előírt jelölés elemeket egyértelműen el kell választani egymástól, pl. ferde vonallal vagy szóközzel, hogy könnyen azonosíthatók legyenek.

6.5.2.1.2

Az előző 6.5.2.1.1 a) – h) pont szerinti jelölések példái különböző IBC típusokra:

11A/Y/02 99
NL/Mulder 007
5500/1500

Szilárd anyagok szállítására készült, acélból gyártott fém IBC gravitációs úton történő ürítéshez / a II és a III csomagolási csoporthoz / gyártási idő 1999. február / engedélyezve Hollandiában / a Mulder cég gyártmánya azon gyártási típusnak megfelelően, amelyet az illetékes hatóság a 007 sorozatszámmal látott el / a halmazolási próba terhelése kg-ban / a megengedett legnagyobb bruttó tömeg kg-ban.

13H3/Z/03 01
F/Meunier 1713
0/1500

Szilárd anyagok szállítására készült, hajlékony falú IBC műanyagszövetből, béléssel ellátva, például gravitációs úton történő töltéshez / nem halmazolható.

31H1/Y/04 99
GB/9099
10800/1200

Folyadékok szállítására készült, merev falú műanyag IBC, amelyet a halmazolási terhelés elviselésére alkalmas szerkezeti elemekkel láttak el.

-
- 1) Ezt a jelet használják annak tanúsítására is, hogy az olyan hajlékony ömlesztettáru-konténerek, amelyeket más közlekedési alágazatra hagytak jóvá, megfelelnek az ENSZ Minta Szabályzat 6.8 fejezete követelményeinek.
- 2) A közúti közlekedésről szóló Bécsi Egyezmény (Bécs, 1968) által előírt államjelzés a nemzetközi forgalomban résztvevő gépjárművekre.

31HA1/Y/05 01
D/Müller 1683
10800/1200

Folyadékok szállítására készült összetett IBC merev falú műanyag belső tartállyal és külső acél burkolattal.

11C/X/01 01
S/Aurigny 9876
3000/910

Szilárd anyagok szállítására készült fa IBC béléssel, amelyet az I, a II és a III csomagolási csoport szilárd anyagaihoz engedélyeztek

6.5.2.2

Kiegészítő jelölés

6.5.2.2.1

Minden egyes IBC-n rajta kell lenni a 6.5.2.1 bekezdésben előírt jelölésnek és ezenkívül a következő adatoknak, amelyek feltüntethetők egy a felülvizsgálathoz könnyen hozzáférhető helyre tartósan felerősített, korrózióálló fémlapon:

Kiegészítő jelölés	az IBC kategóriája				
	Fém	Merev falú műanyag	Összetett	Papír-lemez	Fa
Ürtartalom literben ^{a)} 20 °C-on	X	X	X		
Saját tömeg kg-ban ^{a)}	X	X	X	X	X
Próbanyomás kPa-ban vagy bar-ban ^{a)} (ha van ilyen)		X	X		
Legnagyobb töltési/ürítési nyomás kPa-ban vagy bar-ban ^{a)} (ha van ilyen)	X	X	X		
A test anyaga és legkisebb vastagsága mm-ben	X				
Az utolsó tömörségi próba időpontja (hónap és év) (ha van ilyen)	X	X	X		
Az utolsó felülvizsgálat időpontja (hónap és év)	X	X	X		
A gyártó sorozatszáma	X				
Legnagyobb megengedett halmazolási terhelés ^{b)}	X	X	X	X	X

a) A mértékegységet fel kell tüntetni.

b) Lásd a 6.5.2.2.2 pontot. Ezt a kiegészítő jelölést minden, 2011. január 1. után gyártott, javított, ill. átalakított IBC-n fel kell tüntetni. (Lásd még az 1.6.1.15 pontot is.)

6.5.2.2.2

Az IBC használata során megengedett legnagyobb halmazolási terhelést a következő jelképpel kell feltüntetni:

Halmazolható IBC-kre

Nem halmazolható IBC-kre

A jelképnek legalább 100 x 100 mm nagyságúnak, tartósnak és jól látható kell lennie. A tömeget legalább 12 mm magas számokkal, ill. betűkkel kell feltüntetni.

A jelkép fölött feltüntetett tömeg nem lehet nagyobb, mint a gyártási típus vizsgálat (lásd a 6.5.6.6.4 pontot) során alkalmazott terhelés és 1,8 hányadosa.

Megjegyzés: A 6.5.2.2.2 pont előírásait minden, 2011. január 1. után gyártott, javított, ill. átalakított IBC-re alkalmazni kell. (Lásd az 1.6.1.15 bekezdést is).

6.5.2.2.3 A 6.5.2.1 bekezdésben előírt jelölésen kívül a hajlékony falú IBC-ket el lehet látni az ajánlott emelési módra utaló piktogrammal.

6.5.2.2.4 A 2011. január 1-je után gyártott összetett IBC-k belső tartályán fel kell tüntetni a 6.5.2.1.1 pont b), c), d) alpontjában előírt jelöléseket, ahol ez utóbbi a műanyag belső tartály gyártásának időpontjára vonatkozik, továbbá az e) és f) alpontban előírtakat. Az UN csomagolóeszköz jelet nem szabad elhelyezni. A jelöléseket a 6.5.2.1.1 pontban feltüntetett sorrendben kell feltüntetni. A jelölésnek tartósnak, jól olvashatónak kell lennie, és olyan helyre felvinni, hogy akkor is jól látható legyen, ha a belső tartály a külső burkolatban van.
A műanyag belső tartály gyártási időpontját alternatívaként a belső tartályon, a jelölés többi része mellett is fel lehet tüntetni. Példa a megfelelő jelölésre:

6.5.2.2.5 Amennyiben az összetett IBC úgy van kialakítva, hogy külső burkolata eltávolítható az üresen történő szállításhoz (pl. ha újrahasználat céljából az IBC-t az eredeti feladónak visszaküldik), minden levehető részen fel kell tüntetni a gyártási hónapot és évet, a gyártó nevét vagy jelét és az IBC-nek az illetékes hatóság által meghatározott egyéb azonosítóját [lásd a 6.5.2.1.1 f) pontot].

6.5.2.3 *A gyártási típusnak való megfelelés*

A jelölés azt jelzi, hogy az IBC azonos a sikeresen bevizsgált gyártási típussal és a jóváhagyásban szereplő követelményeknek megfelel.

6.5.2.4 *Az átalakított összetett IBC-k (31HZ1) jelölése*

Az eredeti IBC-ről a 6.5.2.1.1 pontban és a 6.5.2.2 bekezdésben előírt jelöléseket el kell távolítani vagy véglegesen olvashatatlanná kell tenni, és az ADR előírásai szerint átalakított IBC-re új jelölést kell felvinni.

6.5.3 Gyártási előírások

6.5.3.1 *Általános előírások*

6.5.3.1.1 Az IBC-knek a külső környezet okozta károsodással szemben ellenállónak vagy alkalmas módon védettnek kell lenniük.

6.5.3.1.2 Az IBC-ket úgy kell gyártani és lezárni, hogy normális szállítási körülmények között, beleértve a rezgések, a hőmérséklet-, a páratartalom- vagy a nyomásváltozás hatását, a tartalomtól semmi ne szabadulhasson ki.

6.5.3.1.3 Az IBC-ket és zárószerkezeteiket olyan anyagból kell gyártani, amely a tartalommal összeférhető, vagy belülről védeni kell, hogy ne álljon fenn a veszélye annak, hogy

- a tartalom az IBC-t megtámadva annak használatát veszélyessé teszi;
- a tartalom reakciója vagy bomlása következik be, vagy az IBC anyagával káros vagy veszélyes vegyületek képződnek.

- 6.5.3.1.4** A tömítéseket, ha vannak, olyan anyagból kell készíteni, amelyet az IBC-ben szállított anyag nem támad meg.
- 6.5.3.1.5** Valamennyi üzemi szerelvényt úgy kell elhelyezni vagy védeni, hogy a szállított anyag kiszabadulásának kockázata a szállítás és kezelés során bekövetkező sérülések esetén a legcsekélyebb mértékűre korlátozódjék.
- 6.5.3.1.6** Az IBC-t, tartozékait, valamint az üzemi és szerkezeti szerelvényeit úgy kell kialakítani, hogy a tartalom elvesztése nélkül ellen tudjanak állni a tartalom belső nyomásának és azoknak az igénybevételeknek, amelyeknek normális kezelési és szállítási körülmények között ki vannak téve. A halmazolásra szánt IBC-ket ennek megfelelően kell kialakítani. Az IBC valamennyi rögzítő és emelő berendezésének megfelelő szilárdságúnak kell lennie ahhoz, hogy normális kezelési és szállítási körülmények között se jelentős alakváltozást, se meghibásodást ne szenvedjenek, és ezeket a berendezéseket úgy kell elhelyezni, hogy az IBC egyetlen része se legyen túlzott igénybevételnek kitéve.
- 6.5.3.1.7** Ha az IBC egy keretszerkezetben levő testből áll, azt oly módon kell kialakítani, hogy:
- a test ne ütődjön vagy dörzsölődjön úgy a keretszerkezethez, hogy az a test sérülését okozza;
 - a test mindig a keretszerkezeten belül maradjon;
 - a szerelvényeket úgy kell elhelyezni és rögzíteni, hogy ne sérülhessenek meg, ha a test és a keretszerkezet közötti kapcsolat lehetővé teszi a relatív tágulást vagy elmozdulást.
- 6.5.3.1.8** Ha az IBC-t alsó ürítőszeleppel szerelik fel, ennek zárt helyzetben rögzíthetőnek kell lennie és sérülés ellen az egész ürítőrendszert megfelelően védeni kell. Azokat a szelepeket, amelyek emeltyű segítségével záródnak, ill. nyitódnak, úgy kell kialakítani, hogy véletlen kinyílás ellen védhetők legyenek és nyitott vagy zárt helyzetük könnyen felismerhető legyen. A folyékony anyagok szállítására szolgáló IBC-ken az ürítő nyílásokat egy második zárószerkezettel is fel kell szerelni, pl. vakkarimával vagy ezzel egyenértékű készülékkel.
- 6.5.4 Vizsgálat, tanúsítás és felülvizsgálat**
- 6.5.4.1** *Minőségbiztosítás:* Annak biztosítására, hogy minden legyártott, javított, ill. átalakított IBC megfeleljen e fejezet előírásainak, az IBC-ket olyan minőségbiztosítási program szerint kell gyártani, javítani, ill. átalakítani és bevizsgálni, amelyet az illetékes hatóság kielégítőnek tart.
- Megjegyzés: Az alkalmazható eljárás(ok)ra megfelelő útmutatást ad az ISO 16106:2006 szabvány: „Csomagolás. Veszélyes áruk szállítási csomagolása. Veszélyes áruk csomagolásai, közepes méretű szállítótartályok (IBC-k) és nagyméretű csomagolások. Útmutató az ISO 9001 alkalmazásához”.*
- 6.5.4.2** *Vizsgálati követelmények:* Az IBC-ket gyártási típus vizsgálatnak kell alávetni, és ha szükséges, a 6.5.4.4 bekezdés szerinti, első alkalommal, ill. időszakosan végzendő vizsgálatoknak és felülvizsgálatoknak.
- 6.5.4.3** *Tanúsítás:* Minden IBC gyártási típusra bizonyítványt kell kiállítani és jelölést kell hozzárendelni (lásd a 6.5.2 szakaszt), amely tanúsítja, hogy a gyártási típus a szerelvényeivel együtt kielégíti a vizsgálati követelményeket.
- 6.5.4.4** *Vizsgálat, felülvizsgálat*
- Megjegyzés: A javított IBC-k vizsgálatára, felülvizsgálatára lásd a 6.5.4.5 bekezdést is.*
- 6.5.4.4.1** Minden fém, merev falú műanyag és összetett IBC-t az illetékes hatóság által elfogadott módon meg kell vizsgálni:

- a) az üzembe helyezés előtt (ill. átalakítás után) és azután legalább öt évenként az alábbiak tekintetében:
 - i) a gyártási típusmintának való megfelelés, beleértve a jelöléseket;
 - ii) a belső és külső állapot;
 - iii) az üzemi szerelvények kifogástalan működése.

Az esetleges hőszigetelést csak olyan mértékben kell eltávolítani, amennyire az az IBC test megfelelő vizsgálatához szükséges;

- b) legalább két és fél évenként az alábbiak tekintetében:
 - i) külső állapot;
 - ii) az üzemi szerelvények kifogástalan működése.

Az esetleges hőszigetelést csak olyan mértékben kell eltávolítani, amennyire az az IBC test megfelelő vizsgálatához szükséges.

Minden IBC-nek minden szempontból meg kell felelnie a gyártási típusának.

6.5.4.4.2 Minden olyan fém, merev falú műanyag és összetett IBC-t, amelyet folyadékokhoz vagy nyomás alatt töltött vagy üritett szilárd anyagokhoz használnak

- a) a szállításhoz történő első használat előtt;
- b) legfeljebb két és fél éves időközönként

a 6.5.6.7.3 pontban leírt próbával legalább azonos hatékonyságú, megfelelő tömörségi próbának kell alávetni, amelynek során a 6.5.6.7.3 pontban meghatározott vizsgálati szintnek kell megfelelnie.

Ehhez a vizsgálatához az IBC-n rajta kell lenni az elsődleges, alsó zárószerkezetének. Az összetett IBC belső tartálya a külső burkolat nélkül is vizsgálható, ha ez a vizsgálati eredményeket nem befolyásolja.

6.5.4.4.3 Az egyes vizsgálatokról, felülvizsgálatokról készült jegyzőkönyvet az IBC tulajdonosának legalább a következő felülvizsgálat időpontjáig meg kell őriznie. A jegyzőkönyvnek tartalmaznia kell a vizsgálat, ill. felülvizsgálat eredményeit és a vizsgálatot, felülvizsgálatot végző azonosítását (lásd még a jelölési előírásokat a 6.5.2.2.1 pontban).

6.5.4.4.4 Az illetékes hatóság bármely időpontban megkövetelheti annak bizonyítását – e fejezet előírásainak megfelelő próbák szerint eljárva –, hogy az IBC kielégíti a gyártási típus vizsgálatára vonatkozó előírásokat.

6.5.4.5 *Javított IBC-k*

6.5.4.5.1 Amennyiben az IBC ütközés (pl. baleset) révén vagy más okból megsérül, az IBC-t ki kell javítani vagy más módon helyre kell állítani (lásd az IBC rendszeres karbantartása meghatározást az 1.2.1 szakaszban), hogy a gyártási típusnak megfeleljen. A merev műanyag IBC megsérült testét, ill. az összetett IBC megsérült belső tartályát ki kell cserélni.

6.5.4.5.2 Az ADR-ben előírt minden más vizsgálaton kívül az IBC-t javítás után a 6.5.4.4 bekezdésben előírt teljes körű vizsgálatnak kell alávetni és az előírt vizsgálati jegyzőkönyvet el kell készíteni.

6.5.4.5.3 A gyártó által felvitt UN gyártási típus jelölés közelében tartós módon fel kell tüntetni a javítás utáni vizsgálatokat végző szervre utaló, következő jelöléseket:

- a) annak az államnak a jelét, ahol a vizsgálatokat végezték;
- b) a vizsgálatokat végző nevét vagy engedélyezett jelét; és
- c) a vizsgálatok időpontját (hónap, év).

- 6.5.4.5.4** A 6.5.4.5.2 pont szerint végzett vizsgálatok úgy tekinthetők, hogy megfelelnek a két és félévenként és az ötévenként végzendő időszakos vizsgálatokra vonatkozó előírásoknak.
- 6.5.5 Különleges követelmények az IBC-kre**
- 6.5.5.1 Különleges követelmények a fém IBC-kre**
- 6.5.5.1.1** Ezek a követelmények a szilárd vagy folyékony anyagok szállítására szolgáló, fém IBC-kre vonatkoznak. A fém IBC-k három fajtája használatos:
- 11A, 11B, 11N a gravitációs úton töltött vagy ürített szilárd anyagok szállítására;
 - 21A, 21B, 21N a 10 kPa-nál (0,1 bar-nál) nagyobb túlnyomással töltött vagy ürített szilárd anyagok szállítására;
 - 31A, 31B, 31N a folyékony anyagok szállítására.
- 6.5.5.1.2** A testet olyan alkalmas, alakítható fémből kell készíteni, amelynek hegeszthetősége bizonyított. A hegesztési varratokat szakszerűen kell elkészíteni és azoknak teljes biztonságot kell nyújtaniuk. Szükség esetén figyelembe kell venni az alacsony hőmérsékleten tanúsított viselkedést.
- 6.5.5.1.3** Gondoskodni kell arról, hogy az egymással határos különböző fémek révén létrejövő elektrolitikus korrózió elkerülhető legyen.
- 6.5.5.1.4** Azokon az alumíniumból gyártott IBC-ken, amelyek gyúlékony folyékony anyagok szállítására szolgálnak, nem lehet védelem nélküli, nem rozsdamentes acélból készített mozgó rész, mit pl. fedelek, zárószervezetek stb., amelyek az alumíniumhoz való súrlódás vagy nekiütődés révén veszélyes reakciót válthatnának ki.
- 6.5.5.1.5** A fém IBC-ket olyan fémből kell készíteni, amely teljesíti a következő követelményeket:
- acél esetében a szakadási nyúlás %-os értéke nem lehet kisebb, mint $\frac{10000}{R_m}$, de legalább 20%,
ahol
 R_m a használt acél minimális szavatolt szakítószilárdsága N/mm²-ben;
 - alumínium és ötvözetek esetében a szakadási nyúlás %-ban nem lehet kisebb, mint $\frac{10000}{6R_m}$, de legalább 8%.
- A szakadási nyúlás meghatározásához használt próbatesteket a hengerlési irányra merőlegesen kell kivágni és úgy kell befogni, hogy az
- $$L_o = 5d \text{ vagy } L_o = 5,65\sqrt{A} \text{ legyen,}$$
- ahol
- L_o = a próbatest mérési jeltávolsága a vizsgálat előtt;
- d = a próbatest átmérője;
- A = a próbatest keresztmetszeti területe.
- 6.5.5.1.6** Legkisebb falvastagság
- Az $R_m \times A_o = 10\,000$ értékkel bíró referencia acélnál a falvastagság nem lehet kisebb a következő értékeknél:

Úrtartalom (C) literben	Falvastagság (T) mm-ben			
	11A, 11B, 11N típus		21A, 21B, 21N, 31A, 31B, 31N típus	
	nem védett	védett	nem védett	védett
$C \leq 1000$	2,0	1,5	2,5	2,0
$1000 < C \leq 2000$	$T = C/2000 + 1,5$	$T = C/2000 + 1,0$	$T = C/2000 + 2,0$	$T = C/2000 + 1,5$
$2000 < C \leq 3000$	$T = C/2000 + 1,5$	$T = C/2000 + 1,0$	$T = C/1000 + 1,0$	$T = C/2000 + 1,5$

ahol

A_0 = az alkalmazott referencia acél minimális szakadási nyúlása (százalékban) a szakítóvizsgálat során (lásd a 6.5.5.1.5 pontot);

- b) az a) pontban említett referencia acéltól eltérő más fémeknél a legkisebb falvastagság a következő képlettel számítható:

$$e_1 = \frac{21,4 \times e_0}{\sqrt[3]{R_{m1} \times A_1}}$$

ahol

e_1 = a felhasznált fém szükséges azonos értékű falvastagsága, mm;

e_0 = a referencia acél szükséges minimális falvastagsága, mm;

R_{m1} = a felhasználandó fém szavatolt minimális szakítószilárdsága, N/mm²; [lásd a c) pontot]

A_1 = a felhasznált fém minimális szakadási nyúlása (százalékban) a szakítóvizsgálat során (lásd a 6.5.5.1.5 pontot);

A falvastagság azonban semmilyen esetben sem lehet 1,5 mm-nél kisebb.

- c) A b) pontban leírt számítás céljából a felhasználandó fém szavatolt minimális szakítószilárdságának (R_{m1}) a nemzeti vagy nemzetközi szabványok szerinti legkisebb értéknek kell lennie. Ausztrális acélok esetében azonban az anyagszabványok szerint meghatározott R_m legkisebb érték 15%-kal növelhető, ha az anyag minőségére vonatkozó bizonylatban nagyobb érték szerepel. Ha a szóban forgó anyagra nincs anyagszabvány, az R_m értékének az anyag minőségére vonatkozó bizonylatban szereplő legkisebb értéket kell venni.

6.5.5.1.7

Nyomáskiegyenlítési követelmények: A folyadékok szállítására szolgáló IBC-nek elegendő mennyiségű gőzt kell tudni kiszabadítani ahhoz, hogy tűz hatására bekövetkező melegeedés során elkerülhető legyen a csomagolóeszköz-test repedése. Ez hagyományos nyomáskiegyenlítő szerkezetekkel vagy más szerkezeti megoldással érhető el. Ezeknek a szerkezeteknek a működését kiváltó nyomás nem lehet nagyobb, mint 65 kPa (0,65 bar) és nem lehet kisebb, mint az IBC-ben előálló összes túlnyomás (azaz a töltet gőznyomása növelve a levegő vagy egyéb inert gáz parciális nyomásával és mindez csökkentve 100 kPa-lal (1 bar-ral) 55 °C-on, a 4.1.1.4 bekezdésében meghatározott maximális töltési fok mellett. A szükséges nyomáskiegyenlítő szerkezeteket a gőztérben kell elhelyezni.

6.5.5.2

Különleges követelmények a hajlékony falú IBC-kre

6.5.5.2.1

Ezeket a követelményeket a következő hajlékony falú IBC-kre kell alkalmazni:

- 13H1 Műanyagszövet belső bevonat vagy bélés nélkül
- 13H2 Műanyagszövet belső bevonattal
- 13H3 Műanyagszövet béléssel

- 13H4 Műanyagszövet, belső bevonattal és béléssel
- 13H5 Műanyagfólia
- 13L1 Textilszövet belső bevonat vagy bélés nélkül
- 13L2 Textilszövet belső bevonattal
- 13L3 Textilszövet béléssel
- 13L4 Textilszövet, belső bevonattal és béléssel
- 13M1 Papír, többrétegű
- 13M2 Papír, többrétegű, vízálló

A hajlékony falú IBC-k csak szilárd anyagok szállítására szolgálnak.

- 6.5.5.2.2** A testet megfelelő anyagból kell gyártani. Az anyag szilárdságának és az IBC gyártási módszerének igazodnia kell az IBC ürtartalmához és rendeltetéséhez.
- 6.5.5.2.3** A 13M1 és 13M2 típusú, hajlékony falú IBC-k gyártásához használt minden anyagnak legalább 24 órán át tartó, vízbe való merítés után meg kell őriznie annak a szakítószilárdságnak legalább 85%-át, amelyet az anyag kiegyenlített klimatizálása után 67% vagy ennél kisebb relatív nedvességtartalom mellett mértek.
- 6.5.5.2.4** A egyesítéseket varrással, hőhegesztéssel, ragasztással vagy ezekkel egyenértékű eljárással kell elkészíteni. A varrással kialakított egyesítések minden végét el kell dolgozni.
- 6.5.5.2.5** A hajlékony falú IBC-knek kielégítő ellenállással kell rendelkezniük az ultraibolya sugárzás hatására, a klimatikus hatásokra vagy a rendeltetés szerint szállított anyag hatására bekövetkező öregedéssel és gyengüléssel szemben.
- 6.5.5.2.6** Amennyiben a műanyagból készült, hajlékony falú IBC-t az ultraibolya sugarak ellen védeni kell, ennek korom vagy más alkalmas pigment vagy inhibitor hozzáadásával kell történnie. Az adalékoknak összeférhetőnek kell lenniük a tartalommal és hatásukat a csomagoló-eszköz-test teljes élettartama alatt meg kell őrizniük. Olyan korom, pigment vagy inhibitor alkalmazásánál, amely különbözik a bevizsgált gyártási típus gyártásához használttól, a vizsgálatok megismétlésétől el lehet tekinteni, ha a megváltozott korom-, pigment vagy inhibitor tartalom a szerkezeti anyag fizikai tulajdonságait kedvezőtlenül nem befolyásolja.
- 6.5.5.2.7** A test anyagába adalékanyagok keverhetők, hogy az öregedéssel szembeni ellenállóképességet javítsák, vagy más célokra, feltéve, hogy ezek az adalékok az anyag fizikai vagy kémia tulajdonságait kedvezőtlenül nem befolyásolják.
- 6.5.5.2.8** Az IBC test gyártásához már használt tartályokból származó anyag nem használható. Az ugyanazon gyártási sorozatból származó hulladékok vagy gyártási maradékok azonban felhasználhatók. Ismételten felhasználhatók az elemek, mint például rögzítők és rakodólap alapok, feltéve hogy ezek a korábbi használat során semmiféle módon nem károsodtak.
- 6.5.5.2.9** Megtöltött állapotban a magasság és a szélesség aránya nem haladhatja meg a 2:1 értéket.
- 6.5.5.2.10** A bélést alkalmas anyagból kell készíteni. A felhasznált anyag szilárdságának és a bélés kialakításának meg kell felelni az IBC ürtartalmának és rendeltetésének. Az egyesítéseknek és zárószerkezeteknek portömörnek kell lenniük és ellen kell tudni állniuk a normális kezelési és szállítási feltételek mellett előforduló nyomásoknak és ütéseknek.

6.5.5.3 *Különleges követelmények a merev falú műanyag IBC-kre*

- 6.5.5.3.1** Ezek a követelmények a szilárd vagy folyékony anyagok szállítására szolgáló, merev falú műanyag IBC-kre vonatkoznak. A merev falú műanyag IBC-k következő típusai használatosak:

- 11H1 halmazoláskor a teljes terhelés elviselésére alkalmas vázszerkezetű, gravitációs úton töltött vagy ürített szilárd anyagokhoz való IBC

- 11H2 önhordó típusú, gravitációs úton töltött vagy ürített szilárd anyagokhoz való IBC
- 21H1 az IBC-k halmazolásakor a teljes terhelés elviselésére alkalmas vázszerkezetű, nyomás alatt töltött vagy ürített szilárd anyagokhoz való IBC
- 21H2 önhordó típusú, nyomás alatt töltött vagy ürített szilárd anyagokhoz való IBC
- 31H1 az IBC halmazolásakor a teljes terhelés elviselésére alkalmas kialakítású vázszerkezettel rendelkező IBC folyadékokhoz
- 31H2 önhordó típusú, folyadékokhoz való IBC.

6.5.5.3.2 A testet ismert minőségi jellemzőjű, alkalmas műanyagból kell gyártani és ürtartalmának és rendeltetésszerű felhasználási módjának megfelelő szilárdsággal kell rendelkeznie. Az anyagnak kielégítő ellenállást kell tanúsítania a tartalmazott anyag és esetleg az ultraibolya sugárzás hatására bekövetkező öregedéssel és gyengüléssel szemben. Szükség esetén figyelembe kell venni az alacsony hőmérsékleten tanúsított viselkedését. A benne levő tartalom esetleges áthatolása normális szállítási feltételek között nem okozhat veszélyt.

6.5.5.3.3 Amennyiben az ultraibolya sugarak ellen védelem szükséges, ennek korom vagy más alkalmas pigment vagy inhibitor hozzáadásával kell történnie. Ezeknek az adalékoknak összeférhetőnek kell lenniük a tartalommal és hatásukat a test teljes élettartama alatt meg kell őrizniük. Olyan korom, pigment vagy inhibitor alkalmazásánál, amely különbözik a bevizsgált gyártási típus gyártásához használttól, a vizsgálatok megismétlésétől el lehet tekinteni, ha a megváltozott korom-, pigment- vagy inhibitor tartalom a szerkezeti anyag fizikai tulajdonságait kedvezőtlenül nem befolyásolja.

6.5.5.3.4 A test anyagába adalékanyagok keverhetők, hogy az öregedéssel szembeni ellenálló-képességet javítsák, vagy más célokra, feltéve, hogy ezek az adalékok az anyag fizikai vagy kémia tulajdonságait kedvezőtlenül nem befolyásolják.

6.5.5.3.5 A merev falú műanyag IBC gyártásához az ugyanazon gyártási eljárásból származó gyártási maradékok vagy örlemények kivételével más használt anyag nem használható fel.

6.5.5.4 *Különleges követelmények az összetett IBC-kre belső műanyag tartállyal*

6.5.5.4.1 Ezeket a követelményeket a szilárd anyagok és folyadékok szállítására szolgáló, következő típusú IBC-kre kell alkalmazni:

- 11HZ1 összetett IBC merev falú műanyag belső tartállyal gravitációs úton töltött vagy ürített szilárd anyagokhoz
- 11HZ2 összetett IBC hajlékony falú műanyag belső tartállyal gravitációs úton töltött vagy ürített szilárd anyagokhoz
- 21HZ1 összetett IBC merev falú műanyag belső tartállyal nyomás alatt töltött vagy ürített szilárd anyagokhoz
- 21HZ2 összetett IBC hajlékony falú műanyag belső tartállyal nyomás alatt töltött vagy ürített szilárd anyagokhoz
- 31HZ1 összetett IBC merev falú műanyag belső tartállyal folyadékokhoz
- 31HZ2 összetett IBC hajlékony falú műanyag belső tartállyal folyadékokhoz.

Ezt a kódot ki kell egészíteni, a Z betűt helyettesítve, a 6.5.1.4.1 b) pont szerinti nagybetűvel, amely a külső burkolathoz használt anyag fajtáját jelzi.

6.5.5.4.2 A belső tartály nem arra szolgál, hogy a tartályfunkciót a külső burkolat nélkül betöltse. A „merev falú” belső tartály olyan tartály, amely üres állapotban, a zárószerkezet helyre tétele és a külső burkolat segítségével nélkül is megtartja szokásos alakját. A nem „merev falú” belső tartályokat „hajlékony falú”-nak kell tekinteni.

6.5.5.4.3 A külső burkolat normál esetben merev anyagból készül, és olyan alakú, hogy megvédje a belső tartályt a kezelés és szállítás során bekövetkező fizikai sérülésekkel szemben, de nem feladata a tartályfunkció betöltése. Ahol rakodólap alapzat szükséges, az is beleértendő.

- 6.5.5.4.4** A teljesen körbeérő külső burkolattal rendelkező összetett IBC-t úgy kell kialakítani, hogy a belső tartály sértetlensége a tömörségi és a hidraulikus nyomáspróbát követően könnyen megállapítható legyen.
- 6.5.5.4.5** A 31HZ2 típusú IBC-k ürtartalma nem haladhatja meg az 1250 litert.
- 6.5.5.4.6** A belső tartályt ismert minőségi jellemzőjű, alkalmas műanyagból kell gyártani és ürtartalmának és rendeltetésszerű felhasználási módjának megfelelő szilárdsággal kell rendelkeznie. Az anyagnak kielégítő ellenállást kell tanúsítania a tartalmazott anyag és esetleg az ultraibolya sugárzás hatására bekövetkező öregedéssel és gyengüléssel szemben. Szükség esetén figyelembe kell venni az alacsony hőmérsékleten tanúsított viselkedését. A benne levő tartalom esetleges áthatolása normális szállítási feltételek között nem okozhat veszélyt.
- 6.5.5.4.7** Amennyiben az ultraibolya sugárzás ellen védelem szükséges, ennek korom vagy más alkalmas pigment vagy inhibitor hozzáadásával kell történnie. Ezeknek az adalékoknak összeférhetőnek kell lenniük a tartalommal és hatásukat a test teljes élettartama alatt meg kell őrizniük. Olyan korom, pigment vagy inhibitor alkalmazásánál, amely különbözik a bevizsgált gyártási típus gyártásához használttól, a vizsgálatok megismétlésétől el lehet tekinteni, ha a megváltozott korom-, pigment- vagy inhibitor tartalom a szerkezeti anyag fizikai tulajdonságait kedvezőtlenül nem befolyásolja.
- 6.5.5.4.8** A belső tartály anyagába adalékanyagok keverhetők, hogy az öregedéssel szembeni ellenállóképességet javítsák, vagy más célokra, feltéve, hogy ezek az adalékok az anyag fizikai vagy kémia tulajdonságait kedvezőtlenül nem befolyásolják.
- 6.5.5.4.9** A belső tartály gyártásához az ugyanazon gyártási eljárásból származó gyártási maradékok vagy örlemények kivételével más, használt anyag nem használható fel.
- 6.5.5.4.10** A 31HZ2 típusú IBC-k belső tartályának legalább háromrétegű fóliából kell állnia.
- 6.5.5.4.11** A külső burkolat szerkezete és anyagának szilárdsága feleljen meg az összetett IBC ürtartalmának és rendeltetésszerű használatának.
- 6.5.5.4.12** A külső burkolatnak mentesnek kell lennie minden olyan kiszögelléstől, ami a belső tartályt megsérthetné.
- 6.5.5.4.13** A fém külső burkolatokat megfelelő vastagságú, alkalmas fémből kell készíteni.
- 6.5.5.4.14** A fából készült külső burkolathoz felhasznált fának jól kiérleltnek, kereskedelmi szárazságúnak és olyan hibától mentesnek kell lennie, ami a burkolat bármely részének szilárdságát csökkentené. A tető és fenék vízálló farostlemezből, pl. keménylemezből, faforgácslemezből vagy egyéb, alkalmas típusból is készíthető.
- 6.5.5.4.15** A rétegelt falemez burkolatokhoz felhasznált rétegelt falemezt jól kiérlelt, hántolással, vágással vagy fűrészeléssel nyert furnérból kell készíteni, amely kereskedelmi szárazságú és olyan hibáktól mentes, amelyek a burkolat bármely részének szilárdságát csökkentenék. A szomszédos rétegeket vízálló ragasztóval kell összeragasztani. A burkolat szerkezetében a rétegelt falemezzel együtt más alkalmas anyagok is használhatók. A burkolat lapjait a sarokoszlopokhoz vagy homloklapokhoz szilárdan hozzá kell szegezni vagy erősíteni, vagy azonos mértékben alkalmas eszközökkel össze kell erősíteni.
- 6.5.5.4.16** A farostlemezből készült külső burkolatok falait vízálló farostlemezből, pl. keménylemezből, faforgácslemezből vagy egyéb alkalmas típusból kell készíteni. A burkolatok egyéb részei más alkalmas anyagokból is készíthetők.
- 6.5.5.4.17** A papírlemez külső burkolatokhoz jó minőségű és ellenállóképes, tömör- vagy hullámpapírlamezt (három vagy többretegűt) kell használni, amely megfelel a burkolat ürtartalmának és rendeltetésszerű használatának. A külső felület vízállóságának olyan mértékűnek kell lenni, hogy a Cobb-módszerrel végzett vízfelvétel-próba 30 perce alatt a

tömegnövekedés ne haladja meg a 155 g/m^2 értéket – lásd az ISO 535:1991 szabványt. A papírlameznek megfelelő hajlítószilárdsággal kell rendelkeznie. A papírlamezt úgy kell kiszabni, átmetszés nélkül völgyelni és réselni, hogy az összeállításnál ne repedjen meg, a felülete ne törjön meg és ne hasasodjon ki. A hullámpapírlamez hullámosított rétegét a fedőrétegekhez szilárdan hozzá kell ragasztani.

- 6.5.5.4.18** A papírlamez külső burkolat végei elláthatók fakerettel vagy teljes egészében fából készíthetők. Erősítésként falécek alkalmazhatók.
- 6.5.5.4.19** A papírlamez külső burkolatok palástillesztéseit vagy ragasztószalaggal kell leragasztani, vagy át kell lapolni és össze kell ragasztani, vagy fémkapoccsal össze kell tűzni. Az átlapolásnak kielégítő mértékűnek kell lennie. Ha a zárás ragasztással vagy ragasztószalaggal történik, vízálló ragasztót kell használni.
- 6.5.5.4.20** Amennyiben a külső burkolat műanyagból van, a 6.5.5.4.6 – 6.5.5.4.9 pont vonatkozó követelményeit kell alkalmazni annak figyelembevételével, hogy ebben az esetben a belső tartályra vonatkozó követelményeket kell az összetett IBC külső burkolatára is alkalmazni.
- 6.5.5.4.21** A 31HZ2 típusú IBC-k külső burkolatának a belső tartályt mindenütt teljesen körül kell vennie.
- 6.5.5.4.22** Az IBC szerves részét képező rakodólap alapzatnak ill. bármilyen különálló rakodólapnak alkalmasnak kell lennie a megengedett legnagyobb bruttó tömegig megtöltött IBC gépi kezelésére.
- 6.5.5.4.23** A rakodólapot, ill. az IBC szerves részét képező alapzatot úgy kell kialakítani, hogy az IBC alapján ne legyen semmilyen kiszögellés, ami a kezelés során sérülést okozhatna.
- 6.5.5.4.24** A külső burkolatot a különálló rakodólaphoz hozzá kell erősíteni, hogy biztosítva legyen a stabilitás a kezelés és a szállítás során. A különálló rakodólap felső felületének mentesnek kell lennie mindenféle éles kiszögelléstől, ami az IBC-t megsérthetné.
- 6.5.5.4.25** A halmazolás megkönnyítésére erősítő szerkezetek, mint pl. fa tartóelemek használhatók, de ezeket a belső tartályon kívül kell elhelyezni.
- 6.5.5.4.26** Amennyiben az IBC-t halmazolásra szánják, a teherviselő felületnek olyannak kell lennie, hogy a terhelés biztonságos módon elosztodjék. Az ilyen IBC-t úgy kell kialakítani, hogy a terhet ne a belső tartály hordja.

6.5.5.5 *Különleges követelmények a papírlamez IBC-kre*

- 6.5.5.5.1** Ezek a követelmények a gravitációs úton töltött vagy ürített szilárd anyagok szállítására szolgáló papírlamez IBC-kre vonatkoznak. A papírlamez IBC típusa:
11G papírlamez IBC.
- 6.5.5.5.2** A papírlamez IBC-kbe nem szabad felülről emelő szerkezetet beépíteni.
- 6.5.5.5.3** Szilárd és jó minőségű, tömör- vagy hullámpapírlamezt (három vagy többretegűt) kell használni, amely megfelel az IBC ürtartalmának és rendeltetésszerű használatának. A külső felület vízállóságának olyan mértékűnek kell lenni, hogy a Cobb-módszerrel végzett vízfelvétel-próba 30 perce alatt a tömegnövekedés ne haladja meg a 155 g/m^2 értéket – lásd az ISO 535:1991 szabványt. A papírlameznek megfelelő hajlítószilárdsággal kell rendelkeznie. A papírlamezt úgy kell kiszabni, átmetszés nélkül völgyelni és réselni, hogy az összeállításnál ne repedjen meg, a felülete ne törjön meg és ne hasasodjon ki. A hullámpapírlamez hullámosított rétegét a fedőrétegekhez szilárdan hozzá kell ragasztani.
- 6.5.5.5.4** Az oldalfalaknak, a tetőnek és a fenéknek minimálisan 15 J beszakítási szilárdsággal kell rendelkezniük, az ISO 3036:1975 szabvány szerint mérve.
- 6.5.5.5.5** A papírlamez IBC-testeken a palást illesztéseit megfelelő mértékben át kell lapolni és azokat

ragasztószalaggal kell lezárni, le kell ragasztani vagy fémkapcsokkal kell tűzni, vagy legalább azonos hatékonyságú módszerrel kell egyesíteni. Ha az egyesítés ragasztással vagy ragasztószalaggal történik, vízálló ragasztót kell használni. A fémkapcsoknak minden összeerősítendő részen teljesen át kell hatolniuk és oly módon kell azokat kialakítani vagy védeni, hogy a bélést ne dörzsölhessék vagy ne szűrassák ki.

- 6.5.5.5.6** A bélést alkalmas anyagból kell készíteni. A használt anyag szilárdságának és a bélés szerkezetének meg kell felelnie az IBC ürtartalmának és rendeltetésszerű használatának. Az illesztéseknek és zárásoknak portömörnek kell lenniük és alkalmasnak kell lenniük a normális szállítási körülmények között fellépő nyomások és ütődések elviselésére.
- 6.5.5.5.7** Az IBC szerves részét képező rakodólap alapzatnak, ill. bármilyen különálló rakodólapnak alkalmasnak kell lennie a megengedett legnagyobb bruttó tömegig megtöltött IBC gépi kezelésére.
- 6.5.5.5.8** A rakodólapot, ill. az IBC szerves részét képező alapzatot úgy kell kialakítani, hogy az IBC alapján ne legyen semmilyen kiszögellés, ami a kezelés során sérülést okozhatna.
- 6.5.5.5.9** Az IBC-testet a különálló rakodólaphoz hozzá kell erősíteni, hogy biztosítva legyen a stabilitás a kezelés és a szállítás során. A különálló rakodólap felső felületének mentesnek kell lennie mindenféle éles kiszögelléstől, ami az IBC-t megsérthetné.
- 6.5.5.5.10** A halmazolás megkönnyítésére erősítő szerkezetek, mint pl. fa tartóelemek használhatók, de ezeket a bélésen kívül kell elhelyezni.
- 6.5.5.5.11** Amennyiben az IBC-t halmazolásra szánják, a teherviselő felületnek olyannak kell lennie, hogy a terhelés biztonságos módon elosztodjék.

6.5.5.6 *Különleges követelmények a fa IBC-kre*

- 6.5.5.6.1** Ezeket a követelményeket a gravitációs úton töltött vagy ürített szilárd anyagok szállítására szolgáló fa IBC-kre kell alkalmazni. A fa IBC-k a következő típusúak:
- 11C közönséges fa IBC béléssel
 - 11D rétegelt falemez IBC béléssel
 - 11F farostlemez IBC béléssel
- 6.5.5.6.2** A fa IBC-kbe nem szabad felülről emelő szerkezetet beépíteni.
- 6.5.5.6.3** A felhasznált anyag szilárdsága és a test gyártás módja feleljen meg az IBC ürtartalmának és rendeltetésszerű használatának.
- 6.5.5.6.4** A fának jól kiérleltnek, kereskedelmi szárazságúnak és olyan hibáktól mentesnek kell lennie, amelyek az IBC bármely részének szilárdságát csökkentenék. Az IBC minden egyes részét egyetlen darabból vagy ezzel egyenértékű módon kell gyártani. Az elemek akkor tekinthetők az egyetlen darabból készülttel egyenértékűnek, ha a következő ragasztásos kötés típusok valamelyikét alkalmazzák: Lindermann-illesztés (fecskefarok illesztés), hornyolás, átlapolás vagy tompaillesztés, minden csatlakozásnál legalább két, hullámosított fém rögzítőelemmel, vagy akkor, ha legalább azonos hatékonyságú más eljárást alkalmaznak.
- 6.5.5.6.5** A rétegelt falemez testeknek legalább 3 rétegűnek kell lenniük. Jól kiérlelt, hántolással, vágással vagy fűrészeléssel nyert furnérból kell készíteni, amely kereskedelmi szárazságú és mentes az olyan hibáktól, amelyek a test bármely részének szilárdságát csökkentenék. A szomszédos rétegeket vízálló ragasztóval kell összeeragasztani. A test szerkezetéhez a rétegelt falemezzel együtt más alkalmas anyagok is használhatók.
- 6.5.5.6.6** A farostlemezről készült testeket vízálló farostlemezről, pl. keménylemezről, faforgácslemezről vagy egyéb alkalmas típusból kell készíteni.
- 6.5.5.6.7** Az IBC-k lapjait szilárdan az élekhez vagy saroklécekhez kell szögezni vagy kapcsolni,

vagy a homlokoldalához kell szögezni vagy más alkalmas eszközökkel kell összeerősíteni.

- 6.5.5.6.8** A bélést alkalmas anyagból kell készíteni. A használt anyag szilárdságának és a bélés szerkezetének meg kell felelnie az IBC úrtartalmának és rendeltetésszerű használatának. Az illesztéseknek és zárásoknak portömörnek kell lenniük és alkalmasnak kell lenniük a normális szállítási körülmények között fellépő nyomások és ütődések elviselésére.
- 6.5.5.6.9** Az IBC szerves részét képező rakodólap alapzatnak, ill. bármilyen különálló rakodólapnak alkalmasnak kell lennie a megengedett legnagyobb bruttó tömegig megtöltött IBC gépi kezelésére.
- 6.5.5.6.10** A rakodólapot, ill. az IBC szerves részét képező alapzatot úgy kell kialakítani, hogy az IBC alapján ne legyen semmilyen kiszögellés, ami a kezelés során sérülést okozhatna.
- 6.5.5.6.11** A IBC testet a különálló rakodólaphoz hozzá kell erősíteni, hogy biztosítva legyen a stabilitás a kezelés és a szállítás során. A különálló rakodólap felső felületének mentesnek kell lennie mindenféle éles kiszögelléstől, ami az IBC-t megsérthetné.
- 6.5.5.6.12** A halmazolás megkönnyítésére erősítő szerkezetek, mint pl. fa tartóelemek használhatók, de ezeket a bélésen kívül kell elhelyezni.
- 6.5.5.6.13** Amennyiben az IBC-t halmazolásra szánják, a teherviselő felületnek olyannak kell lennie, hogy a terhelés biztonságos módon elosztodjék.

6.5.6 Vizsgálati követelmények az IBC-kre

6.5.6.1 *A vizsgálatok végrehajtása és gyakorisága*

- 6.5.6.1.1** Minden egyes IBC gyártási típusnak sikeresen ki kell állnia az ebben a fejezetben előírt vizsgálatokat mielőtt az IBC-t használatba vennék és a jelölés felvitelét engedélyező illetékes hatóság jóváhagyná. Az IBC gyártási típusát kialakítása, nagysága, anyaga és falvastagsága, gyártásmódja és töltő- és ürítőberendezései határozzák meg; egy típushoz azonban különböző felületkezelés is tartozhat. Ugyanaz a típus magában foglalja azokat az IBC-ket is, amelyek csak csökkentett külméreteikben térnek el a gyártási típustól.

- 6.5.6.1.2** A vizsgálatokat a szállításra előkészített IBC-ken kell végrehajtani. Az IBC-t a megfelelő szakaszokban előírtak szerint kell megtölteni. Az IBC-kben szállítandó anyagokat helyettesíteni lehet más anyagokkal, feltéve, hogy ez a vizsgálat eredményeit nem hamisítja meg. Ha szilárd anyagok esetében más anyagot használnak, ennek ugyanolyan fizikai jellemzőkkel (tömeg, szemcseméret stb.) kell rendelkeznie, mint a szállítandó anyagnak. A küldeménydarab megkövetelt össztömegének elérése érdekében használhatók kiegészítő töltetek is, pl. ólomsöréttel töltött zacskók, feltéve, hogy ezek úgy vannak elhelyezve, hogy nem befolyásolják a vizsgálati eredményeket.

6.5.6.2 *A gyártási típus vizsgálata*

- 6.5.6.2.1** Minden egyes gyártási típusú, méretű, falvastagságú és kialakítású IBC-ből egy darabot alá kell vetni a 6.5.6.4 – 6.5.6.13 bekezdésben felsorolt próbáknak a 6.5.6.3.7 pont szerinti sorrendben. Ezeket a gyártási típus vizsgálatokat az illetékes hatóság előírásai szerint kell elvégezni.
- 6.5.6.2.2** A halmazolásra kialakított, 31H2 típusú merev falú műanyag IBC-k, ill. 31HH1 és 31HH2 típusú összetett IBC-k esetén a szállítani kívánt anyaggal, ill. a standardfolyadékkal való kielégítő kémiai összeférhetőség 6.5.6.3.3, ill. 6.5.6.3.5 pont szerinti bizonyításához egy másik IBC-t lehet használni. Ebben az esetben ezt a másik IBC-t is előzetes tárolásnak kell alávetni.
- 6.5.6.2.3** Az illetékes hatóság engedélyezheti azon IBC-k szelektív vizsgálatát, amelyek csak kis

mértékben térnek el a már bevizsgált típustól, pl. külső méreteik valamivel kisebbek.

- 6.5.6.2.4** Amennyiben a vizsgálatoknál különálló rakodólapokat használnak, a 6.5.6.14 bekezdés szerint kiadott vizsgálati jegyzőkönyvnek tartalmaznia kell a használt rakodólapok műszaki leírását is.

6.5.6.3 *Az IBC előkészítése a vizsgálathoz*

- 6.5.6.3.1** A papír IBC-eket, a papírlemez IBC-eket és az összetett IBC-eket papírlemez külső burkolattal legalább 24 órán át olyan klímában kell tartani, amelynek hőmérséklete és relatív páratartalma szabályozott. Három lehetőség közül lehet választani. A legelőnyösebb vizsgálati klíma a $23\text{ °C} \pm 2\text{ °C}$ és $50\% \pm 2\%$ relatív páratartalom. A másik két lehetőség a $20\text{ °C} \pm 2\text{ °C}$ és $65\% \pm 2\%$ relatív páratartalom vagy a $27\text{ °C} \pm 2\text{ °C}$ és $65\% \pm 2\%$ relatív páratartalom.

***Megjegyzés:** Az átlagértékeknek ezen határok közé kell esniük. A rövid idejű ingadozások és a mérési korlátok az egyedi mérésektől legfeljebb $\pm 5\%$ relatív páratartalom eltérést eredményezhetnek a vizsgálatok reprodukálhatóságának észrevehető csökkenése nélkül.*

- 6.5.6.3.2** Kiegészítő intézkedéseket kell tenni, annak ellenőrzésére, hogy a 31H1 és 31H2 típusú merev falú műanyag és a 31HZ1 és 31HZ2 típusú összetett IBC-k gyártására használt műanyag megfelel-e a 6.5.5.3.2 – 6.5.5.3.4, illetve a 6.5.5.4.6 – 6.5.5.4.9 pont előírásainak.

- 6.5.6.3.3** Annak bizonyítására, hogy kielégítő a kémiai összeférhetőség a tartalommal, az IBC mintát hat hónapos előzetes tárolásnak kell alávetni, amely alatt az IBC minta a szállítani kívánt anyaggal van töltve, vagy olyan anyaggal, amelyről ismeretes, hogy a kérdéses műanyagra legalább ugyanolyan mértékben fejt ki feszültségi repedést, duzzadás révén lágyulást okozó vagy molekuláris degradáló hatást. Ezután a mintát alá kell vetni a 6.5.6.3.7 táblázatban felsorolt próbáknak.

- 6.5.6.3.4** Amennyiben a műanyag viselkedését más módon határozták meg, az előző összeférhetőségi vizsgálatoktól el lehet tekinteni. Az ilyen más eljárásoknak legalább az előző összeférhetőségi vizsgálatnál azonos értékűeknek és az illetékes hatóság által elismerteknek kell lenniük.

- 6.5.6.3.5** A 6.5.5.3 bekezdés szerinti, polietilénből készült, merev falú műanyag IBC-knél (31H1 és 31H2 típus) és a 6.5.5.4 bekezdés szerinti, polietilénből készült belső műanyag tartállyal rendelkező összetett IBC-knél (31HZ1 és 31HZ2 típus) a folyékony töltőanyaggal való kémiai összeférhetőség a 4.1.1.21 bekezdés alapján hozzárendelt standardfolyadék(ok)kal is bizonyítható a következők szerint (lásd a 6.1.6 szakaszt is).

A standardfolyadékok a polietilénnél fellépő károsító folyamatok (így a lágyulás duzzadás révén, a feszültségkorrózió, a molekula degradációs reakciók és ezek kombinációi) szempontjából reprezentálják a szállítandó anyagot.

Az IBC kielégítő kémiai összeférhetősége bizonyítható háromhetes 40 °C -on végzett tárolással a megfelelő standardfolyadék(ok)kal feltöltve; az ezen eljárással végzett tárolásra nincs szükség, ha standardfolyadékként víz van megadva. Ugyancsak nem szükséges tárolni a halmazolási próbához használt mintadarabokat, ha standardfolyadékként nedvesítőszer oldat vagy ecetsav van megadva. A tárolás után a mintadarabot a 6.5.6.4 – 6.5.6.9 bekezdésben előírt próbáknak kell alávetni.

Az 5.2 osztályba tartozó, 40%-nál nagyobb peroxid-tartalmú terc-butil-hidroperoxid és a peroxi-ecetsavak esetében az összeférhetőségi vizsgálat standardfolyadékkal nem végezhető el. Ezeknél az anyagoknál a kielégítő kémiai összeférhetőség bizonyításához a mintadarabot a szállítani kívánt anyaggal megtöltve hat hónapon keresztül kell szobahőmérsékleten tárolni.

A polietilénből készült IBC-kre e pont szerinti eljárás alapján kapott eredmények azokra a hasonló gyártási típusokra is elfogadhatók, amelyek belső felülete fluorozott.

6.5.6.3.6 Azoknál a 6.5.6.3.5 pont szerinti specifikációjú polietilénből készült IBC-knél, amelyek gyártási típusa kiállta a 6.5.6.3.5 pont szerinti próbát, valamely töltőanyaggal való kémiai összeférhetőség úgy is bizonyítható, hogy laboratóriumi vizsgálatokkal igazolják, hogy ennek a töltőanyagnak a hatása a mintadarabra – a figyelembe veendő károsodási folyamatok szempontjából – gyengébb, mint a standardfolyadék(ok)é. A relatív sűrűsége és a gőznyomásra az 4.1.1.21.2 pont feltételei érvényesek.

6.5.6.3.7 A szükséges gyártási típus vizsgálatok és sorrendjük

Az IBC típusa	Rázóvizsgálat ^{d)}	Emelés alulról	Emelés felülről ^a	Halmazolás ^{b)}	Tömörség	Folyadéknyomás	Ejtés	Továbbszakadás	Billentés	Felállítási ^{c)}

- a) Az ilyen kezelési módra kialakított IBC-knél.
- b) Ha az IBC halmazolásra van kialakítva.
- c) Ha az IBC felülről vagy oldalról történő emelésre van kialakítva.
- d) Ahol a szükséges próbát x jelzi, az azt jelenti, hogy az egyik próbát elviselt IBC-n a további próbák bármilyen sorrendben végrehajthatók.
- e) Az ejtőpróba azonos kialakítású másik IBC-n is végrehajtható.
- f) A rázóvizsgálat azonos kialakítású másik IBC-n is végrehajtható.
- g) Az egymás utáni sorrendtől eltérően a 6.5.6.2.2 pont szerinti másik IBC közvetlenül az előzetes tárolás után vizsgálható.

6.5.6.4 Emelési próba alulról

6.5.6.4.1 Alkalmazási terület

Gyártási típus vizsgálatként minden fa és papírlemez IBC-nél és minden olyan IBC típusnál, amely az alulról való emeléshez el van látva szerkezettel.

6.5.6.4.2 Az IBC előkészítése a próbához

Az IBC-t meg kell tölteni. Egyenletesen elosztott kiegészítő terhelést kell alkalmazni. A megtöltött IBC és a kiegészítő terhelés együttes tömegének a megengedett legnagyobb bruttó tömeg 1,25-szorosát kell kitennie.

6.5.6.4.3 Vizsgálati eljárás

Az IBC-t emelővillás targoncával kétszer fel kell emelni és le kell tenni. Ennek során a villákat központosan kell elhelyezni, és azoknak egymástól olyan távolságra kell lenniük, amely a bevezetés felőli oldalméret háromnegyed részének felel meg, (hacsak a bevezetési pontok nincsenek rögzítve). A villákat a bevezetés irányában háromnegyed részig kell bevezetni. A próbát minden lehetséges irányból meg kell ismételni.

6.5.6.4.4 *Elfogadási feltétel*

Nem következhet be sem olyan tartós alakváltozás, amely az IBC (beleértve a rakodólap alapot is, ha ilyen van) biztonságát a szállítás szempontjából csökkentené, sem a tartalom elvesztése.

6.5.6.5 *Emelési próba felülről*

6.5.6.5.1 *Alkalmazási terület*

Gyártási típus vizsgálatként minden olyan IBC típusnál, amely el van látva a felülről való emelésre szolgáló szerkezettel és a felülről vagy oldalról történő emeléshez kialakított hajlékony falú IBC-knél.

6.5.6.5.2 *Az IBC előkészítése a próbához*

A fém, a merev falú műanyag és az összetett IBC-t meg kell tölteni. Egyenletesen elosztott kiegészítő terhelést kell alkalmazni. A megtöltött IBC és a kiegészítő terhelés együttes tömegének a megengedett legnagyobb bruttó tömeg kétszeresét kell kitennie. A hajlékony falú IBC-t a töltőanyagot reprezentáló anyaggal megtöltve, a megengedett legnagyobb bruttó tömeg hatszorosaig kell – a terhelést egyenletesen elosztva – megterhelni.

6.5.6.5.3 *Vizsgálati eljárás*

A fém és a hajlékony falú IBC-t rendeltetésszerűen fel kell emelni, amíg az a talajtól elválik, és ebben a helyzetben kell tartani 5 perc időtartamig.

A merev falú műanyag és összetett IBC-eket a következőképpen kell felemelni:

- a) Az IBC-t mindegyik emelőszerkezet-párjánál (egymással átlósan szemben levő két emelőszerkezeténél) fogva öt perc időtartamig felemelve kell tartani, úgy hogy az emelő erők függőlegesen hassanak; és
- b) az IBC-t mindegyik emelőszerkezet-párjánál (egymással átlósan szemben levő két emelőszerkezeténél) fogva öt perc időtartamig felemelve kell tartani, úgy hogy az emelő erők a középpontra a függőlegeshez képest 45°-ban hassanak.

6.5.6.5.4 A hajlékony falú IBC-knél a felülről történő emelés és az előkészítés legalább azonos hatékonyságú más módszerrel is történhet.

6.5.6.5.5 *Elfogadási feltétel*

- a) Fém IBC-knél, merev falú műanyag IBC-knél és összetett IBC-knél: az IBC a normális szállítási körülmények között továbbra is biztonságos, nem következhet be sem észlelhető tartós alakváltozás az IBC-n (beleértve a rakodólap alapot, ha ilyen van), sem a tartalom elvesztése.
- b) Hajlékony falú IBC-knél: nem következhet be olyan sérülés sem az IBC-n, sem annak emelőszerkezetén, amely az IBC biztonságát a szállítás vagy kezelés szempontjából csökkentené, sem a tartalom elvesztése.

6.5.6.6 *Halmazolási próba*

6.5.6.6.1 *Alkalmazási terület*

Gyártási típus vizsgálatként minden olyan IBC típusnál, amelyek kialakításuknál fogva egymásra halmazolhatók.

6.5.6.6.2 *Az IBC előkészítése a próbához*

Az IBC-t a megengedett legnagyobb bruttó tömegéig kell megtölteni. Ha a vizsgálathoz használt termék sűrűsége ezt nem teszi lehetővé, az IBC-hez egyenletesen elosztott kiegészítő terhelést kell alkalmazni úgy, hogy a vizsgálatot a megengedett legnagyobb bruttó tömeggel terhelve végezzék.

6.5.6.6.3 *Vizsgálati eljárás*

- a) Az IBC-t alapzatával vízszintes, sík, kemény talajra kell állítani és egyenletesen elosztott próbaterhelést kell ráhelyezni (lásd a 6.5.6.6.4 pontot). A 31H2 típusú merev falú műanyag IBC-k, ill. a 31HH1 és 31HH2 típusú összetett IBC-k esetén a halmazolási próbát a 6.5.6.3.3 pont szerint az eredeti töltőanyaggal, ill. a 6.5.6.3.5 pont szerint a standardfolyadékkal (lásd a 6.1.6 szakaszt) megtöltött, a 6.5.6.2.2 pont szerinti másik IBC-n kell végrehajtani az előzetes tárolás után. Az IBC-t a próbaterhelésnek legalább a következő időtartamig kell kitenni:
 - i) a fém IBC-t 5 percig;
 - ii) a 11H2, 21H2 és 31H2 típusú merev falú műanyag IBC-t és az összetett IBC-t külső műanyag burkolattal, amely a halmazolási terhelést viseli (azaz a 11HH1, 11HH2, 21HH1, 21HH2, 31HH1 és 31HH2 típusúakat) 28 napig 40 °C-on;
 - iii) minden más IBC típust 24 óráig;
- b) A próbaterhelést a következő módok egyike szerint kell alkalmazni:
 - i) a megengedett legnagyobb bruttó tömegig megtöltött egy vagy több, azonos típusú IBC-t kell a vizsgált IBC-re ráhelyezni;
 - ii) megfelelő tömeget kell egy sík lapra vagy az IBC alapzatának utánzatára helyezni, amelyet azután a vizsgálandó IBC-re kell felhelyezni.

6.5.6.6.4 *A ráhelyezendő próbaterhelés kiszámítása*

A tehernek, amelyet az IBC-re helyeznek, meg kell egyeznie a szállítás során az IBC-re halmazolható hasonló IBC-k együttes megengedett legnagyobb bruttó tömegének legalább 1,8-szeresével.

6.5.6.6.5 *Elfogadási feltétel*

- a) A hajlékony falú IBC kivételével minden más IBC-nél: nem következhet be sem olyan tartós alakváltozás, amely az IBC (beleértve a rakodólap alapot is, ha ilyen van) biztonságát a szállítás szempontjából csökkentené, sem a tartalom elvesztése.
- b) Hajlékony falú IBC-nél: nem következhet be sem az IBC test olyan károsodása, ami az IBC biztonságát a szállítás szempontjából csökkentené, sem a tartalom elvesztése.

6.5.6.7 *Tömörségi próba*

6.5.6.7.1 *Alkalmazási terület*

Gyártási típus vizsgálatként és időszakos vizsgálatként olyan IBC típusoknál, amelyeket folyadékokhoz vagy nyomás alatt töltött vagy ürített szilárd anyagokhoz használnak.

6.5.6.7.2 *Az IBC előkészítése a próbához*

A próbát az esetleges hőszigetelés felhelyezése előtt kell végrehajtani. A szellőző zárószerkezeteket vagy hasonló, nem szellőző szerkezetekre kell kicserélni vagy tömören le kell zárni.

6.5.6.7.3 *Vizsgálati eljárás és alkalmazandó próbanyomás*

A nyomáspróbát legalább 10 perc időtartamig legalább 20 kPa (0,2 bar) állandó túlnyomással kell végrehajtani. Az IBC légtömörségét megfelelő módszerrel, pl. légnyomás-különbség méréssel vagy az IBC vízbe merítésével vagy fém IBC-knél az egyesítési helyek és varratok szappan oldattal történő bekenésével kell megállapítani. Vízbe merítés esetén a hidrosztatikai nyomás figyelembe vételéhez korrekciós tényezőt kell alkalmazni.

6.5.6.7.4 *Elfogadási feltétel*

Nem következhet be tömítetlenség.

6.5.6.8 Belső (folyadék) nyomáspróba

6.5.6.8.1 Alkalmazási terület

Gyártási típus vizsgálatként olyan IBC típusoknál, amelyeket folyadékokhoz vagy nyomás alatt töltött vagy üritett szilárd anyagokhoz használnak.

6.5.6.8.2 Az IBC előkészítése a próbához

A próbát az esetleges hőszigetelés felhelyezése előtt kell végrehajtani. A nyomáscsökkentő szerkezeteket hatástalanítani kell, vagy el kell távolítani és a nyílásokat le kell zárni.

6.5.6.8.3 Vizsgálati eljárás

A nyomáspróbát legalább 10 perc időtartamig kell végezni olyan hidraulikus nyomással, amely nem kisebb mint a 6.5.6.8.4 pontban megadott nyomás. Az IBC-t a próba végrehajtása alatt nem szabad megtámasztani.

6.5.6.8.4 Alkalmazandó nyomás

6.5.6.8.4.1 Fém IBC-knél:

- a) a 21A, 21B és 21N típusú IBC-knél, amelyeket az I csomagolási csoport szilárd anyagaihoz használnak, 250 kPa (2,5 bar) túlnyomás;
- b) a 21A, 21B, 21N, 31A, 31B és 31N típusú IBC-knél, amelyeket a II vagy a III csomagolási csoport anyagaihoz használnak, 200 kPa (2 bar) túlnyomás;
- c) kiegészítő vizsgálatként a 31A, 31B, 31N típusú IBC-knél 65 kPa (0,65 bar) túlnyomás. Ezt a vizsgálatot a 200 kPa-lal (2 bar-ral) végzett próba előtt kell elvégezni.

6.5.6.8.4.2 Merev falú műanyag IBC-knél és összetett IBC-knél:

- a) a 21H1, 21H2, 21HZ1 és 21HZ2 típusú IBC-knél: 75 kPa (0,75 bar) túlnyomás;
- b) a 31H1, 31H2, 31HZ1 és 31HZ2 típusú IBC-knél:
a következő módszerekkel meghatározott első érték:
 - i) az IBC-ben mért össznyomást (azaz a betöltött anyag gőznyomásához hozzáadva a benne levő levegő vagy inert gáz parciális nyomását és 100 kPa-t levonva) 55 °C-on meg kell szorozni 1,5-ös biztonsági tényezővel; ezt az össznyomást a 4.1.1.4 bekezdés szerinti maximális töltési fok és 15 °C töltési hőmérséklet alapján kell meghatározni; vagy
 - ii) szállítandó anyag 50 °C-on fennálló gőznyomásának 1,75-szorosából le kell vonni 100 kPa-t, de minimálisan 100 kPa próbanyomás; vagy
 - iii) a szállítandó anyag 55 °C-on fennálló gőznyomásának 1,5-szereséből le kell vonni 100 kPa-t, de minimálisan 100 kPa próbanyomás;és a következő módszerrel meghatározott második érték:
 - iv) a szállítandó anyag statikus nyomásának kétszerese, de legalább a víz statikus nyomásának kétszereseközül a nagyobbik.

6.5.6.8.5 Elfogadási feltétel

- a) Azoknál a 21A, 21B, 21N, 31A, 31B és 31N típusú IBC-knél, amelyeket a 6.5.6.8.4.1 a) vagy b) pont szerinti nyomáspróbának tettek ki, nem következhet be szivárgás.
- b) Azoknál a 31A, 31B és 31N típusú IBC-knél, amelyeket a 6.5.6.8.4.1 c) pont szerinti próbanyomásnak tettek ki, sem olyan tartós alakváltozás, amely az IBC biztonságát a szállítás szempontjából csökkentené, sem pedig szivárgás nem következhet be.
- c) Merev falú műanyag IBC-knél és összetett IBC-knél: nem következhet be sem olyan

tartós alakváltozás, amely az IBC biztonságát a szállítás alatt befolyásolná, sem pedig szivárgás.

6.5.6.9 Ejtési próba

6.5.6.9.1 Alkalmazási terület

Gyártási típus vizsgálatként minden IBC típusnál.

6.5.6.9.2 Az IBC előkészítése a próbához

- a) Fém IBC-nél: az IBC-t szilárd anyagok esetén legnagyobb űrtartalmának legalább 95%-áig, folyékony anyagok esetén legnagyobb űrtartalmának legalább 98%-áig kell megtölteni. A nyomáscsökkentő szerkezeteket hatástalanítani kell, vagy el kell távolítani és a nyílásokat le kell zárni.
- b) Hajlékony falú IBC-nél: az IBC-t megengedett legnagyobb bruttó tömegéig kell – a tartalmat egyenletesen elosztva – megtölteni.
- c) Merev falú műanyag IBC-nél és összetett IBC-nél: az IBC-t szilárd anyagok esetén legnagyobb űrtartalmának legalább 95%-áig, folyékony anyagok esetén legnagyobb űrtartalmának legalább 98%-áig kell megtölteni. A nyomáscsökkentő szerkezeteket hatástalanítani kell, vagy el kell távolítani és a nyílásokat le kell zárni. Az IBC-k vizsgálatát olyan állapotban kell elvégezni, amikor a vizsgálati minta és a tartalom hőmérsékletét -18 °C -ra vagy az alá csökkentették. A minta ilyen előkészítése esetén a 6.5.6.3.1 pontban meghatározott kondicionálástól összetett IBC-nél el lehet tekinteni. A vizsgálatnál használt folyadékot folyékony állapotban kell tartani, szükség esetén fagyásgátló hozzáadásával. Ettől a kondicionálástól el lehet tekinteni, ha a kérdéses anyagok hajlékonysága és szakítószilárdsága -18 °C -on vagy az alatt jelentősen nem csökken.
- d) Papírlemez és fa IBC-nél: az IBC-t legnagyobb űrtartalmának legalább 95%-áig kell megtölteni.

6.5.6.9.3 Vizsgálati eljárás

Az IBC-t olyan módon kell 6.1.5.3.4 pont követelményeinek megfelelő, rugalmatlan, vízszintes, sima, masszív és szilárd felületre, a fenékre ejteni, ami biztosítja, hogy az IBC alapfelületének leggyengébbnek tekintett részén ütközzön fel. A $0,45\text{ m}^3$ vagy annál kisebb űrtartalmú IBC-t ezenkívül a következőképpen is le kell ejteni:

- a) a fém IBC-t az első ejtési próbánál vizsgált, az alapfelület leggyengébbnek tekintett részétől eltérő, legsérülékenyebb részre;
- b) a hajlékony falú IBC-t a legsérülékenyebb oldalára;
- c) a merev falú műanyag, az összetett, a papírlemez és a fa IBC-t: laposan az oldallapra, laposan a tetőlapra és az egyik sarokra.

Az egyes ejtésekhez ugyanazon vagy másik IBC is használható.

6.5.6.9.4 Ejtési magasság

Szilárd és folyékony anyagoknál, ha a próbát a szállítandó szilárd vagy folyékony anyaggal vagy lényegében azonos fizikai jellemzőkkel bíró egyéb anyaggal végzik:

I csomagolási csoport	II csomagolási csoport	III csomagolási csoport
1,8 m	1,2 m	0,8 m

Folyékony anyagoknál, ha a vizsgálatot vízzel hajtják végre:

- a) olyan szállítandó anyagok esetén, amelyeknek relatív sűrűsége nem haladja meg az 1,2 értéket:

II csomagolási csoport	III csomagolási csoport
1,2 m	0,8 m

- b) olyan szállítandó anyagok esetén, amelyeknek relatív sűrűsége meghaladja az 1,2 értéket, az ejtési magasságot a szállítandó anyag relatív sűrűségéből a következő módon kell kiszámítani (egy tizedesre felkerekítve):

II csomagolási csoport	III csomagolási csoport
relatív sűrűség \times 1,0 m	relatív sűrűség \times 0,67 m

6.5.6.9.5 *Elfogadási feltétel*

- a) Fém IBC-knél: nem következhet be a tartalom elvesztése;
- b) Hajlékony IBC-knél: nem következhet be a tartalom elvesztése. A tartalom kismértékű elfolyása a záráson vagy a varrásokon keresztül a felütközéskor nem tekintendő az IBC tönkremenetelének, feltéve, hogy miután az IBC-t a talajról felemelték, további szivárgás nem következik be.
- c) Merev falú műanyag, összetett, papírlemez és fa IBC-knél: nem következhet be a tartalom elvesztése. A tartalom kismértékű elfolyása a záráson keresztül a felütközéskor nem tekintendő az IBC tönkremenetelének, feltéve, hogy további szivárgás nem következik be.
- d) Az összes IBC-nél: nem következhet be sem olyan sérülés, ami miatt nem lenne biztonságos az IBC mentési vagy ártalmatlanítási célból történő szállítása, sem a tartalom elvesztése. Ezenkívül alkalmasnak kell lennie arra, hogy valamilyen alkalmas eszközzel öt perc időtartamra teljesen el lehessen emelni a talajról.

Megjegyzés: A d) pont kritériumait a 2011. január 1-je után gyártott IBC-k gyártási típusára kell alkalmazni.

6.5.6.10 *Továbbszakadási próba*

6.5.6.10.1 *Alkalmazási terület*

Gyártási típus vizsgálatként minden hajlékony falú IBC típusnál.

6.5.6.10.2 *Az IBC előkészítése a próbához*

Az IBC-t ürtartalmának legalább 95%-áig és megengedett legnagyobb bruttó tömegéig kell – a tartalmat egyenletesen elosztva – megtölteni.

6.5.6.10.3 *Vizsgálati eljárás*

Amikor az IBC már a talajon van, késsel 100 mm hosszú, teljesen áthatoló vágást kell az egyik széles oldalfalán ejteni az IBC fő tengelyére 45°-os szögben, mégpedig a fenék és a tartalom szintje közötti félmagasságban. Az IBC-re ezután a megengedett legnagyobb bruttó tömeg kétszeresével egyenlő terhelést kell – egyenletesen elosztva – helyezni. A terhelést legalább 5 percig kell rajta tartani. Az olyan IBC-t, amelyet felülről vagy oldalról emelésre alakítottak ki, a terhelés eltávolítása után fel kell emelni, amíg az a talajtól elválik, és ebben a helyzetben kell tartani 5 perc időtartamig.

6.5.6.10.4 *Elfogadási feltétel*

A vágás eredeti hosszának 25%-ánál nagyobb mértékben nem növekedhet meg.

6.5.6.11 Billentési próba

6.5.6.11.1 Alkalmazási terület

Gyártási típus vizsgálatként minden hajlékony falú IBC típusnál.

6.5.6.11.2 Az IBC előkészítése a próbához

Az IBC-t ürtartalmának legalább 95%-áig és megengedett legnagyobb bruttó tömegéig kell – a tartalmat egyenletesen elosztva – megtölteni.

6.5.6.11.3 Vizsgálati eljárás

Az IBC-t oly módon kell átbillenteni, hogy felső része a merev, rugalmatlan, sima, sík és vízszintes felületnek ütközzön.

6.5.6.11.4 Billentési magasság

I csomagolási csoport	II csomagolási csoport	III csomagolási csoport
1,8 m	1,2 m	0,8 m

6.5.6.11.5 Elfogadási feltétel

Nem következhet be a tartalom elvesztése. A tartalom kismértékű kiszabadulása a záráson vagy a varrásokon keresztül a felütközéskor nem tekintendő az IBC tönkremenetelének, feltéve, hogy további szivárgás nem következik be.

6.5.6.12 Felállítási próba

6.5.6.12.1 Alkalmazási terület

Gyártási típus vizsgálatként minden hajlékony falú IBC-nél, amely felülről vagy oldalról való emelésre van kialakítva.

6.5.6.12.2 Az IBC előkészítése a próbához

Az IBC-t ürtartalmának legalább 95%-áig és megengedett legnagyobb bruttó tömegéig kell – a tartalmat egyenletesen elosztva – megtölteni.

6.5.6.12.3 Vizsgálati eljárás

Az egyik oldalára fektetett IBC-t egyik emelőszerkezeténél, vagy amennyiben négy van, két emelőszerkezeténél fogva legalább 0,1 m/s sebességgel függőleges helyzetbe kell felemelni, amíg a talajtól elválik.

6.5.6.12.4 Elfogadási feltétel

Nem következhet be sem az IBC, sem emelőszerkezetének olyan sérülése, amely az IBC biztonságát a szállítás vagy kezelés során csökkentené.

6.5.6.13 Rázóvizsgálat

6.5.6.13.1 Alkalmazási terület

Gyártási típus vizsgálatként minden olyan IBC típusnál, amelyeket folyadékokhoz használnak.

Megjegyzés: Ezt a vizsgálatot a 2010. december 31. után gyártott IBC-k gyártási típusára kell alkalmazni (lásd még az 1.6.1.14 bekezdést is).

6.5.6.13.2 Az IBC előkészítése a próbához

Egy IBC-t kell véletlenszerűen kiválasztani, és ugyanúgy kell előkészíteni és lezárni, mint a szállításra. Az IBC-t legnagyobb ürtartalmának legalább 98%-áig kell vízzel megtölteni.

6.5.6.13.3 *Vizsgálati eljárás és a vizsgálat időtartama*

6.5.6.13.3.1 Az IBC-t a vizsgálóberendezés asztalának közepére kell helyezni, amely függőleges irányú, szinuszos rezgőmozgást végez, amelynek teljes amplitúdója (csúcstól-csúcsig kitérése) $25\text{ mm} \pm 5\%$. Ha szükséges, az asztalhoz olyan kitámasztó eszközt kell erősíteni, amely meggátolja, hogy a mintadarab vízszintes irányban elmozduljon az asztalon, anélkül, hogy a függőleges irányú mozgást akadályozná.

6.5.6.13.3.2 A vizsgálatot egy órán át kell folytatni olyan frekvenciával, amelynél az IBC alapjának egy része minden periódus egy részében átmenetileg olyan mértékben felemelkedik a rázóasztalról, hogy egy fémlemezt időnként az IBC alapja és a vizsgáló asztal közé legalább egy ponton teljes egészében be lehessen csúsztatni. A kezdeti beállított frekvencia értéket – szükség esetén – úgy kell változtatni, hogy a csomagolóeszköz ne rezonáljon. Mindazonáltal a vizsgáló frekvenciának továbbra is lehetővé kell tennie a fémlemez behelyezését az IBC alá, ahogy e bekezdés azt előírja. A fémlemez folyamatos behelyezhetősége elengedhetetlen a vizsgálat elviselése szempontjából. Az ehhez a vizsgálatához használt fémlemeznek legalább 1,6 mm vastagnak és 50 mm szélesnek kell lennie, és elég hosszúnak ahhoz, hogy a vizsgálat végrehajtása céljából az IBC és a rázóasztal közé legalább 100 mm-re becsúsztható legyen.

6.5.6.13.4 *Elfogadási feltétel*

Sem szivárgás, sem törés nem következhet be. Ezenkívül a szerkezeti elemek nem törhetnek el, ill. nem hibásodhatnak meg, pl. a hegesztések nem törhetnek el, a rögzítések nem rongálódhatnak meg.

6.5.6.14 *Vizsgálati jegyzőkönyv*

6.5.6.14.1 A vizsgálatokról jegyzőkönyvet kell készíteni, amit az IBC felhasználói számára hozzáférhetővé kell tenni és amelynek legalább a következő adatokat kell tartalmaznia:

1. A vizsgálatot végző szerv neve és címe;
2. A vizsgálatot kérő neve és címe (ha szükséges);
3. A vizsgálati jegyzőkönyv egyedi azonosítója;
4. A vizsgálati jegyzőkönyv kelte;
5. Az IBC gyártója;
6. Az IBC típus leírása (pl. a méretek, az anyagok, a zárószerkezetek, a falvastagság stb.), beleértve a gyártási módszert (pl. üreges test fűvás), ami rajzokkal és/vagy fényképekkel kiegészíthető;
7. Legnagyobb ürtartalom;
8. A vizsgálat alatti tartalom jellemzői, pl. folyadékoknál a viszkozitás és a relatív sűrűség és szilárd anyagoknál a szemcseméret;
9. A vizsgálatok leírása és eredményei;
10. A vizsgálati jegyzőkönyvet alá kell írni, az aláíró nevét és beosztását fel kell tüntetni.

6.5.6.14.2 A vizsgálati jegyzőkönyvnek megállapítást kell tartalmaznia arra nézve, hogy a szállításra előkészített IBC a jelen fejezet megfelelő rendelkezéseivel összhangban került vizsgálatra és más csomagolási módszerek vagy alkotórészek használata azt érvénytelenné teheti. A vizsgálati jegyzőkönyv egy példányát az illetékes hatóságnak kell átadni.

6.6 FEJEZET

A NAGYCSOMAGOLÁSOK GYÁRTÁSÁRA ÉS VIZSGÁLATÁRA VONATKOZÓ ELŐÍRÁSOK

6.6.1 Általános előírások

6.6.1.1 Ezen fejezet követelményei nem vonatkoznak:

- a gázt tartalmazó tárgyakhoz (beleértve az aeroszolokat) használt nagycsomagolások kivételével a 2 osztály anyagainak csomagolóeszközeire;
- az UN 3291 kórházi hulladékhoz használt nagycsomagolások kivételével a 6.2 osztály áruinak csomagolóeszközeire;

l) a radioaktív anyagot tartalmazó, 7 osztályba tartozó küldeménydarabokra.

6.6.1.2 Annak biztosítására, hogy minden legyártott, ill. átalakított nagycsomagolás megfeleljen e fejezet előírásainak, a nagycsomagolásokat olyan minőségbiztosítási program szerint kell gyártani, bevizsgálni és átalakítani, amelyet az illetékes hatóság kielégítőnek tart.

Megjegyzés: Az alkalmazható eljárás(ok)ra megfelelő útmutatást ad az ISO 16106:2006 szabvány: „Csomagolás. Veszélyes áruk szállítási csomagolása. Veszélyes áruk csomagolásai, közepes méretű szállítótartályok (IBC-k) és nagyméretű csomagolások. Útmutató az ISO 9001 alkalmazásához”.

6.6.1.3 A nagycsomagolásokra a 6.6.4 szakaszban felsorolt különleges követelmények a jelenleg használt nagycsomagolásokon alapulnak. A tudományos és műszaki haladás figyelembe vétele érdekében nincs akadálya olyan nagycsomagolások használatának, amelyek eltérnek a 6.6.4 szakaszban levő specifikációktól, ha azonos hatékonyságúak, az illetékes hatóság számára elfogadhatóak és képesek sikeresen kiállni a 6.6.5 szakaszban leírt vizsgálatokat. Az ADR-ben leírt vizsgálatoktól eltérő vizsgálatok is alkalmazhatók, ha azonos hatékonyságúak és az illetékes hatóság elfogadja.

6.6.1.4 A csomagolóeszköz gyártójának és forgalmazójának információt kell nyújtania a követendő eljárásokra és a zárószervezetek (beleértve a szükséges tömítéseket) típusára és méreteire és minden más alkatrészre, ami annak biztosításához szükséges, hogy a szállításra előkészített küldeménydarab képes legyen az e fejezet vonatkozó igénybevételi próbáinak elviselésére.

6.6.2 A nagycsomagolások típusát jelölő kód

6.6.2.1 A nagycsomagolásokhoz használt kód a következőkből áll:

- a) két arab számjegy
 - 50 a merev falú nagycsomagolásokhoz; vagy
 - 51 a hajlékony falú nagycsomagolásokhoz; és
- b) egy latin nagybetű, amely az anyag fajtáját jelöli, pl. fa, acél stb. A használható nagybetűket a 6.1.2.6 bekezdés sorolja fel.

6.6.2.2 A nagycsomagolások típusát jelölő kódot egy „W” betű követheti. A „W” betű azt jelenti, hogy a nagycsomagolás, bár a kód által jelzett típus alá tartozik, de a 6.6.4 szakaszban előírtaktól eltérően gyártották, és a 6.6.1.3 bekezdés előírásai szerint azonos értékűnek tekinthető.

6.6.3

Jelölés

6.6.3.1

Alapjelölés

Minden, az ADR előírásai szerint gyártott és ADR szerinti felhasználásra szánt nagycsomagoláson jelölésnek kell lennie, amely tartós, jól olvasható és jól látható helyen van. A betűk, számok és jelek magasságának legalább 12 mm-nek kell lennie a következő tartalommal:

- a) az Egyesült Nemzetek jele a csomagolóeszközön:  .
- Ezt a jelet csak annak tanúsítására szabad használni, hogy a csomagolóeszköz, a mobil tartány, ill. a MEG-konténer megfelel a 6.1, a 6.2, a 6.3, a 6.5, a 6.6, ill. a 6.7¹⁾ fejezet vonatkozó előírásainak Amennyiben a jelölést beütéssel viszik fel a fém nagycsomagolásokra, e jel helyett az „UN” nagybetűk is használhatók;
- b) az „50” szám a merev falú nagycsomagolások esetében, ill. az „51” a hajlékony falú nagycsomagolások esetében, amit a 6.5.1.4.1 b) pont szerinti anyagfajta jelölése követ;
- c) egy nagybetű, amely a csomagolási csoporto(ka)t jelöli, amely(ek)re a gyártási típust jóváhagyták:
- X az I, a II és a III csomagolási csoporthoz;
- Y a II és a III csomagolási csoporthoz;
- Z csak a III csomagolási csoporthoz;
- d) a gyártási hónap és év (az utolsó két számjegy);
- e) annak az államnak a jele, amely a jelölés alkalmazását engedélyezte, a nemzetközi forgalomban résztvevő gépjárművek államjelzésével²⁾;
- f) a gyártó neve vagy jele, vagy a nagycsomagolásoknak az illetékes hatóság által megállapított egyéb azonosító jele;
- g) a halmazolási próba során alkalmazott terhelés kg-ban. A halmazolásra nem tervezett nagycsomagolásokon „0”-t kell feltüntetni;
- h) a megengedett legnagyobb bruttó tömeg kilogrammban.

Az alapjelölést az előző pontok sorrendjében kell felvinni.

Az előző a) – h) pontban előírt jelölés elemeket egyértelműen el kell választani egymástól, pl. ferde vonallal vagy szóközzel, hogy könnyen azonosíthatók legyenek.

6.6.3.2

Példák a jelölésre

50A/X/05 01/N/PQRS
2500/1000

Acél nagycsomagolásokhoz, amelyek halmazolhatók, a halmazolási próba során alkalmazott terhelés: 2500 kg; a megengedett legnagyobb bruttó tömeg: 1000 kg.

50H/Y/04 02/D/ABCD 987
0/800

Műanyag nagycsomagoláshoz, amely nem halmazolható, a megengedett legnagyobb bruttó tömeg: 800 kg.

51H/Z/06 01/S/1999
0/500

Hajlékony falú nagycsomagoláshoz, amely nem halmazolható, a megengedett legnagyobb bruttó tömeg: 500 kg.

-
- 1) Ezt a jelet használják annak tanúsítására is, hogy az olyan hajlékony ömlesztettáru-konténerek, amelyeket más közlekedési alágazatra hagytak jóvá, megfelelnek az ENSZ Minta Szabályzat 6.8 fejezete követelményeinek.
- 2) A közúti közlekedésről szóló Bécsi Egyezmény (Bécs, 1968) által előírt államjelzés a nemzetközi forgalomban résztvevő gépjárművekre.

6.6.3.3

A nagycsomagolás használata során megengedett legnagyobb halmazolási terhelést a következő jelképpel kell feltüntetni:

A jelképnek legalább 100 x 100 mm nagyságúnak, tartósnak és jól látható kell lennie. A tömeget legalább 12 mm magas számokkal, ill. betűkkel kell feltüntetni.

A jelkép fölött feltüntetett tömeg nem lehet nagyobb, mint a gyártási típus vizsgálat (lásd a 6.6.5.3.3.4 pontot) során alkalmazott terhelés és 1,8 hányadosa.

6.6.4

Különleges követelmények a nagycsomagolásokra

6.6.4.1

Különleges követelmények a fémből készült nagycsomagolásokra

- 50A kódjelű acél nagycsomagolás
- 50B kódjelű alumínium nagycsomagolás
- 50N kódjelű fém (acélt és alumíniumot kivéve) nagycsomagolás

6.6.4.1.1

A nagycsomagolást olyan alkalmas, alakítható fémből kell készíteni, amelynek hegeszthetősége bizonyított. A hegesztési varratokat szakszerűen kell elkészíteni és azoknak teljes biztonságot kell nyújtaniuk. Szükség esetén figyelembe kell venni az alacsony hőmérsékleten tanúsított viselkedést.

6.6.4.1.2

Gondoskodni kell arról, hogy az egymással határos különböző fémek révén létrejövő elektrolitikus korrózió elkerülhető legyen.

6.6.4.2

Különleges követelmények a hajlékony falú nagycsomagolásokra

- 51H kódjelű hajlékony falú műanyag nagycsomagolás
- 51M kódjelű hajlékony falú papír nagycsomagolás

6.6.4.2.1

A nagycsomagolásokat megfelelő anyagokból kell gyártani. Az anyag szilárdságának és a hajlékony falú nagycsomagolás gyártási módszerének igazodnia kell a nagycsomagolás ürtartalmához és rendeltetéséhez.

6.6.4.2.2

Az 51M típusú, hajlékony falú nagycsomagolások gyártásához használt minden anyagnak legalább 24 órán át tartó, vízbe való merítés után meg kell őriznie annak a szakítószilárdságnak legalább 85%-át, amelyet az anyag kiegyenlített klimatizálása után 67% vagy ennél kisebb relatív nedvességtartalom mellett mértek.

6.6.4.2.3

A egyesítéseket varrással, hőhegesztéssel, ragasztással vagy ezekkel egyenértékű eljárással kell elkészíteni. A varrással kialakított egyesítések minden végét el kell dolgozni.

6.6.4.2.4

A hajlékony falú nagycsomagolásnak kielégítő ellenállással kell rendelkeznie az ultrahő sugárzás hatására, a klimatikus hatásokra vagy a rendeltetés szerint szállított anyag hatására bekövetkező öregedéssel és gyengüléssel szemben.

- 6.6.4.2.5** Amennyiben a műanyagból készült, hajlékony falú nagycsomagolást az ultraibolya sugarak ellen védeni kell, ennek korom vagy más alkalmas pigment vagy inhibitor hozzáadásával kell történnie. Az adalékoknak összeférhetőnek kell lenniük a tartalommal és hatásukat a csomagolóeszköz-test teljes élettartama alatt meg kell őrizniük. Olyan korom, pigment vagy inhibitor alkalmazásánál, amely különbözik a bevizsgált gyártási típus gyártásához használttól, a vizsgálatok megismétlésétől el lehet tekinteni, ha a megváltozott korom-, pigment vagy inhibitor tartalom a szerkezeti anyag fizikai tulajdonságait kedvezőtlenül nem befolyásolja.
- 6.6.4.2.6** A nagycsomagolás anyagába adalékanyagok keverhetők, hogy az öregedéssel szembeni ellenállóképességet javítsák, vagy más célokra, feltéve, hogy ezek az adalékok az anyag fizikai vagy kémia tulajdonságait kedvezőtlenül nem befolyásolják.
- 6.6.4.2.7** Megtöltött állapotban a magasság és a szélesség aránya nem haladhatja meg a 2:1 értéket.
- 6.6.4.3** ***Különleges követelmények a merev falú műanyag nagycsomagolásokra***
- 50H kódjelű merev falú műanyag nagycsomagolás
- 6.6.4.3.1** A nagycsomagolást ismert minőségi jellemzőjű, alkalmas műanyagból kell gyártani és űrtartalmának és rendeltetésszerű felhasználási módjának megfelelő szilárdsággal kell rendelkeznie. Az anyagnak kielégítő ellenállást kell tanúsítania a tartalmazott anyag és esetleg az ultraibolya sugárzás hatására bekövetkező öregedéssel és gyengüléssel szemben. Szükség esetén figyelembe kell venni az alacsony hőmérsékleten tanúsított viselkedését. A benne levő tartalom esetleges áthatolása normális szállítási feltételek között nem okozhat veszélyt.
- 6.6.4.3.2** Amennyiben az ultraibolya sugarak ellen védelem szükséges, ennek korom vagy más alkalmas pigment vagy inhibitor hozzáadásával kell történnie. Ezeknek az adalékoknak összeférhetőnek kell lenniük a tartalommal és hatásukat a test teljes élettartama alatt meg kell őrizniük. Olyan korom, pigment vagy inhibitor alkalmazásánál, amely különbözik a bevizsgált gyártási típus gyártásához használttól, a vizsgálatok megismétlésétől el lehet tekinteni, ha a megváltozott korom-, pigment- vagy inhibitor tartalom a szerkezeti anyag fizikai tulajdonságait kedvezőtlenül nem befolyásolja.
- 6.6.4.3.3** A nagycsomagolás anyagába adalékanyagok keverhetők, hogy az öregedéssel szembeni ellenállóképességet javítsák, vagy más célokra, feltéve, hogy ezek az adalékok az anyag fizikai vagy kémia tulajdonságait kedvezőtlenül nem befolyásolják.
- 6.6.4.4** ***Különleges követelmények a papírlemez nagycsomagolásokra***
- 50G kódjelű merev falú papírlemez nagycsomagolás
- 6.6.4.4.1** Szilárd és jó minőségű, tömör vagy hullámpapírlemezt (három vagy többretegűt) kell használni, amely megfelel a nagycsomagolás űrtartalmának és rendeltetésszerű használatának. A külső felület vízállóságának olyan mértékűnek kell lenni, hogy a Cobb-módszerrel végzett vízfelvétel-próba 30 perce alatt a tömegnövekedés ne haladja meg a 155 g/m² értéket – lásd az ISO 535:1991 szabványt. A papírlemeznek megfelelő hajlítószilárdsággal kell rendelkeznie. A papírlemezt úgy kell kiszabni, átmetszés nélkül völgyelni és réselni, hogy az összeállításnál ne repedjen meg, a felülete ne törjön meg és ne hasasodjon ki. A hullámpapírlemez hullámosított rétegét a fedőrétegekhez szilárdan hozzá kell ragasztani.
- 6.6.4.4.2** Az oldalfalaknak, a tetőnek és a fenéknek minimálisan 15 J beszakítási szilárdsággal kell rendelkezniük, az ISO 3036:1975 szabvány szerint mérve.
- 6.6.4.4.3** A nagycsomagolások külső burkolatain a palást illesztéseit megfelelő mértékben át kell lapolni és ragasztószalaggal kell lezárni, le kell ragasztani vagy fémkapcsokkal kell tűzni, vagy legalább azonos hatékonyságú módszerrel kell egyesíteni. Ha az egyesítés ragasztással vagy ragasztószalaggal történik, vízálló ragasztót kell használni. A fémkapcsoknak minden összeerősítendő részen teljesen át kell hatolniuk és oly módon kell azokat kialakítani vagy védeni, hogy a bélést ne dörzsölhessék vagy ne szűrassák ki.

- 6.6.4.4.4** A nagycsomagolás részét képező rakodólap alapzatnak, ill. bármilyen különálló rakodólapnak alkalmasnak kell lennie a megengedett legnagyobb bruttó tömegig megtöltött nagycsomagolás gépi kezelésére.
- 6.6.4.4.5** A rakodólapot, ill. a nagycsomagolás részét képező alapzatot úgy kell kialakítani, hogy a nagycsomagolás alapján ne legyen semmilyen kiszögellés, ami a kezelés során sérülést okozhatna.
- 6.6.4.4.6** A testet a különálló rakodólaphoz hozzá kell erősíteni, hogy biztosítva legyen a stabilitás a kezelés és a szállítás során. A különálló rakodólap felső felületének mentesnek kell lennie mindenféle éles kiszögelléstől, ami a nagycsomagolást megsérthetné.
- 6.6.4.4.7** A halmazolás megkönnyítésére erősítő szerkezetek, mint pl. fa tartóelemek használhatók, de ezeket a bélésen kívül kell elhelyezni.
- 6.6.4.4.8** Amennyiben nagycsomagolásokat halmazolásra szánják, a teherviselő felületnek olyannak kell lennie, hogy a terhelés biztonságos módon eloszódjon.
- 6.6.4.5** ***Különleges követelmények a fa nagycsomagolásokra***
- 50C kódjelű közönséges fa nagycsomagolás
- 50D kódjelű rétegelt falemez nagycsomagolás
- 50F kódjelű farostlemez nagycsomagolás
- 6.6.4.5.1** A felhasznált anyag szilárdsága és a test gyártási módja feleljen meg a nagycsomagolás ürtartalmának és rendeltetésszerű felhasználásának.
- 6.6.4.5.2** A felhasznált fának jól kiérleltnek, kereskedelmi szárazságúnak és olyan hibáktól mentesnek kell lennie, ami a nagycsomagolás bármely részének szilárdságát csökkentené. A nagycsomagolás minden elemét egy darabból vagy ezzel egyenértékű módon kell gyártani. Az elemek akkor tekinthetők az egy darabból készülttel egyenértékűnek, ha a következő ragasztós kötéstípusok valamelyikét alkalmazzák: Lindermann-illesztés (fecskefarok illesztés), hornyolt átlapolás vagy a tompa illesztés, minden csatlakozásnál legalább két, hullámosított fém rögzítőelemmel, vagy akkor, ha legalább azonos hatékonyság más eljárást alkalmaznak.
- 6.6.4.5.3** A nagycsomagoláshoz felhasznált rétegelt falemeznek legalább háromrétegűnek kell lennie. Jól kiérlelt, hántolt vagy fűrészelt furnérból kell készíteni, amely kereskedelmi szárazságú és mentes olyan hibáktól, ami a test bármely részének szilárdságát csökkentené. A szomszédos rétegeket vízálló ragasztóval kell összeragasztani. A nagycsomagolás szerkezetéhez a rétegelt falemezzel együtt más alkalmas anyagok is használhatók.
- 6.6.4.5.4** A farostlemez nagycsomagolásokat vízálló farostlemezéből, pl. keménylemezből, faforgácslemezből vagy egyéb alkalmas típusból kell készíteni.
- 6.6.4.5.5** A nagycsomagolások oldallapjait szilárdan a sarokoszlopokhoz vagy homloklapokhoz kell szegezni vagy erősíteni vagy azonos mértékben alkalmas eszközökkel kell összeerősíteni.
- 6.6.4.5.6** A nagycsomagolás szerves részét képező rakodólap alapzatnak, ill. bármilyen különálló rakodólapnak alkalmasnak kell lennie a megengedett legnagyobb bruttó tömegig megtöltött nagycsomagolás gépi kezelésére.
- 6.6.4.5.7** A rakodólapot, ill. a nagycsomagolás szerves részét képező alapzatot úgy kell kialakítani, hogy nagycsomagolás alapján ne legyen semmilyen kiszögellés, ami a kezelés során sérülést okozhatna.
- 6.6.4.5.8** A testet a különálló rakodólaphoz hozzá kell erősíteni, hogy biztosítva legyen a stabilitás a kezelés és a szállítás során. A különálló rakodólap felső felületének mentesnek kell lennie mindenféle éles kiszögelléstől, ami a nagycsomagolást megsérthetné.

- 6.6.4.5.9** A halmazolás megkönnyítésére erősítő szerkezetek, mint pl. fa tartóelemek használhatók, de ezeket a bélésen kívül kell elhelyezni.
- 6.6.4.5.10** Amennyiben nagycsomagolásokat halmazolásra szánják, a teherviselő felületnek olyannak kell lennie, hogy a terhelés biztonságos módon elosztódjék.
- 6.6.5 Vizsgálati követelmények a nagycsomagolásokra**
- 6.6.5.1 *A vizsgálatok végrehajtása és gyakorisága***
- 6.6.5.1.1** Minden nagycsomagolás gyártási típusát a jelölés felvitelét engedélyező illetékes hatóság által meghatározott eljárás szerint, a 6.6.5.3 bekezdésben előírt vizsgálatoknak kell alávetni, és ugyanennek az illetékes hatóságnak jóvá kell hagyni.
- 6.6.5.1.2** A nagycsomagolások gyártási típusának sikeresen ki kell állnia az e fejezetben előírt vizsgálatokat, mielőtt az adott típusú nagycsomagolást használatba vennék. A nagycsomagolás gyártási típusát kialakítása, nagysága, anyaga és falvastagsága, gyártásmódja és a csomagolási módszer határozzák meg; egy típushoz azonban különböző felületkezelés is tartozhat. Ugyanaz a típus magában foglalja azokat a nagycsomagolásokat is, amelyek a gyártási típustól csak kisebb szerkezeti magasságban térnek el.
- 6.6.5.1.3** A vizsgálatokat a gyártásból vett mintákon az illetékes hatóság által meghatározott időközönként meg kell ismételni. Az ilyen vizsgálatoknál papírlemez nagycsomagolások esetén a szobahőmérsékleten való előkészítés azonosnak tekintendő a 6.6.5.2.4 pont előírásaival.
- 6.6.5.1.4** A vizsgálatokat minden olyan módosítás után meg kell ismételni, ami megváltoztatja a nagycsomagolás kialakítását, anyagát vagy gyártásmódját.
- 6.6.5.1.5** Az illetékes hatóság engedélyezheti azon nagycsomagolások szelektív vizsgálatát, amelyek csak kismértékben térnek el a már bevizsgálttól, pl. kisebb méretű belső csomagolásokat vagy kisebb nettó tömegű belső csomagolásokat tartalmaznak; és amelyek olyan nagycsomagolások, melyek a külső méret(ek)et tekintve valamivel kisebbek.
- 6.6.5.1.6** (fenntartva)
- Megjegyzés:** Különböző típusú belső csomagolóeszközök egy nagycsomagolásba való helyezésére, ill. a belső csomagolóeszköz változatokra vonatkozóan lásd a 4.1.1.5.1 pontot.*
- 6.6.5.1.7** Az illetékes hatóság bármikor előírhatja, hogy a jelen szakasz előírásainak megfelelő próbákkal igazolják, hogy a sorozatban gyártott csomagolóeszközök megfelelnek a gyártási típus követelményeinek.
- 6.6.5.1.8** Amennyiben a vizsgálat eredményeit nem befolyásolja és az illetékes hatóság hozzájárul, ugyanazon a mintán több vizsgálat is végezhető.
- 6.6.5.2 *Előkészítés a vizsgálatokhoz***
- 6.6.5.2.1** A próbákat szállításra kész csomagolásokon kell végrehajtani, beleértve az alkalmazott belső csomagolóeszközöket. A belső csomagolóeszközöket folyadékok esetén ürtartalmuk legalább 98%-áig, szilárd anyag esetén legalább 95%-áig kell megtölteni. Az olyan nagycsomagolásoknál, ahol a belső csomagolóeszközök folyadékokat és szilárd anyagokat egyaránt tartalmaznak, külön vizsgálat szükséges a folyadék és külön a szilárd anyag tartalomra. A belső csomagolóeszközben levő anyag, ill. a szállítandó tárgy helyettesíthető más anyaggal vagy tárggyal, kivéve, ha ez meghamisítaná a próbák eredményét. Amennyiben más belső csomagolóeszközt vagy tárgyat alkalmaznak, annak ugyanolyan fizikai jellemzői legyenek (tömeg stb.), mint a szállítandó anyagnak vagy tárgynak. Abból a

célból, hogy elérjék a küldeménydarab megkövetelt össztömegét, kiegészítő terhek is használhatók, pl. ólomszemcsét tartalmazó zsákok, feltéve, hogy ezeket oly módon helyezik el, hogy nem hamisítják meg a próbák eredményét.

6.6.5.2.2 Ha a folyadékra vonatkozó ejtőpróbáknál helyettesítő anyagot használnak, ennek a szállítandó anyaggal azonos relatív sűrűségűnek és viszkozitásúnak kell lennie. Folyadékokra vonatkozó ejtőpróbánál a 6.6.5.3.4.4 pont feltételei szerint helyettesítő anyagként víz is használható.

6.6.5.2.3 A műanyagból készült nagycsomagolásokat és a műanyag belső csomagolóeszközöket – a szilárd anyagokat vagy tárgyakat tartalmazó zsákok kivételével – tartalmazó nagycsomagolásokat akkor kell az ejtőpróbának alávetni, amikor a vizsgálati minta és tartalma hőmérsékletét -18 °C -ra vagy az alá lehűtötték. Ezt a kondicionálást nem kell alkalmazni, ha a kérdéses anyagok alacsony hőmérsékleten elegendő hajlékonysággal és szakítószilárdsággal bírnak. Ha a vizsgálandó mintát ily módon készítették elő, a 6.6.5.2.4 pont szerinti kondicionálás elhagyható. A vizsgálatához használt folyadékot szükség esetén fagyásgátló hozzáadásával folyékony állapotban kell tartani.

6.6.5.2.4 A papírlemezből készült nagycsomagolásokat legalább 24 órán át szabályozott hőmérsékletű és relatív páratartalmú levegőn kell tartani. Három megoldás közül lehet választani. Az ajánlott érték $23\text{ °C} \pm 2\text{ °C}$ hőmérséklet és $50\% \pm 2\%$ páratartalom. A másik két lehetőség: $20\text{ °C} \pm 2\text{ °C}$ hőmérséklet és $65\% \pm 2\%$ páratartalom, illetve $27\text{ °C} \pm 2\text{ °C}$ hőmérséklet és $65\% \pm 2\%$ páratartalom.

Megjegyzés: Az átlagértékeknek ezen határok közé kell esniük. A rövid idejű ingadozások és a mérési korlátok az egyedi mérésektől legfeljebb $\pm 5\%$ relatív páratartalom eltérést eredményezhetnek a vizsgálatok reprodukálhatóságának észrevehető csökkenése nélkül.

6.6.5.3 Vizsgálati követelmények

6.6.5.3.1 Emelési próba alulról

6.6.5.3.1.1 Alkalmazási terület

Gyártási típus vizsgálatként minden olyan nagycsomagolás típusnál, amely az alulról való emeléshez el van látva szerkezettel.

6.6.5.3.1.2 A nagycsomagolás előkészítése a próbához

A nagycsomagolást megengedett legnagyobb bruttó tömegének 1,25-szorosáig kell – a terhelést egyenletesen elosztva – megtölteni.

6.6.5.3.1.3 Vizsgálati eljárás

A nagycsomagolást emelővillás targoncával kétszer fel kell emelni és le kell tenni. Ennek során a villákat központosan kell elhelyezni, és azoknak egymástól olyan távolságra kell lenniük, amely a bevezetés felőli oldalméret háromnegyed részének felel meg, (hacsak a bevezetési pontok nincsenek rögzítve). A villákat a bevezetés irányában háromnegyed részig kell bevezetni. A próbát minden lehetséges irányból meg kell ismételni.

6.6.5.3.1.4 Elfogadási feltétel

Nem következhet be sem olyan tartós alakváltozás, amely a nagycsomagolás biztonságát a szállítás szempontjából csökkentené, sem a tartalom elvesztése.

6.6.5.3.2 Emelés felülről

6.6.5.3.2.1 Alkalmazási terület

Gyártási típus vizsgálatként minden olyan nagycsomagolás típusnál, amely el van látva a felülről való emelésre szolgáló szerkezettel.

- 6.6.5.3.2.2** A nagycsomagolás előkészítése a próbához
A nagycsomagolást a megengedett legnagyobb bruttó tömeg kétszereséig kell megtölteni. A hajlékony falú nagycsomagolást a megengedett legnagyobb terhelés hatszorosaig kell – a terhelést egyenletesen elosztva – megtölteni.
- 6.6.5.3.2.3** Vizsgálati eljárás
A nagycsomagolást rendeltetésszerűen fel kell emelni, amíg az a talajtól elválik, és ebben a helyzetben kell tartani 5 perc időtartamig.
- 6.6.5.3.2.4** Elfogadási feltétel
- a) Fém és merev falú műanyag nagycsomagolásoknál: nem következhet be sem olyan tartós alakváltozás, amely a nagycsomagolás (beleértve a rakodólap alapot, ha ilyen van) biztonságát a szállítás szempontjából csökkentené, sem a tartalom elvesztése.
 - b) Hajlékony falú nagycsomagolásoknál: nem következhet be olyan sérülés sem a nagycsomagoláson, sem annak emelőszerkezetén, amely a nagycsomagolás biztonságát a szállítás vagy kezelés szempontjából csökkentené, sem a tartalom elvesztése.
- 6.6.5.3.3** *Halmazolási próba*
- 6.6.5.3.3.1** Alkalmazási terület
Gyártási típus vizsgálatként minden olyan nagycsomagolás típusnál, amelyek kialakításuknál fogva egymásra halmazolhatók.
- 6.6.5.3.3.2** A nagycsomagolás előkészítése a próbához
A nagycsomagolást megengedett legnagyobb bruttó tömegéig kell megtölteni.
- 6.6.5.3.3.3** Vizsgálati eljárás
A nagycsomagolást alapzatával vízszintes, sík, kemény talajra kell állítani és egyenletesen elosztott próbaterhelést kell ráhelyezni (lásd a 6.6.5.3.3.4 pontot) legalább 5 percig, fa, papírlemez és műanyag nagycsomagolások esetében 24 órán át.
- 6.6.5.3.3.4** A ráhelyezendő próbaterhelés kiszámítása
A tehernek, amelyet a nagycsomagolásra helyeznek, meg kell egyeznie a szállítás során a nagycsomagolásra halmazolható hasonló nagycsomagolások összes tömegének legalább 1,8-szeresével.
- 6.6.5.3.3.5** Elfogadási feltétel
- a) A hajlékony falú nagycsomagolás kivételével minden más nagycsomagolásnál: nem következhet be sem olyan tartós alakváltozás, amely a nagycsomagolás (beleértve az esetleges rakodólap alapot is, ha ilyen van) biztonságát a szállítás szempontjából csökkentené, sem a tartalom elvesztése.
 - b) Hajlékony falú nagycsomagolásnál: nem következhet be sem a test olyan károsodása, ami a nagycsomagolás biztonságát a szállítás szempontjából csökkentené, sem a tartalom elvesztése.
- 6.6.5.3.4** *Ejtőpróba*
- 6.6.5.3.4.1** Alkalmazási terület
Gyártási típus vizsgálatként minden nagycsomagolás típusnál.
- 6.6.5.3.4.2** A nagycsomagolás előkészítése a próbához
A nagycsomagolást a 6.6.5.2.1 pont szerint kell megtölteni.
- 6.6.5.3.4.3** Vizsgálati eljárás
A nagycsomagolást oly módon kell a 6.1.5.3.4 pont követelményeinek megfelelő, rugalmatlan, vízszintes, sima, masszív és szilárd felületre ejteni, ami biztosítja, hogy a

nagycsomagolás az alapfelület legérzékenyebbnek tekintett részén ütközzön fel.

6.6.5.3.4.4 Ejtési magasság

Megjegyzés: Az 1 osztály anyagaihoz és tárgyaihoz használandó nagycsomagolást a II csomagolási csoport igénybevételi szintjén kell vizsgálni.

6.6.5.3.4.4.1 Szilárd vagy folyékony anyagokat, ill. tárgyakat tartalmazó belső csomagolásoknál, ha a próbát a szállítandó szilárd vagy folyékony anyaggal, ill. tárgyakkal vagy lényegében azonos fizikai jellemzőkkel bíró egyéb anyaggal vagy tárggyal végzik:

I csomagolási csoport	II csomagolási csoport	III csomagolási csoport
1,8 m	1,2 m	0,8 m

6.6.5.3.4.4.2 Folyékony anyagokat tartalmazó belső csomagolásoknál, ha a vizsgálatot vízzel hajtják végre:

- a) olyan szállítandó anyagok esetén, amelyek relatív sűrűsége nem haladja meg az 1,2 értéket:

I csomagolási csoport	II csomagolási csoport	III csomagolási csoport
1,8 m	1,2 m	0,8 m

- b) olyan szállítandó anyagok esetén, amelyek relatív sűrűsége meghaladja az 1,2 értéket, az ejtési magasságot a szállítandó anyag relatív sűrűségéből (d) a következő módon kell kiszámítani (egy tizedesre felkerekítve):

I csomagolási csoport	II csomagolási csoport	III csomagolási csoport
$d \times 1,5$ (m)	$d \times 1,0$ (m)	$d \times 0,67$ (m)

6.6.5.3.4.5 Elfogadási feltétel

6.6.5.3.4.5.1 Nem következhet be olyan sérülés, amely a szállítás biztonságát befolyásolná. A belső csomagolóeszközökben vagy tárgyakban levő anyag nem szivároghat.

6.6.5.3.4.5.2 Az 1 osztály tárgyaihoz használandó nagycsomagolás nem szenvedhet olyan törést, ami lehetővé teszi a nagycsomagolásból a robbanóanyag kifolyását vagy tárgyak kiszóródását.

6.6.5.3.4.5.3 A nagycsomagolás ejtési próbája során a minta megfelelőnek tekinthető, ha a teljes tartalmat megtartotta, még ha a zárás a továbbiakban nem is portömör.

6.6.5.4 Bizonyítvány és vizsgálati jegyzőkönyv

6.6.5.4.1 Minden nagycsomagolás gyártási típusra bizonyítványt kell kiállítani és (a 6.6.3 szakasz szerinti) jelölést kell hozzáfűzteni, tanúsítva, hogy a gyártási típus, beleértve annak szerelvényeit, kielégíti a vizsgálat követelményeit.

6.6.5.4.2 A vizsgálatokról legalább a következő adatokat tartalmazó jegyzőkönyvet kell készíteni, amit a nagycsomagolás felhasználói számára hozzáférhetővé kell tenni

1. A vizsgálatot végző szerv neve és címe;
2. A vizsgálatot kérő neve és címe (ha szükséges);
3. A vizsgálati jegyzőkönyv egyedi azonosítója;
4. A vizsgálati jegyzőkönyv kelte;
5. A nagycsomagolás gyártója;
6. A nagycsomagolás gyártási típusának leírása (pl. méretek, anyagok, zárószervezetek, falvastagságok stb.) és/vagy fénykép(ek);
7. Legnagyobb ürtartalom / megengedett legnagyobb bruttó tömeg;

8. A vizsgálat alatti tartalom jellemzői, pl. a belső csomagolóeszközök vagy tárgyak típusa és leírása;
9. A vizsgálatok leírása és eredményei;
10. A vizsgálati jegyzőkönyvet alá kell írni, az aláíró nevét és beosztását fel kell tüntetni.

6.6.5.4.3

A vizsgálati jegyzőkönyvnek megállapítást kell tartalmaznia arra nézve, hogy a szállításra előkészített nagycsomagolás ezen fejezet megfelelő rendelkezéseivel összhangban került vizsgálatra és más csomagolási módszerek vagy alkotórészek használata azt érvénytelenné teheti. A vizsgálati jegyzőkönyv egy példányát az illetékes hatóságnak kell átadni.

6.7 FEJEZET

A MOBIL TARTÁNYOK ÉS AZ UN TÖBBELEMES GÁZKONTÉNEREK (UN MEG-KONTÉNEREK) TERVEZÉSÉRE, GYÁRTÁSÁRA ÉS VIZSGÁLATÁRA VONATKOZÓ ELŐÍRÁSOK

Megjegyzés: *A fémről gyártott, rögzített tartányokra (tartányjárművekre), leszerelhető tartányokra, tankkonténerekre és tartányos cserefelépítményekre, valamint a baté-riás járművekre és a többelemes gázkonténerekre (MEG-konténerekre) – az UN MEG-konténerek kivételével – lásd a 6.8 fejezetet; a szálvázis műanyag tartányokra lásd a 6.9 fejezetet, a hulladékok szállítására szolgáló, vákuummal üzemelő tartányokra lásd a 6.10 fejezetet.*

6.7.1 Alkalmazási terület és általános előírások

6.7.1.1 E fejezet követelményei a veszélyes áruk bármely alágazattal történő szállítására használt mobil tartányokra, ill. a 2 osztály nem mélyhűtött gázainak bármely alágazattal történő szállítására használt MEG-konténerekre vonatkoznak. Eltérő előírás hiányában, ha egy mobil tartány, ill. MEG-konténer a – többször módosított – „A Biztonságos Konténerekről szóló 1972. évi Nemzetközi Egyezmény” (CSC) meghatározása szerint konténernek minősül, akkor e fejezet követelményein kívül a CSC egyezmény előírásait is be kell tartani. A nyílt tengeren kezelt „offshore” mobil tartányokra, ill. MEG-konténerekre kiegészítő követelmények is vonatkozhatnak.

6.7.1.2 A tudományos és műszaki haladás figyelembe vétele érdekében e fejezet műszaki követelményei helyett alternatívaként más előírások is alkalmazhatók. Az alternatív kialakítású mobil tartánynak, ill. MEG-konténernek a szállított anyaggal való összeférhetőség, az ütdésekkel, a rakodási igénybevételekkel és a tüzsz szembeni ellenállóképesség tekintetében legalább olyan biztonságosnak kell lenniük, mintha e fejezet követelményeit teljesítették volna. Nemzetközi szállítás esetén az alternatív kialakítású mobil tartányt, ill. MEG-konténert az érintett illetékes hatóságoknak jóvá kell hagyniuk.

6.7.1.3 Ha egy anyaghoz a 3.2 fejezet „A” táblázat 10 oszlopában nincs is mobil tartány utasítás (T1 – T23, T50 vagy T75) feltüntetve, a származási ország illetékes hatósága ideiglenes szállítási engedélyt adhat ki. Az engedélynek legalább azokat az információkat kell tartalmaznia, amelyek normál esetben a mobil tartány utasításban szerepelnek, és tartalmaznia kell az anyag szállítási feltételeit. Az engedélyt a küldemény okmányaihoz kell csatolni.

6.7.2 Az 1 és a 3 – 9 osztály anyagainak szállításához használt mobil tartányok gyártására és vizsgálatára vonatkozó követelmények

6.7.2.1 Meghatározások

E szakasz alkalmazásában:

Az alternatív kialakítási engedély az e fejezetben meghatározottaktól eltérő műszaki előírások alapján tervezett, gyártott vagy eltérő vizsgálati módszer szerint vizsgált (alternatív kialakítású) mobil tartányra vagy MEG-konténerre az illetékes hatóság által kiadott engedély.

A *mobil tartány* olyan multimodális tartány, amelyet az 1 és a 3 – 9 osztály anyagainak szállítására használnak. A mobil tartány fogalmába maga a tartány és a veszélyes anyag szállításához szükséges üzemi és szerkezeti szerelvényei tartoznak. A mobil tartánynak a szerkezeti szerelvények eltávolítása nélkül tölthetőnek és üríthetőnek kell lennie. A tartány külső részén stabilizáló elemeknek kell lenniük, és alkalmasnak kell lennie arra, hogy megtöltött állapotban felemeljék. Úgy kell kialakítani, hogy elsősorban közúti járműre,

vasúti kocsira, ill. tengerjáró vagy belvízi hajóba lehessen rakni, a gépi rakodás megkönnyítésére kerettel vagy egyéb szerkezetekkel kell ellátni. A közúti tartányjárművek, a vasúti tartálykocsik, a nem fém-ből készült tartányok és a nagyméretű csomagolóeszközök (IBC-k) e meghatározás értelmében nem minősülnek mobil tartánynak.

A *tartány* a mobil tartány azon része, amely a szállítandó anyag megtartására szolgál (maga a tartány), beleértve a nyílásokat és zárószerveit, de kizárva az üzemi szerelvényeket és a külső szerkezeti szerelvényeket.

Az *üzemi szerelvények* a töltő- és ürítő-, a szellőző-, a biztonsági, a fűtő-, a hűtő- és a hőszigetelő berendezések, valamint a mérőeszközök.

A *szerkezeti szerelvények* a tartány külső részén található erősítő-, rögzítő-, védő- vagy stabilizáló elemek.

A *megengedett legnagyobb üzemi nyomás* a tartány üzemi helyzetében, annak tetején mérhető nyomás, amely nem lehet kisebb, mint a következő két nyomás érték közül a nagyobbik:

- a) a tartányban a töltés, ill. ürítés során megengedett legnagyobb tényleges nyomás (túlnyomás); vagy
- b) a legnagyobb tényleges túlnyomás, amelyre a tartány méretezve van, ami nem lehet kevesebb, mint
 - i) az anyag abszolút gőznyomása (bar-ban) 65 °C-on mínusz 1 bar; és
 - ii) a folyadékszint feletti térben levő levegő, ill. egyéb gáz parciális nyomásai (bar-ban), amelyet a következők alapulvételével kell meghatározni: legfeljebb 65 °C hőmérsékletű folyadékszint feletti tér, valamint az átlagos hőmérséklet $t_r - t_f$ értékű növekedéséből adódó folyadék-fázis tágulás (ahol t_f = a töltési hőmérséklet, rendszerint 15 °C; t_r = a legnagyobb átlagos hőmérséklet, 50 °C).

A *tervezési nyomás* a nyomástartó edényekre vonatkozó szabályzat szerint a számításokhoz használandó nyomás. A tervezési nyomás nem lehet kisebb, mint a következő nyomások közül a legnagyobb:

- a) a tartányban a töltés, ill. ürítés során megengedett legnagyobb tényleges nyomás (túlnyomás); vagy
- b) a következők összege:
 - i) az anyag abszolút gőznyomása (bar-ban) 65 °C-on mínusz 1 bar;
 - ii) a folyadékszint feletti térben levő levegő, ill. egyéb gáz parciális nyomásai (bar-ban), amelyet a következők alapulvételével kell meghatározni: legfeljebb 65 °C hőmérsékletű folyadékszint feletti tér, valamint az átlagos hőmérséklet $t_r - t_f$ értékű növekedéséből adódó folyadék-fázis tágulás (ahol t_f = a töltési hőmérséklet, rendszerint 15 °C; t_r = a legnagyobb átlagos hőmérséklet, 50 °C); és
 - iii) a 6.7.2.2.12 pontban meghatározott statikus erők alapján meghatározott folyadéknyomás, de legalább 0,35 bar; vagy
- c) a 4.2.5.2.6 pontban, az alkalmazandó mobil tartány utasításban meghatározott legkisebb próbanyomás kétharmada.

A *próbanyomás* a tervezési nyomás legalább 1,5-szeresével végzett folyadéknyomás-próba alatt a legnagyobb túlnyomás a tartány tetején. Az egyes anyagokhoz használt mobil tartányokra a legkisebb próbanyomás értékét a 4.2.5.2.6 pontban az alkalmazandó mobil tartány utasítások határozzák meg.

A *tömörségi próba* az a gázzal végzett vizsgálat, amelynek során a tartányt az üzemi szerelvényeivel a megengedett legnagyobb üzemi nyomás legalább 25%-át elérő tényleges belső nyomásnak teszik ki.

A *megengedett legnagyobb bruttó tömeg* a mobil tartány saját tömege és a szállításra engedélyezett legnagyobb rakomány össztömege.

A *referencia acél* a 370 N/mm^2 szakítószilárdságú és 27% szakadási nyúlású acél.

A *szerkezeti acél* olyan acél, amelynek szavatolt legkisebb szakítószilárdsága $360 \dots 440 \text{ N/mm}^2$ között van, és szakadási nyúlása megfelel a 6.7.2.3.3.3 pontnak.

A *tervezési hőmérséklet-tartomány* a környezeti hőmérsékleten szállított anyagokhoz használt tartányok esetében $-40 \text{ }^\circ\text{C} \dots +50 \text{ }^\circ\text{C}$. A magas hőmérsékleten szállított egyéb anyagoknál a tervezési hőmérséklet nem lehet alacsonyabb, mint az anyag töltés, ürítés, ill. szállítás alatti legmagasabb hőmérséklete. Szélsőséges éghajlati körülményeknek kitett mobil tartányok esetében szigorúbb tervezési hőmérsékleteket kell alkalmazni.

A *finom szemcseszerkezetű acél* olyan acél, amelyben a ferrit szemcsék mérete az ASTM E 112-96 szabvány szerint meghatározva 6 vagy annál finomabb vagy az EN 10028-3 szabvány 3 részében meghatározott acél.

Az *olvadóbeté*t egy hő hatására aktiválódó (kiolvadó), nem visszazárható nyomáscsökkentő szerkezet.

Az „*offshore*” *mobil tartány* olyan többször használható mobil tartány, amelyet speciálisan nyílt tengeri létesítményekhez, létesítményektől, ill. létesítmények közötti szállításra terveztek. Az „*offshore*” mobil tartányt a nyílt tengeren kezelt „*offshore*” konténerekre vonatkozó jóváhagyási útmutató szerint kell tervezni és gyártani, amit a Nemzetközi Tengerészeti Szervezet (IMO) MSC/Circ.860 dokumentuma tartalmaz.

6.7.2.2 *Általános tervezési és gyártási követelmények*

6.7.2.2.1

A tartányokat az illetékes hatóság által elismert, a nyomástartó edényekre vonatkozó szabályzat előírásainak megfelelően kell tervezni és gyártani. A tartányt alakításra alkalmas fémes anyagból kell készíteni. Az anyagoknak általában a belföldi vagy nemzetközi anyagszabványoknak kell megfelelniük. Hegesztett tartányokhoz csak olyan anyagok használhatók, amelyek hegeszthetősége teljes mértékben szavatolt. A hegesztéseket szakszerűen kell elkészíteni, és teljesen biztonságosnak kell lenniük. Ha a gyártási folyamat vagy az anyag szükségessé teszi, a tartányt megfelelően hőkezelní kell, hogy a hegesztéseknél és a hőhatásnak kitett zónákban biztosítsák a kielégítő szívósságot. Az anyagok kiválasztásánál a ridegtörés veszélye, a feszültség alatti korróziós repedezések és az ütésállóság szempontjából figyelembe kell venni a tervezési hőmérséklet-tartományt. Finom szemcseszerkezetű acélok használata esetén a szavatolt folyáshatár nem lehet nagyobb, mint 460 N/mm^2 , és a szavatolt szakítószilárdság felső határa nem lehet nagyobb, mint 725 N/mm^2 az anyagspecifikáció szerint. Alumínium szerkezeti anyagként csak akkor használható, ha az adott anyagra a 3.2 fejezet „A” táblázat 11 oszlopában található mobil tartány utasítás erre utal, vagy ha az illetékes hatóság engedélyezte. Alumínium engedélyezése esetén a tartányt szigeteléssel kell ellátní, ami megakadályozza a fizikai tulajdonságok jelentős romlását olyan esetekben, amikor a tartányt legalább 30 percen át 110 kW/m^2 hőterhelés éri. A hőszigetelésnek $649 \text{ }^\circ\text{C}$ alatti minden hőmérsékleten hatásosnak kell maradnia, és olyan anyaggal kell burkolni, amelynek olvadáspontja legalább $700 \text{ }^\circ\text{C}$. A mobil tartány anyagainak alkalmasnak kell lenniük ahhoz a külső környezethez, amelyben a tartányt szállíthatják.

6.7.2.2.2

A mobil tartányokat, a szerelvényeiket és a csővezetékeket olyan anyagból kell készíteni,

- a) amelyet a szállított anyag(ok) eleve nem támad(nak) meg; vagy
- b) amely kémiai reakció révén megfelelően passzíválódik vagy semlegesítődik; vagy
- c) amely a tartányhoz közvetlenül hozzáerősített vagy azzal egyenértékű módon hozzászertelt korrózióálló anyaggal van bélelve.

6.7.2.2.3

A tömítéseket olyan anyagokból kell készíteni, amelyeket a szállítandó anyag(ok) nem támad(nak) meg.

6.7.2.2.4

Ha a tartány bélelt, a bélésanyagnak eleve olyannak kell lennie, amit a szállított anyag(ok) nem támad(nak) meg, ezenkívül homogénnek, hézag- és áttörésmentesnek és kellően rugalmasnak kell lennie, valamint igazodnia kell a tartány hőtágulási jellemzőihez. Ha a tartányhoz külső szerelvény van hegesztve, a bélésnek folytonosan túl kell nyúlnia a

szerelvényen keresztül a karima legkülső pereméig.

- 6.7.2.2.5** A bélés illesztéseit és varratait az anyag összeolvasztásával vagy más, azonos hatékonyságú módszerrel kell kialakítani.
- 6.7.2.2.6** Kerülni kell a különböző fémek érintkezését, ami a galvanikus hatás folytán károsodást okozhat.
- 6.7.2.2.7** A mobil tartány, a szerelvények, a tömítések, a bélések és a tartozékok anyaga nem gyakorolhat kedvezőtlen hatást a mobil tartányban szállítandó anyagokra.
- 6.7.2.2.8** A mobil tartányt megfelelő emelő és rögzítő szerelvényekkel és olyan tartószerkezettel kell tervezni és kialakítani, amely a szállítás során biztos alátámasztást nyújt.
- 6.7.2.2.9** A mobil tartányt olyanra kell tervezni, hogy a szállított anyag vesztesége nélkül ellenálljon legalább a szállított anyag által kifejtett belső nyomásnak és a normális szállítási és kezelési feltételek mellett fellépő statikus, dinamikus és hőterhelésnek. A tervezés során bizonyítani kell, hogy az ezen terheléseknek a mobil tartány várható élettartama alatti ismétlődése folytán kialakuló kifáradást figyelembe vették.
- 6.7.2.2.10** Azokat a tartányokat, amelyeket vákuumszeleppel látnak el, úgy kell tervezni, hogy maradó alakváltozás nélkül ellenálljanak akkora külső nyomásnak, amely a belső nyomásnál legalább 0,21 bar-ral nagyobb. A vákuumszelepeket úgy kell beállítani, hogy legfeljebb 0,21 bar vákuum hatására kinyissanak, kivéve, ha nagyobb külső túlnyomásra vannak méretezve, amikor is a felszerelendő szelepek nyitónyomása nem lehet nagyobb, mint a tartány tervezésénél figyelembe vett vákuum mértéke. Az illetékes hatóság engedélye alapján kisebb külső nyomásra is méretezhetők azok a tartányok, amelyeket kizárólag olyan szilárd (porszerű vagy szemcsés) anyagok szállítására használnak, amelyek a II vagy a III csomagolási csoportba tartoznak és a szállítás alatt nem válnak folyékonnyá. Ebben az esetben a vákuumszelep nyitását erre a kisebb nyomásra kell beállítani. Azokat a tartányokat, amelyeken nincs vákuumszelep, úgy kell tervezni, hogy maradó alakváltozás nélkül ellenálljanak akkora külső nyomásnak, amely a belső nyomásnál legalább 0,4 bar-ral nagyobb.
- 6.7.2.2.11** A 3 osztály kritériumainak megfelelő lobbanásponztú anyagok (beleértve a lobbanásponztúkon vagy annál magasabb hőmérsékleten szállított, magas hőmérsékletű anyagokat) szállítására szolgáló mobil tartányokon használt vákuumszelepeknek meg kell akadályozni a lángnak a tartányba történő közvetlen behatolását, vagy a mobil tartánynak alkalmasnak kell lennie arra, hogy szivárgás nélkül ellenálljon a lángnak a tartányba történő behatolása következtében fellépő belső robbanásnak.
- 6.7.2.2.12** A mobil tartányoknak és rögzítőelemeiknek a megengedett legnagyobb töltési tömeg mellett a következő, külön-külön fellépő, statikus erők elviselésére kell alkalmasnak lenniük:
- a) menetirányban: a megengedett legnagyobb bruttó tömeg kétszerese szorozva a nehézségi gyorsulással (g)¹⁾;
 - b) vízszintesen a menetirányra merőlegesen: a megengedett legnagyobb bruttó tömeg (amennyiben a menetirány nincs egyértelműen meghatározva, a megengedett legnagyobb bruttó tömeg kétszerese) szorozva a nehézségi gyorsulással (g)¹⁾;
 - c) függőlegesen felfelé: a megengedett legnagyobb bruttó tömeg szorozva a nehézségi gyorsulással (g)¹⁾; és
 - d) függőlegesen lefelé: a megengedett legnagyobb bruttó tömeg (összes terhelés beleértve a gravitáció hatását) kétszerese szorozva a nehézségi gyorsulással (g)¹⁾.
- 6.7.2.2.13** A 6.7.2.2.12 pontban felsorolt erőknél a következő biztonsági tényezőket kell figyelembe venni:
- a) határozott folyáshatárral rendelkező fémeknél a szavatolt folyáshatárra vonatkozóan

1) A számítások céljára $g = 9,81 \text{ m/s}^2$.

1,5-es biztonsági tényezőt; vagy

- b) határozott folyáshatárral nem rendelkező fémeknél: a 0,2%-os (vagy ausztenites acélokra az 1%-os) szavatolt, egyezményes folyáshatárra vonatkozóan 1,5-es biztonsági tényezőt.

6.7.2.2.14 A tényleges, ill. az egyezményes folyáshatár értékére a belföldi vagy nemzetközi anyagszabványok által meghatározott értékeket kell használni. Ausztenites acélok használata esetén a tényleges, ill. az egyezményes folyáshatárra az anyagszabványokban előírt legkisebb értékeket legfeljebb 15%-kal meg lehet haladni, ha ezeket a magasabb értékeket a vizsgálati bizonyítvány hitelesíti. Ha a szóban forgó fémre nincs anyagszabvány, a használt tényleges, ill. egyezményes folyáshatár értéket az illetékes hatóságnak jóvá kell hagynia.

6.7.2.2.15 A mobil tartányoknak elektromosan földelhetőnek kell lenniük, ha a 3 osztály kritériumainak megfelelő lobbaspontú anyagok (beleértve a lobbaspontjukon vagy annál magasabb hőmérsékleten szállított, magas hőmérsékletű anyagokat) szállítására használják. Intézkedéseket kell tenni a veszélyes elektrosztatikus kisülések megakadályozására.

6.7.2.2.16 Ha egy anyagra a 3.2 fejezet „A” táblázat 10 oszlopában feltüntetett és a 4.2.5.2.6 pontban leírt mobil tartány utasítás szerint, vagy a 3.2 fejezet „A” táblázat 11 oszlopában feltüntetett és a 4.2.5.3 bekezdésben leírt mobil tartány különleges előírás szerint szükséges, akkor a mobil tartányt kiegészítő védelemmel kell ellátni, amely nagyobb falvastagságból, ill. nagyobb próbanyomásból állhat, a nagyobb falvastagságot, ill. a nagyobb próbanyomást az anyag szállításában rejlő veszélyek figyelembevételével kell meghatározni.

6.7.2.3 *Tervezési kritériumok*

6.7.2.3.1 A tartányt úgy kell megtervezni, hogy matematikailag vagy kísérleti úton (pl. nyúlásmérő bélyegek alkalmazásával vagy az illetékes hatóság által jóváhagyott más módszerrel) szilárdsági ellenőrzésnek, ill. vizsgálatnak lehessen alávetni.

6.7.2.3.2 A tartányokat úgy kell tervezni és gyártani, hogy a tervezési nyomás legalább 1,5-szeresével végrehajtott folyadéknyomás-próbát kiállják. Bizonyos anyagokra különleges előírások találhatók a 3.2 fejezet „A” táblázat 10 oszlopában feltüntetett és a 4.2.5.2.6 pontban leírt mobil tartány utasításokban vagy a 3.2 fejezet „A” táblázat 11 oszlopában feltüntetett és a 4.2.5.3 bekezdésben leírt mobil tartány különleges előírásokban. Ezeknél a tartányoknál tekintettel kell lenni a 6.7.2.4.1 – 6.7.2.4.10 pontban meghatározott, legkisebb falvastagságra vonatkozó követelményekre is.

6.7.2.3.3 A határozott folyáshatárral rendelkező, ill. szavatolt, egyezményes folyáshatárral (általában a 0,2%-os, ausztenites acéloknál az 1%-os egyezményes folyáshatárral) jellemzett fémeknél a tartányban a próbanyomáson fellépő σ primer membránfeszültség nem haladhatja meg a $0,75R_e$ vagy a $0,50R_m$ értékek közül az alacsonyabbat, ahol

R_e = a tényleges folyáshatár N/mm²-ben vagy a 0,2%-os vagy ausztenites acéloknál az 1%-os egyezményes folyáshatár;

R_m = a legkisebb szakítószilárdság N/mm²-ben.

6.7.2.3.3.1 Az R_e és R_m értékére a belföldi vagy nemzetközi anyagszabványok által meghatározott legkisebb értékeket kell használni. Ausztenites acélok használata esetén az anyagszabványokban előírt legkisebb értékeket legfeljebb 15%-kal meg lehet haladni, ha ezeket a magasabb értékeket az anyagvizsgálati bizonyítvány hitelesíti. Ha a szóban forgó fémre nincs anyagszabvány, a használt R_e és R_m értéket az illetékes hatóságnak vagy az általa felhatalmazott szervezetnek kell jóváhagynia.

6.7.2.3.3.2 Hegesztett tartányok gyártásához használt acéloknál 0,85-öt meghaladó R_e/R_m arány nem megengedett. Az anyagvizsgálati bizonyítványban szereplő értékeket kell alapul venni az egyes esetekben az R_e/R_m arány meghatározásához.

6.7.2.3.3.3 A tartány gyártásához használt acélnál a szakadási nyúlás értéke %-ban nem lehet kisebb, mint $10\,000/R_m$, azonban finom szemcseszerkezetű acélok esetében 16%-nál, más acélok esetében 20%-nál semmi esetre sem lehet kisebb. Alumíniumötvözetek esetében a szakadási nyúlás értéke %-ban nem lehet kisebb, mint $10\,000/6R_m$, de 12%-nál semmi esetre sem lehet kisebb.

6.7.2.3.3.4 Az anyagokra a tényleges értékek meghatározásánál figyelembe kell venni, hogy fémlemez esetén a szakítópróbához használt próbatest tengelye a hengerlési irányra merőleges legyen. A szakadási nyúlást négyzög keresztmetszetű próbatesten kell mérni az ISO 6892:1998 szabvány szerint, 50 mm-es befogási hossz mellett.

6.7.2.4 *Legkisebb falvastagság*

6.7.2.4.1 A legkisebb falvastagságnak a következők szerint adódó legnagyobb vastagságnak kell lennie:

- a) a 6.7.2.4.2 – 6.7.2.4.10 pont szerint meghatározott legkisebb vastagság;
- b) a nyomástartó edényekre vonatkozó, elismert szabályzat és a 6.7.2.3 bekezdés követelményei szerint meghatározott legkisebb vastagság; és
- c) a 3.2 fejezet „A” táblázat 10 oszlopában feltüntetett és a 4.2.5.2.6 pontban leírt mobil tartány utasításban vagy a 3.2 fejezet „A” táblázat 11 oszlopában feltüntetett és a 4.2.5.3 bekezdésben leírt mobil tartány különleges előírásban meghatározott legkisebb vastagság.

6.7.2.4.2 Az 1,80 m-nél nem nagyobb átmérőjű tartányoknál a palást, a fenekek és a búvónyílás fedelek falvastagságának legalább 5 mm-nek kell lennie referencia acélra számolva, vagy a felhasználandó fémből azzal egyenértékű vastagságúnak. Ha az átmérő meghaladja az 1,80 m-t, a falvastagságnak legalább 6 mm-nek kell lennie, kivéve a II és a III csomagolási csoportba tartozó, porszerű vagy szemcsés anyagok szállítására használt tartányok esetét, amikor is a legkisebb falvastagságot referencia acélra legfeljebb 5 mm-ig, illetve a felhasználandó fémből az azzal egyenértékű vastagságúra lehet csökkenteni.

6.7.2.4.3 Ha a tartány a sérülések ellen védőszerkezettel van ellátva, a 2,65 bar-nál kisebb próbanyomású mobil tartány esetében az illetékes hatóság megengedheti a legkisebb falvastagságnak a nyújtott védelem arányában való csökkentését. Az 1,80 m-nél nem nagyobb átmérőjű tartányok falvastagságának azonban legalább 3 mm-nek kell lennie referencia acélra számolva, vagy a felhasználandó fémből az azzal egyenértékű vastagságúnak. Az 1,80 m-nél nagyobb átmérőjű tartányoknál a legkisebb falvastagságának legalább 4 mm-nek kell lennie referencia acélra számolva, vagy a felhasználandó fémből az azzal egyenértékű vastagságúnak.

6.7.2.4.4 A tartány palást, a fenekek és a búvónyílás fedelek vastagsága a szerkezeti anyagtól függetlenül nem lehet 3 mm-nél kisebb.

6.7.2.4.5 A 6.7.2.4.3 pontban említett kiegészítő védelem kialakítható teljes külső szerkezeti védelemként, pl. megfelelő szendvics szerkezet formájában, ahol a külső burkolat a tartányhoz van erősítve, vagy kettős falú szerkezettel, vagy úgy, hogy a tartányt egy hosszirányú és keresztirányú szerkezeti elemekkel rendelkező, teljes keretvázba erősítik.

6.7.2.4.6 Valamely fém egyenértékű vastagságát, kivéve a 6.7.2.4.2 pontban a referencia acélra előírt vastagságot, a következő képlettel kell kiszámítani:

$$e_1 = \frac{21,4 e_0}{\sqrt[3]{R_{mI} A_I}},$$

ahol

e_1 = a felhasználandó fém esetén megkövetelt egyenértékű falvastagság (mm-ben);

e_0 = a 3.2 fejezet „A” táblázat 10 oszlopában feltüntetett és a 4.2.5.2.6 pontban leírt mobil tartány utasításban vagy a 3.2 fejezet „A” táblázat 11 oszlopában feltüntetett és a 4.2.5.3 bekezdésben leírt mobil tartány különleges előírásban a referencia acélra meghatározott legkisebb falvastagság (mm-ben);

R_{mI} = a felhasználandó fém szavatolt legkisebb szakítószilárdsága (N/mm²-ben, lásd a 6.7.2.3.3 pontot);

A_I = a felhasználandó fém belföldi vagy nemzetközi szabványok szerinti szavatolt legkisebb szakadási nyúlása (%-ban).

6.7.2.4.7

Figyelembe kell venni, hogy amennyiben az alkalmazandó mobil tartány utasításban a 4.2.5.2.6 pont szerint 8 mm vagy 10 mm legkisebb falvastagság van előírva, ez a vastagság a referencia acélra és 1,80 m tartány átmérőre vonatkozik. Szerkezeti acéltól (lásd a 6.7.2.1 bekezdést) eltérő fémek használata vagy nagyobb tartányátmérő esetén a vastagságot a következő képlettel kell meghatározni:

$$e_I = \frac{21,4e_0d_I}{1,8\sqrt[3]{R_{mI}A_I}},$$

ahol

e_I = a felhasználandó fém esetén megkövetelt egyenértékű falvastagság (mm-ben);

e_0 = a 3.2 fejezet „A” táblázat 10 oszlopában feltüntetett és a 4.2.5.2.6 pontban leírt mobil tartány utasításban vagy a 3.2 fejezet „A” táblázat 11 oszlopában feltüntetett és a 4.2.5.3 bekezdésben leírt mobil tartány különleges előírásban a referencia acélra meghatározott legkisebb falvastagság (mm-ben);

d_I = a tartány átmérője (m-ben), de legalább 1,80 m;

R_{mI} = a felhasználandó fém szavatolt legkisebb szakítószilárdsága (N/mm²-ben, lásd a 6.7.2.3.3 pontot);

A_I = a felhasználandó fém belföldi vagy nemzetközi szabványok szerinti szavatolt legkisebb szakadási nyúlása (%-ban).

6.7.2.4.8

A falvastagság semmilyen esetben sem lehet kisebb a 6.7.2.4.2, a 6.7.2.4.3 és a 6.7.2.4.4 pontban meghatározott értéknél. A tartány egyetlen részének sem lehet kisebb a falvastagsága, mint a 6.7.2.4.2 – 6.7.2.4.4 pontban meghatározott legkisebb vastagság. Ebbe a falvastagságba nem szabad beszámítani a korrózió miatti esetleges ráhagyásokat.

6.7.2.4.9

Szerkezeti acél (lásd a 6.7.2.1 bekezdést) használata esetén a 6.7.2.4.6 pontban található képlettel való számításra nincs szükség.

6.7.2.4.10

A lemezzvastagságban nem lehet hirtelen változás ott, ahol a tartány hengeres része és a fenekek csatlakoznak.

6.7.2.5

Üzemi szerelvények

6.7.2.5.1

Az üzemi szerelvényeket úgy kell elhelyezni, hogy a szállítás és a kezelés során leszakadás vagy sérülés veszélye ellen biztosítva legyenek. Amennyiben a váz és a tartány közötti kapcsolat lehetővé teszi a szerkezeti részek egymáshoz képesti elmozdulását, a szerelvényeket úgy kell rögzíteni, hogy az ilyen elmozdulás a működő részek sérülésének veszélye nélkül lehetővé váljon. A külső üritő szerelvényeket (csőcsonkokat, záró-szerkezeteket), a belső zárószelepet és annak ülékét védeni kell a külső erők hatására történő leszakadás veszélyével szemben (például nyíródő keresztmetszet kialakításával). A töltő- és üritőszerkezeteket (beleértve a karimákat és a menetes dugókat is), valamint az esetleges védőkupakokat a nem szándékos kinyitás ellen biztosítani kell.

6.7.2.5.2

A mobil tartány minden töltő-, ill. üritőnyílását, a tartányhoz a lehető legközelebb

elhelyezett, kézzel működtethető zárószeleppel kell ellátni. A többi nyílást, kivéve a szellőző-, ill. nyomáscsökkentő szerkezetek nyílásait, a tartányhoz a lehető legközelebb elhelyezett zárószeleppel vagy más alkalmas zárószerkezettel kell ellátni.

- 6.7.2.5.3** A belső részek vizsgálata, karbantartása és javítása céljából a mobil tartányokat megfelelő méretű búvónyílással vagy vizsgálónyílással kell ellátni. A kamrákra osztott mobil tartányok minden egyes kamráját el kell látni búvónyílással vagy vizsgálónyílással.
- 6.7.2.5.4** A külső szerelvényeket – amennyire csak lehet – egy helyre csoportosítva kell elhelyezni. Hőszigetelt mobil tartányoknál a felső szerelvényeket megfelelő lefolyóval kialakított, a kiömlő folyadékot felfogó tartállyal kell ellátni.
- 6.7.2.5.5** A mobil tartány minden csatlakozásán jól láthatóan fel kell tüntetni a rendeltetését.
- 6.7.2.5.6** A zárószelepeket és zárószerkezeteket úgy kell tervezni és kialakítani, hogy a névleges nyomásuk legalább akkora legyen, mint a tartány megengedett legnagyobb üzemi nyomása, figyelembe véve a szállítás alatt várható hőmérsékleteket. A csavarorsós zárószelepeknek a kézikerek óramutató járásával megegyező irányba történő elforgatásával kell záródniuk. Másfajta zárószelepeknél a zárószelep (nyitott és zárt) állását és a zárás irányát jól láthatóan fel kell tüntetni. Minden zárószelepet úgy kell kialakítani, hogy akaratlanul ne lehessen kinyitni.
- 6.7.2.5.7** Ha a 3 osztály kritériumainak megfelelő lobbanáspontú anyagok (beleértve a lobbanáspontjukon vagy annál magasabb hőmérsékleten szállított, magas hőmérsékletű anyagokat) szállítására szolgáló mobil tartány alumíniumból készült, akkor semmiféle olyan mozgatható rész, amely az alumínium tartánnyal ütközhet vagy súrlódhat (pl. fedél, zárórész stb.) nem gyártható bevonat nélküli, rozsdásodó acélból.
- 6.7.2.5.8** A csővezetéseket úgy kell tervezni, gyártani és felszerelni, hogy ne jöjjön létre sérülésveszély a hőtágulás és összehúzódás, a mechanikai ütések és rezgések következtében. Minden csövet megfelelő fémes anyagból kell készíteni. Ahol csak lehetséges, hegesztett csökötetéseket kell alkalmazni.
- 6.7.2.5.9** A rézcsövek csatlakozásait keményforrasztással kell készíteni vagy azzal azonos szilárdságú, fémes csökötetést kell alkalmazni. A forrasztófém (keményforrasztás) olvadáspontja nem lehet 525 °C-nál alacsonyabb. A kötések nem csökkenthetik a csővezeték szilárdságát, mint az csavarmentes kötéseknel előfordulhat.
- 6.7.2.5.10** Egyetlen csővezeték és csőszerelvény repesztőnyomása sem lehet kisebb, mint a tartány megengedett legnagyobb üzemi nyomásának négyszerese és azon nyomás négyszerese közül a nagyobb, amelynek a használat során, szivattyú vagy egyéb szerkezet (kivéve a nyomáscsökkentő szerkezeteket) működése révén ki lehetnek téve.
- 6.7.2.5.11** A szelepek és a tartozékok gyártásához kovácsolható fémet kell használni.

6.7.2.6 *Alsó nyílások*

- 6.7.2.6.1** Bizonyos anyagok nem szállíthatók alsó nyílással ellátott mobil tartányban. Ha a 3.2 fejezet „A” táblázat 10 oszlopában feltüntetett és a 4.2.5.2.6 pontban leírt mobil tartány utasításokban alsó nyílás nem megengedett, akkor a megengedett legnagyobb töltési szint esetén a tartány folyadékszintje alatt nem lehetnek nyílások. Ha egy meglevő nyílást lezárnak, a zárást a tartányhoz kívülről és belülről hozzáhegesztett lemezzel kell kiképezni.
- 6.7.2.6.2** Bizonyos kristályosodó vagy nagy viszkozitású anyagok szállítására használt mobil tartányok alsó ürítő nyílásait két, egymás mögött elhelyezett, egymástól független zárószerkezettel kell ellátni. A szerkezetet az illetékes hatóság vagy az általa felhatalmazott szervezet előírásai szerint kell kialakítani, és a következőkből kell állnia:
- a) a tartányhoz a lehető legközelebb felszerelt külső zárószelepből, amely olyan kialakítás, hogy megakadályozza az ütés vagy figyelmetlenség folytán bekövetkező nem

szándékos kinyílást; és

- b) az ürítőcső végén levő folyadéktömör zárószervezetből, ami lehet csavározott vakkarima vagy csavarmentes kupak.

6.7.2.6.3

Minden alsó ürítő nyílást, kivéve a 6.7.2.6.2 pontban meghatározottakat, három, egymás mögött elhelyezett, egymástól független zárószervezettel kell ellátni. A szerkezetet az illetékes hatóság vagy az általa felhatalmazott szervezet előírásai szerint kell kialakítani, és a következőkből kell állnia:

- a) egy önzáró belső zárószelepből, azaz a tartány belsejébe vagy egy hegesztett karimába vagy ellenkarimába beépített zárószelepből, amely olyan, hogy:
 - i) a belső zárószelep működtető-szerkezete a szelep ütközésből vagy gondatlanságból bekövetkező, nem kívánt kinyílását megakadályozza;
 - ii) a belső zárószelep alulról vagy felülről működtethető;
 - iii) ha lehet, a belső zárószelep nyitott vagy zárt helyzete a talajszintről ellenőrizhető;
 - iv) a legfeljebb 1000 liter befogadóképességű mobil tartányok kivételével a szelepet el lehet zárni a mobil tartány olyan hozzáférhető helyéről, ami távol van magától a szeleptől; és
 - v) a külső működtető-szerkezet megsérülése esetén a belső zárószervezet továbbra is hatásos marad;
- b) a tartányhoz a lehető legközelebb felszerelt külső zárószelepből; és
- c) az ürítőcső végén levő folyadéktömör zárószervezetből, ami lehet csavározott vakkarima vagy csavarmentes kupak.

6.7.2.6.4

Ha a tartány bélelt, a 6.7.2.6.3.a) pontban előírt belső zárószelep kiegészítő külső zárószeleppel helyettesíthető. A gyártónak be kell tartania az illetékes hatóság vagy az általa felhatalmazott szervezet előírásait.

6.7.2.7

Biztonsági szerkezetek

6.7.2.7.1

Minden mobil tartányt legalább egy nyomáscsökkentő szerkezettel kell ellátni. Minden nyomáscsökkentő szerkezetet úgy kell tervezni, gyártani és megjelölni, hogy az megfeleljen az illetékes hatóság vagy az általa felhatalmazott szervezet előírásainak.

6.7.2.8

Nyomáscsökkentő szerkezetek

6.7.2.8.1

Minden, 1900 liter vagy annál nagyobb befogadóképességű mobil tartányt, vagy független mobil tartány kamrát egy vagy több, rugóterhelésű nyomáscsökkentő szerkezettel kell ellátni, és a rugóterhelésű szerkezetekkel párhuzamosan hasadótárcsák vagy olvadóbetétek is használhatók, kivéve, ha a 4.2.5.2.6 pontban a mobil tartány utasításban a 6.7.2.8.3 pontra való hivatkozással ez tiltva van. A nyomáscsökkentő szerkezet teljesítményének elegendőnek kell lennie, hogy megakadályozza a tartány repedését a töltésből, ürítésből vagy a tartalom melegedéséből eredő túlnyomás vagy vákuum hatására.

6.7.2.8.2

A nyomáscsökkentő szerkezeteket úgy kell kialakítani, hogy megakadályozzák az idegen anyagoknak a tartányba való bejutását, a folyadék kiszivárgását és mindenféle veszélyes túlnyomás kialakulását.

6.7.2.8.3

Amennyiben a 3.2 fejezet „A” táblázat 10 oszlopában feltüntetett és a 4.2.5.2.6 pontban leírt mobil tartány utasítás szerint bizonyos anyagra elő van írva, a mobil tartányt olyan nyomáscsökkentő szerkezettel kell ellátni, amit az illetékes hatóság jóváhagyott. A nyomáscsökkentő szerkezetnek egy rugóterhelésű nyomáscsökkentő szelepből és egy elhelyezett hasadótárcsából kell állnia, kivéve, ha – különleges rendeltetésű mobil tartány esetén – a szállított anyaggal összeférhető anyagból készült, jóváhagyott típusú nyomáscsökkentő szerkezet van a tartányon. Ha a nyomáscsökkentő szerkezet elé hasadótárcsa van

elhelyezve, akkor a hasadótárcsa és a nyomáscsökkentő szerkezet közti térbe nyomásmérőt, vagy más, alkalmas jelzőeszközt kell csatlakoztatni, ami lehetővé teszi, hogy észleljék a hasadótárcsa repedését, kilyukadását vagy szivárgását, ami a nyomáscsökkentő rendszer hibás működését okozhatja. A hasadótárcsának a nyomáscsökkentő szelep nyitónyomását 10%-kal meghaladó névleges nyomásnál kell felszakadnia.

6.7.2.8.4 Minden, 1900 liternél kisebb befogadóképességű mobil tartányt nyomáscsökkentő szerkezettel kell ellátni, amely hasadótárcsa is lehet, amennyiben megfelel a 6.7.2.11.1 pont előírásainak. Ha nem rugóterhelésű nyomáscsökkentő szerkezetet alkalmaznak, akkor olyan hasadótárcsát kell alkalmazni, amely a próbanyomással megegyező névleges nyomáson szakad fel. Ezenkívül a 6.7.2.10.1 pont szerinti olvadóbetétek is használhatók.

6.7.2.8.5 Ha a tartány nyomással történő üritésre van kialakítva, a bemenő csővezeték olyan alkalmas nyomáscsökkentő szerkezettel kell ellátni, amely a tartány megengedett legnagyobb üzemi nyomását meg nem haladó nyomáson lép működésbe, és a tartányhoz a lehető legközelebb zárószelepet kell elhelyezni.

6.7.2.9 *A nyomáscsökkentő szerkezetek beállítása*

6.7.2.9.1 Figyelembe kell venni, hogy a nyomáscsökkentő szerkezet csak túlzott hőmérséklet emelkedés esetén léphet működésbe, mivel a tartány normális szállítási feltételek között nem lehet túlzott nyomásingadozásnak kitéve (lásd a 6.7.2.12.2 pontot).

6.7.2.9.2 Az előírt nyomáscsökkentő szerkezeteket úgy kell beállítani, hogy ha a tartány próbanyomása 4,5 bar-nál nem nagyobb, akkor a nyitónyomás a próbanyomás öthatodának megfelelő névleges nyomás legyen, illetve, ha a tartány próbanyomása 4,5 bar-nál nagyobb, akkor a próbanyomás kétharmadának 110%-a legyen a nyitónyomás. Lefűvás után a szerkezetnek a nyitónyomásánál legfeljebb 10%-kal alacsonyabb nyomáson záródnia kell. Minden, ennél alacsonyabb nyomáson a szerkezeteknek zárva kell maradnia. Ez a követelmény azonban nem tiltja vákuumszelepek, ill. egybeépített nyomáscsökkentő és vákuumszelepek használatát.

6.7.2.10 *Olvadóbetétek*

6.7.2.10.1 Az olvadóbetéteknek 100...149 °C közötti hőmérsékleten kell kiolvadniuk, azzal a feltétellel, hogy a betét kiolvadási hőmérsékletén a tartányban kialakuló nyomás nem lehet nagyobb, mint a tartány próbanyomása. Az olvadóbetétet a tartány felső részén kell elhelyezni úgy, hogy bemenete a gőztérben legyen, és ha a szállítás biztonságát szolgálja, akkor a külső hőhatással szemben nem szabad árnyékolni. Az olvadóbetétek nem használhatók olyan tartányoknál, amelyek próbanyomása meghaladja a 2,65 bar-t, kivéve, ha a 3.2 fejezet „A” táblázat 11 oszlopában a TP36 különleges előírás megengedi. A magas hőmérsékletű anyagok szállítására szolgáló mobil tartányokon használt olvadóbetétet úgy kell kialakítani, hogy csak a szállítás során fellépő legnagyobb hőmérsékletnél magasabb hőmérsékleten olvadjon ki, és meg kell felelnie az illetékes hatóság vagy az általa felhatalmazott szervezet előírásainak.

6.7.2.11 *Hasadótárcsák*

6.7.2.11.1 A 6.7.2.8.3 pontban előírtak kivételével, a hasadótárcsáknak a teljes tervezési hőmérséklet-tartományban a tartány próbanyomásával megegyező névleges nyomáson kell felszakadniuk. Hasadótárcsa alkalmazása esetén különös figyelmet kell szentelni a 6.7.2.5.1 és a 6.7.2.8.3 pont követelményeinek.

6.7.2.11.2 A hasadótárcsáknak el kell viselniük azt a vákuumot, amely a mobil tartányban kialakulhat.

6.7.2.12 *A nyomáscsökkentő szerkezetek teljesítménye*

6.7.2.12.1 A 6.7.2.8.1 pont szerinti rugóterhelésű nyomáscsökkentő szelep legkisebb átfolyási keresztmetszetének 31,75 mm átmérőjű szájnyílásnak kell megfelelnie. Az esetleges vákuumszelepeknek legalább 284 mm² átfolyási keresztmetszettel kell rendelkezniük.

6.7.2.12.2 A nyomáscsökkentő rendszer összes lefűvási teljesítményének (figyelembe véve az áramlás csökkenését, ha a mobil tartányon a rugóterhelésű nyomáscsökkentő szerkezet előtt hasadótárcsa van vagy ha a rugóterhelésű nyomáscsökkentő szerkezet a láng áthatolását akadályozó szerkezettel – lángzárral – van ellátva) elégnek kell lennie ahhoz, hogy abban az esetben, ha a mobil tartányt teljesen elfedi a tűz, a tartányban a nyomás legfeljebb 20%-kal legyen nagyobb, mint a nyomáscsökkentő szerkezet nyitónyomása. A szükséges összes lefűvási teljesítmény eléréséhez vészlefűvó szerkezetek is használhatók. A vészlefűvó szerkezetek rugóterhelésűek, hasadótárcsás vagy olvadóbetétes típusúak lehetnek, vagy rugóterhelésű szerkezet és hasadótárcsa kombinációjából is állhatnak. A nyomáscsökkentő szerkezetek szükséges teljesítményét a 6.7.2.12.2.1 pontban található képlet vagy a 6.7.2.12.2.3 pontban levő táblázat használatával lehet meghatározni.

6.7.2.12.2.1 A nyomáscsökkentő szerkezetek szükséges összes teljesítményének meghatározására, ami úgy tekintendő, mint az együttműködő szerkezetek egyedi teljesítményének összege, a következő képletet kell használni:

$$Q = 12,4 \frac{FA^{0,82}}{LC} \sqrt{\frac{ZT}{M}},$$

ahol

Q = a szükséges legkisebb lefűvási teljesítmény légköbméter per sec-ban (m³/s) 1 bar és 0 °C (273 K) normálfeltételek mellett;

F = együttható, amelynek értéke a következő:

nem szigetelt tartányra $F = 1$;

szigetelt tartányra $F = U(649 - t)/13,6$, de legalább 0,25,

ahol

U = a szigetelőréteg hőátadási együtthatója, kW·m⁻²·K⁻¹, 38 °C-on;

t = anyag tényleges hőmérséklete a töltés alatt (°C-ban); ha ez a hőmérséklet ismeretlen, akkor $t = 15$ °C;

Szigetelt tartányra az előzőekben megadott F érték akkor használható, ha a szigetelés megfelel a 6.7.2.12.2.4 pont előírásainak;

A = a tartány teljes külső felülete m²-ben;

Z = a gáz kompresszibilitási tényezője lefűváskor (ha ez a tényező ismeretlen, $Z = 1$);

T = az abszolút hőmérséklet Kelvinben (°C + 273) a nyomáscsökkentő szerkezet felett lefűváskor;

L = a folyadék látens párolgáshője kJ/kg-ban lefűváskor;

M = a távozó gáz molekulatömege;

C = a következő képletek egyikéből származtatott állandó, mint a fajhők aránya, k :

$$k = \frac{C_p}{C_v},$$

ahol

C_p = a fajhő állandó nyomáson; és

C_v = a fajhő állandó térfogaton.

Ha $k > 1$:

$$C = \sqrt{k \left(\frac{2}{k+1} \right)^{\frac{k+1}{k-1}}}$$

Ha $k = 1$ vagy k ismeretlen:

$$C = \frac{1}{\sqrt{e}} = 0,607,$$

ahol az e matematikai állandó, melynek értéke 2,7183.

C értékei a következő táblázatból is vehetők:

k	C	k	C	k	C
1,00	0,607	1,26	0,660	1,52	0,704
1,02	0,611	1,28	0,664	1,54	0,707
1,04	0,615	1,30	0,667	1,56	0,710
1,06	0,620	1,32	0,671	1,58	0,713
1,08	0,624	1,34	0,674	1,60	0,716
1,10	0,628	1,36	0,678	1,62	0,719
1,12	0,633	1,38	0,681	1,64	0,722
1,14	0,637	1,40	0,685	1,66	0,725
1,16	0,641	1,42	0,688	1,68	0,728
1,18	0,645	1,44	0,691	1,70	0,731
1,20	0,649	1,46	0,695	2,00	0,770
1,22	0,652	1,48	0,698	2,20	0,793
1,24	0,656	1,50	0,701		

6.7.2.12.2.2 Az előző képletek helyett a folyadékok szállítására szolgáló tartányok nyomáscsökkentő szerkezeteinek mérete a 6.7.2.12.2.3 pontban levő táblázat szerint is meghatározható. Ez a táblázat feltételezi az $F = 1$ szigetelési értéket, és ha a tartány szigetelt, akkor annak megfelelően kell az adatokat módosítani. A táblázat összeállításához használt többi érték a következő:

$$\begin{array}{ll} M = 86,7 & T = 394 \text{ K} \\ L = 334,94 \text{ kJ/kg} & C = 0,607 \quad Z = 1 \end{array}$$

6.7.2.12.2.3 A szükséges legkisebb lefűvási teljesítmény, Q , léghőméter per sec-ban (m^3/s) 1 bar és 0°C (273 K) normálfeltételek mellett

A tartány felület (m^2)	Q (léghőméter/sec)	A tartány felület (m^2)	Q (léghőméter/sec)
2	0,230	37,5	2,539
3	0,320	40	2,677
4	0,405	42,5	2,814
5	0,487	45	2,949
6	0,565	47,5	3,082
7	0,641	50	3,215
8	0,715	52,5	3,346
9	0,788	55	3,476

A tartány felület (m ²)	Q (légméter/sec)	A tartány felület (m ²)	Q (légméter/sec)
10	0,859	57,5	3,605
12	0,998	60	3,733
14	1,132	62,5	3,860
16	1,263	65	3,987
18	1,391	67,5	4,112
20	1,517	70	4,236
22,5	1,670	75	4,483
25	1,821	80	4,726
27,5	1,969	85	4,967
30	2,115	90	5,206
32,5	2,258	95	5,442
35	2,400	100	5,676

6.7.2.12.2.4 A lefűvási teljesítmény csökkentése érdekében alkalmazott szigetelési rendszert az illetékes hatóságnak vagy az általa felhatalmazott szervezetnek jóvá kell hagynia. Az erre a célra jóváhagyott szigetelési rendszernek minden esetben:

- 649 °C-ig minden hőmérsékleten hatásosnak kell maradnia; és
- olyan anyaggal kell bevonni, amelynek olvadáspontja legalább 700 °C.

6.7.2.13 *A nyomáscsökkentő szerkezetek jelölése*

6.7.2.13.1 Minden nyomáscsökkentő szerkezeten jól olvashatóan és tartósan fel kell tüntetni a következő adatokat:

- a nyitónyomást (bar-ban vagy kPa-ban) vagy a hőmérsékletet (°C-ban) amelyen a szerkezet lefűj;
- rugóterhelésű szerkezeteknél a nyitónyomás megengedett tűrését;
- a hasadótárcsák névleges nyomásához tartozó referencia hőmérsékletet;
- olvadóbetéteknél a megengedett hőmérséklet tűrést; és
- a rugóterhelésű nyomáscsökkentő szerkezetek, a hasadótárcsák és az olvadóbetétek névleges átfolyási teljesítményét normál légméter per sec (m³/s) egységben;
- a rugóterhelésű nyomáscsökkentő szerkezetek, a hasadótárcsák és az olvadóbetétek átfolyási keresztmetszetét mm²-ben.

Amennyiben lehetséges, a következő információt ugyancsak fel kell tüntetni:

- a gyártó nevét és a szerkezet gyártmány katalógus számát.

6.7.2.13.2 A rugóterhelésű nyomáscsökkentő szerkezeteken feltüntetett névleges átfolyási teljesítményt az ISO 4126-1:2004 és az ISO 4126-7:2004 szabvány szerint kell meghatározni.

6.7.2.14 *A nyomáscsökkentő szerkezetek csatlakoztatása*

6.7.2.14.1 A nyomáscsökkentő szerkezetekhez történő csatlakozásnak akkorának kell lennie, hogy szabad átfolyást biztosítson a biztonsági szerkezetekhez. A tartány és a nyomáscsökkentő szerkezet közé nem szabad zárószelepet elhelyezni, kivéve a karbantartási vagy egyéb okból kialakított kettős nyomáscsökkentő szerkezeteknél, ha a ténylegesen működő nyomáscsökkentő szerkezet zárószelepe nyitott állapotban reteszelve van, vagy a zárószelepek úgy vannak összekapcsolva, hogy a kettős nyomáscsökkentő szerkezetek közül legalább az egyik mindig működjön. A szellőző vagy nyomáscsökkentő szerkezetekhez vezető nyílásban nem lehet semmiféle akadály, ami korlátozná vagy elzárná az áramlást a tartányból a szerkezetekhez. A szellőző vagy nyomáscsökkentő szerkezet kimenetéhez csatlakozó cső-

vezetéknek, ha ilyet használnak, a kiszabadult gőzt vagy folyadékot a szerkezetre gyakorolt minimális torlóhatással kell a szabadba vezetniük.

6.7.2.15 *A nyomáscsökkentő szerkezetek elhelyezése*

6.7.2.15.1 Minden nyomáscsökkentő szerkezet bemenetet a tartány tetején úgy kell elhelyezni, hogy a tartány középpontjához a lehető legközelebb legyen. Minden nyomáscsökkentő szerkezet bemenetnek a megengedett legnagyobb töltési feltételek mellett a tartány gőzterében kell lennie, és a szerkezetet úgy kell elhelyezni, hogy biztosítva legyen a kiszabadult gőz akadálytalan távozása. Gyúlékony anyagok esetében a kiszabaduló gőzt a tartánytól el kell terelni oly módon, hogy az ne csapódhasson a tartánynak. A gőz áramlását elterelő védőszerkezetek engedélyezettek, ha nem csökkentik a nyomáscsökkentő szerkezet szükséges teljesítményét.

6.7.2.15.2 Intézkedéseket kell tenni annak érdekében, hogy megakadályozzák illetéktelen személyeknek a nyomáscsökkentő szerkezethez való hozzáférését, és hogy megvédjék a szerkezetet attól, hogy a tartány felborulása esetén megsérüljön.

6.7.2.16 *Mérőeszközök*

6.7.2.16.1 A tartány tartalmával közvetlenül érintkező, üvegből készült szintjelzők és egyéb törékeny anyagú mérőeszközök nem használhatók.

6.7.2.17 *A mobil tartány tartószerkezete, vázszerkezete, emelő és rögzítő szerelvényei*

6.7.2.17.1 A mobil tartányt tartószerkezettel kell tervezni és gyártani, ami biztos alátámasztást nyújt a szállítás során. Erre vonatkozóan a tervezésnél a 6.7.2.2.12 pontban meghatározott erőket és a 6.7.2.2.13 pontban meghatározott biztonsági tényezőt kell figyelembe venni. Talpak, vázszerkezete, csúszótalpak vagy egyéb hasonló szerkezetek elfogadhatók.

6.7.2.17.2 A mobil tartányra szerelt eszközöktől (pl. talpaktól, vázszerkezettől) és a mobil tartány emelő és rögzítő szerelvényeitől származó összetett feszültségek a tartány egyetlen részén sem okozhatnak túlzott feszültségeket. Minden mobil tartányt állandó emelő és rögzítő szerelvényekkel kell ellátni. Ezeket lehetőleg a mobil tartány tartószerkezetéhez kell erősíteni, de rögzíthetők a tartányon a megtámasztási pontokon elhelyezett erősítőlemezekhez is.

6.7.2.17.3 A tartószerkezet és a keretváz tervezésénél figyelembe kell venni a környezet korróziós hatását is.

6.7.2.17.4 Az emelővilla zsebeket zárhatóra kell kialakítani. Az emelővilla zsebek zárószerkezetének a keretváz állandó részét kell képeznie, vagy a keretvázhoz tartósan hozzá kell erősíteni. Az olyan, egyetlen tartánykamrából álló mobil tartányoknál, amelyek 3,65 m-nél rövidebbek, nem kell az emelővilla zsebeknek zárhatónak lenniük, amennyiben

- a) a tartány és a szerelvények kellőképpen védve vannak, nehogy az emelővillák megüssék; és
- b) az emelővilla zsebek középpontjai közötti távolság legalább a fele a mobil tartány legnagyobb hossz méretének.

6.7.2.17.5 Ha a mobil tartány nincs a 4.2.1.2 bekezdés szerinti védelemmel ellátva, a tartányt és az üzemi szerelvényeit védeni kell a szállítás alatt a hosszirányú és oldalirányú lökésekből vagy felborulásból adódóan a tartányt vagy a szerelvényeit érő sérülésekkel szemben. A külső szerelvényeket úgy kell védeni, hogy az ütések hatására, ill. a mobil tartánynak a szerelvényekre való ráborulása esetén a tartányban szállított anyag ne szabaduljon ki. Példák a védelemre:

- a) az oldalirányú ütésekkel szembeni védelem, ami állhat a tartány mindkét oldalán a

középvonal szintjében védő hosszirányú rudakból;

- b) a mobil tartány felborulás elleni védelme, ami állhat erősítő gyűrűkből vagy a kereten keresztben elhelyezett rudakból;
- c) a hátulról jövő ütésekkel szembeni védelem, ami lökhárítóból vagy keretből állhat;
- d) a tartány ütésekkel vagy felborulásból eredő sérüléssel szembeni védelme az ISO 1496-3:1995 szabvány szerinti ISO vázszerkezet használatával.

6.7.2.18 *Típusjóváhagyás*

6.7.2.18.1 Minden új mobil tartány típus esetén az illetékes hatóságnak vagy az általa felhatalmazott szervezetnek gyártási típus bizonyítványt kell kiállítani. Ennek a bizonyítványnak tanúsítania kell, hogy a mobil tartányt ez a hatóság megvizsgálta, az a kívánt célra alkalmas, és megfelel e fejezet követelményeinek és ha alkalmazandó, akkor a 4.2 fejezetben és a 3.2 fejezet „A” táblázatban az egyes anyagokra vonatkozó követelményeknek. Ha a mobil tartányokat sorozatban gyártják módosítás nélkül, ez a bizonyítvány a teljes sorozatra érvényes. A bizonyítványban utalni kell a gyártási típus vizsgálati jegyzőkönyvére, azokra az anyagokra és/vagy anyagcsoportokra, amelyek szállíthatók, a tartány és a bélés (ha van) gyártási anyagára és a jóváhagyási számra. A jóváhagyási számnak annak az államnak a megkülönböztető jeléből [A közúti közlekedésről szóló Bécsi Egyezmény (Bécs, 1968) által előírt államjelzés a nemzetközi forgalomban résztvevő gépjárművekre], amelyben az engedélyt kiadták, és egy nyilvántartási számból kell állnia. A 6.7.1.2 bekezdés szerinti esetleges alternatív kialakítást a bizonyítványban fel kell tüntetni. A típusjóváhagyás az azonos anyagból és azonos falvastagsággal gyártott, kisebb mobil tartányok jóváhagyásának is tekinthető, amelyeket ugyanolyan gyártási technológiával és azonos tartószerkezetekkel, egyenértékű záró szerkezetekkel és egyéb tartozékokkal gyártottak.

6.7.2.18.2 A gyártási típus vizsgálati jegyzőkönyvének a típusjóváhagyáshoz legalább a következőket kell tartalmaznia:

- a) a vázszerkezetre vonatkozó, ISO 1496-3:1995 szabványban meghatározott vizsgálatok eredményeit;
- b) a 6.7.2.19.3 pont szerinti üzembe helyezés előtti vizsgálat eredményeit; és
- c) a 6.7.2.19.1 pont szerinti ütközési próba eredményeit, ha alkalmazható.

6.7.2.19 *Vizsgálat*

6.7.2.19.1 Azokat a mobil tartányokat, amelyek „A Biztonságos Konténerekről szóló 1972. évi Nemzetközi Egyezmény” (CSC) módosított kiadása meghatározása szerint konténernek minősülnek, csak azután szabad használni, hogy a gyártási típus prototípusa sikeresen kiállta a „Vizsgálatok és kritériumok kézikönyv” IV. rész, 41 fejezetében előírt dinamikus, hosszirányú ütközési próbát.

6.7.2.19.2 Az első üzembe helyezés előtt minden mobil tartányt és szerelvényeit vizsgálatnak kell alávetni (üzembe helyezés előtti vizsgálat) és azután legfeljebb ötéves időközönként (5 évenkénti időszakos vizsgálat), és az 5 éves időközök közepén közbenső vizsgálat (2,5 évenkénti közbenső időszakos vizsgálat). A 2,5 évenkénti vizsgálatot az előírt időponthoz képes 3 hónapon belül kell elvégezni. Ha a 6.7.2.19.7 pont szerint soron kívüli vizsgálatra van szükség, azt a legutóbbi időszakos vizsgálat időpontjától függetlenül el kell végezni.

6.7.2.19.3 A mobil tartány üzembe helyezés előtti vizsgálatának ki kell terjednie a szerkezeti jellemzők ellenőrzésére, a mobil tartány és szerelvényeinek külső és belső vizsgálatra, különös tekintettel a szállítandó anyagok szempontjából, és nyomáspróbára. Mielőtt a mobil tartányt üzembe helyezik, tömörségi próbát is kell végezni és az üzemi szerelvények megfelelő működését is ellenőrizni kell. Amennyiben a nyomáspróbát a tartányon és a szerelvényeken külön végezték, a tömörségi próbát az összeszerelést követően kell végrehajtani.

- 6.7.2.19.4** Az 5 évenkénti időszakos vizsgálatnak belső és külső állapot vizsgálatából és általában folyadéknymás-próbából kell állnia. A hő- vagy egyéb szigetelőborításokat csak annyira kell eltávolítani, amennyire a tartány jellemzőinek biztonságos megítéléséhez feltétlenül szükséges. Amennyiben a nyomáspróbát a tartányon és a szerelvényeken külön végezték, a tömörségi próbát az összeszerelést követően kell végrehajtani.
- 6.7.2.19.5** A 2,5 évenkénti közbenső időszakos vizsgálatnak ki kell terjednie legalább a mobil tartány és szerelvényeinek külső és belső vizsgálatra, különös tekintettel a szállítandó anyagok szempontjából, és tömörségi próbára, továbbá az üzemi szerelvények megfelelő működését is ellenőrizni kell. A hő- vagy egyéb szigetelőborításokat csak annyira kell eltávolítani, amennyire a tartány jellemzőinek biztonságos megítéléséhez feltétlenül szükséges. A csak egyetlen anyag szállítására szolgáló mobil tartánynál a 2,5 évenkénti közbenső időszakos vizsgálat elhagyható, vagy az illetékes hatóság vagy az általa felhatalmazott szervezet által előírt más vizsgálati módszerrel vagy ellenőrzéssel helyettesíthető.
- 6.7.2.19.6** A mobil tartányok a 6.7.2.19.2 pontban előírt utolsó 5 évenkénti vagy 2,5 évenkénti időszakos vizsgálat érvényességének lejártá után nem tölthetők meg és nem adhatók át szállításra. Az utolsó időszakos vizsgálat lejártá előtt megtöltött mobil tartányok az utolsó időszakos vizsgálat érvényességének letelte után legfeljebb három hónapig szállíthatók. Ezen kívül a mobil tartány az utolsó időszakos vizsgálat érvényességének letelte után is szállítható
- a) kiürítés után, de tisztítás előtt az újratöltés előtt szükséges vizsgálat elvégzésének céljából, és
 - b) a veszélyes anyag ártalmatlanítására (megfelelő elhelyezésére) vagy visszaforgatására történő visszaszállítása céljából az időszakos vizsgálat érvényességének lejártá után legfeljebb hat hónapig, hacsak az illetékes hatóság másként nem rendelkezik. Ezt a mentességet a fuvarokmányba be kell jegyezni.
- 6.7.2.19.7** Soron kívüli vizsgálatot szükséges végezni, ha a mobil tartány sérült, rozsdás, szivárog vagy bármely más körülmény a mobil tartány sértetlenségét befolyásolhatja. A soron kívüli vizsgálatnak mértékét az határozza meg, hogy a mobil tartány mennyire sérült vagy hibás. A soron kívüli vizsgálatnak azonban legalább a 6.7.2.19.5 pont szerinti 2,5 évenkénti vizsgálatokra kell kiterjednie.
- 6.7.2.19.8** A külső és a belső vizsgálat során biztosítani kell, hogy
- a) ellenőrizzék a tartányt, hogy nincs rajta rozsdá, kipattogzás, kopás, horpadás, torzulás, hegesztési hiba vagy bármi más (pl. szivárgás), ami miatt a mobil tartány szállítása nem lenne biztonságos;
 - b) ellenőrizzék a csövezeteket, a szelepeket, a fűtő/hűtő rendszert és a tömítéseket, hogy nincs rajtuk rozsdá, sérülés vagy bármi más (pl. szivárgás), ami miatt a mobil tartány töltése, ürítése vagy szállítása nem lenne biztonságos;
 - c) a bűvönnyílások fedelének rögzítését biztosító szerkezetek jól működjenek, és a bűvönnyílás fedeleknél, ill. a tömítéseknél ne legyen szivárgás;
 - d) a csőkarima csatlakozásoknál és vakkarimáknál a hiányzó vagy laza csavarokat vagy csavaranyákat pótolják, ill. meghúzzák;
 - e) minden vészlefüvő szerkezet és szelep mentes legyen a korróziótól és minden olyan sérüléstől vagy meghibásodástól, ami megakadályozhatja normális működését. A távműködtetésű zárószerkezeteket és az önzáró szelepeket ki kell próbálni, hogy megfelelően működnek-e;
 - f) az esetleges béléseket a gyártó előírásai alapján megvizsgálják;
 - g) az előírt jelölések a mobil tartányon olvashatóak, és a vonatkozó követelményeknek megfelelnek; és
 - h) a mobil tartány váz- és tartószerkezete, ill. az emelésre szolgáló berendezései megfelelő állapotban legyenek.

- 6.7.2.19.9** A 6.7.2.19.1, 6.7.2.19.3, 6.7.2.19.4, 6.7.2.19.5 és 6.7.2.19.7 pont szerinti vizsgálatokat az illetékes hatóság vagy az általa felhatalmazott szervezet által elismert szakértőnek kell elvégeznie vagy tanúsítania. Ha a nyomáspróba a vizsgálat részét képezi, a vizsgálatot a mobil tartány adattábláján feltüntetett nyomással kell végezni. A nyomás alatt lévő mobil tartányon a tartány, a csővezeték és a szerelvények szivárgásmentességét is vizsgálni kell.
- 6.7.2.19.10** Minden esetben, amikor a mobil tartányt vágással, melegítéssel vagy hegesztéssel javítják, ezt a munkát az illetékes hatóságnak vagy az általa felhatalmazott szervezetnek jóvá kell hagynia, figyelembe véve azt a nyomástartó edényekre vonatkozó szabályzatot, amely alapján a tartányt gyártották. A munka befejezése után az eredeti próbanyomással nyomáspróbát kell végezni.
- 6.7.2.19.11** Amennyiben a biztonságot veszélyeztető körülményeket tapasztalnak, a mobil tartány addig nem használható újra, amíg meg nem javították és az ismételt vizsgálatot ki nem állta.
- 6.7.2.20 Jelölés**
- 6.7.2.20.1** Ellenőrzés céljából könnyen elérhető, szembetűnő helyre minden mobil tartányra nem korrodálódó fémtáblát kell tartósan rögzíteni. Ha a mobil tartány kialakítása folytán a tábla nem erősíthető tartósan a tartányhoz, legalább a nyomástartó edényekre vonatkozó szabályzatban előírt információkat kell a tartányon feltüntetni. A fémtáblán legalább a következőkben felsorolt adatokat kell feltüntetni beütéssel vagy más hasonló módon:
- a) Tulajdonosi információk
 - i) a tulajdonos nyilvántartási száma;
 - b) Gyártási információk
 - i) a gyártási ország;
 - ii) a gyártási év;
 - iii) a gyártó neve vagy jele;
 - iv) a gyártó sorozatszáma;
 - c) Jóváhagyási információk
 - i) az Egyesült Nemzetek jele a csomagolóeszközön:  .
Ezt a jelet csak annak tanúsítására szabad használni, hogy a csomagolóeszköz, a mobil tartány, ill. a MEG-konténer megfelel a 6.1, a 6.2, a 6.3, a 6.5, a 6.6, ill. a 6.7²⁾ fejezet vonatkozó előírásainak;
 - ii) a jóváhagyó ország;
 - iii) a típusjóváhagyásra felhatalmazott szervezet;
 - iv) típusjóváhagyási szám;
 - v) „AA” betűk, ha a típust alternatív kialakításuként hagyták jóvá (lásd a 6.7.1.2 bekezdést);
 - vi) a nyomástartó edényekre vonatkozó szabályzat, amely szerint a tartányt méretezték;
 - d) Nyomások
 - i) MAWP, a megengedett legnagyobb üzemi nyomás (bar vagy kPa, túlnyomás)³⁾;
 - ii) a próbanyomás (bar vagy kPa, túlnyomás)³⁾;

2) Ezt a jelet használják annak tanúsítására is, hogy az olyan hajlékony ömlesztettáru-konténerek, amelyeket más közlekedési alágazatra hagytak jóvá, megfelelnek az ENSZ Minta Szabályzat 6.8 fejezete követelményeinek.

3) A mértékegységet fel kell tüntetni.

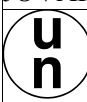

- iii) az üzembe helyezés előtti nyomáspróba időpontja (hónap és év);
- iv) az üzembe helyezés előtti nyomáspróbát tanúsító szakértő azonosító jele;
- v) a külső tervezési nyomás⁴⁾ (bar vagy kPa, túlnyomás)³⁾;
- vi) a fűtő-/hűtőrendszer megengedett legnagyobb üzemi nyomása (bar vagy kPa, túlnyomás)³⁾ (ha van);
- e) Hőmérsékletek
 - i) tervezési hőmérséklet-tartomány (°C)³⁾;
- f) Anyagok
 - i) a tartány anyaga(i) és az anyagszabvány hivatkozás(ok);
 - ii) az egyenértékű vastagság referencia acélra (mm)³⁾;
 - iii) a bélés anyaga (ha van);
- g) Űrtartalom
 - i) a tartány víztérfogata 20 °C-on (liter)³⁾;

Ez után az „S” szimbólumot kell feltüntetni, ha a tartány hullámtörő lemezekkel legfeljebb 7500 liter űrtartalmú rekeszekre van osztva;

 - ii) az egyes kamrák víztérfogata 20°C-on (liter)³⁾ (többkamrás tartánynál, ha alkalmazható).

Ez után az „S” szimbólumot kell feltüntetni, ha a tartánykamra hullámtörő lemezekkel legfeljebb 7500 liter űrtartalmú rekeszekre van osztva;
- h) Időszakos vizsgálatok
 - i) a legutóbbi időszakos vizsgálat típusa (2,5-évenkénti, 5-évenkénti, soronkívüli);
 - ii) a legutóbbi időszakos vizsgálat időpontja (hónap és év);
 - iii) a legutóbbi időszakos vizsgálat próbanyomása (bar vagy kPa, túlnyomás)³⁾ (ha alkalmazható);
 - iv) a felhatalmazott szervezet azonosító jele, amely a legutóbbi vizsgálatot végezte vagy tanúsította.

6.7.2.20.2 A következő adatokat magán a mobil tartányon vagy a mobil tartányhoz biztosan rögzített fémtáblán kell feltüntetni:

Az üzemben tartó neve

Megengedett legnagyobb bruttó tömeg kg

Üres (tára) tömeg kg.

A 4.2.5.2.6 pont szerinti mobil tartány utasítás.

Megjegyzés: A szállított anyagok azonosítására lásd az 5. részt is.

6.7.2.20.3 A nyílt tengeren történő kezelésre tervezett és jóváhagyott mobil tartány esetén az „OFFSHORE PORTABLE TANK” feliratot kell feltüntetni az azonosító táblán.

6.7.3 **A nem mélyhűtött, cseppfolyósított gázokhoz használt mobil tartányok gyártására és vizsgálatára vonatkozó követelmények**

Megjegyzés: Ezek a követelmények vonatkoznak a nyomás alatti vegyszerek (UN 3500, 3501, 3502, 3503, 3504 és 3505) szállítására szolgáló mobil tartányokra is.

6.7.3.1 **Meghatározások**

E szakasz alkalmazásában:

Az *alternatív kialakítási engedély* az e fejezetben meghatározottaktól eltérő műszaki előírások alapján tervezett, gyártott vagy eltérő vizsgálati módszer szerint vizsgált (alternatív kialakítású) mobil tartányra vagy MEG-konténerre az illetékes hatóság által kiadott engedély.

A *mobil tartány* olyan multimodális tartány, amelynek befogadóképessége 450 liternél nagyobb és amelyet a 2 osztály nem mélyhűtött, cseppfolyósított gázainak szállítására használnak. A mobil tartány fogalmába maga a tartány és a gázok szállításához szükséges üzemi és szerkezeti szerelvényei tartoznak. A mobil tartánynak a szerkezeti szerelvények eltávolítása nélkül tölthetőnek és üríthetőnek kell lennie. A tartány külső részén stabilizáló elemeknek kell lenniük, és alkalmasnak kell lennie arra, hogy megtöltött állapotban felemeljék. Úgy kell kialakítani, hogy elsősorban közúti járműre, vasúti kocsira, ill. tengerjáró vagy belvízi hajóba lehessen rakni, a gépi rakodás megkönnyítésére kerettel vagy egyéb szerkezetekkel kell ellátni. A közúti tartányjárművek, a vasúti tartálykocsik, a nem

fém-ből készült tartányok és a nagyméretű csomagolóeszközök (IBC-k), a gázpalackok és a nagypalackok e meghatározás értelmében nem minősülnek mobil tartánynak.

A *tartány* a mobil tartány azon része, amely a szállítandó, nem mélyhűtött, cseppfolyósított gáz megtartására szolgál (maga a tartány), beleértve a nyílásokat és azok zárószerveit, de kizárva az üzemi szerelvényeket és a külső szerkezeti szerelvényeket.

Az *üzemi szerelvények* a töltő- és ürítő-, a szellőző-, a biztonsági és a hőszigetelő berendezések, valamint a mérőeszközök.

A *szerkezeti szerelvények* a tartány külső részén található erősítő-, rögzítő- védő- vagy stabilizáló elemek.

A *megengedett legnagyobb üzemi nyomás* a tartány üzemi helyzetében, annak tetején mérhető nyomás, amely nem lehet kisebb, mint a következő két nyomás érték közül a nagyobbik érték, de semmilyen esetben sem lehet 7 bar-nál kisebb:

- a) a tartányban a töltés, ill. ürítés során megengedett legnagyobb tényleges nyomás (túlnyomás); vagy
- b) a legnagyobb tényleges túlnyomás, amelyre a tartány méretezve van, ami
 - i) a 4.2.5.2.6 pontban, a T50 mobil tartány utasításban felsorolt, nem mélyhűtött, cseppfolyósított gázok esetében a gázra a T50 mobil tartány utasításban megadott megengedett legnagyobb üzemi nyomás (bar-ban);
 - ii) egyéb nem mélyhűtött, cseppfolyósított gázok esetében legalább a következő nyomások összege:
 - a nem mélyhűtött, cseppfolyósított gáz abszolút gőznyomása (bar-ban) a tervezési referencia hőmérsékleten mínusz 1 bar; és
 - a folyadékszint feletti térben levő levegő, ill. egyéb gáz parciális nyomásai (bar-ban), amelyet a következők alapulvételével kell meghatározni: tervezési referencia hőmérséklet, valamint az átlagos hőmérséklet $t_r - t_f$ értékű növekedéséből adódó folyadék-fázis tágulás (ahol t_f a töltési hőmérséklet, rendszerint 15 °C; t_r a legnagyobb átlagos hőmérséklet, 50 °C).
 - iii) a nyomás alatti vegyszerek esetén a hajtóanyagnak a 4.2.5.2.6 pontban, a T50 mobil tartány utasításban felsorolt cseppfolyósított gáz összetevőjére a T50 mobil tartány utasításban megadott megengedett legnagyobb üzemi nyomás (bar-ban).

A *tervezési nyomás* a nyomástartó edényekre vonatkozó szabályzat szerint a számításokhoz használandó nyomás. A tervezési nyomás nem lehet kisebb, mint a következő nyomások közül a legnagyobb:

- a) a tartányban a töltés, ill. ürítés során megengedett legnagyobb tényleges nyomás (túlnyomás) vagy
- b) a következők összege:
 - i) a legnagyobb tényleges túlnyomás, amelyre a tartány méretezve van, mint azt a megengedett legnagyobb üzemi nyomás fogalmának b) pontja meghatározza; és
 - ii) a 6.7.3.2.9 pontban meghatározott statikus erők alapján meghatározott folyadéknyomás, de legalább 0,35 bar.

A *próbanyomás* a nyomáspróba alatt a tartány tetején fellépő legnagyobb túlnyomás.

A *tömörségi próba* az a gázzal végzett vizsgálat, amelynek során a tartányt az üzemi szerelvényeivel a megengedett legnagyobb üzemi nyomás legalább 25%-át elérő tényleges belső nyomásnak teszik ki.

A *megengedett legnagyobb bruttó tömeg* a mobil tartány saját tömege és a szállításra engedélyezett legnagyobb rakomány össztömege.

A *referencia acél* a 370 N/mm² szakítószilárdságú és 27% szakadási nyúlású acél.

A *szerkezeti acél* olyan acél, amelynek szavatolt legkisebb szakítószilárdsága 360...440

N/mm² között van, és szakadási nyúlása megfelel a 6.7.3.3.3 pontnak.

A *tervezési hőmérséklet-tartomány* a környezeti hőmérsékleten szállított nem mélyhűtött, cseppfolyósított gázokhoz használt tartányok esetében -40 °C...+50 °C. Szélsőséges éghajlati körülményeknek kitett mobil tartányok esetében szigorúbb tervezési hőmérsékleteket kell alkalmazni.

A *tervezési referencia hőmérséklet* az a hőmérséklet, amelyen a tartalom gőznyomását meghatározzák a megengedett legnagyobb üzemi nyomás kiszámításához. A tervezési referencia hőmérsékletnek kisebbnek kell lennie, mint a szállítandó, nem mélyhűtött, cseppfolyósított gáz, ill. nyomás alatti vegyszerekhez használt cseppfolyósított hajtógáz kritikus hőmérséklete, annak biztosítására, hogy a gáz mindenkor cseppfolyós maradjon. Ez az érték az egyes mobil tartány típusokra a következő:

- a) 1,5 m, vagy annál kisebb átmérőjű tartányra: 65 °C;
- b) 1,5 m-nél nagyobb átmérőjű tartányra:
 - i) hőszigetelés és napsugárzás elleni védőlemez nélkül: 60 °C;
 - ii) napsugárzás elleni védőlemezzel (lásd a 6.7.3.2.12 pontot): 55 °C; és
 - iii) szigeteléssel (lásd a 6.7.3.2.12 pontot): 50 °C.

A *töltési sűrűség* a nem mélyhűtött, cseppfolyósított gáznak a tartány befogadóképességére vetített átlagos tömegét (kg/l) jelenti. A töltési sűrűség adatokat a 4.2.5.2.6 pontban a T50 mobil tartány utasítás tartalmazza.

6.7.3.2 *Általános tervezési és gyártási követelmények*

6.7.3.2.1

A tartányokat az illetékes hatóság által elismert, a nyomástartó edényekre vonatkozó szabályzat előírásainak megfelelően kell tervezni és gyártani. A tartányt alakításra alkalmas acélból kell készíteni. Az anyagoknak általában a belföldi vagy nemzetközi anyagszabványoknak kell megfelelniük. Hegesztett tartányokhoz csak olyan anyagok használhatók, amelyek hegeszthetősége teljes mértékben szavatolt. A hegesztéseket szakszerűen kell elkészíteni, és teljesen biztonságosnak kell lenniük. Ha a gyártási folyamat vagy az anyag szükségessé teszi, a tartányt megfelelően hőkezelní kell, hogy a hegesztéseknél és a hőhatásnak kitett zónákban biztosítsák a kielégítő szívósságot. Az anyagok kiválasztásánál a ridegtörés veszélye, a feszültség alatti korróziós repedések és az ütésállóság szempontjából figyelembe kell venni a tervezési hőmérséklet-tartományt. Finom szemcseszerkezetű acélok használata esetén a szavatolt folyáshatár nem lehet nagyobb, mint 460 N/mm², és a szavatolt szakítószilárdság felső határa nem lehet nagyobb, mint 725 N/mm² az anyagspecifikáció szerint. A mobil tartány anyagainak alkalmasnak kell lenniük ahhoz a külső környezethez, amelyben a tartányt szállíthatják.

6.7.3.2.2

A mobil tartányokat, a szerelvényeiket és a csővezetéseket olyan anyagból kell készíteni,

- a) amelyet a szállított anyag(ok) eleve nem támad(nak) meg; vagy
- b) amely kémiai reakció révén megfelelően passzíválódik vagy semlegesítődik.

6.7.3.2.3

A tömítéseket olyan anyagokból kell készíteni, amelyeket a szállítandó, nem mélyhűtött, cseppfolyósított gáz(ok) nem támad(nak) meg.

6.7.3.2.4

Kerülni kell a különböző fémek érintkezését, ami a galvanikus hatás folytán károsodást okozhat.

6.7.3.2.5

A mobil tartány, a szerelvények, a tömítések és a tartozékok anyaga nem gyakorolhat kedvezőtlen hatást a mobil tartányban szállítandó, nem mélyhűtött, cseppfolyósított gáz(ok)ra.

6.7.3.2.6

A mobil tartányt megfelelő emelő és rögzítő szerelvényekkel és olyan tartószerkezettel kell tervezni és kialakítani, amely a szállítás során biztos alátámasztást nyújt.

- 6.7.3.2.7** A mobil tartányt olyanra kell tervezni, hogy a szállított anyag vesztesége nélkül ellenálljon legalább a szállított anyag által kifejtett belső nyomásnak és a normális szállítási és kezelési feltételek mellett fellépő statikus, dinamikus és hőterhelésnek. A tervezés során bizonyítani kell, hogy az ezen terheléseknek a mobil tartány várható élettartama alatti ismétlődése folytán kialakuló kifáradást figyelembe vették.
- 6.7.3.2.8** A tartányokat úgy kell tervezni, hogy tartós alakváltozás nélkül ellenálljanak akkora külső nyomásnak, amely a belső nyomásnál legalább 0,4 bar-ral nagyobb. Amennyiben a tartány jelentős vákuumnak van kitéve a töltés előtt vagy az ürítés során, akkor úgy kell tervezni, hogy tartós alakváltozás nélkül ellenálljon akkora külső nyomásnak, amely a belső nyomásnál legalább 0,9 bar-ral nagyobb, és a tartányt erre a nyomásra kell vizsgálni.
- 6.7.3.2.9** A mobil tartányoknak és rögzítőelemeiknek a megengedett legnagyobb töltési tömeg mellett a következő, külön-külön fellépő, statikus erők elviselésére kell alkalmasnak lenniük:
- a) menetirányban: a megengedett legnagyobb bruttó tömeg kétszerese szorozva a nehézségi gyorsulással (g)⁵⁾;
 - b) vízszintesen a menetirányra merőlegesen: a megengedett legnagyobb bruttó tömeg (amennyiben a menetirány nincs egyértelműen meghatározva, a megengedett legnagyobb bruttó tömeg kétszerese) szorozva a nehézségi gyorsulással (g)⁵⁾;
 - c) függőlegesen felfelé: a megengedett legnagyobb bruttó tömeg szorozva a nehézségi gyorsulással (g)⁵⁾; és
 - d) függőlegesen lefelé: a megengedett legnagyobb bruttó tömeg (összes terhelés beleértve a gravitáció hatását) kétszerese szorozva a nehézségi gyorsulással (g)⁵⁾.
- 6.7.3.2.10** A 6.7.3.2.9 pontban felsorolt erőknél a következő biztonsági tényezőket kell figyelembe venni:
- a) határozott folyáshatárral rendelkező acélnál a szavatolt folyáshatárra vonatkozóan 1,5-es biztonsági tényezőt; vagy
 - b) határozott folyáshatárral nem rendelkező acélnál: a 0,2%-os (vagy ausztenites acélokra az 1%-os) szavatolt, egyezményes folyáshatárra vonatkozóan 1,5-es biztonsági tényezőt.
- 6.7.3.2.11** A tényleges, ill. az egyezményes folyáshatár értékére a belföldi vagy nemzetközi anyagszabványok által meghatározott értékeket kell használni. Ausztenites acélok használata esetén a tényleges, ill. az egyezményes folyáshatárra az anyagszabványokban előírt legkisebb értékeket legfeljebb 15%-kal meg lehet haladni, ha ezeket a magasabb értékeket a vizsgálati bizonyítvány hitelesíti. Ha a szóban forgó fémre nincs anyagszabvány, a használt tényleges, ill. egyezményes folyáshatár értéket az illetékes hatóságnak jóvá kell hagynia.
- 6.7.3.2.12** Ha a nem mélyhűtött, cseppfolyósított gázok szállítására szolgáló tartányokat hőszigeteléssel látják el, a hőszigetelő rendszernek a következő követelményeket kell kielégítenie:
- a) a hőszigetelésnek fényvédő tetőből kell állnia, amely a tartány felületének legalább a felső harmadát, de legfeljebb a felső felét takarja, és attól legalább 4 cm-es légréteg választja el; vagy
 - b) szigetelőanyagból készült, elegendő vastagságú teljes burkolat, amely úgy van védve, hogy normális szállítási körülmények között nem sérülhet meg és a nedvesség sem szivároghat bele, ill. hőátadási együtthatója legfeljebb $0,67 \text{ W} \cdot \text{m}^{-2} \cdot \text{K}^{-1}$;
 - c) ha a védőburkolat gázzáró, külön szerkezettel meg kell akadályozni, hogy a szigetelőrétegben a tartány vagy a szerelvények tömítetlensége esetén veszélyes nyomás lépjen fel;
 - d) a hőszigetelés nem akadályozhatja a szerelvényekhez és ürítő berendezésekhez való hozzáférést.

5) A számítások céljára $g = 9,81 \text{ m/s}^2$.

- 6.7.3.2.13** A gyúlékony, nem mélyhűtött, cseppfolyósított gázok szállítására használt mobil tartányoknak elektromosan földelhetőnek kell lenniük.
- 6.7.3.3** *Tervezési kritériumok*
- 6.7.3.3.1** A tartányoknak körkeresztmetszetűeknek kell lenniük.
- 6.7.3.3.2** A tartányokat úgy kell tervezni és gyártani, hogy a tervezési nyomás legalább 1,3-szeresével végrehajtott nyomáspróbát kiállják. A tartány tervezésénél a szállítandó, nem mélyhűtött, cseppfolyósított gázra a 4.2.5.2.6 pontban a T50 mobil tartány utasításban a megengedett legnagyobb üzemi nyomásra megadott legkisebb értékeket kell figyelembe venni. Ezeknél a tartányoknál tekintettel kell lenni a 6.7.3.4 bekezdésben meghatározott, legkisebb falvastagságra vonatkozó követelményekre is.
- 6.7.3.3.3** A határozott folyáshatárral rendelkező, ill. szavatolt, egyezményes folyáshatárral (általában a 0,2%-os, ausztenites acéloknál az 1%-os egyezményes folyáshatárral) jellemzett acéloknál a tartányban a próbanyomáson fellépő σ primer membránfeszültség nem haladhatja meg a $0,75R_e$ vagy a $0,50R_m$ értékek közül az alacsonyabbat, ahol
- R_e = a tényleges folyáshatár N/mm²-ben vagy a 0,2%-os vagy ausztenites acéloknál az 1%-os egyezményes folyáshatár;
- R_m = a legkisebb szakítószilárdság N/mm²-ben.
- 6.7.3.3.3.1** Az R_e és R_m értékére a belföldi vagy nemzetközi anyagszabványok által meghatározott legkisebb értékeket kell használni. Ausztenites acélok használata esetén az anyagszabványokban előírt legkisebb értékeket legfeljebb 15%-kal meg lehet haladni, ha ezeket a magasabb értékeket az anyagvizsgálati bizonyítvány hitelesíti. Ha a szóban forgó fémre nincs anyagszabvány, a használt R_e és R_m értéket az illetékes hatóságnak vagy az általa felhatalmazott szervezetnek kell jóváhagynia.
- 6.7.3.3.3.2** Hegesztett tartányok gyártásához használt acéloknál 0,85-öt meghaladó R_e/R_m arány nem megengedett. Az anyagvizsgálati bizonyítványban szereplő értékeket kell alapul venni az egyes esetekben az R_e/R_m arány meghatározásához.
- 6.7.3.3.3.3** A tartány gyártásához használt acélnál a szakadási nyúlás értéke %-ban nem lehet kisebb, mint $10\ 000/R_m$, azonban finom szemcseszerkezetű acélok esetében 16%-nál, más acélok esetében 20%-nál semmi esetre sem lehet kisebb.
- 6.7.3.3.3.4** Az anyagokra a tényleges értékek meghatározásánál figyelembe kell venni, hogy fémlemez esetén a szakítópróbához használt próbatest tengelye a hengerlési irányra merőleges legyen. A szakadási nyúlást négyszög keresztmetszetű próbatesten kell mérni az ISO 6892:1998 szabvány szerint, 50 mm-es befogási hossz mellett.
- 6.7.3.4** *Legkisebb falvastagság*
- 6.7.3.4.1** A legkisebb falvastagságnak a következők szerint adódó nagyobbik vastagságnak kell lennie:
- a 6.7.3.4 bekezdés szerint meghatározott legkisebb vastagság;
 - a nyomástartó edényekre vonatkozó, elismert szabályzat és a 6.7.3.3 bekezdés követelményei szerint meghatározott legkisebb vastagság; és
- 6.7.3.4.2** Az 1,80 m-nél nem nagyobb átmérőjű tartányoknál a palást, a fenekek és a bűvönnyílás fedelek falvastagságának legalább 5 mm-nek kell lennie referencia acélra számolva, vagy a felhasználandó acélból azzal egyenértékű vastagságúnak. Ha az átmérő meghaladja az 1,80 m-t, a falvastagságnak legalább 6 mm-nek kell lennie referencia acél esetében, ill. más acél használata esetén ezzel egyenértékű vastagságnak.
- 6.7.3.4.3** A tartány palást, a fenekek és a bűvönnyílás fedelek vastagsága a szerkezeti anyagtól függetlenül nem lehet 4 mm-nél kisebb.

6.7.3.4.4 Valamely acél egyenértékű vastagságát, kivéve a 6.7.3.4.2 pontban a referencia acélra előírt vastagságot, a következő képlettel kell kiszámítani:

$$e_I = \frac{21,4e_0}{\sqrt[3]{R_{mI}A_I}},$$

ahol

e_I = a felhasználandó acél esetén megkövetelt egyenértékű falvastagság (mm-ben);

e_0 = a legkisebb falvastagság (mm-ben) a 6.7.3.4.2 pontban meghatározott referencia acél esetében;

R_{mI} = a felhasználandó acél szavatolt legkisebb szakítószilárdsága (N/mm²-ben, lásd a 6.7.3.3.3 pontot);

A_I = a felhasználandó acél belföldi vagy nemzetközi szabványok szerinti szavatolt legkisebb szakadási nyúlása (%-ban).

6.7.3.4.5 A falvastagság semmilyen esetben sem lehet kisebb a 6.7.3.4.1 – 6.7.3.4.3 pontban meghatározott értéknél. A tartány egyetlen részének sem lehet kisebb a falvastagsága, mint a 6.7.3.4.1 – 6.7.3.4.3 pontban meghatározott legkisebb vastagság. Ebbe a falvastagságba nem szabad beszámítani a korrózió miatti esetleges ráhagyásokat.

6.7.3.4.6 Szerkezeti acél (lásd a 6.7.3.1 bekezdést) használata esetén a 6.7.3.4.4 pontban található képlettel való számításra nincs szükség.

6.7.3.4.7 A lemezvastagságban nem lehet hirtelen változás ott, ahol a tartány hengeres része és a fenekek csatlakoznak.

6.7.3.5 *Üzemi szerelvények*

6.7.3.5.1 Az üzemi szerelvényeket úgy kell elhelyezni, hogy a szállítás és a kezelés során leszakadás vagy sérülés veszélye ellen biztosítva legyenek. Amennyiben a váz és a tartány közötti kapcsolat lehetővé teszi a szerkezeti részek egymáshoz képesti elmozdulását, a szerelvényeket úgy kell rögzíteni, hogy az ilyen elmozdulás a részek sérülésének veszélye nélkül lehetővé váljon. A külső ürítő szerelvényeket (csőcsonkokat, zárószerkezeteket), a belső zárószelepet és annak ülékét védeni kell a külső erők hatására történő leszakadás veszélyével szemben (például nyíródnó keresztmetszet kialakításával). A töltő- és ürítőszerveket (beleértve a karimákat és a menetes dugókat is), valamint az esetleges védőkupakokat a nem szándékos kinyitás ellen biztosítani kell.

6.7.3.5.2 A mobil tartányok minden 1,5 mm-nél nagyobb átmérőjű nyílását – kivéve a nyomás-csökkentő szerkezetek nyílásait, a vizsgálónyílásokat és a lezárt légtelenítő nyílásokat – legalább három, egymás mögött elhelyezett, egymástól független zárószerkezettel kell ellátni, amelyek közül az első egy belső zárószelep, túlfolyószelep vagy más, egyenértékű szerkezet, a második egy külső zárószelep, a harmadik egy vakkarima vagy más, egyenértékű szerkezet.

6.7.3.5.2.1 Ha a mobil tartány túlfolyószeleppel van ellátva, a túlfolyószelepet úgy kell elhelyezni, hogy szelephüvelje a tartányon belül vagy egy hegesztett karimán belül legyen, vagy ha kívül van elhelyezve, szerelését úgy kell megtervezni, hogy ütközés esetén is hatásos maradjon. A túlfolyószelepeket úgy kell kiválasztani és felszerelni, hogy automatikusan zárjanak, ha a gyártó által meghatározott névleges átfolyási mennyiséget elérték. Az ilyen szelepekhez vezető és az utánuk levő csatlakozásoknak és szerelvényeknek nagyobb átfolyási mennyiséget kell felvenniük, mint a túlfolyó szelepek névleges áteresztési mennyisége.

6.7.3.5.3 A töltő- és ürítőnyílások esetén az első zárószerkezetnek egy belső zárószeleppnek kell lennie, a másodiknak egy zárószeleppnek, amelyet minden töltő- és ürítőcsövön hozzáférhető helyen kell elhelyezni.

- 6.7.3.5.4** A gyúlékony és/vagy mérgező, nem mélyhűtött, cseppfolyósított gázok és a nyomás alatti vegyszerek szállítására használt mobil tartányok alsó töltő- és ürítőnyílásait el kell látni olyan, azonnal záródó belső biztonsági szerkezettel, amely a tartány töltés vagy ürítés közbeni véletlen elmozdulása vagy tűz esetén önműködően lezár. Az 1000 l-nél nagyobb befogadóképességű mobil tartányok esetén a zárószerkezetnek távolról is működtethetőnek kell lennie.
- 6.7.3.5.5** A töltő, ürítő és gőznyomás kiegyenlítő nyílásokon kívül a tartányokat el lehet látni mérőeszközök, nyomásmérő és hőmérő behelyezésére alkalmas nyílásokkal. Az ilyen eszközök csatlakozásait alkalmas hegesztett csomaggal vagy zsebbel kell kialakítani, a tartányon keresztül csavarkötés nem lehet.
- 6.7.3.5.6** A belső részek vizsgálata, karbantartása és javítása céljából a mobil tartányokat megfelelő méretű bűvőnyílással vagy vizsgálónyílással kell ellátni.
- 6.7.3.5.7** A külső szerelvényeket – amennyire csak lehet – egy helyre csoportosítva kell elhelyezni.
- 6.7.3.5.8** A mobil tartány minden csatlakozásán jól láthatóan fel kell tüntetni a rendeltetését.
- 6.7.3.5.9** A zárószelepeket és zárószerkezeteket úgy kell tervezni és kialakítani, hogy a névleges nyomásuk legalább akkora legyen, mint a tartány megengedett legnagyobb üzemi nyomása, figyelembe véve a szállítás alatt várható hőmérsékleteket. A csavarorsós zárószelepeknek a kézikerek óramutató járásával megegyező irányba történő elforgatásával kell záródniuk. Másfajta zárószelepeknél a zárószelep (nyitott és zárt) állását és a zárás irányát jól láthatóan fel kell tüntetni. Minden zárószelepet úgy kell kialakítani, hogy akaratlanul ne lehessen kinyitni.
- 6.7.3.5.10** A csővezetéseket úgy kell tervezni, gyártani és felszerelni, hogy ne jöjjön létre sérülésveszély a hőtágulás és összehúzódás, a mechanikai ütések és rezgések következtében. Minden csövet megfelelő fémes anyagból kell készíteni. Ahol csak lehetséges, hegesztett csökötetéseket kell alkalmazni.
- 6.7.3.5.11** A rézcsövek csatlakozásait keményforrasztással kell készíteni vagy azzal azonos szilárdságú, fémes csökötetést kell alkalmazni. A forrasztófém (keményforrasztás) olvadáspontja nem lehet 525 °C-nál alacsonyabb. A kötések nem csökkenthetik a csővezeték szilárdságát, mint az csavarmentes kötéseknel előfordulhat.
- 6.7.3.5.12** Egyetlen csővezeték és csőszerelvény repesztőnyomása sem lehet kisebb, mint a tartány megengedett legnagyobb üzemi nyomásának négyszerese és azon nyomás négyszerese közül a nagyobb, amelynek a használat során, szivattyú vagy egyéb szerkezet (kivéve a nyomáscsökkentő szerkezeteket) működése révén ki lehetnek téve.
- 6.7.3.5.13** A szelepek és a tartozékok gyártásához kovacsolható fémet kell használni.
- 6.7.3.6** *Alsó nyílások*
- 6.7.3.6.1** Bizonyos nem mélyhűtött, cseppfolyósított gázok nem szállíthatók alsó nyílásokkal ellátott mobil tartányokban, ha a 4.2.5.2.6 pontban a T50 mobil tartány utasítás jelzi, hogy alsó nyílás nem megengedett. Ekkor a megengedett legnagyobb töltési szint esetén a tartány folyadékszintje alatt nem lehetnek nyílások.
- 6.7.3.7** *Nyomáscsökkentő szerkezetek*
- 6.7.3.7.1** A mobil tartányokat egy vagy több, rugóterhelésű nyomáscsökkentő szerkezettel kell ellátni. A nyomáscsökkentő szerkezetnek legalább a megengedett legnagyobb üzemi nyomással megegyező nyomáson automatikusan kell nyílnia, és a megengedett legnagyobb üzemi nyomás 110%-ának megfelelő nyomáson teljesen nyitva kell lennie. Lefűtés után a szerkezetnek a nyitónyomásánál legfeljebb 10%-kal alacsonyabb nyomáson záródnia kell, minden ennél alacsonyabb nyomáson zárva kell maradnia. A nyomáscsökkentő szerkezetnek

olyan típusúnak kell lennie, ami ellenáll a dinamikus hatásoknak, beleértve a folyadék hullámzását is. Olyan hasadótárcsa, amely nem rugóterhelésű nyomáscsökkentő szerkezet előtt van elhelyezve, nem alkalmazható.

6.7.3.7.2 A nyomáscsökkentő szerkezetet úgy kell kialakítani, hogy megakadályozza az idegen anyagoknak a tartányba való bejutását, a gáz kiszivárgását és mindenféle veszélyes túlnyomás kialakulását.

6.7.3.7.3 A 4.2.5.2.6 pontban a T50 mobil tartány utasításban meghatározott, egyes, nem mélyhűtött, cseppfolyósított gázok szállítására szolgáló mobil tartányokat olyan nyomáscsökkentő szerkezettel kell ellátni, amelyet az illetékes hatóság jóváhagyott. A nyomáscsökkentő szerkezetnek egy rugóterhelésű nyomáscsökkentő szelepből és egy elhelyezett hasadótárcsából kell állnia, kivéve, ha – különleges rendeltetésű mobil tartány esetén – a szállítandó anyaggal összeférhető anyagból készült, jóváhagyott típusú nyomáscsökkentő szerkezet van a tartányon. Ha a nyomáscsökkentő szerkezet elé hasadótárcsa van elhelyezve, akkor a hasadótárcsa és a nyomáscsökkentő szerkezet közti térbe nyomásmérőt vagy más, alkalmas jelzőeszközt kell csatlakoztatni, ami lehetővé teszi, hogy észleljék a hasadótárcsa repedését, kilyukadását vagy szivárgását, ami a nyomáscsökkentő rendszer hibás működését okozhatja. A hasadótárcsának ebben az esetben a nyomáscsökkentő szelep nyitónyomását 10%-kal meghaladó névleges nyomásnál kell felszakadnia.

6.7.3.7.4 Többcélú mobil tartány esetében a nyomáscsökkentő szerkezeteknek a mobil tartányban szállítható gázok közül a legnagyobb megengedett legnagyobb üzemi nyomással rendelkező gázra a 6.7.3.7.1 pontban meghatározott nyomáson ki kell nyílniuk.

6.7.3.8 *A nyomáscsökkentő szerkezetek teljesítménye*

6.7.3.8.1 A nyomáscsökkentő szerkezetek összes lefúvási teljesítményének elégnek kell lennie ahhoz, hogy abban az esetben, ha a mobil tartányt teljesen elfedi a tűz, a tartányban a nyomás (beszámítva a nyomás növekedését) ne múlja felül a megengedett legnagyobb üzemi nyomás 120%-át. A szükséges összes lefúvási teljesítmény eléréséhez rugóterhelésű nyomáscsökkentő szerkezeteket kell alkalmazni. Többcélú tartányok esetében a nyomáscsökkentő szerkezetek összes lefúvási teljesítményét arra a gázra kell méretezni, amely a mobil tartányban szállítható gázok közül a legnagyobb lefúvási teljesítményt igényli.

6.7.3.8.1.1 A nyomáscsökkentő szerkezetek szükséges összes teljesítményének meghatározására, ami úgy tekintendő, mint az együtműködő szerkezetek egyedi teljesítményének összege, a következő képletet⁶⁾ kell használni:

$$Q = 12,4 \frac{FA^{0,82}}{LC} \sqrt{\frac{ZT}{M}},$$

ahol

Q = a szükséges legkisebb lefúvási teljesítmény légköbméter per sec-ban (m³/s) 1 bar és 0 °C (273 K) normálfeltételek mellett;

F = együttható, amelynek értéke a következő:

nem szigetelt tartányra $F = 1$;

szigetelt tartányra $F = U(649 - t)/13,6$, de legalább 0,25,

ahol

6) Ez a képlet csak azon nem mélyhűtött, cseppfolyósított gázokra alkalmazható, amelyek kritikus hőmérséklete jóval magasabb a lefúváskor fennálló hőmérsékletnél. Olyan gázokra, amelyek kritikus hőmérséklete a lefúváskor fennálló hőmérséklet közelében vagy az alatt van, a nyomáscsökkentő szerkezetek teljesítményének számításához figyelembe kell venni a gáz további termodinamikai tulajdonságait (lásd pl. a CGA S-1.2-2003 „Pressure Relief Device Standards – Part 2 – Cargo and Portable Tanks for Compressed Gases” (Nyomáscsökkentő szerkezet szabványok – 2. rész – Árutartányok és mobil tartányok sűrített gázokhoz) kiadványt).

U = a szigetelőréteg hőátadási együtthatója, $\text{kW} \cdot \text{m}^{-2} \cdot \text{K}^{-1}$, 38°C -on;

t = a nem mélyhűtött, cseppfolyósított gáz tényleges hőmérséklete a töltés alatt - ($^\circ\text{C}$ -ban); ha ez a hőmérséklet ismeretlen, akkor $t = 15^\circ\text{C}$;

Szigetelt tartányra az előzőekben megadott F érték akkor használható, ha a szigetelés megfelel a 6.7.3.8.1.2 pont előírásainak;

A = a tartány teljes külső felülete m^2 -ben;

Z = a gáz kompresszibilitási tényezője lefűváskor (ha ez a tényező ismeretlen, $Z = 1$);

T = az abszolút hőmérséklet Kelvinben ($^\circ\text{C} + 273$) a nyomáscsökkentő szerkezet felett lefűváskor;

L = a folyadék látens párolgáshője kJ/kg -ban lefűváskor;

M = a távozó gáz molekulatömege;

C = a következő képletek egyikéből származtatott állandó, mint a fajhők aránya, k :

$$k = \frac{C_p}{C_v},$$

ahol

C_p = a fajhő állandó nyomáson; és

C_v = a fajhő állandó térfogaton.

Ha $k > 1$:

$$C = \sqrt{k \left(\frac{2}{k+1} \right)^{\frac{k+1}{k-1}}}.$$

Ha $k = 1$ vagy k ismeretlen:

$$C = \frac{1}{\sqrt{e}} = 0,607,$$

ahol az e matematikai állandó, melynek értéke 2,7183.

C értékei a következő táblázatból is vehetők:

k	C	k	C	k	C
1,00	0,607	1,26	0,660	1,52	0,704
1,02	0,611	1,28	0,664	1,54	0,707
1,04	0,615	1,30	0,667	1,56	0,710
1,06	0,620	1,32	0,671	1,58	0,713
1,08	0,624	1,34	0,674	1,60	0,716
1,10	0,628	1,36	0,678	1,62	0,719
1,12	0,633	1,38	0,681	1,64	0,722
1,14	0,637	1,40	0,685	1,66	0,725
1,16	0,641	1,42	0,688	1,68	0,728
1,18	0,645	1,44	0,691	1,70	0,731
1,20	0,649	1,46	0,695	2,00	0,770
1,22	0,652	1,48	0,698	2,20	0,793
1,24	0,656	1,50	0,701		

6.7.3.8.1.2 A lefűvási teljesítmény csökkentése érdekében alkalmazott szigetelési rendszert az illetékes hatóságnak vagy az általa felhatalmazott szervezetnek jóvá kell hagynia. Az erre a célra jóváhagyott szigetelési rendszernek minden esetben:

- a) 649 °C-ig minden hőmérsékleten hatásosnak kell maradnia; és
- b) olyan anyaggal kell bevonni, amelynek olvadáspontja legalább 700 °C.

6.7.3.9 *A nyomáscsökkentő szerkezetek jelölése*

6.7.3.9.1 Minden nyomáscsökkentő szerkezeten jól olvashatóan és tartósan fel kell tüntetni a következő adatokat:

- a) a nyitónyomást (bar-ban vagy kPa-ban);
- b) rugóterhelésű szerkezeteknél a nyitónyomás megengedett tűrését;
- c) a hasadótárcsák névleges nyomásához tartozó referencia hőmérsékletet;
- d) a szerkezet névleges átfolyási teljesítményét normál légköbméter per sec (m³/s) egységben;
- e) a rugóterhelésű nyomáscsökkentő szerkezetek és a hasadótárcsák átfolyási keresztmetszetét mm²-ben;

Amennyiben lehetséges, a következő információt ugyancsak fel kell tüntetni:

- f) a gyártó nevét és az eszköz vonatkozó katalógus számát.

6.7.3.9.2 A nyomáscsökkentő szerkezeteken feltüntetett névleges átfolyási teljesítményt az ISO 4126-1:2004 és az ISO 4126-7:2004 szabvány szerint kell meghatározni.

6.7.3.10 *A nyomáscsökkentő szerkezetek csatlakoztatása*

6.7.3.10.1 A nyomáscsökkentő szerkezetekhez történő csatlakozásnak akkorának kell lennie, hogy szabad átfolyást biztosítson a biztonsági szerkezethez. A tartány és a nyomáscsökkentő szerkezet közé nem szabad zárószelepet elhelyezni, kivéve a karbantartási vagy egyéb okból kialakított kettős nyomáscsökkentő szerkezeteknél, ha a ténylegesen működő nyomáscsökkentő szerkezet zárószelepe nyitott állapotban reteszelve van, vagy a zárószelepek úgy vannak összekapcsolva, hogy a kettős nyomáscsökkentő szerkezetek közül legalább az egyik mindig működőképes, és kielégíti a 6.7.3.8 bekezdés követelményeit. A szellőző vagy nyomáscsökkentő szerkezethez vezető nyílásban nem lehet semmiféle akadály, ami korlátozná vagy elzárná az áramlást a tartányból a szerkezethez. A szellőző vagy nyomáscsökkentő szerkezet kimenetéhez csatlakozó csővezetéknek, ha ilyet használnak, a kiszabadult gőzt vagy folyadékot a szerkezetre gyakorolt minimális torlóhatással kell a szabadba vezetniük.

6.7.3.11 *A nyomáscsökkentő szerkezetek elhelyezése*

6.7.3.11.1 Minden nyomáscsökkentő szerkezet bemenetet a tartány tetején úgy kell elhelyezni, hogy a tartány középpontjához a lehető legközelebb legyenek. Minden nyomáscsökkentő szerkezet bemenetnek a megengedett legnagyobb töltési feltételek mellett a tartány gőzterében kell lennie, és a szerkezetet úgy kell elhelyezni, hogy biztosítva legyen a kiszabadult gőz akadálytalan távozása. Gyúlékony, nem mélyhűtött, cseppfolyósított gázok esetében a kiszabaduló gőzt a tartánytól el kell terelni oly módon, hogy az ne csapódhasson a tartánynak. A gőz áramlását elterelő védőszerkezetek engedélyezettek, ha nem csökkentik a nyomáscsökkentő szerkezet szükséges teljesítményét.

6.7.3.11.2 Intézkedéseket kell tenni annak érdekében, hogy megakadályozzák illetéktelen személyeknek a nyomáscsökkentő szerkezethez való hozzáférését, és hogy megvédjék a szerkezetet attól, hogy a tartány felborulása esetén megsérüljön.

6.7.3.12 *Mérőeszközök*

- 6.7.3.12.1** Ha a mobil tartányt nem tömegre töltik, akkor egy vagy több szintmérő eszközzel kell ellátni. A tartány tartalmával közvetlenül érintkező, üvegből készült szintjelzők és egyéb törékeny anyagú mérőeszközök nem használhatók.

6.7.3.13 *A mobil tartány tartószerkezete, keretváza, emelő és rögzítő szerelvényei*

- 6.7.3.13.1** A mobil tartányt tartószerkezettel kell tervezni és gyártani, ami biztos alátámasztást nyújt a szállítás során. Erre vonatkozóan a tervezésnél a 6.7.3.2.9 pontban meghatározott erőket és a 6.7.3.2.10 pontban meghatározott biztonsági tényezőt kell figyelembe venni. Talpak, keretvázak, csúszótalpak vagy egyéb hasonló szerkezetek elfogadhatók.

- 6.7.3.13.2** A mobil tartányra szerelt eszközöktől (pl. talpaktól, keretváztól) és a mobil tartány emelő és rögzítő szerelvényeitől származó összetett feszültségek a tartány egyetlen részén sem okozhatnak túlzott feszültségeket. Minden mobil tartányt állandó emelő és rögzítő szerelvényekkel kell ellátni. Ezeket lehetőleg a mobil tartány tartószerkezetéhez kell erősíteni, de rögzíthetők a tartányon a megtámasztási pontokon elhelyezett erősítőlemezekhez is.

- 6.7.3.13.3** A tartószerkezet és a keretváz tervezésénél figyelembe kell venni a környezet korróziós hatását is.

- 6.7.3.13.4** Az emelővilla zsebeket zárhatóra kell kialakítani. Az emelővilla zsebek zárószervezetének a keretváz állandó részét kell képeznie, vagy a keretvázhoz tartósan hozzá kell erősíteni. Az olyan, egyetlen tartánykamrából álló mobil tartányoknál, amelyek 3,65 m-nél rövidebbek, nem kell az emelővilla zsebeknek zárhatónak lenniük, amennyiben

- a) a tartány és a szerelvények kellőképpen védve vannak, nehogy az emelővillák megüssék; és
- b) az emelővilla zsebek középpontjai közötti távolság legalább a fele a mobil tartány legnagyobb hosszúságának.

- 6.7.3.13.5** Ha a mobil tartány nincs a 4.2.2.3 bekezdés szerinti védelemmel ellátva, a tartányt és az üzemi szerelvényeit védeni kell a szállítás alatt a hosszirányú és oldalirányú lökésekkel vagy felborulásból adódóan a tartányt vagy a szerelvényeit érő sérülésekkel szemben. A külső szerelvényeket úgy kell védeni, hogy az ütések hatására, ill. a mobil tartánynak a szerelvényekre való ráborulása esetén a tartányban szállított anyag ne szabaduljon ki. Példák a védelemre:

- a) az oldalirányú ütésekkel szembeni védelem, ami állhat a tartány mindkét oldalán a középvonal szintjében védő hosszirányú rudakból;
- b) a mobil tartány felborulás elleni védelme, ami állhat erősítő gyűrűkből vagy a kereten keresztben elhelyezett rudakból;
- c) a hátulról jövő ütésekkel szembeni védelem, ami lökhárítóból vagy keretből állhat;
- d) a tartány ütésekkel vagy felborulásból eredő sérüléssel szembeni védelme az ISO 1496-3:1995 szabvány szerinti ISO keret használatával.

6.7.3.14 *Típusjóváhagyás*

- 6.7.3.14.1** Minden új mobil tartány típus esetén az illetékes hatóságnak vagy az általa felhatalmazott szervezetnek gyártási típus bizonyítványt kell kiállítani. Ennek a bizonyítványnak tanúsítania kell, hogy a mobil tartányt ez a hatóság megvizsgálta, az a kívánt célra alkalmas, és megfelel e fejezet követelményeinek és ha alkalmazandó, akkor a 4.2.5.2.6 pontban levő T50 mobil tartány utasításban meghatározott, az egyes gázokra vonatkozó követelményeknek. Ha a mobil tartányokat sorozatban gyártják módosítás nélkül, ez a bizonyítvány a teljes sorozatra érvényes. A bizonyítványban utalni kell a gyártási típus vizsgálati jegyzőkönyvére, azokra a

gázokra, amelyek szállíthatók, a tartány és a bélés (ha van) gyártási anyagára és a jóváhagyási számra. A jóváhagyási számnak annak az államnak a megkülönböztető jeléből [A közúti közlekedésről szóló Bécsi Egyezmény (Bécs, 1968) által előírt államjelzés a nemzetközi forgalomban résztvevő gépjárművekre], amelyben az engedélyt kiadták, és egy nyilvántartási számból kell állnia. A 6.7.1.2 bekezdés szerinti esetleges alternatív kialakítást a bizonyítványban fel kell tüntetni. A típusjóváhagyás az azonos anyagból és azonos falvastagsággal gyártott, kisebb mobil tartányok jóváhagyásának is tekinthető, amelyeket ugyanolyan gyártási technológiával és azonos tartószerkezetekkel, egyenértékű záró-szerkezetekkel és egyéb tartozékokkal gyártottak.

6.7.3.14.2 A gyártási típus vizsgálati jegyzőkönyvének a típusjóváhagyáshoz legalább a következőket kell tartalmaznia:

- a) a keretvázra vonatkozó, ISO 1496-3:1995 szabványban meghatározott vizsgálatok eredményeit;
- b) a 6.7.3.15.3 pont szerinti üzembe helyezés előtti vizsgálat eredményeit; és
- c) a 6.7.3.15.1 pont szerinti ütközési próba eredményeit, ha alkalmazható.

6.7.3.15 *Vizsgálat*

6.7.3.15.1 Azokat a mobil tartányokat, amelyek „A Biztonságos Konténerekről szóló 1972. évi Nemzetközi Egyezmény” (CSC) módosított kiadása meghatározása szerint konténernek minősülnek, csak azután szabad használni, hogy a gyártási típus prototípusa sikeresen kiállta a „Vizsgálatok és kritériumok kézikönyv” IV. rész, 41 fejezetében előírt dinamikus, hosszirányú ütközési próbát.

6.7.3.15.2 Az első üzembe helyezés előtt minden mobil tartányt és szerelvényeit vizsgálatnak kell alávetni (üzembe helyezés előtti vizsgálat) és azután legfeljebb ötéves időközönként (5 évenkénti időszakos vizsgálat), és az 5 éves időközök közepén közbenső vizsgálat (2,5 évenkénti közbenső időszakos vizsgálat). A 2,5 évenkénti vizsgálatot az előírt időpont-hoz képest 3 hónapon belül kell elvégezni. Ha a 6.7.3.15.7 pont szerint soron kívüli vizsgálatra van szükség, azt a legutóbbi időszakos vizsgálat időpontjától függetlenül el kell végezni.

6.7.3.15.3 A mobil tartány üzembe helyezés előtti vizsgálatának ki kell terjednie a szerkezeti jellemzők ellenőrzésére, a mobil tartány és szerelvényeinek külső és belső vizsgálatra, különös tekintettel a szállítandó nem mélyhűtött, cseppfolyósított gázok szempontjából, és a 6.7.3.3.2 pont szerinti próbanyomással végzett nyomáspróbára. A nyomáspróba vízzel vagy az illetékes hatóság vagy az általa felhatalmazott szervezet hozzájárulásával más folyadékkal vagy gázzal is végezhető. Mielőtt a mobil tartányt üzembe helyezik, tömörségi próbát is kell végezni és az üzemi szerelvények megfelelő működését is ellenőrizni kell. Amennyiben a nyomáspróbát a tartányon és a szerelvényeken külön végezték, a tömörségi próbát az összeszerelést követően kell végrehajtani. A tartányon levő, minden, teljes feszültség-szintnek kitett hegesztési varratot az első alkalommal végzett vizsgálat során radiográfiás, ultrahangos vagy más, alkalmas, roncsolásmentes vizsgálati módszerrel kell ellenőrizni. Ez azonban nem vonatkozik a burkolatra.

6.7.3.15.4 Az 5 évenkénti időszakos vizsgálatnak belső és külső állapot vizsgálatából és általában folyadéknomás-próbából kell állnia. A hő- vagy egyéb szigetelőborításokat csak annyira kell eltávolítani, amennyire a tartány jellemzőinek biztonságos megítéléséhez feltétlenül szükséges. Amennyiben a nyomáspróbát a tartányon és a szerelvényeken külön végezték, a tömörségi próbát az összeszerelést követően kell végrehajtani.

6.7.3.15.5 A 2,5 évenkénti közbenső időszakos vizsgálatnak ki kell terjednie legalább a mobil tartány és szerelvényeinek külső és belső vizsgálatra, különös tekintettel a szállítandó nem mélyhűtött, cseppfolyósított gázok szempontjából, és tömörségi próbára, továbbá az üzemi szerelvények megfelelő működését is ellenőrizni kell. A hő- vagy egyéb szigetelőborításokat csak annyira kell eltávolítani, amennyire a tartány jellemzőinek biztonságos megítéléséhez

feltétlenül szükséges. A csak egyetlen nem mélyhűtött, cseppfolyósított gáz szállítására szolgáló mobil tartánynál a 2,5 évenkénti közbenső időszakos vizsgálat elhagyható, vagy az illetékes hatóság vagy az általa felhatalmazott szervezet által előírt más vizsgálati módszerrel vagy ellenőrzéssel helyettesíthető.

6.7.3.15.6 A mobil tartányok a 6.7.3.15.2 pontban előírt utolsó 5 évenkénti vagy 2,5 évenkénti időszakos vizsgálat érvényességének lejártja után nem tölthetők meg és nem adhatók át szállításra. Az utolsó időszakos vizsgálat lejártja előtt megtöltött mobil tartányok az utolsó időszakos vizsgálat érvényességének letelte után legfeljebb három hónapig szállíthatók. Ezen kívül a mobil tartány az utolsó időszakos vizsgálat érvényességének letelte után is szállítható

- a) kiürítés után, de tisztítás előtt az újratöltés előtt szükséges vizsgálat elvégzésének céljából, és
- b) a veszélyes anyag ártalmatlanítására (megfelelő elhelyezésére) vagy visszaforgatására történő visszaszállítása céljából az időszakos vizsgálat érvényességének lejártja után legfeljebb hat hónapig, hacsak az illetékes hatóság másként nem rendelkezik. Ezt a mentességet a fuvarokmányba be kell jegyezni.

6.7.3.15.7 Soron kívüli vizsgálatot szükséges végezni, ha a mobil tartány sérült, rozsdás, szivárog vagy bármely más körülmény a mobil tartány sértetlenségét befolyásolhatja. A soron kívüli vizsgálat mértékét az határozza meg, hogy a mobil tartány mennyire sérült vagy hibás. A soron kívüli vizsgálatnak azonban legalább a 6.7.3.15.5 pont szerinti 2,5 évenkénti vizsgálatokra kell kiterjednie.

6.7.3.15.8 A külső és a belső vizsgálat során biztosítani kell, hogy

- a) ellenőrizzék a tartányt, hogy nincs rajta rozsdás, kipattogzás, kopás, horpadás, torzulás, hegesztési hiba vagy bármi más (pl. szivárgás), ami miatt a mobil tartány szállítása nem lenne biztonságos;
- b) ellenőrizzék a csővezetékét, a szelepeket, a fűtő/hűtő rendszert és a tömítéseket, hogy nincs rajtuk rozsdás, sérülés vagy bármi más (pl. szivárgás), ami miatt a mobil tartány töltése, ürítése vagy szállítása nem lenne biztonságos;
- c) a bűvönnyílások fedelének rögzítését biztosító szerkezetek jól működjenek, és a bűvönnyílás fedeleknél, ill. a tömítéseknél ne legyen szivárgás;
- d) a csőkarima csatlakozásoknál és vakkarimáknál a hiányzó vagy laza csavarokat vagy csavaranyákat pótolják, ill. meghúzzák;
- e) minden vészlelfűvő szerkezet és szelep mentes legyen a korróziótól és minden olyan sérüléstől vagy meghibásodástól, ami megakadályozhatja normális működését. A távműködtetésű zárószerkezeteket és az önzáró szelepeket ki kell próbálni, hogy megfelelően működnek-e;
- f) az előírt jelölések a mobil tartányon olvashatóak, és a vonatkozó követelményeknek megfelelnek; és
- g) a mobil tartány váz- és tartószerkezete, ill. az emelésre szolgáló berendezései megfelelő állapotban legyenek.

6.7.3.15.9 A 6.7.3.15.1, 6.7.3.15.3, 6.7.3.15.4, 6.7.3.15.5 és 6.7.3.15.7 pont szerinti vizsgálatokat az illetékes hatóság vagy az általa felhatalmazott szervezet által elismert szakértőnek kell elvégeznie vagy tanúsítania. Ha a nyomáspróba a vizsgálat részét képezi, a vizsgálatot a mobil tartány adattábláján feltüntetett nyomással kell végezni. A nyomás alatt lévő mobil tartányon a tartány, a csővezeték és a szerelvények szivárgásmentességét is vizsgálni kell.

6.7.3.15.10 Minden esetben, amikor a mobil tartányt vágással, melegítéssel vagy hegesztéssel javítják, a munkát az illetékes hatóságnak vagy az általa felhatalmazott szervezetnek jóvá kell hagynia, figyelembe véve azt a nyomástartó edényekre vonatkozó szabályzatot, amely alapján a tartányt gyártották. A munka befejezése után az eredeti próbanyomással nyomáspróbát kell végezni.

6.7.3.15.11 Amennyiben a biztonságot veszélyeztető körülményeket tapasztalnak, a mobil tartány addig nem használható újra, amíg meg nem javították és az ismételt vizsgálatot ki nem állta.

6.7.3.16 Jelölés

6.7.3.16.1 Ellenőrzés céljából könnyen elérhető, szembetűnő helyre minden mobil tartányra nem korrodálódó fémtáblát kell tartósan rögzíteni. Ha a mobil tartány kialakítása folytán a tábla nem erősíthető tartósan a tartányhoz, legalább a nyomástartó edényekre vonatkozó szabályzatban előírt információkat kell a tartányon feltüntetni. A fémtáblán legalább a következőkben felsorolt adatokat kell feltüntetni beütéssel vagy más hasonló módon:

- a) Tulajdonosi információk
 - i) a tulajdonos nyilvántartási száma;
- b) Gyártási információk
 - i) a gyártási ország;
 - ii) a gyártási év;
 - iii) a gyártó neve vagy jele;
 - iv) a gyártó sorozatszáma;
- c) Jóváhagyási információk
 - i) az Egyesült Nemzetek jele a csomagolóeszközön:  .

Ezt a jelet csak annak tanúsítására szabad használni, hogy a csomagolóeszköz, a mobil tartány, ill. a MEG-konténer megfelel a 6.1, a 6.2, a 6.3, a 6.5, a 6.6, ill. a 6.7⁷⁾ fejezet vonatkozó előírásainak;
 - ii) a jóváhagyó ország;
 - iii) a típusjóváhagyásra felhatalmazott szervezet;
 - iv) típusjóváhagyási szám;
 - v) „AA” betűk, ha a típust alternatív kialakításuként hagyták jóvá (lásd a 6.7.1.2 bekezdést);
 - vi) a nyomástartó edényekre vonatkozó szabályzat, amely szerint a tartányt méretezték;
- d) Nyomások
 - i) MAWP, a megengedett legnagyobb üzemi nyomás (bar vagy kPa, túlnyomás)⁸⁾;
 - ii) a próbanyomás (bar vagy kPa, túlnyomás)⁸⁾;
 - iii) az üzembe helyezés előtti nyomáspróba időpontja (hónap és év);
 - iv) az üzembe helyezés előtti nyomáspróbát tanúsító szakértő azonosító jele;
 - v) a külső tervezési nyomás⁹⁾ (bar vagy kPa, túlnyomás)⁸⁾;
- e) Hőmérsékletek
 - i) tervezési hőmérséklet-tartomány (°C)⁸⁾;
 - ii) tervezési referencia hőmérséklet (°C)⁸⁾;
- f) Anyagok

7) Ezt a jelet használják annak tanúsítására is, hogy az olyan hajlékony ömlesztettáru-konténerek, amelyeket más közlekedési alágazatra hagytak jóvá, megfelelnek az ENSZ Minta Szabályzat 6.8 fejezete követelményeinek.

8) A mértékegységet fel kell tüntetni

9) Lásd a 6.7.3.2.8 pontot.

- i) a tartány anyaga(i) és az anyagszabvány hivatkozás(ok);
 - ii) az egyenértékű vastagság referencia acélra (mm) ⁸⁾;
- g) Úrtartalom
 - i) a tartány víztérfogata 20 °C-on (liter) ⁸⁾;
- h) Időszakos vizsgálatok
 - i) a legutóbbi időszakos vizsgálat típusa (2,5-évenkénti, 5-évenkénti, soronkívüli);
 - ii) a legutóbbi időszakos vizsgálat időpontja (hónap és év);
 - iii) a legutóbbi időszakos vizsgálat próbanyomása (bar vagy kPa, túlnyomás) ⁸⁾ (ha alkalmazható);
 - iv) felhatalmazott szervezet azonosító jele, amely a legutóbbi vizsgálatot végezte vagy tanúsította.

* Próbanyomás, ha alkalmazható.

6.7.3.16.2 A következő adatokat magán a mobil tartányon vagy a mobil tartányhoz biztosan rögzített fémtáblán kell feltüntetni:

Az üzemben tartó neve

A szállításra engedélyezett nem mélyhűtött, cseppfolyósított gáz(ok) neve

A töltet megengedett legnagyobb tömege minden egyes szállításra engedélyezett, nem mélyhűtött, cseppfolyósított gázra kg

Megengedett legnagyobb bruttó tömeg kg

Üres (tára) tömeg kg.

A 4.2.5.2.6 pont szerinti mobil tartány utasítás.

Megjegyzés: A szállított nem mélyhűtött, cseppfolyósított gázok azonosítására lásd az 5. részt.

6.7.3.16.3 A nyílt tengeren történő kezelésre tervezett és jóváhagyott mobil tartány esetén az „OFFSHORE PORTABLE TANK” feliratot kell feltüntetni az azonosító táblán.

6.7.4 A mélyhűtött, cseppfolyósított gázokhoz használt mobil tartányok gyártására és vizsgálatára vonatkozó követelmények

6.7.4.1 Meghatározások

E szakasz alkalmazásában:

Az *alternatív kialakítási engedély* az e fejezetben meghatározottaktól eltérő műszaki előírások alapján tervezett, gyártott vagy eltérő vizsgálati módszer szerint vizsgált (alternatív kialakítású) mobil tartányra vagy MEG-konténerre az illetékes hatóság által kiadott engedély.

A *mobil tartány* olyan hőszigetelt, multimodális tartány, amelynek befogadóképessége 450 liternél nagyobb, és amelyet a mélyhűtött, cseppfolyósított gázok szállítására használnak. A mobil tartány fogalmába maga a tartány és a gázok szállításához szükséges üzemi és szerkezeti szerelvényei tartoznak. A mobil tartánynak a szerkezeti szerelvények eltávolítása nélkül tölthetőnek és üríthetőnek kell lennie. A tartány külső részén stabilizáló elemeknek kell lenni és alkalmasnak kell lennie arra, hogy megtöltött állapotban felemeljék. Úgy kell kialakítani, hogy elsősorban közúti járműre, vasúti kocsira, ill. tengerjáró vagy belvízi hajóba lehessen rakni, a gépi rakodás megkönnyítésére kerettel vagy egyéb szerkezetekkel kell ellátni. A közúti tartányjárművek, a vasúti tartálykocsik, a nem fémből készült tartányok és a nagyméretű csomagolóeszközök (IBC-k), a gázpalackok és a nagypalackok e meghatározás értelmében nem minősülnek mobil tartánynak;

A *tartány* olyan konstrukció, amely rendszerint a következőkből áll:

- a) vagy egy burkolatból és egy vagy több belső tartányból, ahol a tartány(ok) és a burkolat közötti tér légtelenítve van (vákuum szigetelés), és hőszigetelő rendszert is tartalmazhat;
- b) vagy egy burkolatból és egy belső tartányból köztes szilárd hőszigetelő réteggel (pl. szilárd habbal).

A tartány a mobil tartány azon része, amely a szállítandó, mélyhűtött, cseppfolyósított gáz megtartására szolgál (maga a tartány), beleértve a nyílásokat és azok zárószerveit, de kizárva az üzemi szerelvényeket és a külső szerkezeti szerelvényeket.

A *burkolat* a külső szigetelő burkolat vagy borítás, ami a szigetelő rendszer részét képezheti.

Az *üzemi szerelvények* a töltő- és ürítő-, a szellőző-, a biztonsági-, a fűtő-, a hűtő-, a hőszigetelő és a hermetizáló berendezések, valamint a mérőeszközök.

A *szerkezeti szerelvények* a tartány külső részén található erősítő-, rögzítő-, védő- vagy stabilizáló elemek.

A *megengedett legnagyobb üzemi nyomás* a megtöltött tartány üzemi helyzetében, annak tetején megengedett, tényleges túlnyomás, beleértve a töltés és ürítés alatti legnagyobb tényleges nyomást is.

A *próbanyomás* a nyomáspróba alatt a tartány tetején fellépő legnagyobb túlnyomás.

A *tömörségi próba* az a gázzal végzett vizsgálat, amelynek során a tartányt az üzemi szerelvényeivel a megengedett legnagyobb üzemi nyomás legalább 90%-át elérő tényleges belső nyomásnak teszik ki.

A *megengedett legnagyobb bruttó tömeg* a mobil tartány saját tömege és a szállításra engedélyezett legnagyobb rakomány össztömege.

A *megtartási idő* az az időtartam, ami a kezdeti töltési körülmények létrejöttétől addig telik el, amíg a nyomás a hőfelvétel következtében a nyomáshatároló eszköz(ök) legkisebb nyitónyomását eléri.

A *referencia acél* a 370 N/mm² szakítószilárdságú és 27% szakadási nyúlású acél.

A *legkisebb tervezési hőmérséklet* a tartány tervezésénél és gyártásánál alkalmazott hőmérséklet, ami nem magasabb, mint a tartalom legalacsonyabb hőmérséklete (üzemi hőmérséklet) normális töltési, ürítési és szállítási feltételek esetén.

6.7.4.2 *Általános tervezési és gyártási követelmények*

- 6.7.4.2.1** A tartányokat az illetékes hatóság által elismert, a nyomástartó edényekre vonatkozó szabályzat előírásainak megfelelően kell tervezni és gyártani. A burkolatot és a tartányt alakításra alkalmas fémes anyagból kell készíteni. A burkolatot acélból kell készíteni. A burkolat és a tartány közötti csatlakozásokat és támasztékokat nem fémes anyagból is lehet készíteni, ha az anyag tulajdonságai a legkisebb tervezési hőmérsékleten bizonyítottan kielégítőek. Az anyagoknak általában a belföldi vagy nemzetközi anyagszabványoknak kell megfelelniük. Hegesztett burkolatokhoz és tartányokhoz csak olyan anyagok használhatók, amelyek hegeszthetősége teljes mértékben szavatolt. A hegesztéseket szakszerűen kell elkészíteni, és teljesen biztonságosnak kell lenniük. Ha a gyártási folyamat vagy az anyag szükségesé teszi, a tartányt megfelelően hőkezelní kell, hogy a hegesztéseknél és a hőhatásnak kitett zónákban biztosítsák a kielégítő szívósságot. Az anyagok kiválasztásánál a ridegtörés veszélye, a hidrogénes elridegedés, a feszültség alatti korróziós repedezések és az ütésállóság szempontjából figyelembe kell venni a legkisebb tervezési hőmérsékletet. Finom szemcseszerkezetű acélok használata esetén a szavatolt folyáshatár nem lehet nagyobb, mint 460 N/mm^2 , és a szavatolt szakítószilárdság felső határa nem lehet nagyobb, mint 725 N/mm^2 az anyagspecifikáció szerint. A mobil tartány anyagainak alkalmasnak kell lenniük ahhoz a külső környezethez, amelyben a tartányt szállíthatják.
- 6.7.4.2.2** A mobil tartány minden részének, beleértve a szerelvényeket, a tömítéseket és csővezetéseket, amely rendes körülmények között érintkezhet a szállított mélyhűtött, cseppfolyósított gázzal, összeférhetőnek kell lennie ezzel a gázzal.
- 6.7.4.2.3** Kerülni kell a különböző fémek érintkezését, ami a galvanikus hatás folytán károsodást okozhat.
- 6.7.4.2.4** A hőszigetelő rendszernek a tartány(oka)t teljesen beburkoló külső burkolatot és hatásos szigetelő anyagot kell tartalmaznia. A külső szigetelést burkolattal kell védeni, hogy a nedvesség ne hatolhasson be, és a szigetelés ne sérülhessen meg normális szállítási feltételek esetén.
- 6.7.4.2.5** Ha a burkolat gázzáró, külön szerkezettel meg kell akadályozni, hogy a szigetelő térben veszélyes nyomás lépjen fel.
- 6.7.4.2.6** Az atmoszferikus nyomáson -182 °C alatti forráspontú, mélyhűtött, cseppfolyósított gázok szállítására szolgáló mobil tartányok esetén a hőszigetelés nem tartalmazhat olyan anyagokat, amelyek az oxigénnel vagy oxigénben dús atmoszférában veszélyesen reagálnak, ha ezek az anyagok a hőszigetelés olyan részében találhatók, ahol fennáll az oxigénnel vagy az oxigénben feldúsult folyadékkal való érintkezés veszélye.
- 6.7.4.2.7** A szigetelőanyagok minősége a használat során nem csökkenhet túlzott mértékben.
- 6.7.4.2.8** A referencia megtartási időt minden egyes, a mobil tartányban szállítandó mélyhűtött, cseppfolyósított gázra meg kell határozni.
- 6.7.4.2.8.1** A megtartási időt az illetékes hatóság által elismert módszerrel a következő tényezők alapján kell meghatározni:
- a) a szigetelőrendszer 6.7.4.2.8.2 pont szerint meghatározott hatékonysága;
 - b) a nyomáshatároló eszköz(ök) legkisebb nyitónyomása;
 - c) a kezdeti töltési körülmények;
 - d) 30 °C feltételezett környezeti hőmérséklet;
 - e) a szállítandó mélyhűtött, cseppfolyósított gáz(ok) fizikai tulajdonságai.
- 6.7.4.2.8.2** A szigetelőrendszer hatékonyságát (hőátadás wattban) a mobil tartány típusvizsgálata során kell meghatározni, az illetékes hatóság által elfogadott eljárással. Ennek a vizsgálatnak a következők egyikebőől kell állnia:

- a) állandó nyomáson (pl. atmoszferikus nyomáson) végzett próba, amely során a mélyhűtött, cseppfolyósított gáz veszteségét mérik meghatározott idő alatt; vagy
- b) zárt rendszerű próba, amelynek során a tartányban a nyomás növekedését mérik meghatározott idő alatt.

Az állandó nyomáson végzett próbánál az atmoszferikus nyomás változásait figyelembe kell venni. Mindkét próbánál korrekciót kell végezni a környezeti hőmérsékletnek a feltételezett 30 °C-os referencia környezeti hőmérséklettől való eltérése miatt.

Megjegyzés: Az egyes szállítások előtt a tényleges megtartási idő meghatározására lásd a 4.2.3.7 bekezdést.

- 6.7.4.2.9** A kettős falú, vákuumszigetelésű tartány burkolatát vagy a nyomástartó edényekre vonatkozó szabályzatot szerint legalább 100 kPa (1 bar) túlnyomásra mint külső tervezési nyomásra, vagy legalább 200 kPa (2 bar) (túlnyomás) számított kritikus repesztőnyomásra kell méretezni. A belső és külső erősítő szerkezetek figyelembe vehetők a tartány külső nyomással szembeni ellenállóképességének számításánál.
- 6.7.4.2.10** A mobil tartányt megfelelő emelő és rögzítő szerelvényekkel és olyan tartószerkezettel kell tervezni és kialakítani, amely a szállítás során biztos alátámasztást nyújt.
- 6.7.4.2.11** A mobil tartányt olyanra kell tervezni, hogy a szállított anyag vesztesége nélkül ellenálljon legalább a szállított anyag által kifejtett belső nyomásnak és a normális szállítási és kezelési feltételek mellett fellépő statikus, dinamikus és hőterhelésnek. A tervezés során bizonyítani kell, hogy az ezen terheléseknek a mobil tartány várható élettartama alatti ismétlődése folytán kialakuló kifáradást figyelembe vették.
- 6.7.4.2.12** A mobil tartányoknak és rögzítőelemeiknek a megengedett legnagyobb töltési tömeg mellett a következő, külön-külön fellépő, statikus erők elviselésére kell alkalmasnak lenniük:
- a) menetirányban: a megengedett legnagyobb bruttó tömeg kétszerese szorozva a nehézségi gyorsulással (g)¹⁰⁾;
 - b) vízszintesen a menetirányra merőlegesen: a megengedett legnagyobb bruttó tömeg (amennyiben a menetirány nincs egyértelműen meghatározva, a megengedett legnagyobb bruttó tömeg kétszerese) szorozva a nehézségi gyorsulással (g)¹⁰⁾;
 - c) függőlegesen felfelé: a megengedett legnagyobb bruttó tömeg szorozva a nehézségi gyorsulással (g)¹⁰⁾; és
 - d) függőlegesen lefelé: a megengedett legnagyobb bruttó tömeg (összes terhelés beleértve a gravitáció hatását) kétszerese szorozva a nehézségi gyorsulással (g)¹⁰⁾.
- 6.7.4.2.13** A 6.7.4.2.12 pontban felsorolt erőknél a következő biztonsági tényezőket kell figyelembe venni:
- a) határozott folyáshatárral rendelkező anyagoknál a szavatolt folyáshatárra vonatkozóan 1,5-es biztonsági tényezőt; vagy
 - b) határozott folyáshatárral nem rendelkező anyagoknál: a 0,2%-os (vagy ausztenites acélokra az 1%-os) szavatolt, egyezményes folyáshatárra vonatkozóan 1,5-es biztonsági tényezőt.
- 6.7.4.2.14** A tényleges, ill. az egyezményes folyáshatár értékére a belföldi vagy nemzetközi anyagszabványok által meghatározott értékeket kell használni. Ausztenites acélok használata esetén a tényleges, ill. az egyezményes folyáshatárra az anyagszabványokban előírt legkisebb értékeket legfeljebb 15%-kal meg lehet haladni, ha ezeket a magasabb értékeket a vizsgálati bizonyítvány hitelesíti. Ha a szóban forgó fémre nincs anyagszabvány, a használt tényleges, ill. egyezményes folyáshatár értéket az illetékes hatóságnak jóvá kell hagyania.
- 6.7.4.2.15** A gyúlékony, mélyhűtött, cseppfolyósított gázok szállítására használt mobil tartányoknak

10) A számítások céljára $g = 9,81 \text{ m/s}^2$.

elektromosan földelhetőnek kell lenniük.

6.7.4.3 Tervezési kritériumok

6.7.4.3.1 A tartányoknak körkeresztmetszetűnek kell lenniük.

6.7.4.3.2 A tartányokat úgy kell tervezni és gyártani, hogy a megengedett legnagyobb üzemi nyomás legalább 1,3-szeresével végrehajtott nyomáspróbát kiállják. A vákuumszigetelésű tartányoknál a próbanyomás nem lehet kisebb, mint a megengedett legnagyobb üzemi nyomás és 100 kPa (1 bar) összegének 1,3-szerese. A próbanyomás semmilyen esetben sem lehet 300 kPa (3 bar) túlnyomásnál kisebb. Ezenkívül tekintettel kell lenni a 6.7.4.4.2–6.7.4.4.7 pontban meghatározott, legkisebb falvastagságra vonatkozó követelményekre is.

6.7.4.3.3 A határozott folyáshatárral rendelkező, ill. szavatolt, egyezményes folyáshatárral (általában a 0,2%-os, ausztenites acéloknál az 1%-os egyezményes folyáshatárral) jellemzett fémeknél a tartányban a próbanyomáson fellépő σ primer membránfeszültség nem haladhatja meg a $0,75R_e$ vagy a $0,50R_m$ értékek közül az alacsonyabbat, ahol

R_e = a tényleges folyáshatár N/mm²-ben vagy a 0,2%-os vagy ausztenites acéloknál az 1%-os egyezményes folyáshatár;

R_m = a legkisebb szakítószilárdság N/mm²-ben.

6.7.4.3.3.1 Az R_e és R_m értékére a belföldi vagy nemzetközi anyagszabványok által meghatározott legkisebb értékeket kell használni. Ausztenites acélok használata esetén az anyagszabványokban előírt legkisebb értékeket legfeljebb 15%-kal meg lehet haladni, ha ezeket a magasabb értékeket az anyagvizsgálati bizonyítvány hitelesíti. Ha a szóban forgó fémre nincs anyagszabvány, a használt R_e és R_m értéket az illetékes hatóságnak vagy az általa felhatalmazott szervezetnek kell jóváhagynia.

6.7.4.3.3.2 Hegesztett tartányok gyártásához használt acéloknál 0,85-öt meghaladó R_e/R_m arány nem megengedett. Az anyagvizsgálati bizonyítványban szereplő értékeket kell alapul venni az egyes esetekben az R_e/R_m arány meghatározásához.

6.7.4.3.3.3 A tartány gyártásához R_e acélnál a szakadási nyúlás értéke %-ban nem lehet kisebb, mint $10\,000/R_m$, azonban finom szemcseszerkezetű acélok esetében 16%-nál, más acélok esetében 20%-nál semmi esetre sem lehet kisebb. Alumínium esetében a szakadási nyúlás %-ban nem lehet kisebb mint $10\,000/6R_m$, de 12%-nál semmi esetre sem lehet kisebb.

6.7.4.3.3.4 Az anyagokra a tényleges értékek meghatározásánál figyelembe kell venni, hogy fémlemez esetén a szakítópróbához használt próbatest tengelye a hengerlési irányra merőleges legyen. A szakadási nyúlást négyszög keresztmetszetű próbatesten kell mérni az ISO 6892:1998 szabvány szerint, 50 mm-es befogási hossz mellett.

6.7.4.4 Legkisebb falvastagság

6.7.4.4.1 A legkisebb falvastagságnak a következők szerint adódó nagyobbik vastagságnak kell lennie:

- a 6.7.4.4.2 – 6.7.4.4.7 pont szerint meghatározott legkisebb vastagság;
- a nyomástartó edényekre vonatkozó, elismert szabályzat és a 6.7.4.3 bekezdés követelményei szerint meghatározott legkisebb vastagság.

6.7.4.4.2 Az 1,80 m-nél nem nagyobb átmérőjű tartányok falvastagságának legalább 5 mm-nek kell lennie referencia acélra számolva, vagy a felhasználandó fémből azzal egyenértékű vastagságúnak. Ha az átmérő meghaladja az 1,80 m-t, a falvastagságnak legalább 6 mm-nek kell lennie referencia acélra számolva, vagy a felhasználandó fémből azzal egyenértékű vastagságúnak.

6.7.4.4.3 Az 1,80 m-nél nem nagyobb átmérőjű, vákuumszigetelt tartányok falvastagságának legalább

3 mm-nek kell lennie referencia acélra számolva, vagy a felhasználandó fémből azzal egyenértékű vastagságúnak. Ha az átmérő meghaladja az 1,80 m-t, a falvastagságnak legalább 4 mm-nek kell lennie referencia acélra számolva, vagy a felhasználandó fémből azzal egyenértékű vastagságúnak.

6.7.4.4.4 Vákuumszigetelt tartányoknál a burkolat és a tartány együttes vastagságának kell megfelelnie a 6.7.4.4.2 pontban meghatározott legkisebb vastagságnak, azonban magának a tartánynak a falvastagsága nem lehet kisebb, mint a 6.7.4.4.3 pontban meghatározott legkisebb falvastagság.

6.7.4.4.5 A tartányok falvastagsága a szerkezeti anyagtól függetlenül nem lehet 3 mm-nél kisebb.

6.7.4.4.6 Valamely fém egyenértékű vastagságát, kivéve a 6.7.4.4.2 és a 6.7.4.4.3 pontban a referencia acélra előírt vastagságot, a következő képlettel kell kiszámítani:

$$e_I = \frac{21,4e_0}{\sqrt[3]{R_{mI}A_I}},$$

ahol

e_I = a felhasználandó fém esetén megkövetelt egyenértékű falvastagság (mm-ben);

e_0 = a legkisebb falvastagság (mm-ben) a 6.7.4.4.2 és a 6.7.4.4.3 pontban meghatározott referencia acél esetében;

R_{mI} = a felhasználandó fém szavatolt legkisebb szakítószilárdsága (N/mm²-ben) (lásd a 6.7.4.3.3 pontot);

A_I = a felhasználandó fém belföldi vagy nemzetközi szabványok szerinti szavatolt legkisebb szakadási nyúlása (%-ban).

6.7.4.4.7 A falvastagság semmilyen esetben sem lehet kisebb a 6.7.4.4.1 – 6.7.4.4.5 pontban meghatározott értéknél. A tartány egyetlen részének sem lehet kisebb a falvastagsága, mint a 6.7.4.4.1 – 6.7.4.4.6 pontban meghatározott legkisebb vastagság. Ebbe a falvastagságba nem szabad beszámítani a korrózió miatti esetleges ráhagyásokat.

6.7.4.4.8 A lemezvastagságban nem lehet hirtelen változás ott, ahol a tartány hengeres része és a fenekek csatlakoznak.

6.7.4.5 Üzemi szerelvények

6.7.4.5.1 Az üzemi szerelvényeket úgy kell elhelyezni, hogy a szállítás és a kezelés során leszakadás vagy sérülés veszélye ellen biztosítva legyenek. Amennyiben a váz és a tartány közötti kapcsolat lehetővé teszi a szerkezeti részek egymáshoz képesti elmozdulását, a szerelvényeket úgy kell rögzíteni, hogy az ilyen elmozdulás a részek sérülésének veszélye nélkül lehetővé váljon. A külső üritő szerelvényeket (csőcsonkokat, zárószerkezeteket), a belső zárószelepet és annak ülékét védeni kell a külső erők hatására történő leszakadás veszélyével szemben (például nyíródnó keresztmetszet kialakításával). A töltő- és üritőszerkezeteket (beleértve a karimákat és a menetes dugókat is), valamint az esetleges védőkupakokat a nem szándékos kinyitás ellen biztosítani kell.

6.7.4.5.2 A gyúlékony, mélyhűtött, cseppfolyósított gázok szállítására használt mobil tartányok minden töltő- és üritőnyílását legalább három, egymás mögött elhelyezett, egymástól független zárószerkezettel kell ellátni, amelyek közül az első egy, a burkolathoz a lehető legközelebb elhelyezett zárószelep, a második egy zárószelep és a harmadik egy vakkarima vagy más, egyenértékű szerkezet. A burkolathoz legközelebb levő zárószelepnél pillanat záró szerkezetnek kell lennie, amely automatikusan lezár a mobil tartány töltés vagy ürités alatti nem szándékos elmozdulása esetén, ill. ha tűzbe kerül. Ennek a szerkezetnek távvezérléssel is működtethetőnek kell lennie.

6.7.4.5.3 A nem gyúlékony, mélyhűtött, cseppfolyósított gázok szállítására szolgáló mobil tartányok

minden töltő- és ürítőnyílását legalább két, egymás mögött elhelyezett, egymástól független zárószervezettel kell ellátni, amelyek közül az első egy, a külső burkolathoz a lehető legközelebb elhelyezett zárószelep, a második pedig egy vakkarima vagy más, egyenértékű szerkezet.

- 6.7.4.5.4** Azokat a csőszakaszokat, amelyek mindkét végükön zárhatóak és amelyekben folyékony termék maradhat vissza, a csőszakaszban a túlnyomás elkerülésére automatikus nyomáscsökkentő rendszerrel kell ellátni.
- 6.7.4.5.5** A vákuumszigetelésű tartányokat nem szükséges vizsgálónyílással ellátni.
- 6.7.4.5.6** A külső szerelvényeket – amennyire csak lehet – egy helyre csoportosítva kell elhelyezni.
- 6.7.4.5.7** A mobil tartány minden csatlakozásán jól láthatóan fel kell tüntetni a rendeltetését.
- 6.7.4.5.8** A zárószelepeket és zárószervezeteket úgy kell tervezni és kialakítani, hogy a névleges nyomásuk legalább akkora legyen, mint a tartány megengedett legnagyobb üzemi nyomása, figyelembe véve a szállítás alatt várható hőmérsékleteket. A csavarorsós zárószelepeknek a kézikerek óramutató járásával megegyező irányba történő elforgatásával kell záródniuk. Másfajta zárószelepeknél a zárószelep (nyitott és zárt) állását és a zárás irányát jól láthatóan fel kell tüntetni. Minden zárószelepet úgy kell kialakítani, hogy akaratlanul ne lehessen kinyitni.
- 6.7.4.5.9** Ha nyomás fenntartó egységeket használnak, az egységhez vezető folyadék és gőz csatlakozásokat a burkolathoz a lehető legközelebb szeleppel kell ellátni, ami megakadályozza a tartalom elvesztését a nyomás fenntartó egység meghibásodása esetén.
- 6.7.4.5.10** A csővezetéseket úgy kell tervezni, gyártani és felszerelni, hogy ne jöjjön létre sérülésveszély a hőtágulás és összehúzódás, a mechanikai ütések és rezgések következtében. Minden csövet megfelelő fémes anyagból kell készíteni. A tűz hatására bekövetkező szivárgás elkerülésére a burkolat és minden kimeneti nyílás első zárószervezetéhez való csatlakozás között csak acél csővezeték és hegesztett csőkötés alkalmazható. A zárószervezet ehhez a csatlakozáshoz való hozzáerősítését az illetékes hatóságnak vagy az általa felhatalmazott szervezetnek jóvá kell hagynia. Ahol csak lehetséges, hegesztett csőkötésekkel kell alkalmazni.
- 6.7.4.5.11** A rézcsövek csatlakozásait keményforrasztással kell készíteni vagy azzal azonos szilárdságú, fémes csőkötetést kell alkalmazni. A forrasztófém (keményforrasztás) olvadáspontja nem lehet 525 °C-nál alacsonyabb. A kötések nem csökkenthetik a csővezeték szilárdságát, mint az csavarmentes kötéseknel előfordulhat.
- 6.7.4.5.12** A szelepek és a tartozékok gyártásához csak olyan anyagok használhatók, amelyek a mobil tartány legkisebb üzemi hőmérsékletén is megfelelő anyagi jellemzőkkel rendelkeznek.
- 6.7.4.5.13** Egyetlen csővezeték és csőszerelvény repesztőnyomása sem lehet kisebb, mint a tartány megengedett legnagyobb üzemi nyomásának négyszerese és azon nyomás négyszerese közül a nagyobb, amelynek a használat során, szivattyú vagy egyéb szerkezet (kivéve a nyomáscsökkentő szerkezeteket) működése révén ki lehetnek téve.

6.7.4.6 *Nyomáscsökkentő szerkezetek*

- 6.7.4.6.1** A mobil tartányokat egy vagy több, rugóterhelésű nyomáscsökkentő szervezettel kell ellátni. A nyomáscsökkentő szervezetnek legalább a megengedett legnagyobb üzemi nyomással megegyező nyomáson automatikusan kell nyílnia, és a megengedett legnagyobb üzemi nyomás 110%-ának megfelelő nyomáson teljesen nyitva kell lennie. Lefűtés után a szervezetnek a nyitónyomásánál legfeljebb 10%-kal alacsonyabb nyomáson záródnia kell, minden ennél alacsonyabb nyomáson zárva kell maradnia. A nyomáscsökkentő szervezetnek olyan típusúnak kell lennie, ami ellenáll a dinamikus hatásoknak, beleértve a folyadék hullámzását is.

- 6.7.4.6.2** A nem gyúlékony, mélyhűtött, cseppfolyósított gázokhoz és a hidrogénhez használt tartányok ezenkívül a rugóterhelésű szerkezetekkel párhuzamosan hasadótárcsákkal is elláthatók, mint azt a 6.7.4.7.2 és a 6.7.4.7.3 pont meghatározza.
- 6.7.4.6.3** A nyomáscsökkentő szerkezeteket úgy kell kialakítani, hogy megakadályozzák az idegen anyagoknak a tartányba való bejutását, a gáz kiszivárgását és mindenféle veszélyes túlnyomás kialakulását.
- 6.7.4.6.4** A nyomáscsökkentő szerkezetet az illetékes hatóságnak vagy az általa felhatalmazott szervezetnek jóvá kell hagynia.
- 6.7.4.7** *A nyomáscsökkentő szerkezetek teljesítménye*
- 6.7.4.7.1** Vákuumszigetelésű tartányoknál a vákuum megszűnése vagy a szilárd anyaggal szigetelt tartánynál a szigetelés 20%-ának tönkremenetele esetén a nyomáscsökkentő szerkezetek összes lefűvási teljesítményének elegendőnek kell lennie ahhoz, hogy a nyomás (beleszámítva a nyomásnövekedést) a tartány belsejében ne haladja meg a megengedett legnagyobb üzemi nyomás 120%-át.
- 6.7.4.7.2** A nem gyúlékony, mélyhűtött, cseppfolyósított gázok (az oxigén kivételével) és a hidrogén esetében ez a teljesítmény a szükséges nyomáscsökkentő szerkezetekkel párhuzamosan elhelyezett hasadótárcsák alkalmazásával is elérhető. A hasadótárcsáknak a tartány próbanyomásával megegyező névleges nyomáson át kell szakadniuk.
- 6.7.4.7.3** A 6.7.4.7.1 és a 6.7.4.7.2 pontban leírt körülmények között, ha a tartányt a tűz teljesen elfedi, a nyomáscsökkentő szerkezetek összes teljesítményének elegendőnek kell lenni ahhoz, hogy a nyomást a tartányban a próbanyomásra korlátozza.
- 6.7.4.7.4** A nyomáscsökkentő szerkezetek szükséges teljesítményét az illetékes hatóság által elismert, jól bevált műszaki szabályzat¹¹⁾ szerint kell kiszámítani.
- 6.7.4.8** *A nyomáscsökkentő szerkezetek jelölése*
- 6.7.4.8.1** Minden nyomáscsökkentő szerkezeten jól olvashatóan és tartósan fel kell tüntetni a következő adatokat:
- a) a nyitónyomást (bar-ban vagy kPa-ban);
 - b) rugóterhelésű szerkezeteknél a nyitónyomás megengedett tűrését;
 - c) a hasadótárcsák névleges nyomásához tartozó referencia hőmérsékletet;
 - d) a szerkezet névleges átfolyási teljesítményét normál légköbméter per sec (m³/s) egységben;
 - e) a rugóterhelésű nyomáscsökkentő szerkezetek és a hasadótárcsák átfolyási keresztmetszetét mm²-ben.
- Amennyiben lehetséges, a következő információt ugyancsak fel kell tüntetni:
- f) a gyártó neve és az eszköz vonatkozó katalógus száma.
- 6.7.4.8.2** A nyomáscsökkentő szerkezeteken feltüntetett névleges átfolyási teljesítményt az ISO 4126-1:2004 és az ISO 4126-7:2004 szabvány szerint kell meghatározni.
- 6.7.4.9** *A nyomáscsökkentő szerkezetek csatlakoztatása*
- 6.7.4.9.1** A nyomáscsökkentő szerkezetekhez történő csatlakozásnak akkorának kell lennie, hogy

11) Lásd például a CGA S-1.2-2003 „Pressure Relief Device Standards – Part 2 – Cargo and Portable Tanks for Compressed Gases” (Nyomáscsökkentő szerkezet szabványok – 2. rész – Árutartányok és mobil tartányok sűrített gázokhoz) kiadványt.

szabad átfolyást biztosítson a biztonsági szerkezethez. A tartány és a nyomáscsökkentő szerkezet közé nem szabad zárószelepet elhelyezni, kivéve a karbantartási vagy egyéb okból kialakított kettős nyomáscsökkentő szerkezeteknél, ha a ténylegesen működő nyomáscsökkentő szerkezet zárószelepe nyitott állapotban reteszelve van, vagy a zárószelepek úgy vannak összekapcsolva, hogy mindig kielégíti a 6.7.4.7 bekezdés követelményeit. A szellőző vagy nyomáscsökkentő szerkezethez vezető nyílásban nem lehet semmiféle akadály, ami korlátozná vagy elzárná az áramlást a tartányból a szerkezethez. A szellőző vagy nyomáscsökkentő szerkezet kimenetéhez csatlakozó csővezetéknek, ha ilyet használnak, a kiszabadult gőzt vagy folyadékot a szerkezetre gyakorolt minimális torlóhatással kell a szabadba vezetniük.

6.7.4.10 *A nyomáscsökkentő szerkezetek elhelyezése*

6.7.4.10.1 Minden nyomáscsökkentő szerkezet bemenetét a tartány tetején úgy kell elhelyezni, hogy a tartány középpontjához a lehető legközelebb legyen. Minden nyomáscsökkentő szerkezet bemenetnek a megengedett legnagyobb töltési feltételek mellett a tartány gőzterében kell lennie, és a szerkezetet úgy kell elhelyezni, hogy biztosítva legyen a kiszabadult gőz akadálytalan távozása. Mélyhűtött, cseppfolyósított gázok esetében a kiszabaduló gőzt a tartánytól el kell terelni oly módon, hogy az ne csapódhasson a tartánynak. A gőz áramlását elterelő védőszerkezetek engedélyezettek, ha nem csökkentik a nyomáscsökkentő szerkezet szükséges teljesítményét.

6.7.4.10.2 Intézkedéseket kell tenni annak érdekében, hogy megakadályozzák illetéktelen személyeknek a nyomáscsökkentő szerkezethez való hozzáférését, és hogy megvédjék a szerkezetet attól, hogy a tartány felborulása esetén megsérüljön.

6.7.4.11 *Mérőeszközök*

6.7.4.11.1 A mobil tartányokat egy vagy több mérőeszkőzzel kell ellátni, kivéve ha tömegre töltik. A tartány tartalmával közvetlenül érintkező, üvegből készült szintjelzők és egyéb törékeny anyagú mérőeszközök nem használhatók.

6.7.4.11.2 A vákuumszigetelésű mobil tartányok burkolatán a vákuummérő számára csatlakozást kell kialakítani.

6.7.4.12 *A mobil tartány tartószerkezete, keretváza, emelő és rögzítő szerelvényei*

6.7.4.12.1 A mobil tartányt tartószerkezettel kell tervezni és gyártani, ami biztos alátámasztást nyújt a szállítás során. Erre vonatkozóan a tervezésnél a 6.7.4.2.12 pontban meghatározott erőket és a 6.7.4.2.13 pontban meghatározott biztonsági tényezőt kell figyelembe venni. Talpak, keretvázak, csúszótalpak vagy egyéb hasonló szerkezetek elfogadhatók.

6.7.4.12.2 A mobil tartányra szerelt eszközöktől (pl. talpaktól, keretváztól) és a mobil tartány emelő és rögzítő szerelvényeitől származó összetett feszültségek a tartány egyetlen részén sem okozhatnak túlzott feszültségeket. Minden mobil tartányt állandó emelő és rögzítő szerelvényekkel kell ellátni. Ezeket lehetőleg a mobil tartány tartószerkezetéhez kell erősíteni, de rögzíthetők a tartányon a megtámasztási pontokon elhelyezett erősítőlemezekhez is.

6.7.4.12.3 A tartószerkezet és a keretváz tervezésénél figyelembe kell venni a környezet korróziós hatását is.

6.7.4.12.4 Az emelővilla zsebeket zárhatóra kell kialakítani. Az emelővilla zsebek zárószerkezetének a keretváz állandó részét kell képeznie, vagy a keretvázhoz tartósan hozzá kell erősíteni. Az olyan, egyetlen tartánykamrából álló mobil tartányoknál, amelyek 3,65 m-nél rövidebbek, nem kell az emelővilla zsebeknek zárhatónak lenniük, amennyiben

a) a tartány és a szerelvények kellőképpen védve vannak, nehogy az emelővillák

megüssék; és

- b) az emelővilla zsebek középpontjai közötti távolság legalább a fele a mobil tartány legnagyobb hossz méretének.

6.7.4.12.5

Ha a mobil tartány nincs a 4.2.3.3 bekezdés szerinti védelemmel ellátva, a tartányt és az üzemi szerelvényeit védeni kell a szállítás alatt a hosszirányú és oldalirányú lökésekkel vagy felborulásból adódóan a tartányt vagy a szerelvényeit érő sérülésekkel szemben. A külső szerelvényeket úgy kell védeni, hogy az ütések hatására, ill. a mobil tartánynak a szerelvényekre való ráborulása esetén a tartányban szállított anyag ne szabaduljon ki. Példák a védelemre:

- a) az oldalirányú ütésekkel szembeni védelem, ami állhat a tartány mindkét oldalán a középvonal szintjében védő hosszirányú rudakból;
- b) a mobil tartány felborulás elleni védelme, ami állhat erősítő gyűrűkből vagy a kereten keresztben elhelyezett rudakból;
- c) a hátulról jövő ütésekkel szembeni védelem, ami lökhárítóból vagy keretből állhat;
- d) a tartány ütésekkel vagy felborulásból eredő sérüléssel szembeni védelme az ISO 1496-3:1995 szabvány szerinti ISO keret használatával;
- e) a mobil tartány ütésekkel és felborulással szembeni védelme vákuumszigetelő burkolattal.

6.7.4.13

Típusjóváhagyás

6.7.4.13.1

Minden új mobil tartány típus esetén az illetékes hatóságnak vagy az általa felhatalmazott szervezetnek gyártási típus bizonyítványt kell kiállítani. Ennek a bizonyítványnak tanúsítania kell, hogy a mobil tartányt ez a hatóság megvizsgálta, az a kívánt célra alkalmas, és megfelel e fejezet követelményeinek. Ha a mobil tartányokat sorozatban gyártják módosítás nélkül, ez a bizonyítvány a teljes sorozatra érvényes. A bizonyítványban utalni kell a gyártási típus vizsgálati jegyzőkönyvére, azokra a mélyhűtött, cseppfolyósított gázokra, amelyek szállíthatók, a tartány és a burkolat gyártási anyagára és a jóváhagyási számra. A jóváhagyási számnak annak az államnak megkülönböztető jeléből [A közúti közlekedésről szóló Bécsi Egyezmény (Bécs, 1968) által előírt államjelzés a nemzetközi forgalomban résztvevő gépjárművekre], amelyben az engedélyt kiadták, és egy nyilvántartási számból kell állnia. A 6.7.1.2 bekezdés szerinti esetleges alternatív kialakítást a bizonyítványban fel kell tüntetni. A típusjóváhagyás az azonos anyagból és azonos falvastagsággal gyártott, kisebb mobil tartányok jóváhagyásának is tekinthető, amelyeket ugyanolyan gyártási technológiával és azonos tartószerkezetekkel, egyenértékű zárószervezetekkel és egyéb tartozékokkal gyártottak.

6.7.4.13.2

A gyártási típus vizsgálati jegyzőkönyvének a típusjóváhagyáshoz legalább a következőket kell tartalmaznia:

- a) a keretvázra vonatkozó, ISO 1496-3:1995 szabványban meghatározott vizsgálatok eredményeit;
- b) a 6.7.4.14.3 pont szerinti üzembe helyezés előtti vizsgálat eredményeit; és
- c) a 6.7.4.14.1 pont szerinti ütközési próba eredményeit, ha alkalmazható.

6.7.4.14

Vizsgálat

6.7.4.14.1

Azokat a mobil tartányokat, amelyek „A Biztonságos Konténerekről szóló 1972. évi Nemzetközi Egyezmény” (CSC) módosított kiadása meghatározása szerint konténernek minősülnek, csak azután szabad használni, hogy a gyártási típus prototípusa sikeresen kiállta a „Vizsgálatok és kritériumok kézikönyv” IV. rész, 41 fejezetében előírt dinamikus, hosszirányú ütközési próbát.

- 6.7.4.14.2** Az első üzembe helyezés előtt minden mobil tartányt és szerelvényeit vizsgálatnak kell alávetni (üzembe helyezés előtti vizsgálat) és azután legfeljebb ötéves időközönként (5 évenkénti időszakos vizsgálat), és az 5 éves időközök közepén közbenső vizsgálat (2,5 évenkénti közbenső időszakos vizsgálat). A 2,5 évenkénti vizsgálatot az előírt időponthoz képes 3 hónapon belül kell elvégezni. Ha a 6.7.4.14.7 pont szerint soron kívüli vizsgálatra van szükség, azt a legutóbbi időszakos vizsgálat időpontjától függetlenül el kell végezni.
- 6.7.4.14.3** A mobil tartány üzembe helyezés előtti vizsgálatának ki kell terjednie a szerkezeti jellemzők ellenőrzésére, a mobil tartány és szerelvényeinek külső és belső vizsgálatra, különös tekintettel a szállítandó mélyhűtött, cseppfolyósított gázok szempontjából, és a 6.7.4.3.2 pont szerinti próbanyomással végzett nyomáspróbára. A nyomáspróba vízzel vagy az illetékes hatóság vagy az általa felhatalmazott szervezet hozzájárulásával más folyadékkal vagy gázzal is végezhető. Mielőtt a mobil tartányt üzembe helyezik, tömörségi próbát is kell végezni és az üzemi szerelvények megfelelő működését is ellenőrizni kell. Amennyiben a nyomáspróbát a tartányon és a szerelvényeken külön végezték, a tömörségi próbát az összeszerelést követően kell végrehajtani. A tartányon levő minden, teljes feszültség szintnek kitett hegesztési varratot az első alkalommal végzett vizsgálat során radiográfiás, ultrahangos vagy más, alkalmas, roncsolásmentes vizsgálati módszerrel kell ellenőrizni. Ez azonban nem vonatkozik a burkolatra.
- 6.7.4.14.4** Az 5 és a 2,5 évenkénti közbenső időszakos vizsgálatnak ki kell terjednie legalább a mobil tartány és szerelvényeinek külső és belső vizsgálatra, különös tekintettel a szállítandó mélyhűtött, cseppfolyósított gázok szempontjából, és tömörségi próbára, továbbá az üzemi szerelvények és az esetleges vákuummérő megfelelő működését is ellenőrizni kell. Nem vákuumszigetelt tartányok esetében a burkolatot és a szigetelést csak annyira kell eltávolítani, amennyire az 5 és a 2,5 évenkénti közbenső időszakos vizsgálat során a tartány jellemzőinek biztonságos megítéléséhez feltétlenül szükséges.
- 6.7.4.14.5** (törölve)
- 6.7.4.14.6** A mobil tartányok a 6.7.4.14.2 pontban előírt utolsó 5 évenkénti vagy 2,5 évenkénti időszakos vizsgálat érvényességének lejártá után nem tölthetők meg és nem adhatók át szállításra. Az utolsó időszakos vizsgálat lejártá előtt megtöltött mobil tartányok az utolsó időszakos vizsgálat érvényességének letelte után legfeljebb három hónapig szállíthatók. Ezen kívül a mobil tartány az utolsó időszakos vizsgálat érvényességének letelte után is szállítható:
- a) kiürítés után, de tisztítás előtt az újratöltés előtt szükséges vizsgálat elvégzésének céljából, és
 - b) a veszélyes anyag ártalmatlanítására (megfelelő elhelyezésére) vagy visszaforgatására történő visszaszállítása céljából az időszakos vizsgálat érvényességének lejártá után legfeljebb hat hónapig, hacsak az illetékes hatóság másként nem rendelkezik. Ezt a mentességet a fuvarokmányba be kell jegyezni.
- 6.7.4.14.7** Soron kívüli vizsgálatot szükséges végezni, ha a mobil tartány sérült, rozsdás, szivárog vagy bármely más körülmény a mobil tartány sértetlenségét befolyásolhatja. A soron kívüli vizsgálat mértékét az határozza meg, hogy a mobil tartány mennyire sérült vagy hibás. A soron kívüli vizsgálatnak azonban legalább a 6.7.4.14.4 pont szerinti 2,5 évenkénti vizsgálatokra kell kiterjednie.
- 6.7.4.14.8** A belső vizsgálatnak az üzembe helyezés előtti vizsgálat során biztosítani kell, hogy ellenőrizzék a tartányt, hogy nincs rajta rozsdás, kipattogzás, kopás, horpadás, torzulás, hegesztési hiba vagy bármi más (pl. szivárgás), ami miatt a mobil tartány szállítása nem lenne biztonságos.
- 6.7.4.14.9** A mobil tartány külső vizsgálata során biztosítani kell, hogy
- a) ellenőrizzék a csővezeték, a szelepek, a hermetizáló/hűtő rendszert és a tömítéseket, hogy nincs rajtuk rozsdás, sérülés vagy bármi más (pl. szivárgás), ami miatt a mobil tartány töltése, ürítése vagy szállítása nem lenne biztonságos;

- b) bűvönnyílás fedeleknél, ill. a tömítéseknél ne legyen szivárgás;
- c) a csőkarima csatlakozásoknál és vakkarimáknál a hiányzó vagy laza csavarokat és csavaranyákat pótolják, ill. meghúzzák;
- d) minden vészlelfűvő szerkezet és szelep mentes legyen a korróziótól és minden olyan sérüléstől vagy meghibásodástól, ami megakadályozhatja normális működését. A távműködtetésű zárószerkezeteket és az önzáró szelepeket ki kell próbálni, hogy megfelelően működnek-e;
- e) az előírt jelölések a mobil tartányon olvashatóak, és a vonatkozó követelményeknek megfeleljenek; és
- f) a mobil tartány váz- és tartószerkezete, ill. az emelésre szolgáló berendezései megfelelő állapotban legyenek.

6.7.4.14.10 A 6.7.4.14.1, 6.7.4.14.3, 6.7.4.14.4, 6.7.4.14.5 és 6.7.4.14.7 pont szerinti vizsgálatokat az illetékes hatóság vagy az általa felhatalmazott szervezet által elismert szakértőnek kell elvégeznie vagy tanúsítania. Ha a nyomáspróba a vizsgálat részét képezi, a vizsgálatot a mobil tartány adattábláján feltüntetett nyomással kell végezni. A nyomás alatt lévő mobil tartányon a tartány, a csővezeték és a szerelvények szivárgásmentességét is vizsgálni kell.

6.7.4.14.11 Minden esetben, amikor a mobil tartányt vágással, melegítéssel vagy hegesztéssel javítják, ezt a munkát az illetékes hatóságnak vagy az általa felhatalmazott szervezetnek jóvá kell hagynia, figyelembe véve azt a nyomástartó edényekre vonatkozó szabályzatot, amely alapján a tartányt gyártották. A munka befejezése után az eredeti próbanyomással nyomáspróbát kell végezni.

6.7.4.14.12 Amennyiben a biztonságot veszélyeztető körülményeket tapasztalnak, a mobil tartány addig nem használható újra, amíg meg nem javították és az ismételt vizsgálatot ki nem állta.

6.7.4.15 Jelölés

6.7.4.15.1 Ellenőrzés céljából könnyen elérhető, szembetűnő helyre minden mobil tartányra nem korrodálódó fémtáblát kell tartósan rögzíteni. Ha a mobil tartány kialakítása folytán a tábla nem erősíthető tartósan a tartányhoz, legalább a nyomástartó edényekre vonatkozó szabályzatban előírt információkat kell a tartányon feltüntetni. A fémtáblán legalább a következőkben felsorolt adatokat kell feltüntetni beütéssel vagy más hasonló módon:

- a) Tulajdonosi információk
 - i) a tulajdonos nyilvántartási száma;
- b) gyártási információk
 - i) a gyártási ország;
 - ii) a gyártási év;
 - iii) a gyártó neve vagy jele;
 - iv) a gyártó sorozatszám;
- c) Jóváhagyási információk

- i) az Egyesült Nemzetek jele a csomagolóeszközön:

Ezt a jelet csak annak tanúsítására szabad használni, hogy a csomagolóeszköz, a mobil tartány, ill. a MEG-konténer megfelel a 6.1, a 6.2, a 6.3, a 6.5, a 6.6, ill. a 6.7¹²⁾ fejezet vonatkozó előírásainak;

- ii) a jóváhagyó ország;

12) Ezt a jelet használják annak tanúsítására is, hogy az olyan hajlékony ömlesztettáru-konténerek, amelyeket más közlekedési ágazatra hagytak jóvá, megfelelnek az ENSZ Minta Szabályzat 6.8 fejezete követelményeinek.

- iii) a típusjövahagyásra felhatalmazott szervezet;
 - iv) típusjövahagyási szám;
 - v) „AA” betűk, ha a típust alternatív kialakításuként hagyták jóvá (lásd a 6.7.1.2 bekezdést);
 - vi) a nyomástartó edényekre vonatkozó szabályzat, amely szerint a tartányt méretezték;
- d) Nyomások
- i) MAWP, a megengedett legnagyobb üzemi nyomás (bar vagy kPa, túlnyomás)¹⁰⁾;
 - ii) a próbanyomás (bar vagy kPa, túlnyomás)¹⁰⁾;
 - iii) az üzembe helyezés előtti nyomáspróba időpontja (hónap és év);
 - iv) az üzembe helyezés előtti nyomáspróbát tanúsító szakértő azonosító jele;
- e) Hőmérsékletek
- i) legkisebb tervezési hőmérséklet (°C)¹³⁾;
- f) Anyagok
- i) a tartány anyaga(i) és az anyagszabvány hivatkozás(ok);
 - ii) az egyenértékű vastagság referencia acélra (mm)¹³⁾;
- g) Űrtartalom
- i) a tartány víztérfogata 20 °C-on (liter)¹³⁾;
- h) Szigetelés
- i) “Hőszigetelt” vagy “Vákuumszigetelt” felirat” (értelemszerűen);
 - ii) a szigetelőrendszer hatékonysága (hőátadás) watt (W)¹³⁾;
- i) Megtartási idő – a mobil tartányban szállításra engedélyezett minden egyes mélyhűtött, cseppfolyósított gázra.
- i) a mélyhűtött, cseppfolyósított gáz teljes neve;
 - ii) referencia megtartási idő (nap vagy óra)¹³⁾;
 - iii) kezdeti nyomás (bar vagy kPa, túlnyomás)¹³⁾;
 - iv) töltési fok (kg)¹³⁾;
- j) Időszakos vizsgálat
- i) a legutóbbi időszakos vizsgálat típusa (2,5-évenkénti, 5-évenkénti, soronkívüli);
 - ii) a legutóbbi időszakos vizsgálat időpontja (hónap és év);
 - iii) felhatalmazott szervezet azonosító jele, amely a legutóbbi vizsgálatot végezte vagy tanúsította.

13) A mértékegységet fel kell tüntetni.

6.7.4.15.1 ábra: Az azonosító tábla jelölés példája

- 6.7.4.15.2** A következő adatokat magán a mobil tartányon vagy a mobil tartányhoz biztosan rögzített fémtáblán kell feltüntetni:
- A tulajdonos és az üzemben tartó neve
- A szállításra engedélyezett mélyhűtött, cseppfolyósított gáz(ok) neve (és a legkisebb átlagos hőmérséklete)
- A megengedett legnagyobb bruttó tömeg kg
- Az üres (tára) tömeg kg
- A tényleges megtartási idő a szállított gázra nap (vagy óra)
- A 4.2.5.2.6 pont szerinti mobil tartány utasítás.

Megjegyzés: A szállított mélyhűtött, cseppfolyósított gáz(ok) azonosítására lásd az 5. részt is.

- 6.7.4.15.3** A nyílt tengeren történő kezelésre tervezett és jóváhagyott mobil tartány esetén az „OFFSHORE PORTABLE TANK” feliratot kell feltüntetni az azonosító táblán.

6.7.5 A nem mélyhűtött gázokhoz használt, UN többelemes gázkonténerek (UN MEG-konténerek) tervezésére, gyártására és vizsgálatára vonatkozó előírások

6.7.5.1 Meghatározások

E szakasz alkalmazásában:

Az *alternatív kialakítási engedély* az e fejezetben meghatározottaktól eltérő műszaki előírások alapján tervezett, gyártott vagy eltérő vizsgálati módszer szerint vizsgált (alternatív kialakítású) mobil tartányra vagy MEG-konténerre az illetékes hatóság által kiadott engedély.

A (MEG-konténer) *elemei* palackok, nagypalackok, ill. palackkötegek.

A *tömörégi próba* az a gázzal végzett vizsgálat, amelynek során a MEG-konténer elemeit és üzemi szerelvényeit a próbanyomás legalább 20%-át elérő tényleges belső nyomásnak teszik ki.

A *gyűjtőcső* az elemek töltő- és/vagy ürítő nyílásait összekötő csővezeték és szelepei.

A *megengedett legnagyobb bruttó tömeg* a MEG-konténer saját tömegének és a szállításra engedélyezett legnagyobb rakomány tömegének összege.

Az *UN többelemes gázkonténer (MEG-konténer)* vázra szerelt és egymással gyűjtőcsővel összekötött palackokból, nagypalackokból, ill. palackkötegekből álló multimodális szállítóeszköz. A MEG-konténer fogalmába a gázok szállításához szükséges üzemi és szerkezeti szerelvények is beletartoznak.

Az *üzemi szerelvények* a töltő- és ürítő-, a szellőző- és a biztonsági berendezések, valamint a mérőeszközök.

A *szerkezeti szerelvények* a tartány külső részén található erősítő-, rögzítő- védő- és stabilizáló elemek.

6.7.5.2 Általános tervezési és gyártási követelmények

- 6.7.5.2.1** A MEG-konténernek a szerkezeti szerelvények eltávolítása nélkül tölthetőnek és üríthetőnek kell lennie. A MEG-konténer elemei külső részén stabilizáló elemeknek kell lenniük a kezelés és szállítás során a szerkezeti sértetlenség biztosításához. A MEG-konténert olyan tartószerkezettel kell tervezni és kialakítani, amely a szállítás során biztos alátámasztást nyújt, és megfelelő emelő és rögzítő szerelvényekkel kell ellátni, amelyek lehetővé teszik a MEG-konténer felemelését akkor is, ha a megengedett legnagyobb bruttó tömegig meg van töltve. A MEG-konténert úgy kell kialakítani, hogy közúti járműre, vasúti kocsira, ill. tengerjáró vagy belvízi hajóba be lehessen rakni, a gépi rakodás megkönnyítésére kerettel

vagy egyéb szerkezetekkel kell ellátni.

- 6.7.5.2.2** A MEG-konténert úgy kell megtervezni, gyártani és szerelvényekkel ellátni, hogy a normális szállítási és kezelési feltételek mellett előforduló minden körülményt elviseljen. A tervezés során a dinamikus terhelés és a kifáradás hatását figyelembe kell venni.
- 6.7.5.2.3** A MEG-konténer elemeit acélból kell gyártani, varrat nélküli kivitelben, és gyártásuk, ill. vizsgálatuk során be kell tartani a 6.2.1 és a 6.2.2 szakasz előírásait. Egy MEG-konténer minden elemének ugyanahhoz a gyártási típushoz kell tartoznia.
- 6.7.5.2.4** A MEG-konténer elemeit, a szerelvényeit és a csővezetéseket olyan anyagból kell gyártani, amely:
- a) összeférhető a szállítandó anyagokkal (lásd az ISO 11114-1:1997 és az ISO 11114-2: 2000 szabványt); vagy
 - b) kémiai reakció révén megfelelően passzíválódik vagy semlegesítődik.
- 6.7.5.2.5** Kerülni kell a különböző fémek érintkezését, ami a galvanikus hatás folytán károsodást okozhat.
- 6.7.5.2.6** A MEG-konténer, a szerelvények, a tömítések és a tartozékok anyaga nem gyakorolhat kedvezőtlen hatást a MEG-konténerben szállítandó gáz(ok)ra.
- 6.7.5.2.7** A MEG-konténert olyanra kell tervezni, hogy a szállított anyag vesztesége nélkül ellenálljon legalább a szállított anyag által kifejtett belső nyomásnak és a normális szállítási és kezelési feltételek mellett fellépő statikus, dinamikus és hőterhelésnek. A tervezés során bizonyítani kell, hogy az ezen terheléseknek a MEG-konténer várható élettartama alatti ismétlődése folytán kialakuló kifáradást figyelembe vették.
- 6.7.5.2.8** A MEG-konténereknek és rögzítőelemeiknek a megengedett legnagyobb töltési tömeg mellett a következő, külön-külön fellépő, statikus erők elviselésére kell alkalmasnak lenniük:
- a) menetirányban: a megengedett legnagyobb bruttó tömeg kétszerese szorozva a nehézségi gyorsulással (g)¹⁴⁾;
 - b) vízszintesen a menetirányra merőlegesen: a megengedett legnagyobb bruttó tömeg (amennyiben a menetirány nincs egyértelműen meghatározva, a megengedett legnagyobb bruttó tömeg kétszerese) szorozva a nehézségi gyorsulással (g)¹⁴⁾;
 - c) függőlegesen felfelé: a megengedett legnagyobb bruttó tömeg szorozva a nehézségi gyorsulással (g)¹⁴⁾; és
 - d) függőlegesen lefelé: a megengedett legnagyobb bruttó tömeg (összes terhelés beleértve a gravitáció hatását) kétszerese szorozva a nehézségi gyorsulással (g)¹⁴⁾.
- 6.7.5.2.9** A 6.7.5.2.8 pontban meghatározott erők hatására a feszültség az elemek leginkább igénybe vett részén nem lehet nagyobb, mint a 6.2.2.1 bekezdésben hivatkozott, vonatkozó szabványokban meghatározott érték, ill. a nem ezen szabványok szerint tervezett, gyártott és vizsgált elemek esetében a felhasználó ország illetékes hatósága által elismert műszaki előírásban vagy szabványban meghatározott érték (lásd a 6.2.5 szakaszt).
- 6.7.5.2.10** A 6.7.5.2.8 pontban felsorolt erőknél a keretvázra és a rögzítésekre a következő biztonsági tényezőket kell figyelembe venni:
- a) határozott folyáshatárral rendelkező acéloknál a szavatolt folyáshatárra vonatkozóan 1,5-es biztonsági tényezőt; vagy
 - b) határozott folyáshatárral nem rendelkező acéloknál a 0,2%-os (vagy ausztenites acélnál az 1%-os) szavatolt, egyezményes folyáshatárra vonatkozóan 1,5-es biztonsági tényezőt.

14) A számítások céljára $g = 9,81 \text{ m/s}^2$.

- 6.7.5.2.11** A gyúlékony gázok szállítására használt MEG-konténereknek elektromosan földelhetőnek kell lenniük.
- 6.7.5.2.12** Az elemeket úgy kell rögzíteni, hogy a vázszerkezethez képest nemkívánt módon ne mozdulhassanak el, és ne alakuljon ki veszélyes helyi feszültségkoncentráció.
- 6.7.5.3** *Üzemi szerelvények*
- 6.7.5.3.1** Az üzemi szerelvényeket úgy kell kialakítani vagy elrendezni, hogy normális szállítási és kezelési körülmények között ne sérülhessenek úgy meg, hogy a nyomástartó tartály tartalma a szabadba jusson. Amennyiben a váz és az elemek közötti kapcsolat lehetővé teszi a szerkezeti részek egységei egymáshoz képesti elmozdulását, a szerelvényeket úgy kell rögzíteni, hogy az ilyen elmozdulás a működő részek sérülésének veszélye nélkül lehetővé váljon. Az összekötő csővezetékeket, az ürítő szerelvényeket (csőcsonkokat, zárószerkezeteket) és a zárószelepet védeni kell a külső erők hatására történő leszakadás ellen. A gyűjtőcső rendszer zárószelepekhez vezető részeinek kellően rugalmasnak kell lenniük, hogy megvédjék a szelepeket és a vezetéket az elnyíródástól, ill. attól, hogy a nyomástartó tartályban levő anyagot kiengedjék. A töltő- és ürítőszerkezeteket (beleértve a karimákat és a menetes dugókat is), valamint az esetleges védőkupakokat a nem szándékos kinyitás ellen biztosítani kell.
- 6.7.5.3.2** A mérgező gázok (T, TF, TC, TO, TFC és TOC csoport gázai) szállítására szolgáló elemeket szeleppel kell ellátni. A cseppfolyósított, mérgező gázok (2T, 2TF, 2TC, 2TO, 2TFC és 2TOC osztályozási kód alá tartozó gázok) esetén a gyűjtőcsövet úgy kell kialakítani, hogy az elemek külön-külön tölthetők és rögzíthetők szelepekkel elválaszthatók legyenek. A gyúlékony gázok (F csoport gázai) szállításához az elemeket egymástól szeleppel elválasztott, legfeljebb 3000 liter befogadóképességű csoportokra kell osztani.
- 6.7.5.3.3** A MEG-konténer töltő és ürítőnyílásaihoz két, egymás mögött elhelyezett szelepet kell minden töltő- és ürítőcsövön hozzáférhető helyre elhelyezni. Az egyik szelep lehet visszacsapó szelep is. A töltő- és ürítőszerkezetek gyűjtőcsövön is elhelyezhetők. Azokon a csőszakaszokon, amelyek mindkét végükön zárhatók és bennük folyékony termék maradhat vissza, a túlzott nyomás kialakulásának megakadályozására nyomáscsökkentő szelepet kell elhelyezni. A MEG-konténer fő leválasztó szelepein jól láthatóan fel kell tüntetni a zárás irányát. A zárószelepeket és egyéb zárószerkezetet úgy kell tervezni és kialakítani, hogy a MEG-konténer próbanyomásának legalább 1,5-szeresét elérő nyomásnak ellenálljanak. A csavarorsós zárószelepeknek a kézikerek óramutató járásával megegyező irányba történő elforgatásával kell záródniuk. Másfajta zárószelepeknél a zárószelep (nyitott és zárt) állását és a zárás irányát jól láthatóan fel kell tüntetni. Minden zárószelepet úgy kell kialakítani, hogy akaratlanul ne lehessen kinyitni. A szelepek és a tartozékok gyártásához kovacsolható fémet kell használni.
- 6.7.5.3.4** A csővezetékeket úgy kell tervezni, gyártani és felszerelni, hogy ne jöjjön létre sérülésveszély a hőtágulás és összehúzódás, a mechanikai ütések és rezgések következtében. A csővezetékek csatlakozásait keményforrasztással kell készíteni vagy azzal azonos szilárdságú, fémes csököttést kell alkalmazni. A forrasztófém (keményforrasztás) olvadáspontja nem lehet 525 °C-nál alacsonyabb. A gyűjtőcső és az üzemi szerelvények névleges nyomása nem lehet az elemek próbanyomásának kétharmadánál kisebb.
- 6.7.5.4** *Nomáscsökkentő szerkezetek*
- 6.7.5.4.1** Az UN 1013 szén-dioxid és az UN 1070 dinitrogén-oxid szállítására használt MEG-konténer elemeit egymástól szeleppel elválasztott, legfeljebb 3000 liter befogadóképességű csoportokra kell osztani. Az egyes csoportokat legalább egy nyomáscsökkentő szerkezettel kell ellátni. Ha a felhasználó ország illetékes hatósága előírja, az egyéb gázok szállításához használt MEG-konténereket az ezen illetékes hatóság által meghatározott nyomáscsökkentő szerkezetekkel kell ellátni.

- 6.7.5.4.2** Ha nyomáscsökkentő szerkezetek vannak elhelyezve, a MEG-konténer minden elválasztható elemét vagy elem-csoportját egy vagy több nyomáscsökkentő szerkezettel kell ellátni. A nyomáscsökkentő szerkezetnek olyan típusúnak kell lennie, ami ellenáll a dinamikus hatásoknak, beleértve a folyadék hullámzását is, és úgy kell kialakítani, hogy megakadályozza az idegen anyagoknak a tartányba való bejutását, a gáz kiszivárgását és mindenféle veszélyes túlnyomás kialakulását.
- 6.7.5.4.3** A 4.2.5.2.6 pontban a T50 mobil tartány utasításban meghatározott, egyes, nem mélyhűtött, cseppfolyósított gázok szállítására szolgáló MEG-konténereket olyan nyomáscsökkentő szerkezettel lehet ellátni, amelyet annak az országnak az illetékes hatósága ír elő, amelyben használják. A nyomáscsökkentő szerkezetnek egy rugóterhelésű nyomáscsökkentő szelepből és egy elhelyezett hasadótárcsából kell állnia, kivéve, ha – különleges rendeltetésű MEG-konténer esetén – a szállítandó gázzal összeférhető anyagból készült, jóváhagyott típusú nyomáscsökkentő szerkezet van rajta. A hasadótárcsa és a rugóterhelésű szerkezet közti térbe nyomásmérőt vagy más, alkalmas jelzőeszközt kell csatlakoztatni, ami lehetővé teszi, hogy észleljék a hasadótárcsa repedését, kilyukadását vagy szivárgását, ami a nyomáscsökkentő rendszer hibás működését okozhatja. A hasadótárcsának ebben az esetben a rugóterhelésű szerkezet nyitónyomását 10%-kal meghaladó névleges nyomásnál kell felszakadnia.
- 6.7.5.4.4** A kis nyomáson cseppfolyósított gázok szállítására szolgáló, többcélú MEG-konténer esetében a nyomáscsökkentő szerkezeteknek a MEG-konténerben szállítható gázok közül a legnagyobb megengedett legnagyobb üzemi nyomással rendelkező gázra a 6.7.3.7.1 pontban meghatározott nyomáson ki kell nyílniuk.
- 6.7.5.5** *A nyomáscsökkentő szerkezetek teljesítménye*
- 6.7.5.5.1** A nyomáscsökkentő szerkezetek – ha vannak – összes lefűvási teljesítményének elégnek kell lennie ahhoz, hogy abban az esetben, ha a MEG-konténert teljesen elfedi a tűz, az elemekben a nyomás (beszámítva a nyomás növekedését) ne múlja felül a nyomáscsökkentő szerkezetek nyitónyomásának 120%-át. A nyomáscsökkentő szerkezetekből álló rendszer legkisebb összegzett átfolyási kapacitásának meghatározására a CGA S-1.2-2003 „Pressure Relief Device Standards – Part 2 – Cargo and Portable Tanks for Compressed Gases” (Nyomáscsökkentő szerkezet szabványok – 2. rész – Árutartányok és mobil tartányok sűrített gázokhoz) kiadványban található képletet kell használni. Az egyes elemek lefűvási teljesítményének meghatározására a CGA S-1.1-2003 „Pressure Relief Device Standards – Part 1 – Cylinders for Compressed Gases” (Nyomáscsökkentő szerkezet szabványok – 1. rész – Sűrített gáz palackok) kiadvány használható. Kis nyomáson cseppfolyósított gázok esetén az előírt összes lefűvási teljesítmény eléréséhez rugóterhelésű nyomáscsökkentő szerkezetek alkalmazhatók. Többcélú MEG-konténer esetén a nyomáscsökkentő szerkezetek összes lefűvási teljesítményét arra a gázra kell méretezni, amely a MEG-konténerben szállítható gázok közül a legnagyobb lefűvási teljesítményt igényli.
- 6.7.5.5.2** A cseppfolyósított gázok szállítására szolgáló elemekre felszerelt nyomáscsökkentő szerkezetek szükséges összes lefűvási teljesítményének számításánál figyelembe kell venni a gáz termodinamikai tulajdonságait (lásd például kis nyomáson cseppfolyósított gázokra a CGA S-1.2-2003 „Pressure Relief Device Standards – Part 2 – Cargo and Portable Tanks for Compressed Gases” (Nyomáscsökkentő szerkezet szabványok – 2. rész – Árutartányok és mobil tartányok sűrített gázokhoz), ill. nagy nyomáson cseppfolyósított gázokra a CGA S-1.1-2003 „Pressure Relief Device Standards – Part 1 – Cylinders for Compressed Gases” (Nyomáscsökkentő szerkezet szabványok – 1. rész – Sűrített gáz palackok) kiadványt).
- 6.7.5.6** *A nyomáscsökkentő szerkezetek jelölése*
- 6.7.5.6.1** A nyomáscsökkentő szerkezeteken jól olvashatóan és tartósan fel kell tüntetni a következő adatokat:
- a) a gyártó nevét és a szerkezet vonatkozó katalógus számát;

- b) a nyitónyomást és/vagy hőmérsékletet;
- c) a legutóbbi vizsgálat időpontját;
- d) a rugóterhelésű nyomáscsökkentő szerkezetek és a hasadótárcsák átfolyási keresztmetszetét mm²-ben.

6.7.5.6.2 A kis nyomáson cseppfolyósított gázokhoz használt rugóterhelésű nyomáscsökkentő szerkezeteken feltüntetett névleges átfolyási teljesítményt az ISO 4126-1:2004 és az ISO 4126-7:2004 szabvány szerint kell meghatározni.

6.7.5.7 *A nyomáscsökkentő szerkezetek csatlakoztatása*

6.7.5.7.1 A nyomáscsökkentő szerkezetekhez történő csatlakozásnak akkorának kell lennie, hogy szabad átfolyást biztosítson a nyomáscsökkentő szerkezethez. Az elem és a nyomáscsökkentő szerkezet közé nem szabad zárószelepet elhelyezni, kivéve a karbantartási vagy egyéb okból kialakított kettős nyomáscsökkentő szerkezeteknél, ha a ténylegesen működő nyomáscsökkentő szerkezet zárószelepe nyitott állapotban reteszelve van, vagy a zárószelepek úgy vannak összekapcsolva, hogy a kettős nyomáscsökkentő szerkezetek közül legalább az egyik mindig működőképes, és kielégíti a 6.7.5.5 bekezdés követelményeit. A szellőző vagy nyomáscsökkentő szerkezethez vezető nyílásban nem lehet semmiféle akadály, ami korlátozná vagy elzárná az áramlást az elemből a szerkezethez. Minden csővezeték és szerelvény átfolyási keresztmetszetének legalább akkorának kell lennie, mint annak a nyomáscsökkentő szerkezetnek a bemeneti nyílása, amelyhez csatlakoztatva van. A lefűvőcső névleges méretének legalább akkorának kell lennie, mint a nyomáscsökkentő szerkezet kimeneti nyílása. A nyomáscsökkentő szerkezetek kimenetéhez csatlakozó lefűvőcsőnek, ha ilyet használnak, a kiszabadult gőzt vagy folyadékot a szerkezetre gyakorolt minimális torlóhatással kell a szabadba vezetnie.

6.7.5.8 *A nyomáscsökkentő szerkezetek elhelyezése*

6.7.5.8.1 Minden nyomáscsökkentő szerkezetnek a megengedett legnagyobb töltési feltételek mellett a cseppfolyósított gázok szállítására szolgáló elem gőzteréhez kell csatlakoznia. A nyomáscsökkentő szerkezetet – ha ilyen van – úgy kell elhelyezni, hogy biztosítva legyen a kiszabadult gőz felfelé történő akadálytalan távozása, és elkerüljék hogy a kiszabaduló gáz vagy folyadék a MEG-konténernek, a konténer elemeinek vagy a kezelőszemélyzetnek ütközzön. A gyúlékony, a piroforos és a gyújtó hatású gázok esetében a kiszabaduló gázt az elemtől el kell terelni oly módon, hogy az ne csapódhasson a többi elemnek. A gőz áramlását elterelő, hőálló védőszerkezetek engedélyezettek, ha nem csökkentik a nyomáscsökkentő szerkezet szükséges teljesítményét.

6.7.5.8.2 Intézkedéseket kell tenni annak érdekében, hogy megakadályozzák illetéktelen személyeknek a nyomáscsökkentő szerkezethez való hozzáférését, és hogy megvédjék a szerkezetet attól, hogy a MEG-konténer felborulása esetén megsérüljön.

6.7.5.9 *Mérőeszközök*

6.7.5.9.1 Ha a MEG-konténert tömegre töltik, akkor egy vagy több szintmérő eszközzel kell ellátni. Üvegből vagy egyéb törékeny anyagból készült szintjelzők nem használhatók.

6.7.5.10 *A MEG-konténer tartószerkezete, keretváza, emelő és rögzítő szerelvényei*

6.7.5.10.1 A MEG-konténert tartószerkezettel kell tervezni és gyártani, ami biztos alátámasztást nyújt a szállítás során. Erre vonatkozóan a tervezésnél a 6.7.5.2.8 pontban meghatározott erőket és a 6.7.5.2.10 pontban meghatározott biztonsági tényezőt kell figyelembe venni. Talpak, keretvázak, csúszótalpak vagy egyéb hasonló szerkezetek elfogadhatók.

6.7.5.10.2 A MEG-konténerre szerelt eszközöktől (pl. talpaktól, keretvázától) és a MEG-konténer emelő

és rögzítő szerelvényeitől származó összetett feszültségek egyetlen elemben sem eredményezhetnek túlzott feszültségeket. Minden MEG-konténert állandó emelő és rögzítő szerelvényekkel kell ellátni. Az emelő vagy rögzítő szerelvényeket nem szabad az elemekre hegeszteni.

6.7.5.10.3 A tartószerkezet és a keretváz tervezésénél figyelembe kell venni a környezet korróziós hatását is.

6.7.5.10.4 Ha a MEG-konténer nincs a 4.2.4.3 bekezdés szerinti védelemmel ellátva, az elemeket és az üzemi szerelvényeket védeni kell a szállítás alatt a hosszirányú és oldalirányú lökésekkel vagy felborulásból adódó sérülésekkel szemben. A külső szerelvényeket úgy kell védeni, hogy az ütések hatására, ill. a MEG-konténernek a szerelvényekre való ráborulása esetén az elemek tartalma ne szabaduljon ki. Különös figyelmet kell fordítani az összekötő csővezeték védelmére. Példák a védelemre:

- a) az oldalirányú ütésekkel szembeni védelem, ami állhat hosszirányú rudakból;
- b) felborulás elleni védelem, ami állhat erősítő gyűrűkből vagy a kereten keresztben elhelyezett rudakból;
- c) a hátulról jövő ütésekkel szembeni védelem, ami lökhárítóból vagy keretből állhat;
- d) az elemek és az üzemi szerelvények ütésekkel vagy felborulásból eredő sérüléssel szembeni védelme az ISO 1496-3:1995 szabvány szerinti ISO keret használatával.

6.7.5.11 *Típusjóváhagyás*

6.7.5.11.1 Minden új MEG-konténer típus esetén az illetékes hatóságnak vagy az általa felhatalmazott szervezetnek gyártási típus bizonyítványt kell kiállítani. Ennek a bizonyítványnak tanúsítania kell, hogy a MEG-konténert ez a hatóság megvizsgálta, az a kívánt célra alkalmas, és megfelel e fejezet követelményeinek, valamint a 4.1 fejezetben és a P200 csomagolási utasításban az egyes gázokra vonatkozó követelményeknek. Ha a MEG-konténereket sorozatban gyártják módosítás nélkül, ez a bizonyítvány a teljes sorozatra érvényes. A bizonyítványban utalni kell a gyártási típus vizsgálati jegyzőkönyvére, a gyűjtőcső gyártási anyagaira, azon szabványokra, amely szerint az elemeket gyártották és a jóváhagyási számra. A jóváhagyási számnak annak az államnak a megkülönböztető jeléből [A közúti közlekedésről szóló Bécsi Egyezmény (Bécs, 1968) által előírt államjelzés a nemzetközi forgalomban résztvevő gépjárművekre], amelyben az engedélyt kiadták, és egy nyilvántartási számból kell állnia. A 6.7.1.2 bekezdés szerinti esetleges alternatív kialakítást a bizonyítványban fel kell tüntetni. A típusjóváhagyás az azonos anyagból és azonos falvastagsággal gyártott, kisebb MEG-konténerek jóváhagyásának is tekinthető, amelyeket ugyanolyan gyártási technológiával és azonos tartószerkezetekkel, egyenértékű zárószerkezetekkel és egyéb tartozékokkal gyártottak.

6.7.5.11.2 A gyártási típus vizsgálati jegyzőkönyvének a típusjóváhagyáshoz legalább a következőket kell tartalmaznia:

- a) a keretvázra vonatkozó, ISO 1496-3:1995 szabványban meghatározott vizsgálatok eredményeit;
- b) a 6.7.5.12.3 pont szerinti üzembe helyezés előtti vizsgálat eredményeit; és
- c) a 6.7.5.12.1 pont szerinti ütközési próba eredményeit, ha alkalmazható; és
- d) annak tanúsítására szolgáló bizonyítványok és dokumentumok, hogy a palackok és nagypalackok megfelelnek a vonatkozó szabványoknak.

6.7.5.12 *Vizsgálat*

6.7.5.12.1 Azokat a MEG-konténereket, amelyek „A Biztonságos Konténerekről szóló 1972. évi Nemzetközi Egyezmény” (CSC) módosított kiadása meghatározása szerint konténernek minősülnek, csak azután szabad használni, hogy a gyártási típus prototípusa sikeresen kiállta

a „Vizsgálatok és kritériumok kézikönyv” IV. rész, 41 fejezetében előírt dinamikus, hossz-irányú ütközési próbát.

- 6.7.5.12.2** Az első üzembe helyezés előtt a MEG-konténer elemeit és szerelvényeit vizsgálatnak kell alávetni (üzembe helyezés előtti vizsgálat) és azután legfeljebb öt éves időközönként (5 évenkénti időszakos vizsgálat) időszakos vizsgálatot kell végezni. Függetlenül az utolsó időszakos vizsgálat időpontjától, soron kívüli vizsgálatot kell végezni, ha a 6.7.5.12.5 pont szerint erre szükség van.
- 6.7.5.12.3** A MEG-konténer üzembe helyezés előtti vizsgálatának ki kell terjednie a szerkezeti jellemzők ellenőrzésére, a MEG-konténer és szerelvényeinek külső vizsgálatra, különös tekintettel a szállítandó gázokra és a 4.1.4.1 bekezdés P200 csomagolási utasítása szerinti próbanyomással végzett nyomáspróbára. A gyűjtőcső víznyomás-próbája az illetékes hatóság vagy az általa felhatalmazott szervezet hozzájárulásával más folyadékkal vagy gázzal is végezhető. Mielőtt a MEG-konténert üzembe helyezik, tömörségi próbát is kell végezni és az üzemi szerelvények megfelelő működését is ellenőrizni kell. Amennyiben a nyomáspróbát az elemeken és a szerelvényeken külön végezték, a tömörségi próbát az összeszerelést követően kell végrehajtani.
- 6.7.5.12.4** Az 5 évenkénti időszakos vizsgálatnak a szerkezet, az elemek és az üzemi szerelvények 6.7.5.12.6 pont szerinti külső állapotvizsgálatából kell állnia. Az elemeket és a csővezetéseket a P200 csomagolási utasításban előírt időszakonként a 6.2.1.6 bekezdés előírásai szerint kell vizsgálni. Amennyiben a nyomáspróbát az elemeken és a szerelvényeken külön végezték, a tömörségi próbát az összeszerelést követően kell végrehajtani.
- 6.7.5.12.5** Soron kívüli vizsgálatot szükséges végezni, ha a MEG-konténer sérült, rozsdás, szivárog vagy bármely más körülmény a MEG-konténer sértetlenségét befolyásolhatja. A soron kívüli vizsgálat mértékét az határozza meg, hogy a MEG-konténer mennyire sérült vagy hibás. A soron kívüli vizsgálatnak azonban legalább a 6.7.5.12.6 pont szerinti vizsgálatokra kell kiterjednie.
- 6.7.5.12.6** A vizsgálat során biztosítani kell, hogy:
- a) ellenőrizzék az elemeket, hogy nincs rajtuk rozsdás, kipattogzás, kopás, horpadás, torzulás, hegesztési hiba vagy bármilyen más (pl. szivárgás), ami miatt a MEG-konténer szállítása nem lenne biztonságos;
 - b) ellenőrizzék a csővezetéseket, a szelepeket és a tömítéseket, hogy nincs rajtuk rozsdás, sérülés vagy bármilyen más (pl. szivárgás), ami miatt a MEG-konténer töltése, ürítése vagy szállítása nem lenne biztonságos;
 - c) a csőkarima csatlakozásoknál és vakkarimáknál a hiányzó vagy laza csavarokat vagy csavaranyákat pótolják, ill. meghúzzák;
 - d) minden vészlefüvő szerkezet és szelep mentes legyen a korróziótól és minden olyan sérüléstől vagy meghibásodástól, ami megakadályozhatja normális működését. A távműködtetésű zárószerkezeteket és az önzáró szelepeket ki kell próbálni, hogy megfelelően működnek-e;
 - e) az előírt jelölések a MEG-konténeren olvashatóak, és a vonatkozó követelményeknek megfelelnek; és
 - f) a váz- és tartószerkezet, ill. az emelésre szolgáló berendezések megfelelő állapotban legyenek.
- 6.7.5.12.7** A 6.7.5.12.1, 6.7.5.12.3, 6.7.5.12.4 és 6.7.5.12.5 pont szerinti vizsgálatokat az illetékes hatóság által felhatalmazott szervezetnek kell elvégeznie vagy hitelesítenie. Ha a nyomáspróba a vizsgálat részét képezi, a vizsgálatot a MEG-konténer adattábláján feltüntetett nyomással kell végezni. A nyomás alatt lévő MEG-konténeren az elemek, a csővezetékek és a szerelvények szivárgásmentességét is vizsgálni kell.
- 6.7.5.12.8** Amennyiben a biztonságot veszélyeztető körülményeket tapasztalnak, a MEG-konténer

addig nem használható újra, amíg meg nem javították és az ismételt vizsgálatot és ellenőrzéseket ki nem állta.

6.7.5.13 Jelölés

6.7.5.13.1 Ellenőrzés céljából könnyen elérhető, szembetűnő helyre minden MEG-konténerre nem korrodálódó fémtablát kell tartósan rögzíteni. A fémtablát nem szabad az elemekre rögzíteni. Az elemeket a 6.2 fejezet szerint kell jelölni. A fémtablán legalább a következőkben felsorolt adatokat kell feltüntetni beütéssel vagy más hasonló módon:

- a) Tulajdonosi információk
 - i) a tulajdonos nyilvántartási száma;
- b) Gyártási információk
 - i) a gyártási ország;
 - ii) a gyártási év;
 - iii) a gyártó neve vagy jele;
 - iv) a gyártó sorozatszáma;
- c) Jóváhagyási információk
 - i) az Egyesült Nemzetek jele a csomagolóeszközön:  .

Ezt a jelet csak annak tanúsítására szabad használni, hogy a csomagolóeszköz, a mobil tartány, ill. a MEG-konténer megfelel a 6.1, a 6.2, a 6.3, a 6.5, a 6.6, ill. a 6.7¹⁵⁾ fejezet vonatkozó előírásainak;
 - ii) a jóváhagyó ország;
 - iii) a típusjóváhagyásra felhatalmazott szervezet;
 - iv) típusjóváhagyási szám;
 - v) „AA” betűk, ha a típust alternatív kialakításuként hagyták jóvá (lásd a 6.7.1.2 bekezdést);
- d) Nyomások
 - i) a próbanyomás (bar, túlnyomás)¹⁶⁾;
 - ii) az üzembe helyezés előtti nyomáspróba időpontja (hónap és év);
 - iii) az üzembe helyezés előtti nyomáspróbát tanúsító szakértő azonosító jele;
- e) Hőmérsékletek
 - i) tervezési hőmérséklet-tartomány (°C)¹⁶⁾;
- f) Elemek/űrtartalom
 - i) az elemek száma;
 - ii) az elemek összes víztérfogata (liter)¹⁶⁾;
- g) Időszakos vizsgálatok
 - i) a legutóbbi időszakos vizsgálat típusa (5-évenkénti, soronkívüli);
 - ii) a legutóbbi időszakos vizsgálat időpontja (hónap és év);
 - iii) a felhatalmazott szervezet azonosító jele, amely a legutóbbi vizsgálatot végezte

15) Ezt a jelet használják annak tanúsítására is, hogy az olyan hajlékony ömlesztettáru-konténerek, amelyeket más közlekedési alágazatra hagytak jóvá, megfelelnek az ENSZ Minta Szabályzat 6.8 fejezete követelményeinek.

16) A mértékegységet fel kell tüntetni.

vagy tanúsította.

- 6.7.5.13.2** A következő adatokat a MEG-konténerhez biztosan rögzített fémtablán kell feltüntetni:
- Az üzemben tartó neve
- A töltet megengedett legnagyobb tömege kg
- Üzemi nyomás 15 °C-on bar (túlnyomás)
- Megengedett legnagyobb bruttó tömeg kg
- Az üres (tára) tömeg kg.

6.8 FEJEZET

A FÉMBŐL GYÁRTOTT, RÖGZÍTETT TARTÁNYOK (TARTÁNYJÁRMŰVEK), LESZERELHETŐ TARTÁNYOK, TANKKONTÉNEREK ÉS TARTÁNYOS CSEREFELÉPÍTMÉNYEK, VALAMINT BATTÉRIÁS JÁRMŰVEK ÉS TÖBBELEMES GÁZKONTÉNEREK (MEG-KONTÉNEREK) GYÁRTÁSÁRA, SZERELVÉNYEIRE, TÍPUSJÓVÁHAGYÁSÁRA, VIZSGÁLATÁRA ÉS JELÖLÉSÉRE VONATKOZÓ KÖVETELMÉNYEK

Megjegyzés: *A mobil tartányokra és az UN többelemes gázkonténerekre (UN MEG-konténerekre) lásd a 6.7 fejezetet; a szálvázaz műanyag tartányokra lásd a 6.9 fejezetet; a hulladékok szállítására szolgáló, vákuummal üzemelő tartányokra lásd a 6.10 fejezetet.*

6.8.1 Alkalmazási terület

6.8.1.1 Az oldal teljes szélességében nyomtatott követelményeket a rögzített tartányokra (tartányjárművekre), a leszerelhető tartányokra, a battériás járművekre, valamint a tankkonténerekre, tartányos cserefelépítményekre és MEG-konténerekre egyaránt alkalmazni kell. Az egyetlen oszlopban nyomtatott előírásokat csak

- a rögzített tartányokra (tartányjárművekre), a leszerelhető tartányokra és a battériás járművekre (bal oldali oszlop);
- a tankkonténerekre, a tartányos cserefelépítményekre és a MEG-konténerekre (jobb oldali oszlop)

kell alkalmazni.

6.8.1.2 Ezeket a követelményeket a gáz alakú, a folyékony és a porszerű vagy szemcsés anyagok szállításához használt,

rögzített tartányokra (tartányjárművekre),
leszerelhető tartányokra és battériás
járművekre

tankkonténerekre, tartányos cserefelépítményekre és MEG-konténerekre

kell alkalmazni.

6.8.1.3 A 6.8.2 szakasz tartalmazza az összes osztály anyagainak szállítására szolgáló rögzített tartányokra (tartányjárművekre), leszerelhető tartányokra, tankkonténerekre és tartányos cserefelépítményekre, valamint a 2 osztály gázainak szállítására szolgáló battériás járművekre és MEG-konténerekre vonatkozó követelményeket. A 6.8.3 – 6.8.5 szakasz különleges követelményeket tartalmaz, amelyek kiegészítik vagy módosítják a 6.8.2 szakasz követelményeit.

6.8.1.4 Az ezen tartányok használatára vonatkozó előírásokra lásd a 4.3 fejezetet.

6.8.2 Az összes osztályra vonatkozó követelmények

6.8.2.1 Gyártás

Alapelvek

6.8.2.1.1 A tartányt, a tartozékait, az üzemi és szerkezeti szerelvényeit úgy kell kialakítani, hogy a szállított anyag vesztesége nélkül (nem számítva az esetleges szelepeken keresztül

kiszabaduló gázmennyiséget) ellenálljon:

- a 6.8.2.1.2 és a 6.8.2.1.13 pontban meghatározott, normális szállítási körülmények között előforduló statikus és dinamikus igénybevételeknek;
- a 6.8.2.1.15 pontban meghatározott legkisebb igénybevételeknek.

6.8.2.1.2

A tartányoknak és rögzítőelemeiknek a megengedett legnagyobb töltési tömeg mellett a következőkből eredő igénybevételeket kell elviselniük:

- menetirányban a kétszeres összes tömeg;
- menetirányra merőlegesen az egyszeres összes tömeg;
- függőlegesen felfelé az egyszeres összes tömeg;
- függőlegesen lefelé a kétszeres összes tömeg.

A tankkonténereknek és rögzítőelemeiknek a megengedett legnagyobb töltési tömeg mellett a következőkből eredő igénybevételeket kell elviselniük:

- menetirányban a kétszeres összes tömeg;
- vízszintesen a menetirányra merőlegesen az egyszeres összes tömeg (ha a menetirány egyértelműen nem határozható meg, akkor minden irányban a kétszeres összes tömeg);
- függőlegesen felfelé az egyszeres összes tömeg;
- függőlegesen lefelé a kétszeres összes tömeg.

6.8.2.1.3

A tartányok falvastagságának legalább

a 6.8.2.1.17 – 6.8.2.1.21

a 6.8.2.1.17 – 6.8.2.1.20

pontban meghatározottnak kell lennie.

6.8.2.1.4

A tartányokat a 6.8.2.6 bekezdésben felsorolt szabványok, ill. az illetékes hatóság által a 6.8.2.7 bekezdés alapján elismert műszaki szabályzat követelményeinek megfelelően kell tervezni és gyártani, amelyek a gyártási anyag megválasztásánál és a tartány falvastagság meghatározásánál számításba veszik a legnagyobb és a legkisebb töltési és üzemi hőmérsékleteket is; a 6.8.2.1.6 – 6.8.2.1.26 pont minimális előírásait azonban be kell tartani.

6.8.2.1.5

Bizonyos veszélyes anyagok szállítására használt tartányokat kiegészítő védelemmel kell ellátni. Ez állhat a tartány (nagyobb tervezési nyomásból adódó) nagyobb falvastagságából (ezt az illető veszélyes anyag veszélyességi foka alapján kell meghatározni) vagy valamely védőszerkezetből (lásd a 6.8.4 szakasz különleges előírásait).

6.8.2.1.6

A hegesztéseket szakszerűen kell elkészíteni, és azoknak teljes biztonságot kell nyújtaniuk. A hegesztési varratok kivitelezésére és ellenőrzésére a 6.8.2.1.23 pont követelményeit kell betartani.

6.8.2.1.7

Intézkedni kell annak érdekében, hogy a tartányok a belső vákuum következtében fellépő deformáció veszélye ellen védve legyenek.

A 6.8.2.2.6 pontban említett tartányokon kívüli egyéb tartányoknak, amelyekre vákuumszelepet terveztek, olyan külső nyomást kell maradandó alakváltozás nélkül elviselniük, amely a belső nyomást legalább 21 kPa-lal (0,21 bar-ral) meghaladja. A belső nyomást kisebb mértékben, de legalább 5 kPa-lal (0,05 bar-ral) meghaladó külső nyomásra is méretezhetők azok a tartányok, amelyeket kizárólag olyan szilárd (porszerű vagy szemcsés) anyagok szállítására használnak, amelyek a II vagy a III csomagolási csoportba tartoznak és a szállítás alatt nem válnak folyékonnyá. A vákuumszelepeket úgy kell beállítani, hogy akkora (vagy annál kisebb) vákuumnál nyissanak ki, mint amekkorára a tartányt méretezték. Azoknak a tartányoknak, amelyekre nem terveztek vákuumszelepeket, olyan külső nyomást kell maradandó alakváltozás nélkül elviselniük, amely legalább 40 kPa-lal (0,4 bar-ral) meghaladja a belső nyomást.

A tartányok anyaga

6.8.2.1.8

A tartányokat olyan alkalmas fémből kell készíteni, amely ellenáll a ridegtörésnek és a feszültség alatti korróziós repedezésnek -20 °C és $+50\text{ °C}$ között, hacsak az egyes osztályoknál nincsenek más hőmérséklet-tartományok előírva.

6.8.2.1.9 A tartánynak vagy védőburkolatának a tartalommal érintkező részei a tartalommal veszélyes reakcióba lépő (a „veszélyes reakció” fogalmát lásd az 1.2.1 szakaszban) vagy veszélyes vegyületet képező, vagy a tartány anyagát lényegesen gyengítő anyagot nem tartalmazhatnak.

Ha a szállított anyag és a tartány gyártásához felhasznált anyag érintkezése a falvastagság folyamatos csökkenését idézi elő, akkor a falvastagságot a gyártás folyamán megfelelően meg kell növelni. A korrózió miatt ráhagyott falvastagságot a tartány falvastagságának kiszámításakor nem szabad tekintetbe venni.

6.8.2.1.10 Hegesztett tartányokhoz csak olyan hibátlanul hegeszthető anyagok használhatók fel, amelyek ütőszilárdsága -20 °C környezeti hőmérsékleten – különösen a hegesztési varratokban és a velük szomszédos övezetekben – szavatolható.

Finom szemcseszerkezetű acélok használata esetén a szavatolt folyáshatár nem lehet nagyobb, mint 460 N/mm^2 , és a szavatolt szakítószilárdság felső határa nem lehet nagyobb, mint 725 N/mm^2 az anyagspecifikáció szerint.

6.8.2.1.11 Hegesztett tartányok gyártásához használt acéloknál $0,85$ -öt meghaladó R_e/R_m arány nem megengedett, ahol

R_e = a határozott folyáshatárral rendelkező acéloknál a tényleges folyáshatár, vagy a határozott folyáshatárral nem rendelkező acéloknál a $0,2\%$ -os (ausztenites acéloknál az 1% -os) szavatolt, egyezményes folyáshatár; és

R_m = a szakítószilárdság.

A minőségi tanúsítványban szereplő értékeket kell alapul venni az egyes esetekben az R_e/R_m arány meghatározásához.

6.8.2.1.12 Acéloknál a szakadási nyúlás értéke %-ban nem lehet kisebb, mint

$$\frac{10000}{\text{meghatározott szakítószilárdság, N/mm}^2},$$

azonban finom szemcseszerkezetű acéloknál 16% -nál, más acéloknál 20% -nál semmi esetre sem lehet kisebb.

Alumíniumötvözetek szakadási nyúlása 12% -nál kisebb nem lehet.¹⁾

A tartány falvastagságának méretezése

6.8.2.1.13 A tartány falvastagságának méretezésekor a mértékadó nyomás nem lehet kisebb, mint a tervezési nyomás, de figyelembe kell venni a 6.8.2.1.1 pontban említett igénybevételeket és – szükség esetén – a következő igénybevételeket is:

Az olyan járműveknél, ahol a tartány a jármű önhordó részét képezi, a tartányt úgy kell méretezni, hogy az egyébként fellépő hatásokon kívül az ebből eredő igénybevételeket is kiállja.

Az ezekből az igénybevételekből a tartány, ill. a rögzítőelemek legjobban igénybevett helyén keletkező feszültség nem haladhatja meg a 6.8.2.1.16 pontban meghatározott értéket.

Az igénybevételeknél a következő biztonsági tényezőket kell figyelembe venni:

- határozott folyáshatárral rendelkező fémeknél: a tényleges folyáshatárra vonatkozóan $1,5$ -es biztonsági tényezőt; vagy
- határozott folyáshatárral nem rendelkező fémeknél: a $0,2\%$ -os (vagy ausztenites acéloknál az 1% -os) szavatolt, egyezményes folyáshatárra vonatkozóan $1,5$ -es biztonsági tényezőt.

1) Fémlemez esetén a szakítópróbához használt próbatest tengelyének a hengerlési irányra merőlegesnek kell lennie. A szakadási nyúlást olyan kör keresztmetszetű próbatesten kell mérni, amelyen a két jel közötti l távolság a d átmérő ötszöröse ($l = 5d$). Négyzetű keresztmetszetű próbatest esetén a jelek közötti távolságot az $l = 5,65 \sqrt{F_0}$ képlettel kell kiszámítani, ahol F_0 a próbatest kezdeti keresztmetszetének területe.

6.8.2.1.14 A tervezési nyomás a 3.2 fejezet „A” táblázat 12 oszlopa szerinti tartánykód második részében (lásd a 4.3.4.1 bekezdést) szerepel.

Ha a kódban „G” szerepel, a következő követelményeket kell alkalmazni:

- a) Az 50 °C-on 110 kPa (1,1 bar) (abszolút nyomás) értéket meg nem haladó gőznyomású anyagok szállítására használt, gravitációs töltésű és ürítésű tartányokat a szállítandó anyag statikus nyomásának kétszeresére, de legalább a víz statikus nyomásának kétszeresére kell méretezni.
- b) Az 50 °C-on 110 kPa (1,1 bar) (abszolút nyomás) értéket meg nem haladó gőznyomású anyagok szállítására használt, nyomás alatt töltendő vagy ürítendő tartányokat a töltési vagy ürítési nyomás 1,3-szeresére kell méretezni.

Ha a legkisebb tervezési nyomás (túlnyomás) számértéke adott, akkor a tartányt erre a nyomásra kell méretezni, ez azonban nem lehet kisebb, mint a töltési vagy ürítési nyomás 1,3-szerese. Ezekben az esetekben a következő minimális követelményeket kell alkalmazni:

- c) Az 50 °C-on 110 kPa-nál (1,1 bar-nál) értéknél nagyobb gőznyomású és 35 °C-nál magasabb forráspontú anyagok szállítására használt tartányokat – függetlenül a töltés vagy az ürítés módjától – a 150 kPa (1,5 bar) túlnyomás, ill. a töltési vagy ürítési nyomás 1,3-szerese közül a nagyobbik nyomásértékre kell méretezni.
- d) A 35 °C-nál nem magasabb forráspontú anyagok szállítására használt tartányokat – függetlenül a töltés vagy az ürítés módjától – a töltési vagy ürítési nyomás 1,3-szeresére, de legalább 0,4 MPa (4 bar) túlnyomásra kell méretezni.

6.8.2.1.15 A nyomáspróba révén a tartány legjobban igénybe vett helyén keletkező σ feszültség nem haladhatja meg a gyártási anyagtól függően a következőkben előírt határértékeket. A hegesztés miatti gyengülést figyelembe kell venni.

6.8.2.1.16 Minden fémnél és ötvözetnél a próbanyomás által keltett σ feszültségnek kisebbnek kell lennie, mint a következő képletekkel kapott kisebbik érték:

$$\sigma \leq 0,75 R_e \text{ vagy } \sigma \leq 0,5 R_m$$

ahol

R_e = a határozott folyáshatárral rendelkező acéloknál a tényleges folyáshatár, vagy a határozott folyáshatárral nem rendelkező acéloknál a 0,2%-os (ausztenites acéloknál az 1%-os) szavatolt, egyezményes folyáshatár; és

R_m = a szakítószilárdság.

Az R_e és R_m értékére az anyagszabványok által meghatározott legkisebb értékeket kell használni. Ha a szóban forgó fémre vagy ötvözetre nincs anyagszabvány, a használt R_e és R_m értéket az illetékes hatóságnak vagy az általa kijelölt szervezetnek kell jóváhagynia.

Ausztenites acélok használata esetén az anyagszabványokban előírt legkisebb értékeket legfeljebb 15%-kal meg lehet haladni, ha ezeket a magasabb értékeket a vizsgálati bizonyítvány hitelesíti. A 6.8.2.1.18 pontban megadott képlet alkalmazása esetén azonban a legkisebb értékeket nem lehet meghaladni.

A tartány legkisebb falvastagsága

6.8.2.1.17 A tartányok falvastagságának legalább akkorának kell lennie, mint a következő képletekből adódó nagyobbik érték:

$$e = \frac{P_T D}{2\sigma\lambda}$$

$$e = \frac{P_C D}{2\sigma}, \text{ ahol}$$

e = a tartány legkisebb falvastagsága mm-ben

P_T = a próbanyomás MPa-ban

P_C = a 6.8.2.1.14 pont szerinti tervezési nyomás MPa-ban

D = a tartány belső átmérője mm-ben

σ = a 6.8.2.1.16 pontban meghatározott megengedett feszültség N/mm²-ben

λ = 1-nél nem nagyobb tényező a hegesztések miatti esetleges gyengülés figyelembe vételéhez, a 6.8.2.1.23 pontban meghatározott ellenőrzési módszer alapján.

A falvastagság semmiképpen sem lehet kisebb

a 6.8.2.1.18 – 6.8.2.1.21

a 6.8.2.1.18 – 6.8.2.1.20

pontban meghatározott értéknél.

6.8.2.1.18

A 6.8.2.1.21 pontban említetteken kívüli, 1,80 m-nél nem nagyobb átmérőjű²⁾, kör keresztmetszetű tartány falvastagságának legalább 5 mm-nek kell lennie, ha szerkezeti acélból³⁾ van, vagy azzal egyenértékű vastagságúnak, ha más fémből készült. Ha az átmérő²⁾ meghaladja az 1,80 m-t, ezt a vastagságot, a porszerű vagy szemcsés anyagok szállítására használt tartányok esetét kivéve, 6 mm-re kell növelni, ha a tartány szerkezeti acélból³⁾, vagy azzal egyenértékű vastagságúra, ha más fémből készült.

A tartány falvastagságának legalább 5 mm-nek kell lennie, ha szerkezeti acélból³⁾ van (a 6.8.2.1.11 és a 6.8.2.1.12 pontnak megfelelően), vagy azzal egyenértékű vastagságúnak, ha más fémből készült. Ha az átmérő²⁾ meghaladja az 1,80 m-t, ezt a vastagságot, a porszerű vagy szemcsés anyagok szállítására használt tartányok esetét kivéve, 6 mm-re kell növelni, ha a tartány szerkezeti acélból³⁾, vagy azzal egyenértékű vastagságúra, ha más fémből készült. Bármilyen fémeket használnak is, a tartány fala nem lehet 3 mm-nél vékonyabb.

Az „egyenértékű vastagság” a következő képlet⁴⁾ szerinti vastagságot jelenti:

$$e_I = \frac{464e_0}{\sqrt[3]{(R_{mI}A_I)^2}}$$

- 2) A nem kör keresztmetszetű, pl. a koffer alakú vagy ellipszis keresztmetszetű tartányoknál a jelzett átmérőt az azonos keresztmetszeti területű kör keresztmetszetből kell számítani. Az ilyen keresztmetszeteknél a palást görbületi sugara nem haladhatja meg az oldalakon a 2000 mm-t, illetve alul és felül a 3000 mm-t.
- 3) A „szerkezeti acél” és a „referencia acél” meghatározására lásd az 1.2.1 szakaszt. A „szerkezeti acél” meghatározás kiterjed az acélokra is, melyek az EN-anyagszabványokban „szerkezeti acél”-ként vannak megnevezve és legkisebb szakítószilárdságuk 360 N/mm² és 490 N/mm² között van, továbbá legkisebb szakadási nyúlásuk megfelel a 6.8.2.1.12 pontban előírtak.

- 4) Ez a képlet a következő általános képletből adódik: $e_I = e_0 \sqrt[3]{\left(\frac{R_{m0}A_0}{R_{mI}A_I}\right)^2}$, ahol

e_I = a legkisebb tartány falvastagság a választott fémre mm-ben;

e_0 = a legkisebb tartány falvastagság szerkezeti acélra mm-ben a 6.8.2.1.18 és a 6.8.2.1.19 pont szerint;

R_{m0} = 370 (szakítószilárdság a referencia acélra, lásd a meghatározást az 1.2.1 szakaszban, N/mm²-ben);

A_0 = 27 (szakadási nyúlás a referencia acélra %-ban);

R_{mI} = a választott fém legkisebb szakítószilárdsága, N/mm²-ben; és

A_I = a választott fém legkisebb szakadási nyúlása %-ban.

6.8.2.1.19

Ha a tartány az oldalirányú ütközésekből vagy felborulásból eredő sérülések ellen 6.8.2.1.20 pont szerinti védelemmel van ellátva, az illetékes hatóság megengedheti a legkisebb falvastagságnak a nyújtott védelem arányában való csökkentését; 1,80 m-nél nem nagyobb átmérőjű²⁾ tartányok falvastagsága azonban nem lehet kisebb szerkezeti acél³⁾ esetén 3 mm-nél, más fémeknél az ezzel egyenértékű falvastagságnál. Az 1,80 m-nél nagyobb átmérőjű²⁾ tartányoknál azonban az előbb említett legkisebb falvastagság nem lehet kisebb szerkezeti acél³⁾ esetén 4 mm-nél, más fémeknél az ezzel egyenértékű falvastagságnál.

Az „egyenértékű falvastagság” a 6.8.2.1.18 pontban megadott képlet szerinti vastagságot jelenti.

Azokat az eseteket kivéve, amelyekről a 6.8.2.1.21 pont rendelkezik, a 6.8.2.1.20 a) vagy b) pont szerinti sérülés elleni védelemmel ellátott tartány falvastagsága nem lehet kisebb a következő táblázatban megadott értékeknél:

A tartány átmérője		≤1,80 m	> 1,80 m
A tartány legkisebb falvastagsága	Auszténites rozsdamentes acél	2,5 mm	3 mm
	Auszténites-ferrites rozsdamentes acél	3 mm	3,5 mm
	Egyéb acél	3 mm	4 mm
	Alumíniumötvözet	4 mm	5 mm
	99,80%-os tisztaságú alumínium	6 mm	8 mm

Ha a tartány a sérülések ellen a 6.8.2.1.20 pont szerinti védelemmel van ellátva, az illetékes hatóság megengedheti a legkisebb falvastagságnak a nyújtott védelem arányában való csökkentését; 1,80 m-nél nem nagyobb átmérőjű²⁾ tartányok falvastagsága azonban nem lehet kisebb szerkezeti acél³⁾ esetén 3 mm-nél, más fémeknél az ezzel egyenértékű falvastagságnál. Az 1,80 m-nél nagyobb átmérőjű²⁾ tartányoknál azonban az előbb említett legkisebb falvastagság nem lehet kisebb szerkezeti acél³⁾ esetén 4 mm-nél, más fémeknél az ezzel egyenértékű falvastagságnál.

Az „egyenértékű falvastagság” a 6.8.2.1.18 pontban megadott képlet szerinti vastagságot jelenti.

A 6.8.2.1.20 pont szerinti sérülés elleni védelemmel ellátott tartány falvastagsága nem lehet kisebb a következő táblázatban megadott értékeknél:

6.8.2.1.20

Az 1990. január 1-je után gyártott tartányok akkor rendelkeznek a 6.8.2.1.19 pontban említett védelemmel, ha a következő vagy ezekkel egyenértékű előírások⁵⁾ teljesülnek:

- Porszerű vagy szemcsés anyagok szállítására használt tartányok sérülés elleni védőszerkezetének meg kell felelnie az illetékes hatóság előírásainak.
- Az egyéb anyagok szállítására használt tartányok akkor védettek a sérülések ellen, ha:
 - A legfeljebb 2 m görbületi sugarú, kör vagy ellipszis keresztmetszetű tartányok el vannak látva erősítőelemekkel (válaszfalakkal, hullámtörő lemezekkel, külső vagy belső abroncsokkal), amelyek úgy vannak elhelyezve, hogy a következő

A 6.8.2.1.19 pont szerinti védelem lehet

- olyan teljes külső védelem, mint a „szendvics”-szerkezet, ahol a külső burkolat a tartányhoz van erősítve, vagy
- olyan kialakítás, ahol a tartányt hossz- és keresztirányú szerkezeti elemekből álló váz támasztja alá, vagy
- kettős falú tartány.

Az olyan kettős falú tartányoknál, ahol a két fal között légüres tér van, a külső fémfal és a tartányfal együttes vastagságának meg kell felelnie a 6.8.2.1.18 pontban előírt falvastagságnak, a tartány falvastagságának pedig legalább akkorának kell lennie, mint a 6.8.2.1.19 pontban előírt legkisebb falvastagság.

5) Egyenértékű előírások azok, amelyek a 6.8.2.6 bekezdésben hivatkozott szabványokban szerepelnek.

feltételek közül legalább az egyiknek megfelelnek:

- két szomszédos erősítőelem távolsága legfeljebb 1,75 m
- két válaszfal vagy hullámtörő lemez közötti rész térfogata legfeljebb 7500 liter.

Az abroncsok merőleges keresztmetszeti tényezőjének legalább 10 cm^3 -nek kell lennie (az együttműködő tartányfal-résszel együtt).

A külső abroncsok kiálló éleit legalább 2,5 mm sugárral kell lekerekíteni.

A válaszfalaknak és a hullámtörő lemezeknek meg kell felelniük a 6.8.2.1.22 pont előírásainak.

A válaszfalak és a hullámtörő lemezek falvastagsága soha nem lehet kisebb a tartány falvastagságánál.

2. Az olyan kettős falú tartányoknál, ahol a két fal között légüres tér van, a külső fémfal és a tartányfal együttes vastagsága megfelel a 6.8.2.1.18 pontban előírt falvastagságnak, a tartány falvastagsága pedig legalább akkora, mint a 6.8.2.1.19 pontban előírt legkisebb falvastagság.
3. Az olyan kettős falú tartányoknál, ahol a két fal között legalább 50 mm vastag közbenső szilárd réteg van, a külső fal vagy legalább 0,5 mm vastag szerkezeti acél³⁾, vagy legalább 2 mm vastag üvegszál-erősítésű műanyag. Közbenső szilárd réteggént olyan szilárd hab is használható, amelynek ütéselnyelő képessége olyan, mint pl. a poliuretán-habé.
4. Az 1. pontban említettektől eltérő formájú, különösen a koffér alakú tartányoknál a tartány magasságának felénél, körben a magasság legalább 30%-át kitevő részén olyan kiegészítő védelemmel van ellátva, amelyet úgy terveztek, hogy a különleges deformációs munka legalább egyenlő legyen az olyan szerkezeti acél³⁾ tartányéval, amely 5 mm falvastagságú, ha átmérője legfeljebb 1,80 m, vagy 6 mm falvastagságú, ha átmérője 1,80 m-nél nagyobb.

Ezt a kiegészítő védőelemet a tar-

Az olyan kettős falú tartányoknál, ahol a két fal között legalább 50 mm vastag közbenső szilárd réteg van, a külső fal vagy legalább 0,5 mm vastag szerkezeti acél³⁾, vagy legalább 2 mm vastag üvegszál-erősítésű műanyag. Közbenső szilárd réteggént olyan szilárd hab is használható, amelynek ütéselnyelő képessége olyan, mint pl. a kemény poliuretán-habé.

tányra tartósan kell rögzíteni. Ez a követelmény – a különleges deformációs munka további vizsgálata nélkül – akkor tekinthető teljesítettnek, ha a kiegészítő védelem a tartány erősítendő részével azonos anyagból készült lemez hozzáhegesztéséből áll úgy, hogy a legkisebb falvastagság megfelel a 6.8.2.1.18 pontban említettnek.

Ez a védelem attól a lehetséges igénybevételtől függ, amely baleset során az olyan szerkezeti acél³⁾ tartányban keletkezne, amelynek falvastagsága 5 mm, ha átmérője legfeljebb 1,80 m, vagy falvastagsága 6 mm, ha átmérője 1,80 m-nél nagyobb. Ha a tartány más fémből készült, az egyenértékű vastagságot a 6.8.2.1.18 pontban található képlet adja.

Leszerelhető tartányoknál ilyen védelemre nincs szükség, ha a tartányt minden oldalról a hordozó jármű oldalfalai védik.

6.8.2.1.21

A legfeljebb 5000 liter űrtartalmú vagy legfeljebb 5000 liter űrtartalmú, szivárgásmentes kamrákra osztott tartányoknál a 6.8.2.1.14 a) pont szerint számított falvastagság tovább csökkenthető legfeljebb a következő táblázatban megadott értékekig, kivéve, ha a 6.8.3 vagy a 6.8.4 szakaszban más érték van

A tartány legnagyobb görbületi sugara, m	A tartány vagy tartánykamra űrtartalma, m ³	Legkisebb falvastagság, mm
		Szerkezeti acél esetén
≤ 2	≤ 5,0	3
2...3	≤ 3,5	3
	> 3,5 de ≤ 5,0	4

Ha nem szerkezeti acélt³⁾, hanem más fémet használnak, a falvastagságot a 6.8.2.1.18 pontban előírt egyenérték-képlettel kell számítani és nem lehet kisebb a következő táblázatban megadott értékeknél:

	A tartány legnagyobb görbületi sugara, m	≤ 2	2 – 3	2 – 3
	A tartány vagy tartánykamra űrtartalma, m ³	≤ 5,0	≤ 3,5	> 3,5 de ≤ 5,0
A tartány legkisebb falvastagsága	Auszténites rozsdamentes acél	2,5 mm	2,5 mm	3 mm
	Egyéb acél	3 mm	3 mm	4 mm
	Alumínium ötvözet	4 mm	4 mm	5 mm
	99,80%-os tisztaságú alumínium	6 mm	6 mm	8 mm

A válaszfalak és a hullámtörők falvastagsága sohasem lehet kisebb, mint a tartányfal vastagsága.

- 6.8.2.1.22** A hullámtörőknek és a válaszfalaknak domborúnak (legalább 10 cm mélységgel) vagy hullámos vagy alakos kiképzésűnek kell lenniük, vagy más módon úgy kell megerősíteni, hogy azonos szilárdságúak legyenek. A hullámtörő lemez felületének legalább akkorának kell lennie, mint a tartány – amelyben a hullámtörő lemez van – keresztmetszeti területének 70%-a.

Hegesztés és a hegesztések ellenőrzése

- 6.8.2.1.23** A gyártó alkalmasságát a hegesztési munka elvégzésére az illetékes hatóságnak kell elismernie. A hegesztést vizsgázott hegesztőnek olyan hegesztési eljárással kell végeznie, amelynek alkalmasságát (beleértve a szükséges hőkezelést is) vizsgálattal igazolták. Ultrahangos vagy radiográfias (röntgen-) eljárással végrehajtott roncsolásmentes vizsgálatokkal kell igazolni a hegesztési varratoknak az igénybevételnek megfelelő minőségét.

A tartány falvastagságának a 6.8.2.1.17 pont szerinti méretezéséhez használt λ varratényező (varratjósági fok) értékének függvényében a következő ellenőrzéseket kell elvégezni:

- $\lambda = 0,8$: a hegesztési varratokat mindkét oldalon, amennyire csak lehet, vizuális vizsgálatnak kell alávetni, és szűrőpróbaszerű roncsolásmentes vizsgálatot kell végezni. Minden „T” csatlakozást meg kell vizsgálni úgy, hogy a teljes vizsgált varrathossz nem lehet kisebb, mint az összes hossz- és körvarrat, ill. sugárirányú varrat (a tartányfenekeknél) együttes hosszának 10%-a.
- $\lambda = 0,9$: roncsolásmentes vizsgálatnak kell alávetni teljes hosszúságban az összes hosszirányú varratot, az összes varratcsatlakozási pontot, a körvarratok 25%-át és a nagy átmérőjű szerelvények összeállításához szükséges hegesztéseket. A varratokat, amennyire lehetséges, mindkét oldalon vizuálisan is ellenőrizni kell;
- $\lambda = 1,0$: az összes varratot roncsolásmentes vizsgálatnak kell alávetni, és amennyire lehetséges, mindkét oldalon vizuálisan is ellenőrizni kell. Egyúttal hegesztési próbadarabot kell készíteni.

Ha az illetékes hatóságnak a hegesztési varratok minőségét illetően kételyei vannak, további kiegészítő vizsgálatokat követelhet meg.

Egyéb gyártási követelmények

- 6.8.2.1.24** A védőbevonatot úgy kell elkészíteni, hogy tömör maradjon a normális szállítási körülmények között (lásd a 6.8.2.1.2 pontot) előforduló bármilyen alakváltozás esetén.
- 6.8.2.1.25** A hőszigetelést úgy kell elkészíteni, hogy a töltő- és ürítőberendezésekhez, valamint a biztonsági szelepekhez való hozzáférést és működtetésüket ne akadályozza.
- 6.8.2.1.26** Ha a legfeljebb 60 °C lobbanáspontú gyúlékony folyékony anyagok szállítására szolgáló tartányok nemfémes védőbevonattal (béléssel) vannak ellátva, a tartányt és a védőbevonatot úgy kell kialakítani, hogy az elektrosztatikus feltöltődés ne okozhasson gyulladásveszélyt.
- 6.8.2.1.27** A 60 °C vagy annál alacsonyabb lobbanáspontú folyadékok, a gyúlékony gázok és a II csomagolási csoportba tartozó UN 1361 szén, ill. UN 1361 korom szállítására használt tartányokat a jármű alvázával legalább egy, jó elektromos csatlakozással

A 60 °C vagy annál alacsonyabb lobbanáspontú folyadékok, a gyúlékony gázok és a II csomagolási csoportba tartozó UN 1361 szén, ill. UN 1361 korom szállítására használt tankkonténerek minden részének villamosan földelhetőnek kell lenniük. Elektrokémiai korró-

<p>össze kell kötni. Elektrokémiai korróziót okozó fémes csatlakozást nem szabad létesíteni.</p>	<p>ziót okozó fémes csatlakozást nem szabad létesíteni.</p>
--	---

A tartányokat el kell látni legalább egy földelő szerelvénnyel, ami a „” szimbólummal jól látható módon meg van jelölve és alkalmas az elektromos csatlakoztatáshoz.

6.8.2.1.28 A tartány felső részén levő szerelvények védelme

A tartányok tetején levő szerelvényeket és tartozékokat a felborulásból adódó sérülések ellen védeni kell. A védelem állhat erősítő-gyűrűk, védőtetők, kereszt- és hosszirányú elemek elhelyezéséből, amelyeknek alakja olyan, hogy kielégítő védelmet nyújt.

6.8.2.2 Szerelvények

6.8.2.2.1

Az üzemi és szerkezeti szerelvények és tartozékok gyártásához alkalmas, nemfémes anyagok is használhatók.

A szerelvényeket úgy kell elhelyezni, hogy a szállítás és a kezelés során leszakadás vagy sérülés veszélye ellen biztosítva legyenek. A szerelvényeknek ugyanolyan biztonságúaknak kell lenniük, mint a tartálynak, és különösen

- összeférhetőnek kell lenniük a szállított anyaggal; és
- meg kell felelniük a 6.8.2.1.1 pont követelményeinek.

A csővezetéket úgy kell tervezni, gyártani és felszerelni, hogy ne jöjjön létre sérülésveszély a hőtágulás és összehúzódás, a mechanikai ütések és rezgések következtében.

Az üzemi szerelvényeket úgy kell elhelyezni, hogy a tartányfalon szükséges nyílások száma a lehető legkevesebb legyen.

Az üzemi szerelvények tömítettségét, beleértve a vizsgálónyílások zárószerkezetét (fedelét) is, még akkor is biztosítani kell, ha a tartány felborul. Figyelembe kell venni azokat az erőhatásokat is (gyorsulást, dinamikus nyomást), amelyek ütközés során léphetnek fel. A tartány tartalmának az ütközés miatt fellépő feszültségcsúcs hatására történő kis mértékű kiszivárgása azonban megengedhető.

Az üzemi szerelvények tömítettségét még akkor is biztosítani kell, ha a tankkonténer felborul.

A tömítések anyagának a szállított anyaggal összeférhetőnek kell lennie, és ha hatékonyságuk csökkent, pl. öregedés miatt, azonnal ki kell cserélni.

A tartányok rendes használata folyamán kezelést igénylő szerelvények szivárgásmentességét biztosító tömítéseket úgy kell megtervezni és felszerelni, hogy a szerelvények kezelésekor ne sérüljenek meg.

6.8.2.2.2

Azokon a tartányokon, amelyekre a 3.2 fejezet „A” táblázat 12 oszlopában feltüntetett tartánykód (lásd a 4.3.4.1.1 pontot) harmadik részében „A” betű szerepel, az alsó töltő-, ill. ürítőnyílást legalább két, egymás mögött elhelyezett, egymástól független zárószerkezettel kell ellátni, amely a következőkből áll:

- egy kovacsolható fémes anyagból készült, külső zárószelepből és ürítőcsőből; valamint

- minden cső végén egy zárószervezetből, ami lehet csavarmenetes záródugó, vakkarima vagy más, egyenértékű szerkezet. A zárószervezetnek annyira tömítettnek kell lennie, hogy az anyagot veszteség nélkül megtartsa. Meg kell hozni a szükséges intézkedéseket, hogy lehetővé váljon az ürítőcsőben a biztonságos nyomásmentesítés előtt a zárószervezetet teljesen eltávolítják.

Azokon a tartányokon, amelyekre a 3.2 fejezet „A” táblázat 12 oszlopában feltüntetett tartánykód (lásd a 4.3.3.1.1, ill. a 4.3.4.1.1 pontot) harmadik részében „B” betű szerepel, az alsó töltő-, ill. ürítőnyílást legalább három, egymás mögött elhelyezett, egymástól független zárószervezettel kell ellátni, amely a következőkből áll:

- egy belső zárószelepből, azaz a tartány belsejébe vagy egy hegesztett karimába vagy ellenkarimába beépített zárószelepből;
- egy külső zárószelepből vagy más, azzal egyenértékű szerkezetből⁶⁾, amely minden cső végén el van helyezve; és a tartányhoz a lehető legközelebb van elhelyezve; és
- minden cső végén egy zárószervezetből, ami lehet csavarmenetes záródugó, vakkarima vagy más, egyenértékű szerkezet. A zárószervezetnek annyira tömítettnek kell lennie, hogy az anyagot veszteség nélkül megtartsa. Meg kell hozni a szükséges intézkedéseket, hogy lehetővé váljon az ürítőcsőben a biztonságos nyomásmentesítés előtt a zárószervezetet teljesen eltávolítják.

Bizonyos kristályosodó vagy nagy viszkozitású anyagok szállítására használt tartányoknál, ill. az ebonit vagy hőre lágyuló bevonatú tartányoknál azonban a belső zárószelep helyett külső zárószelep is alkalmazható, ha megfelelő kiegészítő védelemmel van ellátva.

A belső zárószelepnek felülről vagy alulról működtethetőnek kell lennie. Ha lehet, a belső zárószelep nyitott vagy zárt helyzetének a talajszintről ellenőrizhetőnek kell lennie. A belső zárószelep működtető-szerkezetének olyannak kell lennie, hogy a szelep ütközésből vagy gondatlanságból bekövetkező, nem kívánt kinyílását megakadályozza.

A külső működtető-szerkezet megsérülése esetén a belső zárószervezetnek továbbra is hatásonak kell maradnia.

A külső töltő- vagy ürítőszervevények (csőcsonkok, oldalsó zárószervezetek) sérüléséből adódó elfolyás elkerülése érdekében a belső zárószelepet és fészket (ülékét) úgy kell kialakítani, hogy a külső erőhatásra történő leszakadás ellen védve legyen, vagy az ilyen erőhatásnak ellen tudjon állni. A töltő- és ürítőszervezeteket (beleértve a karimákat és a menetes dugókat is), valamint az esetleges védőkupakokat a nem szándékos kinyitás ellen biztosítani kell.

A zárószervezetek állásának és/vagy zárási irányának világosan láthatónak kell lennie.

Azokon a tartányokon, amelyekre a 3.2 fejezet „A” táblázat 12 oszlopában feltüntetett tartánykód (lásd a 4.3.3.1.1, ill. a 4.3.4.1.1 pontot) harmadik részében „C” vagy „D” betű szerepel, a tartány minden nyílásának a folyadékszint felett kell lennie. Ezen tartányoknál a folyadékszint alatt nem lehetnek csövek és csőcsatlakozások. Az olyan tartányok, amelyek tartánykódjának harmadik részében „C” betű szerepel a tartánytest alsó részén tisztítónyílással (kézi tisztítónyílással) láthatók el. Ezt úgy kell kialakítani, hogy karimával szivárgásmentesen zárható legyen, aminek gyártási típusát az illetékes hatóságnak vagy az általa kijelölt szervezetnek kell jóváhagynia.

6.8.2.2.3

A nem légmentesen zárt tartányokat a nem megengedhető mértékű vákuum elkerülésére szelepekkel lehet ellátni; a vákuumszelepeket úgy kell beállítani, hogy akkora (vagy annál kisebb) vákuumnál nyissanak ki, mint amekkorára a tartányt méretezték (lásd a 6.8.2.1.7 pontot). A légmentesen zárt tartányokon nem lehetnek vákuumszelepek. Légmentesen zártnak tekintendők azok az SGAH, S4AH, ill. L4BH tartánykódú tartányok is, amelyeken csak 21 kPa (0,21 bar) vagy annál nagyobb vákuum esetén kinyitó vákuumszelepek vannak. Ez az érték 5 kPa-ig (0,05 bar-ig) csökkenthető azoknál a tartányoknál, amelyeket kizárólag olyan szilárd (porszerű vagy szemcsés) anyagok szállítására használnak, amelyek a II vagy a

6) Az 1 m³-nél kisebb befogadóképességű tankkonténereknél a külső zárószelep vagy a vele egyenértékű szerkezet vakkarimával helyettesíthető.

III csomagolási csoportba tartoznak és a szállítás alatt nem válnak folyékonyá.

A 3 osztály kritériumainak megfelelő lobbanáspontú anyagok szállítására szolgáló tartányokon használt vákuumszelepeknek és légző-berendezéseknek (lásd a 6.8.2.2.6 pontot) alkalmas védőszerkezettel meg kell akadályozni a lángnak a tartányba történő közvetlen behatolását, vagy a tartánynak magának alkalmasnak kell lennie arra, hogy szivárgás nélkül ellenálljon a lángnak a tartányba történő behatolása következtében fellépő robbanásnak.

Ha a védőszerkezet alkalmas lángzárból vagy lángáthatolást gátló szerkezetből áll, azt a tartányhoz vagy a tartánykamrához a lehető legközelebb kell elhelyezni. Többkamrás tartánynál minden tartánykamrát külön-külön kell védeni.

6.8.2.2.4 Minden tartánynak, illetve minden tartánykamrának a belső vizsgálatához megfelelő nagyságú vizsgálónyílással kell rendelkeznie.

6.8.2.2.5 (fenntartva)

6.8.2.2.6 Az 50 °C-on legfeljebb 110 kPa (1,1 bar) (abszolút) gőznyomású folyadékok szállítására használt tartányokat légző-berendezéssel és feldőlés esetén tartalmának kiömlése ellen védőszerkezettel kell ellátni, ellenkező esetben a tartánynak a 6.8.2.2.7, ill. a 6.8.2.2.8 pont előírásainak kell megfelelnie.

6.8.2.2.7 Az 50 °C-on 110 kPa-nál (1,1 bar-nál) nagyobb gőznyomású és 35 °C-nál magasabb forráspontú folyadékok szállítására használt tartányokat olyan biztonsági szeleppel kell ellátni, amely legalább 150 kPa (1,5 bar) túlnyomásra van beállítva, és amely egy, a próbanyomást meg nem haladó nyomáson már teljesen kinyílik, ellenkező esetben a tartányoknak a 6.8.2.2.8 pont előírásainak kell megfelelniük.

6.8.2.2.8 A 35 °C-nál nem magasabb forráspontú folyadékok szállítására használt tartányokat olyan biztonsági szeleppel kell ellátni, amely legalább 300 kPa (3 bar) túlnyomásra van beállítva, és amely egy, a próbanyomást meg nem haladó nyomáson már teljesen kinyílik, ellenkező esetben a tartánynak légmentesen zárva⁷⁾ kell lennie.

6.8.2.2.9 Ha a 60 °C vagy annál alacsonyabb lobbanáspontú gyúlékony folyadékok vagy gyúlékony gázok szállítására használt tartány alumíniumból készült, akkor semmiféle olyan mozgatható rész, amely az alumínium tartánnyal ütközhet vagy súrlódhat (pl. fedél, zárórész stb.) nem gyártható bevonat nélküli, rozsdásodó acélból.

6.8.2.2.10 Ha a tartányon, amelyet légmentesen kell zárni, biztonsági szelep van, a szelep elé hasadó-tárcsát kell szerelni és a következő feltételeket kell betartani:

A hasadó-tárcsa és a biztonsági szelep kialakításának meg kell felelnie az illetékes hatóság előírásainak. A hasadó-tárcsa és a biztonsági szelep közti térbe nyomásmérőt vagy más, alkalmas jelzőeszközt kell csatlakoztatni, ami lehetővé teszi, hogy észleljék a hasadó-tárcsa repedését, kilyukadását vagy szivárgását, ami a biztonsági szelep hibás működését okozhatja.

6.8.2.3 *Típusjóváhagyás*

6.8.2.3.1 Minden új tartányjármű, leszerelhető tartány, tankkonténer, tartányos cserefelépítmény, battériás jármű, ill. MEG-konténer típus esetén az illetékes hatóságnak vagy az általa kijelölt szervnek bizonyítványt kell kiállítani annak tanúsítására, hogy az általa megvizsgált gyártási típus, beleértve a rögzítőeszközöket is, a kívánt célra alkalmas, és hogy a 6.8.2.1 bekezdés gyártási követelményeinek, a 6.8.2.2 bekezdés szerelvényekre vonatkozó követelményeinek és a szállított anyag osztályára vonatkozó különleges követelményeknek megfelel.

A bizonyítványban fel kell tüntetni:

- a vizsgálat eredményeit;
- a típus jóváhagyási számát;

7) A „légmentesen zárt tartány” meghatározására lásd az 1.2.1 szakaszt.

A jóváhagyási számnak annak az államnak megkülönböztető jeléből⁸⁾, amelyben az engedélyt kiadták, és egy nyilvántartási számból kell állnia.

- a 4.3.3.1.1, ill. a 4.3.4.1.1 pont szerinti tartánycódot;
- 6.8.4 szakasz gyártásra, szerelvényekre és típusjóváhagyásra vonatkozó különleges előírásainak TC, TE és TA betűkkel kezdődő kódját, amely a 3.2 fejezet „A” táblázat 13 oszlopában fel van tüntetve azon anyag(ok)ra, amelyekre a tartányt jóváhagyták;
- szükség esetén azokat az anyagokat és/vagy anyagcsoportokat, amelyeknek szállítására a tartányt jóváhagyták. Az anyagokat kémiai elnevezéssel vagy a megfelelő gyűjtőmegnevezéssel (lásd a 2.1.1.2 bekezdést) kell feltüntetni, a besorolásukkal együtt (osztály, osztályozási kód és csomagolási csoport). A 2 osztály anyagai és a 4.3.4.1.3 pontban felsorolt anyagok kivételével az engedélyezett anyagok felsorolásától el lehet tekinteni. Ilyen esetekben a 4.3.4.1.2 pontban szereplő csoportos hozzárendelés szerint a tartánycóddhoz engedélyezett anyagokat lehet szállításra elfogadni, figyelembe véve az esetleges különleges előírásokat is.

A bizonyítványban feltüntetett anyagoknak, ill. a csoportos hozzárendelés alapján engedélyezett anyagcsoportoknak általában összeférhetőnek kell lenniük a tartány jellemzőivel. Ha az összeférhetőség alapos vizsgálatára nem volt lehetőség a típusjóváhagyás kiadásakor, akkor a bizonyítványba ezt a fenntartást kell bejegyezni.

Minden egyes legyártott tartány, battériás jármű, ill. MEG-konténer tartány-vizsgálati könyvéhez (gépkönyvéhez) csatolni kell a bizonyítvány másolatát (lásd a 4.3.2.1.7 pontot).

Az illetékes hatóságnak vagy az általa kijelölt szervnek azokat a szelepeket és egyéb üzemi szerelvényeket, amelyekre a 6.8.2.6.1 pontban van szabvány feltüntetve, a kérelmező kívánására az adott szabvány szerint külön típusvizsgálatnak kell alávetnie. Az így kiadott típusjóváhagyást a tartány jóváhagyási bizonyítványának kiadásakor figyelembe kell venni, ha a vizsgálati eredményeket bemutatják és a szelepek, ill. egyéb üzemi szerelvények a kívánt célra alkalmasak.

6.8.2.3.2 Ha a tartányokat, battériás járműveket, ill. MEG-konténereket sorozatban gyártják módosítás nélkül, ez az engedély a sorozatban vagy a gyártási minta alapján gyártott tartányokra, battériás járművekre, ill. MEG-konténerekre egyaránt érvényes.

A típusjóváhagyás az olyan tartányok jóváhagyásának is tekinthető, amelyeket az eredeti gyártási típushoz képest olyan, kisebb eltérésekkel gyártanak, amelyek által csökken a tartány igénybevétele, ill. csökkennek a feszültségek (pl. kisebb nyomás, kisebb tömeg, kisebb befogadóképesség) vagy nő a szerkezet biztonsága (pl. nagyobb falvastagság, több hullámtörő lemez, kisebb nyílások). Az eltéréseket egyértelműen fel kell tüntetni a típusjóváhagyási bizonyítványban.

6.8.2.3.3 A következő előírásokat azokra a tartányokra kell alkalmazni, amelyekre a 6.8.4 szakasz TA4 különleges előírása (és így az 1.8.7.2.4 pont) nem vonatkozik.

A típusjóváhagyás legfeljebb tíz évig lehet érvényes. Ha ezen időtartam alatt az ADR vonatkozó műszaki követelményei (beleértve a hivatkozott szabványokat is) úgy változnak meg, hogy a jóváhagyott típus már nem felel meg a követelményeknek, a típusjóváhagyást kiadó illetékes hatóságnak vagy az általa felhatalmazott szervezetnek vissza kell azt vonnia és erről értesítenie kell a típusjóváhagyás tulajdonosát.

Megjegyzés: A meglévő típusjóváhagyások legkésőbbi visszavonási idejére lásd a 6.8.2.6, ill. 6.8.3.6 bekezdésben lévő táblázatokat (5) oszlopát.

8) A közúti közlekedésről szóló Bécsi Egyezmény (Bécs, 1968) által előírt államjelzés a nemzetközi forgalomban résztvevő gépjárművekre.

Ha egy típusjóváahagyás lejárt vagy visszavonták, akkor e típusjóváahagyás alapján tartány, battériás jármű, ill. MEG-konténer tovább nem gyártható.

Ilyen esetekben, ha a típusjóváahagyás lejárt, ill. visszavonása előtt gyártott tartányok, battériás-járművek, ill. MEG-konténerek a típusjóváahagyás lejárt, ill. visszavonása után még tovább használhatók, akkor a használatukra, időszakos és közbenső vizsgálatukra a lejárt, ill. visszavont típusjóváahagyás vonatkozó előírásait kell alkalmazni.

Addig használhatók tovább, amíg megfelelnek az ADR követelményeinek. Ha már nem felelnek meg az ADR követelményeinek, csak abban az esetben használhatók tovább, ha azt az 1.6 fejezet vonatkozó átmeneti előírása megengedi.

A típusjóváahagyás megújítható, miután a megújítás idején érvényes ADR előírásoknak való megfelelésértékelése és teljes felülvizsgálata megtörtént. Visszavont típusjóváahagyás már nem újítható meg. Meglévő típusjóváahagyás időközi kisebb módosítása, úgy hogy az nem befolyásolja a megfelelést (lásd a 6.8.3.2.3 pontot) nem hosszabbítja meg és nem módosítja a bizonyítvány eredeti érvényességét.

Megjegyzés: *A felülvizsgálatot és a megfelelésértékelést az eredeti típusjóváahagyást kiadó szervezettől eltérő szervezet is végezheti.*

A típusjóváahagyást kiadó szervezetnek a típusjóváahagyáshoz, beleértve a megújításhoz, ha ilyen történt, szükséges összes dokumentumot meg kell őriznie az érvényessége teljes időtartama alatt.

Ha egy vizsgáló szervezet jóváahagyását visszavonták vagy az érvényességét korlátozták, vagy a vizsgáló szervezet felhagyott a tevékenységgel, az illetékes hatóságnak meg kell tennie a szükséges lépéseket, hogy az iratokat vagy egy másik vizsgáló szervezet kezelje vagy biztosítani kell, hogy az iratok továbbra is hozzáférhetők legyenek.

6.8.2.3.4

Az érvényes, lejárt vagy visszavont jóváahagyással rendelkező tartány átalakítása esetén a vizsgálatok és a jóváahagyás a tartány azon elemeire korlátozódik, amelyet átalakítottak. Az átalakításnak az átalakítás időpontjában érvényes ADR előírásainak kell megfelelnie. A tartány átalakítás által nem érintett minden elemére az első típusjóváahagyási dokumentáció továbbra is érvényes.

Az átalakítás érinthet egy vagy több nyomástartó tartányt is, amelyre a típusjóváahagyás vonatkozik.

Az átalakítást jóváahagyó bizonyítványt valamely ADR Szerződő Fél illetékes hatóságának vagy az általa kijelölt szervezetnek kell kiállítania a kérelmező számára, és a tartányvizsgálati könyvhöz (gépkönyvhöz) kell csatolni.

Az átalakításra vonatkozó jóváahagyási bizonyítvány iránti minden kérelmet egyetlen illetékes hatósághoz vagy az általa kijelölt szervezethez kell benyújtani.

6.8.2.4

Vizsgálatok

6.8.2.4.1

Üzembe helyezés előtt a tartányokat és szerelvényeiket együtt vagy külön-külön vizsgálatnak kell alávetni. A vizsgálatnak magában kell foglalnia:

- annak ellenőrzését, hogy a tartány megegyezik-e a jóváahagyott típussal;
- a szerkezeti jellemzők ellenőrzését⁹⁾;
- a belső és a külső állapot vizsgálatát;
- a folyadéknomás-próbát¹⁰⁾ a 6.8.2.5.1 pontban előírt táblán feltüntetett próbanyomással végrehajtva; és
- a tömörségi próbát és a szerelvények megfelelő működésének ellenőrzését.

9) A szerkezeti jellemzők ellenőrzésekor 1 MPa (10 bar) vagy annál nagyobb próbanyomású tartányok esetén hegesztési mintadarabokat (üzemi mintákat) is kell vizsgálni, a 6.8.2.1.23 pont és a 6.8.5 szakaszban előírt vizsgálatok szerint.

10) Különleges esetekben az illetékes hatóság által elismert szakértő hozzájárulásával a folyadéknomás-próba vízen kívül más folyadékkal vagy gázzal is elvégezhető, amennyiben ez az eljárás nem veszélyes.

A hidraulikus nyomáspróbánál alkalmazott nyomás – a 2 osztály esetét kivéve – a tervezési nyomástól függ, legalább a következő értékeket kell alkalmazni:

Tervezési nyomás (bar)	Próbanyomás (bar)
$G^{11)}$	$G^{11)}$
1,5	1,5
2,65	2,65
4	4
10	4
15	4
21	10 ($4^{12)}$)

A 2 osztályhoz a legkisebb próbanyomás értéke a 4.3.3.2.5 pontban a gázokra és gázkeverékekre vonatkozó táblázatban található.

A folyadéknomás-próbát a tartány egészen és a kamrákra osztott tartányok minden kamráján külön kell elvégezni.

A vizsgálatot minden kamrán legalább akkora nyomással kell végrehajtani, mint a legnagyobb üzemi nyomás 1,3-szerese.

A folyadéknomás-próbát az esetleg szükséges hőszigetelés felszerelése előtt kell elvégezni.

Ha a tartányt és szerelvényeit külön-külön vizsgálják, a 6.8.2.4.3 pont szerinti tömörségi próbának összeszerelve kell alávetni.

A tömörségi próbát a kamrákra osztott tartányok minden kamrájára külön kell elvégezni.

6.8.2.4.2

A tartányokat és szerelvényeiket

legalább hat évenként

| legalább öt évenként

időszakos vizsgálatnak kell alávetni.

Az időszakos vizsgálatnak magában kell foglalnia:

- a belső és külső állapot vizsgálatát;
- a tartány és a szerelvények együttes tömörségi vizsgálatát a 6.8.2.4.3 pont szerint, valamint az összes szerelvény megfelelő működésének ellenőrzését;
- általában folyadéknomás-próbát¹⁰⁾ (a tartányok és az esetleges tartánykamrák próbanyomására lásd a 6.8.2.4.1 pontot).

A hő- vagy egyéb szigetelőborításokat csak annyira kell eltávolítani, amennyire a tartány jellemzőinek biztonságos megítéléséhez feltétlenül szükséges.

Porszerű és szemcsés anyagok szállítására használt tartányoknál az illetékes hatóság által elismert szakértő egyetértésével az időszakos folyadéknomás-próba elhagyható és a 6.8.2.4.3 pont szerinti, legalább a legnagyobb üzemi nyomásnak megfelelő belső nyomással végrehajtott tömörségi próbával helyettesíthető.

6.8.2.4.3

A tartányokat és szerelvényeiket az üzembe helyezés előtti és minden időszakos vizsgálatot követően

legalább három évenként

| legalább két és fél évenként

közbenső vizsgálatnak kell alávetni. A közbenső vizsgálat három hónappal a megadott időpont előtt, ill. után is elvégezhető.

Mindazonáltal a közbenső vizsgálat a megadott időpont előtt bármikor végezhető. Ha a közbenső vizsgálatot a megadott időpont előtt több mint három hónappal végzik, ezen időpont után

11) G = legkisebb tervezési nyomás a 6.8.2.1.14 pont általános követelményei alapján (lásd a 4.3.4.1 bekezdést).

12) Legkisebb próbanyomás az UN 1744 bróm, ill. UN 1744 bróm oldatok esetén.

legkésőbb három évvel | legkésőbb két és fél évvel
egy további közbenső vizsgálatot kell végezni.

A közbenső vizsgálatnak a tartány és a szerelvények együttes tömörségi vizsgálatát, valamint az összes szerelvény megfelelő működésének ellenőrzését kell tartalmaznia.

Ebből a célból a tartányt olyan tényleges belső nyomásnak kell alávetni, amely a legnagyobb üzemi nyomással egyenlő. Folyadékok, ill. porszerű vagy szemcsés szilárd anyagok szállítására szolgáló tartánynál, ha a tömörségi próbához gázt használnak, a próbát olyan nyomással kell végrehajtani, ami legalább a legnagyobb üzemi nyomás 25%-ával egyenlő. A próbanyomás azonban semmilyen esetben sem lehet 20 kPa (0,2 bar) túlnyomásnál kisebb.

Légző-berendezéssel és a tartány felborulása esetén a tartalom kifolyását megakadályozó szerkezettel felszerelt tartányok esetén a tömörségi próba során alkalmazott nyomásnak a betöltött anyag statikus nyomásával kell megegyeznie.

A tömörségi vizsgálatot a kamrákra osztott tartányok minden kamrájára külön el kell végezni.

6.8.2.4.4 Ha a tartánynak vagy szerelvényeinek a biztonságát javítás, átalakítás vagy baleset kétségesse teszi, soron kívüli vizsgálatnak kell alávetni. Ha a soron kívüli vizsgálatot a 6.8.2.4.2 pont követelményei szerint végzik, akkor a soron kívüli vizsgálat időszakos vizsgálatnak tekinthető. Ha a soron kívüli vizsgálatot a 6.8.2.4.3 pont követelményei szerint végzik, akkor a soron kívüli vizsgálat közbenső vizsgálatnak tekinthető.

6.8.2.4.5 A 6.8.2.4.1 – 6.8.2.4.4 pont szerinti próbákat, ellenőrzéseket és vizsgálatokat az illetékes hatóság által elismert szakértőnek kell végeznie. E műveletek eredményéről tanúsítványt kell kiadnia, még akkor is, ha a vizsgálat negatív eredménnyel járt. A tanúsítványban – a 6.8.2.3 bekezdéssel összhangban – hivatkozni kell azon anyagok felsorolására, amelyek szállítására a tartányt jóváhagyták vagy a tartánykódra és a különleges előírások betűkből és számokból álló kódjára.

Minden egyes megvizsgált tartány, battériás jármű, ill. MEG-konténer tartány-vizsgálati könyvéhez (gépkönyvéhez) csatolni kell a tanúsítvány másolatát (ld. a 4.3.2.1.7 pontot).

6.8.2.5 Jelölés

6.8.2.5.1 Ellenőrzés céljából könnyen elérhető helyre minden tartányra nem korrodálódó fémtablát kell tartósan rögzíteni. A fémtablán legalább a következőkben felsorolt adatokat kell feltüntetni beütéssel vagy más hasonló módon. Az adatokat közvetlenül a tartány falába is be lehet vésni, ha a falak úgy meg vannak erősítve, hogy a bevésés a tartány szilárdságát nem csökkenti:

- a jóváhagyás száma;
- a gyártó megnevezése vagy jele;
- a gyártási sorozat száma;
- a gyártás éve;
- a próbanyomás (túlnyomás)¹³⁾;
- külső tervezési nyomás¹³⁾ (lásd a 6.8.2.1.7 pontot)
- az űrtartalom¹³⁾–több kamrára osztott tartányok esetén mindegyik kamra űrtartalma–, ami után az „S” szimbólumot kell feltüntetni, ha a 7500 liternél nagyobb űrtartalmú tartány, ill. tartánykamra hullámtörő lemezekkel legfeljebb 7500 liter űrtartalmú rekeszekre osztva;
- tervezési hőmérséklet¹³⁾ (csak akkor, ha nagyobb, mint +50 °C vagy kisebb, mint -20 °C)
- a legutóbbi vizsgálat időpontja és fajtája: „hónap, év”, ami után a 6.8.2.4.1 pont szerint végrehajtott első, üzembe helyezés előtti vizsgálat, ill. a 6.8.2.4.2 pont szerinti

13) A mértékegységet a szám után fel kell tüntetni.

időszakos vizsgálat esetén „P” betűt kell feltüntetni; a 6.8.2.4.3 pont szerint végrehajtott tömörségi vizsgálat esetén a „hónap, év” után „L” betűt kell feltüntetni;

- a vizsgálatokat végző szakértő bélyegzőlenyomata;
- a tartány anyaga az esetleges anyagszabványok megjelölésével, és – ha van – a védőborítás (bélés) anyaga;
- a tartány egészére alkalmazott próbanyomás (túlnyomás) és az egyes kamrák próbanyomása (túlnyomás), ha a kamrákenti próbanyomás kisebb, mint az egész tartány próbanyomása, MPa-ban vagy bar-ban¹³⁾.

A nyomás alatt töltött vagy ürített tartányoknál az engedélyezett legnagyobb üzemi nyomást¹³⁾ is fel kell tüntetni.

6.8.2.5.2

A következő adatokat a tartányjárművön (magán a tartányon vagy egy táblán) kell feltüntetni:

- a tulajdonos vagy üzemben tartó neve;
- a tartányjármű saját tömege¹³⁾;
- a tartányjármű saját megengedett legnagyobb összes tömege¹³⁾.

A következő adatokat magán a leszerelhető tartányon vagy egy táblán kell feltüntetni:

- a tulajdonos vagy üzemben tartó neve;
- „leszerelhető tartány”
- a tartány saját tömege¹³⁾;
- a tartány megengedett legnagyobb összes tömege¹³⁾;
- a 4.3.4.1.3 pont szerinti anyagok esetében a szállításra engedélyezett anyag(ok) helyes szállítási megnevezése;
- a 4.3.4.1.1 pont szerinti tartánycód;
- a nem a 4.3.4.1.3 pont szerinti anyagok esetében minden különleges előírás TC és TE betűkkel kezdődő kódja, amely a tartányban szállítandó anyag(ok)ra a 3.2 fejezet „A” táblázat 13 oszlopában fel van tüntetve.

A következő adatokat a tankkonténeren (magán a tartányon vagy egy táblán) kell feltüntetni:

- a tulajdonos vagy üzemben tartó neve;
- a tartány úrtartalma¹³⁾;
- saját tömeg¹³⁾;
- a megengedett legnagyobb összes tömeg¹³⁾;
- a 4.3.4.1.3 pont szerinti anyagok esetében a szállításra engedélyezett anyag(ok) helyes szállítási megnevezése;
- a 4.3.4.1.1 pont szerinti tartánycód;
- a nem a 4.3.4.1.3 pont szerinti anyagok esetében minden különleges előírás TC és TE betűkkel kezdődő kódja, amely a tartányban szállítandó anyag(ok)ra a 3.2 fejezet „A” táblázat 13 oszlopában fel van tüntetve.

6.8.2.6

A hivatkozott szabványok szerint tervezett, gyártott és vizsgált tartányokra vonatkozó követelmények

Megjegyzés: A szabványokban megnevezett, az ADR értelmében felelős személyeknek vagy szervezeteknek be kell tartaniuk az ADR előírásait.

6.8.2.6.1

Tervezés és gyártás

A következő táblázatban hivatkozott szabványokat a 6.8 fejezetnek a táblázat (3) oszlopában hivatkozott követelményeinek való megfelelés céljából a típusjóváahagyás kiadásánál a táblázat (4) oszlopa szerint kell alkalmazni. A 6.8 fejezetnek a táblázat (3) oszlopában hivatkozott követelményei azonban minden esetben elsőbbséget élveznek. Az (5) oszlopban van megadva az a legkésőbbi időpont, ameddig a meglévő típusjóváahagyásokat az 1.8.7.2.4, ill. a 6.8.2.3.3 pont szerint vissza kell vonni; ha itt nincs időpont megadva, akkor a típusjóváahagyás az eredeti lejártáig érvényes.

A hivatkozott szabványok alkalmazása 2009. január 1-je óta kötelező. A kivételek a 6.8.2.7 és a 6.8.3.7 bekezdésben találhatók.

Ha ugyanarra a követelményre vonatkozóan több szabványra is van hivatkozás, akkor csak az egyiket kell alkalmazni, de azt teljes egészében, kivéve, ha a következő táblázatban másként van megadva.

Hivatkozás	A dokumentum címe	A vonatkozó bekezdés, ill. pont	Új típus-jóváhagyásra, ill. típusjóváhagyás megújítására alkalmazható	Meglévő típus-jóváhagyás visszavonásának legkésőbbi időpontja

6.8.2.6.2 Vizsgálat

A 6.8 fejezet (3) oszlopban hivatkozott előírásainak való megfelelés céljából a tartályok vizsgálatára a következő táblázatban hivatkozott szabványt kell alkalmazni, ahogy azt a (4) oszlop előírja. A 6.8 fejezetnek a táblázat (3) oszlopában hivatkozott követelményei azonban minden esetben elsőbbséget élveznek.

Hivatkozott szabvány alkalmazása kötelező.

Hivatkozás	A dokumentum címe	A vonatkozó bekezdés, ill. pont	Alkalmazható
(1)	(2)	(3)	(4)
EN 12972:2007	Szállítótartályok veszélyes anyagok szállítására. A fém szállítótartályok vizsgálata, ellenőrzése és megjelölése	6.8.2.4; 6.8.3.4	további intézkedésig

6.8.2.7 A nem a hivatkozott szabványok szerint tervezett, gyártott és vizsgált tartályokra vonatkozó követelmények

Az illetékes hatóság elismerhet olyan, azonos biztonsági szintet eredményező műszaki szabályzatot, amely célja a tudományos és műszaki haladás követése, vagy amely olyan szakterületre vonatkozik, amelyre a 6.8.2.6 bekezdésben nem szerepel szabvány, ill. olyan részterületet érint, amellyel a 6.8.2.6 bekezdésben szereplő szabvány nem foglalkozik. A 6.8.2 szakasz minimális követelményeinek azonban ezeknek a tartályoknak is meg kell felelniük.

Az elismert szabályzatok jegyzékét az illetékes hatóságnak meg kell küldenie az UNECE Titkárságának. A jegyzéknek tartalmaznia kell a szabályzat(ok) címét, dátumát, tárgyát és elérhetőségének részleteit. A Titkárság a jegyzékeket a honlapján nyilvánosságra hozza.

Az illetékes hatóság az UNECE Titkárság értesítése nélkül is engedélyezheti olyan szabvány használatát, amelyet már elfogadtak, hogy az ADR valamely későbbi kiadása hivatkozzon rá.

A vizsgálatokra és a jelölésekre a 6.8.2.6 bekezdésben hivatkozott, megfelelő szabványok is

alkalmazhatók.

6.8.3 A 2 osztályra vonatkozó különleges előírások

6.8.3.1 A tartányok gyártása

6.8.3.1.1 A sűrített, a cseppfolyósított, ill. az oldott gázok szállítására használt tartányokat acélból kell készíteni. Hegesztés nélküli tartány esetén a 6.8.2.1.12 pontban előírtaktól eltérően 14%-os legkisebb szakadási nyúlás és az anyagtól függő, a következőkben megadott értékhatárokkal egyenlő vagy ezeknél kisebb σ feszültség elfogadható:

- a) ha hőkezelés után a minimálisan szavatolt jellemzők R_e/R_m aránya 0,66-nál nagyobb, de nem haladja meg a 0,85-öt:

$$\sigma \leq 0,75 R_e;$$

- b) ha hőkezelés után a minimálisan szavatolt jellemzők R_e/R_m aránya nagyobb, mint 0,85: $\sigma \leq 0,5 R_m$.

6.8.3.1.2 A hegesztett tartányok gyártási anyagára és gyártására a 6.8.5 szakasz előírásait kell alkalmazni.

6.8.3.1.3 (fenntartva)

A battériás járművek és a MEG-konténerek gyártása

6.8.3.1.4 A battériás jármű vagy MEG-konténer elemeit képező palackokat, nagypalackokat, gáz-hordókat és palackkötegeket a 6.2 fejezet szerint kell gyártani.

Megjegyzés: 1. Azokra a palackkötegekre, amelyek nem battériás jármű vagy MEG-konténer elemei, a 6.2 fejezet követelményei vonatkoznak.

2. A battériás jármű vagy MEG-konténer elemeit képező tartányokat a 6.8.2.1 és a 6.8.3.1 bekezdés szerint kell gyártani.

3. A leszerelhető tartányok¹⁴⁾ nem tekinthetők battériás jármű vagy MEG-konténer elemeinek.

6.8.3.1.5 Az elemeknek és rögzítésüknek alkalmasnak kell lenniük a megengedett legnagyobb rakomány mellett a 6.8.2.1.2 pontban meghatározott erők felvételére. Bármelyik erő hatására a feszültség az elem és rögzítésének leginkább igénybevett részén nem lehet nagyobb a 6.2.5.3 bekezdésben meghatározott σ értéknél palackok, nagypalackok, gáz-hordók és palackkötegek esetén, illetve a 6.8.2.1.16 pontban meghatározott σ értéknél tartányok esetében.

6.8.3.2 Szerelvények

6.8.3.2.1 A tartányok kifolyócsöveinek vakkarimával vagy azzal egyenértékű megbízhatóságú szerkezettel elzárhatóknak kell lenniük. A mélyhűtött, cseppfolyósított gázok szállítására használt tartányoknál ezeket a vakkarimákat vagy az azzal egyenértékű szerkezeteket el lehet látni legfeljebb 1,5 mm átmérőjű nyomáscsökkentő furatokkal.

6.8.3.2.2 A cseppfolyósított gázok szállítására használt tartányokat a 6.8.2.2.2 és a 6.8.2.2.4 pontban - előírt nyílásokon kívül el lehet látni folyadékszint-mutató, hőmérő vagy nyomásmérő behelyezésére alkalmas nyílásokkal, valamint légtelenítőnyílással, ha az üzemeltetéshez, ill. a biztonság érdekében szükségesek.

6.8.3.2.3 A gyúlékony vagy mérgező cseppfolyósított gázok szállítására használt

14) A „leszerelhető tartány” meghatározására lásd az 1.2.1 szakaszt.

tartányok minden töltő- és ürítőnyílása belső zárószelepének azonnal záródónak kell lennie, amely a tartány véletlen elmozdulása vagy tűz esetén önműködően lezár. A belső zárószelepeknek távolról is működtethetőnek kell lennie.

A nem mérgező, gyúlékony, cseppfolyósított gázok szállítására használt tartányoknál azonban a távolról működtethető belső zárószelep visszacsapó szeleppel is helyettesíthető, de kizárólag a tartány gőzfázisában levő töltőnyílásoknál. A visszacsapó szelepet a tartány belsejében kell elhelyezni, rugóterhelésűnek kell lennie, úgy, hogy a szelep lezárjon, ha a nyomás a töltővezetékben a tartányban levő nyomással megegyezik vagy annál kisebb, és megfelelő tömítéssel kell ellátni.¹⁵⁾

- 6.8.3.2.4** A gyúlékony és/vagy mérgező cseppfolyósított gázok szállítására használt tartányok minden 1,5 mm-nél nagyobb névleges átmérőjű nyílását – kivéve a biztonsági szelepek nyílásait és a zárt légtelenítő nyílásokat – fel kell szerelni belső zárószerkezettel.
- 6.8.3.2.5** A 6.8.2.2.2, a 6.8.3.2.3 és a 6.8.3.2.4 pont előírásaitól eltérően a mélyhűtött, cseppfolyósított gázok szállítására használt tartányoknál a belső zárószerkezet helyett külső zárószerkezet is alkalmazható, ha ez a külső szerkezet legalább a tartány falával egyenértékű védelmet nyújt a külső sérülésekkel szemben.
- 6.8.3.2.6** Ha a tartány mérőeszközzel van felszerelve, ennek a szállított anyaggal közvetlenül érintkező része nem lehet áttetsző anyagból. Ha hőmérők vannak, ezek nem nyúlhatnak be közvetlenül a gázba vagy a folyadékba a tartány falán keresztül.
- 6.8.3.2.7** A tartány felső részén levő töltő- és ürítőnyílásokat a 6.8.3.2.3 pontban előírtakon kívül fel kell szerelni egy második, külső zárószerkezettel is. Ennek vakkarimával vagy más, egyenértékű biztonságot adó szerkezettel zárhatónak kell lennie.
- 6.8.3.2.8** A biztonsági szelepeknek meg kell felelniük a következő 6.8.3.2.9 – 6.8.3.2.12 pont követelményeinek.
- 6.8.3.2.9** A sűrített, a cseppfolyósított, ill. az oldott gázok szállítására használt tartányokat el lehet látni rugóterhelésű biztonsági szelepekkel. A biztonsági szelepeknek önműködően kell nyílniuk (lefűjniük) a tartány próbanyomásának 0,9...1,0-szeresénél. Ezeket úgy kell kialakítani, hogy ellenálljanak a dinamikus igénybevételeknek, beleértve a folyadék hullámzását is. Súlyterhelésű (ellensúlyos) szelepek alkalmazása tilos. A biztonsági szelepek szükséges teljesítményét a 6.7.3.8.1.1 pontban található képlettel kell meghatározni.
- 6.8.3.2.10** Ha a tartányt tengeri szállításra szánják, a 6.8.3.2.9 pont követelményei nem akadályozhatják az IMDG Kódexnek megfelelő biztonsági szelepek felszerelését.
- 6.8.3.2.11** A mélyhűtött, cseppfolyósított gázok szállítására használt tartányokat legalább két, egymástól független biztonsági szeleppel kell ellátni, amelyek a tartányon feltüntetett legnagyobb üzemi nyomáson képesek kinyílni. A biztonsági szelepek közül kettőt úgy kell méretezni, hogy egyenként képesek legyenek a normális üzemelés során a párolgással létrejövő gázokat kiengedni a tartányból oly módon, hogy a nyomás ne emelkedjen 10%-nál nagyobb mértékben a tartányon megjelölt üzemi nyomás fölé.
- A biztonsági szelepek közül az egyik olyan hasadótárcsával helyettesíthető, amely a próbanyomásnál átszakad.
- Kettős falú tartánynál a vákuum megszűnése, vagy egyszeres falú tartánynál a szigetelés 20%-ának tönkremenetele esetén a nyomáscsökkentő szerkezetek kombinációjának olyan

15) Fém-fém tömítés alkalmazása nem megengedett.

kiömlési keresztmetszetet kell szabaddá tenni, hogy a tartányban a nyomás ne léphesse túl a próbanyomást. A 6.8.2.1.7 pont előírásait a vákuumszigetelésű tartányokra nem kell alkalmazni.

6.8.3.2.12 A mélyhűtött, cseppfolyósított gázok szállítására használt tartányok nyomáscsökkentő szerkezeteit úgy kell kialakítani, hogy még a legkisebb üzemi hőmérsékleten is hibátlanul működjenek. Az e hőmérsékleten való hibátlan működést az egyes szerkezetek vizsgálatával vagy gyártási típus vizsgálatával kell megállapítani és igazolni.

6.8.3.2.13 A gördíthető, leszerelhető tartányok szelepeit |
védőkupakkal kell ellátni.

Hőszigetelés

6.8.3.2.14 Ha a cseppfolyósított gázok szállítására használt tartány hőszigetelt, akkor ennek a szigetelésnek

- vagy napsugárzás elleni fényvédő tetőből kell állnia, amely a tartány felületének legalább a felső harmadát, de legfeljebb a felső felét takarja, és attól legalább 4 cm-es légréteg választja el;
- vagy szigetelőanyagból készült, elegendő vastagságú teljes burkolatból kell állnia.

6.8.3.2.15 A mélyhűtött, cseppfolyósított gázok szállítására használt tartányokat hőszigeteléssel kell ellátni, amit teljes (folytonos) burkolattal kell védeni. Ha a tartány és a burkolat között légüres tér van (vákuumszigetelés), a védőburkolatot úgy kell méretezni, hogy alakváltozás nélkül legalább 100 kPa (1 bar) külső nyomást (túlnyomást) viseljen el. A „tervezési nyomás” 1.2.1 szakaszban adott meghatározásától eltérően a méretezés során a külső és a belső erősítő elemek figyelembe vehetők. Ha a burkolat gázzáró, külön szerkezettel meg kell akadályozni, hogy a szigetelőrétegben a tartány vagy a szerelvények tömítetlensége esetén veszélyes nyomás lépjen fel. Ezen a szerkezeten keresztül a nedvesség nem szívároghat be a hőszigetelő rétegbe.

6.8.3.2.16 Az atmoszferikus nyomáson -182 °C alatti forráspontú, cseppfolyósított gázok szállítására használt tartányokon sem a hőszigeteléshez, sem a felerősítő elemekhez nem szabad gyúlékony anyagot felhasználni.

A vákuumszigetelt tartányoknál – az illetékes hatóság beleegyezésével – a burkolat és a tartánnyal közötti felerősítő elemek tartalmazhatnak műanyagot.

6.8.3.2.17 A 6.8.2.2.4 pont követelményeitől eltérően a mélyhűtött, cseppfolyósított gázok szállítására használt tartányokat nem kell vizsgálonnyílással ellátni.

Battériás járművek és MEG-konténerek szerelvényei

6.8.3.2.18 Az üzemi és szerkezeti szerelvényeket úgy kell kialakítani vagy elrendezni, hogy normális szállítási és kezelési körülmények között ne sérülhessenek úgy meg, hogy a nyomástartó tartály tartalma a szabadba jusson. Amennyiben a battériás jármű, ill. a MEG-konténer keretváza és az elemek közötti kapcsolat lehetővé teszi a szerkezeti részhelységek egymáshoz képesti elmozdulását, a szerelvényeket úgy kell rögzíteni, hogy az ilyen elmozdulás a részhelységek sérülésének veszélye nélkül lehetővé váljon. A zárószelepekhez vezető gyűjtőcső vezetéknek elegendően hajlékonynak kell lennie, hogy ne következhesen be a szelep, ill. a csővezeték nyíródása, ill. a nyomástartó tartály tartalma ne szabadulhasson ki. A töltő- és ürítőszerkezeteket (beleértve a karimákat és a menetes dugókat is), valamint az esetleges védőkupakokat a nem szándékos kinyitás ellen biztosítani kell.

6.8.3.2.19 A sérülésből adódó elfolyás elkerülése érdekében a gyűjtőcső rendszert, az ürítő szerelvényeket (csőcsonkokat, zárószerkezeteket) és a zárószelepeket úgy kell kialakítani, hogy a külső erőhatásra történő leszakadás ellen védve legyenek, vagy az ilyen erőhatásnak ellen tudjanak állni.

6.8.3.2.20 A gyűjtőcső rendszert $-20\text{ °C} \dots +50\text{ °C}$ hőmérséklet tartományban történő üzemelésre kell tervezni.

A gyújtócső rendszert úgy kell tervezni, gyártani és felszerelni, hogy ne jöjjön létre sérülésveszély a hőtágulás és összehúzódás, a mechanikai ütések és rezgések következtében. Minden csővezeték megfelelő fémes anyagból kell készíteni. Ahol csak lehetséges hegesztett csőkötésekkel kell alkalmazni.

A rézcsövek csatlakozásait keményforrasztással kell készíteni vagy azzal azonos szilárdságú, fémcsőkötetést kell alkalmazni. A forrasztófém (keményforrasztó) olvadáspontja nem lehet 525 °C-nál alacsonyabb. A kötések nem csökkenthetik a csővezeték szilárdságát, mint az csavarmentes kötéseknel előfordulhat.

- 6.8.3.2.21** Az UN 1001 oldott acetilén kivételével a gyújtócső rendszer legnagyobb megengedett σ feszültsége a tartány próbanyomásánál nem haladhatja meg az anyagra szavatolt folyáshatár 75%-át.

A gyújtócső rendszer szükséges falvastagságát az UN 1001 oldott acetilén esetében jóváhagyott műszaki szabályzat alapján kell kiszámítani.

Megjegyzés: A folyáshatárra lásd a 6.8.2.1.11 pontot.

Ezen bekezdés alapvető követelményei teljesítettnek tekinthetők, ha a következő szabványokat alkalmazzák: (fenntartva).

- 6.8.3.2.22** A 6.8.3.2.3, a 6.8.3.2.4 és a 6.8.3.2.7 pont követelményeitől eltérően a battériás jármű, ill. MEG-konténer elemeit képező palackoknál, nagypalackoknál, gázhordóknál és palackkötegeknél az előírt zárószerkezet a gyújtócső rendszeren belül is elhelyezhető.
- 6.8.3.2.23** Ha az egyik elemen biztonsági szelep van, és az elemek között zárószerkezetek vannak, akkor minden egyes elemet el kell látni ilyen biztonsági szeleppel.
- 6.8.3.2.24** A töltésre és ürítésre használt berendezések gyújtócsőre rögzíthetők.
- 6.8.3.2.25** A mérgező gázok szállítására szolgáló minden elemnek, beleértve a palackkötegek minden egyes palackját, zárószeleppel elválaszthatónak kell lennie.
- 6.8.3.2.26** A mérgező gázok szállítására szolgáló battériás járműveken és MEG-konténereken nem lehetnek biztonsági szelepek, kivéve, ha a biztonsági szelep előtt hasadótárcsa van. Ez utóbbi esetben a hasadótárcsa és a biztonsági szelep elrendezésének meg kell felelnie az illetékes hatóság követelményeinek.
- 6.8.3.2.27** Ha a battériás járművet, ill. MEG-konténert tengeri szállításra szánják, a 6.8.3.2.26 pont követelményei nem akadályozhatják az IMDG Kódexnek megfelelő biztonsági szelep felszerelését.
- 6.8.3.2.28** Azokat a tartályokat, amelyek gyúlékony gázok szállítására használt battériás jármű, ill. MEG-konténer elemei, legfeljebb 5000 liter űrtartalmú csoportokká kell egyesíteni, amelyeknek zárószeleppel elválaszthatónak kell lenniük.
- Ha a gyúlékony gázok szállítására használt battériás jármű, ill. MEG-konténer e fejezetnek megfelelő tartányokból áll, minden elemnek zárószeleppel elválaszthatónak kell lennie.

6.8.3.3 *Típusjóváhagyás*

Nincs különleges előírás.

6.8.3.4 *Vizsgálatok*

- 6.8.3.4.1** Minden hegesztett tartány anyagát, kivéve azokat a palackokat, nagypalackokat, gázhordókat és a palackkötegek palackjait, amelyek battériás jármű, ill. MEG-konténer elemei, a 6.8.5 szakaszban előírt módszerrel kell megvizsgálni.
- 6.8.3.4.2** A próbanyomásra vonatkozó alapkövetelményeket a 4.3.3.2.1 – 4.3.3.2.4 pont tartalmazza, és a legkisebb próbanyomások a 4.3.3.2.5 pontban a gázok és gázkeverékek táblázatában

találhatók.

6.8.3.4.3 Az első folyadéknomás-próbát a hőszigetelés felhelyezése előtt kell végrehajtani. Ha a tartányt, szerelvényeit, a csővezetékét és az egyéb szerelvényeket külön-külön vizsgálták, akkor a tartányt összeszerelés után kell a tömörségi próbának alávetni.

6.8.3.4.4 A tömegre töltött sűrített gázok, valamint a cseppfolyósított gázok és az oldott gázok szállítására használt minden egyes tartány űrtartalmát hatóság által elismert szakértő felügyelete mellett a víztöltet tömegének vagy térfogatának mérésével kell megállapítani; az űrtartalom-meghatározás mérési hibája legfeljebb 1% lehet. A tartány méretei alapján számítással való megállapítás tilos. A 4.1.4.1 bekezdés P200 és P203 csomagolási utasításában, valamint a 4.3.3.2.2 és a 4.3.3.2.3 pontban foglaltaknak megfelelő, legnagyobb megengedett töltést hatóság által elismert szakértőnek kell megállapítani.

6.8.3.4.5 A hegesztési varratokat a 6.8.2.1.23 pontban a $\lambda = 1,0$ tényezőhöz tartozó előírásoknak megfelelően kell vizsgálni.

6.8.3.4.6 A 6.8.2.4.2 pont követelményeitől eltérően az időszakos vizsgálatot a mélyhűtött, cseppfolyósított gázok szállítására használt tartányoknál:

legfeljebb hat évvel

legfeljebb nyolc évvel

az üzembe helyezés után és azt követően legalább 12 évenként kell végrehajtani.

Minden időszakos vizsgálat után legfeljebb hat évvel a 6.8.2.4.3 pont szerinti közbenső vizsgálatot kell végrehajtani.

Két, egymást követő időszakos vizsgálat között az illetékes hatóság tömörségi próba vagy a 6.8.2.4.3 pont szerinti közbenső vizsgálat megtartását kívánhatja meg.

6.8.3.4.7 Vákuumszigeteléssel ellátott tartányoknál a belső állapot ellenőrzését és a folyadéknomás-próbát a hatóságilag elismert szakértő beleegyezésével tömörségi próbával és a vákuum mérésével lehet helyettesíteni.

6.8.3.4.8 Ha a mélyhűtött, cseppfolyósított gázok szállítására használt tartányokon az időszakos vizsgálat során nyílásokat vágnak, a használatbavétel előtt a tartány használhatóságát (légmentes zárását) biztosító visszahegesztés módját hatóság által elismert szakértőnek kell engedélyeznie.

6.8.3.4.9 A gázok szállítására használt tartányok tömörségi próbáját legalább a következő nyomással kell végezni:

- a sűrített, a cseppfolyósított, ill. az oldott gázoknál a próbanyomás 20%-a;
- a mélyhűtött, cseppfolyósított gázoknál a legnagyobb üzemi nyomás 90%-a.

Battériás járművek és MEG-konténerek vizsgálata

6.8.3.4.10 A battériás járművek és MEG-konténerek elemeit és szerelvényeit együtt vagy külön-külön az első üzembe helyezés előtt vizsgálatnak kell alávetni (üzembe helyezés előtti vizsgálat). Ezt követően az olyan battériás járműveket, ill. MEG-konténereket, amelyek elemei tartályok, legalább ötévenként kell vizsgálatnak alávetni. Az olyan battériás járműveket, ill. MEG-konténereket, amelyek elemei tartályok, a 6.8.3.4.6 pont szerint kell vizsgálatnak alávetni. Függetlenül az utolsó időszakos vizsgálat időpontjától, soron kívüli vizsgálatot kell végezni, ha a 6.8.3.4.14 pont szerint erre szükség van.

6.8.3.4.11 Az üzembe helyezés előtti vizsgálatnak magában kell foglalnia:

- annak ellenőrzését, hogy a tartány megfelel-e a jóváhagyott mintapédánynak;
- a szerkezeti jellemzők ellenőrzését;
- a belső és a külső állapot vizsgálatát;

- a folyadéknomás-próbát¹⁶⁾ a 6.8.3.5.10 pontban előírt táblán feltüntetett próbanyomással végrehajtva;
- a tömörség vizsgálatát a legnagyobb üzemi nyomáson; és
- a szerelvények megfelelő működésének ellenőrzését.

Ha a nyomáspróbát az egyes elemeken és szerelvényeiken külön-külön végezték, a tömörségi próbát összeszerelt állapotban kell végrehajtani.

6.8.3.4.12 A palackokat, a nagypalackokat, a gázhordókat és a palackkötegeket alkotó palackokat a 4.1.4.1 bekezdés P200 és P203 csomagolási utasítása szerint kell vizsgálni.

A battériás jármű, ill. MEG-konténer gyűjtőcső rendszere próbanyomásának ugyanakkorának kell lennie, mint a battériás jármű, ill. MEG-konténer elemeinek a próbanyomása. A gyűjtőcső rendszer folyadéknomás-próbája vízzel vagy az illetékes hatóság vagy az általa felhatalmazott szervezet hozzájárulásával más folyadékkal vagy gázzal is végezhető. E követelménytől eltérően az UN 1001 oldott acetilén szállítására használt battériás jármű, ill. MEG-konténer gyűjtőcső rendszer próbanyomásának legalább 30 MPa-nak (300 bar-nak) kell lennie.

6.8.3.4.13 Az időszakos vizsgálatnak a legnagyobb üzemi nyomással végzett tömörségi próbából és a szerkezet, az elemek és az üzemi szerelvények szétszerelés nélküli külső szemrevételezéséből kell állnia. Az elemeket és a csővezetékét a 4.1.4.1 bekezdés P200 csomagolási utasításában meghatározott időszakonként a 6.2.1.6, ill. 6.2.3.5 bekezdés követelményei szerint kell vizsgálni. Ha a nyomáspróbát az egyes elemeken és szerelvényeiken külön-külön végezték, a tömörségi próbát összeszerelt állapotban kell végrehajtani.

6.8.3.4.14 Soron kívüli vizsgálatot szükséges végezni, ha a battériás jármű, ill. MEG-konténer sérült, rozsdás, szivárog, vagy bármely más körülmény a battériás jármű, ill. MEG-konténer sértetlenségét befolyásolhatja. A soron kívüli vizsgálatnak, ill. az elemek esetleg szükséges szétszerelésének mértékét az határozza meg, hogy a battériás jármű, ill. MEG-konténer mennyire sérült vagy hibás. A soron kívüli vizsgálatnak azonban legalább a 6.8.3.4.15 pont szerintiekre kell kiterjednie.

6.8.3.4.15 A vizsgálat során biztosítani kell, hogy:

- a) külsőleg ellenőrizték az elemeket, hogy nincs rajtuk rozsdás, kipattogzás, kopás, horpadás, torzulás, hegesztési hiba vagy bármilyen más (pl. szivárgás), ami miatt a battériás jármű, ill. MEG-konténer szállítása nem lenne biztonságos;
- b) ellenőrizték a csővezetékét, a szelepeket és a tömítéseket, hogy nincs rajtuk rozsdás, sérülés vagy bármilyen más (pl. szivárgás), ami miatt a battériás jármű, ill. MEG-konténer töltése, ürítése vagy szállítása nem lenne biztonságos;
- c) a csőkarima csatlakozásoknál és vakkarimáknál a hiányzó vagy laza csavarokat vagy csavaranyákat pótolják, ill. meghúzzák;
- d) minden biztonsági szerkezet és szelep mentes a korróziótól, deformációtól és minden olyan sérüléstől vagy meghibásodástól, ami megakadályozhatja normális működését. A távműködtetésű zárószerkezeteket és az önzáró szelepeket ki kell próbálni, hogy megfelelően működnek-e;
- e) az előírt jelölések a battériás járművön, ill. a MEG-konténeren olvashatóak, és a vonatkozó követelményeknek megfelelnek; és
- f) a battériás jármű, ill. MEG-konténer váz- és tartószerkezete, ill. emelésre szolgáló berendezései megfelelő állapotban vannak.

6.8.3.4.16 A 6.8.3.4.10 – 6.8.3.4.15 pont szerinti vizsgálatokat, ellenőrzéseket és próbákat az illetékes hatóság által elismert szakértőnek kell végeznie, és e műveletek eredményéről tanúsítványt kell kiadnia, még akkor is, ha a vizsgálat negatív eredménnyel járt. A tanúsítványban – a

16) Különleges esetekben az illetékes hatóság által elismert szakértő hozzájárulásával a folyadéknomás-próba vízen kívül más folyadékkal vagy gázzal is elvégezhető, amennyiben ez az eljárás nem veszélyes.

6.8.2.3.1 ponttal összhangban – hivatkozni kell azon anyagok felsorolására, amelyek szállítására a battériás járművet, ill. a MEG-konténert jóváhagyták. Minden egyes megvizsgált tartány, battériás jármű, ill. MEG-konténer tartány-vizsgálati könyvéhez (gépkönyvéhez) csatolni kell a tanúsítvány másolatát (ld. a 4.3.2.1.7 pontot).

6.8.3.5 Jelölés

6.8.3.5.1 A 6.8.2.5.1 pontban előírt fémtablán vagy a tartány falán – ha a fal úgy van megerősítve, hogy a tartány szilárdságát nem csökkenti – a következő kiegészítő adatokat kell feltüntetni beütéssel vagy más hasonló módon.

6.8.3.5.2 Csak egyféle anyag szállítására használt tartányokon:

- a gáz helyes szállítási megnevezését, ezenkívül az m.n.n. tételek alá sorolt gázoknál a műszaki megnevezést¹⁷⁾.

Ezt a jelölést ki kell egészíteni:

- térfogatra (nyomásra) töltött, sűrített gázok szállítására használt tartányok esetében a 15 °C-on a tartányra megengedett legnagyobb töltési nyomással; és
- a tömegre töltött, sűrített gázok, valamint a cseppfolyósított, a mélyhűtött, cseppfolyósított és az oldott gázok szállítására használt tartányok esetében a legnagyobb megengedett töltési tömeggel kg-ban és a töltési hőmérséklettel, ha az –20 °C alatt van.

6.8.3.5.3 Többféle anyag szállítására használható (többcélú) tartányokon:

- a tartányra engedélyezett gázok helyes szállítási megnevezését és ezenkívül az m.n.n. tételek alá tartozó gázok esetében a műszaki megnevezést.¹⁶⁾

Ezen kívül minden gázra meg kell adni a legnagyobb megengedett töltési tömeget kg-ban.

6.8.3.5.4 A mélyhűtött, cseppfolyósított gázok szállításához használt tartányokon:

- a legnagyobb engedélyezett üzemi nyomást.

6.8.3.5.5 A hőszigeteléssel ellátott tartányokon:

- a „hőszigetelt” vagy „vákuummal hőszigetelt” feliratot.

6.8.3.5.6 A 6.8.2.5.2 pontban előírt adatokon kívül a következőket kell felírni magára a tartányra vagy egy táblára

A 6.8.2.5.2 pontban előírt adatokon kívül a következőket kell felírni magára a tank-konténerre vagy egy táblára

- a bizonyítvány szerinti (lásd a 6.8.2.3.1 pontot) tartánykódot a tartány tényleges próbanyomásával együtt;
- az „engedélyezett legalacsonyabb töltési hőmérséklet ...” feliratot;
- ha a tartányt csak egyetlen anyag szállítására használják:
 - a gáz helyes szállítási megnevezését, ezenkívül az m.n.n. tételek alá sorolt gázoknál a műszaki megnevezést¹⁷⁾;
 - a tömegre töltött, sűrített gázok esetében, valamint a cseppfolyósított gázok, a mélyhűtött, cseppfolyósított gázok és az oldott gázok esetében a legnagyobb megengedett töltési tömeget kg-ban;
- ha a tartány többcélú:

17) A „helyes szállítási megnevezés”, ill. – adott esetben – az „m.n.n. tétel helyes szállítási megnevezése a műszaki névvel kiegészítve” helyett a következő megnevezések is engedélyezettek:

- az UN 1078 hűtőgáz, m.n.n. esetében: F1 keverék, F2 keverék, F3 keverék;
- az UN 1060 metil-acetilén és propadién keverék, stabilizált esetén: P1 keverék, P2 keverék;
- az UN 1965 szénhidrogén-gáz keverék, cseppfolyósított, m.n.n. esetén: A keverék, A01 keverék, A02 keverék, A0 keverék, A1 keverék, B1 keverék, B2 keverék, B keverék, C keverék. A 2.2.2.3 bekezdésben a 2F osztályozási kód alatt az UN 1965 anyaghoz fűzött 1. megjegyzésben felsorolt kereskedelmi nevek csak kiegészítésként használhatók;
- az UN 1010 butadiének, stabilizált esetén: 1,2-butadién, stabilizált, 1,3-butadién, stabilizált.

- a tartányra engedélyezett gázok helyes szállítási megnevezését és ezenkívül az m.n.n. tételek alá tartozó gázok esetében a műszaki megnevezést¹⁷⁾;
 - ezen kívül minden gázra meg kell adni a legnagyobb megengedett töltési tömeget kg-ban;
- d) ha a tartány hőszigetelt:
- a „hőszigetelt” vagy „vákuummal hőszigetelt” feliratot a nyilvántartásba vevő ország egyik hivatalos nyelvén, valamint, ha ez a nyelv nem angol, francia vagy német, akkor ezen nyelvek egyikén, kivéve, ha a szállítás által érintett országok közötti megállapodások másként rendelkeznek.

6.8.3.5.7 (fenntartva)

6.8.3.5.8 Leszerelhető tartányokat hordozó járművek esetén ezeket az adatokat nem kell megkövetelni.

6.8.3.5.9 (fenntartva)

A battériás járművek és MEG-konténerek jelölése

6.8.3.5.10 Ellenőrzés céljából könnyen elérhető, szembetűnő helyre minden battériás járműre és MEG-konténerre nem korrodálódó fémtablát kell tartósan rögzíteni. A táblán beütéssel vagy bármilyen más, hasonló módon legalább a következő adatokat kell feltüntetni:

- a jóváhagyás száma;
- a gyártó megnevezése vagy jele;
- a gyártási sorozat száma;
- a gyártás éve;
- a próbanyomás (túlnyomás)¹⁸⁾;
- a tervezési hőmérséklet¹⁸⁾ (csak akkor, ha nagyobb, mint +50 °C vagy kisebb, mint –20 °C);
- a 6.8.3.4.10 – 6.8.3.4.13 pont szerint végrehajtott első, üzembe helyezés előtti vizsgálat és a legutóbbi időszakos vizsgálat időpontja (hónap, év);
- a vizsgálatokat végző szakértő bélyegzőlenyomata.

6.8.3.5.11 A következő adatokat magán a battériás járművön vagy egy táblán kell feltüntetni:

- a tulajdonos vagy az üzemben tartó neve;
 - az elemek száma;
 - az elemek összes űrtartalma¹⁸⁾;
- és tömegre töltött battériás járműveknél:
- a saját tömeg¹⁸⁾;
 - a megengedett legnagyobb összes tömeg¹⁸⁾.

A következő adatokat magán a MEG-konténeren vagy egy táblán kell feltüntetni:

- a tulajdonos vagy az üzemben tartó neve;
 - az elemek száma;
 - az elemek összes űrtartalma¹⁸⁾;
 - a megengedett legnagyobb rakott tömeg¹⁸⁾;
 - a jóváhagyási bizonyítvány szerinti tartánykód (lásd a 6.8.2.3.1 pontot) a MEG-konténer tényleges próbanyomásával együtt¹⁸⁾;
 - azon gázok helyes szállítási megnevezése (m.n.n. tétel alá sorolt gázok esetén kiegészítve a műszaki megnevezéssel¹⁷⁾), amelyek szállítására a MEG-konténert használják;
- és tömegre töltött MEG-konténereknél:
- a saját tömeg¹⁸⁾.

18) A mértékegységet a szám után fel kell tüntetni.

- 6.8.3.5.12** A battériás jármű, ill. a MEG-konténer vázán a betöltőhely közelében elhelyezett táblán a következőket kell feltüntetni:
- a sűrített gázok szállítására használt elemeknél a legnagyobb megengedett töltési nyomást¹⁸⁾ 15 °C-on;
 - a gáz helyes szállítási megnevezését a 3.2 fejezet szerint és ezenkívül az m.n.n. tételek alá sorolt gázok esetében a műszaki megnevezést¹⁷⁾;
- és ezenkívül cseppfolyósított gázok esetében:
- a legnagyobb megengedett töltési tömeget¹⁸⁾ elemenként.
- 6.8.3.5.13** A palackokat, a nagypalackokat, a gázhordókat, valamint a palackkötegek palackjait a 6.2.2.7 bekezdés szerint kell jelöléssel ellátni. Ezeket a tartályokat egyedileg nem kell az 5.2 fejezetben előírt veszélyességi bárcákkal ellátni.
- A battériás járműveket és a MEG-konténereket az 5.3 fejezet szerint kell jelölni és nagybárcával ellátni.
- 6.8.3.6** *A hivatkozott szabványok szerint tervezett, gyártott és vizsgált battériás járművekre, ill. MEG-konténerekre vonatkozó előírások*

Megjegyzés: A szabványokban megnevezett, az ADR értelmében felelős személyeknek vagy szervezeteknek be kell tartaniuk az ADR előírásait.

A következő táblázatban hivatkozott szabványokat a 6.8 fejezetnek a táblázat (3) oszlopában hivatkozott követelményeinek való megfelelés céljából a típusjóváahagyás kiadásánál a táblázat (4) oszlopa szerint kell alkalmazni. A 6.8 fejezetnek a táblázat (3) oszlopában hivatkozott követelményei azonban minden esetben elsőbbséget élveznek. Az (5) oszlopban van megadva az a legkésőbbi időpont, ameddig a meglévő típusjóváahagyásokat az 1.8.7.2.4 pont szerint vissza kell vonni; ha itt nincs időpont megadva, akkor a típusjóváahagyás az eredeti lejártáig érvényes.

Az itt hivatkozott szabványok alkalmazása 2009. január 1-je óta kötelező. A kivételek a 6.8.3.7 bekezdésben találhatók.

Ha ugyanarra a követelményre vonatkozóan több szabványra is van hivatkozás, akkor csak az egyiket kell alkalmazni, de azt teljes egészében, kivéve, ha a következő táblázatban másként van megadva.

Hivatkozás	A dokumentum címe	A vonatkozó bekezdés, ill. pont	Új típus-jóváahagyásra, ill. típus-jóváahagyás megújítására alkalmazható	Meglévő típus-jóváahagyás visszavonásának legkésőbbi időpontja

EN 13807: 2003	Szállítható gázipalackok. Battériás járművek. Tervezés, gyártás, azonosítás és vizsgálat	6.8.3.1.4 és 6.8.3.1.5, 6.8.3.2.18 – 6.8.3.2.26, 6.8.3.4.10 – 6.8.3.4.12 és 6.8.3.5.10 – 6.8.3.5.13	további intézkedésig	

6.8.3.7

A nem a hivatkozott szabványok szerint tervezett, gyártott és vizsgált battériás járművekre, ill. MEG-konténerekre vonatkozó előírások

Az illetékes hatóság elismerhet olyan, azonos biztonsági szintet eredményező műszaki szabályzatot, amely célja a tudományos és műszaki haladás követése, vagy amely olyan szakterületre vonatkozik, amelyre a 6.8.3.6 bekezdésben nem szerepel szabvány, ill. olyan részterületet érint, amellyel a 6.8.3.6 bekezdésben szereplő szabvány nem foglalkozik. A 6.8.3 szakasz minimális követelményeinek azonban ezeknek a battériás járműveknek, ill. MEG-konténereknek is meg kell felelniük.

A típusjóváhagyásban a kibocsátó szervezetnek meg kell határoznia az időszakos vizsgálatra vonatkozó eljárást, ha arra vonatkozóan a 6.2.2, a 6.2.4 szakaszban, ill. a 6.8.2.6 bekezdésben nincs szabvány hivatkozás, vagy a hivatkozott szabványok nem alkalmazhatók.

Az elismert szabályzatok jegyzékét az illetékes hatóságnak meg kell küldenie az UNECE Titkárságának. A jegyzéknek tartalmaznia kell a szabályzat(ok) címét, dátumát, tárgyát és elérhetőségének részleteit. A Titkárság a jegyzékeket a honlapján nyilvánosságra hozza.

Az illetékes hatóság az UNECE Titkárság értesítése nélkül is engedélyezheti olyan szabvány használatát, amelyet már elfogadtak, hogy az ADR valamely későbbi kiadása hivatkozzon rá.

6.8.4

Különleges előírások

Megjegyzés: *1. A legfeljebb 60 °C lobbanáspontú folyadékokra és a gyúlékony gázokra lásd még a 6.8.2.1.26, a 6.8.2.1.27 és a 6.8.2.2.9 pontot is.*

2. A legalább 1 MPa (10 bar) próbanyomású tartányokra és a mélyhűtött, cseppfolyósított gázok szállítására szolgáló tartányokra lásd a 6.8.5 szakaszt.

Ha a 3.2 fejezet „A” táblázat 13 oszlopában fel vannak tüntetve, a következő különleges előírásokat kell alkalmazni:

a) Gyártás (TC)

- TC1** A tartány anyagára és gyártására a 6.8.5 szakasz követelményei vonatkoznak.
- TC2** A tartányt és szerelvényeit legalább 99,5%-os tisztaságú alumíniumból vagy olyan alkalmas acélból kell készíteni, ami nem hajlamos a hidrogén-peroxid elbontására. Amennyiben a tartány legalább 99,5%-os tisztaságú alumíniumból készül, a falvastagságnak nem kell 15 mm-nél nagyobb lennie még akkor sem, ha a 6.8.2.1.17 pont szerinti méretezés nagyobb értéket adna.
- TC3** A tartányt ausztenites acélból kell gyártani.
- TC4** A tartányt zománcból vagy azonos hatékonyságú anyagból készített béléssel kell ellátni, ha a tartány anyagát az UN 3250 klór-ecetsav megtámadja.
- TC5** A tartányt legalább 5 mm vastag ólombéléssel vagy ezzel egyenértékű béléssel kell ellátni.
- TC6** Ha a tartányhoz alumínium használatára van szükség, az ilyen tartányt legalább 99,5%-os tisztaságú alumíniumból kell gyártani, a falvastagságnak nem kell 15 mm-nél nagyobb lennie még akkor sem, ha a 6.8.2.1.17 pont szerinti méretezés nagyobb értéket adna.
- TC7** A tartány tényleges legkisebb falvastagsága nem lehet 3 mm-nél kisebb.
- TC8** A tartányt alumíniumból vagy alumíniumötvözetből kell gyártani.

b) Szerelvények (TE)

TE1 (törölve)

- TE2** (törölve)
- TE3** A tartálynak a következő előírásoknak is meg kell felelnie. A melegítő-berendezés nem nyúlhat be a tartány belsejébe, hanem azt a tartány külsejére kell felszerelni. A foszfor eltávolítására használt csövet azonban fűtő-köpennyel lehet ellátni. A köpeny fűtőkészülékét úgy kell beállítani, hogy a foszfor hőmérséklete ne emelkedjen a tartány töltési hőmérséklete fölé. A töltő- és ürítőcsőnek a tartány felső részébe kell csatlakoznia, nyílások a tartányban csak a foszfor legmagasabb megengedett szintje fölötti részén lehetnek, és reteszelve kupakkal teljesen zárhatóknak kell lenniük.
- A tartányt a foszforszint ellenőrzésére mérőberendezéssel kell ellátni, és ha védőfolyadékként vizet használnak, olyan rögzített szintjelzéssel kell ellátni, amely a megengedett legmagasabb vízszintet mutatja.
- TE4** A tartányt nehezen gyulladó anyagból készített hőszigeteléssel kell ellátni.
- TE5** Ha a tartány hőszigeteléssel van ellátva, az ilyen hőszigetelést nehezen gyulladó anyagból kell készíteni.
- TE6** A tartány ellátható olyan szerkezettel, amely megakadályozza a túlzott nyomás vagy vákuum kialakulását a tartányban, és a kialakítása eleve kizárja, hogy szivárogon vagy a szállított anyagtól eltömjön.
- TE7** A tartány ürítőberendezését két, egymástól függetlenül működő, egymás mögötti zárószervezettel kell ellátni, amelyek közül az első jóváhagyott típusú, pillanat záró szeleppel ellátott belső zárószelepből, a második az ürítő-csonk mindegyik végén külső tolózárból áll. Mindkét külső tolózár kibocsátó-nyílásán vakkarimát vagy más azonos biztonságot nyújtó szerkezetet kell alkalmazni. A belső zárószelepnek a tartányon akkor is rögzítve és zárva kell maradnia, ha az ürítőcső leszakad.
- TE8** A tartány külső töltő-ürítőcső csatlakozásait olyan anyagból kell készíteni, amely nem hajlamos a hidrogén-peroxid bomlásának előidézésére.
- TE9** A tartány felső részén olyan zárószervezetet kell elhelyezni, amely megakadályozza a tartányban a szállított anyag bomlásából adódó túlnyomás kialakulását, a folyadék kiszivárgását és idegen anyagoknak a tartányba bejutását.
- TE10** A tartány zárószervezeteit úgy kell kialakítani, hogy a szállítás során a megszilárduló anyag ne akadályozza a szerkezet működését. Ha a tartány hőszigetelő anyaggal van borítva, az anyagnak szervesnek és gyúlékony anyagoktól teljesen mentesnek kell lennie.
- TE11** A tartányt és üzemi szerelvényeit úgy kell kialakítani, hogy megakadályozzák idegen anyagoknak a tartányba való bejutását, a folyadék kiszivárgását és a tartányban az anyag bomlásából adódó túlnyomás kialakulását. Megfelel ennek az előírásnak az olyan biztonsági szelep, amely megakadályozza idegen anyagoknak a tartányba való bejutását.
- TE12** A tartányt a 6.8.3.2.14 pont előírásainak megfelelő hőszigeteléssel kell ellátni. Ha a tartányban a szerves peroxid ÖBH értéke 55 °C vagy annál kisebb, vagy ha a tartány alumíniumból készült, a tartányt teljes mértékben szigetelni kell. A fényvédő tetőt és a tartány általa nem fedett minden részét, illetve a teljes hőszigetelés külső felületét vagy fehérre kell festeni, vagy világos színű, metál fényezésűnek kell lennie. A festést minden szállítás előtt meg kell tisztítani és sárgulás vagy sérülés esetén fel kell újítani. A hőszigetelésnek nem szabad semmiféle gyúlékony anyagot tartalmaznia. A tartányt hőmérséklet érzékelő

szerkezettel kell ellátni.

A tartányt biztonsági szelepekkel és vészlefűvő szerkezetekkel kell ellátni. Vákuumszelepek is használhatók. A vészlefűvő szerkezeteknek a szerves peroxid tulajdonságai és a tartány szerkezeti jellemzői alapján meghatározott nyomáson kell működésbe lépniük. A tartány testben olvadóbetétek nem engedélyezettek.

A tartányt rugóterhelésű biztonsági szelepekkel kell ellátni, ami megakadályozza a tartányban az 50 °C-on keletkező bomlástermékek és felszabaduló gőzök okozta lényeges nyomásnövekedést. A biztonsági szelep(ek) nyitónyomását és teljesítményét a TA2 különleges előírásban előírt vizsgálatok eredményei alapján kell meghatározni. A nyitónyomás azonban semmi esetre sem lehet akkora, hogy a tartány felborulása esetén a szelepen keresztül folyadék szabadulhasson ki.

A vészlefűvő szerkezetek rugóterhelésű vagy hasadótárcsás típusúak lehetnek, és lehetővé kell tenniük minden bomlástermék és gőz eltávolítását, amely az öngyorsuló bomlás alatt fejlődik, vagy akkor, ha legalább egy óráig olyan láng veszi körül, amely a következő képlettel jellemezhető:

$$q = 70961 \cdot F \cdot A^{0,82},$$

ahol

$$q = \text{hőfelvétel} \quad [\text{W}]$$

$$A = \text{nedvesített felület} \quad [\text{m}^2]$$

$$F = \text{szigetelési együttható} \quad [-]$$

$F = 1$ nem szigetelt tartányokra, vagy

$$F = \frac{U(923 - T_{PO})}{47032} \text{ szigetelt tartányokra,}$$

ahol

$$K = \text{a szigetelőréteg hővezetési együtthatója} \quad [\text{W} \cdot \text{m}^{-1} \cdot \text{K}^{-1}]$$

$$L = \text{a szigetelőréteg vastagsága} \quad [\text{m}]$$

$$U = K/L = \text{a szigetelőréteg hőátadási együtthatója} \quad [\text{W} \cdot \text{m}^{-2} \cdot \text{K}^{-1}]$$

$$T_{PO} = \text{a peroxid hőmérséklete lefűváskor} \quad [\text{K}]$$

A vészlefűvő szerkezet(ek) nyitónyomásának nagyobbnak kell lennie, mint az előzőekben meghatározottak és azt a TA2 különleges előírásban előírt vizsgálatok eredményei alapján kell meghatározni. A vészlefűvő szerkezetet úgy kell méretezni, hogy a tartányban a legnagyobb nyomás soha ne haladja meg a tartány próbanyomását.

Megjegyzés: A vészlefűvő szerkezet méretezésére a „Vizsgálatok és kritériumok kézikönyv” 5. Függelékben található példa.

A teljes hőszigetelésű tartányoknál a vészlefűvő szerkezet(ek) teljesítményét és beállítását a felület 1%-át kitevő szigetelés veszteséget feltételezve kell meghatározni.

A tartányok vákuumszelepeit és rugóterhelésű biztonsági szelepeit lángzárral kell ellátni, kivéve, ha a szállítandó anyagok és azok bomlástermékei nem éghetőek. A lefűvási teljesítménynek a lángzár által okozott csökkenésére figyelemmel kell lenni.

- TE13** A tartányt hőszigeteléssel kell ellátni és fel kell szerelni külső fűtőberendezéssel.
- TE14** A tartányt hőszigeteléssel kell ellátni. A tartánnyal közvetlenül érintkezésben levő hőszigetelés gyulladási hőmérsékletének legalább 50 °C-kal magasabbnak kell lennie annál a legmagasabb hőmérsékletnél, amelyre a tartányt kialakították.
- TE15** (törölve)
- TE16** (fenntartva)
- TE17** (fenntartva)
- TE18** A 190 °C-nál magasabb hőmérsékleten betöltött anyagok szállítására szolgáló tartányt a felső töltőnyílásra merőleges eltérítő lemezekkel kell ellátni, ami megakadályozza a töltés során a falhőmérséklet hirtelen helyi növekedését.
- TE19** A tartány felső részére szerelt szerelvényeket és tartozékokat a következőképpen kell védeni:
- süllyesztett házba kell beszerelni; vagy
 - belső biztonsági szeleppel kell ellátni; vagy
 - zárófedéllel, vagy keresztirányú és/vagy hosszirányú elemekkel, vagy bármilyen más egyenértékűen hatásos készülékkel kell védeni, amelyeknek olyan kiképzésűeknek kell lenniük, hogy felborulás esetén a szerelvények és tartozékok ne szenvedjenek károsodást.
- A tartány alsó részére szerelt szerelvényeket és tartozékokat a következőképpen kell védeni:
- A csőcsatlakozó peremeket, az oldalt elhelyezett elzárókészülékeket és az összes ürítőberendezést a tartány legkülső szélétől legalább 200 mm-rel beljebb kell elhelyezni, vagy olyan korláttal kell védeni, amelynek keresztmetszeti tényezője a haladási irányra merőlegesen legalább 20 cm³; a talajtól való távolságuknak teli tartány esetén is legalább 300 mm-nek kell lennie.
- A tartány hátsó felületére szerelt összes szerelvényt és tartozékot a 9.7.6 szakaszban előírt lökhárítóval kell védeni. A talajtól mért távolságuknak akkorának kell lennie hogy a lökhárító kielégítő védelmet biztosítson részükre.
- TE20** Függetlenül a 4.3.4.1.2 pontban szereplő csoportos hozzárendelés szerinti tartány rangsor által megengedett egyéb tartánycódoktól, a tartány biztonsági

szeleppel kell ellátni.

TE21 A zárószerkezeteket rögzíthető sapkával kell védeni.

TE22 (fenntartva)

TE23 A tartányt olyan szerkezettel kell ellátni, amely megakadályozza a túlzott nyomás vagy vákuum kialakulását a tartányban, és a kialakítása eleve kizárja, hogy szivárogon vagy a szállított anyagtól eltömődjön.

TE24 Ha a bitumen szállítására és kiszórására szolgáló tartány az ürítőcső végén szórófejjel van ellátva, a 6.8.2.2.2 pont szerint szükséges zárószerkezet a szórófej előtt az ürítőcsőre szerelt zárószeleppel is helyettesíthető.

TE25 (fenntartva)

c) Típusjóváhagyás (TA)

TA1 A tartányt nem szabad szerves anyagok szállítására jóváhagyni.

TA2 Ez az anyag a származási ország illetékes hatósága által meghatározott feltételek mellett szállítható rögzített vagy leszerelhető tartányban vagy tankkonténerben, ha a következőkben említett vizsgálatok alapján az illetékes hatóság úgy ítéli meg, hogy a szállítás biztonságosan végrehajtható. Ha a származási ország nem valamely ADR Szerződő Fél, ezeket a feltételeket a küldemény által érintett első ADR Szerződő Fél illetékes hatóságának kell elismernie.

A tartány típusjóváhagyásához vizsgálatokat kell végezni:

- annak bizonyítására, hogy a szállított anyag összeférhető minden olyan anyaggal, amellyel normál esetben a szállítás során érintkezésbe kerül;
- hogy megfelelő adatok álljanak rendelkezésre ahhoz, hogy a tartány szerkezeti jellemzőit is figyelembe véve a vészlefűvő szerkezetek és a biztonsági szelepek tervezhetők legyenek; és
- az anyag biztonságos szállításához szükséges különleges követelmények meghatározásához.

A vizsgálatok eredményeit fel kell tüntetni a típusjóváhagyási bizonyítványban.

TA3 Ez az anyag csak LGAV vagy SGAV tartánykódú tartányokban szállítható; a 4.3.4.1.2 pont szerinti tartány rangsor nem alkalmazható.

TA4 Az 1.8.7 szakasz megfelelésértékelésre vonatkozó eljárását az illetékes hatóságnak, ill. megbízottjának vagy az 1.8.6.2, az 1.8.6.4, az 1.8.6.5 és az 1.8.6.8 bekezdésnek megfelelő és az EN ISO/IEC 17020:2004 szabvány szerint akkreditált, A típusú vizsgáló szervezetnek kell végrehajtani.

TA5 Ez az anyag csak S2.65AN(+) tartánykódú tartányban szállítható, a 4.3.4.1.2 pont szerinti tartányrangsor nem alkalmazható.

d) Vizsgálatok (TT)

TT1 A tiszta alumíniumból készült tartányokat üzembe helyezés előtt és időszakosan elegendő 250 kPa (2,5 bar) nyomással (túlnyomással) a folyadék-

nyomás-próbának alávetni.

- TT2** A tartány belső bevonatát minden évben az illetékes hatóság által elismert szakértővel kell ellenőriztetni, akinek a tartány belsejét meg kell vizsgálni.
- TT3** A tartányt 6.8.2.4.2 pont előírásaitól eltérően legalább nyolcévenként kell időszakos vizsgálatnak alávetni, aminek ki kell terjednie a megfelelő készülékkel végzett falvastagság ellenőrzésre. Ilyen tartánynál a 6.8.2.4.3 pont szerinti tömörségi próbát és ellenőrzést legalább négyévenként el kell végezni.
- TT4** A tartányt
három évenként | két és fél évenként
alkalmas készülékkel (pl. ultrahanggal) a korrózióállóságra meg kell vizsgálni
- TT5** A tartányon a folyadéknomás-próbát
három évenként | két és fél évenként
meg kell ismételni.
- TT6** A tartányt legalább három évenként időszakos vizsgálatnak kell alávetni, ennek keretében folyadéknomás-próbát is kell végezni.
- TT7** A 6.8.2.4.2 pont előírásaitól eltérően a belső állapot időszakos vizsgálatát az illetékes hatóság által jóváhagyott programmal is lehet helyettesíteni.
- TT8** Azokat a tartányokat, amelyeken a 6.8.3.5.1 – 6.8.3.5.3 pontok szerint az UN 1005 vízmentes ammónia helyes szállítási megnevezése fel van tüntetve, és amelyeket az anyagszabvány szerinti finom szemcseszerkezetű, 400 N/mm²-nél nagyobb folyáshatárú acélból gyártottak, a 6.8.2.4.2 pont szerinti minden időszakos vizsgálat alkalmával a felületi repedések észleléséhez mágneses repedésvizsgálatnak kell alávetni.
- Minden tartány alsó részén minden kör- és hosszvarratot legalább hosszúságuk 20%-át kitevő mértékben, valamint minden csőcsonk hegesztést és a javított vagy csiszolt területeket meg kell vizsgálni.
- Ha az anyag jelölését a tartányról, ill. a tartánytábláról eltávolítják, mágneses repedésvizsgálatot kell végezni és ezen tevékenységet a tartány-vizsgálati könyvhöz csatolt vizsgálati tanúsítványban kell rögzíteni.
- A mágneses repedésvizsgálatot csak olyan, arra alkalmas személy végezheti, akinek erre a módszerre az EN 473 szabvány (Roncsolásmentes vizsgálat. Roncsolásmentes vizsgálatot végző személyzet minősítése és tanúsítása. Általános alapelvek) szerinti minősítése van.
- TT9** Az 1.8.7 szakasz vizsgálatokra (beleértve a gyártás felügyeletét is) vonatkozó eljárását az illetékes hatóságnak, ill. megbízottjának vagy az 1.8.6.2, az 1.8.6.4, az 1.8.6.5 és az 1.8.6.8 bekezdésnek megfelelő és az EN ISO/IEC 17020:2004 szabvány szerint akkreditált, A típusú vizsgáló szervezetnek kell végrehajtani.
- TT10** A 6.8.2.4 bekezdés szerinti időszakos vizsgálatot
legalább három évenként | legalább két és fél évenként
kell elvégezni.

e) Jelölés (TM)

Megjegyzés: Ezeket az adatokat a jóváhagyó ország valamelyik hivatalos nyelvén, és ezenkívül, ha ez a nyelv nem angol, francia vagy német, akkor angol,

francia vagy német nyelven is meg kell szövegezni, hacsak a szállítás által érintett államok közötti megállapodások másként nem rendelkeznek.

- TM1** A tartányt a 6.8.2.5.2 pontban előírtakon kívül el kell látni a „**Szállítás alatt tilos kinyitni. Öngyulladásra hajlamos**” felirattal (lásd az előző megjegyzést is).
- TM2** A tartányt a 6.8.2.5.2 pontban előírtakon kívül el kell látni a „**Szállítás alatt tilos kinyitni. Vízzel érintkezve gyúlékony gázokat fejleszt**” felirattal (lásd az előző megjegyzést is).
- TM3** A tartányon a 6.8.2.5.1 pontban előírt táblán fel kell tüntetni az engedélyezett anyagok megnevezését és a tartány megengedett legnagyobb rakomány tömegét kg-ban.
- TM4** A tartányon a 6.8.2.5.2 pontban előírt fémtáblán vagy a tartány falán – ha az úgy van megerősítve, hogy szilárdságát nem csökkenti – a következő kiegészítő adatot kell feltüntetni beütéssel vagy más hasonló módon: az anyag kémiai elnevezése engedélyezett koncentrációjával együtt.
- TM5** A tartányra a 6.8.2.5.1 pontban előírt adatokon kívül fel kell írni a tartány legutóbbi belső vizsgálatának idejét (hónap, év).
- TM6** (fenntartva)
- TM7** A 6.8.2.5.1 pontban előírt táblára beütéssel vagy más hasonló módon fel kell tüntetni az 5.2.1.7.6 pontban ábrázolt sugárveszély szimbólumot is. A stilizált lóherét közvetlenül a tartány falába is be lehet vésni, ha a falak úgy meg vannak erősítve, hogy a bevésés nem csökkenti a tartány szilárdságát.

6.8.5 A legalább 1 MPa (10 bar) próbanyomású rögzített hegesztett tartányok, leszerelhető hegesztett tartányok és tankkonténerek hegesztett tartányai gyártási anyagaira és gyártására, valamint a 2 osztályba tartozó mélyhűtött, cseppfolyósított gázok szállítására használt rögzített hegesztett tartányok, leszerelhető hegesztett tartányok és tankkonténerek hegesztett tartányai gyártási anyagaira és gyártására vonatkozó előírások

6.8.5.1 *Anyagok és tartányok*

- 6.8.5.1.1**
- a) A következő anyagok szállítására szolgáló tartányokat acélból kell gyártani:
 - a 2 osztály sűrített, cseppfolyósított és oldott gázai;
 - a 4.2 osztály UN 1380, 2445, 2845, 2870, 3194 és 3391 – 3394 számú anyagai; és
 - a 8 osztály anyagai közül az UN 1052 vízmentes hidrogén-fluorid és az UN 1790 fluorhidrogénsav 85%-nál több hidrogén-fluorid tartalommal.
 - b) A következő anyagok szállítására szolgáló, finom szemcseszerkezetű acélból gyártott tartányokat a hőhatás okozta feszültség kiküszöbölésére hőkezelésnek kell alávetni:
 - 2 osztály maró gázai és az UN 2073 ammónia oldat; valamint
 - a 8 osztály anyagai közül az UN 1052 vízmentes hidrogén-fluorid és az UN 1790 fluorhidrogénsav 85%-nál több hidrogén-fluorid tartalommal.
 - c) A 2 osztályba tartozó mélyhűtött, cseppfolyósított gázok szállítására használt tartányokat acélból, alumíniumból, alumíniumötvözetből, rézből vagy rézötvözetből, pl. sárgarézből kell gyártani. A rézből vagy rézötvözetből gyártott tartányokat csak olyan gázokhoz szabad használni, amelyek nem tartalmaznak acetilént; az etilén azonban tartalmazhat 0,005% acetilént.
 - d) Csak olyan anyagok használhatók, amelyek a tartány és felszerelései legkisebb és legnagyobb üzemi hőmérsékletéhez megfelelőek.

6.8.5.1.2 A tartányok gyártásához használható anyagok a következők:

- a) olyan acélok, amelyek a legkisebb üzemi hőmérsékleten sem hajlamosak a ridegtörésre (lásd a 6.8.5.2.1 pontot):
 - szerkezeti acélok (kivéve a 2 osztály mélyhűtött, cseppfolyósított gázaihoz);
 - finom szemcseszerkezetű acél – 60 °C hőmérsékletig;
 - nikkellel ötvözött acél (0,5...9% nikkeltartalommal) a nikkeltartalomtól függően –196 °C hőmérsékletig;
 - ausztenites króm-nikkel acél –270 °C hőmérsékletig;
- b) legalább 99,5% tisztasági fokú alumínium vagy alumíniumötvözetek (lásd a 6.8.5.2.2 pontot);
- c) legalább 99,9%-os tisztasági fokú, oxigénmentes réz vagy 56%-nál több rézet tartalmazó rézötvözetek (lásd a 6.8.5.2.3 pontot).

- 6.8.5.1.3**
- a) Az acélból, alumíniumból vagy alumíniumötvözetből gyártott tartányok csak hegesztettek vagy varrat nélküliek lehetnek.
 - b) Az ausztenites acélból, rézből vagy rézötvözetből gyártott tartányok keményforrasztással is készülhetnek.

6.8.5.1.4 A szerelvényeket és a tartozékokat vagy csavarozással, vagy a következő módon lehet a

tartányokra rögzíteni:

- a) acélból, alumíniumból és alumíniumötvözetből készült tartányokra hegesztéssel;
- b) ausztenites acélból, vörösrézről vagy rézötvözetből készült tartányokra hegesztéssel vagy keményforrasztással.

6.8.5.1.5 A tartányokat úgy kell kialakítani, és úgy kell a járműre, az alvázra vagy a konténerkeretbe rögzíteni, hogy eleve kizárt legyen a teherviselő elemek olyan lehülése, amely ridegtörést okozhatna. A tartányokat rögzítő szerkezeti részeket is oly módon kell kialakítani, hogy szükséges mechanikai szilárdságuk még akkor is megmaradjon, ha a tartány a legkisebb üzemi hőmérsékleten van.

6.8.5.2 *Vizsgálati követelmények*

6.8.5.2.1 *Acéltartányok*

A tartányok gyártásához használt anyagoknak és a hegesztési varratoknak a legkisebb üzemi hőmérsékleten, de legalább $-20\text{ }^{\circ}\text{C}$ -on a fajlagos ütőmunka szempontjából legalább a következő feltételeknek kell megfelelniük:

- A vizsgálatot V bemetszésű próbatestekkel kell végezni.
- Szerkezeti acél, finom szemcseszerkezetű acél, 5%-nál kevesebb Ni-tartalmú ferrites acélötvözet, 5...9% Ni-tartalmú ferrites acélötvözet és ausztenites króm-nikkel acél próbapálca esetén a legkisebb fajlagos ütőmunkának (lásd 6.8.5.3.1 – 6.8.5.3.3) 34 J/cm^2 -nek kell lenni. A próbatest hossz tengelyének a hengerlési irányra merőlegesnek, a V alakú bemetszésnek a lemez felületére merőlegesnek kell lennie (az ISO R148 szerint). (A szerkezeti acél próbapálca hossz tengelye az érvényes ISO szabványok szerint a hengerlési iránnyal egybeeshet.)
- Ausztenites acéloknál csak a hegesztési varratokat kell a fajlagos ütőmunka-vizsgálatnak alávetni.
- A $-196\text{ }^{\circ}\text{C}$ -nál kisebb üzemi hőmérsékletek esetén a fajlagos ütőmunka-vizsgálatot nem a legkisebb üzemi hőmérsékleten, hanem $-196\text{ }^{\circ}\text{C}$ -on hajtják végre.

6.8.5.2.2 *Alumínium- vagy alumíniumötvözet-tartányok*

A tartányok hegesztési varratainak meg kell felelniük az illetékes hatóság által előírt követelményeknek.

6.8.5.2.3 *Réz vagy rézötvözet tartányok*

A fajlagos ütőmunka kielégítő voltának meghatározásához nem szükséges vizsgálatot végezni.

6.8.5.3 *A fajlagos ütőmunka-vizsgálat*

6.8.5.3.1 10 mm-nél vékonyabb, de legalább 5 mm vastag lemezeknél $10\text{ mm} \times e\text{ mm}$ keresztmetszetű próbatestet kell használni, ahol e a lemez vastagsága. Szükség esetén megengedett a 7,5 mm-re vagy 5 mm-re történő megmunkálás. A legkisebb 34 J/cm^2 értéknek minden esetben meg kell lennie.

Megjegyzés: 5 mm-nél vékonyabb lemezeknél és hegesztési varrataiknál fajlagos ütőmunka-vizsgálatot nem kell végezni.

- 6.8.5.3.2**
- a) Lemez vizsgálatok a fajlagos ütőmunkát három próbatesten kell meghatározni. A próbatestet a hengerlés irányára merőlegesen kell kivágni, de szerkezeti acél esetén a hengerlés irányában is kivágható.
 - b) A hegesztési varratok vizsgálatok a próbatestet a következőképpen kell kivágni:
 $e \leq 10\text{ mm}$ esetén:

- három próbatestet a hegesztési varrat közepén levő bemetszéssel;
- három próbatestet a hőhatás által érintett övezet közepén levő bemetszéssel; a V alakú bemetszésnek a mintadarab közepén, a megolvadt övezet határán kell lennie;

$10 \text{ mm} < e \leq 20 \text{ mm}$ esetén:

- három próbatestet a hegesztési varrat közepéről;
- három próbatestet a hőhatás által érintett övezetből; a V alakú bemetszésnek a mintadarab közepén, a megolvadt övezet határán kell lennie;

$e > 20 \text{ mm}$ esetén:

- három-három próbatestből álló két készletet (egy készletet a lemez felső oldalán és egy készletet a lemez alsó oldalán) az ábrán megjelölt helyekről kivágva; ha a kivágás a hőhatás által érintett övezetből történik, a V alakú bemetszésnek a mintadarab közepén, a megolvadt övezet határán kell lennie.

Hőhatás által érintett övezet

- 6.8.5.3.3**
- a) Lemezek esetében a három próba eredménye középértékének meg kell felelni a 6.8.5.2.1 pontban jelzett 34 J/cm^2 legkisebb értéknek. A három érték közül legfeljebb egy lehet kisebb, mint a legkisebb érték, de ez sem lehet kisebb, mint 24 J/cm^2 .
 - b) Hegesztéseknél a hegesztési varrat közepéből vett három próbatest vizsgálatkor az eredmény középértéke nem lehet kisebb, mint a 34 J/cm^2 legkisebb érték. A három érték közül legfeljebb egy lehet kisebb, mint a legkisebb érték, de ez sem lehet kisebb, mint 24 J/cm^2 .
 - c) A hőhatás által érintett övezet esetén (amikor a V alakú bemetszés a mintadarab közepén, a megolvadt övezet határán van) a három próbatest közül legfeljebb egynél lehet kisebb érték, mint a legkisebb 34 J/cm^2 , de ez sem lehet kisebb, mint 24 J/cm^2 .

6.8.5.3.4 Ha a 6.8.5.3.3 pontban előírt követelmények nem teljesülnek, a vizsgálatot egyszer meg lehet ismételni akkor, ha

- a) az első három próba eredményének középértéke kisebb, mint a 34 J/cm^2 legkisebb érték, vagy
- b) az egyedi értékek közül egynél többnek az értéke kisebb, mint a 34 J/cm^2 legkisebb érték, de legalább 24 J/cm^2 .

6.8.5.3.5 A lemez vagy a hegesztés ismételt fajlagos ütőmunka-vizsgálatkor az egyedi értékek közül egyik sem lehet kisebb, mint a legkisebb 34 J/cm^2 érték. Az eredeti és az ismételt vizsgálati eredmények átlagának legalább 34 J/cm^2 -nek kell lenni.

A hőhatás által érintett övezeten végzett ismételt fajlagos ütőmunka-vizsgálat esetében az egyedi értékek egyike sem lehet kisebb, mint 34 J/cm^2 .

6.8.5.4 Hivatkozás a szabványokra

A 6.8.5.2 és a 6.8.5.3 bekezdés követelményei a következő szabványok alkalmazása esetén teljesítettnek tekinthetők:

EN 1252-1:1998 Kriogén tartályok. Alapanyagok. 1. rész: Szívóssági követelmények -80°C -nál kisebb hőmérsékletekhez.

EN 1252-2:2001 Kriogén tartályok. Alapanyagok. 2. rész: Szívóssági követelmények -80°C és -20°C hőmérséklet között.

6.9 FEJEZET

A SZÁLVÁZAS MŰANYAGBÓL GYÁRTOTT, RÖGZÍTETT TARTÁNYOK (TARTÁNYJÁRMŰVEK), LESZERELHETŐ TARTÁNYOK, TANKKONTÉNEREK ÉS TARTÁNYOS CSEREFELÉPÍTMÉNYEK TERVEZÉSÉRE, GYÁRTÁSÁRA, SZERELVÉNYEIRE, TÍPUSJÓVÁHAGYÁSÁRA, VIZSGÁLATÁRA ÉS JELÖLÉSÉRE VONATKOZÓ KÖVETELMÉNYEK

Megjegyzés: *A mobil tartányokra és az UN többteleemes gázkonténerekre (UN MEG-konténerekre) lásd a 6.7 fejezetet; a fémből gyártott, rögzített tartányokra (tartányjárművekre), leszerelhető tartányokra, tankkonténerekre és tartányos cserefelépítményekre, valamint a battériás járművekre és többteleemes gázkonténerekre (MEG-konténerekre) – az UN MEG-konténerek kivételével – lásd a 6.8 fejezetet; a hulladékok szállítására szolgáló, vákuummal üzemelő tartányokra lásd a 6.10 fejezetet.*

6.9.1 Általános előírások

6.9.1.1 A szálvázaz műanyag tartányokat az illetékes hatóság által elismert minőségbiztosítási program szerint kell tervezni, gyártani és vizsgálni; a laminálási munkákat és a műanyag betétek hegesztését csak szakképzett személyzet végezheti az illetékes hatóság által elismert eljárással.

6.9.1.2 A szálvázaz műanyag tartányok tervezésére és vizsgálatára a 6.8.2.1.1, a 6.8.2.1.7, a 6.8.2.1.13, a 6.8.2.1.14 a) és b), a 6.8.2.1.25, a 6.8.2.1.27, a 6.8.2.1.28 és a 6.8.2.2.3 pont előírásait ugyancsak be kell tartani.

6.9.1.3 A szálvázaz műanyag tartányokhoz fűtőelemek nem használhatók.

6.9.1.4 A tartányjárművek stabilitására a 9.7.5.1 bekezdés követelményeit kell alkalmazni.

6.9.2 Gyártás

6.9.2.1 A tartányt alkalmas anyagból kell gyártani, amely a -40 °C és $+50\text{ °C}$ közötti üzemi hőmérséklet-tartományban összeférhető a szállítandó anyaggal, kivéve, ha annak az országnak az illetékes hatósága, amelyben a szállítás történik, a különleges éghajlati viszonyok miatt más hőmérséklet-tartományt ír elő.

6.9.2.2 A tartány a következő három fő részből áll:

- belső betét,
- szerkezeti réteg,
- külső réteg.

6.9.2.2.1 A belső betét a tartányfal belső része, amely tartós vegyszerállósága révén elsődleges gátat képez a szállítandó anyaggal szemben, így megakadályoz minden veszélyes reakciót a tartány tartalmával, ill. megakadályozza a szerkezeti réteg minden olyan, lényeges gyengülését, amit a szállított anyagnak a belső betéten keresztüli diffúziója okozna.

A belső betét vagy szálvázaz műanyag vagy hőre lágyuló műanyag betét lehet.

6.9.2.2.2 A szálvázaz műanyag betétnek a következőkből kell állnia:

- a) egy fedőrétegből („gel-coat”): amely egy megfelelő, műgyantában dús felületi réteg,

amely a műgyantával és a szállítandó anyaggal összeférhető fátyolszövettel van megerősítve. Ennek a rétegnek a száltömeg tartalma legfeljebb 30% lehet, a vastagságának 0,25 és 0,6 mm között kell lennie;

- b) erősítő réteg(ek)ből: amely egy vagy több, legalább 2 mm vastagságú réteg, amely legalább 900 g/m² üvegpaplant vagy vágott szálat tartalmaz, és amelynek üvegrost-tartalma legalább 30 tömeg%, kivéve, ha az egyenértékű biztonság kisebb üvegrost-tartalomnál bizonyított.

6.9.2.2.3 A hőre lágyuló műanyag betét a 6.9.2.3.4 pont szerinti hőre lágyuló műanyagból készült lemez, amelyet a kívánt alakúra hegesztenek össze és amelyhez a szerkezeti réteget ragasztják. A betét és a szerkezeti réteg között megfelelő ragasztóval tartós kötést kell kialakítani.

***Megjegyzés:** Gyúlékony folyékony anyagok szállítása esetén a betétnél a 6.9.2.14 bekezdés szerinti kiegészítő intézkedésekre lehet szükség az elektrosztatikus töltés felhalmozódásának megelőzésére.*

6.9.2.2.4 A tartány szerkezeti rétege az a rész, amely a mechanikai igénybevételek elviselése céljából a 6.9.2.4 – 6.9.2.6 bekezdés szerint különlegesen van kialakítva. Ez a rész rendszerint meghatározott elrendezésű, több szálvázis rétegből áll.

6.9.2.2.5 A külső réteg a tartánynak az a része, amely a környezeti hatásoknak közvetlenül ki van téve. Legalább 0,2 mm vastag, műgyantában dús rétegből kell állnia. 0,5 mm-nél vastagabb réteg esetén üvegpaplant kell alkalmazni. Ennek a rétegnek az üvegrost-tartalma csak 30 tömeg%-nál kevesebb lehet, és alkalmasnak kell lennie a külső körülmények, különösen a szállítandó anyaggal való esetleges érintkezés elviselésére. A tartány szerkezeti rétegének az ultraibolya sugárzás okozta károsodással szembeni védelmére a műgyantának töltőanyagot vagy adalékanyagot kell tartalmaznia.

6.9.2.3 Nyersanyagok

6.9.2.3.1 A szálvázis műanyag tartányok gyártásához használt minden anyag eredetének és műszaki tulajdonságainak ismertnek kell lennie.

6.9.2.3.2 Műgyanták

A műgyanta keverék feldolgozását szigorúan a gyártó ajánlásai szerint kell végezni, ez elsősorban a térhálósítók, az iniciátorok és a gyorsítók használatára vonatkozik. A következő műgyanták használhatók:

- telítetlen poliésztergyanták;
- vinilgyanták;
- epoxigyanták;
- fenolgyanták.

A műgyanták ISO 75-1:1993 szabvány szerint meghatározott hőtorzulási hőmérsékletének legalább 20 °C-kal magasabbnak kell lennie, mint a tartány legnagyobb üzemi hőmérséklete, de semmilyen esetben sem lehet 70 °C-nál alacsonyabb.

6.9.2.3.3 Szálvázis erősítés

A szerkezeti réteg erősítő anyagának megfelelő minőségű rostanyagból, pl. az ISO 2078:1993 szabvány szerinti E vagy ECR minőségű üvegszálakból kell állnia. A belső betét fedőrétegéhez az ISO 2078:1993 szabvány szerinti C minőségű üvegszál is használható. Hőre lágyuló műanyagból készült fátyolszövet a belső betétéhez csak akkor használható, ha a szállítandó anyaggal való összeférhetősége bizonyított.

6.9.2.3.4 A hőre lágyuló műanyag betét anyaga

A betét anyagként olyan hőre lágyuló műanyagok használhatók, mint pl. a kemény

poli(vinil-klorid) (kemény PVC), a polipropilén (PP), a poli(vinilidén-fluorid) (PVDF), a poli(tetrafluor-etilén) (PTFE) stb.

6.9.2.3.5 Adalékanyagok

A műgyanta kezeléséhez szükséges adalékanyagok, pl. katalizátorok, gyorsítók, térhálósítók és tixotrop anyagok, valamint a tartány tulajdonságainak javítására használt anyagok, pl. töltőanyagok, színezékek, pigmentek stb. a tartány élettartama alatt a várható hőmérsékleti viszonyok között nem gyengíthetik az anyagot.

6.9.2.4

A tartányt, a tartozékait, az üzemi és szerkezeti szerelvényeit úgy kell kialakítani, hogy tervezett élettartamuk alatt a szállított anyag vesztesége nélkül (nem számítva az esetleges szelepeken keresztül kiszabaduló gázmennyiséget) ellenálljanak:

- a normális szállítási körülmények között fellépő statikus és dinamikus terheléseknek;
- a 6.9.2.5 – 6.9.2.10 bekezdésben előírt minimális terheléseknek.

6.9.2.5

A 6.8.2.1.14 a), ill. b) pontban előírt nyomáson és a tartányra meghatározott legnagyobb sűrűségű szállított anyag által a legnagyobb töltési foknál kifejtett statikus nehézségi erő hatására a tartány bármely rétegében hosszirányban és a kerület mentén a σ mértékadó feszültség nem haladhatja meg a következő értéket:

$$\sigma \leq \frac{R_m}{K},$$

ahol:

R_m = a szakítószilárdság értéke, azaz a vizsgálati eredmények átlagértéke mínusz a vizsgálati eredmények standard szórásának kétszerese. A vizsgálatokat legalább hat, a gyártási típust és a gyártási eljárást reprezentáló mintadarabon az EN 61:1997 szabvány előírásai szerint kell végrehajtani;

$$K = S \cdot K_0 \cdot K_1 \cdot K_2 \cdot K_3,$$

ahol

K legkisebb értékének 4-nek kell lennie; és

S = biztonsági tényező. Általában, ha a tartányhoz a 3.2 fejezet „A” táblázat 12 oszlopában olyan tartánykód tartozik, amely a második részében „G” betűt tartalmaz (lásd a 4.3.4.1.1 pontot), akkor S értékének legalább 1,5-nek kell lennie. Olyan anyagok szállítására szolgáló tartányoknál, amelyek fokozott biztonsági szintet igényelnek, azaz a tartányhoz a 3.2 fejezet „A” táblázat 12 oszlopában olyan tartánykód hivatkozik, amely a második részében a „4” számjegyet tartalmazza (lásd a 4.3.4.1.1 pontot), az S értékét 2-vel meg kell szorozni, kivéve, ha a tartány sérülés elleni védelemmel van ellátva, ami hossz- és keresztirányú szerkezeti elemeket is tartalmazó, teljes fémvázból áll;

K_0 = a kúszás, az öregedés, valamint a szállítandó anyagok kémiai hatásának eredményeként az anyag tulajdonságaiban bekövetkező romlást figyelembe vevő tényező. Ezt a következő képlettel kell meghatározni:

$$K_0 = \frac{1}{\alpha\beta},$$

ahol α a kúszási tényező, β az öregedési tényező, az EN 977:1997 szabvány szerinti vizsgálatok elvégzése után, az EN 978:1997 szabvány szerint meghatározva. Alternatívaként a $K_0 = 2$ biztonságos érték is alkalmazható. Az α és a β tényezőket 2σ értékhez tartozó kezdeti behajlásnál kell meghatározni;

K_1 = az üzemi hőmérsékletet és a műgyanta termikus tulajdonságait figyelembe vevő tényező, amit a következő egyenlettel kell meghatározni és amelynek legkisebb értéke 1;

$$K_1 = 1,25 - 0,0125 (HDT - 70),$$

ahol HDT a műgyanta hőtorzulási hőmérséklete °C-ban;

K_2 = az anyag kifáradására vonatkozó tényező; $K_2 = 1,75$ értéket kell használni, kivéve, ha az illetékes hatóság mást hagyott jóvá. A 6.9.2.6 bekezdésben említett, dinamikai méretezéshez $K_2 = 1,1$ értéket kell használni;

K_3 = a keményedésre vonatkozó tényező, értékei a következők:

- ha a kikeményítés jóváhagyott és dokumentált eljárással történik: 1,1;
- minden más esetben: 1,5.

6.9.2.6 A 6.8.2.1.2 pontban jelzett dinamikus igénybevételeknél a mértékadó feszültség nem haladhatja meg a 6.9.2.5 bekezdésben előírt érték és az α tényező hányadosát.

6.9.2.7 A 6.9.2.5 és a 6.9.2.6 bekezdésben meghatározott feszültségeknél a bekövetkező nyúlás egyetlen irányban sem lehet nagyobb, mint a 0,2% és a műgyanta szakadási nyúlásának egytizede közül a kisebbik érték.

6.9.2.8 Az előírt próbanyomásnál, ami nem lehet kisebb, mint a 6.8.2.1.14 a), ill. b) pontban meghatározott tervezési nyomás, a tartányban fellépő legnagyobb nyúlás nem lehet nagyobb, mint a műgyanta szakadási nyúlása.

6.9.2.9 A tartánynak alkalmasnak kell lennie arra, hogy mindenféle, szemmel látható belső vagy külső sérülés nélkül elviselje a 6.9.4.3.3 pont szerinti golyó ejtési próbát.

6.9.2.10 Az egyesítéseknel (beleértve a végek, a hullámtörő lemezek és a válaszfalak egyesítését a tartányfallal) kialakított átlapoló laminálásoknak alkalmasnak kell lenniük az előzőekben említett statikus és dinamikus igénybevételek elviselésére. Az átlapoló laminálásokban a feszültség-koncentráció elkerülésére a ferde tekercselés menetemelkedése nem lehet 1:6-nál meredekebb.

Az átlapoló laminálás és az általa összekapcsolt tartány alkotórészek közötti nyírószilárdság nem lehet kisebb, mint:

$$\tau = \frac{Q}{l} \leq \frac{\tau_R}{K},$$

ahol:

τ_R = az EN ISO 14125:1998 (három pontos módszer) szabvány szerinti hajlítási nyírószilárdság, amelynek legkisebb értéke $\tau_R = 10 \text{ N/mm}^2$, ha mért adat nem áll rendelkezésre;

Q = az egységnyi szélességére jutó terhelés, amelyet az egyesítésnek a statikus és dinamikus terhelések hatására el kell viselnie;

K = a statikus és dinamikus igénybevételekre a 6.9.2.5 bekezdés szerint számított tényező; és

l = az átlapoló laminálás hossza.

6.9.2.11 A tartányon levő nyílásokat úgy kell megerősíteni, hogy a 6.9.2.5 és a 6.9.2.6 bekezdésben meghatározott statikus és dinamikus igénybevételekkel szemben legalább akkora biztonsági tényezővel rendelkezzenek, mint maga a tartány. A nyílások száma a lehető legkisebb legyen. Az ovális alakú nyílások tengelyeinek aránya legfeljebb 2 lehet.

- 6.9.2.12** A tartányhoz csatlakozó csőkarimák és csővezetékek méretezése során a kezelésnél és a csavarok meghúzásánál fellépő erőket ugyancsak figyelembe kell venni.
- 6.9.2.13** A tartányt úgy kell kialakítani, hogy a 6.9.4.3.4 pont szerinti vizsgálati követelményeknek megfelelő, 30 percen át tartó tűz hatására jelentősen nem szivároghat. Az illetékes hatóság hozzájárulása esetén a vizsgálatról el lehet tekinteni, amennyiben hasonló tartány típus vizsgálata elegendő bizonyítékot szolgáltat.
- 6.9.2.14** *A legfeljebb 60 °C lobbanáspontú anyagok szállítására vonatkozó különleges követelmények*
- A legfeljebb 60 °C lobbanáspontú folyékony anyagok szállítására használt szálvázaz műanyag tartányokat úgy kell kialakítani, hogy a különböző szerkezeti részek elektrosztatikus feltöltődését, és így az elektrosztatikus töltések veszélyes felhalmozódását elkerüljék.
- 6.9.2.14.1** A tartány belső és külső felületi ellenállásának mért értéke legfeljebb 10^9 ohm lehet. Ez elérhető a műgyantához adott adalékanyagokkal vagy közbenső vezetőképes rétegek, például fém- vagy szénszál háló beiktatásával.
- 6.9.2.14.2** A földelési ellenállás mért értéke legfeljebb 10^7 ohm lehet.
- 6.9.2.14.3** A tartány minden elemét egymással, valamint a tartány üzemi és szerkezeti szerelvényeinek fém részeivel és a járművel elektromosan össze kell kötni. Az egymással érintkező elemek és szerelvények között az elektromos ellenállás legfeljebb 10 ohm lehet.
- 6.9.2.14.4** A felületi ellenállást és a földelési ellenállást az üzembe helyezés előtt minden egyes tartányon vagy a tartány mintadarabján az illetékes hatóság által elismert eljárással meg kell mérni.
- 6.9.2.14.5** Az egyes tartányok földelési ellenállását az időszakos vizsgálat részeként az illetékes hatóság által elismert eljárással meg kell mérni.
- 6.9.3 Szerelvények**
- 6.9.3.1** A 6.8.2.2.1, a 6.8.2.2.2 és a 6.8.2.2.4 – 6.8.2.2.8 pont követelményeit kell alkalmazni.
- 6.9.3.2** Ezenkívül, amennyiben egy tételnél a 3.2 fejezet „A” táblázat 13 oszlopában a 6.8.4 b) pont szerinti különleges előírás (TE) is fel van tüntetve, akkor azt is alkalmazni kell.
- 6.9.4 Típusvizsgálat és jóváhagyás**
- 6.9.4.1** Minden szálvázaz műanyag tartány típus anyagait és gyártási mintapéldányát a következők szerinti gyártási típus vizsgálatnak kell alávetni.
- 6.9.4.2 Anyagvizsgálat**
- 6.9.4.2.1** A használandó műgyanta szakadási nyúlását az EN ISO 527-5:1997 szabvány szerint, a hőtorzulási hőmérsékletét az ISO 75-1:1993 szabvány szerint kell meghatározni.
- 6.9.4.2.2** A következő anyagjellemzőket a tartányból kivágott mintán kell meghatározni. A gyártással párhuzamosan készített minták csak akkor használhatók, ha a tartányból nem lehet mintát kivágni. Vizsgálat előtt a belső betétet el kell távolítani.
- A következőket kell megvizsgálni:
- a tartány palástjának és fenekeinek réteg vastagságát;
 - az üvegszál összetételét és tömegarányát, az erősítő rétegek irányát és felépítését;
 - a szakítószilárdságot, a szakadási nyúlást és a rugalmassági moduluszt a igénybevételek irányában, az EN ISO 527-5:1997 szabvány szerint. Ezenkívül a műgyanta szakadási

nyúlását ultrahangos módszerrel meg kell határozni;

- a hajlítószilárdságot és a behajlás mértékét az EN ISO 14125:1998 szabvány szerinti hajlítási kúszásvizsgálattal, amit legalább 50 mm széles próbatesten, a falvastagság legalább 20-szorosát kitevő alátámasztási távolsággal, 1000 órás időtartamig kell végezni. Ezenkívül ezzel a vizsgálattal az EN 978:1997 szabvány szerinti □ kúszási tényezőt és □ öregedési tényezőt is meg kell határozni.

6.9.4.2.3 Az egyesítések rétegek közötti nyírószilárdságát reprezentatív mintán kell meghatározni az EN ISO 14130:1997 szabvány szerinti szakítóvizsgálat keretében.

6.9.4.2.4 A tartány és a szállítandó anyag vegyi összeférhetőségét az illetékes hatóság egyetértésével a következő módszerek valamelyikével bizonyítani kell. Ennek során a tartány és a szerelvényei anyagainak a szállítandó anyagokkal való összeférhetőségét minden szempontból igazolni kell, beleértve a tartány kémiai roncsolódását, a szállítandó anyag kritikus reakciójának iniciálását és a kettő közötti veszélyes kölcsönhatást.

- A tartány roncsolódásának megállapításához a tartányból és az esetleges belső betétek hegesztési tartományából mintát kell venni és az EN 977:1997 szabvány szerinti vegyi összeférhetőségi vizsgálatnak kell alávetni 50 °C-on, 1000 órás időtartamig. Az EN 978:1997 szabvány szerinti hajlítási vizsgálattal meghatározott szilárdság és rugalmassági modulus csökkenése az eredeti mintához képest legfeljebb 25% lehet. Repedések, hólyagok, kipattogzás, a rétegek és a betét szétválása és egyenetlenségek nem fogadhatók el.
- A szállítandó anyagoknak a tartány azon anyagaival való összeférhetőségére, amelyekkel az adott hőmérsékleten, időtartamban és üzemi körülmények között érintkezésbe kerülhetnek, hiteles és dokumentált pozitív tapasztalatok vannak.
- A szakirodalomban, szabványban vagy más forrásban az illetékes hatóság számára elfogadható műszaki adatok találhatók.

6.9.4.3 *Típusvizsgálat*

A tartány mintadarabját a következőkben meghatározott vizsgálatoknak kell alávetni. E célból az üzemi szerelvények szükség esetén más szerelvényekre cserélhetők.

6.9.4.3.1 A mintadarabot meg kell vizsgálni, hogy megfelel-e a gyártási típusnak. Ennek ki kell terjednie a belső és külső szemrevételezésre és a fő méretek megmérésére.

6.9.4.3.2 A mintadarabon minden olyan helyre, ahol a méretezési számítással való összehasonlítás szükséges, nyúlásmérő bélyeget kell elhelyezni, a tartányt meg kell terhelni és a mérési eredményeket fel kell jegyezni. A terheléseknek a következőknek kell lenni:

- a tartányt a legnagyobb töltési fokig meg kell tölteni vízzel. Ezeket a mérési eredményeket kell felhasználni a 6.9.2.5 bekezdés szerinti méretezési számítások hitelesítéséhez;
- a tartányt a legnagyobb töltési fokig meg kell tölteni vízzel, járműre kell erősíteni és vezetési és fékezési próbák végrehajtásával mindhárom irányban gyorsulásnak kell kitenni. A 6.9.2.6 bekezdés szerinti méretezési számítással való összehasonlítás céljából a mérési eredményeket a 6.8.2.1.2 pontban előírt és a ténylegesen mért gyorsulások arányában extrapolálni kell;
- a vízzel töltött tartányt az előírt próbanyomásnak kell kitenni. E terhelés hatására a tartányon nem lehet szemmel látható sérülés vagy szivárgás.

6.9.4.3.3 A mintadarabot az EN 976-1:1997, 6.6 szabvány szerinti golyó ejtési próbának kell alávetni. A tartányon sem kívül, sem belül nem lehet szemmel látható sérülés.

6.9.4.3.4 A mintadarabot – felszerelt üzemi és szerkezeti szerelvényekkel – legnagyobb ürtartalmának 80%-áig meg kell tölteni vízzel, és 30 percen át úgy kell kitenni nyílt tüzelőolaj tűznek vagy ugyanilyen hatású más tűznek, hogy a láng teljesen körülvégye. A tüzelőanyag felületének minden irányban legalább 50 cm-rel nagyobbaknak kell lennie, mint a tartány, a tüzelőanyag

felszíne és a tartány közötti távolságnak pedig 50 és 80 cm között kell lennie. A tartány folyadékszint alatt lévő részeinek, a nyílásoknak és a zárószerkezeteknek is, a csepegéstől eltekintve, szivárgásmentesnek kell maradniuk.

6.9.4.4 *Típusjóváhagyás*

6.9.4.4.1 Minden új tartánytípusra az illetékes hatóságnak vagy az általa kijelölt szervnek jóváhagyást kell kiadnia annak tanúsítására, hogy a típus a kívánt célra alkalmas, és e fejezetnek a gyártásra és a szerelvényekre vonatkozó követelményeinek, valamint a szállítandó anyagra vonatkozó különleges előírásoknak megfelel.

6.9.4.4.2 A jóváhagyásnak a számításokat és minden anyagvizsgálat eredményét és a mintadarab vizsgálatának az eredményeit is tartalmazó vizsgálati jegyzőkönyvet kell alapul venni, valamint a méretezési számítással való összehasonlítását, és utalnia kell a gyártási típus jellemzőire és a minőségbiztosítási programra.

6.9.4.4.3 A jóváhagyásban fel kell tüntetni azokat az anyagokat, ill. anyagcsoportokat, amelyekkel a tartány összeférhető. Az anyagok kémiai elnevezését vagy a megfelelő gyűjtőmegnevezést (lásd a 2.1.1.2 bekezdést), valamint az osztályt és az osztályozási kódot meg kell adni.

6.9.4.4.4 Ezenkívül tartalmaznia kell a jóváhagyott típus alapján gyártott tartányokra a meghatározott tervezési és küszöbértékeket (élettartam, üzemi hőmérséklet-tartomány, üzemi és próbanyomás, anyagjellemzők) és a gyártásnál, vizsgálatnál, típusjóváhagyásnál, jelölésnél és használatnál betartandó minden óvintézkedést.

6.9.5 **Vizsgálat**

6.9.5.1 Minden, a jóváhagyott típus alapján gyártott tartánynál a következő anyagvizsgálatokat és vizsgálatokat kell elvégezni.

6.9.5.1.1 A tartányból kivágott mintán – a szakítóvizsgálat kivételével – a 6.9.4.2.2 pont szerinti anyagvizsgálatokat kell végrehajtani azzal az eltéréssel, hogy a hajlítási kúszásvizsgálat időtartamát 100 órára lehet csökkenteni. A gyártással párhuzamosan készített minták csak akkor használhatók, ha a tartányból nem lehet mintát kivágni. A típusra jóváhagyott értékeknek meg kell felelni.

6.9.5.1.2 Üzembe helyezés előtt a tartányt és szerelvényeit együtt vagy külön-külön vizsgálatnak kell alávetni. A vizsgálatnak magában kell foglalnia:

- annak ellenőrzését, hogy a tartány megfelel-e a jóváhagyott típusnak;
- a szerkezeti jellemzők ellenőrzését;
- a belső és külső állapot vizsgálatát;
- a folyadéknomás-próbát a 6.8.2.5.1 pontban előírt táblán feltüntetett próbanyomással végrehajtva;
- a szerelvények megfelelő működésének ellenőrzését;
- tömörségi próbát, ha a tartányt és szerelvényeit külön-külön vetették alá a nyomáspróbának.

6.9.5.2 A tartányok időszakos vizsgálatára a 6.8.2.4.2 – 6.8.2.4.4 pont követelményeit kell alkalmazni. Ezenkívül a 6.8.2.4.3 pont szerinti vizsgálatnak a tartány belső állapotának vizsgálatára is ki kell terjednie.

6.9.5.3 A 6.9.5.1 és a 6.9.5.2 bekezdés szerinti vizsgálatokat az illetékes hatóság által elismert szakértőnek kell elvégeznie. A vizsgálatok eredményeiről bizonyítványt kell kiállítani. A bizonyítványban fel kell sorolni azokat az anyagokat, amelyek a 6.9.4.4 bekezdés szerint a tartányban szállíthatók.

6.9.6 Jelölés

6.9.6.1 A szálvázazás műanyag tartányok jelölésére a 6.8.2.5 bekezdés előírásait kell alkalmazni a következő eltéréssel:

- – a tartánytábla a tartányra laminálható vagy alkalmas műanyagból is készíthető;
- – a tervezési hőmérséklet-tartományt mindig fel kell tüntetni.

6.9.6.2 Ezenkívül, amennyiben egy tételnél a 3.2 fejezet „A” táblázat 13 oszlopában a 6.8.4 e) pont szerinti különleges előírás (TM) is fel van tüntetve, akkor azt is alkalmazni kell.

6.10 FEJEZET

A HULLADÉKOK SZÁLLÍTÁSÁRA SZOLGÁLÓ, VÁKUUMMAL ÜZEMELŐ TARTÁNYOK GYÁRTÁSÁRA, SZERELVÉNYEIRE, TÍPUSJÓVÁHAGYÁSÁRA, VIZSGÁLATÁRA ÉS JELÖLÉSÉRE VONATKOZÓ ELŐÍRÁSOK

Megjegyzés: 1. A mobil tartányokra és az UN többelemes gázkonténerekre (UN MEG-konténerekre) lásd a 6.7 fejezetet; a fémből gyártott rögzített tartányokra (tartányjárművekre), leszerelhető tartányokra, tankkonténerekre és tartányos cserefelépítményekre, valamint a battériás járművekre és többelemes gázkonténerekre (MEG-konténerekre) – az UN MEG-konténerek kivételével – lásd a 6.8 fejezetet; a szálvázaz műanyag tartányokra lásd a 6.9 fejezetet.

2. Ez a fejezet a rögzített tartányokra, a leszerelhető tartányokra, a tankkonténerekre és a tartányos cserefelépítményekre vonatkozik.

6.10.1 Általános előírások

6.10.1.1 Meghatározások

Megjegyzés: Az olyan tartány, amely mindenben megfelel a 6.8 fejezet előírásainak, nem minősül „hulladékok szállítására szolgáló, vákuummal üzemelő tartány”-nak.

6.10.1.1.1 A „védett terület” a következőképpen elhelyezkedő területeket jelenti:

- a tartány alsó részén, az alsó alkotó mindkét oldalán, 60°-os középponti szöghöz tartozó sávban;
- a tartány felső részén, a felső alkotó mindkét oldalán, 30°-os középponti szöghöz tartozó sávban;
- a gépjárművön lévő tartányon az elülső tartányfenéken;
- a hátsó tartányfenék azon részén, mely a 9.7.6 szakaszban előírt védőszerkezet (lőkhárító) által védett részen belül helyezkedik el.

6.10.1.2 Alkalmazási terület

6.10.1.2.1 A 6.10.2 – 6.10.4 szakasz különleges előírásai a hulladékok szállítására szolgáló, vákuummal üzemelő tartányokra vonatkoznak, és kiegészítik vagy módosítják a 6.8 fejezet előírásait.

A hulladékok szállítására szolgáló, vákuummal üzemelő tartányokat nyitható fenékkal is el lehet látni, ha a 4.3 fejezet előírásai a szállítandó anyag alulról történő ürítését engedélyezik (amire a 3.2 fejezet „A” táblázat 12 oszlopában a 4.3.4.1.1 pont szerinti tartánykód harmadik részében „A” vagy „B” betű utal).

A hulladékok szállítására szolgáló, vákuummal üzemelő tartányoknak meg kell felelniük a 6.8 fejezet minden olyan előírásának, amelyet e fejezet előírásai nem módosítanak. Ennek ellenére a 6.8.2.1.19, a 6.8.2.1.20 és a 6.8.2.1.21 pont előírásait nem kell betartani.

6.10.2 Gyártás

6.10.2.1 A tartányokat a töltési vagy ürítési nyomás 1,3-szeresével egyenlő tervezési nyomásra, de legalább 400 kPa (4 bar) túlnyomásra kell méretezni. Amennyiben a szállítandó anyagra a 6.8 fejezetben nagyobb tervezési nyomást ír elő, úgy ezt a nagyobb nyomást kell alkalmazni.

- 6.10.2.2** A tartányokat 100 kPa (1 bar) vákuum elviselésére kell méretezni.
- 6.10.3 Szerelvények**
- 6.10.3.1** A szerelvényeket úgy kell a tartányon elhelyezni, hogy a szállítás és a kezelés során leszakadás vagy sérülés veszélye ellen biztosítva legyenek. Ez az előírás teljesítettnek tekinthető, ha a szerelvényeket az ún. védett területen (lásd 6.10.1.1.1) helyezik el.
- 6.10.3.2** A tartányok alulról ürítése megoldható külső csővezetékekkel és a tartányhoz a lehető legközelebb elhelyezett zárószeleppel, és egy második zárószerkezettel, amelyik vakkarima vagy más, ugyanennyire hatékony szerkezet lehet.
- 6.10.3.3** A tartányhoz, illetve több kamrás tartány esetén az egyes kamrákhoz tartozó zárószelepek állásának és zárási irányának egyértelműnek és a talajszintről ellenőrizhetőnek kell lennie.
- 6.10.3.4** A külső töltő- vagy ürítőszerelvények (csőcsonkok, oldalsó zárószerkezetek) sérüléséből adódó elfolyás elkerülése érdekében a belső főelzáró szelepet vagy – ha van – az első, külső főelzáró szelepet és fészüket (üléküket) úgy kell kialakítani, hogy a külső erőhatásra történő leszakadás veszélye ellen védve legyenek, vagy az ilyen erőhatásnak ellen tudjanak állni. A töltő- és ürítőszerkezeteket (beleértve a karimákat és menetes dugókat is), valamint az esetleges védőkupakokat a véletlen kinyílás ellen biztosítani kell.
- 6.10.3.5** A tartányokat nyitható fenékkal is el lehet látni, anyitható fenéknek azonban meg kell felelnie a következő feltételeknek:
- a) a fenéket úgy kell kialakítani, hogy zárt állásban szivárgásmentesen rögzítve legyen;
 - b) a fenék véletlenül ne nyílhasson ki;
 - c) gépi nyitó/záró szerkezet esetén energia kimaradáskor a fenéknek biztosan zárva kell maradnia;
 - d) megszakítót vagy egyéb biztonsági berendezést kell beépíteni, amely megakadályozza a fenék kinyitását akkor, ha a tartányban túlnyomás van. Ez az előírás nem vonatkozik azokra a fenékekre, amelyeknek gépi működtetésű nyitó/záró szerkezetük van, ahol a működtető szerkezet kényszervezérelt. Ez esetben viszont biztonsági („holtember”) berendezést kell alkalmazni, valamint azt úgy kell elhelyezni, hogy a kezelő mindvégig megfigyelhesse a fenék mozgását, és a fenék nyitása, zárása ne veszélyeztesse a kezelőt; és
 - e) gondoskodni kell arról, hogy ha a jármű, a tankkonténer vagy a tartányos cserefelépítmény felborul, a fenék védve legyen és ne nyíljon ki.
- 6.10.3.6** Ha a hulladékok szállítására használt, vákuummal üzemelő tartányon a tisztítást vagy ürítést segítő dugattyú van, akkor a tartányt olyan határoló/rögzítő szerkezettel kell ellátni, amely minden üzemi helyzetben meggátolja a dugattyú kiengedését a tartányból, ha a dugattyúra a tartány legnagyobb üzemi nyomásával azonos erő hat. A pneumatikus dugattyúval ellátott tartányok és tartánykamrák legnagyobb üzemi nyomása legfeljebb 100 kPa (1 bar) lehet. A dugattyút olyan anyagból és oly módon kell kialakítani, hogy a dugattyú mozgása során ne keletkezzen szikra.
- A dugattyú válaszfalként is szolgálhat, ha helyzetében rögzítve van. Ha a dugattyú rögzítéséhez használt eszköz bármely része a tartányon kívülre esik, úgy kell elhelyezni, hogy véletlen sérüléseknek ne legyen kitéve.
- 6.10.3.7** A tartányt szívócsővel is fel lehet szerelni, ha
- a) az olyan, belső vagy külső elzárószeleppel van ellátva, amely közvetlenül a tartányra vagy a tartányra hegesztett csomagra van rögzítve; a tartány, ill. a csomok és a külső elzárószelep közé forgatókoszorú helyezhető, ha az az ún. védett területre kerül és a külső elzárószelep működtető szerkezete házzal vagy fedéllel védve van a külső erőhatásra történő leszakadás veszélye ellen;

- b) az a) pontban említett elzárószelep úgy van kialakítva, hogy menet közben nem maradhat nyitva; és
- c) a szívócső úgy van kiképezve, hogy ha véletlenül a tartánynak ütközik, nem okozza annak szivárgását.

6.10.3.8

A tartányt a következő kiegészítő üzemi szerelvényekkel kell ellátni:

- a) A vákuumszivattyú, illetve a kompresszor kivezetését úgy kell kialakítani, hogy a gyúlékony vagy mérgező gőzöket olyan helyre terelje, ahol nem okozhatnak veszélyt;
- b) Ha a gyúlékony hulladékok szállítására szolgáló tartányokra szerelt vákuumszivattyú, ill. kompresszor szikraképződést okozhat, akkor a szívó- és a kipufogócsonkon is olyan eszközt kell alkalmazni, amely megakadályozza a láng közvetlen áthatolását;
- c) Azokon a szivattyúkon, amelyek túlnyomást is elő tudnak állítani, a csővezetékre szerelve olyan biztonsági szelep szükséges, amely nyomás alatt tartható. A biztonsági szelepet úgy kell beállítani, hogy a tartány legnagyobb üzemi nyomásánál kisebb nyomáson nyíljon ki;
- d) Elzárószelepet kell elhelyezni a tartány vagy a tartányra szerelt túltöltés gátló kivezetőnyílása és a tartányt a vákuumszivattyúval, illetve a kompresszorral összekötő csővezeték közé;
- e) A tartányt megfelelő vákuum-, illetve nyomásmérővel kell felszerelni, amit úgy kell elhelyezni, hogy a vákuumszivattyút, illetve a kompresszort kezelő személy könnyen leolvashassa. A nyomásmérő skáláján a tartány legnagyobb üzemi nyomásának értékét megkülönböztető jellel kell ellátni;
- f) A tartányt, illetve minden tartánykamrát szintjelzővel kell ellátni. Kémlelőablak akkor használható e célra, ha
 - i) a kémlelőablak a tartány falában van és azzal azonos nyomásállóságú, vagy a tartány külsejére van erősítve;
 - ii) a tartányhoz való alsó és felső csatlakozásnál olyan elzárószelep van, amely közvetlenül a tartányhoz van erősítve és úgy van kialakítva, hogy a menet közben a szelep nem lehet nyitva;
 - iii) tartány legnagyobb üzemi nyomásán is megfelelően működik; és
 - iv) úgy van elhelyezve, hogy véletlen sérülésnek ne legyen kitéve.

6.10.3.9

A hulladékok szállítására szolgáló, vákuummal üzemelő tartányt el kell látni hasadótárcsával ellátott biztonsági szeleppel.

A szelepnek önműködően kell nyílnia (lefújnia) a tartány próbanyomásának 0,9...1,0-szeresénél. Súlyterhelésű (ellensúlyos) szelep alkalmazása tilos.

A hasadótárcsának legkorábban akkor kell felszakadnia, ha a nyomás eléri a szelep nyitónyomását és legkésőbb akkor, ha a nyomás eléri a tartány próbanyomását.

A biztonsági szerkezeteket úgy kell kialakítani, hogy ellenálljanak a dinamikus igénybevételeknek, beleértve a folyadék hullámzását is.

A hasadótárcsa és a biztonsági szelep közti térbe nyomásmérőt vagy más, alkalmas jelzőeszközt kell csatlakoztatni, ami lehetővé teszi, hogy észleljék a hasadótárcsa repedését, kilyukadását vagy szivárgását, ami a biztonsági szelep hibás működését okozhatja.

6.10.4

Vizsgálatok

A hulladékok szállítására szolgáló, vákuummal üzemelő tartányokat rögzített és leszerelhető tartányok esetében legalább háromévenként, ill. tankkonténerek és tartányos cserefelépítmények esetében legalább kettő és fél évenként a 6.8.2.4.3 pontban előírt vizsgálatokon kívül a belső állapot vizsgálatának is alá kell vetni.

6.11 FEJEZET

AZ ÖMLESZTETTÁRU-KONTÉNEREK TERVEZÉSÉRE, GYÁRTÁSÁRA ÉS VIZSGÁLATÁRA VONATKOZÓ KÖVETELMÉNYEK

6.11.1 Meghatározások

E szakasz alkalmazásában

a *zárt ömlesztettáru-konténer* olyan teljesen zárt ömlesztettáru-konténer, amelynek teteje, oldal- és homlokfalai, ill. padlója (beleértve a garatszerű fenék kialakítást is) merev. E fogalomba beletartoznak a nyitható tetejű, oldal- és homlokfalú ömlesztettáru-konténerek is, ha a szállítás alatt zárva tarthatók. A zárt ömlesztettáru-konténereken lehetnek olyan nyílások, amelyek lehetővé teszik a gőzök és gázok, ill. a szabad levegő kicserélődését, azonban normális szállítási körülmények között megakadályozzák a szilárd anyag tartalom kiszabadulását, valamint a csapadék és a fröccsenő víz bejutását;

a *ponyvás ömlesztettáru-konténer* olyan nyitott tetejű ömlesztettáru-konténer, amelynek fenékrésze (beleértve a garatszerű fenék kialakítást is), oldal- és homlokfalai merevek, és hajlékony „eszközzel” van lefedve;

6.11.2 Alkalmazás és általános követelmények

6.11.2.1 Az ömlesztettáru-konténereket és üzemi és szerkezeti szerelvényeiket úgy kell tervezni és gyártani, hogy a tartalom elvesztése nélkül ellenálljanak a tartalom által kifejtett belső nyomásnak és a normális kezelés és szállítás során fellépő feszültségeknek.

6.11.2.2 Ha a konténer ürítőszeleppel van ellátva, annak zárt állásban rögzíthetőnek kell lennie és a teljes ürítőrendszert alkalmas módon védeni kell a sérülésektől. A karos zárószervezetű szelepnek a nem szándékos nyitással szemben biztosíthatónak kell lennie, és nyitott, ill. zárt állásának jól észlelhetőnek kell lennie.

6.11.2.3 Az ömlesztettáru-konténerek típusát jelölő kód

A következő táblázat tartalmazza az ömlesztettáru-konténerek típusát jelölő kódokat:

Az ömlesztettáru-konténer típusa	Kód
Ponyvás ömlesztettáru-konténer	BK1
Zárt ömlesztettáru-konténer	BK2

6.11.2.4 A tudományos és műszaki haladás figyelembe vétele érdekében az illetékes hatóság elfogadhat olyan alternatív megoldásokat, amelyek legalább olyan biztonságosak, mintha a fejezet követelményeit teljesítették volna.

6.11.3 A CSC előírásainak megfelelő, ömlesztett áru szállításra használt, BK1 és BK2 konténerek tervezésére, gyártására és vizsgálatára vonatkozó előírások

6.11.3.1 Tervezési és gyártási követelmények

6.11.3.1.1 E szakasz tervezési és gyártási követelményei teljesítettnek tekinthetők, ha az ömlesztettáru-konténer megfelel az ISO 1496-4:1991 „1 sorozatú teherkonténerek - Meghatározások és vizsgálat - 4 rész: Nem nyomástartó konténerek száraz áruhoz” szabványnak és a konténer portömör.

6.11.3.1.2 Az ISO 1496-4:1991 „1 sorozatú teherkonténerek - Meghatározások és vizsgálat - 1 rész: Általános rendeltetésű teherkonténerek” szabvány szerint tervezett és vizsgált konténereket

olyan üzemi berendezéssel kell ellátni, amelyek – a konténerhez való csatlakozásukkal együtt – úgy vannak kialakítva, hogy annyira megerősítsék a homlokfalakat és a konténer hosszirányú teherbírását, ami ahhoz szükséges, hogy a konténer megfeleljen az ISO 1496-4:1991 szabvány megfelelő vizsgálati követelményeinek.

6.11.3.1.3 Az ömlesztettáru-konténernek portömörnek kell lennie. Ha a konténer portömörre tételéhez bélést használnak, azt megfelelő anyagból kell készíteni. A béléshez használt anyag szilárdságának és a bélés kialakításának meg kell felelnie a konténer befogadóképességének és szándékolt használatának. A bélés egyesítéseinek és zárásainak el kell viselniük a normális kezelés és szállítás során fellépő nyomásokat és ütéseket. A szellőztetett ömlesztettáru-konténereknél az esetleges bélés nem akadályozhatja a szellőző szerkezetek működését.

6.11.3.1.4 A billentéssel üritett ömlesztettáru-konténerek üzemi berendezéseinek alkalmasnak kell lenniük a teljes töltőtömeg megtartására a döntött helyzetben.

6.11.3.1.5 Minden eltolható tetőt, ill. oldal- vagy homlokfal szakaszt olyan zárószerkezettel kell ellátni, amelynek rögzítőszervezete úgy van kialakítva, hogy zárt helyzetét a talajon álló megfigyelő észlelhesse.

6.11.3.2 *Üzemi szerelvények*

6.11.3.2.1 A töltő- és ürítőszervezeteket úgy kell elhelyezni, hogy a szállítás és a kezelés során leszakadás vagy sérülés veszélye ellen biztosítva legyenek. A töltő- és ürítőszervezeteket a nem szándékos kinyitás ellen biztosítani kell. A zárószerkezetek nyitott és zárt helyzetét és zárási irányát jól láthatóan fel kell tüntetni.

6.11.3.2.2 A nyílások tömítéseit úgy kell kialakítani, hogy az ömlesztettáru-konténer kezelése, töltése és ürítése ne okozza sérülésüket.

6.11.3.2.3 Ha szellőzésre van szükség, az ömlesztettáru-konténert légcserét biztosító eszközzel kell ellátni, akár természetes légáramlás biztosításával, pl. nyílásokkal, vagy aktív elemekkel, pl. ventilátorokkal. A szellőzést úgy kell biztosítani, hogy soha ne jöhessen létre vákuum a konténerben. A gyúlékony anyagok vagy gyúlékony gázokat vagy gőzöket kibocsátó anyagok szállítására szolgáló konténerek szellőző elemeit úgy kell kialakítani, hogy ne képezzenek gyújtóforrást.

6.11.3.3 *Vizsgálat*

6.11.3.3.1 Az e szakasz követelményei szerint ömlesztettáru-konténerként használt, karbantartott és minősített konténereket a CSC előírásai szerint kell vizsgálni és jóváhagyni.

6.11.3.3.2 Az ömlesztettáru-konténerként használt és minősített konténereket a CSC szerint kell időszakos vizsgálatnak alávetni.

6.11.3.4 *Jelölés*

6.11.3.4.1 Az ömlesztettáru-konténerként használt konténereket a CSC szerint „Biztonsági jóváhagyási táblá”-val kell megjelölni.

6.11.4 A nem a CSC előírásainak megfelelő, ömlesztett áru szállításra használt, BK1 és BK2 konténerek tervezésére, gyártására és vizsgálatára vonatkozó előírások

Megjegyzés: *Ha az e szakasz előírásainak megfelelő konténereket szilárd anyagok ömlesztett szállítására használják, a fuvarokmányba a következő bejegyzést kell tenni: „A(z) ... illetékes hatósága által jóváhagyott BK(x) ömlesztettáru-konténer” (lásd az 5.4.1.1.17 pontot).*

6.11.4.1 Az e szakasz alkalmazásában az ömlesztettáru-konténer fogalom alá tartoznak az „offshore” ömlesztettáru-konténerek, a billenőputtonyok, az ömlesztettáru-silók, a cserefelépítmények, a konténertechnők, a görgős konténerek és a járművek rakodótere.

Megjegyzés: *Ezen ömlesztettáru-konténerek közé tartoznak azok a 7.1.3 szakaszban említett UIC 591 és 592-2 – 592-4 Döntvénynek megfelelő konténerek is, amelyek nem felelnek meg a CSC előírásainak.*

6.11.4.2 Az ömlesztettáru-konténereket úgy kell tervezni és gyártani, hogy elég erősek legyenek a normális kezelés és szállítás során fellépő ütődések és igénybevételek elviselésére, beleértve a szállítási módok közötti átrakás során fellépő igénybevételeket is.

6.11.4.3 (fenntartva)

6.11.4.4 Az ömlesztettáru-konténereket az illetékes hatóságnak kell jóváhagynia és a jóváhagyásnak tartalmaznia kell a 6.11.2.3 bekezdés szerinti, az ömlesztettáru-konténer típusát jelölő kódot és adott esetben a vizsgálatra vonatkozó követelményeket.

6.11.4.5 Ha a veszélyes áru megtartásához béléssre van szükség, annak ki kell elégítenie a 6.11.3.1.3 pont előírásait.

6.12 FEJEZET

A MEMU-k TARTÁNYAINAK, ÖMLESZTETTÁRU-KONTÉNEREINEK ÉS ROBBANÓANYAG SZÁLLÍTÁSÁRA SZOLGÁLÓ, KÜLÖNLEGES RAKTEREINEK TERVEZÉSÉRE, GYÁRTÁSÁRA, SZERELVÉNYEIRE, TÍPUSJÓVÁHAGYÁSÁRA, VIZSGÁLATÁRA ÉS JELÖLÉSÉRE VONATKOZÓ KÖVETELMÉNYEK

- Megjegyzés: 1. A mobil tartányokra lásd a 6.7 fejezetet; a fémről gyártott, rögzített tartányokra (tartányjárművekre), leszerelhető tartányokra, tank-konténerekre és tartányos cserefelépítményekre lásd a 6.8 fejezetet; a szálvázaz műanyag tartányokra lásd a 6.9 fejezetet, a hulladékok szállítására szolgáló, vákuummal üzemelő tartányokra lásd a 6.10 fejezetet; az ömlesztettáru-konténerekre lásd a 6.11 fejezetet.*
- 2. Ez a fejezet az 1. megjegyzésben említett fejezetek követelményeinek nem mindenben megfelelő rögzített tartányokra, leszerelhető tartányokra, tank-konténerekre és tartányos cserefelépítményekre, valamint az ömlesztettáru-konténerekre és a robbanóanyag szállítására szolgáló, különleges rakterekre vonatkozik.*

6.12.1 Alkalmazási terület

E fejezet követelményeit a MEMU-val történő veszélyes áru szállításra használt tartányokra, ömlesztettáru-konténerekre és különleges rakterekre kell alkalmazni.

6.12.2 Általános előírások

6.12.2.1 A tartányokra a 6.8 fejezet követelményeit az e fejezet különleges előírásai által módosított formában kell betartani, az 1.2.1 szakaszban rögzített tartányok minimális befogadóképességére vonatkozó meghatározás nem érvényes e tartányokra.

6.12.2.2 A MEMU-val történő veszélyes áru szállításra használt ömlesztettáru-konténereknek a BK2 típusra vonatkozó követelményeknek kell megfelelniük.

6.12.2.3 Ha egy tartány vagy egy ömlesztettáru-konténer többféle anyagot tartalmaz, az anyagokat legalább egy kettős fallal kell elválasztani, melyek egyben a páralecsapódás elvezetésére alkalmas üres légteret határolnak.

6.12.3 Tartányok

6.12.3.1 1000 liter vagy annál nagyobb befogadóképességű tartányok

6.12.3.1.1 A tartányokra a 6.8.2 szakasz követelményeit kell betartani.

6.12.3.1.2 Az UN 1942 és az UN 3375 tételhez használt tartánynál be kell tartani a 4.3 és a 6.8 fejezet légző-berendezésre vonatkozó előírásait, ezen kívül a tartányon hasadótárcsának is kell lenni, vagy egyéb, a használat szerinti ország illetékes hatósága által jóváhagyott nyomás-csökkentő eszköznek.

6.12.3.1.3 Azoknál a nem kör keresztmetszetű tartányoknál (pl. a koffer alakú vagy ellipszis keresztmetszetű tartányoknál), amelyeket nem lehet a 6.8.2.1.4 pont, ill. az ott említett szabványok

vagy műszaki szabályzat szerint méretezni, az illetékes hatóság által meghatározott nyomáspróbával is lehet bizonyítani, hogy a megengedett igénybebevételt képes elviselni.

Ezekre a tartányokra a 6.8.2.1 bekezdés követelményeit kell betartani, a 6.8.2.1.3, a 6.8.2.1.4 és a 6.8.2.1.13 – 6.8.2.1.22 pontok kivételével.

A tartány falvastagsága nem lehet kisebb a következő táblázatban megadott értékeknél:

Anyag	Legkisebb falvastagság
Rozsdamentes ausztenites acél	2,5 mm
Egyéb acél	3 mm
Alumíniumötvözet	4 mm
99,80%-os tisztaságú alumínium	6 mm

A tartányt az oldalirányú ütközésekből vagy felborulásból eredő sérülések ellen védelemmel kell ellátni. Ez lehet a 6.8.2.1.20 pont szerinti védelem, vagy az illetékes hatóság jóváhagyhat egyéb megoldást is.

6.12.3.1.4 A 6.8.2.5.2 pont követelményeitől eltérően a tartányon nem kell feltüntetni sem a tartánykódot, sem a különleges előírásokat.

6.12.3.2 *1000 liternél kisebb befogadóképességű tartányok*

6.12.3.2.1 A tartányok gyártására a 6.8.2.1 bekezdés követelményeit kell betartani, a 6.8.2.1.3, a 6.8.2.1.4, a 6.8.2.1.6, a 6.8.2.1.10 – 6.8.2.1.23 és a 6.8.2.1.28 pontok kivételével.

6.12.3.2.2 A tartányok szerelvényeire a 6.8.2.2.1 pont követelményeit kell betartani. Az UN 1942 és az UN 3375 tételhez használt tartánynál be kell tartani a 4.3 és a 6.8 fejezet légző-berendezésre vonatkozó előírásait, ezen kívül a tartányon hasadótárcsának is kell lenni, vagy egyéb, a használat szerinti ország illetékes hatósága által jóváhagyott nyomáscsökkentő eszköznek.

6.12.3.2.3 A tartány falvastagsága nem lehet kisebb a következő táblázatban megadott értékeknél:

Anyag	Legkisebb falvastagság
Rozsdamentes ausztenites acél	2,5 mm
Egyéb acél	3 mm
Alumínium ötvözet	4 mm
99,80%-os tisztaságú alumínium	6 mm

6.12.3.2.4 A tartányoknak lehetnek nem domború szerkezeti részei. Megerősítésként (merevítésként) alkalmazhatók ívelt vagy hullámos falak, ill. merevítő bordák is. A tartány minden oldalán – legalább az egyik irányban – a párhuzamos merevítések közötti távolság ne legyen nagyobb, mint a falvastagság százszorosa.

6.12.3.2.5 A hegesztéseket szakszerűen kell elkészíteni, és teljes biztonságot kell nyújtaniuk. A hegesztést vizsgázott hegesztőnek olyan hegesztési eljárással kell végeznie, amelynek alkalmasságát (beleértve a szükséges hőkezelést is) vizsgálatokkal igazolták.

6.12.3.2.6 A 6.8.2.4 bekezdés követelményeit nem kell betartani. A MEMU tulajdonosának vagy használójának felelősségére azonban üzembehelyezés előtti és időszakos vizsgálatokat kell végezni. A tartány és a szerelvények külső és belső állapotát szemrevételezéssel meg kell vizsgálni, és legalább három évenként az illetékes hatóság által megfelelőnek tartott módon tömörségi vizsgálatot kell végezni.

6.12.3.2.7 A 6.8.2.3 bekezdés típusjövahagyásra és a 6.8.2.5 bekezdés jelölésre vonatkozó követelményeit nem kell alkalmazni.

6.12.4 Szerelvények

6.12.4.1 Az UN 1942 és az UN 3375 tételhez használt, alsó ürítésű tartányokat legalább két zárószerkezettel kell ellátni. Az egyik zárószerkezet lehet a tartányhoz tartozó keverő vagy a betöltésre szolgáló szivattyú is.

6.12.4.2 Az első zárószerkezet után elhelyezkedő csővezeték csak könnyen olvadó anyagból lehet (pl.gumitömlő) vagy könnyen olvadó részeinek kell lennie.

6.12.4.3 A külső szivattyú vagy ürítőszerelvény (csővezeték) sérüléséből adódó elfolyás elkerülése érdekében az első zárószerkezetet és fészket (ülékét) a külső erőhatásra történő leszakadás veszélye ellen védeni kell, vagy úgy kell kialakítani, hogy az ilyen erőhatásnak ellen tudjon állni. A töltő- és ürítőszerkezeteket (beleértve a karimákat és a menetes dugókat is), valamint az esetleges védőkupakokat a nem szándékos kinyitás ellen biztosítani kell.

6.12.4.4 Az UN 3375 tételhez használt tartányokon a 6.8.2.2.6 pont szerinti légző-berendezés „hattyúnyakkal” helyettesíthető. Az ilyen szerelvényt védeni kell a külső erőhatásra történő leszakadás veszélye ellen, vagy úgy kell kialakítani, hogy az ilyen erőhatásnak ellen tudjon állni.

6.12.5 Robbanóanyag szállítására szolgáló, különleges raktér

A gyutacsokat és/vagy detonátorszerkezeteket, valamint a D összeférhetőségi csoport anyagait és tárgyait tartalmazó küldeménydarabok szállítására szolgáló raktereket úgy kell kialakítani, hogy hatékony elkülönítést biztosítson, hogy ne álljon fenn a detonáció átvitelének a veszélye a gyutacsoktól és/vagy detonátorszerkezetektől a D összeférhetőségi csoport anyagaira, ill. tárgyaira. Az elkülönítést elválasztott rekeszek használatával vagy a két fajta robbanóanyag (robbanótárgy) egyikének különleges védőburkolat-rendszerbe történő helyezésével kell megvalósítani. Az illetékes hatóságnak az elkülönítés mindkét módját jóvá kell hagyni. Ha a raktérhez használt anyag fém, a teljes belső felületét megfelelő tűzállóságú anyaggal kell bevonni. A robbanóanyag szállítására szolgáló rakteret úgy kell elhelyezni, hogy védve legyen a nehéz terepen való rázkódástól, sérüléstől, a szállított többi veszélyes anyaggal való veszélyes kölcsönhatástól, valamint a járműtől származó gyújtóforrások (pl. kipufogó, stb.) ellen.

Megjegyzés: Az EN 13501-1:2002 szabvány szerinti B-S3-d2 osztályba sorolt anyagok megfelelnek a tűzállósági követelménynek.

7. RÉSZ

A SZÁLLÍTÁS FELTÉTELEIRE, A BERAKÁSRA, A KIRAKÁSRA ÉS AZ ÁRUKÉZELÉSRE VONATKOZÓ ELŐÍRÁSOK

7.1 FEJEZET

ÁLTALÁNOS ELŐÍRÁSOK

7.1.1 A veszélyes áruk szállításához e fejezet előírásai szerint és ezenkívül küldeménydarabos szállításnál a 7.2 fejezet, ömlesztett áru szállításnál a 7.3 fejezet, illetve tartányos szállításnál a 7.4 fejezet előírásai szerint meghatározott szállítóeszköz alkalmazása kötelező. Ezen kívül a berakásra, a kirakásra és az árukezelésre a 7.5 fejezet előírásait is be kell tartani.

Az egyes veszélyes árukra a 3.2 fejezet „A” táblázat 16, 17 és 18 oszlopa mutatja, hogy e rész mely előírásait kell betartani.

7.1.2 E rész előírásain kívül a veszélyes áruk szállítására használt járműveknek tervezésük, szerkezetük, és amennyiben szükséges, jóváhagyásuk tekintetében meg kell felelniük a 9. rész vonatkozó előírásainak.

7.1.3 Ha egy nagykonténer, tankkonténer vagy mobil tartány „A Biztonságos Konténerekről szóló 1972. évi Nemzetközi Egyezmény” (CSC) módosított kiadása, ill. az UIC 591 Döntvény (2007. 10. 01. állapot, 3. kiadás), 592-2 Döntvény (2004. 10. 01. állapot, 6. kiadás), 592-3 Döntvény (1998. 01. 01. állapot, 2. kiadás) és 592-4 Döntvény (2007. 05. 01. állapot, 3. kiadás) meghatározása szerint konténernek minősül, csak akkor használható veszélyes áru szállítására, ha a nagykonténer, ill. a tankkonténer vagy a mobil tartány teherhordó váza megfelel ezeknek az előírásoknak.

7.1.4 A nagykonténer csak akkor adható fel szállításra, ha szerkezetileg megfelelő állapotú.

A „szerkezetileg megfelelő” azt jelenti, hogy a konténer szerkezeti részei, így az alsó és felső hossztartók, az alsó és felső kereszttartók (küszöbök és homlokgerendák), a padló kereszttartók, a sarokoszlopok és a sarokelemek mentesek a nagyobb hibáktól. „Nagyobb hibának” számít a szerkezeti elemek 19 mm-nél nagyobb mélységű görbülete vagy horpadása, a hosszúságtól függetlenül; a szerkezeti elemek repedése vagy törése; egynél több vagy helytelen toldás (pl. átlapolt illesztés) az alsó vagy felső kereszttartókon vagy homlokgerendákon; kettőnél több toldás bármelyik alsó és felső hossztartón; bármilyen toldás az alsó kereszttartón (küszöbön) vagy a sarokoszlopon; beszorult, elcsavarodott, törött, hiányzó vagy más okból használhatatlan ajtópántok és egyéb szerelvények; nem záró tömítések; általában a szerkezet olyan torzulása, ami a kezelőberendezés pontos csatlakoztatását, illetve a járművön vagy az alvázon való elhelyezést és rögzítést akadályozza.

Ezen kívül, függetlenül a szerkezet anyagától, elfogadhatatlan a konténer bármely elemének károsodása, pl. az oldalfal lemezelésének rozsdásodása, az üvegszövet szétválása. Megengedett viszont a normális mértékű elhasználódás, beleértve a rozsdásodást, enyhe ferdüléseket és a karcolásokat és olyan egyéb sérüléseket, amelyek nem befolyásolják a konténer használhatóságát és időjárásállóságát.

A megrakás előtt a konténert ellenőrizni kell annak biztosítására, hogy mentes legyen az előző rakomány maradványaitól, és hogy a belső padlón és falakon ne legyenek kiálló részek.

7.1.5 A nagykonténereknek meg kell felelniük azoknak az előírásoknak, amelyeket ez a rész – és esetleg a 9. rész – az adott rakomány esetén a jármű felépítményére tartalmaz; ilyenkor a jármű felépítményének nem kell ezeket az előírásokat teljesítenie.

Ha azonban a nagykonténert szállító jármű rakfelületének szigetelése és hőállósága megfelel az előírásoknak, akkor a nagykonténer mentesül ezek alól.

Ez az előírás az 1 osztály robbanóanyagainak és tárgyainak szállítására használt kis-konténerekre is vonatkozik.

7.1.6

A szállított veszélyes áru természete vagy mennyisége miatt a járműre előírt feltételeket nem változtatja meg az a tény, hogy a veszélyes áru (egy vagy több) konténerben van, a 7.1.5 szakasz első mondatának második részében szereplő kivétellel.

7.2 FEJEZET

A KÜLDEMÉNYDARABOK SZÁLLÍTÁSÁRA VONATKOZÓ ELŐÍRÁSOK

- 7.2.1** Hacsak a 7.2.2 – 7.2.4 szakaszban nincs másként előírva, a küldeménydarabok:
- a) fedett járműbe vagy zárt konténerbe; vagy
 - b) ponyvás járműbe vagy ponyvás konténerbe; vagy
 - c) nyitott járműre vagy nyitott konténerbe rakhatók.
- 7.2.2** Az olyan küldeménydarabokat, amelyek csomagolása nedvességre érzékeny, fedett vagy ponyvás járműbe, ill. zárt vagy ponyvás konténerbe kell rakni.
- 7.2.3** (fenntartva)
- 7.2.4** A következő különleges előírásokat kell betartani, ha a 3.2 fejezet „A” táblázat 16 oszlopában fel vannak tüntetve:
- V1** A küldeménydarabokat fedett vagy ponyvás járműbe, ill. zárt vagy ponyvás konténerbe kell rakni.
- V2**
- 1) A küldeménydarabokat csak olyan EX/II vagy EX/III járművekbe szabad berakni, amelyek kielégítik a 9. rész vonatkozó előírásait. A jármű kiválasztása a szállított mennyiségtől függ, ami szállítóegységenként korlátozva van a berakásra vonatkozó előírások szerint (lásd a 7.5.5.2 bekezdést).
 - 2) Azok a pótkocsik, kivéve a félpótkocsikat, amelyek megfelelnek az EX/II, ill. az EX/III járművekre előírt feltételeknek, olyan gépjárművel is vontathatók, amely nem felel meg ezeknek az előírásoknak.
- A konténerben történő szállításra lásd a 7.1.3 – 7.1.6 szakaszt is.
- Ha az 1 osztály anyagait vagy tárgyait olyan mennyiségben, amihez EX/III jármű(vek)ből képzett szállítóegységre van szükség, multimodális szállítási mód részeként konténerekben szállítják kikötő, vasúti terminál vagy repülőtér területéről mint érkező, vagy területére mint továbbítandó árut, akkor EX/II jármű(vek)ből képzett szállítóegység is használható, amennyiben a szállított konténerek megfelelnek az IMDG Kódex, a RID vagy az ICAO Műszaki Utasítások megfelelő előírásainak.
- V3** Könnyen folyó, porszerű anyagok és tűzijáték testek esetében a konténer padlózatának nemfémes anyagból készítettnek vagy nemfémes anyaggal bevontnak kell lennie.
- V4** (fenntartva)
- V5** A küldeménydarabok nem szállíthatók kiskonténerekben.
- V6** (fenntartva)
- V7** (fenntartva)

- V8**
- 1) A hőmérséklet-szabályozással stabilizált anyagokat úgy kell továbbítani, hogy a 2.2.41.1.17 és a 2.2.41.4, illetve a 2.2.52.1.16 és a 2.2.52.4 bekezdésben - előírt szabályozási hőmérsékleteket soha ne lépjék túl.
 - 2) A szállításhoz a hőmérséklet-szabályozás módjának kiválasztása számos tényező, pl. a következők függvénye:
 - a szállítandó anyag(ok) szabályozási hőmérséklete;
 - a szabályozási hőmérséklet és a várható környezeti hőmérséklet közötti különbség;
 - a hőszigetelés hatékonysága;
 - a szállítás időtartama;
 - az út során a késésre beszámított biztonsági tartalék.
 - 3) A szabályozási hőmérséklet túllépésének elkerülésére alkalmas módszerek növekvő hatékonysági sorrendben a következők:

R1 Hőszigetelés, feltéve, hogy az anyag(ok) kezdeti hőmérséklete elég alacsony a szabályozási hőmérséklethez viszonyítva.

R2 Hőszigetelés és hűtőközeges rendszer, feltéve, hogy:

 - elfogadható mértékű késésre is számítva megfelelő mennyiségű, nem gyúlékony hűtőközeget (pl. cseppfolyósított nitrogént vagy szárazjeget) visznek, vagy a hűtőközeg utánpótlását biztosítják;
 - cseppfolyósított oxigént vagy levegőt nem használnak hűtőközegként;
 - a hűtőhatás még akkor is egyenletes, ha a hűtőközeg túlnyomó része felhasználásra került; és
 - a szállítóegységbe való belépés előtti szellőztetés szükségességére a szállítóegység ajtaján vagy ajtóin levő felirat egyértelműen figyelmeztet.

R3 Hőszigetelés és egyszerű gépi hűtőrendszer, feltéve, hogy azoknál az anyagoknál, amelyek lobbanáspontja alacsonyabb, mint a vész hőmérséklet + 5 °C, az anyagok gyúlékony gőzei meggyulladásának megakadályozására robbanásbiztos (Ex IIB T3) elektromos szerelvényeket használnak a hűtőkamrában.

R4 Hőszigetelés és kombinált gépi hűtésű és hűtőközeges rendszer, feltéve, hogy:

 - a két rendszer egymástól független; és
 - az előző R2 és R3 módszer követelményei teljesülnek.

R5 Hőszigetelés és kettős gépi hűtőrendszer, feltéve, hogy:

 - eltekintve az integrált tápegységtől, a két rendszer egymástól független;
 - mindegyik rendszer egyedül is képes a hőmérséklet megfelelő szabályozásának fenntartására; és
 - azoknál az anyagoknál, amelyek lobbanáspontja alacsonyabb, mint a vész hőmérséklet + 5 °C, az anyagok gyúlékony gőzei meggyulladásának megakadályozására robbanásbiztos (Ex IIB T3) elektromos szerelvényeket használnak a hűtőkamrában.

- 4) Az R4 és az R5 módszer minden szerves peroxidhoz és önreaktív anyaghoz használható.

Az R3 módszer a C, a D, az E és az F típusú szerves peroxidokhoz és önreaktív anyagokhoz használható, és ha a szállítás során a várható legnagyobb környezeti hőmérséklet $10\text{ }^{\circ}\text{C}$ -nál nagyobb mértékben nem haladja meg a szabályozási hőmérsékletet, akkor a B típusú szerves peroxidokhoz és önreaktív anyagokhoz is.

Az R2 módszer a C, a D, az E és az F típusú szerves peroxidokhoz és önreaktív anyagokhoz használható akkor, ha a szállítás során a várható legnagyobb környezeti hőmérséklet $30\text{ }^{\circ}\text{C}$ -nál nagyobb mértékben nem haladja meg a szabályozási hőmérsékletet.

Az R1 módszer a C, a D, az E és az F típusú szerves peroxidokhoz és önreaktív anyagokhoz használható akkor, ha a szállítás során a várható legnagyobb környezeti hőmérséklet legalább $10\text{ }^{\circ}\text{C}$ -kal alacsonyabb, mint a szabályozási hőmérséklet.

- 5) Ha az anyagot hőszigetelt, hűtő vagy gépi hűtésű járműben vagy konténerben kell szállítani, a járműnek, ill. a konténernek ki kell elégítenie a 9.6 fejezet - előírásait.
- 6) Ha az anyag hűtőközeggel megtöltött védőcsomagolásban van, akkor fedett vagy ponyvás járműbe, ill. zárt vagy ponyvás konténerbe kell rakni. A fedett járműveket, ill. a zárt konténereket megfelelően szellőztetni kell. A ponyvás járműveket és konténereket fel kell szerelni oldalfalakkal és hátsó fallal. A ponyvákat vízhatlan és lángmentesített anyagból kell készíteni.
- 7) A hűtőrendszer ellenőrző és hőmérséklet-érzékelő szerkezeteinek könnyen hozzáférhetőek kell lenniük és minden elektromos csatlakozásnak vízállónak kell lennie. A légtér hőmérsékletét a szállítóegységen belül két egymástól független érzékelővel kell mérni és ezek adatait úgy kell rögzíteni, hogy minden hőmérséklet-változás könnyen észlelhető legyen. A hőmérsékletet négy-hat óránként kell ellenőrizni és feljegyezni. Ha a szállított anyag szabályozási hőmérséklete kisebb mint $+25\text{ }^{\circ}\text{C}$, akkor a szállítóegységet el kell látni a hűtőrendszertől független forrású fény és hang vészjelző készülékkel, amit úgy kell beállítani, hogy a szabályozási hőmérsékleten vagy az alatt működésbe lépjen.
- 8) Tartalék hűtőrendszernek vagy tartalék alkatrészeknek rendelkezésre kell állniuk.

Megjegyzés: A V8 előírást nem kell betartani a 3.1.2.6 bekezdésben hivatkozott anyagokra, ha ezek az anyagok kémiai inhibitor hozzáadásával vannak stabilizálva úgy, hogy az ÖBH nagyobb, mint $50\text{ }^{\circ}\text{C}$. Ilyen esetben akkor lehet szükség hőmérséklet-szabályozásra, ha az adott szállítási körülmények között a hőmérséklet meghaladhatja az $55\text{ }^{\circ}\text{C}$ -ot.

V9 (fenntartva)

V10 Az IBC-ket fedett vagy ponyvás járműben, ill. zárt vagy ponyvás konténerben kell szállítani.

V11 A fém és a merev falú műanyag IBC-k kivételével a többi IBC-t fedett vagy ponyvás járműben, ill. zárt vagy ponyvás konténerben kell szállítani.

- V12** A 31HZ2 (31HA2, 31HB2, 31HN2, 31HD2 és 31HH2) típusú IBC-ket fedett járműben vagy zárt konténerben kell szállítani.
- V13** Ha az anyag 5H1, 5L1 vagy 5M1 típusú zsákokba van csomagolva, fedett járműben vagy zárt konténerben kell szállítani.
- V14** A 3.3 fejezet 327 különleges előírása szerint, újrahasznosítás vagy ártalmatlanítás céljából szállított aeroszolok csak jól szellőző vagy nyitott járműben, ill. konténerben vihetők.

7.3 FEJEZET

AZ ÖMLESZTETT SZÁLLÍTÁSRA VONATKOZÓ ELŐÍRÁSOK

7.3.1 Általános előírások

7.3.1.1 Valamely áru csak akkor szállítható ömlesztettáru-konténerben, konténerben vagy járművön ömlesztve, ha:

- a) a 3.2 fejezet „A” táblázat 10 oszlopában BK (betűkkel kezdődő) kóddal jelölt különleges előírás van feltüntetve, amely ezt a szállítási módot kifejezetten megengedi, és ezen szakasz előírásain kívül a 7.3.2 szakasz vonatkozó feltételeit is betartják; vagy
- b) a 3.2 fejezet „A” táblázat 17 oszlopában VV (betűkkel kezdődő) kóddal jelölt különleges előírás van feltüntetve, amely ezt a szállítási módot kifejezetten megengedi, és ezen szakasz előírásain kívül a 7.3.3 szakaszban található, vonatkozó különleges előírás feltételeit is betartják.

Az üres, tisztítatlan csomagolóeszközök azonban szállíthatók ömlesztve, kivéve, ha ezt a szállítási módot az ADR más előírásai kifejezetten tiltják.

Megjegyzés: A tartányos szállításra lásd a 4.2 és a 4.3 fejezetet.

7.3.1.2 Azok az anyagok, amelyek a szállítás alatt valószínűleg előforduló hőmérsékleteken folyékonnyá válhatnak, ömlesztve nem szállíthatók.

7.3.1.3 Az ömlesztettáru-konténernek, konténernek, ill. a jármű felépítményének portömörnek kell lennie és úgy kell lezárni, hogy normális szállítás körülmények között (ideértve a rezgések, a hőmérséklet-, a páratartalom- vagy a nyomásváltozás hatását is) a tartalomból semmi ne szabadulhasson ki.

7.3.1.4 Az ömlesztett szilárd anyagot úgy kell berakni és egyenletesen eloszlatni, hogy minimális legyen az olyan elmozdulás, ami az ömlesztettáru-konténer, a konténer, ill. a jármű sérülését vagy a veszélyes áru szabadba jutását okozhatná.

7.3.1.5 Ha szellőző-szerkezetek vannak felszerelve, azokat tisztán és üzemképes állapotban kell tartani.

7.3.1.6 Az ömlesztett szilárd anyag nem reagálhat veszélyesen az ömlesztettáru-konténer, a konténer, ill. a jármű, a tömítések és a felszerelések – beleértve a tetőket és ponyvákat – azon részeivel, amelyekkel érintkezésbe kerülhet, ill. a védőbevonattal és lényegesen nem gyengítheti azokat. Az ömlesztettáru-konténert, a konténert, ill. a járművet úgy kell gyártani vagy átalakítani, hogy az áru ne hatolhasson be a padlóburkolat hézagaiba, és ne érintkezhessen az ömlesztettáru-konténer, a konténer, ill. a jármű olyan részeivel, amelyeket az anyag vagy annak maradéka megtámadhat.

7.3.1.7 Berakás és szállításra történő átadás előtt minden ömlesztettáru-konténert, konténert, ill. járművet meg kell vizsgálni, ill. ki kell tisztítani, hogy ne tartalmazzon a belsejében vagy a külsején semmiféle olyan maradékot, amely:

- a szállítandó anyaggal veszélyes reakcióba léphet;
- hátrányosan befolyásolhatja az ömlesztettáru-konténer, a konténer, ill. a jármű szerkezeti épségét;
- befolyásolhatja az ömlesztettáru-konténer, a konténer, ill. a jármű veszélyes áru megtartó képességét.

- 7.3.1.8** Szállítás alatt semmiféle veszélyes maradék nem tapadhat az ömlesztettáru-konténer, a konténer, ill. a jármű felépítmény külső felületére.
- 7.3.1.9** Amennyiben egymás mögött több zárószerkezet van beépítve, töltés előtt először a szállítandó anyaghoz legközelebb esőt kell elzárni.
- 7.3.1.10** Azokat az üres ömlesztettáru-konténereket, konténereket, ill. járműveket, amelyekben szilárd anyagot ömlesztve szállítottak, a megrakott ömlesztettáru-konténerre, konténerre, ill. járműre vonatkozó ADR előírások szerint kell kezelni, kivéve, ha megtették a megfelelő intézkedéseket mindenfajta veszély kiküszöbölésére.
- 7.3.1.11** Ha az ömlesztettáru-konténert, a konténert vagy a járművet olyan áru ömlesztett szállítására használják, amely hajlamos a porrobbanásra, vagy gyúlékony gőzök fejlesztésére (pl. bizonyos hulladékok), akkor intézkedéseket kell tenni az anyag töltése, szállítása, ill. ürítése során a gyújtóforrások kiküszöbölésére és az elektrosztatikus feltöltődés elkerülésére.
- 7.3.1.12** Azok az anyagok, pl. hulladékok, amelyek egymással veszélyes reakcióba léphetnek, valamint a különböző osztályok anyagai és az ADR hatálya alá nem tartozó olyan anyagok, amelyek hajlamosak a veszélyes reakcióra, nem tehetők ugyanabba az ömlesztettáru-konténerbe, konténerbe, ill. járműbe.
- Veszélyes reakció:
- a) az égés és/vagy jelentős hőfejlődés;
 - b) gyúlékony és/vagy mérgező gázok fejlődése;
 - c) maró folyékony anyagok képződése;
 - d) vegyileg nem állandó anyagok képződése.
- 7.3.1.13** A megrakás előtt az ömlesztettáru-konténert, a konténert, ill. a járművet szemrevételezéssel ellenőrizni kell annak biztosítására, hogy az szerkezetileg megfelelő legyen, a belső falakon, a padlón és a mennyezeten ne legyenek kiálló részek vagy sérülések, ill. az esetleges béléseken és a szállított anyagot tartalmazó eszközön ne legyen olyan hasadás, szakadás vagy egyéb sérülés, ami veszélyeztetné a szállított anyag megtartását. A „szerkezetileg megfelelő” azt jelenti, hogy az ömlesztettáru-konténer, a konténer, ill. a jármű szerkezeti elemei, pl. ömlesztettáru-konténernél, konténernél az alsó és felső hossztartók, az alsó és felső kereszt-tartók (küszöbök és homlokgerendák), a padló kereszt-tartók, a sarokoszlopok és a sarokelemek mentesek a nagyobb hibáktól. Nagyobb hibának számít:
- a) a szerkezeti vagy tartóelemek görbülése, repedése vagy törése, ami befolyásolja az ömlesztettáru-konténer, a konténer, ill. a jármű felépítmény épségét;
 - b) egynél több vagy helytelen toldás (pl. átlapolt illesztés) az alsó vagy felső kereszt-tartókon vagy homlokgerendákon;
 - c) kettőnél több toldás bármelyik alsó és felső hossztartón;
 - d) bármilyen toldás az alsó kereszt-tartón (küszöbön) vagy a sarokoszlopon;
 - e) beszorult, elcsavarodott, törött, hiányzó vagy más okból használhatatlan ajtópántok és egyéb szerelvények;
 - f) nem záró tömítések;
 - g) általában az ömlesztettáru-konténer, ill. a konténer szerkezetének olyan torzulása, ami a kezelőberendezés pontos csatlakoztatását, illetve a járművön vagy az alvázon való elhelyezést és rögzítést akadályozza;
 - h) az emelőszerkezet vagy a kezelőberendezés bármilyen sérülése; és

- i) az üzemi vagy szerkezeti berendezések bármilyen sérülése.

7.3.2 Az ömlesztett szállításra vonatkozó kiegészítő előírások a 7.3.1.1 a) pont alkalmazása esetén

7.3.2.1 A 3.2 fejezet „A” táblázat 10 oszlopában szereplő BK1 és a BK2 kódok jelentése a következő:

BK1: Ömlesztett szállítás ponyvás ömlesztettáru-konténerben engedélyezett;

BK2: Ömlesztett szállítás zárt ömlesztettáru-konténerben engedélyezett.

7.3.2.2 Az alkalmazott ömlesztettáru-konténernek meg kell felelnie a 6.11 fejezet előírásainak.

7.3.2.3 A 4.2 osztályba tartozó áruk

Az ömlesztettáru-konténerben szállított összes tömeget úgy kell korlátozni, hogy az öngyulladás hőmérséklet 55 °C-nál magasabb legyen.

7.3.2.4 A 4.3 osztályba tartozó áruk

Ezeket az árukat olyan BK2 kódú ömlesztettáru-konténerben kell szállítani, amely víz behatolásával szemben ellenálló.

7.3.2.5 Az 5.1 osztályba tartozó áruk

Az ömlesztettáru-konténereket úgy kell gyártani, vagy átalakítani, hogy az áru ne kerülhessen érintkezésbe fával vagy más, összeférhetetlen anyaggal.

7.3.2.6 A 6.2 osztályba tartozó áruk

7.3.2.6.1 A fertőző anyagot tartalmazó állati eredetű anyagok (UN 2814, UN 2900 és UN 3373) ömlesztettáru-konténerben a következő feltételekkel szállíthatók:

- A BK1 kódú, ponyvás ömlesztettáru-konténerek csak akkor használhatók, ha nincsenek legnagyobb befogadóképességükig megrakva, és ezáltal az anyag a ponyvával nem érintkezik. BK2 kódú, zárt ömlesztettáru-konténerek ugyancsak használhatók.
- A zárt és a ponyvás ömlesztettáru-konténereket és nyílásaikat eleve szivárgásmentesre kell kialakítani vagy megfelelő béléssel kell ellátni.
- Az állati eredetű anyagokat a szállítást megelőző berakás előtt megfelelő szerrel alaposan fertőtleníteni kell.
- A ponyvás ömlesztettáru-konténerben kiegészítésképpen takarót kell helyezni, amelyre nehezezként megfelelő fertőtlenítőszerrel kezelt abszorbeáló anyagot kell tenni.
- A zárt vagy ponyvás ömlesztettáru-konténerek csak akkor használhatók ismételten, ha alaposan kitisztították és fertőtlenítették.

Megjegyzés: Az illetékes nemzeti egészségügyi hatóságok kiegészítő előírásokat is hozhatnak.

7.3.2.6.2 A 6.2 osztályba tartozó hulladékok (UN 3291)

- a) (fenntartva)

- b) A zárt ömlesztettáru-konténereket és nyílásaikat eleve szivárgásmentesre kell kialakítani, belső felületüknek hézagmentesnek/nem-porózusnak kell lennie és nem lehet rajta olyan repedés vagy egyéb hiba, ami a benne lévő csomagolóeszközöket megrongálná, a fertőtlenítő hatást csökkentené vagy az anyag nem szándékos kiszabadulását eredményezné.
- c) Az UN 3291 tétel alá tartozó hulladékot a zárt ömlesztettáru-konténeren belül olyan, UN szerint vizsgált és jóváhagyott típusú, szivárgásmentes, lezárt műanyag zsákba kell helyezni, amelyet szilárd anyaghoz, II csomagolási csoportra vizsgáltak és a 6.1.3.1 bekezdés szerinti jelöléssel van ellátva. A műanyag zsáknak ki kell állni az ISO 7765-1:1988 „Műanyag fólia és lemez – Az ütőszilárdság meghatározása szabadon eső dárda módszerével – 1. rész: Lépcsőzetes módszerek” szabvány, valamint az ISO 6383-2:1983 „Műanyagok – Fólia és lemez – A tépőszilárdság meghatározása. 2. rész: Elmendorf módszer” szabvány szerinti ütő- és tépőszilárdság vizsgálatot. Minden zsák ütőszilárdságának legalább 165 g-nak, tépőszilárdságának legalább 480 g-nak kell lennie a zsák hosszirányában, párhuzamos és merőleges síkban egyaránt. Egy zsák legnagyobb nettó tömege 30 kg lehet.
- d) A 30 kg-nál nagyobb tömegű tárgyak (pl. szennyezett ágybetétek) az illetékes hatóság engedélyével műanyag zsákok nélkül is szállíthatók.
- e) Az UN 3291 tétel alá tartozó, folyadékot tartalmazó hulladék csak olyan műanyag zsákban szállítható, amely elegendő nedvszívó anyagot tartalmaz a teljes folyadék mennyiség felszívására úgy, hogy az nem folyik ki az ömlesztettáru-konténerbe.
- f) Az UN 3291 tétel alá tartozó, éles tárgyakat tartalmazó hulladék csak olyan, UN szerint vizsgált és jóváhagyott típusú, merev falú csomagolóeszközben szállítható, amely megfelel a P621, az IBC620, ill. az LP621 csomagolási utasítás előírásainak.
- g) A P621, az IBC620, ill. az LP621 csomagolási utasítás előírásainak megfelelő, merev falú csomagolóeszközök is használhatók. A csomagolóeszközöket megfelelően rögzíteni kell, hogy normál szállítási körülmények között ne rongálódhassanak meg. Ha egyazon zárt ömlesztettáru-konténerben merev falú csomagolóeszközben és műanyag zsákban is szállítanak hulladékot, megfelelően el kell választani őket egymástól, pl. merev válaszfallal, osztófallal, hálóval vagy egyéb módon úgy, hogy normál szállítási körülmények között ne rongálódhassanak meg.
- h) Az UN 3291 tétel alá tartozó hulladékot tartalmazó műanyag zsákokat nem szabad a zárt ömlesztettáru-konténerben annyira összenyomni, hogy tömítetlenné válhassanak.
- i) A zárt ömlesztettáru-konténert minden szállítás után meg kell vizsgálni, hogy a rakomány nem folyt vagy nem szóródott ki benne. Ha az UN 3291 tétel alá tartozó hulladék kifolyt vagy kiszóródott a zárt ömlesztettáru-konténerbe, akkor nem szabad addig újrahasználni, amíg alaposan ki nem tisztították, és – ha szükséges – megfelelő vegyszerrel nem fertőtlenítették. Az UN 3291 tétel alá tartozó hulladékot – az ember-, ill. állatgyógyászati hulladékon kívül – más áruval együtt szállítani nem szabad. Az ugyanabban a zárt ömlesztettáru-konténerben szállított ilyen hulladékokat az esetleges szennyeződés szempontjából meg kell vizsgálni.

7.3.2.7 *A 7 osztályba tartozó anyagok*

A csomagolatlan radioaktív anyagok szállítására lásd a 4.1.9.2.3 pontot.

7.3.2.8 *A 8 osztályba tartozó áruk*

Ezeket az árukat olyan ömlesztettáru-konténerben kell szállítani, amely víz behatolásával szemben ellenálló.

7.3.3

Az ömlesztett szállításra vonatkozó különleges előírások a 7.3.1.1 b) pont alkalmazása esetén

A következő különleges előírásokat kell betartani, ha a 3.2 fejezet „A” táblázat 17 oszlopában fel vannak tüntetve:

- VV1** Ömlesztve szállítható fedett vagy ponyvás járműben, zárt konténerben vagy ponyvás nagykonténerben.
- VV2** Ömlesztve szállítható fémszekrényes, fedett járműben, zárt fém konténerben vagy lángmentesített ponyvával fedett és fém felépítményű vagy a rakománytól védett fenekű és oldalfalú, ponyvás járműben és ponyvás nagykonténerben.
- VV3** Ömlesztve szállítható ponyvás járműben és ponyvás nagykonténerben megfelelő szellőzés mellett.
- VV4** Ömlesztve szállítható fémszekrényes, fedett vagy ponyvás járműben és zárt fém konténerben vagy ponyvás fém nagykonténerben. Az UN 2008, 2009, 2210, 2545, 2546, 2881, 3189 és 3190 számú anyagok esetében csak a szilárd hulladékok szállíthatók ömlesztve.
- VV5** Ömlesztve szállítható különlegesen felszerelt járműben és konténerben. A be- és kirakásra szolgáló nyílásoknak légmentesen zárhatónak kell lenniük.
- VV6** (fenntartva)
- VV7** Ömlesztve szállítható fedett vagy ponyvás járműben, zárt konténerben vagy ponyvás nagykonténerben akkor, ha az anyag darabos formában van.
- VV8** Ömlesztve szállítható teljes rakományként fedett járműben, zárt konténerben vagy vízhatlan és lángmentesített ponyvával fedett járműben és nagykonténerben.
A járművet és a konténert úgy kell kialakítani, hogy a bennük levő anyag ne érintkezessen fával vagy más gyúlékony anyaggal, vagy pedig, ha a falak és a padló fából vagy más gyúlékony anyagból készültek, ezek teljes felületét el kell látni lángmentesített, vízhatlan béléssel vagy nátrium-szilikátból vagy hasonló anyagból készült bevonattal.
- VV9** Ömlesztve szállítható teljes rakományként ponyvás járműben, zárt konténerben vagy tömör falú, ponyvás nagykonténerben.
A 8 osztály anyagaihoz a jármű vagy a konténer szekrényét megfelelő, elég erős béléssel kell ellátni.
- VV10** Ömlesztve szállítható teljes rakományként ponyvás járműben, zárt konténerben vagy tömör falú, ponyvás nagykonténerben.
A jármű vagy konténer szekrényének szivárgásmentesnek kell lennie, vagy pl. megfelelő, elég erős bélés alkalmazásával szivárgásmentessé kell tenni.
- VV11** Ömlesztve szállítható különlegesen felszerelt járműben és konténerben olyan módon, ami nem veszélyezteti az embereket, az állatokat és a környezetet, pl. a berakás zsákokban vagy légtömör csatlakozásokon keresztül történik.
- VV12** Azok az anyagok, amelyeknél a tartányjárműben, mobil tartányban vagy tankkonténerben történő szállítás az anyag magas hőmérséklete és sűrűsége miatt nem alkalmazható, a származási ország illetékes hatósága által meghatározott szabályok szerint különleges járműben vagy konténerben szállíthatók. Amennyiben a

származási ország nem ADR Szerződő Fél, az előírt feltételeket a küldemény által érintett első ADR Szerződő Fél illetékes hatóságának kell elismernie.

VV13 Ömlesztve szállítható a származási ország illetékes hatósága által meghatározott szabályok szerint különlegesen felszerelt járműben vagy konténerben. Amennyiben a származási ország nem ADR Szerződő Fél, az előírt feltételeket a küldemény által érintett első ADR Szerződő Fél illetékes hatóságának kell elismernie.

VV14 1) A használt akkumulátortelemek különlegesen felszerelt járműben vagy konténerben szállíthatók ömlesztve. Műanyagból készült nagykonténerek nem használhatók. A műanyag kiskonténereknek törés nélkül el kell tudniuk viselni az olyan ejtőpróbát, amely során a teljesen megrakott konténert 0,8 m-ről, kemény felületre, a fenéklapjára ejtik $-18\text{ }^{\circ}\text{C}$ -on.

2) A jármű vagy konténer rakterét a szállított akkumulátortelepben levő maró anyagnak ellenálló acélból kell kialakítani. Kevésbé ellenálló acél is használható, ha elég nagy a falvastagsága, vagy a maró anyagnak ellenálló műanyag bélése vagy belső borítása van. A raktér méretezésénél figyelembe kell venni a maradékáramokat és az akkumulátortelemek által kifejtett üto-hatásokat.

***Megjegyzés:** Ellenállónak minősül az acél akkor, ha a maró anyag hatására bekövetkező fokozatos vékonyodása évente 0,1 mm-nél kevesebb.*

3) Megfelelő konstrukcióval biztosítani kell, hogy a jármű rakteréből a szállítás során maró anyag ne szivároghasson ki. A nyitott rakfelületet le kell fedni. A lefedésre használt eszközöknek a maró anyaggal szemben ellenállónak kell lenniük.

4) Berakodás előtt a jármű vagy a konténer rakterét, beleértve a felszereléseket is, meg kell vizsgálni, hogy van-e rajtuk sérülés. Sérült rakterű járművet vagy konténert nem szabad megrakni.

A járművek vagy konténerek rakterét csak a falak magasságáig szabad megrakni.

5) Nem szabad a jármű vagy a konténer rakterébe sem más veszélyes árut, sem olyan különböző anyagokat tartalmazó akkumulátortelepet tenni, amelyek egymással veszélyes reakcióba (lásd a „veszélyes reakció” fogalmát az 1.2.1 szakaszban) léphetnek.

A szállított akkumulátortelemek által tartalmazott maró anyagból a szállítás alatt semmilyen maradék nem tapadhat a jármű rakterének vagy a konténernek a külsejére.

VV15 Ömlesztve szállítható fedett vagy ponyvás járműben, zárt konténerben vagy teljes falú, ponyvás nagykonténerben, ha a szilárd anyag vagy keverék (készítmény vagy hulladék) az ez alá az UN szám alá tartozó anyagokból átlagosan legfeljebb 1000 mg mennyiséget tartalmaz kg-onként, valamint a koncentráció a rakomány egyetlen pontján sem haladja meg a 10000 mg/kg-ot.

A jármű felépítményének, ill. a konténernek szivárgásmentesnek kell lennie, vagy szivárgásmentessé kell tenni pl. alkalmas és elég erős bélés használatával.

VV16 Ömlesztve szállítható a 4.1.9.2.3 pont előírásai szerint.

VV17 Az SCO-I tárgyak ömlesztve szállíthatók a 4.1.9.2.3 pont előírásai szerint.

7.4 FEJEZET

A TARTÁNYOS SZÁLLÍTÁSRA VONATKOZÓ ELŐÍRÁSOK

- 7.4.1** Valamely áru csak akkor szállítható tartányban, ha a 3.2 fejezet „A” táblázat 10 vagy 12 oszlopában tartánykód van feltüntetve, illetve akkor, ha az illetékes hatóság a 6.7.1.3 bekezdés szerint engedélyezte. A szállítást a 4.2, a 4.3, a 4.4, ill. a 4.5 fejezet előírásai szerint kell végezni. A járműnek, akár tehergépkocsiról, vontatóról, pótkocsiról vagy félpótkocsiról van szó, meg kell felelnie a 9.1, a 9.2 fejezet és a 9.7.2 szakasz azon előírásainak, amelyek a 3.2 fejezet „A” táblázat 14 oszlopában feltüntetett, használandó járműre vonatkoznak.
- 7.4.2** Az EX/III, FL, OX vagy AT kóddal jelölt járműveket a következők szerint kell használni:
- Ahol EX/III jármű van előírva, csak EX/III jármű használható;
 - Ahol FL jármű van előírva, csak FL jármű használható;
 - Ahol OX jármű van előírva, csak OX jármű használható;
 - Ahol AT jármű van előírva, AT, FL vagy OX jármű egyaránt használható.

7.5 FEJEZET

A BERAKÁSRA, A KIRAKÁSRA ÉS AZ ÁRUKEZELÉSRE VONATKOZÓ ELŐÍRÁSOK

7.5.1 A berakásra, a kirakásra és az árukezelésre vonatkozó általános előírások

Megjegyzés: *E szakasz alkalmazásában egy konténer, ömlesztettáru-konténer, tankkonténer vagy mobil tartány járműre helyezése berakásnak, a járműről való levétele kirakásnak minősül.*

7.5.1.1 A be- és kirakás helyére (ideértve a konténer terminált is) érkezéskor a járművezetőnek be kell tartania az előírt rendelkezéseket, valamint a járműnek, ill. a nagykonténernek, ömlesztettáru-konténernek, tankkonténernek és mobil tartánynak is meg kell felelnie ezeknek (különösen a biztonságra, közbiztonságra, tisztaságra és a ki- és berakáshoz használatos berendezések kielégítő üzemelésére vonatkozóan).

7.5.1.2 Hacsak az ADR-ben nincs más előírva, a berakás nem hajtható végre,

- ha az okmányok vizsgálata, vagy
- a jármű, ill. a nagykonténer, ömlesztettáru-konténer, tankkonténer és mobil tartány, valamint ki- és berakáshoz használatos berendezéseik szemrevételezése

azt mutatja, hogy a jármű, ill. a nagykonténer, ömlesztettáru-konténer, tankkonténer és mobil tartány, valamint berendezéseik vagy a jármű vezetője nem felel meg az előírásoknak. Berakás előtt a jármű, ill. a konténer külső felületét és a belsejét is meg kell vizsgálni, hogy ne legyen rajta olyan sérülés, ami a jármű, a konténer vagy a berakandó küldeménydarabok épségét befolyásolná.

7.5.1.3 Hacsak az ADR-ben nincs más előírva, a kirakás nem hajtható végre, ha az előzőekben említett vizsgálat során olyan hiányosságokat tapasztalnak, ami a kirakás biztonságát vagy a közbiztonságot befolyásolhatja.

7.5.1.4 A 3.2 fejezet „A” táblázat 17 vagy 18 oszlopával összhangban, a 7.3.3 vagy a 7.5.11 szakasz különleges előírásai szerint bizonyos veszélyes áruk csak „teljes rakományként” (lásd a meghatározást az 1.2.1 szakaszban) szállíthatók. Ilyen esetben az illetékes hatóság előírhatja, hogy az ilyen szállításhoz használt járművet vagy nagykonténert csak egyetlen helyen rakják ki.

7.5.1.5 Ha az álló helyzetet jelző nyilak elő vannak írva, akkor a küldeménydarabokat és az egyesítőcsomagolásokat a jelölésnek megfelelően kell elhelyezni.

Megjegyzés: *Hacsak egy mód van rá, a folyékony veszélyes árukat a száraz veszélyes áruk alatt kell elhelyezni.*

7.5.2 Együvé rakási tilalom

7.5.2.1 A különböző veszélyességi bárcákkal ellátott küldeménydarabok csak akkor rakhatók együvé ugyanabba a járműbe vagy konténerbe, ha az együvé rakás a rajtuk levő veszélyességi bárcák alapján a következő táblázatban megengedett.

Megjegyzés: *Az 5.4.1.4.2 pont értelmében külön fuvarokmányt kell kiállítani minden olyan küldeményre, amelyet nem lehet egy járműbe vagy konténerbe együvé rakni.*

X =Az együvé rakás megengedett.

a) Az együvé rakás az 1.4S anyagokkal és tárgyakkal megengedett.

b) Az 1 osztály áruinak és a 9 osztály biztonsági felszereléseinek (UN 2990, 3072 és 3268) együvé rakása megengedett.

c) Az 1.4 alosztály G összeférhetőségi csoportjába tartozó légszak gázgenerátorok, légszak modulok, ill. biztonsági öv előfeszítők (UN 0503) és a 9 osztályba tartozó légszak gázgenerátorok, légszak modulok, ill. biztonsági öv előfeszítők (UN 3268) együvé rakása megengedett.

d) Az UN 0083 C típusú robbantóanyag kivételével a többi robbantóanyag és az 5.1 osztályba tartozó ammónium-nitrátok (UN 1942 és 2067), alkálifém-nitrátok és alkáliföldfém-nitrátok együvé rakhatók, amennyiben a nagybárcával való megjelölés, az elkülönítés, a küldeménydarabok elhelyezése és a szállítóegységenként megengedett legnagyobb mennyiség szempontjából a teljes rakományt úgy kezelik, mintha az 1 osztályba tartozó robbantóanyag lenne. Az alkálifém-nitrátok a cézium-nitrát (UN 1451), a lítium-nitrát (UN 2722), a kálium-nitrát (UN 1486), a rubídium-nitrát (UN 1477) és a nátrium-nitrát (UN 1498). Az alkáliföldfém-nitrátok a bárium-nitrát (UN 1446), a berillium-nitrát (UN 2464), a kalcium-nitrát (UN 1454), a magnézium-nitrát (UN 1474) és a stroncium-nitrát (UN 1507).

7.5.2.2

Azokat a küldeménydarabokat, amelyekben az 1 osztály anyagai vagy tárgyai vannak és az 1, az 1.4, az 1.5 vagy az 1.6 számú bárcával vannak ellátva, de különböző összeférhetőségi csoportokba tartoznak, nem szabad egy járműbe vagy konténerbe rakni, kivéve, ha az együvé rakás a következő táblázat szerint ezekre az összeférhetőségi csoportokra megengedett.

Összeférhetőségi csoport	A	B	C	D	E	F	G	H	J	L	N	S
A	X											
B		X		X ^{a)}								X
C			X	X	X		X				X ^{b), c)}	X
D		X ^{a)}	X	X	X		X				X ^{b), c)}	X
E			X	X	X		X				X ^{b), c)}	X
F						X						X
G			X	X	X		X					X
H								X				X
J									X			X
L										X ^{d)}		
N			X ^{b), c)}	X ^{b), c)}	X ^{b), c)}						X ^{b)}	X
S		X	X	X	X	X	X	X	X		X	X

X = Az együvé rakás megengedett.

- A B összeférhetőségi csoport tárgyait és a D összeférhetőségi csoport anyagait és tárgyait tartalmazó küldeménydarabok ugyanazon járműre vagy konténerbe együvé rakhatók, ha azokat hatékonyan elkülönítik, úgy hogy ne álljon fenn a detonáció átvitelének veszélye a B összeférhetőségi csoport tárgyaitól a D összeférhetőségi csoport anyagaira, ill. tárgyaira. Az elkülönítést elválasztott rekeszek használatával vagy a két fajta robbanóanyag (robbanótárgy) egyikének különleges védőburkolat-rendszerbe helyezésével kell megvalósítani. Az illetékes hatóságnak az elkülönítés mindkét módját jóvá kell hagynia.*
- Az 1.6N osztályozási kód alá besorolt különböző típusú tárgyak csak akkor rakhatók együvé mint 1.6N tárgyak, ha vizsgálattal vagy analógia alapján bizonyított, hogy nem áll fenn a tárgyak közötti kapcsolt robbanás veszélye. Egyéb esetben úgy kell kezelni, mintha az 1.1 alosztályba tartoznának.*
- Ha az N összeférhetőségi csoport tárgyait a C, a D vagy az E összeférhetőségi csoport tárgyaival együtt szállítják, az N összeférhetőségi csoport tárgyait úgy kell tekinteni, mintha a D összeférhetőségi csoport jellemzőivel rendelkeznének.*
- Az L összeférhetőségi csoport anyagait és tárgyait tartalmazó küldeménydarabok ugyanezen összeférhetőségi csoport ugyanolyan típusú anyagait és tárgyait tartalmazó küldeménydarabokkal ugyanabba a járműbe vagy konténerbe együvé rakhatók.*

7.5.2.3

Az ugyanazon járműbe való együvé rakás tilalmának alkalmazása során nem kell számításba venni a zárt, tömör falú konténerekben levő anyagokat. A 7.5.2.1 bekezdésben az 1, az 1.4, az 1.5 vagy az 1.6 számú veszélyességi bárcával ellátott küldeménydarabok más küldeménydarabokkal való együvé rakására és a 7.5.2.2 bekezdésben a különböző összeférhetőségi csoportokba tartozó robbanóanyagok együvé rakására vonatkozó tilalmak azonban érvényesek a konténerbe rakott veszélyes áru és az ugyanazon járműbe berakott más áruk között akkor is, ha ez utóbbiak egy vagy több másik konténerben vannak.

7.5.2.4

A korlátozott mennyiségben csomagolt veszélyes árut tilos mindenféle robbanóanyaggal és –tárggyal együvé rakni, kivéve az 1.4 alosztályba, valamint az UN 0161 és 0499 tétel alá tartozókat.

7.5.3 (fenntartva)

7.5.4 **Élelmiszerekre, egyéb fogyasztási cikkekre és takarmányra vonatkozó óvintézkedések**

Ha a 3.2 fejezet „A” táblázat 18 oszlopában egy anyagra vagy tárgyra a CV28 különleges előírás van megadva, akkor az élelmiszerekre, egyéb fogyasztási cikkekre és takarmányra vonatkozó óvintézkedéseket a következők szerint kell fogantatosítani:

A 6.1 vagy a 6.2 számú bárcával ellátott küldeménydarabokat, és azokat a 9 számú bárcával ellátott küldeménydarabokat, amelyek az UN 2212, 2315, 2590, 3151, 3152 vagy 3245 számú anyagokat tartalmazzák, valamint az ilyen üres, tisztítatlan csomagolóeszközöket (beleértve a nagycsomagolásokat és az IBC-eket is), nem szabad a járműveken, a konténerekben és a be-, ki- és átrakás helyén olyan küldeménydarabokra halmazolni vagy közvetlen közelükbe rakni, amelyekről ismert, hogy élelmiszereket, egyéb fogyasztási cikkeket vagy takarmányt tartalmaznak.

Ha az említett bárcákkal ellátott küldeménydarabokat mégis olyan küldeménydarabok közelébe rakják, amelyekről ismert, hogy élelmiszereket, egyéb fogyasztási cikkeket vagy takarmányt tartalmaznak, akkor a következőképpen kell elkülöníteni:

- a) az említett bárcával ellátott küldeménydarabok halmazolási magasságát elérő teljes válaszfalakkal; vagy
- b) olyan küldeménydarabokkal, amelyeken nincs 6.1, 6.2 vagy 9 számú bárca, illetve amelyeken 9 számú bárca van, de nem az UN 2212, 2315, 2590, 3151, 3152 vagy 3245 számú anyagokat tartalmazzák; vagy
- c) legalább 0,8 m térközzel;

kivéve, ha az említett bárcákkal ellátott küldeménydarabok kiegészítő csomagolásban vannak vagy teljesen be vannak burkolva (pl. fóliával, papírlemez burkolattal vagy más módon).

7.5.5 **A szállított anyag mennyiségének korlátozása**

7.5.5.1 Ha a következő előírásokat vagy a 3.2 fejezet „A” táblázat 18 oszlopa szerint a 7.5.11 szakasz szállított mennyiség korlátozására vonatkozó kiegészítő előírásait kell alkalmazni, az előírások alapján az egy szállítóegységbe rakható mennyiséget nem befolyásolja az a tény, hogy a veszélyes áruk egy vagy több konténerben vannak.

7.5.5.2 ***A robbanóanyagok és -tárgyak mennyiségének korlátozása***

7.5.5.2.1 ***Szállított anyagok és mennyiségek***

Az egy szállítóegységben összesen szállítható nettó robbanóanyag-mennyiséget (ill. tárgyak esetében a bennük található összes nettó robbanóanyag-mennyiséget) kg-ban a következő táblázat szerint kell korlátozni (lásd még az együvé rakási tilalmakra a 7.5.2.2. bekezdést):

Az 1 osztályba tartozó árukban található robbanóanyag szállítóegységenkénti megengedett legnagyobb nettó tömege, kg

Szállítóegység	Alosztály	1.1		1.2	1.3	1.4		1.5 és 1.6	Üres, tisztított csomagolóeszközök
	Összeférhetőségi csoport	1.1A	Nem 1.1A			Nem 1.4S	1.4S		
EX/II ^{a)}		6,25	1000	3000	5000	15 000	Korlátlan	5000	Korlátlan
EX/III ^{a)}		18,75	16 000	16 000	16 000	16 000	Korlátlan	16 000	Korlátlan

a) Az EX/II és EX/III járművek meghatározására lásd a 9. részt.

7.5.5.2.2 Ha az 1 osztály különböző alosztályainak anyagait és tárgyait – a 7.5.2.2 bekezdés együtve rakási tilalmain megtartva – egy szállítóegységbe rakják, a rakományt úgy kell tekinteni, mintha teljes egészében a legveszélyesebb alosztályba tartozna (1.1, 1.5, 1.2, 1.3, 1.6 és 1.4 sorrendben). Az S összeférhetőségi csoportba tartozó robbanóanyag nettó tömegét azonban a szállított mennyiség korlátozása szempontjából nem kell beszámítani.

Ha az 1.5D osztályozási kódú anyagokat az 1.2 alosztály anyagaival vagy tárgyaival egy szállítóegységben szállítják, a szállításnál az egész rakományt úgy kell tekinteni, mintha az 1.1 alosztályba tartozna.

7.5.5.2.3 *Robbanóanyag szállítása MEMU-val*

Robbanóanyag szállítása MEMU-val csak a következő feltételekkel engedélyezett:

- Az illetékes hatóság engedélye szükséges a területén történő szállításhoz.;
- A szállított küldeménydarab(ok)ban csak olyan fajtájú és mennyiségű robbanóanyag lehet, ami a MEMU-val előállítandó anyaghoz szükséges, de semmiképpen sem lehet több, mint :
 - a D összeférhetőségi csoport robbanóanyagából 200 kg; és
 - a gyutacsból és a detonátorszerkezetből együttesen 400 egység
 kivéve, ha az illetékes hatóság másként engedélyezi.;
- A robbanóanyagot tartalmazó küldeménydarabok csak a 6.12.5 szakasz követelményeinek megfelelő raktérben szállíthatók.;
- A robbanóanyagot tartalmazó küldeménydarabon kívül más veszélyes áru nem szállítható a raktérben;
- A robbanóanyagot tartalmazó küldeménydarabok csak a többi veszélyes anyag berakodása után és közvetlenül a szállítás megkezdése előtt rakodhatók a MEMU-ra.;
- Amennyiben az együtvétrakás megengedett a robbanóanyagok és az 5.1 osztályba tartozó anyagok (UN 1942 és UN 3375) között, az elkülönítés, rakodás és a megengedett legnagyobb mennyiség szempontjából a teljes rakományt úgy kezelik, mintha az 1 osztályba tartozó robbanóanyag lenne.

7.5.5.3 *A szerves peroxidok és önreaktív anyagok mennyiségének korlátozása*

A B, C, D, E, ill. F típusú, az 5.2 osztályba tartozó szerves peroxidok, ill. 4.1 osztályba tartozó önreaktív anyagok egy szállítóegységben szállítható mennyisége 20 000 kg.

7.5.6 (fenntartva)

7.5.7 Árukezelés és rakodás

7.5.7.1 A járművet, ill. a konténert – ahol szükséges – a veszélyes áru kezelésére és rögzítésére alkalmas eszközzel kell ellátni. A veszélyes árut tartalmazó küldeménydarabokat, ill. a csomagolatlan veszélyes tárgyakat a járműben, ill. a konténerben alkalmas eszközzel (pl. leszorító hevederekkel, csúszó és állítható kengyelekkel) úgy kell rögzíteni, hogy megakadályozzon a szállítás közben minden olyan elmozdulást, ami a küldeménydarab helyzetét megváltoztatná vagy sérülését okozná. Ha a veszélyes árut egyéb áruval (pl. nehéz gépekkel vagy rekeszekkel) együtt szállítják, minden árut úgy kell becsomagolni és rögzíteni a járműben, ill. a konténerben, hogy a veszélyes áru ne szabadulhasson ki. A küldeménydarabok elmozdulása kitámasztással vagy állványzattal is megakadályozható, vagy úgy is, hogy az üres tereket valamilyen, arra alkalmas anyaggal töltik ki. Ha a rögzítés pánttal vagy hevederrel történik, nem szabad túlfeszíteni, nehogy a küldeménydarab megsérüljön vagy eldeformálódjon.¹⁾ E bekezdés követelményei teljesítettnek tekinthetők, ha a rakományt az EN 12196-1:2010 szabvány szerint rögzítik.

7.5.7.2 A küldeménydarabokat csak akkor szabad egymásra halmazolni, ha arra vannak kialakítva. Ha halmazolásra kialakított, de különböző típusú küldeménydarabokat rakodnak együvé, figyelembe kell venni, hogy halmazolás szempontjából összeillenek-e. Ahol szükséges, az alul lévő küldeménydarabokat teherelosztó eszközök segítségével kell védeni a rájuk halmazolt küldeménydarabok okozta sérüléstől.

7.5.7.3 A veszélyes árut tartalmazó küldeménydarabokat a be- és a kirakás során óvni kell a sérülésektől.

***Megjegyzés:** Különös figyelmet kell szentelni a küldeménydarabok kezelésének, mozgatásának a szállításra való előkészítésük során, a jármű, ill. konténer jellegének, amiben a küldeménydarabokat szállítani fogják, a be- és kirakás módjának, nehogy a helytelen kezelés vagy a talajon, padlózaton való csúsztatás folytán a küldeménydarabok esetleg megsérüljenek.*

7.5.7.4 A 7.5.7.1 bekezdés előírásai érvényesek a konténereknek, a tankkonténereknek, a mobil-tartányoknak és a MEG-konténereknek a járművekre való felrakására, elhelyezésére és onnan való lerakására is.

7.5.7.5 A járműszemélyzet tagjai veszélyes anyagokat tartalmazó küldeménydarabokat nem nyithatnak fel.

7.5.8 Kirakás utáni tisztítás

7.5.8.1 Ha az olyan jármű vagy konténer kirakása után, amelyben veszélyes árut tartalmazó küldeménydarab volt, megállapítják, hogy a tartalom egy része kiömlött, a járművet, ill. a konténert, amint lehet, de még mindenképpen az újabb megrakás előtt ki kell tisztítani. Ha a tisztítás helyben nem végezhető el, a járművet, ill. a konténert, ügyelve a megfelelő biztonságra, a legközelebbi alkalmas helyre kell szállítani, ahol a tisztítás elvégezhető.

A szállítás akkor megfelelően biztonságos, ha megtették a megfelelő intézkedéseket a kiömlött veszélyes áru ellenőrizhetetlen szabadba jutásának elkerülésére.

7.5.8.2 Az olyan járműveket vagy konténereket, amelyekben ömlesztett veszélyes áru volt, minden

1) A veszélyes áruk rakodására útmutatás található az Európai Bizottság „Rakományok rögzítése a közúti szállításban – Útmutató a legjobb európai gyakorlathoz” című kiadványában. A hatóságok és az ipar részére egyéb útmutatók is rendelkezésre állnak.

újra megrakás előtt kellőképpen ki kell tisztítani, hacsak az új rakomány nem ugyanolyan veszélyes áruból áll, mint az előző rakomány.

7.5.9 Dohányzási tilalom

A kezelési műveletek alatt tilos a dohányzás a járművek és konténerek környezetében, ill. járművek és konténerek belsejében.

7.5.10 Az elektrosztatikus töltések felhalmozódásának elkerülése

Gyúlékony gázok, 60 °C vagy annál alacsonyabb lobbanáspontú folyékony anyagok és a II csomagolási csoportba tartozó UN 1361 szén vagy korom esetén a tartányok töltése és ürítése előtt a jármű alváza, a mobil tartány, ill. a tankkonténer és a föld között jó villamos összeköttetést kell létesíteni. Ezenkívül a töltési sebességet korlátozni kell.

7.5.11 Egyes osztályokra vagy bizonyos árukra vonatkozó kiegészítő előírások

A 7.5.1 – 7.5.10 szakasz előírásainak kiegészítéseképpen a következő előírásokat kell betartani, ha a 3.2 fejezet „A” táblázat 18 oszlopában fel vannak tüntetve:

CV1 1) Tilos:

- a) lakott területen belüli közterületen árut be- és kirakodni az illetékes hatóságok külön engedélye nélkül;
- b) lakott területen kívüli közterületen árut be- és kirakodni anélkül, hogy erről az illetékes hatóságokat előzetesen értesítették volna, hacsak nem biztonsági okból van szükség sürgős rakodásra.

- 2) Ha az árukezelést bármilyen okból is közterületen kell végezni, a különböző anyagokat és tárgyakat a veszélyességi bárcáknak megfelelően el kell különíteni egymástól.

CV2 1) Berakás előtt a jármű vagy a konténer teljes rakfelületét gondosan meg kell tisztítani.

- 2) Tűz és nyílt láng használata tilos az ezen árukat szállító járműveken és konténerekben, azok környezetében, ill. be- és kirakáskor.

CV3 Lásd a 7.5.5.2 bekezdést.

CV4 Az L összeférhetőségi csoport anyagai és tárgyai csak teljes rakományként szállíthatók.

CV5 – CV8 (fenntartva)

CV9 A küldeménydarabokat nem szabad dobálni és ütődésnek kitenni.

A tartályokat a járműben úgy kell elhelyezni, hogy se fel ne borulhassanak, se le ne eshessenek.

CV10 Az 1.2.1 szakasz meghatározása szerinti palackokat a jármű vagy a konténer hossz tengelyével párhuzamosan vagy arra merőlegesen kell fektetni, a homlokfal közelében levő palackokat azonban a hossz tengelyekre merőlegesen (keresztirányban) kell elhelyezni.

A rövid és nagy átmérőjű (kb. 30 cm és annál nagyobb) palackokat hosszirányban is el lehet helyezni, de a zárókupakokat a jármű vagy a konténer közepe felé kell irányítani.

A kellően stabil és a felborulás ellen védő szerkezetben szállított palackokat állítva is el lehet helyezni.

A fekvő palackokat biztonságosan és alkalmas módon ki kell ékelni, le kell rögzíteni vagy erősíteni, hogy ne mozdulhassanak el.

CV11 A tartályokat mindig abban a helyzetben kell elhelyezni, amelyre azokat tervezték, és védeni kell minden sérülés lehetőségétől, amit más küldeménydarabok okozhatnak.

CV12 Ha a tárgyakkal megrakott rakodólapokat egymásra rakják, minden rakodólap réteget az alatta levőn egyenletesen kell elosztani, szükség esetén megfelelő szilárdságú anyagból készített köztes lapokat használva.

CV13 Ha az anyagból valamennyi kifolyt és a járműben vagy a konténerben szétterjedt, a járművet, ill. a konténert csak azt követően szabad újra használni, ha alaposan kitisztították és – szükség esetén – fertőtlenítették. Az ugyanabban a járműben, ill. konténerben szállított többi anyagot és tárgyat az esetleges szennyeződés miatt ellenőrizni kell.

CV14 Az árut a szállítás alatt védeni kell a közvetlen napsugárzástól és hőhatásoktól.

A küldeménydarabokat csak hűvös, jól szellőzött helyen, hőforrásoktól távol szabad tárolni.

CV15 Lásd a 7.5.5.3 bekezdést.

CV16 –
CV19 (fenntartva)

CV20 Az 5.3 fejezet előírásait és a 7.2 fejezet V1 és V8 5) és 6) különleges előírását nem kell alkalmazni, amennyiben az anyagok csomagolása megfelel a 4.1.4.1 bekezdésben a P520 csomagolási utasítás OP1 vagy az OP2 csomagolási módszerének és az anyag szállítóegységenkénti mennyisége nem haladja meg a 10 kg-ot.

CV21 Berakás előtt szállítóegységeket gondosan meg kell vizsgálni.

Szállítás előtt a szállítót tájékoztatni kell:

- a hűtőrendszer működéséről, beleértve a menet során a hűtőközeg beszerzésére rendelkezésre álló helyek felsorolását;
- a hőmérséklet-szabályozás megszűnése esetén követendő eljárásokról.

A 7.2 fejezet V8 3) különleges előírásának R2 vagy R4 módszere szerinti hőmérséklet-szabályozás esetén elfogadható mértékű késésre is számítva megfelelő mennyiségű, nem gyúlékony hűtőközeget (pl. cseppfolyósított nitrogént vagy szárazjeget) kell a járművön tartani vagy a hűtőközeg pótlását kell biztosítani.

A küldeménydarabokat úgy kell elhelyezni, hogy könnyen hozzáférhetők legyenek.

Az előírt szabályozási hőmérsékletet a teljes szállítási művelet alatt, beleértve a berakást és kirakást, valamint az esetleges köztes megállásokat, be kell tartani.

CV22 A küldeménydarabokat úgy kell berakni, hogy a raktéren belüli szabad levegő áramlás biztosítsa a rakomány egyenletes hőmérsékletét. Ha egy jármű vagy nagykonténer tartalma 5000 kg-nál több gyúlékony szilárd anyag és/vagy szerves peroxid, a rakományt legfeljebb 5000 kg tömegű halmazokra kell osztani, amelyeket legalább 0,05 m légréssel kell egymástól elválasztani.

CV23 A küldeménydarabok kezelése során különleges intézkedéseket kell tenni azok vízzel való érintkezésének megakadályozására.

CV24 A járműveket és a konténereket berakás előtt alaposan ki kell tisztítani és különösen az éghető maradékoktól (széna, szalma, papír stb.) kell megtisztítani.

A küldeménydarabok elhelyezéséhez tilos könnyen gyúló anyagot használni.

CV25 1) A küldeménydarabokat úgy kell elhelyezni, hogy könnyen hozzáférhetők legyenek.

2) Ha a küldeménydarabokat 15 °C-ot meg nem haladó környezeti hőmérsékleten vagy hűtve kell szállítani, a hőmérsékletet a kirakodás vagy a tárolás során is fenn kell tartani.

3) A küldeménydarabokat csak hűvös, jól szellőző helyen, hőforrásoktól távol szabad tárolni.

CV26 A jármű vagy konténer fából készült részeit, amelyek ezekkel az anyagokkal érintkezésbe kerültek, le kell szerelni és el kell égetni.

CV27 1) A küldeménydarabokat úgy kell elhelyezni, hogy könnyen hozzáférhetők legyenek.

2) Ha a küldeménydarabokat hűtve kell szállítani, a hűtőlánc működését a kirakodás és a tárolás során is fenn kell tartani.

3) A küldeménydarabokat csak hűvös, jól szellőző helyen, hőforrásoktól távol szabad tárolni.

CV28 Lásd a 7.5.4 szakaszt.

CV29 –

CV32 (fenntartva)

CV33 ***Megjegyzés:** 1. A „kritikus csoport” a lakosság egyedeinek olyan csoportja, amely egy adott sugárforrás által és adott besugárzási módon bekövetkező sugárterhelését tekintve elfogadhatóan homogén és jellegzetesen olyan személyekből áll, akiket a legnagyobb tényleges dózis ér az adott besugárzási módon az adott sugárforrástól.*

2. A „lakosság” kifejezés általános értelemben a népesség minden egyedét jelenti, kivéve a foglalkozásból vagy gyógykezelésből eredően sugárterhelésnek kitett személyeket.

3. A „dolgozók” olyan személyek, akik teljes vagy részmunkaidőben vagy időszakosan egy munkaadónál dolgoznak és akiknek a munkahelyi sugárvédelemmel kapcsolatosan jogaik és kötelességeik vannak.

1) Elkülönítés

1.1) A radioaktív anyagot tartalmazó küldeménydarabokat, egyesítőcsoma-

golásokat, konténereket és tartányokat, ill. a csomagolatlan radioaktív anyagokat a szállítás során elkülönítve kell tartani:

- a) a rendszeresen használt munkaterületeken tartózkodó dolgozóktól
 - i) a következő „A” táblázat szerint; vagy
 - ii) olyan távolságra, amelyet 5 mSv/év dózis kritérium és óvatos modell paraméterek alapján határoztak meg;

Megjegyzés: Az elkülönítés tekintetében nem kell figyelembe venni azokat a dolgozókat, akikről egyéni sugárterhelési nyilvántartás készül.

- b) a lakosság kritikus csoportjának tagjaitól az olyan területeken, ahol a lakosság rendszeresen tartózkodhat:
 - i) a következő „A” táblázat szerint; vagy
 - ii) olyan távolságra, amelyet 1 mSv/év dózis kritérium és óvatos modell paraméterek alapján határoztak meg;
- c) előhívatlan filmekről és fényképészeti lemezekről, valamint postazsákokról
 - i) a következő „B” táblázat szerint; vagy
 - ii) olyan távolságra, amely úgy van meghatározva, hogy az előhívatlan filmeket és fényképészeti lemezeket a radioaktív anyag szállítása folytán érő besugárzás filmküldeményenként 0,1 mSv értékre korlátozódjon;

Megjegyzés: A postazsákokat úgy kell kezelni, mintha előhívatlan filmeket és fényképészeti lemezeket tartalmaznának és ezért a radioaktív anyagoktól ugyanúgy elkülönítve kell tartani.

- d) egyéb veszélyes áruktól a 7.5.2 szakasz szerint.

„A” táblázat: A II-SÁRGA vagy a III-SÁRGA kategóriájú küldeménydarabok és személyek közötti legkisebb távolságok

A szállítási mutatószámok összege legfeljebb	Besugárzási idő évente (óraban)			
	Olyan területek, ahol a lakosság rendszeresen tartózkodhat		Rendszeresen használt munkaterületek	
	50	250	50	250
	Elkülönítési távolság m-ben, árnyékoló anyag használata nélkül, legalább:			
2	1	3	0,5	1
4	1,5	4	0,5	1,5
8	2,5	6	1,0	2,5
12	3	7,5	1,0	3
20	4	9,5	1,5	4
30	5	12	2	5
40	5,5	13,5	2,5	5,6
50	6,5	15,5	3	6,5

„B” táblázat: A II-SÁRGA vagy III-SÁRGA kategóriájú küldeménydarabok és „FOTO” feliratú küldemények vagy postaszákok közötti legkisebb távolságok

A küldeménydarabok száma legfeljebb		A szállítási mutatószámok összege legfeljebb	A szállítás vagy tárolás időtartama órában							
Kategória			1	2	4	10	24	48	120	240
III-SÁRGA	II-SÁRGA		Legkisebb távolság m-ben							
		0,2	0,5	0,5	0,5	0,5	1	1	2	3
		0,5	0,5	0,5	0,5	1	1	2	3	5
	1	1	0,5	0,5	1	1	2	3	5	7
	2	2	0,5	1	1	1,5	3	4	7	9
	4	4	1	1	1,5	3	4	6	9	13
	8	8	1	1,5	2	4	6	8	13	18
1	10	10	1	2	3	4	7	9	14	20
2	20	20	1,5	3	4	6	9	13	20	30
3	30	30	2	3	5	7	11	16	25	35
4	40	40	3	4	5	8	13	18	30	40
5	50	50	3	4	6	9	14	20	32	45

1.2) A II-SÁRGA és III-SÁRGA kategóriájú küldeménydarabok és egyesítőcsomagolások nem szállíthatók utasok által elfoglalt szakaszokban, kivéve az ilyen küldeménydarabok vagy egyesítőcsomagolások kísérésére felhatalmazott futárok számára fenntartott szakaszokat.

1.3) A II-SÁRGA és III-SÁRGA kategóriájú küldeménydarabokat, egyesítőcsomagolásokat vagy konténereket szállító járműveken a jármű személyzet tagjain kívül egyéb személyek nem tartózkodhatnak.

2) Aktivitáshatárok

LSA anyagok és SCO tárgyak IP-1 típusú, IP-2 típusú vagy IP-3 típusú küldeménydarabokban vagy csomagolatlanul történő szállításánál az összes aktivitás a járművön nem haladhatja meg a „C” táblázatban található határértékeket.

„C” táblázat: Aktivitáshatárok járművenként ipari küldeménydarabokban vagy csomagolatlanul szállított LSA anyagokra és SCO tárgyakra

Az anyag vagy tárgy jellege	Aktivitás határ a járműre
LSA-I	Korlátlan
LSA-II és LSA-III nem éghető szilárd anyagok	Korlátlan
LSA-II és LSA-III éghető szilárd anyagok és minden folyékony anyag és gáz	100A ₂
SCO tárgyak	100A ₂

3) Az áru elhelyezése a szállítás és az átmeneti tárolás során

3.1) A küldeményeket biztonságosan kell elhelyezni.

3.2) Feltéve, hogy a felületen a közepes hőáram nem haladja meg a 15 W/m² értéket, és a közvetlen környezetben nincs zsákokba csomagolt áru, a küldeménydarab vagy az egyesítőcsomagolás különleges rakodási előírás nélkül más, közönséges darabáruval együtt szállítható,

amennyiben az illetékes hatóság engedélye kifejezetten nem ír elő mást.

3.3) A konténerek berakásakor és a küldeménydarabok, egyesítőcsomagolások és konténerek rakodásakor a következő előírásokat kell betartani:

- a) A kizárólagos használat esetét és az *LSA-I* anyagokat tartalmazó küldeményeket kivéve, a küldeménydarabok, egyesítőcsomagolások és konténerek számát egy járművön oly módon kell korlátozni, hogy a szállítási mutatószámok összege a járművön ne lépje túl a „D” táblázatban meghatározott értékeket.

„D” táblázat: Szállítási mutatószám határértékek konténerenként és járművenként nem kizárólagos használat esetén

Konténer vagy jármű	A szállítási mutatószámok összegének határértéke konténerenként és járművenként
Kiskonténer	50
Nagykonténer	50
Jármű	50

- b) A sugárzási szint normális szállítási feltételek esetén a jármű külső felületén egyetlen ponton sem haladhatja meg a 2 mSv/h értéket, és 2 m távolságban egyetlen ponton sem haladhatja meg a 0,1 mSv/h értéket, kivéve a kizárólagos használat mellett szállított küldeményeket, amelyeknél a jármű körüli sugárzási szint határokat a 3.5) b) és c) pont határozza meg;
- c) A kritikussági biztonsági mutatószámok összege egy konténerben vagy járművön nem haladhatja meg az „E” táblázatban megadott értékeket.

„E” táblázat: Kritikussági biztonsági mutatószámok hasadóanyagot tartalmazó konténerenként és járművenként

Konténer vagy jármű	A kritikussági biztonsági mutatószámok összegének határértéke	
	Nem kizárólagos használat esetén	Kizárólagos használat esetén
Kiskonténer	50	tárgytalan
Nagykonténer	50	100
Jármű	50	100

3.4) Minden küldeménydarab vagy egyesítőcsomagolás, amelynek szállítási mutatószáma 10-nél nagyobb, ill. minden küldemény, amelynek kritikussági biztonsági mutatószáma 50-nél nagyobb, csak kizárólagos használat mellett szállítható.

3.5) A sugárzási szint kizárólagos használat mellett szállított küldeményeknél nem haladhatja meg a következő értékeket:

- a) 10 mSv/h-t a küldeménydarabok vagy egyesítőcsomagolások külső felületének bármely pontján; azonban a 2 mSv/h értéket is csak akkor haladhatja meg, ha:
- a jármű el van látva olyan burkolattal, amely a szállítás során illetéktelen személyek számára a rakományhoz való hozzáférést megakadályozza; és
 - megtették a szükséges intézkedéseket ahhoz, hogy a küldeménydarabok vagy egyesítőcsomagolások úgy legyenek rögzítve, hogy azok helyzete a járművön belül normális szállítás

során változatlan maradjon; és

iii) a szállítás kezdete és befejezése között be- és kirakási műveleteket nem végeznek;

- b) 2 mSv/h-t a jármű külső felületének bármely pontján, beleértve a tető- és fenékfelületeket, vagy nyitott járműnél bármely ponton, amely a jármű külső éleitől kiindulva meghosszabbított függőleges síkban vagy a rakomány felületén, ill. a jármű alsó felületén van; és
- c) 0,1 mSv/h-t a jármű külső oldalai által alkotott függőleges síkoktól 2 méter távolságban bármely pontban, vagy amennyiben a rakományt nyitott járművön szállítják, a jármű külső élei által meghatározott függőleges síkoktól 2 m távolságban bármely ponton.

4) A hasadóanyagot tartalmazó küldeménydarabok elkülönítése a szállítás és az átmeneti tárolás során

- 4.1) Az azonos tárolóhelyen átmenetileg tárolt, hasadóanyagot tartalmazó küldeménydarabok, egyesítőcsomagolások és konténerek számát egy csoportban oly módon kell korlátozni, hogy a *CSI*-k összege a csoportban ne haladja meg az 50-et. A csoportokat úgy kell tárolni, hogy a többi, hasonló csoporttól legalább 6 méterre legyenek.
- 4.2) Ha a kritikussági biztonsági mutatószámok összege egy járművön vagy egy konténerben meghaladja az 50-et, mint azt az előző „E” táblázat megengedi, akkor úgy kell tárolni, hogy legalább 6 m távolság maradjon a hasadóanyagot tartalmazó küldeménydarabok, egyesítő-csomagolások és konténerek más csoportjaitól vagy a radioaktív anyagokat tartalmazó más járművektől.

5) Sérült vagy szivárgó küldeménydarabok, szennyezett csomagolóeszközök

- 5.1) Amennyiben egy küldeménydarab nyilvánvalóan sérült vagy tömítetlen, vagy feltételezhető, hogy a küldeménydarab megsérült vagy tömítetlenné vált, az ehhez a küldeménydarabhoz való hozzáférést korlátozni kell és a szennyezettség mértékét, valamint az ebből származó sugárzási szintet szakembernek kell a lehető leggyorsabban megbecsülni. A vizsgálatnak a küldeménydarabra, a járműre, a környező ki- és berakási területre, valamint szükség esetén a járműben szállított minden más áruira ki kell terjednie.

A személyek, javak és a környezet védelme céljából, szükség esetén az illetékes hatóságok által hozott intézkedésekkel összhangban további rendelkezéseket kell fogantatni, hogy az ilyen szivárgás vagy sérülés következményeit leküzdjék és minimálisra csökkentsék.

- 5.2) A küldeménydarabokat, amelyekből a radioaktív tartalom a normális szállítási feltételekre engedélyezett határokat meghaladó mértékben kiszabadult, felügyelet mellett el szabad távolítani egy elfogadható átmeneti helyre, de csak helyreállítás vagy javítás és sugárszennyezettség-mentesítés után szállíthatók tovább.
- 5.3) A radioaktív anyagok szállítására rendszeresen használt járművek és szerelvényeik szennyezettség szintjét időszakonként ellenőrizni kell. Az ilyen vizsgálatok gyakoriságát a szennyezettség valószínűsége és a radioaktív anyag szállított mennyisége szerint kell meghatározni.
- 5.4) Az 5.5) pontban előírtak kivételével, mindazon járműveket, szerelvényeket vagy más részüket, amelyek a szállítás során a 4.1.9.1.2 pontban meghatározott határokat meghaladó mértékben szennyeződtek

radioaktív anyagokkal vagy amelyek 5 $\mu\text{Sv/h}$ értéket meghaladó sugárzási szintet mutatnak, szakembernek kell a lehető leghamarabb a szennyezettségtől mentesíteni; ezeket mindaddig nem szabad újra használni, amíg a nem tapadó szennyezettség mértéke meghaladja a 4.1.9.1.2 pontban megállapított értékeket és amíg a szennyezettségtől való mentesítés után a felületen a tapadó radioaktív szennyezettségből eredő sugárzási szint nem kisebb mint 5 $\mu\text{Sv/h}$.

- 5.5) A csomagolatlan radioaktív anyagok kizárólagos használat melletti szállítására alkalmazott konténert, tartányt, IBC-t vagy járművet csak a belső felületének tekintetében és csak addig, amíg kifejezetten ezen kizárólagos használat alatt maradnak, mentesíteni kell az előző 5.4) pont és a 4.1.9.1.4 pont követelményei alól.

6) Egyéb előírások

Ha egy küldemény nem szolgáltatható ki, akkor a küldeményt biztonságos helyen kell tárolni, az illetékes hatóságokat a lehető leggyorsabban tájékoztatni kell, és a további eljárásra nézve utasítást kell kérni.

- CV34** Nyomástartó tartályok szállítása előtt meg kell győződni arról, hogy a tartályokban a nyomás a lehetséges hidrogénfejlődés következtében nem növekedett.
- CV35** Ha önálló csomagolásként zsákot alkalmaznak, a hőleadás lehetővé tételéhez a zsákokat megfelelően el kell különíteni.
- CV36** A küldeménydarabokat célszerű nyitott vagy jól szellőző járműbe, ill. nyitott vagy jól szellőző konténerbe rakni. Ha ez nem lehetséges és a küldeménydarabokat más fajta fedett járműben, ill. zárt konténerben szállítják, a jármű, ill. a konténer rakománytér ajtaját a következő, legalább 25 mm magas betűkkel írt felirattal kell megjelölni:

“FIGYELEM!
NINCS SZELLŐZÉS,
ÓVATOSAN NYITNI!”

Ezt a feliratot a feladó által alkalmasnak tartott nyelven kell feltüntetni.

„B” MELLÉKLET

A SZÁLLÍTÓESZKÖZÖKRE ÉS A SZÁLLÍTÁSRA VONATKOZÓ ELŐÍRÁSOK

8. RÉSZ

A JÁRMŰ SZEMÉLYZETÉRE, FELSZERELÉSÉRE, ÜZEMELTETÉSÉRE ÉS AZ OKMÁNYOKRA VONATKOZÓ KÖVETELMÉNYEK

8.1 FEJEZET

ÁLTALÁNOS KÖVETELMÉNYEK A SZÁLLÍTÓEGYSÉGEKRE ÉS A JÁRMŰVÖN TARTANDÓ FELSZERELÉSEKRE

8.1.1 Szállítóegységek

Veszélyes anyaggal megrakott szállítóegységben soha nem lehet egynél több pótkocsi vagy félpótkocsi.

8.1.2 A szállítóegységen tartandó okmányok

8.1.2.1 Az egyéb szabályok által előírt okmányokon kívül a következő okmányoknak kell a szállítóegységen lenniük:

- a) mindegyik szállított anyagra vonatkozóan az 5.4.1 szakasz szerinti fuvarokmány, és ha szükséges, az 5.4.2 szakasz szerinti nagykonténer, ill. jármű megrakási bizonyítványnak;
- b) az 5.4.3 szakaszban előírt írásbeli utasításnak;
- c) (fenntartva)
- d) a jármű személyzet minden tagjának az 1.10.1.4 bekezdésben előírt fényképes személyazonosító okmányának.

8.1.2.2 Ha az ADR előírásai a következő okmányok kiállítását megkövetelik, akkor ezeket is a szállítóegységen kell tartani:

- a) minden egyes szállítóegységre vagy szállítóegység-elemre a 9.1.3 szakasz szerinti jóváhagyási igazolást;
- b) a 8.2.1 szakaszban előírt járművezetői oktatási bizonyítványt;
- c) az 5.4.1.2.1 c), az 5.4.1.2.1 d), ill. az 5.4.1.2.3.3 pontban előírt hatósági engedély másolatát, amennyiben szükséges.

8.1.2.3 Az 5.4.3 szakaszban előírt írásbeli utasítást könnyen hozzáférhető helyen kell tartani.

8.1.2.4 (törölve)

8.1.3 A nagybárcák alkalmazása és a jelölés

A veszélyes árut szállító szállítóegységeket az 5.3 fejezet szerint kell nagybárcákkal és jelöléssel ellátni.

8.1.4 Tűzoltó eszközök

8.1.4.1 A veszélyes árut szállító szállítóegységekre – a 8.1.4.2 bekezdésben említett szállítóegységek kivételével – legalább a következő táblázatban feltüntetett, A, B és C tűzosztályú¹⁾ tüzek oltására alkalmas, hordozható tűzoltó készülékek szükségesek:

1) A tűzosztályokra vonatkozóan lásd az MSZ EN 2:1992 „A tüzek osztályozása ” c. szabványt.

(1)	(2)	(3)	(4)	(5)
A szállítóegység legnagyobb megengedett össztömege	A tűzoltó készülékek minimális darabszáma	Az oltóanyag minimális összmenysége a szállítóegységen	A motor, ill. a vezetőfülke oltására alkalmas készülék: legalább egy darab, amelynek minimális oltóanyag mennyisége az alábbi:	A további tűzoltó készülék(ek)re vonatkozó követelmény: legalább az egyiknek az oltóanyag mennyisége legalább az alábbi:
≤ 3,5 t	2	4 kg	2 kg	2 kg
> 3,5 t ≤ 7,5 t	2	8 kg	2 kg	6 kg
>7,5 t	2	12 kg	2 kg	6 kg
Az oltóanyag mennyiségek por oltóanyagú (vagy más, alkalmas oltóanyagú, de azonos oltási képességű) készülékre értendők.				

8.1.4.2 Azokat a szállítóegységeket, amelyek az 1.1.3.6 bekezdés szerint végeznek veszélyes áru szállítást, egy darab, A, B és C tűzosztályú tüzek¹⁾ oltására alkalmas, legalább 2 kg mennyiségű por oltóanyagú (vagy más oltóanyagú, de azonos oltási képességű) hordozható tűzoltó készülékkel kell ellátni.

8.1.4.3 A hordozható tűzoltó készüléknek alkalmasnak kell lennie a járművön való használatra, és meg kell felelnie az EN 3 “Hordozható tűzoltó készülékek” c. szabvány, 7 rész²⁾ (EN 3-7:2004 + A1:2007) vonatkozó előírásainak.

Ha a jármű a motorban keletkező tűz leküzdésére önműködő vagy könnyen működésbe hozható, rögzített tűzoltó készülékkel van felszerelve, nincs szükség arra, hogy a hordozható tűzoltó készülék alkalmas legyen a motorban keletkezett tűz oltására. Az oltóanyagoknak olyannak kell lennie, hogy sem a vezetőfülkében, sem a tűz okozta hő hatására ne fejlesszen mérgező gázokat.

8.1.4.4 Az előző 8.1.4.1, ill. 8.1.4.2 bekezdés előírásainak megfelelő hordozható tűzoltó készülékeket olyan zárral (plombával) kell ellátni, amely lehetővé teszi annak megállapítását, hogy még nem használták. Ezen kívül el kell látni olyan jelöléssel, amely tanúsítja, hogy az illetékes hatóság által elismert szabványnak megfelel, ill. az érvényesség lejáratának időpontját (hónap, év) vagy a legnagyobb megengedett használati időtartamot is fel kell tüntetni.

Az üzemképesség biztosítása céljából a tűzoltó készülékeket az érvényes nemzeti szabványok előírásai szerint időszakosan ellenőrizni kell.

8.1.4.5 A tűzoltó készülékeket a jármű személyzete által könnyen elérhető helyre kell elhelyezni oly módon, hogy az időjárás viszontagságaitól védve legyenek és üzemképességük ne csökkenjen.

8.1.5 Egyéb felszerelések és személyi védőeszközök

8.1.5.1 Minden, veszélyes árut szállító szállítóegységet a 8.1.5.2 bekezdés szerinti, általános felszereléssel és személyi védőeszközökkel kell ellátni. Az egyes felszereléseket a berakott áruhoz tartozó veszélyességi bárcák száma alapján kell kiválasztani. A bárcák száma a fuvar-

2) MSZ EN 3 szabvány 7. rész: Jellemzők, teljesítménykövetelmények és vizsgálati módszerek.

okmányból állapítható meg.

8.1.5.2

A következő felszerelést a szállítóegységen kell tartani:

- minden járműre egy, a jármű legnagyobb megengedett össztömegének és a kerekek átmérőjének megfelelő méretű kerék kitámasztó éket;
- két, önmagában megálló figyelmeztető jelzőt;
- szemöblítő folyadékot³⁾; valamint

a járműszemélyzet minden tagja részére:

- fényvisszaverő mellényt (ruházatot) (pl. az EN 471 szabványnak megfelelőt vagy azzal egyenértékűt);
- a 8.3.4 szakasz szerinti, hordozható világítókészüléket;
- egy pár védőkesztyűt; valamint
- a szem védelmére alkalmas eszközt (pl. védőszemüveget).

8.1.5.3

Bizonyos osztályokhoz a következő kiegészítő felszerelés szükséges:

- a 2.3 vagy a 6.1 veszélyességi bárca, illetve nagybárca használata esetén a járműszemélyzet minden tagja részére légzésvédő maszk⁴⁾ (menekülő-kámzsa);
- lapát⁵⁾;
- csatornanyílás lefedésére alkalmas eszköz⁵⁾;
- gyűjtőedény⁵⁾.

3) Nem szükséges, ha csak az 1, 1.4, 1.5, 1.6, 2.1, 2.2 vagy 2.3 számú veszélyességi bárca, illetve nagybárca van a küldeményen.

4) Például az EN 141 szabványnak megfelelő vagy azzal egyenértékű, A1B1E1K1-P1 vagy A2B2E2K2-P2 típusú, kombinált (gáz és részecske) szűrővel ellátott légzésvédő maszk (menekülőkámzsa).

5) Csak szilárd és folyékony anyagoknál szükséges, ha a 3, 4.1, 4.3, 8 vagy 9 veszélyességi bárca, illetve van a küldeményen.

8.2 FEJEZET

A JÁRMŰ SZEMÉLYZET KÉPZÉSÉRE VONATKOZÓ KÖVETELMÉNYEK

- 8.2.1 Alkalmazási terület és a járművezetők képzésére vonatkozó általános követelmények**
- 8.2.1.1** A veszélyes árut szállító jármű vezetőjének az illetékes hatóság által kiállított bizonyítvánnyal kell rendelkeznie, amely igazolja, hogy részt vett a veszélyes áruk szállítása során betartandó különleges követelményekre vonatkozó képzésen és sikeresen levizsgázott.
- 8.2.1.2** A veszélyes árut szállító jármű vezetőjét alaptanfolyami képzésben kell részesíteni. A képzést az illetékes hatóság által jóváhagyott tanfolyam keretében kell nyújtani. A képzés alapvető célja, hogy a járművezető tudatában legyen azoknak a veszélyeknek, amelyek a veszélyes anyagok szállítása során keletkeznek, és megszerezze azokat az alapismereteket, amelyek elengedhetetlenül szükségesek ahhoz, hogy egy baleset bekövetkezésének valószínűségét minimálisra csökkentse, illetve, ha a baleset bekövetkezett, képes legyen azoknak a biztonsági intézkedéseknek a megtételére, amelyek szükségesnek bizonyulhatnak a saját maga és a közbiztonság, illetve a környezet védelme érdekében a baleset hatásainak korlátozásához. Ennek a tanfolyamnak, amely minden, veszélyes árut szállító jármű vezetőjének alapképzését jelenti, legalább a 8.2.2.3.2 pontban meghatározott témákra kell kiterjednie és egyéni gyakorlati oktatást is kell tartalmaznia. Az illetékes hatóság egyes veszélyes árukra, ill. egyes osztály(ok)ra korlátozott alaptanfolyamot is engedélyezhet. Ilyen korlátozott alaptanfolyam azonban nem tartható a 8.2.1.4 bekezdésben említett járművezetők részére.
- 8.2.1.3** A rögzített tartányban, az 1 m³-nél nagyobb befogadóképességű leszerelhető tartányban veszélyes árut szállító járművezetőknek, ill. MEMU-k vezetőinek, az 1 m³-nél nagyobb összbefogadóképességű battériás járműben veszélyes árut szállító járművezetőknek, a 3 m³-nél nagyobb egyedi befogadóképességű tankkonténerben, mobil tartányban, illetve MEG konténerben veszélyes árut szállító szállítóegységek járművezetőinek, ill. MEMU-k vezetőinek tartányos szakosító tanfolyamon is részt kell venniük, amelynek legalább a 8.2.2.3.3 pontban leírt témákra kell kiterjednie. Az illetékes hatóság egyes veszélyes árukra, ill. egyes osztály(ok)ra korlátozott tartányos szakosító tanfolyamot is engedélyezhet. Ilyen korlátozott tartányos szakosító tanfolyam azonban nem tartható a 8.2.1.4 bekezdésben említett járművezetők részére.
- 8.2.1.4** Az 1.4S osztályozási kódú anyagok kivételével az 1 osztály anyagait és tárgyait szállító járművek vezetőinek (lásd az S1 követelményt a 8.5 fejezetben), az 1 osztály anyagait és tárgyait és az 5.1 osztály anyagait együtt szállító MEMU-k vezetőinek (lásd 7.5.5.2.3 pontot) és bizonyos radioaktív anyagokat szállító járművek vezetőinek (lásd az S11 és az S12 követelményt a 8.5 fejezetben) szakosító tanfolyamon kell részt venniük, amely legalább a 8.2.2.3.4, ill. a 8.2.2.3.5 pontban leírt témákra terjed ki.
- 8.2.1.5** Minden tanfolyamnak, gyakorlati oktatásnak, vizsgának és az illetékes hatóság tevékenységének meg kell felelnie a 8.2.2 szakasz előírásainak.
- 8.2.1.6** Minden olyan bizonyítványt, amely megfelel ezen szakasz előírásainak és amelyet valamely Szerződő Fél illetékes hatósága a 8.2.2.8 bekezdés szerint adott ki, a többi Szerződő Fél illetékes hatóságai a bizonyítvány érvényességi idején belül elfogadnak.
- 8.2.2 A járművezetők képzésére vonatkozó különleges követelmények**
- 8.2.2.1** A szükséges ismereteket és jártasságot elméleti tanfolyamot és gyakorlati oktatást magában foglaló képzésen kell megszerezni. A tudásról vizsgán kell számot adni.

- 8.2.2.2** A képző szervnek biztosítani kell, hogy az oktatók megfelelő tudással rendelkezzenek a veszélyes áru szállítás szabályozásáról és az azzal kapcsolatos képzési követelményekről, illetve figyelembe veszik az ezekben bekövetkezett fejlődést. A képzésnek gyakorlatiasnak kell lennie. A képzési programnak a 8.2.2.3.2 – 8.2.2.3.5 pontban feltüntetett témák tekintetében meg kell felelnie a 8.2.2.6 bekezdés szerinti jóváhagyásnak. A képzésnek egyéni gyakorlati oktatást is kell tartalmaznia (lásd a 8.2.2.3.8 pontot).
- 8.2.2.3** *A képzés felépítése*
- 8.2.2.3.1** A képzést alaptanfolyam és – ha szükséges – szakosító tanfolyam keretében kell nyújtani. A kezdő alap- és a szakosító tanfolyam egyazon képző szerv által, egyazon alkalommal összevont tanfolyam keretében is megszervezhető.
- 8.2.2.3.2** Az alaptanfolyamnak legalább a következő témákra kell kiterjednie:
- a) a veszélyes áruk szállítására vonatkozó általános előírásokra;
 - b) a főbb veszélytípusokra;
 - c) a hulladékok szállításával kapcsolatos környezetvédelmi információkra;
 - d) a különböző veszélytípusoknak megfelelő megelőző és biztonsági intézkedésekre;
 - e) a baleset utáni magatartásra (elsősegélynyújtás, a forgalom biztosítása, a védőfelszerelések használatára vonatkozó alapismeretek, írásbeli utasítás stb.);
 - f) a jelölésre, a bárcázásra, a nagybárcákkal és a narancssárga táblákkal való jelölésre;
 - g) arra, hogy a járművezetőnek mit kell és mit nem szabad tennie a veszélyes áruk szállítása során;
 - h) a járművek műszaki felszerelésének céljára és működésmódjára;
 - i) az ugyanazon járműbe vagy konténerbe való együvé rakási tilalmakra;
 - j) a veszélyes áruk be- és kirakása során betartandó óvintézkedésekre;
 - k) a polgári felelősségre vonatkozó általános információkra;
 - l) a multimodális szállítási tevékenységekre vonatkozó információkra;
 - m) a küldeménydarabok kezelésére és rakodására;
 - n) az alagutakban való forgalomkorlátozásra és az alagutakban való viselkedésre (rendkívüli események megelőzése, biztonság, teendők tűz vagy más veszélyhelyzet esetén stb.);
 - o) a közbiztonság tudatosítására.
- 8.2.2.3.3** A tartányos szállításra vonatkozó szakosító tanfolyamnak legalább a következő témákra kell kiterjednie:
- a) a járművek menet közbeni viselkedésére, beleértve a rakomány mozgását is;
 - b) a járművekre vonatkozó különleges követelményekre;
 - c) a különböző töltési- és ürítési rendszerek elméleti ismeretére;
 - d) az ilyen járművek használatával kapcsolatos kiegészítő előírásokra (jóváhagyási igazolás, jóváhagyási jel, nagybárcával és narancssárga táblával való jelölés stb.).
- 8.2.2.3.4** Az 1 osztályba tartozó anyagok szállítására vonatkozó szakosító tanfolyamnak legalább a következő témákra kell kiterjednie:
- a) a robbanó- és pirotechnikai anyagokban rejlő különleges veszélyekre;

- b) az 1 osztályba tartozó anyagok és tárgyak együvé rakásával kapcsolatos különleges követelményekre.

8.2.2.3.5 A 7 osztályba tartozó, radioaktív anyagok szállítására vonatkozó szakosító tanfolyamnak legalább a következő témákra kell kiterjednie:

- a) az ionizáló sugárzásban rejlő különleges veszélyekre;
- b) a radioaktív anyagok csomagolására, kezelésére, együvé rakására és rakodására vonatkozó különleges követelményekre;
- c) a radioaktív anyaggal történt baleset esetén teendő intézkedésekre.

8.2.2.3.6 Egy tanítási óra általában 45 perces.

8.2.2.3.7 Rendes körülmények között a tanfolyam során, egy napon legfeljebb 8 tanítási óra engedélyezett.

8.2.2.3.8 Az egyéni gyakorlati oktatásnak az elméleti képzéshez kell kapcsolódnia, és legalább az elsősegélynyújtásra, tűzoltásra és a rendkívüli esemény, illetve baleset esetén teendőkre kell kiterjednie.

8.2.2.4 *Kezdő képzési program*

8.2.2.4.1 Az elméleti képzésnek a kezdő tanfolyamokon, ill. az összevont tanfolyamokon legalább a következő időtartamúaknak kell lenniük:

alaptanfolyam	18 tanítási óra
tartányos szakosító tanfolyam	12 tanítási óra
az 1 osztály anyagainak és tárgyainak szállítására vonatkozó szakosító tanfolyam	8 tanítási óra
a 7 osztály radioaktív anyagainak szállítására vonatkozó szakosító tanfolyam	8 tanítási óra

Az alaptanfolyam és a tartányos szakosító tanfolyam során a 8.2.2.3.8 pont szerinti gyakorlati oktatáshoz a járművezetők számától függő, további tanítási órák szükségesek.

8.2.2.4.2 Az összevont tanfolyam teljes időtartamát az illetékes hatóság úgy is meghatározhatja, hogy az alaptanfolyam, ill. a tartányos szakosító tanfolyam eredeti óraszámát megtartja, és azt az 1, ill. a 7 osztályra vonatkozó szakosító tanfolyami rész csökkentett óraszámával egészíti ki.

8.2.2.5 *Ismeretfelújító képzési program*

8.2.2.5.1 A szabályos időközönként történő ismeretfelújító képzés célja, hogy a járművezetők tudását korszerűsítse; a képzésnek ki kell terjednie a műszaki, a jogi és a szállítandó anyagokkal kapcsolatos előírások fejlődésére.

8.2.2.5.2 Az ismeretfelújító képzésnek – az egyéni gyakorlati oktatással együtt – összevont tanfolyam esetén legalább két naposnak kell lennie, önálló (nem összevont) tanfolyam esetén pedig legalább fele akkora időtartamúnak, mint ami a megfelelő alap-, ill. szakosító tanfolyamra a 8.2.2.4.1 pontban elő van írva.

8.2.2.5.3 A járművezető az ismeretfelújító képzés és vizsga helyett a megfelelő alaptanfolyamon is részt vehet és tehet vizsgát.

8.2.2.6 *A képzés jóváhagyása*

8.2.2.6.1 A tanfolyamokat az illetékes hatóságnak kell jóváhagynia.

- 8.2.2.6.2** Jóváhagyás csak írásban benyújtott kérelemre adható.
- 8.2.2.6.3** A kérelemhez a következőket tartalmazó iratokat kell csatolni:
- a) részletes képzési program, a témák, az órarend és a tervezett oktatási módszerek megjelölésével;
 - b) az oktatók képzettsége és tevékenységi köre;
 - c) a tanfolyam helyszínére, az oktatási (segéd)anyagra és a gyakorlati oktatáshoz rendelkezésre álló lehetőségekről, berendezésekről szóló információ;
 - d) a tanfolyamon való részvétel körülményei, pl. a résztvevők létszáma.
- 8.2.2.6.4** Az illetékes hatóságnak meg kell szerveznie a képzés és a vizsgák felügyeletét.
- 8.2.2.6.5** A jóváhagyást az illetékes hatóságnak írásban kell megadnia, ha legalább a következő feltételek teljesülnek:
- a) a képzés a kérelemben feltüntetettek szerint történik;
 - b) az illetékes hatóságnak joga van arra, hogy egy általa felhatalmazott személyt küldjön, hogy a tanfolyamon vagy vizsgán jelen legyen;
 - c) az illetékes hatóságot kellő időben értesíteni kell az egyes tanfolyamok idejéről és helyéről;
 - d) a jóváhagyás visszavonható, ha a feltételeket nem teljesítik.
- 8.2.2.6.6** A jóváhagyásnak tartalmaznia kell, hogy a jóváhagyott tanfolyam kezdő vagy ismeretfelújító, alap- vagy szakosító tanfolyam-e, továbbá, hogy egyes veszélyes árukra vagy osztály(ok)ra korlátozódik-e.
- 8.2.2.6.7** Ha egy képző szerv változtatni kíván egy jóváhagyott tanfolyam valamely, a jóváhagyás szempontjából lényeges részletén, az illetékes hatóságtól előzetesen engedélyt kell kérnie. Különösen érvényes ez a képzési programmal kapcsolatos változtatásokra.
- 8.2.2.7** *Vizsga*
- 8.2.2.7.1** *Alaptanfolyam vizsga*
- 8.2.2.7.1.1** A gyakorlati oktatást is magába foglaló alaptanfolyami képzés befejezése után vizsgát kell tartani.
- 8.2.2.7.1.2** A vizsgán a jelöltnek bizonyítania kell, hogy rendelkezik mindazzal a tudással, áttekinthetőséggel és jártassággal, amely egy veszélyes árut szállító jármű vezetőjének hivatása gyakorlásához szükséges, és amely az alaptanfolyam tárgyát képezte.
- 8.2.2.7.1.3** E célból az illetékes hatóságnak a 8.2.2.3.2. pontban összefoglalt témákra vonatkozó kérdés gyűjteményt kell összeállítania. A vizsgán e gyűjteményből való kérdéseket kell feltenni. A vizsgázóknak a vizsga előtt nem lehet tudomásuk arról, hogy mely kérdéseket választották ki a gyűjteményből az adott vizsgára.
- 8.2.2.7.1.4** Az összevont tanfolyam végén együttes vizsga is tartható.
- 8.2.2.7.1.5** Minden illetékes hatóságnak felügyelnie kell a vizsga lefolyását.
- 8.2.2.7.1.6** A vizsga lehet írásbeli, vagy írásbeli és szóbeli vizsga kombinációja. Alaptanfolyami vizsgán minden jelöltnek legalább 25 írásbeli kérdést, ismeretfelújító képzést követő vizsgán legalább 15 írásbeli kérdést kell feltenni. Az első esetben a vizsga időtartamának legalább 45 percnél, az utóbbi esetben legalább 30 percnél kell lennie. A kérdések különböző

nehézségük lehetnek és különböző súllyal értékelhetők.

8.2.2.7.2 *Szakosító tanfolyami vizsga a tartányos szállításra, az 1 osztály anyagai és tárgya, ill. a 7 osztály radioaktív anyagai szállítására*

8.2.2.7.2.1 Az alaptanfolyami vizsga letétele és a tartányos szállításra, az 1 osztály anyagai és tárgyai, ill. a 7 osztály radioaktív anyagai szállítására vonatkozó szakosító tanfolyamon való részvétel után a jelöltet a tanfolyamnak megfelelő vizsgára kell bocsátani.

8.2.2.7.2.2 A vizsgát ugyanúgy kell tartani és felügyelni, mint a 8.2.2.7.1 pont esetében. A kérdés gyűjteménynek a 8.2.2.3.3, a 8.2.2.3.4, ill. a 8.2.2.3.5 pontban összefoglalt témákra kell vonatkoznia.

8.2.2.7.2.3 Minden szakosító tanfolyam utáni vizsgán legalább 15 írásbeli kérdést, ismeretfelújító képzést követő vizsgán legalább 10 írásbeli kérdést kell feltenni. Az első esetben a vizsga időtartamának legalább 30 percnél, az utóbbi esetben legalább 20 percnél kell lennie.

8.2.2.7.2.4 Ha egy vizsga korlátozott alaptanfolyami képzésen alapul, ez a szakosító tanfolyam vizsgáját ugyanolyan mértékben behatárolja.

8.2.2.8 *A járművezető oktatási bizonyítványa*

8.2.2.8.1 A 8.2.1.1 bekezdés szerint bizonyítványt kell kiadni:

- a) az alaptanfolyam elvégzése után, ha a jelölt sikeresen letette a 8.2.2.7.1 pont szerinti vizsgát;
- b) amennyiben alkalmazható, a tartányos tartányos szállításra, az 1 osztály anyagainak és tárgyainak, ill. a 7 osztály radioaktív anyagainak szállítására vonatkozó szakosító tanfolyam elvégzése után, illetve a 8.5 fejezetben található S1 és S11 különleges követelmény szerinti tudás megszerzése után, ha a jelölt sikeresen letette a 8.2.2.7.2 pont szerinti vizsgát;
- c) amennyiben alkalmazható, a korlátozott alaptanfolyam vagy korlátozott tartányos szakosító tanfolyam elvégzése után, ha a jelölt sikeresen letette a 8.2.2.7.1, ill. a 8.2.2.7.2 pont szerinti vizsgát. A kiadott bizonyítványon egyértelműen fel kell tüntetni, hogy mely veszélyes árukra vagy osztály(ok)ra korlátozott az érvényessége.

8.2.2.8.2 A járművezető oktatási bizonyítványának érvényessége a kezdő alaptanfolyami, ill. kezdő összevont tanfolyami vizsga letételének időpontjától számított öt év.

A bizonyítványt meg kell újítani, ha a járművezető bizonyítja, hogy a 8.2.2.5 bekezdés szerinti ismeretfelújító képzésben részt vett és a 8.2.2.7 bekezdés szerinti vizsgát letette a következők szerint:

- a) a bizonyítvány érvényességének lejártá előtti 12 hónapon belül. Az illetékes hatóságnak új bizonyítványt kell kiadnia, amelynek érvényességi időtartama az előző bizonyítvány érvényességének lejártától számított öt év.
- b) a bizonyítvány érvényességének lejártá előtti 12 hónapnál korábban. Az illetékes hatóságnak új bizonyítványt kell kiadnia, amelynek érvényességi időtartama az ismeretfelújító vizsga letételétől számított öt év.

Ha a járművezető teljesíti a 8.2.2.8.1 b) vagy c) pont követelményeit és a bizonyítványa hatályát az érvényességi időtartamán belül kiterjeszti, az új bizonyítvány csak addig lesz érvényes, mint az előző bizonyítvány. Ha a járművezető a szakosító képzés vizsgáját sikeresen letette, a szakosítás is csak a bizonyítvány lejártáig érvényes.

8.2.2.8.3 A bizonyítványnak a 8.2.2.8.5 pont szerinti mintának kell megfelelnie. A méretekre az ISO 7810:2003 szabvány ID-1 formátumra vonatkozó előírásait kell betartani és műanyagból kell készíteni. A bizonyítvány fehér színű, fekete betűkkel. További biztonsági elemet, pl. holo-

gramot, UV nyomatot vagy gilosmintát kell tartalmaznia.

8.2.2.8.4

A bizonyítványt a kiállító illetékes hatóság országának nyelvén (nyelvein) vagy valamelyik nyelvén kell kiállítani, Ha ez a nyelv nem az angol, a francia vagy a német, akkor a bizonyítvány címét, a 8. tételt és a hátoldal fejlécét vagy angolul, vagy franciául, vagy németül is fel kell tüntetni.

8.2.2.8.5

A veszélyes árut szállító járművek vezetőinek oktatási bizonyítvány-mintája

8.2.3

A veszélyes áruk közúti szállításában résztvevő, a 8.2.1 szakasz szerinti bizonyítvánnyal rendelkező járművezetőkön kívüli személyek képzése

A veszélyes áruk közúti szállításával kapcsolatos munkakört ellátó személyeknek, az 1.3 fejezet szerinti feladatukhoz és felelősségükhöz igazodó képzésben kell részesülniük a veszélyes áruk szállítására vonatkozó előírásokból. Ez az előírás a jármű üzemben tartója, a feladó és a szállítmányozó által alkalmazott személyzetre és a veszélyes áruk be- vagy kirakását végzőkre, ill. a veszélyes áruk közúti szállításában résztvevő olyan járművezetőkre is vonatkozik, akik nem rendelkeznek a 8.2.1 szakasz szerinti bizonyítvánnyal.

8.3 FEJEZET

JÁRMŰVEK SZEMÉLYZETÉRE VONATKOZÓ KÖVETELMÉNYEK

8.3.1 Utasok szállítása

A veszélyes anyagot szállító szállítóegységen – a jármű személyzetén kívül – utas nem szállítható.

8.3.2 A tűzoltó eszközök használata

A jármű személyzet tagjainak ismerniük kell a tűzoltó eszközök használatát.

8.3.3 Küldeménydarabok felnyitásának tilalma

A jármű vezetője vagy a kísérő személy veszélyes anyagot tartalmazó küldeménydarabot nem nyithat fel.

8.3.4 Hordozható világítókészülék

A hordozható világítókészüléken nem lehet olyan fémfelület, amely szikrát okozhat.

8.3.5 Dohányzási tilalom

A kezelési műveletek alatt tilos a dohányzás a járművek környezetében és a járművek belsejében.

8.3.6 A motor működtetése be- és kirakás alatt

A motort a be- és kirakási műveletek alatt le kell állítani, kivéve ha a motor használata a szivattyú vagy más, a töltést vagy ürítést biztosító gépezet működtetéséhez szükséges, illetve ha annak az országnak a jogszabályai, ahol a jármű tartózkodik, ezt a használatot megengedik.

8.3.7 A rögzítőfék és a kerék kitámasztó ékek használata

Veszélyes anyagot szállító szállítóegység csak úgy várakozhat, ha rögzítőfékje be van húzva. A fékberendezés nélküli pótkocsik elmozdulását legalább egy, a 8.1.5.2 bekezdés szerinti kerék kitámasztó ék alkalmazásával kell megakadályozni.

8.3.8 A kábelek használata

A gépjárműből és O₃ vagy O₄ pótkocsiból álló, blokkolásgátló fékrendszerrel ellátott szállítóegységeknél a 9.2.2.6.3 pontban említett villamos csatlakozásnak a vontató jármű és a pótkocsi között a szállítás teljes időtartama alatt meg kell lennie.

8.4 FEJEZET

A JÁRMŰVEK FELÜGYELETÉRE VONATKOZÓ KÖVETELMÉNYEK

8.4.1

Azokat a járműveket, amelyek a 3.2 fejezet „A” táblázat 19 oszlopában az adott anyagra vonatkozó, a 8.5 fejezetben található S1 6) és S14 – S24 különleges előírásban feltüntetett mennyiségű veszélyes árut szállítanak, felügyelet alatt kell tartani, azonban biztonságos telephelyen vagy üzemi területen felügyelet nélkül is várakozhatnak. Ha ilyen várakozási lehetőség nincs, akkor a szállítóegység, ha megfelelően lezárták, a következő a), b) vagy c) pontban leírt feltételek valamelyikének megfelelő helyen elkülönítve várakozhat:

- a) felügyelő személy által felügyelt parkolóhely; a felügyelőt tájékoztatni kell a rakomány természetéről, és arról, hogy a gépkocsivezető hol tartózkodik;
- b) nyilvános vagy magán parkolóhely, ahol a szállítóegység valószínűleg nem fog más járműtől sérülést szenvedni;
- c) főközlekedési utaktól és lakott területektől távol eső megfelelő szabad tér, amelyet rendes körülmények között sem átjárásra, sem gyülekezésre nem használnak.

A b) pontban engedélyezett parkolóhelyet csak az a) pontban jelzett parkolóhely hiányában szabad igénybe venni; a c) pont alatt leírt parkolóhelyet csak az a) és a b) pontban jelzett parkolóhely hiányában szabad igénybe venni.

8.4.2

A rakott MEMU-t felügyelet alatt kell tartani, azonban biztonságos telephelyen vagy üzemi területen felügyelet nélkül is várakozhat. Az üres, tisztítatlan MEMU-ra ez a követelmény nem vonatkozik.

8.5 FEJEZET

KIEGÉSZÍTŐ KÖVETELMÉNYEK EGYES OSZTÁLYOKRA VAGY ANYAGOKRA

A 8.1 – 8.4 fejezet követelményein felül, amennyiben a 3.2 fejezet “A” táblázat 19 oszlopában erre utalás található, akkor a következő előírásokat kell betartani az érintett veszélyes anyagok vagy tárgyak szállítására. Amennyiben a 8.1 – 8.4 fejezet követelményeivel ellentétben állnak, akkor ezen fejezet követelményei érvényesek.

S1 Követelmények a robbanóanyagok és -tárgyak (1 osztály) szállítására

1) A járművezetők különleges képzése

A szakosító tanfolyam egy részén vagy az egész tanfolyamon való részvétel alól felmentés adható, ha a Szerződő Fél országában érvényes más szabályozások értelmében a járművezetők olyan, más rendszerű vagy más célra szolgáló, de azonos értékű, jóváhagyott tanfolyamon vesznek részt, amely kiterjed a 8.2.2.3.4 pontban előírt témákra.

2) Hivatalos személy

Amennyiben a belföldi szabályok előírják, az ADR Szerződő Felek illetékes hatósága megkövetelheti, hogy a járművön – a fuvarozó (szállító) költségére – hivatalos személy legyen jelen.

3) Dohányzás, tűz és nyílt láng használatának tilalma

A dohányzás, a tűz és nyílt láng használata tilos az 1 osztályba tartozó anyagokat vagy tárgyakat szállító járműveken, azok közelében, ill. be- és kirakáskor.

4) A be- és kirakás helye

- a) Lakott területen belüli közterületen 1 osztályba tartozó anyagokat és tárgyakat tilos be- és kirakodni az illetékes hatóságok külön engedélye nélkül.
- b) Lakott területen kívüli közterületen 1 osztályba tartozó anyagokat és tárgyakat tilos be- és kirakodni anélkül, hogy erről az illetékes hatóságokat előzetesen értesítették volna, hacsak nem biztonsági okból van szükség sürgős rakodásra.
- c) Ha az árukezelést bármilyen okból is közterületen kell végezni, a különböző anyagokat és tárgyakat a veszélyességi bárcáknak megfelelően el kell különíteni egymástól.
- d) Ha az 1 osztályba tartozó anyagokat és tárgyakat szállító járművek be- és kirakodás céljából kénytelenek közterületeken megállni, az álló járművektől legalább 50 m távolságot kell tartani.

5) Járműoszlop

- a) Ha az 1 osztályba tartozó anyagokat és tárgyakat szállító járművek oszlopban közlekednek, a szállítóegységek között legalább 50 m távolságot kell tartani.
- b) Az illetékes hatóság előírhatja a járműoszlop sorrendjét és összetételét.

6) A járművek felügyelete

A 8.4 fejezet előírásait csak akkor kell betartani, ha egy járművel az 1 osztály anyagaiból és tárgyaiból a következőknél nagyobb össztömegű robbanóanyagot szállítanak.

1.1 osztály:	0 kg
1.2 osztály:	0 kg
1.3 osztály, C összeférhetőségi csoport:	0 kg
1.3 osztály, a C összeférhetőségi csoport kivételével:	50 kg
1.4 osztály, az alább felsoroltak kivételével:	50 kg
1.5 osztály:	0 kg
1.6 osztály:	50 kg
1.4 osztály UN 0104, 0237, 0255, 0267, 0289, 0361, 0365, 0366, 0440, 0441, 0455, 0456 és 0500 tételei:	0 kg

Különböző áruk együvé rakása esetén a szállított anyagokra, ill. tárgyakra vonatkozó legalacsonyabb értéket kell betartani az egész rakományra .

Ezen kívül minden rosszindulatú beavatkozás megakadályozása érdekében, ill. azért, hogy kár vagy tűz esetén a gépkocsivezetőt és az illetékes hatóságokat riasztani lehessen, ezeket az anyagokat és tárgyakat állandó felügyelet alatt kell tartani.

Kivételek ez alól a tisztítatlan, üres csomagolóeszközök.

7) A járművek lezárása

Az EX/II járművek rakterének ajtajait és fedeleit, ill. EX/III járművek rakterének minden nyílását az 1 osztályba tartozó anyagok, ill. tárgyak szállítása közben zárva kell tartani, kivéve a be-és kirakodás idejét.

S2 A gyúlékony folyékony anyagok és gyúlékony gázok szállítására vonatkozó kiegészítő követelmények

1) Hordozható világítókészülék

A legfeljebb 60 °C lobbanáspontú folyadékokat, ill. a 2 osztály gyúlékony anyagait vagy tárgyait szállító fedett jármű rakterébe csak olyan hordozható világítókészülékkel szabad belépni, amely úgy van kialakítva, hogy a jármű belsejébe esetleg behatolt gyúlékony gőzöket és gázokat nem tudja meggyújtani.

2) Az égéshő felhasználásával működő fűtőberendezés működtetése a berakás vagy kirakás alatt

Az FL járműveken (lásd a 9. részt) tilos működtetni az égéshő felhasználásával működő fűtőberendezést a berakás és kirakás alatt, ill. a rakodóhelyeken.

3) Elektrosztatikus feltöltődés elkerülése

Az FL járművek (lásd a 9. részt) esetén a tartányok töltése és ürítése előtt a jármű alváza és a föld között jó villamos összeköttetést kell létesíteni. Ezen kívül a töltési sebességet korlátozni kell.

S3 A fertőző anyagok szállítására vonatkozó különleges előírások

A 8.1.4.1 bekezdés táblázata (2), (3) és (5) oszlopának, valamint a 8.3.4 szakasznak a követelményeit nem kell alkalmazni.

S4 A veszélyes áruk hőmérséklet-szabályozással történő szállítására vonatkozó kiegészítő előírások

Az előírt hőmérséklet fenntartása a biztonságos szállításnak alapvető feltétele. Ehhez általában a következők szükségesek:

- berakodás előtt a szállítóegység alapos szemrevételezése;
- az útmutatások a fuvarozó számára a hűtőrendszer működésére vonatkozóan, beleértve a menet során a hűtőközeg beszerzésére rendelkezésre álló helyek felsorolását;
- a szabályozás megszűnése esetén követendő eljárások megadása;
- az üzemi hőmérséklet rendszeres ellenőrzése; és
- felkészülés a hűtőhatás támogatására tartalék hűtési módszerrel/rendszerrel.

A légtér hőmérsékletét a szállítóegységen belül két egymástól független érzékelővel kell mérni és ezek adatait úgy kell rögzíteni, hogy minden hőmérséklet változás könnyen észlelhető legyen.

A hőmérsékletet négy-hat óránként kell ellenőrizni és feljegyezni.

Amennyiben a szállítás alatt a hőmérséklet meghaladja a szabályozási hőmérsékletet, azonnal riadóeljárást kell kezdeményezni, beleértve a hűtőberendezés esetleges javítását vagy a hűtőkapacitás növelését (pl. szilárd vagy folyékony hűtőközeg hozzáadásával). Gyakran kell ellenőrizni a hőmérsékletet és a vészhelyzetben teendő intézkedésekre fel kell készülni. Amennyiben a vészhőmérséklet (lásd a 2.2.41.1.17 és a 2.2.52.1.15 – 2.2.52.1.18 pontot) elérték, a vészeljárásokat meg kell indítani.

Megjegyzés: Az S4 előírást nem kell betartani a 3.1.2.6 bekezdésben hivatkozott anyagokra, ha ezek az anyagok kémiai inhibitor hozzáadásával vannak stabilizálva úgy, hogy az ÖBH nagyobb, mint 50 °C. Ilyen esetben akkor lehet szükség hőmérséklet-szabályozásra, ha az adott szállítási körülmények között a hőmérséklet meghaladhatja az 55 °C-ot.

S5 A 7 osztály radioaktív anyagainak engedményes küldeménydarabokban (UN 2908, 2909, 2910 és 2911 szám) történő szállítására vonatkozó különleges előírások

Az írásbeli utasításra vonatkozó 8.1.2.1 b) pont, továbbá a 8.2.1, 8.3.1 és 8.3.4 szakasz előírásait nem kell betartani.

S6 A 7 osztály radioaktív anyagainak nem engedményes küldeménydarabokban történő szállítására vonatkozó különleges előírások

A 8.3.1 szakasz előírását nem kell betartani a csak I-FEHÉR kategória bárcával ellátott küldeménydarabokat, egyesítőcsomagolásokat vagy konténereket szállító járművekre.

A 8.3.4 szakasz előírásait nem kell betartani, ha nincs járulékos veszély.

Egyéb kiegészítő követelmények vagy különleges előírások

S7 (törölve)

S8 Ha a szállítóegység ezekből az anyagokból 2000 kg-nál többet tartalmaz, kerülni kell az üzemi okokból történő várakozást lakott területek vagy gyülekezésre szolgáló helyek közelében. Ilyen helyek közelében hosszabban várakozni csak az illetékes hatóság hozzájárulásával lehet.

S9 Ezen anyagok szállítása során kerülni kell az üzemi okokból történő várakozást lakott területek vagy gyülekezésre szolgáló helyek közelében. Ilyen helyek közelében hosszabban várakozni csak az illetékes hatóság hozzájárulásával lehet.

S10 Ha az adott ország jogszabályai megkövetelik, akkor az április elsejétől október végéig terjedő időszakban a járművet várakozás közben a napsugárzás ellen hatásosan védeni kell pl. a rakomány fölött legalább 20 cm magasságban elhelyezett ponyvával.

S11 A szakosító tanfolyam egy részén vagy az egész tanfolyamon való részvétel alól felmentés adható, ha a Szerződő Fél országában érvényes más szabályozások értelmében a járművezetők olyan, más rendszerű vagy más célra szolgáló, de azonos értékű, jóváhagyott tanfolyamon vesznek részt, amely kiterjed a 8.2.2.3.5 pontban előírt témákra is.

S12 A radioaktív anyagokat szállító járművek vezetőinek nem kell a 8.2.1.4 bekezdés szerinti szakosító tanfolyamon részt venniük, ha a radioaktív anyagot tartalmazó küldeménydarabok száma legfeljebb 10, és a szállított küldeménydarabok szállítási mutatószámának összege legfeljebb 3. A járművezetőknek azonban feladatuknak megfelelő, azzal arányban álló képzésben kell részesülniük, amely tudatosítja bennük a radioaktív anyagok szállításában rejlő sugárveszélyt. A képzésben való részvételt a munkáltató által kiadott tanúsítvánnyal kell igazolni.

S13 Ha a küldemény nem szolgáltatható ki, akkor biztonságos helyen kell tárolni, az illetékes hatóságokat a lehető leggyorsabban tájékoztatni kell, és a további eljárásra nézve utasítást kell kérni.

S14 A 8.4 fejezet előírásait a járművek felügyeletére a szállított anyag mennyiségétől függetlenül be kell betartani.

S15 A 8.4 fejezet előírásait a járművek felügyeletére a szállított anyag mennyiségétől függetlenül be kell tartani. A 8.4 fejezet előírásait azonban nem kell alkalmazni, ha a megrakott rakodótér le van zárva vagy a szállított küldeménydarabok más módon vannak védve az illetéktelen kirakás ellen.

S16 A 8.4 fejezet előírásait a járművek felügyeletére akkor kell betartani, ha ezen anyagok összömege a járművön meghaladja az 500 kg-ot.

Ezenkívül az ezen anyagokból 500 kg-nál többet szállító járműveket folyamatosan felügyelet alatt kell tartani, hogy az esetleges rosszindulatú cselekményeket megakadályozzák, ill. kár vagy tűz esetében a gépjárművezetőt és az illetékes hatóságokat riasztani lehessen.

- S17** A 8.4 fejezet előírásait a járművek felügyeletére akkor kell betartani, ha ezen anyagok összömege a járművön meghaladja az 1000 kg-ot.
- S18** A 8.4 fejezet előírásait a járművek felügyeletére akkor kell betartani, ha ezen anyagok összömege a járművön meghaladja a 2000 kg-ot.
- S19** A 8.4 fejezet előírásait a járművek felügyeletére akkor kell betartani, ha ezen anyagok összömege a járművön meghaladja az 5000 kg-ot.
- S20** A 8.4 fejezet előírásait a járművek felügyeletére akkor kell betartani, ha ezen anyagok összes tömege, ill. térfogata a járművön meghaladja küldeménydarabos szállítás esetén a 10 000 kg-ot, tartányos szállítás esetén a 3000 litert.
- S21** A 8.4 fejezet előírásait a járművek felügyeletére a mennyiségtől függetlenül minden anyagra be kell tartani. Ezenkívül minden rosszindulatú beavatkozás megakadályozása érdekében, ill. azért, hogy kár vagy tűz esetén a gépkocsivezetőt és az illetékes hatóságokat riasztani lehessen, ezeket az árukat állandó felügyelet alatt kell tartani. A 8.4 fejezet előírásait nem kell azonban betartani, ha
- a) a rakodótér le van zárva vagy a szállított küldeménydarabokat illetéktelen lerakás ellen más módon védik; és
 - b) a sugárzási szint a jármű felületének bármely hozzáférhető pontján nem haladja meg az 5 $\mu\text{Sv/h}$ értéket.
- S22** A 8.4 fejezet előírásait a járművek felügyeletére akkor kell betartani, ha ezen anyagok összes tömege, ill. térfogata a járművön meghaladja küldeménydarabos szállítás esetén az 5000 kg-ot, tartányos szállítás esetén a 3000 litert.
- S23** A 8.4 fejezet előírásait a járművek felügyeletére akkor kell betartani, ha ezt az anyagot ömlesztve vagy tartányban szállítják és az összes tömege, ill. térfogata a járművön meghaladja a 3000 kg-ot, ill. a 3000 litert.
- S24** A 8.4 fejezet előírásait a járművek felügyeletére akkor kell betartani, ha ezen anyagok összömege a járművön meghaladja a 100 kg-ot.

8.6 FEJEZET

VESZÉLYES ÁRUT SZÁLLÍTÓ JÁRMŰVEK KÖZLEKEDÉSÉNEK KORLÁTOZÁSA KÖZÚTI ALAGUTAKBAN

8.6.1 Általános előírások

Ha a járművek közúti alagutakon való áthaladását az 1.9.5 szakasz szerint korlátozzák, e fejezet előírásait kell alkalmazni.

8.6.2 A veszélyes árut szállító járművek áthaladását szabályozó közúti jelzések

Az alagút kategóriát – melyet egy adott közúti alagútra az illetékes hatóság határoz meg, hogy a veszélyes árut szállító járművek áthaladást korlátozza – a következők szerint kell közúti jelzésekkel jelölni:

Közúti jelzés	Alagút kategória
Nincs jelzőtábla	„A”
Jelzőtábla „B” betűt tartalmazó kiegészítő táblával	„B”
Jelzőtábla „C” betűt tartalmazó kiegészítő táblával	„C”
Jelzőtábla „D” betűt tartalmazó kiegészítő táblával	„D”
Jelzőtábla „E” betűt tartalmazó kiegészítő táblával	„E”

8.6.3 Alagút korlátozási kód

8.6.3.1 Az egyes veszélyes áruk alagútban való szállításának korlátozása az adott árura a 3.2 fejezet „A” táblázat (15) oszlopában feltüntetett alagútkorlátozási kódon alapul. Az alagútkorlátozási kód a rovat alsó részében, zárójelben található. Ha az alagútkorlátozási kód helyett a „(–)” jelölés szerepel, az adott veszélyes árura nincs alagútkorlátozás; az UN 2919 és 3331 tétel alá tartozó veszélyes árukra azonban az illetékes hatóság(ok) által jóváhagyott, az 1.7.4.2 bekezdés szerinti különleges megegyezés tartalmazhat alagútkorlátozást.

8.6.3.2 Ha egy szállítóegységen olyan veszélyes áruk vannak, melyekhez különböző alagútkorlátozási kód tartozik, ezek közül a legszigorúbbat kell az egész rakományhoz rendelni.

8.6.3.3 Az 1.1.3 szakasz szerint szállított veszélyes árukra az alagút korlátozás nem vonatkozik, és ezeket az árukat nem kell figyelembe venni, amikor a szállítóegység egész rakományának az alagútkorlátozási kódját állapítják meg, kivéve, ha a szállítóegységet a 3.4.13 szakasz előírásai alapján – figyelembe véve a 3.4.14 szakaszt is – meg kell jelölni.

8.6.4 A veszélyes árut tartalmazó szállítóegységek alagútban való közlekedésére vonatkozó korlátozások

Az alagútban való közlekedésére vonatkozó korlátozás a következőkre vonatkozik:

- „E” kategóriájú alagút esetén azokra a szállítóegységekre, amelyeket a 3.4.13 szakasz előírásai alapján – figyelembe véve a 3.4.14 szakaszt is – meg kell jelölni⁶⁾; és
- azokra a szállítóegységekre, amelyekre az 5.3.2 szakasz szerint narancssárga tábla van előírva, az egész rakományára meghatározott alagútkorlátozási kód alapján a következő táblázat szerint:

6) vagy a 2010.december 31-ig érvényes ADR 3.4.10 szakasz előírásai alapján alapján – figyelembe véve a 3.4.11 szakaszt is –, amennyiben az 1.6.1.20 bekezdés átmeneti előírását alkalmazzák

Az egész rakomány alagútkorlátozási kódja	Korlátozás
B	Tilos áthaladni a B, a C, a D és az E kategóriájú alagutakon
B1000C	Ha a szállítóegységben a nettó robbanóanyag összes tömege: – több mint 1000 kg: tilos áthaladni a B, a C, a D és az E kategóriájú alagutakon, – legfeljebb 1000 kg: tilos áthaladni a C, a D és az E kategóriájú alagutakon
B/D	Tartányos szállítás esetén: tilos áthaladni a B, a C, a D és az E kategóriájú alagutakon; Egyéb szállítás esetén: tilos áthaladni a D és az E kategóriájú alagutakon
B/E	Tartányos szállítás esetén: tilos áthaladni a B, a C, a D és az E kategóriájú alagutakon; Egyéb szállítás esetén: tilos áthaladni az E kategóriájú alagutakon
C	Tilos áthaladni a C, a D és az E kategóriájú alagutakon
C5000D	Ha a szállítóegységben a nettó robbanóanyag összes tömege: – több mint 5000 kg: tilos áthaladni a C, a D és az E kategóriájú alagutakon, – legfeljebb 5000 kg: tilos áthaladni a D és az E kategóriájú alagutakon
C/D	Tartányos szállítás esetén: tilos áthaladni a C, a D és az E kategóriájú alagutakon; Egyéb szállítás esetén: tilos áthaladni a D és az E kategóriájú alagutakon
C/E	Tartányos szállítás esetén: tilos áthaladni a C, a D és az E kategóriájú alagutakon; Egyéb szállítás esetén: tilos áthaladni az E kategóriájú alagutakon
D	Tilos áthaladni a D és az E kategóriájú alagutakon
D/E	Ömlesztett és tartányos szállítás esetén: tilos áthaladni a D és az E kategóriájú alagutakon; Egyéb szállítás esetén: tilos áthaladni az E kategóriájú alagutakon
E	Tilos áthaladni az E kategóriájú alagutakon
–	A közlekedés minden alagútban megengedett (az UN 2919 és 3331 tételekre lásd a 8.6.3.1 bekezdést is)

Megjegyzés: 1. Példa: egy szállítóegység 1.3C osztályozási kódú UN 0161 füstnélküli lőport szállít, melynek az alagútkorlátozási kódja C5000D. Ha a szállítóegységben a nettó robbanóanyag összes tömege 3000 kg, tilos áthaladni a D és az E kategóriájú alagutakon.

2. Az IMDG kódex előírásai szerint jelölt, korlátozott mennyiségben csomagolt veszélyes árut szállító konténerekre és szállítóegységekre nem vonatkozik az „E” kategóriájú alagúton való áthaladás tilalma, ha a korlátozott mennyiségben csomagolt veszélyes áru összes bruttó tömege szállítóegységenként nem több, mint 8 tonna.

9. RÉSZ

A JÁRMŰVEK SZERKEZETÉRE ÉS JÓVÁHAGYÁSÁRA VONATKOZÓ KÖVETELMÉNYEK

9.1 FEJEZET

ALKALMAZÁSI TERÜLET, MEGHATÁROZÁSOK ÉS A JÁRMŰVEK JÓVÁHAGYÁSÁRA VONATKOZÓ KÖVETELMÉNYEK

9.1.1 Alkalmazási terület és meghatározások

9.1.1.1 *Alkalmazási terület*

A 9. rész követelményei a „Közös határozat a járművek szerkezetére” (R.E.3)¹⁾ 7 Melléklete szerinti N és O kategóriájú, veszélyes árut szállító járművekre vonatkoznak.

Ezeket a követelményeket a járművek szerkezetére, típusjóváhagyására, ADR jóváhagyására és éves műszaki vizsgálatára kell alkalmazni.

9.1.1.2 *Meghatározások*

A 9 rész alkalmazásában:

Jármű: minden olyan kész (teljes) jármű, befejezetlen (nem teljes) jármű, vagy befejezett jármű, amelyet veszélyes áruk közúti szállítására szánnak;

EX/II és

EX/III jármű: az 1 osztályba tartozó robbanóanyagok és tárgyak szállítására szánt jármű;

FL jármű:

- a) a legfeljebb 60 °C lobbanáspontú folyadékok (kivéve az UN 1202 számú, EN 590:2004 szabvány szerinti dízelolajat, EN 590:2004 szabvány szerinti lobbanáspontú gázolajat és könnyű fűtőolajat) rögzített tartányban vagy 1 m³-nél nagyobb befogadóképességű leszerelhető tartányban, ill. 3 m³-nél nagyobb befogadóképességű tankkonténerben vagy mobil tartányban való szállítására szolgáló jármű; vagy

- b) a gyúlékony gázok rögzített tartányban vagy 1 m³-nél nagyobb befogadóképességű leszerelhető tartányban, ill. 3 m³-nél nagyobb befogadóképességű tankkonténerben, mobil tartányban vagy MEG-konténerben való szállítására szolgáló jármű; vagy

- c) a gyúlékony gázok szállítására szolgáló, 1 m³-nél nagyobb össz-befogadó-képességű battériás jármű;

OX jármű: a stabilizált hidrogén-peroxid, ill. a 60%-nál több hidrogén-peroxidot tartalmazó stabilizált hidrogén-peroxid (5.1 osztály UN 2015) rögzített tartányban vagy 1 m³-nél nagyobb befogadóképességű leszerelhető tartányban, ill. 3 m³-nél nagyobb befogadóképességű tankkonténerben vagy mobil tartányban való szállítására szolgáló jármű;

AT jármű:

- a) veszélyes anyagok rögzített tartányban vagy 1 m³-nél nagyobb befogadóképességű leszerelhető tartányban, ill. 3 m³-nél nagyobb befogadóképességű tankkonténerben, mobil tartányban vagy MEG-konténerben való szállítására szolgáló, az EX/III-tól, az FL-től, az OX-tól és a MEMU-tól eltérő jármű;

1) Az ENSZ Európai Gazdasági Bizottsága TRANS/WP.29/78/Rev.1 jelű dokumentuma módosított változata. Magyarországon lásd még az 5/1990.(IV.12.)KöHÉM rendeletet.

	b) 1 m ³ -nél nagyobb összbefogadóképességű, az FL-től eltérő battériás jármű;
MEMU	az 1.2.1 szakasz robbanóanyag előállító mobil egység meghatározását kielégítő jármű
Kész (teljes) jármű:	minden olyan jármű, amely nem igényel további összeszerelési munkát (pl. egy gyártási lépcsőben készült tehergépkocsi, vontató, pótkocsi);
Befejezetlen (nem teljes) jármű:	minden olyan jármű, amely legalább egy további gyártási lépcsőt igényel (pl. járóképes alváz, pótkocsi alváz);
Befejezett jármű:	minden olyan jármű, amely több lépcsős gyártási művelet eredménye (pl. felépítménnyel ellátott járóképes alváz);
Típusjóváhagyással rendelkező jármű:	minden olyan jármű, amelyet az ENSZ-EGB 105. sz. előírás ²⁾ vagy a 98/91/EK irányelv ³⁾ szerint jóváhagytak;
ADR jóváhagyás:	valamely Szerződő Fél illetékes hatósága általi tanúsítása annak, hogy a veszélyes áru szállításra használni kívánt járműegyed, mint EX/II, EX/III, FL, OX, AT jármű, ill. MEMU megfelel az előírt műszaki követelményeknek.

9.1.2 Az EX/II, az EX/III, az FL, az OX, az AT járművek és a MEMU-k jóváhagyása

Megjegyzés: A származási ország általános biztonsági szabályai által megkövetelt igazolásokon túlmenően különleges jóváhagyási igazolás csak az EX/II, az EX/III, az FL, az OX, az AT járművekre és a MEMU-kra szükséges.

9.1.2.1 Általános előírások

Az EX/II, az EX/III, az FL, az OX, az AT járműveknek és a MEMU-knak meg kell felelniük e fejezet vonatkozó követelményeinek.

Minden kész, ill. befejezett jármű első vizsgálata során az illetékes hatóságnak ezen fejezet eljárási követelményei szerint ellenőriznie kell, hogy megfelel-e a 9.2 – 9.8 fejezet vonatkozó műszaki követelményeinek.

A 9.1.2.2 bekezdés szerinti típusjóváhagyással ellátott nyerges vontatók esetében az illetékes hatóság eltekinthet az első vizsgálattól, ha a gyártó vagy megfelelően felhatalmazott képviselője vagy az illetékes hatóság által elismert szervezet nyilatkozatot adott ki arról, hogy megfelel a 9.2 fejezet követelményeinek.

A járművek megfelelőségét a 9.1.3 szakasz szerinti jóváhagyási igazolás kiadásával kell tanúsítani.

Ha a járműre visszatartó féket (tartós lassító féket) kell felszerelni, a jármű gyártójának vagy megfelelően felhatalmazott képviselőjének nyilatkozatot kell adni arról, hogy a visszatartó fék (tartós lassító fék) megfelel az ENSZ-EGB 13. sz. előírás⁴⁾ 5. Melléklete előírásainak.

2) ENSZ-EGB 105. sz. előírás (Egységes feltételek a veszélyes áruk szállítására szánt járművek jóváhagyására a különleges szerkezeti jellemzők szempontjából)

3) Az Európai Parlament és a Tanács 1998. december 14-i 98/91/EK irányelve a veszélyes áruk közúti szállítására szánt gépjárművekről és pótkocsijaikról, valamint a gépjárművek és pótkocsijaik típusjóváhagyására vonatkozó 70/156/EGK irányelv módosításáról (lásd az EK Hivatalos Lapja L011 sz., 1999.01.16, 25-36 o.)

4) ENSZ-EGB 13. sz. előírás (Egységes feltételek az M, N és O kategóriájú járművek jóváhagyására a fékezés vonatkozásában)

Ezt a nyilatkozatot az első műszaki vizsgálatnál be kell mutatni.

9.1.2.2 *A típusjóváhagyással rendelkező járművekre vonatkozó követelmények*

A gyártó vagy a megfelelően felhatalmazott képviselője kérésére a 9.1.2.1 bekezdés szerint jóváhagyásra kötelezett járművek az illetékes hatóság által típusjóváhagyással láthatók el. A 9.2 fejezet vonatkozó műszaki követelményei kielégítettnek tekinthetők, ha az illetékes hatóság az ENSZ-EGB 105. sz. előírása²⁾ vagy a 98/91/EK irányelv³⁾ szerint típusjóváhagyást adott ki, amennyiben az említett előírás, ill. irányelv követelményei a 9.2 fejezet előírásaival megegyeznek, kivéve, ha a jármű valamilyen módosítása befolyásolja a típusjóváhagyás érvényességét. Az ENSZ-EGB 105. előírás szerinti típusjóváhagyási jel szerint a MEMU lehet MEMU vagy EX/III. Kifejezetten MEMU-ként csak a 9.1.3 szakasz szerinti jóváhagyási igazoláson kell szerepelnie.

A valamely Szerződő Fél által kiadott típusjóváhagyást a többi Szerződő Félnek el kell fogadnia a jármű megfelelőségének bizonyítékaul, amikor a járműegységet ADR szerinti jóváhagyásra bemutatják.

Az ADR szerinti jóváhagyás során végzett vizsgálatnál, ha a befejezetlen járműre típusjóváhagyást adtak ki, akkor a járműnek csak azokat a részeit kell a 9.2 fejezet vonatkozó követelményeinek való megfelelőségük szempontjából vizsgálni, amelyeket a befejezési munka során adtak hozzá vagy módosítottak.

9.1.2.3 *Éves műszaki vizsgálat*

Az EX/II, az EX/III, az FL, az OX, az AT járműveket és a MEMU-kat a forgalomba helyezés országában évente műszaki vizsgálatnak kell alávetni annak megállapítására, hogy megfelelnek-e ennek a résznek a vonatkozó előírásainak és a forgalomba helyezés országában érvényben levő általános biztonsági előírásainak (fékek, világítás stb.).

A jármű megfelelőségét a 9.1.3 szakasz szerinti jóváhagyási igazolás érvényességének meghosszabbításával vagy új jóváhagyási igazolás kiadásával kell tanúsítani.

9.1.3 **Jóváhagyási igazolás**

9.1.3.1 Az EX/II, az EX/III, az FL, az OX, az AT járművek és a MEMU-k esetében az e rész előírásainak való megfelelőség tanúsításaként a forgalomba helyező ország illetékes hatóságának mindazokra a járműegységekre, amelyek vizsgálata kielégítő eredménnyel járt vagy amelyekre a vizsgálat alapján a 9.2 fejezetnek való megfelelőségről a 9.1.2.1 bekezdés szerint nyilatkozatot adtak ki, jóváhagyási igazolást (ADR jóváhagyási igazolást) kell kiadnia.

9.1.3.2 Bármely Szerződő Fél illetékes hatósága által, a területén forgalomba helyezett járműre kiadott minden jóváhagyási igazolást – érvényességének időtartamán belül – a többi Szerződő Fél illetékes hatóságai elfogadnak.

9.1.3.3 A jóváhagyási igazolásnak meg kell egyeznie a 9.1.3.5 bekezdésben szereplő mintával. Az igazolás mérete 210 x 297 mm (A4 formátum). A lap mindkét oldala használható. Az űrlap színe fehér, rózsaszínű átlós sávval.

Az igazolást a kibocsátó ország (egyik) nyelvén kell kiállítani. Ha ez a nyelv nem angol, nem francia vagy nem német, akkor a jóváhagyási igazolás címét és a 11. pontban szereplő megjegyzéseket e nyelvek egyikén is meg kell adni.

A hulladékok szállítására használt, vákuummal üzemelő tartányjárművek jóváhagyási igazolásában szerepelnie kell a „hulladék szállítására használt, vákuummal üzemelő tartányjármű” megjegyzésnek.

9.1.3.4 A jóváhagyási igazolás érvényessége legkésőbb a járműnek az igazolás kiadását megelőző műszaki vizsgálata időpontját követő egy év elteltével lejár. A következő érvényességi határidőt azonban az előző lejáratási időtől kell számítani, ha a műszaki vizsgálat a lejáratási idő

előtt vagy után egy hónapon belül történt.

Ennek az előírásnak a betartása azonban nem jelenti azt, hogy az időszakos vizsgálat kötelezettségének alávetett tartányok tömörségi vizsgálatát, folyadéknomás-próbáját vagy belső vizsgálatát rövidebb időközökben kellene elvégezni, mint ahogy azt a 6.8 és a 6.9 fejezet előírja.

9.1.3.5 *Jóváhagyási igazolás bizonyos veszélyes árut szállító járművek részére*

Jóváhagyási igazolás bizonyos veszélyes árut szállító járművek részére

Certificate of approval for vehicles carrying certain dangerous goods

Ez az igazolás tanúsítja, hogy az alábbiakban meghatározott jármű megfelel a „Veszélyes Áruk Nemzetközi Közúti Szállításáról szóló Európai Megállapodás” (ADR) által előírt feltételeknek.

1. Az igazolás száma:	2. A jármű gyártója:	3. A jármű azonosítási száma:	4. A jármű rendszáma (ha van):
-----------------------	----------------------	-------------------------------	--------------------------------

5. A fuvarozó, az üzemben tartó vagy a tulajdonos neve és hivatalos címe:

6. A jármű kategóriája¹⁾:

7. A jármű rendeltetése(i) az ADR 9.1.1.2 bekezdése szerint²⁾:

EX/II

EX/III

FL

OX

AT

MEMU

8. Visszatartó fék (tartós lassítófék)³⁾:

☐ Tárgytalan

☐ Az ADR 9.2.3.1.2 pontja szerint a teljesítmény megfelelő, ha a járműszerelvény össztömege: tonna⁴⁾

9. A tartányjármű vagy battériás jármű tartányának (tartányainak) leírása (ha van):

9.1 A tartány gyártója:

9.2 A tartány vagy battériás jármű engedély száma:

9.3 A tartány gyártási sorozat száma vagy a battériás jármű elemeinek azonosítója:

9.4 A gyártás éve:

9.5 Az ADR 4.3.3.1 vagy 4.3.4.1 bekezdése szerinti tartánykód:

9.6 Az ADR 6.8.4 szakasza szerinti – esetleges – TC és TE különleges előírás(ok):⁶⁾

10. A következő veszélyes áruk szállíthatók:

A jármű megfelel a 7. pontban szereplő rendeltetése szerinti veszélyes áruk szállítására vonatkozó követelményeknek.

10.1 EX/II vagy EX/III jármű esetén:³⁾ ☐ az 1 osztály anyagai, beleértve a J összeférhetőségi csoport anyagainak
☐ az 1 osztály anyagai, kivéve a J összeférhetőségi csoport anyagainak

10.2 Tartányjármű vagy battériás jármű esetén:³⁾

☐ csak a 9. pontban feltüntetett tartánykód és az esetleges különleges előírások szerint szállítható anyagok⁵⁾; vagy
☐ csak a következő anyagok (az osztály, az UN szám, ha szükséges a csomagolási csoport és a „helyes szállítási megnevezés” megadásával):

Csak olyan anyagok szállíthatók, amelyek a tartány anyagával, tömítéseivel, szerelvényeivel és – ha van – a belső bevonatával nem lépnek veszélyes reakcióba.

11. Megjegyzések (Remarks):

12. Érvényes:-ig

A kiállító szerv bélyegzője

Hely, dátum

Aláírás

1) A „Közös határozat a járművek szerkezetére” (R.E.3.) 7 Mellékletének (vagy a 97/27/EK irányelvnek) az N és O kategóriájú gépjárművekre, illetve pótkocsikra vonatkozó meghatározása szerint.

2) A nem kívánt rész áthúzandó.

3) A megfelelő négyzetet be kell jelölni.

4) A megfelelő értéket be kell írni. Ha itt 44 t van feltüntetve, ez nem módosítja a forgalmi engedélyben szereplő megengedett legnagyobb össztömeget.

5) Azok az anyagok, amelyek a 9. pontban feltüntetett tartánykód, vagy a 4.3.3.1.2 és 4.3.4.1.2 pontok szerinti tartányrangsor alapján engedélyezett egyéb tartánykód és az esetleges különleges előírások szerint szállíthatók.

6) Nem szükséges megadni, ha a szállítható anyagok a 10.2 pontban fel vannak sorolva.

13. Az érvényesség meghosszabbítva:-ig

A kiállító szerv bélyegzője

Hely, dátum

Aláírás

Megjegyzés: Ezt az igazolást a kiállító szervnek vissza kell adni, ha a járművet a forgalomból kivonták; ha a jármű más fuvarozó, üzemben tartó vagy tulajdonos birtokába kerül, mint ami az 5. pontban fel van tüntetve; ha a jóváhagyási igazolás érvényessége lejárt; ha a jármű egy vagy több lényeges jellemzőjében érdemi változás történt.

9.2 FEJEZET

A JÁRMŰVEK SZERKEZETÉRE VONATKOZÓ KÖVETELMÉNYEK

9.2.1 E fejezet követelményeinek alkalmazása

9.2.1.1 Az EX/II, az EX/III, az FL, az OX és az AT járműveknek meg kell felelniük e fejezet követelményeinek, amint azt a következő táblázat tartalmazza.

A többi (nem EX/II, EX/III, FL, OX és AT) jármű esetében:

- a 9.2.3.1.1 pont követelményeit (az ENSZ-EGB 13. sz. előírás vagy a 71/320/EGK irányelv szerinti fékberendezés) azokra a járművekre kell alkalmazni, amelyeket első alkalommal 1997. június 30-a után helyeztek forgalomba (vagy vettek használatba, ahol a forgalomba helyezés nem kötelező);
- a 9.2.5 szakasz követelményeit (az ENSZ-EGB 89. sz. előírás vagy a 92/24/EGK Tanácsi Irányelv szerinti sebességkorlátozó készülék) minden olyan gépjárműre alkalmazni kell, amelynek megengedett legnagyobb össztömege meghaladja a 12 tonnát és 1987. december 31-e után helyezték először forgalomba, valamint minden olyan gépjárműre, amelynek megengedett legnagyobb össztömege meghaladja a 3,5 tonnát, de legfeljebb 12 tonna és 2007. december 31-e után helyezték először forgalomba.

9.2.1.2 A MEMU-knak az e fejezet EX/III járművekre vonatkozó követelményeinek kell megfelelniük.

9.2.5	Sebességkorlátozó készülék	X ^{e)}	X ^{e)}	X ^{e)}	X ^{e)}	X ^{e)}	e) Az először 1987. december 31-e után forgalomba helyezett, 12 tonnánál nagyobb megengedett legnagyobb össztömegű gépjárművekre, valamint az először 2007. december 31-e után forgalomba helyezett, 3,5 tonnánál nagyobb, de legfeljebb 12 tonna megengedett legnagyobb össztömegű gépjárművekre vonatkozik.
9.2.6	Kapcsolószerkezet	X	X				

9.2.2 Villamos felszerelés

9.2.2.1 Általános előírások

A villamos felszerelésnek teljes egészében ki kell elégítenie a 9.2.2.2 – 9.2.2.6 bekezdés előírásait a 9.2.1 szakasz táblázatával összhangban.

9.2.2.2 Kábelezés

9.2.2.2.1 A vezetékeket a túlmelegedés elkerülése érdekében bőségesen kell méretezni. A vezetékeket megfelelően szigetelni kell. Minden áramkört olvadó biztosítóval vagy önműködő megszakítóval kell védeni a túláram ellen a következők kivételével:

- az akkumulátorteleptől a hidegindítóig és a motorleállító rendszerig;
- az akkumulátorteleptől a generátorig;
- a generátortól a biztosíték vagy megszakító dobozáig;
- az akkumulátorteleptől az indítómotorig;
- az akkumulátorteleptől a visszatartó fékrendszer vezérlő dobozig (lásd a 9.2.3.1.2 pontot), ha ez a rendszer villamos vagy elektromágneses működtetésű;
- az akkumulátorteleptől a felemelhető tengely villamos emelőszerkezetéig.

Ezeket a védelem nélküli áramköröket a lehető legrövidebbre kell kialakítani.

9.2.2.2.2 A kábeleket szilárdan kell rögzíteni, és oly módon kell fektetni, hogy a mechanikai és a hőhatásoktól védve legyenek.

9.2.2.3 Akkumulátortelep-főkapcsoló

9.2.2.3.1 Az akkumulátortelephez a lehető legközelebb villamos áramköröket megszakító főkapcsolót kell elhelyezni. Egypólusú kapcsoló használata esetén azt a tápvezetékbe, nem pedig a testvezetékbe kell elhelyezni.

9.2.2.3.2 A gépkocsi vezetőfülkéjében olyan eszközt kell elhelyezni, amely lehetővé teszi az akkumulátortelep főkapcsoló kikapcsolását és újra bekapcsolását. Ezt a járművezető számára könnyen hozzáférhető helyre kell szerelni, jól megkülönböztethető jelöléssel kell ellátni, és védőburkolattal, kettős kapcsolómozgású kialakítással vagy más alkalmas módon védeni kell a nem szándékos működésbe hozás ellen. További kapcsolóeszközök is elhelyezhetők, ha megkülönböztethető jelöléssel vannak ellátva, illetve a nem szándékos működésbe hozás ellen védve vannak. Ha a kapcsolóeszköz(ök) villamos működtetésű(ek), az áramkörökre a 9.2.2.5 bekezdés előírásait be kell tartani.

9.2.2.3.3 Az akkumulátortelep főkapcsolót az IEC 60529 szabvány szerinti IP65 védelmi fokozatú tokozással kell ellátni.

9.2.2.3.4 Az akkumulátortelep főkapcsoló csatlakozásainak IP54 védelmi fokozatúnak kell lenniük. Erre azonban nincs szükség, ha a csatlakozások burkolatban vannak, ami lehet maga az akkumulátordoboz is. Ebben az esetben elegendő a csatlakozásokat rövidzárlat ellen szigetelni, például gumisapkával.

9.2.2.4 Akkumulátortelep

Az akkumulátortelep sorkapcsait elektromosan szigetelni kell, vagy szigetelő akkumulátordoboz fedéllel kell lefedni. Ha az akkumulátortelep nem a motorháztető alatt

van elhelyezve, akkor szellőztetett tartóban kell rögzíteni.

9.2.2.5 Tartósan feszültség alatt lévő áramkörök

9.2.2.5.1

- a) A villamos berendezések azon részeinek (beleértve a vezetékeket is), melyeknek az akkumulátortelep-főkapcsoló nyitott állásában is feszültség alatt kell maradniuk, alkalmasnak kell lenniük a veszélyes környezetben történő üzemeltetésre és ki kell elégíteniük az IEC 60079 szabvány 0 és 14⁵⁾ részének általános követelményeit, valamint az IEC 60079 szabvány 1, 2, 5, 6, 7, 11, 15 vagy 18 részének⁶⁾ vonatkozó kiegészítő követelményeit.
- b) Az IEC 60079 szabvány 14⁵⁾ részének alkalmazása szempontjából a következő osztályozást kell használni:
A 9.2.2.3, ill. a 9.2.2.4 bekezdésbe nem tartozó, tartósan feszültség alatt lévő villamos berendezésekre (beleértve a vezetékeket is) általában az 1 zóna, illetve a vezetőfülke mögött elhelyezett villamos berendezésekre a 2 zóna követelményeit kell teljesíteni. Az IIC robbanási csoport és a T6 hőmérsékleti osztály követelményeit kell teljesíteni.
A T4 hőmérsékleti osztályba kell viszont sorolni azokat a tartósan feszültség alatt lévő villamos berendezéseket, amelyek olyan környezetben vannak, ahol az ott elhelyezett nemvillamos berendezések által okozott hőmérséklet magasabb, mint a T6 hőmérsékleti osztály határa.
- c) A tartósan feszültség alatt lévő berendezések tápvezetékeinek vagy az IEC 60079 szabvány 7 rész („Fokozott biztonság”) előírásainak kell megfelelniük és az áramforráshoz a lehető legközelebb elhelyezett olvadó biztosítóval, ill. önműködő megszakítóval kell védeni, vagy „gyújtószikra mentes berendezés” esetén az áramforráshoz a lehető legközelebb elhelyezett biztonsági retesszel kell védeni.

9.2.2.5.2

Azoknak a villamos berendezéseknek, amelyeknek az akkumulátortelep-főkapcsoló nyitott állásában is feszültség alatt kell maradniuk, a telepfőkapcsolót megkerülő vezetékeit a túlmelegedés ellen megfelelő eszközzel védeni, pl. olvadó biztosítóval, megszakítóval vagy biztonsági retesszel (áramkorlátozóval).

9.2.2.6

A villamos berendezések vezetőfülke mögött elhelyezett részére vonatkozó előírások

Az egész berendezést úgy kell kialakítani, felszerelni és védeni, hogy a jármű normál üzemi feltételei mellett ne idézhessen elő sem gyulladást, sem rövidzárlatot, és a legkisebb mértékre csökkentse ütődések vagy alakváltozások esetén ezek kockázatát. Különösen ügyelni kell a következőkre:

9.2.2.6.1

Kábelezés

A vezetőfülke mögötti kábeleket védeni kell a normális jármű üzemelés során fellépő ütéssel, kopással és dörzsölődéssel szemben. A megfelelő védelem példái az 1 – 4. ábrán láthatók. A blokkolásgátló fékszerkezet érzékelő kábele azonban nem igényel kiegészítő védelmet.

5) E rész előírásai elsőbbséget élveznek az IEC 60079 szabvány 14 részével szemben.

6) Alternatívaként az EN 50014 szabvány általános követelményei, ill. az EN 50016, 50017, 50018, 50019, 50020, 50021 és 50028 kiegészítő követelményei is használhatók.

1. ábra

2. ábra

3. ábra

4. ábra

9.2.2.6.2 *Világítás*

Menetes foglalatú izzólámpák nem használhatók.

9.2.2.6.3 *Villamos csatlakozás*

A gépjármű és a pótkocsi közötti villamos csatlakozásnak az IEC 60529 szabvány szerinti IP54 fokozatú védettséggel kell rendelkeznie, és úgy kell azt kialakítani, hogy a véletlen-szerű megszakítást megakadályozza. A csatlakozásnak az ISO 12098:2004⁷⁾, az ISO 7638:2003⁷⁾, ill. az EN 15207:2006 szabványnak kell megfelelnie.

9.2.3 Fékberendezés

9.2.3.1 *Általános előírások*

9.2.3.1.1 A veszélyes áru szállításához szállítóegységként használt gépjárműveknek és pótkocsiknak ki kell elégíteniük az ENSZ-EGB 13. sz. előírás⁸⁾ vagy a 71/320/EGK irányelv⁹⁾ vonatkozó műszaki követelményeit (a bennük szereplő alkalmazási időpontok szerinti változatban).

9.2.3.1.2 Az EX/III, az FL, az OX és az AT járműveknek az ENSZ-EGB 13. sz. előírás⁸⁾ 5. Mellékletének követelményeit kell teljesíteni.

9.2.3.2 (törölve)

9.2.4 Tűzveszély kiküszöbölése

9.2.4.1 *Általános előírások*

A következő műszaki előírásokat a 9.2.1 szakaszban lévő táblázattal összhangban kell alkalmazni.

9.2.4.2 *Vezetőfülke*

Ha a vezetőfülke nem nehezen éghető anyagokból készült, fémből vagy más alkalmas anyagból készült, a tartánnyal azonos szélességű pajzsot kell a fülke mögött elhelyezni. A fülke hátsó felén vagy a pajzson levő ablakokat légmentesen zárt kivitelben, tűzálló, biztonsági üvegből és tűzálló keretekkel kell kialakítani. Ezen kívül legalább 15 cm üres térnek kell lennie a tartány és a fülke vagy a pajzs között.

9.2.4.3 *Tüzelőanyagtartály*

A gépjármű motorját ellátó tüzelőanyagtartályoknak a következő követelményeket kell kielégíteniük:

- a) Szivárgás esetén a tüzelőanyag a talajra folyjon, anélkül, hogy érintkezésbe kerülne a jármű forró részeivel vagy a rakománnyal.
- b) A benzint tartalmazó tüzelőanyagtartályok töltőnyílását hatékony lángzáró szerkezettel vagy légmentesen zárva tartható zárószerkezettel kell ellátni.

7) Az ebben a szabványban hivatkozott ISO 4009-et nem kell alkalmazni.

8) Az ENSZ-EGB 13. sz. előírás (Egységes feltételek az M, N és O kategóriájú járművek jóváhagyására a fékezés vonatkozásában).

9) A 71/320/EGK Tanácsi Irányelv (lásd az EK Hivatalos Lapja L202 sz., 1971.09.06.) módosított változata

9.2.4.4 Motor

A járművet meghajtó motort úgy kell felszerelni és elhelyezni, hogy elkerüljük a rakomány melegezésének vagy meggyulladásának veszélyét. Az EX/II és az EX/III járművek motorja csak kompressziógyújtású (dízelmotor) lehet.

9.2.4.5 Kipufogó rendszer

A kipufogórendszert, valamint a kipufogó csővezetéseket olyan irányban kell elhelyezni vagy úgy kell védeni, hogy elkerüljük a rakomány melegezésének vagy gyulladásának veszélyét. A kipufogórendszernek közvetlenül a tüzelőanyag-tartály (dízelolaj-tartály) alatt elhelyezett részeinek attól legalább 100 mm távolságban vagy hőszigetelő pajzsos védelemmel kell lenniük.

9.2.4.6 A jármű visszatartó fékrendszere

Ha a jármű visszatartó fékrendszere a vezetőfülke hátsó fala mögött van elhelyezve és forró hőt bocsát ki, akkor a fékrendszer és a tartály vagy rakomány közé biztonságosan rögzített hővédő pajzsot kell elhelyezni annak érdekében, hogy ne következhessek be a tartánynak vagy a rakománynak akár csak helyi felmelegezése se.

Ezenkívül ennek a hővédő pajzsos védenie kell a fékrendszert a szállított anyag még véletlen kifolyásától vagy szivárgásától is, pl. kettős falú pajzsos tartalmazó védelem kielégítőnek tekinthető.

9.2.4.7 Égéshő felhasználásával működő fűtőberendezés

9.2.4.7.1 Az égéshő felhasználásával működő fűtőberendezésnek meg kell felelnie az ENSZ-EGB 122. sz. előírás¹⁰⁾ vagy a 2001/56/EK Irányelv¹¹⁾ előírásainak (a bennük szereplő alkalmazási időpontok szerinti változatban) és a 9.2.4.7.2 – 9.2.4.7.6 pont követelményeinek, a 9.2.1 szakasz táblázatával összhangban.

9.2.4.7.2 A égéshő felhasználásával működő fűtőberendezést, illetve az égéstermék elvezető rendszerét úgy kell kialakítani, elhelyezni, védeni vagy lefedni, hogy a rakomány meggyulladásának vagy megengedhetetlen felmelegezésének veszélyét elkerüljük. E követelmény teljesítettnek tekinthető, ha a berendezés tüzelőanyag-tartálya és az égéstermék elvezető rendszere hasonlóan van kialakítva ahhoz, ahogy a 9.2.4.3, ill. a 9.2.4.5 bekezdésben a jármű tüzelőanyag-tartályára és a kipufogó rendszerére elő van írva.

9.2.4.7.3 Az égéshő felhasználásával működő fűtőberendezésnek legalább a következő esetekben ki kell kapcsolnia:

- a) a kézi kapcsoló vezetőfülkéből történő, szándékos működtetésekor;
- b) a jármű motorjának leállásakor, ez esetben a fűtőberendezést a gépjárművezető kézzel visszakapcsolhatja;
- c) a gépjárműnek a szállítandó anyag betöltéséhez használt szivattyúja beindításakor.

9.2.4.7.4 Az égéshő felhasználásával működő fűtőberendezés kikapcsolása után utóégés megengedett. A 9.2.4.7.3 pont b) és c) alpontja esetén a porlasztólevegő ellátást legfeljebb 40 s-ig tartó utóégés után, alkalmas eszközzel meg kell szakítani. Csak olyan fűtőberendezések használhatók, amelyeknél bizonyított, hogy normális használati idejük alatt a hőcserélő elviseli a 40 s-ig tartó mérsékelt utóégéseket.

10) ENSZ-EGB 122. sz. előírás (Előírások a fűtési rendszerek típusjóváhagyásáról és a járművek fűtési rendszerek vonatkozásában történő típusjóváhagyásáról).

11) Az Európai Parlament és a Tanács 2001. szeptember 27-i 2001/56/EK Irányelve a gépjárművek és pótkocsijaik fűtési rendszereiről (lásd az EK Hivatalos Lapja L292 sz., 2001.11.09.).

9.2.4.7.5 Az égéshő felhasználásával működő fűtőberendezésnek kézzel kapcsolhatónak kell lennie. Programozott kapcsoló nem alkalmazható.

9.2.4.7.6 Az égéshő felhasználásával működő fűtőberendezéshez gáznemű tüzelőanyag nem használható.

9.2.5 Sebességkorlátozó készülék

A 3,5 tonnát meghaladó legnagyobb megengedett össztömegű gépjárműveket (tehergépkocsikat és nyerges vontatókat) az ENSZ-EGB 89. számú előírás¹²⁾ szerinti sebességkorlátozó készülékkel kell ellátni. A készüléket – a technológiai tűrés figyelembevételével – úgy kell beállítani, hogy a sebesség ne lépesse túl a 90 km/h értéket.

9.2.6 A pótkocsik kapcsolószerkezete

A pótkocsik kapcsolószerkezetének meg kell felelnie az ENSZ-EGB 55. sz. előírás¹³⁾ vagy a 94/20/EK Irányelv¹⁴⁾ műszaki követelményeinek (a bennük szereplő alkalmazási időpontok szerinti változatban).

-
- 12) Az ENSZ-EGB 89. sz. előírás: Egységes feltételek a járművek jóváhagyására:
I. maximális sebességük korlátozása szempontjából;
II. a jóváhagyott típusú sebességkorlátozó (SLD) beépítése szempontjából;
III. a sebességkorlátozó készülékek jóváhagyására.
Alternativaként az 1992. március 31-i 92/24/EGK Tanácsi Irányelv (lásd az EK Hivatalos Lapja L129 sz., 1992.05.14.) megfelelő előírásai is alkalmazhatók, feltéve, ha a jármű jóváhagyás idejében érvényes ENSZ-EGB 89. sz. előírással összhangban módosítva vannak.
- 13) Az ENSZ-EGB 55. sz. előírás: Egységes feltételek a járműszerelvények mechanikus kapcsolószerkezeteinek jóváhagyására, legújabb módosított változata.
- 14) Az Európai Parlament és a Tanács 1994. május 30-i 94/20/EK Irányelve (lásd az EK Hivatalos Lapja L195 sz., 1994.07.29.).

9.3 FEJEZET

KIEGÉSZÍTŐ KÖVETELMÉNYEK AZ 1 OSZTÁLYBA TARTOZÓ ROBBANÓANYAGOK ÉS -TÁRGYAK KÜLDEMÉNYDARABOKBAN TÖRTÉNŐ SZÁLLÍTÁSÁRA SZOLGÁLÓ, EX/II ÉS EX/III (KÉSZ, ill. BEFEJEZETT) JÁRMŰVEKRE

9.3.1 A járműszekrény gyártásához használt anyagok

A járműszekrény gyártásához nem szabad olyan anyagot használni, amely a szállított anyaggal veszélyes vegyületet képezhet.

9.3.2 Égéshő felhasználásával működő fűtőberendezés

9.3.2.1 Az EX/II és az EX/III járműveken égéshő felhasználásával működő fűtőberendezést csak a vezetőfülke fűtésére, ill. a motor melegítésére lehet használni.

9.3.2.2 Az égéshő felhasználásával működő fűtőberendezésnek meg kell felelnie a 9.2.4.7.1, a 9.2.4.7.2, a 9.2.4.7.5 és a 9.2.4.7.6 pont követelményeinek.

9.3.2.3 Az égéshő felhasználásával működő fűtőberendezés kapcsolója a vezetőfülkén kívül is elhelyezhető.

Nem szükséges bizonyítani, hogy a hőcserélő elviseli a mérsékelt utóégéseket.

9.3.2.4 Nem szabad a raktéren belül elhelyezni az égéshő felhasználásával működő fűtőberendezést, ill. a működéséhez szükséges tüzelőanyagtartályt, áramforrást, porlasztó levegő (égési levegő) és fűtőlevegő beszívónyílást, illetve égéstermék kivezetőnyílást.

9.3.3 EX/II jármű

A járműveket úgy kell kialakítani és felszerelni, hogy a robbanóanyagot megvédjék a külső veszélyektől és az időjárás hatásaitól, lehetnek fedettek vagy ponyvásak. A ponyvát nagy szakítószilárdságú, vízhatlan és lángmentesített anyagból¹⁵⁾ kell készíteni. A ponyvát úgy kell kifeszíteni, hogy a rakfelületet minden oldalon fedje.

A fedett járművek rakterében minden nyílást hézag nélkül illeszkedő, zárható ajtóval vagy fedéllel kell ellátni. A vezetőfülkét a raktértől hézagmentes fallal kell elválasztani.

9.3.4 EX/III jármű

9.3.4.1 A járműveket úgy kell kialakítani és felszerelni, hogy a robbanóanyagot megvédjék a külső veszélyektől és az időjárás hatásaitól. A járműnek fedettnek kell lennie. A vezetőfülkét a raktértől hézagmentes fallal kell elválasztani. A rakfelületnek megszakítás nélkülinek kell lennie. Rakomány lehorgonyzó szerelvények elhelyezhetők. Minden illesztést tömíteni kell. Minden nyílást úgy kell kialakítani, hogy zárható legyen, és úgy kell elhelyezni, hogy a csuklópántok el legyenek fedve.

9.3.4.2 A járműszekrényt legalább 10 mm vastag, hő- és lángálló anyagból kell készíteni. E követelmény az EN 13501-1:2002 szabvány szerinti B-S₃-d₂ osztályba sorolt anyagok

15) A gyúlékonyság tekintetében ez a követelmény teljesítettnek tekinthető, ha a ponyva mintákat az ISO 3795:1989 „Közúti járművek, valamint mező- és erdőgazdasági vontatók és munkagépek – A belső anyagok égési viselkedésének meghatározása” c. szabványban meghatározott módszerrel vizsgálva az égési sebesség nem haladja meg a 100 mm/min értéket.

használata esetén teljesítettnek tekinthető.

Ha a járműszekrényhez használt anyag fém, annak teljes belső felületét ezen követelményt kielégítő anyaggal kell bevonni.

9.3.5 Motor és raktér

Az EX/II, ill. az EX/III járművet meghajtó motort a raktér elülső fala előtt kell elhelyezni; ha azonban a kialakítás olyan, hogy semmilyen hőhatás nem jár azzal a veszéllyel, hogy a raktér belső felületének hőmérséklete 80 °C fölé emelkedik, akkor a motor a raktér alatt is elhelyezhető.

9.3.6 Külső hőforrások és raktér

A (kész vagy befejezett) EX/II és az EX/III járművek kipufogó rendszerét, illetve minden más részét úgy kell kialakítani és elhelyezni, hogy semmilyen hőhatás ne járjon azzal a veszéllyel, hogy a raktér belső felületének hőmérséklete 80 °C fölé emelkedik.

9.3.7 Villamos berendezések

9.3.7.1 A villamos berendezések névleges feszültsége nem haladhatja meg a 24 V-ot.

9.3.7.2 Az EX/II járművek rakterében minden világítást a mennyezeten kell elhelyezni és burkolattal kell ellátni, azaz szabadon álló vezetékek vagy izzók nem alkalmazhatók.

A villamos berendezéseknek a J összeférhetőségi csoport esetén legalább IP65 (pl. EEx d nyomásálló tokozású) típusúnak kell lenniük. A raktér belsejéből hozzáférhető villamos berendezéseket megfelelő módon védeni kell a belülről fellépő mechanikai hatásokkal szemben.

9.3.7.3 Az EX/III járművek villamos berendezéseinek a 9.2.2.2, a 9.2.2.3, a 9.2.2.4, a 9.2.2.5.2 és a 9.2.2.6 bekezdés vonatkozó követelményeinek kell megfelelniük.

A raktérben a villamos berendezésnek pormentesnek (legalább IP54 típusúnak vagy azzal egyenértékűnek), vagy a J összeférhetőségi csoport esetén legalább IP65 (pl. EEx d nyomásálló tokozású) típusúnak kell lennie.

9.4 FEJEZET

KIEGÉSZÍTŐ KÖVETELMÉNYEK A VESZÉLYES ÁRUT KÜLDEMÉNYDARABOKBAN SZÁLLÍTÓ (KÉSZ, ill. BEFEJEZETT) JÁRMŰVEK (KIVÉVE AZ EX/II ÉS EX/III JÁRMŰVEK) FELÉPÍTMÉNYÉNEK SZERKEZETÉRE

- 9.4.1** Az égéshő felhasználásával működő fűtőberendezésnek ki kell elégítenie a következő követelményeket:
- a) a kapcsoló a vezetőfülkén kívül is elhelyezhető;
 - b) a fűtőberendezést a raktéren kívülről is ki lehet kapcsolni; és
 - c) nem szükséges bizonyítani, hogy a hőcserélő elviseli a mérsékelt utóégéseket.
- 9.4.2** Ha a járművel olyan veszélyes árut szállítanak, amelyre 1, 1.4, 1.5, 1.6, 3, 4.1, 4.3, 5.1 vagy 5.2 veszélyességi bárca van előírva, akkor nem szabad a raktéren belül elhelyezni az égéshő felhasználásával működő fűtőberendezés működéséhez szükséges tüzelőanyagtartályt, áramforrást, porlasztó levegő (égési levegő) és fűtőlevegő beszívónyílást, illetve égéstermék kivezetőnyílást. Biztosítani kell, hogy a rakomány ne torlaszolja el a fűtőlevegő kivezetőnyílást. A küldeménydarabok legfeljebb 50 °C-ra melegedhetnek fel. A raktéren belül elhelyezett fűtőberendezésnek olyannak kell lennie, hogy üzemi körülmények között a robbanóképes környezetben ne okozzon gyulladást.
- 9.4.3** Egyes veszélyes áruk vagy egyes csomagolások szállítása esetén a jármű felépítményének szerkezetére további követelmények lehetnek még a 7. rész 7.2 fejezetében, ahogy azt az egyes anyagokra vonatkozóan a 3.2 fejezet „A” táblázat 16 oszlopa feltünteti.

9.5 FEJEZET

KIEGÉSZÍTŐ KÖVETELMÉNYEK A SZILÁRD VESZÉLYES ÁRUT ÖMLESZTVE SZÁLLÍTÓ (KÉSZ, ill. BEFEJEZETT) JÁRMŰVEK FELÉPÍTMÉNYÉNEK SZERKEZETÉRE

- 9.5.1** Az égéshő felhasználásával működő fűtőberendezésnek ki kell elégítenie a következő követelményeket:
- a) a kapcsoló a vezetőfülkén kívül is elhelyezhető;
 - b) a fűtőberendezést a raktéren kívülről is ki lehet kapcsolni; és
 - c) nem szükséges bizonyítani, hogy a hőcserélő elviseli a mérsékelt utóégéseket.
- 9.5.2** Ha a járművel olyan veszélyes árut szállítanak, amelyre 4.1, 4.3 vagy 5.1 veszélyességi bárca van előírva, akkor nem szabad a raktéren belül elhelyezni az égéshő felhasználásával működő fűtőberendezés működéséhez szükséges tüzelőanyagtartályt, áramforrást, porlasztó levegő (égési levegő) és fűtőlevegő beszívónyílást, illetve égéstermék kivezetőnyílást. Biztosítani kell, hogy a rakomány ne torlaszolja el a fűtőlevegő kivezetőnyílást. A rakomány legfeljebb 50 °C-ra melegedhet fel. A raktéren belül elhelyezett fűtőberendezésnek olyannak kell lennie, hogy üzemi körülmények között a robbanóképes környezetben ne okozzon gyulladást.
- 9.5.3** Szilárd veszélyes áruk ömlesztett szállítása esetén a jármű felépítményének meg kell felelnie a 6.11, ill. a 7.3 fejezet követelményeinek, beleértve a 7.3.2, ill. a 7.3.3 szakaszt, ahogy azt az egyes anyagokra vonatkozóan a 3.2 fejezet „A” táblázat 10, ill. 17 oszlopa feltünteti.

9.6 FEJEZET

KIEGÉSZÍTŐ KÖVETELMÉNYEK A HŐMÉRSÉKLET-SZABÁLYOZÁSSAL TÖRTÉNŐ SZÁLLÍTÁSRA SZOLGÁLÓ (KÉSZ, ill. BEFEJEZETT) JÁRMŰVEKRE

9.6.1

A veszélyes anyagok hőmérséklet-szabályozással történő szállítására szolgáló hőszigetelt, hűtött vagy hűtőgépes járműveknek a következő feltételeknek kell megfelelniük:

- a) a járműveknek hőszigetelésüket és hűtési módjukat illetően olyanoknak kell lenniük és úgy kell azokat felszerelni, hogy a hőmérséklet ne haladja meg a 2.2.41.1.17 és a 2.2.52.1.16 pontokban, ill. a 2.2.41.4 és a 2.2.52.4 bekezdésben a szállított anyagra előírt szabályozási hőmérsékletet. Az együttes hőátadási együttható nem haladhatja meg a $0,4 \text{ W}/(\text{m}^2 \cdot \text{K})$ értéket;
- b) a járművet úgy kell felszerelni, hogy a szállított anyagból vagy a hűtőközegből származó gőzök ne juthassanak a vezetőfülkébe;
- c) megfelelő készülékkel lehetővé kell tenni a raktérben uralkodó hőmérséklet meghatározását bármely időpontban a vezetőfülkéből;
- d) a raktérben biztosítani kell a szellőzést, vagy azt szellőző szelepekkel kell ellátni, ha fennáll benne a veszélyes túlnyomás kialakulásának veszélye. Ilyen esetekben kellő óvatossággal kell eljárni, hogy a szellőzés vagy a szellőző szelepek ne csökkentsék a hűtést;
- e) a hűtőközeg nem lehet gyúlékony; és
- f) a hűtőgépes jármű hűtőkészülékének alkalmasnak kell lennie arra, hogy a jármű meghajtására szolgáló motortól függetlenül működjön.

9.6.2

A szabályozási hőmérséklet túllépésének elkerülésére szolgáló módszerek a 7.2 fejezetben vannak felsorolva (R1 – R5). Az alkalmazott módszertől függően a jármű felépítményének szerkezetére további követelmények lehetnek a 7.2 fejezetben.

9.7 FEJEZET

KIEGÉSZÍTŐ KÖVETELMÉNYEK A TARTÁNYJÁRMŰVEKRE (RÖGZÍTETT TARTÁNYOKRA), AZ 1 m³-NÉL NAGYOBB BEFOGADÓKÉPESSÉGŰ BATTÉRIÁS JÁRMŰVEKRE, A VESZÉLYES ÁRUK 1 m³-NÉL NAGYOBB BEFOGADÓKÉPESSÉGŰ LESZERELHETŐ TARTÁNYBAN, 3 m³-NÉL NAGYOBB BEFOGADÓKÉPESSÉGŰ TANKKONTÉNERBEN, MOBIL TARTÁNYBAN VAGY MEG-KONTÉNERBEN VALÓ SZÁLLÍTÁSÁRA SZOLGÁLÓ (KÉSZ, ill. BEFEJEZETT) JÁRMŰVEKRE (EX/III, FL, AT, OX JÁRMŰVEKRE)

9.7.1 Általános előírások

- 9.7.1.1** A tartányjármű a járműből vagy az azt helyettesítő közúti futómű-elemekből, egy vagy több tartányból, szerelvényeiből és a tartányokat a járműhöz vagy a futómű-elemekhez csatlakoztató alkatrészekből áll.
- 9.7.1.2** A hordozó-járműhöz erősített leszerelhető tartánynak a tartányjárműre vonatkozó előírásoknak meg kell felelnie.

9.7.2 A tartányokra vonatkozó követelmények

- 9.7.2.1** A fémből készült rögzített vagy leszerelhető tartányoknak meg kell felelniük a 6.8 fejezet vonatkozó követelményeinek.
- 9.7.2.2** Abban az esetben, ha a MEG-konténer elemei palackok, nagypalackok, gázhordók vagy palackkötegek, a 6.2 fejezet, ha tartányok, a 6.8 fejezet vonatkozó követelményeit kell betartani.
- 9.7.2.3** A fémből készült tankkonténereknek a 6.8 fejezet, a mobil tartányoknak a 6.7 fejezet, illetve – ahol alkalmazható – az IMDG Kódex (lásd az 1.1.4.2 bekezdést) vonatkozó követelményeinek kell megfelelniük.
- 9.7.2.4** A szálvázazás műanyagból gyártott tartányoknak a 6.9 fejezet követelményeinek kell megfelelniük.
- 9.7.2.5** A hulladékok szállítására szolgáló, vákuummal üzemelő tartányoknak a 6.10 fejezet követelményeinek kell megfelelniük.

9.7.3 Rögzítőelemek

A rögzítőelemeket úgy kell kialakítani, hogy a normál szállítási körülmények között fellépő statikus és dinamikus terheléseket, ill. a tartányjárművekre, a battériás járművekre és a leszerelhető tartányt hordozó járművekre a 6.8.2.1.2, a 6.8.2.1.11 – 6.8.2.1.16 pontban meghatározott minimális igénybevételeket el tudják viselni.

9.7.4 Az FL járművek földelése

Az FL tartányjárművek fémből vagy szálvázazás műanyagból készült tartányait, ill. az FL battériás jármű elemeit a jármű alvázával legalább egy, jó elektromos csatlakozással össze kell kötni. Elektrokémiai korróziót okozó fémes kapcsolatot nem szabad létesíteni.

Megjegyzés: Lásd még a 6.9.1.2 bekezdést és a 6.9.2.14.3 pontot is.

9.7.5 A tartányjárművek stabilitása

9.7.5.1 A talajon támaszkodó felület teljes szélességének (az ugyanazon tengely jobb és bal oldali gumibroncsának a talajjal érintkező legkülső pontjai közötti távolságnak) legalább akkorának kell lennie, mint a terhelt tartányjármű tömegközéppont magasságának 90 %-a. Nyerges szerelvényeknél a terhelt félpótkocsit hordozó egység tengelyeire eső tömeg nem haladhatja meg a terhelt nyerges szerelvény összes névleges tömegének 60%-át.

9.7.5.2 Az előzőeken túlmenően a folyadékok vagy olvadékok szállítására szolgáló, 3 m³-nél nagyobb befogadóképességű rögzített tartányt hordozó járműveknek (tartányjárműveknek), amelyeknél a tartány próbanyomása 4 bar-nál kisebb, meg kell felelniük az ENSZ-EGB 111. sz. előírás¹⁶⁾ oldalirányú stabilitásra vonatkozó követelményeinek. Ezeket a követelményeket az először 2003. július 1-je után forgalomba helyezett járművekre kell alkalmazni.

9.7.6 A járművek hátsó védelme

A jármű hátsó részét a hátulról jövő lökésekkel szemben a tartány teljes szélességben kielégítően védő lökhárítóval kell felszerelni. A tartány hátsó fala és a lökhárító hátsó része között legalább 100 mm távolságnak kell lennie; ezt a távolságot a tartány hátsó falának leghátsó pontjától, vagy a szállított anyaggal érintkezésben lévő, kiálló tartozékoktól vagy szerelvényektől kell mérni. A por alakú vagy szemcsés anyagok szállítására használt, hátsó ürítésű, billenthető tartánnyal ellátott járműveknél és a hulladékok szállítására szolgáló, vákuummal üzemelő, hátsó ürítésű, billenthető tartánnyal ellátott járműveknél nem szükséges lökhárító, ha a tartány hátsó szerelvényei el vannak látva olyan védőszerkezettel, amely a tartányt a lökhárítóhoz hasonló módon védi.

Megjegyzés: 1. Ezt az előírás nem vonatkozik a veszélyes árut tankkonténerben, mobil tartányban vagy MEG-konténerben szállító járművekre.

2. A tartányok oldalirányú lökésekkel vagy felborulással szembeni védelmére tartányok esetében lásd a 6.8.2.1.20 és a 6.8.2.1.21 pontot, ill. mobil tartányok esetében a 6.7.2.4.3 és a 6.7.2.4.5 pontot.

9.7.7 Égéshő felhasználásával működő fűtőberendezés

9.7.7.1 Az égéshő felhasználásával működő fűtőberendezésnek meg kell felelnie a 9.2.4.7.1, a 9.2.4.7.2, a 9.2.4.7.5 pont követelményeinek és a következő feltételeknek:

- a) a kapcsoló a vezetőfülkén kívül is elhelyezhető;
- b) a fűtőberendezést a raktéren kívülről is ki lehet kapcsolni; és
- c) nem szükséges bizonyítani, hogy a hőcserélő elviseli a mérsékelt utóégéseket.

Az FL járművek esetében az előzőeken túlmenően a 9.2.4.7.3 és a 9.2.4.7.4 pont előírásainak is meg kell felelni.

9.7.7.2 Ha a járművel olyan veszélyes árut szállítanak, amelyre 1.5, 3, 4.1, 4.3, 5.1 vagy 5.2 veszélyességi bárca van előírva, akkor nem szabad a raktéren belül elhelyezni az égéshő felhasználásával működő fűtőberendezés működéséhez szükséges tüzelőanyagtartályt, áramforrást, porlasztó levegő (égési levegő) és fűtőlevegő beszívónyílást, illetve égéstermék kivezetőnyílást. Biztosítani kell, hogy a rakomány ne torlaszolja el a fűtőlevegő kivezetőnyílást. A rakomány legfeljebb 50 °C-ra melegedhet fel. A raktéren belül elhelyezett fűtőberendezésnek olyannak kell lennie, hogy üzemi körülmények között a robbanóképes környezetben ne okozzon gyulladást.

16) Az ENSZ-EGB 111. sz. előírás: Egységes feltételek az N és O kategóriájú tartányjárművek jóváhagyására a borulási stabilitás vonatkozásában.

9.7.8 Villamos berendezések

9.7.8.1 A 9.1.2 szakasz szerint jóváhagyásra kötelezett FL járművek villamos berendezéseinek a 9.2.2.2, a 9.2.2.3, a 9.2.2.4, a 9.2.2.5.1 és a 9.2.2.6 bekezdés követelményeinek kell megfelelniük.

A villamos berendezések kiegészítése vagy változtatása esetén a szállítandó anyagoknak megfelelő csoport és hőmérsékleti osztály villamos berendezésekre vonatkozó követelményeit teljesíteni kell.

***Megjegyzés:** Az átmeneti előírásokra lásd az 1.6.5 szakaszt is.*

9.7.8.2 Az FL járművek villamos berendezéseinek, amelyek olyan helyen vannak, ahol robbanóképes környezet van vagy várható, a veszélyes környezetben történő használatra alkalmasnak kell lenniük. Az ilyen berendezéseknek meg kell felelniük az IEC 60079 szabvány 0 és 14 részének általános követelményeinek és az IEC 60079 szabvány 1, 2, 5, 6, 7, 11 vagy 18 részének¹⁷⁾ vonatkozó kiegészítő követelményeinek. A villamos berendezéseknek meg kell felelniük a szállítandó anyag szerinti megfelelő csoport és hőmérsékleti osztály villamos berendezéseire vonatkozó követelményeknek.

Az IEC 60079 szabvány 14 részének¹⁷⁾ alkalmazása szempontjából a következő osztályozást kell használni:

0 zóna: a tartány belseje, a töltő és ürítő szerelvények és gőzvisszavezető.

1 zóna: a töltéshez és ürítéshez használt felszerelések kezelőszekrényének belseje, valamint a szellőztető szerkezetek és a biztonsági szelepek 0,5 m-es környezete.

9.7.8.3 A 0 és 1 zónán kívül elhelyezkedő, tartósan feszültség alatt levő villamos berendezésekre (beleértve a vezetékeket is), általában az 1 zóna, illetve a vezetőfülkében elhelyezett villamos berendezésekre az IEC 60079 szabvány 14¹⁷⁾ része szerinti 2 zóna követelményeit kell teljesíteni. A szállítandó anyagoknak megfelelő csoport és hőmérsékleti osztály villamos berendezésekre vonatkozó követelményeit teljesíteni kell.

9.7.9 Az EX/III járművekre vonatkozó kiegészítő biztonsági követelmények

9.7.9.1 Az EX/III járműveket a motortérben keletkező tűz leküzdésére önműködő tűzoltó készülékkel kell felszerelni.

9.7.9.2 A rakományt az abroncstüzzel szemben fémből készült hőszigetelő pajzzsal kell védeni.

17) Alternatívaként az EN 50014 szabvány általános követelményei, ill. az EN 50016, 50017, 50018, 50019, 50020 és 50028 kiegészítő követelményei is használhatók.

9.8 FEJEZET

KIEGÉSZÍTŐ KÖVETELMÉNYEK A KÉSZ, ill. BEFEJEZETT MEMU-KRA

9.8.1 Általános előírások

A MEMU a járműből vagy az azt helyettesítő közúti futómű-elemekből, egy vagy több tartányból és ömlesztettáru-konténerből, szerelvényeikből és a járműhöz vagy a futómű-elemekhez csatlakoztató alkatrészekből áll.

9.8.2 Tartányokra és ömlesztettáru-konténerekre vonatkozó követelmények

A tartányokra, az ömlesztettáru-konténerekre és a robbanóanyag szállítására szolgáló, különleges rakterekre a 6.12 fejezet követelményeit kell betartani.

9.8.3 A MEMU-k földelése

A MEMU egységek fémből vagy szálvázazás műanyagból készült tartányait, ömlesztettáru-konténereit, ill. a robbanóanyag szállítására szolgáló, különleges raktereit az alvázal legalább egy, jó elektromos csatlakozással össze kell kötni. Elektrokémiai korróziót okozó vagy a tartányban, ill. ömlesztettáru-konténerben szállított veszélyes áruval reakcióba lépő fémek kapcsolatát nem szabad létesíteni

9.8.4 A MEMU-k stabilitása

A talajon támaszkodó felület teljes szélességének (az ugyanazon tengely jobb és bal oldali gumibroncsának a talajjal érintkező legkülső pontjai közötti távolságnak) legalább akkorának kell lennie, mint a terhelt jármű tömegközéppont magasságának 90%-a. Nyerges szerelvényeknél a terhelt felpótkocsit hordozó egység tengelyeire eső tömeg nem haladhatja meg a terhelt nyerges szerelvény összes névleges tömegének 60%-át.

9.8.5 A MEMU-k hátsó védelme

A jármű hátsó részét a hátulról jövő lökésekkel szemben a tartány teljes szélességben kielégítően védő lökhárítóval kell felszerelni. A tartány hátsó fala és a lökhárító hátsó része között legalább 100 mm távolságnak kell lennie; ezt a távolságot a tartány hátsó falának leghátsó pontjától, vagy a szállított anyaggal érintkezésben lévő, kiálló tartozékoktól vagy szerelvényektől kell mérni. A hátsó üritésű, billenthető tartánnyal ellátott járműveknél nem szükséges lökhárító, ha a tartány hátsó szerelvényei el vannak látva olyan védőszerkezettel, amely a tartányt a lökhárítóhoz hasonló módon védi.

Megjegyzés: Ez az előírás nem vonatkozik az olyan MEMU-ra, amelynek a tartánya a hátulról jövő lökésekkel szemben más módon védve van, pl. a gépszerkezet vagy a veszélyes árut nem tartalmazó csővezeték által.

9.8.6 Égéshő felhasználásával működő fűtőberendezés

9.8.6.1 Az égéshő felhasználásával működő fűtőberendezésnek meg kell felelnie a 9.2.4.7.1, a 9.2.4.7.2, a 9.2.4.7.5, a 9.2.4.7.6 pont követelményeinek és a következő feltételeknek:

- a kapcsoló a vezetőfülkén kívül is elhelyezhető;
- a fűtőberendezést a MEMU karakterén kívülről lehet kikapcsolni; és
- nem szükséges bizonyítani, hogy a hőcserélő elviseli a mérsékelt utóégéseket.

9.8.6.2 Abban a raktérben, ahol tartány van nem szabad elhelyezni az égéshő felhasználásával működő fűtőberendezés működéséhez szükséges tüzelőanyag-tartályt, áramforrást, porlasztó levegő (égési levegő) és fűtőlevegő beszívónyílást, illetve égéstermék kivezetőnyílást. Biztosítani kell, hogy a fűtőlevegő kivezetőnyílása ne legyen eltorlaszolva. Bármelyik szerelvény legfeljebb 50 °C-ra melegedhet fel. A raktéren belül elhelyezett fűtőberendezésnek olyannak kell lennie, hogy üzemi körülmények között a robbanóképes környezetben ne okozzon gyulladást.

9.8.7 Kiegészítő biztonsági követelmények

9.8.7.1 A MEMU-kat a motortérben keletkező tűz leküzdésére önműködő tűzoltó készülékkel kell felszerelni.

9.8.7.2 A rakományt az abroncstűzzel szemben fémből készült hőszigetelő pajzzsal kell védeni.

9.8.8 Kiegészítő közbiztonsági követelmények

A MEMU-n a keverő- és töltőberendezést és a különleges rakteret zárral kell ellátni.

A Veszélyes Áruk Nemzetközi Közúti Szállításáról szóló Európai Megállapodás (ADR) „A” és „B” Mellékletében foglalt egyes feladatok megosztása

A közlekedésért felelős miniszter

Részt vesz az ADR „A” és „B” Mellékletével kapcsolatos nemzetközi tárgyalásokon; az ezeken felmerült módosításokra és kiegészítésekre vonatkozó magyar álláspontot – az illetékes miniszterekkel egyetértésben – kialakítja.

Az ADR Megállapodás 4. cikk 3. pontja alapján más Szerződő Felek illetékes hatóságaival megállapodik abban, hogy területeiken bizonyos szállításokat – az ADR „A” Mellékletének 7 osztályába tartozó anyagok (a továbbiakban: radioaktív anyagok) szállításának kivételével – ideiglenesen az ADR „A” és „B” Mellékletének előírásaitól eltérően engedélyeznek, feltéve, hogy ez a biztonságot nem veszélyezteti. Az általa kezdeményezett ideiglenes eltérésekről értesíti az ENSZ Európai Gazdasági Bizottság Titkárságát.

Közlekedési hatóság

Ellátja az ADR „A” és „B” Mellékletében meghatározott:

- a) a veszélyes áruk közúti alagutakban való szállításának korlátozásával kapcsolatos hatósági feladatokat;
- b) a veszélyes áru szállítási biztonsági tanácsadó képesítésével, vizsgáztatásával és nyilvántartásával kapcsolatos hatósági feladatokat;
- c) a veszélyes árut szállító járművek vezetőinek képzésével, vizsgáztatásával és nyilvántartásával kapcsolatos hatósági feladatokat; és
- d) a veszélyes árukat szállító járművek – szakhatóság bevonásával történő – jóváhagyásával és a jóváhagyási igazolás kiadásával kapcsolatos hatósági feladatokat.

Atomenergia-felügyeleti szerv

Ellátja az ADR „A” és „B” Mellékletében meghatározott, a radioaktív anyagokkal, csomagolásukkal és szállításukkal kapcsolatos, jóváhagyási, engedélyezési és értesítési hatósági feladatokat.

Bányafelügyelet

Ellátja az ADR „A” és „B” Mellékletében meghatározott:

- a) az ADR „A” Mellékletének 1 osztályába tartozó robbanóanyagokkal és tárgyakkal, valamint a járulékos veszélyként robbanó tulajdonsággal rendelkező anyagokkal kapcsolatos hatósági feladatokat; és
- b) a szerves peroxidok és az önreaktív anyagok besorolásával és szállítási feltételeivel kapcsolatos hatósági feladatokat.

Katasztrófavédelmi hatóság

Ellátja az ADR „A” és „B” Mellékletében meghatározott, a veszélyes áruk szállítása során bekövetkezett eseményekről szóló jelentéssel kapcsolatos hatósági feladatokat, szükség esetén kivizsgálja a bekövetkezett eseményt az előidéző okok és a felelősök megállapítása érdekében.

Műszaki biztonsági hatóság

Ellátja az ADR „A” és „B” Mellékletében meghatározott:

- a)* a veszélyes áruk szállítására használt nyomástartó tartályok, tartányok jóváhagyásával,
- b)* a veszélyes áruk szállítására használt nem nyomástartó tartályok, tartányok, valamint a csomagolóeszközök, nagycsomagolások, ömlesztettáru-konténerek jóváhagyásával, és
- c)* az EX/II és EX/III konténerek jóváhagyásával kapcsolatos hatósági feladatokat.
